CFS-2	Given an assignment to conduct a commodity flow study for a jurisdiction, identify major steps in the process, such as the following: (1)Identify the specific purpose(s) of the study. (2)Review baseline information appropriate to the study. (3)Design the study. (4)Conduct field surveys. (5)Analyze the results. (6)Apply the results to the study purpose and objectives.
CFS-3	Given an assignment to conduct a commodity flow study for a jurisdiction, identify the specific purpose(s) of the study.
CFS-3.1	Assess the emergency management needs and other possible applications and uses for hazardous materials transportation data in the jurisdiction.
CFS-3.2	Identify the specific types of hazardous materials transportation data needed for the study.

Recommended Training

CFS-4	Given the specific purpose(s) of a commodity flow study for a jurisdiction, demonstrate the ability to identify and review existing baseline information appropriate to the study.
CFS-4.1	Describe common sources of existing information that can be used to identify roads available to hazardous materials transportation.
CFS-4.2	Describe common sources of existing information on vehicle traffic patterns, chemical flows, and accident histories in the jurisdiction.
CFS-5	Given the specific purpose(s) and baseline data of a commodity flow study for a jurisdiction, demonstrate the ability to design a field investigation appropriate to the study.
CFS-5.1	Compare baseline information with project goals to determine whether a field investigation should be undertaken.
CFS-5.2	Identify options and considerations for determining survey locations.
CFS-5.3	Identify options and considerations for determining survey times and repetitions.
CFS-5.4	Identify the personnel and other resource requirements associated with selected field survey methods.
CFS-6	Given an area to be surveyed and the commodity flow study design for a jurisdiction, demonstrate the ability to implement common data collection methods.
CFS-6.1	Describe common methods and demonstrate the appropriate use of placard surveys.
CFS-6.2	Describe common methods and demonstrate the appropriate use of shipping papers reviews.
CFS-6.3	Describe common methods and demonstrate the appropriate use of driver interviews.
CFS-6.4	Describe common methods and demonstrate the appropriate use of facility surveys.
CFS-6.5	Describe the advantages and disadvantages of various data recording procedures that can be used in field surveys.
CFS-7	Given hazardous materials transportation data for a jurisdiction, demonstrate the ability to apply appropriate sampling techniques to the collection and interpretation of the data.
CFS-7.1	Describe key statistical concepts (e.g., Poisson distribution, expected and observed value, confidence intervals) relevant to traffic flow analysis.
CFS-7.2	Make appropriate conclusions and inferences based on sample characteristics and collected data.

Recommended Training

CFS-8	Given hazardous materials transportation data and analyses for a jurisdiction, demonstrate the ability to apply the results in planning.
CFS-8.1	Map or otherwise display and report the results of the commodity flow study to obtain a clear picture of hazardous materials transportation in the jurisdiction.
CFS-8.2	Compare the study results and project goals to identify action items and a schedule for implementing them through the jurisdiction's plan development and implementation process.

Hazardous Materials
Planning Curriculum Guidelines:

Hazards Analysis

General Training Considerations

Scope/Objectives of Training

A hazards analysis includes (1) identifying hazards associated with the storage, handling, processing and transportation of hazardous materials, (2) conducting a vulnerability analysis to identify people, property, and environments susceptible to damage should a hazardous materials release occur, and (3) conducting a risk analysis to determine the probability of various types of emergencies and estimates of resulting damage.

Training should provide the knowledge and skills necessary to conduct a comprehensive hazards analysis for a jurisdiction or facility. Skill development should include the ability to assess the jurisdiction's or facility's hazards analysis needs, determine appropriate methods, collect and interpret data, and report the results. Specifically included is the use of tables and other tools for determining the level of concern, establishing hazard and vulnerability zones, and identifying related priorities. More sophisticated and technical approaches to hazards analysis may also be covered, if appropriate, or references provided for additional training and assistance.

Audience

Potential training audiences are all participants in the planing process that have been assigned responsibility for conducting a hazards analysis that exceeds the competencies covered under Planning Essentials. Possible audience members include:

- Community planning team members
- Facility planners and managers
- Response agency representatives
- Prevention personnel
- Technical experts and consultants

Prerequisites or Presumed Prior Knowledge/Skills of Students

Students are assumed to possess Planning Orientation and Planning Essentials levels of competency in hazards analysis. Consideration should be given to students that have a defined responsibility for conducting higher level hazards analyses for a jurisdiction or facility as a regular part of their job.

Typical Program Format

Seminar-type instructor-led program, approximately one to two days in length. Longer programs may be appropriate where more complex studies are planned or when actual field surveys are included as training activities. Training managers may wish to combine this instruction with a module on capability assessment for audiences that perform both tasks.

Methodology and Training Delivery Considerations

The successful accomplishment of training objectives should result in enhanced student proficiency in applying the principles of hazards analysis to a specific jurisdiction's or facility's planning needs and processes. Training should focus on developing knowledge of the steps and components of hazards analysis and on developing skill in performing hazard identification, vulnerability analysis, and risk analysis. Trainees must understand the significance and application of hazards analysis information, and develop the ability to recognize and develop useful and meaningful data on which to base subsequent emergency operations planing and prevention programmatic and organizational decisions.

Much of the content for analyzing hazards can be introduced through self-study, but training should include formal classroom instruction with significant time spent in individual and small group work. Activities should focus on skill development in extracting hazard identification and vulnerability information from available data sources, determining vulnerable zones from maps and hazard data, and performing the analyses leading to accurate risk determination. Content testing is appropriate for demonstrating knowl-

edge of the steps involved in hazards analysis, listing types of hazard information, and identifying the components of a completed hazards analysis.

Because of the interdisciplinary nature of planning and hazards analysis, training audiences should be heterogeneous and, whenever possible, small-group work should be conducted to encourage cross-disciplinary interactions. Integration of the information learned by the trainee can be demonstrated in a post-class activity involving the development of a limited hazards analysis using data from the trainee's home jurisdiction or facility, or scenarios provided by the instructor. Members of planning teams that are conducting a complex hazards analysis should be trained together, if possible, with student activities based on assignments.

Objective Identification Legend

This is the identification of the objective used in this document. It matches the identification code used in course assessment references. (See the Training Program Management section of this document.) Decimal numbers (such as HAZAN-1.1) indicate enabling objectives supporting the primary objective.

Identification	***Recommended** Training Objectives*
HAZAN-1	Given an assignment to conduct a hazards analysis for a jurisdiction or facility, describe the process to be used for conducting the study.
HAZAN-1.1	Describe the purpose and benefits of conducting a hazards analysis, including appropriate applications of the results in planning.
HAZAN-1.2	Describe the basic steps in a hazards analysis (hazards identification, vulnerability analysis, risk analysis).
HAZAN-1.3	Identify types and sources of information commonly used in hazards analysis.
HAZAN-2	Given an assignment to conduct a hazards analysis for a jurisdiction or facility, demonstrate the ability to identify hazards and situations that pose a serious threat in the planning area.
HAZAN-2.1	Describe the process and data sources to be used for hazards identification.
HAZAN-2.2	Identify the location of hazardous materials facilities and major transportation routes within the planning area.
HAZAN-2.3	Identify the types, quantities, and specific locations of hazardous materials used by facilities within the planning area.

Recommended Training

HAZAN-2.4	Identify the types and quantities of hazardous materials transported in or through the planning area.
HAZAN-2.5	Assess the storage conditions of hazardous materials in the planning area (e.g., containment, packaging, security, release detection).
HAZAN-2.6	Identify the nature of hazards (e.g., flammable, explosive, toxic) most likely to accompany hazardous materials spills or releases.
HAZAN-3	Given the results of the hazard identification, demonstrate the ability to analyze and map the vulnerability of people, property, business interests, and environments in the planning area.
HAZAN-3.1	Describe the process and data sources to be used for vulnerability analysis.
HAZAN-3.2	Identify methods to screen and prioritize hazards for more in-depth analysis.
HAZAN-3.3	Identify the level of concern for chemical hazards.
HAZAN-3.4	Estimate the credible worst-case scenario for hazardous materials threats.
HAZAN-3.5	Determine the extent of vulnerable zones for identified hazards using worst-case scenarios.
HAZAN-3.6	Map vulnerable zones, and identify conditions that influence the zone of impact.
HAZAN-3.7	Identify susceptible human populations, property, business interests, and environments in the vulnerable zone, including high-risk populations, critical facilities, and sensitive environments.
HAZAN-4	Given a hazard identification and vulnerability analysis for a community or facility, demonstrate the ability to assess the risk of injury or damage due to a hazardous materials release in the planning area.
HAZAN-4.1	Describe the process and data sources to be used for risk assessment.
HAZAN-4.2	Estimate the probability of occurrence of worst-case scenarios, and describe unusual conditions, such as the possibility of simultaneous incidents.
HAZAN-4.3	Assess community and facility safeguards, response capabilities in place, and incident histories (as necessary).
HAZAN-4.4	Describe the type of harm to human populations and damage to property, business interests, and environments expected in worst-case situations.
HAZAN-4.5	Categorize, prioritize, and/or rank hazards for planning, as appropriate.

HAZAN-5	Given the hazard identification, vulnerability analysis, and risk assessment for a community or facility, demonstrate the ability to prepare a comprehensive hazard analysis report.
HAZAN-5.1	Identify and describe hazards and related conditions in the planning area.
HAZAN-5.2	Describe the vulnerability of populations, property, business interests, and environments to hazardous materials threats in the planning area.
HAZAN-5.3	Describe the risk of injury and/or damage from hazardous materials incidents in the planning area, and prioritize risks for planning, as appropriate.

Hazardous Materials
Planning Curriculum Guidelines:

Capability Assessment

General Training Considerations

Scope/Objectives of Training

A capability assessment provides information designed to help the planning team evaluate preparedness, prevention, and response resources and capabilities. It includes an assessment of fixed site business and industry resources, transportation resources, and community (response and government agency) resources that could be called upon in the event of a potential emergency identified in the jurisdiction's or facility's hazards analysis.

Training should provide the knowledge and skills necessary to conduct a capability assessment for a jurisdiction or facility. Skill development should include the ability to assess the jurisdiction's or facility's capability assessment needs, determine appropriate methods, collect and interpret data, and report the results. Specifically included is the use of checklists, criteria, surveys, and other methods to identify available resources, determine requirements for accessing them, evaluate deficiencies in existing plans and procedures, and assess the effectiveness of emergency response, prevention, and recovery efforts. The successful accomplishment of training objectives should result in enhanced student proficiency in applying general principles of capability assessment to specific jurisdiction or facility planning needs and processes.

Audience

Potential training audiences include all participants in a jurisdiction or facility planing process that have been assigned responsibility for conducting a capability assessment study. Possible audience members include:

- Community planning team members
- Facility planners and managers
- Response agency representatives
- Prevention personnel
- Technical experts and consultants

Prerequisites or Presumed Prior Knowledge/Skills of Students

Students are assumed to possess Planning Orientation and Planning Essentials levels of competency in capability assessment. Consideration should be given to students that have a defined responsibility for conducting a higher level capability assessment as a regular part of their job for a jurisdiction or facility.

Typical Program Format

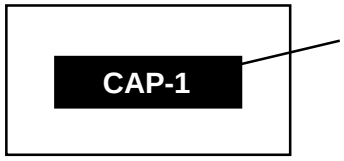
Seminar-type instructor-led program, approximately one to two days in length. Longer programs may be appropriate where more complex studies are planned or when actual field surveys are included as training activities. Training managers may wish to combine this instruction with a module on hazard analysis for audiences that perform both tasks.

Methodology and Training Delivery Considerations

Training should focus on providing knowledge of the steps and components of a comprehensive capability assessment and on developing related skills. Trainees must understand the significance and application of capability assessment information, and develop the ability to recognize and develop useful and meaningful data on which to base subsequent emergency operations planing and prevention programmatic and organizational decisions.

Much of the content for assessing capabilities can be introduced through self-study, but training should include formal classroom instruction with significant time spent in individual and small group work. Activities should focus on skill development in extracting capability assessment information from available data sources, identifying and assessing existing resources, assessing the effectiveness of emergency management activities, and identifying and evaluating planning shortfalls.

Integration of the information learned by the trainee can be demonstrated in a post-class activity involving the development of a limited capability assessment based on the hazards analysis and resource data from the trainee's home jurisdiction or facility, or from scenarios provided by the instructor. Content testing is appropriate for demonstrating knowledge of the steps involved in capability assessment, listing types of community and facility resources, and identifying the components of a completed capability assessment.



Objective Identification Legend

This is the identification of the objective used in this document. It matches the identification code used in course assessment references. (See the Training Program Management section of this document.) Decimal numbers (such as CAP-1.1) indicate enabling objectives supporting the primary objective.

Identification	***Recommended** Training Objectives*
CAP-1	Given an assignment to conduct a capability assessment for a jurisdiction or facility, describe the process to be used for conducting the study.
CAP-1.1	Describe the purpose and benefits of conducting a capability assessment, including appropriate applications of the results in planning.
CAP-1.2	Describe the advantages and disadvantages of alternative methods for conducting the capability assessment (checklists, criteria, surveys, expert panels, etc.).
CAP-1.3	Identify specific types and sources of information needed to conduct the capability assessment.
CAP-2	Given the process to be used for conducting a capability assessment for a jurisdiction or facility, assess the adequacy of existing resources to support preparedness, prevention/mitigation, response, and short-term recovery activities.
CAP-2.1	Determine the type, amount, capabilities, and accessibility of existing facility resources.
CAP-2.2	Determine the type, amount, capabilities, and accessibility of existing transporter resources.
CAP-2.3	Determine the type, amount, capabilities, and accessibility of existing community resources.
CAP-3	Given hazardous materials plans and SOPs, a completed hazard analysis, an evaluation of existing resources, critiques of incidents, exercises, and drills, and other pertinent information, demonstrate the ability to assess the jurisdiction's or facility's capability to prepare for, respond to, and recover from worst-case incidents identified in the hazard analysis.

Recommended Training

CAP-3.1	Evaluate response issues and concerns identified through surveys and reviews of hazardous materials incident critiques, exercises, and drills.
CAP-3.2	Assess the adequacy of the jurisdiction's or facility's concept of operations, including roles and functional assignments, for responding to and recovering from worst-case incidents.
CAP-3.3	Assess the adequacy of existing resources for implementing the concept of operations in worst-case incidents.
CAP-3.4	Assess the adequacy of organizational policies and SOPs for implementing the concept of operations in worst-case incidents.
CAP-3.5	Assess the level of competency of emergency personnel to respond in worst-case incidents identified in the hazard analysis..
CAP-4	Given hazardous materials plans and SOPs, a completed hazard analysis, an evaluation of existing resources, critiques of incidents, exercises, and drills, and other pertinent information, demonstrate the ability to assess the jurisdiction's or facility's capability to prevent or mitigate the effects of identified risks.
CAP-4.1	Evaluate prevention issues and concerns identified through surveys or reviews of hazardous materials incident critiques, exercises, and drills.
CAP-4.2	Assess the adequacy of prevention measures, including roles and functional assignments, for preventing or mitigating the effects of identified risks.
CAP-4.3	Assess the adequacy of existing resources for implementing necessary prevention measures.
CAP-4.4	Assess the adequacy of organizational policies and SOPs for implementing necessary prevention measures.
CAP-4.5	Assess the level of competency of prevention personnel to implement necessary prevention measures.
CAP-5	Given the results of the capability assessment analysis, prepare a comprehensive written report.
CAP-5.1	Describe preparedness, mitigation/prevention, response, and short-term recovery capability shortfalls identified in the analysis.
CAP-5.2	Identify additional resources that may be needed to prepare for, prevent/mitigate, respond to, and recover from worst-case hazardous materials incidents.
CAP-5.3	Describe deficiencies in community and/or facility safety plans and procedures identified in the analysis, and recommend modifications, as appropriate. .

Hazardous Materials
Planning Curriculum Guidelines:

Planning for Protective Actions

General Training Considerations

Scope/Objectives of Training:

Planning for protective actions addresses policy and procedures for providing personal protection to the public, including protection in place and evacuation. Considerations include public education, alert and warning systems, the availability of appropriate shelter, the nature and duration of hazardous materials releases, traffic flow and control, reception and care facilities, health and medical services, protection of water and sewage systems, ongoing incident assessment, and other emergency response functions and capabilities.

Training should provide a working knowledge of the benefits and limitations of various protection strategies, including evacuation, in-place protection, and a combination thereof. Participants should gain an understanding of the need for protective action planning and important planning considerations. They should develop the ability to implement a decision-making process for any given hazardous materials emergency situation and protective action option, and learn strategies and techniques for communicating the desired protection action to the general public to elicit the best possible response.

Plans for protective actions must address roles, strategies, and procedures for a broad range of emergency preparedness and response activities. Depending on the jurisdiction's or facility's needs, planning may involve very complex analyses, decisions, and negotiations that must be addressed before incidents occur. Therefore, the goal of training is to give participants the knowledge and skills they need to assess existing capabilities in this area, identify needed resources, and establish systems for promoting effective response in any realistic hazardous materials incident scenario.

Audience:

The training audience includes decision makers, planning team members, SOP writers, and agency and organization representatives with responsibilities related to mass care and protective actions in hazardous materials emergencies. Possible audience members include:

- Community planning team members
- Local Emergency Planning Committees
- Government and response agency representatives
- Facility planners and managers
- Community support services and volunteer group representatives
- Incident Commanders
- Public Information Officers
- Warning Officers
- Emergency Management Officials

Prerequisites or Presumed Knowledge/Skills of Students:

Students should have mastered basic skills in hazardous materials planning, and have assigned responsibilities for hazardous materials emergency planning for a jurisdiction or facility. They should understand basic concepts of the Incident Command System, public relations and education, and emergency information and warning.

Typical Program Format:

An instructor-facilitated one to two day program with lecture/discussion, student and/or tabletop exercises, and case study reviews. Longer programs may be appropriate where more complex studies, student activities, and field work are planned.

Methodology and Training Delivery Considerations:

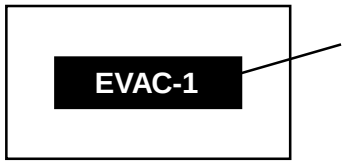
Planning for protective actions requires knowledge and skills in a broad range of disciplines and emergency response functions. Typically, many different government agencies, community organizations, and private sector groups are assigned related responsibilities under the emergency plan. For these reasons, the use of planning teams is particularly suited for this type of planning. Whenever possible, planning teams should be trained together to promote information sharing, inter-organizational understanding, and cooperation. Other considerations include:

- The training competencies identified for this curriculum area assume that a comprehensive hazards analysis and capability assessment have been completed for the jurisdiction or facility. If this assumption is incorrect, training managers may wish to incorporate additional competencies from other planning specialty areas in the instruction.

- Instructional content should stress the interrelationships among planning processes, prepared ness activities, response actions, and the public information and education components of emergency management.

- Training methodologies should emphasize small group interactions among various participants in the planning process. Hazardous materials incident case examples should be incorporated into the course, using student activities or tabletop exercises to promote and evaluate skill/ learning objectives.

- An instructional cadre concept, emphasizing diverse organizational interests and expertise, is particularly appropriate for this type of training.



Objective Identification Legend

This is the identification of the objective used in this document. It matches the identification code used in course assessment references. (See the Training Program Management section of this document.) Decimal numbers (such as EVAC-1.1) indicate enabling objectives supporting the primary objective.

Identification	***Recommended** Training Objectives*
EVAC-1	Given a hazards analysis and capability assessment for a jurisdiction or facility, demonstrate the ability to develop decision-making criteria for implementing protective actions.
EVAC-1.1	Describe the purpose and benefits of various protective action strategies, including evacuation, in-place sheltering, water supply protection, sewage system protection, and relocation.
EVAC-1.2	Compare the advantages and disadvantages of evacuation and in-place protection options for mass care in hazardous materials emergencies.

Recommended Training

EVAC-1.3 Identify factors to consider in selecting a protective action strategy in a hazardous materials emergency situation, including:

- The nature of the threat
- The population at risk
- Time factors involved
- Weather conditions
- Communications
- Response capabilities

EVAC-1.4 Identify and assess resources available for implementing various protective actions, including capabilities of organizations assigned related responsibilities under the plan.

EVAC-1.5 Develop decision-making criteria for implementing protective actions that address evacuation (precautionary, general, and selective), in-place sheltering, and other options in emergency situations identified in the hazards analysis.

EVAC-2 Given the assignment to plan for protective actions for a jurisdiction or facility, demonstrate the ability to assess existing systems, strategies, and procedures for notifying, warning, and informing the public about protective action decisions.

EVAC-2.1 Identify factors that influence the public's understanding of and response to protective actions in hazardous materials emergencies.

EVAC-2.2 Assess existing public education programs for informing the public about protective actions in the event of a hazardous materials emergency, including citizen roles and responsibilities.

EVAC-2.3 Assess existing warning and emergency public notification systems for implementing protective actions in a hazardous materials emergency.

EVAC-3 Given a hazards analysis and capability assessment for a jurisdiction or facility, demonstrate the ability to assess existing systems, strategies, and procedures for evacuating populations at risk in a hazardous material incident.

EVAC-3.1 Identify eight considerations when planning an evacuation, as follows:

(1)Emergency scene access and evacuation routes
(2)Areas of responsibility
(3)Geographical area, size and type
(4)Evacuation area
(5)Weather conditions
(6)Transportation
(7)Resisters
(8)Mass care centers and shelters

EVAC-3.2 Identify four constraints to an effective evacuation, as denoted in the Hans and Sells Study conducted for the U.S. Environmental Protection Agency, as follows:

(1)Time delay
(2)Notification time
(3)Mobilization time
(4)Travel time

EVAC-3.3	Identify six steps for implementing the evacuation process, as follows: (1)Form work groups (2)Track personnel assignments (3)Use map coordinates for making assignments (4)Issue evacuation warnings (5)Identify relocation shelters (6)Use the three-phase notification process
EVAC-3.4	Assess systems, strategies, and procedures for moving people out of risk areas (availability of vehicles, evacuation routes and alternatives, controlling traffic, special populations, etc.)
EVAC-3.5	Assess preparedness for reception and care of evacuees (shelter locations, supplies, notifying family members, health and medical care, mutual aid agreements, etc.)
EVAC-3.6	Assess decision-making criteria and procedures for re-entry after an evacuation.
EVAC-4	Given a hazards analysis and capability assessment for a jurisdiction or facility, demonstrate the ability to assess existing systems, strategies, and procedures for implementing in-place sheltering and other protective actions in a hazardous materials incident.
EVAC-4.1	Assess systems, strategies, and procedures for initiating and implementing in-place protection.
EVAC-4.2	Assess systems, strategies, and procedures for initiating and implementing water supply protection.
EVAC-4.3	Assess systems, strategies, and procedures for initiating and implementing sewage system protection.
EVAC-4.4	Assess systems, strategies, and procedures for monitoring toxic releases, continually assessing the potential for injury and damage, notifying the public as necessary, and terminating response activities.
EVAC-5	Given an assessment of the jurisdiction's or facility's capabilities to implement protective action options in hazardous materials incidents, demonstrate the ability to develop related emergency plans and procedures.
EVAC-5.1	Describe potential problems and capability shortfalls for implementing protective actions in worst-case hazardous materials incidents.
EVAC-5.2	Identify additional resources that may be needed to prepare for and implement protective actions in worst-case hazardous materials incidents.
EVAC-5.3	Identify recommended changes to hazardous materials emergency plans (addressing, for example, sections on the concept of operations, roles and responsibilities, direction and control, warning systems and emergency public notification, resource management, health and medical, personal protection of citizens, ongoing incident assessment, and human services).
EVAC-5.4	Describe modifications to jurisdiction and/or facility policies and procedures that are required to facilitate the recommended plan changes.

Hazardous Materials
Planning Curriculum Guidelines:

Plan Implementation and Maintenance

General Training Considerations

Scope/Objective of Training

Training in this curriculum area will provide students with the knowledge, skills, and practical tools they need to successfully implement a completed hazardous materials response plan, anticipate future outcomes, monitor and evaluate the plan's effectiveness, and revise it as appropriate to improve the jurisdiction's or facility's emergency operations and prevention/mitigation capabilities. Instruction builds on Planning Essentials competencies to help participants develop the feedback loop necessary for long-term plan maintenance and enhancement.

The content of training addresses (1) plan implementation, including promulgation and dissemination of the plan, orientation of plan users, and integration of multi-jurisdictional planning efforts; (2) validation of the plan, including methods of plan review, plan testing, and exercising; and (3) plan maintenance, including development of strategies and processes to identify, illuminate, and correct problems with the plan. Other subject areas potentially include environmental scanning, management audits, performance audits, and other long-term and strategic planning concepts.

Training focuses on the role of the planning manager or administrator in establishing systems and strategies for plan implementation and maintenance. This person may also participate in (and need training in) the actual writing and development of the plan, as defined in Planning Essentials and other Planning Specialties areas. Furthermore, the planning manager or administrator may function as the jurisdiction's or facility's Exercise Manager/Officer. However, advanced competencies in exercise design and development will be covered in a separate Planning Specialty area in subsequent editions of these *Guidelines*.

Audience

The training audience includes all personnel involved in the implementation, validation, and maintenance of a completed hazardous materials plan for their respective jurisdiction or facility. Audience members potentially include planners and decision makers for agencies and organizations represented in the plan, community leaders, and others interested in improving hazardous materials preparedness. Possible audience members are:

- Community planning team members
- Local Emergency Planning Committee members
- Government and response agency representatives
- Facility planners and managers
- Community support services and volunteer group representatives
- Exercise program managers and exercise officers
- Emergency Management Officials

Prerequisites or Presumed Prior Knowledge/Skills of Students

Students should possess Planning Orientation and Planning Essentials competencies and previous experience in community or organizational planning. They should have job responsibilities directly related to the management and administration of hazardous materials plans and planning processes for a jurisdiction or facility.

Typical Program Format

One to two days of classroom instruction with an emphasis on activities designed to help students develop strategies and mechanisms to assess, evaluate, and refine existing hazardous materials plans. Job aids to facilitate later work may be desirable. Training program managers may wish to combine this instruction with more in-depth materials on exercise design and development for audiences that perform both roles.

Methodology and Training Delivery Considerations

- Ideally, training audiences should be heterogeneous, reflecting the wide range of personnel involved in the integrated hazardous materials planning process. If possible, individuals who work together as members of a planning team should be trained together.

- Training methodologies should emphasize small group interactions and practical activities based on actual plans and realistic situations. Since teamwork and continuity are important in plan implementation and maintenance, it is recommended that student groupings be maintained throughout training.

- Generic case studies or scenarios should be available for use with audiences from diverse communities and organizations. The instructor should be able to flexibly tailor, update, or substitute these materials, depending on audience needs.

- Training emphasizes skills and attitudes needed for students to become effective long-term community change agents. Emphasis will be placed on methods and techniques for effecting meaningful change.

Objective Identification Legend

This is the identification of the objective used in this document. It matches the identification code used in course assessment references. (See the Training Program Management section of this document.) Decimal numbers (such as PI&M-1.1) indicate enabling objectives supporting the primary objective.

Identification	***Recommended** Training Objectives*
PI&M-1	Given the goals and objectives of the integrated hazardous materials planning process for a jurisdiction or facility, develop a strategy for plan implementation.
PI&M-1.1	List organizations and key personnel who should participate in plan implementation, including: • Planning team members • Organizations, groups, and facilities assigned responsibilities under the plan • Local, state, and federal oversight agencies • Community support services organizations affected by the plan
PI&M-1.2	Establish objectives for plan review and validation as part of the plan development process.
PI&M-2	Given a completed integrated hazardous materials plan for a jurisdiction or facility, develop strategies to ensure proper promulgation and dissemination of the plan.

Recommended Training

PI&M-2.1	Identify the steps necessary to ensure proper promulgation of the plan.
PI&M-2.2	Determine the information needs of various groups, and develop strategies to orient them to their roles and assignments under the plan.
PI&M-2.3	Develop strategies to orient the public on the plan, including clarifying technical information as necessary to promote public understanding.
PI&M-3	Given an approved integrated hazardous materials plan for a jurisdiction or facility, develop strategies to ensure coordination with multi-jurisdictional planning efforts.
PI&M-3.1	Identify and assess options for coordinating and integrating the plan within the jurisdiction and/or facility.
PI&M-3.2	Develop strategies to communicate the substance of the plan to other jurisdictions, including surrounding communities, state offices, and federal (national/regional) personnel involved in related planning efforts.
PI&M-3.3	Develop strategies to establish communication links with local, state, and federal organizations to obtain feedback on emergency management program changes that may affect the plan.
PI&M-4	Given an approved integrated hazardous materials plan for a jurisdiction or facility, develop strategies to ensure that organizations and personnel are capable of carrying out their assigned responsibilities.
PI&M-4.1	Develop strategies to ensure that each organization develops the SOPs necessary to facilitate the accomplishment of assigned tasks under the plan.
PI&M-4.2	Develop strategies to assess related training needs.
PI&M-4.3	Identify training programs and assistance available in the public and private sectors.
PI&M-5	Given implementation of an approved integrated hazardous materials plan for a jurisdiction or facility, develop strategies for monitoring changes and trends that impact the plan or planning process.
PI&M-5.1	Identify changes and trends that could impact the plan or planning process, including but not limited to: • Economic • Legal • Political • Technological • Social • Demographic
PI&M-5.2	Identify strategies for collecting and assessing information from reviews or critiques of actual hazardous materials incidents affecting the jurisdiction.

PI&M-5.3	Identify strategies to ensure that various organizations with a role under the plan provide feedback as changes occur that may affect the plan.
PI&M-6	Given implementation of an approved integrated hazardous materials plan for a jurisdiction or facility, participate in the design and development of an exercise program that is useful for evaluating and updating the plan.
PI&M-6.1	Describe five types of exercises and their appropriate use in plan evaluation, to include: • Drill • Orientation • Table top • Functional • Full Scale
PI&M-6.2	Identify the goals and objectives of the hazardous materials exercise program and its relationship to the overall planning process.
PI&M-6.3	Identify methods to be used for determining hazardous materials exercise needs, addressing at a minimum: • Number and type of exercises to be conducted • Functions to be tested (preparedness, response, recovery, and mitigation/ prevention) • Exercise goals and objectives • Appropriate scenarios
PI&M-6.4	Identify exercise criteria, resources, and reference materials.
PI&M-6.5	On specific exercises, establish effective policies and plans for working with the Exercise Manager, organizational participants, and others to: • Control the exercise • Recruit and brief participants • Record and evaluate exercise play • Critique exercise results and identify follow-up actions
PI&M-7	Given changes and trends that impact the plan or planning process, incident critiques, exercise results, expert opinion, and other information, develop strategies for conducting periodic reviews and updates of the plan.
PI&M-7.1	Determine whether goals and objectives established in the plan have been achieved.
PI&M-7.2	Evaluate changes and trends, incident critiques, exercise results, expert opinion, and other information to assess the need for plan revisions.
PI&M-7.3	Identify strategies for making the needed revisions to the plan and for implementing the plan revisions.
PI&M-7.4	Identify strategies and timetables for reviewing and updating the plan on a periodic basis.

Hazardous Materials
Planning Curriculum Guidelines:

Facility Planning

General Training Considerations

Scope/Objectives of Training

Facility Planners develop, validate, and maintain emergency response plans and safety plans for any facility subject to federal contingency planning regulations, as well as other facilities that wish to improve emergency preparedness through planning. They also develop procedures to ensure compliance with federal, state, and local mandates for participation in community planning and right-to-know activities. In this context, the term "facility" is meant to have a wide connotation and may include, but is not limited to, any mobile or fixed onshore or offshore building, structure, installation, equipment, pipe, or pipeline.

The Facility Planning specialty area provides participants with the knowledge and skills they need to develop a basic hazardous materials emergency plan for a facility. The primary training audience is facility planners and planning team members. Training objectives cover a broad range of generic competencies, including the ability to function effectively in a team environment, assist in or conduct a basic hazards analysis and capability assessment, work with others to analyze options and draft sections of the plan, and participate in plan implementation, evaluation, and maintenance.

The legislative and regulatory basis for this training can be found primarily in the requirements specified in OSHA 1910.120 for development of employers' emergency response plans, SARA Title III for development of planning jurisdictions' emergency response plans, and various federal agency regulations for the development of facility and transporter emergency response plans. The competencies defined here incorporate generic concepts and processes derived from various sources in the planning literature. Several of the most important reference documents, and more specific models for planning, are described in the Appendices. The training objectives are intended to be comprehensive, i.e., to address the requirements of all identified audience members; thus, training developers and instructors will need to tailor these objectives to meet local audience interests, needs, and planning processes.

Audience

The training audience for Facility Planning includes planning team members who have a defined responsibility in researching, preparing, implementing, and maintaining hazardous materials facility plans. These persons generally represent an organizational or functional specialty in an integrated planning process for the facility. Audience members may include industry owners and executives, business planners, production/process managers, functional managers (e.g., communications, public information, emergency response, etc.), safety officers, technical experts, and others employed by the facility. Personnel who have responsibilities for reviewing and approving facility plans and/or enforcing compliance with existing community regulations and standards may also benefit by training.

Prerequisites or Presumed Prior Knowledge/Skills of Students

Training covers basic skills, with an emphasis on the ability to interpret and use information provided by various technical specialists in developing the plan. More advanced planning skills are addressed under other Planning Specialties. Audience members are assumed to already possess training competencies covered under Planning Orientation, as well as an expertise in the professional discipline that the student represents on the planning committee. It is further assumed that managerial, administrative, and logistic requirements for organizing the planning process, including staff recruitment and assignments, have already been met.

Typical Program Format

Training can typically be accomplished in two to four days of classroom instruction led by an experienced facilitator. Breaking training into modules (e.g., Hazards Analysis) that are delivered at different times is also possible, and this approach may be beneficial if timed to coincide with planning team assignments. However, team building is very important in the planning process, so continuity of student groupings throughout training is recommended.

Methodology and Training Delivery Considerations

It is recognized that the planning needs of facilities, and the resulting training needs of planning team members, can vary greatly, depending on such factors as business size, demographics, product mix, hazards, local resources, and planning preferences. However, training described here is intended to address the generic training requirements of all hazardous materials facility planners. Training managers, course developers, and instructors may need to tailor these materials to meet the unique needs and interests of different audiences, incorporating elements covered in other Planning Specialties, as appropriate. Other training considerations include the following:

- Training should focus on the actual development of facility plans, with the work product and participation in the group planning process used to demonstrate student mastery of the objectives.
- Audiences should be heterogeneous, reflecting the diverse groups and professional disciplines represented in the planning process. It is highly recommended that team members who will work together in subsequent planning efforts be trained together.
- Course methodology should emphasize group interactions, team building, and resolution of interpersonal conflicts, as well as the development of the plan product itself.
- Course materials can be multi-tracked by type of plan (OSHA, EPA, etc.) to facilitate tailoring the instruction to the needs of different audiences.
- If possible, instruction should address practical strategies for consolidating planning requirements (i.e. merging several requirements into one plan development effort) to foster greater planning efficiency.
- Instruction should emphasize the need for on-going planning commitments by the team and the organizations they represent.
- Instruction should emphasize the need for ongoing evaluation at each step in the planning process.
- Instructors should emphasize that steps in the planning process, although taught sequentially, may actually be performed simultaneously.

Objective Identification Legend

This is the identification of the objective used in this document. It matches the identification code used in course assessment references. (See the Training Program Management section of this document.) Decimal numbers (such as FACIL-1.1) indicate enabling objectives supporting the primary objective.

Identification	***Recommended** Training Objectives*
FACIL-1	Given an assignment as a facility planning team member, describe an appropriate planning strategy and team member responsibilities in the process.
FACIL-1.1	Describe the benefits of a team approach to planning, and identify skills necessary to participate in the team planning process.
FACIL-1.2	Identify individual roles and responsibilities in the facility planning process, to include work expectations, administrative support systems, and time lines.

Recommended Training

FACIL-1.3	Identify the need to coordinate planning with outside groups (e.g., local government, surrounding jurisdictions, state offices, federal/regional offices such as EPA and FEMA, RRTs, and CAER.)
FACIL-1.4	Demonstrate understanding of the planning process mission statement, goals, and objectives.
FACIL-1.5	Describe the expected results of the planning process, to include required planning elements and plan format.
FACIL-1.6	Identify resources needed to conduct the planning process, including personnel, budgets, and technical capabilities, and solicit these resources within the company.
FACIL-2	Given an assignment as a facility planning team member, demonstrate the ability to conduct a review of federal, state, and local authorities applicable to the planning process.
FACIL-2.1	Describe the purpose and benefits of completing a review of existing plans and authorities.
FACIL-2.2	Identify methods and procedures for reviewing plans and authorities (collecting and organizing information, identifying and clarifying issues, identifying incompatibilities and shortfalls, etc.), including associated costs and staffing requirements.
FACIL-2.3	Identify planning regulatory requirements that apply to the facility, to include consideration of: • SARA Title III • EPA's Oil Pollution Prevention Regulation (SPCC and Facility Response Plan Requirements)—40 CFR part 112.7(d) and 112.20 to 112.21 • MMS's Facility Response Plan Regulation—30 CFR part 254 • RSPA's Pipeline Response Plan Regulation—49 CFR part 194 • USCG's Facility Response Plan Regulation—33 CFR part 154, subpart F • EPA's Risk Management Programs Regulation—40 CFR part 68 • OSHA's Emergency Action Plan Regulation—29 CFR 1910.38(a) • OSHA's Process Safety Standard—29 CFR 1910.119 • OSHA's HAZWOPER Regulation—29 CFR 1910.120 • EPA's Resource Conservation and Recovery Act Contingency Planning Requirements—40 CFR part 264, subpart D, 40 CFR part 265, subpart D, and 40 CFR part 279.52 State and local policies, codes, ordinances, etc.
FACIL-2.4	Describe the advantages and disadvantages of all-hazard planning and hazard-specific planning.
FACIL-3	Given an assignment as a facility planning team member, demonstrate the ability to conduct background research appropriate to the planning requirement.

FACIL-3.1	Identify critical internal and external products, services, and operations that impact the facility plan, including: • Internal products and services and the facilities and equipment needed to produce them • External products and services provided by suppliers, especially sole source vendors • Services such as electrical power, water, sewer, gas, telecommunications, and transportation • Operations, equipment, and personnel vital to the continued functioning of the facility
FACIL-3.2	Identify, gather, and review copies of existing hazardous materials plans (community emergency plans, mitigation/prevention plans, response agency SOPs, facility plans, etc.).
FACIL-3.3	Review critiques of actual incidents, exercises, and drills conducted by the facility or by the community with participation by the facility.
FACIL-3.4	Review important changes and trends impacting the facility.
FACIL-3.5	Conduct surveys, interviews, etc. to gather expert opinion on planning needs, as required.
FACIL-3.6	Identify and summarize related planning issues, priorities, concerns, and challenges.
FACIL-4	Given the planning process to be used by the facility, identify the purpose, benefits, methods, expected results, and participant roles in hazards analysis and capability assessment.
FACIL-4.1	Describe the purpose and benefits of conducting a hazards analysis.
FACIL-4.2	Describe the purpose and benefits of conducting a capability assessment.
FACIL-4.3	Describe the methods to be used and the expected results of the facility's hazards analysis and capability assessment processes.
FACIL-4.4	Identify organizational and team member responsibilities in the facility's hazards analysis and capability assessment processes, including the roles of various technical specialists.
FACIL-5	Given the facility's production processes and potential hazards, demonstrate the ability to identify, collect, and interpret hazards analysis and capability assessment data needed for planning.
FACIL-5.1	Collect or assist in collecting data, as identified in *Technical Guidance for Hazards Analysis*.
FACIL-5.2	Identify types of emergencies that have occurred in the community, at the facility, and in similar facilities.

Recommended Training

FACIL-5.3	Identify geographic factors that could contribute to potential emergencies.
FACIL-5.4	Identify types of emergencies that could occur from technological process or system failures.
FACIL-5.5	Identify types of emergencies that could occur as a result of human error.
FACIL-5.6	Identify types of emergencies that could result from the design or construction of the facility and production processes.
FACIL-5.7	For each potential emergency, identify possible complications and relationships to other emergency events, and estimate the probability of occurrence.
FACIL-5.8	Identify and evaluate internal and external resources and capabilities that could be applied in an emergency.
FACIL-5.9	Conduct an insurance review to identify and evaluate facility insurance coverage and benefits in various types of emergency situations.
FACIL-5.10	Review and interpret the data.
FACIL-5.11	Identify, map, and prioritize hazards, risk areas, and vulnerable zones, and identify capability shortfalls and excesses (gap analysis).
FACIL-6	Given the results of the facility's hazards analysis and capability assessment, demonstrate the ability to identify issues and solutions to be addressed in the plan, and assignments for developing the plan.
FACIL-6.1	Identify issues and solutions to be addressed in the facility plan by examining existing plans, hazards analysis results, capability assessment results, and other pertinent information.
FACIL-6.2	Identify facility plan development tasks and assignments.
FACIL-7	Given identified issues and solutions to be addressed in the facility plan, participate as assigned in developing or updating the hazardous materials emergency operations plan, to address preparedness, response and short-term recovery.
FACIL-7.1	Identify the planning elements necessary to comply with regulatory requirements, standards, and guidelines.
FACIL-7.2	Develop or update the emergency operations plan to meet the required planning elements.
FACIL-8	Given identified issues and solutions to be addressed in the facility plan, participate as assigned in developing or updating a comprehensive prevention/mitigation section in the plan.
FACIL-8.1	Identify prevention/mitigation strategies and techniques to address the identified issues and solutions.

FACIL-8.2	Develop or update the plan to meet all identified prevention/mitigation planning needs.
FACIL-9	Given a draft facility hazardous materials plan, participate as assigned in the plan review and appraisal process.
FACIL-9.1	Describe the purpose and benefits of reviewing the facility plan.
FACIL-9.2	Conduct an internal review of the draft facility plan to assess adequacy and completeness.
FACIL-9.3	Facilitate an external review of the draft facility plan, which may include peer review, management review, and local, state and federal review.
FACIL-9.4	Make necessary revisions, and promote formal plan promulgation.
FACIL-10	Given an approved hazardous materials facility plan, describe appropriate strategies and identify methods for implementing the plan.
FACIL-10.1	Describe the purpose and benefits of implementing the plan.
FACIL-10.2	Describe the strategy and methods to be used for implementing the plan, to include: • Disseminating copies of the plan • Briefing and orienting users of the plan • Integrating the plan with other plans and work processes within the facility
FACIL-10.3	Identify options and develop strategies for coordinating the plan with multi-jurisdictional planning efforts.
FACIL-10.4	Identify options and develop strategies for ensuring that personnel are adequately trained to carry out their assigned responsibilities under the plan.
FACIL-10.5	Identify roles and responsibilities for implementing the plan, to include available resources, administrative systems, and time lines.
FACIL-11	Given an approved hazardous materials facility plan, describe appropriate strategies and identify methods for evaluating and maintaining the plan.
FACIL-11.1	Describe the purpose and benefits of evaluating and maintaining the plan.
FACIL-11.2	Identify options and develop strategies for monitoring changes and trends affecting the facility and/or jurisdiction.
FACIL-11.3	Identify options and develop strategies for critiquing actual incidents and accidents that occur, and for identifying and implementing remedial actions.
FACIL-11.4	Identify options and develop strategies for developing, conducting, and evaluating exercises and drills.

Recommended Training

FACIL-11.5	Identify options and develop strategies for conducting an annual audit of the facility plan and/or periodically updating and revising the facility plan, as necessary.
FACIL-11.6	Identify roles and responsibilities for evaluating and maintaining the facility plan, to include available resources, administrative systems, and time lines.
FACIL-11.7	Work with planning team members, facility managers, and other facility and community representatives to test planning concepts and measures (e.g., through tabletop exercises and drills), as necessary.

Hazardous Materials
Planning Curriculum Guidelines:

Planning for Public Education

General Training Considerations

Note: There are several aspects and potential training requirements associated with hazardous materials public education. These include training for Public Information Officers (PIOs) and others who design and develop related programs, strategies, and outreach materials; training for media representatives and others who influence the perceptions of the public; and training for planners in "marketing" the plan to gain public support for the planning process. The Planning Specialty area described here identifies general competencies for individual members of the public. Other facets of public education will be addressed in subsequent editions of the *Guidelines*.

Scope/Objectives of Training

Training in this curriculum area provides an overview of the hazardous materials emergency management system, with an emphasis on the citizen's role in that system. No skill development is attempted. Training should result in a positive attitudinal change, an improved awareness of threats to personal and community safety, an enhanced understanding of the need for and benefits of jurisdictional and facility planning and emergency management, and motivation to improve personal and community preparedness.

Benefits to be derived from training the general public include a greater understanding of and support for the jurisdiction's emergency management system and capabilities; improved citizen understanding of appropriate actions to take in hazardous materials emergency situations; heightened cooperation with responders and prevention/mitigation personnel; and enhanced citizen planning and preparedness for potential incidents in the home or neighborhood.

Audience

The audience for public education training includes all persons who have a "stake" in the hazardous materials emergency management system, although they have no defined role in the development and implementation of emergency operations and mitigation/prevention plans. Potential audience members include the general public, community groups, volunteer groups, business/industry associations, employee groups, and others with a self-interest in improving community and individual/family preparedness.

Prerequisites or Presumed Prior Knowledge/Skills of Students

Participants are assumed to have an interest in hazardous materials threats facing the community, as well as the jurisdiction's ability to provide effective hazardous materials emergency management. However, no prior knowledge of community plans and systems is required to participate in training.

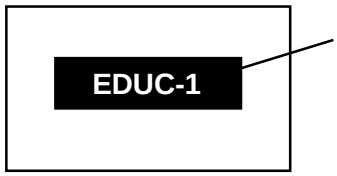
Typical Program Format

A short (one to two hours or as need is expressed by the customer) facilitator-led presentation or seminar.

Methodology and Training Delivery Considerations

Training should emphasize opportunities for interaction with audience members to identify and address individual perceptions and concerns. Whenever possible, use of dynamic media (video, slides, computer simulations, CD-ROM, etc.) is encouraged to promote interest and motivate support. Depending on audience needs and time, simple activities, exercises, or role plays emphasizing local examples and realistic personal situations may be appropriate.

The instructor should be able to discuss a broad range of topics of potential interest to audience members, including community and household hazardous materials threats; requirements of the Emergency Planning and Community Right to Know Act; pertinent jurisdiction and facility plans and capabilities; technical resources and ways to access community information (MSDS forms, chemical inventories, release reports, etc.), and materials available from EPA, DOT, FEMA, NIEHS, and other federal, state, and local sources.



Objective Identification Legend

This is the identification of the objective used in this document. It matches the identification code used in course assessment references. (See the Training Program Management section of this document.) Decimal numbers (such as EDUC-1.1) indicate enabling objectives supporting the primary objective.

Identification	***Recommended** Training Objectives*
EDUC-1	Given residency in a specific jurisdiction, identify the purpose, benefits, and components of the jurisdiction's hazardous materials emergency management system.
EDUC-1.1	Describe the hazardous materials threat within the jurisdiction, to include the routine use of chemicals by the general public from everyday sources.
EDUC-1.2	Identify major legislation affecting the jurisdiction's hazardous materials emergency management system, including the Emergency Planning and Community Right-to-Know Act.
EDUC-1.3	Describe the jurisdiction's hazardous materials emergency management system.
EDUC-1.3.1	Describe the four phases of the comprehensive emergency management system (preparedness, response, recovery, and mitigation/prevention).
EDUC-1.3.2	Explain the purpose and participants in the jurisdiction's integrated response system.
EDUC-1.3.3	Explain the purpose and participants in the jurisdiction's prevention and mitigation system.
EDUC-1.3.4	Describe general requirements for facility planning, safety management, and emergency response.
EDUC-1.4	Identify the purpose and participants in the jurisdiction's hazardous materials planning process.
EDUC-1.4.1	Identify the jurisdiction's LEPC planning district and planning requirements.
EDUC-1.4.2	Identify major steps and participants in the hazardous materials planning process, to include hazards analysis, capability assessment, plan development, and plan evaluation.

Recommended Training

EDUC-1.4.3	Identify major components in the jurisdiction's hazardous materials plan.
EDUC-2	Given residency in a specific jurisdiction, describe the citizen's role in the jurisdiction's hazardous materials emergency management system.
EDUC-2.1	Identify the personal and community benefits of citizen participation in the jurisdiction's hazardous materials emergency management system.
EDUC-2.2	Identify ways to participate in and contribute to the jurisdiction's hazardous materials emergency management system (e.g. provide feedback, serve as resource, attend meetings, join committees)
EDUC-2.3	Describe the citizens' role in individual and family preparedness.
EDUC-2.3.1	Identify steps in conducting a personal hazards analysis, to include threats to the neighborhood.
EDUC-2.3.2	Identify components of a personal and family preparedness plan.
EDUC-2.3.3	Identify steps in testing and maintaining personal/family preparedness plans.
EDUC-3	Given residency in a specific jurisdiction, identify personal actions to promote hazardous materials emergency management.
EDUC-3.1	Identify available sources of assistance and information and requirements for accessing them.
EDUC-3.2	Develop an action plan for promoting hazardous materials emergency management and personal/family preparedness.

Hazardous Materials
Planning Curriculum Guidelines:

Appendix A:
Planning Guide Summaries

Appendix A
Planning Guide Summaries

This appendix provides content summaries of key reference documents used in the preparation of the *Hazardous Materials Planning Curriculum Guidelines*. These materials include the *Guide for All-Hazard Emergency Operations Planning* (FEMA SLG 101), *Hazardous Materials Emergency Planning Guide* (NRT-1), *Technical Guidance for Hazards Analysis* (EPA/FEMA/DOT), *Handbook of Chemical Hazard Analysis Procedures* (FEMA/DOT/EPA), and *Emergency Management Guide for Business & Industry* (FEMA 141). More information on the planning models described in these materials is presented in Appendix B.

Federal Emergency Management Agency, *Guide for All-Hazard Emergency Operations Planning*, SLG 101, September 1996.

The Guide is designed as a "toolbox" of ideas and advice, not a sample emergency operations plan (EOP). It is intended primarily for use by personnel responsible for EOP development and maintenance in state and local emergency management agencies. It establishes no requirements, and its recommendations may be used, adapted, or disregarded.

This SLG replaces Civil Preparedness Guide (CPG) 1-8, *Guide for the Development of State and Local Emergency Operations Plans* (dated September 10, 1990); CPG 1-8A, *Guide for the Review of State and Local Emergency Operations Plans,* (dated October 1992); and CPG 1-10, *Guide for the Development of a State and Local Continuity of Government Capability* (dated July 27, 1987), which have been rescinded.

The document is organized as follows:

- Chapter 1 explains what an EOP is at the state and local levels, why the EOP is a necessary part of a comprehensive approach to emergency management, and how the EOP relates to other aspects of the comprehensive, risk-based, all-hazard approach.
- Chapter 2 describes the approach FEMA recommends for a step-by-step process of risk-based, all-hazard emergency operations planning (see Appendix B for more detail).
- Chapter 3 suggests how to format the results of the planning process in a written EOP. Components discussed include the Basic Plan, functional annexes, hazard-specific appendices, SOPs, and checklists.
- Chapter 4 lists and discusses elements of the Basic Plan, and provides detailed examples of the types of tasking that should be assigned to agencies, organizations, and individuals under the plan.
- Chapter 5 explains the purpose of functional annexes, and provides a brief description of eight core functions: Direction and Control, Communications, Warning, Emergency Public Information, Evacuation, Mass Care, Heath and Medical Services, and Resource Management.
- Chapter 6 notes unique aspects of certain hazards, including associated regulatory requirements. It suggests how to address hazardous materials in the all-hazard EOP rather than in a stand-alone plan. The chapter is not meant to replace hazard-specific planning guidance issued by the National Response Team.
- Chapter 7 contains information on integrating State EOPs with the Federal Response Plan, so that all levels of government can provide a coordinated response to communities in need.

National Response Team, *Hazardous Materials Emergency Planning Guide*, NRT-1, March 1987.

This guidance is intended to help local communities prepare for potential incidents involving hazardous materials. It describes how to form a local planning team, find a team leader, identify and analyze hazards, identify existing response equipment and personnel, write a plan, and keep the plan up to date. The information can be used both by local communities developing their own plan, and by local emergency planning committees formed in accord with the "Emergency Planning and Community Right-to-Know Act of 1986."

State officials seeking to develop a state emergency plan that is closely coordinated with local plans can adapt this guidance to their purposes. Likewise, officials of chemical plants, railroad yards, and shipping and trucking companies can use the guide to coordinate their own hazardous materials emergency planning with that of the local community.

The guidance deals specifically with response to hazardous materials incidents—both at fixed facilities (manufacturing, processing, storage, and disposal) and during transportation (highways, waterways, rail, and air). Plans for responding to radiological incidents and natural emergencies such as hurricanes, floods, and earthquakes are not the focus of this guidance, although most aspects of plan development and appraisal are common to these emergencies.

The guide is intended to focus community activity on emergency preparedness and response; provide communities with information useful in organizing the planning task; furnish criteria to determine risk and to help communities decide whether they need to plan for hazardous materials incidents; help communities conduct planning that is consistent with their needs and capabilities; and provide a method for continually updating a community's emergency plan.

The document is organized as follows:

Chapter 1: Introduction
Chapter 2: Selecting and Organizing the Planning Team
Chapter 3: Tasks of the Planning Team
Chapter 4: Developing the Plan
Chapter 5: Hazardous Materials Planning Elements
Chapter 6: Plan Appraisal and Continuing Planning

Several appendices provide helpful information for community planning. In particular, Appendix A includes a detailed summary of Title III of SARA, and Appendix D presents criteria that can be used to assess a state or local hazardous materials emergency response preparedness program.

U.S. Environmental Protection Agency, Federal Emergency Management Agency, and U.S. Department of Transportation, *Technical Guidance for Hazards Analysis*, December 1987.

The purpose of this guide is to help local emergency planning committees (LEPCs) conduct site-specific hazards analyses for airborne releases of extremely hazardous substances (EHSs), as required by Title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA), also known as the Emergency Planning and Community Right-to-Know Act (EPCRA). Although these substances may also threaten property and the environment, this guide is primarily concerned with lethal effects of airborne substances on humans.

This document represents a joint effort by EPA, FEMA, and DOT to provide coordinated and coherent technical guidance. Although the guide can be useful to all community and industry planners, it is intended especially for LEPCs established under the provisions of SARA. The three steps of hazards analysis—hazards identification, vulnerability analysis, and risk analysis—provide a decision-making process for the LEPCs to follow as they undertake the development of comprehensive emergency plans mandated by SARA Title III.

This document is organized as follows:

Chapter 1: Introduction and Overview

Chapter 2: Hazards Analysis: An Overview
- 2.1 - Hazards Identification
- 2.2 - Vulnerability Analysis for Airborne Extremely Hazardous Substances
- 2.3 - Risk Analysis

Chapter 3: Step-by-Step Procedures for Conducting a Hazards Analysis of Extremely Hazardous Substances

Chapter 4: Using the Results of a Hazards Analysis

Appendices:
- Appendix A: Acronyms and Glossary of Terms
- Appendix B: The Criteria Used to Identify Extremely Hazardous Substances
- Appendix C: The List of Extremely Hazardous Substances
- Appendix D: Additional Information on Levels of Concern
- Appendix E: Sample Profile
- Appendix F: Fire and Reactivity Hazards
- Appendix G: Equations Used for the Estimation of Vulnerable Zones
- Appendix H: General Considerations for Evacuation or In-Place Sheltering
- Appendix I: Information Collecting to Evaluate Sites for Emergency Planning
- Appendix J: Methods for Evaluating Hazards Used by Facilities
- Appendix K: Evaluation Guide for Available Computer Applications Addressing Hazardous Materials Emergency Response Planning
- Appendix L: Selected Bibliography
- Appendix M: EPA and FEMA Regional Contacts

Federal Emergency Management Agency, U.S. Department of Transportation, and U.S. Environmental Protection Agency, *Handbook of Chemical Hazard Analysis Procedures*.

The *Handbook of Chemical Hazard Analysis Procedures* has several objectives, one of which is to expand *NRT-1* and the *Technical Guidance on Hazards Analysis* documents by including information for explosive, flammable, reactive, and otherwise dangerous chemicals. Although *NRT-1* was aimed at addressing planning for all types of hazardous materials, SARA Title III required local planners to focus on a specific initial list of acutely toxic chemicals (referred to as Extremely Hazardous Substances) due to their high inhalation toxicity when airborne, and this was the primary focus of the supplemental guidance document. By introducing additional methodologies on how to plan for these and other dangerous chemicals, this handbook serves as a stepping stone from *NRT-1* and the *Technical Guidance on Hazards Analysis* to a more comprehensive approach for emergency planning.

Beyond providing additional methodologies for assessing the potential impacts of hazardous materials releases, this handbook also expands the three-step hazards analysis approach (hazard identification, vulnerability analysis, and risk analysis) presented in *NRT-1* and its supplement by introducing a four-step approach involving hazard identification, consequence analysis, probability analysis, and risk analysis. In addition, it provides a tutorial on hazardous chemicals, suggestions for applying hazard analysis results to writing and updating an emergency plan, and an expanded discussion of issues relating to sheltering-in-place (in-place protection) and evacuation.

The document is organized as follows:

Chapter 1: Introduction
Chapter 2: Key Properties of Chemical Substances
Chapter 3: Actions Upon Release to the Environment
Chapter 4: Fire Hazards of Chemical Substances

Chapter 5: Explosion Hazards of Chemical Substances
Chapter 6: Toxicity Hazards of Chemical Substances
Chapter 7: Reactivity Hazards of Chemical Substances
Chapter 8: Hazardous Material Classification Systems
Chapter 9: Overview of the Hazard Analysis Process
Chapter 10: Hazard Identification Guidelines
Chapter 11: Probability Analysis Procedures
Chapter 12: Consequence Analysis Procedures
Chapter 13: Formulation of a Planning Basis
Chapter 14: Use of Hazard Analysis Results in Emergency Planning

Appendices:
- Appendix A: A Tutorial on Fundamental Mathematical Skills
- Appendix B: Technical Basis for Consequence Analysis Procedures
- Appendix C: Overview of "Shelter-in-Place" Concepts
- Appendix D: Chemical Compatibility Chart
- Appendix E: Guide to Installation of the ARCHIE Computer Program
- Appendix F: Basis of Probability Analysis Procedures

Federal Emergency Management Agency, *Emergency Management Guide for Business and Industry,* FEMA 141, October 1993.

This guide provides step-by-step advice on how to create and maintain a comprehensive emergency management program. It can be used by manufacturers, corporate offices, retailers, utilities, or any organization where a sizable number of people work or gather. It applies equally to businesses large or small, whether they operate from a high-rise building or an industrial complex, and whether they own, rent or lease property.

Users of the document need not have in-depth knowledge of emergency management. All that is required is the authority to create a plan and a commitment from the chief executive officer to make emergency management part of the corporate culture.

Businesses that already have a plan can use this guide as a resource to assess and update the plan. The guide is organized as follows:

Section 1: Four Steps in the Planning Process—how to form a planning team; how to conduct a vulnerability analysis; how to develop a plan; and how to implement the plan. The information can be applied to virtually any type of business or industry.

Section 2: Emergency Management Considerations—how to build such emergency management capabilities as life safety, property protection, communications, and community outreach.

Section 3: Hazard-Specific Information—technical information about specific hazards the facility may face.

Section 4: Information Sources—where to turn for additional information.

Hazardous Materials
Planning Curriculum Guidelines:

Appendix B: Planning Models

Appendix B
Planning Models

Various explanations of the planning process can be found in the literature, including those described in the *Guide for All-Hazard Emergency Operations Planning* (FEMA SLG 101), *Hazardous Materials Emergency Planning Guide* (NRT-1), *Technical Guidance for Hazards Analysis* (EPA/FEMA/DOT), *Handbook of Chemical Hazard Analysis Procedures* (FEMA/DOT/EPA), and *Emergency Management Guide for Business & Industry* (FEMA 141). These approaches to planning, which are briefly described here, incorporate the generic functional requirements of planning, although the steps and procedures may be defined somewhat differently. Jurisdictions and facilities should select and/or modify these models to best meet their unique planning needs and preferences.

Federal Emergency Management Agency, *Guide for All-Hazard Emergency Operations Planning*, SLG 101, September 1996.

Chapter 2 of this Guide, The Planning Process, describes principles and major steps recommended for developing an all-hazard plan for protecting lives and property within the jurisdiction. In particular, the benefits of a team approach to planning are emphasized, including the role of the Chief Executive Official (CEO). Steps in the development and continual refinement of an emergency operations plan (EOP) are summarized as follows:

I. **Research**—This phase involves reviewing the jurisdiction's planning framework, analyzing the hazards faced by the jurisdiction, determining the resource base, and noting characteristics of the jurisdiction that could affect emergency operations. Steps in research include:

A. Review applicable laws, regulatory requirements, local plans, mutual aid agreements, and existing guidance.

B. Conduct a Hazard/Risk Analysis
   1. Identify hazards
      a. List hazards that concern emergency management
      b. Determine whether these hazards have occurred or could occur
   2. Profile hazards and their potential consequences
      a. Develop information on each hazard (frequency, magnitude, location, etc.)
      b. Develop information on the potential consequences of the hazard
   3. Compare and prioritize risks
   4. Create and apply scenarios

C. Determine the resource base—list and quantify resources available for emergency response and recovery. Compare them with those needed for an effective emergency response to determine shortfalls.

D. Note special facets of the planning environment—geographic and topographic features that may affect operations, transportation routes, special populations, demographic and other trends, etc.

II. **Development**—During this phase, the EOP is written through steps similar to these: developing a rough draft of the basic plan, functional annexes, and hazard-specific appendices; conducting preliminary briefings and interviews; conducting initial planning meetings and establishing committees for parts of the EOP; working with committees on successive drafts; preparing necessary graphics, and producing and circulating a final draft for planning team review and comment; holding meetings to obtain feedback and concurrence from organizations with identified responsibilities under the plan; obtaining official promulgation of the EOP; and printing and distributing the EOP.

III. **Validation**—During this phase, the EOP is checked for conformity to applicable regulatory requirements and the standards of federal and state agencies. Recommended steps include conducting tabletop exercises with key representatives of tasked organizations as a practical means to help validate the plan; consulting with and participating in plans reviews with the next level of government; and using functional and full-scale emergency management exercises to determine if an EOP is understood and "works."

IV. **Maintenance**—As problems emerge, situations change, gaps become apparent, and requirements are altered, the plan must be continually adapted to remain useful and up-to-date. Possible steps include:

A. Remedial Action Process designed to (1) capture information from exercises, post-disaster critiques, self-assessments, audits, administrative reviews, and the like which may indicate deficiencies; (2) bring together members of the planning team to discuss problems and to consider and assign responsibility for remedies; and (3) tracking and following up on assigned actions.

B. Revision Process for review and modification of the EOP on at least an annual basis.

C. Implementing Documents to ensure that each tasked organization or individual develops the SOPs necessary to facilitate the accomplishment of assigned tasks.

Attachment C of the Guide, Hazardous Materials, provides additional information on plan requirements for locating hazardous materials at fixed facilities and on transport routes, estimating vulnerable zones, determining vulnerability, and assessing risk. Planning considerations unique to hazardous materials are described under the following major headings:

- Direction and control
- Emergency public information
- Evacuation
- Mass care
- Health and medical
- Resource management

National Response Team, *Hazardous Materials Emergency Planning Guide*, NRT-1, March 1987.

This guidance presents a comprehensive approach to hazardous materials planning. However, it is emphasized that every community must plan according to its own situation. Small communities with few planning resources, or communities with few or no threatening hazards, can choose the planning elements appropriate to their circumstances. Steps in the planning process can be summarized as follows:

I. Organizing the Planning Process
   - A. Selecting the planning team
   - B. Selecting the team leader
   - C. Organizing for planning team responsibilities, including staffing, managing the planning tasks, and the use of computers

II. Review of Existing Plans
   - A. Reviewing applicable state and local emergency plans
   - B. Consulting with state and local agencies and volunteer organizations, regional offices of federal agencies, local industry and industrial associations, the RRT and OSC, etc.

III. Hazards Analysis
- A. Hazards Identification
- B. Vulnerability Analysis
- C. Risk Analysis

IV. Capability Assessment—sample questions are presented to help the planning team evaluate preparedness, prevention, and response resources and capabilities in the following three categories:
- A. Facility resources
- B. Transporter resources
- C. Community resources

V. Developing the Plan
- A. Developing or revising a hazardous materials appendix to a multi-hazard EOP
- B. Developing or revising a plan covering only hazardous materials

Planning elements and plan requirements that should be considered in this phase of the process are described in detail, including the following fourteen response functions:

- Initial Notification of Response Agencies
- Direction and Control
- Communication (among Responders)
- Warning Systems and Emergency Public Notification
- Public Information/Community Relations
- Resource Management
- Health and Medical
- Response Personnel Safety
- Personal Protection of Citizens
- Fire and Rescue
- Law Enforcement
- Ongoing Incident Assessment
- Human Services
- Public Works

VI. Plan Appraisal and Continuing Planning
- A. Plan Review and Approval
  1. Internal review
  2. External review
- B. Keeping the plan up-to-date
- C. Continuing planning
  1. Exercises
  2. Incident review
  3. Training

U.S. Environmental Protection Agency, Federal Emergency Management Agency, and U.S. Department of Transportation, *Technical Guidance for Hazards Analysis*, December 1987.

This guidance is compatible with and recommends the same approach to hazardous materials planning as NRT-1. However, significantly more detail is presented on the Hazards Analysis step of the process. The hazards analysis is separated into two phases. The first phase is the initial screening of all facilities reporting Extremely Hazardous Substances (EHSs) on their premises in excess of their threshold planning quantities (TPQs). The initial screening is performed to establish priorities among reporting facilities using credible worst case assumptions. The second phase represents a reassessment by order of priority of the potential hazards posed by the reporting facilities. This is accomplished through the reevaluation of the assumptions used for the initial screening.

Both the initial screening and the reevaluation phases utilize the three basic steps of hazards analysis: hazards identification, vulnerability analysis, and risk analysis. Steps in the process are summarized as follows:

Initial Screening

I. Hazards Identification

A. List facilities that have reported EHSs in the community in excess of the TPQ.
B. Contact each facility on the list for information on the EHSs present.
C. Obtain information on transportation routes of EHSs, if possible.
D. Obtain information on hazardous materials, facilities, and transportation routes (other than for those with EHSs above the TPQ) listed by SERCs (optional).

II. Vulnerability Analysis

A. Estimate the vulnerable zone for screening using credible worst case assumptions.
B. Identify characteristics of human populations within the estimated vulnerable zone.
C. Identify critical facilities within the estimated vulnerable zone.

III. Risk Analysis

A. Collect information obtained in hazards identification and vulnerability analysis.
B. Make rough estimate of risks based on the likelihood of a release and severity of consequences.
C. Identify those facilities with higher priority due to the estimated risks they pose.

Planning for Facilities by Priority

IV. Hazards Identification

A. Contact each facility on the list and other expert sources for additional information.
B. Obtain additional information on typical transportation conditions, if possible.

V. Vulnerability Analysis

A. Reestimate the vulnerable zone using reevaluated assumptions from the facility and other expert sources.
B. Identify characteristics of human populations within the estimated vulnerable zone.
C. Identify critical facilities within the estimated vulnerable zone.

VI. Risk Analysis

A. Collect all information obtained in hazards identification and vulnerability analysis in a table.
B. Obtain additional information on community and facility safeguards, response capabilities, and accident records.
C. Make a judgment of the probability of release and severity of consequences.
D. Organize all information (from A, B, and C) in a matrix format.
E. Rank risks.
F. Develop or revise emergency plans for higher priority facilities.

Federal Emergency Management Agency, U.S. Department of Transportation, and U.S. Environmental Protection Agency, *Handbook of Chemical Hazard Analysis Procedures*.

This guide presents four basic steps for conducting a hazard analysis, and a related fifth step that takes advantage of the knowledge gained during the effort to develop a comprehensive emergency plan. These steps include:

I. Hazard Identification—location, identification, and characterization of potential spill sources and accident sites in the jurisdiction or locality of concern. This step essentially concludes with the identification and/or postulation of fundamental accident scenarios requiring further consideration and analysis. Results from the probability analysis which follows can often help in further refining these scenarios. Methods discussed include:

- Enforcement of right-to-know laws
- Use of fire department and building inspection records
- Industry questionnaires
- Meetings with business organizations and trade groups
- Meetings with individual business personnel
- Queries of rail, marine, and pipeline transportation companies
- Truck traffic surveys
- Use of permit records
- Use of the “Yellow Pages”
- Access to detailed chemical property data and hazard information

II. Probability Analysis—evaluation of the likelihood of individual accident scenarios. This step permits examination and/or prioritization of potential accident scenarios in terms of their probability of occurrence. Categories of activities discussed include:

- Bulk transportation by highway
- Bulk transportation by rail
- Bulk transportation by barge or other marine vessel
- Transportation by pipeline
- Bulk storage, processing, or handling at fixed facilities
- Transportation of packaged hazardous materials
- Transportation by air

III. Consequence Analysis—evaluation of the consequences and impacts associated with the occurrence of postulated accident scenarios. This step provides an understanding of the nature and outcome of an accident and permits examination and/or prioritization of scenarios in terms of their potential impact on people and property. The Automated Resource for Chemical Hazard Incident Evaluation (ARCHIE) computer program and a set of hazard assessment procedures and models are discussed.

IV. Risk Analysis—combination of results from the accident probability and consequence analysis efforts to provide a measure of overall risk associated with the specific activity or activities. The effort permits examination and/or prioritization of scenarios in terms of *overall* risk. Steps include:

- Definition of annual accident probability categories
- Definition of accident severity categories
- Application of screening guidelines

V. Formulation of a Planning Basis—use of the results of the above activities during actual development and preparation of an emergency plan. The material includes discussion of 43 separate topics in 13 subject areas, as follows:

- Notification
- Command and Communications
- Evacuation
- Fire response
- Health Care
- Personal Protection
- Public Relations
- Spill Containment and Cleanup
- Spill Documentation
- Spill Monitoring
- Post-Spill Recovery
- Training
- Waste Disposal

Federal Emergency Management Agency, *Emergency Management Guide for Business & Industry*, FEMA 141, October 1993.

This document emphasizes the emergency planning and management needs of business and industry. Four steps are identified in the planning process, as follows:

I. Establish a Planning Team
   A. Form the team
   B. Establish authority
   C. Issue a mission statement
   D. Establish a schedule and budget

II. Analyze Capabilities and Hazards
   A. Where do you stand right now?
      1. Review internal plans and policies
      2. Meet with outside groups
      3. Identify codes and regulations
      4. Identify critical products, services, and operations
      5. Identify internal resources and capabilities
      6. Identify external resources
      7. Do an insurance review

   B. Conduct a vulnerability analysis
      1. List potential emergencies
      2. Estimate probability
      3. Assess the potential human impact
      4. Assess the potential property impact
      5. Assess the potential business impact
      6. Assess internal and external resources
      7. Add the columns

III. Develop the Plan
- A. Identify challenges and prioritize activities
- B. Write the plan
- C. Establish a training schedule
- D. Coordinate with outside organizations
- E. Maintain contact with other corporate offices
- F. Review, conduct training and revise
- G. Seek final approval
- H. Distribute the plan

IV. Implement the Plan
- A. Integrate the plan into company operations
- B. Conduct training (including exercises and drills)
- C. Evaluate and modify the plan

The guide also identifies planning considerations that are unique to hazardous materials, as well as core operational considerations of emergency management, in the following categories:

- Direction and Control
- Communications
- Life Safety
- Property Protection
- Community Outreach
- Recovery and Restoration
- Administration and Logistics

The National Response Team's Integrated Contingency Plan Guidance

AGENCY: Environmental Protection Agency (EPA), U.S. Coast Guard (USCG), Minerals Management Service (MMS), Research and Special Programs Administration (RSPA), Occupational Safety and Health Administration (OSHA).

ACTION: Notice.

SUMMARY: The U.S. Environmental Protection Agency, as the chair of the National Response Team (NRT), is announcing the availability of the NRT's Integrated Contingency Plan Guidance (''one plan''). This guidance is intended to be used by facilities to prepare emergency response plans. The intent of the NRT is to provide a mechanism for consolidating multiple plans that facilities may have prepared to comply with various regulations into one functional emergency response plan or integrated contingency plan (ICP). This notice contains the suggested ICP outline as well as guidance on how to develop an ICP and demonstrate compliance with various regulatory requirements. The policies set out in this notice are intended solely as guidance.

ADDRESSES: Additional copies of this one-plan guidance can be obtained by writing to the following address: William Finan, U.S. Environmental Protection Agency, Mail Code 5101, 401 M Street SW, Washington, DC 20460. Copies of the ICP Guidance are also available by calling the EPCRA/RCRA/Superfund Hotline at (800) 424–9346 (in the Washington, DC, metropolitan area, (703) 412–9810). In addition, this guidance is available electronically at the home page of EPA's Chemical Emergency Preparedness and Prevention Office (http://www.epa.gov/swercepp/).

FOR FURTHER INFORMATION CONTACT: William Finan, U.S. Environmental Protection Agency, Mail Code 5101, 401 M Street, SW., Washington, DC 20460, at (202) 260–0030 (E-Mail homepage.ceppo@epamail.epa.gov—please include ''one plan'' in the subject line). In addition, the EPCRA/RCRA/Superfund Hotline can answer general questions about the guidance.

For further information and guidance on complying with specific regulations, contact: for EPA's Oil Pollution Prevention Regulation: Bobbie Lively-Diebold, U.S. Environmental Protection Agency, Mail Code 5203G, 401 M Street, SW., Washington, DC 20460, at (703) 356–8774 (E-Mail Lively.Barbara@epamail.epa.gov), or the SPCC Information Line at (202) 260–2342); for the U.S. Coast Guard's Facility Response Plan Regulation: LCDR Mark Hamilton, U.S. Coast Guard, Commandant (G–MOR), 2100 2nd Street, SW., Washington, DC 20593, at 202–267–1983 (E-Mail M.Hamilton/G-M03@CGSMTP.uscg.mil); for DOT/RSPA's Pipeline Response Plan Regulation: Jim Taylor, U.S. Department of Transportation, Room 2335, 400 7th Street, SW., Washington, DC 20590 at (202) 366–8860 (E-Mail OPATEAM@RSPA.DOT.GOV); for pertinent OSHA regulations, contact either your Regional or Area OSHA office; for DOI/MMS' Facility Response Plan Regulation: Larry Ake, U.S. Department of the Interior—Minerals Management Service, MS 4700, 381 Elden Street, Herndon, VA 22070–4817 at (703) 787–1567 (E-Mail Larry__Ake@SMTP.MMS.GOV); for EPA's Risk Management Program Regulation: William Finan (see above); and for RCRA's Contingency Planning Requirements, contact the EPCRA/RCRA/Superfund Hotline (see above).

The NRT welcomes comments on specific implementation issues related to this guidance. Please provide us with information about the successful use of this guidance, about problems with using this guidance, as well as suggestions for improving the guidance. Send comments to William Finan (see above) or to any of the other people listed in the previous paragraph.

SUPPLEMENTARY INFORMATION:

Presidential Review Findings

Section 112(r)(10) of the Clean Air Act required the President to conduct a review of federal release prevention, mitigation, and response authorities. The Presidential Review was delegated to EPA, in coordination with agencies and departments that are members of the National Response Team (NRT). The Presidential Review concluded that, while achieving its statutory goals to protect public safety and the environment, the current system is complex, confusing, and costly. It identified several key problem areas and recommended a second phase to address these issues. One of the issues identified by the Presidential Review is the multiple and overlapping federal requirements for facility emergency response plans.

NRT Policy Statement

This one-plan guidance is intended to be used by facilities to prepare emergency response plans for responding to releases of oil and non-radiological hazardous substances. The intent of NRT is to provide a mechanism for consolidating multiple plans that facilities may have prepared to comply with various regulations into one functional emergency response plan or integrated contingency plan (ICP). A number of statutes and regulations, administered by several federal agencies, include requirements for emergency response planning. A particular facility may be subject to one or more of the following federal regulations:

- EPA's Oil Pollution Prevention Regulation (SPCC and Facility Response Plan Requirements)—40 CFR part 112.7(d) and 112.20–.21;
- MMS's Facility Response Plan Regulation—30 CFR part 254;
- RSPA's Pipeline Response Plan Regulation—49 CFR part 194;
- USCG's Facility Response Plan Regulation—33 CFR part 154, Subpart F;
- EPA's Risk Management Programs Regulation—40 CFR part 68;
- OSHA's Emergency Action Plan Regulation—29 CFR 1910.38(a);
- OSHA's Process Safety Standard—29 CFR 1910.119;
- OSHA's HAZWOPER Regulation—29 CFR 1910.120; and
- EPA's Resource Conservation and Recovery Act Contingency Planning Requirements—40 CFR part 264, Subpart D, 40 CFR part 265, Subpart D, and 40 CFR 279.52.

In addition, facilities may also be subject to state emergency response planning requirements that this guidance does not specifically address. Facilities are encouraged to coordinate development of their ICP with relevant state and local agencies to ensure compliance with any additional regulatory requirements.

Individual agencies' planning requirements and plan review procedures are not changed by the advent of the ICP format option. This one-plan guidance has been developed

to assist facilities in demonstrating compliance with the existing federal emergency response planning requirements referenced above. Although it does not relieve facilities from their current obligations, it has been designed specifically to help meet those obligations. Adherence to this guidance is not required in order to comply with federal regulatory requirements. Facilities are free to continue maintaining multiple plans to demonstrate federal regulatory compliance; however, the NRT believes that an integrated plan prepared in accordance with this guidance is a preferable alternative.

The NRT realizes that many existing regulations pertaining to contingency planning require review by a specific agency to determine compliance with applicable requirements. It is not the intent of the NRT to modify existing agency review procedures or to supersede the requirements of a regulation.

This one-plan guidance was developed through a cooperative effort among numerous NRT agencies, state and local officials, and industry and community representatives. The NRT and the agencies responsible for reviewing and approving federal response plans to which the ICP option applies agree that integrated response plans prepared in the format provided in this guidance will be acceptable and be the federally preferred method of response planning. The NRT realizes that alternate formats for integrating multiple plans already exist and that others likely will be developed. Certain facilities may find those formats more desirable than the one proposed here. The NRT believes that a single functional plan is preferable to multiple plans regardless of the specific format chosen. While they are acceptable, other formats may not allow the same ease of coordination with external plans. In any case, whatever format a facility chooses, no individual NRT agency will require an integrated response planning format differing from the ICP format described here. The NRT anticipates that future development of all federal regulations addressing emergency response planning will incorporate use of the ICP guidance. Also, developers of state and local requirements will be encouraged to be consistent with this document.

The ICP guidance does not change existing regulatory requirements; rather, it provides a format for organizing and presenting material currently required by the regulations. Individual regulations are often more detailed than the ICP guidance. To ensure full compliance, facilities should continue to read and comply with all of the federal regulations that apply to them. Furthermore, facilities submitting an ICP (in whatever format) for agency or department review will need to provide a cross-reference to existing regulatory requirements so that plan reviewers can verify compliance with these requirements. The guidance contains a series of matrices designed to assist owners and operators in consolidating various plans and documenting compliance with federal regulatory requirements. (See Attachments 2 and 3.) The matrices can be used as the basis for developing a cross-reference to various regulatory requirements.

This guidance also provides a useful contingency planning template for owners and operators of facilities not subject to the federal regulations cited previously.

Integrated Contingency Plan Philosophy

The ICP will minimize duplication in the preparation and use of emergency response plans at the same facility and will improve economic efficiency for both the regulated and regulating communities. Facility expenditures for the preparation, maintenance, submission, and update of a single plan should be much lower than for multiple plans.

The use of a single emergency response plan per facility will eliminate confusion for facility first responders who often must decide which of their plans is applicable to a particular emergency. The guidance is designed to yield a highly functional document for use in varied emergency situations while providing a mechanism for complying with multiple agency requirements. Use of a single integrated plan should also improve coordination between facility response personnel and local, state, and federal emergency response personnel.

The adoption of a standard plan format should facilitate integration of plans within a facility, in the event that large facilities may need to prepare separate plans for distinct operating units. The ICP concept should also allow coordination of facility plans with plans that are maintained by local emergency planning committees (LEPCs),[1] Area Committees,[2] co-operatives, and mutual aid organizations. In some cases, there are specific regulatory requirements to ensure that facility plans are consistent with external planning efforts. Industry use of this guidance along with active participation on local and Area Committees will improve the level of emergency preparedness and is therefore highly encouraged.

In some areas, it may be possible to go beyond simple coordination of plans and actually integrate certain information from facility plans with corresponding areas of external plans. The adoption of a single, common ICP outline such as the one proposed in this guidance would facilitate a move toward integration of facility plans with local, state, and federal plans.

The projected results described above will ultimately serve the mutual goal of the response community to more efficiently and effectively protect public health, worker safety, the environment, and property.

Scope

This one-plan guidance is provided for any facility subject to federal contingency planning regulations and is also recommended for use by other facilities to improve emergency preparedness through planning. In this context, the term ''facility'' is meant to have a wide connotation and may include, but is not limited to, any mobile or fixed onshore or offshore building, structure, installation, equipment, pipe, or pipeline.

Facility hazards need to be addressed in a comprehensive and coordinated manner. Accordingly, this guidance is broadly constructed to allow for facilities to address a wide range of risks in a manner tailored to the specific needs of the facility. This includes both physical and chemical hazards associated with events such as chemical releases, oil spills, fires, explosions, and natural disasters.

Organizational Concepts

The ICP format provided in this one-plan guidance (See Attachment 1) is organized into three main sections: an introductory section, a core plan, and a series of supporting annexes. It is important to note that the elements contained in these sections are not new concepts, but accepted emergency response activities that are currently addressed in various forms in existing contingency planning regulations. The goal of the NRT is not to create new planning requirements, but to provide a mechanism to consolidate existing concepts into a single functional plan structure. This approach would provide a consistent basis for addressing

[1] LEPC plans are developed by LEPCs in coordination with facility emergency response coordinators under section 303 of the Emergency Planning and Community Right-to-Know Act.

[2] Area Contingency Plans are developed by Area Committees pursuant to section 4202(a)(6) of the Oil Pollution Act of 1990 (OPA).

emergency response concerns as it gains widespread use among facilities.

The introduction section of the plan format is designed to provide facility response personnel, outside responders, and regulatory officials with basic information about the plan and the entity it covers. It calls for a statement of purpose and scope, a table of contents, information on the current revision date of the plan, general facility information, and the key contact(s) for plan development and maintenance. This section should present the information in a brief factual manner.

The structure of the sample core plan and annexes in this guidance is based on the structure of the National Interagency Incident Management System (NIIMS) Incident Command System (ICS). NIIMS ICS is a nationally recognized system currently in use by numerous federal, state, and local organizations (e.g., some Area Committees under OPA). NIIMS ICS is a type of response management system that has been used successfully in a variety of emergency situations, including releases of oil or hazardous substances. NIIMS ICS provides a commonly understood framework that allows for effective interaction among response personnel. Organizing the ICP along the lines of the NIIMS ICS will allow the plan to dovetail with established response management practices, thus facilitating its ease of use during an emergency.

The core plan is intended to contain essential response guidance and procedures. Annexes would contain more detailed supporting information on specific response management functions. The core plan should contain frequent references to the response critical annexes to direct response personnel to parts of the ICP that contain more detailed information on the appropriate course of action for responders to take during various stages of a response. Facility planners need to find the right balance between the amount of information contained in the core plan versus the response critical annexes (Annexes 1 through 3). Information required to support response actions at facilities with multiple hazards will likely be contained in the annexes. Planners at facilities with fewer hazards may choose to include most if not all information in the core plan. Other annexes (e.g., Annexes 4 through 8) are dedicated to providing information that is non-critical at the time of a response (e.g., cross-references to demonstrate regulatory compliance and background planning information). Consistent with the goal of keeping the size of the ICP as manageable as practicable, it is not necessary for a plan holder to provide its field responders with all the compliance documentation (e.g., Annexes 4 through 8) that it submits to regulatory agencies. Similarly, it may not be necessary for a plan holder to submit all annexes to every regulatory agency for review.

Basic headings are consistent across the core plan and annexes to facilitate ease of use during an emergency. These headings provide a comprehensive list of elements to be addressed in the core plan and response annexes and may not be relevant to all facilities. Planners should address those regulatory elements that are applicable to their particular facilities. Planners at facilities with multiple hazards will need to address most, if not all, elements included in this guidance. Planners at facilities with fewer hazards may not need to address certain elements. If planners choose to strictly adopt the ICP outline contained in this guidance but are not required by regulation to address all elements of the outline, they may simply indicate ''not applicable'' for those items where no information is provided. A more detailed discussion of the core plan and supporting annexes follows.

Core Plan

The core plan is intended to reflect the essential steps necessary to initiate, conduct, and terminate an emergency response action: recognition, notification, and initial response, including assessment, mobilization, and implementation. This section of the plan should be concise and easy to follow. A rule of thumb is that the core plan should fit in the glovebox of a response vehicle. The core plan need not detail all procedures necessary under these phases of a response but should provide information that is time critical in the earliest stages of a response and a framework to guide responders through key steps necessary to mount an effective response. The response action section should be convenient to use and understandable at the appropriate skill level.

The NRT recommends the use of checklists or flowcharts wherever possible to capture these steps in a concise easy-to-understand manner. The core plan should be constructed to contain references to appropriate sections of the supporting annexes for more detailed guidance on specific procedures. The NRT anticipates that for a large, complex facility with multiple hazards the annexes will contain a significant amount of information on specific procedures to follow. For a small facility with a limited number of hazard scenarios, the core plan may contain most if not all of the information necessary to carry out the response thus obviating the need for more detailed annexes. The checklists, depending on their size and complexity, can be in either the core or the support section.

The core plan should reflect a hierarchy of emergency response levels. A system of response levels is commonly used in emergency planning for classifying emergencies according to seriousness and assigning an appropriate standard response or series of response actions to each level. Both complex and simple industrial facilities use a system of response levels for rapidly assessing the seriousness of an emergency and developing an appropriate response. This process allows response personnel to match the emergency and its potential impacts with appropriate resources and personnel. The concept of response levels should be considered in developing checklists or flowcharts designed to serve as the basis for the core plan. Note that for those facilities subject to planning requirements under OPA, response levels in the core plan may not necessarily correspond to discharge planning amounts (e.g., average most probable discharge, maximum most probable discharge, and worst case discharge).

Facility owners and operators should determine appropriate response levels based on 1) the need to initiate time-urgent response actions to minimize or prevent unacceptable consequences to the health and safety of workers, the public, or the environment; and 2) the need to communicate critical information concerning the emergency to offsite authorities. The consideration and development of response levels should, to the extent practicable, be consistent with similar efforts that may have been taken by the LEPC, local Area Committee, or mutual aid organization. Response levels, which are used in communications with offsite authorities, should be fully coordinated and use consistent terminology.

Annexes

The annexes are designed to provide key supporting information for conducting an emergency response under the core plan as well as document compliance with regulatory requirements not addressed elsewhere in the ICP. Annexes are not meant to duplicate information that is already contained in the core plan, but to augment core plan information. The annexes should relate to the basic

headings of the core plan. To accomplish this, the annexes should contain sections on facility information, notification, and a detailed description of response procedures under the response management system (i.e, command, operations, planning, logistics, and finance). The annexes should also address issues related to post accident investigation, incident history, written follow-up reports, training and exercises, plan critique and modification process, prevention, and regulatory compliance, as appropriate.

The ICP format contained in this guidance is based on the NIIMS ICS. If facility owners or operators choose to follow fundamental principles of the NIIMS ICS, then they may adopt NIIMS ICS by reference rather than having to describe the system in detail in the plan. The owner or operator should identify where NIIMS ICS documentation is kept at the facility and how it will be accessed if needed by the facility or requested by the reviewing agency. Regardless of the response management system used, the plan should include an organization chart, specific job descriptions,[3] a description of information flow ensuring liaison with the on-scene coordinator (OSC), and a description of how the selected response management system integrates with a Unified Command.[4] If a system other than NIIMS ICS is used, the plan should also identify how it differs from NIIMS or provide a detailed description of the system used.

The NRT anticipates that the use of linkages (i.e., references to other plans) when developing annexes will serve several purposes. Linkages will facilitate integration with other emergency plans within a facility (until such plans can be fully incorporated into the ICP) and with external plans, such as LEPC plans and Area Contingency Plans (ACPs). Linkages will also help ensure that the annexes do not become too cumbersome. The use of references to information contained in external plans does not relieve facilities from regulatory requirements to address certain elements in a facility-specific manner and to have information readily accessible to responders. When determining what information may be linked by reference and what needs to be contained in the ICP, response planners should carefully consider the time critical nature of the information. If instructions or procedures will be needed immediately during an incident response, they should be presented for ready access in the ICP. The following information would not normally be well-suited for reference to documents external to the ICP: core plan elements, facility and locality information (to allow for quick reference by responders on the layout of the facility and the surrounding environment and mitigating actions for the specific hazard(s) present), notification procedures, details of response management personnel's duties, and procedures for establishing the response management system. Although linkages provide the opportunity to utilize information developed by other organizations, facilities should note that many LEPC plans and ACPs may not currently possess sufficient detail to be of use in facility plans or the ICP. This information may need to be developed by the facility until detailed applicable information from broader plans is available.

In all cases, referenced materials must be readily available to anticipated plan users. Copies of documents that have been incorporated by reference need not be submitted unless it is required by regulation. The appropriate sections of referenced documents that are unique to the facility, those that are not nationally recognized, those that are required by regulation, and those that could not reasonably be expected to be in the possession of the reviewing agency, should be provided when the plan is submitted for review and/or approval. Discretion should be used when submitting documents containing proprietary data. It is, however, necessary to identify in the ICP the specific section of the document being incorporated by reference, where the document is kept, and how it will be accessed if needed by the facility or requested by the reviewing agency. In addition, facility owners or operators are reminded to take note of submission requirements of specific regulations when determining what materials to provide an agency for review as it may not be necessary to submit all parts of an ICP to a particular agency.

As discussed previously, this guidance contains a series of matrices designed to assist owners and operators in the plan consolidation process and in the process of ensuring and documenting compliance with regulatory requirements. The matrix in Attachment 2 to this guidance displays areas of current regulations that align with the suggested elements contained in this guidance document. When addressing each element of the ICP outline, plan drafters can refer to this matrix to identify specific regulatory requirements related to that element. The matrices in Attachment 3 to this guidance display regulatory requirements as contained in each of the regulations listed in the NRT policy statement above (which are applicable to many facilities) along with an indication of where in the suggested ICP outline these requirements should be addressed. If a facility chooses to follow the ICP outline, these matrices can be included as Annex 8 to a facility's ICP to provide the necessary cross-reference for plan reviewers to document compliance with various regulatory requirements. To the extent that a plan deviates from the suggested ICP outline, plan drafters will have to alter the matrices to ensure that the location of regulatory requirements within the ICP is clearly identified for plan reviewers.

Integrated Contingency Plan Elements

Presented below is a list of elements to be addressed in the ICP and a brief explanation, displayed in italicized text, of the nature of the information to be contained in that section of the ICP. Attachment 1 presents the complete outline of the ICP without the explanatory text. As discussed previously, the elements are organized into three main sections: plan introduction, core plan, and response annexes.

Section I—Plan Introduction Elements

1. Purpose and Scope of Plan Coverage

This section should provide a brief overview of facility operations and describe in general the physical area, and nature of hazards or events to which the plan is applicable. This brief description will help plan users quickly assess the relevancy of the plan to a particular type of emergency in a given location. This section should also include a list of which regulation(s) are being addressed in the ICP.

[3] OPA 90 planning requirements for marine transfer facilities (33 CFR 154.1035) require job descriptions for each spill management team member regardless of the response management system employed by the facility.

[4] Under NIIMS ICS, the command module has traditionally been represented by a single incident commander (supported by a command staff) who directs efforts of and receives input from the four supporting functional areas (planning, logistics, operations, and finance). More recently, a Unified Command System as described in the National Oil and Hazardous Substances Pollution Contingency Plan (NCP) found at 40 CFR part 300 has been used for larger spill responses where the command module is comprised of representatives from the federal government (i.e., federal on-scene coordinator), state government (state on-scene coordinator), and the responsible party working in a cooperative manner. Unified Command allows all parties who have jurisdictional or functional responsibility for the incident to jointly develop a common set of incident objectives and strategies. Such coordination should be guided by procedures found in the NCP (see figure 1a at 40 CFR 300.105(e)(1)) and the applicable Area Contingency Plan.

2. Table of Contents

This section should clearly identify the structure of the plan and include a list of annexes. This will facilitate rapid use of the plan during an emergency.

3. Current Revision Date

This section should indicate the date that the plan was last revised to provide plan users with information on the currency of the plan. More detailed information on plan update history (i.e., a record of amendments) may be maintained in Annex 6 (Response Critique and Plan Review and Modification Process).

4. General Facility Identification Information

a. Facility name
b. Owner/operator/agent (include physical and mailing address and phone number)
c. Physical address of the facility (include county/parish/borough, latitude/longitude, and directions)
d. Mailing address of the facility (correspondence contact)
e. Other identifying information (e.g., ID numbers, SIC Code, oil storage start-up date)
f. Key contact(s) for plan development and maintenance
g. Phone number(s) for key contact(s)
h. Facility phone number
i. Facility fax number

This section should contain a brief profile of the facility and its key personnel to facilitate rapid identification of key administrative information.

Section II - Core Plan Elements

1. Discovery

This section should address the initial action the person(s) discovering an incident will take to assess the problem at hand and access the response system. Recognition, basic assessment, source control (as appropriate), and initial notification of proper personnel should be addressed in a manner that can be easily understood by everybody in the facility. The use of checklists or flowcharts is highly recommended.

2. Initial Response

a. Procedures for internal and external notifications (i.e., contact, organization name, and phone number of facility emergency response coordinator, facility response team personnel, federal, state, and local officials)
b. Establishment of a response management system
c. Procedures for preliminary assessment of the situation, including an identification of incident type, hazards involved, magnitude of the problem, and resources threatened
d. Procedures for establishment of objectives and priorities for response to the specific incident, including:
  (1) Immediate goals/tactical planning (e.g., protection of workers and public as priorities)
  (2) Mitigating actions (e.g., discharge/release control, containment, and recovery, as appropriate)
  (3) Identification of resources required for response
e. Procedures for implementation of tactical plan
f. Procedures for mobilization of resources

This section should provide for activation of the response system following discovery of the incident. It should include an established 24-hour contact point (i.e., that person and alternate who is called to set the response in motion) and instructions for that person on who to call and what critical information to pass. Plan drafters should also consider the need for bilingual notification. It is important to note that different incident types require that different parties be notified. Appropriate federal, State, and local notification requirements should be reflected in this section of the ICP. Detailed notification lists may be included here or in Annex 2, depending upon the variety of notification schemes that a facility may need to implement. For example, the release of an extremely hazardous substance will require more extensive notifications (i.e., to State Emergency Response Commissions (SERCs) and LEPCs) than a discharge of oil. Even though no impacts or awareness are anticipated outside the site, immediate external notifications are required for releases of CERCLA and EPCRA substances. Again, the use of forms, such as flowcharts, checklists, call-down lists, is recommended.

This section should instruct personnel in the implementation of a response management system for coordinating the response effort. More detailed information on specific components and functions of the response management system (e.g., detailed hazard assessment, resource protection strategies) may be provided in annexes to the ICP.

This part of the plan should then provide information on problem assessment, establishment of objectives and priorities, implementation of a tactical plan, and mobilization of resources. In establishing objectives and priorities for response, facilities should perform a hazard assessment using resources such as Material Safety Data Sheets (MSDSs) or the Chemical Hazard Response Information System (CHRIS) manual. Hazardous Materials Emergency Planning Guide (NRT–1), developed by the NRT to assist community personnel with emergency response planning, provides guidance on developing hazard analyses. If a facility elects to provide detailed hazard analysis information in a response annex, then a reference to that annex should be provided in this part of the core plan.

Mitigating actions must be tailored to the type of hazard present. For example, containment might be applicable to an oil spill (i.e., use of booming strategies) but would not be relevant to a gas release. The plan holder is encouraged to develop checklists, flowcharts, and brief descriptions of actions to be taken to control different types of incidents. Relevant questions to ask in developing such materials include:

- *What type of emergency is occurring?*
- *What areas/resources have been or will be affected?*
- *Do we need an exclusion zone?*
- *Is the source under control?*
- *What type of response resources are needed?*

3. Sustained Actions

This section should address the transition of a response from the initial emergency stage to the sustained action stage where more prolonged mitigation and recovery actions progress under a response management structure. The NRT recognizes that most incidents are able to be handled by a few individuals without implementing an extensive response management system. This section of the core plan should be brief and rely heavily on references to specific annexes to the ICP.

4. Termination and Follow-Up Actions

This section should briefly address the development of a mechanism to ensure that the person in charge of mitigating the incident can, in coordination with the federal or state OSC as necessary, terminate the response. In the case of spills, certain regulations may become effective once the ''emergency'' is declared over. The section should describe how the orderly demobilization of response resources will occur. In addition, follow-up actions associated with termination of a response (e.g., accident investigation, response critique, plan review, written follow-up reports) should also be outlined in this section. Plan drafters

may reference appropriate annexes to the ICP in this section of the core plan.

Section III—Annexes

Annex 1. Facility and Locality Information

a. Facility maps
b. Facility drawings
c. Facility description/layout, including identification of facility hazards and vulnerable resources and populations on and off the facility which may be impacted by an incident

This annex should provide detailed information to responders on the layout of the facility and the surrounding environment. The use of maps and drawings to allow for quick reference is preferable to detailed written descriptions. These should contain information critical to the response such as the location of discharge sources, emergency shut-off valves and response equipment, and nearby environmentally and economically sensitive resources and human populations (e.g., nursing homes, hospitals, schools). The ACP and LEPC plan may provide specific information on sensitive environments and populations in the area. EPA Regional Offices, Coast Guard Marine Safety Offices, and LEPCs can provide information on the status of efforts to identify such resources. Plan holders may need to provide additional detail on sensitive areas near the facility. In addition, this annex should contain other facility information that is critical to response and should complement but not duplicate information contained in part 4 of the plan introduction section containing administrative information on the facility.

Annex 2. Notification

a. Internal notifications
b. Community notifications
c. Federal and state agency notifications

This annex should detail the process of making people aware of an incident (i.e., who to call, when the call must be made, and what information/data to provide on the incident). The incident commander is responsible for ensuring that notifications are carried out in a timely manner but is not necessarily responsible for making the notifications. ACPs, Regional Contingency Plans (RCPs), and LEPC plans should be consulted and referenced as a source of information on the roles and responsibilities of external parties that are to be contacted. This information is important to help company responders understand how external response officials fit into the picture. Call-down lists must be readily accessible to ensure rapid response. Notification lists provided in the core plan need not be duplicated here but need to be referenced.

Annex 3. Response Management System

This annex should contain a general description of the facility's response management system as well as contain specific information necessary to guide or support the actions of each response management function (i.e., command, operations, planning, logistics, and finance) during a response.

a. General

If facility owners or operators choose to follow the fundamental principles of NIIMS ICS (see discussion of annexes above), then they may adopt NIIMS ICS by reference rather than having to describe the response management system in detail in the plan. In this section of Annex 3, planners should briefly address either 1) basic areas where their response management system is at variance with NIIMS ICS or 2) how the facility's organization fits into the NIIMS ICS structure. This may be accomplished through a simple organizational diagram.

If facility owners or operators choose not to adopt the fundamental principles of NIIMS ICS, this section should describe in detail the structure of the facility response management system. Regardless of the response management system used, this section of the annex should include the following information:

- *Organizational chart;*
- *Specific job description for each position;*[5]
- *A detailed description of information flow; and*
- *Description of the formation of a unified command within the response management system.*

b. Command

(1) List facility Incident Commander and Qualified Individual (if applicable) by name and/or title and provide information on their authorities and duties.

This section of Annex 3 should describe the command aspects of the response management system that will be used (i.e., reference NIIMS ICS or detail the facility's response management system). The location(s) of predesignated command posts should also be identified.

(2) Information (i.e., internal and external communications).

This section of Annex 3 should address how the facility will disseminate information internally (i.e., to facility/response employees) and externally (i.e., to the public). For example, this section might address how the facility would interact with local officials to assist with public evacuation and other needs. Items to consider in developing this section include press release statement forms, plans for coordination with the news media, community relations plan, needs of special populations, and plans for families of employees.

(3) Safety.

This section of Annex 3 should include a process for ensuring the safety of responders. Facilities should reference responsibilities of the safety officer, federal/state requirements (e.g., HAZWOPER), and safety provisions of the ACP. Procedures for protecting facility personnel should be addressed (i.e., evacuation signals and routes, sheltering in place).

(4) Liaison—Staff Mobilization.

This section of Annex 3 should address the process by which the internal and external emergency response teams will interact. Given that parallel mobilization may be occurring by various response groups, the process of integration (i.e., unified command) should be addressed. This includes a process for communicating with local emergency management especially where safety of the general public is concerned.

c. Operations

(1) Operational response objectives
(2) Discharge or release control
(3) Assessment/monitoring
(4) Containment
(5) Recovery
(6) Decontamination
(7) Non-responder medical needs, including information on ambulances and hospitals
(8) Salvage plans

This section of Annex 3 should contain a discussion of specific operational procedures to respond to an incident. It is important to note that response operations are driven by the type of incident. That is, a response to an oil spill will differ markedly from a response to a release of a toxic gas to the air. Plan drafters should tailor response procedures to the particular hazards in place at the facility. A facility with limited hazards may have relatively few procedures. A larger more complex facility with numerous hazards is likely to have a series of procedures

[5] OPA 90 planning requirements for marine transfer facilities (33 CFR 154.1035) require job descriptions for each spill management team member regardless of the response management system employed by the facility.

designed to address the nuances associated with each type of incident.

d. Planning

(1) Hazard assessment, including facility hazards identification, vulnerability analysis, prioritization of potential risks.

This section of Annex 3 should present a detailed assessment of all potential hazards present at the facility, an analysis of vulnerable receptors (e.g., human populations, both workers and the general public, environmentally sensitive areas, and other facility-specific concerns) and a discussion of which risks deserve primary consideration during an incident. NRT–1 contains guidance on conducting a hazard analysis. Also, ACPs and LEPC plans may provide information on environmentally sensitive and economically important areas, human populations, and protection priorities. Plan drafters should address the full range of risks present at the facility. By covering actions necessary to respond to a range of incident types, plan holders can be prepared for small, operational discharges and large catastrophic releases. One approach that is required by certain regulations, such as the Clean Air Act (CAA) and OPA is to develop planning scenarios for certain types and sizes of releases (i.e., worst case discharge). Facilities may address such planning scenarios and associated calculations in this section of Annex 3 or as part of a separate annex depending on the size and complexity of the facility.

(2) Protection

This section of Annex 3 should present a discussion of strategies for protecting the vulnerable receptors identified through the hazard analysis. Primary consideration should be given to minimizing those risks identified as a high priority. Activities to be considered in developing this section include: population protection; protective booming; dispersant use, in-situ burning, bioremediation; water intake protection; wildlife recovery/ rehabilitation; natural remediation; vapor suppression; and monitoring, sampling, and modeling. ACPs and LEPC plans may contain much of this information.

(3) Coordination with natural resource trustees.

This section should address coordination with government natural resource trustees. In their role as managers of and experts in natural resources, trustees assist the federal OSC in developing or selecting removal actions to protect these resources. In this role, they serve as part of the response organization working for the federal OSC. A key area to address is interaction with facility response personnel in protection of natural resources.

Natural resource trustees are also responsible to act on behalf of the public to present a claim for and recover damages to natural resources injured by an oil spill or hazardous substance release. The process followed by the natural resource trustees, natural resource damage assessment (NRDA), generally involves some data collection during emergency response. NRDA regulations provide that the process may be carried out in cooperation with the responsible party. Thus, the facility may wish to plan for how that cooperation will occur, including designation of personnel to work with trustees in NRDA.

(4) Waste management.

