Laurence, Scott (Defence Systems) Limited, PO Box 25, Norwich, Norfolk NR1 1JD, England.

LSDS optical fire director

3829.493

CH84 SUBMARINE ATTACK PERISCOPE

This is one of the periscopes designed for the RN Type 2400 and 'Trafalgar' class submarines. The CH84 periscope incorporates many of the above water sensors available in Barr & Stroud periscopes. The crosshead unit is fitted with a torque drive motor, controlled at the periscope or remotely, which rotates the periscope without physical assistance from the operator. A motorised Olympus OM2 camera is fitted; it has automatic exposure control and the time and date are shown on each of the 250 frames. The optical system includes anti-vibration features and is designed to give maximum resolution in high and low power. It is quasi-binocular to reduce eye strain. Top window heating is controlled by a solid-state unit in the periscope. Bearing transmission is from an optical encoder in the crosshead, and true bearing can be displayed in the left eyepiece. Range from the range estimator is calculated by a microprocessor; estimated target height is set on a unit remote from the periscope.

A laser rangefinder can be fitted. Accurate collimation is maintained with the aiming mark in the optical, image intensification and thermal image systems. Accuracy is ±10 metres. Range to the target is displayed in the eyepiece and can be transmitted to the fire control system. An image intensifier can also be fitted in the optical system. This gives a luminous gain of up to 30 000 ×, (equivalent to near-starlight) with high resolution. This system uses an additional 110 mm diameter window in the top of the main tube.

A television camera can be fitted at the rear of the ocular box. This can relay the optical, image intensifier or thermal image picture to a remote monitor and/or a video tape recorder, with provision for alpha-numeric insertion of data. A thermal imager can be fitted as an alternative to the image intensifier, and this utilises the 110 mm window (made of germanium) at the top of the main tube. The thermal picture can be viewed in the eyepiece or relayed to a remote monitor and/or video tape recorder.

An active receive antenna can be incorporated in the top tube.

Alternative versions are the CH85 and CH86.

CHARACTERISTICS

Main tube diameter: 254 mm

Top tube diameter: 70 mm nominal

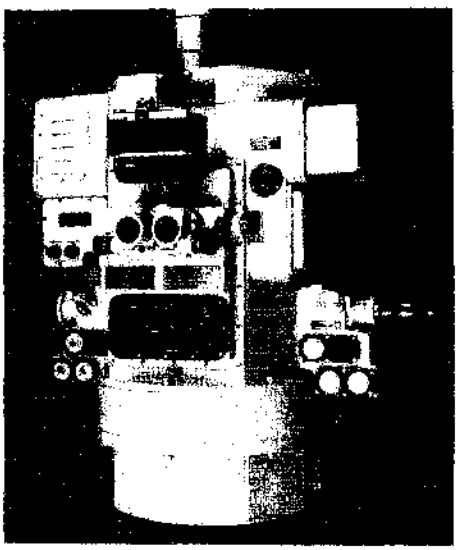
Overall length: 13·5 m approx

Well radius: 356 mm

Magnification: ×1·5, ×6

FOV: 32° × 8°

Laser protection: Filters



TV: 16 mm SIT vidicon

Image intensifier: Mullard 50/40 mm Type XX 1332

Thermal imager: 8–13 micron band

STATUS

Production.

CH84 submarine attack periscope

Barr & Stroud Ltd, Melrose House, 4-6 Saville Row, London W1X 1AF, England.

3830.493

CK34 SUBMARINE SEARCH PERISCOPE

This is one of the periscopes designed for the RN Type 2400 and 'Trafalgar' class submarines. The CK34 was designed to provide the optical qualities necessary for high resolution photography, the taking of star sights with the artificial horizon sextant and visual observation in poor light conditions. The CK34 periscope shares the following common features with the CH84: torque drive; Olympus camera; anti-vibration optics; top window heater; range estimator and transmission; bearing transmission. (In this case the true bearing is displayed on the front of the ocular box.)

A number of systems which have in the past been operated mechanically are now operated by electro-servo mechanisms. These include: top elevating prism, change power, sextant filters, graticule IN/OUT, and range estimator. They all have 'fail safe' arrangements. All controls and read-outs are now contained in two simplified panels either side of the ocular box. The periscope is quasi-binocular and has three magnifications: ×1·5, ×6 and ×12.

Artificial horizon sextant (AHPS 4): A stabilised mirror slaved to the submarine's compass or SINS system replaces the gyro stabilised platform. All controls have been simplified with the object of taking a sight within a few seconds. Provision is made for automatically removing errors in the observed altitude caused by the periscope bending or the ship's structure distorting. A print-out provides the observed altitude, bearing and time of observation. An electronic support measures (ESM) antenna can be fitted, the ESM office equipment to be specified by the customer. An active receive antenna can be fitted on top of the ESM array. A television camera can be fitted at the rear of the ocular box to relay the optical picture to a remote monitor and/or video tape recorder, with a facility for alpha-numeric insertion of data.

Alternative versions are the CK35 and CK36.

CHARACTERISTICS

Main tube diameter: 254 mm

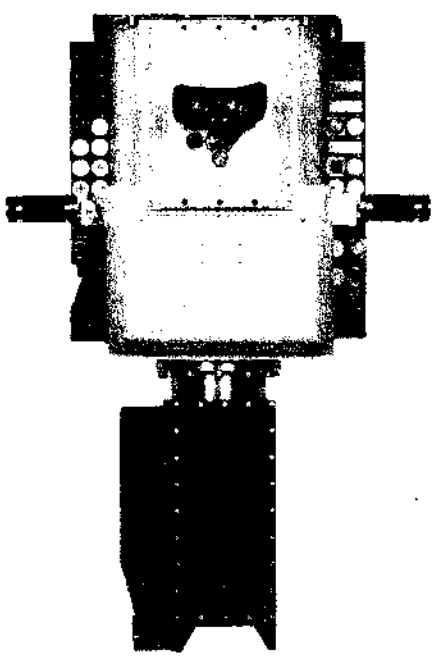
Overall length: 13·5 m approx

Well radius: 356 mm

Magnification: ×1·5, ×6, ×12

FOV: 24°, 6°, 3°

Laser protection: Filters



TV: 16 mm SIT vidicon

CK34 submarine search periscope

3831.493
SUBMARINE PERISCOPE IMAGE INTENSIFIER

Barr & Stroud has developed a submarine periscope image intensifier equipment which can be retrofitted to existing periscopes such as the CH74, 75, 77, and 81, and others with a tube diameter of 180 mm or more, which can accept a large aperture window, to provide an enhanced night watchkeeping capability. This equipment is offered as a refit package with a complementary laser rangefinder (**3832.493**) for periscope modernisation programmes. A low light television system that can be used with the Attack normal viewing optics or with the image intensifier, is also understood to be available.

The intensifier window near the top of the periscope amplifies the light level of the picture at the phosphor screen to an adequate level for transmission down the periscope. Use of a second-generation intensifier tube produces a high level of amplification and a capability of dealing with bright lights in the field of view. It relays a relatively high light-level image even at low illumination levels. The window being below surface in daylight eliminates unwanted glint. When accurately aligned with a laser rangefinder (if fitted) this enables the rangefinder to be used at night.

A large aperture lens system at the top of the main tube section of the periscope focuses the maximum amount of light which can be gathered with a periscope of this diameter on to the photo cathode of an image intensifier tube. The resultant image on the tube's phosphor screen is projected via the main optical system which is designed for optimum viewing at the eyepiece(s) with ×6 magnification. The elevation reflector for the image intensification system operates at the same angle of elevation as the main elevation prisms with which it is directly connected.

The electrical supply for the image intensifier tube is derived from the window heating control unit 24 V supply, and the illumination for the graticule is by a light emitting diode (LED) projected into the main optical system. On/off switches for the tube and graticule illumination, together with a dimmer and warning light, are mounted on the faceplate. The tube, with its encapsulated power supply, is in quantity production for the Chieftain tank.

CHARACTERISTICS

Tube type: Mullard 50/40 mm diameter second-generation channel tube with encapsulated power supply
Magnification: ×6 nominal
Angular field: 7° nominal
Line of sight referred to horizon: Elevation ⩾ 15°; depression ⩾ 7½°
Graticule: LED illuminated crossline

CONTRACTOR

Barr & Stroud Ltd, Melrose House, 4-6 Saville Row, London W1X 1AF, England.

3832.493
SUBMARINE LASER RANGEFINDER

This equipment complements the Barr & Stroud submarine image intensifier (**3831.493**) for submarine periscopes. Both equipments are available as an integrated package for updating existing periscopes to provide enhanced capabilities. Used in this way the laser rangefinder provides accuracies of 10 metres over all ranges, with a digital read-out and output to the submarine's fire control system, and day/night capability. False ranges from nearby targets are eliminated.

The range is projected into the eyepiece and uses a LED display. A facility is provided to permit the operator to feed this data to a fire control system.

The main on/off switch is key operated because of the eye hazard posed by lasers. A fire button initiates the laser action for ranging on to the target indicated by the periscope graticule. The first/last range switch normally operates on last range but this gives facility to operate on first range for special situations. A range cut button removes the range displayed and allows another ranging to proceed.

The laser is a compact Nd-YAG system operating at 1·06 micron. A flashlamp pumps the laser cord and a dye-cell Q-switch allows the generation of the high power laser pulse required for ranging applications. The receiver consists of a silicon avalanche photo-diode that converts the reflected 1·06 micron laser energy into an electrical signal which is then amplified by a sensitive, wide-band, low-noise amplifier. The output from the amplifier is fed into a threshold circuit which is set to give a probability of false alarm of 0·1 per cent. With a return signal of 10 nW the amplifier produces a signal which has 99·5 per cent probability of being recorded as a target return.

Power supply, charger and pulse forming network modules convert the ship's supply of 24 V into the voltages required for all the other electronic circuits and also control the sequencing of the rangefinder operation.

The range logic board acts as an electronic stopwatch to determine the time interval from transmission of the laser pulse to reception of the target pulse. The start pulse is provided by sampling a small portion of the laser pulse and the stop pulse is direct from the receiver threshold circuit. The accuracy of timing is determined by the frequency of the internal clock which in this case gives ±10 metres for the displayed target returns (±5 metres can be achieved, if required). A switch on the ocular box allows the logic to determine the time to the first or last pulse within maximum range of the counter.

CHARACTERISTICS

Laser output from periscope window: >30 mJ
Pulse width: $<10\times10^{-9}$ s
Range accuracy: 10 m

CONTRACTOR

4721.493
BARR & STROUD SUBMARINE OPTRONICS POD

Barr & Stroud is developing a submarine optronics pod which allows a group of sensors to be mounted on a single mast, thus reducing the overall radar signature of the vessel when at periscope depth or when snorting. The pod can be mounted on top of a mast or the search periscope.

The pod is understood to include an IR18 thermal imager, a low-light level TV camera, and ESM and communications antennas. The pod exterior is covered with radar-absorbent material to minimise the reflecting area. Operating equipment includes visual display units and a remote control console for manual or automatic control.

STATUS

IRCOM

The IRCOM system was developed by PPE to meet the requirement for directional ship to ship covert signalling. A PPE night vision device is used to sight the receiving or transmitting ship and to aim the ship's own Francis signalling lamp. The signal beam is viewed by the night sight which is sensitive to the infra-red light and is visible at up to 6 n miles in daylight and on the horizon at night.

The night sight can be used for general surveillance at night and will enable recognition of a frigate at 3 to 4 n miles under starlight conditions. Targets can be readily detected by their phosphorescent wash or shape.

The signalling light can be used to provide additional illumination for more positive identification of intruders, etc, where the sight is used in the surveillance role.

CHARACTERISTICS

Night vision system
Field of view: 22°
Magnification: ×1·4
Range (moonlight): Frigate at 4 nm
Resolution (starlight): 0·7 mrad
Tube: 3-stage 25 mm extended S20; XX1060/01 Mullard or equivalent; automatic brightness control
Weight: 4·7 kg
Size: 720 × 100 mm
Mounting: Fitted to searchlight

Signalling searchlight
Diameter: 300 mm
Power: 150, 250, or 400 W
Beam divergence: 2 - 3° depending on light source

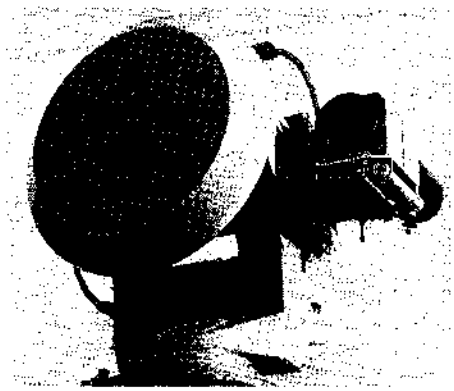
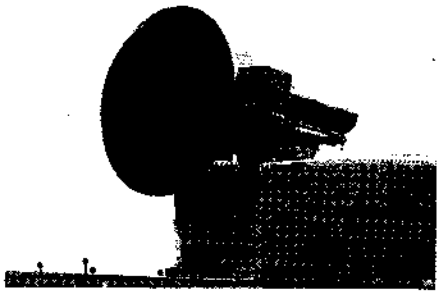
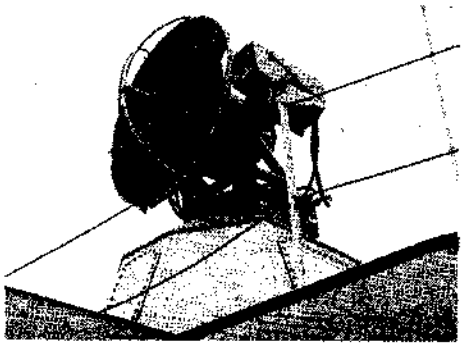
3794.093
GEC AVIONICS V300 SERIES CCTV EQUIPMENT



GEC Avionics Ltd has designed and produces a wide range of closed-circuit television (CCTV) equipment which is used for a variety of military applications, including missile and weapon control and guidance, target damage assessment, manual or automatic target tracking, surveillance, and security uses. Development of the range began in the early 1960s and variants have been in service for some years. The V323, for example, was supplied to the Royal Navy and other navies for use in Seacat missile guidance and control and this version was described in *Jane's Weapon Systems 1974-75* and earlier editions under entry number **1021.293**.



V334



The V334 is the latest daylight/low light TV camera channel equipment in this series. It is a single unit camera of modular design as described below.

The camera is assembled from a range of modules to form either a daylight or low light camera, using a selection of lenses to provide a wide angle or narrow angle field-of-view with a suitable aperture. The camera head incorporates the camera and optical assembly within a totally enclosed housing for full environmental protection and electromagnetic shielding.

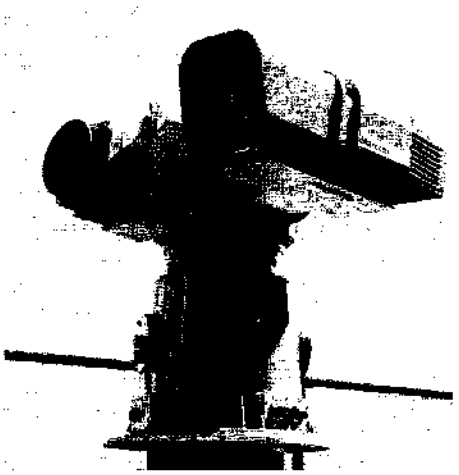
The front section of the housing is sealed with a special window module having integral heating and wiping facilities. The optical assembly combines the objective lens and elements of the light control system, including neutral density filters, spectral filters, or focal plane apertures. The camera module provides the necessary scanning, processing circuits and supplies for a daylight TV camera. The light control module contains the additional facilities required to operate an intensifier Ebsicon low light sensor tube and allows automatic exposure control over the full range of naturally occurring illumination. Additional features include spectral and polarising filters, each of which offers conditional enhancement of video signal contrast while focal plane apertures of different sizes aid in the rejection of interfering light sources from within the field-of-view. A simple mechanical interface is provided for attachment of the camera to most director platforms.

Several generations of GEC V300 Series military television equipment are illustrated in these three typical applications. Right is the V323 used on an Orion tracker radar for Seacat missile direction; centre is the V0084 low light TV system, on a GEC ST801 tracker radar; the picture shows a similar radar but this time with the latest V334 TV camera

Four cameras have been identified:
V3341: Low light; narrow angle field-of-view
V3342: Daylight; narrow angle field-of-view
V3343: Daylight; wide angle field-of-view
V3344: Low light; wide angle field-of-view

STATUS
The V334 daylight camera is being supplied for the RN lightweight Seawolf system, and for other RN applications. It has been selected for various export requirements and also forms part of the Ferranti combat weapon system for four new Brazilian corvettes.

CONTRACTOR
GEC Avionics Ltd, Electro-Optical Products Division, Christopher Martin Road, Basildon, Essex SS14 3EL, England.



5729.293
V3800 THERMAL IMAGING SENSOR

The V3800 has been designed specifically for long-range detection and automatic target tracking either in support of naval tracking radars or as the prime sensor in an electro-optical fire control system. It is designed as a 'stand-alone' unit capable of incorporation into various defence systems to give indirect-viewing capability in all weathers.

The sensor is based on the UK Thermal Imaging Common Module programme class II (**4280.193**) and uses either a ×20 magnification telescope with a 3° field-of-view (FOV), or a switchable ×20 to ×5 telescope with a 3 to 12° FOV. The telescopes have been developed by Rank Pullin Controls. The high sensitivity and resolution of the V3800, together with full environmental protection, makes the equipment equally suitable for coastal defence or border surveillance applications.

STATUS
In production. The V3800 has been ordered as part of a fire control system being supplied by Ferranti to equip four new corvettes for Brazil, and by Contraves, Switzerland for its Seaguard close-in-weapon system. The Royal Aircraft Establishment has integrated the V3800 with a SAAB TLT 510 for long range tracking of aircraft and missiles. The United States has incorporated the V3800 into its AVCARS B programme.

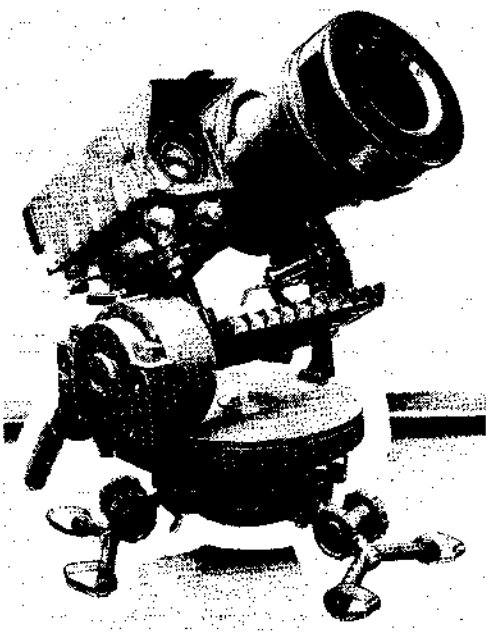
3765.093
VINTEN TRACKING MOUNT

The Vinten tracking mount has been designed and developed to military specification to meet UK MoD requirements. It is a compact, robust, portable unit designed for accurate tracking of moving targets. The mount is designed to carry a wide range of sensors and rangefinders including laser rangefinders and target markers, cameras recording either photographic or electronic images, night observation and thermal imaging devices. The mount is designed to accept single or multiple equipments which can be boresighted to each other and to an aiming viewfinder.

The payload can be positioned for convenient operator viewing and the mount adjusted for an imbalance of load up to 690 kg/cm. To allow smooth and accurate tracking at both high and low slew rates, an easily adjustable friction-free drag is incorporated in both axes.



The mount is available with or without data read-out but all equipments are manufactured to accept data. Movement of the equipment pointing angle is measured by an encoder disc on each axis. Angular movement is measured as decimal degrees and can be shown, on a sunlight readable display located in the base of the mount, as either decimal degrees, milliradians or artillery mils (3600/6400). The output, in the form of a digital signal, can be used to operate peripheral equipment for weapon control and guidance or similar applications.

Payloads may be mounted either directly onto the lightweight mounting table or employ the current Army interface assembly. A tripod base, with adjustable feet for levelling on rough terrain, can be supplied with the mount.

CHARACTERISTICS
Bearing system accuracy: Better than 0·5 mrad
Balance to cancel imbalance loads up to 690 kg/cm
Payload: Up to 45 kg

STATUS
Production.

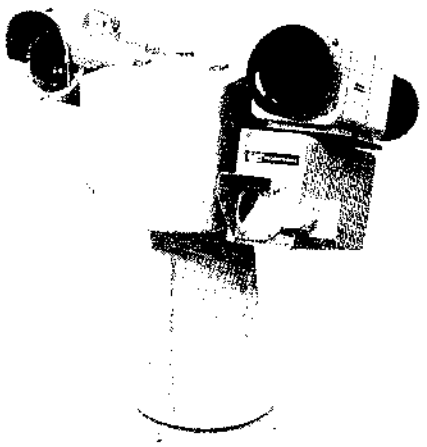
ROD REMOTE OPTRONICS DIRECTOR



A high performance line-of-sight stabilised remotely controlled optronic director (ROD) by Laurence, Scott (Defence Systems) Limited is the result of four years' work on naval stabilised directors and research on the remote optronic director.

The director, which is suitable for fitting to any surface vessel, provides surveillance, tracking and fire control direction. Weighing approximately 155 kg, it can carry a sensor load of up to 75 kg on each side of the training head. It has an excellent field of vision with unlimited azimuth tracking capability.

Control is by joystick from below deck with the dynamic package being suitable for auto-track. The sensor payload capability and dynamic configuration enable the selection of virtually any optronic sensor package. Sensors include low light television and thermal imaging cameras, and laser rangefinders supplied by GEC, Barr & Stroud and Ericsson, but other types of different manufacture may be fitted.

CHARACTERISTICS: (Tinus sensors)
Weight: 155 kg
Height: 1080 mm (overall); 880 mm (sensor axis)
Width: 710 mm
Training arc: Unlimited
Elevation arc: -30 to +85°
Training: 150°/s² (acceleration); 120°/s (velocity)
Elevation: 150°/s² (acceleration); 90°/s (velocity)
Shock: 30 gV; 12 gH
Temperature: -20 to +55°C ambient

STATUS
In production.

4238.293
LROD LIGHTWEIGHT REMOTE OPTRONICS DIRECTOR

The Laurence, Scott lightweight remote optronics director (LROD) has been designed to match the trend toward lower cost, but effective, fire control equipment demanded for surface vessels of all types. It provides surveillance, tracking and fire control direction, and the general principle of operation is similar to that of the company's ROD remote optronic director (**4109.293**, above). Weighing about 60 kg, the LROD can carry a sensor load equal to its own weight and has a capability for two complete turns in azimuth in its standard form, although where required slip-rings can be fitted to permit unlimited traverse.

Control is by a joystick from below deck, although the servo arrangements are suitable for use in automatic tracking systems. Typical sensors are the Marconi television camera and Ericsson laser rangefinder sight shown in the adjacent illustration.

CHARACTERISTICS
Weight: 60 kg
Height: 620 mm (overall); 525 mm (sensor axis)
Training arc: 2 turns (standard); continuous unlimited optional
Elevation arc: -40 to +85°
Training: 150°/s² (acceleration); 120°/s velocity
Elevation: 150°/s² (acceleration); 90°/s velocity
Shock: 10 g both planes
STATUS
In production.

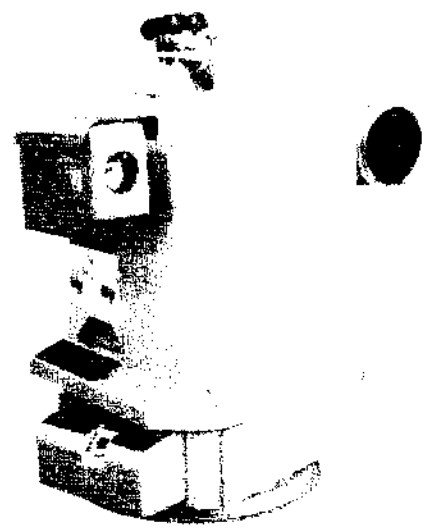
4720.293
DIRECTOR AIM STABILISED LOOK-OUT EQUIPMENT

The Director Aim Stabilised Look-out Equipment (DASLE) is a lightweight line-of-sight stabilised unit comprising a deck-mounted pedestal with a rotating head, and a platform which carries a seated operator. A binocular is mounted at eye-level on an elevating arm, and seat height is adjustable. Facilities are also incorporated for fitting additional sensors, ie laser rangers, thermal imagers and TV, which, with the aid of autotrack facilities can provide an advanced system for passive direction and laser rangefinding. On-mount prediction facilities can also be fitted.

Two servo systems are incorporated, one to train the rotating head on to the target, the other to position the binocular arm and sensors in accordance with target elevation. The servo systems can be controlled either locally by the operator or remotely from the associated fire control system (FCS).



Under local control, the director constitutes the principal control point of an FCS. The servo systems are gyro-stabilised to offset random ship motion, and as the operator tracks a target, positional information of the latter, in the form of synchro signals, is fed to other sections of the system as follows:

(1) target training and elevation to the FCS
(2) target training and elevation to the gun mounting and/or missile launcher
(3) target bearing to an indicator.

When the director is set-up for remote control, the training and elevation servo systems are stabilised by a tachogenerator feedback and fed with synchro signals from external sources, eg tracker radar, via the FCS. The director operator acts as an observer, verbally recording fall-of-shot and similar information. Synchro signals are fed to other sections of the system as in the local operating mode.

A further operating mode is incorporated which is used in place of the remote mode permitting elevation to be controlled locally while the director is trained remotely by FCS signals.

CHARACTERISTICS
Overall height: 1820 mm
Weight (without sensors): 615 kg
STATUS
Development.

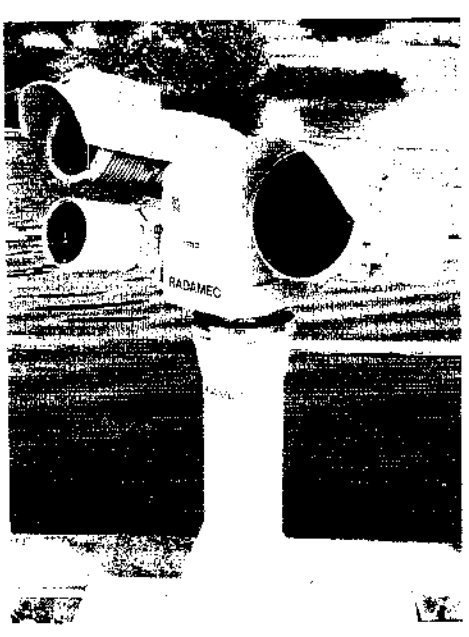
Laurence Scott (Defence Systems) Ltd, PO Box 25, Kerrison Road, Norwich, Norfolk NR1 1JD, England.

Director Aim Stabilised Look-out Equipment

4129.093
RADAMEC SERIES 2000 PLUS FIRE DIRECTOR



Series 2000 PLUS maritime fire control equipment is designed to locate and follow fast moving targets, providing video and data returns for general surveillance, gun-laying computation, action information and post-mission analysis.

The sensors, normally comprising a TV camera, thermal imager and laser rangefinder, are mounted on a gyro-stabilised electro-optical director. A choice of three basic designs for the director is available, each with a number of options to suit the payload and environment. Pictured here is the RADAMEC 409 mount, capable of high positioning accuracy with payloads up to 200 kg. The internal 120-way slip-ring enclosure allows continuous azimuth rotation. Also available is the new RADAMEC 449 high-performance unit capable of continuous rotation and velocities in excess of three radians per second. The 409 and 429 can be equipped with binocular sights and local joystick for above-deck training onto the target.

The basic below-deck equipment configuration enables the director to be controlled by joystick for manual tracking and surveillance tasks. At the top end of the Series 2000 PLUS range the equipment is structured as a fully integrated weapons system with closed-loop TV tracking and gun-laying computation. The TV tracker unit enables the director to lock-on to any feature entering a defined 'gate' area within the video field. Lock is held despite target-profile variation; a special 'coast' facility enables immediate re-acquisition after momentary loss, for example, behind clouds.

The company also produces mounts for waveguide-fed antennas, lightweight heads for CCTV surveillance, and X-Y camera tables for presenting graphics.

STATUS
RADAMEC equipment is in service with several of the world's navies and has been specified by two major UK EW system manufacturers

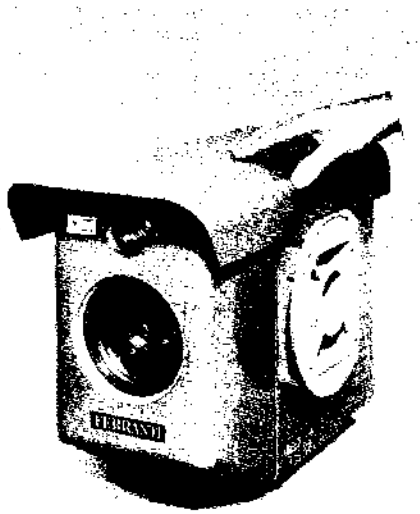
RADAMEC Defence Systems Limited, Bridge Road, Chertsey, Surrey KT16 8LJ, England.

RADAMEC Type 409 electro-optical director



5920.293
TYPE 409/25 FIRE CONTROL DIRECTOR
Type 409/25 is a special development of the Radamec Type 409 tracking mount (see **4129.093**) for use on fast patrol boats, and enables an above-decks operator to follow a fast-moving target, and to initiate gunfire. When the system is 'live', the optical sight becomes motion stabilised and can be directed on to the target using a thumb-operated joystick on the right-hand end of the grip bar. The gunfire switch is on the left. Internal position sensors resolve to within 0·2 milliradians for high accuracy control of the ship armaments. Passive target designators with binocular or pointer sights can also be provided.
CHARACTERISTICS
Travel: Azimuth ±200° or continuous, elevation -20 to +95°
Maximum speed: 60°/s
Height: 1·7 m
Weight: 240 kg
STATUS
In production and in operational service with the Royal Danish Navy.

4719.293
FERRANTI MULTI-ROLE NAVAL LASERS
Ferranti has developed a number of lasers which can be used in naval applications. The Type 908 rangefinder/designator is modular in concept and is one of a family of naval lasers using common modules. The constituent parts come from the extensive range of successful systems used worldwide in various operational roles. The basic version uses a Type 629 general purpose laser transmitter (**4787.193**) operating at medium power in the wavelength of 1·064 μm and delivering high stability coded pulses.

The Type 908 is a twin aperture equipment, with transmit optics which have a variable beamwidth to allow for rangefinding or illumination. A high sensitivity wide aperture receiver enables rangefinding at extended ranges, the system using the Type 629 transmitter being able to range to 20 km and designate to 9 km. An alternative, the Type 905 high power laser module, is directly interchangeable with the Type 629 and gives the Type 908 a capability of rangefinding out to 35 km and target designation to 16 km. The Type 905 has an output energy of up to 300 mJ, a PRF of up to 20 pps and a beam divergence of 0·25 mrad. Accuracy of range measurement is 2·5 metres.

A simple external attachment to the Type 908 can convert it into a homing beacon for those aircraft which are fitted with either a Ferranti Laser Ranger and Marked Target Seeker (**1196.393**), or a simple infra-red detector with small field-of-view.

Ferranti is also developing an interchangeable receiver module which will provide angle error information to the director servo system, and thus an auto tracking capability, by the use of a quadrant photodiode in place of the existing ranging diode.
STATUS
In production.

MODEL 910 STABILISED SIGHT
The Model 910 stabilised naval sight provides viewing for an observer within the pilot house. Two magnifications are provided, ×8 and ×2, with fields of view of 7° and 28° in the object space, respectively. The sight can be used as an entity, completely independent of the fire control system. In addition, the sight can be a master or a slave to the other sub-systems aboard the ship. The system can be used for reconnaissance or to provide position data for slaving a weapon turret. Regardless of the mode, boresight information is generated at all times. The sight has almost unlimited access to the visible hemisphere above the ship. By means of a gimbaled prism, the line of sight can be depressed -10°, elevated to +85°, and rotated continuously 360° about a vertical axis. Within these bounds, the only hindrances to the line of sight are those provided by the ship itself.
CHARACTERISTICS
Optical
Magnification: ×2; ×8
Elevation LOS: -10 to +45°
Fields of view: 28° at ×2 magnification; 7° at ×8 magnification
Eyepiece focus: ±3 dioptres
Electrical
LOS stabilisation: Dual axis ±20° of motion at 0·5 Hz to 2 mrad
Tracking accuracy: ±1 mrad
Slewing rates: Azimuth and/or elevation 100°/s
Output signals: 2-speed resolver with 1 mrad accuracy for elevation and azimuth analogue output
System weight: 100 kg (approx)
CONTRACTOR
Kollmorgen Corporation, Electro-Optical Division, Northampton, Massachusetts 01060, USA.

4024.293
MODEL 975 OPTRONIC DIRECTOR
The Model 975 optronic director has the function of acquiring and tracking surface or air targets for surveillance or directing the ship's defensive weapons. The platform's line of sight is internally stabilised in two axes to the deck plane. Under control of an operator, automatic tracking and range determination of targets are available using the television system or infra-red target pointer and the laser rangefinder. The ship's weapons can be slaved to the optronic director through the fire control system. The director optical scanning capability can be combined with inputs from an existing ship's fire control system or it can be integrated with the Kollmorgen fire control system (**4019.281**).

The director can be utilised in three modes of operation:
(1) search (surveillance mode)
(2) weapon slave (manual or automatic target tracking mode)
(3) director slaved (external designation).

Operational features include: stabilised line of sight; low light-level television with automatic tracking; infra-red target pointer or thermal imaging; laser rangefinder; optional visual capability.

CHARACTERISTICS
Electrical
Angular coverage: -25 to +70° elevation; n × 360° azimuth
Slew rate: 120°/s² (acceleration); 80°/s (velocity)
Tracking rate: 80°/s² (acceleration); 80°/s (velocity)
Tracking accuracy: ±20 mrad
Television
Field of view (FOV): 30° or 7·5°
Resolution (angular): 1 mrad
Scan rates: 525/60 (other scan rates available)
Video output: 1 V P-P, 75 Ω termination
Thermal imaging sensor
Wavelength: 8 - 12 μm
Field of view: 12° wide; 4° narrow
Detector: MCT (Sprite)
Cooler: Closed cycle (Split Sterling)
Laser
Type: Nd-YAG
Power: 4 mW
Pulse energy (radiated): 60 mJ
Repetition rate: 10 pps/continuous
Range: 12 km (with good visibility)
STATUS
Production.

Kollmorgen Model 975 optronic director showing above-deck optical head and operator's console

4023.293

MODEL 985 OPTICAL DIRECTOR

The Model 985 optical director has the function of acquiring and tracking surface and air targets. It is an internally stabilised optical aiming instrument which provides target bearing and elevation signals to the ship's weapon. It consists of:

(1) the director, including all required components for self-stabilisation, power change, and focusing
(2) control console, including all controls, indicators, and read-outs
(3) junction box through which all inputs and outputs are interfaced. Miscellaneous electrical and electronic components are housed in the junction box
(4) cabling to interface the junction box to the console and the director.

CHARACTERISTICS

Angular coverage: -25 to +70° (elevation); n × 360° (azimuth)
Slew rate: 120°/s² (acceleration); 80°/s (velocity)
Tracking rate: 80°/s² (acceleration); 80°/s (velocity)
Tracking accuracy: ±2 mrad
Magnification: ×2, ×8
Field of view: 30°; 7·5°
Focus: 10 m - infinity

STATUS

In production.

CONTRACTOR

Kollmorgen Corporation, Electro-Optical Division, Northampton, Massachusetts 01060, USA.

Mk 5 LOW LIGHT-LEVEL TV SYSTEM

The Mk 5 LLLTV system can be used for day and night target detection and recognition, extremely long-range detection of faint light sources at night, damage assessment, multiple target discrimination, plus general surveillance and navigation purposes.

The system normally operates at standard line rates, thus permitting easy use with additional remote monitors, video tape recorders, and video trackers, but simple modifications are available for operation at other than standard line rates.

When mounted on the Mk 73 guided missile director, the Mk 5 TV system provides day and night remote viewing capability for the Mk 74 Tartar fire control system.

STATUS

Operational with the USN as part of the Mk 74 Tartar missile fire control system.

CONTRACTOR

General Electric Company, Aircraft Equipment Division, French Road, Utica, New York 13503, USA.

Mk 5 low light-level television system mounted on USN Mk 73 guided missile director

SEA LITE BEAM DIRECTOR

Sea Lite is an experimental pointing and tracking system being developed by Hughes Aircraft Company. It is intended for use by naval forces and consists of a telescope which expands the beam of a high energy laser and focuses it on to the target. Also included are large gimbals to direct the telescope, a precision tracking system to position the beam on the target, and alignment and stabilisation equipment.

STATUS

Experimental system for the US Navy. Sea Lite is being integrated with the US Navy MIRACLE (Mid-Infrared Advanced Chemical Laser) for trials.

CONTRACTOR

Hughes Aircraft Company, PO Box 902, El Segundo, California 90245, USA.

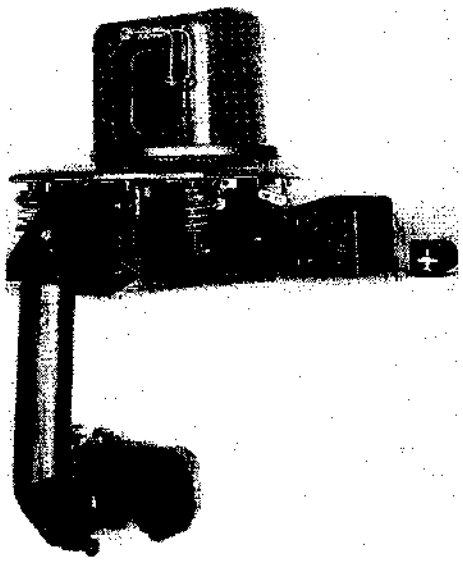
7032.393
APX M334 SERIES GYRO-STABILISED SIGHTS

The APX M334 sight has been designed for the surveillance of land, detection and acquisition of targets, and guidance of missiles in manual remote control.

OPERATION

The equipment consists of a monocular, angularly positioned single lens sight, a body made of a prism correcting the image slanting and a panoramic head including a gyroscope for stabilisation. Two magnifications, ×2·5 and ×10, are provided and the mirror scanning speed is adjustable from 1·5°/s to 13·5°/s at the lower magnification, and from 1·5°/s to 4·5°/s at ×10 magnification. The field of view is 22° at magnification ×2·5 and 5° 30' at magnification ×10; the total scanning field is 262° in azimuth and 72° in elevation.

In the wide field of view, a luminous circle represents the narrow field, and angular differences between the line of sight and the axis of the helicopter can be indicated. For safety reasons the eyepiece is retractable when the equipment is not in use to enable the operator to have normal unobstructed vision outside the aircraft.



The M334 forms the basis of a series of sights; M334-02, M334-04 (**3763.393**), M334-25 (**3763.393**); M397 for HOT, M396 in the Atlantic aircraft and M334-05.

STATUS

In production. In operation on nine types of helicopter and serving with the forces of nine countries. The M334-13 is fitted in WG13 and AB212 helicopters.

CONTRACTOR

SFIM (Société de Fabrication d'Instruments de Mesure), 13 avenue Ramolfo-Garnier, BP 74, 91301 Massy Cedex, France (under DTAT-APX licence).

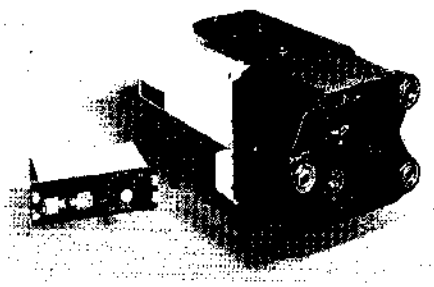
APX M334 gyro-stabilised sight and control box

3661.393
TCV 115 AIRBORNE LASER RANGEFINDER

The TCV 115 laser rangefinder was designed for integration into the gyro-stabilised APX M334-04 helicopter sight (**3763.393**), and consists of a TCV 80H laser rangefinder and an optical assembly which adapts the rangefinder to the sight and also ensures the projection of the rangefinder cross-hairs in the eyepiece of the sight. The TCV 80H laser rangefinder is also employed in the APX M550 rangefinder/sight (**3414.193**) for land-based use.

CHARACTERISTICS

Wavelength: 1·06 micron
Pulse duration: 25×10^{-9} s
Energy: 100 mJ
Peak power: 4 MW
Divergence of emitted beam: ⩽0·7 mrad
Detector: Avalanche photodiode
Minimum detectable power: $\leqslant 2 \times 10^{-8}$ W
Receiver field: ⩽0·5 mrad
Operating voltage: Rangefinder 19 – 28V DC; graticule projector 115V/400Hz
Dimensions: 390 × 190 × 180 mm
Weight: 8kg (with optical assembly)
Measurement range: 450 – 19 900 m
Accuracy: ±10 m
Repetition rate: 1 measurement every 2 s for 3 successive shots; 12 measurements/minute



An optical attenuator in the eyepiece ensures protection for the operator's eye during laser firing and provides attenuation of 70 dB at 1·06 micron

STATUS

In series production.

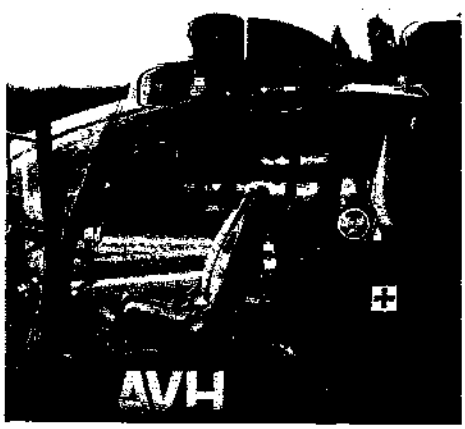
CILAS TCV 115 airborne laser rangefinder

3763.393
APX M334-04 GYRO-STABILISED SIGHT

The APX M334-04 gyro-stabilised sight is an improved model developed from the APX M334 sight (**7032.393**). The main items of the equipment are: the sight itself incorporating a gyro-stabilised mirror allowing the aiming axis to be kept stable irrespective of pitch and yaw movements; an aiming control stick which controls the sight in azimuth and elevation; an optional direction indicator for use by the pilot; and an electronics unit.

The APX M334-04 sight can be fitted if needed with a luminous reticle generator, a fire simulator device, a laser rangefinder, a special eyepiece bearing arm, a TV or cine camera and electronics for sighting assistance.

The APX M334-04 sight is of the monocular type with two magnifications, ×3·2 and ×10·8, the respective fields of view being 300 and 90 mrad. The total scan field is 260° in azimuth and 70° in elevation. The azimuth scan raster can be varied in a stepless fashion over the range 0·2 to 230 mrad with ×3·2 magnification, and 0·2 to 80 mrad with ×10·8 magnification. Stabilisation and aiming accuracy is better than 0·1 mrad.



The M334-04, equipped with a laser rangefinder, forms the main element of the SFIM OSLOH (Optique Stabilisée de Localisation d'Objectifs sur Hélicoptères) system developed for target detection and localisation by aircraft and helicopters. In this application the nomenclature is M334-25.

STATUS

Production.

SFIM APX M334-04 stabilised sight in French military helicopter

4239.393
PGS 600 STABILISED OPTRONIC SYSTEMS

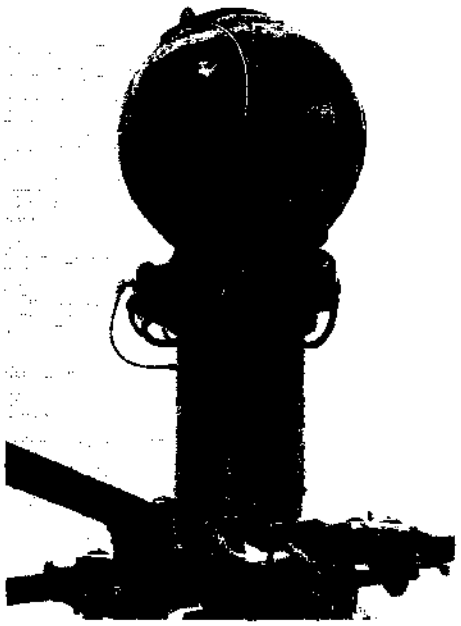
PGS 600 systems are designed to add night capability to airborne sighting systems and include a two or three field FLIR, a long focal distance TV and a rangefinder.

PGS 600 systems can be fitted on helicopters in a variety of ways; pod-mounted, chin-mounted as in the Heloise system on the Dauphin or rotor-mast mounted as the Ophelia system on the BO 105 and the Pharaon system on the Gazelle.

Another version of the PGS 600, Venus, is used on the Dauphin helicopter as a night aiming system for the aircraft HOT anti-tank missile system. The mast-mounted systems allow all-azimuth sighting with the helicopter staying under cover.

DEVELOPMENT

SFIM has developed a lightweight day/night system for use with the next generation of combat helicopters. It is a third-generation device which can be mounted on the aircraft chin, roof or rotor mast.



CHARACTERISTICS

Diameter of sphere: 600 mm
Angular displacement: 55° elevation; 180° azimuth; for mast-mounted system
Stabilisation: 300 μrad (coarse); fine limits are classified

STATUS
Production.

4725.393
SCOTCH WEAPON DELIVERY SYSTEM

The Scotch weapon delivery system is intended specifically for use on helicopters for target tracking and aiming in air-to-air or air-to-ground gun or rocket fire, and presentation of data to the pilot during the target tracking phases. The system consists of a COLTH weapon sight and its associated control unit, and an electronics unit which incorporates a computer. The COLTH sight, which projects a ballistic reticle at infinity, is installed in the upper section of the helicopter cabin and offers a maximum field of view together with minimum masking.

The system is connected to the aircraft sensors which supply the data required, including a rate gyro unit which provides the angular rates of the helicopter. The computer constantly determines the point of impact of the munitions. This point is displayed by the reticle generated by COLTH and superimposed on the landscape. The reticle is slaved to the position of the weapon, with firing corrections superimposed. The computer can be an integral part of the helicopter fire control system.

CHARACTERISTICS
Reticle definition: 140 (±8) mrad in elevation and azimuth
Field of view: azimuth 22°; elevation 20°
Colour of reticle: Blue-green (adjustable brightness)
Accuracy: 1 mrad
Weight: 8 kg
Power supply: 28V dc 120W
STATUS
In production.

Scotch helicopter weapon delivery system

3856.393
VENUS HOT/HELICOPTER NIGHT SIGHT

The Venus system enables the Dauphin-type helicopters, equipped with HOT anti-armour missiles, to engage tanks in complete darkness (the helicopter is equipped with a night flying system). The Venus system is an adjunct to the standard HOT weapon system, with the same missile and a small modification to the firing post. The night sight and missile IR localising equipments are grouped within a blister located in the nose of the helicopter.

The Venus system is mainly composed of a SFIM gyro-stabilised platform (**4239.393**) supporting a TRT Hector thermal camera (**3854.393**) used to detect, recognise and identify a target from its IR radiation, and a SAT deviation measuring instrument, used to track the missile and supply deviation signals (in relation to the platform axis). There is also a canopy-mounted M 397 stabilised day sight.

A control unit, equipped with a control stick, is provided for the operator, to control the platform axis and, thereby, the line of sight. The platform also accommodates fine stabilising devices. The thermal camera operates in the ten micron band and has two optical fields: one to observe and detect the targets, the other to recognise, identify and track them during the firing sequence. Joule-Thomson effect-type cooling is provided. The received IR image is displayed on a CRT screen located in the eyepiece of the gyro-stabilised sight: the switch-over from day to night observation, and inversely, is thus performed by a mere switching action. The localiser also has two optical fields, one to capture the missile and the other to track it during the cruising phase.

Venus HOT/helicopter night sight

CHARACTERISTICS
Thermal camera: Large field 8·1 × 5·4°; small field 2·7 × 1·8°
Localiser: Large field ±4°; small field ±0·5°
Platform assembly movement: Azimuth +30 to −20°; elevation 110°
Diameter: 600 mm
Weight: 90 kg
Target detection range: >5000 m
Target engagement range: 4000 m
STATUS
The Venus programme was implemented as a collaborative project and tests of the system's night firing capabilities were concluded successfully in early 1981. More than 50 successful firings have been carried out, even at extreme ranges. In production.
CONTRACTORS
Main contractor: Aerospatiale-Euromissile
Principal sub-contractors: SFIM, SAT, TRT

3855.393
HADES HELICOPTER LASER ANGLE TRACKER

The HADES system is intended for military helicopters and is used to control missile launching at laser designated targets, under day and night conditions.

The system performs the following functions: target search within a wide angular domain; acquisition of designation targets; automatic target tracking through continuous, accurate aiming of the fire control sight at the illuminated target; enlargement of firing envelope in conjunction with the laser rangefinder.

The HADES equipment consists of two compact modular sub-assemblies: a detection module and an electronic module. The former is associated with the optical unit of the sight, while the latter supplies angular error data to the servomechanisms.

CHARACTERISTICS

Acquisition field: 10° (elevation); ±10° (bearing)
Supply voltage: 28 V DC
Weight: 2 kg

CONTRACTOR

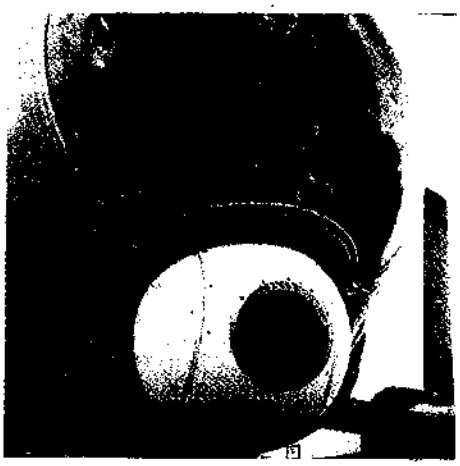
Thomson-CSF, Division Equipements Avioniques, 178 boulevard Gabriel-Péri, 92240 Malakoff, Paris, France.

5923.393
TANGO THERMAL IMAGER

Tango is an airborne IR system intended for use in maritime applications. It can be used in the search mode to detect surface vessels, schnorkels, etc and for search and rescue missions. It has been designed for installation in a ball-shaped gyro-stabilised platform mounted under the nose of the French Navy Atlantique 2 aircraft. The complete Tango system incorporates a turret and a camera, the latter using modules developed under the SMT common module programme (**4107.093**). These modules operate in the 8 to 13 micron waveband and are cooled by a split-Sterling system. The turret is a 60 cm diameter gimballed platform which rotates in azimuth and elevation.

The system converts the thermal radiation of a target into an image which, when incorporated with the necessary symbology, is displayed on TV monitors in the aircraft. Normally the system is slaved to the line-of-sight but it is possible to automatically designate a target using co-ordinates generated by the aircraft weapon system.

CHARACTERISTICS



Wavelength: 8 - 13 microns
Magnification: Partial ×2 magnification is provided in a window in the centre of the image
Camera lens: Bifocal type with 6·45° × 4·3° and 2·15° × 1·43° fields-of-view
Image scanning: Serial-parallel
Platform assembly movement: Azimuth ±110°; elevation +15° to -45°
Stabilisation accuracy: 1 mrad
Weight: 150 kg

STATUS

In operational service in the Atlantique 2 aircraft of the French Navy.

CONTRACTOR

TRT (Télécommunications Radioélectriques et Téléphoniques), Defence and Avionics Commercial Division, 88 rue Brillat-Savarin, 75460 Paris Cédex 13, France.

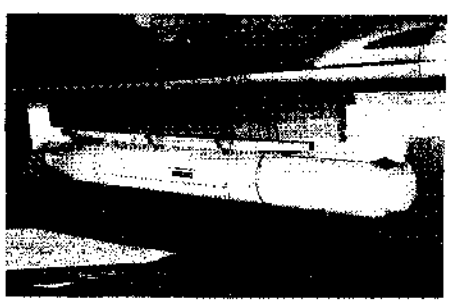
5924.393
CALIPSO THERMAL IMAGER

The Calipso thermal imaging system has been developed for mounting in the spherical Ophelia pod produced by SFIM for the BO 105 helicopter. The complete system is mounted above the rotor to enable target observation and identification while the helicopter is hidden. The thermal camera uses a bifocal system which offers an 8·1° × 5·4° wide-angle field-of-view (FOV) for observation and detection, and a narrow-angle FOV of 2·7° × 1·8° for target identification. Calipso operates in the 8 to 13 micron waveband using modules developed under the SMT common module programme (**4107.093**). The image produced is normally shown on a TV display.



CONTRACTOR

TRT (Télécommunications Radioélectriques et Téléphoniques), Defence and Avionics Commercial Division, 88 rue Brillat-Savarin, 75460 Paris Cédex 13, France.

3136.393
THOMSON-CSF ATLIS LASER TARGET DESIGNATION POD

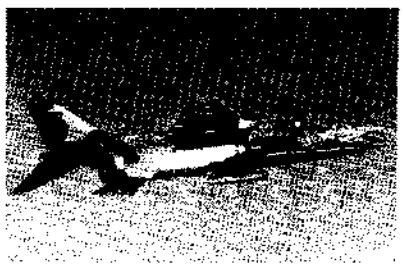
ATLIS (automatic-tracking laser illumination system) is a high precision air-to-ground designation system mounted in a pod. It can be mounted on single-seater combat aircraft. The system consists of:

(1) TV/laser fire control pod with TV camera operating with wide or narrow field of view, laser illuminator/rangefinder, automatic two-mode TV tracking, stabilising system, and air-conditioning system
(2) monitoring and control panel and a hand controller in the cockpit, associated with a TV monitor if no TV-type display equipment is already available. The system can be connected to the head-up display, or the radar navigation system or helmet sight for target predesignation.

Laser target designation pod

OPERATION

ATLIS is used for low altitude, high speed, autonomous attack of surface targets with laser-guided weapons; it reduces risks for the attacker owing to the immediate breakaway and long stand-off ranges allowed by the system.



CHARACTERISTICS

Weight: 160 kg
Diameter: 300 mm
Length: 2·52 m

DEVELOPMENT

In 1975 Thomson-CSF awarded a $3·7 million contract to Martin Marietta Aerospace for the development and test of the ATLIS pod. The French company is prime contractor to the French Government, and is responsible for all the cockpit equipment (HUD, video monitor, and controls). The Orlando Division of Martin Marietta is responsible for the pod. The French CILAS company provides the ITAY 139 laser illuminator-rangefinder. Joint arrangements have been concluded between Thomson-CSF and Martin Marietta for the commercial exploitation of the ATLIS pod.

The first prototype system, known as ATLIS 1, was flight tested during the late 1970s. These flight tests were highly successful with some 700 passes against a wide variety of targets which confirmed the system's ability to locate and mark targets for attack by a laser guided missile such as the AS.30 (**3335.311**), from a range of 10 km. This programme's results were such that the French Air Force decided to equip a number of Jaguar aircraft with ATLIS pods, and cockpit viewing and control equipment. Development and production of suitable laser guided bombs and rockets by Matra/Thomson-CSF and Thomson Brandt has continued in parallel with AS.30 development by Aérospatiale using the Thomson-CSF Ariel laser seeker.

Launch of AS.30 Laser missile from a Jaguar equipped with Thomson-CSF LDP designator pod

Following completion of the ATLIS pod development, Thomson-CSF and Martin Marietta developed and flight tested a new system, ATLIS 2, for use with Jaguar and F-16 aircraft. ATLIS 2 weighs 160 kg, compared with the 240 kg of the original ATLIS, and includes a computer to interface directly with a digital bus-bar as employed in later aircraft such as the Mirage 2000 and F-16.

STATUS

ATLIS 2 is in full production for the French Air Force.

CONTRACTOR

Thomson-CSF, Division Equipements Avioniques, 178 boulevard Gabriel Péri, 92240 Malakoff, Paris, France.

3423.393
THOMSON-CSF VE 110 HEAD-UP DISPLAY

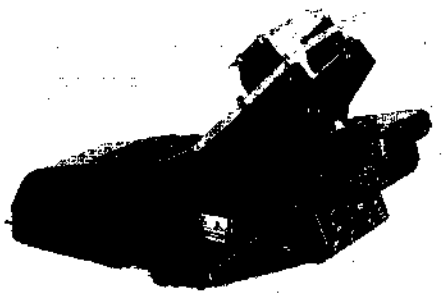
This display comprises two units: a pilot display unit and an electronic unit operating in conjunction with the aircraft nav-attack system. These are described separately in the following paragraphs.

Pilot Display Unit: Collimated images are generated by a pilot display unit which includes: high brilliance and long-life CRT with its deflection control coils, providing stroke written or raster images; the EHT generation circuits; a collimation optical system with a large-diameter lens (110 mm for the VE 110 model which is a simplified version adapted to light combat or training aircraft); the power supply; and push-button test. A sight recorder mount and pilot controls are provided at the rear part of the pilot display unit. A special mount permits instantaneous replacement of the pilot display unit without any adjustment or re-harmonisation.

Electronic Unit: The symbol generation, ballistic and flight circuits, the interface with the digital data transmission system, and an integrated test system are contained in the electronic unit. The electronic circuitry is of solid-state, integrated circuit type. All circuits are distributed on plug-in cards. The technology used in this equipment gives maximum design flexibility.

OPERATION

The following functions are provided:



(1) Air-to-air:
- (a) All weather interception (operation with a fire control radar such as the Thomson-CSF Cyrano) with display of flight and target information, and flight director.
- (b) Missile launching: missiles of all types can be launched and the HUD may accommodate any type of approach: snap-up or down, head-on, etc.
- (c) Gunfire: with or without radar to provide target range and closing speed, the HUD will provide lead angle and gravity drop corrections, or it will provide a continuous computation of tracer line generating a synthetic line for snap shooting in dog-fight conditions.

(2) Air-to-ground:
- (a) Conventional armament (gun, rocket, bombs): the HUD provides flight, target, and aiming information in continuous computation of impact point or continuous computation of release point mode for automatic bomb release.
- (b) Special weapons: the HUD is designed to allow operation of a large variety of special weapons, eg missiles of all types including laser or electro-optically guided weapons.

(3) Navigation

The HUD displays flight and target information, flight director and optionally, TV presentation of FLIR images.

(4) All weather approach and STOL landing.

Thomson-CSF VE 110 head-up display

STATUS

The VE 110 is in production for the modernised Mirage III/IV, the Alpha Jet NG and other light tactical support/trainer aircraft. It is also fitted to the Mirage III G.

CONTRACTOR

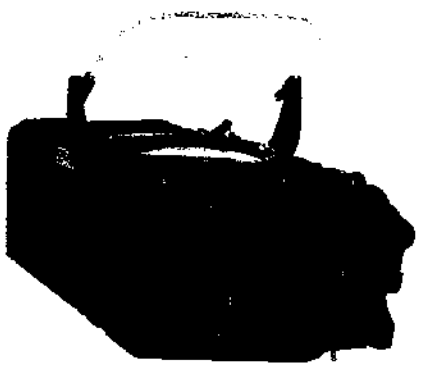
Thomson-CSF, Division Equipements Avioniques, 178 boulevard Gabriel Péri, 92240 Malakoff, Paris, France.

