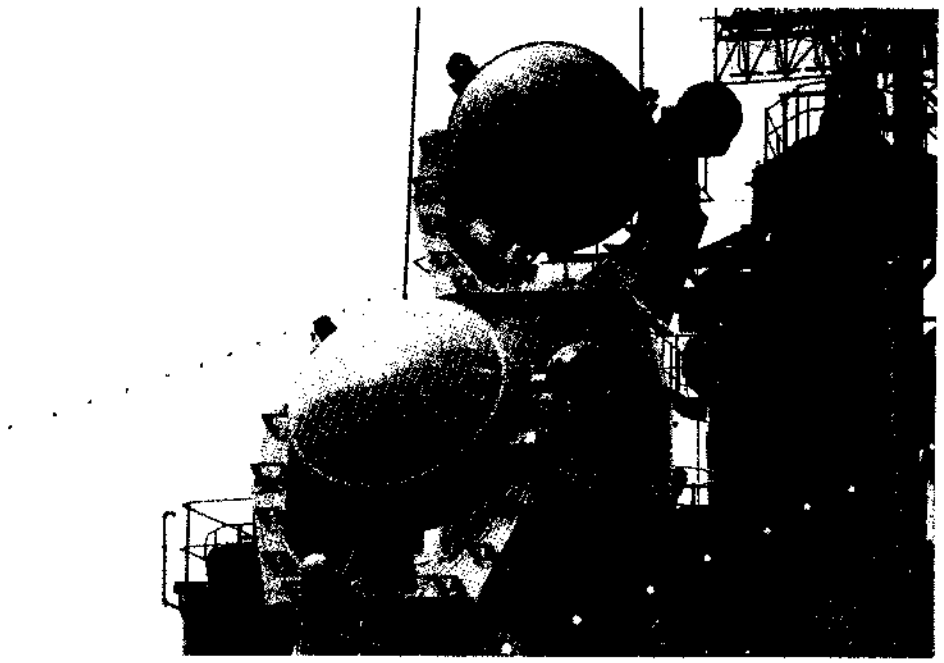
The SPG-51 is widely used on US Navy vessels, and development proceeded through A, B, C and D versions. The last of these began deployment in 1972. Among the other navies using this radar are those of Australia, France, Federal Republic of Germany, Italy, Japan, the Netherlands and Spain.

CONTRACTOR
Raytheon Company, Equipment Divison, Wayland, Massachusetts 01778, USA.



SPG-51 missile guidance radars. Three-dimensional search radar on left is SPS-52

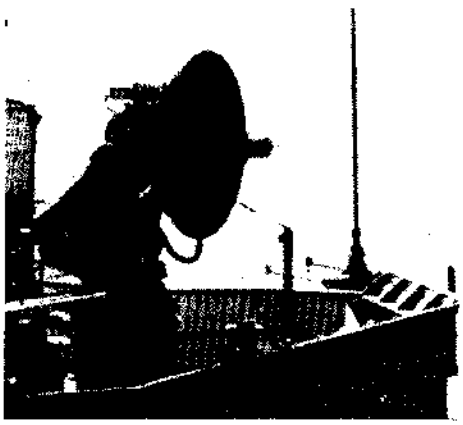
1748.253
AN/SPG-55 RADAR

The AN/SPG-55 radar is the G/H-band guidance radar for the Terrier surface-to-air missile system (**6005.231**) fitted in ships of the US and a number of allied navies. Transmitter power is thought to be of the order of 50 kW and the typical operating range, 50 km. Three versions of this radar have been identified: SPG-55, A and B models. Some references have been found to the use of an associated CW target illuminator system, AN/SPA-44, but no other details have been obtained. Early American Terrier installations employed, instead of the SPG-55, a radar designated AN/SPQ-5, which in appearance is similar to the SPG-49. It is not known how many of these installations remain operational but the SPG-55 remains on three ships of the Italian Navy.

In 1977 Sperry Rand Corporation received US Navy

contracts for updating and refurbishing SPG-55B radars, four of which have been brought to a Mod 8 Block 1 configuration for the Mk 86 Terrier fire control system.

SPG-55 Terrier missile guidance radars aboard USS Dahlgren



1932.253
AN/SPG-60 RADAR

The AN/SPG-60 is a monopulse, X-band pulse doppler search and tracking radar forming part of the Mk 86 fire control system (**1241.281**). It is used for acquisition and tracking of air targets to ranges of about 60 nautical miles (110 km), tracking being either automatic or manually aided. The radar's search-to-acquire capability is computer directed, and it accepts two- or three-dimensional target designation co-ordinates in digital or synchro format from either the AN/SPQ-9 radar (**1931.253**), which is also part of the Mk 86 FCS, or other shipboard search radars. The antenna is stabilised.

Acquisition for SPG-60 is automatic, the radar performing its programmed scan search pattern about the designated point under computer control. The computer resolves the problems of blind range and range rates inherent in doppler radars, as well as range ambiguity.

The computer also automatically controls and calibrates receiver gain and monopulse channel balance.

Other features include four-horn monopulse antenna arrangement; continuous azimuth rotation; bore-sighted TV camera; passive angle tracking; adaptive scan patterns for automatic acquisition; adaptive computer control of PRF and pulse-length.

SPG-60 (STIR) radar aboard USS South Carolina (Stefan Terzibaschitsch)

The Mk 86 FCS uses the SPG-60 to provide tracking data for the SM-1 SAM system, and it also provides target illumination by means of CW injection at the SPG-60 antenna.

DEVELOPMENT

Prototypes of the complete Mk 86 FCS were delivered to the US Navy in March 1970, and by February 1985, 68 production units had been delivered for fitting aboard various US Navy ships, or for training and test sites. These include the 'Ticonderoga', 'Virginia' and 'California' class guided missile cruisers, 'Spruance' class destroyers, 'Tarawa' class amphibious assault ships, 'Kidd' class guided missile destroyers and three ships of the 'Charles F. Adams' class guided missile destroyers.

STATUS

The system is now at sea with the US Fleet. Production is continuing for applications related to the DDG 15 class Fleet Modernisation programme for the American and West German Navies, and USN CG 47 Aegis ship class.

CONTRACTOR

Lockheed Electronics Company Inc, US Highway 22, Plainfield, New Jersey 07061, USA.

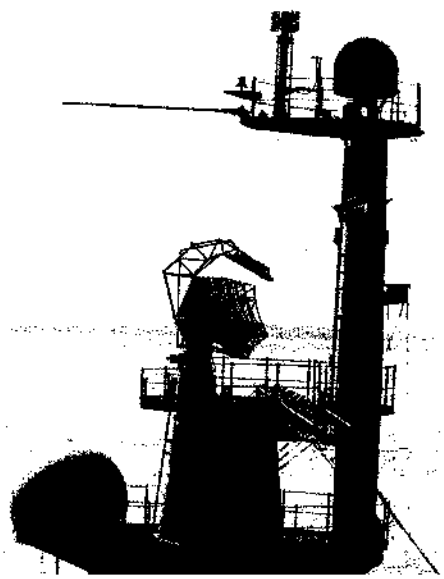
1931.253
AN/SPQ-9 RADAR

The AN/SPQ-9 is a high-resolution, track-while-scan (TWS), pulse compression, X-band naval radar. It forms part of the Lockheed Mk 86 fire control system (**1241.281**) and provides detection and tracking facilities within a range of 20 nautical miles (37 km). The minimum range is 150 yards (137 m). The radar antenna provides surface search and limited air cover (up to 2000 ft, or 610 m). A separate transmitter/receiver interrogates, receives, and decodes replies from transponders such as the AN/TPN-7, AN/TPN-16, or AN/UPN-32. The surface-search-only antenna is mounted on a stabilised platform and protected by a radome. The combined surface-and-air search antenna is deck mounted and also is stabilised.

A high scanner rotation rate is a feature of the SPQ-9 giving a one-second data rate. Real-time signal and data processing permit detection, acquisition, and simultaneous tracking of multiple targets. The basic capacity of the complete Mk 86 system is four targets, and TWS is expansible to 120 targets. The radar operates in any one of five selectable frequency ranges, with pulse-to-pulse frequency agility as an additional countermeasure to jamming and natural clutter. This feature also permits a number of radars to operate without mutual interference. An MTI facility is being developed to further enhance sub-clutter visibility.

Other elements of the Mk 86 system are the AN/SPG-60 radar (**1932.253**) and an electro-optical sensor system, connected to an AN/UYK-7 computer complex and consoles for command and weapon control. Both guns and missiles can be controlled by the system.

DEVELOPMENT



Prototypes of the complete Mk 86 FCS were delivered to the US Navy in March 1970. By February 1985, 68 sets had been delivered for installation aboard various US Navy ships. These include the 'Ticonderoga', 'Virginia' and 'California' class guided missile cruisers, 'Spruance' class destroyers, 'Tarawa' class amphibious assault ships, 'Kidd' class guided missile destroyers and three ships of the 'Charles F. Adams' class guided missile destroyers. The Mk 86 is also being fitted in the West German DDG modernisations.

STATUS

The system is now at sea with the US Fleet. Production is continuing, see SPG-60 status, above.

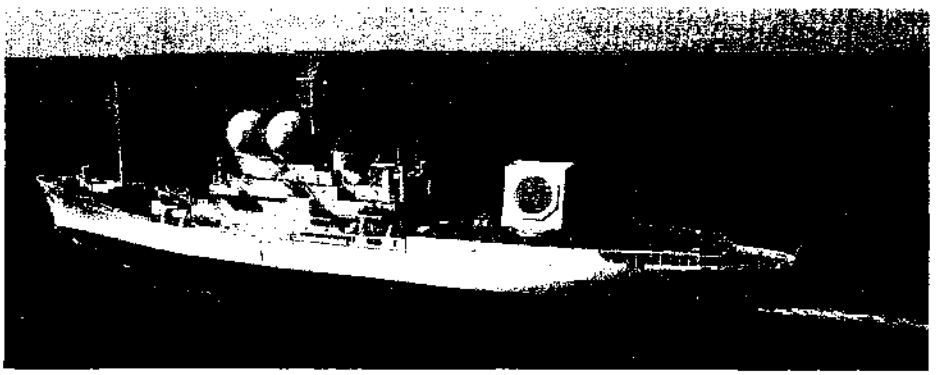
4301.253
AN/SPQ-11 COBRA JUDY RADAR

The Cobra Judy shipborne phased array radar is a detection and tracking system enabling data to be collected on foreign strategic ballistic missiles tests. The system is similar to the land-based Cobra Dane radar (**1949.153**) although consicerably smaller.

The large octagonal array of this racar measures 22·5 feet (approximately seven metres) in diameter and is composed of 12 288 antenna elements. The elements are co-ordinated to form transmission patterns by a large scale Control Data CYBER 175-112 computer which allows the radar to detect and track objects at very high rates. After detection and tracking the information is fed to a computer for storage and display as well as post-mission reduction and analysis.

Cobra Judy is installed on the stern of a former merchant vessel, the USNS *Observation Island*, which has been extensively modified. The system weighs 250 tons (approximately 250 000 kg), stands four stories high and is integrated into a steel turret which can be rotated mechanically. The octagonal array makes up one wall of the pyramid-like structure. The complete shipborne sensor is operating in the Pacific Ocean, based at Pearl Harbor, Hawaii.

The Cobra Judy system is undergoing a major upgrade, managed by the US Air Force Electronic Systems Division and carried out by Raytheon. This will add an X-band radar, using a parabolic dish antenna, to complement the existing S-band phased-array system. The addition of this new equipment is designed to improve the ability to observe and collect intelligence data on the terminal phase of ballistic missile tests, from the time the re-entry vehicles enter the atmosphere through their descent to the Soviet test range on the Kamchatka Peninsula. Since operation in X-band offers a better degree of resolution and target separation, the additional system may well improve intelligence considerably by the ability to differentiate between multiple warheads and ECM chaff and decoys.



The X-band dish antenna is installed forward of the phased array, aft of the ship's funnel, and stands five stories high. The dish and pedestal have been supplied by the USAF, and were previously used as a shipborne telemetry radar. The dish is being refurbished by Raytheon and a new software program is being written. The Control Data CYBER 175-112 computer will serve both radars.

STATUS

The radar has been acquired and operated by the US Air Force Systems Command, Electronic Systems Division. Test and evaluation trials took place during 1981 and the system is fully operational.

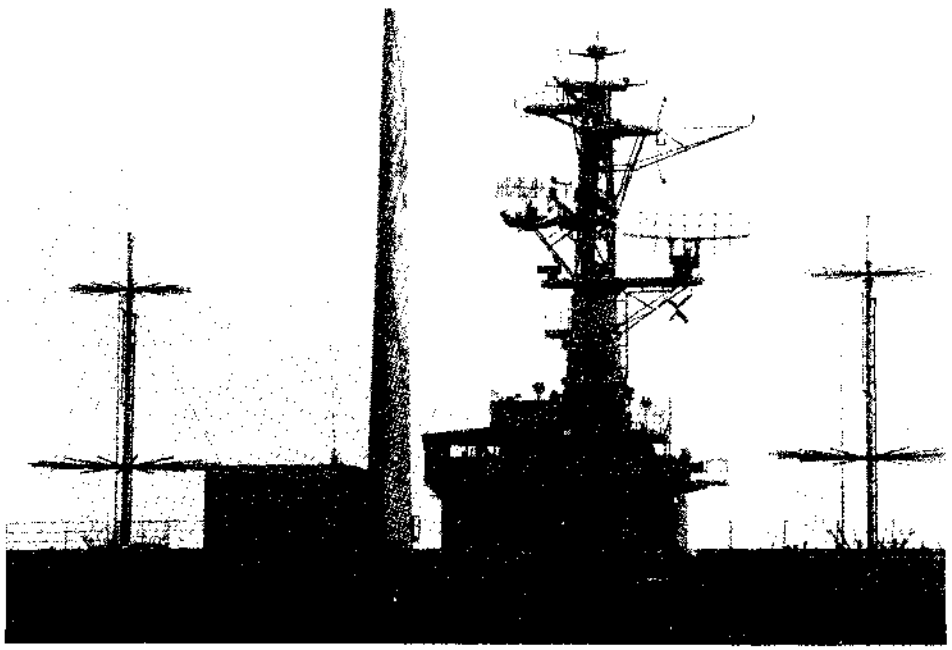
1744.253
AN/SPS-6 RADAR

The AN/SPS-6 is a naval air and surface search radar, operating in the D-band of the radar spectrum and having an output of the order of 500 kW. Approximate range of the equipment is 100 to 200 km. The SPS-6 is widely used on ships of the US Navy and numerous other nations and has been in service for many years. During this period various versions, denoted by suffix letters to the designation, have been evolved. These differ in transmitter/receiver and antenna details.



The SPS-6, SPS-6A and SPS-6B all employ the same below-decks equipment but have different antennas. The SPS-6C has the same antenna as the SPS-6B (on a different pedestal) and with certain differences in the below-decks equipment. The principal effect of the different antennas used is in the vertical beamwidth for each: SPS-6, 10°; SPS-6A, 20°; SPS-6B/C, 30°. The SPS-6C is believed to incorporate more comprehensive receiver video processing.

STATUS

In addition to the various classes of US Navy vessels fitted with the SPS-6, it is used by the navies of Italy, Japan, Spain, Taiwan, Turkey, Venezuela, and West Germany, and all those navies supplied with 'Fletcher' class destroyers are users.

CONTRACTOR

Westinghouse Command and Control Division, PO Box 1897, Baltimore, Maryland 21203, USA.

The larger of the two search antennas is the SPS-6, the higher antenna being the SPS-10. Note also the extensive communications arrays aboard the communication relay ship USS Arlington (Stefan Terzibaschitsch)

1564.253
AN/SPS-10 RADAR

The AN/SPS-10 is a surface search radar operating at G-band frequencies. Limited air search and tracking capabilities are available also. The scanner is of open lattice construction and is illuminated by a horn feed supported by a boom projecting from beneath the lower edge of the scanner. The transmitter/receiver is mounted below decks, so that radar head weight is minimised, thus permitting mounting as high as possible on the ship's upper-works. The span is estimated to be about 2·4 m.

The SPS-10 is widely used and now exists in a variety of forms, denoted by suffix letters to the main designation, and five or six manufacturers have produced one or more models.

STATUS

The SPS-10 has been in service since the early 1960s and is extensively fitted on US Navy ships, and vessels which have been passed on to friendly navies by the US Navy.

The SPS-10 antenna has been the subject of a modification in which a new dual feed is substituted for the original unit to permit integrated use of the SPS-10 scanner for both that radar and the SPS-58 (**1359.253**).

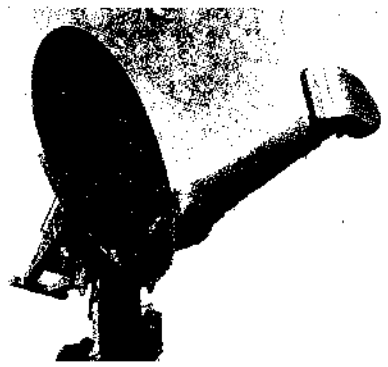
1745.253
AN/SPS-30 RADAR

The AN/SPS-30 is a long-range three-dimensional radar fitted in certain aircraft carriers and some guided missile ships of the US Navy. Among its features are a high-gain antenna of characteristic configuration (see illustration), broadband frequency operation, and high power output. The antenna is mechanically stabilised against ship's motion, with compensation for roll and pitch. It is stated to provide range, bearing, and height information on multiple airborne targets with 'extreme' accuracy. Although primarily a high-grade heightfinding radar, the SPS-30 is capable of being used for additional tasks such as long-range air search and target designation.

CHARACTERISTICS



Peak power: Classified
Average power: 9 kW
Frequency: E/F-band
PRF: Classified
Pulse width: Classified
Receiver sensitivity: 117 dBm
Beam characteristics: Pencil beam
Beamwidth: 1·5° azimuth; 1·2° elevation
Antenna azimuth rate: 1, 2, 3, 5, 10 rpm plus sector scan
Elevation rate: 240, 480, 720, 1200, 2400 scans/s
Elevation scan sector: Any 12° sector from 0 - 36°
Antenna gain: 41 dB

STATUS

The SPS-30 was introduced into US Navy service in the early 1960s and is carried on many aircraft carriers and some guided missile ships.

SPS-30 3-D radar head

1565.253
AN/SPS-37 RADAR

The AN/SPS-37 is a metric wavelength, long-range air surveillance ship's radar of conventional design. The antenna consists of lattice structure with an open mesh reflector, and supporting an array of 28 dipoles arranged in four horizontal rows of seven. The upper edge of the scanner usually carries an associated IFF antenna. Approximate dimensions of the SPS-37 array are: span 6 m, and height 3·3 m. This is the same item as employed by the earlier SPS-29, thus complicating the identification problems. No performance details have been disclosed.

STATUS

The SPS-37 entered service in 1958 and production ceased in 1962. It is widely fitted on ships of the US Navy and of some friendly navies. In recent years the driver has been replaced by an all-solid-state version.

CONTRACTOR

Westinghouse Defense and Electronic Systems Center, Baltimore, Maryland 21203, USA.

1249.253
AN/SPS-39A (FRESCAN) RADAR

The AN/SPS-39A is a shipborne 3-D radar for air surveillance. It uses mechanical rotation for azimuth coverage and electronic scanning for beam steering in the vertical plane. Vertical scanning is achieved by selection of the transmitted frequency input to the sinuous feed on the side of the AN/SPA-72B antenna. Although still fitted in US Navy guided missile ships and also to ships of France, Italy and Japan, this radar is now out of production. More information is given in *Jane's Weapon Systems 1982-83* and earlier editions.

CONTRACTOR

Hughes Aircraft Company, Fullerton, California, 92634, USA.

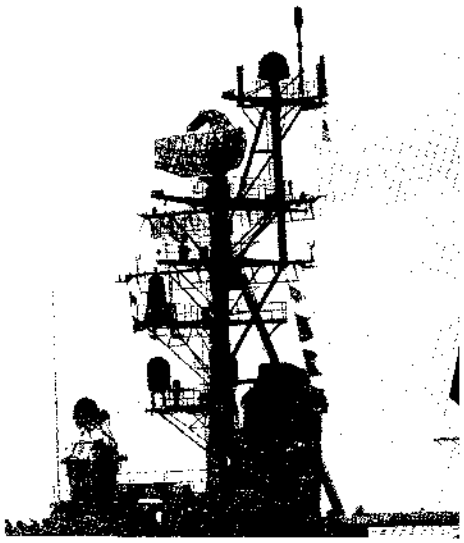
1746.253
AN/SPS-40 RADAR

The AN/SPS-40 is a naval search and surveillance radar for the detection of air targets at long and medium ranges and a range of 320 km has been quoted. Official performance data have not been released but operation in the E/F-band is probable and a transmitter power of about 1 MW may be expected. The reflector is of open lattice construction and has somewhat irregular, angular outlines. A prominent characteristic is the use of an overslung, lattice construction boom to support the feed assembly.

STATUS

The SPS-40 was first introduced into US Navy service in the early 1960s and is now seen on numerous classes of ship of all sizes from escorts upward. It has subsequently been fitted in ships of other navies, among them those of Argentina, Australia, Brazil, Chile, Federal Republic of Germany, Greece, Saudi Arabia, Spain and Turkey.

In 1979 Norden Systems was awarded additional contracts to continue the SPS-40 updating programme, among them one contract for 11 modification kits for SPS-40A radars to bring them up to the latest production standard, SPS-40B. Sets modified in this way carry the designation SPS-40D. Similarly, earlier SPS-40 sets previously updated by Norden were re-designated SPS-40C. Altogether, Norden has modified 176 equipments.



The company also designed an automation module for the SPS-40 which allows the radar to interface with the AN/SYS( ) system which automatically computes and compiles a total tactical picture for the ship's commander from several radar inputs.

In mid-1979 Norden Systems was awarded a contract to produce a modified transmitter for US Navy SPS-40B, C and D radars. A total of 86 sets to receive the modified transmitter have been delivered.

In February 1980 Norden Systems was awarded a contract to update the SPS-40 long-range naval radar for the Turkish Navy. This entailed refurbishing an existing SPS-40, installing an SPS-40D modification kit and testing and delivering the completed system to the Turkish Navy.

A contract was awarded to Norden in January 1982 for the conversion of four SPS-40A radars to SPS-40D configuration. The contract, from US Naval Sea Systems Command, also includes the supply of 20 DMTI kits to replace analogue versions.

In 1981 the AN/SPS-40 solid-state transmitter (SSTX), developed by Westinghouse was designed to replace the existing transmitter in the AN/SPS-40 radar series. The SSTX has successfully passed evaluation trials and is now being fitted.

1747.253
AN/SPS-43 RADAR

The AN/SPS-43 is a high-power, very long-range search radar, probably operating at metric wavelength frequencies and using a transmitter output of 1 to 2 MW. The large (about 13 metres span) antenna assembly is of open lattice construction and rectangular aspect, but with a characteristic 'sideways-W' profile in side elevation. The upper edge of the array generally carries an on-mounted IFF antenna.

STATUS

The SPS-43 has been in operational service with the US Navy since the early 1960s and is fitted to many of the larger ships of the US Navy. In recent years the driver has been replaced by an all-solid-state driver.

CONTRACTOR

Westinghouse Electric Corporation, Command and Control Division, PO Box 1897, Baltimore, Maryland 21203, USA.

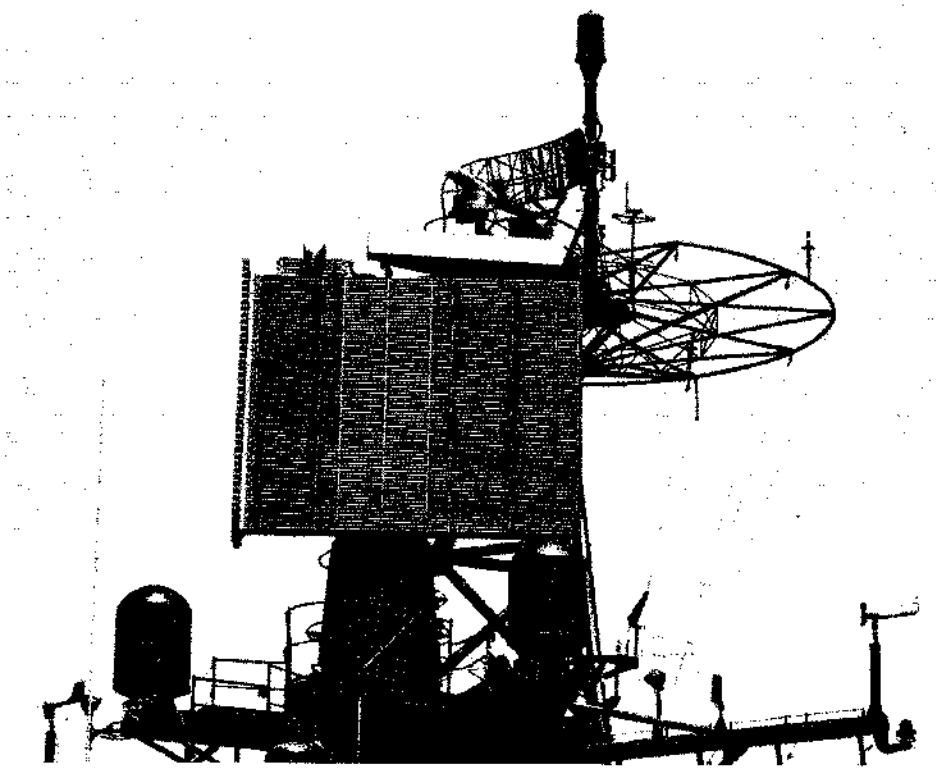
SPS-43 antenna aboard USS Springfield (Stefan Terzibaschitsch)

1252.253
AN/SPS-48 AIR SURVEILLANCE RADAR

The AN/SPS-48 is a three-dimensional, long-range air surveillance radar for ship-board applications. It uses a combination of mechanical scanning in azimuth and electronic beam steering in elevation to provide plan position and height information on aircraft targets. Multiple beams can be formed, and elevation scanning is accomplished by changing the frequency under computer control of the E/F-band (10 cm) RF energy to the planar array, frequency-sensitivity antenna, thereby radiating a series of pencil beams. Stabilisation of radiation against ship's motion is achieved electronically. Eight operating modes are available under computer program control, and a range of over 400 km at 30 500 m for target designation and aircraft direction is reported.

In general appearance and in operating principles the SPS-48 is similar to the SPS-52 (which see). Several features enable the two types to be distinguished, however. The SPS-48 is somewhat larger, and there is only one 'end-plate' to the flat antenna array, on the left side when facing the antenna. The scanner is of square proportion, compared with the oblong configuration of the SPS-52. In most installations, the SPS-48 has an on-mounted IFF antenna at its upper edge, whereas with the SPS-52 the IFF is normally mounted at the lower edge.

STATUS



A later development in the SPS-48 radar's evolution is the introduction of the SPS-48(C) model which includes MTI and automatic detection and tracking. The latter significantly increases the overall effectiveness of the ships' combat systems by providing the capability to detect and track multiple air targets automatically.

The contractor has completed the development of modifications to the radar for the New Threat Upgrade (NTU) programme. Designated the AN/SPS-48E, the radar provides early detection of anti-ship missiles launched from a bomber, such as the TU-26 (backfire), in heavy ECM conditions; it also provides positional data for mid-course guidance to the extended range SM-2 weapons system. The modifications include a lower sidelobe antenna, increased available energy from the transmitter, adaptive energy management, and computer software interface with the ship's automatic detection and tracking modifications. The US Navy plans to provide NTU modifications to 30 SPS-48 systems serving on Terrier and Tartar missile equipped combatants and a $44 million contract was awarded in September 1983 to upgrade SPS-48 radars to meet new threats. A contract worth $14·9 million for final design work prior to production of the AN/SPS-48E was announced at the end of 1982.

The SPS-48 radar is the primary 3-D air search radar and is installed on CVs/CVNs, LCC, CGs/CGNs, DDG-37 and certain DDG-31 class ships. In April 1981 a $10·8 million contract was awarded for the production of an SPS-48C radar for the US Navy's carrier CVN-71. An order for eight AN/SPS-48E systems, and two SPS-48C radars for CVN-72 and -73, was awarded in mid-1983 with a contract value of about $170 million.

CONTRACTOR

ITT-Gilfillan, 7821 Orion Avenue, Van Nuys, California 91409, USA.

ITT-Gilfillan AN/SPS-48 antenna array

1939.253
AN/SPS-49 RADAR

AN/SPS-49 is a very long range two-dimensional air search radar designed for use as the primary detection radar aboard various combatant ships of several countries. The radar antenna is line-of-sight horizon-stabilised to provide acquisition of low altitude targets in all sea states. It has a state-of-the-art ECCM capability and modern adaptive DMTI and CFAR for reliable detection in clutter.

The radar is all solid-state with a klystron final amplifier. Each production system is subjected to a minimum of 150 hours of continuous test in a shipboard simulated environmental chamber thus eliminating failures through this accelerated maturing of each system.

STATUS

The AN/SPS-49 is fitted, or due to be fitted to the US, Australian and Spanish FFG 7 class, the new Canadian patrol frigate, Terrier missile firing cruisers and destroyers, Aegis CG 47 class cruisers, battleships, attack aircraft carriers and LSD class landing ships. By early 1984 130 systems had been procured and it is anticipated that 15 to 20 systems will be procured each year over the next few years.

CONTRACTOR

Raytheon Company, Equipment Division, Wayland, Massachusetts, 01778, USA.

1248.253
AN/SPS-52/52A/52B RADAR

This series of shipborne radars evolved from the AN/SPS-39A radar. With the addition of a digital stabilisation computer, and transmitter/receiver modifications, the AN/SPS-39A was upgraded to the AN/SPS-52. Minor modifications subsequently upgraded the latter to the AN/SPS-52A. Further modifications produced theAN/SPS-52B which has a clutter rejection capability to enable moving targets to be detected in the presence of natural clutter. More detailed information of the AN/SPS-52/52A/52B is given in previous issues of *Jane's Weapon Systems*. The latest version, AN/SPS-52C, is covered under entry **5606.253**.

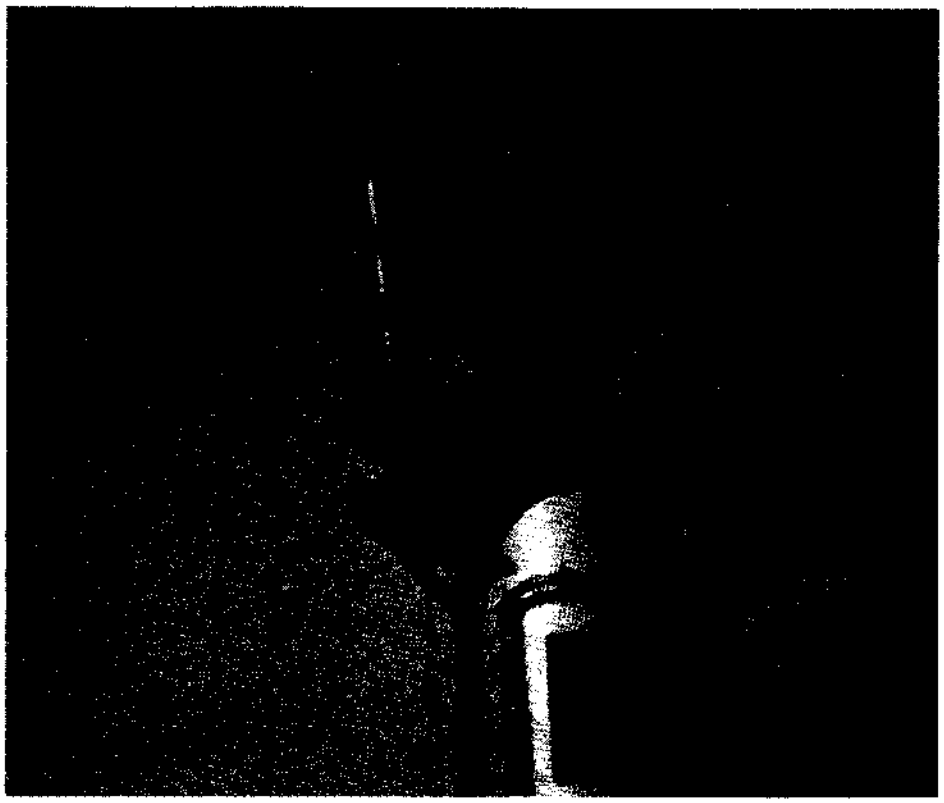
STATUS

The AN/SPS-52 and 52A are now believed to be out of service. The AN/SPS-52B is scheduled to be used aboard the US FFG-1 class ships. Several 52B systems will also remain in use in ships of the Spanish and Japanese navies. The 52, 52A and 52B are now out of production.

CONTRACTOR

Hughes Aircraft Company, Fullerton, California 92634, USA.

5606.253
AN/SPS-52C RADAR



The AN/SPS-52C is a shipborne air surveillance, three-dimensional radar system providing target position in range, bearing and elevation. Three-dimensional coverage from a single antenna is achieved by electronic scanning in elevation and mechanical rotation of the antenna in azimuth. The AN/SPS-52C uses the same AN/SPA-72B antenna as the earlier AN/SPS-52 systems but employs completely different below-decks electronics and incorporates the latest in advanced design and signal processing concepts. As a result, significant improvements have been achieved in the detection performance and in reliability, maintainability and availability.

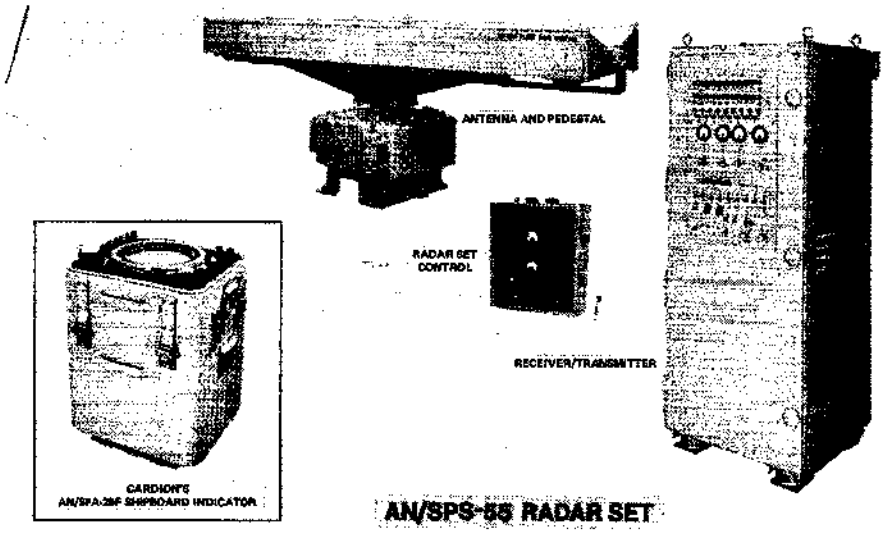
The antenna assembly is a planar array, tilted back at an angle of 25° from the vertical. This tiltback makes possible coverage to high elevation angles. The array consists of rows of slotted waveguide radiators, fed from a sinuous feed system running the length of one side of the array. Scanning in the vertical plane is achieved by selection of the transmitted frequency. Frequency selection is controlled by a digital computer.

DEVELOPMENT

Development started in 1973 with a study of the system requirements. One of the key requirements resulting from this study was the use of automatic target detection and in 1974 the design of this was commenced. The resulting design was implemented into the pre-production model which underwent extensive testing at a land-based test site and at sea aboard the USS *Towers*. Approval for service use was granted in 1978 and production started that year.

STATUS
The AN/SPS-52C is operational in the US Navy on LHA-1 ships and a number of guided-missile destroyers. It is scheduled for deployment on LHD-1 class ships. The system is also operational in the navies of West Germany and Japan, and will be fitted to Australian, Spanish and Italian ships.
CONTRACTOR
Hughes Aircraft Company, Fullerton, California 92634, USA.

AN/SPA-72 antenna for the SPS-52 3-D radar. This antenna replaced the original units fitted in SPS-39 radars aboard US and other ships



1697.253
AN/SPS-55 NAVAL RADAR

The SPS-55 is a modern solid-state surface search and navigation radar developed as a replacement for the SPS-10. It is designed for service on ships of destroyer size or above. Operational uses are: the detection of small surface targets from ranges of less than 50 m to the radar horizon; navigation and pilotage; tracking of low-flying aircraft and helicopters, detection of submarines at schnorkel and periscope depth.

A lightweight antenna (less than 90 kg) has a low profile configuration to minimise installation space requirements and consists of two (selectable) back-to-back, end fed, slotted arrays, one with circular polarisation and the other linear-horizontal polarised. The horizontal beamwidth is 1·5°, and beam squint compensation is used to optimise bearing accuracy over the operating frequency range. Vertical beamwidth is 20°.

The transmitter/receiver sub-system is housed below decks in a single cabinet, and is capable of operating at any selected frequency in the band from 9·05 to 10 GHz. Two pulse widths (1 and 0·12 μs) are provided. The minimum peak transmitter output is 130 kW. Variable sector radiation is also provided.

The SPS-55 set does not normally include its own display, and a separate control unit is provided to permit remote operation of the transmitter/receiver and scanner sub-systems.

AN/SPS-55 RADAR SET

CHARACTERISTICS
Antenna
Rotation rate: 16 rpm
Polarisation: Circular or linear
Horizontal beamwidth (3 dB): 1·5°
Gain: 31 dB
Transmitter
Frequency band: 9·05 - 10 GHz (a version operating in the band 5·45 - 5·825 GHz is also available)
Peak power: 130 kW
PRF/pulsewidth: 750 pps/1 μs; 2250 pps/0·12 μs
Receiver
Type: Low-noise, image-suppression mixer
IF: 60 MHz
Bandwidth: 1·2 MHz (long pulse); 10 MHz (short pulse)
Receiver processors: Linear logarithmic, FTC, variable sensitivity time control
DEVELOPMENT
Developed as replacement for SPS-10.
STATUS
In production and installed in US Navy ships, including the DD-963, FFG-7, CGN-41, and CGN-47 classes, as well as other navies.
CONTRACTOR
Cardion Electronics, Woodbury, New York 11797, USA.

1359.253
AN/SPS-58/SPS-65 NAVAL RADARS

The basic AN/SPS-58 (latest US Navy version, AN/SPS-65(V)) is a D-band, pulse doppler air search and target acquisition radar, designed to operate with the US Navy point defence surface missile system, but capable of use with a variety of other weapons and produced in several versions. A major design consideration has been the achievement of good low elevation angle performance, high data rate, and clutter rejection characteristics to meet the threat of low-flying aircraft or missile attacks.

This is achieved by means of a modular design, AN/SPS-65 (V1) (V2) models being assembled from various combinations of standard units. The transmitter (common to all four) is a self-contained, air cooled, coherent amplifier unit of solid-state design with klystron power amplifier stages. The receiver/processor also is solid-state and includes a low noise superheterodyne RF receiver. A DMTI filter provides a good anti-clutter performance, and built-in test facilities are incorporated. This unit is common to the 58 and 58A while the 65 V1/V2 configurations utilise a high performance variant of the basic receiver/processor. The 58 and 58A also include a console group for display and weapons interface. The display console provides multiple video display and control functions for manual threat assessment and target designation to weapon systems.

The AN/SPS-65 (V1) configuration, now in production, will be installed on ships with existing tactical display systems. Target data is provided on every detected target (ATD) in digital format by a MIL-STD-1397 ANEWS interface. Automatic detection and tracking (ADT) can be performed using this output and an external computer or the V2 hardware which includes its own computer. The AN/SPS-65 (V2) includes an advanced radar/weapons interface group and is intended for use on non-TDS ships. Both the V1 and V2 include a radar set control for remote operation of the radar.

A variety of antenna arrangements are available. One is a medium size double-curvature open lattice array of approximately elliptical outline, illuminated by a stacked feed arrangement on a stabilised pedestal. This antenna provides extended vertical coverage, and allows dual operation of radar and IFF system. For smaller ships, a dual-feed unit enables

the SPS-58 radar to share an existing SPS-10 lightweight antenna, and permits simultaneous SPS-58, SPS-10, and IFF radar operation.

For installations where there is no SPS-10 antenna, and it is not possible or desirable to mount the larger stabilised antenna unit, a passive planar array is available, this being suitable for back-to-back mounting with almost any existing antenna, or on its own turning gear.

The various configurations of these modules are as follows:

AN/SPS-58: This comprises a stabilised antenna, transmitter, receiver/processor, antenna control unit, signal data converter, and display console.

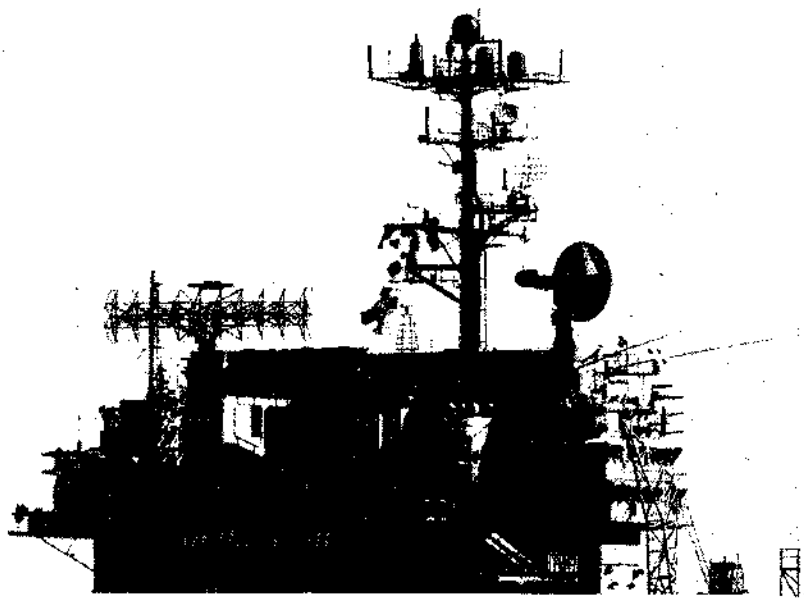
AN/SPS-58A: This version has the lightweight antenna (SPS-10), transmitter, receiver/processor, signal data converter, and display console.

AN/SPS-65 (V1): This consists of the lightweight, integral antenna, transmitter, high performance receiver/processor, and radar set control unit. Radar data are fed directly to ship's display/action data system.

AN/SPS-65 (V2): This is the same as the V1 version but includes an advanced, radar/weapons interface unit.

The SPS-58/SPS-65 family is fully compatible with Mk 10 and Mk 12 IFF systems, and it provides correlation of IFF and target returns for improved threat reaction time. This latter characteristic is further aided by a high data rate and a low false alarm rate for rapid reaction/threat evaluation and weapon assignment.

Provision has been made in the design for the addition of further facilities such as automatic target designation to weapon systems, or the application of adaptive radar techniques. Modification kits to convert and upgrade AN/SPS-58 units to AN/SPS-65 units are available.



STATUS

The SPS-65 (V) is the latest naval radar of those developed by Westinghouse. The SPS-58 series radar has completed operational evaluation and is service with the US Navy. Systems with which various versions of SPS-58 have been integrated successfully include:

Mk 37 gun fire control system 5 in/38
Mk 68 gun fire control system 5 in/54
SPA-50
Mk 5 WDS (Tartar, Standard)
Basic point defence surface missile system
NATO Seasparrow surface missile system
Naval tactical data system

CONTRACTOR

Westinghouse Electric Corporation, 1801K Street NW, Washington, DC 20006, USA.

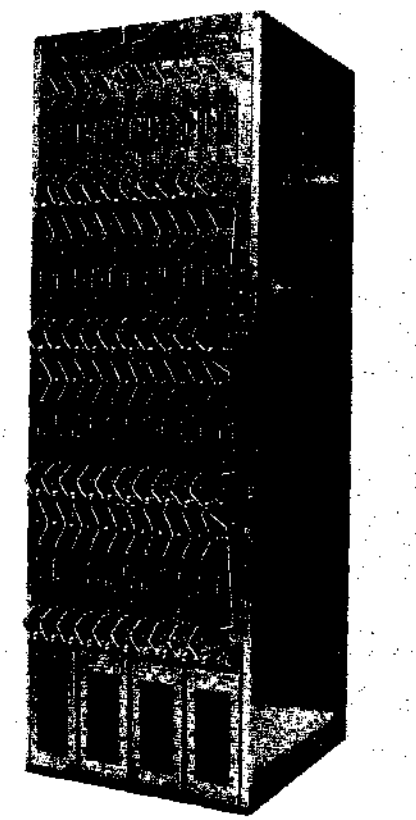
AN/SPS-58LR NAVAL SURVEILLANCE RADAR

The SPS-58LR is a long-range version of the AN/SPS-58/65 family of radars (**1359.253**) currently in the US Navy inventory. This radar uses a 25 kW solid-state power amplifier of advanced design to achieve very high reliability, maintainability and performance. The AN/SPS-58LR retains features of the SPS-58/65 family such as the detection of low flying missiles and high performance DMTI, while at the same time providing long-range surveillance capability.



The SPS-58LR has an instrumented range of 100 nautical miles. It uses a phase-coded, compressed pulse to increase the transmitter average power and to provide good target resolution. Frequency agility on a burst-to-burst basis is provided as an ECCM feature. Advanced DMTI permits operation in severe clutter environments. The radar outputs digital target reports suitable for direct entry into a wide variety of fire control systems.

The solid-state transmitter uses 44 identical power amplifier modules of 650 watts each to achieve the full 35 kW output. It is designed such that the failure of any module will reduce output power by less than three per cent rather than cause a catastrophic failure. Each power module has an MTBF of 56 000 hours. The highest voltage present in the transmitter is 40 V DC.

Although the SPS-58LR has its own lightweight array-type antenna it is also capable of operating with any D-band antenna which has matching frequency and power handling characteristics. It provides a modern replacement for the AN/SPS-6, AN/SPS-12 and other radars still in service around the world and can use the existing antennas of these radars.

CONTRACTOR

Westinghouse Electric Corporation, 1801K Street NW, Washington, DC 20006, USA.

AN/SPS-58LR transmitter

1940.253

AN/SPS-63 RADAR

AN/SPS-63 is the American designation given to the 3TM20-H version of the 3RM series of radars produced by the Italian company Segnalamento Marittimo ed Aereo (SMA) and described in **1702.253**.

The 3TM20-H model is the selected standard navigation radar for the PHM NATO hydrofoil.

The 3RM series of naval radars are I-band equipments, for which different sizes of scanner and high and lower power transmitters are available.

3722.253

AN/SPS-67 RADAR

The AN/SPS-67(V) is a solid-state C-band equipment designed to replace the 30-year old SPS-10 (**1564.253**) surface search radar, which is very widely fitted in US Navy and other ships. The antenna of the older radar is retained as an interim measure but will be eventually replaced, and the below-deck equipment is replaced by solid-state hardware utilising standard electronic modules that will replace the vacuum tube technology of the SPS-10. In the latter equipment there are 12 below-deck boxes which will be replaced by five SPS-67 units: transmitter/receiver, video processor, radar set control, antenna controller, and antenna safety switch.

Performance of the SPS-67 is improved through the addition of a very narrow pulse mode (0·1 μs) for better navigation and improved resolution of small targets at short ranges. Long and medium pulse (1 and 0·25 μs) modes will be used in open sea for detection of long and medium range targets. Performance is also improved by a digital noise suppressor. An add-on unit for the SPS-67 will provide DMTI and automatic target detection and will also permit its integration into the AN/SYS shipboard system which automatically correlates data from several ships' radars to present a combined single tactical track.

STATUS

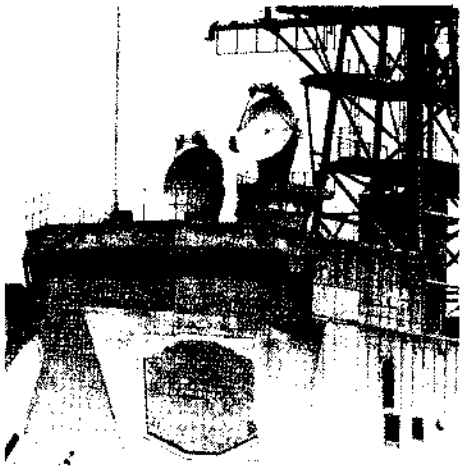
After technical and operational evaluation, a production contract for the US Navy was awarded in late summer 1982. A separate contract was awarded to Norden to design a new antenna system which was tested in autumn 1983. The first production systems were delivered in autumn 1983 for installation on the battleships *Iowa* and the LSD-41 dock landing ship.

CONTRACTOR

Norden Systems, United Technologies Corporation, Norden Place, Box 5300, Norwalk, Connecticut 06856, USA.

1570.253
AN/SPY-1 MULTI-FUNCTION ARRAY RADAR

The AN/SPY-1 is the electronically scanned fixed array radar for the US Navy Aegis fleet air defence missile system (**2507.231**). It operates in the E/F-band, and the output is several megawatts. The Raytheon transmitter serves several parallel channels simultaneously. The phase scanned arrays are mounted in pairs on each ship, two on the forward deck-house and two on the after deck-house, to provide all-round radar cover. Each array has 4100 discrete elements, and measures 3·65 × 3·65 m. These elements are controlled by AN/UYK-7 digital computers to produce and steer multiple radar beams for target search, detection, and tracking. The SPY-1 also tracks own ship's missiles fired against hostile targets. It also has the function of providing target designation data for the Raytheon target illuminating radars (up to four on a ship) which direct the semi-active homing missiles employed in the Aegis systems.



DEVELOPMENT

The SPY-1 radar was developed by RCA, the prime contractor for the overall Aegis system, under a contract awarded in late 1969. The antenna array began tests in 1972, and by 1973 the transmitter and array were integrated for further tests before embarking on full-scale testing with other elements of the Aegis system.

By early 1974 land-based tests of the radar had been completed and the radar moved from RCA's Moorestown, New Jersey, test site to Long Beach Naval Shipyard, California, for installation in the USS *Norton Sound* in preparation for sea trials. In May 1974 it was announced that while operating in the USS *Norton Sound*, the SPY-1 had detected and automatically gone into the tracking mode to track multiple aircraft flying over the Pacific.

US Navy Combat Systems Engineering Development site, at Moorestown, New Jersey, showing location of the two SPY-1A planar arrays and AN/SPG-62 slaved radars for target illumination

STATUS

The AEGIS system (**1834.281**) is now at sea and RCA have announced advanced versions of the SPY-1A radar system. SPY-1B is to be fitted to AEGIS cruisers starting with CG-59. It uses a new antenna design to give much lower sidelobes, plus an improved signal processor and a new transmitter tube having double the duty cycle with the same peak power. SPY-1C is a private RCA proposal for use on board aircraft carriers and as yet has no official backing or funding. A fourth version, SPY-1D, has been proposed for the DDG-51 and uses only one transmitter with the antennas mounted on a single deckhouse, as opposed to two for the SPY-1A. Considerable space savings have been made in the SPY-1D by using VLSI technology. ECCM capabilities have also been improved.

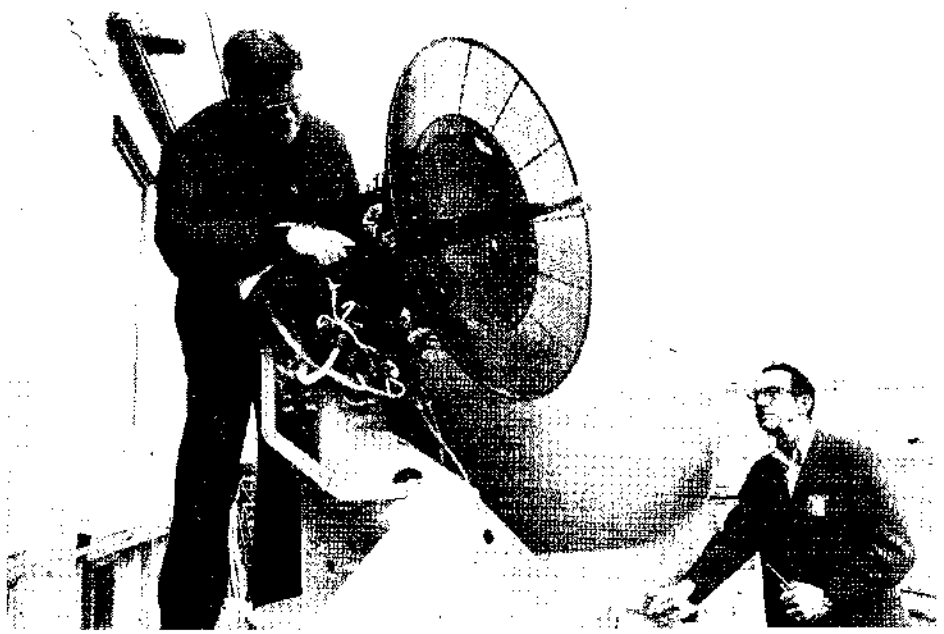
CONTRACTORS

RCA Missile and Surface Radar, Moorestown, New Jersey 08057, USA - SPY-1 antenna array.

The Raytheon Company, Wayland, Massachusetts, USA - SPY-1 high power transmitter.

Computer Sciences Corporation, Moorestown, New Jersey, USA - computer programs.

3256.253
W-120 SHIPBOARD FIRE CONTROL RADAR



The W-120 is a lightweight I/J-band acquisition and tracking radar especially adapted from the AN/APQ-120 airborne radar design for small ship gun fire control systems and consists of four major elements:

(1) a lightweight compact equipment enclosure containing both the transmitter and receiver for the radar
(2) a lightweight antenna/pedestal assembly enclosed by a radome
(3) a displays/control assembly providing both 'A' and 'C' scope displays and the operating controls for the radar
(4) an antenna control unit which provides manual control of the antenna.

This radar provides both automatic and manual acquisition and tracking. Automatic acquisition is based on a designation received from the fire control system computer. The automatic acquisition is a result of a search using a selected search pattern around the designation. If automatic track is lost, the W-120 automatically seeks to re-acquire the target. In the automatic mode, when the fire control system computer is not designating or the radar is not processing a current track, the W-120 reverts to ready status wherein the system is fully operational except that the full antenna motion and radiation is inhibited.

In the absence of a fire control system designation, a manually designated bearing, elevation position and range gate can be given and the antenna scans a selected search pattern in azimuth and elevation about the designated position. A 4000 yard acquisition window is positioned to the designated range.

The W-120 provides a low flyer detection mode for acquisition and tracking operations. The off-boresight mode may be selected for tracks lying within 0·8 beamwidths of the sea surface and provides a significant improvement in rejection of multi-path interference as compared with boresight tracking of the same target.

W-120 antenna/pedestal assembly and radome

Detection range of the W-120 is 30 nautical miles (56 km) against a 1 m² target. Range accuracy is ±0·01 to 2·5 nautical miles, then ±2 per cent over that distance. Tracking accuracy is better than two milliradians in both bearing and elevation.

STATUS

No information on ship fittings is available.

CONTRACTOR

Westinghouse Electric Corporation, Command and Control Division, PO Box 1897, Baltimore, Maryland 21203, USA.

4048.253
W-160 SHIPBOARD FIRE CONTROL RADAR

The W-160 shipboard tracking radar is based on technology used in the AN/APG-66 radar (**3303.353**), built by Westinghouse for the US Air Force F-16 aircraft. The W-160 combines the lightweight and low cost of an airborne system with the capability to track, at all attitudes, small, high speed targets on and over the surface of the sea. A medium-PRF, X band, multimode, pulse doppler system, the W-160 has two axis monopulse tracking which provides accurate position data at ranges necessary to achieve a fire control solution. It can acquire and track targets in rain, heavy clutter, and in smooth or rough seas. A collocated and boresighted TV camera is optional.

The W-160 utilises coherent pulse doppler MTI for superior sub-clutter visibility and operation in high clutter environments. Doppler processing and circular polarisation greatly improve performance in rain. In low elevation tracking, the boresight of the antenna is maintained above the target. This off-boresight tracking (or low-flyer) mode reduces tracking inaccuracies caused by reflections from the surface of the sea, an interference problem known as multipath reflection. Interface between the radar and the shipboard fire control system is made possible through the use of modular-dig bus techniques.

The W-160 has seven radar modes:

(1) ready mode: Antenna motion and radiation are inhibited but the radar may be instantaneously

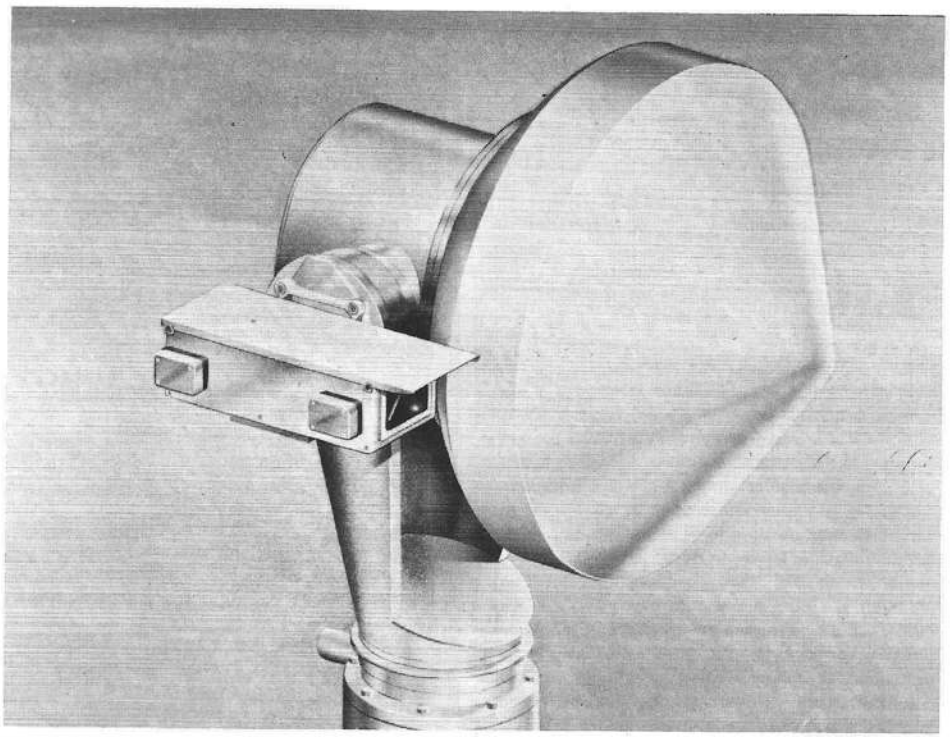
switched to full operating status. The ready mode prevents enemy detection of radar signals and reduces system overall operating time

(2) automatic acquisition, automatic track: The radar automatically steps from the ready mode to full operating status when designated by the fire control computer; no operator is required. The system automatically locks-on and tracks targets in the search volume (±4, ±8 or ±12° azimuth by 30 or 60° elevation by 5000-yard (4570 metre) range window) and presents its co-ordinates to the computer

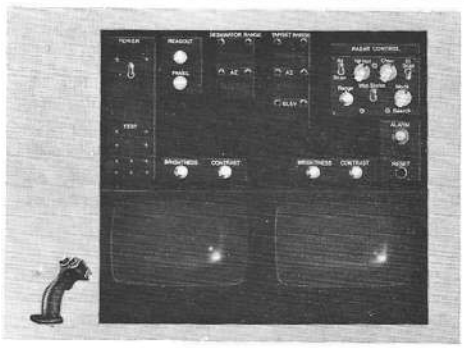
(3) manual acquisition, automatic track: In the presence of multiple targets or certain types of interference, the operator uses the radar displays and controls to select the target and initiate tracking. Following acquisition the radar automatically tracks the target

(4) manual track: The operator uses console controls to position the antenna beam and range gate on the target

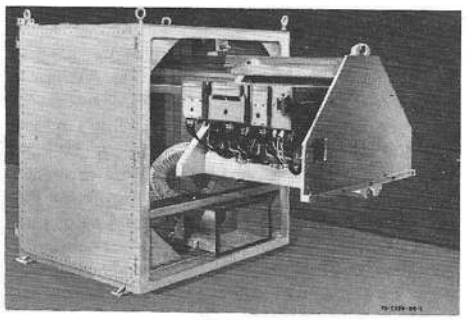
(5) general search mode: The W-160 may be used to search 360° in azimuth and can display this video to supplement or replace the coverage of a search radar. This mode may also be used to provide additional coverage in selected, high-risk azimuth sectors



(6) low-flyer mode: Used when the track lies within 0·8° beamwidth of the water's surface, this off-boresight mode results in at least a 10 dB improvement in the rejection of multipath interference over boresight tracking of the same target



(7) self-test mode: Extensive built-in test equipment (BITE) automatically indicates faults and performs fault isolation to a line replaceable unit (LRU).



The W-160 consists of three main elements; the antenna/pedestal unit, a radar electronics assembly, and the controls and displays.

The antenna is a 36-inch (91 cm) effective diameter paraboloid with a six-horn feed. This combination yields a two-axis monopulse capability. The operator can select either linear or circular polarisation, and antenna instruments indicate angular position and rate. Capable of continuous 360° azimuth rotation with elevation coverage from 0 to 90°, the pedestal is an electric, two-axis, elevation-over-azimuth configuration which incorporates gearless torque motor drivers. Full gyrocompass stabilisation is provided during all search and track operations. The antenna assembly is enclosed in a radome to protect it from wind and water damage; it can operate in wind velocities up to 100 knots. A 72-inch (183 cm) antenna is also available with a gain of 43 dB. Use of this antenna extends the radar range to 90 km. Provision is made for missile illumination.

The RF front end of the receiver, a rugged waveguide assembly designed to provide its own stable operating temperature (60° C), is located above deck with the antenna/pedestal assembly. Solid-state devices providing RF sensitivity time control, transmitter/receiver protection, and low noise RF gain are located with the duplexer in an armoured box for protection and also to preserve system low noise temperature. The 227 kg radar electronics assembly, mounted below deck, contains the transmitter (a coherent amplifier with a TWT final power amplifier), IF/video portion of the receiver, antenna servo-drive circuits, range tracker, digital signal processor, computer, and associated sub-systems. The entire assembly is shock mounted and slides from its cabinet for ease of maintenance. A common multiplex bus (DIGIBUS) permits interface between the computer, major radar sub-systems, and other shipboard equipments.

W-160 shipboard fire control radar

CHARACTERISTICS

Frequency: X-band
Peak power: 16 kW
Pulse widths: 1 and 0·25 μs
PRF: 1000 - 14 200 pps
Detection range: 46·3 km against a 1 m² target with 91 cm antenna; 70 km with 183 cm antenna
Tracking accuracy: 1 mrad in bearing and elevation, 15 m in range
Angle tracking capability: Targets with angular rates up to 60°/s and velocities up to 2500 knots
Tracker type: Kalman estimator
Receiver noise: 3·5 dB
Antenna type: 2-axis monopulse
Antenna gain: 36 dB
Antenna beamwidth: 2·5° (1·25° with 183 cm antenna)
Antenna polarisation: Linear (vertical), circular (right), circular (left)
Search pattern: ±4, ±8, ±12° azimuth × 30 or 40° elevation; 10° azimuth × 15° elevation; spotlight or fixed beam position; 360° low angle air or surface search
Rotation speed: 100°/sec
Clutter processing: Coherent pulse doppler
Platform speed: Motion compensation for complete range of ship's velocities
Reliability: 600 h MTBF
Weights
Antenna/pedestal assembly: 136 kg
Radar electronics: 227 kg
Display/controls: 45·5 kg

STATUS

The W-160 is used in the W-1200 series of naval fire control systems (**3514.261**) but no details of ship fittings are available.

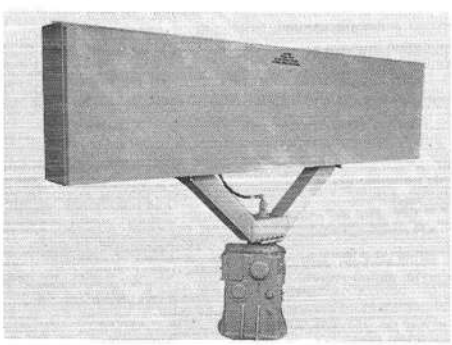
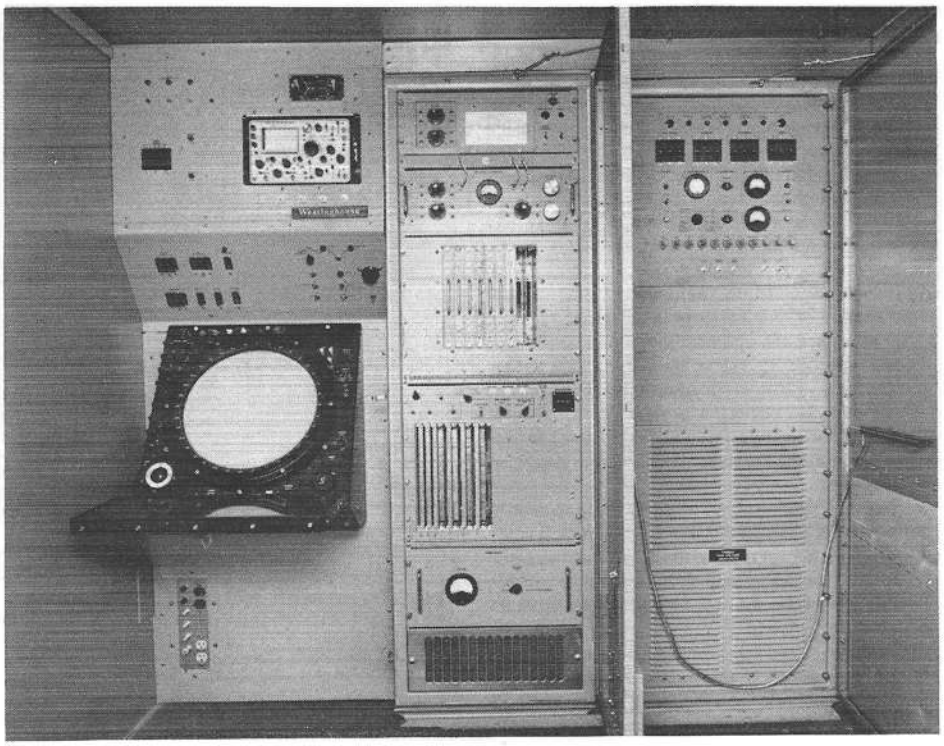
Westinghouse Electric Corporation, Defense and Electronic Systems Center, Baltimore, Maryland 21203, USA.



3257.253
W-611 NAVAL RADAR

The W-611 is a lightweight air search and target acquisition D-band radar that provides ships with self-defence capability against small, high speed incoming threats at ranges to 25 nautical miles (46 km). It is a shipboard version of the land-based range surveillance radar, AN/TPS-61.

The W-611 radar is especially designed to perform in a severe clutter environment by elimination of unwanted returns from slow or stationary targets and from rain or chaff. The transmitter utilises a three-stage coherent amplifier which incorporates highly reliable and tunable klystrons for mid and final power amplification. The remaining transmitter circuitry is solid-state. Peak power is 12 kW.



The receiver/processor utilises all solid-state designs and provides built-in self test. The MTI and signal processing are digital. The antenna is a lightweight passive planar array which incorporates an IFF antenna and provides compatibility with IFF equipment.

Provision is made for a common antenna to be shared with a G/H-band surface search and navigation radar to minimise topside weight and to optimise and simplify antenna positioning. Provision is also made for extended range capability through the modular addition of a crossed-field amplifier. Automatic target detection and automatic detection and tracking are available through the addition of available optional equipment.

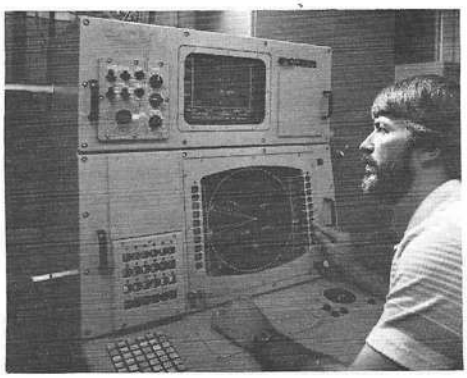
3258.253
FLEXAR WEAPON CONTROL SYSTEM



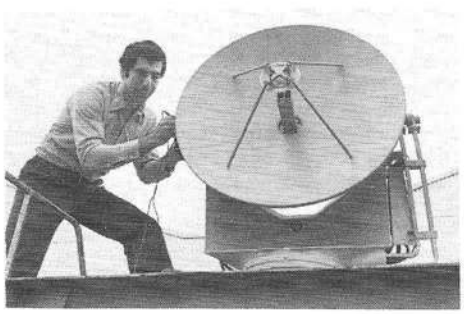
FLEXAR (flexible adaptive radar), is proposed as a next generation shore or shipboard weapon control system for short- and medium-range missiles or guns against ships, aircraft or missiles. The system combines fire control functions with surveillance modes that complement existing air search radars. Very fast reaction time to short-range, high-speed targets makes FLEXAR an effective defence against anti-ship missiles. Target acquisition and track initiation are completely automatic. The adaptive radar accepts designation from other active or passive sensors and provides automatic threat evaluation, automatic weapon assignment and rapid kill assessment. It employs multiple waveforms adaptively selected for high performance in clutter, rapid resolution of complex targets and optimum tracking.

The system uses a 40-inch electronically agile dish antenna that rotates mechanically at 60 rpm to provide hemispheric coverage, but also operates with the antenna stationary in sector fire control modes. The transmitter is capable of handling multiple waveforms and a programmable signal processor provides an optimum match for each waveform. The entire system is under real-time control by a general purpose digital computer with clutter-free data being displayed on a symbolic plan position indicator. The many modes of the system are interleaved by the general purpose computer to provide effective simultaneous search, acquisition, multi-target track and weapon control. The mode of most interest to the US Navy is that in which FLEXAR would serve as a positionable multiple target tracker/illuminator for the latest US Navy ship-launched missiles.

A land-based fire control system, known as Multi-function Radar (MFR) (**5607.153**) is a new application that uses technology derived from the FLEXAR programme. This system, intended for use with existing I-HAWK and other short-to-medium range missiles, can provide a significant reduction in manpower and equipment, greater mobility and transportability, improved operation in ECM and reduced life cycle costs.

STATUS
FLEXAR completed first phase proof of principal search and multi-target track tests in 1981 and intermediate weapon control testing in 1982. Evaluation of the system's multi-function roles with captive I-Hawk and navy standard missiles was completed successfully during 1983. Additional testing and evaluation is continuing.

CONTRACTOR
Hughes Aircraft Company, Fullerton, California 92634, USA.



FLEXAR display unit

3768.253
R-76 NAVAL FIRE CONTROL RADAR

The RCA R-76 naval radar is an I-band monopulse fire control radar with combined search, detection and tracking capabilities. It is employed as the principal sensor in the Honeywell H-930 series of naval fire control systems (**3749.281** in 1982-83 and earlier editions), in conjunction with other equipments, and also in the RCA HR-76 naval fire control system (**3748.281**). Lightweight construction permits mounting high on a ship's superstructure thereby aiding early detection, and the gyro-stabilised antenna provides for continuous 360° search. Dual monopulse tracking enables simultaneous missile and target tracking, with the data displayed on the system's dual A-scope presentation unit, with facilities for instantaneous entry for weapon system control.

The main elements of the equipment are the director, the transmitter, receiver/signal processor, computer and a servo controller. A complete ship's installation typically weighs approximately 1200 kg, of which the above-deck equipment accounts for about 205 kg. As the illustration shows, the antenna is a four-horn cassegrain unit, housed in a protective radome and mounted on a stabilised elevation-over-azimuth director. The transmitter employs a vacuum tube modulator allowing multiple waveforms; other transmitter features include multiple pulse widths, multiple jittered PRFs, and provision for CW illumination. Crystal control allows for a narrow-band missile link. A micro-computer performs such functions as: angle and range servo controls; CFAR; AGC; beacon AFC; control; and data correction.

RCA R-76 naval fire control radar

CHARACTERISTICS
Transmitter
Frequency: I-band
Tuning: 12 pre-selected frequencies
Peak power: 250 kW
Pulse width: 0·25, 0·5, 1 μs
PRF: 1000 - 3000 Hz
Receiver: 2-channel monopulse
Antenna
Diameter: 1 m
Beamwidth: 2·7°
Signal processor: Digital
Acquisition range: 40 km (on 1 m² target)
Tracking range: 40 km (on 1 m² target)
Accuracy at 20 km: 10 m range; 1 mrad angular
Search scan period: 4 s
Reaction time: 3·5 s average from designation to tracking

STATUS
Production.

RCA Government Systems Division, Missile and Surface Radar, Moorestown, New Jersey 08057, USA.

4223.253
MBAR FIRE CONTROL RADAR

Multiple Beam Acquisition Radar (MBAR) is a new C-band defensive weapon control system designed to provide smaller ships with self defence capability against small high-speed threats approaching at very low angles, as well as targets diving simultaneously from very high angles.

The MBAR employs a fan beam transmit antenna and a 17-beam receive antenna, which are stabilised electronically in pitch and mechanically in roll. The system can acquire targets in range, azimuth, elevation and range rate during a single scan (1·5 s). The equipment analyses the threat and designates the targets in order of priority to available weapon systems. Up to 100 targets can be accommodated by the system. Target threat assessment is performed on every antenna scan and weapon designation on the following scan.

The receive antenna is equipped with ultra low sidelobes of -50 dB rms for operation in a severe ECM environment. The transmitter employs a high reliability TWT and uses high average power coupled with frequency agility to minimise ECM. The digital

processor employs a coherent pulse doppler waveform with fast Fourier transform processing. It is capable of automatic target detection in severe weather and clutter, with a sub-clutter visibility of 60 dB. The equipment can also be operated in a long range search mode or in a navigation surface gun mode.

CHARACTERISTICS

Transmitter: TWT
Frequency: C-band
Peak power: 70 kW
PRF: 17·2 kHz nominal
Receiver: 16 beams time-multiplexed into 8 processor channels
Noise figure: 3·5 dB

Antenna
Azimuth: 1·75° beamwidth
Elevation
Transmit – fan beam, peak gain 26 dB
Receive – beam forming lens, peak gain 32 dB
17 beams varying from 5 – 8° in vertical beamwidth; 16 active, 1 reserved for electronic stabilisation
Dimensions: 2·6 × 0·9 m
Scan rate: 40 rpm (less in long range mode)
Detection range: 55 km (1 m² target); 36 km (0·2 m² target) (110 nm instrumented range in long range search)
Target speed: Up to 1189 m/s incoming; up to 366 m/s outgoing

Accuracies: ≥0·4° azimuth; ≥1° elevation; ≥61 m in range; ≥7 m/s in range rate; ≥0·15° azimuth in surface gun mode
Angular resolution: 5° elevation beamwidth (low angle); 8° elevation beamwidth (high angle)
Target tracking: 100 targets simultaneously
Weight: 1500 lb (682 kg) at masthead; 4500 lb (2045 kg) below decks

STATUS

In development as a private venture.

CONTRACTOR

Raytheon Company, Equipment Division, Wayland, Massachusetts, 01778, USA.

4608.253
FLANKING-BEAM ARRAY SWITCHING TECHNIQUE RADAR (FAST)

FAST is a shipborne search radar system developed by General Electric, one prototype having been completed in 1982 as a private venture. It employs two phase-scanned antenna faces, mounted back-to-back, which are rotated at either 30 rpm in C-band or 15 rpm in S-band. Each face consists of 5736 elements, scanned only in elevation, and multiple pencil beams (1·4 × 2°) are generated in four different directions at 15 and 45° either side. By the use of eight simultaneous beams, FAST achieves a high data rate to provide precise tracking, mid-course guidance and target illuminator guidance. Peak power is claimed as 1 MW in C-band and 2 MW in S-band, with detection ranges as 143 nautical miles (C-band) and 246 nautical miles (S-band). Pulse compression techniques are used in the signal processor.

STATUS

In development as a private venture.

CONTRACTOR

General Electric Company, PO Box 4840, Syracuse, New York 13221, USA.

4609.253
Mk 23 TARGET ACQUISITION SYSTEM RADAR

The Mk 23 target acquisition system (TAS) is a two-dimensional L-band rotating fan-beam pulse doppler radar intended for use with NATO Sea Sparrow missiles for protection against sea-skimming, high-diving and pop-up missiles. As a secondary role, the system can also be used for air defence surveillance and aircraft control. The 14-foot antenna incorporates 26 flared horns which provide 360 degrees azimuth coverage and up to 75 degrees in elevation while rotating at 15 or 30 rpm. It is attached to a 30 degree stabilised pedestal and is mounted back-to-back with a Mk 12 IFF equipment. The system has a detection range of more than 20 nautical miles on a 1 metre target and a range of nearly 100 nautical miles when used in the secondary role.

The Mk 23 system has four operational roles:

(1) a normal point defence mode where the equipment is used to detect and track missiles at ranges beyond 20 miles and then engage them with anti-missile missiles
(2) A medium range mode for surveillance and aircraft control out to nearly 100 nautical miles
(3) a mixed mode combining (1) and (2)
(4) an emission control mode which allows the operator to scan selected sectors and switch the equipment on and off automatically to avoid detection.

A number of upgrades are likely to be made to the system over the next few years to improve response times, expand radar coverage and add to the system flexibility. These include a new computer to increase the system speed and expand its memory. A new phased array antenna using phase shifters instead of horn antennas was due to be tested in the summer of 1985. According to Hughes this will give the system a four-dimensional capability in bearing, range, elevation angle and range rate to reduce the weapon response time and allow the TAS to be used as a designation radar for 'fire-and-forget' missiles.

STATUS

In production and fitted to various US Navy warships, including destroyers and aircraft carriers.

CONTRACTOR

Hughes Aircraft Company, Fullerton, California 92364, USA.

5848.293
AIMS ANTENNA SYSTEM

An advanced shipborne antenna system, the AIMS OE-120/UPX group, has been developed by Lockheed. The system is also suitable for land-based operations. It consists of an electronically scanned circular antenna which offers multi-function performance and provides military IFF in all interrogation modes, as well as operation with military and commercial air traffic control equipment. It is particularly suited for operation in systems where rapid multi-target identification is necessary, such as track-while-scan phased-array or multiple search radars.

The antenna group consists of an antenna, antenna position programmer and a control unit. The antenna itself measures 3·75 m diameter × 40·6 cms high and has an array of 64 RF radiators on its perimeter. For shipborne applications it is mounted concentrically around the mast to avoid any blockage inherent with mechanical rotating systems. Interrogate Side Lobe Suppression (ISLS) is provided by selectively energising radiating elements to produce the required omni-directional and directional beam patterns. The system can be operated in a continuous, sector or jump-scan mode. In the latter mode, switching from one beam to another can be accomplished within 50 μsec.

The antenna position programmer is located within the perimeter of the antenna. On command from the control unit it distributes RF power to the radiators which, in turn, form and steer the beam. The remotely positioned control unit receives either digital or synchro beam position data and translates this into digital antenna beam steering commands. In the shipborne application, the control unit also provides compensation for roll, pitch and ship's heading. In addition, internally generated beam steering commands may be selected by means of front panel controls.

System maintenance is enhanced by a built-in diagnostic test system which automatically monitors more than 200 operational test points. A front panel digital display provides fast indication of the position of any malfunction within the system.

STATUS

Installed on a number of the US Navy's latest warships.

AIRBORNE RADAR

CANADA

5874.353
IRIS RECONNAISSANCE RADAR

Iris is a reconnaissance system consisting of a sideways-looking synthetic aperture radar (SAR) with on-board digital processing and image production capabilities able to produce the radar image in real-time on board the aircraft. Alternatively, imagery can be downlinked to mobile receivers or to a ground-based precision processing facility. A number of Iris configurations are available to suit differing surveillance requirements. The system is designed for applications such as harbour, maritime, airfield and border surveillance and a number of configurations are available to suit different requirements.

The Iris SAR is a high resolution, side-looking tactical system which is packaged in discrete modular elements. The airborne element consists of a dual-sided 1·4 metre standard slotted waveguide array which is stabilised for roll, pitch and yaw. The transmitter/receiver sub-system is a derivative of the Litton AN/APS-504 maritime patrol radar (**3473.353**). Control is exercised from a single operator console containing a video display unit, control keys and a hexidecimal keypad. The inclusion of ECCM features enables the equipment to operate in high ECM conditions. Iris can be reconfigured in flight to suit the application. The swath covered can be changed from wide-area, fine resolution coverage to small area, high resolution on either side of the aircraft within seconds. The narrow swath can be positioned anywhere within the wide swath and is used operationally to examine selected targets in greater detail. At altitudes of 15 km or higher, and a stand-off distance of over 100 km, the system images targets spaced only a few metres apart. More than 65 000 km² can be monitored every hour of flight.

STATUS

In production.

MIRAGE 2000 RADARS

New radars have been developed for the multi-role and all-altitude interceptor versions of the Mirage 2000 aircraft. The RDM radar is a low PRF doppler system which is fitted to the multi-role aircraft, while the RDI is a high PRF pulse doppler radar designed for the interceptor version. The first Mirage 2000s of the French Air Force are equipped with the RDM system. Both radars are illustrated nearby, enabling both the external differences and similarities to be seen. Few technical details have been cleared for publication but the following paragraphs contain summaries of the salient features of each.

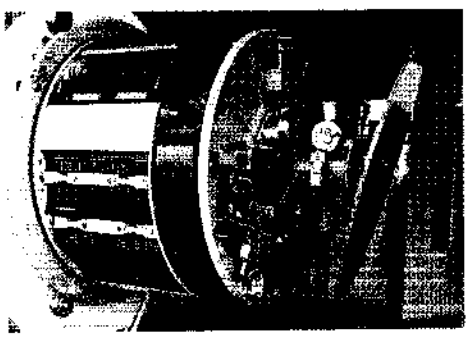
RDI

This version will equip the all-altitude air superiority interceptor variant of the Mirage 2000 for the French Air Force. It uses a TWT I/J-band coherent 4 kW transmitter, and features a flat slotted plate antenna with a diameter of only 67·4 cm. The antenna has an integrated IFF antenna and the overall system incorporates an integrated IFF transmitter/receiver. The equipment is optimised for air superiority in all weather conditions at any height, and range is stated as being in the region of 120 km against a head-on target and 50 km against a tail-aspect target. TWS facilities are available and the RDI radar incorporates an internal digital data bus to facilitate sophisticated radar signal processing. Other facilities include digital doppler filtering circuits and higher resistance to ECM. The available air-to-ground and air-to-air modes will allow the following functions to be performed:

(1) air-to-air search at all altitudes
(2) long-range continuous tracking and missile guidance
(3) automatic short-range tracking for missiles or guns

RDI pulse doppler radar for the air superiority versions of the Mirage 2000

Antilope V terrain-following and navigation radar



(4) ground mapping
(5) contour mapping
(6) air-to-ground ranging.

STATUS

In development. Flight testing continuing. The first production systems are scheduled for 1986. Thomson-CSF is the prime contractor for this programme and co-operates with Electronique Serge Dassault.

RDM

This low PRF doppler radar is fitted in multi-role variants of the Mirage 2000. It employs a TWT I/J-band coherent transmitter in conjunction with an inverse cassegrain antenna. Features emphasised in the design are operational versatility, extensive options and growth potential. The radar is capable of accommodating a CW illuminator for the guidance of missiles that use a doppler homing head, an IFF interrogator, doppler beam sharpening circuits for high resolution mapping and ground target identification, as well as new high reliability sub-systems for low level penetration and sea surface search and tracking. The basic operational functions provided are:

RDM doppler radar for the multi-role version of the Mirage 2000

(1) air-to-air search (all-altitude, all sectors) and interception. Detection range is given as 60 nautical miles in clear air and 20 nautical miles looking down against ground clutter (5 m² cross-section target)
(2) low level strike (mapping, terrain avoidance, blind let-down)
(3) air-to-ground attack
(4) sea surface search and attack.

For air-to-air combat, the RDM offers a 60 degree cone of coverage, the antenna scanning at either 50°/s or 100°/s, with ±60°, ±30° or ±15° of scan. A 5 m² target can be detected at up to 60 nautical miles range, with automatic tracking when the target is within 48 nautical miles. For air-to-air gun attacks, the 3·5° beam-width radar can be locked on to the target at 10 nautical miles range, with automatic tracking within the head-up display's field of view or in a 'super-search' area. In a look-down air-to-air situation, a 5 m² target can be detected at 20 nautical miles range.

TWS facilities are available, and the design incorporates an internal digital data bus, and built-in test equipment (BITE).

For both RDI and RDM, radar data are displayed on a HUD and on a trichromatic multi-mode CRT head-down display, linked to an interception and firing computer.

STATUS

The first flight tests of the RDM model began in 1979 and first production deliveries were made in January 1983. By the end of 1984, 88 systems had been delivered. A total of 124 Mirage 2000 aircraft have been ordered by Abu Dhabi, Egypt, India and Peru and are, or will be, equipped with RDM radars.

MIRAGE 2000 N RADAR
Antilope V TC

The Antilope V TC radar has been designed to equip the penetration version of the Mirage 2000 N. Its basic functions are terrain following, air-to-air, air-to-sea, air-to-ground and navigation with mapping and updating. It uses a TWT J-band coherent transmitter and features a flat slotted plate antenna. The radar data are displayed on a HUD and on a trichromatic multi-mode CRT head-down display.

STATUS

Electronique Serge Dassault is the main contractor for this programme and co-operates with Thomson-CSF. Pre-production radars will be delivered in 1986 and initial production systems at the beginning of 1987.

CONTRACTORS

Thomson-CSF, Avionics Division, 178 boulevard Gabriel Péri, 92240 Malakoff, France.

3298.353

IGUANE/AGRION/VARAN AIRBORNE RADARS

Under French Government contract, a family of airborne radars has been developed for sea surface surveillance and maritime warfare applications. Three versions have been named:

Iguane: This model is in production to replace the DRAA 2A ASV radar (**1961.353** in 1981-82 and earlier editions) fitted in the Breguet Alize carrier-borne maritime and ASW aircraft, and is also being fitted to the Breguet Atlantic ATL2 long-range maritime patrol aircraft.

Varan: This is essentially an Iguane radar with an antenna which makes it suitable for virtually all the medium size maritime patrol aircraft (fixed wing and helicopter). The Varan is the radar on the French Navy Gardian maritime surveillance aircraft.

Agrion: This model exists in several versions but is primarily designed for use aboard helicopters or light aircraft forming a part of task forces employed for support at sea or for coastal protection. An important function of the Agrion radar is AS 15TT missile (**3359.311**) guidance in strike missions against small surface vessels and patrol boats, where it is fully integrated via data link, to the ship's weapon system. Agrion is on order for several foreign navies including that of Saudi Arabia for Dauphin shipborne helicopters, deliveries of which commenced in 1983.

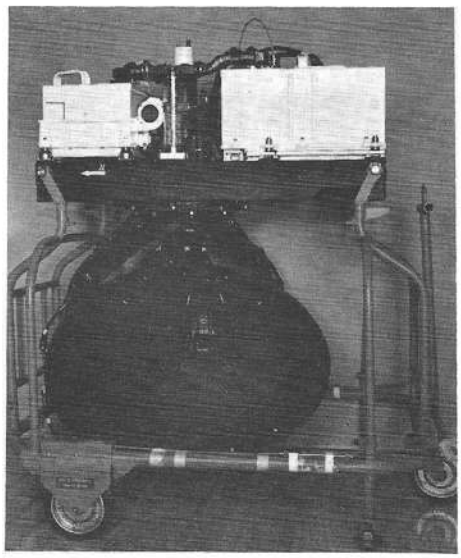
Each member of the Iguane family can perform the following operational missions:

(1) surface and anti-submarine warfare
(2) over-the-horizon targeting for shipborne SSMs
(3) search and rescue
(4) marine environmental protection
(5) maritime law enforcement
(6) navigation
(7) weather avoidance.

All three models operate in the X-band, using pulse compression and frequency agility to ensure high performance on maritime targets in all combinations of weather, sea state, and operating altitude. These same techniques also provide the Iguane family of radars with maximum protection against ESM and ECM. The Iguane and Varan radars are also reported to be capable of providing sideways-looking radar imagery in real-time using the basic antenna as an optional extra facility.

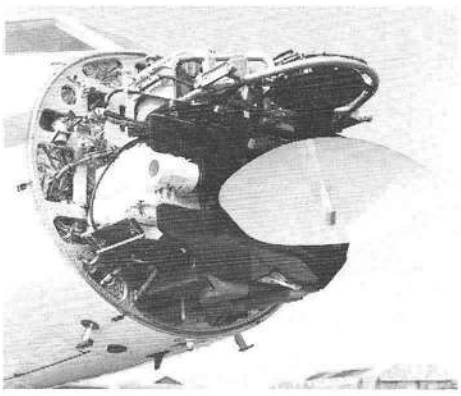
Last design of the family is the ARCANA radar for the French Air Force.

STATUS



The Iguane is in production for the Alize update programme and the Breguet Atlantic ATL2, as noted above. The Varan version is fitted to the sea surveillance model of the Gardian aircraft. The Agrion radar is in service on Dauphin helicopters of the Saudi Arabian defence force. The Agrion 15 version is also designed for use with OTHT ship-launched surface-to-surface missile.

CONTRACTOR



Thomson-CSF, Avionics Division, 178 boulevard Gabriel Péri, 92240 Malakoff, France.

Agrion radar antenna on a Dauphin helicopter

4797.353

RAPHAEL TH AIRBORNE SURVEILLANCE RADAR

Raphael TH is a sideways-looking airborne radar employing techniques based on the Iguane family (**3298.353**). It was originally designed for land area surveillance but is also capable of use in the maritime surveillance role. The system is pod-mounted and employs pulse compression techniques to provide accurate and sharp mapping. Radar information is transmitted by a high-speed link to a ground or ship-based command centre, which can be up to several hundreds of kilometres away, where the information is processed and displayed in virtual real-time.

STATUS

In development for the Mirage F1 of the French Air Force and other countries. The system is also to be fitted to the Mirage 2000 (SLAR 2000). Production units will be available in 1986.

CONTRACTOR

Thomson-CSF, Avionics Division, 178 boulevard Gabriel Péri, 92240 Malakoff, France.

1793.353

ORB-31 AIRBORNE RADAR

The ORB-31 designation covers a series of I-band radars for use on helicopters or small aircraft, and the main functions are surface vessel detection, navigation, and also as a weather radar. The range of equipment includes three types of transmitter/receiver and several antenna options, from which installations appropriate to a variety of missions can be assembled.

The main items of equipment and their variations are as follows:

Transmitter/receivers

Type	**OEB 312**	**OEB 315**	**OEB 314**
Frequency	I-band	(9375±40 MHz)	
Pulsewidth	0·25 μs	4 μs	
PRF	1600 Hz	800 Hz	400 Hz
Bandpass (-3dB)	5±1 MHz	2·5±0·5 MHz	1+0·25 MHz −0·5

Receiver noise factor: 9·5 dB

Receiver gain control

Manual: 45 dB minimum

Automatic: 24 dB from 1·5 - 24 nm

Weight

Single transmitter/receiver: 22·6 kg

Dual transmitter/receiver: 42·6 kg

Antenna type	**OAB 3110**	**OAB 3112**	**OAB 3113**
Width	608 mm	728 mm	460 mm
Height	308 mm	368 mm	308 mm
Weight	1·1 kg	1·3 kg	0·8 kg
Gain	29·2 dB	30·5 dB	28 dB
Beamwidth (3 dB)			
Horizontal	4°	3·2°	4·8°
Vertical	7·5°	6°	7·5°

All are elliptic reflector primary source, rear-illuminated units, with horizontal polarisation. There are two types of scanner mechanism, OAB 3102 and OAB 310ID, the latter being a modification of the former with different sensors and mounting arrangements. Both types can accept all three scanner sizes. Pitch and roll stabilisation is provided and manual control of the elevation datum is possible within limits of ±15°

Indicators: Four types are produced:

OSB 315 surveillance PPI display

OSB 316 surveillance PPI with mobile markers, digital azimuth display (designation by marker), digital range display (optional)

OSB 317 target designation PPI

OSB 318 target designation B-scope indicator.

The data display in each is by means of a 5 × 3 inch (127 × 76 mm) rectangular CRT, and the front panel carries the appropriate controls for the type of operation for which each type of indicator is designed.

Telemetry box OTB 310: This is used to generate and transmit the oblique range and bearing of a preset target and provides for automatic target tracking. The position of the target designation window on the OSB 317 display is controlled by means of a small joystick and the area thus defined is displayed on indicator OSB 318. In addition to the joystick, controls are provided for selection of target designation or tracking modes of operation, selection of No 1 or No 2 transmitter, and selection of No 1 or No 2 indicator.

Various permutations of this equipment are described in the Heracles entry (**1960.353**).

STATUS

The ORB-31-W is fitted to French Lynx helicopters. For other details see Heracles (**1960.353**) which follows.

CONTRACTOR

Omera-Segid, 49 rue Ferdinand Berthoud, 95101 Argenteuil, France.

1960.353

HERACLES RADAR SYSTEM

The Heracles I system (*Système héliporté de radar pour le contrôle du lancement d'engins et pour la surveillance de surface* – Airborne radar system for missile launching control and surface surveillance) is a range of airborne radar systems designed to carry out the following missions:

(1) detection of surface ships
(2) target designation
(3) weather mapping
(4) radar navigation
(5) search and rescue at sea.

All the Heracles I system radars operate in the I-band and are especially suited to helicopter-borne uses. The configurations, based on modular units, are calculated according to the mission and the carrier. The different sub-systems available are described in the ORB 31 radar (**1793.353**), which exists in the following configurations:

ORB 31 S1 Alouette III (SNIAS Helicopter Division)
ORB 31 W French Navy WG 13 helicopter
ORB 31 AS anti-submarine
ORB 31 D Super Frelon (Exocet system).

ORB 31 S1

The ORB 31 S1 system is an airborne surveillance radar fitted to the Alouette III helicopter. The choice of the transmitter (0·5 or 4 μs pulsewidth) enables the system to be adapted to the scheduled mission.

OPERATIONAL CHARACTERISTICS

Pitch and roll antenna stabilisation
180° azimuth and 30° elevation coverage
Range: 35 nm on naval target of 1000 m² with sea state 4 and 4 mm per hour rain
Weight: 38 kg

ORB 31 W

The ORB 31 W system is an airborne surveillance system fitted to the French Navy's WG 13 helicopter (design undertaken under STTA contract).

The ORB 31 W system uses two transmitter/receivers. The first is intended for long-distance detecton, and the second, with its higher resolution, is less sensitive to clutter.

OPERATIONAL CHARACTERISTICS

Pitch and roll antenna stabilisation
180° azimuth and 30° elevation coverage
Range: 50 nm on naval target of 1000 m² with sea state 4 and 4 mm per hour rain
Weight: 61 kg

ORB 31 AS

Anti-submarine warfare model for the detection, identification, location and station-keeping of other helicopters of a tactical ASW group. A continuous and updated display of sonar contact and the tactical situation is provided, and features of the large-display console include time motion, offset, scales up to 100 nautical miles, and all controls positioned on the front panel.

ORB 31 D

The ORB 31 D system is a target designation airborne radar fitted to the Super Frelon helicopter carrying the Exocet system. Its function is to detect, track, and then locate accurately a target on the sea in order to supply the data necessary to the weapon system with which it is integrated.

The system consists of two transmitter/receivers, three indicators (two PPI and one B-scope), and a telemetry box.

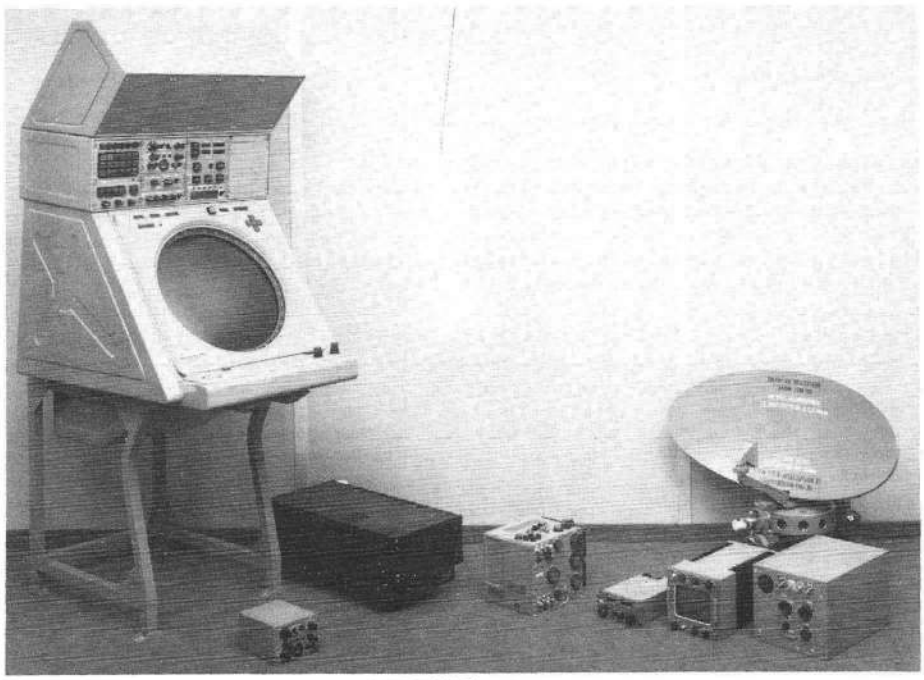
OPERATIONAL CHARACTERISTICS

Pitch and roll antenna stabilisation
180° azimuth and 30° elevation coverage
Range: 80 km on naval target of 1000 m² with sea state 4 and 4 mm per hour rain
Automatic target tracking, bearing range or azimuth range data delivered to the weapon system in BCD form with ±50 m precision in range and ±1° in bearing
Weight: 75 kg

HERACLES II

Heracles II is a range of I-band airborne radars, based on the considerable experience acquired by Omera during the development, manufacture and operation of Heracles I, of which it is a logical extension. It is built from modular sub-assemblies compatible with one another, each performing one of the following functions:

(1) maritime patrol
(2) anti-submarine warfare (ASW)
(3) active missile fire control (TD)
(4) search and rescue (SAR)
(5) radar navigation
(6) weather radar.



Reduced weight and dimensions facilitate installation on all types of aircraft.

OPERATIONAL CHARACTERISTICS

Pitch and roll antenna stabilisation
360° azimuth and 30° elevation scanning
Sectoral scans of 60, 120, 180 or 240°
Azimuth, bearing or true motion stabilisation

ORB 31D airborne maritime surveillance and missile firing radar

ORB 32 WAS system

Peak power: 80 kW, fixed, tunable, frequency agile
Range: 90 km on 500 m target
Special-to-type characteristics appear below.

ORB 32 W
This is a simple, compact and lightweight system, suitable for small aircraft and helicopters, specially designed for surface reconnaissance, search and rescue (SAR), radar navigation, weather radar.

The system comprises:

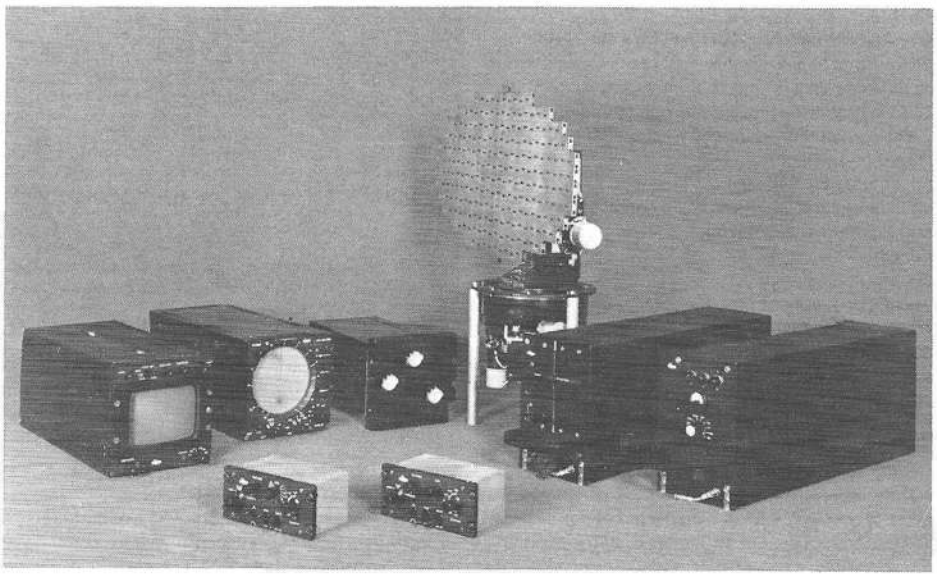
1 OAB 3118	antenna (60 × 30 cm)
1 OAB 3105	drive mechanism
1 OJB 321	junction box
1 OEB 321	transmitter/receiver (tuned frequency, 0·25 - 2 μs, 80 kW peak)
1 OSB 330	5-inch (127 mm) digital indicator, 120 or 240° scan, daylight viewing type, iso-contour, memory (freeze)
1 OFB 320	
and	
1 OFB 326	ancillaries for OSB 330
1 OFB 322	control box

Weight: 44 kg

ORB 32 WN
This system, which uses one of the larger display consoles, performs all the functions required for maritime patrol missions.

The system comprises:

1 OAB 3124	antenna (85 × 36 cm)
1 OAB 3105	drive mechanism
1 OJB 321	junction box
1 OEB 321	transmitter/receiver
1 OFB 322	control box
1 ODC 327	9-inch (229 mm) indicator, fixed range rings and moving markers, true motion with or without reset, anti-sea-clutter signal processing
or, ODC 323	16-inch (406 mm) indicator



Weight: 58 kg

ORB 32 WAS
This is one of the elements of the anti-submarine warfare weapon system in the SA 321 Super Frelon helicopter. It performs the following functions: helicopter station holding in ASW, tactical situation information, guidance and helicopter attack on a designated target, navigation, weather mapping. The ORB 32 WAS consists essentially of a system performing both primary radar and secondary radar functions. The use of transponders allows the localisation and identification of helicopters flying at low altitudes by eliminating sea-clutter.

The system comprises:

2 OAB 3114	antenna (72 × 36 cm)
1 OAB 3103	drive mechanism
1 OJB 321	junction box
1 OEB 321	transmitter/receiver
1 OSB 330	5-inch (127 mm) indicator
1 ODC 323	display console, 16-inch (406 mm) displays secondary radar data simultaneously with primary radar echoes and displays sonar contact co-ordinates in decimal form
1 switching unit	
1 OAB 3115	transponder antenna
1 ODA 312	transponder
1 ODB 312	transponder control box

Weight (moving parts only): 129 kg
The ORB-32 has been ordered by the Peoples Republic of China for the upgrading of its SA321J helicopter avionics fit.

ORB 37 airborne weather radar equipment

ORB 32 WLD
The ORB 32 WLD is an airborne reconnaissance and target designation radar. When integrated in a weapon system, its purpose is to detect, designate and accurately track two sea-targets. Target co-ordinates may be automatically transmitted to the active missile carried by aircraft, or helicopter or to a launch vessel (over the horizon surface-to-surface attack).

The system comprises:

1 OAB 3119	antenna (72 × 36 cm)
1 OAB 3105	drive mechanism
1 OJB 321	junction box
1 OEB 321	transmitter/receiver
1 OFB 322	control box
1 ODC 321	display console (9-inch (229 mm) scope, TWS and telemetry circuits)

ORB 32 ASD
Combination of the WAS and WLD types.

One version of the ORB 32 has been selected by the Swedish Navy for integration into a new anti-surface, anti-submarine and search rescue system for helicopters known as the 9HCI 100.

It has been developed in co-operation with Philips Elektronikindustrier, with the latter supplying a new generation radar display known as RADDS, and MEL of UK supplying transponders.

ORB 37
This is a high performance radar for aircraft and helicopters designed for detection and analysis of cloud masses and navigation by radar. It is equipped with a digital indicator in the forward compartment (one sector of 120 or 240°) on which dangerous zones are emphasised by the iso-contour function; a PPI-type analogue indicator at the operator station, (one sector of 240° and mobile alidade) particularly suited to the ground display function; a beacon channel which affords an additional navigation aid.

The ORB 37 is fitted to Transall C-130 aircraft of the French Air Force.

CONTRACTOR
Omera-Segid, 49 rue Ferdinand Berthoud, 95100 Argenteuil, France.

1211.353
AIDA II FIRE CONTROL RADAR
The Aida II fire control radar is a miniaturised system designed for installation in light interceptors and aircraft with restricted accommodation in the nose. It is also suitable for pod mounting. It performs automatic search, acquisition, and range tracking of targets (air or sea) within a cone of 18°. It can also supply the surface range in the boresight axis. Used with a gyroscopic gun sight it will supply all the data necessary for interception and attack by guns, rockets, bombs, or missiles, viz range of the target or ground, angular position of an air or sea target with respect to the boresight axis, gravity drop, and sensitivity corrections for air-to-air firing.

More detailed information on Aida II is given under this entry number in *Jane's Weapon Systems 1982-83* and earlier editions.

CONTRACTOR

3131.353
CYRANO RADAR FAMILY
The Avionics Division of Thomson-CSF designed and developed the Cyrano family of airborne fire control radars for the Mirage fighter aircraft. The first one of the family, Cyrano I, was fitted on the Mirage III C. The subsequent versions were:

Cyrano II
Multi-function radar for the Mirage III E.

CHARACTERISTICS
I/J-band; monopulse; cassegrain antenna; peak power 200 kW; liquid cooling; mounted in a pressurised radome. Data are displayed on a CRT and a head-up display. Weight of equipment: 188 kg in nosecone; 29·5 kg in equipment bay and cockpit.

DEVELOPMENT
The first prototype was completed in 1962 and the radar put into service in 1963.

STATUS
Cyrano II is used on the Mirage III E aircraft of the French Air Force and a number of other countries.

Cyrano III
Cyrano III radar has a design which is not specific to a given aircraft. It was developed as a prototype and should be considered merely as a development phase of the Cyrano IV.

Cyrano IV
The Cyrano IV radars constitute a family of multi-role radars designed to meet the requirements of different users.

Cyrano IV M
This is an updated model of the Cyrano IV series and embodies the latest advances in technology to obtain improvements in reliability and maintainability. Cyrano IV M is described in detail under entry **1396.353**.

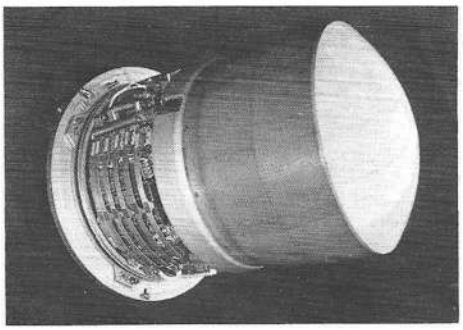
Cyrano IV MR
This is a new version of the IV M designed for fitment to the Mirage F1 CR, the reconnaissance version of the F1.

Cyrano IV M3
This has been designed for retrofitting to the Mirage IIIE, or for adaption to other versions of Mirage III, such as Mirage V, Mirage 50 or Mirage NG. The Cyrano IV M3 can be connected to an analogue or to a digital system.

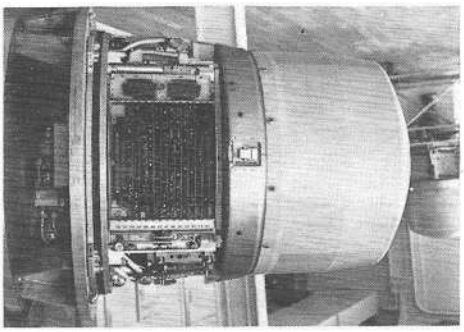
CONTRACTOR
Thomson-CSF, Avionics Division, 178 boulevard Gabriel Péri, 92240 Malakoff, France.

1396.353
CYRANO IV/CYRANO IV M ATTACK RADAR

The Cyrano IV is a development of the Cyrano series of airborne radars and is a multi-role system. The Cyrano IV M is the newest version of this series.



Basic functions performed by the radar are:
(1) air-to-air search
(2) automatic tracking
(3) interception and fire domain computations
(4) dog-fight engagements
(5) home-on-jam mode
(6) ground mapping



Additional options are:
(7) contour mapping
(8) terrain avoidance
(9) blind let-down
(10) air-to-ground ranging.

The Cyrano IV M model incorporates TWS facilities and is also suitable for air-to-sea search and tracking roles in addition to those listed for the Cyrano IV.

Data can be presented by means of a Type 196 gunsight or CRT HUD, and inputs to weapon systems are available also. Other aircraft systems providing inputs to the radar system include an inertial or gyro platform for altitude reference information, and an air data computer for aircraft performance and ambient parameters.

Operational missions include interception, air superiority or interdiction using guns or missiles; all-weather penetration; air-to-ground attack with guns, bombs and rockets.

Cyrano IV and Cyrano IV M attack multi-function radars pictured side-by-side for comparison. The later Cyrano IV M (right) incorporates TWS facilities and improved reliability and maintainability due to new technology

The Cyrano IV M, as well as being a multi-function radar, differs from its predecessor in the embodiment of new technology which confers improved reliability and maintainability on the later model.

STATUS

The Cyrano IV was produced in quantity for the Mirage F1 aircraft of the French Air Force and those of other countries. All French aircraft and many of the others have been fitted with the Cyrano IV M version. Production of the IV M began in 1980. Two versions of this radar have been developed, the Cyrano IV M3 for adaption to Mirage III, Mirage V and Mirage 50, and the Cyrano IV MR for the reconnaissance version of the Mirage F1.

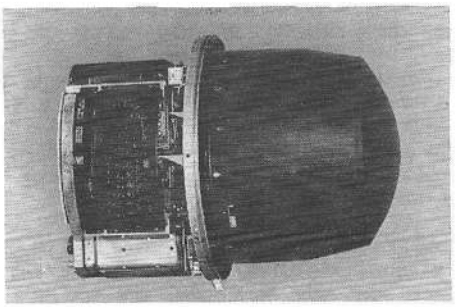
CONTRACTOR

Thomson-CSF, Avionics Division, 178 boulevard Gabriel Péri, 92240 Malakoff, France.

1672.353
AGAVE AIRBORNE RADAR

The Agave is a lightweight, multi-role radar, fitted to the Super-Etendard carrier-based aircraft and the Jaguar International strike aircraft. It has been optimised for naval applications, but its air-to-air and air-to-ground functions give it appreciable interception and ground attack capabilities.

Basic functions fulfilled are:
(1) search: air-to-surface
air-to-air
(2) target designation for the homing head of a long-range active missile or to a HUD
(3) automatic tracking: air-to-surface
air-to-air
(4) ranging: air-to-air
air-to-ground
(5) map display.



CHARACTERISTICS

X-band; monopulse; inverse cassegrain antenna stabilised in roll and pitch; PRF and pulsewidths adapted to operating conditions; beam shaping; solid-state construction; integrated circuits; built-in test equipment. Weight of equipment: 48 kg in nosecone, 17 kg in cockpit and fuselage.

OPERATION

In the search mode, the scanned sector is 140° in azimuth and 60° in elevation. After target identification, the pilot switches to automatic tracking. Target data are supplied either to the homing head of an active missile, or to a HUD. In the air-to-air mode, the detection range for a fighter aircraft is within 10 and 15 nautical miles (18 to 28 km). In the air-to-surface mode, the detection range for a patrol boat is within 22 and 30 nautical miles (40 to 55 km).

The angle of search in azimuth as noted above is

Agave airborne radar

±70° forward from the line-of-flight, thus giving 140° sweep coverage ahead from left to right. In elevation, the angle of search can be either 6 or 12° depending on whether a one- or two-bar scan pattern is used. In practice, a one-bar pattern is selected automatically for low level altitudes and, at higher altitudes, a two-bar scan cuts in to improve near coverage. The pilot, however, has the option of moving this scan pattern up or down through 60°.

To keep the pilot's work-load to a minimum, the Agave radar system has been automated as far as possible. For example, the radar is provided with an instantaneous automatic gain control, which uses the echoes received for adjusting the receiver so that extensive and scattered echoes – such as sea, cloud and ground clutter – are considerably reduced in comparison with the pin-point reflections sought, such as aircraft and surface vessels, which are sharply displayed. In another example, when the air-to-ground mode for ground mapping is used, the best possible tracking elevation for maximum ground coverage ahead of the aircraft is automatically set up. The pilot can still, however, override this computed elevation and has the option of fine adjustment when short-range, high power echoes are present.

Once airborne, the pilot must select manually the mode and the range to be scanned from 5 to 80 nautical miles and, to simplify the operation, the radar-pulse repetition frequency and pulse width are automatically and directly related to the scanning range thus selected.

All essential radar controls are positioned on a control stick, the handgrip controlling not only the antenna elevation, designation marker bearing and range, but also the commencement of lock-on for the automatic tracking sequence which, once the target has been pinpointed, will provide the pilot with continually updated range and bearing information.

In the model for the Jaguar, all radar information will be displayed either on a raster head-up display by means of a scan converter on a combined map/radar head-down display, thus retaining the projected map display in its normal place. The radome is fitted in the nose of the aircraft in place of the laser ranger and marked target facilities of the 'S' version of the aircraft.

STATUS

Agave is fitted to the French Navy Super Etendard aircraft, the international version of Jaguar and the export versions of the Mirage F1 and Mirage 50. It is also fitted to the Dassault-Breguet Lancier, the combat version of the Alpha Jet trainer. Over 170 Agave systems have been ordered.

5871.353
NRAI-7A AIRBORNE IFF INTERROGATOR

The NRAI-7A is a solid-state diversity transponder which inhibits replies to interrogator side-lobe transmissions, and automatically codes special replies to provide assistance in the position identification of particular aircraft and in emergencies. The diversity function is provided by a dual receiver with inputs connected to upper and lower antennas, a system for comparison of received signals and an antenna switch that directs the response to the antenna that has received the strongest interrogation signal. This allows more accurate identification, particularly during aircraft manoeuvres which can blanket or interrupt signals. The pilot is also able to insert codes such as radio failure alert and warning of hijackers aboard. A single or two-unit format is offered and a naval version is also available. Modes 1,2,3/A and C are provided, with compatibility with Mode 4. Available are 32 codes on Mode 1, 4096 on modes 2 and 3/A, and 2048 on mode C. Peak power is 500 W.

STATUS

In production.

5872.353
NRAI-10A AIRBORNE IFF INTERROGATOR

The NRAI-10A is an airborne IFF interrogator designed primarily for maritime surveillance purposes, to enable the radar operator to identify aircraft and ships passing through his control area. Coded interrogation signals are transmitted synchronously with pulses from the aircraft's radar, the coded reply supplying the identity, or its altitude for aircraft, according to the interrogator mode selected. The interrogator is a 3/8 ATR single box unit weighing 5·9 kg, which incorporates a coder/decoder, transmitter and dual receiver. The equipment is normally used with a monopulse antenna having two different radiation patterns, one with a maximum and one with a minimum on the antenna axis. This enables unwanted replies due to sidelobe interrogation to be suppressed and valid replies to be sharpened on the display. Power output of the equipment is 1 kW at 1030 ± 0·2 MHz.

STATUS

Developed for the Breguet Atlantic ATL2. In pre-production phase.

CONTRACTOR

LMT Radio Professionelle, 46 quai Alphonse LeGallo, 92103 Boulogne-Billancourt Cedex, France.

5873.363
NRAI-11 IFF INTERROGATOR-DECODER

The NRAI-11 is an interrogator-decoder for identifying and determining the range and bearing of any friendly mobile unit within the surveillance area of the IFF system with which it is operating. The equipment consists of an encoder, a transmitter, an antenna switch, two receivers, an anologue processing unit, a defruiter, a passive decoder, an evaluator, an extractor, a vobulator and an automatic self test. Peak output power of the system is 1 kW with a duty cycle of 1%.

The dual receiver system determines bearing of the target by monopulse techniques and an antenna switch is incorporated for suppression of sidelobes during ISLS interrogation. Interrogation mode is 1, 2, 3 without interlacing, with passive decoding on mode 1, 2 or 3 and 4096 combinations. The extractor has a memory capacity of 255 plots. Weight of the equipment is 12 kg.

STATUS

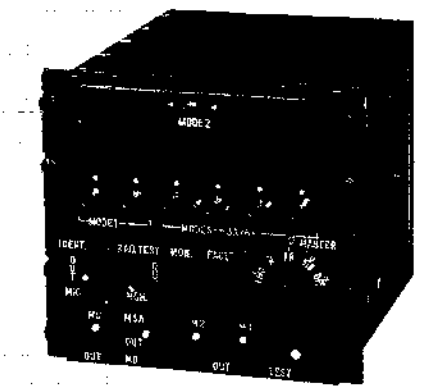
In production for the Mirage 2000.

CONTRACTOR

LMT Radio Professionnelle, 46 quai Alphonse LeGallo, 92103 Boulogne-Billancourt Cedex, France.

1962.353
ESD 3300/3400 IFF/SIF TRANSPONDERS

The range of type 3000 IFF airborne transponders designed by ESD are used for the identification of any type of fixed or rotary wing aircraft by interrogation from a secondary radar or air traffic control system. These micro-miniaturised equipments represent a new generation of airborne transponders and can be installed easily in the cockpit of any aircraft or helicopter. Their modular design facilitates maintenance and a built-in automatic test system allows permanent monitoring of operation.



The type 3000 range has been designed for association, if required, without any internal modification, with an automatic code switching system, increasing airspace protection. In addition, the ESD 3400 possesses a space diversity system maintaining contact with interrogating stations independently of aircraft manoeuvres, thereby reinforcing mission safety.

The range of transponders meets military specifications: Stanag 5017 (Mk XA/IFF 3300; Mk XII/IFF 3400), Air 7304 and civilian specifications ICAO (Appendix 10) and ARINC 572. They are used as standard equipment by various air forces.

Modular design has permitted the two functionally identical versions to be packaged in either the ESD 3300 single-box model or the ESD 3400 two-box configuration.

CHARACTERISTICS

Reception
Frequency: 1030 MHz
Sensitivity: -77 dBm
IF: 60 MHz
SLS: 3-pulse
Transmission
Frequency: 1090 MHz
Power output: 500 W peak
Power consumption: 28 V DC 50 W
Dimensions
ESD 3300: 133 × 146 × 145 mm
ESD 3400: 133 × 146 × 75 mm (controller)
194 × 90 × 319 mm (transmitter/receiver)
⅜ short ATR
Weight

ORCHIDEE STAND-OFF RADAR

The Orchidée system is a stand-off radar designed to provide tactical information to the battlefield commander. The name is an acronym for Observatoire Radar Coherent Heliporté d'Investigation Des Elements Ennemis and is intended to be helicopter-mounted on the AS 332 version of the Super Puma.

The system consists of two elements, airborne and ground, the former comprising the helicopter itself, a pulse doppler X-band radar transceiver and antenna, and a data link for two-way communication with the ground element. The radar is designed to detect moving targets only, between speeds of 6 to 400 km/h, with the information transmitted over the data link to a mobile ground station and shown on a map display. LCT is responsible for the radar development, ESD for the communication links and the ground station, and Aerospatiale for total system co-ordination.

STATUS

Development is expected to begin at the end of 1985 with prototype testing in 1987. The system is scheduled to become operational in 1992.

CONTRACTOR

LCT (Laboratoire Central de Telecommunications), 18 – 20 rue Grange Dame-Rose, 78140 Velizy-Villacoublay, France.

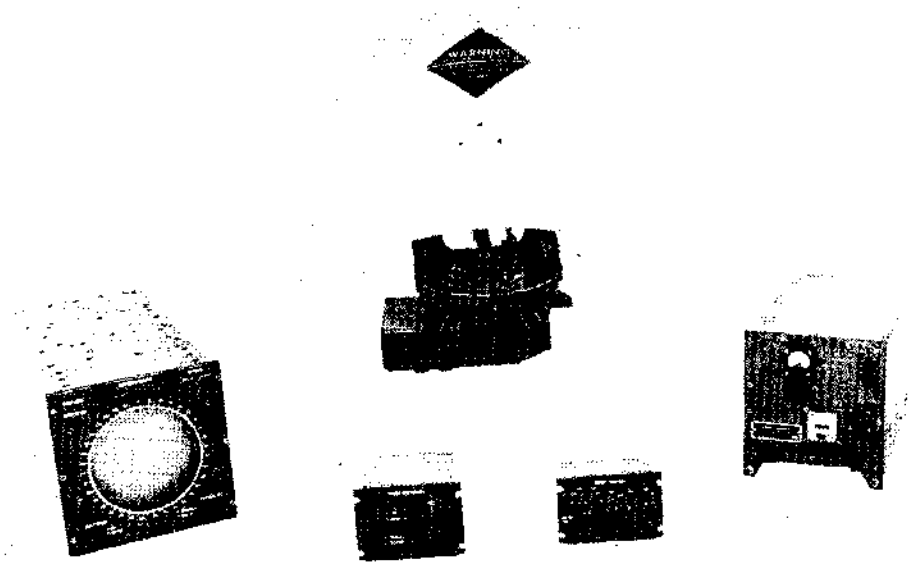
1784.353
AN/APS-503 and LASR-2 RADARS

The AN/APS-503 airborne search radar is installed in Sea King helicopters of the Canadian Forces (Sea Element) in service with DDH280 class destroyers.

The AN/APS-503 radar is lightweight (45 kg) with high power (50 kW peak) for its size. It comprises five units: a transmitter/receiver, an antenna complete with mounting, an azimuth range indicator (PPI), a radar control unit, and a range bearing unit. The ARI is seven inches (18 cm) P-7 phosphor, designed for use by a radar operator, and possesses three scales each with range markers spaced appropriately.



The range and bearing unit positions a range strobe and an azimuth marker on the PPI, at the same time transmitting this information to ancillary equipment such as navigation systems.

The transmitter operates in the I-band, with a pulse-width and pulse recurrence frequency optimised for maritime reconnaissance, and a 50 kW peak power. The receiver has a solid-state local oscillator with logarithmic response and sensitivity time control and fast time constant.

The antenna is a 24 × 18 inch (61 × 46 cm) parabola, providing a 4° beam in azimuth and a 5° beam in elevation. The antenna is stabilised for pitch and roll and has a manual tilt control. Top-mounted, belly-mounted, and nose-mounted antenna versions are also available. A pilot's bright display is available as an option.

CHARACTERISTICS

Transmitter
Frequency: 9·2 – 9·4 GHz, fixed
Power output: 50 kW peak
Pulse width: 0·5 μs
PRF: 400 Hz
Antenna: 24 × 18 inch (61 × 46 cm) parabola
Gain: 30 dB
Beamwidth: 4° azimuth; 5° elevation
Sidelobes: -20 dB
Polarisation: Horizontal
Rotation rate: 30 rpm
Stabilisation: Automatic compensation for pitch and roll up to ±20°
Tilt control: ±8°
Receiver
Local oscillator: Solid-state with AFC
Type: Balanced mixer with 60 MHz IF
Noise figure: 8 dB
Bandwidth: Matched to pulse width
Response: Logarithmic
Processing: STC, FTC

AN/APS-503 airborne radar system

Display
Type: 7 inch (18 cm) PPI with P-7 phosphor
Scales: 3 - 20 nm, variable; 50 nm; 100 nm; 250 nm
Markers: Range markers; reading strobe; sweable azimuth cursor and range dot, each with digital readout

LASR-2
A higher-power commercial version is also available. The Litton airborne search radar LASR-2 is a development of the AN/APS-504. Peak power is 100 kW, and it possesses dual pulse widths, four pulse recurrence frequencies and three rotation rates in normal operation. Weight is 170 lb (76 kg) with a pilot's bright display included. A variety of antenna sizes are available. Sector scan, a delayed sweep, ground stabilisation, and beacon mode are included.

System characteristics are generally similar to the AN/APS-504 (**3473.353**) below.

The system is no longer in production but is still in service.

3473.353
AN/APS-504(V) SERIES AIRBORNE RADAR
The APS-504(V) series of airborne search radars have been designed for tactical transport and maritime surveillance applications. They can be employed in either a fixed or rotary wing type of aircraft. The systems are operationally suitable for use in a sea search, ground mapping, navigation, station keeping or weather avoidance role.

The APS-504(V)3 provides digital signal processing and scan conversion allowing the use of standard RS343A high-resolution 875 line TV displays. This system also allows recording and playback of mission radar data and alpha-numerics on compatible TV systems.

The system consists of six basic units:
(1) receiver/transmitter
(2) antenna/pedestal assembly
(3) digital TV displays
(4) radar control unit with joystick cursor control
(5) radar processor and converter
(6) key pad entry unit.

The antenna is stabilised for pitch and roll and is designed to make use of available radome volume. Features include variable width sector scan, range delay, offset sweep, sweep expansion, true motion display using inputs from the navigation system and an MS-1553B interface to the tactical mission computer.

The APS-504(V)5 is the latest system in the series. It enhances the detection capability of the original (V)2 system and couples it with the digital processing, high definition and rastered display of the (V)3. The V(5) version incorporates frequency agility, pulse compression techniques and a TWT amplifier. An SAR derivative of this version is used in the IRIS reconnaissance radar (**5874.353**).

CHARACTERISTICS (AN/APS-504(V)5)
Frequency: 8·9 - 9·4 GHz
Peak power: 8 kW
Antenna: Parabolic, selectable polarisation
Beamwidth: Horizontal 2·5°; vertical 7°
Beacon mode/search mode/simultaneous beacon/search
Linear and logarithmic receivers
Digital X-Y displays viewable in high ambient light
Multi-function display

NATO IDENTIFICATION SYSTEM (NIS)
NATO's future IFF system, the NATO Identification system (NIS), was in the design phase in early 1985 with studies and development being carried out in USA, UK, West Germany and France. Present Mk X and Mk XII IFF systems in use with NATO are becoming outdated. Both use a fixed frequency system which can easily be jammed by hostile action. Another problem is that the current systems can only identify friendlies and the lack of a response leaves the operator uncertain whether he is interrogating a hostile aircraft or a friendly one whose IFF is faulty, turned off or jammed.

The new system being developed, under NATO Standardisation Agreement (Stanag) 4162, and known as Mk XV, will use spread spectrum and additional ECCM techniques to counter jamming, and will have a high level of message security. It is intended to combine the basic information with other data sources to provide a high accuracy IFF. After considerable discussion the four countries concerned have agreed on the development of a system in D-band (1 to 2 GHz). The UK is still interested in a modified D-band which involves the addition of a radar mode whereby a ground radar transmission is modulated with IFF information and a transponder in the aircraft responds when scanned by the radar beam.

The main companies involved in development are two teams in the US - Bendix/Raytheon and Texas Instruments/E-Systems/Teledyne; Cossor and Plessey in UK, Siemens in West Germany and Thomson-CSF in France. Agreement has been reached between Cossor and Siemens for a joint development programme. Time scales are difficult to assess, the two teams in the US are being funded by the US Air Force to carry out development work in two phases. Phase 1, which consists of building 'breadboard' models, has been completed and the two US teams have moved into the second phase with both working on parallel contracts to produce advanced development models for flight testing. This development and flight test phase is expected to last a further three years. The US Air Force expects to award contracts early in 1988 with production deliveries probably starting around 1990. It is understood that the European companies, which are also being funded by the individual governments, are on a similar time scale.

ISRAEL

3305.353
EL/M-2001B RADAR
The Elta EL/M-2001B dual-mode radar for combat aircraft is a range-only equipment for air-to-air and air-to-ground operations. Of compact dimensions and weighing less than 50 kg, it is suitable for installation in the nose position of small new combat aircraft or for retrofitting to earlier types.

It is constructed of six line replaceable units: transmitter, receiver, power supply, RF exciter, RTU, and servo unit. These are attached to the radar chassis/mounting unit which also carries the beam directing unit, gear box, RF head and TWT. The last of these items is the only component that is not solid-state.

OPERATION
Modes of operation are air-to-air, all altitudes and all aspects, air-to-ground, manual or computer controlled. Target detection is by visual means and the radar will automatically acquire and track any target viewed in the HUD by the pilot. It operates in heavy ground clutter and remains clutter-free even in very low level air combat, according to Elta.

Target acquisition is also automatic in the air-to-ground mode, although in both modes there is provision for pilot intervention for selection of targets of interest. Information provided by the EL/M-2001B can either be displayed on the aircraft HUD or fed into the weapons' control computer where it may be used for CCIP and CCRP weapon delivery computation.

CHARACTERISTICS
Frequency: Probably I- or J-band
Form factor: Frustum of a cone
Length: 49 cm (including connectors)
Base diameter: 45 cm
Antenna aperture: 195 mm
Weight: <50 kg
Power requirements: 115 V, 400 Hz, 3-phase, 1 kVA, DC 30 W
STATUS
In production.

EL/M-2001B airborne radar

CONTRACTOR
Elta Electronics Industries Ltd, (a subsidiary of Israel Aircraft Industries Ltd), Ashdod, Israel.

3306.353
EL/M-2021 RADAR
The Elta EL/M-2021 multi-role combat radar operates in the I/J-band of the radar spectrum and provides facilities for a variety of air-to-air and air-to-ground missions. These include air interception, close-in combat, air-to-ground bombing and gunnery, terrain following, avoidance and mapping.

In the air-to-air mode it performs search and automatic tracking, and in the air-to-ground mode it supplies ranging information to the bombing computer (both CCIP and CCRP weapon delivery modes are available). Head-up and head-down displays provide the pilot with data for interception of targets and provide fire control for guns. A stabilised radar picture is produced which is of value in the navigation mode using radar mapping.

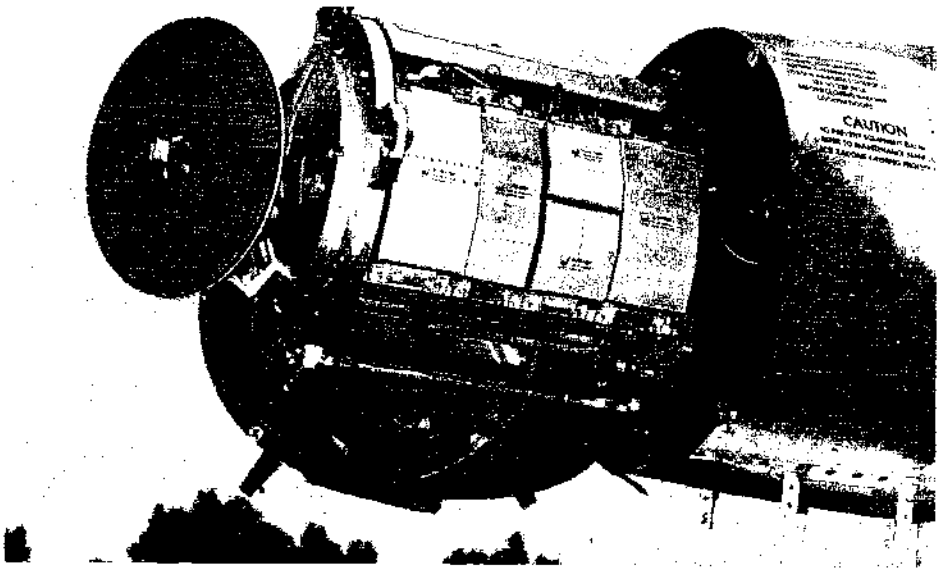
The equipment is constructed of line replaceable units which include transmitter, processor, modulator, missile illumination unit, RF head, weapon delivery unit, receiver, RF exciter, servo amplifier unit, power supply, interface computer unit, and missile delivery computer. An inverse cassegrain antenna is employed and solid-state circuitry is used.

Coherent processing using digital techniques is used, and both look-up and look-down waveforms are understood to be provided.

CHARACTERISTICS
Transmitter
Frequency: Probably I/J-band
Bandwidth: 500 MHz
Peak power: 3 kW
Average power: 200 W

Receiver noise: –5 dB
Antenna: Inverse cassegrain

Scan	Tracking	Search/Al	Dogfight
Azimuth	±70°	±45°	±10°
Elevation	–80 to –40°	±5°	0 to +60°



Range tracking accuracy: 10 m + 10%
Processor: CCD processor for signal extraction, digital data processor for avionics interface
Dimensions (excluding antenna)
Max diameter: 74 cm
Minimum diameter: 44 cm
Height: 1·295 m
Weight: 120 kg (including antenna)

STATUS

Development. The EL/M-2021B has been flight tested in an F-4 Phantom. Although designed originally for the F-16 aircraft of the Israeli Air Force, a version has been developed for the new Israeli Lavi fighter (**5876.353**).

CONTRACTOR

Elta Electronics Industries Ltd, (a subsidiary of Israel Aircraft Industries Ltd), Ashdod, Israel.

EL/M-2021 multi-role combat radar

5876.353
LAVI AIRBORNE RADAR

Elta Industries has developed an airborne multi-mode radar for the new Israeli Lavi fighter aircraft. It is a version of the EL/M-2021B radar (**3306.353**) and is adaptable to a wide range of combat and surveillance missions. As a sensor for the Lavi avionics system, the equipment determines both airborne and ground target data such as position, velocity and acceleration. A coherent transmitter and stable multi-channel receiver are incorporated to provide reliable look-down performance over a broad band of frequencies. In the air-to-air mode it includes track-while-scan facilities and performs search and automatic target acquisition. For air-to-ground use, beam-sharpened ground mapping provides accurate resolution, and terrain avoidance and sea search modes are incorporated. The signal processing unit is software programmable and is backed up by a distributed computer network to allow optimal allocation of computing power for the various modes.

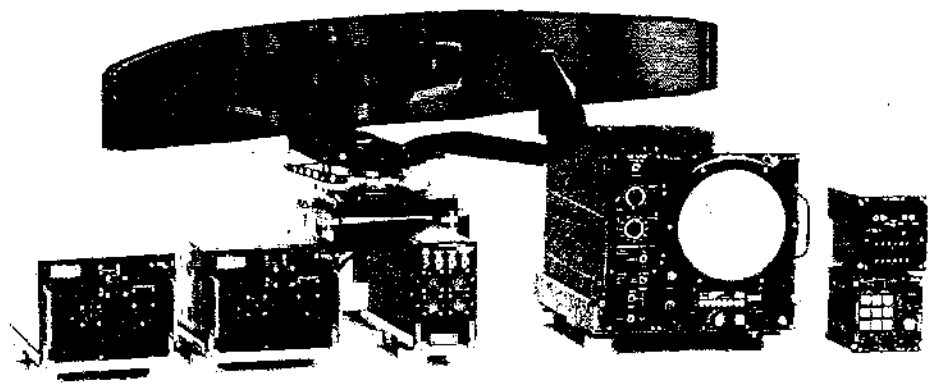
STATUS

Flight testing of prototypes is in progress.

CONTRACTOR

Elta Industries Ltd (a subsidiary of Israel Aircraft Industries Ltd), Ashdod, Israel.

ITALY



3307.353
MM/APS-705 RADAR

The MM/APS-705 is an airborne search and navigation radar designed specifically for naval helicopters, in particular the AB.212 and SH-3D types, providing for ASW, mapping, SAR, and similar operations. The operating frequencies are in the I-band and two transmitter/receivers are used for frequency diversity operation providing clutter decorrelation and enhancing reliability. There are four pulse length/PRF combinations and eight range settings matched to bearing/range discrimination.

Antenna groups for either ventral or dorsal mounting are produced and there are also size variations, that for the SH-3D having a wider aperture than that for the AB.212 (1·6 m compared with 1·2 m). Line-of-sight stabilisation is provided in both cases, and there are alternative, selectable antenna rotation rates, 20 or 40 rpm. Manually controlled antenna tilt provides for ±20° of movement. An alternative back-to-back antenna is another option for use where higher data rates are required, for instance.

The display unit incorporates a 9-inch (23 cm) diameter CRT PPI with digital true motion presentation facilities, electronic and mechanical cursors, markers, and complemented by a separate digital readout X-Y reference display.

There is an expanded micro-B display for chaff or multi-target detection, and the radar provides outputs for other displays and extractor units. Other facilities include sector transmissions and blanking; interfaces for Beacon receiver, IFF, ASW and ESM systems; built-in test; data link; TWS and dense-environment tracker. Equipment options, in addition to the back-to-back antenna already mentioned, include a 75 kW frequency-agile transmitter/receiver, a pilot's bright display and the auto-tracker with ECCM provisions and micro-B display.

MM/APS-705 airborne radar installation

CHARACTERISTICS

Transmitter/receiver: Dual, I-band
Peak power: 25 kW each
Pulse length/PRF: 0·05 μs/1600 Hz, 0·15 μs/1300 Hz, 0·5 μs/1300 Hz, 1·5 μs/650 Hz
Noise figure: 8·5 dB
Receiver characteristics: Linear; log up to 80 dB
Anti-clutter: STC, FTC, log-averaging
Antenna: Cylindrical-parabolic segment. Horn feed
Polarisation: Horizontal
Beamwidth: 2° azimuth × 7° elevation (AB.212, 1·2 m aperture); 1·5° azimuth × 10° elevation (SH-3D, 1·6 m aperture)
Rotation rate: 20 and 40 rpm
Stabilisation: ±20° pitch and roll
Manual tilt: ±20°
Display: P33 phosphor, 9 inch (23 cm)
Range settings: 0·5, 1, 2, 5, 10, 20, 40, 80 nm
System weight: 87 kg

STATUS

Standard equipment in Italian Navy AB.212 and SH-3D helicopters, and procured by other navies.

CONTRACTOR

SMA (Segnalamento Marittimo ed Aereo), PO Box 200, Via del Ferrone Soffiano, 50100 Florence, Italy.

3308.353
MM/APS-707 RADAR

This is a military standard search radar for airborne applications where reduced weight and dimensions are prime considerations, coupled with low-power consumption and limited cost.

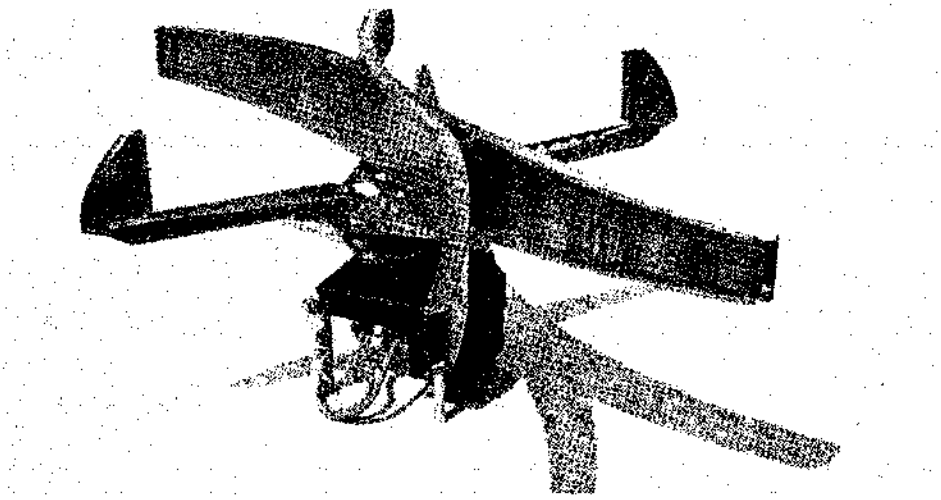
Main operational features include: long range 360 degree coverage; detection of small targets; target designation for weapon systems; radar mapping; various ECCM and graphic facilities for tactical data presentation.

Technical characteristics incorporated are: a rapid rotation rate stabilised antenna, X-band operation, pulse-to-pulse frequency agility, high transmission power, scan-to-scan integration, 'freeze' display capability with TV format presentation.

STATUS

The first production equipment is ready for fitting in helicopters for a foreign customer.

CONTRACTOR



SMA (Segnalamento Marittimo ed Aereo), PO Box 200, Via del Ferrone Soffiano, 50100 Florence, Italy.

3309.353
MM/APQ-706 RADAR

The MM/APQ-706 search and attack radar is used in the Italian Navy Marte helicopter-launched anti-ship missile system (**1651.321**). It consists of two I-band transmitter/receiver channels operating in frequency diversity, with frequency agility facilities on one channel, and is provided with a data processing and extraction system and tactical display console. The MM/APQ-706 can fulfil typical naval helicopter roles such as surface search, navigation, ASW etc in addition to providing target detection, acquisition and missile guidance facilities for the Marte system.

The antenna group utilises a pair of back-to-back mounted parabolic antennas, line-of-sight stabilised, housed in a chin radome in the case of Italian Navy SH-3D helicopters. High accuracy and acquisition capability against small surface targets in the presence of severe sea clutter and/or intense EW opposition are among the main features of this radar.

Many details of the MM/APQ-706 are classified but it belongs to the SMA APS/APQ-700 series of airborne radars and is probably closest to the MM/APS-705 version (**3307.353**) with the addition of known enhancements such as the back-to-back antenna, 75 kW frequency-agile transmitter/receiver, auto-tracker/ECCM package, and certain other unspecified additions.

Back-to-back antenna assembly of MM/APQ-706 airborne radar

STATUS
Installed on Italian Navy SH-3D helicopters for Marte anti-ship missile system but no longer in production.

CONTRACTOR

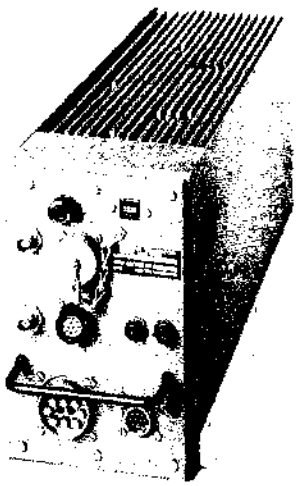
3488.353
SIT 432 (AN/APX-104(V)) AIRBORNE INTERROGATOR

The SIT 432 (AN/APX-104(V)) is a lightweight airborne IFF interrogator equipment suitable for installation on helicopters or fixed-wing aircraft to provide air-to-air and air-to-ship identification facilities.



The receiver/transmitter module contains a 1200 W transmitter, a dual-channel receiver and an RF interface module. The receiver operates at 1090 MHz and is of a dual-channel type which, in conjunction with a dual-channel antenna, provides for receiver side lobe suppression.

The design employs surface acoustic wave technology in the local oscillator to obtain a reliable, simple design with good stability and no field alignment requirements. The transmitter is solid-state. It accepts coded video pulse trains from an external source and the internally generated Mode 4 ISLS pulse, converts the coded video pulse trains and Mode 4 ISLS pulse into radio-frequency pulse groups for transmission as IFF interrogation.

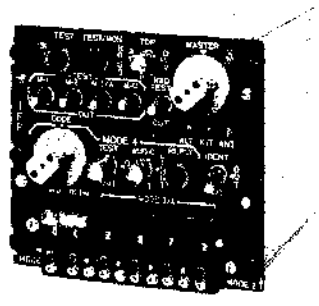
CHARACTERISTICS
Frequency: 1090 ±0·2 MHz (receiver); 1030 ±0·2 MHz (transmitter)
Sensitivity: -83 dBm
Output power: Not less than 1200 W
Duty cycle: 1% max
Dynamic range: 50 dB
Weight: 6·5 kg

STATUS
Co-development with Hazeltine USA.

CONTRACTOR
ITALTEL (Società Italiana Telecomunicazioni), 12 Piazzale Zavattari, 20149 Milan, Italy.

SIT 432 (AN/APX-104(V)) airborne interrogator

3489.353
SIT 421 (MM/UPX-709) TRANSPONDER



The SIT 421 (MM/UPX-709) is a 'one-box' airborne IFF transponder, suitable for fitting in fixed-wing aircraft or helicopters. It operates in Modes 1, 2, 3/A, 4 and C. The receiver/transmitter includes a 500 W solid-state transmitter, dual-channel receiver and RF interface module. The first of these comprises a delay line oscillator, modulator, driver and power amplifier.

The controls for operation of the transponder, code and mode selection, etc, are mounted on the front of the equipment (which is designed for cockpit mounting) but versions are produced in which remote control facilities are provided.

CHARACTERISTICS
Frequency: 1030 MHz (receiver); 1090 MHz (transmitter)
Sensitivity: -77 dBm (adjustable 69 - 77)
Dynamic range: 55 dB
Output power: 27 ±3 dBW at 1% duty cycle
Weight: 3·5 kg

STATUS
Production.

CONTRACTOR
ITALTEL (Società Italiana Telecomunicazioni), 12 Piazzale Zavattari, 20149 Milan, Italy.

SIT 421 (MM/UPX-709) IFF transponder

SWEDEN

1210.353
PS-37/A AIRBORNE ATTACK RADAR

This is a multi-mode airborne attack radar, operating in the I/J-band, and using the monopulse technique. High output power is employed to provide long range performance. Cassegrain or parabolic dish scanners with fixed feed have been developed for this radar, but the latter is the preferred antenna system.

The PS-37/A is an important element in the attack system of the Saab Viggen aircraft, and its design provides for considerable integration with the navigation, display, and the digital computer-based data processing sub-systems.

The radar is comprised of two main units: the electronics package and the scanner assembly. The former is made up of 13 replaceable units housed in a main assembly which carries the interconnecting cable looms. The division of electronic functions between the individual replaceable units has been arranged so that, as far as possible, related functions are housed within one unit, enabling the replacement of units to be effected without the need for subsequent trimming or adjustment. Each of the replaceable units contains between three and eight sub-units, which provide further facility for servicing.

With the exception of certain high-frequency devices, the PS-37/A is a completely solid-state equipment. The mechanical design incorporates an hydraulic drive for the antenna scanning and stabilisation system, providing accurate and rapid movement over wide angles.

In the interest of high performance and optimum operational flexibility, including conditions of high interference (natural or ECM), elaborate signal processing facilities at both the radio-frequency and video levels are provided in the PS-37/A. Another technique employed to increase accuracy and resolution is lobe-shaping, which synthetically produces the effect of increased antenna aperture and reduced sidelobes.

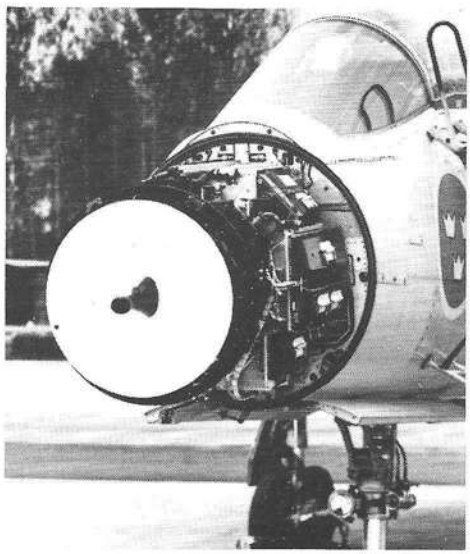
In the Viggen installation both head-up and head-down display of radar information is provided, the data presented varying in accordance with the operational mode employed.

OPERATION

To comply with the requirements of operation of the Viggen by a single crew member (pilot), the PS-37/A is designed for semi-automatic operation to reduce cockpit work-load. Facilities provided include: search, target acquisition, air target ranging, surface target ranging, obstacle warning, fixed point radar navigation, and terrain mapping. The system is designed to allow for terrain following by the addition of one unit.

Radar information is shown on the head-down display in the form of sector-PPI or B-scope presentation. This unit features a dual persistence CRT in which rapidly changing data (such as a radar map) are presented with a shorter persistence than alpha-numeric characters or other symbols. The latter can be used for the display of flight information or target designation, and are derived from a waveform generator driven by the aircraft central digital computer.

DEVELOPMENT



The PS-37/A is the third generation of airborne radar equipment developed by Ericsson. Theoretical studies for a radar to meet the requirements of the Viggen were started in 1958, and ground tests on the first prototype took place in 1961. The first system-engineered model was built in 1965 and air tests began in 1966, with the radar fitted in a Lansen test-bed aircraft equipped with Viggen electronics. Verification tests in a Viggen took place in 1968, and production was ordered, starting in 1970. A version for the Swedish fighter version of the Viggen (JA 37) is described under **1964.353**.

STATUS

Operational but no longer in production.

CONTRACTOR

PS-37/A radar in AJ 37 Viggen aircraft

1209.353

UAP 13 SERIES AIRBORNE ATTACK RADARS

This is a range of nose-mounted, forward-looking radars for search and fire control applications in interceptor aircraft. The radars in this series are pulse radars operating in the I/J-band of the spectrum.

The basic model of the range is the UAP 13102, which is also designated PS-01/A. It is fitted to the Saab Draken J35F. The UAP 13103 (PS-011/A) is similar to the UAP 13102 but is designed to be used with the S71N infra-red search and track set. Both these models are intended for use in aircraft having a fire control computer.

OPERATION

The following operating modes are provided: search, acquisition, lock-on and tracking. An additional feature is the provision for slaving of missile radar and infra-red guidance systems to the aircraft radar. A two-bar scanner search pattern is used in the elevation plane for the UAP 13102, and a choice of two- or four-bar in the UAP 13103.

DEVELOPMENT

The UAP 13 series is largely associated with the requirements of the J35F version of the Draken. The project started in 1959.

STATUS

UAP 13102 and 13103 models are fitted to Swedish Air Force Draken aircraft, the latter variant of radar being the one used with the S71N infra-red search and track set. The UAP 13104 model equips Drakens of the Finnish Air Force.

1964.353

PS-46/A MULTI-MODE AI RADAR

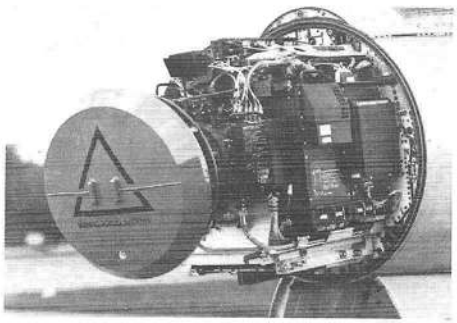
PS-46/A is the multi-mode AI radar fitted to the JA 37 fighter version of the Saab-Scania Viggen. The pre-production models of this radar were described in **1741.353** (*Jane's Weapon Systems*, 1974-75) under their developmental designation, DAX-100/200.

To the general operational requirements of all-weather capability, ability to operate effectively in an ECM environment, and high availability, the PS-46/A specification covers the following particular requirements for air-to-air roles:

(1) capability against high-performance aircraft, transports, and helicopters
(2) all hemisphere coverage
(3) look-down capability
(4) air-to-ground ranging with (optional) mapping.

In considering the transmitter waveform options to meet the above multi-role requirements, a number of techniques are available.

The air-to-ground requirements can be met by the conventional non-coherent pulsed waveform whereas the air-to-air requirement calls for a more sophisticated waveform. Waveforms that provide look-down capability are:



HPD: high PRF pulse doppler
MPD: medium PRF pulse doppler
LPD: low PRF pulse doppler

These waveforms are mainly characterised by their pulse repetition frequencies since this parameter is the determining factor on overall performance.

HPD and MPD require an internal radar frequency reference and subsequently coherent transmission, whereas LPD in addition can use a pseudo-coherent transmission (coherent-on-receiver) or a non-coherent transmission resulting in auto-coherent or non-coherent airborne moving target indicator. A careful review of the pros and cons of these waveforms led to the selection of the two waveforms:

(1) low PRF waveform for look-up modes
(2) medium PRF waveform with doppler filters and signal processing to resolve range ambiguities for look-down modes.

The radar is designed as a 'cartridge' fixed to the forward aircraft bulkhead with four bolts. The aircraft systems supply the necessary electric power, cooling air, and hydraulic power for the hydraulic vane motors that drive the two-axis antenna. The radar consists of ten line replaceable units (LRUs) and these are supported or housed in a lightweight frame which is in itself an LRU. The construction provides for simple removal and replacement of units.

Ericsson PS-46/A multi-mode AI radar installed in Viggen

The main design characteristics of the PS-46/A radar are summarised as:

I/J-band
medium PRF pulse doppler operation
coherent transmitter (TWT)
large antenna with low sidelobes
digital signal and data processing
integrated CW target illumination
built-in test.

Target data extraction and smoothing are carried out by Kalman filtering in stabilised Cartesian co-ordinates.

OPERATION

The PS-46/A radar can be configured to provide the following modes of operation:

(1) target search
(2) target acquisition
  (a) automatic using HUD
  (b) semi-automatic using HUD
(3) target tracking
  (a) TWS mode
  (b) continuous track
(4) target illumination
(5) air-to-ground ranging.

Single- and multi-bar scans, wide or narrow, are provided as well as spiral or raster scans for HUD lock-on in dogfights.

STATUS

In production.

CONTRACTOR

Ericsson Radio Systems AB, Defence and Space Division, 431 26 Mölndal, Sweden.

4083.353

ERICSSON SLAR

Ericsson SLAR (side-looking airborne radar) is a lightweight system for maritime surveillance and other reconnaissance purposes. It is an I-band equipment and consists of a three metre long antenna pod which is usually mounted underneath the aircraft, with the other electronics carried in standard 19-inch (483 mm) racks in the aircraft cabin. The total weight of the equipment, including the antenna housed in the pod, is less than 70 kg.

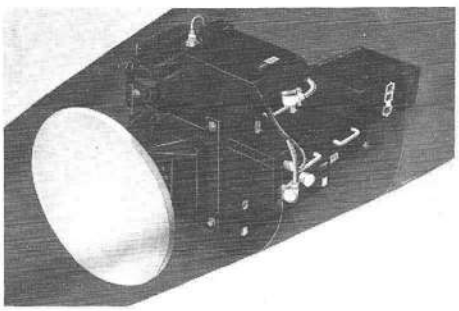
The radar uses a standard TV display, which gives a true real-time presentation of flicker-free images with 64 grey-tone levels. Digital signal processing is used, and digital recording of radar video is possible on the aircraft for further processing on the ground later. The TV images may also be recorded on a standard tape recorder for replay of sequences of interest on the ground. All images are annotated with alpha-numeric information, including time, position and heading etc. The TV image display gives a rolling map presentation covering either one or both sides of the aircraft, and medium or large ships can readily be detected at ranges of up to 100 km. An MTI filter can be provided.

DEVELOPMENT

Development was carried out by Ericsson in co-operation with the Swedish Coast Guard.

STATUS

In production and in service with the Swedish Coast Guard and several other countries.



CONTRACTOR
Ericsson Radio Systems AB, Defence and Space Division, 431 26 Mölndal, Sweden.

Ericsson SLAR in use aboard a Swedish Coast Guard Cessna 337 engaged on maritime surveillance

5684.353
JAS-39 AIRBORNE RADARS

In addition to the various airborne radars described under separate entries in this section, Ericsson is engaged in other development programmes. Two of these are described briefly below.

Artist's impression of the JAS-39 Gripen radar

JAS-39 Gripen radar (PS-05)

The JAS-39 Gripen is the replacement aircraft for the Viggen. Prototypes are due to fly in 1987 and the aircraft is scheduled to enter operational service in the early 1990s. Ericsson is currently engaged in the development of an advanced multi-mode, pulse doppler radar for this aircaft, which has been given the nomenclature PS-05. The system uses the planar array antenna and employs FM pulse compression for long-range detection. Ferranti of UK is a nominated sub-contractor and is providing the antenna pedestal and is participating in design and development of the signal processor. In the air-to-air role the new radar will perform long-range search and multi-target TWS, short range wide-angle quick scan, and missile and gunfire control. The air-to-ground functions are sea and ground target search, ground mapping and missile fire control.

STATUS
Manufacture and unit test of the first prototype was due in late 1985. Major sub-systems and components such as the antenna, exciter, A/D converter, transmitter and processor have been tested satisfactorily. A standardised computer system, Ericsson SDS8D, has been developed.

AEW radar

Ericsson, in co-operation with the Swedish Air Force, is studying a new air defence, pod-mounted early warning radar which could be carried under combat aircraft, including the new JAS-39. No details are available but synthetic aperture techniques are believed to be the probable basis. The pod would probably carry the complete radar and signal processor, plus air-to-ground communications. It is unlikely that there would be any control function as in the more sophisticated AEW systems.

CONTRACTOR
Ericsson Radio Systems AB, Defence and Space Division, 431 26 Mölndal, Sweden.

5887.353
HERA AIRBORNE RADAR

Philips of Sweden has developed a new surveillance radar designed for use by the Royal Swedish Navy in helicopters and potentially as an airborne targeting aid for the RBS 15 anti-ship missile. The radar uses a transceiver supplied by Omera of France and is allied to a display system developed by Philips. The transmitter has a power output of 100 kW and employs frequency agility techniques to counter ECM. A frequency-agile IFF system is incorporated. The Hera system will be used in the anti-submarine role and is claimed to be able to detect a submarine snorkel at a range of 30 nautical miles in sea state 5 conditions.

STATUS
Fifteen systems have been ordered and deliveries were due to have commenced in late 1984.

CONTRACTOR
Philips Elektronikindustrier AB, 17588 Jarfalla, Sweden.

UNION OF SOVIET SOCIALIST REPUBLICS

3311.353
JAY BIRD AIRBORNE RADAR

Jay Bird is the NATO reporting name of the air-to-air ranging radar fitted in the intake nosecone of the MiG-19 Fishbed-J multi-role fighter aircraft. It is not clear if the NATO designation derives from the 'J' of the aircraft model name, or from the fact that the radar operates in the J-band, on frequencies between 12·88 and 13·2 GHz according to one source.

Antenna gain has been calculated at about 33 dB for an approximate diameter of 40 cm. Three PRF ranges have been quoted: 2042 to 2048 pps; 1592 to 1792 pps; 2716 to 2724 pps; and the provisional search and tracking ranges are 30 and 20 km, respectively.

Raster scanning is used for the search mode and lobe switching for tracking. A transmitter peak power in the region of 100 kW is assumed.

The Fishbed-J armament is said to include a radar-homing version of the Atoll air-to-air missile, in which case a target illuminating radar mode will be required of the Jay Bird.

The NATO designation, Jay Bird B, applies to an alternative version which may be the export version for MiG-19M Fishbed-Js and/or MiG-19SMT Fishbed-K used by India and Warsaw Pact states, respectively. Alternatively, this designation may refer to a version of Jay Bird said to be fitted to the MiG-25 Foxbat in one of its versions.

1475.353
LOOK TWO AIRBORNE RADAR

Look Two is the NATO designation for an I-band Soviet bombing and navigation radar system. No mechanical or technical details are available beyond the signal characteristics which have been obtained by 'Western' Elint (electronic intelligence) operations. These include operating frequencies in the band 9245 to 9508 MHz, with frequency agility capability and four PRFs: 320 to 336 pps, 619 to 632 pps, 1247 to 1253 pps, and 1871 to 1879 pps. Presumably, pulse length is also varied, changes being made according to operating mode and height. Fittings are apparently limited to certain versions of the Yak-28 Brewer twin-engined aircraft.

1476.353
PUFF BALL AIRBORNE RADAR

Puff Ball is the NATO designation given to an I-band Soviet search radar which has been stated to equip the Bison long-range, four-jet reconnaissance bomber. It is also probably fitted in certain versions of the Badger and Bear. Its principal function is long-range surface mapping, and among its uses may be the direction of air-launched missiles such as Kangaroo, Kennel, Kelt, and Kipper.

American reports state that Puff Ball has facilities for providing friendly surface-to-surface missile batteries with target designation services, and that this is accomplished by transmitting via a data link the relative positions of target and missile battery as presented on the radar PPI display.

Puff Ball PRFs are 414 to 418 and 621 to 628 pps.

1477.353
SCAN FIX AIRBORNE RADAR

Scan Fix is the NATO designation given to the AI (airborne intercept) radar fitted to MiG-17 and MiG-19 interceptors. Like those aircraft, the Scan Fix must be considered obsolescent. Both I-band and E/F-band versions are believed to have been produced. The latter equipped the Frescoe series of MiG-17s, while the MiG-19 Farmer A, C, and D versions were given I-band models, these being known by the NATO designation High Fix. American reports confusingly state that both versions employ fixed scans. This may mean that there is no antenna stabilisation, or that the radars may provide only target ranging and illumination facilities.

1479.353
SCAN ODD AIRBORNE RADAR
Scan Odd is the NATO designation for the AI (airborne intercept) radar fitted in MiG-19, Farmer B, Soviet interceptors. It is an I-band set, operating at frequencies between 9300 and 9400 MHz. This is apparently a later system than the Scan Fix AI radar, and is reputed to have an unusually complex scan pattern. There are differing PRFs for search and tracking modes of operation.

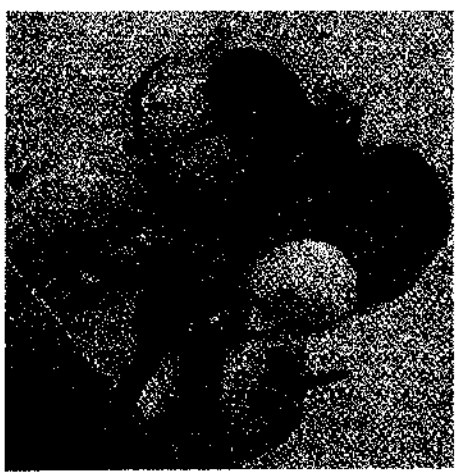
1480.353
SCAN THREE AIRBORNE RADAR
Scan Three is the NATO designation for the AI (airborne intercept) radar fitted in the Yak-25, Flashlight, Soviet interceptor aircraft. It operates in the same frequency band, I-band between 9300 and 9400 MHz, as the Scan Odd radar (**1479.353**). Three scan patterns for different operational modes have been detected and Scan Three is reported to employ a very high PRF. The Yak-25 was introduced in 1955 and this radar is presumably obsolete.

1478.353
SHORT HORN AIRBORNE RADAR
Short Horn is the NATO designation given to an airborne bombing and navigation radar, which, from the Elint (electronic intelligence) data available, appears to be an example of some of the latest Soviet radar technology. The operating frequency is in the J-band, between 14 and 15 GHz, and there are frequency agility and frequency diversity facilities. There are four PRF/pulse-width combinations for various operational modes: 313 to 316/1 to 1·8, 496 to 504/0·5 to 1·4, 624 to 626/0·4 to 1·3, and 1249 to 1253/0·01 to 0·9 pps/μs. Both circular and sector scans have been recorded.

No information is available on the physical configuration but the parameters above suggest that its uses include air-to-surface vessel and maritime applications. Aircraft type reported to be equipped with Short Horn include the Brewer Yak-28 in its B, C, D and E variants, the Tu-22 Blinder A, C and G models, and the Tu-16 Badger H.

1481.353
SKIP SPIN AIRBORNE RADAR
Skip Spin is the NATO designation for the AI (airborne intercept) radar installed in Su-11, Flagon-A, and Yak-28P, Firebar interceptors. The Soviet designation is understood to be RP11. Introduction took place in the mid-1960s. The operating frequency is in the I-band, and estimated transmitter power is in the region of 100 kW, giving a reported range of 40 km. The frequency has been quoted as being between 8690 and 8995 MHz, pulse width about 0·5 μs, and PRF 2700 to 3000 pps.

The Flagon-A and Firebar interceptors generally are armed with Anab air-to-air missiles (**1144.331**), (though the IR homing Atoll air-to-air missile (**1146.331**) is also carried) and therefore Skip Spin can be assumed to provide search and tracking modes for both these weapons, and target illumination for the radar homing version of Anab. The Yak-28P has also been observed with a significantly longer nose radome but the reason for this is not known.

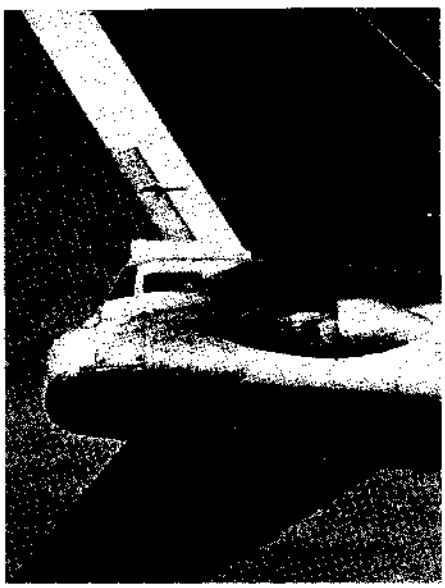


1482.353
SPIN SCAN AIRBORNE RADAR
Spin Scan is the NATO designation given to a series of AI (airborne intercept) radars. The Soviet designation is believed to be R1L, and in the export version (eg, India) the R2L. They operate at I-band frequencies, and have a transmitter power in the 100 kW region.

Soviet aircraft fitted with Spin Scan radars are the D and F models of the MiG-21, Fishbed interceptor, and the Su-9, Fishpot B. In all cases, the radar installation is of the type where it is housed in an aerodynamic pod in the nose air intake of the aircraft. These differ in size, that of the Fishbed D being larger than the Fishbed F version. Spin Scan A/B fitted in Fishbed D and Fishpot B, has two PRFs, 825 to 950 pps for search, and 1750 to 1850 pps for the intercept and tracking modes. A rotating scan pattern is employed.

Another version known to NATO as Spin Scan B is designated by Soviet Forces RP9.

4616.353
SUAWACS AIRBORNE AEW RADAR
A second generation SUAWACS (Soviet Union Airborne Warning and Control System) is currently being developed to follow-on to the TU-126 system illustrated below. Very little is known about the radar other than it will probably be carried in an AWACS version of the IL-76 aircraft (known to NATO as 'Mainstay'), and is coupled with the MiG-25M Foxhound aircraft which has a nose radar able to display and track 20 targets simultaneously. Unconfirmed reports have suggested that the antenna is the conventionally located rotating 'saucer' type. The IL-86 has also been considered as a next generation early warning platform.



NOTE: Other Soviet airborne radars will be found listed in the Airborne Radar Table (**1194.354**) in the Analysis Section of this volume. Separate entries have not been made for this equipment as it has not been possible to establish reliable data in sufficient quantity to justify such action. However the tabular references contain the salient information that has been obtained.

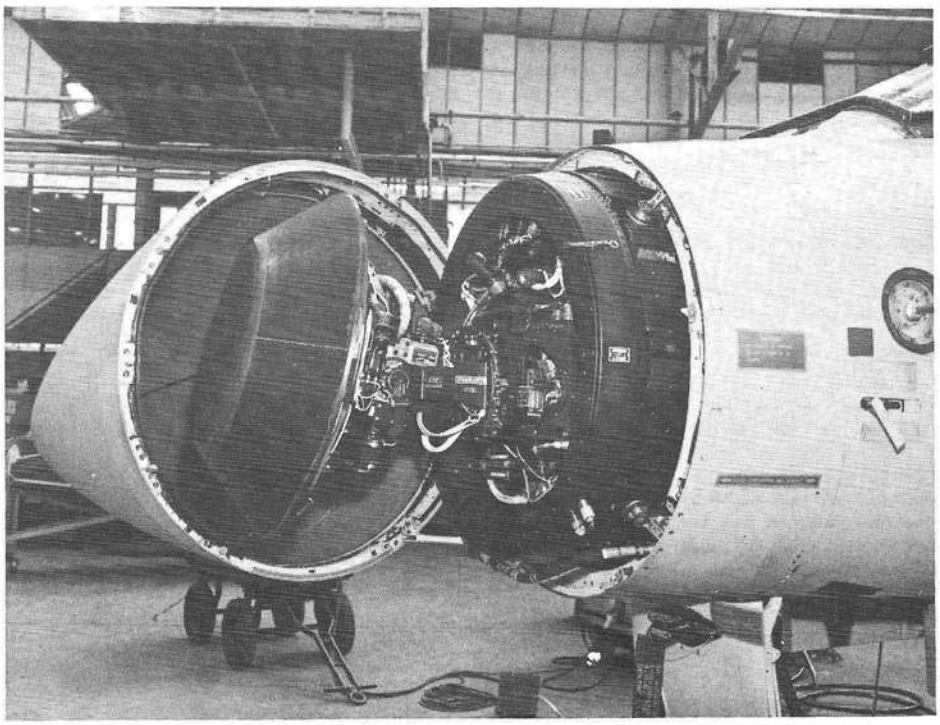
1785.353
FOXHUNTER AIRBORNE INTERCEPTION RADAR



The Foxhunter airborne interception radar was first publicised in early 1974 when GEC Avionics was awarded a major development contract for the AI (airborne intercept) radar of the RAF air defence version of the Tornado. The Electronic Systems Department of Ferranti is the major sub-contractor. The Foxhunter system made its first flight in a Tornado in June 1981 after extensive proving trials in other types of aircraft.

The design of this AI radar provides a multi-mode system compatible with the size and weight limits of the RAF air defence variants of Tornado and the operational requirements of the next two decades. A substantial part of the signal processing is performed digitally, in addition to digital radar data handling. The equipment anticipates trends in offensive tactics such as low-level penetration, use of ECM, etc, and has the flexibility to operate as part of ground or AEW based control environments while retaining the ability to operate autonomously.

Foxhunter is designed to detect and track subsonic and supersonic targets at ranges in excess of 100 nautical miles at both low and high level. Although it is intended to form part of an overall air defence system, ie in a ground or AEW control environment, the equipment has been designed to operate independently since either or both of the former may be nullified or degraded by enemy action. In normal circumstances, however, Foxhunter will be integrated within the overall UK air defence system, unified by the JTIDS - ECM resistant data link fitted in the Tornado ADV aircraft.

Foxhunter operates in I-band (3 cm) using a pulse-doppler technique known as frequency modulated interrupted continuous wave (FMICW). At the heart of the radar is a master timing and synchronising unit, employing phase-locked loop techniques, which generates the complex transmission waveforms for amplification by the transmitter, and the accurately related reference signals and sets of precise timing pulses employed within the receiver and signal processing circuits.

High performance microwave integrated circuits are used in the receivers giving benefits in size and weight. Compact and lightweight surface acoustic wave devices, developed by Marconi, provide signal waveforms for the pulse compression modes of the radar. The antenna uses the 'Elliott' twist-reflecting cassegrain principle which combines rigidity and light weight with extremely low levels of spurious radiation lobes, a key feature in the rejection of ground clutter and jamming signals. This type of antenna has been developed to a very advanced level of performance. The scanner, built by Ferranti, employs a hydraulic drive mechanism and very high grade servos to achieve the speed and precision of beam pointing and stabilisation demanded while the aircraft is manoeuvring under conditions of high *g* and rapid rates of roll.

Foxhunter radar mounted in the nose of a Tornado

The transmitter, which is also the responsibility of Ferranti, has been designed with the flexibility to provide the optimum form of transmission for the wide variety of operational tasks. The heart of the signal processing system is a signal processor embodying fast Fourier transform techniques of frequency analysis to filter the signal returns into narrow frequency channels enabling target echoes to be segregated from clutter returns and enabling a particularly uniform detection threshold to be achieved against all target velocities. Digital data processing assembles the various output data in format for clearly displaying on the Tornado TV displays.

OPERATION

With the radar in the main FMICW mode, the targets are detected and their tracks stored in the main computer. The radar must be capable of detecting mass raids at long range, whether terrain following over land or sea or approaching at high supersonic speed at high altitude. Once the targets are detected and tracked the threat is assessed. Foxhunter has the ability to track a number of targets while the radar continues to scan for others, so enabling the crew to evaluate the overall situation and carry out attacks in rapid succession. This has an added advantage since, because the radar continues to scan normally, tracked targets will be unaware that they are being analysed and assessed.

The data on each tracked target is produced on the navigator's tactical electronic display which gives an overall view of the entire tactical area. Weapon selection is then made and the attack can be commenced referring to head-up and/or head-down target data. As the attack develops the navigator continues to process target data and to monitor the overall tactical scene. An IFF interrogator is integrated with the radar and correlated returns are

displayed, differentiating between hostile and friendly tracks.

Foxhunter also provides target illumination for the Sky Flash medium range air-to-air missiles which have semi-active homing heads and, since heavy jamming is virtually certain, the system incorporates strong ECCM facilities.

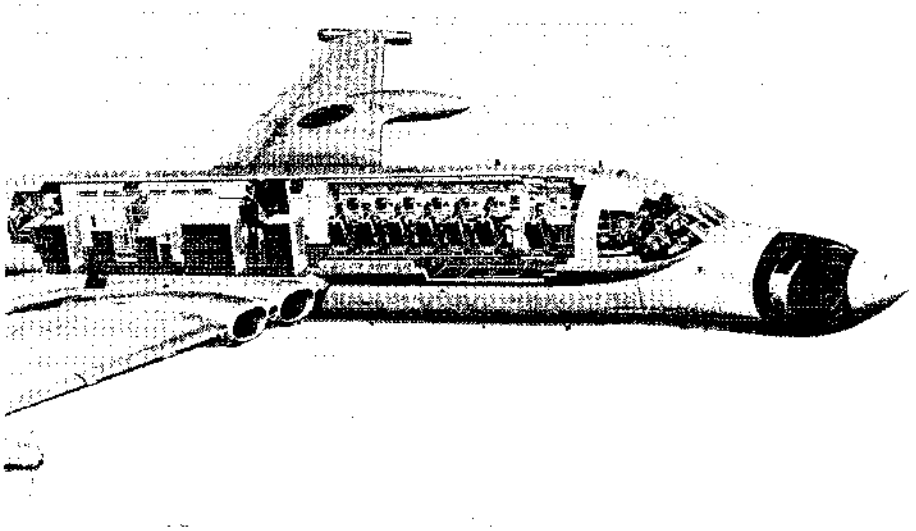
STATUS

Preproduction has been completed and deliveries against the main production order are in progress.

CONTRACTOR

GEC Avionics Ltd, Elstree Way, Borehamwood, Hertfordshire WD6 1RX, England.

1971.353



UK AEW RADAR

In March 1977 the British Government announced its intention to proceed with development of the Nimrod AEW equipped with the GEC Avionics airborne early warning radar, following the inability of NATO nations to agree a satisfactory basis for the establishment of a NATO AEW force. The Nimrod AEW radar installation comprises a pair of scanners mounted fore and aft in protective radomes. The general arrangement of this and the crew stations is shown in the illustration.

At the centre of the AEW system is a digital data handling system (DHS), accepting data from the two radar scanners and their associated receiver and integrated IFF systems, and from the ESM equipment. Other inputs are navigation data and information received via tactical data links. Within the DHS, the data from all sensors is analysed to provide automatic initiation and tracking of targets, and the association of tracks from radar, IFF and surface based systems. All these provide a picture in the computer store which will be displayed and monitored by the operators. Other outputs are control signals to the radar and ESM systems and tactical data via the data link(s). Other communications include UHF, VHF, and HF radio with a secure voice link facility in addition to the secure digital data link(s).

The pulse doppler radar system operates at E/F-band frequencies with pulsing of the transmission enabling range measurement while doppler filtering is used for MTI and clutter rejection purposes. The receiver analyses groups of return pulses to detect any doppler shift. At any instant the returning pulse corresponds to a narrow cross-section of the radar beam at a particular range. Areas not at this range return no simultaneous signals. In this way small moving targets can be resolved from strong stationary ground returns. A maritime detection and surveillance capability is also provided and this may be interleaved with the airborne detection mode to provide a combined air and surface surveillance capability. The radar PRF can be varied, as presumably can the pulse width, to maximise detection in different terrain conditions or sea states. The radar passes to the DHS target plots comprising range, bearing, radial velocity, and height. Highly sophisticated ECCM provisions are stated to be incorporated.

The radar antennas have been specially designed to minimise sidelobes, and are of identical shape. Mounted in the nose and tail of the aircraft their respective 180° azimuth scans are synchronised. The antennas are automatically roll and pitch stabilised by a pair of gyro platforms which compensate for structural flexing, and overcome the cyclic error present in other systems. A new airborne IFF interrogator has been designed and developed by Cossor Electronics for AEW Nimrod, under the code-name Jubilee Guardsman. The IFF interrogator uses the same antennas as the primary radar to aid correlation of returns.

Internal layout of AEW Nimrod equipment and crew positions. There is a flight crew of four and a tactical crew of six operators

OPERATION

Operation of the AEW Nimrod requires a tactical crew of six and a flight crew of four. The navigator is primarily a member of the flight crew but also supports the tactical crew and is located in that part of the aircraft. The specialist AEW team consists of a tactical air control officer who directs the mission and five air direction officers responsible for track monitoring and reporting and fighter direction as required; one of these acts also as communications control officer and one as ESM officer for the identification and correlation of ESM intercepts. The flight positions for the tactical controller and air direction officers are identical in layout and facilities allowing maximum interchange of roles to meet changing circumstances. The communications and ESM consoles carry additional equipment for their specific functions but have standard multi-function keyboards enabling the operators to have access to the DHS. All positions have access to internal and external communications networks, overall control residing with the communications control officer.

The operators interface with the system through their multi-function display consoles. Each has a tactical situation CRT display to show the tracks selected by the operator, and there is also a tabular display for the selective presentation of detailed track control information. Operator control of the DHS is by tracker-ball and keyboards. Much of the data control is entirely automatic and the following functions require no operator action.

(1) track initiation
(2) tracking
(3) association of radar, IFF and ESM
(4) data storage

Operator functions include:

(1) system control
(2) track classification
(3) fighter control
(4) data link management.

STATUS

Roll-out of the first development aircraft, a modified Comet, carrying a full radar system took place in March 1977. Flight trials began later the same year and have since been successfully completed. The UK force of 11 Nimrod AEW, together with the other new major elements of Tornado ADV and the Improved Ground Environment (UKADGE), will provide a greatly enhanced UK air defence system from the late-1980s onwards. In addition the UK Nimrod AEW force will form the British contribution to the NATO AEW mixed force and will be inter-operable with the E3 AWACS. As at June 1985, three Nimrods were involved in developing the aircraft and its systems to a specification to meet the operational requirements of the Royal Air Force.

CONTRACTOR

GEC Avionics Ltd, Elstree Way, Borehamwood, Hertfordshire WD6 1RX, England.

4614.353

SKY GUARDIAN AEW RADAR

Sky Guardian is the name of a family of AEW radars being developed by GEC Avionics. The systems are based on the comprehensive range of equipments designed for the RAF's Nimrod AEW aircraft (**1971.353**) and are for fitment to a variety of maritime and AEW aircraft to customer requirement. Layout designs for various types of aircraft and configurations are in existence, based on the company's expertise in system integration and preparation of software for Nimrod.

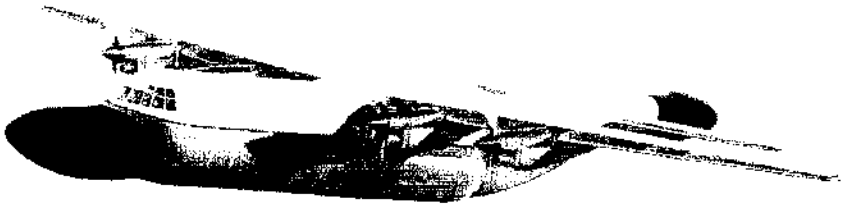
STATUS

In development. One system, known as the APY920 is described under entry **5878.353**.

CONTRACTOR

GEC Avionics Ltd, Elstree Way, Borehamwood, Hertfordshire WD6 1RX, England.

5878.353



APY920 MISSION AVIONICS SYSTEM

The APY920 is derived from the mission avionics system developed for the UK AEW Nimrod and includes a version of the AEW radar described under **1971.353**. It has been developed in collaboration with Lockheed, Georgia for installation in a C-130 aircraft. The complete system consists of the radar, IFF and ESM sensors, a data handling system, communications and data link facilities. The radar is an export version of the S-band pulse doppler equipment used in the Nimrod giving 360 degree surveillance, and differs mainly in the frequency used and its software programmes. As with the Nimrod, the antennas are stabilised and mounted in fore and aft radomes on the C-130.

STATUS

GEC Avionics and Lockheed are exploring world-wide markets, particularly the large number of operators who are currently flying C-130 aircraft. In the event of an order production would start in 1986 with deliveries in 1989.

CONTRACTOR
GEC Avionics, Elstree Way, Borehamwood, Hertfordshire WD6 1RX, England.

5612.353
SKYRANGER AIRBORNE RADAR

Skyranger is a new, lightweight airborne weapon control radar developed for light fighter and light attack aircraft and with the retrofit market very much in mind. It consists of three main units: antenna, transmitter/receiver and signal processor/power supply, and since the amount of space available for retrofit programmes can often be limited and irregular in shape, the modularity of Skyranger has been established at printed circuit card level. The individual cards can, therefore, be packaged into housings designed for the space available.

Skyranger accepts discrete digital commands from a cockpit-mounted control panel and provides output data in the form of a digital serial link (ARINC 429) to a HUD and other weapon aiming systems. It has two main modes, guns and missiles, the former having a shorter range, wide-angle beam. In the missile mode the radar energy is fed from the feed horn and reflected back from the parabolic antenna in a 6 degree beam with a maximum range of 14 km. For gun attacks, the radar energy is fed directly out from the antenna through a polarised window. This results in an 18 degree beam width and a range of 4·5 km. Minimum range is 300 m for guns and 150 m for missiles, with ranging accuracy in the order of ± 15 m below 3 km and ± 30 m above. Target relative velocities of from −500 to +1000 metres/second may be handled.

The equipment operates in X-band and has five per cent pulse-to-pulse agility. MTBF is given as 200 hours and the equipment contains built-in test systems. The current version has a fixed antenna but a scanning antenna is planned as an option.

CHARACTERISTICS
Frequency: X-band
Range: 15 km for missiles; 5 km for gun operation
Range resolution: 150 m
Pulse-to-pulse agility: 5%

Skyranger radar in format for Asian fighter project

Power requirements: 27 V DC, <50 W; 115 V 400 Hz single phase, <400 VA
Weight
Antenna: 4 kg
Transmitter/receiver: 25 kg
Signal processor/power supply: 8 kg
Total installed weight: 40 kg

STATUS
In production. An Asian customer has ordered over 100 units for its indigenous fighter project

1740.353
SEARCHWATER SURVEILLANCE RADAR (ARI 5980)

Searchwater is the commercial name for the long range maritime surveillance radar which, under the designation of ARI 5980, entered service in 1979 as standard equipment on the Nimrod MR Mk 2 aircraft of the Royal Air Force. During 1982 a slightly modified version of Searchwater was fitted to two Sea King helicopters for AEW use, and is being retrofitted to a number of other Sea Kings.

Claimed as the most advanced deployed maritime patrol radar in the Western world, the performance of Searchwater in terms of detection, information extraction, ergonomics and aircraft compatibility has been achieved by several features:

(1) a frequency-agile radar which uses pulse compression techniques and a pitch and roll stabilised scanning antenna with controllable tilt and automatic sector scan. IFF systems are included for the interrogation of surface vessels and helicopters
(2) a signal processing system which enhances the detection of surface targets (including periscopes) in high sea states at long ranges. Plan corrected presentation and classification of targets and transponder returns are eased by an integrating scan converter. The single radar observer is presented with a selection of bright flicker-free TV-type PPI, B-scope and A-scope displays in a variety of interactive operating modes. Weather radar and navigation facilities are provided within the system
(3) a real-time digital computer which continuously and automatically tracks, stores and analyses classification data on a multiplicity of targets at the same time. Built-in test equipment provides automatic detection and diagnosis of faults
(4) a compact heat extraction system for the radar transmitter, based on the use of fluorocarbon PP3.

These facilities enable patrol aircraft to operate effectively in a 'stand-off' mode out to ranges beyond the surface horizon and avoids the need to overfly the target for visual confirmation. They also provide 'over-the-horizon' targetting data for anti-ship weapons such as Harpoon, Sea Eagle, etc.

All units are designed on a modular basis, with the interface and mechanical construction optimised for ease of fault location and replacement. Major units are designed to be functionally self-contained as far as possible with a minimum of inter-connections to other parts of the system. Extensive use is made of hybrid and integrated circuit micro electronic techniques.

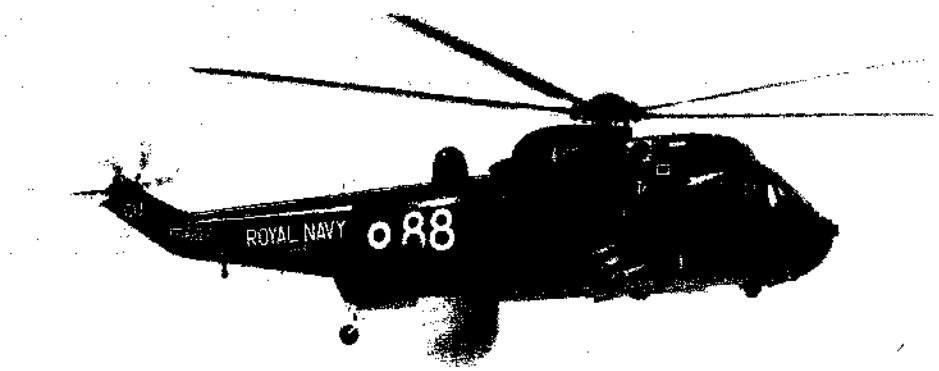
The radar system and its services consist of separate line-replaceable units, most of which contain built-in test equipment which is connected to a central processing and display unit at the operator's position. The radar is controlled by a single operator using separate control panels arranged around the display screen.

The transmitter uses solid-state frequency generators and mixers, followed by two cascaded

Radar operator at the Searchwater display console during flying trials with the Nimrod Mk 2 aircraft

TWTs. A fluorocarbon liquid cooling system is used.

The scanner, which transmits and receives both radar and IFF signals, uses a reflector of lightweight construction based upon resin-bonded carbon-fibre techniques. Control of the pitch, roll and azimuth axes is effected by hydraulic servo mechanism. Surface acoustic wave technology is employed in the pulse compression system.



DEVELOPMENT

The entire Nimrod fleet is due to complete conversion by the mid-1980s. Further improvements in Searchwater performance are being developed to counter increasing threats in the maritime scenario. The US Navy has also finished a series of operational trials with Searchwater fitted in a P-3B Orion maritime surveillance aircraft for possible retrofit into a number of these aircraft for long range target surveillance.

As a result of lessons learned during the Falklands campaign in 1982, Searchwater has been fitted to two Sea King helicopters for trials as an AEW system. These trials have proved successful and the RN will operate a flight of three Sea Kings, fitted with Searchwater, on each of its carriers. The equipment is housed in a retractable dome and only minor hardware changes were necessary for its adoption into this new role.

STATUS

In service. Contracts totalling over £100 million have been placed for Searchwater radars. These contracts cover both the standard reconnaissance radar and the AEW version, and include a £13 million order from the Spanish Navy for the AEW version in its SH3D helicopters. Deliveries of the AEW version began in mid-1984. In May 1985, a £6 million contract was received from the UK MoD to develop and supply a colour display for the Nimrod version.

SKYMASTER MULTI-ROLE AIRBORNE RADAR

Skymaster is an I-band multi-role airborne radar system designed to carry out early warning, maritime reconnaissance and battlefield surveillance. In the AEW role it provides automatic detection and tracking of airborne targets with control of airborne interceptions. Three operational modes are incorporated for long range detection of high- and low-level and all altitude targets. In the reconnaissance and surveillance roles, Skymaster will carry out long range detection of surface vessels and battlefield targets, with over-the-horizon targeting.

The radar system employs an I-band, travelling wave tube transmitter and a fully stabilised antenna giving a narrow beam 360 degree search with automatic sector scan. Track-while-scan features are included and enable the operator to track specific returns while the radar continues to scan for other targets. A multi-colour TV display, touch sensitive plasma control panel and a ground stabilised or rolling map are also provided.

STATUS

In development. Scheduled for flight trials in late 1985.

Thorn EMI Electronics, Radar Division, Dawley Road, Hayes, Middlesex UB3 1HN, England.

3310.353

ARI 5983 AIRCRAFT TRANSPONDER

The ARI 5983 transponder is used in RN helicopters operating beyond visual range of their parent or co-operating ships to provide a means of enabling interrogation by normal primary radars aboard the ships. This provides navigational assistance, enhances ship's radar range performance and gives an identification facility in the course of patrol, ASW, and sonar operations involving ships and helicopters.

The equipment operates at frequencies in the I-band and consists of two units, transponder and control unit. These operate in conjunction with two antennas mounted on the exterior of the helicopter.

The transponder receives interrogating signals, via the antenna, from pulse radars at any frequency in two bands, 100 MHz wide. On the receipt of such interrogation the transponder will transmit a reply at a closely controlled fixed frequency in the same region. This will be either a single RF pulse, which provides enhancement of the radar return, or a coded group of up to six pulses which provide identification. Sixteen different reply codes are available. These facilities may be selected by the operator at the transponder control unit.

Reception and transmission can take place via either of two antennas, the required antenna being selected by means of an RF switch in the transponder which in turn is controlled from the control unit. Another switch causes a reduction of the transmitted power of approximately 11 dB. The equipment is arranged so that it will be suppressed during the operation of other 3 cm equipment in the aircraft. Similarly, a suppression pulse is fed to other 3 cm equipments when the transponder is replying.

Each transponder can transmit a choice of differently coded replies, selected by the operator simply setting a switch on the operator's control unit. A self-test generates an interrogate signal which is fed into the system input and if the transponder is functioning correctly a green acceptance lamp is illuminated.

The same basic transponder design can have several forms. For example, the system can be designed so that it requires double or multiple pulse interrogation to provide a reply selectively where there are many interrogating radars (such as in a harbour or other busy area). Where there are few radar-bearing vessels, a single pulse is usually sufficient.

CHARACTERISTICS

Transponder: I-band
Receiver frequency: 2 bands, centre $F_1 \pm 85$ MHz
Bandwidth: ±50 MHz
Sensitivity: –93 dBW sufficient to trigger reply
Transmitter frequency: $F_2 \pm 7$ MHz
Output power: 135 W minimum to 300 W max peak
Pulse duration: 0·4 μs ± 0·1 μs
Reply code: 6-pulse code, 16 settings, single-pulse reply capability
Pulse spacing: 2·9 μs nominal
Duty cycle: 0·005 max
Weight: 2·5 kg

STATUS

In production for the RN. Fittings include current types such as the Lynx and the Sea Harrier. Ten sets have been supplied to the Royal Marine helicopter squadron, the system was also fitted in RAF Harriers for the Falklands campaign.

See also transponder reply receiver RRB (**3487.253**) in the Naval Radar section of this volume.

IFF 2720 AIRBORNE TRANSPONDER

The Cossor IFF 2720 is a general-purpose secondary surveillance radar transponder which is now in service with all types of aircraft from helicopters to interceptors. The equipment is housed within a ⅜ ATR case size and provides 4096 reply code capability on all modes 1, 2, 3/A, B, and with 2048 codes on mode C. The basic equipment operates, without the need for cooling air or pressurisation, up to an altitude of over 15 000 m. For operation above this altitude a pressurised version is available.

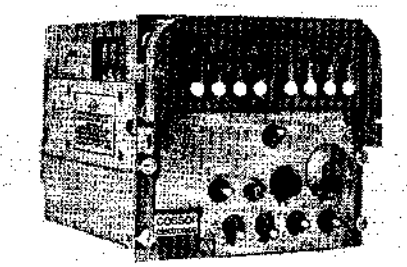
The complete equipment consists of the type 2720 transponder with an IFF 2743 control unit. Single or dual antenna installations can be provided, in the latter case an automatic antenna switch is available. Electronic warfare provisions include resistance to CW, MCW, and pulse jamming, sidelobe rate limiting, short pulse and spurious interference protection, single pulse rejection and long pulse discrimination.

CHARACTERISTICS
Transmitter frequency: 1090 MHz
Transmitter power: 27 dBW (500 W)
Receiver frequency: 1030 MHz
Sensitivity: -76 dBm
Dynamic range: ≥50 dB
Sidelobe suppression: 3 pulse
Low sensitivity reduction: 14 dBm
Dimensions: 90 × 194 × 314 mm
Weight: 4·6 kg
IFF 2723 control unit: 146 × 95 × 76 mm; 0·91 kg
IFF 2733 control unit: 146 × 57 × 114 mm; 0·56 kg
STATUS
In quantity production and in service with British and other air forces.
CONTRACTOR
Cossor Electronics Ltd, The Pinnacles, Harlow, Essex CM19 5BB, England.

IFF 2720 airborne transponder showing internal accessibility

5603.353
IFF 2743 ELECTRONIC CONTROL UNIT

The Cossor IFF 2743 is a microprocessor-based digital controller used with IFF 2720 and other transponders. In a panel height of 95 mm, full 4096 code selection on modes 1, 2, 3/A and 3/B, together with height encoding. Emergency and Identification of Position (IP) selection facilities are provided. Code readout is by means of large easy-to-read LED displays. LED dimming is microprocessor controlled and is provided by a flick switch. Code selection is by flick switches, which offer many advantages over older thumbwheel switches.
STATUS
In production for many customers.
CONTRACTOR
Cossor Electronics Ltd, The Pinnacles, Harlow, Essex CM19 5BB, England.



Cossor IFF 2743 control unit

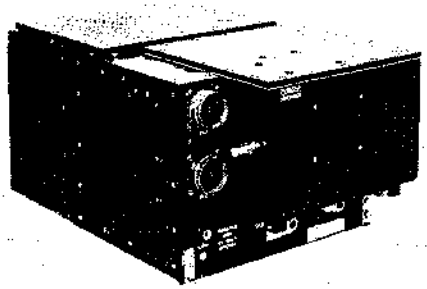
3696.353
IFF 3100 AIRBORNE TRANSPONDER

The Cossor IFF 3100 transponder was designed initially as a compact single unit for cockpit mounting in the Tornado multi-role combat aircraft. Full 4096 code capability on modes 1, 2, 3/A, and B and 2048 codes on mode C are provided together with space for future expansion. Other features of this equipment include ECM/interference protection measures such as long pulse limitation, short pulse rejection, single pulse rejection, and echo suppression.

CHARACTERISTICS
Transmitter frequency: 1090 MHz
Transmitter power output: 27 dBW
Receiver frequency: 1030 MHz
Sensitivity: ≥–76 dBm
Dynamic range: ≥50 dB
Sidelobe suppression: 3 pulse; rate limiting provided
Dimensions: 146 × 132 × 165 mm
Weight: 5·3 kg (max)
STATUS
In production for the Tornado IDS and F2 aircraft.
CONTRACTOR
Cossor Electronics Ltd, The Pinnacles, Harlow, Essex CM19 5BB, England.

Cossor IFF 3100 transponder for RAF Tornado

3697.353
IFF 3500 AIRBORNE INTERROGATOR



The Cossor IFF 3500 airborne interrogator has been designed for use in any type of aircraft, including high-performance interceptors and helicopters. It has also been specified by the UK MoD for use in the AEW Nimrod aircraft, (**1971.353**). It is regarded as having previously been impossible to achieve a narrow beamwidth for airborne IFF systems, but in this equipment Cossor claims to have solved the problem. The company says that techniques have been developed that yield extremely high resolution, even when operating within small radomes. Collaboration with radar manufacturers and aircraft constructors ensures that the system achieves the required performance.

Within a 1 ATR case size, the IFF 3500 contains a transmitter, logarithmic receivers, encoder, decoder, defruiter and improved video processing. Automatic code changing is provided to reduce pilot workload, to eliminate incorrect code selection and to improve the security of the IFF Mk 10A system. The automatic code change units are suitable for use, not only with interrogators but also with transponders. Coding information in either serial or parallel format ensures commonality with all in-service transponders.

Special video processing circuits in IFF 3500 provide an indication if incoming signals are garbled, and echo suppression and multipath suppression circuits reduce the effects of reflections from ground and sea surfaces.

After extensive studies, Cossor rejected such previously used methods known as receiver sidelobe suppression, centre beam marking, sliding window techniques, and others as unsuitable to achieve high bearing resolution. The transmitter employs P2 emphasis to provide antenna beam sharpening. P1 and P3 are transmitted on the antenna sum channel and P2 on the difference channel, and 6 dB of emphasis is available, variable in steps of 3 dB.

CHARACTERISTICS
Transmitter frequency: 1030 ± 0·75 MHz
Power output: P1, P3: 30·5 dBW
P2: 36 +3 -0 dBW selectable -3 and -6 dBW
Receiver frequency: 1090 ± 1·5 MHz
Sensitivity: -80·5 dBm
Dynamic range: 60 dB
Weight: No more than 15·9 kg
STATUS
In production for the UK AEW Nimrod, Phantom and Tornado (ADV) aircraft. Deliveries to the RAF are in progress. In August 1983, Cossor announced a £2·5 million order for a variant, known as IFF 3570, for Sea King AEW helicopters, designed for integration with Searchwater radar.
CONTRACTOR
Cossor Electronics Ltd, The Pinnacles, Harlow, Essex CM19 5BB, England.

Cossor IFF 3500 airborne interrogator designed for use in any class of aircraft and being produced for Tornado (ADV), Phantom and AEW Nimrod for the RAF

4341.353
MAREC II MARITIME RECONNAISSANCE RADAR

The MAREC II (maritime reconnaissance radar) is based on MEL's helicopter systems. Suitable for both fixed-wing aircraft and helicopters it provides a large true-motion plotting table display with 360° azimuth cover out to a range of 250 nautical miles and a pilot's display. As well as general surveillance, operational roles include:

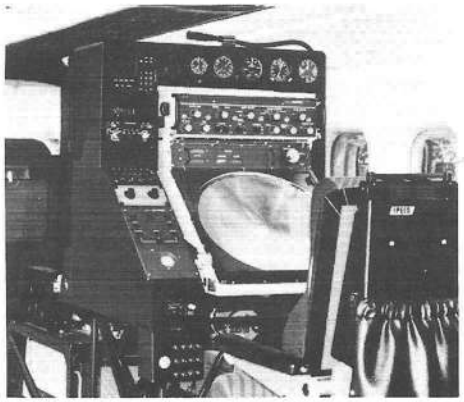
(1) search and rescue
(2) fishery and oil field patrol
(3) ASV
(4) ASW
(5) weapons control.

CHARACTERISTICS
Scan cover: 360° and sector steerable scanning
Plotting table display ranges: 17 - 219 nm
Plotting table: 43 × 43 cm
Pilot's indicator ranges: 10 - 250 nm
Frequency: I-band, 9345 MHz
Power output: 80 kW
Pulse widths: 0·4 and 2·5 μs
PRF: 200 and 400 Hz
Antenna gain: 33·7 dB
Receiver noise factor: 7 dB

The plotting table display is a development of the ARI 5991 display. Information is presented in three

modes, all of which are north stabilised. Centre PPI, ground stabilised or true motion PPI, and ground stabilised with offset. Range and bearing markers are provided for data transfer for weapons control etc. Transparent overlay maps build up a complete record of a sortie with position and movement of targets. The position and track-made-good of the parent aircraft can be displayed even with the radar transmitter OFF. A roller-ball controlled marker gives target range and bearing measurements on LED readouts.

Anti-clutter facilities include a logarithmic receiver, STC and FTC. A colour pilot's display can be provided as a repeat of the main plotting table display or as a weather radar. This display has independent range selection. Built-in test facilities are incorporated.



MAREC II has been selected for various aircraft including the BAe HS748 Coastguarder maritime reconnaissance aircraft. This provides a full 360° scan together with sector scanning which is steerable to any heading and may be controlled in sector width from about 60 to 120°.

The MAREC II system is also included in the proposed BAe HS125 Protector where the antenna is mounted in the droop nose, giving 240° scan coverage.

On the Dornier Do-128-6 the installation design locates the antenna beneath the fuselage to provide full 360° scanning. MAREC II has also been ordered for 36 Dornier Do228 aircraft of the Indian Coastguard. A series of trials by the French Navy with the system installed on the Skyship 600 airship have been completed.

CONTRACTOR

MEL, Manor Royal, Crawley, Sussex RH10 2PZ, England.

MAREC II installed in an Indian Coastguard Do228 aircraft

ASR 360 AIRBORNE SURVEILLANCE RADAR

The ASR 360 is an X-band radar designed for maritime surveillance in small to medium size low performance fixed-wing aircraft and medium size helicopters. It is based on the Racal standard range of solid-state marine radars which are currently in service with many naval forces and merchant ships throughout the world. The system has now been adapted for airborne use and consists of three main units: antenna and gear box, transmitter/receiver, true motion display.

The antenna unit consists of the antenna itself, which is a centre fed slotted waveguide radiator with an aperture of 30 inches (76 cm), and the necessary gearing and drive. The antenna rotates at 23 rpm around a coaxial feed which runs concentrically through the main gear wheel, and is coupled into the waveguide between the magnetron and the transmitter/receiver. The radiation pattern at the 3 dB (half-power) points has a beamwidth of 3° in the horizontal plane, and 27° in the vertical plane for a stable picture under pitch and roll conditions.

The transmitter/receiver unit contains the 25 kW transmitter, duplexer and receiver, together with the power supply and the processing circuits. The transmitter consists of a trigger-controlled thyristor modulator driving a magnetron which produces the short bursts of RF energy. The PRF and the pulse lengths are controlled from the display unit.

The true motion display provides a bright, clear, high-definition picture based on the Clearscan video processing system to give high resolution for small targets to be detected against rain and sea clutter. Eight range scales are provided with range rings at fixed intervals; all of these, with the exception of the longest range scale, can be off-centred.

CHARACTERISTICS

Antenna

Type: Centre-fed slotted waveguide contained in fibreglass radome

Aperture: 760 mm

Rotation speed: 23 rpm

Polarisation: Horizontal

Beamwidth: 3° horizontal; 27° vertical

Transmitter

Peak power: 25 kW nominal

Pulse lengths: 0·05, 0·25, 1 μs

Display

Minimum range: 23 m on 10 m² targets

Discrimination: 9 m on the 0·5 nm scale with 10 m² targets

Range scales: 8 ranges covering 0·5 to 95 nm

STATUS

ASR 360 has been sold to the Royal Navy for use in Jetstream 31 aircraft, the Royal Norwegian Navy's Navajo, the Royal Swedish Air Force, the Finnish Air Force and the Sultanate of Oman for installation in Short Skyvan aircraft.

CONTRACTOR

Racal Avionics Ltd, Burlington House, Burlington Road, New Malden, Surrey KT3 4NW, England.

3710.353

ARI 5991 SEA SEARCHER AIRBORNE RADAR

Sea Searcher ARI 5991 is an airborne radar with primary and secondary radar capability for ASV, ASW, SAR, and other maritime roles. While it was designed for updating RN Sea King helicopters, it is also applicable to other helicopters and fixed-wing aircraft.

The ARI 5991 is a high-power I-band (3 cm) system with selectable pulse widths, 360° scanning and sector scan, plus a multiple TWS facility and digital readout plot extraction. The indicator is a large 43 cm diameter plotting table, with a stabilised true-motion tactical display. It provides presentation of raw radar data, secondary radar and numerous markers, and generates and displays multiple tactical symbols in response to digital position and identification information from a computer store. Optional features include: I-band IFF compatibility; pilot's repeater display; a weather radar mode of operation.

The Sea Searcher antenna is constructed from metal giving a price claimed to be one-tenth of an equivalent unit in carbon-fibre for a weight penalty of only 2 kg. The antenna scans through 360° with an elevation coverage of ±10°. It is available in 24, 36 or 42 inch (610, 914 or 1067 mm) sizes, and can be operated either upright or inverted. The largest version has been selected for the Sea King and will be mounted on top of the fuselage. The antenna can be set to cover a desired sector so that a search can be concentrated in that sector while maintaining radar silence over the remainder.

Among the operational features of the Sea Searcher are the following: direct plotting tactical display; rolling-ball target designation marker; target designation interface with ASM systems, via voice or data link; I-band beacon/transponder capability; and raw radar and synthetic data display. The built-in test equipment is operable in flight, in radar silence if necessary.

In operation the rolling ball is used to set the grid datum initially or to change it in flight and for correction of any accumulated dead-reckoning errors. The navigation data is continuously updated despite changes of radar mode. The tracking processor unit provides automatic plot extraction on two targets simultaneously and maintains an output of their positions on LED readouts. Other LED displays give radar contact position, rolling ball marker position and offset distances. Any of this data can be supplied to on-board weapon systems. The two-target TWS facility allows both a missile in flight and its target to be tracked, enabling mid-course guidance to be transmitted to the weapon.

Display and control section of the MEL Sea Searcher ARI 5991 fitted to RN Sea King helicopters

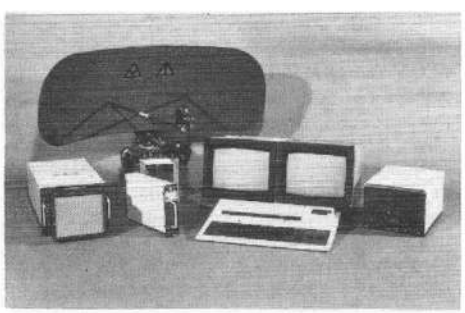
Effective range of the Sea Searcher will be approximately double that of predecessor equipments.

STATUS

In production and in operational service.

CONTRACTOR

MEL, Manor Royal, Crawley, Sussex RH10 2PZ, England.



5625.353

SUPER SEARCHER AIRBORNE RADAR

Super Searcher airborne radar is a lightweight, high performance I-band system designed specifically for the ultimate C³I facility for single operators in complex multi-threat situations. It is optimised for the maritime surveillance, ASW and ASTT scenario but high technology signal processing provides also a functional AEW mode.

Antennas are supplied with a standard 42-inch horizontal aperture, with variants between 35 and 48 inches. The antenna can be mounted in either the dorsal or ventral positions on rotary or fixed-wing aircraft. 14-inch colour or monochrome displays are provided which can be a master/slave configuration or operated singly. They show true motion of centre PPI, and variable sector scan-down to illuminate for missile systems such as Sea Skua.

Super Searcher incorporates three selectable pulses, one of which is stated to be ultra-short providing high definition of small targets in poor weather conditions. Contact recognition is also improved by the use of integrated circuit techniques which clean up the picture. The screen display includes freeze frame and memory storage facilities as well as an MTI. The display operates in either true motion/offset modes or relative motion latitude/longitude lines, grids, previous mission intelligence, etc. It provides accurate and permanent plotting on 32-plus individually vectored point markers. A TWS capability is integral to the system.

Super Searcher airborne radar

Both primary and secondary radar are available, either separately or combined, providing the operator with an integrated display in real-time. A library of symbols, which can be vectored, is also provided.

STATUS

Super Searcher has been selected by the Indian Navy for its Sea King helicopters. Delivery is scheduled to begin in 1986. The Royal Australian Navy is also likely to instal the system in its new S-70B helicopters.

CONTRACTOR

MEL, Manor Royal, Crawley, Sussex RH10 2PZ, England.

4617.353

SKY SEARCHER AIRBORNE AEW RADAR

Sky Searcher is a lightweight airborne early warning radar combined with comprehensive fighter direction capability. The system is designed specifically for maritime aircraft, including helicopters, and is based on the Sea and Super Searcher radars described in **3710.353** and **5625.353**. Commonality with these radars is maintained down to line replaceable units.

The radar provides 360° coverage with selectable scan between 60 and 120°. The configuration allows one man operation during both the search and fighter direction phases for up to three simultaneous intercepts although, should further operators be available the system is capable of providing extra simultaneous intercepts.

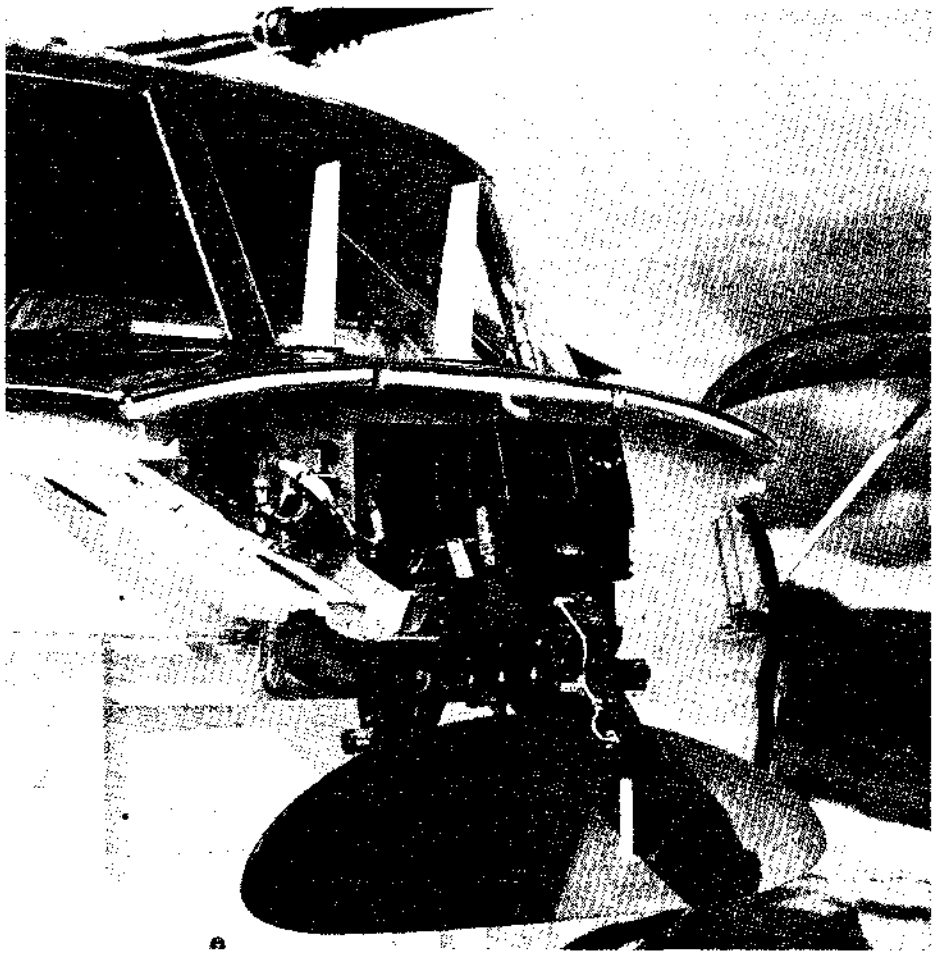
STATUS

In development.

CONTRACTOR

MEL, Manor Royal, Crawley, Sussex RH10 2PZ, England.

1342.353



SEASPRAY HELICOPTER ASV RADAR

Seaspray was specifically developed for, and is fitted to, the RN's Westland Lynx helicopter, in which application it carries the designation ARI 5979. The equipment has been designed to detect and track small high-speed surface craft of the type increasingly used as platforms for anti-shipping missiles. Other possible applications include general maritime surveillance and over-the-horizon targeting.

The system consists of five line replaceable units (LRUs): scanner assembly, transmitter, receiver, processor, and a display and control unit. The system operates at I-band frequencies with a high transmitter power, and employs frequency agility operation. This is employed for reasons of improved detection of targets in sea and weather clutter and ECM conditions, and also improves bearing resolution by reducing the effect of target 'glint'. Built-in test facilities are incorporated.

The scanner LRU is located in a nose radome on the Westland Lynx naval helicopter, and is capable of providing a wide angle search (±90° relative to aircraft heading), or narrow angle search (±30° on selected bearing). The observer is provided with a scan-converted, bright TV-type display unit, on which target range and bearing information are displayed in alpha-numeric form in addition to PPI of radar returns. In addition to the display controls, this unit also carries push-buttons for radar operational mode selection and other functions. The display can also be used for other sensors, such as FLIR and low-light television.

Two advanced models, designated Mks 2 and 3 are available. The Mk 2 incorporates TWS of multiple targets to permit tracking of these on the observer's display. The processor LRU is replaced to allow TWS processing and a control panel is added. The Mk 3 version incorporates 360° scanning (as well as TWS) for use in the control of the Sea Skua missile (**1530.321**), and can be fitted to a variety of helicopters and fixed-wing aircraft, or to small naval vessels for ship-launched missile control.

Seaspray naval helicopter radar system

OPERATION

Eight operational modes are provided as follows:

(1) Search: used for the detection of low-flying aircraft, submarine periscopes, and large and small vessels in bad weather and/or high sea conditions
(2) Weapon systems integration: this employs monopulse tracking techniques and provides guidance for the Sea Skua air-to-surface missile, and accurate target range and bearing inputs for surface-to-surface missiles via a data link
(3) Identification: used in an interrogate mode for target indentification
(4) Navigation: normal operation and by integration with a Racal TANS system
(5) Search and rescue
(6) Station keeping
(7) Weather warning
(8) Let-down and recovery to base in bad visibility.

CHARACTERISTICS

Weight: 140 lb (64 kg)
Antenna dimensions: 686 mm wide × 254 mm deep
Antenna scan: 90° about fore and aft axis

STATUS

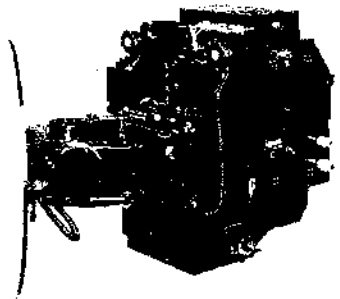
Seaspray is in production and in service with Sea Lynx helicopters of the Royal Navy and seven other countries. Seaspray Mk 3 has been ordered by the West German Navy for Sea King Mk 41 helicopters and another NATO country for Agusta Bell 212 helicopters.

CONTRACTOR

Ferranti Defence Systems Ltd, Ferry Road, Edinburgh EH5 2XS, Scotland.

4615.353

BLUE VIXEN RADAR



Ferranti has been awarded a contract from the UK MoD to develop a new radar system, known as Blue Vixen, for the update programme for Sea Harrier, in conjunction with the fitment of the AMRAAM air-to-air missile, to provide a look-down/shoot-down capability. Like several other Ferranti airborne radars, this system was developed from a private venture programme known as Blue Falcon. The design of Blue Vixen is a multi-mode coherent pulse doppler radar for all weather operation in air-to-air and air-to-surface modes, providing look-up and look-down capability over land and sea against airborne targets. It incorporates high resolution land and sea search modes for navigation and surface target detection, with air-to-surface ranging for weapon delivery. Ericsson Radio Systems of Sweden are working on the antenna and parts of the electronics as a sub-contractor to Ferranti.

STATUS

In development. The system was due on flight trials in late 1985.

CONTRACTOR

Ferranti Defence Systems Ltd, Ferry Road, Edinburgh EH5 2XS, Scotland.

Blue Vixen radar system

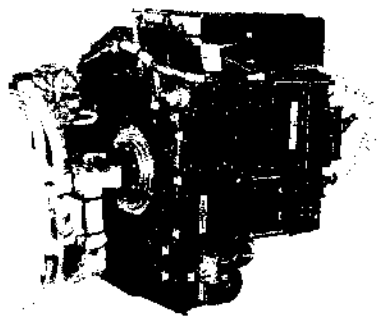
1972.353
BLUE FOX RADAR

Blue Fox is a lightweight, high-performance, radar designed to fulfil the dual role of airborne interception and air-to-surface search and strike. It has been developed primarily for the RN Sea Harrier V/STOL aircraft in which it forms part of a fully-integrated weapon system.

Blue Fox operates in I-band and uses frequency agility to enhance the radar's immunity to ECM, and improve its ability to detect small targets in bad weather or rough sea states.

For air-to-air interception, Blue Fox can be used for lead-pursuit or chase attacks and incorporates a transponder mode for identifying friendly aircraft or ships.

Using a flat aperture, slotted array antenna stabilised in pitch and roll, Blue Fox fits neatly into the nose of the Sea Harrier. Built on the line replacement unit principle, each component part of the radar (transmitter, receiver, processor, amplifier) can be easily checked or removed for servicing independently.



The radar display provides a bright, digital scan-converted picture, which can be used to display other sensors requiring a TV-type display. Superimposed on the display are the flight symbols showing aircraft attitude, speed, heading etc, so that the pilot can monitor and control the aircraft's manoeuvres while using the radar.

STATUS

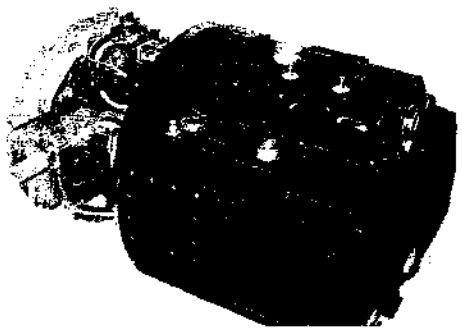
Deliveries to the Royal Navy and Indian Navy are complete. India is likely to order more Sea Harriers equipped with Blue Fox.

CONTRACTOR

Ferranti Defence Systems Ltd, Ferry Road, Edinburgh EH5 2XS, Scotland.

Blue Fox radar showing the distinctive flat aperture antenna

5877.353
RED FOX AIRBORNE RADAR



Red Fox is a lightweight, high performance I-band pulse modulated radar designed to fulfill the roles of airborne interception, air-to-sea surface search and attack plus an overland capability. It is basically a repackaged version of Blue Fox (**1972.353**) which is used in the Royal Navy Sea Harrier FRS MK1. It employs a two plane monopulse flat aperture antenna which is roll stabilised for air-to-surface ranging accuracy. Frequency agility is incorporated for ECM and clutter protection and the complete system is packaged in modular line replacement units for ease of maintenance and handling.

STATUS

Fully developed.

CONTRACTOR

Ferranti Defence Systems Ltd, Ferry Road, Edinburgh EH5 2XS, Scotland.

Red Fox radar system

5685.353
BLUE KESTREL HELICOPTER RADAR

Ferranti is designing and developing a new radar for the Sea King replacement helicopter, the EH-101, for the RN. It is a multi-mode coherent pulse doppler ASV/ASW system, known as Blue Kestrel, with 360° scan and TWS facilities. No other information is available.

STATUS

Blue Kestrel is another development from the Blue Falcon programme. It was due for flight trials in 1985.

CONTRACTOR

Ferranti Defence Systems Ltd, Ferry Road, Edinburgh EH5 2XS, Scotland.