This section should address procedures for the disposal of contaminated materials in accordance with federal, state, and local requirements.

e. Logistics

(1) Medical needs of responders
(2) Site security
(3) Communications (internal and external resources)
(4) Transportation (air, land, water)
(5) Personnel support (e.g., meals, housing, equipment)
(6) Equipment maintenance and support

This section of the Annex 3 should address how the facility will provide for the operational needs of response operations in each of the areas listed above. For example, the discussion of personnel support should address issues such as: volunteer training; management; overnight accommodations; meals; operational/ administrative spaces; and emergency procedures. The NRT recognizes that certain logistical considerations may not be applicable to small facilities with limited hazards.

f. Finance/procurement/administration

(1) Resource list
(2) Personnel management
(3) Response equipment
(4) Support equipment
(5) Contracting
(6) Claims procedures
(7) Cost documentation

This section of Annex 3 should address the acquisition of resources (i.e., personnel and equipment) for the response and monitoring of incident-related costs. Lists of available equipment in the local and regional area and how to procure such equipment as necessary should be included. Information on previously established agreements (e.g., contracts) with organizations supplying personnel and equipment (e.g., oil spill removal organizations) also should be included. This section should also address methods to account for resources expended and to process claims resulting from the incident.

Annex 4. Incident Documentation

a. Post accident investigation
b. Incident history

This annex should describe the company's procedures for conducting a follow-up investigation of the cause of the accident, including coordination with federal, State, and local officials. This annex should also contain an accounting of incidents that have occurred at the facility, including information on cause, amount released, resources impacted, injuries, response actions, etc. This annex should also include information that may be required to prove that the facility met its legal notification requirements with respect to a given incident, such as a signed record of initial notifications and certified copies of written follow-up reports submitted after a response.

Annex 5. Training and Exercises/Drills

This annex should contain a description of the training and exercise program conducted at the facility as well as evidence (i.e., logs) that required training and exercises have been conducted on a regular basis. Facilities may follow appropriate training or exercise guidelines (e.g., National Preparedness for Response Exercise Program Guidelines) as allowed under the various regulatory requirements.

Annex 6. Response Critique and Plan Review and Modification Process

This annex should describe procedures for modifying the plan based on periodic plan review or lessons learned through an exercise or a response to an actual incident. Procedures to critique an actual or simulated response should be a part of this discussion. A list of plan amendments (i.e., history of updates) should also be contained in this annex. Plan modification should be viewed as a part of a facility's continuous improvement process.

Annex 7. Prevention

Some federal regulations that primarily address prevention of accidents include elements that relate to contingency planning (e.g., EPA's RMP and SPCC regulations and OSHA's Process Safety Standard). This annex is designed to allow facilities to include

prevention-based requirements (e.g., maintenance, testing, in-house inspections, release detection, site security, containment, fail safe engineering) that are required in contingency planning regulations or that have the potential to impact response activities covered in a contingency plan. The modular nature of the suggested plan outline provides planners with necessary flexibility to include prevention requirements in the ICP. This annex may not need to be submitted to regulatory agencies for review.

Annex 8. Regulatory Compliance and Cross-Reference Matrices

This annex should include information necessary for plan reviewers to determine compliance with specific regulatory requirements. To the extent that plan drafters did not include regulatory required elements in the balance of the ICP, they should be addressed in this annex. This annex should also include signatory pages to convey management approval and certifications required by the regulations, such as certification of adequate response resources and/or statements of regulatory applicability as required by regulations under OPA authority. Finally, this annex should contain cross-references that indicate where specific regulatory requirements are addressed in the ICP for each regulation covered under the plan. As discussed previously, Attachment 3 contains a series of matrices designed to fulfill this need in those instances where plan drafters adhere to the outline contained in this guidance.

Attachment 1—ICP Outline

Section I—Plan Introduction Elements

1. Purpose and Scope of Plan Coverage
2. Table of Contents
3. Current Revision Date
4. General Facility Identification Information
   a. Facility name
   b. Owner/operator/agent (include physical and mailing address and phone number)
   c. Physical address of the facility (include county/parish/borough, latitude/longitude, and directions)
   d. Mailing address of the facility (correspondence contact)
   e. Other identifying information (e.g., ID numbers, SIC Code, oil storage start-up date)
   f. Key contact(s) for plan development and maintenance
   g. Phone number for key contact(s)
   h. Facility phone number
   i. Facility fax number

Section II—Core Plan Elements

1. Discovery
2. Initial Response
   a. Procedures for internal and external notifications (i.e., contact, organization name, and phone number of facility emergency response coordinator, facility response team personnel, federal, state, and local officials)
   b. Establishment of a response management system
   c. Procedures for preliminary assessment of the situation, including an identification of incident type, hazards involved, magnitude of the problem, and resources threatened
   d. Procedures for establishment of objectives and priorities for response to the specific incident, including:
   (1) Immediate goals/tactical planning (e.g., protection of workers and public as priorities)
   (2) Mitigating actions (e.g., discharge/release control, containment, and recovery, as appropriate)
   (3) Identification of resources required for response
   e. Procedures for implementation of tactical plan
   f. Procedure for mobilization of resources
3. Sustained Actions
4. Termination and Follow-Up Actions

Section III-Annexes

Annex 1. Facility and Locality Information

a. Facility maps
b. Facility drawings
c. Facility description/layout, including identification of facility hazards and vulnerable resources and populations on and off the facility which may be impacted by an incident

Annex 2. Notification

a. Internal notifications
b. Community notifications
c. Federal and state agency notifications

Annex 3. Response Management System

a. General
b. Command
   (1) List facility Incident Commander and Qualified Individual (if applicable) by name and/or title and provide information on their authorities and duties
   (2) Information (i.e., internal and external communications)
   (3) Safety
   (4) Liaison—Staff mobilization
c. Operations
   (1) Operational response objectives
   (2) Discharge or release control
   (3) Assessment/monitoring
   (4) Containment
   (5) Recovery
   (6) Decontamination
   (7) Non-responder medical needs including information on ambulances and hospitals
   (8) Salvage plans
d. Planning
   (1) Hazard assessment, including facility hazards identification, vulnerability analysis, prioritization of potential risks
   (2) Protection
   (3) Coordination with natural resource trustees
   (4) Waste management
e. Logistics
   (1) Medical needs of responders
   (2) Site security
   (3) Communications (internal and external resources)
   (4) Transportation (air, land, water)
   (5) Personnel support (e.g., meals, housing, equipment)
   (6) Equipment maintenance and support
f. Finance/procurement/administration
   (1) Resource list
   (2) Personnel management
   (3) Response equipment
   (4) Support equipment
   (5) Contracting
   (6) Claims procedures
   (7) Cost documentation

ATTACHMENT 3: REGULATORY CROSS-COMPARISON MATRICES—Continued

	ICP Citation(s)
(ix) Follow-up report	III.4.a.
EPA's Oil Pollution Prevention Regulation (40 CFR 112)	
112.7(d)(1) Strong spill contingency plan and written commitment of manpower, equipment, and materials.[10,11]	
112.20(g) General response planning requirements	III.3.d.(3); III.6.
112.20(h) Response plan elements	I.2; III.8.
(1) Emergency response action plan (Appendix F1.1):	
(i) Identity and telephone number of qualified individual (F1.2.5)	III.3.b.(1).
(ii) Identity of individuals/organizations to contact if there is a discharge (F1.3.1)	III.2.
(iii) Description of information to pass to response personnel in event of a reportable spill (F1.3).	II.2.a.
(iv) Description of facility's response equipment and its location (F1.3.2)	II.2.d.(3); III.3.e.(3); III.3.e.(6); III.3.f.(1); III.3.f.(3).
(v) Description of response personnel capabilities (F1.3.4)	II.2.b; III.3; III.3.e.(5); III.3.f.(2);
(vi) Plans for evacuation of the facility and a reference to community evacuation plans (F1.3.5).	III.3.b.(3); III.3.e.(5)
(vii) Description of immediate measures to secure the source (F1.7.1)	II.2.d.(2); III.3.c.(2); III.3.c.(4).
(viii) Diagram of the facility (F1.9)	III.1.a–b.
(2) Facility information (F1.2, F2.0)	I.4.b–d; III.1.
(3) Information about emergency responses:	
(i) Identity of private personnel and equipment to remove to the maximum extent practicable a WCD or other discharges (F1.3.2, F1.3.4).	III.3.c.(2); III.3.c.(4)–(5); III.3.e.(5).
(ii) Evidence of contracts or other approved means for ensuring personnel and equipment availability.	III.3.e.(5); III.3.f.(5)
(iii) Identity and telephone of individuals/organizations to be contacted in event of a discharge (F1.3.1).	II.2.a; III.2.b–d; III.3.b.(2).
(iv) Description of information to pass to response personnel in event of a reportable spill (F1.3.1).	II.2.a.
(v) Description of response personnel capabilities (F1.3.4)	II.2.b; III.3; III.3.e.(5); III.3.f.(2).
(vi) Description of a facility's response equipment, location of the equipment, and equipment testing (F1.3.2, F1.3.3).	II.2.d.(3); III.3.e.(3); III.3.e.(6); III.3.f.(1); III.3.f.(3).
(vii) Plans for evacuation of the facility and a reference to community evacuation plans as appropriate (F1.3.5).	III.3.b.(3); III.3.e.(5).
(viii) Diagram of evacuation routes (F1.9).	III.3.b.(3).
(ix) Duties of the qualified individual (F1.3.6)	II.2.c; II.2.d.(1); I.2.e; III.2.b–c; III.3.c.(3); III.3.d.(1); III.3.f.
(4) Hazard evaluation (F1.4)	II.2.c; III.3.d.(1); III.4.b.
(5) Response planning levels (F1.5, F1.5.1, F1.5.2)	II.3.d.(1).
(6) Discharge detection systems (F1.6, F1.6.1, F1.6.2)	II.1.
(7) Plan implementation (F1.7)	II.2.d–f; II.3; II.4.
(i) Response actions to be carried out (F1.7.1.1)	II.2; III.3.d.(2).
(ii) Description of response equipment to be used for each scenario (F1.7.1.1)	III.3.d.(1).
(iii) Plans to dispose of contaminated cleanup materials (F1.7.2)	III.3.c.(5)–(6)
(iv) Measures to provide adequate containment and drainage of spilled oil (F1.7.3)	III.3.c.(2); III.3.c.(4); III.3.d.(2); III.3.d.(4).
(8) Self-inspection, drills/exercises, and response training (F1.8.1–F1.8.3.2)	III.3.e.(6); III.5.
(9) Diagrams (F1.9)	III.1.b.
(10) Security systems (F1.10)	III.3.e.(2).
(11) Response plan cover sheet (F2.0).	
112.21 Facility response training and drills/exercises (F1.8.2, F1.8.3)	III.5.
Appendix F Facility-Specific Response Plan:[12]	I.2.
1.0 Model Facility-Specific Response Plan.	
1.1 Emergency Response Action Plan.	
1.2 Facility Information	I.3; I.4.a; I.4.b–c; I.4.h; II.2.a; III.1.
1.3 Emergency Response Information:	
1.3.1 Notification	II.2.a; III.2.a–c.
1.3.2 Response Equipment List	II.2.d.(3); III.3.e.(3); III.3.f.(1); III.3.f.(3)–(4).
1.3.3 Response Equipment Testing/Deployment	III.3.e.(6).
1.3.4 Personnel	II.2.b; III.3; III.3.f.(2).
1.3.5 Evacuation Plans	III.3.b.(3); III.3.e.(5).
1.3.6 Qualified Individual's Duties	II.2.
1.4 Hazard Evaluation	II.2.c.
1.4.1 Hazard Identification	III.1.c; III.3.d.(1).
1.4.2 Vulnerability Analysis	II.2.c; III.3.d.(1).
1.4.3 Analysis of the Potential for an Oil Spill	III.3.d.(1).
1.4.4 Facility Reportable Oil Spill History	III.4.b.
1.5 Discharge Scenarios:	
1.5.1 Small and Medium Discharges	III.3.d.(1).
1.5.2 Worst Case Discharge	III.3.d.(1).
1.6 Discharge Detection Systems:	
1.6.1 Discharge Detection By Personnel	II.1.

ATTACHMENT 3: REGULATORY CROSS-COMPARISON MATRICES—Continued

1.6.2 Automated Discharge Detection	II.1.
1.7 Plan Implementation	II.2.
1.7.1 Response Resources for Small, Medium, and Worst Case Spills	II.2.d.(3); II.2.f; III.3.c.(3); III.3.d.(2); III.3.f.(1); III.3.f.(3)–(4).
1.7.2 Disposal Plans	III.3.c.(5)–(6); III.3.d.(4).
1.7.3 Containment and Drainage Planning	II.2.d; III.3.c.(4); III.3.d.(2).
1.8 Self-Inspection, Drills/Exercises, and Response Training:	
1.8.1 Facility Self-Inspection	III.3.e.(6).
1.8.2 Facility Drills/Exercises	III.5.
1.8.3 Response Training	III.5.
1.9 Diagrams	I.4; III.1.a–c.
1.10 Security	III.3.e.(2).
2.0 Response Plan Cover Sheet	I.4.b; I.4.c; I.4.h; III.1.
USCG FRP (33 CFR part 154)	
154.1026 Qualified individual and alternate qualified individual	II.2.a; III.3.b.(1).
154.1028 Availability of response resources by contract or other approved means	III.3.f or III.8; III.3.f.(5).
154.1029 Worst case discharge	III.3.d.(1).
154.1030 General response plan contents:.	
(a) The plan must be written in English.	
(b) Organization of the plan [13]	I.2.
(c) Required contents.	
(d) Sections submitted to COTP.	
(e) Cross-references	III.8.
(f) Consistency with NCP and ACPs	III.3.d.(3).
154.1035 Significant and substantial harm facilities:	
(a) Introduction and plan content	III.1.
(1) Facility's name, physical and mailing address, county, telephone, and fax	I.4.a; I.4.c–d; I.4.h–i
(2) Description of a facility's location in a manner that could aid in locating the facility	I.4.c.
(3) Name, address, and procedures for contacting the owner/operator on 24-hour basis.	I.4.b; II.2.a
(4) Table of contents	I.2.
(5) Cross index, if appropriate	III.8.
(6) Record of change(s) to record information on plan updates	I.3; III.6.
(b) Emergency Response Action Plan:	
(1) Notification procedures:	
(i) Prioritized list identifying person(s), including name, telephone number, and role in plan, to be notified in event of threat or actual discharge.	II.2.a; III.2.a–c.
(ii) Information to be provided in initial and follow-up notifications to federal, state, and local agencies.	III.3.b; III.2.a–c.
(2) Facility's spill mitigation procedures [14]	II.2.d.(2); III.3.c.(2).
(i) Volume(s) of persistent and non-persistent oil groups.	
(ii) Prioritized procedures/task delegation to mitigate or prevent a potential or actual discharge or emergencies involving certain equipment/scenarios.	II.2.
(iii) List of equipment and responsibilities of facility personnel to mitigate an average most probable discharge.	II.2.e–f; III.3.f.(3); III.3.c.(1)–(5).
(3) Facility response activities [15]	II.2.c; II.2.e–f; II.3; II.4; III.3.c.(3).
(i) Description of facility personnel's responsibilities to initiate/supervise response until arrival of qualified individual.	II.1; II.2.
(ii) Qualified individual's responsibilities/authority	II.2.
(iii) Facility or corporate organizational structure used to manage response actions	II.2.b; II.3; III.3.a; III.3.b.(2)–(4); III.3.c; III.3.d.(1); III.3.e–f.
(iv) Oil spill response organization(s)/spill management team available by contract or other approved means.	II.2.d.(3); III.3.c.(4)–(5); III.3.e.(6); III.3.f.(1)–(2); III.3.f.(5).
(v) For mobile facilities that operate in more than one COTP, the oil spill response organization(s)/spill management team in the applicable geographic-specific appendix.	II.2.d.(3).
(4) Fish and wildlife sensitive environments	III.1.c; III.3.d.(1)–(2).
(i) Areas of economic importance and environmental sensitivity as identified in the ACP that are potentially impacted by a WCD.	II.2.c.
(ii) List areas and provide maps/charts and describe response actions.	
(iii) Equipment and personnel necessary to protect identified areas	II.2.e–f; III.3.f.(3); III.3.c.(1)–(5).
(5) Disposal plan	III.3.d.(4).
(c) Training and exercises	III.5.
(d) Plan review and update procedures	III.6.
(e) Appendices	I.4.c; III.1.b.
(1) Facility specific information	III.1.
(2) List of contacts	II.2.a; III.2.a–c; III.3.b.(1).
(3) Equipment lists and records	III.3.e.(3); III.3.e.(6); III.3.f.(1); III.3.f.(3)–(5).
(4) Communications plan	III.3.b.(2).
(5) Site-specific safety and health plan	III.3.b.(3); III.3.c.(7); III.3.e. (1).

OSHA Emergency Action Plans (29 CFR 1910.38(a)) and Process Safety (29 CFR 1910.119)	
1910.38(a) Emergency action plan:	
(1) Scope and applicability	III.3.c.(1); III.3.d.
(2) Elements:	
(i) Emergency escape procedures and emergency escape route assignments	II.2; II.2.c; III.3.b.(3); III.3.c.
(ii) Procedures to be followed by employees who remain to operate critical plant operations before they evacuate.	II.2; II.2.c; II.2.e; III.3.c.
(iii) Procedures to account for all employees after emergency evacuation has been completed.	II.2.a; III.3.b.(2); III.3.b.(3); III.3.c; III.4.
(iv) Rescue and medical duties for those employees who are to perform them	III.3.b.(3); III.3.c; III.3.c.(7); III.3.e.(1).
(v) The preferred means of reporting fires and other emergencies	II.2.a; III.3.b.
(vi) Names or regular job titles of persons or departments who can be contacted for further information or explanation of duties under the plan.	I.4.f; II.2.a; III.3.b.(2); III.3.b.(4).
(3) Alarm system[16]	II.2.a; III.3.c.(3); III.3.e.(3).
(4) Evacuation	II.2.d; III.3.b.(3); III.3.c.(3); III.3.d; III.3.d.(1).
(5) Training	III.3.e.(5); III.5.
1910.119 Process safety management of highly hazardous chemicals:	
(e)(3)(ii) Investigation of previous incidents	III.4; III.4.b.
(e)(3)(iii) Process hazard analysis requirements	III.3.e.(3).
(g)(1)(i) Employee training in process/operating procedures	III.5.
(j)(4) Inspection/testing of process equipment	III.3.e.(6).
(j)(5) Equipment repair	III.3.e.(6).
(l) Management of change(s)	III.5.
(m) Incident investigation	III.4.a.

(n) Emergency planning and response	I.1; II.1; II.2; II.2.d; III.2; III.2.a; III.2.b.
(o)(1) Certification of compliance	III.6.
1910.165 Employee alarm systems:	
(b) General requirements	III.3.e.(3).
(b)(1) Purpose of alarm system	III.2; III.2.a.
(b)(4) Preferred means of reporting emergencies	III.2.
(d) Maintenance and testing	III.3.e.(6).
1910.272 Grain handling facilities:	
(d) Development/implementation of emergency action plan	I.1; III.2.
OSHA HAZWOPER (29 CFR 1910.120)	
1910.120(k) Decontamination	III.3.c.(6).
1910.120(l) Emergency response program	I.1.
(1) Emergency response plan:	
(i) An emergency response plan shall be developed and implemented by all employers within the scope of this section to handle anticipated emergencies prior to the commencement of hazardous waste operations.	
(ii) Employers who will evacuate their employees from the workplace when an emergency occurs, and who do not permit any of their employees to assist in handling the emergency, are exempt from the requirements of this paragraph if they provide an emergency action plan complying with section 1910.38(a) of this part.	
(2) Elements of an emergency response plan:	
(i) Pre-emergency planning and coordination with outside parties	I.4.f; II.2.b; II.2.c; III.2.b; III.2.c; III.3.b.(4); III.3.d.
(ii) Personnel roles, lines of authority, and communication	I.4.f; II.2.b; III.2.a; III.2.c; III.3.b.(4); III.3.e.(4).
(iii) Emergency recognition and prevention	II.1; III.7.
(iv) Safe distances and places of refuge	III.3.b.(3); III.3.d.(2).
(v) Site security and control	III.3.d.(2); III.3.e.(2).
(vi) Evacuation routes and procedures	II.2.d; III.3.b.(3)
(vii) Decontamination procedures	III.3.c.(6).
(viii) Emergency medical treatment and response procedures	II.2.d; III.3.c.(7); III.3.e.(1).
(ix) Emergency alerting and response procedures	II.2; II.2.a; II.2.f; II.4; III.2; III.2.a; III.2.b; III.2.c; III.3.d.
(x) Critique of response and follow-up	II.3; III.4; III.4.a; III.6.
(xi) PPE and emergency equipment	III.3.e.(6); III.3.f.(3); III.3.d.(2); III.3.e.(6); III.3.f.(3).
(3) Procedures for handling emergency incidents:	
(i) Additional elements of emergency response plans:	
(A) Site topography, layout, and prevailing weather conditions	III.1.c.
(B) Procedures for reporting incidents to local, state, and federal government agencies.	II.2.a; III.2.
(ii) The emergency response plan shall be a separate section of the Site Safety and Health Plan.	
(iii) The emergency response plan shall be compatible with the disaster, fire, and/or emergency response plans of local, state, and federal agencies.	III.3.e.
(iv) The emergency response plan shall be rehearsed regularly as part of the overall training program for site operations.	III.5.
(v) The site emergency response plan shall be reviewed periodically and, as necessary, be amended to keep it current with new or changing site conditions or information.	
(vi) An employee alarm system shall be installed in accordance with 29 CFR 1910.165 to notify employees of an emergency situation; to stop work activities if necessary; to lower background noise in order to speed communications; and to begin emergency procedures.	
(vii) Based upon the information available at time of the emergency, the employer shall evaluate the incident and the site response capabilities and proceed with the appropriate steps to implement the site emergency response plan.	II.2.c; II.2.d.
1910.120(p)(8) Emergency response program:	I.1
(i) Emergency response plan.	
(ii) Elements of an emergency response plan:	
(A) Pre-emergency planning and coordination with outside parties	I.4.f; II.2.b; II.2.b; III.2.b; III.2.c; III.3.b.(4); III.3.d.
(B) Personnel roles, lines of authority, and communication	I.4.f; II.2.b; III.2.c; III.2.c; III.3.b.(4); III.3.e.(4).
(C) Emergency recognition and prevention	II.1; III.7
(D) Safe distances and places of refuge	III.3.b.(3); III.3.d.(2)
(E) Site security and control	III.3.d.(2); III.3.e.(2)
(F) Evacuation routes and procedures	II.2.d; III.3.b.(3).
(G) Decontamination procedures	III.3.c.(6).
(H) Emergency medical treatment and response procedures	II.2.d; III.3.c.(7); III.3.e.(1).
(I) Emergency alerting and response procedures	II.2; II.2.a; II.2.f; II.4; III.2; III.2.a; III.2.b; III.2.c; III.3.d.

(J) Critique of response and follow-up	II.3; III.4; III.4.a; III.6.
(K) PPE and emergency equipment	III.3.e.(6); III.3.f.(3); III.3.d.(2); III.3.e.(6); III.3.f.(3).
(iii) Training	III.5.
(iv) Procedures for handling emergency incidents:	
(A) Additional elements of emergency response plans:	
(1) Site topography, layout, and prevailing weather conditions	III.1.c; III.3.d.(1).
(2) Procedures for reporting incidents to local, state, and federal government agencies.	II.2.a; III.2.
(B) The emergency response plan shall be compatible and integrated with the disaster, fire and/or emergency response plans of local, state, and federal agencies.	III.3.e.
(C) The emergency response plan shall be rehearsed regularly as part of the overall training program for site operations.	
(D) The site emergency response plan shall be reviewed periodically and, as necessary, be amended to keep it current with new or changing site conditions or information.	
(E) An employee alarm system shall be installed in accordance with 29 CFR 1910.165.	
(F) Based upon the information available at the time of the emergency, the employer shall evaluate the incident and the site response capabilities and proceed with the appropriate steps to implement the site emergency response plan	II.2.d; II.2.e; III.3.d.(1).
1910.120(q) Emergency response to hazardous substance releases:	
(1) Emergency response plan	III.3.1.
(2) Elements of an emergency response plan:	
(i) Pre-emergency planning and coordination with outside parties	I.4.f; II.2.b; II.2.c; III.2.b; III.2.c; III.3.b.(4); III.3.d.
(ii) Personnel roles, lines of authority, training, and communication	I.4.f; II.2.b; III.2.b; III.2.c; III.3.b.(4); III.3.e.(4).
(iii) Emergency recognition and prevention	II.1; III.7.
(iv) Safe distances and places of refuge	III.3.b.(3); III.3.d.(2).
(v) Site security and control	III.3.d.(2); III.3.e.(2).
(vi) Evacuation routes and procedures	II.2.d; III.3.b.(3).
(vii) Decontamination procedures	III.3.c.(6).
(viii) Emergency medical treatment and response procedures	II.2.d; III.3.c.(7); III.3.e.(1).
(ix) Emergency alerting and response procedures	II.2; II.2.a; II.2.f; II.4; III.2; III.2.a; III.2.b; III.2.c; III.3.d.
(x) Critique of response and follow-up	II.3; III.4; III.4.a; III.6.
(xi) PPE and emergency equipment	III.3.e.(6); III.3.f.(3); III.3.d.(2); III.3.e.(6); III.3.f.(3).
(xii) Emergency response plan coordination and integration	III.3.e; III.8.
(3) Procedures for handling emergency response:	
(i) The senior emergency response official responding to an emergency shall become the individual in charge of a site-specific Incident Command System (ICS).	II.2.b; III.3; III.3.a; III.3.b; III.3.b.(1); III.3.b.(2); III.3.e.(3).
(ii) The individual in charge of the ICS shall identify, to the extent possible, all hazardous substances or conditions present and shall address as appropriate site analysis, use of engineering controls, maximum exposure limits, hazardous substance handling procedures, and use of any new technologies.	II.2.c; II.2.d; III.3.c.(3).
(iii) Implementation of appropriate emergency operations and use of PPE	II.2.c; II.2.d; II.2.e; III.3.c; III.3.c.(1); III.3.d.(1); III.3.d.(2).
(iv) Employees engaged in emergency response and exposed to hazardous substances presenting an inhalation hazard or potential inhalation hazard shall wear positive pressure self-contained breathing apparatus while engaged in emergency response.	II.2.d.
(v) The individual in charge of the ICS shall limit the number of emergency response personnel at the emergency site, in those areas of potential or actual exposure to incident or site hazards, to those who are actively performing emergency operations.	III.3.c; III.3.e.(5).
(vi) Backup personnel shall stand by with equipment ready to provide assistance or rescue.	II.2.d; III.3.e.(5).
(vii) The individual in charge of the ICS shall designate a safety official, who is knowledgeable in the operations being implemented at the emergency response site.	II.2.d; III.3.b.(3).
(viii) When activities are judged by the safety official to be an IDLH condition and/or to involve an imminent danger condition, the safety official shall have authority to alter, suspend, or terminate those activities.	III.3.b.(3).
(ix) After emergency operations have terminated, the individual in charge of the ICS shall implement appropriate decontamination procedures.	III.3.c.(6).

68.95(a) Elements of an emergency response program:	
(1) Elements of an emergency response plan:	
(i) Procedures for informing the public and emergency response agencies about accidental releases.	II.2.a; III.2.
(ii) Documentation of proper first-aid and emergency medical treatment necessary to treat accidental human exposures.	III.3.c.(7); III.3.e.(1).
(iii) Procedures and measures for emergency response after an accidental release of a regulated substance.	II.1; II.2; II.3; II.4; III.3.a–c.
(2) Procedures for the use of emergency response equipment and for its inspection, testing, and maintenance.	III.3.e.(6).
(3) Training for all employees in relevant procedures	III.5.
(4) Procedures to review and update the emergency response plan	III.6.
68.95(b) Compliance with other federal contingency plan regulations.	
68.95(c) Coordination with the community emergency response plan.	

Notes to Attachment 3

[1] Facilities should be aware that most states have been authorized by EPA to implement RCRA contingency planning requirements in place of the federal requirements listed. Thus, in many cases state requirements may not track this matrix. Facilities must coordinate with their respective states to ensure an ICP complies with state RCRA requirements.

[2] Facilities should be aware that most states have been authorized by EPA to implement RCRA contingency planning requirements in place of the federal requirements listed. Thus, in many cases state requirements may not track this matrix. Facilities must coordinate with their respective states to ensure an ICP complies with state RCRA requirements.

[3] Facilities should be aware that most states have been authorized by EPA to implement RCRA contingency planning requirements in place of the federal requirements listed. Thus, in many cases state requirements may not track this matrix. Facilities must coordinate with their respective states to ensure an ICP complies with state RCRA requirements.

[4] Section 264.56 is incorporated by reference at § 264.52(a).

[5] Incorporates by reference § 264.37.

[6] Section 265.56 is incorporated by reference at § 265.52(a).

[7] Incorporates by reference § 265.37.

[8] Section 279.52(b)(6) is incorporated by reference at § 279.52(b)(2)(i).

[9] Incorporates by reference § 279.52(a)(6).

[10] Non-response planning parts of this regulation (e.g., prevention provisions) require a specified format.

[11] If a facility is required to develop a strong oil spill contingency plan under this section, the requirement can be met through the ICP.

[12] The appendix further describes the required elements in 120.20(h). It contains regulatory requirements as well as recommendations.

[13] Specific plan requirements for sections listed under 154.1030(b) are contained in 154.1035(a)–(g).

[14] Note: Sections 154.1045 and 154.1047 contain requirements specific to facilities that handle, store, or transport Group I–IV oils and Group V oils, respectively.

[15] Ibid.

[16] Section 1910.38(a)(3) incorporates 29 CFR 1910.165 by reference.

Hazardous Materials
Planning Curriculum Guidelines

About the Planning Guidelines

The Planning Curriculum Guidelines are intended to assist public sector training managers and employers to understand the requirements for training public sector personnel involved in planning for hazardous materials emergencies. Existing regulatory requirements are defined, and training recommendations are offered to help public sector training mangers improve the quality and effectiveness of hazardous materials planning.

The Planning Curriculum Guidelines are organized into 14 sections. The first section addresses general planning training issues and includes:

- What is a plan?
- Requirements for hazardous materials planning.
- The planning process.
- The need to train.
- The scope of the planning Curriculum

The second through eleventh sections address training objectives that should be achieved by public sector employees performing various hazardous materials planning functions. The competency areas are:

- Planning Orientation
- Planning Essentials
- Planning Specialties
  - Commodity Flow Study
  - Hazard Analysis
  - Capability Assessment
  - Planning for Protective Actions
  - Plan Implementation and Maintenance
  - Facility Planning
  - Planning for Public Education

The final 3 sections are appendices provided a reference in using the *Guidelines,* and include:

- Appendix A: Planning Guide Summaries
- Appendix B: Planning Models
- Appendix C: National Response Team's Integrated Contingency Plan Guidance

Directions on the use of this material to assess and to support overall planning of training programs are provided in Hazardous Materials Training Program Management at the end of this document.

Hazardous Materials
Planning Curriculum Guidelines:

Planning
Training Issues

What is a Plan?

According to the Federal Emergency Management Agency (FEMA), an emergency operations plan (EOP) is a document that:

- Assigns responsibility to organizations and individuals for carrying out specific actions at projected times and locations in an emergency.
- Sets forth lines of authority and organizational relationships, and shows how all actions will be coordinated.
- Describes how people and property will be protected in emergencies and disasters.
- Identifies personnel, equipment, facilities, supplies, and other resources available for use during response and recovery operations.
- Identifies steps to address mitigation concerns during response and recovery activities.

The fundamental logic that underlies the development of emergency plans is that these and related decisions must be addressed before an incident occurs. During an emergency, no time exists to resolve such issues or to practice and refine roles and responsibilities. The complex analysis and preparation required to establish an effective emergency operations capability must be completed in advance so that public officials and response personnel can act quickly and decisively to control dangerous situations and protect the public.

Given this rationale, an emergency plan must be more than just a document. To be effective, all personnel who will participate in a hazardous materials emergency response must know their roles and responsibilities and be competent in the tasks they will perform. This goal is greatly enhanced by participation of tasked organizations in an integrated planning process, including exercising the plan and periodically revising the plan as needed.

The elements covered in a hazardous materials plan and the approach to planning will vary, depending on the jurisdiction's or facility's unique needs. However, all plans should contain: (1) an analysis of the emergencies likely to occur; (2) an assessment of available resources and existing capabilities; (3) detailed response operations strategies and assignments that address notification, command and control, life safety, and other functional requirements; and (4) identification of prevention measures that can mitigate the seriousness of an emergency or prevent it from occurring. The level of detail captured in the plan will also vary, but must be adequate to allow tasked organizations and individuals to develop comprehensive SOPs in their assigned areas.

Requirements for Hazardous Materials Planning

The responsibility to plan for and, if possible, prevent hazardous materials emergencies is a fundamental extension of the civic responsibility of state and local organizations to ensure the safety of responders and to protect the public. Congress recognizes this government responsibility for emergency management in the Robert T. Stafford Disaster Relief and Emergency Assistance Act, as amended. Hazardous materials emergency planning is also required under a number of other federal laws and regulations.

The Emergency Planning and Community Right-to-Know Act (EPCRA)
Title III of Superfund Amendments and Reauthorization Act of 1986 (SARA)

EPCRA and Title III of SARA require the formation of state emergency response commissions (SERCs), tribal emergency response commissions (TERCs), emergency planning districts, and local emergency planning committees (LEPCs). Each LEPC must develop, exercise, and maintain an emergency plan that identifies: (1) facilities and transportation routes related to specific chemicals; (2) response procedures of facilities and local emergency and medical personnel; (3) names of community and facility emergency coordinators; (4) procedures for notifying officials and the public in the event of a hazardous material release; (5) methods for detecting a release and identifying areas and populations at risk; and (6) schedules for exercising the emergency plan.

OSHA 29 CFR Part 1910.120
The Occupational Safety and Health Administration (OSHA) regulations (29 CFR Part 1910.120) require employers involved in hazardous waste operations to develop and implement an emergency response plan for employees. The elements of this plan must include: (1) recognition of emergencies; (2) methods and procedures for alerting employees; (3) evacuation procedures and routes; (4) means and methods for emergency medical treatment; (5) lines of authority; (6) on-site decontamination procedures; (7) site control means; and (8) methods for evaluating the plan.

Resource Conservation and Recovery Act (RCRA)
Under subtitle C of RCRA, the Environmental Protection Agency (EPA) implements standards for the treatment, storage, and disposal of hazardous wastes through permits issued by EPA or an authorized state. Permit requirements include a facility contingency plan, with required opportunities for local government and public comment and input into the plan development.

FEMA Emergency Operations Plan Requirements
Planning requirements for jurisdictions receiving FEMA funds are set forth in 44 CFR Part 302, effective May 12, 1986. This regulation requires states and local governments to prepare emergency operations plan (EOPs) that: (1) identify available personnel, equipment, facilities, supplies, and other resources in the jurisdiction; and (2) describe the method or scheme for coordinating actions taken by individuals and government services in the event of emergencies, including those involving hazardous materials.

Coordination with Federal Response
State and local hazardous materials emergency preparedness should include plans for coordination with and support for federal response to emergencies. The National Contingency Plan (NCP) is coordinated by the National Response Team under section 105 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). The NCP provides for federal support to local responders during hazardous materials transportation and fixed facility incidents. The Federal Response Plan (FRP), coordinated by FEMA, describes resources and support for state and local governments during natural and man-made disasters, including major hazardous materials emergencies.

Other Facility Planning Requirements
Facilities that store, handle, or transport certain types and quantities of hazardous materials may be subject to additional federal contingency planning regulations. In this context, the term “facility” is meant to have a wide connotation, and may include, but is not limited to, any mobile or fixed onshore or offshore building, structure, installation, equipment, pipe, or pipeline. A particular facility may be subject to one or more of the following federal regulations:

- EPA’s Oil Pollution Prevention Regulation (SPCC and Facility Response Plan Requirements)— 40 CFR part 112.7(d) and 112.20 to 112.21
- MMS’s Facility Response Plan Regulation—30 CFR part 254
- RSPA’s Pipeline Response Plan Regulation—49 CFR part 194
- USCG’s Facility Response Plan Regulation—33 CFR part 154, subpart F
- EPA’s Risk Management Programs Regulation—40 CFR part 68
- OSHA’s Emergency Action Plan Regulation—29 CFR 1910.38(a)
- OSHA’s Process Safety Standard—29 CFR 1910.119
- EPA’s Resource Conservation and Recovery Act Contingency Planning Requirements—40 CFR part 264, subpart D, 40 CFR part 265, subpart D, and 40 CFR part 279.52

In addition, states and local jurisdictions may mandate regulatory requirements and procedures that must be considered in hazardous materials planning. Local governments and facilities are encouraged to coordinate the development of hazardous materials plans with relevant state and local agencies to ensure compliance with any additional regulatory requirements.

General Training Issues

The Planning Process

There is no single correct way to write a hazardous materials emergency plan. Each entity must plan according to its own situation, based on such factors as geographic size, types of hazards, populations at risk, resources, and level of preparedness. Jurisdictions and facilities should choose the planning elements and processes most appropriate to their circumstances. However, every community and industry needs to evaluate its preparedness for hazardous materials incidents and plan accordingly.

Various explanations of the planning process can be found in the literature, including those described in the *Guide for All-Hazard Emergency Operations Planning* (FEMA SLG 101), *Hazardous Materials Emergency Planning Guide* (NRT-1), *Technical Guidance for Hazards Analysis* (EPA/FEMA/DOT), *Handbook of Chemical Hazard Analysis Procedures* (FEMA/DOT/EPA), and *Emergency Management Guide for Business & Industry* (FEMA 141). These documents and approaches to planning, which are briefly described in Appendices A and B, incorporate the generic functional requirements of planning, although the steps and procedures may be defined somewhat differently. Jurisdictions and facilities should review these and/or other models to select a process that best meets their unique planning needs and preferences.

Whatever model is adopted for the planning process, a team approach is strongly recommended. A planning team is the best mechanism for incorporating the various types of expertise needed in planning, building consensus among organizations and individuals affected by the plan, and promoting professional relationships and understanding among responders. Team members can also help ensure that plans are adequately implemented, evaluated, and maintained after promulgation, and that personnel are given the training and tools they need to achieve competency in their assigned roles and responsibilities.

No specific format is mandated for the results of hazardous materials planning. SLG 101 discusses format options for all-hazard and hazard-specific community plans. NRT's *Integrated Contingency Plan Guidance* (see Appendix C) describes an approved format for consolidating multiple plans that facilities may have to prepare in compliance with various federal regulations. However, a format is "good" if users understand it, are comfortable with it, and can extract the information they need. FEMA recommends that planning teams consider the following design characteristics when deciding upon a format: organization, progression, consistency, adaptability, and compatibility.

The approach taken in these *Guidelines* identifies two fundamental planning products, both of which are derived from a common hazards analysis and capability assessment base: (1) an emergency operations plan that addresses preparedness for, response to, and short-term recovery from hazardous materials incidents; and (2) a prevention/mitigation section of the plan that addresses measures designed to eliminate or reduce the effects of potential emergencies (e.g., land use planning, building codes, inspections, equipment testing, release detection, site security, containment, and fail safe engineering). Note that community development planning, long-term recovery, and organizational administrative planning (financial management, personnel management, record keeping, labor relations, etc.) are outside the intended scope of the *Guidelines*.

The Need to Train

The skill and training of individual responders is only one aspect of safe and effective emergency operations. Hazardous materials incidents are complex and involve the coordinated and timely actions of many different persons, often under stressful conditions. The quality of this coordination—based on clearly defined lines of authority, adequate communication systems, availability of resources when needed, etc.—may play a more important role than individual responder training in minimizing injuries and maximizing control of the emergency.

In hazardous materials emergencies, the importance of pre-response planning cannot be overstated. Plans provide a mechanism for evaluating operational strategies, defining roles and procedures, communicating organizational assignments, and assessing the adequacy of responder training. The integrated team planning process fosters trust and cooperation among individuals and organizations that must work together during an incident. Planning also leads to effective mitigation and prevention measures, thus providing communities and facilities with an opportunity to eliminate or reduce the costly and tragic effects of hazardous materials incidents before they occur.

Effective response and prevention planning depends upon the ability of the people who do the work. The quality of hazard analyses and capability assessments, and the effectiveness of response and prevention plans, is directly related to the competency of the personnel assigned responsibility for performing related tasks—public and private sector officials, agency and program managers, planners, technical experts, and many others.

OSHA's regulation 29 CFR 1910.120(q) requires that all employees be properly trained to perform their roles in response to hazardous materials emergencies. Employers are not now federally required to train personnel involved in planning. However, federal guidelines strongly recommend that all personnel who participate in the hazardous materials planning process at the state and local levels be trained to full competency to perform their roles.

The Scope of the Planning Curriculum

The *Hazardous Materials Planning Curriculum* addresses training needed by persons who have a defined role in the development, implementation, evaluation, and maintenance of hazardous materials emergency plans and standard operating procedures (SOPs). These critical documents must be prepared by state governments, local communities/jurisdictions, community support services organizations (hospitals, schools, mass care, business/industry, etc.), public sector agencies, and private sector facilities that store, use, or transport significant quantities of hazardous materials.

Training requirements for the curriculum span a tremendous variety of functions, skills, and audiences. In the public sector, functional responsibilities include directing and controlling the planning process, collecting data and managing information, identifying hazards, analyzing related vulnerabilities, estimating risk, assessing capabilities, serving as operational experts in writing plans and SOPs, implementing and integrating the results with other planning efforts, designing and evaluating complex exercises, and updating the plan on a regular basis. Individuals performing this work include community officials, SERC and LEPC members, agency and program managers, emergency managers, fire service workers, police, emergency medical services personnel, public works officials, community services and volunteer organization representatives, consultants and technical experts, and many others.

In the private sector, similar roles and functions must be performed. In addition, facilities that meet certain criteria must also conduct technically sophisticated analyses for chemicals they store, handle, or transport; develop production/process safety management plans and employee safety plans; and comply with employee and community right-to-know requirements and other reporting mandates. Potential training audiences include industry owners and executives, business planners, production/process managers, functional managers (e.g., communications, public information, emergency response, etc.), safety officers, technical experts, and others employed by the facility. Local government personnel who have responsibilities for reviewing and approving facility plans and/or enforcing compliance with existing regulations and standards may also benefit by training in this area.

This diversity of audiences and roles presents a special challenge for hazardous materials training management. Access to training audiences is more complex because the interdisciplinary nature of the audience suggests a broad range of possible training delivery mechanisms. Audience members may have limited time available for training in planning since this role is often viewed as an ancillary duty to primary work responsibilities. Finally, hazardous materials training resources may be limited, necessitating an emphasis on response training, with planning and prevention receiving a lower organizational priority.

General Training Issues

Organization of the Planning Curriculum Guidelines

The goal of the *Hazardous Materials Planning Curriculum* is to enhance the knowledge, skills, and attitudes of a broad spectrum of state and local training audiences, thus promoting better hazardous materials planning by jurisdictions and facilities. The curriculum is organized into three training levels based on general skill requirements of the target audience: Planning Orientation, Planning Essentials, and Planning Specialties. These areas are briefly described below; more detailed information on each is presented in subsequent sections of the *Guidelines*.

Planning Orientation

The Planning Orientation curriculum area provides an introduction to hazardous materials planning, with an emphasis on the need for effective plans and the benefits to be derived. Instruction is designed to help individual students identify their roles and responsibilities in the planning process, and motivate them to participate fully and effectively as planning team members. Desired training competencies include an awareness level understanding of general hazardous materials planning concepts, processes, and legal requirements. No prerequisite knowledge of planning and emergency management concepts is assumed, and no skill development is attempted. Training should result in a positive attitudinal change and a general understanding of the planning function.

Planning Essentials

The Planning Essentials curriculum area provides participants with the knowledge and skills they need to develop a basic integrated hazardous materials emergency plan for a jurisdiction or facility. The primary training audience is local planning team members. Training objectives cover a broad range of general competencies, including the ability to function effectively in a team environment, assist in or conduct a basic hazards analysis and capability assessment, work with others to analyze options and draft sections of the plan, and participate in plan implementation, evaluation, and maintenance.

Planning Essentials addresses basic skills, with an emphasis on the student's ability to interpret and use information provided by various technical specialists in developing the plan. More advanced planning skills are covered in the Planning Specialties curriculum area, discussed below. Audience members are assumed to already possess training competencies covered in Planning Orientation and an expertise in the professional discipline that the student represents on the planning committee. Managerial, administrative, and logistic requirements for organizing the planning process, including staff recruitment and assignments, are not addressed.

Planning Specialties

Recognizing that many skills are needed to support the planning process above those involved in basic plan development, the Planning Specialties curriculum area has been organized to articulate additional, often more advanced learning competencies. State and local planning needs and training requirements will vary considerably in these specialty areas. Hence, the curriculum supports selective focused training by jurisdictions and facilities in only those specialty skill areas where training is needed at any given time.

The list of specialty areas included in the curriculum is intended to reflect the prevailing needs of state and local training organizations. It is anticipated that more specialty areas will be defined over time, and some may be eliminated or modified as needs change. Specialty skill training areas identified for the current edition of the *Guidelines* include the following:

- Commodity Flow Study
- Hazards Analysis
- Capability Assessment

- Planning for Protective Actions
- Plan Implementation and Maintenance
- Facility Planning
- Planning for Public Education

Content of the Guidelines

The following sections of the *Guidelines* identify training requirements for each major curriculum area: Planning Orientation, Planning Essentials, and Planning Specialties. These requirements are defined primarily in the form of terminal and enabling objectives that describe basic competencies needed by audience members to successfully perform related tasks. Narrative information describing the curriculum area, target audiences, subject matter content, and recommended training methodologies is included, as appropriate.

The training requirements described in this model support the tasks needed to produce comprehensive OSHA and SARA Title III plans and facility plans. They reflect the general planning philosophies and team approaches incorporated in FEMA and NRT guidance. As noted previously, the training requirements address a variety of audiences and needs. A challenge for state and local training managers will be to match the unique roles and responsibilities of personnel in their jurisdictions with the categories used in this model, or to tailor the model to meet their specific needs. Assistance in this general process will be addressed in the *Guidelines for Training Program Management* section of subsequent editions of this manual.

Hazardous Materials
Planning Training Guidelines

Planning Orientation

General Training Considerations

Introduction

The Planning Orientation curriculum area provides an introduction to hazardous materials planning, with an emphasis on the need for planning and the benefits to be derived. Instruction should to help individual students identify their roles and responsibilities in the planning process, and motivate them to participate fully and effectively as planning team members. Desired training competencies include an awareness level understanding of general hazardous materials planning concepts, processes, and legal requirements. No previous knowledge is assumed, and no skill development should be attempted. Training should result in a positive attitudinal change and the achievement of a general understanding of the planning function.

Audience

The primary training audience for Planning Orientation includes all potential participants in the hazardous materials planning process from jurisdictions, government and response agencies, community services organizations, private sector facilities and transporters, and other businesses and industries. Specifically included are elected and appointed officials, CEOs, program mangers, and others who are able to influence jurisdictional and organizational planning priorities and resources. In addition, training is encouraged for the broad spectrum of persons who have a "stake" in planning, i.e., they may be impacted by the results of planning, although they have no defined role in the actual development of emergency plans. Thus, audience members might include:

- Jurisdiction and facility planning team members
- LEPC and SERC members
- Local and state government officials, including elected and appointed
- Facility owners and managers
- Representatives of government and response agencies, including SOP writers
- Representatives of community support services and volunteer organizations
- Emergency responders and mitigation/prevention personnel
- Citizens in the impacted planning jurisdiction
- Special interest and advocacy groups
- Emergency program managers

Methodology Recommendations

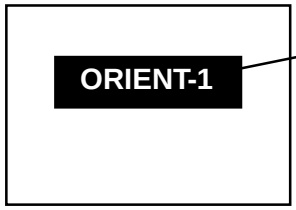
The typical training delivery format for Planning Orientation is a brief (one to four hours) presentation or seminar led by an experienced and dynamic facilitator. Whenever possible, the audience should include representatives from a broad range of organizations and disciplines, thereby promoting a heightened understanding of the diverse interests and requirements associated with hazardous materials planning. Since training should motivate and encourage attitudinal change, the use of presentation graphics and instructional media (slides, videotapes, etc.) is particularly appropriate. Other considerations include:

- Training must be tailored to audience needs, recognizing that some students may have no understanding of emergency management or the challenges associated with interdepartmental planning and coordination.
- When possible, training should permit group interactions and foster initial team building.
- Training experiences should be practical and constructive to promote positive attitudinal change. The discussion of hazardous materials threats, which is important to focus attention and clarify program need, should emphasize positive solutions through community and industrial planning and cooperation.
- Course materials should include local examples and issues to help generate interest and participation in local planning processes.
- Recruitment of students may be an issue due to lack of preexisting interest in the subject. "Teaser" programs and strategies to peak community interest and enrollment may be appropriate.

Recommended Training

Planning Orientation

The following instructional objectives describe student competencies recommended for orienting planning team members and others to the subject of hazardous materials planning. The legislative and regulatory basis for this training can be found primarily in the requirements specified in OSHA 1910.120 for development of employers' emergency response plan, SARA Title III for development of planning jurisdiction emergency response plans, and various federal agency regulations for development of facility and transporter emergency response plans. Sources for the material include the planning guidance in FEMA SLG 101, NRT-1, and other reference documents, the most important of which are described in the Appendices. The objectives are designed to be comprehensive, i.e., to address the training requirements of all identified audience members; thus, training developers and instructors will need to tailor these objectives to meet local audience interests, needs, and planning processes.



Objective Identification Legend

This is the identification of the objective used in this document. It matches the identification code used in course assessment references. (See the Training Program Management section of this document.) Decimal numbers (such as ORIENT-1.1) indicate enabling objectives supporting the primary objective.

Identification	***Recommended** Training Objectives*
ORIENT-1	Given a description of potential hazardous materials risks, explain the purpose and benefits of integrated hazardous materials emergency planning, and describe typical roles and participants in the emergency management system.
ORIENT-1.1	Describe the nature of the hazardous materials threat and associated risks for the government, industry, and community, including the relationship between natural and technological hazards.
ORIENT-1.2	Describe the purpose and benefits of a comprehensive and integrated approach to hazardous materials planning, including the relationships among plans, SOPs, and exercises.
ORIENT-1.3	Describe the roles and general responsibilities of federal, state, and local government agencies and private sector organizations in integrated hazardous materials preparedness, response, recovery, and mitigation/prevention.
ORIENT-2	Given a jurisdiction or facility with the need to develop an integrated hazardous materials plan, identify legal requirements impacting the planning process and product.

Recommended Training

ORIENT-2.1 Identify hazardous materials planning requirements for state and local jurisdictions contained in the following authorities:

- Robert T. Stafford Disaster Relief and Emergency Assistance Act, as amended
- Title III of the Superfund Amendments Reauthorization Act (SARA)
- Hazardous Materials Emergency Planning Guide (NRT-1)
- OSHA 29 CFR 1910.120 and EPA 40 CFR

ORIENT-2.2 List legislation and regulations that affect facility planning requirements, including:

- EPA's Oil Pollution Prevention Regulation (SPCC and Facility Response Plan Requirements)— 40 CFR part 112.7(d) and 112.20 to 112.21
- MMS's Facility Response Plan Regulation—30 CFR part 254
- RSPA's Pipeline Response Plan Regulation—49 CFR part 194
- USCG's Facility Response Plan Regulation—33 CFR part 154, subpart F
- EPA's Risk Management Programs Regulation—40 CFR part 68
- OSHA's Emergency Action Plan Regulation—29 CFR 1910.38(a)
- OSHA's Process Safety Standard—29 CFR 1910.119
- OSHA's HAZWOPER Regulation—29 CFR 1910.120
- EPA's Resource Conservation and Recovery Act Contingency Planning Requirements—40 CFR part 264, subpart D, 40 CFR part 265, subpart D, and 40 CFR part 279.52

ORIENT-2.3 Describe the characteristics and advantages of all-hazard planning and hazard-specific planning.

ORIENT-3 Given the assignment to conduct hazardous materials emergency planning, identify the scope and elements of an integrated hazardous materials emergency plan.

ORIENT-3.1 Define the scope (in terms of types of emergencies and functions to be addressed) of an integrated hazardous materials emergency plan for a jurisdiction or facility.

ORIENT-3.2 Identify the elements of an integrated hazardous materials emergency plan that are necessary to meet local, state, and federal requirements and guidelines.

ORIENT-4 Given the assignment to conduct hazardous materials emergency planning, identify and describe the major steps, participants, and other resources needed in the planning process.

Note: Various explanations of the planning process can be found in the literature, including those described in the Guide for All-Hazard Emergency Operations Planning (FEMA SLG 101), Hazardous Materials Emergency Planning Guide (NRT-1), Technical Guidance for Hazards Analysis (EPA/FEMA/DOT), Handbook of Chemical Hazard Analysis Procedures (FEMA/DOT/EPA), and Emergency Management Guide for Business & Industry (FEMA 141), and NRT's Integrated Contingency Plan Guidance. These approaches to planning, which are briefly described in Appendix B, incorporate the generic functional requirements of planning, although the steps and procedures may be defined somewhat differently. Jurisdictions and facilities should select and/or modify these models to best meet their unique planning needs and preferences.

ORIENT-4.1 Identify and describe the major steps in the planning process to be used.

ORIENT-4.2	Identify participants and other resources needed for the planning process.
ORIENT-5	Given an assignment to participate in or support integrated hazardous materials planning, develop strategies for promoting planning.
ORIENT-5.1	Describe the participant's role, responsibilities, and work requirements in the integrated hazardous materials planning process.
ORIENT-5.2	Identify related information and training needs, available resources, contacts, and possible obstacles or constraints.
ORIENT-5.3	Develop strategies for promoting planning.

Hazardous Materials
Planning Training Guidelines

Planning Essentials

General Training Considerations

Introduction

The Planning Essentials curriculum provides participants with the knowledge and skills they need to develop a basic integrated hazardous materials emergency plan for a jurisdiction or facility. The primary training audience is local planning team members. Training objectives cover a broad range of generic competencies, including the ability to function effectively in a team environment, assist in or conduct a basic hazards analysis and capability assessment, work with others to analyze options and draft sections of the plan, and participate in plan implementation, evaluation, and maintenance.

Planning Essentials covers basic skills, with an emphasis on the ability to interpret and use information provided by various technical specialists in developing the plan. More advanced planning skills are addressed in Planning Specialties. Audience members are assumed to already possess training competencies covered in Planning Orientation and an expertise in the professional discipline that the student represents on the planning committee. It is further assumed that managerial, administrative, and logistic requirements for organizing the planning process, including staff recruitment and assignments, have already been accomplished. The training competencies for senior management of the overall planning process are addressed separately in this guidance as a planning specialty area.

Audience

The training audience for Planning Essentials includes planning team members who have a defined responsibility in researching, preparing, implementing, and maintaining hazardous materials plans for jurisdictions or facilities. These persons generally represent their organization or functional specialty in an integrated planning process. Audience categories can be summarized as follows:

- For communities, training audiences may include local government emergency planners, SERC/LEPC and Area Committee members, hazardous materials officers and team leaders, emergency program managers, public sector agency representatives, community support services and volunteer organization representatives, and various technical specialists.

- For private sector facilities, audience members may include industry owners and executives, general planners, production/process managers, functional managers (e.g., communications, public information, emergency response, etc.), safety officers, technical experts, and others employed by the facility.

- Personnel who have responsibilities for reviewing and approving facility plans and/or enforcing compliance with existing community regulations and standards may also benefit by training.

Methodology Recommendations

It is recognized that the planning needs of different jurisdictions and facilities, and the resulting training needs of planning team members, can vary greatly, depending on such factors as geographic size, demographics, hazards, local resources, and political preferences. However, Planning Essentials is intended to address the generic training requirements of all hazardous materials planners. Training managers, course developers, and instructors may need to tailor materials to meet the unique needs and interests of different audiences, incorporating elements covered in Planning Specialties, as appropriate.

Training can typically be accomplished in two to four days of classroom instruction led by an experienced facilitator. Breaking training into modules (e.g., Hazards Analysis) that are delivered at different times is also possible, and this approach may be beneficial if timed to coincide with planning team assignments. However, team building is very important in the planning process, so continuity of student groupings throughout training is recommended. Other training considerations include the following:

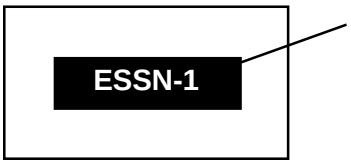
- Training should focus on the actual development of local plans, with the product and participation in the group planning process used to demonstrate student mastery of the objectives.
- Audience should be heterogeneous, reflecting the diverse community members and professional disciplines involved in the planning process. It is highly recommended that team members who will work together in subsequent planning efforts be trained together as a team.
- Course methodology should emphasize group interactions, team building, and resolution of interpersonal conflicts, as well as the development of the plan product itself.
- Course materials should be multi-tracked in terms of type of plan (OSHA, SARA, etc.) to facilitate tailoring the instruction to the needs of the audience.
- Instruction should include practical strategies for merging local plan requirements and needs (i.e. merging several plan requirements into one development effort) to foster more efficient planning efforts.
- Instruction should emphasize the need for on-going planning commitments by the team and the organizations they represent.
- Instruction should emphasize the need for ongoing evaluation at each step in the planning process.
- Instructors should emphasize that steps in the planning process, although taught sequentially, may actually be performed simultaneously.

Recommended Training

Planning Essentials

The following instructional objectives describe competencies recommended for training planning team members and others in the essentials of hazardous materials planning. The legislative and regulatory basis for this training can be found primarily in the requirements specified in OSHA 1910.120 for development of employers' emergency response plan, SARA Title III for development of planning jurisdiction emergency response plans, and various federal agency regulations for the development of facility and transporter emergency response plans. The objectives incorporate generic concepts and processes derived from various sources in the planning literature. Several of the most important reference documents, and more specific models for planning, are described in the Appendices. The objectives are intended to be comprehensive, i.e., to address the training requirements of all identified audience members; thus, training developers and instructors will need to tailor these objectives to meet local audience interests, needs, and planning processes.

Objective Identification Legend



This is the identification of the objective used in this document. It matches the identification code used in course assessment references. (See the Training Program Management section of this document.) Decimal numbers (such as ESSN-1.1) indicate enabling objectives supporting the primary objective.

Identification	***Recommended** Training Objectives*
ESSN-1	Given an assignment as a planning team member and an overview of the planning process to be used, describe an appropriate planning strategy and identify team member responsibilities in the process.

Recommended Training

ESSN-1.1	Describe the benefits of a team approach to planning and identify skills necessary to participate in the team planning process.
ESSN-1.2	Identify team members with related roles, coordination requirements, available resources, and administrative support systems.
ESSN-1.3	Describe roles of participants in the team planning process, to include organizational and/or functional areas of responsibility.
ESSN-1.4	Demonstrate an understanding of the planning process mission statement, goals, and objectives.
ESSN-1.5	Describe the expected results of the planning process, to include the plan format and time lines.
ESSN-2	Given a review of pertinent information sources and data collection methods, demonstrate the ability to identify, acquire and summarize background information related to individual organizational and/or functional area(s) of responsibility that will impact the team planning process.
ESSN-2.1	Demonstrate the ability to identify, gather, and review copies of policies, plans, and authorities (e.g., community Emergency Operations Plans, mitigation/prevention plans, response agency SOPs, facility plans, codes and ordinances, etc.).
ESSN-2.2	Demonstrate the ability to review critiques of actual incidents, exercises, and drills and identify issues to be addressed in the plan.
ESSN-2.3	Demonstrate the ability to review changes and trends impacting the jurisdiction, organization, or facility and identify issues to be addressed in the plan.
ESSN-2.4	Demonstrate the ability to interview managers, public officials, technical specialists, and practitioners in organizations affected by the plan and identify issues to be addressed in the plan.
ESSN-2.5	Identify, aggregate, and summarize related planning issues, priorities, concerns, and challenges.
ESSN-3	Given an assignment as a planning team member and an overview of the planning process to be used, identify and describe the purpose, benefits, major steps, and participant's role in Hazards Analysis & Capability Assessment.

ESSN-3.1	Explain the purpose, benefits, and major steps in conducting a Hazards Analysis.
ESSN-3.2	Explain the purpose, benefits, and major steps in conducting a Capability Assessment.
ESSN-3.3	Identify responsibilities in the Hazards Analysis & Capability Assessment processes, as appropriate.
ESSN-3.4	Describe the methods and expected results of the Hazards Analysis & Capability Assessment processes, including roles of various planning team members and technical specialists.
ESSN-4	Given an assignment as a planning team member and an overview of the planning process to be used, demonstrate the ability to identify, collect, review and interpret the Hazards Analysis & Capability Assessment data.
ESSN-4.1	Demonstrate the ability to collect or assist in collecting the data, as required.
ESSN-4.2	Demonstrate the ability to review and interpret the data.
ESSN-4.3	Demonstrate the ability to identify, map, and prioritize hazards, risk areas, and vulnerable zones, and identify capability shortfalls and excesses (gap analysis).
ESSN-5	Given an assignment as a planning team member and the results of research and input from other planning team members, describe the issues and solutions to be addressed in the plan and identify needed assignments for developing the plan.
ESSN-5.1	Describe issues and solutions to be addressed in the plan by examining existing plans, Hazards Analysis results, Capability Assessment results and other pertinent information.
ESSN-5.2	Identify plan development tasks to be assigned to planning team and other organizational representatives.
ESSN-6	Given identified issues and solutions to be addressed in the plan and assignments to planning team members, demonstrate the ability to participate in developing or updating the Integrated Hazardous Materials Emergency Plan, to address preparedness, response and short term recovery.
ESSN-6.1	Identify the planning elements necessary to comply with regulatory requirements, standards, and guidelines.

Recommended Training

ESSN-6.1.1	If developing or updating a jurisdictional plan, describe format guidelines specified in SLG-101 and NRT-1.
ESSN-6.1.2	If developing or updating a facility or organization plan, describe format guidelines specified in the NRT's Integrated Contingency Plan guidance.
ESSN-6.2	Demonstrate the ability to develop or update the plan to meet the required regulatory elements.
ESSN-7	Given identified issues and solutions to be addressed in the plan and assignments to planning team members, demonstrate the ability to participate in developing or updating a comprehensive prevention/mitigation section in the plan.
ESSN-7.1	Identify prevention/mitigation strategies and techniques to address the identified issues and solutions.
ESSN-7.2	Demonstrate the ability to write the plan to meet all identified prevention/mitigation planning needs.
ESSN-8	Given a completed draft hazardous materials plan, demonstrate the ability to participate in the plan review and appraisal process.
ESSN-8.1	Identify the purpose and benefits of reviewing the plan.
ESSN-8.2	Demonstrate the ability to conduct an internal draft plan review to assess adequacy and completeness.
ESSN-8.3	Demonstrate the ability to facilitate an external review of the draft plan, which may include peer review, management review, community input, and state/federal review.
ESSN-8.4	Demonstrate the ability to make necessary revisions, and promote formal plan promulgation.
ESSN-9	Given a completed hazardous materials plan, describe an appropriate strategy and identify methods for implementing the plan.
ESSN-9.1	Identify the purpose and benefits of conducting plan implementation.

ESSN-9.2	Identify roles and responsibilities for plan implementation, to include available resources, administrative systems, and time lines.
ESSN-9.3	Describe the strategy and methods for plan implementation, to include: · Disseminating copies of the plan · Briefing and orienting users of the plan · Coordinating the plan with other planning efforts · Coordinating the plan with other training efforts
ESSN-10	Given a completed hazardous materials plan, describe an appropriate strategy and identify methods for evaluating and maintaining the plan.
ESSN-10.1	Identify the purpose and benefits of conducting plan evaluation and maintenance.
ESSN-10.2	Identify roles and responsibilities for plan evaluation and maintenance.
ESSN-10.3	Describe the strategy and methods for plan evaluation and maintenance, to include: · Monitoring changes, trends, and actual events impacting the plan · Developing, conducting, and evaluating exercises and drills · Periodically updating and revising the plan

Hazardous Materials
Planning Curriculum Guidelines:

Planning Specialties Introduction

Introduction

Introduction

Recognizing that many skills are needed to support the planning process beyond those involved in basic plan development, the Planning Specialties curriculum has been organized to articulate additional, often more advanced learning competencies. It is anticipated that state and local planning needs and training requirements will vary considerably in these specialty areas. Hence, the curriculum supports selective focused training by jurisdictions in only those specialty skill areas where training is needed at any given time.

The list of specialty areas included in the curriculum is intended to reflect the prevailing needs of state and local training organizations. It is anticipated that more specialty areas will be defined over time, and some may be eliminated or modified as needs change. Specialty skill training areas identified for the current edition of the *Guidelines* include the following:

- Commodity Flow Study
- Hazards Analysis
- Capability Assessment
- Planning for Protective Actions
- Plan Implementation and Maintenance
- Facility Planning
- Planning for Public Education

Other topics planned or under discussion include Organizing the Planning Process, Planning Information Management, Exercising the Plan, SOP Writing, Illicit Use of Hazardous Materials, Liability Issues in Hazardous Materials, Marketing the Plan, and Public Information/Education Programs. Recommendations or feedback on the selection of topic areas for inclusion in future editions of the *Guidelines* should be directed to William Lewis, Emergency Management Institute, FEMA.

Audience:

The training audience for the Planning Specialties curriculum includes jurisdiction and/or facility hazardous materials planning team members that have been assigned responsibilities requiring advanced level knowledge and skills, i.e., exceeding that needed to develop a basic plan as defined in Planning Essentials. Included are representatives of local government and response agencies, community services organizations, private sector facilities and transporters, and other businesses and industries. Since audience members will vary somewhat according to the topic, they are defined in more detail for each specialty area. However, a generic listing might include:

- Jurisdiction and facility planning team members
- LEPC and SERC members
- Facility owners and managers
- Representatives of government and response agencies
- Representatives of community support services and volunteer organizations
- Mitigation/prevention personnel
- Consultants and technical experts
- Emergency program managers

Methodology Recommendations

The typical training delivery format for Planning Specialties is a one to two day course led by an experienced instructor. However, more or less time may be appropriate, depending on the subject area, degree of complexity, and related planning requirements. Training managers may also wish to combine Planning Specialties modules for audiences that need training in more than one area, or add one or more modules to Planning Essentials. Other training considerations include the following:

- Audience members are assumed to already possess basic competencies in hazardous materials plan development. Otherwise, experience and expertise among audience members may vary significantly.
- Training should be tailored to audience needs, focusing on the specific jurisdiction's or facility's planning requirements and individual assignments in the planning process.
- Course materials should include local examples, and activities should be based on local issues and data to the extent possible.
- Where local teams are conducting complex studies, members should be trained concurrently, and training should permit group interactions and foster team building.

More information on training scope, audiences, and appropriate methodologies is presented on subsequent pages for each specialty topic area.

Hazardous Materials
Planning Curriculum Guidelines:

Commodity Flow Study

General Training Considerations

Scope/Objectives of Training

Most communities, whether large or small, are origins, destinations, or through-routes for hazardous materials transportation. In order to plan and prepare for possible hazardous materials incidents, planners need basic data on the types and quantities of chemicals transported through the jurisdiction. The process of acquiring and analyzing this information, referred to here as a commodity flow study, is one of the first steps in preparing a community's integrated hazardous materials emergency plan. Results can be used to analyze current traffic patterns, focus planning efforts on existing needs, and reduce the potential for incidents to occur.

This training specialty area builds on Planning Essentials competencies to provide participants with the knowledge and skills they need to prepare a simple commodity flow study. Content areas covered by training should include the purpose and benefits of conducting commodity flow studies, an overview of appropriate data collection methods, generic steps in the process, related statistical concepts, and sources of additional assistance and information. Where appropriate, more specific models and procedures followed by the jurisdiction can be introduced. Applications and limitations of the study results in the planning process should also be reviewed.

Audience

Potential training audiences include all participants in the planing process that have been assigned responsibility for conducting a commodity flow study that exceeds the competencies covered under Planning Essentials. Possible audience members include:

- • Community planning team members
- Facility planners and managers
- Response agency representatives
- Prevention personnel, transport inspectors
- Technical experts and consultants

Prerequisites or Presumed Prior Knowledge/Skills of Students

Students are assumed to possess Planning Orientation and Planning Essentials levels of competency in hazards analysis and related skills. Consideration should be given to students that have a defined responsibility for conducting a commodity flow study for a jurisdiction as a regular part of their job.

Typical Program Format

Seminar-type instructor-led program, approximately one to two days in length. Longer programs may be appropriate where more complex commodity flow studies are planned or when actual field surveys are included as training activities.

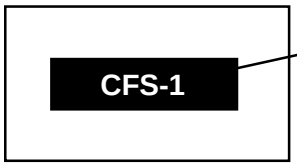
Methodology and Training Delivery Considerations

Training should provide students with knowledge of the steps and components of a generic commodity flow study, and skill in performing various data collection methods. Trainees must understand the significance and application of commodity flow study information, and develop the ability to recognize and develop useful and meaningful data on which to base subsequent emergency operations and prevention programmatic and organizational decisions.

Much of the subject matter in this specialty area can be introduced through self-study, but training should include formal classroom instruction with time spent in individual and small group work. Activities should focus on skill development in identifying, collecting, and interpreting various types of commodity flow data, and in using this information in the planning process. Limited field surveys, reviews of shipping papers, role plays of driver interviews, etc. are particularly appropriate for promoting learning. Realistic local situations and scenarios should be used as the basis for activities, when possible.

Recommended Training

Integration of the information learned by trainees can be demonstrated in a post-class activity involving the development of a limited commodity flow study based on data from the jurisdiction or scenarios provided by the instructor. For this reason, members of jurisdictional planning teams should be trained together, if possible, using the planned study as the basis for activities. Content testing is appropriate for demonstrating knowledge of the steps involved in a commodity flow study and methods of data collection.



Objective Identification Legend

This is the identification of the objective used in this document. It matches the identification code used in course assessment references. (See the Training Program Management section of this document.) Decimal numbers (such as CFS-1.1) indicate enabling objectives supporting the primary objective.

Identification	***Recommended** Training Objectives*
CFS-1	Given a jurisdiction with the need to develop an integrated hazardous materials emergency plan, describe the purpose and benefits of conducting a commodity flow study, including appropriate applications of the results in planning.
CFS-1.1	Describe the purpose and benefits of conducting a commodity flow study in hazardous materials planning.
CFS-1.2	Describe appropriate applications of the results of commodity flow studies in hazardous materials planning.
CFS-2	Given an assignment to conduct a commodity flow study for a jurisdiction, identify major steps in the process, such as the following: (1)Identify the specific purpose(s) of the study. (2)Review baseline information appropriate to the study. (3)Design the study. (4)Conduct field surveys. (5)Analyze the results. (6)Apply the results to the study purpose and objectives.
CFS-3	Given an assignment to conduct a commodity flow study for a jurisdiction, identify the specific purpose(s) of the study.
CFS-3.1	Assess the emergency management needs and other possible applications and uses for hazardous materials transportation data in the jurisdiction.
CFS-3.2	Identify the specific types of hazardous materials transportation data needed for the study.

Recommended Training

CFS-4	Given the specific purpose(s) of a commodity flow study for a jurisdiction, demonstrate the ability to identify and review existing baseline information appropriate to the study.
CFS-4.1	Describe common sources of existing information that can be used to identify roads available to hazardous materials transportation.
CFS-4.2	Describe common sources of existing information on vehicle traffic patterns, chemical flows, and accident histories in the jurisdiction.
CFS-5	Given the specific purpose(s) and baseline data of a commodity flow study for a jurisdiction, demonstrate the ability to design a field investigation appropriate to the study.
CFS-5.1	Compare baseline information with project goals to determine whether a field investigation should be undertaken.
CFS-5.2	Identify options and considerations for determining survey locations.
CFS-5.3	Identify options and considerations for determining survey times and repetitions.
CFS-5.4	Identify the personnel and other resource requirements associated with selected field survey methods.
CFS-6	Given an area to be surveyed and the commodity flow study design for a jurisdiction, demonstrate the ability to implement common data collection methods.
CFS-6.1	Describe common methods and demonstrate the appropriate use of placard surveys.
CFS-6.2	Describe common methods and demonstrate the appropriate use of shipping papers reviews.
CFS-6.3	Describe common methods and demonstrate the appropriate use of driver interviews.
CFS-6.4	Describe common methods and demonstrate the appropriate use of facility surveys.
CFS-6.5	Describe the advantages and disadvantages of various data recording procedures that can be used in field surveys.
CFS-7	Given hazardous materials transportation data for a jurisdiction, demonstrate the ability to apply appropriate sampling techniques to the collection and interpretation of the data.
CFS-7.1	Describe key statistical concepts (e.g., Poisson distribution, expected and observed value, confidence intervals) relevant to traffic flow analysis.
CFS-7.2	Make appropriate conclusions and inferences based on sample characteristics and collected data.

Recommended Training

CFS-8	Given hazardous materials transportation data and analyses for a jurisdiction, demonstrate the ability to apply the results in planning.
CFS-8.1	Map or otherwise display and report the results of the commodity flow study to obtain a clear picture of hazardous materials transportation in the jurisdiction.
CFS-8.2	Compare the study results and project goals to identify action items and a schedule for implementing them through the jurisdiction's plan development and implementation process.

Hazardous Materials
Planning Curriculum Guidelines:

Hazards Analysis

General Training Considerations

Scope/Objectives of Training

A hazards analysis includes (1) identifying hazards associated with the storage, handling, processing and transportation of hazardous materials, (2) conducting a vulnerability analysis to identify people, property, and environments susceptible to damage should a hazardous materials release occur, and (3) conducting a risk analysis to determine the probability of various types of emergencies and estimates of resulting damage.

Training should provide the knowledge and skills necessary to conduct a comprehensive hazards analysis for a jurisdiction or facility. Skill development should include the ability to assess the jurisdiction's or facility's hazards analysis needs, determine appropriate methods, collect and interpret data, and report the results. Specifically included is the use of tables and other tools for determining the level of concern, establishing hazard and vulnerability zones, and identifying related priorities. More sophisticated and technical approaches to hazards analysis may also be covered, if appropriate, or references provided for additional training and assistance.

Audience

Potential training audiences are all participants in the planing process that have been assigned responsibility for conducting a hazards analysis that exceeds the competencies covered under Planning Essentials. Possible audience members include:

- Community planning team members
- Facility planners and managers
- Response agency representatives
- Prevention personnel
- Technical experts and consultants

Prerequisites or Presumed Prior Knowledge/Skills of Students

Students are assumed to possess Planning Orientation and Planning Essentials levels of competency in hazards analysis. Consideration should be given to students that have a defined responsibility for conducting higher level hazards analyses for a jurisdiction or facility as a regular part of their job.

Typical Program Format

Seminar-type instructor-led program, approximately one to two days in length. Longer programs may be appropriate where more complex studies are planned or when actual field surveys are included as training activities. Training managers may wish to combine this instruction with a module on capability assessment for audiences that perform both tasks.

Methodology and Training Delivery Considerations

The successful accomplishment of training objectives should result in enhanced student proficiency in applying the principles of hazards analysis to a specific jurisdiction's or facility's planning needs and processes. Training should focus on developing knowledge of the steps and components of hazards analysis and on developing skill in performing hazard identification, vulnerability analysis, and risk analysis. Trainees must understand the significance and application of hazards analysis information, and develop the ability to recognize and develop useful and meaningful data on which to base subsequent emergency operations planing and prevention programmatic and organizational decisions.

Much of the content for analyzing hazards can be introduced through self-study, but training should include formal classroom instruction with significant time spent in individual and small group work. Activities should focus on skill development in extracting hazard identification and vulnerability information from available data sources, determining vulnerable zones from maps and hazard data, and performing the analyses leading to accurate risk determination. Content testing is appropriate for demonstrating knowl-

edge of the steps involved in hazards analysis, listing types of hazard information, and identifying the components of a completed hazards analysis.

Because of the interdisciplinary nature of planning and hazards analysis, training audiences should be heterogeneous and, whenever possible, small-group work should be conducted to encourage cross-disciplinary interactions. Integration of the information learned by the trainee can be demonstrated in a post-class activity involving the development of a limited hazards analysis using data from the trainee's home jurisdiction or facility, or scenarios provided by the instructor. Members of planning teams that are conducting a complex hazards analysis should be trained together, if possible, with student activities based on assignments.

Objective Identification Legend

This is the identification of the objective used in this document. It matches the identification code used in course assessment references. (See the Training Program Management section of this document.) Decimal numbers (such as HAZAN-1.1) indicate enabling objectives supporting the primary objective.

Identification	***Recommended** Training Objectives*
HAZAN-1	Given an assignment to conduct a hazards analysis for a jurisdiction or facility, describe the process to be used for conducting the study.
HAZAN-1.1	Describe the purpose and benefits of conducting a hazards analysis, including appropriate applications of the results in planning.
HAZAN-1.2	Describe the basic steps in a hazards analysis (hazards identification, vulnerability analysis, risk analysis).
HAZAN-1.3	Identify types and sources of information commonly used in hazards analysis.
HAZAN-2	Given an assignment to conduct a hazards analysis for a jurisdiction or facility, demonstrate the ability to identify hazards and situations that pose a serious threat in the planning area.
HAZAN-2.1	Describe the process and data sources to be used for hazards identification.
HAZAN-2.2	Identify the location of hazardous materials facilities and major transportation routes within the planning area.
HAZAN-2.3	Identify the types, quantities, and specific locations of hazardous materials used by facilities within the planning area.

Recommended Training

HAZAN-2.4	Identify the types and quantities of hazardous materials transported in or through the planning area.
HAZAN-2.5	Assess the storage conditions of hazardous materials in the planning area (e.g., containment, packaging, security, release detection).
HAZAN-2.6	Identify the nature of hazards (e.g., flammable, explosive, toxic) most likely to accompany hazardous materials spills or releases.
HAZAN-3	Given the results of the hazard identification, demonstrate the ability to analyze and map the vulnerability of people, property, business interests, and environments in the planning area.
HAZAN-3.1	Describe the process and data sources to be used for vulnerability analysis.
HAZAN-3.2	Identify methods to screen and prioritize hazards for more in-depth analysis.
HAZAN-3.3	Identify the level of concern for chemical hazards.
HAZAN-3.4	Estimate the credible worst-case scenario for hazardous materials threats.
HAZAN-3.5	Determine the extent of vulnerable zones for identified hazards using worst-case scenarios.
HAZAN-3.6	Map vulnerable zones, and identify conditions that influence the zone of impact.
HAZAN-3.7	Identify susceptible human populations, property, business interests, and environments in the vulnerable zone, including high-risk populations, critical facilities, and sensitive environments.
HAZAN-4	Given a hazard identification and vulnerability analysis for a community or facility, demonstrate the ability to assess the risk of injury or damage due to a hazardous materials release in the planning area.
HAZAN-4.1	Describe the process and data sources to be used for risk assessment.
HAZAN-4.2	Estimate the probability of occurrence of worst-case scenarios, and describe unusual conditions, such as the possibility of simultaneous incidents.
HAZAN-4.3	Assess community and facility safeguards, response capabilities in place, and incident histories (as necessary).
HAZAN-4.4	Describe the type of harm to human populations and damage to property, business interests, and environments expected in worst-case situations.
HAZAN-4.5	Categorize, prioritize, and/or rank hazards for planning, as appropriate.

HAZAN-5	Given the hazard identification, vulnerability analysis, and risk assessment for a community or facility, demonstrate the ability to prepare a comprehensive hazard analysis report.
HAZAN-5.1	Identify and describe hazards and related conditions in the planning area.
HAZAN-5.2	Describe the vulnerability of populations, property, business interests, and environments to hazardous materials threats in the planning area.
HAZAN-5.3	Describe the risk of injury and/or damage from hazardous materials incidents in the planning area, and prioritize risks for planning, as appropriate.

Hazardous Materials
Planning Curriculum Guidelines:

Capability Assessment

General Training Considerations

Scope/Objectives of Training

A capability assessment provides information designed to help the planning team evaluate preparedness, prevention, and response resources and capabilities. It includes an assessment of fixed site business and industry resources, transportation resources, and community (response and government agency) resources that could be called upon in the event of a potential emergency identified in the jurisdiction's or facility's hazards analysis.

Training should provide the knowledge and skills necessary to conduct a capability assessment for a jurisdiction or facility. Skill development should include the ability to assess the jurisdiction's or facility's capability assessment needs, determine appropriate methods, collect and interpret data, and report the results. Specifically included is the use of checklists, criteria, surveys, and other methods to identify available resources, determine requirements for accessing them, evaluate deficiencies in existing plans and procedures, and assess the effectiveness of emergency response, prevention, and recovery efforts. The successful accomplishment of training objectives should result in enhanced student proficiency in applying general principles of capability assessment to specific jurisdiction or facility planning needs and processes.

Audience

Potential training audiences include all participants in a jurisdiction or facility planing process that have been assigned responsibility for conducting a capability assessment study. Possible audience members include:

- Community planning team members
- Facility planners and managers
- Response agency representatives
- Prevention personnel
- Technical experts and consultants

Prerequisites or Presumed Prior Knowledge/Skills of Students

Students are assumed to possess Planning Orientation and Planning Essentials levels of competency in capability assessment. Consideration should be given to students that have a defined responsibility for conducting a higher level capability assessment as a regular part of their job for a jurisdiction or facility.

Typical Program Format

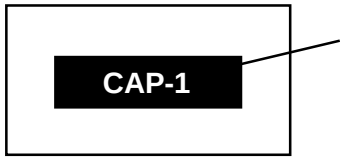
Seminar-type instructor-led program, approximately one to two days in length. Longer programs may be appropriate where more complex studies are planned or when actual field surveys are included as training activities. Training managers may wish to combine this instruction with a module on hazard analysis for audiences that perform both tasks.

Methodology and Training Delivery Considerations

Training should focus on providing knowledge of the steps and components of a comprehensive capability assessment and on developing related skills. Trainees must understand the significance and application of capability assessment information, and develop the ability to recognize and develop useful and meaningful data on which to base subsequent emergency operations planing and prevention programmatic and organizational decisions.

Much of the content for assessing capabilities can be introduced through self-study, but training should include formal classroom instruction with significant time spent in individual and small group work. Activities should focus on skill development in extracting capability assessment information from available data sources, identifying and assessing existing resources, assessing the effectiveness of emergency management activities, and identifying and evaluating planning shortfalls.

Integration of the information learned by the trainee can be demonstrated in a post-class activity involving the development of a limited capability assessment based on the hazards analysis and resource data from the trainee's home jurisdiction or facility, or from scenarios provided by the instructor. Content testing is appropriate for demonstrating knowledge of the steps involved in capability assessment, listing types of community and facility resources, and identifying the components of a completed capability assessment.



Objective Identification Legend

This is the identification of the objective used in this document. It matches the identification code used in course assessment references. (See the Training Program Management section of this document.) Decimal numbers (such as CAP-1.1) indicate enabling objectives supporting the primary objective.

Identification	***Recommended** Training Objectives*
CAP-1	Given an assignment to conduct a capability assessment for a jurisdiction or facility, describe the process to be used for conducting the study.
CAP-1.1	Describe the purpose and benefits of conducting a capability assessment, including appropriate applications of the results in planning.
CAP-1.2	Describe the advantages and disadvantages of alternative methods for conducting the capability assessment (checklists, criteria, surveys, expert panels, etc.).
CAP-1.3	Identify specific types and sources of information needed to conduct the capability assessment.
CAP-2	Given the process to be used for conducting a capability assessment for a jurisdiction or facility, assess the adequacy of existing resources to support preparedness, prevention/mitigation, response, and short-term recovery activities.
CAP-2.1	Determine the type, amount, capabilities, and accessibility of existing facility resources.
CAP-2.2	Determine the type, amount, capabilities, and accessibility of existing transporter resources.
CAP-2.3	Determine the type, amount, capabilities, and accessibility of existing community resources.
CAP-3	Given hazardous materials plans and SOPs, a completed hazard analysis, an evaluation of existing resources, critiques of incidents, exercises, and drills, and other pertinent information, demonstrate the ability to assess the jurisdiction's or facility's capability to prepare for, respond to, and recover from worst-case incidents identified in the hazard analysis.

Recommended Training

CAP-3.1	Evaluate response issues and concerns identified through surveys and reviews of hazardous materials incident critiques, exercises, and drills.
CAP-3.2	Assess the adequacy of the jurisdiction's or facility's concept of operations, including roles and functional assignments, for responding to and recovering from worst-case incidents.
CAP-3.3	Assess the adequacy of existing resources for implementing the concept of operations in worst-case incidents.
CAP-3.4	Assess the adequacy of organizational policies and SOPs for implementing the concept of operations in worst-case incidents.
CAP-3.5	Assess the level of competency of emergency personnel to respond in worst-case incidents identified in the hazard analysis..
CAP-4	Given hazardous materials plans and SOPs, a completed hazard analysis, an evaluation of existing resources, critiques of incidents, exercises, and drills, and other pertinent information, demonstrate the ability to assess the jurisdiction's or facility's capability to prevent or mitigate the effects of identified risks.
CAP-4.1	Evaluate prevention issues and concerns identified through surveys or reviews of hazardous materials incident critiques, exercises, and drills.
CAP-4.2	Assess the adequacy of prevention measures, including roles and functional assignments, for preventing or mitigating the effects of identified risks.
CAP-4.3	Assess the adequacy of existing resources for implementing necessary prevention measures.
CAP-4.4	Assess the adequacy of organizational policies and SOPs for implementing necessary prevention measures.
CAP-4.5	Assess the level of competency of prevention personnel to implement necessary prevention measures.
CAP-5	Given the results of the capability assessment analysis, prepare a comprehensive written report.
CAP-5.1	Describe preparedness, mitigation/prevention, response, and short-term recovery capability shortfalls identified in the analysis.
CAP-5.2	Identify additional resources that may be needed to prepare for, prevent/mitigate, respond to, and recover from worst-case hazardous materials incidents.
CAP-5.3	Describe deficiencies in community and/or facility safety plans and procedures identified in the analysis, and recommend modifications, as appropriate. .

Hazardous Materials
Planning Curriculum Guidelines:

Planning for Protective Actions

General Training Considerations

Scope/Objectives of Training:

Planning for protective actions addresses policy and procedures for providing personal protection to the public, including protection in place and evacuation. Considerations include public education, alert and warning systems, the availability of appropriate shelter, the nature and duration of hazardous materials releases, traffic flow and control, reception and care facilities, health and medical services, protection of water and sewage systems, ongoing incident assessment, and other emergency response functions and capabilities.

Training should provide a working knowledge of the benefits and limitations of various protection strategies, including evacuation, in-place protection, and a combination thereof. Participants should gain an understanding of the need for protective action planning and important planning considerations. They should develop the ability to implement a decision-making process for any given hazardous materials emergency situation and protective action option, and learn strategies and techniques for communicating the desired protection action to the general public to elicit the best possible response.

Plans for protective actions must address roles, strategies, and procedures for a broad range of emergency preparedness and response activities. Depending on the jurisdiction's or facility's needs, planning may involve very complex analyses, decisions, and negotiations that must be addressed before incidents occur. Therefore, the goal of training is to give participants the knowledge and skills they need to assess existing capabilities in this area, identify needed resources, and establish systems for promoting effective response in any realistic hazardous materials incident scenario.

Audience:

The training audience includes decision makers, planning team members, SOP writers, and agency and organization representatives with responsibilities related to mass care and protective actions in hazardous materials emergencies. Possible audience members include:

- Community planning team members
- Local Emergency Planning Committees
- Government and response agency representatives
- Facility planners and managers
- Community support services and volunteer group representatives
- Incident Commanders
- Public Information Officers
- Warning Officers
- Emergency Management Officials

Prerequisites or Presumed Knowledge/Skills of Students:

Students should have mastered basic skills in hazardous materials planning, and have assigned responsibilities for hazardous materials emergency planning for a jurisdiction or facility. They should understand basic concepts of the Incident Command System, public relations and education, and emergency information and warning.

Typical Program Format:

An instructor-facilitated one to two day program with lecture/discussion, student and/or tabletop exercises, and case study reviews. Longer programs may be appropriate where more complex studies, student activities, and field work are planned.

Methodology and Training Delivery Considerations:

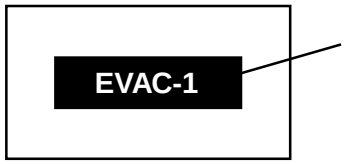
Planning for protective actions requires knowledge and skills in a broad range of disciplines and emergency response functions. Typically, many different government agencies, community organizations, and private sector groups are assigned related responsibilities under the emergency plan. For these reasons, the use of planning teams is particularly suited for this type of planning. Whenever possible, planning teams should be trained together to promote information sharing, inter-organizational understanding, and cooperation. Other considerations include:

- The training competencies identified for this curriculum area assume that a comprehensive hazards analysis and capability assessment have been completed for the jurisdiction or facility. If this assumption is incorrect, training managers may wish to incorporate additional competencies from other planning specialty areas in the instruction.

- Instructional content should stress the interrelationships among planning processes, prepared ness activities, response actions, and the public information and education components of emergency management.

- Training methodologies should emphasize small group interactions among various participants in the planning process. Hazardous materials incident case examples should be incorporated into the course, using student activities or tabletop exercises to promote and evaluate skill/ learning objectives.

- An instructional cadre concept, emphasizing diverse organizational interests and expertise, is particularly appropriate for this type of training.



Objective Identification Legend

This is the identification of the objective used in this document. It matches the identification code used in course assessment references. (See the Training Program Management section of this document.) Decimal numbers (such as EVAC-1.1) indicate enabling objectives supporting the primary objective.

Identification	***Recommended** Training Objectives*
EVAC-1	Given a hazards analysis and capability assessment for a jurisdiction or facility, demonstrate the ability to develop decision-making criteria for implementing protective actions.
EVAC-1.1	Describe the purpose and benefits of various protective action strategies, including evacuation, in-place sheltering, water supply protection, sewage system protection, and relocation.
EVAC-1.2	Compare the advantages and disadvantages of evacuation and in-place protection options for mass care in hazardous materials emergencies.

Recommended Training

EVAC-1.3 Identify factors to consider in selecting a protective action strategy in a hazardous materials emergency situation, including:

- The nature of the threat
- The population at risk
- Time factors involved
- Weather conditions
- Communications
- Response capabilities

EVAC-1.4 Identify and assess resources available for implementing various protective actions, including capabilities of organizations assigned related responsibilities under the plan.

EVAC-1.5 Develop decision-making criteria for implementing protective actions that address evacuation (precautionary, general, and selective), in-place sheltering, and other options in emergency situations identified in the hazards analysis.

EVAC-2 Given the assignment to plan for protective actions for a jurisdiction or facility, demonstrate the ability to assess existing systems, strategies, and procedures for notifying, warning, and informing the public about protective action decisions.

EVAC-2.1 Identify factors that influence the public's understanding of and response to protective actions in hazardous materials emergencies.

EVAC-2.2 Assess existing public education programs for informing the public about protective actions in the event of a hazardous materials emergency, including citizen roles and responsibilities.

EVAC-2.3 Assess existing warning and emergency public notification systems for implementing protective actions in a hazardous materials emergency.

EVAC-3 Given a hazards analysis and capability assessment for a jurisdiction or facility, demonstrate the ability to assess existing systems, strategies, and procedures for evacuating populations at risk in a hazardous material incident.

EVAC-3.1 Identify eight considerations when planning an evacuation, as follows:

(1)Emergency scene access and evacuation routes
(2)Areas of responsibility
(3)Geographical area, size and type
(4)Evacuation area
(5)Weather conditions
(6)Transportation
(7)Resisters
(8)Mass care centers and shelters

EVAC-3.2 Identify four constraints to an effective evacuation, as denoted in the Hans and Sells Study conducted for the U.S. Environmental Protection Agency, as follows:

(1)Time delay
(2)Notification time
(3)Mobilization time
(4)Travel time

EVAC-3.3	Identify six steps for implementing the evacuation process, as follows: (1)Form work groups (2)Track personnel assignments (3)Use map coordinates for making assignments (4)Issue evacuation warnings (5)Identify relocation shelters (6)Use the three-phase notification process
EVAC-3.4	Assess systems, strategies, and procedures for moving people out of risk areas (availability of vehicles, evacuation routes and alternatives, controlling traffic, special populations, etc.)
EVAC-3.5	Assess preparedness for reception and care of evacuees (shelter locations, supplies, notifying family members, health and medical care, mutual aid agreements, etc.)
EVAC-3.6	Assess decision-making criteria and procedures for re-entry after an evacuation.
EVAC-4	Given a hazards analysis and capability assessment for a jurisdiction or facility, demonstrate the ability to assess existing systems, strategies, and procedures for implementing in-place sheltering and other protective actions in a hazardous materials incident.
EVAC-4.1	Assess systems, strategies, and procedures for initiating and implementing in-place protection.
EVAC-4.2	Assess systems, strategies, and procedures for initiating and implementing water supply protection.
EVAC-4.3	Assess systems, strategies, and procedures for initiating and implementing sewage system protection.
EVAC-4.4	Assess systems, strategies, and procedures for monitoring toxic releases, continually assessing the potential for injury and damage, notifying the public as necessary, and terminating response activities.
EVAC-5	Given an assessment of the jurisdiction's or facility's capabilities to implement protective action options in hazardous materials incidents, demonstrate the ability to develop related emergency plans and procedures.
EVAC-5.1	Describe potential problems and capability shortfalls for implementing protective actions in worst-case hazardous materials incidents.
EVAC-5.2	Identify additional resources that may be needed to prepare for and implement protective actions in worst-case hazardous materials incidents.
EVAC-5.3	Identify recommended changes to hazardous materials emergency plans (addressing, for example, sections on the concept of operations, roles and responsibilities, direction and control, warning systems and emergency public notification, resource management, health and medical, personal protection of citizens, ongoing incident assessment, and human services).
EVAC-5.4	Describe modifications to jurisdiction and/or facility policies and procedures that are required to facilitate the recommended plan changes.

Hazardous Materials
Planning Curriculum Guidelines:

Plan Implementation and Maintenance

General Training Considerations

Scope/Objective of Training

Training in this curriculum area will provide students with the knowledge, skills, and practical tools they need to successfully implement a completed hazardous materials response plan, anticipate future outcomes, monitor and evaluate the plan's effectiveness, and revise it as appropriate to improve the jurisdiction's or facility's emergency operations and prevention/mitigation capabilities. Instruction builds on Planning Essentials competencies to help participants develop the feedback loop necessary for long-term plan maintenance and enhancement.

The content of training addresses (1) plan implementation, including promulgation and dissemination of the plan, orientation of plan users, and integration of multi-jurisdictional planning efforts; (2) validation of the plan, including methods of plan review, plan testing, and exercising; and (3) plan maintenance, including development of strategies and processes to identify, illuminate, and correct problems with the plan. Other subject areas potentially include environmental scanning, management audits, performance audits, and other long-term and strategic planning concepts.

Training focuses on the role of the planning manager or administrator in establishing systems and strategies for plan implementation and maintenance. This person may also participate in (and need training in) the actual writing and development of the plan, as defined in Planning Essentials and other Planning Specialties areas. Furthermore, the planning manager or administrator may function as the jurisdiction's or facility's Exercise Manager/Officer. However, advanced competencies in exercise design and development will be covered in a separate Planning Specialty area in subsequent editions of these *Guidelines*.

Audience

The training audience includes all personnel involved in the implementation, validation, and maintenance of a completed hazardous materials plan for their respective jurisdiction or facility. Audience members potentially include planners and decision makers for agencies and organizations represented in the plan, community leaders, and others interested in improving hazardous materials preparedness. Possible audience members are:

- Community planning team members
- Local Emergency Planning Committee members
- Government and response agency representatives
- Facility planners and managers
- Community support services and volunteer group representatives
- Exercise program managers and exercise officers
- Emergency Management Officials

Prerequisites or Presumed Prior Knowledge/Skills of Students

Students should possess Planning Orientation and Planning Essentials competencies and previous experience in community or organizational planning. They should have job responsibilities directly related to the management and administration of hazardous materials plans and planning processes for a jurisdiction or facility.

Typical Program Format

One to two days of classroom instruction with an emphasis on activities designed to help students develop strategies and mechanisms to assess, evaluate, and refine existing hazardous materials plans. Job aids to facilitate later work may be desirable. Training program managers may wish to combine this instruction with more in-depth materials on exercise design and development for audiences that perform both roles.

Methodology and Training Delivery Considerations

- Ideally, training audiences should be heterogeneous, reflecting the wide range of personnel involved in the integrated hazardous materials planning process. If possible, individuals who work together as members of a planning team should be trained together.

- Training methodologies should emphasize small group interactions and practical activities based on actual plans and realistic situations. Since teamwork and continuity are important in plan implementation and maintenance, it is recommended that student groupings be maintained throughout training.

- Generic case studies or scenarios should be available for use with audiences from diverse communities and organizations. The instructor should be able to flexibly tailor, update, or substitute these materials, depending on audience needs.

- Training emphasizes skills and attitudes needed for students to become effective long-term community change agents. Emphasis will be placed on methods and techniques for effecting meaningful change.

Objective Identification Legend

This is the identification of the objective used in this document. It matches the identification code used in course assessment references. (See the Training Program Management section of this document.) Decimal numbers (such as PI&M-1.1) indicate enabling objectives supporting the primary objective.

Identification	***Recommended** Training Objectives*
PI&M-1	Given the goals and objectives of the integrated hazardous materials planning process for a jurisdiction or facility, develop a strategy for plan implementation.
PI&M-1.1	List organizations and key personnel who should participate in plan implementation, including: • Planning team members • Organizations, groups, and facilities assigned responsibilities under the plan • Local, state, and federal oversight agencies • Community support services organizations affected by the plan
PI&M-1.2	Establish objectives for plan review and validation as part of the plan development process.
PI&M-2	Given a completed integrated hazardous materials plan for a jurisdiction or facility, develop strategies to ensure proper promulgation and dissemination of the plan.

Recommended Training

PI&M-2.1	Identify the steps necessary to ensure proper promulgation of the plan.
PI&M-2.2	Determine the information needs of various groups, and develop strategies to orient them to their roles and assignments under the plan.
PI&M-2.3	Develop strategies to orient the public on the plan, including clarifying technical information as necessary to promote public understanding.
PI&M-3	Given an approved integrated hazardous materials plan for a jurisdiction or facility, develop strategies to ensure coordination with multi-jurisdictional planning efforts.
PI&M-3.1	Identify and assess options for coordinating and integrating the plan within the jurisdiction and/or facility.
PI&M-3.2	Develop strategies to communicate the substance of the plan to other jurisdictions, including surrounding communities, state offices, and federal (national/regional) personnel involved in related planning efforts.
PI&M-3.3	Develop strategies to establish communication links with local, state, and federal organizations to obtain feedback on emergency management program changes that may affect the plan.
PI&M-4	Given an approved integrated hazardous materials plan for a jurisdiction or facility, develop strategies to ensure that organizations and personnel are capable of carrying out their assigned responsibilities.
PI&M-4.1	Develop strategies to ensure that each organization develops the SOPs necessary to facilitate the accomplishment of assigned tasks under the plan.
PI&M-4.2	Develop strategies to assess related training needs.
PI&M-4.3	Identify training programs and assistance available in the public and private sectors.
PI&M-5	Given implementation of an approved integrated hazardous materials plan for a jurisdiction or facility, develop strategies for monitoring changes and trends that impact the plan or planning process.
PI&M-5.1	Identify changes and trends that could impact the plan or planning process, including but not limited to: • Economic • Legal • Political • Technological • Social • Demographic
PI&M-5.2	Identify strategies for collecting and assessing information from reviews or critiques of actual hazardous materials incidents affecting the jurisdiction.

PI&M-5.3	Identify strategies to ensure that various organizations with a role under the plan provide feedback as changes occur that may affect the plan.
PI&M-6	Given implementation of an approved integrated hazardous materials plan for a jurisdiction or facility, participate in the design and development of an exercise program that is useful for evaluating and updating the plan.
PI&M-6.1	Describe five types of exercises and their appropriate use in plan evaluation, to include: • Drill • Orientation • Table top • Functional • Full Scale
PI&M-6.2	Identify the goals and objectives of the hazardous materials exercise program and its relationship to the overall planning process.
PI&M-6.3	Identify methods to be used for determining hazardous materials exercise needs, addressing at a minimum: • Number and type of exercises to be conducted • Functions to be tested (preparedness, response, recovery, and mitigation/ prevention) • Exercise goals and objectives • Appropriate scenarios
PI&M-6.4	Identify exercise criteria, resources, and reference materials.
PI&M-6.5	On specific exercises, establish effective policies and plans for working with the Exercise Manager, organizational participants, and others to: • Control the exercise • Recruit and brief participants • Record and evaluate exercise play • Critique exercise results and identify follow-up actions
PI&M-7	Given changes and trends that impact the plan or planning process, incident critiques, exercise results, expert opinion, and other information, develop strategies for conducting periodic reviews and updates of the plan.
PI&M-7.1	Determine whether goals and objectives established in the plan have been achieved.
PI&M-7.2	Evaluate changes and trends, incident critiques, exercise results, expert opinion, and other information to assess the need for plan revisions.
PI&M-7.3	Identify strategies for making the needed revisions to the plan and for implementing the plan revisions.
PI&M-7.4	Identify strategies and timetables for reviewing and updating the plan on a periodic basis.

Hazardous Materials
Planning Curriculum Guidelines:

Facility Planning

General Training Considerations

Scope/Objectives of Training

Facility Planners develop, validate, and maintain emergency response plans and safety plans for any facility subject to federal contingency planning regulations, as well as other facilities that wish to improve emergency preparedness through planning. They also develop procedures to ensure compliance with federal, state, and local mandates for participation in community planning and right-to-know activities. In this context, the term "facility" is meant to have a wide connotation and may include, but is not limited to, any mobile or fixed onshore or offshore building, structure, installation, equipment, pipe, or pipeline.

The Facility Planning specialty area provides participants with the knowledge and skills they need to develop a basic hazardous materials emergency plan for a facility. The primary training audience is facility planners and planning team members. Training objectives cover a broad range of generic competencies, including the ability to function effectively in a team environment, assist in or conduct a basic hazards analysis and capability assessment, work with others to analyze options and draft sections of the plan, and participate in plan implementation, evaluation, and maintenance.

The legislative and regulatory basis for this training can be found primarily in the requirements specified in OSHA 1910.120 for development of employers' emergency response plans, SARA Title III for development of planning jurisdictions' emergency response plans, and various federal agency regulations for the development of facility and transporter emergency response plans. The competencies defined here incorporate generic concepts and processes derived from various sources in the planning literature. Several of the most important reference documents, and more specific models for planning, are described in the Appendices. The training objectives are intended to be comprehensive, i.e., to address the requirements of all identified audience members; thus, training developers and instructors will need to tailor these objectives to meet local audience interests, needs, and planning processes.

Audience

The training audience for Facility Planning includes planning team members who have a defined responsibility in researching, preparing, implementing, and maintaining hazardous materials facility plans. These persons generally represent an organizational or functional specialty in an integrated planning process for the facility. Audience members may include industry owners and executives, business planners, production/process managers, functional managers (e.g., communications, public information, emergency response, etc.), safety officers, technical experts, and others employed by the facility. Personnel who have responsibilities for reviewing and approving facility plans and/or enforcing compliance with existing community regulations and standards may also benefit by training.

Prerequisites or Presumed Prior Knowledge/Skills of Students

Training covers basic skills, with an emphasis on the ability to interpret and use information provided by various technical specialists in developing the plan. More advanced planning skills are addressed under other Planning Specialties. Audience members are assumed to already possess training competencies covered under Planning Orientation, as well as an expertise in the professional discipline that the student represents on the planning committee. It is further assumed that managerial, administrative, and logistic requirements for organizing the planning process, including staff recruitment and assignments, have already been met.

Typical Program Format

Training can typically be accomplished in two to four days of classroom instruction led by an experienced facilitator. Breaking training into modules (e.g., Hazards Analysis) that are delivered at different times is also possible, and this approach may be beneficial if timed to coincide with planning team assignments. However, team building is very important in the planning process, so continuity of student groupings throughout training is recommended.