1317.393
THOMSON-CSF SERIES 121-196 ATTACK SIGHTS

These displays comprise three units: a collimating head projecting a coloured display; an electronic unit,for signal processing; a pilot's control unit (not required if the head-up display (HUD) is operated through the control unit of the nav/attack system).

Collimating Unit: The coloured display required for an operating mode is obtained with servoed reticles, controlled by signals from the electronic unit. Up to four different sets of reticles may be used. After optical mixing of reticles' images, collimation is effected by a large 120 mm lens.

Electronic Unit: This fulfils the following functions: interface with the nav/attack system associated to the HUD elaboration of the display control signals delivered to the collimating head, according to the operating mode; permanent auto-test of the HUD; power supply.



OPERATION

The following modes may be available:

(1) Air-to-air (operation with a fire control radar, such as the Cyrano)
- (a) All weather interception with display of flight information (horizon, altitude, airspeed), and target information (elevation/azimuth, range, closing speed).
- (b) Missile launching: missiles of all types can be launched, and the HUD may accommodate any type of approach: snap-up or down, head-on etc.
- (c) Gunfire: the HUD is designed to permit automatic gunfire at optimum radar range, in all-weather conditions, with no limitation (such as altitude, speed, etc).

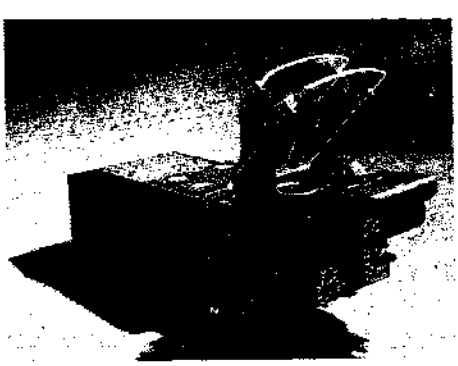
(2) Air-to-ground
- (a) Conventional armament (gun, rocket, bombs): the HUD provides the following display for air-ground attacks: target position, for all-weather approach and ranging (laser or radar, with subsequent display of range to target); bomb impact line roll stabilised, drift corrected, enabling accurate automatic release of low drag and high drag bombs; and altitude levels.
- (b) Special weapons: the HUD is designed to enable operation of a large variety of special weapons, eg missiles of all types, AS.30, Martel, cluster bombs, etc.

(3) Navigation and landing
- (a) Navigation (cruise, terrain following, target approach): the following data can be displayed: horizon; heading and heading commands to keep a selected track; altitude and altitude commands; airspeed (or Mach number) and airspeed commands; flight director.
- (b) All weather approach: this provides for the additional display of the axis of an instrument landing system.
- (c) STOL landing: this is a special display which enables a precise control of flight path angle and airspeed, resulting in an accurate impact on the runway threshold (within ±30 m), with the proper airspeed.

Thomson-CSF A 121 attack sight collimating head

STATUS

Systems of this type are in production for the French Air Force and for export. The 121 sight is fitted in the Jaguar mainly for air-to-ground missions; the 196 sight is employed in the Mirage F1 principally for air-to-air roles.



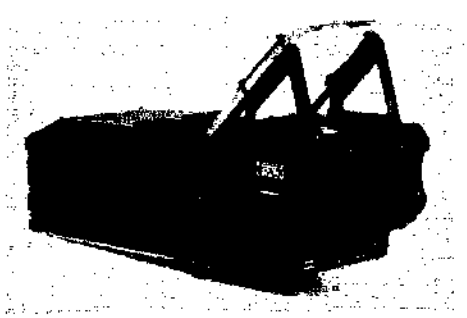
CONTRACTOR

Thomson-CSF, Division Equipements Avioniques, 178 boulevard Gabriel Péri, 92240 Malakoff, Paris, France.

3135.393
THOMSON-CSF SERIES VE 120/130 HEAD-UP DISPLAYS

These displays comprise two units: a pilot display unit and an electronic unit operating in connection with the aircraft nav/attack system.

Pilot Display Unit: Collimated images are generated by a pilot display unit which includes: high brilliance and long-life CRT with its deflection control coils, providing stroke written or raster images; the EHT generation circuits; a collimation optical system with a large-diameter lens and combiner giving a large IFOV and a push-button built-in test. A sight recorder mount and pilot controls are provided at the rear part of the pilot display unit. A special mount permits instantaneous replacement of the pilot display unit without any adjustment or pre-harmonisation.



Thomson-CSF 130 head-up display unit

Electronic Unit: The symbol generation, fire computation and navigation computation circuits, the interface with the digital data transmission system, and an integrated test system are contained in the electronic unit. The electronic circuitry is of solid-state, integrated circuit type. All circuits are distributed on plug-in cards. The technology used in this equipment gives maximum design flexibility and allows modifications in symbology. An air-to-air sensor unit, Thomson-CSF AA 120 containing rate gyros, can be added to the system for gyro lead fire control.

OPERATION

The following functions are provided:

(1) Air-to-air
- (a) All weather interception (operation with a fire control radar such as the Thomson-CSF Cyrano) with display of flight and target information, and flight director.
- (b) Missile launching: missiles of all types can be launched and the HUD may accommodate any type of approach snap-up or down, head-on etc.
- (c) Gunfire: with or without radar to provide target range and closing speed the HUD will

Thomson-CSF VE 120 head-up display unit

provide bead angle and gravity drop corrections, or it will provide a continuous computation of tracer line generating a synthetic line for snap shooting in dog fight conditions.

(2) Air-to-ground

(a) Conventional armament (gun, rocket, bombs): the HUD provides flight, target and aiming information in continuous computation of impact point or continuous computation of release point mode.

(b) Special weapons: the HUD is designed to allow operation of a large variety of special weapons, eg missiles of all types including laser or electro optically guided weapons.

(3) Navigation

The HUD displays flight and target information, flight director and TV or FLIR images.

(4) All weather approach and STOL landing.

STATUS

Systems are in production for the Super-Etendard of the French Navy, for Mirage F1 and integrated in an all-electronic multi-display system on the Mirage 2000 (**4723.393**).

CONTRACTOR

Thomson-CSF, Division Equipements Avioniques, 178 boulevard Gabriel Péri, 92240 Malakoff, Paris, France

4723.393

TMV 980A ELECTRONIC MULTIDISPLAY SYSTEM

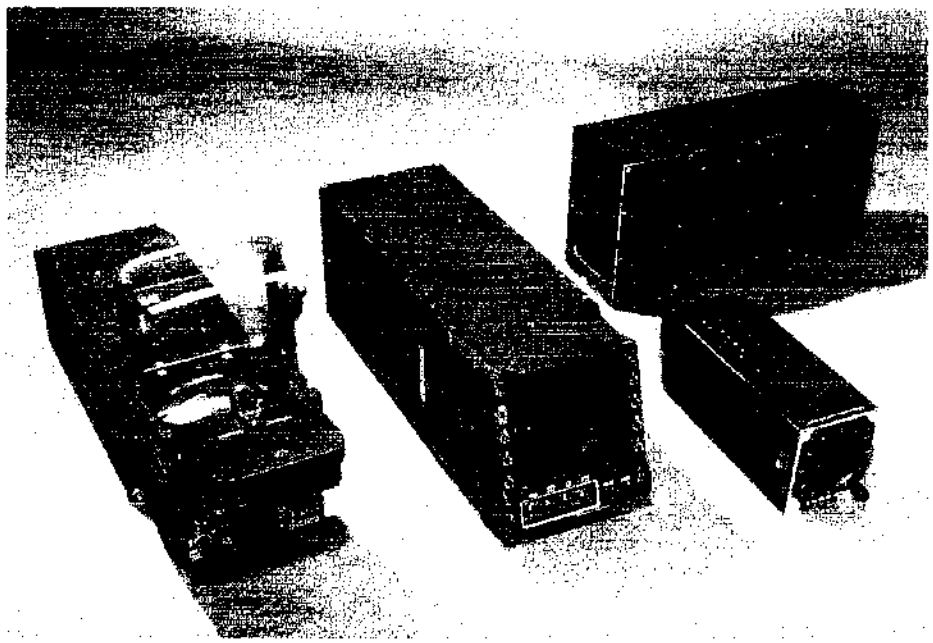
The TMV 980A is a highly flexible multimode, multicolour digital display system for the Mirage 2000 aircraft. It consists of an integrated head-up display (HUD), a head-down display (HDD), a complementary HDD in monochrome and an electronics unit/digital computer. The system is intended for use by the pilot in most stages of the mission, using either the HUD or HDD as appropriate. Information on the displays is provided by the various sensors on board and is designed to give the pilot all the information required for a particular phase of his flight.

The VE 130 HUD (**3135.393**) has a large field of view through the windscreen and provides information symbols collimated on the combining glass at infinity. It uses a 3 inch high-resolution, high-brightness, monocolour (green) cathode ray tube associated with the collimating optical system. The 5·1 inch diameter collimating lens gives wide instantaneous field of view which is enlarged in elevation by the use of a twin glass combiner with an optical transmit factor of 80 per cent. An automatic brightness control and manual contrast allows the symbols to be read in ambient light up to 100 000 lux.

The Type VMC 180 HDD is a multifunction unit whereby information is presented in TV raster and/or caligraphic writing with coding and colour for rapid assimilation of the visual data. Two video inputs are provided (radar and TV) plus a link to the electronics unit for generation of coloured alpha-numerics for superimposition on either the radar or TV frame. Information presented includes a radar map, synthetically derived tactical situations, TV raster images (from TV sensors and flight instruments), and tactical data from the system itself or from external sources. The unit uses a 5 × 5 inch multimode cathode ray tube screen with red, amber and green colours. For brightness control, automatic photo cells and manual override are incorporated on the control panel.

The complementary Type VMC 65 HDD provides the same information on a 2·5 inch circular monocolour screen.

The electronics unit provides the interface with the aircraft systems, carries out flight and weapon aiming computations, and processes and generates the display symbology.



Weights of the various units are 13 kg for the HUD, 14 kg for the VMC 180 HDD, 4 kg for the VMC 65 HDD and 9 kg for the electronics unit. The latter is of ½ ATR format.

STATUS

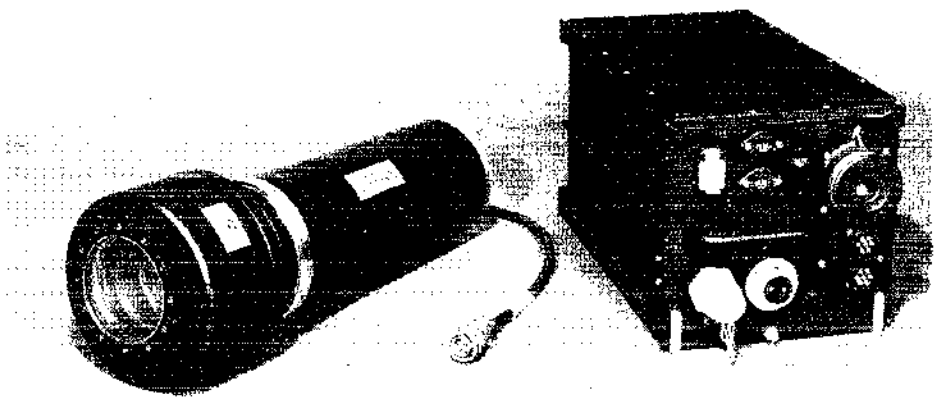
In production for the Mirage 2000 multi-role fighter aircraft.

CONTRACTOR

Thomson-CSF, Division Equipements Avioniques, 178 boulevard Gabriel Péri, 92240 Malakoff, Paris, France.

Units of the TMV 980A multidisplay system

1736.393



TAV-38 LASER RANGEFINDER

The TAV-38 laser rangefinder is designed to provide air-to-ground ranging facilities up to ranges of 10 km in clear-sky conditions. The equipment comprises two units, laser head and power unit. The latter unit weighs 12 kg and has no moving parts. It provides the high energy DC voltage to the flash exciter tube and the auxiliary supplies to the system. The laser head weighs 8·5 kg, and houses the laser cavity, with its neodymium rod, flash exciter, and triggering device. It also contains the receiver circuitry which incorporates an avalanche photodiode, the digital range counter, and transmission/reception optics.

Among the design features contributing to light weight and modest dimensions is an original type of exciter yielding more power to the neodymium rod, thus reducing the heat that needs to be carried away. The laser/internal cooling arrangements make the unit suitable for use under a wide range of ambient temperature conditions.

OPERATION

Ranging is effected by measuring the time interval between the emission of an energy pulse and the return of reflected energy. Measurement is by means of a digital counter, with a clock frequency of 29·98 MHz, which corresponds to a distance increment of five metres. The digital output is converted into serial binary format for output. The wavelength of the emissions is 1·06 micron.

TAV-38 laser rangefinder

The deflector system developed by Thomson CSF enables the direction of the beam emitted by the laser rangefinder to be referenced to the boresight provided for the pilot by a collimator. The angle of deviation thus obtained is ±10° in both elevation and azimuth.

DEVELOPMENT

The type TAV-38 is the result of collaboration between Thomson-CSF and Marcoussis Laboratories CGE Research Centre, the former being responsible for the beam deflector system and the latter for the TAV-34 laser rangefinder.

STATUS

In operational use with a number of exported Mirage F-1 aircraft and in the French Air Force Jaguar.

TMV 630 LASER RANGEFINDER

The TMV 630 laser rangefinder is a second generation equipment developed with the experience gained in the design and manufacture of the TAV-38 (**1736.393**). It is a high performance monobloc compact equipment, especially designed for installation even on board small tactical aircraft. It has a very high performance in angular precision and PRF. Several versions have been designed with a variety of analogue and digital interfaces.

The rangefinder consists of one line-replaceable unit to be fitted on an aircraft mount which is only boresighted once. Its replacement, if necessary, does not require further boresighting. It is composed of two modules integrated into one unit; a laser transmitter/receiver and a beam steerer.

CHARACTERISTICS
Wave length: 1·06 μm
Ranging: Up to 20 km
Length: 530 mm
Weight: 15 kg (33 lb)
STATUS
In production and fitted to the Alpha Jet and modernised Mirage V.
CONTRACTOR

3562.393
THOMSON-CSF TYPE 902 GUNSIGHT

The 902 gunsight is the latest model of the series R gunsights (**1518.393** in 1979-80 and earlier editions) produced by Thomson-CSF and sold in many countries as well as in France. In its category, the 902 assures maximum performance efficiency in air-to-ground attacks with guns, rockets and clean or retarded bombs and also in the air-to-air gun fire mode with visual stabilised tracking. It is specially acaptec to the sighting problem of light strike aircraft.

The 902 gunsight TMV 53[illegible] is of monobloc construction and is located directly in front of the pilot's eyes. The nearby illustration shows the general arrangement of the unit. A dove-tail support allows the replacement of the sighting head without realignment.

Two bright graticules (one fixed, one mobile) are collimated on the combining glass, allowing the pilot to view them superimposed upon the outside world without any accommodation problem.

STATUS
In production.
CONTRACTOR
Thomson-CSF, Division Equipements Avioniques, 178 boulevard Gabriel Péri, 92240 Malakoff, Paris, France.

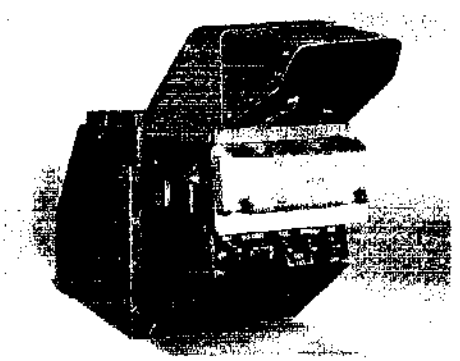
CN_2H NIGHT OBSERVATION BINOCULARS

The CN_2H binoculars are designed for night observation, night flying and instrument and map reading in helicopters and fixed-wing aircraft. They incorporate either second or third generation light intensifier tubes with the appropriate optics. The binoculars are normally mounted in a fixed position on the pilot's helmet using a special support. The power pack, for supply from the aircraft system, can be fitted at the rear of the helmet. The binoculars are also battery operated in the event of aircraft system failure.

CHARACTERISTICS
Field of view: 40°
Magnification: ×1
Weight: 400 g (binoculars); 550 g (full equipment)
CONTRACTOR
SOPELEM, 102 rue Chaptal, 92306 Levallois Perret, France.



CN_2H night observation binoculars

4724.393
HUD SIGHT REPEATER

The Head-up Display (HUD) Sight Repeater is designed for use by the rear seat occupant in two-seat aircraft and provides a television, collimated image of the display seen through the combiner glass of the pilot's HUD. The rear occupant, normally an instructor pilot, can then follow the symbolic HUD data superimposed on the landscape, control the actions of the front pilot as necessary and check target identification or obstacle avoidance.

The sight repeater consists of two elements:
(1) an electronic scanning unit installed in the front cockpit and consisting of a vidicon pick-up tube, an optical lens, an automatic shutter and a 4-filter filtering unit
(2) the display sub-assembly mounted in the rear cockpit and comprising the display unit itself and a control panel for remote control of the scanning unit operation. The display unit is available in two sizes

STATUS
In production.

4794.393
ACX DISPLAY SYSTEM

Thomson-CSF, in collaboration with SFENA, is studying an integrated display system intended for the experimental ACX fighter aircraft developed by Marcel Dassault/Breguet Aviation. The proposed system will include three types of display: a wide field-of-view holographic HUD, an 'eye level' collimated picture display, and a lateral colour 'shadow mask' CRT display.

The holographic and eye-level displays will be provided by Thomson-CSF, with SFENA supplying the lateral colour TV raster display and interfaces to two symbol generators. These latter have been designed by Thomson-CSF and use a new graphic processor, based on LSI integrated circuit technology, to generate all the alpha-numeric information and symbols displayed on the various VDUs.

STATUS
In early design

5925.393
CROUZET HELICOPTER SIGHT

This is a simple and low-cost sighting head for helicopter pilots which has been developed for weapon firing management on light helicopters equipped with a fixed gun, rockets or missiles. It provides the pilot with a reticle image collimated to infinity over an arc of +6° to -6° in azimuth, and -10° to +70° in elevation. The total range of the optical system is 130 milliradians and allows the pilot to obtain the reticle very quickly and to keep it in sight with ease.

The sight consists of an optical unit which generates the symbology and ensures collimation; a combiner mirror for superimposing the symbology on to the external scene; an elevation motorisation module which produces a circular movement of the mirror enabling the reticle displacement to be followed without head movement; and an azimuth motor module producing a rotation movement of the optical unit. The line-of-sight direction in elevation and azimuth is determined either by a simple electronic control for air-to-surface firing, or by a weapon management computer for air-to-air firing.

3853.393
CE626 LASER TRANSMITTER

This unit has been developed for the Panavia Tornado multi-role combat aircraft system.

The transmitter is a nitrogen-cooled neodymium-YAG laser operating with a variable pulse repetition frequency between 9 and 11 Hz and ascertaining together with the receiver the exact range to mobile and stationary targets. The display/operating and control unit and the corresponding power supply units form part of the laser transmitter.

Since its electronics and technology are tailored to system integration, it can be used in many fields, eg ships, aircraft, helicopters, tracked and wheeled vehicles as well as spacecraft. It has been developed for a PRF of 40 Hz.

Eltro GmbH, Postfach 102120, 69 Heidelberg 1, Federal Republic of Germany.

4793.393
MBB NIGHT SIGHT ATTACK SYSTEM

The MBB night sight attack system is an experimental programme being carried out in a modified G91 aircraft. It consists of a head-up display (HUD) mounted in the cockpit and an FLIR camera contained in an externally mounted pod. The image from the FLIR camera is transmitted to the HUD, and also to a ground station by means of a digital data link. Additional symbols for flight guidance and alpha-numeric information can be added to the picture to give further information concerning the mission to the pilot.

The FLIR camera, supplied by Eltro, and an AEG Telefunken TV system are mounted on a two-axis stabilisation platform housed in a special front section of the pod.

STATUS

In development.

3801.393
WDNS-141 WEAPON DELIVERY SYSTEMS

WDNS-141 is the name of a family of weapon delivery systems produced for fighter/bomber aircraft by Israel Aircraft Industries Ltd. They are designed to assist the pilot by presenting essential data on the head-up display (HUD) for use in navigation, air-to-air and air-to-surface combat missions.

Typically, the system comprises sensors, processors, display and control units. Among the sensors are radar, inertial measuring units, the angle-of-attack systems and a flux-valve compass. In addition to the central processor, computers will include an auxiliary computer and an air data computer. Display equipment may comprise the HUD, horizontal situation indicator, attitude direction indicator and a terminal unit.

The WDNS-141s used by the Israeli Air Force are capable of the following operating modes:

(1) Air-to-air: gunnery, including Hotline (snap shooting), and/or Hotpoint; missile fire; override of air-to-air mode.
(2) Air-to-ground: continuously computed impact point immediate or delayed release; continuously computed release point designated toss bombing (Des-toss), Dive-toss, Toss; manual altitude or range release.

It is possible to use the system to 'mark and store' targets of opportunity.

STATUS

In production and operational.

4241.383
LOW COST WEAPON DELIVERY SYSTEM (LCWDS)

Based on the company's experience in developing and producing systems for A-4, F-4 and Kfir aircraft operated by the Israeli Forces, Elbit recently introduced a low cost weapon delivery system (LCWDS) equipment which represents a compromise between the expensive, full performance weapon delivery and navigation system and the very low cost, low performance gunsight. The LCWDS is designed to enhance aircraft operational performance capabilities, while the use of digital computation with a head-up display (HUD) improves pilot performance. It is particularly suitable for use on light attack aircraft, advanced trainers and interceptors.

Modes of operation provided include: air-to-ground, air-to-air, and navigation. The navigation mode requires the aircraft to be fitted with a doppler velocity sensor. Facilities provided in the air-to-ground mode are continuously computed impact point, CCRP and manual. There are two uses of the air-to-air mode, Hotline (snap shooting) and LCOS. Computation and display of steering commands for pre-selected waypoints is the main function of the navigation mode.

The LCWDS is based on the installation of three items of equipment in the aircraft and interfacing them with existing aircraft sensors and indicators. The added equipment consists of: the central mission computer (CMC), containing a digital processor, symbol generator and aircraft interface unit; HUD; and the control terminal unit (CTU). Existing aircraft systems interfaced to the LCWDS comprise flux valve, angle of attack, air data computer and gyro reference unit sensors; control facilities such as an armament programmer, and stick and throttle switches; and displays (attitude direction indicator and the horizontal situation indicator).

Elbit LCWDS units, left to right: central mission computer, head-up display, control terminal unit

CHARACTERISTICS
Accuracies: 10 mrad (A/G); 3 mrad (A/A) dependent on accuracy of aircraft gyro reference unit
MTBF: 800 h minimum
Dimensions: CMC 249 × 194 × 140 mm; CTU 167 × 175 × 127 mm; HUD 320 × 120 × 150 mm
Weight: CMC 9 kg; CTU 2·5 kg; HUD 5 kg
Environmental Conditions: CMC MIL-E-5400 Class II; CTU MIL-E-5400 Class IA; HUD MIL-E-5400 Class IA
STATUS
Early production.

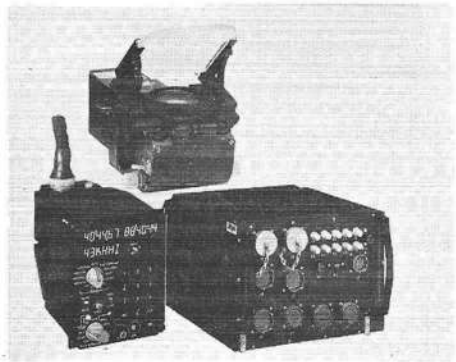
4242.383
SYSTEM 81 WDNS



The Elbit weapon delivery and navigation system (WDNS) 81 is a modern IMU-based digital computerised weapon delivery and navigation system for use in advanced combat aircraft for both air-to-air and air-to-ground operations. There are three principal modes of operation provided by the System 81: air-to-air, ground attack, and navigation. In the first of these, the missile launching envelope is computed and displayed to the pilot by a head-up display (HUD) for engaging missiles. When using guns in this mode, Hotline (snap shooting) is the normal method but there is also a lead computing optical sight (LCOS) back-up facility available. For delivering ground attack weapons there are facilities for continuously computed impact point (CCIP), CCRP, toss bombing (toss), release of 'smart bombs', guided munitions etc (special ordnance), and a direct back-up visual delivery capability. The navigation mode computes and displays steering commands for pre-selected destinations, with up to 40 waypoints.

These facilities enable a pilot to navigate to his target accurately and on time, to release a wide range of airborne weapons in 'uncanned' paths, obtain air-to-air missile firing envelope information presented on the HUD, employ 'snap shooting' and LCOS air-to-air firing modes, and to enter before-flight data and control commands. Other features include in-flight position and velocity update, rapid warm-up/alignment, and the design is based on the HOTAS (hands on throttle and stick) principle.

System 81 equipment comprises four main items: fire control and navigation computer (FCNC), inertial measurement unit, control terminal unit (CTU) and the HUD. The first of these comprises the following five units: central processing unit and program store, converter unit, symbol generator, core store and the power supply unit. The CTU is used for entering data to the central computer and the presentation of certain data from the FCNC to the pilot. The CTU controls system alignment, operation, test, and selection of sub-modes. Its external features can be seen from the nearby illustration. The HUD provides the pilot with all relevant operational information and is designed to employ the minimum number of signals and to have the least possible interference with the pilot's normal viewing. It provides warning information symbology.

Other aircraft systems, indicators and sensors which are linked with the System 81 central computer as peripherals include search radar (range, range rate, antenna position, target data, altitude, Mach number, aspect angle), radar altimeter, inertial measurement unit, flux valve heading reference, air data computer, ADF, attitude direction indicator, horizontal situation display, armament programmer, 'smart' weapons interface, stick and throttle switches.

CHARACTERISTICS
Central computer: 16-bit with 17 32-bit registers and 7 16-bit registers
Converter: A/D: 28 channels; D/A: 6 channels; S/D: 3 channels; Synchro buffers: 2 channels; Input discrete: 48 channels; Output discrete: 24 channels
Symbol generators: 3000 mrad/20ms, straight lines, scales, digits, letters, circles
Core store: 16 K
Memory: EPROM 48 K × 16 bits; RAM 6 K × 17 bits; Non-volatile RAM 2 K × 17 bits
Dimensions: 273 × 382 × 195 mm
Weight: 20 kg
Control terminal unit
Serial interface to main computer: 1 Mbit/s (16-bit words)
Dimensions: 175 × 167 × 127 mm
Weight: 2·5 kg

4002.383
SYSTEM 82 WDNS

The Elbit System 82 weapon delivery and navigation system is an enhanced version of the company's System 81 (**4242.383**, above), providing automated weapon aiming and aircraft navigation facilities for advanced combat aircraft employed on air-to-air and ground attack missions using missiles, guns, conventional bombs, and 'smart' weapons. Compared with the System 81, the WDNS 82 differs in having a stores management sub-system, consisting of an image (TV) display capability for all 'smart' weapons, a separate computer for stores management, a microprocessor-based back-up computer for the fire control and navigation computer (FCNC) and a CRT-based armament control and display panel.

The stores management computer (SMC) manages weapon release with maximum efficiency and safety, taking into account the conditioning and limiting factors. It includes the following units: dual redundant symbol generator, common memory, fault monitor and power supply unit. The back-up computer (BUC) calculates and generates the display of LCOS air-to-air and air-to-ground back-up mode functions to the FCNC. The armament control and display panel (ACDP) is controlled by both the pilot and the SMC. It displays on a TV-type screen continuously updated weapons inventory, video from a variety of sensors (such as forward looking infra-red imaging equipment fitted to the aircraft, or E-O sensors in the homing heads of 'smart' weapons carried by the aircraft), selected program parameters, and warnings in case of erroneous programming.

The extra capacity permits much greater exploitation of the weapons and other related systems and equipment fitted in the aircraft as well as

Elbit WDNS System 82 in KFIR C-7 cockpit

Elbit System 82 WDNS showing (left to right) armament control and display panel and control terminal units (top); back-up computer, stores management computer and fire control and navigation computer (below)

allowing greater flexibility in the choice of weapons carried and sophistication in their employment. The system is also understood to incorporate a considerable growth potential. Where the System 82 characteristics differ from those of the System 81, they are listed in the table that follows.

CHARACTERISTICS

HELIOS HELICOPTER SIGHT

Helios is a helicopter roof-mounted sight for use with air/ground weapons. It has magnifications of ×3 and ×12 and provisions for laser target marking and a thermal imaging system for night use. It can accept commands from a helmet sight or from an avionics system and generates accurate position and rate outputs to weapon systems. It can also be slaved to directions from a laser warning receiver, hostile fire indicator or radar warning receiver. Future developments could have a laser illuminator as an easy-add-on feature, and a medium-sized forward-looking infra-red camera would be incorporated if the stabilised optical sight head was replaced by a thermal imaging head.

The use of rate-integrating gyros and the remote location of the electronics has kept the weight of the roof sight down to only 19 kg. The optical design (by Pilkington, UK, which also builds the optical train) is characterised by low vignetting and low field curvature. The eyepiece arm protruding into the cabin area can be stowed close to the roof when not in use and the eyepiece height is adjustable to suit the operator.

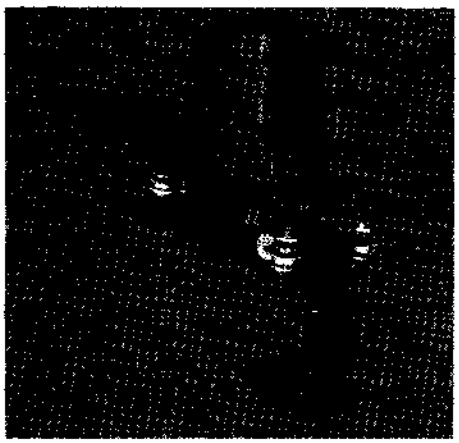
The sight is composed of a number of modules with interfaces to ensure minimal adjustments when a module is changed. The system itself consists of five units: the roof-mounted sight, an electronics unit, control panel, control unit and a line-of-sight indicator.

CHARACTERISTICS

Magnification/field of view: ×3/18° and ×12·4/4·6°

Line-of-sight variation: ±25° elevation; ±120° azimuth

Slew rate: Up to 100°/s



System weight: 27·6 kg

STATUS

In production.

3818.393

RGS 1 OPTICAL SIGHT

The Saab RGS 1 optical sight is an advanced low cost fixed type sight combining simplicity with accuracy and reliability. Optically the RGS 1 sight displays to the pilot an aiming mark projected at infinity. Deflection of the aiming mark projection is made in azimuth and elevation by manual adjustment of a spherical mirror via turning knobs on either side of the sight unit. The depression and adjustment for the crosswind component are read on indicator scales facing the pilot. The useful width of the RGS 1 optical sight is approximately 100 mm, permitting full two-eyed viewing, so enhancing pilot efficiency even in turbulent conditions.

In the standard form, the RGS 1 aiming mark includes vertical references intended as ranging aids for stadiametric ranging. The aiming mark appearance and the width of the vertical references can be adapted to customer choice and weapon ranges. The RGS 1 optical sight is designed with a dual lamp arrangement in case of lamp burn-out. The second lamp could be fitted with a coloured filter providing a different aiming mark contrast against a highly illuminated target background. As an additional feature there is also a brightness control device available for optimisation of the aiming mark illumination for varying brightness conditions. The RGS 1 optical sight is designed to allow the use of a 16 mm recording camera.

STATUS

In production.

Licence manufacture in UK: Avimo Ltd, Taunton, Somerset, England.

1730.393

RGS 2 AIRCRAFT SIGHT

The Saab RGS 2 is a lead computing optical sight developed for use with any type of fighter or attack aircraft. Important design objectives were accuracy, small dimensions and weight, and low price. Its operational function is to display to the pilot a movable aiming mark projected to infinity. The deflection of the aiming mark is controlled in accordance with the characteristics of the preselected weapon, and with certain parameters of the prevailing flight conditions. In the basic configuration, pitch, roll, and yaw rates are measured and all other parameters, such as speed, altitude, and range, are preset manually by the pilot. In more sophisticated configurations, one or more signals are fed to the system from external sources. This flexibility enables the RGS 2 to be applied to a variety of aircraft types with minimum additional design effort.

The system has provisions for the following attack modes: guns, rockets, and missiles for air-to-air; guns, rockets, and bombs in the air-to-ground role. Stadiametric range (by wing-span setting) measurement is used in the air-to-air gun mode. When bombing, a suitable aiming mark depression (maximum 200 mils) is preset on the control unit. The dynamic range of the aiming mark deflection is plus or minus 140 mils in yaw, and plus 80 to minus 200 mils in pitch. In ground attack modes the RGS 2 system has the optional facility of accepting speed, altitude and attitude data from aircraft sensors, so automatically deflecting the aiming mark to compensate for actual deviations from the preset values.

Twin installation of Saab RGS 2 sight in Italian Aermacchi 339 jet trainer aircraft

The RGS 2 system is comprised of three units: sight head, computer and gyro unit, and control unit. Principal dimensions of these items are as follows:

Sight head: 163 × 136 × 259 mm

Computer and gyro unit: 114 × 175 × 275 mm

Control unit: Size dependent upon system facilities

The sole purpose of the sight head is to generate a moving aiming mark of controllable width. Deflection of the aiming mark is accomplished by a spherical mirror, suspended in gimbals and controlled by a pair of servo systems, comprising torque motors, feed-back pick-offs, and servo amplifiers. The width of the

aiming mark is controlled by a reticle mechanism placed in the focal plane of the spherical mirror. The whole optical assembly, with the exception of a fixed plane mirror and an ordinary inclined combining glass, is housed in the base of the sight head.

The computer and gyro unit contains three rate gyros and several circuit boards bearing the computing circuits, signal converters, two identical servo amplifiers, and power supply circuits.

A twin sight arrangement for use in dual control trainer aircraft is simply accomplished by the RGS 2 equipment by having the computer and gyro unit control two sight heads in parallel.

Laser Augmented RGS 2

By incorporating a laser rangefinder and an additional electronics unit, the RGS 2 sighting system will provide considerably improved accuracy in air-to-ground delivery modes, including diving attacks at all angles from level flight and shallow dives to steep attacks.

STATUS

Operational with Royal Netherlands Air Force NF-5A aircraft. In production for Hawk aircraft of the Finnish Air Force and Italian Air Force Aermacchi MB-339 aircraft. Installed in Saab 105G, it has been contracted for the Spanish CASA C-101, Portuguese Air Force Fiat G91R3 aircraft and for others.

ERICSSON LASER RANGEFINDER

A compact airborne high repetition rate laser rangefinder has been developed by Ericsson for easy up-grading of existing systems. It can be integrated into any sighting and weapon delivery system to give higher accuracy and enhanced safety in dive attacks. The rangefinder uses a modular design consisting of transmitter, receiver, range counter and deflection unit. The laser is aimed at the target by steering the deflection unit to the aircraft sighting system.

The transmitter is a Nd-YAG type with a PRF of 5 Hz continuously and 10 Hz in bursts. Typical range is 7 km or greater at an optical visibility better than 20 km. The range counter resolution is 5 m.

F-16 HUD-SIGHT

The head-up display (HUD) system developed for the F-16 air combat fighter by GEC Avionics is now in full-scale production. It is essentially an updated version of the very successful digital HUD supplied for US A-7D and A-7E Corsair aircraft. Its 16 K-word electronics unit makes use of the latest MSI technology and EPROM programming to provide a weapon aiming computer and display generator which is readily adaptable to changing weapon technology or new user requirements.

The system accepts inputs of both digital and analogue data from the aircraft sensors and uses these with stored ballistic information to derive weapon aiming solutions which are presented symbolically to the pilot on the combiner glass of the pilot's display unit. The display unit employs a developed and lighter version of the very accurate A-7 optical system and, in versions for the F-16 itself, features an extremely rugged combiner glass to cater for the canopy off situation. Versions for aircraft with more conventional canopy arrangements employ a much lighter combiner.

Variants of the F-16 system have been adapted for a number of other aircraft types with only minor modifications to system hardware. The major

GEC Avionics F-16 HUD sight

differences between the various versions is in the programming instructions to the electronics unit. The flexibility inherent in this unit allows any symbology format, made up from straight lines and segments of circles, required by the user to be displayed and algorithms suitable for any current air weaponry to be mechanised. The system is also compatible with a raster format in which display symbology is overlaid on a raster presentation of electronic imagery such as radar, forward-looking infra-red or low light level TV. This feature gives the system day/night and, depending on the sensor employed, all weather capability. Changes involved in providing this capacity are all electronic in nature and require no additional boxes or changes in system architecture.

A new technology dual-mode HUD has now been developed and the first production model was delivered to General Dynamics in May 1984. This is the first wide-angle system of its kind, with stroke written symbology operating in both day and night modes. It was produced under a $75 million contract for fitment to F-16C and F-16D aircraft.

STATUS

Now in full production in GEC Avionics factories at both Rochester, Kent and Atlanta, Georgia. In addition, full-scale production of EUs at Kongsberg Vapenfabrikk of Norway and of PDUs at NV Optische Industrie of the Netherlands has been instituted for NATO F-16 models. Overall control of all F-16 HUD set production is exercised by a central programme management team at Rochester.

CONTRACTOR

GEC Avionics Ltd, Airborne Display Division, Airport Works, Rochester, Kent, England.

4314.393
LANTIRN HUD SIGHT

The latest GEC Avionics HUD system is a wide angle, holographic, day/night HUD on order by the USAF to provide 24-hour attack capability for LANTIRN versions of the F-16 and A-10 aircraft. It makes use of the latest, diffractive optical technology to provide a full 30° by 18° instantaneous field-of-view and combines this with a unique stroke write in raster-flyback technique to superimpose flight and mission symbology on a forward looking infra-red sensor picture of the terrain over which the aircraft is operating.

The electronics unit for this HUD incorporates all three of the basic triad of avionic design standards; Mil-STD-1589B High Order Language, Mil-STD

GEC Avionics HUD sight for F-16 LANTIRN aircraft

1750A Airborne Instruction Set Architecture and MIL-STD 1553B Digital Data Bus. This first-ever real application of the three standards will provide improved adaptability in use, improved performance and reduce life cycle costs.

Although the physical shape and size of the F-16 and A-10 HUDs is considerably different, to accommodate the different cockpit arrangements of the two aircraft, electrical and optical modules are to a large extent common to both, and design studies have shown that the system is ready adapted to most modern tactical aircraft cockpits.

STATUS

Prototype deliveries from GEC Avionics' Rochester plant began in early 1982 and the sight is now in full production.

CONTRACTOR

GEC Avionics Ltd, Airborne Display Division, Airport Works, Rochester, Kent, England.

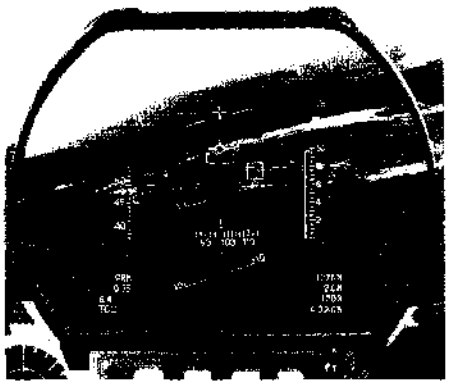
4726.393

THERMAL CUEING UNIT

The GEC Avionics Thermal Cueing Unit (TCU) is intended to assist the pilot to detect a potential target at the earliest moment, particularly when flying low and fast over unfamiliar terrain by day or night. Used in conjunction with a forward looking infra-red (FLIR) imaging sensor and a head-up display (HUD), the TCU alerts the pilot to the presence of ground targets that he might otherwise not detect. It extracts the location of potential targets from the FLIR video signal and generates cue symbols for display at the appropriate position on the HUD, overlaying the real scene by day or the synthetic FLIR image by night.

In sophisticated systems, target position coordinates generated by the TCU and designated by the pilot can be further processed to allow automatic target acquisition and weapon handover. Position data can be used to direct a narrow field-of-view imager at a point of interest for target recognition on a head-down display (HDD).

The TCU is fully compatible with the UK Thermal Imager Common Module (TICM) system (**4280.193**) and the GEC Avionics LANTIRN HUD (**4314.393**). Alternative input and output interfaces can be made available to allow the TCU to operate with other types of FLIR sensor and HUD.



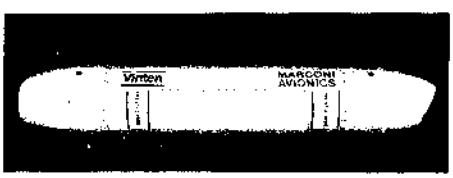
In systems where a thermal image is not required on any display, the TCU can operate directly from the FLIR scanner and pre-amplifiers, thus avoiding the need for scan conversion to raster display format.

STATUS

The Thermal Cueing Unit is now in development following trials and evaluation under UK MoD contract.

CONTRACTOR

GEC Avionics Ltd, Electro-Optical Advanced Systems Division, Christopher Martin Road, Basildon, Essex SS14 3EL, England.



Thermal Cueing Unit display

GEC AVIONICS TICM II FLIR POD

This is a joint development by GEC Avionics and Vinten, to create a flexible and lightweight thermal imaging system which can be attached to a variety of fixed- and rotary-wing aircraft with a minimum of modification. The 14 inch (355·6 mm) pod designed by W. Vinten Ltd accommodates the GEC Avionics thermal imager (TICM II) (**4280.193**) scanner head and telescope. It provides a TV signal output to cockpit displays on a video monitor or head-up displays (HUDs).

TICM II FLIR pod

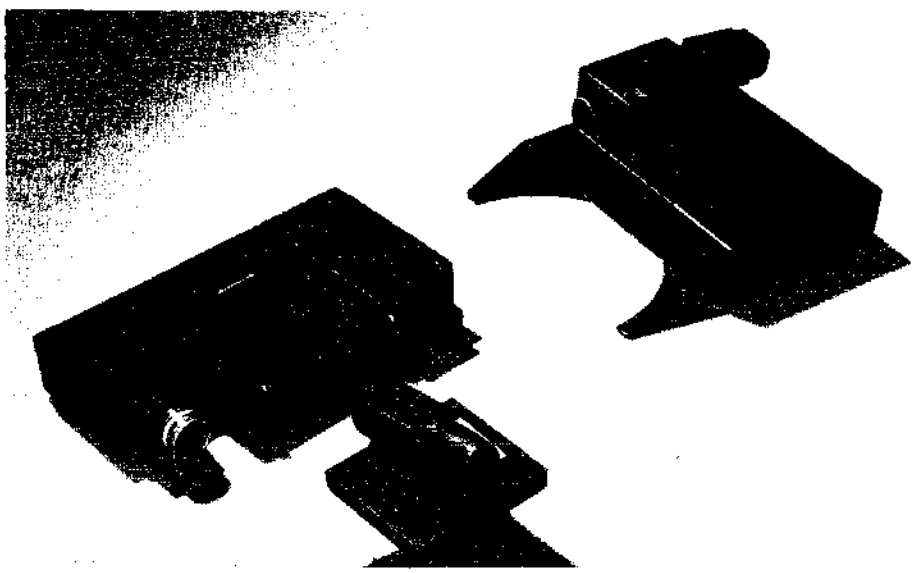
The scanner head and a suitable afocal and athermalised infra-red telescope are boresighted to the pilot's HUD. The telescope magnification is selected to match the field of view of the HUD so that the imagery displayed is in 1:1 registration with the real world. Infra-red radiation reaches the telescope through an infra-red transmissive window at the front end of the pod. The TICM II processing electronics unit which converts the infra-red signals from the scanner head into TV compatible output, plus a cooling air system to cool the scanner dectector, are incorporated in the pod, which also contains a video cassette recorder to record the FLIR imagery for post flight debriefing and detailed analysis.

STATUS

In production. Successful flight tests, integrated with a GEC Avionics HUD and night vision goggles have been carried out by the US Marine Corps in a TA-7C aircraft.

A 10 inch (254 mm) FLIR pod system, suitable for installation on high-performance aircraft, is being developed by GEC Avionics and was due for demonstration in the summer of 1985.

CONTRACTOR



GEC Avionics Ltd, Electro-Optical Systems Group, Christopher Martin Road, Basildon, Essex SS14 3EL, England.

3795.093

GEC AVIONICS CCD CAMERAS

GEC Avionics manufactures a range of TV camera equipment based on the use of solid-state area imaging devices known as charge-coupled devices (CCD). A practical feature of this equipment is the combination of very small dimensions and extreme ruggedness. Among other valuable attributes are low power requirements and long operating life.

CCDs are said to yield an order of magnitude improvement over vidicon camera tubes in dynamic range; they have the broad spectral range of silicon, are free from microphonic effects, have zero lag and inherent geometric accuracy. Cameras based on CCDs can be used with standard TV monitors and video tape recorders and can be employed as discrete items or as part of a larger system.

Typical system for a head up display, and alternative sensors, showing separation from electronics unit

A typical application is the AN/AXQ-16V cockpit TV system which provides a real-time recording of gunsight head-up display image data, as well as cockpit audio data, and can provide a real-time presentation of visual data on a rear cockpit display. The system is based on an all-solid-state TV camera which uses a Fairchild 380 × 488 CCD photosensor array to achieve outstanding sensitivity, resolution, and dynamic range. A split camera design minimises obstruction of the pilot's view, the small camera head being installed on the head-up display.

The use of an on-board video cassette recorder (V-1000 AB-R) ensures that a complete video and audio record of engagements is available for immediate replay as soon as the aircraft lands.

Monochrome and colour variants of these systems can be supplied for installation in many aircraft types and fitments.

STATUS

The system is flight proven, qualified and now in production for military aircraft worldwide.

CONTRACTOR

GEC Avionics Limited, Electro-optical Products Division, Christopher Martin Road, Basildon, Essex SS14 3EL, England.

3056.393

AV-8A HEAD-UP DISPLAY AND WEAPON AIMING COMPUTING SYSTEM

The Smiths Industries HUDWAC system which is currently fitted to the AV-8A aircraft of the USMC and the Matador aircraft of the Spanish Navy provides a comprehensive display of weapon aiming, flight and navigation symbology, as well as performing all the weapon aiming calculations in a separate dedicated computer. The basic system comprises a pilot's display unit (PDU), waveform generator (WFG), interface and weapon aiming computer (IWAC), pilot's control pane (PCP) and extra high tension unit (EHTU).

Pilot's Display Unit: Similar to the Harrier-Jaguar unit, the AV-8A PDU consists essentially of two modules: the optical system and the CRT assembly. The optical system consists of a collimating lens assembly and a combining glass. The 100 mm f0·97 lens assembly provides a total field of view of 25°. All glass-to-air surfaces are treated with an anti-reflective coating to reduce spurious reflections. The CRT assembly consists of a high-brightness CRT, a deflection coil assembly, a focus magnet and a brightness amplifier. The electro-magnetically focused CRT is capable of producing a brightness level which enables the display to be viewed against a background intensity of 35 000 candelas/m² (10 000 ft lamberts).

Waveform Generator: The AV-8A waveform generator is almost identical to that supplied for the Harrier and Jaguar. It generates and controls a comprehensive array of flight, navigation and weapon aiming symbology. The nature and amount of symbology presented to the pilot at any instant, is restricted to those symbols which are relevant to the operating mode selected. This minimises display clutter and enables the pilot to be presented with clear, unambiguous information. The WFG is a special purpose digital computer which accepts analogue DC signals and discrete control inputs from various sensors and systems on the aircraft. It is of modular construction, housed in a ½ ATR case, and incorporates integrated circuits and multi-layer printed circuit boards.

Interface and Weapon Aiming Computer: The IWAC not only performs all the weapon aiming computing on the AV-8A but also serves as the interface between the Smiths Industries head-up display and the attitude and heading reference system (AHRS). In its latest configuration the IWAC can provide air-to-air, lead-angle aiming and CCIP air-to-ground attacks using rockets, guns and either free-fall, retarded or cluster bombs. It also features a continuously computed break-away warning based on ground avoidance and fragmentation hemisphere criteria.

The IWAC is a hybrid computer performing analogue computation under the control of a central processor. It is housed in a ½ ATR (short) case with a 'dog box' extension.

The original WFG and IWAC are now being replaced by a signal data converter (SDC) and digital interface and weapon aiming computer (DIWAC), both of which have been designed by the company's Clearwater Division in Florida, USA. The new units are 'form, fit and function' replacements of the original units but employ later technology.

Extra High Tension Unit. The EHTU provides a high voltage supply to the CRT in the PDU. To maintain the high level of accuracy required for weapon aiming, the 15 kV output from the EHTU has a very high degree of stabilisation over the full operating temperature range.

STATUS

In production.

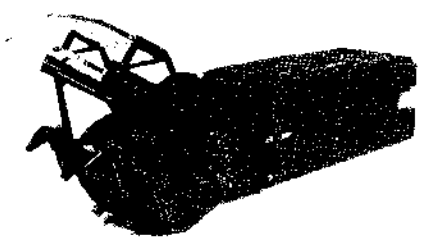
4130.393

AV-8B HEAD-UP DISPLAY



Smiths Industries (UK) and Smiths Industries Inc (USA) were selected to supply the pilot's display unit (PDU) and the display processor respectively, for the AV-8B version of the Harrier.

The PDU, designed to US MIL specifications, has a 4½ inch lens and is a line replaceable unit. A feature is the precision dual combining glass assembly. There is also an electronically depressible stand-by sight. The high grade optical system and the HUD electronics are housed in separate castings mounted one above the other. This eliminates many of the normal fasteners and mating surfaces and allows easy access to all components for servicing. This construction technique and the use of lighter castings, have made it possible to design a HUD with the same mechanical strength as conventional equipment but weighing 20 per cent less.

The electrostatically focused CRT and electromagnetic deflection yoke are supplied as a fully tested assembly. Together with the bright-up circuitry, this forms a shop replaceable assembly (SRA) requiring minimal adjustment on replacement.

Compensation for windshield distortion is applied electronically and optically and can be adjusted to suit the characteristics of the aircraft. The CRT is protected from solar radiation by ultra-violet and infra-red filters in the optical system and CRT brightness, display accuracy and deflection amplifier performance are monitored by a highly reliable BIT system.

All HUD associated controls are mounted on an integral panel at the rear of the HUD. System controls can be mounted on an up-front control panel designed to suit particular aircraft requirements. A

AV-8B HUD pilot's display unit

connector is provided to enable connecting wires to be routed through the HUD. Provision is made for installing a side-mounted pilot's recording camera which views the symbology and the outside world simultaneously through a precision periscope assembly.

The stand-by sight is a precision LED matrix on a glass substrate. It is electronically depressible and brightness can be adjusted by varying the intensity of the LEDs. This is a simple and highly effective approach that avoids the gear trains and moving parts of mechanical systems.

To prevent salt fog or contamination from the aircraft cooling system, the electronics and optical system are housed in airtight modules cooled by external heat exchangers.

The display processor (computer), designed to full military specifications, generates calligraphic symbology for the HUD and a combination of calligraphic and raster symbology for the head-down multi purpose display in the AV-8B. The display processor is normally controlled by the aircraft's main avionic mission computer (MC) through the multiplex data bus. It can also receive and process composite video inputs from either the dual mode tracker or various weapon sensors. If the aircraft's main MC fails, the display processor will assume control of sufficient aircraft avionics to provide all essential information for navigation and aircraft attitude control, including data transfer with the engine display panel, the up-front control set, and the all-weather landing system.

Maximum fail operational capability is provided by a combination of redundant circuitry and multiple path data processing. Full utilisation of BIT circuitry provides failure detection and isolation without use of ground support equipment. Periodic and initiated BIT routines provide up to 98 per cent detection of failures. The test mode enables the pilot and ground crew to determine the operational status of the equipment. A high degree of maintainability and human engineering has been incorporated in the design which features a microprocessor and the latest in logic circuits. Positive easy-to-operate module fasteners are provided to facilitate maintenance. Symbol positioning accuracy is achieved using a closed-loop correction technique. All symbols are positioned within one DI (digital increment) for HUD deflection outputs.

TORNADO HEAD-UP DISPLAY

Smiths Industries Ltd, in collaboration with Teldix GmbH and Ottica Meccanica Italiana (OMI), currently supplies the head-up display and weapon aiming computing (HUDWAC) system for the multi-national Tornado programme. The system consists basically of a pilot's display unit (PDU) and an electronic unit (EU). In addition, Smiths Industries is sub-contracted by Litef-Litton Technische Werke for manufacture of the Spirit 3 airborne computer for the Tornado.

Pilot's Display Unit: The PDU is fully line-replaceable and incorporates an integral pilot's control panel, deflection amplifiers, bright-up and power supply modules (including the EHT supply), and depressible standby sight. It consists essentially of two main sub-assemblies: the electronic (front) module and the optical module. The optical module consists of a combining glass assembly, and a high grade lens group with a 127 mm exit lens providing a total field of view of 25°. All glass-to-air surfaces are treated with an anti-reflective coating to reduce spurious reflections. The electronic module forms the main structure of the PDU and consists of a light, rigid, accurately machined aluminium alloy casting. It houses the deflection amplifiers, CRT assembly, BITE modules and EHT supply. The casting has a machined surface at one end to provide the accurate location of the optical module. The machined end also serves to locate the tube unit accurately relative to the optical module. The electronic module features a removable top metal plate which, when secured, produces a sealed volume enclosing the various modules. Removal of the plate allows access to the modules within.

Electronic Unit: This computer unit is based on a powerful digital on-line processor running on a stored program. Its purpose is to process data, control the generation of the display in the PDU and

Tornado pilot's head-up display unit

carry out weapon-aiming computations. It is housed in a compact case. Construction of the computer unit is modular, the main circuits being mounted on 20 multi-layer boards, assembled in pairs to form ten rugged, easily replaceable modules.

The computer unit consists of four main functional areas. The input interface accepts eight channels of serial digital data which it holds in buffer stores until the information is required by the central processor. The buffer stores are data acquisition devices in the form of MOS circuits designed by Smiths Industries' own Microcircuit Circuit Engineering Company. The central processor is a powerful, high-speed, general-purpose digital computer capable of carrying out extensive weapon-aiming computing tasks, in addition to controlling the generation of a comprehensive display of flight data, navigation information and weapon aiming symbology. The processor is programmed by means of a central memory consisting of semiconductor programmable read only memory (PROM) assemblies which provide high density circuitry and high integrity at low unit cost and power consumption. The output interface generates the waveforms necessary to control the 'cursive' symbology display on the CRT of the PDU in terms of deflection (X and Y) and bright-up (Z) commands. The power supply module accepts 200 V, 400 Hz, 3-phase aircraft supply and 28 V DC.

Built-in test equipment is provided in two forms: continuous in-flight self-monitoring, which checks the internal processes of the computer, and interruptive testing, which allows the checking of symbol generation by the display of test patterns on the PDU.

STATUS

Production.

3090.393

HEAD-UP DISPLAY FOR HARRIER AND JAGUAR

From inception the Harrier and Jaguar weapon systems have featured a Smiths Industries electronic HUD. The system, which comprises a pilot's display unit (PDU), waveform generator (WFG), pilot's control panel (PCP) and extra high tension unit (EHTU), is designed to provide the pilot with accurate analogue and alpha-numeric symbol displays of primary flight data and navigation and weapon aiming information.

Pilot's Display Unit: This consists essentially of two modules: the optical system and the CRT assembly. The optical system consists of a collimating lens assembly and a combining glass. The 100 mm, f0·97 lens assembly provides a 25° total field of view. The installation provides an instantaneous binocular field of view in the region of 18° in azimuth and 16° in elevation. All glass-to-air surfaces are treated with an anti-reflective coating to reduce spurious reflections.

The CRT assembly consists of a high-brightness CRT, a deflection coil assembly, a focus magnet and a brightness amplifier. The electromagnetically focused CRT, the face of which is coated with a P1 phosphor, is capable of producing a brightness level which enables the display to be viewed against a background intensity of 35 000 candelas/m² (10 000 ft lamberts). The datum brightness is set by the pilot and thereafter automatically controlled by the action of a solar cell which maintains a constant contrast between the display and the background.

The PDU carries a dual-purpose mounting bracket at the rear, which accepts either a pilot's display recorder (camera) or a crash pad.

Waveform Generator: The symbol generation computer, which forms the heart of the HUD system, is a special purpose digital computer which accepts analogue DC signals and discrete control inputs from various sensors and systems on the aircraft. The analogue signals are converted to digital form at the input stage and thereafter all processing is by digital techniques until the final output stage, where the digital information is converted to analogue waveforms suitable for transmission to the PDU. The entire processing is controlled by a program incorporated during manufacture on MOS storage devices (read-only memories). This system provides high reliability and considerable flexibility of the display content.

The computer is of modular construction, housed in a ½ ATR short case, and incorporates integrated circuits and multi-layer printed circuit boards. The integral supply operates from the 200 V, 400 Hz, 3-phase aircraft supply. A built-in test facility is provided which allows continuous monitoring of the system and special test modes enable the pilot to perform a confidence check prior to flight or attack.

Pilot's Control Panel (PCP): Manual switching of the HUD system is controlled from the PCP and allows the pilot to select the display required for the particular flight mode in progress. Various alternative symbols or additional symbols can also be selected when required. The panel includes controls for display brightness, target wing-span setting, barometric scale setting and a built-in test facility.

Extra High Tension Unit: The EHTU provides a high voltage supply to the CRT in the PDU. To maintain the high level of accuracy required for weapon aiming, the 15 kV output from the EHTU has a very high degree of stabilisation over the full operating temperature range.

STATUS

Production, with over 600 systems supplied for the Harrier and Jaguar programmes to date.

CONTRACTOR

Smiths Industries, Aerospace & Defence Systems Company, Cheltenham Division, Bishops Cleeve, Cheltenham, Gloucestershire GL52 4SF, England.

3117.393

HEAD-UP DISPLAY FOR SEA HARRIER

The Smiths Industries' head-up display and weapon aiming computing (HUDWAC) system which is currently being supplied for the Sea Harrier, provides a comprehensive display of weapon-aiming, flight and navigation symbology as well as performing all the weapon aiming computations. The system comprises a pilot's display unit (PDU), an electronic unit (EU) and a pilot's control panel (PCP).

Pilot's Display Unit: This is a fully line-replaceable PDU featuring integral deflection amplifiers, bright-up and power supply modules (including EHT) and standby sight. A special feature of this PDU is that it can display symbology and outside world pictures in raster form in addition to traditional cursive symbology. It is of modular construction for ease of maintenance and consists essentially of two main sub-assemblies: the electronic (front) module and the optical module.

The optical module features two optical channels: 'Main' CRT and 'Standby'. In addition it also houses the electronics needed to convert the 28 V aircraft supply to the six volts required to illuminate the quartz halogen lamp used for the standby sight. The combiner glass mounting forms an integral part of the module and is so arranged that the combiner can hinge downwards to allow both it and the aircraft windscreen to be cleaned. Provision is also made for the mounting of a pilot's display recording camera. The high grade optical system has a 114 mm exit lens providing a total field of view of 22°. Careful design throughout has ensured that optical performance is of a very high standard.

