

Minecraft 1.19 Snapshots, Minecraft Adds Frogs And 3D Audio

We have an experimental snapshot for Minecraft's next major upgrade however the standard 1.19 snapshot series is now available with snapshot 22w11a. Mojang's Minecraft developers are currently focused on the Wild update. We'll be releasing weekly beta versions for Minecraft: Java Edition, where you will be able to experience those new features as soon as they are available.

The latest snapshot lets you play around with the Deep Dark biome, frogs and tadpoles as well as mangroves, mud blocks, and the Sculk systems. Additionally, you can explore 3D directional audio in the sound settings, a feature that "is best enjoyed using headphones".

The Deep Dark and Sculk were already implemented in the experimental 1.19 snapshot in February, but frogs as well as mangroves are getting their time to shine in the present. Frogs can swim, jump and walk on land, croak and even eat small magma cubes. This causes a froglight bloc to fall. PUBGQA 's just normal frog stuff. You can check out the full patch notes over on the official site.