Methodology and Training Delivery Considerations

It is recognized that the planning needs of facilities, and the resulting training needs of planning team members, can vary greatly, depending on such factors as business size, demographics, product mix, hazards, local resources, and planning preferences. However, training described here is intended to address the generic training requirements of all hazardous materials facility planners. Training managers, course developers, and instructors may need to tailor these materials to meet the unique needs and interests of different audiences, incorporating elements covered in other Planning Specialties, as appropriate. Other training considerations include the following:

- Training should focus on the actual development of facility plans, with the work product and participation in the group planning process used to demonstrate student mastery of the objectives.
- Audiences should be heterogeneous, reflecting the diverse groups and professional disciplines represented in the planning process. It is highly recommended that team members who will work together in subsequent planning efforts be trained together.
- Course methodology should emphasize group interactions, team building, and resolution of interpersonal conflicts, as well as the development of the plan product itself.
- Course materials can be multi-tracked by type of plan (OSHA, EPA, etc.) to facilitate tailoring the instruction to the needs of different audiences.
- If possible, instruction should address practical strategies for consolidating planning requirements (i.e. merging several requirements into one plan development effort) to foster greater planning efficiency.
- Instruction should emphasize the need for on-going planning commitments by the team and the organizations they represent.
- Instruction should emphasize the need for ongoing evaluation at each step in the planning process.
- Instructors should emphasize that steps in the planning process, although taught sequentially, may actually be performed simultaneously.

Objective Identification Legend

This is the identification of the objective used in this document. It matches the identification code used in course assessment references. (See the Training Program Management section of this document.) Decimal numbers (such as FACIL-1.1) indicate enabling objectives supporting the primary objective.

Identification	***Recommended** Training Objectives*
FACIL-1	Given an assignment as a facility planning team member, describe an appropriate planning strategy and team member responsibilities in the process.
FACIL-1.1	Describe the benefits of a team approach to planning, and identify skills necessary to participate in the team planning process.
FACIL-1.2	Identify individual roles and responsibilities in the facility planning process, to include work expectations, administrative support systems, and time lines.

Recommended Training

FACIL-1.3	Identify the need to coordinate planning with outside groups (e.g., local government, surrounding jurisdictions, state offices, federal/regional offices such as EPA and FEMA, RRTs, and CAER.)
FACIL-1.4	Demonstrate understanding of the planning process mission statement, goals, and objectives.
FACIL-1.5	Describe the expected results of the planning process, to include required planning elements and plan format.
FACIL-1.6	Identify resources needed to conduct the planning process, including personnel, budgets, and technical capabilities, and solicit these resources within the company.
FACIL-2	Given an assignment as a facility planning team member, demonstrate the ability to conduct a review of federal, state, and local authorities applicable to the planning process.
FACIL-2.1	Describe the purpose and benefits of completing a review of existing plans and authorities.
FACIL-2.2	Identify methods and procedures for reviewing plans and authorities (collecting and organizing information, identifying and clarifying issues, identifying incompatibilities and shortfalls, etc.), including associated costs and staffing requirements.
FACIL-2.3	Identify planning regulatory requirements that apply to the facility, to include consideration of: • SARA Title III • EPA's Oil Pollution Prevention Regulation (SPCC and Facility Response Plan Requirements)—40 CFR part 112.7(d) and 112.20 to 112.21 • MMS's Facility Response Plan Regulation—30 CFR part 254 • RSPA's Pipeline Response Plan Regulation—49 CFR part 194 • USCG's Facility Response Plan Regulation—33 CFR part 154, subpart F • EPA's Risk Management Programs Regulation—40 CFR part 68 • OSHA's Emergency Action Plan Regulation—29 CFR 1910.38(a) • OSHA's Process Safety Standard—29 CFR 1910.119 • OSHA's HAZWOPER Regulation—29 CFR 1910.120 • EPA's Resource Conservation and Recovery Act Contingency Planning Requirements—40 CFR part 264, subpart D, 40 CFR part 265, subpart D, and 40 CFR part 279.52 State and local policies, codes, ordinances, etc.
FACIL-2.4	Describe the advantages and disadvantages of all-hazard planning and hazard-specific planning.
FACIL-3	Given an assignment as a facility planning team member, demonstrate the ability to conduct background research appropriate to the planning requirement.

FACIL-3.1	Identify critical internal and external products, services, and operations that impact the facility plan, including: • Internal products and services and the facilities and equipment needed to produce them • External products and services provided by suppliers, especially sole source vendors • Services such as electrical power, water, sewer, gas, telecommunications, and transportation • Operations, equipment, and personnel vital to the continued functioning of the facility
FACIL-3.2	Identify, gather, and review copies of existing hazardous materials plans (community emergency plans, mitigation/prevention plans, response agency SOPs, facility plans, etc.).
FACIL-3.3	Review critiques of actual incidents, exercises, and drills conducted by the facility or by the community with participation by the facility.
FACIL-3.4	Review important changes and trends impacting the facility.
FACIL-3.5	Conduct surveys, interviews, etc. to gather expert opinion on planning needs, as required.
FACIL-3.6	Identify and summarize related planning issues, priorities, concerns, and challenges.
FACIL-4	Given the planning process to be used by the facility, identify the purpose, benefits, methods, expected results, and participant roles in hazards analysis and capability assessment.
FACIL-4.1	Describe the purpose and benefits of conducting a hazards analysis.
FACIL-4.2	Describe the purpose and benefits of conducting a capability assessment.
FACIL-4.3	Describe the methods to be used and the expected results of the facility's hazards analysis and capability assessment processes.
FACIL-4.4	Identify organizational and team member responsibilities in the facility's hazards analysis and capability assessment processes, including the roles of various technical specialists.
FACIL-5	Given the facility's production processes and potential hazards, demonstrate the ability to identify, collect, and interpret hazards analysis and capability assessment data needed for planning.
FACIL-5.1	Collect or assist in collecting data, as identified in *Technical Guidance for Hazards Analysis*.
FACIL-5.2	Identify types of emergencies that have occurred in the community, at the facility, and in similar facilities.

Recommended Training

FACIL-5.3	Identify geographic factors that could contribute to potential emergencies.
FACIL-5.4	Identify types of emergencies that could occur from technological process or system failures.
FACIL-5.5	Identify types of emergencies that could occur as a result of human error.
FACIL-5.6	Identify types of emergencies that could result from the design or construction of the facility and production processes.
FACIL-5.7	For each potential emergency, identify possible complications and relationships to other emergency events, and estimate the probability of occurrence.
FACIL-5.8	Identify and evaluate internal and external resources and capabilities that could be applied in an emergency.
FACIL-5.9	Conduct an insurance review to identify and evaluate facility insurance coverage and benefits in various types of emergency situations.
FACIL-5.10	Review and interpret the data.
FACIL-5.11	Identify, map, and prioritize hazards, risk areas, and vulnerable zones, and identify capability shortfalls and excesses (gap analysis).
FACIL-6	Given the results of the facility's hazards analysis and capability assessment, demonstrate the ability to identify issues and solutions to be addressed in the plan, and assignments for developing the plan.
FACIL-6.1	Identify issues and solutions to be addressed in the facility plan by examining existing plans, hazards analysis results, capability assessment results, and other pertinent information.
FACIL-6.2	Identify facility plan development tasks and assignments.
FACIL-7	Given identified issues and solutions to be addressed in the facility plan, participate as assigned in developing or updating the hazardous materials emergency operations plan, to address preparedness, response and short-term recovery.
FACIL-7.1	Identify the planning elements necessary to comply with regulatory requirements, standards, and guidelines.
FACIL-7.2	Develop or update the emergency operations plan to meet the required planning elements.
FACIL-8	Given identified issues and solutions to be addressed in the facility plan, participate as assigned in developing or updating a comprehensive prevention/mitigation section in the plan.
FACIL-8.1	Identify prevention/mitigation strategies and techniques to address the identified issues and solutions.

FACIL-8.2	Develop or update the plan to meet all identified prevention/mitigation planning needs.
FACIL-9	Given a draft facility hazardous materials plan, participate as assigned in the plan review and appraisal process.
FACIL-9.1	Describe the purpose and benefits of reviewing the facility plan.
FACIL-9.2	Conduct an internal review of the draft facility plan to assess adequacy and completeness.
FACIL-9.3	Facilitate an external review of the draft facility plan, which may include peer review, management review, and local, state and federal review.
FACIL-9.4	Make necessary revisions, and promote formal plan promulgation.
FACIL-10	Given an approved hazardous materials facility plan, describe appropriate strategies and identify methods for implementing the plan.
FACIL-10.1	Describe the purpose and benefits of implementing the plan.
FACIL-10.2	Describe the strategy and methods to be used for implementing the plan, to include: • Disseminating copies of the plan • Briefing and orienting users of the plan • Integrating the plan with other plans and work processes within the facility
FACIL-10.3	Identify options and develop strategies for coordinating the plan with multi-jurisdictional planning efforts.
FACIL-10.4	Identify options and develop strategies for ensuring that personnel are adequately trained to carry out their assigned responsibilities under the plan.
FACIL-10.5	Identify roles and responsibilities for implementing the plan, to include available resources, administrative systems, and time lines.
FACIL-11	Given an approved hazardous materials facility plan, describe appropriate strategies and identify methods for evaluating and maintaining the plan.
FACIL-11.1	Describe the purpose and benefits of evaluating and maintaining the plan.
FACIL-11.2	Identify options and develop strategies for monitoring changes and trends affecting the facility and/or jurisdiction.
FACIL-11.3	Identify options and develop strategies for critiquing actual incidents and accidents that occur, and for identifying and implementing remedial actions.
FACIL-11.4	Identify options and develop strategies for developing, conducting, and evaluating exercises and drills.

Recommended Training

FACIL-11.5	Identify options and develop strategies for conducting an annual audit of the facility plan and/or periodically updating and revising the facility plan, as necessary.
FACIL-11.6	Identify roles and responsibilities for evaluating and maintaining the facility plan, to include available resources, administrative systems, and time lines.
FACIL-11.7	Work with planning team members, facility managers, and other facility and community representatives to test planning concepts and measures (e.g., through tabletop exercises and drills), as necessary.

Hazardous Materials
Planning Curriculum Guidelines:

Planning for Public Education

General Training Considerations

Note: There are several aspects and potential training requirements associated with hazardous materials public education. These include training for Public Information Officers (PIOs) and others who design and develop related programs, strategies, and outreach materials; training for media representatives and others who influence the perceptions of the public; and training for planners in "marketing" the plan to gain public support for the planning process. The Planning Specialty area described here identifies general competencies for individual members of the public. Other facets of public education will be addressed in subsequent editions of the *Guidelines*.

Scope/Objectives of Training

Training in this curriculum area provides an overview of the hazardous materials emergency management system, with an emphasis on the citizen's role in that system. No skill development is attempted. Training should result in a positive attitudinal change, an improved awareness of threats to personal and community safety, an enhanced understanding of the need for and benefits of jurisdictional and facility planning and emergency management, and motivation to improve personal and community preparedness.

Benefits to be derived from training the general public include a greater understanding of and support for the jurisdiction's emergency management system and capabilities; improved citizen understanding of appropriate actions to take in hazardous materials emergency situations; heightened cooperation with responders and prevention/mitigation personnel; and enhanced citizen planning and preparedness for potential incidents in the home or neighborhood.

Audience

The audience for public education training includes all persons who have a "stake" in the hazardous materials emergency management system, although they have no defined role in the development and implementation of emergency operations and mitigation/prevention plans. Potential audience members include the general public, community groups, volunteer groups, business/industry associations, employee groups, and others with a self-interest in improving community and individual/family preparedness.

Prerequisites or Presumed Prior Knowledge/Skills of Students

Participants are assumed to have an interest in hazardous materials threats facing the community, as well as the jurisdiction's ability to provide effective hazardous materials emergency management. However, no prior knowledge of community plans and systems is required to participate in training.

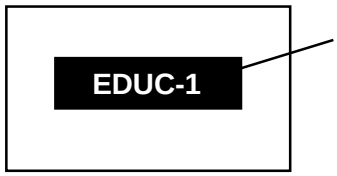
Typical Program Format

A short (one to two hours or as need is expressed by the customer) facilitator-led presentation or seminar.

Methodology and Training Delivery Considerations

Training should emphasize opportunities for interaction with audience members to identify and address individual perceptions and concerns. Whenever possible, use of dynamic media (video, slides, computer simulations, CD-ROM, etc.) is encouraged to promote interest and motivate support. Depending on audience needs and time, simple activities, exercises, or role plays emphasizing local examples and realistic personal situations may be appropriate.

The instructor should be able to discuss a broad range of topics of potential interest to audience members, including community and household hazardous materials threats; requirements of the Emergency Planning and Community Right to Know Act; pertinent jurisdiction and facility plans and capabilities; technical resources and ways to access community information (MSDS forms, chemical inventories, release reports, etc.), and materials available from EPA, DOT, FEMA, NIEHS, and other federal, state, and local sources.



Objective Identification Legend

This is the identification of the objective used in this document. It matches the identification code used in course assessment references. (See the Training Program Management section of this document.) Decimal numbers (such as EDUC-1.1) indicate enabling objectives supporting the primary objective.

Identification	***Recommended** Training Objectives*
EDUC-1	Given residency in a specific jurisdiction, identify the purpose, benefits, and components of the jurisdiction's hazardous materials emergency management system.
EDUC-1.1	Describe the hazardous materials threat within the jurisdiction, to include the routine use of chemicals by the general public from everyday sources.
EDUC-1.2	Identify major legislation affecting the jurisdiction's hazardous materials emergency management system, including the Emergency Planning and Community Right-to-Know Act.
EDUC-1.3	Describe the jurisdiction's hazardous materials emergency management system.
EDUC-1.3.1	Describe the four phases of the comprehensive emergency management system (preparedness, response, recovery, and mitigation/prevention).
EDUC-1.3.2	Explain the purpose and participants in the jurisdiction's integrated response system.
EDUC-1.3.3	Explain the purpose and participants in the jurisdiction's prevention and mitigation system.
EDUC-1.3.4	Describe general requirements for facility planning, safety management, and emergency response.
EDUC-1.4	Identify the purpose and participants in the jurisdiction's hazardous materials planning process.
EDUC-1.4.1	Identify the jurisdiction's LEPC planning district and planning requirements.
EDUC-1.4.2	Identify major steps and participants in the hazardous materials planning process, to include hazards analysis, capability assessment, plan development, and plan evaluation.

Recommended Training

EDUC-1.4.3	Identify major components in the jurisdiction's hazardous materials plan.
EDUC-2	Given residency in a specific jurisdiction, describe the citizen's role in the jurisdiction's hazardous materials emergency management system.
EDUC-2.1	Identify the personal and community benefits of citizen participation in the jurisdiction's hazardous materials emergency management system.
EDUC-2.2	Identify ways to participate in and contribute to the jurisdiction's hazardous materials emergency management system (e.g. provide feedback, serve as resource, attend meetings, join committees)
EDUC-2.3	Describe the citizens' role in individual and family preparedness.
EDUC-2.3.1	Identify steps in conducting a personal hazards analysis, to include threats to the neighborhood.
EDUC-2.3.2	Identify components of a personal and family preparedness plan.
EDUC-2.3.3	Identify steps in testing and maintaining personal/family preparedness plans.
EDUC-3	Given residency in a specific jurisdiction, identify personal actions to promote hazardous materials emergency management.
EDUC-3.1	Identify available sources of assistance and information and requirements for accessing them.
EDUC-3.2	Develop an action plan for promoting hazardous materials emergency management and personal/family preparedness.

Hazardous Materials
Planning Curriculum Guidelines:

Appendix A:
Planning Guide Summaries

Appendix A
Planning Guide Summaries

This appendix provides content summaries of key reference documents used in the preparation of the *Hazardous Materials Planning Curriculum Guidelines*. These materials include the *Guide for All-Hazard Emergency Operations Planning* (FEMA SLG 101), *Hazardous Materials Emergency Planning Guide* (NRT-1), *Technical Guidance for Hazards Analysis* (EPA/FEMA/DOT), *Handbook of Chemical Hazard Analysis Procedures* (FEMA/DOT/EPA), and *Emergency Management Guide for Business & Industry* (FEMA 141). More information on the planning models described in these materials is presented in Appendix B.

Federal Emergency Management Agency, *Guide for All-Hazard Emergency Operations Planning*, SLG 101, September 1996.

The Guide is designed as a "toolbox" of ideas and advice, not a sample emergency operations plan (EOP). It is intended primarily for use by personnel responsible for EOP development and maintenance in state and local emergency management agencies. It establishes no requirements, and its recommendations may be used, adapted, or disregarded.

This SLG replaces Civil Preparedness Guide (CPG) 1-8, *Guide for the Development of State and Local Emergency Operations Plans* (dated September 10, 1990); CPG 1-8A, *Guide for the Review of State and Local Emergency Operations Plans,* (dated October 1992); and CPG 1-10, *Guide for the Development of a State and Local Continuity of Government Capability* (dated July 27, 1987), which have been rescinded.

The document is organized as follows:

- Chapter 1 explains what an EOP is at the state and local levels, why the EOP is a necessary part of a comprehensive approach to emergency management, and how the EOP relates to other aspects of the comprehensive, risk-based, all-hazard approach.
- Chapter 2 describes the approach FEMA recommends for a step-by-step process of risk-based, all-hazard emergency operations planning (see Appendix B for more detail).
- Chapter 3 suggests how to format the results of the planning process in a written EOP. Components discussed include the Basic Plan, functional annexes, hazard-specific appendices, SOPs, and checklists.
- Chapter 4 lists and discusses elements of the Basic Plan, and provides detailed examples of the types of tasking that should be assigned to agencies, organizations, and individuals under the plan.
- Chapter 5 explains the purpose of functional annexes, and provides a brief description of eight core functions: Direction and Control, Communications, Warning, Emergency Public Information, Evacuation, Mass Care, Heath and Medical Services, and Resource Management.
- Chapter 6 notes unique aspects of certain hazards, including associated regulatory requirements. It suggests how to address hazardous materials in the all-hazard EOP rather than in a stand-alone plan. The chapter is not meant to replace hazard-specific planning guidance issued by the National Response Team.
- Chapter 7 contains information on integrating State EOPs with the Federal Response Plan, so that all levels of government can provide a coordinated response to communities in need.

National Response Team, *Hazardous Materials Emergency Planning Guide*, NRT-1, March 1987.

This guidance is intended to help local communities prepare for potential incidents involving hazardous materials. It describes how to form a local planning team, find a team leader, identify and analyze hazards, identify existing response equipment and personnel, write a plan, and keep the plan up to date. The information can be used both by local communities developing their own plan, and by local emergency planning committees formed in accord with the "Emergency Planning and Community Right-to-Know Act of 1986."

State officials seeking to develop a state emergency plan that is closely coordinated with local plans can adapt this guidance to their purposes. Likewise, officials of chemical plants, railroad yards, and shipping and trucking companies can use the guide to coordinate their own hazardous materials emergency planning with that of the local community.

The guidance deals specifically with response to hazardous materials incidents—both at fixed facilities (manufacturing, processing, storage, and disposal) and during transportation (highways, waterways, rail, and air). Plans for responding to radiological incidents and natural emergencies such as hurricanes, floods, and earthquakes are not the focus of this guidance, although most aspects of plan development and appraisal are common to these emergencies.

The guide is intended to focus community activity on emergency preparedness and response; provide communities with information useful in organizing the planning task; furnish criteria to determine risk and to help communities decide whether they need to plan for hazardous materials incidents; help communities conduct planning that is consistent with their needs and capabilities; and provide a method for continually updating a community's emergency plan.

The document is organized as follows:

Chapter 1: Introduction
Chapter 2: Selecting and Organizing the Planning Team
Chapter 3: Tasks of the Planning Team
Chapter 4: Developing the Plan
Chapter 5: Hazardous Materials Planning Elements
Chapter 6: Plan Appraisal and Continuing Planning

Several appendices provide helpful information for community planning. In particular, Appendix A includes a detailed summary of Title III of SARA, and Appendix D presents criteria that can be used to assess a state or local hazardous materials emergency response preparedness program.

U.S. Environmental Protection Agency, Federal Emergency Management Agency, and U.S. Department of Transportation, *Technical Guidance for Hazards Analysis*, December 1987.

The purpose of this guide is to help local emergency planning committees (LEPCs) conduct site-specific hazards analyses for airborne releases of extremely hazardous substances (EHSs), as required by Title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA), also known as the Emergency Planning and Community Right-to-Know Act (EPCRA). Although these substances may also threaten property and the environment, this guide is primarily concerned with lethal effects of airborne substances on humans.

This document represents a joint effort by EPA, FEMA, and DOT to provide coordinated and coherent technical guidance. Although the guide can be useful to all community and industry planners, it is intended especially for LEPCs established under the provisions of SARA. The three steps of hazards analysis—hazards identification, vulnerability analysis, and risk analysis—provide a decision-making process for the LEPCs to follow as they undertake the development of comprehensive emergency plans mandated by SARA Title III.

This document is organized as follows:

Chapter 1: Introduction and Overview

Chapter 2: Hazards Analysis: An Overview
- 2.1 - Hazards Identification
- 2.2 - Vulnerability Analysis for Airborne Extremely Hazardous Substances
- 2.3 - Risk Analysis

Chapter 3: Step-by-Step Procedures for Conducting a Hazards Analysis of Extremely Hazardous Substances

Chapter 4: Using the Results of a Hazards Analysis

Appendices:
- Appendix A: Acronyms and Glossary of Terms
- Appendix B: The Criteria Used to Identify Extremely Hazardous Substances
- Appendix C: The List of Extremely Hazardous Substances
- Appendix D: Additional Information on Levels of Concern
- Appendix E: Sample Profile
- Appendix F: Fire and Reactivity Hazards
- Appendix G: Equations Used for the Estimation of Vulnerable Zones
- Appendix H: General Considerations for Evacuation or In-Place Sheltering
- Appendix I: Information Collecting to Evaluate Sites for Emergency Planning
- Appendix J: Methods for Evaluating Hazards Used by Facilities
- Appendix K: Evaluation Guide for Available Computer Applications Addressing Hazardous Materials Emergency Response Planning
- Appendix L: Selected Bibliography
- Appendix M: EPA and FEMA Regional Contacts

Federal Emergency Management Agency, U.S. Department of Transportation, and U.S. Environmental Protection Agency, *Handbook of Chemical Hazard Analysis Procedures*.

The *Handbook of Chemical Hazard Analysis Procedures* has several objectives, one of which is to expand *NRT-1* and the *Technical Guidance on Hazards Analysis* documents by including information for explosive, flammable, reactive, and otherwise dangerous chemicals. Although *NRT-1* was aimed at addressing planning for all types of hazardous materials, SARA Title III required local planners to focus on a specific initial list of acutely toxic chemicals (referred to as Extremely Hazardous Substances) due to their high inhalation toxicity when airborne, and this was the primary focus of the supplemental guidance document. By introducing additional methodologies on how to plan for these and other dangerous chemicals, this handbook serves as a stepping stone from *NRT-1* and the *Technical Guidance on Hazards Analysis* to a more comprehensive approach for emergency planning.

Beyond providing additional methodologies for assessing the potential impacts of hazardous materials releases, this handbook also expands the three-step hazards analysis approach (hazard identification, vulnerability analysis, and risk analysis) presented in *NRT-1* and its supplement by introducing a four-step approach involving hazard identification, consequence analysis, probability analysis, and risk analysis. In addition, it provides a tutorial on hazardous chemicals, suggestions for applying hazard analysis results to writing and updating an emergency plan, and an expanded discussion of issues relating to sheltering-in-place (in-place protection) and evacuation.

The document is organized as follows:

Chapter 1: Introduction
Chapter 2: Key Properties of Chemical Substances
Chapter 3: Actions Upon Release to the Environment
Chapter 4: Fire Hazards of Chemical Substances

Chapter 5: Explosion Hazards of Chemical Substances
Chapter 6: Toxicity Hazards of Chemical Substances
Chapter 7: Reactivity Hazards of Chemical Substances
Chapter 8: Hazardous Material Classification Systems
Chapter 9: Overview of the Hazard Analysis Process
Chapter 10: Hazard Identification Guidelines
Chapter 11: Probability Analysis Procedures
Chapter 12: Consequence Analysis Procedures
Chapter 13: Formulation of a Planning Basis
Chapter 14: Use of Hazard Analysis Results in Emergency Planning

Appendices:
- Appendix A: A Tutorial on Fundamental Mathematical Skills
- Appendix B: Technical Basis for Consequence Analysis Procedures
- Appendix C: Overview of "Shelter-in-Place" Concepts
- Appendix D: Chemical Compatibility Chart
- Appendix E: Guide to Installation of the ARCHIE Computer Program
- Appendix F: Basis of Probability Analysis Procedures

Federal Emergency Management Agency, *Emergency Management Guide for Business and Industry,* FEMA 141, October 1993.

This guide provides step-by-step advice on how to create and maintain a comprehensive emergency management program. It can be used by manufacturers, corporate offices, retailers, utilities, or any organization where a sizable number of people work or gather. It applies equally to businesses large or small, whether they operate from a high-rise building or an industrial complex, and whether they own, rent or lease property.

Users of the document need not have in-depth knowledge of emergency management. All that is required is the authority to create a plan and a commitment from the chief executive officer to make emergency management part of the corporate culture.

Businesses that already have a plan can use this guide as a resource to assess and update the plan. The guide is organized as follows:

Section 1: Four Steps in the Planning Process—how to form a planning team; how to conduct a vulnerability analysis; how to develop a plan; and how to implement the plan. The information can be applied to virtually any type of business or industry.

Section 2: Emergency Management Considerations—how to build such emergency management capabilities as life safety, property protection, communications, and community outreach.

Section 3: Hazard-Specific Information—technical information about specific hazards the facility may face.

Section 4: Information Sources—where to turn for additional information.

Hazardous Materials
Planning Curriculum Guidelines:

Appendix B: Planning Models

Appendix B
Planning Models

Various explanations of the planning process can be found in the literature, including those described in the *Guide for All-Hazard Emergency Operations Planning* (FEMA SLG 101), *Hazardous Materials Emergency Planning Guide* (NRT-1), *Technical Guidance for Hazards Analysis* (EPA/FEMA/DOT), *Handbook of Chemical Hazard Analysis Procedures* (FEMA/DOT/EPA), and *Emergency Management Guide for Business & Industry* (FEMA 141). These approaches to planning, which are briefly described here, incorporate the generic functional requirements of planning, although the steps and procedures may be defined somewhat differently. Jurisdictions and facilities should select and/or modify these models to best meet their unique planning needs and preferences.

Federal Emergency Management Agency, *Guide for All-Hazard Emergency Operations Planning*, SLG 101, September 1996.

Chapter 2 of this Guide, The Planning Process, describes principles and major steps recommended for developing an all-hazard plan for protecting lives and property within the jurisdiction. In particular, the benefits of a team approach to planning are emphasized, including the role of the Chief Executive Official (CEO). Steps in the development and continual refinement of an emergency operations plan (EOP) are summarized as follows:

I. **Research**—This phase involves reviewing the jurisdiction's planning framework, analyzing the hazards faced by the jurisdiction, determining the resource base, and noting characteristics of the jurisdiction that could affect emergency operations. Steps in research include:

A. Review applicable laws, regulatory requirements, local plans, mutual aid agreements, and existing guidance.

B. Conduct a Hazard/Risk Analysis
   1. Identify hazards
      a. List hazards that concern emergency management
      b. Determine whether these hazards have occurred or could occur
   2. Profile hazards and their potential consequences
      a. Develop information on each hazard (frequency, magnitude, location, etc.)
      b. Develop information on the potential consequences of the hazard
   3. Compare and prioritize risks
   4. Create and apply scenarios

C. Determine the resource base—list and quantify resources available for emergency response and recovery. Compare them with those needed for an effective emergency response to determine shortfalls.

D. Note special facets of the planning environment—geographic and topographic features that may affect operations, transportation routes, special populations, demographic and other trends, etc.

II. **Development**—During this phase, the EOP is written through steps similar to these: developing a rough draft of the basic plan, functional annexes, and hazard-specific appendices; conducting preliminary briefings and interviews; conducting initial planning meetings and establishing committees for parts of the EOP; working with committees on successive drafts; preparing necessary graphics, and producing and circulating a final draft for planning team review and comment; holding meetings to obtain feedback and concurrence from organizations with identified responsibilities under the plan; obtaining official promulgation of the EOP; and printing and distributing the EOP.

III. **Validation**—During this phase, the EOP is checked for conformity to applicable regulatory requirements and the standards of federal and state agencies. Recommended steps include conducting tabletop exercises with key representatives of tasked organizations as a practical means to help validate the plan; consulting with and participating in plans reviews with the next level of government; and using functional and full-scale emergency management exercises to determine if an EOP is understood and "works."

IV. **Maintenance**—As problems emerge, situations change, gaps become apparent, and requirements are altered, the plan must be continually adapted to remain useful and up-to-date. Possible steps include:

A. Remedial Action Process designed to (1) capture information from exercises, post-disaster critiques, self-assessments, audits, administrative reviews, and the like which may indicate deficiencies; (2) bring together members of the planning team to discuss problems and to consider and assign responsibility for remedies; and (3) tracking and following up on assigned actions.

B. Revision Process for review and modification of the EOP on at least an annual basis.

C. Implementing Documents to ensure that each tasked organization or individual develops the SOPs necessary to facilitate the accomplishment of assigned tasks.

Attachment C of the Guide, Hazardous Materials, provides additional information on plan requirements for locating hazardous materials at fixed facilities and on transport routes, estimating vulnerable zones, determining vulnerability, and assessing risk. Planning considerations unique to hazardous materials are described under the following major headings:

- Direction and control
- Emergency public information
- Evacuation
- Mass care
- Health and medical
- Resource management

National Response Team, *Hazardous Materials Emergency Planning Guide*, NRT-1, March 1987.

This guidance presents a comprehensive approach to hazardous materials planning. However, it is emphasized that every community must plan according to its own situation. Small communities with few planning resources, or communities with few or no threatening hazards, can choose the planning elements appropriate to their circumstances. Steps in the planning process can be summarized as follows:

I. Organizing the Planning Process
   - A. Selecting the planning team
   - B. Selecting the team leader
   - C. Organizing for planning team responsibilities, including staffing, managing the planning tasks, and the use of computers

II. Review of Existing Plans
   - A. Reviewing applicable state and local emergency plans
   - B. Consulting with state and local agencies and volunteer organizations, regional offices of federal agencies, local industry and industrial associations, the RRT and OSC, etc.

III. Hazards Analysis
- A. Hazards Identification
- B. Vulnerability Analysis
- C. Risk Analysis

IV. Capability Assessment—sample questions are presented to help the planning team evaluate preparedness, prevention, and response resources and capabilities in the following three categories:
- A. Facility resources
- B. Transporter resources
- C. Community resources

V. Developing the Plan
- A. Developing or revising a hazardous materials appendix to a multi-hazard EOP
- B. Developing or revising a plan covering only hazardous materials

Planning elements and plan requirements that should be considered in this phase of the process are described in detail, including the following fourteen response functions:

- Initial Notification of Response Agencies
- Direction and Control
- Communication (among Responders)
- Warning Systems and Emergency Public Notification
- Public Information/Community Relations
- Resource Management
- Health and Medical
- Response Personnel Safety
- Personal Protection of Citizens
- Fire and Rescue
- Law Enforcement
- Ongoing Incident Assessment
- Human Services
- Public Works

VI. Plan Appraisal and Continuing Planning
- A. Plan Review and Approval
  1. Internal review
  2. External review
- B. Keeping the plan up-to-date
- C. Continuing planning
  1. Exercises
  2. Incident review
  3. Training

U.S. Environmental Protection Agency, Federal Emergency Management Agency, and U.S. Department of Transportation, *Technical Guidance for Hazards Analysis*, December 1987.

This guidance is compatible with and recommends the same approach to hazardous materials planning as NRT-1. However, significantly more detail is presented on the Hazards Analysis step of the process. The hazards analysis is separated into two phases. The first phase is the initial screening of all facilities reporting Extremely Hazardous Substances (EHSs) on their premises in excess of their threshold planning quantities (TPQs). The initial screening is performed to establish priorities among reporting facilities using credible worst case assumptions. The second phase represents a reassessment by order of priority of the potential hazards posed by the reporting facilities. This is accomplished through the reevaluation of the assumptions used for the initial screening.

Both the initial screening and the reevaluation phases utilize the three basic steps of hazards analysis: hazards identification, vulnerability analysis, and risk analysis. Steps in the process are summarized as follows:

Initial Screening

I. Hazards Identification

A. List facilities that have reported EHSs in the community in excess of the TPQ.
B. Contact each facility on the list for information on the EHSs present.
C. Obtain information on transportation routes of EHSs, if possible.
D. Obtain information on hazardous materials, facilities, and transportation routes (other than for those with EHSs above the TPQ) listed by SERCs (optional).

II. Vulnerability Analysis

A. Estimate the vulnerable zone for screening using credible worst case assumptions.
B. Identify characteristics of human populations within the estimated vulnerable zone.
C. Identify critical facilities within the estimated vulnerable zone.

III. Risk Analysis

A. Collect information obtained in hazards identification and vulnerability analysis.
B. Make rough estimate of risks based on the likelihood of a release and severity of consequences.
C. Identify those facilities with higher priority due to the estimated risks they pose.

Planning for Facilities by Priority

IV. Hazards Identification

A. Contact each facility on the list and other expert sources for additional information.
B. Obtain additional information on typical transportation conditions, if possible.

V. Vulnerability Analysis

A. Reestimate the vulnerable zone using reevaluated assumptions from the facility and other expert sources.
B. Identify characteristics of human populations within the estimated vulnerable zone.
C. Identify critical facilities within the estimated vulnerable zone.

VI. Risk Analysis

A. Collect all information obtained in hazards identification and vulnerability analysis in a table.
B. Obtain additional information on community and facility safeguards, response capabilities, and accident records.
C. Make a judgment of the probability of release and severity of consequences.
D. Organize all information (from A, B, and C) in a matrix format.
E. Rank risks.
F. Develop or revise emergency plans for higher priority facilities.

Federal Emergency Management Agency, U.S. Department of Transportation, and U.S. Environmental Protection Agency, *Handbook of Chemical Hazard Analysis Procedures*.

This guide presents four basic steps for conducting a hazard analysis, and a related fifth step that takes advantage of the knowledge gained during the effort to develop a comprehensive emergency plan. These steps include:

I. Hazard Identification—location, identification, and characterization of potential spill sources and accident sites in the jurisdiction or locality of concern. This step essentially concludes with the identification and/or postulation of fundamental accident scenarios requiring further consideration and analysis. Results from the probability analysis which follows can often help in further refining these scenarios. Methods discussed include:

- Enforcement of right-to-know laws
- Use of fire department and building inspection records
- Industry questionnaires
- Meetings with business organizations and trade groups
- Meetings with individual business personnel
- Queries of rail, marine, and pipeline transportation companies
- Truck traffic surveys
- Use of permit records
- Use of the “Yellow Pages”
- Access to detailed chemical property data and hazard information

II. Probability Analysis—evaluation of the likelihood of individual accident scenarios. This step permits examination and/or prioritization of potential accident scenarios in terms of their probability of occurrence. Categories of activities discussed include:

- Bulk transportation by highway
- Bulk transportation by rail
- Bulk transportation by barge or other marine vessel
- Transportation by pipeline
- Bulk storage, processing, or handling at fixed facilities
- Transportation of packaged hazardous materials
- Transportation by air

III. Consequence Analysis—evaluation of the consequences and impacts associated with the occurrence of postulated accident scenarios. This step provides an understanding of the nature and outcome of an accident and permits examination and/or prioritization of scenarios in terms of their potential impact on people and property. The Automated Resource for Chemical Hazard Incident Evaluation (ARCHIE) computer program and a set of hazard assessment procedures and models are discussed.

IV. Risk Analysis—combination of results from the accident probability and consequence analysis efforts to provide a measure of overall risk associated with the specific activity or activities. The effort permits examination and/or prioritization of scenarios in terms of *overall* risk. Steps include:

- Definition of annual accident probability categories
- Definition of accident severity categories
- Application of screening guidelines

V. Formulation of a Planning Basis—use of the results of the above activities during actual development and preparation of an emergency plan. The material includes discussion of 43 separate topics in 13 subject areas, as follows:

- Notification
- Command and Communications
- Evacuation
- Fire response
- Health Care
- Personal Protection
- Public Relations
- Spill Containment and Cleanup
- Spill Documentation
- Spill Monitoring
- Post-Spill Recovery
- Training
- Waste Disposal

Federal Emergency Management Agency, *Emergency Management Guide for Business & Industry*, FEMA 141, October 1993.

This document emphasizes the emergency planning and management needs of business and industry. Four steps are identified in the planning process, as follows:

I. Establish a Planning Team
   A. Form the team
   B. Establish authority
   C. Issue a mission statement
   D. Establish a schedule and budget

II. Analyze Capabilities and Hazards
   A. Where do you stand right now?
      1. Review internal plans and policies
      2. Meet with outside groups
      3. Identify codes and regulations
      4. Identify critical products, services, and operations
      5. Identify internal resources and capabilities
      6. Identify external resources
      7. Do an insurance review

   B. Conduct a vulnerability analysis
      1. List potential emergencies
      2. Estimate probability
      3. Assess the potential human impact
      4. Assess the potential property impact
      5. Assess the potential business impact
      6. Assess internal and external resources
      7. Add the columns

III. Develop the Plan
- A. Identify challenges and prioritize activities
- B. Write the plan
- C. Establish a training schedule
- D. Coordinate with outside organizations
- E. Maintain contact with other corporate offices
- F. Review, conduct training and revise
- G. Seek final approval
- H. Distribute the plan

IV. Implement the Plan
- A. Integrate the plan into company operations
- B. Conduct training (including exercises and drills)
- C. Evaluate and modify the plan

The guide also identifies planning considerations that are unique to hazardous materials, as well as core operational considerations of emergency management, in the following categories:

- Direction and Control
- Communications
- Life Safety
- Property Protection
- Community Outreach
- Recovery and Restoration
- Administration and Logistics

The National Response Team's Integrated Contingency Plan Guidance

AGENCY: Environmental Protection Agency (EPA), U.S. Coast Guard (USCG), Minerals Management Service (MMS), Research and Special Programs Administration (RSPA), Occupational Safety and Health Administration (OSHA).

ACTION: Notice.

SUMMARY: The U.S. Environmental Protection Agency, as the chair of the National Response Team (NRT), is announcing the availability of the NRT's Integrated Contingency Plan Guidance (''one plan''). This guidance is intended to be used by facilities to prepare emergency response plans. The intent of the NRT is to provide a mechanism for consolidating multiple plans that facilities may have prepared to comply with various regulations into one functional emergency response plan or integrated contingency plan (ICP). This notice contains the suggested ICP outline as well as guidance on how to develop an ICP and demonstrate compliance with various regulatory requirements. The policies set out in this notice are intended solely as guidance.

ADDRESSES: Additional copies of this one-plan guidance can be obtained by writing to the following address: William Finan, U.S. Environmental Protection Agency, Mail Code 5101, 401 M Street SW, Washington, DC 20460. Copies of the ICP Guidance are also available by calling the EPCRA/RCRA/Superfund Hotline at (800) 424–9346 (in the Washington, DC, metropolitan area, (703) 412–9810). In addition, this guidance is available electronically at the home page of EPA's Chemical Emergency Preparedness and Prevention Office (http://www.epa.gov/swercepp/).

FOR FURTHER INFORMATION CONTACT: William Finan, U.S. Environmental Protection Agency, Mail Code 5101, 401 M Street, SW., Washington, DC 20460, at (202) 260–0030 (E-Mail homepage.ceppo@epamail.epa.gov—please include ''one plan'' in the subject line). In addition, the EPCRA/RCRA/Superfund Hotline can answer general questions about the guidance.

For further information and guidance on complying with specific regulations, contact: for EPA's Oil Pollution Prevention Regulation: Bobbie Lively-Diebold, U.S. Environmental Protection Agency, Mail Code 5203G, 401 M Street, SW., Washington, DC 20460, at (703) 356–8774 (E-Mail Lively.Barbara@epamail.epa.gov), or the SPCC Information Line at (202) 260–2342); for the U.S. Coast Guard's Facility Response Plan Regulation: LCDR Mark Hamilton, U.S. Coast Guard, Commandant (G–MOR), 2100 2nd Street, SW., Washington, DC 20593, at 202–267–1983 (E-Mail M.Hamilton/G-M03@CGSMTP.uscg.mil); for DOT/RSPA's Pipeline Response Plan Regulation: Jim Taylor, U.S. Department of Transportation, Room 2335, 400 7th Street, SW., Washington, DC 20590 at (202) 366–8860 (E-Mail OPATEAM@RSPA.DOT.GOV); for pertinent OSHA regulations, contact either your Regional or Area OSHA office; for DOI/MMS' Facility Response Plan Regulation: Larry Ake, U.S. Department of the Interior—Minerals Management Service, MS 4700, 381 Elden Street, Herndon, VA 22070–4817 at (703) 787–1567 (E-Mail Larry__Ake@SMTP.MMS.GOV); for EPA's Risk Management Program Regulation: William Finan (see above); and for RCRA's Contingency Planning Requirements, contact the EPCRA/RCRA/Superfund Hotline (see above).

The NRT welcomes comments on specific implementation issues related to this guidance. Please provide us with information about the successful use of this guidance, about problems with using this guidance, as well as suggestions for improving the guidance. Send comments to William Finan (see above) or to any of the other people listed in the previous paragraph.

SUPPLEMENTARY INFORMATION:

Presidential Review Findings

Section 112(r)(10) of the Clean Air Act required the President to conduct a review of federal release prevention, mitigation, and response authorities. The Presidential Review was delegated to EPA, in coordination with agencies and departments that are members of the National Response Team (NRT). The Presidential Review concluded that, while achieving its statutory goals to protect public safety and the environment, the current system is complex, confusing, and costly. It identified several key problem areas and recommended a second phase to address these issues. One of the issues identified by the Presidential Review is the multiple and overlapping federal requirements for facility emergency response plans.

NRT Policy Statement

This one-plan guidance is intended to be used by facilities to prepare emergency response plans for responding to releases of oil and non-radiological hazardous substances. The intent of NRT is to provide a mechanism for consolidating multiple plans that facilities may have prepared to comply with various regulations into one functional emergency response plan or integrated contingency plan (ICP). A number of statutes and regulations, administered by several federal agencies, include requirements for emergency response planning. A particular facility may be subject to one or more of the following federal regulations:

- EPA's Oil Pollution Prevention Regulation (SPCC and Facility Response Plan Requirements)—40 CFR part 112.7(d) and 112.20–.21;
- MMS's Facility Response Plan Regulation—30 CFR part 254;
- RSPA's Pipeline Response Plan Regulation—49 CFR part 194;
- USCG's Facility Response Plan Regulation—33 CFR part 154, Subpart F;
- EPA's Risk Management Programs Regulation—40 CFR part 68;
- OSHA's Emergency Action Plan Regulation—29 CFR 1910.38(a);
- OSHA's Process Safety Standard—29 CFR 1910.119;
- OSHA's HAZWOPER Regulation—29 CFR 1910.120; and
- EPA's Resource Conservation and Recovery Act Contingency Planning Requirements—40 CFR part 264, Subpart D, 40 CFR part 265, Subpart D, and 40 CFR 279.52.

In addition, facilities may also be subject to state emergency response planning requirements that this guidance does not specifically address. Facilities are encouraged to coordinate development of their ICP with relevant state and local agencies to ensure compliance with any additional regulatory requirements.

Individual agencies' planning requirements and plan review procedures are not changed by the advent of the ICP format option. This one-plan guidance has been developed

to assist facilities in demonstrating compliance with the existing federal emergency response planning requirements referenced above. Although it does not relieve facilities from their current obligations, it has been designed specifically to help meet those obligations. Adherence to this guidance is not required in order to comply with federal regulatory requirements. Facilities are free to continue maintaining multiple plans to demonstrate federal regulatory compliance; however, the NRT believes that an integrated plan prepared in accordance with this guidance is a preferable alternative.

The NRT realizes that many existing regulations pertaining to contingency planning require review by a specific agency to determine compliance with applicable requirements. It is not the intent of the NRT to modify existing agency review procedures or to supersede the requirements of a regulation.

This one-plan guidance was developed through a cooperative effort among numerous NRT agencies, state and local officials, and industry and community representatives. The NRT and the agencies responsible for reviewing and approving federal response plans to which the ICP option applies agree that integrated response plans prepared in the format provided in this guidance will be acceptable and be the federally preferred method of response planning. The NRT realizes that alternate formats for integrating multiple plans already exist and that others likely will be developed. Certain facilities may find those formats more desirable than the one proposed here. The NRT believes that a single functional plan is preferable to multiple plans regardless of the specific format chosen. While they are acceptable, other formats may not allow the same ease of coordination with external plans. In any case, whatever format a facility chooses, no individual NRT agency will require an integrated response planning format differing from the ICP format described here. The NRT anticipates that future development of all federal regulations addressing emergency response planning will incorporate use of the ICP guidance. Also, developers of state and local requirements will be encouraged to be consistent with this document.

The ICP guidance does not change existing regulatory requirements; rather, it provides a format for organizing and presenting material currently required by the regulations. Individual regulations are often more detailed than the ICP guidance. To ensure full compliance, facilities should continue to read and comply with all of the federal regulations that apply to them. Furthermore, facilities submitting an ICP (in whatever format) for agency or department review will need to provide a cross-reference to existing regulatory requirements so that plan reviewers can verify compliance with these requirements. The guidance contains a series of matrices designed to assist owners and operators in consolidating various plans and documenting compliance with federal regulatory requirements. (See Attachments 2 and 3.) The matrices can be used as the basis for developing a cross-reference to various regulatory requirements.

This guidance also provides a useful contingency planning template for owners and operators of facilities not subject to the federal regulations cited previously.

Integrated Contingency Plan Philosophy

The ICP will minimize duplication in the preparation and use of emergency response plans at the same facility and will improve economic efficiency for both the regulated and regulating communities. Facility expenditures for the preparation, maintenance, submission, and update of a single plan should be much lower than for multiple plans.

The use of a single emergency response plan per facility will eliminate confusion for facility first responders who often must decide which of their plans is applicable to a particular emergency. The guidance is designed to yield a highly functional document for use in varied emergency situations while providing a mechanism for complying with multiple agency requirements. Use of a single integrated plan should also improve coordination between facility response personnel and local, state, and federal emergency response personnel.

The adoption of a standard plan format should facilitate integration of plans within a facility, in the event that large facilities may need to prepare separate plans for distinct operating units. The ICP concept should also allow coordination of facility plans with plans that are maintained by local emergency planning committees (LEPCs),[1] Area Committees,[2] co-operatives, and mutual aid organizations. In some cases, there are specific regulatory requirements to ensure that facility plans are consistent with external planning efforts. Industry use of this guidance along with active participation on local and Area Committees will improve the level of emergency preparedness and is therefore highly encouraged.

In some areas, it may be possible to go beyond simple coordination of plans and actually integrate certain information from facility plans with corresponding areas of external plans. The adoption of a single, common ICP outline such as the one proposed in this guidance would facilitate a move toward integration of facility plans with local, state, and federal plans.

The projected results described above will ultimately serve the mutual goal of the response community to more efficiently and effectively protect public health, worker safety, the environment, and property.

Scope

This one-plan guidance is provided for any facility subject to federal contingency planning regulations and is also recommended for use by other facilities to improve emergency preparedness through planning. In this context, the term ''facility'' is meant to have a wide connotation and may include, but is not limited to, any mobile or fixed onshore or offshore building, structure, installation, equipment, pipe, or pipeline.

Facility hazards need to be addressed in a comprehensive and coordinated manner. Accordingly, this guidance is broadly constructed to allow for facilities to address a wide range of risks in a manner tailored to the specific needs of the facility. This includes both physical and chemical hazards associated with events such as chemical releases, oil spills, fires, explosions, and natural disasters.

Organizational Concepts

The ICP format provided in this one-plan guidance (See Attachment 1) is organized into three main sections: an introductory section, a core plan, and a series of supporting annexes. It is important to note that the elements contained in these sections are not new concepts, but accepted emergency response activities that are currently addressed in various forms in existing contingency planning regulations. The goal of the NRT is not to create new planning requirements, but to provide a mechanism to consolidate existing concepts into a single functional plan structure. This approach would provide a consistent basis for addressing

[1] LEPC plans are developed by LEPCs in coordination with facility emergency response coordinators under section 303 of the Emergency Planning and Community Right-to-Know Act.

[2] Area Contingency Plans are developed by Area Committees pursuant to section 4202(a)(6) of the Oil Pollution Act of 1990 (OPA).

emergency response concerns as it gains widespread use among facilities.

The introduction section of the plan format is designed to provide facility response personnel, outside responders, and regulatory officials with basic information about the plan and the entity it covers. It calls for a statement of purpose and scope, a table of contents, information on the current revision date of the plan, general facility information, and the key contact(s) for plan development and maintenance. This section should present the information in a brief factual manner.

The structure of the sample core plan and annexes in this guidance is based on the structure of the National Interagency Incident Management System (NIIMS) Incident Command System (ICS). NIIMS ICS is a nationally recognized system currently in use by numerous federal, state, and local organizations (e.g., some Area Committees under OPA). NIIMS ICS is a type of response management system that has been used successfully in a variety of emergency situations, including releases of oil or hazardous substances. NIIMS ICS provides a commonly understood framework that allows for effective interaction among response personnel. Organizing the ICP along the lines of the NIIMS ICS will allow the plan to dovetail with established response management practices, thus facilitating its ease of use during an emergency.

The core plan is intended to contain essential response guidance and procedures. Annexes would contain more detailed supporting information on specific response management functions. The core plan should contain frequent references to the response critical annexes to direct response personnel to parts of the ICP that contain more detailed information on the appropriate course of action for responders to take during various stages of a response. Facility planners need to find the right balance between the amount of information contained in the core plan versus the response critical annexes (Annexes 1 through 3). Information required to support response actions at facilities with multiple hazards will likely be contained in the annexes. Planners at facilities with fewer hazards may choose to include most if not all information in the core plan. Other annexes (e.g., Annexes 4 through 8) are dedicated to providing information that is non-critical at the time of a response (e.g., cross-references to demonstrate regulatory compliance and background planning information). Consistent with the goal of keeping the size of the ICP as manageable as practicable, it is not necessary for a plan holder to provide its field responders with all the compliance documentation (e.g., Annexes 4 through 8) that it submits to regulatory agencies. Similarly, it may not be necessary for a plan holder to submit all annexes to every regulatory agency for review.

Basic headings are consistent across the core plan and annexes to facilitate ease of use during an emergency. These headings provide a comprehensive list of elements to be addressed in the core plan and response annexes and may not be relevant to all facilities. Planners should address those regulatory elements that are applicable to their particular facilities. Planners at facilities with multiple hazards will need to address most, if not all, elements included in this guidance. Planners at facilities with fewer hazards may not need to address certain elements. If planners choose to strictly adopt the ICP outline contained in this guidance but are not required by regulation to address all elements of the outline, they may simply indicate ''not applicable'' for those items where no information is provided. A more detailed discussion of the core plan and supporting annexes follows.

Core Plan

The core plan is intended to reflect the essential steps necessary to initiate, conduct, and terminate an emergency response action: recognition, notification, and initial response, including assessment, mobilization, and implementation. This section of the plan should be concise and easy to follow. A rule of thumb is that the core plan should fit in the glovebox of a response vehicle. The core plan need not detail all procedures necessary under these phases of a response but should provide information that is time critical in the earliest stages of a response and a framework to guide responders through key steps necessary to mount an effective response. The response action section should be convenient to use and understandable at the appropriate skill level.

The NRT recommends the use of checklists or flowcharts wherever possible to capture these steps in a concise easy-to-understand manner. The core plan should be constructed to contain references to appropriate sections of the supporting annexes for more detailed guidance on specific procedures. The NRT anticipates that for a large, complex facility with multiple hazards the annexes will contain a significant amount of information on specific procedures to follow. For a small facility with a limited number of hazard scenarios, the core plan may contain most if not all of the information necessary to carry out the response thus obviating the need for more detailed annexes. The checklists, depending on their size and complexity, can be in either the core or the support section.

The core plan should reflect a hierarchy of emergency response levels. A system of response levels is commonly used in emergency planning for classifying emergencies according to seriousness and assigning an appropriate standard response or series of response actions to each level. Both complex and simple industrial facilities use a system of response levels for rapidly assessing the seriousness of an emergency and developing an appropriate response. This process allows response personnel to match the emergency and its potential impacts with appropriate resources and personnel. The concept of response levels should be considered in developing checklists or flowcharts designed to serve as the basis for the core plan. Note that for those facilities subject to planning requirements under OPA, response levels in the core plan may not necessarily correspond to discharge planning amounts (e.g., average most probable discharge, maximum most probable discharge, and worst case discharge).

Facility owners and operators should determine appropriate response levels based on 1) the need to initiate time-urgent response actions to minimize or prevent unacceptable consequences to the health and safety of workers, the public, or the environment; and 2) the need to communicate critical information concerning the emergency to offsite authorities. The consideration and development of response levels should, to the extent practicable, be consistent with similar efforts that may have been taken by the LEPC, local Area Committee, or mutual aid organization. Response levels, which are used in communications with offsite authorities, should be fully coordinated and use consistent terminology.

Annexes

The annexes are designed to provide key supporting information for conducting an emergency response under the core plan as well as document compliance with regulatory requirements not addressed elsewhere in the ICP. Annexes are not meant to duplicate information that is already contained in the core plan, but to augment core plan information. The annexes should relate to the basic

headings of the core plan. To accomplish this, the annexes should contain sections on facility information, notification, and a detailed description of response procedures under the response management system (i.e, command, operations, planning, logistics, and finance). The annexes should also address issues related to post accident investigation, incident history, written follow-up reports, training and exercises, plan critique and modification process, prevention, and regulatory compliance, as appropriate.

The ICP format contained in this guidance is based on the NIIMS ICS. If facility owners or operators choose to follow fundamental principles of the NIIMS ICS, then they may adopt NIIMS ICS by reference rather than having to describe the system in detail in the plan. The owner or operator should identify where NIIMS ICS documentation is kept at the facility and how it will be accessed if needed by the facility or requested by the reviewing agency. Regardless of the response management system used, the plan should include an organization chart, specific job descriptions,[3] a description of information flow ensuring liaison with the on-scene coordinator (OSC), and a description of how the selected response management system integrates with a Unified Command.[4] If a system other than NIIMS ICS is used, the plan should also identify how it differs from NIIMS or provide a detailed description of the system used.

The NRT anticipates that the use of linkages (i.e., references to other plans) when developing annexes will serve several purposes. Linkages will facilitate integration with other emergency plans within a facility (until such plans can be fully incorporated into the ICP) and with external plans, such as LEPC plans and Area Contingency Plans (ACPs). Linkages will also help ensure that the annexes do not become too cumbersome. The use of references to information contained in external plans does not relieve facilities from regulatory requirements to address certain elements in a facility-specific manner and to have information readily accessible to responders. When determining what information may be linked by reference and what needs to be contained in the ICP, response planners should carefully consider the time critical nature of the information. If instructions or procedures will be needed immediately during an incident response, they should be presented for ready access in the ICP. The following information would not normally be well-suited for reference to documents external to the ICP: core plan elements, facility and locality information (to allow for quick reference by responders on the layout of the facility and the surrounding environment and mitigating actions for the specific hazard(s) present), notification procedures, details of response management personnel's duties, and procedures for establishing the response management system. Although linkages provide the opportunity to utilize information developed by other organizations, facilities should note that many LEPC plans and ACPs may not currently possess sufficient detail to be of use in facility plans or the ICP. This information may need to be developed by the facility until detailed applicable information from broader plans is available.

In all cases, referenced materials must be readily available to anticipated plan users. Copies of documents that have been incorporated by reference need not be submitted unless it is required by regulation. The appropriate sections of referenced documents that are unique to the facility, those that are not nationally recognized, those that are required by regulation, and those that could not reasonably be expected to be in the possession of the reviewing agency, should be provided when the plan is submitted for review and/or approval. Discretion should be used when submitting documents containing proprietary data. It is, however, necessary to identify in the ICP the specific section of the document being incorporated by reference, where the document is kept, and how it will be accessed if needed by the facility or requested by the reviewing agency. In addition, facility owners or operators are reminded to take note of submission requirements of specific regulations when determining what materials to provide an agency for review as it may not be necessary to submit all parts of an ICP to a particular agency.

As discussed previously, this guidance contains a series of matrices designed to assist owners and operators in the plan consolidation process and in the process of ensuring and documenting compliance with regulatory requirements. The matrix in Attachment 2 to this guidance displays areas of current regulations that align with the suggested elements contained in this guidance document. When addressing each element of the ICP outline, plan drafters can refer to this matrix to identify specific regulatory requirements related to that element. The matrices in Attachment 3 to this guidance display regulatory requirements as contained in each of the regulations listed in the NRT policy statement above (which are applicable to many facilities) along with an indication of where in the suggested ICP outline these requirements should be addressed. If a facility chooses to follow the ICP outline, these matrices can be included as Annex 8 to a facility's ICP to provide the necessary cross-reference for plan reviewers to document compliance with various regulatory requirements. To the extent that a plan deviates from the suggested ICP outline, plan drafters will have to alter the matrices to ensure that the location of regulatory requirements within the ICP is clearly identified for plan reviewers.

Integrated Contingency Plan Elements

Presented below is a list of elements to be addressed in the ICP and a brief explanation, displayed in italicized text, of the nature of the information to be contained in that section of the ICP. Attachment 1 presents the complete outline of the ICP without the explanatory text. As discussed previously, the elements are organized into three main sections: plan introduction, core plan, and response annexes.

Section I—Plan Introduction Elements

1. Purpose and Scope of Plan Coverage

This section should provide a brief overview of facility operations and describe in general the physical area, and nature of hazards or events to which the plan is applicable. This brief description will help plan users quickly assess the relevancy of the plan to a particular type of emergency in a given location. This section should also include a list of which regulation(s) are being addressed in the ICP.

[3] OPA 90 planning requirements for marine transfer facilities (33 CFR 154.1035) require job descriptions for each spill management team member regardless of the response management system employed by the facility.

[4] Under NIIMS ICS, the command module has traditionally been represented by a single incident commander (supported by a command staff) who directs efforts of and receives input from the four supporting functional areas (planning, logistics, operations, and finance). More recently, a Unified Command System as described in the National Oil and Hazardous Substances Pollution Contingency Plan (NCP) found at 40 CFR part 300 has been used for larger spill responses where the command module is comprised of representatives from the federal government (i.e., federal on-scene coordinator), state government (state on-scene coordinator), and the responsible party working in a cooperative manner. Unified Command allows all parties who have jurisdictional or functional responsibility for the incident to jointly develop a common set of incident objectives and strategies. Such coordination should be guided by procedures found in the NCP (see figure 1a at 40 CFR 300.105(e)(1)) and the applicable Area Contingency Plan.

2. Table of Contents

This section should clearly identify the structure of the plan and include a list of annexes. This will facilitate rapid use of the plan during an emergency.

3. Current Revision Date

This section should indicate the date that the plan was last revised to provide plan users with information on the currency of the plan. More detailed information on plan update history (i.e., a record of amendments) may be maintained in Annex 6 (Response Critique and Plan Review and Modification Process).

4. General Facility Identification Information

a. Facility name
b. Owner/operator/agent (include physical and mailing address and phone number)
c. Physical address of the facility (include county/parish/borough, latitude/longitude, and directions)
d. Mailing address of the facility (correspondence contact)
e. Other identifying information (e.g., ID numbers, SIC Code, oil storage start-up date)
f. Key contact(s) for plan development and maintenance
g. Phone number(s) for key contact(s)
h. Facility phone number
i. Facility fax number

This section should contain a brief profile of the facility and its key personnel to facilitate rapid identification of key administrative information.

Section II - Core Plan Elements

1. Discovery

This section should address the initial action the person(s) discovering an incident will take to assess the problem at hand and access the response system. Recognition, basic assessment, source control (as appropriate), and initial notification of proper personnel should be addressed in a manner that can be easily understood by everybody in the facility. The use of checklists or flowcharts is highly recommended.

2. Initial Response

a. Procedures for internal and external notifications (i.e., contact, organization name, and phone number of facility emergency response coordinator, facility response team personnel, federal, state, and local officials)
b. Establishment of a response management system
c. Procedures for preliminary assessment of the situation, including an identification of incident type, hazards involved, magnitude of the problem, and resources threatened
d. Procedures for establishment of objectives and priorities for response to the specific incident, including:
  (1) Immediate goals/tactical planning (e.g., protection of workers and public as priorities)
  (2) Mitigating actions (e.g., discharge/release control, containment, and recovery, as appropriate)
  (3) Identification of resources required for response
e. Procedures for implementation of tactical plan
f. Procedures for mobilization of resources

This section should provide for activation of the response system following discovery of the incident. It should include an established 24-hour contact point (i.e., that person and alternate who is called to set the response in motion) and instructions for that person on who to call and what critical information to pass. Plan drafters should also consider the need for bilingual notification. It is important to note that different incident types require that different parties be notified. Appropriate federal, State, and local notification requirements should be reflected in this section of the ICP. Detailed notification lists may be included here or in Annex 2, depending upon the variety of notification schemes that a facility may need to implement. For example, the release of an extremely hazardous substance will require more extensive notifications (i.e., to State Emergency Response Commissions (SERCs) and LEPCs) than a discharge of oil. Even though no impacts or awareness are anticipated outside the site, immediate external notifications are required for releases of CERCLA and EPCRA substances. Again, the use of forms, such as flowcharts, checklists, call-down lists, is recommended.

This section should instruct personnel in the implementation of a response management system for coordinating the response effort. More detailed information on specific components and functions of the response management system (e.g., detailed hazard assessment, resource protection strategies) may be provided in annexes to the ICP.

This part of the plan should then provide information on problem assessment, establishment of objectives and priorities, implementation of a tactical plan, and mobilization of resources. In establishing objectives and priorities for response, facilities should perform a hazard assessment using resources such as Material Safety Data Sheets (MSDSs) or the Chemical Hazard Response Information System (CHRIS) manual. Hazardous Materials Emergency Planning Guide (NRT–1), developed by the NRT to assist community personnel with emergency response planning, provides guidance on developing hazard analyses. If a facility elects to provide detailed hazard analysis information in a response annex, then a reference to that annex should be provided in this part of the core plan.

Mitigating actions must be tailored to the type of hazard present. For example, containment might be applicable to an oil spill (i.e., use of booming strategies) but would not be relevant to a gas release. The plan holder is encouraged to develop checklists, flowcharts, and brief descriptions of actions to be taken to control different types of incidents. Relevant questions to ask in developing such materials include:

- *What type of emergency is occurring?*
- *What areas/resources have been or will be affected?*
- *Do we need an exclusion zone?*
- *Is the source under control?*
- *What type of response resources are needed?*

3. Sustained Actions

This section should address the transition of a response from the initial emergency stage to the sustained action stage where more prolonged mitigation and recovery actions progress under a response management structure. The NRT recognizes that most incidents are able to be handled by a few individuals without implementing an extensive response management system. This section of the core plan should be brief and rely heavily on references to specific annexes to the ICP.

4. Termination and Follow-Up Actions

This section should briefly address the development of a mechanism to ensure that the person in charge of mitigating the incident can, in coordination with the federal or state OSC as necessary, terminate the response. In the case of spills, certain regulations may become effective once the ''emergency'' is declared over. The section should describe how the orderly demobilization of response resources will occur. In addition, follow-up actions associated with termination of a response (e.g., accident investigation, response critique, plan review, written follow-up reports) should also be outlined in this section. Plan drafters

may reference appropriate annexes to the ICP in this section of the core plan.

Section III—Annexes

Annex 1. Facility and Locality Information

a. Facility maps
b. Facility drawings
c. Facility description/layout, including identification of facility hazards and vulnerable resources and populations on and off the facility which may be impacted by an incident

This annex should provide detailed information to responders on the layout of the facility and the surrounding environment. The use of maps and drawings to allow for quick reference is preferable to detailed written descriptions. These should contain information critical to the response such as the location of discharge sources, emergency shut-off valves and response equipment, and nearby environmentally and economically sensitive resources and human populations (e.g., nursing homes, hospitals, schools). The ACP and LEPC plan may provide specific information on sensitive environments and populations in the area. EPA Regional Offices, Coast Guard Marine Safety Offices, and LEPCs can provide information on the status of efforts to identify such resources. Plan holders may need to provide additional detail on sensitive areas near the facility. In addition, this annex should contain other facility information that is critical to response and should complement but not duplicate information contained in part 4 of the plan introduction section containing administrative information on the facility.

Annex 2. Notification

a. Internal notifications
b. Community notifications
c. Federal and state agency notifications

This annex should detail the process of making people aware of an incident (i.e., who to call, when the call must be made, and what information/data to provide on the incident). The incident commander is responsible for ensuring that notifications are carried out in a timely manner but is not necessarily responsible for making the notifications. ACPs, Regional Contingency Plans (RCPs), and LEPC plans should be consulted and referenced as a source of information on the roles and responsibilities of external parties that are to be contacted. This information is important to help company responders understand how external response officials fit into the picture. Call-down lists must be readily accessible to ensure rapid response. Notification lists provided in the core plan need not be duplicated here but need to be referenced.

Annex 3. Response Management System

This annex should contain a general description of the facility's response management system as well as contain specific information necessary to guide or support the actions of each response management function (i.e., command, operations, planning, logistics, and finance) during a response.

a. General

If facility owners or operators choose to follow the fundamental principles of NIIMS ICS (see discussion of annexes above), then they may adopt NIIMS ICS by reference rather than having to describe the response management system in detail in the plan. In this section of Annex 3, planners should briefly address either 1) basic areas where their response management system is at variance with NIIMS ICS or 2) how the facility's organization fits into the NIIMS ICS structure. This may be accomplished through a simple organizational diagram.

If facility owners or operators choose not to adopt the fundamental principles of NIIMS ICS, this section should describe in detail the structure of the facility response management system. Regardless of the response management system used, this section of the annex should include the following information:

- *Organizational chart;*
- *Specific job description for each position;*[5]
- *A detailed description of information flow; and*
- *Description of the formation of a unified command within the response management system.*

b. Command

(1) List facility Incident Commander and Qualified Individual (if applicable) by name and/or title and provide information on their authorities and duties.

This section of Annex 3 should describe the command aspects of the response management system that will be used (i.e., reference NIIMS ICS or detail the facility's response management system). The location(s) of predesignated command posts should also be identified.

(2) Information (i.e., internal and external communications).

This section of Annex 3 should address how the facility will disseminate information internally (i.e., to facility/response employees) and externally (i.e., to the public). For example, this section might address how the facility would interact with local officials to assist with public evacuation and other needs. Items to consider in developing this section include press release statement forms, plans for coordination with the news media, community relations plan, needs of special populations, and plans for families of employees.

(3) Safety.

This section of Annex 3 should include a process for ensuring the safety of responders. Facilities should reference responsibilities of the safety officer, federal/state requirements (e.g., HAZWOPER), and safety provisions of the ACP. Procedures for protecting facility personnel should be addressed (i.e., evacuation signals and routes, sheltering in place).

(4) Liaison—Staff Mobilization.

This section of Annex 3 should address the process by which the internal and external emergency response teams will interact. Given that parallel mobilization may be occurring by various response groups, the process of integration (i.e., unified command) should be addressed. This includes a process for communicating with local emergency management especially where safety of the general public is concerned.

c. Operations

(1) Operational response objectives
(2) Discharge or release control
(3) Assessment/monitoring
(4) Containment
(5) Recovery
(6) Decontamination
(7) Non-responder medical needs, including information on ambulances and hospitals
(8) Salvage plans

This section of Annex 3 should contain a discussion of specific operational procedures to respond to an incident. It is important to note that response operations are driven by the type of incident. That is, a response to an oil spill will differ markedly from a response to a release of a toxic gas to the air. Plan drafters should tailor response procedures to the particular hazards in place at the facility. A facility with limited hazards may have relatively few procedures. A larger more complex facility with numerous hazards is likely to have a series of procedures

[5] OPA 90 planning requirements for marine transfer facilities (33 CFR 154.1035) require job descriptions for each spill management team member regardless of the response management system employed by the facility.

designed to address the nuances associated with each type of incident.

d. Planning

(1) Hazard assessment, including facility hazards identification, vulnerability analysis, prioritization of potential risks.

This section of Annex 3 should present a detailed assessment of all potential hazards present at the facility, an analysis of vulnerable receptors (e.g., human populations, both workers and the general public, environmentally sensitive areas, and other facility-specific concerns) and a discussion of which risks deserve primary consideration during an incident. NRT–1 contains guidance on conducting a hazard analysis. Also, ACPs and LEPC plans may provide information on environmentally sensitive and economically important areas, human populations, and protection priorities. Plan drafters should address the full range of risks present at the facility. By covering actions necessary to respond to a range of incident types, plan holders can be prepared for small, operational discharges and large catastrophic releases. One approach that is required by certain regulations, such as the Clean Air Act (CAA) and OPA is to develop planning scenarios for certain types and sizes of releases (i.e., worst case discharge). Facilities may address such planning scenarios and associated calculations in this section of Annex 3 or as part of a separate annex depending on the size and complexity of the facility.

(2) Protection

This section of Annex 3 should present a discussion of strategies for protecting the vulnerable receptors identified through the hazard analysis. Primary consideration should be given to minimizing those risks identified as a high priority. Activities to be considered in developing this section include: population protection; protective booming; dispersant use, in-situ burning, bioremediation; water intake protection; wildlife recovery/ rehabilitation; natural remediation; vapor suppression; and monitoring, sampling, and modeling. ACPs and LEPC plans may contain much of this information.

(3) Coordination with natural resource trustees.

This section should address coordination with government natural resource trustees. In their role as managers of and experts in natural resources, trustees assist the federal OSC in developing or selecting removal actions to protect these resources. In this role, they serve as part of the response organization working for the federal OSC. A key area to address is interaction with facility response personnel in protection of natural resources.

Natural resource trustees are also responsible to act on behalf of the public to present a claim for and recover damages to natural resources injured by an oil spill or hazardous substance release. The process followed by the natural resource trustees, natural resource damage assessment (NRDA), generally involves some data collection during emergency response. NRDA regulations provide that the process may be carried out in cooperation with the responsible party. Thus, the facility may wish to plan for how that cooperation will occur, including designation of personnel to work with trustees in NRDA.

(4) Waste management.

This section should address procedures for the disposal of contaminated materials in accordance with federal, state, and local requirements.

e. Logistics

(1) Medical needs of responders
(2) Site security
(3) Communications (internal and external resources)
(4) Transportation (air, land, water)
(5) Personnel support (e.g., meals, housing, equipment)
(6) Equipment maintenance and support

This section of the Annex 3 should address how the facility will provide for the operational needs of response operations in each of the areas listed above. For example, the discussion of personnel support should address issues such as: volunteer training; management; overnight accommodations; meals; operational/ administrative spaces; and emergency procedures. The NRT recognizes that certain logistical considerations may not be applicable to small facilities with limited hazards.

f. Finance/procurement/administration

(1) Resource list
(2) Personnel management
(3) Response equipment
(4) Support equipment
(5) Contracting
(6) Claims procedures
(7) Cost documentation

This section of Annex 3 should address the acquisition of resources (i.e., personnel and equipment) for the response and monitoring of incident-related costs. Lists of available equipment in the local and regional area and how to procure such equipment as necessary should be included. Information on previously established agreements (e.g., contracts) with organizations supplying personnel and equipment (e.g., oil spill removal organizations) also should be included. This section should also address methods to account for resources expended and to process claims resulting from the incident.

Annex 4. Incident Documentation

a. Post accident investigation
b. Incident history

This annex should describe the company's procedures for conducting a follow-up investigation of the cause of the accident, including coordination with federal, State, and local officials. This annex should also contain an accounting of incidents that have occurred at the facility, including information on cause, amount released, resources impacted, injuries, response actions, etc. This annex should also include information that may be required to prove that the facility met its legal notification requirements with respect to a given incident, such as a signed record of initial notifications and certified copies of written follow-up reports submitted after a response.

Annex 5. Training and Exercises/Drills

This annex should contain a description of the training and exercise program conducted at the facility as well as evidence (i.e., logs) that required training and exercises have been conducted on a regular basis. Facilities may follow appropriate training or exercise guidelines (e.g., National Preparedness for Response Exercise Program Guidelines) as allowed under the various regulatory requirements.

Annex 6. Response Critique and Plan Review and Modification Process

This annex should describe procedures for modifying the plan based on periodic plan review or lessons learned through an exercise or a response to an actual incident. Procedures to critique an actual or simulated response should be a part of this discussion. A list of plan amendments (i.e., history of updates) should also be contained in this annex. Plan modification should be viewed as a part of a facility's continuous improvement process.

Annex 7. Prevention

Some federal regulations that primarily address prevention of accidents include elements that relate to contingency planning (e.g., EPA's RMP and SPCC regulations and OSHA's Process Safety Standard). This annex is designed to allow facilities to include

prevention-based requirements (e.g., maintenance, testing, in-house inspections, release detection, site security, containment, fail safe engineering) that are required in contingency planning regulations or that have the potential to impact response activities covered in a contingency plan. The modular nature of the suggested plan outline provides planners with necessary flexibility to include prevention requirements in the ICP. This annex may not need to be submitted to regulatory agencies for review.

Annex 8. Regulatory Compliance and Cross-Reference Matrices

This annex should include information necessary for plan reviewers to determine compliance with specific regulatory requirements. To the extent that plan drafters did not include regulatory required elements in the balance of the ICP, they should be addressed in this annex. This annex should also include signatory pages to convey management approval and certifications required by the regulations, such as certification of adequate response resources and/or statements of regulatory applicability as required by regulations under OPA authority. Finally, this annex should contain cross-references that indicate where specific regulatory requirements are addressed in the ICP for each regulation covered under the plan. As discussed previously, Attachment 3 contains a series of matrices designed to fulfill this need in those instances where plan drafters adhere to the outline contained in this guidance.

Attachment 1—ICP Outline

Section I—Plan Introduction Elements

1. Purpose and Scope of Plan Coverage
2. Table of Contents
3. Current Revision Date
4. General Facility Identification Information
   a. Facility name
   b. Owner/operator/agent (include physical and mailing address and phone number)
   c. Physical address of the facility (include county/parish/borough, latitude/longitude, and directions)
   d. Mailing address of the facility (correspondence contact)
   e. Other identifying information (e.g., ID numbers, SIC Code, oil storage start-up date)
   f. Key contact(s) for plan development and maintenance
   g. Phone number for key contact(s)
   h. Facility phone number
   i. Facility fax number

Section II—Core Plan Elements

1. Discovery
2. Initial Response
   a. Procedures for internal and external notifications (i.e., contact, organization name, and phone number of facility emergency response coordinator, facility response team personnel, federal, state, and local officials)
   b. Establishment of a response management system
   c. Procedures for preliminary assessment of the situation, including an identification of incident type, hazards involved, magnitude of the problem, and resources threatened
   d. Procedures for establishment of objectives and priorities for response to the specific incident, including:
   (1) Immediate goals/tactical planning (e.g., protection of workers and public as priorities)
   (2) Mitigating actions (e.g., discharge/release control, containment, and recovery, as appropriate)
   (3) Identification of resources required for response
   e. Procedures for implementation of tactical plan
   f. Procedure for mobilization of resources
3. Sustained Actions
4. Termination and Follow-Up Actions

Section III-Annexes

Annex 1. Facility and Locality Information

a. Facility maps
b. Facility drawings
c. Facility description/layout, including identification of facility hazards and vulnerable resources and populations on and off the facility which may be impacted by an incident

Annex 2. Notification

a. Internal notifications
b. Community notifications
c. Federal and state agency notifications

Annex 3. Response Management System

a. General
b. Command
   (1) List facility Incident Commander and Qualified Individual (if applicable) by name and/or title and provide information on their authorities and duties
   (2) Information (i.e., internal and external communications)
   (3) Safety
   (4) Liaison—Staff mobilization
c. Operations
   (1) Operational response objectives
   (2) Discharge or release control
   (3) Assessment/monitoring
   (4) Containment
   (5) Recovery
   (6) Decontamination
   (7) Non-responder medical needs including information on ambulances and hospitals
   (8) Salvage plans
d. Planning
   (1) Hazard assessment, including facility hazards identification, vulnerability analysis, prioritization of potential risks
   (2) Protection
   (3) Coordination with natural resource trustees
   (4) Waste management
e. Logistics
   (1) Medical needs of responders
   (2) Site security
   (3) Communications (internal and external resources)
   (4) Transportation (air, land, water)
   (5) Personnel support (e.g., meals, housing, equipment)
   (6) Equipment maintenance and support
f. Finance/procurement/administration
   (1) Resource list
   (2) Personnel management
   (3) Response equipment
   (4) Support equipment
   (5) Contracting
   (6) Claims procedures
   (7) Cost documentation

Annex 4. Incident Documentation

a. Post accident investigation
b. Incident history

Annex 5. Training and Exercises/Drills

Annex 6. Response Critique and Plan Review and Modification Process

Annex 7. Prevention

Annex 8. Regulatory Compliance and Cross-Reference Matrices

BILLING CODE 6560–50–P

Attachment 2: ICP Development Matrix

ICP Elements	RCRA (40 CFR part 264, Subpart D, 40 CFR part 265, Subpart D, and 40 CFR 279.52)	EPA's Oil Pollution Prevention Regulation (40 CFR part 112)	USCG-FRP (33 CFR part 154)	DOT/RSPA-FRP (49 CFR part 194)	OSHA Emergency Action Plans (29 CFR 1910.38(a)) and Process Safety (29 CFR 1910.119)	OSHA HAZWOPER (29 CFR 1910.120)	CAA RMP (40 CFR part 68)
Section I - Plan Introduction Elements							
1. Purpose and scope of plan coverage	264.51 265.51 279.52(b)(1) 264.52(a) 265.52(a) 279.52(b)(2)(i)				38(a)(1)[1] 119(n) 272(d)	(l)[2] (p)(8) (q)(1)	
2. Table of contents		112.20(h) **Appendix F**	1035(a)(4)[3] 1030(b)	**Appendix A**			
3. Current revision date		**F1.2**	1035(a)(6)				
4. General facility identification information		**F1.2** **F1.9**		194.107(d)(1)(i) 194.113 194.113(b)(1)			
a. Facility name		**F1.2**	1035(a)(1)				
b. Owner/operator/ agent		112.20(h)(2) **F1.2** **F2.0**	1035(a)(3)	194.113(a)(1) **A-1**			
c. Physical address and directions		112.20(h)(2) **F1.2** **F2.0**	1035(a)(1) 1035(a)(2) 1035(e)	194.113(a)(2) 194.113(b)(3),(4) **A-1**			
d. Mailing address		112.20(h)(2)	1035(a)(1)	194.113(a)(1)			
e. Other identifying information

EPA's Oil Pollution Prevention Regulation (40 CFR 112)	
112.7(d)(1) Strong spill contingency plan and written commitment of manpower, equipment, and materials.[10,11]	
112.20(g) General response planning requirements	III.3.d.(3); III.6.
112.20(h) Response plan elements	I.2; III.8.
(1) Emergency response action plan (Appendix F1.1):	
(i) Identity and telephone number of qualified individual (F1.2.5)	III.3.b.(1).
(ii) Identity of individuals/organizations to contact if there is a discharge (F1.3.1)	III.2.
(iii) Description of information to pass to response personnel in event of a reportable spill (F1.3).	II.2.a.
(iv) Description of facility's response equipment and its location (F1.3.2)	II.2.d.(3); III.3.e.(3); III.3.e.(6); III.3.f.(1); III.3.f.(3).
(v) Description of response personnel capabilities (F1.3.4)	II.2.b; III.3; III.3.e.(5); III.3.f.(2);
(vi) Plans for evacuation of the facility and a reference to community evacuation plans (F1.3.5).	III.3.b.(3); III.3.e.(5)
(vii) Description of immediate measures to secure the source (F1.7.1)	II.2.d.(2); III.3.c.(2); III.3.c.(4).
(viii) Diagram of the facility (F1.9)	III.1.a–b.
(2) Facility information (F1.2, F2.0)	I.4.b–d; III.1.
(3) Information about emergency responses:	
(i) Identity of private personnel and equipment to remove to the maximum extent practicable a WCD or other discharges (F1.3.2, F1.3.4).	III.3.c.(2); III.3.c.(4)–(5); III.3.e.(5).
(ii) Evidence of contracts or other approved means for ensuring personnel and equipment availability.	III.3.e.(5); III.3.f.(5)
(iii) Identity and telephone of individuals/organizations to be contacted in event of a discharge (F1.3.1).	II.2.a; III.2.b–d; III.3.b.(2).
(iv) Description of information to pass to response personnel in event of a reportable spill (F1.3.1).	II.2.a.
(v) Description of response personnel capabilities (F1.3.4)	II.2.b; III.3; III.3.e.(5); III.3.f.(2).
(vi) Description of a facility's response equipment, location of the equipment, and equipment testing (F1.3.2, F1.3.3).	II.2.d.(3); III.3.e.(3); III.3.e.(6); III.3.f.(1); III.3.f.(3).
(vii) Plans for evacuation of the facility and a reference to community evacuation plans as appropriate (F1.3.5).	III.3.b.(3); III.3.e.(5).
(viii) Diagram of evacuation routes (F1.9).	III.3.b.(3).
(ix) Duties of the qualified individual (F1.3.6)	II.2.c; II.2.d.(1); I.2.e; III.2.b–c; III.3.c.(3); III.3.d.(1); III.3.f.
(4) Hazard evaluation (F1.4)	II.2.c; III.3.d.(1); III.4.b.
(5) Response planning levels (F1.5, F1.5.1, F1.5.2)	II.3.d.(1).
(6) Discharge detection systems (F1.6, F1.6.1, F1.6.2)	II.1.
(7) Plan implementation (F1.7)	II.2.d–f; II.3; II.4.
(i) Response actions to be carried out (F1.7.1.1)	II.2; III.3.d.(2).
(ii) Description of response equipment to be used for each scenario (F1.7.1.1)	III.3.d.(1).
(iii) Plans to dispose of contaminated cleanup materials (F1.7.2)	III.3.c.(5)–(6)
(iv) Measures to provide adequate containment and drainage of spilled oil (F1.7.3)	III.3.c.(2); III.3.c.(4); III.3.d.(2); III.3.d.(4).
(8) Self-inspection, drills/exercises, and response training (F1.8.1–F1.8.3.2)	III.3.e.(6); III.5.

USCG FRP (33 CFR part 154)	
154.1026 Qualified individual and alternate qualified individual	II.2.a; III.3.b.(1).
154.1028 Availability of response resources by contract or other approved means	III.3.f or III.8; III.3.f.(5).
154.1029 Worst case discharge	III.3.d.(1).
154.1030 General response plan contents:.	
(a) The plan must be written in English.	
(b) Organization of the plan [13]	I.2.
(c) Required contents.	
(d) Sections submitted to COTP.	
(e) Cross-references	III.8.
(f) Consistency with NCP and ACPs	III.3.d.(3).
154.1035 Significant and substantial harm facilities:	
(a) Introduction and plan content	III.1.
(1) Facility's name, physical and mailing address, county, telephone, and fax	I.4.a; I.4.c–d; I.4.h–i
(2) Description of a facility's location in a manner that could aid in locating the facility	I.4.c.
(3) Name, address, and procedures for contacting the owner/operator on 24-hour basis.	I.4.b; II.2.a
(4) Table of contents	I.2.
(5) Cross index, if appropriate	III.8.
(6) Record of change(s) to record information on plan updates	I.3; III.6.
(b) Emergency Response Action Plan:	
(1) Notification procedures:	
(i) Prioritized list identifying person(s), including name, telephone number, and role in plan, to be notified in event of threat or actual discharge.	II.2.a; III.2.a–c.
(ii) Information to be provided in initial and follow-up notifications to federal, state, and local agencies.	III.3.b; III.2.a–c.
(2) Facility's spill mitigation procedures [14]	II.2.d.(2); III.3.c.(2).
(i) Volume(s) of persistent and non-persistent oil groups.	
(ii) Prioritized procedures/task delegation to mitigate or prevent a potential or actual discharge or emergencies involving certain equipment/scenarios.	II.2.
(iii) List of equipment and responsibilities of facility personnel to mitigate an average most probable discharge.	II.2.e–f; III.3.f.(3); III.3.c.(1)–(5).
(3) Facility response activities [15]	II.2.c; II.2.e–f; II.3; II.4; III.3.c.(3).
(i) Description of facility personnel's responsibilities to initiate/supervise response until arrival of qualified individual.	II.1; II.2.
(ii) Qualified individual's responsibilities/authority	II.2.
(iii) Facility or corporate organizational structure used to manage response actions	II.2.b; II.3; III.3.a; III.3.b.(2)–(4); III.3.c; III.3.d.(1); III.3.e–f.
(iv) Oil spill response organization(s)/spill management team available by contract or other approved means.	II.2.d.(3); III.3.c.(4)–(5); III.3.e.(6); III.3.f.(1)–(2); III.3.f.(5).
(v) For mobile facilities that operate in more than one COTP, the oil spill response organization(s)/spill management team in the applicable geographic-specific appendix.	II.2.d.(3).
(4) Fish and wildlife sensitive environments	III.1.c; III.3.d.(1)–(2).
(i) Areas of economic importance and environmental sensitivity as identified in the ACP that are potentially impacted by a WCD.	II.2.c.
(ii) List areas and provide maps/charts and describe response actions.	
(iii) Equipment and personnel necessary to protect identified areas	II.2.e–f; III.3.f.(3); III.3.c.(1)–(5).
(5) Disposal plan	III.3.d.(4).
(c) Training and exercises	III.5.
(d) Plan review and update procedures	III.6.
(e) Appendices	I.4.c; III.1.b.
(1) Facility specific information	III.1.
(2) List of contacts	II.2.a; III.2.a–c; III.3.b.(1).
(3) Equipment lists and records	III.3.e.(3); III.3.e.(6); III.3.f.(1); III.3.f.(3)–(5).
(4) Communications plan	III.3.b.(2).
(5) Site-specific safety and health plan	III.3.b.(3); III.3.c.(7); III.3.e. (1).

(v) Site security and control	III.3.d.(2); III.3.e.(2).
(vi) Evacuation routes and procedures	II.2.d; III.3.b.(3)
(vii) Decontamination procedures	III.3.c.(6).
(viii) Emergency medical treatment and response procedures	II.2.d; III.3.c.(7); III.3.e.(1).
(ix) Emergency alerting and response procedures	II.2; II.2.a; II.2.f; II.4; III.2; III.2.a; III.2.b; III.2.c; III.3.d.
(x) Critique of response and follow-up	II.3; III.4; III.4.a; III.6.
(xi) PPE and emergency equipment	III.3.e.(6); III.3.f.(3); III.3.d.(2); III.3.e.(6); III.3.f.(3).
(3) Procedures for handling emergency incidents:	
(i) Additional elements of emergency response plans:	
(A) Site topography, layout, and prevailing weather conditions	III.1.c.
(B) Procedures for reporting incidents to local, state, and federal government agencies.	II.2.a; III.2.
(ii) The emergency response plan shall be a separate section of the Site Safety and Health Plan.	
(iii) The emergency response plan shall be compatible with the disaster, fire, and/or emergency response plans of local, state, and federal agencies.	III.3.e.
(iv) The emergency response plan shall be rehearsed regularly as part of the overall training program for site operations.	III.5.
(v) The site emergency response plan shall be reviewed periodically and, as necessary, be amended to keep it current with new or changing site conditions or information.	
(vi) An employee alarm system shall be installed in accordance with 29 CFR 1910.165 to notify employees of an emergency situation; to stop work activities if necessary; to lower background noise in order to speed communications; and to begin emergency procedures.	
(vii) Based upon the information available at time of the emergency, the employer shall evaluate the incident and the site response capabilities and proceed with the appropriate steps to implement the site emergency response plan.	II.2.c; II.2.d.
1910.120(p)(8) Emergency response program:	I.1
(i) Emergency response plan.	
(ii) Elements of an emergency response plan:

Guidelines for Hazardous Materials TRAINING PROGRAM MANAGEMENT

About the Training Program Management Guidelines

The Training Program Management Guidelines are provided to assist public sector training managers and employers in performing several key tasks in the management of hazardous materials trainining programs. Guidance is provided for the following tasks:

1. Training Needs Assessment: Guidance is provided on developing, maintaining and reporting information regarding levels of responder/planner competencies and on defining and reporting type and volume of training needed within the manager's jurisdiction. Existing regulatory requirements are defined and procedural recommendations are provided. Directions are provided for using a standardized data form for data compilation and reporting.

2. Assessment of Response Courses: Guidance is provided on using the Response Guidelines to assess courses for compliance with OSHA 29 CFR 1910.120 and EPA 311, and compatibility with NFPA 472 and other recommended standards. Guidance is also provided on using the Response Guidelines for standardized description of the substance, scope and utility of courses, to facilitate information sharing and materials exchange with peer training program managers in other jurisdictions. Directions are provided for using standardized course objectives assessment worksheets and a standardized course description and assessment reporting format.

3. Assessment of Planning Courses:
Guidance is provided on using the Planning Guidelines to assess courses for fit with the training competencies identified for the different roles and functions involved in hazardous materials planning. Guidance is also be provided on using the Planning Guidelines for standardized description of the substance, scope and utility of courses, to facilitate information sharing and materials exchange with peer training program managers in other jurisdictions. Directions are provided for using standardized course objectives assessment worksheets and a standardized course description and assessment reporting format.

Hazardous Materials

TRAINING NEEDS ASSESSMENT

The purpose of a hazardous materials training program is to ensure, through training, that persons performing assigned response, planning and prevention responsibilities have the knowledge, skills and abilities to discharge their responsibilities safely and effectively. Other aspects of these guidelines provide support in evaluating existing training materials against established performance standards and in managing the delivery of hazardous materials training. However, providers of training also need to identify the numbers and types of individuals that need to be trained within their juridiction. This information is essential in order determine the scope of the overall training program needed to ensure that all personnel within the jurisdiction will be properly trained to meet the standards and/or achieve a given level of capability. This is the objective of a jurisdictional training needs assessment.

This section explores the rationale for conducting jurisdictional training needs assessments, discusses some of the methodology options and issues associated with jurisdiction-wide needs determination, and provides directions for using a standardized needs assessment worksheet for collecting, organizing and reporting needs assessment data.

What is it?

A training needs assessment is any method of determining what training is needed. It can range from an in-depth analysis of a single specific job task in support of development of a single portion of a training program, to a broad analysis of all hazards faced by an entire jurisdiction in order to determine the tasks and functions that all responders and planners need to be trained to perform. It can range in expense and effort from an "educated guess" of training need made by a group of experts in a single meeting to a jurisdiction-wide survey and statisitical analysis that involves great expense and effort by many people over a period of many months or even years.

For any jurisdiction, the primary purpose of a hazardous materials training needs assessment is to determine how many persons there are within the jurisdiction who are involved in hazardous materials planning, prevention and response and which of those persons need which types and levels of training. The process for determining this information can vary greatly in terms of the amount of effort expended and the breadth of issues considered. Regardless of the approach taken and the complexity of the needs assessment that is produced, a "bottom line" for any jurisdiction-level needs assessment effort is the final data on the training need for that jurisdiction. This "bottom line" should consist of clearly stated data on the numerical size of the training audience and the numbers of employees and other personnel which will need complete or refresher training at each of the different response levels and for all appropriate levels in planning and prevention. This data is essential for jurisdiction-wide training plan development, prioritization of programs, and the strategic allocation of training resources.

Why do it?

A jurisdiction-level training needs assessment is often viewed as a "nice to do" activity and is usually deferred as a lower priority in the face of limited resources for hazardous materials training. However, there are several compelling reasons why such a training needs assessment should be given a high priority in jurisidictions who do not have the needs assessment data presently.

COMPLIANCE WITH FEDERAL REGULATIONS

Under OSHA 29 CFR 1910.120 and EPA 311, the employer must ensure that all responders are trained to minimum competency before responding. State, tribal, territorial and local governments are employers of public sector responders. Data on how many there are, who is trained and who isn't is essential to be able to document that State and local governments are in compliance.

EFFICIENT USE OF RESOURCES

This data is vital for good training plan development. State, tribal, territorial and local training offices must know the scope and nature of the overall training requirement and the specific areas in which current training levels are deficient, in order to determine resources needed and to prioritize training properly to achieve compliance through training with OSHA/EPA requirements.

STRATEGIC PLANNING
Clear data documention of the overall training need within the jurisdiction can be used as the foundation for measurement of progress toward established goals. The data makes possible multi-year training plans and budgets that focus on the impact and comprehensiveness of training. For financial planning and budget purposes, the data is fundamental to justify appropriations and support applications for critically needed supplemental funding and support.

Methodology Considerations

There are two basic approaches usually used to conduct a jurisdiction-level needs assessment, although there are numerous variations possible depending upon differences in State, tribal, territorial and local organizational responsibilities, resources and preferences. The two basic approaches are (1) estimating the need at the State, tribal, or territorial level, and (2) determining the need at the local level and aggregating it at the State, tribal or territorial level.

ESTIMATING NEED AT THE STATE, TRIBAL OR TERRITORIAL LEVEL
This is the least accurate method, but is often used when resources or time prohibit the survey approach discussed below. The challenge is to attempt an unbiased and well-informed estimate. It is recommended that an expert team be formed including good representation of the different jurisidictions within the State, tribe or territory, and representation of the primary disciplines or professions involved in planning and response. All relevant existing data, such as demographic infomation, known turnover percentages, and existing needs estimates should be compiled and provided to the team. The final needs assessment estimate of the team should be a concensus product reflecting the best opinion of all team members. If possible, the resulting estimate should be reviewed by as many local jurisdictions as resources permit.

SURVEYING: USING THE “BOTTOMS UP APPROACH”
This is the most accurate approach to State, tribal or territory needs assessment and has many ancillary benefits beyond accurate data such as hightened local understanding of local training needs. The general process is to develop a needs survey instrument and distribute it to local jurisdictions for development of the information. It is important to have local jurisdiction input into the development of the survey instrument, and to allow sufficient time and resources for local jurisdictions to conduct the needs assessment. The instrument should include directions and a reporting form, and the model form provided in this guidance is offered for optional use. It is recommended that local personnel receive an orientation to the needs assessment work as well as the instrument itself, and that attention be given to consistency to avoid skewed information. It is recommended that attempts be made to establish a “network” with these persons for subsequent updates to maintain the currency and accuracy of the final information. Logistical problems should be anticipated and budgeted for, such as the time needed by State, tribal or territory personnel to follow-up to ensure that all participants complete the work

USING A MIXED APPROACH
Often, it is necessary to use both approaches to determine complete State, tribal and territorial needs assessment data, because local resources and data management systems can vary such that incomplete data will be received from the survey method. In that case, it is recommended that (1) data be collected from major metropolitan areas and local jurisidictions with well-staffed training resources, (2) a sampling be conducted of smaller jurisdictions to determine average data for those groups, and (3) an expert team be assembled at the State, tribe or territory level to extrapolate and “fill in the holes” to reach a final estimate of the need within the jurisdiction.

Issues

DEFINING PLANNING AND PREVENTION TRAINING LEVELS
Defining Planning and Prevention training needs is usually more difficult than defining Response needs, because the roles and responsibilities of public sector employees in these areas are usually not as well defined. It is recommended that survey instruments or expert team work include a draft definition of these

roles for each jurisdiction on which to base an estimate of the training needed to support competency in these roles.This is very important to avoid gaps in training that may result in persons being asked to perform planning and prevention functions (such as preparing local response plans) for which they are not trained or fully competent and upon which the safety of responding personnel may depend. Attention should also be given to the difficulties in determining planning audiences and roles when the planning and SOP work is done as a secondary or occasional duty and the need for training is not immediately evident.

For hazardous materials planning, it is recommended that individual personnel roles be identified at the needs assessment stage in terms of the orientation, essentials, and speciality competencies used in the Planning Guidelines. This will simplify subsequent identification of training need.

VOLUNTEER RESPONDERS

Hard data on number of volunteer responders in the jurisdiction and their existing level of training may be very difficult to acquire because many volunteers may be part time or infrequent participants in response, and volunteer department rosters may include many inactive members. However, State, tribal, territory and local governments are the "employer" of volunteers when they are participating in the response, and therefore are responsible for ensuring competency. Every effort should be made to not underestimate the training need for volunteer responders.

BALANCING RESPONSE PLANS WITH RESPONSE TRAINING NEEDS

Care should be taken to ensure that response training needs describe levels of competency that match actual response plans. For example, the number of persons that are needed to be competent as members of hazardous materials teams should reflect the number and organizational location of hazardous materials response teams in the local and State, tribal and territory emergency response plans. If there is a question about the soundness of the resource requirements described in the plans, some jurisdictions may find the need to undertake a more significant needs assessment for hazardous materials that would include revisiting hazards analyis and/or revisiting response capabilitiy needs. If emergency plans themselves are in question, this may also entail revisiting organizational responsibilities for plan development and jurisdictional models for plan structure and soundness. These issues involve a much more complex effort than is addressed in this guidance, but may have to be considered if it is found that problems in these areas prevent State, tribal, territory and local definition or confirmation of the training need.

Training Needs Information- The Bottom Line Numbers

Regardless of the process used to develop needs assessment data and regardless of the depth or complexity of the information addressed, there are severall basic and simple questions that must be answered if the needs assessment is to support training plan development. In order to determine training resource requirements, training strategies, and compliance with OSHA and EPA requirements, the absolute minimum information that must be determined is the number of people who are not trained or able to perform the function they will be called upon to perform. The basic questions that provide this information are:

(1) How many need to be able to perform each function (such as Incident Commander),
(2) How many are able to perform this function at present, and
(3) How many have not yet been trained or are not yet able to perform this function.

Example

10 firefighters needed to function as incident commander at haz mat emergencies.

4 have already received training or are certified competent at the incident commander level of the guidelines.

6 need to be trained to the incident commander level.

For large jurisdictions such as State training offices with training responsibilities for all response and planning functions, four sets of "bottom line" information are needed:

1. The potential training population. This is the number of persons in the jurisdiction who will potentially be involved in hazardous materials response, planning and prevention work. This information is usually divided by discipline, such as number of fire service potential responders, number of law enforcement potential responders, etc. Anticipated annual turn-over rates are usually included, so the number in the potential training population is usually somewhat larger than the actual number of persons currently employed.

2. How many are needed to be competent at a particular level. This is the number of persons in the jurisdiction that need to be competent to perform each role called for in response, planning, and prevention. For example, one portion of this data would be the number of firefighters needed to be competent at the Technician level. This number is determined by the response plans and response rotocols of the individual jurisdiction, and will vary greatly across jurisdictions. For example, one jurisdiction may use regional hazardous materials response teams and need a smaller number of technican-level responders than a comparably sized jurisdiction with a greater frequency of calls that must maintain local hazardous materials response teams and therefor a greater number of trained technicians.

3. How many have already been trained or certified as competent. This is the number of persons in the jurisdiction that need to be competent and either have already been trained or have been certified as competent by the employer. Records should exist to confirm that the training was received to maintain compliance with OSHA and EPA requirements. If the responder is certified as competent in lieu of training, this must be done by the immediate employer (for example, the Fire Chief or designee on behalf of the local municipal government). Note that OSHA and EPA requirements for annual refresher training apply to all persons already trained or certified as competent. Therefore, this number also becomes the number of persons needing annual refresher training or recertification.

4. How many will need complete training. This is the number of persons in the jurisdiction that need to be competent but are not so at the present time and need to be fully trained.

Example

	Firefighter	Law Enf.	
How many total potential responders (all functions)?	*2,800*	*1,400*	
Anticipated annual turnover?	*280*	*140*	
Total Potential Training Population	*3,080*	*1,540*	
Incident Commander Level			**Total**
How many are needed to be competent at this level?	*190*	*50*	
How many have already been trained or certified as competent?	*35*	*10*	*45*
How many will needed complete training?	*155*	*40*	*195*

Training Need

195 Incident Commander Full Training
45 Incident Commander Refresher Training

Reporting the Training Need

On the following pages are model needs assessment reporting forms. These forms focus on quantifiable summaries of training need- the bottom line numbers- as discussed above. These should be used to report training need with the HMEP grant applications and it is recommended that they also be used as a data gathering form for local submissions to the State, tribal or territory level during the needs assessment process.

The response form follows the above models and uses the standard function definitions of OSHA and NFPA, specifically as elaborated upon in the Response Guidelines portion of this document. Using the above samples, data entry into this form should be self-explanatory.

The planning form follows the above models and uses the function/competency definitions (orientation, essentials, and specialities) presented in the planning guidelines. Translation of existing demographic information (such as the number of LEPC members within a State) into the numbers of persons to be trained to a given competency requires judgement and decision-making regarding the sophisitication of planning roles to be performed. This will vary from jurisdiction to jurisdiction, depending upon the organization of planning responsibilities. For example, one State might prefer that all commodity flow studies in the State be done by State staff, so all local planning team members might require essentials-level training but only selected state personnel would need speciality-level training in doing a commodity flow study. See the planning curriculum guidelines for more thorough background information on defining these roles and responsibilities.

Hazardous Materials
Response Course Assessment

Response Course Assessment DIRECTIONS

These instructions describe the methodology for assessing hazardous materials response courses. Section 1, **General Information**, explains the purpose and nature of the assessment process. Section 2, **Performing a Course Assessment**, identifies basic steps for completing the assessment instruments. Section 3, **Specific Instructions**, provides block-by-block directions for filling out the instruments. A completed sample is attached, showing the assessment of the National Fire Academy course *Initial Response to Hazardous Materials Incidents: Basic Concepts*.

Every effort has been made to keep these instruments and instructions as simple and useful as possible. However, assessing adult training activities inherently involves some time and work.

1. GENERAL INFORMATION

Purpose of the Response Course Assessment Worksheet

The Response Course Assessment Worksheets are designed to (1) gather descriptive information about individual hazardous materials training activities in a standardized format, and (2) facilitate comparison of course content with the mandated and recommended training requirements identified in the Hazardous Materials Emergency Preparedness (HMEP) grant program document *Guidelines for Public Sector Hazardous Materials Training (Guidelines)*. The data can be used to:

- Evaluate the scope of existing courses relative to Federal and other national standards and guidelines.
- Disseminate information to state and local training managers nationwide about existing courses.
- Help training agencies assess the usefulness of existing courses for their own needs.

Why Assess Response Courses?

State and local agencies with hazardous materials training responsibilities can use the results of the assessment process for the purpose of:

1. Certifying compliance of training with OSHA 29 CFR 1910.120 and EPA 311, and with the HMEP grant program curriculum Guidelines.
2. Verifying compatibility of training with NFPA 472, NFPA 473, and other training recommendations or requirements.
3. Analyzing and revising the current training plan.
4. Developing new courses or revising current ones to address unmet training needs.

5. Assessing whether to adopt or adapt an outside course for use within the organization or jurisdiction.

6. Communicating characteristics of existing courses to peer training managers in other organizations and jurisdictions.

7. Evaluating the capabilities of currently trained State and local response personnel.

8. Documenting and explaining the scope of training activities to outside decision-makers and the public.

The training needs of individual agencies or jurisdictions may differ from those defined here. Many factors that affect the quality of training are outside the scope of this assessment process. Training managers may supplement the results of this assessment process through peer instructor evaluation of deliveries, professional review of course materials, in-depth student and instructor interviews, student testing, and other forms of expert opinion.

Who Should Complete a Response Course Assessment?

A course assessment should be conducted by any organization with hazardous materials response training requirements.

All courses used in the HMEP grant program should be assessed. This includes Federal, State, tribal, and Protectorate, national professional association, and private sector courses used by grantees in their public sector training curriculums. Each course should be formally assessed by only one sponsoring organization.