The electronics module forms the main structure of the PDU as well as providing the location for the mounting dowels and bolts from which all datum measurements are taken. Considerable attention has been paid to maintaining the internal packaging and all major modules are plug-in items, accessible through two removable top covers. The case houses the deflection amplifier and power supply boards which are located at the sides of the module to give good thermal characteristics. These boards may be removed easily without the need for special extractors. Two other electronic boards (built-in test and brightness control) are plugged into a separate wiring tray positioned above the CRT assembly. The EHT unit, which provides the stabilised 15 kV supply to the anode of the electrostatically focused CRT, is also easily accessible and is mounted at the front of the electronic module.

Electronic Unit: The EU is centred around a powerful, high-speed, general-purpose digital processor, programmed by a central memory which contains 16 K words of read/write core-store and 6 K words of read-only store. The core-store may be loaded without removing the unit covers by connecting a tape reader to a dedicated plug on the front of the unit. The computer is capable of handling a large number of inputs, both digital and analogue. The analogue signals are multiplexed and then sequentially converted to digital format, while the digital inputs are assembled in data acquisition devices (DADs) of Smiths Industries' own design. The use of DADs enables the input stage to operate asynchronously with respect to the central processor and results in considerable savings in processor time.

In addition to the conventional head-up symbol generator, which generates and controls the cursive symbology on the PDU, the computer unit contains a raster symbol generator. This enables raster symbology to be displayed on head-up and head-down display units either independently or combined with raster inputs from radar or E-O sensors. The computer has two integral power supplies, one for the core-store and one for the electronics. Each derives its power from the aircraft 200 V, 400 Hz, 3-phase supply. The functional circuitry is mounted on 32 multi-layer boards, assembled in pairs to form 16 modules which are functionally and electrically interchangeable with modules of the same coding.

Considerable attention has been paid to the integrity of the system. Built-in test equipment continuously monitors the functioning of the system and the validity of the input information, and interruptive testing can be performed by the selection of special test modes.

Pilot's Control Panel: Manual switching of the HUD system is controlled from the PCP and allows the pilot to select the display required for the particular flight mode in progress. Various alternative symbols or additional symbols can also be selected when required. The panel includes controls for display brightness, target wingspan setting, barometric scale setting and a built-in test facility.

SAAB JA37 VIGGEN HEAD-UP DISPLAY

Smiths Industries currently supplies the pilot's display unit (PDU) for the JA37 version of the Viggen. This is a fully line-replaceable PDU consisting essentially of two modules; an electronic or front module and an optical module (with integral control panel).

The optical module consists of a combining glass assembly and a high accuracy 100 mm lens system. The lens system features precision ground input and exit lens groups and a prism, the whole providing a total field of view of 28°. In addition the optical module is provided with a standby sight in order to permit reversionary weapon aiming in the event of a HUD failure.

The electronic module forms the main structure of the PDU and houses the deflection amplifiers, power supplies (including EHT), BITE, CRT assembly, brightness control, combiner servo-amplifier and all the peripheral electronic circuitry. For ease of maintenance the electronics are contained within the PDU in modular form.

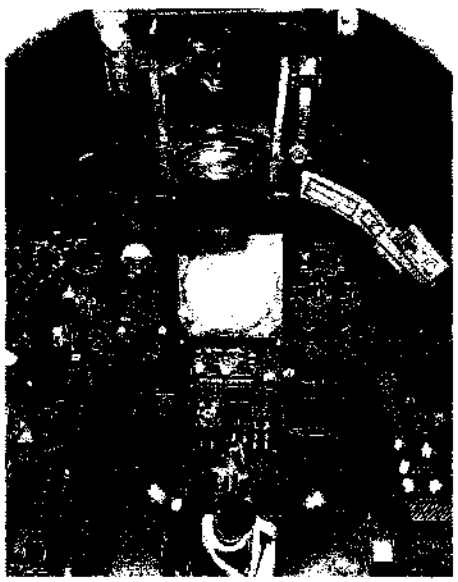
4178.383
FIN 1064 DINAS

The Ferranti FIN 1064 digital inertial navigation and attack system (DINAS) was developed for the RAF Jaguar refit programme to replace the original NAVWASS equipment (**1312.383**).

In the Jaguar, five separate units were replaced by one unit, with a reduction in volume of two-thirds and a weight-saving of some 50 kg compared with the previous system. The FIN 1064 system incorporates the computer, platform, power supply, electronics and interface modules into the same line replaceable unit (LRU).

FIN 1064 interfaces with all the other weapon-aiming and navigation facilities in the RAF's Jaguars, including the Ferranti LRMTS (laser ranger and marked target seeker) (**1196.393**) which is standard equipment in the single-seat version. Built-in system test software enables the FIN 1064 to self-check automatically, and also to check all the interface signals, thereby indicating to the pilot or ground crew the serviceability of such systems as Tacan, HUD and horizontal situation indicator; this aids assessing the practicability of continuing a mission or in identifying a systems failure for subsequent maintenance action.



Three units comprising FIN 1064 for RAF Jaguar (left to right) pilot's display, control unit, and one-box LRU incorporating computer, inertial platform interface, electronics and power supply modules

For the pilot, the Ferranti FIN 1064 offers significant advantages over older systems, in terms of both ergonomics and performance. Pre-flight alignment times have been minimised and the advanced design of the inertial platform and computer maximises weapon-aiming and navigation accuracy. The control and display unit is mounted on the cockpit coaming, where the pilot can see and operate it easily, without having to go 'head-down' for long periods. Navigation and steering commands are shown on the HUD, providing the pilot with vital data super-imposed on his view of the outside world. With the single-pass, low-level ground attack very much in mind, FIN 1064 has been developed to provide a comprehensive range of 'hands-on-stick and throttle' weapon delivery profiles.

The digital computer is addressable up to 64 K of memory – a large increase on previous systems. System reliability is significantly improved, based on the experience gained by similar Ferranti systems and the early FIN 1064 models.

DEVELOPMENT

FIN 1064 is one of the FIN 1060 family of inertial nav/attack systems derived from the FIN 1000 series. These are in production at Ferranti's Silverknowes, Edinburgh factory for the Tornado, Sea Harrier, Nimrod MR2 and Mitsubishi F1 aircraft, as well as Jaguar. FIN 1060 can accept PODS (portable data store) for in-cockpit transfer of mission data pre-loaded into PODS by computer-assisted mission planning equipment such as Ferranti Autoplan or Tacplan.

FIN 1064 in an aircraft cockpit

STATUS

The FIN 1064 is now in operational service.

FERRANTI FINAS

FINAS (Ferranti Nav/Attack System) is an integrated system which includes the Type 4510 cursive/raster head-up display and weapon aiming computer (HUDWAC), the FIN 2000 inertial navigator and the Type 105D laser rangefinder. It is intended both for new aircraft and as a retrofit package for current types.

The Type 4500 HUDWAC was first displayed in public at the Farnborough Air Show in 1982. It consists of two units, the HUD display itself and a ½ ATR weapon aiming computer. The HUD has an unusually large field of view, 24 × 18, and incorporates its own controls for mode selection. Dual combiners are provided and can be replaced without reharmonisation being necessary. The HUD projects a comprehensive variety of information on to the pilot's line of vision and a number of air-to-air and air-to-ground modes provide data for the automatic or manual release of weapons. It is compatible with night vision goggles.

The FIN 2000 inertial navigator is derived from the FIN 1000 fitted to the Nimrod and the Tornado, and also the Sea Harrier NAVHARS system. The Type 105D laser rangefinder has already been produced for the Royal Danish Air Force Draken aircraft and is described under entry **4003.393**.

STATUS

The complete system is on offer for both new aircraft and retrofit programmes. The Type 4500 is undergoing a series of flight trials and has been proposed for a number of aircraft. The FIN 2000 has been on flight trials in both fixed wing aircraft and helicopters of the RAF. The Type 105D laser rangefinder is in operational service with the Danish Draken aircraft.

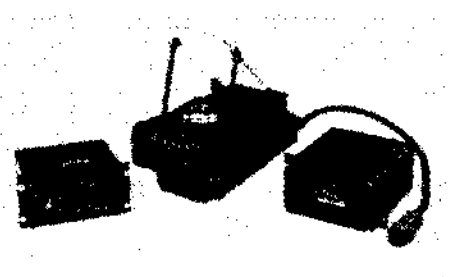
1012.393
ISIS WEAPON AIMING SYSTEM

The ISIS (integrated strike and interception systems) series of equipment comprises a range of aircraft sighting systems based on the use of gyro-controlled, lead computing optical techniques. Different versions are available to fulfil air-to-air and air-to-ground missions with varying degrees of complexity, according to operational requirements. Initially intended for the aiming of guns, rockets, missiles and bombs, the ISIS sight can use range information from a laser rangefinder. It can also serve as a low-cost alternative to a CRT type HUD by displaying pointing data from a laser seeker such as the Martin Marietta Pave Penny or the Ferranti LRMTS.



Common to all versions of the ISIS family of weapon aiming sights is the use of a two-axis rate gyro, the movement of which is controlled by variations in the magnetic restraint imposed upon it in accordance with the requirements of the aiming process. The gyro is located in the sighting head, and has two principal parts, concerned with display and control, respectively. The display portion consists of a circular mirror centred on the rotational axis of the gyro. The aiming pattern is reflected from this into the pilot's forward view so that any deflection of the gyro relative to its housing results in a corresponding deflection of the aiming pattern relative to the centre of the field of view. The control portion of the gyro rotates in a controllable magnetic field, the strength of which determines the amount of deflection produced by a given aircraft rate of turn. The control field may also be intentionally unbalanced to produce required deflections of the gyro, and thus the aiming pattern.

ISIS D-209RM sight for Hunter aircraft

OPERATION

Air-to-air (guns): Control of the magnetic restraint of the gyro is particularly applicable to this mode. The constant of proportionality between gyro deflection and aircraft rate of turn is defined as the sensitivity of the sight, which for a given weapon is required to vary with range. This is achieved by coupling the ranging sensor (radar or optical) to a potentiometer which thereby adjusts the field strength operating on the gyro dome. The gyro deflection, and hence the lead angle, is then correct throughout the attack sequence. Fixed range sensitivity operation is possible at a cost in reduced overall accuracy. The effect of gravity upon the projectile is compensated by arranging for a small depression of the sight-line, and the amount of depression is controlled by a similar arrangement for that used to adjust sensitivity, so that the allowance for gravity drop is correct throughout the attack. In tracking the target with the aiming mark, the aircraft is caused to change its heading continuously, and this rate of change of the aircraft axis is a function of the relative speed between the target and fighter. This is measured directly by the two-axis gyro so that the required aim-off angle proportional to range (a measure of the magnetic restraint of the gyro) is determined by the system.

ISIS D-195R sight for Hawk aircraft

Air-to-surface: In this mode, gravity drop effect assumes greater importance, and a depressed sight-line method of approach is used. The magnetic field controlling the gyro is unbalanced to cause a downward deflection of the aiming pattern, the amount of deflection being dependent upon the aircraft dive angle, speed, and release range. In some versions of ISIS switching is arranged to provide the correct sight-line depression for one fixed speed and one range of dive angles. If continuous speed and pitch angle inputs are available, however, these can be used to provide for continuous variation of sight-line depression.

Manual adjustment of sight-line depression can also be provided. A fixed sensitivity datum is used for each type of weapon in the ground attack mode.

Roll stabilisation of the aiming mark has become a standard feature of many of the ISIS variants where a vertical reference gyro is already installed in the aircraft. This feature reduces the tracking time of the target to a matter of two to three seconds thus limiting the 'exposure time' of the pilot to ground fire.

Additional Facilities: Provisions can be made for the ISIS system to accept inputs from other sources such as doppler drift, laser or radar ranging.

DEVELOPMENT

The basic concept of the ISIS has been developed with the object of enabling the requirements of different users to be met from a range of standard systems, several of which are capable of subsequent extension.

STATUS

The ISIS system first entered operational service in 1968 and current users include the air forces of Argentina, Australia, Austria, Canada, India, Indonesia, Italy, Kenya, Norway, Singapore, UK and Venezuela, and the USMC. Approximately 1500 systems had been ordered as of mid-1982.

ISIS equipment has been fitted to 25 different aircraft types, including the SAAB 105, (ISIS F-126), Fiat G91Y (ISIS B), Aeromacchi MB 326 (ISIS F-126), McDonnell Douglas A-4S (ISIS D-101), Northrop CF-5A (ISIS N), Northrop NF-5A (ISIS F-195R), BAe Hawk (ISIS D-195R), HAL Ajeet (ISIS F-195R), HAL HF24 (ISIS F-124) MiG 21FL, Mostar Galeb, and LAS A-4C (D-126R).

The ISIS D-01 has been delivered to the USN for use by the USMC, in conjunction with a USN laser target designator system.

The BAe Hunter aircraft is in service throughout the world, using the GGS MK8S weapon aiming system. As this system was designed in 1953, most of its components are now obsolescent. Ferranti has designed the ISIS D-209RM (three units) weapon aiming system to replace the GGS MK8S (13 units) system in the Hunter so that cockpit modification work is kept to a minimum. The ISIS D-209RM not only embodies latest technology components but also benefits from user Services' experience of ISIS equipment over the last ten years and is designed to incorporate modules for laser target seeker. Laser range and radar range input modules may be incorporated without need to alter the envelope of either the sight head or the electronics unit. The ISIS D-209RM and the Type 106 laser target seeker are combined to form an integrated low-cost head-up air-to-ground target acquisition system for ground attack aircraft.

The ISIS F-195R/3 entered licence production at the Hindustan Aeronautics Ltd, Lucknow plant in 1978, for installation in the HAL Ajeet aircraft.

CONTRACTOR

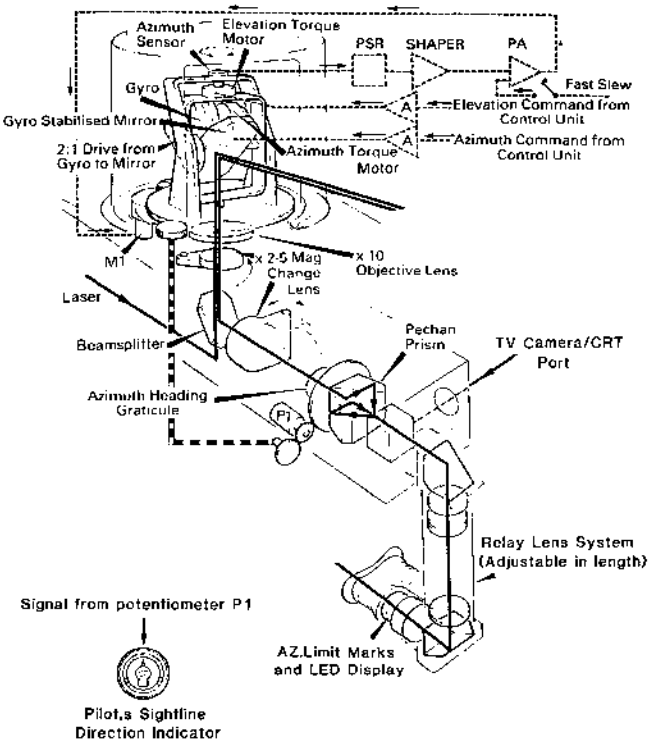
Ferranti Defence Systems Ltd, Electro-optics Department, Robertson Avenue, Edinburgh EH11 1PX, Scotland.

4261.393

AF532/AF533/AF580 HELICOPTER ROOF SIGHTS

These Ferranti helicopter sights are designed for use in surveillance, target identification and missile guidance. A built-in interface allows a laser ranger or designator module to be added. Facilities are also provided for the attachment of a recording TV camera. The sight can be adapted for use with night vision equipment, helmet sights and weapons. The AF532 version is in production for the UK Army Air Corps and the AF580 is under evaluation in the United States (see under STATUS below).

The sight provides for two magnifications. For initial surveillance ×2·5 is provided, with a field of view of 22°, and for target recognition and identification, ×10, with a field of view of 5·5°. The choice of these magnifications are based on optical considerations such as specified identification and recognition criteria as well as the need to achieve a compact and light design.



Every effort has been made in the design to keep the sight lightweight, simple and reliable. Modular construction eases its maintenance and allows for growth. Built-in first line test facilities are incorporated and dedicated automatic test equipment has been developed for use in servicing at base and overhaul levels.

The sight is installed with its head and most of the optics carried above the normal roof line. Only the down-tube and eyepiece extend down in front of the operator when the sight is in use. The down-tube is adjustable in length which enables the installation to be readily tailored to fit most helicopters. When not required the down-tube is swung up and locked in position, out of the way, against the roof.

The down-tube may be adjusted as necessary for use then pushed aside until required. Also, if the pilot were to be incapacitated, it would be easy for the sight operator to push aside the down-tube and take over control immediately. The control handle is adjustable, both in length and tilt, so that it may always be used with the right forearm resting on the knee for comfortable control. A thumbstick controller on the control handle is used to steer the sightline through ±120° in azimuth and ±30° in elevation, movement of which is achieved by precession of the gyro which directly stabilises the mirror mounted within the rotating head. At ×10 magnification the slew rate is variable up to 5°/s; at ×2·5 magnification the slew rate is progressively variable up to 5°/s but 75°/s fast-slew can be obtained with full deflection of the thumbstick. The two-degree-of-freedom gyro is prevented from toppling under all operational conditions by limit and logic switches associated with a caging mechanism.

AF533 gyro-stabilised helicopter observation sight installed in Gazelle helicopter

Schematic diagram of the AF533 helicopter sight

DEVELOPMENT

The AF533 sight is developed from the AF530 on which work was commenced in 1970 by Ferranti for use with the BAe Hawkswing missile. Successful trials were carried out before termination of that system's development by the UK MoD in 1975. It is a refined version of the AF530 updated and incorporating improved electronics. Sights with other AF500 designations are being prepared for various helicopters.

Ferranti's first-generation stabilised sight, the AF120, which uses similar stabilisation techniques, is still in service with the British Army.

STATUS

The AF532 is now in production, under a UK MoD contract for fitment to Gazelle helicopters of the Army Air Corps.

The AF580, which is similar to the AF533, has been fitted to two Bell OH58 helicopters of the US Army and is undergoing flight trials in the United States. The sight also incorporates a Ferranti Type 118 laser rangefinder and designator which is a repackaged version of the Type 629 (**4787.193**) plus a telescope.

CONTRACTORS

Ferranti Instrumentation Ltd, Aircraft Equipment Department, Lily Hill House, Lily Hill Road, Bracknell, Berkshire RG12 2SJ, England, is responsible for the electronics and gyro sub-systems and are the main contractors for the sight. The optical sub-system of this equipment is manufactured by Avimo Ltd, Taunton, Somerset, England.

CHARACTERISTICS

Weight of installed system: 28 kg (33 kg with laser rangefinder/designator)

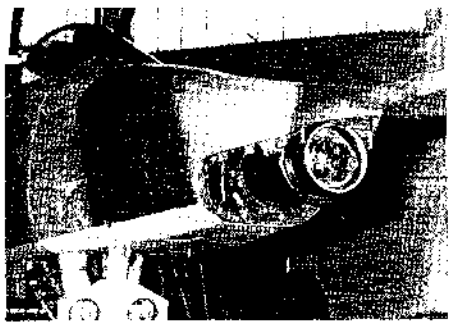
Resolution: 20 line pairs/mrad

Magnification: ×2·5, ×10

Field of view: 22° (×2·5 magnification); 5·5° (× 10 magnification)

Total sightline exploration: Azimuth ±120°; elevation ±30°

Exit pupil size: 5 mm diameter



Eye relief: 35 mm

Eyepiece focus: Fixed at -1 dioptre

Vertical adjustment of eyepiece: Variable over 110 mm

1196.393
FERRANTI LASER RANGER AND MARKED TARGET SEEKER

This is an aircraft ranging and direction system designed primarily for air-to-surface attacks, when it is used either as a self-contained laser ranger or, when operating in conjunction with a laser target marker (designator), as a simultaneous rangefinder and target seeker. This latter feature, coupled with high accuracy, gives this laser system a distinct advantage over radar ranging equipment. The laser ranger and marked target seeker is specifically intended for use with weapon systems optimised for low level, first pass attack when targets are difficult to detect, tracking time is necessarily short and air-to-surface grazing angles are very low.

Ferranti laser ranger and marked target seeker installation in the nose of a Jaguar aircraft

OPERATION

The laser ranger operates by directing a pulse of infra-red energy from a YAG laser at the target. Range is then derived by measuring the time interval between transmitting the pulse and receiving the scattered energy returned to the ranger from the target. The laser beam is stabilised against vibration and angular movement to ensure accurate alignment with the target. A high PRF allows continuous range information to be obtained when this is required.

When used in conjunction with a laser target marking system, a forward air controller aims a pulsed laser marker at the designated target and uses a radio link to direct the pilot of the attacking aircraft. As the aircraft approaches the target, the target marker is switched on. The target seeker in the aircraft automatically acquires and tracks the scattered laser energy from the target. The tracking operation generates signals which are translated into director information for presentation to the pilot on a head-up display.

Advantages arising from the latter mode of operation include positive identification of the target by someone who normally has relatively more time available than the pilot; pilot work load is reduced by elimination of the task of searching for the target over a wide field of view; an attack can still be made even though the pilot may not see his target due to poor light or because of camouflage.

The laser beam is fully stabilised against aircraft movements by mounting the transmit and receive optics within a three-axis gimbal head. The head may be used to direct the beam +3 to -20° in elevation, ±20° in azimuth and is roll stabilised to ±90°. The target seeker coverage is considerably more than the limits of head movement. Range is quoted as being greater than pilot's visual range up to 9 km.

The main unit weighs 21·5 kg and is 607 mm long by 269 mm in diameter. The total height, including the heat exchanger, is 300 mm. The electronics unit, weighing 14·5 kg and measuring 432 mm long by 330 mm wide by 127 mm high, contains ranging, seeking, and power supply circuits.

STATUS

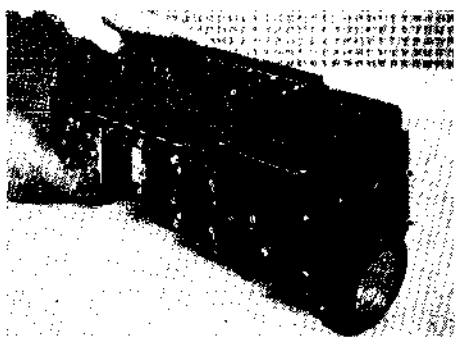
The equipment is now in service with the RAF and several other air forces. It is operational in Jaguar and Harrier aircraft and a close variant is in production for the RAF Tornado. Over 500 systems have been produced.

CONTRACTOR

Ferranti Defence Systems Ltd, Electro-optics Department, Robertson Avenue, Edinburgh EH11 1PX, Scotland.

3046.393
TYPE 105 AIR-TO-SURFACE LASER RANGER

The Type 105 system is a low cost, air-to-surface laser ranger aimed at satisfying the all important ranging requirements of ground attack aircraft. The compact, one unit design is ideally suited for installations, on a retrofit basis if necessary, in aircraft when laser ranging is required as an alternative to less accurate radar or other ranging methods. The small size and modular design of the Type 105 may also be used to good advantage in aircraft where, up to now, lack of space has prohibited the inclusion of a range sensor. In particular, two configurations are offered; the in-line Type 105 (illustrated) or the T-shaped Type 105. The latter configuraton is specifically designed for installations with short back to front dimensions.



The Type 105 weighs approximately 9 kg and comprises laser transceiver and beam steerer modules in one unit. The laser is convection cooled Nd-YAG, capable of operation up to at least two pps or at bursts of ten pps. Higher PRFs are available with the simple addition of a liquid cooling block attached to the transceiver module. A photodiode detector for ranging is integrated with the laser transmitter. The beam steerer is simple and of a novel design, permitting roll (±360°) stabilisation of the laser beam which may also be directed over a 20° cone as required by the weapon system.

OPERATION

The Type 105 will provide a range for a wide variety of gunsights (including the Ferranti ISIS series) and weapon systems. It is accurate to better than ±5 m SD and is virtually unjammable. High reliability is a particular feature with a specified figure of not less than 500 hours mean time between failure. A far higher figure is confidently expected by the manufacturers.

STATUS

Prototypes have been flown in the Fairchild two-seat A-10 attack aircraft.

Type 105 air-to-surface laser ranger

CONTRACTOR

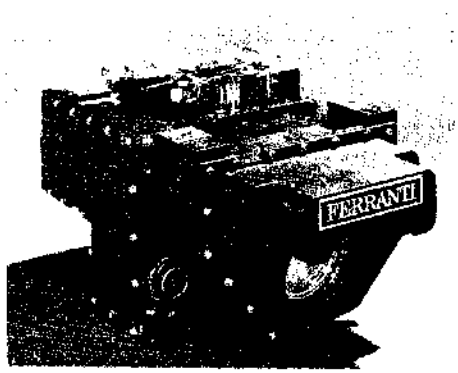
Ferranti Defence Systems Ltd, Electro-optics Department, Robertson Avenue, Edinburgh EH11 1PX, Scotland.

4003.393
TYPE 105D AIR-TO-SURFACE LASER RANGER

The Type 105D is a low cost variant of the earlier private venture Type 105 equipment (**3046.393**). It is a compact single unit system ideally suited for installation, on a retrofit basis if necessary, in aircraft when laser ranging is required as an alternative to less accurate radar or other ranging methods. The small size and modular design of the Type 105D may also be used to good advantage in aircraft where, up to now, lack of space has prohibited the inclusion of a range sensor.

The Type 105D weighs approximately 9 kg and its Nd:YAG laser transceiver operates continuously at ten pps. The beam steerer directs the laser beam within a 20° cone as required by the weapon system. It also provides ±360° roll stabilisation.

OPERATION



The Type 105D is capable of being integrated with a wide variety of weapon systems including gyro gunsights, head-up displays and full inertial nav/attack systems. The transceiver concept, where the receiver is incorporated within the transmitter, gives particularly good protection against ranging returns on spurious targets such as dust or smoke, and this is a special operating feature of the Ferranti equipment.

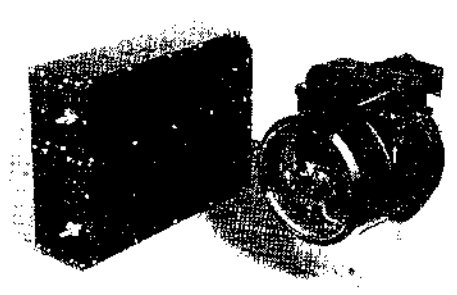
STATUS

The equipment is part of the ISIS range of gunsights or HUD systems. It is fitted to the Draken aircraft of the Royal Danish Air Force and is being offered as a retrofit to other aircraft.

CONTRACTOR

Ferranti Defence Systems Ltd, Electro-optics Department, Robertson Avenue, Edinburgh EH11 1PX, Scotland.

Type 105D laser ranger



3119.393
TYPE 106 LASER TARGET SEEKER

The Type 106 laser target seeker was conceived in answer to a requirement for a simple laser seeking device for installation in light, ground attack aircraft. It is designed to integrate with the Ferranti ISIS series of gunsights head-up display systems.

The concept of use is described under the item dealing with the Ferranti laser ranger and marked target seeker (**1196.393**). The incorporation of this system significantly increases the effectiveness of close air support against difficult targets, while reducing the required briefing time between forward air controller and pilot.

The main unit comprises the stabilised optical head of the Ferranti laser ranger and marked target seeker equipment contained in a short, pressurised, canister. An electronics unit contains power supplies and target seeking circuits and is also a variant of the RAF's equipment.

The optical head is roll stabilised ±90° by the aircraft reference and is capable of being directed and stabilised +20 to -25° in elevation, relative to equipment roll axis. The azimuth coverage is ±8° relative to aircraft heading with automatic scanning. This coverage may be further increased by simply manoeuvring the aircraft.

Ferranti Type 106 laser target seeker

OPERATION
The aircraft approaches the target area with the target seeker automatically scanning about a selectable depression angle. When marked target returns are received the seeker locks on and positions an appropriate reticle or gunsight symbol to lie over the target. If the target is outside the field of view of the sight, the pilot is given a direction to steer. The pilot simply tracks the reticle with his aiming mark and carries out an attack. With this system he need never actually sight the target.

The main and electronics unit weigh approximately 10·5 kg each. The main unit is 312 mm long with a diameter of 247 mm. The total height is 275 mm. The electronics unit is 432 mm long by 330 mm wide by 127 mm high, though it may be repackaged to approximately half this volume if so desired.

In September 1978 a podded version of the Type 106 was announced by Ferranti and Portsmouth Aviation. The pod weighs 125 kg, inclusive of air conditioning, and is about 2·3 m long and 37 cm in diameter.

The Type 106 is also used in combination with the ISIS D-209RM gyro gunsight to form a low-cost head-up air-to-ground target acquisition system for ground attack aircraft.

DEVELOPMENT
The equipment is a private venture variant of similar devices for Jaguar and Harrier.

STATUS
Several other air forces are showing interest in the Type 106 but it is not yet in production other than in its RAF form.

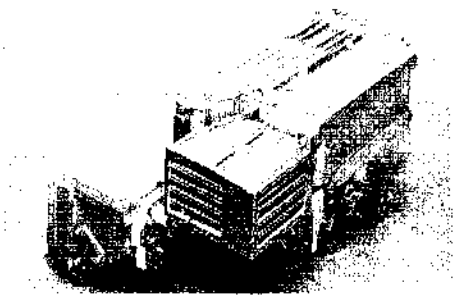
CONTRACTOR
Ferranti Defence Systems, Electro-optics Department, Robertson Avenue, Edinburgh EH11 1PX, Scotland.

5929.393
TYPE 116 LASER RANGEFINDER

The Type 116 is a high repetition rate CO_2 laser rangefinder which has been designed initially for airborne applications. The equipment is 'eye-safe', is compatible with forward looking infra-red (FLIR) systems and provides high performance in smoke and battlefield conditions. It contains an integral power supply and receiver electronics.

CHARACTERISTICS
Type: Sealed CO_2 TEA
Wavelength: 10·59 microns
Peak power: 250 kW
Pulse energy: 30 mJ nominal
PRF: 20 - 50 Hz
Beam divergence: 0·4 mrad
Laser Endurance: $>10^6$ shots
Receiver: Photoconductive cadmium mercury telluride
Range: 0·5 - 10 km
Accuracy: 2·5 m
Dimensions: 275 × 230 × 230 mm
Weight: 17·5 kg

STATUS
In development for the Royal Aircraft Establishment, Farnborough.



CONTRACTOR
Ferranti Defence Systems Ltd, Electro-optics Department, St Andrew's Works, Robertson Avenue, Edinburgh EH11 1PX, Scotland.

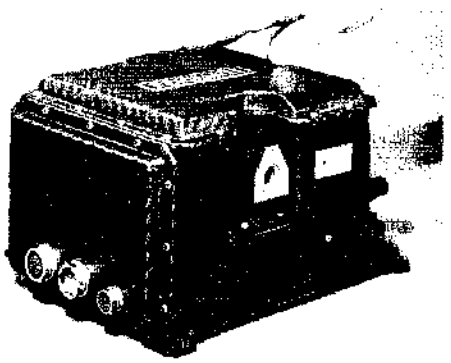
4727.393
TYPE 117 LASER DESIGNATOR

The Type 117 laser designator/ranger has been designed by Ferranti as an integral part of the forward looking infra-red (FLIR) pod for the US Navy F/A-18 Hornet aircraft. No technical details have been released other than that it is a high power, high-repetition rate Nd:YAG device with an output power in excess of 100 mJoules.

STATUS
In development under contract to Ford Aerospace and Communications Corporation. The initial contract, worth over $2 million, covers engineering developments and provision of units for qualification and flight testing. The first development model has been delivered to Ford Aerospace.

CONTRACTOR
Ferranti Defence Systems Ltd, Electro-optics Department, Robertson Avenue, Edinburgh EH11 1PX, Scotland.

Type 117 laser designator



5930.393
TYPE 118 LASER DESIGNATOR/RANGER

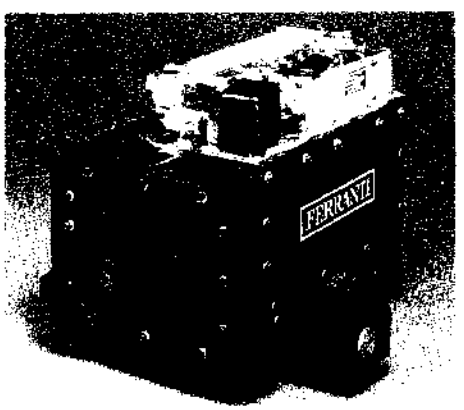
The Type 118 laser designator/ranger is a lightweight system derived from the Type 629 (**4787.193**), and is intended primarily for use in helicopter applications. It is of modular design, has common transmit/receive optics and can be easily integrated into a variety of sights or combined with other electro-optical sensors. The Type 118 can operate with all existing laser guided weapons and laser spot trackers.

CHARACTERISTICS
Type: Nd:YAG
PRF: 20 pps max
Beam divergence: 2 mrad (raw beam)
Output energy: 130 mJ
Range: 0·3 - 10 km
Resolution: 5 m
Dimensions: 270 × 215 × 160 mm
Weight: 5·9 kg

STATUS
In production for the AF560 mast-mounted sight (**4261.393**) for the US Army OH58 helicopters. First production equipment was delivered in mid-1985.

CONTRACTOR
Ferranti Defence Systems Ltd, Electro-optics Department, St Andrew's Works, Robertson Avenue, Edinburgh EH11 1PX, Scotland.

Type 118 laser designator/ranger



5931.393
TYPE 121 DESIGNATOR/RANGER

The Type 121 is another variant of the Type 629 laser rangefinder/designator (**4787.193**) and is intended for integration with the Ferranti AF500 series of helicopter roof mounted sights (**4261.393**). It is designed to provide low-cost airborne designation for all existing laser guided weapons and spot trackers with ranging information to the target. The designator can be rapidly fitted to, or removed from, the sight from inside the aircraft. It is fully interchangeable without re-alignment.

CHARACTERISTICS
Type: Nd:YAG
PRF: 20 pps max
Output energy: 90 mJ
Beam divergence: 3 mrad (raw beam)
Range: > 10 km
Accuracy: 3·5 m
Dimensions: 248 × 187 × 218 mm
Weight: 6·5 kg

STATUS
In production

CONTRACTOR
Ferranti Defence Systems Ltd, Electro-optics Department, St Andrew's Works, Robertson Avenue, Edinburgh EH11 1PX, Scotland.

Type 121 laser designator/ranger

5955.393
TYPE 122 HELICOPTER LASER RANGEFINDER

The Type 122 is a low-cost Nd:YAG laser rangefinder designed for helicopter use and suitable for integration with the visual optics of both existing and future sights. It is designed to provide accurate range measurement from an aircraft in a variety of tactical situations. A Type 520 laser transceiver (**5757.193**) is used.

The Type 122 rangefinder is similar in many respects to the Type 121 (**5931.393**) and can also be installed in the Ferranti AF500 series of roof mounted sights (**4261.393**).

STATUS
In production.

CONTRACTOR
Ferranti Defence Systems Ltd, Electro-optics Department, St Andrew's Works, Robertson Avenue, Edinburgh EH11 1PX, Scotland.

5747.393
HELICOPTER LASER DESIGNATOR (HELD)

As with its two ground-based variants, HOLD and FOLD, the Ferranti helicopter laser designator (HELD) is based on the Type 306 designator which has been in service with the British Army since 1980 under the name Laser Target Marker and Ranger (LTMR) (**1742.193**). In the HELD version the Type 306 is fitted to a simple helicopter mount which requires virtually no modification to the helicopter. A gyro-stabilised mirror is added to the mount to remove the worst of the vibration and motion effects on the laser spot. The system has been successfully tested with laser guided bombs and spot trackers.

CONTRACTOR

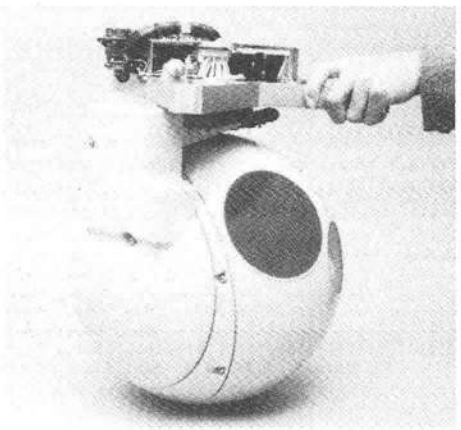
Ferranti Defence Systems Ltd, Electro-optics Department, Robertson Avenue, Edinburgh EH11 1PX, Scotland.

HELD in a Royal Canadian armed forces helicopter

5928.393
FERRANTI SENSOR BALL SYSTEM

The Ferranti sensor ball is a fully stabilised optronic sensor package mounted in a ball-shaped head. The system is derived from work carried out in connection with an RPV project and consists of a laser rangefinder/designator, a thermal imager and a TV camera in a combination of two from these three sensors. It is suitable for fixed wing aircraft, helicopters or RPVs and a version has also been developed for shipborne applications.

The Nd:YAG laser rangefinder/designator is a variant of Type 629 (**4787.193**) and operates at 1·06 μm. The thermal imager is a Rank Pullin Controls high performance unit with a switched dual field of view.



For marine applications the sensor ball would be either mast or deck mounted providing an angular movement covering ±220° in azimuth and -60° to +90° in elevation, with a pointing accuracy of 3 mrad. It would normally be fitted to fast patrol boats or maritime surveillance vessels.

CHARACTERISTICS

Sensor head
Angular freedom: Full lower hemisphere coverage; pan ±220°; tilt +20° to -120°
Pointing accuracy: 3 mrad
Slew rate: 1 rad/s
Slew acceleration: 1 rad/s²
Stabilisation: Better than 50 μrad
Dimensions: 330 mm diameter × 470 mm high
Weight: 24 kg
Laser rangefinder/designator
Type: Nd:YAG
Waveband: 1·06 μm
Beam divergence: 0·4 mrad
Range accuracy: 10 m
Output energy: 70 mJ
PRF: 20 pps
Thermal imager
Wavelength: 8 - 14 microns
Field-of-view: Dual switched
TV system: New vicon or CCD with zoom lens

CONTRACTOR

Ferranti Defence Systems Ltd, Electro-optics Department, St Andrew's Works, Robertson Avenue, Edinburgh EH11 1PX, Scotland.

Ferranti stabilised electro-optic sensor package

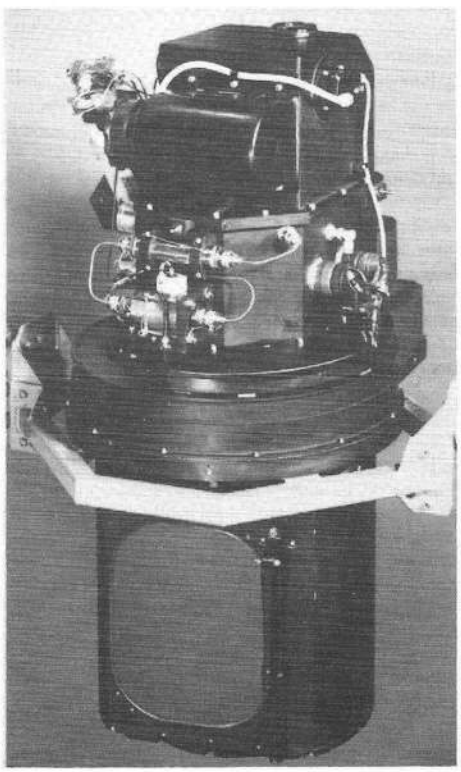
5749.393
TYPE 221 THERMAL SURVEILLANCE SYSTEM

The Type 221 thermal imaging surveillance system is designed for use with military helicopters but can also be installed in fixed-wing aircraft and surface vessels. Developed by Ferranti in conjunction with Barr & Stroud, the system incorporates an IR18 thermal imager and telescope by Barr & Stroud (**3834.093**), with sightline stabilisation steering provided by a Ferranti stabilised mirror. The assembly is contained in a pod which can be mounted either beneath the nose of a helicopter or may project through an aperture in the aircraft floor.

The Barr & Stroud IR18 imager unit provides a normal field-of-view (FOV) of 38° in azimuth and 25·5° in elevation. In the Type 221 application, users can choose a telescope magnification of either ×2·5 or ×9, with corresponding wide or narrow FOV. These are 15·2° azimuth and 10·2° elevation for the wide FOV and 4·2° × 2·6° for the narrow. With the Ferranti sighting mirror in the pod installation the system has fields of regard of +15 to -30° in elevation and ±178° azimuth. The entire sensor system is vertically mounted above the mirror which is angled, periscope fashion, at 45° to the horizontal to provide views in the horizontal plane.

The mirror, produced by Ferranti, has an aluminium reflective element which is diamond-machined to a flatness of two fringes at 550 nanometres. The mirror has a reflectivity of greater than 97·5 per cent at 45° incidence, averaged over 8 to 12 μm. Its stabilisation system comprises a two-axis device with integrating-rate gyros as rate sensors. The mechanism is driven in each axis by a direct-drive torque motor while steering is obtained by torquing the integrating-rate gyro. Angular information is derived from a resolver fitted to each axis. The mirror sightline is controlled by means of signals from an electronics unit which also provides power and signals to the main turret azimuth drive on the pod. System control may be exercised either through a digital computer or by a hand control unit.

The display may be presented on either 525 or 625 line TV monitors. The output is either in CCIR or EIA composite video formats as required. This TV-compatible output may be displayed on one or more monitors.



STATUS

In production and operational service.

CONTRACTORS

Barr & Stroud Ltd, Caxton Street, Anniesland, Glasgow G13 1HZ, Scotland.

Type 221 thermal surveillance system

4785.193
HELICOPTER INFRA-RED SYSTEM

The Helicopter Infra-Red System (HIRS) has been developed by Barr & Stroud and Lasergage as a helicopter flying and surveillance aid, based on the former company's IR18 system (**3834.093**). A choice of IR telescopes, depending on the application and range requirements, is available for HIRS and these can be easily fitted and interchanged.

The IR18 thermal imager is housed in a weatherproof pod, aerodynamically designed to ensure minimum drag. The pod is mounted on the exterior of the aircraft via a gimbal and yoke mechanism and is easily transferred from one aircraft to another. The system is also suitable for marine, vehicular or tripod mounting. The controls for the scanner and gimbal are on a single panel in the cockpit. The joystick for the gimbal allows the operator to rotate the pod 100 degrees right and left, 10 degrees above and 100 degrees below level. An LED display indicates the position of the pod.

CHARACTERISTICS

Magnification: ×1, ×1·5 or ×6
Field of view: 38° × 25·5°, 25·3° × 17° or 6·3° × 4·25°
Resolution: 1·73, 1·15 or 0·29 mrad
Weights
Camera pod and gimbals: 20 kg
Control unit: 1·5 kg
Monitor (9″): 4·8 kg
Position indicator: 0·7 kg
Air bottle: 4 kg
Cabling: 4 kg
Optional telescopes: 3·9 kg (×6); 1·2 kg (×1·5)
Compressor (in lieu of air bottle): 18 kg

BAe TARGET DATA ACQUISITION SYSTEM

As part of a continuing research programme concerned with developing passive homing techniques for future ground-to-ground weapons, British Aerospace Dynamics Group has been evaluating an automatic target tracking and recording system in a helicopter. Built by the Dynamics Group, the auto-tracking system incorporates many existing items of equipment including the Helitele helicopter gimballed platform (**3356.353**) produced by Marconi.

Westland Whirlwind helicopter operated by Bristow for British Aerospace equipped with Helitele platform for use in research programme into use of passive infra-red homing for future ground-to-ground weapons

Infra-red emissions from the ground target being investigated are recorded on magnetic tape from the output of an infra-red camera mounted on the gimbal platform. The infra-red camera is initially pointed at the designated target and then kept accurately aligned on the target by the auto-tracking system, independently of the helicopter's motion. Target tracking accuracies achieved are better than 0·25 milliradians. Both stationary and moving targets can be tracked with equal accuracy. A sodium lamp mounted on the target is used to designate it to the auto-tracking system. A sodium lamp was selected as it provides a suitable high-intensity source for tracking purposes while having a very low infra-red output – low enough not to affect significantly the data being recorded.

A pair of standard industrial TV cameras are mounted on the helicopter's Helitele platform collimated with the infra-red camera sensor. One camera with a wide field-of-view is linked to a TV monitor display and is utilised by the operator to acquire the designated target. With the aid of a joystick control that is part of the Helitele equipment, the operator aligns the camera on the target. The second TV camera has a narrower field-of-view and is coupled to the servo-system controlling the platform. Following acquisition, the operator switches control over to this camera and the servo-system maintains the target's sodium light source centred in the field-of-view and, hence, the infra-red camera pointing accurately at the target while infra-red emission data is being recorded.

The helicopter was used by British Aerospace Dynamics Group to acquire detailed information of the patterns of infra-red radiation from stationary and moving targets when viewed from all aspects. Apart from utilising this equipment for recording target data (to be used in system modelling and algorithm development) it has recently been developed to demonstrate target tracking in the infra-red wavelength.

STATUS

Development project. Data gathering trials have now been completed and the infra-red camera performance has been further refined.

CONTRACTOR

British Aerospace Dynamics Group, Six Hills Way, Stevenage, Hertfordshire SG1 2DA, England.

3404.393

NIMTAN AIRBORNE NIGHT SIGHT

The PPE Nimtan sight is a modified Spartan battlefield sight (**3403.193**) incorporating a straight eyepiece and pintle mounting. The sight was designed for the MoD for use by the RAF in maritime patrol aircraft. It can also be used in other patrol, supply, and spotter aircraft, helicopters, land vehicles, ships, and hovercraft with or without the pintle.

The sight interfaces with aircraft window shelves provided with bearing potentiometers. The mounting is provided with azimuth locking, horizontal scanning, and a safety lanyard. Sight controls consist of on-off switch, focus, shutter, and light control setting. Power is obtained from a self-contained battery. The tube is fitted with automatic brightness control.

The sight is of modular construction for ease of maintenance. Both the equipment and storage case meet the environmental requirements of DEF 133.

The range and field of view provide excellent surveillance and reconnaissance capability and the magnification (×1·7) is sufficiently low not to cause vibration of the picture.

CHARACTERISTICS

Magnification: ×1·7

Field of view: 20°

Image tube: 25 mm 3-stage cascade

Weight: 4·5 kg (7·4 kg with support bracket)

STATUS

In service with the RAF.

5927.393

PPE OPTICAL MODULES

Pilkington PE designs and manufactures a wide range of optical modules for incorporation in aircraft head-up display (HUD) systems. These include the following:

A4 Optical Module

This was developed for the GEC Avionics HUD weapon aiming system and has been in service for over 15 years in the US Navy Skyhawk aircraft. The system uses conventional 3 inch refractive optics relaying essential flight information and weapon aiming sights via a semi-reflecting combiner, into the pilot's line of sight. Weight is 15 lb (6·8 kg).

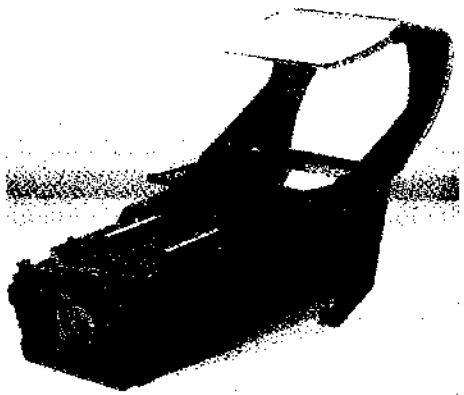
A7 Optical Module

This unit incorporates 5 inch refracting optics and was developed for the GEC Avionics HUD for the US Navy A7 Corsair aircraft. Over 2500 have been produced. It incorporates an integral stand-by sight which can be independently superimposed on the CRT display in red, via dichroic beam splitting optics. Weight is 20 lb (9.1 kg).

F16 A/B Optical Module

Incorporated in the GEC Avionics HUD weapon-aiming system, this model has been installed in over 2000 F-16 single and twin seat aircraft. Employing conventional optics, the pilot has a field of view (FOV) 20° circular through an exit aperture of 5 inches. Weight is 20 lb (9·1 kg).

F16 C/D Optical Module



This unit has a 6·7 inch exit aperture and a 25° FOV. It can project forward-looking infra-red (FLIR) pictures into the pilot's FOV to provide a fly-by-night capability. Weight is 28 lb (12·7 kg)

F16 Lantirn Optical Module

This module features the latest developments in holographic optical elements. It produces a very wide FOV (30° × 20°) and gives a clearer and brighter display than conventional optics. The optical module can be linked into a FLIR system. Weight is 27 lb (12·3 kg).

A10 Lantirn Optical Module

The A10 module employs diffractive optics which replace the conventional collimating optics and combiner glass with the new holographical optical element. The optics increase the pilot's FOV to 30° × 20°, and produce a brighter image on the combiner. The unit can also be linked into a FLIR system. Weight is 40 lb (18·2 kg).

VICON 90 SERIES 101 FLIR POD

The Vinten Vicon 90 is a high resolution miniature forward looking infra-red (FLIR) pod designed for use in an airborne reconnaissance role. The FLIR sensor is a lightweight thermal imager manufactured by Rank Pullin Controls and based on the Sprite detector which, with the incorporation of advanced signal processing, provides high levels of thermal sensitivity and spacial resolution. The imager comprises a scanner and processing electronics unit incorporating a cryogenic cooling system, and is fully automatic in operation.

The pod is self-contained with the aircraft interface requirement being limited to the installation of a control panel. The imagery is recorded on a video cassette recorder fitted in the pod, and can also be displayed in real-time on a video monitor in the aircraft.

CHARACTERISTICS

FLIR head depression angle: 0 or 10° fixed

FLIR window: Zinc sulphide

Pod dimensions: 1345 mm long × 203 mm diameter

Weight: 37 kg approx

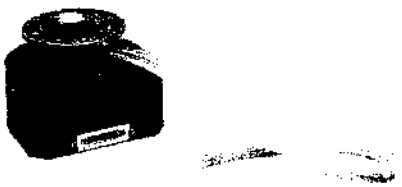
TOMAHAWK CCD TV SENSOR

A miniature, solid-state charge-coupled device (CCD) TV camera has been designed and built by Fairchild Imaging Systems Division under contract to McDonnell Douglas Astronautics Corporation for use as the sensor in the Tomahawk cruise missile (**3993.011** and **4197.221**) digital scene matching area correlator (DSMAC) guidance system.



In conjunction with suitable optics and an image intensifier, the CCD TV camera presents real-time video imagery to the processor designed by McDonnell Douglas Astronautics. The latter, using this video information in a correlation mode, supplies final guidance corrections in the terminal phase of the cruise missile flight to its target. The camera uses a CCD sensor developed by Fairchild.

STATUS

In volume production

CONTRACTOR

Fairchild Weston Systems Inc, 300 Robbins Lane, Syosset, New York 11791, USA.

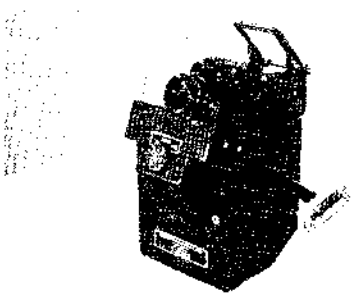
Fairchild CCD TV camera sensor unit for Tomahawk cruise missile programme DSMAC guidance system

1008.393
XM76 ANTI-OSCILLATION SIGHTING SYSTEM

The XM76 is a telescopic target acquisition and identification equipment, providing stabilisation against vibrating environments such as helicopters, vehicles, boats, and ships.

OPERATION

The sighting system senses motion in two axes by means of rate gyros, and the resulting signals are used to control torque motors acting upon a fluid prism optic system to compensate for the sensed motion, thus stabilising the image of the desired field of view. There are separate, and virtually identical, servo-loops for each axis control. The motion signals measured at the optical head are applied to a control module as error signals, and are then demodulated, amplified, and stabilised, power amplified and fed to the torque motors as correction signals. The polarity and magnitude of the corrective signals determines the direction and speed of the torque motors to compensate for the motion of the optical head.



The optical device responsible for effecting motion correction is a fluid prism. This is a variable geometry, liquid-filled prism enclosed by a flexible opaque bellows and two optical flats, front and rear. The flats are movable, transparent windows which serve as the prism faces. There is one flat for each channel, or axis of motion, and each is connected by a linkage to its respective torque motor. Movement of the flat varies the optical geometry of the fluid prism, thereby varying the refraction of light through the prism. These controlled changes result in stabilisation of the image.

The anti-oscillation sighting system has also been adapted to armed helicopter fire control. There have been two applications. The first was to improve the accuracy of the fire by providing the gunner with a stabilised image and ×1·5 to ×12 magnification optics on the gun sight. The second was also to provide a further increase in accuracy by incorporating resolvers into the optical servo loop, and thus slaving the turret to the optical line-of-sight of the XM76 mounted on the sighting station in the cockpit.

The sight also incorporates a monocular zoom lens, controlled by two push-buttons on the unit. These control the direction of the zoom; the ×1·5 for zoom-out (decreased magnification) and the ×12 for zoom-in (increased magnification). Speed of zoom is determined by the detent to which the ×1·5 or ×12 button is pressed: first detent for slow zoom, second detent for fast zoom.

STATUS

Users include the US Army, USAF, USMC, USN, and the Government of Israel. Vehicles fitted with the XM76 sighting system include the OV-2, AHIG, OH6A, OH-58A, and the UH-1 series helicopters for observation, target acquisition, attack and damage assessment.

Stabilised sight head for the M97 20 mm armament system on the Bell AH-1J Twin Cobra

Fixed-wing aircraft include the A-4 and F-4, and other types of vehicle fitted range over AFVs and various types of naval craft. Recent helicopter applications are the stabilisation of laser beams for both target designation and weapon simulation. The Dynaens optical element which corrects for motion has also been incorporated in the pantograph sight of the M97 20/30 mm flexible armament system produced by the General Electric Company (**1288.303** in 1983-84 and earlier editions).

1630.393
HONEYWELL VISUALLY COUPLED SYSTEMS

The Honeywell electro-optical and magnetic helmet sights have evolved with the related objectives of simplifying target acquisition for airborne weapons, and also improving this function by utilising the wide search-angle and flexibility of the human eye. This is accomplished by arranging for the pilot's line-of-sight to be determined in relation to aircraft axes. This data can be used as pointing information for a wide range of aircraft systems (AI radar, cameras, infra-red seekers, etc) and for weapon aiming.

The Honeywell helmet sight system consists of the following major elements: helmet-mounted unit (HMU), sensor surveying units (SSU), sensor electronics unit (SEU), and controls mounted on the instrument panel and control stick.

The system operates as follows: two sensor surveying units, rigidly mounted to the airframe and aimed in the pilot's direction emit fan-like beams of infra-red light rotating at constant velocity. The light beams sweep over a reference photo sensor and two pairs of helmet-mounted photo sensors (one pair on each side of the pilot's helmet). The time intervals between the pulses from the helmet photo sensors and the reference pulses are a measure of the angular position of the pilot's head relative to the XYZ reference axes of the aircraft. The photo sensor outputs are transmitted to the sensor electronics unit where the angular computations are performed and converted into azimuth and elevation information. A collimated reticle image, aligned with the sensor pairs, is reflected off the parabolic visor and into the pilot's right eye. Additional digital computations such as fire control and missile launch envelopes may easily be incorporated in the sensor electronics unit with little or no increase in system complexity. In versions being supplied to the USN, a Honeywell HDC-202 digital computer is included.

The advanced magnetic helmet-mounted sight (AMHMS) utilises a system of magnetic fields surrounding the pilot's helmet to determine the direction of the pilot's line-of-sight relative to the aircraft.

Honeywell IHADSS helmet sight/display

VTAS

A total of 500 electro-optical helmet sight systems were supplied to the USN for fitting in F4J aircraft. The visual target acquisition system (VTAS) is used for off-boresight targeting of the Sidewinder air-to-air missile

IHADSS

The latest version of the Honeywell electro-optical system is the Integrated Helmet and Display Sighting System (IHADSS) which is now in production for the AH-64A advanced attack helicopter. Both the pilot and co-pilot/gunner are provided with helmet units and controls to allow independent and co operative use of the system. The IHADSS sight component provides off-boresight line-of-sight information to the fire control computer for slaving weapon and sensor to the pilot's head movements. Real world sized video imagery from the slaved and gimballed infra-red sensor is overlaid with targeting as well as flight information on symbology, and projected on a combiner glass immediately in front of the pilot's eye. The IHADSS allows night nap-of-the-earth flight at below treetop altitudes without reference to cockpit instruments, and rapid target engagement.

AMHMS

The Advanced Magnetic Helmet Mounted Sight System (AMHMS) has been fully qualified for USAF applications through a contract with the USAF Aeronautical Systems Division and is undergoing flight evaluation in the AFTI-16 aircraft. The system uses a visor projected reticle and a line-of-sight computation, based on magnetic fields, to allow off-boresight target engagement by merely turning the head to place the reticle on the target.

Advanced Concepts

Honeywell is developing advanced helmet-mounted sight and display concepts which include sophisticated displays, 3-D displays, eye tracking, and improved head tracking methods for both aircraft and ground vehicle applications.

STATUS

The company has delivered 500 VTAS systems for the F4J aircraft.

The IHADSS is currently in production for the Hughes AH-64A advanced attack helicopter and is also to be fitted into the CH-53E, HH-60D and A-129 aircraft.

The AMHMS has been military qualified and is undergoing flight evaluation in the AFTI-16 aircraft. It is also in use in the Helmet Mounted Oculometer System for the tactical combat trainer at the US Wright Patterson AFB.

CONTRACTOR

Honeywell Military Avionics Division, 2600 Ridgway Parkway, Minneapolis, Minnesota 55413, USA.

5753.393
SPASYN VISUAL TARGET ACQUISITION SYSTEM

The SPASYN visual target acquisition system is an advanced, ultra-light helmet-mounted sighting system. SPASYN (space synchro) measures the location and orientation of an object in space by means of radiating directional magnetic fields in three orthogonal co-ordinates. Applied to a helmet-mounted sight, this closed-loop transducing system provides a full 6° of freedom in measuring a pilot's line-of-sight to an accuracy of better than 0·5° within a head motion envelope of 5 ft³ (0·14m³). The system enables a pilot to achieve visual acquisition of a given target and lock on automatic tracking systems while remaining in the head-up position and free to perform evasive manoeuvres or other in-flight tasks.

A small transmitter (radiator) mounted on the cockpit frame emits magnetic field vectors which induce voltages (signals) in a sensor mounted in the helmet. These signals are processed by a computer in the system's electronics unit to define the sensor's translation and orientation, ie the operator's line-of-sight angles. The sensor mounted on the helmet weighs approximately ½ ounce (14 grams) and does not encumber the wearer. The SPASYN-based system can be used in both fixed- and rotary-wing aircraft to command weapons and sensors. It can also be used on land or at sea as a target acquisition system, can be vehicle-mounted or can act as an alternative fire-control system in naval vessels.