4613.353
CORPS AIRBORNE STAND-OFF RADAR (CASTOR)

The Castor project is a study into the application of airborne radar to long-range battlefield surveillance. It is designed to be operated from a fixed-wing aircraft and a number of these have been deemed suitable. Two systems are currently being evaluated, a Ferranti lightweight I-band search radar, originally intended to be carried by the Lynx helicopter but now installed in an Islander aircraft, and a synthetic aperture radar (SAR) designed by Thorn EMI which has been test flown in a Canberra and has demonstrated a range of 50 km from an altitude of 60 000 feet. Related equipment includes a data link and ground processing facilities incorporating computer interpretation.

Ferranti Castor system mounted in the nose of an Islander aircraft

Originally, battlefield surveillance was intended to be the work of the Army Air Corps, who tended to favour an Islander solution, using either radar system, operating in tandem with the Phoenix remotely piloted vehicle. However, the RAF has realised the value of an SAR system operating a high altitude to provide long range reconnaissance.

DEVELOPMENT

In April 1984, Ferranti was selected by the UK MoD to carry out an engineering definition study. The Ferranti system uses an advanced coherent pulse doppler radar, based on its Blue Falcon development programme, mounted in the nose of a specially modified light aircraft. A modified Pilatus Islander, fitted with a Ferranti radar, was handed over to the MoD in May 1984.

Thorn EMI has been developing SAR techniques since the early 1970s and has been carrying out trials in a Canberra and a Defender version of the Islander aircraft since early 1982. This was privately funded but the company received a £1 million contract from the UK MoD in mid-1983, also to carry out an engineering study and make recommendations.

Studies from both companies have now been completed and evaluated by the UK MoD, which has decided to put out to competitive tender two demonstrator contracts to prove the concepts under review. The concept chosen will need to fulfill the needs of both the RAF and the Army before proceeding beyond the demonstrator phase.

PTR 820 AIRBORNE IFF

This is a lightweight D-band transmitter/receiver unit, with an associated encoder-decoder and control unit, designed to provide certain aircraft with IFF interrogation facilities in modes 1, 2, 3/A, B, C and D. Interlaced mode operation using any three modes is available. Mode selection is from the control unit, or the modulator can be triggered by an external pulse train. Passive decoding is to customer requirements.

Digital shift registers using silicon integrated circuits are employed in the encode and decode sections, eliminating bulky and temperature-dependent delay lines. Solid-state digital defruiters use pulse-to-pulse validation techniques to ensure reliable operation in the presence of PRF jitter. A modular range store is used which can be matched to SSR range and mode requirements. The PTR 820 includes self-test facilities.

DEVELOPMENT

Development was carried out by Plessey under UK Government contract, and was started in 1967. The first prototype was completed in mid-1969.

STATUS

Nimrod maritime aircraft of RAF Strike Command have been equipped with the PTR 820.

CONTRACTOR

The Plessey Co Ltd, Vicarage Lane, Ilford, Essex IG2 6BB, England.

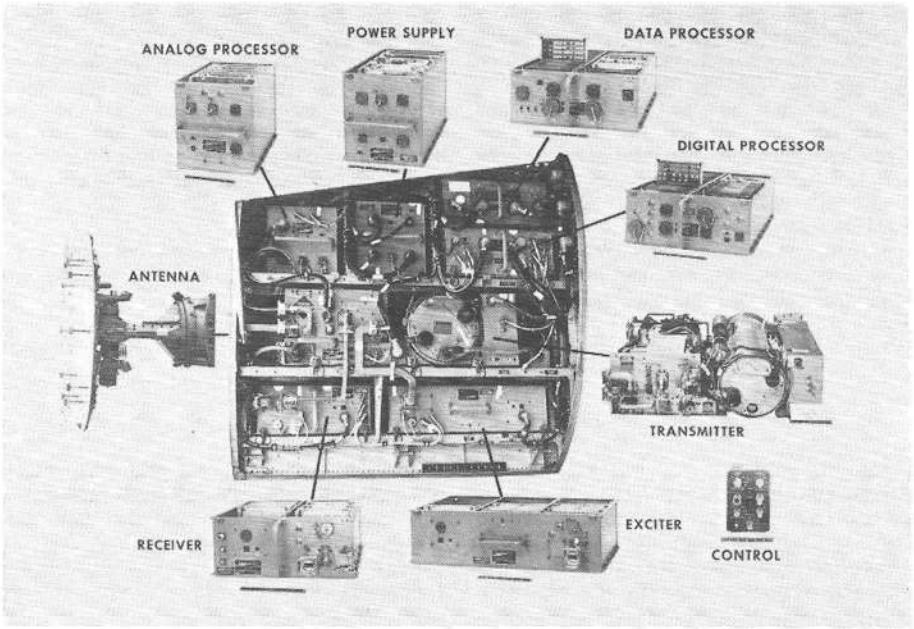
1765.353
AN/APG-63 AIRBORNE RADAR



The APG-63 is an advanced multi-mode nose radar installed in the US Air Force F-15 supersonic fighter aircraft. It is a pulse doppler system thought to operate on a number of (selectable) frequencies in the I/J-band. A gridded TWT transmitter is employed, with digital doppler signal processing, and digital mode/data management. These features permit operation over a wide range of PRFs, pulse widths, and processing modes. The I/J-band antenna is a planar array type, carried on a three-axis gimbal system. Mounted on the same gimbal system are three other antennas, a set of dipoles for IFF, a guard horn, and a null-filling antenna. System weight is 224 kg.

Radar information is digitally processed and there are two types of display employed: one is a small CRT located at the upper left-hand corner of the instrument panel and called the vertical situation display (VSD); the other is the HUD. In general, the VSD is employed for the longer-range, initial stages of an interception, while the HUD is for use during actual engagements or close-in encounters.

The VSD presents the pilot with a 'cleaned' synthetic display of computer-processed radar video data, together with alpha-numerics and symbols.

Controls for the APG-63 are located at three positions in the cockpit. The main control panel is on the console on the left side of the pilot. This console also carries the two throttles and key radar operating controls are located on them. The third location for radar controls is the aircraft control stick.

Mounted on the main control panel are switches for power, frequency channel selection, selection of various antenna scan patterns in azimuth and elevation, range, display control, and mode selector switches. The main mode selector has positions for four air-to-air modes, three air-to-ground modes, and 'beacon' for homing and rendezvous use of the radar. A separate selector switch for the SPL mode has OFF, MAN TRK (manual track), SNIFF (passive, open receiver operation), and FLOOD (probably a target illumination mode). A two-position switch provides for manual or automatic mode control. The latter mode is mostly applicable to the air-to-air roles of the APG-63, and this function enables the pilot to operate the radar according to the changing circumstances of an engagement while keeping his hands on the control stick and throttles. Controls on the latter are the antenna elevation adjuster, target designator button, IFF interrogate button, and the weapon selector. The last of these is a three-position switch that enables the pilot to select either medium- or short-range air-to-air missiles (Sparrow or Sidewinder) or guns. Having made his selection, the information displayed on the VSD and HUD is programmed to the appropriate format automatically and radar scan patterns are similarly adjusted automatically to suit the weapon chosen.

AN/APG-63 radar showing individual sub-systems and their location in the complete equipment

Typical alpha-numeric information that can be presented on the VSD are target altitude, ground-speed, heading, range, aspect angle, closure rate, and *g*-force. Ground-speed and *g*-force data give valuable indications of the kind of target being tracked. A satisfactory response to an IFF interrogation is indicated by a symbol displayed on the VSD.

An automatic acquisition switch on the aircraft control stick enables the pilot to lock the radar on to targets within the 10 nautical mile range. There are three modes: in the boresight mode, the radar locks on to the first target that enters the aircraft boresight, as designated by the gun reticle on the HUD; the second, called super-search, locks the radar on to the first target that comes within the HUD field of view; the third, vertical scan, locks the radar on to the first target that enters an elevation scan pattern normal to the aircraft's lateral axis.

STATUS

The APG-63 is in production. In February 1978 an APG-63 fitted in an F-15 aircraft was used as a test bed for a study intended to increase the accuracy of aircraft armament by means of on-board radar gun direction. Modifications to the radar software improve accuracy at ranges approaching 1200 metres. New software-controlled programmable signal processors were incorporated in new F-15 APG-63 radars in mid-1980 and retrofitting programmes are being implemented for earlier F-15 aircraft. Features include doppler beam-sharpened ground mapping and the ability to discriminate several close formation targets. An upgrade of the AN/APG-63, designated the AN/APG-70 (**5879.353**), is being developed for use in the F-15E and may be retrofitted into F-15C/Ds.

An AN/APG-63 radar, with modifications to incorporate synthetic aperture radar for real-time all-weather high resolution ground mapping and air-to-ground weapons delivery, has been flying in a Hughes/McDonnell Douglas sponsored F-15 advanced fighter capability demonstrator for several years. The modified radar utilises doppler processing to distinguish closely spaced targets within an antenna beamwidth. Aircraft motion provides the doppler spectrum to be processed and the resultant radar picture is synthesised electronically.

Trials of ground mapping have produced results claimed to have a resolution ten times better than that of any previous airborne tactical radar maps. The system produced high resolution ground maps, as if seen from overhead, at ranges in excess of 100 nautical miles and resolution down to 8·5 feet (under three metres).

Evaluation of an APG-63 radar in a US Navy P-3A Orion patrol aircraft, for use against drug smuggling, took place in 1985.

CONTRACTOR

Hughes Aircraft Company, Radar Systems Group, El Segundo, California 90245, USA.

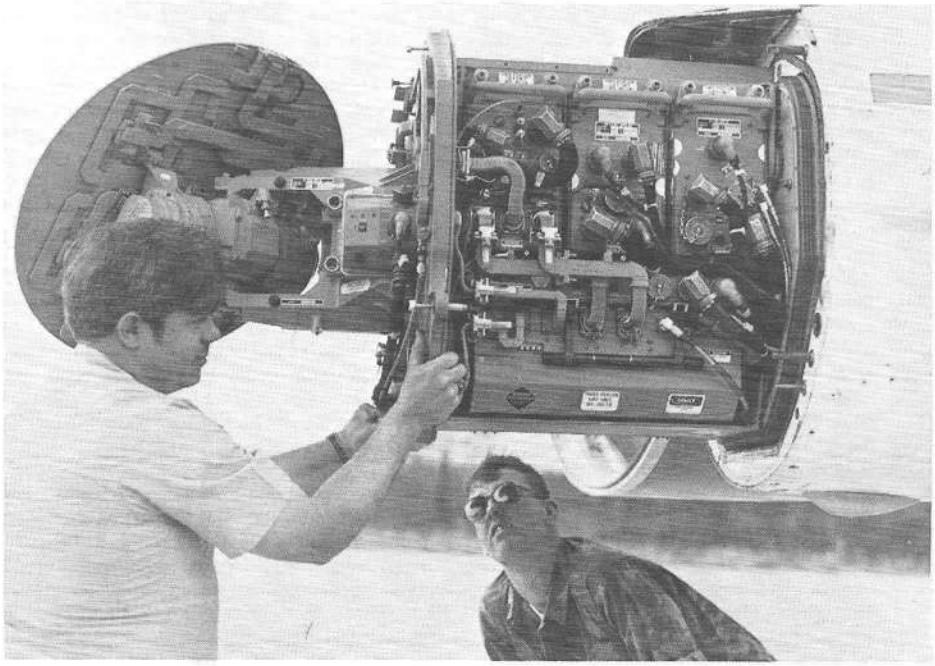
3302.353
AN/APG-65 AIRBORNE RADAR

The APG-65 radar was developed by Hughes for use in the US Navy's F/A-18 Hornet strike fighter aircraft. It is an I/J-band equipment designed as an all-digital, multi-mode system suitable for both air-to-air combat and air-to-ground weapon delivery missions.

It provides radar information for the control of the F/A-18's 20 mm gun, Sparrow and Sidewinder missiles in aerial combat, and a full range of conventional and precision guided weapons in the ground attack role.

In its air-to-air role, the APG-65 presents a 'clean-scope', synthetic scan-converted display against airborne targets in all aspects, all altitudes and through all target manoeuvres. It incorporates complete search, track and air combat mode variations.

The radar includes a velocity search mode to provide maximum detection range capability against nose aspect targets; a range-while-search mode to detect all-aspect targets; a TWS mode which, combined with a future autonomous missile such as AMRAAM, will give the aircraft a launch-and-leave capability; a single target track mode; a gun director mode; and a rapid assessment mode which enables the operator to expand the region centred on a single tracked target, permitting radar separation of closely spaced targets.



Three air combat manoeuvring modes provide automatic target acquisition in various search volumes; the HUD acquisition mode to scan the entire HUD volume and to lock onto the first target located within a specified range; the vertical acquisition mode in which the radar scans vertically in a narrow width volume and automatically acquires the first target found within a specific range; and a boresight acquisition mode to allow the pilot to point the aircraft at the desired target and acquire it automatically. The pilot can step through successive targets until he acquires the one he wants.

Surface attack modes include long range, high resolution surface mapping which, combined with other modes, gives the pilot the ability to detect and track fixed or moving targets on land or sea. The APG-65 radar includes a precision velocity update feature to improve navigational accuracy; a terrain avoidance mode for low-level penetration missions in limited visibility conditions; ground moving target indication/track or fixed target modes which the pilot may select depending on the target tactical situation; air-to-surface ranging; and a sea surface mode which enables the radar to detect ship targets regardless of sea condition.

STATUS

In operational service. The first F/A-18 Hornet squadron was formed at Lemoore Naval Air Station, California on 13 November 1980 to train US Navy and Marine pilots. The first operational squadron to receive the aircraft was at the Marine Corps Air Station, El Toro, California on 7 January 1983. Canada has ordered 138 CF-18 aircraft, and initial deliveries of the AN/APG-65 radars were made in 1982 and are in service. Additional units will be delivered to Canada until 1988. Australia and Spain have also ordered the F/A-18 to serve as their new combat aircraft. The first of 75 Hornets ordered by Australia was delivered in 1984, and Spain has ordered 72, with an option on 12 more, for delivery beginning in 1986. A $46 million contract was received by Hughes in late 1982 for the production of nine test sets for the AN/APG-65 the first of these being delivered in late 1984. Selection of the AN/APG-65 to upgrade the F-4F Phantoms of the Federal Republic of Germany was announced by the German government in early 1985.

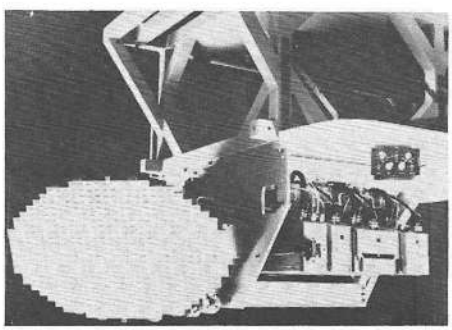
3303.353
AN/APG-66 F-16 RADAR

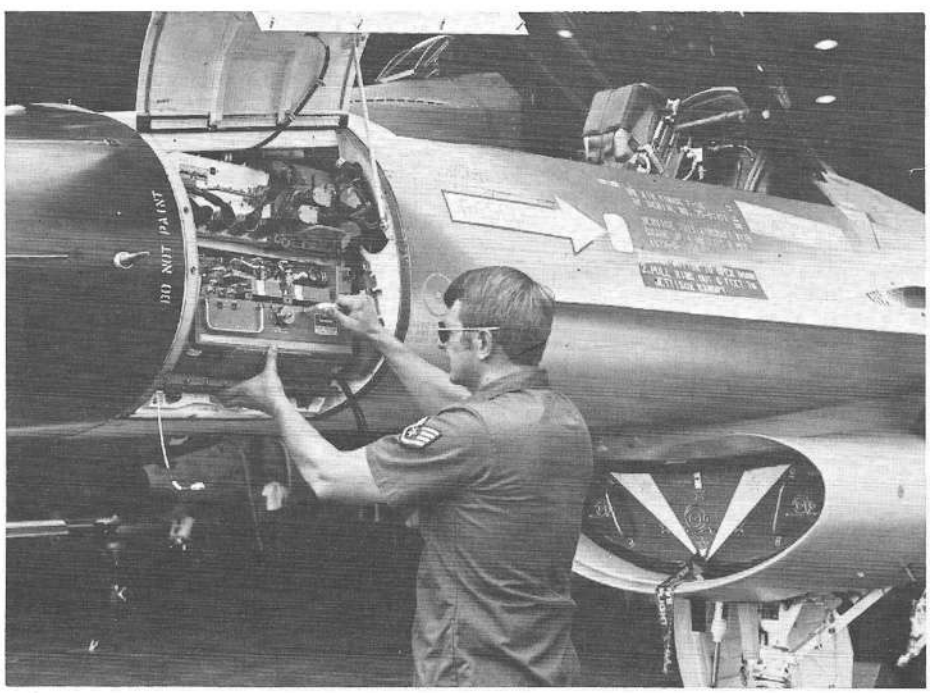
Developed for the US Air Force F-16 multi-role air combat fighter, the F-16 radar is a coherent, I/J-band pulse doppler equipment with low and medium PRFs to permit both look-up and look-down operations. The system comprises six line replaceable units (LRUs): antenna, transmitter, low-power RF unit, digital signal processor, radar computer, and a radar control panel.

The antenna is a slotted-plate planar array on a two-axis gimbal mount, and provides high gain and low sidelobes over all scan angles. An electric drive is used for steering and stabilisation. The entire transmitter is solid-state apart from an air-cooled TWT final output tube. The pilot can select one of four different frequencies, and the transmitter also provides frequency agility for certain air-to-surface modes. The digital signal processor carries out clutter rejection and other radar signal processing.



The radar computer configures the radar system for the various operating modes, directs the signal processor to inject symbols into the video output, performs calculations, routes data to the fire control computer, and interfaces with other aircraft and radar LRUs. It also provides the AIM-9 Sidewinder missile target seeker with a pointing signal.

OPERATION



Air-to-air

In the air-to-air role, the F-16 radar provides all-aspect, all-altitude coverage in four modes of operation.

(1) look-up (up look) for search and tracking above the horizon
(2) look-down (down look) for search and tracking below the horizon
(3) air combat for automatic target acquisition in a dogfight engagement

F-16 radar mounted in ground rig

F-16 aircraft with radar receiver and transmitter in lower section for easy accessibility

(4) auto for automatic selection of up look or down look.

The pilot selects the appropriate operating mode and mode parameters by controls on the radar control panel, or the aircraft's fire control computer automatically selects a radar mode appropriate to the tactical situation. In normal operation, up look or down look is automatically selected depending on the radar sensed absence or presence of clutter. Auto-acquisition is always selected manually by a switch on the throttle grip which immediately configures the entire aircraft for a dogfight engagement.

In either up look or down look, the pilot can select antenna scan limits of ±10, ±30, or ±60° about any centre datum within the maximum ±60° scan limits relative to aircraft centre-line. Elevation can be set at one, two, or four bars. Although actual range performance is dependent on search volume and target size, the radar provides range-scale selections of 10, 20, 40, and 80 nautical miles.

Up look is a low-PRF search and tracking mode designed to increase the detection range in a clutter-free environment. Radar operation is the same as in the down look mode except that it provides about 25 per cent greater detection range at medium altitude.

Down look is a medium-PRF pulse doppler search and tracking mode which provides target detection and acquisition in the presence of clutter. In this mode, low-flying aircraft can be distinguished from ground clutter.

For close-in combat, the pilot can initiate an automatic air combat search and tracking mode by pressing the 'Dogfight' switch on the throttle grip. In this mode, the radar scans the HUD field of view (20 × 20°), automatically acquires the first target it encounters, and then tracks that target. Depending on the geometry of the engagement, the pilot has the option of selecting an alternative search pattern (10 × 40° in elevation) to aid in target acquisition.

When automatic tracking has been initiated, the F-16 radar computer will then provide the AIM-9L Sidewinder missile target seeker with pointing information and will provide the F-16 fire control computer with accurate target data for aircraft envelope calculations. Provisions have been made in the F-16 radar to add, if desired, a missile illuminator signal for the Sparrow (AIM-7) missile.

Air-to-Surface

Eight air-to-surface modes of F-16 radar operation are available:

(1) a real beam mapping mode provides the pilot with an all-weather map of a select ground area ahead of the aircraft. The range scales for the real beam mapping mode are 10, 20, 40 and 80 nautical miles (20, 40, 75 and 150 km)
(2)(3) the pilot can select an expanded real beam map mode for 4:1 expansion of the displayed video centred around the tracking cursors. A doppler beam sharpening mode can be selected for an

improvement in the azimuth resolution of the expanded real beam ground map. These mapping modes can be used for navigation fix-taking using recognisable landmarks, for detection and location of ground targets, and for direct and offset weapon delivery

(4) a scan freeze mode can be selected for quasi-silent mapping operation. In this mode, the ground map is frozen on the display while the radar transmitter is in standby. Cursor movement displays aircraft motion relative to the frozen ground map using information from the F-16 inertial navigation system. Periodically a radar scan can be initiated by the pilot to update the ground map

(5) an air-to-ground ranging mode provides real-time measurement to a designated ground point. The command for this mode comes from the F-16 fire control computer which uses the slant range and rate information for accurate surface weapon delivery

(6) the pilot can also select a beacon mode which provides accurate navigation fix-taking and offset weapon delivery relative to a ground beacon. This mode can also be used for rendezvous with aerial tankers

(7)(8) two sea-surface search modes can be selected by the pilot for detection of ships in a variety of sea states. SEA 1 employs frequency agility techniques to detect stationary and moving ships in conditions up to sea state 4, and in SEA 2 targets can be detected in higher sea states by using a narrow doppler notch filter. This mode can also provide an MTI capability against moving radar-significant ground targets.

Additional radar modes, such as high-resolution synthetic aperture mapping, ground target tracking and terrain following/terrain avoidance, could be added to further increase the radar's existing capability for all-weather strike and reconnaissance.

DEVELOPMENT

General Dynamics Corporation awarded a full-scale development contract to Westinghouse in November 1975. The predecessor to the F-16 radar was the WX-200 model in the WX Series (**1673.353**). A variety of other roles is foreseen.

STATUS

In full production. Co-production contracts have been placed with companies based in European countries procuring the F-16 aircraft. In Belgium, MBLE is building up to 800 radar computers; up to 500 antenna assemblies are being produced in the Netherlands by Signaal; B & W Electronik is manufacturing up to 800 radar control panels in Denmark; and Nera of Norway is providing up to 800 radar equipment racks. A designation, AN/APG-68 (**5881.353**), has been used to describe an uprated version for future derivatives of the F-16 aircraft.

Westinghouse received a $25·2 million US Air Force contract in August 1980 for full scale development of modifications which will enable more effective use of the APG-66 with the Advanced Medium Range Air-to-Air Missile (AMRAAM), and improved ECCM facilities. Deliveries were due to commence in early 1984. This version includes a programmable signal processor and a dual mode transmitter. In January 1982, Westinghouse delivered the 1000th radar system to the US Air Force and in March 1982 the Japanese Air Self-Defence Force selected the AN/APG-66 to replace the AN/APQ-120 in its F-4EJ aircraft. It was announced in January 1982 that the new terrain following and navigation radar for the B-1B bomber, being developed by Westinghouse, would be similar to the AN/APG-66/68. This system, known as AN/APQ-164, is described briefly under entry **4647.353**.

A derivative of the AN/APG-66 and the Grifo airborne radar, developed by FIAR of Italy and known as Altair, is being developed under a co-operative venture by Westinghouse and FIAR.

CONTRACTOR

Westinghouse Defense and Electronic Systems Center, Baltimore, Maryland 21203, USA.

5610.353

AN/APG-67 MULTIMODE AIRBORNE RADAR

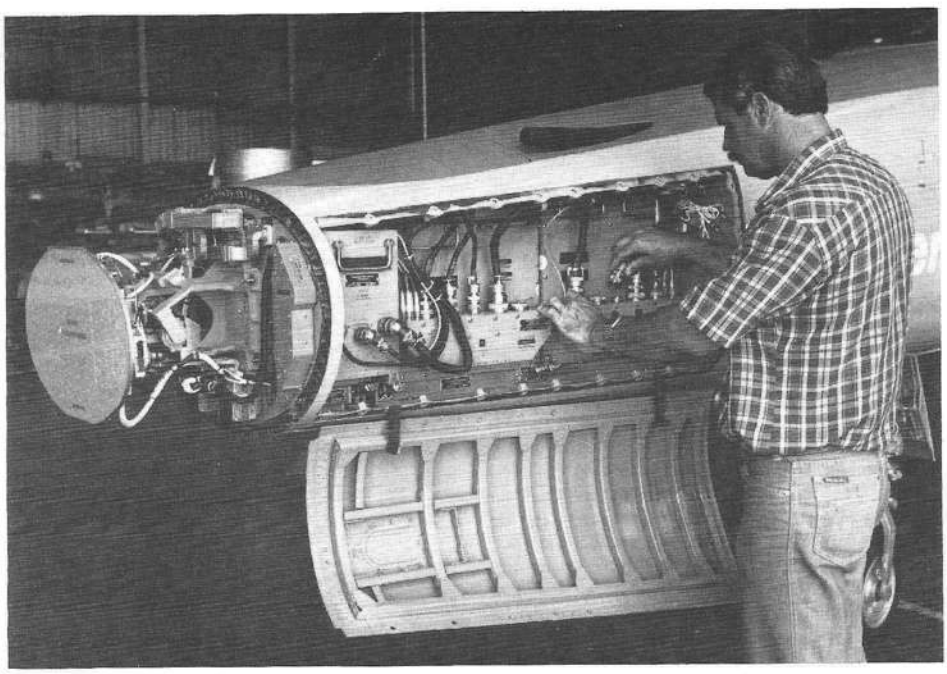
The AN/APG-67 multimode airborne radar is a coherent X-band pulse doppler system which has been designed for both air-to-air and air-to-surface modes for the F-20 Tigershark aircraft. The system comprises four line replaceable units (LRUs): antenna, transmitter, radar target data processor and a radar data computer containing two central processing units (CPUs) with an overall weight of 270 lb (123 kg).

The antenna is a flat plate slotted array which features low sidelobes and full azimuth and elevation monopulse operation. Scan capability covers ±60° in both azimuth and elevation. Variable sector width scans are selectable and elevation search can be accomplished in either 1, 2 or 4 bar modes. The antenna can be either line-of-sight or rate gyro stabilised. The radar receiver is mounted on the antenna assembly and features a low noise front end which gives additional detection range. The receiver consists of two channels which provide the monopulse sum and multiplexed difference channels (azimuth and elevation).

The transmitter is coherent, containing a TWT operating in X-band, and is programmable providing a high degree of mode flexibility. It operates at low, medium and high PRFs and other features include variable output power and pulse widths.

The radar data computer is the heart of the system and contains two CPUs. One CPU handles radar mode control via the internal radar data bus and interfaces with the F-20 mission computer. This CPU also conducts the built-in-test function to determine operational status without the need for special flight line test equipment. The second CPU performs the radar data processing requirements associated with motion compensation and target tracking, and provides raster scan output of the radar data and symbology to the cockpit display. The radar target data processor receives raw data from the receiver and integrates this to establish firm target reports. To achieve its various capabilities, this unit performs a variety of functions including fast Fourier transformation, MTI, pulse compression, motion compensation, variable waveforms and variable bandwidth operation.

OPERATION



The AN/APG-67 is designed for six main missions: supersonic intercept, combat air patrol and air superiority in the air-to-air mode with interdiction, close air support and sea detection in the air-to-surface mode.

Air-to-air

In the air-to-air role the AN/APG-67 provides all-aspect, all-altitude coverage in three main modes of operation:

(1) search and track in the look-up (up look) (above the horizon)

(2) search and track in the look-down (down look) (below the horizon)

AN/APG-67 multimode airborne radar installed in an F-20 Tigershark

(3) automatic acquisition and tracking for air combat.

The pilot selects the appropriate operating mode and mode parameters by controls on the radar control panel or the fire control computer automatically selects a mode appropriate to the tactical situation. In either look-up or look-down modes the pilot can select antenna scan limits of ±10, ±30 or ±60° and elevation can be set at 1, 2 or 4 bars. Range scales are set at 5, 10, 20, 40 and 80 nautical miles although ranges against a typical fighter are 30 nautical miles in the look-up mode and 22 nautical miles for look-down.

In the air combat mode, the radar scans a 20 × 20° field of view and automatically acquires the target. The pilot can also select an alternative vertical scan of 7 × 60°, or boresight. In the track-while-scan mode the radar tracks and displays all aircraft within the search area and gives priority to ten of these on the basis of time-to-go.

Air-to-surface

Six air-to-surface modes are available:

(1) ground mapping using a real beam mapping mode with azimuth scans of ±10, ±30 or ±60° and range scales of 5, 10, 20, 40 and 80 nautical miles

(2) an expanded map mode using doppler beam sharpening techniques to improve resolution for navigation and/or target location

(3) an air-to-ground ranging mode providing real-time measurement to a designated ground point

(4) a freeze mode whereby the ground map is frozen on the display in a quasi-silent operation, with the transmitter on stand-by. Aircraft movement relative to the map is shown from outside information and the map can be updated periodically by operating a radar scan

(5)(6) two sea surface search modes for surface vessel detection. Sea 1 employs frequency agility techniques to detect stationary and moving targets with a detection range of 35 nautical miles for a 50 m² target in sea state 1. Sea 2 uses a coherent MTI mode with a detection range of 30 nautical miles for the same target in sea state 4.

STATUS

All development and ground testing phases had been completed in November 1982, approximately 18 months after commencing the multimode radar programme. Flight testing on a C-54 aircraft continued until mid-1983 with test flying aboard an F-20 Tigershark throughout 1983, 1984 and 1985. The US Air Force is to replace the existing radar on its entire F/FB-111 fleet with a version of the AN/APG-67 as part of a $1·1 billion avionics modernisation programme stretching from 1984 to 1990.

CONTRACTOR

General Electric Company, Aircraft Equipment Division, French Road, Utica, New York 13503, USA.

5881.353
AN/APG-68 AIRBORNE RADAR

The AN/APG-68 is a development based on the AN/APG-66 (**3303.353**) to allow new mode capability such as velocity search, track-while-scan (TWS) (to provide multi-shot AMRAAM compatability), a doppler beam sharpened map and ground moving target indication/tracking. A programmable signal processor is incorporated to enable multimode operation using common digital hardware. A dual-mode transmitter permits optimum radar performance in high, medium and low PRF waveforms.

The transmitter incorporates a dual-mode travelling wave tube which provides the equivalent of two separate transmitters for long-range as well as all-aspect target detection. It provides low peak power/high duty cycle for long range intercepts, medium PRF waveforms with high peak power for all-aspect interceptions, and low PRF for air-to-surface modes. With the TWS facility, the system will automatically track up to ten targets while displaying ten additional targets. This mode will allow simultaneous launch of AMRAAM missiles at multiple targets.

For air-to-surface attack, the AN/APG-68 offers a mode complement that enables successful radar navigation, target acquisition and engagement of both fixed- and moving-targets in all weather conditions. The modes also include improved doppler beam sharpened map and ground track. In the former mode, enhanced azimuth resolution is achieved and an 8:1 beam sharpening mode is available for targets that lie between 5 and 60 degrees off the aircraft's velocity vector. For more precise location of targets or offset aims that fall between 15 and 60 degrees off the velocity vector, a 64:1 mode allows recognition and designation of tactical targets in all weather conditions. Ground moving target indication/tracking modes allow radar tracking of slow speed targets. For range fixed targets, accurate range, bearing and elevation is provided during the run-in. The AN/APG-68 provides radar guidance for the AMRAAM missile.

The multi-function display replaces the radar control panel. The display in the cockpit is used by the pilot to command the desired radar channel mode, range scale, scan width and elevation bar scan. The avionics system can also assume control of the radar functions, depending on the weapons and/or the delivery mode selected.

STATUS

In production for the F-16 C/D aircraft. The first two AN/APG-68 radars were delivered in April 1984.

CONTRACTOR

Westinghouse Defense and Electronic Systems Center, Baltimore, Maryland 21203, USA.

5882.353
AN/APG-69 MULTIMODE AIRBORNE RADAR

The AN/APG-69 is another member of the Emerson multimode radar family and is similar to the AN/APG-159 (**3114.353**) and EC-153 (**3299.353**) systems. It is a modular lightweight pulse doppler equipment which has been designed for flexibility to fit a variety of aircraft and missions. In the air combat modes the AN/APG-69 features boresight, vertical scan and super-search to provide automatic acquisition and track of manoeuvering targets. Air-to-ground ranging and sea surface search modes are provided for air-to-surface weapon deliveries. Advanced versions are available which offer expanded air-to-air modes and a high resolution ground map for precision ground attack.

Although designed for installation in a wide variety of aircraft, the prime target for the AN/APG-69 is for retrofit into existing F-5s which is relatively easy as the system is modular. The manufacturer claims major improvements over the existing F-5 radar systems which include longer detection and acquisition ranges, improved reliability and maintainability, and the ability to look down, detect and track low flying aircraft much more effectively.

CHARACTERISTICS

Frequency: X-band
Peak power: 8·16 kW
Antenna: Flatplate, vertical polarisation, beam-width 4·5° azimuth; 7·7° elevation
Weight: 63 kg

STATUS

The AN/APG-69 has been extensively tested in a USAF F-5F.

CONTRACTOR

Emerson Electric Company, Government and Defense Group, 8100 West Florissant Avenue, St. Louis, Missouri 63136, USA.

5879.353
AN/APG-70 AIRBORNE RADAR

The AN/APG-70 is an upgrade of the AN/APG-63 (**1765.353**) and is intended for the F-15E aircraft. Four advanced design, higher performance line replacement units (LRUs) succeed the previous five units, and two other LRUs are modified. Features in the modified transmitter include high average power gridded TWT, multiple PRFs and increased stability giving increased dynamic range. The newly designed receiver/exciter has increased bandwidth, improved tracking in ECCM, greater sensitivity and longer range detection. Other newly designed units are the radar data processor, programmable signal processor and the analogue signal converter. The antenna and power supply are the same as with the AN/APG-63.

STATUS

In development for the F-15E aircraft and may be retrofitted into the F-15C/Ds in due course. Successful trials with an AN/APG-63 have been carried out to incorporate a synthetic aperture radar for real-time all-weather high resolution ground mapping and display (see **1765.353** STATUS) which can be included in the AN/APG-70 fit.

CONTRACTOR

Hughes Aircraft Company, Radar Systems Group, El Segundo, California 90245, USA.

5880.353
AN/APG-71 AIRBORNE RADAR

The AN/APG-71 is an upgraded version of the AN/AWG-9 airborne weapon control system (**1100.353**) which is in development to satisfy US Navy air superiority requirements. Key elements in the upgrade are a fully programmable processor and a companion radar data processor which replace the AN/AWG-9's four analogue processors and provide digital capability. Digital radar displays are incorporated and the system includes sophisticated ECCM provisions. Detection and tracking ranges have also been increased over those of the AN/AWG-9. Operational details and use are the same as for the AN/AWG-9.

STATUS

In development under a contract from Grumman Aerospace Corporation.

CONTRACTOR

Hughes Aircraft Company, Radar Systems Group, El Segundo, California 90245, USA.

4333.353
TORNADO NOSE RADAR

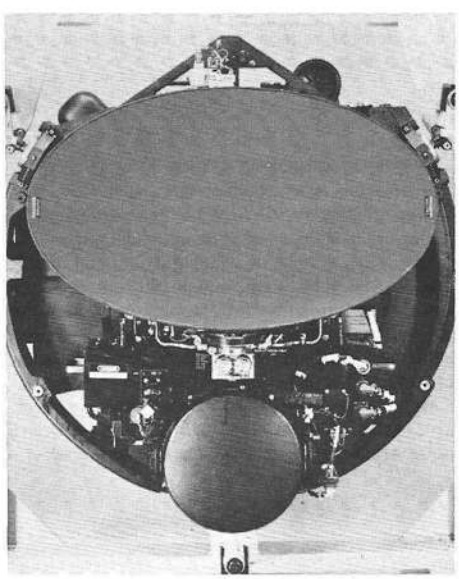
The nose-mounted radar for the interdictor/strike version of the Tornado aircraft has been developed and manufactured by Texas Instruments under contract to Panavia. The radar is essentially two separate systems which share a common mount, power supply and processor/computer. The two systems are the terrain following radar (TFR) and the ground map radar (GMR). Both systems are designed to operate in severe ECM conditions.

The TFR is an advanced terrain following radar enabling the aircraft to make blind, low-level, high speed terrain following attacks using natural geography masking to avoid radar detection.

The GMR is the primary attack sensor for the Tornado and operates in the air-to-ground and air-to-air modes to provide high resolution mapping for navigation update and target identification, air-to-air fire control and air-to-ground fire control. The system enables the pilot to have accurate fixes that update the navigation system, perform air-to-ground ranging and target tracking for weapon delivery, and air-to-air ranging and tracking for self-defence.

The radar also provides obstacle warning above a zero height clearance plane which is horizontally stabilised. Video signals of all obstacles penetrating this clearance are displayed simultaneously with ground map video. Terrain following can be either automatic or manual.

For air-to-ground attack the GMR automatically acquires, locks-on and tracks designated ground targets. In the air-to-air mode, the radar locks on to designated airborne targets in range and angle for weapon delivery.



Both radars incorporate a high degree of advanced technology and feature broadband frequency agility, monopulse (four-lobe for GMR), wide and narrow antenna scan, fast and slow antenna scan and ECCM features. The system operates in the Ku-band.

STATUS

Currently in production for the Tornado interdictor/strike aircraft in the USA and Europe.

CONTRACTOR

Texas Instruments Inc, PO Box 226015, Dallas, Texas 75266, USA.

E-3A (AWACS) RADAR AN/APY-1

The primary radar of the E-3A airborne warning and control system (AWACS) is the Westinghouse AN/APY-1. This radar was specially developed for airborne early warning and control applications and for mounting on a modified Boeing 707-320B airframe. The radar antenna is mounted back-to-back with a complementary IFF/SSR antenna, both of which are contained in a saucer-shaped radome carried above the fuselage of the aircraft. Within the fuselage are radar transmitters, computers, displays and other associated electronics. The radome has a normal rotation rate of six rpm, to give a scan rate of one every ten seconds. Operating frequency of the AN/APY-1 is in the 10 cm wavelength band and there are seven operating modes. On any azimuth scan, the surveillance volume can be divided into as many as 24 sub-sectors, each with its own set of operating modes and conditions. These modes can be accommodated on subsequent scans or re-arranged to vary the type of coverage for any given area of interest, or to accommodate changes in operating conditions. The seven modes are summarised briefly as follows:

(1) pulse doppler non-elevation scan (PDNES): this provides surveillance of aircraft down to the surface using pulse doppler, with narrow doppler filters and a sharp beam, to eliminate ground clutter. Target elevation is not measured
(2) pulse doppler elevation scan (PDES): radar operation in this mode is similar to PDNES, but target elevation is derived by electronic scanning of the beam in the vertical plane
(3) beyond-the-horizon (BTH): the BTH mode uses pulse radar – without doppler – for extended range surveillance where ground clutter is in the horizon shadow
(4) passive: the radar transmitter can be shut down in selected sub-sectors while the receivers continue to process ECM data. A single strobe line passing through the position of each jamming source is generated on the display console
(5) maritime: this involves use of a very short pulse to decrease the size of the sea clutter patch to enhance the detection of moving or stationary surface ships. An adaptive digital processor adjusts automatically to variations in sea clutter, and blanks land returns by means of computer-stored maps of land areas
(6) test/maintenance: control is delegated to the radar technician for maintenance purposes
(7) standby: radar kept in a warmed operational condition, ready for immediate use. Receivers are shut down.

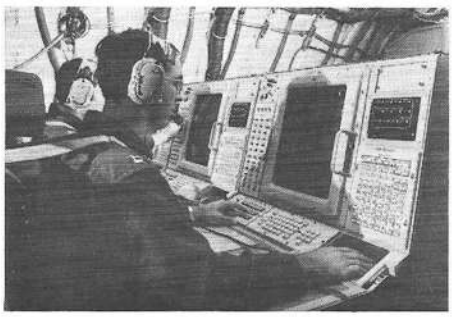
PDES and BTH can be used simultaneously or alone; either or both can be active or passive, as required. PDNES may be used simultaneously with the maritime mode. Blanking commands in BTH and pulse doppler modes can be used in each of the 24 sub-sectors, thus enabling the maximum potential of the system to be concentrated in those sub-sectors of greatest interest.

E-3A Sentry (AWACS) aircraft take-off showing rotating radome of AN/APY-1 early warning radar

New colour displays are to be retrofitted to the US Air Force's AWACS fleet under a $16 million contract awarded to Hazeltine in late 1984. These high resolution displays will equip the aircraft's 14 command and control consoles.

The technical functioning of the AN/APY-1 radar and its associated signal processing was described at some length under this entry number in the 1977 edition of *Jane's Weapon Systems* and other details appeared in earlier editions.

Arrangements have been made to reshape the radar pulse in order not to interfere with certain ground radars used in the European network.



There is also a programme called Salty Net designed to enable AWACS to operate with the 412L, NADGE, and other systems. The NATO AWACS will also interface with 407L in the American Tactical Air Control System.

STATUS

AWACS requirements for CONUS air defence depend on the air defence alert condition. In peace time, a total of five AWACS aircraft would be deployed on a rotational basis, one at each of the US Region operations control centres of the Joint Surveillance System (JSS). Four are in the continental USA, and the fifth in Alaska.

The first AWACS aircraft were delivered to the US Air Force in March 1977. The 552nd AWACS Wing at Tinker Air Force Base became operational in the spring of 1978. All 34 aircraft, now designated the E-3A Sentry, have been delivered to the US Air Force, and are being progressively updated to E-3B and E-3C standard of electronic fit.

In December 1978, the NATO Defence Planning Council, made up of the Defence Ministers of the member nations, gave a go-ahead to acquire a fleet of

Two of the multipurpose consoles aboard the US Air Force AWACS aircraft

18 E-3A aircraft for the NATO AEW requirement. This is an $1800 million undertaking. Boeing is the major contractor for the programme.

In addition to the sub-contract team assisting with the E-3A Sentry, a team of West German and Canadian sub-contractors are engaged on the NATO AEW aircraft. These include AEG-Telefunken, Ulm, which co-operates with Westinghouse in the manufacture of the E-3A radar system. First delivery of a NATO system was made on 22 January 1982 and deliveries were due to continue until mid-1985.

Five E-3A aircraft, also to be fitted with the AN/APY-1 system, have been ordered by the Royal Saudi Air Force, with deliveries commencing in 1985.

AN/APN-215 AIRBORNE RADAR

The latest in a series of airborne terrain mapping and weather radars, the APN-215 has been developed by Bendix from its successful commercial equipment, the RDR1300. The APN-215 is a digital, full-colour, multi-mode lightweight equipment designed for terrain mapping, surface search and weather information. It is designed specifically for such aircraft as heavy twins, transports, etc and has a range of up to 240 nautical miles.

Weather is shown on the display in three discrete colours and when used with other on-board equipment, pictorial navigation data can be superimposed over the weather map, or over the terrain map when the precision mapping mode is used. The system also enables a pilot-programmable check list display of selected flight data to be used, eg terminal areas, airways, beacons, etc.

The complete system comprises a transmitter/receiver, a 30 cm diameter, fully stabilised antenna and a panel mounted colour display unit.

CHARACTERISTICS

System weight
Receiver/transmitter: 6·8 kg
Antenna: 3·6 kg
Display: 5 kg
Mounts: 1·3 kg

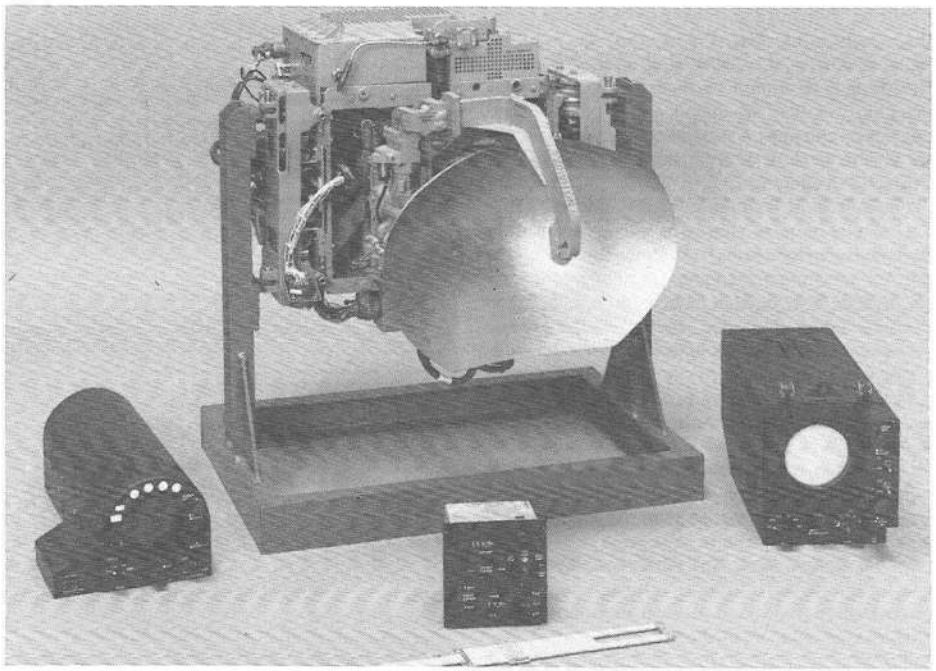
Frequency: 9345 MHz
Power output: 10 kW
Range: 240 nm

STATUS

Fitted in the US Army U-21 and RU-21 aircraft.

CONTRACTOR

Bendix Corporation, Avionics Division, PO Box 9414, Fort Lauderdale, Florida 33310, USA.



1970.353
AN/APQ-99 RADAR

The AN/APQ-99 is a forward-looking radar developed by Texas Instruments for the RF-4 version of the Phantom aircraft. It is an elevation (two-lobe) monopulse system with ground-mapping and terrain-following capabilities. Operation is at J-band frequencies.

STATUS

The AN/APQ-99 has been supplied to the air arms of the United States, Federal Republic of Germany, Iran, and Japan. In March 1985 Texas Instruments received $30 million as part of a $96 million multi-year contract to increase the reliability and maintainability of the AN/APQ-99 for the US Air Force's RF4C aircraft.

Texas Instruments AN/APQ-99 radar

1966.353
AN/APQ-113 RADAR

The APQ-113 radar is a multi-mode nose radar system developed in the early 1960s for the F-111A, C, and E aircraft. The radar operates in the J-band frequency range and provides both air-to-ground and air-to-air facilities. In the air-to-ground mode the system is used for navigational position fixing, all-weather weapon delivery, and air-to-ground ranging. The air-to-air mode is compatible with the AIM-9 Sidewinder missile systems and provides automatic range search, target acquisition, and track, while angle tracking in a TWS mode.

The APQ-113 radar is the first of a family of attack radars which includes the AN/APQ-114, the AN/APQ-144, and the B-1 bomber forward-looking radar.

CHARACTERISTICS
Frequency: 16 - 16·4 GHz
Tuning: Frequency agility/manual tuning
PRF: 337/674/2022 pps
Pulse width: 2·4/1·2/0·4 μs
Noise figure: 10 dB
IF: 40 MHz
Scan width: ±10 or ±45°
Scan speeds: 40 or 74°/s
Range scales: 5, 10, 30, 80, 160 nm
Dynamic range: 80 dB

AN/APQ-113/114 radar installation on the General Dynamics F-111 aircraft

STATUS
In service with the F-111A and F-111E of the US Air Force and the F-111C of the Royal Australian Air Force.

CONTRACTOR
General Electric Company, French Road, Utica, New York 13503, USA.

1967.353
AN/APQ-114 RADAR

The AN/APQ-114 is a member of the APQ-113 family (**1966.353**) and was developed in the mid-1960s specifically for use in the FB-111A strategic bomber. In addition to the basic characteristics of the APQ-113, modifications were incorporated to add the following facilities:
(1) a north-oriented display
(2) beacon mode of operation
(3) automatic photo recording.

CONTRACTOR
General Electric Company, French Road, Utica, New York 13503, USA.

1310.353
AN/APQ-120 FIRE CONTROL RADAR

This is the latest in the APQ series of aircraft fire control radars produced by Westinghouse for the various versions of the F-4 Phantom. In 1959/60 the first of this series, the APQ-72, was delivered to the US Navy in the F-4B which remains a fundamental item in the US Fleet's interceptor and tactical aircraft inventory. Participation by the US Air Force in the Phantom aircraft programme from 1962 onwards resulted in three versions of the initial weapons' control radar - the APQ-100 in the F-4C, APQ-109 in the F-4D, and finally the APQ-120. The various versions which followed the APQ-72 were all the result of advancing performance and air-to-ground operational mode requirements additional to the original air interception functions.

The APQ-120 offers considerable improvements in weight (290 kg), volume, performance, and reliability through the use of solid-state circuitry. It is also designed to operate reliably in close proximity to the nose-gun installation of the F-4E.

STATUS
In production since 1967, nearly 2000 examples of the APQ-120 had been built when production was completed in 1980. It is in the inventory of nine nations. The APQ-120 has now been modified with a new digital computer produced by Westinghouse.

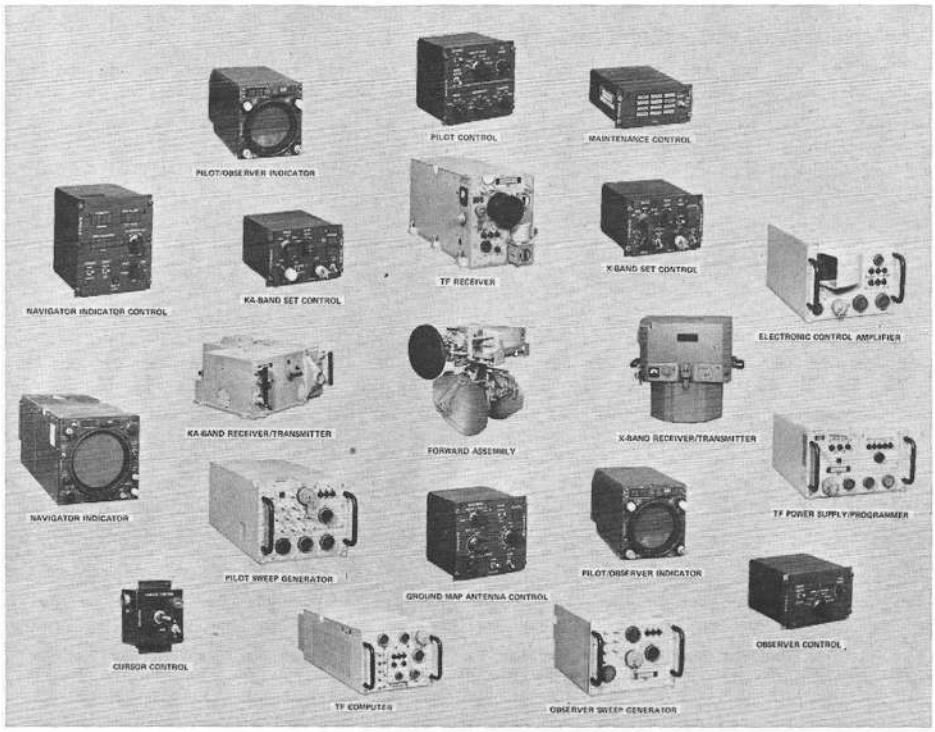
Westinghouse Defense and Electronic Systems Center, Baltimore, Maryland 21203, USA.

1487.353
AN/APQ-122(V) AIRBORNE RADAR

The AN/APQ-122(V) is a dual frequency nose radar developed for use in the US Air Force AWADS (adverse weather aerial delivery system) programme for installation in C-130E transport aircraft. This long range navigation sensor is used for weather avoidance and navigation in supply dropping missions. The equipment provides ground mapping out to more than 200 nautical miles, weather information up to 150 nautical miles and beacon interrogation up to 240 nautical miles when using the I-band frequency radar. K-band frequencies are used when short range high resolution performance and target location are required. In the K-band role the radar provides a high-resolution ground map display to permit target identification and location for position fixing and aerial delivery missions. In this situation, the radar detects and displays a target with a radar cross section of 50 m² while operating in a rainfall environment of 4 mm per hour.

In addition to the dual frequency system designed for AWADS (designated APQ-122(V1)), three other configurations have been developed. A single



frequency (I-band) radar has been designed under the designation AN/APQ-122(V5) as a direct replacement for the AN/APN-59 radar for use in C-130 and E-4B aircraft. Facilities include long range mapping, weather evaluation and avoidance, and beacon rendezvous. A navigation trainer version of the V5, the AN/APQ-122(V7), has been designed, for use in T-43A aircraft.

Another dual frequency radar, the AN/APQ-122(V8) incorporates a terrain following capabililty in the basic radar for use in C-130 aircraft. In addition to the normal ground mapping, weather information and beacon interrogation modes, this configuration provides terrain following, terrain avoidance and cross-scan. In the terrain following mode the radar supplies commands to fly the aircraft at a fixed distance above the terrain while in the terrain avoidance mode the radar displays all terrain at and above the altitude of the aircraft. The cross-scan mode combines the terrain following and avoidance functions on a time-shared basis. The K-band radar supplies the high resolution map display for target identification and location.

In the terrain following, terrain avoidance and cross-scan modes a smaller circular antenna is connected to the I-band receiver/transmitter. Both antennas are mounted on the forward assembly.

STATUS

The APQ-122(V) is being supplied to the US Air Force as well as Austria, the Philippines, Israel, Egypt, Morocco, Portugal, Ecuador, Bolivia, Zaire, Cameroon, Congo, Denmark, Spain, Nigeria, Greece, Iran, Venezuela, and Saudi Arabia. Installations have been carried out in C-130H, RC-135C, RC-135A, KC-135A, RC-130A, and B747 (AABNCP) aircraft.

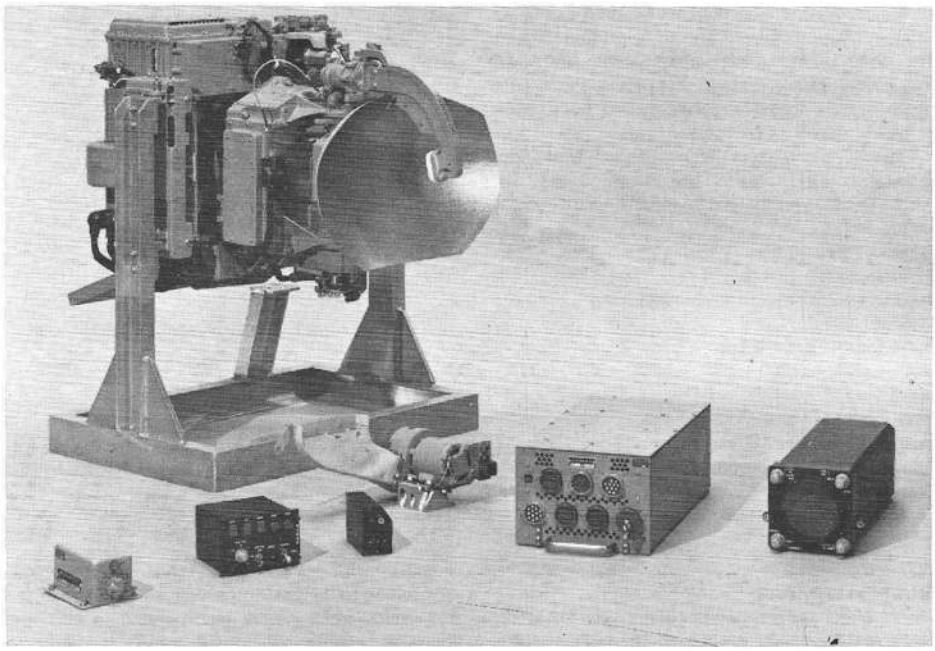
4334.353

AN/APQ-126(V) AIRBORNE NAVIGATION AND ATTACK RADAR



The AN/APQ-126(V) is a forward looking, variable configuration, airborne navigation and attack radar in production for the US Navy A-7E and the US Air Force A-7D aircraft. Operating frequency of the APQ-126(V) is in J-band and its primary functions are ground mapping, air-to-ground ranging and safety of flight (TF/TA). The units of this radar provide the following modes of operation:

(1) ground mapping (GMP/GMS) - pencil-shaped beam
(2) air-to-ground ranging (AGR)
(3) air-to-air boresight ranging
(4) terrain avoidance (TA)
(5) terrain following (TF)
(6) cross-scan terrain following/terrain avoidance (CSTA)
(7) cross-scan terrain following/ground map pencil (CSGMP)
(8) beacon (BCN)
(9) television (TV)
(10) radar homing and warning (RHAW).

The AN/APQ-126(V) also features adverse weather 'look-through' using selectable circular polarisation, slaved antenna pointing in air-to-air ground ranging and variable antenna tilt control which allows the system operator to optimise ground maps displays and highlight targets of interest.

STATUS

The AN/APQ-126(V) has been supplied to the US Navy and Air Force, as well as Greece and Portugal. A variant, known as the AN/APQ-158, has been developed for the HH-53 helicopter (**4336.353**).

1401.353

AN/APQ-137 AIRBORNE RADAR

The APQ-137 is a lightweight K-band high definition radar designed to provide for the detection of ground targets from the air. It has MTI facilities for locating moving targets against background clutter, and the MTI threshold and other parameters can be adjusted during operation.

The APQ-137B is used in pod-mounted form in the US Army SMASH programme (**1400.302** in 1973-74 and earlier editions) in which it is used in conjunction with a forward-looking infra-red sensor on board a number of modified AH-1G Huey Cobra helicopters for night operations.

Operating frequency is 34·5 GHz and peak power is 25 kW, giving a maximum range of about 18 km. Pulse-length is 0·25 μs and the PRF is 4000 pps. It is reported to employ an externally coherent doppler technique of signal processing. Detection speed range of the MTI system is 3 to 30 km/h.

Emerson AN/APQ-137 radar pods

Search and target ranging modes of operation are possible, with a cosecant² beam pattern for the former and a pencil beam for the latter. A 40° sector is scanned during search.

A 13 cm diameter direct view storage tube display is provided, with B-scan presentation of data. Three range scale settings are provided.

DEVELOPMENT

Development of the APQ-137 began as a private venture by Emerson Electric, under the designation Motardes which derives from moving target detection system, but was later supported by the US Army.

CONTRACTOR

Emerson Electric Co, Government and Defense Group, 8100 West Florissant Avenue, St Louis, Missouri 63136, USA.

1488.353

AN/APQ-140 AIRBORNE RADAR

The AN/APQ-140 is a multi-mode phased array forward-looking radar. In place of a mechanically steered reflector, beam steering and formation is accomplished by electronic scanning. This technique offers the possibility of mechanical simplicity allied to greater flexibility and increased capabilities.

Of the two generic types of airborne phased arrays, the APQ-140 is of the reflective variety in which a matrix of individual elements (3800) which are capable of controlled variation of phase are illuminated from the front. The beam formation and steering functions are effected by computer control of the individual elements so that the combined effect on the energy they reflect is the generation of a beam which is capable of being steered at rates impossible by mechanical means.

The phase shifting elements are ferrite rod devices located within control coils, the driver amplifiers for which are also located within each individual element. The amplifiers are solid-state units and a single phase-shift element measures about 12 cm × 16 mm diameter. The complete array of 3800 elements measures approximately 72 cm diameter. The computer used for phase-shift/beam steering is believed to be the Honeywell Alert.

Illumination of the array is by means of a circular ridged horn supported about 75 cm ahead of the phase-shifter mounting. The horn is fed by six waveguides. Linear or circular polarisation of signals can be employed. Operating frequency is in the J-band and it is believed that there are facilities for frequency-agile operation.

CONTRACTOR

Raytheon Company, Missile Systems Division, Hartwell Road, Bedford, Massachusetts 01730, USA.

APQ-140 multi-mode phased array radar test installation on Boeing KC-135 aircraft

---

1968.353

AN/APQ-144 RADAR

The APQ-144 is another in the APQ-113 family of forward radars (**1966.353**) and was developed in the late 1960s for use in the F-111F tactical bomber. The basic features of the APQ-113 and APQ-114 (**1967.353**) radars were retained with a number of performance enhancement features added. The principal among these were the addition of a 0·2 μs pulse width and a 2·5 mile (4 km) display range.

DEVELOPMENT

Programmes for adding DMTI and K-band transmitter facilities have been carried out and successfully flight tested, but these features have not been incorporated in production units. A modified APQ-144 radar was produced in small numbers for the B-1 bomber prototype programme. This was given the designation AN/APQ-163 (**3682.253**).

CONTRACTOR

General Electric Company, French Road, Utica, New York 13503, USA.

4335.353

AN/APQ-146 AIRBORNE RADAR

The AN/APQ-146 is a dual channel, forward looking, multi-mode radar developed for the F-111F. The radar's primary function is to provide proper commands to automatically control the F-111 aircraft at a pre-selected set clearance (altitude) above the terrain. This allows the F-111 to follow a low altitude contour to the earth's surface, thereby avoiding detection. Each channel of the terrain following radar (TFR) system is identical, providing system flexibility and improving overall system reliability and mission success. The units of this radar provide the following modes of operation:

(1) terrain following
(2) situation (terrain avoidance)
(3) ground map.

There are two F-111 attack radar backup modes which may be selected by equipment external to the APQ-146. One is an air-to-ground ranging mode which uses the elevation monopulse resolution improvement capability of the TFR, and is slaved in elevation to an externally generated position taken from the lead-computing optical sight, the azimuth axis being aligned with the drift angle. The other is a ground map backup mode where the TFR transmitter/receiver is routed through the attack antenna.

DEVELOPMENT

Earlier versions of the APQ-146 were the APQ-110 designed for use on the F-111A, F-111C and F-111E aircraft; the APQ-128 designed for use on the F-111D aircraft and the AQP-134 designed for use on the FB-111. In addition the APQ-146 was modified for installation on the B-1 bomber.

AN/APQ-146 airborne radar

CONTRACTOR

Texas Instruments Inc, PO Box 226015, Dallas, Texas 75266, USA.

1567.353

AN/APQ-148/156 MULTI-MODE RADAR

The AN/APQ-148/156 is a J-band airborne multi-mode radar specially developed to combine the functions of two radars previously required by US Navy A-6A all-weather attack aircraft, in a single radar. These two radars are the APQ-92 (search, and terrain avoidance/following) and the APQ-112 (target tracking and ranging). The APQ-156 system is a modification of the APQ-148 to accommodate the addition of a FLIR/laser target recognition attack multi-sensor system to the A-6E aircraft. Functions performed by the APQ-148/156 include:

(1) search
(2) ground mapping
(3) tracking and ranging of fixed or moving targets
(4) terrain avoidance or terrain following
(5) beacon detection and tracking.

The TWS capability provides simultaneous range, azimuth, and evaluation data for weapon delivery. As in other systems, range and azimuth markers must be placed on the target, but elevation data are available on a continuous basis and are derived from a separate phase interferometer array carried below the main scanner dish. The latter has a width of about one metre and is illuminated by a conventional horn feed, to produce a very narrow beam in azimuth.

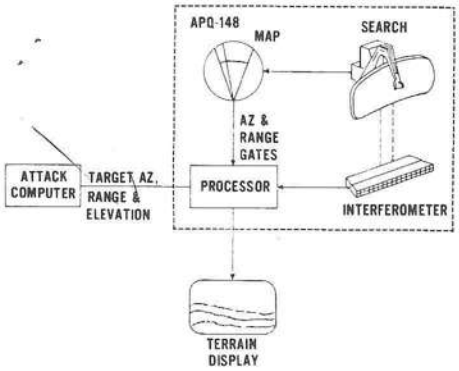
The beam has a cosecant² profile in elevation and this, with the interferometer elevation data provided, eliminates the need for mechanical scanning in the elevation plane. The interferometer array consists of two adjacent rows of 32 horns and moves with the main dish. Energy reflected from ground targets arrives at the upper and lower rows with a time difference which is measured by phase comparison techniques and translated into angular information.

There are two cockpit displays in the A-6E APQ-148 installation: a 5-inch (127 mm) storage tube unit for the pilot, and a 7-inch (178 mm) direct view radar indicator (DVRI) for the bombardier/navigator. In the case of the APQ-156, only the DVRI is provided. Terrain data from the radar system are also presented on a vertical display for the pilot. The system incorporates comprehensive built-in test facilities. System weight is about 500 lb (230 kg).

STATUS

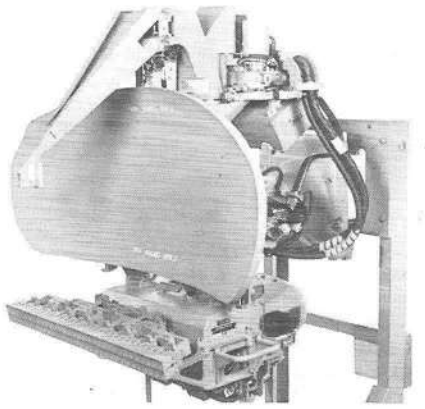
In 1970 Norden received a $5·946 million contract for the delivery of 13 systems, and the first production equipment was handed over in 1971. Approximately 200 systems had been developed by the end of 1975, some of which are being used to retrofit equipment in A-6A aircraft.

In 1978 the manufacturer was awarded a $394 000 contract for the first 18 production MX-9736/APQ



video processor-airborne moving target indicator (AMTI) units for A-6E aircraft. Six pre-production examples were developed in 1976. The AMTI enables the radar to detect moving surface targets in the presence of clutter.

In June 1980 Norden received a $5·2 million US Navy contract for 295 AMTI units, and in July there was a further award of $3·8 million for six complete radars for new aircraft and 56 units for updating AN/APQ-148 radars of older A-6E aircraft to AN/APQ-156 standard. In April 1981 a $15 million contract was received which included updating 39 AN/APQ-148 radars, and a number of new AN/APQ-156 systems.

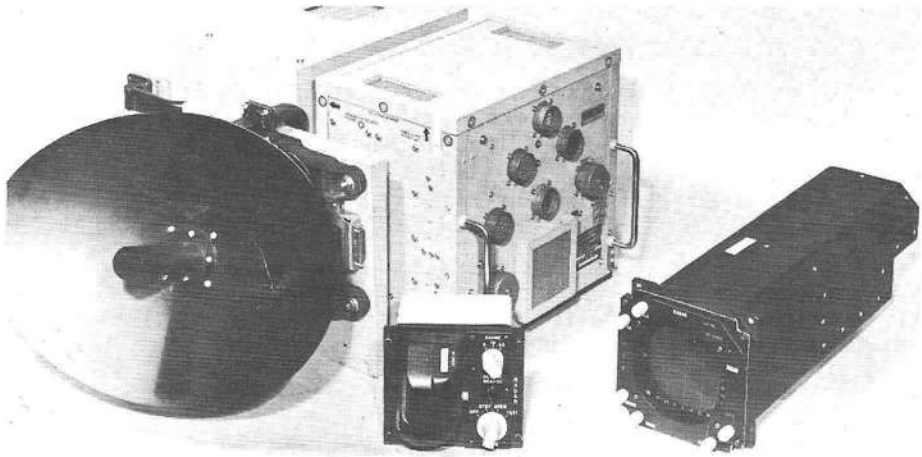


In early 1985, Norden received a contract from Grumman to supply a new radar for the A-6E upgrade programme. The time scale envisages deliveries in late 1986 for flight testing, and up to 300 systems required for new and retrofitted US Navy aircraft. The new radar is designed to have improved detection, tracking and ECCM facilities and easier maintainability.

CONTRACTOR

Norden Systems, United Technologies Corporation, Norden Place, Box 5300, Norwalk 06856, Connecticut, USA.

Schematic diagram of the APQ-148/156 radar. The interferometer generates an elevation-versus-range profile of approaching terrain, this information being presented to the pilot on a separate display to permit 'nap-of-the-earth' flight paths. It also gives the precise elevation angle to the target, the point where azimuth and range cursors intersect. This means that while the radar is providing a clear mapping display, it can also track a moving or stationary target to the instant of weapons release



Norden AN/APQ-148/156 multi-mode radar for A-6E aircraft

1675.353

AN/APQ-153 FIRE CONTROL RADAR

The AN/APQ-153 ASTAR (airborne search target attack radar) is a lightweight search and range tracking radar used aboard F-5E aircraft. This system operates in the I-band frequency range and provides stabilised search, automatic acquisition and target illumination, and automatic target ranging with boresight steering in the missile mode for heads-down launch of the Sidewinder AIM-9 series missiles. In the gunnery modes, the radar automatically provides range and range-rate outputs for targets within the sight lead angle computation envelope.

The system comprises five main units: antenna assembly, receiver/transmitter, radar processor, indicator, and set control. Combined weight is 110 lb (50 kg). The antenna is a parabolic 12 × 16 inch (30 × 40 cm) dish with horizontal polarisation. The indicator uses a 5-inch (127 mm) direct view storage tube and provides a 'B' type search display and a lock-on missile mode display. Built-in test is provided for radar performance verification.

APQ-153 fire control radar

OPERATION

The APQ-153 has the following principal modes of operation:

Search Mode

In search operation, a 7° elevation beamwidth is stepped up 3° at the right azimuth limit and down 3° at the left azimuth limit, providing a two-bar scan coverage of 10° in elevation. This two-bar 10° coverage can be adjusted ±45° in elevation by the pilot. Azimuth search coverage is ±45°. The search pattern is space stabilised for aircraft pitch and roll motion to allow searching a given volume of space and to prevent loss of the target and/or smearing of the display. Range of search coverage extends to 20 nautical miles (37 km).

Boresight Missile Mode

The missile mode enables the pilot to lock-on to targets out to 10 nautical miles (19 km) and provides aircraft steering information to align the acquisition envelope of the AIM-9 missile with the target. Once a target has been acquired a lock-on occurs, and azimuth and elevation steering data are provided on the indicator display in the form of a target steering bar. The aircraft is flown towards the bar to align it within the allowable AIM error circle scribed on the overlay. Missile acquisition occurs when the steering bar is within the allowable AIM error circle and the IN-RANGE indicator is illuminated.

Air-to-Air Gunnery Modes

There are two air-to-air gunnery modes in the APQ-153: dogfight, and AA1/AA2. Both are external commands to the radar. The gunnery modes are heads-up and the radar automatically provides range and range rate information to the sight. Activation of a gunnery mode causes the antenna to align to a boresight in azimuth and a 2·2° down in elevation. The range gate will automatically slew from 500 to 6000 feet at 22 000 feet per second (152 to 1830 m at 6700 m/second). Acquisition is automatic for the first target encountered.

STATUS

Currently in production for use aboard Northrop F-5E aircraft of 14 countries.

CONTRACTOR

Emerson Electronic Co, Government and Defense Group, 8100 West Florissant Avenue, St Louis, Missouri 63136, USA.

3113.353

AN/APQ-157 FIRE CONTROL RADAR

The AN/APQ-157 is a dual control lightweight search and range tracking radar used aboard F-5F aircraft. This system operates in the I/J-band frequency range and provides stabilised search, automatic acquisition and target illumination, and automatic target ranging with boresight steering in the missile mode for heads-down launch of the Sidewinder AIM-9 series missile. In the gunnery modes, the radar automatically provides range and range-rate outputs for targets within the sight lead angle computation envelope.

The system comprises eight main units: radar processor, antenna assembly, receiver/transmitter, front indicator, rear indicator, coupler power supply, and two set controls. Combined weight is 140 lb (64 kg). The indicators use a 5-inch (127 mm) direct view storage tube and provide a 'B' type search display and a lock-on missile mode display. Video trim is provided for harmonisation of video displays. Each display can be adjusted to suit the individual pilot operational preference and will correlate information within 1°. The set controls are transferable for individual cockpit control. The antenna is a parabolic 12 × 16 inch (30 × 40 cm) dish with horizontal polarisation. Built-in test is provided for radar performance verification.

OPERATION

The APQ-157 has the following principal modes of operation:

Search Mode

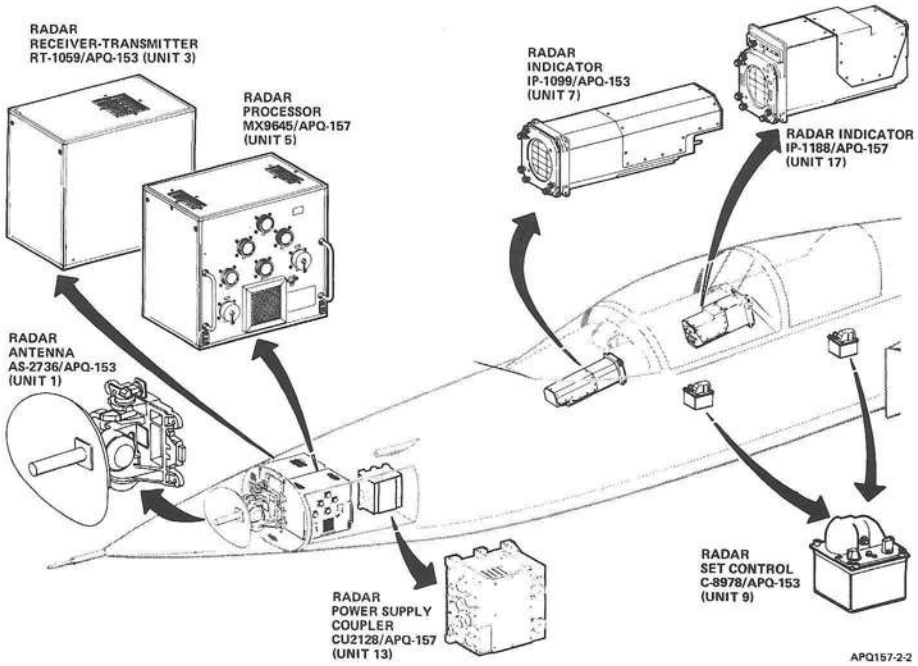
In search operation, a 7° elevation beamwidth is stepped up 3° at the right azimuth limit and down 3° at the left azimuth limit, providing a two-bar scan coverage of 10° in elevation. This two-bar 10° coverage can be adjusted ±45° in elevation by the pilot. Azimuth search coverage is ±45°. The search pattern is space stabilised for aircraft pitch and roll motion to allow searching a given volume of space and to prevent loss of the target and/or smearing of the display. Range of search coverage extends to 20 nautical miles (37 km).

Boresight Missile Mode

The missile mode enables the pilot to lock-on to targets out to 10 nautical miles (19 km) and provides aircraft steering information to align the acquisition envelope of the AIM-9 missile with the target. Once a target has been acquired a lock-on occurs, azimuth and elevation steering are provided on the indicator display in the form of a target steering bar. The aircraft is flown toward the bar to align it within the allowable AIM error circle scribed on the overlay. Missile acquisition occurs when the steering bar is within the allowable AIM error circle and the IN-RANGE indicator is illuminated.

Air-to-Air Gunnery Modes

There are two air-to-air gunnery modes in the APQ-157: dogfight, and AA1/AA2. Both are external commands to the radar. The gunnery modes are heads-up and the radar automatically provides range



and range-rate information to the sight. Activation of a gunnery mode causes the antenna to align to a boresight in azimuth and 4·7° down in elevation. The range gate will automatically slew from 500 to 6000 feet at 22 000 feet per second (152 to 1830 m at 6700 m/s). Acquisition is automatic for the first target encountered.

STATUS

Currently in production for use aboard Northrop F-5F aircraft.

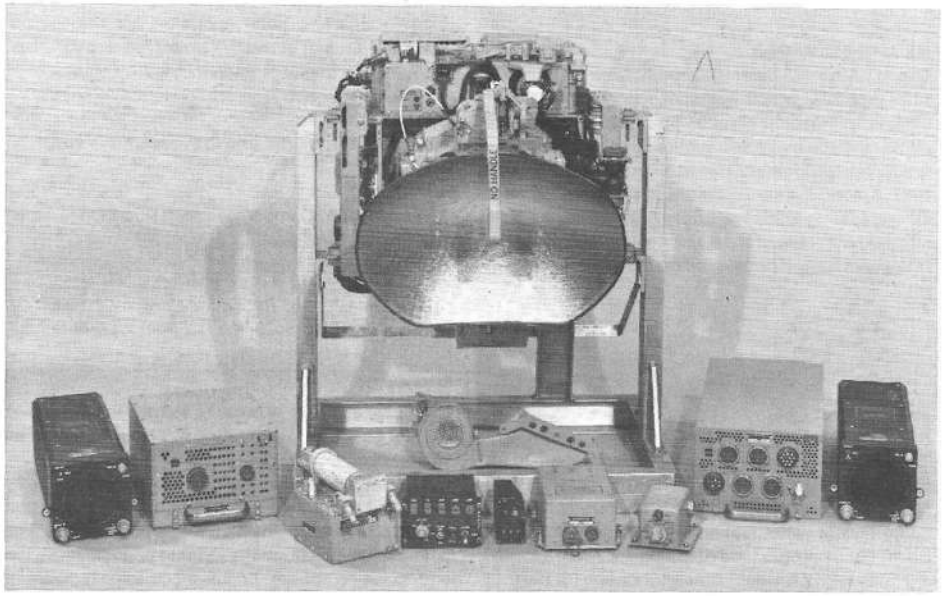
Emerson AN/APQ-157 radar and location of units in F-5F aircraft

4336.353



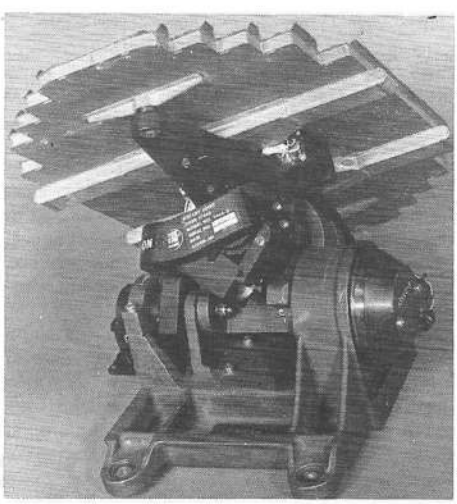
AN/APQ-158 AIRBORNE RADAR

The AN/APQ-158 is a multi-mode forward-looking radar used primarly for terrain following/terrain avoidance at low altitudes, in the Pavelow III Night/Adverse Weather Search and Rescue helicopter, HH-53. The equipment is similar to the AN/APQ-126 but is modified for compatibility with unique helicopter characteristics and Pavelow III mission requirements. The radar contains 15 line-replaceable units which provide the same basic ten modes of operation as detailed for the AN/APQ-126 (**4334.353**).

System upgrades provide this radar with the capability to supply updates in all modes except TF and to perform TF missions over very high clutter areas such as cities.

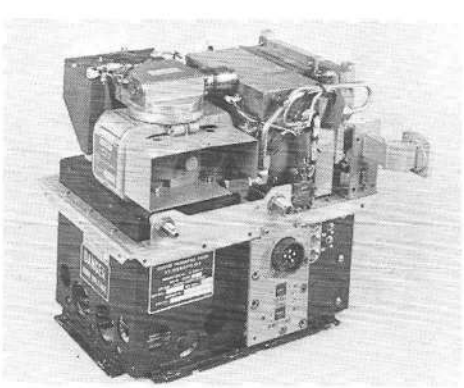
CONTRACTOR

Texas Instruments Inc, PO Box 226015, Dallas, Texas 75266, USA.



AN/APQ-158 airborne multi-mode radar

3114.353



AN/APQ-159 AIRBORNE RADAR

The AN/APQ-159(V)-1 is a lightweight multi-mode forward-looking I/J-band pulse radar used on the F-5E aircraft. This system incorporates a dual PRF frequency agility transmitter and provides stabilised search, automatic and manual acquisition and tracking on and off boresight, and target spotlight with automatic target ranging and tracking for air targets. In the missile mode the radar provides range, range rate and angular position from boresight, for heads-down launch of the Sidewinder AIM-9 series missiles. In the gunnery modes the radar automatically provides range and range-rate outputs for targets within the sight lead angle computation envelope. In the electro-optical (EO) mode the radar displays a normal or expanded image from the AGM-65A Maverick missile, and control is provided for the EO sensor.

The AN/APQ-159(V)-2 is a dual control radar system with characteristics the same as the (V)-1, and is used on the F-5F aircraft. In addition it provides independently selectable radar/EO presentations with transferable functions on the set controls and video indicators.

Planar scanner of Emerson AN/APQ-159

Transmitter/receiver of Emerson AN/APQ-159

The (V)-1 system comprises six main units: antenna assembly, receiver/transmitter, radar processor, signal data converter, set control, and video indicator. Combined weight is 140 lb (64 kg). The antenna is an 11 × 19 inch (28 × 48 cm) planar array with vertical polarisation. The video indicator uses a 5-inch (127 mm) high brightness CRT and provides a radar 'B' type search display, a lock-on missile mode display, and an electro-optic TV image.

The (V)-2 system consists of the (V)-1 units plus the addition of another set control and video indicator. Combined weight is 155 lb (70 kg). Built-in test is provided in both systems for radar performance evaluation and signal data converter and video indicator fault isolation.

There are also (V)-3 and (V)-4 models which have identical performance to the (V)-1 and (V)-2 sets, and which are also configured for single-seat and twin cockpit aircraft types, respectively. The essential difference is in the display arrangements; in place of the 12 × 12 cm rectangular CRTs used for the (V)-1 and (V)-2, the (V)-3 and (V)-4 versions have one or two 8·6 cm circular direct view storage-tube (DVST) displays; and in the absence of EO data presentation facilities, the signal data converter unit is not required in the later two versions of the APQ-159. System weights for the (V)-3 and (V)-4 are 56 kg and 71 kg, respectively.

OPERATION

The APQ-159 has the following principal modes of operation:

Search Mode

In search operation, a 8° elevation beamwidth is

stepped up 3° at the right azimuth limit and down 3° at the left azimuth limit providing a two-bar scan coverage of 11° in elevation. In longer range selection a single bar scan is provided. The antenna elevation coverage is ±45° and is controllable by the pilot. Azimuth search coverage is ±45°. The search pattern is space stabilised for aircraft pitch and roll motion to allow searching a given volume of space and to prevent loss of target. Range of search coverage extends to 40 nautical miles (74 km) with 20, 10, and 5 nautical miles (37, 19, and 9 km) selectable.

Missile Modes

The off boresight missile mode acquisition enables the pilot to lock-on to targets over the full angular coverage out to 10 nautical miles (19 km) and provides steering information to align the acquisition envelope of the AIM-9 missile with the target. A boresight missile mode acquisition is also provided with acquisition to 5 nautical miles (9 km). Once a target has been acquired and lock-on occurs, azimuth and elevation steering data are provided on the video display in the form of a steering cross. The aircraft is flown toward the cross to align it within the allowable AIM error circle. Missile acquisition occurs when the steering bar is within the allowable AIM error circle and the IN-RANGE indicator is illuminated. There is also an auto-acquisition mode for targets within 5 nautical miles range, in which case the pilot may select on boresight missile acquisition (dogfight missile).

Air-to-Air Gunnery Modes

There are two air-to-air gunnery modes in the APQ-159: dogfight guns and AA1/AA2. Both are external commands to the radar. The gunnery modes are heads-up and the radar automatically provides range and range-rate information to the sight. Activation of a gunnery mode causes the antenna to align to boresight and the range gate will automatically sweep from 500 to 6000 feet at 22 000 feet per second (152 to 1830 m at 6700 m/s). Acquisition is automatic for the first target encountered. Lock-on is maintained while switching between the gunnery and missile modes.

Electro-Optical Modes

These are available only with (V)-1 and (V)-2 versions. The CRT indicator units enable the pilot to present raster-type images from the EO sensor of missiles such as the Maverick at either normal or expanded (2:1) scale. The latter presentation can be 'frozen' for an indefinite period to permit a detailed examination of the image displayed. Sixteen shades of grey are available in both scales.

STATUS

Currently in production for use aboard the F-5E, F-5F and F-5G aircraft. To provide additional radar growth for the F-5, Emerson has repacked the EC-153 radar which can retrofit into existing F-5 aircraft with minimum airframe changes.

A version of the AN/APQ-159 for retrofit into MiG 21 fighters has been developed by Emerson. It is believed that the Egyptian Air Force is very interested in this system.

3301.353

AN/APQ-161 RADAR

The APQ-161 is an update of the APS-144 radar (**1968.353**) for use in the PAVE TACK F-111F tactical bomber. Modifications to the radar include a digital scan converter and a dual-tube display which enables the operator to display multi-sensor data simultaneously.

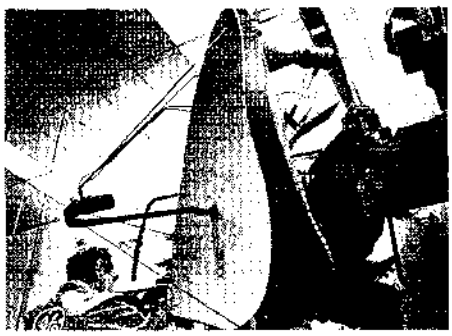
CONTRACTOR

General Electric Company, French Road, Utica, New York 13503, USA.

3682.353

AN/APQ-163 RADAR

The AN/APQ-163 radar is a modification of the APQ-144 (**1968.353**) which was specifically designed for the B-1 supersonic bomber prototype programme. Three of these equipments were supplied and a pre-production programme had been established by mid-1977. Among the modifications to the APQ-144 were an increase in the scan angle from 45 to 60° and nuclear hardening of the system electronics.



Subsequently a doppler beam sharpening mode of synthetic aperture radar operation has undergone flight tests on one of the B-1 prototype aircraft. This operating technique is implemented by means of a coherent-on-receive modification to the APQ-163.

STATUS

Experimental flying and development work is continuing.

CONTRACTOR

General Electric Company, French Road, Utica, New York 13503, USA.

One of the APQ-163 forward-looking radars built by General Electric for the B-1 bomber programme

---

4647.353

AN/APQ-164 AIRBORNE RADAR

The AN/APQ-164 is the airborne radar developed for the US Air Force B-1B aircraft. This radar system combines technology from the F-16 aircraft AN/APG-66/68 system (**3303.353**) and the Electronically Agile Radar (EAR) programme of the US Air Force.

The system provides radar information for the four basic capabilities of navigation, penetration, weapon delivery and ancillary functions such as air refuelling. The primary navigation and weapon delivery mode is based on a high resolution synthetic aperture radar which overcomes the physical constraints of antenna size through software techniques to provide high accuracy target location. The penetration function of the radar includes automatic terrain following and avoidance to enable aircraft to fly at low altitude in all weather conditions.

The AN/APQ-164 consists of a single phased array antenna, two transmitters, two signal processors and a special display for the high resolution imagery. The antenna, which allows the radar to change the shape and position of its beam electronically without mechanical movement of the array, is derived from the EAR programme. This system, plus sophisticated digital signal processing allows simultaneous presentation of multiple modes to the operators. The antenna has over 1000 electronically switched elements. Over 10% of these elements can fail without a noticeable effect on detection performance. The APG-66/68 radar has provided the dual mode transmitter, a programmable signal processor and the modular low power RF which provides all the receiver and stable local oscillator functions.

STATUS

The AN/APQ-164 is in production, the first production system having been delivered to the aircraft manufacturer in February 1984. A BAC 1-11 aircraft has been modified for flight trials of the radar. These trials commenced in July 1984 and were expected to last about one year.

CONTRACTOR

Westinghouse Defense and Electronic Systems Center, Baltimore, Maryland 21203, USA.

1484.353

AN/APS-94F SIDE-LOOKING RADAR

The AN/APS-94F is a side-looking airborne radar carried by US Army OV-1 Mohawk aircraft and used for battlefield and forward area reconnaissance and surveillance. The radar also has survey and mapping applications. The main difference between the AN/APS-94F and earlier versions is the inclusion of an ECCM capability.

The aircraft installation comprises five main sub-assemblies:

(1) antenna
(2) receiver/transmitter
(3) power supply/mount
(4) signal processor
(5) interconnecting box
(6) cockpit complex.

The antenna unit consists of a pod containing two slotted waveguide arrays mounted back-to-back on a gyro-stabilised assembly that pivots at the centre. In flight, the antenna arrays are yaw stabilised to preserve the quality of the radar picture.

The receiver/transmitter is tunable within a portion of the radar band. It is located in the Mohawk equipment bay, with the signal processor and the interconnecting box. The antenna and other units can be simply removed and replaced on the aircraft to permit its use for alternative duties at short notice. Apart from high-power microwave devices, and certain display components, the APS-94F is of solid-state design.

The cockpit complex consists of the units necessary for operator control of the radar, recording and presentation of the data gathered. Two radar area maps are available to the operator. One depicts the entire sensed area, including all detected ground targets as though they are stationary; this is called the fixed target map. The other radar map shows detected moving targets and displays them against a suppressed background map of the area resulting in a

AN/APS-94F side looking radar mounted on a US Army OV-1 Mohawk

moving target map. The radar imagery is developed in the air using a dry silver film process.

An area up to 100 km on each side of the aircraft can be mapped when both of the antenna arrays are in use. Either one can be selected if it is desired to map only one side. A range control determines the width of the target area to be mapped and presented on the photo-radar map. This control has three settings corresponding to 25, 50, and 100 km wide scans by each antenna. When used in conjunction with the antenna switch to select either left, right, or both arrays, maps corresponding to four standard scales can be presented on the display: 1:250 000, 1:500 000, 1:1 million and 1:2 million. Provisions are made for the insertion of fiducial markers and other data.

DEVELOPMENT

The AN/APS-94F was developed under contract to the US Army Electronics and Readiness Command.

STATUS

The AN/APS94F is in service on US Army OV-1D Mohawk reconnaissance aircraft. The AN/APS-94D has also been fitted in an Argus of the Canadian Forces and has been installed in B-26 and P-3 aircraft, and the UH-1 helicopter.

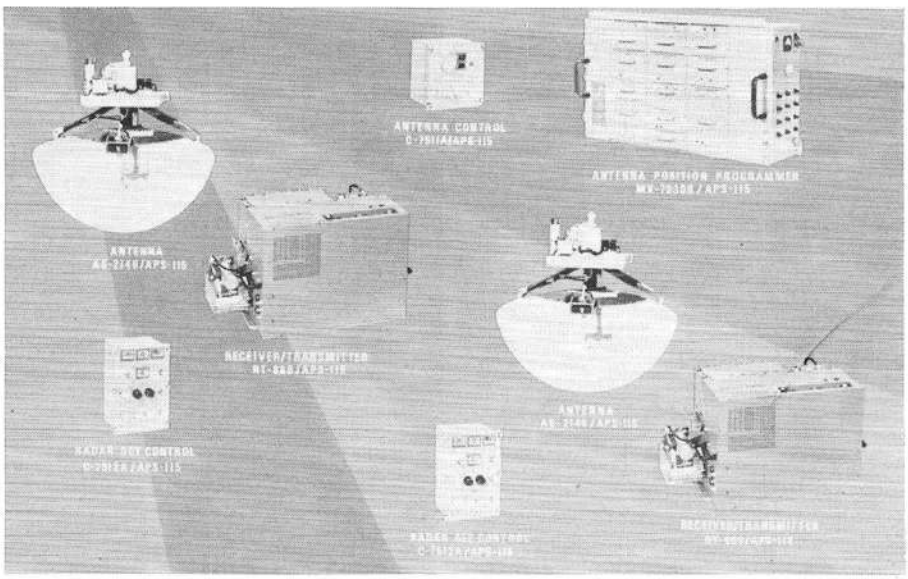
1969.353

AN/APS-115 AIRBORNE RADAR



The AN/APS-115 is one of the Texas Instruments family of airborne search radars, and is an I-band frequency-agile system of modular design. It is employed principally for ASW and maritime roles. The AN/APS-115 is a dual system to provide 360° coverage for the P-3C 'Orion' land-based ASW aircraft. One antenna is mounted in the nose and the other in the rear. In addition to the underslung, stabilised antenna assemblies, the equipment includes dual receiver/transmitters, an antenna position programmer, dual radar set controls and a common antenna control unit.

STATUS

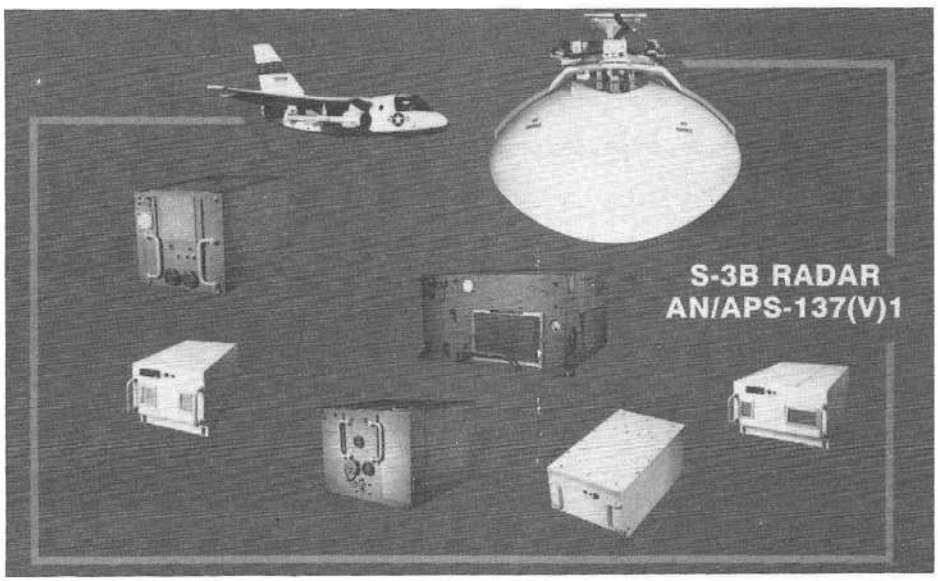
In operational service.

CONTRACTOR

Texas Instruments Inc, PO Box 226015, Dallas, Texas 75266, USA.

AN/APS-115 radar system

1485.353



AN/APS-116/AN/APS-137(V)1 AIRBORNE RADAR

The AN/APS-116 is the ASW search radar currently in use in the US Navy's fleet of S-3A 'Viking' carrier borne ASW aircraft. It was specifically designed for detecting periscope-type targets of limited exposure time in high sea states. Its suitability in meeting the design objectives and requirements has been demonstrated in sea trials and fleet operations. It operates in the I-band with the scanner housed in a nose radome. Principal features include high transmitted energy (obtained from a high-power TWT driving a cross-field amplifier), low-noise receiver, linear FM pulse compression, rapid-scan antenna, scan-to-scan integration for sea clutter decorrelation, and multiple display formats (PPI, B scan, scan converter, raw) available to the sensor stations.

The system is integrated with the aircraft's ASW data processing and display system, and in addition to periscope and other small target detection, it provides mapping, navigation, and general surface vessel detection.

STATUS

The AN/APS-116 is currently being upgraded to the AN/APS-137(V)1 as part of the weapon system improvement programme to upgrade the 'Viking' to the S-3B configuration. The most significant of the radar improvements is the addition of inverse synthetic aperture radar imaging to provide long-range ship classification capabilities. The AN/APS-137(V) is to be fitted to the P-3C aircraft of the US Navy, and is also being considered for the A-6E radar update.

Texas Instruments Inc, PO Box 226015, Dallas, Texas 75266, USA.

1783.353

AN/APS-120 RADAR

The APS-120 radar was installed in the first 33 E-2C aircraft. It operates in conjunction with the OL-93/AP radar detector processor (RDP) and APA-171 antenna group incorporating many of the techniques proven in the APS-111 (XN-1) flight test programme to detect targets at even longer ranges and in more severe clutter environments than the APS-96. An APS-120 improvement programme, known as advanced radar processing sub-system (ARPS), resulted in a new US Navy nomenclature, AN/APS-125, which has now been renamed AN/APS-138. This system is described in entry **1965.353**.

STATUS

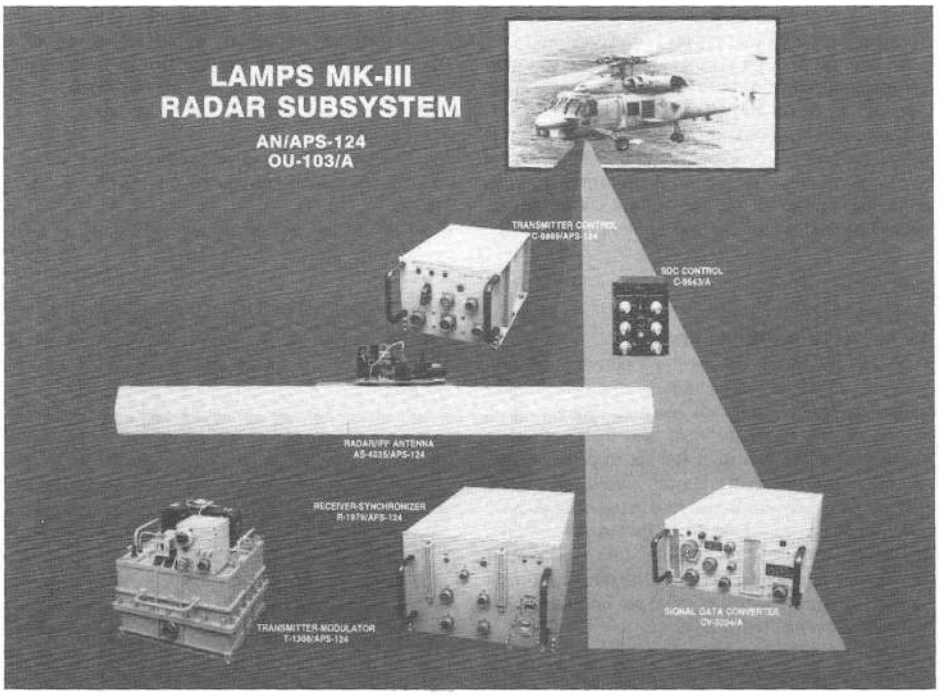
The last production models of the APS-120 and OL-93/AP RDP were delivered in mid-1976. Subsequent production was then devoted to the APS-125. A programme to retrofit existing APS-120 radars to APS-125/138 configuration was completed in 1984.

CONTRACTOR

General Electric Company, French Road, Utica, New York 13503, USA.

3518.353
AN/APS-124 AIRBORNE RADAR

The AN/APS-124 search radar was designed and developed specifically for use in the US Navy SH-60B Seahawk helicopter (also known as LAMPS Mk III). It is specifically designed for helicopter installation featuring a low-profile antenna and radome. Optimum detection of surface targets in high sea states is accomplished by several unique features including fast scan antenna and interface with the auxiliary OU/103 signal data converter (digital scan converter) to achieve scan-to-scan integration.



The system is integrated with a multipurpose display and with the LAMPS data link for display of airborne radar video on board LAMPS equipped ships.

STATUS

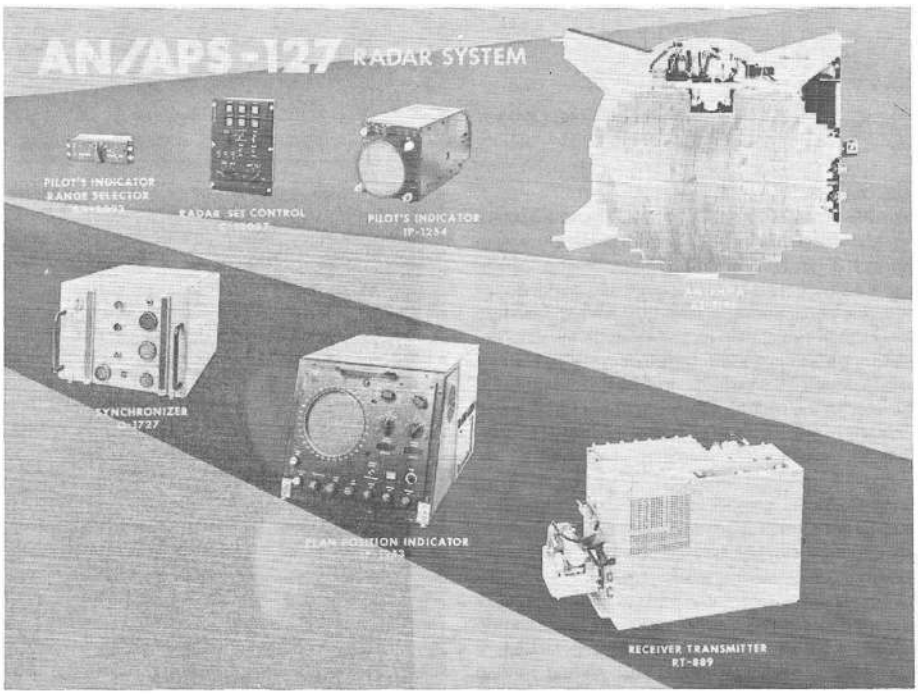
The equipment is currently in main production to support the LAMPS Mk III system production schedule.

CONTRACTOR

Texas Instruments Inc, PO Box 226015, Dallas, Texas 75266, USA.

AN/APS-124 search radar equipment for US Navy LAMPS helicopter

3519.353
AN/APS-127 AIRBORNE RADAR



The AN/APS-127 search radar is produced for the US Coast Guard for use in the Falcon Guardian HU-25A aircraft. The system was developed to support search and rescue missions as well as for enforcement of laws and treaties. A unique feature that characterises the AN/APS-127 is the stabilised, lightweight, high efficiency fast scanning antenna. Scan-to-scan integration is accomplished by interface with separate direct-view storage-tube displays for both the pilot and the surveillance system operator.

STATUS

The equipment is in production for both domestic and international applications.

CONTRACTOR

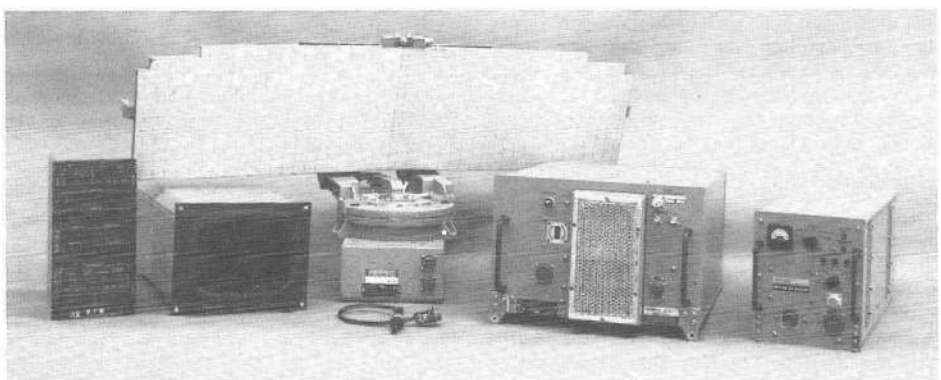
Texas Instruments Inc, PO Box 226015, Dallas, Texas 75266, USA.

AN/APS-127 radar equipment

3132.353
AN/APS-128 MODEL D SURVEILLANCE RADAR

The AN/APS-128 Model D surveillance radar is an all-digital equipment using a scan converter to present data in TV raster format. It contains target enhancement and clutter reduction circuitry consisting of frequency agility, sensitivity time control, CFAR and scan-to-scan integration.

The system consists of a rectangular flat-plate antenna and pedestal, a transmitter/receiver, a radar control unit, a digital scan converter, a trackball or joystick cursor and a bright display. Dual display for cockpit weather presentation is available as well as add-on cabin displays. The system uses fully programmable microprocessor operational features with alpha-numeric and graphic options to meet varied mission requirements. A number of antenna array sizes are available to suit aircraft and radome configurations. An alternative parabolic antenna features a dual-polarisation capability in one moulded dish to provide pencil beam for sea search and shaped beam for mapping.



Target detection of the system are given as:

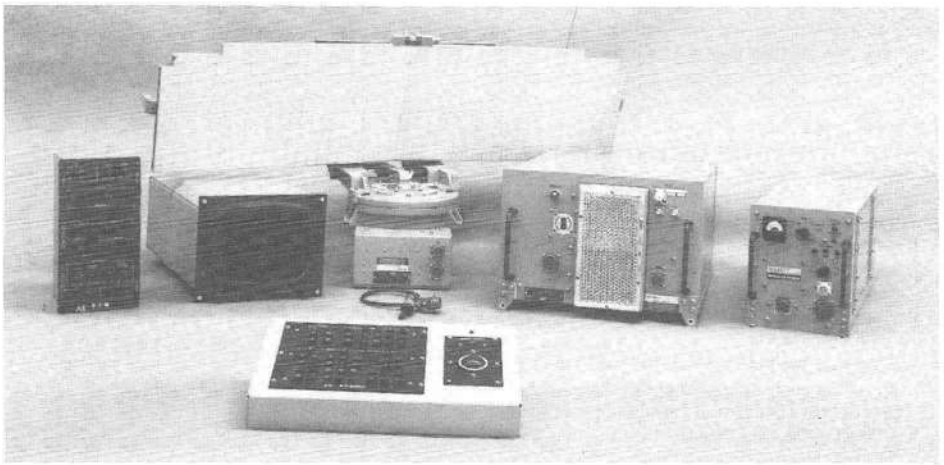
(1) 30 nautical miles on a snorkel or fishing vessel (assumed six metres long), 10 m² cross-section, in sea state 3
(2) 60 nautical miles on a trawler (160 metres long), 150 m² cross-section, in sea state 5
(3) 100 nautical miles on a freighter (360 metres long), 500 m² cross-section, in sea state 5
(4) 120 nautical miles on a tanker (600 metres long), 1000 m² cross-section, in sea state 5.

The system also functions as a weather radar with a range of approximately 200 nautical miles.

CHARACTERISTICS

Frequency: 9375 MHz
Frequency agility: 85 MHz peak/peak
Power output: 100 kW peak
Pulse width: 2·4 and 0·5 μs (0·1 μs pulse compression system optional)
PRF: 400, 1200, 1600 Hz
Noise figure: GAS-FET 3·5 dB low noise RF amplifier
Pulse compression: Retrofit transmitter/receiver to provide linear chirp capability for pulse width of 0·1 μs. Provides detection of 1 - 5 m² targets in heavy sea states

AN/APS-128 Model D airborne surveillance radar



Antenna rotation rate: 15 or 60 rpm continuous. 15 rpm sector scan from 30 - 360° selectable
Bright display: High ambient light, 875 line high resolution
System weight: 91·8 kg (202 lbs) with 8 inch display

STATUS
Over 90 AN/APS-128 systems have been sold worldwide and the radar is operational with the Brazilian Air Force, Chilean Navy, Gabon Air Force, Indonesian Air Force, Japanese Maritime Safety Agency, NASA, Royal Malaysian Air Force, Spanish Air Force, Uruguayan Air Force, Uruguayan Navy and the US Customs Service.
CONTRACTOR
Eaton Corporation, Command Systems Division, 815 Broad Hollow Road, Farmingdale, Long Island, New York 11735, USA.

4612.353
DIGITAL TACTICAL SYSTEM (DITACS) RADAR
The Digital Tactical System (DITACS) radar is a full AN/APS-128 Model D surveillance radar with added tactical sensor capability for enhanced multi-mission applications.

Tactical navigation and sensor plot data are displayed alternately or in combination on a bright display, together with radar target data. Control and management data are stored, recalled and displayed in operator-oriented formats. Both display and radar are under microprocessor control providing bright presentation with alpha-numeric designations, tailored graphic formats and multi-sensor overlays.

Keyset functional firmware is based on specialised mission operational sequences. DITACS requires only the addition of a keyset control panel in hardware, the remaining features being added in software ROM and RAM programming capability. This provides a stand-alone tactical control and display system.
STATUS
DITACS is installed on the Beech multi-mission 200T aircraft and is under development for the Grumman S-2E Tracker aircraft as well as several helicopter installations.

Digital Tactical System (DITACS) radar

Eaton Corporation, Command Systems Division, 815 Broad Hollow Road, Farmingdale, Long Island, New York 11735, USA.

3520.353
AN/APS-130 AIRBORNE RADAR
The AN/APS-130 radar is a variation of the Norden Systems AN/APQ-148 radar system (**1567.353**) in the US Navy A-6E Intruder all-weather attack aircraft. The Intruder is an electronic warfare aircraft and carries no offensive weapons, and therefore the APS-130 uses only the navigational features of the APQ-148. It replaces an older radar system, also supplied by Norden Systems, which was used on the EA-6B.
STATUS
In operational service with the US Navy.
CONTRACTOR
Norden Systems, United Technologies Corporation, Norden Place, Box 5300, Norwalk 06856, Connecticut, USA.

5883.353
AN/APS-131 SIDE-LOOKING RADAR
The AN/APS-131 is a side-looking airborne radar (SLAR) used for the detection of ships and boats, search and rescue, and the detection of oil pollution. The aircraft installation consists of six main sub-assemblies; antenna, receiver/transmitter, synchroniser, amplifier, recorder-processor-viewer and a control unit.

The antenna unit consists of a pod containing two eight-foot (2·44 metre) yaw stabilised, vertically polarised, slotted waveguide arrays mounted back-to-back on a gyro-stabilised assembly that pivots at the centre. The remaining equipment is mounted inside the cabin. The synchroniser provides radar timing and control functions and, based on inputs from the aircraft inertial navigation system, creates latitude and longitude lines for display on the radar imagery. The recorder-processor-viewer contains the components necessary to create the film imagery. Video data is impressed on the film by applying it to two CRTs as the film is pulled across the CRT faces. Typically, each CRT generates an image of the earth's surface on either side of the aircraft. The dry silver film is developed in near real-time.

An area of up to 108 nautical miles on either side of the aircraft can be mapped when both arrays are in use and either can be selected if mapping of only one side is required. A range control determines the width of the target area to be mapped and presented on the photo-radar map. This control has four settings corresponding to 13·5, 27, 54 and 108 nautical mile wide scans by each antenna. When used in conjunction with the antenna switch to select either left, right or both arrays, maps corresponding to four standard scales can be presented on the display: 1:250 000, 1:500 000, 1:1 000 000 and 1:2 000 000. Radar and aircraft operational data is annotated on the film. This data, together with the latitude and longitude printed on the film, helps the measurement of map co-ordinates for any feature observed on the radar image.

AN/APS-131 installed in a US Coast Guard HU 25A aircraft

STATUS
The AN/APS-131 was developed under contract to the US Coast Guard and is in service on HU-25A aircraft. A similar radar, the AN/APS-135 (**5884.353**) is used on the US Coast Guard HC-130s.
CONTRACTOR
Motorola Inc, Government Electronics Group, Radar Operations, 2100 East Elliot Road, Tempe, Arizona 85252, USA.

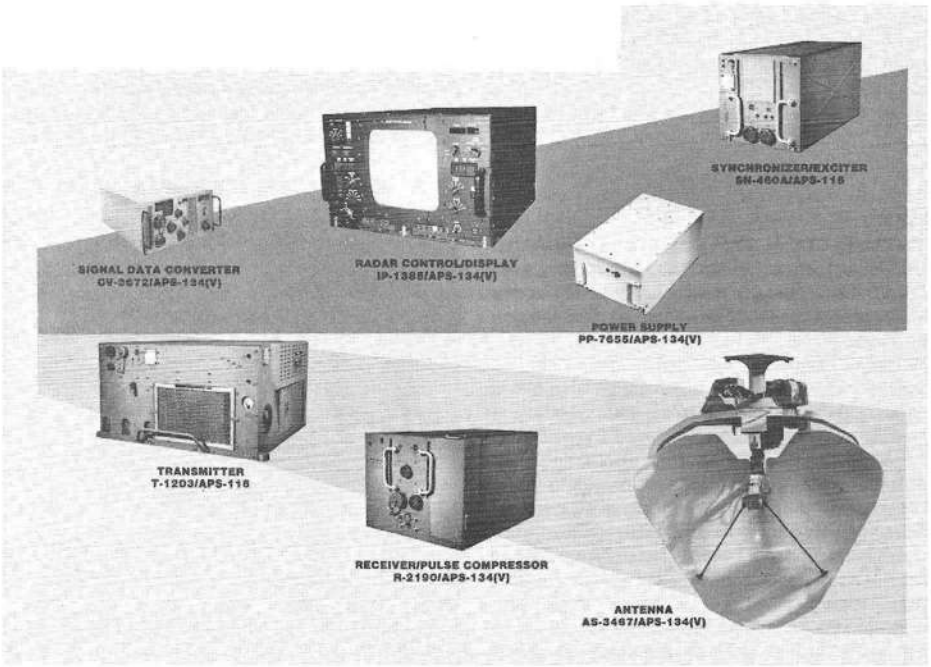
4337.353
AN/APS-133 AIRBORNE RADAR
The airborne full colour, multi-mode radar, AN/APS-133, manufactured by Bendix, is a high performance weather and terrain mapping radar used in military transports and commercial aircraft. Although its main function is en-route weather evaluation, the AN/APS-133 provides high resolution terrain mapping, plus a beacon homing mode.

The display is in full colour with each of three different levels of cloud moisture content, or ground return, being presented as three colours, red, yellow and green. The display may also be used in conjunction with other systems to display various types of information such as programmable check lists and area navigation information superimposed on the weather or terrain map.

The complete system consists of four units, a receiver/transmitter, display unit, control panel and a 30-inch (76 cm) diameter, fully stabilised antenna.
CHARACTERISTICS
Frequency: 9375 ±5 MHz
Power output: 65 kW
Range: 300 nm
Antenna: 30-inch (76 cm) parabola with CSC^2Cos fan beam
Weight
Receiver/transmitter: 24·9 kg + 4 kg mounting
Indicator: 6·3 kg + 0·6 kg mounting
Controller: 0·9 kg
Antenna: 15 kg
DEVELOPMENT
The AN/APS-133 is derived from the commercial RDR-1F radar in widespread use in wide-body aircraft. It has been fitted to KC-130T aircraft of the US Marine Cops. Deliveries will continue until late 1986 with 62 sets being fitted.
CONTRACTOR
Bendix Corporation, Avionics Division, PO Box 9414, Fort Lauderdale, Florida 33310, USA.

4338.353
AN/APS-134(V) MARITIME SURVEILLANCE RADAR

The AN/APS-134(V) ASW and maritime surveillance radar is the successor to the AN/APS-116 system (**1485.353**) used in the US Navy for airborne surveillance. It is designed specifically to detect periscopes under high sea conditions and incorporates all the features of the previous generation with improved performance and a unique maritime surveillance mode. The principal features include a fast scan antenna and associated digital signal processing which form an effective means of eliminating sea clutter. Two other techniques, pulse compression and scan-to-scan processing, are used to combat the inherent problems of detecting small targets in the sea clutter environment.



Three modes of operation are available:

(1) periscope target detection in sea clutter using fast scan (150 rpm), high PRF (2000 pps) and high resolution with display ranges selectable up to 32 nautical miles
(2) maritime surveillance out to 150 nautical miles with high resolution, low PRF (500 pps) and medium scan speed (40 rpm)
(3) long range search and navigation out to 150 nautical miles with medium resolution, low PRF and slow scan (6 rpm).

Long range performance is provided by a high power transmitter (500 kW peak power) coupled with a high antenna gain. A radar control/display gives video presentation on a ten inch square CRT, with the necessary controls and indicators.

CHARACTERISTICS

Transmitter frequency: 9·5 - 10 GHz (modes A & B) 9·6 - 9·9 GHz (mode C)

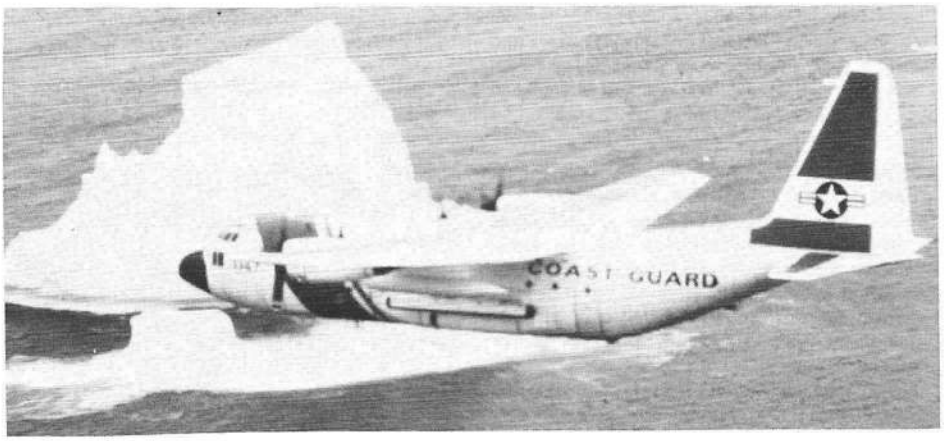
Elements of the AN/APS-134(V)1 radar installed in the Federal German Atlantic maritime aircraft

Power output: 500 kW, peak, average 500 W
Antenna beamwidth: 2·4° azimuth, 4° elevation
Polarisation: Vertical

STATUS

The AN/APS-134(V) is in production to meet several international requirements, including the Federal German Atlantic maritime patrol aircraft and the Royal New Zealand Air Force P-3Bs. A helicopter version is under development.

CONTRACTOR



Texas Instruments Inc, PO Box 226015, Dallas, Texas 75266, USA.

5884.353
AN/APS-135 SIDE-LOOKING RADAR

The AN/APS-135 is a side-looking airborne radar (SLAR) used for the detection of ships and boats, search and rescue, and ice patrol in the North Atlantic. Apart from the position of the antennas, the system is virtually identical to the AN/APS-131 (**5883.353**). The aircraft installation consists of seven main sub-assemblies: antennas, antenna switching unit, receiver/transmitter, synchroniser, amplifier, recorder-processor-viewer and a control unit.

The antenna unit consists of two pods, mounted either side of the aircraft to provide an unobstructed view, each containing a sixteen foot (4·88 metre) horizontally polarised slotted waveguide array. In flight the arrays are yaw stabilised to preserve the radar picture quality. The remaining equipment is mounted on a pallet inside the aircraft for easy removal. The synchroniser provides radar timing and control functions and, based on inputs from the aircraft inertial navigation system, creates latitude and longitude lines for display on the radar imagery. The receiver/transmitter contains the magnetron and low noise receiver. The antenna switching unit directs the radiated power to the left or right antenna.

The process for creation of the film imagery and the mapping areas covered is identical to the AN/APS-131 system.

AN/APS-135 installed in a US Coast Guard HC-130 aircraft showing the left side antenna

STATUS

The AN/APS-135 has been developed under contract to the US Coast Guard and is currently in service on HC-130 aircraft. The AN/APS-131 is used on the US Coast Guard HU-25A aircraft.

CONTRACTOR

Motorola Inc, Government Electronics Group, Radar Operations, 2100 East Elliot Road, Tempe, Arizona 85252, USA.

5885.353
SLAMMR SIDE-LOOKING RADAR

SLAMMR (Side-Looking Airborne Multi-Mission Radar) is a versatile long-range surveillance radar intended for use in maritime patrol, border surveillance and mapping. It can also be used for ice patrol missions, oil pollution detection, search and rescue and fishing area patrol. It is a member of the same SLAR family as the AN/APS-131 (**5883.353**) and the AN/APS-135 (**5884.353**) and is identical in many respects.

The aircraft installation consists of eight main sub-assemblies; antennas, antenna switching unit, receiver/transmitter, synchroniser, amplifier, recorder-processor-viewer, control unit and an optional moving target processor. The antenna consists of two yaw stabilised, horizontally polarised, slotted waveguide arrays. These can be mounted back-to-back within a single pod, or individually mounted on either side of the aircraft to provide an unobstructed view.

The remaining units are either pallet or rack mounted inside the aircraft for easy removal. The synchroniser provides radar timing and control functions and, based on inputs from the aircraft inertial navigation system, creates latitude and longitude lines for display on the radar imagery. The receiver/transmitter contains the magnetron transmitter and the low noise receiver. The antenna switching unit directs the radiated power and received signal to either the left or right antenna.

The process for the creation of the film imagery, and the mapping areas covered, are identical to those of the AN/APS-131 and 135 systems. A real-time CRT colour display is available which stores and displays the data. The data can also be recorded for future use as well as transmitted to ground stations, in real-time, via a radio link. The moving target processor is an MTI option that is available for the detection of moving targets at long-range for border surveillance. By the use of this processor, surveillance can be carried out at ranges up to 80 nautical miles. A high quality fixed target map is also available for radar mapping and geological exploration.

STATUS

SLAMMR is in service on C-130 and Boeing 737 aircraft.

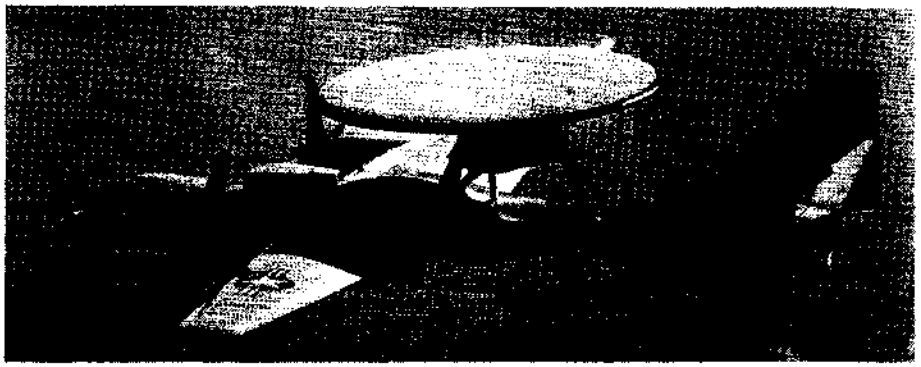
Motorola Inc, Government Electronics Group, Radar Operations, 2100 East Elliot Road, Tempe, Arizona 85252, USA.

1965.353
AN/APS-138/125 AIRBORNE RADARS

ARPS (Advanced Radar Processing Sub-system), is an improvement to the AN/APS-120 (**1783.353**) which combines increased sensitivity in noise and clutter conditions with sophisticated false alarm control and significant ECCM advances to provide the E-2 aircraft early warning system with a truly automatic overland capability. It also provides a digital airborne MTI in place of the analogue MTI of the AN/APS-120. Another capability is the suppression of sidelobe jamming. Implementation of ARPS into the APS-120 occasioned the US Navy nomenclature of APS-125 to denote the improved model. Two sets of ARPS modified APS-120 radars existed in 1974 and, after laboratory testing, underwent flight test at Grumman. Testing continued until early 1978 when US Navy requirements were met completely.

STATUS

A retrofit programme for existing APS-120 radars to bring them up to APS-125 standards started in 1977 and was completed in 1984. Production of the basic radar, now designated APS-138, is expected to continue until the early 1990s. The first APS-138 was delivered to Grumman in December 1982 and a retrofit programme has been started to upgrade all APS-125 systems to the APS-138 configuration. This change is relatively minor when compared to that of the ARPS implementation.



The radars for the E-2 series aircraft have represented an evolutionary programme causing a change in nomenclature when a major change, such as ARPS, occurs, or when a number of small improvements have accumulated as was the case with the APS-138. Further major changes or updates are likely which will provide different nomenclatures before production of complete basic radars ceases. Beyond those, since the E-2C is projected to continue flying until at least the year 2000, other major improvements may well be made in the 1990s.

Four aircraft, fitted with the APS-125, have been purchased and are being operated by Israel, eight have been purchased by Japan, and four each by Egypt and Singapore. Pakistan has decided to equip its air force with E-2Cs fitted with the AN/APS-138. The APS-138 has also been fitted to a Lockheed P-3 as an airborne early warning proposal for the international market, and possibly to the US Customs Service in a drug enforcement role. Flight trials and system integration of a P-3 fitted with AN/APS-138 are scheduled for late 1985.

General Electric has embarked on a Conformal radar programme (**5609.353**) with Grumman for the US Navy. Use of parts of the conformal radar concept and/or provision of adaptive processing could provide the basis for enhancements beyond those currently underway.

CONTRACTOR

General Electric Company, French Road, Utica, New York 13503, USA.

E-2C Hawkeye aircraft equipped with AN/APS-125 airborne early warning radar

5609.353
CONFORMAL RADAR SYSTEM

General Electric has confirmed that it is engaged on a Conformal Radar programme with Grumman Aerospace, for the US Navy. This concept involves a radar embedded in the wings and sides of an aircraft using solid-state transmit/receive modules. This would eliminate the need for a rotodome antenna for early warning radar as employed with the APS-125/138 (**1965.353**) in the E-2C aircraft.

DEVELOPMENT

As at early 1984, in the first phase of the development programme, the passive receive only portion of the concept was being pursued in an aircraft wing structure and ground tests took place during the summer of 1984. These have been followed by flight testing. The active capability will be added after these tests are completed.

STATUS

Development in conjunction with Grumman Aerospace.

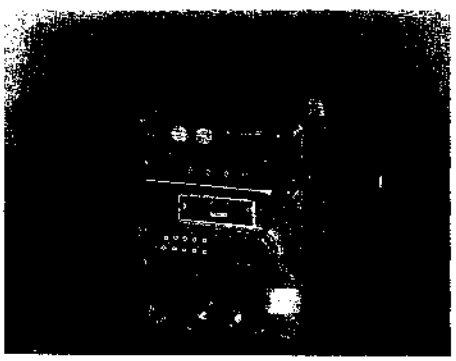
CONTRACTOR

General Electric Company, French Road, Utica, New York 13503, USA.

3688.353
AN/APX-72 AIRBORNE IFF TRANSPONDER

The AN/APX-72 is an airborne IFF transponder which is widely used on US military and certain civil aircraft. It provides automatic radar identification, emergency signals, altitude reporting (when used in conjunction with a suitable altitude digitiser) and responds to interrogations in modes 1, 2, 3/A, C and 4. The last mode requires use of a KIT-1A/TSEC computer. The equipment incorporates the latest IFF Mk XII performance improvements.

CHARACTERISTICS



Frequency: 1090 MHz
Transmitter power output: 27 dBW nominal
Receiver frequency: 1030 MHz
Dynamic range: >50 dB
Sensitivity: –90 dBV nominal
Dimensions: 146 × 162 × 340 mm
Weight: 6·8 kg

STATUS

Operational in US fixed-wing aircraft, helicopters and shipborne installations. Well over 45 000 transponders have now been manufactured.

CONTRACTOR

Hazeltine Corporation, Greenlawn, New York 11740, USA.

AN/APX-72 IFF transponder

3690.353
AN/APX-76 AIRBORNE IFF INTERROGATOR

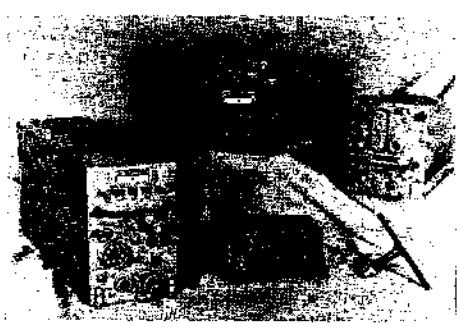
The AN/APX-76 airborne interrogator exists in two main versions, the original electron tube model having been updated by the introduction of a solid-state transmitter. The earlier model, AN/APX-76A is described first.

AN/APX-76A

The AN/APX-76A is an air-to-air interrogator for all-weather interceptor and other tactical aircraft, and has full AIMS capability in modes 1, 2, 3/A and 4. It achieves a narrow antenna beamwidth, and a reduction in 'fruit' through ISLS and RSLS circuits (interrogation and receiver sidelobe suppression, respectively), in conjunction with special antennas having sum (main-lobe) and difference (sidelobe) suppression patterns. Bracket-decoded video and discrete code-decoded video are displayed on the radar screen to provide unambiguous correlation between IFF and primary radar targets. The equipment is fully IFF Mk XII compatible. The equipment consists of four black boxes with a combined weight of 16·8 kg: the receiver/transmitter, control unit, a switch/amplifier, and an electrical synchroniser. Various antennas have been designed for different aircraft types, but a typical arrangement, on the F-4E Phantom, consists of eight small dipoles mounted in two horizontal rows of four on the reflector for the aircraft primary radar antenna.

AN/APX-76B

Hazeltine has developed an all solid-state transmitter and power supply unit for the APX-76, under a US Navy contract, thus yielding a number of advantages, both operational and in respect of maintenance and reliability; MTBF increased to 400 hours, compared with 225 hours for the AN/APX-76A.



The new version of the AN/APX-76 is directly interchangeable with its predecessor, and no re-alignment is necessary, the complete operation requiring only 15 minutes. The D-band power output of the tube transmitter is 2 kW with power reduction steps of 2 and 4 dB. As the transmitter tube ages, the power output gradually decreases, the tubes normally being replaced when the output has dropped to 1 kW. The power output of the solid-state transmitter is 1·5 kW with a power reduction step of 3 dB, and there is no decrease in power output with age, nor is periodic maintenance required.

STATUS

The AN/APX-76 entered production in 1967, and it is estimated that more than 4500 of these sets have since been supplied to the air forces of the USA and friendly nations. Orders have been placed for the APX-76B version and the US Navy is retrofitting all APX-76As with solid-state transmitter/power supply assemblies. The APX-76A/B is installed in the F-4B, C, E, J, EC-121, P-3C Orion, CP-140, E-2C, F-111D, F-14, F-15, SH-60B and others. In addition to American forces, the equipment has been supplied to Australia, Canada, Greece and South Korea.

CONTRACTOR

Hazeltine Corporation, Greenlawn, New York 11740, USA.

AN/APX-76 IFF interrogator system

1569.353
AN/APX-83 AIRBORNE IFF INTERROGATOR

The AN/APX-83 is an airborne IFF interrogator installed in EC-121 airborne early warning aircraft to upgrade their surveillance capability. Each aircraft is equipped with an interrogator system and control/indicator equipment groups for each operator position in the aircraft. Each group semi-automatically processes and displays IFF responses from aircraft, ships, and ground transponders within the EC-121 interrogation range. There are provisions for expansion to a fully automated processing and display system.

A complete equipment set consists of either a synchroniser/coder or coder, decoder, decoder controls, decode displays, interrogator control, receiver/transmitter, and RF switch.

The coder interfaces with the associated radar, R/T unit, RF switch, decoder, decoder control, and the aircraft's APX-72 transponder. It accepts an external pre-trigger from the associated radar set and generates synchronous pulse-pairs and SLS pulses. These pulses are sent to the R/T unit for modulation of the RF signals. A sync-trigger is sent to the decoder for range correlation of replies. Mode coding on a per sweep basis is done on two data lines which are also connected to the decoder. Video is steered through the coder to the decoder.

The decoder accepts raw video and mode triggers from the coder and generates bracket decodes, delayed raw video and identity, or altitude data for processing by the decoder control.

The following functions are performed:
(1) reply detection
(2) garble sensing
(3) altitude conversion
(4) emergency detection and alarm
(5) identification of position (I/P or SPI).

The decoder control receives the digital data and sync-triggers, bracket video, and raw video from the decoder. It performs two different types of filtering: passive decoding and active decoding. The former is accomplished by six sets of thumbwheel switches. A target whose mode and code combination is dialled into any one of the thumbwheel sets causes its bracket decode video to be stretched on the PPI. Two degrees of stretching (narrow and wide) are available in order to sort out the six sets.

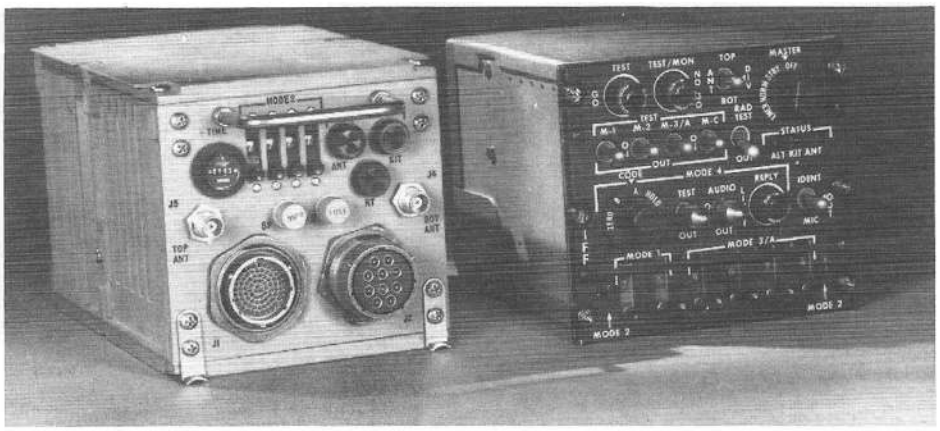
Active decoding is accomplished by generating an area gate around an unknown IFF target by means of a range 'marker' on the PPI and a hand held switch which is activated just prior to the radar sweep passing through the target of interest. When the target is thus acquired, its coded replies to the interrogation modes are transferred for display by the decode indicator.

The indicator accepts the active decode target code and/or altitude data from the decoder control, and displays them for approximately one scan period (8 to 15 seconds) on a set of numeric readouts. It also displays the current interrogation modes. A military or civil emergency or communication failure causes one of three alarm lights to flash.

The interrogator control is a small box which performs the control functions for the IFF interrogator receiver.

STATUS

In production and fitted to EC-121 early warning aircraft.



CONTRACTOR

Eaton Corporation, Command Systems Division, 815 Broad Hollow Road, Farmingdale, Long Island, New York 11735, USA.

4339.353
AN/APX-100(V) AIRBORNE IFF TRANSPONDER

The AN/APX-100(V) transponder is a panel mounted IFF transponder using micro-miniature technology in both digital and RF circuitry, and is currently in production for a number of US military aircraft to enable them to operate in the military ATC surveillance system.

The system is a completely solid-state, modular constructed equipment with a complete dual channel diversity system, comprehensive built-in test, digital coding and encoding and high anti-jamming capability. Two antennas form part of the equipment and the diversity system receives signals from each and switches the transmitter output to the antenna which received the strongest interrogation signal. This system is designed to cure the problems of poor coverage with a single antenna which suffers on occasions from aircraft manoeuvre and antenna 'shadowing'.

AN/APX-100(V) IFF transponder

The transmitter is all solid-state with its 500 watt peak power output obtained from four parallel microwave transistors. Two additional transistors complete the transmitter oscillator and driver stages. The diversity system provides improved antenna coverage and allows improvement in performance in overloaded, jamming and multipath environments. Automatic overload control and anti-jamming features are also incorporated.

For retrofit to aircraft that have no cockpit space available, a remote configuration, RT-1157/APX-100(V), is available. In addition, a data bus version, operating in accordance with MIL-STD 1553B, will be available in late 1984.

CHARACTERISTICS

Transmit frequency: 1090 ± 0·5 MHz
Receiver frequency: 1030 ± 0·5 MHz
Peak power output: 500 W ± 3 dB
Dimensions: 13·3 × 12·7 × 17·1 cm
Weight: 3·8 kg

STATUS

Currently in production for all new US tri-service aircraft including the F-18, AV-8B, C-12, EC-130, SH-60B, UH-60, AH-1S, HH-65A, AH-64A, T-46A, SH-65A, C-5B, HH-60A and US Navy 'Sea Fox' surface craft. It is also being retrofitted to several other aircraft, including the OH-58 and CH-47.

CONTRACTOR

Bendix Corporation, Communications Division, 1300 E Joppa Road, Baltimore, Maryland 21204, USA.

3300.353
AN/APX-103 AIRBORNE INTERROGATOR

The AN/APX-103 interrogator set being provided for use in the E-3A airborne warning and control system (AWACS) (**1585.353**) by the Eaton Corporation, Command Systems Division, under contract to the Boeing Company, is the first airborne IFF interrogator set to offer complete AIMS Mark X SIF air traffic control (ATC) and Mark XII military IFF processing capabilities in one integrated system. Simultaneous Mark X and Mark XII multi-target and multi-mode operations permit an operator to obtain instantaneously the position (range, azimuth and elevation), code identification, and friend/foe status for all targets within the radar surveillance volume. This information can be used in conjunction with the radar to perform ATC, AEW, intercept tracking and escort surveillance missions.

OPERATION

Command words received from the E-3A display processor functional group initiate processor action and direct the mode of operation. The processor generates interrogations to the active receiver/transmitter (R/T), which modulates interrogations and sends them via an RF switch to sum and difference antenna channels. Target aircraft within the surveillance volume respond with coded RF replies via the antenna and RF switch. Replies are demodulated and detected by the active R/T and are sent as video pulses to the processor.

The processor detects, degarbles, and decodes replies and forms target records for replies which meet certain criteria. Completed target records are sent to the E-3A DPFG as target reports.

Features of the AN/APX-103 include:
(1) simultaneous multi-target, multi-mode, Mark X SIF and Mark XII IFF operation
(2) superior positional accuracy and resolution
(3) unique friend-from-foe evaluator
(4) full compatibility with DOD/AIMS requirements
(5) extended surveillance range
(6) use of jittered PRF
(7) full ISLS, RSLS, and GTC capabilities
(8) dual frequency transmit/receive capability
(9) MTBF exceeds that of present IFF systems
(10) completely redundant R/T and power supply units with automatic failure sensing and switchover
(11) built-in self-test facilities to allow automatic fault detection and isolation of failures in conjunction with the E-3 OBTM&M system.

CONTRACTOR

Eaton Corporation, Command Systems Division, 815 Broad Hollow Road, Farmingdale, Long Island, New York 11735, USA.

3689.353
AN/APX-104 AIRBORNE IFF INTERROGATOR

The AN/APX-104 is a lightweight IFF interrogator providing all the functions required for air-to-air and air-to-ship identification and determination of the range and bearing of friendly aircraft and ships under all weather conditions. Typical applications include such operations as flight refuelling rendezvous with tanker aircraft and maintaining contact with other aircraft engaged on a common mission.

The controller unit is separate from the receiver/transmitter, and the combined weight is about 9 kg. The equipment provides for operation in modes 1, 2, 3/A and 4 (when a KIR-1A/TSEC computer is fitted), and operation is on the conventional transmission and reception frequencies of 1030 and 1090 MHz, respectively.

The transmitter is all solid-state, employing high peak power transistor amplifier modules in parallel to obtain the specified maximum output of 1·2 kW; output can be switched to half power where required,

and a 1 per cent duty cycle is specified. Integrated circuits are extensively utilised and Hazeltine employed surface acoustic wave technology in the local oscillator design in the interests of reliability, low cost, and ease of maintenance.

CHARACTERISTICS

Frequency: 1030 MHz transmit; 1090 MHz receive
Decoding sensitivity: -83 dBm
Power output: 1·2 kW, up to 1% duty cycle
Dimensions: 194 × 127 × 445 mm
Weight: 9 kg

STATUS

The APX-104 can be used to modernise existing IFF interrogator capabilities in aircraft originally fitted with the APX-76 (**3690.353**), and a simple retrofit can be made in the KC-130, S-3, P-3, E-2, F-4, F-111 and existing F-14 series aircraft with a slight cable change. The F-15 accepts the APX-104 without modification.

Other fittings foreseen for the APX-104 include the LAMPS Mk 111 helicopter, F-16, F-18, F-18L and F-5E aircraft.

Licence production of this equipment is also carried out in Italy by Italtel (**3489.353**).

CONTRACTOR

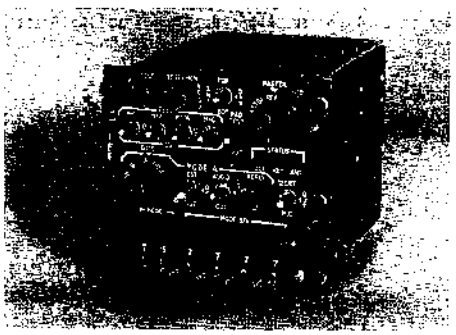
Hazeltine Corporation, Greenlawn, New York 11740, USA.

AN/APX-104 IFF interrogator

3691.353
MM/UPX-709 AIRBORNE IFF TRANSPONDER

The MM/UPX-709 is an airborne multiplex diversity IFF transponder providing civil and military air controllers with full aircraft identity information and automatic altitude reporting. The equipment can be fitted in aircraft, helicopters and ships, and coverage is all-round. The diversity features give full spherical coverage, and continuous track data is supplied to automatic processing systems regardless of aircraft attitude: antenna blind spots are virtually eliminated because of the antennas located above and below the aircraft fuselage.

CHARACTERISTICS



Frequency: 1030 MHz receive; 1090 MHz transmit
Sensitivity: Adjustable (-90 dBV matched load); normal -77 dBm
Modes: 1, 2, Test, 3/A, C, AIMS mode 4
Dimensions: 136 × 136 × 213 mm (remote version); 133 × 146 × 160 mm (panel mounted)
Weight: 4·1 kg (remote); 3·2 kg (panel)

STATUS

Production. Licence manufacture is undertaken in Italy by Italtel (**3489.353**).

CONTRACTOR

Hazeltine Corporation, Greenlawn, New York 11740, USA.

MM/UPX-709 IFF transponder - panel mounted version

1100.353
AN/AWG-9 AIRBORNE WEAPON CONTROL SYSTEM

This is the aircraft-fitted element of the Phoenix (AIM-54) weapon control system (which see) developed for the US Navy F-14 aircraft. It comprises a fire control and target illuminating radar, digital computers, and displays. Provision is also included for the automatic exchange of data link information between the AWG-9 and the naval tactical data system (NTDS) and airborne tactical data system (ATDS) for target designation and other functions.

For on-board target acquisition, the AWCS includes a long range, high-power pulse doppler radar. This system has a look-down capability that enables it to pick moving targets out of the ground clutter that normally obscures targets in a conventional radar.

In addition to its long range, the AWCS introduced into the fleet for the first time in an aircraft, the ability to track many targets at once, with computer-aided selection of target priority. The system is designed for consecutive launch and for simultaneous guidance of up to six AIM-54 missiles against separate targets.

The radar antenna is a planar, slotted-plate array, and represents a significant step forward in design, with a high aperture efficiency for increased radar range.

The principal weapon is the long-range Phoenix, AIM-54 (**1099.331**) air-to-air missile, but the AWG-9 system can be used also for launching Sparrow (**1106.331**), Sidewinder (**1308.331** in 1983-84 and earlier editions), and AMRAAM missiles,and control of an M-61 Vulcan 20 mm cannon.

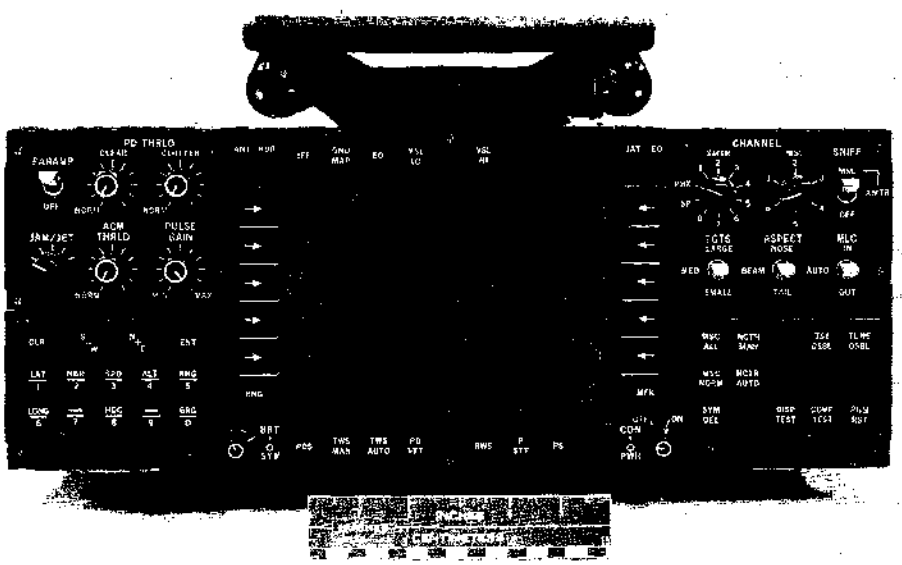
OPERATION

The AWCS uses the pulse doppler radar as its primary target sensor, a multipurpose digital computer, and associated control and display sub-systems. The pulse doppler radar system represents several years of development in transmitter tubes, crystal filters, and planar array antenna techniques to enable the long range requirements of Phoenix to be met. A low noise parametric amplifier in the receiver section contributes to this long range capability. Advanced doppler techniques make look-down target acquisition possible. A flexible, high capacity computer permits simultaneous track of a large number of targets and aids the radar intercept officer (RIO) in the assignment of kill priorities and in missile firing.

Target detection, tracking, and ranging functions for all F-14 air-to-air weapon configurations (6 × Phoenix; 6 × Sparrow; a mixture of these; plus 4 × Sidewinder; and the 20 mm Vulcan cannon) are handled by the AWG-9 radar. It can operate in either pulse doppler or conventional pulse modes. A separate TWT provides CW illuminating energy for the semi-active homing Sparrow (AIM-7E or -7F CW). Time-sharing techniques allow up to six Phoenix missiles to be given pulse doppler mid-course guidance simultaneously.

Data processing in the AWG-9 AWCS is performed by a general-purpose digital computer that features high speed operation and a large memory capacity in an extremely compact package. The central computer keeps track of targets detected by the radar while the radar continues to search. Based on pre-programmed logic the computer evaluates threats, generates steering information for the pilot, and paints a complete tactical situation for the RIO in standard NTDS symbology, all based on data generated either internally or obtained through external data links.

For control of the Phoenix weapon system, the aircraft's RIO is provided with two CRT display units. One, a 12·7 cm diameter unit, is used as a multi-mode display for the presentation of raw radar derived target information and IFF returns, while a larger (25·4 cm diameter) unit is used for the display of processed data.



The latter includes target track information, alpha-numeric and symbolic data obtained via data link from other units of a naval force. The display is also used as a computer read-out device for the presentation of computer-generated missile/target assignments.

A new digital display (see picture) has been developed for the F-14. It incorporates a computer keyboard with software programmable switches and display symbols essential to the capabilities added to the system by a programmable signal processor (PSP). This new PSP is a high-speed, special purpose computer to extend the AWG-9 mission capability.

DEVELOPMENT

The AWG-9 AWCS is related to the AN/ASG-18 developed by Hughes for the YF-12A Mach 3 interceptor, and it is believed that considerable similarity in concept and technology exists between the two systems.

After cancellation of the US Navy F-111B in 1968, the AWG-9 system was selected for development for the F-14A aircraft. Among changes made were provision for controlling weapons additional to Phoenix (Sparrow, Sidewinder and Vulcan 20 mm cannon), additional operational modes for dogfight missions, and a reduction in overall size and weight.

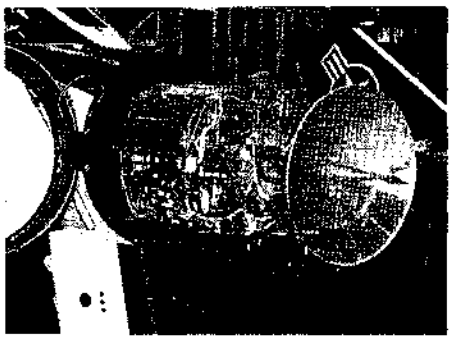
AWG-9 digital display on US Navy F-14

The first test model was delivered to the US Navy in February 1970.

STATUS

US Navy squadrons now operational with the F-14A are embarked on four aircraft carriers in the Pacific and four in the Atlantic. More than 845 F-14s are planned by the US Navy to support its 12 carrier oriented force structure. Currently funded US Navy programmes include doubling the core memory in the central processor and converting the analogue signal processors to programmable digital processing. A passive non-co-operative target recognition mode is also under development. In early 1984, Hughes received a $20 million contract from the US Navy for AN/AWG 9 systems.

In 1984, Hughes was awarded a development contract from Grumman Aerospace Corporation to design, develop and test an upgraded version designated the AN/APG-71 (**5880.353**). Key elements in the upgrade are a fully programmable processor and a companion radar processor to replace the original four analogue processors and provide digital capability, digital displays, ECCM and improvements to extend detection and tracking range.



CONTRACTOR

Hughes Aircraft Company, Radar Systems Group, El Segundo, California 90245, USA.

3018.353

AN/AWG-10, 11 and 12 MISSILE CONTROL SYSTEMS

The AN/AWG-10 is the airborne, multi-mode, missile control system (MCS) which is fitted to the US Navy F-4J aircraft. It provides pulse doppler (down look) and pulse air-to-air search and track modes, high/low map modes and air-to-ground ranging as well as a variety of ECCM. It also provides missile launch computations and semi-active illumination for AIM-7 radar missiles. This MCS became operational in 1967 and was first deployed in 1968.

AWG-10 missile control system radar

In addition to the antenna, the radar nose package includes the transmitter, receiver, RF oscillator, scan pattern generator, trackers, and power supplies. Cockpit units include the pilot's indicator, indicator control, radar set control, antenna control, and built-in test unit. The aircraft equipment bay houses the three remaining AWG-10 units - the computer elements.

AN/AWG-10A Weapons Control System

The AN/AWG-10A weapons control system is an improved version of the AN/AWG-10 MCS. Only three of the 29 line replaceable units (LRUs) of the AN/AWG-10 are utilised, unchanged, in the AN/AWG-10A. Six completely new LRUs are added, seven LRUs are deleted entirely, and 19 LRUs are modified in varying degrees.

The results of two early-1970 development programmes were combined to create the AN/AWG-10A. One effort was a development programme for reliability/maintainability improvement. The second was a demonstration of the improved effectiveness of weapon delivery through the use of modern digital computer techniques and improved displays.

The AN/AWG-10A incorporates a new servoed optical sight and adds one air-to-air and three air-to-ground modes to the basic AN/AWG-10 system.

An important product of this effort is the improved maintenance capability resulting from the new digital built-in test mode.

AN/AWG-11/12

The AN/AWG-10 was produced as the AN/AWG-11 and AN/AWG-12 for UK Royal Navy and Royal Air Force Phantoms, F-4K and F-4M with Ferranti of Edinburgh as the UK main contractor.

AN/AWG-11A/12A

The reliability/maintainability improvements incorporated into the AN/AWG-10A have been procured by the UK for incorporation into the AN/AWG-11/12 missile control system.

STATUS

Between 1963 and 1971 more than 850 AN/AWG-10/11/12 radars were delivered. About 300 AN/AWG-10A modification sets were delivered between 1975 and the end of 1980.

CONTRACTOR

Westinghouse Electric Corporation, Aerospace Divisions, Baltimore-Washington International Airport, PO Box 746, Baltimore, Maryland 21203, USA.

5611.353

MULTIBEAM MULTIMODE SURVEILLANCE RADAR

The Multibeam Multimode Surveillance Radar (MSR) is an air-to-ground system for battlefield surveillance applications and is being developed by General Electric as a candidate for the new US Air Force/Army Joint Surveillance Target Attack Radar System (J-STARS).

The MSR system consists of a multibeam electronically scanned phased array antenna and a real-time all digital LSI radar signal processor. It is a computer controlled multi-mode radar that operates in the MTI search, MTI area track, synthetic aperture radar spotlight, and doppler beam-sharpened modes, and includes extensive ECCM capabilities.

The MSR uses multiple waveforms and includes a reconfigurable real-time radar signal processor. The system consists of nine core line replaceable units:

(1) pod-mounted multibeam electronically scanned phased array antenna
(2) coherent transmitter
(3) exciter/synchroniser
(4) multi-channel receiver/converter
(5) preprocessor
(6) digital pulse compressor
(7) spectral analyser
(8) target detect and data report
(9) radar controller.

The preprocessor, spectral analyser, digital pulse compressor, and target detect and data report form the radar signal processor.

The system operates at Ku-band, using linear and non-linear frequency modulation plus binary coded waveforms with bandwidths of 5 and 20 MHz. The pod-mounted, side-looking multibeam antenna has a 2·5 metre aperture length and provides ±60° azimuth scan coverage in both the single and multibeam modes. Real-time radar signal processing, especially pulse compression and spectral analysis, is accomplished by using fast Fourier transforms hardware.

The radar controller contains two computers; one controls the operation of all units over a data bus, the other implementing the required motion compensation of the data for the imaging modes.

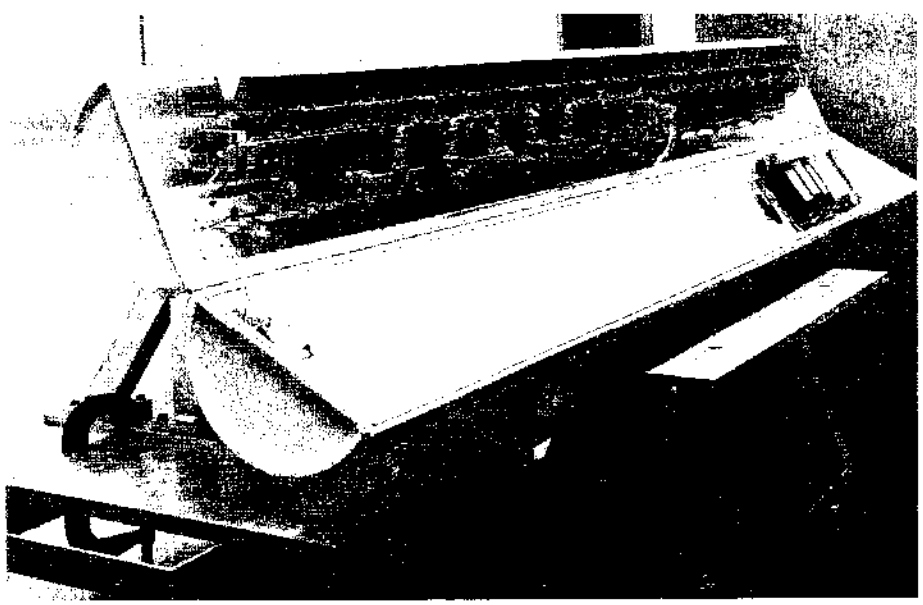
Except for the antenna, standardised packaging has been used throughout the units with microwave, analogue, digital, LSI and power supply circuitry all packaged in standard ¾ ATR modules, making them applicable in other programmes.

STATUS

The MSR has been under development by General Electric since 1978. The antenna was developed under sponsorship of the Defense Advanced Research Projects Agency (DARPA), with the balance of the radar being designed on a private venture basis. The system is currently undergoing flight tests on a C-54 aircraft.

CONTRACTOR

General Electric Company, French Road, Utica, New York 13503, USA.



3304.353

HOWLS EXPERIMENTAL AIRBORNE RADAR

A new experimental airborne radar system for detecting and locating hostile weapons has been developed by General Electric as part of the hostile weapons location systems (HOWLS) programme under the sponsorship of the US Defense Advanced Research Projects Agency (DARPA) and management of MIT's Lincoln Laboratory. The HOWLS radar is an extremely versatile coherent J-band phased-array radar, which is designed to investigate techniques from which solutions may be defined to detect and locate fixed tactical targets in a clutter environment. Particular emphasis is being given to the detection of artillery.

Key to the new radar system is a lightweight, phased-array antenna designed and developed by GE. The antenna system utilises a low cost, highly producible phased array element that combines the radiating element and P-I-N diode phase shifter in a single integrated structure to minimise weight and cost.

HOWLS has six basic modes of operation. These are: contextual ground map, fixed target detection, ground moving target detection, low level doppler spectrum signature analysis, projectile detection and

HOWLS programme experimental phased array radar

tracking, and doppler beam sharpening. Through microprocessor control, the radar has mode parameter flexibility and is capable of interleaved multi-mode operation. Selectable parameters include antenna scanning pattern and rate, PRF, data sampling window position, and data sampling pattern. The radar is capable of switching among parameters in an orderly manner so that up to four operating modes can be interleaved. Characteristics of one of the experimental HOWLS radars appeared in *Jane's Weapon Systems 1978*.

Results of the experimental HOWLS programme will provide the technology base from which radars for RPVs, helicopters, and fixed-wing aircraft can be configured to meet a variety of operational missions.

STATUS

The HOWLS radar is undergoing a comprehensive flight test programme.

WESTINGHOUSE WX SERIES FIRE CONTROL RADARS

The Westinghouse WX Series is a private venture project for the development of a range of forward radars for fighter and attack aircraft, based on the use of modular design. The latter feature is intended to enable radars appropriate to varying roles and with differing degrees of sophistication to be constructed from mostly standard units, with consequent cost benefits.

The 'base' model of the range is the WX-200 and this is a pulse doppler system intended for air-to-air combat purposes. Beyond a provisional system weight of about 350 lb (160 kg), without cockpit display, few specific details have been revealed, but the following general design characteristics are known. A TWT will be used in the transmitter to provide wide bandwidth, a high peak-to-average power ratio, and to permit the adoption of frequency agility techniques of ECM.

Wherever possible digital circuitry is used, with incoming returns being converted to digital format as near the receiver front as convenient. The receiver employs a parametric amplifier. A cassegrain scanner is employed to eliminate the cost, weight, and reliability considerations of a rotary joint. The scanner itself is not stabilised, this function being performed electronically to provide a stabilised cockpit display, the data presumably being derived from the aircraft's own attitude sensors.

The Westinghouse development plan is to evolve other radars from the WX-200 which are both simpler and more sophisticated than the base model. The WX-50, a lightweight air-to-ground system for close-air-support applications, has also been fabricated. The WX-50 is a non-coherent Ka-band radar with a reflector antenna for ground mapping and a receive-only elevation phase monopulse antenna for letdown terrain clearance. Additional growth modes include ground MTI, terrain avoidance, air-to-ground ranging, and EO cueing. The production WX-50 will weigh 64 kg.

Westinghouse WX-50

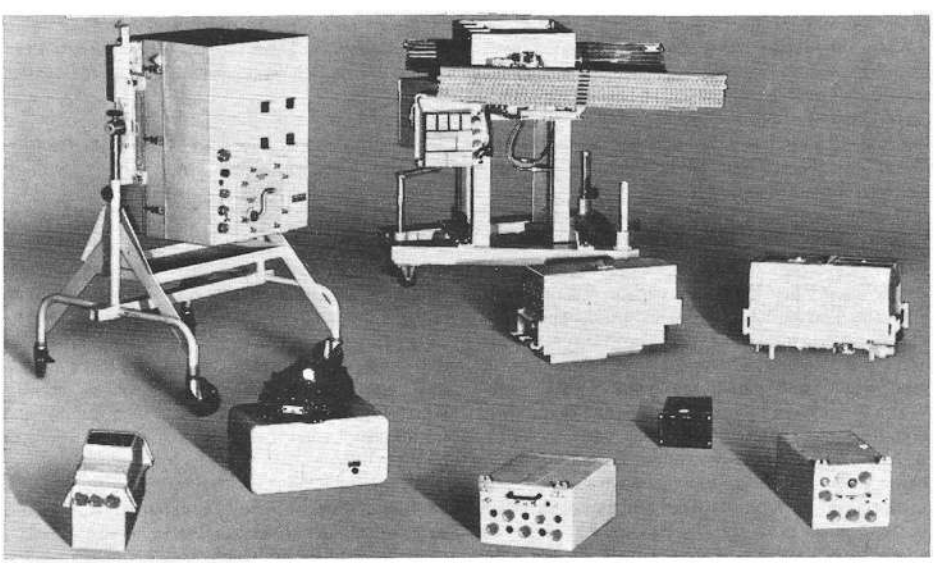
The other models of WX radar would be achieved either by the addition of modules to provide extra desired operational features, or by a simplification of the basic WX-200 to satisfy less elaborate requirements. The company has given a number of provisional designations to other models which could be developed in the WX series. The WX-150 is a reduced power version of the WX-200. By adding data processing capacity to provide beam sharpening for high resolution ground mapping, the WX-200 would become the WX-300 for air-to-air and air-to-ground roles. The WX-400 would be a higher power version, without air-to-ground facilities but capable of long-range AI missions. A lightweight , lower cost, non-coherent pulse version would carry the designation WX-60.

STATUS

Two models of the WX-200 have been fabricated and have undergone extensive engineering testing at the Westinghouse facility. A pod-mounted version of the WX-50 has been flight tested by the US Navy on a TA-4J, on OV-10 and a UH-1N helicopter. The 208 kg prototype system demonstrated excellent performance and achieved a field MTBF of 160 hours without any contractor support.

Westinghouse is currently producing the F-16 radar which is based on the WX series. Information on the F-16 system is given under entries **3303.353** (AN/APG-66) and **5881.353** (AN/APG-68).

CONTRACTOR



Westinghouse Defense and Electronics Center, Baltimore, Maryland 21203, USA.

1676.353

AN/UPD-4 SIDE-LOOKING RADAR SYSTEM

The AN/UPD-4 side-looking radar system is an advanced design, all-weather, high-resolution reconnaissance sensor system for airborne collection of tactical and strategic intelligence information. Utilising I/J-band radar energy to illuminate selected terrain swathes, it operates equally as well in darkness as in daylight and in adverse weather.

The AN/UPD-4 consists of an AN/APD-10 synthetic aperture radar set mounted in an RF-4 aircraft, a ground-based correlator/processor set and test consoles for the maintenance of airborne and ground equipment. Airborne data link transmitters and ground receiving and processing systems are optional additions to provide radar-collected information to ground commanders more rapidly than the basic system.

Basic components of the airborne equipment of the AN/UPD-4 radar reconnaissance system with data link equipment

The airborne system includes multi-element, phased, linear waveguide antenna arrays individually gimballed for left or right side operation. Look-angle of the antennas is maintained in flight by a control system that receives error signals from the aircraft inertial navigation system and gimbal-mounted gyroscopes and accelerometers.

The frequency converter/transmitter generates the stable radio frequency used for phase locking the radar signals and contains the transmit/receive and antenna switching components. It also supplies the swept frequency for modulating the transmitted pulses, amplifies the reflected signals and converts the received RF to IF. The amplifier/modulator is a high pulse RF pulse amplifier.

The signal data generator receives information relative to the aircraft velocity and mode, and uses this data to establish the radar PRF and generate the basic timing reference signals required throughout the system.

The radar mapping recorder contains the optical, electronic and electro-mechanical assemblies required to record the radar video data and associated coded data on 241 mm wide photographic film. These data are displayed on two 5-inch CRTs as four intensity modulated traces that are transferred by two mirror assemblies and four recording lenses to focus the images on the film. Mode strips that convey essential operational information and multi-element blocks containing information pertinent to the mission are recorded on the film. For data link operation, an identical recorder is used at the correlator/processor on the ground to establish a continuous recording/correlation path. Film speed is carefully controlled in either application to maintain a fixed relationship to aircraft ground speed.

OPERATION
The equipment has several modes of operation, providing a variety of stand-off distances and altitudes, and the option of recording only fixed target imagery (FTI), or both FTI and MTI. Imaging of the terrain at either side can be obtained at the discretion of the operator. With data link equipped systems, the information may be transmitted to a ground station in real-time for recording and processing. The final imagery is recorded on 241 mm wide film in four channels at a scale of 1:100 000 for all modes. In the azimuth (along track) direction, targets and terrain features are imaged in terms of distance travelled and represent true ground separation. In the range (across) track direction, the imagery is recorded in slant range or the distance from the aircraft to the target.
STATUS
The AN/UPD-4 is in service in several versions with Phantom aircraft of the US Marine Corps and the Japanese Air Force. The system was developed for the US Air Force as a successor to the AN/APD-102A; but has since been enhanced and designated AN/UPD-8 (**5686.353**).
CONTRACTOR
Goodyear Aerospace Corporation, Arizona Division, Litchfield Park, Arizona 85340, USA.

5686.353
AN/UPD-8 SIDE-LOOKING RECONNAISSANCE RADAR
The AN/UPD-8 is a side-looking, synthetic aperture airborne reconnaissance radar system for the US Air Force. It is, in fact, an updated and improved version of the AN/UPD-4 equipment (**1676.353**), and gives a much greater range. The system provides an all-weather, day/night, stand-off, tactical and strategic reconnaissance capability, and with its extended range antenna pods and airborne data link electronics is the latest in a sequence of Goodyear airborne reconnaissance radars to have been operational since 1964.

Operating in the I/J band, the system records with equal effectiveness during daylight and darkness, and through periods of adverse weather that would render other types of reconnaissance systems ineffective. The airborne radar system's stand-off capability, which is increased by 60 per cent in the new equipment, allows coverage of border regions, harbours and coastal areas without violating another nation's airspace or national waters.
OPERATION
The airborne sensor part of the overall system, the AN/APD-12, operates in eight modes selectable by the operator according to aircraft altitude and the distance to the target area. The system can record to left or right of the aircraft with the normal antennas or with the extended-range antennas which are mounted in a centre-line pod. Target information can be transmitted to the ground in real-time through a data link, or can be recorded in flight for later processing on the ground. The former facility enables a commander on the ground, perhaps several hundred kilometres away, to evaluate detected targets while the aircraft continues its mission.
STATUS
In operational service with the US Marine Corps.
CONTRACTOR
Goodyear Aerospace Corporation, Arizona Division, Litchfield Park, Arizona 85340, USA.

4618.353
PROJECT SEEK SKYHOOK BALLOON-BORNE RADAR
Project Seek Skyhook is a tethered balloon-borne radar system in operation in Florida to provide surveillance of the state's coastal regions. The radar system used is an RCA AN/DPS-5 equipment which has a range of 150 nautical miles at an altitude of 12 000 feet. It is designed to detect low-flying unidentified aircraft for the US Air Force and other users. It is the latest in a series of aerostat developments that began in 1969, and four systems are in operation in Florida.

The AN/DPS-5 radar is an S-band equipment using a rotating parabolic dish measuring 22 × 12·5 feet which returns an inverted cosecant signal with two selectable polarisations that can be directed circular and horizontal or vertical and horizontal.

The radar ground sub-system has an RCA digital processor with the capability of simultaneous operation with two aerostats. Normal and MTI radar video are selectable with or without CFAR. Display can be either PPI or digitised video. The radar beacon digitiser includes capabilities for clutter mapping, target sorting and use of target track history.

CHARACTERISTICS
Frequency: 3100 MHz
Range: 150 nm (278 km) at 12 000 feet altitude
Resolution: Range 500 feet, azimuth 1°
Antenna: Rotating parabolic dish
Scan speed: 5 rpm
Weight: 1000 lb (455 kg) including mounting, gimbal, antenna, transmitter, receiver and power supply
Endurance aloft: 120 h normal, 143 h peak
STATUS
Operational.
CONTRACTOR
RCA, Government Systems Division, Missile and Surface Radar, Moorestown, New Jersey 08057, USA.

3162.353
WESTINGHOUSE BALLOON-BORNE RADAR
Under contract to the US Defense Advanced Research Projects Agency (DARPA), Westinghouse has provided radars for use with advanced aerostat or balloon platforms. In the mid-1960s DARPA initiated an R and D programme to develop a stable balloon platform and to exploit the use of such platforms for sensor and communications applications. Early work was carried out using modified British barrage balloons and these were later superseded by purpose-designed aerostats, of various sizes. Typical dimensions range between 1415 and 16 990 cm; 35 and 8·5 metres in length; and 9 and 30 metres in diameter.

Example of a Westinghouse balloon-borne surveillance radar installation on a DARPA Family II aerostat

This family of tethered balloons is stated to be capable of operations at altitudes of 3000 and 4500 metres. A powered tether system and low helium leakage allow the aerostat to operate at altitude for extended periods, providing greatly increased radar surveillance or communications coverage due to the increased line-of-sight ranges obtainable. Typical radar applications proposed include surveillance and AEW, location, and tracking of targets, fire control and weapons direction. Communications, EW, and target location/designation by other means, eg electro-optical sensors, are other possibilities.

Radars employed at first were all of the non-coherent variety but Westinghouse later received a contract from the US Air Force Rome Air Development Center to build a coherent system to detect airborne moving targets.

Airship Industries has signed an agreement with Westinghouse to co-operate in plans for a 'battle surveillance airship system' for the US Navy.
DEVELOPMENT
The following brief details of this programme refer to the Westinghouse balloon-borne radar projects which have been identified.

Low Altitude Surveillance Radar (LASS)
This is a static tethered balloon-borne system which is able to carry a radar such as the AN/TPS-63. It can carry 1800 kg to a height of several thousand metres for periods of up to 20-30 days. Westinghouse has received a $12·6 million contract from Saudi Arabia for a demonstration of a LASS system to supplement the E-3A airborne early warning aircraft. The system consists of an AN/TPS-63 radar installed in a 365 000 cubic feet aerostat, having a nominal altitude of approximately 10 000 feet (3048 metres). The demonstration and trials will take place in Saudi Arabia in 1986.
Small Tethered Aerostat Relocatable Systems (STARS)
A tactical, transportable system built by TCOM Corporation, a subsidiary of Westinghouse. Normal use is for coastal surveillance and at 750 metres altitude a small balloon-borne radar can detect a target with a radar cross-section of 100 m² at ranges of up to 110 km. TCOM has linked with LMT Radio Professionelle (a Thomson-CSF subsidiary) to offer the RASIT battlefield surveillance radar for tactical use.
CONTRACTOR
Westinghouse Defense and Electronics Center, Baltimore, Maryland 21203, USA.

3299.353
EC-153 AIRBORNE HUNTER RADAR
The EC-153 Airborne Hunter radar is designed for use in lightweight fighter aircraft, and is the latest addition to Emerson's APQ-153 (**1675.353**) and APQ-159 (**3114.353**) family. Unlike those equipments the EC-153 is a coherent system using digital processing techniques, the latter comprising a feature called digital plant control by the manufacturer. By this is meant that a general-purpose mini-computer enables all scan patterns and servo stabilisation loops to be software controlled. In addition to the range, velocity and angle, the computer also controls tracking loops. This technique yields a claimed reduction of 30 per cent in the hardware employed.

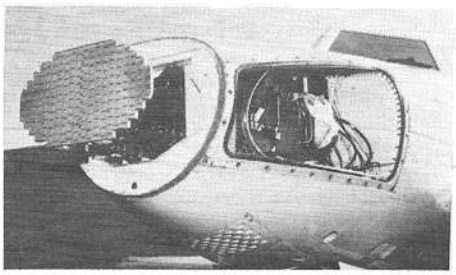
The EC-153 is a pulse doppler radar operating in the I/J-band, with a look-down capability in the air-to-air mode. The digital coherent waveform maintains a low false alarm rate, and a set of nine PRFs are used to eliminate range and velocity blind zones, and to resolve range and velocity ambiguities.

The three main functions are search, acquisition and tracking, but additional roles such as air-to-ground ranging, high-resolution mapping, missile illumination, and terrain avoidance are also possible. In the air-to-air look-down search mode, coherent pulse doppler processing is used to detect targets against ground clutter, while in the look-up air search mode, a non-coherent pulse waveform provides long-range detection where background clutter levels are lower. Target tracking can be initiated in the latter mode. In the look-down search mode, the pilot initiates the acquisition and tracking sequence. The radar locks on and tracks the target in range, velocity and angle, and automatically switches PRFs to keep the targets in a clear region. In an air combat situation, manual or automatic acquisition and tracking sequences are provided for use with guns or dogfight missiles.

The EC-153 comprises the following hardware: a flat plate antenna array; a coherent transmitter/receiver; digital electronic signal conditioner; a radar data controller; scan converter and indicator unit; and control panel. The antenna is a two-axis monopulse planar array of slotted waveguides with a guard horn,

digitally controlled with rate gyro track stabilisation. The transmitter/receiver employs a crystal source coherent exciter with a ring loop TWT. The display unit contains a bright CRT for the presentation of TV format information derived from a digital scan converter.

CHARACTERISTICS



Frequency: I/J-band
Peak power: 10 kW
Waveform: Pulse, low PRF; pulse doppler, medium PRF
Receiver: 2-channel, GaAs FET/microwave ICs
Antenna: Plate
Gain: 29·5 dB
Sidelobes: -40 dB
Search coverage: 90 × 90°

Detection range	Look-up	Look-down
	Pulse	Pulse doppler
Search/track	37 km	24 km
Range tracking	150 - 300 m	15 m
accuracy	300 - 915 km	9 m
	915 m - 150 km	1%

Range rate accuracy: 3 m/s
Range rate limits: -300 to +150 m/s
Max range: 150 km
Minimum range: 150 m

5888.353
B-52 AIRBORNE RADAR

The radar system currently carried by the US Air Force B-52 bomber force, which is nearly 30-years old, is being upgraded to provide greater reliability and capabilities. In particular the system will be enhanced in terms of terrain avoidance and ground mapping capabilities, also analogue units will be replaced by digital. The new system will consist of eight units in place of the 50 currently installed in the aircraft, a reduction which highlights the advances made in radar technology over the past three decades. Boeing is the prime contractor for the updated radar and will be designing the antenna, interfaces and displays, but the transmitter, radar and processor will be provided by Norden Systems.

STATUS

Boeing has received a £109 million contract which covers 11 systems, training, spares and logistics support. As many as 264 B-52S may eventually be scheduled for upgrading.

CONTRACTORS

Boeing Military Airplace Company, Wichita, Kansas, USA.

Norden Systems Inc, Norden Place, Norwalk, Connecticut 06856, USA.

5624.353
JOINT SURVEILLANCE AND TARGET ATTACK RADAR SYSTEM

The Joint Surveillance and Target Attack Radar (J-STARS) project is a joint US Air Force and US Army development which combines the former's Pave Mover programme with the latter's Battlefield Data Systems projects (Assault Breaker programme). J-STARS was scheduled for development commencing in 1983, under the control of a joint US Air Force/US Army team, as an airborne anti-tank radar system for the two services. Various designs were proposed and four of these were flight tested during 1982. Four industry teams are bidding for the contract; Hughes/E-Systems; Grumman/UTC Norden Systems/TRW Systems Engineering and Development; Westinghouse/Lockheed and Boeing/General Electric.

The radar is primarily intended to detect enemy armour on and behind the battlefield and also to direct attacks against it. The system is designed to direct real-time attacks against moving ground targets by low-flying aircraft and missiles, and also to provide guidance of missiles carrying sub-munitions to the target locale. Tactical information on targets would either be processed on board the aircraft or relayed to the ground via a data link.

It was originally intended that requests for proposals (RFP) be issued in 1983 but due to disagreements between the two services this date slipped and an RFP was finally issued in August 1984. Proposals have now been received and a contract was expected to be awarded during 1985. Originally the US Army wanted a wide area surveillance and an MTI capability, and the US Air Force wanted a fixed target indicator and a data link to guide weapons. This issue has apparently been settled and the Boeing C-18 has been agreed as the platform to carry the synthetic aperture and MTI radar. In a typical US Army mission data would be sent directly to a ground station via the secure data link for processing and dissemination to the field commanders. On the other hand, the US Air Force would process the information on board so that the operators could make target decisions and relay these to existing C31 networks.

The J-STARS RFP calls for the development of four systems, two to be tested initially in the USA before being sent to Europe for demonstrations in an operational environment. The other two will be kept back for full-scale development testing. A decision regarding production is expected in 1989.

Funds for J-STARS itself, the J-STARS ground stations and the associated J-TACMS (Joint Tactical Missile System) have been earmarked and the US Federal Year 85 research and development budget recommended approximately $60 million for the US Army and $95 million for the US Air Force. The total cost of the programme is expected to reach about $1 billion. So far, Motorola's Government Electronics Group has received a $31 million contract to provide the ground station equipment. Under the terms of a contract awarded in August 1984 it will develop six pre-production models of its S-280 shelter which house communications, computers and displays to receive, process and disseminate target information from the aircraft.

4648.353
COVERT STRIKE RADAR

Covert Strike is a bistatic radar system project under development by the USAF Avionics Laboratory at Wright Patterson Air Force Base. The system provides for illumination of a target by a stand-off radar installed on either a satellite or an aircraft, with only a receiving system required on board the strike aircraft. This allows the latter to approach the target in a passive, or covert, manner, and is also designed to seriously hamper the enemy in his jamming techniques. No technical details have been disclosed other than that the radar is probably a synthetic aperture system.

STATUS

A long-term project in the design phase with development and trials continuing until about 1990.

ELECTRONIC WARFARE EQUIPMENT (LAND)

FRANCE

3913.193
FRENCH LAND-BASED EW SYSTEMS

A number of French military EW systems have been identified which are land-based if not necessarily dedicated to the French Army; most are mainly concerned with communications aspects of EW and while there is insufficient detail to warrant individual entries for each, the following paragraphs give what information can be revealed.

BROMURE

This is a vehicle-mounted or static tactical VHF communications jammer and is currently in service with the French Army. It uses an omni-directional antenna array and is believed to have a power output of 1 kW ERP. Thomson-CSF is the manufacturer.

BINOC

Probably another jammer, possibly covering a different part of the spectrum to Bromure.

ELEBORE

Elebore operates in the HF part of the telecommunications spectrum and performs several functions (eg detection, location, monitoring, etc). It is computer-based and uses a version of the CISMA 15M digital computer.

ELFA

Elfa is the name of an intercept system. The frequency coverage is not known.

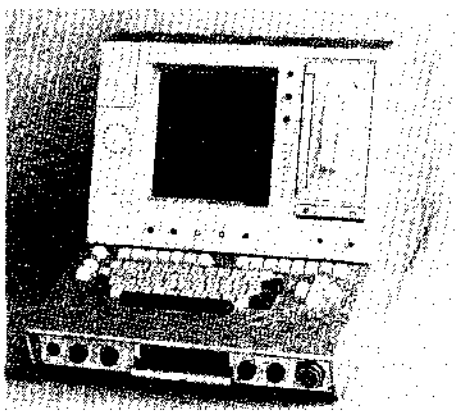
ELODEE

Elodee is the name of a DF, emitter locating system. The frequency coverage is not known in detail but it is known that the system operates in the communications bands so that it is probable that the HF, VHF and UHF parts of the spectrum are covered. A CISMA 15M computer is incorporated.

EMERAUDE

Emeraude operates in the VHF band and is a combination system providing several facilities relating to communications monitoring, surveillance, and emitter location. A CISMA 15M computer is used in the system.

STATUS



All are believed to be operational with the French Armed Forces.

CONTRACTORS

Not identified, but probably most of the major French electronics companies have been involved. The government DGA (Délégation Générale pour l'Armement) establishment SEFT (Section d'Etudes et Fabrications des Télécommunications) was responsible for development of the above systems.

3534.053
TMV 200 ELISA ELINT RECEIVER

The Elisa ESM/Elint receiver is designed for search and analysis of pulse or CW signals for use in strategic or tactical operations conducted by land, air or naval forces. It can be deployed in airborne, shipborne or ground based configurations. The equipment consists of a rotatable broadband antenna array, frequency converter, receiver/processor and an operator's console

Thomson-CSF Elisa ESM/Elint receiver control/display console

The Elisa system was developed to ensure detection of radars having a high pulse compression rate and also radars with fixed, random and coded parameters. The system has a high instantaneous probability of intercept and through the use of reprogrammable software, is able to face changes of the threat.

The digitally controlled receiver features fast frequency commutation, a high sweep rate, modular design and includes a microprocessor unit for data processing and automatic system operation. The frequency converters in association with the basic receiver provide operation over the whole radar spectrum. Automatic measurements are made of the usual parameters, assisted by the use of high accuracy quartz-driven oscillators and low-noise RF amplifiers for high sensitivity. Pulse-by-pulse DF is possible, and the display incorporates a memory device to assist interception of brief signals and frequency-agile radars.

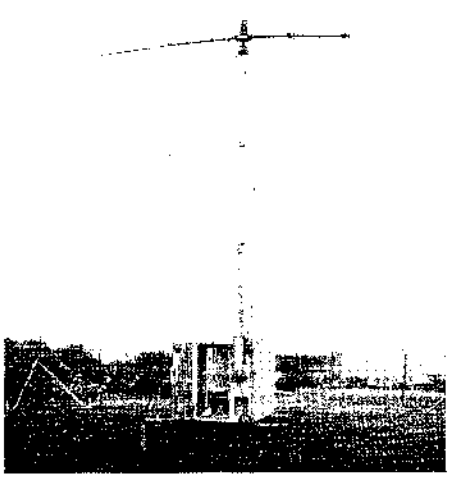
The search pattern is easily programmed by the operator in terms of frequency coverage, disabled frequencies, wide or narrow band selectivity, dwell time, etc, which results in quick adaptation to operational needs. The operator communicates with the system via a keyboard. The console includes a plasma screen showing the panoramic situation, radar parameters and a detailed radar analysis (emission histograms and spectrums).

The system is compatible with peripheral equipments for additional analysis and immediate or delayed operational exploitation.

CHARACTERISTICS

Dimensions	Width (mm)	Height (mm)	Depth (mm)	Weight (kg)
Converter	258	194	500	30
Receiver/processor	258	194	500	30
Control unit	410	390	665	30

STATUS



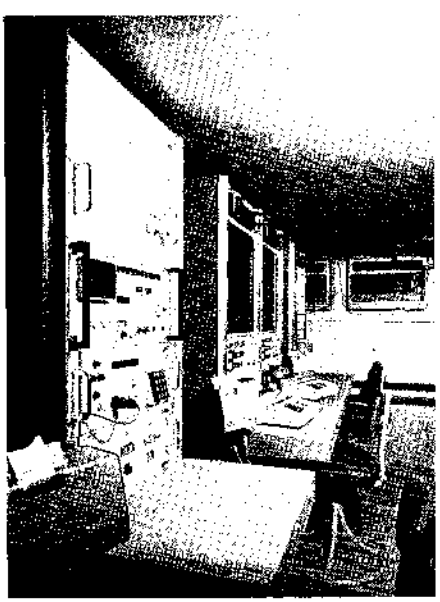
In production and in service. A helicopter version has been designed and is being evaluated by the French Army. Thomson-CSF has also completed work on a ground-based Elint station using Elisa systems.

CONTRACTOR

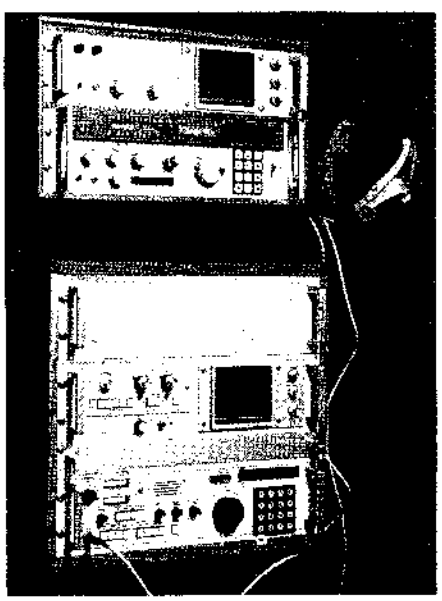
Thomson-CSF, Avionics Division, 178 boulevard Gabriel Péri, 92240 Malakoff, France.

3914.153
THOMSON-CSF COMMUNICATIONS INTELLIGENCE EQUIPMENT

The Thomson-CSF concern produces a wide range of special-purpose receivers and associated equipment for communications intelligence gathering, surveillance and monitoring purposes and the main examples of the current range are described briefly in the following paragraphs.



Listening post of Thomson-CSF communications countermeasures system



The range is suitable for equipping listening stations (fixed or mobile) for strategic or tactical applications, and frequency bands from 10 kHz to 1 GHz are covered.

TRC 243

The TRC 243 is a new HF system which has recently entered production. It is a state-of-the-art receiver operating over the frequency range 10 kHz to 30 MHz and employs a built-in cyclo scan module to carry out frequency scanning functions. Optional equipment includes a 200 kHz frequency expander, for high accuracy DF and jamming, and a special

Interior of command station of French communications countermeasures systems. TRC 291 VHF intercept receiver can be seen among other equipment on the left

Upper units are TRC 394 HF monitoring receiver and associated TRC 3941 panoramic adapter, while the lower three items are (top to bottom) TRC 2919 transposer unit, TRC 2941 panoramic receiver, and TRC 294 VHF/UHF receiver

demodulator for reconstituting the original intercepted signal.

TRC 291

The TRC 291 is a VHF intercept receiver covering the 20 to 120 MHz frequency range, or 20 to 500 MHz if the TRC 2919 converter is added, and it has been designed for driving modern communications countermeasures systems. Applications such as listening posts, automatic DF stations, jamming posts etc are typical. The TRC 291 (9) provides for activity detection, display of the received signal within a selected ten MHz sub-band, and selection and analysis of a particular signal. Another unit which can be added to the TRC 291 is the TRC 2913 AM/FM demodulator which permits aural monitoring of appropriate signals of the type intercepted.

TRC 294

The TRC 294 is a combined VHF/UHF receiver for radio monitoring and listening in the band 20 to 120 MHz, with the possibility of extending the upper frequency limit to 500 MHz or 1000 MHz. Frequency selection is by either a keyboard or a flywheel fine tuning knob, for reception of known frequencies or for surveillance purposes. The receiver can store up to ten frequencies with transmission mode and band-pass, and it can also be remotely controlled. There is an add-on panoramic receiver, TRC 2941, which can be used in conjunction with the TRC 294 to provide for display of a bandwidth up to 180 MHz and analysis of received signals.

TRC 298

The TRC 298 is a combined VHF/UHF receiver for monitoring over the frequency range 20 to 1350 MHz. It is in the late development stage and likely to enter production towards the end of 1985.

TRC 394

The TRC 394 is a HF monitoring receiver. The TRC 394C uses a high stability synthesiser with 10 Hz steps to cover the 100 kHz to 30 MHz band. The frequency can be selected by either a keyboard or flywheel tuning control with increments of 10 Hz, 100 Hz or 1 kHz, and there is provision for 20 stored frequencies. The TRC 3941 is a panoramic adaptor for use with the TRC 394C and provides for the display of signals in a band centred on the frequency tuned on the receiver. The bandwidth of the frequency range displayed on the panoramic display for analysis is selected according to the scanned frequency band. Like the TRC 291 and TRC 294, the TRC 394C is compatible with remote control operation for use in computer-based COMINT or SIGINT systems.

STATUS

This equipment is in production and has been supplied to French and overseas forces.

CONTRACTOR

Thomson-CSF, Division Telecommunications, 66 rue du Fosse-Blanc, BP156, 92231 Gennevilliers, France.

3535.053

XR100 COMINT RECEIVING SYSTEM

The XR100 V/UHF receiving system has been designed for surveillance and analysis of communications signals (AM, FM, CW or pulse) in the frequency range 20 to 500 MHz (1500 MHz on request). It can be operated either as a manual or semi-automated system. The basic system consists of: XRP100 panoramic receiver; and XRA100 analysis receiver. Both types are equipped with the XRT series of RF voltage-tuned heads (XRT 050, 100, 200, 300 and 310).

The modular design allows for additional equipment options:

(1) frequency indicator and repeater for the manual system, used for dialogue between the chief controller and the operators

(2) automatic tuning module for XRA analysis receiver for semi-automatic system working operationally as a manual system but without need for manual tuning.

XR100 SA Automatic Receiving System

The automatic receiving system uses a fast synthesised local oscillator for XRP panoramic receiver controlled by a data processing equipment in the automatic system. The data processing equipment is composed of a mini-computer with a mass memory and a display/keyboard console. The sweeping of the XRP panoramic receiver is controlled according to the inhibited sub-bands and frequencies (permanent or temporary inhibition) and to the already detected transmissions. As soon as a transmission is detected a vacant XRA analysis receiver is looked for, and when found it receives the control messages for automatic tuning to this frequency. Then the XRP receiver sweeping starts again. The display/keyboard console is used for updating the list of sub-bands and frequencies either to be inhibited or more frequently swept.

A system can be equipped with six XRA analysis receivers in a manual or semi-automated configuration, or more (up to 16) if automated. A DF system (manual or automatic) can also be associated with the equipment.

Design features and objectives include: versatility, compactness, ease of operation; frequency automatic digital display on all receivers; modular construction; 2400 baud multiplexed digital frequency signals between instruments (connections by a simple coaxial cable, or remote control by modems on telephone line). Provision is made for central operation between several receiving stations (for triangulation), and for coupling with a DF system. The equipment is suitable for use in airborne, shipborne or ground based systems.

CHARACTERISTICS

XRP100 Panoramic Receiver

Dynamic range: 70 dB

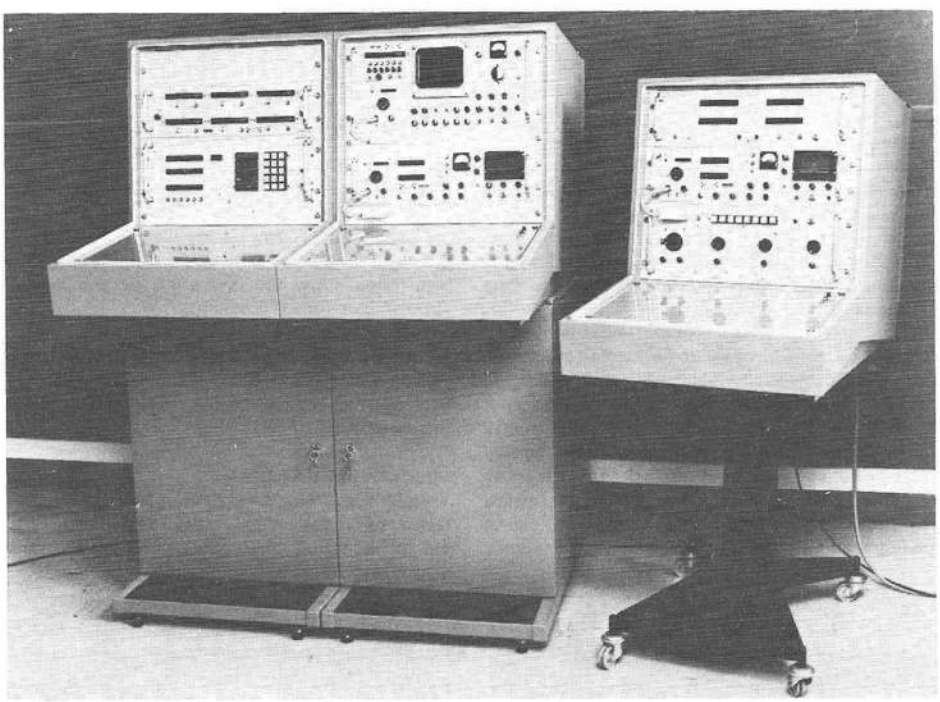
Operating modes

PANORAMIC (the whole frequency range of the RF tuning head is displayed on the 8 × 10 cm CRT)
PARTIAL (or sector)
PANORAMIC/PARTIAL (uncalibrated)
PANORAMIC/PARTIAL (calibrated)

ANALYSIS

Digital readout of the centre tuning frequency with:
5 digits during the panoramic sweep,
6 digits in the analysis mode.
Push-button transfer of this tuning frequency to the selected analysis receiver XRA100 for the manual mode.
In the analysis mode: same specifications as for the analysis receiver (except the loudspeaker).

XRA100 Analysis Receiver



Operates with the same voltage tuned heads as the XRP100,
Digital readout of the frequency to be tuned (sent by the chief operator in the manual system),
Digital readout of the tuned frequency (6 digits),
AM, FM, CW and pulse reception.
IF bandwidths: 300, 50, 20 and 10 kHz,
BFO and COR facilities (for magnetic recorder)
Sensitivity: -103 to -109 dBm for 10 dB (S + N)/N ratio (depends on the RF tuning head)
Spectrum display section
Sweep width: 0 - 3 MHz
Resolution: 10 kHz
Sweep rate: 20 Hz
Marker frequency: at the IF: 30 MHz
Loudspeaker or headphone monitoring
Audio output power: 100 mW (minimum) into 600 Ω load
Audio frequency response: 20 Hz - 20 kHz
Meter: signal strength
Phase lock of the tuned frequency (on the quartz oscillator of the frequency meter)
Push-button link with the chief operator (end of a signal analysis)
Possibility of automatic tuning on the frequency sent by the chief operator (semi-automatic mode).

STATUS

In series production.

AEG-TELEFUNKEN RECEIVERS AND ANCILLARY SYSTEMS

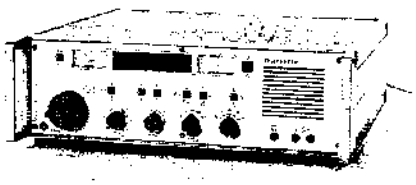
AEG-Telefunken produces a range of receivers and ancillary equipment for monitoring and surveillance applications. The following paragraphs list the salient features of major examples of this range. All systems listed are in current production.

E 1600 VU VHF/UHF Receiver

The receiver E 1600 VU is designed for radio monitoring in the VHF/UHF range up to 1000 MHz and is used in combination with the WAG 1600 panoramic display. This receiver is designed for operation in both fixed and mobile radio monitoring stations.

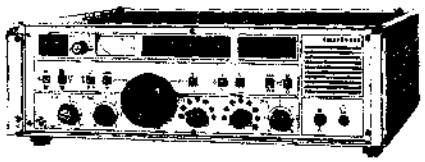
The frequency range from 20 to 500 MHz may be extended without increasing equipment dimensions by inserting a module for frequencies up to 1000 MHz. The receiver is characterised by its compact and rugged construction and by simple operation.

For special purposes the receiver is supplied for a frequency resolution of 100 Hz instead of 1 kHz.



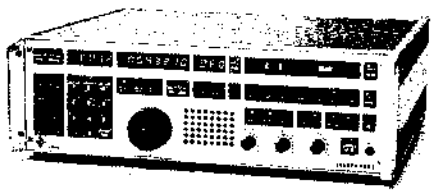
CHARACTERISTICS

Frequency range: 20 - 500 MHz, optional to 1000 MHz

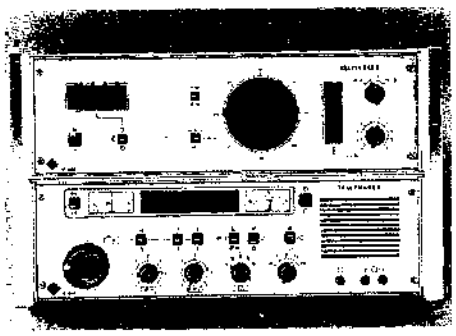


Operating modes

Standard: CW, MCW, AM, FM, pulse modulation



Optional: SSB



E 1600 VU VHF/UHF receiver

E 1700 general purpose receiver

E 1800 general purpose receiver

Telegon 7 direction finder

General Purpose Receiver E 1700

The E 1700 is characterised by high immunity to large signals, easy operation and compact construction. With a high quality input circuit and a very low noise synthesiser, the receiver features large signal characteristics not achieved before. The receiver may be complemented with a passive automatically locked preselector which improves its reception properties, particularly for operation on board ships. The equipment is provided with a 30-channel service data memory. Appropriate plug-in modules are supplied for many further types of service, such as ISB, FSK high data rates and diversity operation.

CHARACTERISTICS

Frequency range: 10 kHz - 30 MHz

Operation modes

Standard: A1, A2, A3, A3J, A3A, A3H

Optional: 6A3B, 6A7B, F1, F4, F6

General Purpose Receiver E 1800

The E 1800 is a service monitoring receiver for the frequency range from 10 kHz to 30 MHz. Its technical features include a remote control facility, a microprocessor control and immunity to large signals. Through a serial data interface, the E 1800 may be controlled remotely in all its functions. By means of an addressing system several receivers may be set by one or more central control panels. Depending on the requirement, all types of normal service in the VLF to HF bands may be demodulated by means of integration. In a service data memory with 100 channels all receiver settings may be programmed. The incorporated microprocessor-controlled scanning unit extends the range of uses and allows, for example, the scanning of fixed programmed frequencies or scanning over a programmable frequency range.

A signal detector makes possible reliable automatic detection of busy frequencies by checking the signal-to-noise ratio. For the selection of different receiving antennas, control signals are available at an additional interface for an external antenna switching panel. A microprocessor-controlled BITE allows rapid checks of serviceability.

CHARACTERISTICS

Frequency range: 10 kHz - 30 MHz

Operation modes

Standard: A1, A2, A3, A3J, A3A, A3H

Optional: 6A3B, 6A7B, F1, F4, F6

VHF/UHF Receiver E 1900

The E 1900 is a search and monitoring receiver for the frequency range from 20 to 500 MHz. The frequency coverage may be extended to 1000 MHz by inserting a plug-in module. Its features are a remote control facility, a microprocessor control and compact construction. Through a serial data interface, the E 1900 may be remotely controlled in all its functions. By means of an addressing system, several receivers may be set by one or more central control panels.

The receiver is designed for the reception of A1, A2, A3, F3, pulse-modulated signals and optionally for A3J signals. In a service data memory with 100 channels all receiver settings may be programmed.

Other technical details are identical with the E 1800 above.

CHARACTERISTICS

Frequency range: 20 - 500 MHz. Optional to 1000 MHz

Operating modes

Standard: CW, MCW, AM, FM, pulse modulation

Optional: SSB

Digital Frequency Measuring Equipment DFM 1500/2

The DFM 1500/2 frequency measuring equipment is used for measuring the frequency of modulated, unmodulated and keyed transmitter signals (CCIR) in the frequency range from 10 kHz to 30 MHz. The measured frequencies are indicated digitally, quickly and accurately. On combination with the type E 1600 receiver and a microwave converter, the frequency coverage may be extended to 1 and 10·5 GHz respectively. Further accessories for digital and analogue registration make it possible to record using suitable printers and recorders and the output of data to computers.

The system provides accurate measurement of frequency, microprocessor-controlled automatic measuring cycle, digital display of results, and digital and analogue output of results for record purposes.

Measurement of F1, F4 and F6 demodulation may be made using the type E 1700 receiver, and diversity reception by means of an antenna diversity combining assembly. Setting reception frequencies, modes, bandwidths and measurement control can be remotely controlled by computer. A panoramic display can also form part of the overall system.

CHARACTERISTICS

Frequency range 10 kHz - 30 MHz

With receiver E 1600: 30 - 500 MHz (1000 MHz optional)

With Microwave converter: 1 - 10·5 GHz

Modes (basic edition): A0, A1, A2, A3, A3A, A3B, A7B, A9B, A3H, F1, F4, F6

Modes on extension above 30 MHz: FM, AM

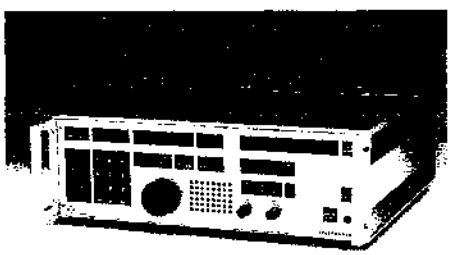
Direction Finder Telegon 7

The Telegon 7 direction finder consists of the VHF/UHF receiver E 1600 and a single-channel DF unit (EP 1650) with a frequency coverage of 20 to 500 MHz. The equipment operates on the principle of the electronically rotating antenna and automatically evaluates the bearing angle. This angle is displayed non-ambiguously in digital and analogue form. In addition the relative field strength is indicated, an advantage on mobile operations.

For mobile and camouflaged operation, the manual control unit HB 1650 is supplied and carries the most important control elements for the single-channel direction finder, and also indicates the bearing angle in digital and analogue form.

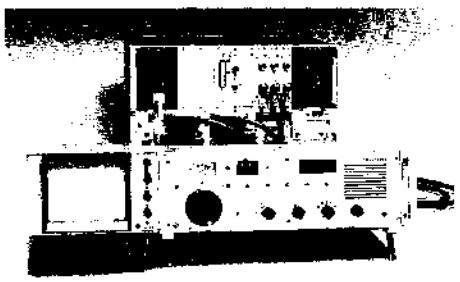
The Telegon 7 may be installed in fixed, semi-mobile and mobile DF systems. Appropriate data interfaces allow the operation of unattended remotely-controlled DF stations.

CHARACTERISTICS



Frequency range: 20 - 500 MHz (1000 MHz optional)

Frequency display: 7-digit LED display



Evaluation of bearing: Digital by integrating phase measurement

Direction Finder Telegon 8

Telegon 8 is a Watson-Watt direction finder with a frequency range from 10 kHz to 30 MHz. It consists of the DF receiver P 1520, control unit BP 1520 and display unit SH 1520. All information important to the

E 1900 VHF/UHF receiver

Telegon 8 direction finder

operator, ie frequency, digital and analogue bearing, are indicated on a single display.

The more important features of Telegon 8 are:

(1) three-channel DF with non-ambiguous sense indication
(2) microprocessor controlled DF procedure
(3) electronic bearing cursor, digital bearing read-out following setting of cursor
(4) HF stability with ten Hz resolution.

An extensive test programme is integrated into the equipment and the operator can test the entire equipment from antenna input to display, step by step. The digital frequency input makes possible the remote control of the direction finder through other equipment, such as receivers. By the use of additional modules, the Telegon 8 may be used in fully automated DF networks.

CHARACTERISTICS
Frequency range: 10 kHz - 30 MHz
Frequency display: 7-digit display on CRT
Resolution: 10 Hz

Active Adcock DF Antenna AK 1205

The mobile basic omni-directional receiving antenna A 1205 was developed to receive vertically polarised waves in the MF and HF bands. Its horizontal pattern is circular and the vertical pattern is cosine-shaped. Active receiving antennas of this type are especially suitable for use in antenna groups and Adcock systems since their mutual coupling is negligibly small and the antennas have excellent amplitude and phase synchronism.

A combination, the Adcock System AK 1205, is particularly suitable for use in conjunction with the AEG-Telefunken receiver system Telegon VI or Telegon 8.

Due to light weight, small stowage space and the low constructional height of the antennas, the equipment is highly mobile and is especially suited for use wherever high mobility is demanded and small terrain space is available.

CHARACTERISTICS
Frequency range: 0·25 - 10 MHz (with 20 m base). 2 - 30 MHz (6 m base)
System error: 1° rms
Construction height: 2 m
Weight of each antenna: 7 kg
CONTRACTOR
AEG-Telefunken, Postfach 1730, 7900 Ulm, Federal Republic of Germany.

4353.153
HUMMEL VHF JAMMER

The HUMMEL jamming transmitter is an automatically responding VHF jamming transmitter for use against voice and data links. The transmitter works as a multi-channel jamming transmitter in look-through operation in which the frequencies to be jammed may be distributed throughout the entire frequency range without restriction.

A computer controlled transceiver consisting of modules from the 'Baustein-program' is the basic unit of the jamming transmitter. Operating modes are:

(1) transmission and reception with manual control
(2) automatic single-channel operation as responding jamming transmitter
(3) multi-channel fixed frequency operation
(4) search operation with multi-channel jamming transmissions.

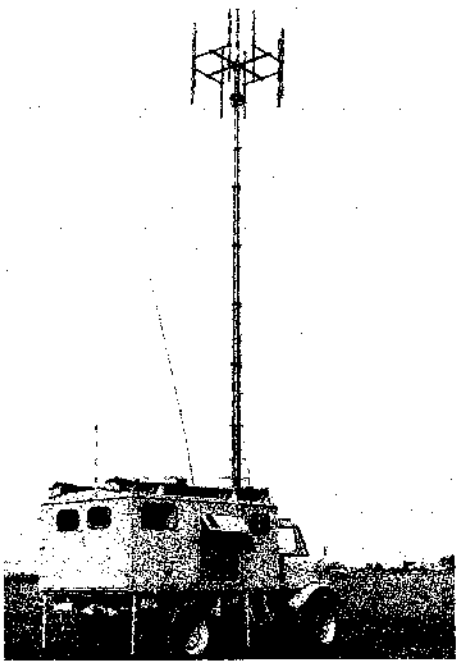
The HUMMEL system is normally installed in an armoured station vehicle with integrated power supply which ensures high mobility and effective operation in the forward edge of the battle area.

Through a remote command system, the jamming transmitter may be connected directly to an Elint centre. All settings needed for this operation may be performed directly at this Elint centre without the operator in the vehicle having to make adjustments. One Elint centre can control several transmitters at the same time.

STATUS
In production and in service with the West German Army.
CONTRACTOR
AEG-Telefunken, Postfach 1730, 7900 Ulm, Federal Republic of Germany.

3536.193
EP 1650 AUTOMATIC VHF/UHF RADIO RECONNAISSANCE SYSTEM

The EP 1650 system consists of a central station, at least three remote DF stations and other equipments. The central station incorporates a computer-controlled search receiver consisting of indicator and analysis receiver for the rapid detection and analysis of radio traffic as well as equipment for the direction of the DF stations and for passing instructions to the monitoring receivers and other equipments.



Technical features include:

(1) recognition of signals present in frequency bands
(2) coarse analysis of new transmissions
(3) DF and position fixing
(4) detailed analysis and monitoring reception
(5) ECM
(6) determination of the times relevant transmitters are on the air.

The search receiver sweeps frequency channels sequentially and in cycles, whereby the reporting accessory detects in a very short time the presence of a transmission and reports the fact to the computer. The computer keeps a file showing the occupancy of the channels and when a new transmission is detected it instructs the analysis receiver to measure the exact frequency. The computer instructs the direction finders in the mobile DF base to take bearings on this frequency. From the bearings determined automatically by at least two DF stations the computer fixes the most likely transmission position.

If the position determined is situated in a definite area then a monitoring receiver is automatically instructed to register or record the contents of the message. The results obtained are available in suitable forms for further processing. The dialogue with the system is performed through a data display station. This dialogue includes both the input of data for the search receivers as well as the printing out of results in formats.

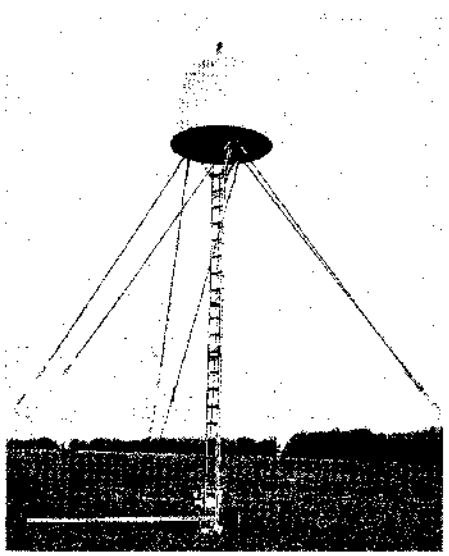
1901.053
ROHDE & SCHWARZ DIRECTION FINDING EQUIPMENT

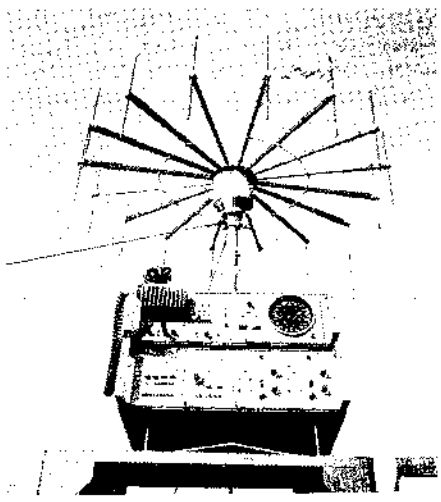


Rohde & Schwarz produces a comprehensive range of radio and electronic DF equipment, embodying a variety of techniques and covering most of the spectrum. Some of this equipment is reviewed in the following paragraphs.

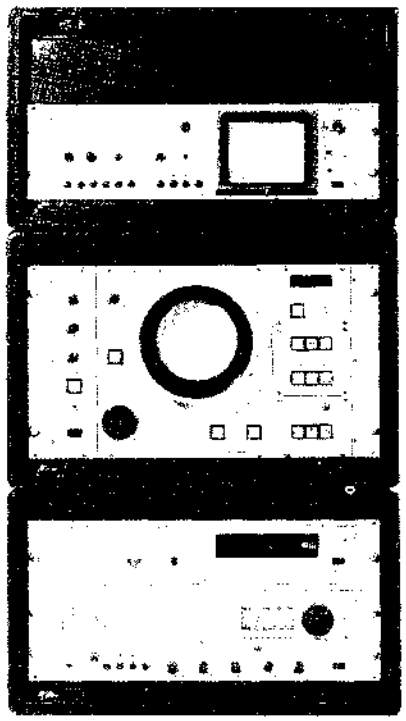
Direction finders operating on the doppler principle are frequently used in the VHF and UHF ranges. In these cases, the DF antenna system consists of a large number of vertical dipoles (16 to 32) arranged in a circle with a diameter of a few wavelengths. To simulate the rotation of a single dipole about a circle, the individual elements are cyclically scanned, thereby producing a frequency modulation of the incoming signal, which can be automatically evaluated. Triangulation systems with unattended direction finders can be realised by using the accessory remote frequency-control or remote bearing-transmission equipment PU 004 or PU 040.

The doppler-type wide-aperture direction finders PA 007 and PA 008 are available for the VHF range and the PA 009 for the UHF range, and are mainly used for air traffic control. For reconnaissance applications, the broadband doppler direction finder PA 055 (see **3532.093**) is recommended for the VHF/UHF range, and model PA 010 for the shortwave range from 0·5 to 30 MHz. The 12-channel VHF PA 022 is designed for coastal use to take bearings of ships and is also suitable for stationary or mobile application against aircraft.

The PA 003 rotating direction finder covers the range 20 to 1000 MHz. Two pairs of log-periodic antennas, and active loop antennas, are used for vertical and horizontal polarisation and are suitable for minimum-signal (differentiating circuit) and maximum-signal DF. The bearing diagram is represented on the screen of a CRT, a manually adjustable bearing graticule being used for determining the exact azimuth.



By means of the data multiplexer PU 004 or PU 040, several doppler direction finders can be remotely controlled and the bearings taken transmitted back via CCITT telephone lines. Rohde & Schwarz provides computer-controlled display consoles for such automatic triangulation systems. These display the result of the triangulation process on suitable



Transportable PA 003 DF antenna unit

maps or include it in a synthesised representation. Such a computer-controlled DF system by Rohde & Schwarz receives RF transmissions in the frequency range 0·5 to 1000 MHz and locates the respective transmitter, if necessary, by triangulation. The system is devised such that it can be assembled and extended in stages, particular importance being attached to the possibility of adding equipment without making other equipment redundant. The complete system contains the following main components: one or more monitoring positions as required, a command and evaluation centre, and DF stations depending on the number or the size and nature of the areas being monitored. The individual radio monitoring and DF stations are interconnected by an audio frequency (AF) and data transmission system with the command and evaluation centre.

Tape recording equipment is provided for the storage of the modulation information. The assembly also contains an AF junction panel to which the telephone set can be connected, and a control unit for linking the monitoring position and central station or DF station. The received signals present at the monitoring position can moreover be transmitted from a command centre to the DF stations via this control unit, thereby ensuring that all stations used for the bearing determination take the bearings of the same transmitter. The central station includes evaluation desks, a control centre with interface, the AF distribution network, and the data transmission equipment. The evaluation desks contain a data display unit for indication of the DF frequency, the direction finders in use, the bearings taken, and for monitoring the data input. The individual units include an alpha-numeric keyboard for control command inputting, data stores, an alpha-numeric printer for printing out the screen contents of the data display unit, a telephone set for the monitoring position and for the radiotelephone traffic to the intercept-on and DF operators, and a DF triangulation display which projects the bearings on to a transparent map. A process computer with peripherals controls the data distribution and storage processes centrally as well as the data display units, the DF triangulation system, and the AF switching network.

5658.153
DIRECTIONAL ANTENNA SYSTEM AC 002

The controllable directional antenna system AC 002 has been designed for radio monitoring tasks in the frequency range 1 to 12 GHz within computer-controlled systems. This antenna system has high gain of 25·5 to 45·7 dB at the output of the driven element and permits simultaneous reception of horizontally and vertically polarised waves as well as small-power transmission.

The highly directive broadband antenna consists of a 2·7 m parabolic reflector and a crossed log-periodic element for horizontal and vertical polarisation. It is set to the desired position by a microprocessor-controlled azimuthal rotator with high angle accuracy. The maximum azimuth run-in speed is 12°/s with a maximum run-in error of 0·1°. The elevation of the basic antenna system can be set manually within a range of ±6° about the horizontal, using a handwheel. A control unit and a distant motor control unit are used for manual control of the rotating equipment; the control unit can either be operated from a computer or integrated in a computer-controlled radio-monitoring system via a bus interface in line with IEC 625-1 and IEEE 488.

Four-digit, seven-segment displays indicate the actual and desired angles. The control unit has a stop button for search operation and switches for setting north or any other reference and for electronic limiting of the rotating range. A self-test facility is incorporated with an LED display for error indication.

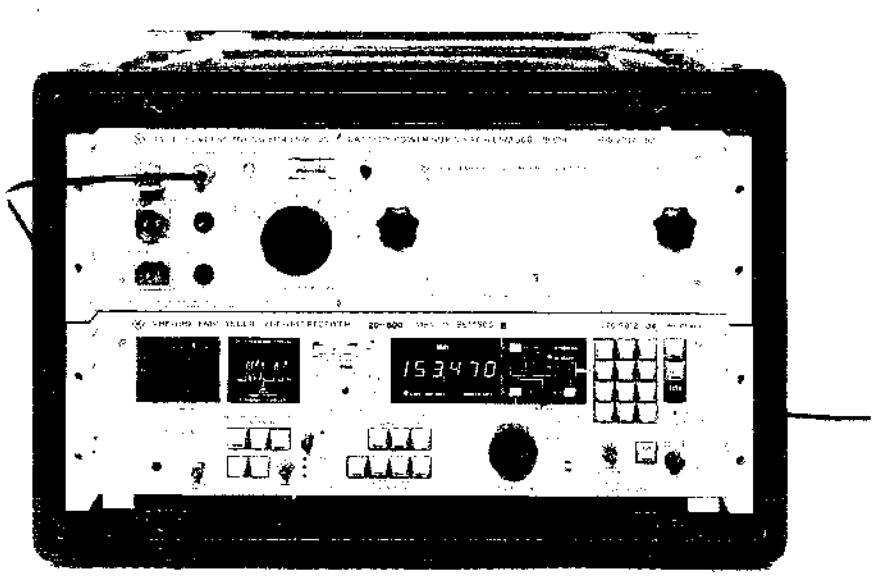
Rohde & Schwarz, Mühldorfstrasse 15, 8000 Munich 80, Federal Republic of Germany.



Directional antenna system AC 002

4138.093
ESM 500 SERIES VHF/UHF RECEIVERS

The ESM 500 is a family of microprocessor-controlled receivers covering VHF and UHF ranges (20 to 1000 MHz) for applications which are primarily in radio detection, radio monitoring and surveillance. It includes broadband desk-top receivers offering a high degree of operating ease and, for use in computerised radio detection systems, hand-off receivers with receive bands tailored to the frequencies of different radio services.

High sensitivity, high overload capability, low oscillator phase noise and tracking input filters provide a wide dynamic range and the high accuracy of frequency tuning is achieved with a built-in synthesiser. Other major features are fast tuning, frequency scanning, non-volatile memory for all the settings associated with up to 99 frequencies, programmed scanning for any of the stored 99 frequencies and BITE for self-testing. The desk-top version, ESM 500A (20 to 1000 MHz), is suitable for use in mobile stations, at manually or remotely controlled observer positions (eg in master-slave operations, one master driving up to ten slaves without a controller), in semi-automatic systems or as

ESM 500B broadband desk-top receiver

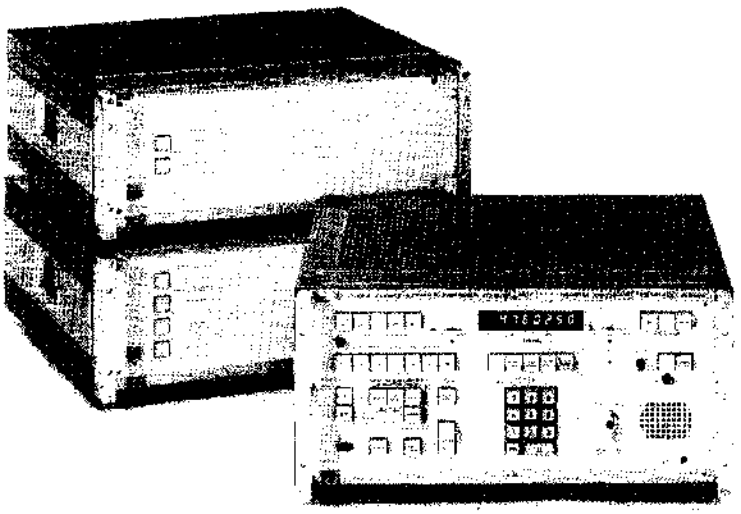
a purely remotely controlled receiver in automatically or centrally controlled monitoring and DF systems.

Frequency tuning is either by a keyboard with a buffer memory and check display, by transfer from an internal memory, by a rotary knob with magnetic locking and stepping increments or externally and remotely by a bus or interface. As tuning aids there are two pointer meters for indicating level and offset, plus a built-in panoramic display that makes a signal visible before it is in the IF receiving bandwidth.

For simultaneous monitoring of large numbers of frequencies there are hand-off receivers ESM 508K, ESM 517K and ESM 540K, which, with their facility for centralised control and supply (as many as eight receivers in a group), can be used to form large-scale, multi-channel monitoring systems. The hand-off receivers are driven with sub-addresses, ie only one main address is required for each group. In this way an IEC-bus controller can handle up to 120 receivers.

STATUS
In production and operational.

CONTRACTOR
Rohde & Schwarz, Mühldorfstrasse 15, 8000 Munich 80, Federal Republic of Germany.



4139.093
ESP SCANNING RECEIVER

The ESP automatic receiver 'intelligently' scans the frequency spectrum at a rate of 1000 channels per second in the range from 10 kHz to 1300 MHz. An optional extension to this frequency range is available and extends the range to 2500 MHz.

The receiver is designed for communications intelligence and radio monitoring and, in conjunction with other equipments such as direction finders, monitoring receivers and printers, general-purpose radio monitoring installations can be established and are suitable for computer-control and provide high detection probability.

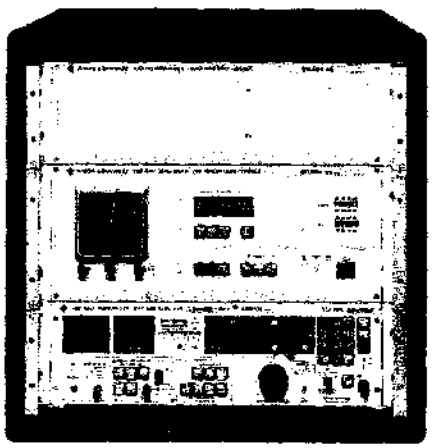
STATUS
In production and operational.