HMEP grantees are responsible for assessing those courses in their curriculums (1) which they have developed entirely or modified for their specific use and (2) which are provided by private sector sources and contractors (other than national associations) and are used by the HMEP grantees use as part of their public sector curriculum. HMEP grantees are not responsible for assessing Federal, national association courses, or courses from other HMEP grantee curriculums. Federal and national association providers of training will be asked to provide assessment of their respective programs which are in use by HMTA grantees.

Assessment Evaluator Qualifications

It is recommended that assessment evaluators have the following minimum qualifications:

- A thorough understanding of the course purpose, training objectives, content, and instructional methodologies.

- Be familiar with the course delivery requirements, related administrative considerations, and student evaluation results.

- Have in-depth knowledge of all target training audiences, including their response roles, job tasks, and required competencies.

- Have knowledge of hazardous materials response operations, applicable regulations and standards, including those promulgated by OSHA, EPA, and NFPA.

- Have experience and credentials in applying the principles and techniques of adult education to emergency services audiences.

Given the nature of the assessment process, sponsoring organizations may wish to consider using a workgroup approach, particularly for major courses. Assessment evaluators may include members of the course design and development team; experienced instructors, training program administrators, and course managers; qualified members of the training audience; and other hazardous materials experts as deemed appropriate.

2. PERFORMING A RESPONSE COURSE ASSESSMENT

Initial Considerations

Before filling out the assessment instruments, participants should understand the purpose and requirements of the assessment process, and be familiar with the HMEP *Guidelines*.

The first step is to determine the desired depth of the analysis. Generally, one set of assessment instruments is completed for each course. If a course is comprised of major modules or sections that could serve as stand-alone courses in themselves it may be desirable to complete a separate set of instruments for each of those modules or sections of the course.

To decide the appropriate level of assessment consider the possible ways other emergency services organizations may use the training, the information, and decision-making needs of peer training managers. If, in your judgement, a significant number of agencies would benefit by more detailed information, complete one set of instruments for each major module or section of the course. Otherwise, fill out one set of instruments for the entire course.

General Steps in the Process

You are now ready to begin the course assessment. Following the general steps listed below will help you prepare the forms quickly and accurately.

Step 1: Review Course Training Materials — Gather and review all course instructional materials. These may include plans of instruction, content outlines, student manuals, instructor guides, audiovisual presentations (films, videotapes, slide-tapes, etc.), job aids, reference materials, and handout materials.

Step 2: Review Course Delivery Data — Gather and review materials that describe the effectiveness of previous course deliveries. These may include data on course offerings and participants, student and instructor training evaluations, student test summaries, and long-term performance evaluation results. You may interview or survey persons knowledgeable about course deliveries.

Step 3: Gather Related Documents — Obtain copies of other documents that may be useful in the course assessment process. Examples might include related federal legislation and regulations, copies of NFPA 472 and 473, source materials used in the development of the course, refresher training and train-the-trainer materials, course promotional materials, technical documents referenced in the course.

Step 4: Select Appropriate Instruments — Each course assessment requires filling out two separate instruments:

- **Response Course Assessment Worksheet** describes the course and related delivery considerations. The basic format of the instrument is the same for all training activities assessed under this process. Copies of the instrument can be made from the master copy accompanying these instructions.

- **Response Course Objectives Worksheet(s)** assesses course content relative to the HMEP *Guidelines*, and identifies the required and recommended training objectives for all competency areas addressed in the course. Separate Course Objectives Worksheets are available for the following competency areas:

  First Responder Awareness
  First Responder Operations
  Hazardous Materials Technician
  Incident Commander
  Hazardous Materials Branch Chief (NFPA)
  Safety Officer at Hazardous Materials Incidents (OSHA)
  Hazardous Materials Branch Safety Officer (NFPA)
  Specilalist Employee (OSHA)
  Private Sector Specialist Employee C (NFPA)
  Private Sector Specialist Employee B (NFPA)
  Private Sector Specialist Employee A (NFPA)
  Hazardous Materials Specialist (OSHA)
  Technician with a Tank Car Speciality (NFPA)
  Technician with a Cargo Tank Speciality (NFPA)
  Technician with an Intermodal Tank Speciality (NFPA)
  Emergency Medical Service Level 1 Responder
  Emergency Medical Service Level 2 Responder
  Hospital Emergency Room Personnel

You should complete a separate Course Objectives Worksheet for each competency area addressed in the course. Make copies of the appropriate worksheets from the master copies accompanying these instructions. (More information is provided under Specific Instructions, Response Course Assessment Worksheet.)

Step 5: Fill in the Instruments — The block-by-block instructions for the instruments begin below. If more space is needed for your answers, use Section 12, Continuation, and attach separate sheets, as needed.

For most courses, the process can take approximately one to two hours per day of training depending on the complexity of the course, the number of people participating, their familiarity with the instructional materials, the desired workgroup process, the course's structural relationship to OSHA/EPA and NFPA standards, and other factors.

Step 6: Using the Completed Instruments — The completed instruments should be filed as documentation of your organization's finished HMTA self-assessment of response courses. They can also be used to review your curriculum for completeness and to support dialogue with other training systems regarding your programs. For submission of the information into the HMTA Course Assessment Project, please use the enclosed return envelope or equivalent and send copies of the completed Response Course Assessment Worksheet with Course Objectives Worksheets attached for each course assessed to:

William Lewis
HMTA Course Assessment Project
National Emergency Training Center, FEMA
16825 South Seton Avenue
Emmitsburg, MD 21727

If you have any questions or would like assistance in completing your course assessment, call William Lewis (301) 447-1009, or Jennifer Krietz (301) 447-1585, or FAX (301) 447-1588.

3. SPECIFIC INSTRUCTIONS

This section provides detailed instructions for filling out the Response Course Assessment Worksheet and the Course Objectives Worksheet. A completed sample of the instruments is attached. Please read these directions carefully as you proceed.

Response Course Assessment Worksheet

Block 1: Organization Sponsoring Course

Enter the name and address of the Sponsoring Organization (the agency that has primary responsibility for the design and content of the course, and which maintains associated rights) in Block 1. Include subdivision titles, as appropriate.

Block 2: Individual to Contact

Enter the name, mailing address, and phone number of a person assigned to serve as a contact for federal agencies, State and local training managers, and others interested in learning more about the course. This person should be knowledgeable about the course and able to answer questions about the assessment process and results.

Block 3: General Course Description

A. Course Title — Enter the complete formal title of the course, including subtitles.

B. Edition Number and/or Date — Enter the official course number or edition/revision number and date which is used to identify the course. This number typically appears on the cover or title page of the instructional materials.

The identifying number should refer to the entire course, not separate elements such as the student manual, instructor guide, or videotapes. Do not list the International Standard Book Number (ISBN), Library of Congress Catalog Card Number, or other publishing reference number. For published works, enter the most recent publication date, but not the date of later reprintings (if any).

C. Length (hours) — Enter the length or duration of classroom hours per course. Course length includes all educational activities that are part of the course.

D. Course Purpose or Goal — The course purpose or goal is a brief statement (one to three sentences) that broadly defines the desired outcome(s) of the total educational experience, and attempts to clarify the competencies or capabilities that students should possess after having satisfactorily completed all course requirements. This goal is met when all training objectives identified for the course have been achieved. As a rule of thumb, consider how best to complete the sentence “Having successfully completed the course, students will be able to....”

Block 4: Target Audiences, Competencies and Objectives

A. Target Audiences — For purposes of this assessment, target audiences are broadly defined as groups with similar organizational missions in hazardous materials incident response. These include the emergency services (fire, law enforcement, and emergency medical), public works, and other functional areas of State and local responsibility.

Identify the target audience categories for which this course is suitable by checking the appropriate boxes on the form. List other audiences that would benefit by this training. Examples might include elected/appointed officials, emergency management, public health, environmental agencies, and medical facilities.

B. Competencies and Objectives Addressed in Course — Competency areas are defined as response roles that public sector employees may be required to perform during a hazardous materials incident. The seven competency areas listed on the assessment form follow the categories identified in OSHA 1910.120, EPA 311 and the HMEP *Guidelines*.

An individual course may address parts of a competency area, a total competency area, or multiple competency areas. To determine which competency area(s) your course addresses, you must first compare the course content with the training objectives identified for each area. The objectives are listed in the HMEP *Guidelines* and are duplicated on the respective Course Objectives Worksheets.

After determining which competency areas your course addresses, check the appropriate boxes on the form. If the course addresses all the objectives in the competency area check "All"; if the course addresses only a portion of them check "Selected". You may need to check one or more competency areas. If you check "Selected" for any competency area, briefly explain the scope of the course in the space provided on the form. If more space is needed, continue in section 10: Special Course Characteristics. (Note: the description you provide should expand on and clarify the course purpose or goal statement entered in Block 3.)

Reminder: Fill out Course Objectives Worksheets for each competency area you check here, whether "All" or "Selected."

Block 5: Course Materials

A. Instructional Materials — Check the appropriate boxes to indicate which of the listed types of instructional materials are used in delivering the course. Enter the correct quantities for each type of material, as specified on the form. If separate refresher training materials are available, please describe them in Section 10: Special Course Characteristics. List other types of instructional materials used in the course (e.g., job aids, reference documents, films, computer software) in the space provided, continuing as necessary in Section 10: Special Course Characteristics.

B. Training Evaluation Materials — Check the appropriate boxes to indicate which of the listed types of evaluation materials are used in the course. If evaluation approaches other than student tests or instructor/student assessments are used, describe fully in Section 10: Special Course Characteristics.

C. Refresher Training Materials— Check the appropriate boxes to indicate whether refresher training guidance and/or materials are included in the course package. Describe focus, scope and competency priorities of any refresher training components in Section 10: Special Course Characteristics

D. Physical Skills Laboratory & Demonstration Equipment and Supplies — If special equipment or supplies are used in the delivery of the course, check the appropriate box(es) and explain briefly in Section 10: Special Course Characteristics. These materials include any props, tools, supplies, apparatus, equipment, or instructional aids that would not be readily available in a typical emergency services training environment. Do not include standard response equipment (turnout gear, firefighting tools, etc.) or common training supplies (media projectors, flipcharts, photocopying machines, etc.).

Block 6: Course Delivery Formats

Courses are designed for use in certain settings or environments, depending on the resources required for delivery, nature of the instruction, size and location of the target audience, cost considerations, and many other factors. Typical formats for emergency services training include:

- Independent student use — self-contained educational materials designed for use by individual target audience members without ongoing instructor support. (Note: this category includes computer-assisted instruction and interactive videodisc presentations).

- Local department/employer delivery — training that can be delivered by public sector organizations with the resources and capabilities commonly available at the local level.

- Field delivery run by centralized office — training delivered locally, but administered and perhaps staffed by a centralized facility, such as the Emergency Management Institute, State Fire Marshal's office, regional training academy, or private university.

- Special facility or fixed-site delivery — training that must be conducted on-site at a specific facility because it employs large, non-transportable equipment (such as large piping and valve systems, specialized simulation structures, etc.) or because other instructional considerations (such as co-locating with another program) restrict delivery of the course to the specific site.

- Broadcast or televised delivery — training designed for delivery to groups of students via teleconference, broadcast television, closed-circuit television, radio, or other similar instructional media.

Check the box for the delivery format that applies to the course. In most cases, only one delivery format should be marked. Sometimes, however, multiple delivery formats may be possible for the same course (e.g., local department/employer delivery or field delivery run by a centralized office). In other cases, different modules may be delivered using different instructional formats. If more than one delivery format applies, check the appropriate boxes and explain briefly.

Block 7: Unit or Module Summary

Use Block 7 to list the major modules, units, chapters, or sections of the course. Include the unit/module number, planned or expected duration in hours (see the instructions for Block 3), and title. If the sum of the hours shown here does not match the total for the course reported in Block 3, explain in Section 10, Special Course Characteristics.

For each unit/module, indicate whether it could serve in other curriculums as a stand-alone module. The purpose of this information is to assist other training managers in determining whether the material could be incorporated into their programs. In general, a unit has potential as a stand-alone training module if (1) there is closure within the unit of student learning including demonstration of mastery of the material, and (2) if the material is not dependent for coherency or learning upon the unique sequence of content in the preceding and following units of the course.

In addition, identify the types of instructional methodologies used in each unit/module by checking one or more of the boxes on the form. Check other methodologies (e.g., role play, interactive videodisc, behavior modeling, etc.) in the space provided.

Block 8: Materials From Other Programs Used in Course Development

Source materials are training programs, job task analyses, research reports, technical manuals, etc. that are used in developing the course. By identifying these source materials it will help peer training managers and others to:

- Understand the course based on familiarity with the source materials.
- Identify similarities and differences among training activities and programs.
- Evaluate appropriate applications of the course.

In this section of the form, you are asked to identify major source materials used in developing the course. Include only those materials that were used extensively or that contributed significantly to the final form and content of the course. Do not list others whose impact was less important, even if they were researched as part of the course design and development process. For each major source material, fill in the title and the

name of the organization that developed it. Then list the module/unit numbers (from Block 7) of the course that were strongly influenced by the source material. If the source material applies to the entire course, write "all." Explain as necessary in Section 12: Continuation.

Block 9: Factors Affecting Use of Course By Other Organizations

Many factors must be weighed when considering whether to adopt or adapt an existing course: associated costs, delivery requirements, compatibility with mission and audiences, ability to modify, available support services, ease of use. This section of the assessment form includes a checklist of these factors to help other training managers make decisions about using the course for their own needs.

Review the questions and check the appropriate box for each one that you answer affirmatively. Then, using this checklist as a "mind jogger," write in Section 11: Special Delivery Characteristics a brief summary of all major factors that could affect use of the course by other agencies. In your narrative, try to address typical decision-making needs and obstacles faced by training managers in emergency services organizations when developing, adapting, or conducting training. If more space is needed, use Section 12, Continuation.

Blocks 10-12

Use Blocks 10-12 to complete your response to other sections of the form (see the instructions for Blocks 4 through 9). Keep your responses as clear as possible.

Response Course Objectives Worksheets

The Response Course Objectives Worksheet is a tool to help you determine whether the course adequately addresses minimum training objectives set forth in the HMTA Guidelines. Required and recommended objectives are identified. The required objectives are based on OSHA/EPA regulations; recommended objectives were developed using NFPA 472 and 473 standards.

Worksheets exist for each of eighteen (18) competency areas. You should complete a separate worksheet for each competency area addressed in the course (see Block 4 of the Response Course Assessment Worksheet).. The competency areas are:

First Responder Awareness
First Responder Operations
Hazardous Materials Technician
Incident Commander
Hazardous Materials Branch Chief (NFPA)
Safety Officer at Hazardous Materials Incidents (OSHA)
Hazardous Materials Branch Safety Officer (NFPA)
Specilalist Employee (OSHA)
Private Sector Specialist Employee C (NFPA)
Private Sector Specialist Employee B (NFPA)
Private Sector Specialist Employee A (NFPA)
Hazardous Materials Specialist (OSHA)
Technician with a Tank Car Speciality (NFPA)
Technician with a Cargo Tank Speciality (NFPA)
Technician with an Intermodal Tank Speciality (NFPA)
Emergency Medical Service Level 1 Responder
Emergency Medical Service Level 2 Responder
Hospital Emergency Room Personnel

Enter the course title and name of the sponsoring organization on each form you fill out. The training objectives are listed in the left column. You may use either the required or the recommended objectives for your assessment. For each training objective, work horizontally across the page to make three determinations for each objective:

- The course time spent on the objective.
- The methods used to demonstrate student achievement of the objective.
- Whether the objective is adequately addressed in the course.

Course Time Spent On Objective

Estimating the amount of course time spent on each objective provides a useful indicator of the scope or depth of training in each area. More course time implies the opportunity for more in-depth instruction, and vice-versa. Estimating training time can be relatively straightforward for courses that are structured according to the OSHA/EPA or NFPA standards. In these situations, you need only analyze a typical course schedule or training agenda to determine how much time is allocated to each objective. Round the estimates to the nearest tenth (0.1) hour. If precise estimates are difficult, break the course down at least to half-hour (0.5) increments.

For courses that do not directly match the objectives or have a mix of origins, estimating training time will require more effort. You must review the course content using the following general procedures:

1. Think through the knowledge, skills, and attitudes (KSAs) needed by a typical student to achieve the training objective.
2. Identify all course content related to these KSAs. (Note: the content may be consolidated or spread out in different sections of the program).
3. Estimate the training time spent on this course content in a typical delivery.

As you conduct the analysis, you may find that some course content is related to more than one training objective. Other course content may not be associated with any of the objectives listed on the worksheet. Use your best judgement to include in your estimate all course time spent on content related to the objective whether or not this time is also reported for other objectives on the form. Relatively broad time estimates are acceptable.

Don't worry if the sum of the hours you estimate for the training objectives is different from the total you reported in Blocks 3 and 7. The figures will be adjusted later to reflect actual contact or classroom hours.

How Is Student Achievement of the Objectives Demonstrated?

Well-designed performance evaluation techniques provide an useful indicator of each student's ability to achieve the training objectives specified for the course. They also provide a powerful tool for assessing whether the course produces the desired results.

Successful student achievement of training objectives can be demonstrated through various means, including performance on written or skills tests, performance in objective-specific activities individually or as a group, or application of what has been learned in large exercises (or subsequently on the job). In this section you are asked to identify which technique or techniques are used to evaluate student learning. To make the determination, compare the course content covered in the evaluation mechanism with that related to the training objective. If they match, check the appropriate box on the form.

Is Objective Adequately Addressed? Comment As Needed

The heart of this assessment process lies in determining whether the training objectives identified in the HMTA Guidelines have been adequately addressed in the course. For purposes of this assessment, an objective is considered adequately addressed when it is judged that the course materials and instructional methodology are sufficient to provide students with the knowledge, skills, and attitudes required to accomplish the objective safely and effectively during hazardous materials response.

Note that this analysis requires you to make a subjective evaluation of the adequacy of the course materials to support effective training delivery. Take into account the course time spent on the objective and the results of actual student performance evaluations reviewed previously. Other factors might include the scope of the training covered, methodologies used, clarity of presentation, and level of instructor support. Qualitative factors relating to the art and science of adult training should also be considered. Based on your knowledge of the course, determine whether each objective listed on the worksheet is adequately addressed in the instructional materials. If it would be helpful for other training managers, briefly explain your rationale in the space provided for comments. If the course does not cover a specific learning objective, enter “Not addressed” in the appropriate space.

1997 Response Course Assessment Worksheet

1 Organization Sponsoring Course

National Fire Academy
Federal Emergency Management Agency
16825 South Seton Avenue
Emmitsburg, Maryland 21727

2 Individual to Contact

Contact for further information regarding the course (name, address, phone).

Rob Weiderhold, Hazardous Materials Program Chair
National Fire Academy
(same address)
(301) 447-1000

3 General Course Description

(A) Course Title *Initial Response to Hazardous Materials Incidents*
Course 1: Basic Concepts (IHRMI-BC)

(B) Edition Number and/or Date *August, 1992* (C) Length (hours) *12*

(D) Course Purpose or Goal *The course is designed to address the basic training needs of all first responders, covering basic concepts and techniques of first response and emphasizing the requirements of OSHA 29 CFR 1910.120. The course is the first part of a two course series addressing awareness and operations competencies.*

4 Target Audiences, Competencies, Objectives

See instructions. Check each box if yes. If only selected objectives are addressed, describe. Attach appropriate course assessment worksheets. Continue as needed in Section 10: Special Course Characteristics.

(A) Target Audiences

[X] Course is suitable for all potential responders meeting competency prerequisites.

[ ] Course is targeted for specific disciplines.

- [ ] Fire
- [ ] Law Enforcement
- [ ] EMS
- [ ] Hospital
- [ ] Public Works
- [ ] Private Sector Employees
- [ ] Other _____

(B) Competencies and Objectives Addressed in Course

All Objectives	Selected Objectives	Competencies
[X]	[ ]	First Responder Awareness
[ ]	[X]	First Responder Operations
[ ]	[ ]	Hazardous Materials Technician
[ ]	[ ]	Incident Commander
[ ]	[ ]	Hazardous Materials Branch Chief
[ ]	[ ]	Safety Officer at Hazardous Materials Incidents
[ ]	[ ]	Hazardous Materials Branch Safety Officer
[ ]	[ ]	Specialist Employee
[ ]	[ ]	Private Sector Offsite Specialist Employee B
[ ]	[ ]	Private Sector Offsite Specialist Employee C
[ ]	[ ]	Hazardous Materials Specialist
[ ]	[ ]	Private Sector Offsite Specialist Employee A
[ ]	[ ]	Technician with a Tank Car Speciality
[ ]	[ ]	Technician with a Cargo Tank Speciality
[ ]	[ ]	Technician with an Intermodal Tank Speciality
[ ]	[ ]	Emergency Medical Service Level 1
[ ]	[ ]	Emergency Medical Service Level 2
[ ]	[ ]	Hospital Emergency Room Personnel
[ ]	[ ]	Other

Describe Selected Objectives *(below or in Sec. 10)*

The course exceeds current standards for Awareness, progressing into Operations. (See course assessment worksheets for details).

[X] **Continued in Section 10?**

5 Course Materials

See instructions. Check each box if yes and indicate quantities as requested. Explain as needed in Section 10: Special Course Characteristics.

(A) Instructional Materials

- [X] Instructor Guide (*266* pages)
- [X] Student Manual (*239* pages)
- [X] Handouts (*10* pages)
- [X] Slides (*347* number)
- [ ] Overhead Transparencies (_____ number)
- [X] Videotapes (*3*) number) (*28* total length in minutes)
- [ ] Slide/tapes (____) number) (_____ total length in minutes)
- [ ] Audiotapes (____) number) (_____ total length in minutes)
- [ ] Computer floppy discs (_____ number) (_____ format(s))
- [ ] Computer CDs (_____ number) (_____ format(s))
- [X] Other *DOT Emergency Response Guide*

(B) Evaluation Materials

- [X] Student tests
  - [X] Pretest [ ] End of units [X] End of course
- [ ] Delivery Assessment Instruments
  - [ ] End of units [ ] End of course
- [ ] Other _____

(C) Refresher Training Materials

- [ ] Refresher training guidance included
- [ ] Refresher training materials included

If yes, please describe in Sec. 10 Special Course Characteristics

(D) Physical Skills Laboratory and Demonstration Equipment & Supplies

- [ ] Are standard issue responder equipment and protective gear used in course?
- [ ] Are specialized hazardous materials response equipment and protective gear used in course?
- [ ] Are incident mock-ups, scenario equipment and props use in course (drums, tanks, valve assemblies, etc.)?

Please describe the use of any specialized equipment or supplies in Section 10 Special Course Characteristics

[X] **Continued in Section 10?**

Sample Completed Response Course Assessment

6 *Course Delivery Formats*

See instructions. Check which formats are used to deliver the course. If format varies by module, note which modules apply to each format. Explain as needed in Section 11: Special Course Delivery Considerations..

Check if yes.

- [ ] Independent study use (no instructor)
- [X] Field delivery run by centralized office
- [ ] Broadcast or televised delivery
- [X] Local department/ employer delivery
- [X] Special facility or fixed-site delivery
- [ ] Other _____

If the course is delivered using more than one format, please explain.

The course is designed for easy use in field or local department, and may be used at centralized Academy.

[X] ***Continued in Section 10?***

7 *Unit or Module Summary*

See instructions. Provide module title, length in hours or fraction, and check instructional methodologies employed. Use Section 12: Continuation, if necessary.

Unit / Module Number	Unit / Module Length (in Hours)	Unit / Module Has Potential For Use As Stand-Alone Training Module	Unit / Module Title	Instructional Methodologies Used In Unit/Module: Lecture / Discussion	Skills Demonstration / Performance Modeling	Audiovisual Presentation	Classroom Activities: Individual Student Work	Classroom Activities: Group and/or Table Top Work	Physical Skills Laboratory: Hands-On Student Work	Field Exercises or Drills	Self-Study	Computer-Assisted Instruction	Written Testing: Pre-Test, Unit Tests, Posttest	Other
1	1		*Introduction*	X		X	X							
2	1		*Regulations and Standards*	X										
3	1		*Personal Safety*	X		X		X						
4	1		*Toxicology*	X			X							
5	1.75		*Introduction to Recognition and Identification*	X			X	X						
6	2.2	X	*Site Management and Scene Set-up*	X		X	X	X						
7	.66		*Personal Protective Equipment*	X			X							
8	1		*Decontamination*	X										
9	.5		*Resources*	X			X							
10	1.5		*Course Wrap-up*	X				X						X

[ ] ***Continued in Section 12?***

Side 2 - Response Course Assessment Worksheet **1997**

8 Materials From Other Programs Used In This Course

See instructions. Applies to major sources only. Explain as needed in Section 12: Continuation.

Organization	Title of Program or Course Used	Comment
	None.	*Original development using task analysis based on OSHA 29 CFR 1910.120 and NFPA 472.*
		Some scenarios adapted from other NFA programs.

☐ **Continued in Section 12?**

9 Factors Affecting Use of Course by Other Organizations

See instructions. Check if yes. Explain as needed in Section 11: Special Course Delivery Considerations.

- [X] Do course materials have to be purchased?
- [ ] Do copyright limitations apply to use of the materials?
- [ ] Are there any special instructor skills or experience requirements?
- [ ] Are there any special facility or equipment requirement that would impede another jurisdiction's use of this course?
- [ ] Are there any special competency requirements or prerequisites for students?
- [X] Does a train-the-trainer program exist?
- [X] Are optional activities provided for different disciplines (fire, public works, EMS, etc.)?
- [ ] Are course texts available on computer disc?
- [ ] Are course evaluations available for review?
- [ ] Are summaries of student achievement available for review?
- [X] Do the majority of the scenarios apply to other locales or geographic regions?

[X] **Continued in Section 11?**

10 Special Course Characteristics

See instructions. Identify special or innovative characteristics of the course which would be of interest to other trainers, such as new activity approaches, new videos, unusual content sequencing, etc. If clarifying entries in other sections, identify which sections.

4. The course can be presented in conjunction with Course II: Concept Implementation for more detail and greater depth, covering other competencies of First Responder Operations. Training emphasis is on fire service but is appropriate for other audiences.

5. A 10-question pretest and 25-question posttest (multiple choice) are included. The DOT Emergency Response Guide is used in activities; one copy per student is ideal, although 5-6 copies is adequate for small group work. Slides are used extensively to support lectures and activities.

The course provides a broad overview and introduction to haz mat response concepts, functions and roles. Many individual and small group activities allow students to apply learning to realistic haz mat response situations. An emphasis is placed on defensive operations and personal safety.

All Awareness objectives are adequately met, and most Operations objectives are met.

1997 Response Course Assessment Worksheet - **Side 3**

Sample Completed Response Course Assessment

11 *Special Course Delivery Considerations*

See instructions. Identify training issues, special requirements or challenges not identified elsewhere that would affect another organization using or adapting this course. If clarifying entries in other sections, identify which sections.

6. *The course is designed as a standard National Fire Academy two-day field course for use by Fire departments and other response agencies at the State and local level. In-depth instructor support (lesson plan, slide references, activity instructions, sample discussion questions, etc.) is included. The student manual can be used for self-study after class.*

9. *All course materials (except for the DOT Emergency Response Guide) can be purchased from the National Audiovisual Center for minimal costs. The materials are in the public domain. No special instructor skills or facility/equipment requirements apply. The course assumes no previous haz mat response training for students. A train-the-trainer program was conducted at the National Fire Academy in 1992; no further offerings are currently planned. Many States and metros have conducted further train-the-trainer programs.*

The course activities utilize a range of scenarios that are representative of incidents in various locales and geographic areas. Fire service and EMS functions are emphasized, but the roles of other responders are addressed. Jurisdictions could substitute local scenarios/slides, if desired. The posttest is designed to test the student's grasp of the course content. The State or local agency presenting the course must determine if the test instrument is valid for determining competency within the jurisdiction.

12 *Continuation*

See instructions. Use this section to continue comments that exceed space allowed in other sections. For each comment, identify section being continued.

Side 4- Response Course Assessment Worksheet **1997**

***1997** Response Course Objectives Worksheet*

First Responder Awareness: Required Objectives

Course Title: *Initial Response to Hazardous Materials Incidents: Basic Concepts*

Organization: *National Fire Academy*

First Responder Awareness training courses may be assessed using either the required objectives or the recommended objectives in the curriculum guidelines. Required objectives are defined in OSHA 29 CFR 1910.120 (q)(6)(i), and are abbreviated below as OSHA AWARE-A through F. See *Guidelines for Public Sector Hazardous Materials Training* for additional information.

An objective is considered "adequately addressed" in this course assessment when it is judged that the course materials and instructional methodology are sufficient to provide students with the knowledge, skills and attitudes required to accomplish the objective safely and effectively during hazardous materials response. Refer to the accompanying Response Course Assessment Instructions for directions on how to use this worksheet.

Required Objective	Course Time Spent On Objective (Hours)	How Is Student Achievement Of The Objective Demonstrated?							Is The Required Objective Adequately Addressed? Comment As Needed.
		Individual Activity	Group Activity	Course Exercise	Written Test	Skills Test	Other	None	
OSHA AWARE-A *Define hazardous substances and identify risks at hazardous materials incidents.*	Time *2.5*	*X*	*X*		*X*				Check if objective is adequately addressed. *X* Comment: *Definitions, incident levels, zones, hazard types, toxicity, other areas covered.*
OSHA AWARE-B *Identify potential outcomes at hazardous materials incidents.*	Time *n/a*	*X*	*X*		*X*				Check if objective is adequately addressed. *X* Comment: *Many concepts and activities relate to haz mat operations, outcomes throughout course.*
OSHA AWARE-C *Recognize presence of hazardous materials at incidents.*	Time *2.5*	*X*	*X*		*X*				Check if objective is adequately addressed. *X* Comment: *Markings, placards, container types, and other clues are covered.*
OSHA AWARE-D *Identify hazardous substances present at incidents.*	Time *3.5*	*X*	*X*		*X*				Check if objective is adequately addressed. *X* Comment: *Identification procedures and resources (e.g. ERG, MSDS) are covered.*
OSHA AWARE-E *Understand role of first responder at awareness level in emergency response plan.*	Time *1.5*	*X*	*X*		*X*				Check if objective is adequately addressed. *X* Comment: *Response roles, planning requirements, SOP's, personal safety, other areas are covered.*
OSHA AWARE-F *Given haz mat incident, determine additional resources needed & notify comm, center.*	Time *2.5*	*X*	*X*		*X*				Check if objective is adequately addressed. *X* Comment: *Resources and notification requirements are covered and applied in activities.*

***1997** Response Course Objectives Worksheet*

First Responder Awareness: Recommended Objectives

Course Title: *Initial Response to Hazardous Materials Incidents: Basic Concepts*

Organization: *National Fire Academy*

First Responder Awareness training courses may be assessed using either the required objectives or the recommended objectives in the curriculum guidelines. Recommended objectives have their origin primarily in NFPA 472, Chapter 2: Competencies for the First Responder at the Awareness Level. Only principle objectives are used in course assessment. Accomplishment of appropriate enabling objectives is assumed, given student achievement of the principle objective. See *Guidelines for Public Sector Hazardous Materials Training* for additional information.

An objective is considered "adequately addressed" in this course assessment when it is judged that the course materials and instructional methodology are sufficient to provide students with the knowledge, skills and attitudes required to accomplish the objective safely and effectively during hazardous materials response. Refer to the accompanying Response Course Assessment Instructions for directions on how to use this worksheet.

Recommended Objective	Course Time Spent On Objective (Hours)	How Is Student Achievement Of The Objective Demonstrated?							Is The Recommended Objective Adequately Addressed? Comment As Needed.
		Individual Activity	Group Activity	Course Exercise	Written Test	Skills Test	Other	None	
AWARE-1 **NFPA 2-1.3** *Understand role of first responder at the awareness level.*	Time *3.75*	*X*	*X*		*X*				Check if objective is adequately addressed. ☐ Comment: *Personal safety, toxicology, and basic recognition and identification are covered.*
AWARE-2 **NFPA 2-2.1** *Detect the presence of hazardous materials at incidents.*	Time *.66*	*X*			*X*				Check if objective is adequately addressed. ☐ Comment: *Types, protective capabilities, and limitations of PPE's are covered.*
AWARE-3 **NFPA 2-2.2** *Survey incidents from safe location and identify the hazardous materials present.*	Time *n/a*								Check if objective is adequately addressed. ☒ Comment: *Basic concepts, terminology, regulations and standards are covered throughout course.*
AWARE-4 **NFPA 2-2.3** *Analyze incidents and identify the fire, explosion and health hazards for materials present.*	Time *2.5*	*X*	*X*		*X*				Check if objective is adequately addressed. ☐ Comment: *Basic concepts, methods and roles of site management/scene set-up are covered.*
AWARE-5 **NFPA 2-4.1** *Given haz mat incidents, identify actions to protect responders and others and to control access.*	Time *1*				*X*				Check if objective is adequately addressed. ☐ Comment: *Methods, zones and general procedures are covered.*
AWARE-6 **NFPA 2-4.2** *Given haz mat incidents, identify appropriate notification procedures.*	Time *n/a*								Check if objective is adequately addressed. ☐ Comment: *General information is presented throughout, more training on local SOPs is required.*

1997 Response Course Assessment Worksheet

1 Organization Sponsoring Course	2 Individual to Contact — *Contact for further information regarding the course (name, address, phone).*

3 General Course Description

(A) Course Title _____

_____

(B) Edition Number and/or Date _____ (C) Length (hours) _____

(D) Course Purpose or Goal _____

_____

_____

_____

4 Target Audiences, Competencies, Objectives

See instructions. Check each box if yes. If only selected objectives are addressed, describe. Attach appropriate course assessment worksheets. Continue as needed in Section 10: Special Course Characteristics.

(A) Target Audiences

☐ Course is suitable for all potential responders meeting competency prerequisites.

☐ Course is targeted for specific disciplines.

- ☐ Fire
- ☐ Law Enforcement
- ☐ EMS
- ☐ Hospital
- ☐ Public Works
- ☐ Private Sector Employees
- ☐ Other _____

(B) Competencies and Objectives Addressed in Course

All Objectives	Selected Objectives	Competencies
☐	☐	First Responder Awareness
☐	☐	First Responder Operations
☐	☐	Hazardous Materials Technician
☐	☐	Incident Commander
☐	☐	Hazardous Materials Branch Chief
☐	☐	Safety Officer at Hazardous Materials Incidents
☐	☐	Hazardous Materials Branch Safety Officer
☐	☐	Specialist Employee
☐	☐	Private Sector Offsite Specialist Employee B
☐	☐	Private Sector Offsite Specialist Employee C
☐	☐	Hazardous Materials Specialist
☐	☐	Private Sector Offsite Specialist Employee A
☐	☐	Technician with a Tank Car Speciality
☐	☐	Technician with a Cargo Tank Speciality
☐	☐	Technician with an Intermodal Tank Speciality
☐	☐	Emergency Medical Service Level 1
☐	☐	Emergency Medical Service Level 2
☐	☐	Hospital Emergency Room Personnel
☐	☐	Other

Describe Selected Objectives *(below or in Sec. 10)*

_____

_____

_____

☐ **Continued in Section 10?**

5 Course Materials

See instructions. Check each box if yes and indicate quantities as requested. Explain as needed in Section 10: Special Course Characteristics.

(A) Instructional Materials

- ☐ Instructor Guide (_____ pages)
- ☐ Student Manual (_____ pages)
- ☐ Handouts (_____ pages)
- ☐ Slides (_____ number)
- ☐ Overhead Transparencies (_____ number)
- ☐ Videotapes (____) number) (_____ total length in minutes)
- ☐ Slide/tapes (____) number) (_____ total length in minutes)
- ☐ Audiotapes (____) number) (_____ total length in minutes)
- ☐ Computer floppy discs (_____ number) (_____ format(s))
- ☐ Computer CDs (_____ number) (_____ format(s))
- ☐ Other _____

(B) Evaluation Materials

- ☐ Student tests
  - ☐ Pretest ☐ End of units ☐ End of course
- ☐ Delivery Assessment Instruments
  - ☐ End of units ☐ End of course
- ☐ Other _____

(C) Refresher Training Materials

- ☐ Refresher training guidance included
- ☐ Refresher training materials included

If yes, please describe in Sec. 10 Special Course Characteristics

(D) Physical Skills Laboratory and Demonstration Equipment & Supplies

- ☐ Are standard issue responder equipment and protective gear used in course?
- ☐ Are specialized hazardous materials response equipment and protective gear used in course?
- ☐ Are incident mock-ups, scenario equipment and props use in course (drums, tanks, valve assemblies, etc.)?

Please describe the use of any specialized equipment or supplies in Section 10 Special Course Characteristics

☐ **Continued in Section 10?**

6 Course Delivery Formats

See instructions. Check which formats are used to deliver the course. If format varies by module, note which modules apply to each format. Explain as needed in Section 11: Special Course Delivery Considerations..

Check if yes.

- ☐ Independent study use (no instructor)
- ☐ Field delivery run by centralized office
- ☐ Broadcast or televised delivery
- ☐ Local department/ employer delivery
- ☐ Special facility or fixed-site delivery
- ☐ Other _____

If the course is delivered using more than one format, please explain.

_____

_____

_____

☐ **Continued in Section 10?**

7 Unit or Module Summary

See instructions. Provide module title, length in hours or fraction, and check instructional methodologies employed. Use Section 12: Continuation, if necessary.

Unit / Module Number	Unit / Module Length (in Hours)	Unit / Module Has Potential For Use As Stand-Alone Training Module	Unit / Module Title	Instructional Methodologies Used In Unit/Module: Lecture / Discussion	Skills Demonstration / Performance Modeling	Audiovisual Presentation	Classroom Activities: Individual Student Work	Classroom Activities: Group and/or Table Top Work	Physical Skills Laboratory: Hands-On Student Work	Field Exercises or Drills	Self-Study	Computer-Assisted Instruction	Written Testing: Pre-Test, Unit Tests, Post-test	Other

☐ **Continued in Section 12?**

8 Materials From Other Programs Used In This Course

See instructions. Applies to major sources only. Explain as needed in Section 12: Continuation.

Organization	Title of Program or Course Used	Comment

☐ Continued in Section 12?

9 Factors Affecting Use of Course by Other Organizations

See instructions. Check if yes. Explain as needed in Section 11: Special Course Delivery Considerations.

- ☐ Do course materials have to be purchased?
- ☐ Do copyright limitations apply to use of the materials?
- ☐ Are there any special instructor skills or experience requirements?
- ☐ Are there any special facility or equipment requirement that would impede another jurisdiction's use of this course?
- ☐ Are there any special competency requirements or prerequisites for students?
- ☐ Does a train-the-trainer program exist?
- ☐ Are optional activities provided for different disciplines (fire, public works, EMS, etc.)?
- ☐ Are course texts available on computer disc?
- ☐ Are course evaluations available for review?
- ☐ Are summaries of student achievement available for review?
- ☐ Do the majority of the scenarios apply to other locales or geographic regions?

☐ Continued in Section 11?

10 Special Course Characteristics

See instructions. Identify special or innovative characteristics of the course which would be of interest to other trainers, such as new activity approaches, new videos, unusual content sequencing, etc. If clarifying entries in other sections, identify which sections.

11 *Special Course Delivery Considerations*

See instructions. Identify training issues, special requirements or challenges not identified elsewhere that would affect another organization using or adapting this course. If clarifying entries in other sections, identify which sections.

12 *Continuation*

See instructions. Use this section to continue comments that exceed space allowed in other sections. For each comment, identify section being continued.

***1997** Response Course Objectives Worksheet*

First Responder Awareness: Required Objectives

Course Title

Organization

First Responder Awareness training courses may be assessed using either the required objectives or the recommended objectives in the curriculum guidelines. Required objectives are defined in OSHA 29 CFR 1910.120 (q)(6)(i), and are abbreviated below as OSHA AWARE-A through F. See *Guidelines for Public Sector Hazardous Materials Training* for additional information.

An objective is considered "adequately addressed" in this course assessment when it is judged that the course materials and instructional methodology are sufficient to provide students with the knowledge, skills and attitudes required to accomplish the objective safely and effectively during hazardous materials response. Refer to the accompanying Response Course Assessment Instructions for directions on how to use this worksheet.

Required Objective	Course Time Spent On Objective (Hours)	How Is Student Achievement Of The Objective Demonstrated?							Is The Required Objective Adequately Addressed? Comment As Needed.
		Individual Activity	Group Activity	Course Exercise	Written Test	Skills Test	Other	None	
OSHA AWARE-A *Define hazardous substances and identify risks at hazardous materials incidents.*	Time								Check if objective is adequately addressed. ☐
	Comment								
OSHA AWARE-B *Identify potential outcomes at hazardous materials incidents.*	Time								Check if objective is adequately addressed. ☐
	Comment								
OSHA AWARE-C *Recognize presence of hazardous materials at incidents.*	Time								Check if objective is adequately addressed. ☐
	Comment								
OSHA AWARE-D *Identify hazardous substances present at incidents.*	Time								Check if objective is adequately addressed. ☐
	Comment								
OSHA AWARE-E *Understand role of first responder at awareness level in emergency response plan.*	Time								Check if objective is adequately addressed. ☐
	Comment								
OSHA AWARE-F *Given haz mat incident, determine additional resources needed & notify comm, center.*	Time								Check if objective is adequately addressed. ☐

1997 Response Course Objectives Worksheet

Haz Mat Branch Officer: Recommended Objectives

Course Title

Organization

Haz Mat Branch Officer recommended objectives have their origin primarily in NFPA 472, Chapter 7: Competencies for the Hazardous Materials Branch Officer. Only principle objectives are used in course assessment. Accomplishment of appropriate enabling objectives is assumed, given student achievement of the principle objective. See *Guidelines for Public Sector Hazardous Materials Training* for additional information.

An objective is considered "adequately addressed" in this course assessment when it is judged that the course materials and instructional methodology are sufficient to provide students with the knowledge, skills and attitudes required to accomplish the objective safely and effectively during hazardous materials response. Refer to the accompanying Response Course Assessment Instructions for directions on how to use this worksheet.

Recommended Objective	Course Time Spent On Objective (Hours)	How Is Student Achievement Of The Objective Demonstrated?							Is The Recommended Objective Adequately Addressed? Comment As Needed.
		Individual Activity	Group Activity	Course Exercise	Written Test	Skills Test	Other	None	
HMBO-1 **NFPA 7-1.3** *Understand the role of hazardous materials branch officer.*	Time								Check if objective is adequately addressed. ☐ Comment
HMBO-2 **NFPA7-2.1** *Given a haz mat incident, estimate potential outcomes within endangered areas.*	Time								Check if objective is adequately addressed. ☐ Comment
HMBO-3 **NFPA 7-3.1** *Select appropriate personal protective equipment for action options specified in plan of action.*	Time								Check if objective is adequately addressed. ☐ Comment
HMBO-4 **NFPA 7-3.2** *Develop a plan of action consistent with local emer. response plan and SOPs.*	Time								Check if objective is adequately addressed. ☐ Comment
HMBO-5 **NFPA 7-4.1** *Identify requirements of plan, including notification procedures and use of nonlocal resources.*	Time								Check if objective is adequately addressed. ☐ Comment
HMBO-6 **NFPA 7-4.2** *Direct haz mat branch resources in safe and efficient manner.*	Time								Check if objective is adequately addressed. ☐ Comment

1997 Response Course Objectives Worksheet

Specialist Employee: Recommended Objectives

Course Title

Organization

Specialist Employee training courses may be assessed using either the required objectives or the recommended objectives in the curriculum guidelines. Recommended objectives have their origin primarily in NFPA 472, Chapter 6: Competencies for Private Sector Specialist Employees, Section 6.2: Private Sector Specialist Employee C, and Section 6.3: Private Sector Specialist Employee B. To retain the integrity of the NFPA citations, the objectives are referred to respectively as SPEC(C) and SPEC(B), and are presented as separate groupings of objectives. Only principle objectives are used in course assessment. Accomplishment of appropriate enabling objectives is assumed, given student achievement of the principle objective. See *Guidelines for Public Sector Hazardous Materials Training* for additional information.

An objective is considered "adequately addressed" in this course assessment when it is judged that the course materials and instructional methodology are sufficient to provide students with the knowledge, skills and attitudes required to accomplish the objective safely and effectively during hazardous materials response. Refer to the accompanying Response Course Assessment Instructions for directions on how to use this worksheet.

EMS(1)-8 **NFPA 2-4.2** *Demonstrate ability to administer proper treatment to patient.*	Time								Check if objective is adequately addressed. ☐ Comment
EMS(1)-9 **NFPA 2-4.3** *Demonstrate ability to transport patient to appropriate facility.*	Time								Check if objective is adequately addressed. ☐ Comment
EMS(1)-10 *Describe patient decontamination process.*	Time								Check if objective is adequately addressed. ☐ Comment
EMS(1)-11 **NFPA 2-5.1** *Perform reporting, documentation, and follow-up required of EMS component according to local emer. response plan.*	Time								Check if objective is adequately addressed. ☐ Comment

Response Course Objectives Worksheet - **1997**
EMS Responder Level 1: Recommended Objectives

1997 Response Course Objectives Worksheet

EMS Responder Level 2: Recommended Objectives

Course Title

Organization

EMS Responder Level 2 recommended objectives have their origin primarily in NFPA 473, Chapter 3: Competencies for EMS/HM Le vel 2 Responders. Only principle objectives are used in course assessment. Accomplishment of appropriate enabling objectives is assumed, given student achievement of the principle objective. See *Guidelines for Public Sector Hazardous Materials Training* for additional information.

An objective is considered "adequately addressed" in this course assessment when it is judged that the course materials and instructional methodology are sufficient to provide students with the knowledge, skills and attitudes required to accomplish the objective safely and effectively during hazardous materials response. Refer to the accompanying Response Course Assessment Instructions for directions on how to use this worksheet.

Recommended Objective	Course Time Spent On Objective (Hours)	How Is Student Achievement Of The Objective Demonstrated?							Is The Recommended Objective Adequately Addressed? Comment As Needed.
		Individual Activity	Group Activity	Course Exercise	Written Test	Skills Test	Other	None	
EMS(2)-1 **NFPA 3-1.3** *Demonstrate an understanding of the role of emergency medical service responder level 2*	Time								Check if objective is adequately addressed. ☐ Comment
EMS(2)-2 **NFPA 3-2.1** *Given a haz mat incident, determine the hazards present to both the responder and the patient in that situation.*	Time								Check if objective is adequately addressed. ☐ Comment
EMS(2)-3 **NFPA 3-2.2** *Given a haz mat incident, assess the patient and conditions to determine risk of secondary contamination.*	Time								Check if objective is adequately addressed. ☐ Comment
EMS(2)-4 **NFPA 3-3.1** *Given a plan of action by the incident commander and EMS role in haz mat incident, describe importance of coordination between agencies at the scene.*	Time								Check if objective is adequately addressed. ☐ Comment
EMS(2)-5 **NFPA 3-3.2** *Given a haz mat incident, plan a response to provide appropriate level of emergency medical care to persons involved and to provide medical support to haz mat response personnel.*	Time								Check if objective is adequately addressed. ☐ Comment

EMS Responder Level 2
Recommended Objectives (Continued)

Recommended Objective	Course Time Spent On Objective (Hours)	How Is Student Achievement Of The Objective Demonstrated?							Is The Recommended Objective Adequately Addressed? Comment As Needed.
		Individual Activity	Group Activity	Course Exercise	Written Test	Skills Test	Other	None	
EMS(2)-6 **NFPA 3-3.3** *Given the name of the hazardous material and the type, duration, and extend of exposure, determine if the protective clothing and equipment available to EMS personnel is appropriate to implement the planned response.*	Time								Check if objective is adequately addressed. ☐ Comment
EMS(2)-7 **NFPA 3-4.1** *Given a plan for providing patient care at a haz mat incident, perform the preparations necessary to receive the patient for decontamination, treatment, and transport; and demonstrate proper donning, doffing and usage of personal protective equipment.*	Time								Check if objective is adequately addressed. ☐ Comment
EMS(2)-8 **NFPA 3-4.2** *Provide or coordinate patient care.*	Time								Check if objective is adequately addressed. ☐ Comment
EMS(2)-9 **NFPA 3-4.3** *Demonstrate the ability to coordinate patient care activities, including, treatment, disposition, and transportation of patients.*	Time								Check if objective is adequately addressed. ☐ Comment
EMS(2)-10 **NFPA 3-4.4** *Perform medical support of haz mat incident response personnel.*	Time								Check if objective is adequately addressed. ☐ Comment
EMS(2)-11 **NFPA 3-5.1** *Given the termination of a haz mat incident, complete the reporting, documentation, and EMS termination activities as required by the local emergency response plan or org's SOPs.*	Time								Check if objective is adequately addressed. ☐ Comment

Response Course Objectives Worksheet - **1997**
EMS Responder Level 2: Recommended Objectives

1997 Response Course Objectives Worksheet

Hospital Personnel: Recommended Objectives

Course Title

Organization

Hospital Personnel recommended objectives have their origin primarily in the Joint Commission for the Accreditation of Healthcare Organizations (JCAHO) standards for handling contaminated patients. Only principle objectives are used in course assessment. Accomplishment of appropriate enabling objectives is assumed, given student achievement of the principle objective. See *Guidelines for Public Sector Hazardous Materials Training* for additional information.

An objective is considered "adequately addressed" in this course assessment when it is judged that the course materials and instructional methodology are sufficient to provide students with the knowledge, skills and attitudes required to accomplish the objective safely and effectively during hazardous materials response. Refer to the accompanying Response Course Assessment Instructions for directions on how to use this worksheet.

Recommended Objective	Course Time Spent On Objective (Hours)	How Is Student Achievement Of The Objective Demonstrated?							Is The Recommended Objective Adequately Addressed? Comment As Needed.
		Individual Activity	Group Activity	Course Exercise	Written Test	Skills Test	Other	None	
HOSP-1 *Describe the ways in which a medical center or hospital can become involved in a haz mat event or response effort.*	Time								Check if objective is adequately addressed. ☐ Comment
HOSP-2 *Describe some of the key issues involved in the reception of a patient contaminated by or exposed to a chemical substance.*	Time								Check if objective is adequately addressed. ☐ Comment
HOSP-3 *Describe the need for the hospital to develop emergency response plans.*	Time								Check if objective is adequately addressed. ☐ Comment
HOSP-4 *Describe the hospitals documented management plan for the environment of care to be provided during a haz mat emergency that considers all factors of the emergency response.*	Time								Check if objective is adequately addressed. ☐ Comment

Hazardous Materials
Planning Course Assessment

Planning Course Assessment
DIRECTIONS

These instructions describe the methodology for assessing hazardous materials planning courses. Section 1, **General Information**, explains the purpose and nature of the assessment process. Section 2, **Performing a Course Assessment**, identifies basic steps for completing the assessment instruments. Section 3, **Specific Instructions**, provides block-by-block directions for filling out the instruments. A completed sample is attached, showing the assessment of the National Fire Academy course *Initial Response to Hazardous Materials Incidents: Basic Concepts*.

Every effort has been made to keep these instruments and instructions as simple and useful as possible. However, assessing adult training activities inherently involves some time and work.

1. GENERAL INFORMATION

Purpose of the Planning Course Assessment Worksheet

The Response Course Assessment Worksheets are designed to (1) gather descriptive information about individual hazardous materials training activities in a standardized format, and (2) facilitate comparison of course content with the recommended training requirements identified in the Hazardous Materials Emergency Preparedness (HMEP) grant program document *Guidelines for Public Sector Hazardous Materials Training (Guidelines)*. The data can be used to:

- Evaluate the scope of existing courses relative to Federal and other national standards and guidelines.
- Disseminate information to state and local training managers nationwide about existing courses.
- Help training agencies assess the usefulness of existing courses for their own needs.

Why Assess Planning Courses?

State and local agencies with hazardous materials training responsibilities can use the results of the assessment process for the purpose of:

1. Certifying compliance and/or verifying compatibility of training with the HMEP grant program curriculum Guidelines.
2. Analyzing and revising the current training plan.
3. Developing new courses or revising current ones to address unmet training needs.
4. Assessing whether to adopt or adapt an outside course for use within the organization or jurisdiction.

6. Communicating characteristics of existing courses to peer training managers in other organizations and jurisdictions.

7. Evaluating the capabilities of currently trained State and local personnel involved in planning.

8. Documenting and explaining the scope of training activities to outside decision-makers and the public.

The training needs of individual agencies or jurisdictions may differ from those defined here. Many factors that affect the quality of training are outside the scope of this assessment process. Training managers may supplement the results of this assessment process through peer instructor evaluation of deliveries, professional review of course materials, in-depth student and instructor interviews, student testing, and other forms of expert opinion.

Who Should Complete a Planning Course Assessment?

A course assessment should be conducted by any organization with hazardous materials planning training requirements.

All courses used in the HMEP grant program should be assessed. This includes Federal, State, tribal, and Protectorate, national professional association, and private sector courses used by grantees in their public sector training curriculums. Each course should be formally assessed by only one sponsoring organization.

HMEP grantees are responsible for assessing those courses in their curriculums (1) which they have developed entirely or modified for their specific use and (2) which are provided by private sector sources and contractors (other than national associations) and are used by the HMEP grantees use as part of their public sector curriculum. HMEP grantees are not responsible for assessing Federal, national association courses, or courses from other HMEP grantee curriculums. Federal and national association providers of training will be asked to provide assessment of their respective programs which are in use by HMTA grantees.

Assessment Evaluator Qualifications

It is recommended that assessment evaluators have the following minimum qualifications:

- A thorough understanding of the course purpose, training objectives, content, and instructional methodologies.

- Be familiar with the course delivery requirements, related administrative considerations, and student evaluation results.

- Have in-depth knowledge of all target training audiences, including their planning roles, job tasks, and required competencies.

- Have knowledge of hazardous materials planning processes, responsibilities, and applicable regulations and standards including those promulgated by OSHA, EPA, and NFPA.

- Have experience and credentials in applying the principles and techniques of adult education to emergency services and planning audiences.

Given the nature of the assessment process, sponsoring organizations may wish to consider using a workgroup approach, particularly for major courses. Assessment evaluators may include members of the course design and development team; experienced instructors, training program administrators, and course managers; qualified members of the training audience; and other hazardous materials experts as deemed appropriate.

2. PERFORMING A PLANNING COURSE ASSESSMENT

Initial Considerations

Before filling out the assessment instruments, participants should understand the purpose and requirements of the assessment process, and be familiar with the HMEP *Guidelines*.

The first step is to determine the desired depth of the analysis. Generally, one set of assessment instruments is completed for each course. If a course is comprised of major modules or sections that could serve as stand-alone courses in themselves it may be desirable to complete a separate set of instruments for each of those modules or sections of the course.

To decide the appropriate level of assessment consider the possible ways other emergency services organizations may use the training, the information, and decision-making needs of peer training managers. If, in your judgement, a significant number of agencies would benefit by more detailed information, complete one set of instruments for each major module or section of the course. Otherwise, fill out one set of instruments for the entire course.

General Steps in the Process

You are now ready to begin the course assessment. Following the general steps listed below will help you prepare the forms quickly and accurately.

Step 1: Review Course Training Materials — Gather and review all course instructional materials. These may include plans of instruction, content outlines, student manuals, instructor guides, audiovisual presentations (films, videotapes, slide-tapes, etc.), job aids, reference materials, and handout materials.

Step 2: Review Course Delivery Data — Gather and review materials that describe the effectiveness of previous course deliveries. These may include data on course offerings and participants, student and instructor training evaluations, student test summaries, and long-term performance evaluation results. You may interview or survey persons knowledgeable about course deliveries.

Step 3: Gather Related Documents — Obtain copies of other documents that may be useful in the course assessment process. Examples might include related federal legislation and regulations, copies of relevant NFPAstandards, source materials used in the development of the course, refresher training and train-the-trainer materials, course promotional materials, technical documents referenced in the course.

Step 4: Select Appropriate Instruments — Each course assessment requires filling out two separate instruments:

- **Planning Course Assessment Worksheet** describes the course and related delivery considerations. The basic format of the instrument is the same for all training activities assessed under this process. Copies of the instrument can be made from the master copy accompanying these instructions.

- **Planning Course Objectives Worksheet(s)** assesses course content relative to the HMEP *Guidelines*, and identifies the rrecommended training objectives for all competency areas addressed in the course. Separate Course Objectives Worksheets are available for the following competency areas:

  Planning Orientation
  Planning Essentials
  Planning Specialities
    Commodity Flow Study
    Hazard Analysis
    Capability Assessment
    Planning for Protective Actions
    Plan Implementation and Maintenance
    Facility Planning
    Planning for Public Educaiton

  You should complete a separate Course Objectives Worksheet for each competency area addressed in the course. Make copies of the appropriate worksheets from the master copies accompanying these instructions. (More information is provided under Specific Instructions, Planning Course Assessment Worksheet.)

Step 5: Fill in the Instruments — The block-by-block instructions for the instruments begin below. If more space is needed for your answers, use Section 12, Continuation, and attach separate sheets, as needed.

For most courses, the process can take approximately one to two hours per day of training depending on the complexity of the course, the number of people participating, their familiarity with the instructional materials, the desired workgroup process, and other factors.

Step 6: Using the Completed Instruments — The completed instruments should be filed as documentation of your organization's finished HMEP self-assessment of response courses. They can also be used to review your curriculum for completeness and to support dialogue with other training systems regarding your programs. For submission of the information into the HMEP Course Assessment Project, please use the enclosed return envelope or equivalent and send copies of the completed Response Course Assessment Worksheet with Course Objectives Worksheets attached for each course assessed to:

William Lewis
HMEP Course Assessment Project
National Emergency Training Center, FEMA
16825 South Seton Avenue
Emmitsburg, MD 21727

If you have any questions or would like assistance in completing your course assessment, call William Lewis (301) 447-1009, or Jennifer Krietz (301) 447-1585, or FAX (301) 447-1588.

3. SPECIFIC INSTRUCTIONS

This section provides detailed instructions for filling out the Planning Course Assessment Worksheet and the Course Objectives Worksheet. A completed sample of the instruments is attached. Please read these directions carefully as you proceed.

Planning Course Assessment Worksheet

Block 1: Organization Sponsoring Course

Enter the name and address of the Sponsoring Organization (the agency that has primary responsibility for the design and content of the course, and which maintains associated rights) in Block 1. Include subdivision titles, as appropriate.

Block 2: Individual to Contact

Enter the name, mailing address, and phone number of a person assigned to serve as a contact for federal agencies, State and local training managers, and others interested in learning more about the course. This person should be knowledgeable about the course and able to answer questions about the assessment process and results.

Block 3: General Course Description

A. Course Title — Enter the complete formal title of the course, including subtitles.

B. Edition Number and/or Date — Enter the official course number or edition/revision number and date which is used to identify the course. This number typically appears on the cover or title page of the instructional materials.

The identifying number should refer to the entire course, not separate elements such as the student manual, instructor guide, or videotapes. Do not list the International Standard Book Number (ISBN), Library of Congress Catalog Card Number, or other publishing reference number. For published works, enter the most recent publication date, but not the date of later reprintings (if any).

C. Length (hours) — Enter the length or duration of classroom hours per course. Course length includes all educational activities that are part of the course.

D. Course Purpose or Goal — The course purpose or goal is a brief statement (one to three sentences) that broadly defines the desired outcome(s) of the total educational experience, and attempts to clarify the competencies or capabilities that students should possess after having satisfactorily completed all course requirements. This goal is met when all training objectives identified for the course have been achieved. As a rule of thumb, consider how best to complete the sentence “Having successfully completed the course, students will be able to....”

Block 4: Target Audiences, Competencies and Objectives

A. Target Audiences — For purposes of this assessment, target audiences are broadly defined as groups with similar organizational missions in hazardous materials planning. These include emergency management personnel, emergency services personnel, public works personnel, public officials, private sector representatives, and others.

Identify the target audience categories for which this course is suitable by checking the appropriate boxes on the form. List other audiences that would benefit by this training.

B. Competencies and Objectives Addressed in Course — Competency areas are defined as the different planning roles that public sector employees may be required to perform as participants in the planning process at the local, state and federal levels. The competency areas listed on the assessment form follow the categories identified in the HMEP *Guidelines*.

An individual course may address parts of a competency area, a total competency area, or multiple competency areas. To determine which competency area(s) your course addresses, you must first compare the course content with the training objectives identified for each area. The objectives are listed in the HMEP *Guidelines* and are duplicated on the respective Course Objectives Worksheets.

After determining which competency areas your course addresses, check the appropriate boxes on the form. If the course addresses all the objectives in the competency area check "All"; if the course addresses only a portion of them check "Selected". You may need to check one or more competency areas. If you check "Selected" for any competency area, briefly explain the scope of the course in the space provided on the form. If more space is needed, continue in section 10: Special Course Characteristics. (Note: the description you provide should expand on and clarify the course purpose or goal statement entered in Block 3.)

Reminder: Fill out Course Objectives Worksheets for each competency area you check here, whether "All" or "Selected."

Block 5: Course Materials

A. Instructional Materials — Check the appropriate boxes to indicate which of the listed types of instructional materials are used in delivering the course. Enter the correct quantities for each type of material, as specified on the form. If separate refresher training materials are available, please describe them in Section 10: Special Course Characteristics. List other types of instructional materials used in the course (e.g., job aids, reference documents, films, computer software) in the space provided, continuing as necessary in Section 10: Special Course Characteristics.

B. Training Evaluation Materials — Check the appropriate boxes to indicate which of the listed types of evaluation materials are used in the course. If evaluation approaches other than student tests or instructor/student assessments are used, describe fully in Section 10: Special Course Characteristics.

C. Refresher Training Materials— Check the appropriate boxes to indicate whether refresher training guidance and/or materials are included in the course package. Describe focus, scope and competency priorities of any refresher training components in Section 10: Special Course Characteristics

D. Demonstration Equipment and Supplies — If special equipment or supplies are used in the delivery of the course, check the appropriate box(es) and explain briefly in Section 10: Special Course Characteristics. These materials include any props, tools, supplies, apparatus, equipment, computer display systems, or other instructional aids that would not be readily available in a typical training environment.

Block 6: Course Delivery Formats

Courses are designed for use in certain settings or environments, depending on the resources required for delivery, nature of the instruction, size and location of the target audience, cost considerations, and many other factors. Typical formats for planning training include:

- Independent student use — self-contained educational materials designed for use by individual target audience members without ongoing instructor support. (Note: this category includes computer-assisted instruction and interactive videodisc presentations).

- Local department/employer delivery — training that can be delivered by public sector organizations with the resources and capabilities commonly available at the local level.

- Field delivery run by centralized office — training delivered locally, but administered and perhaps staffed by a centralized facility, such as the Emergency Management Institute, State Fire Marshal's office, regional training academy, or private university.

- Special facility or fixed-site delivery — training that must be conducted on-site at a specific facility because it employs large, non-transportable equipment (such as large table top displays, specialized simulation structures, etc.) or because other instructional considerations (such as co-locating with another program) restrict delivery of the course to the specific site.

- Broadcast or televised delivery — training designed for delivery to groups of students via teleconference, broadcast television, closed-circuit television, radio, or other similar instructional media.

Check the box for the delivery format that applies to the course. In most cases, only one delivery format should be marked. Sometimes, however, multiple delivery formats may be possible for the same course (e.g., local department/employer delivery or field delivery run by a centralized office). In other cases, different modules may be delivered using different instructional formats. If more than one delivery format applies, check the appropriate boxes and explain briefly.

Block 7: Unit or Module Summary

Use Block 7 to list the major modules, units, chapters, or sections of the course. Include the unit/module number, planned or expected duration in hours (see the instructions for Block 3), and title. If the sum of the hours shown here does not match the total for the course reported in Block 3, explain in Section 10, Special Course Characteristics.

For each unit/module, indicate whether it could serve in other curriculums as a stand-alone module. The purpose of this information is to assist other training managers in determining whether the material could be incorporated into their programs. In general, a unit has potential as a stand-alone training module if (1) there is closure within the unit of student learning including demonstration of mastery of the material, and (2) if the material is not dependent for coherency or learning upon the unique sequence of content in the preceding and following units of the course.

In addition, identify the types of instructional methodologies used in each unit/module by checking one or more of the boxes on the form. Check other methodologies (e.g., role play, interactive videodisc, behavior modeling, etc.) in the space provided.

Block 8: Materials From Other Programs Used in Course Development

Source materials are training programs, job task analyses, research reports, technical manuals, etc. that are used in developing the course. By identifying these source materials it will help peer training managers and others to:

- Understand the course based on familiarity with the source materials.
- Identify similarities and differences among training activities and programs.
- Evaluate appropriate applications of the course.

In this section of the form, you are asked to identify major source materials used in developing the course. Include only those materials that were used extensively or that contributed significantly to the final form and content of the course. Do not list others whose impact was less important, even if they were researched as part of the course design and development process. For each major source material, fill in the title and the

name of the organization that developed it. Then list the module/unit numbers (from Block 7) of the course that were strongly influenced by the source material. If the source material applies to the entire course, write "all." Explain as necessary in Section 12: Continuation.

Block 9: Factors Affecting Use of Course By Other Organizations

Many factors must be weighed when considering whether to adopt or adapt an existing course: associated costs, delivery requirements, compatibility with mission and audiences, ability to modify, available support services, ease of use. This section of the assessment form includes a checklist of these factors to help other training managers make decisions about using the course for their own needs.

Review the questions and check the appropriate box for each one that you answer affirmatively. Then, using this checklist as a "mind jogger," write in Section 11: Special Delivery Characteristics a brief summary of all major factors that could affect use of the course by other agencies. In your narrative, try to address typical decision-making needs and obstacles faced by training managers in emergency services organizations when developing, adapting, or conducting training. If more space is needed, use Section 12, Continuation.

Blocks 10-12

Use Blocks 10-12 to complete your response to other sections of the form (see the instructions for Blocks 4 through 9). Keep your responses as clear as possible.

Planning Course Objectives Worksheets

The Planning Course Objectives Worksheet is a tool to help you determine whether the course adequately addresses minimum training objectives set forth in the HMEP Guidelines.

Worksheets exist for each of nine (9) competency areas. You should complete a separate worksheet for each competency area addressed in the course (see Block 4 of the Planning Course Assessment Worksheet).. The competency areas are:

Planning Orientation
Planning Essentials
Planning Specialities
- Commodity Flow Study
- Hazard Analysis
- Capability Assessment
- Planning for Protective Actions
- Plan Implementation and Maintenance
- Facility Planning
- Planning for Public Education

Enter the course title and name of the sponsoring organization on each form you fill out. The training objectives are listed in the left column. You may use either the required or the recommended objectives for your assessment. For each training objective, work horizontally across the page to make three determinations for each objective:

- The course time spent on the objective.
- The methods used to demonstrate student achievement of the objective.
- Whether the objective is adequately addressed in the course.

Course Time Spent On Objective

Estimating the amount of course time spent on each objective provides a useful indicator of the scope or depth of training in each area. More course time implies the opportunity for more in-depth instruction, and vice-versa. Estimating training time can be relatively straightforward for courses whose objectives are structured similarly to the competency organization in the HMEP *Guidelines*. In these situations, you need only analyze a typical course schedule or training agenda to determine how much time is allocated to each objective. Round the estimates to the nearest tenth (0.1) hour. If precise estimates are difficult, break the course down at least to half-hour (0.5) increments.

For courses that do not directly match the objectives or have a mix of origins, estimating training time will require more effort. You must review the course content using the following general procedures:

1. Think through the knowledge, skills, and attitudes (KSAs) needed by a typical student to achieve the training objective.

2. Identify all course content related to these KSAs. (Note: the content may be consolidated or spread out in different sections of the program).

3. Estimate the training time spent on this course content in a typical delivery.

As you conduct the analysis, you may find that some course content is related to more than one training objective. Other course content may not be associated with any of the objectives listed on the worksheet. Use your best judgement to include in your estimate all course time spent on content related to the objective whether or not this time is also reported for other objectives on the form. Relatively broad time estimates are acceptable.

Don't worry if the sum of the hours you estimate for the training objectives is different from the total you reported in Blocks 3 and 7. The figures will be adjusted later to reflect actual contact or classroom hours.

How Is Student Achievement of the Objectives Demonstrated?

Well-designed performance evaluation techniques provide an useful indicator of each student's ability to achieve the training objectives specified for the course. They also provide a powerful tool for assessing whether the course produces the desired results.

Successful student achievement of training objectives can be demonstrated through various means, including performance on written or skills tests, performance in objective-specific activities individually or as a group, and application of what has been learned in large exercises or in post-course exercise (or subsequently on the job). In this section you are asked to identify which technique or techniques are used to evaluate student learning. To make the determination, compare the course content covered in the evaluation mechanism with that related to the training objective. If they match, check the appropriate box on the form.

Is Objective Adequately Addressed? Comment As Needed

The heart of this assessment process lies in determining whether the training objectives identified in the HMTA Guidelines have been adequately addressed in the course. For purposes of this assessment, an objective is considered adequately addressed when it is judged that the course materials and instructional methodology are sufficient to provide students with the knowledge, skills, and attitudes required to accomplish the objective safely and effectively during hazardous materials response.

Note that this analysis requires you to make a subjective evaluation of the adequacy of the course materials to support effective training delivery. Take into account the course time spent on the objective and the results of

actual student performance evaluations reviewed previously. Other factors might include the scope of the training covered, methodologies used, clarity of presentation, and level of instructor support. Qualitative factors relating to the art and science of adult training should also be considered. Based on your knowledge of the course, determine whether each objective listed on the worksheet is adequately addressed in the instructional materials. If it would be helpful for other training managers, briefly explain your rationale in the space provided for comments. If the course does not cover a specific learning objective, enter "Not addressed" in the appropriate space.

9 *Factors Affecting Use of Course by Other Organizations*

See instructions. Check if yes. Explain as needed in Section 11: Special Course Delivery Considerations.

- ☐ Do course materials have to be purchased?
- ☐ Do copyright limitations apply to use of the materials?
- ☐ Are there any special instructor skills or experience requirements?
- ☐ Are there any special facility or equipment requirement that would impede another jurisdiction's use of this course?
- ☐ Are there any special competency requirements or prerequisites for students?
- ☐ Does a train-the-trainer program exist?
- ☐ Are optional activities provided for different disciplines (emergency management, fire, EMS, private sector, etc.)?
- ☐ Are course texts available on computer disc?
- ☐ Are course evaluations available for review?
- ☐ Are summaries of student achievement available for review?
- ☐ Do the majority of the scenarios apply to other locales or geographic regions?

☐ ***Continued in Section 11?***

10 *Special Course Characteristics*

See instructions. Identify special or innovative characteristics of the course which would be of interest to other trainers, such as new activity approaches, new videos, unusual content sequencing, etc. If clarifying entries in other sections, identify which sections.

11 *Special Course Delivery Considerations*

See instructions. Identify training issues, special requirements or challenges not identified elsewhere that would affect another organization using or adapting this course. If clarifying entries in other sections, identify which sections.

12 *Continuation*

See instructions. Use this section to continue comments that exceed space allowed in other sections. For each comment, identify section being continued.

Side 4- Planning Course Assessment Worksheet **1997**

1997 Planning Course Objectives Worksheet

Planning Orientation

Course Title

Organization

Training for competencies at the *Planning Orientation* level may be assessed using the recommended objectives displayed below. Only principle objectives are used in course assessment. Accomplishment of appropriate enabling objectives is assumed, given student achievement of the principle objective. See *Guidelines for Public Sector Hazardous Materials Training* for additional information.
An objective is considered "adequately addressed" when it is judged that the course materials and instructional methodology are sufficient to provide students with the knowledge, skills and attitudes needed to accomplish the objective effectively on the job. Refer to the accompanying Planning Course Assessment Instructions for directions on how to use this worksheet.

Recommended Objective	Course Time Spent On Objective (Hours)	How Is Student Achievement Of The Objective Demonstrated?							Is The Recommended Objective Adequately Addressed? Comment As Needed.
		Individual Activity	Group Activity	Course Exercise	Written Test	PostCourse Project	Other	None	
ORIENT-1 *Given a description of potential haz mat risks, explain the purpose and benefits of integrated haz mat emergency planning, and describe roles and participants in the emergency management system.*	Time								Check if objective is adequately addressed. ☐ Comment
ORIENT-2 *Given a jurisdiction or facility with the need to develop an integrated haz mat plan, identify legal requirements impacting the planning process and product.*	Time								Check if objective is adequately addressed. ☐ Comment
ORIENT-3 *Given the assignment to conduct haz mate emergency planning, identify the scope and elements of an integrated haz mat emergency plan.*	Time								Check if objective is adequately addressed. ☐ Comment
ORIENT-4 *Given the assignment to conduct hazardous materials emergency planning, identify and describe the major steps, participants, and other resources needed in the planning process.*	Time								Check if objective is adequately addressed. ☐ Comment
ORIENT-5 *Given an assignment to participate in or support integrated hazardous materials planning, develop strategies for promoting planning.*	Time								Check if objective is adequately addressed. ☐ Comment

Guidelines for Hazardous Materials TRAINING PROGRAM MANAGEMENT

About the Training Program Management Guidelines

The Training Program Management Guidelines are provided to assist public sector training managers and employers in performing several key tasks in the management of hazardous materials trainining programs. Guidance is provided for the following tasks:

1. Training Needs Assessment: Guidance is provided on developing, maintaining and reporting information regarding levels of responder/planner competencies and on defining and reporting type and volume of training needed within the manager's jurisdiction. Existing regulatory requirements are defined and procedural recommendations are provided. Directions are provided for using a standardized data form for data compilation and reporting.

2. Assessment of Response Courses: Guidance is provided on using the Response Guidelines to assess courses for compliance with OSHA 29 CFR 1910.120 and EPA 311, and compatibility with NFPA 472 and other recommended standards. Guidance is also provided on using the Response Guidelines for standardized description of the substance, scope and utility of courses, to facilitate information sharing and materials exchange with peer training program managers in other jurisdictions. Directions are provided for using standardized course objectives assessment worksheets and a standardized course description and assessment reporting format.

3. Assessment of Planning Courses:
Guidance is provided on using the Planning Guidelines to assess courses for fit with the training competencies identified for the different roles and functions involved in hazardous materials planning. Guidance is also be provided on using the Planning Guidelines for standardized description of the substance, scope and utility of courses, to facilitate information sharing and materials exchange with peer training program managers in other jurisdictions. Directions are provided for using standardized course objectives assessment worksheets and a standardized course description and assessment reporting format.

Hazardous Materials

TRAINING NEEDS ASSESSMENT

The purpose of a hazardous materials training program is to ensure, through training, that persons performing assigned response, planning and prevention responsibilities have the knowledge, skills and abilities to discharge their responsibilities safely and effectively. Other aspects of these guidelines provide support in evaluating existing training materials against established performance standards and in managing the delivery of hazardous materials training. However, providers of training also need to identify the numbers and types of individuals that need to be trained within their juridiction. This information is essential in order determine the scope of the overall training program needed to ensure that all personnel within the jurisdiction will be properly trained to meet the standards and/or achieve a given level of capability. This is the objective of a jurisdictional training needs assessment.

This section explores the rationale for conducting jurisdictional training needs assessments, discusses some of the methodology options and issues associated with jurisdiction-wide needs determination, and provides directions for using a standardized needs assessment worksheet for collecting, organizing and reporting needs assessment data.

What is it?

A training needs assessment is any method of determining what training is needed. It can range from an in-depth analysis of a single specific job task in support of development of a single portion of a training program, to a broad analysis of all hazards faced by an entire jurisdiction in order to determine the tasks and functions that all responders and planners need to be trained to perform. It can range in expense and effort from an "educated guess" of training need made by a group of experts in a single meeting to a jurisdiction-wide survey and statisitical analysis that involves great expense and effort by many people over a period of many months or even years.

For any jurisdiction, the primary purpose of a hazardous materials training needs assessment is to determine how many persons there are within the jurisdiction who are involved in hazardous materials planning, prevention and response and which of those persons need which types and levels of training. The process for determining this information can vary greatly in terms of the amount of effort expended and the breadth of issues considered. Regardless of the approach taken and the complexity of the needs assessment that is produced, a "bottom line" for any jurisdiction-level needs assessment effort is the final data on the training need for that jurisdiction. This "bottom line" should consist of clearly stated data on the numerical size of the training audience and the numbers of employees and other personnel which will need complete or refresher training at each of the different response levels and for all appropriate levels in planning and prevention. This data is essential for jurisdiction-wide training plan development, prioritization of programs, and the strategic allocation of training resources.

Why do it?

A jurisdiction-level training needs assessment is often viewed as a "nice to do" activity and is usually deferred as a lower priority in the face of limited resources for hazardous materials training. However, there are several compelling reasons why such a training needs assessment should be given a high priority in jurisidictions who do not have the needs assessment data presently.

COMPLIANCE WITH FEDERAL REGULATIONS

Under OSHA 29 CFR 1910.120 and EPA 311, the employer must ensure that all responders are trained to minimum competency before responding. State, tribal, territorial and local governments are employers of public sector responders. Data on how many there are, who is trained and who isn't is essential to be able to document that State and local governments are in compliance.

EFFICIENT USE OF RESOURCES

This data is vital for good training plan development. State, tribal, territorial and local training offices must know the scope and nature of the overall training requirement and the specific areas in which current training levels are deficient, in order to determine resources needed and to prioritize training properly to achieve compliance through training with OSHA/EPA requirements.

STRATEGIC PLANNING
Clear data documention of the overall training need within the jurisdiction can be used as the foundation for measurement of progress toward established goals. The data makes possible multi-year training plans and budgets that focus on the impact and comprehensiveness of training. For financial planning and budget purposes, the data is fundamental to justify appropriations and support applications for critically needed supplemental funding and support.

Methodology Considerations

There are two basic approaches usually used to conduct a jurisdiction-level needs assessment, although there are numerous variations possible depending upon differences in State, tribal, territorial and local organizational responsibilities, resources and preferences. The two basic approaches are (1) estimating the need at the State, tribal, or territorial level, and (2) determining the need at the local level and aggregating it at the State, tribal or territorial level.

ESTIMATING NEED AT THE STATE, TRIBAL OR TERRITORIAL LEVEL
This is the least accurate method, but is often used when resources or time prohibit the survey approach discussed below. The challenge is to attempt an unbiased and well-informed estimate. It is recommended that an expert team be formed including good representation of the different jurisidictions within the State, tribe or territory, and representation of the primary disciplines or professions involved in planning and response. All relevant existing data, such as demographic infomation, known turnover percentages, and existing needs estimates should be compiled and provided to the team. The final needs assessment estimate of the team should be a concensus product reflecting the best opinion of all team members. If possible, the resulting estimate should be reviewed by as many local jurisdictions as resources permit.

SURVEYING: USING THE “BOTTOMS UP APPROACH”
This is the most accurate approach to State, tribal or territory needs assessment and has many ancillary benefits beyond accurate data such as hightened local understanding of local training needs. The general process is to develop a needs survey instrument and distribute it to local jurisdictions for development of the information. It is important to have local jurisdiction input into the development of the survey instrument, and to allow sufficient time and resources for local jurisdictions to conduct the needs assessment. The instrument should include directions and a reporting form, and the model form provided in this guidance is offered for optional use. It is recommended that local personnel receive an orientation to the needs assessment work as well as the instrument itself, and that attention be given to consistency to avoid skewed information. It is recommended that attempts be made to establish a “network” with these persons for subsequent updates to maintain the currency and accuracy of the final information. Logistical problems should be anticipated and budgeted for, such as the time needed by State, tribal or territory personnel to follow-up to ensure that all participants complete the work

USING A MIXED APPROACH
Often, it is necessary to use both approaches to determine complete State, tribal and territorial needs assessment data, because local resources and data management systems can vary such that incomplete data will be received from the survey method. In that case, it is recommended that (1) data be collected from major metropolitan areas and local jurisidictions with well-staffed training resources, (2) a sampling be conducted of smaller jurisdictions to determine average data for those groups, and (3) an expert team be assembled at the State, tribe or territory level to extrapolate and “fill in the holes” to reach a final estimate of the need within the jurisdiction.

Issues

DEFINING PLANNING AND PREVENTION TRAINING LEVELS
Defining Planning and Prevention training needs is usually more difficult than defining Response needs, because the roles and responsibilities of public sector employees in these areas are usually not as well defined. It is recommended that survey instruments or expert team work include a draft definition of these

roles for each jurisdiction on which to base an estimate of the training needed to support competency in these roles.This is very important to avoid gaps in training that may result in persons being asked to perform planning and prevention functions (such as preparing local response plans) for which they are not trained or fully competent and upon which the safety of responding personnel may depend. Attention should also be given to the difficulties in determining planning audiences and roles when the planning and SOP work is done as a secondary or occasional duty and the need for training is not immediately evident.

For hazardous materials planning, it is recommended that individual personnel roles be identified at the needs assessment stage in terms of the orientation, essentials, and speciality competencies used in the Planning Guidelines. This will simplify subsequent identification of training need.

VOLUNTEER RESPONDERS

Hard data on number of volunteer responders in the jurisdiction and their existing level of training may be very difficult to acquire because many volunteers may be part time or infrequent participants in response, and volunteer department rosters may include many inactive members. However, State, tribal, territory and local governments are the "employer" of volunteers when they are participating in the response, and therefore are responsible for ensuring competency. Every effort should be made to not underestimate the training need for volunteer responders.

BALANCING RESPONSE PLANS WITH RESPONSE TRAINING NEEDS

Care should be taken to ensure that response training needs describe levels of competency that match actual response plans. For example, the number of persons that are needed to be competent as members of hazardous materials teams should reflect the number and organizational location of hazardous materials response teams in the local and State, tribal and territory emergency response plans. If there is a question about the soundness of the resource requirements described in the plans, some jurisdictions may find the need to undertake a more significant needs assessment for hazardous materials that would include revisiting hazards analyis and/or revisiting response capabilitiy needs. If emergency plans themselves are in question, this may also entail revisiting organizational responsibilities for plan development and jurisdictional models for plan structure and soundness. These issues involve a much more complex effort than is addressed in this guidance, but may have to be considered if it is found that problems in these areas prevent State, tribal, territory and local definition or confirmation of the training need.

Training Needs Information- The Bottom Line Numbers

Regardless of the process used to develop needs assessment data and regardless of the depth or complexity of the information addressed, there are severall basic and simple questions that must be answered if the needs assessment is to support training plan development. In order to determine training resource requirements, training strategies, and compliance with OSHA and EPA requirements, the absolute minimum information that must be determined is the number of people who are not trained or able to perform the function they will be called upon to perform. The basic questions that provide this information are:

(1) How many need to be able to perform each function (such as Incident Commander),
(2) How many are able to perform this function at present, and
(3) How many have not yet been trained or are not yet able to perform this function.

Example

10 firefighters needed to function as incident commander at haz mat emergencies.

4 have already received training or are certified competent at the incident commander level of the guidelines.

6 need to be trained to the incident commander level.

For large jurisdictions such as State training offices with training responsibilities for all response and planning functions, four sets of "bottom line" information are needed:

1. The potential training population. This is the number of persons in the jurisdiction who will potentially be involved in hazardous materials response, planning and prevention work. This information is usually divided by discipline, such as number of fire service potential responders, number of law enforcement potential responders, etc. Anticipated annual turn-over rates are usually included, so the number in the potential training population is usually somewhat larger than the actual number of persons currently employed.

2. How many are needed to be competent at a particular level. This is the number of persons in the jurisdiction that need to be competent to perform each role called for in response, planning, and prevention. For example, one portion of this data would be the number of firefighters needed to be competent at the Technician level. This number is determined by the response plans and response rotocols of the individual jurisdiction, and will vary greatly across jurisdictions. For example, one jurisdiction may use regional hazardous materials response teams and need a smaller number of technican-level responders than a comparably sized jurisdiction with a greater frequency of calls that must maintain local hazardous materials response teams and therefor a greater number of trained technicians.

3. How many have already been trained or certified as competent. This is the number of persons in the jurisdiction that need to be competent and either have already been trained or have been certified as competent by the employer. Records should exist to confirm that the training was received to maintain compliance with OSHA and EPA requirements. If the responder is certified as competent in lieu of training, this must be done by the immediate employer (for example, the Fire Chief or designee on behalf of the local municipal government). Note that OSHA and EPA requirements for annual refresher training apply to all persons already trained or certified as competent. Therefore, this number also becomes the number of persons needing annual refresher training or recertification.

4. How many will need complete training. This is the number of persons in the jurisdiction that need to be competent but are not so at the present time and need to be fully trained.

Example

	Firefighter	Law Enf.	
How many total potential responders (all functions)?	*2,800*	*1,400*	
Anticipated annual turnover?	*280*	*140*	
Total Potential Training Population	*3,080*	*1,540*	
Incident Commander Level			**Total**
How many are needed to be competent at this level?	*190*	*50*	
How many have already been trained or certified as competent?	*35*	*10*	*45*
How many will needed complete training?	*155*	*40*	*195*

Training Need

195 Incident Commander Full Training
45 Incident Commander Refresher Training

Reporting the Training Need

On the following pages are model needs assessment reporting forms. These forms focus on quantifiable summaries of training need- the bottom line numbers- as discussed above. These should be used to report training need with the HMEP grant applications and it is recommended that they also be used as a data gathering form for local submissions to the State, tribal or territory level during the needs assessment process.

The response form follows the above models and uses the standard function definitions of OSHA and NFPA, specifically as elaborated upon in the Response Guidelines portion of this document. Using the above samples, data entry into this form should be self-explanatory.

The planning form follows the above models and uses the function/competency definitions (orientation, essentials, and specialities) presented in the planning guidelines. Translation of existing demographic information (such as the number of LEPC members within a State) into the numbers of persons to be trained to a given competency requires judgement and decision-making regarding the sophisitication of planning roles to be performed. This will vary from jurisdiction to jurisdiction, depending upon the organization of planning responsibilities. For example, one State might prefer that all commodity flow studies in the State be done by State staff, so all local planning team members might require essentials-level training but only selected state personnel would need speciality-level training in doing a commodity flow study. See the planning curriculum guidelines for more thorough background information on defining these roles and responsibilities.

Hazardous Materials
Response Course Assessment

Response Course Assessment DIRECTIONS

These instructions describe the methodology for assessing hazardous materials response courses. Section 1, **General Information**, explains the purpose and nature of the assessment process. Section 2, **Performing a Course Assessment**, identifies basic steps for completing the assessment instruments. Section 3, **Specific Instructions**, provides block-by-block directions for filling out the instruments. A completed sample is attached, showing the assessment of the National Fire Academy course *Initial Response to Hazardous Materials Incidents: Basic Concepts*.

Every effort has been made to keep these instruments and instructions as simple and useful as possible. However, assessing adult training activities inherently involves some time and work.

1. GENERAL INFORMATION

Purpose of the Response Course Assessment Worksheet

The Response Course Assessment Worksheets are designed to (1) gather descriptive information about individual hazardous materials training activities in a standardized format, and (2) facilitate comparison of course content with the mandated and recommended training requirements identified in the Hazardous Materials Emergency Preparedness (HMEP) grant program document *Guidelines for Public Sector Hazardous Materials Training (Guidelines)*. The data can be used to:

- Evaluate the scope of existing courses relative to Federal and other national standards and guidelines.
- Disseminate information to state and local training managers nationwide about existing courses.
- Help training agencies assess the usefulness of existing courses for their own needs.

Why Assess Response Courses?

State and local agencies with hazardous materials training responsibilities can use the results of the assessment process for the purpose of:

1. Certifying compliance of training with OSHA 29 CFR 1910.120 and EPA 311, and with the HMEP grant program curriculum Guidelines.
2. Verifying compatibility of training with NFPA 472, NFPA 473, and other training recommendations or requirements.
3. Analyzing and revising the current training plan.
4. Developing new courses or revising current ones to address unmet training needs.

5. Assessing whether to adopt or adapt an outside course for use within the organization or jurisdiction.

6. Communicating characteristics of existing courses to peer training managers in other organizations and jurisdictions.

7. Evaluating the capabilities of currently trained State and local response personnel.

8. Documenting and explaining the scope of training activities to outside decision-makers and the public.

The training needs of individual agencies or jurisdictions may differ from those defined here. Many factors that affect the quality of training are outside the scope of this assessment process. Training managers may supplement the results of this assessment process through peer instructor evaluation of deliveries, professional review of course materials, in-depth student and instructor interviews, student testing, and other forms of expert opinion.

Who Should Complete a Response Course Assessment?

A course assessment should be conducted by any organization with hazardous materials response training requirements.

All courses used in the HMEP grant program should be assessed. This includes Federal, State, tribal, and Protectorate, national professional association, and private sector courses used by grantees in their public sector training curriculums. Each course should be formally assessed by only one sponsoring organization.

HMEP grantees are responsible for assessing those courses in their curriculums (1) which they have developed entirely or modified for their specific use and (2) which are provided by private sector sources and contractors (other than national associations) and are used by the HMEP grantees use as part of their public sector curriculum. HMEP grantees are not responsible for assessing Federal, national association courses, or courses from other HMEP grantee curriculums. Federal and national association providers of training will be asked to provide assessment of their respective programs which are in use by HMTA grantees.

Assessment Evaluator Qualifications

It is recommended that assessment evaluators have the following minimum qualifications:

- A thorough understanding of the course purpose, training objectives, content, and instructional methodologies.

- Be familiar with the course delivery requirements, related administrative considerations, and student evaluation results.

- Have in-depth knowledge of all target training audiences, including their response roles, job tasks, and required competencies.

- Have knowledge of hazardous materials response operations, applicable regulations and standards, including those promulgated by OSHA, EPA, and NFPA.

- Have experience and credentials in applying the principles and techniques of adult education to emergency services audiences.

Given the nature of the assessment process, sponsoring organizations may wish to consider using a workgroup approach, particularly for major courses. Assessment evaluators may include members of the course design and development team; experienced instructors, training program administrators, and course managers; qualified members of the training audience; and other hazardous materials experts as deemed appropriate.

2. PERFORMING A RESPONSE COURSE ASSESSMENT

Initial Considerations

Before filling out the assessment instruments, participants should understand the purpose and requirements of the assessment process, and be familiar with the HMEP *Guidelines*.

The first step is to determine the desired depth of the analysis. Generally, one set of assessment instruments is completed for each course. If a course is comprised of major modules or sections that could serve as stand-alone courses in themselves it may be desirable to complete a separate set of instruments for each of those modules or sections of the course.

To decide the appropriate level of assessment consider the possible ways other emergency services organizations may use the training, the information, and decision-making needs of peer training managers. If, in your judgement, a significant number of agencies would benefit by more detailed information, complete one set of instruments for each major module or section of the course. Otherwise, fill out one set of instruments for the entire course.

General Steps in the Process

You are now ready to begin the course assessment. Following the general steps listed below will help you prepare the forms quickly and accurately.

Step 1: Review Course Training Materials — Gather and review all course instructional materials. These may include plans of instruction, content outlines, student manuals, instructor guides, audiovisual presentations (films, videotapes, slide-tapes, etc.), job aids, reference materials, and handout materials.

Step 2: Review Course Delivery Data — Gather and review materials that describe the effectiveness of previous course deliveries. These may include data on course offerings and participants, student and instructor training evaluations, student test summaries, and long-term performance evaluation results. You may interview or survey persons knowledgeable about course deliveries.

Step 3: Gather Related Documents — Obtain copies of other documents that may be useful in the course assessment process. Examples might include related federal legislation and regulations, copies of NFPA 472 and 473, source materials used in the development of the course, refresher training and train-the-trainer materials, course promotional materials, technical documents referenced in the course.

Step 4: Select Appropriate Instruments — Each course assessment requires filling out two separate instruments:

- **Response Course Assessment Worksheet** describes the course and related delivery considerations. The basic format of the instrument is the same for all training activities assessed under this process. Copies of the instrument can be made from the master copy accompanying these instructions.

- **Response Course Objectives Worksheet(s)** assesses course content relative to the HMEP *Guidelines*, and identifies the required and recommended training objectives for all competency areas addressed in the course. Separate Course Objectives Worksheets are available for the following competency areas:

  First Responder Awareness
  First Responder Operations
  Hazardous Materials Technician
  Incident Commander
  Hazardous Materials Branch Chief (NFPA)
  Safety Officer at Hazardous Materials Incidents (OSHA)
  Hazardous Materials Branch Safety Officer (NFPA)
  Specilalist Employee (OSHA)
  Private Sector Specialist Employee C (NFPA)
  Private Sector Specialist Employee B (NFPA)
  Private Sector Specialist Employee A (NFPA)
  Hazardous Materials Specialist (OSHA)
  Technician with a Tank Car Speciality (NFPA)
  Technician with a Cargo Tank Speciality (NFPA)
  Technician with an Intermodal Tank Speciality (NFPA)
  Emergency Medical Service Level 1 Responder
  Emergency Medical Service Level 2 Responder
  Hospital Emergency Room Personnel

You should complete a separate Course Objectives Worksheet for each competency area addressed in the course. Make copies of the appropriate worksheets from the master copies accompanying these instructions. (More information is provided under Specific Instructions, Response Course Assessment Worksheet.)

Step 5: Fill in the Instruments — The block-by-block instructions for the instruments begin below. If more space is needed for your answers, use Section 12, Continuation, and attach separate sheets, as needed.

For most courses, the process can take approximately one to two hours per day of training depending on the complexity of the course, the number of people participating, their familiarity with the instructional materials, the desired workgroup process, the course's structural relationship to OSHA/EPA and NFPA standards, and other factors.

Step 6: Using the Completed Instruments — The completed instruments should be filed as documentation of your organization's finished HMTA self-assessment of response courses. They can also be used to review your curriculum for completeness and to support dialogue with other training systems regarding your programs. For submission of the information into the HMTA Course Assessment Project, please use the enclosed return envelope or equivalent and send copies of the completed Response Course Assessment Worksheet with Course Objectives Worksheets attached for each course assessed to:

William Lewis
HMTA Course Assessment Project
National Emergency Training Center, FEMA
16825 South Seton Avenue
Emmitsburg, MD 21727

If you have any questions or would like assistance in completing your course assessment, call William Lewis (301) 447-1009, or Jennifer Krietz (301) 447-1585, or FAX (301) 447-1588.

3. SPECIFIC INSTRUCTIONS

This section provides detailed instructions for filling out the Response Course Assessment Worksheet and the Course Objectives Worksheet. A completed sample of the instruments is attached. Please read these directions carefully as you proceed.

Response Course Assessment Worksheet

Block 1: Organization Sponsoring Course

Enter the name and address of the Sponsoring Organization (the agency that has primary responsibility for the design and content of the course, and which maintains associated rights) in Block 1. Include subdivision titles, as appropriate.

Block 2: Individual to Contact

Enter the name, mailing address, and phone number of a person assigned to serve as a contact for federal agencies, State and local training managers, and others interested in learning more about the course. This person should be knowledgeable about the course and able to answer questions about the assessment process and results.

Block 3: General Course Description

A. Course Title — Enter the complete formal title of the course, including subtitles.

B. Edition Number and/or Date — Enter the official course number or edition/revision number and date which is used to identify the course. This number typically appears on the cover or title page of the instructional materials.

The identifying number should refer to the entire course, not separate elements such as the student manual, instructor guide, or videotapes. Do not list the International Standard Book Number (ISBN), Library of Congress Catalog Card Number, or other publishing reference number. For published works, enter the most recent publication date, but not the date of later reprintings (if any).

C. Length (hours) — Enter the length or duration of classroom hours per course. Course length includes all educational activities that are part of the course.

D. Course Purpose or Goal — The course purpose or goal is a brief statement (one to three sentences) that broadly defines the desired outcome(s) of the total educational experience, and attempts to clarify the competencies or capabilities that students should possess after having satisfactorily completed all course requirements. This goal is met when all training objectives identified for the course have been achieved. As a rule of thumb, consider how best to complete the sentence “Having successfully completed the course, students will be able to....”

Block 4: Target Audiences, Competencies and Objectives

A. Target Audiences — For purposes of this assessment, target audiences are broadly defined as groups with similar organizational missions in hazardous materials incident response. These include the emergency services (fire, law enforcement, and emergency medical), public works, and other functional areas of State and local responsibility.

Identify the target audience categories for which this course is suitable by checking the appropriate boxes on the form. List other audiences that would benefit by this training. Examples might include elected/appointed officials, emergency management, public health, environmental agencies, and medical facilities.

B. Competencies and Objectives Addressed in Course — Competency areas are defined as response roles that public sector employees may be required to perform during a hazardous materials incident. The seven competency areas listed on the assessment form follow the categories identified in OSHA 1910.120, EPA 311 and the HMEP *Guidelines*.

An individual course may address parts of a competency area, a total competency area, or multiple competency areas. To determine which competency area(s) your course addresses, you must first compare the course content with the training objectives identified for each area. The objectives are listed in the HMEP *Guidelines* and are duplicated on the respective Course Objectives Worksheets.

After determining which competency areas your course addresses, check the appropriate boxes on the form. If the course addresses all the objectives in the competency area check "All"; if the course addresses only a portion of them check "Selected". You may need to check one or more competency areas. If you check "Selected" for any competency area, briefly explain the scope of the course in the space provided on the form. If more space is needed, continue in section 10: Special Course Characteristics. (Note: the description you provide should expand on and clarify the course purpose or goal statement entered in Block 3.)

Reminder: Fill out Course Objectives Worksheets for each competency area you check here, whether "All" or "Selected."

Block 5: Course Materials

A. Instructional Materials — Check the appropriate boxes to indicate which of the listed types of instructional materials are used in delivering the course. Enter the correct quantities for each type of material, as specified on the form. If separate refresher training materials are available, please describe them in Section 10: Special Course Characteristics. List other types of instructional materials used in the course (e.g., job aids, reference documents, films, computer software) in the space provided, continuing as necessary in Section 10: Special Course Characteristics.

B. Training Evaluation Materials — Check the appropriate boxes to indicate which of the listed types of evaluation materials are used in the course. If evaluation approaches other than student tests or instructor/student assessments are used, describe fully in Section 10: Special Course Characteristics.

C. Refresher Training Materials— Check the appropriate boxes to indicate whether refresher training guidance and/or materials are included in the course package. Describe focus, scope and competency priorities of any refresher training components in Section 10: Special Course Characteristics

D. Physical Skills Laboratory & Demonstration Equipment and Supplies — If special equipment or supplies are used in the delivery of the course, check the appropriate box(es) and explain briefly in Section 10: Special Course Characteristics. These materials include any props, tools, supplies, apparatus, equipment, or instructional aids that would not be readily available in a typical emergency services training environment. Do not include standard response equipment (turnout gear, firefighting tools, etc.) or common training supplies (media projectors, flipcharts, photocopying machines, etc.).

Block 6: Course Delivery Formats

Courses are designed for use in certain settings or environments, depending on the resources required for delivery, nature of the instruction, size and location of the target audience, cost considerations, and many other factors. Typical formats for emergency services training include:

- Independent student use — self-contained educational materials designed for use by individual target audience members without ongoing instructor support. (Note: this category includes computer-assisted instruction and interactive videodisc presentations).

- Local department/employer delivery — training that can be delivered by public sector organizations with the resources and capabilities commonly available at the local level.

- Field delivery run by centralized office — training delivered locally, but administered and perhaps staffed by a centralized facility, such as the Emergency Management Institute, State Fire Marshal's office, regional training academy, or private university.

- Special facility or fixed-site delivery — training that must be conducted on-site at a specific facility because it employs large, non-transportable equipment (such as large piping and valve systems, specialized simulation structures, etc.) or because other instructional considerations (such as co-locating with another program) restrict delivery of the course to the specific site.

- Broadcast or televised delivery — training designed for delivery to groups of students via teleconference, broadcast television, closed-circuit television, radio, or other similar instructional media.

Check the box for the delivery format that applies to the course. In most cases, only one delivery format should be marked. Sometimes, however, multiple delivery formats may be possible for the same course (e.g., local department/employer delivery or field delivery run by a centralized office). In other cases, different modules may be delivered using different instructional formats. If more than one delivery format applies, check the appropriate boxes and explain briefly.

Block 7: Unit or Module Summary

Use Block 7 to list the major modules, units, chapters, or sections of the course. Include the unit/module number, planned or expected duration in hours (see the instructions for Block 3), and title. If the sum of the hours shown here does not match the total for the course reported in Block 3, explain in Section 10, Special Course Characteristics.

For each unit/module, indicate whether it could serve in other curriculums as a stand-alone module. The purpose of this information is to assist other training managers in determining whether the material could be incorporated into their programs. In general, a unit has potential as a stand-alone training module if (1) there is closure within the unit of student learning including demonstration of mastery of the material, and (2) if the material is not dependent for coherency or learning upon the unique sequence of content in the preceding and following units of the course.

In addition, identify the types of instructional methodologies used in each unit/module by checking one or more of the boxes on the form. Check other methodologies (e.g., role play, interactive videodisc, behavior modeling, etc.) in the space provided.

Block 8: Materials From Other Programs Used in Course Development

Source materials are training programs, job task analyses, research reports, technical manuals, etc. that are used in developing the course. By identifying these source materials it will help peer training managers and others to:

- Understand the course based on familiarity with the source materials.
- Identify similarities and differences among training activities and programs.
- Evaluate appropriate applications of the course.

In this section of the form, you are asked to identify major source materials used in developing the course. Include only those materials that were used extensively or that contributed significantly to the final form and content of the course. Do not list others whose impact was less important, even if they were researched as part of the course design and development process. For each major source material, fill in the title and the

name of the organization that developed it. Then list the module/unit numbers (from Block 7) of the course that were strongly influenced by the source material. If the source material applies to the entire course, write "all." Explain as necessary in Section 12: Continuation.

Block 9: Factors Affecting Use of Course By Other Organizations

Many factors must be weighed when considering whether to adopt or adapt an existing course: associated costs, delivery requirements, compatibility with mission and audiences, ability to modify, available support services, ease of use. This section of the assessment form includes a checklist of these factors to help other training managers make decisions about using the course for their own needs.

Review the questions and check the appropriate box for each one that you answer affirmatively. Then, using this checklist as a "mind jogger," write in Section 11: Special Delivery Characteristics a brief summary of all major factors that could affect use of the course by other agencies. In your narrative, try to address typical decision-making needs and obstacles faced by training managers in emergency services organizations when developing, adapting, or conducting training. If more space is needed, use Section 12, Continuation.

Blocks 10-12

Use Blocks 10-12 to complete your response to other sections of the form (see the instructions for Blocks 4 through 9). Keep your responses as clear as possible.

Response Course Objectives Worksheets

The Response Course Objectives Worksheet is a tool to help you determine whether the course adequately addresses minimum training objectives set forth in the HMTA Guidelines. Required and recommended objectives are identified. The required objectives are based on OSHA/EPA regulations; recommended objectives were developed using NFPA 472 and 473 standards.

Worksheets exist for each of eighteen (18) competency areas. You should complete a separate worksheet for each competency area addressed in the course (see Block 4 of the Response Course Assessment Worksheet).. The competency areas are:

First Responder Awareness
First Responder Operations
Hazardous Materials Technician
Incident Commander
Hazardous Materials Branch Chief (NFPA)
Safety Officer at Hazardous Materials Incidents (OSHA)
Hazardous Materials Branch Safety Officer (NFPA)
Specilalist Employee (OSHA)
Private Sector Specialist Employee C (NFPA)
Private Sector Specialist Employee B (NFPA)
Private Sector Specialist Employee A (NFPA)
Hazardous Materials Specialist (OSHA)
Technician with a Tank Car Speciality (NFPA)
Technician with a Cargo Tank Speciality (NFPA)
Technician with an Intermodal Tank Speciality (NFPA)
Emergency Medical Service Level 1 Responder
Emergency Medical Service Level 2 Responder
Hospital Emergency Room Personnel

Enter the course title and name of the sponsoring organization on each form you fill out. The training objectives are listed in the left column. You may use either the required or the recommended objectives for your assessment. For each training objective, work horizontally across the page to make three determinations for each objective:

- The course time spent on the objective.
- The methods used to demonstrate student achievement of the objective.
- Whether the objective is adequately addressed in the course.

Course Time Spent On Objective

Estimating the amount of course time spent on each objective provides a useful indicator of the scope or depth of training in each area. More course time implies the opportunity for more in-depth instruction, and vice-versa. Estimating training time can be relatively straightforward for courses that are structured according to the OSHA/EPA or NFPA standards. In these situations, you need only analyze a typical course schedule or training agenda to determine how much time is allocated to each objective. Round the estimates to the nearest tenth (0.1) hour. If precise estimates are difficult, break the course down at least to half-hour (0.5) increments.