CHARACTERISTICS

Weight: Sensor ½ oz (14 g); Radiator 1 oz (28 g); Electronics unit 22 lb (10 kg)

Dimensions: Sensor ½ in (1·26 cm) cube; Radiator 1 in (2·54 cm) cube; Electronics unit 13⅛ × 7⅝ × 4⅝ in (33·3 × 19·3 × 12·2 cm)

Accuracy: Nominal head position 0·1°; max error condition 0·5°

SPASYN visual target acquisition sight

4136.393
AN/ASG-26A LEAD COMPUTING OPTICAL SIGHT

The General Electric Company has developed an improved lead computing optical sight (LCOS) which enables air-to-air attacks to be made without the need for continuous target tracking. This capability is incorporated in the LCOS system for the McDonnell Douglas F-4E aircraft. The complete equipment consists of a pilot's head-up display, a two-axis lead computing gyroscope, gyro mount, and a lead computing amplifier.

Against airborne targets, the equipment displays gun and missile fire control information by means of a servoed aiming reference. Against ground targets, the pilot adjusts the aiming reference manually to control gunnery, rocket firing and bombing displays. An optical path in the centre of the sight-head presents radar aiming data. The head-up display projects the aiming reference by means of a collimated reticle display reflected from the combining glass into the pilot's field of view. The image is focused at infinity.

The aircraft's own manoeuvres generate rate and acceleration signals in the gyro lead computer, range to target is measured by radar, and angle of attack, air density and airspeed data are obtained from the air data computer. Using these parameters, the pilot's aiming reference is displaced in the proper direction to introduce lead angle and gravity corrections. Analogues of the aircraft's roll angle and range information are also projected onto the combining glass. In ground attack modes, other aircraft systems are used to generate corrections for drift, and offset bombing is also possible.

STATUS

GE is, or has been, engaged on lead computing optical sight programmes for the F-101, F-104, F-105, F-111 and F-5 aircraft. The company is supplying the AN/ASG-29 lead computing optical sight (**4137.393**) for the F-5E.

CONTRACTOR

General Electric Company, Aircraft Equipment Division, Binghampton, New York 13902, USA.

4137.393
AN/ASG-29 LEAD COMPUTING OPTICAL SIGHT

General Electric produces the AN/ASG-29 lead computing optical sight (LCOS) for the F-5E aircraft. Compared with the GE AN/ASG-26A, which has a family relationship with the AN/ASG-29, the latter comprises two main units only; a pilot's optical display and a lead computer with its associated mounting base. The equipment provides all weapon delivery modes applicable to the aircraft type, including air-to-air and ground attack engagements with both guns and missiles. Provision is also made for the inclusion of a CCIP bombing mode. In most other respects the AN/ASG-29 is broadly similar to the AN/ASG-26A described in **4136.393**.

CHARACTERISTICS

Total field of view: ±6° azimuth; +2 to -12° elevation

Instantaneous field of view: 7·5°

Collimating lens: 10·4 inches (264 mm) focal length, 4 inches (102 mm) clear aperture

Weights: 6·9 kg (sight head); 7·9 kg (gyro lead computer); 0·8 kg (mounting base)

MTBF: Over 300 h

STATUS

In production for F-5E aircraft.

CONTRACTOR

General Electric Company, Aircraft Equipment Division, Binghampton, New York 13902, USA.

3815.393
LAAT SIGHT

An improved M65 sight known as the laser augmented airborne TOW (LAAT) sight is produced by Hughes for use on US Army AH-15 Cobra attack helicopters. The M65 contains a thermal imaging system comprised of standard US Army common modules, and Hughes has designed and developed a laser transmitter capable of being fitted in the small space between the gimbal assembly and the housing plate of the existing right turret for the TOW anti-tank missile system. This unit is approximately 13 × 13 × 4 cm in size and has a repetition rate of four pulses per second for five seconds on and five seconds off. A multi-pulse laser rangefinder is necessary due to the helicopter's forward motion during target sighting, requiring several range measurements to update the fire control computer.

A novel cooling technique is embodied to reduce size and weight; the laser's flash tube is embedded in a heat conductive and highly reflective layer to avoid the need for more conventional cooling techniques.

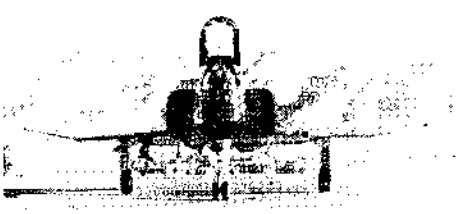
STATUS

In operational service.

CONTRACTOR

Hughes Aircraft Company, PO Box 902, El Segundo, California 90245, USA.

The thousandth telescopic sight for the airborne TOW system, at the Hughes plant prior to delivery to the US Army



---

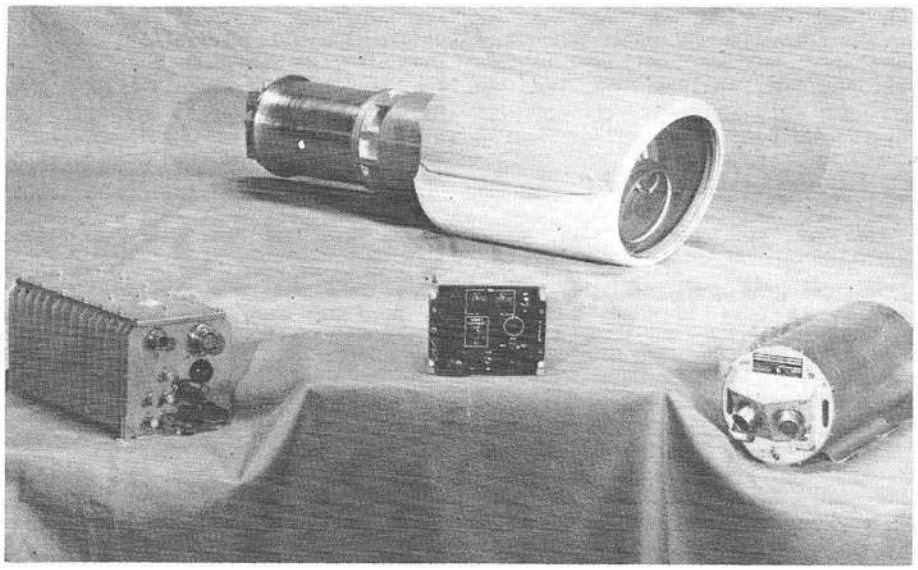
1806.363
AN/ASX-1 TARGET IDENTIFICATION SYSTEM, ELECTRO-OPTICAL (TISEO)

The target identification system, electro-optical (TISEO) is a high resolution closed-circuit television sensor used for target acquisition, recognition and tracking. The sensor contains a single telescope with two fields of view mounted on a stabilised platform.

TISEO can be slaved to the aircraft radar or operate

TISEO enables the pilot of high speed aircraft to acquire, track, and identify targets at far greater ranges than previously possible. TISEO is installed in recent production F4E Phantoms of the USAF and other air forces

in an independent manual mode. The system is used for air-to-air and air-to-ground target spotting, lock-on and continuous tracking at ranges far beyond the capability of the pilot's unaided eye.



Four line-replaceable-units (LRUs) comprise the total system. The sensor head/stabilised platform is mounted in the left leading edge wing of the F4E aircraft. Separate video processor and power supply units are stored within the aircraft. A control panel is integrated in the F4E rear cockpit. TISEO operator viewing is shared with the F4E radar monitor.

STATUS

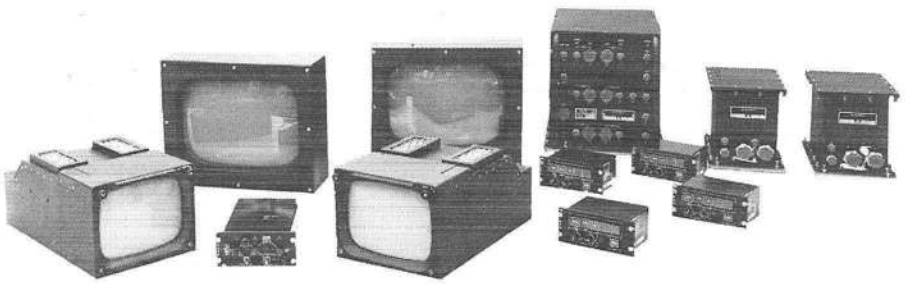
TISEO was developed by Northrop under contract to the USAF and is in full production. It is operational as standard equipment on USAF F4E aircraft and is also deployed on F4E aircraft of five other countries. To date, over 540 systems have been delivered.

CONTRACTOR

Northrop Corporation, Electro-Mechanical Division, 500 East Orangethorpe Avenue, Anaheim, California 92801, USA.

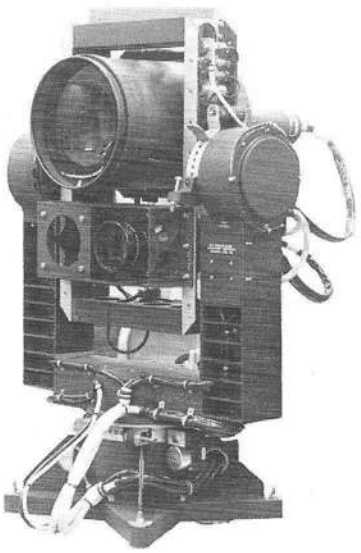
AN/ASX-1 TISEO airborne LRUs

3098.353
AN/ASQ-145 LOW LIGHT-LEVEL TV SYSTEM



A passive TV system, the AN/ASQ-145 is a USAF system utilising dual cameras to provide wide and narrow fields of views simultaneously. In addition to production, General Electric was responsible for system assembly, alignment, and test. The ASQ-145 is a primary sensor of the airborne fire control system used on board the USAF AC-130 aircraft.

STATUS



Operational on board AC-130 aircraft.

CONTRACTOR

General Electric Company, Aircraft Equipment Division, French Road, Utica, New York 13503, USA.

AN/ASQ-145 low light-level television system (without camera heads)

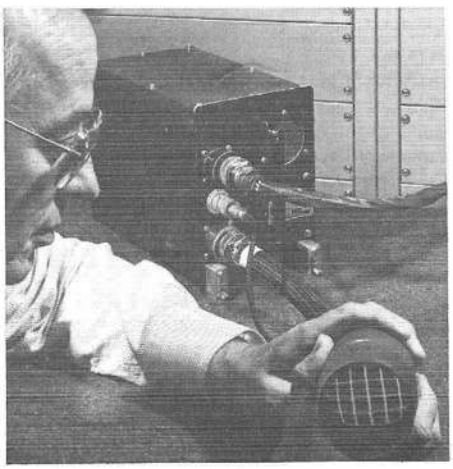
AN/ASQ-145 wide and narrow field of view cameras for the passive LLLTV system

3569.393
VIRTUAL IMAGE DISPLAY

The Virtual Image Display (VID) system is a cockpit TV-display developed to enable fighter aircraft to use the precision-guided Maverick missile (**1098.311**) or other air-to-surface missiles with TV or imaging infra-red-type guidance.

The display, which uses only a quarter of the space required by a conventional unit, consists of a miniature CRT 2·54 cm in diameter with optics to provide a pilot with a high resolution image more than twice the size of the display unit's lens. This enables the pilot to quickly identify and lock-on to targets at long stand-off ranges.

The optics are designed so that the pilot may look outside the cockpit, then view the display without re-focusing his eyes. A built-in contrast enhancement filter provides a clear display in bright sunlight without using a hood. Remote electronics are used to drive the CRT so that only the optics and the CRT need to be mounted on the cockpit panel. The system is flexible enough to be modified to fit other applications where a compact remote TV display is needed. The electronics unit does not require special cooling systems and can be located remotely in the aircraft up to a 6·1-metre cable length from the display unit.



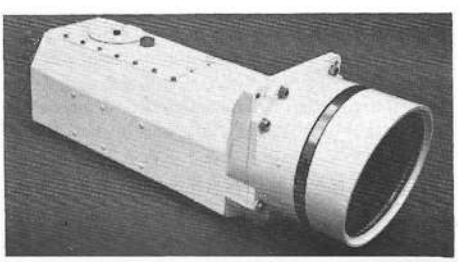
The display was designed by Hughes under contract from SRA Communications AB, Stockholm and the Swedish Air Material Department to enable the Swedish Air Force Viggen fighter to carry the Maverick missile without costly and extensive modification to the aircraft's cockpit.

STATUS

Hughes manufactured and delivered 110 sets of the VID system, which is currently operational with the Viggen. The system is also operational with the air forces of Singapore and Switzerland.

CONTRACTOR

Hughes Aircraft Company, Radar Systems Group, El Segundo, California 90245, USA.



Viggen cockpit TV monitor display for use with Maverick air-to-surface missile system shows test pattern

4215.393
MODEL 200 TISS

The Model 200 thermal imaging sensor set (TISS) provides a passive target imaging capability for naval fire control. The equipment is designed to replace or complement conventional television target sensors on naval fire directors or gimbal sets. Existing video displays, auto-trackers and symbology generators can be used without modification.

The Model 200 incorporates an IR scanner and two-fields-of-view telescope optics. The IR scanner has 20 mercury cadmium telluride detectors arranged in two arrays which are cooled to between 77 and 90° K. Detector cooling can be provided by either a split-cycle refrigeration machine or a high pressure bottle of nitrogen and a Joule-Thompson cryostat.

Ford Aerospace Model 200 thermal imaging sensor set (TISS)

The equipment is designed to be mounted on a two-axis gimbal without loss of imaging performance. Boresight stability is maintained by an internal raster control circuit. For target recognition and surveillance, a built-in grey scale display is provided to aid the operator in making control settings for optimum imaging performance.

CHARACTERISTICS
Spectral response: 8 - 11·5 μm
Output: Direct video 625 line 50 Hz
Fields of view: 2·4 × 1·8° (narrow); 9·7 × 7·3° (wide)
Resolution: 0·12 mrad horizontal (narrow field-of-view)
Noise equivalent temperature: 0·3°C
Minimum resolvable temperature: 0·5°C
Power: 115 V AC, 60 Hz
Weight: 28 kg (not including cryo cooler)
Operating temperature range: -25 to +55°C
CONTRACTOR
Ford Aerospace & Communications Corporation, Ford Road, Newport Beach, California 92660, USA.

3809.363
NORTHROP TCS (TELEVISION SIGHT UNIT)

The Northrop television camera set (TCS), formerly TVSU television sight unit, is an electro-optical tracking system with functional characteristics similar to those of the basic Northrop TISEO (**1806.353**). It features a stabilised closed-circuit television system and precision optics that provide passive target acquisition, identification and tracking at ranges far beyond the capability of the unaided eye. It is packaged in two weapon replaceable assemblies which interface with the avionics and electrical power supply system of the aircraft. TCS interfaces with an on-board video recorder to retain target tracking data. It can operate in an independent manual mode or be slaved to the aircraft radar. The TCS also contains the capability of automatic search and automatic acquisition of airborne targets.

TCS satisfies the requirement for target identification at long stand-off ranges, enabling use of superior range weapons in the modern battlefield scenario. The TCS in the F-14 Tomcat (left) is shown in a chin-mounted installation

STATUS
TCS was developed by Northrop for installation on the USN F-14 Tomcat fighter to satisfy both air-to-air and air-to-ground missions and an initial production contract was awarded in 1981 to start a multi-year installation programme on new and existing F-14 aircraft. In mid-1982 the contractor received a continuation award from the US Naval Air Systems Command to produce 31 sets for the F-14. The contract contained an option for 72 additional sets.

First production sets were delivered at the end of 1982.

CONTRACTOR
Northrop Corporation, Electro-Mechanical Division, 500 East Orangethorpe Avenue, Anaheim, California 92801, USA.

4728.393
NORTHROP FOCAL PLANE ARRAY

The Northrop focal plane array system is an experimental infra-red sensor that enables optical target acquisition systems to find distant targets at night and in adverse weather. The system consists of 16 384 sensors, each 0·001 inch in diameter, arranged in a small cluster and linked to a microprocessor. Infra-red radiation detected by the sensors is processed for conversion into a picture display on the host optical unit's television monitor.

STATUS
Flight testing has been carried out successfully in a US Army helicopter. The system is a privately funded venture and no details have yet been disclosed as to its applications, although one possibility is use with the Northrop TCS (**3809.363**).

CONTRACTOR
Northrop Corporation, Electro-Mechanical Division, 500 East Orangethorpe Avenue, Anaheim, California 92801, USA.

4011.383
AQUILA MISSION PAYLOAD SUB-SYSTEM

Under contract to Lockheed Missile and Space Company, Westinghouse has developed the sensor for the US Army's Aquila remotely piloted vehicle (**3168.351**). The system will be used for aerial target acquisition, designation and reconnaissance missions.

The Mission payload sub-system weighs only 43 lb (6·35 kg) and consists of 14 modules that make up the TV camera, target tracker, and laser ranger/designator (**4729.393**), as well as an optical stabilisation system and microprocessor electronics for control and processing. Modular construction of the MPS facilitates adaptation to day/night (FLIR) operation and helps minimise life cycle cost. The Aquila mission payload sub-system embodies previous work carried out by the company in developing the Blue Spot target designator equipment (**3050.383**) described in previous editions of *Jane's Weapon Systems*.

CONTRACTOR
Westinghouse Electric Corporation, Defense and Electronic Systems Center, Box 746, Baltimore, Maryland 21203, USA.

4113.393
ROCKWELL MAST-MOUNTED SIGHT

Rockwell International's Missile Systems Division, working in co-operation with ARRADCOM (US Army Armament Research and Development Command), Dover, New Jersey, has developed and tested a mast-mounted sight and target designator for use on ground attack helicopters. The device is mounted at the rotor hub, above the blades, to permit the helicopter crew maximum observation height while enabling the aircraft to remain behind cover as far as possible.

The mast-mounted sight sensor head contains stabilised optics for target detection and recognition at ranges of 3 to 4 km and laser target designation for weapons such as the Hellfire and Copperhead guided weapons. The equipment has been installed and flown on UH-1M and OH-58C helicopters.

STATUS
In performance tests on a UH-1M the equipment has demonstrated its ability to detect targets at a range of 4 km while remaining undetected by 7 × 10 power optical devices on the ground.

CONTRACTOR
Rockwell International, Missile Systems Division, 4300 East Fifth Avenue, Columbus, Ohio 43216, USA.

5758.393
ILS MAST-MOUNTED LASER RANGEFINDER

International Laser Systems (ILS) has developed a laser rangefinder/target designator for the Northrop mast-mounted sight. Pod-mounted above the rotor, the equipment allows the US Army's Scout helicopter to acquire and illuminate targets at greater stand-off ranges while concealed from the battle area. Hellfire, Copperhead and other laser guided munitions can be guided to their targets by the rangefinder. Northrop is responsible for the integration of all the sensors in the sight on behalf of the prime contractor, McDonnell-Douglas.

The packaging design enables the rangefinder to incorporate all the electronics, power supply, cooling system, range receiver and laser transmitter into one compact lightweight line replaceable unit. The microprocessor system includes a serial, asynchronous digital interface for communication with the sight computer. Internally all sub-assemblies interface via a common bus under control of the main processor which maintains all systems timing through software control. This improves system flexibility for expansion and/or alternative functions.

CONTRACTOR
International Laser Systems Inc, 3404 North Orange Blossom Trail, Orlando, Florida 32804, USA.

4729.393
AQUILA LASER TRANSMITTER ASSEMBLY

This ILS laser transmitter assembly is a subsystem of the US Army Aquila remotely piloted vehicle (**3168.351**). It operates in conjunction with a television camera to provide intelligence gathering, navigation update, range-to-target information and target illumination. It consists of a heat exchanger, cooling system, power supply, pulse forming network, optics and associated electronics in a package weighing approximately 3 kg. Although designed for the Aquila vehicle, the assembly is suitable for installation in other RPVs. See also entry **4011.383**

STATUS
In production.

CONTRACTOR
International Laser Systems Inc, 3404 North Orange Blossom Trail, Orlando, Florida 32804, USA.

3053.383
ATAFCS EQUIPMENT

The airborne target acquisition and fire control system (ATAFCS) is an advanced electro-optical system containing a television camera for daylight operations, a forward looking infra-red (FLIR) equipment for day/night operations, a laser spot detector for target acquisition, a laser transmitter/receiver for target designation and ranging, and an autotracker with both day and night mission capability. It is designed for installation on both attack and scout helicopters, and is intended to increase the combat effectiveness of US Army helicopters.

Development was undertaken by Ford Aerospace & Communications Corporation, and the project was originally known as ALLD (airborne laser locator designator). In August 1974 the US Army Material Command Precision Designator Project Office, Redstone Arsenal issued a follow-on contract valued at about $3·5 million for the building of another four sets of ATAFCS equipment. This made a total of six sets ordered, two having been called for in the initial award.

US Army Cobra AH-1G ground attack helicopter showing nose mounting of ATAFCS

STATUS

The first equipment was delivered during 1974 and installed on a US Army Bell Cobra helicopter for flight test and evaluation by the US Army Missile Command. Further deliveries were made in 1974 and in 1975.

The system has been tested successfully in both a pod-mounted version and in a configuration integral with the helicopter nose (as shown).

A helicopter mounted ATAFCS has been used successfully in a night test at the White Sands Missile Range, to acquire and mark a moving tank target for a US Army cannon launched guided projectile (CLGP) fired from a 155 mm howitzer at a range of 5 miles (8 km).

CONTRACTOR

Ford Aerospace & Communications Corporation, Ford Road, Newport Beach, California 92660, USA.

3981.393
ALT AIRBORNE LASER TRACKER

The Rockwell airborne laser tracker (ALT) is an automatic laser seeker equipment used to automatically search and track laser marked targets. The ALT is in production for use on the AH-1S Cobra helicopter. In addition ALT components are being produced for the AAH-64A helicopter's target acquisition designation system/pilot night vision system (TADS/PNVS) competition (**3609.393**) and units have also been delivered for other helicopter programmes.

The equipment consists of three units: an electronics unit, a control panel, and a receiver unit. The gimballed optics in the last of the three have a five-inch (127 mm) aperture, and the equipment field of regard is 180° in azimuth and +30° to -60° in elevation.

CHARACTERISTICS

Detector: 4 quadrant silicon
Dynamic range: 120 dB (10^6)
Instantaneous field of view: 20° azimuth × 10° elevation
Logic: Last pulse
Optics: 5 inches (127 mm) f 0·3
Primary power: 28 V DC and 400 Hz AC

STATUS

In production.

TADS/PNVS

The target acquisition designation sight and the pilot night vision sensor (TADS/PNVS) are two independently functioning systems designed and under development for use with US Army advanced attack helicopters (AAH) to enable these aircraft to operate at extended stand-off ranges, day or night, under adverse weather conditions. TADS provides the gunner with a search, detection, and recognition capability with direct view optics, television, or forward looking infra-red (FLIR) sighting systems; these may be used singly, or in combination, depending on tactical, weather, or visibility conditions. Once acquired, targets can be tracked manually or automatically for autonomous attack with 30 mm guns, rockets, or Hellfire missiles. The laser may also be used to designate targets for remote attack by other helicopters or by artillery units firing laser-guided Copperhead munitions. The TADS equipment consists of a rotating turret that mounts on the nose of the helicopter and houses the sensor sub-systems, an optical relay tube (ORT) at the co-pilot/gunner's position, four electronic units in the avionics bay, and cockpit-mounted controls and displays.

TADS/PNVS system on AH-64A Apache advanced attack helicopter

PNVS is used by the pilot for night navigation, and consists of an FLIR sensor system packaged in a rotating turret mounted above the TADS; an electronic unit located in the avionics bay; and the pilot's display and controls. The PNVS is slaved to the pilot's helmet display line-of-sight and provides imagery that allows the helicopter to be flown in a 'nap-of-the-earth' fashion at altitudes likely to avoid, or at least minimise, enemy detection.

The laser rangefinder/target designator, provided by International Laser Systems, is integrated with the system and provides navigation and attack capability in low visibility and night conditions.

CHARACTERISTICS

TADS

System coverage: ±120° azimuth; +30 to -60° elevation
Fields of view (day): TV 0·9° narrow, 4° wide; Direct view 4° narrow (× 16), 18° wide (× 3·5)
Fields of view (night): 3·1° narrow; 10·1° medium; 50° wide

PNVS

System coverage: ±90° azimuth; +20 to -45° elevation
Fields of view: 30× 40°

STATUS

In production and in service.

SEEHAWK SRR FLIR

The lightweight SEEHAWK FLIR (forward looking infra-red) was developed by Northrop under contract to the US Coast Guard. The system provides capability for search and rescue, surveillance, marine patrol, night navigation and a variety of other tasks.

The passive sensor, gimballed with servos, provides complete hemispheric coverage with automatic search, acquisition and target tracking system. Three fields of view (FOV) satisfy a wide range of operational requirements from low level navigation in wide FOV to inspection and identification in the narrow FOV. The servo system provides line-of-sight stabilisation to eliminate vibration and to ensure image quality and resolution. Sensor imagery is displayed on a video monitor in the aircraft with appropriate symbology to aid the operator. A manual control system allows the operator to direct the sensor line-of-sight to any position in the surveillance field. The system can also be slaved to track the radar line-of-sight or other external inputs. Video and audio information may be recorded for either test or record purposes. The SEEHAWK FLIR can be installed on helicopters, fixed wing aircraft or ships.

CHARACTERISTICS

System coverage: Azimuth ±190°; elevation +30 to −105°

Field of view: Wide 30° × 40°; medium 15° × 20°, narrow 5° × 6·7°

STATUS

Over 2000 hours testing on the US Coast Guard HH-52 helicopter and the Beech B-200™ special mission aircraft. In production.

CONTRACTOR

Northrop Corporation, Electro-Mechanical Division, 500 East Orangethorpe Avenue, Anaheim, California 92801, USA.

US Coast Guard HH-52 helicopter equipped with test installation of the Northrop SEEHAWK FLIR for operational trials

---

5932.393
HONEYWELL FLIR SYSTEMS

Honeywell produces a range of airborne forward looking infra-red (FLIR) systems for both fixed wing aircraft and helicopters. These include the following systems:

F-16B Night Navigation Pod

This is a lightweight self-contained night navigation pod with cockpit raster displays. It is used on a number of aircraft types, including the F-16B, F-5 and A-10.

HNVS

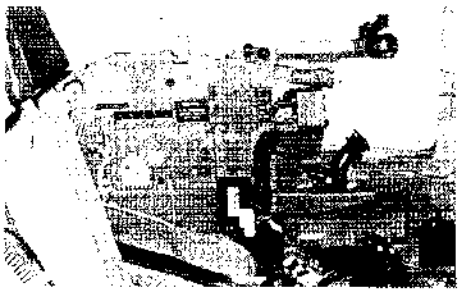
The helicopter night vision system (HNVS) is a high-performance miniature FLIR with single field-of-view (FOV) optics mounted on a two-axis gimbal. It is a compact, spherical shaped sensor package with a diameter of 203 mm and a weight of 11 kg.

FLIR Mini-pod

The FLIR mini-pod was designed for use in helicopters and is a serial scanned thermal imaging sensor. Energy from the scene is scanned in the horizontal direction with a continuously rotated eight-faceted mirror, and a flat mirror in the vertical direction. The output signal from the detectors is amplified and processed, and then displayed in the standard TV format. A FOV of 24° × 37° or 7·5° × 10·5° is provided. Dimensions of the system are 292 × 152 mm and the weight is 8·6 kg.

Falcon Portable Sensor System

The Falcon night vision system is designed for both fixed and rotary wing aircraft. It is a ball-mounted equipment mounted on a two-axis stabilised gimbal, and provides day/night navigation search and reconnaissance. Diameter of the sensor head is 305 mm with a total weight of less than 22 kg.



CONTRACTOR

Honeywell, Electro-optics Operations, 2 Forbes Road, Lexington, Massachussetts 02173, USA.

3808.363
AN/AVQ-27 AIRBORNE LASER TARGET DESIGNATOR SET (LTDS)

The AN/AVQ-27 LTDS is rail mounted in the rear cockpit of the Northrop F-5F. The system features small size, light weight, low power, simple operation, and ease of installation and removal. It is packaged and installed so that it does not interfere with other cockpit operations. The LTDS may be installed in most two-seat fighter or fighter-bomber aircraft with only minor wiring modification and without affecting the aircraft's suitability for other missions. The LTDS concept allows the aircraft to be equipped with target designation capability as required by the mission and have it removed when not in use.

The system's principal elements are a stabilised operator sight unit with a retractable periscopic telescope, a laser transmitter, and a 16 mm mission recording camera, all of which are boresighted through common optics in a single self contained package. The stabilised sighting assembly includes a rate-stabilised mirror that is controlled by a two-axis hand control and provides two tracking modes (rate and rate-aided), a retractable periscopic telescope, and associated optics. The hand control grip contains all the switches necessary to allow for one-hand operation. The laser transmitter consists of a single package that houses a hermetically sealed laser and its associated optics and electronics. The 16 mm mission camera integrated into the LTDS is a version of the same KB 25A/KB-26A standard gun camera now used in the Northrop F-5E/F and other aircraft.

LTDS mounted in rear cockpit of F-5F provides a single-package laser designator for laser guided weapons

STATUS

LTDS was developed by Northrop to expand the capabilities of F-5B and F-5F aircraft for foreign military sales. Various foreign operators of F-5 aircraft are using, or have awarded contracts for, LTDS.

Northrop Corporation, Electro-Mechanical Division, 500 East Orangethorpe Avenue, Anaheim, California 92801, USA.

3065.393
PAVE TACK AN/AVQ-26

The Pave Tack system is a 24-hour, adverse weather, electro-optical acquisition, laser designator and weapon delivery system in production for the USAF.

Previous systems such as Pave Knife were used very successfully in South-east Asia by both the USAF and USN to provide target acquisition and laser target designation for the Mk 82, Mk 83 and Mk 84 laser guided bombs from high performance aircraft. The Pave Knife system was used extensively in high threat areas because it allowed the aircraft to manoeuvre and escape throughout designation and weapon delivery. It was limited, however, to clear weather daytime or twilight operations. Other sensor systems used on the B-57G and AC-130 gunships had the capability to deliver ordnance at night but the aircraft were slow and had limited manoeuvrability making them vulnerable to enemy defences and limiting their use to less heavily defended areas.

The Pave Tack system provides 24-hour capability in clear and adverse weather from all altitudes, including extremely low altitude penetration and interdiction. It provides precise target acquisition and laser target designation for a variety of existing and projected laser, electro-optical and IR weapons, against fixed and moving targets. The system additionally provides target location data to the aircraft weapon delivery digital computer to permit more accurate delivery of free-fall conventional ordnance.

The programme employs several key contractors producing major elements of the system under contract to the USAF. Ford Aerospace & Communications Corporation furnishes the pod structure, electronics control, environmental control system and stabilisation systems and is the Pave Tack Pod systems integrator.

The laser and range receiver sub-system is designed and produced by International Laser Systems at Orlando, Florida. It provides target designation capability for the delivery of laser-guided weapons and range to target information for navigation and conventional munition delivery. It is tri-service coded AN/AVQ-25 and is designed for use with existing and projected laser guided weapons.

The forward-looking infra-red (FLIR) sensor is produced by Texas Instruments at Dallas, Texas.

General Electric is producing the virtual image display which is used in the rear cockpit to magnify the image presented on the display. Initially engineered for USAF F-111F aircraft, it is now being applied to expand the weapons delivery capabilities of the RF-4C and F-4E night attack systems.

Basis of the VID design is a multi-element bi-ocular lens system which provides the cockpit observer with a non-distorted, magnified, virtual image of a cluster of small, high resolution CRTs. As developed for the F-111, the VID is directly interchangeable with the AN/APQ-144 indicator/recorder installed in the cockpit, and this was achieved by substituting for the electro-mechanical device that produces a radar scan on a six-inch CRT, a new electronic co-ordinate transformation circuitry. This makes space available for the small CRTs also. Another modification was the addition of an alpha-numeric character generator which enables avionics data to be written on the main CRT electronically, thus eliminating the need for a number of panel dials and indicators. In addition to its ability to display radar information, the VID can present video from TV, FLIR, and weapons.

After successfully completing the F-111 configuration, GE was instructed to produce equipment for the trials of the system in F-4 Pave Tack aircraft. This programme involves a similar conversion for the AN/APQ-120 radar pilot indicator.

The Pave Tack pod is divided into two basic sections, a base section assembly and a head section assembly. The latter contains an optical bench on which are mounted the FLIR, laser, range receiver and the stabilised sight assembly. The optical bench is mounted on the turret structure, which rotates in pitch and is driven by turret servo drive motors. The turret is mounted to the head structure, which rotates in roll with respect to the base section. Roll motion of the head and pitch motion of the turret provide complete unvignetted lower hemisphere coverage and a highly stabilised line-of-sight which is fully controllable over the entire lower hemisphere of the aircraft.

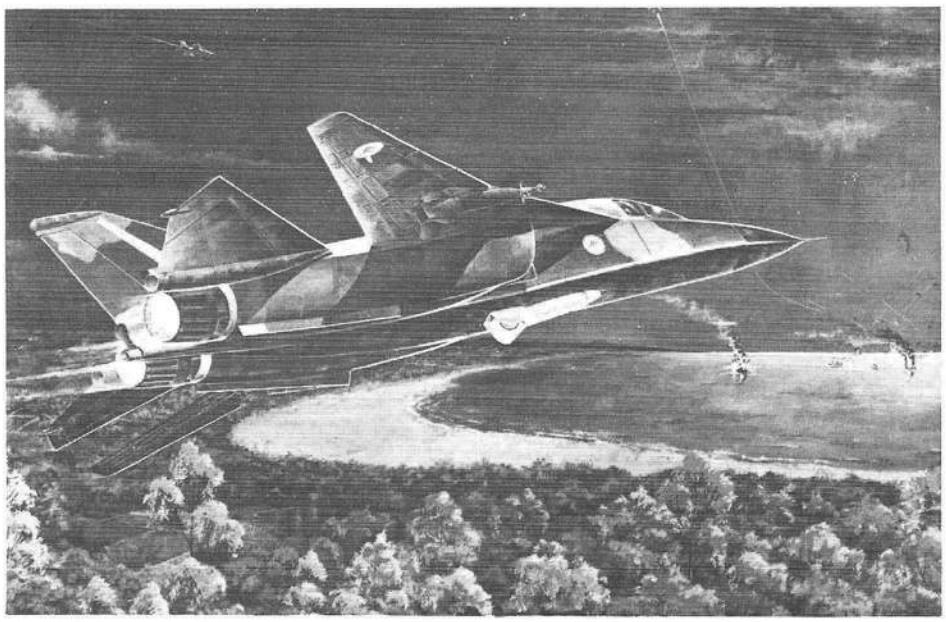
The FLIR is boresighted to (and stabilised with) the laser, and the entire assembly is controlled by the Pave Tack operator aided by a pod-mounted digital aircraft interface unit. The stabilised image and rate-aided tracking mechanisation provide accurate target tracking, laser designation, and weapon delivery throughout a wide spectrum of evasive aircraft manoeuvres. The FLIR has a wide field-of-view display for target acquisition. A narrow field-of-view provides high magnification to enhance target identification and allow precise target tracking.

The electronic assemblies to operate the head section are located in the base section. In addition to the power supply and control electronics, the base section contains a digital aircraft interface unit and a CRT display interface unit. The digital aircraft interface unit is integrated with the ARN-101 digital avionics on board the F-4E and RF-4C aircraft as well as with the digital avionics on board the F-111 aircraft. It provides precise target location data to the aircraft weapon delivery digital computer. A special mode designed into the computer permits Pave Tack to be used for terrain avoidance by pointing the line-of-sight along the velocity vector of the aircraft. The computer additionally provides complete built-in testing for all components on the pod.

A video tape recorder records the video displayed in the cockpit for use in bomb damage assessment and location of targets for future missions.

Northrop Corporation is developing a video-augmented tracking system (VATS), under a contract from Ford Aerospace, for retrofit to the Pave Track system. VATS is a next generation, all-digital, dual-mode tracking system using high density packaging techniques, a micro-processor computer, self-contained power supply and a digital interface to day/night optical sensor systems. VATS allows automatic tracking of ground targets to allow for a reduction in the weapons operator workload. The system has completed DT & E and IOT & E testing for retrofit into Pave Track.

STATUS



The USAF have taken delivery of 149 pods, the last of these being accepted into service in July 1982. The number of aircraft converted to accept Pave Tack pods is believed to be 60 RF-4Cs, 180 F-4Es and 100 F-111s. Total cost of the 149 systems, plus modifications to the various aircraft is nearly $240 million. In addition, Ford Aerospace has produced pods worth $26·8 million for the RAAF, the last of these being delivered in September 1983, and is supplying pods, spares and support equipment to South Korea.

3154.393
AN/ASQ-153 PAVE SPIKE LASER TARGET DESIGNATOR

Pave Spike is a day tracking/laser target designator system that provides the F-4D and F-4E aircraft with a self-contained laser-guided ordnance delivery capability. It is being produced by Westinghouse under production contracts monitored by the Aeronautical Systems Division of the USAF. Designated AN/ASQ153(V), the Pave Spike system is able to acquire, track, and designate tactical surface targets from a manoeuvring aircraft at stand-off ranges usual with laser-guided munitions.

The Pave Spike pod contains an optical sub-system, stabilisation and beam pointing sub-system, TV tracking sensor, laser designator/ranger sub-system, environmental control system, and associated electronics. The aircraft-mounted parts of the system comprise line-of-sight indicator, control panel, and range indicator, and a modified radar control handle and weapons release computer.

Dimensions of the pod are: length 366 cm, diameter 25·4 cm, and weight 193 kg. As shown in the adjacent diagram, it is divided into three major sections:

(1) Forward nose/roll section
(2) Umbilical section
(3) Aft electronics section

The forward nose/roll section rotates about the pod's axis, and the rotating assembly contains the electro-optical sensors and the stabilised gimbal. It is sealed and pressurised with nitrogen and temperature controlled for optimum sensor performance. The umbilical section provides physical and electrical interconnections between the rotating nose section, the aircraft, and the aft electronics section. The last of these contains a thermal cold plate that runs the length of the section. Six major electronic LRUs are mounted on it:

(1) Low-voltage power supply and pod control
(2) Servo electronics
(3) Laser control electronics
(4) Laser power supply
(5) Interface electronics

The AN/ASQ-153(V) designates the Pave Spike system as configured for the F-4D and F-4E aircraft, the pod being mounted in the left front Sparrow missile well by means of a standard 30 inch (76·2 cm) centre ECM pod adaptor. It has also been integrated with other NATO aircraft. The Pave Spike pod designation is AN/AVQ-23.

STATUS

Delivery of the last Pave Spike pod for the USAF was in August 1977, by which time 327 aircraft had been modified to utilise the pod. Deliveries of pods

amounted to 156. In February 1977 it was reported that an undisclosed number of pods had been ordered for use by the Turkish Air Force. This system continues in production for FMS (Foreign Military Sales) requirements.

In August 1978, Ferranti received UK MoD contracts for the provision of technical support for a number of avionic systems in RAF Buccaneer aircraft. Among the equipments are Pave Spike airborne laser designation systems and the associated Pave Way seeker systems mounted on the weapons employed with Pave Spike.

In September 1979 it was disclosed that Westinghouse had supplied 238 ASQ-153 Pave Spike pods, 156 for the USAF and 82 for foreign countries. At that time a developed version, Pave Spike B, was proposed for the USAF F-16 programme, in competition with the ATLIS II pod (**3820.393** in 1981-82 and earlier editions), but has not gone into production. Pave Spike B is almost half the length of the orignal Pave Spike (A) model and correspondingly lighter. A Pave Spike C model has also been proposed with 24-hour capability.

4305.393

LANTIRN

LANTIRN (Low Altitude Navigation, Targeting Infra-red Night) is a pod-mounted system that will permit attack aircraft to acquire, track, and destroy ground targets with both guided and unguided weapons. It is planned for the single-seat F-16 and A-10 aircraft, but is applicable to other one- or two-seat aircraft in the air-to-ground attack role. With the option to use either or both pods, depending on the particular mission requirement, the system provides operational flexibility and minimises system support impact.

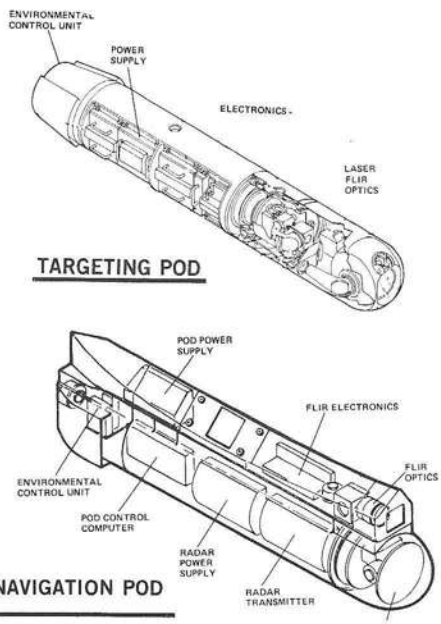
The navigation pod contains a wide field-of-view forward-looking infra-red (FLIR) and a terrain-following radar. The FLIR is displayed to the pilot on a new wide field-of-view head-up display, providing him a night window for low-level flight. The terrain-following radar enables the pilot to operate at very low altitudes with en route weather penetration and blind let-down capability.

The targeting pod contains a stabilised wide and narrow field-of-view targeting FLIR and a laser designator ranger in the nose section, automatic target recogniser and Maverick hand-off unit in the electronics centre section, and an environmental control unit in the tail section. The targeting pod interfaces with the aircraft controls and displays and with the aircraft fire control system to permit low-level, day/night, automatic and manual target acquisition and precision weapon delivery.

The disposition of individual items of equipment can be seen from the illustrations.

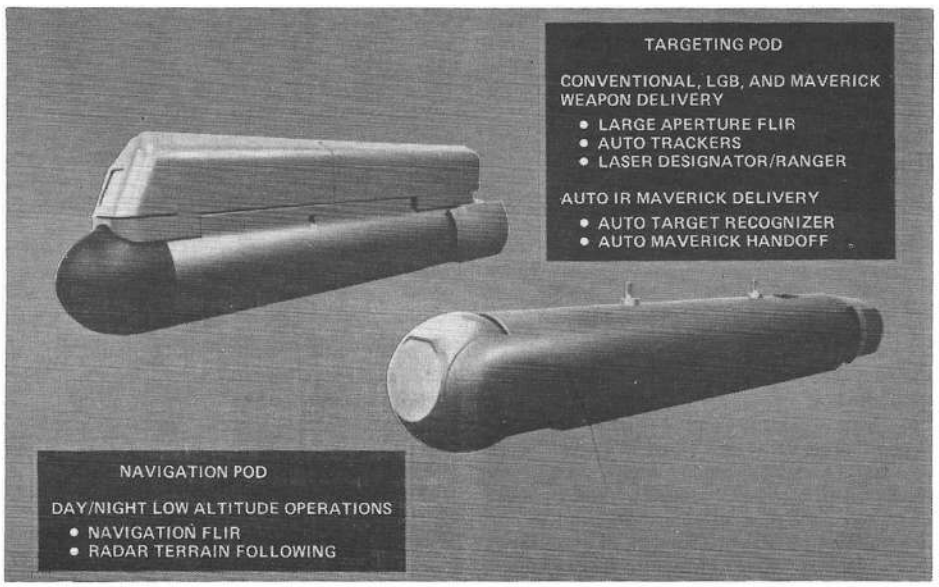
In operational use the LANTIRN target acquisition FLIR's two fields-of-view are optimised for target acquisition and recognition. The line-of-sight is cued by the aircraft inertial navigation system or is automatically scanned. The sensor will be properly oriented for the planned attack and selected weapon delivery profile. Previous low altitude target acquisition problems are alleviated by this combination of optimum sensor fields-of-view with automatic cueing or target search. This ensures maximum stand-off and first-pass attack for guided and unguided weapon delivery. The system is particularly effective when used for the delivery of such weapons as the infra-red Maverick missile or laser-guided bombs.

The laser designator/ranger, designed by Intemation Laser Systems, consists of four LRVs: a laser transmitter/receiver, an electronics unit, a power supply and a synchroniser/range computer.



STATUS

The LANTIRN system is in full-scale development by Martin Marietta Orlando Aerospace under a $94 million contract awarded by the USAF in September 1980. The multi-year contract covers the design, development, and test of six prototype units and initial production of the system. Production and deployment is scheduled for the mid-1980s. Initial flight testing began in September 1982 using an F-16B outfitted with a wide field-of-view head-up-display manufactured by GEC Avionics (UK) (**4314.393**). Flight testing of operational pods began in late 1983 and continued throughout 1984. In February 1985 Martin Marietta was awarded an $87 million contract to begin production of navigation pods. Delivery of the first production model is scheduled for April 1987. Production of the targeting pod is due to begin in the spring of 1986. In all, 700 complete systems are due to be produced over an eight-year period.



CONTRACTORS

Martin Marietta is teamed with Hughes Aircraft, which is responsible for the target recogniser and boresight correlator for Maverick hand-off. Other suppliers include Texas Instruments, (terrain-following radar), Delco Division of General Motors (computers), Sundstrand Aerospace (environmental control systems), and International Laser Systems (laser designator).

The LANTIRN programme is directed by the USAF Aeronautical Systems Division, Deputy for Reconnaissance/Electronic Warfare Systems, Wright Patterson AFB, Ohio, USA.

Internal arrangement of components in LANTIRN pods

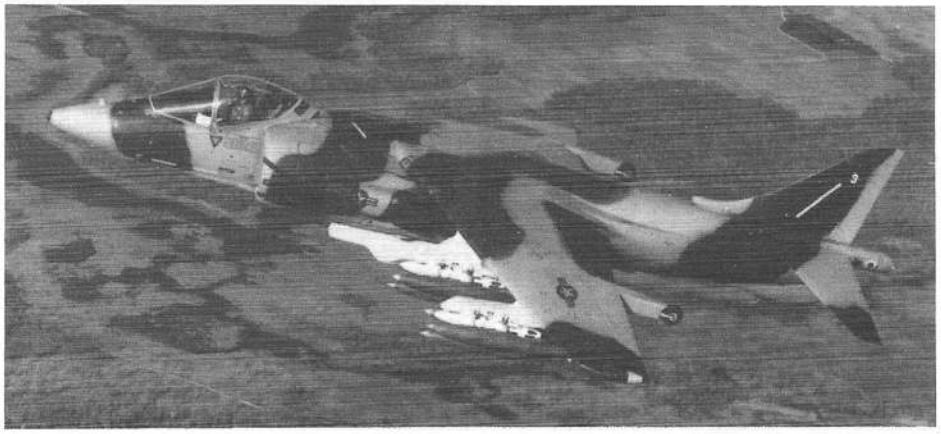
3203.383

AN/ASB-19 ARBS ANGLE-RATE BOMBING SET



The AN/ASB-19, ARBS, is basically a simple angle-rate system. The tracker, after locking on a target, provides the aircraft-to-target line-of-sight angle and angle rate to the weapon delivery computer (WDC). This information, combined with the true airspeed and altitude (from the air data computer), is processed by the WDC, yielding the weapon delivery solution. Target position, weapon release, and azimuth steering information are generated for display to the pilot via a head-up display (HUD). Unlike most current operational bombing systems neither measurement of range to the target nor inertial quality platform inputs are required for ARBS.

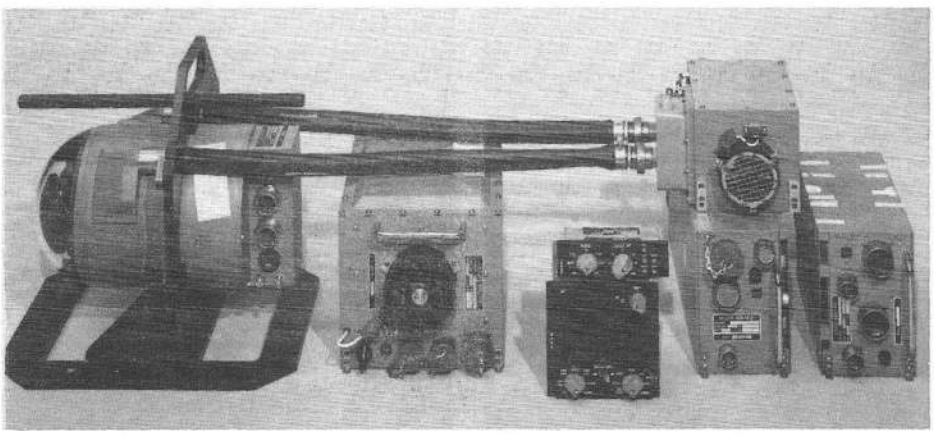
Once the tracker is locked on to the target, in either the laser or TV mode of operation, the pilot is free to manoeuvre within the gimbal limits of 70° nose down, 35° either side of the nose, 10° nose up, and 450° of roll. This freedom allows him to fly an erratic, unpredictable flight path to confuse enemy AAA/SAM tracking, while simultaneously providing target tracking information to the computer. Demonstrated accuracy of ARBS is better than radar or laser trackers. A stand-off, accurate delivery and identification of targets is made possible by the ×6 magnification of the TV tracker.

ARBS is in production for the US Marine Corps A-4M Skyhawk and AV-8B Harrier, the UK GR.Mk 5 Harrier and the Spanish Harrier II.

In the A-4M, ARBS consists of a dual-mode laser/TV tracker (DMT) designed by Hughes, a System/4 Pi Model Sp-1 general purpose digital computer built by IBM Federal Systems Division under US Navy contract, and a control sub-system. Its weight is about 58 kg. The system works in conjunction with the existing cockpit controls and aircraft sensors. An AVQ-24 HUD by Marconi Avionics is used to display steering information to the pilot.

With the AV-8B/GR.Mk 5, Hughes supplies the DMT to McDonnell-Douglas Aircraft Corporation in St Louis where it is integrated into the Harrier's on-board mission computer. ARBS controls, data imagery, video imagery and steering information have been integrated into the HUD, the multi-purpose display (video) and the up-front control set.

US Marine Corps AV-8B Harrier equipped with ARBS



The DMT is the main element of the system. A modification of the Hughes STALOC II TV tracker with TV camera shares a common optical element with a laser spot tracker detector on a three-gimbal stabilised platform. Tracking filter electronics, an output signal converter, power supplies, and control logic complete the DMT. A dichroic filter behind the optics separates the laser energy from the visible light for sensing by a four-quadrant laser detector.

The visible light is directed to form an image on the TV vidicon. TV tracking of small, low-contrast, poorly defined moving targets through changes in aspect ratio and in the presence of competing clutter, and even when partially lost to view behind rocks and other obstructions, was demonstrated according to Hughes.

Operating in the laser mode, the sensor automatically acquires the target and, via the WDC, presents steering signals for the pilot on the HUD. After head-up TV acquisition, the pilot is shown a magnified image of the target on the cockpit TV monitor. He may use a hand control to slew the tracker gate to a new track point or to a nearby alternative target. Weapon release in both laser and optical tracking modes is either automatic or manual. A weapon data insert panel provides entry into the weapon delivery computer of weapon characteristics and rack type for ordnance being carried on a particular mission. The necessary ballistic parameters for all weapons are stored in the WDC memory. This unit also provides the computational and control capability for performing the ARBS operational readiness test and fault isolation testing of itself and the dual mode tracker. The system provides automatic tracking of ground targets plus first-pass automatic day/night acquisition of laser-designated targets, providing a useful night-bombing capability.

In addition to the fuselage installation, in the A-4 and the AV-8B/GR.Mk 5, a podded configuration is under consideration to give aircraft with radars or other equipment in the nose an accurate, precise air-to-ground capability. Aircraft such as the F-5E and the F-4 are candidates for the pod.

ARBS can be employed with the complete inventory of guided and unguided weapons. Only software update is required to adapt it to new weapons such as the laser and infra-red guided Maverick air-to-surface missiles.

Components of the ARBS showing (from left), receiver/processor, signal data converter, bombing set control (top), control indicator, heat exchanger (top), computer and computer interface

STATUS

The US Marine Corps is accepting deliveries of ARBS for retrofit into the A-4M. Deliveries from the production line are also being made for the AV-8B/GR.Mk 5 Harrier for the US, UK and Spain. Production is expected to last until the early 1990s with a potential of over 500 units, even without additional orders.

Hughes Aircraft Company, Missile Systems Group, Canoga Park, California 91304, USA.

5935.393

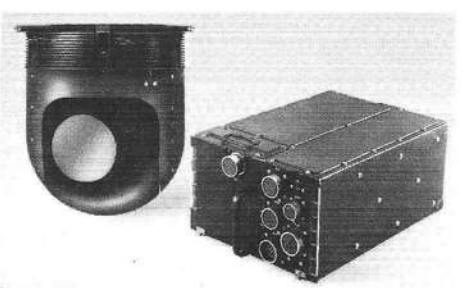
HUGHES NIGHT VISION SYSTEM

The Hughes night vision system is a microprocessor-controlled, two-axis gimballed forward looking infra-red (FLIR) equipment suitable for a variety of surveillance applications. It consists of a turret/FLIR unit (TFU), a systems electronics unit (SEU), a control unit, and a display unit(s) which can be either panel or helmet mounted. The TFU is the sensor which is used to collect and convert IR radiation to the electronic signals employed by the SEU. It has a 30° × 40° wide field-of-view (FOV) at ×1 magnification, and a narrow FOV at ×6 magnification. A triple FOV model giving magnifications from ×1 to ×9 is also available.

The SEU converts the signals received from the TFU into standard TV format video. Avionic data processing, symbol generation, video processing, turret pointing and built-in-test are microprocessor controlled.

The FLIR turret mounted under the nose of the helicopter is controlled via a servo linkage to the pilot's helmet such that his head movements are instantly transmitted to keep the turret aimed along his line-of-sight. A FLIR image is projected on to a holographic combiner on his helmet visor, and can be superimposed with flight symbology if required. A panel-mounted CRT display can also be fitted to the aircraft, although the system can be interfaced with display systems already installed.

CHARACTERISTICS



Field-of-view: 30° × 40° (wide-angle)

Telescopes: Dual FOV ×1 to ×6 magnification; triple FOV ×1 to ×9 magnification (optional)

Turret angular movement: Azimuth ±210°; elevation +85° to −180°

Slew speed: 2·5 rad/s

Weight: Turret/FLIR unit 19·1 kg; electronics unit 17·3 kg; panel display unit 5 kg

Turret/FLIR and electronics unit of the Hughes night vision system

3982.393
FIREFLY III

Firefly III is the designation of a new integrated fire and flight control (IFFC) system being developed by the Aircraft Equipment Division of General Electric Company. This system will provide a combined air-to-air and air-to-surface weapon delivery capability which will interface with the flight control system and give aircraft control system inputs. The integrated control system will give the USAF a system that is capable of evasive aircraft manoeuvre weapon delivery to ensure significantly increased fighter aircraft survivability coupled with improved weapon delivery accuracy.

Firefly III will employ an electro-optical sensor/tracker system and on-board aircraft sensors to determine target state, using a Kalman filter in the data processing loop. The filter is coupled with gunnery and bombing algorithms to provide commands to the aircraft flight control system to form the overall integrated flight/fire control system.

Under the terms of its contract, GE will be responsible for the design, development, and manufacture of the hardware and related software for the added capability to the fire control system. Flight tests will be carried out in an F-15B aircraft. GE developed and produces the lead computing gyro unit for the F-15, as well as flight controls for this aircraft and others such as the F-105, F-11, F-4, A-10 and F-18.

STATUS

General Electric was awarded a $3·6 million USAF contract for the design, development and demonstration of the Firefly III integrated fire and flight control system in 1979. No further information has been made available.

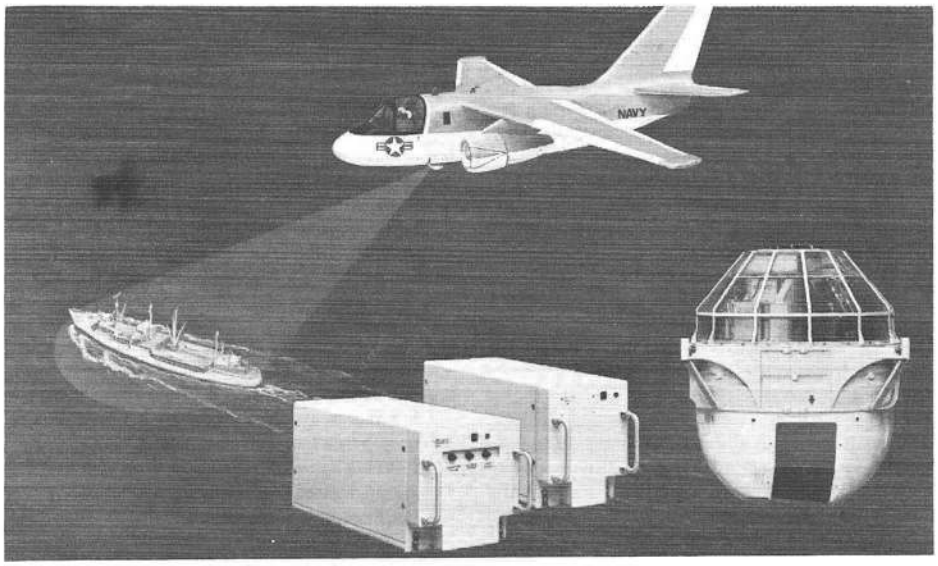
CONTRACTOR

General Electric Company, Aircraft Equipment Division, French Road, Utica, New York 13503, USA.

4114.393
OR-89/AA FLIR

The OR-89/AA forward-looking infra-red (FLIR) equipment is a direct derivative of the AN/AAD-4 and AN/AAD-7 FLIR sensors extensively used for the USAF 'gunship' programmes in South-east Asia. The OR-89/AA version is adapted primarily to meet the needs of the S-3A Viking maritime aircraft.

The equipment comprises three main items:



(1) the infra-red sensor package which is designed for gimbal mounting in the aircraft fuselage, with the optical sensor elements projecting below the fuselage underside, and with self-contained stabilisation and servo units
(2) power supply/video converter
(3) infra-red control converter.

Control of the system is via a general purpose digital computer (GPDC) to the FLIR system control converter. The former transmits digital words to the FLIR converter which translates the data into set control commands or analogue servo commands. Position data is supplied by the FLIR system control converter, which converts the data into digital format for transmission to the GPDC for status purposes.

The IR sensors employ HgCdTe detectors and there is automatic optical temperature compensation. The output from the system is in television format.

