

As a website owner, you have to continuously monitor its uptime. There are rare cases where people in particular areas are not able to visit your site when actually, it's online. So in this tutorial, we'll learn a couple of distinct methods on how to check whether a web site is down or that it's available globally.

How to Check if Your Website is Down

If your site is on your side but offline anyplace else, it can cost you traffic and brand reputation. This may occur due to technical issues -- like server upkeep or DNS changes. Here are four ways in which you can make sure that the matter is not occurring to your website:

Strategy 1 -- Checking with Website Planet

Website Planet is an online tool to confirm your website accessibility website Earth gives a simple online checker that educates whether your website is up or not. All you need to do is follow these easy steps:

-
- 1. See OutageAlert.
-
- 2. Fill in your site address (URL) on the field and press the Access button.
-
- 3. Website Planet will show whether your website is online or not.

This is what you will see if the site is up: OutageAlert's outcome when a website is up and running and if your site is down, you may see: This is what you see every time a site is down when using Website Planet

Strategy 2 -- Checking with Host Tracker

Host Tracker landing page host Tracker gives a lot more info compared to Website Planet. This site allows you to confirm the page rate, HTTPS, ping, trace, port, health, security, etc. In addition, this instrument may also be utilized to monitor a website in real-time. But to enjoy this feature, you need to enroll for a free trial or cover \$9.92 to \$74.92/year. But, you can still use the online tool to check your site status at no cost.

By default, the website intends to check the page speed. However, since we would like to know whether your website is available globally, you must pick the right click tab.

Pick ping on Host Tracker to look at your site status.

Fill in the information required -- your website URL and the evaluation location. Pick All World from the place tab if you would like to look at your website status around the globe, then click CHECK.

Await the data to load completely. However, you only have to look closely at the very first point of the Status column to find out if the website is online or not. If you see results similar to the one above, your site is online. You should ignore one or two fails because the connection might have been interrupted because of other reasons. If the majority of tests are Great, then you can be sure that your site is online worldwide.

Strategy 3 -- Assessing with Site24x7

site24x7 can check your site from over 100 places around the globe. Site24x7 permits you to check your site availability from more than 100 different locations, including China, Barcelona, London, New York, and

Sydney. Aside from assessing your site online status, this instrument also provides you clear information about the entire response time, the time to solve DNS and also to connect, plus the first-byte and last-byte time. Here [downorjustme](#) are the measures to look at your website online status using this instrument:

-
- 1. Visit Site24x7, and you will immediately see a field where you can enter a site URL.
-
- 2. Fill it in with your site address (URL) and click on Test Now.
-
- 3. Wait for a little until all of the information is accumulated. Then you'll see a chart and a table with additional details.

Your website is online worldwide if the Status for each location shows OK. Here's the illustration of Hostinger's test result: Here is the test result of Hostinger's site on Site24x7. Alternatively, if the site is down, it will show dashboard symbols and Host Unavailable beneath the Status and the IP columns respectively: the results of a down site if assessed on Site24x7

Strategy 4 -- Assessing with HideMy.name Proxy Server

HideMy.name provides a unique method to check your site status by using a proxy server to redirect your website to different locations and verify its status. As you might have known, accessing a web site through a proxy server can make sure the site can be found at another location. This is possible since the connection will first reach a proxy server located in a completely different part of the Earth, then the server will send a request to the site, which will then be displayed on your own screen. Here is how you do a trusted online test status of your website using the above mentioned scheme:

-
- 1. Navigate to HideMy.name, then click the Try it free of button. HideMy.name landing page with call to action "Try it for free" button
-
- 2. Enter a valid email address and press Send me code. In this manner, you'll be given a free VPN login code on your mailbox (you will need it later). As an alternative, you may even install the Mac, Linux, or Android version of the program.
-
- 3. Practice the installation process. After that, open the HideMy.name VPN program on your computer and enter the code you have received in your email address. Pick a particular nation to test your site link. For example, we use this software to assess whether Hostinger is currently online in Tanglin, Singapore. This picture indicates that Hostinger is up and running at Tanglin, Singapore.

In case you can't access your website after changing your server location, it means that your site is down in this particular place. Try checking from different places to be certain that your site is available globally. You have just learned how to check if your website is down or functioning worldwide using four different online tools. To have a more accurate result, you can combine each of the approaches above.
