5.6 To measure $g$ (the acceleration due to gravity) the following experiment is carried out. A ball is dropped from the top of a $30-\mathrm{m}$-tall building. As the object is falling down, its speed $v$ is measured at various heights by sensors that are attached to the building. The data measured in the experiment is given in the table.

| $x(\mathrm{~m})$ | 0 | 5 | 10 | 15 | 20 | 25 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $v(\mathrm{~m} / \mathrm{s})$ | 0 | 9.85 | 14.32 | 17.63 | 19.34 | 22.41 |

In terms of the coordinates shown in the figure (positive down), the speed of the ball $v$ as a function of the distance $x$ is given by $v^{2}=2 g x$. Using linear
 regression, determine the experimental value of $g$.

## Solution

The equation $v^{2}=2 g x$ can be transformed into linear form by setting $Y=v^{2}$. The resulting equation, $Y=2 g x$, is linear in $Y$ and $x$ with $m=2 g$ and $b=0$. Therefore, once $m$ is determined, $g$ can be calculating using $g=\frac{m}{2}$. The calculations are done by executing the following MATLAB program (script file):

```
clear all; clc;
x=[[0 5 10 15 20 25];
y}=[\begin{array}{lllllll}{0}&{9.85}&{14.32}&{17.63}&{19.34 22.41}\end{array}]
Y=y.^2;
X=x;
% Equation 5-13
SX=sum (X);
SY=sum(Y);
SXY=sum(X.*Y);
SXX=sum(X.*X);
% Equation 5-14
n=length(X);
a1=(n*SXY-SX*SY)/(n*SXX-SX^2)
a0=(SXX*SY-SXY*SX)/(n*SXX-SX^2)
m=a1
```

$\mathrm{b}=\mathrm{a} 0$
$\mathrm{g}=\mathrm{m} / 2$
When the program is executed, the following values are displayed in the Command Window:

```
a1 =
    19.7019
a0 =
    1.9170
m =
    19.7019
b =
    1.9170
g =
    9.8510
```

Thus, the measured value of $g$ is $9.8510 \mathrm{~m} / \mathrm{s}^{2}$.