For courses that do not directly match the objectives or have a mix of origins, estimating training time will require more effort. You must review the course content using the following general procedures:

1. Think through the knowledge, skills, and attitudes (KSAs) needed by a typical student to achieve the training objective.
2. Identify all course content related to these KSAs. (Note: the content may be consolidated or spread out in different sections of the program).
3. Estimate the training time spent on this course content in a typical delivery.

As you conduct the analysis, you may find that some course content is related to more than one training objective. Other course content may not be associated with any of the objectives listed on the worksheet. Use your best judgement to include in your estimate all course time spent on content related to the objective whether or not this time is also reported for other objectives on the form. Relatively broad time estimates are acceptable.

Don't worry if the sum of the hours you estimate for the training objectives is different from the total you reported in Blocks 3 and 7. The figures will be adjusted later to reflect actual contact or classroom hours.

How Is Student Achievement of the Objectives Demonstrated?

Well-designed performance evaluation techniques provide an useful indicator of each student's ability to achieve the training objectives specified for the course. They also provide a powerful tool for assessing whether the course produces the desired results.

Successful student achievement of training objectives can be demonstrated through various means, including performance on written or skills tests, performance in objective-specific activities individually or as a group, or application of what has been learned in large exercises (or subsequently on the job). In this section you are asked to identify which technique or techniques are used to evaluate student learning. To make the determination, compare the course content covered in the evaluation mechanism with that related to the training objective. If they match, check the appropriate box on the form.

Is Objective Adequately Addressed? Comment As Needed

The heart of this assessment process lies in determining whether the training objectives identified in the HMTA Guidelines have been adequately addressed in the course. For purposes of this assessment, an objective is considered adequately addressed when it is judged that the course materials and instructional methodology are sufficient to provide students with the knowledge, skills, and attitudes required to accomplish the objective safely and effectively during hazardous materials response.

Note that this analysis requires you to make a subjective evaluation of the adequacy of the course materials to support effective training delivery. Take into account the course time spent on the objective and the results of actual student performance evaluations reviewed previously. Other factors might include the scope of the training covered, methodologies used, clarity of presentation, and level of instructor support. Qualitative factors relating to the art and science of adult training should also be considered. Based on your knowledge of the course, determine whether each objective listed on the worksheet is adequately addressed in the instructional materials. If it would be helpful for other training managers, briefly explain your rationale in the space provided for comments. If the course does not cover a specific learning objective, enter “Not addressed” in the appropriate space.

3 General Course Description

(A) Course Title *Initial Response to Hazardous Materials Incidents*
Course 1: Basic Concepts (IHRMI-BC)

(B) Edition Number and/or Date *August, 1992* (C) Length (hours) *12*

(D) Course Purpose or Goal *The course is designed to address the basic training needs of all first responders, covering basic concepts and techniques of first response and emphasizing the requirements of OSHA 29 CFR 1910.120. The course is the first part of a two course series addressing awareness and operations competencies.*

4 Target Audiences, Competencies, Objectives

See instructions. Check each box if yes. If only selected objectives are addressed, describe. Attach appropriate course assessment worksheets. Continue as needed in Section 10: Special Course Characteristics.

(A) Target Audiences

[X] Course is suitable for all potential responders meeting competency prerequisites.

[ ] Course is targeted for specific disciplines.

- [ ] Fire
- [ ] Law Enforcement
- [ ] EMS
- [ ] Hospital
- [ ] Public Works
- [ ] Private Sector Employees
- [ ] Other _____

(B) Competencies and Objectives Addressed in Course

All Objectives	Selected Objectives	Competencies
[X]	[ ]	First Responder Awareness
[ ]	[X]	First Responder Operations
[ ]	[ ]	Hazardous Materials Technician
[ ]	[ ]	Incident Commander
[ ]	[ ]	Hazardous Materials Branch Chief
[ ]	[ ]	Safety Officer at Hazardous Materials Incidents
[ ]	[ ]	Hazardous Materials Branch Safety Officer
[ ]	[ ]	Specialist Employee
[ ]	[ ]	Private Sector Offsite Specialist Employee B
[ ]	[ ]	Private Sector Offsite Specialist Employee C
[ ]	[ ]	Hazardous Materials Specialist
[ ]	[ ]	Private Sector Offsite Specialist Employee A
[ ]	[ ]	Technician with a Tank Car Speciality
[ ]	[ ]	Technician with a Cargo Tank Speciality
[ ]	[ ]	Technician with an Intermodal Tank Speciality
[ ]	[ ]	Emergency Medical Service Level 1
[ ]	[ ]	Emergency Medical Service Level 2
[ ]	[ ]	Hospital Emergency Room Personnel
[ ]	[ ]	Other

Describe Selected Objectives *(below or in Sec. 10)*

The course exceeds current standards for Awareness, progressing into Operations. (See course assessment worksheets for details).

[X] **Continued in Section 10?**

5 Course Materials

See instructions. Check each box if yes and indicate quantities as requested. Explain as needed in Section 10: Special Course Characteristics.

(A) Instructional Materials

- [X] Instructor Guide (*266* pages)
- [X] Student Manual (*239* pages)
- [X] Handouts (*10* pages)
- [X] Slides (*347* number)
- [ ] Overhead Transparencies (_____ number)
- [X] Videotapes (*3*) number) (*28* total length in minutes)
- [ ] Slide/tapes (____) number) (_____ total length in minutes)
- [ ] Audiotapes (____) number) (_____ total length in minutes)
- [ ] Computer floppy discs (_____ number) (_____ format(s))
- [ ] Computer CDs (_____ number) (_____ format(s))
- [X] Other *DOT Emergency Response Guide*

(B) Evaluation Materials

- [X] Student tests
  - [X] Pretest [ ] End of units [X] End of course
- [ ] Delivery Assessment Instruments
  - [ ] End of units [ ] End of course
- [ ] Other _____

(C) Refresher Training Materials

- [ ] Refresher training guidance included
- [ ] Refresher training materials included

If yes, please describe in Sec. 10 Special Course Characteristics

(D) Physical Skills Laboratory and Demonstration Equipment & Supplies

- [ ] Are standard issue responder equipment and protective gear used in course?
- [ ] Are specialized hazardous materials response equipment and protective gear used in course?
- [ ] Are incident mock-ups, scenario equipment and props use in course (drums, tanks, valve assemblies, etc.)?

Please describe the use of any specialized equipment or supplies in Section 10 Special Course Characteristics

[X] **Continued in Section 10?**

Sample Completed Response Course Assessment

6 *Course Delivery Formats*

See instructions. Check which formats are used to deliver the course. If format varies by module, note which modules apply to each format. Explain as needed in Section 11: Special Course Delivery Considerations..

Check if yes.

- [ ] Independent study use (no instructor)
- [X] Field delivery run by centralized office
- [ ] Broadcast or televised delivery
- [X] Local department/ employer delivery
- [X] Special facility or fixed-site delivery
- [ ] Other _____

If the course is delivered using more than one format, please explain.

The course is designed for easy use in field or local department, and may be used at centralized Academy.

[X] ***Continued in Section 10?***

7 *Unit or Module Summary*

See instructions. Provide module title, length in hours or fraction, and check instructional methodologies employed. Use Section 12: Continuation, if necessary.

Unit / Module Number	Unit / Module Length (in Hours)	Unit / Module Has Potential For Use As Stand-Alone Training Module	Unit / Module Title	Instructional Methodologies Used In Unit/Module: Lecture / Discussion	Skills Demonstration / Performance Modeling	Audiovisual Presentation	Classroom Activities: Individual Student Work	Classroom Activities: Group and/or Table Top Work	Physical Skills Laboratory: Hands-On Student Work	Field Exercises or Drills	Self-Study	Computer-Assisted Instruction	Written Testing: Pre-Test, Unit Tests, Posttest	Other
1	1		*Introduction*	X		X	X							
2	1		*Regulations and Standards*	X										
3	1		*Personal Safety*	X		X		X						
4	1		*Toxicology*	X			X							
5	1.75		*Introduction to Recognition and Identification*	X			X	X						
6	2.2	X	*Site Management and Scene Set-up*	X		X	X	X						
7	.66		*Personal Protective Equipment*	X			X							
8	1		*Decontamination*	X										
9	.5		*Resources*	X			X							
10	1.5		*Course Wrap-up*	X				X						X

[ ] ***Continued in Section 12?***

Side 2 - Response Course Assessment Worksheet **1997**

8 Materials From Other Programs Used In This Course

See instructions. Applies to major sources only. Explain as needed in Section 12: Continuation.

Organization	Title of Program or Course Used	Comment
	None.	*Original development using task analysis based on OSHA 29 CFR 1910.120 and NFPA 472.*
		Some scenarios adapted from other NFA programs.

☐ **Continued in Section 12?**

9 Factors Affecting Use of Course by Other Organizations

See instructions. Check if yes. Explain as needed in Section 11: Special Course Delivery Considerations.

- [X] Do course materials have to be purchased?
- [ ] Do copyright limitations apply to use of the materials?
- [ ] Are there any special instructor skills or experience requirements?
- [ ] Are there any special facility or equipment requirement that would impede another jurisdiction's use of this course?
- [ ] Are there any special competency requirements or prerequisites for students?
- [X] Does a train-the-trainer program exist?
- [X] Are optional activities provided for different disciplines (fire, public works, EMS, etc.)?
- [ ] Are course texts available on computer disc?
- [ ] Are course evaluations available for review?
- [ ] Are summaries of student achievement available for review?
- [X] Do the majority of the scenarios apply to other locales or geographic regions?

[X] **Continued in Section 11?**

10 Special Course Characteristics

See instructions. Identify special or innovative characteristics of the course which would be of interest to other trainers, such as new activity approaches, new videos, unusual content sequencing, etc. If clarifying entries in other sections, identify which sections.

4. The course can be presented in conjunction with Course II: Concept Implementation for more detail and greater depth, covering other competencies of First Responder Operations. Training emphasis is on fire service but is appropriate for other audiences.

5. A 10-question pretest and 25-question posttest (multiple choice) are included. The DOT Emergency Response Guide is used in activities; one copy per student is ideal, although 5-6 copies is adequate for small group work. Slides are used extensively to support lectures and activities.

The course provides a broad overview and introduction to haz mat response concepts, functions and roles. Many individual and small group activities allow students to apply learning to realistic haz mat response situations. An emphasis is placed on defensive operations and personal safety.

All Awareness objectives are adequately met, and most Operations objectives are met.

1997 Response Course Assessment Worksheet - **Side 3**

Sample Completed Response Course Assessment

11 *Special Course Delivery Considerations*

See instructions. Identify training issues, special requirements or challenges not identified elsewhere that would affect another organization using or adapting this course. If clarifying entries in other sections, identify which sections.

6. *The course is designed as a standard National Fire Academy two-day field course for use by Fire departments and other response agencies at the State and local level. In-depth instructor support (lesson plan, slide references, activity instructions, sample discussion questions, etc.) is included. The student manual can be used for self-study after class.*

9. *All course materials (except for the DOT Emergency Response Guide) can be purchased from the National Audiovisual Center for minimal costs. The materials are in the public domain. No special instructor skills or facility/equipment requirements apply. The course assumes no previous haz mat response training for students. A train-the-trainer program was conducted at the National Fire Academy in 1992; no further offerings are currently planned. Many States and metros have conducted further train-the-trainer programs.*

The course activities utilize a range of scenarios that are representative of incidents in various locales and geographic areas. Fire service and EMS functions are emphasized, but the roles of other responders are addressed. Jurisdictions could substitute local scenarios/slides, if desired. The posttest is designed to test the student's grasp of the course content. The State or local agency presenting the course must determine if the test instrument is valid for determining competency within the jurisdiction.

12 *Continuation*

See instructions. Use this section to continue comments that exceed space allowed in other sections. For each comment, identify section being continued.

Side 4- Response Course Assessment Worksheet **1997**

***1997** Response Course Objectives Worksheet*

First Responder Awareness: Required Objectives

Course Title: *Initial Response to Hazardous Materials Incidents: Basic Concepts*

Organization: *National Fire Academy*

First Responder Awareness training courses may be assessed using either the required objectives or the recommended objectives in the curriculum guidelines. Required objectives are defined in OSHA 29 CFR 1910.120 (q)(6)(i), and are abbreviated below as OSHA AWARE-A through F. See *Guidelines for Public Sector Hazardous Materials Training* for additional information.

An objective is considered "adequately addressed" in this course assessment when it is judged that the course materials and instructional methodology are sufficient to provide students with the knowledge, skills and attitudes required to accomplish the objective safely and effectively during hazardous materials response. Refer to the accompanying Response Course Assessment Instructions for directions on how to use this worksheet.

Required Objective	Course Time Spent On Objective (Hours)	How Is Student Achievement Of The Objective Demonstrated?							Is The Required Objective Adequately Addressed? Comment As Needed.
		Individual Activity	Group Activity	Course Exercise	Written Test	Skills Test	Other	None	
OSHA AWARE-A *Define hazardous substances and identify risks at hazardous materials incidents.*	Time *2.5*	*X*	*X*		*X*				Check if objective is adequately addressed. *X* Comment: *Definitions, incident levels, zones, hazard types, toxicity, other areas covered.*
OSHA AWARE-B *Identify potential outcomes at hazardous materials incidents.*	Time *n/a*	*X*	*X*		*X*				Check if objective is adequately addressed. *X* Comment: *Many concepts and activities relate to haz mat operations, outcomes throughout course.*
OSHA AWARE-C *Recognize presence of hazardous materials at incidents.*	Time *2.5*	*X*	*X*		*X*				Check if objective is adequately addressed. *X* Comment: *Markings, placards, container types, and other clues are covered.*
OSHA AWARE-D *Identify hazardous substances present at incidents.*	Time *3.5*	*X*	*X*		*X*				Check if objective is adequately addressed. *X* Comment: *Identification procedures and resources (e.g. ERG, MSDS) are covered.*
OSHA AWARE-E *Understand role of first responder at awareness level in emergency response plan.*	Time *1.5*	*X*	*X*		*X*				Check if objective is adequately addressed. *X* Comment: *Response roles, planning requirements, SOP's, personal safety, other areas are covered.*
OSHA AWARE-F *Given haz mat incident, determine additional resources needed & notify comm, center.*	Time *2.5*	*X*	*X*		*X*				Check if objective is adequately addressed. *X* Comment: *Resources and notification requirements are covered and applied in activities.*

***1997** Response Course Objectives Worksheet*

First Responder Awareness: Recommended Objectives

Course Title: *Initial Response to Hazardous Materials Incidents: Basic Concepts*

Organization: *National Fire Academy*

First Responder Awareness training courses may be assessed using either the required objectives or the recommended objectives in the curriculum guidelines. Recommended objectives have their origin primarily in NFPA 472, Chapter 2: Competencies for the First Responder at the Awareness Level. Only principle objectives are used in course assessment. Accomplishment of appropriate enabling objectives is assumed, given student achievement of the principle objective. See *Guidelines for Public Sector Hazardous Materials Training* for additional information.

An objective is considered "adequately addressed" in this course assessment when it is judged that the course materials and instructional methodology are sufficient to provide students with the knowledge, skills and attitudes required to accomplish the objective safely and effectively during hazardous materials response. Refer to the accompanying Response Course Assessment Instructions for directions on how to use this worksheet.

Recommended Objective	Course Time Spent On Objective (Hours)	How Is Student Achievement Of The Objective Demonstrated?							Is The Recommended Objective Adequately Addressed? Comment As Needed.
		Individual Activity	Group Activity	Course Exercise	Written Test	Skills Test	Other	None	
AWARE-1 **NFPA 2-1.3** *Understand role of first responder at the awareness level.*	Time *3.75*	*X*	*X*		*X*				Check if objective is adequately addressed. ☐ Comment: *Personal safety, toxicology, and basic recognition and identification are covered.*
AWARE-2 **NFPA 2-2.1** *Detect the presence of hazardous materials at incidents.*	Time *.66*	*X*			*X*				Check if objective is adequately addressed. ☐ Comment: *Types, protective capabilities, and limitations of PPE's are covered.*
AWARE-3 **NFPA 2-2.2** *Survey incidents from safe location and identify the hazardous materials present.*	Time *n/a*								Check if objective is adequately addressed. ☒ Comment: *Basic concepts, terminology, regulations and standards are covered throughout course.*
AWARE-4 **NFPA 2-2.3** *Analyze incidents and identify the fire, explosion and health hazards for materials present.*	Time *2.5*	*X*	*X*		*X*				Check if objective is adequately addressed. ☐ Comment: *Basic concepts, methods and roles of site management/scene set-up are covered.*
AWARE-5 **NFPA 2-4.1** *Given haz mat incidents, identify actions to protect responders and others and to control access.*	Time *1*				*X*				Check if objective is adequately addressed. ☐ Comment: *Methods, zones and general procedures are covered.*
AWARE-6 **NFPA 2-4.2** *Given haz mat incidents, identify appropriate notification procedures.*	Time *n/a*								Check if objective is adequately addressed. ☐ Comment: *General information is presented throughout, more training on local SOPs is required.*

Response Course Objectives Worksheet - **1997**
Hazardous Materials Technician: Required Objectives

1997 Response Course Objectives Worksheet

Haz Mat Technician: Recommended Objectives

Course Title

Organization

Haz Mat Technician training courses may be assessed using either the required objectives or the recommended objectives in the curriculum guidelines. Recommended objectives have their origin primarily in NFPA 472, Chapter4:Competencies for the Hazardous Materials Technician. Only principle objectives are used in course assessment. Accomplishment of appropriate enabling objectives is assumed, given student achievement of the principle objective. See *Guidelines for Public Sector Hazardous Materials Training* for additional information.

An objective is considered "adequately addressed" in this course assessment when it is judged that the course materials and instructional methodology are sufficient to provide students with the knowledge, skills and attitudes required to accomplish the objective safely and effectively during hazardous materials response. Refer to the accompanying Response Course Assessment Instructions for directions on how to use this worksheet.

Recommended Objective	Course Time Spent On Objective (Hours)	How Is Student Achievement Of The Objective Demonstrated?							Is The Recommended Objective Adequately Addressed? Comment As Needed.
		Individual Activity	Group Activity	Course Exercise	Written Test	Skills Test	Other	None	
TECH-1 **NFPA 4-1.3** *Understand role of hazardous materials technician.*	Time								Check if objective is adequately addressed. ☐ Comment
TECH-2 **NFPA 4-2.1** *Using appropriate equipment, identify special containers, identify of classify unknown materials, verify identification of hazardous materials, and determine concentration.*	Time								Check if objective is adequately addressed. ☐ Comment
TECH-3 **NFPA 4-2.2** *Using printed & technical resources, computer data, & monitoring equipment, collect and interpret hazard and response information.*	Time								Check if objective is adequately addressed. ☐ Comment
TECH-4 **NFPA 4-2.3** *Describe facility & transportation container damage.*	Time								Check if objective is adequately addressed. ☐ Comment
TECH-5 **NFPA 4-2.4** *Predict likely behavior of haz mat in facility and trans. incidents involving multiple haz mat.*	Time								Check if objective is adequately addressed. ☐ Comment

Specialist Employee: Recommended Objectives

Course Title

Organization

Specialist Employee training courses may be assessed using either the required objectives or the recommended objectives in the curriculum guidelines. Recommended objectives have their origin primarily in NFPA 472, Chapter 6: Competencies for Private Sector Specialist Employees, Section 6.2: Private Sector Specialist Employee C, and Section 6.3: Private Sector Specialist Employee B. To retain the integrity of the NFPA citations, the objectives are referred to respectively as SPEC(C) and SPEC(B), and are presented as separate groupings of objectives. Only principle objectives are used in course assessment. Accomplishment of appropriate enabling objectives is assumed, given student achievement of the principle objective. See *Guidelines for Public Sector Hazardous Materials Training* for additional information.

An objective is considered "adequately addressed" in this course assessment when it is judged that the course materials and instructional methodology are sufficient to provide students with the knowledge, skills and attitudes required to accomplish the objective safely and effectively during hazardous materials response. Refer to the accompanying Response Course Assessment Instructions for directions on how to use this worksheet.

Response Course Objectives Worksheet - **1997**
Hazardous Materials Specialist: Required Objectives

1997 Response Course Objectives Worksheet

Course Title

Organization

Haz Mat Specialist: Recommended Objectives

Hazardous Materials Specialist training courses may be assessed using either the required objectives or the recommended objectives in the curriculum guidelines. Recommended objectives have their origin primarily in NFPA 472, Chapter 6: Competencies for Private Sector Employees, Section 6.4: Private Sector Specialist Employee A; Chapter 9: Competencies for the Technician with a Tank Car Speciality; Chapter 10: Competencies for the Technician with a Cargo Tank Specialty; and Chapter 11: Competencies for the Technician with an Intermodal Tanks Specialty. Only principle objectives are used in course assessment. Accomplishment of appropriate enabling objectives is assumed, given student achievement of the principle objective. See *Guidelines for Public Sector Hazardous Materials Training* for additional information.

An objective is considered "adequately addressed" in this course assessment when it is judged that the course materials and instructional methodology are sufficient to provide students with the knowledge, skills and attitudes required to accomplish the objective safely and effectively during hazardous materials response. Refer to the accompanying Response Course Assessment Instructions for directions on how to use this worksheet.

Hazardous Materials
Planning Course Assessment

Planning Course Assessment
DIRECTIONS

These instructions describe the methodology for assessing hazardous materials planning courses. Section 1, **General Information**, explains the purpose and nature of the assessment process. Section 2, **Performing a Course Assessment**, identifies basic steps for completing the assessment instruments. Section 3, **Specific Instructions**, provides block-by-block directions for filling out the instruments. A completed sample is attached, showing the assessment of the National Fire Academy course *Initial Response to Hazardous Materials Incidents: Basic Concepts*.

Every effort has been made to keep these instruments and instructions as simple and useful as possible. However, assessing adult training activities inherently involves some time and work.

1. GENERAL INFORMATION

Purpose of the Planning Course Assessment Worksheet

The Response Course Assessment Worksheets are designed to (1) gather descriptive information about individual hazardous materials training activities in a standardized format, and (2) facilitate comparison of course content with the recommended training requirements identified in the Hazardous Materials Emergency Preparedness (HMEP) grant program document *Guidelines for Public Sector Hazardous Materials Training (Guidelines)*. The data can be used to:

- Evaluate the scope of existing courses relative to Federal and other national standards and guidelines.
- Disseminate information to state and local training managers nationwide about existing courses.
- Help training agencies assess the usefulness of existing courses for their own needs.

Why Assess Planning Courses?

State and local agencies with hazardous materials training responsibilities can use the results of the assessment process for the purpose of:

1. Certifying compliance and/or verifying compatibility of training with the HMEP grant program curriculum Guidelines.
2. Analyzing and revising the current training plan.
3. Developing new courses or revising current ones to address unmet training needs.
4. Assessing whether to adopt or adapt an outside course for use within the organization or jurisdiction.

6. Communicating characteristics of existing courses to peer training managers in other organizations and jurisdictions.

7. Evaluating the capabilities of currently trained State and local personnel involved in planning.

8. Documenting and explaining the scope of training activities to outside decision-makers and the public.

The training needs of individual agencies or jurisdictions may differ from those defined here. Many factors that affect the quality of training are outside the scope of this assessment process. Training managers may supplement the results of this assessment process through peer instructor evaluation of deliveries, professional review of course materials, in-depth student and instructor interviews, student testing, and other forms of expert opinion.

Who Should Complete a Planning Course Assessment?

A course assessment should be conducted by any organization with hazardous materials planning training requirements.

All courses used in the HMEP grant program should be assessed. This includes Federal, State, tribal, and Protectorate, national professional association, and private sector courses used by grantees in their public sector training curriculums. Each course should be formally assessed by only one sponsoring organization.

HMEP grantees are responsible for assessing those courses in their curriculums (1) which they have developed entirely or modified for their specific use and (2) which are provided by private sector sources and contractors (other than national associations) and are used by the HMEP grantees use as part of their public sector curriculum. HMEP grantees are not responsible for assessing Federal, national association courses, or courses from other HMEP grantee curriculums. Federal and national association providers of training will be asked to provide assessment of their respective programs which are in use by HMTA grantees.

Assessment Evaluator Qualifications

It is recommended that assessment evaluators have the following minimum qualifications:

- A thorough understanding of the course purpose, training objectives, content, and instructional methodologies.

- Be familiar with the course delivery requirements, related administrative considerations, and student evaluation results.

- Have in-depth knowledge of all target training audiences, including their planning roles, job tasks, and required competencies.

- Have knowledge of hazardous materials planning processes, responsibilities, and applicable regulations and standards including those promulgated by OSHA, EPA, and NFPA.

- Have experience and credentials in applying the principles and techniques of adult education to emergency services and planning audiences.

Given the nature of the assessment process, sponsoring organizations may wish to consider using a workgroup approach, particularly for major courses. Assessment evaluators may include members of the course design and development team; experienced instructors, training program administrators, and course managers; qualified members of the training audience; and other hazardous materials experts as deemed appropriate.

2. PERFORMING A PLANNING COURSE ASSESSMENT

Initial Considerations

Before filling out the assessment instruments, participants should understand the purpose and requirements of the assessment process, and be familiar with the HMEP *Guidelines*.

The first step is to determine the desired depth of the analysis. Generally, one set of assessment instruments is completed for each course. If a course is comprised of major modules or sections that could serve as stand-alone courses in themselves it may be desirable to complete a separate set of instruments for each of those modules or sections of the course.

To decide the appropriate level of assessment consider the possible ways other emergency services organizations may use the training, the information, and decision-making needs of peer training managers. If, in your judgement, a significant number of agencies would benefit by more detailed information, complete one set of instruments for each major module or section of the course. Otherwise, fill out one set of instruments for the entire course.

General Steps in the Process

You are now ready to begin the course assessment. Following the general steps listed below will help you prepare the forms quickly and accurately.

Step 1: Review Course Training Materials — Gather and review all course instructional materials. These may include plans of instruction, content outlines, student manuals, instructor guides, audiovisual presentations (films, videotapes, slide-tapes, etc.), job aids, reference materials, and handout materials.

Step 2: Review Course Delivery Data — Gather and review materials that describe the effectiveness of previous course deliveries. These may include data on course offerings and participants, student and instructor training evaluations, student test summaries, and long-term performance evaluation results. You may interview or survey persons knowledgeable about course deliveries.

Step 3: Gather Related Documents — Obtain copies of other documents that may be useful in the course assessment process. Examples might include related federal legislation and regulations, copies of relevant NFPAstandards, source materials used in the development of the course, refresher training and train-the-trainer materials, course promotional materials, technical documents referenced in the course.

Step 4: Select Appropriate Instruments — Each course assessment requires filling out two separate instruments:

- **Planning Course Assessment Worksheet** describes the course and related delivery considerations. The basic format of the instrument is the same for all training activities assessed under this process. Copies of the instrument can be made from the master copy accompanying these instructions.

- **Planning Course Objectives Worksheet(s)** assesses course content relative to the HMEP *Guidelines*, and identifies the rrecommended training objectives for all competency areas addressed in the course. Separate Course Objectives Worksheets are available for the following competency areas:

  Planning Orientation
  Planning Essentials
  Planning Specialities
    Commodity Flow Study
    Hazard Analysis
    Capability Assessment
    Planning for Protective Actions
    Plan Implementation and Maintenance
    Facility Planning
    Planning for Public Educaiton

  You should complete a separate Course Objectives Worksheet for each competency area addressed in the course. Make copies of the appropriate worksheets from the master copies accompanying these instructions. (More information is provided under Specific Instructions, Planning Course Assessment Worksheet.)

Step 5: Fill in the Instruments — The block-by-block instructions for the instruments begin below. If more space is needed for your answers, use Section 12, Continuation, and attach separate sheets, as needed.

For most courses, the process can take approximately one to two hours per day of training depending on the complexity of the course, the number of people participating, their familiarity with the instructional materials, the desired workgroup process, and other factors.

Step 6: Using the Completed Instruments — The completed instruments should be filed as documentation of your organization's finished HMEP self-assessment of response courses. They can also be used to review your curriculum for completeness and to support dialogue with other training systems regarding your programs. For submission of the information into the HMEP Course Assessment Project, please use the enclosed return envelope or equivalent and send copies of the completed Response Course Assessment Worksheet with Course Objectives Worksheets attached for each course assessed to:

William Lewis
HMEP Course Assessment Project
National Emergency Training Center, FEMA
16825 South Seton Avenue
Emmitsburg, MD 21727

If you have any questions or would like assistance in completing your course assessment, call William Lewis (301) 447-1009, or Jennifer Krietz (301) 447-1585, or FAX (301) 447-1588.

3. SPECIFIC INSTRUCTIONS

This section provides detailed instructions for filling out the Planning Course Assessment Worksheet and the Course Objectives Worksheet. A completed sample of the instruments is attached. Please read these directions carefully as you proceed.

Planning Course Assessment Worksheet

Block 1: Organization Sponsoring Course

Enter the name and address of the Sponsoring Organization (the agency that has primary responsibility for the design and content of the course, and which maintains associated rights) in Block 1. Include subdivision titles, as appropriate.

Block 2: Individual to Contact

Enter the name, mailing address, and phone number of a person assigned to serve as a contact for federal agencies, State and local training managers, and others interested in learning more about the course. This person should be knowledgeable about the course and able to answer questions about the assessment process and results.

Block 3: General Course Description

A. Course Title — Enter the complete formal title of the course, including subtitles.

B. Edition Number and/or Date — Enter the official course number or edition/revision number and date which is used to identify the course. This number typically appears on the cover or title page of the instructional materials.

The identifying number should refer to the entire course, not separate elements such as the student manual, instructor guide, or videotapes. Do not list the International Standard Book Number (ISBN), Library of Congress Catalog Card Number, or other publishing reference number. For published works, enter the most recent publication date, but not the date of later reprintings (if any).

C. Length (hours) — Enter the length or duration of classroom hours per course. Course length includes all educational activities that are part of the course.

D. Course Purpose or Goal — The course purpose or goal is a brief statement (one to three sentences) that broadly defines the desired outcome(s) of the total educational experience, and attempts to clarify the competencies or capabilities that students should possess after having satisfactorily completed all course requirements. This goal is met when all training objectives identified for the course have been achieved. As a rule of thumb, consider how best to complete the sentence “Having successfully completed the course, students will be able to....”

Block 4: Target Audiences, Competencies and Objectives

A. Target Audiences — For purposes of this assessment, target audiences are broadly defined as groups with similar organizational missions in hazardous materials planning. These include emergency management personnel, emergency services personnel, public works personnel, public officials, private sector representatives, and others.

Identify the target audience categories for which this course is suitable by checking the appropriate boxes on the form. List other audiences that would benefit by this training.

B. Competencies and Objectives Addressed in Course — Competency areas are defined as the different planning roles that public sector employees may be required to perform as participants in the planning process at the local, state and federal levels. The competency areas listed on the assessment form follow the categories identified in the HMEP *Guidelines*.

An individual course may address parts of a competency area, a total competency area, or multiple competency areas. To determine which competency area(s) your course addresses, you must first compare the course content with the training objectives identified for each area. The objectives are listed in the HMEP *Guidelines* and are duplicated on the respective Course Objectives Worksheets.

After determining which competency areas your course addresses, check the appropriate boxes on the form. If the course addresses all the objectives in the competency area check "All"; if the course addresses only a portion of them check "Selected". You may need to check one or more competency areas. If you check "Selected" for any competency area, briefly explain the scope of the course in the space provided on the form. If more space is needed, continue in section 10: Special Course Characteristics. (Note: the description you provide should expand on and clarify the course purpose or goal statement entered in Block 3.)

Reminder: Fill out Course Objectives Worksheets for each competency area you check here, whether "All" or "Selected."

Block 5: Course Materials

A. Instructional Materials — Check the appropriate boxes to indicate which of the listed types of instructional materials are used in delivering the course. Enter the correct quantities for each type of material, as specified on the form. If separate refresher training materials are available, please describe them in Section 10: Special Course Characteristics. List other types of instructional materials used in the course (e.g., job aids, reference documents, films, computer software) in the space provided, continuing as necessary in Section 10: Special Course Characteristics.

B. Training Evaluation Materials — Check the appropriate boxes to indicate which of the listed types of evaluation materials are used in the course. If evaluation approaches other than student tests or instructor/student assessments are used, describe fully in Section 10: Special Course Characteristics.

C. Refresher Training Materials— Check the appropriate boxes to indicate whether refresher training guidance and/or materials are included in the course package. Describe focus, scope and competency priorities of any refresher training components in Section 10: Special Course Characteristics

D. Demonstration Equipment and Supplies — If special equipment or supplies are used in the delivery of the course, check the appropriate box(es) and explain briefly in Section 10: Special Course Characteristics. These materials include any props, tools, supplies, apparatus, equipment, computer display systems, or other instructional aids that would not be readily available in a typical training environment.

Block 6: Course Delivery Formats

Courses are designed for use in certain settings or environments, depending on the resources required for delivery, nature of the instruction, size and location of the target audience, cost considerations, and many other factors. Typical formats for planning training include:

- Independent student use — self-contained educational materials designed for use by individual target audience members without ongoing instructor support. (Note: this category includes computer-assisted instruction and interactive videodisc presentations).

- Local department/employer delivery — training that can be delivered by public sector organizations with the resources and capabilities commonly available at the local level.

- Field delivery run by centralized office — training delivered locally, but administered and perhaps staffed by a centralized facility, such as the Emergency Management Institute, State Fire Marshal's office, regional training academy, or private university.

- Special facility or fixed-site delivery — training that must be conducted on-site at a specific facility because it employs large, non-transportable equipment (such as large table top displays, specialized simulation structures, etc.) or because other instructional considerations (such as co-locating with another program) restrict delivery of the course to the specific site.

- Broadcast or televised delivery — training designed for delivery to groups of students via teleconference, broadcast television, closed-circuit television, radio, or other similar instructional media.

Check the box for the delivery format that applies to the course. In most cases, only one delivery format should be marked. Sometimes, however, multiple delivery formats may be possible for the same course (e.g., local department/employer delivery or field delivery run by a centralized office). In other cases, different modules may be delivered using different instructional formats. If more than one delivery format applies, check the appropriate boxes and explain briefly.

Block 7: Unit or Module Summary

Use Block 7 to list the major modules, units, chapters, or sections of the course. Include the unit/module number, planned or expected duration in hours (see the instructions for Block 3), and title. If the sum of the hours shown here does not match the total for the course reported in Block 3, explain in Section 10, Special Course Characteristics.

For each unit/module, indicate whether it could serve in other curriculums as a stand-alone module. The purpose of this information is to assist other training managers in determining whether the material could be incorporated into their programs. In general, a unit has potential as a stand-alone training module if (1) there is closure within the unit of student learning including demonstration of mastery of the material, and (2) if the material is not dependent for coherency or learning upon the unique sequence of content in the preceding and following units of the course.

In addition, identify the types of instructional methodologies used in each unit/module by checking one or more of the boxes on the form. Check other methodologies (e.g., role play, interactive videodisc, behavior modeling, etc.) in the space provided.

Block 8: Materials From Other Programs Used in Course Development

Source materials are training programs, job task analyses, research reports, technical manuals, etc. that are used in developing the course. By identifying these source materials it will help peer training managers and others to:

- Understand the course based on familiarity with the source materials.
- Identify similarities and differences among training activities and programs.
- Evaluate appropriate applications of the course.

In this section of the form, you are asked to identify major source materials used in developing the course. Include only those materials that were used extensively or that contributed significantly to the final form and content of the course. Do not list others whose impact was less important, even if they were researched as part of the course design and development process. For each major source material, fill in the title and the

name of the organization that developed it. Then list the module/unit numbers (from Block 7) of the course that were strongly influenced by the source material. If the source material applies to the entire course, write "all." Explain as necessary in Section 12: Continuation.

Block 9: Factors Affecting Use of Course By Other Organizations

Many factors must be weighed when considering whether to adopt or adapt an existing course: associated costs, delivery requirements, compatibility with mission and audiences, ability to modify, available support services, ease of use. This section of the assessment form includes a checklist of these factors to help other training managers make decisions about using the course for their own needs.

Review the questions and check the appropriate box for each one that you answer affirmatively. Then, using this checklist as a "mind jogger," write in Section 11: Special Delivery Characteristics a brief summary of all major factors that could affect use of the course by other agencies. In your narrative, try to address typical decision-making needs and obstacles faced by training managers in emergency services organizations when developing, adapting, or conducting training. If more space is needed, use Section 12, Continuation.

Blocks 10-12

Use Blocks 10-12 to complete your response to other sections of the form (see the instructions for Blocks 4 through 9). Keep your responses as clear as possible.

Planning Course Objectives Worksheets

The Planning Course Objectives Worksheet is a tool to help you determine whether the course adequately addresses minimum training objectives set forth in the HMEP Guidelines.

Worksheets exist for each of nine (9) competency areas. You should complete a separate worksheet for each competency area addressed in the course (see Block 4 of the Planning Course Assessment Worksheet).. The competency areas are:

Planning Orientation
Planning Essentials
Planning Specialities
- Commodity Flow Study
- Hazard Analysis
- Capability Assessment
- Planning for Protective Actions
- Plan Implementation and Maintenance
- Facility Planning
- Planning for Public Education

Enter the course title and name of the sponsoring organization on each form you fill out. The training objectives are listed in the left column. You may use either the required or the recommended objectives for your assessment. For each training objective, work horizontally across the page to make three determinations for each objective:

- The course time spent on the objective.
- The methods used to demonstrate student achievement of the objective.
- Whether the objective is adequately addressed in the course.

Course Time Spent On Objective

Estimating the amount of course time spent on each objective provides a useful indicator of the scope or depth of training in each area. More course time implies the opportunity for more in-depth instruction, and vice-versa. Estimating training time can be relatively straightforward for courses whose objectives are structured similarly to the competency organization in the HMEP *Guidelines*. In these situations, you need only analyze a typical course schedule or training agenda to determine how much time is allocated to each objective. Round the estimates to the nearest tenth (0.1) hour. If precise estimates are difficult, break the course down at least to half-hour (0.5) increments.

For courses that do not directly match the objectives or have a mix of origins, estimating training time will require more effort. You must review the course content using the following general procedures:

1. Think through the knowledge, skills, and attitudes (KSAs) needed by a typical student to achieve the training objective.

2. Identify all course content related to these KSAs. (Note: the content may be consolidated or spread out in different sections of the program).

3. Estimate the training time spent on this course content in a typical delivery.

As you conduct the analysis, you may find that some course content is related to more than one training objective. Other course content may not be associated with any of the objectives listed on the worksheet. Use your best judgement to include in your estimate all course time spent on content related to the objective whether or not this time is also reported for other objectives on the form. Relatively broad time estimates are acceptable.

Don't worry if the sum of the hours you estimate for the training objectives is different from the total you reported in Blocks 3 and 7. The figures will be adjusted later to reflect actual contact or classroom hours.

How Is Student Achievement of the Objectives Demonstrated?

Well-designed performance evaluation techniques provide an useful indicator of each student's ability to achieve the training objectives specified for the course. They also provide a powerful tool for assessing whether the course produces the desired results.

Successful student achievement of training objectives can be demonstrated through various means, including performance on written or skills tests, performance in objective-specific activities individually or as a group, and application of what has been learned in large exercises or in post-course exercise (or subsequently on the job). In this section you are asked to identify which technique or techniques are used to evaluate student learning. To make the determination, compare the course content covered in the evaluation mechanism with that related to the training objective. If they match, check the appropriate box on the form.

Is Objective Adequately Addressed? Comment As Needed

The heart of this assessment process lies in determining whether the training objectives identified in the HMTA Guidelines have been adequately addressed in the course. For purposes of this assessment, an objective is considered adequately addressed when it is judged that the course materials and instructional methodology are sufficient to provide students with the knowledge, skills, and attitudes required to accomplish the objective safely and effectively during hazardous materials response.

Note that this analysis requires you to make a subjective evaluation of the adequacy of the course materials to support effective training delivery. Take into account the course time spent on the objective and the results of

actual student performance evaluations reviewed previously. Other factors might include the scope of the training covered, methodologies used, clarity of presentation, and level of instructor support. Qualitative factors relating to the art and science of adult training should also be considered. Based on your knowledge of the course, determine whether each objective listed on the worksheet is adequately addressed in the instructional materials. If it would be helpful for other training managers, briefly explain your rationale in the space provided for comments. If the course does not cover a specific learning objective, enter "Not addressed" in the appropriate space.

3 General Course Description

(A) Course Title _____

_____

(B) Edition Number and/or Date _____ (C) Length (hours) _____

(D) Course Purpose or Goal _____

_____

_____

_____

4 Target Audiences, Competencies, Objectives

See instructions. Check each box if yes. If only selected objectives are addressed, describe. Attach appropriate course assessment worksheets. Continue as needed in Section 10: Special Course Characteristics.

(A) Target Audiences

☐ Course is suitable for all potential participants in community haz mat planning who meet prerequisites.

☐ Course is targeted for specific disciplines.

- ☐ Emergency Mgt
- ☐ Fire
- ☐ Law Enforcement
- ☐ EMS
- ☐ Public Works
- ☐ Private Industry Responders and Planners
- ☐ Private Industry Mgt Officials
- ☐ Public Officials
- ☐ Public Community Members
- ☐ Other _____

(B) Competencies and Objectives Addressed

All Objectives	Selected Objectives	Competencies
☐	☐	Planning Orientation
☐	☐	Planning Essentials
		Planning Specialities
☐	☐	Commodity Flow Study
☐	☐	Hazard Analysis
☐	☐	Capability Assessment
☐	☐	Planning for Protective Actions
☐	☐	Plan Implementation and Maintenance
☐	☐	Facility Planning
☐	☐	Planning for Public Education
☐	☐	Other

Describe Selected Objectives *(below or in Sec. 10)*

_____

_____

_____

_____

☐ **Continued in Section 10?**

5 Course Materials

See instructions. Check each box if yes and indicate quantities as requested. Explain as needed in Section 10: Special Course Characteristics.

(A) Instructional Materials

- ☐ Instructor Guide (_____ pages)
- ☐ Student Manual (_____ pages)
- ☐ Handouts (_____ pages)
- ☐ Slides (_____ number)
- ☐ Overhead Transparencies (_____ number)
- ☐ Videotapes (____) number) (_____ total length in minutes)
- ☐ Slide/tapes (____) number) (_____ total length in minutes)
- ☐ Audiotapes (____) number) (_____ total length in minutes)
- ☐ Computer floppy discs (_____ number) (_____ format(s))
- ☐ Computer CDs (_____ number) (_____ format(s))
- ☐ Other _____

(B) Evaluation Materials

- ☐ Student tests
  - ☐ Pretest ☐ End of units ☐ End of course
- ☐ Delivery Assessment Instruments
  - ☐ End of units ☐ End of course
- ☐ Other _____

(C) Refresher Training Materials

- ☐ Refresher training guidance included
- ☐ Refresher training materials included

If yes, please describe in Sec. 10 Special Course Characteristics

(D) Demonstration Equipment & Supplies

- ☐ Are scenario or community hazard mock-ups (such as table top displays) used in course?
- ☐ Are computerized displays (such as plume modeling or mapping systems) used in course?
- ☐ Are copies of large sheet student materials (such as blueprints, construction plans or community maps) used in course?
- ☐ Other *Please describe any specialized equipment or supplies in Section 10 Special Course Characteristics*

☐ **Continued in Section 10?**

6 Course Delivery Formats

See instructions. Check which formats are used to deliver the course. If format varies by module, note which modules apply to each format. Explain as needed in Section 11: Special Course Delivery Considerations..

Check if yes.

- ☐ Independent study use (no instructor)
- ☐ Field delivery run by centralized office
- ☐ Broadcast or televised delivery
- ☐ Local department/ employer delivery
- ☐ Special facility or fixed-site delivery
- ☐ Other _____

If the course is delivered using more than one format, please explain.

_____

_____

_____

☐ ***Continued in Section 10?***

7 Unit or Module Summary

See instructions. Provide module title, length in hours or fraction, and check instructional methodologies employed. Use Section 12: Continuation, if necessary.

Unit / Module Number	Unit / Module Length (in Hours)	Unit / Module Has Potential For Use As Stand-Alone Training Module	Unit / Module Title	Instructional Methodologies Used In Unit/Module										
				Lecture / Discussion	Audiovisual Presentation	Classroom Activities: Individual Student Work	Classroom Activities: Group Work	Table Top or Simulation Lab Exercise	Field or Community Exercise	Self-Study	Computer-Assisted Instruction	Written Testing: Pre-Test, Unit Tests, Post-test	Completion of Post-Course Project	Other

☐ ***Continued in Section 12?***

8 *Materials From Other Programs Used In This Course*

See instructions. Applies to major sources only. Explain as needed in Section 12: Continuation.

Organization	Title of Program or Course Used	Comment

☐ ***Continued in Section 12?***

9 *Factors Affecting Use of Course by Other Organizations*

See instructions. Check if yes. Explain as needed in Section 11: Special Course Delivery Considerations.

- ☐ Do course materials have to be purchased?
- ☐ Do copyright limitations apply to use of the materials?
- ☐ Are there any special instructor skills or experience requirements?
- ☐ Are there any special facility or equipment requirement that would impede another jurisdiction's use of this course?
- ☐ Are there any special competency requirements or prerequisites for students?
- ☐ Does a train-the-trainer program exist?
- ☐ Are optional activities provided for different disciplines (emergency management, fire, EMS, private sector, etc.)?
- ☐ Are course texts available on computer disc?
- ☐ Are course evaluations available for review?
- ☐ Are summaries of student achievement available for review?
- ☐ Do the majority of the scenarios apply to other locales or geographic regions?

☐ ***Continued in Section 11?***

10 *Special Course Characteristics*

See instructions. Identify special or innovative characteristics of the course which would be of interest to other trainers, such as new activity approaches, new videos, unusual content sequencing, etc. If clarifying entries in other sections, identify which sections.

11 *Special Course Delivery Considerations*

See instructions. Identify training issues, special requirements or challenges not identified elsewhere that would affect another organization using or adapting this course. If clarifying entries in other sections, identify which sections.

12 *Continuation*

See instructions. Use this section to continue comments that exceed space allowed in other sections. For each comment, identify section being continued.

The *Guidelines for Hazardous Materials Public Sector Training* is a component of the Hazardous Materials Emergency Preparedness (HMEP) Grants Program, administered by the Department of Transportation (DOT). This work represents the efforts of many professionals in the federal, State, tribal, local and professional association hazardous materials communities over the last several years. The work has been accomplished under the overall leadership of the managers and supervisors of DOT, Research and Special Programs Administration, and the Federal Emergency Management Agency (FEMA), Preparedness, Training and Exercises Directorate, Training Division. Individual contributors have been grouped into the following categories: project coordination federal staff, 1997 edition authors, 1997 edition reviewers, 1994 edition authors, 1994 edition reviewers:

Project Coordination

USFA Hazardous Materials Guide for First Responders
About This Guide

Objectives

This book is the result of an extensive study of available hazardous materials response resources for first responders undertaken by the United States Fire Administration (USFA) as part of the Firefighters' Safety Study Act of 1990 (P.L. 101-446). The study concluded that, while several excellent and technically accurate resources are available, none are directed to the specific needs of the first responder trained at the Awareness or Operational Levels of Training; the training levels of most first responders. It is the hope and the intent of the USFA that this book will be that much needed resource.

This book provides important information for the initial response to both transportation and fixed facility incidents. It has been designed to present the first responder with a maximum amount of useful key information in a limited amount of space. As with any reference, it cannot include all information that might be useful or discuss all situations which might occur; nor can it replace the training and experience of individual responders. The information contained in this book has been reviewed by several sources and is as technically accurate as possible. For major incidents it will be necessary to obtain more detailed information from other resources as well as more advanced expertise from those with more extensive training.

It is assumed that those using this book will have had some training in hazardous materials response. Because most first responders are trained at the Awareness or Operational levels, this book is directed at appropriate responses for these levels of training. These levels are defined below as published by the National Fire Protection Association (NFPA 472, 1992) and the Occupational Safety and Health Administration (OSHA 1910.120).

OSHA 1910.120

FIRST RESPONDER AT AWARENESS LEVEL: First responders at the **Awareness Level** are individuals who are likely to witness or discover a hazardous substance release and who have been trained to initiate an emergency response sequence by notifying the authorities of the release. First responders at the **Awareness Level** shall have sufficient training or have had sufficient experience to objectively demonstrate competency in the following areas:

A. An understanding of what hazardous substances are, and the risks associated with them in an incident.
B. An understanding of the potential outcomes associated with an emergency created when hazardous substances are present.
C. The ability to recognize the presence of hazardous substances in an emergency.
D. The ability to identify the hazardous substances, if possible.
E. An understanding of the role of the first responder awareness individual in the employers emergency response plan including site security and control and the U.S. Department of Transportation's Emergency Response Guidebook.
F. The ability to realize the need for additional resources, and to make appropriate notifications to the communication center.

FIRST RESPONDER OPERATIONS LEVEL: First responders at the **Operations Level** are individuals who respond to releases or potential releases of hazardous substances as part of the initial response to the site for the purpose of protecting nearby persons, property, or the environment from the effects of the release. They are trained to respond in a defensive fashion without actually trying to stop the release. Their function is to contain the release from a safe distance, keep it from spreading, and prevent exposures. First responders at the **Operations Level** shall have received at least eight hours of training or have had sufficient experience to objectively demonstrate competency in the

following areas in addition to those listed for the **Awareness Level** and the employer shall so certify:

A. Knowledge of the basic hazard and risk assessment techniques.
B. Know how to select and use proper personal protective equipment provided to the first responder operational level.
C. An understanding of basic hazardous materials terms.
D. Know how to perform basic control, containment, and/or confinement operations within the capabilities of the resources and personal protective equipment available with their unit.
E. Know how to implement basic decontamination procedures.
F. An understanding of the relevant standard operating procedures and termination procedures.

About This Guide

How the Book is Organized

The body of this book is divided into seven sections:

- Indexes: Alphabetical Material Name Index followed by a UN/NA Number Index.
- Specific Material Guides: specific recommendations for 430 commonly encountered materials.
- Materials Summary Response Table: summary information for 1,422 less commonly encountered materials.
- DOT Placards - Chart 10.
- Silhouettes of Rail Cars, Tank Trucks and Chemical Tanks.
- General Approach to a Hazmat Incident.
- Glossary of Terms and Abbreviations used in the book.

The main body of the book provides information on about 1750 different materials. The materials included in these sections include most of those which have been reported to have been involved in hazardous materials incidents. Most drugs have been excluded. Materials were assigned to the Specific Material Guide section or the Materials Summary Response Table based upon the likelihood that they would be encountered and the magnitude of the hazards they represent, using a formula designed for this project. The information in these two sections is intended to be used during an actual incident.

The General Approach to a Hazmat Incident section provides specific information about a number of different response scenarios. It also provides useful information and techniques for assisting in the identification of materials. This section should be studied as part of training for Hazmat response. It is not intended for use during an actual incident.

Following the General Approach section is a Glossary of the technical terms and abbreviations used throughout the book. While the authors have tried to use simple and straightforward language, some terms may not be familiar to all users. Also included in this last section are several Appendices providing reference information mentioned in the text.

This book has been extensively indexed using all of the material names and synonyms (other names for the same chemical) found in the book. There is a separate index for UN and NA numbers which are commonly found on shipping papers when materials are in transport. While the Specific Material Guides section is arranged in alphabetical order by the most widely used name of the material, the index should be used as the most rapid way of locating information about a specific material.

This book does not contain specific recommendations about isolation or evacuation distances. Because this book is designed to be used in a wide range of scenarios involving different container sizes, it was felt that the calculation of such distances could be misleading and perhaps dangerous. Isolation distances are best determined by those trained above the operations level, taking into account the amount of material involved, the weather conditions and the specific circumstances of the release.

USFA Hazardous Materials Guide for First Responders
About This Guide

How to Use the Specific Material Guide (Chemical-specific) Pages

The Specific Material Guides (RED TAB) provides detailed response information for 430 materials. These materials were systematically selected based on their likelihood of being encountered and the magnitude of the hazard they pose to the first responder. An example of a specific material guide is shown in Figure 1.

The most widely accepted chemical name for the material is found in the top center of each page. Underneath the primary name is the UN (United Nations) number or the NA (North American) number. The UN number is commonly used for materials in commerce and can be found on shipping papers. A few materials in this section do not have an assigned UN number. This may mean either that the material is not considered a hazard, or that it is not found in transport in a sizeable amount. The shipping name of the material appears directly under the chemical name. Finally, other less commonly used names for the material are listed.

In the upper right hand corner of the page are the DOT placard(s)/label(s) assigned to the material when transported within the United States. A complete list of current DOT placards is found in Chart 10 on page 521. For a few materials, no specific DOT placard designation has been made in 49CFR and this area is left blank.

In the upper left corner of the page is the NFPA 704 placard providing summary information on acute health, fire and reactivity hazards plus any special concerns such as water reactivity which apply to the material. An explanation of the number designations used in the NFPA placard taken from NFPA 704 is found on page 550. The placard is commonly found on storage containers or is posted at fixed facilities. When posted on fixed facilities each designation represents the worst hazard in that category within the building or facility. The placard is not found on materials in transport.

NFPA 704 designations were taken, when available, from the 1994 editions of NFPA 49 and NFPA 325. If the material was not rated in these references, values were determined and assigned from published data, where available, or were based on reasonable estimation from data published on structurally similar materials, using the definitions for these designations from NFPA 49. If the information in the placard is from the NFPA 49 or NFPA 325, the designation "NFPA" appears along the right edge of the placard. If there is no such designation, the content of the NFPA 704 placard was determined by the authors.

Below the list of synonyms may appear a section printed in red entitled WARNING. This section is vitally important. It provides crucial information about hazards that are **immediately life threatening** to the first responder. A WARNING indicates a very dangerous material because of the health risk or because of the extreme fire, explosion or reactivity risk(s). Most materials will not have a WARNING section. This does not mean that they are not dangerous and cannot injure or kill, only that they are not likely to do so if they are handled properly.

Below the WARNING section is a section entitled HAZARDS. This section describes the physical, chemical, or toxic properties of the material which create risks for the first responder. This section includes such things as explosion hazard, flammability risk and acute health hazards. Hazards are arranged in the approximate order of their importance to the first responder.

Next to the HAZARDS is a section entitled DESCRIPTION. This section describes what the material looks and smells like, along with some important information about the physical properties of the material, such as whether it floats or sinks in water or whether it is heavier or lighter than air (if it is a gas). The information in this section may be useful in

verifying the identity of a hazardous material and in anticipating some of its actions.

In the middle of the page are sections entitled AWARENESS AND OPERATIONAL LEVEL TRAINING RESPONSE and OPERATIONAL LEVEL TRAINING RESPONSE. These sections list the appropriate actions for the first responder trained to each of these two levels of expertise. Not all of the statements listed may be appropriate for every situation, but actions should not be more aggressive than those listed. The most important recommendations are given first. Remember that these are initial recommendations for the first responder. They may be modified by the on-scene Hazmat Incident Commander. Awareness Level Response actions are all defensive in nature. Operational Level Response actions are divided into two general situations, those involving releases of material without an accompanying fire and those where a fire is involved, whether or not the material itself is burning. Operational Level Responders must remember that actions listed under Awareness and Operational Level Response should be completed *before* beginning the more definitive Operational Level Response actions.

At the bottom of the page is a FIRST AID section. These recommendations should be used in caring for victims who are out of the Hot zone. Rescue of victims from within a Hot zone should only be performed by trained personnel wearing appropriate chemical resistant gear and is not generally a first responder action.

Removal of hazardous material from the skin, eyes or clothing of a victim (decontamination) is usually the most important first aid action that can be initiated. It should be performed only by appropriately trained and equipped individuals. Rapid removal of the material may be the difference between a minor injury and a serious injury. The details of decontamination techniques are beyond the scope of this book. In general, using large quantities of water to rinse off materials is almost always the first choice for decontamination in the field. Materials which are so toxic that first aid should not be performed on contaminated victims because of the risk of serious injury to the responder are clearly labeled. There are very few antidotes for treating victims exposed to chemicals and they are listed in this section for the benefit of hospital personnel who may care for these victims. Other First Aid information is also provided.

Finally, at the middle of the page below the first aid section is a CHEMICAL ABSTRACTS SERVICE REGISTRY NUMBER (CAS: _ _ _-_ _-_). This is a specific identifying number given to each chemical by the Chemical Abstract Service. Mixtures are usually not assigned CAS numbers. While not commonly used in shipping, the CAS number may be found on containers and Material Safety Data Sheets (MSDS) and is used by many more detailed references as an indexing number. It is provided as another positive identifier and to allow quick reference to other data bases.

About This Guide

How to Use the Materials Summary Response Table

The Materials Summary Response Table (YELLOW TAB) provides summary information on 1,422 additional materials. These materials are either less likely to be encountered by the first responder. This table is arranged in alphabetic order using the most common chemical name of the material. For each material the UN number and DOT placard designation are provided, if available. NFPA designations are provided for all materials. In the case where NFPA designations were not available from NFPA 49 or 325, values were assigned by the authors using NFPA 49 definitions along with available data on the material or on structurally similar materials. NFPA 704 designations taken from NFPA sources are shown in green while the those assigned by the authors are in black.

USFA Hazardous Materials Guide for First Responders
About This Guide

Acknowledgments

This document was prepared under a Cooperative Agreement (EMW-93-K-4351) between the Federal Emergency Management Agency/United States Fire Administration and the University of Louisville. The data was assembled and formatted by an active Writing Committee with direction and oversight by the Firefighters' Safety Study Project Committee. Technical content was also reviewed under a separate contract (EMW-3-4649) with Louisiana State University.

HYDROGEN CYANIDE

(STABILIZED)

UN 1051

Shipping Name: Hydrogen cyanide, stabilized with less than 3 percent water

Other Names: AC — Hydrocyanic acid solution
HCN — Prussic acid
Hydrocyanic acid

WARNING!
- POISON! BREATHING THE VAPORS OR SKIN CONTACT CAN KILL YOU!
- Firefighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- EXTREMELY FLAMMABLE!

Hazards:

- Odor is not a reliable indicator of the presence of toxic amounts of vapor
- May react with itself without warning with explosive violence
- Container may BLEVE or explode when exposed to fire
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Vapors are slightly lighter than air but will collect and stay in low areas
- Combustion products are less toxic than the material itself

Awareness and Operational Level Training Response:

- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid that boils at 78˚ F
- Sweet odor like bitter almonds; many people cannot smell it
- Dissolves slowly in water but is soluble in water
- Extremely flammable
- Vapors are slightly lighter than air but will collect and stay in low areas
- Transported in red and white candy striped containers
- Produces large amounts of vapor
- Freezes at 8˚ F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- If material is on fire and conditions permit, DO NOT EXTINGUISH; combustion products are less toxic then the original material. Cool exposures using unattended monitors.
- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- DO NOT ATTEMPT RESCUE!
- The contaminated victim poses a health risk to the responder
- Decontaminate the victim from a safe distance with a stream of water; have the victim remove clothing if possible; provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- Do NOT perform direct mouth to mouth resuscitation; use a bag/mask apparatus
- Note to physician: can produce cyanide toxicity; if symptoms indicate, initial treatment includes the cyanide antidote kit

Firefighters' Safety Study Act (P.L. 101-446)

Report on the Status of Activities
October 1998

Federal Emergency Management Agency
United States Fire Administration

Status of the Firefighter Safety Study

The goal of this study is to improve the accuracy and usefulness of response guidance so that safer and more effective responses to hazardous materials incidents can be conducted. The results of this study are to be reported to Congress, and recommendations of the report are to be reviewed annually. This report is the seventh annual report on the status of the Firefighter Safety Study.

Background

Public Law 101-446, the Firefighter Safety Study Act of 1990, directs the Administrator of the United States Fire Administration to consult and coordinate a review of information available to first responders with government agencies, private sector firms, and first responders. The goal of these efforts is to improve the accuracy and suitability of response guidance so that safer and more effective responses to hazardous materials incidents can be conducted at the State and local level. The Study has been approached in three phases that follow in detail.

Phase One - Under the first phase of the study, the Administrator established three committees which worked together to perform this review. These committees were the:

Coordinating Committee - composed of representatives of Federal agencies, State and local officials, and the chemical industry who developed or had the responsibility for the maintenance of guidance used by first responders;

Technical Committee - composed of technical representatives from Federal agencies, industry, and local government to determine what constituted vital and accurate information; and

Field Applications Committee - composed of fire and emergency service personnel who are themselves users of response guidance in emergency situations.

The report of the Working Group of the Firefighter Safety Act, *Firefighter Safety Study: Review of Adequacy of Response Information on Hazardous Material*, submitted to the Congress in October of 1992, determined that the currently available information was generally accurate and the response network was sufficient in most cases. The working committees, however, concluded that one response guide should be available to first responders since they generally do not have the time to consult multiple sources. Moreover, the working committees recommended an improved format for this response guide.

The working committees acknowledged the effort that a new format would entail. Nonetheless, the committees felt that the opportunity to tailor a guide to the special needs of the first responder would have substantial benefits.

Phase 2 - In the second phase of the study, a sub-group of the three Firefighter Safety Committees was formed to specifically address the improved response guide recommendation. This sub-group, designated as the Project Committee of the Firefighter Safety Study, consists of the principal members of the Technical and Field Applications Committee. The Fire Administration also entered into a cooperative agreement with the University of Louisville to develop, under the direction of the Project Committee, a

prototype document based on the recommendations of the preliminary report. Louisiana State University was separately retained to review the prototype document for technical accuracy and the suitability of the response level.

The Project Committee devised a format style that incorporates the recommendations from the preliminary report of the Firefighter Safety Study. In addition, the committee has identified the major sections of the prototype document that are appropriate for the first responder.

Phase 3 - The final phase in the Firefighter Safety Study was the formal test and evaluation of a prototype *Hazardous Materials Guide for First Responders*.

Status of Actions

Since the last status report in 1997, the Project Committee completed changes to the draft as a result of comments from participants in the field evaluation. Changes to the draft were also made based on comments from the U.S. Department of Transportation's Office of Hazardous Materials Safety.

Printing and Distribution

The USFA has entered into an interagency agreement with the U.S. Department of Commerce, National Technical Information Service (NTIS) for the printing and distribution of the Guide. The agreement calls for NTIS to print and stock the document for sale to the public. Availability of the publication will be promoted through the FEMA/USFA and NTIS web sites, in addition to press releases and special notices to fire service organizations throughout the United States.

The agreement with NTIS will also provide the USFA with over 4,000 copies of the Hazardous Materials Guide which will be distributed to public safety dispatch centers at no cost to those centers. This will permit those agencies that cannot afford to purchase a guide for each emergency response vehicle to have at least one copy available in their communications center for reference by dispatchers who can then relay critical information to the scene by radio.

Electronic Distribution

In addition to a printed version, USFA staff began work on an application to make the guide accessible via the World Wide Web at http://www.usfa.fema.gov. When complete, the user will be able to view any portion of the document on-line, or download the document for printing. The Web based version is expected to be on line by the end of October 1998.

A version of the Guide is also being developed for CD-ROM. The CD-ROM version will also be duplicated and distributed through NTIS.

Update and Maintenance of Guide

Periodic updates of the guide will be necessary due to the nature of the information. It will be necessary to add or remove chemicals, and update guidance as new information or methods for handling materials become available. The Project Committee recommended updating the guide on a four-year cycle.

Prior to the publication of each new edition, USFA staff will solicit input for improvements to the guide through a variety of sources. Those sources would include, but not be limited to the following:

- Public announcements through the Federal Register;
- Notices posted on the FEMA/USFA Web Site;
- Notices sent to major publications aimed at First Responders from the fire, police, and emergency medical services community;
- Notices to the chemical industry

Once the comment period has ended, USFA staff will meet with the Project and Coordinating Committees and review each comment to make the necessary changes for each new edition.

VINYLTRICHLOROSILANE

UN 1305

Shipping Name: Vinyltrichlorosilane
Other Names: A-150
Trichloroethyenylsilane
Trichlorovinylsilicon
Vinylsilicon trichloride

WARNING!
- POISON! BREATHING THE VAPOR CAN KILL YOU! SKIN AND EYE CONTACT CAN CAUSE SEVERE BURNS AND BLINDNESS!
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER! REACTS VIOLENTLY TO FORM TOXIC HYDROGEN CHLORIDE AND HYDROCHLORIC ACID!

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Upon contact with moisture reacts with metals to produce hydrogen gas
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay uphill and upwind
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release and call for expert help
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the area downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to pale yellow fuming liquid
- Sharp choking odor like hydrochloric acid
- Sinks in water and reacts with water to form hydrochloric acid
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and run from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- If material is on fire and conditions permit, DO NOT EXTINGUISH.
- Material reacts with water but can be extinguished with low or medium expansion AFFF foam or dry chemical if available in sufficient amounts
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

ALLYL ALCOHOL

UN 1098

Shipping Name: Allyl Alcohol

Other Names: AA, Allyl al, Allylic alcohol, Orvinylecarbinol, 2-Propenol, Propenol, Propenyl alcohol, Vinylcarbinol

WARNING!
- POISON! BREATHING THE VAPORS OR SKIN CONTACT CAN KILL YOU!
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Highly flammable
- Container may BLEVE when exposed to fire
- Severely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Clear, colorless liquid
- Pungent, mustard-like smell
- Initally floats on the surface of water and is soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:
RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff water from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors and dilute standing pools of water
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 107-18-6

HYDROGEN CYANIDE

(STABILIZED)

UN 1051

Shipping Name: Hydrogen cyanide, stabilized with less than 3 percent water

Other Names: AC, Hydrocyanic acid solution, HCN, Prussic acid, Hydrocyanic acid

WARNING!
- POISON! BREATHING THE VAPORS OR SKIN CONTACT CAN KILL YOU!
- Firefighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- EXTREMELY FLAMMABLE!

Hazards:
- Odor is not a reliable indicator of the presence of toxic amounts of vapor
- May react with itself without warning with explosive violence
- Container may BLEVE or explode when exposed to fire
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Vapors are slightly lighter than air but will collect and stay in low areas
- Combustion products are less toxic than the material itself

Awareness and Operational Level Training Response:
- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless liquid that boils at 78° F
- Sweet odor like bitter almonds; many people cannot smell it
- Dissolves slowly in water but is soluble in water
- Extremely flammable
- Vapors are slightly lighter than air but will collect and stay in low areas
- Transported in red and white candy striped containers
- Produces large amounts of vapor
- Freezes at 8° F

Operational Level Training Response:
RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- If material is on fire and conditions permit, DO NOT EXTINGUISH; combustion products are less toxic then the original material. Cool exposures using unattended monitors.
- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- DO NOT ATTEMPT RESCUE!
- The contaminated victim poses a health risk to the responder
- Decontaminate the victim from a safe distance with a stream of water; have the victim remove clothing if possible; provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- Do NOT perform direct mouth to mouth resuscitation; use a bag/mask apparatus
- Note to physician: can produce cyanide toxicity; if symptoms indicate, initial treatment includes the cyanide antidote kit

CAS: 74-90-8

ACETALDEHYDE

UN 1089

Shipping Name: Acetaldehyde
Other Names: Acetic aldehyde
Ethanal
Ethylaldehyde

WARNING!
- EXTREMELY FLAMMABLE!
- MAY EXPLODE WITHOUT WARNING WHEN EXPOSED TO HEAT, DUST OR CORROSIVE OR OXIDIZING AGENTS!

Hazards:

- Very irritating to skin and eyes, prolonged contact can cause burns
- Container may BLEVE when exposed to fire
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Vapors are heavier than air and will collect and stay in low areas
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Vapors may travel long distances to ignition sources and flashback

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Pungent fruity odor
- Soluble in water
- Extremely flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors

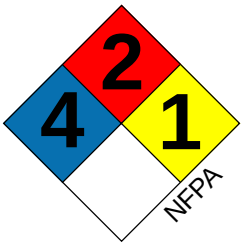
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support /CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns rinse with water and apply a clean dry dressing

CAS: 75-07-0



LACTONITRILE

UN 3275

Shipping Name: Nitriles, toxic, flammable, n.o.s.
Other Names: Acetaldehyde cyanohydrin
Hydroxypropinonitrile
Acetocyanohydrin
2-Hydroxypropinonitrile

WARNING! • POISON! SKIN CONTACT, BREATHING THE VAPORS OR SWALLOWING THE LIQUID CAN KILL YOU! CONVERTED TO CYANIDE IN THE BODY!
• Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Combustion products include toxic cyanide gas
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Remove all ignition sources
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

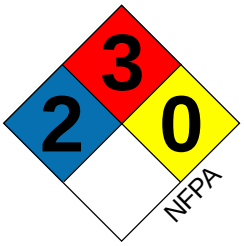
Description:
- Colorless to straw colored liquid
- No odor found
- Initially floats on water and is soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:
RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a non-flammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- Note to physician: can produce cyanide toxicity; if symptoms indicate, initial treatment includes the cyanide antidote kit

CAS: 78-97-7



ACETAL

UN 1088

Shipping Name: Acetal
Other Names: Acetaldehyde ethylacetal
Acetol
1,1-Diethoxyethane

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Pungent, woody odor
- Floats on the surface of water and is slightly soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support /CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns rinse with water and apply a clean dry dressing

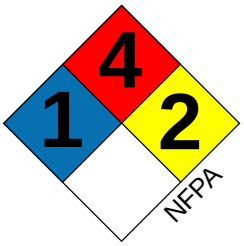
"**R**" under special situations signifies a radioactivity hazard.



ETHYLENE

UN 1038 (Cryogenic liquid)
UN 1962 (Compressed gas)

Shipping Names: UN 1962 Ethylene, compressed
UN 1038 Ethylene, refrigerated liquid (cryogenic liquid)

Other Names: Acetene Ethene
Etherin

WARNING! ● EXTREMELY FLAMMABLE!

Hazards:

- Containers may BLEVE or explode when exposed to fire
- Odor is not a reliable indicator of the presence of toxic amounts of gas
- Cold gas is heavier than air and will collect and stay in low areas
- Gas may travel long distances to ignition sources and flashback
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Contact with liquid may cause frostbite

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- Evacuate the immediate area and downwind for a large release
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Notify local health and fire officials and pollution control agencies

Description:

- Colorless gas which may appear white
- Shipped and stored as a gas, a liquefied compressed gas or a cryogenic liquid
- Faint slightly sweet odor
- Liquefied gas floats and boils on water
- Extremely flammable
- Cold gas is heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely
- Use large amounts of water well away from the release to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

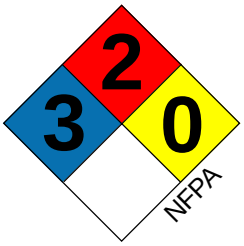
FIRE:

- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed noncryogenic containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location
- DO NOT APPLY WATER TO CRYOGENIC LIQUID CONTAINERS; if cryogenic liquid containers are exposed to direct flame or elevated temperatures for prolonged times, withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - ♦ Inhalation - remove the victim to fresh air and give oxygen if available
  - ♦ Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - ♦ Eye - rinse eyes with large volumes of water or saline for 15 minutes
- Seek medical attention
- Frostbite - warm injured area in very warm water
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 74-85-1



ACETIC ACID

UN 2789 (More than 80%)
UN 2790 (Solution in water 1-80%)

Shipping Name: UN 2789 Acetic acid, glacial
UN 2790 Acetic Acid, solution, more than 10% but not more than 80% acid.

Other Names: Ethanoic acid, Glacial acetic acid, Ethylic acid, Methane carboxylic acid

Hazards:
- Very irritating to skin, eyes, nose and lungs; prolonged contact with skin can cause burns
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Vapors may travel long distances to ignition sources and flashback
- Will attack many forms of rubber or plastic

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless liquid
- Sour, pungent odor like vinegar
- Soluble in water and produces heat when mixed with water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

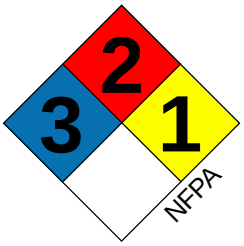
Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using alcohol foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a nonflammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns rinse with water and apply a clean dry dressing

CAS: 64-19-7



ACETIC ANHYDRIDE

UN 1715

Shipping Name: Acetic Anhydride
Other Names: Acetic acid anhydride
Acetyl anhydride
Acetyl ether
Acetyl oxide
Ethanoic anhydride

Hazards:

- Vapors and liquid are extremely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Reacts explosively with a large number of chemicals

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Remove all ignition sources
- Isolate the area of release or fire and deny entry
- Evacuate or shelter in place the immediate area and downwind for a large release
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Strong vinegar-like smell
- Dissolves in water and reacts with water to form acetic acid (vinegar) and heat
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the release to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Use alcohol foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a nonflammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns rinse with water and apply a clean dry dressing

CAS: 108-24-7

ACETYL BROMIDE

UN 1716

Shipping Name: Acetyl Bromide
Other Names: Acetic acid bromide
Ethanoyl bromide

WARNING!
- POISON! BREATHING THE VAPORS CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER! REACTS VIOLENTLY WITH WATER TO FORM TOXIC HYDROGEN BROMIDE GAS!

Hazards:
- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic and corrosive hydrogen bromide

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Remove all ignition sources
- Isolate the area of release or fire and deny entry
- Evacuate the immediate area and downwind for a large release
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless liquid
- Sharp, unpleasant acrid smell
- Sinks in water and reacts violently with water to produce acetic acid and toxic and corrosive hydrogen bromide
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Attacks and corrodes wood and most metals in the presence of moisture

Operational Level Training Response:
RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the release to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Approach fire with extreme caution; consider letting fire burn
- Do not allow water to come in contact with the material; if material is on fire, use dry chemical to extinguish. If water must be used, use in flooding quantities
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 506-96-7

ACETYL CHLORIDE

UN 1717

Shipping Name: Acetyl Chloride
Other Names: Acetic acid chloride
Acetic chloride
Ethanoyl chloride

WARNING!
- POISON! BREATHING THE VAPORS CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER DIRECTLY ON MATERIAL! REACTS VIOLENTLY WITH WATER TO FORM TOXIC HYDROGEN CHLORIDE AND ACETIC ACID!

Hazards:
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic hydrogen chloride
- Corrosive to most metals particularly in the presence of moisture producing flammable hydrogen gas

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterway, notify downstream users of potentially contaminated water

Description:
- Colorless to pale yellow fuming liquid
- Pungent, irritating odor
- Sinks in water and reacts violently with water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:
RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Do not allow water to come in contact with material; if material is on fire, use dry chemical to extinguish; if water must be used, use in flooding quantities
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns rinse with water and apply a clean dry dressing

CAS: 75-36-5

DIMETHYLACETAMIDE

Other Names: Acetic acid dimethylamide
Dimethylamide acetate
N,N-Dimethylacetamide
DMA
DMAC

Hazards:
- Irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless, oily liquid
- Weak fishy or ammonia-like odor
- Initially floats on the surface of water and is soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at -4° F

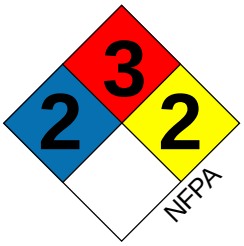
Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a nonflammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 127-19-5



VINYL ACETATE

(INHIBITED)

UN 1301

Shipping Name: Vinyl acetate, inhibited

Other Names:		
	Acetic acid, ethinyl ester	VAC
	Acetic acid, vinyl ester	VAM
	1-Acetoxyethylene	Vinyl A Monomer

WARNING! ● MAY REACT WITH ITSELF WITH EXPLOSIVE VIOLENCE BLOCKING RELIEF VALVES LEADING TO TANK EXPLOSION!

Hazards:

- Highly flammable
- Container may BLEVE or explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs; prolonged contact with skin can cause burns
- Reacts violently with strong acids, bases and peroxides

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Sweet, fruity odor
- Floats on water and is slightly soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resitant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 108-05-4

METHYL ACETATE

UN 1231

Shipping Name: Methyl acetate
Other Names: Acetic acid, methyl ester
Methyl acetic ester

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Fruity odor
- Initially floats on the surface of water and is soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 79-20-9

n-BUTYL ACETATE

UN 1123

Shipping Name: Butyl acetates
Other Names: Acetic acid, n-butyl ester
1-Butyl acetate
Butyl ethanoate

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Slightly irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Strong, fruity odor
- Floats on the surface of water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

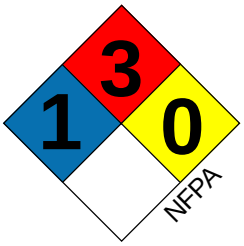
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS 123-86-4



n-PROPYL ACETATE

UN 1276

Shipping Name: n-Propyl acetate
Other Names: Acetic acid, n-propyl ester
1-Acetoxypropane
1-Propyl acetate

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Clear, colorless liquid
- Pleasant, sweet odor
- Floats on the surface of water and is slightly soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely

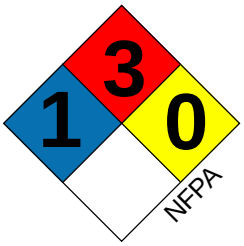
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 109-60-4



ETHYL ACETATE

UN 1173

Shipping Name: Ethyl acetate
Other Names: Acetic ester
Acetic ether
Ethyl ethanoate

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Pleasant, fruity odor
- Floats on the surface of water and is moderately soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 141-78-6

PENTAN-2,4-DIONE

UN 2310

Shipping Name: Pentan-2,4-dione

Other Names: Acetoacetone
Acetyl acetone
Diacetylmethane
2,4-Pentadione
Pentadione

Hazards:

- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flash back
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and down wind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Sweet odor
- Floats in water and is moderately soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at -9° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol based foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support (CPR) as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 123-54-6

ACETONE CYANOHYDRIN

(STABILIZED)

UN 1541

Shipping Name: Acetone cyanohydrin, stabilized

Other Names: Acetocyanohydrin 2-Cyano-2-propanol
2-Hydroxyisobutyronitrile Isopropylcyanohydrin
2-Methyl lactonitrile

WARNING!
- POISON! BREATHING THE VAPORS, SKIN CONTACT OR SWALLOWING THE MATERIAL CAN KILL YOU! PRODUCES CYANIDE IN THE BODY!
- Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- EXPOSURE TO HEAT WILL PRODUCE CYANIDE GAS!

Hazards:
- Decomposes in water to form hydrogen cyanide
- Combustion products include the toxic gases hydrogen cyanide and nitrogen oxides
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire

Awareness and Operational Level Training Response:
- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Evacuate or shelter in place the immediate area and downwind for a large release
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless to light yellow liquid
- Almond-like odor
- Soluble in water
- Decomposes in water to form hydrogen cyanide
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

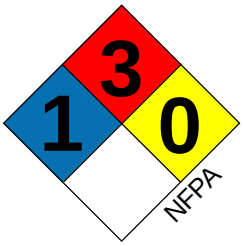
Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff water from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of fog to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to large areas of spilled liquid to control vapors

FIRE:
- If material is on fire and conditions permit, DO NOT EXTINGUISH. Cool exposures using unattended monitors.
- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a nonflammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:
- DO NOT ATTEMPT RESCUE!
- The contaminated victim poses a health risk to the responder
- Decontaminate the victim from a safe distance with a stream of water; have the victim remove clothing if possible; provide Basic Life Support/CPR as needed
- Further decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Do NOT perform mouth to mouth resuscitation; use a bag/mask apparatus
- Note to physician: can produce cyanide toxicity, if symptoms indicate, initial treatment includes the cyanide antidote kit

CAS: 75-86-5



ACETONE

UN 1090

Shipping Name: Acetone
Other Names: Dimethyl ketone
Methyl ketone
2-Propanone

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Vapors may travel long distances to ignition sources and flashback
- Vapors are heavier than air and will collect and stay in low areas
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Smells like fingernail polish remover
- Soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

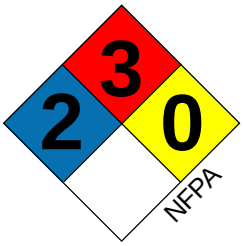
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns rinse with water and apply a clean dry dressing

CAS: 67-64-1



ACETONITRILE

UN 1648

Shipping Name: Acetonitrile

Other Names: Cyanomethane, Ethanenitrile, Ethyl nitrile, Methanecarbonitrile, Methyl cyanide

Hazards:

- Breathing the vapors, skin contact or swallowing the liquid can kill you! Converted to cyanide in the body!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Odor is not a reliable indicator of the presence of toxic amounts of vapor
- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Combustion products include toxic hydrogen cyanide and nitrogen oxides

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Remove all ignition sources
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Sweet, ether-like smell
- Initially floats on the surface of water and is soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- If material is on fire and conditions permit, DO NOT EXTINGUISH. Cool exposures using unattended monitors.
- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, specially trained personnel can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Note to physician: can cause cyanide poisoning; if symptoms indicate, treat with the cyanide antidote kit

CAS: 75-05-8

2-CHLORO-ACETOPHENONE

UN 1697

Other Names: CAF, CAP, Chloroacetaphenone, CN, Mace, Tear gas

Hazards:
- Swallowing the material may be harmful
- Severely irritating to the eyes; also irritating to the skin, nose and lungs; prolonged contact can cause burns
- Container may explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Training Response:
- Stay uphill and upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless to gray solid
- Flower-like smell at low concentrations; irritating smell at high concentrations
- Sinks in water and is insoluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas
- Used as a crowd control agent

Operational Level Training Response:

RELEASE, NO FIRE:
- Prevent runnoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Use water to extinguish fire
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location
- Use unattended equipment whenever possible

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 532-27-4

DIKETENE

(INHIBITED)

UN 2521

Shipping Name: Diketene, inhibited

Other Names: Acetyl ketene; 3-Buteno-beta-lactone; Ketene dimer; 4-Methylene Oxetanone

WARNING!

- POISON! BREATHING THE VAPOR CAN KILL YOU! SKIN AND EYE CONTACT CAN CAUSE SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- MAY REACT WITH ITSELF WITHOUT WARNING BLOCKING RELIEF VALVES LEADING TO CONTAINER EXPLOSION!

Hazards:

- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Description:

- Clear, colorless liquid
- Pungent odor
- Reacts with water releasing heat and is soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 20° F

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

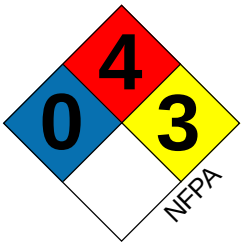
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, venting sound suddenly stops, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 674-82-8



ACETYLENE

(Dissolved)

UN 1001

Shipping Name: Acetylene, dissolved
Other Names: Ethine
Ethyne

WARNING! ● EXTREMELY FLAMMABLE!
● CONTAINER MAY EXPLODE WHEN EXPOSED TO FIRE!

Hazards:

- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Vapors may travel long distances to ignition sources and flashback
- Reacts explosively with many materials
- Exposure of cylinders to fire and flame or elevated temperatures may cause cylinder to rupture or frangible disc to burst, releasing entire contents of cylinder. Ruptured or venting cylinders may rocket through buildings and/or travel a considerable distance

Awareness and Operational Level Training Response:

- Stay upwind
- Determine the extent of the problem
- Remove all ignition sources
- Isolate the area of release or fire and deny entry
- Evacuate the immediate area and downwind for a large release
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Notify local health and fire officials and pollution control agencies
- If contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless gas
- Garlic or ether-like odor
- Soluble in water
- Extremely flammable
- Vapors are lighter than air
- Often shipped and stored dissolved in acetone
- Not shipped by rail tank cars
- Cylinders have a fusible plug not a relief valve

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Use large amounts of water to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - ♦ Inhalation - remove the victim to fresh air and give oxygen if available
  - ♦ Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - ♦ Eye - rinse eyes with large volumes of water or saline for 15 minutes
- Seek medical attention

CAS: 74-86-2

1,2-DICHLOROETHYLENE

UN 1150

Shipping Name: Dichloroethylene
Other Names: Acetylene dichloride
1,2-DCE
Dioform
Ethylene dichloride

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Sweet, pleasant odor
- Sinks in water and is insoluble in water
- Highly flammable
- Produces large amounts of vapor
- Vapors are heavier than air and will collect and stay in low areas
- Boils at 119° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 540-59-0

TETRACHLOROETHANE

UN 1702

Shipping Name: Tetrachloroethane
Other Names: Acetylene tetrachloride
Bonoform
Cellon
1,1,2,2-Tetrachloroethane
s-Tetrachloroethane

Hazards:
- Irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Decomposition products upon heating include toxic hydrogen chloride
- Corrosive to some plastics and rubber

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless to light yellow liquid
- Sweet odor
- Sinks in water and is insoluble in water
- Nonflammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 79-34-5

TRICHLOROETHYLENE

UN 1710

Shipping Name: Trichloroethylene

Other Names: Acetylene trichloride, Trichlor, Ethylene trichloride, Trichloroethene, TCE, TRI

Hazards:

- Irritating to skin, eyes, nose and lungs; prolonged contact with skin will cause burns
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion products include toxic hydrogen chloride

Description:

- Colorless liquid
- Sweet odor, similar to chloroform
- Sinks in water and is insoluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors or blanket spilled material - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 79-01-6

CALCIUM CARBIDE

UN 1402

Shipping Name: Calcium carbide
Other Names: Acetylenogen
Calcium acetylide
Carbide

WARNING! ● DO NOT USE WATER! REACTS VIOLENTLY WITH WATER TO PRODUCE EXPLOSIVE ACETYLENE GAS!

Hazards:

- Highly flammable
- Severely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Gray to black powder or solid
- Faint garlic-like odor
- Reacts violently with water to form explosive acetylene gas and toxic calcium hydroxide
- Highly flammable

Operational Level Training Response:

RELEASE, NO FIRE:

- Cover material to protect from wind, rain or spray
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Do not allow water to come in contact with the material; if material is on fire, use dry chemical to extinguish
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS 75-20-7

ALLYLTRICHLOROSILANE

(STABILIZED)

UN 1724

Shipping Name: Allyltrichlorosilane, stabilized
Other Names: Acetylsilicon trichloride
Propene-3-yltrichlorosilane
Trichloroallysilane

WARNING!

- POISON! BREATHING THE VAPOR CAN KILL YOU! SKIN AND EYE CONTACT CAN CAUSE SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER ON MATERIAL! REACTS VIGOROUSLY WITH WATER TO FORM TOXIC HYDROCHLORIC ACID!

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Pungent smell
- Reacts vigorously with water to form hydrochloric acid
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- If material is on fire and conditions permit, DO NOT EXTINGUISH
- Material reacts with water but can be extinguished with low or medium expansion AFFF foam or dry chemical if available in sufficient amounts
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 107-37-9

alpha-CHLOROPROPIONIC ACID

UN 2511

Shipping Name: 2-Chloropropionic acid

Hazards:

- Extremely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion products include toxic hydrogen chloride
- Corrosive to many metals

Description:

- A liquid
- Pungent odor
- Sinks in water and is soluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 10° F

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterway, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a non-flammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 598-78-7

ACRYLIC ACID

(INHIBITED)

UN 2218

Shipping Name: Acrylic acid, inhibited

Other Names: Acroleic acid; Ethylene carboxylic acid; GAA; Glacial acrylic acid; Propene acid; Propenoic acid; 2-Propenoic acid; Vinyl formic acid

WARNING! ● MAY REACT WITH ITSELF BLOCKING RELIEF VALVES LEADING TO TANK EXPLOSION!

Hazards:

- Vapors or liquid can cause burns to eyes, nose, skin and lungs
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- May react with itself without warning with explosive violence
- Vapors may travel long distances to ignition sources and flash back

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Shipped as a colorless liquid
- Sharp rancid odor
- Initally sinks in water and is soluble in water
- Very flammable
- Freezes at 56° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors

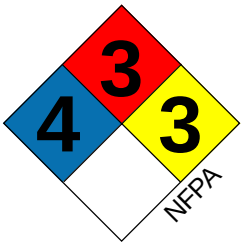
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a nonflammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - ♦ Inhalation - remove the victim to fresh air and give oxygen if available
  - ♦ Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - ♦ Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - ♦ Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 79-10-7



ACROLEIN

(INHIBITED)

UN 1092

Shipping Name: Acrolein, inhibited

Other Names: Acryladehyde 2-Propenal
Allyl aldehyde
Biocide

WARNING!
- POISON! BREATHING THE VAPORS CAN KILL YOU!
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- MAY REACT WITH ITSELF BLOCKING RELIEF VALVES LEADING TO TANK EXPLOSION!

Hazards:
- Highly flammable
- Container may BLEVE when exposed to fire
- Irritating to eyes, nose and lungs
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Reacts with acids, alkalis and air producing a violent reaction with itself
- Prolonged contact with skin will cause burns

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Remove all ignition sources
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

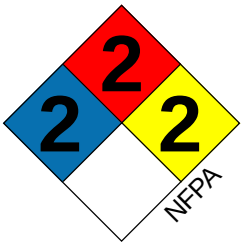
Description:
- Colorless to yellow liquid
- Sharp pungent odor
- Floats on the surface of water and is soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:
RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff water from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- If material is on fire and conditions permit, DO NOT EXTINGUISH. Cool exposures using unattended monitors.
- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 107-02-8



ACRYLAMIDE

UN 2074

Shipping Name: Acrylamide
Other Names: Acrylic amide
Propenamide
Vinyl amide

WARNING! ● MAY DECOMPOSE WITH HEAT AND REACT EXPLOSIVELY WITH ITSELF AT TEMPERATURES ABOVE 184° F RELEASING TOXIC AMMONIA GAS!

Hazards:
- Irritating to skin, eyes, nose and lungs
- Container may explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion products include toxic nitrogen oxides

Description:
- White solid
- No odor
- Initially sinks in water and is soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Awareness and Operational Level Training Response:
- Stay upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:
- Cover material to protect from wind, rain or spray
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Material does not easily burn; fight surrounding fire with an agent other than water; if water must be used, use it in flooding quantities
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 79-06-1

ACRYLYL CHLORIDE

NA 9188

Other Names: Acrylic acid chloride
Acryloyl chloride
Propenoyl chloride

WARNING!
- POISON! BREATHING THE GAS CAN KILL YOU!
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- HEATED MATERIAL MAY REACT WITH ITSELF LEADING TO CONTAINER EXPLOSION!

Hazards:
- Highly flammable
- Container may BLEVE when exposed to fire
- Severely irritating to skin, eyes, nose and lungs; prolonged contact with skin may cause burns
- Combustion products include toxic hydrogen chloride

Description:
- A liquid
- Irritating odor
- Sinks in water and decomposes in water to hydrochloric acid
- Highly flammable

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Remove all ignition sources
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 814-68-6

BUTYL ACRYLATE

(INHIBITED)

UN 2348

Other Names: Acrylic acid, butyl ester
n-Butylacrylate
Butyl-2-propenoate

WARNING! • MAY REACT WITH ITSELF WITHOUT WARNING BLOCKING RELIEF VALVES LEADING TO CONTAINER EXPLOSION!

Hazards:

- Very irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- White water-like liquid
- Biting, sharp odor
- Floats on the surface of water and is insoluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

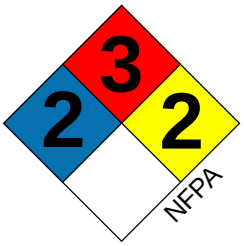
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS 141-32-2



ETHYL ACRYLATE

(INHIBITED)

UN 1917

Shipping Name: Ethyl acrylate, inhibited
Other Names: Acrylic acid, ethyl ester
Ethyl propenoate
Ethyl 2-propenoate
Propenoic acid, ethyl ester

WARNING! ● MAY REACT WITH ITSELF BLOCKING RELIEF VALVES AND LEADING TO TANK EXPLOSION!

Hazards:

- Highly flammable
- Very irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Acrid, penetrating odor
- Floats on the surface of water and is slightly soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If venting sound suddenly increases and/or unexpectedly stops, withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 140-88-5

METHYL ACRYLATE
(INHIBITED)

UN 1919

Shipping Name: Methyl acrylate, inhibited
Other Names: Acrylic acid, methyl ester
Methoxycarbonylethylene
Methyl propenoate
Propenoic acid, methyl ester

WARNING! • MAY REACT WITH ITSELF BLOCKING RELIEF VALVES AND LEADING TO TANK EXPLOSION!

Hazards:
- Highly irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless liquid
- Acrid odor
- Floats on the surface of water and is moderately soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent and material runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, venting sound suddenly increases or unexpectedly stops, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 96-33-3

ACRYLONITRILE

(INHIBITED)

UN 1093

Shipping Name: Acrylonitrile, inhibited

Other Names: Carbacryl, 2-Propenenitrile, Cyanoethylene, Vinyl cyanide, Propenenitrile

WARNING!

- POISON! BREATHING THE VAPORS, SKIN CONTACT OR SWALLOWING THE MATERIAL CAN KILL YOU! PRODUCES CYANIDE IN THE BODY!
- Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- MAY REACT WITH ITSELF WITHOUT WARNING BLOCKING RELIEF VALVES LEADING TO CONTAINER EXPLOSION!

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Prolonged contact with skin will cause burns
- Combustion products include toxic cyanide gas and nitrogen oxide

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- Evacuate the immediate area and downwind for a large release
- Remove all ignition sources
- For containers exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to light yellow liquid
- Strong, pungent smell like onions or garlic
- Floats on the surface of water and is moderately soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- If material is on fire and conditions permit, DO NOT EXTINGUISH. Cool exposures using unattended monitors.
- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- The contaminated victim poses a risk to the responder. Decontaminate the victim from a safe distance with a stream of water. Provide Basic Life Support/CPR as needed, then further decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Victims should be examined by a physician as soon as possible
- Note to physician: can produce cyanide toxicity, if symptoms indicate, initial treatment includes the cyanide antidote kit

CAS: 107-13-1

CYCLOHEXIMIDE

Other Names: Actidione
Actidone
Naramycin

Hazards:
- Extremely irritating to skin, eyes, nose and lungs; prolonged contact with skin can cause burns
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:
- Stay upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterway, notify downstream users of potentially contaminated water

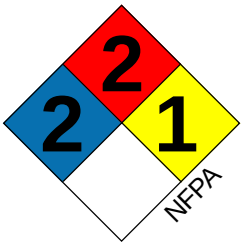
Description:
- Colorless solid
- Forms a fragrant vapor upon contact with alkalis
- Slightly soluble in water
- Flammable

Operational Level Training Response:
RELEASE, NO FIRE:
- Cover material to protect from wind, rain or spray
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of deforming), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 66-81-9



ADIPONITRILE

UN 2205

Shipping Name: Adiponitrile
Other Names: Adipic acid dinitrile
1,4-Dicyanobutane
Hexanedinitrile
Tetramethylene cyanide

WARNING!
- POISON! BREATHING THE VAPORS, SWALLOWING THE MATERIAL OR SKIN CONTACT CAN KILL YOU! PRODUCES CYANIDE IN THE BODY!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- EXPOSURE TO HEAT WILL PRODUCE TOXIC CYANIDE GAS!

Hazards:
- Odor is not a reliable indicator of the presence of toxic amounts of vapor
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion or decomposition products upon heating include toxic hydrogen cyanide and nitrogen oxides

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless liquid
- Practically odorless
- Floats on the surface of water and is moderately soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 34° F

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- Note to physician: can produce cyanide toxicity; if symptoms indicate, initial treatment includes the cyanide antidote kit

CAS: 111-69-3

CHLORINE DIOXIDE HYDRATE

NA 9191

Shipping Name: Chlorine dioxide, hydrate, frozen
Other Names: Alcide
Chlorine dioxide
Chlorine dioxide hydrate (frozen)
Chlorine peroxide

WARNING!
- POISON! BREATHING THE GAS CAN KILL YOU!
- Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- STRONG OXIDIZER! WILL INCREASE THE INTENSITY OF A FIRE! MAY CAUSE FIRE UPON CONTACT WITH COMBUSTIBLES!

Hazards:
- Extremely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Container may explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- When heated, vapors in closed spaces (e.g., tanks, sewers, buildings) in the presence of combustible materials may explode
- Reacts with water or steam to produce hydrochloric acid
- Decomposes upon heating releasing toxic chlorine gas

Awareness and Operational Level Training Response:
- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies

Description:
- Orange to red gas
- Shipped frozen, appearing like a solid block of ice
- Faint bleach-like odor
- Flammable and a strong oxidizer which may cause other combustible materials to burn
- Vapors are heavier than air and will collect and stay in low areas
- A liquid below 52° F

Operational Level Training Response:
RELEASE, NO FIRE:
- Keep material frozen if possible
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Material does not easily burn; if surrounding materials are on fire and conditions permit, do not extinguish. Cool exposures using unattended monitors. If fire must be fought, use an agent appropriate for the burning material
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of deforming), withdraw immediately to a secure location

First Aid:
- DO NOT ATTEMPT RESCUE!
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 10049-04-4

ALDICARB

UN 2757

Shipping Name: Carbamate pesticides, solid, toxic
Other Names: Carbamyl
Temik

Hazards:
- Container may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Decomposition products upon heating include toxic sulfur oxides

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- White solid
- Slight sulfur-like odor
- Sinks in water and is insoluble in water
- Nonflammable
- A carbamate insecticide

Operational Level Training Response:

RELEASE, NO FIRE:
- Cover material to protect from wind, rain or spray
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release

FIRE:
- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Note to physician: a carbamate insecticide; if symptoms indicate, initial treatment includes atropine

CAS: 116-06-3

DINITROPHENOL

UN 1320 (Wet with more than 15% water)
UN 1599 (Solution)
UN 0076 (Dry)

Shipping Names: UN 1599 Dinitrophenol solutions
UN 1320 Dinitrophenol, wetted with not less than 15% water
UN 0076 Dinitrophenol, dry or wetted with less than 15% water

Other Names: Aldifen, Dinofan, 2,4-DNP, 2,4-Dinitrophenol, Nitrophen

WARNING! ● KEEP MATERIAL WET! DRY MATERIAL (less than 15% water added) WILL SPONTANEOUSLY EXPLODE IF HEATED OR SHOCKED!

Hazards:
- Very irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Yellow crystalline solid
- Sweet musty odor
- Sinks in water and is insoluble in water
- Flammable
- May be shipped or stored dry, as a wetted solid or in water solution

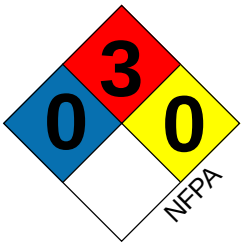
Operational Level Training Response:

RELEASE, NO FIRE:
- Dilute material with foam or water
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Approach fire with extreme caution; consider letting fire burn
- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 51-28-5



ETHYL ALCOHOL

UN 1170

Shipping Name: Ethyl alcohol or Ethanol

Other Names:

Algrain	Ethanol
Anhydrol	ETOH
Anhydrous ethanol	Grain alcohol
Denatured alcohol	Methylcarbinol

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin and eyes

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Wine or whiskey-like odor
- Soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Denatured alcohol contains small amounts of toxic materials

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 64-17-5

METHYL ACETYLENE, PROPADIENE MIXTURE

(STABILIZED)

UN 1060

Shipping Name: Methyl acetylene, propadiene mixture, stabilized
Other Names: Allene-methyl acetylene mixture
MAPP gas
Methyl acetylene-allene mixture

WARNING! ● EXTREMELY FLAMMABLE!

Hazards:
- Container may BLEVE or explode when exposed to fire
- Gas is heavier than air and will collect and stay in low areas
- Gas may travel long distances to ignition sources and flashback
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Moderately irritating to skin, eyes, nose and lungs
- Contact with liquid may cause frostbite

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies

Description:
- Colorless liquefied compressed gas
- Garlic-like odor
- Liquid floats on water and boils
- Extremely flammable
- Gas is heavier than air and will collect and stay in low areas

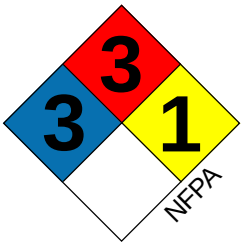
Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Use large amounts of water to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
- Seek medical attention
- Frostbite - warm injured area in very warm water
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: none



ALLYL BROMIDE

UN 1099

Shipping Name: Allyl Bromide
Other Names: Bromoallylene
3-Bromo-1-propene
3-Bromopropylene
2-Propenyl bromide

WARNING!
- POISON! BREATHING THE VAPOR CAN KILL YOU!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Severely irritating to skin, eyes, nose and lungs; prolonged contact with skin can cause burns
- Highly flammable
- Container may BLEVE when exposed to fire
- When heated may react with itself without warning with explosive violence
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion produces toxic hydrogen bromide gas

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Remove all ignition sources
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to light yellow liquid
- Pungent, unpleasant smell
- Sinks in water and is slightly soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

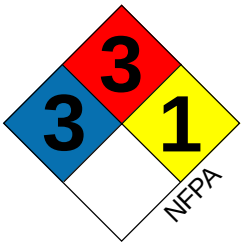
FIRE:

- Use foam or dry chemical if available in sufficient amounts; under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely.
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 106-95-6



ALLYL CHLORIDE

UN 1100

Shipping Name: Allyl Chloride

Other Names: Chlorallylene, Chloropropylene, Chloropropene, Propenyl chloride, 3-Chloropropene

WARNING!
- POISON! BREATHING THE VAPOR CAN KILL YOU!
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Severely irritating to skin, eyes, nose and lungs; prolonged contact with skin can cause burns
- Highly flammable
- Container may BLEVE when exposed to fire
- When heated, may react with itself without warning with explosive violence
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion produces the toxic gas hydrogen chloride and phosgene

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Remove all ignition sources
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to yellow-brown or red liquid
- Sharp and irritating odor
- Floats on water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

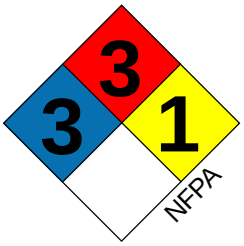
FIRE:

- Use foam or dry chemical if available in sufficient amounts; under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely.
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 107-05-1



ALLYL CHLOROFORMATE

UN 1722

Shipping Name: Allyl Chloroformate
Other Names: Allyl chlorocarbonate
2-Propenyl chloroformate

Hazards:

- Severely irritating to skin, eyes, nose and lungs
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Highly flammable
- Container may BLEVE when exposed to fire
- When heated may react with itself without warning with explosive violence
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Remove all ignition sources
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Extremely irritating smell
- Sinks in water and is insoluble in water and reacts with water to form allyl alcohol and chloroformic acid
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Use foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 2937-50-0

ALLYLAMINE

UN 2334

Shipping Name: Allylamine

Other Names: 3-Aminopropene, 3-Aminopropylene, Monoallylamine, 2-Propenamine, 2-Propen-1-amine

WARNING!
- POISON! BREATHING THE VAPOR CAN KILL YOU! SKIN AND EYE CONTACT CAN CAUSE SEVERE BURNS AND BLINDNESS!
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- When heated may react with itself without warning with explosive violence
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release.
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to light yellow liquid
- Ammonia-like odor
- Completely soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff water from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam only to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 107-11-9

BENZYL BROMIDE

UN 1737

Shipping Name: Benzyl bromide
Other Names: alpha-Bromotoluene
Bromophenylmethane

Hazards:

- Severely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- In the presence of metals may react violently with itself without warning
- Combustion products include toxic hydrogen bromide

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to yellow liquid
- Irritating odor like tear gas
- Sinks in water and is insoluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 25° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 100-39-0

BENZOYL CHLORIDE

UN 1736

Shipping Name: Benzoyl chloride
Other Names: Benzenecarbonyl chloride
alpha-Chlorobenzaldehyde

WARNING! • DO NOT USE WATER! REACTS VIOLENTLY WITH WATER TO FORM TOXIC HYDROCHLORIC ACID!

