

5 Protections you must take Against Malware and Viruses

You play a risky game once you plan to download a file from an unknown source. At www.webroot.com/safe antivirus support, you can stay safe by following the steps we bring you here. Read carefully and implement it anytime, to stay your device and data safe.

A little research can open your eyes

Google is such a goldmine of data that each one you would like to try to to is open it on your phone or PC and read a touch about (almost) anything under the sun. In this case, browse and determine information on the sort of program that you simply have in mind also because the programs that you are considering to download, so take your pick. At webroot.com/safe, we recommend browsing to find out what other people who have used similar services have experienced.

Choose to download from the original publisher site

Other than researching how trustworthy are the opposite sites, it's always smart to see out the first publisher site. This is where you find the safest and latest version of the program. When the publisher's site redirects you to another download site, then rest assured that it's the well-liked version for it.

Install after scanning it thoroughly

Yes, your Webroot antivirus scans the program as and when it downloads. But there's no harm to be doubly safe.

Webroot antivirus support centre recommends that you ask your antivirus program to scan the file once again after the file is downloaded. There are many good malware scanners available within the market. You can select one such for a second opinion.

Be careful about the chance of false positives

Antivirus software is often a touch but perfect sometimes. They may, for instance, see malware when it doesn't really exist. So if both your antivirus and malware scanner show there's a malware, you've got a drag . On the other hand, if one shows you have malware and the other shows you don't, then Webroot antivirus support number technicians suggest that you try another on demand scanner to find out what is the issue.

At any step, when any of those programs find a malware, they typically tell you what it's. Then you'll look around your program to seek out more about it.

Steer clear of PUPs

Be on the alert for PUPs all time once you install any software. Your antivirus may warn you sometimes of a PUP (potentially unwanted program) once you are downloading something. You can continue to download it but take care about it. These are some easy to follow steps that Webroot security help team recommends when downloading files and programs online www.webroot.com/secure. A little awareness goes an extended way in protecting your data.
