Hello and welcome to my first cycle of Clenbuterol. This specific dosage is: Clenbuterol is a sympathomimetic amine which belongs to the drugs class named Beta- 2 agonists. This class of drugs is used for the treatment of various chronic breathing disorders and respiratory issues including diseases like asthma. The Clen pills act as a bronchodilator, dilating the bronchi and bronchioles, which is making the breathing much easier by increasing the airflow to the lungs. In addition to that, the drug has wide application in weight reduction and cutting cycles. It acts as a powerful fat- burning supplement, which is increasing the metabolic activity and is stimulating the Beta- 2 receptors. This is a rush transcript. Copy may not be in its final form. The information in this article comes from an interview I conducted with my ex-lover, a male health professional. While he was there, he met with a lot of resistance from women around the community as well. They often portray women who have abortions as victims of Clen as it is not something that is approved by the local government. It is not something that I am personally opposed to, nor is it something that I would ever want to do myself. However, when it comes to females who are involved in bodybuilding, it can be very problematic for them. The approach taken by many Clen users is to engage in risky sexual activity with the intention to avoid any adverse side effect. It is suggested that when an individual begins using Clenbuterol, he or she should take 3 to 4 tablets a day. The reason many women use Clen is that it has been shown to increase muscle mass and fiber size, both within a short period of time and in very small a period of time. The problem is that Clenbuterol can be unstable and this causes the user to have to change their minds whenever they want to stop