CONTRACTOR
Rohde & Schwarz, Mühldorfstrasse 15, 8000 Munich 80, Federal Republic of Germany.

ESP intercept receiver with ESP-T1 and -T2 tuner units

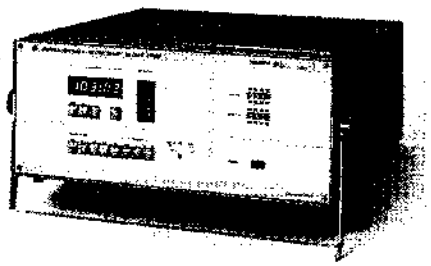
3532.093
PA 055 & PA 010 DOPPLER DIRECTION FINDERS

Rohde & Schwarz has developed the PA 055 broadband doppler direction finder to enable DF and source location as well as detection and signal analysis.



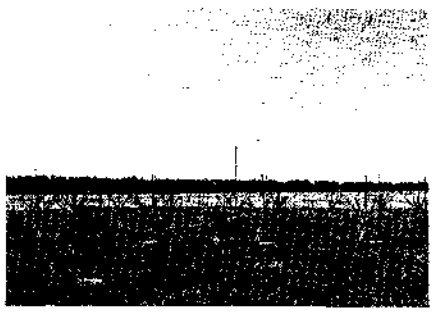
The PA 055 can indicate the direction of a target transmitter to within ±1°. Frequency coverage is from 20 to 1000 MHz, using two antenna systems, one for the band 20 to 200 MHz and the other for the band 200 to 1000 MHz.

The doppler system employed by Rohde & Schwarz is claimed to offer considerable advantages over conventional Adcock systems, including: wide aperture; low bearing error with high angle of incidence or depolarised waves; the possibility of using normal receivers; simple separation of the antenna system from the actual DF instrumentation; digital bearing readout; fully automatic operation; fully remote operation; high sensitivity through the use of an integrating IF summator and a special method of compensating for unwanted frequency modulation in the input signal. In addition to the digital bearing readout, there is an analogue display to permit an assessment of bearing quality. Full remote operation is available. The direction finder can already take bearings of signals as short as 10 milliseconds duration.



PA 010

Engineering advances by Rohde & Schwarz have resulted in what is claimed as the first HF doppler direction finder, the PA 010 which covers the range from 0·5 to 30 MHz. The proven technology applied to the shortwave range offers several advantages, for example: the possibility of taking bearings using high-angle signals (sky waves) and indicating their angle of elevation. All the other advantages of the doppler principle, such as uncomplicated remote-control capability, automatic transmission of bearing data, and immunity to multipath propagation due to the use of wide-aperture antennas, are retained with the new HF system.



STATUS
Both the PA 055 and the PA 010 are in production and operation.

4636.193
ROHDE AND SCHWARZ ANTENNA SYSTEMS

In addition to the equipment and systems detailed elsewhere in this section, Rohde and Schwarz design and manufacture a wide range of antenna systems, many of which are used in the ELINT and ESM fields.

VHF/UHF Coaxial Dipole HK 014

This is a vertically polarised broadband omni-directional antenna (100 to 1300 MHz) suitable for transmission and reception. As a transmitting antenna, the dipole is suitable for CW operation of 400 W maximum up to 400 MHz, and of 200 W over the total range. The VSWR of this coaxial dipole is better than 2 over the total frequency range, the typical maximum value being 1·8. It is especially suitable for shipboard installation.

Crossed Log-periodic Antenna HL 037

Log-periodic antennas are especially useful for wideband measurements and monitoring of RF signals. For reception and identification of signals with the two most common types of polarisation (horizontal and vertical) in the VHF/UHF range, the HL 037 consists of two orthogonally arranged radiator systems so that both types of polarisation can be received simultaneously. The HL 037 can also be used for low-power transmission (100 W). The antenna is suitable for semi-mobile use, has a wide frequency range from 25 to 1000 MHz and has almost frequency-independent radiation patterns.

Active Rod Antenna HE 010

The HE 010 has excellent receiving characteristics achieved by careful matching of the passive antenna structure to the active circuitry. It has a wide frequency range from 10 kHz to 80 MHz and is optimised for maximum dynamic range (high sensitivity and excellent large-signal characteristics).

Active Receiving Dipole HE 202

This is a high sensitivity, lightweight, small dimension antenna with a dipole length of only 515 mm, and a weight of 1·7 kg. It covers the frequency range 200 to 1000 MHz and has a high immunity to non-linear distortion.

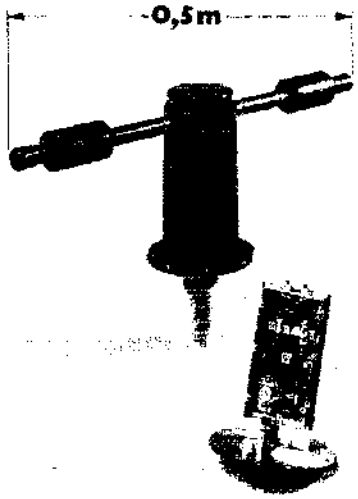
Active Receiving Dipole HE 302

This is a high sensitivity, lightweight small dimension antenna with a dipole length of 1000 mm, a weight of 2·5 kg and a frequency range of 20 to 500 MHz.

Active Antenna Systems HE 003, 004, 005, 006

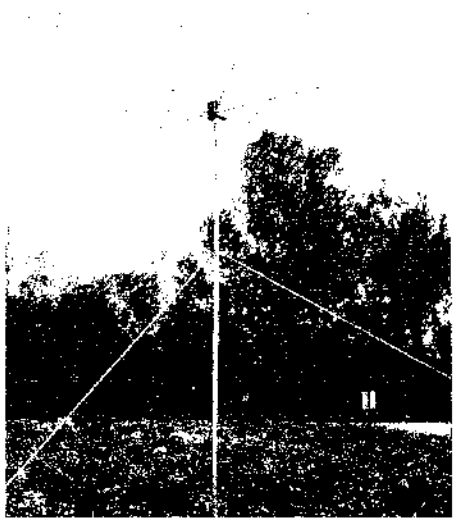
These antenna systems are a combination of the Active HF Rod Antenna HE 010 and one or two horizontal Active HF Dipole Antennas HE 202. Two dipole antennas can be interconnected via a 90 degree coupler to produce an omni-directional antenna pattern for the reception of horizontally polarised signals. Frequency range coverage is from 1·5 to 30 MHz.

Active Antenna Systems HE 112 and HE 115



The HE 112 and HE 115 are small dimensional, high sensitivity antennas covering the frequency range 20 to 200 MHz. They are combinations of the Active Vertical Dipole HE 109 and one or two crossed Active Receiving Dipoles HE 101.

STATUS



In full production and operation.

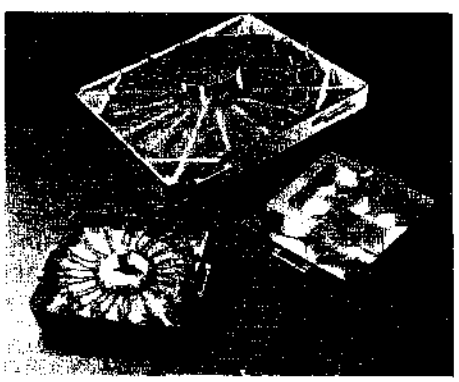
4637.193

PA 510 MOBILE DIRECTION FINDING SYSTEM

The PA 510 is a vehicle mounted mobile DF system. Frequency range is from 1 to 30 MHz with a narrow bandwidth of ±75 Hz, and a 3-digit readout of instantaneous value or average value plus standard deviation. Excellent results are claimed up to elevation angles of 30 degrees. The antenna can be set up on a tripod and operated remotely to avoid any adverse effects caused by the vehicle.

The vehicle also contains the VHF/UHF DF system, PA 555, which is a mobile version of the PA 055 direction finder (**3532.093**) and has similar characteristics. It has a frequency range of 20 to 1000 MHz.



Only three antennas are required to cover the complete frequency range from 1 to 1000 MHz.

STATUS

PLATH DIRECTION FINDING SYSTEMS

C Plath GmbH of Hamburg manufactures a number of automatic and manually operated direction finding (DF) systems. These include DF nets and systems for very long wave to microwave range, stationary and mobile systems, and special receivers and antennas. Three examples with brief details are listed below.

Type 1160 VHF DF System

This is an automatic, remote controlled system for the frequency range 20 to 80 MHz, but extensible to 180 MHz. The complete system consists of three vehicles fully equipped with: DF systems and a central station which controls the complete operation, receives the bearings and plots the transmitter position by the normal triangulation method. Each bearing station is equipped with a three-channel DF receiver and associated equipment, with a telescopic mast antenna mounted on top of the vehicle. Although designed primarily for remote operation, each mobile station can be manually operated if required. The system is capable of taking bearings on both very weak and short period signals.

SFP 7200 Visual Direction Finder

The SFP 7200 radio direction finder consists of a DF receiver and the necessary antenna system, and is designed for automatic DF over the frequency range 10 to 3999·9 KHz. Tuning to the received frequency is achieved by means of a frequency synthesiser in discrete steps of 100 Hz, with crystal-controlled accuracy. The employed frequency is shown as a digital LED display on the front panel. Bearing measurement of the received frequency is automatic in the form of a line on the front panel CRT display whereby the quality of the signal and the presence of possible interfering signals can also be seen easily. The SFP 7200 is normally used in shipborne applications.

KE 393 Miniature DF Receiver

This is a miniature lightweight receiver used for taking DF measurements for a variety of purposes, particularly for monitoring in the long, medium and shortwave ranges. Applications include mobile use and with its small size and weight the receiver can, for example, be hidden under the coat of the operator, with a DF antenna placed in the back of the coat. It is supplied complete with a 220 V mains power supply, a battery pack, earphones and a carrying case. Weight of the unit is 2 kg and the dimensions are 140 × 55 × 230 mm.

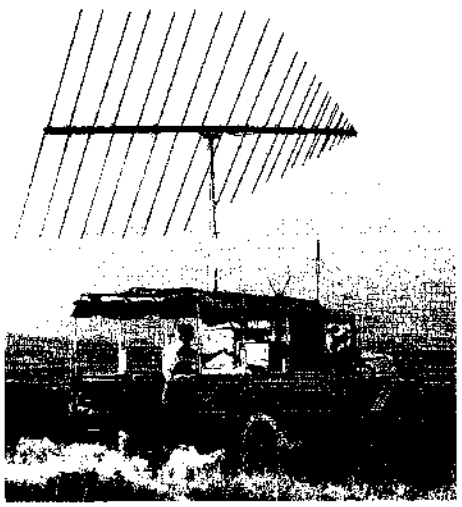
ELTA GROUND-BASED EW SYSTEMS

Elta Electronics, part of Israel Aircraft Industries, has disclosed an extensive capability in ground-based electronic warfare systems. These are mainly concerned with intelligence gathering and jamming. Details regarding some of these systems are given below. In addition the EL/L-8300 series of equipments, which are primarily designed for shipborne applications, can also be used in the land-based role. Information on these is given under entry **5841.253**.

COMINT Receivers

For radio monitoring Elta has developed a range of digitally-controlled receivers. The EL/K-1150 is a VHF/UHF equipment operating over the frequency range 20 to 500 MHz and the EL/K-1160 is an HF system covering 0·5 to 30 MHz. Both are synthesised receivers incorporating internal microprocessors to enable local or remote control, and a variety of operational roles such as auto-scan and preset tasks according to remotely controlled programmes.



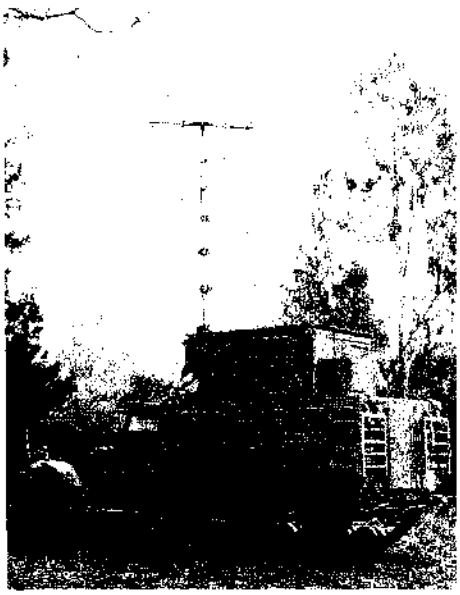
The EL/K-1250 is a compact synthesised receiver operating in the 20 to 510 MHz band. Its main use is as a basic building block for larger COMINT or EW systems. The equipment demodulates AM, FM, CW and SSB signals, employing four selectable IF filters. Operation is by digital remote control.

EL/K-7001 Communications EW System

The EL/K-7001 is designed to provide close communication intelligence and jamming support at tactical levels. The system consists of two units; the EL/K-7001RC receiving and control unit and the EL/K-7001T transmitter. The EL/K-7001RC incorporates a compact VHF/UHF receiver and microprocessor control circuitry, with a CRT display and keyboard in the front panel permitting convenient data presentation and operation. The EL/K-7001T includes a solid-state wideband transmitter operated by remote control from the EL/K-7001RC. Operating frequency is from 20 to 500 MHz receiving, and 20 to 90 or 100 to 400 MHz for transmission. Normal transmitter output power is 400 W, although up to 1 kW can be provided.

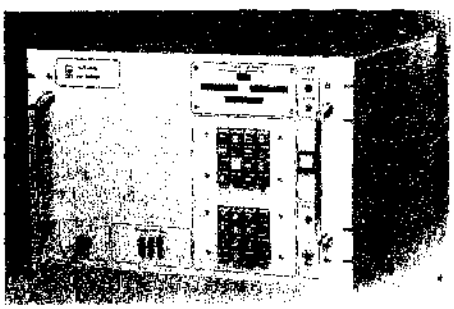
Elta COMINT receivers

EL/K-7001 communications EW system



The system is intended for either COMINT operation using only the EL/K-7001RC or both COMINT and COM-JAM activities. A direction finder unit is available to enable more comprehensive COMINT operations. The EL/K-7001 is normally installed in light vehicles, such as jeeps and armoured cars, but is also suitable for installation in light aircraft, helicopters and boats.

EL/K-7010 VHF Communications Jammer



The EL/K-7010 is a VHF communication jammer of modular construction with microprocessor control which is primarily designed for ground-based mobile use. It employs the EL/K-7012 exciter which offers multi-task simultaneous jamming and selectable modular transmit modes to allow communication with friendly forces, free of interference. This system has now been developed for use in naval vessels and small transport aircraft.

EL/K-7012 Communication Jamming Exciters

The EL/K-7012 series of exciters is intended to generate the low level RF signal, further amplified by a power amplifier, for communications jamming purposes. The series consists of three units; EL/K-7012 operating over the frequency range 20 to 100 MHz, EL/K-7012A from 0·5 to 30 MHz, and the EL/K-7012B from 100 to 400 MHz. Each exciter contains two signal generators, a modulation signal generator and an RF synthesiser. Remote control is normally used since the exciter is designed to operate as a basic element of larger ECM computerised systems.

EL/K 7010 VHF communications jammer

EL/K-7012 jamming exciter

EL/K-7020 EW System

This is a command and control centre deployed at divisional or higher level. Its capabilities consist of automatic search and acquisition, target location and identification, preset tasks monitoring and interception, and countermeasures management by remote control over several EL/K-7010 or equivalent systems. The system is modular and expandable according to requirements.

RAJ 101 GROUND RADAR JAMMER

The RAJ 101 is a ground radar jammer covering 180 degrees and ranges of up to 30 km. The system uses a high ERP jammer and wide frequency band, and is capable of dealing with three threats simultaneously. In the acquisition mode, RAJ 101 measures frequency, direction, PRF, pulse width and amplitude in order to detect, identify and locate hostile radars. The information collected can also be used for battle analysis.

The high power jammer operates in fully automatic or semi-automatic mode. Frequency and direction are set up to prevent hostile radars from detecting and locating friendly forces. The system is completely self-contained, is vehicle mounted and able to operate and travel in extremely rugged terrain.

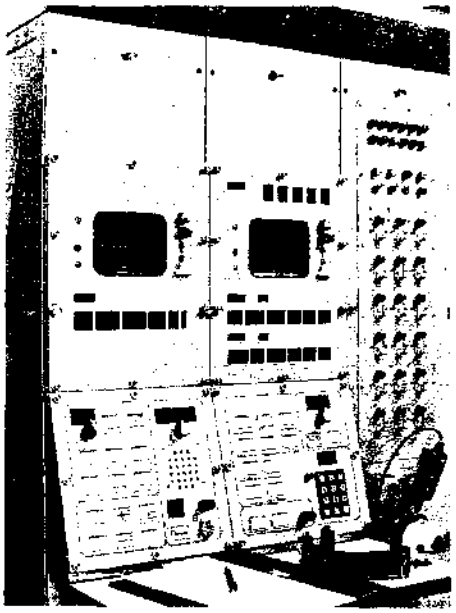
TIMNEX-4CH AUTOMATIC ELINT/ESM SYSTEM



The Timnex-4CH system is an Elint/ESM receiver intended for intercepting radar signals and for operating in land, sea or airborne environments. It covers the frequency range from 2 to 18 GHz and is designed to intercept simple or complex transmissions and to sort and compare them with a preprogrammed radar library.

The system features a channelised IFM receiver, a sophisticated IDF sub-system and real-time computer processing. Tabular display of the signal parameters with instantaneous spectra and gonio displays are presented to the EW operator. Hard copy print out and data logging on magnetic media are additional features.

Timnex-4CH has been designed to intercept radars at a range of several hundred kilometres. By making several measurements during a known path, computations of the radar location are carried out to provide a full tactical picture of the area. The data acquired may be either used in the vehicle or transmitted to ground/shore control stations by data link. Processed information is displayed on a 19-inch (483 mm) colour raster display in several desired cross-sections.

CONTRACTOR

Elbit Computers Ltd, Military Systems and Products Division, Advanced Technology Center, PO Box 5390, Haifa 31053, Israel.

CR-2740 ELINT SYSTEM

The CR-2740 is a mobile electronic intelligence (ELINT) equipment intended primarily for use in the forward battlefield area. It covers the frequency range from 500 MHz to 18 GHz, and consists of a two-man operations cabin, upon which is mounted a high frequency antenna system, and a trailer carrying a low frequency antenna.

The cabin is a standard S280 shelter, suitable for transport on a variety of vehicles, with two 1·2 metre diameter antennas mounted on top which are used for reception in the 4 to 18 GHz band. A 3 metre diameter antenna for the 500 MHz to 4 GHz range is mounted on the trailer. The two operators, using basically identical equipment, monitor the two bands individually. Most of the data acquired is computer analysed.

Although the system is designed as a mobile forward listening post, the control cabin can be remoted from the antennas, with cable or radio links, for semi-static use.

STATUS

In operational service.

AT-4910 COMINT/JAMMING SYSTEM

The AT-4910 is a combat jamming and communications system designed for one-man operation in a number of applications. It is vehicle-mounted to provide high mobility and fast deployment. Frequency coverage is 20 to 100 MHz, 100 to 200 MHz and 200 to 400 MHz, although other bands are also available. The system operates in three modes; communication jamming, a high-power radio station with an output of 400 W, and as a two-way radio relay.

The AT-4910 panoramic receiver covers the frequency range 20 to 500 MHz and provides COMINT surveillance and panoramic monitoring during jamming. The control unit includes all controls, audio and RF switching for the various operation modes, and voice and jamming modulations.

CONTRACTOR

Elisra Electronics Systems Ltd, 48 Mivtza Kadesh St, Bene Beraq 51203, Israel.

ITALY

4645.093
ELT/128 COMMUNICATIONS DIRECTION FINDER

The ELT/128 is a direction finder, suitable for airborne, ground and naval applications, operating in the HF, VHF and UHF frequency bands. The equipment automatically measures direction of arrival and technical analysis of any kind of signal modulation in the requisite bands. ELT/128 is currently in use on a stand-alone basis in ships and land vehicles, and in integrated ESM systems.

The system consists of an RF unit, control unit, control panel and antenna assembly, the last being tailored to suit the required band coverage, platform and application (fixed or mobile). For the HF band the antenna assembly normally consists of half-dipoles for fixed or transportable applications, and crossed-loop ferrites for mobile work. For VHF/UHF an array of active dipoles for naval or ground applications and active half-dipoles when integrated in ESM/COMINT airborne systems.

Outputs are provided for use in a display unit and a printer for sequential printout.

STATUS

In operational service.

ISIS SIGINT SYSTEMS

ISIS is the name of a series of SIGINT systems developed by Elettronica for ground, naval and airborne applications. They feature the latest technologies and have been designed to intercept and analyse complex and sophisticated radio and radar signals, even in very dense electromagnetic environments. The series consists of ISIS-A for airborne applications, ISIS-G for ground and ISIS-N for naval work, and all systems cover the frequency range from VHF to J band. The systems have a high degree of commonality but have been optimised for the individual operational role.

The SIGINT-G system is a powerful data collection and analysis equipment capable of continuous operation on a 24-hour basis. It is modular in design to allow for expansion, and adaptation of the configuration to an individual operator's requirements. It can be operated in conjunction with radio-link connected mobile slave DF stations to allow emitter location through triangulation.

The SIGINT-A configuration has been designed for installation on medium to large aircraft employed in strategic missions. The system antenna can be integrated easily with the fuselage.

ISIS-N is the naval version and can be integrated with existing EW systems on board practically any warship. It can also be supplied with its own dedicated antenna assembly. It will supplement the ship's normal ESM equipment by providing over-the-horizon targetting features, as well as the data measurement and analysis features.

A number of intercept and analysis modules can be added to the basic systems. These include an extension of frequency covered into the millimetre band, a system to recognise messages of interest in radio-link traffic, and the provision of an HF frequency coverage in the ISIS-G and ISIS-N systems.

CONTRACTOR

Elettronica SpA, Via Tiburtina Km 13700, Rome, Italy.

3526.193
IGS-1 MOBILE INTEGRATED ECM SYSTEM

The IGS-1 is an ECM system mounted on a trailer, and intended to be part of a major EW system. It is capable of autonomous data collection, analysis and reaction, as well as co-ordinated operation with a command and control centre, where intercepted data are received and orders are generated.

The system is driven through RQN-1B radar intercept equipment (**3343.253**), which is a wide open receiver with omni-directional coverage, providing direction of arrival, pulse-width, PRF and frequency band measurement. The same parameters are available in digital form on the PAW-1 pulse analyser and warner, where threat radars can be programmed as such for a prompt evaluation and reaction. Digitised data are sent via radio link or telephone cable to the co-ordination centre. Bi-directional voice

communication is possible, and orders can be received through the same way.

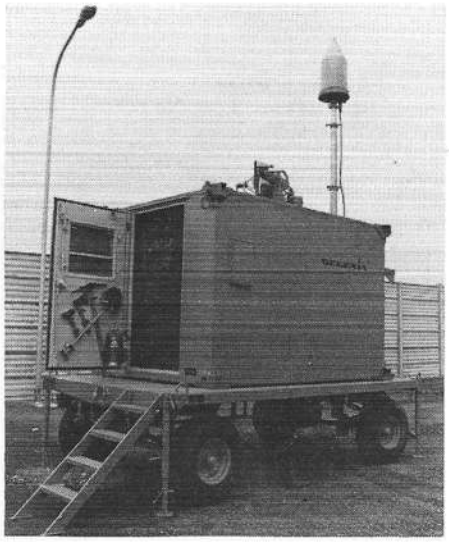
The TQN-1 jammer provides the active reaction against the threat. A highly directional antenna is tracked on the target and the jamming is deployed to deny the use of airborne or surface radars.

All equipments composing the system are fitted in an operational console, housed inside an air conditioned shelter. A trailer with wheels suitable for rough and soft terrain is supplied.

A reduced configuration of the IGS-1 system is also available, installed in a smaller shelter and carried by a Land-Rover (long wheel base) vehicle. This configuration includes only the ESM section of the system, with the addition of a computer based radar identification facility.

Land-Rover mounted version of Selenia IGS-1P ESM system

CHARACTERISTICS



ESM section: RQN-1B/PAW-1
Frequency coverage: D - J-band
Azimuth coverage: Omni-directional
Elevation coverage: -10 to +20°
D/F accuracy: 5° RMS
ECM section: TQN-1X
Frequency coverage: I/J-band
Antenna: High gain
Polarisation: Dual
Jamming: Noise
Precision frequency/angle tracking of selected targets
Identification: RIN-P
Library capacity: Up to 3000 radar modes
Identification: Weighted comparison
Processing time: 1 s
Communication: RP-1
Modulation: FSK (1200 baud), voice, TTY

STATUS

In production and operational in several countries.

SELENIA ELECTRONIC SURVEILLANCE SYSTEM

The Selenia Electronic Surveillance System is an ESM system, carried on a Mercedes Unimog type vehicle, and is mainly designed for coastal and battlefield surveillance, as part of a major EW system. Radar emissions are intercepted by RQN-1B radar intercept equipment (**3343.253**), which is a wide open receiver with omni-directional coverage, providing direction of arrival, pulse-width, PRF and frequency band measurement. The same parameters are available in digital form on the PAW-1 pulse analyser and warner, where threat radars can be programmed as such for a prompt evaluation and reaction. A monopulse antenna system is slaved to the RQN-1B handwheel, and feeds an FBR-1 fine bearing receiver for azimuth measurement with high accuracy. At the same time the FR-1 frequency receiver performs spot frequency measurement.

The RP-1 remoting panel allows exchange of information between the surveillance system and the co-ordination centre via radio link or telephone cable. Bi-directional voice communication is also possible.

The sub-units are fitted in an operations console, which together with the remaining ancillaries is housed inside a NATO 1 type shelter with air conditioning and provided with suitable lifting and levelling devices.

CHARACTERISTICS

Frequency coverage: 1 - 18 GHz
PRF measurement range: 50 - 50 000 Hz
PW measurement range: 0·1 - 50 μs
Azimuth coverage: 360°
Power requirement: 8 kVA, 380 V AC ±10%, 4 wires (with air conditioning) 50 Hz ±10%

STATUS

In production.

ESS-2 ELECTRONIC SURVEILLANCE SYSTEM

ESS-2 is a mobile integrated surveillance and analysis system designed to operate against ground-based radars, and for coastal and battlefield surveillance against shipborne and airborne radars, as part of a major EW network. It provides high detection probability, high accuracy emitter bearing, optional parameter measurement and identification, and gives instantaneous threat warnings. The system can operate on a stand-alone basis, or it may be integrated into a wider ESM/ECM network.

The hardware is installed in a standard NATO air-conditioned shelter which can be mounted on a suitable vehicle for transportation or mobile operation.

CHARACTERISTICS

Frequency coverage: L to Ku-band
Warning channels: 8 or 16
Azimuth coverage: 360°
Maximum displayed identities: 15
Identification library size: 1000, 2000 or 3000

STATUS

In production and operational use in several countries.

SPECTRA ELINT SYSTEM

Signaal has developed a communications intercept and monitoring system covering the LF, MF and HF frequency bands, with an option to cover the VHF and UHF bands. The system is normally operated as a net with several modular designed monitoring stations, tailored to individual requirements, each being equipped to perform specific tasks.

Spectra is intended for emission interception, analysis and storage, as well as emitter location using direction finding techniques. It is completely computer-controlled with operator positions for the monitoring and analysis of voice, telegraphy or facsimile messages. All components are controlled via keyboards and displays from the operator positions.

SIMRAD RL1 LASER WARNING DEVICE

The Simrad RL1 laser warning receiver detects radiation from pulsed laser rangefinders and target markers. The instrument can detect pulsed radiation within the 0·66 to 1·1μm near infra-red band, covering the most common types of pulsed lasers (ruby, GaAs, neodymium) currently being used in rangefinders and target markers. The instrument does not detect continuous radiation.

A detector unit mounted on top of the vehicle has a 360° field-of-view and can in addition detect radiation coming from above. An indicator unit is mounted inside the vehicle. It indicates the approximate direction to the radiating source by means of light-emitting diodes mounted in a circle. Eight 45° sectors are indicated. A ninth emitting diode mounted in the centre indicates radiation received from above. Due to the overlapping fields of view, a total of 17 sectors can be indicated.

The receiver will give an acoustic alarm consisting of a pulsed audio signal in the crew's intercom when a laser pulse is detected. The duration of the alarm is two seconds for a single laser pulse. When more than one pulse is being detected the alarm stays on as long as laser pulses are being received.

CHARACTERISTICS
Detector unit
Number of detectors: Horizontal: 4; Vertical: 1
Detector field of view: 360°
Type of detector: PIN photodiode
Optical bandwidth: 0·66 - 1·1μm
False alarm rate: <10^{-3}/h
Indicator unit
Resolution: Horizontal: 45°; Vertical: 45°
Number of sectors: Horizontal: 8; Vertical: 1
Display brightness adjustment range: >100 X
Duration, acoustic alarm: 2 s
Duration, display: 8 s
Operating voltage: 20 - 32 V (24 V nom)

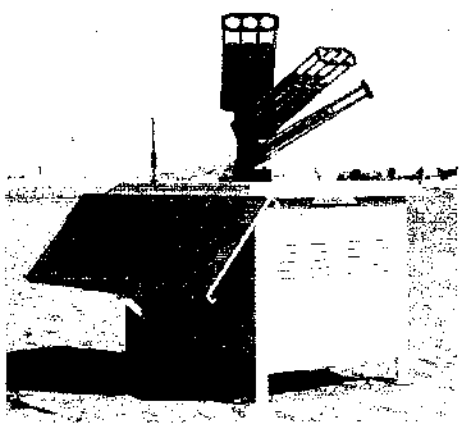
RAMPART



Rampart is designed to give protection to key military areas such as airfields and missile sites against air attacks and is believed to be the world's first passive defence system for this purpose. It is based on a number of individual firing units which are radio controlled by a compact transmitter from a single central convenient position. Any combination of defensive measures can be activated instantly at any time and up to a range of 4 km.

A complete Rampart system is inexpensive, requires a minimum of personnel and is at immediate readiness for action at all times. It provides protection against manned aircraft, laser and TV guided missiles by the rapid emission of smoke; against heat-seeking missiles by infra-red decoys; and against aircraft and missile radars by chaff decoys. It also offers a unique defence against low-level aircraft attack by the quick release of a mass of 'Skysnare' airborne tethered obstructions which provide a formidable obstruction and which can remain aloft indefinitely. A series of Skysnare balloons is placed around a target area and, because of the kite-like design, will hold station even in the lightest wind. Attacking aircraft will be caused severe weapon aiming and delivery problems and will be forced to climb to an altitude which will expose them to active defence systems.

Firing stations are portable, self-contained, solar-powered units, each capable of firing nine rocket decoys (chaff or infra-red), nine smokes and three 'Skysnare' obstructions. Rapid or slow burning black and white smoke is available to give both immediate area coverage and sustained coverage thereafter. The 'Skysnare' system consists of a balloon, 300 m of strong line, case, ground anchor, a gas cylinder and pyrotechnic inflation and release. It is at continuous readiness and can be fully deployed within two minutes by radio signal.

A Mk II version is now available designed to meet NATO requirements. This version is man-portable and has an anti-jamming frequency-hopping facility option in addition to a new infra-red screening smoke back-up to complement the existing decoy features.

STATUS
In full production. A £4 million order has been received for the complete system, including Skysnare.

SENTRY ESM SYSTEM

Sentry is a family of mobile land-based ESM systems designed for intercept and analysis of the high and low frequency bands used by radars employed in battlefield surveillance, mortar locating, forward SAM and airborne applications. The family is based on a modular design such that systems ranging from simple radar intercept equipments to full ESM systems comprising land mobile individual and master/slave radar information gathering units can be provided, complete with advanced communications facilities.

Sentry I utilises crystal video techniques to provide tactical warning to field commanders, and Sentry II employs swept superheterodyne techniques to gather strategic electronic order of battle data for corps and army commander. In the latter role, Sentry would provide a C³I gathering service.

The Sentry equipment consists of:
(1) radome mounted antennas
(2) ESM receivers, processors and recording facilities in sealed compartments
(3) control and display units
(4) radio links
(5) power generators and air conditioning.

The system is normally installed as a completely self contained equipment in a Land-Rover type vehicle but can be configured for other vehicles. In the larger systems facilities can be included to feed in radar information collected by aircraft and other sources.

STATUS
In development.

TYPE 405J MOBILE ECM EQUIPMENT

The ground-to-ground mobile ECM equipment, Type 405J, is a transportable ground jammer which includes an ESM receiving system to detect and analyse the characteristics of a victim radar and an ECM system which provides various types of jamming to combat the victim radar. The equipment is designed to fit into a long-wheelbase Land-Rover which also carries the appropriate receiving and transmitting antennas on a folding mast. The antennas can be adjusted in azimuth and elevation to point towards a chosen victim radar.

The receiver sensitivity, assuming free space propagation conditions and the radiated power output of the jammer, allows the equipment to operate at ranges up to 100 km from a victim radar.

The 405J can be supplied to cover any one of four frequency bands: 1 to 2 GHz, 2 to 4 GHz, 4 to 8 GHz and 8 to 16 GHz. Low jamming-power versions are available to provide a mobile autonomous ECM simulator. The equipment can be located within a few kilometres of an operational radar to give realistic ECM training for radar operators by generating RF signals corresponding to targets and jamming for radiation into the operational radar antenna. High jamming-power versions are available for operational use.

The equipment rack is mounted in the rear of the Land-Rover and there is space for two operators. A portable power supply generator and cables are stored in the rear of the vehicle during transit. Each equipment unit is mounted on slides for easy removal for maintenance. Deployment of the equipment normally takes 10 to 15 minutes and a similar time is taken to dismantle and stow the equipment for transit.

The ESM receiving system, with its processing and display unit, analyses received signals and displays radar parameters in terms of pulse length, PRF, dwell time, radar antenna rotation rate and corrected bearing. The transmitter/receiver control unit receives inputs from the processing unit and generates the selected ECM and target waveforms required by the transmitter. Types of ECM that may be selected include:

(1) CW (spot frequency)
(2) Swept CW (bandwidth controllable)
(3) FM Noise (bandwidth controllable)
(4) Pulse (PRF and pulse length controllable).

The equipment also has the capability to produce false targets in both range and velocity. The Type 405J system is designed on a modular basis and various types of ECM facilities can be included to meet particular customer requirements.

STATUS
In production and supplied to various users.

Type 405J ECM equipment deployed on Land-Rover

3373.053
TYPE R505 ECCM RECEIVER

The R505 receiver is designed to be added easily to or included in new design ground radar equipments. It is compatible with all types of pulsed radars having pulse lengths of 0·2 to 1·5 μs and operates at an intermediate frequency of 60 MHz. Converter units can be provided for operation at other intermediate frequencies. The receiver should be used with a preamplifier having an adequate bandwidth (greater than 12 times the optimum for the pulse length of the radar) and good resistance to saturation and paralysis effects.

It is constructed in a single equipment frame which can be rack-mounted or free-standing and provides a compact unit which, including its associated power supply, occupies a single 480 mm wide rack. The front panel of the receiver contains all the required operator control switches and indicators. Processing circuits are contained in either plug-in printed circuit cards or modular box assemblies for ease of maintenance. The R505 remote control unit is small and compact with height 187 mm, width 120 mm and depth 70 mm. Its weight is 680 g.

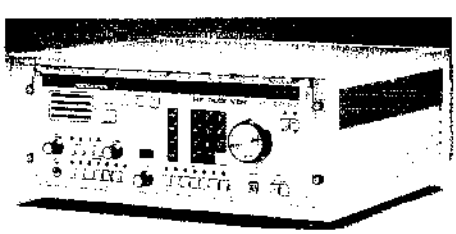
Type R505 can be added to radars whether or not they are fitted with MTI, frequency agility or automatic plot extraction. Further features include short radar pulse operation, dual pulse length capability and dual polarity video outputs. The receiver also provides increased sensitivity under practical conditions of clutter, interference and jamming, for short pulse radars together with a high degree of reliability.

The equipment provides ECCM operation and functional circuits can be selected to provide the following modes:

(1) Linear receiver
(2) Optimised logarithmic (narrow band)
(3) Logarithmic (wide band) with pulse length discrimination
(4) Dicke-fix
(5) Quantised Dicke-fix
(6) Combined logical receiver.

Differentiation (FTC) may be selected with linear or optimised logarithmic as further video processes. Anti-logarithmic may also be selected with logarithmic outputs to expand further the video contrast. Pulse length discrimination is selected automatically with logarithmic (wide band). It can also be selected with the combined logical receiver wide band logarithmic, and gated by quantised Dicke-fix.

Comprehensive remote control facilities are built into the R505 receiver and allow separation of up to 1000 metres between the receiver and the operator's remote control unit.



STATUS
In production and supplied to a variety of users around the world for incorporation in radars of both British and foreign manufacture.

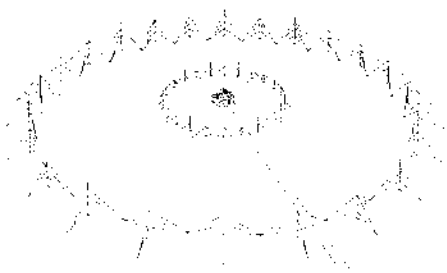
PLESSEY HF MONITORING EQUIPMENT

PRS 2282A HF receiver

The PRS 2282A communications receiver is a fast, fully synthesised HF receiver with a frequency range of 10 kHz to 30 MHz, using keypad and tuning control. Designed to meet the needs of communications and monitoring, it is of modular construction with built-in test equipment. In addition to the standard features of an HF receiver it includes ISB with individual AGC on each sideband, synthesiser BFO with displayed and adjustable offsets, carrier derived AGC, diversity operation (master or slave), FM demodulation, and a signal path performance providing excellent reception even in the presence of interfering signals. The equipment has a noise factor of 10 dB throughout the frequency range.

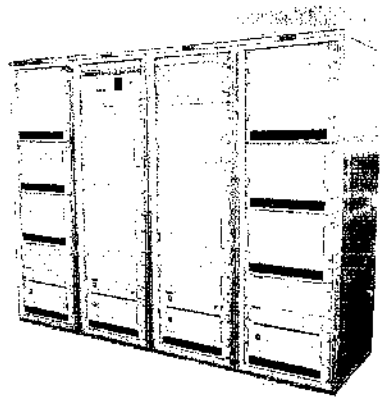
PRS 2282A HF receiver

PRS 1120 HF multi beam antenna array



This antenna array covers the frequency range from 1·5 to 30 MHz and provides a highly cost-effective solution to the problem of frequency and directional agility. Beam forming and 360 degree coverage make this array ideal where space is limited and rhombic antenna performance is required.

HF antenna switching matrix



This equipment incorporates the Plessey high performance PRS 2230 series of low noise HF amplifiers and antenna multicouplers which, for the majority of military users, are assembled in various combinations to meet particular operational requirements. Low voltage operation allows a quantity of equipment to be fed by the minimum AC power supply units. The system can be adapted to accommodate antenna switching to almost an unlimited number of outputs. Control of the matrix is from a remote supervisory panel or, in the case of the Plessey PRS 2282 HF receiver, from the front panel.

CERES COMMUNICATIONS MONITORING SYSTEM

Developed by Rediffusion Radio Systems Ltd in response to a British Government requirement, CERES (computer enhanced radio emission surveillance) provides for communications monitoring in the frequency range 15 kHz to 30 MHz.

A typical system provides monitoring facilities for a team of six operators, each equipped with a console for remote manual and computer control of four receivers and associated equipment, including antenna selection units and two four-channel special purpose tape recorders. Incorporated in the console is a visual tuning aid for each receiver, and audio selection and control circuits for each receiver and tape recorder. The receivers, antenna switching, receiver memories, minicomputer, tape recorders, time-code generator and a disc store, are located as remote equipment in an optimised environment. Automatic control of the remote equipment by the computer is made by means of a visual display unit, which is also used for the transcription of received information. Hard copy is provided by an associated needle printer sited in the console control room.

Rediffusion CERES communications monitoring system in use

The range of operational tasks that can be carried out by the CERES system is wide, and includes monitoring of a precise frequency, narrow band or wide band search, and other functions. Each operator can control four different tasks simultaneously, transcribing one transmission in real time and, if necessary, recording other transmissions for subsequent replay and transcription.

Serial command data used to control the remote equipment are generated by units in the operator's control console. Dedicated control lines are used, but address recognition is included for system flexibility and to allow for future expansion. Manual control and computer command data use the same format and share the same control lines, with provision for either to take priority. Command data are stored in a dedicated memory for each control unit, the memory being updated when a command is changed. The memory output is a continuous stream of data for onward transmission to the commanded unit and back to the control unit to provide status monitoring.

The control parameters of any of the four dedicated receivers can be changed and monitored at the associated console, and include frequency tuning, with BFO control, and selection of antenna input, AGC time constants and bandwidth. A CRT visual tuning aid enables accurate tuning and precise measurement of frequency to be made. Audio output for headphones is available at the console from any of the four receivers, and recordings can be made of any or all the receiver outputs for subsequent replay during periods of reduced activity. During recording, the output of a time code generator is also recorded on a separate track to indicate, on replay, the time the recording was made and the amount of recorded tape used.

Using the VDU at the console, the computer can be instructed to assign automatically controlled tasks to particular receivers. A typical instruction could be to sweep a receiver frequency between specified points at a specified rate. Facilities to monitor these tasks as they are performed and the capability to interrupt or modify them are provided. The computer can also be instructed to accept transcribed information and store it on the computer disc store. Other functions include editing of transcribed information and printing of data retrieved from the disc store as hard copy for analysis.

The computer employed is a 16-bit minicomputer with 32K of main store. Facilities include high speed input/output, hardware arithmetic, a 1 mega-word disc store, paper tape reader and punch, two line printers, teletype, and appropriate interfaces.

RA1792 PROGRAMMABLE RECEIVER

The Racal RA1792 is a programmable synthesised communications and surveillance receiver covering the frequency band 100 kHz to 30 MHz in 10 Hz steps. It was designed as a successor to the RA1770 series of HF receivers. There is an American-built version, designated RA6790, which has considerable commonality with the original UK designed equipment.

The receiver can be controlled directly from its own front panel or remotely using the MA1075 control unit which is visually identical to the RA1792. All controls operate in exactly the same way as those on the receiver front panel and three methods of connection are available.

(1) a simple extension cable, up to 100 m
(2) Racal serial control system (SCORE)
(3) two voice frequency telephone links (with modems).

Frequency setting over the entire range is available from either a keypad or a single, variable rate, flywheel tuning knob. Reception of USB, LSB, AM, CW and FM modes is provided as standard, with ISB operation available as an optional extra. FSK reception is possible by the use of an external modem. It is possible to store, for immediate recall, frequency and mode data on up to 100 channels, and up to 10 of these may be scanned automatically.

Two liquid crystal displays on the front panel indicate channel number, frequency, receiver operating conditions and mode, and include indications of audio line or RF signal level.

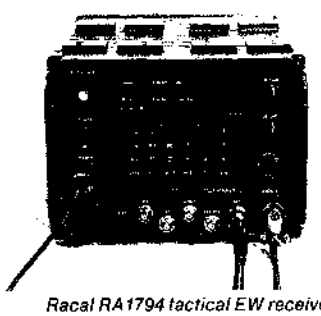
Racal RA1792 HF receiver embodies novel circuit techniques

CONTRACTOR

Racal Communications Ltd, Bracknell, Berkshire RG12 1RG, England.

3919.153
RA1794 TACTICAL EW RECEIVER



The Racal RA1794 tactical receiver was designed as a basic block of the Racal 3000 EW and radio surveillance system (**3918.193**), and related systems, although it is also ideally suited to other communications EW applications.

The receiver incorporates an LSI synthesiser and microprocessor techniques to provide continuous tuning in 10 MHz steps over the entire coverage of 2 to 512 MHz. The synthesiser embodies a new development by Racal, called the Digiphase technique, whereby the synthesiser generates both the phase and frequency of a signal. It is this feature which enables the entire HF/VHF spectrum to be covered with a single phase-locked loop. The RA1794 is normally controlled by a separate operator control unit, although it may be operated as a stand-alone equipment. Traditional receiver front panel controls have largely been replaced by a multi-function keypad which provides continuous tuning, at various rates, direct frequency entry, selection and setting of up to 100 frequency and mode channels, filter bandwidth, reception mode and other functions including an in-built test program. All display and metering functions are provided by an analogue/digital LED readout on the front panel.

The MA1122 tactical DF processing and display unit is designed for use with this receiver. Bearing indication is provided by a digital readout to 0·5° resolution and a polar display using LEDs spaced at 10° intervals. A quality factor is computed automatically for each bearing.

STATUS

The RA1794 is in production and operational service.

Racal RA1794 tactical EW receiver

CONTRACTOR

Racal Communications Ltd, Bracknell, Berkshire RG12 1RG, England.

5679.153
RA1795 VHF/UHF RECEIVER

The RA1795 is a programmable synthesised receiver designed primarily for communications intelligence and electronic warfare applications in the frequency range 20 to 1000 MHz, and is suited for use in standard computer-based systems in both fixed and transportable roles. These include the Racal System 3000 Interception and RTA1470 series direction finding systems. Tuning is in 10 Hz steps across the whole band with reception of AM, LSB, USB, FM, CW and pulse modes. It is fitted in a standard rack mounting unit or in a bench mounting cabinet.

The receiver uses microprocessor techniques to provide a wide range of operational capabilities combined with a high degree of RF performance. These techniques include automatic scanning of frequencies held in a 100-channel memory, comprehensive display of the receiver operating conditions and provision for external control. A wide selection of filters provides for the interception of all transmissions normally encountered in the VHF/UHF spectrum, including wideband radio relay systems. The 100-channel memory can be loaded with frequencies of interest together with associated receiver control settings ready for immediate access by means of a tuning knob or keypad. Automatic scanning of any of the channels can be carried out, the receiver pausing on each channel for a preset dwell time selected with the keypad.

The receiver can be operated by local, extended or remote control. In local mode, tuning is by means of a multi-purpose tuning knob with fast and slow rates. The fast tune provides an adaptive tuning rate which is varied automatically with the speed of rotation, the slow tune is at a fixed rate in 10 Hz steps. Alternatively, frequency can be entered directly by means of the keypad. The built-in carrier operator relay with adjustable threshold can be set to detect

activity in any channel and to activate automatically an external system, eg a tape recorder. All receiver conditions are displayed by either illumination of relevant push-button controls or by an LED display. A compatible signal display unit, type MA1119C, is available and enables a spectrum of up to 8 MHz to be displayed.

STATUS
In production.

RA1795 VHF/UHF receiver

4737.053
RA1796 HF/VHF/UHF RECEIVER

The RA1796 is a rugged compact synthesised receiver intended for communications EW operation covering the frequency range from 2 to 1000 MHz in 10 Hz steps. This gives complete coverage of the HF, VHF and UHF communication bands. It employs microprocessor techniques to provide a wide range of capabilities, including automatic scanning of frequencies held in a 100 channel memory, automatic search across a specified frequency range and provision for external control.

RA1796 receiver

The equipment is designed to operate under exacting environmental conditions and is suitable for deployment in forward combat areas installed in soft-skinned or armoured vehicles, and also in shelters, ships, submarines, aircraft or fixed ground stations.

The RA1796 incorporates a frequency synthesiser based on a new LSI design of high reliability and performance, with microprocessor control and storage for 100 frequencies and associated control settings. Tuning is in 10 Hz steps across the complete band with reception of AM, LSB, USB, FM, CW and MCW modes.

The receiver can be operated in local, extended or fully remote control. In local mode, tuning is by spin-wheel control in selected step sizes or at selected rates, by direct frequency entry via a keypad or by means of UP/DOWN keys. These keys can be used for continuous scanning or for scanning in selected step sizes at a pre-determined rate. The receiver can also be set to scan automatically across a prescribed frequency band, the frequency limits, step size and scanning rate being selected by means of the keypad. A 100-channel memory can be loaded with frequencies of interest together with associated receiver control settings ready for immediate access by means of the keypad or spin-wheel. Automatic scanning of the selected channels can be carried out, the receiver pausing on each channel for a preset dwell time. The receiver can be set to stop the automatic band scan and channel scan routines when signal activity is detected, and also to activate a recorder or other external system.

A compatible signal display unit, the type MA1119, is available and enables a spectrum of up to 3 MHz to be displayed centred on the receiver tuned frequency. The MA1122 tactical DF processing and display unit can also be used with the receiver to provide bearing indication to 0·5° resolution on a digital readout, and a polar display using LEDs spaced at ten degree intervals. A quality factor is computed by the MA1122 for each bearing.

CHARACTERISTICS
Frequency range: 2 - 1000 MHz in 10 Hz steps (2 - 512 MHz optional)
Reception modes: CW, MCW, AM, FM, USB, LSB
Power consumption: 50 W typical
Dimensions: 205 mm high × 390 mm wide × 400 mm deep
Weight: 21 kg
CONTRACTOR
Racal Communications Ltd, Bracknell, Berkshire RG12 1RG, England.

3920.153
RTA1470 SERIES DIRECTION FINDING EQUIPMENT

The Racal RTA1470 series of radio direction finding equipment has been designed principally to meet the needs of EW requirements for emitter location for both tactical and strategic applications. The frequency bands covered include MF/HF/VHF/UHF between 150 kHz and 512 MHz, extending to 1 GHz if required, and fixed, transportable or mobile versions can be supplied.

RTA1470 direction finding equipment in mobile configuration deployed for operation

The system uses electronically commutated four-element antenna arrays to generate a signal which is amplitude modulated with azimuth information. After conversion to digital form, this signal is fed to a microprocessor-based bearing evaluation and display unit (MA1110) which derives the bearing information and presents it directly in numerical form. Seven antenna arrays are available, covering the whole spectrum, two of them being ground-mounted and the others mast-mounted. The four models for the upper segments of the spectrum may be mounted together in pairs on a single mast.

Standard Racal communications/surveillance receivers are employed according to the frequency range(s) of interest, for example:

DF system	Frequency range	Receiver
RTA1472	150 kHz - 30 MHz	RA1792
RTA1471	20 - 512 MHz	RA1794
RTA1474	Suitable channelised receiver	

Bearing evaluation and presentation is performed in all systems by the MA1110 processing and display unit. This has a numeric LED readout which is updated five times per second giving a direct indication of bearing. There is also a polar display which shows the bearing as a radial line, the length of which denotes the signal amplitude. The latter display is provided with an electronic cursor. The same display screen may also be used for an alternative presentation which includes a dual Cartesian display and a histogram presentation. The latter has the horizontal axis representing the bearing angle while the vertical axis shows a continuously accumulating record of bearing data on the selected frequency.

Three or more RTA1470 series DF stations can be linked to form a locating net, which can be manually or semi-automatically controlled. The RTA1470 series of equipments is also fully compatible with the Racal 3000 EW radio surveillance system (**3918.193**) of strategic and tactical intercept and monitoring equipments.

STATUS
In production and in service in several countries.

Racal Communications Ltd, Bracknell, Berkshire RG12 1RG, England.

3918.193
SYSTEM 3000 EW AND RADIO SURVEILLANCE EQUIPMENT

Racal Communications manufactures a comprehensive range of modular equipment from which a variety of radio surveillance and EW interception and processing systems can be configured to meet widely differing operational requirements. Series 3000 systems have been specified for 'strategic', or fixed-base monitoring applications, and for theatre mobile or semi-mobile roles, but both types are based on a common philosophy centred on what the manufacturer terms the Operator Position. This refers to the combination of control unit provided for the operator and the related interface units and other facilities. Two receivers are normally incorporated in a Series 3000 system at each operator position, although more can be accommodated, and it is possible to link several operator positions in large fixed systems by data and audio highways.

Any type of receiver can be employed, provided they have a compatible serial data control facility. Generally they will be drawn from the following Racal types, to suit the frequency coverage required:
RA1784: 15 kHz to 30 MHz
RA1792: 100 kHz to 30 MHz
RA1794: 2 to 512 MHz
RA1795: 20 to 1000 MHz
RA1796: 2 to 1000 MHz

There are two types of operator control unit: the MA1113 is a console or rack-mounted item designed for use in fixed or semi-fixed stations: and MA1114 which is a rugged unit with somewhat reduced facilities and intended for use in vehicles or military shelters where space may be limited. One of these units will be employed with the MA1116 audio switching and operator processor unit to provide for the control and operation of the receivers and to effect the appropriate transfer and exchange of data between other operating positions. These standard modules and sub-systems are based on the use of microprocessor technology and System 3000 embodies the principle of distributed processing.

Racal has defined three levels of complexity for the basic operator positions:
(1) Level 1: This provides for the display of receiver settings, receiver status, antenna in use, intercom calling indicator and procedure prompts for setting the parameters for automatic scanning; selection of any antenna; manual control of the receivers; automatic control of one receiver to search through a list of frequencies (LIST mode) or scan a band of frequencies (SCAN mode) in conjunction with optional automatic signal detection devices; selection of audio outputs for monitoring and recording; control of recorders; intercom with other operators; the exchange of data with other system elements.
(2) Level 2: At this level an interception system processor (ISP) is introduced to serve a number of collocated operator and supervisory positions,

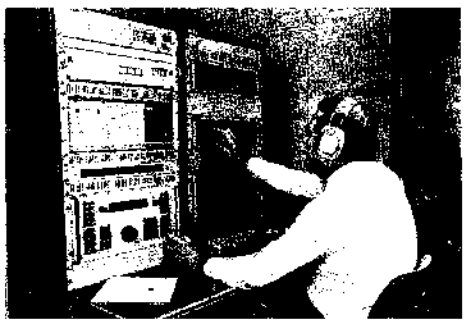
together with other operational elements equipped with keyboard devices that can be interfaced to it, such as a DF control position. With VDUs at the operator positions and the addition of a disc store, the ISP provides facilities for: logging and editing of traffic by the operators; routeing (by address) data information between all terminals in the system; access to reference data to assist the operators in identifying target networks; management and information displays for the supervisor. The standard software package provides the operators with four different displays: target files, task files, search lists, and log files. The supervisor has access to all the files available to the operators, and two other displays are available to him, a current activity file and the receiver status display. Choice of ISP hardware depends on the number of operator and other positions to be served, but typically a PDP 11/34 serves up to eight fully equipped operator positions, or a Ferranti Argus 700 will serve up to 20 positions.

(3) Level 3: To expand facilities still further, an information processing system (INFOPS) is added, with the main purpose of providing data handling and retrieval capabilities for analysts, voice tape transcribers, reporting staff and managers. It is connected to one or more ISPs so that data can be exchanged between the operator and analyst areas. Log files compiled by the operators can be displayed at analysis positions (for example), while technical data bases created by the analysts, such as target files, can be made available to the operators. In a strategic station the ISP and the INFOPS are collocated. In an EW system the ISPs at forward intercept (ESM) stations feed information by radio relay to the INFOPS at the EW control centre where it acts as the nerve centre for command and control of the total system.

There are three standard operator positions which, with choice of the appropriate equipment options, suffice for all intercept system applications.

RS3151: This version is designed for use in fixed station installations, with those items of equipment requiring direct operator attention being located in the operator's console and the remainder of the hardware housed in racks in the equipment room.

RS3152: This is designed for installation in more confined accommodation such as small stations, military field mobile containers or shelters. It includes almost the same facilities as the RS3151 but all the equipment is fitted in twin cabinets provided with desk units and secured to the shelter structure.



RS3153: The third type of operator position is meant for installation in a small shelter or in soft-skinned or armoured vehicles used by forward units employed in EW roles. The same three basic units are included which are common to all operator positions, but in this case the rugged version of the operator control unit (MA1114) is employed. All of the units are frame-mounted so that they can be dispersed in the shelter or vehicle as space allows.

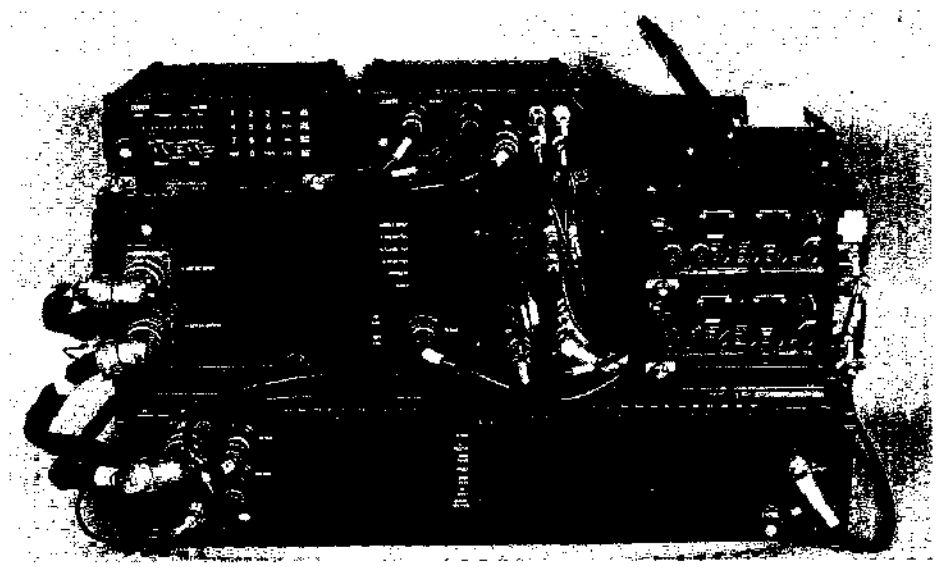
RACJAM-V RESPONSIVE VHF JAMMERS



The RACJAM-V series of responsive VHF jammers has been designed to support ground forces in tactical operations. They are capable of rapid deployment and high mobility.

RJS3101

The RJS3101 (US nomenclature AN/TLQ-502) responsive VHF jammer has been designed to meet the requirements for an automatic mobile jammer system covering the 20 to 80 MHz band for ECM applications in the forward combat zone. It can automatically detect and jam signal activity on any one of 16 preselected target channels, on a priority basis. Since jamming only takes place when targets are active, it is possible to disrupt several nets simultaneously depending upon the activity of individual target nets. Alternatively, the RJS3101 can be programmed to scan a specified band of frequencies and disrupt any non-friendly transmissions detected above a preset threshold level.

Integral communications are included in the equipment with facilities for a remote ECM control station to call the ECM operator, if necessary, by interrupting the jamming action. The equipment is designed for mounting in either soft-skinned or armoured vehicles and is fully ruggedised.

The system is controlled from an MA1112 control and display unit which includes a keypad for entering instructions, an internal clock for timing jamming periods and intervals etc, and a comprehensive display for indicating channel information and signal activity. This microprocessor-based unit contains three types of channel store holding data required in the various modes of operation. The jammer channel stores up to 16 target frequencies, each with a priority rating, and a signal level above which jamming is to be initiated; the communications channel stores contain details of up to four frequencies for communications with the control station; and the protected channel stores hold details of up to nine friendly frequencies on which jamming is inhibited when the system is in the 'Band' mode.

RJS3101 500 W responsive VHF jammer

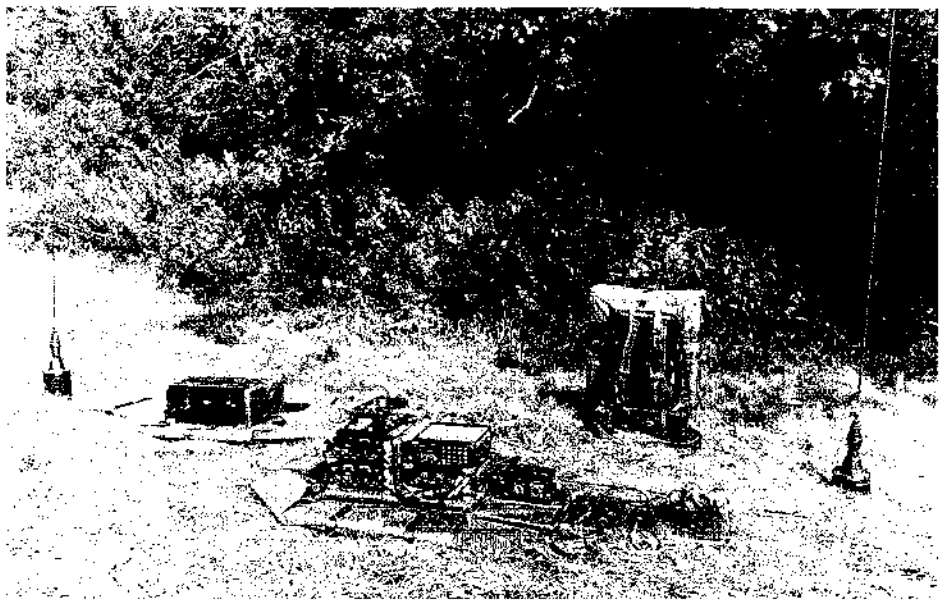
Two PRM4090 VHF transceivers are used, for search and jamming, one of them also acting as a communications receiver. In the transmit condition the output of one transceiver is fed into a PA1840 500 W amplifier. The output of the amplifier is then fed via the MA1019 antenna switch unit to a directional antenna which gives a 2 kW ERP signal. An optional whip antenna may be used for receive only.

An MA4280 modem links the jammer system with a printer and keyboard unit, and the MA1017 vehicle interface unit provides for the various interfaces with the other equipments in the system as well as housing the noise generator for modulating the jammer signal.

OPERATION

There are four modes of operation:

(1) automatic jamming, where both tranceivers initially carry out a search of the 16 target frequencies and four communications channels stored in the memories. Jamming is then automatic on any active channel encountered, on a priority basis. Alternatively, a band of frequencies is searched and any non-friendly signal encountered above a specified threshold level is jammed



(2) dedicated single frequency jamming. In this mode the operator can select any individual frequency, including the stored frequencies, for jamming when active

(3) passive search. With jamming switched off, the receivers scan the 16 target channels and signal levels are displayed for each active channel. There is also a panoramic display facility in this mode

(4) communications. This facility allows the ECM operator to use the equipment for communications with control using either voice (encrypted if secure mode PRM4090 is used) or the MA4270/MA4245 keyboard and MA4333 line printer for data communications

RJS3100

An alternative to the RJS3101 is provided by the RJS3100 system (US nomenclature AN/ULQ-19). This is a 100 W output system which uses whip antennas for both transmit and receive; otherwise operation is the same as for the 500 W system. The RJS3100 is suitable for mounting in small vehicles as a part load and is ideally suited for operations on the move close to the combat zone or for operations in an urban role. It is also useful as a training aid to give personnel experience of radio operating in the face of ECM. This jammer can also be supplied with a directional antenna to produce 400 W ERP. The RJS3100 is also available as a manpack equipment (3-man load) and is suitable for deployment in backpack form with paratroops. Each pack weighs 22 kg approximately.

RACJAM-V jammer in manpack configuration

RJS3102/RJS3103

These jammers are similar to the RJS3101 but with outputs of 200 W and 1 kW respectively.

RJS3105 SERIES COMMUNICATIONS JAMMERS

The RJS3105 series of responsive jammers has been designed to operate in the ground/air communications bands of 110 to 156 MHz and 225 to 400 MHz. They are intended to provide support in the tactical battlefield area by disrupting communications used for close air support, but can be equally effective as part of air defence systems at fixed installations. Three configurations are available, the RJS3106 which covers the frequency range 110 to 156 MHz, the RJS3107 covering from 225 to 400 MHz and the RJS3105 which is a combination of the first two.

All jammers in the series can be programmed to search continuously through a preset list of up to 16 frequencies and to jam automatically, within one second, the highest priority target found active at any given time; or they will scan across a selected band of frequencies in 25 kHz steps and attack hostile targets as they find them. In both modes individual threshold levels can be set to avoid false triggering and there is provision for automatic protection of nine programmable bands of friendly frequencies.

An automatic 'look-through' capability ensures that jamming only takes place when a target is active and that jamming is always concentrated on the highest priority target. Other functions provided include single frequency jamming, passive search with panoramic display of signal activity, intrusion into enemy nets, and automatic printing of all jamming carried out.

Both the RJS3106 and the RJS3107 consist of a transceiver section, a power amplifier, an interface unit, a control unit and an optional printer, contained in a single standard bench mounting cabinet. The RJS3105 is supplied in two cabinets for vehicle installation, or a single cabinet for shelter or fixed station installation. The systems are normally supplied with discone antennas where omnidirectional coverage is required, or with log periodics for increased radiated power.

RJS3105 communications jammer

CHARACTERISTICS

Frequency: 110 to 156 MHz (RJS3106); 225 to 400 MHz (RJS3107)

Channel spacing: 25 kHz

Jamming modulation: Noise (3 Hz audio bandwidth)

Radiated power (with directional antenna): 3 kW (RJS3106); 1·5 kW (RJS3107). Output level switchable to low power

Racal Communications Ltd, Bracknell, Berkshire RG12 1RG, England.

4736.193

RJS3140 UNATTENDED EXPENDABLE JAMMER

The RJS3140 is a low power barrage jammer intended for remote deployment against communication nets operating between 20 and 90 MHz. It is a small, easily concealed unit for use against important targets which are out of range of stand-off jammers, and is deployed by hand. A number of them can be grouped together to increase the area of coverage as well as making location by DF more difficult. When used at close range it is claimed to be the simplest available technique for attacking frequency hopping radios.

The RJS3140 is a completely sealed unit which accepts control data via an optical link from the MA1065—a small calculator type unit with a 16-character display.

CHARACTERISTICS

Frequency range: 20 to 90 MHz

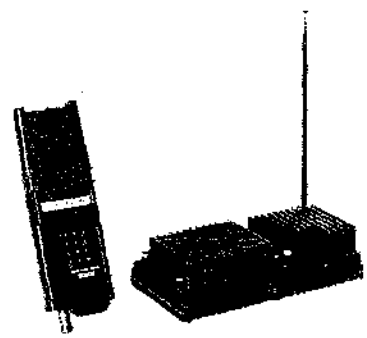
Bandwidth: 1 to 31 MHz (set by a programming unit)

Power output: Typically 10W from 14V DC battery

Jamming signal: Pseudo-random continuous noise

Operation time: 2 hrs minimum (+10 to +60° C); 1 hour (−30 to −10° C)

Internal timer delay: 1 minute to 100 hours selectable by programming unit in 1 minute steps



Antenna: Telescope whip adjustable from 1 to 1·8 m

Dimensions: 80 mm high × 133 mm wide × 279 mm deep

Weight: 2·5 kg (including battery)

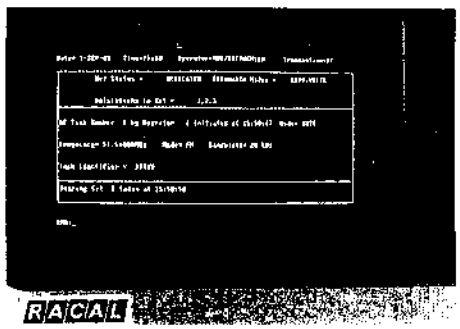
5680.153
SAT 3311 HF SIGNAL ANALYSIS TERMINAL

The SAT 3311 terminal is a comprehensive aid to search and monitoring operations in the HF spectrum with full provision for technical analysis. It provides the search operator with an ability to detect and examine the structure of unusual or complex signals in addition to the more usual facilities provided by traditional monitor operational terminals. Equally it gives full facilities to the PTT monitor operator for investigating signal usage in conformity with CCIR directives.

SAT 3311 HF analysis terminal



The terminal consists of an RA1792 receiver (**3922.153**) covering the frequency range 100 kHz to 30 MHz, an SA3300/2 digital signal processor unit and an SA3300/1 operator console and display unit mounted in a single standard cabinet or console. An instrumentation recorder can be included if off-line processing is required and an ASCII printer can be provided for hard copy production of teleprinter traffic.

The equipment incorporates a CRT which is used to display up to three traces simultaneously of any intercepted signal, from a selection of time waveforms and instantaneous and averaged spectra. The dual and triple trace displays can also include spectra which are recalled for comparison purposes from a stored library of up to 25 signal patterns relating to known types of signal or to unidentified transmissions still under investigation. In the case of FSK teleprinter transmissions, traffic content is displayed and printed automatically. With these displays the operator can determine target signal parameters including carrier frequency, type of modulation, the nature of the moculating signal and the type of information being transmitted. The spectra or time waveforms are presented together with alpha-numeric notation including calculated signal parameters, message text derived from democulated FSK signals, data concerning the operational status of the equipment and 'menus' for selecting the various operating functions. The maximum bandwidth displayed is 16 kHz and there is a 'zoom' facility to provide a range of bandwidths down to 20 Hz to permit examination of individual transmissions in detail.

5681.153
CCS 3900 COMMAND AND CONTROL SYSTEM

The CCS 3900 is an automatic data processing system for command, control and information handling in communications EW and surveillance operations. It is deployed as a network of nodes, intercommected over existing communication links, thereby spreading the load between HF, VHF, landline and microwave radio relay and ensuring minimum reorganisation of communications. Major nodes contain data processing equipment and databases, and are normally situated adjacent to field command posts. Visual display terminals are provided to allow staff users to display and change information stored in database and to prepare and receive messages including directives for the control of EW resources such as direction finding and jamming. Minor nodes, some comprising communication terminals with little or no data processing ability, provide access for lower levels of command. Many configurations are available and are tailored to user needs.

CCS 3900 visual display unit

Used in a typical communications EW system, the CCS 3900 can provide a range of facilities such as:

(1) database management of information, including enemy identities, organisation, personalities, equipment, movement and other intelligence data
(2) database management of EW targetting information and results, including enemy signal plans, DF results, etc
(3) database management of operational information including deployment and status of own forces
(4) secure and flexible message handling and data transmission network
(5) simple means of entering, retrieving and changing database data
(6) automatic or semi-automatic control of DF and jammer sub-systems.

Data may be displayed on the visual terminals in a wide range of formats tailored to the user requirement. The data may be changed simply by authorised users and the databases at the various CCS 3900 nodes are automatically synchronised. Alerts may be set to warn the user automatically when certain data is changed.

5800.153
RACEWS ELECTRONIC WARFARE SYSTEM

RACEWS (Racal Automated Communications Electronic Warfare System) is a tactical, integrated equipment primarily for use against combat net radio. It has been designed for deployment in land operations at corps, divisional or brigade level, or equivalent. The system comprises advanced communications monitoring equipment, accurate direction finding (DF) sub-systems, responsive jamming elements, and a distributed computer network and database.

RACEWS is effectively a C³I system which integrates the various communications monitoring and DF stations in the field, analyses the signals to establish a number of parameters, and combines these with data from other sources, including non-communications EW sensors. It is based around a PDP 11 computer providing a database and a range of information handling and display facilities. Database information would be supplied and inserted by the individual defence force. Information is displayed on alpha-numeric and colour map displays which provide a wide range of facilities to aid the EW analyst, and present tactical commanders with immediate intelligence in an easily assimilated form. The map display consists of a colour map with information overprinted, providing a clear real-time picture of both enemy and own dispositions. The alpha-numeric display gives database information about the various signal parameters and details of the opposing forces.

RACEWS is a flexible system which allows the incorporation of many of the Racal EW systems described elsewhere in this edition, and can be tailored to meet the requirements of individual customers. Through the use of automation and ADP techniques, RACEWS can process and present information more quickly with fewer manpower resources.

Racal RACEWS alpha-numeric and colour map displays.

MA 1122 TACTICAL DF PROCESSING AND DISPLAY UNIT

The MA 1122 has been designed for use in tactical electronic warfare DF systems operating primarily in the VHF/UHF range from 20 to 512 MHz. It can also be used in 'hunting' DF applications in which case the frequency range is extended down to 2 MHz.

Its primary use is with the Racal RA 1794 or 1796 VHF/UHF receivers and a range of DF antennas, including transportable VHF/UHF arrays and special low profile HF and VHF/UHF hunting antennas for mobile operations. Bearing indication is provided by a digital readout to 0·5 degree resolution, and a polar display using LEDs spaced at 10 degree intervals. A quality factor is computed for each bearing and a storage/recall facility allows the last 10 bearings to be displayed after the target signals have gone down. The unit is packaged for tactical use in wheeled or tracked vehicles.

5802.153
RDF3206 DIRECTION FINDING SYSTEM

The RDF3206 has been specially designed for mobile operations in the VHF/UHF bands from 25 to 512 MHz. It is intended for use by internal security forces or civil authorities to hunt down illegal transmitters and is particularly well suited for operation in urban areas. The system can be installed in a variety of vehicles and full provision has been made for concealment of the type of operation where secrecy is important.

The system is based on the RTA1470 equipment (**3920.153**), but by adaptinjg the antenna design for mobile applications a version has been produced which can be used in single station mode to home in on a target transmission by taking successive bearings while moving. The antennas are concealed for low profile operations. The RDF3206 can also be used as part of a DF net in conjunction with other mobile vehicles or fixed DF sites. By the addition of mast mounted antennas the system can be converted quickly to fixed location use.

STATUS
In production.

5938.153
SEEKER EW SYSTEM

Seeker is a mobile, tactical EW sub-system for monitoring purposes over the frequency band from 20 to 400 MHz. It is housed in a long wheelbase Land-Rover vehicle which tows a trailer carrying the generator and other ancillaries. The equipment normally acts as a sub-system to integrated EW networks, and consists basically of two RA1794 receivers (**3919.153**) and various control and processing units. Each Seeker equipment enables the operator to monitor and record transmissions of interest, to produce a DF bearing, to store technical details in the system memory, and to communicate with the EW network controller.

Using the monitoring equipment, the operator can automatically scan a preset frequency range at a speed and channel separation of his own choice. Known target frequencies can be stored in the 100-channel memory and automatically scanned for activity when required.

STATUS

CONTRACTOR
Racal Communications Ltd, Western Road, Bracknell, Berkshire RG12 1RG, England.

5808.193
JAMCAT JAMMING UNIT

JAMCAT is an EW attachment designed to be used with any combat net radio system to provide a low-cost EW jamming capability. The unit is a dual purpose equipment equally usable for offensive operations or as a training aid. When connected to the radio, via the outlet normally used for the handset, JAMCAT converts it to a unit capable of generating a wide range of jamming signals. Internally generated white noise, single tones, rapidly changing multiple tones or externally generated signals may be used to modulate the transmitter of the radio.

In the offensive role, JAMCAT can be connected into the audio/keying input of most radio transmitters regardless of RF power output. In the training role the equipment can be set up to simulate ECM signals typical of those found on the battlefield.

Four modes of operation are available:

(1) manual mode uses the pressel switch of the associated handset to key the transmitter to produce jamming signals on demand
(2) continuous mode which produces signals without operator intervention
(3) responsive mode which uses an internal signal-activated switch to key the transmitter for a short period when a signal is received during a 'look-through' period. Two rates of responsive jamming are available; 0·1 second delay followed by 2 second jamming, and 0·5 second delay followed by 4 seconds jamming
(4) Fast-look-through mode which simulates the effect of a fast-look-through responsive jammer but is not signal responsive.

The JAMCAT unit can be used in manpack or vehicle-mounted configuration and may be interfaced with any transceiver operated normally through a handset and pressel switch. Power is derived from a clip-on battery pack, or from the transceiver in use if DC is available through the audio interconnect lead.

CHARACTERISTICS
Modulation sources: White noise; continuous tone of 1 kHz sinewave or 500 Hz squarewave; random tones over frequency range 400 to 2400 Hz, changing every 128 milliseconds; external modulation of 0·5 rms into 20 k
Dimensions: 170 mm high × 140 mm wide × 70 mm deep (270 mm high with two Ah Ni-Cad batteries)
Weight: 1 kg (2·1 kg when fitted with batteries)

JAMCAT system in manpack configuration

4162.193
TYPE S373 ECM EQUIPMENT

Under government contract, Marconi Radar has produced the Type S373 ECM system which is a multi-band EW equipment providing high-power jamming. The S373 vehicle also carries an autonomous surveillance system which will detect, locate and analyse the radiations of enemy emitters. It is assumed that S373 ECM vehicles are also employed for such tasks as monitoring the performance of friendly radars under jamming conditions and for training purposes.

The S373 antenna array consists of two horn-fed parabolic dish reflectors which are housed in a double-bubble glass-fibre radome, which is raised to its normal operating elevation by a hydraulic jack system. The two antennas can be turned at rates of up to 200 rpm by means of slab torque motors; these drive the arrays directly, eliminating gear boxes. This arrangement allows scan to be varied from 5 to 180° with positional accuracy of <0·1°, and electrical actuators enable elevation angles of -5 to +8° to be selected remotely. Antenna scan speed and positions in azimuth and elevation are displayed on the operator's console in the cabin. The latter consists of a one-ton container, which houses the electronic equipment and is mounted behind the antenna system on a flat-bed vehicle such as a four-ton Bedford truck.

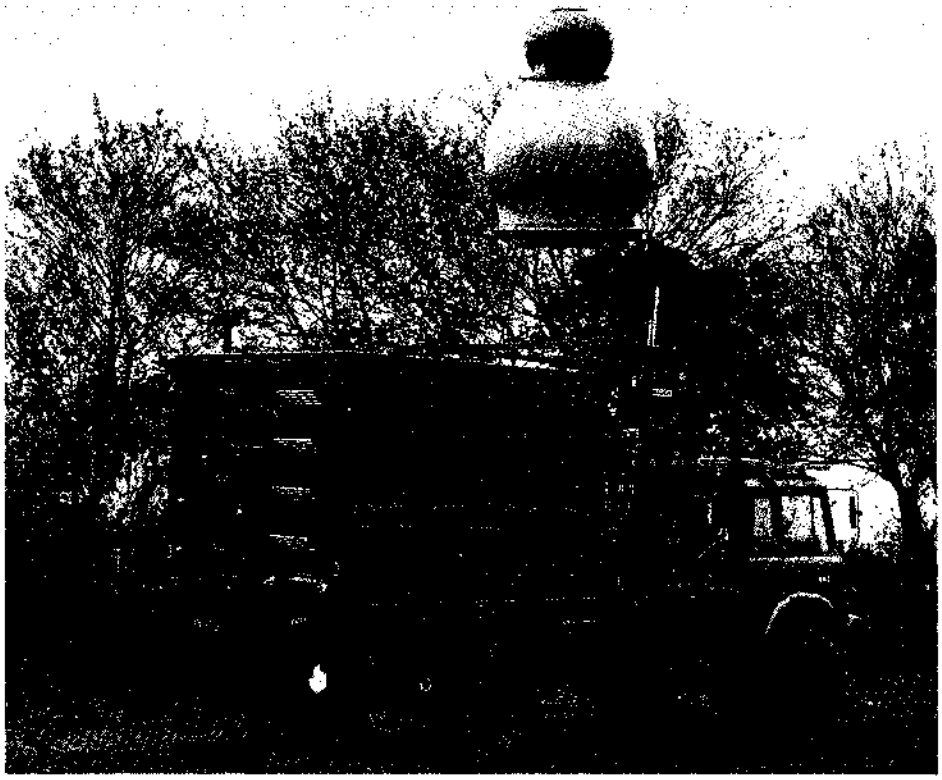
Each jamming band has an independent high-power TWT (travelling wave tube) transmitter feeding its own antenna, and each transmitter incorporates a digitally controlled variable frequency oscillator (VFO), a driver stage and modulator with an output amplifier stage. A comprehensive range of modulation types and patterns is provided for both transmitters, including AM and wide-band FM, which may be sinusoidal, linear swept or noise, pulse modulation over a wide range of pulse widths and duty cycles, and any reasonable combination of these.

To permit an instantaneous response to known threats or to allow a particular jamming pattern to be memorised for future use, a store is provided to hold preset patterns which can be called up from the operator's keyboard. Other operator controls provide for any pattern to be changed or jammers to be set manually. A source locking counter is also available.

The S373 system includes a scanning superhet receiver with associated frequency counter; a radar signal analyser and displays are provided which allow the equipment to operate in an autonomous role. When employed with an associated ESM system, the built-in receiver enables the ECM operator to identify and acquire any emission to which he is directed and thereafter monitor and report any changes in characteristics that are noticed.

During surveillance the antenna operates in a step scan mode, and in each position the receiver sweeps over a preset frequency band. When a signal is detected above a preset level, the sweep is automatically stopped and the frequency, pulse width and PRF are measured and the data stored. Azimuth bearing of an emitter is obtained by continuous scanning of the antenna with the receiver tuned to the emitter frequency. The bearing is extracted

automatically as the antenna scans the emitter and it is then added to the stored data and presented on a VDU display. The output of the receiver during the scan can be displayed on an oscilloscope to permit manual emitter bearing measurement, and the presence of sidelobe reception to be detected. Sidelobe reception in the automatic mode can be eliminated by raising the detection threshold until only main beam signals are accepted.



The S373 cabin also contains radio and teleprinter equipment for communications with EW control centres and HQ units by voice and digital data links. Both VDU and hard copy presentation of messages are provided.

STATUS

No production information or service deployments have been revealed.

Marconi Radar Systems Ltd, Writtle Road, Chelmsford, Essex CM1 3BN, England.

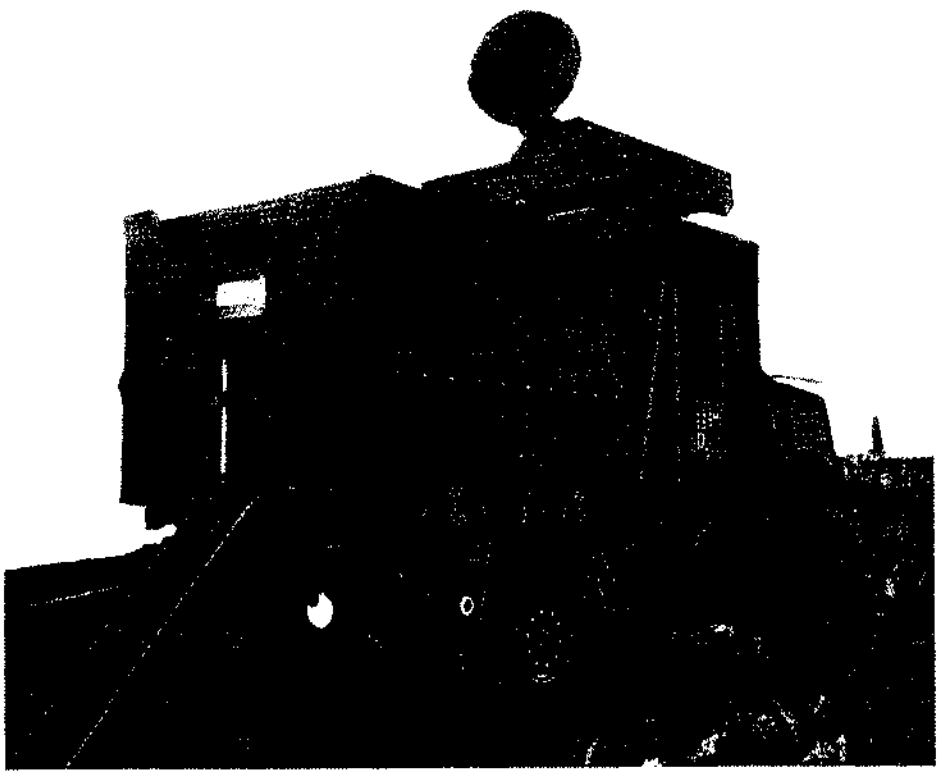
Marconi S373 mobile ECM system on its four-ton truck, showing 'double-bubble' antenna housing in raised position

4163.193

BARBICAN EW SYSTEM

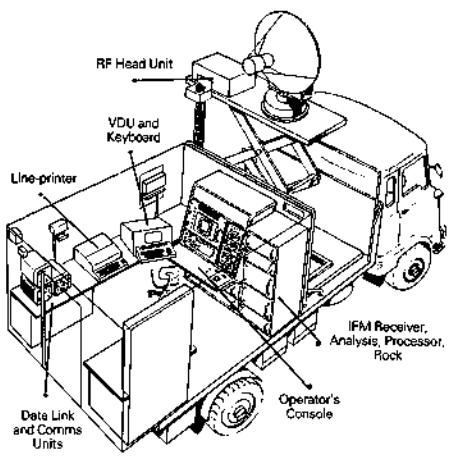
Barbican is a tactical, mobile battlefield automated radar bearing intercept classification and analysis system. The MEL ESM station utilises a configuration very similar to that of the S373 (**4162.193**) in that a one-ton container housing the electronics and operator facilities is carried on a four-ton flat bed truck behind an antenna array which is retracted for mobility. While the Marconi S373 system is intended mainly for active jamming operations, Barbican is a passive ESM system for rapid detection, location and analysis of battlefield threat emitters.

A typical operational deployment of the Barbican system would consist of three or more ESM stations linked by voice and digital data links to one of the control stations which are the responsibility of Ferranti Computer Systems Ltd. An ECM station may also be incorporated. The Ferranti EW tactical control station of Barbican provides facilities for:



(1) system control and co-ordination
(2) communications control
(3) location and classification of emitters
(4) data management
(5) reduction of routine tasks.

The hardware required for these functions includes an FM1600D digital processor, one or more teleprinters, VDUs, communications equipment, and DF facilities for manual or automatic plotting of the bearing data provided by the ESM stations. The FM1600D is the smallest of the powerful 24-bit FM1600 series, which has been adopted by the UK MoD as a standard series of computers for military applications in land, sea and airborne roles. CORAL 66 real-time high level language is employed for the associated software, and this too is compatible with other FM1600 series systems.



The arrangement of the MEL Barbican ESM vehicle equipment can be seen from the general arrangement drawing. Barbican system facilities include a high gain DF antenna; automatic or manual control of DF antenna modes; an automatic signal logger; tunable YIG filters; a digital instantaneous frequency measuring (DIFM) receiver; digital random access display coupled with multiple display options; VDU readout of analysed target parameters; VDU message formatting; compilation and presentation; hard copy printer; microprocessor control of system switching; video and audio outputs for operator signal analysis; and a digital data link. The frequency coverage is from 1 to 18 GHz with a 360° antenna azimuth cover.

Features of the system compatible with FEBA operations include both operating aspects and performance characteristics. The designed performance provides for high system sensitivity; high intercept probability; accurate DF; frequency measurement on a single pulse; and automatic analysis of radar parameters. One man can operate the Barbican ESM unit due to the comprehensive automatic facilities provided and the equipment is designed for rapid set-up and dismantling for redeployment. The rotating DF antenna, for example, is elevated by a simple scissors mechanism with the turning gear carried on what appears to be a self-levelling platform. Automation ensures rapid processing and interpretation of collected signal data, and system switching is also controlled by the MEL 99 microprocessor, resulting in a compact one-man ESM station providing real-time facilities for the following functions:

(1) signal detection
(2) signal sorting

Barbican EW system mounted on a 4-ton vehicle

General arrangement drawing of MEL Barbican ESM station vehicle, showing equipment layout

(3) direction finding
(4) information display
(5) parameter analysis
(6) data formatting
(7) data transmission.

STATUS
The Barbican system is a joint private venture on the parts of MEL and Ferranti Computer Systems Ltd. No contract details have been released.

MIRANDA MICROWAVE INTERCEPT EQUIPMENT

Philips Research Laboratories introduced a mobile microwave interception and analysis equipment in the mid-1970s under the name Miranda. Little has been heard of this development since the original announcement and security has denied any subsequent progress reports. However, an announcement in October 1978 of the award of a multi-million pound contract for the provision of a tactical, 'non-communications' electronic warfare system by the UK MoD may well be related to the Miranda project, and for this reason the known details of the latter are reproduced below.

The Miranda equipment consisted of an antenna array mounted on a mast (possibly telescopic) carried by an enclosed vehicle in which were the other elements of the system. Its function was to receive and process signals from radars and other emitters in the 1·5 to 16·5 GHz band, and it was reported to be able to identify the radar type, provide direction of arrival data, and record information gathered. The microwave receiving system had two wide-open channels, one of them omni-directional for initial detection of all signals, irrespective of direction or frequency, after which the directional channel would be used to provide for signal measurement and analysis.

STATUS
Not accurately known. The work is believed to be on behalf of the British Army and possibly embodies the earlier Miranda work.

MEL, Manor Royal, Crawley, Sussex RH10 2PZ, England.

5740.093
MEL IFM RECEIVERS

MEL manufactures a range of IFM receivers for use as frequency measuring devices, with digital readout, for use in ESM and ECM equipment. The receivers operate from 0·7 to 18 GHz and are primarily for application in microwave receiving systems where radar analysis pulse train de-interleaving is required on the basis of the frequency of the received signal.

They measure the frequency on a pulse-by-pulse basis for signal durations of 50 ns to CW. This is achieved without prior knowledge of the time of arrival or frequency of the signal; the receivers monitor the whole of the operating band simultaneously. There are two families of these receivers, binary and quaternary. Binary receivers provide high measurement integrity where the signal environment is complex and where high data rates are normal. Quaternary receivers are small, lighter and cheaper and are suitable for applications where measurement integrity requirements are less demanding.

Both families can be made to measure and identify CW signals, or to discriminate against them, while looking at pulsed signals. These pulsed signals can be above or below the simultaneous CW signal being received provided that they exceed the threshold of the receiver.

The receivers are available in various combinations of control functions, data interfaces and frequency range. Sampling facilities cover delayed sample, multi-sample and external sample. A digital coded output is provided with a 10, 11 or 12 bit resolution, the 12 bit versions giving improved frequency resolution and accuracy.

STATUS
In production.

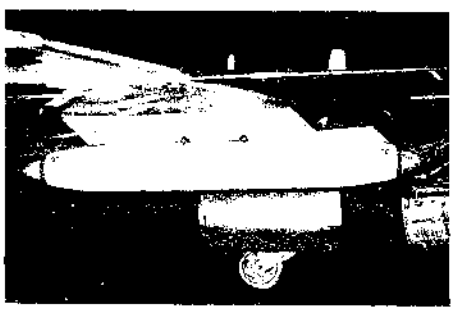
THORN-EMI EW SYSTEMS



In addition to the SARIE and Guardian systems described in the Electronic Warfare – Naval section, Thorn-EMI are known to be designing and manufacturing a number of EW systems of which very few details have been released.

ESM Systems
A family of advanced ESM systems for naval, airborne and land use ranges from threat warners to EW suites with full ESM capability.

Outfit UAA(1) ESM system
Thorn-EMI supplies the complete data processing and antenna systems for this advanced ESM system.

Outfit YAF pulse analyser
This is in service with Royal Navy and other users.

Airborne Elint Pod
This is a 3·5 metre long pod designed to provide tactical information on the location and identification of ground and maritime radars. The company is also developing the associated ground processing, analysis and display equipment.

Airborne Elint pod mounted on wing of trials aircraft

CALFAC
A contract worth some £8 million was awarded by the UK MoD in mid-1983 for the supply of a number of installations to calibrate and monitor the performance of the EW systems of naval vessels and helicopters. Calibration is performed by interrogating the ship's EW systems with suitable signals generated in the CALFAC.

To calibrate ESM receivers, radar type reference signals are transmitted to the vessel at accurately defined frequencies, pulse widths and PRFs. The overall accuracy of the ship's DF system is checked by comparison with an independent DF reference system based on acoustic, hyperbolic radio or transponder principles. The performance of ECM equipment is assessed by analysing the jamming signals generated by the vessel in response to the interrogating signals. Appropriate signal parameters are measured to check that they come within specified limits. This facility is extended by the provision of check radars at additional sites.

CALFAC will be all UK-based initially but it will be possible to containerise the installations for rapid deployment overseas.

RACAL EW PROGRAMMES

In addition to the various EW systems and equipment described in separate entries in this section, Racal is known to be engaged in a number of other developments in this area. These are mainly the subject of security constraints but the following summaries of certain of these projects can be revealed.

UAF-1
A new ESM system for the Royal Navy is in early development under a UK MoD contract. The system, known as UAF-1, will ultimately succeed the UAA-1 Abbey Hill equipment in Royal Navy ships. No technical details are available.

Full-back
This is a radar warning receiver designed to meet the combat and training requirements of tactical fighter and advanced training aircraft. It provides a clear, unambiguous quadrantal bearing on threat radars with simultaneous identification of three pre-programmed threats and an audio cue of threats to crew members. It also provides a facility for automatic or manual selection of chaff or flare dispensers. It is a version of the Prophet system (**5673.353**).

Peregrine
This is a pod-mounted warning receiver combined with a chaff and flare dispenser. It is designed for easy installation on high performance aircraft of all kinds.

ESM/ELINT Systems
Racal is involved in the development of a number of ESM/ELINT systems. These include a ground-based equipment in development for a central European country, the UAF-1 referred to earlier, a version of Cutlass for the Royal Navy's Type 23 frigates (see **3553.293**), and a submarine system for the Royal Navy Type 2400.

CONTRACTOR
Racal Radar Defence Systems Ltd, Davis Road, Chessington, Surrey KT9 1TB, England.

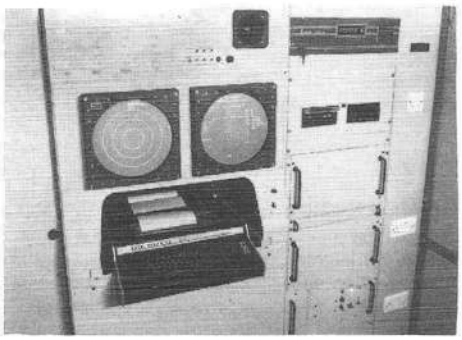
5669.153
WEASEL ESM AND ELINT COLLECTION SYSTEM

Weasel is a variant of Cutlass (**3553.293**), and is a combined electronic support measures (ESM) and electronic intelligence gathering (ELINT) system operating over the frequency range from 2 to 18 GHz with extension capabilities from 0·5 to 2 GHz and from 18 to 40 GHz. It is an advanced automatic system designed to operate in a dense radar environment and to achieve a low workload for a two-man crew operation.

The ESM part of the system acts as a search receiver with an instantaneous bandwidth equal to the full input range, thereby providing a 100 per cent intercept probability. As a stand-alone equipment it can provide accurate direction finding and identification of intercepted emissions. This latter is achieved by measuring the emitter parameters and comparing them with data stored in a library of known emitter characteristics. This is a fully automatic process and the operator is presented with a tabular display of identification and threat significance. Selected digital information can be recorded, hard copied and transmitted to external stations. An operator can select emitters for close attention and hand over this task to the narrow bandwidth, tunable analysis receiver for attention by the analysis

operator. The ESM thereby acts as a filter to reduce the workload on the analysis receiver.

The analysis receiver accepts digital data on any nominated emitter and automatically tunes the receiver to the correct frequency. The higher sensitivity and accuracy of the analysis receiver then permits detailed analysis of the signal. The data obtained can be used to update the library, create new entries and/or be recorded and transmitted to external stations. Both search and analysis receivers are capable of fully independent operation.



The system is designed for installation in a vehicle and for use at both fixed and temporary sites. The equipment is transported and operated in 19 inch (483 mm) special transport housings and is capable of withstanding rough handling and harsh environments.

STATUS

SAVIOUR WARNING SYSTEM

The Saviour system combines radar and laser sensors to provide an integrated threat warning equipment which can be fitted to any type of armoured vehicle. By sensing the electronic irradiation of the vehicle by laser or radar beams, it gives instantaneous aural warning of impending missile or tank gun attack to the tank crew. In addition to the aural warning, an octantal indication of direction and type of attack is displayed and an optional automatic counter measure ie, emergency smoke screen, can be selected.

The radar frequency band coverage is from 6 to 16 GHz with laser coverage from 0·66 to 1·1 μm. Up to eight threats can be displayed simultaneously.

STATUS

In production.

RL1 and RL2 LASER WARNING INSTRUMENTS

The RL1 and RL2 are laser warning instruments able to detect radiation from pulsed laser rangefinders and target markers, and designed for mounting on armoured fighting vehicles. They can detect pulsed radiation within the 0·66 to 1·1 μm near infra-red band, covering the most common types of pulsed lasers (ruby, GaNa and neodymium) currently in use with rangefinders and target markers.

The RL1 has a 360° field of view and can also detect radiation coming from above. An indicator unit is mounted outside the vehicle and indicates the approximate direction of the radiating source by means of light emitting diodes mounted in a circle. Eight 45° sectors are indicated. A ninth emitting diode mounted in the centre indicates radiation from above. Due to the overlapping fields of view, a total of 17 sectors can be indicated.

The receiver gives an audible alarm consisting of a pulsed audio signal in the crews' intercom system when a laser pulse is detected. The duration of the alarm is about two seconds for a single laser pulse. When more than one pulse is being detected the alarm stays on for as long as laser pulses are being received.

The RL2 warning device also has a 360° field of view with a detector unit mounted on top of the vehicle and a control unit mounted inside. The control unit gives an acoustic alarm when a laser pulse is detected in a similar way to the RL1.

CHARACTERISTICS

No of detectors: 4 horizontal and 1 vertical (RL1); 1 (RL2)
Detector field of view: 360°
Type of detector: PIN photodiode
Detector active area: 1 mm^2
Optical bandwidth: 0·66 – 1·1 μm

SCHERMULY INFRA-RED COUNTERMEASURES

Schermuly multiple-band screening is a vehicle-discharged smoke grenade that produces a large cloud of infra-red radiating material between the vehicle and the enemy position. The emission characteristics of the cloud give an effective screen through visual to the far infra-red frequencies. A salvo consists of twelve 66 mm smoke generators which provide a screen 5 metres in height at 15 to 25 metres from the vehicle, with a spread of 110 degrees giving a front 40 metres long. The screen takes a maximum of three seconds from firing and lasts for approximately 30 seconds. This screen is claimed to be effective against thermal imagers operating in the 3 to 5 micron and 8 to 14 micron bands, optical and electro-optical devices, and laser rangefinders.

Pains-Wessex Schermuly also manufactures infra-red decoy flares for airborne use in two versions, 1 × 1 inch and 2 × 1 inch. These flares are fully compatible with the AN/ALE-40 and M130 dispensers, or the equivalent.

STATUS

In production.

AN/ULQ-14 RADAR COUNTERMEASURES

The AN/ULQ-14 is a ground-based radar countermeasures complex operated by the US Army in the 8·5 to 17 GHz frequency band and is designed to be the ground element of the AN/ALQ-143 airborne multi-target electronic warfare system. The system provides electronic countermeasures capability for all army echelons from division upwards for countering ground and air-based threats from radar systems. The primary targets are counter-mortar/counter-artillery radars, surveillance and target acquisition radars and other radar systems in line-of-sight propagation.

The system is housed in a standard US Army S250 shelter for use with a 1½ ton truck and has a data interface with the AGTELIS control processor (**4408.153**), the AN/ALQ-143 MULTEWS airborne systems, Quick Look II and the AN/MSQ-103 Teampack mobile ESM system (**4405.193**). The capabilities of the system include the jamming of four to six signals over a 15 km range.

5834.193
AN/ULQ-19 TACTICAL COMMUNICATION JAMMER

The AN/ULQ-19 system is designed to operate from small armoured or soft-skinned vehicles, or can be installed in a helicopter. It covers the combat net radio frequency band 20 to 80 MHz in 12·5 KHz steps and normally provides 100 W of jamming over this range. Its automatic jamming capabilities include search for and jamming on a priority basis from a list of up to 16 preset channels, or in a specified band of frequencies. It has two variants, a V1 for vehicle installation with a whip antenna, which can operate while on the move, and a V2 which also includes a manually switched amplifier to boost the output to 400 W.

SYLVANIA EW ANTENNAS

The Sylvania Systems Group of GTE has developed and produces a comprehensive range of special antennas for various electronic warfare applications. These are described in some detail under the above entry number in previous editions. Illustrations of typical examples, and summarised information, have been retained for the benefit of readers without access to earlier volumes of *Jane's Weapon Systems*.

AN-10 Broadband Horns

This is a range of microwave horn antennas, usually of the ridged type, and which often are provided with a dielectric phase-correcting lens in the flared section. Individual examples from the range have specific frequency coverage.

AN-13 High-gain Omni-directional Antennas

This range of omni-directional antennas has been developed for signal acquisition and sidelobe suppression applications. The basic construction is that of a bi-conical horn, with metal grids or meander lines in the aperture, yielding 45° slant linear or circular polarisation, respectively.

AN-14 Log Periodic Antennas

Log periodic antennas are linearly polarised structures covering very broad frequency bands with constant performance characterstics (ie frequency independent). They are directional antennas with medium gain, and are suitable for use with direction finding and electronic reconnaissance systems.

AN-15 Conical Log Spiral Antennas

These are produced by means of a three-dimensional printed-circuit technique for generating precision log spirals on dielectric cones. These conical log spirals maintain essentially constant radiation pattern performance with low polarisation axial ratio over several octaves of bandwidth.

AN-16 Cavity-backed Spiral Antenna

The AN-16 is a precision-backed, planar-spiral antenna covering a frequency band of 2 to 18 GHz.

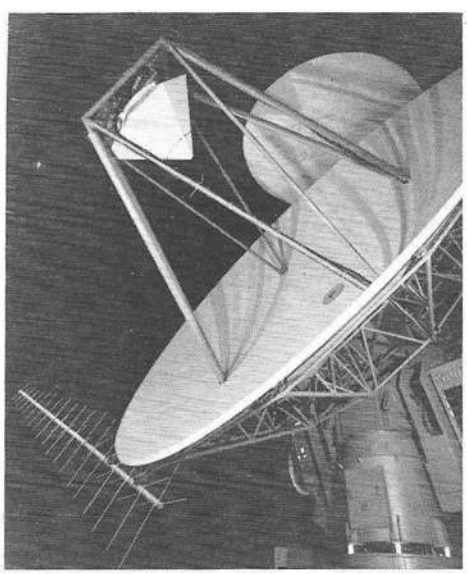
AN-18 Dual-polarised Horn Antenna

A number of broadband, quadruple-ridged horn antennas have been developed covering frequencies in the range 50 MHz to 18 GHz. This series of antennas was designed for use in reconnaissance and surveillance of signals of unknown polarity.

AN-20 Corrugated Horns

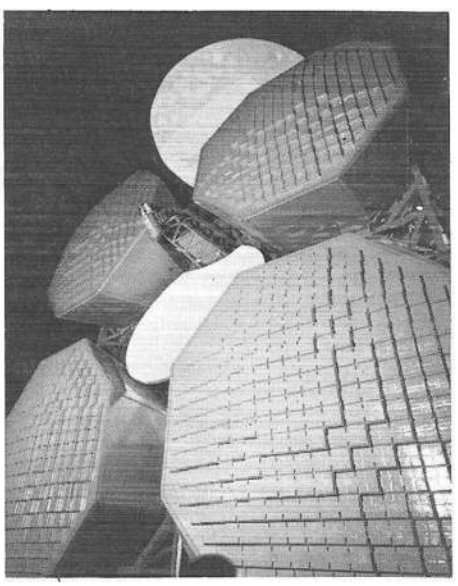
Corrugated horns are used as (cassegrainian or prime focus) feeds in reflectors to obtain maximum efficiency and gain. They are ideal as feeds because of their very symmetrical beams and low sidelobes.

The corrugated horn consists of a conical horn with corrugated interior walls. The corrugations act as 'chokes' to cause the current which would exist on the walls of a conventional horn to go to zero. These currents are the cause of high sidelobes and pattern deterioration in conventional antennas.



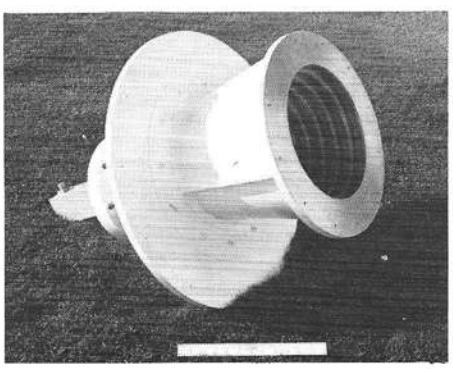
AN-23 Lindenblad Antennas

GTE Sylvania has developed printed circuit board circularly polarised omni-directional Lindenblad antennas to cover octave frequency bands. Five different units are available in the 0·5 to 12 GHz range. They are produced as complete sealed units, with integral radome, and are suitable for airborne use in intercept/collection and other applications.

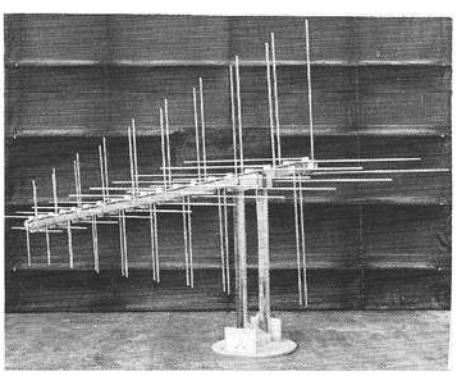


CHARACTERISTICS

	AN-20A	AN-20C	AN-20D	AN-20F	AN-20H
Frequency (GHz)	8 - 12	8 - 18	1·7 - 2·6	3·95 - 5·85	8·2 - 12·4
Beamwidth	30°	30°	28 - 17°	28 - 18°	30 - 18°
VSWR (max)	1·5:1	1·5:1	1·5:1	1·5:1	1·5:1
Gain (dBi)	15·5	15·5	15·2	15·2	15·2
Aperture (in)	4·75	4·75	27	11·8	5·6
Length (in)	2·4	2·4	37·5	16·4	7·6



Other models covering the bands of 12 - 18, 2·6 - 3·95, and 5·85 - 8·2 GHz are also available.

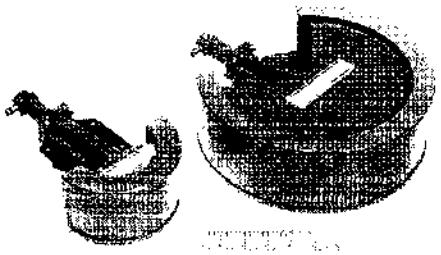


This monopulse tracking system has a bandwidth of 25:1 and provides both senses of circular polarisation. It consists of a log-periodic array feeding a 30 ft (9·4 m) parabolic reflector. Intercept capabilities are provided by the dually-polarised log-periodic antenna mounted on the side of the dish. A tracking accuracy of ±0·01 beamwidths is claimed

GTE Sylvania has been responsible for the development of numerous broadband antenna systems for reconnaissance and ESM applications. This example consists of four circularly polarised horns operating in the VHF/UHF bands which can be used separately for acquisition or together for more accurate tracking through the process of sequential lobing. A 10 ft (3·04 m) offset-fed reflector centred in the assembly provides high-gain precision tracking from 1 to 11 GHz

Sylvania AN-20 corrugated horn antenna

Sylvania AN-14 log periodic array



AN-27 Fan-beam Horns
The fan-beam horn design allows independent control of broad azimuth beams and narrow elevation beams, while providing low axial ratios over the entire beam. E- and H-plane beamwidth ratios of approximately 7:1 are characteristic of these horns.

AN-33 Septum Horns
The septum horns are pyramical horns whose E-plane aperture distribution is compensated to provide sidelobe reduction in that plane.

AN-34 Conical Spiral Array
Under this designation a series of conical-spiral antenna arrays for broadband, high-accuracy tracking and direction finding is produced. Features of such arrays include circular polarisation, low polarisation axial ratio, frequency-independent performance, small bore-sight shift and phase and amplitude tracking among antennas.

AN-121 Rotating DF Antenna Systems
The AN-121 series of rotating DF antenna systems has been developed to meet a wide variety of DF and high gain monitor system applications using GTE Sylvania standard antennas, pedestals, radomes, and control units.

4677.153
J-3400/J-3410 MOBILE ECM SYSTEMS
The J-3400 system is a mobile passive/active equipment designed for both signal intercept and jamming in the VHF frequency band. The complete system consists of transmitters, receivers, computers and an antenna system and is normally mounted on a tracked vehicle for mobility in practically any terrain. It is designed for one man operation and can be deployed within three minutes.

In the active mode the J-3400 will automatically jam up to four frequencies in a sequential time-shared mode. There is also a priority jamming mode which jams on a single priority signal whenever it is active. 1 kW (4 kW ERP) jamming power is provided.

In the passive mode the J-3400 functions as a signal intercept system. It continually sweeps all bands, or spot checks preprogrammed frequencies. In either case the receiver pauses on active signals for active analysis.

The J-3410 is an advanced model which offers more capability, including frequency coverage from 20 to 100 MHz and more jamming modes.

STATUS
In production.

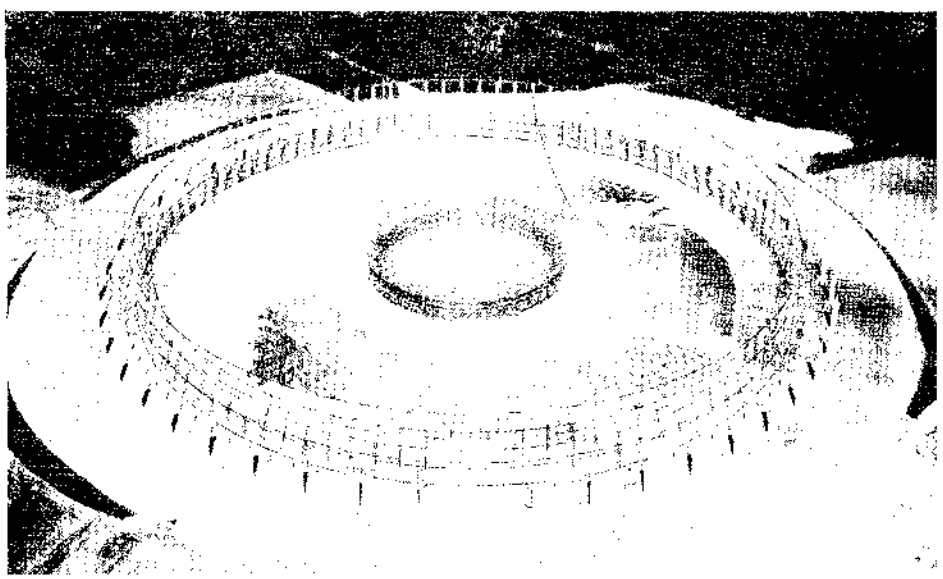
3032.153
CIRCULARLY DISPOSED ANTENNA ARRAY (CDAA)
A CDAA is an antenna system which consists of a number of monopoles, or dipoles, uniformly spaced in front of a circular reflector that has its axis normal to the earth's surface. The antenna operates as a broadside array and is capable of providing several different types of beams to cover 360° in azimuth.



As the wave front of an emitted radio signal passes over the antenna array, each antenna element is excited at a different time. The output from each element is amplified and distributed by power dividers. The outputs of the element pairs that are symmetrically displaced with respect to the arriving wave front are combined. Each of the combined outputs is then delayed by an amount required to cause the outputs of those elements that are used to form a beam to be coherent in phase.

The summing of those equal phase outputs results in a highly directive beam. The directivity of the beam is a function of how many elements are combined.

During the past 20 years, GTE Sylvania has designed, developed, and installed many CDAA systems which operate from HF through to the UHF ranges. The physically large antenna systems operate over bandwidths up to 10:1 and achieve DF accuracies that vary between 3 and 5°. These custom-designed systems were developed under government or company-sponsored funding to meet specific requirements. Delivered fully operational, and based on state-of-the-art information, the systems meet or exceed all performance requirements.

Hardware developments over the years have greatly expanded the capabilities of this antenna system. The development by GTE Sylvania of low NF and high dynamic range preamplifiers led to a large improvement in the system sensitivity. Development of low loss beam forming networks and power combining hybrids provides the capability to form high gain antenna beams simultaneously present over the full 360° azimuth. An arrangement of high dynamic range amplifiers followed by power dividers, patch panels, and selector switches enables the operators to have unrestricted access to each antenna beam.

GTE Sylvania and others have also developed new hardware which permits extension of the frequency range of CDAA systems.

Sylvania circularly disposed antenna array (CDAA)

4386.093
SPERRY UNIVAC ANTENNA SYSTEMS EQUIPMENT
Sperry Univac has developed and produces a wide range of special antennas and ancillary equipment for electronic warfare applications. The salient features of major examples are listed below.

Single-axis Antenna Assembly
This is a single-axis antenna designed to operate in severe environmental conditions extending from ocean surface vehicles to high performance aircraft. The primary application is for use as part of an airborne commmand and telemetry link, where maximum gain through beam stabilisation is required to maintain command and control between the aircraft and a ground control station.
Polarisation: Right hand circular
Frequency: 10 – 10·4 GHz
Beamwidth: 1·8° at 2 dB points

AN/UPQ-3A Steerable Antenna
The AN/UPQ-3A steerable antenna is a versatile directional system designed to operate in severe environments from surface vessels to high altitude airborne vehicles. The primary application is for use as part of an airborne command and telemetry link (as with the single-axis antenna described above).

The antenna is steerable in both azimuth and elevation. Steering is accomplished by the antenna receiving digital pulses, each corresponding to small antenna movements. The antenna will output two three-wire synchro angles representing elevation and azimuth position of the horn relative to its mounting base.

It consists of two basic parts: the antenna assembly containing the horn, drive mechanism and position sensing elements, and the controller assembly containing programmable circuitry for directional control and two-axis stabilisation control.
Frequency range: 9·75 – 10·57 GHz
Beamwidth: 8·5 – 12° (3 dB points)
Polarisation: Circular; right hand or left hand
Azimuth: 360° continuously steerable
Elevation: +45 to −85°
Rate: 30°/s either axis
Position accuracy: ±·75° at max slew rate in either axis

Two-axis Steerable Antenna
This is a directional antenna system with applications identical to the previous item. It consists of two major units: the antenna assembly containing the horn, drive mechanism and position sensing means, and the controller assembly containing programmable circuitry for directional control and three-axis stabilisation compensation. The antenna assembly is normally installed in radomes 12 inches in diameter or less. The mounting base can be supplied with a pressurisation seal for installation through the airframe structure.

Two-axis Corrugated Horn Antenna
This lightweight compact airborne antenna is designed specifically for use where the antenna is located close to other radars or other microwave systems. The corrugated horn design provides low backlobes and minimises interference with other sensors. It is also ideal for installation in pods or mounted in remote locations on the aircraft. Used in tandem with suitable control and RF switching, this unit can maintain constant link-up with directional

ground trackers even when mounted on high performance aircraft.

The antenna is steerable in both azimuth and elevation. Steering is accomplished by the antenna receiving differential TTL digital pulses corresponding to rates up to 60°/s in azimuth and 30°/s in elevation, each corresponding to small antenna movements. The antenna outputs two three-wire synchro angles representing elevation and azimuth position of the horn relative to its mounting base.

Frequency range: 16·7 - 17·7 GHz
Beamwidth: 20° horizontal; 22° elevation
Polarisation: Linear. Circular, right hand or left hand
Azimuth: 360° steerable continuously
Elevation: +45 to -85°
Rate: 30°/s, either axis
Position accuracy: 1·75° at max slew rate in either axis

Multi-band Tracking Antenna
The multi-band tracking antenna is designed for line-of-sight aircraft tracking and control. It will operate in severe environmental conditions and has been tested to military specifications. Two electronic servo control packages are available to operate the antenna. One requires operator presence within 100 feet of the antenna; the other allows remote antenna control from up to 1320 feet away. The servo motor drive uses high-efficiency, pulse-width modulation techniques. The small power amplifiers require no external cooling.

A single-axis tracking feature provides for tracking in areas where multi-path has a tendency to distort the elevation components of spin modulation. The system design permits mobile, fixed or shipborne installations.

Mobile Ground Tracker Terminal
The mobile ground tracker terminal is a rugged multi-band antenna system designed for operation in severe environments. It employs a servo drive using high-efficiency pulse-width modulation techniques to ensure fast slew tracking. Integrated levelling jacks allow rapid set-up in difficult terrain. It can be located up to 1320 feet away from the ground control system to safeguard operator personnel from attacks. The parabolic antenna dish folds down into a stow position and interconnect cables are stowed in the fixed reels to permit air transport.

The ground mobile tracker terminal consists of three major assemblies: the M-390 trailer with levelling system and stowage equipment, the pedestal antenna system, and the electronics enclosure with the antenna control and RF interface electronics.

Frequency range: C, X or Ku
Beamwidth: 1 - 2·25°
Polarisation: Circular, right hand
Slew rates: 30°/s (azimuth and elevation)

125-watt TWT Amplifier
The 125-watt TWT amplifier assembly is a single-unit TWT and power supply designed to withstand the severe environments associated with military aircraft and tactical ground installations. The primary application is a high power, airborne or ground digital data or imagery transmitter.

The assembly consists of three major units: the TWT amplifier providing 150 W (X-band) of CW output power, a solid-state power supply and a built-in test system.

Frequency: X or Ku band
Output power: 150 W

70-watt TWT Amplifier
This consists of two major assemblies: the TWT amplifier providing 70 W (X-band) of output power and the solid-state power supply. As an optional feature this unit is also available with 35 or 50 W power output, and in C or Ku band frequencies with the power output varying slightly with frequency.

Spread Spectrum Modem
The Spread Spectrum Modem has applications as an interface compatible with the AN/UPQ-3(A) data link, as part of an airborne command system, as part of ground-to-air/ground-to-ground/air-to-air data link and is also applicable to reconnaissance use in a jamming environment.

The equipment uses a direct sequence modulated FM carrier at the specified signal levels. The received signal is collapsed to an FM modulated IF by code tracking the PN sequence and multiplying the received signals by the code estimate. The resultant FM signal is phase-lock loop detected and the baseband data is provided at two output ports of the receiver.

Frequency: X or Ku band
Modulation type: FM

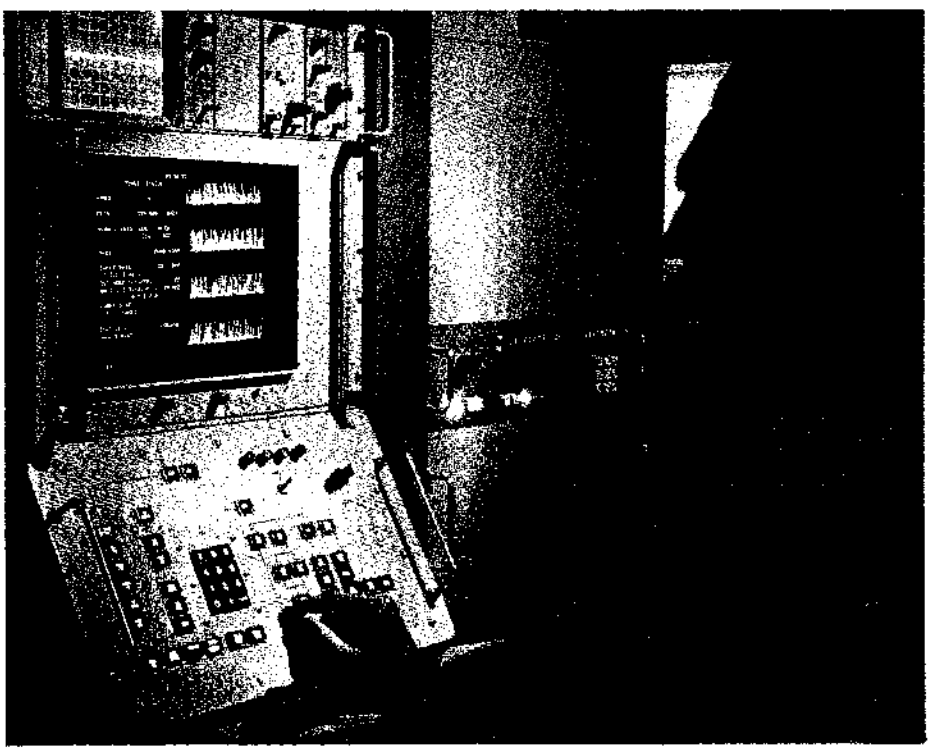
TACTICAL ELECTRONIC RECONNAISSANCE (TEREC) REMOTE TERMINAL (TRT)

The Tactical Electronic Reconnaissance (TEREC) Remote Terminal (TRT) is a collection of equipment, computers and procedures which forms a simple-to-operate portable terminal for tactical operations centres. The system is able to receive, process and report TEREC radar emitter location reports in near-real-time without reliance on ground communications. The TRT accepts voice and data information from the TEREC (AN/ALQ-125) equipped airborne sensor platform and consists of a computer, decryption equipment, a data demodulator, HF and UHF receivers, antennas, and a keyboard and printer.

The radio communications, data processing, keyboard and printing equipment are contained in portable containers which can be transported rapidly (via land, sea or air) and deployed quickly into full operational capability at the operational site. The equipment is fully ruggedised for military use, and can operate from a variety of power sources, including 120 V, 60/400 Hz single phase and 220/240 V, 50 Hz single phase.



STATUS
In operational service.

SYLVANIA COMPUTER CONTROLLED RECEIVING SYSTEMS

During the past decade the traffic in the RF environment encompassing the radar and communication bands has rapidly expanded. This growth coupled with the sophistication of new systems has placed stringent demands on the operations of reconnaissance and electronic warfare communities.

Since mid-1960, GTE Sylvania, California, has been developing receiving systems designed around modern computers to meet these complex challenges; many of these systems are now in field operation. These systems, deployed in ground based, air, naval, and mobile applications, are divided into two areas: radar receiving systems and communication receiving systems.

Sylvania computer-controlled receiving system

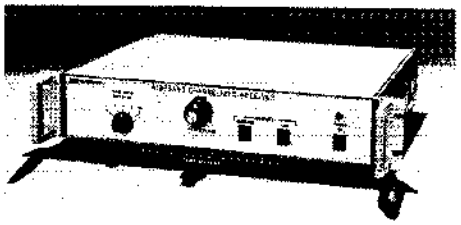
Radar Receiving Systems
Typical radar receiving systems consist of five sub-systems: antennas, receivers, displays, signal digitisers, and the computer and its peripherals. In operation the system performs five major functions: monitor, signal acquisition, identification, cataloguing, and reaction.

The computer controls the system's antennas and receivers in a programmed pattern as directed by the operator. Incoming signals are digitised and routed to the computer where they are sorted, identified, and catalogued according to their measured parameters.

Depending on the mission of the system, reaction to threat signals can consist of alerting the operator, controlling a weapons or countermeasure system, or direct communications. Under control of the operator the computer will sort, correlate, update, and retrieve selected information for analysis and output data to magnetic tape, disc, paper tape, or provide data in numerical form on a CRT display or high speed printer.

Communication Receiving System
Communication receiving systems are divided into eight major sub-systems including: antennas, receivers, demultiplexers, mode analysers, activity detectors, recorders, distribution equipment, and the computer and its peripherals. Incoming communications signals are separated by the system's demultiplexers. The mode analyser determines signal modulation, and passes this information to the computer. The activity detector informs the computer when communications activity takes place. The computer uses this information to control the communications system, routeing signals via the distribution equipment to various recorders and operators, and to maintain activity files.

In summary the availability of today's computer controlled receiving systems allow five major advantages: (1) rapid identification of signals in high density environments; (2) relief of operators from direct involvement in the repetitive control and logging functions making them available for system management and signal analysis; (3) increased operator scope and efficiency reducing operating cost; (4) increased system response time, and probability of detection; (5) modular design of both hardware and software providing an economical building block approach to tailoring systems to meet customer needs and future expansion.



STATUS
Operational.

SYLVANIA BRAGG CELL RECEIVER

A Bragg Cell channelised receiver with wide, instantaneous radio frequency signal bandwidth, excellent spur free range, and simultaneous signal handling capability has been developed by the Western Division of GTE Sylvania, a subsidiary of General Telephone & Electronics Corporation. The receiver is suitable for frequency sorting in radiometer-type radio frequency receiving systems. Applications include spread spectrum signal acquisition, detection and priority ordering. In the new receiver, acoustic and optic techniques are combined with electronics to modulate a laser's light with sound.

Bragg Cell receivers permit rapid analysis of multiple radio frequency signals over wide bandwidths without scanning. Designed to upgrade spread spectrum signal detection systems, the Sylvania unit offers a centre frequency of 2 to 3 GHz and a bandwidth of 1 GHz. This represents the greatest information handling capability of current Bragg Cell units, according to the producers.

Unlike conventional surveillance receivers, Bragg Cell units provide instantaneous, wideband operation over the receiver intermediate frequency bandwidth;

GTE Sylvania Bragg Cell wideband channelised receiver

simultaneous sorting of in-band frequencies; and 100 per cent signal intercept capability. They also are smaller and have simpler processing. The Sylvania units are projected to be less expensive in quantity manufacture than competing systems.

Acoustic and optic techniques are combined with electronics in the receiver to modulate a laser's light with sound. Heart of the unit is an acousto-optical diffraction cell crystal through which radio frequency signals, transformed into acoustic waves, travel. When the crystal is illuminated by laser light, that light is modulated by the acoustic waves. This modulation, which includes the signal information, is detected by a photo-detector diode array.

A multiple channel optical data processor can function as a monopulse direction finder system. This type of system enables instantaneous frequency channelisation to combine with real-time angle of arrival sorting of signals via amplitude matched receiver channels. Both four- and eight-channel processors have been delivered. Instantaneous two-dimension frequency/direction of arrival signal sorting has been developed at GTE using a multiple-dimensional optical data processor.

Optical representations of signals are permanently recorded on film using photo-optic recording.

The Sylvania channelised receiver has an instantaneous bandwidth of 1 GHz; frequency cell resolution of 1 MHz; centre frequency of 2 to 3 GHz; and continuous wave sensitivity of –80 decibels below one milliwatt. Work is progressing on the next generation of the device which is expected to offer a centre frequency capability of 3 to 4 GHz. Integration times are 1, 2, 4, 8 and 16 milliseconds. Dynamic range is 45 decibels spur free and detector range is 30 decibels. The unit weighs 9·5 kg, including power supplies, and measures 279 × 482 × 101 mm.

4665.093
DF-8000 DIRECTION FINDING SYSTEM

A high accuracy, automatic direction finding system, the DF-8000 covers the 20 to 1000 MHz frequency range and is designed for communications monitoring in mobile, fixed, airborne and shipborne applications. It is also available in either a VHF or a UHF version. The equipment operates on the time-difference-of-arrival principle, providing a range of accuracies from better than one degree to several degrees depending on calibration and installation factors. This accuracy performance is maintained at low signal-to-noise ratios against any typical communication signal modulation and is not sensitive to amplitude change. Instantaneous coverage is 360 degrees.

The DF system consists of an antenna array, standard single channel communications receiver and a DF processor with detachable control and display panel. A range of functions includes storage of 100 signals for automatic search operations. The system can be operated locally or remotely with automatic or manual control. Weight, excluding antenna, is 65 lbs (29·5 kg).
STATUS
In production and in service with the US Army. An HF variant is in development.

MPI-5 MINIATURE PULSE ANALYSER

The MPI-5 is designed as a militarised display to allow operator analysis of signals as detected in radar environments. The unit is a reliable, miniaturised, solid-state, modular replacement for the AN/ULA-2 with improved characteristics and additional features. It can be used to perform the following:

(1) pulse width measurement
(2) pulse repetition frequency measurement
(3) pulse risetime measurement
(4) signal envelope analysis
(5) pulse signature analysis
(6) signal sorting
(7) frequency band activity monitor
(8) audio monitoring of video signal.

The MPI-5 is a five-gun CRT display, each successive sweep being 10 times slower than the preceding sweep. The sweeps are triggered when the incoming pulse exceeds a threshold. With the use of delay lines, the entire incoming pulse is displayed. The fifth trace can be switched to a panoramic mode which provides a built-in frequency band monitor. An internal calibrator is provided to permit accurate calibration of the display to its scale. An audio output is also provided for audio monitoring or recording of the video signal.
STATUS
No details of applications or deployment have been disclosed.

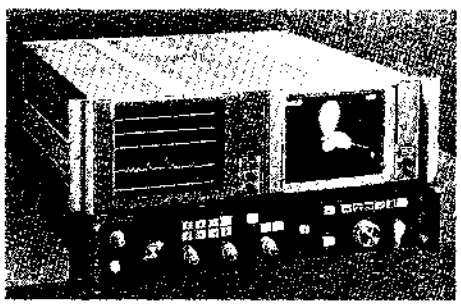
Operating controls and display of MPI-5 miniature pulse analyser

5816.053
R-3030 SURVEILLANCE RECEIVER

The R-3030 is a new series of lightweight surveillance receivers featuring two completely independent receivers in a rack mount which would normally hold a single unit. Features of the R-3030 including tuning in less than eight milliseconds over the full 5 kHz to 30 MHz range and a modular building block design which makes it easier to meet special requirements for data bus connectors, bandwidths, AGC settings, etc.

The R-3030 provides 100 memory channels, IEEE-488 or RS-232 bus connector modules, EMI/EMC shielding, five bandwidths, five operating modes, versatile scan and sweep modes and a low power requirement.



CHARACTERISTICS
Frequency range: 5 kHz to 30 MHz
Operating modes: LSB, USB, AM, FM and CW
Bandwidth: 5 bandwidths (0·5 – 8 kHz)
Power input: Approximately 35 W
Dimensions: The dual system fits into a 25 × 19 inch (635 × 482 mm) rack
Weight: 18·1 kg

STATUS
Production. Nearly 1000 units ordered by the US Navy.

WJ-945 RECEIVING/DF SYSTEM

The WJ-945 receiving/DF system is a sophisticated microwave receiving system covering the entire 0·5 to 18 GHz frequency range. The system provides combined control and display functions for a high sensitivity superheterodyne receiver and a servo-controlled rotary DF antenna. The WJ-945 system is configured to minimise the total number of components, offering maximum operator control and display flexibility in the minimum possible equipment rack space.

Watkins-Johnson WJ-945 receiving/DF system

The system configuration provides each operator with a receiver/DF control unit and two storage type CRT display monitors. Both CRTs in the standard system design are installed directly above the receiver/DF control unit to optimise operation and observation of the system. The microwave tuners used in the WJ-945 system are miniature WJ-940 tuners (described in **3352.053** in 1979-80 and earlier editions). These are mounted in groups of three in tuner enclosure/junction units. Two tuner enclosure/junction units, housing six WJ-940 tuners, allow coverage of the 0·5 to 18 GHz frequency range.

A control/servo drive for the DF antenna is generally located near the antenna pedestal and tuners, and this contains all of the required video processing, digital control and analogue circuitry necessary for antenna control and the DF display generator. This unit also provides digital control outputs for controlling RF switches between the DF and omni antennas and the microwave tuners. The EP-30 antenna pedestal is designed for simplicity, ruggedness, reliability, and ease of maintenance. The pedestal contains a permanent magnet DC torque motor for clock- and counter-clockwise rotation and heavy duty sealed bearings for rotational support.

The L6 spinning DF antenna provides frequency coverage from 0·5 to 18 GHz. The WJ-8535-11 is a very small bi-conical horn broadband omni-directional antenna covering 0·5 to 18 GHz. The polarisation is 45° slant linear.

STATUS
Production.

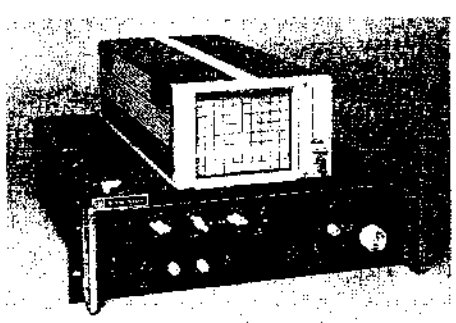
C-204/WJ-1140 ANALYSIS CONTROL UNIT

The C-204/WJ-1140 analysis control unit (ACU) performs three major receiving system functions: operator interface and system control, automatic signal parameter measurement and automatic signal identification. The ACU is a compact unit that replaces four separate units required in older receiving systems (receiver control, video processing, digital processing and alpha-numeric display units). The ACU's automatic operating modes decrease signal identification time and operator training requirements.

The ACU's electronics contain a high-speed microprocessor that controls the unit and performs signal analysis. Under firmware control, the microprocessor compares received signals to a user provided signal library and outputs an alpha-numeric code representing the signal source. Signal parameters are derived from time of arrival (TOA), amplitude, pulse width, and angle of arrival (AOA) data.

To facilitate real-time operator decision making, the ACU provides six different alpha-numeric analysis display formats. Indicators in the upper-left-hand and upper-right-hand fields of display formats notify the operator of 'page' numbers being presented and number of pages of stored information. As an example of display applications, system status displays give overall information concerning system operations (operating mode, threshold level, frequency range, marker location, IF bandwidth, sweep speed, and IF attenuation for each RF tuner) while pulse-by-pulse and average PRI formats give parameters for individual pulses within current pulse trains. Average PRI and pulse-by-pulse formats used together (cross-referenced by using a NEXT CHAPT button) are particularly useful in determining n-tuplet and stagger characteristics of multiple pulse train signals.

C-204/WJ-1140 analysis control unit



The ACU can control up to six tuners with a frequency range of 500 MHz to 18 GHz (ACU generated tuner modes include fixed, band scan, limit scan or sector scan). In typical configurations using six tuners, each tuner can be used to cover one octave band. The ACU generates frequency control commands and transfers them via the tuner junction to each of the tuners. The ACU serially sequences through tuners at a scan rate determined by the ACU under operator control or automatic control. The ACU also controls the parameters for IF bandwidth filtering, IF attenuation, and log-video detection, which are used by an external demodulator to process the RF-to-IF converted signals routed to it from the tuners. The demodulator, in turn, provides the ACU with the IF for its signal-centring circuitry and the log video for the ACU's signal parameter measurements.

In addition, ACU control determines manual or automatic system operating modes, which gives the operator flexibility to operate effectively in the changing environment. When used in automatic modes, the system performs scan lock, scan search and auto search functions. In each of the automatic modes, the ACU halts tuner scan for signal measurement whenever emitters exceed operator controlled threshold levels.

WJ-1920 MULTIPARAMETER DISTRIBUTED PROCESSING SYSTEM

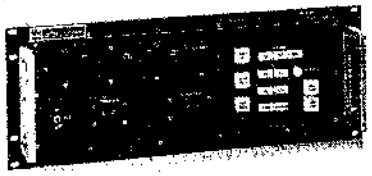
The WJ-1920 multiparameter distributed processing (MDP) system, combines superhet and wideband technologies in a unique way to build a wide open receiver that provides instantaneous intercept and recognition of signals in the 0·5 to 40 GHz range. The WJ-1920 system is built upon three functional units: the IFM, the superhet, and the display/filter subsystems. In the instantaneous frequency measurement unit, signals from an IFM or other broadband receiver channel are processed through a WJ-1921 pulse interval processor (PIP) and tagged in real-time according to their PRI characteristics. This PIP is central to the entire multiparameter distributed processing concept and uses a newly developed PRI time domain transform algorithm which allows a receiver to function in the PRI domain as a channelised receiver does in the frequency domain.

WJ-1921 pulse interval processor

In addition to signal parameters, the WJ-1920 system can incorporate other parameters into its sorting matrix to enhance monopulse characterisation and measurement capabilities (eg, pulse width, pulse amplitude, pulse direction of arrival) and even more subtle characteristics, such as pulse risetime, or pulse shape characteristics. This additional data can then be screened by the WJ-1234 (ACU) channel, displayed on the multiparameter display, or diverted for further automatic processing.

CHARACTERISTICS
Input waveform: Log or threshold video
Outputs: PRF versus activity display; PRI versus activity display, option for display cursor and gated video output; residue output
PRI range: 100 μs – 10 ms (100 Hz – 10 kHz). Extended ranges available. Jitter tolerance 1 – 256 μs, switch selectable
Pulse density: Up to 250 kpps single-signal, up to 50 kpps for most multiple signal environments
De-interleaving: Unlimited number of simultaneous pulse trains provided total pulse density is within limits
Sub-harmonics: Automatic rejection of sub-harmonic responses
Acquisition: 3 – 8 consecutive pulses depending on mode control setting
Scan rate: Channelised operation: processor is wide open to all PRIs
POI: Probability of intercept equals 100% for qualifying pulse trains
Display: Flicker-free refreshed PRI/PRF spectrum with adjustable decay rate
Size: 177 × 482 × 482 mm
Weight: 18·2 kg

CONTRACTOR
Watkins-Johnson Company, 2525 North First Street, San Jose, California 95131, USA



3665.093
WJ-1205B VIDEO DIGITISER UNIT (VDU)

The WJ-1205B video digitiser unit (VDU) is a microprocessor-controlled, high-speed pulse train analyser with a pulse sample capacity of up to 512 pulses. These pulses may be digitised for analysis of pulse characteristics - pulsewidth, pulse repetition interval (PRI), and average pulse amplitude. The WJ-1205B furnishes average PRI screening for interpreting complex pulse trains. A visual indication of these pulse rates is provided on the front panel of the VDU, along with operator controls. A self-test capability for unit checkout is also provided. Auxiliary equipment, such as an external computer, or line printer may be connected through a single rear-panel connector.

The WJ-1205B may be operated with its own internal, temperature-controlled crystal oscillator or phase-locked to a reference frequency provided by an external signal source (video tape recorder). Front end signal sampling may be gated internally by program control or by an external signal source (video disc). The VDU permits precise pulse-by-pulse analysis of modulated signals as well as other complex-grouped signals. To facilitate the deinterleaving of multiple pulse trains, the unit analyses all PRIs present in the video input stream and can compute up to eight independent PRIs that might exist. Pulse amplitude measurements permit additional analysis of the received signals.

CHARACTERISTICS

Video input dynamic range: 0·2 - 2 V (other ranges available)
Pulse sample capacity: 512 pulses standard; can be expanded to 767 in increments of 32
Sample interval: 100 ns
Event measurement accuracy: ±100 ns
Pulsewidth measurement: 100 ns (minimum)
Pulse amplitude measurement: Relative value of 0 -255 over video dynamic range
Tape reference tone input: 50, 100, or 200 kHz; amplitude 1 - 18 V rms
External sync input: Positive true range from 5 - 12 V peak, 100 μs minimum pulsewidth
Threshold output: TTL compatible
Digital data output: TTY and RS-232 compatible, serial rates up to 9600 baud. Parallel output also available for computer or line printer output
Internal clock: 10 MHz temperature-controlled crystal

Watkins-Johnson WJ-1205B video digitiser unit (VDU)

Dimensions: 482 × 177 × 457 mm
Mounting: Standard 19 in equipment rack
Weight: 15·8 kg
Displays: 0-5 in LEDs

STATUS

Production.

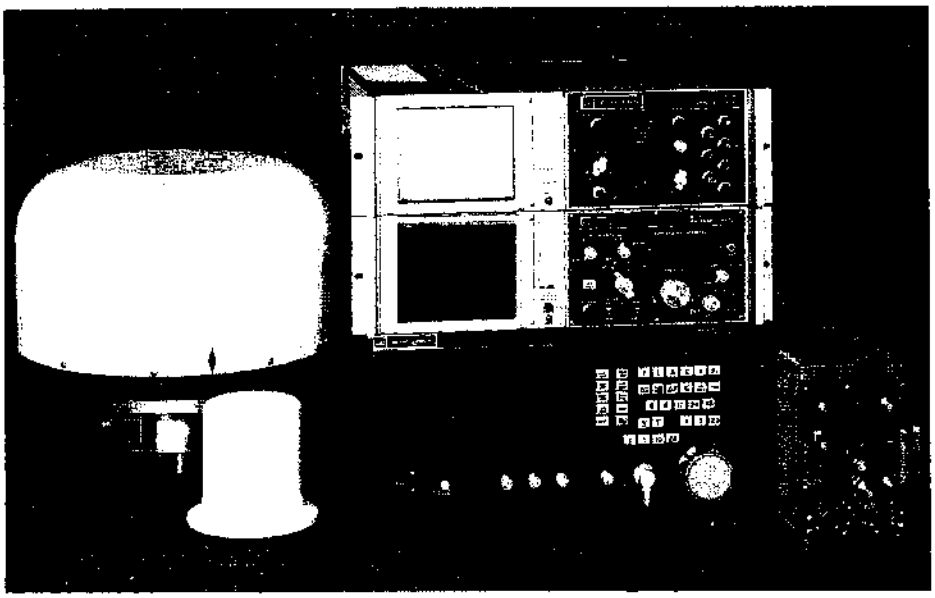
Watkins-Johnson Company, 2525 North First Street, San Jose, California 95131, USA.



4390.053
WJ-927 ESM EQUIPMENT

The WJ-927 system is a highly versatile microwave DF and signal analysis system which provides carry-on ESM capability for airborne, as well as shipboard, mobile, and fixed-site applications. It is small and lightweight, and consumes little power, while attaining high sensitivity and overall exceptional performance characteristics (5 to 18 GHz; expansible to 40 GHz coverage).

The WJ-1234 analysis control unit (ACU), the heart of the WJ-927 system, provides both flexibility and data handling capability previously available only in larger and more complex units. Highly specialised control and analysis functions are performed automatically by the ACU through the use of its solid state base and microprocessor control technology. Specific parameters of signals of known interest can be programmed into the unit. Used as a basis of comparison, this data provides the operator with quick identification of detected signals that match these parameters. In addition, its automatic signal analysis techniques allow the ACU to perform specific or directed search processes. In this mode of operation, the ACU enables only information on detected signals that constitute a match to be displayed to the operator.

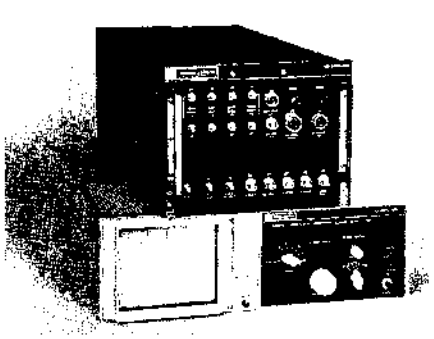
In addition, the ACU offers disc and CRT options which allow on-line modifications of the user's library file. Several other interface options are also available to allow integration of the ACU with other on-board systems or units such as the line printer, magnetic tape recorders, and time code reader interfaces, as well as video and IF outputs for analogue recording of signals of interest.

The antenna sub-system of the WJ-927 consists of a direction-finding antenna, an omni-directional antenna, a control/display unit, and an antenna pedestal.

WJ-927 signal analysis equipment

Watkins-Johnson has developed a DF antenna with a fan-beam pattern that yields narrow azimuth beamwidths for accurate direction-finding and broad elevation beamwidth to enhance the probability of detecting signals independent of aircraft attitude. Antenna DF accuracy is ±1° rms over the full band and not greater than ±5° absolute at the lowend of the band.

The WJ-8535-11 omni-directional antenna which has been chosen for this application gives excellent performance in the 0·5 to 18 GHz frequency range with a deviation from omni-directional of ±3 dB over 90 per cent of the band. The antenna is available with vertical or slant linear polarisation. The antenna itself is 14 cm high with a 14·7 cm diameter base and is mounted inside a low-loss dielectric radome.



The EC-60 control/display unit is the only unit available which provides all control functions (including sector scan) and all display functions, while also containing all of the servo modules necessary for the pedestal.

CONTRACTOR

Watkins-Johnson Company, 2525 North First Street, San Jose, California 95131, USA.

4393.053
WJ-1988 AMPLITUDE MONOPULSE DF PROCESSOR

The WJ-1988 amplitude monopulse DF processor is an economical direction finding sub-system designed to be used with various types of static antenna arrays within tactical and strategic ESM applications. By enabling a single wideband tuner to simultaneously process the DF outputs of each antenna within an array, the WJ-1988 eliminates the need for multiple tuners/receivers.

WJ-1988 amplitude monopulse DF processor

The WJ-1988 equipment provides processing of five channels of simultaneous RF information (one omni-antenna and four sector antennas) over the frequency range of 2 to 18 GHz. It consists of an active multiplexer (a small set of components located directly at the antennas), an MD-200 DF processor unit, and a C-100 control and display unit. Antennas and the receiver are separately required and are dependent on the user requirements. Because the composite signal after encoding is a wideband signal (500 MHz bandwidth), a wideband receiver such as the Watkins-Johnson Company TN-1000 MINCEIVER is recommended.

When used in combination with standard wideband receivers, the WJ-1988 develops a monochannel processing technique, which is made possible by a special bi-phase encoding method which the WJ-1988 uses to 'tag' or encode antenna signals. Bi-phase encoding is accomplished by spreading the original spectral power to produce a null at the original signal frequency. This encoding procedure prevents interferometry effects from occurring in signal processing when signals are combined for RF summation, and it also results in an improvement upon the maintenance of original signal integrity during signal processing.

CHARACTERISTICS

Number of channels: 5 (4 DF and 1 omni-channel)
Frequency range: 2 - 18 GHz
DF sensitivity: -78 dBm (typical antennas)
Omni sensitivity: -83 dBm (typical antenna)
Dynamic range: 60 dB minimum
DF accuracy: 4° rms
Instantaneous bandwidth: 5 MHz
Weight: MD-200 16 kg; C-100 and display 13·6 kg

CONTRACTOR

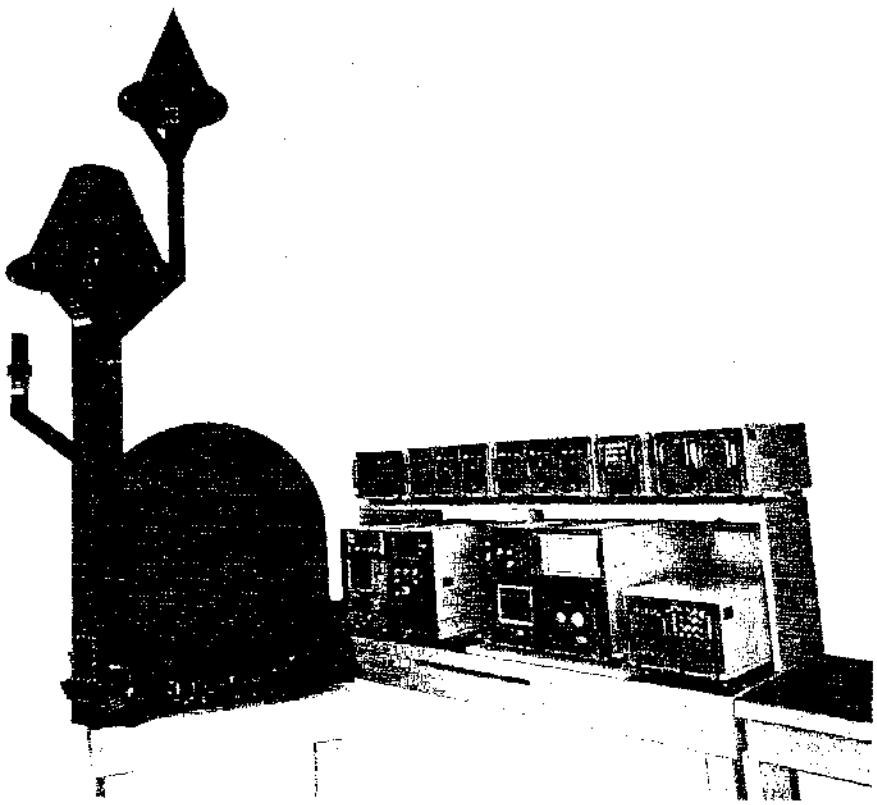
Watkins-Johnson Company, 2525 North First Street, San Jose, California 95131, USA.

1381.053
L-6/A-WJ-1140 MICROWAVE DIRECTION FINDING SYSTEM

This is an integrated microwave direction finding (DF) system, produced by the combination of the L-6/A broadband DF antenna system and the WJ-1140 modular microwave receiving system.

The broadband DF antenna system (L-6/A) is designed to function as a component of an electro-mechanical reconnaissance system when used in conjunction with the WJ-1140 receiver system. The L-6/A provides a visual display of the direction of arrival (DOA) of incoming RF signals that have been processed through the receiving portion of the overall DF system.

Lightweight and compact mechanical packaging makes the L-6/A suitable for use in airborne configurations as well as shipboard and fixed/mobile ground installations. The frequency coverage of this antenna system is 500 MHz to 18 GHz in six bands. Variable azimuth rotation sweep from 0 to 2000 rpm is accomplished through a control on the console.



In addition, the antenna can be steered to any desired azimuth point by a manual control knob located on the indicator. The radiation patterns of the antenna are relatively broad, with circular polarisation. This offers an optimum compromise between probability of signal intercept, direction-finding accuracy and gain. The RF output of the L-6/A system is entirely compatible with the WJ-1140 and the interface is accomplished through the use of standard RF coaxial cabling and connectors.

Used in conjunction with the L-6/A, the WJ-1140 would involve RF tuners covering the ranges 500 to 1000, 1000 to 2000, 2000 to 4000, 4000 to 8000, 8000 to 12 000 and 12 000 to 18 000 MHz. Signals acquired by the L-6/A are simultaneously available at all times to the WJ-1140 tuners without the requirement of RF band switching. Incoming signals are then processed through the appropriate tuners and mixed down to an IF frequency of 160 MHz for processing by the demodulator.

By use of another broadband antenna system, the L-5/A frequency coverage is extended from 18 to 40 GHz. This has similar pedestal and turning gear to the L-6/A, but instead of rotating horn elements, the L-5/A has fixed horns near the centre of rotation, directed up on a spinning reflector plate which is responsible for 360° azimuth coverage. To extend frequency coverage downward a companion antenna/receiver combination (L-4/A/RS-160) is available covering the band 40 to 550 MHz.

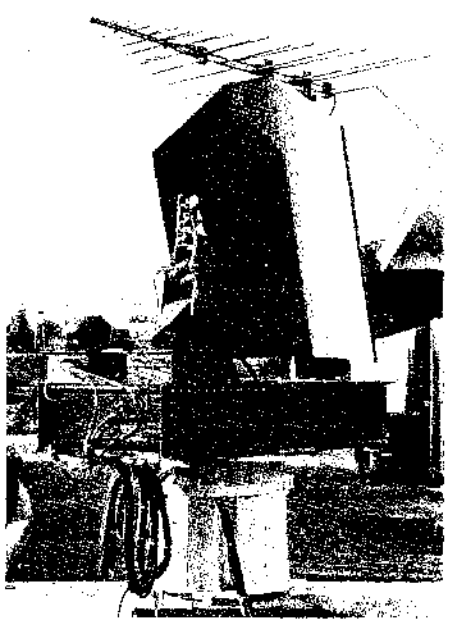
WJ-1140 0·5 to 18 GHz microwave direction finding receiver system with omni-directional antenna system

1716.053
WJ-1240 RECEIVING SYSTEM

The WJ-1240 is a computer-controlled receiving system for reconnaissance and surveillance applications over the radio frequency band 0·03 to 40 GHz, and it also has independent digital tuner control and parallel video display. The equipment consists of a modular integrated electronics package comprising the computerised WJ-1240 receiver itself, display and controls, and a direction-finding antenna system.



Independent tuner control permits multiple situation surveillance and provides independent video outputs for each tuner. This control operates in the absence of the computer for manual systems or as a standby mode of operation in computer-controlled versions. A digitally refreshed display with adjustable decay time retains single pulse signals for detailed visual observation. Display traces are automatically scaled during sector scan.

Several antenna assemblies may be used with the WJ-1240 depending upon the total frequency coverage demanded. The WJ-8312 provides direction-finding facilities over the range 0·1 to 18 GHz. Other Watkins-Johnson arrays which can be employed are the L-4/A (40 to 550 MHz), L-5/A (12 to 40 GHz), and the L-6/A.

The WJ-8312 consists of a rigid box structure supported on the turning gear pedestal and carrying a series of microwave receiver horns. Intercepted signals are directed into the horns (which are of dimensions appropriate to the frequency bands covered) by a curved plate reflector which rotates with the whole assembly. This reflector carries at its upper edge a log-periodic array for reception of the lower frequencies.

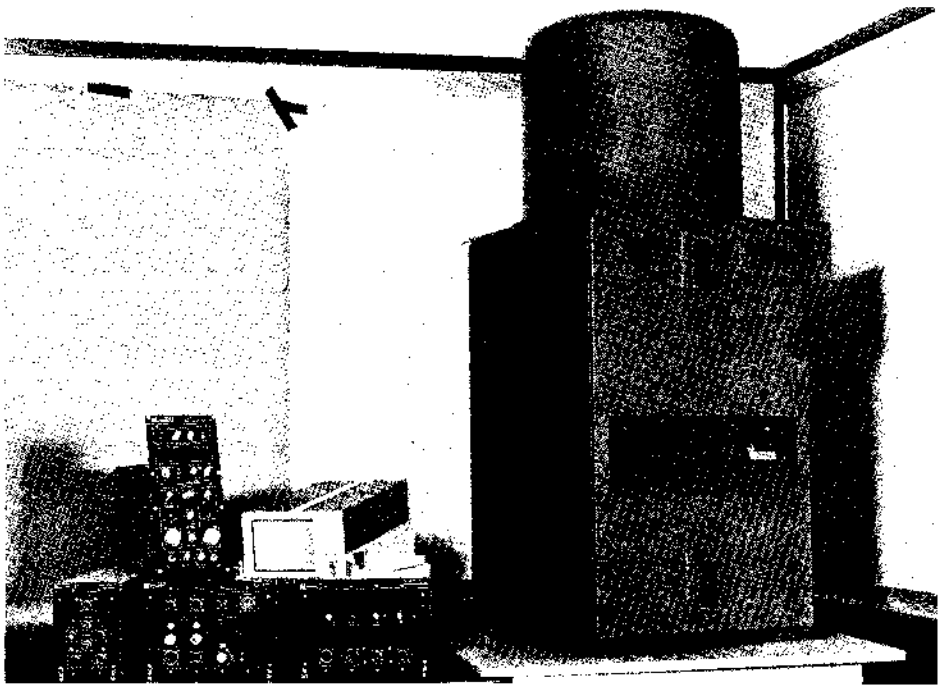
WJ-1424 MICROWAVE RECEIVER (TLR-31)

The WJ-1424 microwave receiver is a small, rugged, special-purpose system covering the frequency range from 10 to 40 GHz (the lower frequency limit may be extended down to 1 GHz as an option). Its compact, modular design lends itself well to applications requiring minimum weight and space consumption. Many functions normally designed into individual units have been integrated to provide multi-functional control and display units. The system includes all the elements necessary for a complete yet operational receiver. The system is comprised of a spinning directional antenna with radome, RF distribution, receiver control, and signal analysis units. The prime power requirement is 110 V AC, 9·2 amps, 37 to 400 Hz.

In its vehicle mounted form, it is believed to carry the designation AN/TLR-31. The receiver control unit provides all system operating control functions including antenna scan control. It also contains pulse analysis circuitry to perform fundamental signal analysis. The receiver operates in three modes: Spectrum, Pan and Analysis/DF. A single-frequency amplitude display is presented to the operator in the Pan mode. When the operator selects DF at the control, the CRT presents signal amplitude in a polar format for bearing information. Signal RF frequency and azimuth are displayed to the operator in digital form via LEDs on the control unit front panel. When utilising the pulse analysis function, the same LEDs provide digital readouts of pulse repetition interval or pulse repetition frequency.



The stand-alone system has been integrated with the AN/MLQ-24 countermeasures receiving set to extend the frequency range coverage into the millimeter wave region.

STATUS

In production and operational.

4394.053

WJ-1440 MICROWAVE RECEIVER SYSTEM

Derived from the fully-militarised WJ-1740 microwave receiver system (**3354.053**), the WJ-1440 incorporates added features that allow it to achieve a wider range of application with fewer optional requirements. The microprocessor controlled memory scan, for example, which is an option in the WJ-1740, has been standardised in the WJ-1440 system. This feature permits the operator to store up to 16 scan control blocks for recall. By selecting the memory scan mode, the operator can cause the receiver to automatically scan through any pre-selected number of scan control blocks, causing them to be sequentially displayed on an analysis display, which can be used to display DF and pulse analysis as well as normal receiver functions. Another WJ-1740 option that has been incorporated into the WJ-1440 standard design is a tuner integrated local oscillator synchroniser (TILOS). TILOS increases overall stability and frequency accuracy to 1 part in 10^7 per day standard.

WJ-1440 microwave receiver system

The WJ-1440 also has analysis alternate mode selection and control to enable expansion of a sector within a band without compromising operator contact with a full-band scan display. In alternate mode, the controller alternately sweeps a tuner through a sector and an entire band, which are displayed on analysis display as two distinct traces, with full-band activity displayed above sector activity display.

Another feature, automatic signal acquisition circuitry, alerts an operator whenever signals exceed a variable (operator-set) threshold level within a sector of interest. Automatic signal acquisition has two basic operating modes: in lock mode, receivers lock onto signals exceeding a threshold level within a selected sector; auto mode, while similar to lock mode, enables receivers to also automatically resume sweep operations several seconds after lock-on. The WJ-1440 also has a dwell mode that is unrelated to signal threshold level. dwell enables receivers to dwell at a marker frequency once every sweep, thus allowing analysis of a specific frequency while maintaining continuous sector coverage.

The WJ-1440 system also offers optional scanner hardware, which, when used in conjunction with a refreshed display, enhances system capability by providing multiple scan sectors in each tuner and completely independent sweep rates. The scanner option enhances system capability by allowing each tuner to scan one or more operator-programmed frequency sectors independently from and in parallel with all other system tuners. In essence, the scanner permits each tuner to perform its own memory scan.

Watkins-Johnson Company, 2525 North First Street, San Jose, California 95131, USA.

3355.053

WJ-1840 RECEIVING SYSTEM

The WJ-1840 microwave receiver system is a broadband equipment that covers the frequency range 0·5 to 18 GHz with a single two-segment superheterodyne RF tuner contained within an A1D enclosure. The 0·5 to 8 GHz segment is an up-converting dual superhet, while a standard pre-selected single-conversion superhet is used for the 8 to 18 GHz segment. Digital control circuitry permits band scanning, sector scan, and manual modes of operation as well as special dependent, dwell, and intercept modes.

WJ-8535 antenna unit

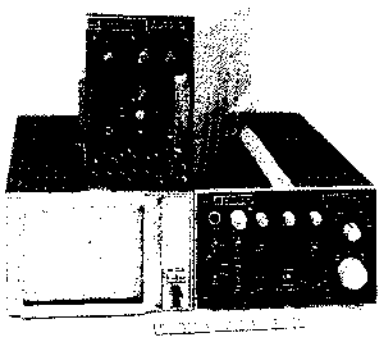
A two-trace display shows signal activity over the full frequency range, over two sectors, or over one sector and a dependent sub-sector. Frequency data is written directly on the face of the CRT in alpha-numeric form. A five-trace display is available as an option.

An optional analysis display is available for time base analysis of pulses as short as 10 nanoseconds. Additionally, IF pan analysis with 1 MHz resolution and 200 MHz bandwidth polar display are available within the analysis display. The optional WJ-8535-11 antenna is a slant-linear polarised bi-conical omni-directional antenna covering the whole of the receiver band.

CHARACTERISTICS

Frequency range: 0·5 - 18 GHz

Noise figure: 18 dB typical, 23 dB max



RF IF bandwidth: 200 MHz nominal

Image rejection: 80 dB typical, 60 dB minimum

Local oscillator radiation: 1 - 12 GHz: -80 dBm max; 12 - 18 GHz: -70 dBm max

Frequency accuracy (max): 0·5 - 18 GHz; ±(·00zf + 10) MHz

Incidental FM (rms): 10 kHz typical, 50 kHz max

Watkins-Johnson WJ-1840 broadband receiving system

1 dB compression point: -20 dBm minimum

Sweep rate: 175 GHz/s max

Video: Logarithmic

Input power: 115 ± 10 or 220 ± 20 V AC, 48 - 420 Hz

CONTRACTOR

4395.053
TN-1000/WJ-1840 MINCEIVER

The TN-1000/WJ-1840 is an alternate tuner for the WJ-1840 receiving system. It uses advances in miniaturisation technology which make it highly suited for applications where small size, weight, and general portability are important.

The TN-1000 MINCEIVER has an RF performance that matches or exceeds that of larger units. It covers 0·5 to 18 GHz frequency range with a 500 MHz instantaneous bandwidth and a noise figure of 19 dB. With this dynamic range, it is excellent for both single signal and two tone intermodulation.

The equipment incorporates its own power supply and synthesiser, and uses isolated microstrip modules within its circuitry to reduce interstage loss, gain variation and signal radiation. The MINCEIVER also has a modular MINPAC low-profile mixer and amplifier design to simplify repair and replacement of individual RF functional blocks, which can be extremely difficult with conventional MIC design. Modularity also allows for upgrading performance as better mixers and amplifiers are developed.

Preamplifiers are not included as part of the basic MINCEIVER. In many applications, a wide dynamic range is of greater importance than high sensitivity (low noise figure) because the receiver sees an R^2 signal power advantage over the radar receiver. However in specialised surveillance applications, where high sensitivity is a primary concern, preamplification is available to reduce the overall noise figure. Depending on system constraints and the noise figures required, preamplifiers may be either inside or outside the MINCEIVER.

Watkins-Johnson TN-1000/WJ-1840

CHARACTERISTICS

Frequency range: 0·5 – 18 GHz
Noise figure without preamplifiers: 19 dB
Gain (RF to IF): 15 dB
Two-tone dynamic range: 70 dB
1 dB compression dynamic range: 94 dB
Image rejection: 70 dB
Minimum frequency step size: 500 kHz
Output IF: 0·75 – 1·25 GHz
Temperature range: 0 – 50°C
Weight: 7·7 kg
Total power consumption: 60 W max

Watkins-Johnson Company, 2525 North First Street, San Jose, California 95131, USA.

4396.053
QRC-259 RECEIVER SYSTEM

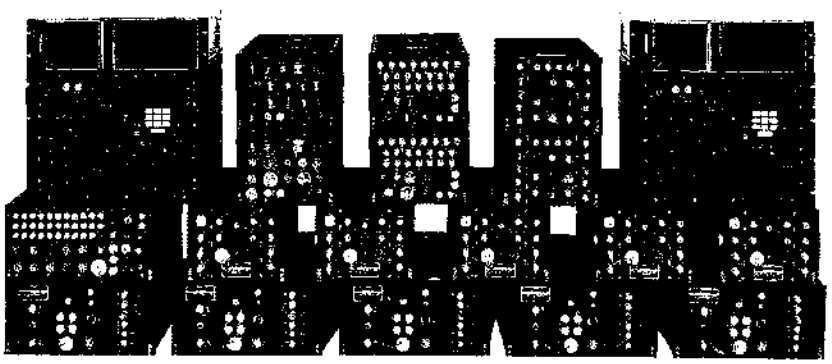
The QRC-259 receiver system is a solid-state, electronically-tuned superheterodyne receiver system providing high frequency accuracy, high stability and high sensitivity. It is qualified to meet severe environmental and EMI specifications, and has been deployed under both field and airborne conditions. The QRC-259 also permits unmanned automatic/semi-automatic or fully-integrated operator computer operations.

Up to ten tuners, in any combination of types, can be connected in any QRC-259 receiver system. This flexibility enhances the system's frequency stretching capability above or below typically used frequency limits. All tuners in the system are connected to a tuner relay, which can select one of the tuners for direct operator control by switching tuning commands to the tuner and by switching the tuner's IF output to an IF processor. Tuners not under direct operator control can be controlled independently, as separate tuners, or by auxiliary digital-control inputs applied to the tuner relay.

The QRC-259 system can be operated manually or by automatic band and limited frequency scanning. It can also be operated in either scan-lock or tuner-lock mode. When the receiver is in scan-lock, it intercepts signals exceeding an operator-set threshold level. If an intercepted signal meets criteria for qualification as a true signal, the receiver locks on to the signal by switching to the manual mode at the signal frequency. In hold mode, the tuner remains tuned to the frequency it was tuned to when the operator put it in hold, and its IF output is made available for processing by peripheral equipment. During this time, the other units of the receiver remain under normal operator control.

Another QRC-259 feature is a pulse coincidence detector function that determines the time coincidence between a received pulsed signal and an externally-applied video pulse. The reference pulse used for this purpose can be derived from another receiver or by local generation. When the system is used in a dual-channel configuration (using two operators), two channels can be connected together to examine the environment for coincident emitters. (Coincicence is defined as existing when two pulses are within five microseconds of each other.)

QRC-259 Available Options



AFC
Provides the operator with the capability of automatically centring the received signal in the passband.
CW
Provides increased sensitivity to CW signals.
Frequency Limit Readout
Allows operator to read out stored upper and lower scan limit frequencies.
Hold Frequency Readout
Allows operator to read out frequency of tuner in hold.
Memory and Memory Gate
Stores up to eight frequencies for instantaneous pushbutton recall, and for frequency gating.
Raster Display
Provides fading raster display for time-history of signal activity and for detection enhancement.
RF Gating and Crystal Video
Provides crystal video outputs of each tuner and permits video to be blanked when tuner's dynamic range is exceeded.
Predetection Conversion
Provides predetection IF conversion for recording.
Product Detector
Provides BFO capability.

STATUS

Production.

L6-24 DF SYSTEM

The L6-24 DF system is used for radar signal collection and analysis operations and related EW applications. It is a passive ECM equipment consisting of a Watkins-Johnson L6-24 spinning direction-finding antenna and EP-30 pedestal, controlled by an EC-60 control/display unit. The EC-60 is mounted with a companion storage-tube CRT display in a standard 19-inch rack. The EC-60 contains a four-decade digital display for bearing read-out and has three modes of antenna operation; scan, slew, and sector scan, which are selectable from the front panel. Available options include true or relative bearing presentation, adjustable video threshold, panel modifications and additional cabling to suit specific installation requirements. The system is capable of use in airborne, shipboard and land based applications and the control system may be used with other Watkins-Johnson antenna and pedestal installations.

The L6-24 DF system with EP-30 pedestal and L6-24 spinning antenna unit on left, and EC-60 control/display on right

The L6-24 spinning DF antenna is a small unit (203 × 381 mm) and provides a frequency coverage over the range 1 to 18 GHz. There is a wide selection of frequency band breaks and signal polarisation options, as well as a choice of switched or simultaneous radio frequency outputs. The antenna consists of a rotating dish with a foam-filled feed, enclosed within a protective radome. The EP-30 pedestal provides for rotation of the antenna at variable speeds of up to 200 rpm in either direction.

STATUS

The L6-24 system is used by the US Air Force for radar signal collection. In early 1980 Watkins-Johnson was awarded a $3·5 million contract to extend the capabilities of the system; this probably involves extending the frequency coverage beyond 18 GHz but may also entail additional analysis facilities.

CONTRACTOR

Watkins-Johnson Company, 2525 North First Street, San Jose, California 95131, USA.

4397.053

CMR-610A WIDEBAND DF RECEIVER

The CMR-610A is a wideband DF receiver designed to provide both visual and aural signal indication of microwave and millimetric activity occurring in the 1·5 to 40 GHz frequency range. The CMR-610A will detect, locate and assign direction to CW, AM, FM and pulse-modulated signals. The receiver has the provision for demodulating audio-modulated signals and has an integral recorder output.

The CMR-610A is a miniature, hand-held, solid-state, battery powered, five-band, crystal video receiver with integral antennas and battery pack. The frequency band to be monitored is selected by the band switch which connects the selected antenna/detector combination to either the video or audio amplifier, according to the mode switch setting in the AM mode of operation. The selected detector output is connected to the video amplifier whose output is routed to the operator's headset, the signal level meter and the recorder output jack. In CW and audio operation the selected detector output is connected to the audio amplifier.

CHARACTERISTICS

Frequency bands:

Band 1: 1·5 – 8 GHz; Band 2: 8 – 12·4 GHz; Band 3: 12·4 – 18 GHz; Band 4: 18 – 26·5 GHz; Band 5: 26·5 – 40 GHz

Dimensions: 89 mm high × 89 mm wide ×197 mm deep

Weight: 1·6 kg

American Electronic Laboratories Inc, PO Box 552, Lansdale, Pennsylvania 19446, USA.

4673.093

RG-5202A VHF SCANNING RECEIVER

The RG-5202A is a scanning receiver designed to scan and monitor up to 16 RF channels in the frequency range 20 to 512 MHz. Each channel can be set to receive either AM or FM signals with a choice of IF bandwidths of 10, 20, 40 or 60 kHz. The receiver can be operated by the front panel controls or remotely through control lines. A memory bank stores the tuned frequency, the IF bandwidth, the demodulator mode and the manual/automatic gain choice for each of 16 channels. Frequency information to the nearest 10 Hz is entered into memory by a keyboard.

The time devoted to each channel can be set from 0·1 to 10 seconds. The channel being monitored is indicated by a tone encoded output for remote indication.

CONTRACTOR

Racal Communications Inc, 5 Research Place, Rockville, Mary and 20850, USA.

4398.053

RG-5540 VHF/UHF MONITORING RECEIVER

The RG-5540 is a high performance VHF/UHF receiver designed for reception of signals in the 20 to 500 MHz band with 10 Hz tuning resolution. It can detect AM, FM, CW, USB, LSB and ISB signals. The receiver includes four IF modules with bandwidths from 10 to 500 kHz; 10, 20, 50 and 100 kHz bandwidths are standard.

The RG-5540 has three operating modes: Manual, Remote and Fast Scan. In the manual mode the receiver is a conventional 'hands-off' receiver with operator control of all functions. Tuning is by a large tuning knob or up/down slew key (with three rates), direct number keypad entry or an internal scan mode. The scan mode continuously tunes the receiver up and down at nine selectable rates between 10 Hz/second and 1000 MHz/second. Frequency is indicated by an eight-digit LED display; tuning and level meters located under the display aid operator tuning. LED-illuminated keys select IF bandwidth, detection mode, gain control mode, and internal or external reference. A dual (stereo) headphone level control, remote/local switch, RF gain slew key and power switch complete the front panel operator controls. A non-volatile memory preserves all operating parameters when power is removed.

In the remote mode, the receiver functions are controlled via an IEEE-488B interface. These functions include tuned frequency, IF bandwidth, detection mode, RF gain mode, RF gain frequency scan and internal/external reference. Commands are provided for full set-up or the setting of individual parameters. The receiver status can also be requested, in either remote or local mode. The receiver front panel displays the operating conditions at all times.

In the fast scan mode, the receiver operates under the control of a spectrum surveillance controller to provide a high-speed spectrum scan with digitally refreshed display. A discrete scan of up to 15 channels is also provided.

An optional front panel plug-in spectrum display is available. When installed, this unit, the RG-1320A spectrum display unit, provides a visual display of signal activity about the tuned frequency. The sweep width is variable from 0 to 400 kHz, with 1 kHz resolution.

CHARACTERISTICS

Frequency range: 20 – 500 MHz

Frequency resolution: 10 Hz

Demodulation modes: Standard: AM, FM, CW; Optional: USB, LSB, ISB

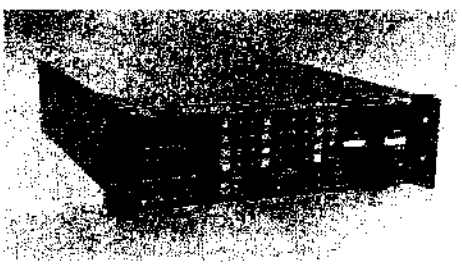
Dimensions: 48·3 cm wide × 13·3 cm high × 51 cm deep

Weight: 27·3 kg

CONTRACTOR

Racal Communications Inc, 5 Research Place, Rockville, Maryland 20850, USA.

4674.093



RG-5545A VHF/UHF RECEIVER

The RG-5545A is a high-performance VHF/UHF receiver that has been specifically designed to allow versatile configured features by means of performance options to the basic unit and is ideally suited for monitoring purposes. The basic unit is a 20 to 500 MHz receiver with AM and FM detectors and four selectable IF bandwidths. Tuning is accomplished to 10 Hz resolution by means of a synthesiser. All local oscillators are phase-locked to a single master reference oscillator, either internal or external, for low phase noise and maximum frequency stability. The RG-5545A has been designed for signal handling in dense electromagnetic environments.

A frequency extension option extends the range to 20 to 1000 MHz, 20 to 1400 MHz or 20 to 1800 MHz. These options include preselection above 500 MHz for a +50 dBm 2nd order intermodulation intercept point.

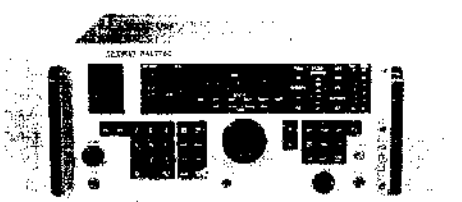
CONTRACTOR

Racal Communications Inc, 5 Research Place, Rockville, Maryland 20850, USA.

RG-5545A receiver and RG-1320A display

4676.093

RA6778-C RECEIVER/RA6778-Q CONVERTER



The RA6778-C receiver is a fully synthesised microprocessor based equipment for communication or monitoring over the frequency range from 10 kHz to 30 MHz. The equipment can be controlled manually or by computer and has an interactive man/computer interface. Control capability is hardware adaptable to conform to system requirements.

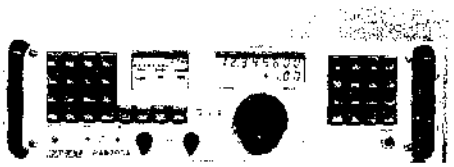
The RA6778-Q converter is a microprocessor controlled tuneable equipment for communication or monitoring over the band 50 kHz to 30 MHz. It provides a 70 kHz IF signal 100 kHz wide which may be used in applications for wideband spectral analysis or demodulation of HF signal.

Both equipments are of modular construction and have LED tuned frequency indicators. Frequency stability of ±1 part in 10^9 is provided as standard with ±1 part in 10^7 optionally available.

CONTRACTOR

Racal Communications Inc, 5 Research Place, Rockville, Maryland 20850, USA.

RA6778-C receiver



4675.093
RA-6793A HF RECEIVER

The RA-6793A is an HF receiver covering the range 0·5 to 30 MHz and used for monitoring purposes in the communications field. Two of the features of this system are its ability to provide full scan and sweep facilities under both local and remote control. The standard scan provides a means to scan up to 100 channels actively with a fixed but selectable dwell between channels for operation interaction. A secondary scan mode allows the operator to set different activity recognition thresholds to each scanned channel, whereupon the receiver will halt on activity.

Sweep provides the capability to set start and stop frequencies and step increment. After sweep initiation, the operator can control the incremental speed and halt the sweep if required. The equipment operates in AM, FM, CW, USB and LSB reception modes. Frequency display is by easy-to-read illuminated liquid crystal display on the front panel.

CONTRACTOR

Racal Communications Inc, 5 Research Place, Rockville, Maryland 20850, USA.

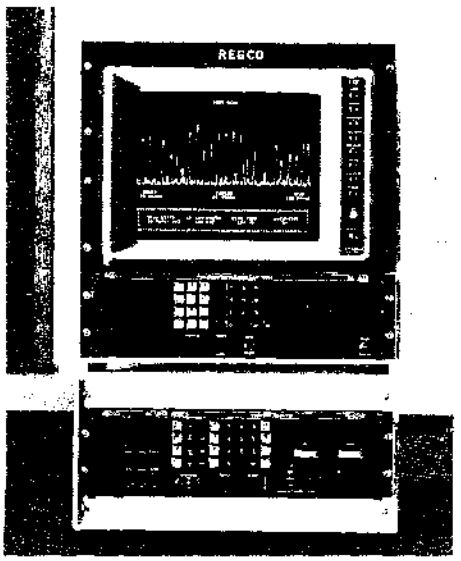
RA-6793A HF receiver

4399.093
RG-1340 SPECTRUM SURVEILLANCE CONTROLLER

The RG-1340 spectrum surveillance controller is designed to work in conjunction with the RG-5540 (**4398.053**) receiver and an external cathode ray tube display forming a surveillance group for monitoring any segment of, or 15 discrete frequencies in, the 20 to 500 MHz band. The RG-1340 provides external scan control to the RG-5540 receiver and X, Y and Z axis information to the display. The spectrum surveillance group may be controlled locally using its own RG-1340 controls or remotely using an IEEE-4888 interface. Alpha-numeric information on the display provides status and operator prompting, and the display is refreshed 50 times per second.

The controller has three operating modes: band scan, discrete scan and manual.

In band scan mode, the controller steps the receiver between two programmed frequency limits. The controller also controls the receiver bandwidth. A signal averaging feature enables an operator to integrate noise and make signals more visible. The operator-controlled cursor can be positioned on a signal of interest; alpha-numerics display the cursor frequency.



In the discrete scan mode, up to 15 different frequencies can be monitored. Frequency, IF bandwidth, dwell time, threshold level and actual level for each channel are displayed in alpha-numeric form on the display. Channel set-ups are automatically arranged from top to bottom in order of ascending frequency, and any channel can be skipped during the scan.

In manual mode, the controller returns control of the system to the receiver front panel. At this time, the display indicates an IF panoramic scan identical to that of an RG-1320A spectrum display unit installed in the left side of the receiver.

The controller front panel consists of two keyboards (functional and numeric), a cursor control, a display brightness control, and local/remote and power switches. To set parameters, the operator selects the operating mode, the prompt function and four keys which can position the prompted parameter. The numeric keyboard is then used to update the parameter.

CONTRACTOR

Racal Communications Inc, 5 Research Place, Rockville, Maryland 20850, USA.

Spectrum surveillance system comprising RG-5540 receiver, RG-1340 controller and display

4400.093
RG-1320A SPECTRUM DISPLAY UNIT

The RG-1320A spectrum display unit provides a visual display of the signal activity present around the tuned frequency of an associated receiver. The display is most useful in tuning and analysing signals intercepted by the receiver. The unit plugs into an RG-5540 or similar receiver and derives its power from that source.

The equipment presents a 60 dB logarithmic display of a band up to 400 kHz wide. A 1 kHz bandwidth Gaussian filter provides high resolution and the sweep rate is adjustable from 2·5 to 25 Hz to allow full resolution at maximum sweep widths.

The one- by three-inch cathode ray tube display uses a bright P31 green phosphor with grey contrast and EMI screen. The X and Y deflection signals are available for an external display.

CONTRACTOR

Racal Communications Inc, 5 Research Place, Rockville, Maryland 20850, USA.

4672.093
RG SERIES SPECTRUM MONITORS

Racal Communications Inc manufactures a range of spectrum monitors designed to provide a visual display of the signal activity present and around the tuned frequency of an associated ESM monitoring receiver. Data is displayed on a CRT display forming part of the monitor.

The RG-1307A features a sweep width of 0 to 40 MHz, manual gain control and an accurate frequency marker. Resolution bandwidth is 250 kHz nominal. The RG-1308A provides a variable sweep width of 0 to 8 MHz, a variable sweep rate of 5 to 25 Hz and a resolution bandwidth of 10 kHz.

In group monitor equipments the RG-1309A and RG-1309A-2 provide visual displays of the individual voice frequency channels in the telephone basic group 'B' of 60 to 108 kHz. The RG-1317A and RG-1317A-1 give four independent visual displays of the individual voice frequency channels in the telephone basic group 'B' and also have provision for displaying channels in basic group 'A' (12 to 60 kHz).

CONTRACTOR

Racal Communications Inc, 5 Research Place, Rockville, Maryland 20850, USA.

4401.193
AN/GLQ-3A HF/VHF COMMUNICATIONS JAMMER

The AN/GLQ-3A is designed to disrupt voice and data communications over the frequency range from 20 to 230 MHz. The system incorporates all-solid-state transmitters and microprocessor controls for look-through jamming, initiated jamming and continuous jamming. It is capable of operating with amplitude modulation, frequency shift keying, continuous wave and frequency modulated continuous wave signals.

The system is housed in a 239 cubic foot shelter and is carried by a ¾- or 1¼-ton truck. System weight is approximately 7500 lb (3400 kg) and is powered by a standard US Army generator supplying 10 kW, 400 Hz power.

The AN/GLQ-3A incorporates a HF/VHF broadband co-planar, log-periodic antenna which can be erected rapidly. The antenna is in three sections which can be used for each of three segments of the frequency coverage, with spot jamming available on any single frequency.

STATUS

In current service with the US Army.

SR SERIES SURVEILLANCE RECEIVERS

Norlin Communications Inc produces a wide range of surveillance and monitoring receivers covering the frequency bands of interest for Comint and Sigint operations. A typical receiver is described in the following paragraphs.

SR-209

The type SR-209 solid-state, modular receiving system is capable of reception of AM, FM, CW, and pulse signals in the frequency range of 20 MHz to 12 GHz. It will accommodate a signal display unit to provide a visual display of signals in a band around the received signal.

SR-209 modular receiver system

Three IF amplifier FM demodulator boards may be used at one time with operational selection by front panel switch. For VHF/UHF, selection of IF bandwidths from 10 kHz to 8 MHz are available. In HF there are three bandwidths.

The wide frequency range of 20 MHz to 12 GHz for a manually tuned receiver is provided through the use of ten plug-in RF tuning heads.

To make the receiver completely self-sufficient for field use a battery pack plug-in unit may be used in lieu of one tuner. No adjustments or changes in the receiver are necessary when this nickel cadmium battery pack is installed. A built-in charger is provided in the battery back unit.

The front ends employ at least two section pre-selectors at the RF input to provide maximum reduction of cross modulation and intermodulation interferences.

The SR-209 basic receiver contains a carrier operated relay to control accessory equipment such as recorders. All operating controls are located on the front panel of the SR-209 and except for the phone jack, all inputs and outputs are located on the rear panel. An exception to this is the optional first local oscillator output which is provided on the plug-in tuning head panel. Two meters, one for tuning and one for signal strength, are on the receiver front panel.

STATUS

Versions of the SR-209 have been supplied for signal intercept, search and DF applications at fixed sites, mobile monitoring stations, airborne, shipborne and submarine collection systems.

CONTRACTOR

Applied Communications (a division of Amstar Technical Products Company Inc), 9125 Gaither Road, Gaithersburg, Maryland 20877, USA.

3903.053

SERIES 2000 RECEIVER SYSTEM

The Norlin Communications Series 2000 range of equipment comprises a number of VHF/UHF receivers, several display units, and a variety of peripheral units from which can be assembled systems for radio surveillance and communications. Modular design permits the combination of units to form equipments appropriate to typical ESM, Elint, Sigint and related functions in both fixed and mobile installations. The basic standard receiver frequency range is 20 to 500 MHz, with a 1200 MHz upper limit as an option.

Six receiver models have been identified:

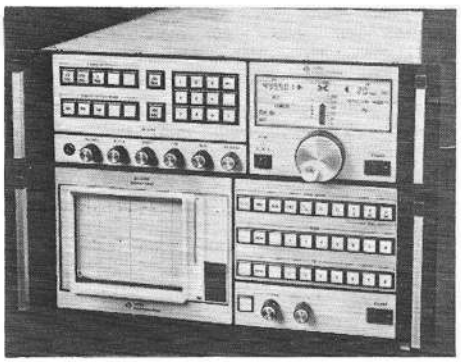
SR-2080: Directly controlled 20 - 1200 MHz
SR-2082: Slave version of SR-2080
SR-2090: Directly controlled 20 - 500 MHz (option to 1200 MHz) with liquid crystal display status indicator (see below)
SR-2091: As SR-2090 with 8 memory slots
SR-2092: Slave version of SR-2090
SR-2100: Directly controlled version of SR-2090 plus solid-state IF/RF panoramic facility

A three-model series, SR-2070/1/2, with a frequency coverage of 0·05 to 30 MHz has been designed but is not in production.

There are three display units:

DU-2081: RF/IF panoramic facility, autoscan mode
DU-2090: RF/IF panoramic facility, 8 memory slots; hand-off to 8 receivers
DU-2091: RF/IF panoramic facility

Typical specimens from this range are the SR-2090 and DU-2090 receiver and display units, and these are described more fully in the following paragraphs.



SR-2090

The basic receiver tunes the 20 to 500 MHz frequency range, expansible to 1200 MHz. The microprocessor control enables single knob tuning and a single direct-reading display of tuned frequency, even with the frequency expansion option installed. The microprocessor also enables the selection of a wide range of IF bandwidths and detection modes. The receiver is prewired to accept modules meeting all standard digital remote control interface specifications. A liquid crystal display (LCD) presents complete receiver tuning information at one focal point and improves the shock and vibration resistance by elimination of conventional signal strength and tuning meters. The LCD is uniformly backlit with an electro-luminescent panel for display under all ambient lighting conditions.

All tuning commands to the receiver can be applied from a remote location through a digital data interface. The interface translates the remote control data format to digital commands that are accepted by the receiver's microprocessor. A wide variety of digital interface format specifications are accommodated by a selection of the proper interface module. The receiver is prewired to accept all interface modules. Within the command the tuned frequency is in BCD format and the IF bandwidths and detection modes have pre-assigned digital codes. A total of 64 receivers can be addressed by the remote controller. Special command formats and functions can be developed upon request.

DU-2090

The DU-2090 display unit is designed to complement Series 2000 VHF/UHF electronic controlled receivers. The DU-2090 enables the system to provide master/slave operation of up to eight receivers from a central control point. An additional eight signals can be stored in memory for operator convenience. The DU-2090 features a dual trace, digitally refreshed, flicker free, panoramic display of the spectrum in scan operation. Scanning is accomplished by rapidly stepping the synthesiser receiver LO. When Receiver 1 is not swept the CRT becomes an IF Pan display for that receiver. Memory update can be inhibited to freeze the display for elusive push-to-talk targets, because the display is digitally refreshed. Since the stepped synthesiser sweep provides extreme linearity, the marker on the display can be exactly placed over the desired signal on the frozen display. Then, returning the receiver to the manual mode, a 100 per cent intercept probability results on the next target transmission.

Norlin Series 2000 VHF/UHF surveillance receiver (above) with a DU 2090 display unit

STATUS

Production.

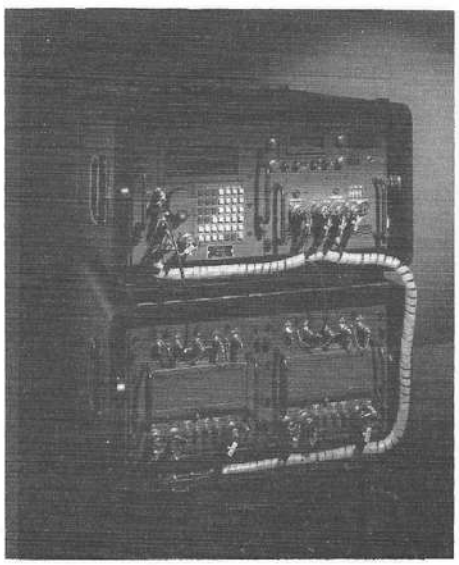
Applied Communications (a division of Amstar Technical Products Company Inc), 9125 Gaither Road, Gaithersburg, Maryland 20877, USA.

4659.093

SR-2020 TACTICAL ESM SYSTEM

The SR-2020 is a remote controlled ESM receiver covering the 0·5 to 500 MHz frequency range in a single package. The range can be extended to 1200 MHz. It meets the need for effective, reliable and maintainable mobile tactical EW systems to satisfy Comint, Sigint, ESM and direction finding requirements. It is designed for independent operation or as an integral part of a larger system where a companion power supply will service groups of four receivers. Specifically designed to meet the needs of mobile, airborne or shipboard applications, the equipment is suited for tactical deployment in either wheeled or tracked vehicles under extreme environmental conditions.



The receiver control unit, RCU-2020, provides comprehensive control and status display for up to eight SR-2020 tactical receivers. All receiver functions are controlled by the internal microprocessor and a variety of proven hardware routines. In addition to receiver control, the unit forms the nucleus of a collection system by providing control and data interface ports for system ancillary equipments.

STATUS

In development and undergoing various acceptance trials in a variety of operational vehicles.

CONTRACTOR

Applied Communications (a division of Amstar Technical Products Company Inc), 9125 Gaither Road, Gaithersburg, Maryland 20877, USA.

SR-2020 ESM system

4660.193

SRS-2500 VHF/UHF RECEIVING SYSTEM

The SRS-2500 VHF/UHF receiving system is an adaptive and comprehensive collection of units for strategic signal intercept, acquisition, direction finding and analysis applications. It is designed for independent or computer-controlled operation for the reception of AM, FM, CW, SSB and pulse signals over the frequency range 20 to 500 MHz. The coverage may be extended down to 0·5 MHz and up to 1200 MHz if required. System architecture enables additional subsystem groups to be added where each group communicates via a serial multi-address data bus.

The system group consists of a control address unit CA-2100, a digital distribution unit, and IF switch and from one to sixteen SR-2154 surveillance receivers. The heart of the system is the CA-2100 which carries out all the selection, tuning and control functions. It also alters and lists receiver memory content as well as displaying signal parameters of the addressed receiver to be handed off to another receiver. A built-in gas-plasma IF spectrum display and alpha-numeric read-out panel provides the operator with a read-out of parameters.

The SR-2154 receiver covers the range 20 to 500 MHz with optional down and up converter units to extend this range to 0·5 to 20 and 500 to 1200 MHz. Each receiver in the system has audio and carrier operator relay outputs for recorder interface or separate operator monitoring.

Fibre optic data links are used so that the receivers, digital distribution unit and the IF switch unit can be remotely controlled by the control address unit.

Applied Communications (a division of Amstar Technical Products Company Inc), 9125 Gaither Road, Gaithersburg, Maryland 20877, USA.

4661.093
SR-2152 VHF/UHF RECEIVER

The SR-2152 receiver is a high-speed, low-phase noise synthesiser applicable to real world Comint requirements. The receiver tunes the 20 to 500 MHz frequency range and is expandable to 1200 MHz. It is fully microprocessor controlled and has a large screen gas-plasma display for IF pan and scanning presentations. The display also presents frequency read-out, signal strength, f1 - f2 frequency band and BFO offset alpha-numeric data. The receiver is designed for signal, intercept, search and DF applications. The system may be deployed for use in fixed station sites, mobile monitoring systems, airborne, shipboard and submarine systems.

The receiver accepts a wide variety of standard modules that enable growth and adaptability. Due to this modularity, the receiver is easily configured and specifically designed to form the nucleus of computer controlled and master/slave hand-off systems. AM, FM, CW, LSB, USB and pulse modulation capability is provided. Up to six IF bandwidths can be installed.

Applied Communications (a division of Amstar Technical Products Company Inc), 9125 Gaither Road, Gaithersburg, Maryland 20877, USA.

4664.193
AN/MLQ-T6 COMMUNICATIONS DATA LINK JAMMER

The AN/MLQ-T6 is a mobile, general purpose, ground-based communications and data link jammer, operating in the frequency band of 960 to 1850 MHz, at a power level of 1 kW CW or 2 kW peak. It is capable of simulating the projected threat jammers in the 1980 to 1990 period and is employed during the development, test and evaluation of future communications and data link systems. Major subsystems are a transmitter, receiver, antennas/pedestal, processor/controller, automatic tracker, control and display console and the shelter.

CONTRACTOR

Cincinnati Electronics, 2630 Glendale-Milford Road, Cincinnati, Ohio 45241, USA.

AN/MLQ-T6 communications data link jammer

4741.193
AN/MLQ-33 ECM SYSTEM

The AN/MLQ-33 is a ground-based search and jamming system operating over the frequency band 100 to 450 MHz, and is designed primarily to detect and jam air-to-ground communications. The system scans the complete frequency band automatically in approximately 0·5 second and on detecting a high priority communications signal will jam automatically. It is housed in a standard US Army S-250 shelter and has an effective radiated power output of approximately 4 kW.

STATUS

The AN/MLQ-33 has been developed under a contract from the US Army. The first systems were delivered in 1984.

CONTRACTOR

GTE Government Systems, 100 Ferguson Drive, Mountain View, California 94042, USA.

3895.193
AN/MLQ-34 TACJAM

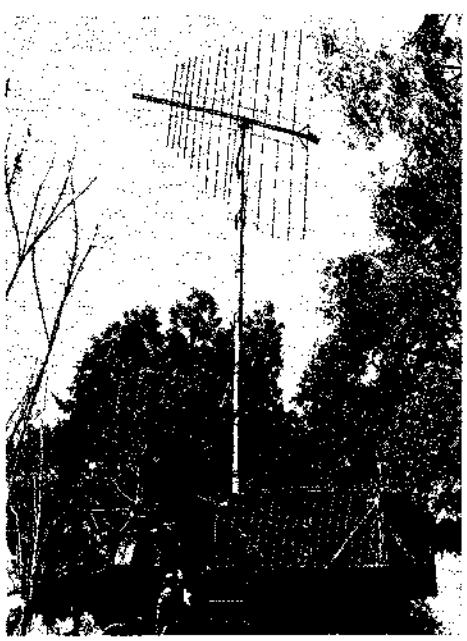
The AN/MLQ-34 TACJAM is a highly mobile tactical communication countermeasures system produced for the US Army Signals Warfare Laboratory by GTE Sylvania. TACJAM can disrupt and deceive communication links over a broad, multi-octave frequency range at multi-kilowatt effective radiated power (ERP) levels. The AN/MLQ-34 has multiple receivers, exciters, and high power transmitters to provide simultaneous multiple threat capability.

The TACJAM equipment operates under computer control to permit quick reaction to changes in the electromagnetic environment. A wide range of modulation formats permit effective jamming of virtually any threat emitter present in the equipment's frequency range.

Each multi-kilowatt solid-state broadband transmitter is constructed of basic power modules (BPMs). These are interchangeable and replaceable in the field. All system electronics are programmed for automatic checkout and fault isolation by the AN/USM-410 EQUATE automatic test equipment.

The complete system is mounted on a tracked cargo carrier which is highly mobile. Rapid deployment is achieved by using an automatic ground rod driver and an unfolding log-periodic antenna mounted on a pneumatically operated telescopic mast.

All TACJAM electronic and cooling equipments are enclosed in an S-595 shelter which has ballistic protection.



STATUS

Production of 17 systems was completed by 1984. A contract worth over $44 million was awarded to American Electronic Laboratories (AEL) in June 1983 for 31 TACJAM systems plus spares and engineering support, and another contract in March 1985 for a further 12 systems. Overall contracts to AEL for the AN/MLQ-34 exceeded $101 million as at April 1985.

AN/MSQ-103 TEAMPACK ESM SYSTEM

The AN/MSQ-103 ESM system is a ground-based transportable equipment designed to collect, identify and provide the direction of signals from ground-based transmitters. It operates in the 500 MHz to 40 GHz frequency range and is intended for use in the field at division level. The system is housed in a ballistically protected shelter and then mounted on an XM-1015 tracked vehicle. It can also be mounted on an M-35 utility truck, a light armoured vehicle, jeep and other types of combat vehicles. It will replace the US Army AN/MLQ-24 as the basic countermeasures receiving equipment and includes built-in computer processing from a ruggedised mini-computer installed in the vehicle.

The system is also known under the name of Teampack and contains secure voice and wideband data link to a forward control and analysis centre. The equipment is also designed to operate with the ULQ-14 ground element of MULTEWS and the TSQ-109 AGTELIS system (**4408.153**).

STATUS
In current service with the US Army. A contract for engineering development and enhancement has been awarded to Emerson by the US Army. Among other improvements the system will be networked.

CONTRACTOR
Emerson Electric Corporation, St Louis, Missouri, USA.

Netted AN/MSQ-103 Teampack system

4403.093
AEL TYPE 6040 UNIVERSAL JAMMER

The Type 6040 ECM universal jammer is a signal source for use in testing system jamming vulnerability. Three classes of jamming signals are generated: barrage noise jamming, spot noise jamming and deception jamming.

Operation is controlled from a digital control unit. The 'dial-a-jam' capabilities of the control unit allow complete operation of the system in a simple and straightforward manner. The system includes a receiver section, a modulation source section and a transmitter.

Depending upon the operator selected mode of operation, the receiver section affects the operation in three different ways. In the transponder modes, the output of the receiver triggers the AEM signal transmissions for which internal RF carrier sources are used; in repeater modes the receiver performs as the front end of the repeater/transmitter configuration; and in the manually actuated modes, the receiver is a passive indicator of the signals which are present in the band of interest. A multi-frequency determining unit and an automatic signal recognition unit are included as part of the receiver section. These signal sorting units identify the class of signal being received, display the information on the control panel, and program ECM response in transponder modes of operation.

The transmitter section accepts the undetected receiver output for use in repeater modes and the detected receiver output for use in the transponder modes as a trigger. The transmitter applies the modulation source signals to either the received RF or to the RF sources, which are internal to the transmitter. Two types of RF sources are included in the transmitter; voltage controlled oscillators and a multi-output frequency synthesiser.

The jammer is controlled by the digital control unit which selects the jamming modes of operation, varies the parameters, controls system gains, and displays this information in simplified form so that an unskilled operator can operate and control the system. When a given type of jamming is required the operator simply dials in the required mode. This establishes an initial set of conditions which can be altered, if necessary by the front-panel controls.

BITE signals are injected into the system by the use of a front-panel control on the controller. System parameters are displayed to the operator. Actual control is easily accomplished and allows fully automatic operation.

A spectrum analyser and preselector are provided to monitor samples of the received input signal, the drive to the high-power amplifier and the transmitted output signal.

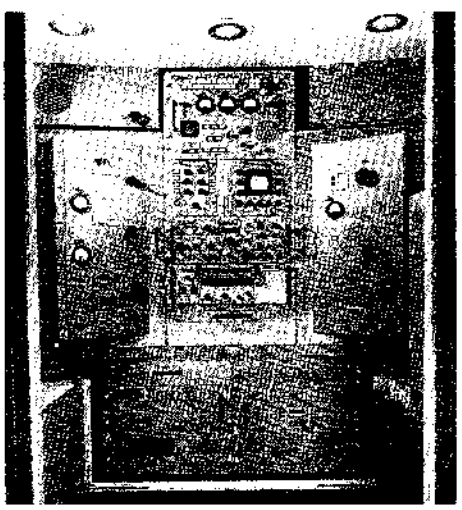
A remote control panel for the high power amplifier is provided to allow the operator to monitor amplifier performance.

CONTRACTOR
American Electronic Laboratories Inc, PO Box 552, Lansdale, Pennsylvania 19446, USA.

3367.193
AN/TLQ-15 COMMUNICATIONS AND COUNTERMEASURES SET

The AN/TLQ-15 communications and countermeasures equipment is a transportable system for tactical use either as a truck-mounted installation or as a deck-mounted unit aboard ship. Fixed or semi-permanent ground-based applications also exist, and the TLQ-15 is capable of airborne use by means of a trailing wire antenna. All units of the equipment are air transportable by fixed- or rotary-winged aircraft.

At the centre of the system is an HF communications transmitter/receiver covering the 1·5 to 20 MHz range. Associated with this unit are: a panoramic indicator unit; frequency counter; modulation generator; RF amplifier; low-pass filter assembly; and an antenna coupler. In addition to the main antenna (a 35-foot telescopic whip, with counterpoise) provisions are made for feeding into a dummy load and for connection to an auxiliary antenna.



The transmitter/receiver is a solid-state design with synthesised receiver/transmitter tracking, and providing the following operational facilities:
(1) continuous transmission
(2) look-through transmission (90 per cent transmit/10 per cent receive)
(3) signal-initiated transmission (signals of 5 μV or above put system into look-through mode)
(4) receive/transmit, AM, FM or DSB voice.

In the first three of these modes, modulation available includes: CW, AM, DSB, FM, AM and FM and FSK.

Automatic frequency control (AFC) tracking of received signals is provided, and there are facilities for signal analysis, various modulations are available for countermeasures operation, and an auxiliary communications link using the AN/VRC-47 can be provided as an option. Additional system potential includes the possibility of using a phased array of two TLQ-15 systems to produce 8 kW of RF power in any desired direction, and continuous reception in the pattern null for a monitoring receiver. The basic power output is 2 kW CW.

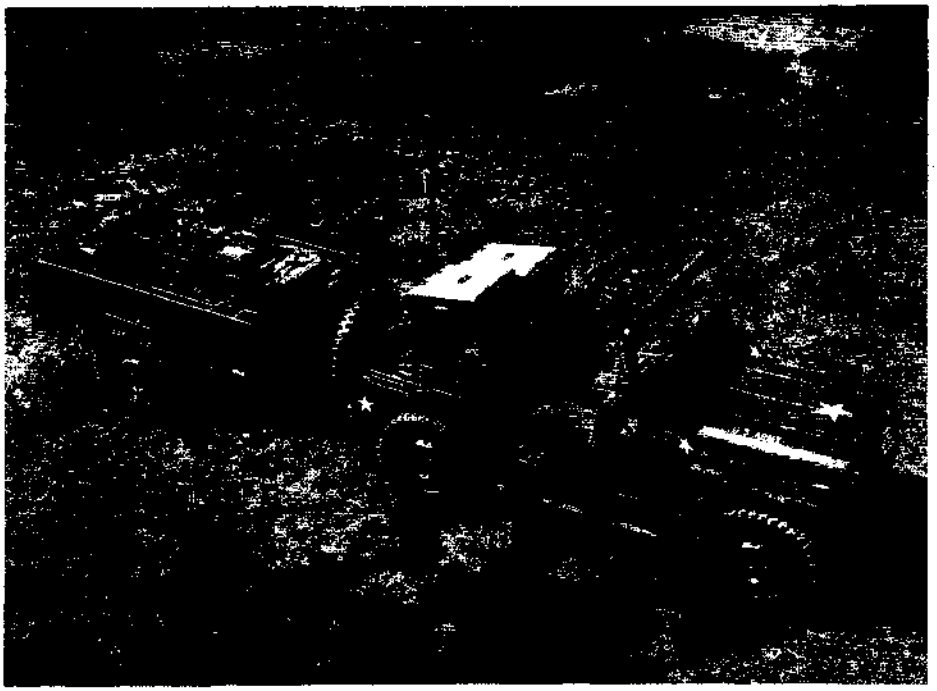
STATUS
Operational with US Forces and possibly used by other countries.

CONTRACTOR
American Electronic Laboratories Inc, PO Box 552, Lansdale, Pennsylvania 19446, USA.

AEL AN/TLQ-15 communications and countermeasures set

4406.093
AN/TLQ-17A COUNTERMEASURES SET

The AN/TLQ-17A countermeasures jamming and monitoring set has been designed to cover the HF/VHF portion of the frequency band. The system is an updated version of the original AN/TLQ-17 using a modular packaging concept and can be fitted into both aircraft and ground vehicles.



The equipment utilises a microprocessor controlled receiver, with programmable sector scans, and can be programmed to search the HF and VHF portions of the frequency spectrum for signal intercepts. It employs a fully synthesised, digitally tuned, high stability receiver to allow the operator to monitor and record both voice and digital communication links.

The wideband solid-state transmitter uses a high power amplifier capable of producing 550 watts of radiated power over the entire frequency range to interrupt tactical communication links.

CHARACTERISTICS
Frequency range: Band 1: 1·5 - 20 MHz; Band 2: 20 - 80 MHz
Effective radiated power: 550 W
Receiver tuning time: 1 s
Preselected frequencies: 256
MTBF: In excess of 400 h

STATUS
In production and operational service.

CONTRACTOR
Fairchild Weston Systems Inc, 300 Robbins Lane, Syosset, New York, USA.

AN/TLQ-17A system mounted in cross-country vehicles

4408.153
AN/TSQ-109 AGTELIS SIGINT SYSTEM

This is an automatic ground transportable emitter location and identification system (AGTELIS) which is designed to locate transmitters in the 500 MHz to 18 GHz frequency band. The AN/TSQ-109 uses both time of arrival and direction of arrival of emissions to provide the necessary information to an accuracy in direction finding of one degree rms with a 30-metre circular error probability at a range of 30 kilometres.

The complete system consists of remote sensor outstations and a two-vehicle control processor set-up. The outstations provide measurements of frequency, pulsewidth, pulse repetition frequency and various other parameters to identify and locate hostile emitters. One control processor controls the outstations by sending search and tuning commands, and receives data while the second processor integrates this data with that of airborne systems and transmits the result to a forward control and analysis centre. The outstations can, however, be operated independently of the control processors.

Three AGTELIS systems are normally deployed with each operational company and consist of three outstations and one control processor, all of which are contained in 2½-ton trucks. The individual units each have a different nomenclature; the outstations are AN/GSQ-189, the first control processor is AN/TYQ-17 and the second processor is AN/TSQ-11.

STATUS
In operational service. Frequency extension to 40 GHz is being studied.

CONTRACTOR
Bunker Ramo, Westlake Village, California, USA.

4409.153
AN/TSQ-112 TACELIS ESM SYSTEM

The AN/TSQ-112 is a location and identification ECM system operating in the frequency range 500 kHz to 500 MHz. The system is fully automatic and performs communication collection, transmitter location and processing functions. It is designed to combat hostile tactical communications radio by generating early warning, target and decision information, and jamming.

TACELIS (tactical automated communications emitter location and identification system) is a major component of the TACOM early warning system and consists of two remote master stations and four slave stations. It is deployed with each operations company forward in one ten-ton truck and three six-ton vans plus a truck tractor. Remote master stations are deployed in three five-ton trucks and each remote slave station is carried by one M113 truck. The component elements of TACELIS include the various stations plus one AN/UYK-7 computer, 13 AN/UYK-19 mini-computers and AN/ULR-17 receivers. The remote slave stations have a direction finding capability only while each master station has 14 receivers and two search/acquisition receivers. The TACELIS system is inter-operable with forward control and analysis centres, the AN/MLQ-34 TACJAM (**3895.193**) via the AN/GRC-103 communications link directly out of the remote master stations, and the Cefly Lancer aircraft.

CONTRACTOR
GTE Sylvania, Electronic Warfare Organization, 100 Ferguson Drive, Mountain View, California 94042, USA.

5810.153
D1800 DF AND MONITORING SYSTEMS

The D1800 series of DF systems provides coverage and signal monitoring over the frequency range from 100 MHz to 40 GHz, and is employed in ground-based, naval and airborne applications. The series consists of a rotating antenna, a pedestal, a control unit and a display. A common servo, control and display unit are used with a wide range of antennas, with sizes ranging from six inches to 15 feet. Single antennas are available covering wide bandwidths such as 0·5 to 18 GHz or 8 to 40 GHz with a single feed. Narrow bandwidths are also available. Omni-directional antennas, receivers, signal processors and receiver control/display units can also be supplied.

At least eight different antenna systems are available for ground fixed and mobile, shipborne and airborne applications. They are wideband and cover various frequencies in the range 0·1 to 40 GHz with weights varying from 14·5 to 255 kg.

STATUS
In production and world-wide operational use in aircraft, ships and ground-based installations.

CONTRACTOR
EM Systems Inc, 290 Santa Ana Court, Sunnyvale, California 94086, USA.

5819.093
TC-5100 SERIES DF SYSTEMS

The TC-5100 series of direction finders has been developed to conform with the US Army requirements for the 'AirLand Battle 2000' plan. The equipment provides monitoring, intercept and bearing information of signals over the frequency range from 1·5 MHz to 1 GHz. Information is displayed as a three-digit LED display and a circular compass point.

The system employs a small broadband slot antenna with a shape and size that allows for rapid deployment and redeployment without the need to assemble and re-assemble any of the elements. The antenna is designed to be mast-mounted on a vehicle and lowered during movement to a height of only a few inches above the vehicle or shelter roof-line. In certain types of shelter, the antenna can be lowered below the roof-line and still provide bearing information while the vehicle is moving. The antennas are small discs, varying in diameter from 22 to 34 inches (56 to 86 cm) and measuring less than six inches in height. They can be easily mounted or concealed on a variety of mobile ground, shipborne or airborne platforms.

STATUS
In production.

CONTRACTOR
Tech-Comm Inc; Fort Lauderdale, Florida, USA.

CP-1380/VRC (SNAP) system

4008.193
CP-1380/VRC STEERABLE NULL ANTENNA PROCESSOR (SNAP)

SNAP was developed for the US Army to provide the receiver of a standard VHF/FM communications set with the capability of recovering a desired signal which is masked by a stronger interfering signal. SNAP automatically recognises a desired signal to prevent nulling it, and tracks moving interference sources. This equipment reduces a strong interfering signal to a level below a weaker desired signal by electronically pointing a spatial null in the direction of the interference. SNAP requires two antennas (eg AS-1729, AS-2731, or other). To achieve a spatial null, SNAP inserts an appropriate phase shift and amplitude adjustment in series with one antenna signal so that subtraction between the two antenna signals occurs at the angle of interference. During

transmission, SNAP is automatically bypassed and only one antenna is used.

SNAP does not require modification to the radio set to be protected, and operates with any standard VHF antenna (two required). It is a low-cost, rugged, self-contained unit housed in a standard R-442/VRC case. The unit is suitable for direct installation on a standard MT-1898/VRC mount. SNAP provides for the recovery of VHF signal from high level interference; processes both analogue and digital signals; requires no modification to radio set to be protected; automatically tracks moving interference source; is fully interoperable with non-equipped radios and is a passive ECM device with no electronic signature.

CHARACTERISTICS

Frequency range: 30 - 88 MHz
Dynamic range: 0 to -114 dBm
Insertion loss: 1 dB max
Power: 50 W max; 22 - 32 V DC
Operating modes: Bypass; automatic; manual
Dimensions: R-442/VRC case 30·5 × 14 × 16·9 cm
Weight: 7·7 kg

STATUS

Completed full-scale engineering development (pre-production) for the US Army. Production was due to commence in 1983 but no details have been released.

CONTRACTOR

Hazeltine Corporation, Greenlawn, New York 11740, USA.

5951.153
CHIEF EW COMBAT SYSTEM

Chief is a vehicle-mounted integrated EW combat system that incorporates ESM, ECM and DF sub-systems. It is packaged into a commercially available 1 ½-ton truck and is modular designed to allow for reconfiguration or expansion. In addition to the basic EW equipment, the vehicle contains a roof-mounted antenna sub-system with automatic microprocessor control, a power supply, and a software control system for integration of the various equipments. Integration of the complete system and development of the control system and software is by HRB-Singer Inc. Although designed primarily for vehicle applications, the system can be reconfigured for naval, airborne or fixed ground station use

The ESM part of the system is provided by Applied Communications and performs the signal acquisition, identification and analysis. It consists of two SR-2020 receivers (**4659.093**), which cover the frequency range from 0·5 to 1200 MHz, together with an adjustable spectrum display.

The ECM sub-system is provided by Rockwell-Collins and consists of a communications jammer which is able to jam up to six frequencies over the frequency range 0·5 to 500 MHz. The sub-system is capable of expansion to 1200 MHz. It has a 'look-through' feature to determine if the jammed frequency is still active, an anti-spoof transmitter capability and imitative communication deception facilities.

DF equipment is manufactured by OAR Corporation and provides the necessary location of enemy transmitters and identification of their parameters. It has two receivers, one covering the frequency range 0·5 to 30 MHz and the other operating over 20 to 1200 MHz.

STATUS

In development. The first prototype was expected in late 1985.

CONTRACTOR

HRB-Singer Inc, PO Box 60, Science Park Road, State College, Philadelphia, Pennsylvania 16804, USA - prime contractor.

3368.193
COMBAT VEHICLE SACS

The US Army is working on the development of a semi-automatic counterfire system (SACS) for combat vehicles and a production prototype model has been built by LTV Aerospace and Defense Company and tested by the Army in an M60 tank.

SACS uses microprocessor electronics to detect and counter laser and helicopter threats. Integration of electro-optical and acoustic sensors with the fire control system allows timely response to threats and improves vehicle survival. In addition to providing a warning to the whole crew, the system simultaneously displays the threat information to the commander and semi-automatically initiates a response. Manual override can be activated when required.

In addition to counterfire and evasive manoeuvres, flare, smoke and jammer countermeasures can be used. Current development work is on the integration of alternate passive warning sensors, information transfer through secure data links and unit cost reduction measures to make system costs attractive for potential high volume production.

STATUS

Experimental. Under development by US Army.

CONTRACTOR

LTV Aerospace and Defense Company, PO Box 225907, Dallas 75265, Texas, USA.

5741.193
HAND-EMPLACED EXPENDABLE JAMMER

The hand-emplaced expendable jammer (HEXJAM) is a solid-state device designed for use against communication links in the HF and VHF bands. It uses wide-band frequency barrage jamming that operates continuously against threat signals. It can be used for screening and protecting friendly communications and for supporting countermobility operations by disrupting enemy communications. It is small and lightweight, easily man-portable, and the rugged design allows assured operation. Panel switches allow the user to select the desired function modes and delay times. A self-disable feature will render the unit inoperable.

HEXJAM is re-usable and capable of multimission operational and training use. It is claimed to be effective against both spot jammers and frequency-hopping radios. It has a selectable activation time delay and can be turned on from a remote location using ordinary bell wire.

STATUS

In production and ordered by the US Army.

CONTRACTOR

Fairchild Weston Systems Inc, 300 Robbins Lane, Syosset, New York 11791, USA.

4663.193
LQ-102 HAND-EMPLACED EXPENDABLE JAMMER

The LQ-102 is a low-power continuous FM-by-noise jammer intended for hand-emplacement near the intended target's receiver. Two VHF bands are selectable for 'threat' and 'training' functions. The unit is of small size and can be easily transported and deployed.

The jammer features ON/OFF remote control, via a wire pair, up to at least 10 km. Delay of jamming operation is operator selectable in 6 minute increments up to 30 hours. Continuous jamming in excess of five hours is claimed. An electrical destruct mechanism is fitted to the unit.

CHARACTERISTICS

Dimensions: 27·3 × 11·4 × 6·4 cm
Weight: 2·3 kg with battery
Antenna: Folding vertical monopole
Output: 10 W minimum ERP

CONTRACTOR

Cincinnati Electronics, 2630 Glendale-Milford Road, Cincinnati, Ohio 45241, USA.

LQ-102 expendable jammer

4658.053
MULTIPLE RADAR EMITTER SYSTEM

The Multiple Radar Emitter System (MRES) is a flexible set of ECM and C³CM threat generators that support personnel training and equipment tests and evaluations in dense electronic operational environments. HF, VHF and UHF communications jammers are available with either high power or moderate power transmitters. Radar, navigation and IFF jammers are also available over the frequency range from 500 MHz to 18 GHz. The jammers can be in either manned or unmanned airborne or field deployable configurations. These threat generators simulate threat signal electromagnetic radiation patterns, modulation techniques and tactics of known or possible threats.

STATUS

In production.

Flight Systems Inc (Tracor), PO Box 2400, Newport Beach, California 92660, USA.

ELECTRONIC WARFARE EQUIPMENT (SEA)

AUSTRALIA

5954.293
WINNIN DECOY SYSTEM

The Winnin decoy countermeasures system is an active expendable rocket vehicle with an ECM payload. The version in development for the Royal Australian Navy has a unique active/passive payload, and features a hovering rocket which enables a variety of ECM payloads to be deployed. This is the key to the system for while it is hovering the vehicle can adjust its speed away from the ship by adjusting its degree of tilt from the vertical. This allows the decoy to be deployed rapidly and positioned in the correct sector, while travelling at a speed typical of the warship it is protecting.

The flight profile of the decoy is controlled after launch by an auto-pilot, which is part of a microprocessor-based flight control system. The latter allows data to be transferred to the decoy on launch, which can be supplemented by additional data obtained during flight. This system of autonomous vehicle control dispenses with the need for trainable launchers.

The Winnin system has three components, the electronic payload, the hovering vehicle and a launching system. The rocket can be programmed to hover, move up or down, sideways or rotate on its longitudinal axis. The rocket is a long cylinder and is launched almost vertically. After launch and moving to a preselected position, it manoeuvres away from the ship comparatively slowly along a pre-calculated trajectory. This is chosen to make sea skimming missiles pass well under the decoy to prevent them from re-acquiring a further target.

The decoy system would normally be interfaced with the ship's ESM, radar and combat data system. Two alternative launchers are being developed; a modification of the Super-RBOC chaff grenade launcher (**4656.293**), or a box-launcher which also serves as a storage.

STATUS

The Winnin system has been in development for some years and full-scale engineering development is expected to last until 1988, and will include technical and operational evaluations. Production is likely to commence in mid-1988 with operational deployment by the Royal Australian Navy in 1989.

CONTRACTOR

Development is being shared among various Australian Government research establishments of the Defence Science and Technology Organisation, and the Government Aircraft and Ordnance Factories.

MODEL 100 NAVAL DF SET

The Model 100 is a shipboard direction finding, intercept, and surveillance system covering the frequency range 10 kHz to 180 MHz.

The Model 100 DF set operates on the principle of resolving the electromagnetic field at the antenna location into a set of orthogonal vectors which are then amplified and applied to the plates of a cathode ray tube (CRT), so as to trace a bearing line indicating the azimuth of arrival of the signal.

Two antennas are used: one for the LF to HF ranges and one for VHF. The LF/HF antenna derives the DF vectors from a pair of multi-turn, switched loops while the sense is obtained from a set of balanced dipoles. The VHF antenna comprises 16 separate monopole elements which can be arranged as crossed-Adcock and parallel dipole arrays in both the horizontal and vertical plane of polarisation. The VHF antenna is constructed around a hollow column which permits the passage of cable to the LF/HF antenna and to an aircraft warning light, located uppermost.

The DF signal vectors are amplified by two identical receiver channels which are accurately matched in phase and gain under all conditions of tuning and signal strength. A third channel, matched in phase only and equipped with a separate AGC, serves to amplify the omni-directional sense signal which is applied to the grid of the CRT to blank out the unwanted half of the bearing trace.

In addition to the instantaneous single-signal DF mode, the receiver can be operated in a panoramic mode (amplitude/frequency display), or in a wideband sweep mode, allowing the operator to see simultaneously the bearings and frequencies of all the signals present within the search band. This '3-D' display is made possible by using colour modulation as the frequency parameter.

A phantom omni-directional audio output is available at all times for intelligence interception purposes. This monitor channel can be tuned to any of the signals within the sweep band without disrupting the panoramic bearing display.

Digital, automatic tuning (local or remote) is derived from a phase-locked frequency synthesiser fitted with an oven stabilised frequency standard. The synthesiser is designed for fast access manual tuning, using the 3-DEK decade reed switches which are gear-interlocked to count up or down automatically. The tuning frequency is indicated directly by the decade knobs and in addition there is a projection-type luminous readout which can be duplicated in a remote location.