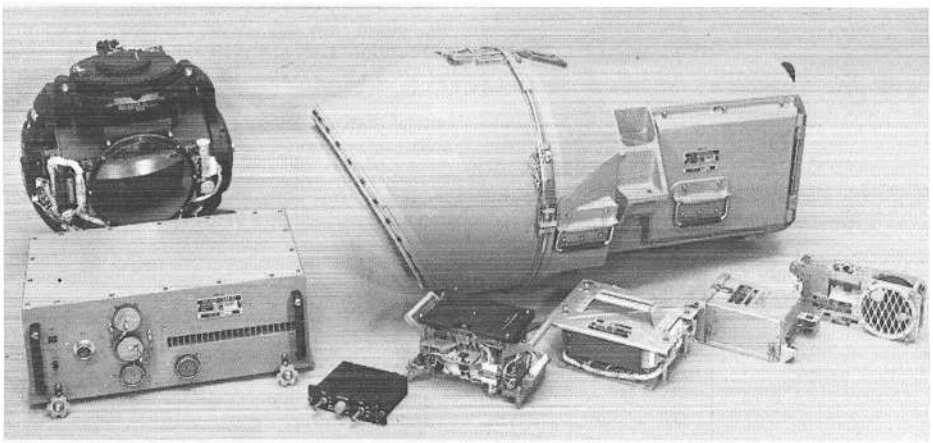
CHARACTERISTICS

Azimuth coverage: ±200°
Elevation coverage: 0 to -84°
Video output: Composite TV, 875-line RS-343
Weight: 120 kg

OR-89/AA FLIR equipment and artist's impression of how the system is employed on S-3A Viking maritime aircraft

STATUS

USN fleet introduction of the OR-89/AA began in February 1973 with deployment continuing up to January 1978. Approximately 400 S-3A systems, or derivatives, had been delivered by 1980. At least 12 other types of aircraft have been fitted with OR-89/AA derivative equipments.



CONTRACTOR

Texas Instruments Incorporated, PO Box 226015, Dallas, Texas 75266, USA.

4120.393
AN/AAR-42 FLIR

The AN/AAR-42 is a pod-mounted forward-looking infra-red (FLIR) equipment, initially designed for use on the A-7E but later modified and used on the A-10 aircraft class. It provides two fields of view displayed on the pilot's head-up display (HUD): the wide FOV gives a 1:1 image of the scene permitting pilot orientation, navigation updating, and target acquisition while the ×4 narrow FOV is employed for target identification and weapon delivery. This two-axis stabilised FLIR sensor enables the A-7 pilot to carry out close air support, interdiction, and surveillance/recce missions by day or night and in adverse weather conditions.

Other features of the equipment are automatic thermal focus compensation and a slewable line of sight.

Components of the AN/AAR-42 FLIR produced for pod-mounting on A-7E aircraft

CHARACTERISTICS

Azimuth coverage: ±20°
Elevation coverage: +5 to -35°
Video output: Composite TV, 875-line RS-343
Weight: 114 kg

STATUS

Production of the AN/AAR-42 for the A-7E began in 1977, with entry into USN service later that year. In an evaluation programme for the USAF in 1979, the equipment was adapted for use on the two seat N/AW A-10 aircraft. This system was pod-mounted and boresighted with the GAU-8 gun and interfaced via a 1553A data bus. Many evaluation programmes have been carried out at Edwards AFB and Elgin AFB during 1983 with satisfactory results.

Texas Instruments Incorporated, PO Box 226015, Dallas, Texas 75266, USA.

4115.393
OR-5008/AA FLIR

The OR-5008/AA is a special derivative of the OR-89/AA forward-looking infra-red (FLIR) equipment (**4114.393**) adapted for use on the Lockheed CP-140 maritime aircraft used by the Canadian Forces. It is mounted in a similar position to the AN/AAS-36 FLIR (**4116.393**) fitted to American P-3 aircraft. The Canadian version is used for search and rescue, maritime surveillance, mapping, ice reconnaissance and various defence tasks.

Additional requirements beyond the facilities of the OR-89/AA included the use of a USN P-3 interface casting; provision for upward viewing (to +5°); additional composite video outputs; facilities for retraction and extension of the sensor head; and reduced system maintenance requirements. The equipment comprises three main items, as does the OR-89/AA, and in this and most other respects the version for the CP-140 is essentially the same as the S-3A Viking equipment.

STATUS

In production.

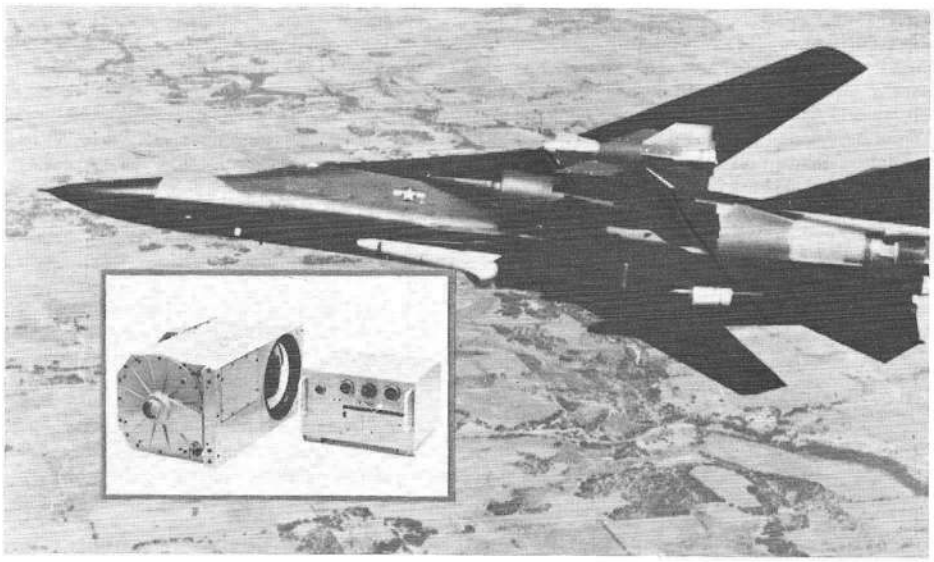
CONTRACTOR

Texas Instruments Incorporated, PO Box 226015, Dallas, Texas 75266, USA.

OR-5008/AA FLIR equipment as fitted in Canadian CP-140 aircraft

4118.393
AN/AAQ-9 FLIR

The AN/AAQ-9 FLIR detecting set was developed for use in the USAF AN/AVQ-26 Pave Tack target designator pod (**3065.393**). The AN/AAQ-9 uses a common module infra-red sensor to provide the aircraft weapon system officer with facilities for location, acquisition, and tracking of enemy targets in day, night, or adverse weather conditions, and to direct weapons against these targets.



The equipment has a two-field-of-view optical system, and there is automatic compensation for aircraft roll movement (derotation). The IR subsystem incorporates automatic thermal and range optical compensation, and has high resolution with very high sensitivity.

CHARACTERISTICS

Magnification: ×2 or ×1
Derotation limits: ±190° to 100°/s
Video output: Composite TV, 525-line RS-170 or 875-line RS-343
Cooling: Forced air
Weight: 48·6 kg (receiver); 12·7 kg (control/electronics)

STATUS

Entered production in 1977. Operationally deployed by USAF on F-4E, RF-4C and F-111 aircraft. The Pave Tack pod with the AN/AAQ-9 has been purchased for use on Australian F-111 aircraft and other countries have disclosed possible applications.

USAF F-111 aircraft with Pave Tack target designator pod on fuselage centre-line. Pod contains AN/AAQ-9 FLIR (inset)

CONTRACTOR

Texas Instruments Incorporated, PO Box 226015, Dallas, Texas 75266, USA.

4117.393
AN/AAQ-10 FLIR

The AN/AAQ-10 is another derivative of the OR-89/AA FLIR (**4114.393**) which has been developed specially for use on helicopters performing search and rescue missions. A single-window turret design was employed to obtain the increased field of regard needed to utilise the helicopter's capability. The vibration characteristics of the vehicle required particular design emphasis on the stabilisation servo elements. The video output is in TV format to EIA standard RS-343A 875-line specification.

The AN/AAQ-10 FLIR configured for use on the HH-53 helicopter consists of an infra-red receiver, power supply, electronic control amplifier, control indicator, and mounting base. All controls are contained in the control indicator, providing the operator with facilities for one-handed control of sensor operation and servo slew commands.

STATUS

In production.

CONTRACTOR

Texas Instruments Incorporated, PO Box 226015, Dallas, Texas 75266, USA.

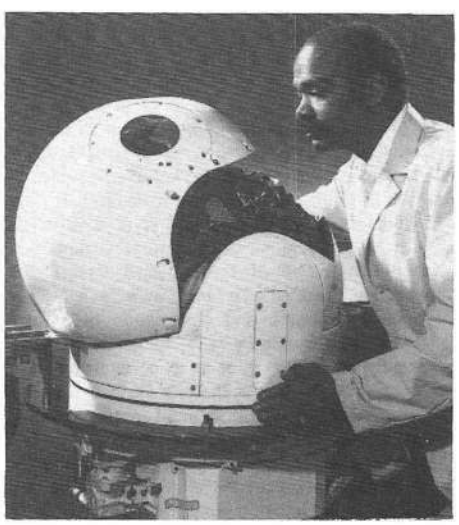
3202.383
AN/AAS-33 TRAM TARGET RECOGNITION AND ATTACK MULTI-SENSOR

The A-6E aircraft TRAM programme incorporates an electro-optical sensor package, AN/AAS-33 TRAM detecting and ranging set, into the basic A-6E. The sensors are contained within a 51 cm diameter stabilised turret, which extends below the aircraft's nose radome. Inside the turret are a forward-looking infra-red receiver (FLIR), a laser ranger/designator, and a separate laser receiver for detecting energy from ground or airborne forward air controller lasers which is reflected by designated targets. The basic operational requirement for TRAM is to improve the USN capability for night surveillance and attack and to deliver laser-guided weapons. Naval applications were foremost in design but the system is capable of all general attack missions.

To fulfil these requirements, the system must have gimbal coverage adequate to permit manoeuvring after weapon release, and stabilisation and pointing accuracies consistent with sensor resolution and weapon performance.

In operation, the operator can simultaneously observe both radar and FLIR displays. For a radar significant target, he would normally use radar for acquisition and hand over to FLIR for identification and attack. The turret can sweep through the full lower hemisphere beneath the aircraft, allowing for free manoeuvre after weapon release.



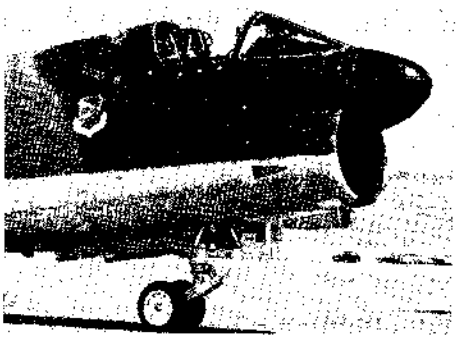
The FLIR has a continuous optical zoom from a wide field of view with ×2·6 magnification to a narrow ×13 field.

STATUS

In 1976 a $21 million contract for production of 36 TRAM equipments was awarded to Hughes, and an extensive technical and operational evaluation programme took place in 1977. The first production TRAM was delivered in early 1979 and more than 100 systems had been delivered by early 1984. A total of 199 systems have been ordered under current contracts. An additional 125 systems were ordered by the US Navy in November 1984.

CONTRACTOR

Hughes Aircraft Company, PO Box 902, El Segundo, California 90245, USA.



AN/AAS-33 TRAM detecting and ranging set incorporates FLIR, a laser rangefinder/designator and a separate laser receiver

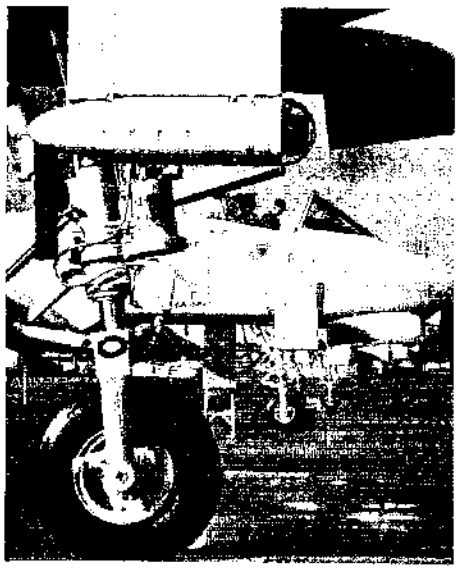
3204.383

PAVE PENNY LASER TRACKER AN/AAS-35

Pave Penny is the code name of a laser tracking pod initially for use on the A-10 close-support attack aircraft and later the A-7D, F-16 and other types. Target designation is accomplished by forward air controllers on the ground or in another aircraft, and the function of the Pave Penny pod is to acquire and track such designated targets, providing outputs to the pilot's head-up display and/or to weapon delivery system avionics.

Pave Penny sensor mounted below air intake on A-7D aircraft

The pod is 20 cm in diameter and 83 cm long. Weight is about 14·5 kg. It contains optics gimballed in roll and pitch to focus the incident energy on to a silicon PIN diode detector housed within the pitch (inner) gimbal. In a typical installation, this arrangement permits tracking targets within -90 and +15° of the aircraft horizontal datum. Azimuth cover is 90° left or right of the aircraft centre line. The pilot is provided with controls that permit selection of seeker scanning patterns and limits, and choice of various modes of operation.



STATUS

Martin Marietta has been awarded at least six contracts worth a total of more than $80 million for production of Pave Penny pods and associated aircraft and support equipment for the A-10 and A-7 aircraft. In March 1977 the first operational Pave Penny/A-10 was delivered, when it was stated that the USAF intends to equip all of the planned 733 of these aircraft with Pave Penny. The first operational unit of the USAF was the 354th Tactical Fighter Wing, in January 1978.

Production of Pave Penny was completed in 1983 with over 700 pods delivered.

CONTRACTOR

Martin Marietta Orlando Aerospace, PO Box 5837, Orlando, Florida 32855, USA.

Pave Penny pod mounted on pylon on USAF A-10 aircraft. Mounts are pre-boresighted so that pods can be installed in a matter of minutes

4116.393

AN/AAS-36 IRDS

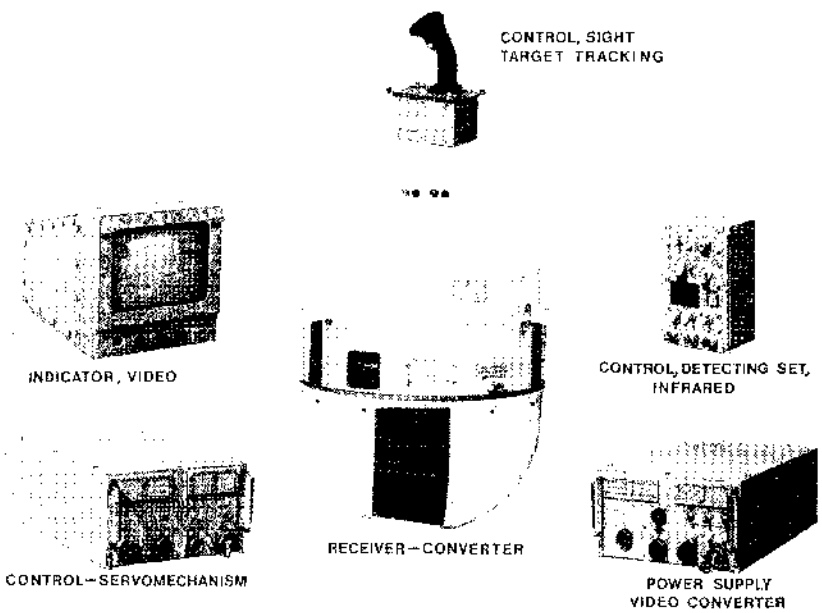
The AN/AAS-36 infra-red detecting set (IRDS) is an airborne equipment using IR common modules as the basis of a passive detection system for use on the USN P-3C maritime aircraft. The IR receiver is mounted in an azimuth-over-elevation stabilised gimbal system attached to the underside of the aircraft fuselage to provide extensive lower hemisphere coverage. This permits covert detection of surface ships, surfaced or snorkel-depth submarines, or other targets during darkness or in limited visibility.

In addition to the sensor turret, other items of the equipment include two electronics boxes for control and servo circuitry, and power supplies and video conversion; a video CRT indicator unit; a control panel; and a control stick for target tracking.

CHARACTERISTICS

Azimuth coverage: ±200°

Elevation coverage: +16 to -82°



IR detectors: HgCdTe

Video output: Composite TV, 875-line RS-343

Weight: 136 kg

STATUS

The AN/AAS-36 entered production for USN P-3C aircraft in 1977 and became operational in early 1979. In addition to the USA, numerous other countries equipped with the P-3 aircraft are fitting the AN/AAS-36. Various other FLIRs have evolved from it, such as the AN/AAS-37 (**4119.393**) fitted in the OV-10D aircraft, and the sensor turret has been employed in various other types, including the CH-53 helicopter, Beechcraft E-90, King Air 200 and Cessna Citation II. Total deliveries of AN/AAS-36 equipments to US and foreign services are expected to exceed 400.

4119.393

AN/AAS-37 DRTS

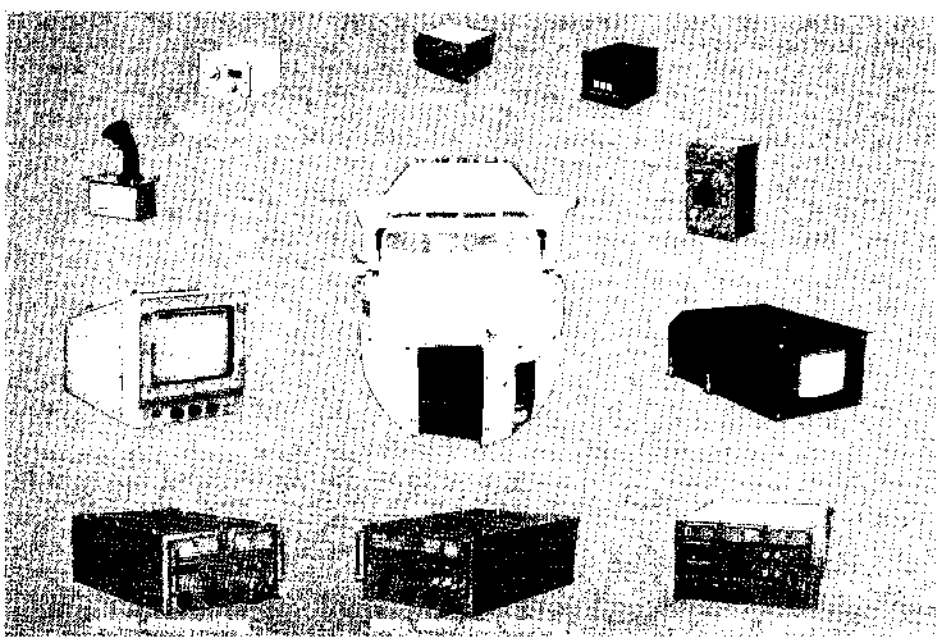
The AN/AAS-37 detecting, ranging, and tracking system (DRTS) is a special derivative of the AN/AAS-36 infra-red detecting set (**4116.393**) to which a number of additions have been made to meet the requirements of USMC OV-10D multiple mission aircraft. Its capabilities include day or night detection and identification of targets and terrain for surveillance, observation and/or interdiction. A laser provides for ranging and designation of ground targets for laser-guided weapons such as Paveway bombs or the Hellfire missile. The electronics are contained in three boxes; there is a separate pilot's video indicator and three small extra control boxes for the additional facilities of this version.

A direct readout of laser ranges is available, and the designation facility uses PRF/PIM coding. There is rate-aided target tracking (adaptive gate or centroid tracker) and offset tracking from the target or a waypoint is possible.

CHARACTERISTICS

Azimuth coverage: ±200°

Elevation coverage: +16 to -82°



Video output: Composite TV, 875-line RS-343

STATUS

In production for USMC since 1978.

CONTRACTOR

Texas Instruments Incorporated, PO Box 226015, Dallas, Texas 75266, USA.

AN/AAS-37 detecting, ranging, and tracking system (DRTS) component units

4110.393
F/A-18 FLIR (AN/AAS-38)

The F/A-18 FLIR equipment AN/AAS-38 will provide the single-seat, twin-engine F/A-18 Hornet with a 24-hour strike capability in support of USN/USMC requirements for attack aircraft to perform interdiction and close air support missions. The FLIR system provides a day, night and adverse weather attack capability by presenting the pilot with real-time passive thermal imagery, in a TV formated display, for locating and identifying targets. Provisions were incorporated in the system design for inclusion of a laser target designator rangefinder which is now in engineering development by Ferranti and is planned for inclusion in the 1986 production deliveries.

The 33 cm diameter, 183 cm long, 170 kg system attaches to the lower left side of the aircraft at the Sparrow missile station. The pilot can select a displayed field-of-view of 3 × 3° or 12 × 12° and can control the system's precisely stabilised line-of-sight over a field of regard of 30°, -150°, with ±540° of roll freedom. Accuracies are: stabilisation 35 microradians; pointing 400 microradians; and tracking 230 microradians.

The F/A-18 FLIR system interfaces with the aircraft and other on-board avionics systems through the mission computer, receiving commands directly over a MIL-STD-1553A multiplex data bus. The system provides the aircraft mission computer with accurate target line-of-sight pointing angles, angle rates and a complete initiated and periodic BIT evaluation of system readiness. It is the first Navy FLIR attack sensor designed to perform in a supersonic flight environment. An automatic in-flight boresight compensation for dynamic pod flexure is employed to assure pointing accuracies over the full flight regime.

AN/AAS-38 FLIR mounted under the fuselage of an F/A-18

STATUS

Full-scale development was initiated in March 1978 and the detail design review was completed in that year. Following delivery of six pre-production systems in 1980, formal qualification and flight testing was initiated. Flight testing on the F/A-18 was successfully completed in December 1981 and full scale development was completed in 1983. The system is now in production and the first unit was delivered in December 1983.

A $35 million contract for 12 additional pods, making a total of 73, was awarded to Ford Aerospace by the US Navy in April 1984.

An advanced fire control pod, based on the AN/AAS-38 design, is under development by Ford and Texas Instruments. It provides increased capability by the inclusion of a laser, an improved FLIR sensor and self-contained cooling. The Ferranti Type 117 laser/designator (**4727.393**) will form part of the pod.

1000A/2000A SERIES THERMAL IMAGING SYSTEMS

The 1000A series IR imagers are TV compatible systems designed for light aircraft and helicopters and can be used in a variety of surveillance roles. The sensor, associated optics and electronics, and the gas reservoir for the detector cooling system are mounted in a rugged, polyester sphere mounted in a gimbal and yoke assembly.

The sensor consists of a two-element mercury cadmium telluride detector operating in the 8 to 12 micron band. The two detectors are mechanically swept in two dimensions to produce the visual images. IR radiation is admitted to the sensor sphere via a germanium window, with a field-of-view (FOV) of 17° vertical × 28° horizontal. The gimbal and yoke assembly can then position the FOV ±105° from the centre in azimuth, and +30° to -90° in elevation. A cockpit mounted joystick is used for gimbal steering and position data is fed back and displayed as two scales on the system display monitor.

The 2000A series imaging systems are basically similar to the 1000A models except that the former has two FOVs, selectable by the operator. External differences are the addition of a 6-inch (152·4 mm) diameter mirror lens for the second FOV, and a quick fill gas-port for the cooling system argon reservoir. The narrow FOV in the 2000A series is essentially a ×4 magnification of the wide-angle and, gives a FOV of 4° vertical and 7° horizontal.

STATUS

In production and operational service.

FLIR Systems Inc, 11830 S. W. Kerr Parkway, Lake Oswego, Oregon 97034, USA.

5750.383
AIRBORNE INFRA-RED SEARCH AND TRACK SYSTEM

An airborne infra-red search and track system (IRSTS) is under development by General Electric which will conduct the design, fabrication and flight evaluation of the system. The equipment employs modern focal plane array technology and sophisticated signal/clutter processing techniques. Relatively unknown as compared with FLIR technologies, the IRSTS sensors are seen as the key in combating the threats anticipated from the mid-1980s onwards.

IRSTS is able to track targets of thermal energy at extremely long ranges with high accuracy and represents a significant 'force multiplier' effect in that a multiplicity of targets can be tracked simultaneously so that weapon management can be optimised effectively. The IRSTS sensor is also passive in operation and consequently relatively immune to countermeasures.

STATUS

The project is being funded by the USAF Wright Aeronautical Laboratories. A 16-month design effort has already been carried out.

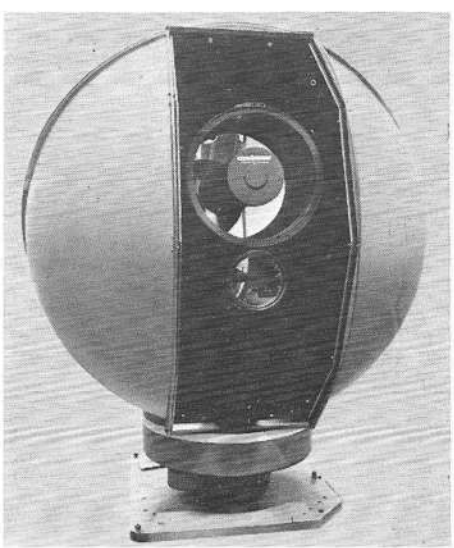
CONTRAVES DAY/NIGHT REMOTE VIDEO EQUIPMENT

This is a product of the US Contraves Goerz concern which consists of a long range video surveillance system capable of operating under all lighting levels. Its electro-optical system is completely dome-enclosed on an elevation platform that provides a gyro-stabilised line-of-sight together with pan and tilt functions.

The system permits the use of separate electro-optical systems for day and night. A choice of different day or night modes, focal lengths, filtering, and focusing are controlled remotely from the control console.

There is a portable version which is also remotely operated and battery powered. In this model the TV camera is tripod mounted and controlled from a console which can be located up to 50 m away.



No further installation, sensor, or performance details are available for publication.

STATUS

No details have been made available.

AN/AXQ-14 WEAPON CONTROL EQUIPMENT

The AN/AXQ 14 is a two-way data link weapon control and guidance system developed by Hughes Aircraft Company for the GBU-15 precision-guided weapon system (**4190.311**). It consists of three major sub-systems: aircraft data link pod, aircraft data link control panel, and weapon data link. The aircraft pod, developed by Hughes and certified by the USAF for supersonic flight, contains four line replaceable units: an electronics unit containing all RF generating and receiving equipment, a de-multiplexer to decode aircraft commands and pod control signals, an encoder, and antenna controls; an electronically phase-scanned antenna which tracks the weapon during normal operation; a forward horn antenna to provide additional antenna coverage; and a mission tape recorder to maintain a permanent record of video data provided by the electro-optical seeker in the weapon. The aircraft data link control panel is used with an existing display in the command aircraft to enable the weapon systems operator to interface with the weapon's guidance system during a mission. The weapon data link mounted on the rear of the GBU-15 provides the link between the weapon and the command aircraft's data link. The system has been successfully flight tested on a variety of USAF and USN aircraft and is compatible with modern high performance aircraft including F-4, F-15, F-16, F/A-18, F-111, A-7 and B-52.

AN/AXQ-14 data link pod contains electronics, coder and decoder units, an electronically-scanned antenna for tracking the weapon in normal operations, a forward horn antenna for extended coverage, and recording equipment

AN/AXQ-14 data link system providing two-way video and command link facilities is used for direction of GBU-15 'launch-and-leave' weapon seen beneath this F-4 Phantom's wing. AN/AXQ-14 data link pod is on aircraft fuselage centre-line

STATUS
The AN/AXQ-14 is currently in production for the USAF and other customers.

CONTRACTOR
Hughes Aircraft Company, Radar Systems Group, El Segundo, California 90245, USA.

5751.393
TIGERSHARK HEAD-UP DISPLAY

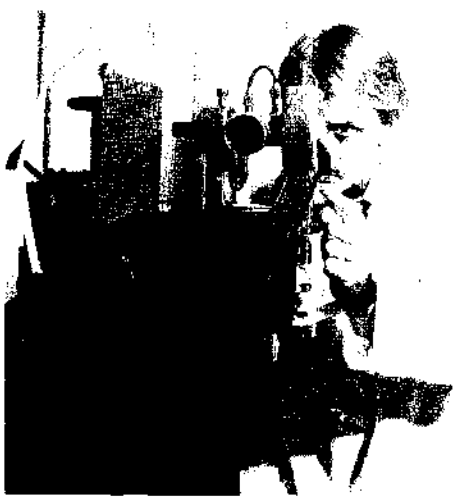
The head-up display (HUD) for the F-20 Tigershark is designed to provide the pilot with a reliable display of weapon delivery and navigation information for maximum operational effectivness and survivability. The unit features an instantaneous field-of-view twice that of the F-5 display and the high brightness CRT imagery is visible against a 10 000 foot lambert background. The HUD is the primary flight instrument for the Tigershark and forms part of an integrated avionics and weapon delivery package. An independent standby reticle for backup capability is provided.

CHARACTERISTICS
Field-of-view: Instantaneous 16° elevation × 19·7° azimuth; total 22° elevation × 22° azimuth
CRT type: Magnetic deflection, P1 phosphor
Power: 87 W continuous
Weight: 24 lb (10·9 kg)

STATUS
In production.

CONTRACTOR
General Electric Company, Aircraft Equipment Division, French Road, Utica, New York 13503, USA.

5752.393
HUGHES HEAD-UP DISPLAY



This latest head-up display (HUD) developed by Hughes uses diffraction optics techniques to provide pilots with a clearer and wider field-of-view. The prime advantage of diffraction optics is that the combiner can be produced with a wide field-of-view such that IR or low-light TV imagery can be displayed on the HUD for high speed low altitude night missions.

The combiner acts as a mirror that reflects only the selected wavelength of light used to produce the symbology on the display. This increases the pilot's ability to see through it to the outside world (transmissivity) to 85 per cent as compared with 50 to 70 per cent for convential HUDs.

Pilot orientated features designed into the HUD include a single piece combiner to avoid bulky support structures, symbology bright enough to be read in very high ambient light conditions, no cockpit reflections and no spillage from the HUD into the cockpit.

STATUS
The new diffraction optics HUD has been selected for the JAS-39 Gripper, Sweden's new multi-role combat aircraft which is due to fly in 1987 and enter service in the 1990s. A full-scale development and production contract was awarded to Hughes by SRA Communications AB, Sweden in January 1983. The first flight test model of the HUD was delivered in November 1984.

ITT ANVIS

The ITT ANVIS (Aviator's Night Vision Imaging System) is a helmet-mounted, binocular-sized, high-performance night vision goggle designed for covert work. It incorporates two third-generation image intensifier tubes, although second-generation tubes can be fitted for applications not requiring such a high performance. The goggle provides full peripheral vision and will give full vision even under overcast starlight conditions.

CHARACTERISTICS
Field-of-view: 40°
Scene illumination: 10⁻⁶ to 1 ft candles
Weight: 0·86 kg

STATUS
In service.

CONTRACTOR
ITT Electro-optical Products Division, 76356 Plantation Road, Roanoke, Virginia 24019, USA.

5936.393
HUGHES ANVIS

The Hughes Aviator's Night Vision Imaging System (ANVIS) is a helmet-mounted, unity power image intensifier binocular which allows night-time, low flying or contour flying in either fixed-wing aircraft or helicopters. The system is compatible with either second or third-generation image intensifier tubes, and can be used in conjunction with FLIR systems. The binocular is lightweight, can be fitted to any aviator helmet and provides full peripheral vision. The complete ANVIS system consists of the binocular assembly, image intensifier tubes, helmet visor interface and a battery power pack.

CHARACTERISTICS
Field-of-view: 40°
Magnification: ×1
Binocular weight: 463 g

STATUS
In service with the US Army.

CONTRACTOR
Hughes Optical Products Inc, 2000 S Wolf Road, Des Plains, Illinois 60018, USA.

Free fall bombs				
FAB-100	—	—	100 kg	GPLD-HE
FAB-250	—	—	250 kg	GPLD-HE
FAB-500	—	—	500 kg	GPLD-HE
FAB-750	—	—	750 kg	GPLD-HE
FAB-1000	—	—	1000 kg	GPLD-HE
OFAB-250	—	—	250 kg	GPLD-HE/fragmentation
OFAB-500	—	—	500 kg	GPLD-HE/fragmentation
(The above are new series bombs, replacing the older wide-body types: FAB-8, -10, -15, -25, -50, -110, -500 & 1000)				
ZAB-100	—	—	100 kg	LD incendiary bomb
ZAB-250	—	—	250 kg	LD incendiary bomb
ZAB-500	—	—	500 kg	LD incendiary bomb
ZAB-750	—	—	750 kg	LD incendiary bomb
ZAP-200	—	—	200 kg	Incendiary container
(Demolition bombs exist in 100, 250, 750 & 1100 kg models)				
Retarded bombs				
BETAB-250	—	—	250 kg	Boosted concrete demolition bomb
BETAB-500	—	—	500 kg	Boosted concrete demolition bomb
M62	**3181.303**	—	500 kg	Penetration bomb. 250 kg version also
Cluster bombs and area weapons				
—	**3181.303**	—	—	Range of cluster bombs with incendiary, HE, HEI, Frag & AT bomblets
PTAB-2	—	—	—	Anti-tank bombs using hollow-charge sub-munitions, superseded by PTK-250
PTAB-5	—	—	—	
PTAB-5/1	—	—	—	
PTK-250	—	—	250 kg	LD cluster bomb with shaped-charge A/T projectiles
RPK-180	—	—	180 kg	LD fragmentation cluster bomb
RPK-250	—	—	250 kg	LD fragmentation cluster bomb
RRAB	—	—	—	Thin-walled cluster bomb with incendiary agent
Chemical munitions				
Old series				
AK-2	—	—	250 kg	In-line dispenser for 240 1 kg bomblets filled with mustard-lewisite mixture
CHAB-505	—	—	500 kg	M1942 bomb carrying 180 kg of phosgene
VAP-200	—	—	200 kg	Container for persistent Toxic-B agents
VAP-1000 (BATT)	—	—	1000 kg	Dispenser with 700 litres of stabilised hydrogen cyanide; 4 per aircraft for low-altitude operations

Designation	Entry no	Dimensions l x d	Weight	Description
USSR cont				
New series				
PLAB-250	—	—	250 kg	LD napalm bomb
PLAB-500	—	—	500 kg	LD napalm bomb
VAP	—	—	—	Various models of dispenser for persistent toxic-B agents
SOV-AB	—	—	—	Various models. Persistent toxic chemical bombs
NOV-AB	—	—	—	Various models. Non-persistent toxic chemical bombs
FAE	—	—	—	Fuel/air explosive boosted napalm bombs. Introduced 1974-75
Rocket projectiles				
Old series				
ARS-212	—	—	—	212 mm, various models
RS-82	—	—	—	82 mm, M1938
RBS-82	—	—	—	82 mm, M1941
RS-132	—	—	—	132 mm, M1939
RS-132A	—	—	—	132 mm
ROFS-132	—	—	—	132 mm boosted M1941
TRS-190	—	—	—	190 mm, various models
New series				
S-5K/S-5MK	—	—	—	57 mm shaped-charge rocket used with UB8, UB16, UB19 & UB32 pods
S-8	—	—	—	80 mm rocket
S-13	—	—	—	130 mm rocket
S-16	—	—	—	160 mm rocket
S-21/S-21M	—	—	—	210 mm rocket, some models with limited visual guidance capability
S-28	—	—	—	280 mm rocket
S-32/S-32M	—	—	—	325 mm rocket, some models with limited visual guidance capability
S-24	—	—	—	240 mm rocket M1976
Miscellaneous				
DAP	—	—	—	Various models. Dispensers for smoke screening agents
DV-AB	—	—	—	Various models. Smoke bomb
FOTAB-250	—	—	250 kg	Photo-flash bomb
PROSAB-250	—	—	250 kg	Parachute flare. Several models
Nuclear munitions				
Bombs	—	—	—	Soviet tactical & stragetic nuclear bombs are stated to be consistently of higher yields than otherwise comparable American weapons. The standard tactical nuclear bomb weighs 1000 kg & has a yield estimated at 350 KT. This is being superseded by a bomb of about 700 kg with a yield of some 250 KT. These weapons may be deployed on Su-17 Fitter A/C/D, MiG-23 Flogger, MiG-27 Flogger D, Su-19 Fencer A, Yak-28 Brewer, MiG-21 Fishbed J/K/L/N, Tu-16 Badger, Tu-22 Blinder & the Tu-26 Backfire. Strategic weapons include bombs of 5, 20, & 50 MT yield carried by Mya A-4 Bison, Tu-20 Bear & the smaller yield strategic bombs on the Tu-16, Tu-22 & Tu-26 also. Nuclear depth bombs are carried by the Tu-20 Bear F, Il-38 May, Be-12 Mail, Ka-25 Hormone A and Mi-14 Haze A on ASW duties.
UNITED KINGDOM				
Free fall bombs				
Mk 1/2	—	—	245 kg	Various aircraft. Battlefield targets
Mk 2	—	—	453 kg	Various aircraft. Battlefield & medium tactical targets
Mk 6	—	—	453 kg	Various aircraft. Battlefield & medium tactical targets
Mk 6*	—	—	453 kg	Various aircraft. Battlefield & medium tactical targets
Mk 7	—	—	453 kg	Various aircraft. Battlefield & medium tactical targets
Mk 7*	—	—	453 kg	Various aircraft. Battlefield & medium tactical targets
Mk 9	—	—	453 kg	Various aircraft. Battlefield & medium tactical targets
Mk 10	—	—	453 kg	Various aircraft. Battlefield & medium tactical targets
Mk 11	—	—	453 kg	Various aircraft. Battlefield & medium tactical targets
Mk 11*	—	—	453 kg	Various aircraft. Battlefield & medium tactical targets
Mk 12*	—	—	453 kg	Various aircraft. Battlefield & medium tactical targets
Mk 13-16	—	—	453 kg	Various aircraft. Battlefield & medium tactical targets
Mk 19	—	—	453 kg	Various aircraft. Battlefield & medium tactical targets
*(Note: Most or all of the above types of bomb can be converted for retarded fall by fitting either Mk 3 or 4 retarder tail type 117, or retarder tail Type 118, See entry no. **1267.393**)				
JP 233	**5218.303**	—	—	Runway cratering weapon.
Type 117	**1267.393**	—	453 kg	British Type 117 bomb retarder tails Mk 3 or Mk 4 can be fitted to 1000 lb class UK bombs Mk 6 & Mks 9-19 & US Mk 83, M65, M117
Type 118	**1267.393**	—	—	British Type 118 bomb retarder tails can be fitted to UK Mk 1/2 & US M64 bombs
Cluster bombs and area weapons				
BL 755	**1277.303**	245 × 42 cm	277 kg	600 lb bomb No 1 Mk 1. Used by UK & other NATO countries 147 bomblets. Mk 2: shorter delays, Mk 3: 250 mm lugs, Mk 4: 250 mm lugs and Mk 2 delays
UNITED STATES OF AMERICA				
Free fall bombs				
AN-M4A2	—	—	—	Cluster, fragmentation bomb, 100 lb (3 × M40A1)
AN-M30A1	—	—	—	Bomb, GP, 100 lb
AN-M41A1/M41A2	—	—	—	Bomb, fragmentation, 20 lb
AN-M46	—	—	—	Bomb, photoflash, 100 lb
AN-M47A2	—	—	—	Bomb, incendiary, 100 lb
AN-M47A3/M47A4	—	—	—	Bomb, indendiary, 100 lb filling, 40 lb incendiary gel
AN-M47A3/M47A4	—	—	—	Bomb, smoke, 100 lb, filling is 74 lb plasticised WP or 100 lb of WP respectively
AN-M50A2/M50A3	—	—	—	Bomb, incendiary, 4 lb filling 0·6 lb magnesium thermite
AN-M50T A2	—	—	—	Bomb, incendiary 4 lb

Designation	Entry no	Dimensions l x d	Weight	Description
USA cont				
AN-M50T X-A3	—	—	—	Bomb, incendiary 4lb
AN-M56A2	—	—	—	Bomb, light case 4000 lb
AN-M57/M57A1	—	—	—	Bomb, GP, 250 lb
AN-M58A2	—	—	—	Bomb, SAP, 500 lb
AN-M59/M59A1/ M59A2	—	—	—	Bomb, SAP, 1000 lb
AN-M64/M64A1	—	—	—	Bomb, GP, 500 lb
AN-M65A1	—	—	—	Bomb, GP, 1000 lb
AN-M66A1/M66A2	—	—	—	Bomb, GP, 2000 lb
AN-M69A1	—	—	—	Bomb, incendiary, 6 lb
AN-M76	—	—	—	Bomb, incendiary, 500 lb, filling 180 lb gasoline and magnesium
AN-M78	—	—	—	Bomb, gas non-persistent, 500 lb
AN-M79	—	—	—	Bomb, gas non-persistent, 1000 lb (various fillings, AC, CK or CG)
AN-M81	—	—	—	Bomb, fragmentation, 260 lb
AN-M88	—	—	—	Bomb, fragmentation, 220 lb
AN-Mk 1 Mod 1/1/3	—	—	—	Bomb, AP, 1600 lb
AN-Mk 23 Mod 1	—	—	—	Bomb, practice miniature, 3 lb
AN-Mk 33	—	—	—	Bomb, AP, 1000 lb
AN-Mk 44	—	—	—	Bomb, depth, 325 lb
AN-Mk 43 Mod 1	—	—	—	Bomb, practice miniature, 3 lb
AN-Mk 47A1	—	—	—	Bomb, GP, 1000 lb
AN-Mk 54	—	—	—	Bomb, depth, 300 lb
AN-Mk 58A2	—	—	—	Bomb, SAP, 500 lb
BDU-27/B	—	—	—	Bomb, fragmentation dummy
BDU-28/B	—	—	—	Bomb, fragmentation dummy
BDU-30B	—	—	—	Bomb, practice
BDU-33B/33A/B	—	—	—	Bomb, practice, 25 lb
BDU-34/B	—	—	—	Bomb, practice
BDU/37B	—	—	—	Bomb, practice
BLU-1/1B/B/1C/B	—	—	—	Bomb, fire, 750 lb, filling 90-100 gallons napalm
BLU-3	—	—	0·79 kg	Bomblet, fragmentation anti-materiel. Cylindrical pop-out drag vanes. 0·16 kg cyclotrol filling projecting 250 steel pellets. Called 'Pineapple'
BLU-4		—	0·54 kg	Bomblet, anti-materiel, containing spherical fragmentation unit that ejects to height of 3 m on impact & then explodes
BLU-6	—	—	—	Bomb, smoke. Sphere used for payload of TMU 10 smoke tank
BLU-7B/-7A/B	—	—	0·64 kg	Bomblet, anti-tank. Parachute armed & stabilised shaped charge
BLU-7A(D-1)/B	—	—	—	Bomb, anti-tank, dummy
BLU-10A/B/10/B	—	—	—	Bomb, fire, 250 lb, filling 33 galls of napalm
BLU-11/B	—	—	—	Bomb, fire, 500 lb, filling 65 galls of napalm
BLU-14	—	—	—	Bomb, modified MLU-10 for low-level penetration skip bombing
BLU-15	—	—	—	Anti-materiel weapon
BLU-16/B	—	—	0·73 kg	Bomb, smoke. Cylindrical, modified M8 grenade with HC filling
BLU-17/B	—	—	0·5 kg	Bomb, smoke. Cylindrical, modified M15 grenade with WP filling
BLU-18/B	—	—	0·19 kg	Bomb, fragmentation anti-personnel. Triangular shaped with delay fuze
BLU-19/B23	—	—	—	Bomb, chemical. Explosive burst with GB nerve gas filling
BLU-20/B23	—	—	—	Bomb, chemical. Parachute retarded. Thermal generator for B2 incapacitant gas
BLU-21/B45	—	—	—	Bomb, dry biological agent
BLU-22/B45	—	—	—	Bomb, wet biological agent
BLU-23/B	—	—	—	Bomb, fire, 500 lb, filling 67 galls of napalm
BLU-24/B/24 A/B	—	—	0·73 kg	Bomb, fragmentation, anti-personnel. Spherical with plastic fins & spin delay fuze. Cyclotrol filling. Known as 'Orange'
BLU-25/B	—	—	—	Bomblet, anti-personnel. Cylindrical
BLU-26/B	—	—	0·43 kg	Bomb, fragmentation, anti-personnel/anti-materiel (APAM). 6 cm sphere with varied surface and cyclotrol A3 filling. Detonates on impact throwing out c300 steel pellets. Known as 'Guava'
BLU-27B		—	—	Bomb, fire, 750 lb, filling 100 galls napalm B
BLU-28/B		—	—	Bomb, containing self-dispersing biological agent
BLU-29/B	—	—	73 kg	Bomb, anti-personnel & anti-materiel (APAM), flame agent canister
BLU-30/B	—	—	—	Bomb, dry chemical agent
BLU-31/B	—	—	—	Bomb, demolition, 750 lb (improved version of MLU-10 land mine with new seismic and acoustic sensor tuned to tanks)
BLU-32/B	—	—	—	Bomb, fire, 500 lb, filling 67 galls of napalm B
BLU-32A/B	—	—	—	Bomb, fire, 595 lb
BLU-33/B	—	—	—	Bomb, demolition, 1500 lb
BLU-34/B	—	—	—	Bomb, demolition, 3000 lb, for hard surface structures
BLU-35/B	—	—	—	Bomb, fire, 250 lb. Modular dispenses 140 kg napalm
BLU-36/B	—	—	0·43 kg	Bomblet APAM, fitted with random relay fuze
BLU-39/B23	—	—	—	Bomb, chemical dummy
BLU-39 (XM16)	—	—	0·08 kg	Bomblet, chemical. Cylindrical with CS filling that burns as bomb bounces over terrain
BLU-40/B	—	—	0·78 kg	Bomb, fragmentation. Random delay fuze
BLU-41/B	—	—	—	Bomb, fragmentation. Spherical with spin arming & spin delay fuze
BLU-42/B	—	—	—	Mine, anti-personnel. Spherical with varied surface & trip-wired sensors Fitted with anti-disturbance device & self-destruct detonator & fitted with 0·12 kg composition B
BLU-43/B	—	—	0·02 kg	Mine, anti-personnel. Triangular blast mine. Called 'Short Dragontooth'
BLU-44/B	—	—	0·02 kg	Mine, anti-personnel. Triangular blast mine. Called 'Long Dragontooth'
BLU-45/B	—	—	9·1 kg	Mine, land anti-tank. Shaped charge with timed self-destruct
BLU-46/B	—	—	—	Bomb, anti-personnel
BLU-47/B	—	—	—	Bomb, general purpose
BLU-48/B	—	—	—	Bomb, fragmentation. Spherical
BLU-49/B	—	—	6·1 kg	Bomb, fragmentation, cyclotrol 70/30 filling. Ring tail fitted
BLU-50/B		—		Bomb, chemical, BZ incapacitant gas filling
BLU 51/B				Bomb, fire
BLU-52/B	—	—	—	Bomb, chemical, 700 lb, filling 615 lb of CS gas

Designation	Entry no	Dimensions l x d	Weight	Description
USA cont				
BLU-53/B	–	—	9 kg	Bomb, fire. Canister with napalm B filling
BLU-54/B	—	—	—	Mine, anti-personnel. Identical to BLU-42/B but fitted long-life self-destruct timer
BLU-55/B	—	—	—	Mine, anti-personnel
BLU-56/B	—	—	—	Mine, anti-personnel
BLU-57/B	—	—	230 kg	Bomb, fragmentation
BLU-58/B	—	—	230 kg	Bomb, general purpose
BLU-59/B	—	—	0·43 kg	Bomb, fragmentation. Identical to BLU-26 but fitted with shorter random delay fuze.
BLU-60/B	—	—	5·9 kg	Bomb, fragmentation, cyclotrol filling
BLU-61/B	—	—	1 kg	Bomb, fragmentation-incendiary/anti-materiel. Spherical, zircon um/ composition B filling
BLU-62/B		—	0·43 kg	Bomb, fragmentation APAM, fitted with bounding fragmentation unit & filled with cyclotrol
BLU-63/B	—	—	0·43 kg	Bomb, fragmentation APAM. Spherical scored steel case, spin & impact fuze. Cyclotrol filling
BLU-64/B	—	—	350 kg	Bomb, general purpose FAE, filled with 200 kg hycrocarbon fuel. Combat tested 1967-68 but not adopted for service
BLU-65/B	—	—	—	Bomb, fire, 280 lb
BLU-66/B	—	—	0·73 kg	Bomb, anti-personnel, spherical with plastic tail fins (known as Pineapple)
BLU-67/B	—	—	5 kg	Bomb, cratering
BLU-68/B	—	—	0·42 kg	Bomb, incendiary APAM. Spherical with zirconium sponge filling
BLU-69/B	—	—	0·73 kg	Bomb, incendiary APAM. Spherical
BLU-70/B	—	—	0·4 kg	Bomb, incendiary APAM. Spherical
BLU-71/B	—	—	—	Mine, land
BLU-72/B	—	—	1100 kg	Bomb, FAE, low speed version with retarding drogue chute. 450 kg propane fuel filling. Known as Pave Pat I. Combat tested 1967-68 but not put into service
BLU-73/B	—	—	60 kg	Bomb, FAE. Drogue chute retarded canister containing 33 kg ethylene oxide fuel & fitted with long probe to detonate unit above ground surface
BLU 74/B	—	—	107 kg	Bomb, fire, modular. Napalm B filling
BLU-75/B	—	—	—	Bomb, fire
BLU-76/B	—	—	1200 kg	Bomb, FAE, high speed version but with low speed delivery capability of BLU-72. Known as Pave Pat II.
BLU-77/B	—	—	—	Bomblet, anti-tank fragmentation, APAM with ability to discriminate between hard & soft targets. Fitted with shaped charge that can act as bounding fragmentation unit against personnel
BLU-80	—	—	—	(also known as Bigeye)
BLU-81/B	—	—	—	Mine, anti-vehicle, known as 'Grasshopper'. Cancelled
BLU-82/B	—	—	—	Bomb, GP, 15 000 lb
BLU-82/B		—	6800 kg	Bomb, blast, container filled with 5715 kg of gelled slurry blast explosive GSX. 97 cm nose probe to detonate bomb above ground surface. Known as 'Big Blue 82'
BLU-86A/B	—	—	0·45 kg	Bomb, fragmentation, steel case with composition B or cyclotrol filling
BLU-87(D-1)/B	—	—	—	Dummy fragmentation bomb
BLU-87(T-1)/B	—	—	—	Training fragmentation bomb
BLU-89/B	—	—	—	Bomb, GP, blast & fragmentation
BLU-90/B	—	—	—	Bomb, GP, fragmentation case with shaped charge penetration device
BLU-91/B	—	—	—	Mine, anti-tank, Gator
BLU-92/B	—	—	—	Mine, anti-personnel, Gator
BLU-93	—	—	—	No information
BLU-94/B	—	—	—	Mine, riverine/shallow water, anti-ship/anti-tank. Pressure/seismic/magnetic detonation
Briteye	—	—	—	Flare, 5000 candlepower
Bigeye	—	—	—	Bomb, chemical
Deneye	—	—	—	Mine, land
Fireye	—	—	—	Bomb, fire, also known as Mk 122
Gladeye	—	—	—	Bomb
Misteye	—	—	—	Bomb, flare
Weteye	—	—	—	Bomb, chemical, also known as Mk 116
M38A2	—	—	—	Bomb, practice, 100 lb
M40A1	—	—	—	Bomb, Bomb, fragmentation, 23 lb
M42	—	—	—	Grenade, anti-tank/anti-personnel. Ribbon stabilised shaped charge with sideways fragmentation burst able to penetrate 100 mm armour
M47	—	—	—	Bomb, incendiary, 100 lb
M52A1	—	—	—	Bomb, AP, 1000 lb
M69X	—	—	—	Bomb, incendiary, 6 lb
M70/M70A1	—	—	—	Bomb, gas, persistent mustard gas or mustard gas gel re-agent, 115 lb
M74/M74A1	—	—	—	Bomb, incendiary, 10 lb
M82	—	—	—	Bomb, fragmentation, 90 lb
M83	—	—	—	Bomb, fragmentation, 4 lb (also known as Butterfly bomb)
M84A1	—	—	—	Bomb, target identification, 100 lb
M86	—	—	—	Bomb, fragmentation, 120 lb
M103	—	—	—	Bomb, SAP, 2000 lb
M104	—	—	—	Bomb, leaflet, 100 lb
M105	—	—	—	Bomb, leaflet, 500 lb
M109	—	—	—	Bomb, GP, 12 000 lb
M110	—	—	—	Bomb, GP, 22 000 lb
M113	—	—	—	Bomb, gas persistent, 125 lb
M116	—	—	—	Bomb, fire, 750 lb, filling 80 galls napalm or thickened fuel
M116AA1/A23	—	—	—	Bomb, fire, 750 lb, filling 100 galls napalm or thickened fuel
M117/A1/A1E2	—	—	—	Bomb, GP, 750 lb
M117D	—	—	—	Destructor bomb, high drag, GP (M117 with tail retarding device)
M118E2	—	—	—	Bomb, GP, 3000 lb
M120/M120A1	—	—	—	Bomb, photoflash, 750 lb
M121		—	—	Bomb, GP, 10 000 lb
M122		—	—	Bomb, photoflash, 100 lb

Designation	Entry no	Dimensions l x d	Weight	Description
USA cont				
M124	—	—	—	Bomb, practice, 250 lb
M125A1	—	—	—	Bomb, gas non-persistent, 10 lb (filled with 2·6 lb of GB)
M126	—	—	—	Bomb, incendiary, 4 lb
M129/M129E1/ M129E2	—	—	—	Bomb, leaflet, 750 lb
MC1	—	—	—	Bomb, gas non-persistent, 750 lb (filling 220 lb of GB)
Mk 1	—	—	—	Bomb, demolition, 2000 lb
Mk 111	—	—	—	Bomb, demolition, 1000 lb
Mk 5 Mods 2 & 3	—	—	—	Bomb, practice miniature, 3 lb
Mk 12	—	—	270 kg	Dispenser 'Padeye' with smoke or BZ incapacitant agent
Mk 15 Mod 2, 3 & 4	—	—	—	Bomb, practice, 100 lb
Mk 17	—	—	—	Dispenser Mk 4 Gladeye with 7 bomblet canisters
Mk 21	—	—	370 kg	Dispenser Mk 5 Sadeye
Mk 22	—	—	370 kg	Dispenser Mk 5 Sadeye
Mk 25	—	—	—	Sea mine, 2000 lb
Mk 36	—	—	—	Sea mine, 1000 lb
Mk 36	—	—	—	Destructor bomb demolition. In Mk 82 fitted with Snakeye Mk 15 tail retarding device & acoustic, seismic & IR detectors to detonate the weapon at approach of vehicle
Mk 39	—	—	—	Sea mine, 2000 lb
Mk 40	—	—	—	Sea mine, 2000 lb
Mk 44	—	—	—	Missile cluster, 550 lb. M16 cluster adaptor with c10 000 'Lazy Dog' shaped iron fragments
Mk 50	—	—	—	Sea mine, 500 lb
Mk 52	—	—	—	Sea mine, 1000 lb
Mk 53	—	—	—	Sea mine, 500 lb
Mk 55	—	—	—	Sea mine, 2000 lb
Mk 56	—	—	—	Sea mine, 2000 lb
Mk 65 Mod 0	—	—	—	Bomb, practice, 500 lb
Mk 66 Mod 0	—	—	—	Bomb, practice, 1000 lb
Mk 76	—	—	—	Bomb, practice, 25 lb
MK 77 Mod 0	—	—	—	Bomb, fire, 750 lb (filling 110 galls gasoline oil)
Mk 77 Mod 1		—	—	Bomb, fire, 500 lb (filling 75 galls gasoline oil)
Mk 78 Mods 0, 1 & 2	—	—	—	Bomb, fire, 750 lb (filling 110 galls gasoline oil)
Mk 79 Mod 1	—	—	—	Bomb, fire, 1000 lb (filling 112 galls napalm-gasoline)
Mk 81 Mod 0 & 1	—	—	—	Bomb, 'Slick' low drag, GP, 250 lb
Mk 81 Mod 1	—	—	—	Snakeye bomb, high drag, GP, 150 lb (Mk 81 fitted with Mk 114 tail retarding device)
Mk 82 Mod 0 & 1	—	—	—	Bomb, 'Slick' low drag, GP, 500 lb
Mk 82 Mod 1	—	—	—	Snakeye bomb, high drag, GP, 560 lb (Mk 82 fitted with Mk 15 tail retarding device)
Mk 83 Mod 2 & 3	—	—	—	Bomb, 'Slick' low drag, GP, 1000 lb
Mk 83	—	—	—	Destructor, high drag, GP, 1000 lb (Mk 83 fitted with MAU-91A/B)
Mk 84 Mod 0 & 1	—	—	—	Bomb, 'Slick' low drag, GP, 1970 lb
Mk 86 Mod 0 & 1	—	—	—	Bomb, practice, 250 lb
Mk 87 Mod 0	—	—	—	Bomb, practice, 500 lb
Mk 88 Mod 0	—	—	—	Bomb, practice, 1000 lb
Mk 89 Mod 0 & 1	—	—	—	Bomb, practice, 56 lb
Mk 94 Mod 0	—	—	—	Gas non-persistent, 500 lb (filling is 108 lb of GB)
Mk 106 Mod 0	—	—	—	Bomb, practice, 5 lb
Mk 116 Mod 0	—	—	—	Bomb, chemical, 750 lb (also known as Weteye, filled with 403 lb of GB)
Mk 122	—	—	—	Bomb, fire (also known as Fireye)
Cluster bombs and area weapons				
AN-M1A1/M1A2	—	—	—	Cluster, fragmentation bomb, 100 lb (6 × AN-M41A1)
AN-M1A3/M1A4	—	—	—	Cluster, fragmentation bomb, 100 lb (6 × AN-M41A2)
AN-M4	—	—	—	Cluster, fragmentation bomb, 1000 lb (3 × M40)
CBU-1	—	—	—	Dispenser SUU-7 and 509 × BLU-4 anti-personnel bomblets
CBU-2/A	—	—	—	Dispenser SUU-7 & 360 × BLU-3 anti-materiel bomblets
CBU-2B/A	—	—	—	Dispenser SUU-7 & 409 × BLU-3 anti-materiel bomblets
CBU-3/A	—	—	300 kg	Dispenser SUU-10/A & 352 × BLU-7A/B bomblets
CBU-3A/A	—	—	300 kg	Dispenser SUU-10A/A & 352 × BLU-7A bomblets
CBU-3B/A	—	—	300 kg	Dispenser SUU-10B/A & 371 × BLU-7A/B bomblets
CBU-5	—	—	—	M30 cluster adaptor with 57 × M138 BZ incapacitant gas bomblets
CBU-6	—	—	—	Redesignated CBU-13/A
CBU-7/A	—	—	—	Dispenser SUU-31/A & 1200 × BLU-18/B bomblets
CBU-8/A	—	—	390 kg	Dispenser SUU-7A/A & 409 BDU-27/B spotting charges
CBU-9/A	—	—	390 kg	Dispenser SUU-7A/A & 406 BDU-28/B dummy bombs
CBU-9A/A	—	—	390 kg	Dispenser SUU-7B/A & 406 BDU-28/B dummy bombs
CBU-10	—	—	—	Dispenser SUU-7. No other details
CBU-11/A	—	—	—	Dispenser SUU-7B/A & 261 BLU-16/B smoke bombs
CBU-12/A	—	—	290 kg	Dispenser SUU-7B/A & 261 BLU-17/B smoke bombs
CBU-12A/A	—	—	290 kg	Dispenser SUU-7C/A & 261 BLU-17B smoke bombs
CBU-13/A	—	—	—	Dispenser SUU-7C/A & 261 BLU-16B & BLU 17-B smoke bombs
CBU-14/A	—	—	—	Dispenser SUU-7B/A & BLU-3/B bombs
CBU-14/A/A	—	—	—	Dispenser SUU-14A/A & BLU-3/B bombs
CBU-15/A	—	—	—	Dispenser SUU-13/A for BLU-19 GB nerve gas bomblets
CBU-16/A	—	—	—	Dispenser SUU-13/A for CDU-9 BZ incapacitant gas cluster
CBU-16A/A	—	—	—	Dispenser SUU-13/A for CDU-9 BZ incapacitant gas cluster
CBU-17/A	—	—	—	Dispenser SUU-13/A & 1200 BLU-34/B practice bomblets
CBU-18/A	—	—	—	Dispenser SUU-13A/A & BLU-25/B anti-personnel bomblet
CBU-19	—	—	—	Twin strongback dispenser with 16 modules each containing 33 BLU-39 bomblets
CBU-22/A	—	—	—	Dispenser SUU-14/A & 72 BLU-17/B smoke bombs

