

Where Is The New Minecraft Launcher Exe Located

Windows apps shortcuts don't involve the .exe.

Option 1

Start > Settings > Personalization > Start > Enable "Show app list on Start menu"

Once enabled, your menu will include an app list to the left side of your start menu (Picture).

Scroll down to Minecraft Launcher and drag the icon to the desktop.

Option 2

An alternate method to create a short for new Minecraft Launcher

Press Windows key + r

Enter shell:AppsFolder

Find the new Minecraft Launcher

Right click and create a shortcut

If they don't involve the .exe does that mean its no longer possible to add Minecraft as a non-steam game to my steam library? Trying to make it work with my xbox controller and thats the main method I've seen people suggest but as far as I've been able to tell I need to select the minecraftlauncher.exe to add it to my library and that doesn't seem to exist anymore.

It was much easier than I expected. Thanks

It worked great, thanks! Minecraft servers I could never figure it out for my forza either

It's a great idea!

C:\Program
Files\WindowsApps\Microsoft.4297127D64EC6_1.0.104.0_x64__8wekyb3d8bbwe

"Don't have permission to open this file" I've tried everything and tried to give permission. Is there a way to bypass it and use a Java edition controller?

This is a great help. However, I am experiencing the dreaded OpenGL1282 error. I cannot locate the correct location to place the file.

I tried all the wonderful advice that was offered by users in this thread, but it didn't work. Steam doesn't support the new launcher, no matter what I do. Although I may be a complete novice, Java MC simply doesn't support controller support. We deserve better than this work-around.