The equipment is also produced in a land-mobile configuration, under the designation Model 109, to form a complete two-man vehicle-mounted DF and surveillance unit.

CANEWS

The Canadian Electronic Warfare System (CANEWS) is a fully automatic naval integrated system incorporating ESM, ECM, and chaff countermeasures elements. It is designed to provide threat warning and surveillance facilities and also has the potential for Elint electronic intelligence gathering operations.

The passive, ESM, section provides surveillance over a frequency range of 1 to 18 GHz and an eight-horn antenna assembly gives 360° coverage in azimuth. An instantaneous frequency measuring (IFM) receiver covers the frequency range with frequency determined to an accuracy of about 5 GHz, and bearings to better than 4° rms. A sensitivity of -70 dB provides maximum detection range, which reaches beyond the horizon (depending upon conditions).

A Westinghouse Canada Ltd signal processor based on two Univac AN/UYK-20 digital computers performs system control and signal processing and analysis. Data rates of up to 500 000 pulses per second can be accepted and there is special purpose hardware in the system to carry out pre-processing of digitised pulse trains. The emitter library store is carried on magnetic tape, with a reported repertoire of 2000 emitter modes arranged in geographical segments. The library is programmable with full operator and access control and a capacity of up to 128 known emitters. Parameters of unidentified emitters that are intercepted can be recorded.

The system is operated from a single full-colour display and control console which incorporates two display units: a tactical PPI presentation showing threat, hostile and friendly sectors, and above it a VDU giving a page-by-page read-out of emitter parameters and other alpha-numeric data.

The receiver employed is an updated version of the MEL UAA-1 (Abbey Hill) equipment and the antenna assembly resembles that company's SUSIE array (**1707.253**) rather than the Abbey Hill antenna. The antenna assembly weight is less than 200 kg, and reliability has been increased by the substitution of solid-state amplifiers for the TWTs formerly employed.

DEVELOPMENT

CANEWS evolved from an experimental project 'Zander', initiated in Canada in the 1960s. A joint Canada/UK successor project called 'Percept' of 1973 involved the mating of the MEL/Royal Navy UAA-1 ESM system with a Canadian signal processor. Trials were carried out in 1973 and these led to the Canadian decision to develop an advanced automated naval ESM system under the project name 'Ogee'.

STATUS

MEL Defense Systems Ltd, Canada has won contracts worth $65 million for CANEWS. Seven systems have been ordered for the Canadian Patrol Frigate project, seven for the Destroyer Life Extension (DELEX) programme, and five for the Tribal class mid-life refit. Together with a contract for six Ramses systems (see **4054.293**) MEL business for Canadian EW systems is now approaching $200 million.

DAGAIE NAVAL COUNTERMEASURES EQUIPMENT

The Dagaie countermeasure equipment is an automatic dispenser for IR decoy flares and chaff grenades to provide naval vessels with passive self-protection against heat seeking, radar homing and dual mode anti-ship missiles. The system will accept threat data from a variety of sources, such as radar, ESM systems, optical, etc, and this information is used with data such as ship's own speed and heading to compute the optimum countermeasures deployment.

The Dagaie launcher comprises ten replaceable containers, each of which is loaded with either IR or chaff rockets. The containers weigh 40 or 45 kg, according to type.

The firing sequence runs automatically and is triggered on a missile alarm from a variety of sources, such as radar, ESM systems, optical sights, thus providing a very short reaction time. The firing direction is optimised in accordance with the threat bearing, wind speed and direction, ship heading and speed data.

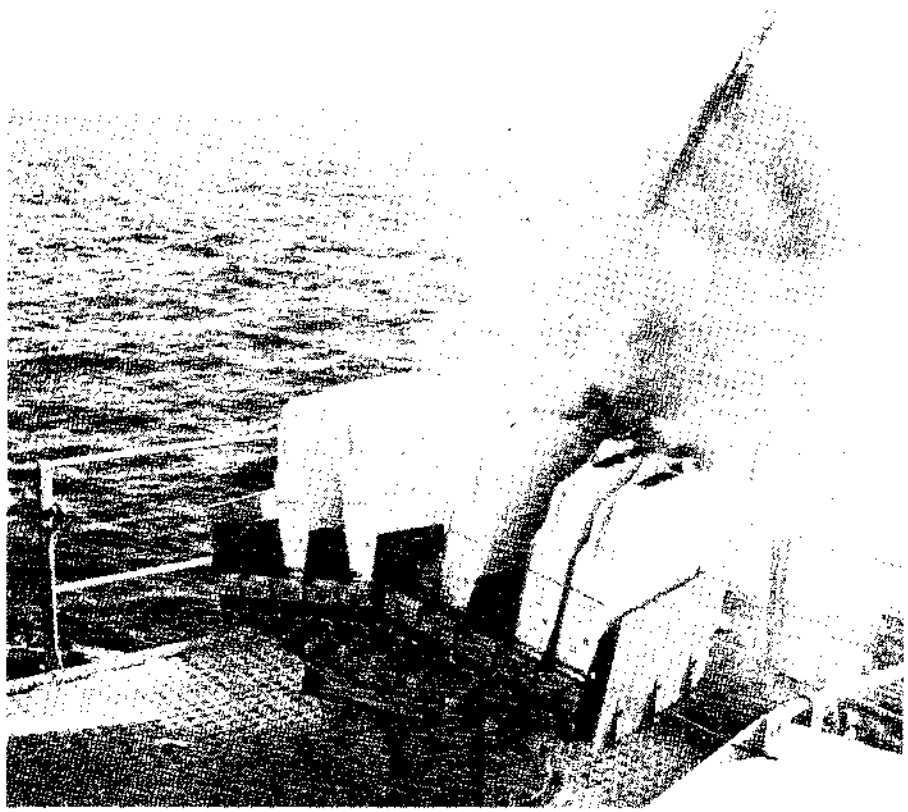
The launching of radar and IR decoys is so arranged that the most advanced mixed guidance missile cannot discriminate them and thus co-location of both decoys is achieved.

The installation is either a double mounting for ships over 800/1000 tons, or a single mounting for smaller vessels, and comprises:

(1) one trainable mounting (or two) which carries ten replaceable containers (suitcases), each of which is loaded with either IR or chaff projectiles. The range of existing ammunition enables decoys to be adapted to the various types of ships
(2) one or two servo-units
(3) one data-processing unit whose purpose is to compute the firing data
(4) one power-supply unit
(5) one supervision unit used to operate the system and display the loading state of the mounting
(6) one manoeuvre indicator which displays the proposed ship's manoeuvre in order to extend the protection time as long as possible without renewing the decoy.

For either the single or double installation a reduced size mounting carrying six suitcases can be supplied.

CHARACTERISTICS



Resetting time for 90°: <2 s
Medium aiming speed: 1·5 rad/s
Average reaction time: <4 s (reaction time is the time lapse between reception of 'missile alarm' information and the end of IR firing)

STATUS

Ordered or operational with 15 navies including those of France, Argentina, Bahrain, Kuwait, Malaysia, Colombia, Peru, Thailand, UAE, the SAWARI programme of the Royal Saudi Navy, the Combattante II in Qatar, the Combattante III in Tunisia and the Moroccan Descubierta Frigate.

Dagaie countermeasure launcher in operation during tests of a production equipment off Toulon

4350.293
MAGAIE LIGHTWEIGHT ANTIMISSILE DECOY SYSTEM

Specifically designed for small and medium sized ships, MAGAIE provides an overall protection against missiles fitted with electromagnetic (EM), infra-red (IR) or combined EM/IR seekers. Directly derived from the DAGAIE system (**3377.293**), it also uses the same ammunition suitcases.

With a reduced overall weight, a lighter launcher, only four suitcases and a single compact processing/servo unit, MAGAIE can be installed in single or double launcher configuration. The operating principle is by centroid effect. Ammunition used is standard DAGAIE EM or IR suitcases manufactured by Societe E Lacroix.

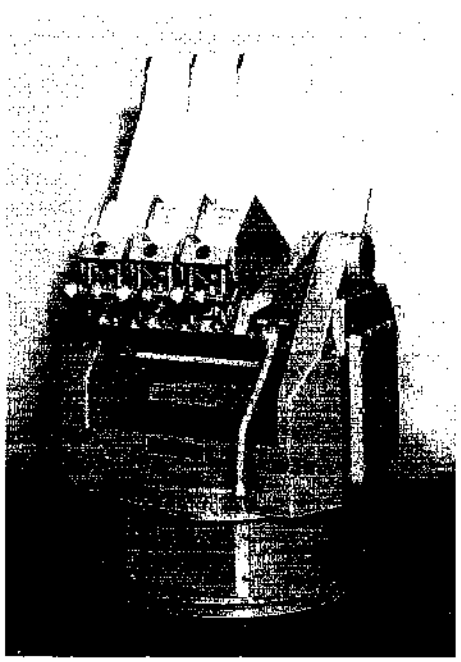
The operation is fully automatic from the reception of a missile threat alarm by computation of firing data and selection of ammunition suitcase during the resetting of the launcher to firing of the suitcase.

The MAGAIE processing and launching installation includes, according to the ship's capabilities:

(1) one or two mobile launchers, fully trainable, capable of receiving three suitcases
(2) a processing and servo control unit where all firing data is computed and the mounting reset orders generated
(3) a supervision unit controlling the system operation
(4) a manoeuvre indicator showing the recommended manoeuvre for the vessel.

The system with its simple interfaces is easily adapted to the various sensors (radar, ESM, optical).

CHARACTERISTICS



Average reaction delay: <5 s
Launcher
Max training arc: 330°
Reslewing time for 90°: ≤2 s
Reslewing speed: 1·2 rad/s
Sweeping radius: 400 mm
Height: 1200 mm
Weight: 600 kg

STATUS

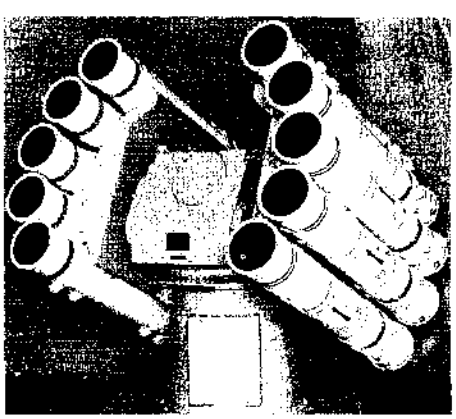
In production

CONTRACTOR

Compagnie de Signaux et d'Entreprises Electriques, Division Defense, 17 place Etienne Pernet, 75738 Paris Cedex 15, France.

MAGAIE decoy launcher

5656.293
SAGAIE NAVAL COUNTERMEASURES DECOY SYSTEM



SAGAIE is a fully automatic, passive countermeasures system designed to protect medium and large ships from surface-to-surface and air-to-surface missiles. It will provide protection from missiles guided by electromagnetic (EM) or infra-red (IR) seekers, or any combination of these two, even when the missiles are attacking simultaneously over the entire horizon.

The system operates in conjunction with DAGAIE (**3377.293**) and provides long-range defence by confusion and dilution effects against enemy target designating radars, and close-in defence by distraction and seduction against acquisition and tracking systems in missile seekers, in order that DAGAIE can complete its centroid deception effect.

The SAGAIE system is fully automatic from the reception of a missile threat alarm originating from any of the surveillance systems (radar, IR, optical or ESM) and will optimise the use of decoys in a very short reaction time. The equipment can be used alone (confusion and distraction) or jointly with a jammer (dilution, substitution after concealment, substitution after deception) by firing of substitution decoys.

The installation comprises:

(1) one or two fully stabilised launchers loaded with ten rockets in containers and trainable in azimuth and elevation
(2) one or two servo units
(3) one or two aiming and maintenance units
(4) a processing unit which computes the rocket launching sequence and provides information for the supervision unit

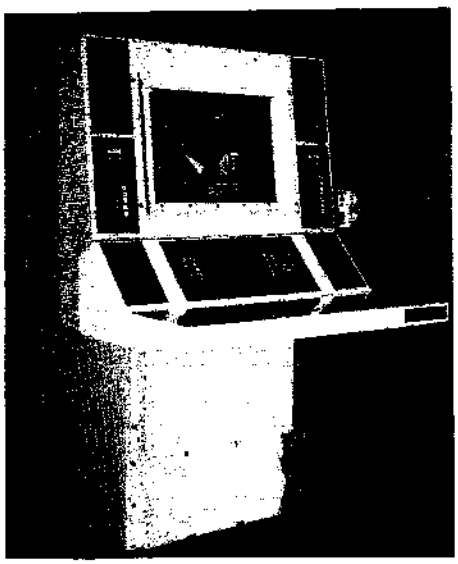
SAGAIE countermeasures system

(5) a supervision unit with controls and status displays
(6) an interface unit which provides for operation with any tactical data or target designation system.

SAGAIE can fire either EM or IR decoy rocket type ammunition. The rocket is packaged in a waterproof launcher container. This container is used for handling, transport and storage, and when secured to the mounting ensures guidance of the rocket at the moment of launch.

CHARACTERISTICS
Height: 2000 mm
Sweeping radius: 1600 mm
Weight(empty): 1900 kg
Number of rockets: 10
Container
Length: 1800 mm
Diameter: 330 mm
Weight: 30 kg

STATUS
The SAGAIE system has been ordered by the French Navy for its aircraft carriers, large frigates and destroyers, and has also been ordered by another unspecified navy.
CONTRACTOR
Compagnie de Signaux et d'Entreprises Electriques, Division Dèfense, 17 place Etienne Pernet, 75738 Paris Cedex 15, France.



5784.253
NEWSY NAVAL ELECTRONIC WARFARE SYSTEM
NEWSY is an integrated electronic warfare equipment which is designed for the protection of major warships against missile attack. The heart of the NEWSY system is a dedicated computer and an associated one-man console The complete system is designed for threat detection, evaluation and classification, selection of appropriate responses and activation of countermeasures against electromagnetic and/or infra-red guided weapons.

NEWSY links together a radar detector for the ESM, a multimodal jammer for the ECM, SAGAIE and DAGAIE launchers for decoying at short, medium and long range, and a control console and display unit. The system is normally completely automatic in operation but manual control can also be exercised if required. Information regarding threats is passed to the operator and displayed on a video screen, which forms part of the ECM control console, in both PPI and alpha-numeric format.

STATUS
In development for the French Navy C70AA corvette. See also SAPIENS EW system (**5657.293**).
CONTRACTOR
Compagnie de Signaux et d'Entreprises Electriques, Division Dèfense, 17 place Etienne Pernet, 75738 Paris Cedex 15, France.

5783.253
NADS NAVAL ANTIMISSILE DECOY SYSTEM
The NADS system is an electronic countermeasures equipment using electromagnetic and infra-red decoys and is normally integrated into the complete warship combat system. The equipment is a combination of two decoy launching sub-systems, the SAGAIE for long and medium range and the DAGAIE for short range, plus an action co-ordination computer and a tactical display. Information on the SAGAIE and DAGAIE systems is given under entries **5656.293** and **3377.293** respectively.

NADS is understood to be an export version of NEWSY (**5784.253**) and can be integrated with any type of ESM detection system and jammer. Depending on the size and type of ship requiring protection, NADS is available in two versions with either a single or a double SAGAIE launcher. Without a jammer the system will operate in confusion, dilution, distraction and centroid seduction modes. In association with a jammer other modes such as range gate stealing, seduction and dissimulation seduction are available.
CONTRACTOR
Compagnie de Signaux d'Entreprises Electriques, Division Dèfense, 17 place Etienne Pernet, 75738 Paris Cedex 15, France.

NADS control console

5657.293
SAPIENS EW SYSTEM
SAPIENS (Surveillance Alarm and Protection, Intelligence EW Naval System) is an EW system designed for small and medium size vessels. It is a joint system by Thomson-CSF and CSEE and comprises elements of both companies' EW equipment. SAPIENS 1, for small patrol boats and mine countermeasures craft, consists of a DALIA analyser/identifier with a radar library of at least 1000 possible threats, a DR2000 crystal video ESM receiver and a DAGAIE decoy launcher.

SAPIENS 2, for corvette and frigate sized ships, is basically the same as SAPIENS 1 but uses the DR4000S IFM receiver, instead of the DR2000, to give high sensitivity for longer range surveillance, low frequency radar detection and synthetic data display facilities. A third variant, SAPIENS 3, incorporates a jammer which additionally provides noise and deception jamming or a combination of both.

The system is another variant of the NEWSY equipment (**5784.253**)
CONTRACTOR
Thomson-CSF, Avionics Division, 178 boulevard Gabriel Péri, 92240 Malakoff, France.

5813.253
ARBR-17 ESM SYSTEM
The ARBR-17 ESM suite is a high performance radar detection, analysis and threat warning system. The actual frequency coverage has not been disclosed although it is understood to operate over the conventional radar threat frequencies. The system analyses the measured radar parameters and uses these characteristics to determine other parameters such as the radar's type and identity.

The equipment uses two antenna assemblies, an omni-directional system installed on the ship's mainmast and two eight-port directional antennas mounted on the same mast but slightly below. The omni-directional antenna provides initial detection and threat frequency, and carries out primary analysis, while the directional units provide more accurate bearing and frequency information. The antenna assemblies contain preamplifiers for improved performance.

STATUS
The ARBR-17 has been selected by the French Navy for installation on its C70AA air-defence frigates which are under construction.
CONTRACTOR
Thomson-CSF, Avionics Division, 178 boulevard Gabriel Peri, 92240 Malakoff, France.

5814.293
ARBB-33 NAVAL JAMMER
The ARBB-33 is a new high-performance radar jammer for use on-board a variety of naval vessels. Although very few specific details have emerged, it is understood to be capable of countering most CW and pulsed radar transmissions by means of either noise or deception jamming. The system is initially alerted by a threat detection equipment and then provides 360 degree coverage in azimuth by means of an electronically switched antenna instead of the conventional directional antenna assembly. This technique is considered to allow faster reaction time to the threat from any direction.

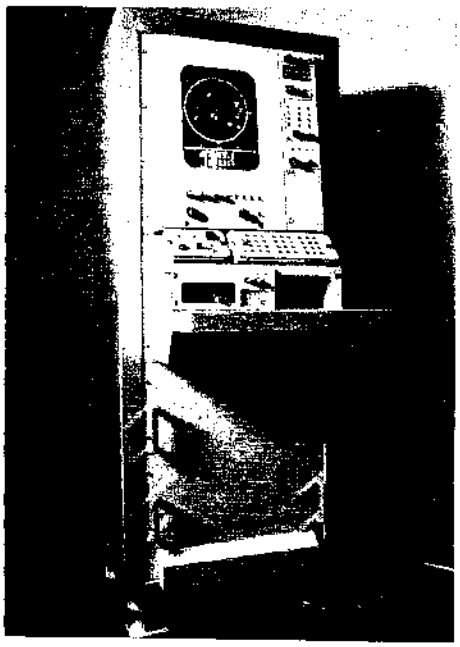
STATUS
The ARBB-33 has been selected by the French Navy for its C70AA air-defence frigates which are under construction.
CONTRACTOR
Electronique Serge Dassault, 55 quai Carnot, 92214 Saint-Cloud, France.

4351.053

DR4000 IFM ESM RECEIVER

The DR4000 is a highly sensitive crystal IFM ESM receiver with frequency coverage from C- to J-band, display of graphic and alpha-numeric signals being provided on a three-colour CRT, together with associated data. Symbols, alpha-numeric data and interface comply with NTDS standards. The display shows the tactical situation in the upper part and intercept parameters below.

Very little information is available on this system other than that there are four variants - DR4000S, DR4000A and DR4000U for surface vessels, maritime patrol aircraft or helicopters, and submarines, and a DR4000H version for helicopters without specific display. The system can be interfaced with decoy dispensers or jammers and automatically controls their operation.



The antenna system of the DR4000S includes two DF arrays (2 × 6 DF channels), one omni antenna (frequency channel) and modules housing RF amplifiers. The installation can be at the masthead, around the mast or on both sides of the bridge or superstructure. The processing unit, either frequency band designation or instantaneous frequency measurement, has reprogramming capabilities with deinterleaving, analysis and identification.

STATUS

In production. Saudi Arabia is buying four systems for installation in four new F2000 frigates being built in France. The first equipment has been installed and is on sea trials.

CONTRACTOR

Thomson CSF, Avionics Division, 178 boulevard Gabriel Péri, 92240 Malakoff, France.

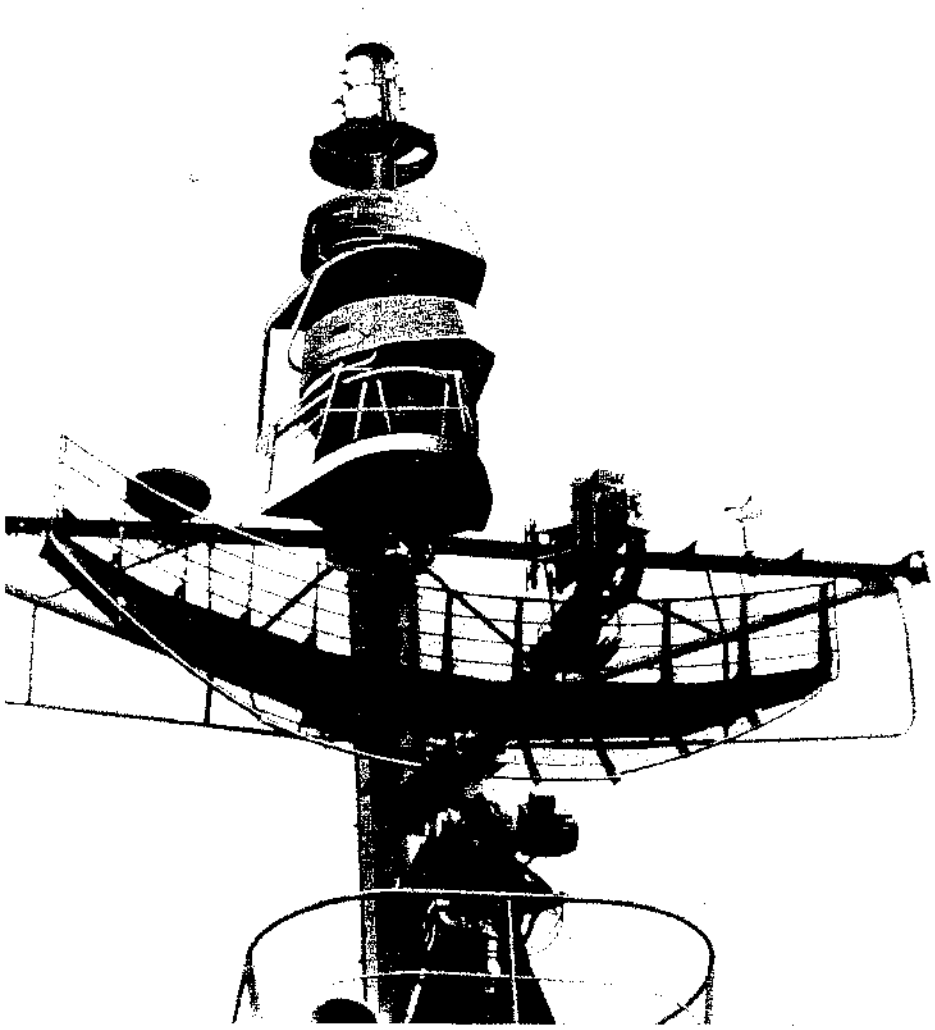
DR4000 IFM ESM system console

5785.293

JANET NAVAL JAMMER

Janet is a naval ECM system designed to jam locked-on missile radar seekers as well as surveillance radars operating in the H, I and J frequency bands. It operates against pulsed radars which may use fixed or staggered frequency, frequency agility, or pulse compression transmission modes, and can function as a noise jammer, a deception jammer or a two-mode jammer. Janet is of modular design and comprises up to four modules, each of which is a complete and autonomous jammer with its own two-horn receive antenna for tracking, radar detector, computer/signal generator, and two TWTs and directional transmit antennas. One TWT/directional antenna combination is used for noise jamming and the other for deception jamming. This enables the system to jam simultaneously two radar threats arriving from completely different directions. Each jammer module can also jam two signals if these are located close to each other.

The receiver is used for accurate target bearing and frequency measurement following an alert from an associated radar warning receiver. The computer controls the signal generator and selects the type of jamming used. This can be a variety of noise signals, including continuous or pulsed noise, as well as dual mode (noise/deception), complex deception and repeater signals. The system has been designed to store received target signals in order to re-create identical ones for deception purposes.



Since Janet is a processor controlled combined noise and deception jammer it provides 'smart' jamming to combat modern ECCM radars. With its modular concept of from one to four modules, it can be installed on many types of ships. Each module has an overall diameter of 1000 mm, a height 270 mm and weighs 250 kg.

STATUS

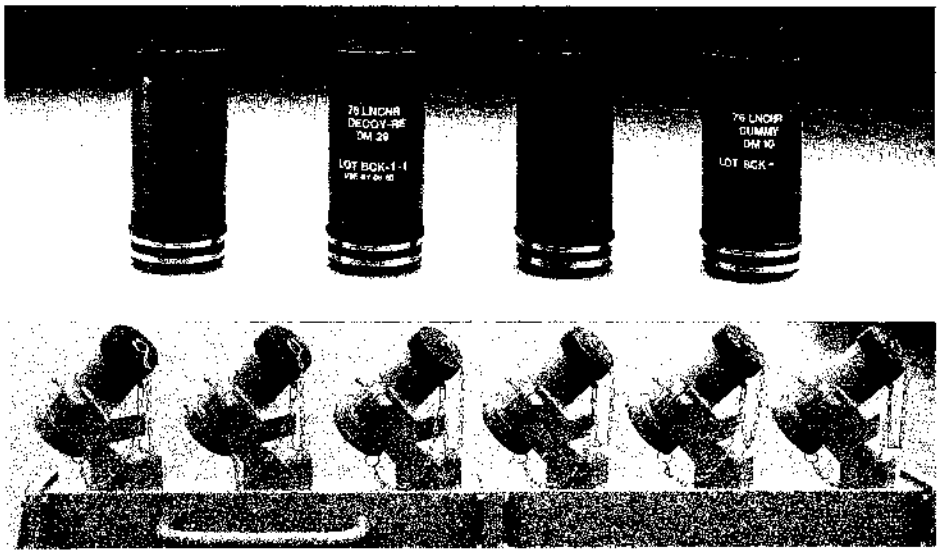
In production. Janet has been ordered by Saudi Arabia for its F2000 frigates being built in France. The first equipment was delivered last year.

CONTRACTOR

Thomson-CSF, Avionics Division, 178 boulevard Gabriel Péri, 92240 Malakoff, France.

Janet naval jammer

GERMANY (FEDERAL REPUBLIC)



3643.293

BUCK-WEGMANN DECOY SYSTEM

The Buck-Wegmann Hot Dog/Silver Dog equipment is an IR/chaff dispenser decoy system for use on boats and ships as a countermeasure against anti-ship missiles equipped with active radar and/or IR seeker heads. The rapid deployment of IR and radar decoy materials from the vessel, and the good radar returns provided by the chaff cloud cause an attacking missile to lock on to this instead of the vessel itself, allowing the target to take evasive escape action.

The system essentially consists of the reloadable 12- or 24-tube launcher, the main and auxiliary control units, the emergency release, the IR decoy grenades (Hot Dog), and the chaff grenades (Silver Dog). Two or four carrier mountings with three launcher tubes each are deck mounted on the port and starboard sides of the ships. The launcher tubes may be loaded with either IR decoys or chaff grenades only, or with a combination of both depending on the threat encountered. The grenades can be fired in single shots or in a series of shots. When using the latter mode whereby continuous firing is carried out automatically, the decoy cloud becomes effective after only two seconds, and is sustained over a considerable period. Small dimensions and low weight make the equipment suitable for use aboard vessels of all sizes down to small craft.

CHARACTERISTICS
Type: 76 mm decoy grenade launcher
Number of tubes: 12 or 24 per system
Weight: 115 or 185 kg (approx), complete system excluding grenades
Dimensions: 185 × 710 × 420 mm (w × l × h), 1 group of 3 launch tubes
IR decoy
Grenade type: Hot Dog 76 mm
Weight: 0·74 kg (approx)
Payload weight: 0·41 kg (approx)
Cloud development time: 2 s
Chaff decoy
Grenade type: Silver Dog 76 mm
Weight: 0·95 kg (approx)
Payload weight: 0·45 kg (approx)
Cloud development time: 2 s
STATUS
Current production. In service with West German navy and other NATO navies.
CONTRACTORS

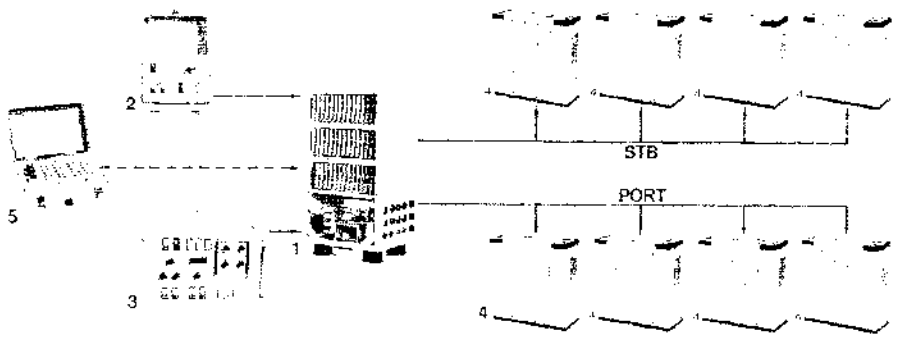
Grenade launcher installation for Buck-Wegmann Hot Dog/Silver Dog naval decoy system

5659.293
SCHALMEI COUNTERMEASURES DECOY SYSTEM



SCHALMEI is an IR/RF countermeasures system designed to provide self-protection for light and medium size naval units against shipborne, aircraft and missile radar and IR sensors by the use of rocket-borne decoy targets. The size and configuration of the targets can be selected either by manually initiated single firing or by an automatic self defence program. The program sequence is controlled by an electronic 'cubicle' which is interfaced with the fire control system. Typical decoy targets are obtainable in the RF range between G and K wavebands and in the IR range of the medium μm bands with maximum radiated power.

The system comprises:
(1) launcher containers and rockets
(2) a CIC control panel
(3) emergency control panel
(4) an electronic 'cubicle'.

The rocket is a 70 mm calibre solid-fuel decoy device, supplied in a standard size of 560 mm long and a weight of approximately 2·5 kg, with an IR flare payload (high radiation power and long position hold by means of a parachute), and high performance RF chaff payload (aluminised fibreglass dipoles). An RF decoy rocket of 800 mm length with double chaff is also available. An alternative possibility is arming of the rocket with IR high performance emitter units in the appropriate frequency bands.

Up to a maximum of four launching containers can be installed on each side of the ship, with ten rockets in each container. In order to reduce the flight time the rockets are fired from individual closed launching tubes. Fully loaded weight of each container is 40 kg.

Operation and control is effected by means of the CIC control panel which can be installed in an existing control panel or in a separate console. The panel provides for a maximum of 80 rockets, and launching for all operational types can be manual, or automatic with the fire control system. Configuration of the selected program is controlled and displayed, together with the number of IR and RF decoy rockets ready for launching. The emergency control panel allows the automatic self-defence program to be initiated from the bridge.

1 Electronic Cubicle
2 Emergency Control Panel Bridge
3 CIC Control Panel
4 Launching Containers
5 Test and Simulation Unit

SCHALMEI IR/RF countermeasures system

STATUS
In production.

5820.253
FL1800S NAVAL ESM/ECM SYSTEM

The FL1800S has been designed as a shipborne ESM/ECM suite and is understood to cover the frequency range 7·5 to 17·5 GHz. It offers 360 degree cover against all threats operating over the range and it can be assumed that the system incorporates full threat detection, analysis and jamming capabilities, and can handle several threats simultaneously, even when these differ considerably in either frequency or direction of arrival. The antenna system consists of a DF antenna which is mounted on top of the mast, and five omni-directional antennas, each covering a different frequency band, mounted on a separate pole. Although it is likely that the system operation is primarily automatic a below-decks operator's console provides system control and display of information on a CRT screen. The console is intended to be operated by one person but can accommodate two operators if necessary. No other technical details have been released.

STATUS
Fitted to the Bremen class frigates of the Federal Germany Navy.
CONTRACTOR
AEG-Telefunken, Postfach 1730, 7900 Ulm, Federal Republic of Germany.

5821.253
FL400 SERIES EW SUITES

The FL400 series is a family of EW suites originally developed for naval applications but now being offered for both ground-based and airborne roles. The series is available in three different basic versions; FL400A ELINT system, FL400U ESM equipment and the FL400G jammer. All versions are capable of operating and handling complex transmission patterns in high density threat conditions.

The FL400A ELINT system covers the frequency range 0·5 to 18 GHz with an optional extension to 40 GHz. It will automatically monitor all radar signals within this band, analyse them to identify and determine their main parameters, and store the information for subsequent use. The equipment uses a superheterodyne receiver coupled to a high-gain reflector antenna and incorporates an omni-directional antenna linked to an IFM receiver and panoramic display to achieve a high probability of intercept. The FL400A can be used as an unmanned ELINT station, forming part of an intelligence gathering network, and controlled from a central station.

The FL400U ESM version also covers the frequency range 0·5 to 18 GHz, with an optional extension to 40 GHz, and is normally used in conjunction with the FL400G jammer. It carries out the duties of signal detection, analysis and identification. It incorporates a large threat library which enables the system to compare incoming signals with those in the computer memory to determine the identity. Any unknown signals are classified and the library is updated for later use. Identified and unknown threats are listed in a continuously updated order of priority and a threat warning is given automatically. When an ECM unit is associated, various ECM options are suggested on the display. Full 360 degree coverage is provided and a rotating antenna is used for accurate DF measurements. As with the FL400A, both a superheterodyne receiver, and an IFM receiver and panoramic display are incorporated.

The FL400G is the ECM jamming version and is intended to be used in association with the FL400U

FSM equipment. Its normal frequency coverage is from 7·5 to 17·5 GHz. The FL400Q provides full 360 degree coverge, and consists of an antenna assembly, a high power TWT amplifier, a signal modulator and a central processor. An effective radiated power of between 20 and 60 kW can be transmitted and a variety of jamming modes are available for selection by the operator. Both noise and deception jamming is available, either in single or combined modes, and false targets can be generated using analogue or digital signals. The signal modulator is a highly sophisticated unit which can provice frequency agility, scan fast modulation, sweep scan rate and sweep RF techniques. A 'look-through' capability is incorporated to enable update of threat frequency and bearing during jamming.

The FL400 series equipment can be housed in shelters for mobile ground-based, shipborne or airborne purposes. It can also be directly installed in ships, aircraft or fixed ground stations.

STATUS

In late development for the export market.

INTERNATIONAL

5683.293

SIBYL EW NAVAL DECOY SYSTEM

Sibyl is a joint Anglo/French comprehensive, fully automatic and 'intelligent' missile decoy system for ships. It is designed to counter the anti-ship missile but not replace any 'hard kill' elements of ship defence.

The main components of the Sibyl system are a multi-tube trainable rocket launcher, seven different rocket-powered munitions to cover all decoy modes and a below-decks display and automatic control console. Using the ship's area defence threat evaluation, the control console integrates this with own ship's information, such as speed and heading, and automatically selects an appropriate combination of decoys. The console initiates arming of decoys, trains the launcher and automatically fires the munitions.

The system is a complete 'soft' weapon system and operates in all decoy modes, seduction, distraction, confusion, location denial and alternative target. The munitions are available in two calibres, 170 mm and 263 mm. There are six main munition types, several of which are of completely new design, plus an exercise round. The munitions, or combination of munitions, operate by preventing the missile head locking on by creating false targets and also by by breaking the missile seeker lock using EW techniques of off-board simulation/jammers and smoke screens. Munitions available have a range capability from 0 to 8·5 km.

The six main types of munition are:

(1) an ARM decoy which operates in the seduction mode and is a floating device simulating the ship's radar
(2) an off-board jammer which is another floating unit and includes a jammer which can be activated by remote control
(3) an EM decoy with a long-term deployment payload
(4) a combined EM/IR payload
(5) a 'hot balloon' decoy where the payload consists of 'hot balloons' plus chaff
(6) an absorbent decoy effective in all wavelengths (visual to 14 microns).

Sibyl is designed to combat the anti-ship missile and is effective in all decoy modes of seduction, distraction and confusion against single or multiple threats. It is adaptable to all trainable launchers and has a very fast reaction time.

The specific rocket launcher, which is stabilised in two axes, is unique among decoy systems in that it trains and elevates. Each launch system consists of one or more 12-tube launchers. The console module is the heart of the system containing a ruggedised military computer that provides turret stabilisation, decoy management, initiation of the rockets and real-time control of the complete command and control system.

Sibyl munitions are also offered in containers for installation on all existing trainable launchers and turrets.

A 40 ft commercial container version, equipped with radars, sensors, a computer and a launcher, is available for unarmed vessels

RAFAEL SHORT RANGE CHAFF ROCKET

This is a short range chaff rocket (SRCR) developed as a ship perimeter defence system to create decoys against missile attacks. Three rockets are encased together in a triple-barrel launcher serving as a loading unit and two sets are mounted on a standard 12·7 mm machine gun stand. This can be rotated to any desired bearing and is normally set to 45 degrees elevation. A remote firing box will operate two such launchers through a rotary selection switch. A solid, single stage rocket motor boosts the rocket into a preselected trajectory and the chaff dispersion takes place at a predetermined distance from the ship.

CHARACTERISTICS

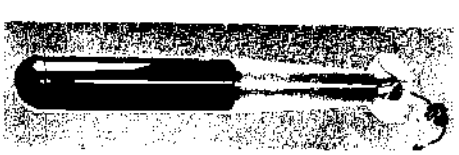
Rocket

Weight: 3·2 kg

Length: 640 mm

Diameter: 90 mm

Chaff content: 1·75 kg



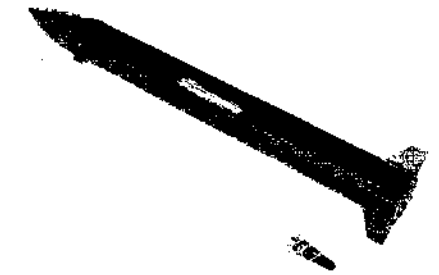
Launcher (three rockets)

Weight: 22 kg loaded

Length: 800 mm

CONTRACTOR

Rafael Armament Development Authority, PO Box 2082, Haifa 31021, Israel.



Rafael SRCR

4355.293

RAFAEL LONG RANGE CHAFF ROCKET

This is a long range chaff rocket (LRCR) system which serves as a naval search radar decoy. It is normally fired from launcher tubes mounted on the ship's superstructure. Loading is quick and simple and may be carried out by one man so that four tubes are considered sufficient for any one vessel. Rockets are fired from a remote control box with a launch tube selector switch. A two stage motor gives an initial boost thrust and a subsequent sustainer stage. Chaff dispersion is actuated by an altitude fuze which is energised from the launcher so that no internal power

Rafael LRCR

supplies are needed. A compact water tight design ensures a long life and minimum maintenance.

CHARACTERISTICS

Rocket

Weight: 9·4 kg

Length: 922 mm

Diameter: 89 mm

Chaff content: 1·3 kg

Launcher (double barrelled)

Weight: 12·5 kg

Length: 1250 mm

Diameter: 216 mm

AUTOMATIC COUNTERMEASURES DISPENSING SYSTEM

The Automatic Countermeasures Dispensing System (ACDS) has been designed for shipboard anti-missile application to control the launch of dispensable electronic countermeasures such as chaff and flares. The system operates automatically thereby reducing reaction time to a minimum, optimising response and providing effective anti-missile protection.

Operating in full automatic mode, with manual back-up, the ACDS selects the countermeasures rockets appropriate to the threat definition, range and direction and launches them with the correct priority and timing. The system will adapt to existing rocket decoy launch systems with suitable interfacing, and will adapt to any tactical arena by software adjustment.

CONTRACTOR

Elbit Computers Ltd, Military Systems and Products Division, Advanced Technology Center, PO Box 5390, Haifa 31053, Israel.

Automatic countermeasures dispensing system

3461.093

ELBIT MN-53 ESM SYSTEM

The Elbit MN-53 is an ESM system for interception and identification of radar emitters. Modular in design, it can be configured to meet a variety of operational requirements. In one configuration, it uses three different functional receivers. The system provides high sensitivity and detection for high intercept probability.

The MN-53 system detects, displays and records radar emitters. These data, when cross-referenced with Elint information, facilitate accurate and quick tactical decision making. The system is readily adaptable to various military environments. Main operational features are:

(1) manual/automatic DF

(2) manual/automatic frequency search

(3) manual/automatic analysis on PRF, PW, PRF wobbulation

(4) automatic printing and recording of RF, PW, PRF, PRF wobbulation, TOA and direction

(5) connection to external computer.

The system incorporates in its design the extensive experience and lessons gained in sea combat during the Yom Kippur war. Human engineering principles applied to the design of consoles, displays and controls allow for simple and comfortable system operation, even under stress conditions.

System components are slide mounted for ease of maintenance and accessibility. The system includes built-in test facilities for fault-detection.

CONTRACTOR

Elbit Computers Ltd, Military Systems and Products Division, Advanced Technology Center, PO Box 5390, Haifa 31053, Israel.

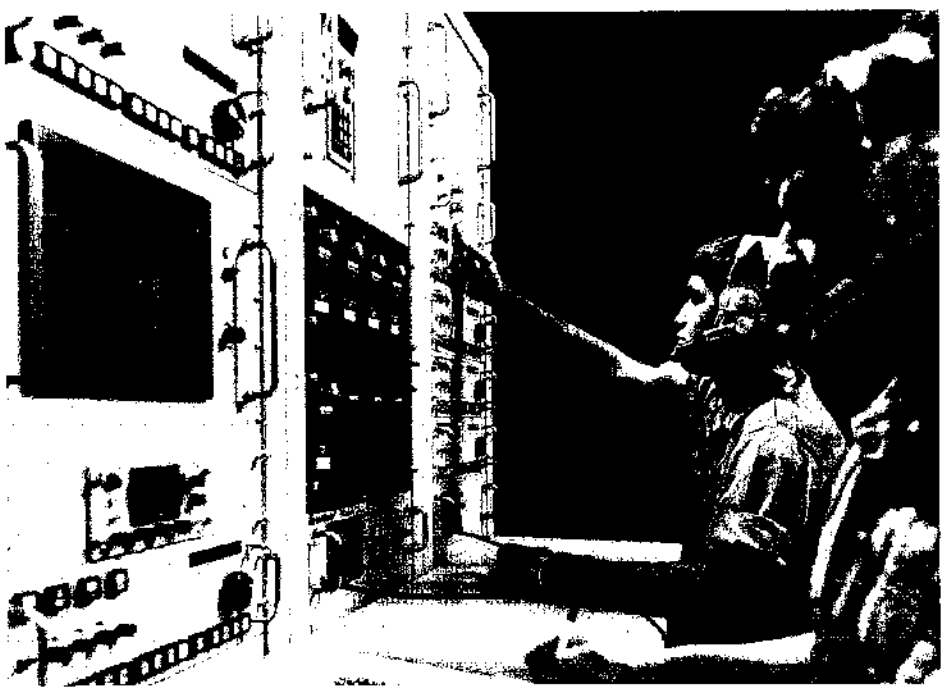
ELTA NAVAL EW SYSTEMS

For naval applications Elta Electronics has developed equipment for ESM and ECM, with chaff dispensing. Typical suites cover a wide spectrum of frequencies and are designed to counter modern naval weapon systems. The ESM is performed by the EL/L-8300 line of modular IFM receivers and DF antennas. ECM is carried out by the EL/L-8200 family of noise jammers, the EB series of deception systems and the naval version of the EL/L-7010 series systems (see entry **4225.093**).

EB41 Naval ECM System

The EB41 is designed for protection of ships of all sizes against radar controlled weapon systems. The system features a wide frequency range, automatic or manual operating modes, a high gain antenna and selectable ECM techniques.



EL/L-8303 ESM System

This is a computerised ESM system for shipborne, ground-based and airborne applications. The system is designed to intercept, digitise, identify, display and record radar signals over the frequency range 2 to 18 GHz, with an optional extension down to 0·5 GHz. The processed data of the system can activate chaff or ECM systems, either automatically or manually.

The system provides computer control and processing, instantaneous direction finding over 360 degrees with high accuracy and high intercept probability. A combined alpha-numeric and graphic display, and a built-in emitter library for storage of data, are provided.

EL/L-8310 ELINT/ESM System

The EL/L-8310 is an advanced microwave superheterodyne receiving system designed for all ELINT/ESM applications. The normal frequency range is from 0·5 to 18 GHz, although this range can be extended at both ends to cover from 60 MHz to 40 GHz. It is one-man operated and capable of shipborne, airborne, fixed or transportable deployment.

EL/L-8312 ELINT/ESM system

EL/L-8312 ELINT/ESM System

This is a fully computerised microwave receiving system based on Elta units such as the EL/L-8310, EL/L-8320 pulse digitiser, EL/S-8610 computer and EL/S-8570 display. It provides signal intercept, analysis, display, emitter classification and identification with a high probability of intercept. Frequency coverage is the same as the EL/L-8310.

STATUS

In production.

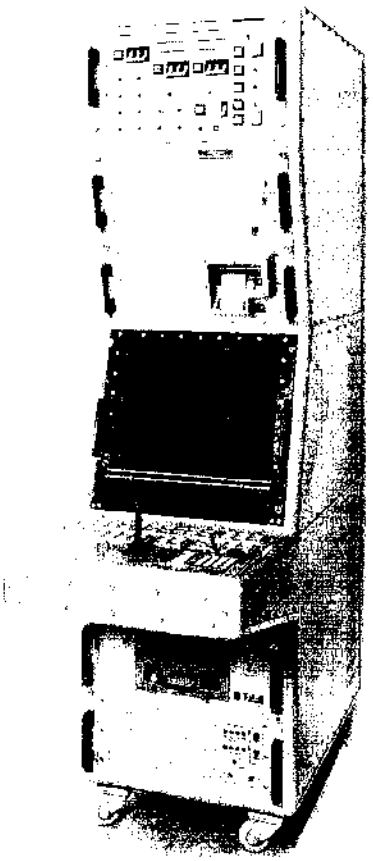
NS-900 SERIES NAVAL EW SYSTEMS

For use in the naval EW scenario, Elisra has developed a range of self-defence systems, known as the NS-900 series, for use in most naval vessels. Each system covers the frequency range 2 to 18 GHz and consists of an antenna assembly (normally mast-mounted), control and processing units, and a display console.

The NS-9001 is an ELINT system offering rapid and accurate analysis of virtually all radar emitters. The NS-9003 and NS-9010 are ESM systems that respond automatically, with instant radar signal interception, platform identification and signal jamming via the NS-9005. The NS-9005 is an ECM equipment providing noise and deception jamming. The NS-9009, described in more detail below, is a compact ESM system for small patrol boats.



The NS-9009 antenna weighs less than 70 kg and consists of 60 static horns, 36 of these covering the Ku band and 12 each covering X and C bands with a 1° accuracy in Ku band and 3° in X and C. Two horns in each band can be selected for feeding into high-sensitivity receivers and processors for detailed analysis. An omni-directional antenna is provided to give all-round warning and is co-mounted with the receiver to give added sensitivity at up to twice the normal radar horizon distance.

The operator is provided with a tabular display of the detected emitter's characteristics, together with either an orthogonal frequency/azimuth or a polar amplitude/azimuth display. The characteristics displayed include frequency, PRF, pulse width, antenna scan rate, and whether the emitter is in search, track or track-while-scan mode.

The system is also able to launch countermeasures, such as chaff or missiles, automatically. This decision is normally left to the operator.

STATUS
In operational service.

4169.293
ELT/211 NAVAL ESM EQUIPMENT

The ELT/211 equipment was designed to fulfil the operational ESM requirements of naval vessels ranging in size from fast patrol boat to destroyer. It is a highly integrated computer-based digital system employing sophisticated software-controlled de-interleaving and data handling techniques. The processor is of Elettronica design and is capable of effective operation in dense electromagnetic (EM) environments. Digital processing also permits maximum automation of the analysis, identification and tracking processes, enabling single-operator facilities with adequate surveillance and supervision capabilities combined with override options. Designed as a self-contained system, the ELT/211 can also be integrated with active ECM elements such as noise or deception jammers and it forms the ESM element of the Elettronica Newton EW system (**4172.293**).

The above-deck equipment consists of a DF antenna unit, service module, and four omni-directional antennas and RF unit. Masthead units weigh about 60 kg. Below deck is the operator console which incorporates the digital processor and display unit.

Surveillance facilities include:
(1) instantaneous automatic warning of pre-programmed threats
(2) continuous azimuth and frequency surveillance of the EM environment with 100% intercept probability even in very dense environments
(3) automatic tracking of selected emitters
(4) tactical evaluation of the radar scenario by means of threat identification symbols

The associated analysis functions provide the following additional facilities:
(5) automatic measurement and alpha-numeric presentation of a detected emitter's characteristic parameters
(6) recognition of emission modes
(7) automatic emitter identification
(8) automatic indication of appropriate ECM reaction.

The ELT/211 can be interfaced with the ship's command and control system, FCS, or with a larger EW system, as mentioned above.

STATUS
In production for several navies.

CONTRACTOR
Elettronica SpA, Via Tiburtina Valeria Km 13700, 00131 Rome, Italy.

4170.293
ELT/318 NAVAL JAMMER

The ELT/318 is a naval noise jamming equipment, generally associated with the Elettronica ELT/211 ESM equipment (**4169.293**) and with that equipment forming the major part of the Newton naval EW system (**4172.293**). The ELT/318 is a dual-band continuous wave noise jammer which employs advanced power management techniques to provide protection within the recognised radar threat bands. Among its facilities are: the ability to inhibit and/or delay weapon system acquisition; jamming of all types of search radar; variable modulation techniques; fast reaction and flexibility to counter new types of threat; full threat frequency band coverage.

The transmitter final output stage incorporates a travelling wave tube amplifier of Elettronica design and manufacture. It is normally employed with one or two ELT/828 stabilised transmit/receive antenna assemblies, although the ELT/318 equipment is suitable for use with medium or high gain antenna sets, depending on the type of ship. The ELT/828 antenna equipment is steerable and this model is generally employed in Newton systems.

STATUS
In production for several navies.

CONTRACTOR
Elettronica SpA, Via Tiburtina Valeria Km 13700, 00131 Rome, Italy.

4171.293
ELT/521 NAVAL DECEPTION JAMMER

The Elettronica ELT/521 is a naval deception jammer using advanced techniques to ensure the self-protection of naval platforms against all types of radar-supported threat. The transmitter's high peak power, together with the possibility of using omni-directional and/or directional antennas, makes ELT/521 suitable for the protection of ships of any size and tactical role. When associated with omni-directional antennas, the ELT/521 provides completely autonomous operation, while bearing data is required from a DF receiver when operating with the higher gain directional antennas (eg ELT/828). The ELT/521 deception jammer can be associated with virtually any ESM receiving equipment; when integrated with the Elettronica computerised ELT/211 ESM receiving system (**4169.293**) it constitutes a complete electronic warfare system combining the radar detection, threat warning and tracking facilities of the latter with the fast reaction capabilities of the ELT/521. It can also be incorporated in the Newton naval EW system (**4172.293**).

The ELT/521 equipment comprises the following modules: an air- or water-cooled transceiver, and a combined circulator and self-test unit. Various deception techniques can be employed and there are programmable deception routines. Multiple target engagement is possible and there is full threat frequency band coverage, providing protection from all types of fire control radars and active and semi-active homing missiles.

STATUS
In production for several navies.

Elettronica SpA, Via Tiburtina Valeria Km 13700, 00131 Rome, Italy.

4172.293

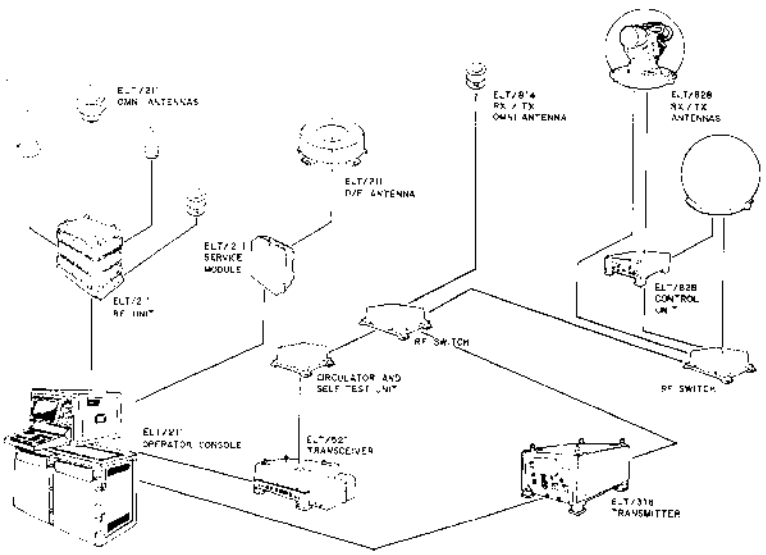
NEWTON NAVAL EW EQUIPMENT

Newton is a family of naval ESM/ECM systems designed by Elettronica to meet the operational requirements of naval forces operating in a dense electromagnetic environment. The systems are configured to suit vessels of various sizes from 100 tons upwards. They provide facilities for complete passive surveillance, DF, analysis and identification of the radar emitters in the operational area, and electronic means of protection against modern anti ship weapons.

The Newton system consists of an ESM section and an ECM section, with the related antennas, controlled from an operator console. The former section is designed to provide 100 per cent intercept probability, passive surveillance, automatic instantaneous warning of pre-programmed threat, automatic analysis of threat parameters, automatic identification and tracking of threats, a synthetic data display, instantaneous DF, and broad frequency coverage. The ECM section provides self-protection by noise and/or deception jamming.

The modular concept is centred on the ELT/211 ESM receiver equipment (**4169.293**) and on several ECM peripheral equipments, in particular the ELT/318 noise jammer (**4170.293**) and/or the ELT/521 deception jammer (**4171.293**) while interface channels are provided to integrate with the ship's command and control as well as other active reaction elements (chaff rocket launchers, FCS etc). The detailed configuration of individual Newton systems are adapted to suit specific ships. Advanced signal processing and handling techniques and software controlled functions, ensure the flexibility necessary to counter the anticipated threat evolution over the next decade. Because of a high level of automation, single-operator control of all ESM and ECM functions from one console is possible, and integration with command system is easily available via computer channels.

The range of Newton configuration possibilities is shown in tabular form. The principal modular elements of Newton systems are shown in another diagram while additional details of these will be found under the entry numbers mentioned above.



Typical Newton system configurations

	Size of craft							
	100–500 tons		250–1500 tons		1000–3000 tons		2500+ tons	
ESM (ELT/211)*	1	1	1		1	1	1	1
ECM (ELT/318) noise		1	1		1		1	2
ECM (ELT/521) deception	1		1		2	2	3	2
ECM Antennas (ELT/814)	1		1					
ECM Antennas (ELT/828)		1	1		3	2	4	4

5661.253

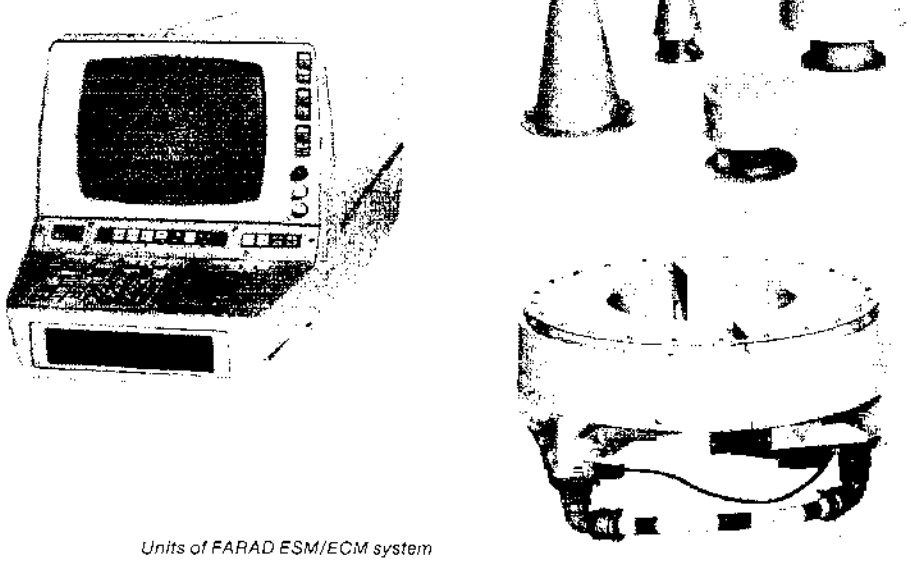
FARAD NAVAL EW SYSTEM

Designed for corvettes, fast patrol boats, fast attack craft and other small naval ships, FARAD is a complete EW system which can provide passive detection and identification of targets coupled with self protection against radar guided weapons.

FARAD is based on four principal units which can be integrated to provide a flexible system adaptable to operational requirements. The principal units are the ELT/123 basic ESM equipment, the ELT/261 analysis module, the ELT/521 deception jammer and the ELT/361 noise jammer with its associated ELT/828 antenna system. The ELT/123 is the fundamental unit. Other units are added as required according to the type of vessel and its operational role.

The ELT/123 supplies radar warning and DF functions to give instantaneous DF of pulse and CW emissions with automatic warning of pre-programmed threat emissions on a CRT display. Information can then be passed to the ELT/261 for automatic analysis of intercept signals and automatic tracking, with continuous surveillance of the radar environment on a panoramic display. The ELT/521 is

a high power deception jammer and is described under entry number **4171.293**. The ELT/361 is a dual-band CW noise jammer with spot and barrage jamming capability. It is driven automatically through the FARAD ESM section (ELT/123 plus ELT/261).



The complete FARAD system is able to operate in a very dense electromagnetic environment and can cope with a large number of simultaneous threats whether by search and acquisition radar or radar homing missiles. In an operational installation, several combinations of the various units described above can be fitted with the ELT/123 either as a stand-alone unit or as the basis upon which the other installations are built.

STATUS

In production and operational service.

5662.453

THETIS SUBMARINE ESM SYSTEM

THETIS is a modular ESM system designed to fulfil the EW requirements of a submarine. The system is produced in two configurations. The first and simpler of these, the ELT/124-S, performs high sensitivity threat warning and DF functions, while the second, the ELT/224-S, extends these functions to those of a full ESM system or tactical ELINT. Both variants use the same DF antenna as the sensor and both can be fitted with an additional and separate RF pre-amplified omni-directional antenna as an option. This latter antenna is very small and can be installed on top of the submarine's attack or search periscope for primary warning.

THETIS submarine ESM system (display/control console and two antennas)

The ELT/124-S variant consists of a threat warning and DF receiver system. The hardware comprises a DF antenna and receiver, a processor unit and a warning display. It provides instantaneous, high sensitivity, automatic warning of threats programmed into the processor and continuous surveillance of the radar environment with 100 per cent intercept probability. A dedicated operator is not required.

The ELT/224-S consists of the units of the ELT/124-S plus an IFM receiver and an ESM display. It provides instantaneous DF with 100 per cent intercept probability of pulse and CW emissions, display of all intercepted emissions, IFM, automatic technical analysis and identification of emitters and their platforms. It will also provide warning that the vessel is entering an area under hostile radar surveillance. A single operator is required for this system.

The antenna assembly consists of one conical spiral omni-directional antenna plus eight plane spiral DF antennas assembled in single casing. It has a very low radar cross-section and is also covered with microwave absorbing material. It is light and strong enough to be mounted on the search periscope. The small, lightweight optional antenna can be mounted on the attack periscope and will provide the submarine commander with a first alarm facility but without DF facilities.

STATUS

In production and operational service.

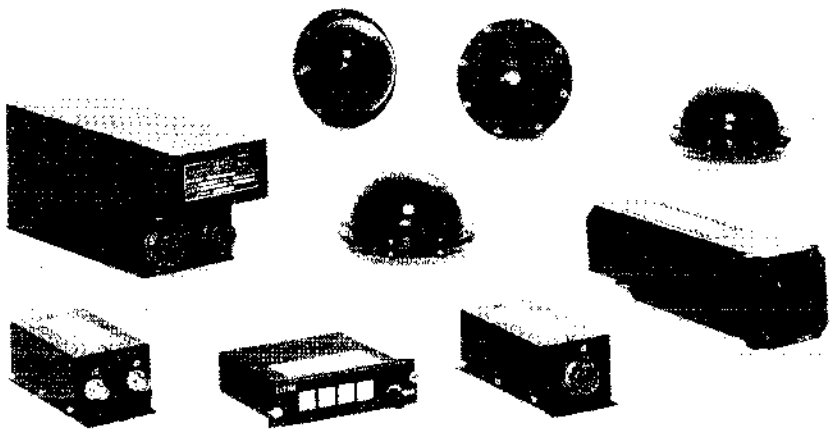
ELETTRONICA EW EQUIPMENT

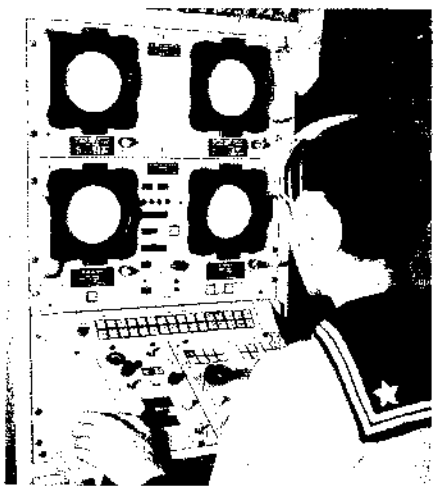
In addition to those items of electronic warfare equipment described in separate entries in this section, Elettronica produces a comprehensive range of hardware. A list of all Elettronica products so far identified follows:



ELT/116:	naval ESM/ECM system
ELT/123:	naval ESM (FARAD)
ELT/124-S:	ESM system for submarines (THETIS)
ELT/128:	communication direction finder
ELT/156:	airborne radar warning receiver
ELT/161:	airborne radar warning system
ELT/211:	computer-based naval ESM system
ELT/214:	naval ESM
ELT/224-S:	ESM system for submarines (THETIS)
ELT/261:	naval ESM analysis module (FARAD)
ELT/263:	ESM/RWR system for maritime aircraft
ELT/311:	jammer
ELT/318:	dual-band CW naval noise jammer
ELT/361:	noise jammer
ELT/457-460:	supersonic noise jammer pods
ELT/511:	naval deception jammer
ELT/521:	naval deception jammer
ELT/555:	supersonic deception jammer pod
ELT/562:	deception jammer
ELT/566:	deception jammer
ELT/711:	naval ESM radar identification module
ELT/712:	naval EW programming unit
ELT/716:	naval EW data interface
ELT/724-S:	omni-directional ESM antenna module for submarines (THETIS)
ELT/814:	naval omni-directional ECM antenna
ELT/828:	stabilised naval ECM transmit/receive directional antenna
ELT/999:	COMINT system

ELT/457 ECM supersonic pod

ELT/460 ECM supersonic pod



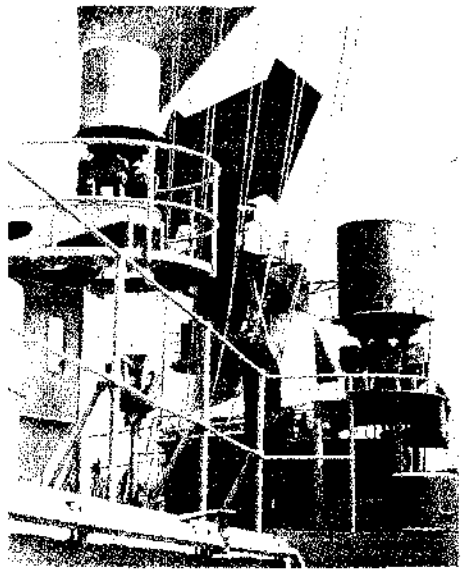
This ELT/156 aircraft radar warning receiver equipment weighs only 10·3 kg with antennas. It provides automatic warning and coarse DF measurements of threats

A great deal of the detailed information about these equipments and others which have not been identified remains classified, but the following items have been partially analysed and the information concerning them that can be published appears in the following paragraphs.

A typical ship's EW suite might comprise:

(1) ELT/116 radar intercept receiver
(2) ELT/711 radar identification unit
(3) ELT/712 programming unit
(4) ELT/716 data transmission module
(5) ELT/311/511 jammer.

The complete system covers the frequency range 2 to 18 GHz and is based on a four-band instantaneous frequency measuring (IFM) receiver which performs all ESM functions. The four channel outputs are presented to the EW operator on two surveillance CRTs, and it is possible to discriminate between pulse and CW signals. Separate displays are provided for DF and signal analysis and measurements, these two CRTs being positioned below the surveillance CRTs on the EW operator's console; an additional CRT for dealing with the D-band (former L-band) signals is mounted above, if fitted. The former displays are part of the ELT/711 radar identification unit, and the latter is the ELT/214 display unit. There are also threat warning indicator lamps for drawing the operator's attention to about 30 intercepted emissions. These may be selected for individual analysis etc by operation of push-buttons associated with the warning indicators.



Operator's console of Elettronica 'Gamma' naval EW suite. Two upper CRTs are for surveillance, left lower CRT is main display and lower right CRT is for DF

The ELT/116 radar intercept receiver system includes omni-directional and DF antennas, an auxiliary DF unit, RF unit and the display and console unit at the EW operator's position. The IFM receiver operates with a crystal video DF receiver in all bands. Frequency measurement accuracy is 0·2%, with a dynamic range of about -70 dBm to zero. Complete digital messages are transmitted to the ship's CIC aboard larger vessels, data transmitted including such items as platform identification, emitter characteristics, lock-on/search warnings and confidence levels etc.

The ELT/311/511 jammers can be used in conjunction with the above passive EW elements to provide a complete EW facility, and jammers can be under operator control or by CIC direction. A wide variety of jamming techniques is employed, including: noise and deception, both automatic and semi-automatic. Range blanking with spot noise or amplitude modulation spot jamming is normally used against search radars, tracking systems and either active or lobe-on-receive-only (LORO) conical scan radars. Angle jamming with spot noise is used against sequential lobing and track-while-scan (TWS) radars. Look-through and time-gated circuits are provided to control jammer operation in conjunction with the system receivers. These circuits are generally employed when the system is required to operate against multiple threats

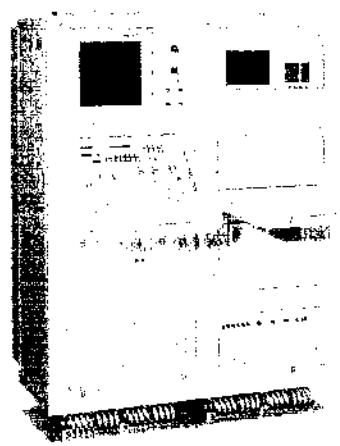
4644.293

CO-NEWS NAVAL ESM SYSTEM

CO-NEWS (Communications Naval Electronic Warfare System) is a naval ESM system which provides full monitoring and analysis of communications in the VHF/UHF frequency band. The system is completely automated to achieve very high intercept probability and to handle high density traffic. It comprises a lightweight antenna assembly, normally mounted at masthead, consisting of three co-planar dipole arrays and a switching matrix, and an operator console located below decks. The equipment is modular in design to cater for expansion and for additional units.



CO-NEWS antenna assembly

CO-NEWS automatically carries out continuous surveillance of the communications band, technical analysis and bearing of the intercepted emissions and real-time data processing and presentation. The intercepted signals can also be demodulated for monitoring purposes.

The operator console houses the system modules including:

(1) the surveillance receiver which scans automatically through the frequency bands at a velocity sufficiently high to ensure 100 per cent intercept probability
(2) a direction finder that takes the bearing and performs the technical analysis of intercepted emissions and also serves to monitor these signals
(3) a computer which manages the sensors, and processes and presents the data
(4) displays for the presentation of the measured data, and the operator's command keyboard. Two different displays are provided; a panoramic display dedicated to a synthetic presentation of the search results, and a plasma display for data and situation evaluation.

The system operates automatically under the supervision of an operator who can also over-ride the system's automatic operation to solve ambiguous situations or to monitor the emissions.

CO-NEWS below-decks equipment console

3343.253

RQN-1 RADAR INTERCEPT EQUIPMENT

The RQN 1 radar intercept equipment is a wide-band radar receiver which provides DF, frequency band measurement, video analysis of pulse width and pulse repetition frequency. Being wide open in frequency, it provides high probability of detection of every radar signal within its sensitivity range, which extends well beyond the radar horizon. Its DF accuracy, together with a number of additional features, like pulse length and PRF measurement and frequency band determination, lend themselves to use in both limited ELINT (electronic intelligence) missions and as a quick reaction device for self and mutual protection.

The RQN 1 measures on a pulse by pulse basis the bearing, pulse length, pulse repetition rate and frequency band of simultaneous radar signals, allowing the operator to identify each of them and to determine the relative danger. Thus, a very valuable means to analyse the tactical situation is available. Better operational effectiveness is achieved if the PAW-1 warning unit and the RIN-1 identification unit are connected to the radar intercept equipment, as well as a TQN-1X radar jammer.

When installed on very small vessels, it can be used for detection and analysis of enemy radiations, while the carrier remains beyond the enemy radar detection range. The manufacturers state that the sensitivity in this mode is sufficient to give as much as five to ten minutes of advance warning (ie detection before the radar receives a valid target echo) when used against ship or airborne search radars. This equipment is also

Operator's console of Selenia RQN-1B radar intercept equipment

used as the passive target acquisition sensor for ship-to-ship missile systems, eg Otomat, Exocet, etc. On larger ships, the RQN-1 may be used in conjunction with active jammers to provide a full ECM capability. The signal analysis facilities are adequate for limited ELINT missions, as well as emission identification and optimisation of active ECM signals.

A separate digital module can be connected to the RQN-1 to give automatic warning of up to eight pre-selected radars.

The main features are: instantaneous detection and DF of all radar emissions; omni-directional wide open coverage; built-in video analysis capability; threat frequency band indication and selection; blanking of nearby radars; solid-state (apart from CRTs).

CHARACTERISTICS

Type: RQN-1A/RQN-1B

Frequency coverage: 1 - 12 GHz (RQN-1A)
1 - 18 GHz (RQN-1B)

Sensitivity: -48 dBm (nominal)

DF accuracy: 5° rms (all azimuth, all frequencies 2 - 12 GHz)

PRF measurement: 50 - 10 000 pps, ±10%, on 3-inch (76 mm) PPI

Pulsewidth measurement: 0·3 - 5 μs, ±10% plus 0·05 μs

Frequency band indication: L, S, C, X, Ku-band lamps ±3%

High level RF protection: 30 MHz - 18 GHz; 100 W/1 μs/1000 pps; 1 W CW

Weights and dimensions

Antenna and radome: 30 kg, 38 cm diameter, 75 cm height

Auxiliary unit: 35 kg, 47 × 39 × 35 cm

Display: 45 kg, 47 × 34 × 55 cm

STATUS

In production and operational.

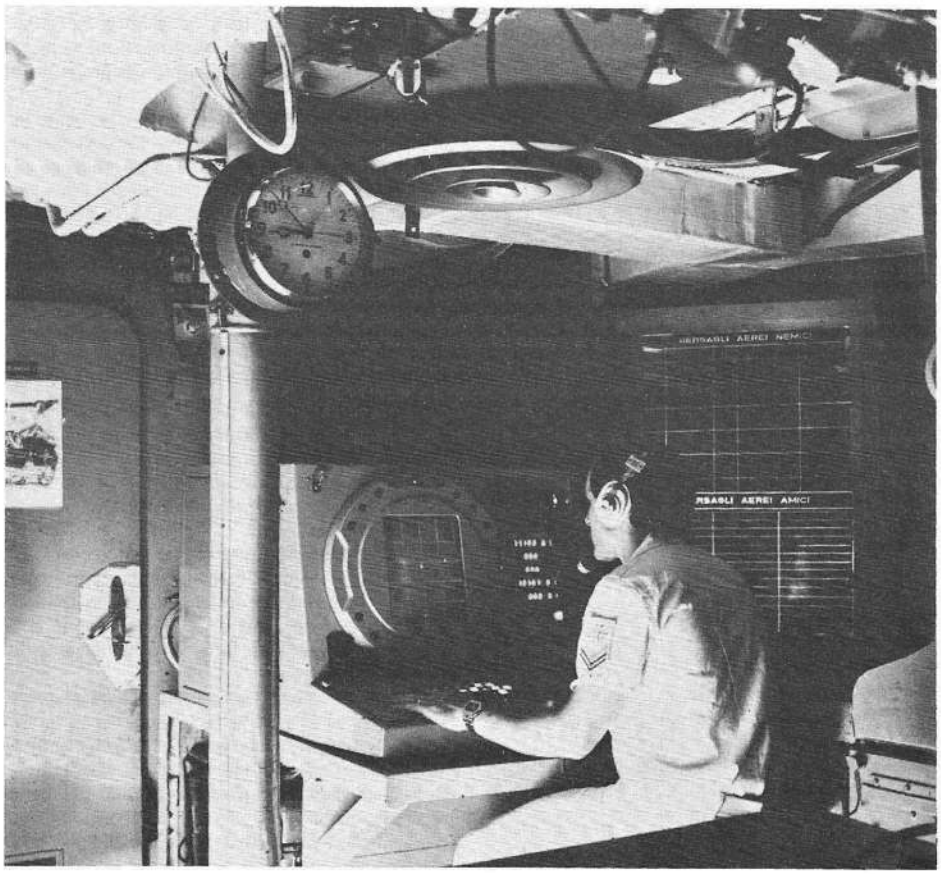
3528.253

RQN-3 RADAR INTERCEPT EQUIPMENT

The Selenia RQN-3 radar intercept equipment is an advanced version of the RQN-1 system, providing a variety of improved operational facilities. It is based on the use of an instantaneous frequency measuring (IFM) receiver in conjunction with discriminators and solid-state microwave amplifiers in the high frequency coverage bands. The reported system sensitivity is about -65 dBm, and the RQN-3B has a frequency range extending up to 18 GHz.



It is normally used in conjunction with the IPN-10 computerised display system and with the RIN-1 radar and threat library which enables sorting and priority ordering of threats, and allows an operator to confirm threats and initiate jamming or other countermeasures.

STATUS

Stated to be in service with several unspecified navies.

5663.253

INS-3 NAVAL ESM/ECM SYSTEM

INS-3 is a total system which allows a single operator to perform both ESM and ECM functions, and is composed of a passive section and an active section. The passive section, RQN-3B, provides automatic detection and analysis, and tracking of emissions in a dense electromagnetic environment. It provides warning of emissions in its coverage area and automatic identification of threats based on parameters stored in a dedicated computer library. Information on threat direction, identification parameters, etc is displayed in alpha-numeric and graphic symbology on a 16-inch CRT display mounted in the INS-3 control console.

The active section, TQN-2, is integrated with the RQN-3B and receives instantaneous data for fast and automatic reaction. It will provide noise and pulse jamming of threat emissions, as well as computer control of passive EW launch systems, eg chaff and flares. It also performs passive tracking in azimuth and elevation of high-speed radar emitters, such as hostile aircraft and anti-ship missiles, and passes this data to other self-defence weapons.

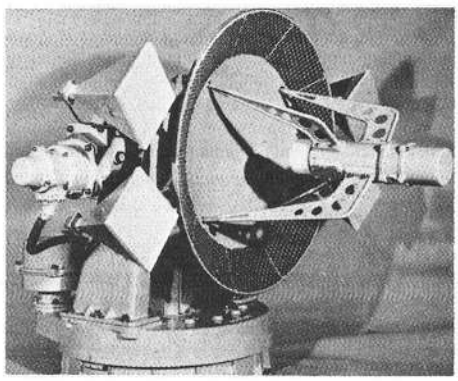
CHARACTERISTICS

ESM operating frequency: 1 - 18 GHz

Receiver: Wide open with IFM and monopulse DF

Horizontal coverage: Omni-directional

Real-time tracking capacity: Over 50 emitters



Automatic identification library: Up to 3000 emitters

ECM operating frequency: I/J-band

Jamming modes: FM-AM-Pulse

ECM antenna of INS-3 system

4175.093

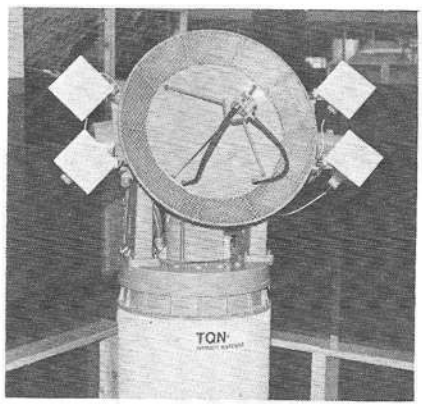
SELENIA EW EQUIPMENT

In addition to those equipments described individually in this section, Selenia produces a wide range of electronic warfare hardware, much of which is protected by security classification. To assist readers, the following list of the major current items of Selenia EW hardware has been compiled as an aid to identification:

ALQ-X Series of airborne jammer pods, various models

ALQ-234 ESM/ECM self-protection jammer pod

ESS-2 Mobile ESM system



IGS-1 Mobile integrated ESM/ECM system

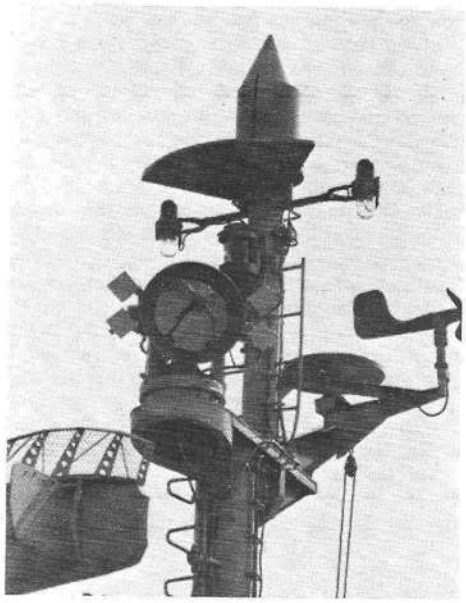
IGS-1P Version of IGS-1

IGS-3 Computerised mobile integrated ESM/ECM system

IHS-6 Integrated helicopter ESM/ECM system

INS-1	Integrated system for FPBs, RQN-1 + PAW-1 + RIN-1
INS-3	Integrated naval ESM/ECM system, computer-aided
PAW-1	Pulse analyser and warner
RIN-1	Naval radar identification unit
RQA-5	Fixed-wing aircraft version of RQH-5
RQH-5	Computer-based helicopter ESM system
RQN-1	Radar intercept set for submarines and small ships
RQN-3	Naval radar intercept and analysis set
TQN-1	Naval jammer
TQN-2	Modular airborne jammer (multi-band)
TQN-3	Jammer
TQN-4	Jammer

One version of Selenia TQN series jammer antenna



Another Italian Air Force EW project is the Aeritalia G222 VS EW aircraft, the first of which was delivered to the Italian Air Force in March 1983. Both Selenia and Elettronica are believed to be engaged on this project but no details have been announced. The Elettronica RIDE ESM system (**4165.393** in 1983-84 and earlier editions) is certainly appropriate to this requirement as would be a fixed-wing version of the IHS-6 heliborne ESM/ECM system (**3382.393**) by Selenia. Communications for the G222 VS system are understood to be the responsibility of Elmer, while SMA of Florence is providing radar.

SCLAR Mk 2 ROCKET LAUNCHING SYSTEM

The SCLAR Mk 2 system is a development of the UCLAR System (**1823.281** in 1982-83 and earlier editions) and has been designed and manufactured for installation in the Italian Navy's 'Maestrale' class ASW frigates and the helicopter carrier 'Garibaldi'. The SCLAR Mk 2 employs the same rocket launcher of the previous system but data is processed by a digital multiprocessing computer based on the Elsag designed ESA 24 microprocessor.

The system is defined as multipurpose since it provides for the execution of various operations, such as decoying incoming missiles, confusion of hostile radars, illumination or HE bombardment, by simply selecting the type of rocket.

A very large set of decoying patterns can be stored in the digital computer and may be recalled and automatically executed as required. Each stored pattern may be substituted easily and rapidly at any time.

The SCLAR Mk 2 consists of one control console which requires a single operator; one data processing unit; one or two rocket launchers; one or two power supply cabinets; and one or two local control panels. In addition the system requires a set of peripheral panels comprising one alarm loading panel and one acoustic warning device for each launcher. An optional illuminating launching remote control panel is also available.

Two remotely controlled rocket launchers can be driven by the SCLAR Mk 2, which will position them in azimuth and elevation and perform all the necessary logic and computation. This includes rocket pattern programming, azimuth and elevation continuous computation for the accurate launch of each rocket to the programmed burst point and rocket automatic selection and firing.

BREDA LIGHT CHAFF ROCKET LAUNCHING SYSTEM

This system consists of two launchers, installed port and starboard, and a control panel. Each launcher holds six 105 mm short rockets, set in tubes at fixed elevation and bearing (45° and 135° relative to ship's head) so as to launch on each quarter and form a chaff 'cross' pattern over the ship. The control panel monitors the state of the launcher, and commands launching from each launcher independently. Two operational cycles, each consisting of one pattern of four followed by one pair ahead, are performed without reloading. The resulting radar homing missile decoy is accompanied by evasive ship manoeuvres. This launcher is particularly intended for the defence of very light craft. The rockets were designed and developed by BFD Difesa-Spazio.

CHARACTERISTICS

Launcher

Height: 1700 mm
Length: 480 mm
Width: 300 mm
Weight: 85 kg (without rockets); 125 kg (with rockets)

Control panel

Height: 260 mm
Length: 400 mm
Width: 220 mm
Weight: 8 kg

Rocket

Calibre: 105 mm
Weight: 5 kg (without container); 6·5 kg (with container)
Power consumption: 0·2 kW

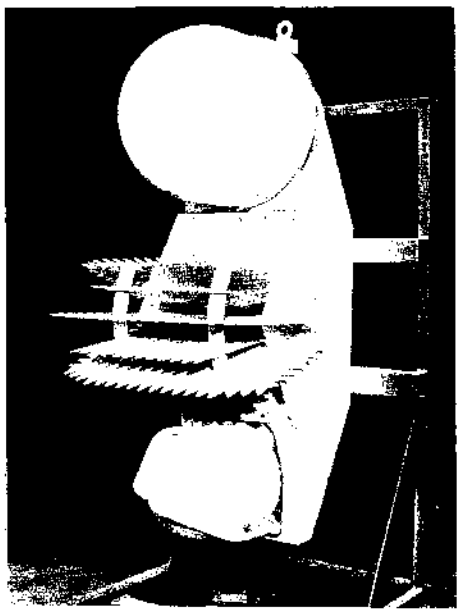
4054.293
RAMSES NAVAL ECM

RAMSES (reprogrammable advanced multi mode shipborne ECM system) is a versatile, modular naval electronic countermeasures equipment, designed principally to provide protection for ships against I/J-band radar threats. Although few details have been cleared for publication, RAMSES has been described as an integrated responsive noise and deception repeater jammer. It provides for jamming of the target indicating search radars at long range to disable or confuse missile launchers (with emphasis on noise jamming) and deception of any missiles launched at shorter ranges (after they have gone into the active radar homing mode, where jamming relies more heavily on deception). Jamming parameters can be revised and updated in the light of experience and developing tactics by reprogramming.

The basic configuration of RAMSES has provisions for interconnection with other ship's systems, such as ESM equipments like Sphinx (**4055.293**) or RAPIDS (**4056.293**) and a tactical data handling system. If necessary, one operator can handle all the EW functions of a ship by these means. Optionally, the control panel and processing cabinet can be integrated into a single console with additional frequency/amplitude and alpha-numeric display.

The principal features of the system are as follows, and the physical characteristics of the hardware are listed in the table below. RAMSES operates in I/J-bands and is capable of high pulse and CW effective radiated power (ERP). Multi mode jamming operation is possible with multi target handling capability. The system is reprogrammable and power management is provided. The antennas are fully trainable and stabilised, and are lightweight.

CHARACTERISTICS



Dimensions	Width (mm)	Height (mm)	Depth (mm)	Weight (kg)
Antenna module (×2)	762	1560	997	100
RF cabinet	938	2058	915	526
Processing cabinet	650	1540	747	250
Control panel	284	321	135	2·5

STATUS

The system was designed and developed by Signaal in co operation with MEL (UK) Ltd. In production. A £20 million contract has been won by MEL (UK) to supply six Ramses systems to the Canadian patrol frigate programme.

RAMSES antenna assembly

4056.293
RAPIDS NAVAL ESM

RAPIDS (radar passive identification system) is a shipborne electronic support measures (ESM) system for the interception, analysis and identification of all forms of radar emissions. It is entirely passive and operates autonomously. The system features:

(1) high probability of interception by an instantaneous field of view of 360° and a large instantaneous frequency coverage
(2) high sensitivity
(3) high pulse density capability
(4) unattended operation as far as threats are concerned when integrated with a data handling system
(5) high bearing accuracy.

Operational functions include: interception, threat processing, analysis, identification, tracking, data exchange with ECM and data handling systems, data logging.

The basic configuration of RAPIDS is illustrated.

Signals of linear as well as circular polarisation can be intercepted by the high sensitivity receiver. The Electronic Data Display provides an overview of the situation by presenting: bearing frequency plots of intercepted signals; alarm cursors for tracking radars locked on to own ship; alarm cursors for radars that trigger the threat warner; symbols to indicate identified interceptions, tell-back data from an ECM when integrated with such a system. Other information displayed includes alpha-numeric data on lock-ons; alpha-numeric data on triggered threat warner channels; alpha-numeric data on identified targets; software keys for the selection of particular system functions.

RAPIDS has provisions for interconnection with a data handling system and an ECM system such as RAMSES (**4054.293**) or Scimitar (**3598.293**). The basic version is illustrated. The frequency range covers 2 to 18 GHz.

CHARACTERISTICS

Dimensions	Width (mm)	Height (mm)	Depth (mm)	Weight (kg)
Antenna, radome and base	536	1554	620	94
Receiver unit	597	835	502	145
Processor unit	650	1570	660	250

Diagram of typical RAPIDS installation

4055.293
SPHINX NAVAL ESM

Sphinx (system for passive handling of intercepted transmissions) is a shipborne electronic support measures (ESM) system for the interception, analysis and identification of all forms of pulsed radar emissions. It is entirely passive and operates autonomously. The system features: a high probability of interception by an instantaneous field of view of 360° and a continuous coverage of the entire frequency range, high sensitivity, high pulse density capability. It is capable of the following functions:

(1) omni directional interception of signals in the range 1 to 18 GHz and determination of their frequency, and bearing
(2) lock-on detection, ie automatic detection and warning of any radar locked on to own ship
(3) automatic analysis of selected signals in terms of: level, pulse duration, frequency (max, minimum), PRI (max, min mum), scan period
(4) automatic tracking in bearing of selected signals
(5) blanking of selected signals tracked in bearing
(6) area blanking
(7) identification of signals by comparison with library
(8) data exchange with ECM and data handling system
(9) data logging on cassette of information acquired.

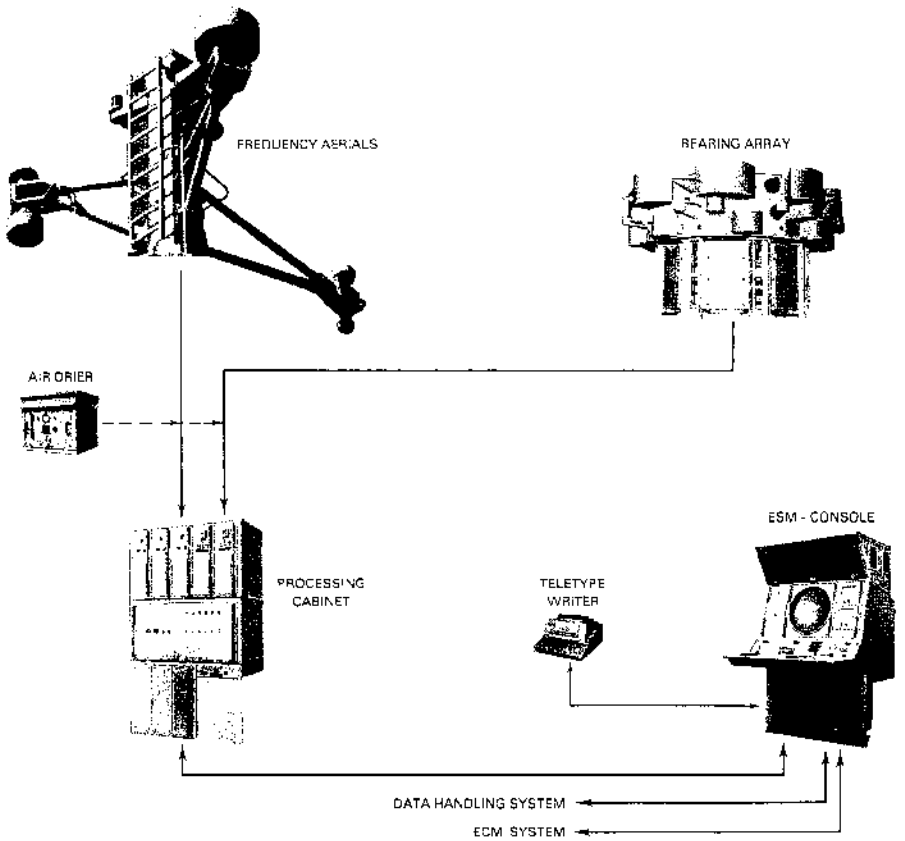
The basic configuration of Sphinx is illustrated and consists of a frequency receiver and an eight sector bearing receiver. Both are omnidirectional and wide open in all directions so providing simultaneous coverage of 360° in azimuth and 40° in elevation (nominal). Interception probability approaches 100 per cent.

Signals of linear as well as circular polarisation can be intercepted.

The operator's console has three displays:

(1) a situation display for presentation of bearing/frequency plots of detected signals and tel-back data from the ECM system
(2) an alpha-numeric display for analyser results
(3) an alpha-numeric display for identification results

Sphinx has provisions for interconnection with a data handling system and an ECM system such as RAMSES (**4054.293**). One operator can then take care of both ESM and ECM functions on board the ship. Sphinx has built-in test facilities for checking both before and during operation. The bearing array is designed to form part of the load bearing structure of a mast. A WM20 series combined antenna system can be easily mounted on top.



Optional enhancements include: a K-band reception package (33 to 40 GHz) with alarm; a threat alarm, sets of parameters; and a CW detection package. Detailed characteristics of this equipment appear under the above entry number in *Jane's Weapon Systems 1981-82*.

NORWAY

4646.293

SR-1A ESM RECEIVER

The SR-1A is a shipborne ESM radar warning receiver, suitable for installation in larger warships, and designed to intercept, analyse and measure incoming radar signals. It consists of two units; an antenna assembly and a display/control console. The antenna assembly comprises a rotating antenna in a protective radome and a fixed omni-directional octagonal horn array. The fixed antenna gives a coarse bearing to ±22·5 degrees while the rotating antenna accuracy is approximately ±3·5 degrees.

Frequency coverage of the system is from 2·5 to 18 GHz with a claimed frequency measurement of better than ±1 per cent. The display systems give visual indication of DF, pulse analysis and frequency measurement functions. A separate indicator giving radar warning and coarse directional information is also provided and can be installed remotely from the main units.

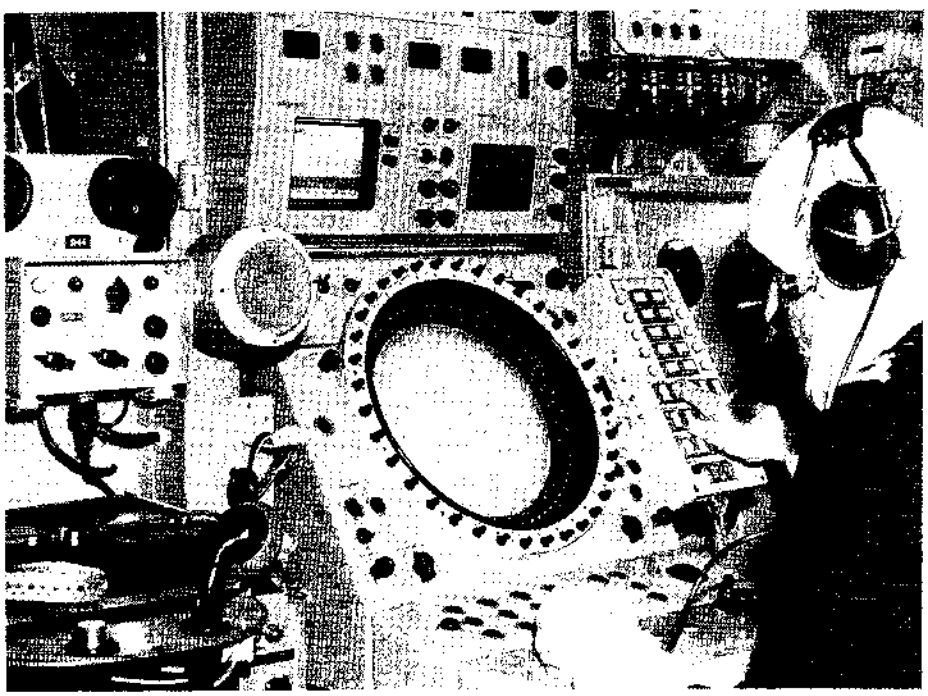
3538.293

EWS-900 CHAFF LAUNCHING SYSTEM

The EWS-900 shipborne chaff system has been developed by Saab-Scania, principally for use aboard smaller vessels. The main purpose of the system is to establish a chaff radar target, large enough and properly located in space and time, to make the ship and the chaff cloud appear as a single target in the seeker of an approaching missile. Ship manoeuvres, based on wind data, ship's course and line-of-sight to the missile, will cause separation of the false target from the actual ship target. The chaff cloud, having a larger radar target area than the ship, will thus cause the missile to miss the ship.



To minimise reaction time, the system can be operated from any of several locations on board. In a fully automatic version of the system, introduced in September 1979, (EWS-900 CA) on-board radar warning facilities can be used to feed a minicomputer with all relevant data for automatic launch of chaff and calculation of information for ship's evasive action.

The system consists of an optional number of launchers, control boxes, and one adaptor unit. The number of modules fitted depends on how many frequency bands are to be covered and on the endurance required of the ship.

The control boxes are located in the CIC near the search radar operator, adjacent to the radar warning operator, and accessible to the lookouts eg on the bridge.

STATUS

A similar system has been developed and delivered to the Swedish Navy. The operational systems have pyrotechnical chaff.

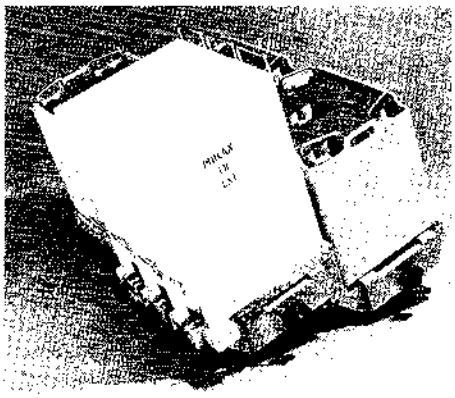
PHILAX COUNTERMEASURES LAUNCHER

Philax is a chaff and IR decoy grenade launching system for the protection of small warships against attacking anti-ship missiles. Of very lightweight construction, it requires only a simple installation.

A ship normally carries two launchers, one on each side, but larger ships might carry four launchers. The launchers are of the fixed type, ie they are not required to be trainable, and their elevation is fixed.



Each launcher consists of four easily exchangeable chaff magazines, two of which may be replaced by three IR containers, requiring only a removable interface plate (the electrical interface is unchanged). Each chaff magazine contains four groups of grenades, each of which is fired by a single ejection cartridge. The nine grenades in each group are distributed to provide an effective chaff-cloud in space in a very short time, typically less than four seconds.

Each IR container is fired with a single ejection cartridge of the same type as for chaff. The IR decoy consists of sequentially-ignited flares, distributed for optimum deflection of IR or multi-sensor seekers. The IR decoy is effective in both the 3 to 5 and the 8 to 14 micron bands.

A range of associated fire control systems are available from simple manual firing panels, to fully automatic systems, which give information on optimum manoeuvring, launcher selection, etc.

CHARACTERISTICS

Launcher
Number of magazines: 4
Groups per magazine: 4
Grenades per group: 9
Ejection cartridge: 1/group
Launcher weight: 180 kg

5731.253
9CM 100 AND 200 NAVAL ECM SYSTEMS

The 9CM 100 and 200 naval ECM systems are designed for integration with the 9LV suite of naval fire-control systems. The 9CM series systems feature an overall concept with ESM and threat warning sensors, ECM dispensers and jammers fully integrated with the ship's fire-control system. They are based on a combination of the Philips Philax system (**3133.293**), and a threat warning system such as Matilda in the case of the 9CM 100 and Rapids Phoenix II or Outlass for the 9CM 200.

Data from the ESM/threat warning module and the fire-control system is fed to the 9CM 100/200 system computer and processed together with the ship's bearing and speed, roll angle, wind direction, radar cross-section, IR signature, etc. The incoming threat can then be classified and the appropriate action taken. The latter will include not only the use of chaff/IR expendables but also the firing of anti-missile and/or manoeuvring of the ship.

The 9CM 200 system consists of a quadruple chaff and IR decoy system launcher with the launch sequence controlled by a microprocessor to optimise decoy effect. The 9CM 100 system is more compact and features two launchers. In all other respects it is identical to the 9CM 200.

STATUS
In service.

9CM 100 system computer unit with integrated operator panel

5836.253
EWS-905 ESM WARNING SYSTEM

This shipborne system is designed to identify targets detected by the vessel's surveillance radar. The antenna turns automatically towards the direction required, using information passed from the ship's tactical display, acquires and analyses threat signals. These are displayed, together with ESM data, and the system will automatically command the chaff launcher and/or other self-protection systems to counter the threat.

Signals received from a limited sector around the designated bearing are analysed and parameters representing bearing, frequency band, pulse interval, pulsewidth and scan time are displayed.

Three modes of operation can be selected:

(1) alert – all bands are covered and the system will detect radars in a selected bearing sector. Frequency and bearing sector are displayed
(2) decision – a selected sector is scanned rapidly and bearing, frequency, pulse interval and width are displayed for every target
(3) surveillance – the selected sector is scanned slowly and the target radar antenna rotation speed is displayed in addition to the parameters in (1).

STATUS
In service with the Royal Swedish Navy.

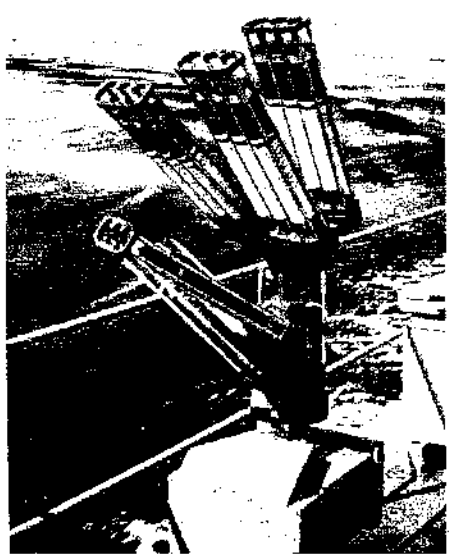
UNITED KINGDOM



4226.293
BARRICADE NAVAL DECOY EQUIPMENT

Barricade is designed to provide ships with an effective and lightweight means of deploying chaff and infra-red decoys as countermeasures to missile attack. The system gives a layered defence against the various phases and types of anti-ship missile attack, ranging from the long-range confusion mode, through medium-range distraction and dump modes to the close-in centroid mode.

The complete system consists of port and starboard launchers, safety switches, a control unit, ready use ammunition lockers and rockets. The launcher consists of six sets of triple barrels, the lower three sets being angled 60° from the next so that a pair of launchers provide all-round coverage. The upper three sets are preset to point to the same bearing, as required. These upper three sets fire short-range Palisade rockets in centroid mode, while the lower barrels fire medium- and long-range Stockade rockets in dump, distraction and confusion modes.

Barricade decoy modes are:

(1) confusion: long range rockets fired to confuse enemy search radar and make target selection difficult
(2) distraction: medium-range chaff and/or infra-red rockets fired in a pattern of six around the ship to present alternative targets to missiles during their search phase. This mode affords defence against any number of missiles from different directions
(3) dump: if a missile is locked on to a ship and its range gate is removed from the ship by the use of a jammer, the gate may be 'dumped' on a suitably placed chaff cloud, allowing the jammer to be re-deployed. Single medium-range rockets are used.

Barricade lightweight 18-barrel launcher

(4) centroid. if a missile is locked on to a ship, a pattern of short-range chaff and/or infra-red rockets is fired quickly to create a large alternative target close to the ship. The ship then manoeuvres away and the missile will home on to the decoy. This is a close range mode for final defence against single missiles.

The Barricade system is based on a spin-stabilised 57 mm rocket plus infra-red and chaff sources. The rockets are fired by induction ignition and the high-speed spin produces very rapid chaff blooming. Launchers may be used in pairs on fast patrol boats and similar vessels and in larger numbers on bigger ships. Even smaller Stockade and Palisade launcher variants are available for larger ships/auxiliaries and small fast patrol boats/hydrofoils respectively.

A small microprocessor-controlled tactical computer for accurate centroid mode control and manoeuvring is available for siting near the control unit. The complete Barricade system is designed for easy integration with EW/AIO/C² systems.

STATUS

In production with 70 systems sold or in service with eight navies, including the Royal Navy and NATO. A Mk II version is now available with microprocessor control and the ability to fire stored decoy sequences.

CONTRACTOR

Wallop Systems Ltd, Arkay House, Weyhill Road, Andover, Hampshire SP10 3NR, England.

4651.293

STOCKADE-SEAFLASH DECOY SYSTEM

The Stockade-Seaflash decoy system is intended to place confusion chaff decoys at distances of up to 20 km from its own forces. This is designed to create ship-like echoes on the enemy's radar screen at a considerable distance from the real force without the need for rocket or gun-propelled systems. The system consists of a Flight Refuelling 'Seaflash' remotely-controlled boat fitted with two Stockade decoy launching systems. Both Seaflash and Stockade are under positive secure radio control from a single unit on the controlling ship. Confusion chaff can be dispersed as required from 18 barrels disposed in groups of three at 60 degree bearing intervals.

STATUS

In late development.

CONTRACTORS

Wallop Systems Ltd, Arkay House, Weyhill Road, Andover, Hampshire SP10 3NR, England.

Flight Refuelling Ltd, Brook Road, Wimborne, Dorset BH21 2BJ, England.

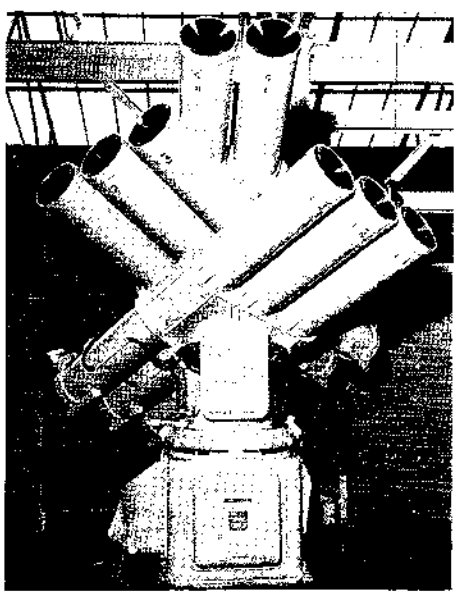
3145.293

3-IN WINDOW DISPENSING ROCKET SYSTEM (CORVUS)

This is a simple, lightweight, quick reaction system for the self-defence of surface vessels against surface-to-surface and air-to-surface missiles. Window (chaff)-dispensing rockets are fired to form a radar decoy screen around the vessel. The system can be installed in any surface vessel other than patrol boat types and its simplicity of construction makes it particularly suitable for installation in destroyers and frigates down to the smallest size and retrospective fitting offers no problems.

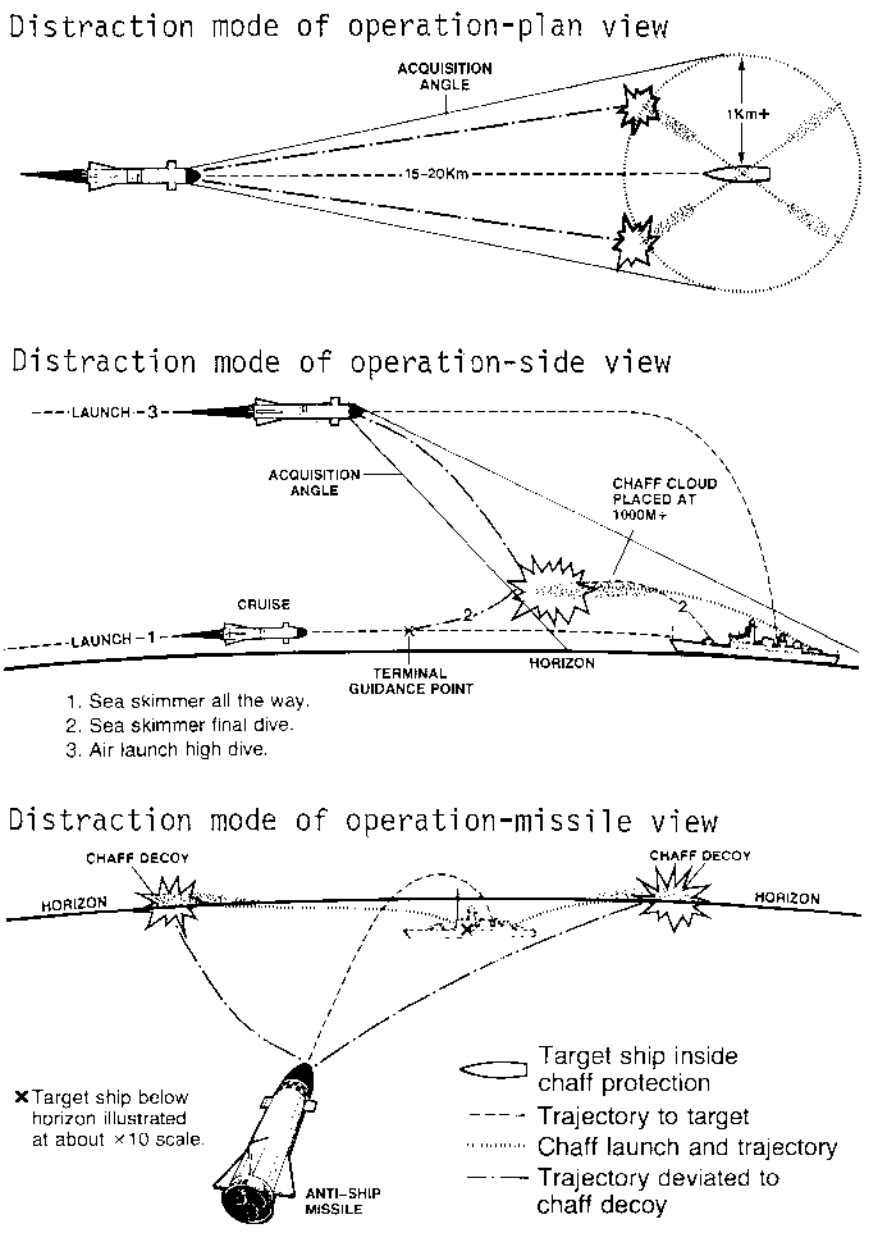
The complete system comprises: two multi-barrelled rocket launchers, launcher control and firing panel, and the 'window' dispensing rockets themselves.

Two modes of operation are available for the system. The modes differ in the azimuth angle at firing and the range at which window is released. The modes of operation are:



(1) Distraction decoy

(2) Centroid decoy.



These are illustrated in the nearby diagrams

A firing and control panel can be ideally situated in the combat information centre. The maximum loading of 16 'window' rockets provides protection against three missile attacks, before reloading. Any member of the combat information centre crew can control and operate the system.

A cylindrical rotating structure carries eight launching tubes mounted in two sets of three, one above the other, and crossed at 90° in azimuth with two further tubes set above, and aligned midway between the other tubes, all at a fixed elevation of 30°. A deck mounted pedestal supports the rotating structure on its training bearing and also houses a self-contained electrical power conversion unit for the control circuits and the associated electrical equipment. The training drive consists of a gearbox driven by a reversible motor, while braking is achieved by an electromagnetic brake. A slip-ring positioning unit, located within the pedestal, controls the training of the launcher to preselected bearings. The normal limits of the training arc for the launcher are between 60 and 120° but as the lower sets of rocket barrels are angled about the centre line of the rotating structure, the arc covered by the rockets is considerably greater. Within these normal limits, fixed firing bearings for the launcher, at 15° intervals can be selected by computing the appropriate circuits at the control panel. Training stops and a buffer assembly are incorporated to prevent over-stressing and twisting of the cable bight in the event of

The latest 8 barrel launcher for British Corvus naval radar decoy system

Mode 1, Distraction decoy. This mode provides up to four separate decoy chaff clouds, deployed in a pattern surrounding the ship at a range of about 1 km+, to present alternative targets to hostile missiles during their search phase. This mode of operation is particularly effective against simultaneous attacks from one or several directions. Under such an attack the majority of missiles will lock-on to decoys, leaving the ship to deal with the remaining threats by direct action, active ECM or other modes of operation

an accidental over-run. The launchers can be fitted in any position on No 1 deck or above, providing adequate space is available for slewing and loading, and there is a clear firing arc of approximately 160° in azimuth and 30° elevation.

CHARACTERISTICS

Training

Bearing arc (normal) ie launcher axis: 60 – 120°

Bearing arc (max) ie tube axis: 15 – 165°

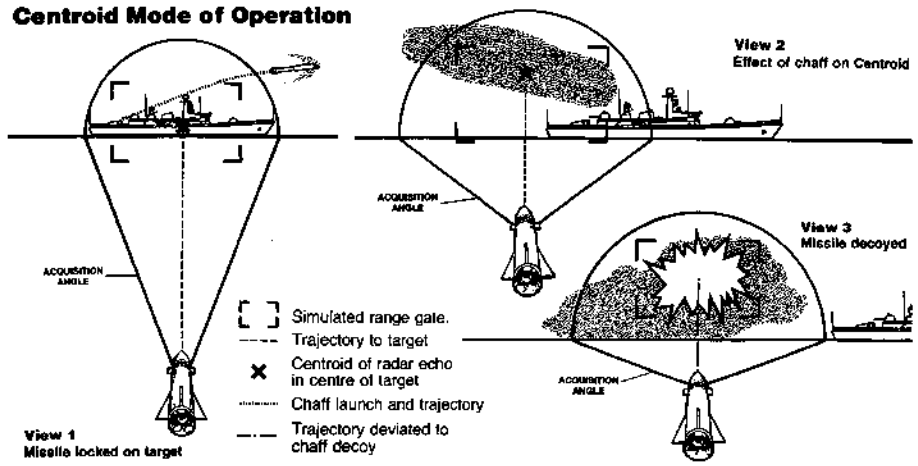
Launcher weight: 585 kg

Off-launcher equipment weight: 42 kg

Tube diameter: 195 mm

Tube length: 1·6 m

Weight (empty): 25 kg



No of guides: 4, RH spiral

STATUS

A new broadband chaff rocket for use with Corvus launchers has been developed by Plessey (**3650.293**) and is in service with the Royal Navy.

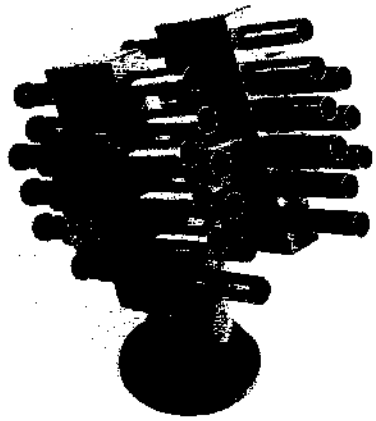
CONTRACTOR

Vickers Shipbuilding and Engineering (a British Shipbuilders subsidiary) Ltd, Barrow Engineering Works, Barrow-in-Furness, Cumbria LA14 1AB, England.

Mode 2, Centroid decoy. Regarded as the last form of passive defence available to the ship, this mode requires the deployment of chaff close to the ship so that large chaff radar echoes remain as the ship moves on. The missile is decoyed sufficiently to avoid a direct hit

---

5737.293



RADAMEC NAVAL ROCKET LAUNCHER

This is a fully trainable naval rocket launcher suitable for launching chaff and infra-red flares. The launcher has two-axis stabilisation and can be target designated from the ship's fire control system. The system is normally mounted in interchangeable pods located midships to port and starboard.

The Radamec launcher is of steel frame construction supporting multi-barrel pods at right angles to the elevation trunnion with the barrels pivoting about their centre of gravity. The elevation drive is by a permanent magnet DC servo motor. The launcher base will fit the mounting centres for existing unstabilised launchers.

CONTRACTOR

Radamec Defence Systems Ltd, Bridge Road, Chertsey, Surrey KT16 8LJ, England.

Radamec naval rocket launcher

3650.293

CHAFF ROCKET

Plessey Aerospace manufactures chaff dispensing rockets for the UK MoD (Navy). The Royal Navy uses the Corvus 3-inch rocket launching system (**3145.293**) for which a Plessey rocket was developed. One rocket, using the same launcher and without modification to the control system, produces a multi-frequency cloud equivalent to the combined clouds of the three previous service round types it replaces.

Each rocket is in three sections:

(1) an electrically ignited solid fuel motor

(2) the payload head which contains chaff packs and dispensing mechanisms

(3) the nose which carries the fuze and head charge.

At a predetermined time the fuze ignites the head charge which separates the nose, chaff packs and dispensing mechanism from the remainder of the rocket. The dispensing of pairs of chaff packs is then evenly and quickly effected to create an efficiently distributed chaff cloud with a rapid bloom characteristic.

The system will provide Distraction or Seduction decoy clouds simply by fuze time adjustment.

STATUS

In production.

Plessey Aerospace Ltd, Abbey Works, Titchfield, Fareham, Hampshire PO14 4QA, England.

5682.293

SHIELD ANTI-SHIP MISSILE DECOY SYSTEM

Shield is a chaff and infra-red decoy system which is designed for both medium/large warships and fleet support ships. A range of modules enables the system to be built up to suit the differing installation requirements and they can be configured to suit ships with, or without, control to command. Launcher barrel modules can be mounted on simple bases in either parallel or crossed formation to give any combination of barrels from 3 to 12 per launcher. Four parallel barrel launchers are normally specified for large ships to give all round protection. The flexibility offered by the Shield module range is such that a complete system can be containerised for use on merchant ships without the need for external services.

Shield decoy system launcher

The Shield system is suitable for an inventory of different types of decoy ammunition and studies and development programmes are in progress. The current decoy most appropriate for defence against anti-ship missiles is a chaff rocket equipped with variable fuze for medium- or short-range cloud deployment. Its large multiband payload is particularly suited to both distraction and seduction modes.

Distraction

This provides for a number of separate decoy chaff clouds deployed in a pattern around the ship to present several alternative targets to hostile missiles while they are seeking targets.

Seduction-Dump

This mode is intended for use with active ECM radar equipment. It characterises the radar and transfers the missile range gate to a chaff cloud. The range of deployment depends upon the ECM radar characteristics.

Seduction-Centroid

The Seduction-Centroid mode is for use against threats that have a short time interval between detection and arrival at the target and which are locked-on at the time of detection. The decoy is deployed at a range and relative bearing such that it and the ship will combine to become a single target within the missile radar cell. As the combined target elongates, due to continuing chaff cloud bloom and ship movement, the missile radar cell remains centred on the mean cloud/ship signature causing sufficient deviation of the missile flight path to miss the ship.

Two versions are available: a manually fuzed version for use in simple independent systems or an electronically fuzed type for use with automatic systems interfaced with the ship's own computer. The command module can be situated ideally in the combat information centre and can be interfaced with the ship's EW suite.

DEVELOPMENT

An infra-red rocket for use with the Shield system is in an advanced stage of development. It is designed to give protection against heat seeking missiles in the seduction mode.

STATUS

In production for the Royal Navy and the new Brazilian corvettes. An order worth $4 million was announced in April 1984 for the Canadian Navy.

SUSIE ESM RECEIVER SYSTEM

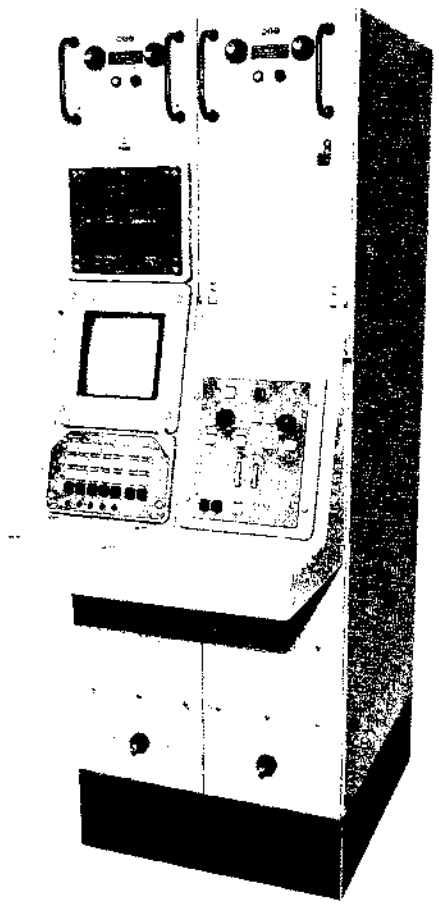
This passive intercept receiver is designed to detect all types of pulsed radar transmission and automatically present the received signals on a tactical display for assessment by the operator. The equipment may be left unattended and will give an alarm when signals of a preselected type or on a preselected bearing are intercepted.

A situation display gives instantaneously a correlated pulse width/bearing indication together with frequency band simultaneously for all detectable signals. Thus the total radar environment is at all times shown without intervention by the operator. Signals may be selected by a strobe controlled by the operator for automatic readout of signal parameters or for automatic tracking, blanking, or warning. The equipment is all solid state (except CRT and lamps), employs digital techniques, and is of modular construction. It has considerable stretch potential to provide for more sophisticated requirements.

The basic SUSIE equipment provides coverage from 2 to 18 GHz in four bands. The antenna system for SUSIE has no moving parts and can be supplied for mounting either on a platform or integrated into the mast structure.

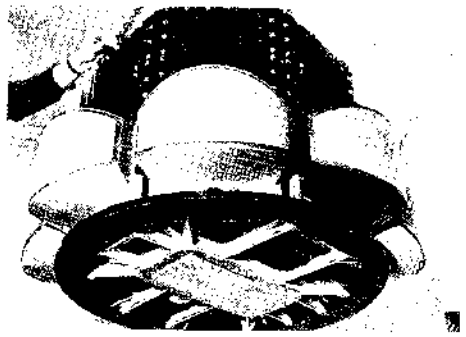
Intended for the smaller ship, SUSIE features include:

(1) 100 per cent probability of interception
(2) wide frequency coverage
(3) all received signals appear instantaneously on tactical display with automatic correlation of frequency band, pulse width, and bearing
(4) instantaneous presentation on alpha-numeric display of pulse width, bearing, frequency band, pulse repetition interval (PRI), and signal level of operator selected signal
(5) automatic warner and blanking stores
(6) automatic tracking
(7) built-in test equipment
(8) one man operation.



CHARACTERISTICS

Frequency coverage: E/F band 2 - 4 GHz; G/H band 4 - 8 GHz; I/J band 8 - 12 GHz; J2/J8 band 12 - 18 GHz
Sensitivity: Fine mode 30 dBm; coarse mode 40 dBm
Dynamic range: 50 dB
Antenna gain: 5·5 - 7·5 dB
Antenna coverage: 360° static
Bearing accuracy: Fine mode 3° rms
Pulse width range: 0·1 - 100 μs
PRI range: 10 μs - 10 ms
Display: Frequency band plus pulse width/bearing
Display writing time: 1·8 μs
Automatic warner stores: 5
Blanking stores: 2
Auto-track stores: 7
Console weight: 270 kg (approx)



Two basic antenna systems, Types A and B, are available for use with the SUSIE ESM receiver:

ANTENNA TYPE A1

Type A1 comprises a total of 24 antenna modules contained in single casting. System includes all common processing units and interfaces directly with the SUSIE console.
Antenna weight: 154 kg approx

Operator console of SUSIE

Typical MEL SUSIE antenna assembly

ANTENNA TYPE A2

Similar to Type A1 but designed to carry fire control/search radar above. Common processing circuits contained in a separate masthead unit ensures direct interface with SUSIE console.
ESM antenna weight: 170 kg approx
Common process unit: 10 kg approx

ANTENNA TYPE B1

Type B1 is designed to accommodate the larger search/tracking radar and permits sharing of the much sought after top mast position. With the ESM antenna effectively replacing the top section of the mast, the mechanical design permits through access for maintenance of radar and also inner access to ESM electronics. Interfaces with SUSIE via masthead unit.
ESM antenna weight: 315 kg approx

ANTENNA TYPE B2

The Type B2 antenna enables sharing of top mast position between ESM and radar equipment, differing from the Type B1 in that access to ESM antenna modules is from outside. The Type B2 antenna embodies standard Type A antenna modules. Interfaces with SUSIE via masthead unit.
ESM antenna weight: 315 kg approx
Typical dimensions

	Height	Diameter	Weight
2 - 4 GHz	280 mm	500 mm	6 kg
4 - 7·5 GHz	225 mm	350 mm	4·5 kg
7·5 - 12 GHz	200 mm	200 mm	4·5 kg
12 - 18 GHz	100 mm	140 mm	4 kg

STATUS

In production and ordered for several navies.

CONTRACTOR

MEL, Manor Royal, Crawley, Sussex RH10 2PZ, England.

3598.293
SCIMITAR JAMMER

The MEL Scimitar jammer derives its name from 'system for countering interdiction missiles and target acquisition radars', and is designed for use with most types of naval on-board ESM system, although specifically intended as a complementary system to the range of major naval ESM equipments produced by MEL, including RAPIDS and CANEWS.

Full jamming capability is provided over the frequency range 8 to 16 GHz to give protection against all types of radar homing missiles and full area defence capability against target indicating radars. Power output is rated at 1·5 kW pulse and 150 W CW. Jamming modes include: CW, programmed band and wide band noise, range-gate pull-off, scan rate and swept scan rate modulation, inverse scan gain and false target generation.

CHARACTERISTICS

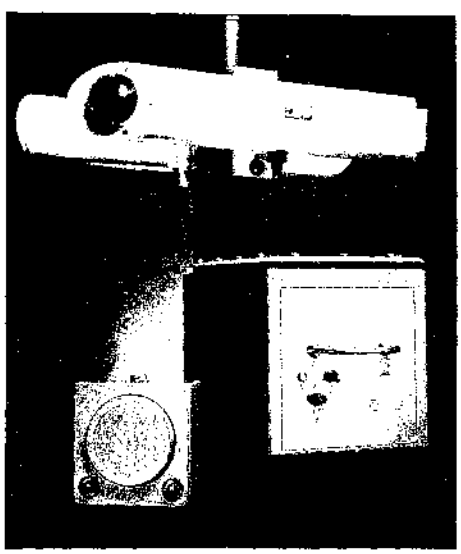
Frequency range: 8 - 16 GHz
Output: 1·5 kW pulse; 150 W CW
Frequency channel sensitivity: -60 dBm
Antenna gain: 23 dB
Beamwidth: 7° azimuth; 7° elevation

STATUS

In series production for several navies.

CONTRACTOR

MEL, Manor Royal, Crawley, Sussex RH10 2PZ, England.



3539.253
MATILDA RADAR WARNING RECEIVER SYSTEM

Matilda has been designed by MEL to meet the requirement for an effective, low-cost radar threat warning equipment for smaller ships. It operates on frequencies from 7·5 to 18 GHz, and is intended to act primarily as a trigger for the MEL Protean chaff launching system (**3193.293**). Matilda can also be successfully integrated with most types of short-range chaff systems to provide automatic defensive measures against missile attack. Matilda can detect and recognise the threat, indicate the bearing in which it lies and, if required, can activate the chaff launcher. Compact modular design permits location in the most convenient positions on board. The system comprises three basic elements: a small, lightweight antenna covering 360 degrees in azimuth, a processing unit and a small display. It can be fitted to a vessel, such as a merchant ship, in approximately two hours.

The antenna unit, which is designed to clamp round a mast, consists of four antenna horns with their associated microwave components, circularly polarised for the detection of vertically, horizontally and circularly polarised signals. It is supplied in two matching halves, each comprising a tube of approximately 115 mm diameter; simple brackets are provided to clamp to either a pole mast or a flat faced mast structure. A multi-pair screened cable is routed down the mast to feed the processing unit. Its weight is approximately 7 kg.

The processing unit, which contains the printed circuit cards for signal processing, parameter measurement and the warning unit counter memory, is approximately 320 × 250 × 195 mm in size and weighs 9 kg. The unit is fitted with integral power supplies and may be located in any convenient position. It is able to achieve a processing time of less than 10 μsec and a total warning time of under 1 second.

The warning unit display consists of a small indicator panel, designed for location at any convenient position in the operations room, remote

Matilda radar warning receiver system

from the processing unit if so desired. On detection of a threat, the unit activates an audio warning with the option of a programmable voice module and provides an indication of the threat and bearing sector channel. It may be directly interfaced with the Protean chaff launcher fire control panel. The unit's dimensions are 155 × 155 × 55 mm and it has a weight of 0·45 kg.

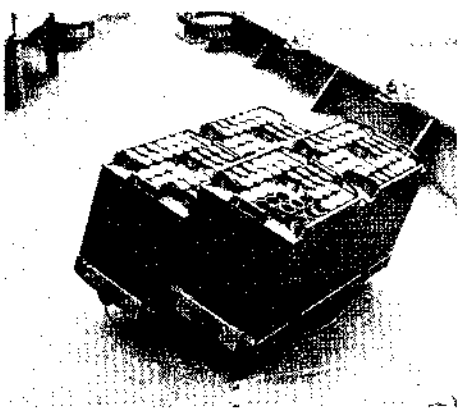
CHARACTERISTICS

Frequency range: 7·5 - 18 GHz
Frequency resolution: 1·5 GHz
Pulse width range: 100 ns - 6·4 μs
Pulse width resolution: 200 ns
Bearing coverage: 360°
Bearing resolution: 45°
Sensitivity (referred to isotropic): -30 dBm
Dynamic range: 40 dB
Antenna gain 7·5 - 18 GHz: 6 - 8 dB
Voice module: Programmable to any warning required in any language
Dimensions

	Weight kg	Width mm	Height mm	Depth mm
Antenna	7	680	114	114
Processor	9	193	257	318
Display unit	0·45	155	155	55

STATUS

In production. Twelve systems were ordered in late summer 1984 for the UK MoD, and will be fitted to such ships as Royal Fleet Auxiliaries



CONTRACTOR

MEL, Manor Royal, Crawley, Sussex RH10 2PZ, England.

3193.293
PROTEAN CHAFF LAUNCHER

The Protean chaff grenade launcher system is designed for naval use as a countermeasure against active radar homing anti-ship missiles. Two or four Protean launchers may be fitted to give forward or fore and aft protection on the port and starboard sides of the ship.

Each launcher is equipped with four reloadable magazines, each containing 36 chaff grenades to give a total ready-use load per launcher of 144 grenades. The launcher is deck mounted and fixed in elevation and azimuth. Firing is in groups of nine grenades and up to four groups can be fired simultaneously. Provision can be made to replace one or more of the chaff grenade magazines by IR decoy grenade magazines.

Protean chaff grenade launcher

Threat detection and direction can be derived from radar or other sensors, or from an associated ESM warning system.

The Protean launcher appears to be identical to that of the Swedish Philax system (**3133.293**) produced by another member company of the Philips group.

OPERATION

Chaff is one of the primary electronic countermeasures available for use against missiles using active radar seekers for terminal homing, particularly those of the sea-skimming type. With or without the use of active ECM, the deployment of chaff greatly improves the probability of successfully countering the threat, provided that the chaff launching system is capable of reacting quickly, since the flight time from detection to impact of an in-flight missile is normally very short.

For maximum effectiveness, the chaff and own ship's echo must appear simultaneously in the seeker's range resolution cell. Ideally, the chaff cloud should appear at a closer range than the ship and have a larger radar target echoing area. Separation of ship and chaff cloud causes the seeker to lock on to and track the chaff cloud.

The design of the ejection system enables any number of barrels (1 to 9) per group to be loaded without deterioration in performance, thus providing a useful economy feature for training exercises.

Each launcher is provided with thermostatically controlled heaters in order to avoid icing in the pyrotechnical components. Each also has an isolating switch.

The firing panel provides two basic facilities:

(1) selection of groups of grenades (with clear visual indication of selection) including either IR or chaff selection. Indication is also given of salvoes available of each type in each launcher
(2) firing of groups of grenades.

Firing is manually controlled or automatically initiated by remote sensors, eg ESM or radar.

CHARACTERISTICS

Launcher
Type: MEL AA 1067
Magazines: 4
Groups per magazine: 4
Barrels per group: 9
Pressure source: 1 cartridge per group
Firing interval: 0·1 s between groups
Weight (excl grenades): 180 kg
Dimensions: Width 835 mm; length 750 mm; max height from deck 550 mm
Grenade
Calibre: 40 mm
Weight (total): 0·35 kg
Chaff type: Chemring Ltd
Frequency coverage: Manufactured to order
Weight: 0·175 kg
Flight time: 7 s
Cloud development time: <5 s
Cloud height dispersion: 40 - 60 m

STATUS

In production and ordered by several navies, including the Egyptian Navy.

CONTRACTOR

MEL, Manor Royal, Crawley, Sussex RH10 2PZ, England

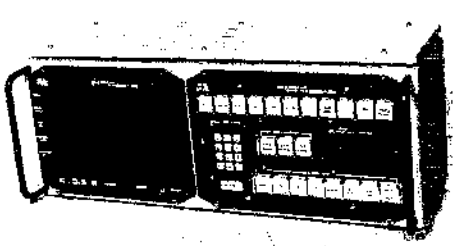
4652.493
MANTA SUBMARINE ESM SYSTEM

Manta is a submarine-borne, passive, long-range ESM system to analyse, classify and identify enemy radars for defence against threats from surface vessels and aircraft. The system is designed to operate in dense multi-radar environments and can be tailored to any type of submarine.

Manta uses a central management computer controlling 'intelligent peripheral' sub-systems each of which incorporates an advanced microprocessor carrying out local processing. This distributed computer concept is made possible by continuing development of a MEL designed modular system and avoids the possibility of the central processing unit becoming the limiting factor in design flexibility. The system is capable of independent operation or integration with the submarine's data handling system, and can be easily updated with replacement hardware modules and revised software programs. Operator override allows for unassigned emitter identification and display of detailed information on threats and system status.

The simplest Manta system uses a lightweight primary antenna attached to the search periscope to provide detection of enemy radars. A more comprehensive second antenna provides accurate bearing data. A compact unit incorporates the receiver, analysis and processor modules, power supply interface and a real-time display. The system provides 360 degree coverage and 100 per cent intercept probability with automatic threat warning and identification. In addition to its fully automatic mode, Manta can be operated manually using a light pen or keyboard and roller ball. Information obtained can be recorded and printed out for post-mission analysis.

STATUS



In development. The company is working closely with EM Systems, USA on the antenna and receiver sub-systems.

CONTRACTOR

MEL, Manor Royal, Crawley, West Sussex RH10 2PZ, England.

1743.263
SARIE-SELECTIVE AUTOMATIC RADAR IDENTIFICATION EQUIPMENT

Speed and capacity are all-important in the modern identification system, because in the present environment the rate of radar intercepts can be high and the time that can be permitted to elapse between intercept and threat evaluation may be only a matter of seconds. Dependence upon operator reference to known radar parameters is thus unacceptably time-consuming and automatic identification is essential. It is to meet this type of operational requirement that the SARIE system has been produced. This system produces a solution to the problem by providing the results of automatic comparison of intercepted signal characteristics with a flexible dictionary of radar parameters in approximately 350 msecs. The equipment is also a useful tool in extending the existing library of data by analysing and indicating previously unrecorded transmissions, which can be stored by the operator using a built-in scratch pad memory. The new data is then treated as a high priority extension of the library.

SARIE control and display unit

The equipment consists of a display unit, control unit, and a data processing unit. The latter houses the dictionary, logic circuitry, magnetic tape reader, and power supply. It can be remotely sited, as access is needed only for maintenance or to modify the dictionary contents. Dimensions are 483 × 355 × 564 mm and the weight 43 kg. The display and control unit carries all the essential controls for operation of the system and the electronic display panel. Separate location of the control and display sections, to suit CIC or EW room requirements, can be accommodated if desired.

SARIE can be used with any EW receiver, accepting the video signal derived from the intercepted transmission. It automatically measures the PRF, pulse width and scan period with high accuracy, and detects the presence of PRF jitter. The equipment also accepts data on frequency, frequency agility modulation type, and scan type for use in identification. This additional data, where available from the EW receiver, can be accepted automatically.

or may be entered manually by the operator from the control panel. The operator is able to select intercepts for identification. The library is capable of storing parameter information on 1000 radar types; these will be selected by the user to suit the anticipated operational requirements, and are loaded by means of a magnetic tape cassette.

The display presents data in alpha-numeric form, and typical information displayed includes the parameters of the intercepted signal, the results of the automatic comparison with the stored data to give possible identification(s) of the signal, and the associated platform or hostility index. Each comparative identification is given an automatic confidence level figure.

STATUS

In production for the Royal Navy and NATO. A £2·5 million contract to supply SARIE II systems to a NATO country was announced in late 1984.

CONTRACTOR

Thorn EMI Electronics Ltd, Radar Division, Hayes, Middlesex, England.

4653.293

GUARDIAN NAVAL EW SYSTEM

Guardian is an advanced shipborne active and passive EW system in development for the Royal Navy. The major provisions meet a wide range of operational requirements against threats, particularly those of radar-guided missiles. The system is able to counter and confuse surveillance and missile homing radars by the use of jamming techniques for both area and point defence. Azimuth coverage is 360 degrees with an elevation cover of 60 degrees and a detection range of up to 500 km.

The Guardian system has two antenna mounts to ensure uninterrupted all-round view. The mounts can be installed either port and starboard, or at forward and aft positions. Each antenna mount carries a direction-finding receiving antenna together with transmit antennas, using mechanical steering to give full azimuth and elevation coverage.

Received signals are passed from the antenna to a wide-band receiver. They are then analysed to indicate those which may represent a threat and the selected signals are processed to allow generation of the jamming signal.

High power transmitter sub-systems, matched to the antenna, provide jamming capability against several types of target simultaneously. A comprehensive ECM library stores the appropriate countermeasures to a range of potential threats and on receipt of a warning from the ESM system, the ECM processor selects the appropriate jamming mode to give fast response.

System hardware is controlled at high speed by distributed microprocessors, and overall control is carried out by a micro-computer central processor which also controls the console and interfaces with the ship's systems.

The main equipment cabinets, situated below decks, contain the receivers, signal processing and generation, and fast control processing. They are connected to the RF power amplifiers which are situated close to the antenna. The cabinets are designed in modular form to give ease of installation and maintenance in smaller ships. A plasma panel display is provided.

STATUS

In development under a £28 million contract from the UK MoD. Sea trials by the Royal Navy were completed in mid-1985.

CONTRACTOR

Thorn-EMI Electronics Ltd, 120 Blyth Road, Hayes, Middlesex UB3 1BP, England.

1942.293

RCM SERIES ECM EQUIPMENT

The Racal RCM series of countermeasures equipment covers a range of radar jammers, either ship or land based, and operating in I or J bands to provide both responsive noise and deception jamming. The series is designed to jam early warning and target acquisition radars at long range and to jam and unlock missile guidance radars on launch platforms and missiles.

RCM requires only bearing information to counter a threat but, in addition, the ESM system normally provides warning that action should be taken against a particular radar plus an identification and allocation of priority. Single or dual antenna systems are available to provide 360° cover for small and large platforms. RCM units have their own receivers to provide RF for re-transmission after modulation.

In the responsive noise mode, a frequency measuring unit is used to fast tune a local oscillator to the frequency of the incoming pulse. For deception jamming the same unit can also be used but a frequency memory loop is offered as an option to provide a jamming capability against frequency agile radars. The incoming pulse frequencies are remembered and re-transmitted after modulation to provide a 'range gate pull-off' deception.

RCM-2 is as described above. Types of modulation available include Conscan and 'range gate pull off'.

RCM-3B jammers are improved versions of RCM-2 with a processor and an instantaneous frequency unit giving very efficient processor controlled power management and modulation sequences.

RCM-4B jammers have additional jamming modes such as noise cover pulse and combination jamming and a much higher effective radiated power.

STATUS

In production and in service with various defence forces world-wide.

CONTRACTOR

Racal Radar Defence Systems Ltd, Davis Road, Chessington, Surrey KT9 1TB, England.

1341.253

RDL SERIES ESM EQUIPMENT

The purpose of this equipment is to detect radar transmissions and so provide warning of the approach of surface ships, submarines, or other weapon platforms employing radar controlled weapon systems.

The main RDL systems are: RDL-1, a basic tactical small ship ESM system covering the 2 to 11·25 GHz range, and including an APA-1C pulse analyser; RDL-2 which also provides the frequency of a particular threat; RDL-257 extends the frequency coverage to 1 to 18 GHz; and RDL-268 provides for actual frequency measurement over this extended range. All RDL systems can be enhanced by addition of the SRU-1 signal recognition unit which can store the parameters of up to 500 emitters to permit threat identification. Versions of this equipment are now available for surface ships, submarines, aircraft, or vehicle use.

RDL console

Surface Ships

A typical system for use on a fast patrol boat is the RDL-1BC, which provides instantaneous bearing, automatic pulse analysis and alarm, together with measurement of frequency band. Frequency coverage is from E to I band. The equipment comprises an antenna, a bearing display, a control unit, a power unit, and a pre-pulse unit, all of which, apart from the display tubes, are solid state. The antenna is light and compact, and has been designed in two halves to wrap around a mast or other mounting and thus avoid the coveted mast head position.

The automatic pulse analyser APA-1C is a self-contained unit which may be used with any suitable EW receiving equipment. Used with the RDL-1BC the unit provides an automatic digital readout of the pulse parameters of all signals or those selected from the switched lower antenna array. The unit is completely automatic and requires minimal operator skill or attention. For Elint purposes a line printer can be used to give a fast permanent record of the measured parameters of the intercepted radar transmissions.

There are also facilities available for the pulse parameters of up to five sets of independent radar transmissions to be set into the unit by plugging in printed circuit cards. When a signal is received which falls within these parameters, the operator is warned by the illumination of a solid state lamp or other remote triggered alarm, that a hostile transmission is present. The unit is completely solid-state and employs LED numerical indicators.

Add-on units are available which convert the RDL 1BC equipment to meet the more exacting requirements of larger ships. The RDL-2ABC equipment has all the facilities of the RDL-1BC and in addition provides frequency measurement, visual pulse analysis, and RF amplification in the analysis channel. The latter increases the range and permits better use of analysis facilities. The equipment consists of the units described previously and in addition contains an RF amplifier unit, a frequency and pulse analyser, and additional power supply units.

The antenna is identical to the RDL-1BC unit but contains additional components to upgrade the performance. The initial simple system can therefore be readily converted to the more comprehensive system.

In the RDL system, frequency is displayed panoramically with signals appearing as vertical deflections on the horizontal frequency scale. The operator must first select the azimuth sector containing the required signal and the band he requires to sweep. Then he may select one of two modes, auto-stop or auto-pause. In the auto-stop mode, the receiver stops sweeping automatically on signal reception and the radio frequency is indicated digitally.

Other facilities permit further expansion of the frequency bands, fine tuning of the received signal to obtain better frequency accuracy, and the suppression, if required, of up to three specific frequencies. This enables the operator to prevent the receiver from stopping automatically on the friendly signals or those already analysed.

The RDL-2ABC system contains, in addition, a visual pulse analyser with a dual trace display. This enables two ranges of either pulse width or pulse repetition frequency to be measured visually against an illuminated graticule. This display also enables pulse peculiarities to be identified, including jittered PRF.

Elements of the RDL Series, RDL-5 and RDL-6, provide for the addition of a D-band capability. All facilities available for the RDL-2 series are either usable or available as additions for signals in this frequency band. Similarly RDL-7 and RDL-8 equipment extend the system capability up to band J8.

The system RDL-2ABC 6AC 8AC covers the full

1 to 18 GHz band with frequency measurement and automatic pulse analysis over the whole range. This equipment, with the addition of standard peripheral units such as computer injection panels, printers, and recorders, represents a system comprehensive enough to fulfil the most stringent requirements, but is nevertheless only a few steps away from the simplest tactical system in the series.

Submarines

The system RDL-4BC is a compact, instantaneous bearing measurement and pulse analysis equipment covering the frequency range 2·5 to 20 GHz. It is in full production in a submarine version, RDL-4BCS, where it uses the standard RDL Series units inboard. The bearing display uses coded vectors automatically to identify the frequency band of intercepted signals.

RDL-1BCS is a submarine version of the RDL-1BC and is identical operationally. It uses a novel antenna in which each of 16 antenna elements are individually encapsulated rather than using an overall submersible radome. Other submarine systems are produced ranging from a simple warner, RWR-1, or very light submarines to complex systems for NATO.

STATUS

Production. RDL Series in service or on order for 18 navies.

CONTRACTOR

Racal Radar Defence Systems Ltd, Davis Road, Chessington, Surrey KT9 1TB, England.

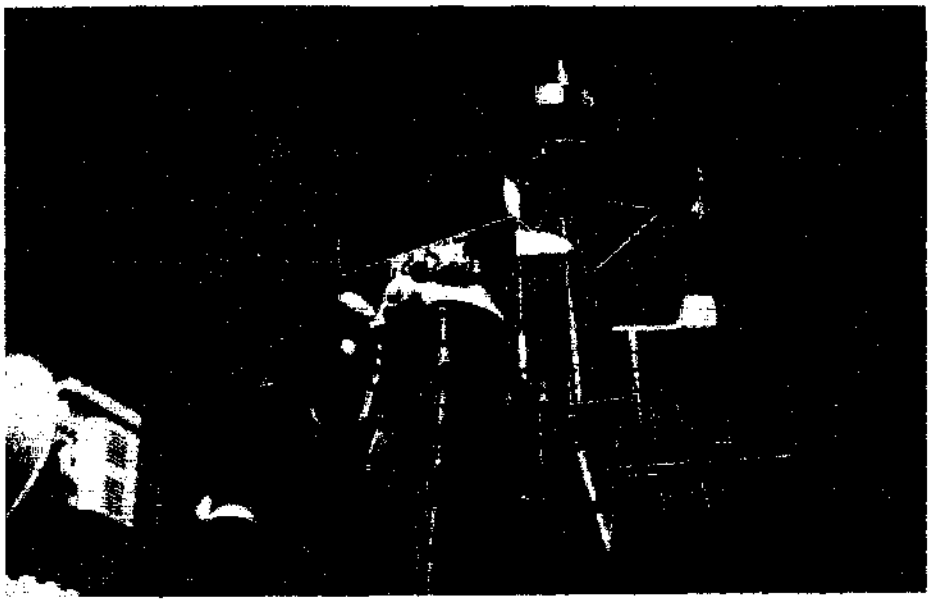
3553.293

CUTLASS ESM/ECM EQUIPMENT

The Racal Cutlass series of equipment consists of a range of advanced computer-controlled ESM and ECM systems, primarily intended for use aboard ships, but capable of deployment on other land-, sea- or air-based platforms. Designed for operation in very dense signal environments the equipment receives signals in the 1 to 18 GHz frequency range, measures their parameters, compares these with those in a pre-programmed radar library and displays the information within 1-2 seconds. The EW operator is presented with a tabular display for threat identity and threat evaluation and a tactical display giving a pictorial representation of the RF environment. Selected digital outputs can be sent to other local systems, and hard copy printout of the intercepted radar is also available. The tabular display can indicate 300 intercepts, in the order of priority. The Cutlass central processor is very advanced with a library containing the parameters of up to 2000 radars.

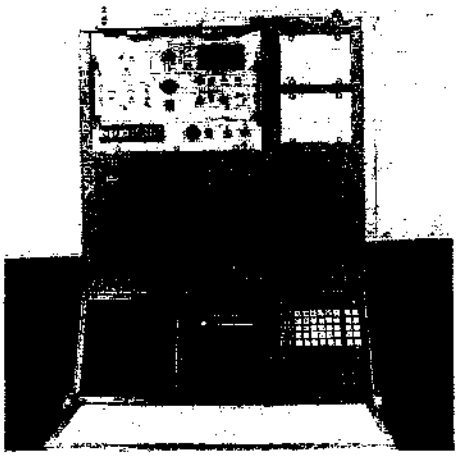
Cutlass is wide open in both bearing and frequency, ie it does not employ sweep techniques, giving a very high intercept probability (nearly 100 per cent, degraded by simultaneous pulse arrival in extremely high density environments).

Cutlass is a modular equipment and can be configured to suit fittings in various classes of ships. The two main variants are Cutlass and Cutlass B1; both use the advanced Cutlass processor which can be integrated with a variety of man-machine interfaces and both use an instantaneous frequency measurement (IFM) receiver. Cutlass has a six-port antenna array for bearing measurement using amplitude comparison techniques, and a separate omni-directional antenna to provide RF for the IFM. Cutlass B1 has a 32-element array antenna to provide bearing measurement by phase analysis techniques. This antenna also provides RF for the IFM. In both systems the processor is provided with fast and accurate information on incoming pulses.



For an integrated EW system, Cutlass can be employed either in conjunction with one of the Racal RCM series of jammers (**1942.293**) or with the Racal Cygnus jammer (**5670.293**). Cutlass will readily integrate with other ship's systems, such as a tactical data system.

STATUS



In production since 1977 and in service with several overseas navies. In mid-1983, Racal was awarded a £30 million contract for the development and reconfiguration of the Cutlass system for installation on board the Type 23 frigates. In January 1984, a contract valued at £12 million for Cutlass and Cygnus systems was received from the Middle East. It is understood that a version of Cutlass has been offered to the Royal Navy against a requirement for a combined ESM and chaff-triggering system, known as UAG-1.

CONTRACTOR

Racal Radar Defence Systems Ltd, Davis Road, Chessington, Surrey KT9 1TB, England.

1876.053

HWR-2 RADAR WARNING RECEIVER

This is a miniature warning receiver, designed specifically for use in environments such as helicopters and small patrol craft where space and weight are invariably at a premium and the installation of sophisticated electronic warfare equipment is uneconomical. In its basic form the receiver is hand-held and operates completely independently of available supplies and mounting arrangements (although it may be hard-mounted in rotary wing aircraft and surface ships).

Held by a pistol-grip handle, it can be used to locate pulsed radar transmissions of any frequency in the range 2 to 11 GHz. The presence of a radar transmission is indicated by listening to the audio note of the transmitted PRF on a headset. The electronic circuits are housed in a cast metal case designed to withstand rugged service conditions.

All controls are grouped on the rear face of the receiver with the single multiway connector for electrical interfaces. Using the hand-held receiver, an operator can assess the following characteristics of a radar signal.

(1) Bearing. By scanning the receiver in azimuth and noting the direction of maximum signal volume in the headset, the bearing of a radar can be ascertained to an accuracy of approximately ±10°.

Racal hand-held warning receiver

(2) Polarisation. By twisting the receiver for maximum signal volume, an assessment can be made of the radar polarisation. When the receiver is held normally with the handle pointing downwards the antenna polarisation is linear at 45°, and thus horizontal, vertical, and circular polarisation can be received. The receiver polarisation is indicated by an arrow on the back of the case.

(3) Frequency Band. By operating the Band switch from the All position to the High position, an assessment can be made of the radar frequency band. If the signal is in I/J-band, then it will remain audible, if it is E/F-band, it will be suppressed.

(4) Scan Pattern. The audible sequence gives a very good indication of the type of radar scan, eg continuously rotating, sector scanning etc.

(5) PRF. An experienced operator will be able to discern quite accurate information about the radar PRF from the audible note.

(6) Range and Power. The relative intensity of a received set of signals provides some indication of their range and power. The sensitivity of the receiver can be reduced by 15 dB by operation of the sensitivity control from high to low.

DEVELOPMENT

Newly developed models are available which extend the frequency coverage to 16 GHz and provide for switching over four bands, together with five position sensitivity selection and CW and pulse reception modes. Development of the system up to 18 GHz is continuing. In addition models can be obtained with RF amplification giving greatly increased sensitivity over all bands, or dedicated to a particular 100 MHz bandwidth at customer specified frequencies.

STATUS

In production and over 200 delivered to various users.

CONTRACTOR

Racal Radar Defence Systems Ltd, Davis Road, Chessington, Surrey KT9 1TB, England.

5670.293

CYGNUS ECM SYSTEM

The Cygnus radar jammer is a ship or land based equipment operating in the I- or J-bands. Originally designed for integration with Cutlass ESM equipment (**3553.293**), Cygnus uses both responsive noise and deception jamming to provide an effective jamming capability against all types of radar including early warning, target acquisition and missile guidance.

Cygnus has a narrow beamwidth giving very high effective radiated power (300 kW) and is kept on target by a built-in, interferometer type passive tracking system, in both azimuth and elevation. The tracking system may also be used to relay accurate position data to systems of other ships. RF received by the tracking antennas is also used as the basis of transmitted RF and modulation and power management is under the control of a processor which also controls the tracking procedure. Types of modulation sequence available include range gate pull off and false target generation.

STATUS

In production and in service worldwide. In January 1984 a £12 million contract was received from the Middle East for Cygnus and Cutlass equipment. The Cygnus system is also being developed to work with Wease, (**5669.153**) as a ground jammer.

CONTRACTOR

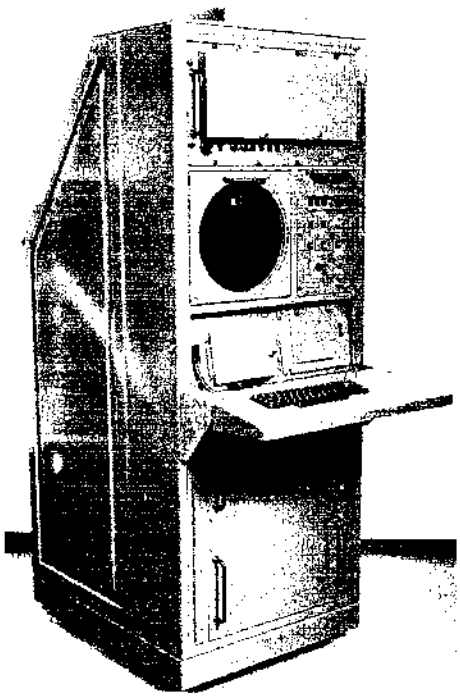
Racal Radar Defence Systems Ltd, Davis Road, Chessington, Surrey KT9 1TB, England

5671.453

PORPOISE SUBMARINE ESM EQUIPMENT

A submarine version of the Cutlass ESM equipment (**3553.293**), Porpoise is a fully automatic ESM system operating throughout 360° of azimuth. The equipment receives signals in the 2 to 18 GHz frequency range measures their parameters and compares these with those contained in a pre-programmed radar threat library. Processing of the radar emitter signals is carried out against the library to give the operator an alpha-numeric or graphic display of identification threat significance order.

The system is capable of integration with the vessel's fire control and communications systems and may also be integrated with periscope mounted radar warning equipments, eg Sprat (**5672.493**). Porpoise also has the ability to give an alert warning when prime threats, such as helicopter or maritime surveillance radars, reach a pre-programmed danger level.



The Porpoise antenna is a compact 6-port system giving adequate bearing accuracy and may be mounted on either hull penetrating or non-hull penetrating masts. It is pressure resistant to 60 bar. With the exception of the antenna system, the primary sub-assemblies of Porpoise are fully compatible with those of Cutlass and so enable common logistic facilities.

STATUS

In production and has been ordered by an unnamed country.

CONTRACTOR

Racal Radar Defence Systems Ltd, Davis Road, Chessington, Surrey KT9 1TB, England.

Porpoise console unit

5672.493

SPRAT SUBMARINE ESM SYSTEM

Sprat is a compact submarine ESM receiver designed to give radar warning of possible hostile emissions as soon as the periscope is raised. The system consists of an omni-directional antenna and receiver mounted on top of the search periscope, and an indicator unit in the control room. The receiver operates over the frequency range 8 to 18 GHz. Detected radar signals are passed to the indicator unit and are displayed as relative signal levels with a corresponding audio output denoting radar activity.

The Sprat antenna/receiver may be integrated with the Porpoise ESM system (**5671.453**), enabling the operator to carry out radar interception prior to raising the main ESM mast. The antenna is pressure resistant to 60 bar. Full built-in-test equipment (BITE) is provided, interlocked to the periscope to prevent BITE signal radiation when the periscope is raised.

SEA SAVIOUR EW SYSTEM

Sea Saviour is designed as a radar threat warning system for small warships with a chaff/infra-red decoy trigger capability. It covers the frequency range from 8 to 18 GHz using a 4-port amplitude comparison bearing measurement system to provide bearing over the full 360° in azimuth. The sensor package gives an immediate audible warning when emissions are received indicating that the vessel is being illuminated by a threat radar. An octantal display of the direction of the emission is also provided. Immediate countermeasures to missile or fire control radars can be made by an automatic decoy dispensing system. The Sea Saviour package provides an integrated system which can include sensors, receiver, processor, display and decoy dispensers.

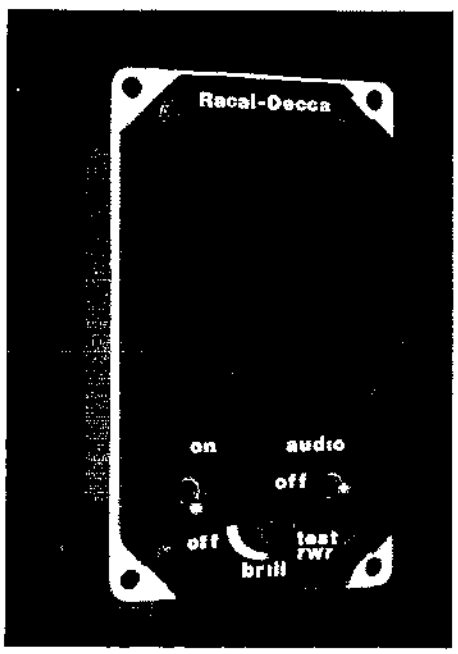
CHARACTERISTICS

Azimuth coverage: 360°

Elevation coverage: -5° to +40° (approximately)

Frequency bands: H, I and J

DF accuracy: to within a 45° sector



Dectection time: within 1s

STATUS

In development.

MENTOR NAVAL ESM SYSTEM

Mentor is a family of naval ESM systems designed for threat warning, surveillance and target indication. Each individual system is tailored to a specific requirement to provide analysis of the radar environment, automatic recognition of potential threats, instant display of threat details, audible and visual alerts and a countermeasures interface.

Common to each member of the series is a masthead assembly, which can be configured to meet a range of mast types; a compact frequency measuring unit; and a display/console located in the operations room. The masthead assembly includes the DF antennas, RF channels and omni-directional antennas. Four, six or eight channels can be included according to requirements and the system can be extended to cover millimetric wavelengths.

CONSOLE

Artist's impression of Mentor console

The frequency measuring unit can be installed either in the masthead assembly or at the base of the mast. It includes RF signal sources to enable extensive system checkout during service use.

The display/console is an ergonomically-designed one man crew station and is available in a range of shapes and sizes to meet specific ship fitting requirements. It contains a digital signal processor that analyses, intercepts and identifies individual pulse trains; measures parameters; and compares these against a threat data library. Data is listed on two monitors which can be either monochrome or colour displays. These provide both tabular and

automatic warning information. Emitters are selected on the situation display by a tracker ball-controlled cursor, and data manipulation is carried out via a keyboard with numeric keypad. Radar data storage capacity extends to 3000 modes, and up to 100 programmable warning channels with audible and visual alarms can be accommodated. Commands can also be transmitted along a data highway to alert command systems, activate decoys or provide targetting information for point defence weapons.

5940.293
SIREN NAVAL DECOY SYSTEM

Siren is an offboard countermeasures decoy system designed to counter anti-ship missiles. It consists of an intelligent all-electronic decoy round, a simple multi-barrelled launcher, and a microprocessor-based fire control unit which can control up to four launchers. The system interfaces with the ship sensors to give fully automatic, semi-automatic or manual activation of the Siren decoy. Once launched, and away from the ship under attack, the decoy switches over to an internal power source, and radiates a powerful jamming signal while descending by parachute to seduce the missile away from its target. The total system can be adapted to suit almost any warship design from a patrol boat to a capital ship, and can also be fitted to naval auxiliaries and merchant vessels.

The decoy round consists of a low g rocket, a parachute, transmitter, receiver and antennas, control electronics, and a battery source. It is completely independent of the on-board ECM equipment. Dimensions are 1800 mm long × 130 mm diameter, and the weight is 28 kg.

The launcher is a 130 mm calibre fixed equipment in banks of three or six. Standard barrel elevation is 45 degrees. Two launcher positions are proposed for smaller craft and four for larger warships. Chaff and IR rounds can be accommodated.

The controller provides the necessary interface to other ship defence systems. It uses its own microprocessor to determine suitable countermeasures, launcher and deployment positions, and initiates firing. Manual operation can be carried out via a keyboard. Slave controllers are available for local control of individual launchers.

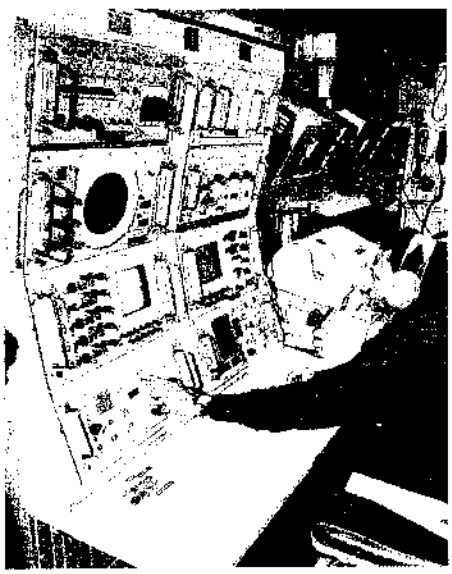
AN/WLR-8 TACTICAL EW RECEIVER SYSTEM



The AN/WLR-8 is a tactical electronic warfare and surveillance receiver designed for fitting in both surface ships and submarines of the US Navy. The system is of modular construction and provisions are made for operation in conjunction with numerous types of direction finding or omni antennas and a wide range of optional peripheral equipment to provide comprehensive ESM (electronic support mission) facilities. The WLR-8 is compatible with NTDS (navy tactical data system) and similar action information automation systems. The system can be expanded in frequency or signal handling capability by means of simple additions and/or software changes. Four versions are available; V(1) for submarines, V(2) for SSN-688 class submarines, V(4) for aircraft carriers and V(5) for Trident submarines.

Two digital computers are incorporated: a Sylvania PSP-300 for system control, automatic signal acquisition and analysis, and file processing; and a Sylvania PSP-200 microcomputer for hardware level control functions. Digital techniques are employed throughout the WLR-8 system, which is all solid-state.

Operational facilities provided include:
(1) automatic measurement of signal direction of arrival
(2) signal classification and recognition
(3) sequential or simultaneous scanning over a wide frequency range
(4) signal activity detection for threat warning
(5) analysis of signal parameters such as frequency, PRF, modulation, pulsewidth, amplitude, scan rate etc
(6) logging of signal parameters for display to operator(s), and printout of hard copy to teletype or printer
(7) extensive built-in test equipment
(8) directed priority searches of specific frequency segments.

Direct reporting to on-board computers, such as NTDS, permits response times in the millisecond range with minimal operator involvement. A two-trace CRT is provided for display purposes and this can be supplemented by an optional five-trace panoramic display for presentation of signal activity data. Another CRT display is incorporated if the WLR-8 is used with automatic or manual DF antenna systems.

STATUS
Operational with USN and possibly other navies. Twenty-one systems are in use on board SSN-688 class submarines, and the V(5) version is fitted to Trident fleet ballistic missile submarines.

AN/WLR-11 IFM RECEIVER

The AN/WLR-11 is an IFM receiver intended for shipborne applications to detect and provide a rapid analysis of anti-ship missile threats. It operates over the frequency range 7 to 18 GHz with a 100 per cent probability of intercept. The equipment is employed with an omni-directional and a DF antenna system which is capable of scanning at 300 rpm. It is used with an automatic processor which can call-up emitter parameters from the computer memory and use these to improve the overall reaction time.

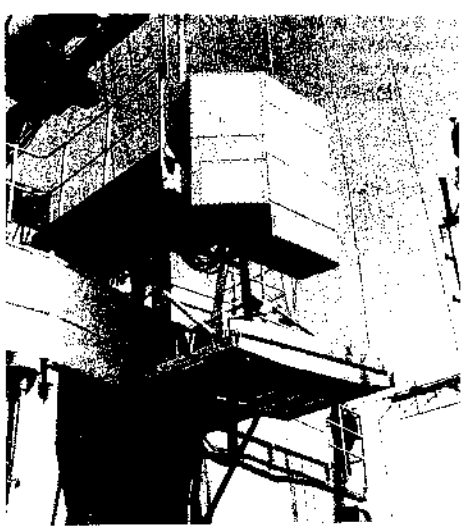
ARGO Systems Inc, Sunnyvale, California, USA.



3551.293
AN/SLQ-17 NAVAL ELECTRONIC COUNTERMEASURES SUITE

The AN/SLQ-17 naval countermeasures set is a deception jammer for shipboard use. It provides the appropriate threat detection and jamming techniques to counter threats and is equipped with the requisite microwave sources and antennas.

The system is designed to protect carriers and other major ships against cruise missiles and other intruders by developing an electronic "image" of the target ship as it is sensed by the enemy's guidance radar. It then offsets the image so that the weapon guides itself to a false "ghost" target some distance from the real one.

The automated SLQ-17 system is designed to operate in dense electromagnetic environments. It detects and tracks signals of several score missiles of many types, and will track up to several hundred signals from other platforms. The system keeps track of signals used for navigation, search, and tracking in the frequency bands that are in the emission range of present and future hostile platforms. It can intercept and track potential missile launch platforms beyond the ranges at which the attacking missiles lock on to the ship and automatically identify both threat and friendly platforms.

As a signal is received on either of the two antennas, the SLQ-17 automatically measures the radar parameters emitted and the computer searches its memory files to separate friend from foe. If it identifies the signal as a missile radar, it generates the most effective deception for the missile, causing it to strike the ocean safely away from the carrier. Meanwhile, the system automatically keeps track of signals in its area, displaying their platforms for the operator to review on his tactical situation display. Information on all the platforms is displayed for the operator's action in order of their decreasing threat level.

An AN/SLQ-17 antenna mounted on the superstructure of a US Navy ship

The system is made up of the AN/UYK-20 computer, a disc file memory, the operator's CRT graphic display unit (with a keyboard for data entry and display control), and the two highly accurate roll-stabilised antennas with their antenna control units, high and low power amplifiers, signal processors, and RF oscillators. Aboard carriers and other vessels, an antenna and related equipment are installed on each side of the ship. The mini-computer and control and display equipment are installed in the ship's combat information centre (CIC).

STATUS

In operational service. An updated version, the AN/SLQ-17A(V)2 is in production for the US Navy.

AN/SLQ-30 TRUMP

The AN/SLQ-30 is an integrated shipborne defensive electronic countermeasures system designed for the US Navy Electronic Systems Command. The name TRUMP is an acronym of Threat Reactive Update Modernisation Programme and the system is designed to improve effective ECM action and response times while still using existing hardware. It comprises extensively modified ULQ-6B transmitters and SLA-12 antennas, a broadband interception receiver and a processor. The digital processor carries out threat analysis, assigns priority of action, selects the appropriate ECM response and operates overall system command.

4389.293

SR-200 SHIPBORNE ESM SYSTEM

The SR-200 is a shipborne instantaneous frequency measuring system used for protection against surface-to-surface missiles. The system performs automatic threat detection and identification and provides alarm signals on a priority basis using emitter profiles stored in the memory of its high-speed digital processor. The system covers the frequency range 500 MHz to 18 GHz with an optional extension up to 40 GHz. Bearing accuracy in the I/J band is better than ± 2° rms.

An omni-directional antenna is used to pass on signals of interest to a rotating direction finding antenna which provides outputs into the equipment. A display unit provides information on the hostile transmissions as well as providing an order of priority on those considered most hostile.

STATUS

The SR-200 is fitted to a number of national naval forces.

Sanders Associates, 95 Canal Street, Nashua, New Hampshire 03061, USA.

4671.253

S-2150 ESM SYSTEMS

The S-2150 ESM systems are shipborne threat warning equipments normally fitted to smaller ships and submarines. They are automatic in operation and provide warning and direction finding facilities.

The S-2150-01 provides instantaneous direction finding cover over the frequency range 2 to 18 GHz, with an accuracy of 10 degrees rms. The system consists of a masthead unit containing the antenna array and receiver, and a processor/display and control panel. An emitter library is referenced with each signal intercepted and an audio alarm is activated if the signal is matched with a possible threat. Information is also displayed in alpha-numeric and graphic form on the display panel.

The S-2150-03 is also an automatic surveillance system that detects and analyses signals in the 2 to 18 MHz band and provides direction finding with a five degree accuracy. The equipment operates independently or as part of an overall EW suite. An operator display provides threat symbology, bearing and approximate range as well as other data.

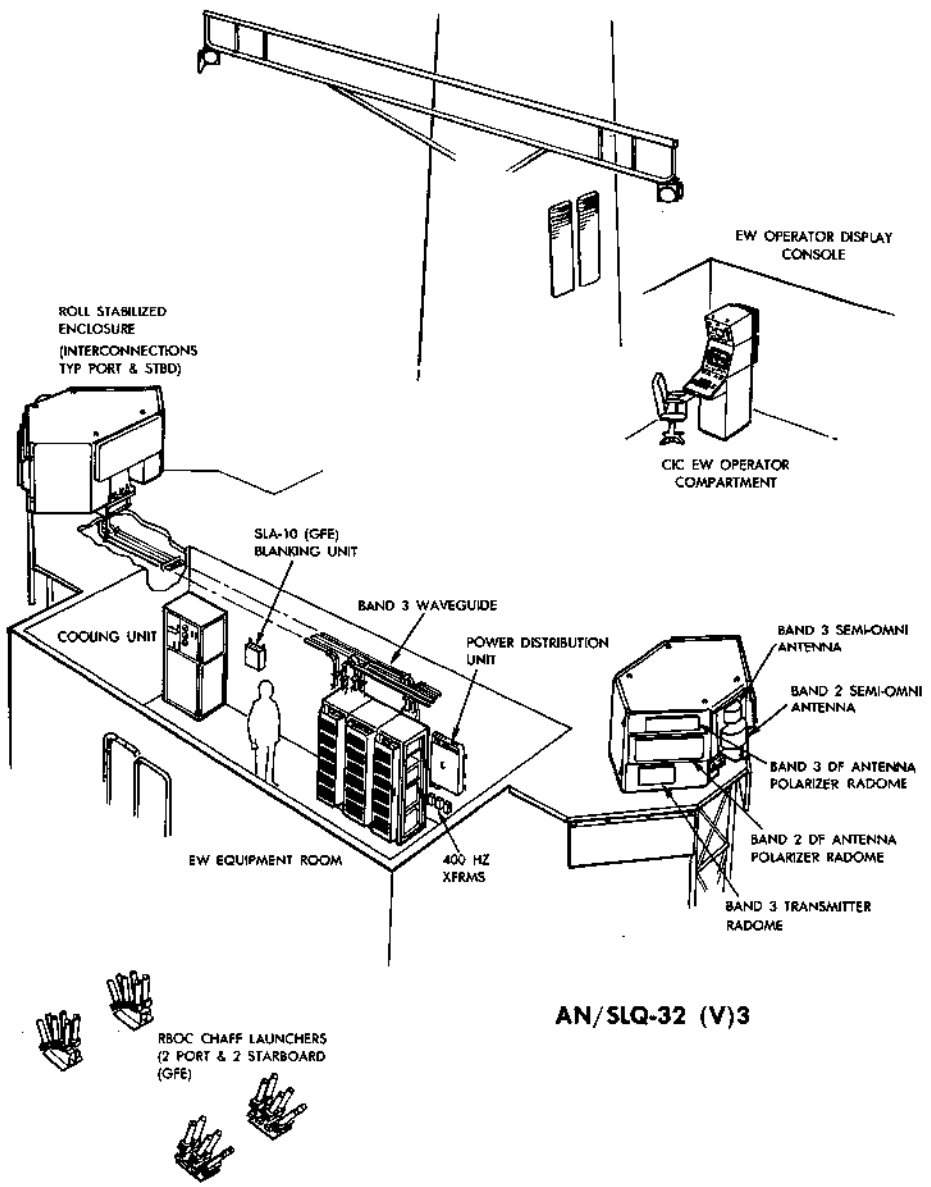
EM Systems Inc, Sunnyvale, California, USA.

3349.293

AN/SLQ-32 SHIPBOARD EW EQUIPMENT



The AN/SLQ-32 is a naval electronic warfare equipment developed to replace AN/WLR-1 receivers and AN/ULQ-6 deception jammers aboard many USN ships. The equipment is the result of a USN/industry programme lasting three or four years, in the course of which Hughes and Raytheon designed and built competitive models for test and evaluation. The Hughes system was designated AN/SLQ-31, and the successful Raytheon version, the AN/SLQ-32.

The AN/SLQ-32 consists of three modular variants of increasing levels of complexity and cost. The basic version, AN/SLQ-32(V)1, provides for warning, identification and direction finding of incoming radar-guided anti-ship missiles; the (V)2 version provides the facilities of the (V)1 plus early warning, identification and direction finding of those radars associated with the targeting and launch of the missiles; (V)3 includes the (V)2 capability to which is added a jamming capability for the prevention or delay of targeting and launch of missiles, and also for the deflection of any missiles that are launched away from their target. The (V)1 was designed for 'Knox' class frigates and smaller auxilliary ships; the (V)2 with its expanded ESM capability for DDGs, FFGs, and 'Spruance' class destroyers; and the (V)3 version with the active jamming system will be fitted in cruisers and certain other larger vessels.

All of the AN/SLQ-32 systems employ multiple beam antennas for reception in all bands except the lowest frequency band, and the lens-fed multiple beam array is a major feature of the system. The antenna consists of an array of elements fed through coaxial cables by a multiple beam parallel-plate lens which is constructed in stripline form using printed circuit techniques. This array provides a set of individual, contiguous high-gain beams, all existing simultaneously, and with each beam having the full gain of the array aperture. For a single array, more than an octave of frequency coverage is provided.

AN/SLQ-32(V)1 Suite

This version is designed to detect all RF signals in Band 3 at all azimuths, covering all potential enemy radar-guided anti-ship missiles and their associated supporting radars. By this ESM the (V)1 suite

AN/SLQ-32 (V)3

AN/SLQ-32 (V)3

provides alert facilities to an attack on the ship and also allows for the control of the Mk 36 chaff rocket system (**3363.293**) carried by the ship. The (V)1 receivers are wide-open in both angle and frequency, and the complete suite consists of two antenna assemblies each having two Band 3 direction finding receiver arrays and lenses covering 90° each. One Band 3 semi-omni antenna covering 180° is located on each antenna assembly. In parallel with the multi-beam antenna and direction finding receivers the system employs a semi-omni antenna to sense the dominant pulse and feed it to the IFM receiver.

A special purpose digital processor, known as the presorter, consists of a direction/frequency correlator and digital tracking unit sections; coarse frequency data from the IFM receiver and amplitude data from the direction finding receiver are correlated in the direction/frequency correlator. Time of arrival data is added to form a pulse descriptor word, which is then stored by frequency and angle cell in the emitter file memory section of the digital tracking unit. If three or more pulses with this angle and frequency signature are received within a programmable time interval (up to 32 milliseconds), the digital tracking unit informs the computer that a new emitter is present. The computer then commands the digital tracking unit to provide enough additional pulses to permit further extensive analysis. The computer calculates from this data the PRF, type of scan, scan period and frequency; these parameters are usually sufficient to characterise an emitter.

Identification is completed by comparing the observed signal characteristics with parameters stored in a library of friendly and threat emitter characteristics within the computer memory. On completion of the identification processs, the computer initiates appropriate alert signals and other actions.

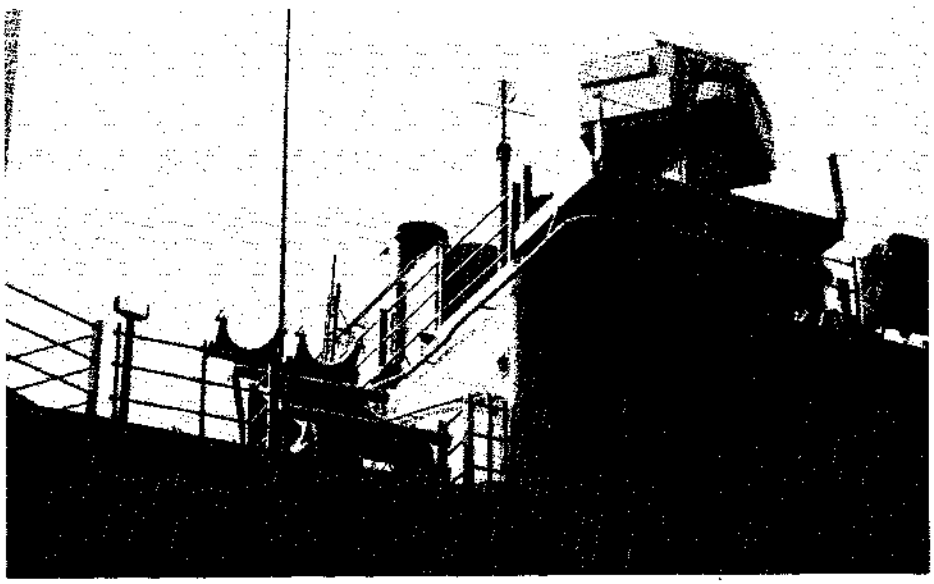
AN/SLQ-32(V)2 Suite

The increased capability of this version is achieved by the addition of two receiving sub-systems. Two Band 2 direction finding receivers and arrays and lenses each covering 90° are added to each of the port and starboard antenna assemblies, and a Band 2 semi-omni antenna covering 180° is added to each assembly. Four small Band 1 spiral antennas are located on a yardarm (port and starboard) to cover 360°. As well as the necessary extra electronics needed to handle the increased input data, the AN/UYK-19 computer remains the same as in the (V)1 version apart from having an additional 16 K of storage capacity.

AN/SLQ-32(V)3 Suite

The ESM capability of the (V)3 suite is the same as that of the (V)2 suite. The active electronic countermeasures (AECM) function of this suite requires two more racks of equipment in the EW room. The main additions are: eight high-voltage power supplies for the TWTs, a transponder, a digital switching unit and a techniques generator. The computer remains the same except for a further increase in memory capacity from 64 K to 80 K. The outboard antenna assemblies are enlarged to accommodate Band 3 transmitter antennas and electronics; two are located in the lower portion of each assembly.

The (V)3 antenna assemblies are hydraulically roll-stabilised.



The AN/SLQ-32(V)3 AECM mode can be operated semi-automatically, where the operator initiates jamming against a given emitter; or automatically, under computer control, where the system initiates countermeasure action as soon as a threat is identified. In each case the actions of the system are essentially the same. The library identifies the jamming technique most appropriate to the particular threat encountered. The parameters of the technique designated in this way are passed to the technique generator unit (TGU), which synthesises the waveforms and applies them as modulation to voltage controlled oscillators in the transponder and the associated drive unit. The output of the drive unit is switched to the appropriate input of the transmission lens to ensure that the energy of the output tubes is directed in the required beam direction. The computer schedules the transmission of energy associated with a given target so that several hostile emitters can be engaged at one time.

STATUS

The AN/SLQ-27 (Shortstop) naval defensive EW system developed between 1966 and 1971 was too expensive for the US Navy to fit in all ships needing an EW capability, and as a result of a study, a decision was taken in 1972 to design a series of EW suites to match the series of target unit prices allocated to ships of various sizes for this requirement. This led to the new system becoming known as the Design-To-Price Electronic Warfare Suite (DTPEWS). In January 1973 six contracts were awarded for a four-month definition phase, after which two contractors, Hughes Aircraft and Raytheon, were awarded contracts for engineering development in August 1973. Two competing (V)3 systems were delivered to the US Navy in January 1976 for trials in USS *Leahy*. Tests and evaluation lasted until September 1976, and the following November Raytheon's design was chosen for production and a contract valued at about $180 million was awarded for a total of 284 sets to be delivered over a period of about four years. It is expected that there will be 107 (V)1 equipments, 113 (V)2 versions, and 64 of the full (V)3 model. More than 300 are expected to be produced for different classes of surface ship. The US Navy has announced that it is negotiating for the design of an EHF transmitter for the SLQ-32, and is also upgrading the system to include high angle cover against diving cruise missiles.

CONTRACTOR

Raytheon Company, Goleta, California, USA.

SEA SENTRY NAVAL ESM

The Kollmorgen Sea Sentry is a passive electronic surveillance system designed to detect and track the direction of radar threats, with an analysis capability, both integrated into a single compact system. There are several versions of the Sea Sentry system:

Sea Sentry I: An ESM system that can be utilised to enhance the Kollmorgen Sea Serpent fire control system (**4019.281** in 1983-84 and earlier editions), or an existing fire control system, or can be used as a stand-alone system for fast patrol boats and other coastal craft.

Sea Sentry II: A complete cost-effective electronic surveillance system for large surface ships. Like the Sea Sentry I, it will detect and track the direction of radar threats in addition to processing, analysing, and displaying all radar threats. Sea Sentry II with its higher sensitivity can also be utilised to enhance ECM jamming systems and reduce the effectiveness of threat countermeasures.

Sea Sentry III: A completely automatic broadband radar threat detection and analysis system that is designed for integration into a submarine

Kollmorgen Sea Sentry ESM set showing broadband antenna/receiver unit, DF/threat-processor, and display and control unit

surveillance platform. The system comprises four main elements:

(1) a multiple antenna array and microwave receiver integrated into a single housing that mounts on a submarine mast. This incorporates an antenna array of two low frequency antennas and four DF spirals; and the microwave receiver, a four-channel receiver contained in the antenna array fed by the four DF spiral antennas. Each channel of the receiver contains a quadruplexer, a high gain video amplifier and a processor interface assembly. The operation of any functional channel is controlled from the display and control console

(2) a display and control unit which includes digital and CRT displays and operational controls and indicators

(3) the DF threat processor that receives pulses from the antenna/receiver sub-system and electronically processes them into digital information and transmits this information to the display and control unit

(4) an optional low frequency receiver, of the spectrum analyser type, which displays low frequency threat signals received by the omni-directional antennas on its own built-in CRT display

The principal features of the Sea Sentry are omni-directional coverage; simultaneous automatic DF; DF accuracy to better than 10° rms; high system sensitivity; threat analyses; broadband coverage; detection of pulsed or CW signals; 100 per cent probability of detection; CRT display of threat identification, bearing, range and other status information.

CHARACTERISTICS

Model: Sea Sentry I
Frequency coverage: 2 – 18 GHz
Azimuth coverage: 360°
DF accuracy: 10° rms
Sensitivity: -35 dBm typical
Dynamic range: 40 dB RF
Limiter power protection: 1 W CW; 100 W peak
Signal detection: Pulsed or CW
Signal processing capability: 35 simultaneous signals
Emitter library capacity: 128 emitters
Emitter identification time: 1 s (constant illuminators); 2 scan periods (scanning emitters)
Power requirements: 115 V/400 Hz
System weight: 125 kg (approx)

Sea Sentry V

Sea Sentry V provides wide signal reception bandwidth, high sensitivity, high precision DF and rapid emitter detection and identification over a frequency range from 0·5 to 40 MHz. The system is composed of five major sub-systems:

(1) a DF receiver system integrated into a combination housing assembly that mounts on the ship's existing mast or on one specially provided

(2) a frequency measurement unit which provides the digital pulse to the processing sub-system, in addition to frequency measurement across the complete system range

(3) a processor which is a high speed digital computer optimised for the EW functions it must perform

(4) a display and control unit which is a variation of the standard Sea Sentry unit. Additional display of frequency is provided and provision of extra control features is included

(5) a system power supply.

Sea Sentry V operates over the frequency range 0·5 to 40 MHz with a DF accuracy of ±2 degrees rms. Programmable library capacity is 200.

3910.253

SLR-600 SERIES NAVAL ESM EQUIPMENT

This range of naval ESM equipment at present comprises three models, of which the base model is the SLR-600. This is a fully automatic and compact equipment primarily intended for fitting in fast patrol boats and similar classes of naval craft, where limited crew numbers are usual and fully automatic operation is of particular value. The SLR-600 combines a broadband E- to J-band microwave receiving system with a specially designed EW processor to ensure both maximum signal intercept probability and rapid system response. The display facilities present signal activity in range and bearing format, and the operator may also select a display which gives a readout at the bottom of the CRT of the operating parameters of selected emitters.

The normal installation aboard a ship includes four combined antenna/receiver units which can be mounted either as a group of four around a mast to give 360° azimuth coverage, or at the ends of yardarms etc to achieve the same result. The display is available as a single console for fitting in the bridge or wheelhouse, or alternatively the display can be configured for use as a separate unit for shelf or overhead mounting in the bridge or as a stand-up bridge control. Display modes include:

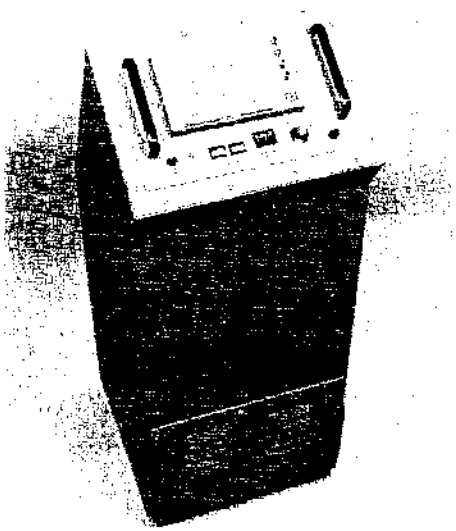
(1) radar identification, which gives specific radar identification based on programmed radar data

(2) unknown characterisation, providing automatic characterisation (pulse width, PRF, frequency, and scan) for unprogrammed radars

(3) radar parameter readout, which provides means for the operator to select any displayed radar for detailed parameter readout on the CRT.

Alarm audio and visual warning indications are given also.

CHARACTERISTICS



Frequency coverage: Continuous E- to J-band in 4 bands, C and D band detection available
Receiver type: Crystal video
Azimuth coverage: 360°
DF accuracy: Better than 15°
Shadow time: 2 μs
Processor memory: 18 000+ words EPROM/RAM/ROM
Emitter library storage: 100+ emitters; 1000 operational modes
Emitters displayed: Up to 15 simultaneously, with identity, status, range and bearing
Display: CRT with computer-controlled symbology
Weight: 56·7 kg
Power consumption: 465 W

SLR-610

The SLR-610 provides the same performance as the SLR-600 but with extended frequency coverage and an alternative method of data display. This display is similar to the SLR-600 except that the radar parameter readout is provided by a column of multiple digit LED panels which show the parameters of the selected radar. There are also facilities for operator monitoring of intercepted radar audio signals.

SLR-640

The SLR-640 provides the highest level of ESM capability in the SLR-600 series and is designed to provide a complete ESM facility for fast patrol boats, frigates and destroyers. It provides broadband, high sensitivity signal detection and frequency measurements together with precision direction of arrival information. A dual-mode CRT display combines a polar plot of total signal activity with a detailed radar parameter readout on a selected list of active emitters over C to J band.

SLR-600 stand-up bridge console configuration

STATUS

Production. Selected by an overseas navy.

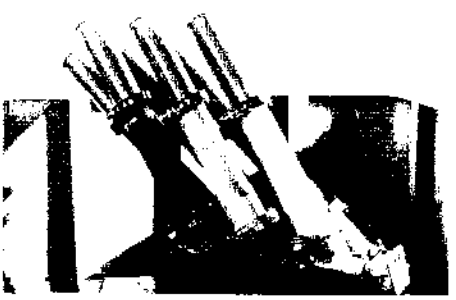
RBOC Mk 33 MOD 0

The Mk 33 Mod 0 Rapid Blooming Off-board Countermeasures (RBOC) launching system comprises a family of mortar launchers, countermeasures cartridges, and appropriate control and support arrangements for the protection of ships of all sizes. The number of launchers per ship, and the number of tubes per launcher, can be tailored to the needs of each particular vessel, as can the cartridge payload. All RBOC installations make use of standardised launch tubes, firing circuits, and cartridges. Mk 33 is the designation for a four-launcher system; there is also a two-launcher system designated Mk 34. The major items of equipment are as follows:

(1) launcher Mk 135 Mod 0. This is a deck-mounted, fixed tube launcher with six tubes arranged in pairs at quadrant elevation angles of 55, 65, and 75°. The firing circuits employ electromagnetic induction to initiate the propelling charge

(2) power supply Mk 160 Mod 0. This converts ship's AC power to DC for operation of the mortar firing circuits and the monitor and indicator lamp circuits. A standby battery and trickle charger are incorporated for emergency use



(3) master launcher control Mk 158 Mod 0. This provides the primary firing controls and status displays for all RBOC launch tubes aboard the ship. It also controls the activation of auxiliary launcher control panels in installations fitted with them

(4) bridge launcher control Mk 164 Mod 0. This provides auxiliary firing controls and status displays for the bridge

(5) ready use locker Mk 4 Mod 0. These units provide storage adjacent to launchers, and each locker houses 16 cartridges.

Loading chaff cartridge into Super RBOC six-barrel launcher during system technical evaluation aboard USS Leahy

Loaded Super-RBOC launcher

A typical arrangement is shown in the nearby block diagram (Figure 1).

The cartridges employed are the Mk 171 Mod 0 chaff payload, the HIRAM (Hycor infra-red anti-missile) decoy, and the Gemini which combines chaff and IR payloads in a single cartridge. There is also a test cartridge (Mk 173 Mod 0) which is equipped with a pick-up coil and indicating meter, and is used to verify complete system functioning of the firing circuit for every launch tube.

When launched from a shipboard mortar (Mk 135 or equivalent) the Mk 171 cartridge rapidly forms a large chaff cloud which confuses radar seekers and fire control systems. Small vessels, such as fast patrol boats, are protected by firing a single Mk 171 cartridge. Ships of arbitrary size are protected by firing an appropriate number of cartridges. The radar cross-section of the Mk 171 chaff cloud is large enough to be effective without any special manoeuvring by the launching ship in most cases.

The Mk 171 Mod 0 chaff cartridge is a cylinder of 112 mm diameter with an overall length of 412 mm. The cylinder is closed at one end by an aluminium cap and at the other by a base plate. A plastic obturating skirt at the base acts as a gas seal to contain the propelling gases. Threaded to the base plate is an assembly containing the firing coil, propelling charge, and pyrotechnic time delay. A burst charge is located along the centreline of the cylinder, with the chaff payload packed around the charge. Inductive initiation is employed to eliminate electric connectors and provide complete HERO and RADHAZ safety.

When loaded into the launch tube, the cartridge firing coil nests within an excitation coil at the bottom of the launch tube. An electric current from the power supply passes through the excitation coil and induces a voltage in the firing coil. This voltage fires a squib, igniting the propelling charge and driving the cartridge from the tube. The gas pressure also impels a firing pin into a primer which initiates the pyrotechnic delay. After 3·4 seconds, the delay ignites the burst charge, driving the chaff payload radially through the cylinder walls at high velocity. The payload is subdivided into a large number of packages which travel great distances before deploying the chaff which can consist of material suitable for any single frequency, or multiple frequencies, or band coverage within the limits 2 to 20 GHz.

The HIRAM decoy cartridge is designed to attract anti-ship missiles that employ IR seekers. When launched from a shipboard mortar (Mk 135 or equivalent) the HIRAM decoy cartridge quickly deploys an IR flare which is equipped with a parachute and float. The flare presents an attractive alternative target to the missile's IR seeker. The output of a single flare is sufficient to simulate the radiant intensity of even a large ship.

The HIRAM decoy cartridge is a cylinder of 112 mm diameter and overall length of 417 mm. The flare is located within a tube along the centreline of the cylinder. Within the flare is a deployment charge, ignition mix, and the flare fuel mixture. Attached to the flare are a CO_2 cartridge, a rubber float (deflated), a folded parachute, and a folded self-erecting staff.

Within a few seconds after launch, the Gemini decoy cartridge develops a large radar echo and simultaneously generates a highly effective IR decoy signal. A small vessel (eg a fast patrol boat) may be protected from radar guided anti-ship missile by firing a single Gemini cartridge. Larger ships are protected by firing additional cartridges.

The IR flare, similar to the HIRAM unit, presents an attractive alternative target to a missile employing an IR seeker. The output of a single Gemini flare is sufficient to simulate the radiant intensity of even a large ship.

The Gemini cartridge is a cylinder of 112 mm diameter with an overall length of 451 mm. The chaff payload is primarily packaged within the bottom portion of the cartridge, identical to the Mk 171 chaff cartridge. The IR flare, its ignition mechanism and folded parachute occupy most of the upper section of the cartridge.

STATUS

Supplied to the US Navy and the navies of several other countries. Hycor (now part of the Loral Corporation) is the sole producer of all components of the Mk 33/Mk 34 launch system, and HIRAM and Gemini cartridges are proprietory developments by Hycor. The Mk 171 chaff cartridge has been produced by both Hycor and Lundy.

MK 36 SUPER RAPID BLOOM OFF-BOARD COUNTERMEASURES

The Mk 36 Super Rapid Bloom Off-board Countermeasures system (SRBOC) provides a deck-launched self-protection against radar or IR guided anti-ship missiles. SRBOC can be activated automatically by the shipborne countermeasures system or by a dedicated microprocessor programmer with interface to the on-board radar warning receiver, IR warning receiver, ship computer, fire control system or other emitter threat data sensors.

The system has large-size expendable decoys and is designed for ships more than 550 feet long. SRBOC is available in either Mod 1 (two launchers) or Mod 2 (four launchers) configuration. This includes six tube launchers, internal battery power for each launcher, bridge remote controls, master launcher control and ready storage locker for each launcher. The decoys are identical in size and weight and use an induction firing system.

CONTRACTOR

Tracor MBA, Radcon Operations, 6500 Tracor Lane, Austin, Texas 78721, USA.

4739.293
TRITON THREAT WARNING SYSTEM

Triton is a digital threat warning system for small combat ships, such as fast patrol boats, to provide warning of attack by air-to-surface and surface-to-surface radar-guided weapons, as well as the presence of unknown threats. It is virtually identical to the AN/APR-39A (**5692.353**) and Dalmo Victor Mk III radar warning receivers (**3893.053**), but repackaged for naval use. It features user-programmable synthetic voice alerts and visual presentation of multi-sensor threats, including the type of threat, its direction of arrival and whether it is tracking or still searching for the target. An indication is also given when the hostile radar lock has been broken.

The system contains a threat library for comparison and analysis which can be reprogrammed on board within minutes to provide for new and updated threats. The display symbols and audio alerts can be adapted quickly to suit user requirements. The system is designed as a direct replacement for older equipments, using the same electrical connections and interfaces.

CONTRACTOR

Dalmo Victor Operations, Bell Aerospace Textron, 1515 Industrial Way, Belmont, California 94002, USA.

5838.293
S-3000 SURVEILLANCE SYSTEM

The S-3000 operates over the frequency range 0·5 to 18 GHz and is designed as a radar surveillance system for rapid, high-sensitivity signal interception, and to provide an audio warning of threats. It uses a narrow beam, high-gain scanning antenna in conjunction with an omni-directional antenna and an IFM receiver. The system contains a comprehensive emitter library which is used to compare parameters of the intercepted signal. These parameters are also displayed on an operator's CRT. The operator controls the DF antenna, choosing between scan, sector and point modes. The system is designed to operate in dense signal environments and will identify priority signals as defined by the user.

CONTRACTOR

EM Systems Inc, 290 Santa Ana Court, Sunnyvale, California 94086, USA.

5840.253
SHIELDS SHIPBORNE EW SYSTEM

SHIELDS (Ships Integrated Electronic Location and Defence System) is a fully automatic passive/active EW equipment for shipborne use. The system operates over the frequency range 2 to 18 GHz and consists of two sub-systems. A wideband IFM receiver/processor intercepts, classifies and indicates threats over the full frequency range and a jamming sub-system acquires, tracks, and jams multiple target signals between 7·8 and 16 GHz.

SHIELDS is a modular system, designed to cater for future expansion, and employs software programming for analysis and classification of the threats. The software program can be easily updated to cater for additional threats. Both alpha-numeric and geographic displays are incorporated to provide indication of threat direction, priority and various parameters.

CONTRACTOR

Sanders Associates Inc, Daniel Webster Highway South, Nashua, New Hampshire 03060, USA.

4407.293
AN/KAS-1 CHEMICAL WARFARE DIRECTIONAL DETECTOR

The AN/KAS-1 is a passive infra-red imaging sensor capable of detecting certain chemical agents. It consists of a sensor mounted on a two-axis pivot and a power conversion unit, and can operate over extended periods by the use of a miniature Stirling-cycle cooler.

The detector sensor unit is based on the man-portable thermal Imager (**3823.093**) developed for the US Army. This system is well-proven in the field, is lightweight and rugged, and is in volume production.

The AN/KAS-1 has been designed for use on ships, and to complete the system for shipborne chemical warfare roles, the original man-portable imager has been modified to include a spectral filter wheel, a power conversion unit and a two-axis mount.

In addition to its primary role in chemical warfare detection, the AN/KAS-1 can also be utilised for other operational roles, such as reconnaissance, base defence, surveillance, threat detection, pilotage, and search and rescue.

STATUS

The AN/KAS-1 is in service with the US Navy.

Texas Instruments Inc, PO Box 226015, Dallas, Texas 75266, USA.

ELECTRONIC WARFARE EQUIPMENT (AIR)

CHILE

5824.393
CAIQUEN AIRBORNE RADAR WARNING RECEIVER

The Caiquen II radar warning receiver has been developed by the Chilean Air Force to meet a requirement for use in combat aircraft. The receiver operates over the 2 to 18 GHz frequency range and provides 360 degree coverage in azimuth, and ±40 degrees in elevation. The equipment is fully automatic and uses a high-speed digital processor to evaluate and classify the threat, determine the radar type and also the direction of arrival. Information is presented to the pilot on a CRT display divided into 45 degree sectors and also indicates whether the threat is a ground-based or airborne radar, whether it is a search, fire control or acquisition type and whether the transmissions are coming from a radar-guided missile. The equipment can also be preprogrammed to determine relative threat priorities.

The Caiquen system consists of eight line-replaceable units with a total weight of 8 kg. Wideband, high sensitivity crystal-video receivers, which can cope with PRFs within the range 200 to 12 000 Hz, are incorporated.

STATUS
Installed on Hunter aircraft of the Chilean Air Force.

CONTRACTOR
ENAER (Empresa Nacional de Aeronautica), Gran Avda J M, Carrera No 11087, Santiago, Chile.

5825.393
ECLIPSE CHAFF/IR DECOY LAUNCHER

Eclipse is an airborne passive self-protection chaff/IR flare dispenser system consisting of up to four dispensing units mounted externally and a control unit in the aircraft cockpit. Each dispenser can carry either 40 RR-170 chaff cartridges, 20 MJU-7/B IR flares or a combination of the two types. Either semi-automatic or manual mode is possible, and in the former mode the pilot can select launch intervals of between 0·25 and 3·5 seconds. A digital processor in the cockpit control unit maintains an updated display of the number and type of loads remaining in each dispenser and carries out the required operating mode and launch sequence selection. The processor also allows the Eclipse system to be interfaced with the Caiquen II (**5824.393**) RWR for automatic reaction to a detected threat. The complete Eclipse system of five line-replaceable units weighs 72 kg.

STATUS
The Eclipse system is fitted to Hunter aircraft of the Chilean Air Force and is being offered in the export market.

CONTRACTOR
ENAER (Empresa Nacional de Aeronautica), Gran Avda J M, Carrera No 11087, Santiago, Chile.

5826.353
IATA AIRBORNE ELINT SYSTEM

The Iata Elint system is another development by the Chilean Air Force and is a high-sensitivity electronic intelligence gathering system able automatically to detect, locate and measure the parameters of emissions from search, acquisition and fire control radars. Iata consists of a fully programmable superheterodyne receiver, a digital pulse analyser, and a high-gain, wideband, rotating dish antenna which provides 360 degree coverage and bearing information to within a few degrees accuracy. Although intended primarily for light transport type aircraft, the equipment can also be installed in shipborne or ground vehicle configurations.

The receiver operates over the wide frequency range of 3 MHz to 18 GHz in six bands. It can be used in either a wide-open mode over the complete frequency range or in a selective mode over a single band. After detection of a transmission of interest, the receiver locks onto it automatically and measures its frequency and other parameters. Digitised data of each intercepted signal can be recorded automatically for subsequent analysis.

STATUS
The Iata system is operational with the Chilean Air Force.

CONTRACTOR
ENAER (Empresa Nacional de Aeronautica), Gran Avda J M, Carrera No 11087, Santiago, Chile.

FRANCE

3374.353
TYPE BF RADAR WARNING RECEIVER

The Type BF radar warning receiver is for airborne applications in aircraft of the Mirage and similar types. It provides the pilot with warning of most categories of airborne or surface threat radars and an indication of their direction.

The system consists of four wide-band antennas, a video receiver, and optionally, a synchronisation unit, in aircraft other than the Mirage, in which case the system controls and indicator unit are integrated into the cockpit by the aircraft manufacturer, these items are supplied as separate units.

Type BF radar warning receiver equipment

Each antenna unit contains a photographically etched spiral antenna and microwave circuits such as: RF test oscillator; limiter modulator diodes; high-pass filter; detector circuits; video modulation unit; video preamplifier. Packing of the antenna units is of two types, one having a flush-mounting radome for the left- and right-hand units, and the other having a conical radome and housing suitable for mounting on the aircraft fin to provide fore and aft coverage. Each antenna has a 90° cover, to provide all-round search capability with the full system.

The BF equipment will detect signals of pulse, CW, ICW, or TWS radars, either fixed frequency or frequency-agile. PRFs between 600 and 12 000 Hz can be accommodated.

An audio alarm is given for each radar threat detected, and the general direction of the threat is given by the illumination of one or more of four signal lamps around the aircraft outline on the indicator. The nature of the threat is shown by illumination of one of three indicator lamps denoting:

(1) conventional pulse radar
(2) CW or ICW radar
(3) TWS ground threat radar.

CHARACTERISTICS
Antenna (L and R) dimensions: 53 × 148 mm diameter
Antenna (F and R) dimensions: 360 × 82 mm diameter
Video receiver dimensions: 322 × 193 × 57 mm
Synchroniser dimensions: 209 × 110 × 45 mm
Indicator dimensions: 68 × 61 × 61 mm
Control box dimensions: 146 × 95 × 40 mm
Combined weight: 9·2 kg

STATUS
Production. Operational in Mirage F1-C and Super Etendard, also Mirage F1-A, Netherlands F-5, and Mirage IIIZ aircraft. A helicopter version is produced as the TMV 008H.

CONTRACTOR
Thomson-CSF, Avionics Division, 178 boulevard Gabriel-Péri, 92240 Malakoff, France.

3379.393
DB 3163 (REMORA) JAMMER POD

The DB 3163 jammer pod, known also as Remora, is designed to provide self-protection for tactical aircraft against both air and ground radar threats. Both pulse and CW emitters can be detected, identified and countered automatically by means of the power management system incorporated in the pod.

A superheterodyne receiver performs a frequency scan search on emissions received by antennas located at both ends of the pod, this being carried out simultaneously. Up to three frequency bands can be selected by the pilot from six bands pre-programmed before flight. Threat data are stored digitally and up to three can be jammed at the same time by means of electronic switching and power management of the TWT transmitter system. A 'boot-strap' system of air cooling is employed.

CHARACTERISTICS
Frequency: I/J-band. Pre-programmed
Pod length: 3·52 m
Diameter: 254 mm
Weight: 175 kg
Power consumption: <1·7 kVA (transmit); <0·7 kVA (receive)

STATUS
In production.

Remora jammer pod

CONTRACTOR
Thomson-CSF, Avionics Division, 178 boulevard Gabriel Péri, 92240 Malakoff, France.

5786.393
DB-3141 NOISE JAMMING POD

The DB-3141 is an airborne noise jamming pod operating in the H to I frequency band, and is a lower band version of the DB 3163 (Remora) pod (**3379.393**). It contains a single receiver, a travelling-wave-tube jammer and fore-and-aft transmitter antennas. The DB-3141 provides a simple active EW capability for Dassault Mirage fighter aircraft and is also fitted to the Super Etendard deck-landing strike aircraft. The system has a 'look-through' capability which enables it to discontinue jamming as soon as threat reception ceases.

CHARACTERISTICS
Dimensions: 3·5 m long × 0·25 m diameter
Weight: 175 kg
Power required: 1·7 kVa at 200 V 400 Hz

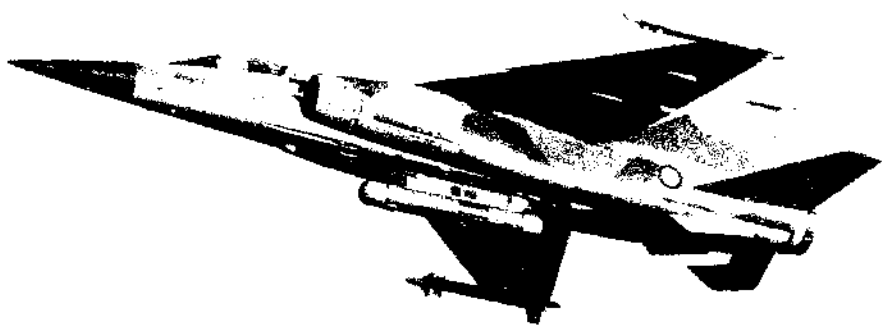
STATUS
In production.
CONTRACTOR
Thomson CSF, Avionics Division, 178 boulevard Gabriel Péri, 92240 Malakoff, France.

5787.353
CAIMAN NOISE/DECEPTION JAMMING POD

Caiman is an airborne noise and deception jamming pod which is probably developed from the earlier Alligator system. It is intended for dedicated EW aircraft which are operating to protect groups of similar aircraft in ground attack roles by jamming surveillance and tracking radars. Within the pod are two jammers, each with its own receiver, and fore-and-aft receiver antennas. Power output from each jammer is 250 watts in I band (7·0 GHz) or 1 kW in L-band (5·0 GHz). The jamming signal has a bandwidth of about 1 GHz and the mode of transmission is selected before the mission. Three modes of operation are available; in manual mode the pilot can select any one of three predetermined frequencies at will; in semi-automatic mode a signal indicates to the pilot when a transmission is being received so that he can take the appropriate action; and in fully automatic mode the jammers are automatically activated when such a signal is received.

The pod is self-contained with ram-air entering the unit through an annular intake to drive a power turbine and provide cooling. It can be installed either underwing or on a fuselage pylon.

Caiman jamming pod on a Mirage F1



CHARACTERISTICS
Dimensions: 5·95 m long × 0·41 m diameter
Weight: 550 kg

STATUS
In production. Fitted to the Mirage F1 aircraft and supplied to other countries for several aircraft types, including the Mirage 2000 and the Jaguar.
CONTRACTOR
Thomson-CSF, Avionics Division, 178 boulevard Gabriel Péri, 92240 Malakoff, France.

5788.393
TMV 018 SYREL ELINT POD

Syrel is a fully-automatic electronic reconnaissance system pod which is pylon-mounted under the fuselage of the Mirage F1 aircraft, and the ELINT version of the Puma helicopter. It is designed primarily for use during tactical penetration missions at medium or low altitudes to acquire and record automatically data relating to the identification and location of ground-based electronic systems. It is intended to provide reliable information of early warning, search and acquisition, GC, and fire control radars associated with anti-aircraft missiles or artillery.

The pod, which is 3·75 metres long, has two antennas at both front and rear, with receiver units, an amplifier and recorders in the centre section. The pylon houses a cooling system which has a ram-air intake in the leading edge. High speed of the system is assisted by thick and microwave circuit assemblies on ceramic substrates.

Syrel ELINT pod mounted on a Mirage F1

STATUS
In production.

CONTRACTOR
Thomson-CSF, Avionics Division, 178 boulevard Gabriel Péri, 92240 Malakoff, France.

5946.393
BAREM SELF-PROTECTION JAMMER

Barem is a pod-mounted self-protection jamming system designed for penetration missions in tactical/strike aircraft. It is equipped with travelling wave tubes and provides instantaneous coverage over a wide frequency band. It can detect, identify and jam simultaneously a number of threats from a variety of ground-to-air and air-to-air pulse, Doppler and CW radars. The equipment has an extensive memory capacity and a modular software design which is reprogrammable to cater for future threat developments. Operation is fully automatic, from a threat warning system, although manual control is also available.

STATUS
In development.
CONTRACTOR
Thomson-CSF, Avionics Division, 178 boulevard Gabriel Péri, 92240 Malakoff, France.

5947.393
BASILISK JAMMING POD

Basilisk is another pod-mounted Thomson-CSF jamming system which has been designed especially for attack jamming, ie against surveillance radars. It instantaneously covers two full octaves of hostile frequencies, and can jam a large number of threats simultaneously. The pod which contains the transmitters, power supplies and antennas can be carried either under the wing or the fuselage of the aircraft. Basilisk incorporates an extensive memory capacity, and modular design software for reprogramming to meet additional threats. No other details are currently available, although it can be assumed that the system is normally automatically activated from a threat warning system with an on-board controller for manual operation.

STATUS
In development.
CONTRACTOR
Thomson-CSF, Avionics Division, 178 boulevard Gabriel Péri, 92240 Malakoff, France.

5789.353
SERVAL RADAR WARNING RECEIVER

The Serval radar warning receiver is a new generation detector which provides the pilot with warning when his aircraft is illuminated by surface or airborne threat radars. Frequency coverage is from 2 to 18 GHz. Displayed information is threat direction, level and identification. The latter is obtained by comparison of the received signal with a threat library contained in the system. The display unit is a panel-mounted CRT where several threats can be displayed simultaneously. At the same time, an audio alarm is generated in the pilot's headset.

Four antennas are used, located at the aircraft wingtips and vertical fin. They are connected to an analogue and digital processing unit.

STATUS
Fitted to both French Air Force and export versions of the Mirage 2000.
CONTRACTOR
Thomson-CSF, Avionics Division, 178 boulevard Gabriel Péri, 92240 Malakoff, France.

5831.353
MIRAGE 2000 INTEGRATED EW SUITE

Thomson-CSF, in collaboration with Electronique Serge Dassault and Matra, is developing a new integrated, internally mounted EW suite for the Mirage 2000 aircraft. This is a highly sophisticated system where all parts are linked to a central interface and management unit.

The system incorporates three warning receivers, plus an IR threat detector which is currently being designed by Matra and SAT. These receivers consist of the Serval equipment (**5789.353**), a super heterodyne receiver to detect CW radar, pulse-compression and low-power pulse Doppler signals, and a receiver/processor mounted in the aircraft nose to detect missile command links. The latter equipment is designed to carry out initial countermeasures when a locked-on missile is detected.

Two sets of the ABD detector-jammer (**5941.393**) are included, each with its own receiver which allows it to operate should the radar warning receiver be out of action. Each jammer consists of a high frequency-band sub-unit to counteract airborne threats and a low frequency-band sub-unit to operate against surface-to-air missiles. One jammer is fitted in the aircraft front end while the second unit is at the rear. The Matra Spirale chaff-IR flare dispenser is also included in the overall system to provide passive countermeasures. Spirale is an internally-mounted equipment which dispenses stores through openings in the aircraft structure.

STATUS

In development for latest French Air Force Mirage 2000 aircraft.

CONTRACTORS

Thomson-CSF, Avionics Division, 178 boulevard Gabriel Péri, 92240 Malakoff, France.

Electronique Serge Dassault, 55 quai Carnot, 92214 St Cloud, France.

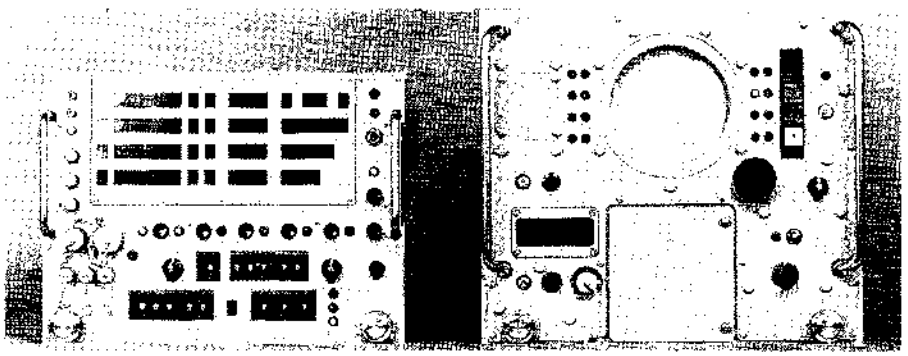
3376.353
TMV 026 AIRBORNE ESM SYSTEM

The TMV 026 airborne ESM system consists of a DR2000 radar intercept receiver, an alarm, analysis and identification equipment (DALIA 500 or ARIAL 15) and a set of six DF antennas and one omni-directional antenna. The equipment is suitable for use in both helicopters or fixed-wing maritime patrol aircraft.

The DR2000 provides all-round passive search, detection of all pulse and CW signals, and gives an instantaneous audible and visual alert.



Additional alarm and analysis capabilities are given by the DALIA 500 (or ARIAL - *analyse radar pour identification et alerte*) equipment. This provides specific threat warning signals; automatic analysis of received signals to yield frequency, PRF, pulsewidth, RF level, antenna rotation rate, jitter, etc; and automatic identification of emitters by comparison with a library including 500 or 15 radars (DALIA 500 or ARIAL 15).

STATUS

Series production. Limited numbers only were delivered with the ARIAL analyser, most employing the higher capacity DALIA equipment.

CONTRACTOR

Thomson-CSF, Avionics Division, 178 boulevard Gabriel Péri, 92240 Malakoff, France.

Dalia processor (left) and DR 2000 display/control unit form part of the TMV 026 system

5941.393
ABD DETECTOR-JAMMER SYSTEM

The ABD detector-jammer system is an internally-mounted system designed primarily for the Mirage 2000 aircraft. It includes a signal receiver for plotting a jammer capable of countering present and foreseeable future air-to-air and surface-to-air radar threats. The system consists of four line replaceable units of which three include a rear coverage antenna while the fourth constitutes the forward coverage antenna module. The ABD system is programmable as a function of the threats present in a particular operational theatre and is capable of operating in a fully automatic mode. A built-in-test function is provided.

STATUS

In production for the Mirage 2000 aircraft.

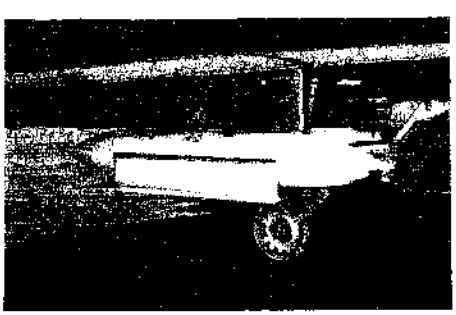
CONTRACTOR

Electronique Serge Dassault, 55 quai Carnot, 92214 St Cloud, France.

5665.393
ALKAN COUNTERMEASURES DISPENSERS

Alkan designs and supplies a range of airborne countermeasures dispensing equipment for the self protection of both fixed and rotary wing aircraft against IR and radar seeker fitted missiles. This equipment takes cylindrical chaff and/or IR pyrotechnic cartridges and is either mounted on existing stores stations or fitted to the airframe.

The Type 532 countermeasures dispenser pod, currently in production, is appropriate for most aircraft capable of carrying external stores, whether NATO standardised or not. Like other pods it can be easily installed and removed from the aircraft.



The structure-fitted dispensers can be integrated into or conformally fitted to the airframe, in both cases leaving free all external store carrying stations. The dispenser construction is modular and is designed for the use of fully interchangeable IR and EM cartridge magazines. Alkan also designs and supplies the associated electronic systems for the cartridge firing sequence.

STATUS

In production. A new range of dispensers has now been introduced, designed for aircraft such as the Mirage 2000.

CONTRACTOR

R. Alkan & Cie, rue du 8 Mai 1945, 94460 Valenton, France.

Type 532 zone saturation countermeasures dispenser

4635.393
LACROIX COUNTERMEASURES AMMUNITION

Société E Lacroix manufactures a range of electromagnetic (EM) and infra-red (IR) passive countermeasures ammunition for combat aircraft. These munitions are used in aircraft such as the F-16, Tornado, Viggen, Jaguar, Mirage, Alpha-Jet, Phantom and a number of helicopters. The company also manufactures 'bright flash' cartridges designed to blind temporarily or to disorientate weapon systems using optical seekers.

The EM cartridges, Types 622, 651 and 888L, are made up of aluminium coated fibre-glass, with the length cut according to the individual customer requirements, and are electrically ejected. The IR munition, Types 407, 587 and 623, consists of one or two IR flares fitted with a pyrotechnic part containing ignition and safety devices and is ejected electrically from the cartridge. A new chaff cartridge, known as ZCH, is being developed in collaboration with Philips of Sweden. The cartridge consists of three groups of three subloads each which are ejected in sequence by pyrotechnic squibs.

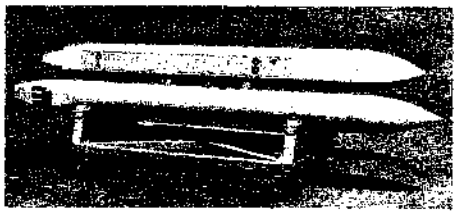
STATUS
Mass production.

CONTRACTOR
Société E Lacroix, Departement Contre-mesures, Route de Toulouse, 31600 Muret, France.

5790.393
MATRA PASSIVE COUNTERMEASURES

MATRA is concerned with the development of passive countermeasures equipment, based primarily on the company's experience with PHIMAT, the electromagnetic decoy chaff system in use with a number of air forces. The company is now engaged in the design and production of an intelligent system family for analysing and dealing with threats, and for control and programming.

Sycomor



This has been developed for the Mirage F1 and other aircraft in service to jam radars, radar seekers and infra-red guided missiles by ejecting clusters of chaff and/or cartridges. The equipment is available in the form of containers and/or gondolas fixed under the wing. It is in operational service with the Mirage F1.

Spirale

This fulfils the same requirements as Sycomor and is in development as an internal system for the Mirage 2000. Dispensers and IR warning receivers are integrated into the fuselage, with chaff and cartridges ejected through openings in the aircraft structure. It has been ordered by the French Air Force and a number of other air forces.

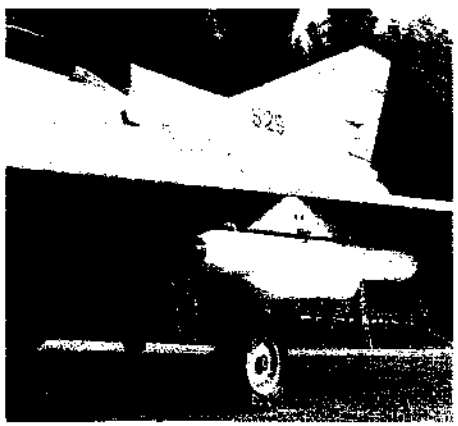
5948.393
EL/K 7032 COMINT SYSTEM

The EL/K 7032 is an airborne communications intelligence (COMINT) system designed for electronic surveillance and interception of signals within the 20 to 500 MHz frequency range. It is performed by local or remote digitally controlled communications receivers operating in the HF, VHF and UHF bands and featuring high speed switching between bands to allow very fast and reliable coverage of the complete spectrum. Computer-controlled automatic operation enables a minimum number of individual operators to carry out multi-task COMINT missions.

STATUS
In production.

CONTRACTOR
Elta Electronics Industries Ltd (a subsidiary of Israel Aircraft Industries Ltd), Ashdod, Israel.

4357.393
EL/L-8202 ECM POD



The EL/L-8202 is a compact ECM pod designed to provide self-protection for combat aircraft against both surface and air radar threats. It has a wide frequency coverage and a high broadband output with selectable ECM techniques. A number of optional versions are available which include specified frequency ranges, an enhanced receiver/processor unit and interfaces which are adaptable to a particular aircraft's avionics.

The EL/L-8202 pod comprises the following major units: antennas and radomes, RF unit, RF power amplifier, logic unit, pod shell and cooling unit. The RF unit generates electronic countermeasures, jamming signals according to the required ECM programme. These signals are further amplified by the power amplifier, employing broadband high-power TWTs and transmission is through the antennas which are located at both ends of the pod and features special beam-shape patterns. The logic unit generates the logic and video signals required for the selected ECM programme and provides interface functions to the aircraft radar warning system and to the cockpit control unit.