Hazards:

- Severely irritating to skin, eyes, nose and lungs; can cause burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic hydrogen chloride and phosgene gas

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to slightly brown liquid
- Pungent odor
- Sinks in water and reacts violently with water to produce toxic hydrochloric acid
- Very flammable
- Fumes in moist air to form hydrogen chloride
- Freezes at 30° F
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the release to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Do not allow water to come in contact with the material; if material is on fire, use dry chemical to extinguish
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 98-88-4

BENZYL CHLORIDE

(USUALLY STABILIZED)

UN 1738

Shipping Name: Benzyl chloride
Other Names: alpha-Chlorotoluene
(Chloromethyl) benzene
Chlorophenyl methane

Hazards:

- May react with itself vigorously in the presence of metals releasing heat and hydrogen chloride
- Severely irritating to skin, eyes, nose and lungs
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to slightly yellow liquid
- Irritating, pungent odor
- Sinks in water and is insoluble in water
- Reacts slowly with water releasing hydrochloric acid
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors -contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 100-44-7

CUMENE HYDROPEROXIDE

UN 2116

Other Names: CHP
alpha-Cumene hydroperoxide
Cumyl hydroperoxide
Dimethylbenzyl hydroperoxide

WARNING!
- MAY SPONTANEOUSLY EXPLODE IF EXPOSED TO HEAT OR FIRE!
- STRONG OXIDIZER! WILL INCREASE THE INTENSITY OF A FIRE! MAY CAUSE FIRE UPON CONTACT WITH COMBUSTIBLES!

Hazards:
- Container may BLEVE or explode when exposed to fire
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:
- DO NOT ATTEMPT RESCUE!
- If the material is involved in or exposed to fire EVACUATE THE AREA IN ALL DIRECTIONS AND CALL FOR EXPERT HELP; THE PROBABILITY OF EXPLOSION IS VERY HIGH IN THIS SITUATION
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless to pale yellow liquid
- Sharp irritating aromatic odor
- Slightly soluble in water
- Very flammable
- Highly explosive
- Freezes at 16° F

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff water from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Approach fire with extreme caution; consider letting fire burn
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- DO NOT ATTEMPT RESCUE!
- Provide Basic Life Support /CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

METHACRYLIC ACID

(INHIBITED)

UN 2531

Shipping Name: Methacrylic acid, inhibited
Other Names: alpha-Methacrylic acid
2-Methyl-2-propenoic acid

WARNING! ● MAY REACT WITH ITSELF BLOCKING RELIEF VALVES AND LEADING TO CONTAINER EXPLOSION!

Hazards:

- Severely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Corrosive to metals

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Acrid, repulsive odor
- Sinks slowly in water and is moderately soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 61° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a non-flammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, venting sound suddenly or unexpectedly increases or stops, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

ISOPROPENYLBENZENE

UN 2303

Shipping Name: Isopropenylbenzene
Other Names: AMS
alpha-Methyl styrene
1-Methyl-1-phenylethene
2-Phenylpropylene

Hazards:

- Irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- At high temperatures may react with itself without warning blocking relief valves leading to container explosion
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Sharp, aromatic odor
- Floats on the surface of water and is insoluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at -9° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, venting sound suddenly increases or unexpecedly stops, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

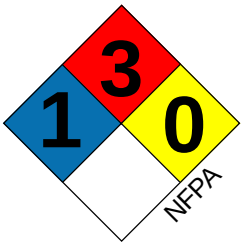
Notes: NFPA -704 designations shown in green are from NFPA49 or NFPA325. Those in black are designations assigned by the authors.
"**R**" under special situations signifies a radioactivity hazard.



alpha-PINENE

UN 2368

Shipping Name: alpha-Pinene
Other Names: Pinene

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay uphill and upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless oily liquid
- Turpentine or pine-like odor
- Floats on the surface of water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 80-56-8

PHENYLACETONITRILE

UN 2470

Shipping Name: Phenylacetonitrile, liquid

Other Names: alpha-Tolunitrile, Benzeneacetonitrile, Benzyl cyanide, Benzyl nitrile, Cyanotoluene

WARNING!
- POISON! BREATHING THE VAPORS, SWALLOWING THE MATERIAL OR SKIN CONTACT CAN KILL YOU! CONVERTED TO CYANIDE IN THE BODY!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion products include toxic hydrogen cyanide

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless, oily liquid
- Aromatic odor
- Sinks in water and is insoluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:
RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- Note to physician: can produce cyanide toxicity; if symptoms indicate, initial treatment includes the cyanide antidote kit

CAS: 140-29-4

TRIISOBUTYLALUMINUM

UN 3051

Shipping Name: Aluminum alkyls
Other Names: Aluminum, triisobutyl
TIBAL
Triisobutylalane

WARNING!

- POISON! BREATHING THE VAPORS CAN KILL YOU! SKIN AND EYE CONTACT CAN CAUSE SEVERE BURNS AND BLINDNESS!
- Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- EXTREMELY FLAMMABLE! IGNITES SPONTANEOUSLY IN AIR!
- DO NOT USE WATER! REACTS VIOLENTLY WITH WATER FORMING HIGHLY FLAMMABLE GASES!

Hazards:

- Container may BLEVE or explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- Remove all ignition sources
- For container exposed to fire, evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Clear, colorless liquid
- Reacts violently with water to produce highly flammable gases
- Extremely flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 34° F
- Usually shipped and stored under a nitrogen blanket

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the release to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- If material is on fire and conditions permit, DO NOT EXTINGUISH
- Specially trained personnel operating from a safe distance can fight fires using dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 100-99-2

AN/FO

NA 0331 (Contains only prilled ammonium nitrate)

Shipping Name: Ammonium nitrate/fuel oil mixtures
Other Names: AMFO
Ammonium nitrate: fuel oil

WARNING! ● EXPLOSIVE! MAY DETONATE IF INVOLVED IN A FIRE!

Hazards:
- Potentially explosive mixture, but is difficult to detonate
- May interfere with the body's ability to use oxygen
- Irritating to skin, eyes, nose and lungs
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

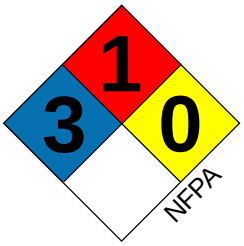
Description:
- A slurry of ammonium nitrate in fuel oil
- Odor like fuel oil
- Flammable
- No information on water solubility
- Used as an explosive

Operational Level Training Response:

RELEASE, NO FIRE:
- Cover material to protect from wind, rain or spray
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release

FIRE:
- Approach fire with extreme caution; consider letting fire burn
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing
- Note to physician: can cause methemoglobinemia; if symptoms indicate, methylene blue is the antidote



AMMONIA

(ANHYDROUS)

UN 1005

Shipping Name: Ammonia, anhydrous

Other Names: AM-FOL, Ammonia, anhydrous, Anhydrous ammonia, Refrigerant R717, Nitro-Sil

WARNING!

- POISON! BREATHING THE VAPORS OR SKIN CONTACT CAN KILL YOU!
- Fire fighting gear including SCBA does not provide adequate protection. If exposure to the chemical occurs, remove and isolate gear immediately and thoroughly decontaminate personnel.
- DO NOT ADD WATER TO LIQUID AMMONIA! WILL INCREASE EVAPORATION!

Hazards:

- Contact with liquid may cause frostbite
- Severely irritating to skin, eyes, nose, throat and lungs, may cause burns
- May burn or explode in closed spaces (e.g., tanks, sewers, buildings)
- Produces a toxic, visible or invisible gas cloud which may hug the ground when cool
- Containers may BLEVE or explode when exposed to fire
- Corrosive to metals

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Evacuate or shelter in place the immediate area and downwind for a large release
- For containers exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- May be shipped or stored as a compressed gas or cryogenic liquid
- Strong, pungent odor
- Soluble in water
- Flammable
- Gas is lighter then air but may hug the ground when cool

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if you can do it safely from a distance
- DO NOT PUT WATER ON LIQUID AMMONIA
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the release to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Frostbite - warm injured area in very warm water
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7664-41-7

FORMIC ACID

UN 1779

Shipping Name: Formic acid
Other Names: Aminic acid
Formylic acid
Hydrogen carboxylic acid
Methanoic acid

Hazards:

- Very irritating to skin, eyes, nose and lungs; skin and eye contact can cause severe burns and blindness
- Very flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- May deteriorate upon normal storage causing pressure buildup and container failure

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless, fuming liquid
- Irritating odor
- Sinks in water and is soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 47° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a nonflammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 64-18-6

2,4-DINITROANILINE

UN 1596

Shipping Name: Dinitroanilines
Other Names: 1-Amino-2,4-dinitrobenzene
2,4-Dinitro-1-aminobenzamine
2,4-Dinitrobenzamine
DNA

WARNING!
- POISON! BREATHING THE VAPORS OR DUST CAN KILL YOU!
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- EXPLOSIVE! CONTAINER OR MATERIAL MAY EXPLODE WHEN EXPOSED TO HEAT OR FLAMES!

Hazards:
- Irritating to skin, eyes, nose and lungs
- Vapors are heavier than air and will collect and stay in low areas
- Can affect the body's ability to use oxygen
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay uphill and upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Yellow solid
- Musty odor
- Sinks in water and is insoluble in water
- Flammable and explosive when exposed to heat or flame
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:
- Cover material to protect from wind, rain or spray
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Approach fire with extreme caution; consider letting fire burn
- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- Note to physician: can cause methemoglobinemia; if symptoms indicate, methylene blue is the initial antidote

CAS: 97-02-9

ISOPROPANOLAMINE

UN 2734

Shipping Name: Amines, liquid, corrosive, flammable, n.o.s.
Other Names: 1-Amino-2-propanol
2-Hydroxypropylamine
1-Methyl-2-aminoethanol
Monoisopropanolamine

Hazards:

- Irritating to skin, eyes, nose and lungs; prolonged contact with skin will cause burns
- Vapors are heavier than air and will collect and stay in low areas
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless, thick liquid
- Ammonia-like odor
- Initially floats on the surface of water and is soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 35° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a non-flammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 78-96-6

ANILINE

UN 1547

Shipping Name: Aniline

Other Names: Aminobenzene, Benzenamine, Aminophen, Blue oil, Aniline oil, Phenylamine

Hazards:

- Inhalation of vapors, ingestion of liquid or skin contact with liquid can cause severe illness
- May interfere with the body's ability to use oxygen
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion or decomposition products upon heating include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Stay uphill and upwind
- Determine the extent of the problem
- Isolate the area of release and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways notify downstream users of potentially contaminated water

Description:

- Colorless to light brown oily liquid
- Musty, fishy odor
- Sinks slowly in water and is slightly soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

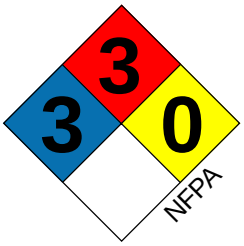
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Symptoms may be delayed for up to 48 hours
- Note to physician: can cause methemoglobinemia; if symptoms indicate, methylene blue is the antidote

CAS: 62-53-3



n-BUTYLAMINE

UN 1125

Shipping Name: n-Butylamine
Other Names: 1-Aminobutane
Butylamine
Monobutylamine

Hazards:

- Very irritating to skin, eyes, nose and lungs; prolonged contact with skin or eyes can cause burns
- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers buildings) may explode when exposed to fire
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Stay uphill and upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterway, notify downstream users of potentially contaminated water

Description:

- Clear, colorless liquid
- Fish-like odor
- Soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from rain or fire fighting from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

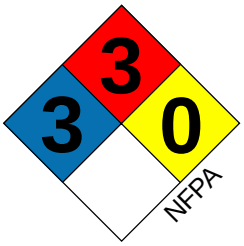
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS 109-73-9



CYCLOHEXYLAMINE

UN 2357

Shipping Name: Cyclohexylamine
Other Names: Aminocyclohexane
Aminohexahydrobenzene
CHA
Hexahydroanaline

Hazards:

- Highly flammable
- Extremely irritating to skin, eyes, nose and lungs; prolonged contact can cause burns
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Container may BLEVE when exposed to fire
- Combustion or decomposition upon heating produces toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to yellow liquid
- Ammonia or strong fish-like odor
- Soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff water from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

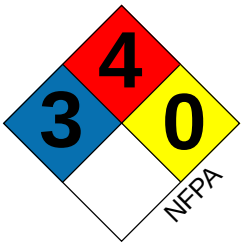
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 108-91-8



ETHYLAMINE

UN 1036

Shipping Name: Ethylamine
Other Names: Aminoethane, Ethanamine, ETN, MEA, Monoethylamine

WARNING! ● EXTREMELY FLAMMABLE!

Hazards:

- Odor is not a reliable indicator of the presence of toxic amounts of gas
- Severely irritating to skin, eyes, nose and lungs; can cause burns
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may BLEVE or explode when exposed to fire
- Gas is heavier than air and will collect and stay in low areas
- Gas may travel long distances to ignition sources and flashback
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode with or with out ignition
- Corrosive to aluminum, copper, tin, zinc and most of their alloys including brass
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless gas which becomes a liquid below 62° F
- Pungent ammonia-like odor
- Soluble in water
- Extremely flammable
- Gas is heavier than air and will collect and stay in low areas
- May be shipped in a water solution

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 75-04-7

ETHANOLAMINE

UN 2491

Shipping Name: Ethanolamine or Ethanolamine solutions
Other Names: 2-Aminoethanol
Glycinol Monoethanolamine
MEA Olamine

Hazards:

- Severely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors in confined areas (e.g., tanks, sewers buildings) may explode when exposed to fire
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless thick liquid
- Fish-like odor
- Initially sinks in water and is soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 51° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a nonflammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 141-43-5

DIETHYLENETRIAMINE

UN 2079

Shipping Name: Diethylenetriamine
Other Names: Aminoethylethandiamine
Bis-(2-aminoethyl) amine
DETA
2,2'-Diaminodiethylamine

Hazards:

- Severely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion or decomposition products upon heating include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to yellow liquid
- Ammonia-like odor
- Soluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Material does not easily burn, if liquid is on fire, specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a nonflammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 111-40-0

t-BUTYLAMINE

UN 2734

Shipping Name: Amines, liquid, corrosive, flammable, n.o.s.
Other Names: 2-Aminoisobutane
tert-Butylamine
1,1 Dimethyl ethylamine

WARNING! ● EXTREMELY FLAMMABLE!

Hazards:
- Irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic nitrogen oxides
- Corrosive to some plastics

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless liquid
- Ammonia-like odor
- Soluble in water
- Extremely flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using alcohol resistent (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS 75-64-9

METHYLAMINE
(ANHYDROUS)

UN 1061

Shipping Name: Methylamine, anhydrous
Other Names: Aminomethane
Monomethylamine

WARNING!
- EXTREMELY FLAMMABLE!
- POISON! BREATHING THE GAS CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Odor is not a reliable indicator of the presence of toxic amounts of gas
- Container may BLEVE or explode when exposed to fire
- Gas is heavier than air and will collect and stay in low areas
- Gas may travel long distances to ignition sources and flashback
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Contact with the liquefied gas may cause frostbite
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies

Description:
- Colorless gas
- May be shipped or stored as a refrigerated liquefied gas
- Ammonia-like odor
- Soluble in water
- Extremely flammable
- Gas is heavier than air and will collect and stay in low areas
- A liquid below 21° F

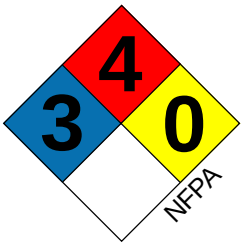
Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed noncryogenic containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location
- DO NOT APPLY WATER TO CRYOGENIC LIQUID CONTAINERS; if cryogenic liquid containers are exposed to direct flame or elevated temperatures for prolonged times, withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
- Seek medical attention
- Frostbite - warm injured area in very warm water
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 74-89-5



METHYLAMINE

(AQUEOUS SOLUTION)

UN 1235

Shipping Name: Methylamine, aqueous solution
Other Names: Aminomethane
MMA

WARNING!

- EXTREMELY FLAMMABLE!
- POISON! BREATHING THE VAPORS CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Odor is not a reliable indicator of the presence of toxic amounts of gas
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic nitrogen oxides

Description:

- Colorless liquid
- Fish-like odor at low concentrations, ammonia-like odor at higher concentrations
- Soluble in water
- Extremely flammable
- Vapors are heavier than air and will collect and stay in low areas
- Shipped as a 30% to 40% solution in water
- Produces large volumes of vapor
- Boils between 86° F and 106° F

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support (CPR) as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 74-89-5

N,N-DIMETHYL-p-PHENYLENEDIAMINE

Other Names: 4-Amino-N,N-dimethylaniline
DMPD

WARNING!
- POISON! BREATHING THE DUST, SWALLOWING THE MATERIAL OR SKIN CONTACT CAN KILL YOU!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Irritating to skin and eyes
- May interfere with the body's ability to use oxygen
- Combustion and decomposition products upon heating include toxic nitrogen oxides

Description:
- Colorless to reddish-violet solid
- No odor
- Initially sinks in water and is soluble in water
- Flammable

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

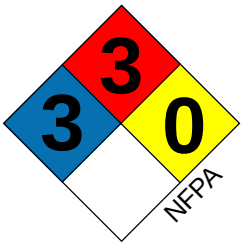
Operational Level Training Response:

RELEASE, NO FIRE:
- Cover material to protect from wind, rain or spray
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Note to physician: can cause methemoglobinemia; if symptoms indicate, methylene blue is the initial antidote

CAS: 99-98-9



DIETHYLAMINE

UN 1154

Shipping Name: Diethylamine
Other Names: 2-Aminopentane
DEA
DEN

Hazards:

- Very irritating to nose and lungs; skin and eye contact causes severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Highly flammable
- Container may BLEVE or explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Fishy, ammonia-like odor
- Initally floats on the surface of water and dissolves in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 109-89-7

ISOPROPYLAMINE

UN 1221

Shipping Name: Isopropylamine
Other Names: 2-Aminopropane
1-Methylethylamine
2-Propylamine

WARNING! ● EXTREMELY FLAMMABLE!

Hazards:

- Severely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Ammonia-like odor
- Soluble in water
- Extremely flammable
- Vapors are heavier than air and will collect and stay in low areas
- Boils at 92° F
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 75-31-0

AMINOPYRIDINES

UN 2671

Shipping Name: Aminopyridines

Other Names: 4-Aminopyridine Avitrol
m-Aminopyridine 4-Pyridinamine
o-Aminopyridine 4-Pyridylamine
p-Aminopyridine

WARNING!
- POISON! BREATHING THE DUST, SWALLOWING THE MATERIAL OR SKIN CONTACT WILL KILL YOU!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Container may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- White powder
- No odor
- Sinks in water and is moderately soluble in water
- Flammable

Operational Level Training Response:

RELEASE, NO FIRE:
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Cover material to protect from wind, rain or spray

FIRE:
- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- If material is on fire and conditions permit, DO NOT EXTINGUISH. Cool exposures using unattended monitors.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed

CAS: 504-24-5 (para, p-); 504-59-0 (ortho, o-); 462-08-8 (meta, m-)

TOLUIDINES

UN 1708

Shipping Name: Toluidines
Other Names: Aminotoluene
m-Toluidine
o-Toluidine
p-Toluidin

Hazards:

- May interfere with the body's ability to use oxygen
- Irritating to skin, eyes, nose and lungs
- Vapors are heavier than air and will collect and stay in low areas
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may BLEVE when exposed to fire
- Combustion and decomposition products upon heating include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to reddish-brown liquid
- Aromatic odor
- Very flammable
- Slightly soluble in water
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Note to physician: can cause methemoglobinemia; if symptoms indicate, methylene blue is the initial antidote

CAS: 95-53-4 (o, ortho), 106-49-0 (p, para), 108-44-1 (m, meta)

AMMONIUM HYDROXIDE

UN 2672 (10 to 35% Ammonia in water)
UN 2073 (35 to 50% Ammonia in water)

Shipping Name: Ammonia Solutions
Other Names: Ammonia monohydrate, Ammonia water, Ammonia solution, Aqueous ammonia

Hazards:
- Severely irritating to skin, eyes, nose and lungs; skin and eye contact can cause severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- May burn or explode in closed spaces (e.g., tanks, sewers, buildings)
- Decomposes upon heating to produce toxic ammonia and nitrogen oxide gases
- Vapors are lighter than air but may hug the ground when cool

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Evacuate or shelter in place the immediate area and downwind for a large release
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless to milky white colored liquid
- Ammonia-like odor
- Soluble in water
- Flammable
- Vapors are lighter than air but may hug the ground when cool

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other sign of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

"**R**" under special situations signifies a radioactivity hazard.

AMMONIUM CARBAMATE

NA 9083

Other Names: Ammonium aminoformate
Carbamic acid, ammonium salt

Hazards:
- Irritating to skin, eyes, nose and lungs
- Container may explode when exposed to fire
- Combustion and decomposition products upon heating include toxic nitrogen oxides and ammonia

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- White crystals
- Ammonia-like smell
- Soluble in water
- Flammable
- Slowly releases ammonia upon contact with air

Operational Level Training Response:

RELEASE, NO FIRE:
- Cover material to protect from wind, rain or spray
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 1111-78-0

AMMONIUM BENZOATE

NA 9080

Other Names: Vulnoc AB

Hazards:	**Description:**
● Irritating to skin, eyes, nose and lungs ● Container may explode when exposed to fire ● Combustion or decomposition products upon heating include toxic nitrogen oxides	● Colorless solid ● Odorless ● Sinks in water and is moderately soluble in water ● Flammable
Awareness and Operational Level Training Response: ● Stay upwind ● Determine the extent of the problem ● Isolate the area of release or fire and deny entry ● For container exposed to fire evacuate the area in all directions because of the risk of explosion ● Notify local health and fire officials and pollution control agencies ● If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water	**Operational Level Training Response:** RELEASE, NO FIRE: ● Cover material to protect from wind, rain or spray ● Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release FIRE: ● Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material ● Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely ● If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 1863-63-4

AMMONIUM SULFIDE

(SOLUTION)

UN 2683

Shipping Name: Ammonium Sulfide, solution
Other Names: Ammonium monosulfide
Diammonium sulfide

WARNING!

- POISON! BREATHING THE VAPOR, SKIN CONTACT OR SWALLOWING THE MATERIAL CAN KILL YOU! RELEASES TOXIC HYDROGEN SULFIDE IN THE BODY! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers ,buildings) may explode when exposed to fire
- When heated or mixed with acid, the solution produces toxic hydrogen sulfide gas
- Combustion products include toxic sulfur and nitrogen oxides

Awareness and Operational Training Level Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to yellow solid; usually shipped and stored as a water solution (40 to 44%)
- Rotten egg and ammonia-like odor
- Soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 0°F
- Produces large amounts of vapor

Operational Level Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Victims should be examined by a physician as soon as possible
- Do NOT perform direct mouth to mouth resuscitation; use a bag/mask apparatus
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing
- Note to physician: can cause hydrogen sulfide poisoning; if symptoms indicate, amyl nitrite is the initial antidote

CAS: 12135-76-1

AMMONIUM PERCHLORATE

UN 1442
UN 0402

Shipping Name: Ammonium perchlorate
Other Names: Ammonium perchlorate high explosive
Ammonium perchlorate oxidizer

WARNING!
- HIGHLY EXPLOSIVE! HEAT, FRICTION OR SHOCK MAY CAUSE MATERIAL TO EXPLODE!
- STRONG OXIDIZER! WILL INCREASE THE INTENSITY OF A FIRE; MAY CAUSE FIRE UPON CONTACT WITH COMBUSTIBLES!

Hazards:
- Irritating to skin and eyes
- Decomposition products upon heating include toxic nitrogen oxides and ammonia

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire deny entry and call for expert help
- For container exposed to fire evacuate a wide area in all directions because of the high risk of explosion
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- White solid
- Odorless
- Sinks in water and dissolves slowly in water
- Nonflammable but may cause combustibles to ignite

Operational Level Training Response:

RELEASE, NO FIRE:
- Keep released material wet
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release

FIRE:
- Approach fire with extreme caution; consider letting fire burn
- Material does not burn, fight surrounding fire with an agent appropriate for the material burning
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 7790-98-9

AMMONIUM THIOCYANATE

NA 9092

Other Names: Ammonium rhodanate
Ammonium sulfocyanide
Amthio

Hazards:

- Irritating to skin, eyes, nose and lungs
- Combustion and decomposition products upon heating include toxic ammonia, nitrogen oxide, sulfur oxide and cyanide gases
- Corrosive to iron, copper and brass

Awareness and Operational Level Training Response:

- Stay upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Consider evacuating or sheltering in place the immediate area and downwind if material is involved in a fire
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless solid
- Odorless
- Initally sinks in water and is soluble in water
- May be shipped and stored as a solid or in a water solution
- Flammable except in water solution

Operational Level Training Response:

RELEASE, NO FIRE:

- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Cover material to protect from blowing, rain or spray

FIRE:

- Solid material burns only with difficulty; as a water solution material does not burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 1762-95-4

AMMONIUM SULFITE

NA 9090

Other Names: Ammonium sulphite
Diammonium sulfite
Sulfurous acid, diammonium salt

Hazards:
- Irritating to skin, eyes, nose and lungs
- Decomposition products upon heating include toxic nitrogen and sulfur oxides and ammonia

Awareness and Operational Level Training Response:
- Stay upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- White crystalline solid, like sand or sugar
- Odorless
- Initally sinks in water and is soluble in water
- Nonflammable

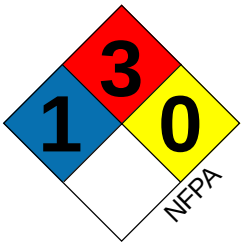
Operational Level Training Response:

RELEASE, NO FIRE:
- Cover material to protect from wind, rain or spray
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release

FIRE:
- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are not effective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 10196-04-0



AMYL ALCOHOL

UN 1105

Shipping Name: Amyl alcohols
Other Names: Amylol, n-Amyl alcohol, n-Butyl carbinol, 1-Pentanol, 1-Pentyl alcohol

Hazards:
- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Very irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless liquid
- Sweet, pleasant odor
- Floats on the surface of water and is slightly soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 71-41-0

METHYL AMYL KETONE

UN 1110

Shipping Name: Amyl methyl ketone
Other Names: Butylacetone
2-Heptanone
Methyl pentyl ketone

Hazards:

- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Clear, colorless liquid
- Banana-like odor
- Floats on water and is insoluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

AMYLTRICHOLORSILANE

UN 1728

Shipping Name: Amyltricholorsilane
Other Names: Pentyltrichlorosilane
Trichloroamylsilane

WARNING!

- POISON! BREATHING THE VAPOR CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER! REACTS VIGOROUSLY WITH WATER TO FORM TOXIC HYDROGEN CHLORIDE VAPOR!

Hazards:

- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Combustion products include toxic hydrogen chloride
- Corrosive to metals

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to yellow liquid
- Pungent odor
- Sinks in water and reacts vigorously with water to form hydrochloric acid
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- If material is on fire, and conditions permit, DO NOT EXTINGUISH
- Material reacts with water but can be extinguished with low or medium expansion AFFF foam or dry chemical if available in sufficient amounts
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 107-72-2

HYDROGEN BROMIDE

UN 1048

Shipping Name: Hydrogen bromide, anhydrous
Other Names: Anhydrous hydrobromic acid

WARNING!
- POISON! BREATHING THE GAS CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure to the chemical occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Containers may BLEVE or explode when exposed to fire
- Gas is heavier than air and will collect and stay in low areas
- Reacts with water to produce toxic hydrobromic acid
- Reacts with metals to produce highly flammable hydrogen gas
- Contact with liquid may cause frostbite

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate and deny entry into the area of release or fire
- For containers exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless gas
- May be shipped as a pale yellow liquid under pressure
- Irritating odor
- Liquid sinks in water and dissolves in water with the production of heat and toxic hydrobromic acid
- Nonflammable
- Gas is heavier than air and will collect and stay in low areas
- Boiling liquid may produce white vapor cloud

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Use large amounts of water to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:

- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Frostbite - warm injured area in very warm water
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 10035-10-6

HYDROGEN FLUORIDE

(ANHYDROUS)

UN 1052

Shipping Name: Hydrogen fluoride, anhydrous
Other Names: Anhydrous hydrofluoric acid
Fluoric acid
HF
Hydrofluoric acid

WARNING!

- POISON! BREATHING THE VAPOR CAN KILL YOU! SKIN AND EYE CONTACT CAUSES BLINDNESS AND SEVERE BURNS WHICH MAY NOT BE IMMEDIATELY PAINFUL !
- Fire fighting gear including SCBA provides NO protection. If exposure to the chemical occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Container may BLEVE when exposed to fire
- Reacts with some metals to produce flammable and explosive hydrogen gas
- Highly corrosive attacking rubber, leather, glass and other materials
- Gas is slightly lighter than air

Awareness and Operational Level Training Response:

- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless fuming liquid which boils at 67° F
- Sharp, irritating odor
- Initally sinks in water and is soluble in water producing toxic hydrofluoric acid and heat
- Nonflammable
- Gas is slightly lighter than air
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff and from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- DO NOT ATTEMPT RESCUE!
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing
- Note to physician: skin burns can be treated with calcium gluconate gel

CAS: 7664-39-3

CYCLOHEXANONE

UN 1915

Shipping Name: Cyclohexanone

Other Names: Anone, Cyclohexylketone, Hexanon, Madone, Pimelic ketone, Sextone

Hazards:

- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs; prolonged contact will cause skin, eye and lung burns

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Clear to pale yellow oily liquid
- Peppermint-like odor
- Floats on the surface of water and is moderately soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a non-flammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 108-94-1

1,2-DIMETHOXYETHANE

UN 2252

Shipping Name: 1,2-Dimethoxyethane

Other Names: Ansul ether 121; Dimethyl cellosolve; 2,5-Dioxahexane; Ethanediol dimethyl ether; Ethylene glycol dimethyl ether; GDME; Glycol dimethyl ether; Glyme

Hazards:

- Highly flammable
- Irritating to lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Sharp, ether-like smell
- Soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 110-71-4

POTASSIUM PERSULFATE

UN 1492

Shipping Name: Potassium persulfate
Other Names: Anthion
Dipotassium persulfate
Potassium peroxydisulfate

WARNING! • STRONG OXIDIZER! WILL INCREASE THE INTENSITY OF A FIRE! MAY CAUSE FIRE UPON CONTACT WITH COMBUSTIBLES!

Hazards:

- Moderately irritating to skin, eyes, nose and lungs; prolonged contact with skin can cause burns
- Material will react with moisture in a closed container producing an explosive mixture of ozone and sulfuric acid
- Container may explode when exposed to fire
- Decomposition products upon heating include toxic sulfur oxides

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless solid
- Odorless
- Sinks in water and is moderately soluble in water
- Nonflammable but may cause combustibles to burn

Operational Level Training Response:

RELEASE, NO FIRE:

- Cover material to protect from wind, rain or spray
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release

FIRE:

- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7727-21-1

NITRIC ACID

UN 1760 (40% or less)
UN 2031 (Nonfuming greater than 40%)
UN 2032 (Fuming)

Shipping Name: UN 1760 Corrosive liquid, n.o.s.
UN 2031 Nitric acid other than red fuming, with more than 70% Nitric acid
UN 2032 Nitric acid, red fuming

Other Names: Aqua fortis
Hydrogen nitrate

WARNING!
- POISON! BREATHING THE VAPOR CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- STRONG OXIDIZER! WILL INCREASE THE INTENSITY OF A FIRE! MAY CAUSE FIRE UPON CONTACT WITH COMBUSTIBLES!

Hazards:

- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Corrosive to almost all metals releasing highly flammable hydrogen gas
- Reacts violently with water
- Decomposes upon heating to form highly toxic nitrogen oxides

Awareness and Operational Level Training Response:

- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- A pale yellow to reddish brown liquid
- Choking odor
- Soluble in water giving off heat
- Nonflammable but may cause combustibles to ignite
- Vapors are heavier than air and will collect and stay in low areas
- Gives off a reddish brown vapor

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:
- Material does not burn; fight surrounding fire with an agent other than water; if water must be used, use it in flooding quantities
- If material is not leaking, cool exposed containers with ● If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- DO NOT ATTEMPT RESCUE!
- The contaminated victim poses a health risk to the responder
- Decontaminate the victim from a safe distance with a stream of water; have the victim remove clothing if possible; provide Basic Life Support/CPR as needed
- Further decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7697-37-2

METHYL CHLORIDE

UN 1063

Shipping Name: Methyl chloride
Other Names: Arctic, Chloromethane, Freon 40, Monochloromethane, R40

WARNING! ● EXTREMELY FLAMMABLE!

Hazards:

- Container may explode or BLEVE when exposed to fire
- Gas is heavier than air and will collect and stay in low areas
- Gas may travel long distances to ignition sources and flashback
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Mildly irritating to skin, eyes, nose and lungs
- Exposure to the liquid may cause frostbite
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Stay upwind
- Determine the extent of the problem
- Isolate the area of the release and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless gas
- May be shipped and stored as a liquefied compressed gas
- Faint sweet odor
- Liquid floats on the surface of water and boils; gas is slightly soluble in water
- Extremely flammable
- Gas is heavier than air and will collect and stay in low areas
- Becomes a liquid below -11° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Use large amounts of water well away from the material to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

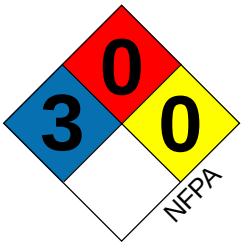
FIRE:

- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - ♦ Inhalation - remove the victim to fresh air and give oxygen if available
  - ♦ Eye - rinse eyes with large volumes of water or saline for 15 minutes
- Seek medical attention
- Frostbite - warm injured area in very warm water
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 74-87-3



ARSENIC TRICHLORIDE

UN 1560

Shipping Name: Arsenic trichloride
Other Names: Arsenic butter
Arsenic chloride
Arsenous chloride
Arsenous trichloride

WARNING!
- POISON! BREATHING THE VAPOR, SKIN CONTACT OR SWALLOWING THE MATERIAL CAN KILL YOU!
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Severely irritating to skin, eyes, nose and lungs; prolonged contact with skin and eyes can cause burns
- Upon contact with water generates toxic hydrochloric acid
- Will react with most metals to produce explosive hydrogen gas
- Vapors are heavier than air and will collect and stay in low areas
- Decomposition products upon heating include toxic hydrogen chloride and arsenic fumes
- Known to cause cancer in humans following long term exposure: contact should be avoided

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Evacuate or shelter in place the immediate area and downwind for a large release
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless to yellow oily liquid
- Pungent odor
- Decomposes in water to form toxic hydrochloric acid
- Nonflammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:
- Material does not burn, fight surrounding fire with an agent appropriate for the material burning
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7784-34-1

ETHYLDICHLOROARSINE

UN 1892

Shipping Name: Ethyldichloroarsine
Other Names: Arsenic dichloroethane
Dichloroethylarsine
TL 214
ED

WARNING!
- POISON! BREATHING THE VAPORS CAN KILL YOU! SKIN AND EYE CONTACT CAN CAUSE SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Reacts with steam or acids producing highly toxic fumes

Awareness and Operational Level Training Response:
- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire and call for expert help
- Evacuate or shelter in place the immediate area and downwind for a large release
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless liquid which may become yellow upon exposure to air or light
- Biting, irritating fruit-like odor
- Sinks in water and reacts with water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas
- Used as a military poison gas

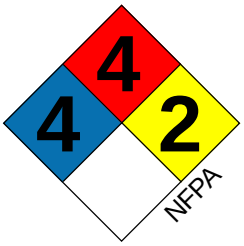
Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:
- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- DO NOT ATTEMPT RESCUE!
- The contaminated victim poses a health risk to the responder
- Decontaminate the victim from a safe distance with a stream of water; have the victim remove clothing if possible; provide Basic Life Support/CPR as needed
- Further decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Do NOT perform direct mouth to mouth resuscitation; use a bag/mask apparatus
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing
- Note to physician; treat as an arsine gas exposure

CAS: 598-14-1



ARSINE

UN 2188

Shipping Name: Arsine
Other Names: Arsenic hydride
Arsenic trihydride
Hydrogen arsenic

WARNING!
- POISON! BREATHING THE GAS OR SKIN CONTACT CAN KILLYOU!
- Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- EXTREMELY FLAMMABLE!

Hazards:
- Exposure of cylinders to fire and flame or elevated temperatures may cause cylinder to rupture or frangible disc to burst, releasing entire contents of cylinder. Ruptured or venting cylinders may rocket through buildings and/or travel a considerable distance
- Vapors may travel long distances to ignition sources and flashback
- Vapors are heavier than air and will collect and stay in low areas
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode
- Combustion products include toxic arsenic oxides
- Known to cause cancer in humans following long term exposure: contact should be avoided

Awareness and Operational Level Training Response:
- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- Remove all ignition sources
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless gas
- Garlic-like odor
- Slightly soluble in water
- Extremely flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Use large amounts of water to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of deforming), withdraw immediately to a secure location

First Aid:
- DO NOT ATTEMPT RESCUE!
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
- Seek medical attention
- Victims should be examined by a physician as soon as possible
- Do NOT perform direct mouth to mouth resuscitation; use a bag/mask apparatus
- Symptoms may be delayed
- Note to physician: causes hemolysis; chelating agents are not effective-if symptoms indicate, use exchange transfusion

CAS: 7784-42-1

1,1-DIMETHYLHYDRAZINE

UN 1163

Shipping Name: Dimethylhydrazine, unsymmetrical
Other Names: asym-Dimethylhydrazine
UDMH
DMH
unsym-Dimethylhydrazine

WARNING!
- POISON! BREATHING THE VAPORS, SKIN CONTACT OR SWALLOWING THE MATERIAL CAN KILL YOU!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Highly flammable
- May interfere with the body's ability to use oxygen
- Severely irritating to skin, eyes, nose and lungs; can cause burns
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion and thermal decomposition products upon heating include toxic nitrogen oxides
- Corrosive to plastics

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire, evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Turns yellow and fumes upon contact with air
- Fishy ammonia-like odor
- Initially floats on the surface of water and is soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Used as a high energy propellant for liquid fueled rockets

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

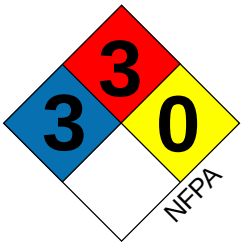
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing
- Note to physician: can cause methemoglobinemia; if symptoms indicate, methylene blue is the initial antidote

CAS: 57-14-7



PYRIDINE

UN 1282

Shipping Name: Pyridine
Other Names: Azabenzene
Azine

Hazards:

- Moderately irritating to skin, eyes, nose and lungs; prolonged exposure can cause burns
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic nitrogen oxides
- Corrosive to some forms of rubber, plastics and coatings

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to slightly yellow liquid
- Powerful fish-like odor
- Initially floats on the surface of water and is soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

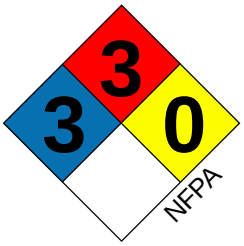
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 110-86-1



PIPERIDINE

UN 2401

Shipping Name: Piperidine
Other Names: Azacyclohexane
Cyclopentimine
Hexahydropyridine

Hazards:

- Very irritating to skin, eyes, nose and lungs; prolonged contact with skin can cause burns
- Highly flammable
- Containers may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area around the release and deny entry
- Remove all ignition sources
- For container exposed to fire, evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Fishy ammonia or pepper-like odor
- Initially floats on water and is soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low area
- Freezes at 19° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 110-89-4

ETHYLENEIMINE

(INHIBITED)

UN 1185

Shipping Name: Ethyleneimine, inhibited

Other Names: Azacyclopropane, Azirane, Aziridine, Dimethylenimine, Ethylimine

WARNING!

- POISON! BREATHING THE VAPORS OR SWALLOWING THE MATERIAL CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- MAY REACT WITH ITSELF BLOCKING RELIEF VALVES AND LEADING TO TANK EXPLOSION!

Hazards:

- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Containers may BLEVE when exposed to fire
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic oxides of nitrogen

Awareness and Operational Level Training Response:

- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of the release and deny entry
- Remove all ignition sources
- For container exposed to fire, evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless clear liquid
- Ammonia-like odor
- Floats on the surface of water and is moderately soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff water from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Approach fire with extreme caution; consider letting burn
- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If venting sound suddenly increases and/or unexpectedly stops, withdraw immediately to a secure location

First Aid:

- DO NOT ATTEMPT RESCUE!
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 151-56-4

SODIUM AZIDE

UN 1687

Shipping Name: Sodium azide
Other Names: Azide
Hydrazoic acid, sodium salt

WARNING! ● EXPLOSIVE! SHOCK OR HEAT MAY CAUSE MATERIAL TO EXPLODE!

Hazards:

- Breathing in the dust, swallowing the material or absorption through the skin can cause serious illness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may explode when exposed to fire
- Decomposition products upon heating include toxic hydrazoic acid fumes and nitrogen oxides

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- Evacuate the immediate area and down wind for a large release
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless solid
- No odor
- Initially sinks in water and is soluble in water
- Nonflammable

Operational Level Training Response:

RELEASE, NO FIRE:

- Cover material to protect from wind, rain or spray
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- APPROACH FIRE WITH EXTREME CAUTION; consider letting fire burn
- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 26628-22-8

METHYL PARATHION

UN 2783

Other Names: Azophos
Bladan-M
Dimethyl-p-nitrophenyl thiophosphate
Metaphos

WARNING! ● POISON! BREATHING THE VAPOR, SKIN OR EYE CONTACT, OR SWALLOWING THE MATERIAL CAN KILL YOU!
● Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Container may BLEVE or explode when exposed to fire
- Combustion products include toxic sulfur and phosphorous oxides

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim!
- Stay uphill and upwind
- Determine the extent of the problem
- Isolate the area of release or fire or release and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- A white solid
- Faint garlic-like odor
- Sinks in water and is insoluble in water
- Flammable
- Melts at 99° F
- An organophosphate insecticide

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done wothout placing personnel at risk

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim!
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- Note to physician: an organophosphate insecticide; if symptoms indicate, initial treatment includes atropine

"**R**" under special situations signifies a radioactivity hazard.

DICHLOROMETHYL ETHER

UN 2249

Shipping Name: Dichloromethyl ether, symmetrical

Other Names: BCME
Bis(chloromethyl) ether
Chloro(chloromethoxy) methane
Chloromethyl ether

WARNING!
- POISON! BREATHING THE VAPORS CAN KILL YOU!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Highly flammable
- Extremely irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Reacts with water to produce hydrochloric acid and formaldehyde
- Combustion products include toxic hydrogen chloride
- May form peroxides upon standing which will detonate with heat or shock
- Known to cause cancer in humans following long term exposure: contact should be avoided

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Suffocating odor
- Sinks in water and decomposes in water to form toxic hydrochloric acid
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- If material is on fire and conditions permit, DO NOT EXTINGUISH. Cool exposures using unattended monitors.
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 542-88-1

BUTADIENE

(INHIBITED)

UN 1010

Shipping Name: Butadienes, inhibited

Other Names: BD, Biethylene, Bivinyl, 1,3-Butadiene, Divinyl, Erythrene, Vinylethylene

WARNING!
- EXTREMELY FLAMMABLE!
- MAY REACT WITH ITSELF BLOCKING RELIEF VALVES LEADING TO TANK EXPLOSION!

Hazards:
- Gas is heavier than air and will collect and stay in low areas
- Gas may travel long distances to ignition sources and flashback
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Container may BLEVE or explode when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Contact with liquid may cause frostbite

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies

Description:
- Colorless liquefied gas
- Pleasant gasoline-like odor
- Floats and boils on water and is insoluble in water
- Gas is heavier than air and will collect and stay in low areas
- Extremely flammable
- Becomes a liquid below 21° F

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Use large amounts of water to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If venting sound suddenly increases and/or unexpectedly stops, withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
- Seek medical attention
- Frostbite - warm injured area in very warm water
- For skin burns decontaminate with water and apply a clean dry dressing

CAS 106-99-0

BENZYLIDENE CHLORIDE

UN 1886

Shipping Name: Benzylidene chloride
Other Names: Benzal chloride
Benzyl dichloride
Benzylene chloride
Dichloromethyl benzene

Hazards:

- Severely irritating to skin, eyes, nose and lungs
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Vapors are heavier than air and will collect and stay in low areas
- Combustion products include toxic hydrogen chloride
- Reacts with water to produce toxic hydrochloric acid

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to brown oily liquid
- Pungent odor
- Sinks in water and is insoluble in water
- Very flammable
- Reacts with water to produce hydrochloric acid
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 3° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the release to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 98-87-3

BENZALDEHYDE

UN 1990

Shipping Name: Benzaldehylde
Other Names: Benzenecarbonal
Benzene methylal
Benzoic aldehyde

Hazards:

- Irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to light yellow liquid
- Almond-like odor
- Sinks in water and is slightly soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at -14°F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a non-flammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 100-52-7

2-CHLORO-BENZALMALONOITRILE

Other Names: o-Chlorobenzylidine malononitrile
CS

Hazards:	**Description:**
● Extremely irritating to skin, eyes and nose; prolonged contact can cause burns ● Container may explode when exposed to fire ● Combustion and decomposition products upon heating include toxic hydrogen cyanide	● White solid ● Pepper-like smell ● Insoluble in water ● Flammable ● Used as a tear gas and riot control agent
Awareness and Operational Level Training Response: ● Stay uphill and upwind ● Determine the extent of the problem ● Isolate the area of release or fire and deny entry ● For container exposed to fire evacuate the area in all directions because of the risk of explosion ● Notify local health and fire officials and pollution control agencies ● If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water	**Operational Level Training Response:** RELEASE, NO FIRE: ● Cover material to protect from wind, rain or spray ● Prevent runnoff from entering sewers and waterways if it can be done safely well ahead of the release FIRE: ● Use water to extinguish fire ● Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely ● If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 2698-41-1

BENZAMIDE

Other Names: Benzoic acid amide
Benzoylamide
Phenylcarboxyamide

Hazards:
- Mildly irritating to skin, eyes, nose and lungs
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:
- Stay upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless solid crystals
- Odorless
- Sinks in water and is slightly soluble in water
- Flammable

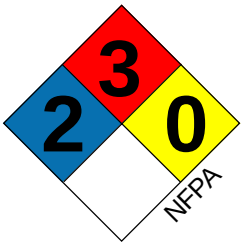
Operational Level Training Response:

RELEASE, NO FIRE:
- Cover material to protect from wind, rain or spray
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release

FIRE:
- Material burns with difficulty, fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 55-21-0 and 27208-38-4



BENZENE

UN 1114

Shipping Name: Benzene
Other Names: Benzol
Coal naphtha
Cyclohexatriene
Mineral naphtha

Hazards:

- Highly flammable
- Vapors may travel long distances to ignition sources and flash back
- Container may BLEVE when exposed to fire
- Vapors in confined areas (e.g., tanks, sewers buildings) may explode when exposed to fire
- Irritating to eyes, moderately irritating to skin and lungs
- Vapors are heavier than air and will collect and stay in low areas
- Known to cause cancer in humans following long term exposure: contact should be avoided
- Corrosive to most rubber products

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Pleasant aromatic odor
- Floats on water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

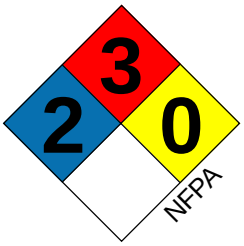
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 71-43-2



CHLOROBENZENE

UN 1134

Shipping Name: Chlorobenzene
Other Names: Benzene chloride
MCB
Monochlorobenzene
Phenyl chloride

Hazards:

- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Combustion products include toxic hydrogen chloride and phosgene

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- Evacuate the immediate area and downwind for a large release
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Sweet almond-like smell
- Sinks in water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Use foam or dry chemical if available in sufficient amounts; under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 108-90-7

FLUOROBENZENE

UN 2387

Shipping Name: Fluorobenzene
Other Names: Benzene fluoride
MFB
Monofluorobenzene
Phenyl fluoride

Hazards:

- Highly flammable
- Irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic hydrogen fluoride

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless, watery liquid
- Benzene-like odor
- Sinks in water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 462-06-6

FLUOROACETIC ACID

UN 2642

Shipping Name: Fluoroacetic acid

Other Names: FAA, 2-Fluoroacetic acid, Fluoroethanoic acid, Monofluoroacetate, MFA

WARNING!
- POISON! BREATHING THE POWDER OR VAPOR, OR SWALLOWING THE POWDER CAN KILL YOU!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Extremely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Combustion or decomposition products upon heating include toxic hydrogen fluoride

Description:
- Colorless solid
- No odor
- Moderately soluble in water
- Flammable and burns with a green flame
- Melts at 95° F

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:
- Cover material to protect from wind, rain or spray
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- The contaminated victim poses a health risk to the responder
- Decontaminate the victim from a safe distance with a stream of water; have the victim remove clothing if possible; provide Basic Life Support/CPR as needed
- Further decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Do NOT perform direct mouth to mouth resuscitation; use a bag/mask apparatus
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 144-49-0

PHENYL PHOSPHOROUS DICHLORIDE

UN 2798

Shipping Name: Phenyl phosphorous dichloride
Other Names: Benzene phosphorous dichloride
Dichlorophenyl phosphine Phenylphosphine dichloride

WARNING!
- POISON! BREATHING THE VAPORS CAN KILL YOU! SKIN AND EYE CONTACT CAN CAUSE SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER! REACTS VIGOROUSLY WITH WATER TO FORM TOXIC HYDROGEN CHLORIDE VAPORS!

Hazards:
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Combustion products include toxic hydrogen chloride
- Corrosive to most metals

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Isolate the area of release or fire and deny entry
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless liquid that fumes in air
- Pungent odor
- Sinks in water and reacts in water to form toxic hydrochloric acid
- Flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:
RELEASE, NO FIRE:
- DO NOT USE WATER DIRECTLY ON PRODUCT. Reacts vigorously with water to form toxic hydrochloric acid
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from rain or fire fighting from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the release to knock down vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- If possible, do not allow water to come in contact with the material; if material is involved in a fire, use dry chemical to extinguish if available. If water must be used, use it in flooding quantities
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 644-97-3

CYCLOHEXANE

UN 1145

Shipping Name: Cyclohexane
Other Names: Benzenehexahydride
Hexahydrobenzene
Hexamethylene

Hazards:

- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Container may BLEVE when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Petroleum-like odor
- Floats on the surface of water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 44° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 110-82-7

BENZONITRILE

UN 2224

Shipping Name: Benzonitrile
Other Names: Benzenenitrile
Cyanobenzene
Phenylcyanide

WARNING!
- POISON! BREATHING THE VAPOR, SWALLOWING THE LIQUID OR SKIN CONTACT CAN KILL YOU! CONVERTED TO CYANIDE IN THE BODY!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Irritating to skin, eyes, nose and lungs even at low concentrations
- Combustion products include toxic nitrogen oxides
- Corrosive to some plastics

Description:
- Colorless liquid
- Almond-like odor
- Sinks in water and is slightly soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 9° F

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways,notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- The contaminated victim poses a risk to the responder
- Decontaminate the vicitm from a safe distance with a stream of water; have the victim remove clothing if possible; provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- Note to physician: can produce cyanide toxicity, if symptoms indicate, initial treatment includes the cyanide antidote kit

CAS: 100-47-0

PHENYL MERCAPTAN

UN 2337

Shipping Name: Phenyl mercaptan
Other Names: Benzenethiol
Mercaptobenzene
Thiophenol

Hazards:

- May interfere with the body's ability to use oxygen
- Severely irritating to skin, eyes, nose and lungs; can cause burns or blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Combustion products include toxic sulfur oxides

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to light yellow liquid
- Burnt rubber stench-like, or garlic-like odor
- Sinks in water and is insoluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 5° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

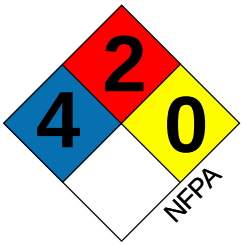
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing
- Note to physician: can cause methemoglobinemia; if symptoms indicate, methylene blue is the initial antidote

CAS: 108-98-5



PHENOL

UN 1671 (Solid)
UN 2312 (Molten)
UN 2821 (Solution)

Shipping Name: Phenol

Other Names: Benzenol, Carbolic acid, Hydroxybenzene, Oxybenzene, Phenic acid, Phenyl alcohol, Phenylic acid

WARNING! • BREATHING THE VAPORS OR SWALLOWING THE MATERIAL CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
• Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Odor is not a reliable indicator of the presence of toxic amounts of vapor
- Container may explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless solid or liquid that darkens pink to red on exposure to light
- Sweet medicinal odor
- Sinks in water and is moderately soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas
- Solid material melts at 106° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Cover solid material to protect from wind, rain or spray
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

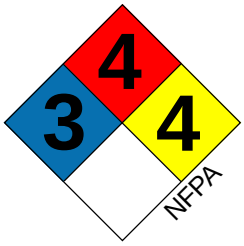
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a nonflammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 108-95-2



ETHYL NITRITE

(SOLUTIONS)

UN 1194

Shipping Name: Ethyl nitrite solutions
Other Names: Hyponitrous ether
Nitrous acid, ethyl ester
Sweet spirit of nitre

WARNING!
- EXTREMELY FLAMMABLE!
- EXPLOSIVE! DECOMPOSES EXPLOSIVELY AT 194°F!
- POISON! BREATHING THE GAS CAN KILL YOU!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Extremely irritating to skin, eyes, nose and lungs
- Containers may BLEVE or explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- May interfere with the body's ability to use oxygen
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless gas above 63° F; colorless to pale yellow liquid below 63° F
- Sweet rum-like odor
- May be shipped and stored dissolved in ethyl alcohol
- Floats on the surface of water and is slightly soluble in water
- Extremely flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the release to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Approach fire with extreme caution; consider letting fire burn
- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing
- Note to physician: can cause methemoglobinemia; if symptoms indicate, methylene blue is the initial antidote

CAS: 109-95-5

BENZOTRICHLORIDE

UN 2226

Shipping Name: Benzotrichloride

Other Names: Benzoic trichloride; Benzyl trichloride; Phenyl trichloromethane; Trichlorormethyl benzene; Trichlororortoluene

Hazards:

- Severely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may BLEVE when exposed to fire
- Reacts with water to produce hydrochloric acid
- Vapors are heavier than air and will collect and stay in low areas
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to yellow, oily fuming liquid
- Pungent odor
- Sinks in water and reacts with water to form hydrochloric acid
- Flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the release to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

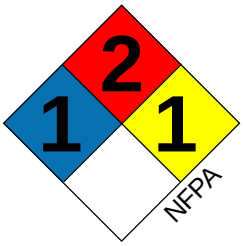
FIRE:

- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material, avoid using water if possible
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 98-07-7



BENZOQUINONE

UN 2587

Shipping Name: Benzoquinone
Other Names: 1,4-Benzoquinone
p-Benzoquinone
1,4-Cyclohexadiene dioxide
Quinone

Hazards:

- Container may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Vapors are heavier than air and will collect and stay in low areas

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Notify local health and fire officials and pollution control agencies
- If contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Greenish-yellow solid
- Chlorine-like odor
- Sinks in water and is slightly soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Cover material to protect from wind, rain or spray
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Use water or foam to extinguish
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 106-51-4

BENZYL CHLOROFORMATE

UN 1739

Shipping Name: Benzyl chloroformate
Other Names: Benzyl carbonyl chloride
Benzyl chlorocarbonate
BZCF

Hazards:

- Very irritating to skin, eyes, nose and lungs; prolonged contact with skin can cause burns
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion and decomposition products upon heating include toxic hydrogen chloride
- Reacts vigorously with hot water or steam to form hydrochloric acid

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to pale yellow oily liquid
- Acrid odor
- Sinks in water and reacts slowly with cold water forming hydrochloric acid; reacts vigorously with hot water or steam
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- If possible, DO NOT allow water to come in contact with material; if material is on fire, use dry chemical to extinguish; if water must be used, use it in flooding quantities
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 501-53-1

DIBENZYL ETHER

UN 3271

Shipping Name: Ethers, n.o.s.
Other Names: Benzyl ether
Benzyl oxide

Hazards:

- Irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to pale yellow liquid
- Almond-like odor
- Floats on the surface of water and is insoluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 38° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

"**R**" under special situations signifies a radioactivity hazard.

CHLOROPRENE

(INHIBITED)

UN 1991

Shipping Name: Chloroprene, inhibited

Other Names: beta-Chloroprene; 2-Chlorobuta -1,3-diene; Chlorobutadiene; Neoprene; 2-Chloro-1,3-butadiene

WARNING! • MAY REACT WITH ITSELF WITHOUT WARNING BLOCKING RELIEF VALVES LEADING TO CONTAINER EXPLOSION!

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Pungent odor
- Floats on the surface of water and is slightly soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from rain or firefighting from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, venting suddenly stops, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 126-99-8

CROTONALDEHYDE

(STABILIZED)

UN 1143

Shipping Name: Crotonaldehyde, stabilized

Other Names:		
	2-Butenal	Crotonaldehyde (E)
	trans-2-Butenal	Diproanoate
	Crotonal	beta-Methyl acrolein

WARNING!
- POISON! BREATHING THE VAPORS CAN KILL YOU!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Highly flammable
- Severely irritating to skin, nose, eyes and lungs; skin and eye contact can cause severe burns and blindness
- May react with itself with explosive violence when heated or exposed to alkalis
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Forms explosive peroxides upon exposure to air
- Vapors are heavier than air will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Clear to yellow liquid
- Pungent suffocating tar-like odor
- Floats on the surface of water and is moderately soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff water from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- If material is on fire and conditions permit, DO NOT EXTINGUISH. Cool exposures using unattended monitors.
- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 4170-30-3

PROPIOLACTONE

Other Names: BPL
2-Oxetanone
3-Propanolide
beta-Propiolactone

Hazards:

- Extremely toxic when inhaled
- Extremely irritating to skin, eyes, nose and lungs; skin and eye contact can cause burns and blindness
- Vapors are heavier than air and will collect and stay in low areas
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may BLEVE when exposed to fire
- Chemical reaction of compound upon storage may plug release vents causing a violent explosion

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Pungent smell
- Initially sinks in water and is soluble in water
- Reacts slowly with water to form less toxic materials
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a nonflammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

n-BUTYL ISOCYANATE

UN 2485

Shipping Name: n-Butyl isocyanate
Other Names: BIC
Butyl isocyanate
1-Isocyanobutane

Hazards:

- Severely irritating to skin, eyes, nose and lungs; prolonged contact with skin or eyes can cause burns
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- No odor found
- Floats on the surface of water and is slightly soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

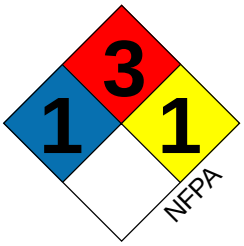
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS 111-36-4



DICYCLOPENTADIENE

UN 2048

Shipping Name: Dicyclopentadiene
Other Names: Bicylcopentadiene
1,3-CPD
1,3-Cyclopentadiene dimer
DCP

Hazards:

- Highly flammable
- Container may BLEVE or explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release of liquid
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless crystalline solid or liquid
- Sweet, sharp camphor-like odor
- Liquid floats on the surface of water; the solid sinks in water; is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Melts at 90° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Cover solid material to protect from wind, rain or spray
- Prevent liquid material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

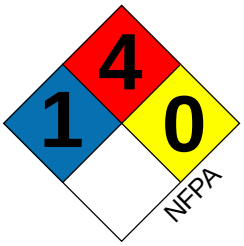
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid or solid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 77-73-6



ETHANE

UN 1035 (Compressed gas)
UN 1961 (Refrigerated liquid)

Shipping Names: UN 1035 Ethane, compressed
UN 1961 Ethane, refrigerated liquid

Other Names: Bimethyl Methylmethane
Dimethyl

WARNING! ● EXTREMELY FLAMMABLE!

Hazards:

- Container may BLEVE or explode when exposed to fire
- Gas is heavier than air and will collect and stay in low areas
- Gas may travel long distances to ignition sources and flashback
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode with or without ignition
- Contact with liquid may cause frostbite

Description:

- Colorless, odorless gas
- Shipped and stored as a compressed gas or cryogenic liquid
- Boils on the surface of water and is insoluble in water
- Extremely flammable
- Gas is heavier than air and will collect and stay in low areas
- May produce a visible vapor cloud

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Use large amounts of water to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

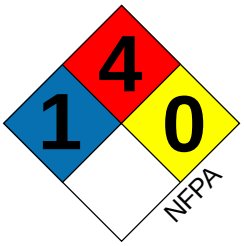
FIRE:

- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed noncryogenic containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location
- DO NOT APPLY WATER TO CRYOGENIC LIQUID CONTAINERS; if cryogenic liquid containers are exposed to direct flame or elevated temperatures for prolonged times, withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - ♦ Inhalation - remove the victim to fresh air and give oxygen if available
  - ♦ Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - ♦ Eye - rinse eyes with large volumes of water or saline for 15 minutes
- Seek medical attention
- Frostbite - warm injured area in very warm water
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 74-84-0



METHANE

UN 1971 (Compressed gas)
UN 1972 (Cryogenic liquid)

Shipping Name: UN 1971 Methane, compressed
UN 1972 Methane, refrigerated liquid (cryogenic liquid)

Other Names: Biogas, Fire damp, Marsh gas, Methyl hydride, Natural gas, R50

WARNING!
- EXTREMELY FLAMMABLE!
- CYLINDERS EXPOSED TO FIRE OR FLAME MAY RUPTURE AND ROCKET THROUGH BUILDING!

Hazards:
- Gas may travel long distances to ignition sources and flash back
- Odor is not a reliable indicator of the presence of toxic amounts of gas
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Gas is lighter than air but will collect and stay in low areas
- Contact with liquid may cause frostbite

Description:
- Colorless gas
- No odor, or with a weak skunk-like odor
- Shipped and stored as a compressed gas or cryogenic liquid
- Liquid floats and boils on the surface of water; is insoluble in water
- Extremely flammable
- Gas is lighter than air but will collect and stay in low areas

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Use large amounts of water to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed noncryogenic containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
- Seek medical attention
- Frostbite - warm injured area in very warm water
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 74-82-8

DIEPOXYBUTANE

Other Names: Bioxirane
Butadiene diepoxide
Butadiene dioxide
1,2,3,4-Diepoxybutane

Hazards:

- Severely irritating to skin, eyes, nose and lungs
- Odor is not a reliable indicator of the presence of toxic amounts of vapor
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at -2° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a non-flammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed

CAS: 1464-53-5

1,3-DICHLOROACETONE

UN 2649

Shipping Name: 1,3-Dichloroacetone
Other Names: Bis (chloromethyl) ketone
1,3-Dichloro-2-propanone

Hazards:

- Highly irritating to skin, eyes, nose and lungs; can cause burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion and decomposition products upon heating include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Crystalline solid
- No odor found
- Sinks in water and is moderately soluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas
- Melts at 113° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Cover material to protect from wind, rain or spray
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release

FIRE:

- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 534-07-6

2,2'-DICHLORODIETHYL ETHER

UN 1916

Shipping Name: 2,2'-Dichlorodiethyl

Other Names: Bis-(2-chloroethyl) ether; Chlorex; DCEE; Dichloroether; Dichloroethyl ether; 1,1-Oxy-bis-(2-chloroethane)

Hazards:

- Extremely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion products include toxic hydrogen chloride
- Explosive peroxides may form in open containers upon standing

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Clear colorless liquid
- Sweet nauseating odor
- Sinks in water and is insoluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Symptoms may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 111-44-4

MECHLORETHANAMINE

UN 1955

Other Names: Bis(2-chloroethyl) methylamine; HN_2; MBA; Mustargen; Mustine; Nitrogen mustard; N-lost

WARNING! ● POISON! BREATHING THE VAPOR OR SWALLOWING THE MATERIALCAN KILL YOU! SKIN OR EYE CONTACT CAUSES SEVERE BURNS OR BLINDNESS!
● Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Odor is not a reliable indicator of the presence of toxic amounts of vapor
- Container may BLEVE or explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion products include toxic nitrogen oxides and hydrogen chloride

Description:
- A liquid
- Faint fish-like odor
- Sinks in water and is insoluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas
- Used as a blister-type war gas

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay uphill and upwind
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area of release or fire, deny entry and call for expert help
- Evacuate or shelter in place the immediate area and downwind for a large release
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

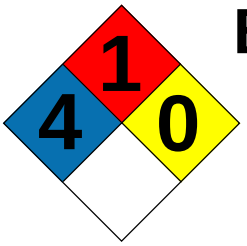
Operational Level Training Response:

RELEASE, NO FIRE:
- BACK OFF! - Isolate a wide area around the release and call for expert help
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemcial if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely.
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location
- Use unattended equipment whenever possible

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- The contaminated victim poses a health risk to the responder
- Decontaminate the victim from a safe distance with a stream of water; have the victim remove clothing if possible; provide Basic Life Support/CPR as needed
- Further decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 51-75-2



BIS(2-CHLOROETHYL) SULFIDE

Other Names: Distilled mustard, H, HD, Mustard gas, Mustard HD, Sulfur mustard, Yperite

WARNING! ● POISON! BREATHING THE VAPOR, OR SWALLOWING THE MATERIAL CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
● Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Odor is not a reliable indicator of the presence of toxic amounts of vapor
- Container may BLEVE or explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion products include toxic hydrogen chloride and sulfur oxides
- Known to cause cancer in humans following long term exposure; contact should be avoided

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay uphill and upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless or amber to black oily liquid
- Weak sweet odor like garlic or horseradish
- Reacts with water to form toxic materials; sinks in water and is slightly soluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas
- Forms yellow crystals on cooling; becomes a yellow solid below 57° F
- Used as a blister type war gas

Operational Level Training Response:

RELEASE, NO FIRE:
- BACK OFF! - Isolate a wide area around the release and call for expert help
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location
- Use unattended equipment whenever possible

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- The contaminated victim poses a health risk to the responder
- Decontaminate the victim from a safe distance with a stream of water; have the victim remove clothing if possible; provide Basic Life Support/CPR as needed
- Further decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Do NOT perform direct mouth to mouth resuscitation; use a bag/mask apparatus
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 505-60-2

TETRAETHYL PYROPHOSPHATE

NA 2783 (Solid)
NA 3018 (Liquid)

Shipping Name: Tetraethylpyrophosphate

Other Names:		
	Bis-O,O-diethylpyrophosphoric anhydride	TEP
	Fosvex	TEPP
	Pyrophosphoric acid, tetraethyl ester	Vapotone

WARNING!
- POISON! BREATHING THE VAPORS, SWALLOWING THE MATERIAL OR SKIN CONTACT CAN KILL YOU!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion or decomposition products upon heating include toxic phosphorous oxides or explosive ethylene gas

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless to amber liquid
- Fruit-like odor
- Reacts with water to form corrosive phosphoric acid and flammable ethylene gas and is soluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 32° F
- An organophosphate insecticide

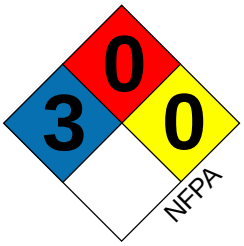
Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- If material is on fire or involved in a fire and conditions permit, DO NOT EXTINGUISH. Cool exposures using unattended monitors.
- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding),withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- Note to physician: an organophosphate insecticide; if symptoms indicate, atropine is an initial antidote

CAS: 107-49-3



SULFUR DIOXIDE

(LIQUEFIED)

UN 1079

Shipping Name: Sulfur dioxide, liquefied

Other Names: Bisulfite; Sulfur oxide; Sulfurous oxide; Sulfurous anhydride; Sulfurous acid anhydride

WARNING!
- POISON! BREATHING THE GAS CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Odor is not a reliable indicator of the presence of toxic amounts of gas
- Gas is heavier than air and will collect and stay in low areas
- Container may BLEVE or explode when exposed to fire
- Reacts with water to form corrosive sulfurous acid
- Contact with liquid may cause frostbite

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless gas
- Sharp pungent odor
- Shipped and stored as a compressed liquefied gas
- Liquid sinks in water and boils forming toxic sulfurous acid
- Nonflammable
- Gas is heavier than air and will collect and stay in low areas
- Becomes a liquid below 14° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:

- Material does not burn; fight surrounding fire with an agent appropriate for the burning material do not allow water to come in contact with the material. If material is involved in a fire, use dry chemical to extinguish; if water must be used, use it in flooding quantities
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Frostbite - warm injured area in very warm water
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7446-09-5

SODIUM HYPOCHLORITE

UN 1791 (Solution)

Shipping Name: Hypochlorite solution, with more than 5% available chlorine
Hypochlorite solution, with 16% or more available chlorine

Other Names: B-K Liquid; Bleach; Clorox; Dakins solution; Hypochlorite; Sodium hypochlorite solution

Hazards:

- Very irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Container may explode or BLEVE when exposed to fire; solutions release oxygen upon storage
- Combustion products include toxic caustic fumes
- Corrosive to aluminum

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Greenish-yellow solid but usually found as a colorless to yellow solution in water
- Bleach-like odor
- Soluble in water
- Nonflammable

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7681-52-9

PARATHION

UN 2783 (Mixture)

Other Names: Bladan
DDP
Diethyl p-nitrophenyl thiophosphate
Fostox
Thiophos

WARNING! • POISON! BREATHING THE VAPOR, SKIN OR EYE CONTACT, OR SWALLOWING THE MATERIAL CAN KILL YOU!
• Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Container may BLEVE or explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion products include toxic sulfur and phosphorous oxides

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim!
- Stay uphill and upwind
- Determine the extent of the problem
- Isolate the area of release or fire or release and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- A yellow liquid
- Faint garlic-like odor
- Sinks in water and is insoluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 43° F
- An organophosphate insecticide used as a war nerve gas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done wothout placing personnel at risk

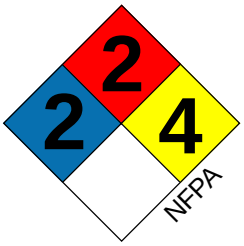
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim!
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- Note to physician: an organophosphate insecticide; if symptoms indicate, initial treatment includes atropine

CAS: 56-38-2



NITROGLYCERIN

UN 0143 (Desensitized)
UN 0144 (1 to 10% Solution in alcohol)
UN 1204 (Not more than 1% Solution in alcohol)
UN 3064 (1 to 5% Solution in alcohol)

Shipping Name: Nitroglycerin
Other Names: Blasting oil
Glycerol trinitrate
Trinitroglycerin

WARNING! ● EXPLOSIVE! SHOCK AND HEAT SENSITIVE!

Hazards:

- Container may BLEVE or explode when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Pale yellow oily liquid
- No odor
- Sinks in water and is slightly soluble in water
- Very flammable
- May be dissolved in flammable or water soluble solvents
- Freezes at 56° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Approach fire with extreme caution; consider letting fire burn
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 55-63-0

SULFOLANE

Other Names: Bondolane A
Sulfolane-W
Tetrahydrothiophene-1
Tetramethylene sulfone
Thiolane-1,1-dioxide
Thiophan sulfone

Hazards:
- Container may BLEVE or explode when exposed to fire
- Irritating to nose, eyes and lungs

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- White solid
- Solid is odorless, liquid has slight oil-like odor
- Initially liquid sinks in water and dissolves in water
- Flammable
- Becomes a liquid at 81° F

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, container discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 126-33-0

DIBORANE

UN 1911

Shipping Name: Diborane
Other Names: Boroethane
Boron hydride
Diboron hexahydride

WARNING!

- POISON! BREATHING THE GAS CAN KILL YOU!
- Firefighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- EXTREMELY FLAMMABLE! WILL IGNITE WITHOUT WARNING IN MOIST AIR AT ROOM TEMPERATURE!
- DO NOT USE WATER! REACTS VIOLENTLY WITH WATER TO PRODUCE FLAMMABLE HYDROGEN GAS!

Hazards:

- Reacts violently with halogenated hydrocarbons (Halon)
- Gas may travel long distances to ignition sources and flash back
- Gas is heavier than air and will collect and stay in low areas
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Containers may explode when exposed to heat or fire
- Severely irritating to skin, eyes, nose and lungs; skin and eye contact can couse severe burns and blindness
- Contact with liquid may cause frostbite

Awareness and Operational Level Training Response:

- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies

Description:

- Colorless compressed gas
- Sweet, repulsive odor
- Decomposes in water rapidly to form flammable hydrogen gas
- Extremely flammable
- Gas is heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Approach fire with extreme caution; consider letting fire burn
- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- DO NOT ATTEMPT RESCUE!
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
- Victims should be examined by a physician as soon as possible
- Do NOT perform direct mouth to mouth resuscitation; use a bag/mask apparatus
- Frostbite - warm injured area in very warm water
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 19287-45-7

BORON TRIBROMIDE

UN 2692

Shipping Name: Boron Tribromide
Other Names: Boron bromide
Tribromoborane
Trona

WARNING!
- POISON! BREATHING THE VAPOR CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER! REACTS VIOLENTLY WITH WATER TO FORM TOXIC HYDROBROMIC ACID FUMES!

Hazards:
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Strongly corrosive to metal, wood and rubber

Awareness and Operational Training Level Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release and call for expert help
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless, fuming liquid
- Sharp, irritating odor
- Reacts violently with water to form toxic hydrobromic acid
- Nonflammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the release to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:
- Do not allow material to come in contact with the material; if material is on fire, use dry chemical to extinguish; fight surrounding fire with agent other than water or foam
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 10294-33-4

BORON TRICHLORIDE

UN 1741

Shipping Name: Boron trichloride
Other Names: Boron chloride
Trichloroborane
Trichloroboron

WARNING!
- POISON! BREATHING THE GAS CAN KILL YOU! PROLONGED SKIN CONTACT CAN CAUSE SEVERE BURNS OR BLINDNESS!
- Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER! REACTS VIGOROUSLY WITH WATER TO FORM TOXIC HYDROGEN CHLORIDE

Hazards:

- Severely irritating to nose and lungs
- Container may explode when exposed to fire
- Odor is not a reliable indicator of the presence of toxic amounts of gas
- Gas is heavier than air and will collect and stay in low areas
- Contact with liquid can cause frostbite
- Decomposition products upon heating include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Container may BLEVE or explode when exposed to fire
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless gas or liquid
- Shipped and stored as a compressed liquefied gas
- Sharp, choking acrid odor
- Reacts vigorously with water to produce hydrochloric acid
- Nonflammable
- Gas is heavier than air and will collect and stay in low areas
- Liquid boils at 54° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the release to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

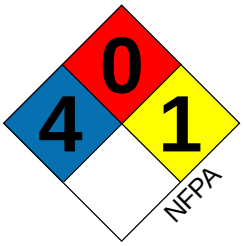
FIRE:

- Material does not burn; fight surrounding fire with an agent appropriate for the burning material - DO NOT ALLOW WATER TO COME IN CONTACT WITH MATERIAL
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Frostbite - warm injured area in very warm water
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 10294-34-5



BORON TRIFLUORIDE

UN 1008

Shipping Name: Boron trifluoride
Other Names: Boron fluoride
Trifluoroboron

WARNING!
- POISON! BREATHING THE GAS CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Vapors are heavier than air and will collect and stay in low areas
- Odor is not a reliable indicator of the presence of toxic amounts of gas
- Container may explode when exposed to fire
- Reacts with water or moist air to produce hydrofluoric acid
- Combustion and decomposition products upon heating include the toxic gases hydrogen fluoride and fluorine
- Will attack some plastics and rubber coatings
- Contact with liquid may cause frostbite

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Evacuate or shelter in place the immediate area and downwind for a large release
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Notify local health and fire officials and pollution control agencies
- If contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless compressed gas
- Pungent and irritating odor, may be considered pleasant at low concentrations
- Forms a dense white aerosol mist upon contact with moist air
- Reacts with water to form toxic hydrofluoric acid
- Soluble in water
- Nonflammable
- Vapors are heavier than air and will collect and stay in low areas
- May be stored as an ethyl ether complex that will increase flammability

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:
- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
- Victims should be examined by a physician as soon as possible
- Frostbite - warm injured area in very warm water
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7637-07-2

DECABORANE

UN 1868

Shipping Name: Decaborane
Other Names: Boron hydride
Decaborane (14)
Decaborane tetrahydride

WARNING!
- POISON! BREATHING THE DUST OR SKIN CONTACT CAN KILL YOU!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Odor is not a reliable indicator of the presence of toxic amounts of vapor
- Skin and eye contact causes severe burns and blindness
- Container may explode when exposed to fire
- Reacts explosively with halogenated hydrocarbons (Halons) or oxidizers
- Vapors are heavier than air and will collect and stay in low areas
- Releases flammable hydrogen gas upon contact with hot water
- Combustion products include toxic borane oxides
- Will attack some plastics and rubbers

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- White to colorless solid
- Sharp, pungent chocolate-like odor
- Floats on the surface of water and is slightly soluble in water
- Very flammable; burns with a green colored flame
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Cover material to protect from wind, rain or spray
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

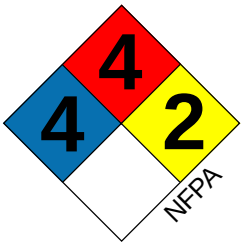
FIRE:

- Use water spray using unattended monitors to extinguish fire. Dry sand or dry chemical may be used if available in sufficient amounts. Avoid the use of carbon dioxide, Halon or Halocarbon extinguishers
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 17702-41-9



PENTABORANE

UN 1380

Shipping Name: Pentaborane
Other Names: Boron hydride
Pentaborane monohydride

WARNING!
- POISON! BREATHING THE VAPORS, SWALLOWING THE LIQUID OR SKIN CONTACT CAN KILL YOU!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- EXTREMELY FLAMMABLE ! MAY IGNITE OR EXPLODE SPONTANEOUSLY UPON CONTACT WITH MOIST AIR!

Hazards:

- Vapors are heavier than air and will collect and stay in low areas
- Extremely irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors may travel long distances to ignition sources and flashback
- Vapors may accumulate in air or confined spaces and explode
- Reacts violently with halogenated (Halon) extinguishing agents

Awareness and Operational Level Training Response:

- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Pungent sour milk-like odor
- Floats on water and is insoluble in water; decomposes slowly in water
- Extremely flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Spills may ignite spontaneously
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- If material is on fire, and conditions permit, DO NOT EXTINGUISH
- Do not use halogenated (Halon) extinguishing agents
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location

First Aid:

- DO NOT ATTEMPT RESCUE!
- The contaminated victim poses a health risk to the responder. Decontaminate the victim from a safe distance with a stream of water; have the victim remove clothing if possible; provide Basic Life Support/CPR as needed
- Further decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 19624-22-7

LIQUEFIED PETROLEUM GAS

(LPG)

UN 1075

Shipping Name: Liquefied petroleum gas

Other Names: Bottled gas LPG
Petroleum gas, liquefied

WARNING! ● EXTREMELY FLAMMABLE!
● CONTAINERS MAY BLEVE OR EXPLODE WHEN EXPOSED TO HEAT OR FLAMES!

Hazards:

- Odor is not a reliable indicator of the presence of toxic amounts of gas
- Gas is heavier than air and will collect and stay in low areas
- Gas may travel long distances to ignition sources and flashback
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Contact with liquid may cause frostbite

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For containers exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies

Description:

- Colorless gas
- May be shipped and stored as a compressed liquefied gas
- Extremely flammable
- No odor unless treated with an odorant
- Floats and boils on the surface of water and is insoluble in water
- Gas is heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Use large amounts of water well away from the material to disperse gas - contain runoff

FIRE:

- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

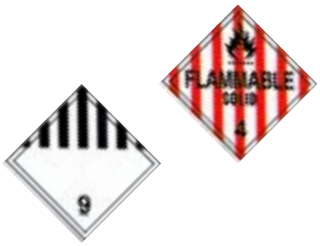
First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - ♦ Inhalation - remove the victim to fresh air and give oxygen if available
  - ♦ Eye - rinse eyes with large volumes of water or saline for 15 minutes
- Seek medical attention
- Frostbite - warm injured area in very warm water
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 68476-85-7

SULFUR

UN 2448 (Molten)
UN 1350
Shipping Name: UN 2448 Sulfer, molten
UN 1350 Sulfer
Other Names: Brimstone



WARNING!
- TANKS OF MOLTEN SULFUR MAY CONTAIN TOXIC AND FLAMMABLE HYDROGEN SULFIDE GAS UNDER PRESSURE!
- COMBUSTION PRODUCES LARGE QUANTITIES OF HIGHLY TOXIC SULFUR DIOXIDE GAS!

Hazards:
- Irritating to skin, eyes, nose and lungs; molten material will cause burns
- Fires may be difficult to extinguish
- Hot molten sulfur will form a solid crust as it cools, liquid below will remain hot for an extended time
- Flames of burning sulfur may be difficult to see in daylight
- Container may BLEVE or explode when exposed to fire

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate a wide area around the release, deny entry and call for expert help
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- If material is on fire, evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Yellow solid
- May have a faint rotten-egg odor
- Sinks in water and is insoluble in water
- Flammable
- May be shipped in molten form at temperatures between 280° F and 300° F

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- For a small release, a carbon dioxide extinguisher may be used to cool and solidify molten material
- Allow the molten material to cool and solidify
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Use water or foam to extinguish
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7704-34-9

BROMINE

UN 1744

Shipping Name: Bromine or Bromine, solution

Other Names: Brom

WARNING!

- POISON! BREATHING THE VAPOR CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- STRONG OXIDIZER! WILL INCREASE THE INTENSITY OF A FIRE! MAY CAUSE FIRE UPON CONTACT WITH COMBUSTIBLES!

Hazards:

- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- When heated will react with water or steam to produce toxic and corrosive fumes

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water
- Notify local health and fire officials and pollution control agencies

Description:

- Fuming red crystals at low temperatures
- A reddish brown fuming liquid above 19° F
- Sharp penetrating odor
- Sinks in water forming hydrobromic acid and is soluble in water
- Nonflammable
- Strong oxidizing agent
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the release to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate the building and confine vapors by closing doors and shutting down HVAC systems

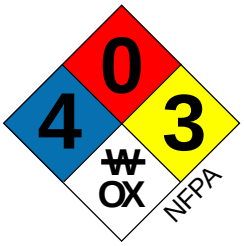
FIRE:

- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7726-95-6



BROMINE PENTAFLUORIDE

UN 1745

Shipping Name: Bromine pentafluoride
Other Names: Bromide fluoride

WARNING!

- POISON! BREATHING THE GAS CAN KILL YOU! SKIN AND EYE CONTACT CAN CAUSE SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER! REACTS VIOLENTLY WITH WATER RELEASING TOXIC HYDROFLUORIC ACID!
- STRONG OXIDIZER - WILL INCREASE THE INTENSITY OF A FIRE; MAY CAUSE FIRE UPON CONTACT WITH COMBUSTIBLES!

Hazards:

- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Reacts violently with many metals, glass, wood and some plastics
- Decomposes upon heating to produce highly toxic hydrogen fluoride and hydrogen bromide gas

Awareness and Operational Level Training Response

- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to pale yellow fuming liquid
- Pungent, highly irritating odor
- Reacts violently with water forming highly toxic hydrofluoric acid
- Nonflammable, but may ignite other flammable materials
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Approach fire with extreme caution; consider letting fire burn
- Material does not burn; fight surrounding fire with an agent other than water; if water must be used, use it in flooding quantities
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- DO NOT ATTEMPT RESCUE!
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing
- Note to physician: skin burns can be treated with calcium gluconate gel

CAS: 7789-30-2

CYANOGEN BROMIDE

UN 1889

Shipping Name: Cyanogen bromide
Other Names: Bromine cyanide
Bromocyan
Cyanobromide

WARNING! • POISON! BREATHING THE VAPORS, SKIN CONTACT OR SWALLOWING THE SOLID CAN KILL YOU! CONVERTED TO CYANIDE IN THE BODY!
• Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Severely irritating to skin, eyes, nose and lungs; skin and eye contact can cause severe burns and blindness
- Vapors are heavier than air and will collect and stay in low areas
- Decomposes rapidly in acid or slowly in water to produce toxic hydrogen cyanide, bromine gas and hydrogen bromide; decomposes in fire to produce nitrogen oxides and hydrogen bromide
- Container may explode when exposed to fire

Awareness and Operational Level Training Response:

- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release and call for expert help
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless solid
- Pungent, unpleasant odor
- Soluble in water
- Nonflammable
- Vapors are heavier than air and will collect and stay in low areas
- Solid produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:

- If material is involved in a fire and conditions permit, DO NOT EXTINGUISH. Cool exposures using unattended monitors. If fire must be extinguished use an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- The contaminated victim poses a health risk to the responder
- Decontaminate the victim from a safe distance with a stream of water; have the victim remove clothing if possible; provide Basic Life Support/CPR as needed
- Further decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Do NOT perform direct mouth to mouth resuscitation; use a bag/mask apparatus
- Toxic effects may be delayed
- Note to physician: can produce cyanide toxicity; if symptoms indicate, initial treatment includes the cyanide antidote kit

CAS: 506-68-3

BROMINE TRIFLUORIDE

UN 1746

Shipping Name: Bromine trifluoride
Other Names: Bromine fluoride

WARNING!

- POISON! BREATHING THE GAS OR SWALLOWING THE LIQUID CAN KILL YOU! SKIN AND EYE CONTACT CAN CAUSE SEVERE BURNS AND BLINDNESS!
- Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER! REACTS VIOLENTLY WITH WATER EVEN AT VERY LOW TEMPERATURES PRODUCING TOXIC HYDROGEN FLUORIDE VAPORS!
- STRONG OXIDIZER! WILL INCREASE THE INTENSITY OF A FIRE AND MAY CAUSE FIRE UPON CONTACT WITH COMBUSTIBLES!

Hazards:

- Vapors and fumes are heavier than air and will collect and stay in low areas
- Exposure of cylinders to fire and flame or elevated temperatures may cause cylinders to rupture or frangible disc to burst, releasing entire contents of cylinder. Ruptured or venting cylinders may rocket through buildlings and/or travel a considerable distance
- Reacts with acids to produce toxic bromine and fluorine fumes
- Decomposes upon heating to produce toxic hydrogen bromide and hydrogen fluoride fumes
- Reacts violently with many metals, glass, wood and some plastics
- Corrosive to many common metals and glass

Awareness and Operational Level Training Response:

- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to pale yellow fuming liquid
- Pungent irritating odor
- Reacts violently with water to produce toxic hydrogen fluoride fumes
- Nonflammable but may cause combustibles to ignite
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 48° F
- Produces large amounts of vapors

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the release to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Approach fire with extreme caution; consider letting fire burn
- If possible do not allow water to come in contact with the material. Material does not burn; fight surrounding fire with an appropriate agent, if water must be used, use it in flooding quantites
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- DO NOT ATTEMPT RESCUE!
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Ingestion - do not induce vomiting
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS 7787-71-5

BROMOACETYL BROMIDE

UN 2513

Shipping Name: Bromoacetyl bromide
Other Names: Bromoethanoyl bromide

WARNING! ● AVOID THE USE OF WATER! REACTS VIGOROUSLY WITH WATER PRODUCING TOXIC HYDROGEN BROMIDE VAPORS!

Hazards:

- Extremely irritating to skin, eyes, nose and lungs; can cause burns and blindness.
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Decomposes upon heating to produce toxic hydrogen bromide vapors

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Evacuate or shelter in place the immediate area and downwind for a large release
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to light yellow liquid
- Sharp, pungent extremely irritating odor
- Sinks in water and reacts vigorously with water to form toxic hydrobromic acid
- Nonflammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the release to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:

- If possible do not allow water to come in contact with the material. Material does not burn; fight surrounding fire with an appropriate agent. If water must be used, use it in flooding quantites
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS 598-21-0

BROMOBENZENE

UN 2514

Shipping Name: Bromobenzene
Other Names: Phenyl bromide

Hazards:

- Irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Combustion products include toxic hydrogen bromide vapors

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Aromatic odor
- Sinks in water and is insoluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS 108-86-1

1-BROMOBUTANE

UN 1126

Shipping Name: n-Butyl bromide
Other Names: Butyl bromide

Hazards:

- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Combustion products include toxic hydrogen bromide vapors

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Remove all ignition sources
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to pale straw colored liquid
- No odor found
- Sinks in water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Use foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS 109-65-9

VINYL BROMIDE

(INHIBITED)

UN 1085

Shipping Name: Vinyl bromide, inhibited
Other Names: Bromoethene
Bromoethylene

WARNING!
- EXTREMELY FLAMMABLE!
- MAY REACT WITH ITSELF WITHOUT WARNING BLOCKING RELIEF VALVES LEADING TO CONTAINER EXPLOSION!

Hazards:

- Container may BLEVE or explode when exposed to fire
- Gas is heavier than air and will collect and stay in low areas
- Gas may travel long distances to ignition sources and flashback
- Gas in confined areas (e.g., tanks, sewers buildings) may explode when exposed to fire
- Very irritating to skin, eyes, nose and lungs
- Contact with liquid may cause frostbite
- Combustion or decomposition products upon heating include toxic hydrogen bromide

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless gas
- Pungent odor
- Insoluble in water and liquid sinks in water
- Extremely flammable
- Gas is heavier than air and will collect and stay in low areas
- A liquid below 60° F
- May be shipped and stored as a liquid under pressure

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse the gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

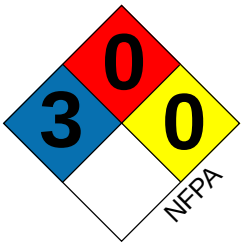
FIRE:

- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cylinders are exposed to direct flame or elevated temperatures, withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Frostbite - warm injured area in very warm water
- Prolonged contact with skin can cause burns

CAS: 593-60-2



ETHYLENE DIBROMIDE

UN 1605

Shipping Name: Ethylene dibromide

Other Names: Bromofume, EDB, 1,2-Dibromoethane, Ethylene bromide, Dibromoethane, Unifume, Dowfume

Hazards:

- Very irritating to skin, eyes, nose and lungs; prolonged contact with skin will cause burns
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion products include toxic hydrogen bromide
- Corrosive to some plastics and rubber

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless heavy liquid
- Sweet odor
- Sinks in water and is insoluble in water
- Nonflammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 50° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 106-93-4

METHYL BROMIDE

UN 1062

Shipping Name: Methyl bromide

Other Names: Brom-O-Gas, Bromomethane, Dowfume, Halon 1001, MB

WARNING!
- POISON! BREATHING THE GAS CAN KILL YOU!
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Odor is not a reliable indicator of the presence of toxic amounts of gas
- Very irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Gas is heavier than air and will collect and stay in low areas
- Container may BLEVE or explode when exposed to fire
- Exposure to the liquid may cause frostbite
- Reacts with aluminum to produce spontaneously combustible compounds
- Combustion products include toxic hydrogen bromide

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of the release and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless gas
- Shipped and stored as a liquefied gas
- Sweet chloroform-like odor
- Sinks in water and is slightly soluble in water
- Flammable
- Gas is heavier than air and will collect and stay in low areas
- A liquid below 38° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
- Seek medical attention
- Frostbite - warm injured area in very warm water
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 74-83-9

2-BROMOPROPANE

UN 2344

Shipping Name: 2-Bromopropane
Other Names: Isopropyl bromide
Propyl bromide

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Combustion products include toxic hydrogen bromide gas

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Remove all ignition sources
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Sinks in water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Use foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS 75-26-3

3-BROMOPROPYNE

UN 2345

Shipping Name: 3-Bromopropyne
Other Names: Bromopropyne
Propargyl bromide

WARNING! • EXPLOSIVE! MATERIAL IS PRESSURE AND SHOCK SENSITIVE AND WILL EXPLODE!

Hazards:

- Severely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and throughly decontaminate personnel
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion and decomposition products upon heating include toxic hydrogen bromide

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate a wide area around the release and call for expert help
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to yellow liquid
- Sharp, pungent odor
- Sinks in water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Approach fire with extreme caution; consider letting fire burn
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS 106-96-7

BUTYRALDEHYDE

UN 1129

Shipping Name: Butyraldehyde

Other Names: Butal, Butaldehyde, Butanal, Butyl aldehyde, Butyral, Butyric aldehyde

Hazards:

- Severely irritating to skin, eyes, nose and lungs
- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Clear, colorless liquid
- Pungent, suffocating odor
- Floats on the surface of water and is moderately soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Forms explosive peroxides upon exposure to air and excessive heat
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS 123-72-8

BUTANE

UN 1011

Shipping Name: Butane or Butane mixture
Other Names: Diethyl
n-Butane

WARNING! ● EXTREMELY FLAMMABLE!

Hazards:

- Container may BLEVE or explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings)
- Contact with liquid may cause frostbite

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies

Description:

- Colorless compressed gas
- Odor of natural gas
- The liquid floats on water and boils; the gas is insoluble in water
- Extremely flammable
- Vapors are heavier than air and will collect and stay in low areas
- Liquid below 30° F
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Use large amounts of water to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Frostbite - warm injured area in very warm water
- For skin burns decontaminate with water and apply a clean dry dressing

CAS 106-97-8

BUTYRONITRILE

UN 2411

Shipping Name: Butyronitrile
Other Names: Butane nitrile
Butyric acid nitrile
Propyl cyanide

WARNING!
- POISON! BREATHING THE VAPORS, SKIN CONTACT OR SWALLOWING THE LIQUID CAN KILL YOU! CONVERTED TO CYANIDE IN THE BODY!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Severely irritating to skin, eyes, nose and lungs
- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Reacts with acids producing toxic hydrogen cyanide
- Combustion products include toxic nitrogen oxides and cyanide

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless liquid
- Sharp, suffocating odor
- Floats on the surface of water and is slightly soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Approach fire with extreme caution; consider letting fire burn - produces cyanide gas under fire conditions
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- For skin burns decontaminate with water and apply a clean dry dressing
- Toxic effects may be delayed
- Note to physician: can produce cyanide toxicity, if symptoms indicate, initial treatment includes the cyanide antidote kit

CAS 109-74-0

BUTYL MERCAPTAN

UN 2347

Shipping Name: Butyl mercaptans
Other Names: 1-Butanethiol
Butanethiol
n-Butyl mercaptan
Thiobutyl alcohol

Hazards:

- Highly flammable
- Irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) May explode when exposed to fire
- Combustion products include toxic sulfur oxides

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition source
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Obnoxious garlic-like odor
- Insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

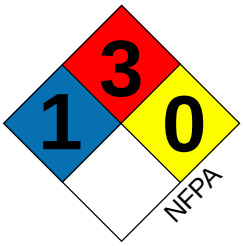
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding) withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS 109-79-5



METHYL ETHYL KETONE

UN 1193

Shipping Name: Methyl ethyl ketone or Ethyl methyl ketone
Other Names: 2-Butanone
MEK

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay uphill and upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Sweet odor like fingernail polish (acetone)
- Initially floats on the surface of water and is soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 78-93-3

BUTYRYL CHLORIDE

UN 2353

Shipping Name: Butyryl chloride
Other Names: Butanoyl chloride
Butyric acid chloride
Butyric chloride

Hazards:

- Severely irritating to skin, eyes, nose and lungs - can cause burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Sharp, irritating odor
- Sinks in water and dissolves slowly in water
- Decomposes in water to form toxic hydrogen chloride gas
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the release to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

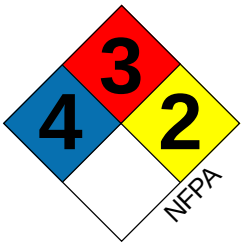
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a nonflammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS 141-75-3



METHYL VINYL KETONE

UN 1251

Shipping Name: Methyl vinyl ketone
Other Names: 3-Buten-2-one
Methylene acetone
MVK
Vinyl methyl ketone

WARNING!
- POISON! BREATHING THE VAPOR CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- MAY REACT WITH ITSELF BLOCKING RELIEF VALVES AND LEADING TO TANK EXPLOSION!

Hazards:
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Description:
- Colorless to light yellow liquid at room temperature
- Strong irritating odor
- Initially floats on the surface of water and is soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 20° F

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of the release and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

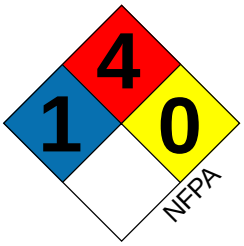
Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, venting sound increases and/or unexpectedly stops, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 78-94-4



BUTYLENE

UN 1012

Shipping Name: Butylene

Other Names: Butene, n-Butylene, cis-Butene, trans-Butene, n-Butene

WARNING! ● EXTREMELY FLAMMABLE!

Hazards:

- Container may BLEVE or explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Contact with liquid may cause frostbite

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies

Description:

- Colorless compressed liquefied gas
- Faint petroleum-like odor
- Boils on the surface of water and is insoluble in water
- Extremely flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Use large amounts of water to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - ♦ Inhalation - remove the victim to fresh air and give oxygen if available
  - ♦ Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - ♦ Eye - rinse eyes with large volumes of water or saline for 15 minutes
- Seek medical attention
- Frostbite - warm injured area in very warm water
- For skin burns decontaminate with water and apply a clean dry dressing

CAS 25167-67-3

1,2-BUTYLENE OXIDE

(STABILIZED)

UN 3022

Shipping Name: 1,2-Butylene oxide, stabilized
Other Names: 1-Butene oxide
1-Butylene oxide
1,2-Epoxybutane

Hazards:

- May react with itself without warning blocking relief valves leading to container explosion
- Highly flammable
- Irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- May react violently with acids and certain other metal catalysts

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Disagreeable odor
- Floats on the surface of water and is moderately soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, venting sound suddenly increases and/or unexpectedly stops, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS 106-88-7

t-BUTYL ALCOHOL

UN 1120

Shipping Name: Butanols
Other Names: t-Butanol
Butyl alcohol

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Camphor-like odor
- Soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes below 75° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

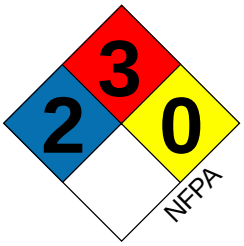
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS 75-65-0



CHLOROBUTANE

UN 1127

Shipping Name: Chlorobutanes
Other Names: Butyl chloride
n-Butylchloride
1-Chlorobutane

Hazards:

- Highly flammable
- Irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion and decomposition products upon heating include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Unpleasant odor
- Floats on the surface of water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 109-69-3

HEXENE

UN 2370

Shipping Name: 1-Hexene
Other Names: Butyl ethylene
1-Hexene
Hexylene

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Gasoline-like odor
- Floats on the surface of water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 592-41-6

CAPROIC ACID

UN 2829

Shipping Name: Caproic acid
Other Names: Butylacetic acid
Capronic acid
Hexanoic acid

Hazards:

- Irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to light yellow oily liquid
- Goat or Limburger cheese-like odor
- Floats on the surface of water and is slightly soluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 26° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

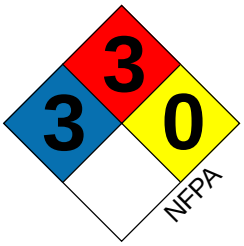
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS 142-62-1



ETHYLBUTYLAMINE

UN 2733

Shipping Name: Amines, liquid, corrosive, flammable, n.o.s.
Other Names: Butylethylamine
N-ethylbutylamine

WARNING! ● POISON! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
● Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Highly flammable
- Severely irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Ammonia-like odor
- Floats on the surface of water and may dissolve in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 13360-63-9

BUTYLTRICHLOROSILANE

UN 1747

Shipping Name: Butyltrichlorosilane
Other Names: Butylsilicon trichloride
Trichlorobutylsilane

Hazards:

- Severely irritating to skin and eyes; can cause severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Reacts vigorously with water to form toxic hydrogen chloride
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Stay uphill and upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Pungent odor
- Sinks in water and reacts vigorously with water to form toxic hydrochloric acid
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- If material is on fire and conditions permit, DO NOT EXTINGUISH.
- Material reacts with water but can be extinguished with low or medium expansion AFFF foam or dry chemical if available in sufficient amounts
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS 7521-80-4

1,4-BUTYNEDIOL

UN 2716

Shipping Name: 1,4-Butynediol
Other Names: 2-Butyne-1,4-diol
2-Butynediol
Butynediol
1,4-Dihydroxy-2-butyne

Hazards:

- Severely irritating to skin, eyes, nose and lungs
- Container may explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas

Awareness and Operational Level Training Response:

- Stay upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- White to light yellow solid
- No odor found
- Initally floats on the surface of water and is soluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Cover material to protect from wind, rain or spray
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

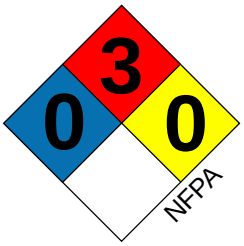
FIRE:

- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding) withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS 110-65-6



ETHYL BUTYRATE

UN 1180

Shipping Name: Ethyl butyrate
Other Names: Butyric acid, ethyl ester
Ethyl butanoate

Hazards:

- Highly flammable
- Irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Fruity, pineapple-like odor
- Floats on the surface of water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 105-54-4

METHYL BUTYRATE

UN 1237

Shipping Name: Methyl butyrate
Other Names: Butyric acid, methyl ester
Methyl-n-butanoate
Methyl-n-butyrate

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Apple-like odor
- Floats on the surface of water and is slightly soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

tert-BUTYL HYDROPEROXIDE

UN 2093 or 2094

Shipping Name: tert-Butyl hydroperoxide

Other Names: CADOXTHB
1,1-Dimethylethyl hydroperoxide
2-Hydroperoxy-2-methylpropene

WARNING!
- EXTREMELY FLAMMABLE!
- STRONG OXIDIZER! WILL INCREASE THE INTENSITY OF A FIRE! MAY CAUSE FIRE UPON CONTACT WITH COMBUSTIBLES!
- CONTAINER MAY BLEVE OR EXPLODE WHEN EXPOSED TO FIRE!
- MAY EXPLODE IF SHOCKED OR EXPOSED TO FRICTION!

Hazards:
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Description:
- Colorless to pale yellow liquid
- Somewhat sweet odor
- Moderately soluble in water
- Extremely flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 17° F and boils at 95° F

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Remove all ignition sources
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Approach fire with extreme caution; consider letting fire burn
- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

OCTENE

UN 3295

Shipping Name: Hydrocarbons, liquid, n.o.s.
Other Names: Caprylene
1-Octene
Octylene

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Gasoline-like odor
- Floats on the surface of water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 111-66-0

DINITRO-o-CRESOL

UN 1598

Shipping Name: Dinitro-o-cresol
Other Names: Capsine
2,4-Dinitro-o-cresol
Dinitrocresol
Nitrador
Nitrofan
Sinox

WARNING! • DILUTE MATERIAL WITH WATER! PURE MATERIAL (less than 10% water) MAY SPONTANEOUSLY EXPLODE IF HEATED OR IF SHOCKED!

Hazards:
- Irritating to skin, eyes, nose and lungs; prolonged contact will cause burns
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion products include toxic nitrogen oxides

Description:
- Yellow solid
- No odor
- Insoluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:
- Dilute material with foam or water
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Approach fire with extreme caution; consider letting fire burn
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 534-52-1

CARBACHOL CHLORIDE

Other Names: Carbachol
Carbacholin
Carbacholine dichloride
Carbamiotin
Choline chloride carbamate
Doryl
Lentin
Miostat

Hazards:
- Inhalation of the dust, absorption through the skin or swallowing the material can lead to severe illness
- Irritating to skin, eyes, nose and lungs
- Combustion products and decomposition products upon heating include toxic hydrogen chloride and nitrogen oxides

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterway, notify downstream users of potentially contaminated water

Description:
- White to yellow powder or crystals
- Slight ammonia-like odor
- Soluble in water
- Flammable
- Usually shipped in a water solution

Operational Level Training Response:

RELEASE, NO FIRE:
- Cover material to protect from wind, rain or spray
- Stop the release if it can be done safely from a distance
- Prevent material or contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release

FIRE:
- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- Note to physician: a cholinergic receptor agonist; if symptoms indicate, atropine is the initial antidote

CAS 51-83-2

UREA PEROXIDE

UN 1511

Shipping Name: Urea hydrogen peroxide
Other Names: Carbamide peroxide
Gly-oxide
Percarbamide

WARNING! ● STRONG OXIDIZER! WILL INCREASE THE INTENSITY OF A FIRE! MAY CAUSE FIRE UPON CONTACT WITH COMBUSTIBLES!