Designation	Entry no	Dimensions l x d	Weight	Description
USA cont				
CBU-23/B		—	—	Dispenser SUU-31/B & BLU-26/B fragmentation bombs
CBU-24/A	—		—	Dispenser SUU-14/A & BLU 24/B fragmentation bombs
CBU-24/B	—	—	—	Dispenser SUU-30/B & 670 BLU-26/B or 670 BLU-36/B fragmentation bombs
CBU-25	—	—	—	Dispenser SUU-14 & BLU-24 bomblets
CBU-26/A	—	—	—	Dispenser SUU-10/A & 352 BDU-37/B dummy fragmentation bombs
CBU-27	—	—	—	Unfilled canister for Type 2 bomblet dispenser, becomes ADU or CDU when filled
CBU-28	—	—	—	Dispenser SUU-13 for 40 × CDJ-2 clusters each of 120 × BLU-43 mines
CBU-29/B	—	—	380 kg	Dispenser SUU-30/B & 670 BLU-36/B fragmentation bomblets
CBU-30	—	—	—	Dispenser SUU-13 & 40 × CDU-12 clusters each of 30 × BLU-39 CS incapacitant gas bomblets
CBU-33/A	—	—	350 kg	Dispenser SUU-36/A & 30 BLU-45/B land mines
CBU-34/A	—	—	—	Dispenser SUU-38/A for 10 × CDU-18 or CDU-19 clusters each of 54 × BLU-42 ant-personnel mines
CBU-37/A	—	—	—	Dispenser SUU-13/A for 40 × CDU-3 clusters each of 120 × BLU-44 ant-personnel mines
CBU-38/A	—	—	—	Dispenser SUU-13/A & 40 × BLU-49/B fragmentation bombs
CBU-41/B	—	—	220 kg	Dispenser SUU-51 for 18 × BLU-53 napalm B canisters. Fire bomb cluster
CBU-42/A	—	—	—	Dispenser SUU-38/A for 10 × CDU-20 or CDU-21 clusters each of 54 × BLU-54 anti-personnel mines
CBU-43	—	—	380 kg	Dispenser SUU-37 for CDU-37 clusters of BLU-48 bomblets. Weight 380 kg
CBU-44	—	—	—	Dispenser for anti-personnel bomblets
CBU-45	—	—	—	Dispenser for anti-personnel/materiel bomblets
CBU-46/A	—	—	400 kg	Dispenser SUU-7C/A for 444 × BLU-66/B anti-personnel bomblets
CBU-47	—	—	—	Dispenser SUU-13 for BLU-55 anti-personnel mines
CBU-49/B	—	—	380 kg	Dispenser SUU-30/B & 670 BLU-59/B fragmentation bomblets
CBU-50/A	—	—	—	Dispenser SUU-13 for 40 × BLU-60 fragmentation bomblets
CBU-51/A	—	—	—	Dispenser SUU-13/A & 40 × BLU-67/B cratering bombs
CBU-52/B	—	—	350 kg	Dispenser SUU-30B/B & 264 × BLU-61/B fragmentation bombs
CBU-53/B	—	—	370 kg	Dispenser SUU-30B/B & 670 × BLU-70/B incendiary bomblets
CBU-54/B	—	—	370 kg	Dispenser SUU-30B/B & 670 × BLU-68/B incendiary bomblets
CBU-55/B	—	—	230 kg	Dispenser SUU-49 for 3 × BLU-73 FAE bombs
CBU-57	—	—	—	Dispenser SUU-14A/A for 132 × BLU-69/B incendiary bomblets
CBU-58A/B	—	—	370 kg	Dispenser SUU-30A/B & 650 BLU-63/B fragmentation bombs
CBU-59/B	—	—	—	Dispenser Mk 7 Mod 3 Rockeye for 717 BLU-77/B APAM fragmentation bomblets
CBU-60	—	—	—	Dispenser SUU-50 for 264 × BLU-24 fragmentation bomblets
CBU-61	—	—	—	Dispenser CS incapacitant gas bomblets
CBU-62	—	—	380 kg	Dispenser SUU-30 for 2025 M38 fragmentation grenades
CBU-63	—	—	380 kg	Dispenser SUU-30 for 2025 M40 fragmentation grenades
CBU-66	—	—	—	Dispenser SUU-51/B for CDU-24/B canisters containing BLU-81/B minelets. Cancelled
CBU-68	—	—	—	Dispenser SUU-30 for BLU-48 fragmentation bomblets
CBU-70	—	—	—	Dispenser SUU-30
CBU-71	—		370 kg	Dispenser SUU-30 A/B for 670 × BLU-86 A/B fragmentation bomblets
CBU-72	—	—	230 kg	Low drager version of CBU-55 fitted with retarder parachutes
CBU-75A/B	—	—	—	Dispenser SUU-54A/B with 1800 BLU-63/B or BLU-86B fragmentation bombs
CBU-76/B	—	—	—	Dispenser SUU-51B/B for 290 × BLU-61A/B fragmentation/ incendiary bomblets
CBU-77/B	—	—		Dispenser SUU-51B/B for 790 × BLU-63/B fragmentation bomblets
CBU-78/B	—	—	—	Dispenser SUU-58/B for Gator ant.-tank & ant-personnel minelets BLU-91/B & BLU-92/B
CBU-82/B	—	—	—	Dispenser SUU-58/B for BLU-91/B Gator ant-tank mines
CBU-83/B	—	—	—	Dispenser SUU-58/B for BLU-92/B Gator ant-personnel mines
CBU-84/B	—	—	—	Dispenser SUU-54A/B for BLU-91/B & BLU-92/B Gator mines
CBU-85/B	—	—	—	Dispenser SUU-54A/B for BLU-91/B Gator ant-tank mines
CBU-86/B	—	—	—	Dispenser SUU-54A/B for BLU-92/B Gator anti-personnel mines
M12	—	—	—	Cluster, incendiary bomb
M13	—	—	—	Cluster, incendiary bomb, 500 lb
M17	—	—	—	Cluster, incendiary bomb, 500 lb
M19	—	—	—	Cluster, incendiary bomb, 500 lb (36 × M69)
M19A2	—	—	—	Cluster, incendiary bomb, 500 lb
M20/M20A1	—	—	—	Cluster, incendiary bomb, 500 lb
M21	—	—	—	Cluster, incendiary bomb, 500 lb
M22/M22A1	—	—	—	Cluster, incendiary bomb, 500 lb
M26A1	—	—	—	Cluster, fragmentation bomb, 500 lb
M28A2	—	—	—	Cluster, fragmentation bomb, 100 lb (24 × M83)
M31	—	—	—	Cluster, incendiary bomb, 500 lb (38 × M74)
M32	—	—	—	Cluster, gas bomb non-persistent, 1000 lb (76 × M125)
M34A1	—	—	—	Cluster, gas bomb non-persistent, 1000 lb (76 × M125A1)
M35	—	—	—	Cluster, incendiary bomb, 750 lb (57 × M74A1)
M36	—	—	—	Cluster, incendiary bomb, 750 lb (182 × M50A3)
M43	—	—	—	Cluster, gas bomb incapacitating BZ agent, 750 lb (57 × M138)
M44	—	—	—	Cluster, gas generator incapacitating BZ agent, 175 lb
SUU-7B/A	—	—	—	Dispenser, bomb
SUU-7C/A	—	—	—	Dispenser, bomb
SUU-10/A	—	—	—	Dispenser, bomb
SUU-10A/A	—	—	—	Dispenser, bomb
SUU-10B/A	—	—	—	Dispenser, bomb
SUU-13/A	—	—	—	Dispenser, bomb
SUU-14/A	—	—	—	Dispenser
SUU-20/A	—	—	—	Dispenser, bombs & rockets
SUU-21	—	—	—	Flare launcher
SUU-24/A	—			Dispenser, bomb, grenades & bomblets
SUU-30/B		—		Dispenser
SUU-30A/B			—	Dispenser
SUU-30B/B	—	—	—	Dispenser

Designation	Entry no	Dimensions l x d	Weight	Description
USA cont				
SUU-30C/B	—	—	—	Dispenser
SUU-31/B	—	—	—	Dispenser
SUU-36/A	—	—	—	Dispenser, mine
SUU-37/A	—	—	—	Dispenser, bomb
SUU-38/A	—	—	—	Dispenser, high speed tactical fighter munition
SUU-41/A	—	—	—	Dispenser
SUU-41A/A	—	—	—	Dispenser
SUU-42/A	—	—	—	Dispenser, buoy-flare
SUU-43/A	—	—	—	Dispenser, buoy-flare
SUU-44	—	—	—	Dispenser, flare
SUU-45/A	—	—	—	Dispenser, high speed tactical fighter munition
SUU-46/A	—	—	—	Dispenser, bomb
SUU-48/A	—	—	—	Dispenser, bomb
SUU-54/A	—	—	—	Dispenser, bomb
PLU-77/B	—	—	—	Dual purpose anti-tank anti-personnel (APAM) 11 lb fragmentation bomb
MLU-10B	—	—	—	750 lb land mine equipped with seismic, magnetic & IR sensors to detect vehicles & then detonate mine
Rockeye II Mk 20	**4599.303**	233 × 33 cm	222 kg	Used on A-4, A-6, A-7, F-4 & F-8. About 250 fragmentation bomblets
Grasshopper	—	—	—	Anti-tank mine & aerial dispenser system development programme
Gator	**1849.303**	—	—	Anti-tank & anti-personnel mine dispensing system for US Army, USAF & USN. In early development stage
HSM	**1848.303**	—	—	Hard structure munitions. Development project
M56	—	—	—	Helicopter mining system. 2 SUU-13 dispensers. M15 mine
SUU-54B	**1534.311**	—	907 kg	Cluster bomb. Also guided version (Pave Storm)

(SUU = suspended underwing unit; BLU = bomb live unit; BDU = bomb dummy unit; CBU = cluster bomb unit)

Fuel/air explosive weapons

BLU-76	—	—	—	For use against pressure-sensitive targets
CBU-55B	**1847.303**	200 × 35 cm	226 kg	Contains 3 separate 45 kg canisters. Used for mine clearance & against pressure-sensitive structures
CBU-72	**1847.303**	—	—	USN development of CBU-55B with retarder parachute
HSF-I	**1847.303**	—	226 kg	FAE bomb development project by USAF
HSF-II	**1847.303**	—	900 kg	FAE bomb development project by USAF
MAD	**1847.303**	—	—	USMC helicopter dispensed FAE project

Guided bombs

Mk 20 (Rockeye)	**1534.311** **1998.303**	—	226 kg	Laser homing version of Mk 20 (Rockeye) cluster bomb with KMU-420/B guidance package
Mk 82 (Snakeye)	**1534.311**	— × 23 cm	226 kg	Laser homing version of GP Mk 82 bomb KMU-388B/B guidance package
Mk 84	**1534.311**	— × 33 cm	907 kg	Guided versions of GP Mk 84 bomb. KMU-351/A/B laser guidance package, or KMU-353A/B electro-optical guidance package
M117	**1534.311**	—	340 kg	Laser homing. KMU-342/B guidance package
M118E1	**1597.311** **1534.311**	—	1360 kg	Guided versions of M118 demolition bomb. KMU-370B/B laser guidance package, or KMU-390/B electro-optical guidance package
Pave Rocket (RBU-1/A)	**1997.303**	—	—	Guided cluster munition
Pave Storm	**1534.311**	—	907 kg	Laser guided version of SUU-54B cluster bomb
Walleye I	**1129.311**	344 × 33 cm	499 kg	TV-guided
Walleye II	**1129.311**	404 × 46 cm	1061 kg	TV-guided
KMU-420/B	—	—	—	500 lb laser guided bomb (Mk 20 Mod 2 Rockeye II with laser guidance kit)
KMU-342/B	—	—	—	750 lb laser guided bomb (Mk 117 with laser guidance kit)
KMU-351A/B	—	—	—	2000 lb laser guided bomb (Mk 84 with laser guidance kit)
KMU-353A/B	—	—	—	2000 lb electro-guided bomb (Mk 84 with electro-optical guidance kit)
KMU-359/B	—	—	—	2000 lb IR guided bomb (Mk 84 with IR guidance kit)
KMU-370/B	—	—	—	3000 lb laser guided bomb (M118E1 with laser guidance kit)
KMU-388A/B	—	—	—	500 lb laser guided bomb (Mk 82 with laser guidance kit)
KMU-390/B	—	—	—	3000 lb electro-optical guided bomb (M118E1 with electro-optical guidance kit)
KMU-420/B	—	—	—	500 lb laser guided bomb (Mk 20 Mod 2 Rockeye II with laser guidance kit)
KMU-421/B	—	—	—	2000 lb laser guided bomb known as Pave Storm (SUU-54B cluster bomb with laser guidance kit)

Nuclear munitions

B28	—	—	—	Nuclear free fall bomb. Tactical & strategic versions. Deployed (nos in brackets) on B-52 (4 or 8), A-4(1), F-4 (1), A-6(3), B-1B (20 max). Yields (strategic versions) 1·4 - 28 MT
B41	—	—	—	Strategic bomb. Obsolete
B43	—	—	—	Tactical/strategic bomb. Deployed (nos in brackets) on A-4(1), A-6(3), A-7(4), F-16(2), F-4(3), F-111(6), B-52(4). At least 5 different yields available, in KT to MT range. Various nose forms employed; parachute retarded or free fall. 'Lay-down' delayed surface burst capability from low-altitude release
B43Y1	—	—	—	Version of B43 under development to similar standard of B77, in lieu of the latter
B57	—	—	—	Tactical. Mods 0/1/2 deployed (nos in brackets) on A-4(1), A-6(3), A-7(4), P-3(3), S-3(4), SH-3(1), F-16(2), F-4(3), FB-111(6). Yields 10-20 KT
B61	—	—	—	Tactical (Mods 0, 2, 3, 4, 5) & strategic (Mod 1) versions produced by Mods 3 & 4 are also strategic. Deployed (nos in brackets) on A-6(3), A-7(4), F-16(2), F-111(6), B-52(4 or 8), FB-111(6), B-1B(38 max). Mods 0/2/3/4/5 yields range 100 - 500 KT; Mod 1 has yield in MT range
B77	—	—	—	FUFO (full fuzing option) bomb. Free fall or retarded, airburst or ground burst. Fitted with lifting aerofoil parachute. Production cancelled, but development continued. Requirement being met by B43Y1, as above
B83	—	—	—	New strategic free fall bomb
BDU8	—	—	—	Probably training version of B43 nuclear bomb

Designation	Entry no	Dimensions l x d	Weight	Description
USA cont				
BDU11	—	—	—	Probably training version of nuclear bomb
BDU12	—	—	—	Probably training version of B57 nuclear bomb
BDU38	—	—	—	Probably training version of B61 nuclear bomb
YUGOSLAVIA				
Free fall bombs				
FAB-250	**5223.303**	—	250 kg	General purpose
FAB-500	**5223.303**	—	500 kg	General purpose
PLAB 150L	**5223.303**	—	—	150 litre napalm
RAB	**5223.303**	—	120 kg	Fragmentation cluster bombs
ZAB-45	**5223.303**	—	45 kg	Incendiary
Cluster bombs and area weapons				
DPT-150	**5223.303**	—	—	Cluster bomb unit with 54 × 1·5 kg, 44 × 2·5 kg, or 34 × 3·5 kg bomblets

ER-116-A	**2157.153**	IFF interrogator	Thomson-CSF
LDTR	—	G/H-band scanning radar for special application. Designed to work under high level ECM conditions, has an exceptionally narrow antenna beam	Thomson-CSF
Louxor	**3275.153**	Experimental electronic scan short-range air defence radar	Thomson-CSF
LP23 (TRS 2050)	*2100.153*	Long-range D-band surveillance radar	Thomson-CSF
Matador	*2102.153*	3-D E/F-band radar (Mobile and tridimensional air defence operations radar). Range about 250 km. Electronic elevation scan for accurate height measurement	Thomson-CSF
Mirador	*2080.151* *2116.153*	Pulse-doppler surveillance and target designation radar E/F-band; 18 km range; pencil beam 6·6° wide. Associated with ELDORADO tracking radar for mobile operations for defence against low-flying aircraft	Thomson-CSF

Designation	Entry no	Description	Contractor(s)
FRANCE cont			
Miracor I'	*2080.151*	Mobile E/F-band pulse-doppler surveillance radar for defence	Thomson-CSF
	2074.131	against low-flying aircraft. Associated with Crotale	
	2117.153	surface-to-air guided weapons system. Dual, back-to-back, 4° beamwidth antennas. Range 18 km	
MRS 1-3	**5782.153**	IFF interrogator	LMT
Oeil Noir (DR-VC-1A)	*2129.153*	D-band pulse-doppler surveillance radar. 10° cosecant pattern beam. Range 15 km. Mounted on AMX-30 tracked AFV with twin 30 mm cannon to form mobile anti-aircraft system	Thomson-CSF
Oeil Vert	**3197.153**	Later version of Oeil Noir	Thomson-CSF
Olifant	*2131.153*	Lightweight battlefield radar	Thomson-CSF
Olifant II	*2132.153*	Lightweight man-portable battlefield patrol radar	Thomson-CSF
ORP-105 (DLM-10-E)	*1945.153*	E-band meteorological radar	Omera
ORP-310	**1945.153**	I/J-band meteorological radar	Omera
ORP 340	**1945.153**	I-band meteorological radar	Omera
ORV-3*	**1945.153**	I/J-band meteorological radar	Omera
Palmier	—	20MW 3-D E/F-band surveillance radar	Thomson-CSF
Perceval/Spartiate	**2120.153**	Helicopter recovery radar	Thomson-CSF
Picador	**2119.153**	Mobile 3-D radar	Thomson-CSF
RA 20	*3717.153*	Mobile AA fire control radar	ESD
RA 20S	**5601.153**	Surveillance and target designation radar for low-level air defence	ESD
RA 2*	*3718.153*	Mobile AA fire control radar	ESD
Racine	*2136.153*	I/J-band non-recurrent pulsed doppler surveillance and target acquisition radar	LCT
RALF	*2152.153*	Lightweight I/J-band low altitudes surveillance radar using Racine techniques	LCT
Ramsa	**3274.153**	TRS 2140 low-level air defence gap-filler	Thomson-CSF
Rapace	*2137.153*	J-band AFV-mounted surveillance radar	ESD
Rasit	*2142.153*	I/J-band portable medium-range battlefield surveillance radar	ESD
Rasit 72A1 (Rapière)	**2141.153**	I/J-band ground surveillance radar. 20 km range	LCT
Rasit 72B	*2153.153*	Lightweight version of Rasit 72A	LCT
Rasit 72C	*2154.153*	Short-range (10 km) version of Rasit 72A	LCT
Rasura	*2143.153*	I/J-band portable or vehicle-mounted battlefield surveillance radar	ESD
Rasura II	*3716.153*	Battlefield surveillance radar	ESD
Ratac	**1528.153**	Battlefield surveillance. Also produced in USA and West Germany	LCT
Roceo 2	**5602.153**	Fire control radar for low-level air defence	ESD
Roceo 20	*3719.153*	Anti-aircraft fire control radar	ESD
Sic'amer	**3173.153**	Battlefield IFF	LMT
Savoie	**1944.153**	Long-range tracker	Thomson-CSF
Stentor	**3287.153**	Battlefield surveillance radar, I/J-band	LCT
TH.D 1012	*2133.153*	PAR	Thomson-CSF
TH.D 1013	*2098.153*	Light PAR	Thomson-CSF
TH.D 102*	*2058.153*	Airfield surveillance radar	Thomson-CSF
TH.D 1060	—	D-band medium-range surveillance radar. Transportable and suitable for use as gap-filler or as surveillance element of GCA system. 200 km range on small targets; digital MTI system; 2-beam antenna	Thomson-CSF
TH.D 1940	—	Low cost 3-D surveillance radar with electromechanical elevation sweep. Transportable by cargo aircraft, helicopter, or truck	Thomson-CSF
TH.D 1955	*2155.153*	High-power 3-D E/F-band monopulse stacked-beam radar for surveillance or GCI. 400 km range capability	Thomson-CSF
Tiger (TRS 2100)	**2156.153**	E/F-band lightweight surveillance radar for detection of nap-flying targets	Thomson-CSF
TRS 2050	*2100.153*	See LP 23	Thomson-CSF
TRS 2052		Successor to TRS 2050	Thomson-CSF
TRS 2053	**3099.153**	Smaller antenna version of TRS 2052 for use as gap-filler	Thomson-CSF
TRS 2054	**3683.153**	Long-range D-band surveillance radar	Thomson-CSF
TRS 2055	*2104.153*	2 MW Terminal Area surveillance radar. MTI system. Uses antenna type TH.D-284B	Thomson-CSF
TRS 2056	**3099.153**	Centaure. Transportable recovery radar based on TRS 2052	Thomson-CSF
TRS 2060	*2121.153*	Mobile or static E/F-band surveillance radar	Thomson-CSF
TRS 2065	*2059.153*	ATC approach radar	Thomson-CSF
TRS 2201	**2155.153**	Long-range E/F 3-D air defence radar	Thomson-CSF
TRS 2215	**3272.153**	Transportable version of TRS 2230 E/F-band 3-D radar. TRS 2215D and TRS 22XX are later versions	Thomson-CSF
TRS 2230	**3272.143**	Fixed site 3-D air defence radar. Derived from Satrape	Thomson-CSF
TRS 23*0	**3492.153**	PAR	Thomson-CSF
TRS 2600/2601	**4224.153**	E/F-band pulse doppler target designation radars	Thomson-CSF
TRS 2730	**3276.153**	G-band weather radar	Thomson-CSF
TRS 3405	**3100.153**	I-band coastal surveillance radar	Thomson-CSF
TRS 3410	**3273.153**	Transportable version of TRS 3405	Thomson-CSF
Type 3737A		IFF interrogator antenna	LMT
Volex III (TRS 2205)	*2160.153*	Medium-range 2-beam 3-D radar. Fast electromechanical elevation sweep with narrow (2×2°) beam	Thomson-CSF
Volex IV	**3271.153**	TRS 2206. Improved version of Volex III	Thomson-CSF
—	—	D-band panoramic radar with double-beam AT 431 HB (9×13 m) antenna; 400 km range; high ECM resistance	Thomson-CSF
—	—	Phased array 3-D radar for air defence and ballistic missile detection. Possible replacement for PALMIER radar	Thomson-CSF
—	—	400-600 MHz surveillance radar for special applications. Range better than 1000 km	Thomson-CSF
GERMANY, Federal Republic			
ASR 920	*3707.153*	Mobile radar	AEG-Telefunken
DII 111/DII 511	**3286.153**	Lightweight IFF systems	Siemens

NETHERLANDS			
Flycatcher	**3283.153**	Low-level anti-aircraft fire control system	Signaal
L4/5AA Weapon Control System	—	Weapon control system for use with 40 mm anti-aircraft guns for close air defence. Search and tracking radar antennas on compound mounting which, together with transmitter-receivers computer and displays is mounted on single trailer. Search radar employs FASCAN principle to achieve early detection of very low-flying aircraft	Signaal
LAR, 8GR 200	—	Long-range civil or military air surveillance radar	Signaal
LDTR	—	Long-dwell time radar	Signaal
SLAM	*1557.153*	Signaal low air-defence module	Signaal
Star, 8GR 550	*1556.153*	Terminal area radar with single transmitter-receiver	Signaal
Star, 8GR 552	*1556.153*	Terminal area radar with dual diversity transmitter-receiver	Signaal
Stola	—	Target acquisition system for use against very low flying aircraft. Believed to be I/J-band with back-to-back antenna arrangement. Antennas mounted on telescopic mast which can raise them (apparently) about 10 m to give good low-angle cover and clear obstructions	Signaal
Tank Radar	**2302.153**	Integrated radar system for 35 mm AA tank	Signaal
VI, SGR 104	—	Heightfinding radar	Signaal
VI, 8GR 551	—	Automatic heightfinding and long-range tracking radar	Signaal
—	—	Gap-filling radar	Signaal
POLAND			
AVIA B	**2340.153**	23 cm D-band surveillance radar. 2 1·5 MW transmitter/receivers in frequency diversity. Range 240 km	Industrial Institute of Telecomms, Warsaw
SOUTH AFRICA			
EMVA Mk 10B	**4601.153**	Muzzle velocity measuring radar	Armscor
SPAIN			
IRS-10	**5763.153**	Secondary surveillance radar	CECSA

Knife Rest	**2881.153** **2880.153**	VHF early warning radar. Soviet designation P-10	—
Landfall	—	Coastal warning radar	—
Long Brick	—	Van-mounted array	—
Long Eye	—	Back-to-back dish radars on trailer	—
Long Talk	**3294.153**	Aircraft recovery and GCA search radar	—
Long Track	**2937.153**	Tactical surveillance radar for SAMs	—
Long Trough	—	Trough-shaped air search radar on half-tracked vehicle	—
Low Blow	**2884.153**	I-band radar group for low-level SAMs	—
Mercury Noseband	—	Truck-mounted	—
Mesh Brick	—	Probably mortar locating radar. Offset spiral feeds	—
Mound Brick	—	Trailer-mounted radar with hemispherical dome	—
Nysa B	—	Nodding heightfinder	—
Nysa C	**3296.153**	Long-range air search radar. Probably VHF	—
Odd Lot	—	E-band early warning radar and heightfinder	—
Odd Pair	—	E-band heightfinder	—
One Eye	—	Air search radar with supplementary antenna	—
OR-2	—	Probably airfield surveillance radar	—
OTHR	**3288.153**	Over-the-horizon radar. Pulse type. HF	—
Pat Hand	**2936.153**	H-band missile guidance radar for SA-4 Ganef	—
Patty Cake	**2878.153**	Back-to-back nodding heightfinders	—
Pole Dish	—	—	—
Pork Trough	**4328.153**	Similar to Long Trough on fully tracked vehicle	—
PSNR-1	**4602.153**	Battlefield surveillance radar	—
RL-1	—	Airfield surveillance radar	—
RL-2D	—	Air search radar	—
Rock Cake	—	Transportable nodding heightfinder	—
RP-2E	—	Twin PAR installation	—
Scoreboard	**2974.153**	Broadside array of stacked dipoles. A and B versions	—
Side Net	**3289.153**	Transportable nodding heightfinder	—
Small Yawn	—	Tracker(possibly conical scan) on tracked van	—
Sponge Cake	**2878.153**	Trailer-mounted nodding heightfinder	—
Spoon Rest A	**2889.153**	VHF air warning radar. Vehicle mounted	—
Spoon Rest B	**2899.153**	VHF air warning radar. Semi-fixed version	—
Square Pair	**3290.153**	Target tracking and missile guidance radar for SA-5	—
Squat Eye	**3291.153**	Air search and target acquisition radar	—
Squint Eye	**2891.153**	Target acquisition radar	—
Stone Cake	**2878.153**	Trailer-mounted nodding heightfinder	—
Straight Flush	**2885.153**	Fire control radar group for SA-6	—
Strike Out	—	Similar to Barlock	—
Tachi I	—	Multiple Yagi arrays associated with searchlight	—
Tall King	**3239.153**	Long-range early warning radar. Soviet designation P-14	—
Thin Skin	**3292.153**	H-band nodding heightfinder	—
Token	**2892.153**	E/F-band early warning radar. V-beam antennas	—
Track Dish	—	Dish tracker on tracked van	—
Tub Brick	—	Search radar with radome on trailer	—
Twin Eye	—	Back-to-back dish antennas on building	—
Two Spot	**3295.153**	PAR group	—
Whiff	**2893.153**	Van-mounted fire control radar. E/F-band	—
Whiff Brick	—	Dish-type tracker on trailer van	—
Witch Eight	—	Eight-element dipole-plus-ground-plane array	—
Witch Five	—	Array of five Yagis	—
Witch Four	—	Quadruple dipole array	—
Wood Gage	—	Similar to OR-2	—
Yo Yo	**2895.153**	Early missile guidance radar for SA-1 Guild	—

Designation	Entry no	Description	Contractor(s)
UNITED KINGDOM			
AA No 3 Mk 7	—	Mobile AA fire control radar. Lock and follow	AEI
AA5504	**5767.153**	Muzzle velocity radar	GEC Avionics
ACR-6	—	Medium-range 10 cm search radar. Similar to CR 787 but with additional display and processing facilities	Cossor
ACR-7C	—	Mobile short-range I/J-band surveillance radar	Cossor
ACR 430	*2420.153*	Series of I-band air search and coastal defence radars	Plessey
AR-1	*1140.153*	E/F-band medium-range surveillance radar. 650 kW Single or dual transmitter/receivers with frequency diversity. Range 75 nm	Plessey
AR-3D	**2484.153**	E/F-band 3-D air surveillance radar	Plessey
AR-5	*2416.153*	D-band long-range surveillance radar. 2 MW Single or dual transmitter/receivers. Range 200 nm	Plessey
AR-15/2	*2456.153* and **1141.153**	E/F-band medium-range surveillance radar similar to and superseding AR-1. Available in static (*2456.153*) or mobile (**1141.153**) versions	Plessey
AR-320	**3649.153**	E/F-band surveillance radar. Used in UKADGE update programme	Plessey
AWS-7	*3281.153*	10 cm primary air and surface search radar	Plessey
AWS-8	*3480.153*	Coastal surveillance radar	Plessey
CEL 850	**3692.153**	IFF Interrogator	Cossor
Cervantes	*5631.153*	Mortar and rocket locating radar	Thorn-EMI
Coastal artillery radar	—	3 cm target acquisition and fire control for use with several coastal batteries	Racal
Cossor Monopulse	**4604.153**	Secondary surveillance radar	Cossor
CR 21	—	Medium-range 10 cm surveillance radar. Similar to CR 787 but less microwave preamplifier	Cossor
CR-62	**3715.153**	PAR. UK version of FPN-66	Cossor
CR 787	—	Medium-range 10 cm surveillance radar	Cossor
CR 901	—	23 cm long-range high-cover surveillance radar. 2 MW	Cossor
CRI 600	—	Microminiature IFF Mk 10 interrogator	Cossor
CRS 512	**5622.153**	Large aperture IFF/SSR antenna	Cossor
Cymbeline	**1018.153**	Mortar locating radar	EMI
DASR-1	—	10 cm back-to-back long-range/high-cover surveillance radar. 2800 kW transmitter/receivers. Range 110 nm	Plessey, formerly Decca
DASR-3	—	Improved performance version of DASR-1 2·5 MW transmitter/receivers. Range 150 nm	Plessey, formerly Decca
Falconer	**3715.153**	Precision approach radar	Cossor
FCE.AA No. 7	—	Anti-aircraft fire control radar for use with guns or missiles at close range	EMI
Firelight	**2413.153**	Type 86 (which see) target illuminating radar	Ferranti
Green Archer (FA No 8 Mk 1)	*2412.153*	Mortar locating radar	EMI
GS No 14 Mk 1	**2490.153**	See ZB 298	Marconi
GS No 18 Mk 1	*2483.153*	Infantry combat radar. Successor to ZB 298	Marconi
GS No 20	**3490.153**	Claribel hostile fire locating radar	Racal-MESL
Guardsman	**4607.153**	Point defence radar. Guardsman coastal defence radar (**5775.153**) is a variant	Plessey
HF-200	*1142.153*	E/F-band height finder radar. 2·5 MW. 10·6×2·4 m antenna	Plessey
IFF 600	**2410.153**	Solid-state military IFF/SIF secondary surveillance radar developed from SSR. 700	Cossor
LC 150	—	10 cm low cover coastal surveillance radar 800 kW. (10·6 m antenna)	Racal
Marconi OTH	**5869.153**	Over-the-horizon radar	Marconi
Martello (S713)	**3491.153**	Mobile 3D surveillance radar. Used in UKADGE update programme	Marconi
Martello (S723)	**4798.153**	New version of S713 Martello. Used in UKADGE and NADGE update programme	Marconi
Mk 10 IFF/SIF	*2418.153*	IFF Mk 10(SIF) interrogation and passive and active decoding equipment	Plessey
Messenger	**4603.153**	Monopulse SSR	Marconi
MSR	**5766.153**	Millimetric surveillance radar	Racal
NIS	**5621.153**	Range of IFF interrogators and transponders for NATO indentification system (NIS)	Cossor
Pacer	*2435.153*	Muzzle velocity measuring radar	Ferranti
Pacer 2	**5627.153**	Muzzle velocity measuring radar	Ferranti
Prowler	*1946.153*	Infantry radar	Marconi
Rapier	**2425.153**	Search and target acquisition radar for Rapier AA missile system	Racal
Rapier (DN 181)	**2439.153**	Tracking radar (Blindfire) for Rapier AA missile system	Marconi
S 105	—	3 cm fixed or mobile harbour and coastal surveillance radar. 70 kW.	Marconi
S 244	—	10 cm heightfinder radar. 2·5 MW 12·2×2·1 m antenna	Marconi
S247/S 266	**2458.153**	Back-to-back early warning radar. Two 2·25 MW transmitter/receivers, one 10 and one 23 cm	Marconi
S 259	*2480.153*	Air-transportable D-band 2 MW tactical radar with limited ground mobility	Marconi
S 264	—	Range of 50 cm long-range surveillance radars	Marconi
S 314	—	10 cm coastal defence radar. 800 kW. 8·8×3 m antenna 40 nm range	Marconi
S 330	**2463.153**	Land mobile tactical surveillance radar. Uses 2 low-profile back-to-back antennas, E/F-band, and D-band plus IFF	Marconi
S 404	**2463.153**	Land mobile G/H-band height finder radar	Marconi
S 500 Series	**5615.153**	Static and tactical surveillance radars. Comprises S511, S512, S513, S525, S531 and S532 operating in the 10 or 23 cm band	Marconi
S 505	—	3 cm harbour and coast watch radar. 20 kW	Marconi
S 513	*5641.153*	Primary surveillance radar	Marconi

Designation	Entry no	Description	Contractor(s)
UK cont			
S 600 Series	*1168.153*	Modular systems of transmitter/receivers, static and mobile antenna heads, displays and processing equipment capable of deployment to produce wide range of air defence radar systems. Main elements of S 600 Series are as follows:	Marconi
Antenna heads			
S 1006	—	10 cm static heightfinder antenna. 2·4×12·1 m cylindrical parabolic reflector with linear slotted feed	Marconi
S 1010	—	10 cm transportable surveillance antenna, 5·48×1·8 m single curvature parabolic reflector, linear feed, frequency diversity capability	Marconi
S 1011	—	10 cm static surveillance antenna. 13·7×4·57 m parabolic reflector. Can be used in back-to-back configuration	Marconi
S 1012	—	10 cm static surveillance antenna. 13·7×4·57 m cosecant-squared reflector. Can be used in back-to-back configuration	Marconi
S 1013	—	23 cm static surveillance antenna.13·7×4·57 m parabolic reflector. Can be used in back-to-back configuration	Marconi
S 1014	—	23 cm static surveillance antenna 13·7×4·57 m cosecant-squared reflector. Can be used back-to-back	Marconi
S 1015	—	10 m transportable surveillance antenna. 5·48×1·8 m cosecant-squared reflector	Marconi
S 1016	—	23 cm transportable surveillance antenna. 5·48×1·8 m cosecant-squared reflector	Marconi
S 1017	—	5·5 cm transportable heightfinder antenna. 4·27×1·3 m double curvature, point fed reflector	Marconi
S 1061	—	D-band surveillance. 7·6 × 2·4 m	Marconi
Transmitter/receivers			
S 2010	—	1 MW 10 cm transmitter/receiver. Tunable within band	Marconi
S 2011	—	2 MW 23 cm transmitter/receiver. Tunable within band	Marconi
S 2012	—	2·5 MW 10 cm transmitter/receiver	Marconi
S 2013	—	1 MW 5·5 cm transmitter/receiver	Marconi
S2018	**2458.153**	E/F-band; 3·3 MW	Marconi
S2019	**2458.153**	D-band; 3·3 MW	Marconi
S 613	**2479.153**	G/H-band mobile/transportable heightfinding radar. 1 MW	Marconi
S 631/S 647	**2458.153**	E/F- and D-band back-to-back 2-plus MW surveillance radars	Marconi
S 650	—	50 cm D-band surveillance radar. 16×3·7 m reflector 500 kW. 150 – 160 nm range	Marconi
S 654	*2459.153*	23 cm surveillance radar 11× 4·6 m reflector 2 MW, 90 nm range	Marconi
S 669	**2462.153**	E/F-band 2·25 MW 150 nm heightfinding radar	Marconi
S 670	—	50 cm surveillance radar 20·7×3·7 m reflector 500 kW. 180 nm range	Marconi
S 690	**2458.153**	E/F-band back-to-back surveillance radar	Marconi
S700 series	**4630.153**	Family of mobile surveillance radars in D- and E/F-bands. Comprises S704, S705, S706, S711 and S712	Marconi
S 841/S 842	**2464.153**	'800-series' mobile coastal defence I/J-band surveillance radars. Type S 842 has tunable transmitter	Marconi
ST850	**2466.153**	'800-series' I/J-band tracking radar with TV for use with Tigercat AA missile system (**2465.131**)	Marconi
SLA-3C	—	PAR	STC
Scorpion (Type 87)	**2428.153**	Target tracking and illuminating radar for Bloodhound II surface-to-air missile system	Marconi
Sentinel	*5619.153*	Mobile E/F-band tactical radar	Plessey
Shrimp	*2482.153*	J-band surveillance radar	GEC Avionics/RRE
Stingray (Type 83)	—	Target acquisition, tracking, and illuminating mobile radar for use with Bloodhound I and Thunderbird surface-to-air missiles. Used by UK, Swedish, and Australian forces	Marconi
Transportable Watchman	**4631.153**	Mobile version of Watchman	Plessey
Type 13	—	Heightfinder	—
Type 80	—	Long-range surveillance radar. Range 200 nm plus. Probably D-band	Plessey, formerly Decca
Type 82	*2457.153*	'Volumetric', stacked beam 3-D surveillance radar. Used for tactical control of Bloodhound I surface-to-air missiles	Marconi, formerly AEI
Type 83	—	Mobile target tracking and illuminating radar for Bloodhound I	Marconi, formerly AEI
Type 84	*2457.153*	High-power D-band surveillance radar	Marconi, formerly AEI
Type 85	*2457.153*	High-power stacked beam 3-D surveillance radar similar to AEI 4502. Used in Linesman/Mediator UK air defence/ATC system	Marconi, formerly AEI
Type 86 (Firelight)	**2413.153**	Mobile CW target illuminating radar for Bloodhound II surface-to-air missiles	Ferranti
Type 87 (Scorpion)	**2428.153**	Target tracking and illuminating radar for Bloodhound II. CW	Marconi, formerly AEI
Type 200	**1142.153**	E/F-band heightfinder radar. 2·5 MW. 10·6×2·4 m antenna	Racal
Type 430	**2420.153**	Airfield radar	Plessey
Type 431(M)	*3280.153*	Coastal radar. Fixed and mobile (M) versions	Plessey
Watchman	**5608.153**	E/F-band medium-range surveillance radar. Watchman coastal defence radar (**5774.153**) is a variant	Plessey
ZB 298	**2490.153**	Man-portable non-coherent I/J-band pulsed doppler battlefield surveillance infantry radar for location of men and vehicles out to 10 m	GEC Avionics
870 Series	**3693.153**	IFF interrogators	Cossor
880 Series	**3694.153**	IFF interrogators	Cossor
4502	—	Stacked beam 3-D long range 10 cm surveillance radar 12 lobes. Elliptical parabolic reflector. 17·7×6·6 m. 4 MW	Marconi, formerly AEI
40 Series	*2478.153*	Range of 3-D radars developed from 4502	Marconi, formerly AEI

Designation	Entry no	Description	Contractor(s)
UNITED STATES OF AMERICA			
ADAR	*2506.153*	Advanced design array radar. Electronically steered beam for tracking multiple targets	Hughes
AN/-	--	US joint service nomenclature for many systems listed below uses AN/- prefix. For convenience this prefix has been omitted. Thus AN/CPN-6 is listed simply as CPN-6	—
ARBAT	**4079.153**	J-band ballistic testing instrumentation radar	ITT-Gilfillan
ARSR-3/ASR-30	**5623.153**	D-band surveillance radar	Westinghouse
ARSR-3D	**5779.153**	3-D surveillance radar	Westinghouse
ASR-7	—	E/F-band surveillance radar giving 100 km range on 3 m² target. All digital signal processor. Frequency diversity and 1 MW transmitter available	Texas Instruments
Astar-2 & 3	**5868.153**	Surveillance radars for tactical use	Aydin Corp
AWCS	**2533.181**	Air weapons control system. Code number 412L, otherwise known as QUICKDRAW. Mobile control and warning system	General Electric
Baltic Approach	**4082.153**	E/F-band Danish coastal defence radar (DCR)	Cardion
BMEWS	**2525.181**	Ballistic missile early warning system to give warning of ICBM/IRBM attacks on USA/UK. Sites at Thule, Greenland (equipped with FPS-49 and FPS-50); Clear, Alaska (equipped with FPS-50 and FPS-92); and Fylingdales Moor, UK (equipped with FPS-49) System code 474L	General Electric, RCA and Western Electric
BPS-1000	**3149.153**	Long-range D-band surveillance radar	Bendix
Cobra Dane (663 A)	**1949.153**	Phased array space tracking radar	Raytheon
Cobra OTH-B	**5617.153**	Over-the-horizon surveillance radar	General Electric
CPN-4	—	Mobile GCA	ITT-Gilfillan
CPN-18	—	ATC surveillance radar	Bendix
CPS-1	—	Long-range, semi-transportable early warning radar	General Electric
CPS-5	—	ATC radar	Bendix
CPS-6B	—	Long-range search and heightfinder for early warning	General Electric
CPS-9	—	Weather radar	Raytheon
DEW	**2557.181**	Distant early warning system. Code number 413L	Western Electric
DCR	**4082.153**	See Baltic Approach	Cardion
DR810	**5778.153**	Muzzle velocity radar	Lear Siegler
EMS	—	Emergency mission support system. Air transportable, system designed to set up ATC, communications and varied facilities to support operations in areas where such facilities are not available. Code number 842L. Also known as Project FOUR WHEELS. Radars used TPN-14, TPS-35	Chu Associates, ITT-Gilfillan
FAAR	**1526.153**	Forward area alerting radar. Detects very low-flying high-speed aircraft; checks IFF identification; and relays data by VHF link to anti-aircraft sites equipped with Chaparral Redeye or Vulcan. Mobile system with high-mast antenna	Sanders Associates/Sperry
Falcon series (GPS-100)	**4322.153**	Frequency-agile low-coverage netted radar	ITT-Gilfillan
FPN-1A	—	Airfield approach and landing guidance radar system	Bendix
FPN-16	—	GCA-radar. Similar to CPN-4 and MPN-11	ITT-Gilfillan
FPN-28	—	GCA radar	Bendix
FPN-33	—	GCA radar	ITT-Gilfillan
FPN-34	--	Long-range D-band ATC radar	Bendix
FPN-36	**4125.153**	QUAD radar. Tactical GCA system	ITT-Gilfillan
FPN-40	—	GCA radar with IFF capability	ITT-Gilfillan
FPN-47	—	E/F-band medium-range ATC radar (ASR-5)	Texas Instruments
FPN-48	—	Landing Control Central GCA. Similar to MPN-13	ITT-Gilfillan
FPN-50	—	Landing Control Central GCA. Similar to CPN-4A	ITT-Gilfillan
FPN-51	—	E-band airport surveillance radar. Similar to FPN-47 but with ECM capability	Texas Instruments
FPN-52	**4076.153**	GCA PAR system based on FPN-16	ITT-Gilfillan
FPN-55	—	Similar to FPN-47	Texas Instruments
FPN-62	**3714.153**	PAR	Raytheon
FPQ-6	*2508.153*	MIPIR (Missile Precision Instrumentation Radar) G/H-band monopulse missile tracking radar. Transportation version is TPQ-18	RCA
	2846.153		
FPQ-13	*2857.153*	G/H-band monopulse missile tracking radar	RCA
FPQ-14	*2508.153*	Modified version of FPQ-6	RCA
FPS-3, 3A	--	D-band long-range radars	Bendix
FPS-5	—	Long-range radar	Hazeltine
FPS-6, 6A, 6B	**2492.153**	E/F-band long-range heightfinding radars. Superseded by FPS-89. Mobile version is MPS-14	General Electric
FPS-7, 7A, 7B, 7C, 7D	**2526.153**	10 MW 3-D search/GCI radar. Cosecant-squared elevation pattern with 7 stacked beams. Search range 500 km. Elevation cover 45 km. MTI, frequency diversity. Part of SAGE system	General Electric
FPS-8	**2493.153**	D-band long-range search radar with MTI. Superseded by FPS-88. Mobile version is MPS-11	General Electric
FPS-10	—	See FPS-27	
FPS-14	*2527.153*	E/F-band 500 kW medium-range (110 km) search radar used in SAGE system	Bendix
FPS-16	**4327.153**	G/H-band monopulse missile-tracking combined primary/secondary radar. Transportable version is MPS-25	RCA
FPS-17	—	Long range early warning radar for missile detection	General Electric
FPS-18	*2527.153*	1·2 MW E/F-band search radar used in SAGE	
FPS-19	—	DEW LINE radar	Raytheon
FPS-20, 20A, 20B	**2528.153**	Long-range, dual-channel search and GCI radar with MTI. 2 MW, D-band; range 350 km. FPS-20 is used in SAGE, FPS-20A in AWCS and FPS-20B in both. CPS-4 is mobile version	Bendix
FPS-23	--	Aircraft alarm system. VHF multiple station doppler aircraft intruder detection system	Motorola and Western Instruments
FPS-24	**2494.153**	Long-range search radar, used in SAGE	General Electric

Designation	Entry no	Description	Contractor(s)
USA cont			
FPS-26		Long-range heightfinder for SAGE. Possible application as early warning radar for SLBM after modification	Avco
FPS-27	—	Replacement for FPS-10. Search radar for SAGE. E-band	Westinghouse
FPS-28	—	Search radar for SAGE	Raytheon
FPS-30	—	Long-range duplex search radar. D-band	Bendix
FPS-33	—	D-band long-range, high-altitude tracker for supersonic targets Includes 2×FPS-8 or 2×MPS-11	General Electric
FPS-35	—	Long-range SAGE or ATC surveillance radar	Sperry
FPS-36	**2723.131**	Nike-Hercules radar. Others are FPS-56, FPS-61, FPS-69-71, FPS-75-76	Raytheon
FPS-37	**2499.153** **2723.131**	High-power acquisition radar for Nike-Hercules	General Electric
FPS-41	—	Long-range meteorological recording radar	Raytheon
FPS-46	—	Long-range electronically steerable array radar (ESAR) See FPS-85	Bendix
FPS-49	**2509.153**	Very long-range tracking for missile early warning (BMEWS) and satellite tracking (SPADATS)	RCA
FPS-50	**2511.153**	BMEWS surveillance radar	General Electric
FPS-56	**2723.131**	See FPS-36	
FPS-59	—	Tracking radar	General Electric
FPS-60	—	SAGE heightfinding radar	—
FPS-61	**2723.131**	See FPS-36	
FPS-63	—	DEW line gap-filler, being modified to FPS-74	Budd
FPS-64, 65, 66, 67, 67A	—	Search radars for SAGE. FPS-67A is also used in AWCS	Bendix
FPS-69, 70, 71	**2723.131**	See FPS-36	
FPS-74	—	See FPS-63	
FPS-75, 76	**2723.131**	See FPS-36	
FPS-77	—	Weather radar	Lear Siegler
FPS-78, 79, 80	—	Tracking radars. FPS-79 and FPS-80 are part of SPACETRACK	General Electric
FPS-85	**2546.153**	D-band 3-D phase array radar for satellite detection, identification and tracking. Based on FPS-46 and part of SPADATS/SPACETRACK	Bendix
FPS-87A	—	Long-range D-band surveillance radar. Similar to FPS-91	Bendix
FPS-88, 89	**2512.153** **2513.153**	Modernised versions of FPS-6, FPS-8	General Electric
FPS-90	—	High-power heightfinder, version of FPS-6 ( ). Similar to APS-507 another version of FPS-6B	General Electric and Canadian Marconi
FPS-91	—	Long-range search and tracking radar. Version of FPS-20	Bendix
FPS-92	**2509.153**	BMEWS scanner/tracker radar. Improved version of FPS-49	RCA
FPS-93	—	Modification of FPS-20	Raytheon
FPS-95	—	Tracking radar	RCA
FPS-100	—	Modernised FPS-20	Bendix
FPS-103	—	Weather radar	Bendix
FPS-105(V)	**2847.153**	G/H-band range instrumentation radar	RCA
FPS-115	**3174.153**	Pave Paws	Raytheon
FPS-117	**4326.153**	Long-range 3-D air defence radar for Seek Igloo programme	General Electric
FPS-118	**5617.153**	Nomenclature for CONUS OTH-B radar	General Electric
FPS-507	—	See FPS-90	Canadian Marconi
FPT-5, 7	—	Long-range surveillance and tracking radar transmitters	Ling Temco Vought
FSS-7	*2538.153*	Radar surveillance central for SLBM system	Avco Cincinnati
GE 592	**4321.153**	Export version of TPS-59	General Electric
GPN-2	—	Mobile ATC radar	Bendix
GPN-6	—	E/F-band ATC surveillance radar 150 km range	LFE
GPN-22	**3713.153**	PAR. Improved TPN-25	Raytheon
GPS-3	—	D-band back-up surveillance radar	General Electric
GPS-4	—	See FPS-20	
GPS-57A	—	Surveillance radar	Bendix
GSN-5	—	Landing Control Central automatic landing system	Bell
GSS-1	—	Mobile gap-filler radar	Raytheon
GSS-7	—	Mobile air defence radar	Raytheon/Hazeltine
HADR	**3721.153**	Electronic scan multi-mode 3-D air defence radar	Hughes
HIPAR	**2499.153**	High-power acquisition radar for Nike Hercules See FPS-37	General Electric
LAADS	**3123.153**	Low-altitude aircraft detection system	Sanders
LASR	**4323.153**	Low-altitude surveillance radar	Hughes
MFR (Multi-function radar)	**5607.153**	Weapon control radar	Hughes
Model 2679	**4632.053**	IFF interrogator	Hazeltine
MPG-1	—	Coastal artillery fire control radar	Bendix
MPN-1, 11, 13, 14, 15	—	Mobile GCA radars	ITT-Gilfillan
MPN-3, 5	—	Mobile GCA radars	Bendix
MPQ-4	**2497.153**	Mortar-locating radar	General Electric
MPQ-10A	**2500.153**	E/F-band mortar locating radar	Sperry
MPQ-12, 18	—	E/F-band 300 km range missile tracking radars	Reeves
MPQ-14	—	Radar Course Directing Central	Advance/Ultrasonic
MPQ-25	—	Trailer-mounted radar for Corporal missile system	ITT-Gilfillan
MPQ-29	—	Drone control radar	Sperry
MPQ-31	—	E/F-band 4000 km range 3-D tracking and guidance radar	Canoga
MPQ-32	—	Field detection and tracking radar	Sylvania
MPQ-33	*2640.131*	CW illuminator for Hawk missile system. Also MPQ-39	Raytheon
MPQ-34	*2640.131*	CW target acquisition radar for Hawk	Raytheon
MPQ-35	*2640.131*	Pulse target acquisition radar for Hawk	Raytheon
MPQ-37	*2640.131*	Range radar for Hawk	Raytheon
MPQ-39	*2640.131*	See MPQ-33	
MPQ-43	**2723.131**	HIPIR mobile high-power acquisition radar for Nike Hercules	General Electric
MPQ 49/54	**1526.153**	See FAAR	

Designation	Entry no	Description	Contractor(s)
USA cont			
MPQ-53	**4478.153**	Multi-function radar group for Patriot air defence missile system	Raytheon
MPQ-501	—	Mortar locating radar. Used in Canada	Raytheon
MPS-3, 4	—	Heightfinding radars	Raytheon
MPS-4, 4A, 4C	—	Heightfinding radars	Hazeltine
MPS-7	—	Long-range D-band search radar	Bendix
MPS-9	—	E/F-band drone and missile control radar. Range 300 km	Reeves
MPS-11, 11A	**2493.153**	See FPS-8	
	2495.153		
MPS-14	**2492.153**	See FPS-6	
	2495.153		
MPS-16	—	Nodding heightfinder for AWCS G/H-band; 300 km range	Crosley
MPS-19	—	Mobile tracking radar. E-band	Reeves
MPS-21	—	3-D search radar. See also TPS-34	Sperry
MPS-23	—	FRESCAN-elevation frequency scanning 3-D search radar	Hughes
MPS-24	—	See TPS-28	
MPS-25	**4327.153**	See FPS-16	
MPS-30	—	Mobile surveillance radar; trailer-mounted TPS-25	Hazeltine, FMC
MPS-36	**2514.153**	Instrumentation tracking radar	RCA
MPS-117	**5776.153**	IFF tracking system for FPS-117	Eaton
MSG-1	—	Transportable AA artillery director radar	Sperry
MSQ-1A	—	Aircraft ground attack director system	Reeves
MSQ-2	—	Mobile ground attack director system	Reeves
MSQ-4	—	Mobile ATC system	Adler Communication
MSQ-35		300 km range I/J-band tracking radar	Reeves
MSQ-39	—	Radar Bomb Scoring Central	Reeves
MSQ-44	—	Radar Bomb Scoring Central	Reeves
MSQ-51	—	Target drone control system	Reeves
MSQ-77	—	Radar Bomb Directing Centre	Reeves
MSR	*2791.153*	Missile site radar for Safeguard ABM system. Phased	Raytheon
	2798.131	array type. Prototype at Kwajalein test area	
MSW-1	**2723.131**	Acquisition radar for Nike Ajax and Nike Hercules systems	—
MTTS	—	Mobile target tracking system for drone tracking	Epsco
OTH R	*1948.153*	Over-the-horizon radars	—
OX-60/FPS-117	**4317.153**	IFF interrogator for FPS-117 Seek Igloo radar	Hazeltine
Pave Paws	**1949.153**	Missile warning radars	GE, Raytheon, RCA
	3174.153		
PAR	*2790.153*	Perimeter Acquisition Radar for Safeguard ABM systems	—
	2798.131	Under development	
PAR 80	**4077.153**	Fixed site J-band PAR	ITT-Gilfillan
PPS-3	—	Portable surveillance radar	Sperry
PPS-4	—	Silent Sentry portable forward area surveillance radar	Sperry
PPS-5/5B	**2540.153**	Transistorised versions of PPS-4	AIL
PPS-6	**5604.153**	Portable battlefield surveillance radar	General Instrument Corp
PPS-9	—	Portable battlefield surveillance radar	RCA
PPS-11/12	**5616.153**	Hand-held battlefield surveillance radar	General Instrument Corp
PPS-15A	**1947.153**	I/J-band infantry radar	General Dynamics
	4324.153		
PPS-55	—	Portable forward area surveillance radar	—
PSS-10	**5605.153**	Miniature battlefield radar receiver	General Instrument Corp
Quadradar Mk V	**4125.153**	Multi-function ATC radar	ITT-Gilfillan
Quadradar Mk VI	**4328.153**	Development of Quadradar Mk 5 with MTI	ITT-Gilfillan
R-200 Series	*3640.153*	J-band infantry radar	General Instrument Corp
R-2080	*4316.153*	Battlefield surveillance radar	General Instrument Corp
RCA 2019 M2	*2783.153*	I/J-band hand-held tactical radar. System weight 4 kg; T/R weight 1 kg; range 500 m on 0·5m² target. Resolution 25 m. Aural output	RCA
RCA 4019 M2	*2783.153*	I/J-band hand-held tactical radar. System weight 6·35 kg including accessories; T/R weight 3·6 kg; range 1500 m, resolution 25 m. Aural and/or visual output	RCA
Real-time velocimeter	**5628.153**	Transportable artillery tracking radar	Datron
ROTHR	**5781.153**	Relocatable over-the-horizon-radar	Raytheon
SAGE	**2803.181**	Semi-automatic ground environment system for detecting, identifying and tracking aircraft threats to North America and directing weapon interception. Code number 412L	Western Electric, System Development Corporation Burroughs
SAM-D	**2800.131**	Phased array radar for SAM-D guided missile system now under development	Raytheon
Sentry	**5777.153**	Tactical defence radar- licensed version of Elta EL/M-2106	Lear Siegler
Series 52	**4076.153**	Remote controlled PAR	ITT-Gilfillan
Series 320	**4078.153**	Transportable 3-D E/F-band air defence radar	ITT-Gilfillan
Site Defence Radar	*2792.153*	Phased-array radar similar in purpose to MSR but smaller	General Electric
SLBM	-	Sea-launched ballistic missile detection system. Purpose is to detect and identify missile attack on North America and warn NORAD and SAC. Code number 474N	Avco
Spacetrack	**2825.181**	USAF world-wide detection, identification, tracking, and reporting system. Records data on all space objects Spacetrack is US section of NORAD SPADATS system Spacetrack code number 496L	General Electric, Philco-Ford, RCA, Bendix, System Development Corporation
SPADATS	**2825.181**	NORAD space object detection and recording system of which SPACETRACK is large part	—
STARTLE	**3648.153**	AFV surveillance and target acquisition radar Development suspended late 1982 for 12 months	Martin Marietta
TMQ-19	*3477.153*	Meteorological radar	Servo Corps
TPN-8	—	Helicopter-transportable approach radar	ITT-Gilfillan
TPN-12		ATC GCA	LFE, Bendix
TPN-14		Transportable GCA for EMS	ITT-Gilfillan, RCA
TPN-17	—	Air-transportable landing control centre	LFE