The pod itself is carried on the normal ordnance station of the aircraft and is designed to have a minor impact on aircraft performance. Cooling is performed in the normal ECM pod method, namely an integral ram/air liquid unit.

CHARACTERISTICS
Frequency range: F – J-bands
Power consumption: 1·7 – 2·3 kVA (0·5 kVA standby)
Dimensions: 26 × 39 × 290 cm
Weight: 200 kg

Elta Electronics Industries Ltd (a subsidiary of Israel Aircraft Industries Ltd), Ashdod, Israel.

EL/L-8202 ECM pod

5730.393
EL/L-8230 AIRBORNE ECM SYSTEM

The EL/L-8230 is a combined noise and repeater jammer designed to protect combat aircraft against both surface and air radar threats. It is internally mounted and operates over the G to J frequency band with a power output of nearly 1 kW. The system consists of antennas, an RF unit, an RF power amplifier and a logic unit. The latter unit provides logic and video signals for the application of the required ECM programme, and also provides interface functions to the aircraft radar warning receiver. The system contains its own receiver and is capable of automatic or manual operation modes. It can be packaged in different configurations for a variety of aircraft installations.

CONTRACTOR
Elta Electronics Industries Ltd (a subsidiary of Israel Aircraft Industries Ltd), Ashdod, Israel.

5949.393
EL/L 8312A ELINT SYSTEM

The EL/L 8312A system is an airborne computerised electronics intelligence (Elint) equipment. It comprises units such as the EL/L 8312R modular microwave receiver, the EL/L 8321 pulse digitiser, EL/S 8610 computer and the EL/S 8570 alpha-numeric display. These can be configured according to the operational requirement, and as part of the overall system Elbit Computers has developed a multi-purpose tactical display that can serve various intelligence users.

The system is an automatic microwave receiving system which detects, measures parameters, classifies and identifies targets at long distance. The target bearing is measured instantaneously and the range/location is established after a series of bearings have been taken along the aircraft's track.

STATUS
In production.

CONTRACTOR
Elta Electronics Industries Ltd (a subsidiary of Israel Aircraft Industries Ltd), Ashdod, Israel.

5894.353
LAVI SELF PROTECTION EW SYSTEM

Elta Electronics is the prime contractor for the advanced airborne self-protection system for the Israeli Lavi fighter being designed and built by Israel Aircraft Industries. The equipment is completely automatic, power managed and based on modern architecture backed up by a distributed computer network. It is an integrated ESM/ECM computer-controlled system providing identification of threat emitters and automatic response using jamming and deception techniques. An emitter library contained in the computer enables the system to carry out comparison with incoming signals. Elisra Electronic Systems is a major sub-contractor for the equipment.

STATUS
In development. Deliveries will be phased in with the Lavi fighter programme. Prototypes of the aircraft are due to fly in 1986 with production deliveries commencing in 1989.

CONTRACTOR
Elta Electronics Industries Ltd (a subsidiary of Israel Aircraft Industries Ltd), Ashdod, Israel

4640.353
SPS-20 AIRBORNE SELF PROTECTION SYSTEM

The SPS-20 is a wideband warning system, designed to fit existing airborne installations while providing improved characteristics and additional capabilities. The system detects and displays pulsed radar threats operating within the 0·7 to 18 GHz frequency range. CW radar threats are detected by a dedicated high sensitivity receiver. A high sensitivity, 3-inch display unit provides an alpha-numeric presentation of the type, coarse angle-of-arrival, relative lethality and status of the analysed radar threats.

The SPS-20 features an advanced digital signal analyser which executes data processing and interfacing tasks. It also provides an extensive emitter library file which can be easily updated for new and changing environments and/or systems. The system was originally designed for helicopters but has also been used in fighter aircraft

SPS-200 AIRBORNE SELF PROTECTION SYSTEM

The SPS-200 is an airborne self protection equipment which has been developed from the SPS-20 (**4640.353**), to detect and display pulsed and CW radar threats in the frequency range 1 to 18 GHz. As with the latter equipment it has been designed to fit existing installations, to provide improved characteristics and additional capabilities, as well as being suitable for new installations in the latest aircraft.

The system incorporates an advanced digital signal analyser that provides data processing and interfacing tasks. It operates in conjunction with an optional MPMN-36(V) flare/chaff dispensing sub-system and can interface with on-board radars and jammers. A 3-inch CRT azimuth indicator provides an alpha-numeric display of the type, angle-of-arrival, relative lethality and status of the threats. An extensive threat emitter library, which can be easily updated, provides the necessary comparison information with the incoming signals.

STATUS
In production.

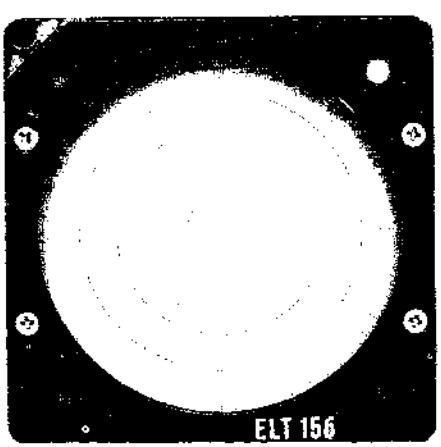
ELT/156 RADAR WARNING RECEIVER

The ELT/156 airborne passive warning receiver is designed to provide rapid non-ambiguous warning of illumination by an enemy search or tracking radar transmission. It is intended for use on light fighter/ground attack aircraft and helicopters employed in the low altitude ground support activities.



The ELT/156 provides warning against radar threats through the frequency coverage of the appropriate radar bands, full 360° azimuth and elevation coverage and bearing/range presentation on a cockpit mounted dual mode bright display. An audio warning facility is also provided to alert the pilot of possible danger. Simultaneous warning is given of multiple threats.

The system is computer-controlled and provides a very high measure of protection and warning for aircraft forced to enter areas protected by radar controlled surface-to-air and air-to-air missiles or anti-aircraft artillery. The software is easily reprogrammable to combat new types of threats

CHARACTERISTICS
Azimuth coverage: 360°
Weights
Antenna (4 off): 0·15 kg each
RF head (2 off): 1 kg each
Signal processor: 5·2 kg
Display: 1·9 kg
Control panel: 0·6 kg
Total system weight: 10·3 kg

STATUS
The system is currently in production for a number of national air forces.

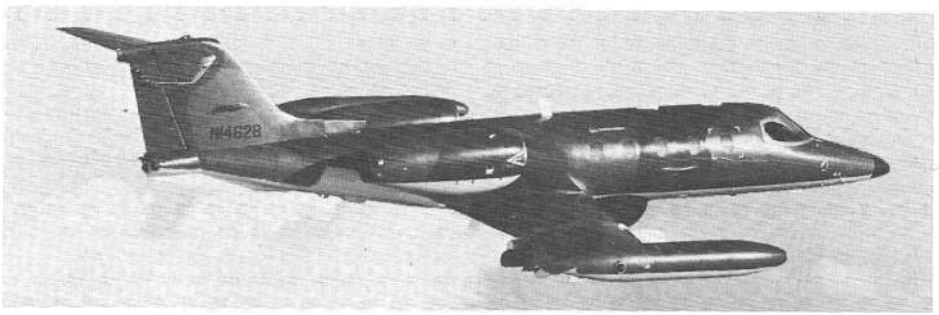
ELT/263 AIRBORNE ESM EQUIPMENT

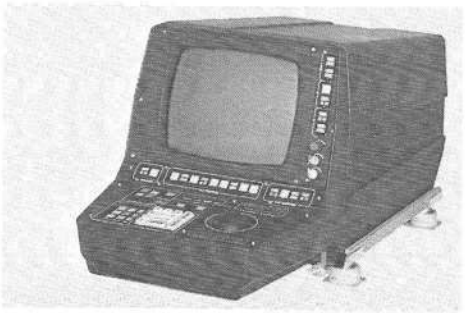
The ELT/263 airborne ESM system is designed principally for use in maritime aircraft such as the Beech 200T but has been configured for other types such as the Guardian, Casa C212, Learjet 36A, F27 Maritime, Bandeirante, Piaggio P166, and Britten Norman Maritime Defender. The surveillance of coastal water is the main function, and detection, analysis and identification of emission in the E- to J-bands is performed in addition to bearing measurement, which permits emitter location by using a series of successive bearing measurements.

The ELT/263 equipment, in addition to its surveillance tasks, provides for emitter location by the triangulation method. The information gathered (emission analysis, identification, bearing, etc) can be transferred to external users such as ground stations, naval units and the patrol aircraft's radar operator/tactical navigator, and can also be recorded on an optional printer. The system's coverage is depicted in the diagram and the associated tables.



The main items of equipment comprise: a set of four DF antennas; an omni-directional antenna set; DF receiver; IFM receiver; ESM display and control console; a radar warning processor; and a radar warning display unit.

STATUS



Production and in operational service.

4168.393
ELT/555 JAMMER POD

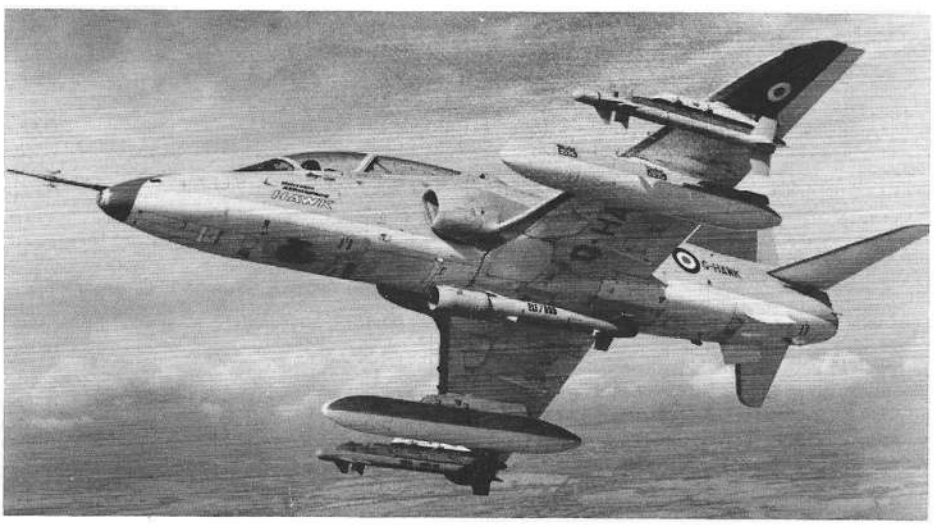
The ELT/555 is a pod-housed airborne deception jammer and warning system designed for the self-protection of modern attack and fighter aircraft from enemy anti-aircraft systems (surface-to-air and air-to-air, and anti-aircraft artillery). The system is completely self-sufficient as regards cooling and primary power and makes no demands whatsoever on the carrier aircraft's power supply. The philosophy adopted for the ELT/555 system ensures that the jammer will automatically tailor its reaction to the type of detected enemy radiation. The system operates against both pulsed and CW radar emissions and presents the following salient operational features: simultaneous multi-threat reaction; very high resistance to ECCM, including any type of frequency agility; full automation; optimised threat deception programs; multi-band frequency coverage (H- to J-band).

The equipment is effective against all types of fire control radars, say the manufacturers, and active or semi-active homing missiles. Various deception techniques are employed, and multiple target engagement is possible.

Air speeds of up to Mach 1·1 at sea level and Mach 1·5 at 40 000 feet were tested during the qualification of the pod. The central main body section and tail module is completely clean, except for the two bottom radomes and stabilising fins. The latter, located toward the rear of the main body section, serve to increase the safety envelope during jettison. The pod can be jettisoned by the pilot and is provided with a self-destruction device. Self-destruction occurs at a presettable interval after the jettison command. The device can be installed or removed at flight-line level.

The pod is provided with a cooling system and self-sufficient power generating system which supplies the electric power necessary to the pod's equipment, independent of the carrier aircraft's supply. The prime mover of the power generating system consists of a ram air turbine (RAT) which drives a four-pole permanent magnet generator. The RAT also drives the compressor of the pod's cooling system, which operates on a closed circuit fluid recycling principle.

There are forward and rear facing CW transmission antennas on the under-surface of the pod body, and nose and tail radomes house antennas for transmission and reception of pulse signals, and reception of CW signals.



The ELT/555 pod measures 300 cm in length, with a body diameter of 27 cm (34 cm RAT maximum) and a weight of 140 kg. Types of aircraft nominated by Elettronica as capable of using the ELT/555 include: F-5, Mirage III, Alpha Jet, MB 326, MB 339, Jaguar, Mig-21, Phantom, Mirage 5, Hawk, Saab 105, etc.

STATUS

In production and operational service. No contractual information is available.

ELT/555 jammer mounted on the ventral pylon of a BAe Hawk

4359.393
ELT NOISE JAMMER PODS

A range of pod-contained automatic airborne noise jammers, ELT 457, 458, 459 and 460 are designed by Elettronica for installation in high performance ground attack and fighter aircraft. They are intended for operation against ground based air defence radars to mask target infomation on attacking and thereby neutralise anti-aircraft systems. Instantaneous automatic warning is given against pulsed radar emissions, with a very high resistance to ECM, including any type of frequency agility. Multi-threat reaction capability is provided and each jammer contains a large 'library' which can be programmed before flight with a selection of probable radar threat characteristics and relative priority levels.

The systems incorporate power management techniques, by which jamming power and optimised

modulation are allocated on a threat priority basis, ie the signals for jamming are radiated in the correct sector, at the correct time and at the appropriate frequency. The power management philosophy therefore ensures that the entire electromagnetic resources of the system are directed against the most dangerous programmed threat or threats.

Each of the four system variants operates on a different radar frequency band and pod deployment can be optimised in view of the expected threat; simultaneously multi-band frequency coverage can be achieved by deploying more than one pod on one or more aircraft.

The pods can be jettisoned by the pilot and are provided with a self destruct device. Self-destruction occurs after a presettable interval after the jettison command.

The main unit of the ELT range is the external pod designed for supersonic speeds up to Mach 1.1 at sea level and Mach 1.6 at 40 000 feet. The pod houses the receivers, transmitters and relevant antennas, the warning processor and the cooling and power generators. The antennas, which are protected by radomes, differ for each type of noise jammer pod. A control panel is installed in the cockpit containing the commands for two pods.

The jammer electronics have been designed for easy maintenance with modular construction and easy access. The pods are provided with a self-sufficient power system in order to render them independent of the aircraft supply. The prime mover of the power generating system is a ram air turbine (RAT).

ELT/562 AND ELT/566 DECEPTION JAMMERS

These are deception jammers designed for internal installation in both fixed and rotary wing aircraft. The ELT/562 is intended to counter pulse radar threats while the ELT/566 operates against CW systems. One or both jammers may be associated with an airborne ESM system such as the Colibri (**4360.353**). The jammers are effective against threats operating in the H to J bands (6 to 20 GHz), and are intended to protect aircraft in battlefield environments.

5796.353
ELT/999 AIRBORNE COMINT SYSTEM

The ELT/999 is designed specifically for airborne applications as a strategic communications intelligence system able to perform surveillance over very large areas at the border of a country, or in difficult access areas, and to classify and recognise a variety of emitters. It provides fast surveillance to ensure intercept on of communications emissions in the VHF and UHF bands, even those of short duration, and direction finding and location of the detected emitters. Technical analysis and demodulation of the intercepted signals is performed for the purpose of monitoring and/or recording on the intelligence information. The collected data is computer-processed and presented to the operators on several displays, including alpha-numeric plasma displays, panoramic and graphic presentations and CRT displays for monitoring.

The ELT/999 is designed for medium-sized aircraft, is of a modular concept, and can be easily configured to fulfil all the different operational requirements for COMINT purposes. The instantaneous surveillance coverage of the system against a typical emitter is approximately 20 per cent greater than the geometrical horizon of the airborne platform, eg at an altitude of 4000 feet (1200 metres) the coverage radius is about 160 km.

The equipment makes use of advanced signal processing and handling techniques, as well as software controlled functions, which provide the high degree of flexibility to render it suitable for different types of missions. It incorporates a high level of automation and advanced human engineering design for easy operation. A single supervisor can control the complete system while up to three operators perform monitoring tasks. The weight of the system depends on its configuration, the maximum being approximately 900 kg.

4360.353
ELT COLIBRI HELICOPTER ESM/ECM SYSTEM

The Colibri system is an integrated ESM/ECM equipment designed for installation on any type of medium sized helicopter operating in the naval surveillance, anti-submarine and anti-ship roles, thereby extending the ESM/ECM range of the parent ship. The system provides a helicopter with the facilities for passive surveillance, DF analysis, identification and location of radar emitters, even when the system is operating in a dense electromagnetic environment. It also provides for effective self or mutual protection against radar guided missiles.

Colibri can be configured to meet particular operational roles by combining a variety of basic modules. The basic configuration is represented by the ELT/161 ESM and radar warning system. A helicopter's radar warning function can then be supplemented by the ELT/562 deception jammer to obtain effective self-protection and the configuration can be further expanded by the addition of the ELT/261 for ESM capability and ELINT roles. An additional unit, the ELT/361, can be added to achieve even greater protection capability.

In the basic configuration, Colibri comprises the ELT/161, consisting of a receiver, the antenna system, a warning processor and a radar warning display. The ELT/161 operating in conjunction with the ELT/261 system, gives overall capability in that field and is designed to fulfil the maritime surveillance and EW roles to extend the electronic warfare range of the parent ship. In this role, the system supplies instantaneous DF and display of intercepted emissions, frequency measurement of pulse and CW emissions, automatic analysis, identification of source and automatic tracking of selected emissions. The addition of the ELT/562 deception jammer provides the helicopter with self-protection against sea-to-air and air-to-air missiles. The ELT/361 noise jammer is added to suppress enemy surveillance radars.

4642.353
SMART GUARD HELICOPTER ESM SYSTEM

Developed for helicopter operation, Smart Guard provides continuous and automatic surveillance of VHF/UHF communications bands. In particular, the system can intercept, analyse and DF any signal in these bands, even those of extremely short duration. Smart Guard will automatically correlate successive intercepts of the same emitter for location purposes.

Basic elements of the system are:

(1) a high scan velocity surveillance receiver
(2) an analysis and monitoring receiver with associated IF display
(3) a very high precision direction finder
(4) a computer and data processing system
(5) a plasma display
(6) a dual-track audio recorder
(7) a digital recorder for mission data.

Smart Guard performs automatic surveillance of one or more frequency ranges, automatic control of predetermined channels, demodulation of intercepted emissions for operator audio or recording, and display of the data acquired.

STATUS
In production.
CONTRACTOR
Elettronica SpA, Via Tiburtina Valeria, Km 13700, 00131 Rome, Italy.

4643.353
FAST JAM HELICOPTER ECM SYSTEM

Fast Jam is a communications ECM system developed specifically for helicopter installation. The system provides surveillance and automatic jamming of hostile emissions with provisions to safeguard friendly emissions.

System elements consists of:

(1) an analysis and monitoring receiver with associated IFF display. The receiver is computer-controlled and operates in look-through mode during jamming to confirm the continuing presence of the hostile emission

(2) a computer for system management which controls the status of the channels under surveillance, processes and displays the collected data and activates jammers following stored instruction

(3) one or more solid-state jammers

(4) a plasma display.

The system normally operates in an automatic mode under the supervision of the operator who assigns the initial instructions, updates of which can be made even during a mission. In the automatic mode the system has an extremely short reception and transmission time. The system may also be wholly or partially manually controlled. Sophisticated jamming techniques allow surveillance of the hostile emission (look-through) and the simultaneous jamming of more emissions without loss of effectiveness.

STATUS

In production.

3382.393
IHS-6 ESM/ECM EQUIPMENT

The IHS-6 is an integrated ESM/ECM system designed for tactical ECM missions in operational roles such as stand-off jamming, support for air strikes against ground targets, fleet protection etc. The system is composed of two main sections: the RQH-5 ESM system, and the TQN-2 modular jamming system.

The former has evolved in at least two versions, denoted by a suffix /1 or /2; the latter is modular and computer based, and is the variant employed in IHS-6 to provide detection, analysis and identification of any radar emission in the 1 to 18 GHz band. The wide open receiver is of the instantaneous frequency measuring (IFM) type with monopulse DF capabilities for automatic emitter analysis, warning and tracking. There is capacity for an automatic emitter library of more than 2000 types and at least 50 targets can be tracked in real-time. A CRT display provides multimode presentation with alpha-numeric and graphic facilities. The ECM jammer section of the system,TQN-2, enables up to four bands to be jammed from one helicopter installation in the full capability model (the system for the Agusta A 109A EW helicopter has two jamming bands only) with a steerable antenna for I- and J-band targets and fixed antennas for the other bands. Jamming modes available include: spot, barrage, and hybrid, and as an option, chaff release for passive countermeasures can be incorporated.

IHS-6 ESM/ECM helicopter equipment mounted on a Westland Commando helicopter

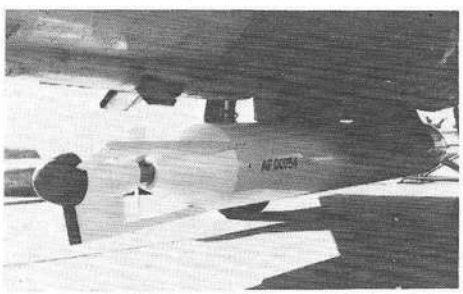
Selenia RQH-5 ESM system console in a helicopter installation

The installation on the Agusta A 109A helicopter comprises RQH-5 DF antennas mounted on the underside, rear (2), and nose (2) of the aircraft; two FBR-2 antennas on the rear fuselage; a TQN-2 I/J-band antenna; an FR-2X IFM receiver; RQH-5 ESM transceivers; processing unit; auxiliary unit; and a power supply unit.

CHARACTERISTICS

ESM section (RQH-5 receiver)
Frequency coverage: 1 - 18 GHz
Azimuth coverage: Omni-directional
Receiver type: Wide open, with IFM and monopulse DF
Emitter analysis, warning and tracking: Automatic
Tracking capacity: >50 emitters (real-time)
Automatic identification library: >2000 emitters
ECM section (TQN-2 jammer)
Frequency: Selectable
Antenna: High gain
Polarisation: Random
Jamming modes: Spot, barrage, hybrid
Precision AFC on selected emitters

STATUS



Among the exports reported for the IHS-6 system are Westland Commando EW helicopters for the Egyptian forces.

4174.393
SL/ALQ-234 ECM POD

The ALQ-234 is designed to provide protection against AA artillery radar directors and surface-to-air missile systems, and it also provides a radar warning facility for the pilot, to indicate any threat which has locked onto the aircraft. It is self-contained and incorporates its own broad-band ESM section, using a wide-open receiver, and intercepted data are fed to the pod's on-board digital computer for use in threat list compilation and comparison against an existing threat library. Intercepted threats are arranged in order of priority automatically. The computer also performs jamming power management against several threats simultaneously (where necessary) in order of priority. Travelling wave tube (TWT) transmitters are used for jamming, covering a band about 6 GHz wide in the fire control region of the radar spectrum. Closed-loop liquid cooling combined with air cooling allows aircraft speeds and altitudes ranging from low level/speed to supersonic/high altitude to be accommodated.

Selenia SL/ALQ-234 self-defence ECM pod for carriage by high performance aircraft

Each pod contains three jammers, a receiver/processor and antennas at each end. One jammer, at the front, is used to counter doppler and CW threats. Two centrally located jammers are 'smart-noise' transmitters. The rear section houses the superheterodyne radar warning receiver (RWR) with an instantaneous frequency measurement (IFM) system.

CHARACTERISTICS

Pod
Length: 3·825 m
Diameter: 414 mm
Weight: 270 kg
Power generation: RAT, 7·5 kVA
Cooling: Dual circuit with heat exchanger
Pulse countermeasures
Frequency band: I-J
Sector coverage: Fore and aft
Detection: Built-in RWR with automatic designation and reaction management

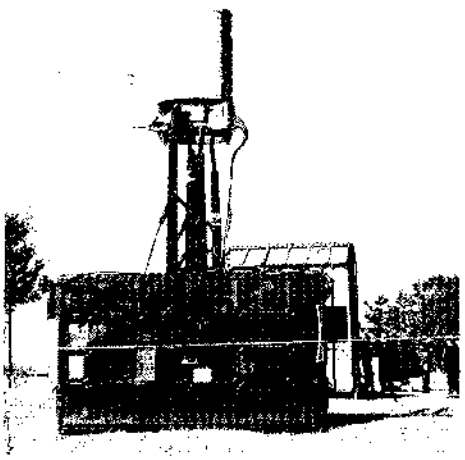
Jamming: Noise and deception. Multiple threat capability by computer controlled power management
CW countermeasures
Frequency band: H-J
Sector coverage: Fore
Detection: Built-in RWR with automatic designation and reaction management
Jamming: Deception. Multiple threat capability

STATUS
Earlier ALQ-234 pods have been supplied to air forces of other countries and it is still in production. A new version has completed trials and is now in production for the Italian Air Force. Development is being carried out on versions with a lower frequency capability (eg C, D, E, F-bands) for use against air defence search radars. The Egyptian Air Force has equipped its Mirage 5 and MiG-21 aircraft with ALQ-234 pods.

CONTRACTOR
Selenia Industrie Elettroniche Associate SpA, Special Equipment and Systems Division, Via dei Castelli Romani 2, 00040 Pomezia, Rome, Italy.

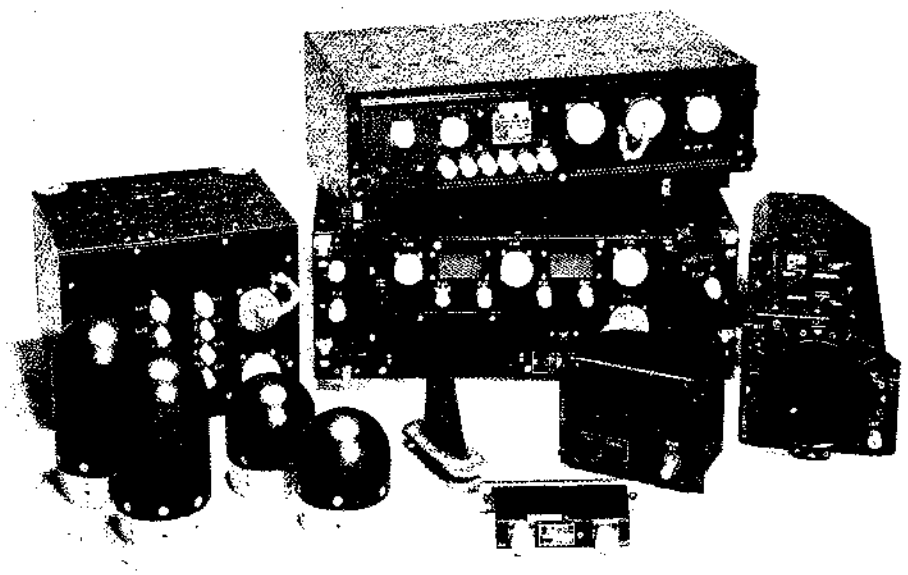
5830.353
MODEL 700 SERIES EW SUITES
Selenia is developing two new EW suites based on its earlier RQH-5 system. These are known as the Model 720 and 730 and are internally-mounted, integrated systems. The former is a passive warning system designed for use on attack helicopters and fighter aircraft and includes a radar warning receiver with an IFM receiver and sophisticated processing equipment. The system can be used in conjunction with the new range of Selenia dual-mode noise/deception jammers, which operate over the 1 to 18 GHz frequency range, and is then renamed as the Model 780. The Model 730 is designed for use in maritime patrol aircraft and helicopters. It is a complete ESM system which can also be fitted with limited ELINT facilities.

STATUS
In development.
CONTRACTOR
Selenia Industrie Elettroniche Associate SpA, Special Equipment and Systems Division, Via dei Castelli Romani 2, 00040 Pomezia, Rome, Italy.



JAPAN

4176.093
JAPANESE EW EQUIPMENT
As with many other categories of defence equipment, Japanese requirements for electronic warfare equipment have previously been met mostly from American sources, but with the steady development of advanced technical abilities and facilities in Japan an increasing range of defence hardware is being produced indigenously. This entry summarises the information about such items that has been obtained.
J/APR-1
A radar warning receiver (RWR) developed by Tokyo Keiki Co Ltd, for the Japanese F-104J Starfighter. Production has long since been completed and the equipment will be retired from service in the near future.
J/APR-2
This RWR was also developed by Tokyo Keiki for the Japanese F-4EJ Phantom. Production has been completed and the equipment is still in service.
J/APR-3
Based on the J/APR-2, this RWR was designed by Tokyo Keiki to update the threat capability for the Japanese F-1 support fighter. The system is still in service.
J/APR-4
Based on experience gained in the course of development of the J/APR-2 and -3, Tokyo Keiki has designed an advanced RWR, designated the J/APR-4, for the Japanese F-15J Eagle. This is capable of processing multiple inputs simultaneously in a dense electromagnetic environment and has a digital computer with a reprogrammable software package to permit reconfiguration to meet future threats. The indicator provides for daylight viewing and multiple-threat data presentation in alpha-numeric and graphic format. The system is also designed to interface with other on-board aircraft EW equipment such as J/ALQ-8, etc.
AIRBORNE EW
Various other items of airborne EW equipment have been identified and associated with a number of specific Japanese aircraft types. Although detailed information on the hardware remains classified, the following list shows a number of known EW equipment/aircraft associations:



EW Equipment	Aircraft Type
J/ALQ-2	T-33
J/ALQ-3	C-46, YS-11
J/ALQ-4	F-104
J/ALQ-5	C-1
J/ALQ-6	F-4, ET-2 (F-1)
J/ALQ-8	F-4, F-15J
J/APR-1	F-104J
J/APR-2	F-4EJ
J/APR-3	F-1
J/APR-4	F-15J

The J/ALQ-8 countermeasures set is understood to operate in three bands: 1 – 4, 4 – 8, and 7·5 – 18 GHz.
CONTRACTORS
Mitsubishi Electric Corporation, Mitsubishi Denki Building, 2,2-chome, Marunouchi, Chiyoda-ku, Tokyo 100, Japan.

Tokyo Keiki Company Ltd, 16, 2-chome, Minami-Kamata, Ohta-ku, Tokyo, Japan.

This unidentified item of Japanese equipment is apparently a transportable battlefield ESM system, although the flexible waveguides which can be discerned on the original photograph could equally indicate facilities for transmission at microwave frequencies. This would suggest a possible combined ESM/ECM role for the equipment. (K Ebata)

The J/APR-4 radar warning receiver system designed by Tokyo Keiki Co for the F-15J Eagle aircraft. Multiple threats can be handled on a simultaneous basis

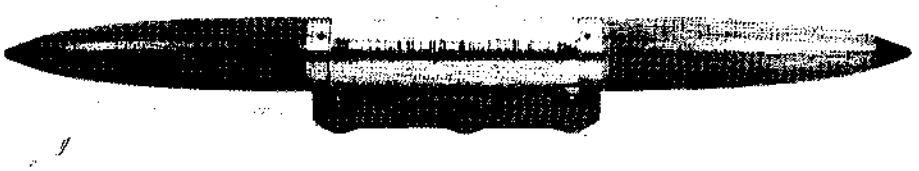
SPAIN

5815.053
SPANISH EW PROGRAMME
Until recently the Spanish electronics industry has designed and manufactured little or nothing in the electronic warfare field. The ground-based, naval and airborne EW systems in use by the armed forces are of foreign design, primarily US or French. However the Spanish Ministry of Defence is now engaged on the design of a comprehensive EW programme due to be completed by the end of 1985. It is understood that this programme is of the highest priority and combines the efforts of private and state-owned companies and research laboratories throughout the country. The objectives are to obtain the widest range of electronic measures and countermeasures, support systems, intercept/ELINT systems and threat warning equipment.

The Ministry of Defence will co-ordinate the programme which will involve 42 armed forces research centres, 51 university research centres and 130 private and state-owned companies. The programme is understood to be worth some 678

million pesetas (approximately $4 million as at April 1985), two-thirds of that sum being in the form of government subsidies. The research and development investment will be devoted to work on ELINT equipment, radar threat warning systems and frequency hopping transceivers. One of the aims of the programme is reported to be the provision of monitoring systems for the Spanish Air Force capable of observing military operations in North Africa.

The principal company likely to be involved in the programme is probably EISA (Experiencias Industriales SA) of Aranjuez, Madrid.



STATUS
Programme definition stage. The design and development programme is scheduled to stretch over the period 1985 to 1987.

AR 753 JAMMER SET-ON RECEIVER

The AR 753 set-on receiver has been designed for use with the AQ 31 range of pod mounted jammers (**3024.393**). As all components employed in the AR 753 have good wide-band characteristics, the operating ranges can readily be varied. Other features claimed include high sensitivity and good selectivity, with digital indications. The cockpit unit, which is common to all pod configurations, contains the displays, the antenna selector switch, and the gain control. Pod dimensions are 1600 mm long, by 140 mm diameter, and the weight is 25 kg. All other information on the AR 753 remains classified.

AR 753 jammer set-on receiver pod

STATUS
In production and operational.

CONTRACTOR
SATT Communications AB, PO Box 32701, 126 11 Stockholm, Sweden.

3537.393
AR 765 RADAR WARNING RECEIVER

The AR765 is a lightweight radar warning receiver (RWR) specially designed for fitting on the Agusta Bell 206A Jet Ranger helicopter, but also suitable for use with other types of fixed-wing aircraft and helicopters. The AR 765 provides visual and aural threat warning and indication against surveillance as well as fire control radars, and specific features include: DF and homing facilities; multi-octave band frequency coverage; built-in test equipment (BITE). In the case of the Jet Ranger, installation is very simple as the main unit is designed as a direct replacement for the battery access panel in the front of the helicopter fuselage, and the RWR is bolted on in place of the normal battery hatch cover plate.

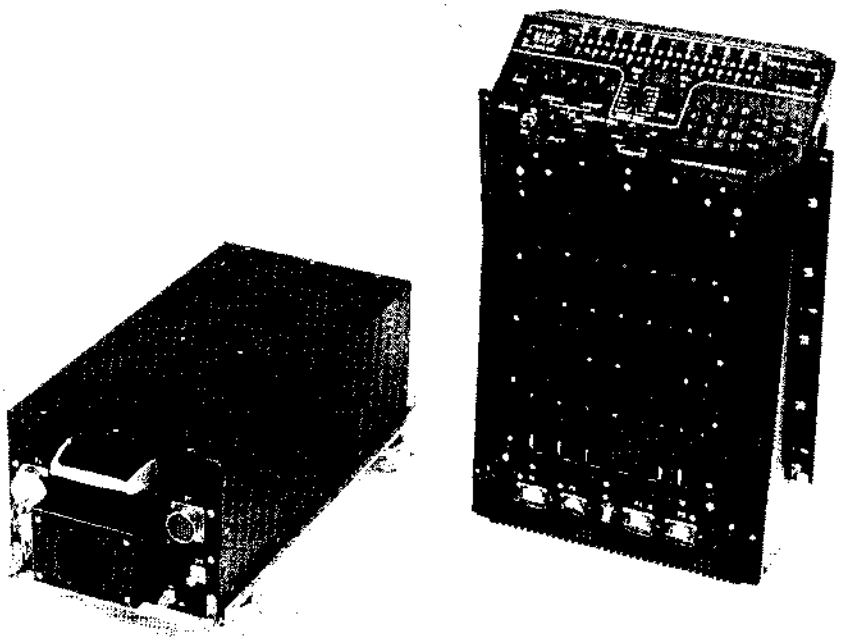
CHARACTERISTICS
Frequency coverage: Multi-octave or narrow-band
Warning sectors: 2 in front ±45° relative to line of flight
Azimuth coverage: ±90°
Elevation coverage: ±45°
Antennas: Broad-band circularly polarised spirals
Receiver: Crystal video, 2 channels
Sensitivity: -40 dBm (TSS)
Dynamic range: >40 dB
Minimum pulsewidth: 0·1 μs
Threshold adjustment range: 35 dB (from cockpit)
Threat indication: Lamps on panel, and headset
Supply voltage: 28 V DC, 40 VA
Options: CW detection, rejection on non-hostile emitters, laser warning

STATUS
In service but no longer in production.

CONTRACTOR
SATT Communications AB, PO Box 32701, 126 11 Stockholm, Sweden.

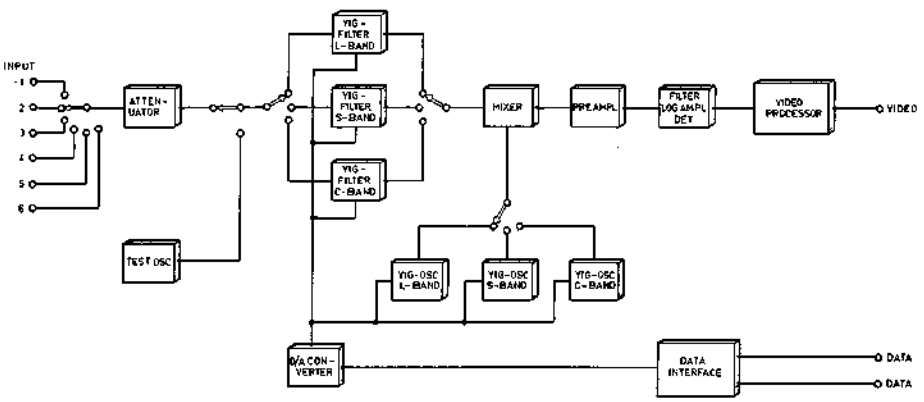
3904.393
AR 777 AIRBORNE MICROWAVE RECEIVER

The AR 777 is a rugged, computer-controlled airborne microwave receiver intended for signal acquisition and jammer set-on. The system performs rapid and unambiguous detection and identification of emitters in dense signal environments.



The AR 777 is a superheterodyne receiver with a high performance YIG-tuned RF head. Due to linear YIG oscillators, a special IF processor and a microcomputer-controlled calibration routine, an excellent frequency accuracy and resolution has been obtained over the entire frequency range.

It covers the frequency range 1 to 8 GHz with three RF-heads, each covering one octave. An RF-head includes YIG-filters, YIG-tuned oscillators and drive circuits. By adding or replacing RF-heads the frequency range can be extended or changed. The receiver uses several modes of tuning and sweeping which are controlled by a microprocessor.



In the present design, two sweep widths are selected, 100 and 300 MHz. The YIG-filters are designed so that they overlap each other; in this way switching between the filters while sweeping is avoided. In order to optimise frequency tracking and linearity over environment, the YIG-filters and local oscillators are matched with their respective drive circuits. The 4-pole YIG-filters have 25 MHz 3 dB bandwidth, spurious depression outside band 70 dB and skirt selectivity of 24 dB per octave. An SP6T switch is used to select any of six inputs to the receiver (see block diagram). A double balanced mixer followed by a preamplifier generates the IF of 160 MHz. Log amplifiers and bandpass filters are used together with a video processor using special techniques to get very high selectivity and unambiguous readouts.

The receiver uses a microprocessor to perform control functions and to process, store and display data. All RF circuits are housed in a standard ATR package called the receiver unit. The microprocessor and associated circuitry are housed in a tailor-made unit called the display unit.

The two units communicate through a digital 32-bit serial word data highway which contains information for the tuning (12 bits), control functions and parity check. A D/A converter converts the digital data to tuning voltages for the YIG components. A keyboard on the display unit is used to communicate with the

SATT AR 777 airborne microwave receiver with display unit on right

Block diagram of AR 777 receiver

microprocessor. This is also used to select the centre frequency. The received signals are displayed on a spectrum-type display consisting of two rows of lamp indicators (see figure). The upper row has a memory function and stores the displayed data for a preset time while the lower row gives a momentary indication. Different search patterns can be initiated as well as a fixed tuned mode. In this (identification) mode the PRF is evaluated and the result is displayed on two digital displays. The displays can simultaneously display two PRFs. If more than two PRFs are present at one RF-frequency they are displayed sequentially on one of the displays. A separate display is used to indicate if garbled or jittered PRFs are present. The spectrum analysis mode is used for recording the output spectrum from a co-operating jammer system.

A digital output is provided from the microcomputer. All essential panel settings and all received emitter information can be transmitted in serial form to an external digital recorder. Stored data can be further analysed in a ground based evaluation equipment.

CHARACTERISTICS

Frequency range: 1 - 8 GHz (std)
Sensitivity: -65 dBm
Dynamic range: 65 dB
Sweep width: 100/300 MHz
Sweep rate: 10 sweep/s
Frequency accuracy: 5 MHz
Frequency resolution: 5 MHz
PRF measurement: 200 - 2000 Hz
PRF accuracy: 1 Hz
Power supply: 200 V 3-phase 400 Hz 300 VA
Dimensions
Receiver unit: 497 × 257 × 194 mm
Display unit: 580 × 355 × 173 mm

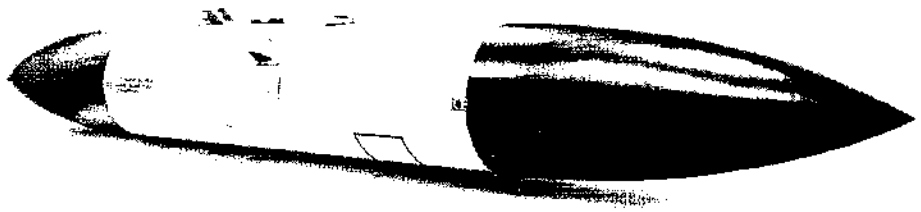
AR 830 AIRBORNE WARNING SYSTEM

The AR 830 is a fully programmable threat warning system for the detection of radar and laser transmissions. It incorporates a special purpose, high speed signal processor, a general-purpose computer and broadband receivers for both radar and laser signals. It is modular in design to allow updating of the system to handle new threats and can be interfaced to jammers, chaff dispensers, flare dispensers, recorders and other systems.



The signal processing provides rapid and unambiguous threat identification in dense electromagnetic environments and an extensive emitter library allows comparison and fast analysis of threats. The library can be easily reprogrammed and updated with new threat information. The incoming threat data is either displayed on a separate CRT or integrated with the aircraft display system.

AQ 31 JAMMER

The AQ 31 is CW radar jamming equipment designed for aircraft pod mounting and up to full band coverage in the E- to J-bands can be provided. Few specific details have been released but AM, FM noise/sawtooth jamming modes are known to be available and high power output is claimed. Ram-air cooling is employed. Digital control of all major functions is provided and interface facilities are available for use of the AQ 31 with digital signal processing equipment. A single control panel in the cockpit enables operation of one or two pods, and pre-programmable routines can be employed. The manufacturers also offer a bolt-on companion set-on receiver for use with AQ 31 jamming pods, designated AR 733 (**3025.393**). No other details are available for publication.

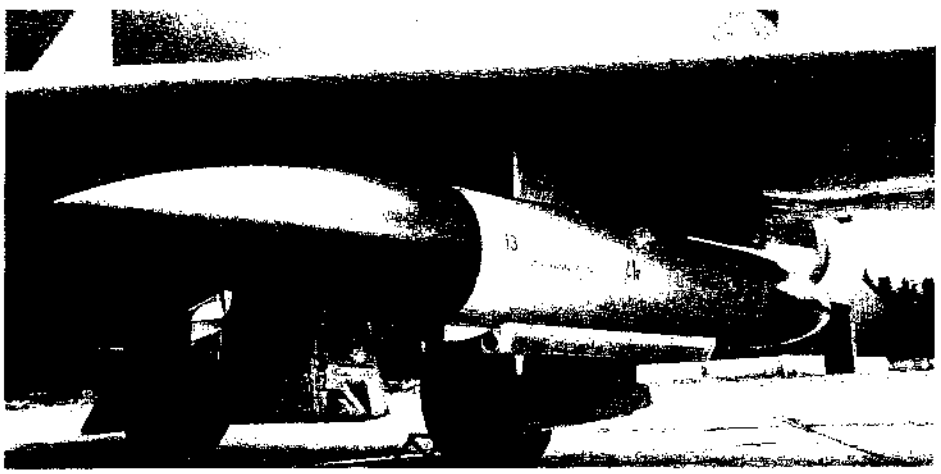
SATT Communications AB, PO Box 32701, 126 11 Stockholm, Sweden.

4361.393
AQ 800 JAMMER



The AQ 800 jammer is intended for use in the training of radar operators and for evaluation of radar station performance. It is pod-mounted and hung from a pylon under the wing or fuselage of an aircraft, the pod is ram-air cooled and has its own built-in cooling system. The method of mounting is flexible to allow mounting on many different types of aircraft.

The system consists of a pod and a cockpit unit. The pod contains a TWT type transmitter and a sweeping superheterodyne set-on receiver. Each pod covers one frequency band, either S-, C-, X- or Ku-band. The cockpit unit can handle two jammer pods of any frequency combination. The transmitter can generate up to three simultaneous jamming signals. The modulation, centre frequency and bandwidth of each signal are independent of each other. Available modulation types are AM-noise, FM-noise and FM-sawtooth plus noise.

Both the receiver and the transmitter have two antennas, one pointing forward and the other pointing aft. Either direction of operation is selected from the control panel. The system can be operated by a special instructor operator or by the pilot himself.

CHARACTERISTICS

Frequency range: S band (2-4 GHz), C-band (4-8 GHz), X-band (8-12 GHz), Ku-band (12-18 GHz)

AQ 800 airborne jammer

Signal generators: Each pod contains 3 signal generators, each generator covering the following part of the band: S-band 700 MHz, C-band 1200 MHz, X-band 2000 MHz, Ku-band 2000 MHz
Antennas: 2; beamwidth 70° horizontal, 30° vertical. Polarisation is slant linear
Weight: 220 kg
Dimensions: 3·9 m long × 0·43 m wide × 0·52 m high

4734.393
AQ 900 AIRBORNE SELF-PROTECTION SYSTEM

The AQ 900 is a pod-mounted automatic jamming system which is available in different wideband versions covering the frequency range from S-band to Ku-band. The complete system consists of two pods, operated from one cockpit control unit, one pod for jamming search radars in S-band and one for jamming fire control radars in X- or Ku-band. The pods are systemwise interchangeable and are designed for pylon mounting on the aircraft.

The S-band and X/Ku-band versions are essentially identical in operation and consist of a receiver, a threat analysis unit, a decision and control unit and a transmitter. Each pod has its own ram air turbine generator and cooling system.

The receiver contains all the RF and signal processing circuitry for reception and threat identification. The signal is then passed to the analysis unit where the signals are analysed and compared with data stored in the system library. The decision and control unit includes a microcomputer that gives the system tactical flexibility and allows threat priority, technique selection, power management, signal generation and control, and cockpit control and indicator interface.

The transmitter contains all the signal generating circuitry and the high power TWT amplifier. The X and Ku-band version also contains a unit for various deception techniques to counter fire control and tracking radars.

SATT Communications AB, PO Box 32701, 126 11 Stockholm, Sweden.

5797.393
LOKE RADAR JAMMER SERIES

The Loke radar jammers constitute a family of self protection systems. They employ modern technology to counter airborne and ground-based fire control radars or missile guidance systems, and are effective against both CW and pulse systems. Loke is designed for compatability with the Saab Viggen, or aircraft with standard 14 or 30 inch suspensions. The Loke family includes jamming systems for tactical and training purposes, the versions differing in terms of software control, frequency range and available jamming techniques.

STATUS
In production and in operation with the Swedish Air Force.
CONTRACTOR
Ericsson Radio Systems AB, Airborne Electronics Division, 163 80 Stockholm, Sweden.

5666.393
BO SERIES COUNTERMEASURES DISPENSERS

A range of aircraft countermeasures dispensers is currently in production or development by Philips Elektronikindustrier.

BOZ 100

This is a pod-mounted advanced ECM dispenser originally developed for the Swedish Air Force but also supplied to export customers. It is capable of sophisticated break-lock and corridor operation at subsonic and supersonic speeds and provides self-protection against electromagnetic and heat-seeking missiles. The unit has a comprehensive EW system interface and is suitable for use in deep-penetration strike, reconnaissance and EW roles. It is microprocessor controlled and has a reprogrammable memory.

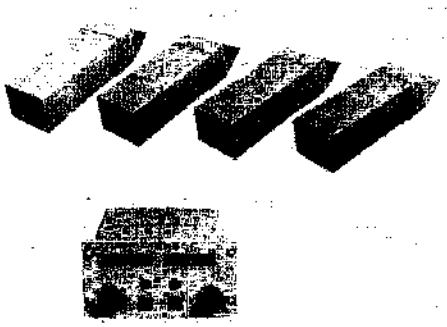
STATUS
In service with the Swedish Air Force (under the nomenclature BOX 9), and also fitted to the Tornado and the French Air Force Jaguar.

BOZ 3

BOZ 3 is a high capacity chaff pod dispenser originally designed to a Swedish Air Force requirement and since adapted for training use. It can be manually or automatically initiated and has both break-lock and corridor chaff modes.

STATUS
In production.

BOP 300



The BOP 300 is designed for the protection of light- to medium-weight fighter aircraft. It is modular in design and can be adapted to various requirements by the addition of one to eight dispensing blocks to dispense both chaff and IR flares. The dispensing blocks are designed to give maximum mounting flexibility to avoid interference with the aircraft stores capability. The unit can be adapted to different types of chaff and flare ammunition.

STATUS
In development.

BOH 300

A chaff/flare dispenser for helicopters and designed to provide protection in hovering and forward flight. It is processor controlled and has reprogrammable operation features. The BOH 300 is suitable for radar, optical and IR deployment. The dispensers can be mounted on the landing gear, fuselage or weapon hard points.

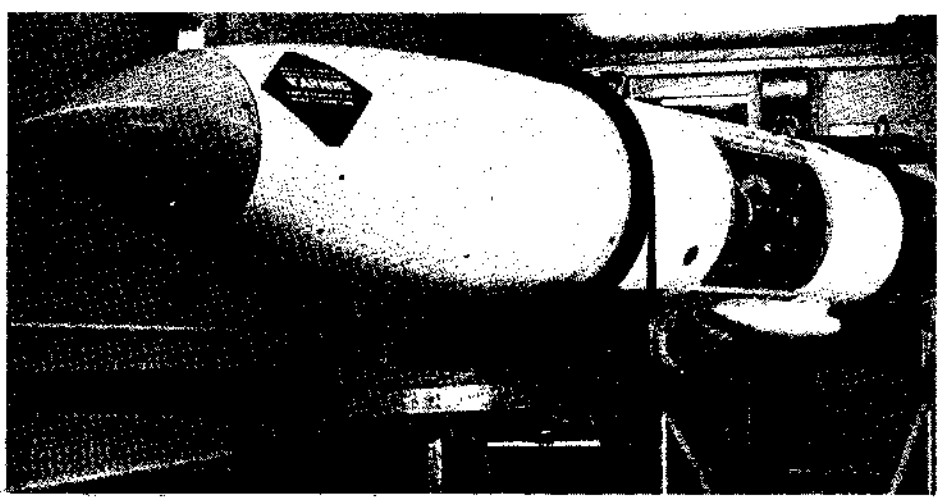
ARI 23246/1 ECM POD (SKYSHADOW)

The ARI 23246/1 (Skyshadow) ECM pod was first shown publicly at the 1976 Farnborough Air Show when it was stated that it was being developed as a modern technology ECM pod for RAF strike aircraft. A multi-million pound contract was awarded to a consortium of British companies led by Marconi Defence Systems, which included Racal Radar Defence Systems, Hawker Siddeley Aviation, GEC Avionics and Plessey. Marconi Defence Systems is the prime contractor with responsibility for overall design and development and subsequent testing.

A high-power TWT amplifier is used with a dual-mode capability for deceptive jamming and CW operation. A voltage-controlled oscillator uses a varactor-tuned Gunn diode covering the full frequency band. The set-on receiver is of Racal design and signal processing uses GEC Avionics hardware and MDS software.

The pod is a fully autonomous jammer which can jam multiple and simultaneous threats. Its dual receivers and jamming transmitters are connected to a dedicated central processor. The processor and central computer identify the threat, establish priorities on lethality and also on optimum jamming strategy. Once a threat is identified, classified and given a priority, the Skyshadow system automatically sets the jamming frequency and optimum modulation technique to counter the enemy radar.



The system is software programmable to allow modification of the threat library, and will easily accommodate changes in operating environment or mission requirements. The equipment digitises receiver outputs which are then passed on to the processor in digital form. The processor maintains a file of all active emitters detected by the system, identifies emissions not previously detected, and then displays the identity and bearing of those categories requiring display. Additional inputs to the processor come from other EW sensors on board the aircraft. The on-board displays provide pilot and navigator with both tabular and graphic presentations of threats, as well as the overall radar environment.

The pod has radomes at both ends and is capable of countering multiple ground and air threats, including surveillance, missile and airborne radar types. Automatic power management can be assumed, and modular construction probably allows for variations in the pod's configuration for differing operational missions. Approximate dimensions are: length 3·35 metres and diameter 38 cm.

STATUS
The system is in full production for the UK MoD and fitted to the IDS version of the RAF Tornado.

MARCONI RADAR WARNING RECEIVERS

Marconi Defence Systems Ltd has developed and produced in quantity the two types of radar warning receivers (RWR) fitted to the Harrier, Jaguar, Buccaneer and Phantom strike aircraft of the Royal Air Force.

Two versions of the RWR were needed to meet the separate requirements of the multi-seat and single-seat aircraft. Whilst both types use the same antenna/RF sub-system, the Jaguars and Harriers are fitted with a lamp type display which shows the quadrant in which the priority threat is located, whilst the Buccaneer and Phantom have the multi-threat CRT displays. Both systems indicate frequency band and type of signal being detected. Frequency coverage is E- to J-band. Audio alarm is also available.

MDS radar warning receiver equipment units

For the Tornado F2 a multi-threat warning system, has been developed to provide threat analysed readouts in alpha-numeric form. The RHWR detects, identifies and provides accurate bearing of emissions out to the aircraft radar horizon, so that the crew can correlate this information with the aircraft AI radar tracks in order to classify and allocate priority to enemy airborne threats. The RHWR is understood to operate in either a passive mode, or can 'see through' enemy jamming attempts to degrade the AI radar. The system provides for long range radar surveillance and accurate direction finding. A processor unit allows parametric measurement of intercepted signals with automatic comparison of these with information contained in a comprehensive emitter library. Direction finding accuracy is enhanced by using a time-shared vernier interferometer to augment the more conventional amplitude comparison techniques. Among the parameters measured are RF frequency, RF agility, PRI, pulse width and scan characteristics.

STATUS

In operational service. The RAF Buccaneer radar warning/ESM suite is being up dated (see **5804.393**).

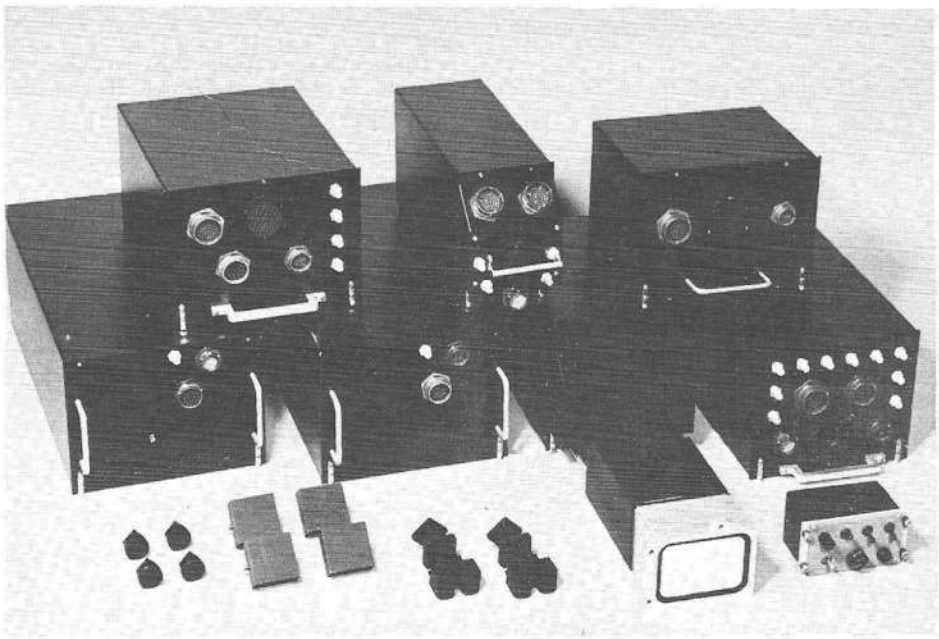
Marconi Defence Systems Ltd, The Grove, Warren Lane, Stanmore, Middlesex HA7 4LY, England.



5689.353

ZEUS AIRBORNE ECM SYSTEM

Zeus is a compact multi-purpose EW countermeasures system for modern combat aircraft, designed by Marconi Defence Systems and using major components from Northrop Defense Systems Division, USA. It provides a complete defensive system consisting of a radar warning receiver (RWR), and a jammer. These may be fitted as a 'stand-alone' RWR, or as a full ECM system with the RWR also providing the jammer control inputs.

The Zeus RWR is the latest in a series of MDS passive intercept systems. It is based on the best features of IFM and fast superheterodyne techniques and is able to intercept and measure the characteristics of all radar controlled systems likely to be a threat to the aircraft. These include radar-controlled anti-aircraft guns, surface-to-air missile radars, air-to-air missile radars and airborne intercept radars. Having measured the threat parameters, the receiver passes the signal to the Zeus digital processor which identifies the radar type and causes it to be shown on the display. This digital processor can also be used to control the Zeus jammer and other means of countermeasures (eg chaff, flares and decoys).

The Zeus jamming system is controlled directly by the RWR digital processor and the transmitter chains have alternative configurations to meet specific tasks of each type of aircraft to which it is fitted. Signals from the processor set all the necessary parameters to allow the transmitter chains to jam both pulse and CW radars, while control features ensure that home-on jam weapons are not allowed enough time to acquire the aircraft. A range of different jamming modes is available with each installation tailored to the operational requirements of the individual customer.

Zeus airborne ECM system

Typically, a full Zeus system (RWR and jammer) would weigh approximately 110 kg although the actual weight would depend on the number of transmitter chains and the exact configuration.

STATUS

The system will be fitted to the UK Harrier GR-3s and GR-5s under a £100 million contract received in April 1984, and the two companies are proposing the equipment for the AV-8B aircraft. Installations have also been designed for the Hawk, F-16, F-18, F-5 export series, A-4, Jaguar and Mirage.

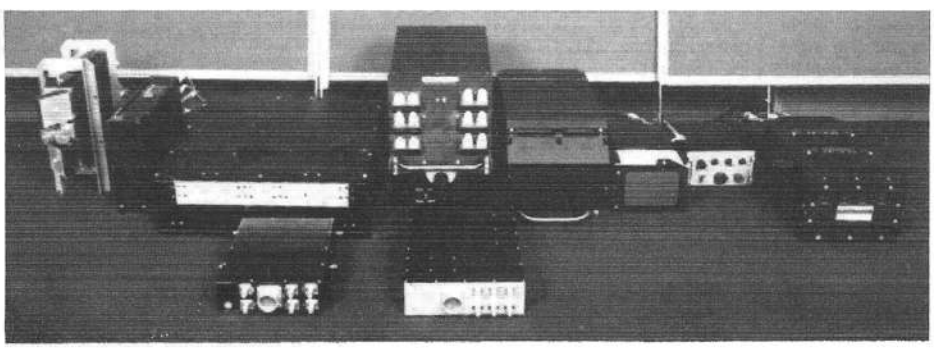
Northrop Corporation, 2301 West 120th St, Hawthorne, California 90250, USA.



5732.053

HERMES ESM SYSTEM

Hermes is a range of ESM surveillance systems which provide the information necessary for planning operations and defence by the interception and analysis of enemy signals. These systems can be part of air defence and coastal defence land-based nets, can be used in the airborne role in many types of aircraft and also have naval applications.

In the airborne role, Hermes can be configured into a range of equipments from a basic radar warning receiver in light strike aircraft and helicopters to a full ESM system for reconnaissance or AEW aircraft. A version can also be fitted to remote piloted vehicles for battlefield surveillance, coupled with a data link to pass vital information to the ground.

In the land-based role, Hermes is known as Sentry (**5803.153**) and can be configured to meet a variety of battlefield surveillance roles to provide signal intercept and analysis capability. For naval applications the system would normally be employed in smaller ships, such as fast patrol boats, to provide interception, analysis and display, and also to activate chaff/flare dispensers if necessary.

Units of the Hermes ESM system

STATUS

The radar warning and homing receiver is based on that used in the Tornado F2 version for the RAF.

Marconi Defence Systems Ltd, The Grove, Warren Lane, Stanmore, Middlesex HA7 4LY, England.

5804.393
GUARDIAN AIRBORNE RADAR WARNING RECEIVER

The Guardian radar warning receiver is a lightweight crystal video equipment based on experience gained with the ARI 18223/228 systems now in service with a variety of aircraft. The system is designed to combine accurate analysis and threat warning with the high probability of signal interception provided by a crystal video receiver.

Parameters of the intercepted signal are measured and passed to a software-controlled digital processor which analyses and identifies the threat. Information is displayed to the aircraft crew by one of several types of display, alpha-numeric presentation on a CRT display, LED display, central warning display, or on the head-up display. The processor also has sufficient capacity to manage a range of countermeasures such as jammers, chaff dispensers, IR flares, etc, and provides the passive intercept and power management element for the Apollo system (**5805.353**).

STATUS
The Guardian system is in production for update programmes on the RAF Buccaneer S2B low level strike aircraft, and the Sea Harrier.

CONTRACTOR
Marconi Defence Systems Ltd, The Grove, Warren Lane, Stanmore, Middlesex HA7 4LY, England.

5805.353
APOLLO AIRBORNE ECM SYSTEM

Apollo is a version of the Zeus system (**5689.353**) and is a comprehensive ECM equipment for both passive and active countermeasures on strike aircraft. The radar warning capability is provided by the Marconi Guardian receiver (**5804.393**) and, using the radar warning receiver processor for management, a transmitter is added to provide a jamming system capable of countering SAM, AAM and radar controlled gun systems. Apollo can be fitted conformally, as a complete on-board system, or can be pod-mounted, depending upon the aircraft type. The system also provides facilities for the control of additional countermeasures such as IR flares and chaff dispensers.

STATUS
In development.

CONTRACTOR
Marconi Defence Systems Ltd, The Grove, Warren Lane, Stanmore, Middlesex HA7 4LY, England.

5807.353
MARCONI RPV EW SYSTEMS

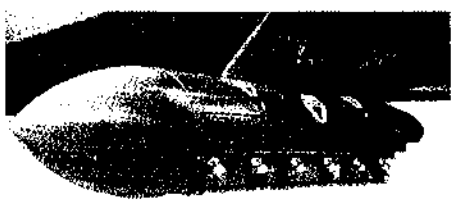
Marconi Defence Systems is engaged in the development of both passive and active EW systems for RPVs. Equipped with a passive ESM system, the RPV can be pre-programmed to carry out surveillance tasks in areas of interest and pass the processed data direct to the ground by means of data links. Control of the on-board system can also be exercised by the same method. A range of expendable jammers for use against hostile communications and radar systems is also being developed. These jammers are also suitable for use in the ground environment.

Although very few details are available on these systems, they are known to be based on the latest technology, and are lightweight and miniaturised to be suitably packaged for fitment into the very restricted payload areas of an RPV.

STATUS
In development. The expendable jammers are undergoing operational trials in the RPV and ground environment.

CONTRACTOR
Marconi Defence Systems Ltd, The Grove, Warren Lane, Stanmore, Middlesex HA7 4LY, England.

RPV engaged in ESM trials



5667.393
MASQUERADE AIRBORNE DECOY SYSTEM

Masquerade is a chaff and infra-red decoy defence pod for combat aircraft, and provides self-defence against air-to-air and ground-to-air radar, infra-red guided missiles and anti-aircraft shells. It carries 48 Wallop 'Radashield' chaff decoy cartridges and 42 Wallop 'Infrashield' infra-red decoy cartridges and can dispense any combination at varying time intervals as required. The pod is an adaption of ML Aviation's light stores bomb carrier CBLS 200 already in service with the RAF and other air forces. Masquerade will fit on the stores station of virtually any aircraft and requires little or no aircraft modification.

The pod has a microprocessor-controlled decoy dispensing system which can be initiated manually or by a radar warning receiver. This latter may be mounted in the pod if required. The cartridges are contained in three separate modules, each containing 30 decoys. These are loaded before being inserted into the pod to give an extremely low operational turn-round time.

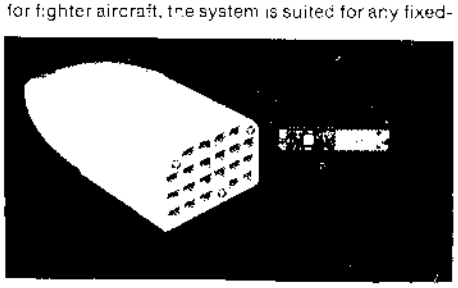
STATUS
In production. The first export order was obtained in 1982 from a Middle East country.

CONTRACTOR
Wallop Systems Ltd, Arkay House, Weyhill Road, Andover, Hampshire SP10 3NR, England.

Masquerade airborne decoy system

5668.393
CASCADE HELICOPTER DECOY SYSTEM

Cascade is a chaff and infra-red decoy system for helicopters. It fires chaff and/or infra-red decoys to protect the aircraft from surface-to-air and air-to-air missile attacks. The decoys are designed specifically for helicopter protection and burst clear of the aircraft to afford protection without the need to manoeuvre, and are also designed to eliminate the danger of matter being ingested by the engines.



The system consists of a small cockpit unit, a lightweight launcher with a rapid reload facility and an automatic sequencer which can disperse any number or variation of decoys as required. The disposable magazine contains completely encapsulated firing circuits and charges for operation under all environmental conditions. Cascade can be fitted to most types of military helicopter and is also easily integrated with a radar warning receiver to provide automatic or semi-automatic firing.

STATUS
In development

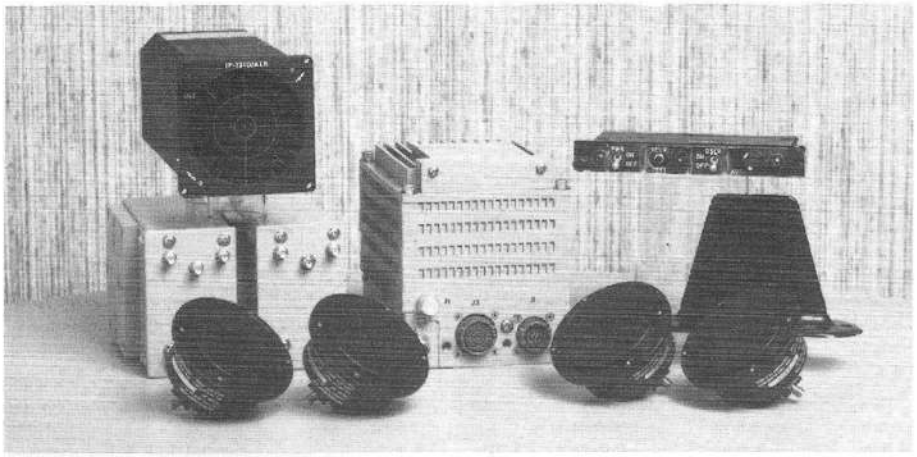
CONTRACTOR
Wallop Systems Ltd, Arkay House, Weyhill Road, Andover, Hampshire SP10 3NR, England.

4650.393
EVADE AIRBORNE DECOY SYSTEM

Evade is an airborne decoy system which provides a highly effective means of firing chaff and infra-red decoys as false targets against radar-guided and heat-seeking missiles. Although intended primarily for fighter aircraft, the system is suited for any fixed-wing type. It comprises four or more lightweight 'scab-on' dispensers and a cockpit control unit. The system is very easy to install and operate and the dispensers can be fitted on any suitable external surface. Pylon mounting is suitable and does not affect the store carrying capacity of the aircraft. On fighter aircraft better chaff dispersion is achieved by mounting on the fuselage underside as far aft as possible.

Evade dispenser unit and cockpit control

The aerodynamically designed dispenser unit is a two piece container which comprises a firing unit containing the electronic circuitry, and either a chaff or flare pack (the standard Evade suite being two of each). The firing unit is aircraft mounted and connected to the cockpit control unit. The chaff or flare pack is fixed to the firing unit with quick release bolts for rapid rearming. The chaff pack contains 21 cartridges which fire to the rear of the aircraft where the chaff is dispersed in the surrounding turbulence. Dipole lengths are supplied to individual requirements. The chaff is slip coated to maximise rapid blooming and minimise 'brassnesting'. The flare pack contains 10 infra-red cartridges which ignite when just clear of the aircraft and burn from 3 to 5 seconds. The cartridges in both packs are ejected by electronically detonated squibs.



A compact lightweight microprocessor in the cockpit gives the pilot complete control of the system. Firing sequences can be preset before flight to give single, burst, salvo or continuous firing modes. Display lamps indicate the system state. Built-in-test is incorporated and can be interfaced with other on-board systems.

STATUS
In full production.

CONTRACTOR
Wallop Systems Ltd, Arkay House, Weyhill Road, Andover, Hampshire SP10 3NR, England.

5734.353
KATIE AIRBORNE RADAR WARNING SYSTEM

KATIE is the acronymic name (killer, alert, threat identification and evasion) of a new airborne radar warning system for helicopters and light fixed-wing aircraft. It has been developed jointly by MEL of the UK and Dalmo Victor, USA, and will be marketed by both companies. The collaborative agreement between the two companies is for Dalmo Victor to further develop the processor and display of its existing Mk III system and for MEL to develop a new receiver and other elements.

Units of the KATIE airborne RWR

The KATIE system provides automatic threat warning and identification, automatic triggering of chaff and IR decoys, and a clear unambiguous display of threats on a 'bright scope' in the cockpit, plus an aural warning to the pilot by a synthetic voice.

Operation of the system covers C- to J-band inclusive and the modular construction of the processor allows extended operation above or below these bands if required. The display unit provides indication of the threat in alpha-numeric symbology, giving bearing and distance and indicating priority of threat in terms of danger. Outputs are provided to chaff dispensers and/or IR decoys.

The complete system consists of a C/D-band blade antenna, an H/M- or E/J-band antenna, two H/M or E/J dual channel receivers, a digital signal processor, pilot's display and a system control panel. Weight of the entire system is 13⅕ lbs (5·9 kg) and cubic capacity is 355 in³ (5818 cm³).

STATUS

In development and preproduction.

CONTRACTOR

MEL, Manor Royal, Crawley, West Sussex RH10 2PZ, England.

4410.393
KESTREL AIRBORNE ESM

The Kestrel airborne ESM system is intended to provide electronic intelligence (ELINT) during all phases from peace to active wartime operations. The system enables staff to gather information on possible hostile threats, their deployment and movements, at long range without the hazards associated with other methods or reconnaissance.

Kestrel receives and processes radar emissions over the frequency range 600 MHz to 18 GHz. A six port amplitude comparison bearing measurement system is used providing instantaneous digital bearing over 360 degrees in azimuth. At the same time a frequency measurement receiver with omni-directional azimuth coverage provides instantaneous digital frequency. The pulse-by-pulse digitised information is then passed to the preprocessor which de-interleaves the overlapping pulse trains from the different radars, deriving their pulse repetition and frequency agility characteristics. The data continues into the main processor which extracts long term information. The most likely identification of the radars is made by comparison of the measured and derived parameters with those stored in the library of known emitters.

Full information about the radar signal environment is presented to the operator on an ordered tabular or tactical display within one second of intercept. Alternatively the information can be displayed on remote displays via a standard data highway to allow the use of common avionic displays. The measured information includes bearing, frequency, frequency agility, PRI, PRI agility, pulse width, scan type and scan period.

STATUS

Development. Flight trials in a helicopter were due to commence in 1985.

CONTRACTOR

Racal Radar Defence Systems Ltd, Davis Road, Chessington, Surrey KT9 1TB, England.

3554.393
MIR-2 ESM EQUIPMENT

The MIR-2 ESM equipment was originally designed for use in helicopters but is also suitable for use on fixed wing aircraft and small naval craft where lightness and compact dimensions are important. The MIR-2 uses an advanced digital receiver, covering a wide range of frequencies from C- to J-band, around which a fully solid-state wide-band system has been built. It features lightweight antennas and a cockpit display which incorporates a very compact solid-state LED (light emitting diode) presentation of signal intercept data.

MIR-2 antennas on a RN Sea King

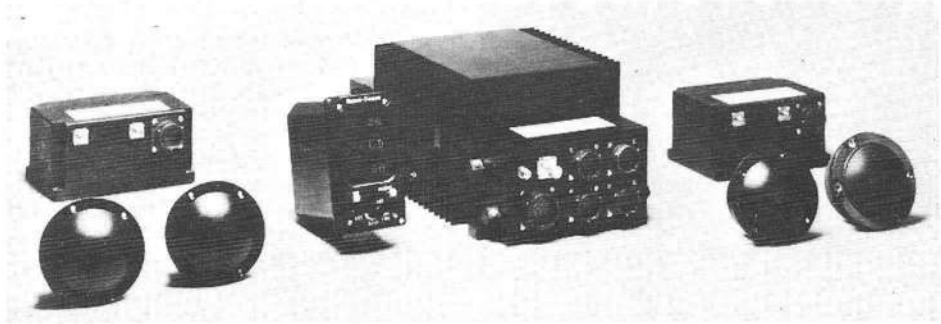
Six antenna packages, which can be flush mounted or externally mounted, are fitted on the aircraft with their boresights at 60° intervals in azimuth. Each antenna package consists of two antennas, both cavity-backed spirals. The modules contain all RF components and received signals are transmitted to the main processing unit. The illustration shows the forward antennas fitted to the nose of a Sea King, the rear antennas mounted just in front and below the roundel with the sideways antennas above the rear wheel.

The pulse receiver processes the signals received from the antennas and presents the information on the control indicator unit. Signals are displayed to the operator by frequency band, bearing and amplitude on the solid-state activity display. The total frequency coverage is divided into four frequency ranges with three amplitude levels indicated in each band at each bearing.

STATUS

Developed for the Royal Navy and in operational service with Lynx and Sea King helicopters. A further contract worth over £11 million was received from the UK MoD in April 1984 for these aircraft. Total sales exceed 200 sets and the equipment is in full production.

CONTRACTOR



Racal Radar Defence Systems Ltd, Davis Road, Chessington, Surrey KT9 1TB, England

5673.353
PROPHET RADAR WARNING RECEIVER

The Prophet system is a radar warning receiver for helicopters and light fixed-wing aircraft designed to reduce vulnerability to radar associated threats on the battlefield by providing the pilot/observer with a real-time and unambiguous threat warning. It is a modular, easily interpreted equipment and system design has taken into account the possible requirement to integrate laser warning, hostile fire indicator and frequency extensions.

The receiver detects radiation in H, I and J bands and, by means of a processor using programmable threat data, warns of the presence of imminent threats. The system can operate in a dense RF

Prophet radar warning receiver

environment with a low false alarm rate. A 4-port antenna system is used, bearing being derived by amplitude comparison and a digital IFM is used to provide frequency data. The processor extracts the data necessary to recognise any threat emission when compared with its field reprogrammable threat library. Audible warning of danger is provided and fed to the aircraft internal communication system.

The display uses light emitting diodes to form an array so that up to three threats can be displayed simultaneously. The information displayed consists of an arrow indicating the direction of the threat relative to the aircraft heading with octantal resolution, together with a two or four character alpha-numeric identifier. The colour and brightness of the display is such that it can be viewed in bright sunlight and through night vision goggles. Display controls are mounted on the display panel, chaff dispensing controls may also be collocated if required. The total equipment weight is 7 kg and power consumption is 70 W.

STATUS

In production. In May 1985 the Prophet system was chosen for the new MBB BK117 A-3M helicopter.

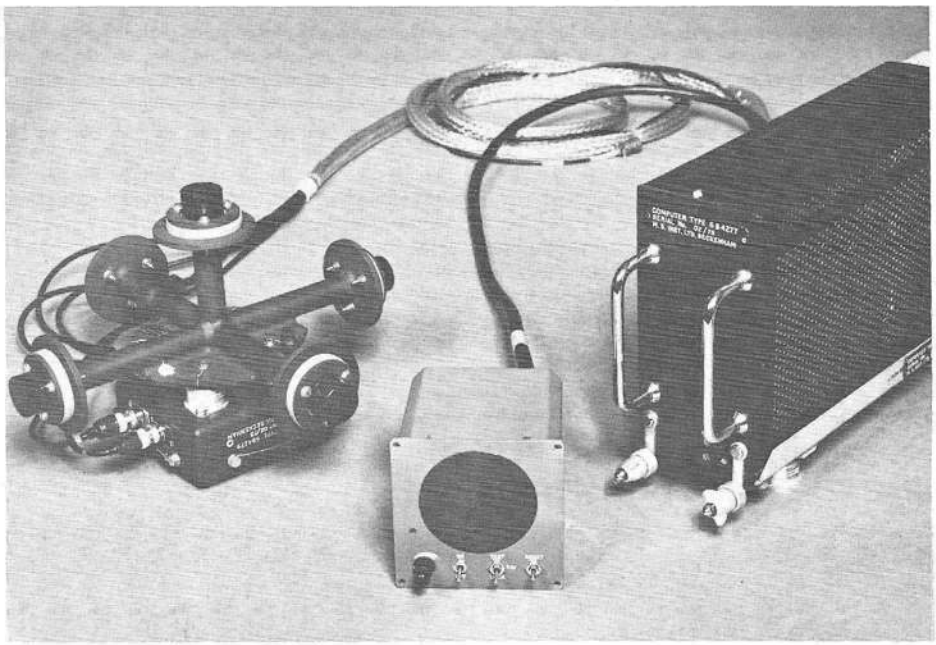
CONTRACTOR

Racal Radar Defence Systems Ltd, Davis Road, Chessington, Surrey KT9 1TB, England.

3369.393

HOFIN HOSTILE FIRE INDICATOR

The MS Instruments Ltd hostile fire indicator (HOFIN) is a passive warning system designed to alert a helicopter pilot that his aircraft is under fire. The first indication is an audible warning which draws the pilot's attention to a visual display which shows the general direction of the threat. This enables evasive action to be taken according to the current operational situation.



Three small units comprise the complete system, which weighs less than 6 kg: sensor array, computer unit, and the indicator unit.

The sensor array is mounted beneath the helicopter, and is aligned to the longitudinal airframe axis. It detects the shock wave front generated by the projectile and converts the impulsive pressure change to electrical signals. The electrical signals are fed to the computer unit for further processing.

The computer unit is housed in a 3/8 ATR short case, and is normally mounted in the equipment bay of the aircraft. This unit processes the signals provided by the sensor array, and computes the general direction of the hostile fire. The computer unit generates the one second audible warning signal, which is fed into the intercom system of the helicopter and also drives the indicator unit.

The indicator unit is housed in a 4 ATI instrument case which is normally located on the instrument panel, and consists of a circular red display which is divided into eight 45° octants. When displaying information to the pilot, four adjacent octants are illuminated for five seconds. The illuminated arc rotates in 45° steps and shows the source of the hostile fire relative to the longitudinal airframe axis. The indicator unit houses the operating controls of the system and consists of the display dimmer control, power on/off switch, system test switch, and the reset switch.

Although the HOFIN system has been designed primarily for helicopter use, it is clear that it can also be used in other situations where the detection of hostile fire is of importance. It should be realised that the detection range can be considerably increased for ground-based applications.

Complete HOFIN hostile fire indicator system with (left to right) detector unit, indicator and computer

CHARACTERISTICS

Power supplies: 22 - 28·5 V DC

Power consumption: 30 W standby, 60 W when display illuminated

Sensitivity: Responsive to supersonic projectiles with miss distances of up to 20 m

Calibration: By means of special-purpose test equipment

Display: 8 45° octants, of which 4 adjacent octants are illuminated. The illuminated 180° arc rotates in 45° steps. The display colour is red, and the brightness can be adjusted by means of a dimmer control

Audio warning: 300 Hz square wave, duration 1 s

Self-test: Built-in test equipment checks computer system

Temperature: Operating conditions -20 to +50° C
Storage conditions -40 to +70° C

Humidity: 95% non-condensing

DIMENSIONS:

Sensor array: 305 × 305 × 195 mm. 1·93 kg

Computer unit: 94 × 418 × 228 mm. 2·72 kg (with tray and cables)

Indicator unit: 106 × 106 × 125 mm. 1 kg

STATUS

Supplied to the British and Canadian Forces and evaluated by a number of other nations.

CONTRACTOR

MS Instruments Ltd, Rowden Road, Beckenham, Kent BR3 4NA, England.

5735.393

BAE INFRA-RED JAMMER

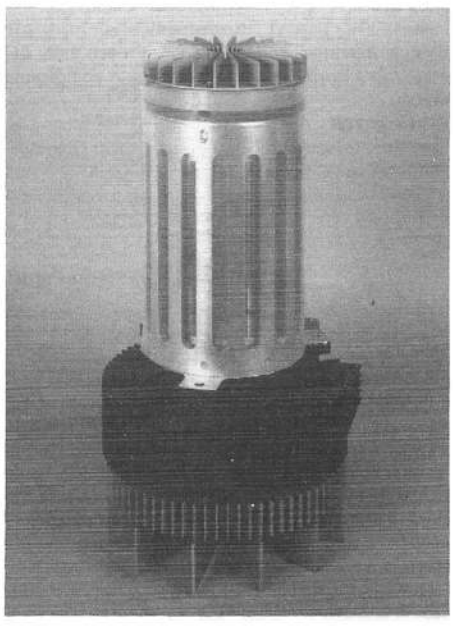
British Aerospace has developed an infra-red jamming system designed to protect helicopters operating in forward battle areas from attack by surface-to-air heat-seeking missiles. The jammer consists of an electrically powered infra-red source, an optical enhancement system, and a mechanical modulation assembly. This assembly modulates the infra-red radiation at a rate which degrades the tracking performance of the missile. Mechanical and electrical complexity has been avoided by the design of the optical enhancement system to provide maximum modulation for increased jammer efficiency.

CHARACTERISTICS

Azimuth cover: 360°

Elevation cover: ±25°

Dimensions: 40 cm × 20 cm diameter



Weight: 15 kg

STATUS

Successful airborne trials carried out by UK MoD. Now in engineering product development stage. A production order has been received from an unspecified customer.

CONTRACTOR

British Aerospace Dynamics Group, Bristol Division, PO Box 5, Filton, Bristol BS12 7QW, England.

BAe infra-red jammer

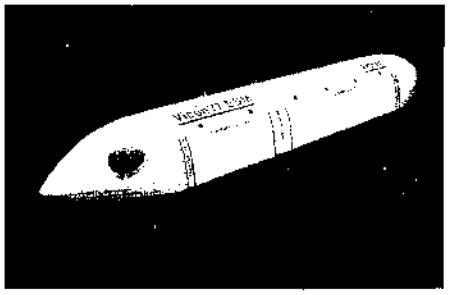
VICON 70 SERIES 33 IRCM POD

The Vicon 70 Series 33 is an infra-red countermeasures (IRCM) self-defence pod-mounted system designed for installation on all types of fixed-wing aircraft. The number of pods required to afford maximum protection will depend on the aircraft type and the location of the engine(s). In most installations one pod per engine will be required.

The complete system consists of an IRCM self-defence system, a 15 kVA ram air turbine and the associated power distribution and control units. The IRCM system fitted is manufactured and supplied by Sanders Associates, USA. A single cockpit control unit will manage up to four pod systems, which are fully activated within 80 seconds. Dimensions of the pod are 2464 mm long × 457 mm diameter, with a maximum all-up-weight of 165 kg. The performance envelope conforms to Mil Spec 8951G.

CONTRACTOR



W Vinten Ltd, Western Way, Bury St Edmunds, Suffolk IP33 3TB, England.

5739.353
VICON 77 ESM POD

Vicon 77 is a passive ESM pod containing a Racal microprocessor controlled radar threat warning system coupled directly to a salvo processing unit for discharging chaff and infra-red flares. The pod can be mounted on a wide variety of fixed and rotary-wing aircraft and is equipped with four dispensers with a total capacity of 128 chaff cartridges and 64 flares. The dispensers are identical in overall dimensions, allowing them to be interchanged according to operational requirements.

The system is designed to operate automatically or manually. In the automatic mode, the microprocessor controlled radar warning system can detect up to three different radiations simultaneously, identify their directions and compare their characteristics with up to 15 pre-programmed specific threats. The aircrew is alerted by both aural and visual warnings, and the unit can feed information to the salvo processing unit to discharge chaff or infra red flares. In the manual mode, chaff, flares or a mixture of the two can be discharged in a variety of configurations.

CHARACTERISTICS
Frequency coverage: H, I and J bands
Pod dimensions: 2·6 m long × 0·41 m diameter
CONTRACTOR

Vicon 77 ESM pod

5822.393
VICON 78 AIRBORNE DECOY DISPENSER

The Vicon 78 is an airframe-mounted chaff and IR flare dispenser intended for a variety of aircraft types. Three alternative dispenser configurations are available. The Series 201 consists of four faired dispenser units which would normally be mounted on the tailplane or the lower fuselage to leave the aircraft stores pylons free. The fairings would be designed to suit individual aircraft installations and would be loaded with interchangeable magazines containing either 32 chaff cartridges or 16 IR flares. The Series 200 is also externally loaded but mounted flush with the aircraft structure, while the Series 203 is loaded from inside the aircraft. The latter is intended mainly for installation in the windows of helicopters and unpressurised aircraft.

The Vicon 78 can be operated either manually from a cockpit-mounted control unit or in association with a radar warning receiver. A full microprocessor-controlled system is available for use with advanced radar threat warning equipments.

STATUS
Fully developed.
CONTRACTOR
W Vinten Ltd, Western Way, Bury St Edmunds, Suffolk IP33 3TB, England

5799.393
CHEMRING COUNTERMEASURES

Chemring Limited is one of the leading European companies engaged in the design and manufacture of ECM chaff for airborne countermeasures use against surveillance, fire control, missile homing and airborne interception radar systems. Aluminised glass chaff, which is one of the company's major chaff products for EW purposes, has excellent ageing and storage characteristics, a low fall rate of approximately 0·20 metres a second at sea level and produces radar cross sections similar to those of solid metal conductors. With its small diameter (nominally 24·5 microns) it is particularly suitable for use against high frequency radars.

Chem-chaff Airbrake Pack

Chemring has designed and produced chaff packs for fitment in the airbrake cavity of aircraft for release when the pilot operates the airbrake switch. The airbrake need only be 'blipped' to release the pack which blooms rapidly after release. The standard pack size is 330 × 250 × 11 mm although other sizes can be made for aircraft whose airbrake cavities will not accept this size pack. Approximate weight of the pack is 0·75 kg.

RR 170 Chaff Cartridge

The RR 170 chaff cartridge is manufactured and sold under licence from Tracor, USA. It is used in the ALE-40 dispenser (**1906.393**) and its variants, which include inboard and outboard fitting. The RR 170 consists of a plastic liner holding the chaff dipoles and a pyrotechnic squib. The squib is pressed into a cavity in the base of the liner and generates gas pressure to eject the chaff from the liner. The chaff used is nominally 25·4 microns diameter aluminium coated glass dipoles which are slip-coated to prevent adhesion and to maximise bloom rate. The dipoles are cut to precise lengths to optimise their radar reflectivity against specific radar threats. The cartridge contains six multi-band dipole lengths to provide protection against radar controlled threats in the 2 to 18 GHz range. More than three million dipoles are contained in each cartridge.

STATUS
In volume production.

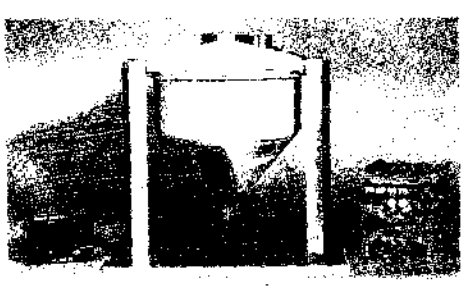
AN/AAR-34 INFRA-RED RECEIVING SET

The AN/AAR-34 is an infra-red receiving set intended for aircraft self-protection against threats from heat seeking missiles. It consists of four units, a scanner and cryogenic converter normally mounted on the tail unit, a processor and a cockpit controller. The system gives automatic pilot warning on a CRT type display, and automatic countermeasures command.

Multiple threat detection and multiple discrimination modes are provided and the equipment is insensitive to clouds, sun and ground clutter.

CONTRACTOR
Cincinnati Electronics Corporation, 2630 Glendale-Milford Road, Cincinnati, Ohio 45241, USA.



AN/AAR-34 infra-red receiving set

3901.393
AN/AAR-44 INFRA-RED WARNING RECEIVER

The AN/AAR 44 airborne infra-red warning receiver was developed under sponsorship of USAF/ASD to provide warning of launched missile attacks. The set continually searches the lower hemisphere while tracking and verifying missile launches. It warns the aircrew of the position of missiles, and automatically controls countermeasures to neutralise threats and enhance survivability.

Design features of the equipment include: automatic pilot warning and countermeasure command; continuous track-while-search processing; multiple missile threat capability; discrimination against solar radiation, terrain and water backgrounds and countermeasures; multiple discrimination modes; lower hemispherical coverage.

CHARACTERISTICS
Control and display unit: 104 × 145 × 79 mm
Weight: 0·64 kg
Processor: 191 × 168 × 259 mm
Weight: 4·22 kg
Sensor: 366 × 376 mm (dia)
Weight: 15·66 kg
Displays: Sector threat indicators; external countermeasures command and audio tone
STATUS
Production.

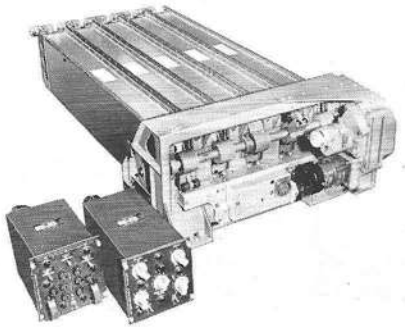
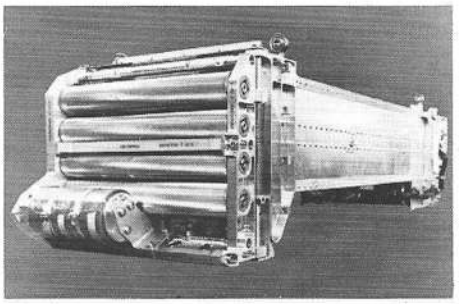
AN/AAR-44 infra-red warning system



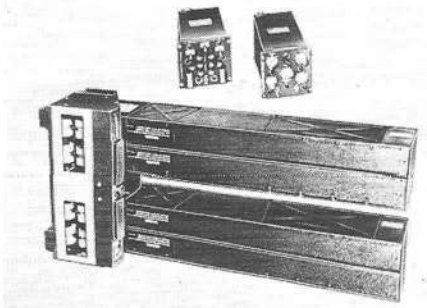
3109.393
LUNDY COUNTERMEASURES

Lundy Electronics and Systems Inc has been a major supplier of penetration aids and expendable countermeasure systems and equipment for over 30 years, and claims to be the world's largest producer of metallised glass chaff. So far as is known, Lundy concentrates on the passive aspects of EW, and in addition to the Minuteman III, Mk 12 re-entry vehicle penetration aids sub-system for which the company was awarded a contract in 1962, a full range of dispenser systems has been produced for aircraft and drone applications. The full list includes the following, some of which are described in more detail in individual entries, as indicated:



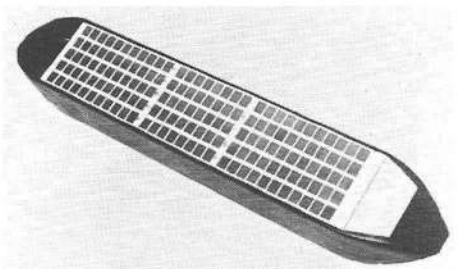
AN/ALE-1 and -2: Dispensing sets, pioneer pod system
AN/ALE-24: Chaff dispensing system for B-52G and H strategic bombers
AN/ALE-27: Chaff dispensing system for B-52C to F model bombers
AN/ALE-29A: Countermeasure dispensing set; deployed on various tactical aircraft (**3360.393**)
AN/ALE-32: Chaff dispensing system for EA-6A aircraft
AN/ALE-33: Chaff dispenser for BQM-34 target drone
AN/ALE-43: Chaff cutter dispenser pod (**3110.393**)
AN/ALE-44: Chaff and flare dispensing system, housed in supersonic pod (**3111.393**)
AN/ALE-XX: Universal pod for expendable countermeasures for RPV applications.

CONTRACTOR



Lundy Electronics & Systems Inc, 3901 NE 12th Avenue, Pompano Beach, Florida 33064, USA.

AN/ALE-24 chaff dispenser for B-52G and H aircraft



Mk 12 penetration aids system for Minuteman ICBM

AN/ALE-27 chaff dispenser for B-52C and F aircraft

High capacity chaff/flare dispenser system on EA-6A

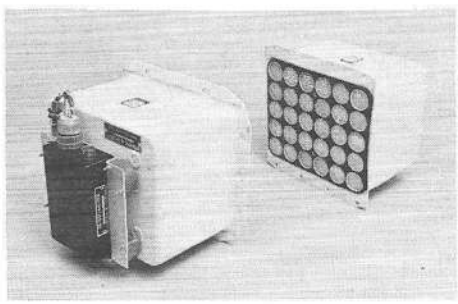
3360.393
AN/ALE-29A/29B COUNTERMEASURES DISPENSER SYSTEM

The AN/ALE-29A countermeasures dispensing equipment is used on tactical aircraft for the controlled pyrotechnic ejection of chaff and IR decoy flares as a means of self-defence against radar directed and IR homing missiles. The equipment is comprised of one programmer; two sequencer switches; two dispensers (each consisting of a block and printed circuit board); two dispenser housings; and inter-connecting cable. The ALE-29A system carries 30 chaff or flare payloads per dispenser, and RR-129 and RR-144 chaff cartridges, and Mk 46 and Mk 47 IR flares are used.

The programmer is normally located in the aircraft cockpit and carries the necessary controls for selection of dispensing patterns, timing sequences, etc. An optional feature is a dual-channel programmer, which allows the simultaneous dispensing of chaff and flares via separate programmes. The AN/ALE-29B is an improved version allowing greater payload flexibility.



The AN/ALE-29A/B system can be interfaced with threat warning devices and forms part of a tactical jamming system on the US Navy EA-6B Prowler aircraft.

STATUS

Operational on US Navy tactical aircraft.

CONTRACTOR

Lundy Electronics & Systems Inc, 3901 NE 12th Avenue, Pompano Beach, Florida 33064, USA. (Lundy is the latest of several manufacturers to build this system.)

4657.393
AN/ALE-36 COUNTERMEASURES DISPENSING POD

The AN/ALE-36 (QRC-490) is a modified AN/ALE-38/41 tactical fighter countermeasures dispenser pod adapted to carry RR-136 and RR-137 chaff units. The QRC/TBC-600 version is a modified AN/ALE-38 pod carrying 600 RR-170 chaff units for saturation/corridor chaff applications. Payloads are carried in 10 dispenser blocks of 60 payloads each and include an integral programmer. Each dispenser can be loaded with chaff units or flares. The fully loaded weight is 680 lbs (309 kg).

STATUS

In production.

CONTRACTOR

Tracor Aerospace, 6500 Tracor Lane, Austin, Texas 78721, USA.

1904.393
AN/ALE-37 CHAFF DISPENSER

The AN/ALE-37 is a high-capacity chaff dispenser for large area coverage, and although not officially confirmed, it is assumed to be carried internally by the seeding aircraft. It is capable of dispensing chaff or expendable jammers for anti-radar purposes, or flares. The probable use for this equipment is not so much self defence for the seeding aircraft as an element of full-scale EW support for a large-scale bomber attack or other large formation operation. Although it cannot be confirmed, it is probable that there are provisions in the equipment for programmed shot dispensing of the chaff or other stores, and that a range of radar frequency bands can be handled.

4654.393
AN/ALE-38/41 BULK CHAFF DISPENSER

The AN/ALE-38 (US Air Force) and AN/ALE-41 (US Navy) equipments are similar high capacity bulk chaff dispensers. They employ unique dispensing techniques and provide continuous dipole dispersal and instantaneous bloom for laying chaff corridors. They can also be used for aircraft self-protection and can be turned on automatically by the radar warning receiver. Pre-cut dipoles are sandwiched between two wraps of mylar film; six 50 lb (22·7 kg) rolls are carried in each pod. The AN/ALE-38/41 can be fitted to aircraft such as the F-105F, F-4, A-3, EA-4, A-7 and AQM-34H.

STATUS

In production.

CONTRACTOR

Tracor MBA, Bollinger Canyon Road, PO Box 196, San Ramon, California 94583, USA

1905.393
AN/ALE-39 ECM DISPENSER

The AN/ALE-39 ECM dispenser is a third generation expendable countermeasures dispenser system for protection of tactical aircraft from ground and air launched missile threats and radar directed anti-aircraft guns. It represents the culmination of over 10 years' evolution of dispenser system refinement by the US Navy, and is designed with flexibility of response to meet present and future needs in a changing threat environment.

The system is capable of accommodating up to three types of expendable payloads (chaff, IR flares and expendable jammers), loaded in any combination of multiples of 10. All three types of payload can be dispensed manually (single payload) or automatically in accordance with preset programs. The dispensing function can be initiated by the pilot (or EWO officer in the case of the F-14). The system is also capable of accepting dispense commands from aircraft warning receivers.

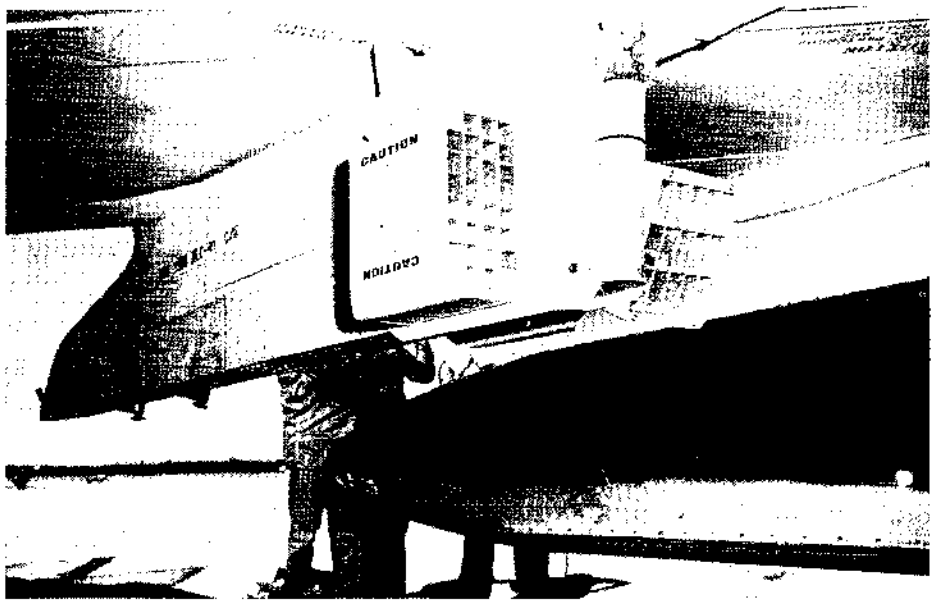
The programming flexibility, payload loading versatility, operational modes and wide selection of payload dispensing options and sequences (which includes simultaneous multiple flare ejection, random chaff ejections and rapid dump of flares) combine to make the AN/ALE-39 one of the better first generation analogue programmable countermeasures dispensing systems in the US inventory.

The system is operational on A-4, A-6, A-7, and F-14 aircraft and is planned for use on US Marine Corps Harriers and the F-18.

STATUS

More than 900 systems have been delivered since the initial production release in October 1973.

CONTRACTOR



Tracor MBA, Radcon Operations, 6500 Tracor Lane, Austin, Texas 78721, USA. (Tracor is the latest of several manufacturers to build this system.)

1906.393
AN/ALE-40 COUNTERMEASURES DISPENSER SYSTEM

The AN/ALE-40 countermeasures dispenser system, RR-170 chaff cartridge and MJU-7/B flare cartridge were developed for the F-4 family of aircraft. Each AN/ALE-40 consists of four dispensers, a chaff/flare programmer and a cockpit control unit (CCU). One dispenser is mounted on each side of the inboard armament pylons. A dispenser consists of a mounting plate to provide attachment to pylon structure, an aerodynamic nose fairing for drag reduction, and a detachable magazine for carrying the chaff cartridge. Each dispenser accommodates 30 RR-170 chaff cartridges for a total of 60 cartridges per pylon and 120 per aircraft. The outboard dispensers can carry 15 MJU-7/B IR flares. System drag is comparable to a Sidewinder missile and launcher. No weapons are displaced. Loaded weight is under 60 kg.

The RR-170 cartridge is square in cross section, 23 mm on each side and 184 mm long. The MJU-7/B flare is rectangular in cross-section, 23 × 50 × 184 mm.

Utilising the technology base of the AN/ALE-40 system, various configurations have been developed for adaptation to other aircraft types. With each new configuration, every attempt is made to install the system in such a way as to avoid interference with weapons stores/capabilities. Installation configurations vary from internal, flush mounted, skin mounted or scab-on, to semi-internal mounting.

AN/ALE-40 countermeasures dispensers mounted on aircraft stores pylon

An example of an internal flush mounted system is the AN/ALE-40(V) 4, 5, 6 installed on F-16 aircraft which consist of CCU, chaff/flare programmer, sequencer switch, EMI filter and two dispensers. The dispensers are mounted internally in the aft fuselage. Each dispenser carriers 30 RR-170 chaff units or 15 MJU-7/B IR flares.

Examples of the semi-internally mounted systems are the AN/ALE-40(V) 7, 8, 9 installed on F-5E/F aircraft. The system consists of CCU, chaff/flare programmer, sequencer switch, EMI filter and one dispenser housing containing two dispenser magazines. Each dispenser magazine carries 30 RR-170 chaff units or 15 MJU-7/B IR flares. The dispenser is mounted in the belly of the aircraft near the left wing root.

The AN/ALE-40(N) is the adaption of AN/ALE-40 for skin mounting on the NF-5 (Royal Netherlands AF) aircraft. A system consists of cockpit controls, chaff/flare programmer and two dispensers. Each dispenser carries 30 RR-170 chaff units or 30 flares. The dispensers are skin mounted onto aft fuselage. Drag is negligible. Loaded weight is less than 30 kg.

A similar AN/ALE-40(N) installation has also been adapted and flight tested on F-104 aircraft. Skin mounting is in the same aft fuselage area with similar controls and dispenser components providing 30 RR-170 chaff units or flares.

Other variants of the AN/ALE-40 are operationally deployed on Hunter and Mirage aircraft.

STATUS

The AN/ALE-40 system is in production and operationally deployed world-wide.

CONTRACTOR

Tracor MBA, Radcon Operations, 6500 Tracor Lane, Austin, Texas 78721, USA.

5688.393
AN/ALE-40(V)X COUNTERMEASURES DISPENSER SYSTEM

The advanced generation AN/ALE-40(V)X is an exact mechanical replacement for AN/ALE-40(V) systems (**1906.393**), and uses solid-state technology to incorporate a threat adaptive programmer. The microprocessor controlled programmer accepts information from the aircraft radar warning receiver and tail warning system (if available), air data computer and throttle quadrant power setting, and enables the optimum deployment routine for available expendables.

AN/ALE-40(V)X countermeasures dispenser system

The AN/ALE-40(V)X is capable of the following operating modes:

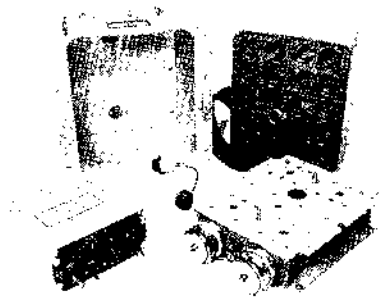
(1) off/standby
(2) manual - in this mode the pilot initiates a pre-selected dispensing programme
(3) automatic - this is a fully automatic mode and causes automatic selection of the appropriate expendables as well as automatically selecting the optimum dispensing programme for the threat engagement at hand
(4) semi-automatic - this requires pilot initiation of the automatically selected optimum dispensing routine.

Mode selection is made by a single switch on the cockpit-mounted control and display unit. An emergency jettison mode is available to dispense all expendables on command.

The AN/ALE-40(V)X is a next generation countermeasures dispensing system fully suited to the latest aircraft. It includes growth capabilities that allow quick updates to programmer decision logic, by modifying microprocessor software for updating threat characteristics or future mission scenarios. The additional mechanical interchangeability feature with conventional AN/ALE-40(V) systems enables inexpensive and rapid retrofit installation in aircraft equipped with the latter system, as well as providing a retrofit for unequipped aircraft requiring sophisticated self-protection.

STATUS

In production. Tracor was awarded a $19 million contract in May 1985 for the US Air Force and nine other countries.



CONTRACTOR

Tracor MBA, Radcon Operations, 6500 Tracor Lane, Austin, Texas 78721, USA.

3362.393
FAC COUNTERMEASURES DISPENSER

The Lundy FAC countermeasures dispenser is a compact, lightweight system which fires both chaff and flares. Designed for the US Air Force to dispense the percussion initiated Mk 50 flare, the FAC dispenser has been successfully flight tested on the O-2 and UH-1 aircraft.

To augment its operational usefulness, Lundy developed and flight tested a percussion initiated chaff unit which is compatible with the FAC dispensing mechanism. The chaff unit provides effective protection against known radar controlled threats operating in 3 to 16 GHz frequency range.

Lundy FAC countermeasures dispenser equipment

The basic FAC system contains a cockpit control/display unit, two payload modules, and two firing mechanisms. A cascade feature in the control circuitry allows any number of dispenser assemblies to be added to the basic system. The payload module holds 20 chaff units or flares interchangeably and is removed from the aircraft during ground operations for loading. The FAC dispenser is configured for both internal and external mounting.

Although primarily developed for use with forward air control aircraft types, this dispenser can be used to fire any 40 mm munitions from air or land vehicles.

CONTRACTOR

Lundy Electronics & Systems Inc. 3901 NE 12th Avenue, Pompano Beach, Florida 33064, USA.

3110.393

AN/ALE-43 CHAFF CUTTER DISPENSER POD

The AN/ALE-43 chaff cutter dispensing system is believed to be the first cutter-type dispenser to receive an American 'AN' nomenclature. It provides the EW operator with the option of selecting, while in flight, various tuned dipole lengths to meet changing threats in frequency ranges from A- to K-band.

The concept of cutting chaff from a continuous supply to various dipole lengths, while in flight, has numerous advantages. The limitations in utilising the 'cutter' concept for chaff countermeasures in the past was the lack of a suitable chaff supply material. Lundy has developed a chaff cutter roving which is now available in a variety of filament counts and package configurations.

AN/ALE-43 chaff cutter dispensing pod

The AN/ALE-43 is designed for two types of installation: an external pod or an internal mount. In the external pod installation, the chaff cutter assembly is mounted on a structural bulkhead at the rear of the pod centre section. This assembly consists of a drive motor, clutch/brake unit, cutting mechanism and supporting framework. The cutting mechanism contains a rubber platen roller and three cutter rollers. The cutter rollers are designed with blades that yield three specific combinations of dipole lengths as commanded. In the internal installation the cutter assembly is mounted directly to the aircraft structure.

For either installation, the system consists of a chaff roving supply, chaff cutter assembly and a cockpit programmer. The chaff supply is made of metallised glass roving packages contained within a chaff hopper. The chaff is dispensed when rovings are drawn simultaneously from each of the roving supply packages. Each roving passes through a guide tube and is drawn between the platen roller and the cutter rollers for dipole cutting. The cut dipole lengths of chaff are then discharged at the exit which opens into the airstream.

A control unit allows the pilot to select dispensing programs and to start and stop dispensing sequences. The pod has mounting provisions for standard NATO 14 inch and 30 inch stores suspension hardware and can be mounted conveniently on existing stores stations.

CHARACTERISTICS

Pod length: 337 cm

Pod diameter: 48 cm

Weight: pod 138·5 kg (empty); internal unit 36 kg

Chaff payload: pod 145 kg (8 roving packages); internal 164 kg (9 packages)

Dispensing rate: pod 7·2 × 10⁶ dipole inches/s; internal 8·1 × 10⁶ dipole inches/s

STATUS

In production

CONTRACTOR

Lundy Electronics & Systems Inc, 3901 NE 12th Avenue, Pompano Beach, Florida 33064, USA.

3111.393

AN/ALE-44 DISPENSER POD

The AN/ALE-44 is a dispensing pod for use on tactical, support, and strike aircraft capable of supersonic flight. It is a lightweight unit for use with both chaff and flare countermeasure stores, and meets 'HERO' requirements. A typical system consists of a control unit and two dispenser pods. Each pod houses two dispenser modules and a sequencer.

The pod features single- or dual-channel dispensing and quick turn-around time. A low frontal profile, small size, and central mounting pod provide for pod mounting on a wingtip, stores pylon, or fuselage. Fully laden weight is only 20 kg.

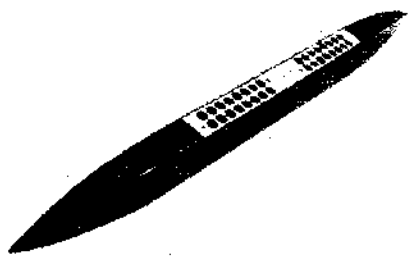
Payloads for the system, the RR-129 chaff package and Mk 46 IR flare, are both US Navy inventory items. The payload capacity for each pod is 32 chaff and/or flare expendables which are ejected by impulse cartridges. The dispensers (loaded) can be installed in the pod without removal from the aircraft.

A cockpit control unit permits selection of various burst rates, burst intervals, and units per burst, with simultaneous dispensing of flares and chaff.

CHARACTERISTICS

Pod dimensions: 206 × 10·7 × 18 cm

Weights: 13·6 kg (empty); 19·9 kg (chaff loaded); 22·6 kg (flare loaded); 1·1 kg (control unit)



Mode: 1 or 2 units per burst

Program: 1, 2, 4, 8 or continuous bursts per program

Rate: 4, 2, 1, or ½ bursts per s

CONTRACTOR

Lundy Electronics & Systems Inc, 3901 NE 12th Avenue, Pompano Beach, Florida 33064, USA.

AN/ALE 44 dispenser pod

5828.393

AN/ALE-45 COUNTERMEASURES DISPENSER SYSTEM

The AN/ALE-45 is a solid-state microprocessor controlled dispenser for high performance aircraft. It is automatic in operation in response to threat information from the radar warning receiver, and can also be initiated by the pilot. A dispensing programme is incorporated which can be easily changed by replacing a plug-in threat matrix memory. The system is designed for the US Air Force F-15 aircraft where it is linked to the aircraft's tactical electronic warfare system (TEWS).

STATUS

In production for the US Air Force F-15 aircraft.

CONTRACTOR

Tracor MBA, Radcon Operations, 6500 Tracor Lane, Austin, Texas 78721, USA.

5829.393

AN/ALE-47 COUNTERMEASURES DISPENSING SYSTEM

The AN/ALE-47 is a new concept in countermeasures dispensing which is intended to replace the AN/ALE-40 on the F-16, A-10 and other aircraft. The line replaceable units are electrically and mechanically interchangeable with the existing units. The ALE-47 is intended to provide protection from both airborne and ground-based threats and will require significantly greater processing power to provide the necessary threat adaptive and automatic capabilities. The system will be completely automatic in operation based on information supplied by an associated threat warning receiver.

STATUS

Still in early design stage. No contracts have been notified and it is understood that both Tracor and Goodyear are competing for the contract.

3345.393

M-130 COUNTERMEASURES DISPENSER

The M-130 aircraft general purpose dispenser is a lightweight countermeasures dispenser system developed using AN/ALE-40 (**1906.393**) technology for the US Army. The system is designed for employment on tactical rotary or fixed wing aircraft, such as the AH-1, CH-47, OH-58, UH-1, RU 21 and OV-1D, to provide self-protection from radar directed weapons by dispensing of chaff, and/or to provide protection from infra-red homing weapons by dispensing flares.

The M-130 system is of a modular design to allow flexibility of operational configuration. The modules consist of a cockpit control unit, and electronics module, one or more dispensers, cabling, and aircraft adaptors. The cabling and adaptors are unique to the aircraft type, whereas the other modules are common among all aircraft types.

The M-130 uses the M 1 countermeasures chaff and the M 206 aircraft countermeasures flare as payloads. Each payload module accommodates 30 payloads of a single type. The system configuration may be either a single dispenser of 30 payload capacity, or a double dispenser of 60 payload capacity. The system weight, with 60 payloads, is 21·5 kg.

The M 130 will function with input from the infra-red threat warning device directly to the electronic module, obviating the need for pilot action.

The payloads, the M-1 countermeasures chaff and the M-206 countermeasures flare, have a nominal 25 by 25 mm square configuration, and are 210 mm in length. The payload form factor is identical to the RR 170A/AL chaff used in the AN/ALE-40 and is functionally interchangeable.

CONTRACTOR

Tracor MBA, Radcon Operations, 6500 Tracor Lane, Austin, Texas 78721, USA.

4655.393
MODULAR CHAFF/FLARE DISPENSER

This is a pyrotechnic cartridge type chaff and IR flare dispensing system which has been developed for service with both United States and NATO forces for passive aircraft protection. Because of its modular design, the system can be adapted to a great variety of aircraft and a short cartridge length allows flush mounting to F-16 and other types.

Chaff cartridges developed for use in the MCFD incorporate several advanced features including transverse chaff dipole orientation for rapid bloom and frequency coverage versatility. The flare cartridge which was designed in conjunction with the equipment is twice the size of the chaff cartridge and is replaceable on a two-to-one exchange basis. The flare incorporates improved composition and a rapid ignition system for fast time rise.

STATUS

In production for the F-35 Draken aircraft of the Royal Danish Air Force and under evaluation for the Harrier aircraft of the Royal Air Force.

Tracor MBA, Bollinger Canyon Road, PO Box 196, San Ramon, California 94583, USA

3112.393
LUNDY CHAFF AND FLARES COUNTERMEASURES SYSTEM

Lundy produces a form of unitary design for expendable countermeasures systems. The basic element of the system is the dispenser unit, which contains 14 flares or chaff cartridges.

Positioned in a back-to-back pair, the two dispenser units form an externally mounted dispensing assembly, having a low aerodynamic profile. Dispenser units are attached to the aircraft with a contoured mounting plate. The plate serves as both a mechanical and electrical interface. This allows mounting options at numerous locations on the surface of the aircraft. Only the contour of the mounting plate is altered to accommodate the skin line curvature at any location.

The dispenser unit contains the payload module and sequencer. These components are handled as a single unit during ground operations. As a result the electrical initiators (squibs) are shorted at all times. This design feature provides immunity to HERO environment. In addition, the signal routeing circuits of the dispenser unit conform to the highest level of EMI specifications.

A particular advantage of this system is that it offers a mission-oriented flexibility, wherein any aircraft can be provided with a flare and chaff capability by the simple installation of mounting plates. These aircraft can be flown with or without dispenser units, reducing the quantity of dispenser units required to support a fleet of aircraft.

A cockpit mounted control/display unit allows the pilot to preselect chaff and flare dispensing programs, initiate and terminate dispensing activity, and monitor the status of the system operation.

The control display unit responds to input commands from warning receivers (automatic mode) and to input commands from the air crew (manual mode).

The performance of the flare (intensity, burn-time) is sufficient for the self-protection of military jet aircraft (F-4, F-16), during maximum cruise conditions. The chaff cartridge responds at threat frequencies in the E, F, G, H, I and J bands. The radar cross-section (RCS) created by the chaff cartridge immediately after ejection, 'less than 2 seconds', will exceed the average RCS of an F-4 aircraft.

CHARACTERISTICS

Dispenser assembly
Dimensions: 71 × 13 × 15 cm
Weights: 5·5 kg (empty)
14·2 kg (flare loaded)
IR flare
Dimensions: 127 × 40 mm (dia)
Weight: 0·32 kg
Output, average: 15 kW, 3 - 5 microns
Burn time: 3 s minimum
Chaff unit
Dimensions: 127 × 40 mm (dia)
Weight: 0·30 kg
RCS, average: 20 m²; 1 - 2 s
Frequency bands: E, F, G, H, I and J

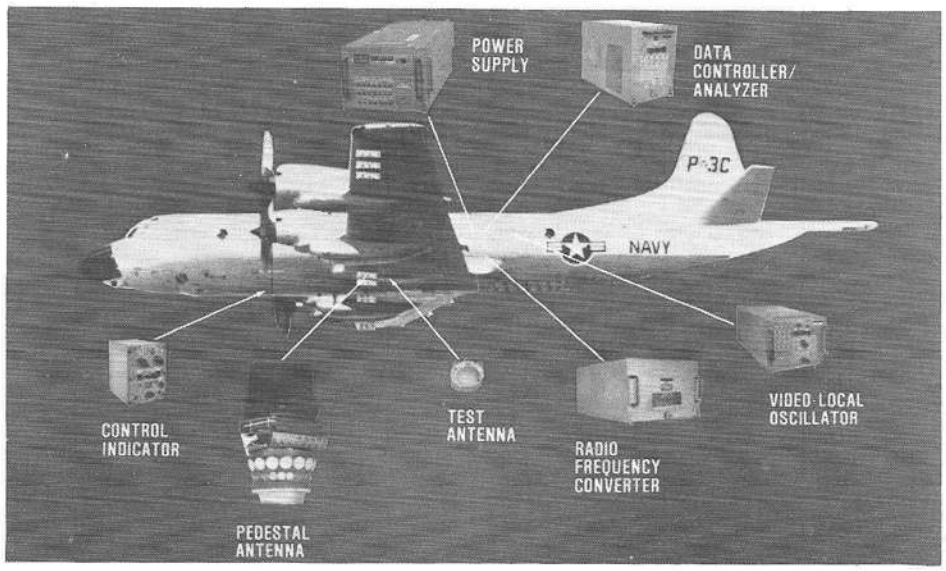
AN/ALQ-78 COUNTERMEASURES SET



Countermeasures set AN/ALQ-78 is used by the US Navy aboard the P-3C maritime aircraft as the ESM sensor. It automatically detects and measures the characteristics and bearings of intercepted radar signals of ASW and EW interest.

The measured parameters and bearing of the intercepted signals are supplied to the aircraft central data processing system for evaluation, recording and presentation on the aircraft displays.

The system uses a high-speed rotating antenna and a scanning, superheterodyne receiver for acquisition of signals in specific frequency bands of particular interest to the P-3C. Operation is to a great extent automatic, based on parametric data. The countermeasures set normally operates in an omni-directional search mode. When a radar signal of interest is acquired and analysed, the AN/ALQ-78 automatically initiates a direction finding routine. The signal data is processed by the central data computer and formatted for readout on a multipurpose display.

STATUS

Operationally deployed with the US Navy since 1969. The AN/ALQ-78 is currently being upgraded to the 'A' configuration. A new ESM system for the P-3C is currently under development (**5690.393**).

AN/ALQ-78 countermeasures set showing location of units on P-3C Orion maritime aircraft

1908.393
AN/ALQ-99 ECM EQUIPMENT

The AN/ALQ-99 is a large and sophisticated tactical noise jamming system forming the major portion of the US Navy EA-6B ECM aircraft's operational payload. It comprises five external pods, each capable of housing two very high powered jamming transmitters, a tracking receiver, the requisite antennas and a ram-air turbine to provide electrical power. Other associated equipment is housed in the large fin-top blister of the EA-6B, and in the aircraft itself there is further ALQ-99 equipment which includes a digital computer and display, and control facilities for two operating crew members.

The pods are detachable from the aircraft and are capable of housing various combinations of transmitters to cover any desired frequency bands. These can be arranged to provide an aircraft with any combination of duplicated and different operating bands, within the total capacity of the equipment and as required by operational necessities.

An IBM 4 Pi general purpose digital computer inside the aircraft carries out processing for the tactical jamming system as well as performing a navigational function. The latter facility enables the computer to perform a transmission beam steering (or transmission blanking) function so that jamming radiation can be restricted to a given 30° azimuth sector. The computer also interfaces with the display sub-systems.

In the automatic mode, one of three possible operating modes for the ALQ-99, the computer performs the sorting of detected signals and directs the selection and activation of jamming against threats. In this mode, the two operators monitor system operation. In the semi-automatic mode, the computer identifies and indicates threats and the operators select and indicate ECM actions. In the manual mode the operators each search their apportioned parts of the spectrum, identify threats, and assign jammers to them.

STATUS

In service with USN EA-6B aircraft. An internally located version of the ALQ-99 was selected by the USAF for use in the EF-111A ECM aircraft currently in production. This version, ALQ-99E, incorporates a number of improvements (some of which are already incorporated into the EA-6B), among them: (1) reduced search time for receivers to search the radar bands and identify enemy signals; (2) an increase in the number of radars that can be jammed by each ALQ-99 transmitter by increasing the jamming bandwidth and generating (modulated?) instead of (noise?) jamming signals; (3) increased operational flexibility by permitting several jammers with different frequency coverage to employ the same exciter, or signal source; and (4) further extra operational flexibility by adding omni-directional antennas to permit selection of either directional or omni-directional transmissions. Note: The words in brackets in the above passage have been substituted for the word 'deleted' which appeared in the original document. It is believed, also, that the EF-111A version of the ALQ-99 employs more transmitters than that used on the EA-6B. A contract worth $35 million for ALQ-99E sets was awarded to Raytheon in December 1981, and other contracts worth $30 million were awarded to AIL Division (Eaton

Corporation) for additional sets for EA-6B and EF 111A aircraft in early 1982.

In October 1984 a team led by Eaton Corporation's AIL Division was awarded a $65 million contract to update the system for the US Air Force EF-111A update programme. The team of Eaton Corporation, General Dynamics, Comptek Research, Delco Systems and Whittaker Tasker Systems will provide full scale development.

1909.393

AN/ALQ-100 ECM EQUIPMENT

The AN/ALQ-100 is an internally-mounted deception electronic countermeasures (DECM) equipment fitted in US Navy A-4, EA-6B and A-7 aircraft. It is a multiple-band, repeater-type track breaking jammer and operates in conjunction with the aircraft's threat warning receiver. No official details have been revealed but it is thought that the ALQ-100 responds to detection of a radar signal associated with a known Soviet AA missile threat by high-power, broad-band noise jamming in the same radar band, or in the DECM mode by repeating the threat radar's signals after a delay to deceive the system and break track.

An advanced version of the ALQ-100 was procured by the US Navy under an upgrading programme called PRIDE.

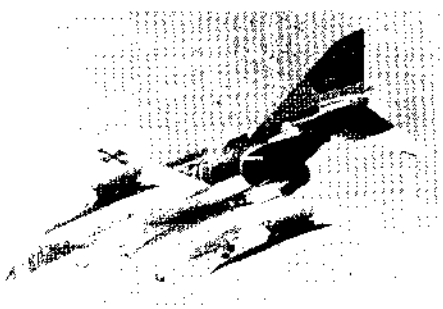
CONTRACTOR

Sanders Associates Inc, Daniel Webster Highway South, Nashua, New Hampshire 03060, USA.

1910.393

AN/ALQ-101 ECM PODS

The AN/ALQ-101 designation embraces a large family of jamming pods with varying capabilities, which have evolved over a period of about 14 years.



All earlier versions of the ALQ-101 were of circular cross-section and were about 25 cm in diameter, the first model having been approximately 230 cm long and the three succeeding versions about 390 cm in length. The final model of the series, the ALQ-101(V)-10, was the first of the so-called 'gondola' type in which the underside of the pod has throughout its length a trough-shaped compartment which considerably increases the available volume of the pod without serious increase in cross-sectional area. This model enlarged the frequency coverage once again and also incorporated other improvements to provide 'full capability', or the ability to counter all known anti-aircraft threats. Earlier ALQ-101 pods were updated to (V)-10 standard and a total of more than 400 was procured. This final model of ALQ-101 is approximately equivalent to the ALQ-119 which followed after the USAF awarded a contract in 1970.

The ALQ-101 pod is usually employed on F-4 aircraft and has been supplied to US forces and other operators of this type. One Buccaneer squadron of the Royal Air Force is equipped with this pod (Mk 10 version) and it is believed that the RAF has 22 further sets.

One other derivative of the original pod should be mentioned. This is the ALQ-105 which consisted of a repackaged version that amounted to a longitudinal splitting of the pod, the two halves being grafted on to the sides of the F-105 fighter-bomber aircraft. About 90 were produced.

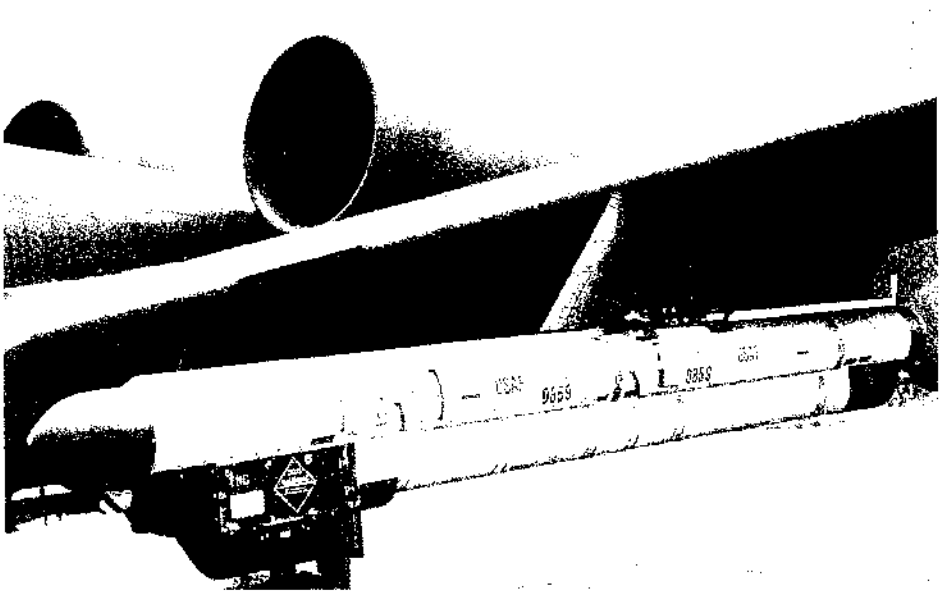
Electronic Warfare Division, Westinghouse Electric Corporation, Baltimore, Maryland 21203, USA.

AN/ALQ-101(V)-10 countermeasures pod on F-4

1911.393

AN/ALQ-119 ECM POD



The AN/ALQ-119 is a dual-mode jammer pod which was developed for the USAF to provide 'full-capability' protection for strike aircraft. By full-capability is meant a complement of countermeasures against known radar threats. Various types of aircraft can be equipped with the ALQ-119 but the principal mode is the F-4 Phantom. The system is also fitted to, or specified for, A-7, A-10, F-15 F-16 and F-111 aircraft. It is reported to be a three-band system, and qualifies for dual-mode status by virtue of facilities for both noise jamming and repeater deception jamming.

When initiated as QRC-522 in 1970, the equipment was given extended frequency capabilities and enhanced modulation performance to become the USAF production version designated ALQ-119. The three frequency bands covered by the equipment have not been disclosed but are probably E/F-, G/H-, and I-bands.

DEVELOPMENT

Development was initiated by QRC-522 and R & D was carried out by Westinghouse. In 1970 a contract for 20 prototype pods was awarded. It entered service in Viet-Nam in 1972.

It is claimed to be the first dual-mode jammer to enter volume production, a claim which is also made for the dual-mode TWT employed.

AN/ALQ-119 ECM pod on a USAF A-10 aircraft

STATUS
More than 1600 ALQ-119 pods have been produced, at rates from 10 to 30 per month.

In addition to US Forces, the ALQ-119 is in service on aircraft operated by Israel, West Germany, Egypt and Turkey.

An update to the ALQ-119 is planned whereby it will be provided with a computer-controlled power management system, by means of which the power radiated by the pod, in terms of frequency, type of signal etc, will be automatically controlled in accordance with the threat encountered.

The pod has been continually updated to combat new threats. The current model (ALQ-119(V)-15) is physically different from earlier versions in that it has a short radome mounted below the forward end of the gondola. All previous models are being upgraded to (V)-15 configuration. A physically shorter version, designated ALQ-119(V)-17, is also employed by the USAF.

CONTRACTOR
Electronic Warfare Division, Westinghouse Electric Corporation, Baltimore, Maryland 21203, USA.

5950.393
AN/ALQ-122 ECM SYSTEM

The AN/ALQ-122 is the power-managed radar jamming system in use on the B-52 bomber. The equipment searches for, acquires and tracks radar threat signals, and generates narrow-band, low duty-cycle ECM signals to deny range and azimuth to enemy radars. Signals are linear amplified by solid-state amplifiers in the aircraft.

STATUS
In operational use on B-52 aircraft. An advanced mixed-mode deception jammer is reported to be in development by Motorola for the US Air Force, based on work on this equipment, and the Westinghouse AN/ALQ-131(V) ECM pod.

CONTRACTOR
Motorola Inc, Government Systems Division, Scottsdale, Arizona, USA.

1912.393
AN/ALQ-123 INFRA-RED COUNTERMEASURES

The AN/ALQ-123 is airborne IR jamming equipment, developed to provide aircraft with protection from IR-homing missiles. It is pod-mounted and powered by a ram-air turbine, and was designed for carriage on A-6 and A-7 type attack aircraft. Modification of the system for internal installation in the tail of fighter aircraft has been given some consideration by the US Navy.

The ALQ-123 is not an IRCM of the flare dispensing type (which is a known technique of decoying IR-homing missiles), and it is understood to comprise a method of generating a train of light pulses appropriately coded to confuse or break the lock-on of an IR seeking missile.

STATUS
In operational service.

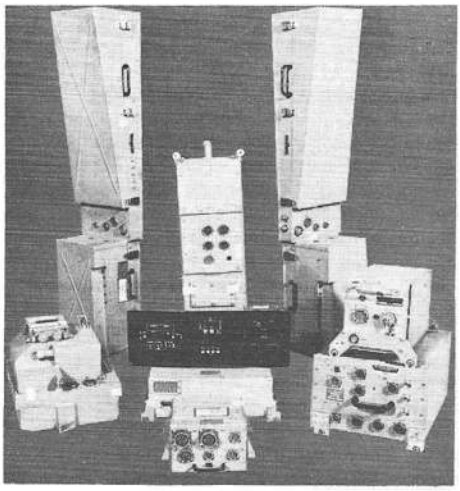
AN/ALQ-123 installed on a US Navy fighter



4366.353
AN/ALQ-125 TACTICAL ELECTRONIC RECONNAISSANCE SENSOR

The AN/ALQ-125 Tactical Electronic Reconnaissance Sensor (TEREC) is an airborne equipment which provides automated threat recognition, direction of arrival and threat location of ground based transmitters, including surface-to-air missiles and AA batteries. The system is fully automatic, except for control provisions which allow the operator to monitor system operation and to designate which threat should be displayed. The primary roles of the system are for rapid threat recognition in the tactical battle area and for dissemination of this information to tactical commanders at all levels of command. TEREC provides two options: a cockpit display for operator readout which provides on-board operators with the ability to pass information to other users and a second option of a data link to transmit data to selected ground sites.

TEREC uses two antennas to provide coverage for both sides of the aircraft. A computer directed frequency search is provided over a broad bandwidth and under computer control the receiving sub-system scans through the pre-programmed RF ranges of interest. Once the data of a threat emission is in the TEREC computer, a direction of arrival is calculated on the basis of quantitised values as measured by the interferometer array. The system general purpose computer enables automatic data collection, data processing and reformatting of the data for display, data linking and magnetic tape recording. Operator controls include the tape recorder, data link, system power and coverage side. In addition a built-in-test function can be performed at the operator's discretion.

STATUS
The US Air Force has ordered 23 production units for outfitting a number of RF-4C aircraft. Work has also begun on a F-15 prototype which can carry the AN/ALQ-125 system internally, as the RF-4C does. Litton has also received a $15 million contract from the USAF for eight systems for tactical electronic surveillance aircraft. The US Marine Corps is also considering the system for installation in RF-4B aircraft to support its reconnaissance requirements.

CONTRACTOR
Litton, Amecom Division, College Park, Maryland, USA.

AN/ALQ-125 TEREC system

1913.393
AN/ALQ-126 ECM EQUIPMENT

The AN/ALQ-126 is a deception electronic countermeasures (DECM) system developed under the US Navy's Charger Blue EW updating programme. It provides a wider coverage of radar frequency bands than the ALQ-100, upon which it is based, and was initiated in response to the new threats represented by recently introduced Soviet anti-aircraft missiles and gun systems.

The ALQ-126 is internally fitted in US Navy tactical aircraft such as the A-7, A-6, and RA-5, and is intended to replace progressively the ALQ-100. In addition to increased frequency coverage, the ALQ-126 incorporates improved deception techniques, more modern construction, packaging, and cooling arrangements. More than 1100 ALQ-126A systems have been delivered to the US Navy.

An improved version, the ALQ-126B, has completed a four year development and flight test programme. The ALQ-126B includes a distributed microprocessor control system to enable the system to be reprogrammed to meet changing threats and also provides considerable improvements in signal processing.

STATUS
More than 1100 ALQ-126A systems have been supplied to the US Navy, plus a small number for the Royal Netherlands Air Force F-104 aircraft.

The US Navy had awarded contracts totalling $338 million as at March 1985 for production of the ALQ-126B. First systems have been delivered and production is expected to continue until 1987 under continuing contract awards. The ALQ-126B has also been selected by a number of countries for fitment to F-18 aircraft, including the CF-18s of the Canadian Defence Force; F/A-18s of the Royal Australian Air Force and the EF-18s of the Spanish Air Force.

CONTRACTOR
Sanders Associates Inc, Daniel Webster Highway South, Nashua, New Hampshire 03060, USA.

4668.393
AN/ALQ-128 WARNING RECEIVER

The AN/ALQ-128 is a multi-mode threat warning receiver forming part of the Tactical EW System (TEWS) used on the US Air Force F-15 aircraft. It is combined with the AN/ALQ-135 (**3346.393**) and the AN/ALR-56 (**3347.353**). No details have been released regarding this equipment but it is known that recent updating changes have been included to increase the number and type of threats that the equipment can recognise.

STATUS
Most, if not all, units required for the US Air Force F-15 aircraft have now been procured.

CONTRACTOR
Magnavox Electronic Systems, Fort Wayne, Indiana 46808, USA.

1914.393
AN/ALQ-130 ECM EQUIPMENT

The AN/ALQ-130 is tactical communications jamming equipment for use by US Navy fighter and attack aircraft, including A-4, A-6, A-7 and F-4 types. The principal function is probably the disruption of the communications links associated with enemy defence networks and surface-to-air missile formations. The jamming may include broad-band electrical and/or acoustic noise or spot frequency jamming, but the former is probably more likely.

Development of the ALQ-130 was initiated as an updating programme for the ALQ-92 tactical communications jammer, which on the USN EA-6B is internally mounted, suggesting that the ALQ-130 will also be carried this way.

CONTRACTOR

Eaton Corporation, AIL Division, Deer Park, Long Island, New York 11729, USA.

1915.393
AN/ALQ-131 ECM POD

The AN/ALQ-131 is an advanced ECM, jamming pod developed under Programme Element 64739F which covers protective systems for various aircraft types. Dimensions of the ALQ-131 shown here are 285 cm × 63 cm deep × 30 cm wide, and weight is 260 kg. It is modular equipment, described in US defence circles as a full-capability-plus system, and is based on the use of a digital computer contained within the pod. Adoption of the modular technique will allow dual-mode (noise/deception) jamming pods covering from one to five frequency bands to be assembled to meet the specific requirements of varying missions and theatre of operations. Particular targets are the radars and guidance systems associated with anti-aircraft defensive systems. The power-management facility of the ALQ-131 is currently scheduled to be a software re-programmable processor. There are a number of different modules for one version of the pod, providing for jamming of all known anti-aircraft missile system frequency bands. The modular design allows assembly of up to 16 structural configurations to meet various requirements. Smaller or larger pod configurations can be used ranging from 221 to 392 cm long.

The pod is a software re-programmable model which allows a tactical commander to tailor his available pod equipment for his mission requirement(s). Another important feature of the ALQ-131 is its ability to be re-programmed, on the flight-line, in response to threat changes by making changes in the pod's digital computer. This will obviate long and expensive hardware modifications when threat techniques or parameters change and can even be made on the flight-line. The final capability of this pod is the self-contained power management feature. This is included in a single receiver/processor module which not only detects radar threats but also directs the optimum jamming programme.

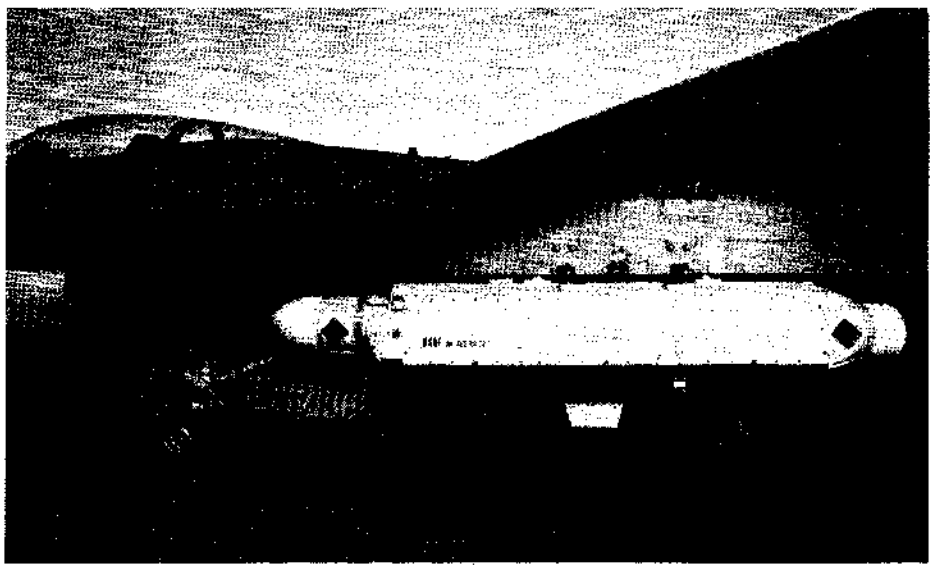
DEVELOPMENT

Development was undertaken in response to a USAF RFP, (QRC-559) in the 1971-72 period, when proposals were put up by a number of US industry teams. That headed by Westinghouse was chosen to develop the ALQ-131. Other members of this team were Motorola and Dalmo Victor whose modules did not go into production. Present power management module developments include Loral's improved receiver/processor to be supplemented in the late 1980s by the W/ITT CPMS module from ASPJ.

In August 1980 the manufacturer was awarded a USAF contract worth $15·6 million to carry out a classified modification to the ALQ-131 under the Have Exit programme. This is understood to embrace the addition of facilities giving protection against new threats.

STATUS

Since 1976 over 800 systems have been ordered, including orders from the Royal Netherlands, Egyptian and Pakistani Air Forces. More than 600 have been delivered.



In mid-summer 1977, the ALQ-131 was officially designated as being compatible with the F-16 fighter aircraft by the USAF. Other types of aircraft associated with this pod include the F-4, F-111, A-7, A-10, and F-15.

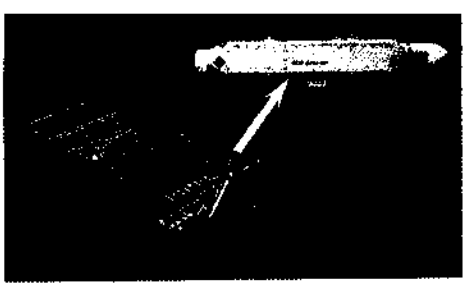
It is expected that by 1986 the USAF will have ordered over 1000 systems and further sales will be concluded with other air forces bringing the total production to approximately 1500 systems.

A second updating programme, known as Seek Ram, is likely to be implemented. RFPs were due to be issued in mid-1985 and a number of companies are expected to bid. Also under consideration is a replacement system called Block III pod, due to start production in 1990.

CONTRACTOR

Westinghouse Electric Corporation, Electronic Warfare Division, Baltimore, Maryland 21203, USA.

AN/ALQ-131 ECM pod mounted on F-16 aircraft



3877.363
AN/ALQ-131 RECEIVER/PROCESSOR

The receiver/processor is a self-contained, single modular package that fits within the AN/ALQ-131 jamming pod (**1915.393**). It enhances the operation of this ECM system by maximising its jamming capability and effectiveness against a multiple radar threat environment. This is accomplished through the concept of power management.

The receiver conducts a signal search within a prescribed frequency range, under control of the processor. When a signal representing a threat is acquired the signal is analysed for parameter values, formatted, and used to control the operation of the jammers so that jamming energy is applied with optimum timing and is better concentrated within the emitters RF, IF and servo bandwidths. The concept of power management thereby assures that energy waste, normally inevitable in conventional jamming, is minimised. A look-through feature of the receiver/processor permits continuous surveillance of the radar environment while jamming is in process.

1916.393
AN/ALQ-133 ELINT EQUIPMENT

The AN/ALQ-133 (Quick Look) is a tactical Elint system deployed in OV-1D Mohawk aircraft for emitter detection and passive surveillance by the US Army. The ALQ-133 has also been proposed for use in a number of A-10 tactical aircraft.

The configuration of the ALQ-133 consists of two pods: one contains Elint receivers needed to cover a frequency range extending from 400 MHz to 18 GHz, and equipped with the appropriate broad-band antennas; the other contains data processing equipment housed in the aircraft fuselage. The pod antennas will be phased interferometer elements, capable of providing direction-of-arrival measurements over a 90° sector abeam of the aircraft to a typical accuracy of 0·5°. If some degradation of bearing accuracy is acceptable, the coverage sector can be enlarged to 120°.

The data processor is responsible for control of the search receivers, analysis of intercepted signals, and comparison of these against a file of known hostile radar characteristics. Other data processing options include housing this part of the equipment in a third pod (this is proposed for the A-10), and locating it on the ground, the raw Elint being passed from the aircraft by data link.

STATUS

In operational service with the US Army.

CONTRACTOR

United Technology Laboratories, 410 Kirby, Garland, Texas 75042, USA.

4368.393
AN/ALQ-134 EXPENDABLE JAMMER

This is an expendable jamming system which includes a microstrip receiver/transmitter occupying a space of approximately 3 cubic inches inside a total package of less than 15 cubic inches. The complete system weighs less than 16 ounces (0·45 kg) and is installed with a spring-loaded unfurlable antenna that includes a reef-cutter drogue chute plus parawing.

The system is battery powered and uses the latest technology in lithium battery development.

STATUS
In production.
CONTRACTOR
Sanders Associates Inc, Microwave Division, Grenier Field, Manchester, New Hampshire 03103, USA.

3346.393
AN/ALQ-135 INTERNAL COUNTERMEASURES SET

The AN/ALQ-135 internal countermeasures set (ICS) has been developed for the F-15 aircraft's tactical electronic warfare system (TEWS) and is the active jamming part of that system, working in conjunction with the ALR-56 radar warning receiver (**3347.353**).

Automatic jamming of threat radars is provided and a dual mode capability enables both CW and pulse radiation threats to be countered. TWTs, integrated circuits and microprocessors are used in construction, and ECM frequency sources are computer managed so that the system can adapt automatically to changing enemy threats.

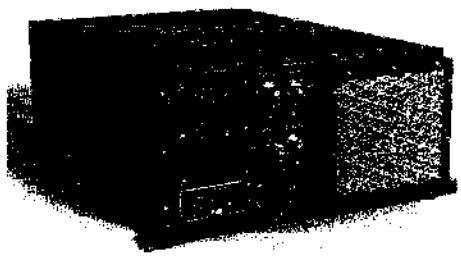
The system consists of six units, including three independent countermeasures sets and associated power-managed, digitally-controlled frequency sources. The fully automatic, high-duty-cycle dual-mode noise jamming system provides multi-octave cover over major threat frequency bands. An automatic built-in-test system provides high reliability by continuously monitoring performance parameters.

STATUS
Northrop Corporation's Defense Systems Division received a contract in September 1975 for production of an initial batch of 44 ALQ-135 ICS sets, costing $25 million, inclusive of spares, data, and production start-up costs. The first of these units were delivered in February 1977. A few weeks earlier, in January 1977, the company had been awarded another contract by the USAF, valued at $15·2 million and calling for a further production batch. In 1978 Northrop was awarded a $19·4 million USAF contract for spares to support ALQ-135 equipment in USAF Tactical Command F-15s and subsequent contracts received in late 1978 and 1979 have brought the contract total to $190 million, with further orders expected.

By January 1980 more than 200 sets had been delivered and contracts under this programme amounted to over $300 million; USAF announced contract awards in early 1980 totalling $93·8 million. A further contract for $100 million to supply sets for the USAF F-15 aircraft was announced in December 1981.

A follow-on contract for $60 million was awarded in 1983. This contract, for additional ECM systems with enhanced capabilities, could extend production for F-15s into the next decade. Northrop has now delivered over 1000 systems for the F-15 under contracts totaling over $800 million and the US Air Force plans to equip over 400 F-15s with the new version. Production of these units is planned to begin in late 1984.

CONTRACTOR
Northrop Corporation, Defence Systems Division, 600 Hicks Road, Rolling Meadows, Illinois 60008, USA.



4369.393
AN/ALQ-136 JAMMER

The AN/ALQ-136 is an airborne jamming system designed for helicopters operating in the tactical role. Its primary role is to protect helicopters against anti-aircraft missile radar systems and operates in the I/J band. It is intended only as a short term jammer to enable the aircraft to carry out a mission from a low-level approach and to 'pop-up' and complete its operational role before the hostile radar can initiate countermeasures.

The system consists of three units, a control unit, two spiral antennas (one each for transmit and receive) and a transmitter/receiver. The latter analyses received signals and responds with the appropriate deception jamming. When the helicopter is illuminated by a hostile radar, the jammer automatically operates, analyses the received pulses and provides the necessary electronic countermeasures.

The entire system weighs approximately 18 kg and is a microprocessor-based system, software programmable and designed for future expansion requirements.

STATUS
Approximately 600 systems are being procured by the US Army, and the system has been evaluated by the US Marine Corps for its AH-1T helicopters. Delivery of equipment for the US Army AH-1S Cobra helicopters is in progress and the system is also likely to be fitted to the AH-64A.

AN/ALQ-136 receiver/transmitter

CONTRACTOR

4669.393
AN/ALQ-137/ALQ-189 AIRBORNE JAMMER

The AN/ALQ-137 is an upgated version of the AN/ALQ-94 and fills the self-protection jammer role for the F/FB-111 and EF-111A aircraft of the US Air Force. It is a power-managed deception jammer using a wide-band crystal-video set-on receiver and can be operated in three modes: repeater, CW noise and transponder. The system is broken down into three sub-systems covering E/F, G/H and I/J bands. A pulse power of more than 1 kW is provided at 4 to 5 per cent duty cycle, with a power output on CW of 100 watts. Jamming techniques available include RGPO, VGPO, jets mode and select ve range jamming. The jammer response time is approximately 100 nanoseconds with a memory duration of about 2·5 microseconds. The AN/ALQ-137 works in conjunction with the AN/ALR-62 radar warning receiver (**4377.393**).

STATUS
In production. The latest variant of the system has been given the nomenclature AN/ALQ-189.
CONTRACTOR

AN/ALQ-140 IR COUNTERMEASURES SET

The AN/ALQ-140 is an internally mounted IR countermeasures equipment for the protection of F-4 aircraft from attack by heat-seeking missiles. It is generally similar in operation to the ALQ-147, Hot Brick, IR deception jammer equipment (**3545.393**) but in this instance it is carried in the tail of the F-4 aircraft in the tail parachute door position. The IR source is ceramic and it is believed to be electrically heated.

STATUS
Production.
CONTRACTOR
Sanders Associates Inc, 95 Canal Street, Nashua, New Hampshire 03061, USA.

4367.353
AN/ALQ-142 ESM SYSTEM

The AN/ALQ-142 is a lightweight, high performance ESM system which is designed for helicopters, marine patrol aircraft and small vessels (fast patrol boats, etc). The system consists of three variants; ASW operations, surface ship surveillance and missile targetting, and airborne area surveillance and missile targetting. Each system has been designed to fulfil a specific mission role.

The ASW operations variant provides real-time identification and bearing of surveillance radars and their associated platforms. It is the basic helicopter configuration to which modules can be added for increased performance. Sorting techniques are used to detect, identify and analyse all electromagnetic radiation from aircraft and surface vessels in the tactical area.

The surface targetting variant is formed by the addition of receiver modules. This allows surveillance and missile targetting from a small surface ship at ranges beyond the radar horizon, including the detection of long range cruise missiles.

The maritime patrol variant provides additional frequency coverage for assessment of enemy forces from the air. Airborne area surveillance and missile targetting use the receivers in the ALQ-142 to identify emissions at extended ranges, to measure its bearing accurately and provide targetting information for air/sea and surface/surface missile systems.

3546.393
AN/ALQ-144 IR COUNTERMEASURES SET

The AN/ALQ-144 is an electrically powered infra-red countermeasures set to provide helicopters with protection against heat-seeking missiles. It is an omni-directional system consisting of a cylindrical source surrounded by a highly efficient modulation system to confuse the seeker of the incoming missile. The electrically heated source is ceramic, and the complete equipment weighs less than 14 kg. It is one of three systems, together with the ALQ-146 and ALQ-147, to comprise the 'Hot Brick' IR countermeasures system.

CHARACTERISTICS
Weight: 12·7 kg (transmitter)
6·3 kg (control unit)
Size: 24·1 × 24·1 × 33·6 cm (transmitter)
Field of view: 360° azimuth

STATUS
Two production contracts have been awarded: 822 sets for the US Army for use on AH-1S and UH-60 helicopters and 182 sets for the US Marine Corps for use on AH-1J, AH-1T and UH-1N. Deliveries commenced in March 1981. An improved version is in development and was due to be completed in late 1985.

CONTRACTOR
Sanders Associates Inc, 95 Canal Street, Nashua, New Hampshire 03061, USA.

3550.393
AN/ALQ-146 IR COUNTERMEASURES SET

The AN/ALQ-146 infra-red countermeasures set is a lightweight system for the protection of US Navy CH-46D heavy lift, and other, helicopters. Two IR jamming sources are mounted on the helicopters, one forward above the cockpit and the other aft above the tail door opening of the CH-46D. The IR source is understood to be ceramic, probably electrically heated. The air crew is provided with some measure of control over the modulation employed, as well as over other equipment functions.

STATUS
Produced for US Navy. Now updated and replaced by the AN/ALQ-144 (**3546.393**).
CONTRACTOR
Sanders Associates Inc, 95 Canal Street, Nashua, New Hampshire 03061, USA.

3545.393
AN/ALQ-147A IR COUNTERMEASURES SET

The AN/ALQ-147A(V)2 is one of two IR countermeasures equipments referred to under the code name 'Hot Brick'. It is a directable system that fits the aft end of the 150-gallon external fuel tank of the OV/RV-1D aircraft. Because of limited electrical power resources on these aircraft, the ALQ-147A employs a fuel-fired source, and only 200 W of electrical power is required. The heart of the system is a ceramic IR source which is heated by burning a small amount of JP fuel with ram air. The IR output from the source is then modulated mechanically to provide the jamming signal. The system contains a covert filter to minimise the visible emissions, and it cannot be seen at night.

The system is modular in that the fuel tank or modulator can be removed by means of a single clamp. It is this feature which facilitated the later development of a 'stand-alone' version designated AN/ALQ-147(V)1. This is a podded equipment specifically developed for use on the OV-1D aircraft, which is thereby enabled to carry IR protection without the need for heavy external fuel tanks.

STATUS
Production.

4678.393
AN/ALQ-149 JAMMER

The AN/ALQ-149 is a communications jammer intended to replace the AN/ALQ-92 equipment on the US Navy EA-6B Prowler aircraft. The system is still in the early development stage after a competitive evaluation between two teams of contractors. The system is configured in two parts; an on-board sub-system which includes the receivers, controller, display and receiver antennas, and an external pod-mounted jamming unit.

The on-board acquisition sub-system contains separate communications and radar intercept and processing elements that co-ordinate activities with the AN/ALR-99 radar jammer (**1908.393**) currently on the EA6-B aircraft. The sub-system acquires communication and radar signals and defines the appropriate jamming responses. Analysis results are transferred to the central processor which acts as the interface to other aircraft systems. Threat information and system status is presented to the operators on a display similar to the ALQ-99.

The external pod contains the jamming elements, their exciters, power amplifiers and antennas. Equipment mounted in the pod generates the required RF waveforms, controls the directed jamming, provides the power amplification and radiates the resultant jamming signals through the antennas. The jammer pod system has the capacity to jam simultaneously any threats identified, including prioritised combinations of communication and radar signals.

STATUS
A full scale engineering development was authorised in mid-1983 under a contract worth $43 million to a joint Sanders/ITT team. Development and trials are expected to last for two to three years and the first production unit is due for delivery in mid-1986.
CONTRACTORS
Sanders Associates Inc, 95 Canal Street, Nashua, New Hampshire 03061, USA.
ITT Avionics Division, Nutley, New Jersey, USA.

4370.353
AN/ALQ-150 ESM RECEIVER

The AN/ALQ-150 is a tactical airborne ESM system used as part of the Cefire Tiger programme of electronic warfare. It is employed against multi-channel communication transmitters and has an electronic support measures capability for integration with jamming systems. The complete system is deployed in four modular units in three US Army RU-21 aircraft and can be used against frequency division multiplexed (FDM), frequency modulated (FM) and time division multiplexed (TDM) emitters.

The Cefire Tiger airborne ESM system interfaces with the Le Fox Grey control processing centre and the forward control and analysis centre to provide overall control of all ECM missions on a real-time basis. The control processing centre has wide-band data links which communicate with up to three Cefire Tiger systems simultaneously. The effective radiated power is from 3 to 10 kW, depending on frequency. Frequency ranges per system are:

(1) Aircraft 1: 60 to 115 and 1500 to 9000 MHz
(2) Aircraft 2: 115 to 480 MHz
(3) Aircraft 3: 450 to 1500 MHz.

STATUS
The first units were deployed during mid-1984.

4371.393
AN/ALQ-151 AIRBORNE EW SYSTEM

The AN/ALQ-151, otherwise known as Quick Fix, is a direction finding, intercept and electronic countermeasures system fitted on standard US Army helicopters. It operates in the frequency range from 2 to 76 MHz and has a jamming output capability of 40 to 150 W. The system can interface with all other tactical army aircraft using a secure communications link, and also interfaces with the operations centre.

Quick Fix is normally deployed in the US Army Blackhawk utility helicopter EH-60A and is operational up to 10 000 feet under nearly all weather conditions. Three units are normally deployed with division support companies and two units with brigade support companies. As a communications jammer, the AN/ALQ-151 has been designed to be interoperable with the US Army Aircraft Survivability Equipment (ASE) and will be mounted on the same platform. See also entry **5811.393**.

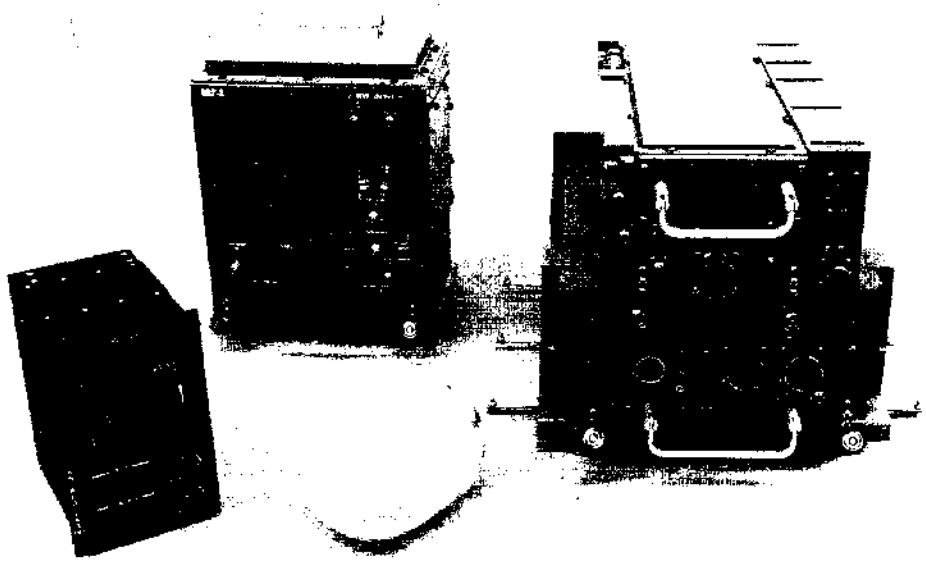
CONTRACTOR
ESL Incorporated, Sunnyvale, California, USA.

3384.393

AN/ALQ-153 TAIL WARNING SET (TWS)

The ALQ-153 tail warning set (TWS) is a rear-looking pulse doppler radar that detects and discriminates approaching missiles and aircraft. It is a range-gated doppler system which automatically ejects chaff and flares against the most dangerous threats.

The system is currently under full-scale production for USAF B-52 aircraft with 321 systems scheduled to be delivered up to 1985. The first two systems were delivered in April 1980, and have been installed in B-52 aircraft. System ground tests were completed successfully in 1976. Competitive 'fly-off' testing against the AIL ALQ-154 in a B-52 aircraft began in 1976 and was completed in 1977, after which Westinghouse was selected for full-scale production.



The TWS is also in development for F/FB-111 aircraft. Other aircraft under consideration are USAF F-15 and A-10, and US Navy A-6 and F-14. A slightly modified version is being developed for use in the B-1B.

STATUS

Currently production is six to eight systems per month for the B-52 aircraft.

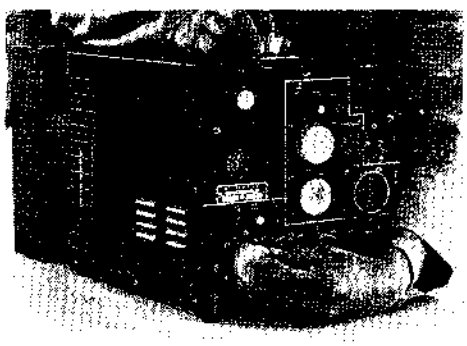
Westinghouse Defense and Electronics Center, Electronic Warfare Division, Baltimore, Maryland 21203, USA

AN/ALQ-153 tail warning set in B-52 aircraft configuration

3552.393

AN/ALQ-155 COUNTERMEASURES SET



The AN/ALQ-155 countermeasures set forms part of the up-grading programme to improve the defence avionics of the USAF B-52 bomber fleet. Each individual system consists of a set-on receiver/transmitter, signal processor, liquid cooler and a control indicator/programmer. It is an improved computer managed system which gives greater protection against defensive weapons by automatically jamming radar signals. Since each transmitter has its own integral receiver, jamming frequency can be set accurately, thereby providing increased effective radiated power density. Frequency control is completely automatic in all modes and techiques. The power management system is fully software-controlled, and field reprogrammable, and ensures automatic signal hand-off from the aircraft radar warning receiver, in addition to the optimum jamming response.

STATUS

Northrop's Defense Systems Division received a contract in 1975 for design and development of the B-52's improved ECM system, and the award of a production contract followed flight test evaluation and qualification. In January 1978 a $27·9 million USAF production contract for the ALQ-155(V) was awarded to Northrop and subsequent contracts have brought this total to more than $160 million. Additional upgrades of the system are planned for the 1984-1994 period.

3547.393

AN/ALQ-156 MISSILE DETECTION SYSTEM

The AN/ALQ-156 missile detection system was developed to provide a means of automatically triggering the ejection of IR decoys from an aircraft (specifically the CH-47C helicopter and RU-21 aircraft) in response to an attack by heat-seeking missile(s).

The ALQ-156 is a pulse doppler radar which effectively creates a continuous protection ring around the aircraft and senses an incoming missile. This results in automatic triggering of an XM-130 dispenser to eject IR decoy flares. The system evaluates the threat by comparison of the closing rates and other parameters, and is stated to be capable of operating in close proximity to the ground without detriment to the performance. The equipment consists of four units: a receiver/transmitter, a control indicator, and two identical antennas. The complete installation weighs about 20 kg.

The use of a microprocessor and a programmable digital signal processor permits rapid adaptation of the ALQ-156 from a helicopter to a fixed-wing aircraft configuration and it can be used in conjunction with other systems such as laser or radar warning receivers.

DEVELOPMENT

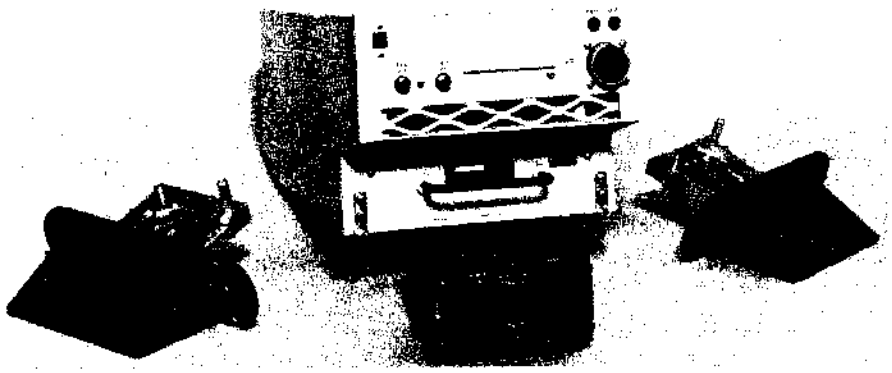
The initial prototype was developed by the Sandia Corporation, but Sanders was subsequently awarded a competitive contract to carry out full-scale engineering development.

CHARACTERISTICS

Weight: 20 kg

Size: 51·8 × 25·9 × 19·3 cm (receiver/transmitter)

MTBF: 300 h



Power: 350 W

STATUS

Production. The system is being considered for installation in A-6E aircraft.

AN/ALQ-156 missile detection set hardware

4375.393

AN/ALQ-157 INFRA-RED COUNTERMEASURES SYSTEM

The AN/ALQ-157 is designed to provide military helicopters with protection against enemy infra-red heat-seeking missiles, and is being manufactured for the US Naval Air System Command for use on large troop-carrying helicopters. Installation is simple and straightforward and the system is adaptable to other types of aircraft. The accompanying illustration shows installation on the sail of a helicopter. Two units are installed, one on each side of the sail.

The AN/ALQ-157 installation consists of four basic sub-systems: two transmitters, a control power supply, EMI filter assembly and a pilot's control

AN/ALQ-157 system installed on sail of heavy-lift helicopter

indicator. A switch on the control power supply allows selection of any one of up to five jamming codes pre-programmed into the microprocessor. Additional codes can be pre-programmed as new threats are defined. The microprocessor also directs all operational sequences of the system.

The system ensures full-time protection against threats, easy access to all components and employs built-in test circuits to perform operational readiness tests automatically.

STATUS

Operational testing has been completed successfully and production commenced in December 1983 under a $5 million contract to fit the system to US Navy CH-46 helicopters.

CONTRACTOR

Loral Electro-Optical Systems, 300 North Halstead Street, Pasadena, California 91107, USA.

3034.393

AN/ALQ-161 B-1 RFS/ECM SUB-SYSTEM

The US Air Force announced the selection of AIL Division in late 1973 to develop the defensive avionics sub-system for the B-1 strategic bomber.

The $70 million cost-plus-incentive-free contract award is for the development, fabrication, and testing of the B-1 radio frequency surveillance/electronic countermeasures sub-system. This sub-system is designed to monitor radio frequencies and employ electronic countermeasures. AIL Division is one of three other Air Force contractors presently working on the B1 development programme. These include Rockwell International Corporation of Los Angeles, system contractor; General Electric Company of Evendale, Ohio, engine contractor, and The Boeing Company of Seattle, avionics sub-systems interface contractor.

The Air Force Systems Command's Aeronautical Systems Division at Wright-Patterson Air Force Base, Ohio, is responsible for overall B-1 system development.

The B-1's defensive avionics system is intended to counter surface-to-air missile, anti-aircraft, and air-to-air missile fire control radars and to degrade by noise jamming early warning and GCI radars.

A single AN/ALQ-161 system contains and controls a large quantity of jamming transmitters and antennas. In addition to the jamming hardware, a sophisticated control system managed by a network of digital computers is employed. This can jam signals from many radars simultaneously. The numerous jamming chains are deployed around the periphery of the B1-B to jam signals in frequencies from 200 MHz up to K-band and coming from any direction.

Integrated with the jamming control system is a network of separate receiving antennas, receivers and processors which act as the 'ears' of the system. By means of this receiving sub-system, new signals can be picked up, identified and then jammed, with optimised jamming techniques, in a fraction of a second. One of the advantages of having the receiving function completely integrated with the jamming function is that it allows the receiving system to detect new signals and continue to monitor old signals while jamming in the same frequency band. A special sub-system allows this to be accomplished by monitoring the output of the jamming transmitters and continuously adjusting the receivers.

The AN/ALQ-161 system is made up of over 100 units which, exclusive of cabling, displays and controls, weighs approximately 5200 lbs (2363 kg) and consumes about 120 kW of power in the 'all-out' jamming mode.

An operator will have displays and controls by which he can monitor and direct the system. The computer will perform the power management role based on radar threats sensed by the RFS system and pre-stored information about the threats.

Terminal threat jammers, phased-array antennas and other hardware are being provided by sub-contractors.

USAF and AIL Division are relying on two features to extend the life and effectiveness of the ALQ-161 system against changing threats in the future in a way that was technologically impossible with the original B-52 ECM hardware. The equipment uses versatile components capable of being adapted. Because the system is digital, it can be software-controlled, permitting changes to be made more easily. Modulation techniques can be added or modified, for example, by changes in the software or by the addition of plug-in modules. There is also growth space to accommodate hardware growth if this becomes necessary. A tail warning function is being integrated.

STATUS

The AN/ALQ-161 is in the preproduction stage and two contracts totalling more than $657 million for full-scale development and initial production were awarded to Eaton Corporation in mid-1982. The development contract for $198·8 million includes modifying one of the original B-1A bombers and conducting a flight test programme. The production contract totals $458·9 million for building the initial systems. Delivery of the first line replaceable units began in February 1984 and flight testing in the B-1A is in progress. A $9 million contract was awarded to Eaton in September 1983 to incorporate a tail-warning function into the system.

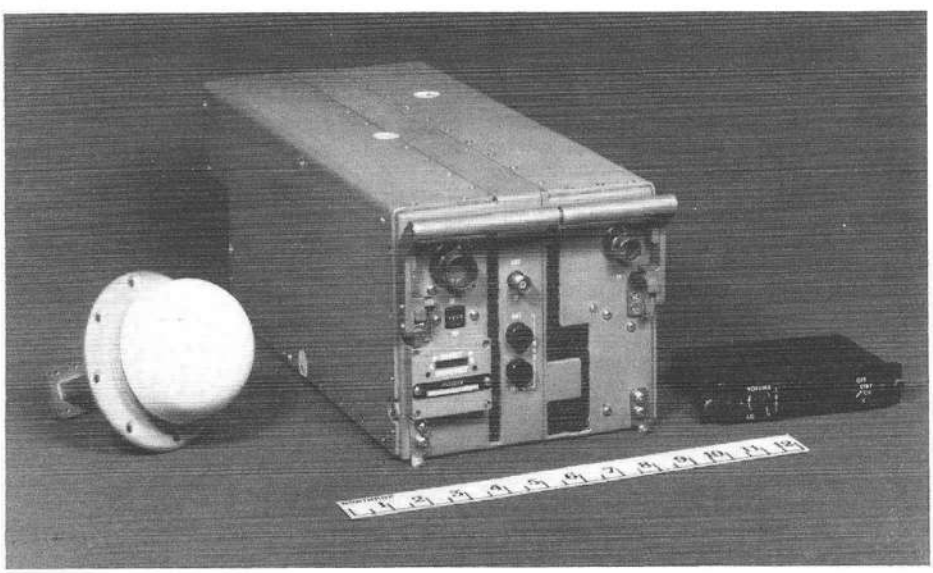
CONTRACTOR

Eaton Corporation, AIL Division, Deer Park, Long Island, New York 11729, USA.

4373.393

AN/ALQ-162(V) ELECTRONIC COUNTERMEASURES SET

The AN/ALQ-162(V) is an internally mounted, compact radar jammer for US Navy and Army aircraft being developed by Northrop under a contract to the US Navy. The programme has a total sales potential, including NATO and overseas markets, of $300 million.



This new system makes use of advanced jamming techniques. It is software programmable to meet new threats and includes built-in-test devices to increase maintainability. It can operate autonomously, using its own receiver/processor, in a 'stand-alone' capacity, or in conjunction with a variety of current radar warning receivers. The system is modular for interchangeability of components, and can be configured for pod mounting. Weight of the complete equipment is 40 lb (18·2 kg).

DEVELOPMENT

In January 1980, Northrop won a competition to develop a small, lightweight, receiver/processor controlled radar jamming system to complement the ALQ-126B on US Navy tactical aircraft, and the ALQ-136 on US Army SEMA aircraft. A contract was awarded in December 1979 for 15 engineering development models and production options for 300 systems.

STATUS

In production. First units due for delivery in late 1985 for US Army and Navy aircraft. System installation is planned on F-4, F-16, F-18, F-35, A-4, A-7, AV-8, EH-1, EH-60, OV/RV and RC-12 aircraft. The Royal Danish Air Force is also to procure this system for its J35 Draken and F-16 aircraft, and the Canadian defence forces will fit it to CF-18s.

AN/ALQ-162(V) CW radar jamming equipment

CONTRACTOR

Northrop Corporation, Defense Systems Division, Rolling Meadows, Illinois 60008, USA.

4740.393

AN/ALQ-164 ECM POD

The AN/ALQ-164 is an airborne pod-mounted jamming system for both pulse and CW modes. It is reprogrammable to provide for threat changes and features mid and high band pulse capabilities developed from the AN/ALQ-126 system (**1913.393**). It is also designed to accommodate the AN/ALQ-162 jammer (**4373.393**) in the pod. It is intended for fitment on the centre-line pylon of the AV-8B VTOL aircraft.

CONTRACTOR

Sanders Associates Inc, Daniel Webster Highway South, Nashua, New Hampshire 03060, USA.

3894.393

AN/ALQ-165 AIRBORNE SELF PROTECTION JAMMER

The AN/ALQ-165 Airborne Self Protection Jammer (ASPJ) is the next generation electronic countermeasures system designed for the US Air Force F-16 and US Navy F-18 tactical aircraft, and also for other fleet aircraft such as the F-14, A-6E/EA-6B and AV-8B. The equipment is being developed jointly by the US Navy and Air Force and will incorporate the latest technology in travelling wave tubes, microwave components and packaging. It can be electrically reprogrammed on the flight line and the built-in-test and modular plug-in design permits rapid replacement of assemblies at the operational level without external test equipment. Weight of the system is between 91 and 123 kg, depending on configuration, and it occupies a space of 2·1 ft³.

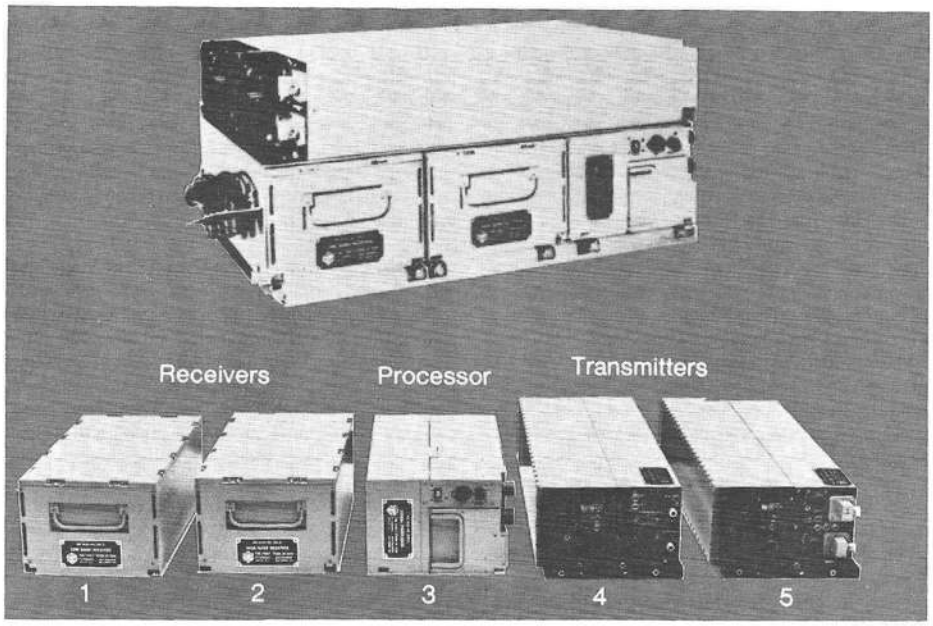
The AN/ALQ-165 has the ability to select automatically the best jamming techniques to use against any given threat, based on the system's own

computer data and real-time data of the threat signal from the receiver/processor. The computer software can be modified to accommodate new threats as they arise. The equipment covers the frequency range in only two bands, and is technically expansible to cover a greater frequency range, if required.

The transmitters with the system can jam a large number of threats simultaneously over various ranges and in different modes. The computer selects the power and duty-cycle criteria. An augmented version, with an additional transmitter power-booster is being considered.

Two configurations are being designed, one will be inside the aircraft, while the other will be installed in an external pod with a comprehensive power management system. The internal set for the F-16C will use an augmentation set installed in the aircraft tail root that will increase the jammer signal power for the aft-end antenna and will also reduce the time in which the system can respond to hostile radars. The remainder of the system will be mounted in the forward fuselage compartment. The F/A-18 aircraft is destined to receive an internally mounted ASPJ that does not need an augmentation set.

The US Navy F-14 will probably require two ASPJ configurations, the earlier F-14A having an external pod-mounted system to avoid the heavy costs in modifying the airframe. The upgraded F-14D models will house the system internally, probably with an augmentation set similar to the F-16. The US Navy AV-88 Harrier II will also use an externally mounted pod based on the standard AN/ALQ-131 unit. A third podded variant is understood to be under consideration to carry an increased capability system.



STATUS

An industry team from ITT Avionics Division and Westinghouse Electronic Warfare Division is under contract to the US Navy to develop and build both engineering developments and prototype models for operational testing and evaluation. In March 1982 the two companies received a $22 million contract for engineering and prototype models. Ten engineering development models (EDMs) have been delivered, plus eight comprehensive power management systems. It is understood that eight receiver/processors were ordered from Loral in mid-1983. Extensive reliability and maintenance testing together with flight trials began in late 1984 on US Air Force F-16 and US Navy F/A-18 aircraft. Production was due to start in mid-1985 with the first production delivery in late 1986. Potential value of this programme is projected at $3000 million and export licences exist for a number of countries.

Westinghouse Electronic Warfare Division, Baltimore, Maryland 21203, USA.

ITT Avionics Division, Nutley, New Jersey 07110, USA.

AN/ALQ-165 ASPJ basic system elements

4374.353

AN/ALQ-171(V) TACTICAL ECM SYSTEM

The AN/ALQ-171(V) is an electronic countermeasures system developed by Northrop's Defense Systems Division for the US Air Force and friendly nations. The system is available both in a pod version and as a conformal countermeasures system (CCS).

The pod adaptation is mounted on an existing pylon station and is designed for a wide variety of aircraft such as A-7, F-4 and F-16. The CCS is mounted directly on the aircraft fuselage without interfering with any existing weapons or stores stations or hampering the aerodynamic capability of the aircraft. The CCS is designed to fit on existing F-5E/F models as well as the new F-20 Tigershark.

Each system is power managed and contains three transmitters which use common electronics, antenna sub-systems and cooling. Two receivers operating over the E to J bands are provided, a fast-scanning superheterodyne unit for search and analysis and a channelised log crystal-video equipment for cue and pulse repeat functions. A closed-loop system takes the received signal to set the jammer on the frequency to be jammed. Intercepted signals are received on three wide band antennas, two circularly polarised spirals covering forward and aft-down sectors and a horn antenna to cover the aft-up sector. The signals are analysed, and given priority rating before the jamming response is determined. High speed switching enables all three transmitters to operate simultaneously to counter different threats. One CW jamming output is fed to a foward transmit antenna, then to an aft-down antenna. The pulsed output is divided and fed to an aft-down antenna, and to either an aft or forward-up antenna.

The jamming modes and techniques are software reprogrammable, each mode using an extensive range of jamming techniques and complex waveforms. Jamming waveforms and frequencies are programmed from threat data provided by the user. Jamming modes may be combined in response to specific threats, eg. deception to produce false target data combined with noise jamming to suppress real radar returns.

STATUS

Northrop built and conducted successful laboratory and flight tests of two CCS prototype systems during 1982. In 1983, the CCS prototype programme was completed. Flight tests have been completed and production units were due to be available by the end of 1985. The Swiss Air Force has signed a contract for full-scale development and preproduction, to update its aircraft. It is understood that the pod-mounted version is to be fitted to the South Korean F-16 aircraft.

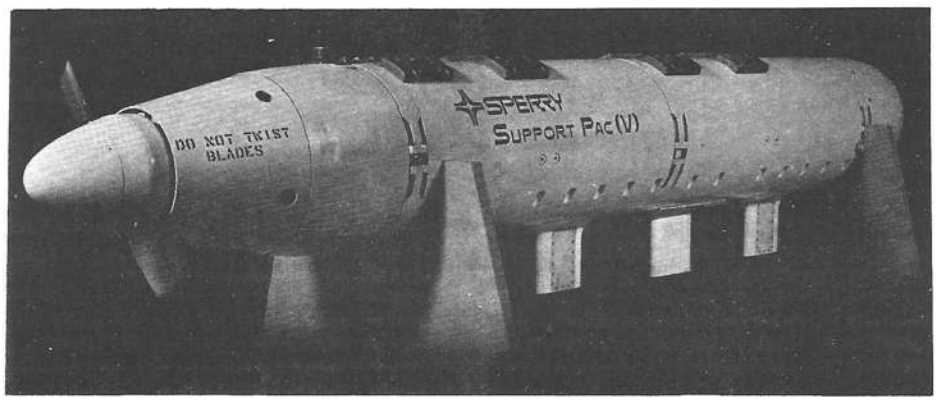
5693.393

AN/ALQ-172 NOISE DECEPTION JAMMER

This is an advanced ECM system intended for installation in the US Air Force B-52 strategic bomber fleet and is a modified version of the AN/ALQ-117 noise deception jammer currently operational in the B-52G/H fleet.

The improvements incorporated in the AN/ALQ-172 are unknown but are expected to include a threat reprogramming capability (possibly automatic), monopulse deception capability and an improved power management system to enable greater power to be directed against hostile emissions.

STATUS



Preproduction. ITT has received contracts totalling $532 million for development and production.

CONTRACTOR

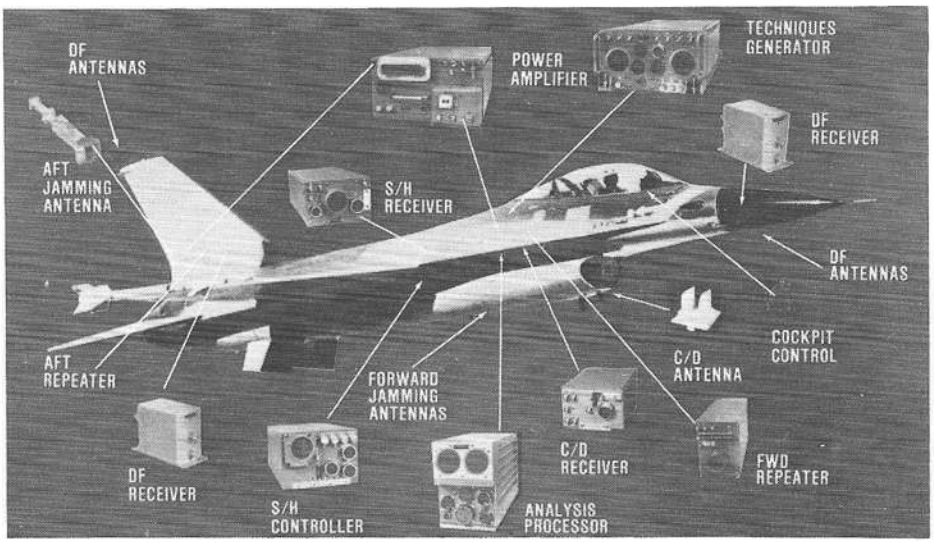
ITT Corporation, Avionics Division, Nutley, New Jersey, USA.

4100.393
AN/ALQ-176(V) SUPPORT PAC(V) JAMMER

The Sperry Support Pac(V) is a ten inch (25 cm) diameter, pod-mounted version of lightweight, high powered, affordable jammers designed primarily for tactical ECM support, standoff jamming, and ECCM training missions. This slim pod is easily mounted on a standard aircraft munitions station and can be powered by either internal aircraft power or self-powered by adding a ram air turbine generator (RAT). The modular design allows the system to be used in either a two- or three-canister configuration. Each canister houses two high-efficiency, high powered voltage tuned magnetron transmitters which were specifically engineered to cover threat radar frequencies from D- to J-bands. Solid-state jammers are available to cover frequencies below 1 GHz. Sperry engineers designed a standard voltage tuned magnetron transmitter to cover different threat frequencies simply by changing the output VTM tube. This standardised transmitter reduces the quantity of spares necessary to maintain a large number of jammers, thus significantly reducing maintenance and training costs.

Sperry Support Pac (V) in two-canister configuration with RAT electrical supply

CHARACTERISTICS
Frequency coverage: 1 - 15·5 GHz
Transmitter power output: 150 - 400 W CW
Modulation: Noise (various)
Weight of transmitter and antenna: 11 kg (each)
Pod input/output power: 2 canister (4 Tx): 3·5 kVA/1·6 kVA; 3 canister (6 Tx): 5 kVA/2·4 kVA
Weights: 2 canister 84 kg (aircraft powered), 89 kg (RAT); 3 canister 114 kg (aircraft powered), 121 kg (RAT)
Diameter: 25 cm
Length: 199 cm (2 canister); 259 cm (3 canister)



STATUS
Support Pac(V) systems have been developed and are currently undergoing tests for US and foreign sales applications. It has now received official US Air Force type designation as the AN/ALQ-176(V). Thirty systems have been ordered by the US Air Force under a $7 million contract.

CONTRACTOR
Sperry Corporation, Electronic Systems, Great Neck, New York 10020, USA.

4009.393
AN/ALQ-178 ECM SYSTEM

The AN/ALQ-178 ECM system is an integrated RWR/ECM suite for the F-16 aircraft. Based upon tested components and techniques of the Rapport II system (**3543.393**), the ALQ-178 provides the F-16 with the automatic countermeasure capability to survive in the increasingly deadly, and sophisticated, hostile air defence environments. The system utilises a central programmable computer for data analysis and system control, with independent micro-processors to direct RWR, display and jamming functions. The wide-band RWR continuously scans the threat radar environment. Detected signals are de-interleaved and identified as to radar type and displayed to the pilot on a daylight viewable CRT, in legible, unambiguous format. The power management algorithm optionally matches the countermeasures to the RWR's constantly changing threat picture. Separate forward and aft jammers are used for maximum spatial coverage. The jammers are accurately set for maximum power output at each victim radar's frequency to maximise ERP and jammer effectiveness. The jammer frequency range provides coverage of the entire threat band while the jammer power is sufficient to counter these radars throughout their lethal area.

Although the AN/ALQ-178 consists of both an RWR and an active jammer, the former can be installed as an independent threat warning system, with the jammer added later.

AN/ALQ-178 ECM system units and their location in F-16 aircraft

CHARACTERISTICS
Receiver: Superheterodyne and crystal video
Memory: 128 k, 2-page

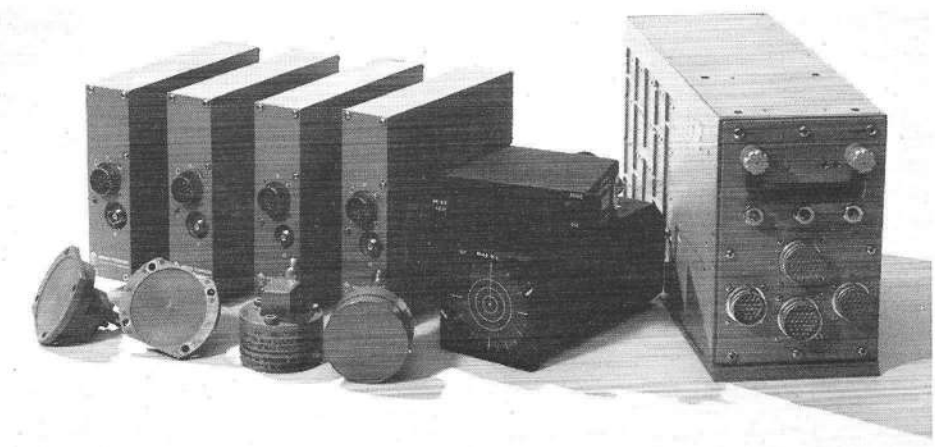
AN/ALR-45 ESM EQUIPMENT



The AN/ALR-45 is an aircraft radar warning receiver which is fitted to most types of US Navy tactical aircraft. It is similar to the earlier APR-25 warning receiver but provides for high-speed, digital processing of threat data as well as having a wider frequency coverage.

Four cavity-backed planar spiral antennas are used, each with its own preamplifier and interface unit linking it to the central receiver and processor.

It is reprogrammable in the field, but not in the air.

STATUS
Extensively used by the USN and since by a number of NATO nations, including Denmark and Canada. Production has reached some thousands of sets.

The ALR-45 is being replaced by the USN with the AN/ALR-67(V) and the ALR-45F. The latter is the processor for the ALR-67(V) and consists of a control indicator and the CP-1293 computer. The first three AN/ALR-45F systems were delivered in April 1983 as part of a $3·6 million contract and an additional 105 sets were due to be delivered by early 1984. An $8·5 million contract was awarded in January 1984 for 55 systems.

AN/ALR-45 digital threat warning receiver system

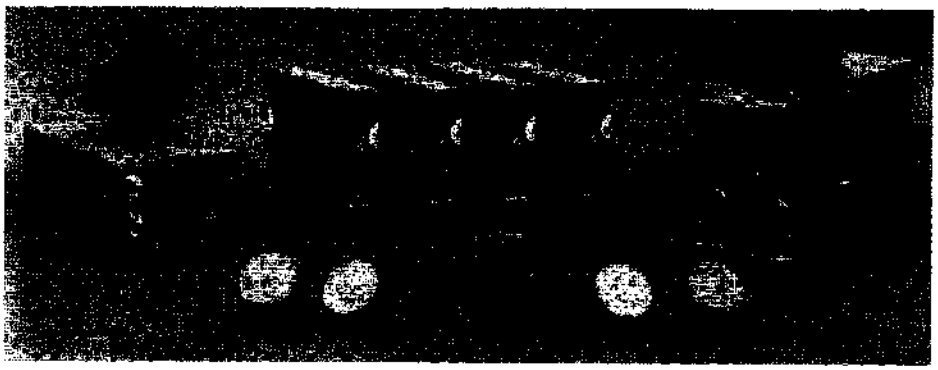
Litton Applied Technology, 645 Almanor Avenue, Sunnyvale, California 94088-3478, USA.



3035.353
AN/ALR-46 RADAR WARNING SYSTEM

The AN/ALR-46 is a digital threat warning receiver system based on improvements incorporated in the APR-36/37 receiver system. A major conversion in this development was to digital operation by the addition of a Dalmo-Victor DSA-20 processor.

The ALR-46 system is a 2 to 18 GHz, wide-open front-end, crystal video, field programmable system. It detects threats from ground, shipboard, and airborne radar signal sources and provides audio and visual alarms to the aircraft crew. The ALR-46(V)-3 uses a Dalmo Victor processor and an Itek receiver and controller. The ALR-46(V)-6 uses an Itek analyser (analogue processor).

STATUS

In service in US aircraft. Also used by Iran, Korea, Malaysia and Saudi Arabia. The ALR-46(V)-3 has been supplied to Egypt, Portugal, Switzerland, Taiwan, and the USAF.

Litton Applied Technology, 645 Almanor Avenue, Sunnyvale, California 94088-3478, USA.

1862.353
AN/ALR-47 RADAR HOMING AND WARNING SYSTEM

The AN/ALR-47 countermeasures receiving set has been developed for the US Navy's ASW aircraft, the S-3A Viking (**1403.302** in 1974-75 and earlier editions). In the Viking the ALR-47 obtains emitter signature and directional data which is fed into the aircraft's general-purpose digital computer for display on a multi-function display console. Among new features of the ALR-47 are automatic operation with variable control for frequency band limits, speed of tuning, and signal selection. Fixed antennas are used (four in each wing-tip), as are superhet receivers, and a digital processor.

Twin narrow-band receivers are incorporated in each ALR-47, and these incorporate an IF discriminator, out-of-band rejection logic, and voltage controlled oscillators which are tuned directly by computer control. The receiver channels are designed for high sensitivity and there is logarithmic compression of video outputs.

The characteristics of video outputs from four monopulse receiver channels are derived in a signal comparator which converts the data to digital format. All subsequent signal processing is performed digitally under computer control.

The two antenna groups are each comprised of two pairs of cavity-backed planar spiral broad-band antennas, arranged in a near orthogonal disposition for monopulse direction finding.

Control of the ALR-47 system is by means of computer programs which provide for receiver tuning, signal processing, and initiating warnings of significant contacts or known threats identified by stored signal characteristics. Provision is made for human intervention and manipulation of the software in the course of a mission to meet specific operational needs. Examples of this are facilities for filtering out unwanted signals of various types so that the overall processing and display load is reduced. Similarly parameters such as scan speed and frequency scanning limits, PRF, pulse-length, or bearing limits can all be varied at the discretion of the operator.

STATUS

In production for the US Navy S-3A Viking ASW aircraft.

CONTRACTOR

IBM, Federal Systems Division, 10215 Fernwood Road, Bethesda, Maryland 20034, USA.

1918.353
AN/ALR-50 ECM EQUIPMENT

The AN/ALR-50 is a surface-to-air missile alert and launch warning receiver set. Official details of its frequency coverage range have not been released but the ALR-50's coverage is believed to provide for warning of the radars associated with such Soviet surface-to-air missiles as the SA-6 Gainful as well as the earlier SA-2 and SA-3 weapons. It is possible, however, that whereas systems of this type (ALR-50) normally provide the aircrew with some indication of the status of the threat (eg, search, tracking, lock-on, etc), in the case of the SA-6 Gainful the use of as many as five bands for this missile's associated radars may prevent the ALR-50 from providing complete threat status information.

STATUS

In service with various US Navy aircraft types, including A-4, RA-5, A-6, A-7, F-4 and F-8.

CONTRACTOR

Magnavox Government and Industrial Electronics Company, 1313 Production Road, Fort Wayne, Indiana 46808, USA.

1919.353
AN/ALR-52 ECM RECEIVER

The AN/ALR-52 is a multi-band IFM (instantaneous frequency measuring) receiver for airborne or land mobile applications. A naval variant is also produced under the nomenclature AN/WLR-11. Typical systems cover the microwave frequency band from 0·5 to 18 GHz, using receiver modules that cover octave bandwidths. Additional capabilities include provision for selection of a particular signal or frequency band, blanking of signals which are of no further interest, separation of interleaved pulse trains, measurement of radar parameters, analysis of CW as well as pulse signals, and direction-of-arrival (DF) measurement. The complete equipment provides for two operator positions, each equipped with a control unit and a display. The two IFM control units are capable of complete control over any band selected. If the same band is selected by both units, the video processing unit gives priority control to one position only. All intercepted signals, however, are presented on the displays at both positions.

A modified version of the ALR-52 has been developed and deployed, in which one of the operator positions has been replaced by an interface unit to link the IFM receiver with a digital computer. This system also employs a 1 to 18 GHz DF antenna system. The computer uses the data to 'tag' every received pulse with its frequency, pulse width, time of arrival, and azimuth. This information is stored and used to develop an emitter parameter.

STATUS

In operational service. Fitted to the EP-3E Elint aircraft operted by the US Navy.

CONTRACTOR

ARGO Systems, 1069 East Meadow Circle, Palo Alto, California 94303.

3347.353
AN/ALR-56 RADAR WARNING RECEIVER

The AN/ALR-56 radar warning receiver (RWR) is used with the AN/ALQ-135 internal countermeasures set jamming equipment (**3346.393**) to form the tactical electronic warfare system (TEWS) of the F-15 fighter aircraft.

The main items of equipment comprising the AN/ALR-56 are: processor and low-band receiver (R-1867); high-band receiver (R-1866); countermeasures display (IP-1164); receiver control (C-9428); receiver control (C-9429); power supply (PP-6968); and the antenna system.

The processor and low-band receiver unit contains three major sections; a single-channel low-band superheterodyne receiver, a dual-channel IF section, and a processor.

The low-band receiver is electronically tuned under control of the processor. The dual channel IF section operates with either the high-band dual-channel receiver (R-1866/ALR-56) or the low-band single-channel receiver. Selection of the receiver to operate with the dual-channel IF section is under the control of the processor.

The processor contains a pre-processor and a general purpose digital computer. The pre-processor contains all the video circuits for analysing intercepted signals. It also provides digital outputs to the computer which represent the measured signal parameters. On the basis of these measurements, a digital output is provided to the display and an audio signal generated. The computer also controls all AN/ALR-56 system functions and is software programmable for the expected threat environment.

The solid-state, digitally controlled, dual-channel high-band receiver is capable of scanning an extremely large portion of the electromagnetic spectrum. Its single conversion superheterodyne design provides high sensitivity; the use of dual YIG RF preselection affords excellent selectivity and spurious rejection.

High frequency accuracy is obtained through the use of a frequency synthesised local oscillator.

The RF input ports are configured to accept two main antenna inputs to each channel and two additional RF inputs which may be designated to either channel. All switching functions are provided internally.

The receiver is capable of receiving signals over a large dynamic range for analysis and DF measurements. A self-contained precision signal source is provided for calibration and/or BIT over the entire tuning range. Provision is also made for multiplexing out important receiver functions.

All receiver functions are controlled by serially generated NRZ Manchester coded data. The precise data rate also serves as the reference clock for the receiver frequency synthesiser.

On the countermeasures display, rapid threat evaluation for aircraft defensive manoeuvres, at night or in direct sunlight, is accomplished through automatic intensity control utilising ambient light sensing techniques. Sharp, high contrast, unambiguous alpha-numerics and special symbology allow immediate assessment of the overall tactical threat, without requiring pilot display

adjustments as external ambient light fluctuates. Phosphor screen-optical filter matching provides contrast enhancement to overcome direct sunlight contrast degradation.

A range-bearing data presentation is provided with special clutter elimination programs as well as special threat status. Built-in test circuits determine display system malfunction and automatically indicate 'GO' conditions. An integral lighting panel provides control illumination for night time viewing.

The antenna system consists of four circularly polarised spiral antenna assemblies, each within its own radome, and a blade antenna. Collectively this antenna system provides omni-directional acquisition and direction finding over the operating frequency range of the RWR. The four spiral antennas, which cover the high band frequency range, are mounted in a manner that provides 360° azimuth coverage. DF operation is accomplished under computer control. The blade antenna provides omni-directional coverage of the low-band frequency range.

Of the two receiver control units, one provides for control of the RWR as well as other countermeasure sub-systems. A single switch controls the entire RWR on/off function, and separate switches and relays are provided for the sub-systems under RWR control. Audio tone cues are controlled from this unit also.

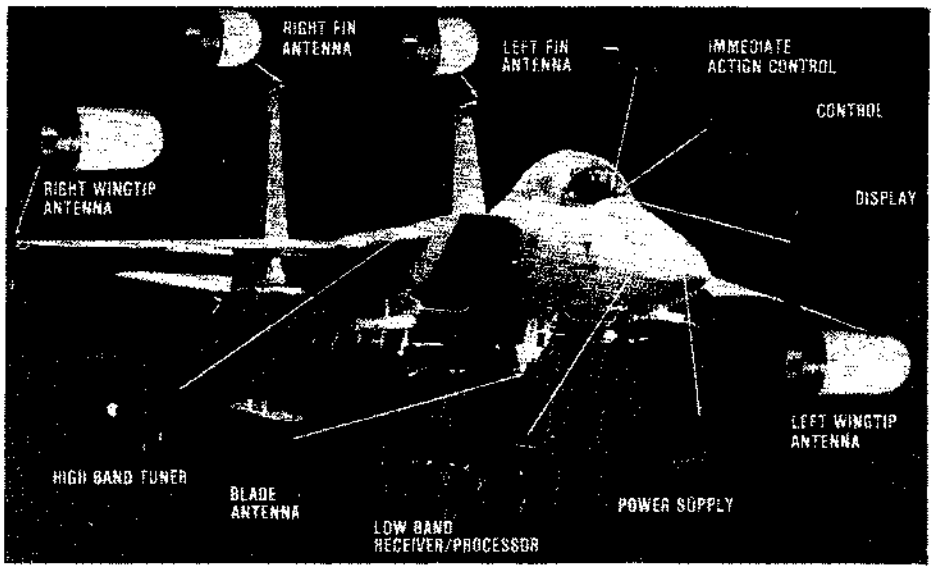
The other receiver control panel is for activating in-flight functions that require instant pilot reaction. In addition to countermeasures sub-system mode control, interrogated data readout on this unit can be called up from the sub-systems by means of push-button operation.

A major update known as the ALR-56C has now been completed with improvements in the processor to handle new threats, greater signal densities and other changes. The ALR-56C is a digitally controlled, dual-channel superheterodyne receiver covering the E to J frequency bands, and is capable of sorting and identifying all current and projected threats to the aircraft. RF input ports are configured to accept two main antenna inputs to each channel and two additional RF inputs that may be designated to either channel, with all switching functions provided internally. The system's major functions are broadly similar to those of the ALR-56A and include programmed frequency search, signal acquisition and analysis, establishment of priorities, jammer management, passive countermeasures management, and visual and audible displays/warnings.

CHARACTERISTICS

System functions

(1) programmed frequency search of threat parameters with:
  (a) low-band priority
  (b) look-through capability
  (c) jammer blanking
(2) signal acquisition and sorting
(3) signal analysis
(4) direction finding
(5) establishment of threat priorities
(6) jammer management and look-through
(7) display threat data



Display: CRT, radar type, degree of threat, range readout
Data input rate: 20 Hz
Refresh rate: 66·6 Hz
Contrast ratio: 1:4 (minimum)
High-band receiver: Superhet, dual-channel RF
Low-band receiver/processor: Superhet, dual-channel IF, video processing, GPDC
System weight: 62·6 kg

STATUS

In production and operational on F-15 Eagle aircraft. A contract valued at over $43 million has been awarded by the US Air Force for 111 ALR-56C equipments. The system was due to be fitted to all new F-15 aircraft, and retrofitted to most existing types replacing the ALR-56A, commencing in mid-1985.

5832.353
AN/ALR-59(V) ESM SYSTEM

This is a broadband ESM receiver used in the US Navy E-2C aircraft. The system employs phase interferometers and amplitude comparison to determine the direction of signal arrival. Frequency coverage is from 500 MHz to 18 GHz and four quadrant antenna arrays are used. The receiver has four-band simultaneous coverage over three octaves and is computer controlled.

STATUS

Nearly 100 units have now been produced for the E-2C aircraft. The system has also been sold to Israel and Japan.

CONTRACTOR

Litton, Amecom Division, College Park, Maryland, USA.

4376.353
AN/ALR-60 COMMUNICATIONS INTERCEPT AND ANALYSIS SYSTEM

The AN/ALR-60 communications intercept and analysis system is carried on the US Navy EP-3E electronic reconnaissance aircraft and is used primarily for tracking and identifying Soviet warships. It is a huge complex and has multiple operator positions, equipped with video terminals that allow the operator to randomly access raw audio data and processed text data. Digitally controlled receivers are operated on a priority basis.

Only seven systems have been built, as far as is known. They use the latest advances in computer technology to provide the maximum information to the operators. Computer formatted CRT pages, and overall control by the computer of the receiving, recording, priority and processing functions, are used to ensure more complete coverage of all signals intercepted.

STATUS

In operational service.

CONTRACTOR

4377.393
AN/ALR-62(V) RADAR WARNING SYSTEM

The AN/ALR-62(V) is the standard radar warning receiver used in the US Air Force F/FB-111 and EF-111A aircraft. The ALR-62(V)-3 is used in the FB-111 aircraft while the ALR-62(V)-4 is installed in the EF-111A electronic warfare aircraft being produced for the USAF. The ALR-62(V)-4 represents a major part of the EF-111A terminal threat warning system. It analyses and monitors radar threats and has the capacity to 'look-through' high power jamming from the AN/ALQ-99 transmitters (**1908.393**) carried on the aircraft.

The AN/ALR-62(V) is a third generation equipment which evolved from the AN/APS-109 radar homing and warning system and consists of forward and aft receivers, an antenna system, a digital signal processor and cockpit-mounted threat indicator and countermeasures control units.

STATUS

In operational service. A $36 million contract was awarded to Dalmo Victor in September 1984 for updated versions.

CONTRACTOR

Dalmo Victor Operations, Bell Aerospace Textron 1515 Industrial Way, Belmont, California 94002, USA.

4378.393
AN/ALR-64 COMPASS SAIL WARNING SYSTEM

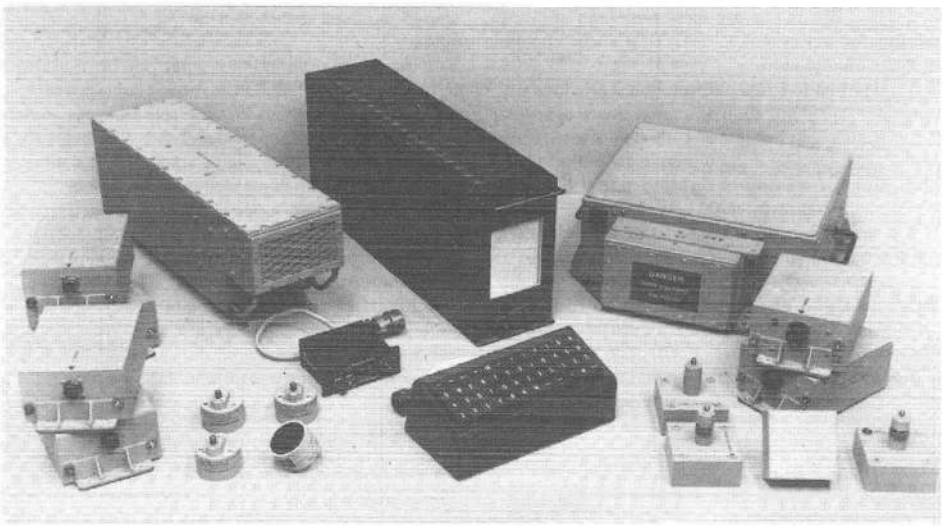
The AN/ALR-64 Compass Sail warning system is fitted to various USAF tactical aircraft, including the F-4, A-10 and F-16. The equipment provides C/D band direction finding capability and consists of a multiple receiver intercept unit and a direction finding antenna array. The system is designed to provide information on missile guidance systems associated with hostile surface-to-air missiles. As a missile launch alert receiver, the AN/ALR-64 forms part of the USAF Compass Tie radar warning suite. The receiver also forms part of the AN/ALR-69 radar warning system (**4379.353**).

CONTRACTOR

Dalmo Victor Operations, Bell Aerospace Textron, 1515 Industrial Way, Belmont, California 94002, USA.

3642.353

AN/ALR-66 SERIES RADAR WARNING RECEIVERS



The AN/ALR-66(V)1 is a fully programmable radar warning receiver that incorporates a digital computer specially designed to provide rapid, unambiguous identification of emitters in complex signal environments. Unique identification of all detected emitters, both friendly, non-hostile and hostile, is given by alpha-numeric symbols on a high-brightness CRT display. The system incorporates an extensive emitter library capable of storing more than 100 emitters and over 1000 operating modes. Up to 15 of these emitters can be displayed at one time on the CRT display, and direction-finding accuracy is better than 15°. True or relative bearing display of DF information can be selected, and other features of the system include: an audio alarm under computer control; operator-initiated emitter hand-off; and 64 specialised computer modes under operator control.

Suitable interfaces are available for use of the ALR-66 with other systems such as chaff or flare dispensers, telemetry links, recorders, and serial and parallel input/output for jammers. The processor memory capacity is 8000 words E²PROM/RAM/ROM (68 K words total capacity), and it is able to perform 1·2 million operations per second.

A variety of system assembly configurations are available to satisfy a wide range of installation and mission requirements. These include fighter aircraft, attack aircraft, helicopters and fast patrol boats.

The AN/ALR-66(VE) is the fighter aircraft configuration of the AN/ALR-66 series and provides enhanced performance and extended versatility due to the introduction of E²PROM devices in its computer memory. It is designed as a 'drop-in' replacement/upgrade of older systems in combat aircraft. The use of E²PROM devices allows complete memory reprogramming in 90 seconds on the flight line. The system operates in the C to J bands to provide warning of all pulse and CW radars. The data library consists of more than 1000 emitters.

The AN/ALR-66(V)2 is a recent development for the US Navy and is an important enhancement in capability for its multimission aircraft. The system forms an integral part of its ocean surveillance systems and can be used on offensive as well as defensive missions. Derived from the AN/ALR-66(V)1, the AN/ALR-66(V)2 provides extremely advanced capabilities in such areas as precision DF accuracy, exceptionally high sensitivity for OTH detection, precise frequency measurement, advanced signal processing concept coupled with expanded data memory, multimode operator-interactive display and controls, precision emitter parameter measurement, capability to integrate with other aircraft primary sensors and E²PROM in-flight reprogramming capability. The ALR-66(V)2 is in production and in worldwide operational service with the US Navy.

AN/ALR-66(V) 2 radar warning receiver

The ALR-66(V)3 version is derived from the (V)2 and is in production for the US Navy P-3C aircraft. It provides high sensitivity for detection and frequency measurement, and employs more advanced signal processing, an expanded data memory, and a plasma control/display unit.

CHARACTERISTICS

Receiver type: Crystal video

Frequency coverage: Continuous over E to J bands; CW detection; C & D band detection available

Azimuth coverage: 360°

Emitter types: all pulsed, pulse doppler & CW; known and unknown

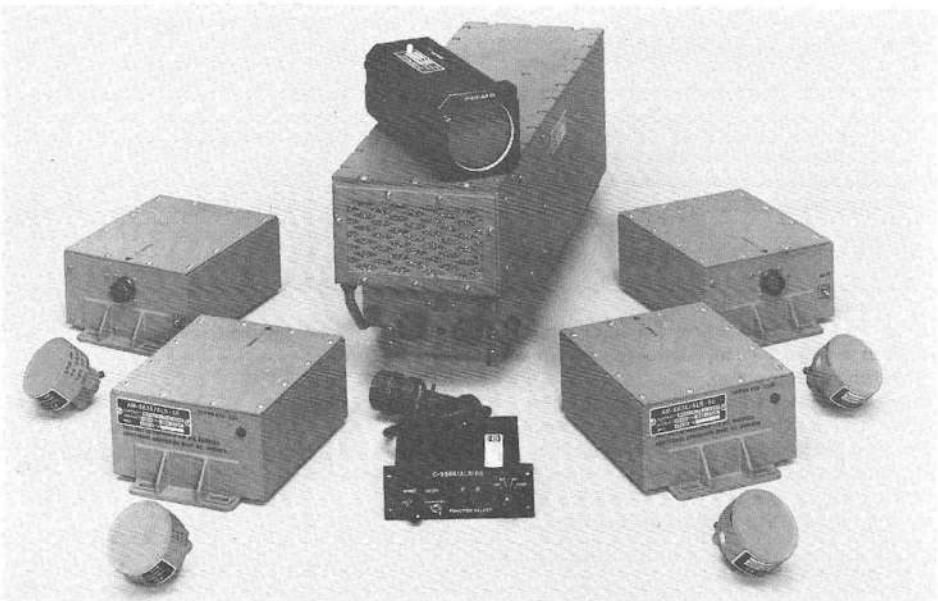
DF accuracy: Better than 15°

Shadow time: 2 μs

Emitter storage: More than 100; more than 1000 operating modes

Weight: 27 kg; 29·2 kg (ALR-66(VE))

Power consumption: 400 W



MTBF: Over 500 h

STATUS

In production for the US Navy Lamps Mk1 (SH-2) helicopters, and for other navies on HSS-2 and Sea King helicopters. (VE) version on US and other countries' fighters. The Venezuelan Air Force has ordered the (VE) version for its F-16 aircraft and an unidentified Middle East country has specified the system for helicopters. The US Navy has placed a $13 million contract for a number of ALR-66(V)3 retrofit systems for the P-3C aircraft.

CONTRACTOR

General Instrument Corporation, Government Systems Division, 600 West John Street, Hicksville, New York 11802, USA.

AN/ALR-66 (V)1 radar warning receiver equipment. ALR-66(VE) is similar but employs different processor and antenna coupler units. The same cavity-backed spiral antenna units are used in both versions

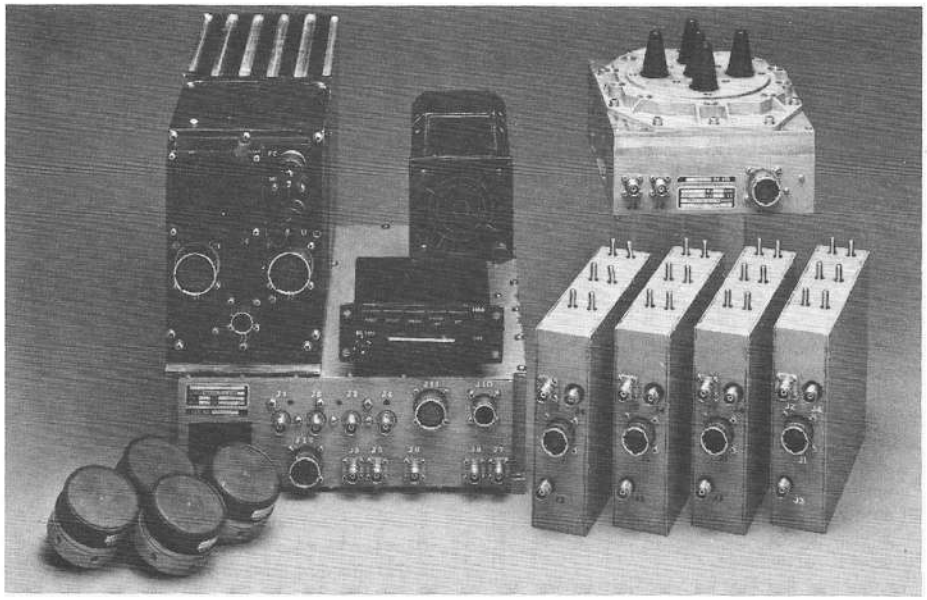
4372.393

AN/ALR-67(V) RADAR WARNING SYSTEM

The AN/ALR-67(V) is a countermeasures warning control system which is the US Navy's front line threat warning system in tactical aircraft. The programme for development of this system began in March 1975 and is currently in the operational evaluation phase by the US Navy. A sub-set of the AN/ALR-67 is the AN/ALR-45F which consists of the central digital processor and the azimuth indicator. The AN/ALR-45F system is replacing the AN/ALR-45 equipment currently deployed.



STATUS

In production. Designed for installation in the US Navy F/A-18 Hornet aircraft and for the A-6E and AV-8B. Litton has received contracts totalling nearly $200 million for the AN/ALR-67(V) from Australia, Canada and Spain as well as the US Navy. A $7 million

contract to provide a prototype installation in an F-14 aircraft was awarded to Grumman Aerospace in March 1985.

CONTRACTOR

Litton Applied Technology, 645 Almanor Avenue, Sunnyvale, California 94088-3478, USA.

AN/ALR-67(V) developed by Itek for the US Navy

3525.353

AN/ALR-68 ADVANCED RADAR WARNING SYSTEM

The ALR-68 is a digital threat warning receiver system based on improvements incorporated in the ALR-46 receiver system. A major conversion in this development was to digital operation by the addition of the ATAC (Applied Technology Advanced Computer).

The ALR-68 system is a wide-open front-end, crystal video, field programmable system. It detects threats from ground, shipboard, and airborne radar signal sources, and provides audio and visual alarms to the aircraft crew. The ALR-68(V) with the Itek ATAC also provides in-cockpit threat parameter programming; provides for unambiguous identification; incorporates processing for all guidance techniques; and provides hand-off to tactical ECM systems.

The AN/ALR-68 was developed for the West German Air Force.

STATUS

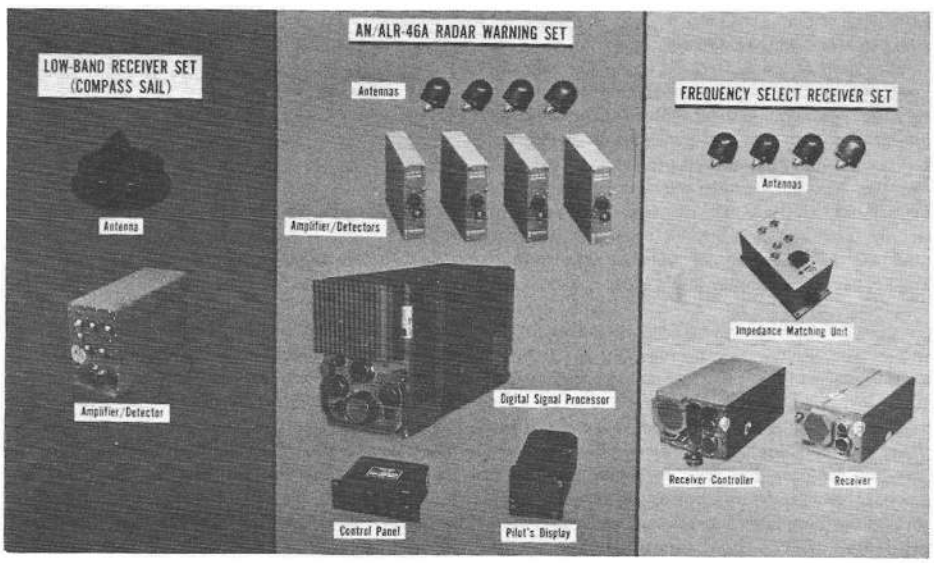
In production.

CONTRACTOR

Litton Applied Technology, 645 Almanor Avenue, Sunnyvale, California 94088-3478, USA.

AN/ALR-68 digital threat warning receiver system

4379.353



AN/ALR-69 RADAR WARNING RECEIVER

The AN/ALR-69 radar warning receiver is a development of the earlier versions of the AN/ALR-46 equipment. It is essentially an ALR-46 with a frequency selective receiver system and a low-band missile alert receiver (AN/ALR-64 Compass Sail) (**4378.353**) added to the basic system. The Compass Sail equipment detects and analyses surface-to-air missile guidance emissions and provides a warning to the pilot of the direction and nature of the threat.

The system is designed to activate counter-measures equipment, eg chaff and flare dispensers, automatically and to integrate with on-board jamming systems. A CM-479 signal processor provides control over the system. It accepts video inputs from five receivers and processed information from the frequency selective receiver system, processes all the information and provides the threat warning to the operator. The frequency selective receiver performs warning and direction finding on the incoming signals, resolves ambiguity and manages jamming blanking.

STATUS

The AN/ALR-69 uses Litton Applied Technology receivers and displays, Dalmo Victor signal processor and C/D-band receiver, and Sperry Flight Systems azimuth indicator. It is the basic system for the F-16 aircraft used by Denmark, Israel, Netherlands, Norway and the US Air Force. Litton received a $24 million contract in September 1983 to update the AN/ALR-69 system. Another contract worth $11·7 million was awarded in September 1984 to supply systems for US Air Force F-16, A-10 and F-4D aircraft.

4164.393

AN/ALR-73 PASSIVE DETECTION SYSTEM

The AN/ALR-73 passive detection system (PDS) is an airborne ESM equipment developed for the US Navy's E-2C airborne early warning aircraft. The primary operational roles assigned to the E-2C consist of surveillance of both airborne and surface, hostile and friendly forces; early warning of hostile aircraft in order to protect the fleet; and the exercise of real-time control of the carrier tactical aircraft. The ALR-73 is intended to augment the AEW, and surface, subsurface, command and control role of the E-2C by enhancing the threat detection and identification performed by the aircraft. It is a completely automatic, computer-controlled, superheterodyne receiver/processing system that communicates directly with the E-2C aircraft command and control central processor. The design of the system was motivated by four major considerations:

(1) very high probability of intercept in dense environments
(2) automatic system operation
(3) high reliability
(4) ease of maintenance.

Features of the ALR-73 which are related to its intercept probability performance include: four quadrant 360° antenna coverage; four independently controlled receivers; dual processor channels; digital closed loop rapid tuned local oscillator. Others concerned with automated system operation are: low false alarm report rate; automatic overload logic; AYK-14 computer adaptively controls hardware; degraded mode operation.

