

Has your heating system quit working? These top 5 furnace issues and their basic solutions might help to get it working.

Having difficulty with your furnace? You're not alone. Thankfully, numerous problems have simple Do It Yourself fixes. The primary step: Check whether your A/C system has power. You don't want to have a service tech concerned your house just to turn a switch at the breaker box. If power isn't the issue, check other possible problems prior to requiring service.

1 PROBLEM: Thermostat isn't working.

LIKELY CULPRIT: If your heat isn't coming on at all, attempt altering the batteries in the thermostat, if it has batteries. While you're at it, offer the thermostat a great cleaning inside with a small paintbrush.

You can also try to reboot it. With the thermostat set to Heat, turn the temperature to about 60°. Then, turn the breaker turn off for 30 seconds and turn it back on Still absolutely nothing? Employ a specialist.

2 ISSUE: Unit not switching on.

MOST LIKELY PERPETRATOR: Check the emergency shutoff switch for the furnace. It might be at the entryway to the furnace closet, at the top of the basement stairs, or on the heating system. It might have a red switch plate. if somebody changed it off, the furnace will not work.

3 ISSUE: Filthy filter

LIKELY CULPRIT: Not swapping out an old filter can cause a host of issues, not to mention increasing your energy bill. To ensure your furnace doesn't work overtime, change your filter every one to 2 months. Here's how: Shut off your heater, discover the filter, get rid of the old one (and remember of the size), replace it and turn the furnace back on.

4 PROBLEM: Heater isn't igniting

MOST LIKELY OFFENDER: Does your furnace click as though it's about to switch on, but then go silent and never ever start? If you have actually examined the power, examined the thermostat and altered the filter, the pilot burner or the ignition sensor is most likely the problem. To repair it, start by switching off the gas to your furnace. Then eliminate the front panel and find the igniter or ignition sensing unit, which is generally near the burners. Snap an image of the sensor to remind you of how it's attached and then eliminate the ignition sensing unit. Rub it with steel wool to eliminate residue, bewareing to not damage it. Then put it back precisely as you found it and change the panel prior to turning the gas back on. If you have any doubt about this job, play it safe and hire the pros.

5 PROBLEM: Heater keeps tripping the breaker

MOST LIKELY CULPRIT: If your heating system keeps tripping the breaker or blowing the fuse when the heat begins, it's more than likely an electrical concern. To keep [furnace installation near me](#) you and your family safe, call in the pros to detect the cause.

While lots of common furnace problems can be fixed without employing the professionals, it is essential to have your heater expertly serviced as soon as a year, especially if you're not comfy performing some of the essential upkeep tasks yourself.
