Billious Inc. Distributor The saws are designed to be extremely durable, which means that it can be used safely by professionals and novices alike, in any type and size of woodworking project, even on projects that require much larger machinery. The Husqvarna chain saw comes in an array of sizes and is able to cut through even the thickest of timber with ease.

The Husqvarna chain saws are available in gas or electric models, both of which run on petrol. While the gas powered saw requires a fuel tank to be attached externally, the electric Husqvarna chainsaw model runs completely on electricity and does not require a fuel tank. This makes them much more environmentally friendly, and therefore much more financially sound when purchasing. Gas powered Husqvarna chainsaw are also much more convenient to use than their electric counterparts; however, they may be harder to start when the fuel is running low. Electric chainsaws tend to be much easier to start upon starting a fuel powered machine.

The main difference between the two chainsaw types is in the main drive unit, the saw has a large engine that pushes and pulls the saw blade along its length to cut the wood. With an electric Husqvarna chainsaw, the blade is instead connected to a counterweight so that it is balanced while running. This is known as counter-balance. As the blade is now balanced, the machine can now cut with greater force and use more wood at one go, making it ideal for cutting larger areas. Unfortunately this means that an electric Husqvarna chainsaw is not as powerful as a gas powered model; it will also be less effective at cutting into tougher, denser woods.

Both Husqvarna saws come in a variety of sizes and models, all of which are engineered to give the user the most efficient possible cutting capacity. In addition to their sheer cutting capacity, both Husqvarna chainsaw models also feature the latest in ergonomic design, meaning that users can work longer hours and more comfortably due to their fine control over how they handle the saw. The five 72 hour lithium ion rechargeable batteries in the saws allow users to cut for longer periods of time without recharging.

The hydraulic cutting lever in the Husqvarna chain saw is designed for professional use and offers a level of control not available with other chain saws. The professional models offer three speeds, with the option to use a lower speed if need be. One of the biggest benefits of these chainsaw models is their maneuverability. Many professional chainsaw buyers prefer these chainsaw models because they offer more agility and less kickback than other popular chainsaw models. This added maneuverability makes the Husqvarna chainsaw a preferred choice of professionals who need to get closer to their work quickly and efficiently.

Another huge benefit of these professional chainsaws is their warranty. Most professional saws come with a twenty year or longer warranty and all the pros know that twenty years is plenty of time to save money on repairs or maintenance. Because these Husqvarna electric saws run on standard household electricity, the warranty covers not only the motor but the cutters and any damage done to the electric saw itself during operation. While professional saws might offer a warranty for electric chainsaw units, most home owners and contractors do not carry the same level of coverage and many find that the Husqvarna brand of electric chainsaw is one of the best warranties on the market. While professional saws offer the most durability, these Husqvarna electric chainsaw models are built to last and still provide exceptional performance.