The PDS system can measure DOA, frequency, pulse width and amplitude, and PRI simultaneously. Scan rate information is also available if called for by the central processor. Special emitter tags can also be provided. A functional block diagram of the PDS is shown in Figure 1. The PDS detects and analyses electromagnetic radiations within the microwave spectrum. It sends emitter data reports (pulse width, PRI, DOA, frequency, pulse amplitude and special tags) to the E-2C's central processor via the PDS data processor. The central processor performs the identification function. The PDS immediately reports new emitters to the central processor. It eliminates redundant data on emitters for a programmable period of time, thus significantly reducing the data rate to the central processor. The PDS – a multiband, parallel scan, mission programmable, superheterodyne receiving system – covers the frequency range in four bands through step sweeping. Programmable frequency bands and dwell time permit very rapid surveillance of priority threat bands. Non-priority bands are also monitored, but at a reduced rate. Probability of intercept is increased without sacrificing sensitivity through the detection of both real and image sidebands.

Installation of the ALR-73 on an existing aircraft required a functional and mechanical modularity in the system partitioning to facilitate installation on the aircraft (Figure 2). Antenna packages located in the four quadrants of the aircraft provide 360° azimuth coverage. The large phase tolerance of the binary beam minimises the sensitivity of the DOA system to radome distortion and aircraft reflection. All four bands in the normal mode of operation scan through their respective frequency limits independently and simultaneously.

Activity indications may be obtained on any of the four bands. Following an indication of activity, permitted dwell time is increased, and processing of the intercepted signal is started. Dual-signal processing circuits allow intercepted signals in any two of the four bands to be processed simultaneously.

The signal processor is a special-purpose logic processor which performs pulse train separation, DF correlation, band tuning and timing, and built-in test equipment (BITE) logic functions. The signal processor also contains the I/O circuitry necessary for the computer to communicate with both the signal processor and the aircraft central processor. The AYK-14 provides the system control function, data storage, and formatting. Variable frequency coverage, along with variable dwell times and processing times, provide a means for optimising probability to intercept for any given theatre.

The local oscillator system consists of three units: the IFM/LO generator, LO amplifier and LO power divider. The system is unique in that it is extremely fast and accurate. The key unit in the LO system is the instantaneous frequency measurement (IFM) receiver, which samples the LO frequency and converts it to a digital tuning command. This closed loop system permits frequency measurement accuracy, while being largely insensitive to environmental variations. The local oscillator signals from the IFM/LO are amplified by the LO amplifiers to overcome the long LO cable losses, and are then routed, via the power divider, to the various receiver front ends.

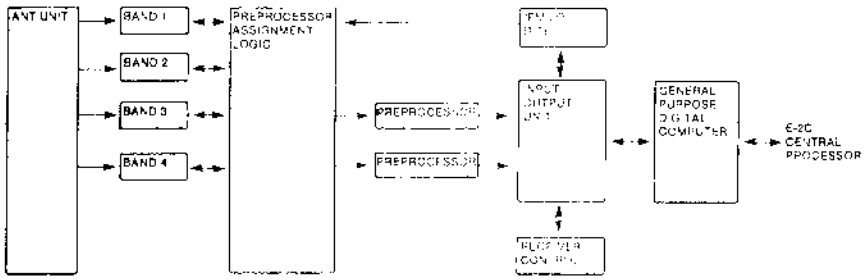

Fig 1 AN/ALR-73 passive detection system block diagram

Antenna
- 4 quadrant 360° coverage
- compact light ground planes
- binary beam for accurate DOA

Pre-processors
- parallel processing
- real-time pulse train de-interleaving
- DOA encoding on each pulse
- FREQ encoding on each pulse
- DOA correlation

Receivers
- 4 band parallel scan
- large dynamic range
- rejects sidelobes of high power narrow pulses
- logical selection of real or image sideband
- no preselection track and slave tuning problem

IFM LO BITE
- rapid tuning
- self test

Receiver control
- INDEP band tuning
- INDEP band dwell time control
- RCVR sensitivity control

Computer functions
- computer operator controlled spectrum surveillance
- real-time emitter data processing
- new emitter report generation
- redundant data removal
- BITE and fault isolation programs
- activity-window processing (real image)

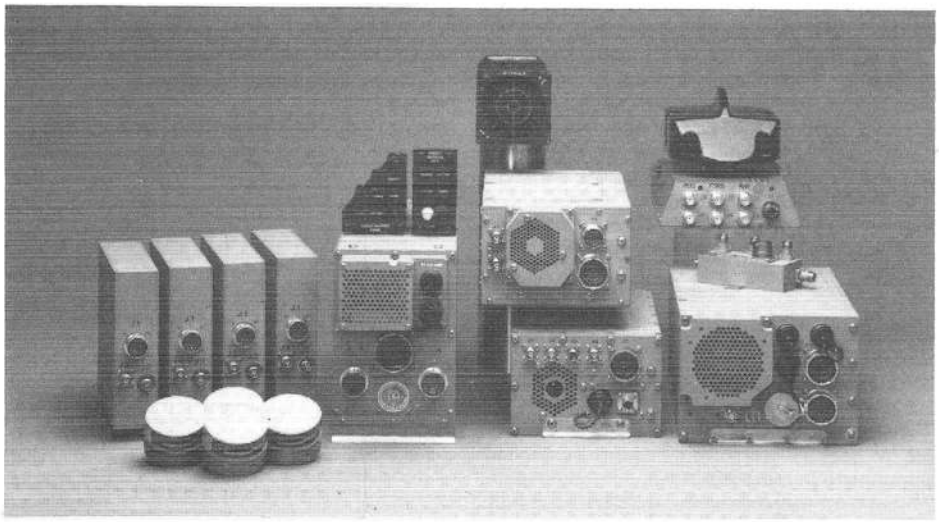
STATUS

One hundred systems had been delivered by mid-1984. Litton has received a contract for the update of the EW system on the EA-6B Prowler aircraft of the US Navy. It is expected that this will be based on the AN/ALR-73 system technology. Engineering development models are scheduled for delivery in 1986.

CONTRACTOR

Litton Systems Inc, Amecom Division, 5115 Calvert Road, College Park, Maryland 20740, USA.

5694.353



AN/ALR-74 RADAR WARNING SYSTEM

The ALR-74 was formerly known as the AN/ALR-67/69 update and is designed to achieve commonality between US Air Force and Navy radar warning systems. Technologies developed for the AN/ALR-67 system (**4372.393**) are to be used to modify the AN/ALR-69 equipment (**4379.353**). The system consists of five line replaceable units.

STATUS

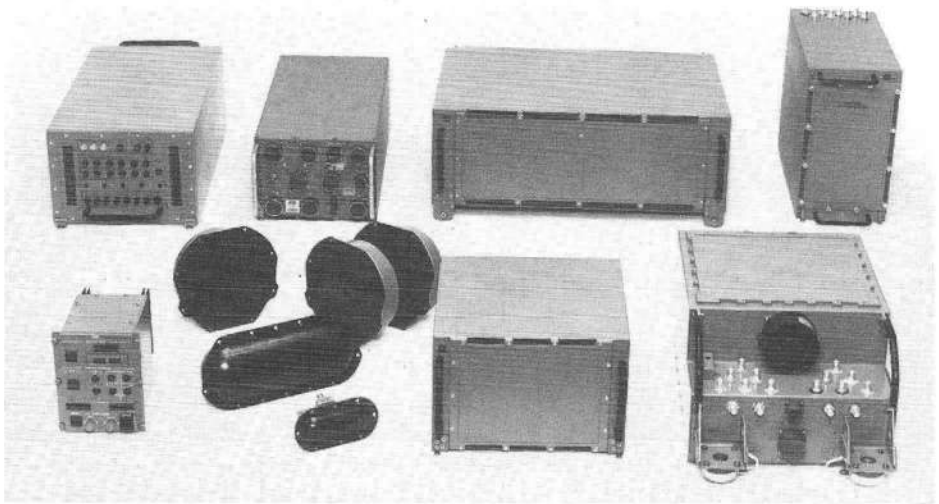
More than $52 million has been awarded to Litton for this system. Deliveries of prototype models commenced in late 1983 and flight testing in an F-16 began in March 1984. First production contract was due in mid-1984 against a US Air Force requirement for 2600 units.

CONTRACTOR
Litton Applied Technology, 645 Almanor Avenue, Sunnyvale, California 94088-3478, USA.

AN/ALR-74 radar warning system

5833.353
AN/ALR-76 ESM SYSTEM

This is a successor to the AN/ALR-47 (**1862.353**) and is intended for fitment to the US Navy S-3B aircraft. It is automatic in operation and provides techniques for ambiguity resolution. With considerable greater processing power than the ALR-47 the system carries out continuous direction finding to provide the exact location of all emitters automatically. The equipment is modular in construction and weighs approximately 59 kg.



CONTRACTOR
IBM Federal Systems Division, Owego, New York 13827, USA.

5690.393
AN/ALR-77 ESM SYSTEM

The AN/ALR-77 ESM system for the P-3C Orion anti-submarine warfare aircraft is in the development stage. The antennas are housed in the wing tips of the aircraft. When in operation, the system detects shipborne and airborne radar signals and feeds this information to an on-board computer. The information is then processed and a readout is provided for the crew with such parameters as the signal location and threat potential. The system also provides targetting data for the radar-guided Harpoon missiles.

The ALR-77 consists of interferometer antennas, multiband converters, processor units, an IFM encoder, IF synthesiser and controller. The antennas are wingtip-mounted with a total of 36 antennas, 18 on each wingtip. Each 90-degree quadrant has nine antennas and these are futher broken down into three sets, each covering one of three bands for bearing determination. A multiband converter is also housed in each wingtip assembly to control the antenna selection, and perform fine direction-finding quadrant selection.

STATUS
Eight systems were due to be produced during a preproduction period. A P-3C was modified by Lockheed to accept the new ESM system during 1985 and was due to be delivered to the US Navy for flight tests in November 1985. Following successful tests a production decision is likely to be made during 1986 for the manufacture of approximately 275 systems.

AN/ALR-80 RADAR WARNING RECEIVER

The AN/ALR-80 is a development from the AN/ALR-66(VE) system (**3642.353**) and is mechanically designed as a 'drop-in' replacement for older equipment in fighter type aircraft. It employs E²PROM in the computer memory and a new software programme to allow complete memory reprogramming on the flight-line in 90 seconds. The AN/ALR-80 is capable of automatically recording the major parameters of all detected pulse and CW radars for post-flight analysis and has a radar storage of more than 1000 emitters. This can be expanded to 2000 if required. The weight of the complete system is 29·3 kg.

STATUS
In production.

CONTRACTOR
General Instrument Corporation, Government Systems Division, 600 West John Street, Hicksville, New York 11802, USA.

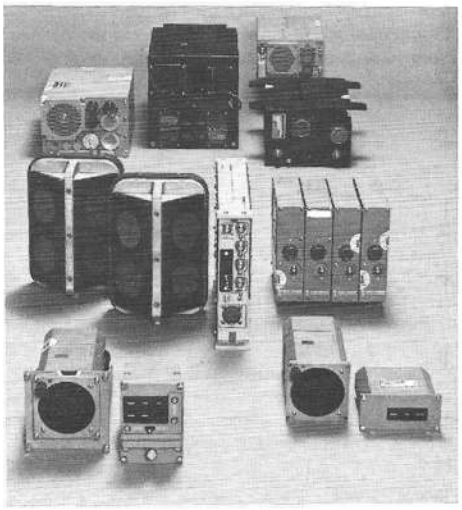
ENHANCED RADAR WARNING SYSTEM

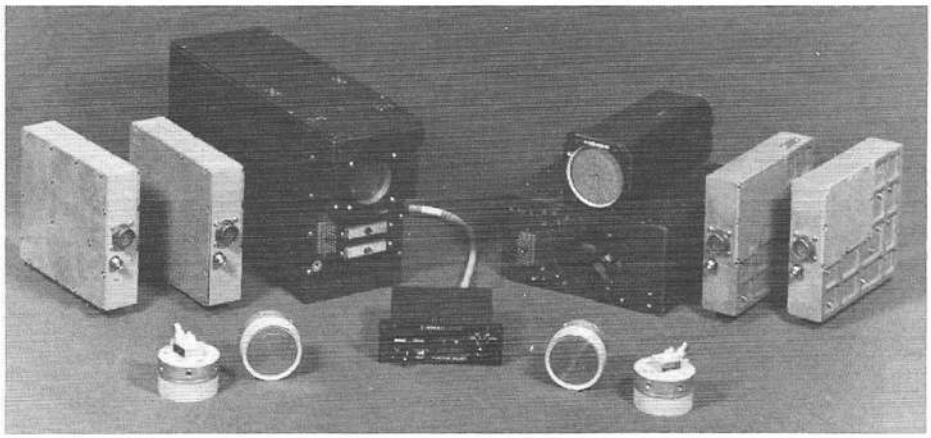


This advanced radar warning equipment was developed and manufactured for use by the Federal Republic of Germany Air Force and Navy on the Tornado aircraft. The system uses the Applied Technology Advanced Computer (ATAC) which provides for data collection, sorting, analysis, threat priority and alpha-numeric display functions using software algorithms. The emitter library is accessible in the cockpit for user-programming for threat update.

STATUS

In production. Co-production agreements with AEG-Telefunken cover both flight and support systems to include exchange of technical data.

CONTRACTOR



Litton Applied Technology, 645 Almanor Avenue, Sunnyvale, California 94088-3478, USA.

Enhanced radar warning system

3908.353
AN/ALR-606(V)1 AND (VE) RADAR WARNING RECEIVERS

The ALR-606(V)1 and (VE) radar warning receivers are the latest models to be introduced by General Instrument Corporation. They share the same hardware configuration as the ALR-66(V)1 and (VE) respectively (**3642.353**) but software enhancements provide additional facilities. The main items of equipment are a digital signal processor; a high intensity CRT cockpit display; four cavity-backed planar spiral antennas and their associated receivers covering the E to J-bands; a power supply unit; and a control indicator unit. The processor separates and categorises the characteristics of received signals, and unique symbols are presented on the display to indicate the range and bearing of each detected target. Symbol blinking and an audio alarm denote high priority radar types. The operator is able to select standard and special equipment operating modes. Radar data is presented in the form of alpha-numeric symbols which indicate specific parameters such as pulse width, PRF (scale 0 - 9), and frequency band (E, G, I or J).

ALR-606(VE) radar warning system

CHARACTERISTICS

Frequency: E to J-band continuous; C/D band optional
Radar types: All pulse types, CW detection
Receiver type: Crystal video
Azimuth coverage: 360°
DF accuracy: Better than 15°
Shadow time: 2 μs
Processor memory: 18 000 words E²PROM/RAM/ROM 68 K total capacity
Radar capacity: 15 symbols can be displayed simultaneously. System signal tracking capacity is 35 radars simultaneously
Weight: 29·22 kg ALR-606(VE); 27 kg ALR-606(V)1

STATUS

The ALR-606(V)1 and -606(VE) were designed specifically for the export market and have been selected by a number of air forces for fighter aircraft fitment.

CONTRACTOR

General Instrument Corporation, Government Systems Division, 600 West John Street, Hicksville, New York 11802, USA.

5952.393
AN/ALT-28 NOISE JAMMER

The AN/ALT-28 is a carcinotron noise jammer carried in pairs aboard the B-52 aircraft and operates over the frequency range from UHF to 100 GHz. It was developed as part of a later series of modifications to the EW suite of the B-52. The equipment depends on the ALQ-155 power management system (**3552.393**) to improve efficiency in multiple threat environments. The system has been continuously updated, the latest being the addition of the ALQ-155 which ties in the AN/ALT-28 with the ALR-46 radar warning receiver.

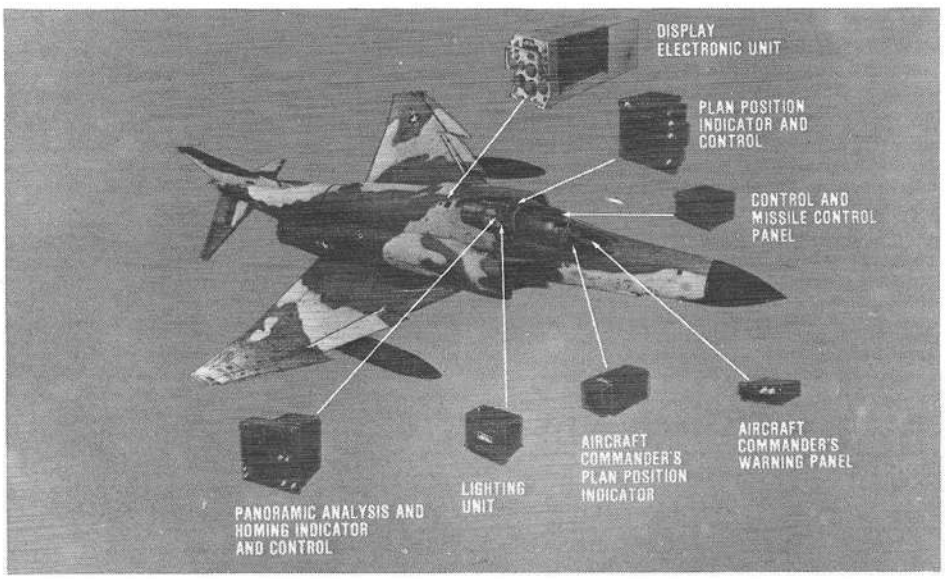
STATUS

The system is in service on the B-52 aircraft but is believed to be no longer in production.

CONTRACTOR

Northrop Corporation, Defense Systems Division, 600 Hicks Road, Rolling Meadows, Illinois 60008, USA.

3544.393
AN/APR-38 WILD WEASEL CIS



The AN/APR-38 control indicator set (CIS), designed to be the "eyes and ears" for the Wild Weasel II aircraft, is composed of seven line replaceable units (LRUs) that receive, display and transmit real-time data, in association with other on-board equipment. It provides the aircraft commander with computer-supplied data that permits him to complete his mission successfully. The system can be operated in either automatic or semi-automatic mode, at the pilot's option. The antenna/receiver systems are installed on the nose and the tail fin.

The CIS receives computer-generated information on detected radar emitters. The digital information is transmitted serially. The highest priority emitters are classified as to threat type, priority of threat, range, magnetic bearing and other pertinent information. A threat library is contained within the central computer.

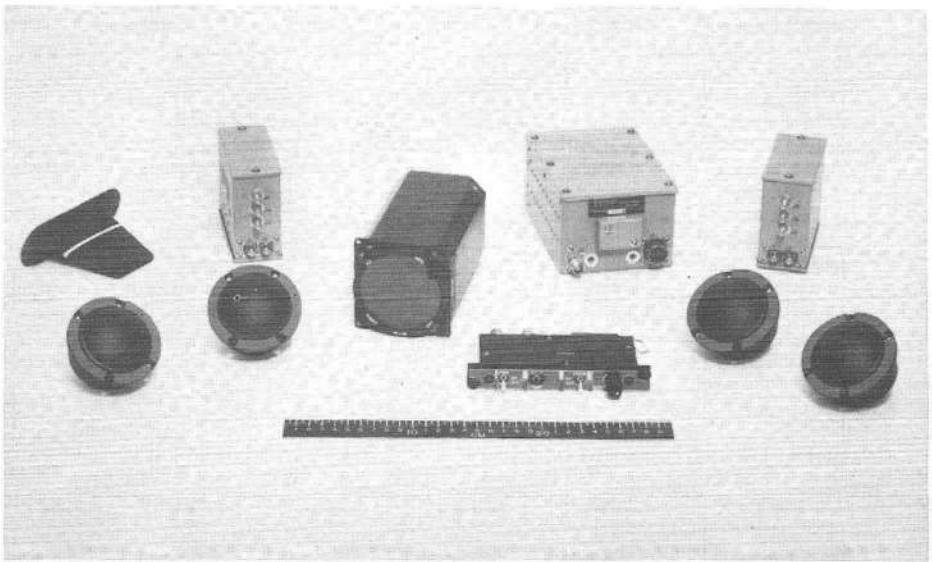
The CIS can select the types of emitters to be displayed on a PPI display and can be controlled by the computer semi-automatically or manually at the option of the operator.

STATUS

The CIS is currently operational in the F-4G aircraft. A performance upgrade programme, including frequency coverage and processing capability, is in progress.

Location of units of APR-38 control indicator set (CIS) in F-4G Wild Weasel aircraft

CONTRACTOR



Loral Electronic Systems, Ridge Hill, Yonkers, New York 10710, USA.

3542.393
AN/APR-39(V) RADAR WARNING SYSTEM

The AN/APR-39 radar warning receiver equipment provides automatic warning of emitters in the E, F, G, H, I and most of J radar bands, as well as the appropriate portions of C and D-band radar associated signals. It is intended for use on either fixed-wing or helicopter type aircraft. The equipment provides indications of bearing, identity, and the mode of operation of detected signals, this being displayed on a cockpit indicator. Proportional PRF of displayed signals, and alarm tones, are presented to the aircraft crew via the audio system also.

The equipment of the basic APR-39(V)1 system comprises: two dual video receivers, four spiral cavity-backed antennas, one blade antenna, an indicator unit, a comparator, and a control unit. Without cables and brackets, this weighs about 3·63 kg, and either internal or pod mounting is possible.

An updated version, APR-39(V)2, is in production. In the APR-39(V)2 the comparator is replaced by a Loral CM-480/APR-39(V) digital processor. This performs signal sorting, identification of emitters, bearing computation, and character generation for the presentation of threat details in alpha-numeric form on the cockpit display. This unit weighs only 6·5 kg, and incorporates an adaptive noise threshold and angle-gate, programmable pulse repetition interval filters, and coded emitter outputs. A 19 K word programmable read-only memory/random access memory is provided.

Units of the AN/APR-39(V) system

DEVELOPMENT

The AN/APR-39(V)1 was designed and developed by E-Systems. The APR-39(V)2 processor was designed and developed by Loral under contract to the US Army Electronic Command. A third version, the AN/APR-39(V)X is in development.

STATUS

Both the APR-39(V)1 and APR-39(V)2 are in production. Deliveries of the APR-39(V)1 totalled 5200 systems by January 1984. It has been fitted to 15 aircraft types, as well as fast patrol boats and gun boats. The West German MoD placed an order in early 1984 for 230 systems for installation on PAH-1 anti-tank helicopters.

E-Systems, Memcor Division, PO Box 23500, Tampa, Florida 33630, USA.

Loral Electronic Systems, Ridge Hill, Yonkers, New York 10710, USA.

5692.353
AN/APR-39A RADAR WARNING SYSTEM

The AN/APR-39A is a lightweight, miniature computer-based radar warning system for helicopters and light fixed-wing aircraft, particularly those operating at very low altitudes. It provides both visual and aural warnings when threat radar signals are received and analysed in the computer-based digital processor.

AN/APR-39A radar warning system

The APR-39A provides coverage over the entire E to M band. C/D band detection is also provided and signals are either correlated with their associated high band emitters or displayed separately if no correlated high-band emitters exist. The system provides rapid display of all known tracking radars used for fire control, air-to-air weapons and surface-to-air missiles. Provision is made for detecting and indicating the presence of unknown emitters, ie emitters whose parameters are not stored in the computer library.

Upon detecting and deinterleaving the pulse train from an emitter, the system determines its pulse repetition interval (PRI) and characteristics, scan characteristics and pulsewidth. These parameters are then compared with information stored in a computer library and the identity established by comparison. The system assigns to each detected signal a priority which is determined by its type, status and signal strength. It tracks the eight highest priority emitters and displays corresponding information to the operator.

Threats are represented on the CRT display by specific, alpha-numeric, user-defined symbology. The positions of the symbols represent the direction in which the threat is located relative to the aircraft-centred, heading-orientated display, the lethality of the threat based on received signal strength, and the effective radiated power of the threat. In addition to symbols for tracking radars, a synthetic strobe in the outer ring of the display denotes the direction of early warning or acquisition radars. A fully programmable synthetic speech audio warning is provided and can be tailored to individual user requirements. See also entry (**3893.053**).

CHARACTERISTICS

Size: 5540 cm³ (338 in³)
Weight: 6·8 kg (14·9 lb)
Power requirements: 56 W at 28 V DC

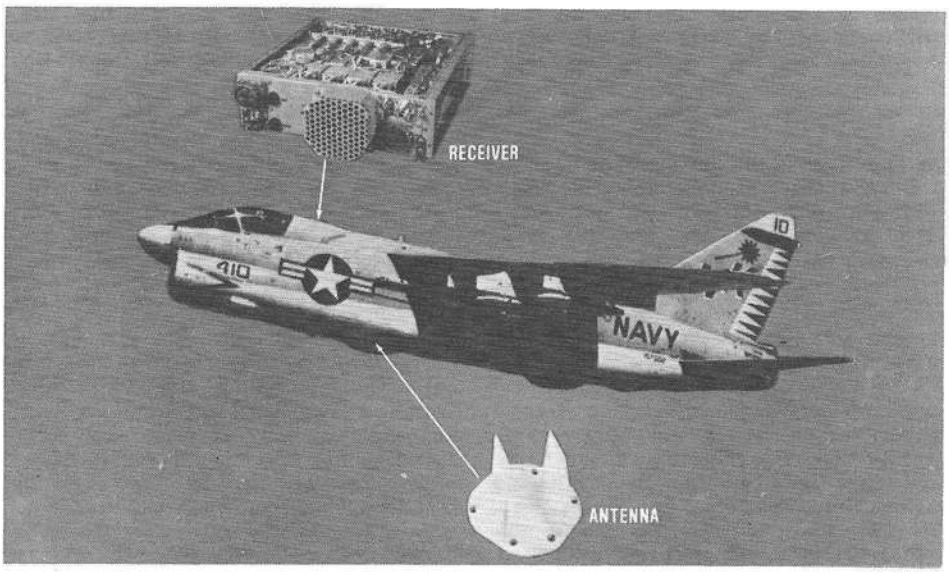
STATUS

In production. Fitted to Apache and some UH-58 helicopters.

CONTRACTOR

Dalmo Victor Operations, Bell Aerospace Textron, 1515 Industrial Way, Belmont, California 94002, USA.

4010.393
AN/APR-43 TACTICAL RADAR WARNING RECEIVER



The AN/APR-43 is the warning receiver developed under the Compass Sail Clockwise programme to provide US Navy operational tactical aircraft with threat warning and identification, direction finding and approximate range information against pulse and CW missile weapon systems. The system consists of two units (weighing approximately 11 kg); a multi-element antenna WRA and multiband receiver WRA containing a crystal video receiver for pulse emitter detection and a superheterodyne receiver for the CW emitters. The APR-43 directly interfaces to the AN/ALR-45 and AN/ALR-45F (ALR-67 processor) warning receivers and defensive jammers AN/ALQ-126 and AN/ALQ-162 to form the USN tactical aircraft ECM protection system. The APR-43 also contains those ALQ-162 antenna output elements required for CW jamming.

STATUS

In production.

CONTRACTOR

Loral Electronic Systems, Ridge Hill, Yonkers, New York 10710, USA.

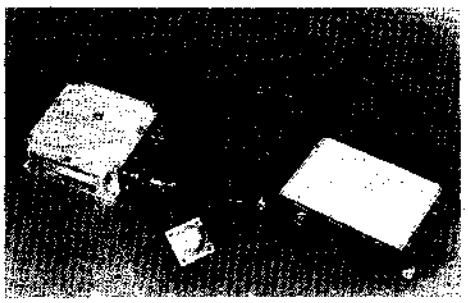
4381.353
AN/APR-44 RADAR WARNING RECEIVER

This is a series of warning receivers designed to provide warning to the pilot of continuous wave (CW) threats from the SA-6 Gainful missile. The equipment provides a visual and audio alert signal whenever a CW threat emission is received in the 14·5 to 16·5 GHz frequency passband created by an input filter.

The system comprises an omni-directional antenna with vertical polarisation; a receiver containing an RF filter, detector limited switch assembly, video amplifier, processing and output circuitry; and a control panel. The receiver is an RF-chopped, crystal-video unit.

DEVELOPMENT



The system was developed as a result of a crash programme during the 1973 Middle East war and made use of television chassis, cables and low-cost antennas. The system is to be installed in AH-1J and AH-1T helicopters.

CONTRACTOR

American Electronic Laboratories Inc, PO Box 552, Lansdale, Pennsylvania 19446, USA.

3365.353
CMR-500B WARNING RECEIVER

The CMR-500B is a small, low-cost warning receiver, designed to detect CW signals. The warning receiver provides a visual and aural output of detected CW RF signals within the frequency range determined by an input filter. The CMR-500B is a modification of the AN/APR-42 (CMR-400) warning receiver (**3364.353** in 1979-80 and earlier editions) and is electrically interchangeable and compatible with the AN/APR-42 for full threat detection capability. The system consists of the following three parts: monopole antenna, providing omni-directional vertically polarised coverage; receiver, which contains an RF filter, detector limiter switch, video amplifier, processing and output circuitry; control panel containing alert indicator lamp, ON/OFF volume control, and phone jack.

CMR-500B CW radar warning equipment

The AEL Model AOS-1543 antenna is an omni-directional vertically polarised antenna, designed to mount on any flat, horizontal surface on the underside of an aircraft fuselage. When mounted on the conductive ground plane the antenna provides coverage in the solid angle defined by an elevation sector 50° wide and omni-directional in azimuth. The gain is 3·5 dB at the beam peak which occurs 15 to 25° below the horizon as a function of the ground plane shape.

The receiver is an RF-chopped, crystal video type with a CW sensitivity of −45 dBm. The receiver consists of a bandpass filter followed by an RF switch/detector module (MIC format), a linear video amplifier and processing circuitry. The output of the video amplifier is routed to a comparator, and then to the processing logic where it is compared to the RF chopping signal to detect the presence of a CW signal. The processing circuitry provides a 3 kHz audio output, a 1·5 kHz logic output, an alert lamp driver, and a logic blink signal (2 Hz), upon reception of a CW signal. The receiver RF frequency is restricted by the bandpass filter to the frequencies of interest. Special pulse suppression circuitry is incorporated in the receiver to prevent false alarms. A power supply regulator is integral with the receiver for operation from 28 V DC aircraft power.

The incorporation of a control panel is optional, determined by the mission requirement. The control panel provides an alert light indicator and a phone jack for a headset for alert aural indication. The control panel also provides an ON/OFF switch and two interface cables.

CHARACTERISTICS

Receiver frequency and bandwidth: Selectable
Sensitivity: −45 dBm (minimum)
Max RF input level: 1 W CW (integral limiter)
Receiver dimensions: 91 × 91 × 33 mm
Receiver weight: 354 g

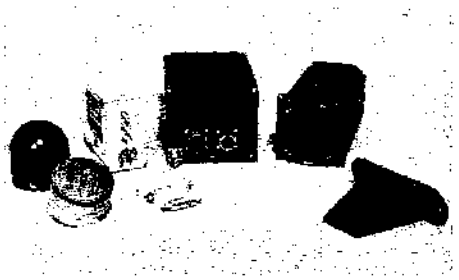
CONTRACTOR

American Electronic Laboratories Inc, PO Box 552, Lansdale, Pennsylvania 19446, USA.

3893.053
DALMO VICTOR MK III MINIATURE DIGITAL RADAR WARNING SYSTEM

The Dalmo Victor Mk III Mini-RW system is a version of the AN/APR-39A (**5692.353**), and is specifically designed for helicopter, light aircraft, and fast patrol boat use. It features complete, unambiguous threat warning, with alpha-numeric threat display. It is lightweight, uses little power, is small, and inexpensive.

The DV Mk III consists of a digital signal processor fed by threat signals derived from wideband antennas and receivers. The processor is microprogrammable, with erasable PROM memories that can be reprogrammed for changing threat parameters. The system presents threat data in alpha-numeric symbols on either a liquid-crystal display (LCD) or a standard CRT. The LCD provides high intensity for undiminished effectiveness even in direct sunlight.



The solid-state processor permits future growth through software reprogrammability. This miniature solid-state package combines high reliability with utmost utility and low cost. There is an integral, continuous self-test function, plus operator-initiated self-test and an audio alarm interface is provided.

STATUS

In production. (Also see KATIE – **5734.353**).

Dalmo Victor Mk III digital radar warning system equipment

3892.363
ALR-46A DIGITAL SIGNAL PROCESSOR

The ALR-46A is a digital signal processor designed as a direct replacement for the analogue, hardwired type of analyser used in radar homing and warning systems (RHAW) such as the ALR-45, APR-25, APR-36, and APR-107. The ALR-46A is interposed between the existing RHAW receiver(s) and threat display and bearing indicators, and no aircraft modifications are called for. A major benefit claimed for this equipment is the improved presentation of information on the RHAW azimuth indicator. In place of the conventional families of radial lines for each emitter detected, the ALR-46A provides alpha-numeric symbols for each class of contact, and the digital system permits priority allocation by push-button so that overlapping threats may be separated and unwanted signals cleared from the display. The use of digital processing offers another significant advantage in that changes in threat signatures that have been detected by Elint operations can be inserted rapidly into the RHAW, with far less delay than is possible with hardwired, analogue analysers.

STATUS

In production for the USAF.

CONTRACTOR

Dalmo Victor Operations, Bell Aerospace Textron, 1515 Industrial Way, Belmont, California 94002, USA.

4742.393
AN/ASQ-171 AIRBORNE ELINT SYSTEM

The AN/ASQ-171 is an airborne electronic intelligence gathering system fitted to the US Navy's EP-3E ECM aircraft. Very little information has been released on this equipment but it is believed to have the capability of detecting backlobe radiation at long distances. It is understood to operate from A- to J-bands, with a capability of extension to K-band. The system can sort and track signals in a dense ECM environment and can carry out automatic search and analysis over the complete spectrum at the same time that detailed threat analysis of previous signals is taking place.

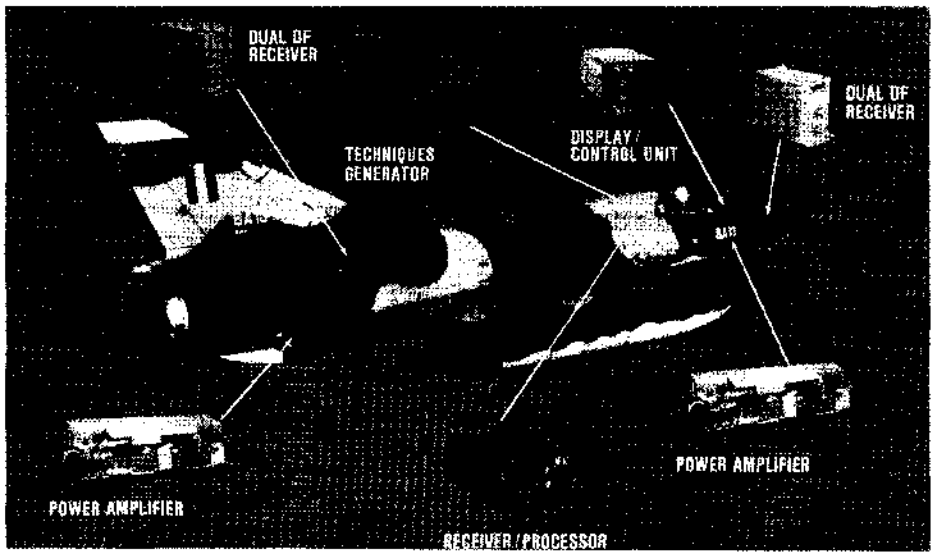
CONTRACTOR

IBM, Federal Systems Division, 10215 Fernwood Road, Bethesda, Maryland 20034, USA.

3543.393
RAPPORT ECM SYSTEMS

The Rapport II ECM system was developed for the Belgian Air Force Mirage V aircraft. It provides pilot warning and automatic, optimal countermeasures required to survive the present day and future hostile air defences. The system weighs less than 100 kg, and consists of separate RWR and jammer sub-systems. The RWR, which includes a programmable core memory computer, provides power management capability required for optimal use of the jammer sub-system. Functionally, the RWR provides the means to sample and sort the environment. It uses a programmable digital processor for all signal analysis, and provides the pilot with an easily readable, unambiguous warning display. The power management capability, incorporated in the RWR processor, matches the countermeasures response to the constantly changing threat picture, for an optimal jamming response. The jammer sub-system, under RWR control, provides the actual response to the hostile radar environment. To conserve jamming power and maximise ERP, the jammers are accurately set to the exact frequencies of the victim radars. The jammer frequency range provides coverage of all threat radars, while its power output is sufficient to counter these radars at lethal range.

A development of the system, known as Rapport III, is being produced for the F-16 aircraft ordered by the Belgian Air Force. This latest version is an internal integrated EW system having both radar warning and jamming functions controlled by a central processor, and is described under entry **4009.393** (AN/ALQ-178)



STATUS

The Rapport II system is operational with Mirage V aircraft of the Belgian Air Force. Loral is developing

Rapport III for the Belgian F-16 aircraft under contract, and also received in September 1983 an $88 million contract from an unidentified country, believed to be Israel, to fit modified Rapport III systems in its F-16s. Flight testing of the Rapport III prototype is expected to commence late 1985.

ARI 18240/1 AEW NIMROD ESM

A version of the EW-1017 ESM (electronic support measures) equipment (**4382.353**) has been developed for the Nimrod Mk 2 MR and Mk 3 AEW3 (airborne early warning) versions, under the designation ARI 18240/1. Few details have been cleared for publication but the main items and their approximate locations on the aircraft can be seen from the adjacent photograph.

Special wingtip pods were built by British Aerospace to house the 16 cavity-backed planar spiral antennas and the two front-end receivers (LRU-1). Two other line-replaceable units (LRU-2 and LRU-3) are housed in the fuselage. These probably include the signal processors and comparator circuitry, as well as providing the requisite interfaces with the sensor elements and receivers and the associate control and display facilities. The last of these facilities almost certainly includes provision for integrating ESM data with that from other sources on the aircraft's main tactical display sub-system.

The 16 antenna elements comprise two sets of eight high-band and low-band signal intercept antennas, these being arranged to produce separate fore and aft coverage quadrants on each side of the aircraft in each of the broad frequency bands covered by the equipment. No information has been given of the frequency limits but the upper limit is practically certain to be 18 GHz and may well be higher. Superhet receivers are believed to be used.

4382.353

EW-1017 ELECTRONIC SURVEILLANCE SYSTEM

As an airborne electronic surveillance the EW-1017 automatically acquires and identifies those emissions over the known frequency band that are liable to provide a threat to the aircraft safety, eg surveillance and tracking radars, both ground-based and airborne. The system is designed to receive and identify all those emissions illuminating the aircraft, including short bursts, in particular when the aircraft is operating in very dense signal environments. The warning of possible danger is given both visually and aurally on a display unit; preferential scan is used to ensure immediate recognition of possible lethal threats.

The system consists of antenna arrays, receiver, a processor system and a cockpit display/control unit. Broadband spiral antennas are used to provide omni-directional coverage and, together with their separate multi-band receivers, are mounted in pods on each wingtip. This location drastically limits aircraft 'shadowing' and the proximity of the receiver cuts signal losses to a minimum. Angular bearing of the emissions is determined by using selected pairs of antennas.

The hybrid superheterodyne receiver combines acquisition probability, high sensitivity, frequency accuracy and a high degree of frequency selection and selectivity to measure emissions. A broad bandwidth is used in the acquisition mode to obtain the initial intercept, and a narrow bandwidth for accurate bearing measurement and analysis. To ensure processing capability in highly dense signal conditions a high speed digital computer performs the data processing functions, supplemented by microprocessors. This enables the receivers to scan the frequency band continuously, on a reprogrammable basis, so that the conventional CW and agile signals are processed for identification.

A control/display unit allows the operator to monitor and control the automatic surveillance function to resolve possible ambiguities and evaluate and use to the best advantage, the data displayed.

STATUS

Fitted to the Mk 2 maritime reconnaissance and Mk 3 airborne early warning Nimrods of the RAF, and the BR1150 Atlantic aircraft.

CONTRACTOR

Loral Electronic Systems, Ridge Hill, Yonkers, New York 10710, USA.

INTEGRATED ELECTRONIC WARFARE SYSTEM

The Integrated Electronic Warfare System (INEWS) programme is sponsored by the US Air Force Aeronautical Division as a joint US Air Force/Navy project to provide an overall EW system for combat aircraft in the 1990s. INEWS will provide threat warning and identification across the entire RF, electro-optical and laser spectrum. The system will analyse threats, activate countermeasures automatically, display information on the threats to the crew, and recommend evasive action.

INEWS is in the conceptual design study and early development stage and no details are likely to emerge for some time, although various sources have suggested a blend of VHSIC, fibre optics and Ada software. Five teams of four or more members have each been awarded contracts of about $15 million for initial study and design work. These contracting teams are:

(a) Raytheon/Northrop teamed with Western Electric, GTE Sylvania, Magnavox, General Research Corporation, Boeing and Tracor

(b) Hughes/Loral with BDM, Boeing, Sperry and EOS (Loral)

(c) TRW/Westinghouse with Honeywell, Perkin-Elmer and Tracor

(d) Sanders/General Electric with Dalmo Victor, Goodyear, SRI and Motorola
(e) ITT/Litton teamed with Rockwell, Texas Instruments and Rockwell International.

One of the joint venture teams is likely to be picked for full-scale development and its members will compete for the production awards. Total development costs are expected to be about $500 million.

STATUS

Early design study. Full production is planned for 1993 with contracts worth several billion dollars.

CONTRACTORS

See above contracting teams. Sponsorship is by US Air Force Aeronautical Division, Wright-Patterson Air Force Base, Ohio, USA.

5817.353
SCARECROW RPV EW SYSTEM

Scarecrow is a combined ESM/ECM/ELINT system intended for use in RPVs over the battlefield area. The system includes a directional high gain antenna and pattern steerability in both the transmit and receive modes. Full data link capability is interfaced for control of the system from the ground and transmission of data from the RPV. A relatively low powered set-on jammer of less than 1 kW is employed for radar neutralisation purposes at close range. Equipment weight is under 18 kg.

STATUS

In flight trials phase. A number of countries have expressed interest, including UK, Canada and various Middle East defence forces.

CONTRACTOR

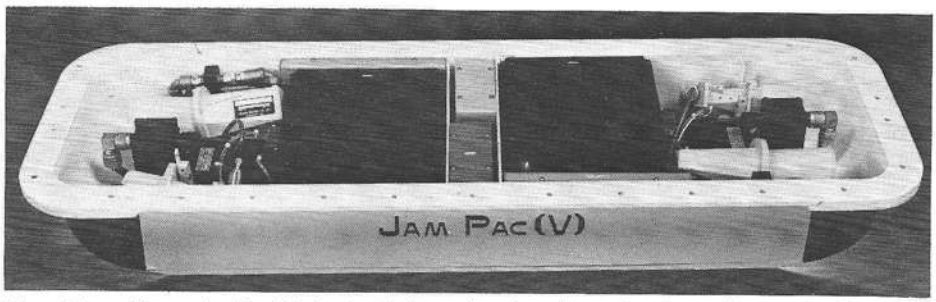
Sanders Associates Inc, Electronic Warfare Division, PO Box 2004, Nashua, New Hampshire 03061, USA.

5818.393
LANCER RADAR WARNING RECEIVER

Lancer is a next-generation airborne radar warning receiver aimed at satisfying electronic surveillance systems requirements in the 1990s. The baseband receiver provides the features needed to reach future goals while allowing for efficient packaging in current allocated installation spaces. Five microwave and one millimetre-wave frequency bands cover an operating frequency range of 0·5 to 42 GHz.

The Lancer system consists of four identical receivers for 360-degree azimuth coverage. Each receiver's sensitivity of -60 to -70 dBm, together with a typical instantaneous bandwidth of 4 GHz, increases the overall system performance. Excellent tracking between the four receivers is achieved by a dual detector calibration scheme which monitors differences in gain between receivers and results in a system DF accuracy better than five degrees. The high sensitivity, in conjunction with rapid environment search, enables detection of low effective radiated power emitters with a high probability of intercept.

STATUS



In development.

4099.393
JAM PAC(V) ELECTRONIC COUNTERMEASURES JAMMER SYSTEM

The Jam Pac(V) is a newly developed family of low cost, high powered electronic countermeasure (ECM) jammers specifically designed for lightweight fighter and helicopter aircraft. These modern, miniaturised radar jammers are tailored for aircraft self-protection and combat systems evaluation. The Jam Pac is a modular, variable configuration, conformal carriage-mounted jamming system. Unlike ECM jamming pods, Jam Pac does not use an aircraft weapon's station. The system is designed to fit into a specially made carriage which can be attached under the wing or to the fuselage. The Jam Pac's aerodynamic shape and light weight have little effect upon aircraft performance. The Jam Pac offers simple retrofit and rapid mounting facilities for mission-adaptable configurations. Through the use of interchangeable modules, engineered to cover frequencies from D- to J-band, the Sperry Jam Pac can provide self-protection against various types of threat radar systems. Each Jam Pac system consists of two voltage tuned magnetron transmitters, which have a combined output power of up to 800 W. Power management receivers are also available to control the tuning of the transmitters automatically to the appropriate jamming frequency.

Internal view of Sperry Jam Pac(V), showing the two voltage tuned magnetron transmitters, each with a pair of forward- and rear-facing horn antennas. It is designed for under-fuselage or under-wing mounting on fighter aircraft or helicopters

STATUS

Jam Pac(V) systems are currently under development and test for US and foreign sales applications.

5945.393
LORAL INFRA-RED COUNTERMEASURES

In addition to the AN/ALQ-123 (**1919.393**) and AN/ALQ-157 (**4365.393**) infra-red countermeasures (IRCM) equipments, Loral produces a number of other IRCM systems. Brief details of these are given below:

Defender

This is a family of pod-mounted systems which can be used for applications where internal-mounted aircrafts are not practical. They can be supplied in various configurations, eg an aft-mounted jammer for aft protection only, an aft mounted jammer with side windows for aft and side protection; a nose-mounted jammer for forward protection only; and aft and nose jammers for all-round protection.

Challenger

A small omni-directional IR jammer, especially suitable for helicopters and light aircraft, which can be installed in fixed aircraft apertures or deployed on retractable platforms. The jammer head weighs about 9 kg and power consumption is within the range 1 to 2 kW. The jammer assembly is driven by a compact controller in the aircraft.

Matador

Matador is an engine-mounted family of IRCM systems which has eleven different configurations. The basic system consists of a transmitter, and electronics control unit (ECU) and an operator control unit. The transmitter unit weighs about 21 kg and one unit is fitted to each engine for maximum protection. Transmitters are electronically synchronised by the ECU which controls and monitors up to two transmitters. The operator control unit is common to all configurations, from one to four transmitters, incorporates a system status display and is also used to select multi-threat jamming codes.

5742.393
NORTHROP INFRA-RED COUNTERMEASURES SYSTEMS

Northrop Defense Systems Division manufactures a number of infra-red countermeasures equipments, both for internal and external mounting on a variety of aircraft. Very few details have ever been released on these equipments although they are known to be deployed on various US aircraft. The AN/AAQ-4 is a full-flight, subsonic, internally-mounted system which has been further developed into the AN/AAQ-4(B). The AN/AAQ-8(V) is designed for supersonic flight and is contained in an externally mounted pod.

Modularised infra-red transmitting set (MIRTS)

The Modularised Infra-Red Transmitting Set (MIRTS) is a version designed for export. Its modular design provides commonality for internal or pod-mounted applications and is suitable for helicopters and fixed-wing aircraft. MIRTS is digitally controlled, has automatic built-in test and can provide all aspect protection against infra-red homing missiles. It is believed to be based technically around a single sapphire lamp with multiple heads, covering the 3-5 μm and 8-14 μm wavelengths.

QUICK FIX IIB COUNTERMEASURES SYSTEM

Tracor is developing a new airborne EW system intended for the EH-60A helicopter. The programme is known as Quick Fix IIB EH-60A Aircraft Countermeasures Integrated System and is intended for direction finding, interception and jamming. A standard UH-60A Blackhawk helicopter is being modified to carry the equipment which includes electronic surveillance measures and active countermeasures.

STATUS
In development under a $51 million contract awarded in November 1984 which includes production, integration, installation, aircraft modification and flight testing. The programme is scheduled to last three years.

CONTRACTOR
Tracor Inc, 6500 Tracor Lane, Austin, Texas 78725-2008, USA.

5743.353
ESCORT AIRBORNE ELINT SYSTEM

ESCORT (Electromagnetic Surveillance Collection of Radar Transmissions) is a real-time electromagnetic surveillance and collection system, suitable for installation in a variety of aircraft. The M804 maritime surveillance equipment combines the capabilities of a high probability intercept receiver with a high-speed signal processor to perform real-time signal sorting, direction finding and identification. Full azimuthal coverage is obtained by antenna arrays in each wing tip. The M805 ELINT system provides precise direction finding by using phase interferometer antenna arrays in conjunction with the M804 receiver, processor and display unit. Outputs are displayed on a CRT unit for use by the electronics surveillance operator.

The receiver/processor library of the system is programmed with emitter characteristics of interest and identification, priority, display and alert criteria are programmed into the resource management portion of the processing unit. When an intercepted signal is received, the processor sorts the detected radiation, compares its characteristics with those stored in the library and displays the results. The display format can be changed from situation to tabular and may also be reformatted to the user's need during the mission.

CONTRACTOR
Raytheon Company, Electromagnetic Systems Division, 1578 Route 3, Wayne, New Jersey 07470, USA.

4384.393
AN/ULQ-11 AIRBORNE JAMMING SYSTEM

This airborne jamming system, known as the AN/ULQ-11 Cefirm Leader, is an ECM equipment system operated by the US Army and comprises nine RU-21 aircraft fitted with various types of electronic countermeasures (ECM) equipment. It is designed to conduct ECM missions, ESM missions, jamming, initiate communications deception and direction finding. Of the nine aircraft, four are designated as 'A' aircraft which carry out airborne direction finding, three are 'B' aircraft conducting intercept and acting as system control, and two are 'C' aircraft which carry out jamming.

The types of communication against which the AN/ULQ-11 operates include amplitude modulation, frequency modulation, frequency shift key, CW, ICW, MCW and single side-band. The system is operated by RU-21 US Army utility aircraft.

CHARACTERISTICS
System frequency: 2 – 80 MHz
Jamming power: 500 W at 2 MHz and 70 W at 80 MHz

STATUS
In operational service.

5809.393
RACAL HELICOPTER-BORNE JAMMING SYSTEM

This system is a helicopter-borne transportable 'carry-on/carry-off' intercept and jamming equipment designed to provide signal intercept and surveillance over the frequency range 2 MHz to 1 GHz, and communications jamming from 20 to 79·975 MHz. Signals are intercepted and analysed using a 2 MHz to 1 GHz receiver and an associated signal/display unit. The frequencies, thresholds and priorities of signals to be jammed are placed in memory for later recall. When the jamming part of the system is activated, the stored frequencies appear on the display and the signals are then automatically jammed in accordance with the priority assigned.

The system is shock-mounted in two cargo cases which allows it to be carried on board and installed quickly. This is easily accomplished since the feet of the cargo cases are designed to fit into the standard cargo hold-downs of the helicopter.

CONTRACTOR
Racal Communications Inc, 5 Research Place, Rockville, Maryland 20850, USA.

5823.393
LORAL MODULAR IR COUNTERMEASURES EQUIPMENT

Loral Electro-Optical Systems has developed a modular IR countermeasures equipment for multi-engined aircraft. The system is suitable for all types of large transport aircraft with unsuppressed engines, one transmitter per engine is suggested for maximum protection. Each transmitter consists of an IR source which emits pulsed radiation to combat a heat-seeking missile, with a common electronics control unit to synchronise the transmitter outputs. Pre-programmed multi-threat jamming codes are provided, selectable on an operator's control panel, and new codes can be entered as required to cope with new threats. Each transmitter weighs approximately 22 kg and is normally pod-mounted for aircraft attachment. The complete system can be arranged in up to 11 different configurations to suit different aircraft arrangements.

STATUS
Fully developed.

CONTRACTOR
Loral Electro-Optical Systems, 300 North Halstead Street, Pasadena, California 91107, USA.

5827.393
GTE SYLVANIA AIRBORNE VHF/UHF JAMMER

GTE Sylvania has developed an airborne VHF/UHF communications jammer against a requirement by the UK MoD. The equipment is believed to be code-named Dragonfly, and is designed to fulfil both a training role and possible use in tactical operations. It is intended to be operated automatically under the control of a computer, and will monitor selected frequencies and jam up to six of these on a priority basis. Manual control can be exercised at any time by the operator.

The system consists of two antennas, two receivers, an exciter/power amplifier, digital processor, and a control/display unit. The latter provides all operator control functions and displays the signal activity as required.

STATUS
In production under a $16 million contract from the UK MoD. Deliveries were due to be completed by autumn of 1985.

CONTRACTOR
GTE Sylvania, 100 Ferguson Drive, Mountain View, California 94039, USA.

4670.353
GUARDRAIL AIRBORNE SIGINT SYSTEM (AN/USD-9(V)2)

Guardrail is an airborne signal intelligence (SIGINT) system that intercepts, locates and classifies target systems and transmits data to ground processors to provide real-time intelligence information. The Guardrail suite consists of a transportable ground-based system and RU-21H and RC-12D aircraft carrying remotely controlled mission equipment.

The Guardrail system operates in three frequency bands, 20 to 75 MHz, 100 to 150 MHz and 350 to 450 MHz.

STATUS
Guardrail has been in operational service with the US Army for a number of years. The original Guardrail II was updated to IIA, and later was updated to Guardrail IV. Further updating has provided the latest version, Guardrail V, with better facilities, under the nomenclature AN/USD-9(V)2. A further product improvement programme has been called for but it seems more likely that a completely new system will be developed eventually.

CONTRACTOR
ESL Inc, Sunnyvale, California, USA.

5837.353
LR-5200 TACTICAL ESM SYSTEM
This system is intended for reconnaissance aircraft to provide real-time intelligence information over the frequency range 0·5 to 18 GHz. Intelligence is gathered by on-board equipment, which may be either internal or pod-mounted, and transmitted to an operations centre by data link. Information is also recorded on magnetic tape for post-flight analysis.

The complete system includes all airborne, ground processing and maintenance support equipment. Ground processing and analysis facilities include a completely self-contained data analysis centre, which can be either fixed or transportable, and a remote data terminal for installation on command aircraft, land vehicles, naval vessels or other forward area platforms. The airborne part of the system weighs 102 kg.

CONTRACTOR
Litton, Amecom Division, College Park, Maryland, USA.

5839.353
COMPASS CALL ECM SYSTEM
Compass Call is a specialised ECM system installed in US Air Force EC-130H aircraft, and works with ground mobile C^3CM systems to confuse enemy defences and to jam their C^3 systems. A number of large blade antennas have been added to the basic C-130 aircraft configuration, including under each outer wing and above the dorsal fin, with a smaller horizontal blade antenna on each side of the rear fuselage. Bullet-shaped cannisters outboard of each underwing antenna and the extreme tail of the aircraft house trailing wire antennas that will extend to several hundred feet behind the aircraft. No technical details of the on-board ECM systems, or the contractors, have been released.

STATUS
In service.

3354.053
WJ-1740 RECEIVING SYSTEM
The WJ-1740 is a parallel-scanned, digitally controlled superheterodyne receiver system which can include as many as eight tuners (12 for special applications) in any combination of frequency bands. The tuners cover the 0·03 to 40 GHz range in nine frequency bands. Tuners are scanned synchronously, in parallel, although the operator can call any one tuner from the scan for signal analysis.

Selection of a tuner for manual analysis switches the IF output of the tuner to an analysis demodulator channel that provides IF attenuation control, IF bandwidth control, and linear with or without AGC, log, or FM video outputs. The tuner selected can also be phase-locked to a stable crystal-controlled reference in a local oscillator synchroniser to provide frequency accuracy and stability of one part in 10^7 per day.

The analysis video is presented on the analysis display, and the tuner selected for analysis can be operated in manual, sector scan, or band scan modes. In the first of these modes, the analysis display provides an IF pan signal presentation; when the tuner in the analysis channel is in either of the other two modes, the display indicates signal activity versus frequency, with the horizontal frequency scale automatically expanded to cover the full width of the CRT.

The system provides auxiliary IF outputs from each tuner, and auxiliary scan demodulator log video outputs for each tuner. It also provides IF and video outputs from the analysis channel.

Individual tuners can be placed in the Hold mode to provide continuous monitoring of signals, and up to 16 frequencies can be stored in memory for instantaneous push-button controlled recall. In the Hold mode, a tuner is tuned to one frequency and its IF and video outputs can be applied to either a tape recorder or special analysis equipment.

An optional memory scan unit provides 64 memory cells and a memory scan mode permitting a programmed search strategy.

The complete system was designed to permit full manual or computer-assisted operation and control by as many as four different operators through individual receiver control panels.

In a computer-assisted WJ-1740 system, the computer monitors the receiver scan, monitors signal activity, makes tentative signal identifications, and records data, leaving the operator free to identify signals and perform detailed analysis tasks.

DEVELOPMENT
The WJ-1740 receiver system was developed for a USAF airborne application.

CONTRACTOR
Watkins-Johnson Company, 2525 North First Street, San Jose, California 95131, USA.

4666.393
SMALL PLATFORM EW SYSTEM
A tactical jamming system to be carried by a remotely piloted vehicle is being developed by Motorola under contract from the US Air Force. This system is known as the Small Platform EW (SPEW) and is intended for use against ground-based radars in support of the US Air Force EF-111A aircraft. The proposed vehicle is the Pave Tiger RPV. Although no details have been released the system appears to consist of a combined transmitter/receiver/processor and a four quadrant antenna.

STATUS
In early development. Laboratory testing was due to take place during 1984.

CONTRACTOR
Motorola Inc, Government Electronics Group, Scottsdale, Arizona, USA.

4667.393
AIRBORNE RADAR JAMMING SYSTEM
The Airborne Radar Jamming System (ARJS) is a new high-power standoff jammer intended to be used against air defence, surveillance and target acquisition radars. It is designed to be helicopter mounted, probably in a UH-60 Apache attack aircraft, and would be deployed behind the forward troop positions.

The technology employed would be based on the AN/ALQ-99 jamming system used by the US Navy in its EA-6B aircraft and the US Air Force in its EF-111As. This would provide detection of a threat signal, location of the emitter, comparison against a threat library held in the system's computer and transmission of a jamming signal.

STATUS
In development.

CONTRACTOR
Grumman Aerospace, South Oyster Bay Road, Bethpage, New York 11714, USA.

YUGOSLAVIA

5943.393
SO-1 RADAR WARNING RECEIVER
The SO-1 is a conventional radar warning receiver designed to warn the pilot that his aircraft is being illuminated by a threat tracking radar. The equipment covers pulse type radar systems in the I and J bands with an azimuth coverage of 360 degrees and an elevation coverage of ±45 degrees. DF accuracy is 17 degrees. The visual alarm consists of a panel-mounted instrument containing four lamps which give quadrantal direction indication. An aural alarm is also incorporated in the aircraft audio system. Weight of the system is approximately 60 kg, and it operates from a 27·5 DC power supply with a consumption of 10 W.

STATUS
In production.

CONTRACTOR
Federal Directorate of Supply and Procurement, Belgrade, Yugoslavia.

SONAR AND UNDERWATER DETECTION EQUIPMENT

AUSTRALIA

1790.453
MULLOKA SONAR

Mulloka is a lightweight active hull-mounted scanning sonar for installation in Royal Australian Navy anti-submarine escorts. It is a solid-state forced air-cooled equipment of high reliability which has been designed using a standardised packaging approach to aid maintainability and keep production simple.

The equipment includes a dedicated on-line computer which is used to control transmission parameters, perform automatic signal processing functions, and conduct checkout procedures. All signal interface equipment with other ship's systems has been grouped at a single location so that modifications necessary to interface Mulloka with other ship equipment configurations are confined to one unit.

The sonar beam-forming process involves the development of a large cylindrical transducer array consisting of 96 staves with 25 transducers per stave, driven in differing combinations and phases under computer control to form the required sonar beams electronically. The hydrophone elements of the array are driven by 480 power amplifiers during the transmit period, the length of which is a function of the pulse-length of the transmitted signal. The transmit period is selectable over the range of approximately one to four seconds. The transmitter beams are formed sequentially during this period and cover the ocean for 360° in azimuth. The formation of the beam transmit pattern is random in nature from one transmission to the next in order to prevent the submarine commander having any indication of detection. Immediately following the transmission, the sonar reverts to the listening mode for a period determined by the range scale selected by the operator.

DEVELOPMENT

Both Australian and foreign companies participated in the production of the pilot model sonar. Production engineering for electronics equipment is being undertaken in Australia by EMI (Australia). Production of the transducers is by Honeywell in the USA.

STATUS

In 1979 a prototype Mulloka sonar was formally handed over to the RAN after undergoing trials in HMAS Yarra since 1975. A production programme to build systems to equip six RAN 'River' class destroyer escorts is in progress.

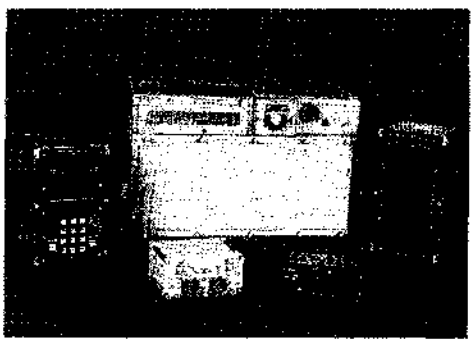
In April 1980 it was announced by the Australian Ministry of Defence that an initial contract worth US$1·1 million had been awarded to Honeywell Inc in America to provide a transducer array for the Mulloka sonar. Two Australian companies, Plessey Australia Pty Ltd and Dunlop Industrial and Aviation, are also participating. A contract for the electronics of the system was let to Thorn EMI (Australia) Ltd in 1979.

In early 1982, two production contracts were awarded for the 'River' class ships to be fitted with Mulloka sonars. One contract for A$16·1 million was awarded to Thorn EMI (Australia) Ltd and the other to Honeywell, USA for A$9·4 million. The Thorn EMI contract was for six systems for delivery in the period 1983-85 and the Honeywell contract for five transducer arrays delivered in 1983/84. This latter contract also provided for the transfer of all technology to Australian industry for future production of transducers in Australia. Plessey Australia has put the transducer design into production and has tendered for the first Australian built array as a result of this transfer of technology.

1791.453
PROJECT BARRA

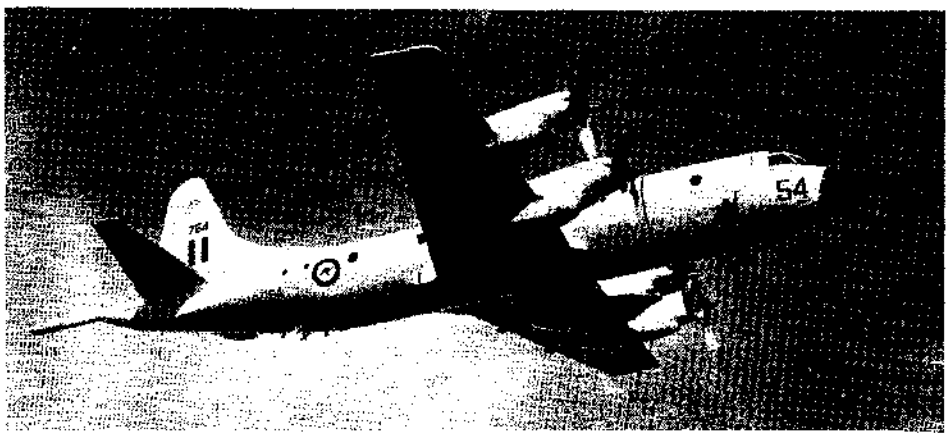
Project Barra concerns the development and production of an advanced submarine detection system for use by long range maritime patrol aircraft.

The project evolved from successful development work under Project Nangana, a research and development programme, undertaken by the Weapons Research Establishment in close collaboration with the RAN and RAAF for the development of improved methods of submarine detection.



Following successful completion of an engineering study, initial development and the establishment of production facilities, together with the first production contract, Amalgamated Wireless (Australasia) Limited was appointed prime contractor, and completed the production of this initial Barra sonobuoy contract by the end of 1981. A further A$55 million contract was let in early 1982 for full production against RAF and RAAF requirements. This contract is being fulfilled and further orders have been received.

The project is a collaborative programme with the UK; Australia developed the SSQ-801 Barra sonobuoy and the airborne processing equipment was developed in the UK under the direction of the UK Ministry of Defence. (See **1981.363**, AQS 901 acoustic data processing and display system, in the UK sub-section of this section.) The platform equipment is suitable for installation in a range of aircraft, and has been fitted in RAF Nimrod MR2 and RAAF P-3C Orion maritime aircraft.



Development of the Barra system generated the need for a ground support facility for the associated aircraft. AWA has designed and built for the RAAF a compilation, mission support, integration and training facility (CMI). This is a self-contained modular cabin complex which was initially transported by road to the RAAF Orion base at Edinburgh in South Australia. This computer-based facility provides training, briefing and analysis facilities.

CONTRACTOR

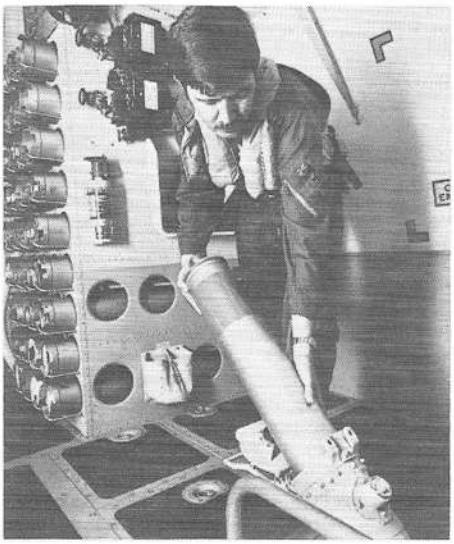
Amalgamated Wireless (Australia) Limited, PO Box 96, North Ryde, NSW 2113, Australia.

The advanced sonobuoy communication link receiver for Barra sonobuoy data exchange

RAAF P-3C Orion maritime patrol aircraft equipped with Barra ASW system

---

3998.453
SSQ-801 BARRA SONOBUOY



The SSQ-801 sonobuoy was developed specifically for the Australian Project Barra anti-submarine programme (**1791.453**, above) and is a passive directional sensor which may be used either singly or deployed in patterns to detect and locate submarine targets. It provides both range and directional information. Within a standard A size buoy, two parts separate on reaching the water, the upper portion containing radio transmission equipment rises to the surface while the other part housing the acoustic sensor array sinks to a predetermined depth. A cable links the two parts.

The lower portion contains a compass and booms fitted with specially developed hydrophones. Arrays are sequentially switched to give the required directional beaming. Multiplexed signals from the lower section are fed to the floating portion of the buoy for transmission by radio to patrol aircraft, where data are analysed by the Barra system AQS-901 sonics processor (**1981.363**). Each sonobuoy transmits information on a pre-selected VHF radio channel so that the aircraft crew can select a particular buoy's data for analysis. Digital techniques are used in the SSQ-801 to convert the combined sonar and compass information into signals to modulate the buoy's VHF transmissions.

The SSQ-801 is suitable for release from fixed-wing aircraft such as the P-3C Orion or Nimrod, and from helicopters of various types.

CHARACTERISTICS

Type: Passive directional array
Size: A
Length: 914 mm
Diameter: 124 mm

SSQ-801 (Barra) sonobuoy about to be launched from an RAAF Orion ASW aircraft

Weight: 13 kg
Operating life: Selectable up to 9 h
RF transmitter frequencies: 136 - 173·5 MHz
RF modulation: Narrow-band FSK

DEVELOPMENT

Development of the SSQ-801 sonobuoy was undertaken as part of the Australian Barra project (see above).

STATUS

Adopted by both the Royal Air Force and the Royal Australian Air Force, a contract valued at A$55 million was placed in early 1982, for the production of SSQ-801 sonobuoys for both air forces. A number of other countries are reported to be interested in the Barra system, including France, Japan, the Netherlands and the USA. Amalgamated Wireless (Australasia) Limited is the prime contractor with Plessey Australia, Commonwealth Aircraft Corporation, Tube Makers and Cable Makers Australia, as major subcontractors.

In mid-1983 the RAAF ordered a further $48 million worth of Barra sonobuoys from AWA for delivery over the period 1984-86, bringing the total value of RAAF orders for Barra sonobuoys to more than $120 million.

CONTRACTOR

Amalgamated Wireless (Australasia) Limited, North Ryde Division, PO Box 96, North Ryde, NSW 2113, Australia.

5864.463
KARRAWARRA TOWED ARRAY SONAR

The Australian Defence Research Centre has refined a towed array sonar for surface ship or submarine use to what is claimed to be the most compact system available. Code-named Karrawarra, the array carrier is only about 19 mm thick, with sensors the size of a normal cigarette spaced along it. It is stated to be suitable for ships down to small patrol boat size. The system has a thick rubberised coating to make it less vulnerable to predators. No other details are available, the sonar is understood to be in the early development phase.

CANADA

1636.453
HS-1000 SERIES SONAR

The HS-1000 series of sonars is a family of lightweight omni-directional ASW sonars which have been developed to give small naval vessels a modern sonar capability in search, detection, and attack. The numbering of each sonar designates transducer mounting and/or sonar power.

(1) HS-1001: lightweight variable depth sonar (VDS)
(2) HS-1002: lightweight hull-mounted (HM) sonar
(3) HS-1001/2: lightweight combined VDS/HM sonar with single electronics and a transfer switch
(4) HS-1007: medium-sized sonar available in either the HM or VDS configuration featuring higher power
(5) HS-1007/7: medium-sized combined VDS/HM sonar with single electronics and a transfer switch.

The HS-1001 and HS-1002 sonars are intended for use on patrol craft and corvettes. The HS-1007s are intended for use on corvettes, frigates, and destroyers.

HS-1001 and HS-1002 Sonars

The HS-1001 and HS-1002 feature:

(1) single cabinet containing receiver, transmitter, display and controls, power supplies, and energy storage
(2) simultaneous search and attack
(3) R-θ ball tracker for cursor control
(4) digital readout of range and bearing
(5) selectable true or relative bearing
(6) VOSIW setting 1400 - 1550 m/s steps
(7) three transmission modes: CW; wideband; alternate CW/WB
(8) integrated test equipment (ITE): tests down to replaceable module resulting in a MTTR of 3·5 minutes as proven under tests witnessed by Canadian Department of National Defence inspectors
(9) ten-second overall test for quick check of receiver inputs/outputs, digital or analogue. Interface unit offers flexibility in interfacing with ship's systems.

HS-1001 VDS showing the body in the launch position

Hull-mounted transducer sub-system

The double-walled, stainless steel dome is matched to the transmission frequency and acoustically isolated from the ship. It may be either fixed or retractable. Retracting mechanisms of either the vertical lifting type or the rotating type are available. The rotating type presents less drag, with the lifting mechanisms outboard of the sea chest to prevent corrosion of the working parts.

Variable depth transducer sub-system

The acoustic window of the low drag towed body is fabricated from stretch formed stainless steel. The body contains both heading and depth sensors. The 2 cm diameter armoured tow cable is faired over its 100 metre (or longer if required) length. With 100 metres out, the tow bar pull on the ship is approximately 2700 kg at a speed of 30 knots. Normal launch and recovery speeds are 8 to 10 knots with a maximum towing speed of about 36 knots. The system bolts flush to the ship's deck and transom, permitting ease of installation and removal. After the initial fitment, outfitting of a multipurpose ship to the VDS role will take less than 24 hours.

HS-1007 Sonars

The HS-1007 sonars are medium-sized sonars which utilise the receiver, display transducer, HM sub-system, and VDS sub-system of the HS-1001 and HS-1002 but with the transmitter and transmitter power supply of the AN/SQS-505 series design so that four times (omni mode) and 20 times (TRDT mode) more sonar energy can be transmitted into the medium. Dimensions of the two additional cabinets are:

Transmitter: Width 63 cm; depth 63 cm; height 173 cm; weight 386 kg
Transmitter power supply: Width 63 cm; depth 63 cm; height 173 cm; weight 600 kg

STATUS

The HS-1000 series sonar is available on a current production status and has been delivered in the VDS configuration and in the combined VDS/HM configuration.

CONTRACTOR

Westinghouse Canada Limited, Electronic Systems Division, PO Box 510, Hamilton, Ontario L8N 3K2, Canada.

1792.453
AN/SQS-505 SONAR

The AN/SQS-505 is a medium-size search and attack sonar intended for use on vessels of 1000 tons and above. It may be used in a hull-mounted and/or variable depth application.

In the Canadian ships, each vessel has two separate but identical SQS-505s on board. One system is variable depth, the other is hull-mounted retractable. Other navies have used the SQS-505 in hull-mounted only applications, with and without hull outfit retracting mechanisms. It is possible to use the 505 in direct communication with a digital computer either for the transfer of range and bearing information or for assistance to the operator in detection and tracking (see **2047.261** underwater combat system).

The essential SQS-505 system features are:

(1) Continuous 360 degree long range search
(2) Capability of tracking several targets while maintaining search
(3) A five 'ping' history to enhance initial detection through visual integration
(4) Classification system using target history, hydrophone effects, doppler, aspect, and audio techniques
(5) 360 degree passive surveillance during active operation

(6) Single operator control
(7) Facilities for computer aided tracking plus two-way command and control and ASW data systems interchange
(8) Built-in semi-automatic test equipment
(9) Ease of operation through quick entry button and symbology

Transducer

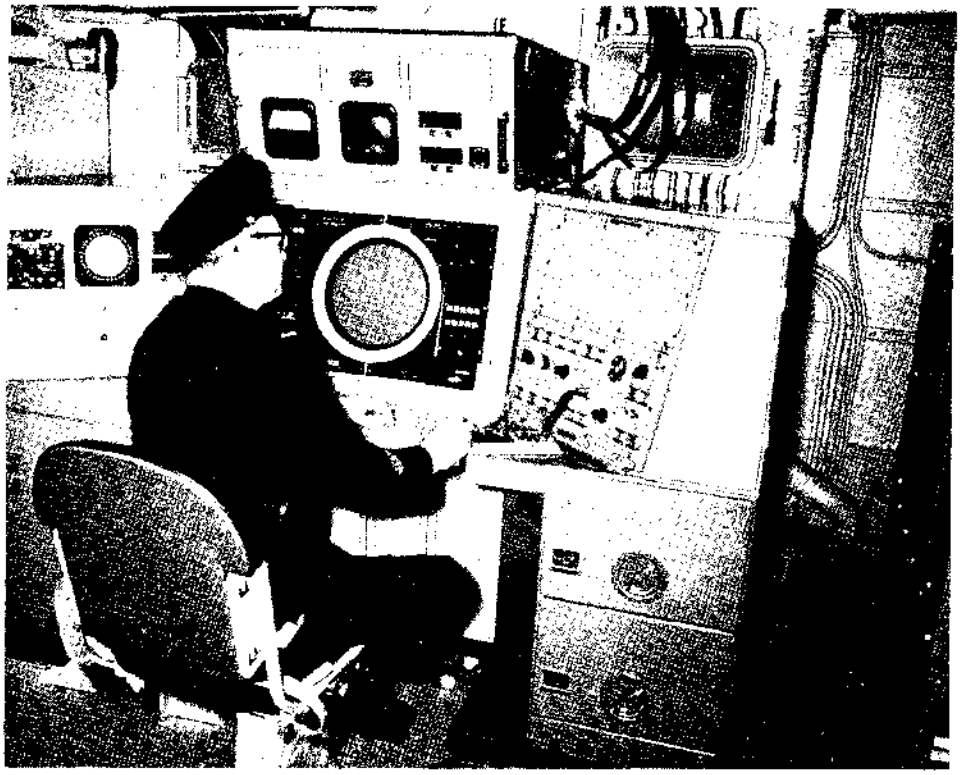
The transducer for the SQS-505 is identical for the VDS or hull-mounted application. The array is approximately 1·2 metres in diameter and 1·2 metres high. It consists of 360 individual elements, each of which can be removed while the array is still in water.

Transmitter Group

The main units of a transmitter group consist of a power supply and a transmitter. The power supply converts the ship's prime AC power to DC, required for the operation of the transmitter. The power supply is contained in one standard SQS-505 size cabinet.

The transmitter consists of 36 power output modules, each driving one stave of the transducer. The transmitter is completely solid-state and contains its own integrated test equipment unit. The principal transmission modes are OMNI and TRDT. In addition, the transmitter can be operated in either CW or wideband.

Receiver Group



The receiver is contained in three cabinets of the standard 505 size. The group is completely solid-state with its own automatic built-in test equipment which will enable the operator to determine the location of a fault down to the replaceable module level.

Control and Indicator Group

The operator's control and indicator console consists of a cluster of displays and controls which will enable one operator to have complete control over the operation of the sonar plus the ability to detect, classify, and track targets. In addition, via separate displays in the console, he is able to maintain continuous independent surveillance of the sonar's passive mode.

VDS Mechanical Equipment

The VDS hoist group for the SQS-505 has been designated the AN/SQA-502, which is manufactured by Fleet Industries Division, Ronyx Corporation, Fort Erie, Canada. This mechanical equipment is located in a cutaway situated on the stern of the Canadian ships. The total weight of the mechanical equipment, hoist auxiliaries, VDS body, and cable is approximately 20 tons.

AN/SQS-505 sonar control and indicator group manned by a single operator

Hull-mounted Hull Outfits

The 505 hull-mounted transducer can be used in any one of the following five applications:

(1) Fixed transducer and dome
(2) Fixed dome/retractable transducer
(3) Bow dome
(4) Retractable dome and transducer using a vertical retracting mechanism
(5) Retractable dome and transducer using a rotating mechanism.

The requirement for these various alternatives would depend upon the configuration of the ship and the location available for the mounting of the transducer.

STATUS

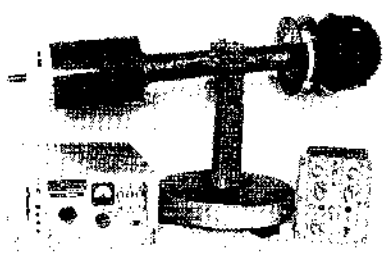
The SQS-505 is currently in production. Several advancements in the sonar's capability have been incorporated since the system was first installed in ships in the early 1970s.

In addition to the seven Canadian ships outfitted with dual SQS-505 sonars (VDS/HM), four hull-mounted systems have been installed on the latest Belgian frigates. The Royal Netherlands Navy has fitted systems to its 'Kortenaer' class frigates.

CONTRACTOR

Westinghouse Canada Limited, Electronic Systems Division, PO Box 510, Hamilton, Ontario L8N 3K2, Canada.

3999.353



AN/ASQ-502 SUBMARINE DETECTING SET (MAD)

The AN/ASQ-502 magnetic anomaly detector (MAD) is a sensitive magnetometer system developed for airborne submarine detection roles. A basic sensitivity of 0·01 gamma is claimed for this equipment, which has a total system weight of less than 15·6 kg (34·5 lb).

In place of the multiple cell detection method, the AN/ASQ-502 employs a single orientated caesium cell as the principal element. It is an optically pumped system, but the unwanted dead zones and heading error effects which are normally minimised by the multi-cell technique are counteracted in the AN/ASQ-502 by orientating the single caesium cell on a mechanical gimbal system. This, combined with an inherently stable self-oscillator caesium sensor loop and a low-noise, infinite dynamic range, frequency-to-voltage converter, is claimed to yield the most sensitive airborne magnetometer available.

CHARACTERISTICS

Sensitivity: 0·01 γ (10^{-7} oersteds)
Detecting head figure of merit (FOM)
Uncompensated: 1·50 γ or less
Compensated: 0·30 γ or less

AN/ASQ-502 submarine detecting set (MAD)

Detector: Single orientated caesium cell, optically-pumped self-oscillator Larmor frequency 3·5 Hz/γ
Operating range: 0·20 – 0·75 oersteds
Larmor output (total field): 14 Hz/γ
Analogue output No 1 (minimally filtered): 105 mV/γ uncompensated and 30 mV/γ compensated
Analogue output No 2: 15·0 V p-p fsd
FSD sensitivities: 20, 10, 4, 2, 1, 0·4, 0·2 γ
HP filter: 0·04, 0·06, 0·1, 0·15, 0·3 Hz
LP filter: 0·4, 0·8, 1·2, 1·6 Hz
Military specification: MIL-E-5400
Operating temperature range: −54 to +71°C
Storage temperature range: −62 to −85°C
Power requirements: 115 V AC 400 Hz, 3-phase, 120 VA and 5 V AC/DC 10 VA for panel illumination
Specified reliability: MTBF 1000 h

STATUS

Service test models have been delivered and successfully evaluated by the Royal Navy for use on the Lynx helicopter. Successful evaluation has also been completed by the RAF on the Nimrod, and by the Canadian Forces on the National Aeronautical Establishment MAD aircraft. Production quantities have been delivered for the Canadian Forces CP-140 Aurora. Several other countries have expressed interest in the equipment for use in their ASW aircraft.

4621.353

AN/ASQ-504(V) MAD SYSTEM

The AN/ASQ-504(V) Advanced Integrated MAD System (AIMS) is designed to provide optimum performance when used on helicopters, fixed wing aircraft and lighter-than-air platforms. AIMS is a fully automatic magnetic anomaly detection (MAD) system which improves detection efficiency while significantly reducing operator work load. For helicopter installation, the detecting head is fixed to the aircraft body. This provides true 'on top' contact when over a target by eliminating the delay inherent in a towed detecting system.

The AN/ASQ-504(V) system combines sensitivity and accuracy with ease of operation, eliminates aircraft generated interference fields and delivers continuous, automated feature recognition. Contact alert, both visual and audible, is provided. Slant range via an LED display allows the operator to determine if he is within target acquisition range.

AIMS eliminates hazards associated with towed systems and permits high speed surveillance and manoeuvrability, thereby increasing patrol range, improving detectability and substantially reducing false alarms. When used with dipping sonar, transition from one system to the other can be performed quickly and effectively.

The AIMS package weighs 50 lb (22·7 kg) and consists of a 0·005 nano tesla optically pumped magnetometer, a vector magnetometer, amplifier computer and a control indicator. The system operates from a single phase, 115 V, 400 Hz power source and requires less than 200 VA power. AIMS has the flexibility either to perform independently or to accept and execute commands from common control/display units via a 1553 data bus.

CHARACTERISTICS

Sensitivity: 0·01 gamma (in-flight)

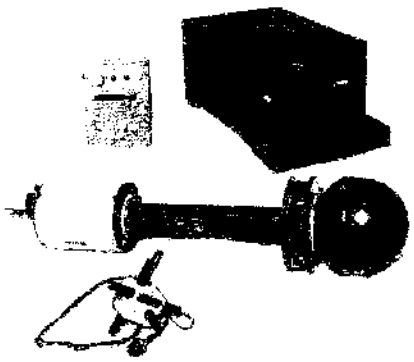
Features: Automatic target detection. Operator alert, visual and audible. Slant range estimate to 2800 feet (854 m)

Outputs

Visual: Contact alert and estimated slant range

Analogue: Adaptive MAD signal

Digital: Display interface to MIL-STD-1553



Audio: ICS alert

STATUS

Fully developed and ready for production.

CONTRACTOR

CAE Electronics Ltd, PO Box 1800, Saint Laurent, Montreal, Quebec H4L 4X4, Canada.

Units of AN/ASQ-504(V) MAD system

4000.453

AN/SQS-509 SONAR

The AN/SQS-509 is a lower frequency version of the SQS-505 (**1792.453**) intended for use on vessels of 2500 tons and above. It has been derived from the SQS-505 by changing the frequency-dependent items, such as the transducer, and consequently there is considerable logistic commonality with the SQS-505. Apart from a lower operating frequency (5·4 kHz) and a higher source level, the SQS-509 has the same operational features as the SQS-505 described above.

The transducer is approximately 1·6 m in diameter and 1·6 m high. It consists of 360 individual elements, each of which can be removed while the array is under water. The transmitter group consists of two cabinets, the power supply cabinet and the transmitter cabinet. The power supply converts the ship's prime AC power to DC, required for the operation of the transmitter. The transmitter contains 36 power output modules, each driving one stave of the transducer. It is completely solid-state and contains its own integrated test equipment. The principal transmission modes are OMNI and TRDT.

The receiver is contained in three cabinets of the standard SQS-505 size. It is completely solid-state with its own automatic built-in test equipment which enables the operator to determine the location of a fault down to the replaceable module level.

The control and indicator console consists of a cluster of displays and controls which enables one operator to have complete control over the operation of the sonar and the ability to detect, classify and track targets. In addition, via separate displays in the console, he is able to maintain continuous independent surveillance of the passive mode. Because of the larger transducer size, the preferred mounting for the transducer is in a bow-dome.

STATUS

The SQS-509 is in production for the Royal Netherlands Navy.

CONTRACTOR

Westinghouse Canada Limited, Electronic Systems Division, PO Box 510, Hamilton, Ontario L8N 3K2, Canada.

5863.253

SQR-501 TOWED ARRAY SONAR (CANTASS)

Computing Devices Company is designing a new anti-submarine sonar equipment known as the SQR-501, or CANTASS (Canadian Towed Array Sonar System). The complete system consists of an array of hydrophones towed behind the ship and the on-board processing and display equipment. It is intended for long-range detection, tracking and classification of submarines. The SQR-501 incorporates a new signal processor, digital computers and an intelligent digital display. No technical details have been made available.

STATUS

In design and development under a contract from the Canadian Navy.

CONTRACTOR

Computing Devices Company (a division of Control Data Canada Ltd), PO Box 8508, Ottawa, Ontario K1G 3V9, Canada.

4222.353

AN/ASA-64 SUBMARINE ANOMALY DETECTOR

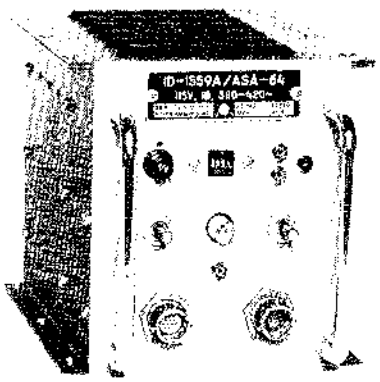
The AN/ASA-64 is a primary signal processor designed to identify and mark submarine-produced local distortions in the earth's magnetic field. When such an event occurs, the operator is alerted by visual and audio alarms, thereby eliminating the requirement for constant signal monitoring.

CHARACTERISTICS

Dimensions	Length (mm)	Width (mm)	Height (mm)	Weight (kg)
Control unit	102	146	90	0·68
ID-1559	229	150	153	2·95

Operating temperature range: -54 to +71°C

Military specification: MIL-E-5400



Power requirement: 115 V AC, 400 Hz, 20 VA

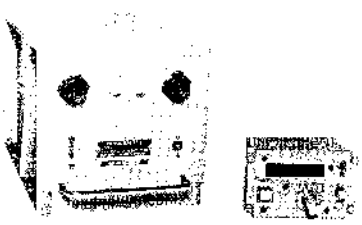
STATUS

Production quantities have been manufactured and delivered for the USN P-3C Orion. CAE has completed a product improvement programme with more processing power. This design improvement is being evaluated by the Royal Navy, Royal Air Force, and the United States Navy. A variant for helicopters is proposed.

CONTRACTOR

CAE Electronics Ltd, PO Box 1800, St Laurent, Montreal, Quebec H4L 4X4, Canada.

AN/ASA-64 submarine magnetic anomaly detector equipment



3231.393

AN/ASA-65 COMPENSATION GROUP ADAPTOR

The compensation group adaptor (CGA) has been developed to increase operational efficiency in existing installations of the AN/ASA-65 magnetic compensator group (**1388.393**). By the incorporation of *total system* built-in test features and automatic data gathering, preflight, troubleshooting and compensation update requirements are significantly reduced with a corresponding improvement in performance.

The CGA consists of a small indicator, magnetic field and a computer, magnetic field containing signal conditioning circuits and a special-purpose micro-computer. Installation does not require any modifications to the existing AN/ASA-65 equipment. Input data from the AN/ASA-65 and the detector magnetometer are used by the micro-computer to calculate the numerical values which indicate changes required for each of the nine terms to produce optimum compensation.

No stringent manoeuvre requirements are necessary. Data to update compensation terms require a simple flight programme that involves low amplitude manoeuvres on four headings. The total time required for this programme is no more than six minutes after which the operator is required to adjust the AN/ASA-65 terms as indicated on the CGA control.

AN/ASA-65 compensator group adaptor

CHARACTERISTICS

Figure of merit: Equal or better than best performance obtainable from standard AN/ASA 65 (generally 1 y or less)

Standard update compensation

Terms compensated: 9

Time: 8 minutes

Manoeuvres required: Small random type on 4 headings

Weapon drop compensation

Terms compensated: 4

Time: 2 minutes

Manoeuvres required: Small manoeuvres on four headings

Dimensions (CGA only)

	Height (cm)	Width (cm)	Depth (cm)	Weight (kg)
Control unit	9·5	14·6	12·7	1·35
Amplifier converter	22·1	22·9	41·8	10·0

STATUS

Fitted to RAF Nimrod, USN P-3C Orion and S-3A Viking maritime aircraft.

CONTRACTOR

CAE Electronics Ltd, PO Box 1800, St Laurent, Montreal, Quebec H4L 4X4, Canada.

1388.393
AN/ASA-65(V) NINE-TERM COMPENSATOR

The CAE nine-term compensator (AN/ASA-65(V)) provides semi-automatic compensation for aircraft-generated manoeuvre interference signals. By minimising unwanted interference signals, it substantially improves MAD detection capability, especially during tactical and turbulent flight conditions. This equipment compensates all significant permanent, induced and eddy-current interference fields in approximately 30 to 45 minutes. Permanent terms can be trimmed up on each flight in about five minutes compared to close to one hour for manual compensation systems.

AN/ASA-65(V) 2 nine-term compensator

The AN/ASA-65(V) is compatible with all existing magnetometer systems in present use. Accommodation for the varying compensation requirements of different aircraft types is conveniently accomplished by means of internal patch connectors. The equipment satisfies the requirements of applicable military specifications, and using state-of-the-art techniques has a demonstrated MTBF of more than 1800 hours. The use of completely solid-state circuitry has resulted in a total system weight of less than 13·6 kg.

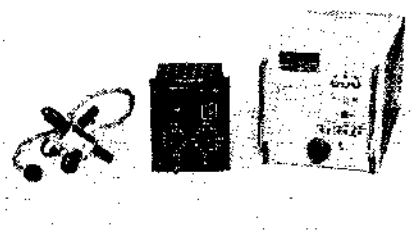
The compensation figure of merit is stated to be consistently less than 1 gamma, and the equipment is capable of accommodating maximum compensation fields of 50 gamma on each aircraft axis.

CHARACTERISTICS

Dimensions	Height (mm)	Width (mm)	Depth (mm)	Weight (kg)
Control indicator	229	146	165	3·85
Electronic control amplifier	197	149	346	7·94
Magnetometer assembly	152	152	152	0·68
Coil assembly (V)1	89	89	89	0·90

STATUS

Production quantities have been manufactured and delivered to the RAF for the Nimrod maritime aircraft, and the AN/ASA-65(V) has also been delivered for USN P-3C Orion aircraft and S-3A Viking.



CONTRACTOR

CAE Electronics Ltd, PO Box 1800, St Laurent, Montreal, Quebec H4L 4X4, Canada.

1980.393
0A-5154/ASQ AUTOMATIC MAD COMPENSATION SYSTEM

The 0A-5154/ASQ is the latest and most advanced version in a series of CAE compensator systems. This system was developed for use with boom-mounted magnetometers to minimise manoeuvre-related noise caused by the effect of magnetic fields inherent in the aircraft structure from interfering with underwater submarine detection or geological surveying. Excellent compensation combined with the ability to update minor variations rapidly and efficiently increases detection sensitivity to the limits of the magnetometer equipment.

The system is completely self-contained providing signal compensation by means of a micro-computer. The uncompensated 'raw' magnetometer input signal is conditioned and produced in a compensated state. This approach eliminates the requirement for output coils which were necessary to generate opposing fields in previous systems. Other than the 'raw' detector magnetometer signal, input requirements are limited to orthogonal vector magnetometer signals that provide heading, manoeuvre and total Earth's field information. The micro-computer is programmed to process this input data and both generate compensation requirements and update any changes on operator command.

0A-5154/ASQ automatic MAD compensation system

No stringent manoeuvre requirements such as purity or accuracy of aircraft heading are necessary. Data to update all 16 independent compensation terms are simultaneously evaluated during a simple flight programme which involves performing small aircraft manoeuvres on four headings. The total time required for this is no more than eight minutes. The equipment requires no operator involvement other than to initiate the recompensation procedure and update request. Incorporation of built-in test functions and fault indicators allows the operator or technician to perform a systematic checkout of the equipment to the WRA and SRA level.

CHARACTERISTICS

Figure of merit: <0·4 *y*
Residual interference signals: <0·03 *y* average
Terms compensated: 16
Compensation time: 8 minutes
Aircraft manoeuvre requirements: 1 minute of manoeuvres on each of 4 approximate orthogonal headings. If desired, other manoeuvres, such as trapping circles, or clover-leafs can be used
Military specification: MIL-E-5400
External input requirements: Minimally filtered analogue output from detector magnetometer
Power requirements: 115 V AC, 400 Hz, and 28 V AC/DC, 10 VA for panel illumination
Specified reliability: 1000 h MTBF
Dimensions

	Height (cm)	Width (cm)	Depth (cm)	Weight (kg)
Control indicator	18·2	14·7	16·6	2·2
Electronic amplifier	22·9	22·9	54·6	11·3
Vector magnetometer	15·2	15·2	15·2	0·7

STATUS

Production quantities have been delivered for the Canadian CP-140 Aurora and the Breguet Atlantic for the Netherlands and West German navies. Several other countries have expressed interest for use in their ASW aircraft.

CONTRACTOR

CAE Electronics Ltd, PO Box 1800, St Laurent, Montreal, Quebec H4L 4X4, Canada.

3086.453
AN/SSQ-522 SONOBUOY

The AN/SSQ-522 is an active sonobuoy developed specially from the AN/SSQ-47B to meet the requirements of the Canadian Forces. The SSQ-47B is produced by both Sparton of Canada and the parent Sparton company in the USA and is described in **1988.453**.

CHARACTERISTICS

Type: Active
Sonar modes: Automatic keyed CW
Transducer depth: 60 or 800 ft (18 or 244 m)
Weight: 24 lb (10·9 kg)
Sonar channels: 6 (HF)
RF channels: 12

Operation of the SSQ-522 is identical to that of the SSQ-47B, except that up to 12 buoys can be launched and operated simultaneously. Two different CW sonar modes are selectable by choice of VHF channel; even channel buoys have sonar modes the same as the SSQ-47B, and odd channel buoys have longer pulse-lengths and intervals.

CONTRACTOR

Sparton of Canada Ltd, London, Ontario, Canada.

3087.453
AN/SSQ-523 (CANCASS) SONOBUOY

The AN/SSQ-523 is the commandable active sonobuoy of the Canadian Command-Active Sonobuoy System (CANCASS), the other main elements being the airborne command signal monitor and active sonar processor.

The SSQ-523 provides ASW aircraft with remotely selectable and controllable sonar capability, and is used to detect, locate and track underwater targets. Proper channel command is achieved by the employment of UHF command channels paired with VHF output channels. The sonar output power level and frequencies are identical to those of the AN/SSQ-47B (**1988.453**); however, sonar mode capability is enhanced to include short, medium, and long CW sonar pulse and linear FM sonar sweeps, thus providing detection and tracking capabilities that exceed those of the AN/SSQ-47B.

CHARACTERISTICS

Type: Commandable active
Sonar modes: Pulsed CW or linear FM
Transducer depth: 60 or 800 ft (18 or 244 m) commandable
Weight: 32 lb (14·5 kg)
Sonar channels: 6 (HF)
RF channels: 12

Auxiliary command functions permit remote deep-depth selection and remote scuttle. The digital technique employed for these facilities is capable of expansion to provide extra functions with very little additional circuitry.

DEVELOPMENT

This was undertaken by Sparton under a Canadian Government contract awarded in 1973, which also included associated CANCASS avionics.

CONTRACTOR

Sparton of Canada Ltd, London, Ontario, Canada.

3780.453
AN/SSQ-527B SONOBUOY

The AN/SSQ-527B is an omni-directional, passive sonobuoy which enables fixed wing maritime patrol aircraft, helicopters and surface ships to conduct underwater search and surveillance using low frequency analysis and recording (LOFAR) techniques.

The AN/SSQ-527B is identical in function to the US Navy AN/SSQ-41B but incorporates features which improve detectability of low level, low frequency signals in a noisy sea environment. These features include a sub-surface assembly suspension system which maintains hydrophone depth within specified limits in shear currents up to 2·5 knots and an acceleration noise cancelling hydrophone.

The sonobuoy can be launched at airspeeds between 30 and 300 knots from altitudes of 30 to 7600 metres. Descent is controlled and stabilised by a parachute. Immediately after entry the sea water activated battery energises a mechanism which deploys the sonobuoy. A flotation bag is inflated and carries the upper electronics assembly, containing a VHF transmitter, to the surface while the hydrophone

descends to a pre-selected operating depth. Three depths are available: 30, 100 or 300 metres. The sonobuoy becomes operative within 60 seconds of impact at the minimum depth and within 100 seconds at the maximum depth. It remains in operation for a minimum of 1, 3 or 8 hours, according to the pre-selected operating life.

The AN/SSQ-527B can be launched by hand from a ship moving at up to 30 knots without it being necessary to activate mechanical or electrical devices before launch. The electrically activated deployment mechanism functions regardless of attitude on entry since it is not dependent on impact forces acting on the bottom plate.

CHARACTERISTICS

Type: Passive omni-directional
Audio frequencies: 10 - 5000 Hz
Depth: 30, 100 or 300 m
Size: A
Weight: 7·5 kg
Operating life: 1, 3 or 8 h
Launch altitude: 30 - 7600 m
Launch speed: 30 - 300 knots
RF channels: 31 (162·25 - 173·5 MHz band)
RF power: 1 W

STATUS

AN/SSQ-527A (two-depth): 35 000 units produced 1979-82.
AN/SSQ-527B: in production.

CONTRACTOR

Sparton of Canada Ltd, London, Ontario, Canada.

4619.453
AN/SSQ-529 (DICANCAS) SONOBUOY

The AN/SSQ-529 is a directional version of the AN/SSQ-523 CANCASS commandable active sonobuoy (**3087.453**), which in turn is derived from the AN/SSQ-47B/522 range-only sonobuoy (**1988.453**).

Energy from target echoes received by the transducer is converted into a directional command active sonobuoy system (DICASS) compatible composite signal containing directional information. This composite signal modulates the output of a VHF transmitter in the floating surface unit. Launch platforms equipped with DICASS-capable electronic equipment can employ the AN/SSQ-529 to determine the range and direction of a target relative to the position of the sonobuoy.

Command functions are identical to DICASS except that three transducer operating depths are provided (20, 100 and 250 metres).

The AN/SSQ-529 provides a cost-effective alternative to the DICASS sonobuoy for tactical training and for improved performance in shallow water.

CHARACTERISTICS

Type: Commandable, directional active
Sonar modes: Pulsed CW or linear FM
Transducer depth: 20, 100 or 250 m (intermediate and greatest depths are command selectable after deployment)
Weight: 14·5 kg
Sonar channels: 6 (HF)
RF channels: 12

DEVELOPMENT

The development was initiated under Canadian government contract awarded in March 1981.

STATUS

Production is scheduled to commence in early 1986.

CONTRACTOR

Sparton of Canada Ltd, London, Ontario, Canada.

4620.453
AN/SSQ-530 DIFAR SONOBUOY

The AN/SSQ-530 is a directional, passive sonobuoy which provides ships, and fixed and rotary wing maritime aircraft with the dual capability of detecting and determining the source direction of underwater acoustic energy radiated by submarines. VHF transmissions containing this information are received by the launch vehicle and are analysed and processed to find the true bearing of the source using directional low frequency analysis and recording (DIFAR) techniques.

The AN/SSQ-530 is an improved version of the AN/SSQ-53A DIFAR sonobuoy (**1990.453**) and is able to select a third intermediate hydrophone operating depth of 100 metres. Depths below the minimum depth setting of 30 metres can be adjusted to suit operating environments. Storage life has been increased from 5 to 7 years.

Launch is possible from aircraft at airspeeds between 30 and 300 knots from altitudes of 30 to 7600 metres. Descent is controlled by parachute. On entry, a sea water activated battery starts deployment of the buoy which becomes operative for one or four hours according to the pre-selected operating life. Ship launch is helped by the electrical activation which ensures reliable deployment regardless of attitude on entry since it is not dependent on water forces acting on the bottom plate.

The sonobuoy is compatible with the AQA-7, OL-82(AYS) and AQS-901 processors. The Sparton TD-1135A demultiplexer/processor/display can provide a self-contained stand-alone DIFAR capability for ships, helicopters and aircraft.

CHARACTERISTICS

Type: Passive, directional LOFAR (DIFAR)
Function: Search and localisation
Hydrophone depth: 30, 100 or 300 m
Weight: 10·2 kg
RF channels: 31
RF power: 1 W
Launch altitude: 30 - 7600 m
Operating life: 1 or 4 h

STATUS

Developed under Canadian government contract. In production.

CONTRACTOR

Sparton of Canada Ltd, London, Ontario, Canada.

4649.363
SBP 1-1 (AN/UYS-503) SONOBUOY PROCESSOR

The SBP 1-1 sonobuoy processor is a small, lightweight, low cost multi-sonobuoy equipment designed for a variety of ASW platforms. It employs a new concept in processor architecture and uses a Computing Devices proprietary universal demultiplexer to assure future growth capability.

The SBP 1-1 is made from four identical, independent processor modules, also known as 'slices'. The processing capability of each slice when used with passive sonobuoys is 7 bands from DIFAR (1 surveillance and 6 vernier) and 14 bands from omni (2 surveillance and 12 vernier). The complete system, therefore, has a total of 28 bands when processing four DIFAR buoys and 56 for eight omni-buoys. All bands are processed and stored continuously for real-time viewing. In the active mode, each slice is able to process one range-only active or one DICASS buoy. The latter is processed in both CW and FM modes. The range-only buoy is processed in the same way as the DICASS CW pulse. For bathythermal buoys the data is spectrum analysed and the output tone detected and converted to temperature.

A single SBP 1-1 system is capable of handling eight omni-passive, four DIFAR, four DICASS, four omni-active, bathythermal buoys and any combinations of these. The processing design of the equipment is such that if one module fails the remaining three are unaffected and continue to function normally. Display formatting is designed to enable the operator to view several of the processing streams simultaneously. The system display monitor is a standard 875-line TV screen with the basic display format dividing the screen into four areas. An operator controlled cursor is provided for alpha-numeric readout of any display parameter (frequency, time, range, bearing, etc).

CHARACTERISTICS

Frequency range: 0 - 2560 Hz
Input channels: 8 standard sonobuoy receivers
Size: 1 ATR short - 22·9 × 19·0 × 30·5 cm (9 × 7·5 × 12 in)
Weight: 44 lb (20 kg) - electronics unit; 132 lb (60 kg) - complete system including display and control

STATUS

In production. An order worth C$1 million was received from the Swedish Navy in early 1984, and additional orders have been received from Canada for ASW helicopter application.

CONTRACTOR

Computing Devices Company (a division of Control Data Canada Ltd), PO Box 8508, Ottawa, Ontario K1G 3M9, Canada.

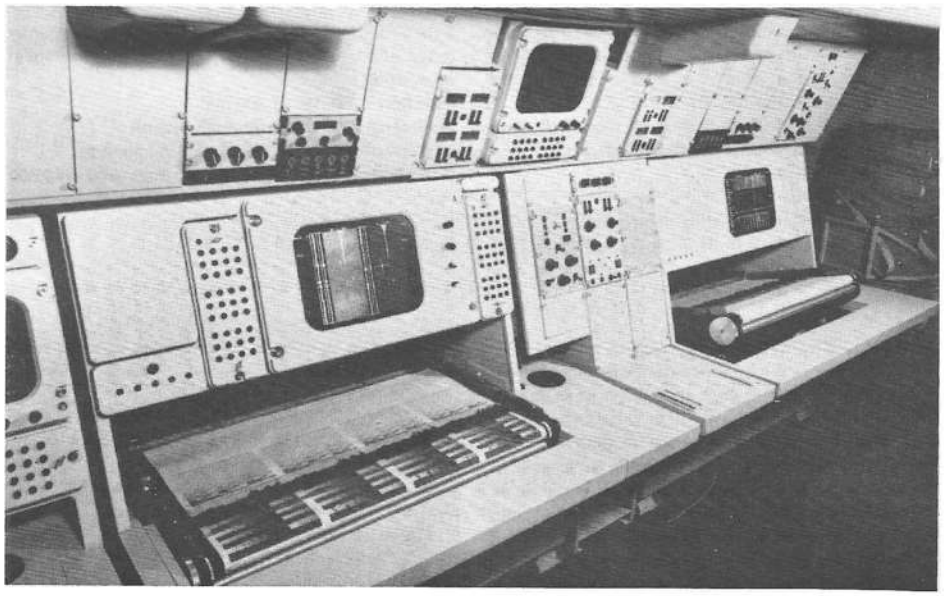
3791.363
TSM 8200 AIRBORNE SONOBUOY PROCESSING EQUIPMENT

Installed aboard fixed- or rotary-wing aircraft, this equipment processes and displays signals received from various types of sonobuoy. Modular design permits optimum system configuration to suit all sonobuoy types and the specific number to be processed simultaneously. All signals received are permanently recorded before being processed to allow more extensive utilisation of data at shore-based processing stations. Categories of sonobuoy whose data can be processed include: passive buoys (directional and omni-directional); active buoys (directional and omni-directional); environmental buoys such as bathythermographic, sea noise measuring, etc; and numerous buoys of the same or several different types can be handled simultaneously.



Three main elements comprise the TSM 8200 equipment:

(1) Communications unit, in which will be found a 99-channel VHF receiver, a UHF transmitter/receiver for active sonobuoy remote control, and ASSG overall test systems. Each set is associated with a control box for the system operators
(2) Signal processing and display unit. This carries out analogue pre-processing and full processing functions in the active and passive modes using digital processors and appropriate software. Information is presented by a high density graphic recorder and a CRT display. The latter is associated with a high-capacity bulk storage unit and numerous image formats are available by means of elaborate software appropriate to the specific types of buoy and signal processing. The dual processor configuration is normally operated by two operators using an alpha-numeric keyboard and tracker ball. A digital data bus permits dialogue between the operators and the tactical co-ordinator, via the tactical computer. Several signal processing and display units can be associated aboard the same aircraft so that system performance can be enhanced by increasing the number and types of buoys which can be processed simultaneously. An on-top-position indicator is used in conjunction with a radio compass for homing towards the sonobuoy
(3) Magnetic recording unit. This multi-track recorder records all the sonobuoy data at the analogue processing level for subsequent analysis ashore
(4) Other optional equipment includes an acoustic signal generator simulator for test purposes, and remote control of active sonobuoys.

STATUS

In production.

TSM 8200 airborne acoustic system installed on French Navy 'Atlantic' maritime patrol aircraft

4347.363
TSM 8210/8220 (LAMPARO) LIGHTWEIGHT AIRBORNE SONOBUOY PROCESSING EQUIPMENT

Derived from the TSM 8200 (**3791.363**), these airborne sonar signal processing and display systems are designed as modern digital equipments for ASW fixed or rotary wing aircraft.

The processing capabilities of the TSM 8210 are essentially identical to those of the TSM 8200, but the configuration is based on a single processing unit in a lighter and more compact packaging. It is manned by a single ASW operator. The same wide panel of facilities and processing modes is available.

The TSM 8220 is orientated towards the processing of omni-directional passive and active buoys.

The signals are displayed on a CRT in TV format and hard copy can be connected for permanent recording. An on-top-position indicator is used in conjunction with a radio compass for homing on the sonobuoy. Weight of the complete system is 140 kg for the TSM 8210 and 70 kg for the TSM 8220.

STATUS
The TSM 8210 and TSM 8220 are currently in the pre-production phase. An export order has been received.

CONTRACTOR
Thomson Sintra, Activités Sous-Marines, 23 rue de Courcelles, BP 096-8, 75362 Paris Cedex, France.

TSM 8210 processing and display system

1159.253
DUBV-23D SURFACE VESSEL SONAR

The DUBV-23D is a bow-mounted, low-frequency, panoramic sonar for anti-submarine operations. The 48-column transducer array is housed in a bulb at the forepart of the ship, the bulb being of streamlined design to reduce parasitic noises to permit listening at high speeds. The panoramic sonar is intended for both search and attack roles.

In addition to the transducer array, the equipment includes the transmitter/receiver unit, a computer section for the processing of data being fed to weapons, and control and display consoles at the anti-submarine attack station.

The DUBV-23 is of identical design to the towed sonar DUBV-43 **(1334.453)** and in French vessels the two sonars are used together for anti-submarine warfare.

OPERATION
Operating modes provide for: panoramic surveillance, sector surveillance, step surveillance, passive surveillance at sonar frequency, panoramic attack transmission, or 'searchlight' attack transmission. In addition to the system's own display devices, the DUBV-23D provides for target data outputs to other ship's systems and repeater PPIs.

The following notes refer to combined use of the DUBV-23 and DUBV-43 sonars. Advantages claimed for this method are:

(1) The attack and target data processing section of the DUBV-23 can be connected to the towed sonar by remote control, which provides for control of weapons by the sonar giving best results
(2) The simultaneous use of a hull transducer and a towed transducer, whose depth can be selected within the limits of 10 to about 200 m, considerably increases the sound volume and correspondingly limits the chances of attack by conventional submarines
(3) The use of a towed transducer array offers a significant measure of protection against performance degradation due to sea-state effects
(4) It is possible to attack a target whilst continuing surveillance
(5) Deep submersion of the DUBV-43 sonar permits a doubling of transmitter power, with an appropriate increase in detection range.

Four modes of operation are possible:

(1) INDEPENDENT. The two sonars are independent except for reciprocal connections for audio and video sensitivity control during transmission. This mode is normally employed only when one sonar is defective
(2) 23 SYN. In this mode the transmissions of the two sonars are synchronised, using the same or different frequencies, with the DUBV-23 as the master. The hull sonar is for attack, and the towed sonar for surveillance
(3) 43 SYN. This mode is identical to the preceding mode, but with the towed sonar as master
(4) 43 ATT. This mode is divided into two phases: the first, Delayed 43 ATT, is a preparatory stage for effecting certain remote switching operations, and the second, Standby 43 ATT, permits processing of data from the towed sonar and its

DUBV-43 sonar control console

transmission to the weapons via the attack section of the DUBV-23 sonar. In this mode the attack section of the DUBV-23 and the DUBV-43 must use the same frequency. However, the surveillance section of the DUBV-23 can, if necessary, be operated on a frequency different from that assigned to the DUBV-43.

CHARACTERISTICS

Transmitter

Frequencies: 4 operating frequencies in the neighbourhood of 5 kHz, of which 2 are operational

Power: 96 kW (2 × 48 kW)

Type: FF (fixed frequency), FM (linear frequency modulation with non-coherent data processing at reception)

Duration: 4, 30, 150 or 700 ms

Scatter echo: With or without rejection

Doppler effect correction: On all 48 channels

Cadence: Adjustable step by step from 1500 to 48 000 yards

Receiver: Panoramic, directional, passive listening in sonar band

STATUS

The DUBV-23D is in service in converted anti-submarine escorts Types T47 and T56, frigates of the 'Suffren' class and Type C67, and corvettes Type C70 of the French Navy.

CONTRACTOR

Thomson Sintra, Activités Sous-Marines, 23 rue de Courcelles, BP 096-8, 75362 Paris Cedex, France.

1786.453

PAP 104 MINE DISPOSAL WEAPON

The PAP 104 system has been developed as a means of remotely placing a mine disposal charge alongside a mine which has previously been located by means of a minehunting sonar. It consists basically of four main parts: a wire-guided submersible vehicle which carries the destruction charge and is equipped with a TV camera, a control console, TV monitor, and remote control box, the last three items being located on the carrier vessel. An optional cutting device for moored mines is entering service. Overall dimensions of the submersible are: length 2·7 m, width 1·2 m, height 1·3 m, and weight 700 kg (inclusive of explosive charge). Operating range is 500 m at depths of 100 m or less with standard motors (300 m or less with optional special motors) and battery life is sufficient for five sorties. The maximum speed is 5·5 knots. A piloting simulator, known as SIMPAP is available for the training of personnel.

DEVELOPMENT

Development of the PAP system was carried out by Direction des Constructions Navales, Groupe d'Etudes Sous-Marines de l'Atlantique in collaboration with Société ECA.

STATUS

More than 180 have been built for the navies of France, Belgium, Netherlands, Norway, the United Kingdom and West Germany and for the European Tripartite minehunter. Orders have been placed by Australia and Malaysia, and negotiations with other navies are in progress.

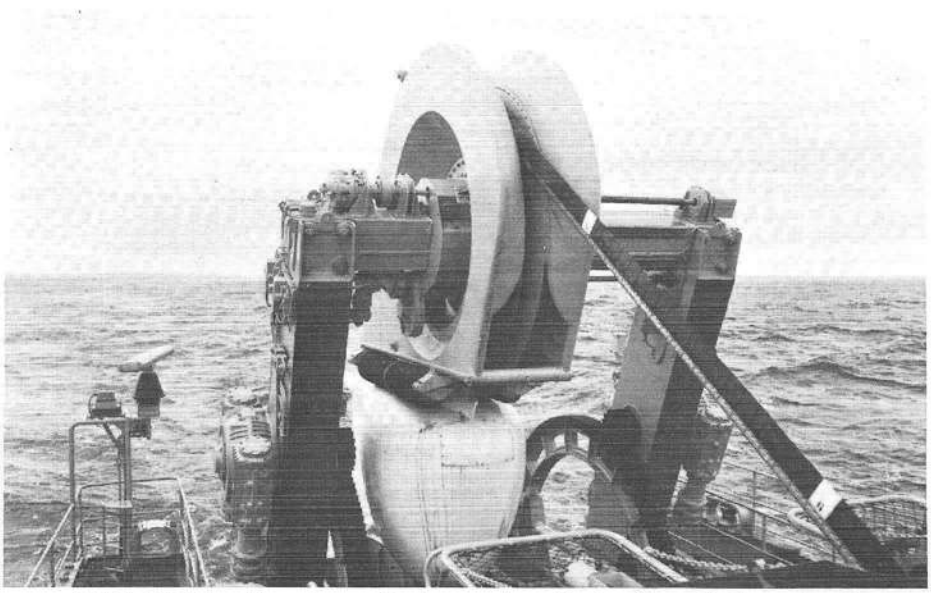
1334.453

DUBV-43B VARIABLE DEPTH SONAR

The DUBV-43B variable depth sonar (VDS) consists of a streamlined towed body called the 'fish', containing the sonar transducer array. This is towed from the rear of the parent vessel at distances of up to 250 metres and can be set to run at depths between 10 and 200 metres. It is equipped with stabilisers providing for control in roll, pitch, and depth. An attack version of the system is also provided with a gyro-compass. Dimensions of the 'fish' are: length 550 cm, width 170 cm, and submerged weight 7·75 tonnes. The towing cable also incorporates 48 pairs of signal conductors. The range of towing speeds is 4 to 24 knots, and detection ranges of up to 25 km are quoted. The DUBV-43B is identical to the DUBV-24C sonar (**1217.253** *1982-83* and earlier editions) except for the transducer array, which in the DUBV-24C is in a hull-mounted sonar dome, while the DUBV-43B array is towed. The increased operating depth of the latter permits an increase in radiated power to 96 kW.

The transducer array is 1 metre in diameter and 1·2 metres high. It consists of 24 vertical 'staves' of eight transducers to give a total of 192 elements.



STATUS

The DUBV-43B is in service in converted anti-submarine escorts Types T47 and T56, frigates of the 'Suffren' class and Type C67, and corvettes Type C70 of the French Navy.

Two updates of the system are in progress:

(a) DUBV-43C incorporating an increase in 'fish' immersion by means of a new transducer developed by DCN and manufactured by Thomson Sintra

(b) UTCS 1B which includes improvement of the signal processor.

ELEDONE SUBMARINE SONAR

ELEDONE is a family of submarine sonars, the most comprehensive of which combine the main submarine sonar functions within a single integrated system. The system may be fitted to any size of submarine or operational requirement by the simple addition of standard cabinets and the appropriate transducer arrays. Simultaneous use of these various functions is achieved by the use of a colour display which integrates all relevant data. Built-in redundancy and built-in test facilities maintain availability. The system provides:

Passive listening

This facility gives high sensitivity, fine bearing accuracy and great flexibility of installation in all types of submarines. The number of hydrophone staves can be selected, either 32 staves for small diameters down to 1·2 metres, 64 staves for large diameters up to 3·5 metres or 96 staves for the largest. Specific processing channels can provide from four to twelve automatic tracks. Accurate target data are sent continuously to the tactical system to allow effective target motion analysis.

Passive adaptive processing

The adaptive processing function is based upon optimal array processing theory which minimises the

effect of jamming by strong signals, when listening to low level signals. It is a very useful facility in the discrimination between two targets when both are within a common limited sector.

Interception

Interception of all active sonar pulses from low frequency surface ship sonars to high frequency torpedo acoustic heads. Very early warning against enemy sonars, with a very low false alarm rate, is provided. Interception warnings are integrated on the passive listening scope with specific colour (visual correlation). Accurate parameters of pulses are presented on digital read-outs and systematically transmitted to the tactical system.

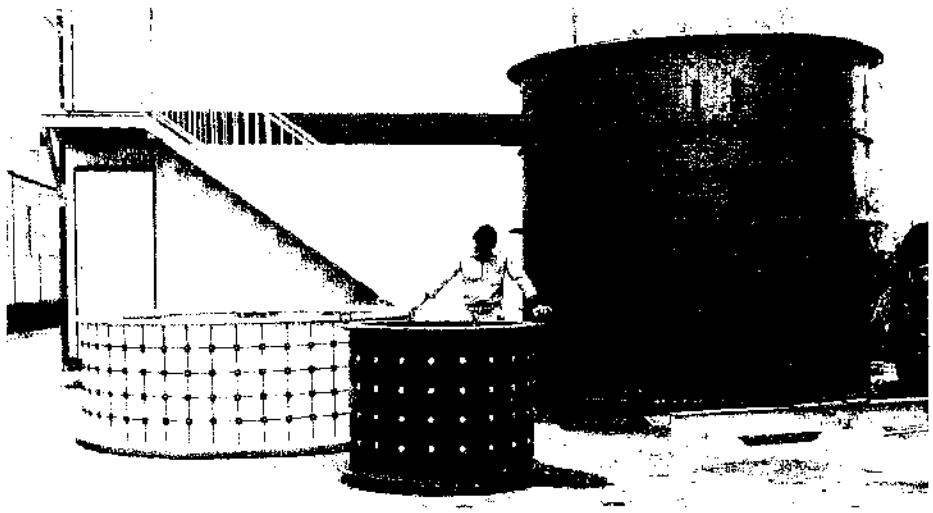
Active capability

Although initial bearings are provided by the passive detection, the operator can also initiate a low frequency wide sector transmission on the same bearing to determine accurate range. In this mode, reception is performed by the passive listening array and associated with high detection sensitivity.

Spectral analysis

The spectrum analysis facility complements the audio function by providing the operator with specific data in target identification. This analysis can be performed in real-time or played back from memory store. Paper recorders, tape recorders, cavitation warnings, additional mass memory data and other facilities can be provided.

Tactical display



The tactical display system is the operational heart of the submarine and provides a continuous tactical situation review. It provides navigation information, storage and display of sensor data, target parameters analysis, geographical and tactical presentation, target motion analysis and weapons control.

STATUS

In operational service and in serial production for several navies. The sonars are known as Octopus for the version intended for submarines of the 'Walrus' class and Argonaute for the RN '2400' class submarines (**5650.453**).

CONTRACTOR

Thomson Sintra, Activités Sous-Marines, 23 rue de Courcelles, BP 096-8, 75362 Paris Cedex, France.

ELEDONE submarine sonar acoustic arrays

5650.453

ARGONAUTE SONAR SYSTEM

Argonaute is the name of a new sonar system ordered by the Royal Navy for use in its forthcoming Type 2400 class submarines.

Argonaute consists of elements of the ELEDONE sonar which have been modified to interface with Royal Navy equipment and operational requirements.

The ELEDONE system operates in both the active and passive modes, full details are given in the entry **1356.453**. No other details are available.

STATUS

In serial production.

CONTRACTOR

Thomson Sintra, Activités Sous-Marines, 23 rue de Courcelles, BP 096-8, 75362 Paris Cedex, France.

1634.453

DUUA-2A ACTIVE/PASSIVE SONAR

The DUUA-2A sonar is fitted to modernised 'Daphne' class submarines and 1200 tonne submarines, and provides for simultaneous surveillance and attack. It can be used:

(1) For active detection in single (FP), or frequency modulation (FM) modes
(2) For passive detection
(3) As an interceptor, localisation of a sonar source.

The DUUA-2A may also be used for ultrasonic communications purposes and for depth sounding in very deep water.

CHARACTERISTICS

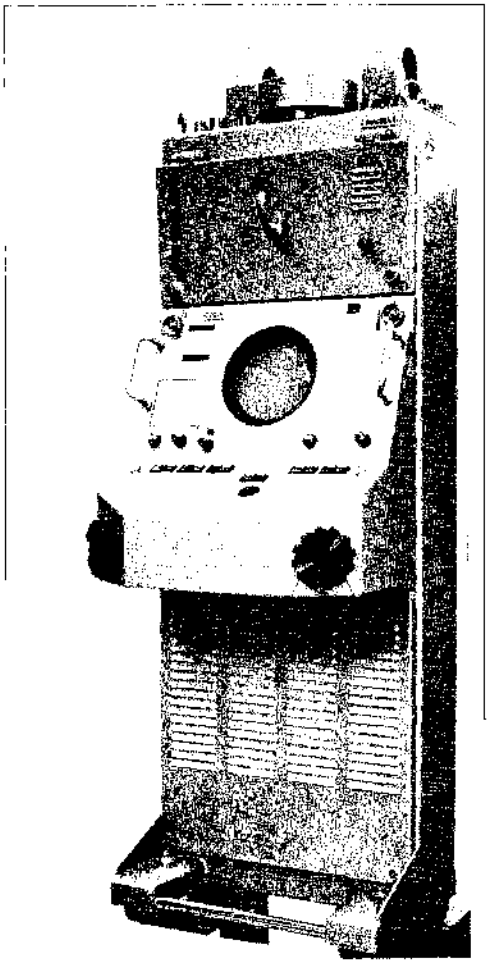
Transmitter: Frequency 8·4 kHz

Power: 20 kW in normal operation, and 1 kW in reduced operation, SGF and IC. Each emission is manually triggered. Emission duration 30 ms in SFG; 300 ms in FP; 500 ms in FM.

Receiver

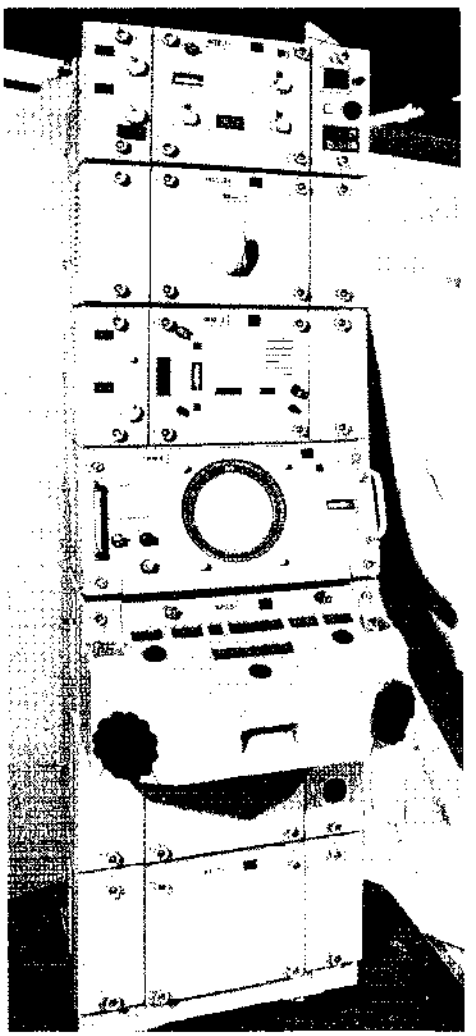
Pass band: ±170 Hz in FP; ±350 Hz in FM in the neighbourhood of 8·4 kHz; ±500 Hz in FM in the neighbourhood of a selected frequency between 2·5 and 15 kHz.

Range scale in active mode: 3, 6, 12, and 24 km.



Transducer: Directional. Type B 88T 8·5, driven by servo mechanism. MSS 5 directivity on site and bearing $2\theta_3 = 10°$ at 8·5 kHz. Manual orientation by crank on azimuth or automatic orientation at 4 or 8°/s from +175 to −175° on bearing. Reset between stops at 60°/s. Site positioning from +15 to −30°.

STATUS



In service in the French 'Daphne' 'Agosta' and 'Narval' classes of submarines.

CONTRACTOR

Thomson Sintra, Activités Sous-Marines, 23 rue de Courcelles, BP 096-8, 75362 Paris Cedex, France.

Control console of DUUA-2B active/passive sonar

DUUA-2 sonar operator console

3232.453

DUUA-2B ACTIVE/PASSIVE SONAR

The DUUA-2B sonar can be fitted in all types of submarine and it provides for simultaneous search, attack, sonar interception, and depth sounding in deep water.

Two versions exist:

Model I: Active sonar
Model II: Passive sonar

Either one or two sonars can be fitted in each submarine, but if two active sonars are fitted only one transmitter need be employed.

CHARACTERISTICS
Transducer: Directional. Manual or automatic search in continuous rotation
Transmitter
Frequency: 8 kHz
Power: 3 kW
Pulse: FP or FM mode
Receiver: In passive mode, from 2·5 to 15 kHz
STATUS
In series production and ordered for the French Navy Type SNA72 fleet submarines.
CONTRACTOR
Thomson Sintra, Activités Sous-Marines, 23 rue de Courcelles, BP 096-8, 75362 Paris Cedex, France.

3498.453
FENELON - DUUX-5 PASSIVE SONAR AND ACOUSTIC RANGEFINDER

Fenelon is the name given to a panoramic sonar capable of automatic and simultaneous tracking of three targets. The equipment incorporates a passive acoustic rangefinder for measuring the range of three targets within 120° sectors, and a panoramic sonar interceptor measuring the true bearing of all sonar transmissions received within the 2 to 15 kHz band.

The DUUX-5 equipment was developed by Alcatel as a successor to the DUUX-2 series (**1162.453** *1979-80* and earlier editions), of which at least 120 equipments were built and supplied to 14 navies for fitting in eight types of submarine. The Fenelon equipment enables range and bearing information on targets to be obtained by the submarine without the need for any transmissions and with minimum delay. Speed of operation permits target course and speed to be computed rapidly, also allowing any changes in either speed or course to be detected without delay. Four targets can be tracked simultaneously (three on radiated self-noise, one on sonar pulses), and there is a continuous panoramic bearing display over 360°. Range information is provided over arcs of 120° on each side of the submarine. There are facilities for transmission of target data automatically to the ship's weapon control system and plotting table.

Performance characteristics include high accuracy and discrimination, immunity against sonar pulse interference, simplified calibration, and integrated test facilities. Under normal conditions, results in the middle sector are 0·3° for bearing accuracy, 2° discrimination accuracy between two targets and 5% of range on radiated noise for a target at 10 km distance. Two types of hydrophones are available. The hydrophonic unit is composed of two bases with three hydrophones each on the starboard and port side of the submarine. All other technical details remain classified.

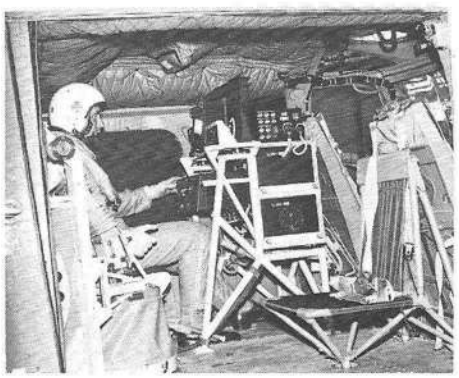
The UX27 is an improvement of the basic DUUX-5, through the use of heterogeneous hydrophones with ten staves, and the addition of preprocessing (filtering, multiplexing, beam forming) to improve the detection threshold and protect against interference.

STATUS
In series production. Replaces DUUX-2 passive acoustic rangefinder. Two Spanish submarines, the *Mistral* and *Tramontara*, are being fitted with DUUX-5 systems.

CONTRACTOR
Thomson Sintra, Activités Sous-Marines, 23 rue de Courcelles, BP 096-8, 75362 Paris Cedex, France.

Fenelon - DUUX-5 control and display console

1631.353
HS/DUAV-4 HELICOPTER SONAR



The HS is an active/passive directive sonar designed for submarine surveillance and location (azimuth, distance, and radial speed). It is specially designed for use on board light, versatile, ship-based helicopters of which the WG13 Lynx is a typical example. It may also be fitted aboard small surface vessels as either a hull sonar or as a VDS system.

The HS differs from conventional sonar in its signal processing system which is designed to give improved detection, especially in severe reverberation conditions such as shallow waters. The sonar can be operated in either the active or passive mode, true bearing, range, and radial speed are measured in the former mode, true bearing only in the passive mode.

A combined display unit permits surveillance display (initial detection) or plotting display (precise azimuth determination). Total weight (including electronic rack, cable, and dome) is 250 kg.

STATUS
The HS is used by the French Navy under the designation DUAV-4. In series production for the French and several other navies.

CONTRACTOR
Thomson Sintra, Activités Sous-Marines, 23 rue de Courcelles, BP 096-8, 75362 Paris Cedex, France.

4097.453
SS 48 SONAR

The SS 48 sonar is a high performance search and attack equipment designed for large ASW ships. It is comprised of two low frequency (LF) panoramic sonars with preformed beams. The first of these sonars is equipped with a cylindrical hull-mounted transducer having 48 vertical staves. The array is housed in a bow sonar dome and suspended to permit freedom in the roll axis. Dimensions are: 1864 mm diameter, 1643 mm height and nine tons weight. The second sonar is a variable depth equipment (VDS) consisting of a cylindrical 24-stave transducer housed in a 'fish' which is towed behind the ship. A mechanical handling equipment located on the after-deck is fitted for stowage, and deployment and towing of the fish.

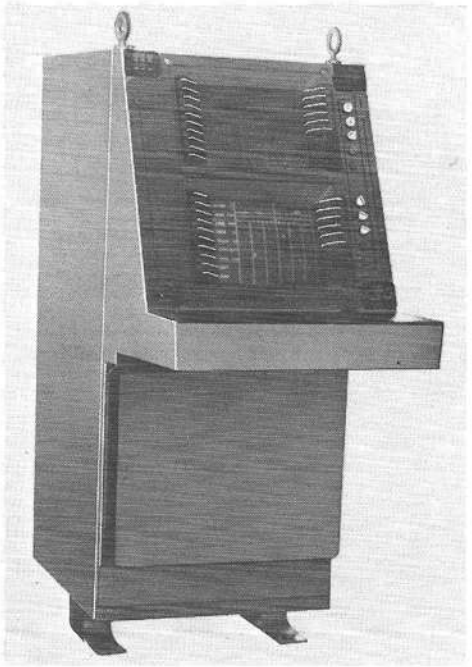
Both sonars provide for coherent processing in CW and FM in all beams, doppler measurement in both modes, classification, extraction and multi-sweep correlation (using synthetic video). The microprocessors employed also permit rapid fault location and self-test. The equipment (additional to the transducers and gear) comprises four electronics cabinets, two junction boxes, and one operational console with two three-colour displays and interactive dialogue facilities.

Close-up of SS 48 VDS deck handling gear and tow cable

The latter item enables a single operator to handle detection, location, classification and situation evaluation. The facilities provided include:

(1) Panoramic active search with multiple correlation
(2) Sector active search (raw video)
(3) Time analysis of echoes
(4) Doppler analysis
(5) Range and bearing measurements
(6) Continuous presentation of tactical situation
(7) Target and firing elements (12 tracked targets)
(8) Continuous torpedo search
(9) Panoramic passive search (96 beams for hull sonar and 48 beams for VDS).

CHARACTERISTICS



Transducer	Hull	VDS (LF)
Frequencies	3 in 5 kHz band	3 in 5 kHz band
Panoramic transmission level (dB)	230	228
Directional transmission level (dB)	241	237
Modes	CW - FM	Crossed codes FM
Handling system and weight		MSR2D (90 t) ECAN Ruelle

STATUS

The SS 48 is involved in an updating programme for French Navy DUBV-23/DUBV-43 sonar systems (**1159.253** and **1334.453**) which equip all major ASW ships of the French Navy.

CONTRACTOR

Thomson Sintra, Activités Sous-Marines, 23 rue de Courcelles, BP 096-8, 75362 Paris Cedex, France.

Console of SS 48 sonar equipment

4096.453
SS 24 LF SONAR

The SS 24 LF is a high performance surface ship sonar for vessels of more than 1000 tons, and is designed primarily for ASW use. The system is based on a panoramic sonar with 24 preformed beams operating in the low frequency band around 5 kHz. A hull-mounted transducer in a sonar dome is employed and the system may or may not be associated with a towed variable depth sonar (VDS). The VDS is a medium frequency sonar with 12 performed beams and is carried on deck handling equipment (Mini-Ulis) produced by Ateliers et Chantiers du Havre (ACH), fitted on the after deck and weighing four tons (**4094.453**).

A single operator can assume responsibility for search and attack, and a situation history display is provided for his use. After coherent processing of CW and FM signals for each beam, the operator has available stored information for:

(1) Panoramic active search; true bearing and range in rectangular co-ordinates with synthetic video
(2) Passive search (24 preformed beams for the hull-mounted sonar and 12 for the VDS)
(3) Active sector search using raw video
(4) Echo analysis
(5) Torpedo alarm
(6) Sonar interception
(7) Situation history.

The sonar can be linked to a weapon control system (DLA) and to all combat systems. A three-colour display unit is provided and provisions are included for interactive dialogue between the SS 24 LF and its operator. These are mounted in the operational console and there are three other electronic/electrical equipment cabinets. The inclusion of micro-processors facilitates self-test and rapid fault-finding.

CHARACTERISTICS

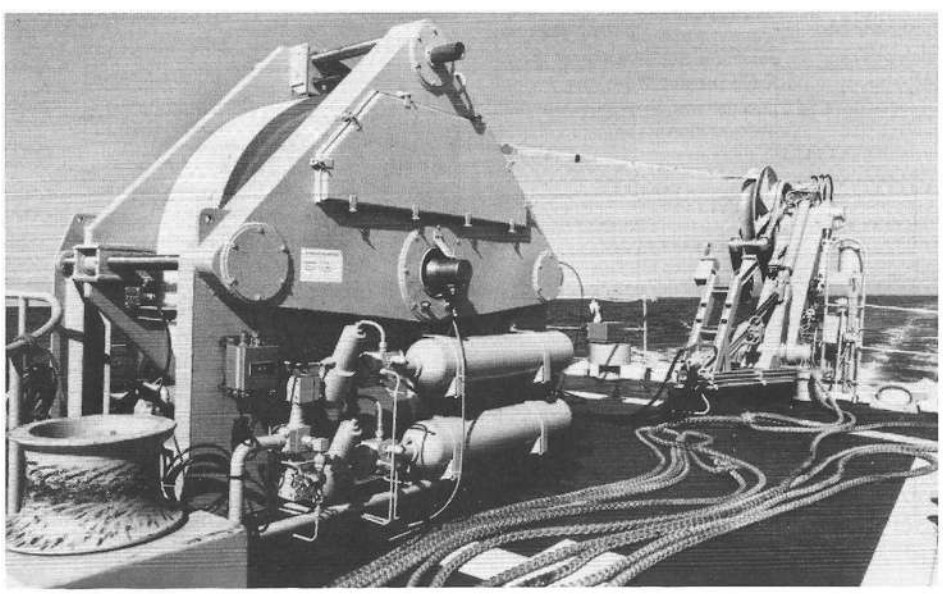
Transducer	Hull (LF)	VDS (MF)
Diameter (mm)	1060	200
Frequencies	3 in 5 kHz band	3 in 13 kHz band
Transmission level (dB)	Panoramic 223 Directional 232	212
Transmission modes	CW or FM	CW or FM

STATUS

The SS 24 LF is involved in a major refit programme relating to the French Navy DUBV-24C sonar (**1217.253** *1982-83* and earlier editions) associated with experience gained with the DUBV-43 (**1334.453**) and VDS.

CONTRACTOR

Thomson Sintra, Activités Sous-Marines, 23 rue de Courcelles, BP 096-8, 75362 Paris Cedex, France.



Three-colour operating console of SS 24 LF sonar

4094.453
SS 12 SMALL SHIP SONAR (HULL AND VDS)

The SS 12 is a panoramic sonar operating at medium frequencies and with preformed beams for fitting in small ships and medium tonnage vessels. It has also been developed in a version suitable for helicopter use (**4095.453**). The use of the same electronics on helicopters and aboard ships yields common training procedures and maintenance facilities.

For surface ships the SS 12 can be supplied as a hull-mounted sonar in either fixed dome or retractable dome configuration, and/or as a variable depth sonar (VDS). In the latter configuration the Mini-Ulis handling system developed and produced by La Société Nouvelle des Ateliers et Chantiers du Havre (ACH) is usually employed, and this has a deck weight of less than four tons. A dipping sonar version can also be provided; in this configuration the complete electronics are housed in a container fitted to the after-deck of the ship.

Sintra's considerable experience of shallow water sonars has been applied to enable optimisation of the SS 12 for small, noisy ships. Special display

Mini-Ulis system

provisions for the coherent signal processing of CW and FM data enables the operator to carry out panoramic search without the strain of conventional PPI presentation, and by preserving all modes the sonar realises the maximum figure of merit. Availability of all data permits rapid and reliable classification of targets.

CHARACTERISTICS

Frequencies: 3 in 13 kHz band

Operating modes: CW, rectangular or cos² pulse; FM, hyperbolic modulation

Transmission level: 212 dB (ref 1 pascal/yard)

Scales: 2, 4, 8, 16 km

Passive listening: Noise or pinger. Automatic tracking of two echoes and data transmission to the control system (DLA) of the weapon system.

Mini-Ulis

Mechanical System

Fish stabilisation: Servo-control system (fish amplitude about ±2 m)

Towing speed: 16 knots

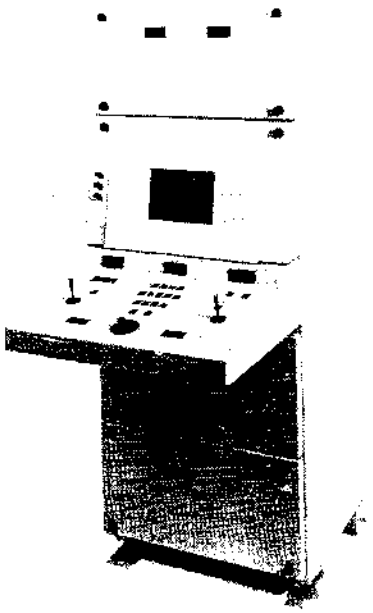
Max speed on brakes: 30 knots

Hoisting and lowering time: 6 minutes

Max cable speed: 3 m/s

Cable length: approx 200 m

Diameter: 14 mm



Breaking load: 7 tons

STATUS

In production.

CONTRACTOR

Thomson Sintra, Activités Sous-Marines, 23 rue de Courcelles, BP 096-8, 75362 Paris Cedex, France.

Operating console of SS 12 sonar

4095.453

HS 12 ACTIVE/PASSIVE HELICOPTER SONAR

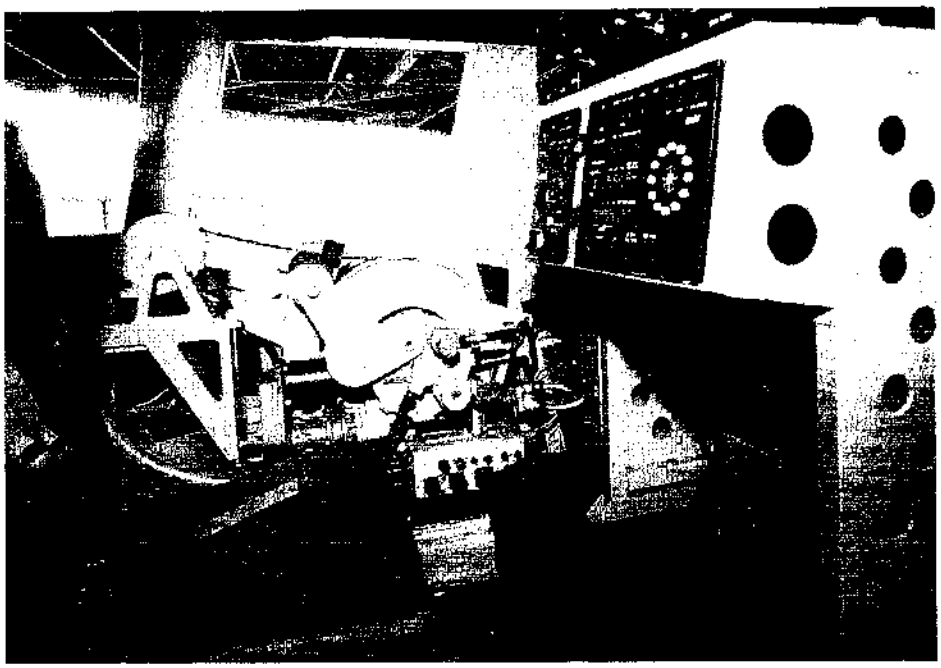
The HS 12 is an active/passive panoramic helicopter version of the SS 12 small ship sonar (**4094.453**) and uses the same electronics as the surface vessels version. It has similar capabilities for operation in shallow/noisy waters, and has a system weight of less than 240 kg, thus suiting it for installation on light naval helicopters such as the Lynx. The HS 12 transducer is raised and lowered by a hydraulic winch and this has a capacity for a 300 metre long cable; the winching cable speed is about five metres/second.

Operation in CW and FM modes is possible and digital signal processing is employed by the system's microprocessor. Automatic tracking of two targets and transmission of elements to an external equipment, such as a plotting table, are provided.

CHARACTERISTICS

Frequencies: 3 in 13 kHz band

Transmission level: 212 dB (ref 1 pascal/yard)



Passive search: Noise or pinger. Display of 12 preformed beams, each subject to adaptive signal processing. Other characteristics as for the SS 12.

STATUS

In series production. Three systems have been ordered by China for SA321J helicopters

CONTRACTOR

Thomson Sintra, Activités Sous-Marines, 23 rue de Courcelles, BP 096-8, 75362 Paris Cedex, France.

DSRX 61X EXPERIMENTAL TOWED LINEAR ARRAY SONAR

In May 1980 a simplified processing system was delivered to the French Navy for an experimental linear towed array sonar designated DSRX 61X. Following successful trials carried out on the research ship *L'Agenais* since January 1981, the Département de Détection Sous-Marine of Sintra-Alcatel obtained a contract from the French Navy to develop a new generation of passive sonars, reflecting a significant evolution in submarine warfare by surface ships and submarines.

CONTRACTOR

Thomson Sintra, Activités Sous-Marines, 23 rue de Courcelles, BP 096-8, 75362 Paris Cedex, France.

Experimental linear towed array sonar aboard trials ship L'Agenais

5634.293
THOMSON SINTRA ANCILLARY SONAR EQUIPMENT

For the majority of the Thomson Sintra sonar systems the following ancillary equipment is available:

Sonar Maintenance Simulators

These include a transmission dummy load as well as a simulation unit giving a number of synthetic echoes corresponding to the various sonar operational modes.

Training Simulator

The training simulator consists of a maintenance simulator and a second unit which controls the synthetic echoes. Each target can be modified in terms of course, speed and immersion, and eventual contact losses due to bathythermic conditions can also be simulated, based on conditions previously put into the memory of the simulator.

Sonar Target Transponders

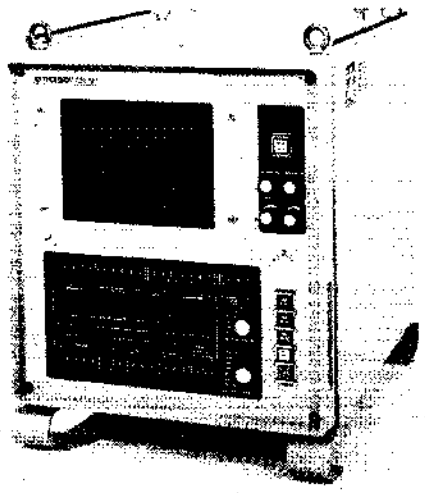
These sonar target transponders are for active sonars and simulate the reflection of a sonar wave on the submarine hull. Transmission and transducer immersion can be manually adjusted before target lowering. The target transponder pass band covers widely the various sonar transmission frequencies.

Calibration Equipment for Passive and Active Sonars - SEB

This equipment has three operational modes:

(1) Transmission mode in CW (from 1·8 to 12 kHz)
(2) Noise transmission mode; permanent or by pulses (from 1·2 to 12 kHz)
(3) Transponder mode; fixed or real.

The calibration equipment can be either towed up to 5 knots or dunked. The maximum depth for the system is 200 metres.



CONTRACTOR

Thomson Sintra, Activités Sous-Marines, 23 rue de Courcelles, BP 096-8, 75362 Paris Cedex, France.

3095.263
SOUND RAY TRACER (TSM 9310)

Derived from the earlier TSM 9300, this equipment uses both a DDA special-purpose processor for sound field computation and a mini-computer for improved data input facilities. Design is to French Navy specifications. The purpose of the equipment is to compute and display the sound rays transmitted or received by an acoustic source, according to a given sound velocity profile. The latter depends upon bathythermic conditions, and can be obtained directly with a sound velocimeter or derived from a bathythermograph profile. On a ship or aircraft, the equipment's ray diagram display shows the actual limitations of sonar equipment and enables ASW personnel to decide upon the best tactics in a given situation.

The TSM 9310 is a single unit on the front face of which are the 150 × 200 mm CRT display and all necessary input and operating controls. The high rate of calculation (1000 km/s) of the TSM 9310 permits real-time display of a large number of rays (over 20), which is essential for effective analysis of the ray diagram. Provision is made for use of a polaroid camera to provide a hard copy record of sound field displays.

Thomson Sintra TSM 9310 sound ray tracer

The displayed ray diagrams depend upon the data input and parameters:

(1) Source data: depth, vertical beamwidth, vertical inclination of beam axis
(2) Sound velocity profile: couples depth/sound velocity determining layers with a constant sound velocity gradient (maximum 12 layers), bottom depth
(3) Ray diagram parameters: scales, angle step between computed rays, number of bottom and surface bounces permitted, and possibly magnified zone range.

CHARACTERISTICS

Input data
Max source depth: 10 000 m
Vertical beamwidth: 0 - 180°
Beam elevation: -90 to +90°
Sound velocity profile
Bottom depth: 10 000 m max
Dimensions: 57 × 44 × 55 cm
Weight: 80 kg

STATUS

In operational service but no longer in production.

CONTRACTOR

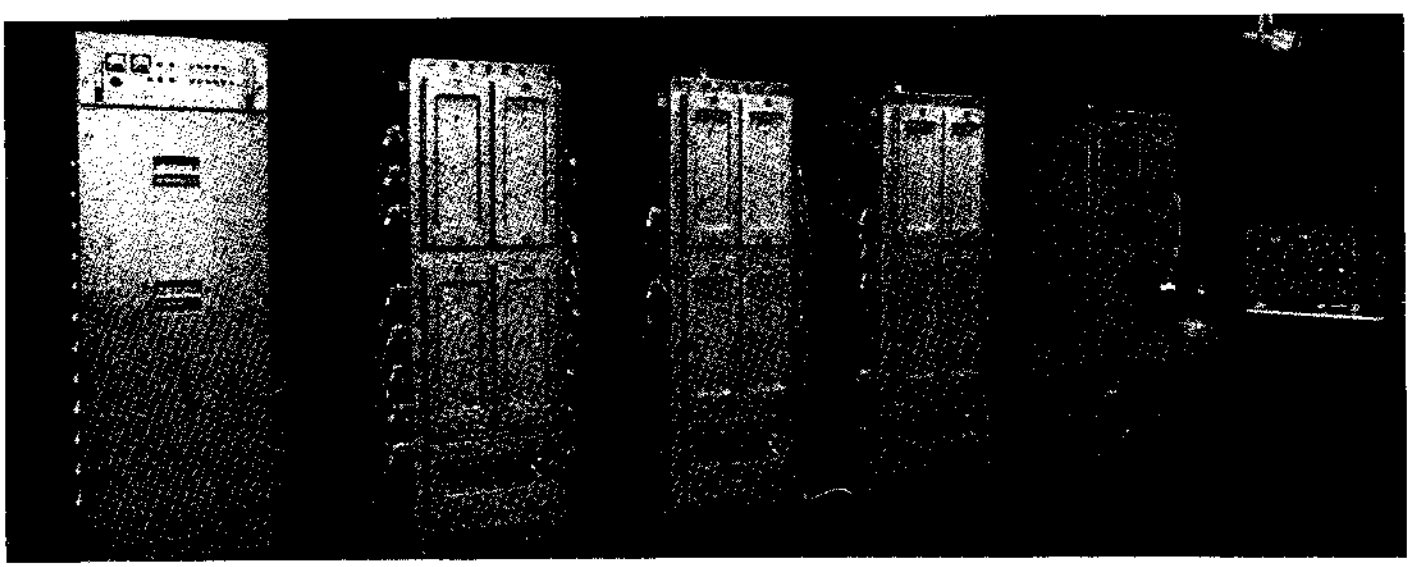
Thomson Sintra, Activités Sous-Marines, 23 rue de Courcelles, BP 096-8, 75362 Paris Cedex, France.

1724.253
DUBA 25 (TSM 2400) SONAR

The Tarpon TSM 2400 (service designation DUBA 25) is a powerful attack sonar fitted in the French 'Aviso' class ships and similar anti-submarine vessels. It is an active sonar with a panoramic transducer array and assembly with sonar dome supplied by the French Navy. Although the sonar is suitable for use as towed VDS equipment, in the DUBA 25 configuration it is hull-mounted, and provides 'Aviso' class ships with all-round surveillance, acquisition and attack facilities for ASW operations. The power employed is sufficient for operating ranges of several kilometres. The transducer array consists of 36 staves arranged to form a cylinder 110 cm in diameter and provided with roll stabilisation.

The electronics assemblies comprise a transmitter cabinet housing 12 identical units, each driving three groups of transmitter transducer elements. Thyratron modular transmitters are employed. An inverter provides the necessary DC electrical power for the transmitters from the ship's mains. Three receiver cabinets of identical dimensions contain:

(1) Received signal amplifiers and circuits for achieving the 36 preformed channels
(2) Data processing circuits for frequency changing, filtering, and rejection, AGC and detection-integration
(3) Interface units for connections to and from other ship's systems, and including the target data memory computer.



The display unit is equipped with all the controls and indicators needed for control of the sonar and its operational use. These include:

(1) Panoramic target acquisition scope
(2) Fine aiming scope
(3) Target doppler measuring CRT indicator
(4) Audio channel
(5) Digital readouts of target azimuth and range parameters
(6) Controls for target data memory circuits
(7) Transmission frequency and mode controls
(8) Reception mode controls.

A test box is provided which permits the injection of calibrated signals into the sonar to simulate an echo to enable circuit tests, performance measurements, or operator training to be undertaken. A target box enables the manual input to the computer of estimated target speed and course.

CHARACTERISTICS

Transmission: Panoramic, pure or modulated, on 3 frequencies
Time: 30 or 90 ms at normal or reduced power
Reception: Panoramic on 36 preformed channels, with or without rejection; one directional channel with magnifier doppler measurement and audio.

1725.253
DIODON SONAR

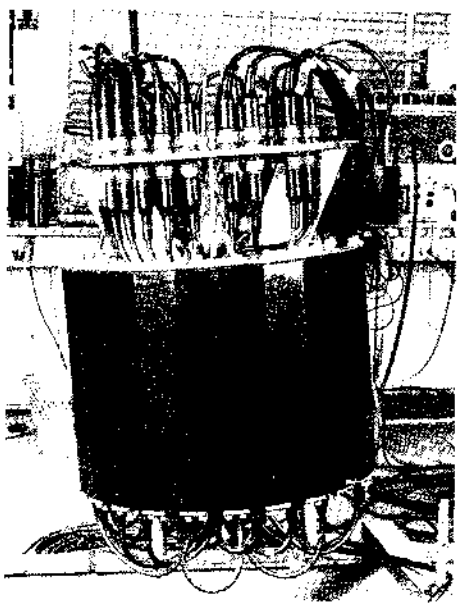
The Diodon sonar is an advanced equipment for fitting in ASW ships of small or medium tonnage. It is an active, all round system employing digital techniques and advanced signal processing facilities. It performs all round submarine detection, target tracking, and attack operations. It is supplied with automatic integrated test facilities and on-board training equipment. The acoustic transducer array for fitting on board smaller ships is provided with an active roll stabilisation system. It can be fitted within a fixed dome, retractable dome, or supplied as a variable depth (towed) sonar (VDS). Among the optional additional facilities that can be provided with the Diodon system are underwater telephone equipment, sound ray path indicator, shore training equipment, and maintenance equipment.

The transducer array is cylindrical in shape and consists of 24 identical and interchangeable vertical staves of transducer elements, each stave being capable of radiating 600 watts of acoustic power. The array is pivoted in roll, and active stabilisation is effected by means of an hydraulic actuating ram. The sensor is a pendulum-type device. Three (selectable) transmission frequencies are provided, 11, 12 and 13 kHz, and there are several modes of operation.

Transmission facilities include:

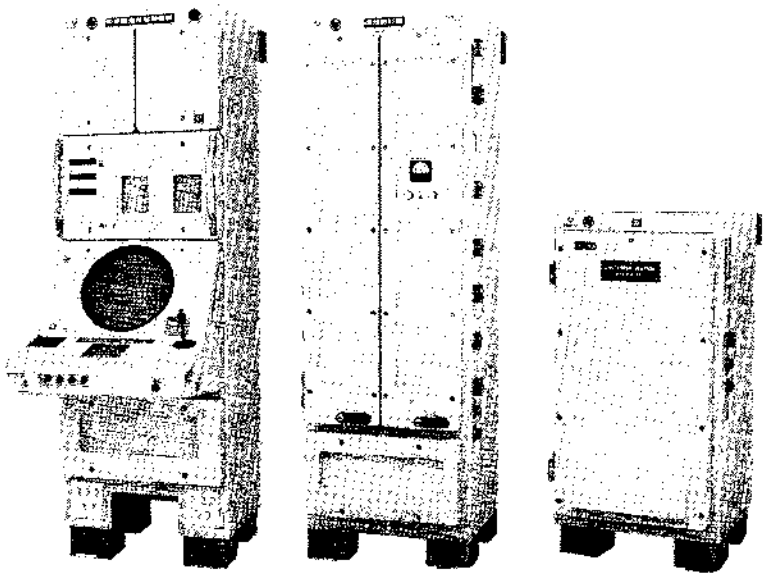
(1) Normal panoramic transmission
(2) Sector or panoramic transmission by the electronic scanning of directional beams (sector beamwidth and sector axis can be controlled throughout 360° in 15° increments)
(3) Normal or reduced power
(4) Pure or modulated frequency
(5) 20, 60 or 200 ms pulses.

The display unit provides the operator with all the necessary controls and indicators, such as:



(1) Panoramic CRT display for active or passive mode acquisition
(2) Target-axis error scope for fine aiming and tracking
(3) Doppler CRT indicator for measurement of target speed
(4) Digital read-out of target data
(5) Audio channel
(6) Controls for the active tracking circuits
(7) Transmission mode controls
(8) Remote control of transducer array assembly
(9) Integrated test system indicator
(10) Control of operational test.

Reception is achieved simultaneously on 24 preformed beams in either of two alternative modes:



(1) Standard filtering (with or without reception), detection and integration
(2) Coherent signal processing.

The sonar can be linked by either synchro or in digital form with other ship's systems, such as ship's log, gyro compass, plotting table, ASW fire control system, tactical displays, etc.

CHARACTERISTICS
Frequency: 11, 12 or 13 kHz, selectable
Beamwidth transmission (3 dB): 15° elevation, 15° azimuth
Panoramic reception: 24 preformed beams
Passive: In band 10 – 14 kHz
Active: Pure frequency with or without rejection (30 Hz). Modulated frequency with coherent signal processing. BT products – 50 on each beam
Range: Fine bearing and range on one target. Semi-automatic or automatic tracking on one target
Dimensions
Display: 180 × 60 × 50 cm, weight 450 kg
Transmitter: 180 × 60 × 50 cm, weight 600 kg
Power supply: 1100 × 60 × 50 cm, weight 500 kg
Transducer: Weight 580 kg
Hydraulic unit: 160 × 55 × 12[illegible] cm, weight 470 kg
STATUS
In production for at least six navies and operational aboard a number of ships

Diodon sonar transducer array

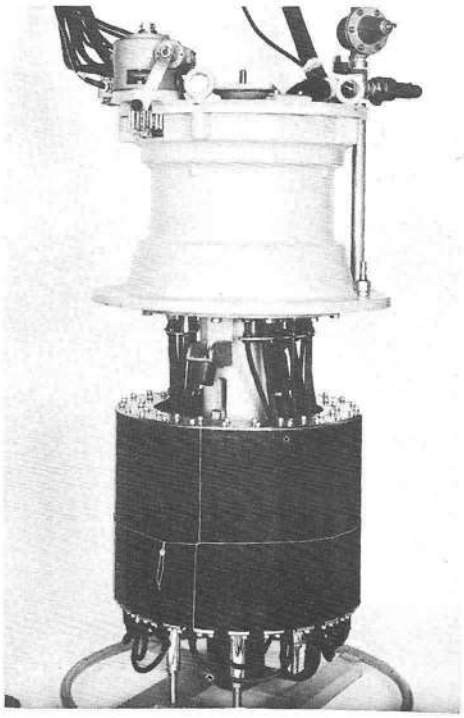
Diodon sonar system, showing (left to right) display console, receiver, and power supply

---

5646.253
TSM 2630 DIODON SONAR

The TSM 2630 Diodon sonar is a compact panoramic, active sonar for surface ships. The acoustic array may be either hull-mounted or towed (VDS).

The main features of the TSM 2630 are sophisticated signal processing, both in CW (optional FFT) and FM modes (pulse compression), for detection of slow and fast moving targets; comprehensive data processing with computer aided detection and tracking facilities; advanced multi-colour displays; integrated sound-ray tracing and prediction of detection range, and digital interfaces to international standards.



The basic version of the sonar includes:

(1) Hull-mounted acoustic assembly (dome and array)
(2) Matching unit
(3) Power supply cabinet
(4) Cabinet housing the transmitting, receiving and video processing circuits
(5) Display console incorporating two identical high-resolution multi-colour TV screens.

Optional equipment includes a panoramic passive capability, a video cassette recorder for play-back training and debriefing, and a torpedo or rocket launching control.

CHARACTERISTICS
Acoustic array: 24 staves; source level 230 dB/μPa/1 yard; weight 340 kg
Transmitter: Omni-directional transmission in CW or FM
Receiver: 48 preformed beams with true bearing stabilisation; conventional and coherent processing (BxT up to 300); directive and steerable audio
Video processing: Data processing in FM and CW (normalisation, interpolation, correlation, automatic tracking of up to 5 targets); conversational procedure for sonar operation; target analysis (apparent length and aspect angle, doppler measurement)

Display console: 2 identical flicker free, high resolution colour TV monitors
Weight: 1750 kg
STATUS
In production. Over 23 units of the Diodon family are in operation with various navies. Seven TSM 2633 Spherion systems have been ordered by the Royal Norwegian Navy and will be produced in collaboration with Simrad Subsea of Norway.
CONTRACTOR
Thomson Sintra, Activités Sous-Marines, 23 rue de Courcelles, BP 096-8, 75362 Paris Cedex, France.

TSM 2630 acoustic array

5648.253
TSM 2640 SALMON SONAR

The TSM 2640 is a compact, medium range, variable depth sonar system for anti-submarine warfare on board light surface patrol craft operating in shallow waters. It provides a high detection capability even against severe background noise and reverberation. The system provides sophisticated signal processing with pulse compression in FM and spectral analysis (FFT) in CW, comprehensive data processing and computer aided facilities, and advanced multi-colour display with high resolution TV monitor.

The basic version consists of an acoustic array of 24 staves in a streamlined fish, a towing winch, an operator console equipped with a multi-colour screen, and a receiver unit and a transmitter unit contained in small cabinets. Optional facilities include automatic extraction, passive listening, sound ray tracer, an additional colour TV screen, video tape recording system and an integrated on-board simulator.

CHARACTERISTICS
Acoustic array: 24 identical staves; source level 217 dB/μPa/1 yard; weight 120 kg
Transmitter: Omni-directional transmission in CW or FM
Receiver: 48 preformed beams in FM (24 in CW); conventional processing; filtering, detection, integration in FM, FFT in CW; coherent signal processing (pulse compression) with BxT up to 200; noise listening in active band
Video processing: Data processing in FM and CW (normalisation, interpolation, correlation, automatic target tracking of up to 3 tracks simultaneously); conversational procedure for sonar operation; target analysis (apparent length and aspect angle, doppler measurement)
Display: High resolution, flicker-free colour TV monitor
Total weight: 750 kg (additional 5 tonnes for winch)
STATUS
In production. Two TSM 2642 systems have been ordered by the Swedish Navy for installation on SPICA III Stockholm class surface attack ships and has been delivered.
CONTRACTOR
Thomson Sintra, Activités Sous-Marines, 23 rue de Courcelles, BP 096-8, 75362 Paris Cedex, France.

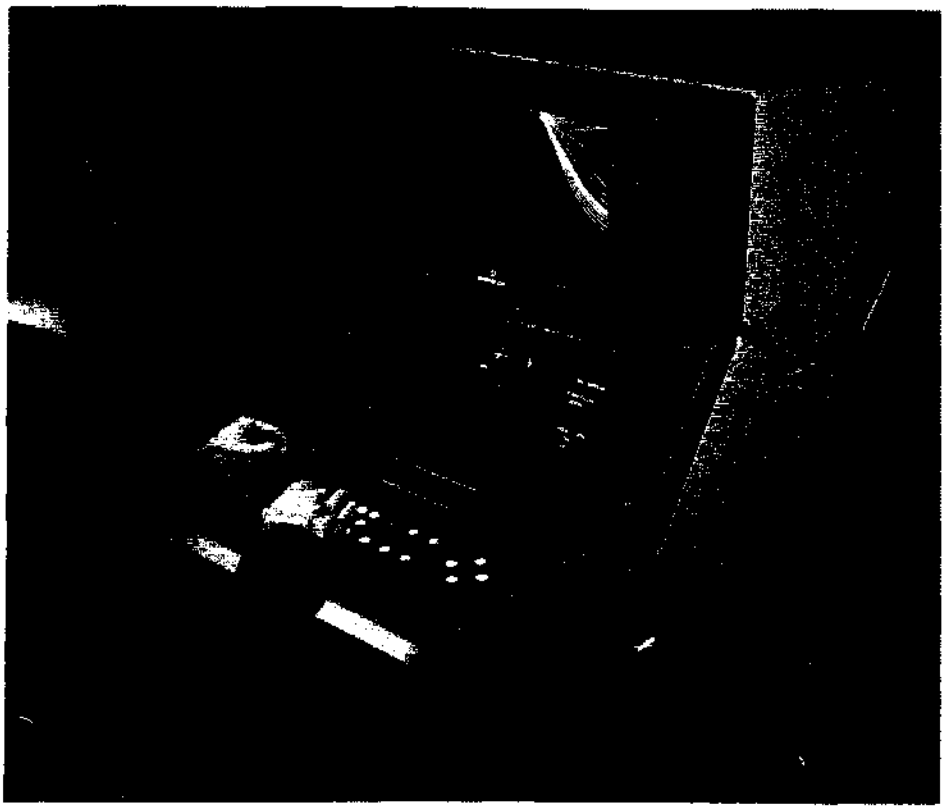
5649.253
TSM 2820 TARPON SONAR



The TSM 2820 is a long-detection range sonar for surface ships. It is a single operator, low-frequency hull-mounted system (HMS) which can be combined with a medium or a low frequency variable depth sonar (VDS). The HMS and VDS can operate simultaneously in alternate modes.

The main facilities of the TSM 2820 are:
(1) Combined HMS/VDS, medium/low frequency capabilities
(2) Sophisticated signal processing, with pulse compression in FM and spectral analysis (FFT) in CW. The TSM 2820 can operate alternatively in FM and CW for optional detection of slow and fast targets
(3) Comprehensive data processing and computer aided facilities with automatic track extraction
(4) Multi-colour display with high resolution TV monitors
(5) Integrated sound ray trace and prediction of detection range
(6) Digital interfaces to international standards.

The basic version of the hull-mounted Tarpon sonar consists of:
(1) Hull-mounted acoustic assembly (dome and acoustic array)
(2) Matching unit and power transformer unit
(3) Energy storage unit
(4) Transmitter unit, active receiver unit and video processing unit, all working in either HMS or VDS
(5) Display console with two identical multi-colour screens. Optional facilities include panoramic passive receiver for torpedo warning and short-range self protection; 1000 × 1000 colour TV display; and video cassette recorder for training or de-briefing.

CHARACTERISTICS
Acoustic array: 32 identical staves of transducers, high efficiency piezo-electric ceramics, source level 222 dB/μPa/1yard
Transmitter: Omni-directional transmission in CW or FM
Receiver: 32 preformed beams; simultaneous signal processing on all beams; spectral analysis (CW); 96 (FFT) doppler channels; pulse compression (FM) with BxT 80 - 240 according to range scale; directive and steerable audio

Video processing: Data processing in FM and CW (normalisation, interpolation, correlation, track extraction of up to 25 tracks simultaneously); conversational procedure for sonar operation; target analysis (apparent length and aspect angle, doppler measurement)
Display: 2 identical high resolution colour TV monitors
Weight: 6000 kg

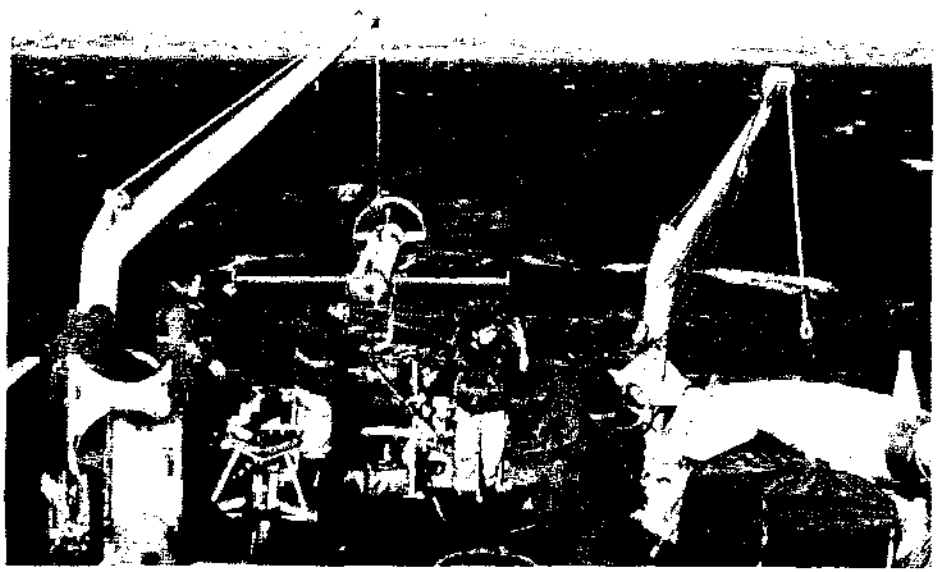
TSM 2820 Tarpon sonar console

1726.453
DUBM 41B SIDE-LOOKING SONAR

The Thomson Sintra TSM 2050 (service designation DUBM 41B) system is a high-resolution side-looking sonar system designed for the location and classification of objects, such as mines, lying on the sea bed. The system consists of three towed sonar vehicles, two consoles, and the necessary cables and shipboard hoists and handling gear. In normal operation two of the three sonar bodies are used, with the third kept as a ready spare. A permanent record of the sonar data gathered is made on a facsimile type recorder and a tape recorder. The information also is presented simultaneously on two CRT storage tubes, these console-mounted displays providing an image of the sea bed. The system is designed for use by low tonnage vessels, and in waters 100 m or deeper. The towed sonars operate at about 5·5 to 7·5 m above the sea bed at speeds of two to six knots. The tow cables are provided with deflector vanes which ensure that the sonar bodies are towed at a distance to left and right of the ship's track, and marker floats are provided to indicate the line of travel for each sonar.



The sonar body is a streamlined vehicle fitted with the side-looking sonars, plus additional sonar transducers for determining height above sea bed and for obstacle detection. Servo-controlled fins are provided for depth control and roll stabilisation is incorporated by means of a separate set of four fins. Dimensions of each sonar vehicle are: length 3·725 m, diameter 36 cm, in-air weight 340 kg. An acoustic pinger is installed as an aid to recovery should the sonar body break its tow. Manual controls are provided at the operating console to permit manual piloting, either to override automatic control or as a standby mode.

Each of the two sonar bodies operates on its own frequency, the two being separated by 50 kHz, with the area of sea bed between the two bodies being scanned by both sonars. A typical scanned area covered by the two bodies amounts to a total width of about 200 m, with maximum sonar range selected. There are two other range settings, 50 and 25 m. At the latter setting, resolution is stated to be better than 5 × 10 cm in the lateral (scan) direction and in the line of travel.

DEVELOPMENT
Development of the DUBM 41B was conducted in collaboration by the French Navy Mine Warfare DCN (GESMA) and Thomson Sintra.

STATUS
In service.

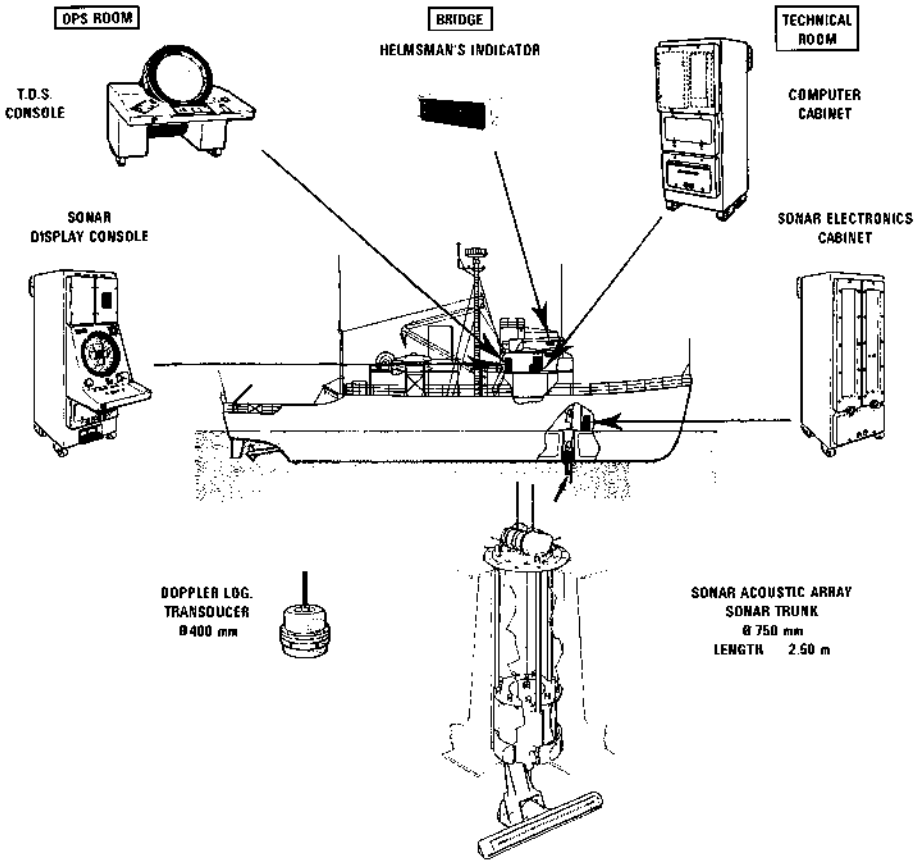
Thomson Sintra, Activités Sous-Marines, 23 rue de Courcelles, BP 096-8, 75362 Paris Cedex, France.

Towed sonar DUBM 41B on manoeuvres

4348.453
IBIS MINEHUNTING SONAR SYSTEMS



IBIS 3 and 5 are fully integrated minehunting systems using a high performance sonar and a tactical display system which integrates and displays all critical information.

The system consists of:
(1) A minehunting sonar, TSM 2021 (**1977.253**) or TSM 2022 (**4349.453**)
(2) A tactical display console, TSM 2060 NAVIPLOT
(3) A doppler sonar log, TSM 5730 or TSM 5722
(4) Navigations systems, autopilot, windspeed sensors, etc.

Mine detection and classification is the function of the sonar (TSM 2021 or TSM 2022). Detection is performed at distances up to 600 m (2000 m in the case of submarines). Classification is possible in two modes, echo mode and shadow mode, allowing identification of moored and bottom mines.

The action/information data display and storage is performed by the tactical display system which provides ship's track monitoring, location of contacts and records of operational data. Positions of classified mines, possible contacts and non-mine objects are recorded and displayed simultaneously.

STATUS
See under separate TSM 2021 and TSM 2022 entries.
CONTRACTOR
Thomson Sintra, Activités Sous-Marines, 23 rue de Courcelles, BP 096-8, 75362 Paris Cedex, France.

TSM 2021B MINEHUNTING SONAR

The Thomson Sintra TSM 2021B (service designation, DUBM 21B) is a modern minehunting sonar, the design of which applies experience with the DUBM 20A, also developed by Thomson Sintra (**1357.253** *1974-75* and earlier editions). It is a hull-mounted equipment intended for use in conjunction with precision navigation equipment and a mine countermeasure (destruction) system such as the PAP 104 (**1786.453**). A former version is the 2021A with different array housings and minor display variations. TSM 2021 functions are:

(1) The detection of mines at distances up to 600 metres
(2) The classification of such targets by the study of the shape of their echo and acoustic shadow, at distances up to 250 metres.

Each detection and classification sonar chain consists of an acoustic transmitter/receiver transducer; the associated transmission and reception electronics; and a display console. The STH sub-assembly performs the stabilisation, steering, and retraction of the detector and classifier arrays. This part of the system is the result of studies and development by ECAN at Ruelle.

TSM 2021B minehunting sonar, showing the main electronics cabinet flanked by the classification and detection display consoles (left and right), with the transducer arrays in the foreground

The electro-acoustic assembly (ELA) includes:
(1) The classification sonar transmitter/receiver chain cabinet
(2) A display console which controls the transmission and reception functions and has CRT presentation of mine detection and location by the detector sonar chain
(3) A display console with CRT displays for presentation of mine locations within the classification chain
(4) Bridge repeater display, showing range and bearing of designated targets.

CHARACTERISTICS
Coverage: ±175° in sectors of 30, 60 and 90° for the detector chain; 3, 5 or 10° for the classification chain
Elevation: Variable, between -5 and -40°
Stabilisation (roll): ±15°
Stabilisation (pitch): ±5°
Detection sonar
Frequency: 100 kHz (modulated ± 10 kHz)
Pulse duration: 0·2 or 0·5 m/s
Range scales: 400, 600 or 900 m
Max sound level: 120 dB
Channels: 20
Beam aperture: 1·5°
Display: PPI
Classification sonar
Range scales: 200 or 300 m
Max sound level: 122 dB
Channels: 80
Beam aperture: 0·17°
Display: CRT and storage magnifier tube

STATUS
The TSM 2021 is in service with the French and other navies. Altogether some 60 systems have been ordered.

CONTRACTOR
Thomson Sintra, Activités Sous-Marines, 23 rue de Courcelles, BP 096-8, 75362 Paris Cedex, France.

4349.453
TSM 2022 MINEHUNTING SONAR

The TSM 2022 is a modern lightweight minehunting sonar designed specifically for small and medium sized mine countermeasures vessels. The sonar can also be used for mine avoidance on minesweepers, or in civil applications such as bottom profiling and side-scan surveys.

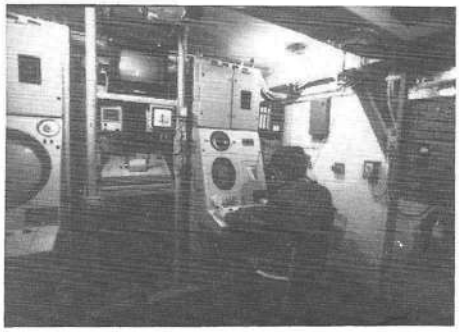
The TSM 2022 is based largely on experience gained with the DUBM 21B in the field of high resolution beam forming techniques. It is a hull mounted equipment intended also for use in conjunction with precision display and navigation equipment and a mine countermeasures system.

The main feature of the TSM 2022 is its small-size retractable single array assembly, used for both detection and classification, which enables easy installation and maintenance. The high resolution features of the DUBM 21 are maintained and improvements are mainly in the field of digital processing technology.

The main functions of the sonar are: detection and classification of moored and bottom mines, detection at distances up to 600 metres (2000 metres for submarines), classification of targets by analysis of the shape of their echo or shadow at distances up to 250 metres. In the classification mode, horizontal beamwidth is 7°, in detection mode either 14° or 28° beamwidth can be selected. In both modes the vertical beamwidth is 15°.

The main assemblies are:

(1) The hoisting and stabilisation system together with the retractable array, which is installed in the sonar trunk (0·75 metre diameter). The total weight is only 900 kg
(2) Electronics cabinet
(3) Operator's console.



The operator console provides display of sonar images in the various modes, memory and display of former sonar contacts, and includes interfaces with current mine disposal and navigation equipments.

STATUS

Twelve equipments have been ordered by three foreign navies, including the Swedish Navy which has six systems on order for new minehunting vessels. Initial deliveries were made at the end of 1983.

CONTRACTOR

Thomson Sintra, Activités Sous-Marines, 23 rue de Courcelles, BP 096-8, 75362 Paris Cedex, France.

Thomson Sintra minehunting sonar operation room

1389.353
DHAX-1 MAGNETIC ANOMALY DETECTOR

The type DHAX-1 MAD is designed for use in aircraft for the detection of submerged submarines by detection of the disturbance to the local natural magnetic field caused by their large ferrous bulk. The system comprises three units: a probe containing two caesium vapour paramagnetic resonance cells (this is usually tail-mounted on the aircraft, and weighs 15 kg), an electronics unit weighing 18 kg, and a control unit (3 kg).

The last of these units incorporates a manual test facility for checking correct operation and calibration of the system in flight. Data from the MAD are fed to the aircraft's ASW tactical data system. No performance details other than a sensitivity of less than one gamma, have been revealed.

STATUS

The DHAX-1 is fitted in French Atlantic ASW aircraft, and in those of a number of other nations. Production has now ended.

1390.353
DHAX-3 MAGNETIC ANOMALY DETECTOR

The DHAX-3 is an improved and more modern version of the DHAX-1 MAD equipment (**1389.353**), and primarily designed for deployment at the end of a cable from ASW helicopters. In place of the four-cell detector unit used in the DHAX-1, the DHAX-3 employs six caesium vapour paramagnetic cells, and is stated to have a very low susceptibility to rotational and heading effect.

Weights of the three units which comprise the equipment are: probe 6·2 kg, electronics unit 7·5 kg, and control unit 0·8 kg. These figures suggest that the use of solid-state electronics has permitted a system weight of less than half that of the DHAX-1 to be achieved. No performance details have been released.

STATUS

In service with French forces, but no longer in production.

5850.353
CROUZET MAGNETIC ANOMALY DETECTOR MARK 3

The Mark 3 magnetic anomaly detector (MAD) is a new development of the system currently in use on a variety of aircraft. The sensor is a measurement probe which can be used in both fixed and rotary wing aircraft, either with the probe located on-board or in a suspended carrier vehicle known as a 'bird'. The probe operates on the principle of nuclear magnetic resonance with electronic pumping which provides a number of advantages. It is lightweight, available for immediate use even at temperatures as low as -40° C, is maintenance free, has a virtually infinite life-time and a low electrical power consumption.

The associated computer unit performs as a high performance frequency meter for the probe signal measurement and provides compensation of magnetic disturbances associated with the platform, processing of signals to provide a target location aid and coupling of the MAD system to the aircraft weapon system. The measurement results are displayed on a graphic recorder.

STATUS

In flight testing.

TSM 8010 AND 8020 SONOBUOYS

Thomson-CSF and Sintra formed a joint venture between their respective underwater activities divisions in September 1984. The Thomson Sintra company designs and manufactures a number of sonobuoys. The TSM 8010 (DSTV-4M) A-size buoy has been in production for several years and large numbers have been delivered to several navies. It is a passive buoy operating in the bandwidth 10 Hz to 20 kHz with VHF transmission of information available on 31 channels spaced 375 kHz apart from 162·25 to 173·5 kHz. Power output supplied to the antenna is greater than 1 W. A more recent variant, the TSM 8010D, provides frequencies, selectable depths and life-times similar to the TSM 8020 below.

A more recent type to enter production is the A/3-size TSM 8020 (DSTV-7) which is a mini omni-directional passive buoy providing a number of additional facilities. These include the on-board selection of the VHF frequency channel from the 31 available before the buoy is dropped, choice of 31 channels from the 99 available between 136 and 173·5 MHz at 375 kHz spacing, a three position selector to give a choice of hydrophone depth immersion (20, 100 or 300 metres), and an increased maximum depth of 300 metres. Other improvements are reduction in overall weight and volume, and the use of a small balloon to act as a brake during the trajectory of the buoy in the air and then as a floater on the water surface. The TSM 8020 is intended to gradually replace the TSM 8010 buoy.

STATUS

In production. Development of other types of sonobuoys is continuing, including a size A DICASS active buoy.

CONTRACTOR

Thomson Sintra, Activités Sous-Marines, 23 rue de Courcelles, BP 096-8, 75362 Paris Cedex, France.

4802.393
ALKAN SONOBUOY LAUNCHERS

Alkan has recently designed a number of sonobuoy launchers for use in various fixed-wing aircraft and helicopters. They meet a range of operational requirements, such as in-flight reloadable, and release or ejection from a pressurised or unpressurised cabin. Various launcher sizes and capacities are available to allow for easy installation in the cabin or equipment bay.

Type 8030

This launcher has been designed specifically for the Breguet Atlantic Mk 1 and Atlantique aircraft which can house up to four launchers. The capacity of each launcher is 18 size A and 18 size F buoys.

Container-launcher

Each buoy is packed in a container-launcher, which provides for its storage and ejection and is equipped with a pressurised vessel at the top and a releasable cap at the bottom. The power for ejection is provided by compressed gas stored in the vessel at the top of the buoy.

STATUS

In series production.

CONTRACTOR

R Alkan & Cie, BP 23, Rue du 8 Mai 1945, 94460 Valenton, France.

DSQS 21 SERIES SONARS

The DSQS 21 series sonars are designed for operation in surface ships as part of an anti-submarine weapon system. For operations against submarines below the layer, the sonar can be supplemented with a towing system providing a variable depth sonar (VDS) capability.

Computer aided detection techniques are used for classification and tracking and the information is presented on colour CRT displays to permit doppler coding and the discrimination of data on the integrated displays. The 'Z' indicates variants equipped with electronic stabilisation to minimise the effects of ship's motion.

The VDS is designed to alternate with the hull mounted sonar, and the displays of the two sonars are integrated. Fitted with automatic depth control and heave compensation for stability of the 'fish', the VDS can be handled automatically or manually.

CHARACTERISTICS

Sonar		Diameter of Transducer Arrays		No of Pre-formed Beams		Class of Ship

4229.453

KRUPP ATLAS-ELEKTRONIK SUBMARINE SONARS

Krupp Atlas-Elektronik has developed a range of submarine sonar equipment. Little information has been disclosed but it is possible to give brief summaries of some of the systems.

CSU 3 Sonar

The CSU 3 is a conventional submarine sonar designed for a single operator. It is a fast-scanning medium range active sonar which can be used as a long range passive device, an intercept sonar and as an underwater telephone. In its active mode, the sonar operates using a single beam. The equipment has a cylindrical transducer array with electronic beam steering. The display is a magnified PPI presenting a 20° sector with continuous memory-refreshed display of target echoes. Target information is transferred digitally to the fire control equipment. In the passive mode, the sonar has 360° azimuth coverage with automatic tracking of up to four targets simultaneously. The target information is presented on a CRT display in true or ship's relative bearing and target elevation angle can be determined for estimation of distance and optimum sound raypath. The sonar is equipped with automatic interference suppression against acoustic countermeasures.

PSU 1-2 Sonar

The PSU 1-2 is a passive sonar for use in small conventional submarines. The equipment has the capability for detection, classification, and bearing determination of noise radiating targets with simultaneous azimuth coverage over 360°. It can be used also to receive underwater telephone signals. The target noise information received by the cylindrical hydrophone array (CHA) is processed into 32 pre-formed beams and presented on a CRT display in true or ship's relative bearing. Four targets can be automatically tracked using the ATT equipment and the respective target bearing is transferred to the weapon control systems.

PRS-3 Passive Ranging Sonar

The PRS-3 is a passive submarine sonar designed to be operated in conjunction with the CSU-3. It has two principal operating modes. In the normal mode, the sonar can detect target noise and determine bearing and distance as well as computation of course and speed for a maximum of four targets. A level of confidence in the range measurement is indicated by the equipment. In the automatic mode, the target information is tracked automatically using the ATT channels of the CSU-3 sonar.

OSID Sonar System

OSID is an integrated sonar system developed for use in small submarines. It comprises a passive sonar, data distribution with a tactical display and a torpedo guidance system. The sonar has a broad-band channel for bearing determination and classification, and utilises minimum correlation techniques for the location of weak targets. It features a 360° panoramic presentation of targets on a CRT display, according to azimuth. The processing computer calculates the position and vectors of the target, own submarine, and the torpedo and the information is presented on a tactical display. The torpedo control is a replaceable module designed for each type of torpedo.

SIP 3 Sonar Signal Processor

The SIP 3 is a sonar information processor developed for use with fast-scanning multi-target tracking sonars of the CSU series. The prime function of the equipment is to provide passive classification of targets using low frequency detection and analysis, spectrum survey and comparison, high target resolution and demon analysis. Doppler analysis of target echoes received by the active sonar of the own submarine is used to determine the target's speed. Sound raypath analysis produces an estimate of the conditions for sound propagation. The system has the capability to determine and present specific sonar signal characteristics, comparing them to sound signatures of selected targets held in a data bank.

CSU 83 Submarine Sonar System

The CSU 83 is an active/passive submarine sonar system tailored for use in vessels from 400 tons upwards. The system consists of a fully equipped panoramic sonar, a trainable active sector limited to about 30°, an intercept sonar and an underwater telephone. It is equipped with a CHA and is normally used in conjunction with the SIP 3 sonar signal processor for tracking, analysis and classification. In its active mode the CSU 83 is able to detect targets by measurement of bearing, range, target doppler and echo amplitude. After classification, the information is transferred to the vessel's command system. In the passive mode, the equipment tracks the targets automatically and measures bearing and strength of target noise. Determination of target parameters such as range, course and speed is based on passive target bearing analysis.

In the intercept mode detection, measurement and analysis of other ships' sonar provides bearing, amplitude, frequency, pulse spectra and modulation type, pulse length and PRF. When used as an underwater telephone, the CSU 83 provides intercommunication with other ships and monitoring of foreign underwater transmissions.

CONTRACTOR

Fried Krupp GmbH, Krupp Atlas-Elektronik Bremen, Sebaldsbrücker Heerstr 235, POB 448545, D 2800 Bremen 44, Federal Republic of Germany.

4230.453

KRUPP ATLAS-ELEKTRONIK/MCM SYSTEMS

Krupp Atlas-Elektronik has developed equipment for use in mine countermeasures (MCM). Few details are available but the following are brief summaries of the equipment.

DSQS-IIA Sonar

The DSQS-IIA is a mine avoidance sonar designed for the location of underwater objects, in particular moored mines. It can be used as a navigational aid in mined areas, for surface ships and submarines. When an object is located, the distance, bearing and depth are presented to the operator on a PPI display, with the bearing referenced to the ship, North, or shown in a true motion mode.

DSQS-IIH Sonar

The DSQS-IIH is a mine countermeasures sonar suitable for the detection and classification of surface, moored and ground mines. The equipment features independent operation of detection and classification modes through 360° of azimuth, with simultaneous azimuth coverage of 90° in the detection mode. Target images are stored in the system to facilitate recognition. Electronic beam stabilisation is fitted for both modes and the sonar can be operated at speeds up to ten knots with minimal degradation of performance.

MWS 80 Mine Countermeasures

MWS 80 is a fully integrated mine countermeasures weapons system developed for the operations rooms of MCM vessels. It comprises the DSQS-IIH sonar; the command and navigation equipment (NCE) for navigation, co-ordination of the MCM operation, and recording and plotting of the surveyed area; and a remote-controlled mine disposal vehicle which is used for the identification and destruction of mines. The MWS 80 is manned by two operators.

AIS 11 Identification Sonar

The AIS 11 is an active identification sonar intended for use in submersibles. Although the equipment can be used for a variety of underwater tasks, its primary role is that of mine countermeasures, for which purpose it is normally fitted to the PAP 104 mine disposal system (**1786.453**).

The underwater part of the AIS 11 consists of an electronics unit and a transducer unit, the latter being fitted in the hull of the submersible. The parent surface ship is equipped with an evaluation unit, a control panel and a display. Weight of the overall system is 160 kg, that of the underwater part being about 20 kg. Data transfer between the underwater part and the surface vessel takes place along a cable. During operation, a 60° conical beam is transmitted ahead of the vehicle and the acoustic signals reflected by an object are received by a linear antenna. These signals are then processed in real-time, by both analogue and digital methods, and transmitted to the surface vessel where the information is shown on a PPI display in a sector-shaped format with correct angular representation. Fast real-time signal processing enables the underwater scene to be displayed at the frame repetition rate of a normal cine film.

INTERNATIONAL

5865.353
HELRAS AIRBORNE SONAR

Bendix Oceanics and British Aerospace Dynamics are collaborating on the development of a helicopter long range dunking sonar known as Helras. The new sonar, which uses a large low frequency volumetric array, will be based largely on Bendix experience with dunking sonars of which large numbers are in operational service with the US defence forces. No details of the array have been made available other than it will fold into a compact body when stored.

STATUS

In early development. The system is scheduled to be in production by 1989 and is expected to be offered for the EH101 helicopter of the Royal Navy. Under the terms of an agreement, British Aerospace will undertake a substantial portion of production and be responsible for marketing in the UK and a number of other countries. B.Ae's Bracknell Division has undertaken considerable research in the past in this type of sonar development. Experimental models of Helras have already undergone sea trials.

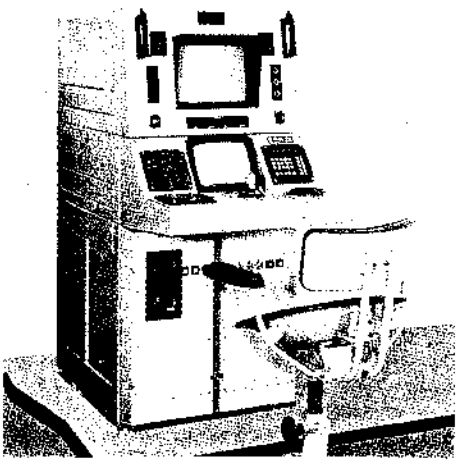
3233.453
IPD70/S INTEGRATED SONAR

The IPD70/S sonar is an improved version of the IPD70 currently installed on the 'Sauro' class submarines and, like the former equipment, it is the result of co-operation between USEA and ELSAG.

The main components of the system are a passive sonar and an active sonar, with three optional equipments: a high precision intercepting equipment, a long-range directional and omni-directional underwater telephone and a spectral analysis sub-system. An additional option, the MD100 passive rangefinder, is also available. This latter option can, however, stand alone and is therefore described in entry **3773.453**.

The IPD70/S uses three transducer arrays to serve the various functions:

(1) a passive low-frequency conformal array disposed along the hull and working from a few hundred Hz up to several kHz
(2) a cylindrical array, common to the active sensor, the high-frequency passive component, the interceptor and the underwater telephone. This transducer is housed in a suitable hull cavity and protected by a high-resistance low flow-noise GRP dome
(3) an optional linear array for the passive rangefinder set.



The equipment can track up to four targets. In the passive operation mode, very long detection ranges can be achieved with the high-directivity characteristics of the conformal array and the signal processing techniques employed. In the active mode bearing, range and doppler data are obtained from a single sonar pulse to minimise the probability of interception by the target. The intercept facilities provide measurement of bearing, pulse length and frequency by enemy sonars within several tens of kilometres.

Long range communication capabilities are given by the underwater telephone which can be operated on either an omni-directional or directional basis. The narrow band spectral analysis sub-system enables the operator to classify a target based on its radiated noise distribution.

The most important change from the earlier IPD70 equipment is the display and control console which has been completely redesigned. The operator's panel now features two high-resolution raster screens on which all relevant data collected and processed by the system can be displayed in an easy-to-read, graphic and alpha-numeric format. The operator controls have been simplified.

DEVELOPMENT

The equipment has been developed directly from the IPD sonar system, the design of which began in the early 1970s following some years of research in the field of electro-acoustic submarine technology.

Control console for IPD 70 integrated sonar

STATUS

The first IPD70/S equipments were installed on the 'Sauro III' series submarines in 1983.

CONTRACTOR

SELENIA-ELSAG Consortium for Naval Systems, Via Panama 52, 00198 Rome, Italy.

3773.453
MD100/S PASSIVE RANGEFINDER SET

The MD100/S is an upgraded version of the MD100 and is the result of co-operation between the companies USEA and ELSAG. The system has been designed for installation on small or medium size submarines and can be supplied either as a stand-alone device or as an optional component of the integrated sonar set IPD70/S (**3233.453**). In the latter case, all necessary space allocation, as well as command and display facilities, are shared on a common basis with the host system.

Though the system has been redesigned, many of the technical solutions employed in the earlier MD100 have been retained. Like its predecessor, the MD100/S is equipped with an independent set of acoustic sensors arranged as two linear arrays, each composed of three equally spaced transducers and steered towards the port and starboard sectors.

The signals collected by the transducers, after initial processing, are fed to the main unit for all the relevant stages of signal processing. Handling of signals entails the evaluation of correlation and coherence relationships existing among the various couples of waveforms involved, so as to obtain bearing and distance estimates of a noise source with high accuracy within the sector coverage of ±60° athwartships.

The MD100/S features simultaneous tracking in bearing and range of up to four targets; bearing initiation data can be either collected by the equipment itself or from a surveillance sonar.

The display unit, both in the stand-alone and in the integrated version, is based on a high-resolution raster-scan type screen, which allows constant monitoring of trajectories and all relevant data (both in graphic and alpha-numeric form) pertaining to the targets being tracked. In addition, continuous indication is given of special parameters, eg reliability coefficients of processed data, tracking losses, etc, which could be valuable in deciding the operator's course of action.

STATUS

The integrated version has been installed in the 'Sauro III' submarines.

SELENIA-ELSAG Consortium for Naval Systems, Via Panama 52, 00198 Rome, Italy.

5754.293
MULTI-APPLICATION SONAR SYSTEM (MAST)

A trainer for sonar operators, known as MAST, has been developed by ELSAG, in co-operation with Raytheon, USA, and delivered to the Italian Navy's training centre. The MAST system consists of the following units:

(1) Trainee equipment consisting of a set of units identical to those used on board
(2) An instructor control station
(3) A computer system
(4) Simulation hardware producing signals relevant to 'own ship's signals' and those of simulated craft. These include all possible variations due to motion, mutual interference, propagation and environmental conditions simulated.

The MAST system is used for the training of operators and maintenance personnel on the DE 1160 and DE 1164 sonar systems. Further improvements will allow training facilities for other passive sonar systems produced by ELSAG and also for the DE 1167 being manufactured under licence from Raytheon.

STATUS

In production.

SELENIA-ELSAG Consortium for Naval Systems, Via Panama 52, 00198 Rome, Italy.

1723.453
SERVOMECCANISMI SONOBUOY EQUIPMENT

The Servomeccanismi organisation produces three types of passive sonobuoy:

BIT-3: This is an A-size omni-directional passive sonobuoy for use at depths between 20 and 100 m, with a selectable life of one to three hours, and transmitting data over a 31-channel, IW link.

BIT-8: This is similar to the BIT-3 but has different frequency/sensitivity characteristics.

BIR: This is a miniature (500 mm long × 100 mm diameter, three kg) sonobuoy for use with helicopters. It is omni-directional and can be deployed at depths to 20 m. Life is one hour.

Receivers for use with these sonobuoys are the REA-16 and REA-31, having 16 and 31 reception channels, respectively.

CONTRACTOR

Servomeccanismi, Via Mediana Km 29.3, 00040 Pomezia, Italy.

3234.453

FIAR MINE DETECTION AND CLASSIFICATION SONAR

The FIAR AN/SQQ-14 is an improved version of the original General Electric AN/SQQ 14 minehunting sonar and is produced under licence from that company.

The equipment is a dual frequency system having two modes of operation, search mode to detect probable targets up to 900 yards and a classify mode so that a trained operator, who can discriminate between mines and mine-like objects, can classify these after detection. The equipment provides range and bearing information which, related to the wide scanned field of view and narrow resolution in both range and bearing, are used to observe and direct a manned or unmanned neutralisation vehicle to mark or destroy the target.

The FIAR AN/SQQ-14 is operational either as a hull-mounted or variable depth sonar. The variable depth feature provides for lowering the towed body, including the transducers, to a maximum depth of 150 feet (46 metres). This gives increased depth for minehunting, optimum positioning of transducers in adverse water conditions and favourable acquisition angles. In the variable depth mode the system can function effectively in sea state 5 when the towed body is towered beneath the ocean surface effects.

In search mode the equipment uses a PPI display and electronically scans a 90° azimuth sector with a narrow beam (1·5 to 2°). In addition, the field may be automatically slewed through 180°, centred as selected on the bow, port bow or starboard bow, at a continuous rate of 15°/second at manually selected ranges of 300, 600 and 900 yards. An azimuth resolution of 1·5° and range resolution of 2·4 feet (0·7 metres) is obtained.

In classify mode the equipment uses a B-scope display associated with a memory display and electronically scans an azimuth sector of 18° with a 0·3° beam. An azimuth resolution of 0·3° and range resolution of approximately seven centimetres is obtained.

Additional details of the AN/SQQ-14 appear in entry **1789.453** in the USA pages of this section.

STATUS

The AN/SQQ-14 is used by the US, Belgian and Spanish navies aboard 'MSO' class minesweepers; the Italian and Saudi Arabian navies have installed it on 'MSC' class ships.

CONTRACTOR

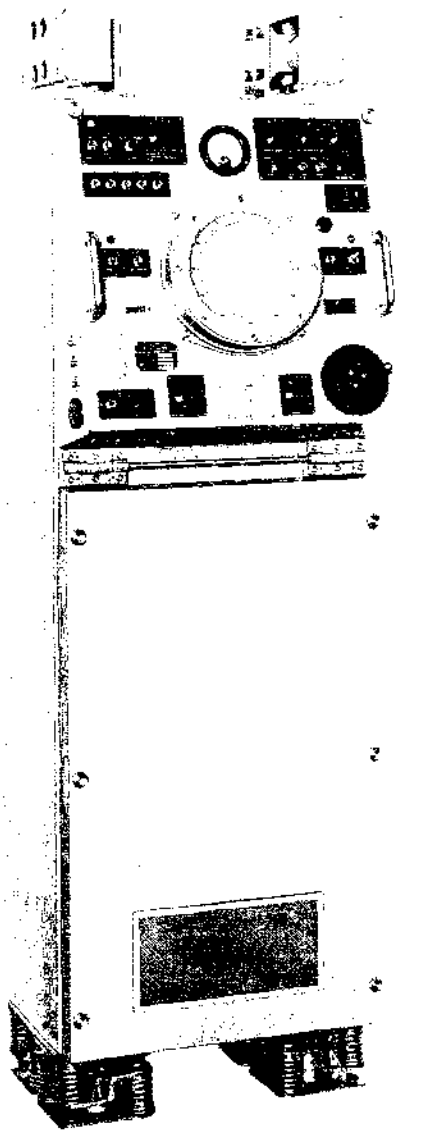
FIAR-Fabbrica Italiana Apparecchiature Radioelettriche SpA, Via Montefeltro 8, 20156 Milan, Italy.

1720.453

IP64-MD64 SONARS

The USEA IP64 sonar set is designed for installation aboard small or medium-size submarines, and it combines passive sonar equipment operating in the band 175 to 5000 Hz, and an active echo-ranging sonar operating at a frequency of 4000 Hz. It is also designed for integration with the MD64 sonar set for range measurement of noise sources by passive means. The receiving transducer elements, which are common to the passive and active mode, are arranged in the bow of the vessel in a long conformal array to enhance the directional capabilities. The transmitting transducer elements are arranged in a circular array located on deck.

Two linear arrays are provided for range measurement by passive means. Each array has a total length of 30 m and is formed by three transducers. The arrays are located on deck, port and starboard.



Search and detection are carried out primarily by means of the passive listening set, which incorporates advanced correlation techniques and records the received signals on a graph plotter. After target detection, a single transmission pulse in the direction of the target by the echo-ranging sonar is sufficient to provide range and relative speed target data.

The MD64 equipment measures the range of a detected noise source and direction is determined by the measurement of the relative time delay of sound waves detected by three hydrophones. Two groups of three hydrophones each are provided, for port and starboard measurements. Each hydrophone uses a number of elements arranged in five vertical staves and phased in the horizontal plane to produce a reception beam, directed toward the source. Main lobe beamwidth is ±15°.

The audio frequency band employed is 1000 Hz wide, centred on any frequency between 4 and 20 kHz. Operation is automatic and after acquisition of the noise source, the equipment locks on and continuous bearing data is produced. Range is measured continuously and is recorded graphically.

CONTRACTOR

USEA, Via G Matteotti 63, 19030 Pugnola di Lerici, La Spezia, Italy.

IP64-MD64 sonar display console

3235.453

SELENIA SONAR ACTIVITIES

Few details have been revealed of the sonar and underwater systems activities of the Selenia-Elsag Consortium for Naval Systems which was set up in 1983 by merging the Naval Systems Divisions of the two companies. The following paragraphs record briefly a summary of some of the most significant of the known programmes.

MLS-1A

This sonar was the company's first major underwater product, having been developed at the Fusaro laboratories, and production continued from 1956 to 1959. More than 30 equipments were made for supply to several navies. Licence production of the DE102 echo sounder sonar followed.

Mk 44 Torpedo

Between 1962 and 1966, more than 400 acoustic homing heads for the Mk 44 torpedo were produced under a joint programme carried out by the Italian Navy and Whitehead-Moto Fides.

CIACIO

In 1964, design work was started on the CIACIO system. This is a self-homing system for torpedoes to be fitted on lightweight and wire-guided torpedoes for both anti-submarine and surface target operations. Design features include good counter-countermeasures performance, and reliability in shallow water and anomalous propagation conditions. There are provisions for presettable or programmed combinations of signal processing, optical filtering and tactical manoeuvring, to match the operating performance to the current tactical situation automatically. It is possible to insert a wide range of search, attack and re-attack torpedo tracks into the programmer to suit any operational circumstances.

The system uses active and passive homing modes to approach its target, and torpedoes equipped with CIACIO are able to deal with current conventional and nuclear-powered submarines.

Dynamic sea trials were carried out using Mk 44 torpedoes equipped with the CIACIO system, although it is suitable for fitting on all types of 12·75 inch (388 mm) torpedoes. A lightweight CIACIO is being mass produced for fitting in A244 torpedoes manufactured by Whitehead-Moto Fides of Livorno.

Production of several hundred sets is in progress.

SFM-A

Between 1968 and 1970 the SFM-A underwater target identification system equipment was produced for the Italian Navy. The system is an active sonar for the detection and classification of underwater targets, and digital processing involving the use of cross-correlation techniques is employed.

FALCO and GIARDA

These form a system for the detection and localisation of submarines by submarines, helicopters and ASW aircraft. Production began in 1972.

P MICCA

Work on this integrated system for remote control of deep sea mines by means of secure acoustic and radio links began in 1976.

CONTRACTOR

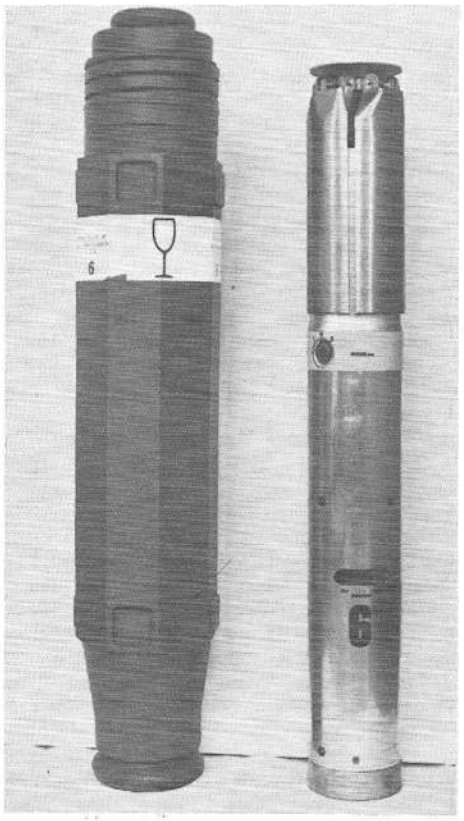
SELENIA-ELSAG Consortium for Naval Systems, Via Panama 52, 00198 Rome, Italy.

1722.353

FALCO SUBMARINE LOCATING SYSTEM

The FALCO system is airborne equipment designed to increase the capability for helicopters and fixed-wing aircraft to detect, classify, and locate submarines. The system operates on the low-frequency noise radiated by targets and gathered by directional low frequency passive sonobuoys.

Noise spectral analysis, target data processing and display are performed by a real-time digital computer. It is claimed that the FALCO system is able to determine target position with an accuracy sufficient to carry out an attack with automatic homing torpedoes, and with errors due to sonobuoys drifting automatically cancelled out. The equipment is produced in several versions.



CONTRACTOR

Selenia Industrie Elettroniche Associate SpA, Via Tiburtina Km 12400, 00131 Rome, Italy.

4007.453
MISAR MSR-810 SONOBUOY

The MSR-810 passive sonobuoy for detecting and locating submarines from aircraft is manufactured by MISAR under Thomson Sintra licence for the Italian market. It is very similar to the Thomson Sintra DSTV-4L (**3501.453**). The sonobuoy transmits, by VHF/FM radio, the underwater acoustic AF signals received from the hydrophone. The MSR-810 complies with NATO and Italian Navy specifications.

CHARACTERISTICS
Type: Passive
Frequency: Low
Weight: 8 kg
Operating life: 1·3 or 8 h
RF channels: 31
RF output: 500 mW (at antenna)
Antenna: ¼ wave
STATUS
Production and in service.
CONTRACTOR
MISAR SpA, Via Brescia 39, 25014 Castenedolo (Brescia), Italy.

MSR-810 passive sonobuoy and transit case

5653.263
ELT/810 SONAR PREDICTION SYSTEM

The ELT/810 is designed to supply accurate prediction of both active and passive sonar range and propagation characteristics in various environmental conditions. Inputs of depth, temperature, salinity, sea state, sonar parameters, target characteristics and other information is obtained from various sensors and inserted into the system by means of a keyboard. The data is processed by the system computer and displayed on the CRT. Basic information, in real-time, is depth/temperature and depth/velocity curves, acoustic ray propagation diagrams, sonar detection range prediction.

The system can be used in surface ships, submarines or ASW aircraft. In the surface ship role, the ELT/810 supplies data which allows the maximum exploitation of the sonar's duct propagation characteristics, the establishment of optimum VDS depth and the efficient deployment of an ASW screen. For submarines the system will enable the commander to establish the best attack and/or evasion paths and depths without using his own active sonar. In an ASW helicopter, the system will work in conjunction with the aircraft dipping sonar.
STATUS
In production and in operational service.
CONTRACTOR
Elettronica SpA, Via Tiburtina Km 13700, Rome, Italy.

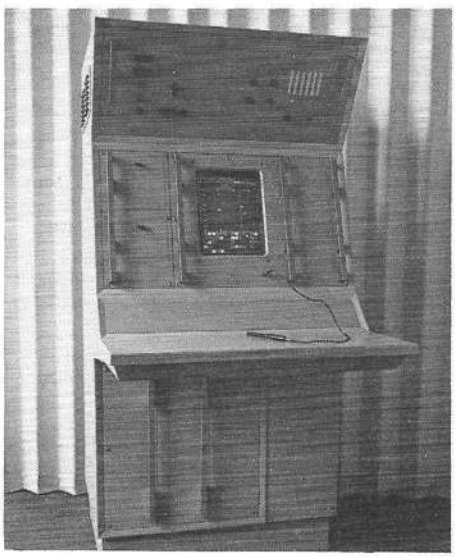
HSS-15 COMPACT SURVEILLANCE SONAR

The HSS-15 is a compact panoramic sonar system for use on fairly small ships in the range of 100 to 800 tons. It fills the gap between commercial fishing sonars and more advanced professional sonar systems and is most useful in ships which need a limited anti-submarine capability, such as small patrol boats on coastal defence work and corvettes or coastguard ships which hitherto could not be fitted with sonar because of size, weight, and cost.



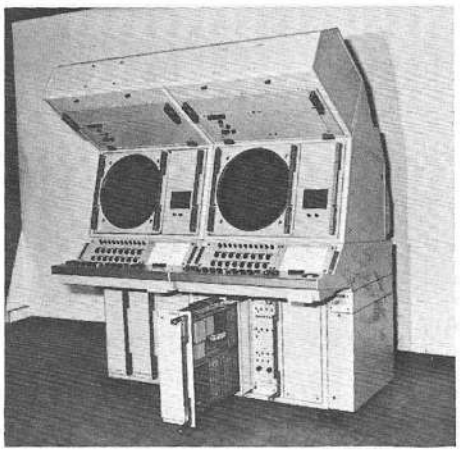
The HSS-15 operates in the 9·3 to 11·7 kHz range with a detection range of four to six km. The design is based on the assumption that the ship in which it is installed will produce fairly high noise levels. The system's main features are: multi-beam panoramic surveillance; relatively low operating frequencies to avoid high transmission loss; three different pulse lengths (25, 50 and 100 ms); three operating frequencies; active or passive operation; ease of operation with light pen control; and small transducer and cabinet dimensions. The overall system weight is about 600 kg.
CONTRACTOR
Hollandse Signaalapparaten BV, PO Box 42, 7550 GD Hengelo, Netherlands.

3142.253
PHS-32 SONAR

The PHS-32 is a medium-range high performance search and attack sonar in which the newest technological developments for signal processing and operation are employed, and helped by the use of a general purpose computer. The computer yields a compact, lightweight sonar for corvettes from 500 tons up to frigate-size ships.

The signal processing facilities provided include Fast Fourier Transformation processing of all preformed beam receiving channels. All data is presented on a single TV-type display, while operation has been much simplified by the use of light pen control. These features combined with a high accuracy make this sonar very useful in an attack.

A circular transducer permits all round coverage in various modes of transmission such as: OMNI, TRDT, MCC (wide vertical beam), LISTEN (passive with time/bearing recorder presentation). An audio beam is also available. The system can be delivered in a fixed, retractable or VDS-dome outfit.
CHARACTERISTICS
Features: single operator control; display data processing for continuous presentation and memory mode (ping history); four-target automatic tracking; built-in energy storage for lower peak power demands on ships mains; integrated on-line and off-line test system.
Frequencies: 3
Pulse lengths: 12·5, 25, 50, 100 m/s and 400 m/s long pulse (CW or FM)
Notch filtering: Selectable rejection bandwidth
Own doppler correction: On all 60 channels
Roll and pitch performance: Automatic co-ordination of transmitting pulse and vertical beamwidth in rough weather
Weights
Electronic cabinets: (Sonar console, duplexer and amplifier cabinet, transmitter cabinet) 1041 kg
Retractable hull-outfit including transducers: 7900 kg
Fixed hull-outfit including transducer: 2500 kg
Variable depth system: 5000 – 8000 kg
STATUS
In series production. Entered operational service in 1978.
CONTRACTOR
Hollandse Signaalapparaten BV, PO Box 42, 7550 GD Hengelo, Netherlands.



PHS-32 sonar console

5636.453
SUBMARINE INTEGRATED ATTACK AND SURVEILLANCE SONAR SYSTEM (SIASS)

The submarine integrated attack and surveillance sonar, developed by Signaal, is available in two versions: SIASS-1 and SIASS-2. The former is a stand-alone system with its own sonar consoles, and interfaces with a submarine data handling and fire control system. SIASS-2 is a sonar system as an integrated part of the Signaal Submarine Sensor Weapon and Command System (SEWACO).

Both SIASS-1 and SIASS-2 perform and integrate the following tasks:

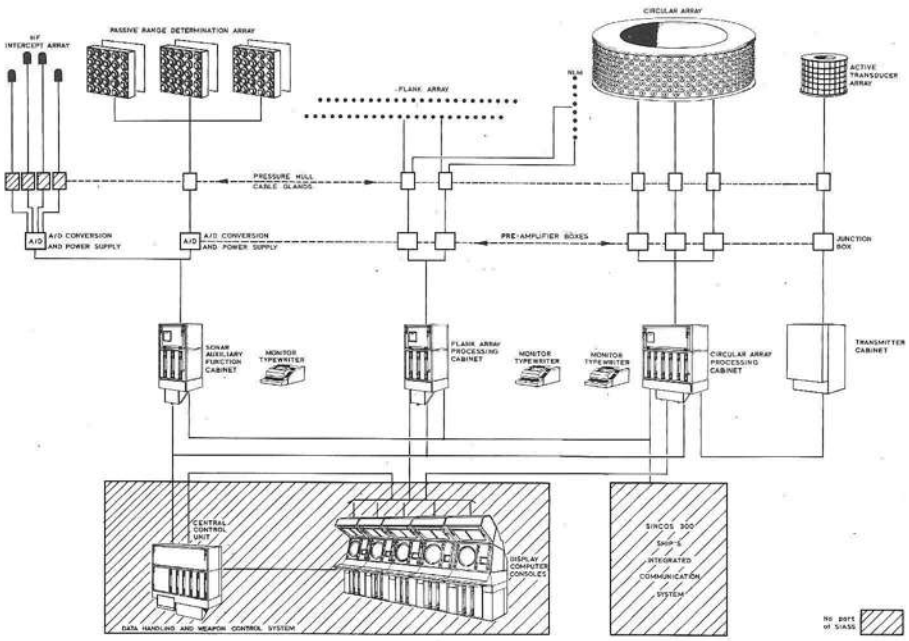
(1) Low (long range) and medium (medium range) surveillance of noise radiating targets through the use of broadband and multi-channel narrowband signal processing for surveillance, analysis and tracking (LOFARGRAMS, ZOOM-FFT, Demon, ALI displays)
(2) Passive range detection
(3) Automatic target tracking for a multitude of targets, including automatic line tracking
(4) Contact motion analysis (position determination on bearings-only information)
(5) Active sonar
(6) LF, MF and HF intercept
(7) Classification
(8) Noise level monitoring and cavitation indication.

SIASS display and computer consoles

The SIASS signal processing is entirely digital and high resolution FFTs are used throughout the system for detection and analysis. Distributed computer architecture and extensive database facilities allow high flexibility, reconfigurability and availability. Analysis and classification aids are provided with electronic libraries and ample history of spectral analysis results (LOFAR) is retained from all preformed beams simultaneously for immediate review. Integrated support functions are sound velocity measuring, ray path indication and performance prediction.

Latest-design acceleration-cancelling hydrophones form the basis of the multi-array configuration which may consist of:

(1) Two low frequency arrays
(2) A medium frequency circular array
(3) A high frequency intercept array
(4) Two sets of medium frequency passive ranging arrays
(5) An active transducer array
(6) Noise and cavitation monitoring hydrophones.



Control is exercised from multi-purpose consoles which may be integrated parts of a total SEWACO system (SIASS-2). These display and computer consoles are equipped with a multi-function control panel, a high resolution raster-scan display and an alpha-numeric display. Because of the built-in computer each console is virtually autonomous.

STATUS

In production.

CONTRACTOR

Hollandse Signaalapparaten BV, PO Box 42, 7550 GD Hengelo, Netherlands.

SIASS-2 sonar system

4001.253
PHS-36 SERIES SONARS

The PHS-36 series of sonar systems is modular in design and intended for world-wide operation on any type of surface ship. The series consists of both hull-mounted (HMS) and variable depth (VDS) sonars, with combined HMS/VDS also available. The series provides various active modes (OMNI, OT, SDT, MCC) with simultaneous FM and CW transmission. A passive mode operates simultaneously with the active mode. Combined FM/CW pulses are transmitted for detection of low and high doppler targets under both reverberation and noise limited conditions. The series also includes frequency diversity and provides computer-aided detection and tracking of 12 targets.

