

Play 'Minecraft' On The Oculus Rift Immediately

Minecraft has landed on the Oculus Rift as part of a free replace to the Home windows 10 Edition beta. Anyone who owns the Computer or Mac model of Minecraft is robotically granted entry to the Windows 10 beta version; hit up Mojang to sign up and start taking part in.

We tried out the Oculus Rift model of Minecraft back in March and found it to be completely delightful.

"It's the most effective and more immersive VR experiences I've had thus far," senior editor Nathan Ingraham wrote. "In reality, that lack of high quality element really helps Minecraft be so successful -- the game would not try to imitate reality. As an alternative, it felt more like I stepped right into a cartoon."

Minecraft is already playable on the Samsung Gear VR, although that's restricted to the options of the Pocket Version. Minecraft server list assist for the Xbox One controller plus keyboard and mouse, and gamers' VR-specific settings are saved separately from their traditional Minecraft world.

Mojang developer Tommaso Checchi tweeted on Thursday that the Oculus Rift model of Minecraft would land a while this week, although he didn't divulge an exact date. Completely satisfied Monday, everyone.
