First off, navigate to the AppData folder where the Minecraft files are situated. Assuming you're working Home windows 7, open the file browser and seek for "%appdata%". The primary consequence ought to be the best folder. Alternately, navigate to it manually by going to: "C:/Users/[your username]/AppData/Roaming". Notice that AppData is a hidden folder, so enable "Show hidden folders" if you don't have already got it enabled.

Your .minecraft folder should be located here; open it. There ought to be a folder labeled "versions", which is what we're going after. Open it and look for a folder with the same identify because the Minecraft version you're searching for; in your case, will probably be named "1.7.4". Inside this folder must be the jar file you're searching for.
