

Clean Minecraft Server File

I have downloaded the java version as an alternative of simply the exe. file as I've seen others with the same drawback strive to repair the difficulty this fashion. I am sure that the exports and imports for the IP address connections and have entered the 25565, and listed each TCP and UDP or no matter. My world my life I take advantage of the CT-5374 which is a Comtrend router. However the Minecraft server file; the stats, log and chat, and players all show up clean. Nevertheless it doesn't checklist it as a "java" or ".jar" or whatever after the file name. I'm unsure what the issue is apart from it is having to deal with the blankness but I am uninterested in running into all of those problems. I've been troubleshooting for practically three straight hours and nonetheless can't seem to quite fix it. I can be a part of onto my multiplayer server, but my pals can not, and I'm unsure of what to do now.
