Whether for this reason or in the pursuit of person experimentation, prodrugs of NPS have been mentioned, developed, and exploited, posing some distinct forensic challenges.

The resulting spectra are similar to these obtained beneath conventional situations the place individual substances are converted to the free base state and subjected to neat ATR-IR measurements. A key difference between ETH-LAD and 1P-ETH-LAD was the absence of the indole NH group within the latter ($\sim 3000\text{ cm}^{-1}$), which is comparable with observations made previously with 1P-LSD. Correspondingly, the appearance of a second carbonyl sign in the spectrum of 1P-ETH-LAD was detected at 1704 cm^{-1} as a result of presence of the propionyl group in the 1-position. GC-*s*IR spectra were recorded for three of the 4 ETH-LAD isomers and are included individually in the Supporting Information part.
