

# How To Allocate Extra RAM To Minecraft

After using method one, my Minecraft nonetheless runs at 38-42 fps, and it solely makes use of 1250 MOB out of the 4,000 I assigned it. How do I repair this?

RAM isn't the only thing that contributes to the quantity of FPS. You need to consider how highly effective your CPU is and what your graphics settings are in recreation. My suggestion is attempt decreasing your render distance and particles. Also, make sure V-Sync is off, as this does limit your frame price. One other factor you possibly can strive is putting in Optifine, which supplies you more management over your graphics settings.

Query

I've 3.19 GB usable and sixty four bits. Should I exploit 1.5 GB for Minecraft?

It is determined by how a lot total RAM you've gotten. Allocating an excessive amount of

RAM to Minecraft may truly make your recreation run more slowly. If in case you have at the very least 6GB total then you should be okay if you happen to allocate 1.5GB to Minecraft. Nonetheless, allocating greater than the standard 1GB is usually pointless for performance unless you might be using texture packs or mods.

Question

Can I allocate 3.5 GB of RAM to Minecraft?

Yes, but you would want a x64 or 64-bit version of Home windows or Mac. Additionally it is recommended to only allocate a maximum of one quarter 1/four of your total usable RAM. Something below this quantity is perfectly fantastic to allocate.

Question

What is the really useful amount of dedicated RAM I should have for a server?

Aidan Gamerdude

Community Answer

When you anticipate 1 - 5 players, then allocate about 512 MB. Nonetheless, in case you plan to do intensive tasks (TNT, a variety of mobs, etc.) allocate extra. For every 5 extra

players, simply bump it up by one other 512 MB.
