

Minecraft - The Wild Update Is Available Now, Java & Bedrock Now One Purchase

QuoteThey will be available in two different versions However, you can have both.

My Sorage is that they're planning to end Java edition and then saying "well, the majority of Java players are playing on Windows and therefore they can play Bedrock!"

Presently, Java supports Windows 7 and later, whereas Bedrock supports Windows 10 and later. I fear that Microsoft will decide that there is no reason to maintain two separate codebases when Windows 7 and 8 are eliminated.

This issue is not due to Microsoft's conflict of interest in (not) supporting Linux. None of the major game studios, including Paradox or Valve are planning to bring full-sized games onto Linux unless they have access to the majority of software for Windows. If the developer decided not to support the Windows version of an exclusive Linux game and it was a result, it was removed from the Linux community.

Quote: mr-victoryQuoteNot that is particularly relevant to Linux players. However, it is a factor for me. Homeshare was using the bedrock edition only because Java was much more expensive but now I can play minecraft on linux. Last time I checked, purchasing BE on one platform didn't allow me to play it on another platform. What has changed? Is it true that buying Minecraft on the desktop now get you Bedrock on Android, or vice the reverse?