Designation	Entry no	Description	Contractor(s)
USA cont			
TPN-18A	**3129.153**	Lightweight I band air transportable ATC radar	ITT-Gilfillan
TPN-19	**2537.153**	All-weather transportable tactical ATC radar with E/F-band terminal area surveillance and I/J-band,dual-mode (search and track) 6 target. PAR. Cassegrain feed antenna	Raytheon
TPN-22	**4075.153**	Automatic all-weather landing radar system	ITT-Gilfillan
TPN-24	**3711.153**	Airfield surveillance radar element of TPN-19 system	Raytheon
TPN-25	**3712.153**	PAR used in TPN-19	Raytheon
TPQ-10	**2498.153**	Transportable radar course direction central for control of close support bombing operations	General Electric
TPQ-14, 15, 16	*2640.131*	Transportable versions of MPQ-33, 34, 35	Raytheon
TPQ-18	**2846.153**	Transportable version of FPQ-6	RCA
TPQ-19	*2640.131*	Transportable version of MPQ-39	Raytheon
TPQ-27	*3720.153*	Radar Course Directing Central	RCA
TPQ-28	—	Omni-directional mortar-locating radar	ITT-Gilfillan
TPQ-31	*1950.153*	Mortar-locating radar	Raytheon
TPQ-32	**1526.153**	See FAAR	
TPQ-36	**2848.153**	Electronically-scanning mortar locating radar. Used by US and Australia	Hughes
TPQ-37	**1976.153**	Artillery locating radar	Hughes
TPQ-39	**2849.153**	G/H-band digital instrumentation radar	RCA
TPS-1	*3128.153*	Transportable D-band air search radar. Version of FPS-36	
TPS-10D	—	I/J-band heightfinder. 220 km range	RCA
TPS-21	**2529.153**	Portable I/J-band battlefield surveillance and reconnaissance radar. Range 9 km. Also TPS-33	Admiral
TPS-22	—	Tactical early warning radar for AWCS system Complemented by TPS-27	Westinghouse
TPS-25, 25A	*3130.153*	Battlefield surveillance radars	Hazeltine
TPS-27	*2515.153*	3-D tactical radar for AWCS. Complemented by TPS-22	Westinghouse
TPS-31	—	Harbour surveillance radar	Raytheon
TPS-32	**2516.153**	Automatic 3-D tactical long-range surveillance radar	ITT
TPS-33	**2529.153**	See TPS-21	Admiral
TPS-34	**2530.153**	3-D (V-beam) tactical long-range early warning radar	Sperry
TPS-35	—	D-band 500 km surveillance radar for UMS. Modernised version of UPS-1	RCA
TPS-37	—	Transportable version of MPS-16	Avco
TPS-40	—	Long-range heightfinder. Transportable. Similar to MPS-16 and TPS-37	General Electric
TPS-43	**2517.153**	Transportable 3-D tactical tracking radar measuring range, altitude, and azimuth plus IFF identification ECM-resistant for forward area operation	Westinghouse
TPS-44	**2518.153**	Transportable tactical surveillance radar (ALERT)	Cardion
TPS-48	*2519.153*	Transportable 3-D tactical radar	Westinghouse
TPS-58	**1528.153**	US designation for RATAC battlefield radar	ITT-Gilfillan
TPS-59	**3282.153**	3-D tactical radar	General Electric
TPS-61	*2520.153*	Tactical surveillance radar	Westinghouse
TPS-63	**3475.153**	Tactical surveillance radar. Operated by USMC	Westinghouse
TPS-65	**3476.153**	Tactical surveillance radar	Westinghouse
TPS-70 (V)-1, -2, -3, -4	**4319.153**	Mobile tactical radar. Air surveillance	Westinghouse
TPX-19, 20, 22	—	Mk X IFF interrogator-responsors	Raytheon
TPX-42	**2535.153**	IFF interrogator system	AIL
TPX-44	—	Interrogator used with TPN-18	ITT-Gilfillan
TPX-45	—	IFF for Hawk missile system	Hazeltine
TPX-46	**3703.153**	IFF interrogator used with various systems	Hazeltine
TPX-50	*3704.153*	IFF interrogator for FAAR system	Hazeltine
TPX-54	**3705.153**	IFF interrogator	Hazeltine
TSQ-81	—	Radar Bomb Directing Central	Reeves
TSQ-96	—	Bomb Directing Central	Reeves
TSW-5	—	Tactical approach radar	RCA
TTQ-28	—	Mortar-locating radar	ITT-Gilfillan
TWS-QR	**4320.153**	Track-while-scan-quiet radar development	Hughes
Type 386	**4325.153**	Battlefield ground surveillance radar	General Dynamics
UPS-1	–	Gap-filler radar for AWCS. See also TPS-35	RCA, Bendix
UPW-1	—	Drone tracking and control radar	Ford, Sperry
UPX-6	—	Mk X IFF interrogator-responsor	Raytheon
VPS-2, 5	**2547.153**	Vulcan air defence system radar	Lockheed
	2844.153		
	2850.131		
Vigilant	**5870.153**	Tactical surveillance radar	Westinghouse
VSTAR	**4080.153**	Transportable E/F-band air defence radar, based on TPQ-37	Hughes
W-2000	**5780.153**	3-D surveillance radar	Westinghouse

ELI 4	*1688.253*	Naval IFF interrogator	LMT
ELR-3	*1934.253*	IFF transponder	LMT
Triton II	**1062.253**	TRS 3030 5 cm air and surface surveillance radar. Used with Castor or Pollux in Vega Series. 205 kW. TRS 3035 is MTI version	Thomson-CSF
Triton C	**3685.253**	TRS 3050 doppler surveillance radar	Thomson-CSF
Triton G	**5844.253**	C-band air and surface surveillance radar	Thomson-CSF
Triton S	**3254.253**	TRS 3033 pulse doppler version of Triton	Thomson-CSF
Triton X	**3481.253**	TRS 3040 used in Vega-Canopus fire control	Thomson-CSF
Castor II	**1063.253**	TRS 3201-4 I/J-band target tracking radar used in some versions of Vega Series fire control system 20 kW	Thomson-CSF
Pollux	**1064.253**	TRS 3220 I/J-band target tracking radar used in some versions of Vega Series fire control systems. 200 kW	Thomson-CSF
Pollux II	*1686.253*	Improved version of Pollux	Thomson-CSF
Calypso II	*1240.453*	TH.D 1030. I/J-band submarine radar for surveillance and navigation. 70 kW	Thomson-CSF
Calypso III	**1933.253**	TRS 3100 I/J-band submarine radar. Improved version of Calypso II	Thomson-CSF
Calypso IV	**3684.253**	TRS 3110 submarine navigation radar	Thomson-CSF
Jupiter	**1236.253**	TRS 3010 Long-range surveillance radar. D-band. 2MW	Thomson-CSF
Ramses	*1239.253*	TH.D 1022. Short-range navigational and surveillance radar. I/J-band. 35 kW. 60 nm range	Thomson-CSF
Lynx	*1238.153*	TH.D 1051. Dual radar coastal mine-watching system	Thomson-CSF
Saturne	*1237.253*	TRS 3043 E/F-band medium-range air and surface surveillance radar. 1 MW peak	Thomson-CSF
Sea Tiger II	**1687.253**	TRS 3001 surveillance radar. Ordered for new Colombian frigates	Thomson-CSF
Triskel	**5845.253**	Multi-function C-band radar	Thomson-CSF
DRBC 32	**1894.253**	Series of gun fire control radars. A, B, C, D, and E versions fitted in various classes of French ships	—
DRBC 33	**5843.253**	Fire control I-band radar	Thomson-CSF
DRBI 10	**1593.253**	E/F-band 3-D air surveillance radar. Robinson scanner	Thomson-CSF
DRBJ 11	**3741.253**	Electronic scan naval radar	Thomson-CSF
DRBV 13	**1893.253**	E/F-band pulse-doppler air search radar. Multi-mode operation	—
DRBV 20	**1892.253**	Long range metric air surveillance radar A and C versions in service	—
DRBV 22	**1891.253**	Search radar. A, C, and D versions in service on French and foreign vessels	—
DRBV 23	**1594.253**	D-band long-range air search radar. B and C versions in service	Thomson-CSF
DRBV 26	**1236.253**	Sea Jupiter	Thomson-CSF
DRBV 27	**1236.253**	Solid-state version of Jupiter. In development	Thomson-CSF
DRBR 51	**1177.231**	I/J-band tracker and target illuminator. 3 scanners	Thomson-CSF
	1890.253	Part of Masurca surface-to-air missile system	
DRBI 23	**1177.231**	3-D surveillance and target designator	Thomson-CSF
	1889.253	radar. D-band 23 cm. Stacked-beam system	
3973A	**3255.253**	IFF interrogator antenna system	Thomson-CSF

EL/M 2208	**4610.253**	Air & surface surveillance radar	Elta
EL/M-2221	**3709.253**	J-band naval fire control radar	Elta
ITALY			
Argus 5000	—	High-power ship's early warning radar. 5 MW peak power	Selenia
MM/BPS-704	**3483.253**	Italian Navy version of 3RM I-band radar for submarine use	SMA
MM/SPN-703	**3482.253**	Italian Navy version of 3RM for surface roles	SMA
MM/SPQ-701	**3262.253**	I-band search and target designation radar	SMA
MM/SPS-702	**3263.253**	Simplified version of MM/SPQ-701	SMA
MM/SPS-768	**1364.253**	Italian Navy version of RAN-3L	Selenia
MM/SPS-774	**1699.253**	Italian Navy version of RAN-10S	Selenia
Orion 250	—	I/J-band fire control radar. Used in NA9 system. Conical scan. 200 kW	Selenia
Orion RTN-10X	**1368.253**	Fire control radar. Usec by RN and Brazil	Selenia
Orion RTN-16X	*1367.253*	I/J-band monopulse fire control radar	Selenia
Orion RTN-20X	**1935.253**	I/J-band fire control radar. Used in DARDO system	Selenia
Orion RTN-30X	**1936.253**	I/J-band fire control radar. Used in Albatros system. Production for Italy 1982	Selenia
RAN-2C	*1700.253*	G/H-band dual purpose air and surface surveillance radar	Selenia
RAN-3L	**1364.253**	D-band early warning radar. Digital signal processing	Selenia
RAN-7S	*1527.253*	10 cm air and surface search radar	Selenia
RAN-10S	**1699.253**	E/F-band dual purpose air/sea search radar	Selenia
RAN-11L/X and 12L/X	**1365.253**	D- and I/J-band system for air warning and weapons control on small ships. Operational Denmark, ordered by Peru and Venezuela	Selenia
RAN-13X	*1701.253*	I/J-band search radar	Selenia
RAN-14X	*1366.253*	I/J-band low altitude and surface search radar	Selenia
Sea Hunter	*1704.253*	Search radar	Contraves
Sea Hunter	*1705.253*	Tracker radar	Contraves
SPQ-2D	**1703.253**	I/J-band search radar	SMA
3RM	**1702.253**	Series of I-band navigation and surface warning radars	SMA

805 Series	**4302.253**	Naval tracking radar for fire control	Marconi
AWS-1	*1139.253*	Naval version of land-based AR-1	Plessey
AWS-2	**1751.253**	Improved version of AWS-1	Plessey
AWS-3	*3170.253*	Advanced version of AWS-2	Plessey
AWS-4	**3171.253**	Lightweight antenna version of AWS-2. Integrated IFF	Plessey
AWS-5	**3172.253**	Advanced version of ASW-4. Integrated IFF	Plessey
AWS-6	**5620.253**	Search and surveillance radar for naval point defence	Plessey
CEL 850	**3699.253**	Naval IFF interrogator	Cossor
Cossor IFF	*1571.253*	Naval IFF Mk 10 (SIF) 800 Series, 825, 825M	Cossor
Decca	**1941.253**	I/J-band navigation/tactical radars	Decca
Dolphin	*4004.253*	Target detection radar for Seaguard weapon system	Plessey
IFF 877	*3700.253*	Naval IFF interrogator	Cossor
MRS3/GWS 22	**1563.253**	Seacat and gun fire control radar	Sperry
PTR 461	*1896.253*	Shipborne IFF transponder	Plessey
PTR 826	*3259.253*	Shipborne IFF interrogator	Plessey
RRB	**3487.253**	Transponder reply receiver for use with ARI 5983/5954	Microwave Assoc
S604 HN	*1895.253*	Search radar. Fitted Egyptian Ramadan class ships	Marconi
S810	**1754.253**	Surveillance radar. Fitted Egyptian Ramadan class ships	Marconi
S820	**1754.253**	E/F-band surveillance radar	Marconi
S1600	**5632.253**	Radar series for navigation and short-range surveillance	Marconi
S1800	**3687.253**	Series of naval surveillance radars (S1820, S1821 and S1840) based on S810/820	Marconi
SNG 20	—	Fire control system	Marconi
SNW 10	—	Metric wavelength early warning radar	Marconi
SNW-12	—	Early warning radar. 150 cm, 450 kW, 4·28×2·14 m scanner	Marconi
SNW-20	—	Early warning radar	—
ST802	**1508.253**	Lightweight fire control radar	Marconi
ST 804	*3686.253*	Naval tracking radar	Marconi
TM626	—	Small navigational radar	Decca
Type 262	—	Short-range anti-aircraft fire control radar	EMI
Type 277	—	Nodding heightfinder radar	—
Type 293	—	General purpose E/F-band search radar	—
Type 294	*3281.253*	Plessey adaptation of RN Type 293	Plessey
Type 901	**1752.253**	Seaslug missile target tracking and guidance radar	Marconi
Type 903	**1563.253**	J-band conical scan tracker used with MRS3 director	Sperry/Plessey
Type 904	**1563.253**	J-band conical scan tracker used with MRS3 director	Sperry/Plessey
Type 909	**1559.253**	Target tracker and illuminating radar for Sea Dart missile system (GWS 30). 8ft cassegrain antenna	Marconi
Type 910	**1562.253**	Tracking radar for Seawolf missile	Marconi
Type 911	**5630.253**	Tracking radar for lightweight Seawolf (previously 805SW)	Marconi
Type 912	**1558.253**	RN designation of Selenia RTN-10X	—
Type 944	—	IFF	—
Type 965	**1560.253**	Primary search radar	Marconi
Type 967	**1561.253**	Compact air surveillance radar. Combined in Sea Wolf system	Marconi
Type 968	**1561.253**	Surface surveillance radar	Marconi
Type 975	**1253.253**	Lightweight I/J-band high definition surface warning radar. 50 kW	Kelvin Hughes
Type 975ZW	**1253.253**	Minehunting version of Type 975. True motion display plus sonar contact working	Kelvin Hughes
Type 978	*1254.253*	3 cm navigational radar. Double-cheese scanner. Successor to Type 974	Decca
Type 979	—	Similar to 978 but with additional B-scope display	
Type 982	—	Aircraft direction	—
Type 983	—	Nodding heightfinder radar	—
Type 984	*1041.253*	3-D air surveillance long-range radar	Marconi
Type 992	*1255.253*	Long-range surveillance radar. Obsolescent	EMI
Type 992Q	**1753.253**	Solid-state general purpose radar	Marconi
Type 993	—	E/F-band search radar	—
Type 994	**3260.253**	Combination of Type 993 antenna with AWS-2 transmitter/receiver	Plessey
Type 996	**4634.253**	3-D surveillance and target indication radar for Type 23 frigates, Type 42 destroyers and Invincible class carriers	Plessey
Type 1006	**1394.253**	Successor to Type 975. Solid-state. 305mm display	Kelvin Hughes
	5847.253	Max range 64 nm	
Type 1007		I-band surveillance radar	Kelvin Hughes
Type 1010	*3598.253*	RN version of Cossor IFF 800	Cossor

Designation	Entry no	Description	Contractor(s)
UK cont			
Type 1013	**3701.253**	Naval version of Cossor IFF 2750	Cossor
Type 1022	**3486.253**	Replacement for Type 965 long-range radar. Fitted in various classes	Marconi
Type 1030	*3485.253*	Surveillance and target indication radar. Type 992Q replacement	Marconi
Type 1800	**3485.253**	Export version of Type 1030	Marconi

BPS-1	—	Submarine I-band search and fire control radar	Western Electric
BPS-2	—	Submarine D-band air search radar	Raytheon
BPS-3	—	H-band submarine air search radar	Western Electric
BPS-4	—	Short-range submarine air and surface search radar	Westinghouse
BPS-5	—	Short-range surface search radar for SSN 593 subs	Lockheed Electric
BPS-9	—	Submarine I-band air search radar	Western Electric
BPS-11	—	Submarine surface-search radar for SSB 616 subs	Western Electric
BPS-12	—	Medium range submarine surface-search radar	Fairchild
BPS-13	—	Similar to BPS-12	Fairchild
BPS-14	—	Similar to BPS-12. I/J-band	Fairchild
BPS-15	—	Submarine search and navigation radar. I-band	Sperry
FAST	**4608.253**	C and S-band search radar	General Electric
FLEXAR	**3258.253**	Weapon control system radar	Hughes
HR-76	**3768.253**	I-band combined search and track FCS radar for H-930 system	RCA
MBAR	**4233.253**	Multiple beam acquisition radar	Raytheon
RTN-10	*1245.253*	I/J-band fire control radar for Sea Sparrow III	Raytheon
Ship OTHR	*1937.253*	Shipboard over-the-horizon radar project	—
SPA-72	—	3-D fixed planar array surveillance radar	Hughes
SPG-49	*1749.253*	Guidance radar for Talos and Terrier surface-to-air missiles Used with SPW-2	Sperry
SPG-51	**1247.253**	Tartar missile guidance radar. I/J-band. Part of Mk 73 FCS	Raytheon
SPG-55	**1748.253**	Terrier missile fire control radar. G/H-band	Sperry
SPG-56	*1750.253*	Talos fire control radar. G/H-band	Sperry
SPG-59	—	Typhon missile radar. Performs all functions. Luneberg lens	Westinghouse
SPG-60	**1932.253**	Mk 86 FCS search and track radar	Lockheed
SPQ-5	*1938.253*	Early guidance radar	Sperry
SPQ-9	**1931.253**	Track-while-scan surface fire control radar used in Mk 86 FCS Housed in 300 cm radome	Lockheed —
SPQ-11	**4301.253**	Missile space tracking radar. Cobra Judy. Operational	Raytheon/RCA/CSC
SPQ-55	—	Terrier tracking and guidance radar	Sperry
SPQ-60	—	Pulse doppler air target tracking radar used in Mk 86 FCS	—
SPS-3	—	Surveillance radar	Sylvania
SPS-4	—	Air and surface surveillance radar	Raytheon
SPS-5	—	Surface surveillance radar	Raytheon
SPS-6	**1744.253**	Search radar	Westinghouse
SPS-10	**1564.253**	G/H-band surface search radar	Sylvania/Raytheon
SPS-12	*1566.253*	D-band medium/long-range surveillance radar	RCA
SPS-17	—	Long-range surveillance radar	General Electric
SPS-23	—	Heightfinder	General Electric
SPS-29	—	Air surveillance radar for guided missile destroyers	Westinghouse
SPS-30	**1745.253**	Long-range 3-D radar	General Electric
SPS-32	*1250.253*	3-D fixed planar array electronic scanning air and surface search radar	Hughes
SPS-33	*1251.253*	3-D fixed planar array electronic scanning target tracking radar	Hughes
SPS-34	—	Shipborne version of FPS-7 stacked beam 3-D radar	General Electric
SPS-37	**1565.153**	Air search radar	Westinghouse
SPS-39	**1249.253**	'Frescan' hybrid 3-D air target search radar	Hughes
SPS-40	**1746.253**	Air search radar. 'A' version has IFF	Norden
SPS-42	—	Hybrid electronic scanning 3-D radar	Hughes
SPS-43	**1747.253**	Air search radar	Westinghouse
SPS-48	**1252.253**	E/F-band long-range frequency scanned search and target acquisition radar. C and E versions now in production	ITT-Gilfillan
SPS-49	**1939.253**	Long-range air search radar for fitting in 5 Spanish FFGs	—
SPS-52/52A/52B	**1248.253**	Rotating planar (hybrid) 3-D surveillance radar	Hughes
SPS-52C	**5606.253**	Development of SPS-52	Hughes
SPS-55	**1697.253**	I/J-band surface radar	Cardion
SPS-58	**1359.253**	D-band air search radar used in H-930 FCS	Westinghouse
SPS-58LR	**4300.253**	Long-range version of SPS-58	Westinghouse
SPS-59	**3749.281**	Surface search radar used in H-930 FCS	—
SPS-63	**1940.253**	US designation for Italian 3RM series radars (SMA) Used on NATO hydrofoil	—
SPS-65	**1359.253**	Variant of SPS-58	Westinghouse
SPS-67	**3722.253**	Solid-state transmitter/receiver to update SPS-10. New antenna being designed	Norden
SPW-2	—	Talos guidance radar. Used with SPG-49	Sperry
SPY-1	**1570.253**	Multi-function array radar for Aegis system. Electronic scan	RCA/Raytheon
Type 23 TAS	**4609.253**	2-D acquisition radar for NATO Sea Sparrow	Hughes
W-120	**3256.253**	Shipboard version of APQ-120 fire control	Westinghouse
W-160	**4048.253**	J-band fire control radar	Westinghouse
W-611	**3257.253**	Shipboard version of TPS-61 D-band search radar	Westinghouse

1194.354 Airborne Radar

Designation	Entry no	Description	Contractor(s)
CANADA			
APS-504	**3473.353**	ASV search radar	Litton
IRIS	**5874.353**	SAR reconnaissance radar	McDonald-Dettwiller

Designation	Entry no	Description	Contractor(s)
FRANCE			
Agave	**1672.353**	I/J-band helicopter radar. Fitted French Navy Super Etendards, Jaguar International, all export Mirage FL and 50	Thomson-CSF/ESD
Aida I	—	Boresight ranging radar. Fitted French Navy Etendard IVM. I/J-band	Electronique Serge Dassault
Aida II	**1211.353**	Improved version of Aida I	Electronique Serge Dassault
Antilope	—	All weather strike radar, J-band. 4-lobe cassegrain antenna. Terrain following, mapping, ground attack	Electronique Serge Dassault
Antilope II	—	Simplified version of Antilope for light aircraft	Electronique Serge Dassault
Antilope IV	*1963.353*	Nose radar development for penetrator version of Super-Mirage	ESD/Thomson-CSF
Antilope V TC	**3297.353**	Strike radar for Mirage 2000N	Thomson-CSF
Cobra	—	Low-level strike and terrain following. Experimental system. Some features used in Cyrano III	Thomson-CSF
Cyrano I bis (RA 536)	*1050.353*	Monopulse fire control radar. Used in Mirage IIIC. I/J-band	Thomson-CSF
Cyrano II (RA 537)	*1051.353*	Monopulse fire control radar. Cassegrain antenna. Used in Mirage IIIE. I/J-band	Thomson-CSF
Cyrano III (RA 538)	**3131.353** *1052.353*	9 models in range, providing number of options up to full multi-role capability including air and ground attack and terrain following	Thomson-CSF
Cyrano IV	**1396.353**	Attack radar, air-air/air-ground. French F1s retrofitted with Mk IVM	Thomson-CSF
DRAA-2B	*1961.353*	ASV and navigation radar for Atlantic ASW aircraft	Thomson-CSF
DRAC-25	—	I/J-band fire control radar used in French Vatour fighters	Thomson-CSF
ESD 3300/3400	**1962.353**	IFF transponders	ESD
Heracles	**1960.353**	System of modular tactical radars based on ORB-31	Omera-Segid
Iguane/Agrion/Varan	**3298.253**	ASV radars in production for fixed and rotary wing aircraft	Thomson-CSF
Madrague	—	Pulse doppler early warning radar	Electronique Serge Dassault
Mirage 2000	**3297.353**	Pulse-doppler I/J-band radar for Mirage 2000. Multi-mode RDM version delivered to French AF 1983	Thomson-CSF/ESD
NR-A1-3-A	*1674.353*	Airborne IFF interrogator	LMT
NRA1-7A	**5871.353**	Airborne IFF interrogator	LMT
NRA1-10A	**5872.353**	Airborne IFF interrogator	LMT
NRA1-11	**5873.353**	IFF interrogator/decoder	LMT
ORB-31	**1793.353**	Helicopter and light aircraft I-band ASV, navigation, and met radar	Omera-Segid
ORB-32	**1960.353**	Sea Heracles	Omera-Segid
Orchidee	**5875.353**	Stand-off radar	LCT
Oryx	*1351.353*	J-band terrain following and attack radar	Electronique Serge Dassault
Rafal	—	I/J-band coherent sideways looking radar	Thomson-CSF
RH 370	*1395.353*	I/J-band helicopter ASV radar	Thomson-CSF
Saiga	*1352.353*	Helicopter terrain avoidance radar. K-band	Electronique Serge Dassault
Saiga II	—	Simplified, lightweight version of Saiga	Electronique Serge Dassault
INTERNATIONAL			
APS-503	**1784.353**	Helicopter ASV, search, and navigation radar. I-band	AIL/Litton Canada
APS-504(V)3	**3473.353**	Airborne search radar	Litton Canada/Eaton
NIS	**5621.053**	NATO identification system (IFF). In development	—
ISRAEL			
EL/M-2001B	**3305.353**	I- or J-band ranging radar	Elta
EL/M-2021	**3306.353**	Multi-mode, pulse-doppler, I/J-band attack radar. A version is under development for the Israeli Lavi fighter (**5876.353**)	Elta
ITALY			
AN/APX-104/SIT 432	**3488.353**	Airborne IFF interrogator	Italtel
MM/APQ-706	**3309.353**	I-band helicopter radar for Marte anti-ship missile system	SMA
MM/APS-705	**3307.353**	I-band helicopter radar. Dual transmitter/receivers	SMA
MM/APS-707	**3308.353**	I-band helicopter radar. Single channel version of APS-705	SMA
MM/UPX-709/SIT 421	**3489.353**	IFF transponder	Italtel
SWEDEN			
DAX-100/200 Series	*1741.353*	Fire control radars	Ericsson
Ericsson SLAR	**4083.353**	J-band maritime surveillance radar	Ericsson
Hera	**5887.353**	Helicopter surveillance radar	Philips
PS-03/A (UAP 12)	*1208.353*	I/J-band AI radar, conical scan. Cassegrain antenna. Used in J35B and J35D Swedish AF Drakens	Ericsson
PS-01/A (UAP 13)	**1209.353**	Improved version of PS-03/A. Used in J35F Draken	
PS-05	**5684.353**	Nose radar for JAS-39	Ericsson
PS-011/A (UAP 13)	**1209.353**	Version of PS-01/A used with S71N IR search and track set in J35F	Ericsson
PS-37/A (UAP 1011)	**1210.353**	I/J-band. Monopulse. Modes include search, ground ranging, mapping, and obstacle avoidance	Ericsson
PS-46A	**1964.353**	Multi-mode radar for Viggen interceptor	Ericsson
JAS-39	**5684.353**	Nose radar and AEW radar for JAS-39 Grippen aircraft	Ericsson
UNION OF SOVIET SOCIALIST REPUBLICS			
Bee Hind	—	Tail warning and gun fire control	—
Big Bulge	—	Large ventral radar on Tu-95 Bear bomber	—
Big Nose	—	AI radar used in Tu-28 Fiddler strike aircraft	—
Down Beat	—	Bombing and navigation radar	—
Fan Tail	—	Tail radar for Tu-26 Backfire bomber	—
Fox Fire	—	AI radar, I-band	—
High Lark	—	J-band AI radar. Used in Flogger B/D/F	—
High Fix	—	Airborne ranging radar for Fitter-A and Fitter-C	—
Jay Bird	**3311.353**	AI radar for MiG-19	—
Look Two	**1475.353**	I/J-band bombing and navigation radar	—
Mushroom	—	Helicopter ASV radar	—
Puff Ball	**1476.343**	I/J-band search radar used in Bison aircraft	—
Scan Can	—	AI radar	—
Scan Fix	**1477.343**	AI radars for MiG-17 and 19 interceptors	—
Scan Odd	**1479.353**	I-band AI radar for MiG-19	—

Designation	Entry no	Description	Contractor(s)
USSR cont			
Scan Three	**1480.353**	I-band AI radar for Yak-25	—
Shore Wark	—	Bombing radar for Yak-28 Brewer-B	—
Short Horn	**1478.353**	J-band bombing and navigation radar	—
Skip Spin	**1481.353**	I-band AI radars used in Su-11 and Yak 28	—
SLAR	—	Side-looking radar ? MW, J-band	—
Spin Scan	**1482.353**	Series of AI radars used in Su-9 and MiG-21	—
SRO-1/2	—	IFF transponder. SRO-1 obsolescent	—
SUAWACS	**4616.393**	Airborne AEW system	—
Toadstool	—	Used on Coke transport aircraft	—
Twin Scan	—	AI radar	—
UNITED KINGDOM			
UK AEW	**1971.353**	Airborne early warning radar using Nimrod aircraft	GEC Avionics
Airpass I	*1031.353*	I/J-band AI radar. Search, tracking and ranging. Used in RAF Lightning interceptors. Produced in 4 versions RAF designation AI23	Ferranti
Airpass II	*1033.353*	Development of Airpass I with added air-to-ground modes	Ferranti
Airpass III	*1032.353*	Surface strike radar for Buccaneer aircraft. Multi-mode I/J-band cassegrain antenna	Ferranti
APY 920	**5878.353**	Version of UK AEW radar for C-130	GEC Avionics
ARI 5955/5954	*1027.353*	I-band system for use in ASW helicopters. Enables helicopter to be used as tactical control centre for ASW operation. Secondary radar capability. Fitted RN Sea Kings	MEL
ARI 5983	**3310.353**	I-band transponder for naval helicopters	Microwave Assoc
ARI 5991	**3710.353**	Sea Searcher. Replacement for ARI 5955/5954	MEL
ASR 360	**5614.353**	Maritime surveillance radar for medium sized fixed wing aircraft and helicopters. Developed from Decca Marine systems	Racal
ASV-21D	—	Air-to-surface vessel search radar used in Nimrod maritime aircraft	EMI Electronics
Blue Fox	**1972.353**	Version of Seaspray. Production for RN and Indian Sea Harriers	Ferranti
Blue Kestrel	**5685.353**	ASV/ASW system in development for EH101 helicopter	Ferranti
Blue Vixen	**4615.353**	Multi-role pulse doppler system for Sea Harrier update programme. In development	Ferranti
CASTOR	**4613.353**	Airborne battlefield surveillance radar	Ferranti/Thorn EMI
E290M	*1028.353*	Combined weather and tactical radar. RCAF	
Foxhunter	**1785.353**	UK airborne interceptor radar. In production for RAF Tornado ADV aircraft	GEC Avionics
IFF 2720	**3695.353**	IFF transponder	Cossor
IFF 2743	**5603.353**	Electronic control unit for use with IFF transponders	Cossor
IFF 3100	**3696.353**	IFF transponder. Selected for P110	Cossor
IFF 3500	**3697.355**	IFF airborne interrogator. Selected for P110	Cossor
LRR	*1035.353*	Lightweight ranging radar. Air and ground ranging Terrain warning	Ferranti
MAREC II	**4341.353**	Maritime reconnaissance radar	MEL
PTR 820	**1224.353**	IFF airborne interrogator	Plessey
P111	—	Coherent pulse multi-mode strike, AI and terrain following radar. Developed for classified project	Marconi
P391	*1023.353*	K-band sideways looking recce radar. Used in UK Phantom recce pod. Licensed to Electronique Serge Dassault	EMI Electronics
Red Fox	**5877.353**	Repackaged version of Blue Fox airborne radar	Ferranti
SATF	*1216.353*	Strike and terrain following radar. I/J-band multi-mode	Ferranti
Searchwater	**1740.353**	ASV and maritime radar. Fitted RAF Nimrods and RN AEW Sea Kings.	Thorn EMI
Sea Searcher	**3170.353**	See ARI 5991. Operational	MEL
Seaspray	**1342.353**	I/J-band helicopter ASV radar	Ferranti
Sky Guardian	**4614.353**	Private venture AEW system based on UK AEW radar	GEC Avionics
Skymaster	**5886.353**	Surveillance and early warning radar	Thorn EMI
Skyranger	**5612.353**	Lightweight weapon control system for small fighter and ground attack aircraft. Aimed at retrofit market	GEC Avionics
Sky Searcher	**4617.353**	AEW radar based on Sea Searcher	MEL
Super Searcher	**5625.353**	Lightweight maritime surveillance system developed from Sea Searcher	MEL
UNITED STATES OF AMERICA			
APD-7	—	Sideways looking radar. Used RA-5C	Westinghouse
APD-8	—	Sideways looking radar for RF-111A. Not deployed	Westinghouse
APG-22	—	CW ranging radar. USN	Raytheon
APG-31	—	Ranging radar. USAF	Raytheon
APG-43	—	CW AI radar	Raytheon
APG-55	—	AI intercept radar for USAF pulse doppler	Westinghouse
APG-59	—	Fire control radar. USN, USAF	Westinghouse
APG-63	**1765.353**	Multi-mode fire control radar for F-15	Hughes
APG-65	**3302.353**	I/J-band multi-mode radar. Operational in F/A-18 Hornet	Hughes
APG-66	**3303.353**	I/J-band multi-mode F-16 radar	Westinghouse
APG-67	**5610.353**	Multi-mode nose radar for F-5G Tigershark	General Electric
AN/APG-68	**5881.353**	Development of AN/APG-66 for F-16 C/D aircraft	Westinghouse
AN/APG-69	**5882.353**	Multi-mode airborne radar	Emerson
AN/APG-70	**5879.353**	Upgrade of AN/APG-63 for F-15E aircraft	Hughes
AN/APG-71	**5880.353**	Upgrade of AN/AWG-9 for the US Navy	Hughes
APN-59	—	Search and mapping radar	Sperry
APN-170	*1037.353*	Terrain following radar	General Dynamics
APN-171	*3124.353*	Terrain following radar	General Dynamics
APN-215	**4340.353**	Weather and terrain mapping radar	Bendix
APQ-55	—	Surveillance mapping radar. US Army	
APQ-56	—	Sideways looking radar for RB-47E. USAF	Westinghouse
APQ-67		AI radar. USAF	Raytheon
APQ-72		I/J-band AI radar. Target illuminator for Sparrow III missile Fitted F-4B	Westinghouse

Designation	Entry no	Description	Contractor(s)
USA cont			
APQ-81	—	Track-while-scan pulse doppler. USN	Westinghouse
APQ-83	—	Fire control radar for Sidewinder missile	Magnavox
APQ-86	—	Sideways looking battlefield surveillance radar	Texas Instruments
APQ-92	*1489.353*	Search radar used in USN A-6A aircraft	Norden
APQ-94	—	Fitted in F-8D aircraft	Magnavox
APQ-97	*7014.353*	Sideways looking radar. US Army	Westinghouse
APQ-99	**1970.353**	Forward radar for RF-4	Texas Instruments
APQ-100	—	Fire control radar. Used in F-4C. USAF	Westinghouse
APQ-102A	—	Recce radar. Used by USAF, USMC RF-4Cs Modified version fitted to some West German RF-104Gs	Goodyear
APQ-109	—	Fire control radar F-4D. USAF	Westinghouse
APQ-110	—	J-band terrain following and avoidance radar for F-111A Mounted below APQ-113	Texas Instruments
APQ-112	*1490.353*	Tracking radar on A-6A. Used with APQ-92 search radar	Norden
APQ-113	**1966.353**	J-band multi-mode radar for F-111A. Operational USAF and RAAF	General Electric
APQ-114	**1967.353**	Multi-mode nose radar for FB-111A	General Electric
APQ-116	—	Fire control radar. Ground ranging, terrain following AI Used on A-7A	Texas Instruments
APQ-119	—	Modified version of APQ-113. Limited procurement for F-111 programme	General Electric (US)
APQ-120	**1310.353**	AI terrain following radar for F-4E	Westinghouse
APQ-122	**1487.353**	Dual frequency I/J- and K-band radars for AWADS C-130 aircraft	Texas Instruments
APQ-124	—	Doppler AI ranging radar. USN	Magnavox
APQ-125	—	Doppler ranging radar for F-8J	Magnavox
APQ-126	**4334.353**	Used in USN A-7 aircraft	Texas Instruments
APQ-127	—	Forward looking radar	Sperry
APQ-128	—	F-111 terrain following radar	Sperry
APQ-130	—	F-111D attack radar for Mk II avionics	Autonetics
APQ-136	—	Nose radar for AC-119 gunship	Texas Instruments
APQ-137	**1401.353**	K-band MTI radar for detection of ground targets	Emerson
APQ-139	*1486.353*	J-band AMTI terrain avoidance/mapping radar Used in Tropic Moon 3 programme	Texas Instruments
APQ-140	**1488.353**	J-band multi-mode electronic scan radar	Raytheon
APQ-144	**1968.353**	Multi-mode nose radar for F-111F	General Electric
APQ-146	**4335.353**	Forward looking multi-mode nose radar	Texas Instruments
APQ-148/156	**1567.353**	J-band multi-mode radar for A-6E aircraft	Norden
APQ-152	—	All-weather topographic mapping radar set	Goodyear
APQ-153	**1675.353**	Fire control radar	Emerson
APQ-156	**1567.353**	See APQ-148	Norden
APQ-157	**3113.353**	Dual control search and range tracking radar for F-5F	Emerson
APQ-158	**4336.353**	Forward looking multi-mode radar used for Pavelow III	Texas Instruments
APQ-159	**3114.353**	Lightweight multi-mode nose radar. (V)-1 model on F-5E. (V)-2 on F-5F	Emerson
APQ-161	**3301.353**	Update of APS-144 for Pave Tack F-111F	General Electric (US)
APQ-163	**3682.353**	Experimental nose radar for B-1	General Electric
APQ-164	**4647.353**	Navigation and weapon delivery radar for B-1 supersonic bomber	Westinghouse
APS-20	—	Airborne early warning radar	
APS-42	—	Navigation and search radar	Bendix
APS-45	—	Airborne heightfinder radar	Texas Instruments
APS-49	—	High scan-rate ASV	Hazeltine
APS-70	—	Airborne early warning radar	General Electric (US)
APS-73	—	Series of SLARs developed for USAF and flown on C-97, B-58, and C-135 aircraft for test and evaluation of coherent, focused, synthetic aperture side-looking radars	Goodyear
APS-81	—	Nose radar for B-52	—
APS-85	—	Sideways looking MTI radar	Motorola
APS-88A	—	ASV search radar for S-2E tracker aircraft	Texas Instruments
APS-91	—	Airborne early warning radar	—
APS-94	**1484.353**	Long-range sideways looking radar. I/J-band	Motorola
APS-96	*1781.353*	Airborne early warning radar for E-2A	General Electric (US)
APS-111 (XN-1)	*1782.353*	Early warning radar for detection of aircraft targets against surface background. Used in E-2A. 2 built	General Electric (US)
APS-113	—	Lightweight helicopter radar	General Electric (US)
APS-115	**1969.353**	ASV search radar for P-3C ASW aircraft. I-band	Texas Instruments
APS-116	**1485.353**	ASV search radar for S-3A ASW aircraft. I-band	Texas Instruments
APS-119 (XN-1)	*1311.353*	Experimental version of APS-96 to provide overland target detection	General Electric
APS-120	**1783.353**	Airborne early warning radar for E-2C aircraft	General Electric
APS-124	**3518.353**	Search radar for LAMPS III helicopter	Texas Instruments
APS-125	**1965.353**	Improved version of APS-120 with ARPS (advanced radar processing sub-system). Fitted E-2C aircraft. Operated US, Israel, Japan etc	General Electric
APS-127	**3519.353**	Search radar for USMC medium-range surveillance aircraft	Texas Instruments
APS-128	**3132.353**	Maritime air search radar. See also DIGITACS (**4612.353**)	AIL
APS-130	**3520.353**	Navigation radar for EA-6B	Norden
APS-131	**5883.353**	Side-looking surveillance radar	Motorola
APS-133	**4337.353**	Weather and terrain mapping radar	Bendix
APS-134(V)	**4338.353**	ASV/maritime reconnaissance radar for BR-1150	Texas Instruments
APS-135	**5884.353**	Side-looking surveillance radar	Motorola
APS-137	—	Fire control radar for UH-1 series helicopters with M21 armament sub-system	—
APS-137(V)1	**1485.353**	Update of APS-116 for S-3A ASW aircraft	Texas Instruments
APS-138	**1965.353**	Updated APS-120/125 radar for E-2C	General Electric (US)
APX-72	**3688.353**	Airborne IFF transponder	Hazeltine
APX-76	**3690.353**	Airborne IFF interrogator	Hazeltine
APX 83	**1569.353**	Airborne IFF interrogator for E-2C aircraft	AIL
APX-100(V)	**4339.353**	Airborne IFF transponder	Bendix

Designation	Entry no	Description	Contractor(s)
USA cont			
APX-103	**3300.353**	IFF interrogator system for E-3A AWACS	AIL
APX-104	**3689.353**	Airborne IFF interrogator	Hazeltine
APY-1	**1585.353**	Airborne warning and control system (AWACS) radar for E-3A	Westinghouse
ASG-14	—	Fire control radar for nuclear armed F-104A	Texas Instruments
ASG-15		Rear fire control radar for B-52	Arma
ASG-17	—	Fire control radar. Nuclear weapons	—
ASG-18	—	Fire control radar for AIM-47A and AIM-54 missile Fitted FY-12A	Hughes
ASG-19	—	Fire control radar for F-105D (Thunderstick)	General Electric (US)
ASG-25	—	Fire control radar. Non-nuclear arms	—
ASQ-112	—	MTI radar. USN	Norden
AWG-9	**1100.353**	Missile fire control radar system. F-14	Hughes
AWG-10	**3018.353**	All-terrain avoidance, mapping radar for F-4J. High prf pulse doppler	Westinghouse
AWG-11	**3018.353**	Version of AWG-10 for RN Phantoms	Westinghouse
AWG-12	**3018.353**	Version of AWG-10 for RAF Phantoms	Westinghouse
DPS-5	**4618.353**	Balloon-borne radar	RCA
UPD-4	**1676.353**	Side-looking radar. Used on USAF RF-4Cs and Japanese RF-4E	Goodyear
UPD-5	—	High resolution side-looking radar with MTI for USAF and West Germany. Development	Westinghouse
UPD-6	*3474.353*	Reconnaissance radar for West German AF	Goodyear
UPD-8	**5686.353**	Side-looking synthetic aperture radar. Update of UPD-4	Goodyear
UPX-709	**3691.353**	Airborne IFF transponder	Hazeltine
AWACS	**1585.353**	Airborne early warning radar for E-3A	Westinghouse
B-52	**5888.353**	Upgrade of B-52 radar	Boeing/Norden
Cobra	*1706.353*	Fire control radar	Hughes
Conformal radar	**5609.353**	Design of surveillance radar embedded in nose and wings with solid-state modules	General Electric
Covert strike radar	**4648.353**	Stand-off radar project	—
DIGITACS	**4612.353**	Improved version of APS-128	Eaton
F-16	**3303.353**	I/J-band pulse-doppler, multi-mode radar for F-16 aircraft	Westinghouse
Egyptian Goose	**3162.353**	Balloon-borne radar project. ARPA	Westinghouse
ESAIRA	*1491.353*	Experimental electronic scanned antenna	Hughes
HOWLS/ULTRA	**3304.353**	Experimental ultra lightweight transmissive array for Hostile Weapons Location Systems programme	General Electric (US)
JSTARS	**5624.353**	Joint USAF/US Army requirement for airborne anti-tank radar. 4 contenders bidding: General Electric, Westinghouse, Hughes, Grumman/Norden	US DoD
MERA	—	Molecular electronics for radar applications Experimental phase scanning system	Texas Instruments
Multibeam Survivable Radar	**5611.353**	Air-to-ground weapon control and battlefield surveillance radar. Contender for JSTARS	General Electric
Project Seek Skyhook	**4618.353**	Balloon-borne radar	RCA
NASARR	*1568.353*	North American search and ranging radar for F-104	Autonetic/NATO
Pocket Veto	**3162.353**	Surveillance radar on ARPA Family II aerostat	Westinghouse
RARF	—	Radome, antenna, RF. Refractive lens phase scanning J-band radar. Experimental	Emerson
RARF	—	Radome, antenna, RF. Reflecting lens phase scanning I- and J-band versions built	Raytheon
Balloon-borne radar	**3162.353**	Improved Pocket Veto radar for surveillance and clutter measurement of USAF	Westinghouse
SLAMMR	**5685.353**	Side-looking surveillance radar	Motorola
Tornado nose radar	**4333.353**	Terrain following/mapping radar for strike version of Tornado	Texas Instruments
EC-153	**3299.353**	I/J-band pulse-doppler multi-mode derivative of APQ-153 and APQ-159.	Emerson
WX Series	**1673.353**	Fire control radar series. Developed version selected for F-16	Westinghouse

1521.454 Sonar Equipment

Airborne Torpedo	**2996.441**	—	—	State
Light Torpedo	**2997.441**	406 mm×5 m approx	Training deck launchers	State
UNITED KINGDOM				
Mk 8	**2552.441**	21 in×6·7 m	1930s design. Compressed air propulsion, free-running. In RN service until 1973. May still be in service elsewhere	UK MoD
Mk 24 Mod 0	**2472.441**	21 in	Wire-guided active/passive acoustic homing	UK MoD
Tigerfish (Mk 24)	**2440.441**	21 in×6·46 m	Long-range wire-guided active/passive acoustic homing. Anti-surface, anti-submarine. Computer allows autonomous homing and re-attack. Entered RN service 1980	MUSL
Spearfish	**4559.441**	21in×6 m(app)	Advanced heavy-weight sub-launched torpedo to meet NSR 7525	MUSL
Stingray	**2448.441**		New acoustic homing lightweight torpedo to replace US Mk 44/46	MUSL
UNITED STATES OF AMERICA				
Mk 14	*2813.441*	21 in×5·25 m	1930s design. Free-running with preset depth and course angles. Compressed air propulsion. Weight 1780 kg. Withdrawn from USN service in 1973 but still in service elsewhere	—
Mk 27 Mod 4	*2165.441*	19 in×3·23 m	Passive acoustic homing. Electric propulsion. Used in USN service as training round prior to Mk 37 introduction but some warshot torpedoes sold elsewhere	—
Mk 32	**3629.441**	2·08 m×483 mm	Acoustic anti-submarine. Operational but obsolescent	—
Mk 37 Mod 0	**2817.441**	19 in×3·52 m	Active/passive acoustic homing. Electric dual-speed propulsion Warshot weight 648 kg. Mod 3 is improved version	Westinghouse
Mk 37 Mod 1	**2818.441**	19 in×4·09 m	Wire-guided. Electric dual-speed propulsion Warshot weight 766 kg. Mod 2 is improved version	Westinghouse
Mk 37 Mod 2	**2818.441**	19 in×4·09 m	Updated version (minor modifications) of Mod 1	Westinghouse
Mk 37 Mod 3	**2817.441**	19 in×3·52 m	Updated version (minor modifications) of Mod 0	Westinghouse
NT 37C Mods 2 & 3	*3971.441*	19 in×3·52 m 19 in×4·09 m	Improved versions of Mk 37 Mods 2 and 3. Better speed, range, and acoustic performance including shallow water capacity. Sold to Canada and Netherlands	Northrop/Honeywell
NT 37D	*4180.441*	19 in×4·5 m (Mod 2) 19 in×3·8m (Mod 3)	Further improvement of NT 37 with Mk 46 OTTO engine and enhanced guidance	Honeywell
NT 37E	**4762.441**	4·5 m× 483 mm	Latest modernised model of Mk 37	Honeywell
Mk 44	**2820.441**	19 in×2·56 m	2 versions differing slightly in length and both weighing about 233 kg. Active acoustic homing. Electric propulsion. Replaced by Mk 46 in USN and UK service but still in service elsewhere	Several in USA also licence-built overseas

Designation	Entry no	Dimensions (d×l)	Description	Contractor(s)
USA cont				
Mk 46 Mod 0	**2822.441**	324 mm×2·67 m	Deep-diving, high-speed, active/passive acoustic homing. Weight about 258 kg. First US torpedo with solid-fuel propulsion	Aerojet-General and others
Mk 46 Mod 1	**2822.441**	324 mm×2·59 m	As Mod 0 but slightly larger and with liquid mono-propellant (OTTO) motor	Aerojet-General and others
CAPTOR	**2541.441**	324 mm×3·7 m	Mk 46 Mod 4 torpedo inserted in a mine casing and released when target detected	Goodyear
Mk 48 Mod 0	**2823.441**	21 in	AS-only version. Superseded during development by Mod 2	Westinghouse
Mk 48 Mod 1	**2823.441**	21 in×5·8 m	Deep-diving (914 m) high-speed (93 km/h) active/passive acoustic homing, wire-guided, long-range (46 km) weapon. Weight about 1600 kg. Said to be most complex torpedo ever designed	Gould (formerly Clevite)
Mk 48 Mod 2	**2823.441**	21 in	Competing against Mod 1 which was selected after comparison at pilot production stage	Westinghouse
Mk 50	**4182.441**	—	Formerly EX-50 Advanced Lightweight Torpedo (ALWT). Successor to Mk 46 (NEARTIP)	Honeywell
Freedom Torpedo	*2618.441*	19 in×4·83 mm	Private-venture development. Wire-guided, pattern-running, electrically propelled. Contact fuze. Warshot weight 1237 kg. Charge 295 kg. Range 11 km Adapts to 21 in tubes	Westinghouse

AN/ALR-46	**3035.353**	Airborne digital threat warning receiver	Itek
AN/ALR-47	**1862.353**	Radar homing and warning set for USN S-3A aircraft	IBM
AN/ALR-50	**1918.353**	Aircraft SAM alert and launch warning receiver	Magnavox
AN/ALR-52	**1919.353**	Multi-band IFM receiver for air or land-mobile applications	ARGO Systems
AN/ALR-56	**3347.353**	Airborne RWR	Loral
AN/ALR-59(V)	**5932.353**	Airborne ESM system	Litton
AN/ALR-60	**4376.353**	Communications intercept and analysis system	GTE Sylvania
AN/ALR-62(V)	**4377.393**	Radar warning system	Dalmo Victor
AN/ALR-64	**4378.393**	Compass sail warning system	Dalmo Victor
AN/ALR-66	**3642.353**	Programmable airborne RWR	General Instruments
AN/ALR-67(V)	**4372.393**	Radar warning system	Itek
AN/ALR-68	**3525.353**	Airborne digital threat warning receiver	Itek
AN/ALR-69	**4379.353**	Radar warning receiver	Applied Technology
AN/ALR-73	**4164.393**	Airborne ESM for USN E-2C early warning aircraft	Litton Systems
AN/ALR-80	**5942.393**	Airborne radar warning receiver	General Instruments
AN/ALR-606	**3908.353**	Aircraft RWR	General Instruments
AN/ALR-646	**3909.353**	Airborne ESM system based on ALR-66	General Instruments
AEL 6040	**4403.093**	ECM universal jammer	American Electronic Labs
AN/ALQ-161B	**3034.393**	Defensive electronics suite for B-1 bomber aircraft	Eaton
AN/ALR-46A	**3892.363**	Airborne digital signal processor	Dalmo Victor
AN/ALT-28	**5952.393**	B-52 noise jammer	Northrop
AN/APR-38	**3544.393**	Control indicator set for Wild Weasel II aircraft	Loral
AN/APR-39(V)	**3542.393**	Airborne radar warning system	E-Systems/Loral
AN/APR-43	**4010.393**	RWR developed for USN Compass Sail Clockwise programme	Loral
AN/APR-44	**3365.353**	CMR-500B low-cost RWR	American Electronic Labs
AN/ASQ-171	**4742.393**	Airborne ELINT system for EP-3E ECM aircraft	IBM
AN/GLQ-3A	**4401.193**	HF/VHF communications jammer	Fairchild
AN/KAS-1	**4407.293**	Chemical warfare detection system	Texas
AN/MLQ-33	**4741.193**	Search and jamming system against air/ground communications	GTE Sylvania
AN/MLQ-34	**3895.193**	Mobile tactical communications countermeasures system for US Army (TACJAM)	GTE Sylvania
AN/MLQ-T6	**4664.193**	Communications data link jammer	Cincinnati Electronics
AN/MSQ-103	**4405.193**	TEAM PACK ESM monitoring system	Emerson
AN/SLQ-27	**3349.293**	Shortstop naval defensive EW system. Superseded by SLQ-32	—
AN/SLQ-30	**4388.293**	Naval electronic countermeasures systems (TRUMP)	Kuras-Alterman
AN/SLQ-32	**3349.293**	Naval ESM/ECM system. Replacement for WLR-1. Modular	Raytheon
AN/TLQ-15	**3367.193**	Communications and countermeasures equipment	American Electronic Labs
AN/TLQ-17A	**4406.093**	Countermeasures and jamming set	Fairchild
AN/TSQ-109	**4408.153**	Sigint system (AGTEWS)	Bunker Ramo
AN/TSQ-112	**4409.153**	ECM ground warning and jamming system	GTE Sylvania
AN/ULQ-11	**4384.394**	Airborne jamming system (confirm header)	—
AN/ULQ-14	**4385.153**	Radar countermeasures system	—
AN/ULQ-19	**5834.193**	Tactical communications jammer	Racal
AN/WLR-8	**3082.253**	Naval tactical EW/ESM receiver system	GTE Sylvania
AN/WLR-11	**5835.293**	Shipborne IFM receiver	Argo
AOCM	*4383.393*	Advanced optical countermeasures pod	Martin Marietta
ARI 18240/1	**4160.393**	ESM suite for UK Nimrod aircraft	Loral
ARJS	**4667.393**	High power stand-off jammer	Grumman
Chief	**5951.193**	Vehicle-mounted EW combat system	HRB-Singer
CVR-610A	**4397.053**	Wideband direction-finding receiver	American Electronic Labs
Compass Sail	**5839.353**	Airborne EW system	—
C204/WJ-1140	**4391.053**	Analysis control unit	Watkins-Johnson
D1800	**5810.153**	DF and monitoring system	EM Systems
D5100	**5819.093**	Family of DF systems	Tech-Comm
DF 8000	**4665.093**	Communications direction-finding system	Cincinnati Electronics
ESCORT	**5743.353**	Airborne Elint system	Raytheon
EW-1017	**4382.353**	Electronic surveillance system	Loral
Guardrail	**4670.353**	Airborne SIGINT system	ESL
HAWCS	**4380.393**	Helicopter all-weather cueing system	Texas Instruments
INEWS	**5812.353**	Integrated EW system in early design	—
Jam Pac (V)	**4099.393**	Family of low-cost jammer pods	Sperry
J-3400/3410	**4677.153**	VHF mobile ECM systems	GTE Sylvania
LQ-102	**4663.193**	Hand-emplaced expendable jammer	Cincinnati Electronics
LR-5200	**5837.353**	Tactical ESM system	Litton
L6-24	**3875.093**	Direction-finding system	Watkins-Johnson
L-6/A-WJ-1140	**1381.053**	Microwave direction-finder	Watkins-Johnson
Lancer	**5818.393**	Airborne radar warning receiver	General Instruments
MPI-5	**3105.093**	Miniature pulse analyser	American Electronic Labs
MRES	**4658.053**	ECM and C³CM threat generators	Tracor
Piranha	*4402.193*	Applique VHF communications jammer	Fairchild
QRC-259	**4396.053**	Superheterodyne receiver system	Watkins-Johnson
Quick Fix IIB	**5811.393**	Airborne countermeasures system	Tracor
R-281	**1875.153**	Computer-controlled search receiver	Cincinnati Electronics
R-1849	*3033.053*	Remote-controlled HF search receiver	Cincinnati Electronics
R-1850	*3033.053*	Remote-controlled VHF search receiver	Cincinnati Electronics
R-1851	*3033.053*	Remote-controlled UHF search receiver	Cincinnati Electronics
R-3030	**5816.053**	Surveillance receiver for ground naval and airborne use	Cubic Communications
R-5500	**3529.093**	Control and display system for ESM	GTE Sylvania
Rapport II	**3543.393**	ECM system developed for Belgian Mirage V aircraft	Loral
RA-6778	**4676.093**	Communications monitoring equipment	Racal
RA 6793A	**4675.093**	HF monitoring receiver	Racal
RBOC Mk33	**3363.293**	Naval rapid bloom off-board countermeasures decoy system	Hycor/Lundy

Designation	Entry no	Description	Contractor(s)
USA cont			
RD-280	**1874.153**	HF/VHF surveillance receiver	Cincinnati Electronics
RE-1320A	**4400.093**	Spectrum display unit	Racal
RG Series	**4672.093**	Family of spectrum monitors	Racal
RG-1340	**4399.093**	Spectrum surveillance controller	Racal
RG-5202A	**4673.093**	VHF monitoring receiver	Racal
RG-5540	**4398.053**	VHF/UHF monitor receiver	Racal
RG-5545A	**4674.093**	VHF/UHF monitoring receiver	Racal
S-2150	**4671.353**	Threat warning systems for small ships and submarines	EM Systems
S-3000	**5838.293**	Shipborne surveillance receiver	EM Systems
Scarecrow	**5817.353**	RPV EW system	Sanders
Sea Sentry	**4020.293**	Series of three naval ESM systems	Kollmorgen
Series 2000	**3903.053**	Range of receivers, control and display units for ESM	Norlin
SHIELDS	**5840.253**	Shipborne EW system	Sanders
SLR-600 Series	**3910.253**	Range of naval ESM systems based on SLR-600	General Instruments Corp
SR Series	**3037.053**	Range of surveillance receivers for Comint and Elint	Norlin
SPEWS	**4666.393**	Tactical jamming systems for RPVs	Motorola
SRBOC Mk 36	**4656.293**	Naval super rapid bloom off-board countermeasures decoy system	Tracor
SR 200	**4389.293**	Naval ESM system	Sanders
SR 2020	**4659.093**	Tactical ESM receiver	Applied Communications
SR 2152	**4661.093**	VHF/UHF COMINT receiver	Applied Communications
SR 2500	**4660.193**	VHF/UHF monitoring receiver	Applied Communications
TEREC	**4387.153**	Tactical electronic reconnaissance remote terminal (TEREC) & (TRT)	Texas
TN-1000/WJ-1840	**4395.053**	Minceiver TM tuner	Watkins-Johnson
Triton	**4739.293**	Naval threat warning system for small vessels	Dalmo Victor
WJ-927	**4390.053**	Microwave and direction-finding signal analysis system	Watkins-Johnson
WJ-945	**3664.093**	Microwave surveillance and direction-finding system	Watkins-Johnson
WJ-1205B	**3665.093**	Computerised pulse train analyser	Watkins-Johnson
WJ-1240	**1716.053**	Computer-controlled microwave recce system	Watkins-Johnson
WJ-1424	**3666.193**	Microwave ESM equipment	Watkins-Johnson
WJ-1440	**4394.053**	Microwave receiver system	Watkins-Johnson
WJ-1740	**3354.053**	Parallel-scanned digitally controlled microwave receiver	Watkins-Johnson
WJ-1840	**3355.053**	Broadband superhet microwave receiver	Watkins-Johnson
WJ-1920	**4392.093**	Distributed processing system	Watkins-Johnson
WJ-1988	**4393.053**	Direction-finding system	Watkins-Johnson
YUGOSLAVIA			
SO-1	**5943.393**	Airborne radar warning receiver	Iskra

