

What's Hot - Portable Sound & Video Products, and Why They're So Popular

Portable Sound and Video products have changed over the years and the latest addition is the Bluetooth audio technology. With the use of this new technology any compatible wireless device can be used to make audio input and output. This has made it possible for people to not only listen to music or to use their handsets as a personal audio player, but they can also use these devices to watch videos. The Bluetooth technology is also widely known as Bluetooth. However, there are many other names by which this particular name is referred to.

In this modern day of high-tech gadgets, having Bluetooth on hand can be extremely useful. When you're in a situation where you may need your hands free for something else, the ability to play music or view a movie without having to use your wireless device is ideal. A good example of this is if you have to use your hearing aid.

There are several different types of Bluetooth speaker systems. These products include digital audio players, wireless microphones as well as digital television receivers. They vary greatly in price, which can be dictated by the type of features and the amount of memory they have to store. Some of the more sophisticated products even allow you to view videos on your phone.

One of the most popular forms of Bluetooth audio is the digital audio player. Most of these devices will connect to your existing home theater system via your home wireless network or through an external digital audio device such as a CD player. Digital players generally have controls similar to those found on your personal computer. They will allow you to browse songs, control volume and sometimes even skip ahead. Some devices will even allow you to control the speaker volume from the speaker itself. A popular feature of some of these is that they even allow you to answer and end conversations.

For those people who want to take portable audio to the next level there are Bluetooth wireless speakers. These products are actually able to connect with your vehicle's bluetooth audio system. You can use bluetooth to access the bluetooth stereo receiver, as well as play and control music and call phone numbers without having to use your hands. The speakers included with many of these units are able to be adjusted in order to provide clear sound.

The final category of Bluetooth products that you may be interested in checking out are digital media players. These products range in price from a few dollars all the way up into the hundreds. The best ones will allow you to carry around dozens of digital media files including mp3s, videos, and music. A big advantage of many of these digital devices is that they have the capability to instantly download to your phone or portable media player, where you can continue listening to them without having to wait for them to buffer.

Although portable sound & video technology has come a long way, there are still many products on the market that just don't quite live up to their full potential. Take for example the

Flip Ultra HD. This little video camera does an amazing job of capturing pictures and videos. However, because it lacks the extra features found in some other models, such as an external hard drive or disc writer, the quality of the pictures and videos it produces isn't as high as we would like. That said, this particular product is still worth checking out, especially if you are looking for something small enough to take with you on the go.

In our next article, we'll take a look at the many digital and compact portable sound & video products available. We'll also touch on the ever-popular HDTV's and their impact on the portable sound & video market. In the meantime, remember that with the right speakers and video equipment, you too can get high definition digital audio and video. portable sound labs inc