Hazards:

- Irritating to skin, eyes, nose and lungs; prolonged contact with skin can cause burns
- Container may explode when exposed to fire
- Combustion or decomposition products upon heating include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Stay upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- White solid
- No odor
- Soluble in water releasing hydrogen peroxide
- Flammable

Operational Level Training Response:

RELEASE, NO FIRE:

- Cover material to protect from wind, rain or spray
- Prevent runoff from entering sewers and waterways if it can be done safely well ahead of the release

FIRE:

- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 124-43-6

DIMETHYLCARBAMOYL CHLORIDE

UN 2262

Shipping Name: Dimethylcarbamoyl chloride
Other Names: Carbamoyl dimethyl chloride
Dimethylcarbamic chloride
DDC DMCC

WARNING! ● REACTS VIGOROUSLY WITH WATER PRODUCING HIGHLY FLAMMABLE DIMETHYLAMINE AND CORROSIVE HYDROCHLORIC ACID!

Hazards:

- Severely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Combustion and decomposition products upon heating include toxic nitrogen oxide and hydrogen chloride

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Irritating smell
- Sinks in water and rapidly decomposes to extremely flammable dimethylamine and corrosive hydrochloric acid
- Flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at -27° F

Operational Level Training Response:

RELEASE, NO FIRE:

- DO NOT use water directly on product - reacts with water to form dimethylamine and hydrochloric acid
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

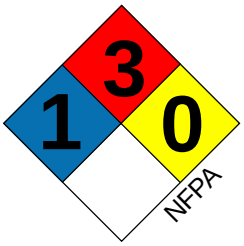
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid consider water decomposition products before using water. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 79-44-7



METHANOL

UN 1230

Shipping Name: Methyl alcohol
Other Names: Carbinol
Methyl hydroxide
Methylol
Wood alcohol

Hazards:

- Highly flammable, burns with invisible flame
- Containers may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin and eyes

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Sweet alcohol odor
- Soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 67-56-1

CARBOFURAN

UN 2757

Shipping Name: Carbamate, pesticides, solid, toxic
Other Names: Furadan
Furadan 3G
Furodan

WARNING!
- POISON! PROLONGED SKIN CONTACT, SWALLOWING THE MATERIAL OR BREATHING THE DUST CAN KILL YOU!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Irritating to skin, eyes, nose and lungs
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- White solid
- No odor
- Sinks in water and is insoluble in water
- Flammable
- May also be shipped and stored as a paste or a suspension in water
- A carbamate insecticide

Operational Level Training Response:

RELEASE, NO FIRE:
- Cover material to protect from wind, rain or spray
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release

FIRE:
- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- Note to physician: is a carbamate insecticide: if symptoms indicate the initial antidote is atropine

CAS 1563-66-2

CARBON DISULFIDE

UN 1131

Shipping Name: Carbon disulfide
Other Names: Carbon bisulfide
Carbon disulphide
Carbon sulfide

WARNING! ● EXTREMELY FLAMMABLE!

Hazards:

- Inhalation of vapors, absorption through the skin or swallowing the liquid can cause severe illness
- Very irritating to skin, eyes, nose and lungs; prolonged contact with skin will cause burns
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Combustion products include toxic sulfur oxides
- Corrosive to plastics and rubber

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to faint yellow liquid
- Rotten egg to sweet smell
- Sinks in water and is insoluble in water
- Extremely flammable
- Vapors are heavier than air and will collect and stay in low areas
- Boils at 116° F
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

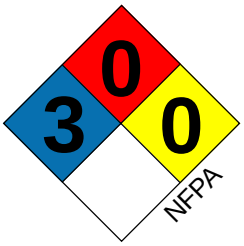
FIRE:

- If material is on fire and conditions permit, DO NOT EXTINGUISH
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 75-15-0



CARBON TETRACHLORIDE

UN 1846

Shipping Name: Carbon tetrachloride

Other Names: Carbona, Carbon chloride, Carbon tet, Freon 10, Tetrachloromethane, Tetrasol

Hazards:
- Irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Decomposition products upon heating include toxic hydrogen chloride and phosgene

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Evacuate or shelter in place the immediate area and downwind for a large release
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless liquid
- Sweet, ether-like smell
- Sinks in water and is insoluble in water
- Nonflammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

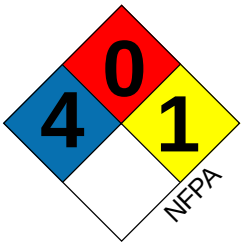
Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to spilled liquid to control vapors for a large release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 56-23-5



PHOSGENE

UN 1076

Shipping Name: Phosgene
Other Names: Carbon dichloride oxide
Carbon oxychloride
Carbonyl chloride
Phosgen
Chloroformyl chloride

WARNING! • POISON! BREATHING GAS WILL KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
• Firefighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Odor is not a reliable indicator of the presence of toxic amounts of gas
- Gas is heavier than air and will collect and stay in low areas
- Containers not equipped with a safety valve may explode or rocket if exposed to heat or fire
- Reacts with water to form hydrochloric acid
- Corrosive to some metals, plastics and rubber
- Decomposition products upon heating include toxic chlorine gas and hydrogen chloride

Awareness and Operational Level Training Response:

- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless gas; a colorless to light yellow fuming liquid below 46° F
- Musty odor like hay but may not be detectable at higher concentrations
- Shipped as liquefied compressed gas in cylinders
- Liquid sinks in water and reacts with water to form hydrochloric acid and carbon dioxide
- Nonflammable
- Gas is heavier than air and will collect and stay in low areas
- Has been used as a war gas

Operations Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of release
- Use large amounts of water well away from the material to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:

- If material is involved in a fire and conditions permit, DO NOT EXTINGUISH. Cool exposures using unattended monitors.
- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location

First Aid:

- DO NOT ATTEMPT RESCUE!
- The contaminated victim poses a health risk to the responder
- Decontaminate the victim from a safe distance with a stream of water; have the victim remove clothing if possible; provide Basic Life Support/CPR as needed
- Further decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 75-44-5

CARBONYL FLUORIDE

UN 2417

Shipping Name: Carbonyl fluoride
Other Names: Carbon difluoride, Carbonic difluoride oxide, Carbon oxyfluoride, Fluorophosgene

WARNING!
- POISON! BREATHING THE GAS CAN KILL YOU! SKIN AND EYE CONTACT CAN CAUSE SEVERE BURNS AND BLINDNESS!
- Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Odor is not a reliable indicator of the presence of toxic amounts of gas
- Extremely irritating to nose and lungs
- Contact with liquid may cause frostbite
- Gas is heavier than air and will collect and stay in low areas
- Container may explode or BLEVE when exposed to fire
- Decomposition products upon heating include toxic carbon monoxide and hydrogen fluoride
- Reacts with water releasing toxic hydrogen fluoride

Awareness and Operational Level Training Response:
- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release and call for expert help
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies

Description:
- Colorless compressed gas or cryogenic liquid
- Slightly pungent odor, nearly odorless
- Decomposes in water to form toxic hydrofluoric acid
- Nonflammable
- Gas is heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Use large amounts of water to disperse gas - contain runoff which may contain toxic hydrofluoric acid
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:
- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- DO NOT APPLY WATER TO CRYOGENIC LIQUID CONTAINERS; if cryogenic liquid containers are exposed to direct flame or elevated temperatures for prolonged times, withdraw immediately to a secure location
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Do not perform mouth to mouth resuscitation; use a bag/mask apparatus
- Frostbite - warm injured area in very warm water
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 353-50-4

CARBON DIOXIDE

UN 1013
UN 2187
UN 1845

Shipping Name: UN 1013 Carbon dioxide
UN 2187 Carbon dioxide, refrigerated liquid
UN 1845 Carbon dioxide, solid *or* Dry ice

Other Names: Carbonic acid anhydride Carbonic anhydride
Carbonic acid gas Dry ice

Hazards:

- Replaces oxygen in enclosed areas leading to possible asphyxiation
- Odor is not a reliable indicator of the presence of toxic amounts of gas
- Container may BLEVE when exposed to fire
- Contact with solid may cause frostbite
- Gas is heavier than air and will collect and stay in low areas

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies

Description:

- Colorless gas, white solid (dry ice) or cryogenic liquid
- Odorless
- Solid sinks in water, liquid floats on the surface of water; is insoluble in water
- Nonflammable
- Gas is heavier than air and will collect and stay in low areas
- Solid or liquid form will produce large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- DO NOT APPLY WATER to cryogenic liquid containers; if cryogenic liquid containers are exposed to direct flame or elevated temperatures for prolonged times, withdraw immediately to a secure location
- Cool exposed noncryogenic containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - ♦ Inhalation - remove the victim to fresh air and give oxygen if available
- Seek medical attention
- Frostbite - warm injured area in very warm water

CAS: 124-38-9

CARBON MONOXIDE

UN 1016
UN 9202

Shipping Name: UN 1016 Carbon monoxide
UN 9202 Carbon monoxide, refrigerated liquid (cryogenic liquid)

Other Names: Carbon oxide, CO, Carbonic oxide, Flue gas

WARNING! ● POISON! BREATHING THE GAS CAN KILL YOU!
● EXTREMELY FLAMMABLE!

Hazards:

- Odor is not a reliable indicator of the presence of toxic amounts of gas
- Under some conditions the gas is heavier than air and will collect and stay in low areas
- Gas may travel long distances to ignition sources and flashback
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Container may BLEVE or explode when exposed to fire
- Contact with liquid may cause frostbite

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- Evacuate the immediate area and downwind for a large release
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Notify local health and fire officials and pollution control agencies

Description:

- Colorless gas or cryogenic liquid
- No odor
- Floats and boils on the surface of water and is slightly soluble in water
- Extremely flammable; flame has very little color
- Under some conditions the gas is heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Use large amounts of water well away from the release to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

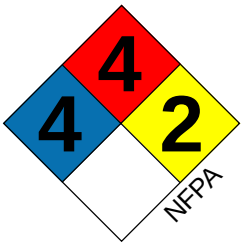
FIRE:

- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- DO NOT APPLY WATER TO CRYOGENIC LIQUID CONTAINERS; if cryogenic liquid containers are exposed to direct flame or elevated temperatures for prolonged times, withdraw immediately to a secure location
- If material is not in cryogenic form, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - ♦ Inhalation - remove the victim to fresh air and give oxygen if available
- Seek medical attention
- Frostbite - warm injured area in very warm water
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 630-08-0



CYANOGEN

UN 1026

Shipping Name: Cyanogen, liquefied

Other Names: Carbon nitride, Dicyan, Dicyanogen, Ethane dinitrate, Oxalonitrile, Oxalyl cyanide, Prussite

WARNING!
- POISON! CONTACT WITH SKIN OR BREATHING THE GAS CAN KILL YOU! CONVERTED TO CYANIDE IN THE BODY!
- Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- EXTREMELY FLAMMABLE!

Hazards:

- Odor is not a reliable indicator of the presence of toxic amounts of gas
- Gas is heavier than air and will collect and stay in low areas
- Gas may travel long distances to ignition sources and flashback
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Containers may BLEVE or explode when exposed to fire
- Severely irritating to skin, eyes, nose and lungs
- Contact with liquid can cause frostbite
- Reacts with acids to produce toxic cyanides and nitrogen oxide
- Combustion products include toxic cyanides and nitrogen oxides

Awareness and Operational Level Training Response:

- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquefied compressed gas
- Almond-like odor which may not be present at toxic levels
- Slightly soluble in water and boils on the surface of water forming toxic hydrogen cyanide
- Extremely flammable
- Gas is heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Use large amounts of water to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- If material is on fire and conditions permit, DO NOT EXTINGUISH. Cool exposures using unattended monitors.
- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other sign of deforming) withdraw immediately to a secure location

First Aid:

- DO NOT ATTEMPT RESCUE!
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
- Seek medical attention
- Do NOT perform direct mouth to mouth resuscitation; use a bag/mask apparatus
- Victims should be examined by a physician as soon as possible
- Frostbite - warm injured area in very warm water
- For skin burns decontaminate with water and apply a clean dry dressing
- Note to physician: can produce cyanide toxicity; if symptoms indicate, initial treatment includes the cyanide antidote kit

CAS: 460-19-5

CARBONYL SULFIDE

UN 2204

Shipping Name: Carbonyl sulfide
Other Names: Carbon oxide sulfide
Carbon oxysulfide

WARNING!
- POISON! BREATHING THE GAS CAN KILL YOU!
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- EXTREMELY FLAMMABLE!

Hazards:

- Odor is not a reliable indicator of the presence of toxic amounts of gas
- Gas is heavier than air and will collect and stay in low areas
- Gas may travel long distances to ignition sources and flashback
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Container may BLEVE or explode when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Contact with liquid may cause frostbite
- Combustion or decomposition products upon heating include toxic hydrogen sulfide and carbon monoxide

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies

Description:

- Colorless gas
- May be shipped as a compressed gas or cryogenic liquid
- Rotten egg-like odor
- Insoluble in water and decomposes in water to form toxic hydrogen sulfide
- Extremely flammable
- Burns with a bluish flame
- Gas is heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Use large amounts of water to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

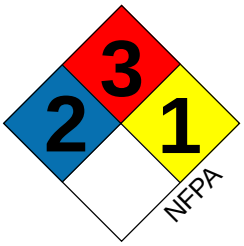
FIRE:

- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- DO NOT APPLY WATER TO CRYOGENIC LIQUID CONTAINERS; if cryogenic liquid containers are exposed to direct flame or elevated temperatures for prolonged times, withdraw immediately to a secure location
- If material is not in cryogenic form, cool exposed containers with large quantities of water from unattended equipment or remove intactcontainers if it can be done safely
- If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
- Seek medical attention
- Frostbite - warm injured area in very warm water
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 463-58-1



DIETHYL CARBONATE

UN 2366

Shipping Name: Diethyl carbonate

Other Names: Carbonic acid, diethyl ester; Carbonic ether; Diatol; Ethyl carbonate; Eufin

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Pleasant, sweet odor
- Floats on the surface of water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 105-58-8

ETHYL CHLOROFORMATE

UN 1182

Shipping Name: Ethyl chloroformate
Other Names: Carbonochloride acid, ethyl ester
Chlorocarbonic acid, ethyl ester
Ethyl chlorocarbonate
Ethyl chloromethanoate

WARNING!
- POISON! BREATHING THE VAPOR CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Light yellow to water white liquid
- Distinct pungent odor like hydrochloric acid
- Sinks in water and reacts with water to form ethyl alcohol and chloroformic acid; is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 541-41-3

GASOLINE

UN 1203

Shipping Name: Gasoline

Other Names: Casing head gasoline, JP-4, Motor fuel, Motor spirit, Petrol

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to yellow liquid which may be dyed to a range of colors
- Characteristic odor
- Floats on water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Blended (oxygenated) gasolines may require higher foam application rates
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 8006-61-9

STRYCHNINE

UN 1692

Shipping Name: Strychnine
Other Names: Caswell No 805, Certox, Kwik-Kil, Mouse-Rid, Ro-Dex

WARNING! ● POISON! BREATHING THE DUST OR SWALLOWING THE SOLID CAN KILL YOU!
● Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Container may explode when exposed to fire
- Combustion or decomposition products upon heating include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If contaminated runoff enters waterway, notify downstream users of potentially contaminated water

Description:

- White to colorless solid
- No odor
- Sinks in water and is insoluble in water
- Flammable

Operational Level Training Response:

RELEASE, NO FIRE:

- Cover material to protect from wind, rain or spray
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Do NOT perform direct mouth to mouth resuscitation; use a bag/mask apparatus
- Toxic effects may be delayed

CAS: 57-24-9

SODIUM HYDROXIDE

UN 1823 (Dry solid)
UN 1824 (Solution)

Shipping Name: UN 1823 Sodium hydroxide, solid
UN 1824 Sodium hydroxide, solution

Other Names: Caustic soda; Caustic soda, solution; Lye; Soda lye; Sodium hydrate; White caustic

WARNING!
- CORROSIVE! SKIN AND EYE CONTACT WILL CAUSE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Reacts with water or moisture to produce large amounts of heat and may splatter
- Reacts with some metals to produce highly flammable hydrogen gas

Description:
- White solid or clear to milky solution in water
- No odor
- Soluble in water producing large amounts of heat
- Nonflammable

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:
- Cover solid material to protect from wind, rain or spray
- Stop the release of liquid material if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release

FIRE:
- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 60 minutes and seek medical evaluation
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 1310-73-2

CHLORAL

(ANHYDROUS, INHIBITED)

UN 2075

Shipping Name: Chloral, anhydrous, inhibited
Other Names: Grasex
Trichloroacetaldehyde
Trichloroethanal

Hazards:

- Severely irritating to skin, eyes, nose and lungs
- Vapors are heavier than air and will collect and stay in low areas
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may BLEVE when exposed to fire
- Chemical reaction of compound may plug release vents causing a violent explosion
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless, oily liquid
- Irritating odor
- Soluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed

CAS: 75-87-6

PHOSPHORUS TRICHLORIDE

UN 1809

Shipping Name: Phosphorus trichloride
Other Names: Chloride of phosphorus
Phosphorus chloride
Trichlorophosphine

WARNING!
- POISON! BREATHING THE VAPORS CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER! REACTS WITH WATER TO PRODUCE HEAT AND HYDROCHLORIC ACID!

Hazards:

- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Rapidly corrodes wet metals producing highly flammable hydrogen gas
- Decomposition products upon heating include toxic hydrogen chloride and phosphoric acid

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to slightly yellow oily liquid that fumes in moist air
- Pungent, musty disagreeable odor
- Sinks in water and reacts violently in water to form toxic hydrochloric acid and phosphoric acid
- Nonflammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Material does not burn; fight surrounding fire with an agent other than water; if water must be used, use it in flooding quantities
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7719-12-2

CHLORINE

UN 1017

Shipping Name: Chlorine

Other Names: Liquid chlorine

WARNING!
- POISON! BREATHING THE GAS CAN KILL YOU!
- Firefighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- STRONG OXIDIZER! WILL INCREASE THE INTENSITY OF A FIRE! MAY CAUSE FIRE UPON CONTACT WITH COMBUSTIBLES!

Hazards:
- Severely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Gas is heavier than air and will collect and stay in low areas
- Container may explode when exposed to fire
- Reacts with water to form toxic hypochlorous acid
- Contact with liquid may cause frostbite
- Corrosive to some rubbers and plastics

Description:
- Greenish-yellow gas
- Shipped as a pressurized liquefied gas
- Pungent bleach-like odor
- Reacts with water to form toxic hypochlorous acid and is slightly soluble in water
- Nonflammable but may cause combustibles to ignite
- Gas is heavier than air and will collect and stay in low areas

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- For container exposed to fire, evacuate the area in all directions because of the risk of explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Use large amounts of water well away from the release to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:
- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
- Seek medical attention
- Frostbite - warm injured area in very warm water
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7782-50-5

CYANOGEN CHLORIDE

(INHIBITED)

UN 1589

Shipping Name: Cyanogen chloride, inhibited

Other Names: Chlorine cyanide Chlorocyanogen
Chlorocyan CK

WARNING!
- POISON! BREATHING THE GAS, SKIN CONTACT OR SWALLOWING THE MATERIAL CAN KILL YOU! CONVERTED TO CYANIDE IN THE BODY!
- Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Gas is heavier than air and will collect and stay in low areas
- Containers may BLEVE or explode when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Contact with liquid may cause frostbite
- Decomposition products upon heating include toxic chlorine gas, cyanide and nitrogen oxides

Awareness and Operational Level Training Response:
- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless gas
- Sharp pungent odor
- Shipped and stored as a compressed gas
- Slightly soluble in water and react slowly with water to form toxic hydrogen cyanide
- Nonflammable
- Gas is heavier than air and will collect and stay in low areas
- Becomes a liquid below 56° F
- Has been used as a war gas

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:
- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- DO NOT ATTEMPT RESCUE!
- The contaminated vicitm poses a risk to the responder
- Decontaminate the victim from a safe distance with a stream of water; have the victim remove clothing if possible; provide Basci Life Support/CPR as needed
- Further decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- Do NOT perform direct mouth to mouth resuscitation; use a bag/mask apparatus
- Note to physician: can produce cyanide toxicity; if symptoms indicate, initial treatment includes the cyanide antidote kit

CAS: 506-77-4

CHLORINE TRIFLUORIDE

UN 1749

Shipping Name: Chlorine trifluoride
Other Names: Chlorine fluoride
Chlorotrifluoride
Trifluorochlorine

WARNING!
- POISON! BREATHING THE GAS CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER! GAS EXPLODES UPON CONTACT WITH COMBUSTIBLE MATERIAL OR WATER!

Hazards:
- Container may explode or BLEVE when exposed to fire
- Gas is heavier than air and will collect and stay in low areas
- Reacts with water to form toxic chlorine gas and hydrofluoric acid
- Corrosive to metals and rubber; reacts vigorously with sand, glass and concrete

Awareness and Operational Level Training Response:
- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release, deny entry and call for expert help
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless gas above 53° F
- Greenish-yellow fuming liquid below 53° F
- Pungent, sweet odor
- Reacts violently with water producing toxic chlorine gas and hydrofluoric acid
- Nonflammable but may cause combustibles to ignite
- Gas is heavier than air and will collect and stay in low areas

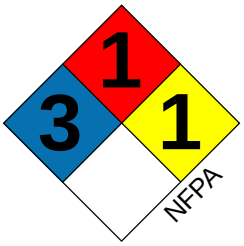
Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the release to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:
- Do not allow water to come in contact with the material; material does not burn, fight surrounding fire with an agent appropriate (not water or foam) for the material burning
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location
- If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location

First Aid:
- DO NOT ATTEMPT RESCUE!
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Do NOT perform direct mouth to mouth resuscitation; use a bag/mask apparatus
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7790-91-2



SULFUR DICHLORIDE

UN 1828

Shipping Name: Sulfer chlorides
Other Names: Chlorine sulfide
Dichlorosulfane

WARNING!
- POISON! BREATHING THE VAPOR CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Strong oxidizer that will increase the intensity of a fire and may cause fire upon contact with combustibles
- Reacts violently with many metals and acids and hydrogen gas
- Combustion and decomposition products upon heating include toxic sulfur oxides and chlorine gas

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire, evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Reddish-brown, fuming liquid
- Pungent, irritating odor
- Sinks in water and reacts with water to form hydrochloric acid
- Flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material; if possible, do not allow water to come in contact with the material. If material is on fire, use dry chemical to extinguish; if water must be used, use it in flooding quantities
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other sign of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 10545-99-0

METHANESULFONYL CHLORIDE

UN 3246

Shipping Name: Methanesulfonyl chloride
Other Names: Chloro methyl sulfane
Mesyl chloride
Methanesulfonic acid chloride
Methane sulfuryl chloride

Hazards:

- Irritating to skin, eyes, nose and lungs; prolonged contact with skin can cause burns
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion and decomposition products upon heating include toxic sulfur oxides and hydrogen chloride

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Pale yellow liquid
- Pungent sharp odor
- Reacts slowly with water to form toxic hydrochloric acid and is slightly soluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at -26° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

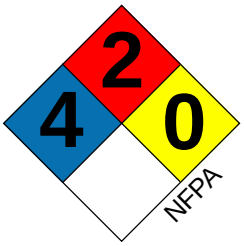
FIRE:

- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 124-63-0



ETHYLENE CHLOROHYDRIN

UN 1135

Shipping Name: Ethylene chlorohydrin
Other Names: 2-Chloroethanol
2-Chloro-1-ethanol
Chloroethanol

WARNING!
- POISON! BREATHING THE VAPOR, SKIN CONTACT OR SWALLOWING THE MATERIAL CAN KILL YOU!
- Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Irritating to skin, eyes, nose and lungs at low concentrations
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include the toxic phosgene gas and hydrogen chloride gas

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless liquid
- Sweet, ether-like odor
- Soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- The contaminated victim poses a health risk to the responder
- Decontaminate the victim from a safe distance with a stream of water; have the victim remove clothing if possible; provide Basic Life Support/CPR as needed
- Further decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed

CAS: 107-07-3

CHLOROTOLUENE

UN 2238

Shipping Name: Chlorotoluene
Other Names: 1-Chloro-4-methylbenzene
4-Chloro-1-methylbenzene
4-Chlorotoluene
p-Chlorotoluene
p-Tolyl chloride

Hazards:

- Very irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Insoluble in water
- Aromatic odor
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 46° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

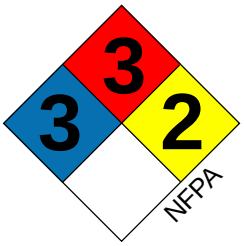
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 106-43-4



EPICHLORHYDRIN

UN 2023

Shipping Name: Epichlorhydrin

Other Names: 1-Chloro-2,3-epoxypropane ECH
Chloromethyloxirane EPI
Chloropropylene oxide

Hazards:

- Extremely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Highly flammable
- Container may BLEVE when exposed to fire
- May react with itself at high temperatures blocking relief valves leading to tank explosion
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode if ignited
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Response:

- Stay uphill and upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Clear, colorless liquid
- Irritating, chloroform-like odor
- Sinks in water and is moderately soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam only to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, venting sound suddenly stops, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 106-89-8

3-CHLOROPROPIONITRILE

UN 3275

Shipping Name: Nitriles, toxic, flammable, n.o.s.
Other Names: 1-Chloro-2-cyanoethane
3-Chloropropanenitrile

WARNING! ● POISON! BREATHING THE VAPORS, SKIN CONTACT OR SWALLOWING THE MATERIAL CAN KILL YOU! CONVERTED TO CYANIDE IN THE BODY!
● Firefighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Container may BLEVE when exposed to fire
- Irritating to eyes, nose and lungs
- Vapors are heavier than air and will collect and stay in low areas
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic nitrogen oxides and hydrogen chloride

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- Evacuate or shelter in place the immediate area and downwind for a large release
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless liquid
- Irritating odor
- Sinks in water and is slightly soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- The contaminatd victim poses a health risk to the responder
- Decontaminate the victim from a safe distance with a stream of water; have the victim remove clothing if possible; provide Basic Life Support/CPR as needed
- Further decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Do NOT perform direct mouth to mouth resuscitation; use a bag/mask apparatus
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- Note to physician: can produce cyanide toxicity; if symptoms indicate, inital treatment includes the cyanide antidote kit

CAS: 542-76-7

CHLORONITROBENZENE

UN 1578

Shipping Name: Chloronitrobenzene, ortho, liquid
Chloronitrobenzene, meta, para, solid

Other Names: 1-Chloro-2-nitrobenzene
m-Chloronitrobenzene
o-Chloronitrobenzene
p-Chloronitrobenzene
Nitrochlorobenzene

Hazards:

- Severely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Vapors are heavier than air and will collect and stay in low areas
- Container may explode when exposed to fire
- Combustion or decomposition products upon heating include toxic nitrogen oxides and hydrogen chloride

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterway, notify downstream users of potentially contaminated water

Description:

- Yellow solid
- Aromatic odor
- Sinks in water and is insoluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas
- Melts at 90° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Cover material to protect from wind, rain or spray
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 88-73-3 (ortho, o-), 121-73-3 (meta, m-), 100-00-5 (para, p-)

CHLOROACETALDEHYDE

UN 2232

Shipping Name: 2-Chloroethanal

Other Names: 2-Chloroacetaldehyde
Chloroacetaldehyde monomer
Chloroaldehyde
Chloroethanal

Hazards:

- Severely irritating to skin, eyes, nose and lungs; skin and eye contact can cause severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Clear colorless liquid
- Pungent odor
- Initally sinks in water and is soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 3° F
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resitant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a non-flammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 107-20-0

CHLOROACETYL CHLORIDE

UN 1752

Shipping Name: Chloroacetyl chloride
Other Names: Chloroacetic acid chloride
Chloroacetic chloride

WARNING! • DO NOT USE WATER! REACTS WITH WATER TO FORM TOXIC HYDROGEN CHLORIDE AND CHLOROACETIC ACID!

Hazards:

- Extremely irritating to skin, eyes, nose and lungs; skin and eye contact can cause severe burns and blindness
- Fire fighting gear (including SCBA) does not provide enough protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Vapors are heavier than air and will collect and stay in low areas
- Combustion or decomposition products upon heating include toxic hydrogen chloride and phosgene
- Corrosive to metals

Awareness and Operational Training Level Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to yellow liquid
- Pungent odor
- Reacts with water to form toxic hydrogen chloride and is soluble in water
- Nonflammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at -8° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:

- If possible do not allow water to come in contact with the material. Material does not burn; fight surrounding fire with an appropriate agent: avoid using water or foam
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely.
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 79-04-9

ETHYL CHLOROACETATE

UN 1181

Shipping Name: Ethyl chloroacetate
Other Names: Chloroacetic acid, ethyl ester
Ethyl monochloroacetate

Hazards:

- Severely irritating to skin, eyes, nose and lungs; produces tearing
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- Evacuate the immediate area and downwind for a large release
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless or white liquid
- Fruity, pungent odor
- Sinks in water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at -15° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other sign of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 105-39-5

METHYL CHLOROACETATE

UN 2295

Shipping Name: Methyl chloroacetate
Other Names: Chloroacetic acid, methyl ester
Methyl monochloroacetate

Hazards:

- Very irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion and decomposition products upon heating include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Stay uphill and upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Sweet, pungent odor
- Sinks in water and is insoluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at -28° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 96-34-4

CHLOROACETONITRILE

UN 2668

Shipping Name: Chloroacetonitrile
Other Names: Chloroethanenitrile
Chloromethyl cyanide

WARNING!
- POISON! BREATHING THE VAPOR, SKIN CONTACT OR SWALLOWING THE LIQUID CAN KILL YOU! CONVERTED TO CYANIDE IN THE BODY!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Low concentrations are very irritating to skin, eyes, nose and lungs
- Vapors may travel long distances to ignition sources and flashback
- Combustion or decomposition products upon heating include toxic nitrogen oxides and hydrogen chloride

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterway, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Pungent odor
- Sinks in water and is moderately soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- APPROACH FIRE WITH EXTREME CAUTION; consider letting fire burn
- Specially trained personnel operating from a safe distance can fight fires using alcohol resitant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a non-flammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Note to physician:can produce cyanide toxicity; if symptoms indicate, inital treatment includes the cyanide antidote kit

CAS: 107-14-2

METHYL 2-CHLOROACRYLATE

Other Names: 2-Chloroacrylic acid, methyl ester
Methyl 2-chloropropenoate

WARNING!
- POISON! BREATHING THE VAPORS CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- At elevated temperatures may react with itself without warning blocking relief valves leading to container explosion
- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion and decomposition products upon heating include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Acrid odor
- Sinks in water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

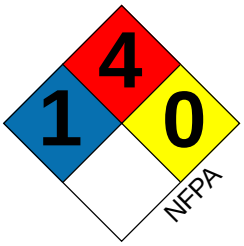
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, venting sound suddenly increases and/or unexpectedly stops, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 80-63-7



ETHYL CHLORIDE

UN 1037

Shipping Name: Ethyl chloride
Other Names: Chloroethane
Hydrochloric ether
Monochlorethane
Muriatic ether

WARNING! ● EXTREMELY FLAMMABLE!

Hazards:

- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Combustion products include toxic hydrogen chloride

Description:

- A colorless gas shipped and stored as a colorless liquid stored under pressure
- Pungent to pleasant ether-like odor
- Floats on the surface of water and is slightly soluble in water
- Extremely flammable
- Vapors are heavier than air and will collect and stay in low areas
- Boils at 54° F

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - ♦ Inhalation - remove the victim to fresh air and give oxygen if available
  - ♦ Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - ♦ Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - ♦ Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 75-00-3

1,1,1-TRICHLOROETHANE

UN 2831

Shipping Name: 1,1,1-Trichloroethane

Other Names:

Chloroethane	Solvent 111
Chlorylen	Tri
Dowclene LS	Triethane
Methylchloroform	Methyltrichloromethane

Hazards:

- Irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Sweet, chloroform-like odor
- Sinks in water and is insoluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor
- Freezes at -22° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

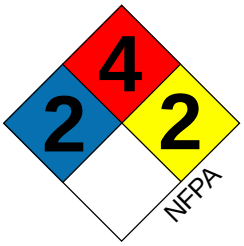
FIRE:

- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 71-55-6



VINYL CHLORIDE

(INHIBITED OR STABILIZED)

UN 1086

Shipping Name: Vinyl chloride, inhibited or stabilized

Other Names:		
	Chloroethene	VC
	Chloroethylene	VCM
	Monochloroethylene	Vinyl chloride monomer

WARNING!
- EXTREMELY FLAMMABLE!
- MAY REACT WITH ITSELF WITHOUT WARNING BLOCKING RELIEF VALVES LEADING TO VIOLENT CONTAINER EXPLOSION!

Hazards:

- Container may BLEVE or explode when exposed to fire
- Gas is heavier than air and will collect and stay in low areas
- Gas may travel long distances to ignition sources and flashback
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes and lungs
- Combustion products include toxic hydrogen chloride
- Contact with liquid may cause frostbite
- Known to cause cancer in humans following long term exposure: contact should be avoided

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For containers exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and down wind for a large release
- Notify local health and fire officials and pollution control agencies

Description:

- Colorless gas
- Shipped as liquefied compressed gas
- Sweet, pleasant odor
- Liquid floats and boils on the surface of water; gas is insoluble in water
- Extremely flammable
- Gas is heavier than air and will collect and stay in low areas
- Combustion produces a visible and toxic vapor cloud
- Becomes a liquid below 7° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Use large amounts of water well away from the material to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed containers with large quantities of water from unattended equipment or remove containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, venting suddenly stops, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Frostbite - warm injured area in very warm water
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 75-01-4

CHOLROETHYL CHLOROFORMATE

UN 2742

Shipping Name: Chloroformates, toxic, corrosive, n.o.s.

Other Names: 2-Chloroethyl chlorocarbonate

Hazards:

- Extremely irritating to nose and lungs; skin and eye contact can cause burns
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Pungent odor
- Sinks in water; reacts slowly with water to form toxic hydrochloric acid and is insoluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 627-11-2

CHLOROFORM

UN 1888

Shipping Name: Chloroform

Other Names: Formyl trichloride, TCM, Freon 20, Trichloroform, Methane trichloride, Trichloromethane, R 20 (refrigerant)

Hazards:

- Irritating to skin, eyes, nose and lungs
- Containers may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Decomposes upon exposure to high temperatures to highly toxic phosgene and hydrogen chloride

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Clear colorless liquid
- Sweet odor
- Sinks in water and is insoluble in water
- Nonflammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of a thin layer of water or foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 67-66-3

ISOPROPYL CHLOROFORMATE

UN 2407

Shipping Name: Isopropylchloroformate

Other Names: Chloroformic acid, isopropyl ester
Isopropyl chlorocarbonate
2-Propyl chloroformate

WARNING! ● EXPLOSIVE! CONTAINERS HAVE EXPLODED EVEN WHEN REFRIGERATED!

Hazards:

- Severely irritating to skin, eyes, nose and lungs; may cause burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Highly flammable
- Container may BLEVE or explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Decomposes upon heating to form toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate a wide area around the release and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Pungent irritating odor
- Sinks in water and is insoluble in water
- Reacts slowly with water to form toxic hydrochloric acid
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Approach fire with extreme caution; consider letting fire burn
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 108-23-6

2-CHLOROPHENYLTHIOUREA

Other Names: N-(2-chlorophenylthiourea)
Thiourea (2-chlorophenyl)

WARNING!
- POISON! BREATHING OR SWALLOWING THE POWDER OR ABSORPTION THROUGH THE SKIN CAN KILL YOU!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Combustion and decomposition products upon heating include toxic hydrogen chloride, and nitrogen oxides and sulfur oxides

Description:
- Colorless solid
- No odor
- Soluble in water
- Flammable

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:
- Cover material to protect from wind, rain or spray
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release

FIRE:
- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 5344-82-1

CHLOROPICRIN

UN 1580

Shipping Name: Chloropicrin

Other Names: Nitrochloroform, Picfume, Tri-clor, Pic-chlor, PS, Picride, Trichloronitromethane

WARNING!

- POISON! BREATHING THE VAPOR, SKIN CONTACT OR SWALLOWING THE MATERIAL CAN KILL YOU! SKIN AND EYE CONTACT CAN CAUSE SEVERE BURNS AND BLINDNESS!
- Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Decomposes explosively when heated above 234° F
- Vapors are heavier than air and will collect and stay in low areas
- Decomposition products upon heating include toxic phosgene, chlorine gas and nitrogen oxides
- Corrosive to rubber and some plastics

Description:

- Pale yellow oily liquid
- Intensely irritating odor
- Sinks in water and is insoluble in water
- Nonflammable
- Vapors are heavier than air and will collect and stay in low areas
- Used as a choking agent

Awareness and Operational Level Training Response:

- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of fire or release and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Material does not burn, fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- DO NOT ATTEMPT RESCUE!
- The contaminatd victim poses a health risk to the responder
- Decontaminate the victim from a safe distance with a stream of water; have the victim remove clothing if possible; provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Do NOT perform direct mouth to mouth resuscitation; use a bag/mask apparatus
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 76-06-2

SULFUR MONOCHLORIDE

UN 1828

Shipping Name: Sulfur chlorides
Other Names: Chlorosulfane
Disulfur dichloride
Sulfur chloride
Sulfur subchloride

WARNING!
- POISON! BREATHING THE VAPOR CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- STRONG OXIDIZER! WILL INCREASE THE INTENSITY OF A FIRE; MAY CAUSE FIRE UPON CONTACT WITH COMBUSTIBLES!

Hazards:
- Vapors are heavier than air and will collect and stay in low areas
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Container may BLEVE when exposed to fire
- Reacts violently with many metals and acids
- Combustion and decomposition products upon heating include toxic sulfur oxides and chlorine gas
- Corrosive to metals and some plastics when wet

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire, evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Light amber to yellowish red oily fuming liquid
- Nauseating odor
- Sinks in water and reacts with water to form toxic hydrochloric acid
- Flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:
RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material; if material is on fire, use dry chemical to extinguish; if water must be used, use it in flooding quantities
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other sign of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 10025-67-9

CHLOROSULFONIC ACID

UN 1754

Shipping Name: Chlorosulfonic acid
Other Names: Chlorosulfuric acid
Sulfuric chlorohydrin

WARNING!

- POISON! BREATHING THE VAPORS OR SWALLOWING THE LIQUID CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER! REACTS VIOLENTLY WITH WATER TO FORM TOXIC HYDROCHLORIC AND SULFURIC ACIDS!
- EXTREMELY STRONG OXIDIZER! WILL INCREASE THE INTENSITY OF A FIRE! MAY CAUSE FIRE UPON CONTACT WITH COMBUSTIBLES

Hazards:

- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Reacts with metals in the presence of moisture to form highly flammable hydrogen gas
- Decomposition products upon heating include toxic sulfur oxides and hydrogen chloride
- Corrosive to most metals

Description:

- Colorless to slightly yellow liquid
- Pungent odor
- Reacts violently with water to form toxic hydrochloric acid and sulfuric acid and sinks in water
- Vapors are heavier than air and will collect and stay in low areas
- Nonflammable but may cause combustibles to ignite
- Produces large amounts of vapor when exposed to water

Awareness and Operational Training Level Response:

- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:

- DO NOT USE WATER DIRECTLY ON PRODUCT - reacts violently with water
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of release
- Use large amounts of water well away from the release to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:

- Material does not burn; fight surrounding fire with dry chemical - if water must be used, use it in flooding quantities
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding) withdraw immediately to a secure location

First Aid:

- DO NOT ATTEMPT RESCUE!
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7790-94-5

TRIFLUORO CHLOROETHYLENE

(INHIBITED)

UN 1082

Shipping Name: Trifluorochloroethylene

Other Names: Chlorotrifluoroethylene R1113
CTFE Trifluorovinyl chloride
Diaflan Trithene

WARNING! ● EXTREMELY FLAMMABLE!
● EXPLOSIVE! CONTAINER MAY BLEVE OR EXPLODE WHEN EXPOSED TO FIRE!

Hazards:
- Chemical reaction of compound may plug pressure release vents causing a violent explosion
- Gas is heavier than air and will collect and stay in low areas
- Gas may travel long distances to ignition sources and flash back
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs; prolonged contact with skin can cause burns
- Contact with liquid may cause frostbite
- Combustion products include toxic hydrochloric acid and hydrofluoric acid vapors

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless gas
- Shipped and stored as a liquefied compressed gas
- Odorless or faint ether-like odor
- Sinks in water and boils in water
- Extremely flammable
- Gas is heavier than air and will collect and stay in low areas
- A liquid below -18° F

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Contact with liquid may cause frostbite
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 79-38-9

TRIMETHYLCHLOROSILANE

UN 1298

Shipping Name: Trimethylchlorosilane
Other Names: Chlorotrimethylsilane

WARNING!
- POISON! BREATHING THE VAPORS CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER! REACTS WITH WATER TO FORM TOXIC HYDROGEN CHLORIDE!

Hazards:

- Containers may BLEVE when exposed to fire
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Corrosive to metals releasing highly flammable hydrogen gas
- Decomposition products upon heating include toxic hydrogen chloride gas

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue victim!
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless fuming liquid
- Pungent odor
- Floats on water and reacts violently with water to form toxic hydrochloric acid
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- If material is on fire and conditions permit, DO NOT EXTINGUISH.
- Material reacts with water but can be extinguished with low or medium expansion (AFFF) alcohol resistant foam
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue victim!
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 75-77-4

LEWISITE

UN 1556

Other Names: Chlorovinyldichloroarsine
Chlorovinylarsine dichloride
Dichloro (2-chlorovinyl) arsine
L
M-1

WARNING! • POISON! BREATHING THE VAPOR, OR SWALLOWING THE MATERIAL CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
• Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Odor is not a reliable indicator of the presence toxic amounts of vapor
- Container may BLEVE or explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion products include toxic hydrogen chloride and arsenic compunds

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay uphill and upwind
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area of release or fire, deny entry and call for expert help
- Evacuate or shelter in place the immediate area and downwind for a large release
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless liquid if pure; turns violet to black or green with age
- Faint geranium-like odor
- Sinks in water and insoluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 9° F
- Has been used as a blister-type war gas

Operational Level Training Response:

RELEASE, NO FIRE:
- BACK OFF! - Isolate a wide area around the release and call for expert help
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location
- Use unattended equipment whenever possible

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- The contaminated victim poses a health risk to the responder
- Decontaminate the victim from a safe distance with a stream of water; have the victim remove clothing if possible; provide Basic Life Support/CPR as needed
- Further decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 541-25-3

CHLORPYRIFOS

UN 2783

Shipping Name: Organophosphorous pesticides, solid, toxic
Other Names: Dursban
Lorsban

Hazards:
- Ingestion, skin absorption or inhalation of the dust can cause illness
- Container may explode when exposed to fire
- Combustion products include toxic hydrogen chloride and sulfur oxides

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- White solid
- Often shipped as a liquid in water or petroleum products
- Mild sulfur-like odor
- Insoluble in water
- Very flammable
- Melts at 108° F
- An organophosphate insecticide

Operational Level Training Response:

RELEASE, NO FIRE:
- Cover material to protect from wind, rain or spray
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release

FIRE:
- Use water or foam to extinguish
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Note to physician: is an organophosphate insecticide; if symptoms indicate, the initial antidote is atropine

CAS: 2921-88-2

STYRENE
(MONOMER, INHIBITED)

UN 2055

Shipping Name: Styrene monomer, inhibited

Other Names: Cinnamenol, Ethenylbenzene, Phenylethylene, Styrene monomer, Styrol, Styrolene, Vinyl benzene

WARNING! ● MAY REACT WITH ITSELF BLOCKING RELIEF VALVES LEADING TO TANK EXPLOSION!

Hazards:
- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Very irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless to yellow liquid
- Sharp, disagreeable odor that is sweet at lower concentrations
- Floats on the surface of water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at -23° F

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, vent sound suddenly increases and/or unexpectedly stops, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 100-42-5

KEROSENE

UN 1223

Shipping Name: Kerosene
Other Names: Coal oil
Fuel oil #1
Jet A
JP-1
JP-4
Kerosine
Range oil

Hazards:
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Irritating to skin and eyes

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless to light brown-amber liquid
- Petroleum-like odor
- Floats on water and is insoluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

ISOPROPYLBENZENE

UN 1918

Shipping Name: Isopropylbenzene
Other Names: Cumene
Curmol
2-Phenylpropane

Hazards:

- Highly flammable
- Irritating to skin, eyes, nose and lungs; prolonged contact will cause burns
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Sharp, aromatic odor
- Insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CYANOACETIC ACID

UN 3275

Shipping Name: Nitriles, toxic, flammable, n.o.s.
Other Names: Malonic mononitrile

WARNING!
- POISON! BREATHING THE VAPORS OR SWALLOWING THE LIQUID CAN KILL YOU! CONVERTED TO CYANIDE IN THE BODY!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Extremely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Container may explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion or decomposition products upon heating include toxic nitrogen oxides and hydrogen cyanide and flammable acetonitrile

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- White crystalline solid
- No odor found
- Soluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:
- Cover material to protect from wind, rain or spray
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing
- Note to physician: can cause cyanide toxicity; if symptoms indicate, the initial treatment is the cyanide antidote kit

CAS: 372-09-8

MALONONITRILE

UN 2647

Shipping Name: Malononitrile

Other Names: Cyanoacetonitrile, Dicyanomethane, Malonic acid dinitrile, Malonic dinitrile, Methylene cyanide

WARNING!

- POISON! BREATHING THE DUST OR THE FUMES FROM COMBUSTION OR DECOMPOSITION UPON HEATING CAN KILL YOU! CONVERTED TO CYANIDE IN THE BODY!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Combustion and decomposition products upon heating include toxic nitrogen oxides and cyanide
- May react with itself violently at elevated temperatures or upon contact with acids
- Container may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Vapors are heavier than air and will collect and stay in low areas

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- White solid
- Sinks in water and is moderately soluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas
- Melts at 93° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Cover material to protect from wind, rain or spray
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- Note to physician:can cause cyanide toxicity; if symptoms indicate, the initial treatment includes the cyanide antidote kit

CAS: 109-77-3

PROPIONITRILE

UN 2404

Shipping Name: Propionitrile
Other Names: Cyanoethane
Ethyl cyanide
Propionic nitrile
Propylnitrile

WARNING! • POISON! BREATHING THE VAPORS, SWALLOWING THE MATERIAL OR SKIN CONTACT CAN KILL YOU! CONVERTED TO CYANIDE IN THE BODY!
• Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel.

Hazards:

- Vapors are heavier than air and will collect and stay in low areas
- Highly flammable
- Container may BLEVE or explode when exposed to fire
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Combustion and decomposition products upon heating include toxic cyanide and nitrogen oxides

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to brown liquid
- Sweet odor
- Floats on the surface of water and is moderately soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam only to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

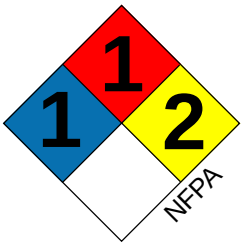
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support (CPR) as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Do NOT perform direct mouth to mouth resuscitation; use a bag/mask apparatus
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- Note to physician: can produce cyanide toxicity; if symptoms indicate, initial treatment includes the cyanide antidote kit

CAS: 107-12-0



ETHYLENE CYANOHYDRIN

Other Names: 2-Cyanoethyl alcohol
2-Cyanohydrin
Glycol cyanohydrin
Hydracrylonitrile
3-Hydroxypropionitrile

Hazards:

- Combustion and decomposition products upon heating include toxic hydrogen cyanide and nitrogen oxides
- Irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- May react with itself when heated blocking relief valves leading to container explosion

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to light yellow liquid
- No odor
- Soluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Approach fire with extreme caution because heated material releases highly toxic hydrogen cyanide. Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- Note to physician: fumes from heated material contain hydrogen cyanide; can produce cyanide toxicity - if symptoms indicate, initial treatment includes the cyanide antidote kit

CAS: 109-78-4

CYANOGEN IODIDE

Other Names: Cyanogen monoiodide
Iodine cyanide

WARNING!
- POISON! BREATHING THE VAPOR, SKIN CONTACT OR SWALLOWING THE MATERIAL CAN KILL YOU! CONVERTED TO CYANIDE IN THE BODY!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Odor is not a reliable indicator of the presence of toxic amounts of vapor
- Container may explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Decomposition products upon heating include toxic cyanide gas, iodide gas and nitrogen oxides

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- White solid
- Pungent odor
- Soluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:
- Cover material to protect from wind, rain or spray
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release

FIRE:
- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- The contaminated victim poses a health risk to the responder
- Decontaminate the victim from a safe distance with a stream of water; have the victim remove clothing if possible; provide Basic Life Support/CPR as needed
- Further decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- Do NOT perform direct mouth to mouth resuscitation; use a bag/mask apparatus
- Note to physician: can produce cyanide toxicity; if symptoms indicate, initial treatment includes the cyanide antidote kit

CAS: 506-78-5

FORMALDEHYDE CYANOHYDRIN

Other Names: Cyanomethanol, Glycolonitrile, Glyconitrile, Hydroxyacetonitrile, Methylene cyanohydrin

WARNING!
- POISON! BREATHING THE VAPOR, SKIN CONTACT OR SWALLOWING THE MATERIAL CAN KILL YOU! CONVERTED TO CYANIDE IN THE BODY!
- Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- MAY REACT WITH ITSELF BLOCKING RELIEF VALVES LEADING TO TANK EXPLOSION!

Hazards:
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Combustion and decomposition products upon heating include toxic hydrogen cyanide and nitrogen oxides

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

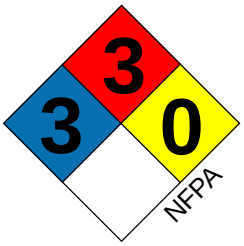
Description:
- Colorless oily liquid
- Shipped as 70% water solution stabilized with phosphoric acid
- No odor
- Soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:
RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- If material is on fire and conditions permit, DO NOT EXTINGUISH. Cool exposures using unattended monitors.
- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a nonflammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- The contaminated vicitm poses a risk to the responder
- Decontaminate the victim from a distance, provide Basic Life Support/CPR as needed and further decontaminate as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible; Toxic effects may be delayed
- Do NOT perform direct mouth to mouth resuscitation; use a bag/mask apparatus
- Note to physician: can produce cyanide toxicity; if symptoms indicate, initial treatment includes the cyanide antidote kit

CAS: 107-16-4



ISOBUTYRONITRILE

UN 2284

Shipping Name: Isobutyronitrile
Other Names: 2-Cyanopropane
Isopropyl cyanide
Isopropyl nitrile

WARNING!
- POISON! BREATHING THE VAPOR, SWALLOWING THE MATERIAL OR SKIN CONTACT CAN KILL YOU! CONVERTED TO CYANIDE IN THE BODY!
- Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Highly flammable
- Containers may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors may explode in confined areas (e.g., tanks, sewers, buildings)
- Irritating to skin, eyes, nose and lungs
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of the release and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless clear liquid
- Almond-like odor
- Floats on the surface of water and is slightly soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:
RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention as soon as possible
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing
- Note to physician: can produce cyanide toxicity; if symptoms indicate, initial treatment includes the cyanide antidote kit

CAS: 78-82-0

METHYL ACRYLONITRILE

(INHIBITED)

UN 3079

Shipping Name: Methyl acrylonitrile, inhibited

Other Names: 2-Cyanpropene; 2-Methylpropenenitrile; Isopropene cyanide; Methacrylonitrile; USAFST-40

WARNING!

- POISON! BREATHING THE VAPORS, SWALLOWING THE MATERIAL OR SKIN CONTACT CAN KILL YOU! CONVERTED TO CYANIDE IN THE BODY!
- Firefighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- MAY REACT WITH ITSELF WITHOUT WARNING WITH EXPLOSIVE VIOLENCE!

Hazards:

- Odor is not a reliable indicator of the presence of toxic amounts of vapor
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Combustion products include toxic nitrogen oxides and cyanide

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Bitter almond-like odor
- Floats on the surface of water and is moderately soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, venting sound suddenly increases or unexpectedly stops, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Deccontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing
- Note to physician: can produce cyanide toxicity; if symptoms indicate, initial treatment includes the cyanide antidote kit

CAS: 126-98-7

CYANURIC CHLORIDE

UN 2670

Shipping Name: Cyanuric chloride
Other Names: 2,4,6-Trichloro-s-triazine

WARNING! • DO NOT USE WATER! MAY REACT VIOLENTLY WITH WATER TO FORM TOXIC HYDROCHLORIC ACID!

Hazards:

- Severely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Vapors are heavier than air and will collect and stay in low areas
- Container may explode when exposed to fire
- Combustion products include toxic hydrogen chloride and nitrogen oxides

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless solid
- Pungent odor
- Insoluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- DO NOT USE WATER DIRECTLY ON THE MATERIAL
- Cover material to protect from wind, rain or spray
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release

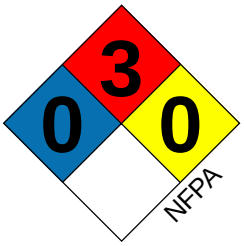
FIRE:

- Do not allow water to come in contact with the material; fight fire with dry chemical if possible - if water must be used, use it in flooding quantities
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 108-77-0



CYCLOHEPTANE

UN 2241

Shipping Name: Cycloheptane
Other Names: Heptamethylene
Suberane

Hazards:

- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Container may BLEVE when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless, oily liquid
- Hydrocarbon-like odor
- Floats on the surface of water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 10° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

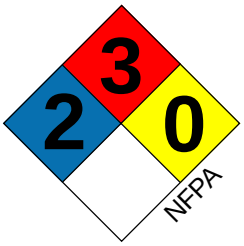
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 291-64-5



METHYLCYCLOHEXANE

UN 2296

Shipping Name: Methylcyclohexane
Other Names: Cyclohexylmethane
Hexahydrotoluene

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Slight benzene-like odor
- Floats on the surface of water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

"**R**" under special situations signifies a radioactivity hazard.

CYCLOPENTANE

UN 1146

Shipping Name: Cyclopentane
Other Names: Pentamethylene

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Gasoline-like odor
- Floats on the surface of water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

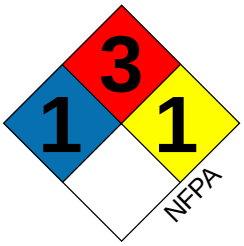
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 287-92-3



CYCLOPENTENE

UN 2246

Shipping Name: Cyclopentene

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs; prolonged contact with skin will cause burns

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Gasoline-like odor
- Floats on the surface of water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor
- Boils at 111° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

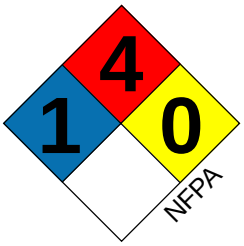
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 142-29-0



CYCLOPROPANE

UN 1027

Shipping Name: Cyclopropane, liquefied
Other Names: Trimethylene

WARNING!
- EXTREMELY FLAMMABLE!
- FOR CONTAINERS EXPOSED TO FIRE EVACUATE THE AREA IN ALL DIRECTIONS BECAUSE OF THE RISK OF BLEVE OR EXPLOSION!

Hazards:

- Gas may travel long distances to ignition sources and flashback
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Gas is heavier than air and will collect and stay in low areas
- Contact with liquid may cause frostbite

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and down wind for a large release
- Notify local health and fire officials and pollution control agencies

Description:

- Colorless gas
- May be shipped and stored as a cryogenic liquid
- Mild sweet odor
- Floats and boils on the surface of water producing a visible flammable vapor cloud; is moderately soluble in water
- Extremely flammable
- Gas is heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Use large amounts of water to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- DO NOT APPLY WATER TO CRYOGENIC LIQUID CONTAINERS; if cryogenic liquid containers are exposed to direct flame or elevated temperatures for prolonged times, withdraw immediately to a secure location
- If material is not leaking, cool exposed noncryogenic containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
- Seek medical attention
- Frostbite - warm injured area in very warm water
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 75-19-4

2,4-D

UN 2765

Shipping Name: Phenoxy pesticides, solid, toxic
Other Names: 2,4-Dichlorophenoxyacetic acid
Dichlorophenoxyacetic acid
Weedone

Hazards:

- Swallowing or inhaling the dust can cause illness
- Container may explode when exposed to fire
- Combustion and decomposition products upon heating include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- White to yellow solid
- No odor
- Sinks in water and is insoluble in water
- Flammable
- An herbicide

Operational Level Training Response:

RELEASE, NO FIRE:

- Cover material to protect from wind, rain or spray
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release

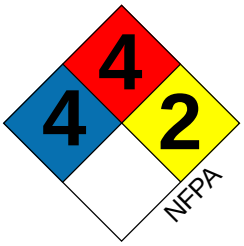
FIRE:

- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 94-75-7



VINYLIDENE CHLORIDE

(INHIBITED)

UN 1303

Shipping Name: Vinylidene chloride, inhibited

Other Names:	1,1,1-DCE	1,1-Dichloroethylene
	DCE	NCI-C54262
	1,1-Dichloroethane	VDC

WARNING! ● EXTREMELY FLAMMABLE! CONTAINER MAY EXPLODE WHEN EXPOSED TO FIRE!
● MAY REACT WITH ITSELF WITHOUT WARNING BLOCKING RELEASE VALVES AND CAUSING A VIOLENT EXPLOSION!

Hazards:

- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- On storage, forms white solid deposits which may explode with shock or heat
- Combustion products include toxic phosgene and hydrogen chloride which may be more toxic than the material itself
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless clear liquid
- Sweet chloroform-like odor
- Sinks in water and is slightly soluble in water
- Extremely flammable
- Forms white solid deposits on storage which may explode with shock or heat
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor
- Boils at 89° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 75-35-4

1,1-DICHLOROETHANE

UN 2362

Shipping Name: 1,1-Dichloroethane
Other Names: 1,1-DCE
Ethylidine chloride
Ethylidine dichloride

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Combustion or decomposition products upon heating include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Chloroform-like odor
- Sinks in water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 75-34-3

DIETHYLAMINOETHANOL

UN 2686

Shipping Name: Diethylaminoethanol
Other Names: DEAE
2-Diethylaminoethanol
Diethylethanolamine
2-Hydroxytriethylamine

Hazards:

- Severely irritating to skin, eyes, nose and lungs; can cause burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Ammonia-like odor
- Floats on the surface of water and is soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

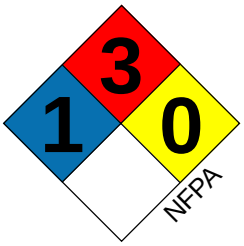
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a nonflammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 100-37-8



DIETHYL KETONE

UN 1156

Shipping Name: Diethyl ketone

Other Names: DEK, Dimethylacetone, Ethyl ketone, Methacetone, 3-Pentanone

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless clear liquid
- Acetone-like odor
- Floats on the surface of water and is sightly soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

"**R**" under special situations signifies a radioactivity hazard.

METHYL METHACRYLATE

(INHIBITED)

UN 1247

Shipping Name: Methyl methacrylate monomer, inhibited

Other Names: Diakon MMA
2-Methylacrylic acid, methyl ester MME
Methyl 2-methyl-2-propenoate

WARNING! • MAY REACT WITH ITSELF WITHOUT WARNING LEADING TO CONTAINER EXPLOSION!

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Very irritating to skin, eyes, nose and lungs
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Fruity odor
- Floats on the surface of water and is slightly soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, venting sound increases and/or unexpectedly stops, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - ♦ Inhalation - remove the victim to fresh air and give oxygen if available
  - ♦ Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - ♦ Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - ♦ Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 80-62-6

HYDRAZINE

UN 2029 (more than 64% or anhydrous)
UN 2030 (37% to 64%)
UN 3293 (not more than 37% hydrazine by mass)

Shipping Name: Hydrazine
Other Names: Diamide Diamine
Diamine hydrate Hydrazine hydrate

WARNING!

- POISON! BREATHING THE VAPOR, SKIN CONTACT OR SWALLOWING THE LIQUID CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- HIGHLY REACTIVE! IGNITES SPONTANEOUSLY UPON CONTACT WITH POROUS MATERIALS SUCH AS WOOD, CLOTH, RUSTING METAL OR SOIL!

Hazards:

- Highly flammable; may continue to burn in the absence of air
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic nitrogen oxides
- Very corrosive to glass and rubber

Awareness and Operational Level Training Response:

- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to slightly yellow oily fuming liquid
- Ammonia-like fishy odor
- Soluble in water
- Highly flammable; will ignite most porous material such as wood, cloth or rusting metal
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 35° F
- Commonly used as rocket fuel

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam only to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Approach fire with extreme caution; consider letting fire burn
- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- DO NOT ATTEMPT RESCUE!
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 302-01-2

HYDRAZINE SULFATE

Other Names: Diamine sulfate
Hydrazine hydrogen sulfate
Hydrazine monosulfate
Hydrazinium sulfate

Hazards:
- Extremely irritating to skin, eyes, nose and lungs
- May interfere with the body's abillity to use oxygen

Awareness and Operational Level Training Response:
- Stay upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterway, notify downstream users of potentially contaminated water

Description:
- White solid
- Weak ammonia-like odor
- Sinks in water and is slightly soluble in water
- Nonflammable

Operational Level Training Response:

RELEASE, NO FIRE:
- Cover material to protect from wind, rain or spray

FIRE:
- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Note to physician: can cause methemoglobinemia; if symptoms indicate, methylene blue is the initial antidote

CAS: 10034-93-2

ETHYLENEDIAMINE

UN 1604

Shipping Name: Ethylenediamine
Other Names: 1,2- Diaminoethane
Dimethylene diamine

Hazards:

- Extremely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of the release and deny entry
- Remove all ignition sources
- Evacuate the immediate area and downwind for a large release
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless thick liquid
- Ammonia-like odor
- Initially floats on the surface of water and is soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 47° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 107-15-3

2,4-TOLUENEDIAMINE

UN 1709

Shipping Name: 2,4-Toluenediamine, or 2,4- Toluylenediamine

Other Names: 2,4-Diaminotoluene Toluene-2,4-diamine
Diaminotoluene Toluene diamine

Hazards:

- May interfere with the body's ability to use oxygen
- Vapors are heavier than air and will collect and stay in low areas
- Irritating to skin, eyes, nose and lungs
- Container may explode when exposed to fire
- Combustion or decomposition products upon heating include toxic nitrogen oxides

Description:

- Colorless solid
- No odor found
- Floats on the surface of water and is slightly soluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas

Awareness and Operational Level Training Response:

- Stay upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:

- Cover material to protect from wind, rain or spray
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release

FIRE:

- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Note to physician: can cause methemoglobinemia; if symptoms indicate, methylene blue is the initial antidote

CAS: 95-80-7

DITHIAZANINE IODIDE

Other Names: Diazan
3,3'-Diethylthiadicarbocyanine iodide
Telmicid
Telmid

Hazards:
- Irritating to skin, eyes, nose and lungs
- Container may explode when exposed to fire
- Combustion or decomposition products upon heating include toxic sulfur oxides, nitrogen oxides and hydrogen iodide

Awareness and Operational Level Training Response:
- Stay upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterway, notify downstream users of potentially contaminated water

Description:
- Dark green or blue violet solid or tablets
- No odor
- Insoluble in water
- Flammable

Operational Level Training Response:

RELEASE, NO FIRE:
- Cover material to protect from blowing, rain or spray
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release

FIRE:
- Material does not readily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 514-73-8

DIBROMOMETHANE

UN 2664

Shipping Name: Dibromomethane
Other Names: Methylene bromide
Methylene dibromide

Hazards:	**Description:**
● Irritating to skin, eyes, nose and lungs ● Container may BLEVE when exposed to fire ● Vapors are heavier than air and will collect and stay in low areas ● Decomposition products upon heating include toxic hydrogen bromide	● Colorless liquid ● Sweet chloroform-like odor ● Sinks in water and is slightly soluble in water ● Nonflammable ● Vapors are heavier than air and will collect and stay in low areas
Awareness and Operational Level Training Response: ● Stay upwind and uphill ● Determine the extent of the problem ● Isolate the area of release or fire and deny entry ● For container exposed to fire evacuate the area in all directions because of the risk of BLEVE ● Evacuate or shelter in place the immediate area and downwind for a large release ● Notify local health and fire officials and pollution control agencies ● If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water	**Operational Level Training Response:** RELEASE, NO FIRE: ● Stop the release if it can be done safely from a distance ● Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release ● Ventilate confined area if it can be done without placing personnel at risk FIRE: ● Material does not burn; fight surrounding fire with an agent appropriate for the burning material ● Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely ● If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 74-95-3

p-DICHLOROBENZENE

UN 1592

Other Names: 1,4-Dichlorobenzene, PDB, Dichloricide, Parazene, Paramoth, Paradichlorobenzene

Hazards:

- Vapors are irritating to skin, eyes, nose and lungs
- Container may explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Stay upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- White solid
- Mothball-like odor
- Sinks in water and is insoluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Cover material to protect from wind, rain or spray
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

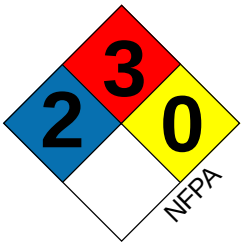
FIRE:

- Use water or foam to extinguish fire
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 106-46-7



PROPYLENE DICHLORIDE

UN 1279

Shipping Name: Propylene dichloride
Other Names: 1,2- Dichloropropane
Dichloro-1,2-propane

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Sweet, chloroform-like odor
- Sinks in water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 78-87-5

DICHLOROBUTENE

UN 2924
UN 2920

Shipping Name: Dichlorobutene
Other Names: 1,4-Dichlorobutene
1,4-Dichloro-2-butene

Hazards:

- Irritating to skin, eyes, nose and lungs; prolonged contact will cause burns
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to straw colored liquid
- Sweet odor
- Sinks slowly in water and is insoluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes between 33° F and 38° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning
  liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 110-57-6

METHYL DICHLOROACETATE

UN 2299

Shipping Name: Methyl dichloroacetate
Other Names: Dichloroacetic acid, methyl ester
Methyl dichloroethanoate

Hazards:

- Severely irritating to skin, eyes, nose and lungs; even brief contact can cause burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Combustion or decomposition products upon heating include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Sweet, ether-like odor
- Sinks and reacts slowly with water to form toxic hydrochloric acid; is slightly soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the release to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

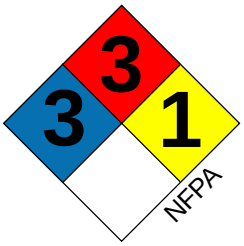
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 116-54-1



DIMETHYLDICHLOROSILANE

UN 1162

Shipping Name: Dimethyldichlorosilane
Other Names: Dichlorodimethylsilane
Dichlorodimethylsilicon
Inerton-DMCS
Inerton DW-DMC

WARNING!

- POISON! BREATHING THE VAPOR CAN KILL YOU SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER! REACTS VIOLENTLY WITH WATER TO FORM TOXIC HYDROGEN CHLORIDE!

Hazards:

- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Container may explode when exposed to fire
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Corrosive to metals when exposed to moisture producing highly flammable hydrogen gas
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay uphill and upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire, evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Clear, colorless fuming liquid
- Sharp, pungent irritating smell like hydrochloric acid
- Sinks in water and decomposes in water to release hydrochloric acid
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

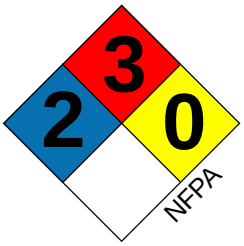
FIRE:

- If material is on fire and conditions permit, DO NOT EXTINGUISH.
- Material reacts with water but can be extinguished with low or medium expansion AFFF foam or dry chemical if available in sufficient amounts
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 75-78-5



ETHYLENE DICHLORIDE

UN 1184

Shipping Name: Ethylene dichloride

Other Names: 1,2-Dichloroethane, Ethylene chloride, Dichloroethane, 1,2-Ethlyene dichloride, Dutch oil, Freon 150

Hazards:

- Highly flammable
- Irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Sweet odor
- Sinks in water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 107-06-2

ETHYLPHENYL DICHLOROSILANE

UN 2435

Shipping Name: Ethylphenyldichlorosilane
Other Names: Dichloroethylphenylsilane

WARNING!
- POISON! BREATHING THE VAPOR CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER! REACTS VIGOROUSLY WITH WATER TO FORM TOXIC HYDROGEN CHLORIDE!

Hazards:
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

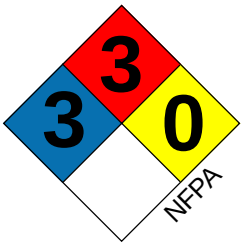
Description:
- Colorless liquid
- Sharp unpleasant odor
- Reacts with water producing toxic hydrochloric acid
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:
RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- If material is on fire and conditions permit, DO NOT EXTINGUISH.
- Material reacts with water but can be extinguished with low or medium expansion AFFF foam or dry chemical if available in sufficient amounts
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 1125-27-5



ETHYL DICHLOROSILANE

UN 1183

Shipping Name: Ethyldichlorosilane
Other Names: Dichloroethylsilane
Monoethyldichlorosilane

WARNING!
- POISON! BREATHING THE VAPORS CAN KILL YOU! SKIN AND EYE CONTACT CAN CAUSE SEVERE BURNS AND BLINDNESS
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER! REACTS WITH WATER TO FORM TOXIC HYDROCHLORIC ACID AND EXPLOSIVE HYDROGEN GAS!

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Irritating odor, similar to hydrochloric acid
- Sinks in water and reacts with water to form toxic hydrochloric acid and explosive hydrogen gas
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- If material is on fire and conditions permit, DO NOT EXTINGUISH. Cool exposures using unattended monitors.
- Material reacts with water but fire can be extinguished with medium expansion AFFF alcohol resistant foam
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

Notes: NFPA -704 designations shown in green are from NFPA49 or NFPA325. Those in black are designations assigned by the authors.
"**R**" under special situations signifies a radioactivity hazard.

DICHLOROMETHANE

UN 1593

Shipping Name: Dichloromethane
Other Names: Methylene bichloride
Methylene chloride
Methylene dichloride

Hazards:

- Harmful or fatal if swallowed; produces carbon monoxide in the body
- Combustion and decomposition products upon heating include toxic hydrogen chloride which is more toxic than the material itself
- Vapors are heavier than air and will collect and stay in low areas

Description:

- Colorless liquid
- Sweet odor
- Sinks in water and is slightly soluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:

- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Note to physician: converted to carbon monoxide in the body; if symptoms indicate; the initial treatment is oxygen

CAS: 75-09-2

METHYLDICHLOROSILANE

UN 1242

Shipping Name: Methyldichlorosilane
Other Names: Dichloromethylsilane

WARNING!

- POISON! BREATHING THE VAPOR CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER! REACTS VIOLENTLY WITH WATER TO FORM HYDROGEN CHLORIDE AND EXPLOSIVE HYDROGEN GAS!

Hazards:

- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- When combined with surface moisture is corrosive to most common metals
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless, fuming liquid
- Pungent, irritating odor
- Sinks in water and reacts violently with water to form hydrochloric acid and explosive hydrogen gas
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Boils at 107° F
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- If material is on fire and conditions permit, DO NOT EXTINGUISH.
- Reacts violently with water producing explosive hydrogen gas and hydrochloric acid. Fight fire with medium expansion AFFF alcohol resistant foam or dry chemical
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 75-54-7

DICHLOROPHENYL TRICHLOROSILANE

UN 1766

Shipping Name: Dichlorophenyltrichlorosilane

WARNING!

- POISON! BREATHING THE VAPOR CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER! REACTS VIOLENTLY WITH WATER TO FORM TOXIC HYDROCHLORIC ACID!

Hazards:

- Containers may BLEVE when exposed to fire
- Decomposition products upon heating include toxic hydrogen chloride
- Corrosive to common metals in the presence of moisture releasing flammable hydrogen gas

Description:

- Straw colored liquid
- Pungent odor
- Sinks in water and reacts vigorously with water to form toxic hydrochloric acid
- Flammable

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay uphill and upwind
- Determine the extent of the problem
- Isolate a wide area around the release and call for expert help
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff water from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- If material is on fire and conditions permit, DO NOT EXTINGUISH.
- Material reacts with water but can be extinguished with low or medium expansion AFFF foam or dry chemical if available in sufficient amounts
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 27137-85-5

PHENYLDICHLOROARSINE

UN 1556

Shipping Name: Arsenic compound, liquid, n.o.s.
Other Names: Dichlorophenylarsine
Phenylarsine dichloride
TL 69

WARNING!
- POISON! BREATHING THE VAPOR, SWALLOWING THE MATERIAL OR SKIN CONTACT CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Combustion products include toxic fumes of arsine and hydrogen chloride

Awareness and Operational Level Training Response:

- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to yellow liquid
- Weak, but very unpleasant odor
- Sinks in water and is insoluble in water
- Reacts slowly with water to form toxic hydrochloric acid
- Flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at -4° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:

- Approach fire with extreme caution; consider letting fire burn
- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- DO NOT ATTEMPT RESCUE!
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention immediately
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing
- Note to physician: if symptoms indicate, treatment is like that for arsine gas

CAS: 696-28-6

DICHLOROPROPENE

UN 2047

Shipping Name: Dichloropropenes

Other Names: 1,3-D; 1,3-Dichloropropene; Dichloropropylene; Dorlone; Nemex; Telone C; Vidden D

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Irritating to skin, eyes, nose and lungs; prolonged contact with skin can cause burns
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to light yellow liquid
- Chloroform-like odor
- Sinks in water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 542-75-6

DICHLOROSILANE

UN 2189

Shipping Name: Dichlorosilane
Other Names: Dichlorosilicone

WARNING!

- POISON! BREATHING THE GAS CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- EXTREMELY FLAMMABLE! MAY IGNITE SPONTANEOUSLY IN AIR!
- DO NOT USE WATER! REACTS VIOLENTLY WITH WATER TO FORM HYDROCHLORIC ACID AND EXPLOSIVE HYDROGEN GAS!

Hazards:

- Gas is heavier than air and will collect and stay in low areas
- Container may BLEVE or explode when exposed to fire
- Gas may travel long distances to ignition sources and flashback
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic hydrogen chloride

Description:

- Colorless gas which reacts with moisture to form a white cloud
- Shipped and stored as a compressed gas
- Very irritating odor
- Reacts violently with water to form hydrochloric acid and explosive hydrogen gas
- Extremely flammable
- Gas is heavier than air and will collect and stay in low areas

Awareness and Operational Level Training Response:

- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and down wind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Use large amounts of water well away from the material to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- REACTS WITH WATER TO PRODUCE HIGHLY EXPLOSIVE HYDROGEN GAS; if fire must be fought medium expansion AFFF alcohol resistant foam can be used
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location

First Aid:

- DO NOT ATTEMPT RESCUE!
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 4109-96-0

ETHYL-BIS-(2-CHLOROETHYL)AMINE

UN 2734

Shipping Name: Amines, liquid, corrosive, flammable, n.o.s.
Other Names: 1,2'-Dichlorotriethylamine
Ethyl-S
HN1

WARNING!
- POISON! BREATHING THE VAPORS CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion or decomposition products upon heating include toxic nitrogen oxides and hydrogen chloride

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- A liquid
- Fish-like odor at low concentrations
- Sinks in water and is insoluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 538-07-8

DIESEL FUEL

NA 1993
UN 1202
Shipping Name: Diesel fuel
Other Names: Diesel
Fuel oil #2

Hazards:
- Container may BLEVE when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Vapors are heavier than air and will collect and stay in low areas

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Yellow to dark brown liquid
- Gasoline-like odor
- Floats on water and is insoluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

ETHYLENE GLYCOL DIETHYL ETHER

UN 1153

Shipping Name: Ethylene glycol diethyl ether

Other Names: 1,2-Diethoxyethane; Diethyl cellosolve; Diethyl glycol; 2-Ethoxyethyl ethyl ether; Ethyl glyme; Glyme-1

Hazards:
- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless liquid
- Sweet odor
- Floats on the surface of water and is slightly soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely

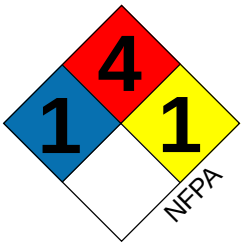
First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 629-14-1



DIETHYL ETHER

UN 1155

Shipping Name: Diethyl ether
Other Names: Diethyl oxide
Ether
Ethyl ether
Ethyl oxide

WARNING!
- EXTREMELY FLAMMABLE!
- CONTAINERS THAT HAVE BEEN STORED OR OPENED MAY CONTAIN PEROXIDES THAT MAY EXPLODE WITH FRICTION, IMPACT OR HEAT!

Hazards:
- Container may BLEVE or explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Clear colorless liquid
- Sweet pungent odor
- Floats on the surface of water and is moderately soluble in water
- Extremely flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapors
- Boils at 94° F

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

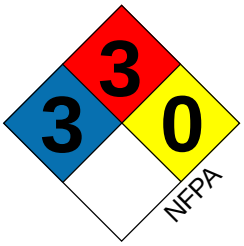
2,4-Dimethylphenol	2261	Poison	1	2	0	

Notes: NFPA -704 designations shown in green are from NFPA49 or NFPA325. Those in black are designations assigned by the authors.
"**R**" under special situations signifies a radioactivity hazard.



TRIETHYLAMINE

UN 1296

Shipping Name: Triethylamine

Other Names: (Diethylamino) ethane TEA
N,N-diethylethanamine TEN

Hazards:

- Highly flammable
- Severely irritating to skin and lungs; eye contact causes severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Liquid attacks some forms of plastics, rubber and coatings
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Stay uphill and upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Fish-like odor at low concentrations; ammonia-like odor at high concentrations
- Floats on the surface of water and is moderately soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

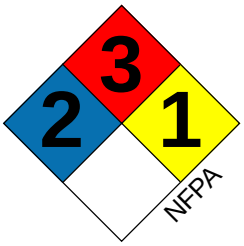
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 121-44-8



1,4-DIOXANE

UN 1165

Shipping Name: Dioxane
Other Names: 1,4-Diethylenedioxide
Diethylene ether
Diethylene oxide
p-Dioxane

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Faint ether-like odor
- Soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 53° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 123-91-1

TETRAHYDROFURAN

UN 2056

Shipping Name: Tetrahydrofuran
Other Names: Diethylene oxide
1,4-Epoxybutane
Hydrofuran
Oxacyclopentane
Tetramethylene oxide
THF

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Irritating to skin, eyes, nose and lungs; prolonged contact will cause burns
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Forms explosive peroxides upon prolonged storage
- Corrosive to some plastics

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Smells slightly fruity like acetone
- Initially floats on the surface of water and is soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

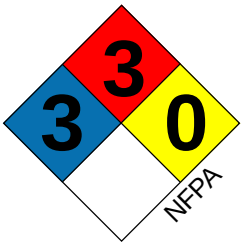
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 109-99-9



MORPHOLINE

UN 2054

Shipping Name: Morpholine
Other Names: Diethylene oximide
Diethylenimide oxide
2-H-1,4-oxazine
Tetrahydro-1,4-oxazine

Hazards:

- Severely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Fishy or ammonia-like odor
- Soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 23° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 110-91-8

1,2-DIETHYLHYDRAZINE

Hazards:

- Severely irritating to skin, eyes, nose and lungs; can cause burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- A liquid
- Fish-like odor at low concentrations; ammonia-like odor at high concentrations
- Floats on the surface of water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 1615-80-1

FLUORINE

UN 1045 (Compressed gas)
NA 9192 (Cryogenic liquid)
Shipping Name: UN 1045 Fluorine, compressed
UN 9192 Fluorine, refrigerated liquid (cryogenic liquid)
Other Names: Difluorine

WARNING!

- POISON! BREATHING THE GAS CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- STRONG OXIDIZER! FORMS EXPLOSIVE OR COMBUSTIBLE MIXTURES WITH MOST MATERIALS INCLUDING ALL FUELS AND MOST METALS!
- DO NOT USE WATER! REACTS VIOLENTLY WITH WATER TO FORM TOXIC HYDROFLUORIC ACID!

Hazards:

- Gas is heavier than air and will collect and stay in low areas
- Container may BLEVE or explode when exposed to fire
- Gas may explode in closed spaces (e.g., tanks, sewers, buildings) without an ignition source
- Contact with liquid may cause frostbite
- Corrosive to most metals

Awareness and Operational Level Training Response:

- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Pale yellow or greenish yellow gas
- Pungent, irritating choking odor
- Stored and shipped as a compressed gas or cryogenic liquid in special cylinders without relief valves
- Reacts violently with water forming toxic hydrofluoric acid
- Nonflammable but may cause combustible materials to ignite
- Gas is heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Approach fire with extreme caution; consider letting it burn.
- Material does not burn; fight surrounding fire with an agent appropriate for burning material; avoid water, if water must be used, use it in flooding quantities
- Cool exposed noncryogenic containers with large quantities of water from unattended equipment or remove containers if it can be done safely
- If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location
- DO NOT APPLY WATER TO CRYOGENIC LIQUID CONTAINERS; if cryogenic liquid containers are exposed to direct flame or elevated temperatures for prolonged times, withdraw immediately to a secure location

First Aid:

- DO NOT ATTEMPT RESCUE!
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
- Seek medical attention
- Toxic effects may be delayed
- Frostbite - warm injured area in very warm water
- For skin burns decontaminate with water and apply a clean dry dressing
- Note to physician: burns can be treated with calcium gluconate gel

CAS: 7782-41-4

OXYGEN DIFLUORIDE

UN 2190

Shipping Name: Oxygen difluoride
Other Names: Difluorine monoxide
Fluorine monoxide
Fluorine oxide

WARNING!
- EXPLOSIVE ! EXPLODES UPON CONTACT WITH AIR AND WATER!
- POISON! BREATHING THE GAS CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- STRONG OXIDIZER! WILL INCREASE THE INTENSITY OF A FIRE; MAY CAUSE FIRE UPON CONTACT WITH COMBUSTIBLES!

Hazards:
- Gas is heavier than air and will collect and stay in low areas
- Container may BLEVE or explode when exposed to fire
- Forms explosive reactions with adsorbents like silica gel, alumina and molecular sieve
- Contact with liquid may cause frostbite
- Decomposition products upon heating include toxic fluorine gas

Description:
- Colorless gas
- Foul odor
- Shipped and stored as a compressed gas
- Moderately soluble in water and reacts slowly in water to form hydrofluoric acid
- Nonflammable
- Vapors are heavier than air and will collect and stay in low areas

Awareness and Operational Level Training Response:
- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Material does not burn; fight surrounding fire with an agent other than water; if water must be used, use it in flooding quantities
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- DO NOT ATTEMPT RESCUE!
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Frostbite - warm injured area in very warm water
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing
- Note to physician: skin burns can be treated with calcium gluconate gel

CAS: 7783-41-7

DIFLUOROETHANE

UN 1030

Shipping Name: 1,1-Difluoroethane, R152a
Other Names: 1,1,-Difluoroethane
Ethylene fluoride
Freon 152

WARNING! ● EXTREMELY FLAMMABLE!

Hazards:

- Container may BLEVE or explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Contact with liquid may cause frostbite
- Combustion products include the toxic gases hydrogen fluoride

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless gas
- No odor
- Shipped and stored as a liquefied compressed gas
- May boil on the surface of water and is insoluble in water
- Extremely flammable
- Vapors are heavier than air and will collect and stay in low areas
- A liquid below -13° F
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Use large amounts of water to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed noncryogenic liquid containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location
- DO NOT APPLY WATER TO CRYOGENIC LIQUID CONTAINERS; if cryogenic liquid containers are exposed to direct flame or elevated temperatures for prolonged times, withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - ♦ Inhalation - remove the victim to fresh air and give oxygen if available
  - ♦ Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - ♦ Eye - rinse eyes with large volumes of water or saline for 15 minutes
- Seek medical attention
- Frostbite - warm injured area in very warm water
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 75-37-6

HYDROGEN PEROXIDE

(STABILIZED, GREATER THAN 60%)

UN 2015

Shipping Name: Hydrogen peroxidestabilized, greater than 60%
Other Names: Dihydrogen dioxide
Hydrogen dioxide
Hydrogen oxide

WARNING!
- CORROSIVE! MAY CAUSE SEVERE EYE AND SKIN BURNS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- STRONG OXIDIZER! WILL INCREASE THE INTENSITY OF A FIRE! MAY CAUSE FIRE UPON CONTACT WITH COMBUSTIBLES!

Hazards:
- Containers may BLEVE when exposed to heat
- Reacts with iron, copper, brass and many other metals

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire, evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless liquid
- Shipped and stored in water solution
- Sharp irritating odor
- Soluble in water
- Nonflammable but may cause combustible materials to ignite

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7722-84-1

HYDROGEN SELENIDE

(ANHYDROUS)

UN 2202

Shipping Name: hydrogen selenide, anhydrous
Other Names: Dihydrogen selenide
Selenium dihydride

WARNING!
- POISON! BREATHING THE GAS CAN KILL YOU!
- Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- EXTREMELY FLAMMABLE!

Hazards:
- Odor is not a reliable indicator of the presence of toxic amounts of gas
- Very irritating to skin, eyes, nose and lungs
- Containers may explode when exposed to fire
- Gas is heavier than air and will collect and stay in low areas
- Gas may travel long distances to ignition sources and flashback
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Awareness and Operational Level Training Response:
- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies

Description:
- Colorless gas
- Offensive odor
- Soluble in water
- Extremely flammable
- Gas is heavier than air and will collect and stay in low areas

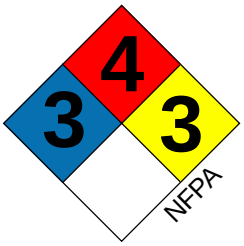
Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Use large amounts of water to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- DO NOT ATTEMPT RESCUE!
- The contaminated vicitm poses a risk to the responder
- Decontaminate the victim from a safe distance with a stream of water; have the victim remove clothing if possible; provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
- Seek medical attention
- Do NOT perform direct mouth to mouth resuscitation; use a bag/mask apparatus
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7783-07-5



ETHYLENE OXIDE

UN 1040

Other Names: Dihydrooxirene, Dimethylene oxide, 1,2-Epoxyethane, Epoxyethane, Ethenoxide, Ethyloxide, Oxane, Oxidoethane, Oxirane, Oxyacyclopropane

WARNING! ● EXTREMELY FLAMMABLE!
● MAY REACT WITH ITSELF WITHOUT WARNING WITH EXPLOSIVE VIOLENCE!

Hazards:

- Very irritating to skin, eyes, nose and lungs; prolonged contact with skin can cause burns
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may explode when exposed to fire
- Gas is heavier than air and will collect and stay in low areas
- Gas may travel long distances to ignition sources and flashback
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Contact with liquid may cause frostbite

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless gas
- Sweet ether-like odor
- Soluble in water
- Extremely flammable
- Gas is heavier than air and will collect and stay in low areas
- Shipped and stored as a liquefied gas
- Becomes a liquid below 51° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Use large amounts of water well away from the material to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

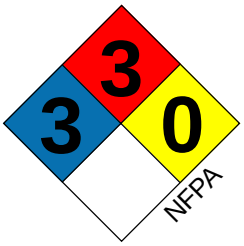
FIRE:

- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Frostbite - warm injured area in very warm water
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 75-21-8



DIISOPROPYLAMINE

UN 1158

Shipping Name: Diisopropylamine
Other Names: DIPA

Hazards:

- Severely irritating to skin, eyes, nose and lungs; skin and eye contact can cause severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Fish-like odor
- Floats on the surface of water and is slightly soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 108-18-9

N,N-DIMETHYLANILINE

UN 2253

Shipping Name: N,N-Dimethylaniline
Other Names: Dimethyl aminobenzene
Dimethylanaline
Dimethyl phenylamine

Hazards:

- May interfere with the body's ability to use oxygen
- Irritating to skin, eyes, nose and lungs; prolonged contact will cause burns
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion or decomposition products upon heating include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Pale yellow oily liquid
- No odor found
- Floats on the surface of water and is insoluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 37° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing
- Note to physician: can cause methemoglobinemia; if symptoms indicate, methylene blue is the initial antidote

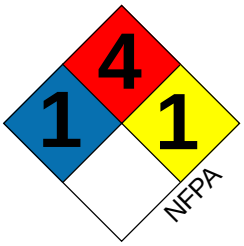
"**R**" under special situations signifies a radioactivity hazard.



DIMETHYL ETHER

UN 1033

Shipping Name: Dimethyl ether
Other Names: Methyl ether
Methyl oxide
Wood ether

WARNING! ● EXTREMELY FLAMMABLE!

Hazards:

- Exposure of cylinders to fire and flame or elevated temperatures may cause cylinder to rupture or frangible disc to burst, releasing entire contents of cylinder. Ruptured or venting cylinders may rocket through buildings and/or travel a considerable distance
- Gas is heavier than air and will collect and stay in low areas
- Gas may travel long distances to ignition sources and flashback
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin and eyes
- Contact with liquid may cause frostbite

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies

Description:

- Colorless compressed gas
- Sweet, ether-like odor
- Liquid floats on water and dissolves slowly in water
- Extremely flammable
- Gas is heavier than air and will collect and stay in low areas
- Becomes a liquid below -12° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Use large amounts of water to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

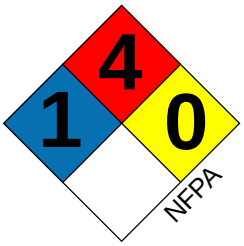
FIRE:

- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cylinders are exposed to excessive heat form fire or flame contact, withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Frostbite - warm injured area in very warm water
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 115-10-6



DIMETHYL SULFIDE

UN 1164

Shipping Name: Dimethyl sulfide
Other Names: Dimethyl monosulfide
DMS
Methyl sulfide
2-Thiopropane

WARNING! ● EXTREMELY FLAMMABLE!

Hazards:

- Container may BLEVE when exposed to fire
- Vapors may travel long distances to ignition sources and flashback
- Vapors are heavier than air and will collect and stay in low areas
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Combustion products include toxic sulfur oxides

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to pale yellow liquid
- Cabbage-like odor
- Floats on the surface of water and is insoluble in water
- Extremely flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor
- Boils at 100° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - ♦ Inhalation - remove the victim to fresh air and give oxygen if available
  - ♦ Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - ♦ Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - ♦ Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

DIMETHYL SULFATE

UN 1595

Shipping Name: Dimethyl sulfate
Other Names: Methyl sulfate
Sulfuric acid, dimethyl ester

WARNING!
- POISON! BREATHING THE VAPOR OR SWALLOWING THE LIQUID CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Odor and irritation are not reliable indicators of the presence of toxic amounts of gas
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion products include toxic sulfur oxides

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless, oily liquid
- Faint onion-like odor
- Decomposes in water to form toxic sulfuric acid
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at -25° F

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a nonflammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- The contaminated victim poses a health risk to the responder
- Decontaminate the victim from a safe distance with a stream of water; have the victim remove clothing if possible; provide Basic Life Support/CPR as needed
- Further decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Do NOT perform direct mouth to mouth resuscitation; use a bag/mask apparatus
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 77-78-1

DIMETHYLPHOSPHORO CHLORIDOTHIOATE

UN 2267

Other Names: Dimethyl thiophosphoryl chloride
Methyl PCT
Phosphorochloridothioic acid, O,O-dimethyl ester

Hazards:

- Very irritating to skin, eyes, nose and lungs; prolonged contact with skin causes burns
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Combustion and decomposition products upon heating include toxic hydrogen chloride and sulfur oxides

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to light amber liquid
- Insoluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas
- An organophosphate insecticide

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- Note to physician: an organophosphate insecticide; if symptoms indicate, atropine is the initial antidote

CAS: 2524-03-0

DIMETHYL ZINC

UN 1370

Shipping Name: Dimethylzinc
Other Names: Methyl zinc
Zinc methyl

WARNING!
- EXTREMELY FLAMMABLE! MAY IGNITE SPONTANEOUSLY IN AIR!
- DO NOT USE WATER! REACTS VIOLENTLY WITH WATER TO FORM EXPLOSIVE METHANE GAS!

Hazards:

- Severely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may BLEVE when exposed to fire
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic zinc oxide gas

Awareness and Operational Level Training Response:

- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire deny entry and call for expert help
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Liquid is odorless but burns with a garlic odor
- Reacts violently with water producing explosive methane gas
- Extremely flammable
- Autoignites at temperatures less than 0° F
- Boils at 115° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Approach fire with extreme caution; if possible let fire burn - there is a good chance of explosive re-ignition
- DO NOT USE WATER! Use dry soda ash, dry graphite or other inert powder to extinguish
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- DO NOT ATTEMPT RESCUE!
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 544-97-8

TABUN

Other Names: Dimethylamidoethoxyphosphoryl cyanide; Ethyl N,N'-dimethylphosphoramidocyanidate; GA; Gelan I; MCE; Trilon 83

WARNING!
- POISON! BREATHING THE VAPOR, SKIN OR EYE CONTACT, OR SWALLOWING THE MATERIAL CAN KILL YOU!
- Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- REACTS WITH WATER OR ACID TO PRODUCE TOXIC HYDROGEN CYANIDE!

Hazards:
- Odor is not a reliable indicator of the presence of toxic amounts of vapor
- Container may BLEVE or explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion or decomposition products upon heating include toxic nitrogen oxides and cyanide

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay uphill and upwind
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area of release or fire, deny entry and call for expert help
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless to brown liquid
- Fruit-like odor, or like bitter almonds
- Reacts quickly with water to produce toxic hydrogen cyanide and is slightly soluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas
- Very volatile
- An organophosphate insecticide used as a war nerve agent

Operational Level Training Response:
RELEASE, NO FIRE:
- BACK OFF! - Isolate a wide area around the release and call for expert help
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:
- If material is on fire and conditions permit, DO NOT EXTINGUISH. Combustion products are less toxic than the compound itself.
- If material is involved in a fire which must be extinguished, use an agent appropriate for the burning material using unattended equipment. Be aware that hydrogen cyanide is produced when the material is mixed with water.

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- The contaminated victim poses a health risk to the responder
- Decontaminate the victim from a safe distance with a stream of water; have the victim remove clothing if possible; provide Basic Life Support/CPR as needed
- Further decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Do NOT perform direct mouth to mouth resuscitation; use a bag/mask apparatus
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- Note to physician: an organophosphate insecticide; if symptoms indicate, initial treatment includes atropine

CAS: 77-81-6

DIMETHYLAMINE

(ANHYDROUS)

UN 1032

Shipping Name: Dimethylamine, anhydrous
Other Names: DMA
N-methyl-methanamine

WARNING! ● EXTREMELY FLAMMABLE!

Hazards:

- Extremely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may BLEVE or explode when exposed to fire
- Gas is heavier than air and will collect and stay in low areas
- Gas may travel long distances to ignition sources and flashback
- Containers or gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Contact with liquid can cause frostbite
- Combustion products include highly toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless gas
- Shipped or stored as a compressed liquefied gas or in water solution
- Fishy, ammonia-like odor
- Soluble in water
- Extremely flammable
- Gas is heavier than air and will collect and stay in low areas
- Becomes a liquid below 44° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the release to disperse gas - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to large areas of spilled liquid to control gas
- Ventilate confined area if it can be done without placing personnel at risk

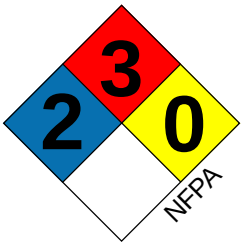
FIRE:

- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - ♦ Inhalation - remove the victim to fresh air and give oxygen if available
  - ♦ Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - ♦ Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - ♦ Swallowed - do not make the victim vomit
- Seek medical attention
- Frostbite - warm injured area in very warm water
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 124-40-3



XYLENES

UN 1307

Shipping Name: Xylenes

Other Names: 1,2-Dimethylbenzene; 1,3-Dimethylbenzene; 1,4-Dimethylbenzene; meta-Xylene; ortho-Xylene; para-Xylene; Xylol

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin and eyes

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Clear, colorless liquid
- Benzene or gasoline-like odor
- Floats on the surface of water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 1330-20-07 (mixed); 95-47-6 (ortho, o-); 108-38-3 (meta, m-); 106-42-3 (para, p-)

NEOHEXANE

UN 1208

Shipping Name: Hexanes
Other Names: 2,2-Dimethylbutane

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Petroleum-like odor
- Floats on the surface of water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 75-83-2

ISOPROPANOL

UN 1219

Shipping Name: Isopropanol

Other Names: Dimethylcarbinol, 2-Propanol, Isopropyl alcohol, sec-Propyl alcohol, 1-Methyl ethyl alcohol, Rubbing alcohol

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors may explode in closed spaces (e.g., tanks, sewers, buildings) if exposed to fire
- Irritating to skin and eyes

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Clear, colorless liquid
- Odor like rubbing alcohol
- Soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

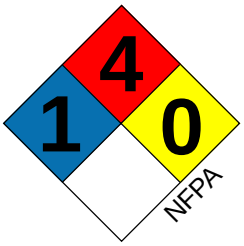
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 67-63-0



ISOBUTANE

UN 1969

Shipping Name: Isobutane
Other Names: 1,1-Dimethylethane
2-Methylpropane
Trimethylmethane

WARNING! • EXTREMELY FLAMMABLE!

Hazards:

- Containers may explode or BLEVE when exposed to fire
- Gas is heavier than air and will collect and stay in low areas
- Gas may travel long distances to ignition sources and flashback
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Contact with liquid may cause frostbite

Description:

- Colorless gas
- Gasoline-like odor
- Liquid floats on the surface of water and boils forming a visible vapor cloud; is insoluble in water
- Extremely flammable
- Gas is heavier than air and will collect and stay in low areas
- A liquid below 10° F

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of the release and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Use large amounts of water to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Frostbite - warm injured area in very warm water
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 75-28-5

DIMETHYLFORMAMIDE

UN 2265

Shipping Name: Dimethylformamide
Other Names: DMF
DMFA
N,N-Dimethyl formamide
N-Formyldimethylamine

Hazards:

- Container may BLEVE or explode when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Vapors are heavier than air and will collect and stay in low areas
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to slightly yellow liquid
- Fish-like odor
- Soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

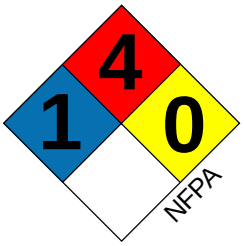
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a non-flammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 68-12-2



PROPANE

UN 1978

Shipping Name: Propane or Propane mixture
Other Names: Dimethylmethane

WARNING! • EXTREMELY FLAMMABLE!

Hazards:

- Container may explode or BLEVE when exposed to fire
- Gas is heavier than air and will collect and stay in low areas
- Gas may travel long distances to ignition sources and flashback
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Exposure to the liquid may cause frostbite

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies

Description:

- Colorless gas
- Faint petroleum-like odor
- Shipped and stored as a liquefied gas under its own pressure
- Liquid floats on the surface of water and boils; is insoluble in water
- Extremely flammable
- Gas is heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Use large amounts of water to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

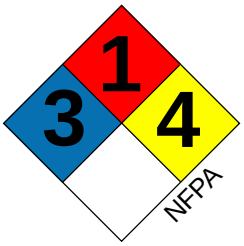
FIRE:

- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Frostbite - warm injured area in very warm water
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 74-98-6



DINITROBENZENES

UN 1597

Shipping Name: Dinitrobenzenes

Other Names: 1,2-Dinitrobenzene
1,3-Dinitrobenzene
1,4-Dinitrobenzene
m-Dinitrobenzene
o-Dinitrobenzene
p-Dinitrobenzene
Dithane A-4

WARNING!
- POISON! BREATHNIG THE VAPORS, SWALLOWING THE MATERIAL OR SKIN CONTACT CAN KILL YOU!
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- CONTAINER MAY EXPLODE WHEN EXPOSED TO HEAT OR SHOCK!

Hazards:

- May interfere with the body's ability to use oxygen
- Vapors are heavier than air and will collect and stay in low areas
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- If containers are exposed to heat or flame BACK OFF! MATERIAL WILL EXPLODE! Isolate a wide area around release deny entry and call for expert help
- Stay uphill and upwind
- Determine the extent of the problem
- Remove all ignition sources
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- White to pale yellow solid
- Sinks and dissolves slowly in water and is insoluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:
- Cover material to protect from wind, rain or spray
- Prevent material or contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- If containers are exposed to direct flame or elevated temperatures, BACK OFF to a secure location; consider letting fire burn
- Material does not readily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- Note to physician: can cause methemoglobinemia; if symptoms indicate, methylene blue is the initial antidote

CAS: 100-25-4 (para, p-) 528-29-0 (ortho, o-) 99-65-0 (meta, m-)

NITROUS OXIDE

UN 1070 (Compressed gas)
UN 2201 (Refrigerated liquid)

Shipping Name: Nitrous oxide, compressed
Nitrous oxide, refrigerated liquid

Other Names: Dinitrogen monoxide Nitrogen oxide
Laughing gas

Hazards:

- Container may explode or BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Contact with liquid may cause frostbite
- May form explosive mixtures with air at elevated temperatures
- Decomposition products upon heating include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies

Description:

- Colorless gas
- Shipped and stored as a cryogenic liquid
- Slightly sweet odor
- Soluble in water
- Nonflammable but will support combustion
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
- Seek medical attention
- Frostbite - warm injured area in very warm water

CAS: 10024-97-2

NITROGEN DIOXIDE

UN 1067

Shipping Name: Dinitrogen tetroxide, liquefied
Other Names: Dinitrogen tetroxide
Nitrogen oxide
Nitrogen tetroxide
Oxides of nitrogen

WARNING!
- POISON! BREATHING THE VAPOR CAN KILL YOU!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- STRONG OXIDIZER! WILL INCREASE THE INTENSITY OF A FIRE! MAY CAUSE FIRE UPON CONTACT WITH COMBUSTIBLES!

Hazards:

- Odor is not a reliable indicator of the presence of toxic amounts of gas
- Vapors are heavier than air and will collect and stay in low areas
- Irritating to skin, eyes, nose and lungs; can cause burns of the skin, eyes and nose
- Container may BLEVE or explode when exposed to fire
- Use water with caution - reacts with water to form nitric acid and nitrous acid
- May interfere with the body's ability to use oxygen

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Yellow liquid or red-brown gas
- Pungent, irritating odor
- Reacts with water to form toxic nitric acid
- Nonflammable but may cause combustibles to ignite
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor
- Boils at 70° F; Freezes at 17° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

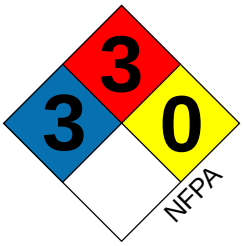
FIRE:

- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing
- Note to physician: can cause methemoglobinemia; if symptoms indicate, methylene blue is the initial antidote

CAS: 10102-44-0



DIPROPYLAMINE

UN 2383

Shipping Name: Dipropylamine
Other Names: Di-n-propylamine
N-Dipropylamine

Hazards:

- Severely irritating to skin, eyes, nose and lungs; can cause burns
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Fish-like odor at low concentrations; ammonia-like odor at high concentrations
- Floats on the surface of water and is slightly soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to knock down vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 142-84-7

OXYGEN

UN 1072 (Compressed gas)
UN 1073 (Refrigerated liquid)

Shipping Name: Oxygen, compressed
Oxygen, refrigerated liquid (cryogenic liquid)

Other Names: Dioxygen; LOX; Liquid oxygen; Molecular oxygen

WARNING! • STRONG OXIDIZER! WILL INCREASE THE INTENSITY OF A FIRE! MAY CAUSE FIRE UPON CONTACT WITH COMBUSTIBLES!

Hazards:

- Container may BLEVE or explode when exposed to fire
- Contact with liquid may cause frostbite
- Gas is heavier than air and will collect and stay in low areas

Awareness and Operational Level Training Response:

- Stay uphill and upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Notify local health and fire officials

Description:

- Colorless gas or light blue liquid; shipped and stored as a compressed gas or cryogenic liquid
- No odor
- Sinks in water and boils in water
- Nonflammable but may cause combustibles to ignite
- Gas is heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Use large amounts of water well away from the material to disperse gas - contain runoff

FIRE:

- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed noncryogenic containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location
- DO NOT APPLY WATER TO CRYOGENIC LIQUID CONTAINERS; if cryogenic liquid containers are exposed to direct flame or elevated temperatures for prolonged times, withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Seek medical attention
- Frostbite - warm injured area in very warm water

CAS: 7782-44-7

PHOSPHORUS PENTASULFIDE

UN 1340

Shipping Name: Phosphorus pentasulfide
Other Names: Diphosphorus pentasulfide
Phosphoric sulfide
Phosphorus persulfide
Sulfur phosphide
Thiophosphoric anhydride

WARNING! • DO NOT USE WATER! REACTS WITH WATER TO FORM PHOSPHORIC ACID AND HIGHLY TOXIC HYDROGEN SULFIDE!
• MATERIAL MAY PRODUCE HEAT AND SPONTANEOUSLY IGNITE IN THE PRESENCE OF MOISTURE!