1505.094 **NATO Designations of Soviet Systems and Equipment**

Designation	Description
Acrid	Air-to-air missile (AA-6)
Alkali	Air-to-air missile (AA-1)
Anab	Air-to-air missile (AA-3)
Apex	Air-to-air missile (AA-7)
Aphid	Air-to-air missile (AA-8)
Ash	Air-to-air missile (AA-5)
Atoll	Air-to-air missile (AA-2)
Awl	Air-to-air missile (AA-4)
Backfire	Tupolev VG bomber
Back Net	Early warning and GCI radar
Badger	Tu-16 bomber/reconnaissance aircraft
Ball End	Naval surface warning radar
Ball Gun	Naval surface warning radar
Band Stand	Naval radar for SSN-9 missile
Bank	B-25 bomber aircraft
Barge	Tu-85 bomber aircraft
Bark	Il-2 bomber aircraft
Barlock	P-50 Twin scanner land-mobile early warning and GCI radar
Bass Tilt	Naval gun fire control radar. Similar to Drum Tilt and Muff Cob
Bat	Tu-2 bomber aircraft
Beagle	Twin-jet tactical bomber, recce, EW aircraft
Beam Track	Yagi tracking array. Mobile
Bean Shell	Aircraft discone VHF antenna
Bear	Tu-20 bomber aircraft
Beast	Il-0 bomber aircraft
Beauty	Formerly Tu-22 (see Blinder)
Bee Hind	Tail warning radar on Blinder, Bison
Bell Clout	Naval ECM
Bell Jar	Naval ECM housing
Bell Tap	Naval ECM
Big Bar A	Early warning and GCI radar
Big Bird	Associated with SA-10 SAM
Big Bulge	Airborne radar on Bear bomber
Big Mesh	Early warning and GCI radar
Big Net	Naval surveillance radar
Big Nose	Airborne radar on Fiddler
Bike Pump	Broadband end-fed dipole antenna
Bill Fold	Transportable search radar
Bill Spring	Helix radiator with plate reflector
Bird	Shipboard dipole and Yagi antenna array
Bison	Mya-4 bomber-reconnaissance aircraft
Blackjack	Long range bomber aircraft
Blinder	Tu-22 bomber aircraft
Blowlamp	I-54 bomber aircraft
Boat Sail	Submarine radar
Bob	Il-4 bomber aircraft
Bob Tail	Naval radio sextant
Boot	Tu-91 bomber aircraft
Bosun	Tu-14 bomber aircraft
Bounder	Prototype bomber
Bowl Mesh	Shipboard tracking radar
Bow Mat	Naval Elint/Sigint antenna
Bow Tie	Broadband shipboard antennas
Box	A-20 aircraft
Box Brick	Mobile radar
Brassard	Formerly Yak-28 (see Brewer)
Brawny	Il-40 bomber aircraft
Bread Bin	Trailer-mounted radar
Brewer	Yak-28 attack aircraft
Brick Group	Submarine ECM system incorporating Brick Pulp and Brick Split
Brick Pulp	Submarine EW antenna
Brick Round	Naval antenna with circular disc reflector
Brick Split	Submarine EW antenna
Brick Spring	High-gain naval helix antenna with ground plane
Brick Square	Similar to Brick Round but with different feed and reflector
Buck	Pe-2 aircraft
Bull	Tu-4 bomber aircraft
Butcher	Formerly Il-28 (see Beagle)
Buzz Stand	Battlefield surveillance radar
Cab	Li-2 (DC-3) transport aircraft
Cage Bare	Naval Elint/Sigint antenna
Cage Cone A/B	Naval IFF antenna
Cage Stalk	Naval broadband dipole communications antenna
Camber	Il-86 transport aircraft
Camel	Tu-104 airliner. Civil version of Badger
Camp	An-8 transport aircraft
Candid	Il-76 transport aircraft
Careless	Tu-154 transport aircraft
Cart	Tu-70 transport aircraft
Cash	An-28 transport aircraft
Cat	An-10 transport aircraft
Cat House	Missile defence system radar
Charger	Tu-144 supersonic transport
Chekhov	ABM system radar
Cheese Brick	Truck-mounted version of Box Brick
Chuck Luck	Similar to Cage Stalk but different polarisation
Chuck Tube	Naval communications dipole antenna
Clam	Il-18 transport aircraft
Clamshell	3-D acquisition radar for SA-11
Clank	An-30 survey version of Coke
Classic	Il-62 transport aircraft
Cleat	Tu-114 transport aircraft
Cline	An-32 transport aircraft
Clobber A	Yak-42 jet transport aircraft
Clod	An-14 general purpose aircraft
Cluster Bay	'Rising' sea mine
Cluster Guard	Anti-sonar hull coating for submarines
Cluster Gulf	'Rising' sea mine for deep water
Coach	Il-12 transport aircraft
Coaler	An-72 transport aircraft
Cock	An-22 transport aircraft
Cod Eye A/B	Submarine sensors
Codling	Yak-40 transport aircraft
Coin Grass	Corner reflector land-based VHF array
Coke	An-24/26 transport aircraft
Colt	An-2 general purpose aircraft
Condor	An-400 heavy transport aircraft
Cooker	Tu-110 transport aircraft
Cookpot	Tu-124 transport aircraft
Coot	Il-18 transport aircraft
Cork	Yak-16 transport aircraft
Crab Pot	Microwave communications link antenna
Crate	Il-14, Improved Coach
Creek	Yak-12 light aircraft
Crib	Yak-8 transport aircraft
Cross Bird	Naval early warning radar
Cross Fork	Truck-mounted Yagi array
Cross Legs	Transportable search radar
Cross Loop A	Naval direction-finder
Cross Out	Trailer-mounted search radar
Cross Slot	Ground radar
Crow	Yak-12 transport aircraft
Crown Drum	Aircraft antenna system
Crusty	Tu-134 transport aircraft
Cub	An-12 transport aircraft
Cuff	Be-30 transport aircraft
Curl	An-26 transport aircraft
Cylinder Head	Ship's gun fire director radar
Dawn	I-band navigation radar
Dead Duck	Naval IFF
Dog House	Phased-array missile and space tracking radar
Dome Glass	Trailer-mounted optical tracker system
Don A/B/2/ Kay	Naval navigation radars
Donets	Series of ship's navigation radars
Down Beat	Navigation/bombing radar for Backfire
Drum Tilt	AA fire control radar
Dry Rack	Pole-mounted quadruple Yagi array
Dumbo	VHF early warning and search radar
Dustbin	Submarine mast sensor
Egg Ball	Naval antenna housing
Egg Cup A/B	Ship's splash spotting radar
End Tray	Ground radar used with Scud
Eye Bowl	Naval missile guidance radar (SS-N-14)
Faceplate	MiG YE-2A fighter aircraft
Fagot	MiG-15 jet fighter
Faithless	Mikoyan STOL fighter aircraft
Fang	La-10 fighter aircraft
Fan Song A	Tracking radar
Fan Song B	Target tracking radar
Fan Song E	Target tracking radar
Fan Song Series	Range of electro-mechanically scanned target tracking radars
Fan Tail	Tail fire control radar for Backfire B
Fargo	MiG-9 fighter aircraft
Farmer	MiG-19 jet fighter
Farm Loaf	Naval EW antenna housing
Feather	Yak-17 fighter aircraft
Fencer	New swing-wing fighter
Feniks	Submarine sonar
Fiddler	Tu-28 strike aircraft
Fig Jar	Naval ECM antenna housing
Fin	La-7 fighter aircraft
Firebar	Yak-28P all-weather fighter aircraft
Fire Can	Land-mobile AA fire control radar
Fire Dish	Trailer-mounted tracking radar
Fire Iron	Naval gun fire control array of 4 Yagi antennas with reflectors
Fire Wheel	AA fire control radar
Fishbed	MiG-21 interceptor aircraft
Fish Bowl	Naval fire control radar
Fish Net	Pole-mounted twin Yagi array possibly IFF
Fishpot	Su-9 interceptor aircraft
Fitter	Su-7 interceptor aircraft
Fix Eight	Land-transportable HF Direction-finding system
Fix Four A	Fixed HF direction-finding system
Fix Four B	Fixed HF direction-finding system
Fix Four C	Fixed Adcock HF direction-finding system
Fix Four D	Fixed VHF direction-finding system
Fix Six A	Similar to Fix Eight with 6 elements
Flagon-A	Su-11 all-weather fighter aircraft
Flagon-B	Sukhoi STOL fighter
Flagon-E	Su-15 interceptor aircraft
Flanker	Su-27 combat/fighter aircraft
Flap Lid	Tracking radar for SA-11
Flap Track	Tracking radar mounted on tracked vehicle
Flap Wheel	AA fire control radar
Flashlight	Yak-25 all-weather interceptor
Flat Face	P-15 Land mobile target acquisition radar
Flat Spin	Naval air search radar
Flat Twin	Tracking radar (ABM-X-3)
Flipper	Experimental fighter
Flora	Yak-23 fighter aircraft
Flogger	Mikoyan variable-geometry fighter (MiG-23)
Foil Two	Ground based IFF
Forger	Yak-36 V/STOL carrier aircraft
Fork Rest A	VHF Yagi array
Four Eyes	Naval electro-optical fire control
Four Stack	UHF Yagi array
Foxbat	MiG-25 interceptor aircraft
Fox Fire	I-band AI radar
Foxhound	'Super-Foxbat' with new look-down radar and AA-9
Frame Spring	Helical tracking antenna with ground-plane. Shipboard
Frank	Yak-9 fighter aircraft
Fred	P-63 (US) fighter aircraft
Freehand	Experimental VTOL aircraft
Fresco	MiG-17 jet fighter
Fritz	La-9 fighter aircraft
Frog-1	Surface-to-surface missile
Frog-2, 3, 4, and 5	Surface-to-surface missiles

Designation	Description
Frog-7	Surface-to-surface missile
Frogfoot	Su-25 ground attack aircraft
Front Dome	Naval FCS radar for SA-N-7
Front Door	Guidance radar for SS-N-3
Front Piece	Guidance radar for SS-N-3
Fulcrum	MiG-29 combat aircraft
Gadfly	SA-11 surface-to-air missile
Gage	Ground target acquisition radar
Gainful	Surface-to-air missile
Galosh	Surface-to-air missile
Gammon	Surface-to-air missile
Ganef	SA-4 surface-to-air missile
Gaskin	SA-9 air defence missile
Gecko	Mobile AA missile system
Gin Pole	Naval ECM
Gladiator	SA-12 SAM system
Goa	Surface-to-air missile
Goblet	SAN-3 naval missile
Golf Ball	Submarine mast sensor
Gopher	SA-13 mobile SAM
Grail	Man-portable AA missile
Grid Bow	Directional broadband naval communications antenna
Grid Shield	Naval Elint/Sigint antenna
Griffon	Surface-to-air missile
Grumble	SA-10 surface-to-air missile
Guideline	Surface-to-air missile
Guild	Surface-to-air missile
Gun Dish	AA fire control radar
Hair Net	Naval search radar
Half Bow	Naval target designation radar
Halo	Mi-26 helicopter
Hare	Mi-1 light helicopter
Harke	Mi-10 helicopter
Harp	Ka-25 helicopter
Hat Rack	Pole-mounted directional antenna
Hat	Ka-10 helicopter
Hawk Screech	Naval fire control radar
Hay Pole	Vertically polarised omnidirectional antenna
Hay Rick	Truck-mounted omni array
Hay Ring	Microwave link relay antenna
Hay Wain	Omnidirectional discone antenna
Havoc	Mi-28 helicopter
Haze	Mi-14P amphibious helicopter
Headlight	Naval fire control radar
Head Net A/B/C	Naval long-range air surveillance radar series
Helix	Ka-32 ASW helicopter
Hen	Ka-15 helicopter
Hen Egg	Ballistic missile early-warning radar
Hen House	Ballistic missile early-warning radar
Hen Nest	Ballistic missile early-warning radar
Hen Roost	High power early-warning radar
Hercules	Submarine sonar
High Brick	Truck-mounted radar
High Fix	Ranging radar for Fitter A/C
High Lark	J-band AI radar
High Lune	Ship's nodding heightfinder
High Pole	Naval IFF transponder antenna
High Ring	Naval Elint/Sigint antenna
High Scoop	Naval search radar
High Sieve	Naval search radar
Hind	Mi-24 attack helicopter
Hip	Mi-8 helicopter
Hog	Ka-18. Obsolete development of Hen helicopter
Home Guide	Yagi array for aircraft homing system
Homer	Mi-12 helicopter
Home Talk	PRL-5M precision approach radar
Hoodlum	Ka-26 helicopter
Hook	Mi-6 helicopter
Hoop	Attack helicopter (poss Mi-29)
Hoplite	Mi-2 helicopter. Enlarged Hare
Hormone	Ka-25 helicopter
Horn Spoon	Ship's navigation radar
Horse	Yak-24. Obsolete military helicopter
Hound	Mi-4 helicopter
Jay Bird	J-band radar used on MiG-25 Foxbat
Kangaroo	Air-to-surface missile
Kelt	Air-to-surface missile
Kennel	Air-to-surface missile
Kerry	Air-to-surface missile
Kingfish	Air-to-surface missile
Kipper	Air-to-surface missile
Kitchen	Air-to-surface missile
Kite Screech	Naval gun fire control radar
Knife Rest	P-10 Series. VHF truck-mounted early warning radar
A, B, C	
Krug	Very large fixed HF direction-finding system
Land Fall	Coastal surveillance radar
Leningrad	Shipboard high definition surface search radar
Light Bulb	Naval search radar
Long Bow	Naval target designation radar
Long Brick	Small truck-mounted radar/comms system
Long Bull	Target designation radar. Back-to-back antennas
Long Ears	Naval optical fire control system
Long Eye	Land-mobile radar. Back-to-back antennas
Long Talk	Land-mobile multi-radar system
Long Track	Search and acquisition radar for SA-4 and SA-6 missiles
Long Trough	Mortar locating radar
Look Two	Bombing and navigation radar
Loop Three	Trailer-mounted direction-finding system
Low Blow	Radar for SA-3 missile system
Low Sieve	Naval surface search radar
Madge	Be-6 flying boat
Maestro	Trainer for Firebar/Brewer aircraft
Magnet	Yak-17 utility aircraft
Magnum	Yak-30 aerobatic competition aircraft
Maiden	Two-seat version of Fitter
Mail	Be-12 maritime reconnaissance amphibian
Mainstay	Il-76 AWACS aircraft
Mallow	Be-8/10 jet flying boat
Mandrake	High flying recce aircraft
Mangrove	Yak-26 tactical reconnaissance aircraft
Mantis	Yak-32 single-seat jet
Mare	Yak-14 assault glider
Mark	Kay-7V aircraft
Mascot	Il-28U trainer version of Beagle
Max	Yak-18 trainer and transport versions
May	Il-38 maritime recce version of Coot
Mercury Grass	Land-mobile system using VHF Yagi arrays
Mercury Noseband	Land-mobile electronic system
Mesh Brick	Land-mobile radar
Midget	MiG-15UTI trainer version of Fagot
Mink	UT-2 (YA-20) aircraft
Mist	TS-25 assault glider
Mole	Be-8 utility amphibian aircraft
Mongol	Trainer version of Fishbed
Moon	Fixed HF direction-finding array
Moon Cone	Large planar array of dipoles with reflector
Moon Face	Similar to Moon Cone
Moon Mat	Similar to Moon Face
Moon Plate	Similar to other Moon systems but land-transportable
Moose	Yak-11 trainer
Mop	Amphibian bomber/recce aircraft
Moss	AEW version of Cleat
Mote	MBR-2 utility amphibian
Mowik	Su-7U utility aircraft
Mound Brick	Trailer-mounted tracking system
Muff Cob	Naval fire control radar
Mug	MDR-6 amphibian bomber/recce aircraft
Mule	Trainer
Mushroom	Helicopter radar
Neptun	Ship's navigation radar
Nysa B	Trailer-mounted radar
Nysa C	Land-transportable radar system
Odd Lot	E-band GCI radar system
Odd Pair	Heightfinder radar. Land-based
Odd Rods	Aircraft multi-band EW antennas
Oka	Ship's navigation radar
One Eye	Surveillance radar. Land-based
OR-2	Semi-fixed search radar
Owl Screech	Naval fire control radar
Paddle Wheel	Shipboard monitoring antenna
Palm Frond	Naval navigation radar
Park Lamp	Submarine mast direction-finding loop antenna
Pat Hand	Radar for SA-4 surface-to-air missile
Patty Cake	Heightfinder radar
Pawn Shop	Missile guidance radar (ABM-X-3)
Pea Pod	Aircraft antennas
Peel Group	Naval fire control radars for SAN-1 surface-to-air missile
Plank shave	Naval search radar
Port Spring	Submarine mast conical spiral antenna
Plinth Net	Target acquisition radar
Plum Jar	Shipboard EW antenna system
Pole Dish	Possible microwave link antenna
Pop Group	Naval radar for SAN-4 missile
Pork Trough	Mortar locating radar
Post Bow	Naval target designation radar
Post Lamp	Naval target designation radar
Pot Drum	Naval fire control radar
Pot Head	Naval surface search radar
Prong Rest	VHF Yagi array
Puff Ball	Airborne search radar
Punch Bowl	Submarine mast radome
Quint Spring	Navigational tracking antenna
Ram J/K	New Soviet fighter aircraft designs
Ram L	MiG-29 fighter aircraft
Ram M	High altitude reconnaissance aircraft
Ram P	Aircraft thought to be equivalent of US B-1 bomber
Rib Cone	Shipboard broadband omni-directional VHF antenna
Ring Two	Trailer-mounted direction-finding system
Rock Cake	Heightfinder radar
Rod Mat	Ground-based IFF
Round Top	Naval optical fire control system
Saddler	SS-7 ICBM
Sagger	Anti-tank missile
Salish	Coastal defence missile
Samlet	Surface-to-surface version of Kennel missile
Sandal	Surface-to-surface missile
Sandbox	SS-N-12 anti-ship missile
Sapwood	Rocket booster
Sark	Obsolete SLBM
Sasin	ICBM
Savage	ICBM
Sawfly	Submarine-launched ballistic missile
Scale	IRBM
Scaleboard	Surface-to-surface missile
Scamp	IRBM
Scan Can	Aircraft fire control radar
Scan Fix	AI radar
Scan Odd	AI radar
Scan Three	I/J-band AI radar
Scapegoat	IRBM
Scarp	ICBM
Scoop Pair	Naval target acquisition radars
Score Board	Ground-based IFF
Score Board A	Naval IFF
Scrag	ICBM
Scrooge	IRBM
Scrubber	Naval anti-shipping missile
Scud A and B	Surface-to-surface missiles
Sea Gull	Long-range naval search radar
Sea Net	Naval search radar
Sego	SS-11 ICBM

Designation	Description
Sepal	Coastal defence version of Shaddock
Serb	Submarine-launched ballistic missile
Shaddock	Naval surface-to-surface missile
Sheet Bend	Naval search radar
Sheet Curve	Naval search radar
Sheet Nest	Shipboard radar reflector/enhancement system
Shelf	Aircraft antenna
Shika	ZSU-23-4 vehicle with quad-23mm AA system
Ship Globe	Shipborne missile and space tracking radar
Ship Wheel	Shipboard space tracking radar circular reflector
Shore Walk	Communications relay system antenna
Short Horn	K-Band bombing and navigation radar
Shyster	Obsolete ballistic missile
Side Globe	EW housings on large Soviet warships
Side Net	Heightfinder radar
Silex	SS-N-14 ASW missile
Siren	SS-N-9 anti-ship missile
Sirena	Aircraft radar warning set
Skean	IRBM
Skin Head	Target acquisition radar for torpedo boats
Ski Pole	Ship's IFF
Skip Spin	AI radar
Slant Blade	Shipboard broadband VHF antenna
Slim Net	Naval search radar
Small Cross	Rotating dipole direction-finding system
Small Yawn	Artillery locating radar
Snapper	Anti-tank missile
SNAR-6	J-band mortar locating radar
Snoop Plate	Submarine surveillance radar
Snoop Slab	Submarine surface search radar
Snoop Tray	Submarine surveillance radar
Snow Net	Shipboard ring and dipole VHF omni antenna
Snow Shoe	Similar to Snow Net
Spandrel	AT-5 anti-tank missile
Spigot	AT-4 anti-tank missile
Spike Two	Truck-mounted twin dipole array
Spin Scan	AI radar
Spin Trough	Naval IR searchlight or gun director
Spiral	AT-6 anti-tank missile
Sponge Cake	Heightfinder radar
Spoon Rest A	P-12 VHF early warning radar
Sprage Star	Shipboard VHF dipole array
Sprat Star	Shipboard communications array
Square Four	Crossed loop direction-finding array Land-based
Square Head	Naval IFF interrogator antenna
Square Pair	Target and missile tracking radar for SA-5 missile
Square Pick	Array of horizontal and vertical dipoles. Land-based
Square Slot	Naval search radar
Square Tie	Naval GP fire control radar
Square Twin	Sigint/Elint antenna
Squat Eye	Search radar. Land-based
Squint Eye	Surveillance radar
Stick Tree	Land-based Yagi array
Stone Cake	Heightfinder radar
Stop Light	Broadband passive ESM
Straight Flush	Radar for SA-6 missile
Straight Key	Sigint/Elint antenna
Strike Out	Land-mobile search radar similar to Barlock
Strut Curve	Naval search radar
Stub Brace	Shipboard broadband crossed dipole array
Styx	Naval anti-shipping missile
Sun Hat	Pole-mounted antenna
Sun Visor A/B	Naval fire control radar
Swatter	Anti-tank missile
Tachi 1	Multiple Yagi arrays associated with searchlight
Tall King	Land-based early warning radar
Tamir	Submarine sonar
Tee Plinth	Naval E-O system
Thick Eight A	Fixed HF direction-finding array
Thin Skin	Heightfinder radar
Till Pot	Probably naval ECM
Toadstool	Airborne radar on Coke
Token	Early warning GCI radar
Top Bow	Naval long-range tracking radar
Top Dome	Naval SA-N-6 missile guidance group
Top Hat	Shipboard EW antenna system
Top Knot	Naval tactical air navigation radar
Top Net	Naval search radar
Top Pair	Naval back-to-back long-range search radar group
Top Sail A/B	Naval 3-D air search radar
Top Steer	Naval back-to-back air surveillance radar group
Top Trough	Naval air search radar
Track Dish	Ground tracking radar
Trap Door	Naval missile fire control radar
Tread Mill	Shipboard Wullenweber VHF dipole array for direction-finding
Try Add	Long-range early warning radar
Tub Brick	Trailer-mounted radar
Tube Tree	Multi-element antenna array
Twice Up	Dipole antenna
Twin Eye	Back-to-back dish antenna array
Twin Scan	I/J-band AI radar
Two Spot	Truck-mounted PAR radar
Vee Cone	Shipboard conical spiral antenna
A/B/C	system
Vee Tube	Naval communications antenna
Wasp Head	Naval optical fire control director
Watch Dog	ESM multi-band intercept antenna array
Whiff	AA fire control radar
Whiff Brick	Trailer-mounted dish radar
Witch Eight	8-element dipole array for IFF
Witch Five	Naval IFF
Witch Four	Four-element dipole array for IFF
Wood Gage	Semi-fixed search radar
Yard Rake	Shipboard rotatable Yagi array (IFF)
Yew Loop	Shipboard radar
Yo Yo	Target tracking radar

Land-based Guns & Artillery

The following five tables contain condensed information from the pages devoted to army ordnance equipment in previous editions of *Jane's Weapon Systems*. This aspect of military technology now forms a major portion of the associated Jane's yearbook, *Jane's Armour and Artillery*, which is published annually and is dedicated to military land fighting vehicles and to tubed artillery; readers seeking detailed treatment of these subjects are directed to that work. Land ordnance was initially incorporated in *Jane's Weapon Systems* as in many instances a gun forms a significant element of one or more of the weapon systems which are the principal concern of this book, but to describe such elements at length can no longer be justified in the context of ever increasing demands on the space available in *Jane's Weapon Systems*, or when the topic has its own Jane's title devoted to it. The tables that follow will be adequate for the understanding and assessment of those weapon systems mentioned in this volume that are concerned with artillery.

4503.114 Self-propelled Artillery

Model	Entry No.	Type	Calibre	Combat weight	Shell weight	Range	Type of ammunition	Engine power/type	Remarks
CHINA, PEOPLE'S REPUBLIC

3179.104 **Land Forces Inventories**

These tables have been designed to help the reader of *Jane's Weapon Systems* to identify quickly the major equipment of all land forces. Equipment covered includes tanks, anti-armour weapons, reconnaissance vehicles, armoured personnel carriers, artillery, and surface-to-surface missiles, and anti-aircraft weapons. Mortars and light anti-tank weapons (including light recoilless rifles) have been omitted. Variants of particular vehicles have also been omitted in certain cases, for example, the M-113 family. In addition some vehicles, eg the AMX-13, can be used in two roles, ie as a reconnaissance vehicle or as a light tank: in these tables they have been included under the heading for which they are normally employed. Finally it should be remembered that some armies use vehicles for different roles than those for which they were designed. A good example is the BMP armoured personnel carrier, which some armies use in its intended role, whilst others use it as a light tank. These tables include equipment that is on order, entering service or in reserve.

User service:
(A) Army
(M) Marines
(O) Other, eg air forces ground units
(S) Internal security role

Fighting Ships

The following pages list what we believe to be the most important ships of each nation and the equipment carried. Ships are shown in order of completion dates for first of class so that readers may readily see where navies are heading.

The selection of ships as 'important' is somewhat arbitrary. In broad terms all fighting ships of 1000 tons and upwards are included as are smaller craft with missiles. However, other craft, minesweepers, motor torpedo boats, auxiliaries, etc. are generally not significant in terms of their weapon systems.

It will be obvious that there are inevitable gaps in our knowledge of armament and equipment. To those readers seeking more information than can be contained, or justified, in this volume, we would direct their attention to our companion publication, *Jane's Fighting Ships*.

The classification of ships in these tables broadly follows that given in *Jane's Fighting Ships* for the USA section which, in brief, is as follows:

BB	Battleship
CA	Gun cruiser
CG	Guided missile cruiser
CV	Aircraft carrier
DD	Destroyer
FF	Frigate
Corv	Corvette
LHA	Amphibious assault ship (General purpose)
LHD	Amphibious assault ship (Multi-purpose)
LPH	Amphibious assault ship (Helicopter carrier)
LSD	Dock landing ship
LCC	Amphibious command ship
PHM	Patrol hydrofoil - guided missile
PG	Fast attack craft
SS	Submarine
AD	Destroyer tender
AOR	Replenishment oiler
AOE	Fast combat support ship
AGSS	Auxiliary research submarine

With the following prefixes and suffixes:

A	Auxiliary
B	Ballistic missiles
G	Guided missiles
H	Helicopter carrier
N	Nuclear propelled

3081.304 **Military Aircraft**

The following table contains details of the major military aircraft, listed under the country of origin. It is not intended to be exhaustive in either the number of aircraft types listed or in the information given. Similarly, the many individual variants of some aircraft types are not treated separately, entries in most cases being for the main application of a given aircraft type. Readers who require more comprehensive aircraft data are referred to the current edition of the companion volume, *Jane's All the World's Aircraft*. (P), in the 'Contractor' column denotes that the aircraft type is in production.

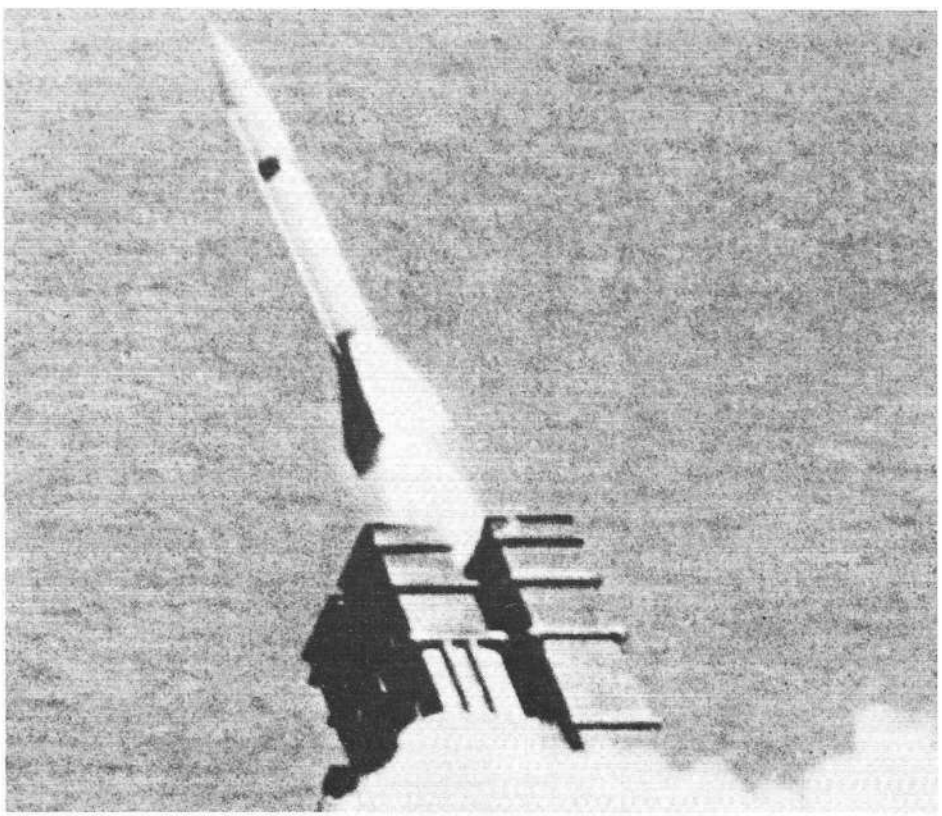
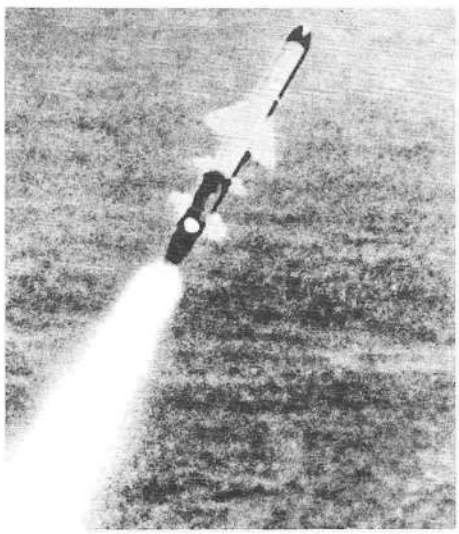
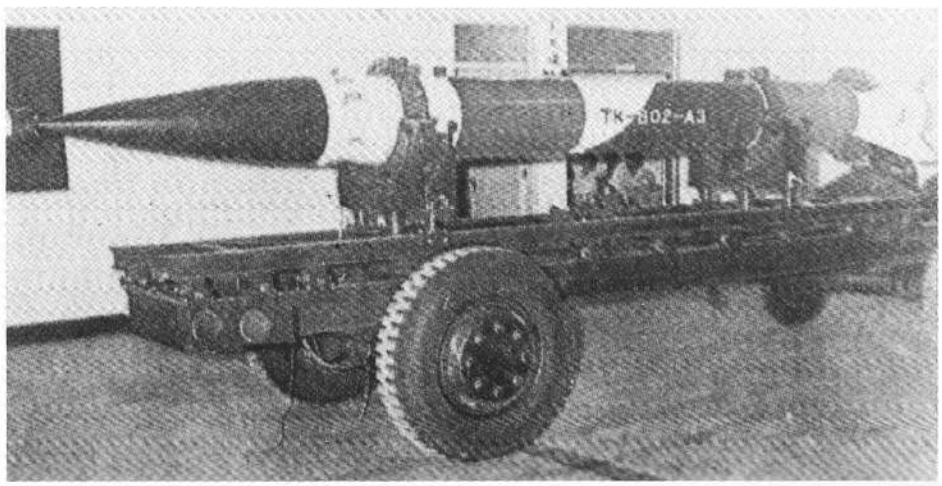
ADDENDA





Artist's impression of the projected US Air Force Small ICBM, popularly known as 'Midgetman'. One element of the American strategic forces modernisation programme, it is planned to be operational in the 1990s



The Radamec Defence Systems Ltd Type 449 heavy-duty direct drive two-axis, gyro-stabilised director platform is the basis of a lightweight, close-range naval SAM system being developed in conjunction with Shorts for the Javelin missile system. The platform can be used for other payloads

Test launch of the Tien Kung (Skybow I) surface-to-air missile, reportedly designed and developed by Chung Shan Institute of Science and Technology, Taiwan. At the time of this launch (July 1985) a Taiwanese MoD spokesman said that the system's computers, fire control radars, mobile launchers etc, had all been designed and manufactured locally. The missile and its four-cell launcher resembles those of the US MIM-104 Patriot system

Booster rocket is used to assist launch of the new Japanese SSM-1 surface-to-surface anti-ship missile, which has been developed from the air-launched ASM-1 Type 80 weapon. A range of about 160 km is claimed for the SSM-1

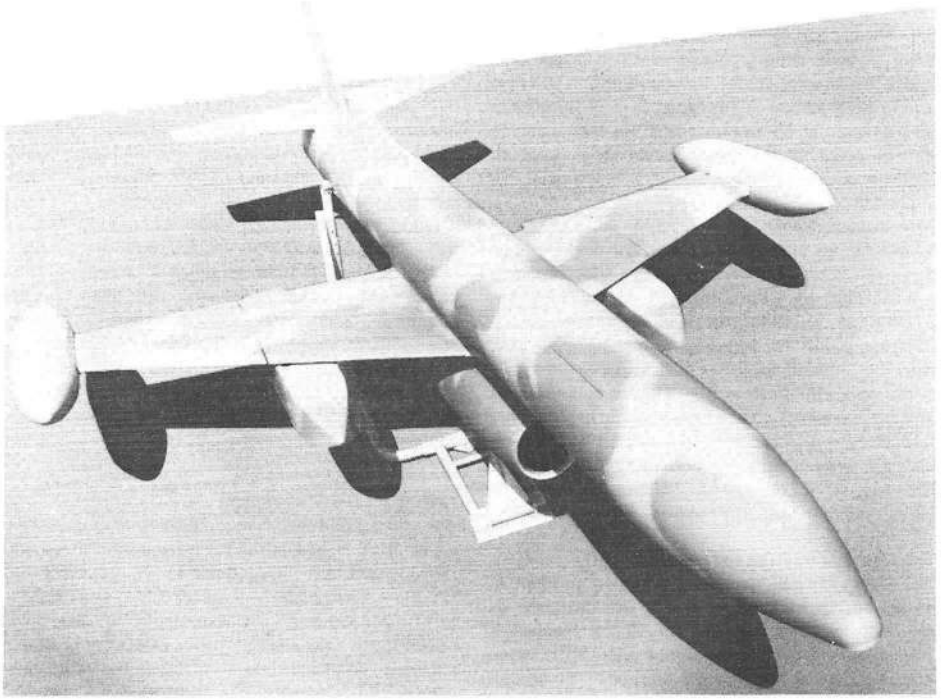
Taiwanese Tien Kung (Skybow I) surface-to-air missile on a transporter trailer. Developed at Chung Shan Institute of Science and Technology, Skybow I is reported to be one of four new missiles being developed there: Skybow II will have ramjet propulsion to enable it to engage long-range high-altitude targets, as a possible replacement for the Nike Hecules; a short-range all-aspect air-to-air replacement for the Sidewinder could be ready by December 1986; and a medium-range air-to-air missile is planned for testing in 1989

4899.391
BQM-126A MISSILE TARGET

Developed for the US Navy, the Beechcraft BQM-126A missile target drone is a turbo-jet powered subsonic target which is recoverable and reusable. Composite materials are used extensively in its construction and a low-profile 'H' tail assembly makes the vehicle readily adaptable for either ground or air launch. Powered by a French Microturbo TRI 60-2/097 engine, it is capable of a maximum speed of 1072 km an hour, and depending on speed, a maximum endurance of between 16·5 minutes and 1 hour 36 minutes. It is strong enough to withstand turns of up to 7*g*.

The BQM-126A can be operated at altitudes from sea level to over 12 000 metres, carrying an internal payload of 45 kg or an external load of up to 90 kg. Designed to meet the US Navy's requirements for a new high reliability, low cost target that will evenutally replace all sub-scale, subsonic targets in the USN inventory, it will be used to simulate the flight of threat aircraft and cruise missiles. It will also be used in the development and evaluation of new weapon systems.

Guidance will be by means of both a digital autopilot and remote command facilities, and both preprogrammed mission and Tacan guidance techniques can be employed.



CHARACTERISTICS
Type: BQM-126A
Length: 5·5 m
Diameter: 38 cm
Wing span: 3 m
Power plant: Microturbo TRI 60-2/097
Max speed: 1072 km/h
Payload: 45 kg (internal); 90 kg (external)
Max altitude: 12 000+ m
Guidance: Digital autopilot, remote command
Endurance: 16·5 min – 1 hr 36 min, depending on speed
STATUS
Developed for US Navy.
CONTRACTOR
Beech Aircraft Corporation, Wichita, Kansas 67201, USA.

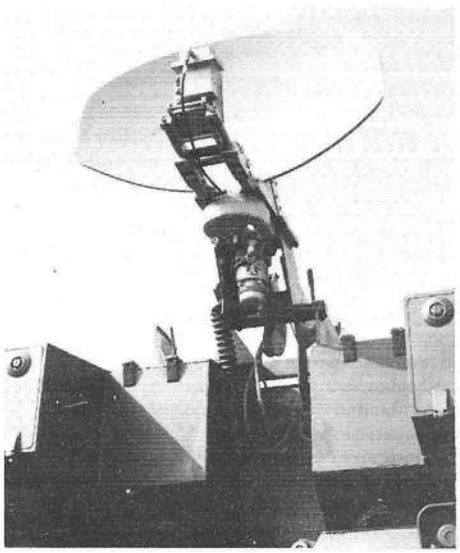
Beechcraft BQM-126A missile target drone

Raider Tactical Drone

At the 1985 Paris Air Show, Beech introduced a new tactical RPV based on the company's successful MQM-107B missile target airframe (**1814.391**) called Raider. The new RPV, which is now under development, uses the MQM-107 airframe with payloads housed in detachable pods, and special mission payloads include active and passive electronic countermeasures, such as radar jammers, flares, chaff and radar enhancement pods. Such payloads would be employed for penetration assistance in support of military air missions, and for decoy purposes. Additional operations envisaged include weapon system evaluation, reconnaissance and intelligence collection.

Beechcraft Raider tactical drone

The Raider is powered by a French Microturbo TRI 6-/12 engine which gives a maximum speed of 954 km an hour, and a typical endurance of between 72 minutes to 2 hours 36 minutes, with auxiliary fuel tanks. The recoverable vehicle has both autonomous (preprogrammed) and semi-autonomous (ground-controlled) guidance capabilities.



CHARACTERISTICS
Type: Raider
Length: 5·5 m
Diameter: 38 cm
Wing span: 3 m
Power plant: Microturbo TRI 60/2
Max speed: 954 km/h
Payload: 45 kg (internal); 160 kg (external)
Max altitude: 12000+ m
Max endurance: 2 hr 36 min (with auxiliary tanks)
STATUS
Development.
CONTRACTOR
Beech Aircraft Corporation, Wichita, Kansas 67201, USA.

3602.351
DORNIER MINI-DRONE/RPV

The entry for this programme in the Drones and RPVs section of this edition, erroneously states that no progress in 1984 had been reported. Too late for inclusion in the main text we have been informed that, 'The development of the anti-radar version, to meet a German Government requirement, is in progress.'

Dagger Egyptian SP Anti-aircraft System

In mid-1985 an agreement was reached between Thomson-CSF and the Egyptian authorities covering the development of a new self-propelled AA gun based on Soviet-supplied ZU-23 towed anti-aircraft guns. The latter will be mounted on a tracked armoured M113A2 chassis and converted from a basic clear-weather system into an all-weather system by the association of an Oeil Vert (Green Eye) Plus target detection and tracking radar, with a range of about 20 km, and a Condor electro-optical night camera to provide for all-weather/night target tracking facilities. The complete system has the Egyptian designation Dagger, consisting of up to six fire units, two tracking and one radar acquisition unit. This will be capable of co-ordination with a Crotale SAM system. The latter system is reported to have been in use in Egypt for several years, with 20 acquisition units and 40 firing units operational.

Thomson-CSF Oeil Vert Plus acquisition radar will be used in Dagger SP anti-aircraft gun system to be developed for production in Egypt

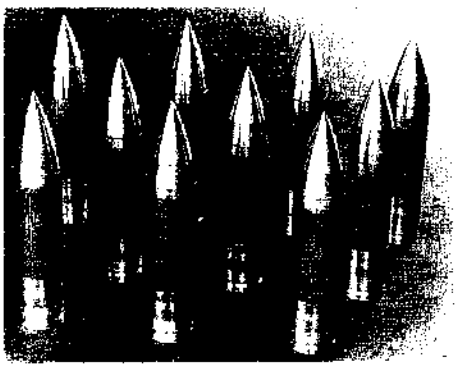
Argus Surveillance System

At the 1985 Paris Air Show, Dornier revealed a continuation of the Argus surveillance drone system which is intended as a West German follow-on to the original Argus I project which was a joint Franco-German programme until the former withdrew in September 1981. This was described in **3602.351** in the 1984-85 and some earlier editions.

Artist's impression of Dornier Argus II free-flying surveillance helicopter drone

On the basis of the experience with the bilateral Argus I programme and with the Dornier minitelecopter (MTC) (**4294.351**), Dornier has proposed the Argus II concept. This has a free-flying platform with two contra-rotating rotors, and the radio tethered rotor platform has no tail rotor.

CHARACTERISTICS



Width: 2·14 m
Length: 2·35 m
Height: 2·23 m
Power plant: Allison C250 C20B
Rotor diameter: 8 m
No of blades: 2 × 3
Max take-off weight: 1 tonne
Max payload: 150 kg
Endurance: 1·5 h
Operating altitude: 3000 m

STATUS

System configuration has been detailed and optimised, and design work has been carried out on the major sub-systems.

CONTRACTOR

Dornier GmbH, Post Box 1420, 7990 Friedrichshafen 1, Federal Republic of Germany.

Raytheon Company has demonstrated the ability to change the course of a 40 mm bullet after it has been fired from a gun, using the impulse manoeuvre technique. This involves the use of explosive charges to change the course of a spin-stabilised shell. Development is being carried out by Aerojet Corporation and Ensign Bickford Corporation under Raytheon sponsorship. Application of this technology to gun-fired projectiles allows for interception of manoeuvring targets, under varying astmospheric conditions and in the presence of other fire control errors. Projectiles ranging in size from 20 mm to 16 inches can be guided in this way. A variety of concepts using strapdown seekers and/or command links may be mechanised offering a low-cost solution to guiding projectiles in a variety of applications such as SAMs, AAMs, etc. In previous range firings Raytheon demonstrated the impulse manoeuvre system in the 155 mm conventional geometry smart projectile (CGSP) programme. The company is under contract to the Large Calibre Laboratory at Picatinny Arsenal

Exercise Stonefish Mine

In the course of 1985, Marconi Underwater Systems Ltd. introduced an exercise variant of the Stonefish naval ground mine (**4558.441**). This offers an acoustically controlled recovery and control system, a multi-mode programmable electronics package and a capacity for vessel data gathering. It can also mimic a full range of mine types. A large number of ship passes can be recorded, and the exercise mine can be prepared for re-use within three hours of recovery after the previous exercise.

Area Defence Sonar

A 360-degree surveillance sonar, for area defence purposes such as harbours or estuaries etc. was announced in September 1985 by Marconi Underwater Systems Ltd. A development of the company's existing 360-degree surveillance sonar, the area defence equipment offers extended range performance for the detection of divers, submersibles and submarines. Two versions, a single and multiple frequency, will be available, to meet particular needs, and the system provides both operator alert and CCTV signals for onward transmission in the event of intrusion into the security field.

Sea Cobra naval Point Defence System

Sea Cobra is a new naval FCS designed for fitting in vessels of 20 metres length upward, designed by Marconi in collaboration with Breda Meccanica Bresciana. The system is a combination of the Breda compact 30 mm gun and the 440 radar fire control system. Operation is automatic from target detection in the radar surveillance mode, through 'lock-on' and tracking, to the point where the target is in range and the operator fires the gun.

Ship equipment consists of two parts: the armament, and the control console. The radar surveillance/director transmitter, synthesiser, signal processor and data extraction unit are all mounted on a frame that is housed within the glass fibre armament housing; and the control panels, monitors and predictor are mounted in the control console. The 440 radar features comprehensive ECCM, frequency agility, and performs both surveillance and tracking functions. Range in the surveillance mode is 12 km and 10 km in the auto-tracking mode.

The 30 mm gun has 2·458-metre long barrels and is fully automatic with a rate of fire of 1600 rounds a minute and a high muzzle velocity. Targets can be effectively engaged at ranges between 100 and 1000 metres, with APDS ammunition, although HE can also be used.

Seawolf 1802SW

Marconi Radar has introduced a version of the Seawolf as an anti-missile air defence system suitable for fitting on small missile boats down to 450 tons, based on use of the 1802SW radar system. This comprises a number of proven elements: the ST1802 tracker radar; the 3800 thermal imager; a missile tracking system used with the Javelin air defence missile; and the command link from the 805SW system. In operation, the 1802SW radar tracks the target and the Javelin TV system tracks the Seawolf defending missile by means of flares mounted on it. The thermal imager is used to support the radar when tracking targets at low elevation angles. The 1802SW is normally used with the Marconi S1820 surveillance radar but the manufacturers say that any radar capable of providing track data on small targets can be employed.

When the surveillance radar identifies a threat, track data is passed to the 1802SW which slews to the target bearing, it then searches in elevation and acquires the target. Typically, the 1802SW will acquire an aircraft target at about 30 km, and a missile at around 13 km range. It then calculates when to launch the Seawolf, and fires it. The Seawolf missiles then gathered onto the target line of sight and continuously tracked by the Javelin TV system to final engagement.

L20 Sight Laser Rangefinder

The L20 is a periscopic, monocular laser rangefinder sight that is available for new installation or retrofitting in most main battle tanks, including the Chieftain, Challenger, Vickers Mk 3, M41 and CVR(T) Scorpion. Of modular construction, the five constituent modules are fully interchangeable, allowing prime mode operation to be virtually 100 per cent (without removing the sight from the vehicle) and allowing the same sight to be used in a mixed fleet of vehicles.

The sight incorporates × 1 (surveillance) and × 10 (aiming) channels. A Nd:YAG laser transmitter/receiver provides a range display in the × 10 eyepiece, while a CRT injects a fire control computer-generated aiming-mark or output from a remote thermal imager or low-light TV camera.

CHARACTERISTICS

Type: 2nd generation Nd:YAG
Wavelength: 1·06 μ
Q-switch: Electro-optical or saturable dye
Output: 15 or 20 mJ
Clock frequency: 30 MHz
Beam divergence: 0·8 or 0·4 mil
Field of view: 0·8 mil
Range limits: 300 – 9995 m
Range accuracy: ±5 m
PRR: 0·5 or 1 pps

STATUS

The L20 is installed in Chieftain, CVR(T) Scorpion and Vickers Mk3 MBT. Significant orders, from Middle Eastern and African countries, were secured in 1982/83/84 and 1985.

CONTRACTOR

Vickers Instruments, Haxby Road, York, Yorkshire YO3 7SD, England

L50 Conversion Unit

The L50 conversion unit is designed to achieve a significant improvement in the hit performance of main battle tanks such as the T54, T55 and T59 by converting the existing gunner's telescope into a laser rangefinder sight, but without any need to cut armour. The L50 is of modular construction, the main items being the optics, laser, CRT (optional) and control; additional equipment includes secondary eyepiece range display, foot firing pedal and commander's range readout unit. This form of construction allows module substitution without sight removal from the vehicle, and minimises spares inventories and maintenance costs.

CHARACTERISTICS

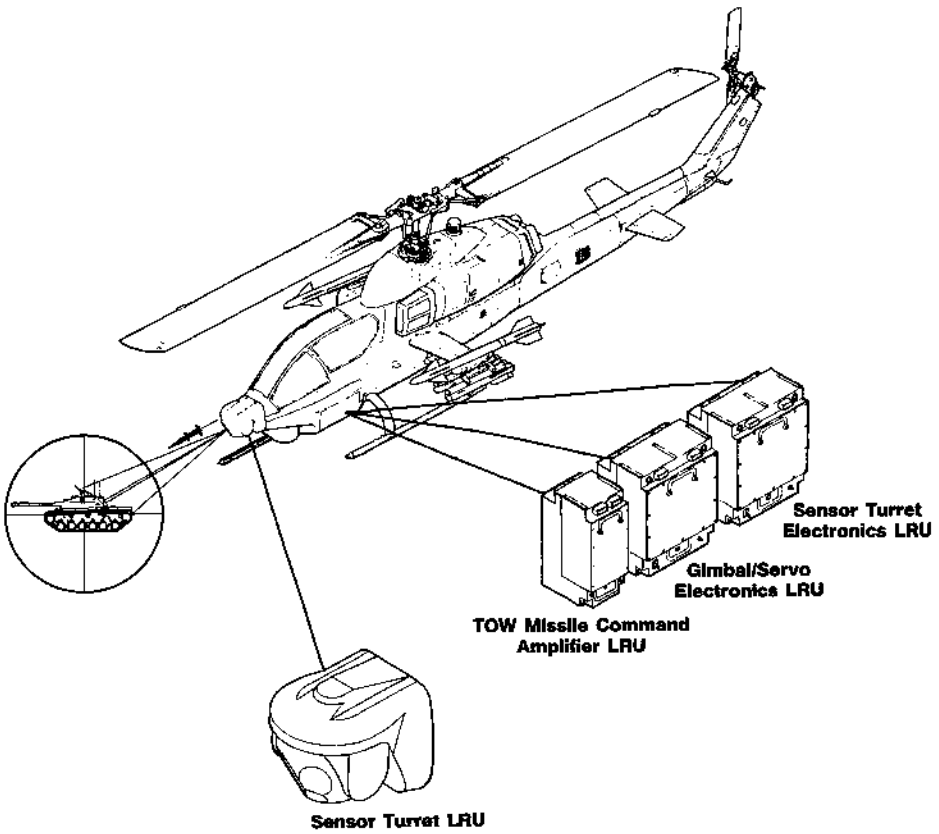
Type: 2nd generation Nd:YAG
Wavelength: 1·064 μ
Q-switch: Electro-optical or saturable dye
Output: 15 or 20 mJ
Clock frequency: 30 MHz
Beam divergence: 1·0 or 0·5 mil
Field of view: 1·0 or 0·6 mil
Range limits: 300 – 9995 m
Range accuracy: ±5 m
PRR: 0·5 or 1 pps

STATUS

Orders have been placed by two unspecified countries.

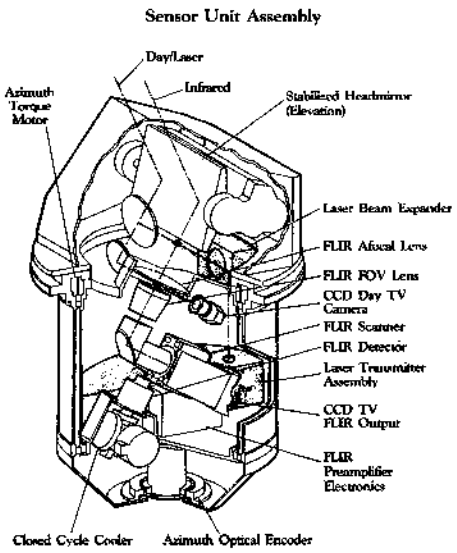
CONTRACTOR

Vickers Instruments, Haxby Road, York, Yorkshire YO3 7SD England.



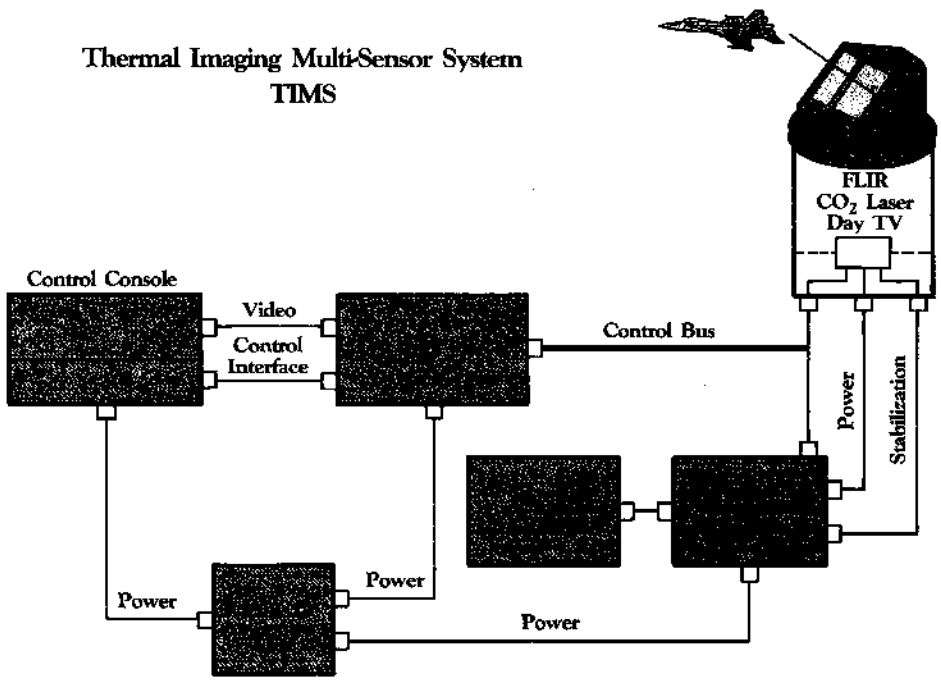
Night ATAC

The Texas Instruments Night Airborne Target Acquisition Capability (ATAC) fire control system is engineered from US DoD night vision 'common modules' to provide a night targeting system with an autonomous facility for controlling the firing of multiple missiles such as TOW, Hellfire, or Sidewinder from an attack helicopter. This enables the helicopter to be used for anti-armour and close air support purposes in adverse weather and under day and night visibility conditions.



The Night ATAC sensors, comprising a digital FLIR and a three field of view FLIR/day TV, are carried in a nose-mounted turret. Associated electronics/control/interface units are carried separately in the helicopter fuselage. Additional optional facilities include: modular direct viewing; automatic target acquisition; inflight video playback; fire control automation; improved FLIR performance, and enhanced digital processing.

CHARACTERISTICS
Field of regard: –120° deg (Az); +30° to –70° deg (Elev)
Field of view (FLIR): 27·8° × 37° (VWFOV); 6° × 8° (WFOV); 1·8° × 2·4° (NFOV)
Field of view (TV): 6° × 8° (VWFOV); 1·8° × 2·4° (NFOV); 1·3° × 1·75° (VNFOV)
Slew rate: 160°/sec
Detection range: Over 6 km
Recognition range: Over 3 km
Turret weight: 150 kg (approx)
CONTRACTOR
Texas Instruments Inc, PO Box 660246, Dallas, Texas 75266, USA.



TIMS
Texas Instruments have introduced a new thermal imaging multisensor (TIMS) stabilised sight suitable for surveillance and fire control used on armoured fighting vehicles or naval craft. The system provides passive day or night automatic tracking and fire control solutions for a variety of applications including air defence, surveillance, and target ranging and tracking. TIMS is fully stabilised and integrates a high-resolution thermal imaging FLIR with CCD television, a carbon-dioxide laser, and an automatic tracker, and this sensor package can be turret-mounted or remotely located aboard ship. Stabilisation is in two axes and the sensor provides hemispherical coverage. A digital processor is used for automatic tracking. A remote control/display console is provided for the operator.
CHARACTERISTICS
FLIR
Wide field of view: ½ mrad, 2·3° × 3·1, f/2·0
Narrow field of view: ⅛ mrad, 6·9° × 9·2°, f/1·9
Field of regard: –20° to +75° elevation; 360° azimuth
TV: High resolution CCD (245 × 780 pixels)
Field of view: Approximates to that of FLIR
Laser: CO2, FLIR integrated
Range: 10 km

Wimera tracking radar (Germany, FR) ... 454
Winnin decoy system (Australia) ... 645
WJ-927 ESM equipment (USA) ... 634
WJ-945 receiving/DF system (USA) ... 633
WJ-1205B video digitiser unit (VDU) (USA) ... 634
WJ-1240 receiving system (USA) ... 635
WJ-1424 microwave receiver (TLR-31) (USA) ... 635
WJ-1440 microwave receiver system (USA) ... 636
WJ-1740 receiving system (USA) ... 716

WJ-1840 receiving system (USA) 636
WJ-1920 multiparameter distributed processing system (USA) 633
WJ-1988 amplitude monopulse DF processor (USA) .. 634
Working Bee-4 127mm artillery rocket system (Taiwan) 38
Working Bee-6 127mm artillery rocket system (Taiwan) 39
WSA-4 fire control system (UK) 326
WSA-400 Series naval weapon control systems (UK) .. 320
WSA-420 and CAAIS 450 Series fire control and action information systems (UK) 320

X

X17255 command active multi-beam sonobuoy (SSQ 963) (UK) 753
XJ/FPS-3 air defence radar (Japan) 466
XM8 40mm armament sub-system helicopter (USA) 431
XM27E1 7·62mm armament sub-system helicopter (USA) 430
XM28E1 armament sub-system (USA) 429
XM30 aircraft armament sub-system (USA) 429
XM59 armament sub-system (USA) 433
XM76 anti-oscillation sighting system (USA) 875
XM94 armament sub-system (USA) 433
XM188E1 30mm three-barrel aircraft gun (USA) 427
XM214 5.56mm automatic gun (USA) 431
XM260 lightweight rocket launcher Hughes (USA) 429
XM815 HEAT-MP-T projectile (USA) 69
XR100 Comint receiving system (France) 609
XSV-01 expendable sound velocimeter (Netherlands) 739

Y

YMQM-105 mini-RPV, Aquila (USA) 355
YMRL 32 128mm multiple rocket launcher M77 (Yugoslavia) 48
YQAM-127A Intimidator SLAT (USA) 353
Yo-Yo missile control radar (USSR) 476
Yugoslavia
aircraft armament 433
army fire control systems 294
battlefield support weapons 48
electronic warfare equipment (air) 716
electro-optical equipment (land) 839
land-based air defence systems 237

Z

Z16 submarine-launched torpedo (France) 211
ZB 298 short range ground surveillance radar (UK) 487
Zeus airborne ECM system (UK) 686
ZSU-23-4 23mm SP AA vehicle (USSR) 127
ZW series naval radars (Netherlands) 534
ZW.06/2 surface search and navigation radar (Netherlands) 533