A colour-coded presentation on a high-resolution display gives a graphic picture of the sonar information. Integrated support functions such as range prediction and sound ray tracing are included. A number of options are also available, including training facilities, underwater telephone, HF-intercept and shore-based training centres.

The PHS-36 series consists of the following systems:

Type	Frequency	HMS	VDS	Platform
PHS-24	High	*	*	Small ships
PHS-33	Medium	*	*	FPB/Corvettes
PHS-34	Low	*	*	Corvettes
PHS-35	Low	*		Frigates
PHS-36	Low	*		Destroyers

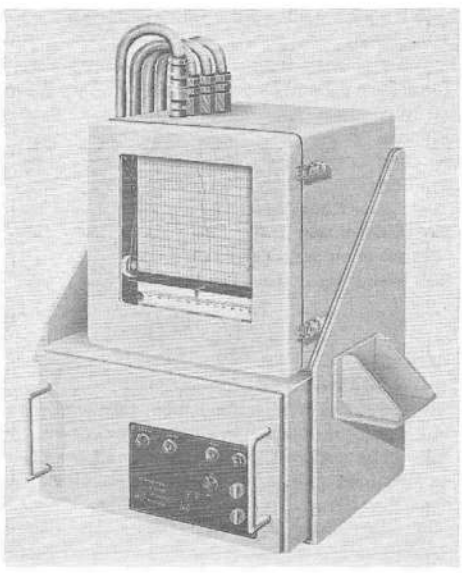
STATUS

The series, which was a result of a joint development programme with the Royal Netherlands Navy, is now in production.

CONTRACTOR

Hollandse Signaalapparaten BV, PO Box 42, 7550 GD Hengelo, Netherlands.

3493.453
XSV-01 EXPENDABLE SOUND VELOCIMETER

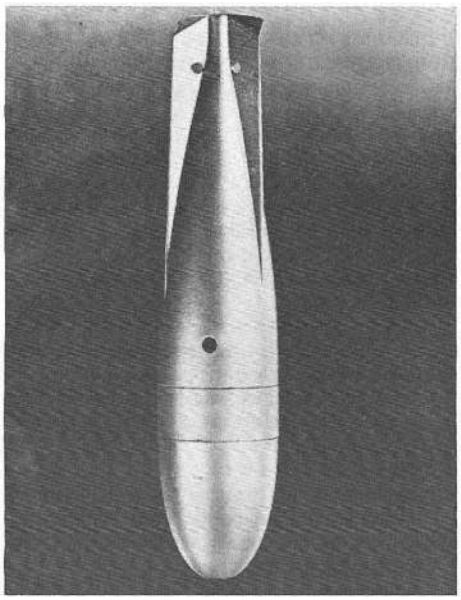


Complete knowledge of the sound velocity/depth profile is provided by this equipment which comprises the XSV processor and display units used with XBT expendable probes.

The XSV-01 probe contains a sound velocimeter sensor, a battery power supply and an integrated circuit. The probe falls free from the ship with the aid of a launcher and is activated upon water impact. Its ballistic shape provides a known rate of descent while sound velocity data is continuously relayed to an on-board processor and recorder via a wire link. The system is also able to launch XBT probes (type T4, T5, T7) which have the same well-known dual spooling technique.

The system is easily operated, in virtually any sea-state requiring only a few minutes per measurement during which the ship need not reduce speed or change heading. It provides the input data required for sound ray path calculations (see **1525.263**, SPI-04).

CHARACTERISTICS



XSV measuring ranges: 1410 - 1510 m/s; 1440 - 1540 m/s; 1460 - 1560 m/s
XBT temperature range: -2·2 to +35·5° C
XSV depth range: 850 m (XSV-01 probe); 2000 m (XSV-02 probe)
XSV system accuracy: Better than 0·3 m/s
XSV depth accuracy: ±2% or 5 m, whichever is greater
XBT depth ranges: 460 m (T4); 760 m (T7); 1830 m (T5)
Launcher types: Deck launcher, through-hull launcher, hand-held launcher
Option: Magnetic digital recorder for high density data registration
Weights: Deck launcher, XSV processor and recorder: 95 kg; probe in canister: 1·25 kg

Processor and recorder units of the XSV-01 sounding equipment

STATUS
Entered production phase in 1978 and now in series production for various navies. The XSV is a result of co-operation between Sippican Ocean System Division and Van Der Heem Electronics (the latter initially developed the system with Philips Scientific Research Laboratories).

CONTRACTORS
Van der Heem Electronics, Regulusweg 15, PO Box 16060, 2500 AB, The Hague, Netherlands, in co-operation with Sippican Corporation, Marion, Massachusetts 02738, USA.

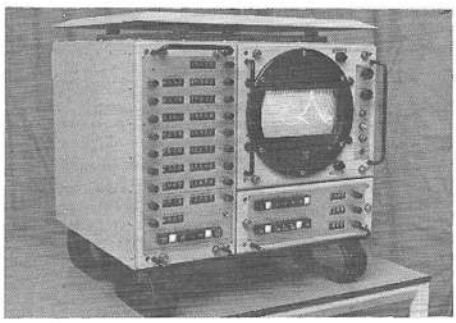
XBT expendable sound velocity probe for XSV-01 system

1525.263
SPI-04 SOUND RAY PATH ANALYSER

The SPI-04 is a small special-purpose computer-based equipment providing instantaneous prediction of sound ray paths calculated directly from sound velocity over long, medium, and short ranges. All electronics, including power supply, are housed in a single cabinet weighing 70 kg. An eight inch (20·3 cm) diameter CRT display is provided, and sound ray paths are displayed with a spacing of 0·5°, the number depending upon beamwidth selection. The SPI-04 is suitable for both anti-submarine operations and oceanography applications. Sound velocity/depth information is provided by equipment such as the Van der Heem/Sippican expendable sound velocimeter (XSV) or similar equipment.

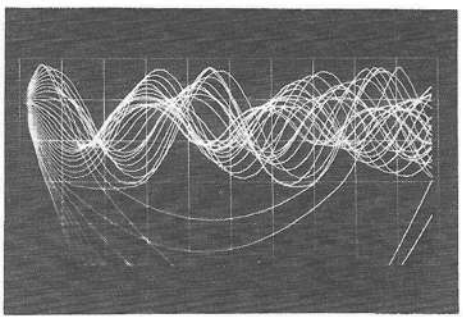
Main features include: use of microprocessors for high speed and reliability; stable presentation due to high display repetition rate; seven adjustable layers with sound velocity settings; variable bottom depth with reflections ON/OFF switch; profile setting display on LED numerical indicators.

Operational applications include:



(1) On surface ships to provide a clear picture of the sonar conditions to enable the best depth for VDS to be established, and to evaluate the possible submarine tactics
(2) In submarines for the determination of optimum listening and escape depths, and defensive tactics against helicopter sonars and sonobuoys
(3) In ASW aircraft and helicopters to establish the best depth for deploying sonobuoy hydrophones and transducers
(4) Minehunting in shallow waters
(5) Instant presentation of sonar coverage.

CHARACTERISTICS
Angular ray spacing: 0·5°
Function switch: Fixed, 4·5 m depth; variable, 0 - 600 m depth
Range/depth scales: 5; 9 km/375 m - 72 km/6000 m
Bottom depth setting accuracy: Better than 2 m



DEVELOPMENT
Development was undertaken by Van der Heem BV in the Netherlands.

STATUS
The SPI-04 is in operational service with the Royal Netherlands Navy and various other navies.

CONTRACTOR
Van der Heem Electronics, Regulusweg 15, PO Box 16060, 2500 AB, The Hague, Netherlands.

SS105 SCANNING SONAR

This sonar is intended to fulfil the sonar requirements of modern ocean going coast guard vessels. It is a 360° scanning sonar with 48 preformed receiving beams with 11° beamwidth and 'split beam' processing in each beam. The working frequency is 14 kHz. The sonar system consists of an operator's console, transmitter unit, receiver unit, hydraulic power unit and hull unit.

The transmitter consists of 48 switching type amplifiers, 600 W each. Total output power is approximately 15 kW. Both OMNI, Single RDT and Triple RDT are available transmission modes. The main display has a CRT PPI, 280 mm in diameter, with scale ranges from 2 to 16 km. Markers provided are target cursor, stern cursor, transmitting and receiving sectors. An LED display shows target range, relative/true target bearing and ship's speed. Target data is transmitted digitally to other systems on board as required.

The 48 stave transducer is installed in a streamlined retractable sonar dome which will take ship's speed up to 25 knots. A fixed dome-arrangement is also possible.

CHARACTERISTICS
Transmitter
Type: Class S amplifier
Number of channels: 48
Max power output per channel: 600 W
Pulse lengths: 10, 30 and 60 ms
Frequency: 14 kHz
Transducer
Number of staves: 48, circular mounted
Active face per stave: 225 cm²
Beamwidth vertical plane: 12 ± 1°
Resonance frequency: 14 kHz
Tilt: 6° mechanical
Transmitting modes and performance
OMNI
Beamwidth vertical plane: 12 ± 1°
Beamwidth horizontal plane: 360°
Max output level: 219 dB rel. 1 μPa at 1 m
Directivity index: 9·5 dB
SRDT
Beamwidth vertical plane: 12 ± 1°, one beam
Beamwidth horizontal plane: 8·5 ± 1°, scanning a sector variable from 10 - 115°
Directivity index: 25 dB
Max output level: 230 dB rel. 1 μPa at 1 m
TRDT
Beamwidth vertical plane: 12 ± 1°
Beamwidth horizontal plane: 8·5 × 1°, 3 beams each scanning a sector of 120°
Max output level: 230 dB rel. 1 μPa at 1 m
Directivity index: 25 dB
Receiving performance
Number of simultaneous beams: 48
Bandwidths: 400 and 800 Hz
Beamwidth vertical plane: 12 ± 1°
Beamwidth horizontal plane: 11 ± 1°
Directivity index: 26 dB

SS105 hull unit

STATUS
The Norwegian Navy has ordered the SS105 scanning sonar for new coast guard vessels. A contract worth N.Kr 6 million was received from the Finnish Coastguard service in January 1985.

CONTRACTOR
Simrad Subsea AS, PO Box 111, 3191 Horten, Norway.

5645.253
SS304 SCANNING SONAR

The SS304 is a high resolution scanning sonar suitable for installation in small ships down to 150 tons. It is designed for detection and tracking of submarines and submersibles, as well as for minehunting.

The system consists of a hull-mounted sensor, a transmitter unit, a receiver unit, and a control/display which provides the operator with a six-colour, memory refresh, true motion 14-inch picture of the underwater situation. The fixed streamlined fibreglass sonar dome is capable of withstanding ship speed up to 40 knots.

The sonar system consists of 17 simultaneous receiving beams which in a single ping cover 85°. The 85° fan-shaped beam can be trained and tilted in any direction, for quick searches 360° around the vessel, tiltable down to 90°. The vertical beam width is only 7° which eliminates nearly all interfering noises from the sea bottom.

CHARACTERISTICS
Frequency: 34 kHz
Range: 3000 m
Source level: 232 dB rel 1 Pa, ref 1 m
Transducer beamwidths: 9° horizontal; 7° vertical
Dome: Fibreglass (GRP) max speed 40 knots

Tilt: Upper limit 15° up; lower limit 105° down; speed 10°/s
Transmitter: Output power to transducer – 4 kW
Display: 14-inch colour monitor; 3 colours for symbols, 3 colours for echoes, 50 Hz refresh, 512 lines raster scan

STATUS
In production.

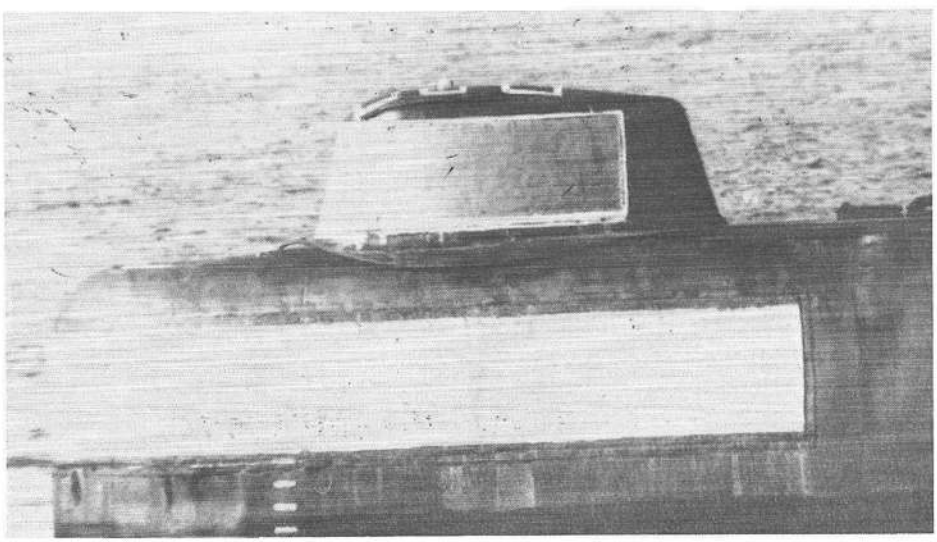
Control console of the SS304 scanning sonar

UNION OF SOVIET SOCIALIST REPUBLICS

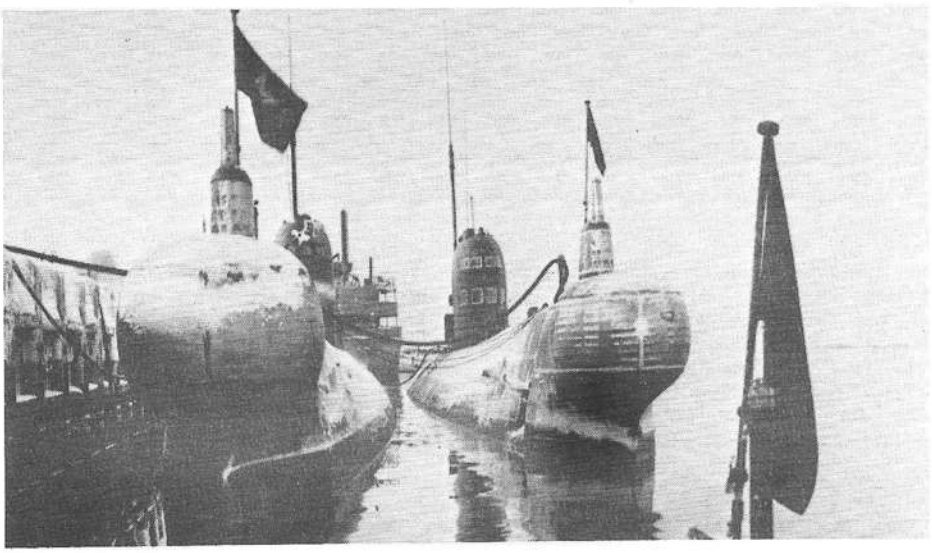
3236.453
SOVIET SONAR

Because of Soviet security constraints and the generally inaccesible location of sonar equipment it is not possible to treat this aspect of Soviet underwater equipment in the same manner as has been adopted for that of other nations. Instead, the following notes summarise what little has been gathered, and which is free of Western security restrictions. While this inevitably falls well short of the ideal treatment, it is hoped that readers will find the ensuing paragraphs of some help.



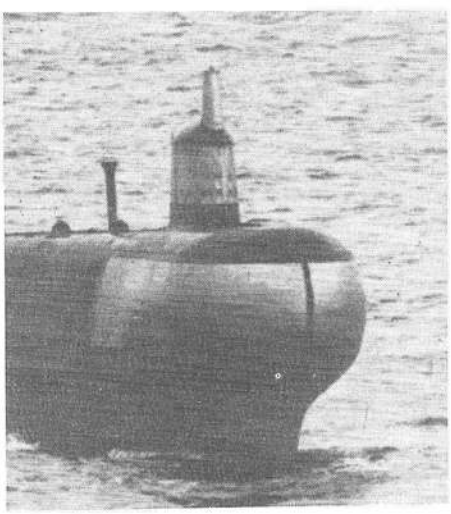
Underwater acoustic experiments, initially in relation to communications applications, by the Soviet Union are widely agreed to date back to the years immediately prior to the First World War, but the earliest references to anything resembling what is now known as sonar occur in the 1930s when research into hydrophones for submarines is mentioned. At this general time, the possibilities of thermal detection devices for both aircraft and surface shipping were pursued. In the same period, the Soviet Union is credited with the production of passive sea bed acoustic detector equipment. Soviet claims record that the Soviet Union's naval forces at the start of the Second World War had available a variety of sonar equipments for shore and ship installations.

Most, if not all, of those reported were apparently passive devices, those for submarine fitting consisting of an elliptical array made of 8, 12 or 16 hydrophone elements. There were also passive sonar sets for surface ships, one of these being named Tamir and which began sea trials in 1940. This equipment is stated by the Soviet Union to have become the standard Soviet sonar employed in the anti-submarine campaign of that time. Neither the Soviet Union's then allies, nor her enemies, appeared to have been unduly impressed by the results achieved, according to historians, official and unofficial. By the post Second World War period, the USSR had gained access to sonar technology originating in America, Britain, and Germany, either by gift or as booty.

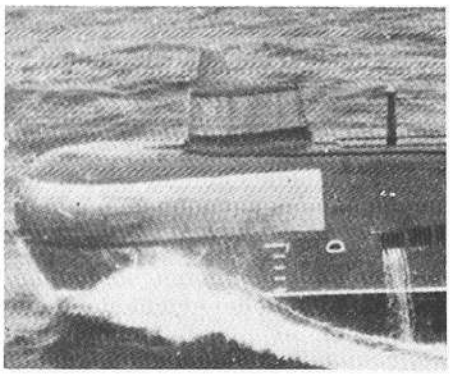


Since then, there has been steady and impressive growth of Soviet interest in all aspects of submarine warfare and it is reasonable to suppose that sonar equipment is accorded a priority within these activities at least as great as that given it by the Western navies. The advent of the Soviet ASW helicopter and aircraft carriers, such as the *Moskva*, *Leningrad* and *Kiev*, in advance of comparable ships being commissioned in Western navies, might imply a higher priority.

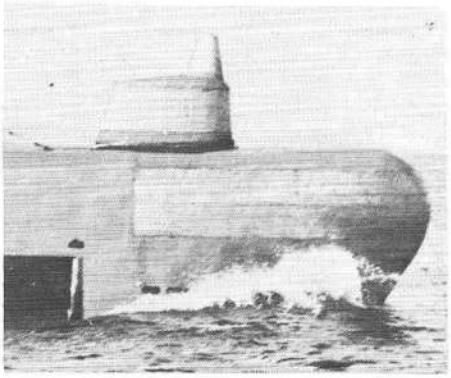
The appearance of these ships was preceded by smaller vessels designed for ASW operations and special-purpose aircraft and helicopters for naval duties, the latter being deployed in both land-based and embarked formations. These developments occurred in the mid-1950s to mid-1960s period.



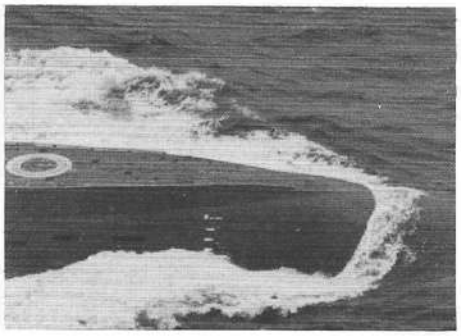
Among the ASW ships, 'Petya' and 'Mirka' class vessels have hull-mounted sonars and some of the



'Juliet' class submarine bow sonars



Large sonar arrays feature prominently on the bows of these Soviet submarines



'Foxtrot' class submarine bow sonars

'Foxtrot' class submarine bow sonars seen from abeam

'Golf' class submarine bow sonars

Bow sonar on 'Kilo' class submarine

earlier 'Petya' class have been retro-fitted with a variable depth sonar which replaces the after torpedo tubes. The 'Kresta I' ASW cruisers have hull-mounted sonar and can carry Hormone helicopters which have been equipped with dipping sonar and a magnetic anomaly detector, and can deploy sonobuoys. A bow-mounted sonar is fitted in the later 'Kresta II' class, and the still more recent 'Kara' class ships have a variable depth towed sonar. The 'Krivak' class ships, which appeared at sea in 1971, have both bow sonar and a variable depth sonar.

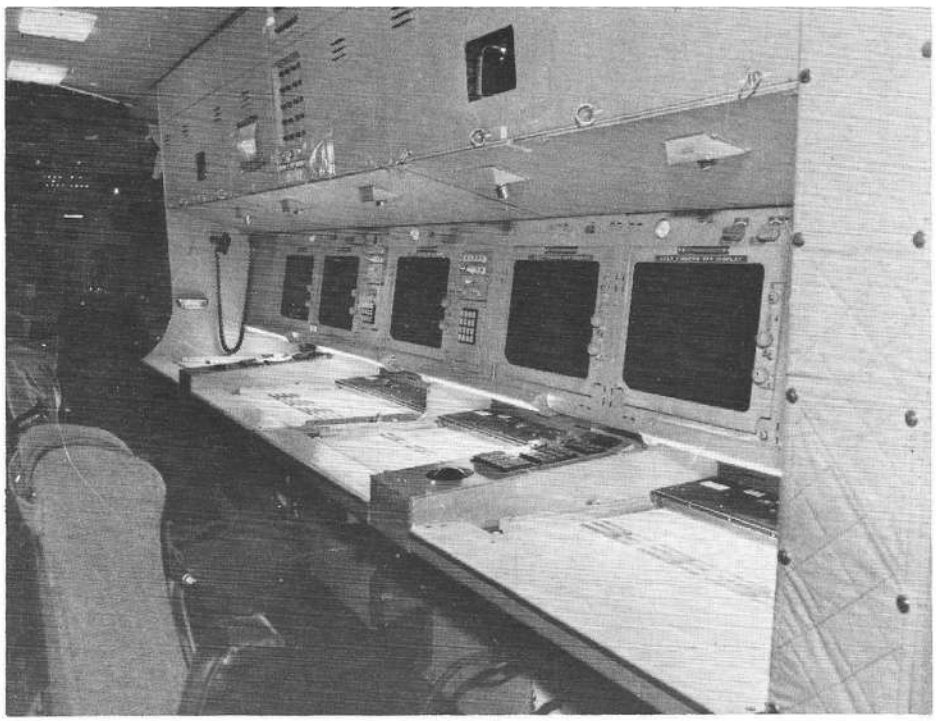
In addition to the Hormone helicopters, the earlier Hound is believed to be capable of operating a dipping sonar, or possibly a towed magnetic anomaly detector (MAD). The MI-14 Haze shore-based helicopter also carries MAD. Other fixed-wing maritime aircraft, such as the Be-12 Mail and the Il-38 May are equipped with MAD, and the latter type also can deploy sonobuoys and process data obtained by this means. Mail has been followed into service by an ASW version of the Tu-20 Bear F which is understood to employ sonobuoys for submarine target detection.

Many submarines of the Soviet fleet prominently feature large sonar arrays and it has been estimated that between 30 and 40 nuclear attack submarines have been commissioned, supported by perhaps as many as 150 diesel attack submarines. These are in addition to the large classes of nuclear and diesel ballistic and cruise missile submarines, all of which have sonar installations.

UNITED KINGDOM

Note: Contracts for the Royal Navy's new range of hull-mounted surveillance sonar systems for both surface ships and submarines have now been finalised (see entries in this section under Types 2050, 2051, 2052 and 2054) and equipment is now in the development stage. This also applies to the Type 2093 minehunting sonar. At the time of going to press, no decisions had been made on the RN requirements for towed array systems. These are the Type 2031 for surface ships and the Type 2046 for submarines. An interim version of the Type 2031 has been manufactured by Waverley Electronics under contract to the Admiralty Research Establishment, using 'Curtiss' technology developed by the latter. Companies competing for this business include Plessey Marine, Ferranti Computer Systems, GEC Avionics, Marconi Underwater Systems and Waverley Electronics.

1981.363
AQS 901 ACOUSTIC DATA PROCESSING AND DISPLAY SYSTEM



The AQS 901 is the designation of the sonics system developed for the RAF Nimrod Mk 2 and the RAAF P-3C Orion long-range maritime patrol aircraft.

The AQS 901, comprising on-board receivers, advanced digital processors and electronic displays, enables submarines to be detected and located for attack. Data from all current and projected NATO sonobuoys can be processed, with inputs from fixed arrays also accepted. AQS 901 can operate with, for example, British CAMBS and Jezebel, and the US-designated DICASS, DIFAR and Ranger buoys. It is also the only system in squadron service which can process data from the Australian Barra buoy.

In the Nimrod Mk 2 the receiver provides 99 channels in the 140 to 176 MHz band. The processor is based on the GEC Avionics 920 ATC digital computer. This has up to 256K words of directly addressable memory. The processor is used in conjunction with a fast Fourier transform (FFT) analyser for spectrum analysis.

Each system is operated by one crew member who controls and interrogates data using a keyboard, roll ball and cursor. Received data from active and passive sonobuoys and other sensors is interpreted on both CRT displays and chart recorders. A fifth display, for system management, can show data from either of the two AQS 901 systems installed in each aircraft. The AQS 901 includes an advanced eight-channel sonobuoy receiver and a command system.

By virtue of its flexible computer based processor and powerful FFT analyser, the system is applicable to other vehicles intended for anti-submarine warfare. Versions have been configured for various types of aircraft.

Complete aircraft installation consists of two full AQS 901 acoustic processing and display systems

DEVELOPMENT

The first complete aircraft installation of the AQS 901 for the RAF was formally handed over in March 1979. Each aircraft installation consists of two complete AQS 901 systems which operate independently but can intercommunicate for system management purposes.

STATUS

AQS 901 is in operational service with the RAF Nimrod MR Mk 2 and the RAAF P-3C Orion aircraft. An order worth £25 million was placed with GEC Avionics in April 1983 to equip the fleet of P-3C Orion aircraft recently purchased by the RAAF.

Update of the RAF Nimrod Mk1 aircraft is complete to the Mk 2 standard.

CONTRACTOR

GEC Avionics Ltd, Maritime Aircraft Systems Division, Airport Works, Rochester, Kent ME1 2XX, England.

3497.363
AQS 902 LIGHTWEIGHT ACOUSTIC PROCESSING AND DISPLAY SYSTEM (LAPADS)

Designed and developed by GEC Avionics, the AQS 902 is intended principally for use in ASW helicopters and maritime patrol aircraft.

The system processes and displays data from both dipping sonar and free sonobuoys simultaneously, providing integrated data. All current and projected NATO dipping sonars and sonobuoys can be processed and displayed. The equipment will interface with any approved UK or USA type of sonobuoy receiver, using either a 31 or 99 RF frequency channel capability, as required.

The design as a modular system enables a configuration to be assembled specific to each type of aircraft, its operational role and the required sonobuoy capability. Four basic units comprise the AQS 902 installation, each of which contains the dedicated modules to allow construction of the selected system configuration at minimum weight and cost. This also permits subsequent expansion or modification of the system.

The processor unit converts the received sonobuoy signals into digital form, carries out the necessary filtering and analysis, and processes the data into a form suitable for display. It is packaged in a short 1 ATR case.

Lightweight acoustic processing and display system in an RN Sea King

The receiver unit is housed in a ¾ ATR case, with an associated antenna preamplifier and a small panel mounted controller.

The display unit may be in the form of either a CRT or chart recorder. Configurations may use either or both of these, with additional CRTs and chart recorder if required.

The CRT based system incorporates an extra unit, the post processor, which prepares data for presentation and provides additional system facilities. All CRT and hard copy formats are fully annotated. A control panel specifies processing modes and parameters, while CRT displays have a roll ball or joystick and cursor with which to interrogate data. Associated with this facility are frequency dividers, markers and data read-out by interrogation. Fixing aids are provided for correlation, detection and recording, manual doppler fix, manual Hyfix and Lloyds Mirror depth analysis. Range and bearing data is available on the CRT display and, in some configurations, bearing data is available on the hard copy recorder.

STATUS

AQS 902 is in operational service with the RN Sea King Mk 5 ASW helicopters, and has been delivered to the Royal Swedish Navy. It is on order for the Indian Navy and is incorporated in the Fokker Maritime Enforcer.

CONTRACTOR

GEC Avionics, Airport Works, Rochester, Kent ME1 2XX, England.

5655.363
AQS 903 ACOUSTIC PROCESSING AND DISPLAY SYSTEM

The AQS 903 is a lightweight system designed primarily for use in helicopters but also equally well suited for fixed-wing aircraft. It has been selected for the Royal Navy, to equip the new EH 101 helicopter due to enter service in the late 1980s.

The AQS 903 is a modular equipment and draws heavily on the experience gained in operating the AQS 902 system in the RN Sea Kings. The modular concept allows various configurations to be assembled appropriate to the type of aircraft to be fitted. In the basic configuration for the RN the processor is designed to handle the complete range of NATO sonobuoys.

The equipment makes extensive use of distributed processing, with the system incorporating the latest component technology to provide the operator with large amounts of data. Information from up to eight buoys can be processed simultaneously, providing 360 degree surveillance on all underwater submersibles. Sector coverage offers additional classification and/or tracking analysis allowing smooth transition from one mission phase to another, irrespective of the buoy type in use.

Analysis and display cues are in plain language, requiring a minimum of operator training. Twin CRT displays are controlled by a single operator using a control panel with menu-driven option selection and multi-function keys.

The AQS 903 system can interface to other on-board systems, responsible for sonobuoy launching, navigation, tactical tracking and weapon release.

STATUS

In development.

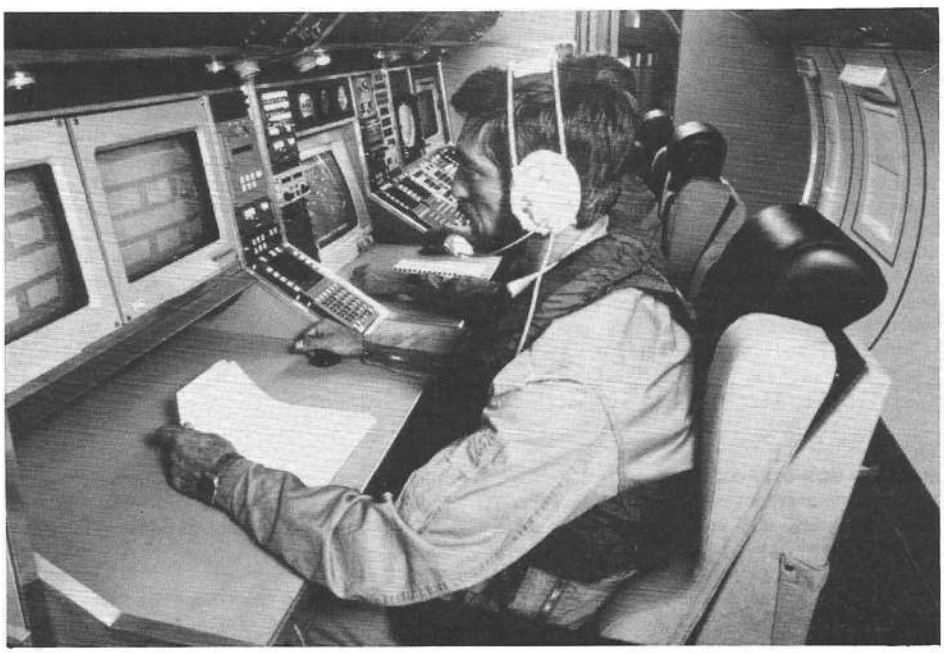
GEC Avionics Limited, Airport Works, Rochester, Kent ME1 2XX, England.



5891.353
TATTIX TACTICAL PROCESSING AND DISPLAY SYSTEM

TATTIX is an integrated or stand-alone tactical processing system for fixed-wing maritime patrol aircraft and ASW helicopters. The system integrates data from sensors and navigation sub-sensors, automating much of the interfacing, processing and display correlation. Information is then interrogated by the tactical co-ordinator using a simple control panel and roller ball or joystick, with the result being clearly displayed on his display. The system employs a flexible design which allows the configuration to meet the widest range of requirements. It is readily adaptable to various levels of system integration, extending to a totally integrated mission management system. Standard interfaces of ARINC 419/429 and 1553 data bus allow installation as either an original equipment or as a retrofit.

TATTIX replaces the variety of individual controls and displays and can provide an integrated control and display even when the sub-systems are of varying design standards.

Integrated avionics suite in the Fokker Enforcer incorporating AQS 902 and TATTIX

5852.363
AD 130 SONAR HOMING AND DF RECEIVER

The AD 130 provides sonobuoy homing and DF facilities on 99 channels over the frequency range 136 to 173·5 MHz at a channel spacing of 375 kHz. It is intended for use on both fixed and rotary wing aircraft. The system consists of a receiver with computer interface, a remote control unit and antenna switching controls. Additional units provided include a DF antenna, a left/right and fore/aft antenna for 'sonobuoy-on-top' indications, and cross-pointer and radio magnetic indicators. Dual receivers, with independent channel selection, may be operated from a single controller.

The system can be operated in either automatic or manual channel selection modes. In automatic mode the computer carries out selection by decoding of the serial bit stream, while manual selection is accomplished by means of pairs of thumbwheel switches. An LED read-out indicates the selected channel. The homing system provides left/right and fore/aft indications on the meter and the DF section detects and processes AM signals from the DF antenna for azimuth display. Built-in test circuitry continuously monitors all modes of operation. The system is stated to be compatible with all known and planned NATO and other allied services sonobuoys.

CHARACTERISTICS

Frequency range: 136 – 173·5 MHz
Channel spacing: 375 kHz
No of channels: 99
Frequency accuracy: 5 parts per million
Selectivity: Minimum 3 dB bandwidth 250 kHz, max 60 dB bandwidth 750 kHz
Dimensions
Receiver: 197 × 125 × 324 mm (½ ATR short)
Controller: 152 × 102 × 302 mm
Switched antennas: Each 50 × 80 × 193 mm
Weights: 8 kg (receiver); 2·3 kg (controller); 0·8 kg (each switched antenna)

STATUS

In production and in service.

3268.493
G 738 TOWED DECOY

The G 738 is an improved and re-engineered version of the Royal Navy Type 182 towed torpedo decoy, now being manufactured for several other navies. Known features of the equipment are modern solid-state signal generation equipment and compact, lightweight, deck machinery.

The equipment is designed to decoy both active and passive homing torpedoes from a ship fitted with the G 738/Type 182. Decoy signals are electronically generated within the ship and fed via the towing cable to electro-acoustic transducers within the towed body; the signals thus produced divert passive homing torpedoes astern and confuse or jam the steering mechanisms of active homing torpedoes.

A variety of deck-handling arrangements is produced, and dual systems may be fitted. Remote control of selection of signal characteristics provides for instantaneous changes from operations room or bridge. Parameters include noise, frequency and amplitude, modulated as well as unmodulated CW random and pre-programmed output beam formations.

The operating characteristics remain confidential between the manufacturer and the purchaser.

STATUS

In production. 14 systems sold overseas.

CONTRACTOR

Graseby Dynamics Ltd, Park Avenue, Bushey, Watford, Hertfordshire WD2 2BW, England.

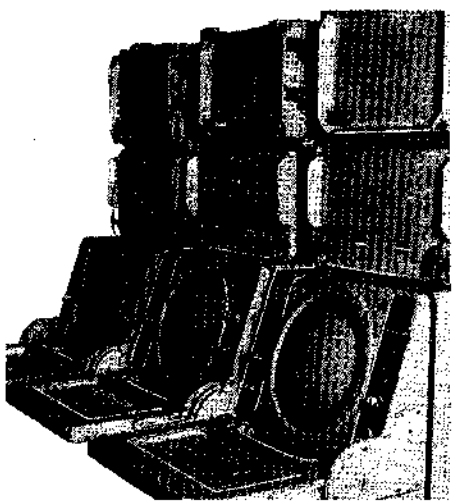
3266.453
G 750 SONAR

The G 750 is a search and attack all-round sonar for ships of frigate size and above. It is a modernised and improved version of the Type 184M (**3265.453**), providing accurate fire control data from two independent automatic tracking systems whilst simultaneously maintaining all-round surveillance, independent doppler search, and classification and continuous torpedo warning.

Three separate processing and display systems are incorporated for:

(1) all-round search and tracking (PPI)
(2) doppler
(3) passive search.

Digital readout displays are used extensively and visual displays are supplemented by audio in all three systems. Nine cabinets are required for the complete electronics. Three are display consoles, three contain transmitter and control equipment, two house receivers, and one is for monitoring purposes. For installation in smaller ships or submarines, single passive or PPI display systems, with smaller transducers, are produced. In the standard G 750 system, an improved version of the Type 184M 32-stave transducer is used to form a large number of beams. Range and bearing measurement is by in-beam scanning, obviating the need for separate expanded displays.



Target range and bearing are measured by either of two methods:

(1) by means of a manually positioned marker technique in which the circular markers are placed over the target echo and it is the marker position that is measured; or
(2) by echo gating where the echo range and bearing are measured directly. This form of tracking is normally on acquisition of a possible target and is available on either computer-assisted or non-computer-assisted basis. Marker boxes representing the gated area replace the circles. In both methods the targets are individually identified by dotted or full markers.

Provisions are made for interfacing the G 750 sonar with computer-based ASW and tactical information systems to provide a source of range, bearing, and target doppler data. Operational capabilities of the equipment include active detection of submarines throughout 360° and the ability to track two targets simultaneously. Similar detection coverage and tracking capabilities are available in respect of torpedo targets, with suitable outputs to torpedo warning and avoidance systems. There is also an active search capability over a 45° arc with facilities for determining target doppler. The system is designed for operation in adverse reverberation conditions, with ripple or omni-direction dual-frequency modulated and doppler CW transmission modes.

STATUS

In production. Three systems sold to Royal New Zealand Navy.

Type G 750 sonar control console

Graseby Dynamics Ltd, Park Avenue, Bushey, Watford, Hertfordshire WD2 2BW, England.

3269.453
GRASEBY SONAR PROJECTS

In addition to the sonar and underwater equipments described in individual entries within this volume, Graseby Dynamics is known to be engaged on a number of other projects of this nature. Brief summaries of some are given below.

800 Series Sonar

A new generation of sonars incorporating the latest in sonar concepts and technology. This development programme is designed to provide a whole range of underwater electro-acoustic equipment for large, medium, and small ships thereby minimising logistic support maintenance and training expenditure. The programme also includes sonars primarily for small submarines.

SACACS

A transportable long range Sonar Accuracy Check and Calibration System (SACACS) is in service with the Royal Navy. Known as the G 740, about 12 of these systems are now in use for sonar and anti-submarine weapon system acceptance trials and periodic calibration.

SLUTT

The G 733 SLUTT (Ship Launched Underwater Transponder Target) simulates an underwater target to permit functional tests of sonar equipment and operator training. This equipment is produced in various sizes and a large number has been sold.

CONTRACTOR

Graseby Dynamics Ltd, Park Avenue, Bushey, Watford, Hertfordshire WD2 2BW, England.

7002.253
PMS26 and PMS27 SURFACE SHIP SONARS

Hull-mounted ship sonars designed for single operator control in both the surveillance and attack roles, the PMS26 and PMS27 are also used as 'dunking' sonars in certain helicopters, under the designation Type 195.

OPERATION

The PMS26 is a self-contained system for ships and patrol craft down to 150 tons. It provides full 360° coverage in four steps of 90° and may be manually controlled to cover a particular sector, or set to carry out automatic search procedure. It incorporates a 'maintenance of close contact' facility for tracking close or deep targets. The single operator controls the sonar through a special console. He is provided with three sources of sonar information – audio, visual doppler, and visual sector.

The doppler facility provides increased initial detection range and improved classification capabilities compared with conventional small ship sonars. The PMS26 transducer array is mounted within a hull outfit with a glass-reinforced plastic dome.

The PMS27 differs from the PMS26 only in its associated hull outfit. The PMS27 transducer array is mounted in a Royal Navy hull outfit 19 or similar, which makes the equipment suitable for installation in small escorts down to about 650 tons displacement. The PMS27 can be used as a surveillance sonar in association with a separate fire control sonar within the same hull outfit. This enables the ship to continue surveillance for new threats whilst engaging a target already detected.

Both systems use fully transistorised circuits to ensure high reliability, while modular construction

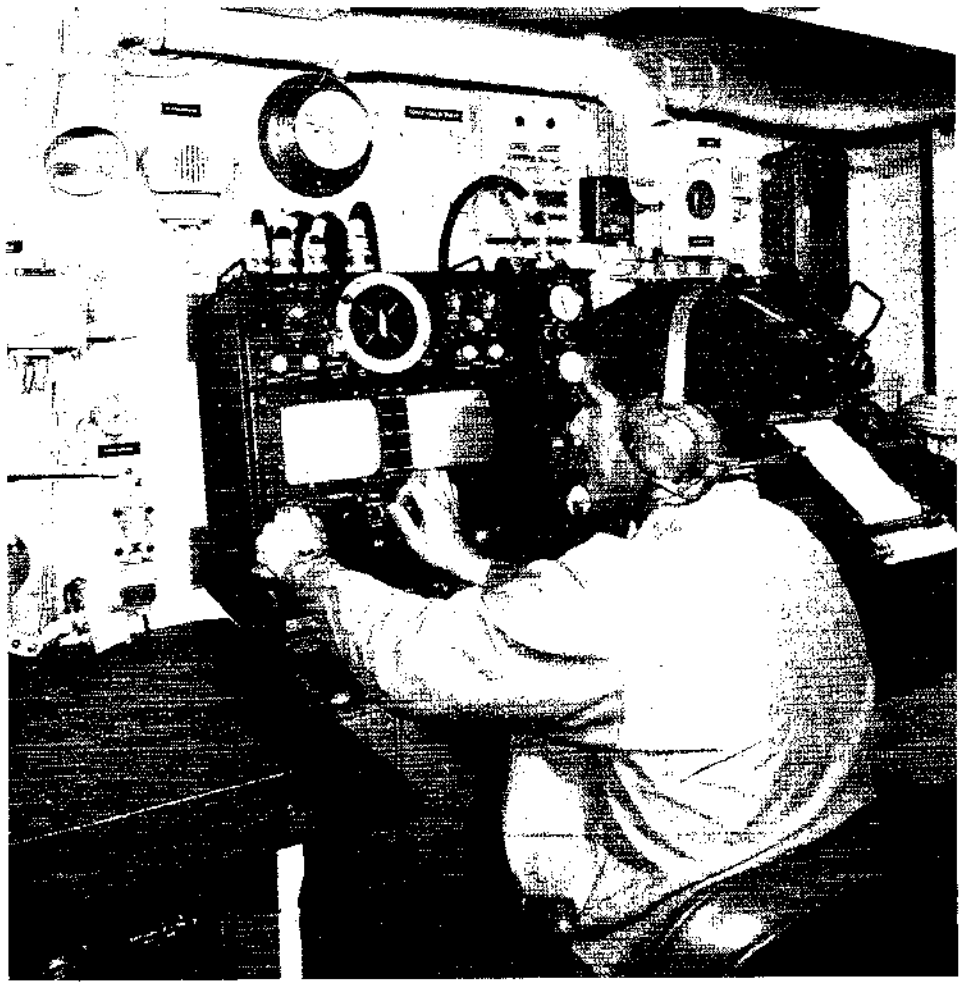
techniques permit rapid maintenance and minimise loss of operational time. They also offer a means of economically providing secondary sonar capability in multi-role vessels. Under slow speed operation, when the background noise is that caused by breaking and pounding of waves, equivalent to, say, sea state 4, the theoretical initial detection range can be calculated at about 7000 m. A practical working range of detection under most conditions is approximately 4500 m.

The equipment is sub-divided into small units which may be sited in convenient areas not necessarily adjacent to the control console.

ADDITIONAL EQUIPMENT

Various other ancillary units are available which will measure transmitter output power and receiver sensitivity; indicate figure of merit under prevailing noise conditions; provide at points remote to the control console tactical information on target movement; provide *in situ* system checking which locates any system fault or performance deterioration, and provide a controlled simulated display for training purposes.

STATUS



Now in quantity production. The PMS26/27 has been adopted by nine navies, including two NATO member countries.

CONTRACTOR

Plessey Marine, Templecombe, Somerset BA8 0DH, England.

TYPE 195 HELICOPTER SONAR

This is a helicopter-mounted 'dipping' sonar, from which the Plessey PMS26/27 range of surface vessel sonars are derived. The principal difference is the use of a winch-controlled transducer for detection and location in place of the hull-mounted units employed in the PMS26/27. Other essential details are the same and will be found in the entry for the PMS26/27 sonars (**7002.253**).

The facilities available to the sonar operator are as follows:

(1) controlling the physical movements of the submersible unit
(2) provision of data on temperature profiles from the bathythermograph
(3) selection of the most appropriate operating procedure in terms of transducer depths, search technique, pulse length, and a range setting in relation to sea conditions and tactical requirements
(4) a doppler display which shows the initial detection of any target-like echoes in the area under examination, thus alerting the helicopter (and possibly other units) to the presence of potential targets
(5) to provide elementary classification of 'contacts' to establish whether further action is appropriate
(6) maintenance of sonar contact with recognised targets during any subsequent manoeuvres, which may include moving and 're-dunking' the submersible unit as well as target movements
(7) provision of co-ordination information (range and geographical bearing relative to helicopter) when required for attack procedures or enemy reporting.

STATUS

The Type 195 sonar is part of the equipment forming the West and Sea King ASW helicopter system, in squadron service with the Royal Navy and sold in substantial numbers to other countries.

Type 195 sonar under a Sea King helicopter

CONTRACTOR

Plessey Marine, Templecombe, Somerset BA8 0DH, England

1755.453

TYPE 162M SIDEWAYS-LOOKING SONAR

Sonar Type 162M, which is fitted as standard in ships of the Royal Navy, detects and classifies both mid-water and sea bed targets. It displays port and starboard recordings simultaneously on a single straight-line recorder, which has a maximum range scale of 1200 yards. Operation is simplified by entirely automatic gain control. Reliability is enhanced with solid-state technology and maintenance is facilitated by ease of access and comprehensive built-in testing and monitoring features.

The three transducers are all similar and employ 49·8 kHz barium titanate elements. Their beam pattern is fan-shaped, about 3° wide and 40° vertical angle; the side-looking elements have their axes 25° below the horizontal.

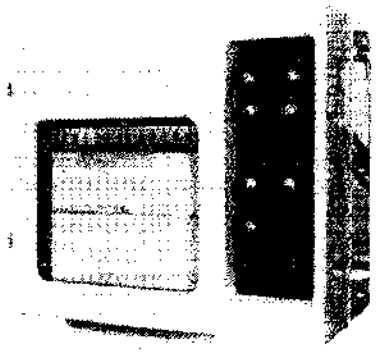
The recorder design uses a double helix (left and right hand) so that there are two points of contact with the moist electro-sensitive paper. As the helix rotates, the two points of contact move outwards from the centre. Port and starboard signals are fed respectively to the left- and right-hand points of contact so that they are recorded simultaneously. There are two zero lines near the middle of the paper, and the 18 mm gap between them is used for time marks every five minutes. The paper width is 286 mm, and each trace occupies 133 mm.

An electronic oscillator provides a controlled frequency supply for the driving motor and interval marks. Motor speed changes, for the three range scales, are made by frequency division so as to avoid the use of change speed gearbox, and a stroboscopic arrangement is included so that the helix speed may be easily checked.

A loudspeaker and a socket for headphones enable signals to be monitored aurally if required.

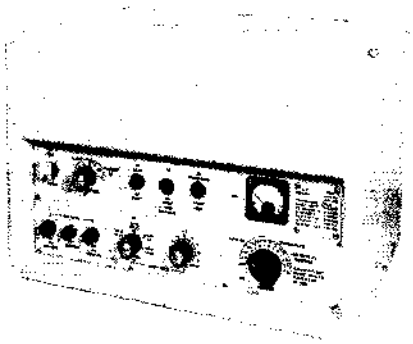
The three range scales are 0 to 300, 0 to 600 and 0 to 1200 yards, and accuracy is better than 2 per cent assuming a sound velocity of 4920 feet/second. The paper speed changes automatically when the range scale is selected, and the speeds are 6, 3 and 1·5 inches/minute (152, 76 and 38 mm/minute) respectively. At a ship speed of 10·8 knots the display scales are the same across the paper and vertically. A take-up spool is fitted but its use is optional. A fix marker draws a line across the width of the paper when a button is pressed, and it can be operated in conjunction with a Type 778 echo sounder or other equipment.

The receiver/transmitter contains:



(1) the transmission system in which a crystal oscillator supplies the correct energising frequency, which is gated to form pulses of 0·75 m/s duration at intervals commanded by the recorder; the pulses are amplified to deliver 80 W to each of the sideways-looking transducers and 40 W to the centre (downward-looking) transducer. There is a switch to cut out either the port or starboard transducer when not required, and the centre transducer is automatically disconnected on the longest range scale

(2) the reception system, which includes signal amplifiers, mixers, transmit/receive switches, initial reverberation suppression and automatic gain control. By careful selection of time constants, it has been found possible to preserve a sufficient level of sea bed reverberation to display target shadows, and yet to permit weak echoes from distant targets to be seen in the presence of the reverberation. This system is so effective that the operator has no need of a manual gain control



(3) the monitoring and test facilities, which enable all supply voltages and the functioning of the transmitter and receiver to be checked and test signals to be injected.

STATUS

In production.

3265.453

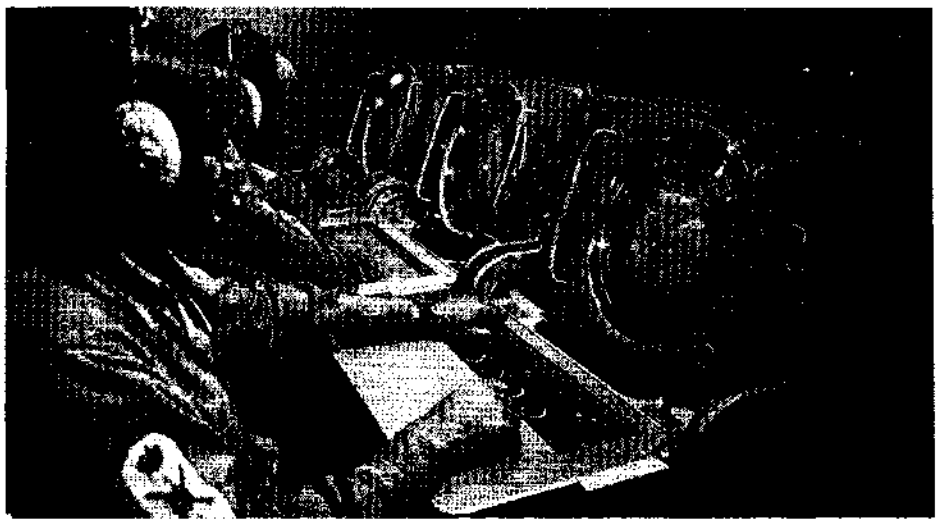
SONAR TYPE 184M

The Type 184M is one of the Royal Navy's primary surface ship anti-submarine search and attack sonars.

It is a 360° scanning sonar incorporating both active and passive modes of operation; it provides range, bearing and target doppler data to the fire control computer. The Type 184 was designed in association with the Admiralty Underwater Warfare Establishment (AUWE), and is fitted in the majority of RN surface ships. The equipment has also been supplied to a number of other navies.

Few technical details have been cleared for publication, but it can be stated that the equipment provides a dual frequency transmission and three receiver systems. The latter comprise:

(1) an all-round search and tracking PPI system



(2) a doppler system with B-scan display

(3) a continuous torpedo warning system with its own display.

A circular 32-stave transducer array is employed.

STATUS

Operational with RN and other navies. RN fittings include Type 21 frigates, Type 42 destroyers and 'Leander' class ships. The G 750 medium-range sonar (**3266.453**) is a solid-state, improved version.

Type 184 sonar control console

CONTRACTOR

Graseby Dynamics Ltd, Park Avenue, Bushey, Watford, Hertfordshire WD2 2BW, England.

1374.253

MINEHUNTING SONAR 193M/193M MOD 1

The 193M is a short-range, high definition sector scanning sonar, operating at two frequencies, providing detection and classification of mines. It has been developed from the Type 193 minehunting sonar; the adoption of solid-state electronics and other advances in technology have resulted in a reduction in installed weight to about 860 kg, which compares with a figure of some 2100 kg for the older Type 193. Among the operational improvements are extensive use of digital displays and facilities for interfacing with computer systems.

The basic concept is to employ high-definition sonar to locate and classify mines which are then destroyed by explosive charges. Other elements of the complete system include a surface warning radar which fixes the ship's position relative to short-scope buoys, and a Mk 20 plotting table into which data is fed from radar and sonar to provide an automatic and continuous display for ship and target position.

The sonar provides both bearing and range data; the fine range and bearing resolution enables the operator to assess accurately the shape of a target and hence its nature. Since the resolution depends both on operating frequency and pulse length, two selectable frequencies are provided, each with a choice of pulse length.

Range and bearing data appear on two displays: in the search mode one display shows the total range covered; in the classification mode, a 27 m (30 yards) section of the search display is expanded to fill the second display screen and permit close examination of the target.

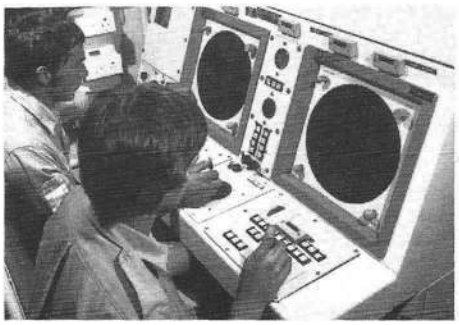
Two frequencies are employed by the 193M sonar, 100 kHz for long range search and 300 kHz for short-range search and classification. The transducers for these signals are carried beneath the ship on a stabilised, steerable mounting, the whole assembly contained within an inflated fabric dome. The receiver uses a modulation scanning technique with 15 beams, 1° wide in LF and 0·5° wide at HF giving azimuth coverage of 15° and 6° respectively. The searching of wider areas of the sea bottom is achieved by means of an automatic search sequence selected in accordance with the type of sea bottom. The returned echoes are presented to the operators on separate CRTs at the control console. One of these displays range and bearing of targets within the sector being scanned by the search transducer, while the other is used for the presentation of the classification channel data. The controls for adjusting the transducer position, signal parameters such as frequency and pulse length and for co-operating with

the rest of the minehunting and destruction team, are also provided at the console. Type 193M data can also be fed into other ships' systems.

The Plessey Speedscan system can be fitted to the Type 193M to allow it to be operated in the side-scan mode and to generate a hard copy print-out of the sea-bed.

DEVELOPMENT

Development of the Type 193M was undertaken by Plessey in 1968. Since then a continuous programme of development and operational trials in conjunction with the UK MoD has resulted in further system improvements defined as the Type 193M Mod 1.



The system offers greatly improved performance in detection and classification by the use of digitally-processed video and display systems, together with computer-aided target classification.

STATUS

In service with the Royal Navy and Federal German Navy, the Type 193M can also be used with the Racal minehunting system and can operate in the Vosper 47 m glass fibre re-inforced minehunter vessel. It is suitable for use with the Sperry Cat mine-disposal weapon (**3161.253** 1983-84 and earlier editions) or the French PAP 104 system (**1786.453**) and can interface with any digital plotting and action information system such as Ferranti CAAIS, Racal CANE and other plotting tables in current use.

Type 193M is fitted in the Royal Navy's 'Hunt' class MCMVs. Twelve navies have now purchased some 50 Plessey minehunting sonar equipments, including both the 193M and the earlier version 193. A continuing programme of enhancement will ensure that the efficiency of the equipment is kept continually under review.

The Type 193M Mod 1 enhancements will be retrofitted as a modification to RN ships fitted with 193M, while complete Type 193M Mod 1 sets are available for export.

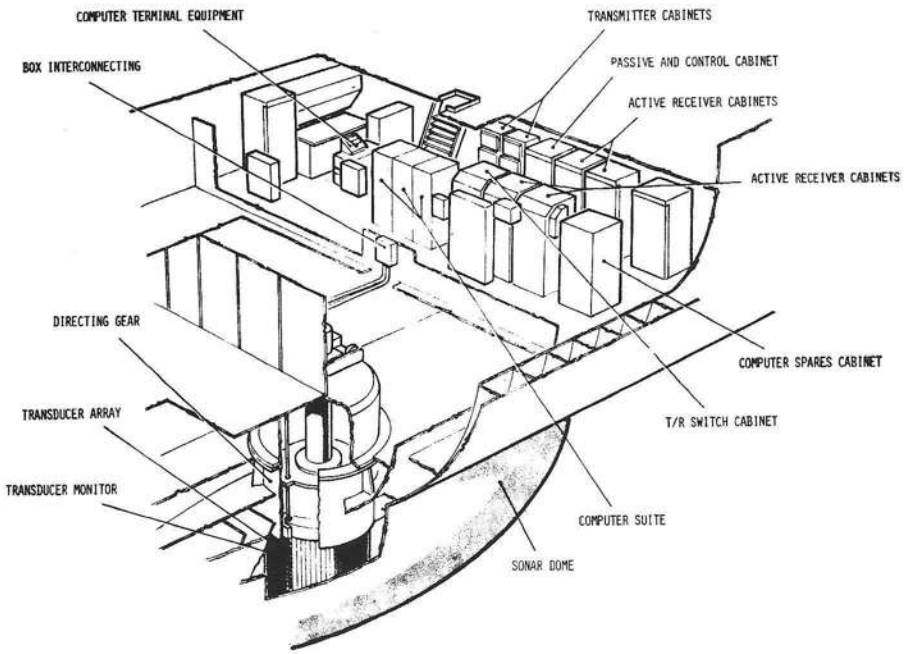
TYPE 2016 FLEET ESCORT SONAR

The Royal Navy's Type 2016 fleet escort sonar is a replacement for the existing RN sonars Types 177 and 184. It employs computer-aided techniques which are operator interactive, have automatic detection and tracking, enhanced signal processing and displays complemented by an information storage facility.

The Type 2016 is a hull-mounted panoramic surveillance and attack equipment with facilities for classification and multiple target tracking. Interference between nearby vessels using the Type 2016 sonar is largely eliminated by the use of a new type of broad band transducer. The sonar display console is designed for manning by a single operator under normal cruise conditions, this crew member being able to initiate the preparatory actions necessary for urgent action.

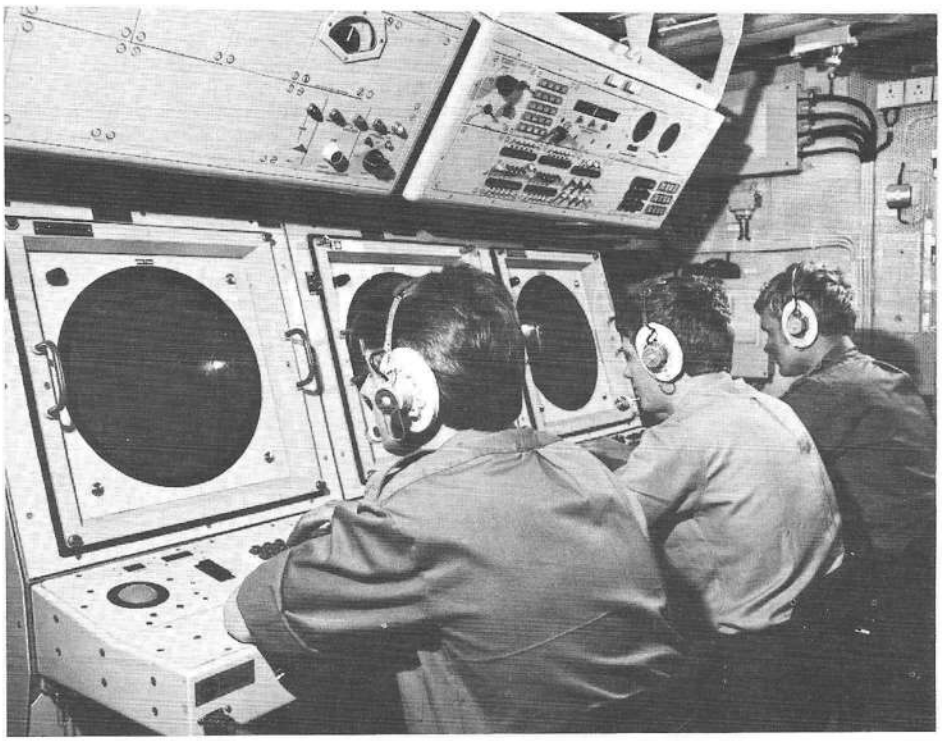
Digital data processing facilities are based on use of Ferranti computer equipment, with other sub-contractors including Marconi Radar.

The Type 2016 system comprises the following main elements: four active receiver cabinets, one passive and control cabinet and one T/R switch and beamformer cabinet, all housed in Plessey MC70 type cabinets. The Ferranti computer suite consists of three of their D.811A cabinets and a separate cabinet for computer spares. The two transmitters are housed in two standard RN/AUWE cabinets. The solid-state electronics are based on a modular system approach using medium scale integrated devices, printed circuit back planes with wire wrap connections and standard line-drive receivers for all inter-cabinet signal connections. Extensive use is made of hybrid circuit techniques to reduce volume.



The Type 2016 array system, which is roll stabilised, is fitted in a ribless monocoque glass reinforced plastic sonar dome within a fixed hull outfit. The current Royal Navy practice employs a keel dome but the array could equally be mounted in a suitable bow dome.

The display console contains three main displays and a top-mounted versatile console system (VCS) unit. The surveillance display incorporates a special simple keyboard for transmission of information to the command/AIO and for the selection of the appropriate display. The surveillance display also displays monitoring information about the performance of the equipment. When a fault is indicated, the maintainer on stand-by is alerted and proceeds direct to the sonar instrument space where further sub-unit monitoring systems enable him to pinpoint the fault down to board level. The classification display provides expanded presentation of part of the surveillance display in both B-scan and A-scan modes to permit the operator to examine the target structure more closely.



The passive and auxiliary data display with two different integration times enables both torpedoes and more distant targets to be tracked. The auxiliary data display is used for data logging and system information which includes the display of such items as course, speed, weather, sea bottom conditions, and bathymetric information.

DEVELOPMENT

Design was initiated in the late 1960s and an

Arrangement of Type 2016 fleet escort sonar equipment and the hull outfit compartment

Console of Type 2016 sonar aboard a RN frigate. The three displays (left to right) are for classification, surveillance, and passive presentation

experimental equipment underwent tests in HMS Matapan. A development contract was awarded in 1973 and the first prototype was completed in 1978.

In April 1980 Plessey Marine announced that it had received UK Ministry of Defence contracts amounting to more than £50 million, including initial research and development contracts which added up to £10 million. Type 2016 fleet escort sonars have been supplied for the Royal Navy Type 22 frigates.

STATUS

In service with the Royal Navy in Type 22 frigates.

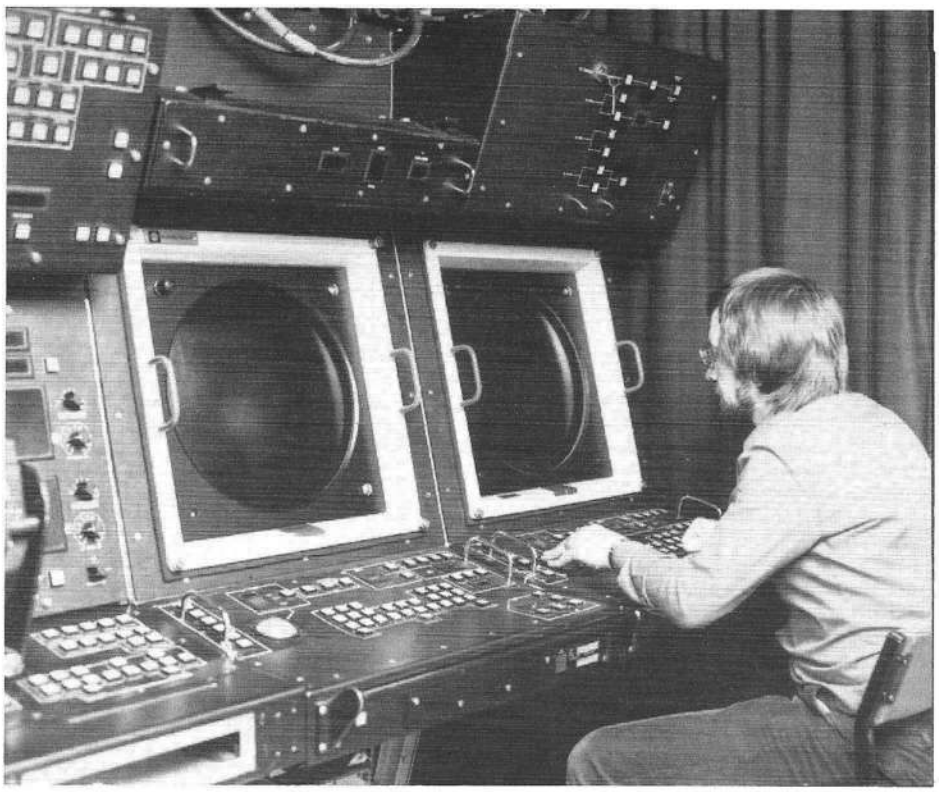
CONTRACTORS

Plessey Marine, Templecombe, Somerset BA8 0DH, England - prime contractor, with Ferranti Computer Systems, Marconi Radar Systems and other sub-contractors.

5651.453

TYPE 2020 SUBMARINE SONAR

The Type 2020 is one of the latest systems from Plessey's range of sonar equipments. It is intended for use in the Royal Navy's hunter-killer nuclear submarines and provides both passive and active detection capabilities from its bow-mounted acoustic array. Although considerable emphasis has been placed on passive detection the equipment incorporates a highly effective computer-aided active capability.



Passive detection is sub-divided into low frequency and high frequency bands with information presented on dual-speed multi-pen recorders. The system is intended primarily for operation in a computer-aided mode but can be automatically reconfigured to a fall-back mode of operation, with target information being passed to the action information organiser in both modes. Facilities for expansion are included in the design to allow interfacing with future sonar systems. Solid-state switching is used for the transmit/receive function and electronic beam steering techniques are employed. The design provides high detection sonar performance with a full 360° coverage.

A computer-controlled automatic monitoring sub-system is incorporated in the equipment, with a central monitoring unit driving local monitoring units within each equipment cabinet. Diagnosis of computer faults and programme loading is accelerated by the use of a floppy disc.

STATUS

The Type 2020 is intended as the replacement for the currently installed Type 2001 and is being fitted to 'Trafalgar' and improved 'Swiftsure' classes of nuclear-powered submarines. Each system costs £6 million.

The first production model was accepted by the Royal Navy in October 1982. Three prototypes had already been manufactured, one of which was installed and commissioned in HMS *Trafalgar*.

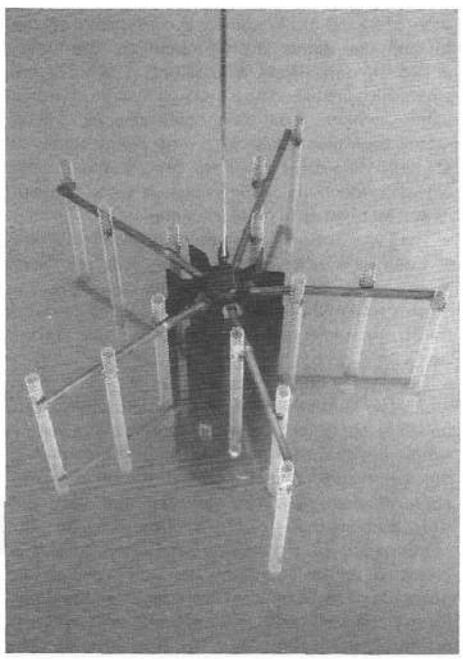
CORMORANT (HISOS 1) LIGHTWEIGHT DIPPING SONAR

Cormorant is a new helicopter integrated sonar system which incorporates a sensor array unit of advanced design, together with a winch, from Plessey Marine, and a lightweight acoustic processor and display from the GEC Avionics AQS 902 LAPADS series (**3497.363**). The system can be supplied as a 'stand-alone' dipping sonar, for active or passive use, or as an integrated system in which both free sonobuoys and dipping sonar are employed.

Cormorant is suitable for installation in medium size helicopters, with an all-up-weight of 4100 kg (9000 lb) and above. The system has a good active detection range against quiet targets in 'inner zone' or noisy environments and its use as a passive detector allows covert surveillance to be maintained.

The sonar array is a wide bandwidth type, probably dual frequency, and is claimed to have a long-range and high bearing measurement accuracy. Mosaic (**5654.363**) integration techniques developed by GEC are described as permitting more efficient exploitation of the sensor array.

A more sophisticated version, Guillemot or HISOS 2 (**5866.353**), is under development, aimed initially at the RN new helicopter, the EH 101, and intended for operation with the GEC AQS 903 processor and display system (**5655.363**).



STATUS

In development. Plessey has teamed with Emerson Electric of the USA, to offer the Cormorant system to the US Navy for its new ASW helicopter.

CONTRACTORS

Plessey Marine, Templecombe, Somerset BA8 0DH, England.

GEC Avionics Ltd, Maritime Aircraft Systems Division, Airport Works, Rochester, Kent ME1 2XX, England.

Cormorant sensor array deployed under water

5866.353

GUILLEMOT (HISOS 2) DIPPING SONAR

Guillemot (HISOS 2) is a low-frequency lightweight helicopter integrated sonar incorporating a dunking sensor array from Plessey Marine and an acoustic processor and display from the GEC Avionics AQS 903 (**5655.363**). The system has been derived from the HISOS 1 Cormorant equipment described under (**5637.353**) and appears to be aimed initially at the Royal Navy new helicopter, EH 101.

Guillemot has five arms with three staves each, but has nine transducers compared with the three per stave in Cormorant.

STATUS

Mechanical models of the Guillemot system are currently in development and are expected to be available for sea trials in 1986.

CONTRACTORS

Plessey Marine, Templecombe, Somerset BA8 0DH, England.

GEC Avionics Ltd, Maritime Aircraft Systems Division, Airport Works, Rochester, Kent ME1 2XX, England.

5639.253
PMS 40 SERIES SONAR SYSTEMS

The PMS 40 series sonar systems use a modular design to ensure that the series suits the majority of applications and warship types, with emphasis on export potential. Three variants are available, each using the same single-operator dual-display console. These are:

(1) PMS 42 with a single electronics cabinet and a 686 mm diameter transducer array for small patrol vessels, corvettes and larger warships with a less demanding ASW role
(2) PMS 44, with two electronics cabinets and a 1200 mm diameter transducer array for corvettes and larger warships
(3) PMS 46, with three electronics cabinets and a 2000 mm diameter transducer array for major ASW vessels.

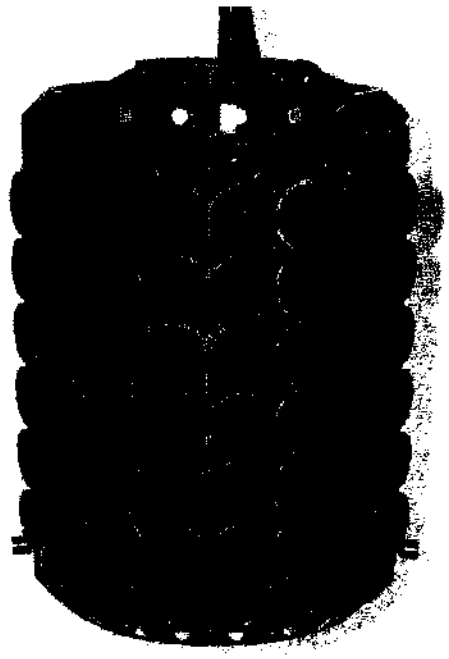
The PMS sonars are hull-mounted, intended for shallow and deep water anti-submarine detection, classification and tracking. They also provide a passive detection and tracking capability against torpedoes. Surveillance of 360 degrees is provided.

A flexible modular concept has been adopted, permitting common electronics and display console to be employed throughout. Advanced digital signal processing techniques are used and the design approach allows for various options and extensions. The systems provide omni-directional surveillance, simultaneous active and passive operation, automatic active and passive target tracking, LPM and CW (doppler) modes, operator selectable transmission frequencies and colour displays. They can also be integrated with a towed array.

Each sonar in the series consists of four elements: the transducer array, a sonar dome, operator's console and the electronics cabinets(s). The transducer array for each sonar comprises a fixed cylindrical configuration of transducer elements in vertical staves. The staves are designed for maximum reliability and are independently sealed against water. The sonar dome is of glass reinforced plastic and conforms to an optimum hydronamic shape to provide good flow and cavitation. An acoustic baffle reduces the effects of propellor noise and internal reflections.

Transmit beam steering/widening is provided by multiple transmitters which incorporate an element of system redundancy. The transmitted pulse may be either linear period modulated (LPM) or continuous wave (CW). LPM with a one second duration is the normal mode since it offers a good range resolution and high detection capability over a wide range of sonar conditions. CW can be selected at will in conditions of high reverberation of known low target strength to give improved detection of moving targets. Another important feature of the PMS 40 series is the ability to operate in active and passive modes simultaneously. Echo signals received at the transducer array are, therefore, separated into active and passive processing channels. In both active and passive modes, half beam pairs are formed to allow later extraction of fine bearing information. The system can be modified to allow transmission of a composite LPM/CW pulse plus simultaneous processing of LPM and doppler data. This provides further aid to classification on initial contact without the need to select an alternative mode.

The single-operator dual-display console incorporates raster scan colour viewing units mounted one above the other in an ergonomically designed layout. Three display formats are available, two of which, 'Active LPM' and 'Doppler CW', are presented as alternatives, normally on the lower viewing unit. The 'Passive' format is usually presented on the upper unit. The units are identical and the formats can be interchanged. All display-data is normally north-stabilised but can be stabilised to an alternative operator-selected bearing. Automatic tracking of up to ten active contacts can be made and data on these is presented on the 'tote' at the bottom of the display.



All sonars in the PMS 40 series are provided with a digital interface to the ship's AIO or command system.

STATUS
In late development.

CONTRACTOR
Plessey Marine, Templecombe, Somerset BA8 0DH, England.

PMS 42 transducer array

4127.453
TYPE 2034 SONAR

The Waverley sonar Type 2034 is a short range, high definition, dual side-scan sonar, suitable for establishing the position of ships, aircraft or other objects lost at sea; for charting obstructions in shipping channels or at sea floor engineering sites; and for evaluating underwater topography. Designed for the utmost reliability and to meet exacting military standards, Type 2034 sonars have been in use with the Royal Navy since 1976. The system is now standard equipment on all ocean going and coastal vessels of the survey fleet.

The sideways-looking, left and right, transducers are housed in a towed body, called the 'towfish', the current version of which is the Mk 3. Some of the electronics are contained in the towfish but the majority of this part of the system is housed in the recorder unit which provides for operation and control of the equipment, and display by hard copy, print-out chart recordings. Three models of recorder unit are available:

(1) recorder E1, is operated manually with panel controls for adjusting the quality of recordings
(2) recorder E2, retains all of the manual controls of the E1 recorder, but with the option of microprocessor control of the signal processing electronics permitting 'hands off' operation
(3) recorder E3, is microprocessor controlled. Manual control is provided only for the initial setting of the threshold of printing. The E3 incorporates a self-test facility.

The sonar operating frequency is 110 kHz with a nominal transmitted pulse length of 100 microseconds. A choice of three range scales, 75, 150 or 300 m and one of three recording paper speeds, 30, 60 or 150 lines/cm can be selected to suit the prevailing operating conditions. The transmission repetition rate depends on the selected range scale, and is 10 pps for 75 m range, 5 pps for 150 m range or 2·5 pps for 300 m range. For all range settings, scale lines are recorded at 15 m range intervals, to aid interpretation of the recordings. Facilities are provided for putting event markers on the recording.

STATUS
In production and operational with the Royal Navy and other services.

CONTRACTOR
Waverley Electronics Ltd, Waverley Road, Weymouth, Dorset, England.

5853.253
TYPE 2050 SONAR

The Type 2050 is the new hull-mounted active sonar for the Royal Navy and will be fitted to the Type 23 and some Type 22 frigates. It is a successor to the Type 2016 (**3787.453**) and is compatible with both bow and keel variants of the Type 2016 array. The equipment has been developed from the Ferranti FMS series (**4625.253**), and includes digital signal processing and distributed data processing using multiple Ferranti Argus M700 microprocessors.

The provision of extensive data processing facilities and improved man-machine interfaces allows one operator to control the complete system. The equipment will interface to the combat system data highway feeding data to the Ferranti CACS action-information system.

STATUS
Orders have already been placed by the UK Ministry of Defence for fitment to Royal Navy frigates.

CONTRACTORS
Ferranti Computer Systems Ltd, Cheadle Heath Division, Bird Hall Lane, Stockport, Cheshire SK3 0XQ, England – prime system contractor.

Marconi Command and Control Systems Ltd – sub-contractor for the transmit/receive function.

5855.453
TYPE 2051 SUBMARINE SONAR

The Type 2051 sonar system is to be provided for the update programme of the Royal Navy 'Oberon' class submarines. The prime contractor for the complete sonar refit programme, know as 'Triton', is Plessey Marine which will supply the displays with Ferranti Computer Systems and GEC Sonics as co-contractors. The 'Triton' fit is designed to bring the 'Oberon' class submarines up to date with the latest advances in sonar technology, including computer-assisted detection and classification.

The main part of the system is an enhanced and compact version of the Ferranti FMS 12 sonar (**4625.253**) which will be linked to the submarine's existing flank array, or to a towed array supplied by Ameeco, to provide all-round surveillance and classification. The FMS 12 equipment employs digital signal processing, based on advanced 'Curtiss' techniques, using programmable modules which can be configured to suit individual arrays. Data processing is handled by distributed Argus M700 microprocessors, using CORAL and MASCOT software to give automatic detection, tracking and classification of multiple targets.

STATUS
A prototype of the equipment has already undergone successful sea trials in HMS *Opossum*. Nine systems have now been ordered under a contract worth about £25 million.

CONTRACTORS
Plessey Marine, Templecombe, Somerset BA8 0DH, England - prime contractor.

Ferranti Computer Systems Ltd, Cheadle Heath Division;

Marconi Underwater Systems Ltd, GEC Sonics Division - sub-contractors.

5858.453
TYPE 2052 SUBMARINE SONAR

The Type 2052 is a passive broadband towed array sonar system designed specifically for submarine use. It is understood that this sonar will be fitted to some of the earlier nuclear-powered fleet submarines of the Royal Navy, ie the 'Valiant' and 'Churchill' classes which were laid down in the 1960s. The system is also understood to be the basis of an export towed array system being developed by Marconi Underwater Systems Ltd. No technical details have been made available.

STATUS
Scheduled to come into operational service with the Royal Navy during 1985.

CONTRACTOR
Marconi Underwater Systems Ltd, GEC Sonics Division, Sefton Park, Bells Hill, Stoke Poges, Buckinghamshire SL2 4TA, England.

5857.453
TYPE 2054 SUBMARINE SONAR

Plessey Marine has been contracted to carry out the design, development, prototype construction and pre-production of the new sonar, designated Type 2054, which will equip the new Royal Navy Trident ballistic missile-carrying submarines. The complete equipment will consist of a suite incorporating passive, active, intercept and towed-array sonars.

Plessey will act as the prime contractor and supply the bow-mounted hydrophone array together with the necessary beam-forming and signal processing equipment (both narrowband and broadband). Major sub-contractors are Ferranti Computers for the consoles, data processing and displays; GEC Sonics for the intercept sonar equipment; and Ameeco Hydrospace for the towed arrays. STC will provide the handling system for the towed array.

STATUS
In development.

CONTRACTORS
Plessey Marine, Templecombe, Somerset BA8 0DH, England - prime contractor.

Ferranti Computer Systems Ltd.

GEC Sonics Ltd.

Ameeco Hydrospace (a Plessey Marine Company).

STC - sub-contractors.

5856.253
TYPE 2093 MINEHUNTING SONAR

Plessey Marine has been contracted for development, prototype manufacture and initial production of a variable depth minehunting sonar, designated Type 2093, for the Royal Navy's new class of mine countermeasures vessel, the single role minehunter. This new system is intended to operate effectively in deep water and under the full range of sea-bed and environmental conditions. It will be integrated with the ship's command system to permit simultaneous operation in search, detection and classification modes, while the area coverage rate capability will allow a significant improvement on current route survey operations.

This development is being carried out in co-operation with General Electric of the USA which will provide the towed body sub-systems.

STATUS
In development and initial production under a contract worth approximately £70 million. Further production contracts are likely to be the subject of competitive tendering.

CONTRACTOR
Plessey Marine, Templecombe, Somerset BA8 0DH, England.

4625.253
FMS SERIES SONAR SYSTEMS

The Ferranti Modular Sonar (FMS) series is a range of compact, high performance systems, developed by the company as a private venture, and designed for a wide variety of platforms and operational roles. The series consists of:

FMS 12 - passive narrowband (2 octave)
FMS 15 - passive narrowband (5 octave)
FMS 20 - active (4 ft hull array with VDS option)
FMS 21 - active (6 ft hull array with VDS option)
FMS 31 - passive broadband

All FMS systems employ advanced digital signal and data processing techniques to provide significant cost, space and performance improvements over many current equipments. Signal processing, based on advanced 'Curtiss' techniques is achieved using programmable Ferranti digital signal processing modules which can be easily configured to meet the performance requirements of specific array outfits. The data processing equipment is based on multiple Argus M700 microprocessors, arranged in distributed arrays. The use of large numbers of these interconnected in the data processing system gives very high levels of computer assistance and automatic operation. Features such as automatic detection, tracking and classification of multiple targets are provided as standard performance. Standard programmable modules for both signal processing and data processing functions enables significant reduction in spares holding, simplifies maintenance and reduces overall cost.

The control/display console is ergonomically designed to allow single operator control of the complete system, and contains two 1000 line high resolution displays and an operator's desk. The man-machine interface includes a trackerball, nudge keys and a touch sensitive plasma panel. From the plasma panel the operator can select various displays, focus on selected beams, scroll around beams, set verniers, annotate features on the display and select a variety

FMS 12 console

of cursors. The trackerball and nudge keys are used for fast and accurate positioning of the cursor to provide specific displays of frequency, bearing, time and harmonic ratio information.

FMS 12
The FMS 12 is designed to provide high resolution narrowband surveillance and classification. The system consists of a single electronics cabinet weighing 300 kg and a single operator's console weighing 350 kg. Signal inputs can be derived from either towed or hull-mounted line arrays. The equipment features two-octave frequency cover, 360 degree bearing cover, 32 beam resolution, multiple beam display surveillance, high resolution vernier analysis classification, with sonar aural and audio communications interface.

FMS 15
As with the FMS 12, the FMS 15 will provide high resolution surveillance and classification derived from hull-mounted or towed line-arrays. The principal features are similar to the FMS 12 except that it provides five-octave frequency cover instead of two-octave. Electronics cabinet and operators's console are also as the FMS 12.

FMS 20
This is an active sonar system which combines the range resolution of an FM sweep with the doppler discrimination of a CW pulse. It consists of four electronic display cabinets with a total weight of 765 kg and a two-display operator's console weighing 340 kg. Associated transducer arrays may be hull-mounted with or without an associated variable depth array. The equipment has a 4 ft diameter hull array with 32 beam resolution, electronic array motion compensation, 360 degree bearing cover, variable range scales and a variable centre frequency of operation. The display includes active FM and CW information, classification of targets, track tote, history tote, environmental and ray tracing, and monitoring.

FMS 21
The FMS 21 is an active system basically similar to the FMS 20 but has a six-foot diameter hull array and 64 beam resolution. Other than this, all operational features, displays and electronic units are the same as the FMS 20.

CHARACTERISTICS

Dimensions
FMS 12/15 cabinets: 600 × 600 × 1460 mm
FMS 12/15 consoles: 1060 × 820 × 1450 mm
FMS 20/21 cabinets: 1700 × 760 × 520 mm
FMS 20/21 consoles: 1450 × 815 × 1090 mm

STATUS
The FMS 12 has been selected as part of the Royal Navy 'Oberon' submarine refit (see entry **5855.453**).

5854.253
VIMOS VIBRATION AND NOISE MONITORING SYSTEM
The Ferranti VIMOS is a vibration and noise monitoring system designed primarily for warships. It measures the radiated noise levels at selected positions throughout the ship, allowing these levels to be detected before they adversely affect the ship's sensor performance or increase the risk of detection. Applications include use by the ship's sonar operators, monitoring of machinery wear and monitoring of detection risk.

A combination of accelerometers and hydrophones, placed at various internal and external points, is employed and signals are transmitted through amplifiers and switching equipment to a central control unit. This gives data acquisition and signal switch control, FFT signal processing providing both narrowband and broadband analysis and back-up facilities. The control unit incorporates a touch sensitive plasma panel allowing the operator to interact with the software database and control the system. Aural listening and communications facilities are provided at the operator's position and at various remote points.

CONTRACTOR
Ferranti Computer Systems Ltd, Cheadle Heath Division, Bird Hall Lane, Stockport, Cheshire SK3 0XQ, England.

4452.453
MARCONI SMALL SHIP'S SONAR
The Marconi 360-degree general purpose small ship's sonar is a fast scanning system designed for a variety of requirements in minehunting, submersible detection, harbour surveillance and underwater navigation.

The sonar consists of an acoustic projector, a circular acoustic array of 100 plastic transducer elements (electronically beam formed to sweep rapidly and repeatedly through 360°), processing electronics and a CRT display. The transducers are capable of operation over a very wide range frequency band so that the frequency, and therefore, the range capability, can be changed during operation.

The transducer head of the equipment operates at one of two frequencies selected on the controls. The higher frequency of 250 kHz gives a greater azimuth resolution of 1·1° and is used primarily for high resolution work at ranges out to 150 m. The lower frequency of 83·3 kHz is usable at all ranges out to 700 m with a lower azimuth resolution of 3·3°.

Marconi small ship's sonar being deployed from a hovercraft

The equipment consists of:

(a) a 'wet end' housing the acoustic projector, receiver amplifiers, multiplexer and power supplies. Full electronic stabilisation is provided

(b) a 'dry end' module containing the controls, decoder, beam-former display electronics and a radar type PPI display.

The wet end may be either hull-mounted or housed in a towed submersible unit depending on individual user requirements. The sonar may be used when the ship is in harbour or at anchor to give warning of underwater saboteurs

CHARACTERISTICS

Size: (Towed body) 1·2 m long × 0·32 m diameter; (Static surveillance unit) 1·3 m long × 0·57 m diameter

Weight: (Towed body) 90 kg; (Static unit) 132 kg

Operating frequency: 83·3 kHz and 250 kHz

Range scales: 0 – 9 m, 18 m, 37 m, 75 m, 150 m, 300 m, 600 m, 1200 m

Range resolution: 1·1° azimuth × 90 mm range at 250 kHz; 3·3° azimuth × 90 mm range at 83·3 kHz

Towing speed: Any speed from 0 – 5 knots

Field cover: 360° × 15° elevation

STATUS

Fully developed.

CONTRACTOR

Marconi Underwater Systems Ltd, Elettra Avenue, Waterlooville, Hampshire PO7 7XS, England.

5862.453

MARCONI 360-DEGREE SURVEILLANCE SONAR

This 360-degree surveillance sonar has been designed specifically for the protection of vulnerable underwater installations and structures in harbours and similar situations.

The system consists of an in-water sonar sensor unit, operator display and control console, image processing console and an interconnecting underwater cable. Depending upon the amount of coverage required, several systems may be deployed from a self-contained, mobile control centre which, together with a purpose-designed deployment side, eliminates the necessity for additional site support facilities. Detection ranges up to 1·2 km radius are achievable, for example divers and chariots may be tracked out to distances of 400 metres and mini-submarines out to 1·2 km.

The sensors are primarily designed for active sonar operation though they also possess a passive sonar capability. Instantaneous all-round surveillance is provided by the sensors on a flicker-free display which is electronically stabilised in azimuth. A picture processing and automatic target detection system provides an operator alert, and also provides a CCTV standard picture for onward transmission to remote monitors.

CHARACTERISTICS

Sonar sensor

Dimensions: 1·3 m long × 0·57 m diameter

Weight: 150 kg in air

Operating frequency: 83 kHz

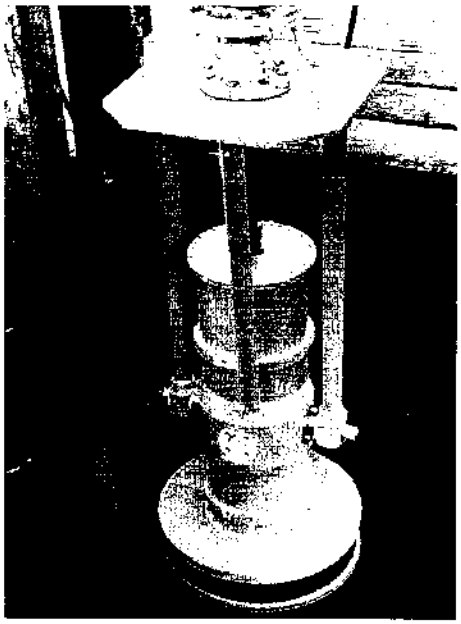
Azimuth resolution: 3·3°

Range resolution: 0·1 m

Azimuth field cover: 360°

Range scales: 0 – 9, 18, 36, 75, 150, 300, 600 and 1200 m

Dry end and display



Display: 12-inch diameter real-time monochrome display with a refresh rate dependent on range but typically 1/s

Marconi 360° surveillance sonar

4626.453

MARCONI AREA DEFENCE SONAR

Marconi has designed a 360-degree sonar based on the surveillance system described under **5862.453**. It has been specifically designed for extended range performance; the longer detection ranges provide much greater surveyed area using a single sonar head.

The system is available in both single and multiple frequency versions. Single fixed frequency versions are factory preset to one of three (high, low or mid) frequencies. The higher frequency version (68 Hz) is optimised for diver and free swimmer detection out to 500 metres from the sonar head, the low frequency (23 Hz) for submarine detection up to 3 km, and the mid-frequency (33 Hz) for well-balanced performance between the two. The multiple frequency version covers all three ranges and allows the operator to select any one frequency in the field. The sonar head is designed for either bottom mounting or for mid-water flotation using an attachable conformal low drag buoy.

The system produces a high resolution radar type PPI display with a fast refresh rate (typically one second) by means of a solid-state electronic scan. It will also provide a CCTV standard picture for transmission to remote monitors.

CHARACTERISTICS

Azimuth field cover: 360°

Azimuth resolution: 1·6°; 3·4°; 4·6°

Typical detection ranges

High frequency: 500 m (diver); 1 km (submarine)

Mid-frequency: 300 m (diver); 1·5 km (submarine)

Low frequency: 200 m (diver); 3 km (submarine)

Sonar head size: 0·75 m diameter × 0·68 m height

Sonar head weight: 130 kg (in air)

STATUS

In development.

CONTRACTOR

Marconi Underwater Systems Ltd, Elettra Avenue, Waterlooville, Hampshire PO7 7XS, England.

5859.453

STS 3000 INTEGRATED SONAR SYSTEM

The STS 3000 has been developed by Marconi as a private venture equipment. It has been designed specifically for use on conventional submarines within the 500 to 2500 ton displacement band. The equipment is of a modular design and incorporates a comprehensive range of capabilities, including passive detection and ranging, intercept and active sonars, underwater communications, and an integrated control and display console. Selected targets can be tracked automatically leaving the operator free to concentrate on new target opportunities. The simultaneous tracking of up to four targets is provided and additional tracking units can be added if required. The data display monitoring and control unit incorporates a light pen and soft keys to facilitate speed and ease of operation.

STATUS

In development.

CONTRACTOR

Marconi Underwater Systems Ltd, GEC Sonics Division, Sefton Park, Bells Hill, Stoke Poges, Buckinghamshire SL2 4TA, England.

5860.253

STS 3100 TOWED ARRAY SONAR

The STS 3100 has been designed for use on both surface vessels and submarines to provide a fully integrated, comprehensive solution to target detection and tracking. The overall system consists of a 'dry-end' containing the on-board processing and display equipment, and a 'wet-end' comprising the array and towing gear.

The on-board equipment comprises a data processor, single operator touch-sensitive console and an integral video display. A number of features have been incorporated, including four automatic trackers, remote hard-copy provision, real-time clock and date display and a hybridised front-end to ensure reliability and high performance.

The 'wet-end' of the system consists of a compact terminal unit which houses the array electronics, a lightweight winch, towing cable and the towed array. The latter incorporates integral instrumentation modules which provide depth, temperature and heading information, and hydrophone modules which sense any target's radiated noise. The complete array is lightweight, neutrally buoyant and easily deployed.

AIRBORNE SONOBUOY TELEMETRY SYSTEMS TYPES 864, 865, 866

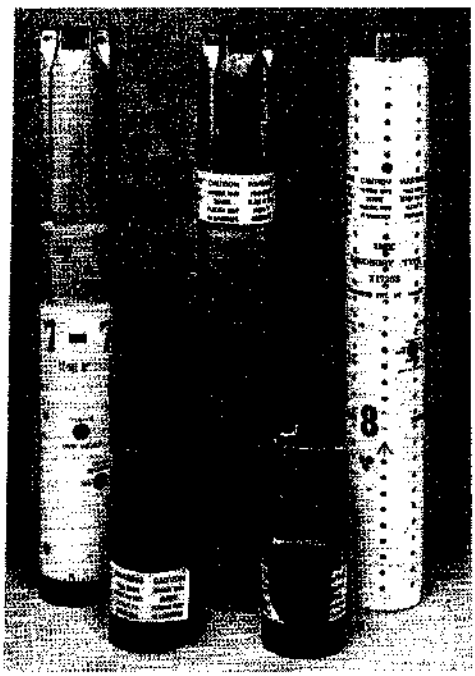
The GEC Sonics Division of Marconi has designed and manufactured a range of sonobuoy telemetry systems for use in a number of ASW fixed-wing aircraft and helicopters. The range offers multi-channel operation and is fully compatible with the majority of sonobuoys and processing systems in service. An antenna pre-amplifier unit ensures maximum performance with low noise even for large separations between antenna and receiver units.

The Type 864 is capable of handling simultaneously four or eight channels of FM telemetry from deployed sonobuoys transmitting on the 99 VHF channels, including Jezebel, Ranger and Batythermograph types. The Type 865 extends this range to the DICASS active type buoys. The Type 866 can handle up to eight sonobuoys of all current types, and is a high performance version for application on the Royal Navy's new EH 101 helicopter. Either manual or remote channel selection is available on all versions, via a computer bus, and receiver outputs are fully compatible with a wide range of existing sonics processors.

CHARACTERISTICS
Frequency band: 134·5 – 174·625 MHz
No of channels: 8 (4 per receiver)
Coverage: 101 RF channels plus test channel
Channel spacing: 375 kHz
Modulation: FM (FM/FSK for Type 866)

Dimensions
Pre-amplifier: 177 × 156 × 285 mm
Control unit: 146 × 190 × 142 mm
Receiver: 123 × 193 × 385 mm
Weights: 2·5 kg (pre-amplifier); 1·5 kg (control unit); 10 kg (receiver)

CONTRACTOR
Marconi Underwater Systems Ltd, GEC Sonics Division, Sefton Park, Bells Hill, Stoke Poges, Buckinghamshire SL2 4TA, England.



4453.363
ARR 901 SONAR RECEIVER
The ARR 901 is a multi-channel sonar receiver of modular construction for use in fixed wing maritime patrol aircraft. It simultaneously receives eight VHF channels which are selected by serialised digital commands from a processor or control unit. Advanced filter technology, extensive use of hybrid circuits and wideband techniques ensure high availability. An antenna preamplifier unit gives a low noise figure and the system's high dynamic range and wide bandwidth enables high speed telemetry data to be received.

The receiver provides its full RF performance when installed at up to 50 m from the preamplifier. All interfaces are to ARINC specification 404A. Outputs are compatible with existing aircraft data processing systems and with more advanced systems under development. A built-in test signal generator provides extensive check facilities for the receiver and associated processing equipment and is designed to facilitate servicing by automatic test equipment.
CHARACTERISTICS
Frequency band: 134·5 - 174·625 MHz
Frequency stability: ±3 ppm (at -26°C to +45°C-ambient temperature)

No of channels: 8
Channel coverage: 101 RF channels plus 2 test channels
Channel spacing: 375 kHz
Input impedance: 50Ω
Modulation: FM/FSK
CONTRACTOR
Marconi Underwater Systems Ltd, Elettra Way, Waterlooville, Hampshire PO7 7XS, England.

3769.453
DEL RANGER (SSQ-47B) SONOBUOY
The DEL Ranger is an omni-directional active sonobuoy, based on an American design, the AN/SSQ-47B, and intended for use in the detection, classification, tracking, and location of submarines. It is slightly lighter than the US model, but in most other respects the performance and operational characteristics are believed to be very similar. For comparison, see **1988.453**, later in this section.
CHARACTERISTICS
Type: Active
Length: 914 mm
Diameter: 124 mm

Weight: 13·2 kg
Transducer depth: 60 or 800 ft (18 or 244 m)
Sonar channels: 6 in 13-19 kHz band
Sonar power output: 200 W approx
Duration: 0·5 h
RF power output: 0·25 W
RF channels: 12
STATUS
Production against UK MoD contracts commenced in 1980.

Current DEL sonobuoy production range showing (rear from left to right) Jezebel, Ranger (SSQ-47B), and CAMBS, with the new miniature bathythermal sonobuoy (left) and the miniature Jezebel sonobuoy (right) in front

---

3502.453
JEZEBEL SONOBUOY
Jezebel is the code name for the standard A-size omni-directional passive sonobuoy system used by the Royal Air Force and the Royal Navy for the detection of submerged submarines. Most details remain classified but it has been stated that these sonobuoys have improved frequency response, a choice of three life settings and a deep hydrophone system which allows various operating depths to be selected.
STATUS
Many thousands of DEL Jezebel sonobuoys have been produced for the British forces over a period of years, and production is continuing, although contracts have been awarded for the newer miniature passive sonobuoy which is about one-third the length of the standard item (**3503.453**).
CONTRACTOR
Dowty Electronics Ltd, Communications Division, 419 Bridport Road, Greenford Industrial Estate, Greenford, Middlesex UB6 8UA, England.

3503.453
MINIATURE JEZEBEL SONOBUOY TYPE SSQ 904
This sonobuoy is designed to be launched from aircraft or helicopters at airspeeds between 60 and 325 knots and at altitudes between about 50 and 3000 m. Once deployed, it detects and amplifies underwater sounds to modulate the self-contained FM transmitter. The FM signals are received by the aircraft processor, which is currently the AN/AQA-5 system, but the sonobuoy is fully compatible with all known processors currently being designed, including the GEC Avionics AQS 901, AQS 902 and AQS 903.

A significant feature is the fact that this buoy is only about one-third the length of a standard A-size sonobuoy, and half the weight, yet is claimed to have precisely the same performance characteristics.
CHARACTERISTICS
Type: Miniature passive omni-directional
Frequency coverage: 10 Hz - 3 kHz
Hydrophone depth: Selectable from either 60 or 300 ft (18 or 91 m); or 60 or 450 ft (18 or 137 m)
Operating life: 1, 4 or 8 h
RF channels: 99 or 31
RF output: 1 W minimum

Dimensions: 30·5 × 12·5 cm (diameter)
Weight: 4·5 kg
STATUS
Production for UK forces commenced in 1980. A £20 million contract was received in mid-1984 from the UK MoD.
CONTRACTOR
Dowty Electronics Ltd, Communications Division, 419 Bridport Road, Greenford Industrial Estate, Greenford, Middlesex UB6 8UA, England.

3237.453
XI7255 COMMAND ACTIVE MULTI-BEAM SONOBUOY (SSQ 963)
The XI7255 command active multi-beam sonobuoy (CAMBS) is a new A-size sonobuoy developed by Dowty Electronics under contract to the British Ministry of Defence. It was first revealed at the 1976 Farnborough Air Show.

CAMBS is an advanced active directional sonobuoy, which features a high data rate, and directional information is obtained by the use of a transmitting acoustic projector combined with a directional receiving hydrophone array. Hydrophone depth is adjustable by radio command and there is a 31-channel radio telemetry link operating on standard NATO frequencies for communication with the parent aircraft. The antenna is a monopole with ground plane, erected by and integral with the buoy flotation bag. The design incorporates a flux-gate compass with very rapid stabilisation.
CHARACTERISTICS
Length: 914 mm
Diameter: 124 mm
Weight: 15·9 kg

Transducer depth: Adjustable
RF channels: 31
STATUS
The new sonobuoy is part of the equipment developed for the Mk II version of the Nimrod ASW aircraft. Full production was achieved during 1980.
CONTRACTOR
Dowty Electronics Ltd, Communications Division, 419 Bridport Road, Greenford Industrial Estate, Greenford, Middlesex UB6 8UA, England.

3770.453
DEL MINIATURE BATHYTHERMAL BUOY (SSQ 937)

This miniature bathythermal buoy is the second A-size buoy to have been reduced by Dowty to the new F size (A/3). It provides all the facilities of the SSQ-36 but is only one third of its size and half the weight.

CHARACTERISTICS

Length: 305 mm
Diameter: 124 mm
Weight: 5 kg
Operating depth: To 427 m
Descent rate: 1·5 m/s (to 305 m)
Temperature range: -2 to +35° C
Gradient accuracy: ±20%
Modulation frequencies: 1360 - 2700 Hz
Probe time constant: >1 s
RF power output: 0·25 W

STATUS

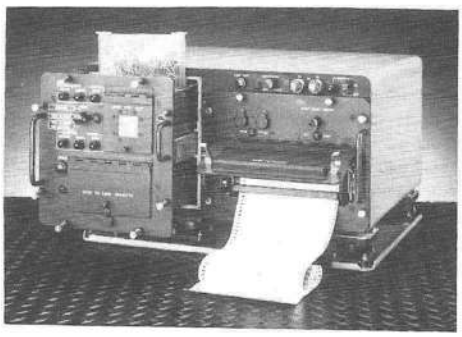
In full series production against UK MoD contracts.

CONTRACTOR

Dowty Electronics Ltd, Communications Division, 419 Bridport Road, Greenford Industrial Estate, Greenford, Middlesex UB6 8UA, England.

3789.453
PLESSEY-SIPPICAN XBT AND XSV

The Plessey-Sippican expendable bathythermograph (XBT) is a surface ship and submarine bathythermograph equipment which uses an expendable probe to obtain accurate and continuous ocean temperature against ocean depth measurements. These can be made in any sea state at ship speeds of up to 56 km/h (30 knots).



The Plessey-Sippican expendable sound velocimeter (XSV) is a new development which reduces the difficulties of direct collection of sound velocity data at sea. This system measures sound velocity directly with the ease and accuracy associated with the well known XBT system.

STATUS

XBT is in service with the Royal Navy and has been sold to over 20 countries. The XSV is now being adopted for service in a number of navies.

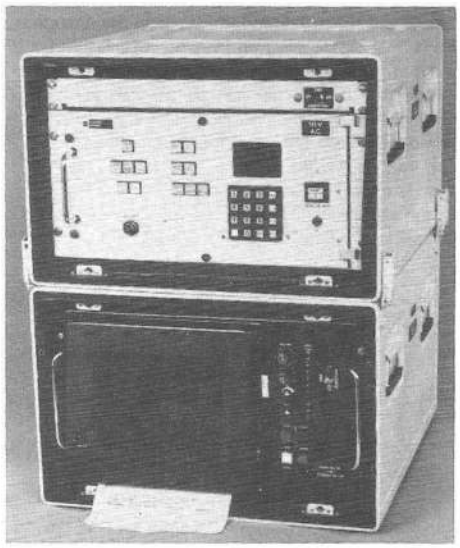
CONTRACTOR

Plessey Marine, Templecombe, Somerset BA8 0DH, England, under licence from The Sippican Corporation, Marion, Massachusetts 02738, USA.

XBT/XSV Mk 8 recorder

5638.263
PMS 75 SPEEDSCAN

The PMS 75 Speedscan is a self-contained equipment for ships already fitted with a compatible sonar system. It allows the sonar system to be operated in a sidescan mode and generates a hard copy printout of the sea bed. It can be fitted to all types of mine-hunting sonar.



When the sonar is operating with Speedscan, its transducer is trained 90 degrees to port or starboard of the ship's track. As the ship proceeds along a predetermined track, an area of sea bed, parallel to the track, is interrogated by the sonar. The received sonar data and reference timing signals are fed to the Speedscan processor which forms a sidescan beam and presents the processed data as hard copy on continuous recording paper.

The Speedscan equipment consists of two main assemblies, each contained in a portable case. In use the two cases are stacked and locked together with the end covers removed. The upper case houses the processor and the operator's control panel, the lower case the recorder unit.

Speedscan presents information on light-sensitive paper exposed in the recorder. On the record, the sea bed is represented as a series of parallel narrow strips of selected length, perpendicular to the ship's track. The sonar data from the whole azimuth sector scanned by the sonar is extracted by Speedscan to represent a narrow strip of sea bed along the sonar beam axis. This data is extracted by the beamformer to generate a parallel beam of sufficient width to overlap the strips covered by the two previous transmissions, so providing the 3-ping sample of each point of the sea bed along the range axis. The beamforming system is programmed by ship's speed and sonar range to provide a controlled interrogation of the sea bed. This information is used to intensify and modulate a light source in the recorder which draws a line across the record for each sonar transmission, echoes appearing as dark spots on the recording paper.

CONTRACTOR

Plessey Marine, Templecombe, Somerset BA8 0DH, England.

PMS 75 Speedscan

4681.273
NAUTIS-M SYSTEM

Nautis-M is an integrated navigation and action information system to provide the command, control and navigation facilities required for naval mine countermeasures. The Nautis (Naval Autonomous Information System) family of systems is modular in design and uses distributed processing rather than a central computer. The family consists of 10 versions, with applications in a wide variety of ships from aircraft carriers to small offshore patrol boats. It can be a single console/single operator system in the smaller type of vessel to a comprehensive multi-operator, multi-console equipment for larger ships. It has been developed by Plessey in association with CAP Scientific Ltd, the latter supplying all the software.

Nautis-M can consist of one, two or three consoles to meet the specific operational requirements and provides an effective method of co-ordinating and controlling the detection, classification and disposal of mines. The system takes in data from navigation, radar and sonar sensors, acts on this data and provides a variety of information and control. This includes operational planning, ship control guidance, a continuous record of own ship movements and sonar coverage, updated underwater and surface pictures, command and control facilities for mine countermeasures and comprehensive operational records.

Presentation is on a 'scissored-screen' viewing unit which combines plan-position display and computer data. Information is presented on mine countermeasures route boundaries, mine danger zones, own ship position, planned search path, current sonar coverage, hunted path, mine disposal vehicle position, and sub-surface contact and environmental data. A raster type screen can also be provided to give facilities for the simultaneous display of other information.

STATUS

Nautis-M has been ordered by the UK MoD for fitment to the Royal Navy's new single-role minehunters.

CONTRACTOR

Plessey Displays Ltd, Addlestone, Weybridge, Surrey KT15 2PW, England.

5654.363
MOSAIC ASW INTEGRATED SYSTEM

MOSAIC is an ASW mission avionics system designed to integrate the numerous sensors and navigation sub-sensors required in modern maritime and surveillance aircraft. It is intended for both fixed- and rotary-wing aircraft and allows selection of sensor and navigation sub-systems to meet particular requirements, and has the ability to obtain the benefits of an integrated system even when the sub-systems are of varying design standards. A major advantage is that multi-function controls and multi-purpose displays can replace the variety of individual controls and displays which are normally dedicated to each sub-system.

Suitable interfaces, controls and displays and data processors can be supplied together with a wide range of proven software to make the MOSAIC system particularly versatile. Use of a data highway between system elements, to interchange information, reduces hard wiring to a minimum and eases changes or additions to the system once installed. Using this type of integration system the wide choice of sensor options normally only available on larger aircraft can also be applied to smaller aircraft.

STATUS

In production.

CONTRACTOR

GEC Avionics Ltd, Airport Works, Rochester, Kent ME1 2XX, England.

4624.453
PLESSEY ACOUSTIC INTRUDER DETECTION SYSTEM

The Plessey Acoustic Intruder Detection and Harbour Surveillance system is intended for a variety of safety and security purposes. It provides coverage of jetty and harbour areas against swimmers, surface and subsurface craft by an automatic detection and alarm system. It is a totally intergrated system employing acoustic elements, radar and communications linked to a central command console.

Swimmer detection and craft location form the primary acoustic elements, the frequencies and coverage of these being matched to the environment and mission requirements. The secondary acoustic elements comprise an acoustic fence and VHF system. The fence provides within-harbour security and preliminary warning of possible violation.

STATUS

Early design stage.

CONTRACTOR

Plessey Marine, Templecombe, Somerset BA8 0DH, England.

5867.453
SWS 35 MINIATURE TOWED ARRAY

The SWS 35 is a mini towed array developed by Ameeco and is designed to be operated by as few as two men in a small boat. The 'wet-end' of the system is composed of a streamer approximately one metre long, equipped with hydrophones designed to detect acoustics in the frequency range 25 to 3200 Hz, and is towed by a winch-operated 150 metre long cable. Signals are fed into an on-board processor which produces broadband beams. The outputs are monitored by an operator, both aurally and visually using an FFT dual-channel spectrum analyser with 'waterfall' display. Two high frequency hydrophones, using a separate display, are also incorporated into the array to detect signals from targets using high definition sonar navigation systems. A variant of the system, known as SWS 40, includes a vertical array in the streamer. It is understood that a third variant, SWS 45, is also available and uses a static sea-bed horizontal array for protection of installations such as oil rigs.

STATUS

In late development for an unnamed customer.

CONTRACTOR

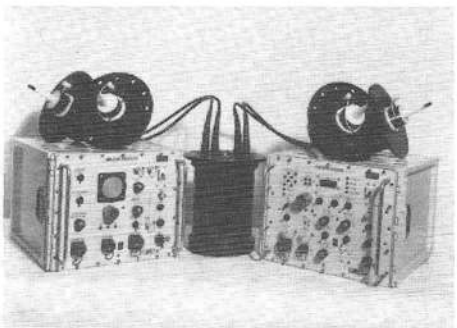
Ameeco Hydrospace Ltd, Oceanographic and Marine Division, 2 North Way, Andover, Hampshire SP10 5AZ, England.

4627.463
AMEECO TOWED ARRAYS

Ameeco Hydrospace Ltd has been the main supplier of towed arrays to the defence industry for some years and has supplied all the arrays for the Royal Navy surface ships and submarines. No details are available on technical construction but the company is now concentrating on arrays for the next RN requirement in this field, the Type 2031 and 2046 sonar systems. Although this is the next requirement, Ameeco is also carrying out research into increased performance and improvements that can be brought about by multiplexing, fibre optics, etc.

Ameeco is engaged in a number of other products in the underwater field such as seismic arrays for survey, torpedo firing systems, sound velocity meters and the design and supply of underwater cable assemblies. A subsidiary, Geophysical Systems Ltd, has produced an underwater orientation sensor for use in remote equipment to measure and transmit the heading, pitch and roll angles of the body in which it is positioned.

The share capital of Ameeco was acquired by Plessey in March 1985 and the company will operate in association with Plessey Marine.



CONTRACTOR

Ameeco Hydrospace Ltd, Oceanographic and Marine Division, 2 North Way, Andover, Hampshire SP10 5AZ, England.

4679.453
THORN EMI UNDERWATER ACOUSTIC RANGES AND SYSTEMS

Thorn EMI Electronics has a range of underwater acoustic systems from simple location transmitters and receivers, through acoustic altimeters to complete three dimensional tracking and navigation systems. Permanent, semi-permanent and portable installations are available.

In permanent installations, sea-bed mounted hydrophones are connected by cable to a shore-based control station and tracking is accurately referred to local geography. Where permanent installations are not possible, generally because of shallow water, a semi-permanent system may be used in which the hyrophones are deployed from a surface vessel and data is telemetered by radio to a permanent or portable shore station. In the fully portable system, hydrophone assemblies are suspended from flotation units on the surface, which are tethered to moored buoys, and data is telemetered to the control station housed in a transportable cabin, either ship or shore based. The mooring buoys are semi-permanent, and to operate the range the flotation units and hydrophone assemblies are deployed from a small boat. Such a system enables the location to be changed with the minimum of trouble and expense.

Torpedo Centred Tracker

The principal items of control equipment are radio, signal processors, X-Y plotter, magnetic tape recorder, depth display, teleprinter and electronics to generate the synchronising pulses to the range. System functions are controlled from a console and a real-time plot produces symbols denoting the positions of underwater vehicles being tracked, their depth being shown on a digital read-out. All data is recorded and the teleprinter gives a printout of the X, Y and Z co-ordinates.

All systems can be used in conjunction with Thorn EMI's deep mobile target (**4680.493**) or with static targets. Several vehicles can be plotted simultaneously and the system gives a record of the target and the performance of each weapon or ship involved in the exercise.

Target Centred Tracker (TCT)

This is a short base line system used to evaluate the performance of exercise torpedoes against submarine targets in the final phase of the attack. Two 4-hydrophone arrays are mounted on the submarine hull and received signals are cabled in-board to the processing equipment.

Fuze Actuating Static Target (FAST)

This equipment deploys tracking hydrophones in an array similar to TCT and consists of a framework providing a suitable magnetic signature to actuate weapon fuzes at close range and on acoustic targets for homing.

Distance Measuring Equipment (DME)

DME enables the slant range between a static or mobile acoustic transmitter and a receiving hydrophone to be measured with high precision.

Acoustic Transmitters

Various acoustic transmitters can be provided. DME Pinger is an acoustic pulse transmitter with a 2-wire arrangement for power supply and trigger signal which simplifies hull penetration on submarines. Various frequencies are available to suit tracking range standard. A dual-frequency version offering operational versatility between range has been developed.

Synchronised Acoustic Transmitter (SAT) is an equipment configured as a torpedo hull section for weapon tracking. It is self-contained and has an array of acoustic transducers mounted on the hull section to produce an optimised beam pattern.

STATUS

TCT and FAST have been supplied to UK MoD and negotiations with other navies are underway. Portable acoustic ranges have been supplied to the UK MoD, the Japanese Defence Agency and the Italian Navy. DME processing units were designed for the UK MoD and are incorporated in UK range systems. DME type acoustic transmitters and SAT have been supplied to the UK MoD, and SAT has also been supplied to Italy, Germany and Japan.

CONTRACTOR

Thorn EMI Electronics Ltd, Defence Systems Division, Albert Drive, Sheerwater, Woking, Surrey GU21 5RU, England.

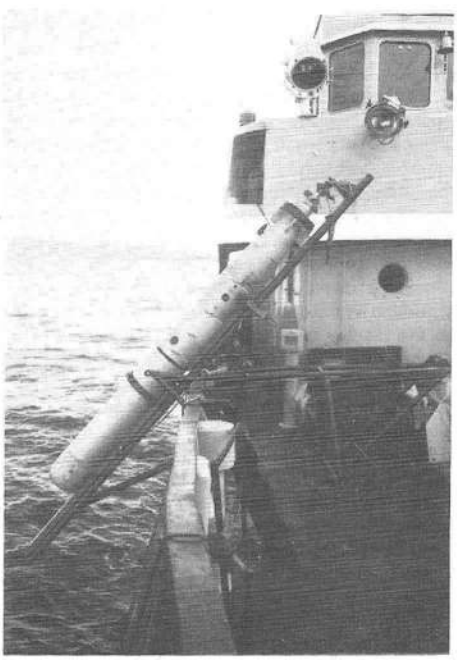
4680.493
DEEP MOBILE TARGET

The Deep Mobile Target (DMT) is a fully instrumented self-contained, unmanned ship-launched vehicle for use on ASW trials and training exercises to simulate the dynamic and acoustic characteristics of submarines and carry out pre-programmed manoeuvres. As well as being a trials and training facility, it is intended as a deep diving mobile torpedo target to avoid the costs, risks and delays associated with weapon trials against a submarine.

DMT is supplied to meet individual requirements for frequencies. It normally carries two sonar/sonics outfits which are interchangeable at base. When used in conjunction with a three dimensional underwater tracking system it is fitted with a SAT Type 5 (**4679.453**) acoustic transmitter for compatability with US, German, Italian and Japanese tracking ranges. A miss-distance indicator is incorporated.

DMT is claimed to be easy to handle and recover with high availability and reliability. The recovery system is initiated by command, failure of the propulsion battery, by being outside the preset depth limits or by program tape breakage.

CHARACTERISTICS



Length: 3·28 metres
Diameter: 0·324 metres
Weight: 236 kg
Speeds: Stop, 8, 14 and 22 knots
Endurance: From 100 minutes at 8 knots to 8 minutes at 22 knots
Depth: 355 metres (1165 feet)

STATUS

DMT was developed in conjunction with the United Kingdom Admiralty Underwater Weapons Establishment and has been supplied to the UK MoD and several other naval authorities.

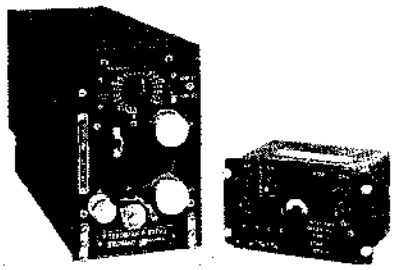
3777.363
AN/AKT-22(V)4 TELEMETRY DATA TRANSMITTING SET



The AN/AKT-22(V)4 telemetry data transmitting set forms an essential element of an airborne ASW installation for the operation of sonobuoys and the relaying of sonobuoy data to co-operating ASW surface vessels.

Two AN/ARR-75 radio receiving sets are included in the airborne element, providing eight VHF receiving channels. This configuration permits relay of up to eight passive sonobuoy transmissions, up to six channels of R-θ, and passive data of which up to four channels may be R-θ, or two channels of DIFAR sonobuoy data. An air-to-ship voice channel is available except when the DIFAR mode is used. The AN/AKT-22(V)4 produced by EDMAC consists of the following major units:

(1) transmitter-multiplexer T-1220B
(2) control indicator C-8988A
(3) antenna AS-3033
(4) actuator TG-229.

The multiplexer section of transmitter-multiplexer T-1220B/AKT-22(V)4 uses low-pass filters and VCOs to provide the eight-channel capability. The trigger filter assembly for this set is located in control indicator C-8988A/AKT-22(V)4. Setting any of the trigger-select switches on the control-indicator to the ON position disables data channels 3C and 4C. Composite trigger tones are brought into the multiplexer on a separate line and combined with the sonic and voice channels at the mixer-amplifier to form the composite FM modulation signal. This composite signal FM modulates the transmitter.

In the DIFAR operating mode, the composite FM modulation signal is disconnected from the transmitter input. Two DIFAR sonobuoy transmissions, received on dedicated receiver channels are demodulated in the receivers and are provided to the transmitter-multiplexer. The receiver output is conditioned in an amplifier-adaptor and the DIFAR-A sonic signal is conditioned in a low-pass filter. The DIFAR-B sonic signal is used to drive a VCO centred at 70 kHz and then passes through a bandpass filter. The two filter outputs are linearly combined, and the composite modulation signal is coupled to the transmitter input when the control-indicator mode select switch is in DIFAR position. Composite sonic or composite DIFAR input to the transmitter is selected by a relay in the DIFAR filter controlled by a switch in the control-indicator.

Two main elements of the EDMAC AN/AKT-22(V)4 telemetry data transmitting set: transmitter-multiplexer (T-1220B) left, and control-indicator (C-8988A) right

The shipboard receiving equipment required for the eight-channel data link is telemetric data receiving set AN/SKR-( ). The receiver demodulates and demultiplexes the composite sonic or DIFAR transmission, and routes the separate outputs to appropriate processing equipment.

CHARACTERISTICS

Transmitter-multiplexer (T-1220B) and control indicator (C-8988A)

Operating modes

(1) standby mode, which turns on and applies power to multiplexer circuits
(2) operate mode, which applies operational power to transmitter and enables multiplexing and transmitting of active data, passive data and voice signals
(3) DIFAR mode, which enables multiplexing and transmitting of 2 composite DIFAR signals.

Operating stability: Over 100 h (continuous or intermittent operation)

Output frequencies: 2·200 - 2·290 GHz, one of 20 switch-selectable S-band channels

Frequency accuracy: ±0·003% of specified unmodulated carrier frequency

Multiplexer inputs

(1) 8 sonic/sonar data channels (7 with 10 - 2000 Hz bandwidth; 1 with 10 - 2800 Hz bandwidth), 0·16 - 16·0 V rms
(2) 4 sonar trigger channels, 26 kHz - 38 kHz, 1·0 - 3·0 V rms
(3) 1 voice channel, 300 - 2000 Hz bandwidth, 0 - 0·25 V rms
(4) 2 composite DIFAR signal channels, 10 Hz - 20 kHz bandwidth; 3·6 V rms or 10·6 V rms nominal, switch-selectable to interface with AN/ARR-52A through AM-6695/AKT-22(V) or with AN/ARR-75 directly.

Multiplexer scaling: Input scaling is adjusted so that 16 V rms will cause full-scale deviation of VCO channels

Channel phase correlation: Difference in phase delay between any 2 passive data channels is less than 1° (10 - 500 Hz)

Antenna AS-3033

Polarisation: Vertical

Radiation pattern: Omni-directional in azimuth plane

Transmitting element frequency range: 2200 - 2290 MHz

RF power: 100 W max

Receiving element frequency range: Standard VHF sonobuoy channels

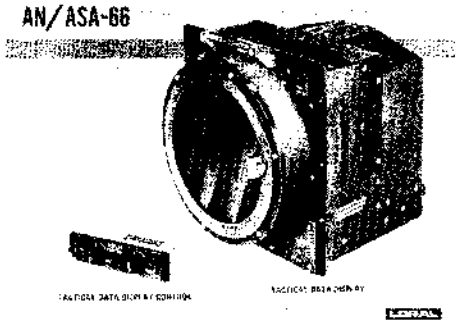
AN/ASA-66 TACTICAL DATA DISPLAY



The AN/ASA-66 is a multipurpose cockpit display for the P-3 Orion maritime patrol aircraft. A 9 inch (23 cm) diameter CRT provides pilot and co-pilot with real-time presentation of tactical situations. Graphic and alpha-numeric data are presented on the high brightness and contrast screen for viewing in either high ambient or controlled lighting conditions. The display is designed to be driven from a remote display generator to provide analogue deflection and video drive from computer data or direct from aircraft sensors.

STATUS

In operational service.

4012.373
AN/ASA-82 TACTICAL DATA DISPLAY SYSTEM

The AN/ASA-82 tactical data display system (TDS) is the primary data display for the US Navy S-3A Viking maritime aircraft. It serves as a real-time link between the four-man crew and the various electronic sensors which the aircraft carries for its task of maritime reconnaissance and anti-submarine warfare. High speed, high density data in the form of alpha-numeric symbols, vectors, conic projections and other appropriate display formats from both acoustic and non-acoustic sensors are presented to the crew. Information is stored, updated and refreshed by the on-board general-purpose digital computer and selectively displayed. Tactical and tabular data, controlled by the computer, are routed to the display via the display generator unit (DGU), which also provides the computer with display fault status information on a priority basis, controls the routing of display information, and generates the system built-in test functions.

The equipment consists of five CRT displays in addition to the DGU. The TACCO and SENSO (tactical co-ordinator and sensor operator) are each provided with identical multipurpose display units in their respective consoles. In addition, the SENSO has an auxiliary readout unit (ARU), the co-pilot has a multipurpose display, and the pilot has a display which presents a summary tactical plot. The DGU provides all of the displays with digital computer data except the ARU which receives acoustic data direct from the acoustic data processor.

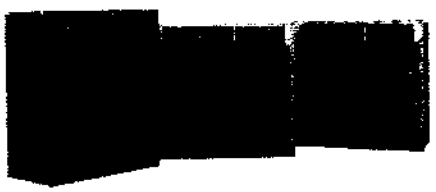
AN/AYA-8B ASW DATA PROCESSING SYSTEM



Since 1968, the General Electric Company has been producing the P-3C data processing system (DPS). The DPS equipment constitutes a major portion of the P-3C anti-submarine aircraft avionics.

The purpose of the AN/AYA-8B DPS is to provide an interface between the central computer and other aircraft systems. The main aircraft systems consist of the tactical co-ordinator (TACCO) station, non-acoustical sensor station, navigation communications (NAV/COM) station, acoustical sensor stations, pilot station, radar interface unit, armament/ordnance system, navigation systems, ARR-72 receivers (**3454.363**), submarine anomaly detector, and OMEGA. The DPS consists of four major logic units, as well as a selection of manual keysets and panels.

LOGIC UNIT 1 provides an interface to four types of peripheral information systems:

(1) manual entry
(2) system status
(3) sonobuoy receiver
(4) auxiliary readout display.

The manual entry sub-system provides the communication between the operator stations and the central computer of the man/machine interface. Each operator has a complex of illuminated switches and indicators by which he communicates with the central computer.

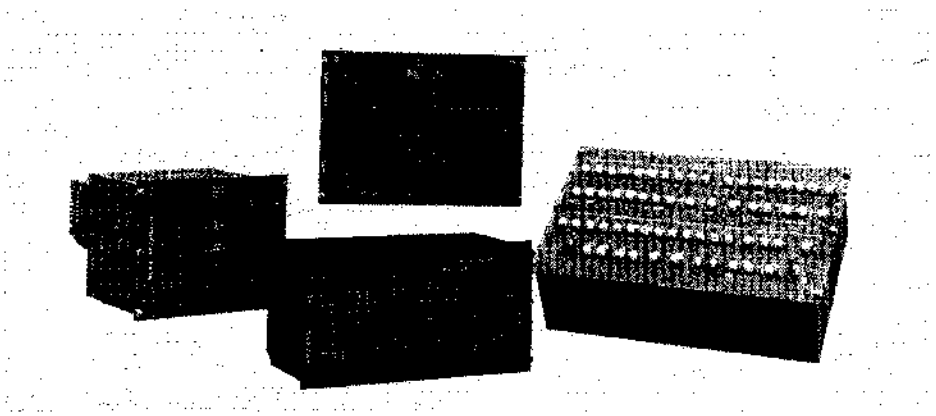
AN/AYA-8B modernised logic units for the P-3C aircraft

System status is received and stored by the status logic sub-unit of logic unit 1 and transmitted to the central computer. The status words are transmitted whenever any status bit changes or upon interrogation by the computer.

The sonobuoy receiver logic provides for the digital tuning of the sonobuoy receiver sub-system by the central computer. Each of the 20 receiver processor channels can be tuned to one of 31 RF cells by the central computer or manually by the operator.

The auxiliary readout display logic provides the digital interface between the computer and the ARO displays located at the TACCO station and the NAV/COM station.

LOGIC UNIT 2 provides digital communications to three major aircraft sub-systems:



(1) navigation
(2) armament/ordnance
(3) magnetic tape transports.

The interface between the central computer and the navigation system is provided by the navigation multiplexer sub-unit, which enables the computer to obtain data from the doppler radar set and two inertial navigation systems. An armament and ordnance interface provides the means for the central computer automatically to launch search and kill stores. The magnetic tape sub-system allows the computer to read and write digital information on magnetic tape transports.

LOGIC UNIT 3 provides the interface between the computer and three display sub-systems:

(1) TACCO multipurpose display
(2) sensor multipurpose display
(3) pilot display.

The TACCO multipurpose display logic sub-unit enables the computer to present characters, vectors, and conics on the TACCO display to assist the TACCO operator. A sensor multipurpose display logic sub-unit provides the same capability as the TACCO except that conics cannot be displayed on the sensor display. The pilot display logic provides the capability to present characters, vectors, and conics on the pilot's display.

AN/AYA-8B pilot keyset (front) with (left to right) ordnance panel, universal keyset, and armament/ordnance panel

LOGIC UNIT 4 provides for the expansion of the computer input/output capability by means of the data multiplexer sub-unit (DMS), furnishes an increased memory capacity by means of the drum auxiliary memory sub-unit (DAMS) and provides an interface between the computer and two aircraft sub-systems:

(1) OMEGA
(2) auxiliary display.

The DMS can service up to eight input and eight output peripherals as selected by the computer. One output channel is used by the auxiliary display logic (ADL) to provide the capability to present characters, vectors, and conics on the auxiliary display. One input channel services the OMEGA sub-system and one input and output channel is used for diagnostic purposes. The remaining channels are available for future peripherals. The DAMS increases the memory available to the computer by 393 216 words so that the operational program can be expanded to accommodate additional functions and sub-systems.

Keysets and Panels

Three universal keysets provide the navigation/ommunication operator and the two acoustic sensor operators with the capability of entering information into and receiving information from the computer program. The pilot keyset is used by the aircraft pilot to control information presented on his CRT display, to enter navigation stabilisation information into the computer, to drop or cause the dropping of smoke floats and weapons, and to enter information on visual contacts.

The ordnance panel is used to display commands from the computer to the ordnance operator concerning search stores, ie bin and chute number, and status information.

The armament/ordnance test panel provides the capability of monitoring each output to the aircraft armament and ordnance systems from the armament output logic unit and ordnance output logic sub-units of logic unit 2.

STATUS

In March 1978 General Electric received a USN contract worth $16·7 million to produce 14 AN/AYA-8B systems for use aboard P-3C aircraft as part of 'Update III' which adds new capabilities. Firstly an adaptive controlled phased-array antenna system, consisting of four antennas, is arranged in a diamond pattern on the underside of the aircraft fuselage. An advanced sonobuoy communications link receiver, presumably the AN/ARR-75(), is provided to extract data received from the sonobuoy signals, and also from simulated acoustic data on 99 radio frequencies to check the system on the ground. Finally an IBM Proteus acoustic analyser is added which processes the acoustic signals, and also determines whether the signals are produced by random ocean noise or by a source such as a submarine.

The first 'Update III' P-3C aircraft has been undergoing flight tests and production versions of the system were scheduled for delivery in May 1984.

CONTRACTOR

General Electric Company, Aircraft Equipment Division, French Road, Utica, New York 13503, USA.

3454.363

AN/ARR-72 SONOBUOY RECEIVING SET

The AN/ARR-72 sonobuoy receiver system is currently used on the P-3C patrol aircraft in conjunction with acoustic signal processors and a digital computer. The receiver system receives, amplifies, and demodulates frequency-modulated radio signals in the 162·25 to 173·5 MHz band transmitted by deployed sonobuoys. These radio signals contain information related to the frequency and directional pattern of the sound spectrum received by each sonobuoy hydrophone array. The baseband information from the receiver is demultiplexed and submitted to a special analysis and/or time correlation and doppler analysis by the acoustic signal processing equipment. Bathythermograph buoys and equipment enable determination of the seawater temperature for acoustic range measurement.

Monitoring of the RF level signals from the 31 on-line receivers enables the digital computer to perform many tactical functions such as the determination of the channel usage or presence of jamming prior to sonobuoy launching, connections of the proper channel RF receiver to each processor, and a determination of remaining sonobuoy life. These same RF level monitoring and channel selection functions may also be accomplished manually through the use of the receiver control-indicator boxes located at the individual sensor stations.

The AN/ARR-72 system is compatible with LOFAR, CODAR, BT, RO, CASS, and DICASS equipment currently being deployed. Specific sonobuoy types include: AN/SSQ-36, AN/SSQ-41, AN/SSQ-47, AN/SSQ-50, AN/SSQ-53, and AN/SSQ-62.

The AN/ARR-72 sonobuoy receiver system is a dual conversion superheterodyne VHF receiver system designed for receiving FM signals from deployed sonobuoys. Radio frequency signals are received at the dual aircraft VHF blade antennas, amplified by the system's AM-4966 dual RF preamplifiers, and provided to the CH-619 31-channel receiver assembly. Within this assembly a multicoupler distributes the preamplified RF to the 31 fixed tuned receivers where it is further amplified and demodulated to provide baseband audio and RF level signals.

The SA-1605 audio assembly accepts the baseband and RF level outputs of the 31 receivers and outputs them to the computer and processing equipment. Each of the 19 audio channels contains a 31 × 1 switching matrix to select the output of a given receiver. This receiver signal is then amplified and provided through two individually buffered outputs to the processing equipment. Selection of a particular receiver channel may be accomplished by the digital computer or the C-7617 dual channel control indicator. An individual 31 × 1 switching matrix is provided within the audio assembly to service the RF level requirements of the digital computer. This switching assembly is controlled by the computer and provides an integrated RF level for the selected receiver in a digital format upon computer interrogation.

STATUS

Operational. An advanced version sonobuoy receiver, probably the AN/ARR-75() is being supplied under the P-3C 'Update III' programme. See **3455.363** and **1982.363**.

CONTRACTOR

EDMAC Corporation, 7500 Main Street, PO Box 750, Fishers, New York 14453-0750, USA.

3455.363
AN/ARR-75 SONOBUOY RECEIVER

The AN/ARR-75 is compatible with all FM sonobuoys in US Navy inventory or in development. Among the improvements incorporated in this receiver are:

(1) single-conversion, frequency-synthesised local oscillator
(2) extremely high dynamic range
(3) linear phase response over broad spectrum
(4) threshold extension of sensitivity through the use of phase-locked demodulation
(5) true, balanced, floating audio output
(6) extremely high rejection of interfering signals
(7) built-in antenna filter utilising helical resonator techniques.

The AN/ARR-75 receiving set was developed as a replacement for the AN/ARR-52A, but may be used to replace the AN/ARR-72. Four AN/ARR-75 equipments can provide the 16 simultaneous audio output channels required in some patrol aircraft configurations with significant size, weight and cost savings. System reliability is improved since any receiver can be tuned to any sonobuoy channel, thus overcoming the limitations of fixed-tuned receivers for each channel.

As a replacement for the AN/ARR-52A (Y configuration), the AN/ARR-75 provides a reduction in volume of approximately 3:1 and a reduction in weight of approximately 2:1. The solid-state design, the use of high reliability components and the use of fixed-tuned circuits to eliminate tuning adjustments has resulted in a tenfold improvement in reliability according to the manufacturer. Operational adequacy of this receiver has been extensively proven in the S2G aircraft. It is currently installed in SH-3H, SH-2F, and LAMPS Mk III.

The AN/ARR-75 receives, demodulates and amplifies FM sonobuoy transmissions in the VHF band between 162·25 and 173·5 MHz, and provides the demodulated output for analysis and display equipment. The receiver is a general-purpose multi-channel FM equipment suitable for use in fixed- or rotary-wing aircraft.

The equipment consists of two units: the receiver group assembly OR-69/ARR-75, in which are the majority of the necessary electronic modules, and the radio set control C-8658/ARR-75. Their respective weights are 9·75 kg and 1·13 kg.

A 99-channel version, the AN/ARR-75 ( ), is also available and probably forms part of 'Update III' to the P-3C aircraft sonar system (see **1982.363**). Export versions include the model R-75 (31 channels) and the model R-75 ( ) (99 channels).

STATUS
Production.

4455.453
AN/WQC-2A SONAR COMMUNICATION SET

The AN/WQC-2A is a sonar underwater communication set for surface ships, submarines and shore installations. The system provides an SSB general voice and CW communication set consisting of a control station, remote control station, receiver/transmitter, and LF and HF transducers.

The system employs voice, audio and low speed telegraphy in two frequency bands: high (8·3 to 11·1 kHz) for close range and low (1·45 to 3·1 kHz) for long range. In addition the system facilitates the use, through separate input and output connectors, of a final transmitter amplifier in a frequency range of 100 kHz to 13 kHz.

The receiver/transmitter contains the main electronic assemblies of the sonar communication system. It consists of a rack-type cabinet with removable drawer assemblies containing the power supply and test panel assembly, the receiver/transmitter assembly and the final amplifier assembly. The primary functions of the receiver/transmitter are to develop the high-powered single sideband transmission from voice, audio and

Control and remote control stations for the AN/WQC-2A system

CW signals to drive the LF or HF transducers and to receive and demodulate signals received from the transducers. The receiver and transmitter outputs are made available to external tape recordings and monitoring equipment. The circuits are also capable of muting, or being muted, by other external equipment.

The control station contains the required controls, indicators, microphones, etc. The remote control station is a secondary operating position, if required.

The two transducers (LF and HF) have a horizontal (radial) omni-directional beam pattern. The electro-mechanical energy conversion is accomplished by piezoelectric ceramic elements which are totally encapsulated and covered by an acoustically transparent neoprene boot.

CHARACTERISTICS
Frequency bands: 1·45 – 3·10 kHz (LF); 8·3 – 11·1 kHz (HF); 100 Hz - 13·0 kHz (auxiliary mode)
Output power: 600 W (LF); 450 W (HF); 1000 VA (auxiliary mode)
Weights
Receiver/transmitter: 223 kg
Control station: 6·8 kg
Remote control: 4·1 kg
Transducers: (with 175 feet of cable) 200 kg (LF) 45·5 kg (HF)

STATUS
In production for US Navy and overseas navies.

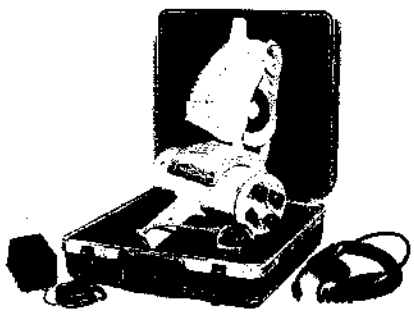
AN/PQS-2A HAND-HELD SONAR



The AN/PQS-2A is a continuous transmission, frequency modulated hand-held non-magnetic sonar set intended for use by divers to locate and close on submerged objects such as mines, lost equipment, downed aircraft and sunken vessels in depths to 300 feet (91 m). Because of its non-magnetic construction, the set can be used safely when working near magnetically-influenced underwater explosive devices.

The equipment has an active (continuous transmission) mode and a passive (listening) mode. In the active mode, one of three range scales is selected (20, 60 or 120 yards (18, 55 or 110 m)) and an acoustic signal is transmitted over a 30 kHz bandwidth, swept from 114 to 145 kHz. When a submerged object is detected a ringing tone, proportional in frequency to the distance of the object, is produced in the earphones. The sonar has a 6° beamwidth and can detect a 12-inch (30·5 cm) diameter air-filled sphere at 120 yards (110 m). In the passive mode, the unit detects active sound sources (pingers) in the 24 to 45 kHz range. The sonar can detect a 39 kHz acoustic beacon at a range of at least 2000 yards (1800 m).

CHARACTERISTICS
Transmission: Continuous transmission frequency modulated (CTFM)
Read-out: Variable audio tone according to range
Active sonar range: Three ranges 18, 55 and 110 m
Passive range: Up to 1800 m
Weight in water: 0·23 kg (positive buoyance collar included in accessories)
Size: 31·75 cm long by 11·43 cm diameter

STATUS
An initial production order for 204 units has been received from the US Navy.

CONTRACTOR
General Instrument Corporation, Government Systems Division, 600 W John Street, Hicksville, New York 11802,USA.

AN/PQS-2A hand-held sonar

3788.363
SPARTON AIRBORNE SONAR PROCESSING EQUIPMENT

Sparton's modular airborne processing systems and components are a flexible, lightweight, low-cost means to process and display data from sonobuoys and similar submarine tracking devices. The modular approach allows individual units to be used separately or combined to form a compact system capable of processing and displaying signals from most of the sonobuoy types currently in use or being developed. Typical hardware is described briefly in the following paragraphs although more detailed information is given in earlier editions of *Jane's Weapon Systems*, under this entry number.

Active Processing System

The active processor system consists of five modules: command signal transmitter; command signal generator; active processor; sonar display; power supply. The active processor system is capable of simultaneously processing and displaying two AN/SSQ-47 or AN/SSQ-522 active sonobuoys. The system can also be modified to provide two-channel processing and displaying a single AN/SSQ-50 or AN/SSQ-523 command active sonobuoy. The modifications provide the matched filter processing required for the additional CW pulse lengths and an FM processor utilising replica correlation. The system can be further expanded to process and display the AN/SSQ-62 or proposed DICANCASS directional command-active sonobuoys by the addition of a sixth module. This module contains a digital arc tangent computer that calculates and displays bearing with a direct readout in degrees.

Command Signal Generator

The command generator is the active sonobuoy's information source. It is a dual-channel control unit that generates the sonar pulse information for two sonobuoys. Selected channels from the sonobuoy receiver are routed to the active processor. The command signal generator also provides the active processor with trigger pulses and other digital control information.

Active Processor

The active processor is a lightweight, dual-channel unit capable of simultaneously processing two command-active sonobuoys. It automatically analyses information for the detection and localisation of submarines. It is completely solid-state, with integrated circuits used extensively in the analyser portion of the unit. The processed signals

from two sonobuoys can be displayed in a split-screen mode on the sonar display.

Sonar Display

The sonar display can be used with the active processor to provide target range and doppler information in the CW mode and target detection and range information in the FM mode. The Sparton sonar display utilises a variable-persistence cathode-ray tube that provides bright, high-quality readouts. In use, the screen is divided vertically into two displays where a combination of A scans or B scans can be displayed for either one of two sonobuoys simultaneously. Persistence time is adjustable from zero to full storage. Stored spot resolution is equivalent to 20 lines/cm.

CHARACTERISTICS

Display: 2 channels, A and/or B scan
CW: Target range and doppler
FM: Target detection and range
Display integration: Variable-persistence CRT for time integration
Controls
Threshold: Provides capability to optimise target detection

TD-1135/A Demultiplexer Processor/Display

The TD-1135/A is a high-quality instrument for testing directional frequency analysis and ranging (DIFAR) and directional command active (DICASS) sonobuoys. The TD-1135/A accepts a composite DIFAR/DICASS signal from any standard sonobuoy receiver, demultiplexes it, and displays the output as a radial vector on a variable-persistence CRT calibrated in degrees from magnetic north. North-south, east-west and omni-directional outputs are provided for computer analysis if greater accuracy is required.

Designed for use with standard sonobuoy monitoring equipment, the TD-1135/A is compatible with receiver types AR/ARR-52, AR/ARR-72, and AR/ARR-75, and with analyser display group types AN/AQA-3, AN/AQA-4 and AN/AQA-5. Included with the TD-1135/A is a Sparton DFS-101A digital frequency synthesiser, with crystal oscillator reference, which is tunable in discrete steps over the entire DIFAR/DICASS frequency band. If an AN/AQA -3, -4 or -5 is not available, the TD-1135/A and frequency synthesiser can be modified by adding a spectrum analysis capability.

TD-1135/A demultiplexer processor/display

The TD-1135/A demultiplexer is available as a separate unit for operation with DIFAR or DICASS sonobuoys.

CHARACTERISTICS

Frequency range: Broadband DIFAR audio
Input impedance: 10 kΩ minimum
Output impedance: 10 kΩ max
Variable gain: 48 dB manual or remote
Time constants: 0·1, 1 and 10 seconds
Phase pilot bandwidth: 1 Hz max
Processor analysis bandwidth: 1 Hz max
MTBF: 1500 h minimum
Outputs available
Demultiplexer: N-S, E-W and omni
Processor: N-S, E-W and omni

Spectrum Analyser

The Sparton spectrum analyser is a low-cost, special-purpose digital processor that performs real-time spectral analysis. The signature of the target being analysed is displayed simultaneously, using both channels of the Sparton sonar display. Discrete Fourier transform technology is used with circuits operating at optimally low bit rates. Features include linear integration of spectral estimates, manual or automatic modes, internal cursor for accurate frequency identification, and total spectrum coverage.

CHARACTERISTICS

Frequency range: 14 - 912 Hz
Frequency bands: 14 - 114 Hz (0·25 Hz resolution); 112 - 912 Hz (2 Hz resolution)
Number of spectral estimates per band: 400
Linear integration of spectral estimates
Manual: 1 - 100 samples
Automatic: 100 samples
Input amplitude dynamic range: 80 dB

OL-5003(-)/ARR Signal Processor Group

The Sparton OL-5003(-)/ARR sonobuoy signal processor is a lightweight, versatile, active processor and display system. Designed to make data from either the AN/SSQ-47 or AN/SSQ-522 sonobuoys instantly available with minimum operator involvement, the OL-5003(-)/ARR automatically synchronises with sonobuoy range trigger, analyses signal returns for echo level and doppler, and displays the result on a variable-persistence storage cathode-ray tube. The single display tube simultaneously presents, in a split-screen mode, the data from two sonobuoys. The B-scan format displays range on the horizontal axis, doppler on the vertical axis, and echo level on the intensity axis.

The OL-5003(-)/ARR processor is completely solid-state with the exception of the storage CRT. Integrated circuits are used extensively in the analyser portion of the unit. The processor is also compatible with the AN/SSQ-523 sonobuoy system in the short-pulse mode.

CHARACTERISTICS

Analysis bandwidth: 10 Hz
Doppler coverage: Compatible with AN/SSQ-47B or AN/SSQ-522 sonobuoy
Doppler accuracy: ±1 knot
Range scale: Selectable, 3600 or 7200 yards
Power: 120 W (115 V, 50 - 400 Hz, single phase)

DICASS Command Signal Monitor

The Sparton DICASS (directional command active sonobuoy system) command signal monitor is used to monitor valid command signals during testing of the AN/SSQ-50. The unit is self-contained and requires a UHF antenna and 115 V AC for operation. It provides a permanent printed record of the VHF channel command, identification of command function, RF signal level during command, time of signal transmission, length of command, and RF signal level prior to command.

Sea Noise Directionality and Level Indicator (ID-1872/A MOD)

The ID-1872/A MOD adds the ambient sea noise directional estimator (ANODE) function to a standard ambient sea noise indicator. It maintains the capability of the ASNI ID-1872/A, which measures and displays the omni-directional sea noise level sensed and transmitted by an AN/SSQ-57 sonobuoy and adds the ANODE function.

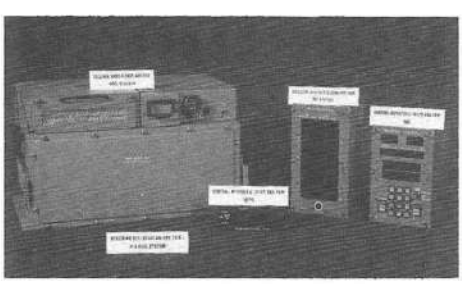
CHARACTERISTICS

Analysis centre frequency: 50, 100, 200, 440, 1000, 1700 Hz
Analysis bandwidth: 25 Hz
Weight: 3·18 kg

CONTRACTOR

Sparton Corporation, Electronics Division, 2400 E Ganson Street, Jackson, Michigan 49202, USA.

3778.363



AN/ARR-78(V) ADVANCED SONOBUOY COMMUNICATION LINK (ASCL)

The AN/ARR-78(V) radio receiving set, also known as ASCL (Advanced Sonobuoy Communication Link), is for the operation and management of anti-submarine sonobuoys by the crew of ASW aircraft such as the P-3C Orion (Update III) maritime patrol aircraft, S-3B Viking and LAMPS III helicopter. The equipment comprises five main items (described below) which can be employed with an associated AN/ALQ-158 airborne adaptive controlled phased array antenna system and an on-board ASW signal processor. The main units of the AN/ARR-78(V) are:

(1) the AM-6875 RF preamplifier is an optimised high performance, low noise VHF preamplifier which provides amplification and pre-filtering of received RF signals
(2) the R-2033 radio receiver contains 20 fully synthesised high performance receiver modules (16 acoustic and 4 auxiliary), and one each of the following modules: RF/ADF amplifier multi-coupler, reference oscillator, PROTEUS digital channel, I/O processor, clock generator, BITE, and DC power supply module. Each single conversion receiver module includes mixer conversion, frequency synthesised LO, demodulator, and output interface circuits. Each of the acoustic receiver modules processes FM/analogue signals at any of the 99 channels in the extended VHF band. Each of the four auxiliary receiver modules processes FM/analogue signals at any of the 99 channels and provides one channel for selection and processing of the on top position indicator (OTPI) signals; two channels for the operator to monitor acoustic information; and one channel to monitor the RF signal level in any of the RF channels. Common receiver modules are interchangeable.

BITE circuits provide comprehensive end-to-end evaluation of each receiver from the VHF preamplifier to the receiver output interface circuits. BITE is initiated automatically by the computer (such as PROTEUS) and/or by the operator through the indicator control unit (ICU). Performance status is displayed on the ICU and routed to the computer

(3) the C-10126 indicator control unit (ICU) provides the operator with a means for manual control of each receiver channel frequency assignment, receiving mode, self test. It also displays status of the receiving set and operator entry information
(4) the ID-2086 receiver status indicator continuously displays the control mode setting, the RF channel number, and the received signal level for each receiver
(5) the C-10127 receiver control unit provides the operator with control over the OTPI channel frequency.

AN/ARR-78(V) sonobuoy communications link equipment

Surface acoustic wave (SAW) IF filters are incorporated to provide high selectivity, coupled with good linear phase characteristics which yield low levels of distortion. Microprocessors are used in the ICU and I/O module to process the commands to, and display status data from the receivers. Versatile programs accommodate changes without requiring aircraft modification.

The auxiliary receivers permit the operator to aurally monitor analogue signals in any of the 99 RF channels without interrupting data processing in that channel.

CHARACTERISTICS

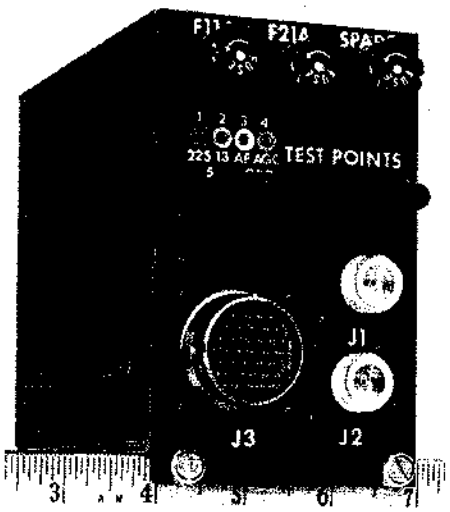
Frequency: Extended VHF
Receivers: 20 (16 acoustic/4 auxiliary) for P-3C/S-3B ASCL configuration; other configurations available
Channels: 99 per receiver
Audio output
Analogue: 2 V or 4%V rms balanced
Power input: 115 V AC ±10%, 380 - 440 Hz, 3 phase 450 W; 18 - 32 V DC, 7 W; 26·5 V AC, ±10%, 400 Hz, 50 W
Dimensions
AM-6875: 7·6 × 14·6 × 10·8 cm; Wt: 0·95 kg
R-2033: 30·9 × 54·1 × 38·9 cm; Wt: 45·9 kg
C-10126: 22·9 × 14·6 × 16·5 cm; Wt: 3 kg
ID-2086: 26·7 × 14·6 × 12·7 cm; Wt: 1·9 kg
C-10127: 5·7 × 14·6 × 8·3 cm; Wt: 0·6 kg

STATUS

Full-scale development was completed in 1980 under US Navy contracts. The first production contract for P-3C systems and S-3B systems was awarded in December 1982. Applications include derivative

configurations for the S-3B maritime aircraft and the LAMPS III helicopter. A new version, the ASCL-IV, is in development. This is an upgraded communications link which provides a capability of simultaneous reception of signals from four sonobuoys.

CONTRACTOR
Hazeltine Corporation, Greenlawn, New York 11740, USA.



3776.253
RADIO RECEIVER R-1651/ARA SONOBUOY OTPI

The R-1651/ARA is a VHF radio receiver of solid-state construction used in locating sonobuoys. It also acts as a receiving converter when employed with compatible automatic direction finding (ADF) systems; when a command is initiated in the control unit of the ADF, the R-1651/ARA switches the direction finder from a UHF/ADF function to a VHF sonobuoy on-top position indicator/locator (OTPI) mode. The equipment is a replacement for the obsolete R-1047 A/A.

The R-1651/ARA is fitted in ASA patrol aircraft or helicopters and used with the AN/ARA-25 direction finder group. It receives, amplifies, and demodulates RF signals from deployed sonobuoys on any one of 31 RF frequencies within the range 162·25 to 173·50 MHz.

STATUS
Production.

CONTRACTOR
EDMAC Corporation, 7500 Main Street, PO Box 750, Fishers, New York 14453-0750, USA.

EDMAC R-1651/ARA sonobuoy OTPI radio receiver

AN/SQR-18A TACTICAL SONAR TOWED ARRAY (TACTAS)

The AN/SQR-18A sonar has been designed to enhance the air/sea warfare capabilities of the US Navy surface fleet. Its long-range, passive detection capability complements the hull-mounted sonar of the US Navy FF 1052 (Knox) class frigates. The 800-foot long array consists of an acoustic section, a vibration isolation module and a rope drogue. It is towed behind the variable depth sonar (VDS) body of the AN/SQS-35(V) (**4179.453**). Preamplifiers are in the VDS body, while signal processing and other electronics are on board the ship.

The AN/SQR-18A is being upgraded to the AN/SQR-18A(V)1, which will include a "noise canceller" that will remove own-ship radiated noise from the operator's display. Another version, the AN/SQR-18A(V)2, will have its own towing and handling capability, permitting it to be used on ships without a VDS.

STATUS
In use with the US Navy, and with the Netherlands and Japan. Approximately 40 AN/SQR-18A systems have been delivered to the US Navy and are being progressively updated to AN/SQR-18A(V)1 standard. One system is being used by the Italian Navy on sea-trials.

CONTRACTOR
EDO Corporation, Government Systems Division, 14-04 111th Street, College Point, New York 11356, USA.

AN/SQR-18A console/display

4463.253
AN/SQR-19 TACTICAL SONAR TOWED ARRAY

The AN/SQR-19 is a passive towed sensor array designed to give surface vessels long range detection and tracking of both submarines and surface ships. It includes a towed sensor array with improved ranging ability and reduced self-noise; a handling system which improves system performance by maintaining array position and depth; and a sophisticated signal processing system providing more sonar information with less operator workload. It is designed for installation on several classes of frigates, destroyers and cruisers including Aegis system ships.

STATUS
The first operational system was installed on board the USS *Moosbrugger* (DD 980) early in 1982 and has completed both technical and operational evaluation. It will be fitted in several classes of frigates, destroyers and cruisers, including Aegis ships. Gould has been awarded a number of contracts for the system, including one of $123 million for the Canadian Navy and another for $71 million for the US and Spanish navies. Initial deliveries were scheduled for mid-1985.

CONTRACTOR
Gould Inc, Defense Electronics Division, 6711 Baymeadow Drive, Glen Burnie, Maryland 21061, USA.

2536.253
AN/SQS-53/26 SONARS

Claimed to be the most advanced surface ship ASW sonar in the US Navy inventory, the AN/SQS-53 is a high-power, long-range system evolved from the AN/SQS-26CX. Functions of the system are the detection, tracking, and classification of underwater targets, and also underwater communications, countermeasures against acoustic underwater weapons, and certain oceanographic recording uses. Target data obtained by the sonar is transmitted to the ship's Honeywell Mk 116 digital underwater fire control system. The latter translates target range, bearing, and depth data sent from the sonar to the ship's central computers into signals controlling the launch of ASW weapons (ASROC or torpedoes).

The AN/SQS-53 can detect, identify, and track multiple targets and is the first USN surface ship sonar designed specifically to interface directly with a vessel's digital computers. The system has a cylindrical array of 576 transducer elements housed in a large bulb dome below the water line of the ship's bow. There are 37 cabinets of signal processing, transmitting, and display equipment. Passive and active operating modes are possible.

There are three active modes:
(1) surface duct
(2) bottom bounce
(3) convergence zone.

The surface duct mode depends upon sound energy being transmitted essentially in the horizontal plane. Because of the high level of noise introduced into the return signals near the surface, this mode is useful only for relatively short distances. Nevertheless, this method is conventional for many surface ship sonars, and the high transmission power of the AN/SQS-53 is stated to provide longer range capability in the surface duct mode than previous sonars.

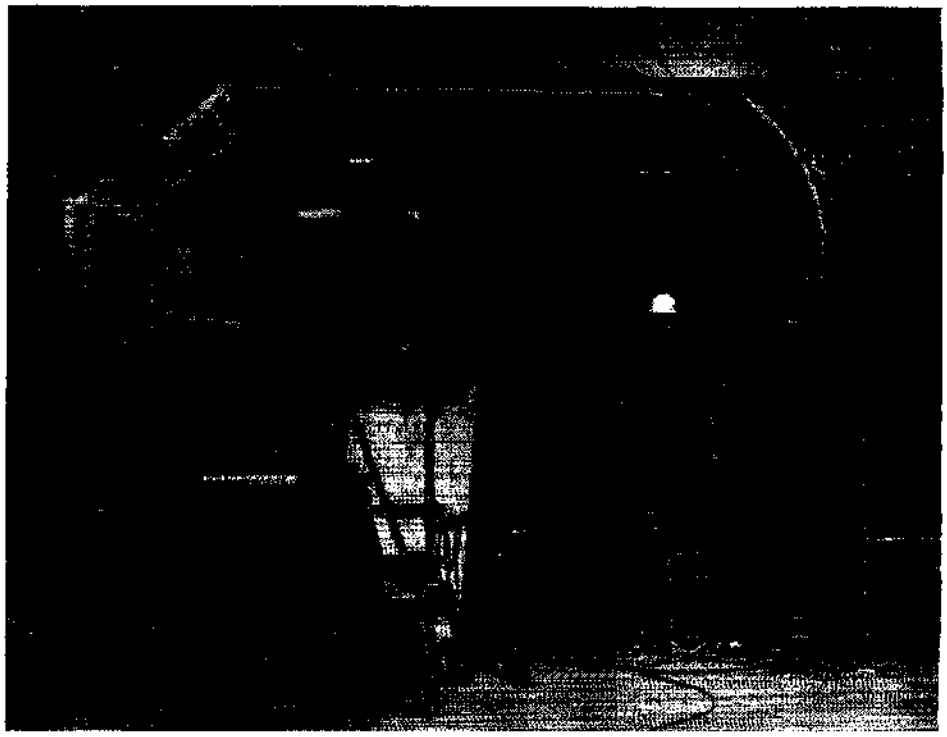
In the bottom bounce mode the sound energy is directed obliquely toward the sea bed. The energy is reflected upward from the ocean floor toward the

Bow housing of SQS-26 sonar

surface at considerable distances from the ship. Submarine echoes are received via a similar return path. This method is useful in waters of more than certain minimum depths and where the sea bed has the requisite favourable characteristics.

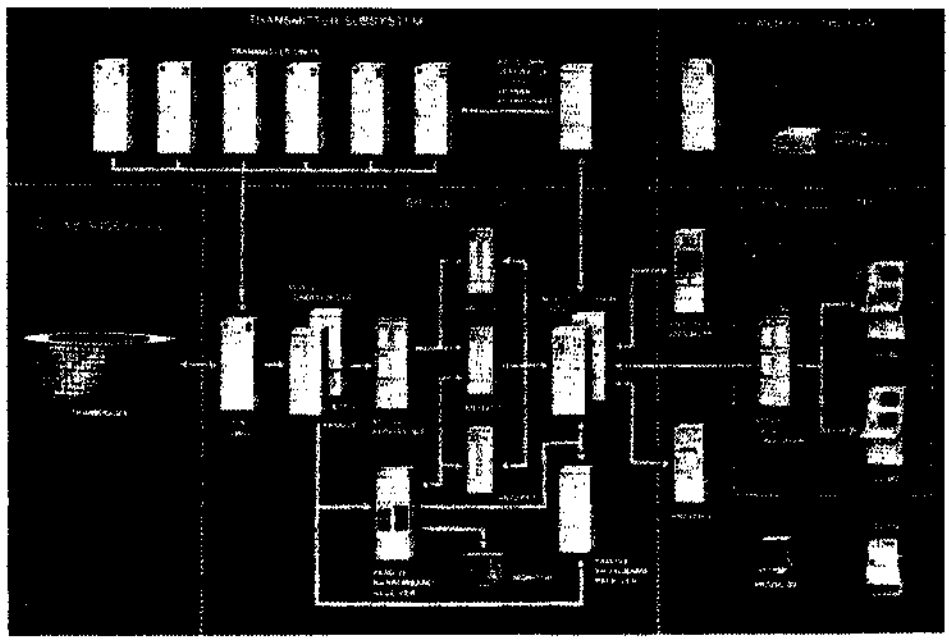
Convergence zone mode operation takes advantage of the characteristics of very deep water. The sound energy is refracted downward due to the temperature and pressure conditions near the surface, but, as depth increases, these physical effects change and the sound path alters direction to cause the energy to return to the surface in a coarsely focused convergence zone. This zone can form at great distances from the ship, and provides the longest range of coverage for the sonar when the water conditions are favourable for this mode of operation.

Passive detection gives the bearings of targets based on their own noise generation, rather than by echo location. It has proved a valuable method on the currently deployed AN/SQS-26 equipped ships, especially at low speed. The *Spruance* and her successors are expected to have improved passive detection capabilities at higher speeds due to improved noise suppression measures. The passive mode can be operated simultaneously with the active modes.



STATUS

The AN/SQS-26 is fitted in ten FF1040 'Garcia' class frigates; six FFG-1 'Brooke' class missile frigates; and 46 FF1052 'Knox' class frigates. The AN/SQS-53 is being fitted in DD963 'Spruance' class destroyers as they are built and a total of 30 ships is planned. The five CGN-38 'Virginia' class nuclear cruisers are fitted with AN/SQS-26CX or AN/SQS-53A systems. An updated version, known as the AN/SQS-53B, is in service and a $77 million contract was awarded to Hughes Aircraft Company by the US Navy for 23 AN/SQS-53B digital display sub-systems.



A new version of the system, the AN/SQS-53C Battle Group Sonar, has been developed by General Electric. The AN/SQS-53C is a much more advanced system which uses 22 fewer cabinets with a consequent reduction in cabling, etc. The new version uses seven Sperry AN/UYK-44(V) computers linked together in a multiple embedded configuration.

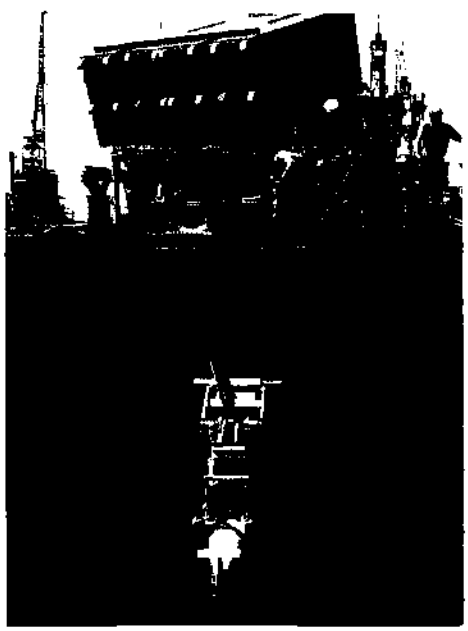
AN/SQS-35 VARIABLE DEPTH SONAR AND AN/SQS-36, AN/SQS-38 HULL-MOUNTED SONARS

These systems have been designed to detect submarines at medium-ranges in both deep and shallow waters. The AN/SQS-35 and the AN/SQS-38 sonars have been in service with the US Navy since the mid 1960s.



The US systems are improved miniaturised solid-state versions of previously developed vacuum-tube equipments manufactured for the Italian, Norwegian and Japanese Navies.

Some versions combine both variable depth capability and hull sonar capability, selectable by the sonar operator at the control console.

Weapons associated with the system are the Mk 44 torpedo and ASROC (USA), Terne (Norway) and Lanciabas (Italy). Over 75 systems have been delivered.

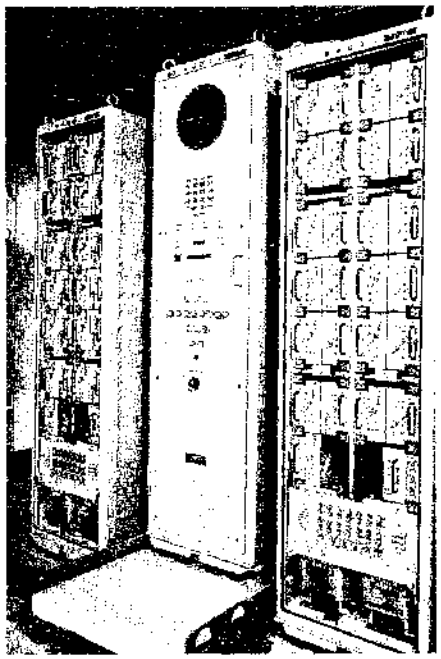
RAYTHEON STANDARD SONAR TRANSMITTER (SST)

The Raytheon SST provides sonar systems with the benefits of modern, solid-state technology, for example greatly reduced maintenance costs through increased reliability, plus very significant space savings relative to vacuum tube transmitters. This transmit sub-system is made available for system modernisation or for new system applications.

Configured to meet a specific system's requirements, the SST consists of multiple one kW modules with associated power supplies. As configured for the AN/SQQ-23 and AN/SQS-23 sonars upgrade, the sub-system consists of two cabinets of 24 modules each and a performance monitor/system interface cabinet. It replaces more than 30 units of the previous transmitter, including all of the energy storage motor generators.

CHARACTERISTICS



Standard 1 kW module (1 per channel)
Power output: 1 kW
Operating frequency: ±1·5 kHz (nominal)
Distortion: 6% max
Load: Nominal ±100%
Duty cycle: 15%
Linearity: ±1 dB from 0 to −12 dB
Gain adjustment: 3 dB
Protection: Short circuit and over-temperature
Mean time to repair: 3 minutes
Weight and size: 1651 kg in 1·2 × 1·8 m of deck space
SST as manufactured for AN/SQQ/SQS-23
Power requirements: 115 V AC 60 Hz 1-ph, 0·37 kVA, 0·92 PF; 440 V AC 60 Hz 3-ph, 128 kW (Max 0·9 PF)
Modes of operation
(1) Transmit: same as any associated system such as omni, sector, FM or CW
(2) Performance monitoring: automatic and manual
(3) Self-test: receiving system not required.

STATUS

Current production includes transmitters for five navies. Similar transmitters are used on the AN/BQS-13, AN/SQS-56, DE1160 series and the AN/SQQ/SQS-23 sonar systems. An air-cooled version of the SST has also been delivered in a programme to upgrade the AN/BQS-4 submarine sonar.

Raytheon Company, Submarine Signal Division, Portsmouth, Rhode Island 02871, USA.

Raytheon standard sonar transmitter

1807.453
AN/SQS-56/DE1160

The AN/SQS-56 is a modern hull-mounted sonar developed as a company funded product by Raytheon's Submarine Signal Division and now in production for the US Navy's FFG-7 class frigates. The US Navy has provided the AN/SQS-56, via the Foreign Military Sales (FMS) programme, to Saudi Arabia for its PCG ships and to Australia for its FFG-7 class frigates. Turkey is procuring this sonar, via US FMS, for its MEKO 200 programme. Versions commercially exported with the designation DE1160 are operational on the Italian Navy's 'Lupo' class frigates and the Spanish, Moroccan and Egyptian navies 'Descubierta' class frigates, and are being considered for new ships of several other navies. The DE1160, when configured with 36 kW transmitters, is identical to the AN/SQS-56. Outfitted with a VDS array and handling subsystem, it becomes Raytheon's DE1164 sonar (**3115.453**) and is installed in the Italian Navy's 'Maestrale' class ships.

The DE1160, when equipped with a larger, low-frequency transducer array and three additional transmitter cabinets, is designated DE1160LF and is capable of convergence zone performance. The DE1160LF was delivered to the Italian Navy for the helicopter carrier 'Garibaldi' early in 1984.

A VDS version of the DE1160LF will combine the convergence zone performance of the 'Garibaldi' sonar with the environmental adaptability of the DE1164 under the denominations DE1160LF/VDS, a sonar system for major ASW combatants.

The AN/SQS-56 sonar features digital implementation, system control by a built-in mini-computer, and an advanced display system. Digital implementation allows packaging of the complete multi-function active and passive sonar in five medium-size electronic cabinets and one operator's console. Computer controlled functions provide a system that is extremely flexible and easy to operate. The computer is also used to provide automated fault detection and localisation and a built-in training capability. The human engineered display ensures proper interpretation by operators, even by those with relatively low levels of training.

The sonar is an active/passive, preformed beam, digital sonar providing panoramic echo ranging and panoramic (DIMUS) passive surveillance. All signal processing, except transducer received signal amplification and linear transducer transmit drive, is accomplished in digital hardware, most of which is implemented using US Navy SEMP (standard electronic module programme) components in compact water-cooled cabinets small enough to allow installation through standard size hatches. All visual data are presented on flicker-free, digitally refreshed television type raster scan CRT displays. Complete symbol and alpha-numeric facilities are included. System timing, control, and interface communication are accomplished by a general purpose mini-computer which is a component of the basic system. Both 400 Hz synchro and MIL-STD-1397 Type A or C, category II digital interfaces are available in the basic sonar system. Except for the 400 Hz synchro reference power, the entire sonar operates from 440 to 480 V, three-phase 60 Hz ship's power.

The basic system includes the transducer array, transducer junction box, five electronic cabinets (array interface, transmitter(s), receiver and controller), operator console, sonar dome, and control unit. Options in production include: a loudspeaker/intercom, a water cooling unit, a remote display, and a performance prediction sub-system. Additional functions under development include computer-aided detection and classification, target tracking, attack manoeuvring, and torpedo weapon setting data. A half-frequency version, the DE1160LF with convergence zone capability, has been delivered to the Italian Navy.

A single operator can search, track, classify, and designate multiple targets from the active system while simultaneously maintaining anti-torpedo surveillance on the passive display. Computer assisted system control permits the operator to concentrate on the sonar data being displayed rather than on the system controls.

AN/SQS-56 operator's console

STATUS

Approval for service use was issued early in 1980 by the US Navy following successful completion of final operational test and evaluation. Systems ordered up to November 1983 totalled 104, including 75 for the US Navy and FMS, 16 for Italy (5 DE1160, 10 DE1164, 1 DE1160LF) and 13 for Spain (8 DE1160, 1 DE1160 for Morocco, 4 SQS-56(SP) for Spanish trainer and FFG-7 ships). Of the 104 systems contracted, 99 were completed as of December 1983. All the Spanish and Moroccan sonars have significant Spanish content. ELSA, Aranjuez is the prime contractor to the Spanish Navy for the 4 SQS-56(SP) systems for the Spanish FFG-7 ships.

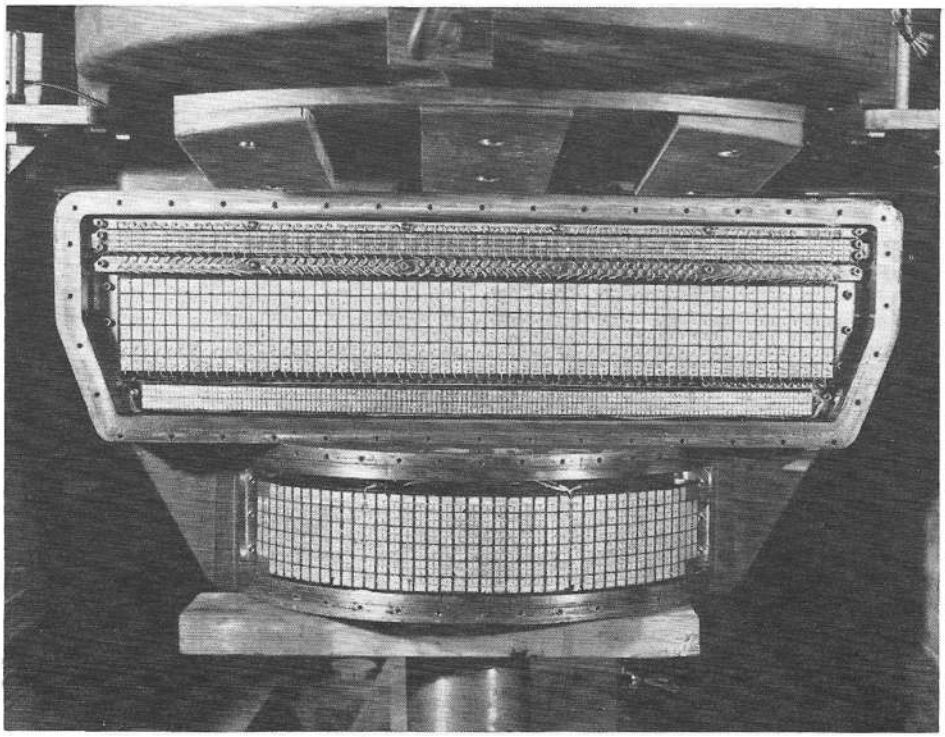
Raytheon Company, Submarine Signal Division, Portsmouth, Rhode Island 02871, USA.

1789.453
AN/SQQ-14 MINEHUNTING SONAR

The AN/SQQ-14 system is essentially a variable-depth, dual-frequency sonar for detecting and classifying bottom mines in shallow water. It utilises a towed body in the shape of an elongated sphere towed through a centre well on a US Navy minesweeper.

A unique aspect of the AN/SQQ-14 design is the towing cable. This consists of discrete, 18 inch (457 mm) sections of articulated struts with universal joints at each section, permitting the cable to flex in any vertical plane, but restraining it from torsional motion. This configuration imparts a constant heading to the towed body, thereby eliminating the need for a gyroscopic heading reference system.

A rubber-jacketed electric cable containing 35 shielded, coaxial, and individual conductors passes through the centre of the strut sections, terminating in a slip ring in the towed body and in a winch with compound winding drum in lieu of a slip ring installed on the 01 deck of a mine countermeasures ship.



The articulated strut type of tow cable posed unique problems related to winching, storage on the winch drum, and ship's tow point construction. Struts, of which there are 117 per system, are stored in a single layer on a cylindrical drum equipped with specially designed pads serving as contact points for the articulated strut knuckles. Since a conventional level wind mechanism could not be used with the struts, the winch drum itself is designed to traverse axially by means of an Acme lead screw and rotating nut, thereby accomplishing the level wind function and maintaining a fixed fleeting point. All equipment for this application must be non-magnetic. Struts, bearings, and knuckles are fabricated of high strength Inconel alloy. The winch drum is cast aluminium and supporting structure is aluminium and stainless steel.

STATUS

In operational service.

The SQQ-14 sonar is produced under licence in Italy by FIAR SpA, which has supplied equipment to the Italian Navy. Other users include the Belgian and Spanish Navies. FIAR is offering an improved version, the SQQ-14A, which uses about 40% of the improvements carried out by GE to upgrade the SQQ-14 to the SQQ-30 (**4623.253**)

AN/SQQ-30 MINEHUNTING SONAR

The AN/SQQ-30 is the successor to the AN/SQQ-14 system (**1789.453**) and is a latest technology minehunting sonar. The system consists of two sonars, a search sonar for initial detection and a high frequency, high resolution sonar for classification of targets. The two sonars are separated to give the area coverage needed. The two sonars are housed in a hydrodynamically, egg-shaped vehicle and towed at various speeds by the minehunter. The towed body is streamed from a well in the foward part of the ship, using a winch driving a 3-metre diameter cable drum on the foredeck. Two display consoles are provided for the search and classification sonars.

STATUS
Fitted to the first few US Navy MSM-1 'Avenger' class minehunters.

5652.253
AN/SQQ-32 ADVANCED MINEHUNTING SONAR SYSTEM

A full scale engineering development programme of an advanced minehunting sonar system (AN/SQQ-32) has been undertaken, with a $24·8 million contract from the US Navy, by Raytheon teamed with Thomson Sintra, France. The new system is scheduled to be installed in the US Navy's newly constructed minesweepers designated MCM-1 and MSH-1.

The proposed system consists of two separate sonars, a search sonar for initial detection and a high frequency, high resolution sonar for classification of the targets. The two sonars are partially housed in a hydrodynamically shaped vehicle and towed at various speeds by the minehunting ship. The latest technologies in beamforming, signal processing, modular packaging and displays are used throughout the system.

The detection sonar is being designed and manufactured by Raytheon and will be able to detect mines over a wide range of distances and bottom conditions. This system incorporates a computer-aided detection facility which is designed to help the sonar operator to discard non-mine objects detected by the sonar. Raytheon is also providing the computer facilities and display consoles and is responsible for overall system integration.

AN/SQQ-32 sonar is to be installed on US Navy minesweepers

The classification sonar is being designed and fabricated by Thomson Sintra and will be based on its experience with the DUBM-21 and TSM-2022 minehunting sonars. The classification sonar will provide very high resolution transmission and reception of underwater signals to enable targets to be identified with near-picture quality.

The 'wet end', consisting of a hydrodynamically shaped vehicle, a deployment/retrieval system, a tow cable and a winch is being designed by Charles Stark Draper Laboratory of Cambridge, Massachusetts.

STATUS
In development. The initial contract calls for design and fabrication of three engineering models with delivery starting before the end of 1984. Will replace AN/SQQ-30 in later 'Avenger' class minehunters.

CONTRACTORS
Raytheon Company, Submarine Signal Division, Portsmouth, Rhode Island 02871, USA.

3115.453
DE1164 SONAR

The DE1164 sonar consists of the Raytheon DE1160B hull-mounted sonar (**1807.453**) augmented by a fully integrated variable-depth sonar sub-system. All sonar functions of the DE1164 are identical to those of the DE1160B. However, the DE1164 provides transmission and reception via various combinations of the hull-mounted and/or the towed variable depth sonar (VDS) transducer arrays. Addition of the VDS sub-system improves overall sonar flexibility, and allows the VDS transducer array to operate at acoustically favourable depths and in a much quieter environment.

In addition to the components of the full DE1160B hull-mounted system the DE1164 includes one extra cabinet of electronics, a VDS towed body with associated cable, and the electro-hydraulic mechanism associated with launching, towing, and retrieving the VDS body. The VDS handling equipment provides for one-man operation for launching and retrieving and unattended no-power towing. For reliability, two independent hydraulic power supplies are provided, either of which may support the entire operation. VDS body weight, cable size and length and careful attention to drag provide a VDS depth capability greater than 200 metres at 20 knots of ship's speed.

Both the hull-mounted and VDS arrays use the common set of DE1160B transmitting, receiving, and display electronics. Selection of the particular

VDS configuration of DE1164 sonar on the Libeccio *of the Italian Navy*

combination of transmit/receive array functions is ordered by the operator via the sonar console input keyboard; the system computer then sets up the required sequence. Alpha-numeric symbols on the display inform the operator about which particular array is in use during any specific ping-cycle.

During the normal operation the power requirements of the DE1164 are identical to those of the DE1160C. A maximum of 50 kW additional power is required from the 440 V, three-phase, 60 Hz power mains during high speed retrieval or launching. The hull-mounted sonar may be operated during VDS launch/recovery operations.

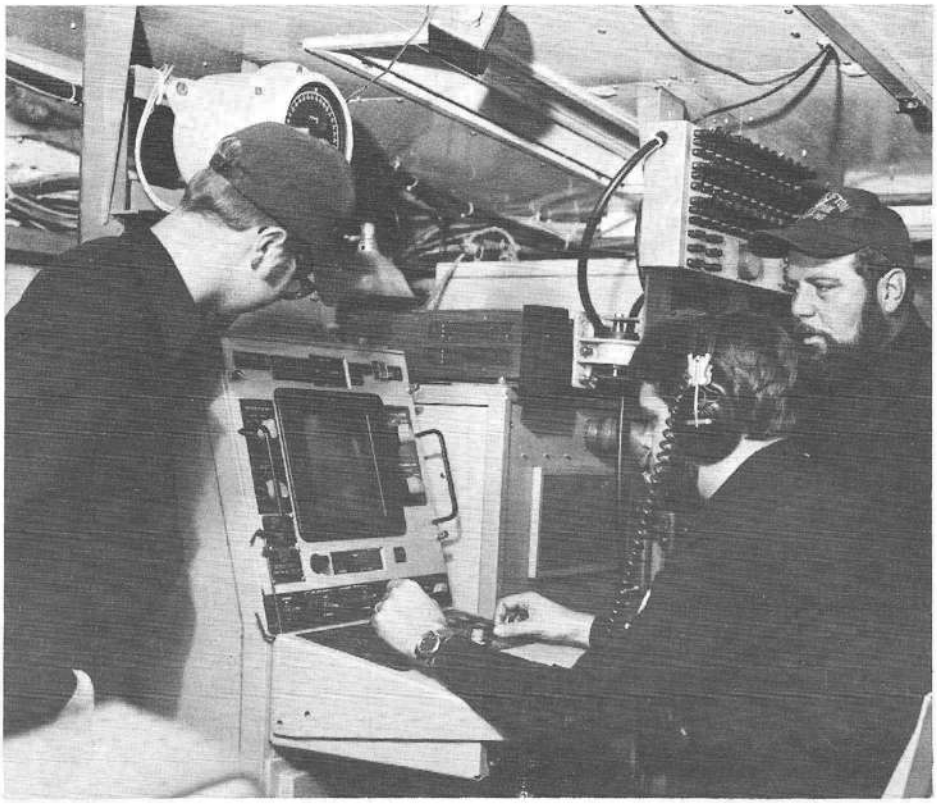
STATUS

Ten have been delivered to the Italian Navy and are in operational service.

CONTRACTOR

Raytheon Company, Submarine Signal Division, Portsmouth, Rhode Island 02871, USA.

3116.453



DE1167 MODERNISATION SONARS

Raytheon's DE1167 family of sonars implements the proven features of the SQS-56/DE1160 systems (**1807.453** and **3115.453**) using advanced microprocessor architecture and state-of-the-art display and transmitter technology. The DE1167 series is based on large modules and air-cooled cabinets, which permit the production of smaller, simpler, cheaper sonar systems, and facilitate local manufacturing and repair. The DE1167 family is designed to satisfy the requirements of most ASW platforms and missions. Configurations include hull-mounted, VDS and integrated HM/VDS systems featuring a 12 kHz VDS and either 12 kHz or 7·5 kHz hull-mounted 36-stave transducer arrays. Configurations using 48-stave arrays, or a frequency lower than 7·5 kHz are possible. A DE1167 receiver and display sub-system, when combined with Raytheon's Standard Sonar Transmitter (SST) (**3494.253**), provides a complete inboard update for older SQS-23 sonars. Raytheon states that this SQS-23 modernisation equipment, DE1191, when coupled with the existing SQS-23 transducer array and dome, results in operability, reliability, maintainability and performance exceeding those of most modern medium-range sonars at a fraction of the cost.

Like the Raytheon DE1160B/C and DE1164 sonars, the DE1167 features primarily digital electronics and an advanced control and display system. The standard inboard electronics consist of three cabinets and a single operator console. Outboard units consist of a transducer array and 2·74 m long dome for the hull-mounted 12 kHz installation (4·17 m long dome for 7·5 kHz) and/or the VDS winch, overboarding assembly, control station, hydraulic power supply and towed body for the 12 kHz variable depth sub-system.

The DE1167 HM is an active/passive, preformed beam, omni and directional transmission sonar which uses three non-interfering 600 Hz wide FM transmission bands centred at 12 or 7·5 kHz and a spatial polarity coincidence correlation (PCC) receiver. The passive mode, which is selected automatically when transmissions are stopped, is primarily useful for torpedo detection. Optional items in production include a performance prediction sub-system, an auxiliary half-frequency passive receiver, an auxiliary display, a remote display, and a training/test target remote control unit. Signal reception and beamforming are accomplished by broadband analogue circuitry followed by clipper amplifiers for perfect data normalisation. Detection processing, display processing, system control/timing and waveform generation are done digitally. Two microprocessors perform display ping history, cursor ground stabilisation, and target motion estimation functions for torpedo direction. The modular air-cooled 12 kW transmitter uses highly efficient class A/D power transistor techniques.

Several operational features are unique to a sonar of this size/range. First, the display processing incorporates a ping history mode through which the sonar data obtained in as many as three of the previous ping cycles is retained on the viewing surface, allowing the operator to readily differentiate between randomly spaced noise events and geographically consistent, valid acoustic reflectors.

Operator's display/control console of Raytheon DE1167 sonar

Second, the clipped PCC processing permits accurate thresholding of all signals such that the false alarm rate, or number of random noise indications on the screen, remains relatively low and constant over all variations in background noise and reverberation levels, further facilitating contact detection. Third, ground-stabilised cursors and target motion analysis permit rapid determination of contact motion over the bottom, an excellent clue as to the nature of the contact. These three operational features, combined with extremely accurate tracking displays, a built-in fault detection/localisation sub-system, performance verification software and test/training, result in a high performance system which is easy to operate, maintain and support.

CHARACTERISTICS

Centre frequency: 12 kHz (HM) and (VDS), 7·5 kHz (LF) (HM)

Source level: Triple 227 dB (HM), omni 217 dB

Pulse type: 600, 2000 Hz FM sweep 100, 200, 50, 25, 6 ms pulse lengths

Receiver type: Spatial polarity coincidence correlator (PCC) between 36 pairs of half beams

Beam characteristics: 36 sets of right and left half beams for active and passive detection. Selectable 10°H × 13°V sum beam for audio listening. 1·25° bearing interpolation for display

Active display: 300 range cells, 288 bearing cells; single and multiple echo history; 4 intensity levels

Passive display: Electronic bearing time recorder (EBTR) with medium time averaging. DIMUS-type LTA/STA with optional passive receiver

Track displays: Sector scan indicator (1000 yards × 10°) and target doppler indicator (1000 yards × ±60 knots)

Target data: Range: 8 yd (6·1 m) resolution. Bearing 1·25° resolution plus active search display - 0·1° and 3·3 yards on SSI display. ±60 knots of doppler at 1 knot steps on the TDI

Data format: Standard: NTDS ANEW (digital). Optional: NTDS slow, Fast Serial D/S synchro converters

Power requirements: Passive 800 W. Active 20 kVA (pulse) at 10% (max) duty cycle 440 V, 60 Hz, 3-phase, VDS launch/retrieve 75 kVA (max) 440 V, 60 Hz, 3-phase

Weights: Hull-mounted 1500 kg (nominal); VDS 10 000 kg (nominal)

STATUS

Fifteen systems were under contract in December 1983 to the Korean Navy (8 DE1167 HM), Spanish built corvettes for the Egyptian Navy (2 DE1167 HM/VDS at 7·5/12 kHz), and ELSAG for the Italian Navy (5 DE1167 HM - lower frequency - 7·5 kHz). ELSAG has implemented a licence agreement with Raytheon for manufacturing DE1167 sonars for the Italian Navy corvette programme. The first ELSAG system and four of the Korean systems were delivered during 1984. ELSAG has also completed delivery of a multi-application sonar trainer (MAST) built in co-operation with Raytheon (**5754.293**).

BATHYTHERMOGRAPH DATA RECORDER RO-308/SSQ-36

The BT recorder is an integral part of US Navy/Lockheed P-3C Orion aircraft ASW system. The equipment converts seawater temperature information provided by the AN/SSQ-36 bathythermograph buoy-transmitter set (**3781.453** 1982-83 and earlier editions) and AN/AAR-72 radio receiving set (**3454.363**) to two output forms:

(1) a permanent record of the vertical temperature profile (temperature v depth) on a paper strip chart

(2) a parallel mode, eight-bit binary coded data word for delivery to the AN/AYA-8B data processing system (**1982.363**).

The BT buoy is dropped from an aircraft in the target area. Seawater is utilised as the activating agent and after an initial, predictable delay, the buoy releases a temperature sensing probe (TS probe). The TS probe is the variable element in a frequency generation circuit. A radio frequency signal, transmitted by the BT buoy is modulated at a frequency correlated to the temperature of the water. On board the aircraft the ARR-72 radio is tuned to the BT buoy carrier frequency. Water temperature information is converted to an audio frequency signal and delivered to the BT recorder.

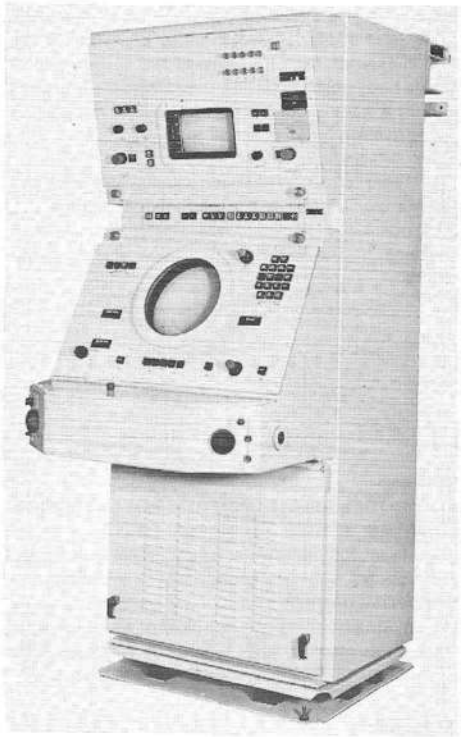
2580.253
EDO MODEL 610 LONG RANGE HULL-MOUNTED SCANNING RADAR

Designed for the long-range detection of submarines in deep and shallow water, the EDO Model 610 scanning sonar has two active consoles, enabling it to perform a search-while-track function. Facilities offered include a search capability in three 120° sectors, passive correlation, and reverberation processing. The transmitter and receiver beams are preformed. Output is available for a fire control system. All mode changes and range scale changes are controlled by console push-buttons, and displays include a doppler display on each of the active consoles and a passive sonar bearing-time recorder display.

DEVELOPMENT



Model 610 was developed by the EDO Corporation as a private venture starting in 1965. The first prototype was completed in 1966 and the first production model completed its sea trials in 1969. The Model 610 has been continuously improved, and the current 610E model is of all solid-state construction.

STATUS

Over 25 Model 610 systems have been ordered for use in the Royal Netherlands Navy, the Italian Navy and other navies. Associated weapon systems include the Mk 44 torpedo (US), 375 rocket launcher (Sweden), Lanciabas (Italy), and Ikara (Australia).

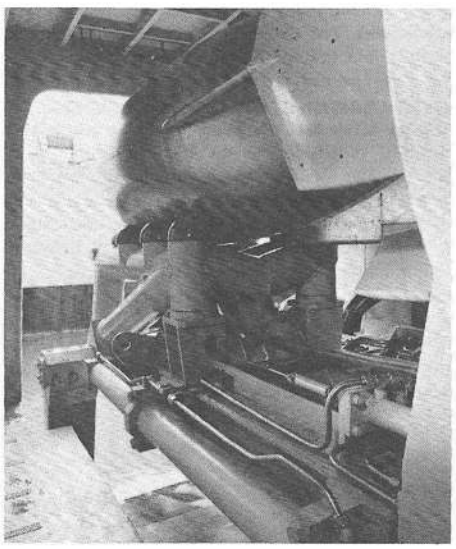
EDO MODEL 700 SERIES SONARS

Latest equipment of this range of single operator sonars is the model 700E medium-range hull-mounted sonar. The Model 700/702 hull-mounted VDS uses common 700E electronics with a hull-mounted transducer and a lightweight VDS hoist. Selection of hull-mounted or VDS operation is by push-button on the operator's console. The Model 700/701 is a VDS which provides a capability to detect deep targets when bathythermal conditions are unfavourable for hull-mounted sonars.



The basic equipment has a 254 mm panoramic CRT display and a doppler display. All mode and range-scale changes are made by push-button controls on the operator's console.

DEVELOPMENT

Like the Model 610 (**2580.253**) the Model 700 series has been developed by the EDO Corporation as a private venture for sale on the international market. Over 20 of these items of equipment have so far been ordered, customers include the Brazilian, Royal Netherlands and Japanese Navies, and other sales are pending. Associated weapon systems include the Mk 44 torpedo (US), the Bofors 375 launcher (Sweden), Lanciabas (Italy), and Ikara (Australia).

CONTRACTOR

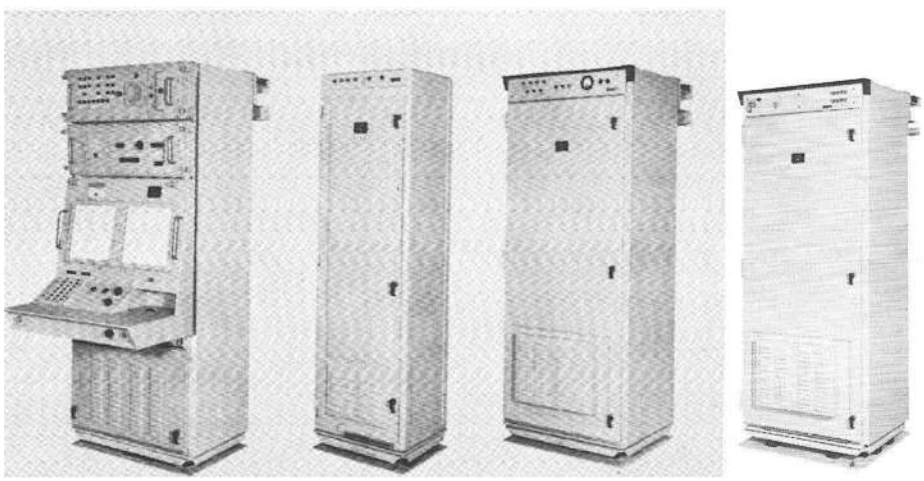
3495.253
EDO MODEL 780 SERIES SONAR

The EDO Model 780 Series sonar is a family of high performance computer-based sonars designed to maximise the ASW capability of ships ranging from high-speed patrol craft to ASW frigates. Configured as a modular system, the Model 780 Series can be assembled to match ship-size constraints and required ASW capability for hull-mounted or variable depth sonar operation. The following models are available:



780: 13 kHz variable depth sonar (VDS)
786: 13 kHz hull-mounted
795: 5 kHz hull-mounted
796: 7 kHz hull-mounted
7860: Combined 13 kHz hull-mounted with 13 kHz VDS
7950: Combined 5 kHz hull-mounted with 13 kHz VDS
7960: Combined 7 kHz hull-mounted with 13 kHz VDS

Simultaneous active and passive detection capabilities are provided as well as an integral acoustic-intercept receiver. In the VDS configuration its lightweight, compact hoist permits installation on very small ships without sacrifice in performance. The completely solid-state design and integral automatic fault detection and localisation equipment provide for high reliability and ease of maintenance.

In all configurations the Model 780 Series employs the latest state-of-the-art computer-aided control and display equipment. Designed for a single operator, a digital computer, with high speed random access memory, provides direct operator control over every facet of the sonar, and selective display of all target data, system status, and related ship operational information. Centralised communication between the operator and computer is provided by an action entry panel and a track ball. Accuracy figures of the series are ±0·5% of the range scale for active range, ±1° for active bearing and ±0·5° for passive bearing.

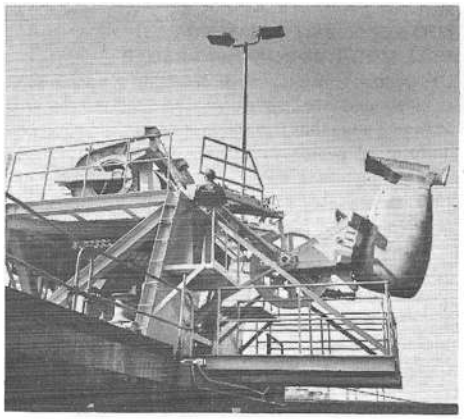
The Model 780 Series electronics is comprised of four major units; the control indicator, a transmitter, a receiver, and a data storage and control unit. A preamplifier unit of small dimensions is separately housed for remote location. All units are air cooled.

The VDS hoist consists of two major units, the

Model 780 sonar system equipment comprising sonar control console, data storage and control, transmitter/power supply and sonar receiver

winch unit and the towed vehicle. A small operator's console is easily located in close proximity to the handling unit. The simplicity of the system allows towed body depth to be controlled from the bridge as well as the sonar control room. It is light enough for fitting in ships as small as 250 tons.

DEVELOPMENT



The Model 780 Series has been developed by the EDO Corporation for sale on the international market.

STATUS

Systems in the VDS configuration are currently deployed at sea, and the 780 has passed formal technical and operational testing and is fully operational. Two Far Eastern navies are using the hull-mounted configuration which became fully operational in 1983.

CONTRACTOR

EDO Corporation, Government Systems Division, 14-04 111th Street, College Point, New York 11356, USA.

Model 780 VDS hoist under test

5644.453

EDO MODEL 900/910 UNDERWATER DETECTION SYSTEMS

The Model 900 underwater detection set is designed for use on submarines in mine avoidance and underwater obstacle location. It is composed of only three small units; a scanning assembly, a transmitter/receiver and a control indicator. The control indicator contains a 7-inch display which presents target data to the operator in ship-centred plan-position format. The scanning assembly contains the transmitting and receiving transducers, and an electrical drive system to train the transducers over 340° of azimuth. The transmitter/receiver unit incorporates a frequency analyser for high resolution of target data.

The model 910 is a small lightweight system for use on board small surface vessels engaged in minesweeping operations. In all other respects it is basically the same as the type 900 described above.

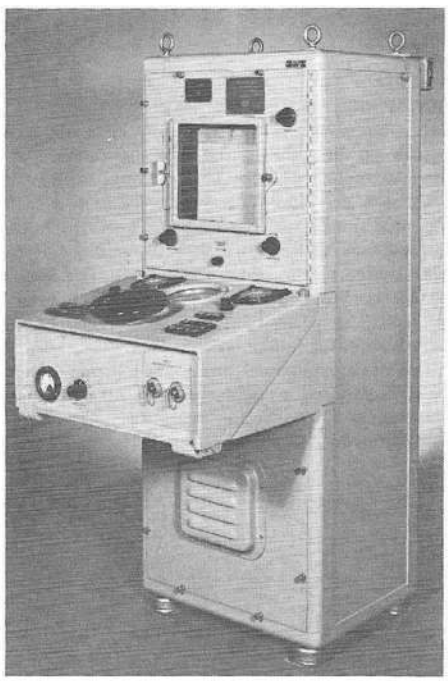
CONTRACTOR

EDO Corporation, Government Systems Division, 14-04 111th Street, College Point, New York 11356, USA.

3496.453

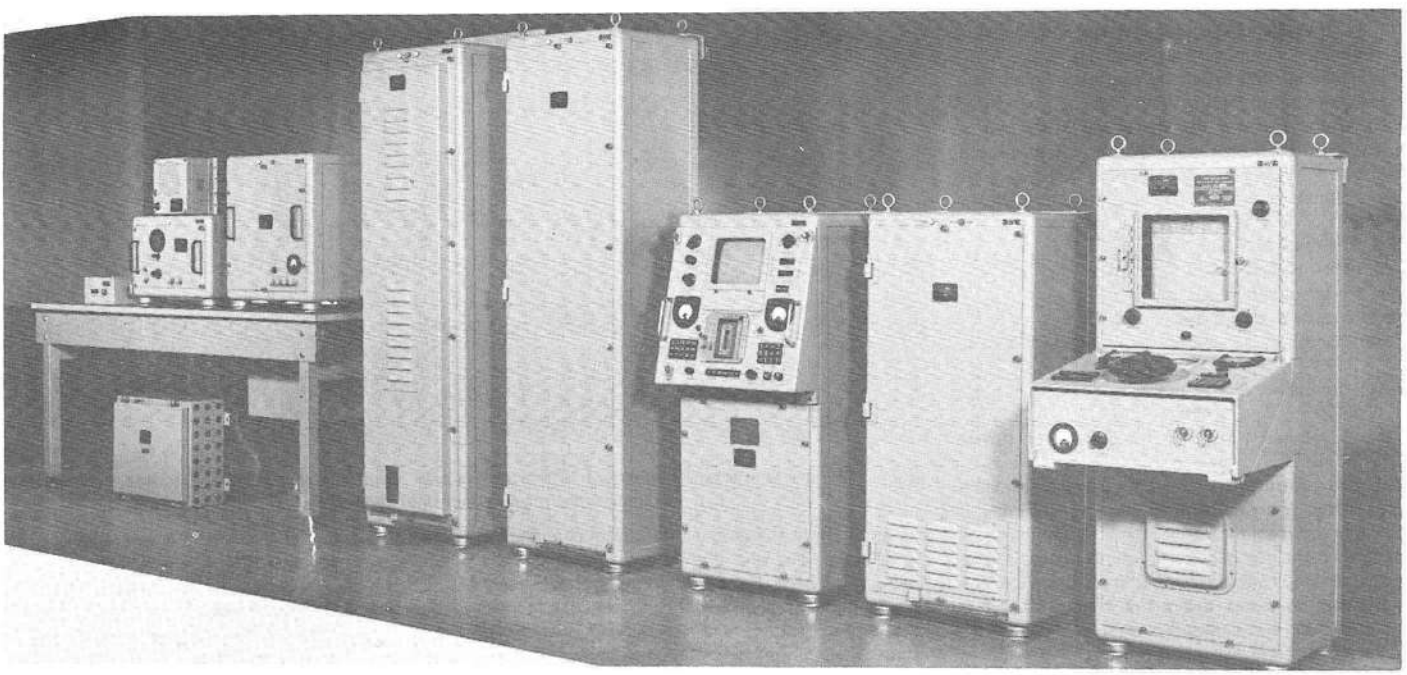
EDO MODEL 1102/1105 SUBMARINE SONAR

The EDO Model 1102/1105 is a passive and active sonar system designed for use on medium size submarines. The Model 1102 passive system is the primary detection configuration. In the passive mode, the sound horizon is scanned. Also available to the operator is a manual mode for selection of a specified bearing. The data received from the automatic channel is presented to the operator on a bearing/time recorder which provides a permanent record of all targets detected. An automatic tracking (ATF) channel may be assigned to any target detected for accurate tracking and bearing determination simultaneous with continuation of search. Target bearing outputs are provided for external use.



The Model 1105 active sub-system is designed as an integral supplement to the passive Model 1102 and is intended for use after detection in the passive mode. The Model 1105 uses the same array, preamplifiers, and beam formers of the passive system. Active data received by the tracking channel is fed to a FFT (Fast Fourier Transform) processor. Data is presented to the operator in doppler versus range format on a CRT display. Outputs of target range and range data are available for external use. This equipment is available either in the passive Model 1102 or passive/active Model 1102/1105 configuration.

DEVELOPMENT



The Model 1102/1105 was developed by the EDO Corporation as a private venture for sale on the international market. No information is available on any orders received.

CONTRACTOR

EDO Corporation, Government Products Division, 14-04 111th Street, College Point, New York 11356, USA

AN/AQS-13 HELICOPTER SONAR

The AQS-13 is a helicopter dunking system, the AQS-13B model continuing in production. It is one of a series of such equipment which began with the Bendix AN/AQS-10 in 1955.

The B system is a long-range, active scanning sonar which detects and maintains contact with underwater targets through a transducer lowered into the water from a novering helicopter. Opening or closing rates of moving targets can be accurately determined and the system also provides target classification clues.

The AN/AQS-13B has significant advantages in operation and maintenance over earlier systems. To aid the operator, some electronic functions were automated to eliminate several controls. Maintenance was simplified by eliminating all internal adjustments and adding built-in-test (BITE) circuits.

These advantages were brought about by the use of the latest electronic circuits and packaging techniques which also reduced system size and weight.

To enhance detection capability in shallow water and reverberation-limited conditions while essentially eliminating false alarms from the video display, Bendix developed an adaptive processor sonar (APS) for the system.

The APS is a completely digital processor employing Fast Fourier Transform (FFT) techniques to provide narrow-band analysis of the uniquely shaped CW pulse transmitted in the APS mode. The display retains the familiar PPI readout of target range and bearing but APS adds precise digital readout of the radial component of target doppler.

With APS, processing gains of greater than 20 dB with zero false alarm rates have been measured for target dopplers under 0·5 knot.

The higher energy transmitted with the longer pulse APS mode, combined with the narrow-band analysis, also substantially improves the figure of merit (FOM) in the non-reverberant conditions more typical of deep water operation. Measured processing gains for APS under ambient, wideband noise limited conditions exceeded 7 dB.

CHARACTERISTICS

Frequencies: 9·25, 10, 10·75 kHz
Sound pressure level: 113 dB ref 1 m/μbar
Range scales: 1, 3, 5, 8, 12, 20 kyds (0·9, 2·7, 4·6, 7·3, 11, 18·3 km)
Operational modes: Active 3·5 or 35 ms, MTI, APS, passive, voice communications, key communications (13A only)
Visual outputs: (13A) range, bearing; (13B) range, range rate, bearing, operator verification
Audio output: (13A) single channel with gain control; (13B) dual channel with gain control plus constant level to aircraft intercom
Recorder operation: Bathythermograph, range, aspect, VAD self-test
System weight: (13A) 373 kg; (13B) 282 kg

STATUS

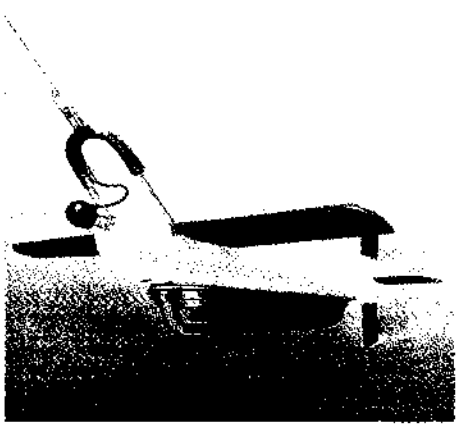
The AQS-13 is widely used by American forces and has been supplied or ordered for naval helicopters of 15 foreign navies in Europe, Asia, Middle East, and South America. The AN/AQS-18 (**4456.353**) an advanced version of the sonar featuring smaller size, lighter weight and increased performance, has been developed and is in production.

CONTRACTOR

The Bendix Corporation, Oceanics Division, 11600 Sherman Way, North Hollywood, California 91605, USA.

4462.353
AN/AQS-14 AIRBORNE MINEHUNTING SONAR

This is a helicopter towed side-looking multibeam sonar, with electronic beam forming, all-range focusing and an adaptive processor, intended for use with the RH-53D Sea Stallion helicopters used by the US Navy for mine clearance. The underwater vehicle is three metres long and has an active control system which enables it to be run at a fixed height above the seabed, or at a fixed depth beneath the water surface, as chosen by the operator in the helicopter. The tow cable is armoured and is non-magnetic.



Controls in the helicopter include: a TV-type moving window sonar display; underwater vehicle controls and status displays; system status indicators; and a magnetic tape recorder for sonar data recording. The system functions include all that is needed to locate, classify, mark, permanently record, and review records of mines, mine-like objects, and underwater features in the search area. Because the sonar employs multibeam techniques, a rapid search speed is possible. At lower tow speeds the towed sonar automatically reduces the number of transmitted beams. The system is adaptable to surface platforms, especially hovercraft, for route survey missions. Non-linear parametric array and synthetic aperture sonar technologies are incorporated.

STATUS

The AQS-14 is in production under a contract worth more than $17 million and deliveries commenced in early 1984. It is believed that about 30 units have been ordered.

CONTRACTOR

Westinghouse Electric Corporation, PO Box 1488, Annapolis, Mary and 21404, USA.

AN/AQS-14 towed sonar vehicle

4456.353
AN/AQS-18 AIRBORNE SONAR

The AN/AQS-18 is a helicopter-borne, long range active scanning sonar. The system detects, and maintains contact with underwater targets through a transducer lowered into the water from a hovering helicopter. Active echo-ranging determines a target's range and bearing, and opening or closing rate relative to the aircraft. Target identification clues are also provided.

The AN/AQS-18 is an advanced version of earlier dunking sonars made by Bendix and includes digital technology, improved signal processing and improved operator displays. The system consists of a small high density transducer with a high sink and retrieval rate, a built-in multiplex system to permit use of a single conductor cable, a 330 m cable and compatible reeling machine and a lightweight transmitter built into the transducer package. Offered as an optional extra is the Adaptive Processor Sonar (APS).

The AN/AQS-18 offers a number of improvements over earlier dipped sonars. These include increased transmitter power output giving longer range, high speed dip cycle time and reductions in weight of all units.

The APS increases detection capability in shallow water and reverberation-limited conditions while essentially eliminating false alarms from the video display. The APS is a micro-programmable processor which uses Fast Fourier Transform (FFT) techniques to provide narrow-band analysis of the uniquely-shaped CW pulse transmitted in the APS mode. The PPI display retains the normal read-out of target range and bearing.

The APS processing gain improvement over the normal AN/AQS-18 analogue processing is 20 dB for a two knot target and 15 dB for a five knot doppler target. The higher energy transmitted with the longer pulse APS mode, combined with the narrow-band analysis also improves operation in the non-reverberant conditions more typical of deep water. The gain improvement outside the high reverberation zone (ten knots or greater) under wideband noise limited conditions exceeds 7 dB.

CHARACTERISTICS

Operating depth: 330 m
Operating frequencies: 9·23, 10, 10·77 kHz
Sound pressure level: 215 dB ref 1 μPa at 1 yard (0·9 m)
Range scales: 1, 3, 5, 8, 12, 20 Kyd
Operational modes: 3·5 or 35 ms MTI, passive, communicate (voice)
Visual outputs: Range, range rate, bearing, operator verification
Audio output: Dual channel with gain control, plus constant level to aircraft intercom system
Recorder operation: Bathythermograph, range, ASPECT, VAD, BITE
System weight: 252 kg plus 13·3 for APS

STATUS

In production and in operational use with the West German Navy, and selected by three other defence forces.

AN/AQS-18 sonar deployed from West German Navy Westland Lynx Mk 88 helicopter

CONTRACTOR

The Bendix Corporation, Oceanics Division, 11600 Sherman Way, North Hollywood, California 91605, USA.

3772.453
MICROPUFFS PASSIVE RANGING SONAR

The MicroPUFFS system is a high accuracy, long ranging passive sonar designed for installation aboard submarines. The name suggests that this equipment is a derivative of the original US Navy PUFFS (passive underwater fire control feasibility study) hardware; the PUFFS designation was also applied to USN AN/BQG-1/2/3/4 anti-submarine warfare system. It was developed for the detection and tracking of submarine and surface targets, and provides automatic target tracking of up to four targets simultaneously. Instantaneous and continuous ranging solution, fire control range and bearing output and secure operation. The basic technique is signal enhancement by cross correlation of the signals received at the arrays with conversion of two measured time differentials into bearing and range data.

The system consists of three hydrophonic baffled arrays mounted on each side of the submarine. The arrays are connected to a display control console, which utilises an analogue processor, digital processor and AN/UYK 26 computer. The console

also includes built-in fault localiser equipment. The system is built to US military specifications, and uses standard electronic modules throughout.

STATUS

MicroPUFFS systems are currently installed aboard six 'Oberon' class submarines of the Royal Australian Navy. A subsequent model has been built for the US Navy for test installation on the USS *Barb*.

CONTRACTOR

Sperry Corporation, Electronic Systems, Great Neck, New York 11020, USA.

1983.453
AN/BQQ-5 SONAR

The BQQ-5 sonar system is the principal sensor system of the US Navy's nuclear attack submarines, the SSN-688 class, all of which are to be fitted in addition to retrofitting all 'Permit' and 'Sturgeon' class SSNs during regular refits. The BQQ-5 is a digital, multi-beam system employing both hull-mounted and towed acoustic hydrophone arrays. The latter of the two arrays will be produced in two types; initially a manually detached and attached receiver array connecting to a fixed towing point will be employed, to be replaced later by a towed array that will be retractable and housed along the submarine's hull. Both fixed tow and retractable array versions will have provision for mechanically cutting the array adrift in the event of an emergency, except for the first seven equipped with the fixed tow point. The polyethylene-covered tow cable, which has a maximum length of about 800 m, is 9·5 mm in diameter, and the array at the end of the cable where the hydrophones and electronics are located is 82·5 mm in diameter. The array is tapered fore and aft to minimise flow noise. Drag is stated to account for a maximum reduction in speed of 0·5 knot, with no serious inhibition on submerged manoeuvres and little adverse effect on surface manoeuvres with the one exception of those entailing going about.

A US defence spokesman has stated that the BQQ-5 will provide for detection of Soviet submarines at significantly greater ranges than are now attainable, and that the advanced beam forming and display features will yield much higher search rates.

The AN/WLR-9A acoustic intercept receiver, produced by Norden, has been successfully evaluated and will form an integral sub-system of the BQQ-5 and BQQ-6 on new attack and Trident missile submarines. The sub-system features a CRT display, a digital readout and a remote unit for the submarine commander. A 'sensitivity improvement' kit for the AN/WLR-9A has been developed by Norden and deliveries to the US Navy are in progress.

STATUS

The AN/BQQ-5 underwent extensive developmental testing during 1972 and 1973, and was approved for production later in 1973. The original initial production appropriation planned for a batch of eight sets but this was subsequently reduced to six as a result of budget cuts. The fiscal year request was for $55.8 million to produce a further quantity of nine sonars, later amended to eight, to be fitted in seven submarines (SSN Nos 606, 612, 637, 638, 661, 663, and 677) with the eighth equipment being assigned to the training role.

In April 1975 $84·2 million was requested for fiscal year 1976 and $42·6 million in successive years for another nine and five systems, respectively. This request was for equipment to retrofit SSN 594/637 class submarines.

In May 1978, the US Navy Sea Systems Command announced a contract modification by which eight BQQ-5 towed array (hydrophones) handling and stowage equipments would be supplied.

Commencing in October 1979 Raytheon was awarded a series of US Naval Sea Systems Command contracts calling for refurbishment and conversion of AN/BQS-11, 12, and 13 sonar transmission sub-systems to AN/BQQ-5 standards.

Over the period 1980-1982, IBM, Gould, Raytheon and Norden were awarded contracts worth nearly $50 million. Tracor has also been awarded a $45 million contract to provide technical support.

IBM, Federal Systems Division, 10215 Fernwood Road, Bethesda, Maryland 20034, USA.

Raytheon Company, Portsmouth, Rhode Island, USA.

4629.453
AN/BQQ-6 SONAR

The AN/BQQ-6 is an advanced active/passive sonar set developed for the Trident submarine. Forming part of the Trident command and control system it is an integrated complex of command, control, communications and ship defence equipment.

The AN/BQQ-6 is based on the AN/BQQ-5 (**1983.453**) and has many of the same parts. The primary detection group is a digital integrated system employing spherical array, hull-mounted line array and towed array sensors, with an active emission acoustic intercept receiver and high frequency active short range sonar. In the passive mode the system used is identical to that of the AN/BQQ-5. Support equipment has been added to provide for underwater communications, environmental sensing, magnetic recording and acoustic emergency devices. All other technical details are classified.

STATUS

Installed on Trident class submarines.

CONTRACTORS

IBM, Federal Systems Division, 10215 Fernwood Drive, Bethesda, Maryland 20034, USA.

Gould Inc, Defense Electronics Division, Glen Burnie, Maryland, USA.

1984.453
AN/BQR-15 SONAR

The BQR-15 is a towed array sonar used by US Navy fleet ballistic missile submarines (SSBNs). Because the array is towed behind the submarine, these sonars provide the first long-range passive detection capability astern. In addition, since the sensors are removed from the submarine hull and internal ship's noise, detection of other submarines is possible at greatly increased ranges. As installed, the BQR-15 includes specially designed hydraulically operated handling equipment that permits the cable array to be partially or completely streamed, retrieved, and adjusted automatically while the SSBN is submerged. The equipment forms part of the SSBN sonar system which also includes the AN/BQR-19 receiving set and the AN/BQR-21 (**1985.453**).

DEVELOPMENT

In May 1972 contracts were awarded for the design and development of SPAD (signal processing and display) systems to exploit more fully the signal gathering potential of the BQR-15 towed array sonar, but difficulties and delays led to the cancellation of this effort in March 1974. Since then funds have been allocated for procurement of a multiple channel signal processing and display equipment for use on FBM submarines and at FBM training facilities with the BQR-15 sonar system.

STATUS

In operational service. A modified array entered production during 1984.

CONTRACTOR

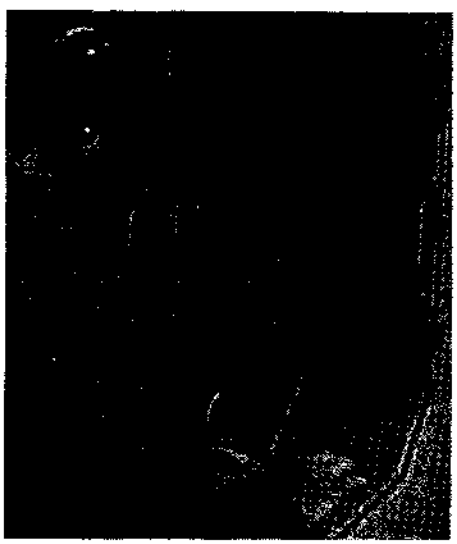
Western Electric Company, Winston-Salem, North Carolina, USA.

1985.453
AN/BQR-21 DIMUS SONAR

The BQR-21 DIMUS sonar is a hull-mounted preformed beam passive sonar with improved digital signal processing for the detection and tracking of quiet nuclear submarines. It is intended for fitting on all pre-Trident SSBNs and selected SSNs, and will be a direct replacement for the AN/BQR-2. The BQR-21 will incorporate the same array configuration as the earlier equipment but will embody significantly enhanced signal processing capabilities. In addition to improvements in the electronics, performance will be improved through platform noise reductions which are being made in the bow dome of the submarine. These include the addition of an array baffle.

DEVELOPMENT

A contract for AN/BQR-21 development was awarded to Honeywell in June 1972. One engineering model was delivered in early 1974, sea trials were completed in mid-1974, environmental testing and service approval were accomplished in November 1974.



STATUS

Funding of $47·1 million in fiscal years 1975/76/77 allowed for BQR-21 procurement for both SSBN and SSN fittings, and for training installations at New London, Charleston, and Pearl Harbor, and the SSN training facility at San Diego. 42 submarines were scheduled for fitting under this programme.