Hazards:

- Vapors are heavier than air and will collect and stay in low areas
- Odor is not a reliable indicator of the presence of toxic amounts of vapor
- Container may explode when exposed to fire
- Combustion products include the toxic sulfur oxide, phosphorous pentoxide, hydrogen sulfide gases and phosphoric acid
- Interferes with the body's ability to use oxygen

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- If in a confined area STAY OUT - toxic hydrogen sulfide may be released
- Isolate the area of release or fire and deny entry
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Greenish-yellow, greenish-gray or grayish-yellow solid
- Rotten egg-like odor
- Sinks in water and reacts with water to form toxic hydrogen sulfide and phosphoric acid
- Flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Cover material to protect from wind, rain or spray
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- DO NOT allow water to come in contact with the material
- If material is on fire and conditions permit, DO NOT EXTINGUISH - fight fire with carbon dioxide or dry chemical if available in sufficient amounts
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other sign of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- Note to physician: can cause sulfhemglobinemia; if symptoms indicate, amyl nitrate is the initial antidote

CAS: 1314-80-3

OLEUM

UN 1831

Shipping Name: Sulfuric acid, fuming
Other Names: Disulfuric acid
Fuming sulfuric acid

WARNING!
- POISON! BREATHING THE VAPORS OR SWALLOWING THE MATERIAL CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- STRONG OXIDIZER! WILL INCREASE THE INTENSITY OF A FIRE! MAY CAUSE FIRE UPON CONTACT WITH COMBUSTIBLES!

Hazards:

- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Decomposition products upon heating include toxic sulfur oxides
- Corrosive to most metals

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless oily, fuming liquid
- Choking odor
- Produces heat when mixed with water and is soluble in water
- Nonflammable but may cause combustibles to ignite
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:
- Material does not burn; fight surrounding fire with an agent other than water; if water must be used, use it in flooding quantities
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 8014-95-7

DIMETHYL DISULFIDE

UN 2381

Shipping Name: Dimethyl disulfide
Other Names: Dithiabutane
Methyl disulfide

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Combustion products include toxic sulfur oxides

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire, evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- A liquid
- Odor like human waste
- Sinks in water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 624-92-0

FURAN

UN 2389

Shipping Name: Furan
Other Names: Divinylene Oxide
Oxacyclopentadiene

WARNING! • EXTREMELY FLAMMABLE!

Hazards:

- Very irritating to skin, eyes, nose and lungs; prolonged contact can cause burns to eyes
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Description:

- Clear colorless liquid that turns brown upon standing
- Mild pleasant odor
- Floats on the surface of water and is slightly soluble in water
- Extremely flammable
- Vapors are heavier than air and will collect and stay in low areas
- Boils at 90° F
- Produces large amounts of vapors

Awareness and Operational Level Training Response:

- Stay uphill and upwind
- Determine the extent of the problem
- Isolate the area of the release and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

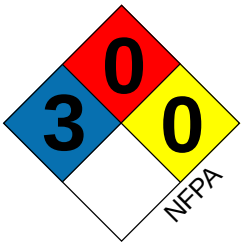
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 110-00-9



PENTACHLOROPHENOL

UN 3155

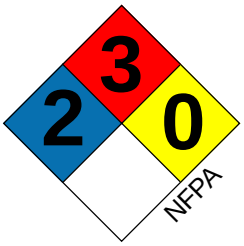
Shipping Name: Pentachlorophenol
Other Names: Dowcide 7
PCP
Woodtreat

Hazards:	**Description:**
● Irritating to skin, eyes, nose and lungs; prolonged contact with skin can cause burns ● Container may explode when exposed to fire ● Decomposition products upon heating include toxic hydrogen chloride ● Solutions of material are flammable	● Colorless to grey solid ● Sweet phenol-like odor ● Sinks in water and is insoluble in water ● Nonflammable ● May be shipped and stored as a solution in a flammable solvent
Awareness and Operational Level Training Response: ● Stay upwind ● Determine the extent of the problem ● Isolate the area of release or fire and deny entry ● Notify local health and fire officials and pollution control agencies ● If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water	**Operational Level Training Response:** RELEASE, NO FIRE: ● Cover material to protect from wind, rain or spray ● Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release ● Ventilate confined area if it can be done without placing personnel at risk FIRE: ● Solid material does not burn; fight surrounding fire with an agent appropriate for the burning material ● Material in solution will burn, fight fire with foam or water ● Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely ● If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 87-86-5



ETHYLBENZENE

UN 1175

Shipping Name: Ethylbenzene
Other Names: EB
Phenylethane

Hazards:

- Highly flammable
- Irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g.. tanks, sewers, buildings) may explode when exposed to fire

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Sweet, gasoline-like odor
- Floats on the surface of water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 100-41-4

ETHYLENE GLYCOL MONOMETHYL ETHER

UN 1188

Shipping Name: Ethylene glycol monomethyl ether

Other Names:		
	EGM	2-Methoxyethanol
	EGME	Ethylene glycol methyl ether
	Methyl cellosolve	Glycol methyl ether

Hazards:
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flash back
- Slightly irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless liquid
- Mild, sweet, ether-like smell
- Initially floats on the surface of water and is soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

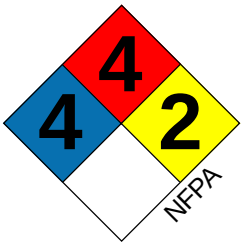
Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 109-86-4



PHOSPHORUS

UN 1381 (Dry, under water or in water solution)
UN 2447 (White molten)

Shipping Name: UN 2447 Phosphorus, white, molten
UN 1381 Phosphorus white, dry or under water or in solution; Phosphorus, yellow dry or under water or in solution.

Other Names: Elemental phosphorus; White phosphorus; Molten phosphorus; Yellow phosphorus

WARNING!
- POISON! BREATHING THE VAPORS OR SWALLOWING THE MATERIAL CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Fire fighting gear including SCBA does not provide adequate protection. If exposure to the chemical occurs, remove and isolate gear immediately and thoroughly decontaminate personnel.
- EXTREMELY FLAMMABLE! WILL BURN SPONTANEOUSLY UPON CONTACT WITH AIR!

Hazards:
- Will re-ignite after fire is extinguished if still exposed to air

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of spill or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

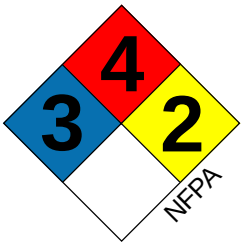
Description:
- Soft waxy solid
- Sharp garlic-like smell
- Sinks in water and is slightly soluble in water
- Stable under water or when excluded from air; burns spontaneously in air
- Extremely flammable
- Melts at 111° F to a yellow or white liquid

Operations Level Training Response:
RELEASE, NO FIRE:
- Flood with water spray or fog
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release

FIRE:
- Fight fire with large amounts of water spray or fog, dry chemical, earth or sand
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support (CPR) as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7723-14-0



PROPYLENE OXIDE

UN 1280

Shipping Name: Propylene oxide
Other Names: 1,2-Epoxypropane
Epoxy propane
Methyloxirane
Propene oxide

WARNING!
- EXTREMELY FLAMMABLE!
- MAY REACT WITH ITSELF BLOCKING RELIEF VALVES AND LEADING TO TANK EXPLOSION!

Hazards:

- Severely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Clear colorless liquid
- Sweet ether-like odor
- Soluble in water
- Shipped under a blanket of nitrogen
- Extremely flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor
- Boils at 94° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, vent sound suddenly increases and/or unexpectedly stops, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 75-56-9

STYRENE OXIDE

Other Names: Epoxyethylbenzene
2-Phenyloxirane
Styrene-7,8-oxide

WARNING! • MAY REACT WITH ITSELF WITHOUT WARNING BLOCKING RELIEF VALVES LEADING TO CONTAINER EXPLOSION!

Hazards:
- Irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- May react vigorously with water in the presence of acids or alkalis

Description:
- Colorless to yellow liquid
- Sweet odor
- Sinks in water and is insoluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

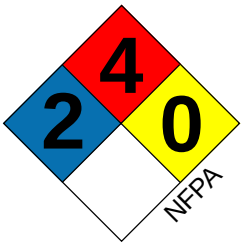
Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, vent sound suddenly increases and/or unexpectedly stops, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 96-09-3



ETHYL MERCAPTAN

UN 2363

Shipping Name: Ethyl mercaptan

Other Names: Ethanethiol, Ethyl hydrosulfide, Ethyl sulfhydrate, Thioethanol, Thioethylalcohol

WARNING! ● EXTREMELY FLAMMABLE!

Hazards:

- Container may BLEVE when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Odor is not a reliable indicator of the presence of toxic amounts of gas
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic sulfur oxides

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Skunk-like odor; smells like garlic at low concentrations
- Moderately soluble and floats on the surface of water
- Extremely flammable
- Vapors are heavier than air and will collect and stay in low areas
- Boils at 94° F
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

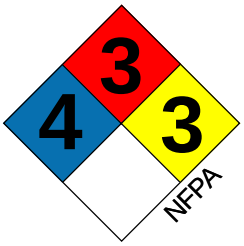
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 75-08-1



PROPARGYL ALCOHOL

NA 1986

Shipping Name: Propargyl alcohol
Other Names: Ethinylcarbinol
3-Hydroxy-1-propyne
2-Propynol
Propynyl alcohol

WARNING!
- POISON! BREATHING THE VAPOR, SWALLOWING THE MATERIAL OR SKIN CONTACT CAN KILL YOU!
- Firefighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- MAY REACT WITH ITSELF WITHOUT WARNING WITH EXPLOSIVE VIOLENCE!

Hazards:

- Highly flammable
- Very irritating to skin, eyes, nose and lungs
- Container may BLEVE or explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to yellow liquid
- Mild, geranium-like odor
- Initially floats on the surface of water and is soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- If material is on fire and the consequences are acceptable, DO NOT EXTINGUISH.
- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

"**R**" under special situations signifies a radioactivity hazard.

ETHYLENE GLYCOL MONOETHYL ETHER

UN 1171

Shipping Name: Ethylene glycol monoethyl ether

Other Names: 2-Ethoxyethanol Ethylene glycol ethyl ether
Ethyl cellosolve Ethyl glycol

Hazards:
- Container may BLEVE when exposed to fire
- Irritating to eyes and nose
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless liquid
- Ether-like odor
- Soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a nonflammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 110-80-5

ETHYL FORMATE

UN 1190

Shipping Name: Ethyl formate
Other Names: Ethyl methanoate
Formic acid, ethyl ester
Formic ether

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose; very irritating to lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- Evacuate the immediate area and downwind for a large release
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Rum-like odor
- Floats on the surface of water and is moderately soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

Notes: NFPA -704 designations shown in green are from NFPA49 or NFPA325. Those in black are designations assigned by the authors.
"**R**" under special situations signifies a radioactivity hazard.

ETHYL THIOCYANATE

Other Names: Ethyl rhodanate
Ethyl sulfocyanate
Thiocyanic acid, ethyl ester

Hazards:

- Very irritating to skin, eyes, nose and lungs
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Decomposition products upon heating include toxic nitrogen and sulfur oxides

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to yellow liquid
- No odor found
- Floats or sinks in water depending upon the temperature and is insoluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 542-90-5

VINYL ETHYL ETHER

(INHIBITED)

UN 1302

Shipping Name: Vinyl ethyl ether, inhibited
Other Names: Ethyl vinyl ether

WARNING!
- EXTREMELY FLAMMABLE!
- MAY REACT WITH ITSELF BLOCKING RELIEF VALVES AND LEADING TO TANK EXPLOSION!

Hazards:
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Description:
- Colorless liquid
- Ether-like odor
- Floats on the surface of water and is insoluble in water
- Extremely flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor
- Boils at 96° F

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, venting suddenly stops, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 109-92-2

ETHYLENE FLUOROHYDRIN

Other Names: 2-Fluoroethanol

WARNING!
- POISON! BREATHING THE VAPOR, SKIN CONTACT OR SWALLOWING THE MATERIAL CAN KILL YOU!
- Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion and decomposition products upon heating include toxic hydrogen fluoride gas

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- A liquid
- Color and odor not found
- Soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at -15° F

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a nonflammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- The contaminated victim poses a health risk to the responder
- Decontaminate the victim from a safe distance with a stream of water; have the victim remove clothing if possible; provide Basic Life Support/CPR as needed
- Further decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Do NOT perform direct mouth to mouth resuscitation; use a bag/mask apparatus
- Toxic effects may be delayed

CAS: 371-62-0

TETRACHLOROETHYLENE

UN 1897

Shipping Name: Tetrachloroethylene

Other Names: Ethylene tetrachloride
PCE
PERC
Perchlor
Perchloroethylene
Perclene

Hazards:
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Irritating to skin, eyes, nose and lungs
- Decomposition products upon heating include toxic hydrogen chloride

Description:
- Colorless liquid
- Sweet chloroform-like odor
- Sinks in water and is insoluble in water
- Nonflammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at -8° F

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 127-18-4

PROPIONIC ACID

UN 1848

Shipping Name: Propionic acid

Other Names: Ethylformic acid, Luprisol, Methyl acetic acid, Propanoic acid, Prozoin

Hazards:

- Very irritating to skin, eyes, nose and lungs; skin and eye contact can cause severe burns and blindness
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless, oily liquid
- Pungent rancid odor
- Initially floats on the surface of water and is soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at -6° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a non-flammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 79-09-4

ETHYLTRICHLOROSILANE

UN 1196

Shipping Name: Ethyltrichlorosilane
Other Names: Trichloroethylsilane
Trichloroethyl silicon

WARNING!
- POISON! BREATHING THE VAPOR CAN KILL YOU ! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER! REACTS VIGOROUSLY WITH WATER TO FORM HYDROCHLORIC ACID AND HEAT!

Hazards:

- Highly flammable
- Container may BLEVE or explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explode
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless fuming liquid
- Intolerable pungent odor
- Reacts vigorously with water to form hydrochloric acid
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- If material is on fire and conditions permit, DO NOT EXTINGUISH.
- Material reacts with water but can be extinguished with low or medium expansion AFFF foam or dry chemical if available in sufficient amounts
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

FLUOROSILICIC ACID

UN 1778

Shipping Name: Fluorosilicic acid

Other Names: FKS, Fluosilicic acid, Hexafluosilicic Acid, Silicofluoric acid, Sand acid, Hydrogen hexafluorosilicate

WARNING!
- POISON! BREATHING THE VAPORS CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Decomposition products upon heating include toxic hydrogen fluoride
- Corrosive to glass and stoneware

Description:
- Colorless to straw colored liquid
- Unpleasant sour odor
- Soluble in water with the release of heat
- Nonflammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 63° F

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:
RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:
- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing
- Note to physician: skin burns can be treated with calcium gluconate gel

CAS: 16961-83-4

METHANESULFONYL FLUORIDE

Other Names: Fumette
MSF

WARNING!
- POISON! BREATHING THE VAPORS, SWALLOWING THE MATERIAL OR SKIN CONTACT CAN KILL YOU!
- Firefighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Vapors are heavier than air and will collect and stay in low areas
- Irritating to skin, eyes, nose and lungs even at low concentrations
- Container may BLEVE when exposed to fire
- Combustion and decomposition products upon heating include toxic hydrogen fluoride and sulfur oxides

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Clear colorless liquid
- No odor found
- Slightly soluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas

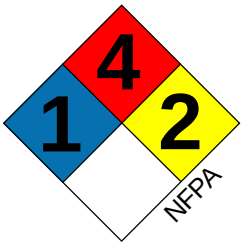
Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Approach fire with extreme caution; consider letting fire burn
- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing
- Note to physician: material is a cholinesterase inhibitor; if symptoms indicate, initial antidote is atropine. Hydrofluoric acid burns can be treated with calcium gluconate gel

CAS: 558-25-8



VINYL FLUORIDE

(INHIBITED)

UN 1860

Shipping Name: Vinyl fluoride, inhibited

Other Names: 1-Fluoroethene
Fluoroethene
Fluoroethylene
Monofluoroethene

WARNING!
- EXTREMELY FLAMMABLE!
- MAY REACT WITH ITSELF BLOCKING RELIEF VALVES AND LEADING TO TANK EXPLOSION!

Hazards:

- Container may BLEVE or explode when exposed to fire
- Gas is heavier than air and will collect and stay in low areas
- Gas may travel long distances to ignition sources and flashback
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic hydrogen fluoride gas
- Contact with liquid may cause frostbite

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies

Description:

- Colorless compressed gas
- Sweet ether-like odor
- Liquid floats on the surface of water and boils and is insoluble in water
- Extremely flammable
- Gas is heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Use large amounts of water well away from the material to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Frostbite - warm injured area in very warm water
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 75-02-5

FLUOROSULFONIC ACID

UN 1777

Shipping Name: Fluorosulfonic acid
Other Names: Fluorosulfuric acid

WARNING!

- POISON! BREATHING THE VAPORS CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER! REACTS VIOLENTLY WITH WATER TO FORM TOXIC HYDROGEN FLUORIDE AND SULFURIC ACID MIST!

Hazards:

- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Reacts with metals generating flammable hydrogen gas
- Decomposition products upon heating include toxic hydrogen fluoride and sulfur oxides

Awareness and Operational Level Training Response:

- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless fuming liquid
- Acrid odor
- Reacts violently with water forming toxic hydrofluoric and sulfuric acids
- Nonflammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor when exposed to water or moisture

Operational Level Training Response:

RELEASE, NO FIRE:

- DO NOT USE WATER DIRECTLY ON THE PRODUCT. Reacts violently with water to form toxic hydrofluoric and sulfuric acids
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:

- Material does not burn; fight surrounding fire with an agent appropriate for the burning material - if possible, do not allow water to come in contact with material; if water must be used, use it in flooding quantities
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- DO NOT ATTEMPT RESCUE!
- The contaminated victim poses a health risk to the responder
- Decontaminate the victim from a safe distance with a stream of water; have the victim remove clothing if possible; provide Basic Life Support/CPR as needed
- Further decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Do NOT perform direct mouth to mouth resuscitation; use a bag/mask apparatus
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7789-21-1

FORMALDEHYDE

(SOLUTION)

UN 1198 (Solutions, flammable)
UN 2209 (Solution)

Shipping Name: UN 1198 Formaldehyde, solutions, flammable
UN 2209 Formaldehyde, solutions with not less than 25% formaldehyde

Other Names: Formalin, Methaldehyde, Methanal, Methylaldehyde, Methylene Oxide, Oxymethylene

WARNING! ● EXTREMELY FLAMMABLE!

Hazards:

- Severely irritating; can cause burns of skin, eyes, nose and lungs
- Odor is not a reliable indicator of the presence of toxic amounts of vapor
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire, evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless or cloudy liquid
- Usually shipped as a solution in water (30 to40%) or methanol (0 to 15%)
- Pungent and irritating odor
- Soluble in water
- Extremely flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 50-00-0

ISOPROPYL FORMATE

UN 1281

Shipping Name: Propyl formates

Other Names: Formic acid isopropyl ester

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Description:

- Colorless liquid
- Pleasant smell
- Floats on the surface of water; is slightly soluble in water
- Slowly decomposes in water to form formic acid and isopropyl alcohol
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated run ff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

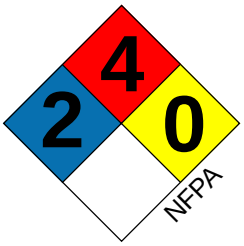
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 625-55-8



METHYL FORMATE

UN 1243

Shipping Name: Methyl formate
Other Names: Formic acid, methyl ester
Methyl methanoate

WARNING! ● EXTREMELY FLAMMABLE!

Hazards:

- Very irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Description:

- Colorless liquid
- Pleasant fruity odor
- Initially floats on the surface of water and is soluble in water
- Extremely flammable
- Vapors are heavier than air and will collect and stay in low areas
- Boils at 89° F

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of the release and deny entry
- Remove all ignition sources
- For container exposed to fire, evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam only to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 107-31-3

FURFURAL

UN 1199

Shipping Name: Furfural
Other Names: 2-Formylfuran
Furaldehyde
2-Furaldehyde
2-Furfural

Hazards:

- Extremely irritating to skin, eyes, nose and lungs
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors mat travel long distances to ignition sources and flashback
- Reacts violently upon contact with acids

Awareness and Operational Level Training Response:

- Stay uphill and upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to yellow liquid
- Almond-like odor
- Sinks in water and is moderately soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a nonflammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed

CAS: 98-01-1

SOMAN

Other Names: 3,3-Dimethyl-2-butyl methylphosphonofluoridate
GD
Pinacolyl methylphosphonofluoridate
PMFP

WARNING! • POISON! BREATHING THE VAPOR, SKIN OR EYE CONTACT, OR SWALLOWING THE MATERIAL CAN KILL YOU!
• Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Odor is not a reliable indicator of the presence of toxic amounts of vapor
- Container may BLEVE or explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion products include toxic phosphorous oxides

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay uphill and upwind
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area of release or fire, deny entry and call for expert help
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless to yellow or brown liquid
- Faint camphor-like odor
- Reacts slowly with water to form less toxic materials and is soluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas
- Very volatile
- An organophosphate insecticide used as a war nerve gas

Operational Level Training Response:
RELEASE, NO FIRE:
- BACK OFF! - Isolate a wide area around the release and call for expert help
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:
- If material is on fire and conditions permit, DO NOT EXTINGUISH. Combustion products are less toxic than the material itself.
- If material is involved in a fire which must be extinguished, use an agent appropriate for the burning material using unattended equipment.

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- The contaminated victim poses a health risk to the responder
- Decontaminate the victim from a safe distance with a stream of water; have the victim remove clothing if possible; provide Basic Life Support/CPR as needed
- Further decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Do NOT perform direct mouth to mouth resuscitation; use a bag/mask apparatus
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- Note to physician: an organophosphate insecticide; if symptoms indicate, initial treatment includes atropine

CAS: 96-64-0

HEXANE

UN 1208

Shipping Name: Hexanes
Other Names: Gettysolve B
n-Hexane

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Gasoline-like odor
- Floats on the surface of water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 110-54-3

GLYPHOSATE

Other Names: Muster
N-phosphonomethylglycine
Rodeo
Roundup

Hazards:
- Moderately irritating to eyes, nose and lungs
- Container may explode when exposed to fire
- Combustion and decomposition products upon heating include toxic phosphoric acid and nitrogen oxides

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- White solid
- Shipped and stored in solution containing at least 48% water
- No odor
- Floats on water and is slightly soluble in water
- Flammable
- An herbicide

Operational Level Training Response:

RELEASE, NO FIRE:
- Cover material to protect from wind, rain or spray
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release

FIRE:
- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 1071-83-6

METHYL IODIDE

UN 2644

Shipping Name: Methyl iodide
Other Names: Halon 10001
Iodomethane

WARNING!
- POISON! BREATHING THE VAPORS CAN KILL YOU!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Prolonged contact with eyes can cause burns
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Combustion and decomposition products upon heating include toxic hydrogen iodide

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless liquid that turns brown upon exposure to light
- Sweet odor
- Sinks in water and slowly decomposes in water; is slightly soluble in water
- Nonflammable
- Vapors are heavier than air and will collect and stay in low areas
- Boils at 108° F
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material or runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Material does not burn; fight surrounding fire with an agent appropriate for the material burning
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 74-88-4

HYDROGEN CHLORIDE

(ANHYDROUS)

UN 1050 (gas)

UN 2186 (refrigerated liquid)

Shipping Name: UN 1050 Hydrogen chloride, gas
UN 2186 Hydrogen chloride, refrigerated liquid

Other Names: HCl

WARNING!
- POISON! BREATHING THE GAS CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE or explode when exposed to fire
- Reacts with water to produce heat and hydrochloric acid
- Corrosive to common metals especially in the presence of moisture to form flammable hydrogen gas
- Contact with liquid may cause frostbite

Description:
- Colorless gas
- Shipped and stored as a cryogenic liquid
- Sharp pungent odor
- Initally sinks in water and is soluble in water
- Nonflammable
- Vapors are heavier than air and will collect and stay in low areas

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area around the release and deny
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

Perform Awareness Level Actions and:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Material does not burn; fight surrounding fire with an agent other than water; if water must be used, use it in flooding quantities
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, venting suddenly stops, tank discolors or shows any signs of deforming), withdraw immediately to a secure location
- DO NOT APPLY WATER TO CRYOGENIC LIQUID CONTAINERS, if cryogenic liquid containers are exposed to direct flame or elevated temperatures for prolonged times, withdraw to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Frostbite - warm injured area in very warm water
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7647-01-0

HEPTANES

UN 1206

Shipping Name: Heptanes
Other Names: n-Heptane

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay uphill and upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Gasoline-like odor
- Floats on the surface of water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

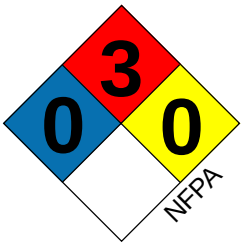
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 142-82-5



n-HEPTENE

UN 2278

Shipping Name: n-Heptene
Other Names: 1-Heptene
Heptylene

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Mildly irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Gasoline-like odor
- Floats on the surface of water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 592-76-7

METHYL BUTYL KETONE

UN 1224

Shipping Name: Ketones, n.o.s.
Other Names: 2-Hexanone
MBK
MNBK
Propylacetone

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Finger nail polish remover (acetone)-like odor
- Floats on the surface of water and is slightly soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 591-78-6

METHYL ISOBUTYL KETONE

UN 1245

Shipping Name: Methyl isobutyl ketone

Other Names:		
	Hexone	MIBK
	Isobutyl methyl ketone	MIK
	2-Methyl-4-pentanone	

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Awareness and Operational Level Training Response:

- Stay uphill and upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Mild pleasant odor
- Floats on the surface of water and is slightly soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 108-10-1

TRIS-(2-CHLOROETHYL) AMINE

Other Names: HN_3
Nitrogen mustard
2,2',2''-Trichlorotriethylamine
TS 160

WARNING!
- POISON! BREATHING THE VAPORS, SWALLOWING THE MATERIAL OR SKIN CONTACT CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Odor is not a reliable indicator of the presence of toxic amounts of gas
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Combustion products include toxic nitrogen oxides and hydrogen chloride

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Pale yellow liquid
- Faint fishy, or soap-like odor
- Slightly soluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 25° F
- Has been used as a blister-type war gas

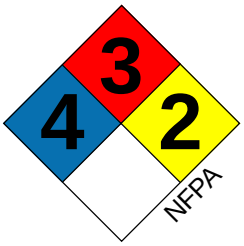
Operational Level Training Response:

RELEASE, NO FIRE:
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:
- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- The contaminated victim poses a health risk to the responder
- Decontaminate the victim from a safe distance with a stream of water; have the vicitm remove clothing if possible; provide Basic Life Support/CPR as needed
- Further decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 555-77-1



METHYLHYDRAZINE

UN 1244

Shipping Name: Methylhydrazine
Other Names: Hydrazomethane
1-Methylhydrazine
MMH
Monomethylhydrazine

WARNING!

- POISON! BREATHING THE VAPORS, SWALLOWING THE MATERIAL OR CONTACT WITH SKIN CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- HIGHLY FLAMMABLE! MAY IGNITE SPONTANEOUSLY UPON CONTACT WITH POROUS MATERIALS LIKE EARTH, WOOD OR CLOTH!

Hazards:

- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Material may burn in the absence of air
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- May interfere with the body's ability to use oxygen
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless fuming liquid
- Fishy ammonia-like odor
- Soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Used as rocket fuel

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- DO NOT ATTEMPT RESCUE!
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing
- Note to physician: can cause methemoglobinemia; if symptoms indicate, methylene blue is the initial antidote

CAS: 60-34-4

HYDROCHLORIC ACID

(SOLUTION GREATER THAN 25%)

UN 1789

Shipping Name: Hydrochloric acid, solution
Other Names: Hydrogen chloride solution
Muriatic acid

WARNING!
- POISON! BREATHING THE VAPORS CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Reacts with common metals to produce flammable hydrogen gas

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area around the release and deny
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless to light yellow liquid
- Depending upon concentration may fume upon release
- Sharp pungent irritating odor
- Soluble in water
- Nonflammable
- Vapors are heavier than air and will collect and stay in low areas

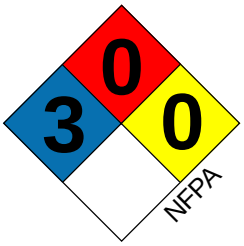
Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7647-01-0



SODIUM CYANIDE

UN 1689

Shipping Name: Sodium cyanide
Other Names: Hydrocyanic acid, sodium salt

WARNING!
- POISON! BREATHING OR SWALLOWING THE DUST, OR SKIN CONTACT CAN KILL YOU!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- CONTACT WITH CARBON DIOXIDE (CO_2) OR ACIDS WILL RELEASE CYANIDE GAS!

Hazards:
- Decomposition products upon heating include toxic cyanide and nitrogen oxides
- Corrosive to aluminum

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterway, notify downstream users of potentially contaminated water

Description:
- Colorless solid
- Odorless or almond-like odor
- Dissolves in water
- Nonflammable

Operational Level Training Response:
RELEASE, NO FIRE:
- Cover material to protect from wind, rain or spray
- Prevent runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- DO NOT USE CARBON DIOXIDE (CO_2) EXTINGUISHERS ON FIRE; releases toxic hydrogen cyanide gas
- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- The contaminated victim poses a health risk to the responder
- Decontaminate the victim from a safe distance with a stream of water; have the victim remove clothing if possible; provide Basic Life Support/CPR as needed
- Further decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Do NOT perform direct mouth to mouth resuscitation; use a bag/mask apparatus
- Note to physician: can produce cyanide toxicity; if symptoms indicate, initial treatment includes the cyanide antidote kit

CAS: 143-33-9

HYDROFLUORIC ACID

UN 1790

Shipping Name: Hydrofluoric acid, solution
Other Names: Hydrogen fluoride, solution

WARNING!
- POISON! BREATHING THE VAPORS, SWALLOWING THE LIQUID OR SKIN CONTACT CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Container may BLEVE when exposed to fire
- Reacts with most metals to form flammable and explosive hydrogen gas
- Corrosive to most metals

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated run off enters waterway, notify downstream users of potentially contaminated water

Description:
- Colorless liquid
- Shipped and stored as a 40% to 70% solution of hydrogen fluoride in water
- Irritating odor
- Soluble in water
- Nonflammable

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing
- Note to physician: skin burns can be treated with calcium gluconate gel

CAS: 7664-39-3

HYDROGEN

UN 1049 (Compressed gas)
UN 1966 (Cryogenic liquid)
Shipping Name: UN 2029 Hydrogen, compressed
UN 1966 Hydrogen, refrigerated liquid
(cryogenic liquid)

WARNING! ● EXTREMELY FLAMMABLE! BURNS WITH AN INVISIBLE FLAME EVEN IN THE DARK!
● CONTAINER MAY EXPLODE WHEN EXPOSED TO FIRE!

Hazards:
- Gas may travel long distances to ignition sources and flashback
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- High pressure releases often ignite without any apparent source of ignition
- Exposure to the liquid may cause frostbite

Awareness and Operational Level Training Response:
- Stay upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials

Description:
- Colorless compressed gas or cryogenic liquid
- No odor
- Insoluble in water
- Extremely flammable
- Gas is lighter than air

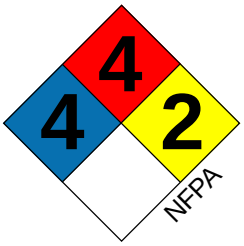
Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed noncryogenic containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location
- DO NOT APPLY WATER TO CRYOGENIC LIQUID CONTAINERS; if cryogenic liquid containers are exposed to direct flame or elevated temperatures for prolonged times, withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - ♦ Inhalation - remove the victim to fresh air and give oxygen if available
- Seek medical attention
- Frostbite - warm injured area in very warm water
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 1333-74-0



PHOSPHINE

UN 2199

Shipping Name: Phosphine
Other Names: Hydrogen phosphide
Phosphorous hydride
Phosphorous trihydride

WARNING!
- POISON! BREATHING THE GAS CAN KILL YOU!
- Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- EXTREMELY FLAMMABLE! MAY IGNITE SPONTANEOUSLY UPON EXPOSURE TO AIR!

Hazards:

- Gas is heavier than air and will collect and stay in low areas
- Odor is not a reliable indicator of the presence of toxic amounts of gas
- Container may BLEVE or explode when exposed to fire
- Gas may travel long distances and flashback
- Gas may explode in closed spaces (e.g., tanks, sewers, buildings)
- Irritating to skin, eyes, nose and lungs
- Contact with liquid may cause frostbite

Awareness and Operational Level Training Response:

- DO NOT ATTEMPT RESCUE!
- Stay uphill and upwind
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies

Description:

- A colorless gas
- Garlic or fish-like odor
- Shipped and stored in cylinders as liquefied compressed gas
- Liquid floats and boils on the surface of water and is insoluble in water
- Extremely flammable
- Gas is heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location

First Aid:

- DO NOT ATTEMPT RESCUE!
- Provide Basic Life Support/CPR as needed
- Further decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
- Seek medical attention
- Toxic effects may be delayed
- Frostbite - warm injured area in very warm water
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7803-51-2

SULFURIC ACID

UN 1830 (More than 51%)

Shipping Name: Sulfuric acid

Other Names: Hydrogen sulfate
Oil of Vitrol

WARNING!

- POISON! BREATHING THE VAPORS OR SWALLOWING THE MATERIAL CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- REACTS VIOLENTLY WITH WATER!

Hazards:

- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Contact with most metals produces flammable and potentially explosive hydrogen gas
- Decomposition products upon heating include toxic sulfur oxides
- Reacts violently with many organic materials including wood and paper

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to dark brown thick liquid
- No odor unless heated, then has a choking odor
- Reacts violently with water producing sulfuric acid and is soluble in water
- Nonflammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 50° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

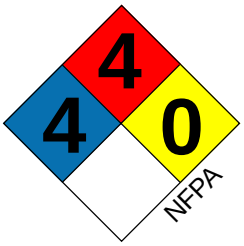
FIRE:

- Material does not burn; fight surrounding fire with an agent appropriate for the burning material; if possible, do not allow water to come in contact with the material. If material is involved in a fire, use dry chemical to extinguish; if water must be used, use it in flooding quantities
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 60 minutes and seek medical attention
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7664-93-9



HYDROGEN SULFIDE

UN 1053

Shipping Name: Hydrogen sulfide, liquefied
Other Names: Hydrosulfuric acid
Sewer gas
Sulfureted hydrogen
Sulfur hydride

WARNING!
- POISON! BREATHING THE GAS WILL KILL YOU!
- Fire fighting gear including SCBA does not provide adequate protection. If exposure to the chemical occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- EXTREMELY FLAMMABLE!

Hazards:

- Odor is not a reliable indicator of the presence of toxic amounts of gas
- Gas is heavier than air and will collect and stay in low areas
- Containers may BLEVE or explode when exposed to fire
- Gas may travel long distances to ignition sources and flashback
- Gas in confined areas (e.g., tanks, sewers buildings) may explode when exposed to fire
- Contact with liquid can cause frostbite
- Combustion products include toxic sulfur oxides
- Will burn or explode in the presence of metal oxides

Awareness and Operational Level Training Response:

- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For containers exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Notify local health and fire officials and pollution control agencies
- If contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless gas that produces a visible cloud
- Shipped and stored as liquefied compressed gas
- Rotten egg odor
- Insoluble in water
- Extremely flammable
- Gas is heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE NO FIRE:

- Stop the release if it can be done safely from a distance
- Use large amounts of water well away from the material to disperse gas - contain runoff

FIRE:

- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- DO NOT ATTEMPT RESCUE!
- The contaminated victim poses a health risk to the responder
- Decontaminate the victim from a safe distance with a stream of water; have the victim remove clothing if possible; provide Basic Life Support/CPR as needed
- Further decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
- Victims should be examined by a physician as soon as possible
- Do NOT perform direct mouth to mouth resuscitation; use a bag/mask apparatus
- Frostbite - warm injured area in very warm water
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing
- Note to physician: if symptoms indicate, initial treatment includes amyl nitrite

CAS: 7783-06-4

HYDROXYLAMINE

Other Names: Oxammonium

WARNING! ● EXPLOSIVE! CONTAINER MAY EXPLODE WHEN EXPOSED TO FIRE OR HEATED ABOVE 265°F! MAY EXPLODE AT LOWER TEMPERATURES IF MATERIAL IS EXPOSED TO AIR!

Hazards:
- May interfere with the body's ability to use oxygen
- Very irritating to skin, eyes, nose and lungs; prolonged contact with skin can cause burns
- Combustion or decomposition products upon heating include toxic nitrogen oxides

Description:
- White solid
- No odor found
- Melts at 90° F forming a colorless liquid
- Initally sinks in water and is soluble in water
- Nonflammable

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the area of release or fire and deny entry and call for expert help
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:
- Cover material to protect from wind, rain or spray
- Prevent runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Use extreme caution in approaching fire because material may explode without warning; no attempt should be made to fight fires except with unattended monitors using an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing
- Note to physician: can cause methemoglobinemia; if symptoms indicate, methylene blue is the initial antidote

CAS: 7803-49-8

HYDROXYPROPYL METHACRYLATE

Other Names: 1,2-Propanediol-1-methacrylate
Propylene glycol monomethacrylate

Hazards:	**Description:**
● Container may BLEVE when exposed to fire ● Irritating to skin, eyes, nose and lungs ● Vapors are heavier than air and will collect and stay in low areas ● At elevated temperatures, may react with itself blocking relief valves leading to container explosion	● Colorless, clear liquid ● Pungent odor ● Sinks slowly in water and is slightly soluble in water ● Flammable ● Vapors are heavier than air and will collect and stay in low areas
Awareness and Operational Level Training Response: ● Stay upwind and uphill ● Determine the extent of the problem ● Isolate the area of release or fire and deny entry ● For container exposed to fire evacuate the area in all directions because of the risk of BLEVE ● Notify local health and fire officials and pollution control agencies ● If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water	**Operational Level Training Response:** RELEASE, NO FIRE: ● Stop the release if it can be done safely from a distance ● Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release ● Use large amounts of water to disperse vapors - contain runoff ● Consider the application of foam to large areas of spilled liquid to control vapors ● Ventilate confined area if it can be done without placing personnel at risk FIRE: ● Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material ● Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely ● If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 27813-02-1

IRON PENTACARBONYL

UN 1994

Shipping Name: Iron pentacarbonyl
Other Names: Iron carbonyl
Pentacarbonyliron

WARNING! ● HIGHLY FLAMMABLE! MAY IGNITE SPONTANEOUSLY IN AIR!

Hazards:

- Container may BLEVE when exposed to fire
- Severely irritating to skin, eyes, nose and lungs
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion or decomposition products upon heating include toxic carbon monoxide

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterway, notify downstream users of potentially contaminated water

Description:

- Yellow to dark red oily liquid
- No odor found
- Sinks in water and reacts slowly with water; insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at -4° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

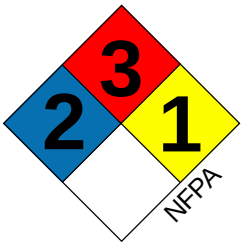
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - ♦ Inhalation - remove the victim to fresh air and give oxygen if available
  - ♦ Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - ♦ Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - ♦ Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns rinse with water and apply a clean dry dressing

CAS: 13463-40-6



MESITYL OXIDE

UN 1229

Shipping Name: Mesityl oxide

Other Names: Isobutenyl methyl ketone
Isopropylidene acetone
Methyl isobutenyl ketone
MIBK
4-Methyl-3-penten-2-one

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Irritating to skin, eyes, nose and lungs; can cause burns to eyes
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless, oily liquid
- Spearmint or honey-like odor
- Floats on the surface of water and is moderately soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 141-79-7

METHYL ISOBUTYL CARBINOL

UN 2053

Shipping Name: Methyl isobutyl carbinol

Other Names: Isobutyl methyl carbinol, MAOH, MIBC, 3-MIC, Methyl amyl alcohol, 4-Methyl-2-pentanol

Hazards:
- Irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless liquid
- Sharp, irritating odor
- Floats on the surface of water and is slightly soluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 108-11-2

ISOBUTYLENE

UN 1055

Shipping Name: Isobutylene
Other Names: 2-Methylpropene

WARNING! ● EXTREMELY FLAMMABLE!

Hazards:

- Container may BLEVE or explode when exposed to fire
- Gas is heavier than air and will collect and stay in low areas
- Gas may travel long distances to ignition sources and flashback
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Exposure to the liquid may cause frostbite

Description:

- Colorless gas
- Mild odor similar to gasoline
- Liquid floats on the surface of water and boils; is insoluble in water
- Extremely flammable
- Gas is heavier than air and will collect and stay in low areas
- Becomes a liquid below 20° F

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Use large amounts of water to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

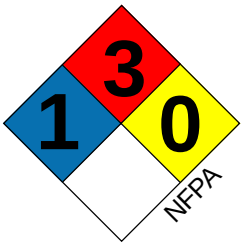
FIRE:

- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Frostbite - warm injured area in very warm water
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 115-11-7



4-METHYL-1-PENTENE

UN 2288

Shipping Name: Isohexenes
Other Names: Isobutylethene
Isohexene

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Gasoline-like odor
- Floats on the surface of water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

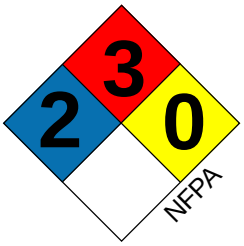
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 691-37-2



n-PROPYL BENZENE

UN 2364

Shipping Name: n-Propyl benzene
Other Names: Isocumene
1-Phenylpropane

Hazards:

- Highly flammable
- Irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Light yellow to colorless liquid
- Petroleum-like odor
- Floats on the surface of water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 103-65-1

ETHYL ISOCYANATE

UN 2481

Shipping Name: Ethyl isocyanate
Other Names: Isocyanic acid, ethyl ester
Isocyanatoethane

Hazards:

- Irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- A liquid
- No color or odor found
- Floats on the surface of water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a nonflammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 109-90-0

METHYL ISOCYANATE

UN 2480

Shipping Name: Methyl isocyanate
Other Names: Isocyanic acid, methyl ester
Methylcarbylamine
MIC

WARNING!
- POISON! BREATHING THE GAS CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER! REACTS VIOLENTLY WITH WATER OR STEAM!

Hazards:

- Odor is not a reliable indicator of the presence of toxic amounts of gas
- Vapors are heavier than air and will collect and stay in low areas
- Highly flammable
- May react with itself without warning blocking relief valves leading to violent tank explosion
- Container may explode when exposed to fire
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include hydrogen cyanide and nitrogen oxides

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Sharp pungent odor
- Reacts violently with water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Boils at 104° F
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the release to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Approach fire with extreme caution; consider letting fire burn
- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cylinders are exposed to excessive heat from fire or flame contact or if venting sound suddenly increases and/or unexpectedly stops, withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 624-83-9

ISOPRENE

(INHIBITED)

UN 1218

Shipping Name: Isoprene, inhibited
Other Names: Isopentadiene
2-Methyl-1,3-butadiene
2-Methylbutadiene

WARNING!
- EXTREMELY FLAMMABLE!
- MAY REACT WITH ITSELF BLOCKING RELIEF VALVES AND LEADING TO TANK EXPLOSION!

Hazards:
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) or containers may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless liquid
- Mild petroleum-like odor
- Floats on the surface of water and is insoluble in water
- Extremely flammable
- Vapors are heavier than air and will collect and stay in low areas
- Liquid boils at 93° F
- Produces large amounts of vapor

Operational Level Training Response:
RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, venting sound suddenly increases and/or unexpededly stops, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 78-79-5

METHYL ISOPROPENYL KETONE

(INHIBITED)

UN 1246

Shipping Name: Methyl isopropenyl ketone, inhibited
Other Names: Isopropenyl methyl ketone
2-Methyl-1-butenone
3-Methyl-3-butene-2-one

Hazards:

- Highly flammable
- May react with itself without warning blocking relief valves leading to container explosion
- Extremely irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated run \off enters waterways, notify downstream users of potentially contaminated water

Description:

- Clear, colorless liquid
- Pleasant odor
- Floats on the surface of water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, venting sound increases and/or unexpectedly stops, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 814-78-8

3-METHYL-2-BUTANONE

UN 2397

Shipping Name: 3-Methylbutan-2-one
Other Names: Isopropyl methyl ketone
3-Methylbutan-2-one
Methyl isopropyl ketone
MIPK

Hazards:

- Highly flammable
- Irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Sweet acetone-like odor
- Floats on the surface of water and is slightly soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

METHYL ISOTHIOCYANATE

UN 2477

Shipping Name: Methyl isothiocyanate

Other Names: MITC; Vorlex; Methyl mustard; MIT; Isothiocyanic acid, methyl ester

WARNING!
- POISON! BREATHING THE VAPOR OR DUST OR SWALLOWING THE DUST CAN KILL YOU!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Highly flammable
- Severely irritating to skin, eyes, nose and lungs; skin and eye contact can cause severe burns
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE or explode when exposed to fire
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic cyanides and sulfur oxides

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless solid
- Horseradish-like odor
- Sinks in water and is sightly soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Melts at 95° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Cover material to protect from wind, rain or spray
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning material. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 556-61-6

THIOUREA

NA 1325

Shipping Name: Medicines, flammable, solid, n.o.s.
Other Names: Isothiourea
Thiocarbamide
2-Thiourea

Hazards:
- Harmful or fatal if swallowed
- Irritating to skin, eyes, nose and lungs
- Container may explode when exposed to fire
- Combustion or decomposition products upon heating include toxic nitrogen and sulfur oxides

Awareness and Operational Level Training Response:
- Stay upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- White solid
- No odor found
- Sinks in water and is moderately soluble in water
- Flammable

Operational Level Training Response:

RELEASE, NO FIRE:
- Cover material to protect from wind, rain or spray
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release

FIRE:
- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 62-56-6

POTASSIUM

UN 2257

Shipping Name: Potassium
Other Names: K

WARNING!
- DO NOT USE WATER! REACTS VIOLENTLY TO FORM HIGHLY FLAMMABLE AND EXPLOSIVE HYDROGEN GAS!
- MAY IGNITE SPONTANEOUSLY IN AIR!
- DO NOT USE CARBON DIOXIDE OR HALOGENATED EXTINGUISHING AGENTS - FORMS EXPLOSIVE MIXTURES!

Hazards:

- Skin and eye contact causes severe burns and blindness
- Highly flammable
- Fumes from burning material are extremely irritating to skin, eyes, nose and lungs
- Container may explode when exposed to fire

Description:

- Silvery-white soft solid
- No odor
- Shipped and stored under oil or nitrogen
- Reacts violently with water producing highly flammable and explosive hydrogen gas
- Highly flammable

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If contaminated runoff enters waterway notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:
- DO NOT USE WATER DIRECTLY ON MATERIAL - reacts violently with water to form highly flammable hydrogen gas
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release

FIRE:
- APPROACH FIRE WITH EXTREME CAUTION; consider letting fire burn
- Do not allow water to come in contact with the material; if material is on fire use Class D extinguisher, graphite, soda ash or inert powder to extinguish
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7440-09-7

LITHIUM

UN 1415

Shipping Name: Lithium
Other Names: Li
Lithium metal

WARNING! ● DO NOT USE WATER! REACTS VIOLENTLY WITH WATER TO FORM FLAMMABLE HYDROGEN GAS AND A CAUSTIC SOLUTION!
● METAL POWDER OR SHAVINGS MAY IGNITE SPONTANEOUSLY IN AIR!

Hazards:
- Skin and eye contact causes severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Fumes from burning metal are highly irritating to skin, eyes, nose and lungs

Description:
- Silvery white solid - turns yellow upon exposure to moisture
- No odor
- Shipped and stored under inert gas, mineral oil or kerosene
- Floats on the surface of water and reacts with water to form highly flammable hydrogen gas and a caustic solution
- Very flammable

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterway, notify downstream users of potentially contaminated water

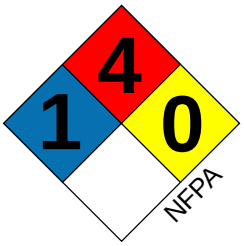
Operational Level Training Response:

RELEASE, NO FIRE:
- Cover material to protect from wind, rain or spray
- Prevent runoff from entering sewers and waterways if it can be done safely well ahead of the release

FIRE:
- DO NOT allow water to come in contact with the material; if material is on fire, use Class D extinguisher to extinguish
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7439-93-2



LIQUEFIED NATURAL GAS

(LNG)

UN 1972

Shipping Name: Liquefied natural gas
Other Names: LNG
Natural gas

WARNING!
- EXTREMELY FLAMMABLE!
- CYLINDERS EXPOSURED TO FIRE OR FLAME MAY RUPTURE AND ROCKET THROUGH BUILDING!

Hazards:
- Gas may travel long distances to ignition sources and flashback
- Odor is not a reliable indicator of the presence of toxic amounts of gas
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Gas is lighter than air but will collect and stay in low areas
- Contact with liquid may cause frostbite

Description:
- Colorless gas
- No odor or with weak skunk-like odor
- Shipped and stored as a compressed gas or cryogenic liquid
- Liquid floats and boils on the surface of water; is insoluble in water
- Extremely flammable
- Gas is lighter than air but will collect and stay in low areas

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Use large amounts of water to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed noncryogenic containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
- Seek medical attention
- Frostbite - warm injured area in very warm water
- For skin burns decontaminate with water and apply a clean dry dressing

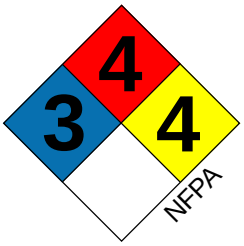
"**R**" under special situations signifies a radioactivity hazard.



PICRIC ACID

UN 0154 (dry or wetted with less than 30% water)
NA 1344 (wetted with greater than 10% water)

Shipping Name: UN 0154 Picric acid, dry or or wetted with less than 30% water
NA 1344 Picric acid, wet with not less than 10% water

Other Names: Melinite, Picral, Phenol trinitrate, Trinitrophenol

WARNING!
- EXPLOSIVE! DRY MATERIAL WILL EXPLODE UPON CONTACT WITH HEAT, FLAMES OR IF SHOCKED!
- EXTREMELY FLAMMABLE!

Hazards:

- Very irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Vapors are heavier than air and will collect and stay in low areas
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Vapors in confined areas (e.g., tanks, sewers ,buildings) may explode when exposed to fire
- Combustion products include toxic nitrogen oxides
- Corrosive to metals

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Evacuate the immediate area and down wind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Yellow solid
- No odor
- Sinks in water and is slightly soluble in water
- Extremely flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Wet material with water or foam from a safe distance
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

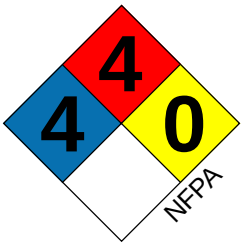
FIRE:

- Approach fire with extreme caution; consider letting fire burn
- Use water or foam to extinguish fire
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 88-89-1



METHYL MERCAPTAN

UN 1064

Other Names: Mercaptomethane
Methanethiol
Methyl sulfhydrate
Thiomethyl alcohol

WARNING!
- POISON! BREATHING THE GAS CAN KILL YOU!
- Firefighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- EXTREMELY FLAMMABLE!

Hazards:
- Gas is heavier than air and will collect and stay in low areas
- Container may BLEVE or explode when exposed to fire
- Gas may travel long distances to ignition sources and flashback
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs
- May interfere with the body's ability to use oxygen
- Combustion products include toxic sulfur oxides

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless gas
- Shipped and stored as a liquefied gas under its own vapor pressure
- Rotten cabbage-like very disagreeable odor
- Slightly soluble in water
- Extremely flammable
- Gas is heavier than air and will collect and stay in low areas
- Becomes a liquid below 43° F

Operational Level Training Response:
RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse gas - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing
- Note to physician: can cause methemoglobinemia; if symptoms indicate, methylene blue is the initial antidote

CAS: 74-93-1

METHACRYLOYL CHLORIDE

Other Names: Methacrylic acid chloride
Methylacryl chloride

Hazards:

- Extremely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion and decomposition products include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shleter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- A liquid
- Pungent, irritating odor
- Sinks slowly in water and is insoluble in water
- Reacts with water to form toxic hydrogen chloride
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 920-46-7

METHYL PHOSPHONIC DICHLORIDE

NA 9206

Shipping Name: Methyl phosphonic dichloride
Other Names: Methanephosphonyl chloride

WARNING! • DO NOT USE WATER! REACTS VIOLENTLY WITH WATER TO PRODUCE TOXIC HYDROGEN CHLORIDE VAPOR!

Hazards:

- Severely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Pungent irritating odor
- Sinks in water and reacts violently with water to form toxic hydrochloric acid
- Flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- DO NOT USE WATER DIRECTLY ON PRODUCT; reacts violently with to form toxic hydrochloric acid
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:

- DO NOT allow water to come in contact with the material; if material is on fire, use dry chemical to extinguish; if water must be used, use it in flooding quantities
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 676-97-1

METHYL tert-BUTYL ETHER

UN 2398

Shipping Name: Methyl tert-butyl ether
Other Names: t-Butyl methyl ether
2-Methoxy-2-methylpropane
MTBE

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Clear, colorless liquid
- Sharp, turpentine-like odor
- Floats on the surface of water and is moderately soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

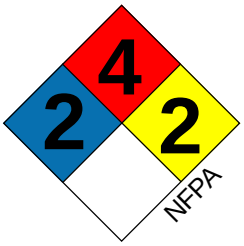
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 1634-04-4



VINYL METHYL ETHER

(INHIBITED)

UN 1087

Shipping Name: Vinyl methyl ether, inhibited
Other Names: 1-Methoxyethylene
Methoxyethylene
Methyl vinyl ether

WARNING! • EXTREMELY FLAMMABLE! CONTAINER MAY EXPLODE WHEN EXPOSED TO FIRE!
• MAY REACT WITH ITSELF BLOCKING RELIEF VALVES AND LEADING TO TANK EXPLOSION!

Hazards:

- Gas is heavier than air and will collect and stay in low aeas
- Gas may travel long distances to ignition sources and flashback
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs; prolonged contact with skin can cause burns
- Contact with liquid may cause frostbite

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless gas
- Sweet odor
- Liquid floats on the surface of water and is slightly soluble in water
- Extremely flammable
- Shipped and stored as a compressed gas
- Gas is heavier than air and will collect and stay in low areas
- A liquid below 42° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - ♦ Inhalation - remove the victim to fresh air and give oxygen if available
  - ♦ Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - ♦ Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - ♦ Swallowed - do not make the victim vomit
- Seek medical attention
- Frostbite - warm injured area in very warm water
- For skin burns decontaminate with water and apply a clean dry dressing

"**R**" under special situations signifies a radioactivity hazard.

METHYL PHOSPHONOTHIOIC DICHLORIDE

UN 1760

Shipping Name: Methyl phosphonothioic dichloride, anhydrous
Other Names: Methyl phosphorous dichloride
MPTD

WARNING! ● DO NOT USE WATER! REACTS VIOLENTLY WITH WATER TO PRODUCE HYDROGEN CHLORIDE VAPOR!

Hazards:

- Severely irritating to skin, eyes, nose and lungs; prolonged contact with the skin will cause burns
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic hydrogen chloride and sulfur oxides

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Clear liquid
- Sharp, acrid irritating smell
- Sinks in water and reacts with water producing hydrogen chloride vapor and hydrochloric acid
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at -14° F

Operational Level Training Response:

RELEASE, NO FIRE:

- DO NOT USE WATER DIRECTLY ON PRODUCT; reacts with water to form toxic hydrochloric acid
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- DO NOT ALLOW WATER TO COME IN CONTACT WITH MATERIAL; if material is on fire, use dry chemical to extinguish; if water must be used, use it in flooding quantities
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 676-98-2

METHYL THIOCYANATE

Other Names: Methyl rhodanate
Methyl sulfocyanate
Thiocyanomethane

WARNING! ● POISON! BREATHING THE VAPOR, SWALLOWING THE MATERIAL OR SKIN CONTACT WITH LIQUID CAN KILL YOU! CONVERTED TO CYANIDE IN THE BODY!
● Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Decomposition products upon heating include toxic nitrogen and sulfur oxides and hydrogen cyanide

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate a wide area around the release and deny entry
- For container exposed to fire, evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterway, notify downstream users of potentially contaminated water

Description:
- Colorless liquid
- Onion-like odor
- Sinks in water and is insoluble in water
- Nonflammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:
RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material or runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:
- Material does not burn, fight surrounding fire with an agent appropriate for the material burning
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- Note to physician: can produce cyanide toxicity; if symptoms indicate, initial treatment includes the cyanide antidote kit

CAS: 556-64-9

VINYL TOLUENE

(INHIBITED)

UN 2618

Shipping Name: Vinyl toluene inhibited

Other Names: Methyl styrene

WARNING! ● WHEN HEATED, MAY REACT WITH ITSELF WITHOUT WARNING BLOCKING RELIEF VALVES LEADING TO CONTAINER EXPLOSION!

Hazards:

- Irritating to skin, eyes, nose and lungs
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback

Description:

- Colorless liquid
- Strong, disagreeable odor
- Floats on the surface of water and is insoluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterway, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - ♦ Inhalation - remove the victim to fresh air and give oxygen if available
  - ♦ Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - ♦ Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - ♦ Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 25013-15-4

PROPYLENEIMINE

(INHIBITED)

UN 1921

Shipping Name: Propyleneimine, inhibited
Other Names: Methylaziridine

WARNING! • MAY REACT WITH ITSELF BLOCKING RELIEF VALVES LEADING TO CONTAINER EXPLOSION!

Hazards:

- Extremely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless oily liquid that fumes upon contact with air
- Strong ammonia-like smell
- Initially floats on the surface of water and is soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 75-55-8

TOLUENE

UN 1294

Shipping Name: Toluene
Other Names: Methylbenzene
Methylbenzol
Phenylmethane
Toluol
Tolu-sol

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flash back
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Pleasant odor like model glue
- Floats on water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

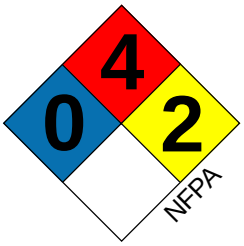
RELEASE, NO FIRE:

- Stop the release if it can be done safely
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk
- FIRE:
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 108-88-3



1,3-PENTADIENE

UN 3295

Shipping Name: Hydrocarbons, liquid, n.o.s.
Other Names: 1-Methylbutadiene
Piperylene

WARNING! • EXTREMELY FLAMMABLE!

Hazards:

- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Description:

- Colorless liquid
- Floats on the surface of water and is slightly soluble in water
- Extremely flammable
- Vapors are heavier than air and will collect and stay in low areas
- Boils at 108° F
- Produces large amounts of vapor

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterway, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 504-60-9

METHYLCYCLOPENTANE

UN 2298

Shipping Name: Methylcyclopentane
Other Names: Methylpentamethylene

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For containers exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Gasoline-like odor
- Floats on the surface of water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

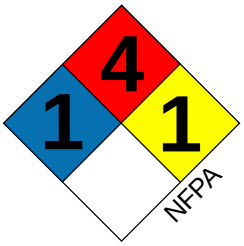
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 96-37-7



PROPYLENE

UN 1077

Shipping Name: Propylene
Other Names: Methylene, Methylethylene, 1-Propene, Propene, 1-Propylene

WARNING! • EXTREMELY FLAMMABLE!

Hazards:

- Container may BLEVE or explode when exposed to fire
- Gas is heavier than air and will collect and stay in low areas
- Gas may travel long distances to ignition sources and flashback
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Contact with liquid may cause frostbite

Awareness and Operational Level Training Response:

- Stay upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies

Description:

- Colorless gas
- Faint petroleum-like odor
- Floats on water and boils on water and is insoluble in water
- Shipped and stored as a liquefied compressed gas
- Extremely flammable
- Gas is heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Use large amounts of water to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
- Seek medical attention
- Frostbite - warm injured area in very warm water

CAS: 115-07-1

VX

Other Names: s-(2-Bis(1-methylethyl)amino)ethyl) o-ethylester
Methylphosphonothioic acid
TX 60

WARNING! • POISON! BREATHING THE VAPOR, SKIN OR EYE CONTACT, OR SWALLOWING THE MATERIAL CAN KILL YOU!
• Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Odor is not a reliable indicator of the presence of toxic amounts of vapor
- Container may BLEVE or explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:
- DO NOT ATTEMPT RESCUE!
- Stay uphill and upwind
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area of release or fire, deny entry and call for expert help
- Evacuate or shelter in place the immediate area and downwind for a large release
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless to yellow liquid
- No odor
- Sinks in water and is slightly soluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas
- An organophosphate insecticide used as a war nerve gas

Operational Level Training Response:

RELEASE, NO FIRE:
- BACK OFF! - Isolate a wide area around the release and call for expert help
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:
- If material is on fire and conditions permit, DO NOT EXTINGUISH. Combustion products are less toxic than the material itself.
- If material is involved in a fire which must be extinguished, use an agent appropriate for the burning material, using unattended equipment.

First Aid:
- DO NOT ATTEMPT RESCUE!
- The contaminated victim poses a health risk to the responder
- Decontaminate the victim from a safe distance with a stream of water; have the victim remove clothing if possible; provide Basic Life Support/CPR as needed
- Further decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Do NOT perform direct mouth to mouth resuscitation; use a bag/mask apparatus
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- Note to physician: an organophosphate insecticide; if symptoms indicate, initial treatment includes atropine

CAS: 50782-69-9

METHYLTRICHLORO SILANE

UN 1250

Shipping Name: Methyltrichlorosilane
Other Names: Trichloromethylsilane
Trichloromethylsilicon

WARNING!
- POISON! BREATHING THE VAPOR CAN KILL YOU ! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER! REACTS VIOLENTLY WITH WATER TO FORM HYDROCHLORIC ACID!

Hazards:
- Highly flammable
- Container may BLEVE or explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic hydrogen chloride

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

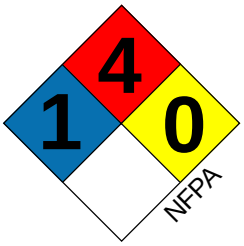
Description:
- Colorless fuming liquid
- Sharp acrid odor
- Reacts violently with water to form hydrochloric acid
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:
RELEASE, NO FIRE:
- Stop release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- If material is on fire and conditions permit, DO NOT EXTINGUISH
- Material reacts with water but can be extinguished with low or medium expansion AFFF foam or dry chemical if available in sufficient amounts
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- Skin and eye contact causes severe burns and blindness

CAS: 75-79-6



NAPHTHA

UN 1255
UN 1256
UN 1268
UN 2553

Shipping Name: Petroleum distillate, n.o.s.

Other Names: Benzin; Mineral spirits; Petroleum; Stoddard solvent; Petroleum ether; Petroleum naphtha; Petroleum solvent

WARNING! • EXTREMELY FLAMMABLE!

Hazards:

- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Description:

- Colorless to light yellow liquid
- Gasoline-like odor
- Floats on water and is insoluble in water
- Extremely flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor
- Boils between 95° F and 140° F

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and down wind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 8030-30-6

NITROBENZENE

UN 1662

Shipping Name: Nitrobenzene

Other Names: Benzene nitro, Mirbane oil, Nitrobenzol, o-Nitrobenzene, p-Nitrobenzene, Oil of bitter almonds

WARNING!
- POISON! BREATHING THE VAPOR, SWALLOWING THE MATERIAL OR SKIN CONTACT CAN KILL YOU!
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Odor is not a reliable indicator of the presence of toxic amounts of vapor
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Combustion products include toxic nitrogen oxides
- Attacks some rubbers, plastics and coatings
- May interfere with the body's ability to use oxygen

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to yellow to brownish oily liquid
- Odor like almonds or bitter almonds (some may not be able to smell it)
- Sinks in water and is insoluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- Note to physician: can cause methemoglobinemia; if symptoms indicate, methylene blue is the initial antidote

NITROTOLUENES

UN 1664

Shipping Name: Nitrotoluenes, liquid or solid

Other Names: 2-Nitrotoluene, o-Nitrotoluene, 3-Nitrotoluene, p-Nitrotoluene, 4-Nitrotoluene, 3-Nitrotoluol, m-Nitrotoluene

Hazards:

- May interfere with the body's ability to use oxygen
- Vapors are heavier than air and will collect and stay in low areas
- Irritating to skin, eyes, nose and lungs
- Container may BLEVE or explode when exposed to fire
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Yellow liquid
- Weak, aromatic odor
- Sinks in water and is insoluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 60° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- Note to physician: can cause methemoglobinemia; if symptoms indicate, methylene blue is the initial antidote

CAS: 99-08-1(m, meta-); 99-99-0 (p, para-); 88-72-2 (o, ortho-)

SARIN

Other Names: Mous-con
Phosvin
Ratal
ZP

WARNING! • POISON! BREATHING THE VAPOR, SKIN AND EYE CONTACT CAN KILL YOU!
• Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Odor is not a reliable indicator of the presence of toxic amounts of vapor
- Container may BLEVE or explode when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion products include toxic phosphorous oxides

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay uphill and upwind
- Determine the extent of the problem
- BACK OFF! - Isolate the area of release or fire, deny entry and call for expert help
- Evacuate or shelter in place the immediate area and downwind for a large release
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- A colorless liquid
- No odor
- Sinks in water and is insoluble in water
- Flammable
- Very volatile
- Vapors are heavier than air and will collect and stay in low areas
- An organophosphate insecticide used as a war nerve agent

Operational Level Training Response:

RELEASE, NO FIRE:

- BACK OFF! - Isolate a wide area around the release and call for expert help
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:

- If material is involved in a fire and conditions permit, DO NOT EXTINGUISH. Combustion products are less toxic than the material itself.
- If material is involved in a fire which must be extinguished, use an agent appropriate for the burning material using unattended equipment

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- The contaminated victim poses a health risk to the responder
- Decontaminate the victim from a safe distance with a stream of water; have the victim remove clothing if possible; provide Basic Life Support/CPR as needed
- Further decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Do NOT perform direct mouth to mouth resuscitation; use a bag/mask apparatus
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- Note to physician: an organophosphate insecticide; if symptoms indicate, initial treatment includes atropine

CAS: 107-44-8

ZINC PHOSPHIDE

UN 1714

Shipping Name: Zinc phosphide
Other Names: Mous-con
Phosvin
Ratal
ZP

WARNING! ● DO NOT USE WATER, CARBON DIOXIDE (CO_2) OR HALOGENATED FIRE FIGHTING AGENTS! HIGHLY TOXIC AND FLAMMABLE PHOSPHINE RELEASED!

Hazards:

- Highly flammable
- Harmful or fatal if swallowed
- Container may explode when exposed to fire
- Reacts with acids and water to produce highly toxic and flammable phosphine gas
- Decomposition products upon heating include toxic phosphorous oxides

Awareness and Operational Level Training Response:

- Stay upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Gray solid
- Faint garlic-like odor
- Sinks in water and reacts with water releasing highly toxic and flammable phosphine gas; is insoluble in water
- Highly flammable

Operational Level Training Response:

RELEASE, NO FIRE:

- Cover material to protect from wind, rain or spray
- Prevent runoff from entering sewers and waterways if it can be done safely well ahead of the release

FIRE:

- If material is on fire and conditions permit, DO NOT EXTINGUISH.
- Do not allow water to come in contact with the material; if material is on fire, use Class D extinguisher to extinguish
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 1314-84-7

Notes: NFPA -704 designations shown in green are from NFPA49 or NFPA325. Those in black are designations assigned by the authors.
"**R**" under special situations signifies a radioactivity hazard.

N-(2-METHYLPHENYL)-THIOUREA

Other Names: o-Tolyl thiourea
1-(2-Tolyl)thiourea

Hazards:
- Irritating to skin, eyes, nose and lungs
- Combustion and decomposition products upon heating include toxic nitrogen and sulfur oxides

Description:
- Colorless solid
- No odor
- Soluble in water
- Flammable

Awareness and Operational Level Training Response:
- Stay upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:
- Cover material to protect from wind, rain or spray
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release

FIRE:
- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 614-78-8

SODIUM

UN 1428

Shipping Name: Sodium
Other Names: Naturium

WARNING!
- DO NOT USE WATER! REACTS VIOLENTLY TO FORM HIGHLY FLAMMABLE AND EXPLOSIVE HYDROGEN GAS!
- HIGHLY FLAMMABLE! WHEN HEATED IGNITES SPONTANEOUSLY IN AIR!
- MAY REACT VIOLENTLY WITH CARBON DIOXIDE OR HALOGENATED EXTINGUISHING AGENTS!

Hazards:

- Skin and eye contact causes severe burns and blindness
- Fumes from burning material are extremely irritating to skin, eyes nose and lungs
- Container may explode when exposed to fire

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Silvery-white solid
- Shipped or stored under an inert gas or mineral oil
- No odor
- Floats on the surface of water and reacts violently with water producing flammable and explosive hydrogen gas
- Highly flammable

Operational Level Training Response:

RELEASE, NO FIRE:

- DO NOT USE WATER DIRECTLY ON MATERIAL - reacts with water to form highly flammable hydrogen gas
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release

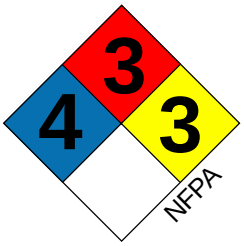
FIRE:

- APPROACH FIRE WITH EXTREME CAUTION; consider letting fire burn
- Do not allow water to come in contact with the material; if material is on fire, use graphite, Class D extinguisher, soda ash or inert powder to extinguish
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7440-23-5



NICKEL CARBONYL

UN 1259

Shipping Name: Nickel carbonyl
Other Names: Nickel tetracarbonyl
Tetracarbonyl nickel

WARNING!
- POISON! BREATHING THE VAPOR OR SWALLOWING THE MATERIAL CAN KILL YOU! RELEASES CARBON MONOXIDE IN THE BODY!
- Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- EXPLOSIVE! MATERIAL MAY EXPLODE WHEN MIXED WITH AIR AT TEMPERATURES AS LOW AS 68°F EVEN WITHOUT AN IGNITION SOURCE!

Hazards:

- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to yellow liquid
- Musty or sooty odor
- Sinks in water and is slightly soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at -2° F and boils at 109° F
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to spilled liqud to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Approach fire with extreme caution; consider letting burn
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location

First Aid:

- DO NOT ATTEMPT RESCUE!
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing
- Note to physician: converted to carbon monoxide in the body; if symptoms indicate, initial treatment includes 100% oxygen

CAS: 13463-39-3

NITRIC OXIDE

UN 1660

UN 1975 (Mixture with Dinitrogen Tetroxide)

Shipping Name: UN 1660 Nitric oxide
UN 1975 Nitric oxide and dinitrogen tetroxide mixtures or Nitric oxide and nitrogen dioxide mixture

Other Names: Nitrogen monoxide Nitrogen oxide NO

WARNING!
- POISON! BREATHING THE GAS CAN KILL YOU! SKIN AND EYE CONTACTCAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- STRONG OXIDIZER! WILL INCREASE THE INTENSITY OF A FIRE! MAY CAUSE FIRE UPON CONTACT WITH COMBUSTIBLES!

Hazards:
- Odor is not a reliable indicator of the presence of toxic amounts of gas
- Gas is heavier than air and will collect and stay in low areas
- Container may explode or BLEVE when exposed to heat or fire
- Reacts with steam or water to produce corrosive nitric acid and nitrous acid
- Contact with liquid may cause frostbite
- May interfere with the body's ability to use oxygen

Description:
- Colorless gas
- Shipped and stored as liquefied compressed gas
- Sharp unpleasant odor
- Moderately soluble in water
- Reacts with water to produce corrosive nitric acid and nitrous acid
- Nonflammable but may cause combustibles to ignite
- Gas is heavier than air and will collect and stay in low areas
- A liquid below 43°F

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Evacuate or shelter in place the immediate area and down wind for a large release
- Notify local health and fire officials and pollution control agencies

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:
- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location
- If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Frostbite - warm injured area in very warm water
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing
- Note to physician: can cause methemoglobinemia; if symptoms indicate, methylene blue is the initial antidote

CAS: 10102-43-9

NITROMETHANE

UN 1261

Shipping Name: Nitromethane
Other Names: Nitrocarbol

WARNING! ● EXPLOSIVE! MAY EXPLODE WHEN HEATED ABOVE 446°F OR SHOCKED!

Hazards:

- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Stay uphill and upwind
- Determine the extent of the problem
- Isolate a wide area around the release and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Clear colorless oily liquid
- Disagreeable odor
- Sinks in water and is moderately soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam only to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

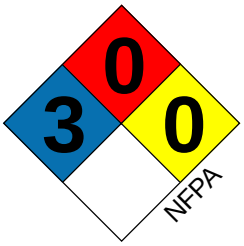
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - ♦ Inhalation - remove the victim to fresh air and give oxygen if available
  - ♦ Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - ♦ Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - ♦ Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 75-52-5



NITROGEN

UN 1066 (Compressed gas)
UN 1977 (Refrigerated liquid, Cryogenic Liquid)

Shipping Name: UN 1066 Nitrogen, compressed
UN 1977 Nitrogen, refrigerated liquid (cryogenic liquid)
Other Names: Nitrogen gas
Nitrogen liquid

Hazards:

- Odor is not a reliable indicator of the presence of toxic amounts of gas
- Cold vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE or explode when exposed to fire
- Contact with liquid may cause frostbite

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Notify local health and fire officials

Description:

- Colorless gas or faint yellow liquid
- Shipped and stored as a compressed gas or cryogenic liquid
- No odor
- Liquid floats on the surface of water and boils; gas is insoluble in water
- Nonflammable
- Cold vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed noncryogenic containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location
- DO NOT APPLY WATER TO CRYOGENIC LIQUID CONTAINERS; if cryogenic liquid containers are exposed to direct flame or elevated temperatures for prolonged times, withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
- Seek medical attention
- Frostbite - warm injured area in very warm water
- Toxic effects may be delayed

CAS: 7727-37-9

NITROSYL CHLORIDE

UN 1069

Shipping Name: Nitrosyl chloride
Other Names: Nitrogen chloride oxide
Nitrogen oxychloride

WARNING!
- POISON! BREATHING THE GAS CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- STRONG OXIDIZER! WILL INCREASE THE INTENSITY OF A FIRE! MAY CAUSE FIRE UPON CONTACT WITH COMBUSTIBLES!

Hazards:

- Gas is heavier than air and will collect and stay in low areas
- Container may BLEVE or explode when exposed to fire
- May interfere with the body's ability to use oxygen
- Decomposition products upon heating include toxic hydrogen chloride and nitrogen oxides

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Yellow to reddish gas
- Choking odor
- Reacts with water to form toxic hydrochloric acid and is soluble in water
- Nonflammable but may cause combustibles to burn
- Gas is heavier than air and will collect and stay in low areas
- Becomes a liquid at 24° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

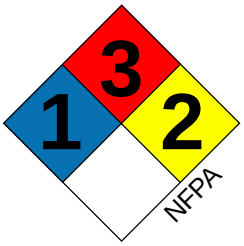
FIRE:

- Material does not burn; fight surrounding fire with an agent appropriate for the burning material; do not allow water to come in contact with the material, if water must be used, use it in flooding quantities
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing
- Note to physician: can cause methemoglobinemia; if symptoms indicate, methylene blue is the initial antidote

CAS: 2696-92-6



NITROPROPANE

UN 2608

Shipping Name: Nitropropanes
Other Names: 1-Nitropropane
2-Nitropropane

Hazards:

- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Container may BLEVE when exposed to fire
- When heated, material may decompose with explosive violence
- Irritating to skin, eyes, nose and lungs
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Mild, fruity odor
- Floats on the surface of water and is slightly soluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

TRIETHYLENETETRAMINE

UN 2259

Shipping Name: Triethylenetetramine
Other Names: N-N'-bis(2-aminoethyl)-1,2-ethanediamine
TETA
Trien

Hazards:

- Severely irritating to skin, eyes, nose and lungs; prolonged contact with skin can cause burns
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Combustion or decomposition products upon heating include toxic nitrogen oxides

Description:

- Straw colored to amber colored oily liquid
- Ammonia-like odor
- Soluble in water
- Flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 52° F

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

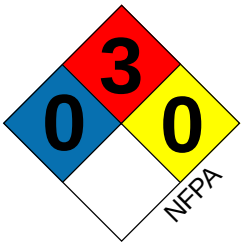
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid or dilute to a nonflammable mixture. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 112-24-3



OCTANE

UN 1262

Shipping Name: Octanes
Other Names: n-Octane

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Clear, colorless liquid
- Gasoline-like odor
- Floats on the surface of water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

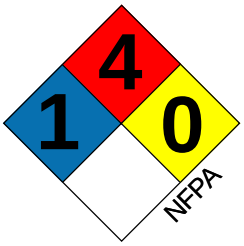
FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 111-65-9



PENTANE

UN 1265

Shipping Name: Pentanes
Other Names: n-Pentane
Skellysolve A

WARNING! • EXTREMELY FLAMMABLE!

Hazards:

- Container may BLEVE when exposed to heat or fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Description:

- Colorless liquid
- Gasoline-like odor
- Floats on the surface of water and is insoluble in water
- Extremely flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor
- Boils at 97° F

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 109-66-0

PHENYLTHIOUREA

UN 2767

Shipping name: Phenyl urea, pesticides, solid, toxic
Other Names: N-phenylthiourea
Phenylthiocarbamide
1-Phenyl-2-thiourea
PTU

WARNING! ● POISON! SWALLOWING OR BREATHING THE POWDER CAN KILL YOU!
● Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:
- Irritating to skin, eyes, nose and lungs
- Combustion or decomposition products upon heating include toxic nitrogen and sulfur oxides
- Reacts with acids to release toxic sulfur oxides

Description:
- White solid
- No odor found
- Sinks in water and is slightly soluble in water
- Very flammable

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:
- Cover material to protect from wind, rain or spray
- Prevent runoff from entering sewers and waterways if it can be done safely well ahead of the release

FIRE:
- Use water to extinguish fire
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 103-85-5

n-PROPYL CHLOROFORMATE

UN 2740

Shipping Name: n-Propyl chloroformate
Other Names: Propyl chlorocarbonate
Propyl chloroformate

Hazards:

- Highly flammable
- Very irritating to skin, eyes, nose and lungs; prolonged contact with skin can cause burns
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion and decomposition products upon heating include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterway, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Pungent, irritating odor
- Decomposes slowly in water to form toxic hydrochloric acid
- Highly flammable
- Vapors are heavier than air and will collect and stay in low area

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using alcohol resistant (AFFF) foam or dry chemical if available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 109-61-5

PROPANETHIOL

UN 2402

Shipping Name: Propanethiols
Other Names: 1-Propanethiol
n-Propyl mercaptan
Propyl mercaptan

WARNING! • EXTREMELY FLAMMABLE!

Hazards:

- Container may BLEVE when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic sulfur oxides

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Offensive, skunk-like odor
- Floats on the surface of water and is slightly soluble in water
- Extremely flammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of alcohol resistant (AFFF) foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

TURPENTINE

UN 1299

Shipping Name: Turpentine
Other Names: Oil of turpentine
Spirits of turpentine
Turpentine oil
Turpentine spirits

Hazards:

- Highly flammable
- Container may BLEVE when exposed to fire
- Vapors are heavier than air and will collect and stay in low areas
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Characteristic odor
- Floats on water and is insoluble in water
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors

PERCHLORIC ACID

(50 TO 72%)

UN 1873

Shipping Name: Perchloric acid (50 to 72%)

WARNING!
- POISON! BREATHING THE VAPOR CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- STRONG OXIDIZER! WILL INCREASE THE INTENSITY OF A FIRE! MAY CAUSE FIRE UPON CONTACT WITH COMBUSTIBLES!

Hazards:
- Vapors are heavier than air and will collect and stay in low areas
- Containers may BLEVE when exposed to fire
- Reacts vigorously with water and produces heat
- Decomposition products upon heating include toxic hydrogen chloride

Description:
- Colorless fuming liquid
- No odor
- Soluble in water
- Nonflammable but may cause combustibles to ignite
- Vapors are heavier than air and will collect and stay in low areas

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

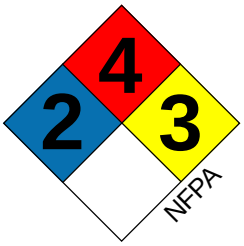
Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material or runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Approach fire with extreme caution; consider letting fire burn
- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7601-90-3



TETRAFLUOROETHYLENE
(INHIBITED)

UN 1081

Shipping Name: Tetrafluoroethylene, inhibited
Other Names: Perfluoroethylene

WARNING!
- EXTREMELY FLAMMABLE!
- MAY REACT WITH ITSELF WITHOUT WARNING BLOCKING RELIEF VALVES LEADING TO CONTAINER EXPLOSION!

Hazards:
- Container may explode when exposed to fire
- Gas is heavier than air and will collect and stay in low areas
- Gas may travel long distances to ignition sources and flashback
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Combustion products include toxic hydrogen fluoride

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies

Description:
- Colorless compressed gas
- No odor
- Insoluble in water
- Extremely flammable
- Gas is heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Use large amounts of water to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If venting sound suddenly increases and/or unexpectedly stops, withdraw immediately to a secure location

First Aid:
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
- Seek medical attention
- For skin burns decontaminate with water and apply a clean dry dressing

PHOSPHORUS TRIBROMIDE

UN 1808

Shipping Name: Phosphorus tribromide
Other Names: Phosphorus bromide
Tribromophosphine

WARNING!
- POISON! BREATHING THE VAPORS CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER! REACTS VIOLENTLY WITH WATER TO FORM TOXIC HYDROGEN BROMIDE AND PHOSPHORIC ACID!

Hazards:

- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Corrosive to most metals when moisture is present
- Decomposition products upon heating include toxic phosphine, phosphoric acid and hydrogen bromide

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to yellow liquid that fumes in moist air
- Sharp, irritating odor
- Sinks in water and reacts violently with water releasing toxic hydrobromic acid and phosphoric acid
- Nonflammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Material does not burn; fight surrounding fire with an agent appropriate for the burning material; if water must be used, use it in flooding quantites
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7789-60-8

PHOSPHORUS OXYCHLORIDE

UN 1810

Shipping Name: Phosphorus oxychloride
Other Names: Phosphorus chloride oxide
Phosphorus oxide trichloride
Phosphoryl chloride
Phosphorus oxytrichloride

WARNING!
- POISON! BREATHING THE VAPORS CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER! REACTS WITH WATER TO PRODUCE HEAT AND HYDROCHLORIC ACID!

Hazards:

- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Rapidly corrodes wet metals producing highly flammable hydrogen gas
- Decomposition products upon heating include toxic hydrogen chloride and phosphoric acid

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to slightly yellow oily liquid that fumes in moist air
- Pungent, musty disagreeable odor
- Sinks in water and reacts violently in water to form toxic hydrochloric acid and phosphoric acid
- Nonflammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at 36° F

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Material does not burn; fight surrounding fire with an agent other than water; if water must be used, use it in flooding quantities
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 10025-87-3

"**R**" under special situations signifies a radioactivity hazard.

TRICHLOROSILANE

UN 1295

Shipping Name: Trichlorosilane
Other Names: Silicochloroform
Trichloromonosilane

WARNING!

- POISON! BREATHING THE VAPORS CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- EXTREMELY FLAMMABLE! SPONTANEOUSLY COMBUSTS IN AIR!
- DO NOT USE WATER! REACTS VIOLENTLY WITH WATER TO FORM TOXIC HYDROGEN CHLORIDE AND EXTREMELY FLAMMABLE AND EXPLOSIVE HYDROGEN GAS!

Hazards:

- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Vapors may travel long distances to ignition sources and flash back
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Combustion products include toxic hydrogen chloride
- Corrosive to common metals releasing highly flammable hydrogen gas

Description:

- Colorless liquid that fumes upon contact with air
- Sharp choking odor
- Sinks in water and reacts violently with water to produce toxic hydrochloric acid and extremely flammable and explosive hydrogen gas
- Extremely flammable
- Vapors are heavier than air and will collect and stay in low areas
- Boils at 90° F
- Produces large amounts of vapor

Awareness and Operational Level Training Response:

- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- If material is on fire, and conditions permit, DO NOT EXTINGUISH.
- Material reacts with water but can be extinguished with medium expansion AFFF alcohol resistant foam
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- DO NOT ATTEMPT RESCUE!
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 10025-78-2

SILICON CHLORIDE

UN 1818

Shipping Name: Silicon tetrachloride
Other Names: Tetrachlorosilane

WARNING!
- POISON! BREATHING THE VAPORS CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER! REACTS VIOLENTLY WITH WATER TO FORM TOXIC HYDROGEN CHLORIDE!

Hazards:

- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Decomposition products upon heating include toxic hydrogen chloride
- In the presence of moisture is corrosive to most metals

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless fuming liquid
- Suffocating odor
- Sinks in water and reacts violently with water to produce silicic acid and hydrochloric acid; is insoluble in water
- Nonflammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large volumes of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Do not use water directly on the material; material reacts violently with water to produce toxic hydrochloric acid
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:

- Do not allow water to come in contact with the material; Material does not burn; fight surrounding fire with an agent appropriate for the burning material; if material is involved in a fire, use dry chemical to extinguish, if water must be used, use it in flooding quantities
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other sign of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

SULFUR TRIOXIDE

(INHIBITED)

UN 1829

Other Names: Sulfan
Sulfur anhydride
Sulfuric anhydride
Sulfuric oxide

WARNING!
- POISON! BREATHING THE VAPORS, SWALLOWING THE MATERIAL OR SKIN CONTACT CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Fire fighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER! REACTS VIOLENTLY WITH WATER TO FORM TOXIC SULFURIC ACID!

Hazards:
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE or explode when exposed to fire
- Corrosive to common metals to form flammable hydrogen gas
- Decomposition products upon heating include toxic sulfur oxides

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless to white fuming solid or liquid
- Irritating, pungent acid-like odor
- Reacts violently with water to form sulfuric acid
- Nonflammable
- Vapors are heavier than air and will collect and stay in low area
- Produces large amounts of vapor
- Freezes below 62° F and boils at 112° F

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Cover solid material to protect from wind, rain or spray
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:
- If possible, do not allow water to come in contact with the material. Material does not burn; fight surrounding fire with an agent other than water; if water must be used, use it in flooding quantities
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Victims should be examined by a physician as soon as possible
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7446-11-9

THIONYL CHLORIDE

UN 1836

Shipping Name: Thionyl chloride
Other Names: Sulfinyl chloride
Sulfur chloride oxide
Sulfurous oxychloride

WARNING!

- POISON! BREATHING THE VAPORS, SWALLOWING THE MATERIAL OR SKIN CONTACT CAN KILL YOU! SKIN AND EYE CONTACT CAN CAUSE SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER! REACTS VIOLENTLY WITH WATER TO FORM TOXIC HYDROCHLORIC ACID!

Hazards:

- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Decomposition products upon heating include toxic hydrogen chloride and sulfur oxides

Awareness and Operational Level Training Response:

- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire, deny entry and call for expert help
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated run off enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to yellow or red fuming liquid
- Suffocating, pungent odor
- Reacts violently with water to form hydrochloric acid
- Nonflammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and run off from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain run off
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Material does not burn; fight surrounding fire with an agent other than water or foam; do not allow water to come in contact with the material; if water must be used, use it in flooding quantities
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- DO NOT ATTEMPT RESCUE!
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7719-09-7

SULFURYL CHLORIDE

UN 1834

Shipping Name: Sulfuryl chloride
Other Names: Sulfonyl chloride
Sulfur oxychloride
Sulfuric oxychloride

WARNING!
- POISON! BREATHING THE VAPORS CAN KILL YOU! EXTREMELY CORROSIVE TO SKIN AND EYES! CAN CAUSE SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER! REACTS VIGOROUSLY WITH WATER TO FORM TOXIC HYDROCHLORIC AND SULFURIC ACIDS!

Hazards:
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Decomposition products upon heating include highly toxic sulfur oxides and hydrogen chloride
- Reacts with metals in the presence of moisture to release highly flammable and explosive hydrogen gas

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless liquid
- Very pungent odor
- Sinks in water and reacts vigorously with water producing toxic hydrochloric and sulfuric acids
- Nonflammable
- Vapors are heavier than air and will collect and stay in low areas
- Produces large amounts of vapor

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of release
- Use large amounts of water well away from the release to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:
- If possible, do not allow water to come in contact with the material. Material does not burn; if material is involved in a fire, fight surrounding fire with an agent other than water; if water must be used, use it in flooding quantities
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7791-25-5

SULFUR TETRAFLUORIDE

UN 2418

Shipping Name: Sulfur tetrafluoride
Other Names: Tetrafluorosulfurane

WARNING!
- POISON ! BREATHING THE GAS CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) provides NO protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER DIRECTLY ON THE MATERIAL! REACTS WITH WATER TO FORM TOXIC HYDROFLUORIC ACID!

Hazards:
- Gas is heavier than air and will collect and stay in low areas
- Container may explode or BLEVE when exposed to fire
- Decomposes upon heating to form toxic sulfur oxides and hydrogen fluoride gas
- Exposure to the liquid may cause frostbite

Awareness and Operational Level Training Response:
- DO NOT ATTEMPT RESCUE!
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies

Description:
- Colorless gas
- Distinct sulfur odor like rotten eggs
- Reacts with water to form toxic hydrofluoric acid
- Nonflammable
- Gas is heavier than air and will collect and stay in low areas
- Shipped and stored as a compressed liquefied gas

Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Use large amounts of water well away from the material to disperse the gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine gas by closing doors and shutting down HVAC systems

FIRE:
- Material does not burn; fight surrounding fire with an agent appropriate for the burning material; if possible, do not allow water to come in contact with the material. If material is involved in a fire, use dry chemical to extinguish; if water must be used, use it in flooding quantites
- If container is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove containers if it can be done safely
- Material does not burn; fight surrounding fire with an agent appropriate for the burning material

First Aid:
- DO NOT ATTEMPT RESCUE!
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
- Victims should be examined by a physician as soon as possible
- Frostbite - warm injured area in very warm water
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing
- Note to physician: skin burns can be treated with calcium gluconate gel

CAS: 7783-60-0

TOLUENE DIISOCYANATE

UN 2078

Shipping Name: Toluene diisocyanate
Other Names: 2,4-TDI
TDI
Toluene 2,4-diisocyanate

WARNING!
- POISON! BREATHING THE VAPORS, SKIN CONTACT OR SWALLOWING THE MATERIAL CAN KILL YOU!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Vapors are heavier than air and will collect and stay in low areas
- Extremely irritating to skin, eyes, nose and lungs
- Container may explode or BLEVE when exposed to fire
- May react with itself without warning blocking relief valves and causing a violent explosion
- Reacts with water releasing carbon dioxide
- Combustion or decomposition products upon heating include toxic nitrogen oxides and cyanide vapors

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- White to pale yellow liquid or solid
- Sharp pungent smell
- Sinks in water and reacts with water to form carbon dioxide
- Flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes between 67° F and 71° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Cover material to protect from wind, rain or spray
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts. Under favorable conditions, specifically trained personnel may use coordinated fog streams to extinguish burning liquid. Keep exposures cool to prevent re-ignition. Do not direct straight streams into the liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed

CAS: 584-84-9

TETRAETHYL LEAD

NA 1649

Shipping Name: Tetraethyl lead, liquid
Other Names: TEL
Tetraethylplumbane

Hazards:

- Container may BLEVE when exposed to fire
- Inhaling the vapors or absorption through the skin can cause severe lead poisoning
- Slightly irritating to skin, eyes, nose and lungs
- Vapors are heavier than air and will collect and stay in low areas

Awareness and Operational Level Training Response:

- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless oily liquid; often dyed red, orange or blue
- Pleasant fruity odor
- Sinks in water and is insoluble in water
- Very flammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at -17° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention

CAS: 78-00-2

TELLURIUM HEXAFLUORIDE

UN 2195

Shipping Name: Tellurium hexafluoride
Other Names: Tellurium fluoride

WARNING!
- POISON! BREATHING THE GAS CAN KILL YOU!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Gas is heavier than air and will collect and stay in low areas
- Container may explode when exposed to fire
- Irritating to skin, eyes, nose and lungs
- Decomposes upon heating to release toxic hydrofluoric acid and tellurium

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies

Description:

- Colorless, compressed gas
- Repulsive odor
- Decomposes slowly in water
- Nonflammable
- Gas is heavier than air and will collect and stay in low areas
- May impart a garlic-like odor to the breath and sweat after exposure

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Use large amounts of water to disperse gas - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, confine gas by closing doors and shutting down HVAC systems while evacuating the occupants

FIRE:

- Material does not burn; fight surrounding fire with an agent appropriate for the burning material
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- Note to physician: skin burns can be treated with calcium gluconate gel

CAS: 7783-80-4

TITANIUM TETRACHLORIDE

UN 1838

Shipping Name: Titanium tetrachloride
Other Names: Tetrachlorotitanium
Titanium chloride
Titanium (IV) chloride

WARNING! ● DO NOT USE WATER! REACTS WITH WATER TO FORM TOXIC HYDROCHLORIC ACID!

Hazards:

- Severely irritating; skin and eye contact causes severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Vapors are heavier than air and will collect and stay in low areas
- Containers may BLEVE when exposed to fire
- Decomposition products upon heating include toxic hydrogen chloride
- Corrosive to most metals

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Container may BLEVE when exposed to fire
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to light yellow fuming liquid
- Vapors react with moisture in air forming a white cloud
- Pungent odor
- Reacts with water to form hydrochloric acid and heat
- Nonflammable
- Vapors are heavier than air and will collect and stay in low areas
- Freezes at -11° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Material does not burn; fight surrounding fire with an agent other than water; if possible, do not allow water to come in contact with the material. If water must be used, use it in flooding quantities
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

"**R**" under special situations signifies a radioactivity hazard.

TETRANITROMETHANE

UN 1510

Shipping Name: Tetranitromethane
Other Names: Tetran
TNM

WARNING!
- EXPLOSIVE! MAY EXPLODE WHEN HEATED OR SHOCKED!
- STRONG OXIDIZER! WILL INCREASE THE INTENSITY OF A FIRE! MAY CAUSE FIRE UPON CONTACT WITH COMBUSTIBLES!

Hazards:
- Severely irritating to skin, eyes, nose and lungs; prolonged contact with skin can cause burns
- May interfere with the body's ability to use oxygen
- Vapors are lighter than air but may collect and stay in low areas
- Combustion products include toxic nitrogen oxides
- Corrosive to iron, copper, brass, zinc and rubber

Description:
- Colorless to yellow oily liquid
- Pungent to acrid biting odor
- Sinks in water and is insoluble in water
- Flammable
- Vapors are lighter than air but may collect and stay in low areas
- Freezes at 56° F

Awareness and Operational Level Training Response:
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate or shelter in place the immediate area and down wind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

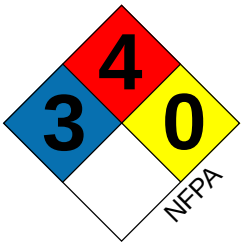
Operational Level Training Response:

RELEASE, NO FIRE:
- Stop the release if it can be done safely
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of release
- Use large amounts of water to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Approach fire with extreme caution; consider letting fire burn
- Specially trained personnel operating from a safe distance can fight fires using foam or dry chemical if available in sufficient amounts or use fog streams to extinguish burning liquid. Keep exposures cool to protect against re-ignition. Do not direct straight streams into liquid.
- Cool exposed containers with large quantities of water from unattended equipment or remove containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support (CPR) as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing
- Note to physician: can cause methemoglobinemia; if symptoms indicate, methylene blue is the initial antidote

CAS: 509-14-8



TRIMETHYLAMINE

(ANHYDROUS)

UN 1083

Shipping Name: Trimethylamine, anhydrous

Other Names: TMA

WARNING! ● EXTREMELY FLAMMABLE!
● CONTAINER MAY BLEVE OR EXPLODE WHEN EXPOSED TO FIRE!

Hazards:

- Severely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Fire fighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- Gas is heavier than air and will collect and stay in low areas
- Gas may travel long distances and flashback
- Gas in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- Contact with liquid may cause frostbite
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay uphill and upwind
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE or explosion
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless compressed gas
- Pungent fishy odor
- Completely soluble in water
- Extremely flammable
- Gas is heavier than air and will collect and stay in low areas
- May be shipped as an aqueous (water) solution; which is highly flammable and will generate large amounts of flammable gas
- A liquid below 37° F

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent contaminated runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- Do not extinguish the fire unless the flow of the gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Frostbite - warm injured area in very warm water
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 75-50-3

TRINITROTOLUENE

UN 0209 (Dry or wetted with less than 30% water)
UN 1356 (Wetted with more than 30% water)

Other Names: 2,4,6-Trinitrotoluene
TNT

WARNING! ● EXTREMELY FLAMMABLE!
● CONTAINER MAY EXPOLED WHEN EXPOSED TO FIRE!

Hazards:
- Irritating to skin, eyes, nose and lungs
- May interfere with the body's ability to use oxygen
- Combustion products include toxic nitrogen oxides

Awareness and Operational Level Training Response:
- Do not put yourself in danger by entering a contaminated area to rescue victim!
- Stay upwind and uphill
- Determine the extent of the problem
- BACK OFF! - Isolate a wide area around the release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of explosion
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Colorless to pale yellow solid
- No odor
- Sinks in water and is insoluble in water
- Very flammable

Operational Level Training Response:

RELEASE, NO FIRE:
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release

FIRE:
- If material is on fire and conditions permit, DO NOT EXTINGUISH. Cool exposures using unattended monitors. If fire must be extinguished, use any agent appropriate for the burning material.
- Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (unvented container distorts, bulges or shows any other signs of expanding), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue victim!
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- Note to physician: can cause methemoglobinemia: if symptoms indicate, methylene blue is the inital antidote

CAS: 8001-26-1

TRICHLOROACETYL CHLORIDE

UN 2442

Shipping Name: Trichloroacetyl chloride

Other Names: Trichloroacetic acid chloride

WARNING! ● DO NOT USE WATER! REACTS VIOLENTLY WITH WATER RELEASING TOXIC HYDROCHLORIC ACID!

Hazards:

- Severely irritating to skin, eyes, nose and lungs; skin and eye contact causes severe burns and blindness
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Combustion and decomposition products upon heating include toxic hydrogen chloride

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Evacuate or shelter in place the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless to yellow liquid
- Pungent, irritating smell
- Reacts violently with water to form toxic hydrochloric acid
- Flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk
- If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems

FIRE:

- Material does not easily burn; fight surrounding fire with an agent appropriate for the burning material; if possible do not allow water to come in contact with the material; if water is used, use in flooding quantities
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of expanding), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

TRIMETHOXYSILANE

NA 9269

Shipping Name: Trimethoxysilane

WARNING!
- POISON! BREATHING THE VAPORS, SWALLOWING THE MATERIAL OR SKIN CONTACT CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel

Hazards:

- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas
- Containers may BLEVE when exposed to fire
- Vapors may travel long distances to ignition sources and flashback
- Vapors in confined areas (e.g., tanks, sewers, buildings) may explode when exposed to fire
- May react with itself when heated plugging relief valves causing a violent explosion

Awareness and Operational Level Training Response:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Remove all ignition sources
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Evacuate the immediate area and downwind for a large release
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:

- Colorless liquid
- Sweet odor
- Floats on water and is insoluble in water but slowly reacts with water forming a corrosive mixture
- Highly flammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Training Response:

RELEASE, NO FIRE:

- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Consider the application of foam to large areas of spilled liquid to control vapors
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:

- If material is on fire, and conditions permit, DO NOT EXTINGUISH.
- Material reacts with water but can be extinguished with medium expansion AFFF alcohol resistant foam
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:

- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 2487-90-3

VANADIUM OXYTRICHLORIDE

UN 2443

Shipping Name: Vanadium oxytrichloride
Other Names: Vanadium oxychloride
Vanadium trichloride oxide
Vanadyl trichloride

WARNING!
- POISON! BREATHING THE VAPORS CAN KILL YOU! SKIN AND EYE CONTACT CAUSES SEVERE BURNS AND BLINDNESS!
- Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel
- DO NOT USE WATER! REACTS VIOLENTLY WITH WATER RELEASING TOXIC HYDROGEN CHLORIDE VAPOR!

Hazards:
- Vapors are heavier than air and will collect and stay in low areas
- Container may BLEVE when exposed to fire
- Corrosive to most metals in the presence of moisture
- Decomposition products upon heating include toxic hydrogen chloride

Awareness and Operational Level Response:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Stay upwind and uphill
- Determine the extent of the problem
- Isolate the area of release or fire and deny entry
- Evacuate or shelter in place the immediate area and downwind for a large release
- For container exposed to fire evacuate the area in all directions because of the risk of BLEVE
- Notify local health and fire officials and pollution control agencies
- If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated water

Description:
- Yellow liquid that becomes thick and blood red when mixed with water
- Emits red fumes upon contact with moist air
- Sharp irritating and unpleasant odor
- Sinks in water and reacts violently with water to form toxic hydrochloric acid
- Nonflammable
- Vapors are heavier than air and will collect and stay in low areas

Operational Level Response:
RELEASE, NO FIRE:
- Stop the release if it can be done safely from a distance
- Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release
- Use large amounts of water well away from the material to disperse vapors - contain runoff
- Ventilate confined area if it can be done without placing personnel at risk

FIRE:
- Material does not burn; fight surrounding fire with an agent other than water or foam; if possible, do not allow water to come in contact with material; if water must be used, use it in flooding quantities
- If material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely
- If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors or shows any signs of deforming), withdraw immediately to a secure location

First Aid:
- Do not put yourself in danger by entering a contaminated area to rescue a victim
- Provide Basic Life Support/CPR as needed
- Decontaminate the victim as follows:
  - Inhalation - remove the victim to fresh air and give oxygen if available
  - Skin - remove and isolate contaminated clothing (including shoes) and wash skin with soap and large volumes of water for 15 minutes
  - Eye - rinse eyes with large volumes of water or saline for 15 minutes
  - Swallowed - do not make the victim vomit
- Seek medical attention
- Toxic effects may be delayed
- For skin burns decontaminate with water and apply a clean dry dressing

CAS: 7727-18-6

			Refer to Page 550 for explanation of numbers			
Zinc dithionite	1931	Class 9		0	1	
Zinc fluoride	9158		2	0	0	
Zinc fluoroborate			2	0	0	
Zinc fluorosilicate	2855	Poison	2	0	0	
Zinc formate	9159		1	0	0	
Zinc nitrate	1514	Oxidizer	1	0	0	OX
Zinc oxide			0	0	0	
Zinc phenolsulfonate	9160		1	0	0	
Zinc potassium chromate			2	1	0	
Zinc sulfate	9161		0	0	0	
Zineb			1	1	1	
Ziram			1	1	0	
Zirconium	2008	Spontaneously combustible	1	4	1	
Zirconium acetate			1	0	0	
Zirconium nitrate	2728	Oxidizer	1	0	0	OX
Zirconium oxychloride			3	0	0	
Zirconium potassium fluoride	9162		2	0	0	
Zirconium sulfate	9163	Corrosive	0	0	0	
Zirconium tetrachloride	2503	Corrosive	**3**	**0**	**2**	**~~W~~**
Zylylene dichloride			2	1	0	

Notes: NFPA -704 designations shown in green are from NFPA49 or NFPA325. Those in black are designations assigned by the authors.
"**R**" under special situations signifies a radioactivity hazard.
