

What is the most pricey trojan horse in history?

The most expensive computer virus in history is the Love Bug infection, which was launched in 2000. A trojan horse is a type of destructive code or program that, when implemented, reproduces by placing itself into various other computer system programs, data documents, or the boot industry of the disk drive. As a result, bug can spread throughout a network of computer systems and also create significant damages. Once a computer was contaminated, the virus would delete important files and spread itself to other computer systems. types of computer viruses The Love Bug virus was ultimately stopped by a team of antivirus researchers who produced a vaccine that could protect computer systems from the virus.