A total of 56 of this equipment for fitting in fleet ballistic missile submarines and certain attack submarines has now been procured. System delivery began in August 1977 and was completed in December 1979. Two engineering models have been refurbished and delivered for use as trainers. In November 1982 Honeywell was awarded a $5 million contract for engineering support.

CONTRACTOR

Honeywell Inc, Training and Control Systems Operations, 1200 East San Bernardino Road, West Covina, California 91790, USA.

AN/BQR-21 DIMUS sonar display console

1986.453
AN/BQS-13 SONAR

The BQS-13 sonar system is the primary sonar in USN 'Permit Sturgeon' SSN class nuclear attack submarines. The system was service approved in December 1971 and is in operation. A system addition providing new functional capability was service approved in late 1974. This addition, the BQS-13 multipurpose sub-system (BQR-24), is being procured for a limited number of SSNs.

DEVELOPMENT

Acceptance testing of the multipurpose sub-system began in late 1973 and technical and operational testing were conducted aboard the *Archerfish* during 1974. The BQS-13 multipurpose sub-system (BQR-24) was service approved in late 1974. The extended operational test programme delayed procurement to fiscal year 1975/76 when 11 systems plus support were procured for $25·3 million. These sub-systems provide interim improvement in sonar and fire control capability for those submarines not scheduled to receive the BQQ-5 sonar (**1983.453**) until late in that programme. The BQR-24 has been installed only in submarines where it will have a useful life of at least three years prior to receiving a BQQ-5 sonar system.

Commencing in October 1979, Raytheon was awarded a series of US Naval Sea Systems Command contracts calling for refurbishment and conversion of AN/BQS-11, 12, and 13 sonar transmission sub-systems to AN/BQQ-5 transmission sub-system configuration. These sub-systems are part of the AN/BQQ-5 system.

CONTRACTOR

Raytheon Company, Submarine Signal Division, Portsmouth, Rhode Island 02871, USA.

1987.453
AN/SSQ-41B SONOBUOY

The Sparton AN/SSQ-41B is an omni-directional, passive sonobuoy with a multiple life and depth capability. In volume production since 1963, the series has been the mainstay of US Navy sonobuoy operations but is gradually yielding this role to the newer, directional AN/SSQ-53A.

The AN/SSQ-41B, extensively redesigned from the earlier AN/SSQ-41, provides an audio bandwidth expanded to ten kHz and improved dynamic range capabilities. The depth selection is 60 or 1000 feet and life selection is one, three, or eight hours.

The AN/SSQ-41B may be launched from an aircraft at airspeeds between 30 and 425 knots and from altitudes of 100 to 40 000 feet (30·5 to 12 200 metres).

After a controlled and stabilised descent and upon impact with the water, the termination mass and the hydrophone are released and descend to a preselected operating depth of either 60 or 1000 feet (18·3 or 305 metres). On contact with seawater, the battery is activated and the sonobuoy becomes fully operative within 60 seconds.

Modulation is accomplished in the crystal oscillator stage by a variable-capacity diode. Two frequency-doubling amplifiers multiply the RF oscillator-doubler frequency to the desired operating frequency of the sonobuoy, which is preset to one of thirty-one channel frequencies within the 162·25 to 173·50 MHz band.

CHARACTERISTICS

Type: Passive
Audio frequencies: 10 – 10 000 Hz
Depth: 18·3 or 305 m
Size: A
Weight: 9 kg
Operating life: 1, 3, or 8 h
Launch altitude: 30·5 – 12 200 m
Launch speed: 30 – 425 knots
RF channels: 31
RF power: 1 W

STATUS

Although large scale production was contracted through 1982, the US Navy has discontinued further development. This unit will continue to be available, however, for the next five to ten years. Sparton had completed the preliminary engineering to add a 99-channel, transmit capability with electronic function selection of channel, life and depth similar to that of the AN/SSQ-53B before the programme was stopped.

CONTRACTORS

Sparton Corporation, Electronics Division, 2400 E Ganson Street, Jackson, Michigan 49202, USA.
Magnavox, Fort Wayne, Indiana 46808, USA.

1988.453
AN/SSQ-47B SONOBUOY

The AN/SSQ-47B is an active sonobuoy. The operational function is that of detection, classification, tracking, and location of submarines.

Sonobuoy AN/SSQ-47B provides an active sonar capability for fixed-wing aircraft. It can be operated from a minimum range of zero to ten nautical miles at an altitude of 500 feet (152 metres) and in sea conditions up to sea state 5. The AN/SSQ-47B permits launching and operation of up to six sonobuoys, either individually or simultaneously, without encountering RF or sonar interference.

CHARACTERISTICS

Type: Active
Sonar modes: Automatic keyed CW
Depth: 18·3 or 244 m
Size: A
Sonar channels: 6 (HF)
RF channels: 12
RF power: 0·25 W
Weight: 14·5 kg

STATUS

Sparton has received the following US Navy contracts: 139 700 SSQ-47 sonobuoys between 1963 and 1974; a $5·12 million contract for SSQ-47B sonobuoys in 1975 which brought orders for 28 732 buoys in 1975 and 1976; 4900 buoys in 1978 for which some of the work was carried out at the Canadian Sparton plant; and 15 440 buoys in mid-1983.

CONTRACTOR

Sparton Corporation, Electronics Division, 2400 E Ganson Street, Jackson, Michigan 49202, USA.

1990.453
AN/SSQ-53A DIFAR SONOBUOY

The AN/SSQ-53A DIFAR (directional frequency and ranging) sonobuoy is becoming the US Navy's primary sonobuoy sensor. As compared to earlier passive sonobuoy types, the Q-53A provides target bearing information as well as improved acoustical sensitivity, particularly in the low-frequency ranges.

The Q-53A sonobuoy is the result of a US Navy-sponsored development programme to improve the operational capabilities of the earlier Q-53. Changes include a dual-depth capability (90 or 1000 feet (27 or 305 metres)), an extended launch envelope and improved low-frequency performance. The sonobuoy's electrical and mechanical design was extensively revised to improve reliability and to lower production costs.

Deliveries of the Q-53A began early in 1975. To date, Sparton has delivered or has contracts for a total of 341 702 Q-53A sonobuoys.

The AN/SSQ-53A sonobuoy may be dropped from an aircraft at indicated airspeeds of 30 to 425 knots and from altitudes of 100 to 40 000 feet (30 to 12 200 metres). Descent of the sonobuoy is stabilised and slowed by a parachute assembly.

Immediately after water entry, the seawater-activated battery system is energised. Gas-filled cylinders inflate the sonobuoy float, jettisoning the parachute assembly and erecting the VHF transmitting antenna. This permits the surface assembly to rise and separate from the sonobuoy housing. The sonobuoy housing serves as a descent vehicle and separates from the sub-surface assembly at the operating depth.

CHARACTERISTICS

Type: Directional LOFAR
Depth: 27 or 305 m
Size: A
Weight: 11·3 kg
Operating life: 1 or 4 h
Launch altitude: 30 – 12 200 m
Launch speed: 30 – 425 knots
RF channels: 31
RF power: 1 W

STATUS

An RFP for up to 100 000 buoys was issued by the US Naval Avionics Center in October 1982. The AN/SSQ-53A is also being manufactured under licence in the UK by Plessey Marine. In January 1983 Sparton received a US Navy contract, reportedly the final purchase of SSQ-53As, for nearly 50 000 units. Production will continue for 5–10 years.

CONTRACTORS

Plessey Electronics Ltd, UK (licence)

4457.453
AN/SSQ-53B SONOBUOY

In addition to Q-53A production, a successor model, the AN/SSQ-53B is well advanced. Acoustical performance is not significantly changed, but the B model offers electronic selection of RF transmit channels, life, and operating depth. Operating parameters are switch selected and verified by a light-emitting diode display on the sonobuoy. The Q-53B can be programmed to transmit on any one of 99 channels, with three depth and three operating life choices instead of a single, preset transmit frequency and two operating depths and lives.

CHARACTERISTICS

Type: Directional LOFAR
Depth: 27, 122 or 305 m, electronically selected
Size: A
Weight: 11·3 kg
Operating life: 1, 3, or 8 h electronically selected
Launch altitude: 30 – 12 200 m
Launch speed: 30 – 425 knots
RF channels: 99, electronically selected
RF power: 1 W

STATUS
In October 1982 the US Naval Avionics Center issued an RFP for up to 180 300 AN/SSQ-53B sonobuoys. The three major manufacturers, Sparton, Magnavox and Hazeltine each received contracts in November 1981. 273 412 AN/SSQ-53B sonobuoys were ordered by the US Navy in November 1983. Contracts were awarded to Sparton, Magnavox, Hermes and Rockwell International.

CONTRACTOR
Sparton Corporation, Electronics Division, 2400 E Ganson Street, Jackson, Michigan 49202, USA.

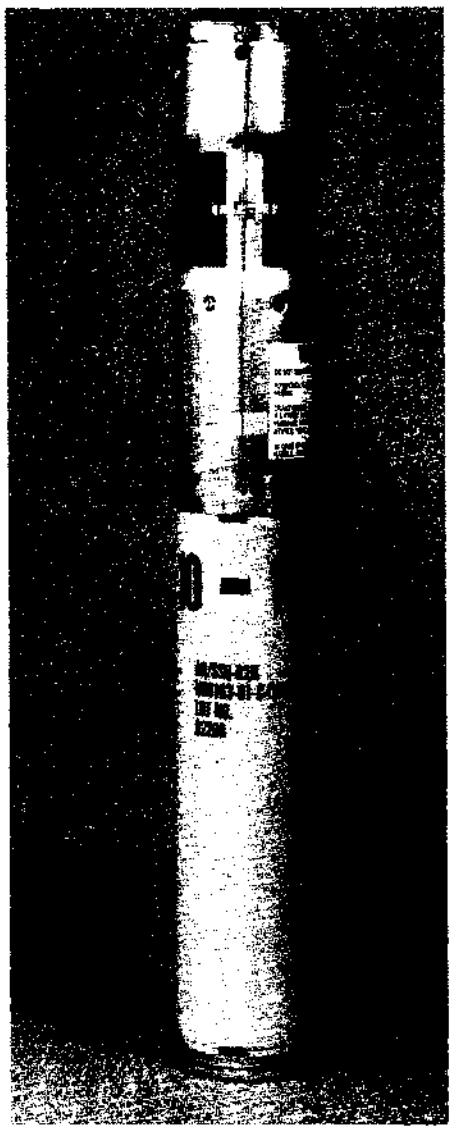
AN/SSQ-53B sonobuoy

3083.453
AN/SSQ-57A SONOBUOY

The AN/SSQ-57A sound reference sonobuoy features a hydrophone that affords exceptional performance stability under temperature and pressure extremes. The hydrophone is a piezoelectric ceramic segmented cylinder with a smooth frequency response to 20 kHz. The sonobuoy is calibrated to allow determination of underwater acoustic sound pressure levels over this wide frequency range.

The AN/SSQ-57A can be air-launched from altitudes between 150 and 10 000 feet (46 and 3048 metres) into sea conditions of up to sea state 5 and is effective at ranges up to ten nautical miles.

Immediately after entering the water the seawater-activated battery system is energised. Gas-filled cylinders inflate the sonobuoy float, jettisoning the parachute assembly and erecting the VHF transmitting antenna. This permits the surface assembly to rise and separate from the sonobuoy housing. The sonobuoy housing serves as a descent vehicle and separates from the sub-surface assembly at the operating depth.



Operating life is one, three or eight hours, selected before launch. At the end of the operating life, the transmitter is shut-off. The watertight sonobuoy housing is equipped with a seawater-soluble plug that dissolves to effect scuttling. The plug's dissolution rate varies as a function of water temperature but is never less than eight hours (maximum selectable operating life) or more than 20 hours. The AN/SSQ-57A also features an externally selectable attenuator that can decrease the sensitivity by 20 dB for special applications.

The AN/SSQ-57A (XN-5) is a version of the AN/SSQ-57A that has a fixed operating depth of 1000 feet (305 metres).

CHARACTERISTICS
Type: Passive, calibrated audio
Audio frequencies: 10 - 20 000 Hz
Depth: 18 - 91 m
Size: A
Weight: 8·6 kg
Operating life: 1, 3, or 8 h
Launch altitude: 30 - 12 200 m
Launch speed: 30 - 425 knots
RF channels: 31
RF power: 1 W

STATUS
The AN/SSQ-57 has been in production since 1968. A US Navy contract for 9300 buoys was awarded in November 1983.

CONTRACTOR
Sparton Corporation, Electronics Division, 2400 E Ganson Street, Jackson, Michigan 49202, USA.

AN/SSQ-62B DICASS sonobuoy

1991.453
AN/SSQ-62B DICASS SONOBUOY

The AN/SSQ-62B is the sonobuoy component of the Directional Command-Activated Sonobuoy System (DICASS). A high-performance sonobuoy, it detects the presence of submarines using sonar techniques under direct command from ASW aircraft. The AN/SSQ-62B can also determine the range and bearing of the target relative to the sonobuoy's position.

The DICASS sonobuoy is composed of three main sections, an air descent retarder, a surface unit and a sub-surface unit. The air descent retarder consists of a spring-loaded parachute release assembly and a parachute to retard descent immediately after launch. The surface unit receives commands from the controlling aircraft, via a UHF receiver, and sends target information to the aircraft, via a VHF transmitter. The sub-surface unit transmits sonar pulses in the ocean upon command from the aircraft and receives sonar target echoes for transmission to the aircraft.

Command signals are received by the sonobuoy and are accepted if the correct address code is identified by a decoder. The command capability includes depth selection, scuttle, and selection of transducer (sonar) transmission signals. The echoes from the selected activating signal are multiplexed in the sub-surface unit before being transmitted to the receiving station or aircraft.

The AN/SSQ-62B may be launched from fixed- or rotary-wing aircraft within the parameters specified in the launch envelope.

Upon impact with the water, the transducer is released for descent to its shallow operating depth. Immediately after entry, the float is inflated and the VHF-transmitter/UHF-receiver antenna is erected. When the float surfaces, the VHF transmitter begins emitting a continuous FM carrier signal. The sonobuoy is now operating in the passive mode and is ready to receive commands.

The main power source for the sonobuoy comes from a lithium battery pack instead of the more costly silver chloride batteries commonly used in sonobuoys. The sonobuoy is designed for economical volume production without compromising performance or reliability. Electronic design is exclusively solid state with maximum use of multifunction integrated circuits.

CHARACTERISTICS
Type: Commandable, omni-directional active, directional receive
Sonar modes: Pulse CW or linear FM
Depth: Commandable, 27, 119 and 457 m (89, 396, 1518 ft)
Size: A
Life: 30 minutes
Weight: 15 kg
Sonar channels: 4
RF channels: 31
RF power: 0·25 W

STATUS
Production. The US Navy awarded a contract for a total of 18 600 SSQ-62B units to Sparton and Magnavox in November 1983. The Royal Australian Air Force awarded a contract in January 1985, to Sparton for over $53 million, to provide 45 891 sonobuoys.

3786.453
AN/SSQ-71 ATAC BUOY

The AN/SSQ-71 air transportable acoustic communication (ATAC) buoy is an expendable two-way sonic RF receive-transmit communications device. It is launched from surface vessels or either fixed-wing or rotary-wing aircraft. Incoming UHF signals are encoded into a multiple-tone format for sonic transmission; incoming sonic signals are likewise processed for VHF transmission. The AN/SSQ-71 borrows heavily from designs developed and refined in other Sparton sonobuoys programmes. The antenna system, for instance, which receives UHF and transmits VHF signals, is derived from the Sparton AN/SSQ-62 sonobuoy. The entire mechanical layout is based upon the AN/SSQ-53A, designed and produced in volume by Sparton.

When deployed, the ATAC comprises two major assemblies with a connecting compliant cable. The surface unit includes the float and its inflation mechanism, the antenna assembly and the RF receiver and transmitter. Both the receiver and the transmitter are miniaturised solid-state designs and are powered by a seawater-activated, non-silver battery. The compliant cable provides separate conductors for the receive and transmit signals. The coiled compliant feature isolates the wave-induced motion of the surface assembly from the sub-surface assembly to provide the desired low-noise background.

The sub-surface assembly includes an encode/decode unit, a sonic transmitter, a projector, a hydrophone, sonic amplifiers, and a line driver. The encode/decode unit uses discrete standard, off-the-shelf logic elements with analogue circuits. It analyses input signals for validity as well as coding them for either sonic or RF retransmission. The sonar transmitter is a linear amplifier whose output is matched to the characteristics of the simple resonant bender projector to provide efficiently the necessary acoustic pressure level over the desired bandwidth. Incoming sonic signals are detached by an omni-directional hydrophone, amplified by the sonic amplifier, decoded, and sent to the surface unit via the line driver for RF transmission. The entire sub-surface unit is powered by an array of lithium batteries.

Deployment of the ATAC buoy is conventional. If air launched, it is slowed and stabilised by a windflap-deployed parachute. If launched from a surface vessel, it is merely thrown over the side. In either case, water entry triggers the water deployment sequence.

Long or short life is selected by a switch before launch. At the end of the period selected, VHF transmission ceases and the buoy automatically scuttles.

CHARACTERISTICS
Type: Communication buoy
Transmitter frequency: 163·75 - 166·75 MHz
Size: A
Weight: 6·8 kg
RF channels: 3
RF power: 1 W
Launch altitude: 46 - 3048 m
Launch speed: 30 - 250 knots
STATUS
Early development.
CONTRACTOR
Sparton Corporation, Electronics Division, 2400 E Ganson Street, Jackson, Michigan 49202, USA.

3084.453
AN/SSQ-77 (VLAD) SONOBUOY

The AN/SSQ-77 VLAD (vertical line array DIFAR) is a passive, tactical search and surveillance sonobuoy designed to improve detection and tracking capability for the DIFAR system in a noisy, high-traffic environment.

The AN/SSQ-77 concept utilises a vertical line array of omni-directional hydrophones in place of the single omni-directional hydrophone used in the standard DIFAR unit. A directional DIFAR hydrophone mounted at the array phase centre provides target bearing data.

The signal format for the AN/SSQ-77 sonobuoy is identical to that for the AN/SSQ-53 and is compatible with the AN/AQA-7 processor and the Sparton TD-1135/A demultiplexer/processor/display. All beam-forming functions are accomplished within the sonobuoy, with provisions for sea-noise equalisation and omni-directional phase tracking.

The AN/SSQ-77 may be dropped from an aircraft at indicated airspeeds of 45 to 380 knots and from altitudes of 100 to 30 000 feet (30 to 9144 metres). Descent is stabilised and slowed by a parachute assembly.

An internal microprocessor electronically selects the desired RF channel and sonobuoy life. Verification of these settings is provided by an LED display readable through the SLC.

Lithium batteries are activated upon entry to the water. These detonate a squib, causing gas-filled cylinders to inflate the sonobuoy flotation bag and initiate deployment. Inflation of the flotation bag provides a pressure force, releasing the release plate in the top of the sonobuoy and causing the parachute to be jettisoned. This permits the surface assembly to rise and separate from the sonobuoy housing. The sonobuoy housing serves as a descent vehicle and separates from the sub-surface assembly at the operating depth.

CHARACTERISTICS
Type: DIFAR with VLA omni
Size: A
Weight: 13·1 kg
Operating life: 4 or 8 h
Launch altitude: 30 - 9144 m
Launch speed: 45 - 380 knots
RF channels: 99, electronically selected
RF power: 1 W
STATUS
In quantity production. Contracts to the value of $17 million were placed with Sparton, Hazeltine and Magnavox for AN/SSQ-77A items in July 1981. A requirement for 35 870 sonobuoys was issued by the US Navy in November 1982 and for 59 928 in November 1983.
CONTRACTORS
Sparton Corporation, Electronics Division, 2400 E Ganson Street, Jackson, Michigan 49202, USA.

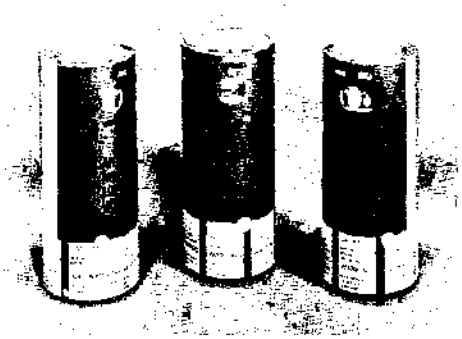
Sippican Ocean Systems Inc, Marion, Massachusetts, USA.

3783.453
TUNED VERTICAL ARRAY OMNI SONOBUOY

The Sparton tuned vertical line array (TVA) sonobuoy is the result of efforts to supply the US Navy with improved target detection capability by means of discrimination against horizontally arriving noise. Externally the design is similar to the Sparton AN/SSQ-53 sonobuoy (**1990.453**). Inside, only the surface unit remains unchanged. The SSQ-53 lower unit has been replaced with a new electronics package and a five-element array. The array is designed to have low drag to maintain verticality and is protected from the flow induced mechanical noise (cable strum). A new suspension system has been incorporated to provide good surface wave isolation while reducing the current flow past the array.

Improved detection is achieved by the use of a tuned vertical line array consisting of five omni-directional hydrophone elements in a centre-phased configuration yielding two independent three-element arrays tuned to specific frequencies. The array provides a signal-to-noise ratio improvement over a single omni-directional hydrophone of 6 to 15 dB in the frequency range of interest, depending upon the target range and the specific noise conditions. Each hydrophone assembly includes a low-noise, high-input-impedance preamplifier to minimise cable losses and to ensure that the array shading factors and phase characteristics are not compromised.

Immediately after water entry, seawater activated batteries are energised. A 1·5 V float inflation battery detonates a squib, causing gas filled cylinders to inflate the sonobuoy flotation bag and erect the VHF transmitting antenna. A 1·5 V life timer battery and a 12 V primary battery are contained in the same pack. The life timer battery operates a circuit that can be set to scuttle the sonobuoy one hour or eight hours after water entry. The 12 V primary battery supplies power to all the electronic circuits and the sonobuoy begins transmitting.



CHARACTERISTICS
Type: Vertical line array
Size: A
Weight: 13·1 kg
Operating life: 8 h minimum
RF channels: 31
RF power: 1 W

Sparton Corporation, Electronics Division, 2400 E Ganson Street, Jackson, Michigan 49202, USA.

3782.453
SPARTON DWARF DIFAR SONOBUOYS

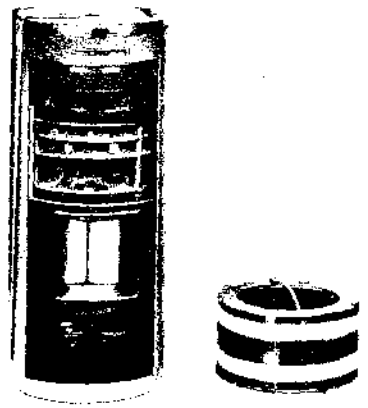
The Sparton Dwarf DIFAR sonobuoy is the electrical and acoustical equivalent of a standard AN/SSQ-53B sonobuoy, but occupies only a third of the volume. The Dwarf DIFAR has the 4·87 inch (124 mm) diameter of a conventional A-sized sonobuoy but an overall length of only 12 inches (305 mm). The small size of the Dwarf DIFAR sonobuoy enables a threefold increase in the number of units an ASW aircraft can carry and is particularly valuable with small fixed-wing ASW aircraft and helicopters. Dwarf DIFAR sonobuoys are compatible with existing shipping containers and handling equipment, and the cost saving in shipping and handling is substantial. They can be incorporated into existing fleet operations with minimal changes to associated equipment and deployment philosophy.

The Dwarf DIFAR sonobuoy can be deployed from fixed-wing or rotary-wing aircraft at indicated airspeeds of 0 to 370 knots and from altitudes of 40 to 30 000 feet (12 to 9144 metres). Air descent is stabilised and slowed by a parachute assembly.

The major components of the Dwarf DIFAR sonobuoy are the external sonobuoy housing, the antenna/VHF assembly, the suspension assembly (which consists of the cable pack, the stabilising kite, the damper disc, and the compliant cable), and the integrated hydrophone and electronics assembly.

Sparton Dwarf DIFAR sonobuoys

Upon entry to the water, the Dwarf DIFAR lithium-sulphur dioxide battery pack is activated by a seawater switch that detonates a squib, causing gas-filled cylinders to inflate the sonobuoy flotation bag, jettisoning the parachute assembly and erecting the VHF transmitting antenna. Inflation of the flotation bag provides the pressure force that activates the release plate in the top of the sonobuoy. This causes the parachute to be jettisoned and permits the surface assembly to separate from the sonobuoy housing and the surface housing. The sonobuoy housing serves as a descent vehicle and falls away from the sub-surface assembly at the operating depth, either 30 or 300 metres.



CHARACTERISTICS
Type: Passive
Depth: 30 or 300 m
Size: A diameter × 304 mm
Weight: 4·5 kg
Operating life: 1 or 4 h
Launch altitude: 12 - 9144 m
RF channels: Multi-channel
STATUS
Development.
CONTRACTOR
Sparton Corporation, Electronics Division, 2400 E Ganson Street, Jackson, Michigan 49202, USA.

4458.453
SPARTON DWARF OMNI SONOBUOY

The Sparton Dwarf Omni is an omni-directional passive sonobuoy that has an A-sized sonobuoy diameter but is only 305 mm long yet offers performance equivalent to a standard AN/SSQ-41B plus 99-channe transmit capability and electronic function selection of channel, life, and depth. Use of dwarf sonobuoys increases the number of sonobuoys that can be carried by an aircraft and is especially valuable for small fixed-wing ASW aircraft and helicopters. The 12 inch (305 mm) sonobuoys are compatible with existing shipping containers, handling equipment, and launching methods. They could be incorporated into existing fleet operations with minimal changes to associated equipment and deployment philosophy.

The Dwarf Omni sonobuoy may be dropped from an aircraft at indicated airspeeds of 30 to 425 knots and from altitudes of 100 to 40 000 feet (30 to 12 200 metres). Descent is stabilised and slowed by a parachute assembly. Operation on entry to the water is identical to the Dwarf DIFAR sonobuoy (**3782.453**).

CHARACTERISTICS
Type: Passive
Depth: 18 or 305 m
Size: A diameter × 305 mm length
Weight: 4·5 kg
Operating life: 1, 3 or 8 h
Launch altitude: 30 - 12 200 m
Launch speed: 30 - 425 knots
RF channels: 31
RF power: 1 W
STATUS
Development.

Sparton Dwarf Omni sonobuoy, cut away to show internal components

3784.453
WIDETRAC SONOBUOY

Widetrac is a developmental communications buoy intended to receive, convert and retransmit data. Both RF-to-acoustic and acoustic-to-RF may be received and transmitted simultaneously. Built to a standard A-size format, Widetrac can be launched from any aircraft equipped to handle sonobuoys.

The Widetrac sonobuoy may be dropped at indicated airpseeds of 30 to 425 knots and descent is slowed by a crogue parachute. Upon water impact, the buoy automatically activates in the receive mode. The operating depth is determined by manual selection before deployment. The acoustic transmit mode is activated only when the output of the UHF receiver contains information signals for transmission; scuttle commands or commands intended for other equipment such as CASS or DICASS sonobuoys do not cause any form of transmission from the Widetrac buoy. Operation is terminated by either a VHF scuttle command, a built-in timer, or a passive backup device. The sonobuoy system includes a floated surface assembly, a long interconnecting cable with mechanical stabilisation provisions, and a sub-surface assembly.

Widetrac consists functionally of an up-link and a down-link. The communication link can be established either as an up-link channel only or as simultaneous up and down channels. Upon receipt of a down-link message, acoustic signals are transmitted. The buoy system continuously maintains an acoustic listening mode so that incoming signals or the acoustic output of the sonobuoy itself can be detected, processed, and transmitted on a VHF link. The communication system is compatible with the submarine underwater telephone AN/WQC-2.

CHARACTERISTICS
Type: Communications buoy
Transmitter frequency: 162·25 - 173·5 MHz
Size: A
Weight: 15·9 kg
RF channels: 4
RF power: 1 W
STATUS
Development.
CONTRACTOR
Sparton Corporation, Electronics Division, 2400 E Ganson Street, Jackson, Michigan 49202, USA.

4459.453
AN/SSQ-86(XN-1) DOWN-LINK COMMUNICATION SONOBUOY

The AN/SSQ-86(XN-1) down-link communication (DLC) sonobuoy is a one-way communication device designed to transmit a pre-programmed message to a submerged submarine. Developed to meet the need for a reliable means of transmitting a message without revealing the receiving submarine's position, the DLC is compatible with existing sonobuoy launch platforms. The unit is packaged in a standard A-sized sonobuoy envelope and can be launched from any properly equipped fixed-wing aircraft or helicopter or from a surface ship.

The desired message is programmed into the DLC using a single push-button switch and four 7-segment LED displays. Four groups of three digits make up the message. The message can be verified and corrected if necessary with a second push-button provided to ensure proper data insertion. Once programmed, all remaining operational functions are automatic.

When air launched, the DLC is slowed and stabilised by a small parachute. For launches from surface vessels, it is merely thrown overboard. Upon water entry, the DLC immediately deploys. As soon as the sub-surface unit reaches the shallow operating depth, the message, coded into appropriate tones, is acoustically transmitted. The first transmission is followed by a five-minute pause while the sub-surface unit deploys to the deep depth. The message is repeated at the deep depth; after a second five-minute pause, the message is transmitted a third time. At the end of the final transmission, the DLC automatically scuttles. The nominal life of the DLC from water entry to scuttle is 17 minutes.

For maximum reliability and minimum development time, extensive use has been made of existing technology and hardware from other Sparton sonobuoy designs. Examples include the lithium battery power supply, the air descent and float inflation hardware, and much of the circuit design. The omni-directional projector is a simple resonant bender element designed to operate efficiently at the desired bandwidth.

CHARACTERISTICS
Depth: Shallow and deep
Size: A (123 × 910 mm)
Weight: 11·4 kg
Operating life: 17 minutes nominal
STATUS
Development.

AN/SSQ-86(XN-1) down-link communication sonobuoy

3599.253
AN/ASQ-81(V) AIRBORNE ASW MAGNETOMETER

The AN/ASQ-81(V) magnetic anomaly detector (MAD) system was developed for the USN for use in the detection of submarines from an airborne platform. The system operates on the atomic properties of optically-pumped metastable helium atoms to detect variations in total magnetic field intensity. The Larmor frequency of the sensing elements is converted to an analogue voltage which is processed by bandpass filters before it is displayed to the operator.

Two configurations of the AN/ASQ-81(V) are available; one for installation within an airframe, and one for towing behind an aircraft. The USN uses the AN/ASQ-81(V)-1 inboard installation with carrier-based S-3A aircraft as well as with the land-based P-3C ASW aircraft. For towing, the configuration is the AN/ASQ-81(V)-2, which is employed by USN SH-3H and SH-2D helicopters. The towed version is also fitted in the USN's latest helicopter the SH-60B Seahawk.

STATUS
The AN/ASQ-81(V) is in production for the USN and a variety of international customers on helicopters such as the WG-13, HSS-2 and 500D.

KLEIN HYDROSCAN SYSTEMS

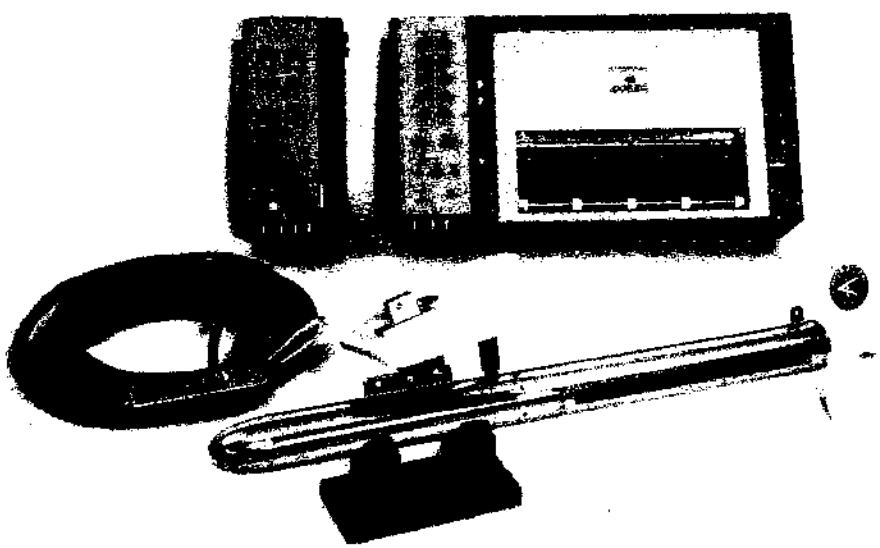
Klein Hydroscan systems map the topography of the sea bed and profile the shallow bottom sediment layers, although they can also be used for underwater detection of objects moored on the sea bed. A side-scan sonar/sub-bottom profiler system consists of a side-scan towfish with a sub-bottom profiler attachment, a towing cable and a graphic recorder.

The side-scan sonar towfish contains transmitting circuitry to energise the transducers which project high frequency bursts of acoustic energy in fan-shaped beams which are narrow in the horizontal plane and wide in the vertical plane. The sub-bottom profiler attachment contains its own electronics and transducer to project a conical beam straight down to the sea floor. Echoes from both side-scan and profiler transducers are received and sent up the tow cable to the graphic recorder for processing and printing.

The standard towfish has a 100 kHz frequency and a horizontal beam angle of one degree which is the optimum for general purposes. A very high resolution version has a frequency of 500 kHz whilst another variant for long range operates at 50 kHz. They can be towed up to a maximum speed of 16 knots and are rated for a depth of up to 1000 m. Deeper units which are rated to 12 000 m are also available and have been tested by the US Navy.

The sub-bottom profiler is used to give a high resolution vertical profile of shallow sediments on the sea floor. It has an output frequency of 3·5 kHz and a normal depth rating of 300 metres, although a special deep tow attachment can operate down to 12 000 metres. Resolution is approximately 600 mm and the beam angle is 50°, conical and pointed straight down.
STATUS
All versions of both side-scan sonar and sub-bottom profiler attachment are in current production. The Swedish Navy has bought seven side-scan systems for ASW purposes in coastal waters.
CONTRACTOR
Klein Associates Inc, Undersea Search and Survey, Klein Drive, Salem, New Hampshire 03079, USA.

Klein side-scan sonograph of a Mk 17 mine with a Mk 18 base



5643.453
UNDERWATER ORDNANCE LOCATOR MK.24 MOD 0

The Mk.24 Mod 0 ordnance locator is a dual-beam side-scan sonar for use in locating mines and other types of underwater ordnance. It is available with modular accessories which adapt the equipment for use in channel conditioning/route survey mine countermeasures operations as well as for use in explosive ordnance disposal operations.

The Mk.24 system consists of a side-scan sonar towfish, weighing approximately 22 kg (48 lb), a lightweight Kevlar towcable, and a combined transceiver and graphic recorder weighing 44 kg (95 lb). The system and its accessories are lightweight and portable, and can be deployed from any available vessel down to 5 m in length. It can also be towed from any available and unmodified helicopter.

The side-scan towfish contains the circuitry to energise the transducers which project high frequency bursts of acoustic energy in fan-shaped beams, narrow in the horizontal plane and broad in the vertical plane. Echoes from both transponders are processed by the combined transceiver and printed by the graphic recorder. Three types of towfish are available; a 50 kHz long range towfish for covering up to 1·2 km swaths of the bottom; a 100 kHz high resolution version for detection operations covering up to 400 m swaths; and a 500 kHz very high resolution towfish for target classification applications with a sweep width of 150 m. A 3·5 kHz sub-bottom profiler is available for assessing bottom hardness to determine potential buried mine hazards.

The towfish can be towed at speeds up to 16 knots, but for optimum operation against small targets the recommended speed is 5 to 6 knots. Standard towfish can operate down to depths of 1000 m (3280 feet) with options permitting operation down to 2270 m (7445 feet). Special units are available for operations down to full ocean depth.

Components of the Mk. 24 mine-hunting sonar

STATUS
All versions of the system are in full production, and are in use by the US Navy Explosive Ordnance Disposal units.
CONTRACTOR
Klein Associates Inc, Undersea Search and Survey, Klein Drive, Salem, New Hampshire 03079, USA.

ELECTRO-OPTICAL EQUIPMENT

Note: This section contains details of electro-optical (also referred to as opto-electronic and/or optronic) equipments which formerly occupied the Rangefinding and Sighting Equipment section of this book. For the convenience of users of *Jane's Weapon Systems* the contents of the section have been divided into three sub-sections, devoted to land, sea and air applications of these equipments respectively. In those cases where an item may be employed in more than one role, it will be found, as a general rule, with either the sub-section relating to its initial application, or the sub-section appropriate to the most common use of the equipment.

Within the complete section readers will find examples of purely optical devices, such as sights and sighting equipment, as well as others which involve the use of different parts of the spectrum beyond the visible region. As a matter of convenience, a number of items will be found in which the use of optical components is incidental (albeit essential). Such entries are mostly related to equipment which has as its main function some role such as weapon delivery, which is a prime objective of most of the entries in this section.

More specifically, the section contains entries concerned with optical sights for land, sea and air use; laser equipment for rangefinding and target designation or marking purposes; infra-red techniques applied to such functions as passive surveillance and detection, thermal imaging sights, night driving periscopes, and forward looking infra-red for aircraft and other uses. From this brief summary it will be appreciated that most of these applications are related closely with one or more of the other aspects of military technology which are the subject matter of this volume, and that certain of them (elaborated to a greater or lesser degree) could equally well be assigned to another part of the book. For example, many of the newer electro-optical (E-O) naval tracking equipments are capable of being expanded, with little additional equipment, to form a naval fire control system for small vessels. Similarly, many of the infra-red techniques employed in equipment in this section have applications in the fields of reconnaissance and countermeasures. For such reasons as these, users with specific interests in such areas should also consult related sections such as Army and Naval Fire Control Systems, Electronic Warfare, etc.

4743.193
LRS 4 Mk II FIRE CONTROL SYSTEM

This is a portable battery-operated laser rangefinder with a built-in ballistic computer. It is claimed to be one of the smallest fire control systems available and is intended for day and night operation. It is designed for direct firing on weapons such as small turrets on armoured vehicles, recoilless guns and portable anti-tank weapons. Depending on the application, the system can be operated by the built-in rechargeable battery or by an independent battery, eg the vehicle supply.

The LRS 4 Mk II consists of a ×3·8 day channel, a ×3·8 image intensifier night sight, an Nd:YAG laser rangefinder, a digital ballistic computer programmed for two different types of ammunition, a moving target tracking system, a computer-driven ballistic aiming mark, a ballistic reticle for emergency firing and a rechargeable battery.

The reticle configuration is identical for night and day observation. There are three separate groups of reticles: a laser cross with moving target marks, a red-coloured cross ballistic aiming mark and a ballistic reticle. Most of the controls for the gunner are push-button types, integrated into the keyboard, either on the instrument itself or a remote control unit.

CHARACTERISTICS
Day and night sights
Magnification: ×3·8
Field of view: 8·5°
Dioptre adjustment: −3 to +3 dioptre
Laser
Type: Nd:YAG
Wavelength: 1·064 μm
Resolution: 5 m
Accuracy: ± 10 m
Range: 200 to 5000 m
Minimum range gating: 200 to 3000 m
STATUS
In production.

LRS 4 Mk II fire control system

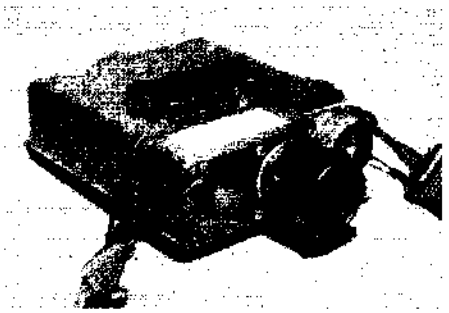
CONTRACTOR
OIP Optics, Meersstraat 138, 9000 Ghent, Belgium.

4744.193
LRS 5 FIRE CONTROL SYSTEM

The LRS 5 is a compact day/night laser rangefinder with a built-in ballistic computer. It is designed for use in most types of battle tanks and other armoured vehicles. The LRS 5 is a monobloc, fully integrated system with no separate boxes except for a small overriding control box for the vehicle commander.

The main components of the system are: a unit vision eyepiece, a ×8 power day sight, a ×4 power second generation image intensifier night sight, an Nd:YAG laser rangefinder, a digital ballistic computer able to be programmed for 4 types of ammunition, a moving target tracking system, a computer-driven ballistic aiming mark, a manual range input as the first emergency mode and a ballistic reticle as the second emergency mode. The system provides a firing sequence identical for both day and night modes of operation, a manual correction for secondary parameters such as temperature and humidity and a visual warning to both commander and gunner for every control being operated.

A number of optional items are also available including an automatic computer-controlled correction for cant angles and a slaved commander's sight allowing 100 per cent override facility. In addition, an agreement between OIP and Thorn-EMI (UK) has provided for the integration of a thermal imager night sight. This is based on the latter company's Multi-Role Thermal Imager (**4260.193**) which is in operational service.



CHARACTERISTICS
Magnification: ×8 (day sight); ×4 (night sight)
Field of view: 7° (day sight); 7·2° (night sight)
Laser
Type: Nd:YAG
Wavelength: 1·064 μm
Radiant energy: 4 mJ (typical)
Ranging resolution: 5 m
Ranging accuracy: ±10 m
Range: 200 to 9995 m
Minimum range gating: 200 to 4000 m
STATUS
Over 700 systems sold to six customers, including 200 to Malaysia. The thermal imager module has now been incorporated in a version of the LRS 5.

OIP Optics, Meersstraat 138, 9000 Ghent, Belgium.

LRS 5 fire control system

4745.193
LRF 104 HAND-HELD LASER RANGEFINDER
The LRF 104 is a rangefinder approximately the size of a pair of 7 × 35 binoculars and weighing only 1 kg. Instant range operation enables the operator to distinguish moving targets up to 10 km distance. Range data and operational indicators displayed in the sighting optics provide the operator with the necessary information without loss of aim to the target.

CHARACTERISTICS
Laser: Nd:YAG
Receiver: Silicon avalanche photodiode
Wavelength: 1·064 μm
Pulse energy: 4 mJ nominal
Magnification: ×5
Field of view: 113 mrad
Range: 50 to 10 000 m
CONTRACTOR
OIP Optics, Meersstraat 138, 9000 Ghent, Belgium.

LRF 104 hand-held laser rangefinder

5889.193
OIP MISCELLANEOUS ELECTRO-OPTICS
In addition to the fire control systems described above, OIP manufactures a number of other electro-optical equipments. These include boresights for large and small calibre weapons, sniper night scopes and a computerised angle indicator system.

The large calibre boresight is intended primarily for use in battle tanks, and can be employed for a number of purposes; boresight of optical instruments in the tank, measurements of gun-bending, and accurate aiming for precision firing rounds. Magnification is × 10 with a field of view of 4 degrees. The equipment weighs approximately 6 kg. The small calibre sight is intended for use on weapons with calibres ranging from 7·62 to 25 mm, and provides accurate alignment of optical sights mounted on the weapon. A programme for the design and manufacture of a number of boresight variants for all sizes of bore has recently been started.

The SNS 3 is a compact night vision sniperscope for use on small arms. It is lightweight and uses a second generation high-performance image intensifier. Magnification is × 3·4 and the field of view is 9·2 degrees.

The computerised angular indicator has been designed for fast and accurate indirect firing from armoured vehicles and tanks. A built-in computer combines with a digital read-out of distance from the elevation channel of the sight and enables the crew to make a precise setting of the weapon in the indirect firing mode.
STATUS
In production.

CHINA (PEOPLE'S REPUBLIC)

5890.153
CHINESE ELECTRO-OPTICAL SYSTEMS
Until comparatively recently virtually nothing was known about the optical and electro-optical systems used by the Chinese armed forces. However over the past year or so a few details have emerged, particularly since China has appeared as an exhibitor at various exhibitions, albeit in a very small way. Much of the equipment used owes a great deal to earlier Russian design, and nothing is available on any research and development work being carried out in this field. It is known that China has an indigenous radar development programme under way and it seems likely that the same would apply to electro-optics, particularly laser, thermal imaging and TV based systems. Information recently obtained from China is given below, although details are somewhat limited and the only modern equipment is the LR1 laser rangefinder.

LR1 laser rangefinder

LR1 Short-range Artillery Laser Rangefinder
This is a tripod-mounted instrument used by the artillery's reconnaissance and command detachment. It is used for observation, rangefinding, angle measurement and direction. Power is supplied by a silver-zinc battery set. Range is given as 200 to 7000 metres, with an accuracy in range of ±10 metres and in azimuth of ±3 mils. Weight is 36 kg including the silver-zinc battery power supply.

SR 0·5 0·5m Artillery Rangefinder
This is a conventional tripod-mounted optical rangefinder used by the artillery. It has a magnification of × 10 and a field of view of 6 degrees with a measuring range of 300 to 4000 metres. The weight of the rangefinder itself is 3·6 kg.

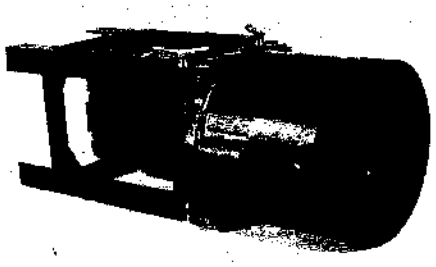
SR 0·8 0·8m Artillery Rangefinder
This is another conventional tripod-mounted optical rangefinder. It has a × 12 magnification, field of view of 6 degrees and a measuring range of 400 to 14 000 metres. Total weight including tripod, angle measuring mechanism, and carrying boxes is 29·3 kg.

ASR 1m Anti-aircraft Rangefinder
This hand-held stereoscopic rangefinder is used to measure the slant range of air targets from either land or sea. Magnification is × 10 with a 6 degree field of view. The measuring range is 500 to 6000 metres. The rangefinder weighs 31 kg.

ASR-3-2 3m Anti-aircraft Rangefinder
This rangefinder is employed in conjunction with the fire control director described below. It has a measuring range of 750 metres to 100 km with a magnification of × 32. The field of view is 1·8 degrees, and the weight of the complete rangefinder 252 kg.

GM-03 Anti-aircraft Fire Control Director
This is a precise tracking and computing equipment for 57 mm guns. Using information provided by a fire control radar or a rangefinder the GM-03 calculates the target lead through servo systems and evaluates the firing data for the guns. The complete system consists of an analogue resolver, rangefinder ASR 3-2, and a trailer for carrying and transporting the two units. It is designed to work with one fire control radar and one to eight 57 mm guns.

AS 8 Battery Commander's Telescope
This is a tripod-mounted field telescope used for observation, and measurement of angles and target distance. The magnification is × 8 and the field of view 7 degrees.



AS 16 Battery Commander's Telescope
Similar to the ASR 8 but has a magnification of × 16 and a field of view of 4·5 degrees.

AC1 Aiming Circle
Tripod-mounted and used for measurement of magnetic bearings, azimuth and elevation. Also used for observation and, when fitted with a range reticle, to measure distance to target.

Q1 Mortar Quadrant
Used to provide mortars with a firing angle.

4237.193
TYPE 772 SIGHTING SYSTEM
This tank sighting system employs the JAI Type 772 low light-level television camera which is similar to the Type 771 produced by the same company for naval applications (**3857.293**), in this case employed with an automatic ballistic calculator and an input from a laser rangefinder to provide a day/night sighting system for use in main battle tanks. The data generated by the system is presented on a TV monitor screen together with the camera picture of the outside scene. These facilities are available to both the gunner and the tank commander, each having his own monitor display.
CHARACTERISTICS
Field of view: *64 × 48 mrad*
Focus: 30 m to infinity
Range: Dependent on guns and ammunition (typically 0–3995 m)
Sensitivity: 2×10^{-6} lux, fp (100% contrast, 200 lines)
Recognition limit: 1·5 m target at 1000 m with 10^{-4} lux illumination (target reflection 30%, contrast 50%)
Automatic fire flash protection
STATUS
In production. JAI also manufactures other low-light TV systems for military purposes, including man portable types.
CONTRACTOR
JAI – Jorgen Anderson Ingeniofirma AS, Produktionsvej 1, 2600 Glostrup, Copenhagen, Denmark.

JAI Type 772 low light-level television camera for tank fire control

FRANCE

TCV 29 AND TCV 30 TANK LASER RANGEFINDERS

The type TCV 29 laser rangefinder has been designed for installation on existing tanks in order to improve their capabilities without any major modifications, and thus increase their operational efficiency. The TCV 30 is an equipment derived from the TCV 29, and has the same main characteristics as those described in the following paragraphs. It is suitable for installation on the T54 and T55 series of tanks.

The equipment consists of a power-supply transmitter-receiver unit and two display and control boxes. The former includes, in a watertight cast housing, the laser transmitter and the detector together with their associated optical systems, the signal processing electronic circuits and the power supplies for the various parts of the rangefinder. It also includes a removable optical sight for aligning it on the gun bore axis. The equipment can be operated either by the tank commander or by the gunner. The first control box is assigned to the tank commander and includes means for transmitting orders to the gunner. The second one is assigned to the gunner and is identical to the commander's box in its functions.

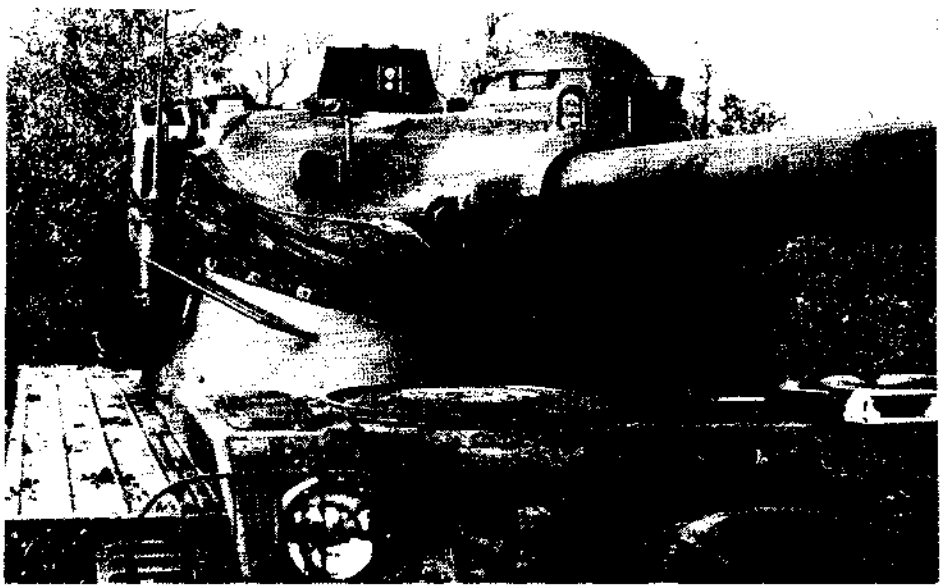
In use, three operations only are involved:
(1) accurately aim at the target
(2) depress the measurement button
(3) read off the range presented in numerical form.

In the case of two echoes being detected, the second measurement is recorded and a warning light indicates this second echo to the operator. The corresponding distance can be displayed by depressing another button.

OPERATION

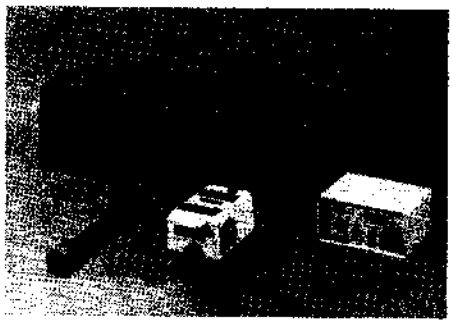
The light pulse is generated by a neodymium-doped glass laser emitting in the near infra-red.

The laser beam goes through a beam expander, the purpose of which is to reduce its divergence. The echo returned by the target is received through an optical system on an avalanche photodiode.



A small fraction of the laser beam is used as a start signal for a pair of counters. The stop signal for the first counter is derived from the first incoming echo; a second echo will act likewise for the second counter.

The receiver gain automatically increases with the time elapsed from the start of the transmitted pulse to compensate for the effects of target remoteness. The information relating to the distance is also available in a digital form for possible transmission to a firing computer.



Laser rangefinding consists basically in measuring the time interval between the emission of a short laser pulse and its reception after reflection on a target. This time interval is automatically converted into distance and the result is numerically displayed. The accuracy is ±5 m with the normal operating range, ie between 400 m and 10 km.

CHARACTERISTICS

Transmitter
Wavelength: 1·06 μm
Peak power: >4 MW
Pulse duration: 25×10^{-9} s

TCV 29 laser rangefinder installed on tank turret

TCV 30 tank laser rangefinder

Energy: over 0·1 J
Repetition rate: 1 measurement every 2 s; 12 per minute
Divergence (at the exit of beam expander): Over 0·5 mrad
Exit pupil (after beam expander): 30 mm Q-switching by rotating prism
Avalanche photodiode detector
Minimum detectable power: 10^{-7} W
Receiving pupil: 40 mm
Clock frequency: 29·97 MHz
Accuracy: ±5 m
Measurement range: 400 - 9995 m
Number of counters: 2
Multiple target distance resolution: 50 m
Output to computer: Parallel BCD (1, 2, 4, 8) coded
Removable optical sight
Field: 3°
Magnification: ×5
Ocular ring: 4 mm
Automatic shutter for protection of emission and reception optical parts.
Power supply
Voltage: 24 ± 8 V, DC
Consumption: 50 W between measurements. 200 J per measurement
Power supply/transmitter/receiver unit
Weight: 19·5 kg, cables: 2 kg
Dimensions: 240 × 350 × 120 mm
Control box I
Weight: 2·7 kg + cable
Dimensions: 150 × 72 × 115 mm
Control box II
Weight: 2·7 kg + cable
Dimensions: 210 × 90 × 115 mm

STATUS

In production. Among others, this equipment is fitted to the Austrian Army Kurassier tank (**5032.102** in 1979-80 and earlier editions).

CILAS (Compagnie Industrielle des Lasers), Route de Nozay, 91460 Marcoussis, France.

SOPELEM, 102 rue Chaptal, 92306 Levallois-Perret, France.

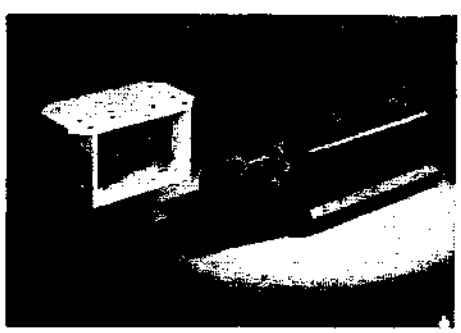
3557.193
TCV 107 TANK LASER RANGEFINDER

The TCV 107 is a miniature laser rangefinder for use on any type of tank. Small size and weight permit its installation outside the vehicle, or inside where it may be associated with an optical sight. It is of modular construction and consists of two parts:
(1) a sealed transmitter receiver power unit. A removable optical sight is used for aligning this unit with the gun boresight axis, by means of an integrated beam deviator.
(2) a control box for operating the equipment and displaying the results.

The digital readout of range measurement is displayed on the control box. A warning light indicates when there are several echoes and the distance of the furthest echo is automatically displayed; the range of the nearest one can then be obtained by pressing a button. For installation outside the vehicle, an armoured container with an automatic shutter for the protection of the optics is available.

CHARACTERISTICS

Wavelength: 1·06 μm
Pulse duration: 20×10^{-9} s
Peak power: 1 MW
Detector: Avalanche photodiode
Output to vehicle computer (option)
Dimensions: 290 × 140 × 100 mm
Mass: 6·3 kg
Measurement range: 150 - 9500 m
Accuracy: ±5 m
Angular resolution: Better than 0·5 mrad
Repetition rate: 1 measurement every 2 s for 3 successive shots; 12 measurements per minute



STATUS

Series production.

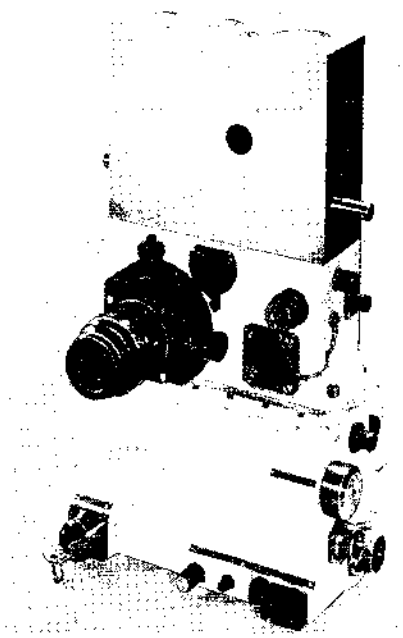
3660.193

TCV 109 TANK LASER RANGEFINDER SIGHT

The TCV 109 is a combined optical sight and laser rangefinder designed for installation inside a tank turret. The equipment consists of four items: an optical sight for observation and aiming, adapted to a prismatic head, providing one channel for observation and another for rangefinder operation; a laser rangefinder, incorporating within the same case the emission, reception, timing, display, and power supply functions; a slaved cross-hairs projector located in a casing mounted at the rear of the rangefinder unit, and which allows superimposition on the aiming sight cross-hairs of a set of computer-generated correction cross-hairs; and a remote control and display box. The last item is optional.

Operating features include: control of the minimum ranging gate; comprehensive display of information within the eyepiece (distance of first and second laser echoes, warning of multiple echoes, warning of an echo within the gated zone, and 'ready-to-fire' gun warning); data output to tank fire control computer; built-in test.

CHARACTERISTICS



Optical sight
Magnification: ×8 and ×1·2, switchable
Field: 7 and 44°
Eyepiece adjustment: -5 to +2 dioptres

Laser rangefinder
Wavelength: 1·06 micron
Pulse duration: 25 × 10⁻⁹ s
Peak power: 1 MW
Detector: Avalanche photodiode
Minimum detectable power: 2 × 10⁻⁸ W
Receiver field: 0·5 mrad
Operating voltage: 20 - 32 V DC
Dimensions: 190 × 240 × 380 mm
Weight: 15 kg (complete)
Measurement range: 320 - 9995 m
Accuracy: ±5 m
Minimum ranging gate adjustable: 300 - 3000 m
Repetition rate: One measurement every 2s for 3 successive shots; 12 measurements per minute. Dichroic plate and filter in observation channel protect observer's eye during laser emission; this provides at least 60 dB attenuation at 1·06 micron

CONTRACTORS

CILAS (Compagnie Industrielle des Lasers), Route de Nozay, 91460 Marcoussis, France.

TCV 186 LASER RANGEFINDER

The TCV 186 is a small, lightweight laser rangefinder for integration into the optical sight of the AMX 40 tank. It can also be integrated into the gyro-stabilised sights of helicopters.

The rangefinder is a self-contained unit housing the laser transmitter, receiver, power supply and electronic counter. The measured distance of two targets is transmitted in serial binary form to the fire computer.

CHARACTERISTICS

Wavelength: 1·06 micron
Pulse duration: 25 × 10⁻⁹ s
Peak power: 1 MW
Detector: Avalanche photodiode
Dimensions: 150 × 110 × 90 mm
Mass: 2 kg

STATUS

Prototype

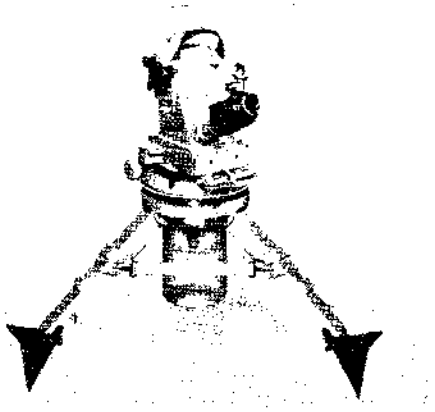
TM 17 (TM 12) ARTILLERY SIGHT/LASER RANGEFINDER



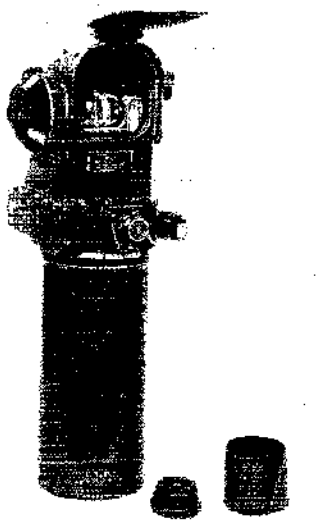
The TM 17 (formerly designated TM 12) is a portable equipment that comprises in a single unit an optical sight and a laser rangefinder. The former provides target elevation and azimuth information, and the latter gives range data. Arrangements are made for this information to be fed into an automatic fire control system.

It is also possible to use the TM 17 for taking topographic measurements and survey work by provision of a suitable north seeking system.

CHARACTERISTICS

Laser material: Nd-doped glass
Wavelength: 1·06μm
Pulse duration: Approx 25 × 10⁻⁹ s
Energy: Over 100 mJ
Peak power: Over 4 MW
Divergence: 0·5 mrad
Measurement range: 150 - 19 900 m. Simultaneous display of 2 echoes
Range blanking: Adjustable between 150 and 5000 m
Measurement accuracy: ±5 m
Repetition rate: 1 measurement every 2 s for 3 successive shots; 12 measurements/minute

Optical sight
Azimuth range: 360°
Azimuth accuracy: 1 mil
Elevation range: -20 to +40°



TM 17 tripod mounting

Elevation accuracy: 2 mils
Orientation: By trough compass
Power supply: 24 V Ni-Cd rechargeable battery allowing over 400 measurements
Weight: 115 kg complete

STATUS

Series production.

TM 18 (TPV 89) LASER RANGEFINDER

The TPV 89 (French Army designation TM 18) is a hand-held laser rangefinder, similar in size and appearance to a pair of field binoculars. The instrument was designed for observation and rapid and accurate range measurement of targets or other items of interest. In use, the operator centres the cross-hairs on the target and triggers the laser by means of a push-button; the distance in metres is displayed immediately in the eyepiece. Accuracy is ±10 m whatever the target distance, within the range limits of the sight. An optical device provides absolute protection of the operator's eyes during laser emission. Other features include a device to prevent accidental triggering of the laser, a multiple echo indicator, a blanking control adjustable between 150 and 2300 m, and an internal power supply. A tripod mounting with elevation and azimuth control, charger for the nickel-cadmium battery, remote trigger, thigh battery and a removable attenuator are also available.

CILAS TPV 89 laser rangefinder

CHARACTERISTICS

Monocular sight
Magnification: ×6
Field of view: 7° (±120 mrad)
Ocular ring: 5 mm

Laser rangefinder
Wavelength: 1·06μm
Beam expansion ratio: 1:4
Energy: 30 mJ
Repetition rate: 12 shots/minute
Time to range: 0·1 s
Detector: PIN photodiode
Measurement range: 150 - 9990 m
Accuracy: ±10 m
Range blanking: Adjustable 150 - 2300 m
Dimensions: 180 × 150 × 75 mm
Weight: 1·9 kg
Power supply: 12 V 0·5 Ah Ni-Cd battery giving 600 shots at 25°C

STATUS

Series production.

CILAS (Compagnie Industrielle des Lasers), Route de Nozay, 91460 Marcoussis, France.

SOPELEM, 102 rue Chaptal, 92306 Levallois-Perret, France.

3146.193
APX M504 OPTICAL SIGHT AND RANGEFINDER

The APX M504 equipment consisting of a laser rangefinder, an aiming optical system, and an optical deflection device, is part of the COTAC fire control system of the AMX-10RC tank. The equipment provides an optical sight for the gunner, with ×10 magnification and a 120 mil field of view (SOPELEM), a laser rangefinder by CILAS, and a line-of-sight deflector by GIAT (Groupement Industriel des Armements Terrestres). The last of these is used to introduce automatically fire corrections into the optical sight.

APX M504 sight and rangefinder

In addition to its observation and aiming functions, it provides information automatically on the distance of the target to the firing control system. Its accuracy is ±5 m regardless of the distance of the target within the limits of the range. The maximum measurable distance depends on the visibility, and can reach 10 km. The unit comprises a pilot light indicating the possible presence of two echoes, in which case the measurement of the second echo can be selected.

CHARACTERISTICS

Rangefinder
Laser material: Nd-glass
Wavelength: 1·06 μm
Pulse duration: 25×10^{-9} s
Energy: 100 mJ
Peak power: 4 MW
Divergence: 0·5 mrad
Repetition rate: 1 measurement every 2 s for 3 successive firings, 12 measurements per minute
Receiver
Detector: Avalanche photodiode
Field angle: 0·5 mrad
Dimensions: 250 × 110 × 150 mm. 3·5 kg (rangefinder only)

OPERATION

The gun-layer's function is simply to aim at the target. As soon as this is correctly performed, he triggers the laser rangefinder, and then inserts the corrections which have been computed automatically. A number of sub-systems developed by GIAT enhance the performance of the overall COTAC system: a device for measuring the angular speed of the target in two axes; an automatic cant angle sensor; meteorological sensors; and a computer for producing fire corrections from the measured parameters.

STATUS

The APX M504 was designed under DTAT contract and is now in series production.

CONTRACTORS

APX M409 OPTICAL SIGHT AND RANGEFINDER

The APX M409, consisting of a laser rangefinder, a daylight sight, a night-time sight, and a prism head, is intended for the AMX-30S tank.

APX M409 optical sight and laser rangefinder

In addition to its observation and aiming functions, it provides information on target range directly to the tank commander.

Its accuracy is ±5 m regardless of the distance of the target within the limits of the range. The maximum measurable distance depends on the visibility and can reach 10 km. When distances relating to two targets are measured simultaneously, the two readings are displayed at the same time one above the other.

Through a blanking device, it is possible to eliminate any echoes from less than a predetermined distance.

CHARACTERISTICS

Emitter
Laser material: Nd-glass
Wavelength: 1·06 micron
Pulse duration: 25×10^{-9} s
Energy: 100 mJ
Peak power: 4 MW
Divergence: 0·5 mrad
Measurement range: 400 – 9995 m
Range blanking: Adjustable between 400 and 5000 m
Repetition rate: 1 measurement every 2 s, 12 measurements per minute
Dimensions
Optical sight and rangefinder: 350 × 200 × 150 mm; 10 kg
Supply unit: 320 × 200 × 160 mm; 25 kg

STATUS

The APX M409 was designed and developed under DTAT contract. It is now in series production for AMX-30S tanks ordered by an undisclosed defence force (believed to be Saudi Arabia).

CONTRACTORS

CILAS (Compagnie Industrielle des Lasers), Route de Nozay, 91460 Marcoussis, France.

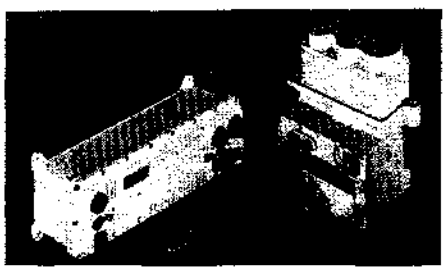
3415.193
APX M546 OPTICAL SIGHT AND RANGEFINDER

The APX M546 optical day and night sight and rangefinder has been developed for AMX-10 AFVs armed with the HOT anti-tank missile system (**2212.111**). It is used by the vehicle commander for observation and rangefinding purposes in target acquisition in the operation of the HOT missile.

The portion of the equipment protruding from the cupola (M517 for HOT, M605 for SAO) is made of armour steel. It incorporates an elevation prism transmitting the landscape image to the inside of the cupola, this prism being under manual control.



The lower part of the equipment (M427) inside the vehicle has two functions: as a day telescope, and as a rangefinder. The former portion of the equipment is the responsibility of SOPELEM and the main features are ×8 magnification, an 8° field of view, adjustable eyepiece (-5 to +2 dioptres), infra-red filter, and a retractable neutral filter. The rangefinding element is the responsibility of CILAS and the laser rangefinder has the following principal characteristics: 1·06 micron operating wavelength, range capability of 400 m to 10 km with an accuracy of ±5 m, range blanking continuously variable between 400 and 5000 m, two echoes are displayed, and measurements can be made at a rate of one every two seconds.

STATUS

In series production.

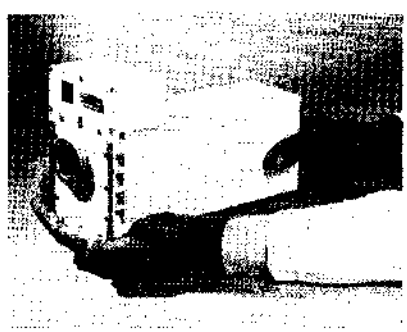
APX M550/TCV 80 LASER RANGEFINDER

The APX M550/TCV 80 laser rangefinder was specially designed for mounting on the optical sight of AMX-10RC and AMX-30 tanks, and on some APX gyro-stabilised sights for helicopter applications. A single unit of small dimensions houses the laser emitter, the receiver, power supply and the electronic clock. In addition to the above applications, this rangefinder can be adapted to any fire control system for accurate distance measuring.

CHARACTERISTICS



Laser type: Nd-glass
Wavelength: 1·06 micron
Pulse duration: 25×10^{-9} s
Energy output: 100 mJ
Peak power: 4 MW
Repetition rate: 1 measurement every 2 s for 3 successive shots; 12 shots/minute
Detector: Avalanche photodiode
Minimum detectable power: $\leqslant 2 \times 10^{-8}$ W
Measurement range: 320 - 9995 m. Output to fire control computer
Range accuracy: ±5 m
Dimensions: 260 × 110 × 160/110 mm (height)
Weight: 3·5 kg
Power supply: Vehicle, 19 – 28 V DC

STATUS

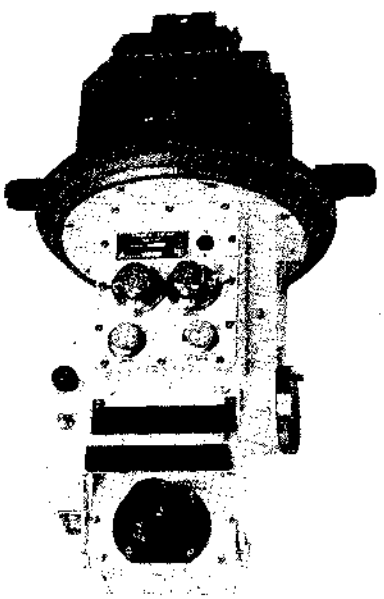
OB-44 NIGHT OBSERVATION BINOCULARS

The OB-44 low light-level binoculars are designed for general night observation purposes and are capable of use from a moving vehicle. The latter feature is assisted by the eyepiece design which requires no inter-pupillary adjustment (between 58 and 72 mm), has no exit pupil and no eyepiece focusing, which enables an observer to retain spectacles (if worn). A special high-performance refractive lens, designed for low light-level applications, is used, and an inverter type micro-channel intensifier tube with manual and automatic gain control is employed.

CHARACTERISTICS
Magnification: ×2·5
Field of view: 11·5°
Resolution: ≥0·6 mrad at 10^{-3} lux
Focus: Adjustable 20 m – ∞
Lens: Dioptre 120 mm focal length
Aperture: f1·6
Image tube: 25 mm type S-20ER cathode
Resolution: 30 line pair/mm
Range performance: 600 m for human targets and 1200 m for tank targets at 10^{-1} lux; 450 m and 900 m at 10^{-3} lux



Sopelem OB-44 night observation binoculars

Dimensions: 90 × 120 × 330 mm
Weight: 2 kg
Power: 2·7 V mercury or lithium battery
STATUS
Production. Operational with French and foreign forces.
CONTRACTOR
SOPELEM, 102 rue Chaptal, 92306 Levallois-Perret, France.

3752.193
OB-47 NIGHT SIGHT

The OB-47 night sight is a light intensification monocular sight which enables the gunner of an AMX-30 main battle tank to aim the tank's main armament in darkness. The image intensifier tube employed has automatic gain control and is of the microchannel inverter type. In the AMX-30, the OB-47 is associated with OB-44 observation binoculars, and an M 427-02 laser rangefinder sight. The driver can be provided with a CN2 516 night driving periscope.

CHARACTERISTICS
Magnification: ×5·5
Field of view: 7°
Elevation travel: 8 to −20°
Dioptre adjustment: −5 to +2 dioptre
Range: 1000 m with 10^{-3} lux illumination
STATUS
Production and in service with a foreign army.
CONTRACTOR

SOPELEM OB-47 night sight

3978.193
OB-49 COMBINED DAY AND NIGHT AIMING SIGHT

This sight comprises two day paths, one with a wide field of view, an image intensification night path, and an eyepiece common to the three paths.

It is connected to the M59* prism head of the AMX-30 tank cupola. For use by the commander it enables day and night firing of the 20 mm weapon from the turret, as well as firing the cupola light weapon.

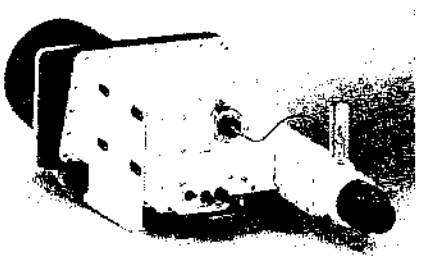
CHARACTERISTICS
Day path
Magnifying power: ×1·2 and ×7
Field of view: 30° and 6°
Night path
Magnifying power: ×3·5
Horizontal field of view: 11°
Micro-channel image intensifier tube automatic and manual gain control
Range: 600 m with 10^{-3} lux
Head prism elevation range: −10 to +45°
STATUS
In production.
CONTRACTOR
SOPELEM, 102 rue Chaptal, 92306 Levallois-Perret, France.

OB-49 combined day and night aiming sight

5698.193
OB-50 NIGHT AIMING TELESCOPE

The OB-50 telescope is designed for night observation and aiming without artificial illumination of the target by intensification of the residual light from the night sky. It is cylindrical in form and is equipped with a high definition objective lens, second generation light intensifier tube and a wide adjustment eyepiece. The line of sight is represented by a micrometer with LED illumination, adjustable in two perpendicular directions for alignment with the weapon. It is mounted on the weapon by a mechanical support.

CHARACTERISTICS
Magnification: ×3
Field: 10°
Resolution: 0·6 mrad at 10^{-1} lux; 0·8 mrad at 10^{-3} lux
Range recognition: 400 m at 10^{-1} lux; 150 m at 10^{-3} lux
Weight: 0·9 kg
STATUS
In service with the French Army.
CONTRACTOR
SOPELEM, 102 rue Chaptal, 92306 Levallois-Perret, France.



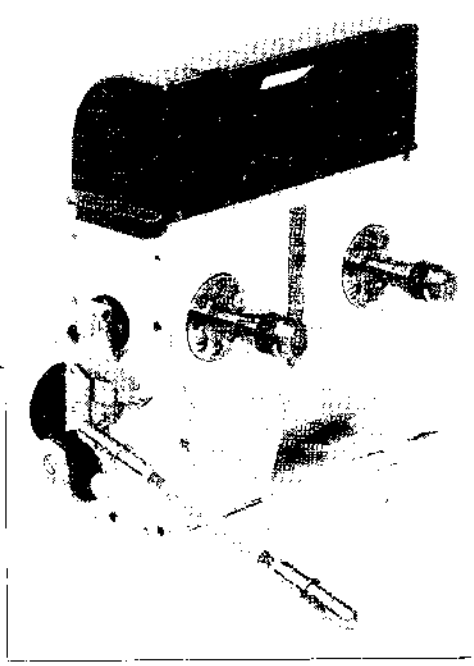
OB-50 night aiming telescope

3754.193
TJN2-90-A COMBINED DAY/NIGHT SIGHT

The TJN2-90-A combined aiming sight comprises both day and night weapon aiming facilities within a single instrument. It employs a light intensifier tube with automatic gain control to enable sighting in darkness without the need for any artificial illumination.

The TJN2-90-A is specially designed for the GIAT TS90, Hispano Lynx type, and SAMM AR 90 turrets. Incorporating slave micrometers, this sight forms the principal aiming element of the SOPELEM SOPTAC range of fire control systems.

CHARACTERISTICS
Sight
Elevation field: −8 to +15°
Day path
Magnification: ×6
Field of view: 8°
Night path
Magnification: ×6
Field of view: 8°
Range: 800 – 2000 m, depending on light
STATUS
In production and operational with the French Army and foreign forces
CONTRACTOR
SOPELEM, 102 rue Chaptal, 92306 Levallois-Perret, France.



TJN2-90-A combined day/night sight for TS90 turret

2105.193
TELESCOPE-PERISCOPE M112/3

This combined monocular telescope and binocular periscope is designed for use with the AML-60 and other light armoured cars. By changing the micrometers, however, it can be adapted for use on anti-aircraft cupolas.

Elevation aiming control is linked to the weapon but provision is made for manual scanning. The micrometers can be illuminated for night firing.

CHARACTERISTICS
Telescope
Magnification: ×1
Field of view: 356 (vertical) × 1132 (horizontal) mils
Elevation range: −20 to +45°
Periscope height: 180 mm
Sight
Magnification: ×5
Field of view: 230 mil
Elevation range: −20 to +45°
Eyepiece adjustment: −2 to +1 dioptres
Weight: 8·6 kg
STATUS
Production.

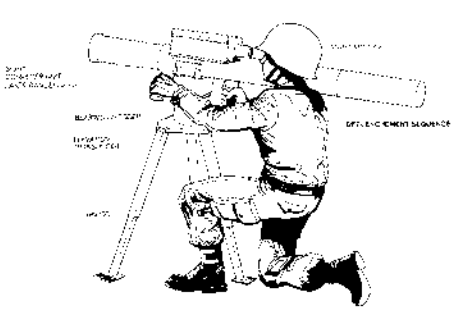
SOPELEM, 102 rue Chaptal, 92306 Levallois-Perret, France.



SOPELEM M112/3 vehicle periscope

4269.183
SOPTAL 29 FIRE CONTROL SYSTEM

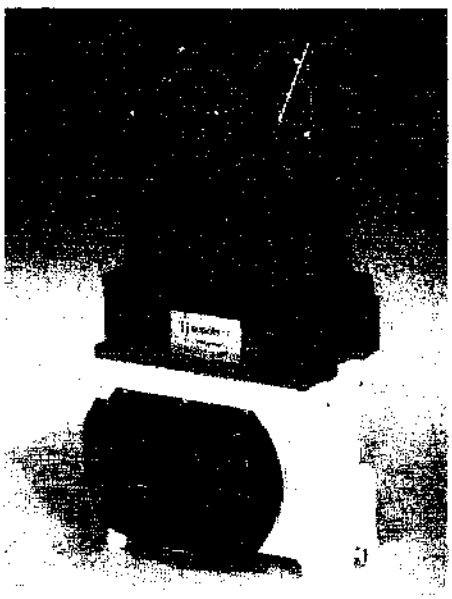
The SOPTAL 29 fire control equipment is an optical director designed for use with the ACL-STRIM anti-tank missile weapon (**2055.111**). It is used to generate a line-of-sight based on target range (determined by laser rangefinder), weapon cant (pendular graticule), type of ammunition, crosswind (manually inserted), target lateral velocity (transducer between weapon launcher and tripod), temperature and pressure. A detachable afocal unit for night firing is an optional addition.

The equipment comprises three interchangeable basic sub-assemblies: sight, processing electronics and laser module; sight aiming module (afocal system with light intensifier); and base, comprising weapon support and tacho bearing data encoder.

CHARACTERISTICS
Optical
Magnification: ×4
Eyepiece aperture: 4 mm
Focal length: 40 mm

SOPTAL 29 fire control equipment as used with ACL-STRIM anti-tank rocket launcher

Field of view: 8°
Aiming
Elevation setting accuracy: 0·3 mil
Bearing offset accuracy: 1 mil
Rangefinder: 150 – 2000 m
Elevation correction: Between 150 and 800 m for two types of ammunition
Lateral target velocity limit: 20 m/s
Autonomy: 1000 rounds
STATUS
Production.
CONTRACTOR
SOPELEM, 102 rue Chaptal, 92306 Levallois-Perret, France.



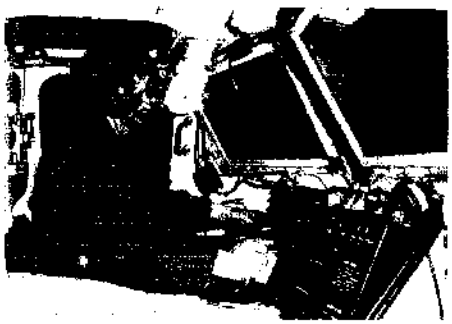
3751.193
CN2-500 SERIES PASSIVE VEHICLE PERISCOPE

The CN2-500 series is a range of second generation passive driving periscopes which enable AFVs to be driven at night without the aid of any artificial lighting. Daylight driving is possible also with the same equipment. The second generation light intensification tube employed is stated to eliminate the effects of sudden glare resulting from unexpected exposure to light sources when operating in darkness.

The optical module is fitted with a binocular eyepiece enabling simultaneous viewing with both eyes without adjustment. Models have been designed within the CN2-500 series for fitting in a range of vehicles, as follows:

CN2-508: Panhard and AMX-13T
CN2-516: AMX tanks and Saviem vehicles
CN2-548: M48 tanks and derivatives
CN2-555: T55 tanks and derivatives

CHARACTERISTICS
Magnification: ×0·9
Resolution: 1·5 mrad at 10^{-1} lux
Objective lens aperture: 1:1
Image tube: TH 1313 with AGC
Tube gain: At least 30 000 FL/FC
Luminance gain: >400
STATUS
Production.
CONTRACTOR
SOPELEM, 102 rue Chaptal, 92306 Levallois-Perret, France.



CN2-508 passive driving periscope for Panhard and AMX-13T vehicles

4245.193
OB-31 NIGHT-DRIVING PERISCOPE

The OB-31 passive periscope is designed to equip AMX-10 and AMX-30 tanks and various other AFVs and may be interchanged with the daylight driving periscope installed in these vehicles to provide combined day/night driving facilities from broad daylight to starlight, without headlights. Two light intensification tubes and suitable optical arrangements provide two separate channels and allow stereoscopic vision. A manually-operated diaphragm permits limiting of image brightness in high ambient light levels and there is a device to protect the tubes from excessive brightness. When the unit is switched off the diaphragm is automatically closed. The use of modern single-stage tubes (XX 1080 type) makes it possible to produce a compact periscope of high performance with simple operation. It can be operated in daylight levels up to about 10 000 lux.

CHARACTERISTICS
Magnification: ×0·9 (approx)
Horizontal field: 48°
Vertical field: 40°
Eyepiece diameter: 20 mm
Lens diameter: 45 mm
Distance between lens axes: 65 mm
Illumination levels: (minimum) classified; (max) 10 000 lux
Dimensions: 327 × 193 × 163 mm
Weight: 11·85 kg (with transport case), 7·85 kg (less case)
STATUS
Production for French and foreign armies. Officially approved by French Army for use in AMX-10, AMX-30 and VAB
CONTRACTOR
TRT (Télécommunications Radioélectriques et Téléphoniques), 88 rue Brillat-Savarin, 75640 Paris Cedex 13, France

OB-31 night-driving periscope

4246.193
OB-41 NIGHT-DRIVING BINOCULARS

The OB-41 passive night-driving binoculars have two separate optical paths each consisting of a micro-channel light intensifier tube with double proximity focus. In this way comfortable stereoscopic vision is obtained. Adjustment of the inter-pupillary distance is by rotation of the body elements in the interior of the close-fitting face mask of the instrument. With the aid of a faint additional light source, the OB-41 can be used in very poor ambient lighting conditions (eg less than 10^{-4} lux) up to a distance of about ten metres.

CHARACTERISTICS
Magnification: ×1
Field: 33°
Focus: Adjustable by 4-position switch for each eyepiece
Distance between eyepieces: Continuously adjustable
Weight: <900 g (complete with battery pack)
Typical range: 250 m
STATUS
In series production and in service with the French and other armies
CONTRACTOR
TRT (Télécommunications Radioélectriques et Téléphoniques), 88 rue Brillat-Savarin, 75640 Paris Cedex 13, France.

OB-41 night-driving binoculars

4247.193
OB-42 NIGHT OBSERVATION BINOCULARS

The OB-42 light intensifier micro-channel passive binoculars have a magnification of ×4 and are composed of two objectives and two eyepiece lenses. The tubes employed are micro-channel tubes with double proximity focusing. The equipment is designed for observation of military objectives at night and the light intensifier technique enables a tank to be recognised at a distance of 600 metres when lit by only starlight (luminosity 1 millilux). The right-hand optical path is equipped with an illuminated graticule graduated in mils for azimuth and elevation and this graticule has adjustable brightness.

CHARACTERISTICS
Magnification: ×4
Field: 8°
Distance between eyepieces: Continuously adjustable
Focus: Continuous, 20 m ∞
Light levels: 10^{-4} to 10^{2} lux
Typical range: 1000 m
STATUS
Production. In service with the French and other armies, police forces and customs authorities.
CONTRACTOR
TRT (Télécommunications Radioélectriques et Téléphoniques), 88 rue Brillat-Savarin, 75640 Paris Cedex 13, France.

OB-42 night observation binoculars

CIRCE PORTABLE NIGHT SIGHT

Circe is a portable night sight which employs a great deal of the thermal imaging technology developed for the Mira sight (**3845.193**). It is a portable, compact and lightweight night observation camera which allows detection at distances greater than 2 km. A number of options are also available, including an eyepiece display, a laser rangefinder and a TV camera for remote display.

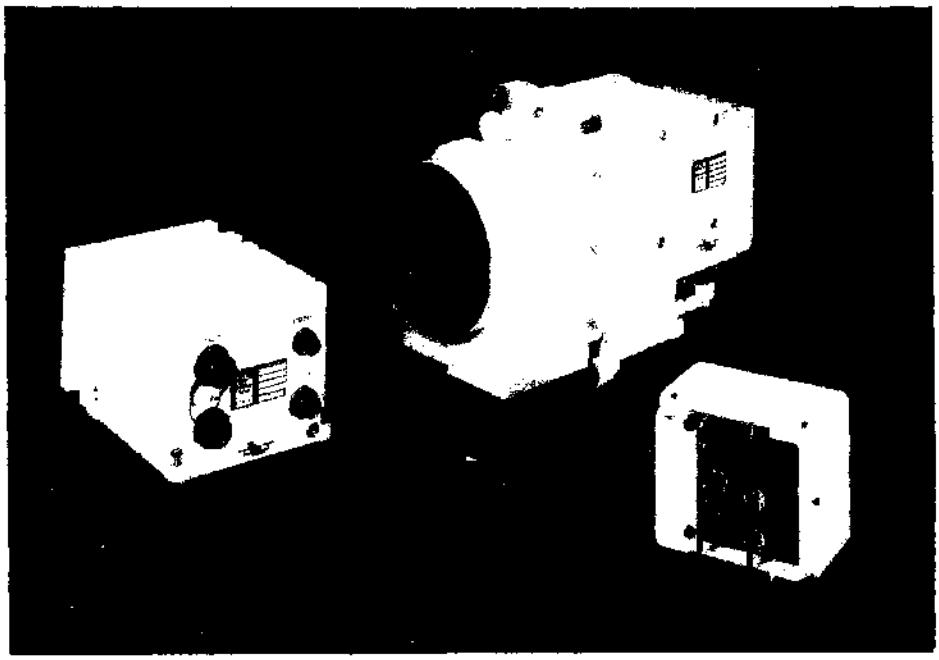
STATUS
In development.
CONTRACTOR
TRT (Télécommunications Radioélectriques et Téléphoniques), 88 rue Brillat Savarin, 75640 Paris, France.

Circe portable night sight

4746.193
CASTOR THERMAL IMAGING SIGHT

The Castor thermal imaging camera is designed for use on armoured vehicles in conjunction with observation and fire control systems. It detects and identifies targets by converting their thermal radiation in the IR spectrum into a visible image which can be displayed on a TV monitor. The system is intended for observation and firing under all conditions of daylight, poor visibility and at night. It can be installed in any armoured vehicle, observation vehicle and various turrets, and can be used with artillery.

CHARACTERISTICS



Wavelength: 8 to 13 microns
Analysis: Series parallel scanning
Detectors: Photovoltaic HgCdTe cooled by Split-Stirling cycle system
Field of view: 6° × 9° (wide); 2·7° × 4° or 2° × 3° (narrow)
Range: Up to 4000 m, depending on lens

STATUS

Production was scheduled to start in mid-1985.

CONTRACTOR

TRT (Télécommunications Radioélectriques et Téléphoniques), 88 rue Brillat-Savarin, 75640 Paris, France.

Units of the Castor thermal imager

3845.193
MIRA THERMAL IMAGER

The Mira thermal imaging sight was developed for use with the Milan anti-tank missile system (**2215.111**). The equipment projects an IR image of the landscape into the observer's day-sight eyepiece permitting use of the normal eyepiece for both day and night operation. Automatic harmonisation of the sight and localiser axes ensures that no adjustment is required by the operator. The equipment includes the Mira sight itself, to which is attached a removable battery pack and a compressed gas bottle, plus an interface which allows the sight to be mounted on the Milan firing post by a single person in a few seconds.

The Mira imager is a compact, robust, sealed metal instrument comprising the following:

(1) a germanium objective lens
(2) a series/parallel mechanical scanner
(3) a detection/visualisation block consisting of a photoconducting CMT detector array and LED array
(4) associated electronics
(5) a cryogenic cooling sub-system (JT self-regulating minicooler).

CHARACTERISTICS

Wavelength: 8 – 13 μm
Processing: Series-parallel
Display: LED
Target detection range: 4000 m (approx)
Target recognition range: 2000 m (approx)
Target identification range: 1500 m (approx)
Field of view: 6 × 3°
Power and cooling supply: 2 h
Weight: Less than 8 kg

STATUS

Series production, carried out under the general management of TRT and their contractors, started in 1983.

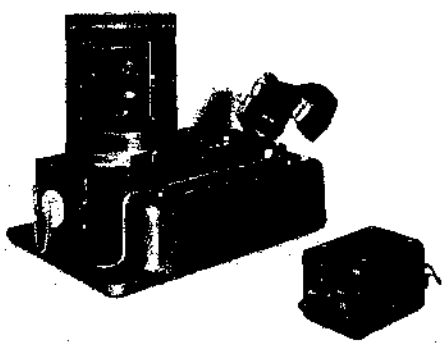
APX M396 STABILISED SIGHT



The APX M396 has been derived from the APX M334 (**7032.393**), and is also referred to as the 'cabin version' of that sight. It is intended for observation, target detection and acquisition, and missile guidance applications in vehicles liable to high amplitude motion over a wide frequency range, such as fast patrol boats, aircraft and helicopters. Stabilisation is by means of gyros, supplemented by elastic suspensions and damping. Detection and acquisition can be effected at ranges up to 30 km. Magnifications of 2·5 and 10 are provided, the respective fields being 22° and 5·5°. Magnification change is accomplished in less than 0·15 second.

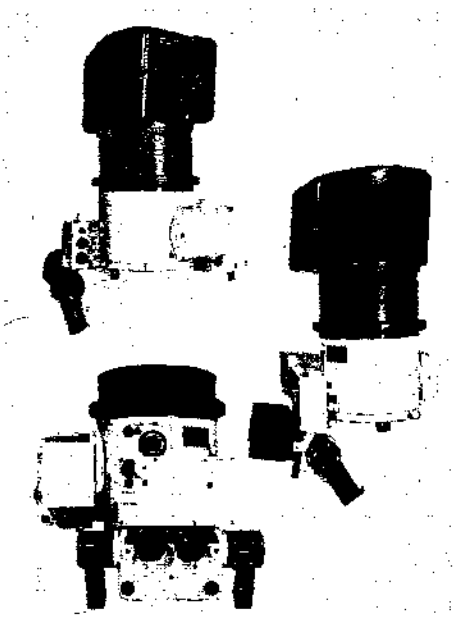
STATUS

Production. In service in Breguet Atlantic maritime patrol aircraft.

CONTRACTOR

SFIM (Société de Fabrication d'Instruments de Mesure), BP 74, 91301 Massy Cedex, France.

APX M396 gyro-stabilised sight and control box



3560.193
VS 580 GYRO-STABILISED VEHICLE SIGHT

The VS 580 sight is intended for the detection, recognition, identification and acquisition of fixed or moving targets from a moving combat vehicle, with accurate line-of-sight stabilisation.

The VS 580 is a family of models which includes:

(1) VS 580 Observation, a panoramic sight for observation and identification
(2) VS 580 Standard, a panoramic sight with a target acquisition aid
(3) VS 580 Multirole, a panoramic sight with complete target processing capability (stabilised laser rangefinder)
(4) VS 580 Gunner, for fire control on the move with an optional night-vision device.

The VS 580 sight can also be used by night, either as a driving aid, for close defence, or to assist night firing of the main gun at a combat firing range. Night vision is through the same eyepieces as daytime vision.

Three views of the VS 580 gyro-stabilised vehicle sight

The VS 580 sight is compatible with a large number of existing vehicles and fire control systems.

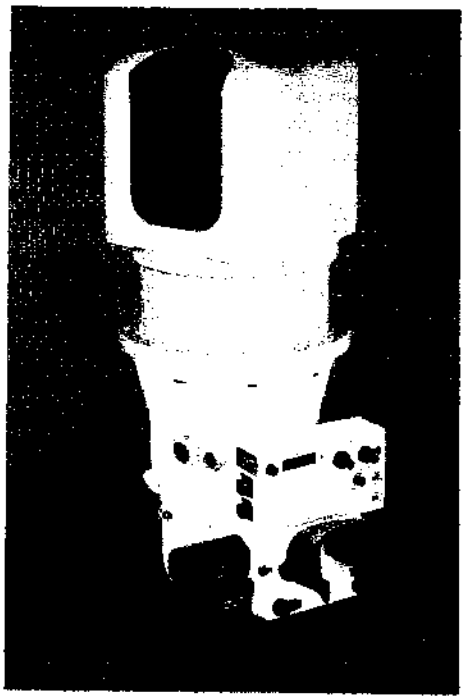
CHARACTERISTICS

Warm-up time: 6 s
Magnifications: ×3 and ×10·5

Angular freedom: 360° in azimuth and 77° in elevation
Line-of-sight displacement speeds: 0·02 mrad/s to 1 rad/s in azimuth and elevation
Line-of-sight stabilisation: Aiming error < 0·1 mrad in normal conditions of use in combat vehicles in motion
Pointing accuracy error: <0·15 mrad

Night vision
Magnification: ×1·3 or ×6
Angular freedom: 360° in azimuth and 70° in elevation
Laser rangefinder
Range: 400 – 10 000 m
Measurement accuracy: ≤5 m
Angular discrimination: <0·3 mrad

Measurement frequency: 1/s
STATUS
In production. Fitted to 11 different vehicles in various versions.
CONTRACTOR
SFIM (Société de Fabrication d'Instruments de Mesure), BP 74, 91301 Massy Cedex, France.



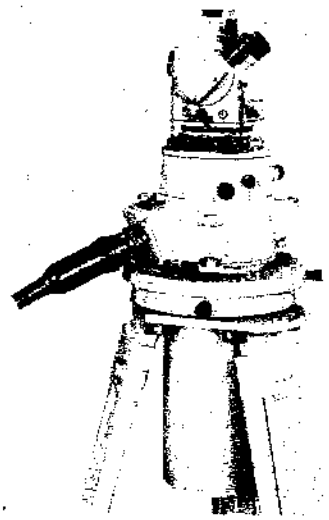
5896.193
VISAA ANTI-AIRCRAFT SIGHT

The VISAA anti-aircraft sight has been developed from the VS 580 range (**3560.193**) and is specially adapted for anti-aircraft engagement from land vehicles. It provides target detection and observation at ranges of up to 30 km, target recognition and identification up to 5 km, sight for firing, and optional target parameter acquisition. The main differences between the VISAA and the VS 580 are an improved travel in elevation and increased tracking speed.

Three modes are available for operational use: an independent mode for observation, a slave mode for alignment on the radar plot, and a master mode for the transmission of target data to the vehicle fire control system. One version of the VISAA sight measures distance and target angular rates. The sight may also be fitted with a built-in tracking system.

STATUS
In late development. The sight has been ordered for several anti-aircraft vehicles under development, including six prototypes, for Vickers and for South Korea.

CONTRACTOR
SFIM (Société de Fabrication d'Instruments de Mesure), BP 74, 91301 Massy Cedex, France.

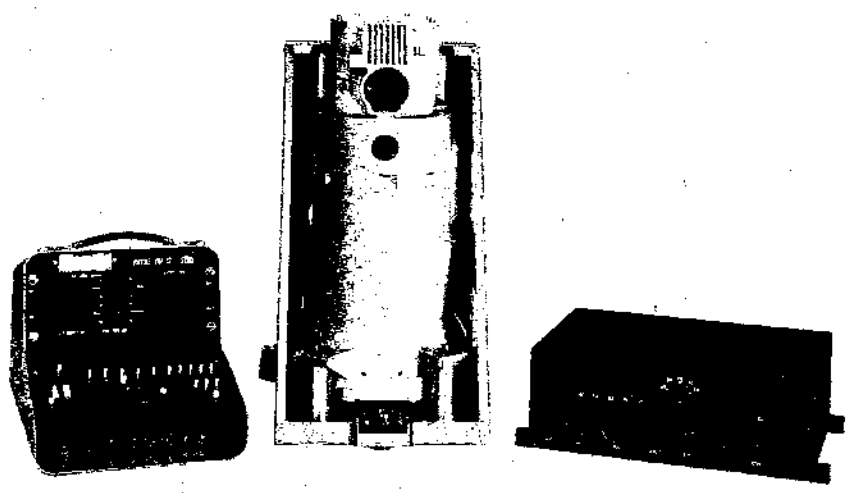


VISAA anti-aircraft sight

4250.193
CDN 13 NORTH SEEKER

The CDN 13 north seeker is a portable instrument designed for tripod mounting and intended for use as a means of determining the azimuth for the autonomous alignment of military systems such as: navigation systems fitted in aircraft, ships, land vehicles or missiles; long range guns; missile launchers; fixed or mobile radars; and for various survey operations. A version for vehicle mounting is available.

CHARACTERISTICS
Accuracy
Measurement: Better than 0·3 mil
Orientation and azimuth measurement resolution: 0·1 mil
Latitude limits: 70° N – 70° S
Run-up and measurement time: 5 minutes
Weights
Electronic unit and battery etc: 13 kg
Carrying case and cable: 31 kg
Tripod: 8 kg
Loader: 9 kg



SFIM CDN 13 north seeker

STATUS
Series production.

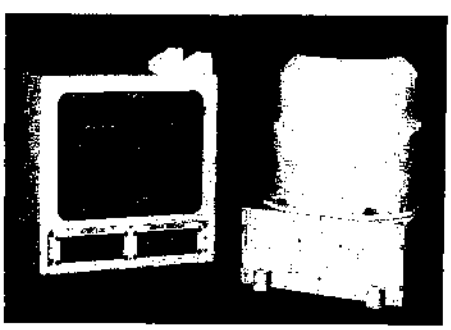
SFIM (Société de Fabrication d'Instruments de Mesure), BP 74, 91301 Massy Cedex, France.

4249.193
CDN 22 NORTH SEEKER

The CDN 22 north seeker is an instrument for determining the azimuth for the alignment and orientation of military systems such as: autonomous navigation systems fitted in aircraft, land vehicles or missiles; long range guns; missile launch ramps; and mobile or semi-mobile radars. It is completely automatic in operation and self-contained.

CHARACTERISTICS
Accuracy: Better than 0·5 mrad
Run-up and measurement time: 4 minutes
Overall weight: 34 kg
Digital output.
STATUS
In production.
CONTRACTOR
SFIM (Société de Fabrication d'Instruments de Mesure), BP 74, 91301 Massy Cedex, France.



Three units comprising the CDN 22 north seeker equipment

5697.193
CC-35 DIRECTION REFERENCE SYSTEM

The CC-35 is a high accuracy direction reference for self-propelled guns and land vehicles. It is designed to provide continuous indication of the direction, or heading, of the axis of its mounting with an azimuth definition of 0·1 mrad. Elevation indication is also available if required. The system includes a gyroscopic sensor and a control/display unit and is claimed to provide the best cost/efficiency ratio for the realignment of artillery pieces without external aid.

CHARACTERISTICS
Drift: <1 mrad/h
Sensitivity: 0·1 mrad
Output: Digital or analogue
STATUS
In production. Incorporated in the French self-propelled gun 155 mm GCT.
CONTRACTOR
SFIM (Société de Fabrication d'Instruments de Mesure), BP 74, 91301 Massy Cedex, France.

CC-35 direction reference system

3838.193
APX M363 FIRE CONTROL

The APX M363 is the fire control unit for the French 155GCT self-propelled gun, providing day and night engagements with the following facilities:

(1) indirect fire from an external directional reference by the 'bearing firing method'
(2) direct fire
(3) elevation angle measurement of obstacles
(4) transfer of a reference bearing to another unit

The equipment weighs, with vertical sensor plate and computer, 160 kg and has an overall height of 1·28 m.

CHARACTERISTICS
Direction finder
Field: 175 mrad
Magnification: ×5
Eyepiece diameter: 4 mm
Elevation: 90 to +1200 mils
Panoramic observation field
Automatic tilt correction: ±10°
Max tilt: 10°
Aiming accuracy: 0·5 mil
Direct fire sight
Field: 120 mils
Magnification: ×8
Eyepiece diameter: 5 mm
Aiming (elevation): 90 to +360 mils
Observation (elevation): −300 to +600 mils (turret stationary)
Accuracy: 0·5 mil

STATUS
Derived from the APX M589-01, the M363-01 has been adopted by the French Army and is in series production for export.

CONTRACTOR
GIAT (Groupement Industriel des Armements Terrestres), 10 Place Georges Clémenceau, 92211 Saint Cloud, France.

3840.193
APX M520 PANORAMIC SIGHT

The APX M520 is the panoramic sight fitted on the VADAR anti-aircraft vehicle (**3333.131** in 1980-81 and earlier editions) turret and is one of the main elements of that system's fire control. For simultaneous use by the tank commander and the gunner (separate eyepieces), the unit provides panoramic search at low magnification, and target acquisition, allocation, tracking and engagement at high magnification, against low-level aircraft. The sight is provided with means of coupling a tracker television camera to allow automatic target tracking.

The sight is rate controlled from the cross-bar of either of the two operators, for the search or tracking modes.

CHARACTERISTICS
Magnification: ×2 (600 mrad field); ×4 (300 mrad field)
Camera field depth: ∞
Magnification: ×1 (100 mrad field)
Sighting range: n × 360° (azimuth); −8 to +73° (elevation)
Overall dimensions: 730 × 676 mm
Weight: 115 kg

STATUS
Prototype.

CONTRACTOR
GIAT (Groupement Industriel des Armements Terrestres), 10 place Georges Clémenceau, 92211 Saint Cloud, France.

3841.193
APX M527 TANK SIGHT

The APX M527 multipurpose tank commander's sight is designed for installation in an appropriate housing for fitting in the AMX-32 MBT. Of modular design, it provides the tank commander with stabilised day vision (two magnifications), night vision (600 metres), and observation on the move at high magnification. It permits target detection and engagement of fixed or moving targets.

CHARACTERISTICS
Day
Magnification: ×8, ×2
Field of view: 100, 400 mils
Exit pupil diameter: 4 mm
Elevation limits: −12 to +24° (×2); −20 to +40° (×8)
Night
Magnification: ×1
Field of view: 580 mils
Elevation limits: −8 to +24°
Range: 600 m (typically)

STATUS
Series production began in 1983.

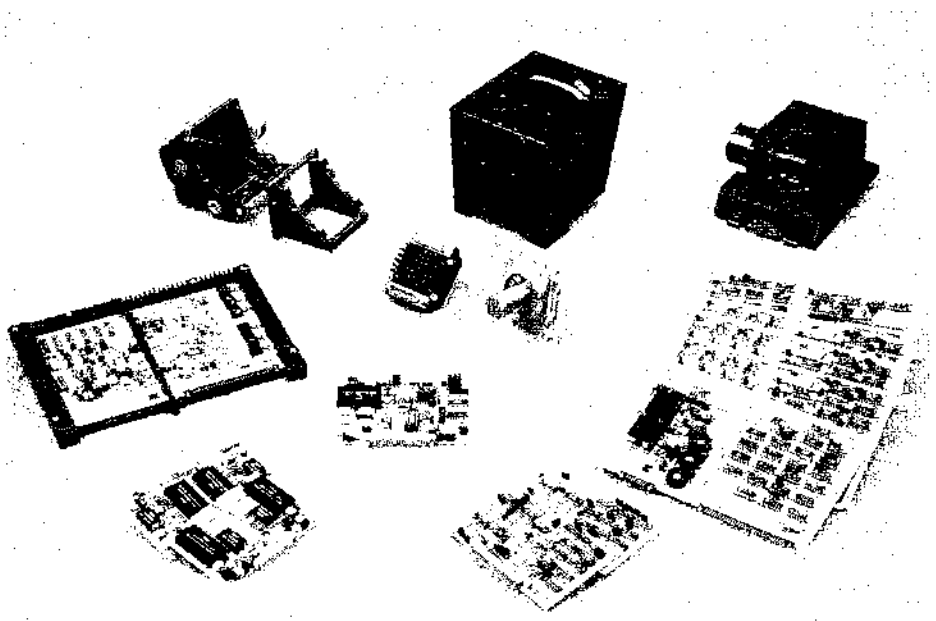
CONTRACTOR
GIAT (Groupement Industriel des Armements Terrestres), 10 place Georges Clémenceau, 92211 Saint Cloud, France.

4107.093
SMT MODULAR THERMAL IMAGING SYSTEM

Under a common module development programme for the French Defence Ministry, TRT in collaboration with SAT has developed a range of thermal-imaging modules to meet the requirements of the three armed services. Under an inter-company agreement each is responsible for the manufacture of specific modules and either may be the prime contractor for system application, depending on the particular project requirements and current workload. Design co-ordination authority, however, is vested in TRT.

The main characteristics of the SMT are: eight to twelve micron spectral bandwidth, full TV display compatibility on a standard CCIR 625-line, a limited number of detector elements, the possibility of application to LED displays, ease of coupling with image processing systems, open or closed-circuit cryogenic cooling, highly stabilised optic axis, and reliable behaviour in the presence of heat sources such as missile traces or fires. The modules include a built-in test system delivering information for the operator and for maintenance purposes.

The modules are assembled in various configurations depending on the particular requirements. They fulfil the basic functions of a thermal imager while specific elements are added to tailor the unit to particular applications. For example, a larger or smaller field of view would require a new optical train, or a TV monitor display would be added should remote viewing of the image be needed.



Current SMT applications are as follows (some are described in more detail in other entries):

Tango
An observation system for the ATL2 aircraft. The thermal camera is fitted in a gyro gimballed platform interfaced with the aircraft.

Mephisto (2212.111)
Firing of a HOT missile from an armoured vehicle.

Castor (4746.193)
A special TRT development for tank applications with all capabilities of a thermal sight in a modern fire control system for guns and missiles.

Mira (3845.193)
This thermal sight is in series production for the MILAN missile (**2215.111**) in bilateral co-operation (TRT, Siemens (FRG) and Marconi Command and Control Systems, (UK)) for the three armies and other customers.

SMT thermal imaging modules

Mithridat
This equipment is a complete day/night fire control system for battle tanks and includes a thermal sight, day sight, laser rangefinder and a fire computer.

Caliope
A man-portable infra-red night sight for observation purposes.

In addition to the above projects other cameras for helicopter and fixed wing aircraft, interfaced with a head-up display or helmet display, are currently in development, either fitted in the aircraft or pod-mounted. A number of other equipments, based on the common module programme are also in development. Brief details of known programmes are as follows:

Judith
This is the name for a series of thermal imaging goggles weighing less than 3·5 kg and operating in the 3 to 5 μm waveband using a CMT detector. They have been accepted by the French Army for further development.

Dorothée
Dorothée is a simple thermal equipment designed for detection and alarm and has also been accepted by the French Army for further development.

Porthos
This is a thermal sight intended for use by helicopters firing HOT missiles at night. It has an adjustable three-field lens assembly (45° × 30°; 8° × 5°; 3° × 2°), with the thermal image presented on a small CRT in the sighting system.

Visir
An experimental thermal sight for main battle tanks. This is a very long term programme with production not expected until the early 1990s.

Aphrodite
A night flying aid for helicopter use. The system is mounted in a stabilised turret and can be used with

either a helmet type sight or displayed on a TV monitor. This is probably another long term programme.

CONTRACTORS

TRT (Télécommunications Radioélectriques et Téléphoniques), 88 rue Brillat Savarin, 75640 Paris Cedex 13, France.

SAT (Société Anonyme de Télécommunications), 41 rue Cantagrel, 75624 Paris Cedex 13, France.

4283.193

VIPERE INFRA-RED SURVEILLANCE EQUIPMENT

The Vipere equipment is an infra-red panoramic surveillance system developed by SAT for the Section d'Etudes et de Fabrications de Telecommunications (SEFT) of the French Army Direction Technique des Armements Terrestres (DTAT). It is designed to detect and locate aircraft at low and medium elevation angles in an entirely passive manner. When employed in an anti-aircraft defence system, Vipere will provide target designation data. A very low false alarm rate is claimed for the specially adapted data processing system manufactured in co-operation with Thomson-CSF.

The optical sensor head can be mounted as a fixed installation on the ground or carried on a vehicle with the electronic data processing system. The former unit incorporates a number of mosaic arrays consisting of multiple elements, cooling being by means of a closed-circuit system built into the head with its own compressor.

CHARACTERISTICS

Weight of optical head: <70 kg
Azimuth coverage: 360°
Elevation coverage: >20°
Detection range: >10 km (aircraft target)
Target designation accuracy: 1 mrad (approx)

STATUS

Development project for French Army.

CONTRACTOR

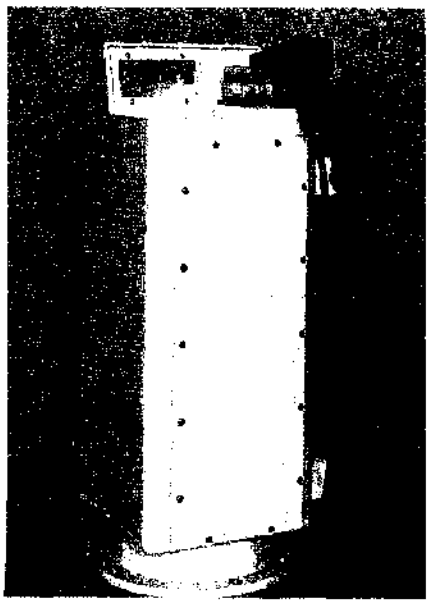
SAT (Société Anonyme de Télécommunications), 41 rue Cantagrel, 75624 Paris Cedex 13, France.

4248.193

ELDO TARGET DESIGNATOR

The Eldo system has been designed to enable manual designation of targets such as aircraft, tanks or ships to be carried out by a foot soldier (or seaman aboard ship) with a minimum of equipment and with minimum restriction on his ability to carry out visual search functions. Targets designated in this way can be handed off to radars or other tracking systems associated with suitable weapons to engage the target(s) or directly to the weapons themselves. Multiple targets, it is claimed, can be handled in rapid succession by a single operator of Eldo and the equipment can be connected to a number of defensive weapon systems and tracking facilities. The Eldo operator has facilities for selecting which weapon systems or trackers are to be handed over to each target designated.

The pistol-shaped aiming sight contains a three-axis gyro sensor, a target designator trigger and an indicator light to show when a target has been handed over and acquired by an associated weapon or tracker system. The control unit houses a microprocessor, the gyro electronics, an alpha-numeric display, weapon selection switches, stowage for the aiming sight gun and miscellaneous switches and indicators.



By pointing the designator 'gun' at the target the operator aligns a line-of-sight from the location of the unit and the computer automatically calculates the parallax corrections necessary for associated weapons or trackers to be brought to bear on the same target. As each weapon/tracker selected by the operator acquires the target a signal is sent back for display on the designator 'gun', after which the operator can designate any other targets detected. Radio or cable links may be used between the Eldo control panel and associated weapons/trackers for the transmission of designation data and the return of acquisition signals.

STATUS

Development project.

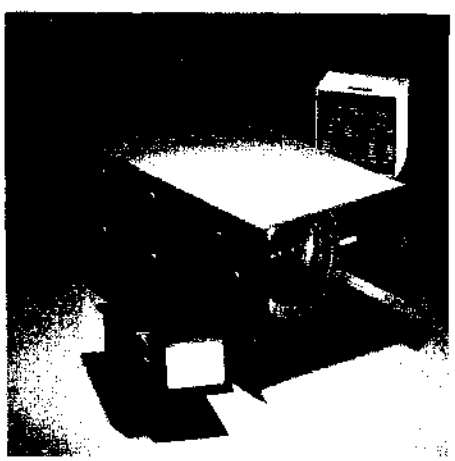
THOMSON-CSF CANASTA DAY/NIGHT AIMING EQUIPMENT (DIVT 13)

Thomson-CSF produces a day/night aiming equipment based on low light-level television, and several versions have been developed. The French Army has adopted the equipment for fitting to its AMX-10RC, AVX-30B2 (modernised) and AMX-32 AFVs where it will be integrated with the tanks' IFCS. In French Army service the equipment is designated DIVT 13, while the name employed by Thomson-CSF for export models is Canasta. Different versions were previously referred to as the TMV560/562, but these designations are no longer employed.

The complete equipment includes a night and day TV camera with its control unit and one or two display units for the gunner and/or the tank commander. Its use permits full passive detection, identification and engagement of static and moving targets by main battle tanks and other classes of AFV. A moving electronic reticule, driven either manually from the control unit in accordance with target distance and selected ammunition, or automatically from a ballistic computer in accordance with firing data, gives the gunner aiming information and firing corrections.

The Canasta system is compatible with any gun ballistic and fire control system and is reported to be capable of installation in any type of MBT without turret modification.

CHARACTERISTICS



Lens assembly: Dioptric
Focal length: 210 mm
Aperture: f/5
Angular field: 4·1 × 5·5°
Camera tube: Super nocticon – silicon
Illumination range: 10^{-4} – 10^{-5} lux
Alignment accuracy: Better than 0·25 mrad
Video output: ITCC standard
Power supply: 20 - 30 V DC

STATUS

Series production. The Canasta system has been installed in M48, Centurion, Leopard, T55, T62, AMX-13, AML 90, ERC 90 Sagaie, and PAC90 vehicles.

CONTRACTOR

Thomson-CSF, Division des Equipements Avioniques, 178 boulevard Gabriel Peri, 92240 Malakoff, France.

MARILU 80 × 240 TELESCOPE

The Marilu 80 × 240 is a high magnification telescope for observation of either land or coastal targets at long ranges. Its high magnification requires a steady and vibration-free mounting and a fixed pedestal is normal. A laser rangefinder may be associated with the Marilu telescope and is available as an option. A 24 × 36 photographic attachment is available, and the telescope is rust- and water-proof. The mounting can be moved easily on retractable wheels.

CHARACTERISTICS

Focal length: 2·4 m
Magnification: ×80
Resolution: Better than 1"
Exit pupil diameter: 3 mm
Image focusing range: 300 m – ∞
Finder telescope: 8 × 40
Line of sight: Adjustable from 1·5 to 1·7 m high
Total weight: 110 kg

STATUS
Production.
CONTRACTOR
REOSC (Recherches et Etudes d'Optique et de Sciences Connexes – a SFIM subsidiary), 10 rue des Ecoles, Ballanvilliers, 91160 Longjumeau, France.

5699.193
DALDO TARGET ACQUISITION AID SYSTEM

Daldo is a helmet-mounted target designation aid system designed primarily for anti-aircraft defence applications although it is adaptable to other fire control systems. The basic principle is the slaving of the gun line-of-sight with the observer's line-of-sight, with the direction of the Daldo sightline being referenced in an axis system based on the earth's magnetic and gravitational fields. Data is supplied by a magnetometer which detects the components of the magnetic field along the helmet reference axis system and therefore along the sightline reference axis system, and two accelerometers which give the vertical reference. The target azimuth and elevation angles are then calculated continuously by the system.

The basic system consists of a helmet cover which contains the sensors and a sight system, a portable control console mounted on the gunner's chest and a processor unit to provide the computation of azimuth and elevation parameters for each gun battery.

A version known as DATAC (device for alignment and target acquisition) has been developed. This variant includes most of the sub-assemblies of Daldo but the headpiece is replaced by a pseudo rifle supporting the line of sight. It provides an accuracy of ±1 degree in both azimuth and elevation.

Daldo target acquisition aid

CHARACTERISTICS
Accuracy: ± 3° in both azimuth and elevation (±1° for DATAC variant)
Field of use: Azimuth 360°; elevation -5 to +85°
STATUS
Developed for the French Army 76 T2 anti-aircraft twin gun system.

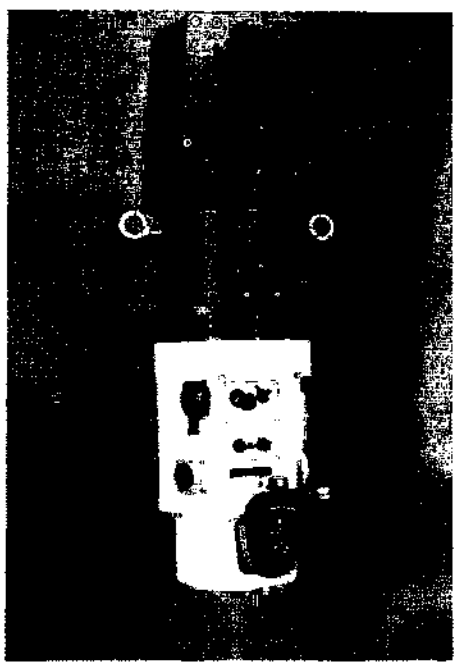
VASSIR 85 ANTI-AIRCRAFT OPTRONIC SIGHT

The Vassir 85 stabilised optronic sight is designed for anti-aircraft defence units. It provides automatic tracking and aiming by gyro-stabilisation of the line-of-sight, associated with automatic deviation-measuring type tracking using TV or thermal camera sensors (FLIR). The sight integrates a day observation and tracking camera, a thermal camera which enables observation and tracking by day and night, and a high frequency laser rangefinder for instantaneous target distance measurement. Information on angular rate and distance is passed to the fire control computer.

The Vassir 85 consists mainly of two units:

(1) a stabilised aiming unit using a 2-degree of freedom, dry, dynamically-tuned GSL type gyroscope
(2) an optical system providing separation of the different channels, integration of the TV field changing functions, laser transmission and reception lenses.



The aiming head can be fitted with an observation TV camera, a tracking TV camera, a thermal camera or a laser rangefinder in an interchangeable manner.

5892.193
M 389 PANORAMIC SIGHT

The M 389 panoramic sight has been designed for use on the TK 105 turret of the AMX 10C tank. Its function is to provide the tank commander with facilities for all-round observation, acquisition of the target designated by the gunner, designation of a target to the gunner and firing of the auxiliary armament. In case of emergency it provides facilities for firing the 105 mm gun, the axis of which appears within the field of sight. Weight of the sight is 31·5 kg.
STATUS
In production.

SAGEM, Departement Armement Terrestre, 6 avenue d'Iena, 75783 Paris Cedex 16, France.

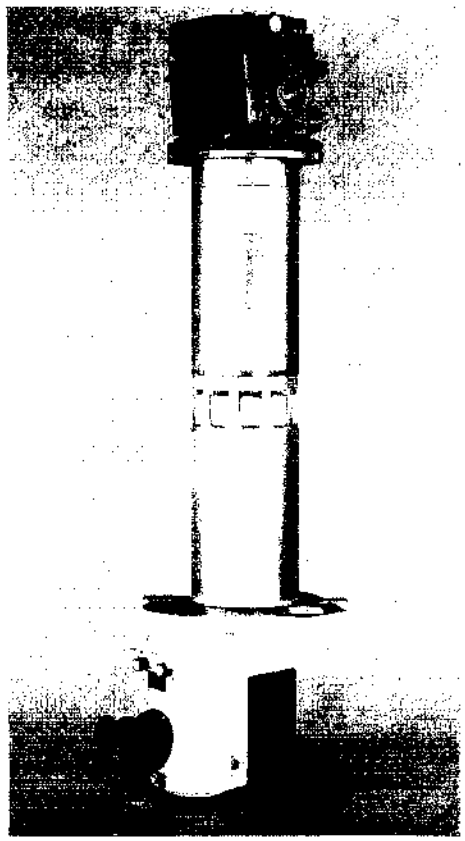
M 389 panoramic sight

LGA 389 artillery sight

5894.193
LGA 389 ARTILLERY GONIOMETER SIGHT

The LGA 389 goniometer sight is used to aim artillery guns. It provides ×2 and ×8 dual-magnification panoramic observation, indirect gun-aiming and direct fire control. The sight is of modular design and can also be fitted with a laser rangefinder or a light intensifier tube for use at night. A digital interface with the Type RS 422 fire control system is provided. Weight of the complete sight and associated electronics is 43 kg.

STATUS
In production.
CONTRACTOR
SAGEM, Departement Armement Terrestre, 6 avenue d'Iena, 75783 Paris Cedex 16, France.



5895.193
M 590 GYROSTABILISED SIGHT

The M 590 sight is designed for use with the HOT missile Mephisto firing unit (**2212.111**) installed on a vehicle. It provides all-round observation while the vehicle is moving, and HOT missile firing by day and night.

The sight is a dual magnification type (×3 and ×12) and consists of:

(1) a panoramic head equipped with a platform supporting a FLIR camera, a stabilising unit, and a Galilelc magnification changing system
(2) a lower body grouping the SAT missile guidance unit, a reticle, an image rectifier and the eyepiece
(3) an electronics unit
(4) a bi-directional control stick
(5) a line-of-sight direction indicator.

STATUS
In production.
CONTRACTOR
SAGEM, Departement Armement Terrestre, 6 avenue d'Iena, 75783 Paris Cedex 16, France.

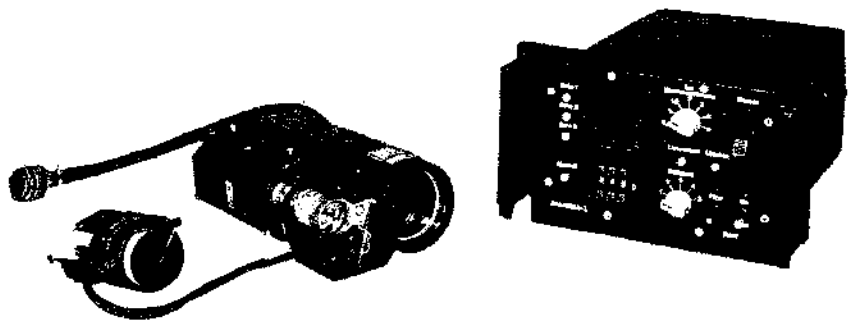
GERMANY (FEDERAL REPUBLIC)

3848.193
B171-II IR AIMING UNIT

The Type B171-II infra-red aiming unit is installed in armoured vehicles where it serves for observation, identification and aiming at night.

Both the security area and the target are illuminated by an IR searchlight. The reflected IR radiation is converted to a visible image by the built-in image converter tube. The B171-II IR-aiming unit is part of the Leopard 1 tank standard equipment.



STATUS
Production.
CONTRACTOR
Eltro GmbH, Postfach 102120, 69 Heidelberg 1, Federal Republic of Germany.

3849.193
CE632 LASER RANGEFINDER

The CE632 laser rangefinder provides accurate rangefinding and operates according to the pulse time-delay method with a repetition frequency of 1 Hz.

Both assemblies, transmitter-receiver and display control with built-in power supply, are of compact and rugged design. The unit is designed to operate self-sufficiently as well as in connection with vehicle-integrated electro-optical fire control systems.

STATUS
In production and in service with West German Army AFVs.
CONTRACTOR
Eltro GmbH, Postfach 102120, 69 Heidelberg 1, Federal Republic of Germany.

Eltro CE632 laser rangefinder

3852.093
CE618 LASER RANGEFINDER

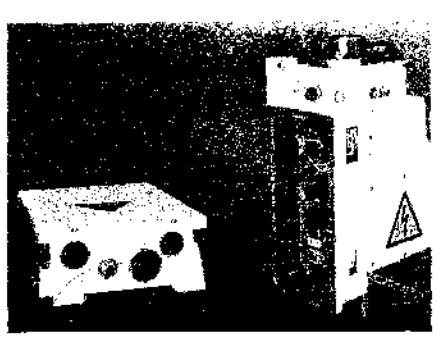
The CE618 laser rangefinder measures accurately the range to moving and fixed targets by transmitting ten pulses per second by the pulse time-delay method. It consists of a Nd-YAG laser transceiver unit, the power supply with electronics and control box.

Apart from other application fields the unit was designed for use in aircraft for target illumination and rangefinding, in electro-optical fire control systems on ground and on ships, as well as a redundant rangefinder for radar anti-aircraft tracking systems.

CONTRACTOR
Eltro GmbH, Postfach 102120, 69 Heidelberg 1, Federal Republic of Germany.

3850.193
CE624 LASER RANGEFINDER/SIGHT

When used with gated viewing, this rangefinder is a combined gunner's sight for use in battle tanks. The range to moving or fixed targets is continuously measured by a laser transmitter and a gated receiver by means of the pulse time-delay method. Range gating enables the observer to determine which target out of several within view was measured by the laser rangefinder. Thus a selection of single targets is provided.



CONTRACTOR
Eltro GmbH, Postfach 102120, 69 Heidelberg 1, Federal Republic of Germany.

3851.193
CE628 LASER RANGEFINDER

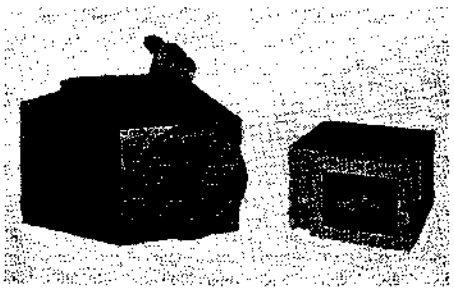
This Nd:YAG laser rangefinder is integrated into the fire control system of the Leopard 2 battle tank and is capable of providing three accurate rangefinding values within four seconds. It consists of laser transmitter, receiver and processing electronics with the related supply unit.

Because of its integration into the observation and aiming equipment, the observer may at all times get an exact digital range readout, the computer simultaneously processing the range data for accurate firing.

STATUS
In production for Leopard 2 MBTs.
CONTRACTOR
Eltro GmbH, Postfach 102120, 69 Heidelberg 1, Federal Republic of Germany.

Eltro CE628 laser rangefinder integrated in periscope control unit, seen here with laser electronics unit

3096.193



RZ1001 THERMAL IMAGING EQUIPMENT

The RZ1001 thermal imaging equipment is the successor to the RZ502 (**1802.193** in 1976 and earlier editions) from which it has been developed. A feature of the RZ1001 is its high geometrical resolution which particularly suits it for the detection of targets at long distances. Operation is possible in day and night conditions or in adverse weather. Due to the equipment's high temperature resolution, the objects of interest are displayed as a flicker-free image on the monitor and with good contrast against their background.

The equipment is of modular design and is suitable for applications such as target recognition in armoured or 'soft' vehicles, aircraft, helicopters, or ships.

CHARACTERISTICS

Field of view (azimuth): Approx 13° (if desired, variable from 6 - 13°)
Field of view (elevation): Approx 4·5°
Entrance pupil: Approx 130 mm
Focal length: 260 mm
Number of lines: 400

RZ1001 thermal imaging equipment

RZ1002 thermal imaging unit with small monitor unit

Line interlacing: 4:1
Geometrical resolution: 0·2 mrad
Frame rate: 25 frames/s
Detector: CdHgTe (100 elements, 4 times line displaced)
Waveband: 8·5 - 12·5 μm
Cooling: Joule-Thomson cooler
Monitor: screen diagonal

Power supply voltage: 24 ± 6 V
Power consumption: Camera with Joule-Thomson cooler 200 W approx
Monitor 50 W approx

Eltro GmbH, Postfach 102120, 69 Heidelberg 1, Federal Republic of Germany.

3434.093

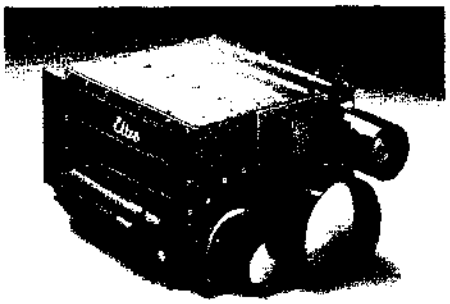
ELTRO ELECTRO-OPTICAL EQUIPMENT

The Eltro organisation produces a wide range of military electro-optical equipment for use both as independent items or as part of a complete weapon system in addition to those items described above. Full details are not available but the following paragraphs briefly describe some significant items.

IR-weapon sight Type B8-V

Mounted on small arms the Type B8-V serves for observation and aiming at night. The associated IR-searchlight illuminates the scene. An image converter tube converts the back-scattered IR-radiation, which is imperceptible to the human eye, to a visible image. This unit was was found to be extremely useful for the operations of the West German Border Guards and the Police.

Image intensifier aiming unit Type Orion



This equipment serves for observing the scene and aiming weapons at night. The Orion 80 and Orion 110 are passive night vision equipments which electronically amplify low-level light by means of a three-stage image intensifier tube to an extent to be perceptible to the human eye. This equipment is being used by the Police, the West German Border Guards and the West German Armed Forces. This is a joint development by Eltro and Zeiss.

HOT tracker

This is part of the anti-tank weapon system HOT (**2212.111**) which is for long-range use. The missile guidance via wire occurs semi-automatically. The system was designed as a high-resolution stabilised periscope. Target acquisition and tracking is accomplished via visual optics designed as a periscope. The determination of the missile position is accomplished by an integrated IR-goniometer, whose deviation values are used for missile guidance.

Milan tracker

This unit is part of the lightweight, semi-automatic anti-tank guidance system Milan (**2215.111**) which is for medium-range use. Target acquisition and tracking is accomplished via the optical sight designed as a periscope. The determination of the missile position is by means of an IR-goniometer, and the combination of the latter with the line of sight gives the guidance function. The Milan anti-aircraft weapon can be fired from vehicles as well as from ground level.

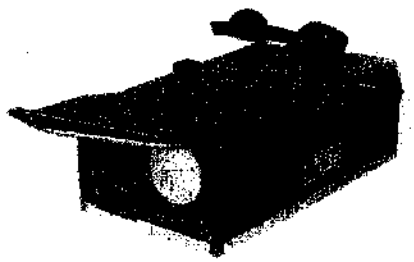
CO_2 laser rangefinder

Mini-laser rangefinder

Roland sight

This is part of the low-level air defence system Roland (**2218.131**) which is equipped with guided missiles. The sight serves for target acquisition and tracking. A built-in IR-goniometer supplies the deviation signals of the missile which are used for determining the guidance command signals.

Thermal pointer WOG 3



This equipment serves for passive reconnaissance and observation of heat-radiating objects. It was designed for use in armoured and non-armoured vehicles. In combination with observation and aiming units the heavy contrast thermal signature is superimposed congruently on the image. Thus searching, observing and aiming processes are considerably reduced and facilitated. This is a joint development by Eltro and Zeiss.

CO_2 laser rangefinder

Eltro is developing a CO_2 laser rangefinder operating in the 10·6 μm waveband. The equipment is in the prototype stage.

Mini-laser rangefinder

This is a device in early development and designed for infantry use. It employs a semi-conductor laser, probably an Nd:YAG, and offers low power transmission and a special measuring system.

RAMAN laser rangefinder

RAMAN laser rangefinder

Another development consisting of a Nd: YAG laser and a RAMAN cell. The 1·06 μm wavelength of the Nd: YAG laser is shifted to 1·54 μm in the RAMAN cell for eye-safe operation.

CONTRACTOR

Eltro GmbH, Postfach 102120, 69 Heidelberg 1, Federal Republic of Germany.

4685.193

OFRIS TARGET TRACKER

OFRIS (Optronische-Feuerleit-Richt-Saule) is a target tracker consisting of a day sight, integrated thermal imager, CO_2 laser rangefinder and IR tracking electronics. To ensure flexibility in the design a modular approach has been adopted to provide various expansion stages and operating modes.

In its basic configuration OFRIS includes a viewing optics block, a drive block and an ocular block with day sight (periscope adaptable to 1·5×, 6× and 12× magnification), and a thermal imager composed of US common modules. The path of the light rays in the day sight and night sight is deflected at right angles into a common broadband optical system. This is accomplished through a window and by way of a tilting mirror, prior to separate processing in the ocular block. The IR image is displayed on an array of LEDs and can be injected into the periscope for night operations. This version makes use of range data supplied by existing surveillance sensors, such as radar and laser ranger, for lead angle calculation and tracking. Manual tracking, with the aid of a joystick, can also be provided.

Integration of a CO_2 laser and IR tracker, with external monitor where applicable, will afford various additional modes up to a version constituting an autonomous, passive sensor for automatic target tracking. This sensor allows redundant second target tracking and unrestricted night combat capability even in an ECM environment. An autonomous tracking computer, using distributed digital processing can be incorporated.

DEVELOPMENT

The OFRIS concept has been developed for the West German authorities by Siemens as prime contractor in collaboration with Zeiss (optics and thermal imager) and Texas Instruments (tracking electronics). Possible uses include the Gepard anti-aircraft tank, the Roland air defence system and the proposed battle tank of the 90s.

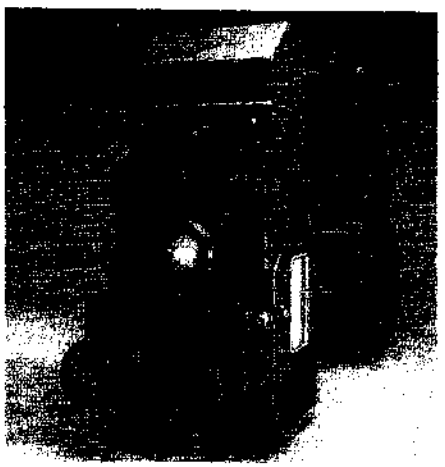
STATUS

In development. Production is likely to start in the second half of 1987.

CONTRACTOR

Siemens AG, ZVW 144, Hofmannstrasse 51; 8000 Munich 70, Federal Republic of Germany.

1727.193
DRIVER'S PERISCOPE TYPE BM 8005



The BM 8005 has been designed for the Marder personnel carrier, Leopard main battle tank, and other armoured vehicles having a standard vision port or the M113 and vehicles with an adapter. It is fitted extensively in NATO forces.

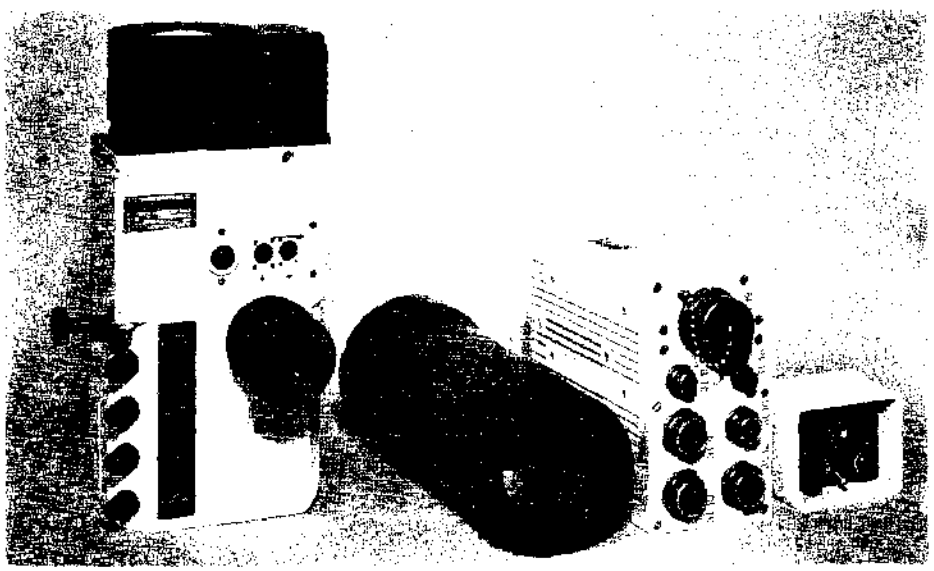
The driver's passive periscope is a binocular night vision device (one optical path for each eye), operated on the principle of image intensification and particularly developed for armoured vehicles provided with the standard vision block port of 65 by 130 mm.

The periscope serves mainly as a driver's vision device enabling night driving, without the assistance of any artificial light sources, down to a minimum illumination level of about 5×10^{-3} ft-c.

In addition the periscope can be utilised for surveillance purposes. There is an individual dioptre control for each eye and eyepiece heating prevents the accumulation of moisture.

CHARACTERISTICS
Magnification: ×1
Field of view: 55 × 40° (horizontal × vertical)
Image intensifier tube: Philips XX 1080
Dioptre adjustment: ±4 dioptres
Angular resolution: 0·6 mrad
STATUS
Over 12 000 units have been supplied for armies throughout the world
CONTRACTOR
Elektro Spezial, Unternehmensbereich der Philips GmbH, Hans-Bredow-Strasse 20, 2800 Bremen 44, Federal Republic of Germany.

BM 8005 driver's passive periscope



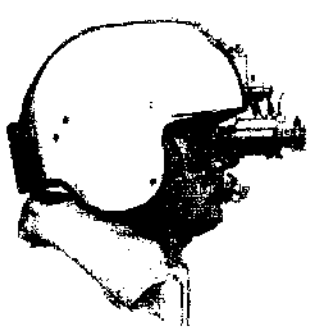
3810.193
BM 8025 PASSIVE NIGHT SIGHT

The BM 8025 passive night sight and observation equipment was developed by Elektro Spezial for the West German armoured personnel carrier Marder and the armoured scout car Luchs. Vehicles equipped with the BM 8025 are qualified for night fighting and do not need any searchlight (IR or white).

In the BM 8025 system, the combination of low light-level imaging and thermal radiation detection offers high tactical efficiency; heat-dissipating targets, like tanks and vehicles, even when camouflaged are rapidly located in the battlefield, and the time for observation, recognition and aiming is shortened to a minimum.

The full field of view of the image-intensifying sight is covered by the scanning thermal target locator. The true position of a detected target is indicated to the operator by a red flashing spot within the light-intensified image of the scene.

CHARACTERISTICS
Magnification: ×6
Field of view: 5·6°
Dioptre focusing range: ±5 dioptres
Thermal target locator
Spectral range: 3 - 5 μm
Field of view: 6 × 2° (horizontal × vertical)
Resolution: 2 mrad
STATUS
The BM 8025 is in service with the West German Army
CONTRACTOR
Elektro Spezial, Unternehmensbereich der Philips GmbH, Hans-Bredow-Strasse 20, 2800 Bremen 44, Federal Republic of Germany.



Units of BM 8025 night sight (left to right): image intensifier sight, thermal sensor, power supply unit, and control unit

4252.193
BM 8028 IMAGE-INTENSIFIER GOGGLES

The BM 8028 image-intensifier night vision goggles are designed for use by AFV drivers, helicopter pilots, reconnaissance patrols and a wide range of similar applications where the ability to see in darkness is a requirement. The equipment comprises the binocular goggles, a face mask and a harness which allows the goggles to be worn under almost any type of helmet or military headgear. Separate multi-channel image intensifier tubes are provided for each eye and there are provisions for adjustment of the inter-pupillary distance, a synchronous focus control for both optical channels and individual dioptre adjustment. There is a small auxiliary infra-red lamp for illumination at close quarters, if necessary incorporated in the goggles. An indicator in the eyepiece shows when this is in use.

CHARACTERISTICS
Magnification: ×1
Field of view: 48°
Focus range: 0·25 m - ∞
Depth of focus (at infinity): 15 m - ∞
Dioptre range: ±5 dioptres
Inter-pupillary adjustment: 58 - 72 mm
Length: 120 mm
Width: 130 mm
Height: 80 mm (goggles with housing)
Weight: 1 kg (without balance weight)
Power supply: 2·2 - 3·2 V (2 × Ni-Cd batteries)
Life: 14 h (without IR source)
STATUS
Series production for Federal German armed forces.
CONTRACTOR
Elektro Spezial, Unternehmensbereich der Philips GmbH, Hans-Bredow-Strasse 20, 2800 Bremen 44, Federal Republic of Germany.

BM 8028 image intensifier goggles (helicopter use)

4684.193
BM 8042 INFRA-RED TARGET MARKER

The BM 8042 target marker is an IR laser projector used together with the BM 8028 night vision goggles (**4252.193**) for aiming infantry weapons (rifles, sub machine guns, anti-tank weapons, etc) at night. It consists of a narrow beam projector providing an IR spot, invisible to the naked eye, onto the target.

The BM 8042 is a small size, rugged sending unit using a specific adaptor for mounting on each weapon. The mechanism for alignment is integrated.

STATUS
In series production.
CONTRACTOR
Elektro Spezial, Unternehmensbereich der Philips GmbH, Hans-Bredow-Strasse 20, 2800 Bremen 44, Federal Republic of Germany.

BM 8042 target marker

5899.093
TRM 7401 THERMAL IMAGER
The TRM 7401 is a wide angle thermal imaging sight which can be used in a variety of night viewing applications on armoured fighting vehicles and helicopters. Versions are also available for naval applications. In the AFV role it provides information to the commander, driver and gunner on either a TV screen or directly integrated into the daylight sighting system. For helicopter use, the equipment provides image reproductions on either a TV monitor screen or a helmet display.

CHARACTERISTICS
Wavelength: 8 – 12 μm
Image field (AFV): Horizontal 55°; vertical 27·5°
Field of vision (helicopter): 30° × 60°
Weight: AFV version 11 kg approx; helicopter version 9·1 kg

CONTRACTOR
Micro and Security Electronic KG, Schone Aussicht 14, 2000 Hamburg 76, Federal Republic of Germany.

TRIGAT SIGHTING SYSTEM
An international consortium, known as SATEL, has been formed by SAT of France, Thorn EMI Electronics of the United Kingdom and Eltro of West Germany, to develop a thermal imager and associated CO_2 laser rangefinder for the sighting system of the Euromissile long-range, third generation, anti-tank guided weapon system (TRIGAT).

The work content has been divided between the three companies. SAT is the lead contractor and has the responsibility for the detector, associated electronics and equipment integration. Thorn EMI is developing the multiple field-of-view telescope and the processing electronics. Eltro is responsible for the scanner, laser rangefinder and detector cooling unit.

The thermal imager, CONDOR I, has multiple fields-of-view and employs parallel scanning with a mercury cadmium telluride detector mosaic of more than one thousand elements, hybridised with charge-coupled device silicon circuits. It will be used in the sights of the TRIGAT system on both armoured fighting vehicles and helicopters. The Eltro CO_2 laser rangefinder has been in development for some time and operates in the 10·6 micron band.

STATUS
In development under a contract from Euromissile Dynamic Group.

4244.193
TD22 THERMAL IMAGING SYSTEM
The Rafael TD22 is a compact high performance thermal imaging system for observation at all ranges. It is built to meet the requirements of a battlefield environment with emphasis on simplicity of operation and maintenance, low cost and long life.

The equipment is based on a parallel scanning mechanism operating in the three to five micron band of the infra-red spectrum and the detectors employed are indium antimonide (In-Sb) devices cooled to 77°K by a Joule-Thompson system which uses pressurised nitrogen. The TD22 has a standard television-type video output enabling remote observation as well as viewing on a built-in direct monitor. It is man-portable, and both portable and vehicle-mounted versions of the equipment have been developed. Company literature suggests that various telescopes can be coupled to the infra-red camera for different applications

CHARACTERISTICS
Waveband: 3 to 5 μm
Detector: 100 element parallel-scan indium antimonide
Detection range: 6·5 km (tanks); 2·5 km (personnel)
Recognition range: 2 km (tanks); 1·5 km (personnel)
Dimensions: 350 × 200 × 150 mm
Weight: 9·5 kg

STATUS
Production.

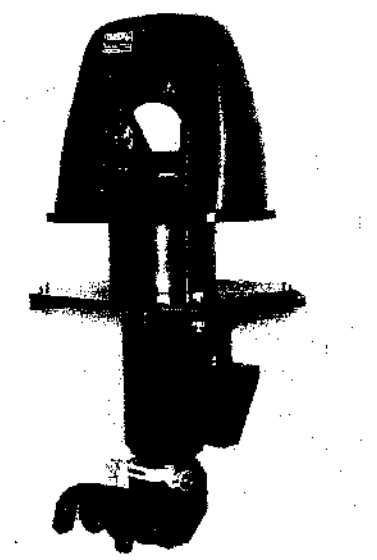
RAINBOW LASER RANGEFINDER
Rainbow is a CO_2 laser rangefinder capable of ranging on targets out to seven km with a 50 metre separation discrimination. The instrument is of modular design, to facilitate maintenance and repair, and consists of a TEA CO_2 laser and beam expander, a receiver, an optical telescope with ×8 magnification, power supply and an associated display unit. Rainbow weighs approximately 22 kg and measures 200 × 200 × 350 mm. No other details are available.

CONTRACTOR
Rafael, Ministry of Defence, PO Box 2082, 31021 Haifa, Israel.



3802.093
GYRO-STABILISED SIGHTING SYSTEM (GSSS)
Tamam's gyro-stabilised sighting system (GSSS) is an essential aid for observation, identification and tracking during aerial, naval, and ground-based missions. Versions are produced suitable for use in helicopters and light aircraft, ships, and armoured vehicles.

The GSSS neutralises motion-produced disturbances of the vehicle, vibration and environmental conditions affecting visual image and alignment accuracy. The system consists of a dual-magnification periscope/telescope the upper folding element (mirror) of which is gyro-stabilised. The mirror coating is effective over a wide spectral range, from the visual to the near infra-red, and permits optional use of laser or IR tracker in parallel with the visual optical path.

High magnification of the stabilised optics enables the observer to identify and lock on to the target at distances greater than the missile's or gun's range, and to distinguish details sufficiently for weapon guidance to the most vulnerable point.

A TV camera permits bi-ocular conventional sighting. TV enables better sighting conditions, and enhances haze penetration. The recording system allows storage and subsequent retrieval of information received during combat patrols, surveillance sorties and training exercises. It is possible to adapt an automatic contrast lock-on target using the TV option. A CRT and simulator assembly enables the GSSS to function as a training aid during simulated and real field firing conditions.

The high precision goniometer serves as an aiming facility for accurate launching and automatic guidance of missiles against armoured targets. The goniometer is mounted on the gyro-stabilised system optical frame and may be aligned with the optical line-of-sight to within 0·1 mrad or better. Alignment can be checked and adjusted by means of an internal collimator. A laser rangefinding system enables accurate target range information for successful launching.

Tamam gyro-stabilised sighting system (GSSS)

LAND NAVIGATION SYSTEM (LANS)

The Tamam land navigation system (LANS) is a small lightweight inertial navigation equipment which provides complete navigational facilities for military land combat vehicles, wheeled or tracked. It consists of three main sub-systems.

(1) heading reference unit (HRU), based on inertial components and an eight-bit digital microprocessor
(2) control and display unit (CDU), which employs an identical microprocessor
(3) distance transmitter (DT), based on a photodiode technique.

The HRU contains a two-gimbals platform providing, as the principal output, the vehicle's heading, the associated electronics, the DTU interface, and a microprocessor performing the gyrocompassing, navigation and automatic gyro drift measurements and computation. The CDU transmits control panel information serially to the HRU and receives the information to be displayed on the panel.

Operating modes include: gyrocompass, navigation, and autocalibration (gyro drift measurements). Navigation is possible by co-ordinates, by bearing and distance, or with four different types of 'terrain compensation'. Any co-ordinate system besides UTM (geographic) can be displayed and other optional facilities include a remote display unit, integration with laser rangefinder, IR etc, or moving map output. It is also possible to report position and azimuth data in real-time via radio links to rear echelons.

CHARACTERISTICS

Position accuracy: ±0·18% of total distance travelled, irrespective of terrain
Heading accuracy: 2 - 3 mrad
Cold start time: 1 minute (stored heading); 15 minutes (full gyrocompassing); 10 minutes (degraded accuracy)
Power supply: 28 V DC 4·5 A
Dimensions: (HRU) 360 × 170 × 27 mm; (CDU) 190 × 130 × 260 mm
Weight: 24 kg

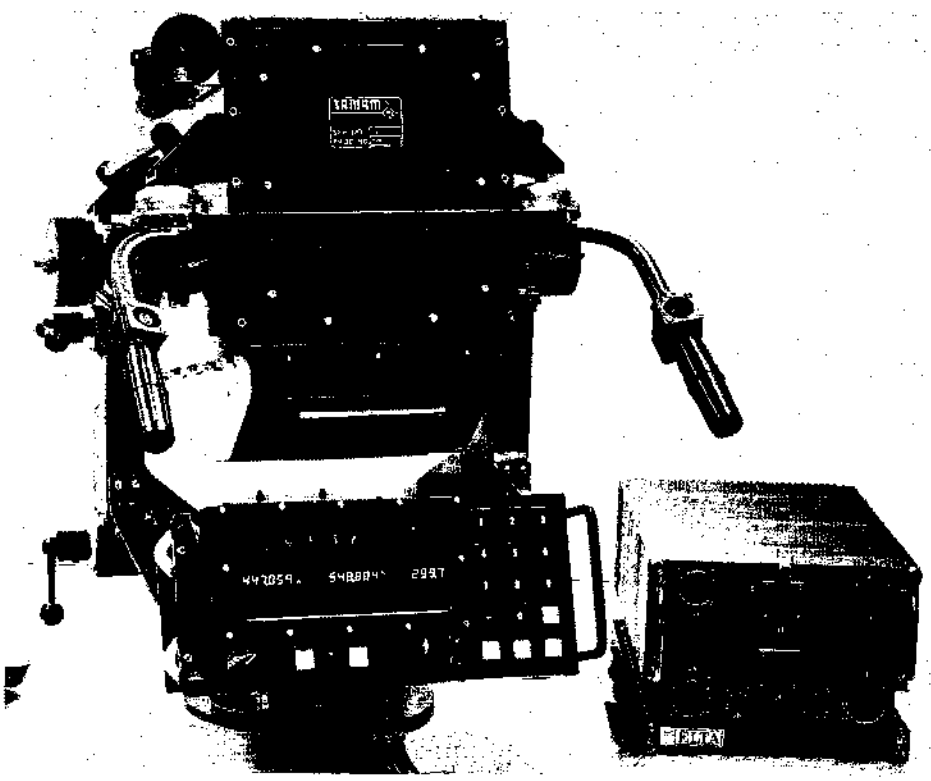
TAMAM PADS

The Tamam position and azimuth determining system (PADS) is a precise ground-based inertial digital navigation equipment supplying instant readout of position, elevation and azimuth for artillery units. The equipment provides firepower co-ordination and orientation for mobile artillery units. It can be mounted on APCs, Jeeps, SP guns or other types of vehicle and is a self-contained, autonomous, all-weather, day/night equipment. Continuous display of co-ordinates and track is available on a moving map and remote display facilities are available. The equipment can be integrated with other sub-systems such as a laser rangefinder or an infra-red sensor.



The main items of the PADS equipment (see illustration) are:

(1) the inertial measurement unit (IMU), which is based on the Singer-Kearfott KT-70 unit operated by the USAF, USN, Israeli and other forces, and its associated power unit
(2) a digital computer, which is software compatible with the Data General Nova and Eclipse families
(3) the control and display unit, which enables the operator to communicate with the computer and accommodates entry of data such as initial position and position updates
(4) a display unit that informs the driver of system status, and particularly any need to stop for velocity updates
(5) an azimuth transfer unit (ATU) which provides remote users with accurate azimuth readings generated by the IMU resolver.

Operation of the ATU is based on a rigid linkage between the optical element and the inertial platform. The gun sight is boresighted and rests with the platform on a common base plate, the whole being gimbal-mounted to permit movement in two axes.

CHARACTERISTICS

Position accuracy: 27 m (CEP at 50° lat)

Tamam position and azimuth determining system (PADS)

Elevation error: 10 m (1 sigma); 33 m (max)
Azimuth error: 0·55 mrad (1 sigma at 50° lat)
Mission duration: 6 h
Latitude limits: 75° N - 75° S
Velocity updates: At 10-minute intervals for 20 s stops

STATUS

Production.

CONTRACTOR

Israel Aircraft Industries Ltd, Yehud Industrial Zone 56000, Israel.

EL-OP DAY/NIGHT GUNNER PERITELESCOPE

The day and night gunner's Peritelescope is a modular integrated electro-optical system designed to upgrade the ranging and aiming capbilities of tanks and armoured fighting vehicles. Its main features are passive night vision, day and night laser rangefinding and enhanced magnification. The primary role of the Peritelescope is to replace the existing system in the Centurion tank, although due to its small size it can be adapted to other tanks and turrets where space is limited.

Two versions are available. The first consists of a mini-laser rangefinder and a 1x prism, both of which permit observation, aiming and rangefinding during daylight. The 1x prism is fully interchangeable with a passive night elbow so that observation, aiming and rangefinding are possible at night. The elbow contains a standard NATO reticle and a laser for night rangefinding. The reticles are projected and collimated on the image intensifier tube giving accurate aiming and rangefinding in the dark. The second version is designed to function without the mini-laser and consists of an 8x daylight elbow combined with a passive night elbow for use both day and night. Since the 1x prism is fully interchangeable with the night elbow, a combination of an 8x daylight elbow and a 1x prism enables observation and aiming during daylight.

5900.193

MT-18 AND MT-19 LASER RANGEFINDERS

The MT-18 is a lightweight, self-contained, hand-held laser rangefinder specifically designed for infantry use, although it can be used in a variety of applications with specially designed accessories, for artillery, armoured fighting vehicles, and with remote control. Range to the target is provided as a four-digit display output in the sighting eyepiece.

As an artillery rangefinder, the equipment is known as the MT-19. It is tripod-mounted and combined with a goniometer which is electrically and mechanically connected. A rapid target-co-ordinates display is available.

CHARACTERISTICS

Range: 200 m to 20 km
Accuracy: ±10 m
Dimensions: 190 × 210 × 80 mm (320 × 220 × 230 mm with goniometer)
Weight: 2·9 kg (5·9 kg with goniometer)

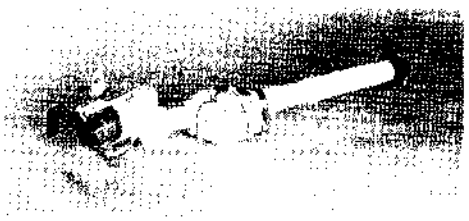
STATUS

In production.

CONTRACTOR

Electro-Optics Industries Ltd (EL-OP), PO Box 1165, Rehovot 76110, Israel.

5901.193
EL-OP TANK LASER RANGEFINDER



The EL-OP tank laser rangefinder is designed to provide high accuracy range measurements for the vehicle fire control system. It comprises four units, a commander's control, gunner's control, electronics unit and a laser periscope/sight. The equipment allows either the commander or the gunner to measure ranges up to 4995 metres.

CHARACTERISTICS
Operating range: 400 - 9995 m (valid range accepted by computer 400 - 4995 m)
Range accuracy: ±10 m
Range resolution: Capable of resolving 2 targets a minimum of 20 m apart
Dimensions: Control 125 × 130 × 190 mm; electronics unit 330 × 260 × 180 mm; laser periscope/sight 325 × 240 × 280 mm
Weight: Control 5·5 kg; electronics unit 11 kg; laser periscope/sight 15 kg
CONTRACTOR
Electro-Optics Industries Ltd (EL-OP), PO Box 1165, Rehovot 76110, Israel.

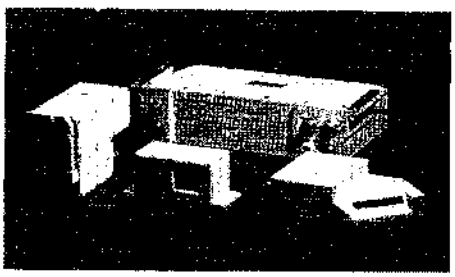
4216.193
C 215 ARTICULATED TELESCOPIC SIGHT



The C 215 articulated telescopic sight, designed by Aeritalia, is part of the secondary direct fire control system of the new Italian-designed OF 40 main battle tank. It is mounted coaxially with the weapon and is used in conjunction with the M114 telescope mount. The instrument consists of a head assembly which includes an eyepiece, support arm and adjustable head-rest, an articulated body in which the prisms are located, and an objective tube assembly.
CHARACTERISTICS
Magnification: ×8
Field of view: 7·5°
Objective focal length: 305 mm
Eyepiece focal length: 38 mm
Exit pupil: 5 mm diameter
Eye relief: 24·5 mm
Eyepiece setting: –4 to +4 dioptres
Dimensions: 1200 × 178 mm
Weight: 25 kg
Operating temperature range: -40 to +65°C
Storage temperature range: –50 to +70°C
STATUS
In production for OF 40 main battle tank.
CONTRACTOR
Aeritalia (Società Aerospaziale Italiana), Viale Europa, 20014 Nerviano, Italy.

Aeritalia C 215 articulated telescope for new Italian OF 40 tank

3558.193
VAQ-3 TANK LASER RANGEFINDER

The VAQ-3 neodymium-glass laser rangefinder for battle tanks has been designed for integration with a computer fire control system. Long-range firing with a very high first round hit probability is possible, even against moving targets. Furthermore, a much shorter reaction time is achieved. The VAQ-3 is now the standard laser rangefinder fitted in the Leopard main battle tank of several armies. An updated version, the VAQ-33, has been produced.
CHARACTERISTICS
Type: VAQ-3
Laser material: Nd-glass
Mode of operation: Q-switched
Wavelength: 1·06 μm
Peak power: 6 MW
Energy per pulse: 150 mJ
Pulse repetition rate: 12 pulses per minute or bursts of 3 pulses in 4 s with an interval of 15 s between bursts
Detector: Avalanche photodiode
Range capability: 400 m – 10 km
Range accuracy: ±5 m
Distance discrimination: 30 m
Azimuth discrimination: 0·25 mrad
Signal to computer: Digital in BCD code with DC logic level of TTL circuits
System composition
Laser optical head (transmitter/receiver)
Gunner's laser control unit (GLCU)
Commander's laser control unit (CLCU)
Laser power supply unit (LPSU)
Laser Optical Head
Weight: 6·8 kg
Dimensions: 280 × 116 × 180 mm
GLCU
Weight: 1·9 kg
Dimensions: 280 × 170 × 75 mm
CLCU
Weight: 0·8 kg
Dimensions: 218 × 131 × 91 mm
LPSU
Weight: 13·9 kg
Dimensions: 511 × 126 × 257 mm
Power supply: 24 V DC (vehicle supply)

Selenia VAQ-3 tank laser rangefinder

STATUS
In quantity production. Several hundred units have been produced for the Leopard tank.
CONTRACTOR
Selenia SpA, Special Equipment and Systems Division, Via dei Castelli Romani 2, Pomezia, Rome, Italy.

5700.193
SELENIA LASER UNITS

In addition to the VAQ-3 described above, Selenia have produced a number of other laser rangefinders and visual units of which very few details are available. These include the VAQ-33 which is an updated version of the VAQ-3 and the GAQ-4. This latter equipment is a high repetition rangefinder for naval and ground anti-aircraft fire control systems and has recently been adopted for use with the new Italian Army self-propelled four-barrel 25 mm gun. Another new unit is the MLS-6 laser visual equipment for day and night aiming on tank guns. It can be installed in many types of tank, without modification, and is claimed to provide very high performance at very low cost.
CONTRACTOR
Selenia SpA Special Equipment and Systems Division, Via dei Castelli Romani 2, Pomezia, Rome, Italy.

4253.193
VTG 120 LIGHT THERMAL IMAGER

VTG 120 is a man-portable thermal imaging equipment for night surveillance and aiming of medium-range weapons, with particular application to the TOW anti-tank missile. It operates in the 8 to 14 micron band and is provided with an eyepiece for direct viewing. It can also be connected to an external CRT for remote monitoring of the observed scene. An electrically generated reticle is correctly positioned for aiming purposes.

The system is completely autonomous with a battery and air bottle which allows more than two hours of continuous operation. The empty bottles and battery can be easily replaced. A range of ancillary equipment is available including a battery charger, boresight collimator for reticle alignment, gas bottle charger and a tripod mounting interface. Standard performances on a tank target are 3000 metres detection and 2000 metres identification in normal meteorological conditions.
CHARACTERISTICS
Wavelength: 8 – 14 microns
Field-of-view: Narrow 20 × 40 mrad; wide 60 × 120 mrad
Resolution: Narrow 0·16 mrad; wide 0·5 mrad
Detector: CMT 60 element array
Cooling system: Joule Thomson mini cooler
STATUS
Production.
CONTRACTOR
Officine Galileo SpA, Via Einstein 35, 50013 Campi Bisenzio, Florence, Italy.

VTG 120 thermal imaging night sight fitted to TOW anti-tank missile launcher

3589.193
P56 SERIES COMPUTING SIGHT AND GUN DRIVE

The basic P56 equipment is a self-powered computing sight and gun laying equipment for local control of light calibre guns against low- and very low-flying targets. It may also be used for the engagement of ground targets. Suitable for fitting on any existing gun, it has been chosen for use with guns of 20 to 40 mm calibres by several countries.

The sight consists of one panoramic articulated telescope with fixed eyepiece for aiming at both air and ground targets. The computer is a solid-state electronic machine. The gun drive consists of an axial pump and hydraulic motor, with prime power being provided by an internal combustion engine or by an electric motor. This motor also drives a generator to provide electrical power for the computer. Tracker training equipment is also available

Sights of this series are encountered frequently on 20 mm guns produced by Rheinmetall in West Germany, GIAT in France and Swiss Oerlikon weapons. The P56/40 version was specially designed for upgrading the Bofors 40/56 weapon.

CHARACTERISTICS

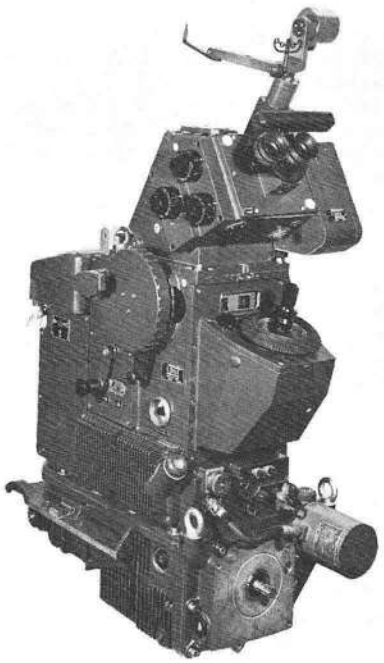
Sight
Elevation: -7 to +85°
Magnification: ×5
True field: 12°
Target speed: 60 - 350 m/s
Crossover point range: 100 - 600 m
Total lead angle: Up to 21°

P56T

The P56T is a turret computing sight and gun laying equipment based on the standard P56 and specially designed for installation on the turret of any wheeled or tracked vehicle intended for AA defence with light calibre guns.

P56/40

This is a special version of the P56 designed for retrofitting to existing 40 mm AA guns, such as the 40/60, to provide an autonomous capability and to enhance performance.



Specific versions for upgrading other weapons are available.

STATUS

Several thousands of the P56 equipment have been supplied for many types of guns of 20 to 40 mm calibre for European and other armed forces (20, 30, 37 and 40 mm calibre). Over 1500 units are in operation in NATO countries and some hundreds in other countries. A series (P56T version) has been produced for use in turrets manufactured by Electronique Serge Dassault.

CONTRACTOR

Officine Galileo SpA, Via Einstein 35, 50013 Campi Bisenzio, Florence, Italy.

P56 computing sight and gun drive for fitting to AA guns

5902.193
VANTH OPTRONIC FIRE CONTROL SYSTEM

This is a family of optronic fire control systems for local control of AA guns, and is the latest generation of an original Galileo concept evolved through the P36, P56 and P75 models. The systems can operate autonomously, can be integrated into a SHORAD system fitted with a co-ordination and control centre and a detection radar, or can be remotely controlled for unmanned operation in association with a fire control unit.

The Vanth family, which incorporates the P75, is characterised by:

(1) up-to-date technology, including a micro-processor-based computer, laser rangefinder and, optionally, optronic sensors for twilight and night operation
(2) modularity and growth capability
(3) direct interchangeability with previous P models on any weapon
(4) adaptability to virtually any AA mount from 20 mm calibre upwards
(5) suitability for retrofit and upgrading of existing guns, with or without own servo systems.

In addition it is possible to upgrade any P56 system into a Vanth model.

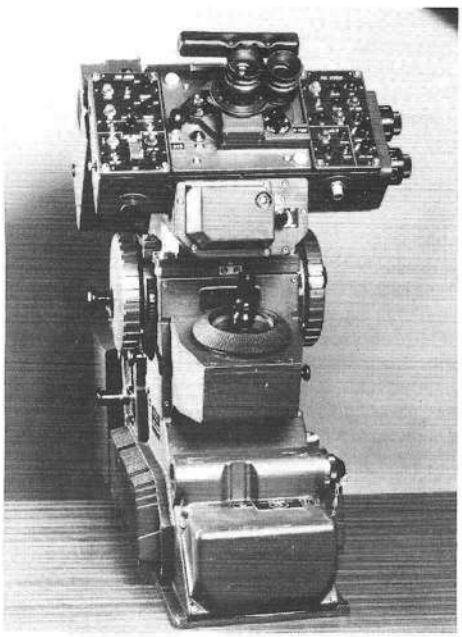
The basic model of the Vanth family features fully automatic computation based on laser rangefinding, local control with remote designation (radar or optical), and integrated autotest. This model can be expanded with any one or more additional options, such as remote control by an external fire control system, firing taboo arcs setting, parallax and meteoballistic introduction, integrated training system, TV automatic tracking, light intensifier channel, and a thermal imaging channel.

The basic sub-assemblies of the system are:

(1) an optical head with acquisition open sight, telescopic line-of-sight, laser rangefinder, optional night sight, and control panels
(2) main structure with control joystick, manual manouevres and digital computer
(3) hydraulic servo systems, drive gears, prime mover and electrical generator.

The optical head integrates the visual, laser and light intensifier channels, and the TV, into a single optical path. This multiple line-of-sight is independent of the line-of-fire so that target aiming is always at the centre of the reticle, even when the gun is given lead angle corrections. The laser rangefinder is an Nd:YAG type with high repetition and accuracy.

The digital computer performs all the firing computations at high speed, controls and manages the operation of the optical sights, laser rangefinder, servos and accessory functions. It also provides facilities for the reconfiguration of the basic system by the addition of optional modules.



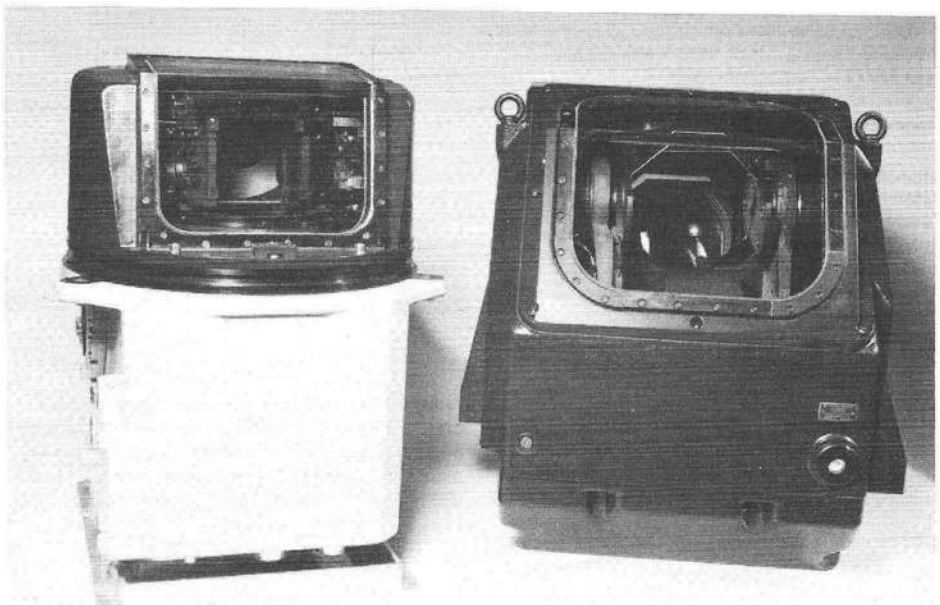
Sight and gun control is performed by the operator through a two-degree of freedom joystick. A back-up manual system is also available. The servo system is electro-hydraulic and provides high speed and acceleration with a very small dynamic error.

STATUS

In production.

CONTRACTOR

Officine Galileo SpA, Via Einstein 35, 50013 Campi Bisenzio, Florence, Italy.



Vanth fire control system

5903.103
MADIS SIGHTING AND DRIVE SYSTEM

Madis is a sighting and turret drive system originally designed for the Oto Melara Quad 25 mm self-propelled gun system. It consists of a daylight optical head, a night optical head, and a hydraulic servo system and control unit. The three units are compact and modular in construction and can be installed in other AA armoured vehicles, either in total or in part.

The daylight optical head contains the visual telescope, self-stabilised by a gyro directly coupled to the line of sight (LOS) to allow operation on the move. It can also operate without the gyro as a servoed optical sight. Provision is made for compensation of

Madis system daylight and night optical heads

image rotation due to the azimuth angle. The head can also accommodate a laser rangefinder and a TV camera, with integration into a single output path of the visual, laser and TV channels to ensure the necessary parallelism.

The night optical head is an optical device designed for integration with a low-light level TV camera in a compact and rugged housing. The LOS can be servo-stabilised to enable use on the move.

The power servo system of the turret and weapon consists of an axial pump and hydraulic motor with an asynchronous motor as prime mover. This assembly also includes the first stage of the reduction gearing and, on the upper part, the computer and control panel.

CHARACTERISTICS

Daylight optical head

Field of movement: Azimuth 45°; elevation -10° to -85°

Telescope magnification: ×5

Telescope field-of-view: 12°

Night optical head

Field of movement: Azimuth 45°; elevation -10° to +75°

Field-of-view: 4·76°

STATUS

V 200 VISION BLOCK

The V 200 vision block is designed for observation from the inside of the M113 APC and other armoured vehicles, giving the observer protection from small arms fire. The V 200 is capable of withstanding direct hits from 7·62 mm ammunition.

CHARACTERISTICS

Magnification: ×1

Field of view: 90° horizontal; 30° vertical

Transmission: 64%

Dimensions: 291 × 187·5 × 114 mm

Weight: 10 kg

Operating and storage temperature range: -54 to +68°C

CONTRACTOR

Aeritalia (Società Aerospaziale Italiana), Viale Europa, 20014 Nerviano, Italy.

4217.193

P 186 TELESCOPIC SIGHT

The P 186 telescopic sight is designed for use as part of the primary fire control system of the Palmaria 155 mm self-propelled howitzer. Fitted on the Bofors telescopic mount, the device is used for laying the weapon in azimuth for indirect fire control. The instrument consists of a head assembly with a right angle prism, top and bottom body assemblies, and an eyepiece which contains an Amici prism.

CHARACTERISTICS

Magnification: ×4

Field of view: 10° (177 mils)

Objective focal length: 110 mm

Eyepiece focal length: 28 mm

Entrance pupil: 19 mm diameter

Exit pupil: 4·75 mm diameter

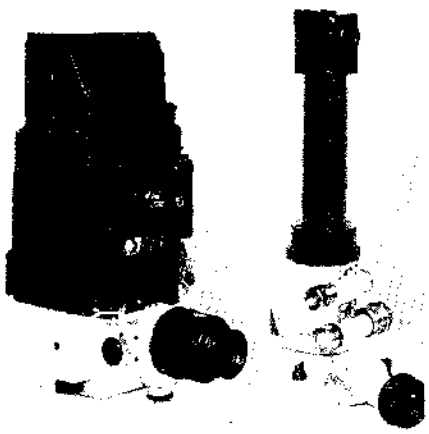
Eye relief: 19·5 mm, 435 mm

Azimuth range: 6400 mils

Elevation limits: -645 to +345 mils

Dimensions: 525 × 162 × 240 mm

Weight: 8 kg



Operating temperature range: -25 to +70°C

STATUS

In production for the Italian-built Palmaria 155 mm SP howitzer.

CONTRACTOR

Aeritalia (Società Aerospaziale Italiana), Viale Europa, 20014 Nerviano, Italy.

---

4218.193

P 192 NIGHT DRIVING PERISCOPE

The P 192 is a passive night vision device for drivers of AFVs using a second generation light intensifier tube. With this periscope, it is claimed to be possible to drive vehicles at a speed of more than 40 km/h in starlight conditions without any artificial illumination. It consists of a head prism, S 25 micro-channel light intensifier and a bi-ocular eyepiece. A head prism was selected for the instrument instead of a mirror, because of its smaller size for a similar field of view, and greater strength. The light intensifier is fitted with a gain control which is automatically switched off when the photocathode illumination level becomes too high. A filter allows a correct observation within a luminance range from 10^{-3} lux to 10^{4} lux. The instrument is equipped with a bi-ocular display which enables the driver to view the scene with both eyes through one large diameter eyepiece. The equipment is designed to be fitted on various types of vehicle including the 6616, M113, VCC 1, Marder, M41, M47, M48, V60, Leopard and the TAM.

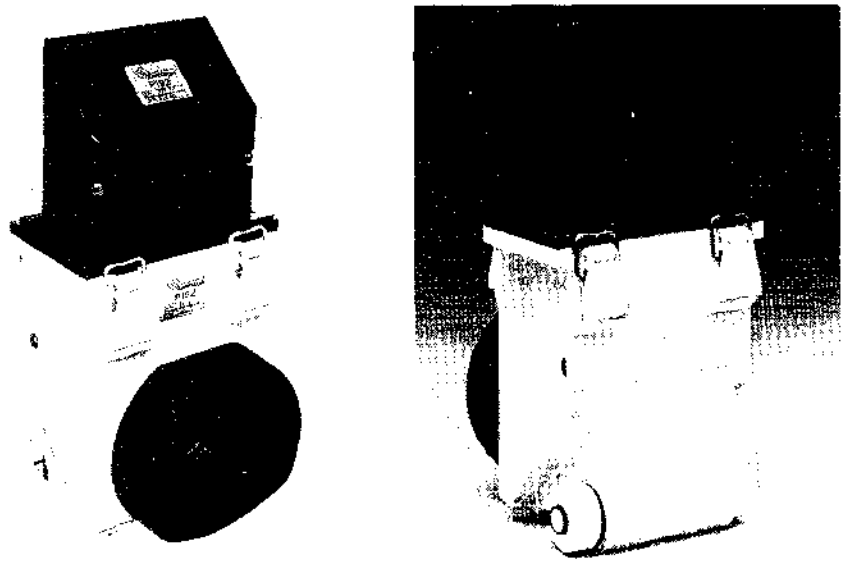
CHARACTERISTICS

Magnification: ×0·9

Field of view: 48° horizontal, 40° vertical

Objective lens focus: 25 mm

Relative objective aperture: 1:1·3



Eyepiece lens focus: 43 mm

Eyepiece aperture: 1:0·54

Focus range: 10 m - ∞

Eyepiece pupils distance: 35 mm

Transmission: >75%

P 204 PERISCOPE

The P 204 periscope is designed for day and night operations as part of the primary fire control system of the SM 6616 armoured car. It can be adapted to replace M32, M34, and M36 periscopes installed in other vehicles. The instrument consists of the body and either a daylight elbow sighting telescope or a night elbow sight with an image intensifier. The two sights are interchangeable. The body contains the head prism, a unity power optical system and includes eyer linkage to the weapon.

(A photograph of this instrument appears in entry **4217.193** for the P 186 telescopic sight, above.)

CHARACTERISTICS:	**day**	**night**
Magnification	×8	×8

MS4GT mini-weapon sight

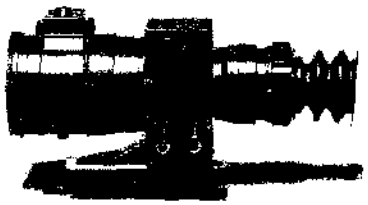
3394.193
TYPE RS4TS INDIVIDUAL WEAPON SIGHT
This is a small, lightweight image-intensifier system for observation and direct firing with weapons at night. Though suitable for mounting on most basic infantry weapons, the sight can also be used as a hand-held viewer. In its modular concept the sight is similar to the crew-served weapon sight type GS6TS (**3395.193**) having the central housing incorporating tube and controls in common.

Design features include automatic brightness control, an adjustable sky light diaphragm to suppress the disturbing effects of night sky illumination, and reticle with adjustable illumination. To prevent tube damage when observing hits on armour special flash-proof image intensifier tubes are incorporated.

CHARACTERISTICS
Magnification: ×4
Field of view: 10°
Focus range: 20 m - ∞
Detection range: Typically 500 m for infantry targets and 1000 m for tanks
Length: 365 mm
Width: 135 mm
Weight: 2 kg

STATUS
In quantity production; deliveries to various military and para-military forces.

CONTRACTOR
Oldelft (NV Optische Industrie De Oude Delft), PO Box 72, 2600 MD Delft, Netherlands.

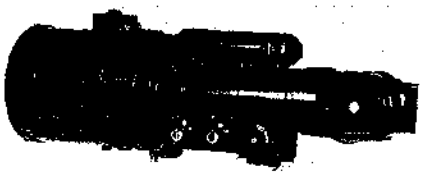


Type RS4TS individual weapon sight

4747.193
RS4MC SMALL ARMS WEAPON SIGHT

This is a small, lightweight second-generation night vision device for observation and direct firing with weapons at night. It is suitable for mounting on most basic infantry weapons and can also be used as a hand-held sight. It is similar in modular construction to the GS6MC crew-served weapon sight (**4690.193**), as it also has the central housing, which incorporates tube, eyepiece and controls. The reticle can be adjusted to the scene brightness.

CHARACTERISTICS
Magnification: ×4
Field of view: 10°
Focus range: 20 m – ∞
Dimensions: 360 mm (long) × 100 mm (high) × 96 mm (wide)
Weight: 2 kg
CONTRACTOR
Oldelft (NV Optische Industrie De Oude Delft), PO Box 72, 2600 MD Delft, Netherlands.



RS4MC small arms weapon sight

3395.193
TYPE GS6TS CREW-SERVED WEAPON SIGHT

This night vision sight can be attached to all types of crew-served weapons such as heavy machine guns, recoilless rifles and anti-tank guns. The modular design permits the use of either a straight or rectangular eyepiece. Reticles can be fitted matching the ballistics of the weapon concerned. The reticle illumination is adjustable. A sky light diaphragm is incorporated for an optimal adaption to night sky illumination. To prevent tube damage when observing hits on armour special flash-proof image intensifier tubes are incorporated.

CHARACTERISTICS
Magnification: ×6·4
Field of view: 6·6°
Focus range: Adjustable 50 m – ∞
Detection range: Typically up to 800 m for infantry targets and 1500 m for tanks
Length: 430 mm
Diameter: 150 mm
Weight: 3·5 kg
STATUS
In quantity production for various armies.
CONTRACTOR
Oldelft (NV Optische Industrie De Oude Delft), PO Box 72, 2600 MD Delft, Netherlands.

Type GS6TS crew-served weapon sight

3396.193
TYPE HV5X80AT MINI-WEAPON SIGHT

The mini-weapon sight is a small lightweight image intensifier system for observation and aiming with personal weapons at night. Its operation is passive; the light available at the scene is electronically intensified so that targets can be observed and engaged even in the darkest night without any artificial illumination and with a maximum security from detection. The system can be used as a mounted weapon sight on basic infantry weapons, such as rifles, light machine guns and rocket launchers, and as a hand-held observation device. The sight has the capability of detecting enemy use of near infra-red emitters.

CHARACTERISTICS
Magnification: ×5
Field of view: 10°
Focus range: 30 m – ∞
Detection range: Typically 500 m for infantry targets and 1500 m for tanks
Dimensions: 365 × 98 × 125 mm
Weight: 2·2 kg
STATUS
In use with various armies.
CONTRACTOR
Oldelft (NV Optische Industrie De Oude Delft), PO Box 72, 2600 MD Delft, Netherlands.

Type HV5X80AT mini-weapon sight

3397.193
TYPE PG1MS NIGHT VISION GOGGLES

These goggles are primarily intended for use by drivers of armoured vehicles and by helicopter pilots. 'Hands-free' operation also provides paratroops, commandos, reconnaissance patrols, sentries and security forces with a useful aid at night. A snap-on IR light source gives additional illumination for map reading and other short-range tasks.

CHARACTERISTICS
Magnification: ×1
Field of view: 47°
Focus range: Adjustable 30 cm – ∞
Range: Typically up to 150 m
Weight: 1 kg (approx)
STATUS
In quantity production for NATO and other forces.
CONTRACTOR
Oldelft (NV Optische Industrie De Oude Delft), PO Box 72, 2600 MD Delft, Netherlands.

Type PG1MS night vision goggles

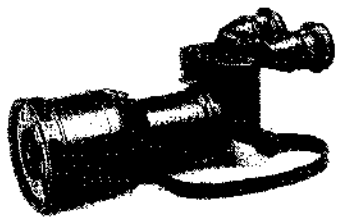
4748.193
PC1MC NIGHT VISION GOGGLES

These are known as "Cyclops" goggles and incorporate a single second-generation image intensifier. They can be used for a variety of night tasks, including night driving of all types of vehicles. They are lightweight and the near-face position of the centre of gravity makes them easy to wear, even with a helmet. The special material of the wearing frame allows ventilation of the skin.

CHARACTERISTICS
Magnification: ×1
Field of view: 40°
Focus range: 25 cm – ∞
Dimensions: 142 mm (long) × 131 mm (wide) × 73 mm (high)
Weight: 560 g
CONTRACTOR
Oldelft (NV Optische Industrie De Oude Delft), PO Box 72, 2600 MD Delft, Netherlands.

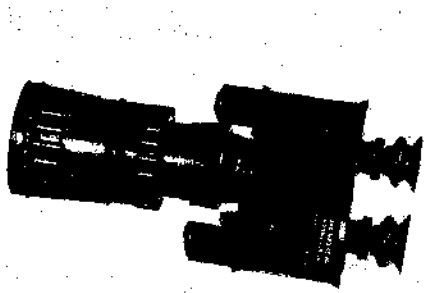
PC1MC night vision goggles

3578.193
TYPE TS7TS PASSIVE AIMING SIGHT
The passive aiming sight TS7TS has been designed to replace the infra-red sight on various types of tanks. It enables gunners to locate, identify and engage targets at night, without the use of any artificial illumination. The combination of high-speed entrance optics, a 25 mm image-intensifier tube and an optimally shaped eyepiece ensures a clear view of the field of fire. A gun-following mirror links the two parts (gun and sight).



CHARACTERISTICS
Total magnification: ×7
Field of view: 6°
Focus: 100 m – ∞
Eyepiece adjustment: ±5 dioptres
Image-intensifier tube: 3-stage with ABC, DC and FP
Power supply: 21-30 V DC
STATUS
Production.
CONTRACTOR
Oldelft (NV Optische Industrie De Oude Delft), PO Box 72, 2600 MD Delft, Netherlands.

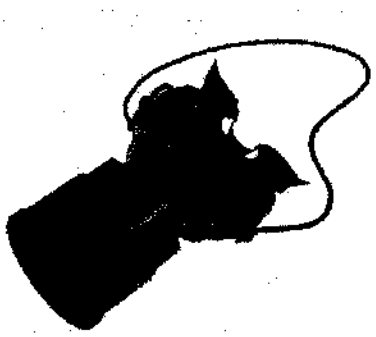
Type TS7TS infra-red tank sight head



3433.193
TYPE UA 1242 NIGHT OBSERVATION SIGHT
The UA 1242 is a lightweight hand-held night observation device with bi-ocular presentation of the image to the eyes. It has a second-generation micro-channel image-intensifier tube with an integrated power supply, automatic brightness control and point highlight suppression.

Both objective and eyepiece lenses are adjustable, as is the inter-ocular distance.
CHARACTERISTICS
Magnification: ×5
Field of view: 7·5°
Resolution: 1 mil at 1 mlux (starlight) at a target contrast of 30%
Focusing range: 25 m – ∞
Eyepiece adjustment: · 5 to +3 dioptres
Interocular distance: 58 – 72 mm
Power supply: 2·2 – 3·4 V DC
Weight: 1·9 kg
STATUS
In production.
CONTRACTOR
Philips Usfa BV, Meerenakkerweg 1, PO Box 218, 5600 MD Eindhoven, Netherlands.

Type UA 1242 night observation sight



3400.193
TYPE PB4DS PASSIVE BINOCULARS
These binoculars are designed for general-purpose night surveillance by AFV commanders, outposts, reconnaissance patrols, border guards, security and police forces. A single two-stage fibre-coupled image-intensifier is used to produce a single image which is viewed through a bi-ocular eyepiece.
CHARACTERISTICS
Magnification: ×4
Field of view: 10°
Focus range: Adjustable 4 m – ∞
Detection range: Typically 400 m for infantry targets and 1500 m for tanks
Weight: 2·3 kg
STATUS
In service with several armed and police forces; in series production.
CONTRACTOR
Oldelft (NV Optische Industrie De Oude Delft), PO Box 72, 2600 MD Delft, Netherlands.

Type PB4DS passive binoculars

4749.193
PB4SL NIGHT BINOCULARS
The PB4SL binoculars are a lightweight second-generation device designed for general-purpose night surveillance and reconnaissance by armoured fighting vehicle commanders, outposts, patrols, border guards, security and police forces. A fibreglass-windowed image intensifier is used to produce a single image which is viewed through a binocular eyepiece. The binoculars are similar to the PC1MC goggles (**4748.193**) and, with the exception of the front optics, all parts are interchangeable.

CHARACTERISTICS
Magnification: ×4
Field of view: 10·5°
Focus range: 8 m – ∞
Dimensions: 230 mm (long) × 125 mm (high) × 90 mm (wide)
Weight: 1·1 kg (approx)
CONTRACTOR
Oldelft (NV Optische Industrie De Oude Delft), PO Box 72, 2600 MD Delft, Netherlands.

PB4SL night binoculars

5904.193
SAMTOR THERMAL OBSERVATION SYSTEM
Oldelft has developed a thermal observation system for coastal and frontier surveillance. The system is completely mobile and can either be transported by a Land-Rover type vehicle, or is man-portable by four people. The equipment can be assembled and be operational on site in less than one hour. It can also be mounted on a vehicle for instantaneous use while stationary or on the move.

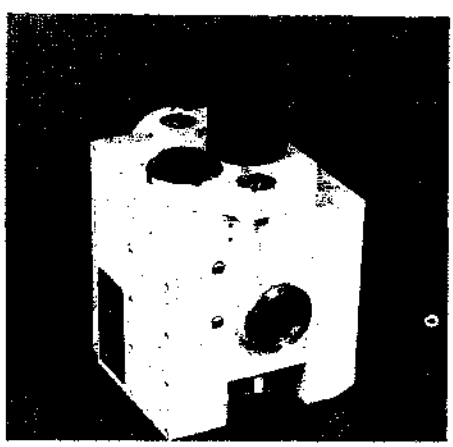
The SAMTOR system consists of:
(1) a thermal imaging camera
(2) a head assembly to allow movement in azimuth and elevation
(3) tripod mounting
(4) an electronics unit
(5) a control and video display unit
(6) an optional laser rangefinder
(7) an optical 220 V generator.

The system is modular based with an afocal telescope providing a dual field of view, scanning module, IR imaging system, closed-cycle cooling system and an electronics module. The last provides system control, processing of the image and multiplexing of the video system. The optional laser rangefinder is fitted in parallel with the camera reticle.

The control/display unit controls the camera position in azimuth and elevation, adjusts brilliance and contrast, changes the image positive/negative, adjusts focus, selects the field of view and controls the rangefinder, when fitted. It also provides a read-out of azimuth and elevation of the camera, plus distance measured by the rangefinder. The thermal image is displayed on a 9-inch (229 mm) high-resolution video screen and can be relayed to outside monitors. Camera azimuth and elevation, and distance from the rangefinder, can also be displayed on the screen.
CHARACTERISTICS
Thermal camera
Field of view: Narrow 1·7° × 4° (optionally a second narrow field 0·85° × 2°); wide 5·1° × 12°

Detection range: Tank 6 – 8 km; person 1·8 km
Reconnaissance range: Tank 2·5 km; person 1 km
Wavelength: 7·5 – 11·7 microns
Cooling system: Closed-cycle Stirling
Time into operation: 10 minutes from starting cooling system
Head assembly
Scanning angle: Azimuth 340° (scan sector is adjustable); elevation –90° to +90°
Accuracy: 3 mils
Laser rangefinder
Type: Nd:YAG
Wavelength: 1·06 microns
Power output: 40 mJ
Range: 200 – 9990 m
Accuracy: 10 m
Field of view: 7°
STATUS
Pre-production.
CONTRACTOR
Oldelft (NV Optische Industrie De Oude Delft), PO Box 72, 2600 MD Delft, Netherlands.

SAMTOR thermal observation system



3576.193
MINILASER RANGEFINDER
The Oldelft Minilaser is a small lightweight laser rangefinder suitable for use in either tripod or vehicle-mounted form. Adapters are available for the latter applications. The Minilaser is of modular construction and has the following sub-assemblies: rangefinder, goniometer, tripod, battery unit, and vehicle adapter (if required). The rangefinder and goniometer have separate housings, enabling each unit to be used independently. A north-seeker incorporated in the instrument facilitates orientation of the observer in respect of magnetic north. Instant digital readouts are provided for distance, azimuth, and elevation angles.
CHARACTERISTICS
Transmitter
Type: Nd-YAG
Wavelength: 1·06 micron
Output energy: 40 mJ
Pulse width: 7 μsec
Power output: 6 MW
Beamwidth: 0·7 mrad
Pulse rate: 10 per minute
Receiver
Field of view: 0·3 mils
Aperture: 45 mm
Range accuracy: ± 10 m
Range (minimum/max): 200/9900 m
Target selection: First or last reply mode
Sight
Magnification: ×7
Field of view: 7°
Eyepiece adjustment: +5 to –5 dioptres
Goniometer
Azimuth: 0 – 6399 mils
Accuracy: ±2 mils
Elevation: ±300 mils
Resolution: ±2 mils
Dimensions
Rangefinder: 184 × 184 × 85 mm
Goniometer: 250 × 225 × 180 mm
Battery: 220 × 110 × 100 mm
Weight: 7·8 kg (rangefinder and goniometer)
STATUS
Production.
CONTRACTOR
Oldelft (NV Optische Industrie De Oude Delft), PO Box 72, 2600 MD Delft, Netherlands.

Oldelft Minilaser on tripod mount

5702.193
RSI TANK LASER RANGEFINDER
The RSI (Rationalisation, Standardisation, Interoperability) laser rangefinder is specifically designed for easy retrofitting to existing battle tanks provided with the M 35 E1 periscope (eg Centurion, M 48 and M60). Daylight aiming sight and laser rangefinder are combined in one unit to replace the existing daylight elbow in the M35 periscope. For use as part of a fire control system, a projected reticle channel is provided to display reticle offsets in the eyepiece. To minimise volume at the gunner's station, the electronic elements are contained in one unit.

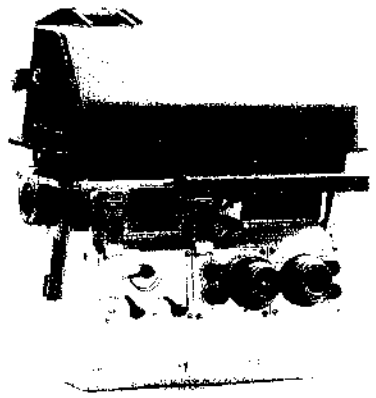
The field of view of the instrument is 7° with a magnification of ×8. A minus blue filter and a neutral density filter are included, and can be actuated with a lever on the housing of the optical unit. The aiming reticle is illuminated to stand out against a dark background. The display in the eypiece field of view gives measured range, first/last return mode indication, multiple return indication, master failure indication and projected reticle (azimuth offset angle).
CONTRACTOR
Oldelft (NV Optische Industrie De Oude Delft), PO Box 72, 2600 MD Delft, Netherlands.

RSI tank laser rangefinder

3429.193
UA 9120 SERIES DAY/NIGHT PERISCOPE

This periscope system has been designed for both day and night observation and gun-laying, either in armoured fighting vehicles equipped with medium calibre main armament, or in main battle tanks. The modular construction permits independent operational use of the day and night systems. Apart from the day and night periscopes a vision block of unity magnification has been incorporated. The entry optics of both periscopes are coupled to the aiming mechanism of the main armament providing for the elevation of the line-of-sight in collimation with the gun. The vision block has a steady line-of-sight to create a continuous forward observation capability for the gunner, independent of the gun elevation.

The night system is provided with: a second-generation image-intensifier tube with automatic brightness control and point highlight suppression; a built-in and adjustable sky-screen; a reticle for ground targets; and an adjustable iris-diaphragm.



The daylight system is provided with: switchable magnification; a built-in and switchable filter for excessive brightness; and a reticle for ground and air targets.

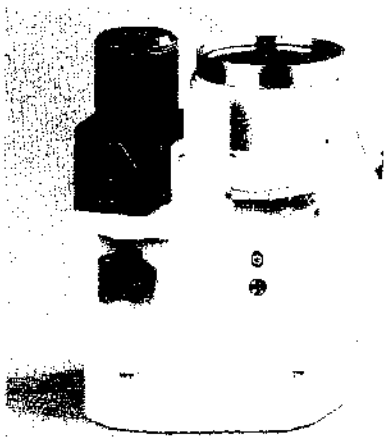
The reticles of both systems are adjustable for both azimuth and elevation (±5 mrad) and can be illuminated.

The system can be extended with a ballistic compensator proportionally designed to fit within the system dimensions.

CHARACTERISTICS
Night system
Magnification: ×7
Field of view: 7°
Eyepiece adjustment: −3 to +3 dioptres
Elevation: −10 to +20°
Daylight system
Magnification: ×6 or ×2
Field of view: 170 and 510 mils
Eyepiece adjustment: −3 to +3 dioptres
Elevation: −10 to +60°
Vision block
Magnification: ×1
Horizontal field of view: 75°
Vertical field of view: 30°
Power supply: 20 – 30 V DC 20 W

CONTRACTOR
Philips Usfa BV, Meerenakkerweg 1, PO Box 218, 5600 MD Eindhoven, Netherlands.

Type UA 9124/9126 day/night periscope



4235.193
UA 9090 TANK THERMAL IMAGER

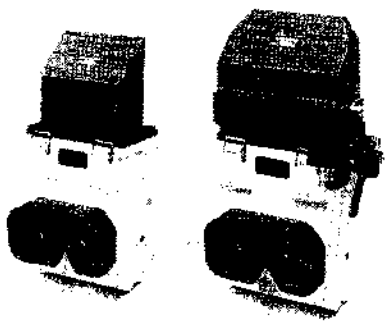
The UA 9090 tank sight is a thermal imaging system designed for target aiming and observation where a target-to-background temperature difference exists in the infra-red wavelength window between 8 and 12 microns. The thermal radiation received from the scene is converted into a CCIR video signal and is presented on video monitors. A controllable aiming mark is added to the video signal for aiming orientation during gun-laying. The system features a stabilised line-of-sight for mobile observation as a search mode. It is supplied ready to interface with a fire control computer and is fitted with BITE. An optional thermal pointer is available for use in a tracking mode. Positioning of the thermal sensor in a vehicle is not restricted by the location of the gunner's or commander's station.

CHARACTERISTICS
Field of view: 5° horizontal; 3° vertical
Spectral range: 8 – 12 microns
Effective object lens aperture: 125 mm
Focal length: 260 mm
Cooling system: Philips Usfa UA 7011 Stirling military mini-cooler
Time to reach camera operational status: 10 minutes
Range of elevation: +23 to −13°
Azimuth: +120 to −120°

STATUS
In production.

CONTRACTOR
Philips Usfa BV, Meerenakkerweg 1, PO Box 218, 5600 MD Eindhoven, Netherlands.

UA 9090 thermal sight and head



3430.193
UA 9630 SERIES UNIVERSAL PASSIVE PERISCOPE

The universal passive periscope has been designed to enable armoured vehicles to be driven at considerable speeds under starlight conditions. Although it has been optimised for driving under starlight conditions it can be employed at higher illumination levels up to daylight. This leads to uninterrupted operation and avoids disruption of the vehicle's sealing under severe conditions such as an NBC warfare environment. The image brightness can be adjusted to suit the user by means of a manually controlled iris-diaphragm. Automatic brightness control (ABC) has also been incorporated and the periscope is fitted with a device providing point highlight suppression, automatically reverting to normal use afterwards.

The periscope is of full binocular design and contains two NATO-standard tubes XX 1080 with a long operational life. The required input power is drawn from the vehicle's battery. Built-in electrical heating of the eyepieces can be switched on to prevent misting and condensation. The equipment meets the optical, mechanical and climatic requirements of the relevant military specifications.

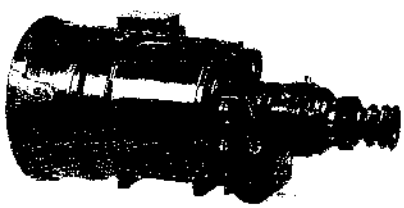
The periscope consists of a main instrument, type UA 1624, and an exchangeable top prism. Changing of the top prism does not affect the sealing of the main instrument. A range of top prisms is available facilitating the fitting of the periscope to all types of armoured vehicle. Among others, top prisms are available for main battle tanks such as Leopard, Centurion and M60 and armoured vehicles like M113, AIFV and Scorpion.

CHARACTERISTICS
Magnification: ×0·9
Horizontal field of view: 50°
Vertical field of view: 40°
Illumination range: 10^{-1} to 10^{4} lux
Range: 5 m – ∞
Tubes: Philips Type XX 1080
Power supply: 20 – 30 V DC
Weight of main instrument: Approx 6 kg
Weight of top prism: 1·5 – 6 kg depending on type

Type UA 9630 series universal periscopes, for Leopard (left) and M113 (right)

CONTRACTOR
Philips Usfa BV, Meerenakkerweg 1, PO Box 218, 5600 MD Eindhoven, Netherlands.

1800.193
TYPE HV7X200AT NIGHT SIGHT



This is a night observation device consisting of an image intensifier system for medium range forward-edge-of-battle surveillance or in a supplementary role as an aiming sight on crew-served weapons. No artificial illumination of any sort is needed. For general surveillance, the system is either tripod- or vehicle-mounted. The spectral sensitivity characteristics of the tubes employed permits detection of the presence of enemy near infra-red emitters.

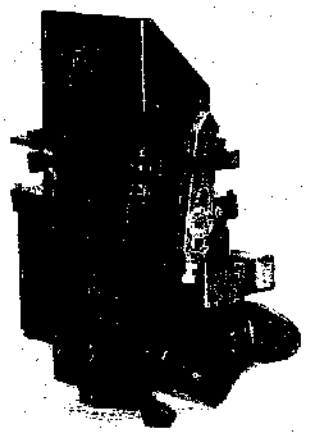
Entirely self-contained, the unit comprises a high-speed mirror objective, a three-stage fibre-coupled image intensifier assembly with power supply, an eyepiece system, and graticule projector with adjustable illumination. Monocular or binocular eyepieces are available. There is an automatic brightness control and a manual gain control.

CHARACTERISTICS
Magnification: ×7
Field of view: 7°
Focus: Adjustable 30 m – ∞
Length: 540 mm
Diameter: 260 mm
Weight: 12·8 kg

STATUS
In series production and used by several armies.

CONTRACTOR
Oldelft (NV Optische Industrie De Oude Delft), PO Box 72, 2600 MD Delft, Netherlands.

Type HV7X200AT night sight



1801.193
TYPE TP1MS NIGHT PERISCOPE

The TP1MS is a passive night periscope for combat vehicles. It is a small, binocular, wide angle, passive night vision image intensifier system for direct visual observation by the driver of the road and terrain in front of the vehicle under ambient night illumination conditions. The system will enable movement of combat vehicles at a speed of approximately 40 km/h under starlight conditions without the aid of artificial illumination, and with maximum security from detection.

The field of view of 55° in the horizontal plane gives the driver a clear view of the roadside.

The high-tension power packs are stabilised and will automatically protect the tube against high photo-cathode illumination, and automatically restore normal use afterwards.

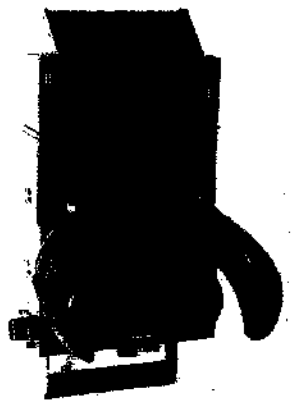
CHARACTERISTICS
Total magnification: ×1
Field of view: Horizontal 55°; vertical 40°
Centre resolution: Under starlight conditions 1 mlux, 2·5 mrad
Weight: Approx 7 kg
Number of tubes: 2
Tube type: Special diode, photocathode S25, phosphor screen P20
Power supply: 20 - 30 V DC
Entrance optics: Focal length 45 mm relative aperture 1:1·1. Fixed focus 15 m
Ocular system: Binocular and adjustable between +5 and -5 dioptres
Operating temperature range: -20 to +50° C
Storage temperature range: -30 to +60° C
STATUS
Series production.
CONTRACTOR
Oldelft (NV Optische Industrie De Oude Delft), PO Box 72, 2600 MD Delft, Netherlands.

Type TP1MS night periscope

4690.193
GS6MC CREW-SERVED WEAPON SIGHT

This passive weapon sight is based on a second generation image intensifier tube and is suitable for medium-range crew-served weapons, such as heavy machine guns, recoilless guns and anti-tank guns. The modular design allows the use of either a straight or rectangular eyepiece. Reticles can be fitted, matching the ballistics of the weapon concerned. Reticle illumination is adjustable to the scene brightness..

CHARACTERISTICS
Magnification: × 6·8
Field of view: 6·6°
Focus setting: 45 m ∞
Focal length: Entrance optics 150 mm; eye piece 21 mm
Dioptre setting: +5 to -5 dioptres
Tube type: Two-stage 18 mm fibre-glass coupled second generation hybrid
Weight: 3 kg
CONTRACTOR
Oldelft (NV Optische Industrie De Oude Delft), PO Box 72, 2600 MD Delft, Netherlands.

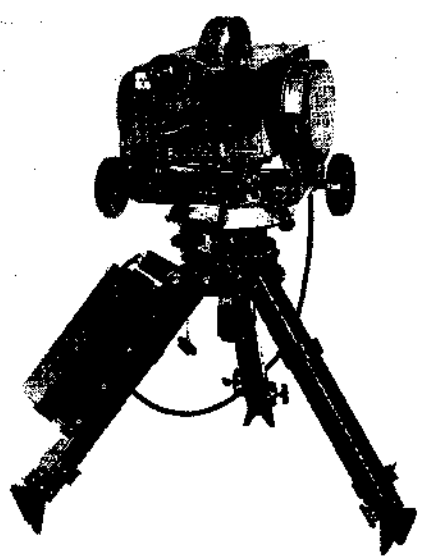


GS6MC crew-served weapon sight

4691.193
TP1MC NIGHT PERISCOPE

The passive driving periscope TP1MC is a small binocular wide-angle night viewing system for direct observation of the road and terrain in front of the vehicle. It consists of two independent viewing channels, each comprising one objective lens system, one second generation flash-protected image intensifier tube, one high voltage unit and an eye piece. The TP1MC can easily be adapted for use in a great variety of armoured combat and personnel carrying vehicles.

CHARACTERISTICS
Magnification: ×1
Field of view: 50° horizontal; 26° vertical
Centre resolution: 2·3 mrad at 3×10^{-2} lux; 3·2 mrad at 10^{-3} lux; 4·2 mrad at 10^{-4} lux
Focal length: 20 mm (approx)
Relative aperture: 1:1·1
Focus setting: Fixed 15 m
Dioptre setting: -3 to +3 dioptres
Tube type: Second generation 18 mm microchannel wafer with fibre-optic input and twisted fibre output window
Weight: 6 kg (approx)
CONTRACTOR
Oldelft (NV Optische Industrie De Oude Delft), PO Box 72, 2600 MD Delft, Netherlands.



TP1MC night periscope

NORWAY

1804.193
LP3 LASER RANGEFINDER

The SIMRAD LP3 laser rangefinder is a one-man portable, tripod-mounted combined sight and laser rangefinder. It enables range, bearing, and elevation data for targets to be rapidly acquired and used directly by weapons or fed into computerised artillery fire control systems. A quick-aiming sight is provided to permit rapid orientation towards targets appearing only briefly, such as shell bursts or gun flashes. A Q-switched neodymium-doped glass laser is used, providing a peak power of 1·5 MW. With a pulse length of 30 nanoseconds this amounts to an equivalent radiated energy of about 45 mJ. A range display shows the ranges to two targets on LED numeric indicators with a resolution of five metres and range discrimination of 30 metres.

CHARACTERISTICS
Transmitter
Laser: Q-switched Nd-doped glass
Wavelength: 1·064 μm
Power (peak): 1·5 MW
Pulse length: 30×10^{-9} s
Pulses per minute: 12 continuous; 30 intermittent
Beamwidth: (90% energy) 1 mrad
Receiver
Field of view: 1 mrad
Detector: Photodiode optimised for 1·06 μm
Effective aperture: 70 mm
Sensitivity: 0·5 A/W
Minimum/max range: 200/20 000 m
Resolution: 5 m
Range discrimination: 30 m
Minimum-range setting: 200 - 6000 m continuously adjustable
Sight
Magnification: ×7
Field of view: 7°
Effective aperture: 50 mm
Eye protection: Dichroic beamsplitter and absorption glass in eyepiece
Goniometer
Elevation: ±350 mil
Azimuth: 6400 mil
Resolution: 1 mil
Dimensions and weights
Rangefinder with goniometer: 260 × 280 × 260 mm; 7·9 kg
Battery pack: 65 × 85 × 230 mm; 1·5 kg
Tripod, folded: 370 × 140 mm diameter; 2·2 kg
Weight, total: 11·6 kg
Transit case: 350 × 350 × 350 mm; 7·8 kg

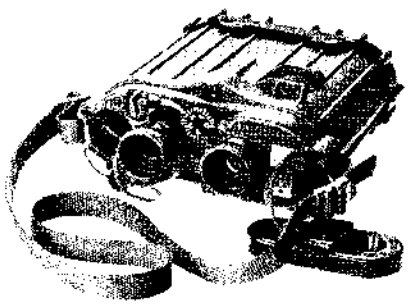
SIMRAD LP3 laser rangefinder

DEVELOPMENT
The SIMRAD LP3 laser rangefinder was developed for the Norwegian Army under government contract. The programme was supported by the Norwegian Defence Research Establishment.

STATUS
In production for the Norwegian Army and the forces of unspecified countries. It is also in production for the British Army, where it is known as the LP6, in this form being supplied without a tripod, goniometer, and battery.

CONTRACTOR
SIMRAD Optronics A/S, PO Box 6114, Etterstad, Oslo 6, Norway.

3155.193
LP7 LASER RANGEFINDER



Intended for use by infantry units in the close support role, the LP7 laser rangefinder weighs only 2·2 kg and is the same size as a standard 7 × 50 binocular. It can be either hand-held or mounted on a support and, when combined with a night observation device, can also be used for ranging at night.

Range is determined by laying the telescope reticle on to the target and pressing the fire button on top of the unit. Range is then immediately displayed in the eyepiece. Indication is given if echoes from more than one target have been detected and unwanted echoes may be gated out by a minimum range control. Indication is also given if one or more targets have been gated out.

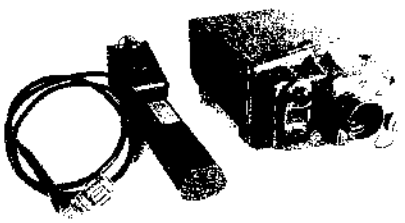
The transmitter is a miniaturised Q-switched Nd:YAG laser. The sighting telescope, with a performance comparable with that of a standard observation monocular, is combined with the optical receiver by a beam-splitting technique.

The receiver uses a silicon avalanche-photodiode giving a range capability up to 10 km with a resolution of 5 metres. The four-digit LED display is observed through the left eyepiece and superimposed on the picture seen in the right eyepiece. Display intensity may be adjusted by rotating the eyepiece housing. After three seconds the display is automatically switched off to preserve battery power. Indication is given if the voltage is too low.

Options are digital setting of minimum range, built-in test and data output from the range counter. A rugged lightweight tripod with angulation head is available. This unit provides azimuth and elevation readouts with a resolution of 5 mils.

SIMRAD LP7 laser rangefinder

CHARACTERISTICS
Dimensions: 215 × 202 × 93 mm
Weight: 2·2 kg (including battery)
Minimum/maximum range: 150 - 9995 m
Transmitter
Laser: Nd:YAG; 1·064 μm wavelength
Output energy: 5 mJ (nominal)
Repetition frequency: 12 pulses/m (30 intermittent)
Beamwidth: 2 mrad
Receiver
Field of view: 1·3 mrad
Aperture: 45 mm
Range resolution: 5 m
Minimum setting: 150 - 4000 m (continuously adjustable)
Telescope
Magnification: ×7
Field of view: 120 mils (nominal)
Aperture: 45 mils
STATUS
In production. In service with the Norwegian, Swedish and British armies, and the forces of a number of other countries. A contract from the New Zealand MoD, worth N. Kr. 6 million, was received in mid-1984.
CONTRACTOR
SIMRAD Optronics A/S, PO Box 6114, Etterstad, Oslo 6, Norway.



3579.193
LP8 LASER RANGEFINDER

The SIMRAD LP8 laser rangefinder is a very small lightweight unit primarily intended for mounting directly on weapons, night observation devices, theodolites and anti-tank weapon systems. The rangefinder contains all electronic and optical units required to enable the operator to lay the instrument on to a target, make measurements and read the range to the target from a digital display.

The transmitter is a miniaturised Q-switched Nd:YAG laser. The receiver uses an avalanche photodiode giving an operational range to typical targets of about 5 to 6 km when optical visibility is 10 km. Unwanted nearby echoes may be gated out from the display by a minimum range control on the operator's side of the instrument.

The range display shows range to the target to the nearest five metres. In addition there are two indicators to warn the operator either that more than one target has been detected or that one or more targets have been gated out.

The 7-segment LED display lights up when a range has been measured and switches off after three seconds. The rangefinder has been designed on modular principles to simplify repair and maintenance and is contained in a sturdy waterproof housing. Mechanical interfaces suitable for weapons, theodolites and night observation devices are available.

SIMRAD LP8 laser rangefinder (with battery and control unit)

CHARACTERISTICS
Transmitter
Laser type: Nd-YAG
Wavelength: 1·064 micron
Output energy: 5 mJ
Pulse width: 10 × 10⁻⁹ s
Pulse rate: 12/minute (30 intermittent)
Beamwidth: 1·5 mrad (90% energy)
Receiver
Field of view: 1·3 mrad
Detector: Avalanche diode
Aperture: 45 mm
Clock frequency: 29·97 MHz
Range resolution: 5 m
Display: 7-segment LED
Minimum/max range: 150/10 000 m
Telescope
Magnification: ×7
Field of view: Approx 120 mils
Aperture: 45 mm
Eye protection: Dichroic beamsplitter and absorption glass in eyepiece

LV5 LASER RANGEFINDER

The SIMRAD LV5 laser rangefinder is designed for external mounting on armoured fighting vehicles to improve their combat effectiveness by providing them with accurate range information for weapon aiming. The compact and low profile laser transmitter/receiver unit is mounted on the gun and accurately boresighted to it. The control/display unit is located inside the vehicle in a position where it may be seen and used by the gunner or commander; an LED range display shows the ranges to two targets with a resolution of 5 metres. An auxiliary output provides range information either to an external fire control computer or to an optional range display unit.

SIMRAD LV5 laser rangefinder outfit for AFV installation, showing (left to right) control/display unit, transmitter/receiver, and optional range display unit

CHARACTERISTICS
Transmitter
Laser: Nd-YAG
Wavelength: 1·064 micron
Pulse length: 10 × 10⁻⁹ s
Output energy: 10 mJ
Firing rate: 12 continuous; 30 intermittent pulses/minute
Beamwidth: 2 mrad
Receiver
Field of view: 1·3 mrad
Detector: Avalanche photodiode
Effective aperture: 45 mm
Minimum/max range: 150 m/10 000 m
Range resolution: 5 m
Range discrimination: 30 m
Minimum range setting: 150 - 400 m continuously variable
Sight
Magnification: ×7
Weight: 2·2 kg (transmitter/receiver); 2 kg (control unit)
STATUS
In production. Manufactured under licence in UK by Lasergage Ltd

4285.193
KN150 NIGHT OBSERVATION DEVICE

The KN150 hand-held passive night observation sight combines high performance with simple operation and low weight. Extensive tests show that tanks can be detected at ranges up to 1500 metres. Military applications include general surveillance, battlefield night observation and target location.

The use of binocular rather than monocular eyepieces minimises operator fatigue and makes it possible to maintain continuous surveillance for long periods. To ease handling, only two controls are fitted, an ON-switch and a twist grip focusing. Focusing range is from 25 metres to infinity. An electronic OFF-switch turns the instrument off after approximately one minute of action.

An automatic brightness control reduces the amplification of sudden bright lights. Normal operation is restored less than one second after a sudden light flash.

The KN150 incorporates a large aperture catadioptric lens and a second generation, high resolution microchannel image intensifier tube. Two standard 1·5V dry cells provide more than 40 hours of observation. The KN1150 can be combined with a Simrad laser rangefinder for night observation and localisation of targets.

CHARACTERISTICS
Magnification: × 8
Field of view: 8°
Maximum detection range: 500 m (target 2·3 × 2·3 m, contrast 30%, reflectivity 50%)
Illuminance level: 3×10^{-3} lux
Focusing range: 25 m – ∞
Resolution: 0·65 mrad (target contrast 30%)
Objective lens: Catadioptric, EFL/135 mm, F No/1·3, T No/1·9
Eyepiece exit pupil: Two; 9 mm
Dioptre setting: 1 dioptre (fixed)
Image intensifier tube: Second generation, microchannel tube with ×1·5 magnification
Weight: 2·6 kg

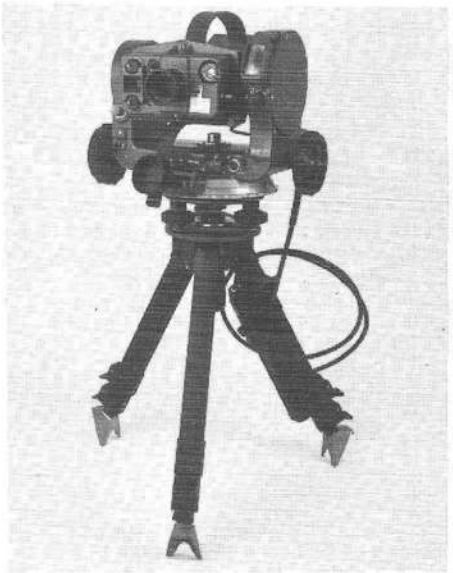
LP160 LASER RANGEFINDER



The LP160 lightweight, one-man portable laser rangefinder is for use by artillery and mortar forward observers. It measures range, azimuth and elevation angles to targets and may be used for fixing own position, target position and for adjustment of fire. Azimuth and elevation angles to the target are measured within 1 mil.

The transmitter is a miniaturised Q-switched Nd:YAG laser with an output energy of typically 10 mJoules. The receiver uses a silicon avalanche photodiode giving a range of up to 20 km. Unwanted echoes can be gated out from the display by a minimum range control which can be set at any range from 150 to 6000 metres.

The operator can select between measuring the range to the first target detected beyond the minimum range setting or the last target within the maximum range. The range display shows the range to the nearest 5 metres. In addition there are indicators to warn the operator if more than one target has been detected, one or more targets have been gated out, battery voltage is too low, laser output is too low or the receiver electronics have failed. Display time is limited to three seconds to save the batteries.

CHARACTERISTICS
Dimensions and weights
Rangefinder and goniometer: 270 × 240 × 230 mm; 5·8 kg
Battery and control unit: 45 × 80 × 220 mm; 0·5 kg
Tripod, folded: 370 × 140 (dia) mm; 1·6 kg
Minimum/max range: 150 – 20 000 m
Transmitter
Laser: Nd:YAG
Wavelength: 1·064 μm
Output energy: 10 mJ (nominal)
Pulse width: 8 ns
Pulse rate: 12 pulses/m (30 intermittent)
Beamwidth: 2 mrad (90% energy)
Receiver
Field of view: 1·3 mrad (nominal)
Aperture: 45 mm
Range resolution: 5 m
Discrimination between close targets: 50 m
Display: 5-digit LED
Telescope
Magnification: ×7
Field of view: 120 mils

LP160 laser rangefinder

4692.193
LP100 LASER RANGEFINDER

The LP100 is a miniaturised combined weapon sight and laser rangefinder for mounting on various types of anti-tank and other direct firing weapons. It replaces the traditional sights and provides instant target range and aiming information. A built-in ballistic computer, pre-programmed for the type of weapon and ammunition used, calculates the elevation angle and the time of flight for the projectile.

LP100 laser rangefinder mounted on a 88 mm Carl Gustav

The transmitter is a miniaturised Q-switched Nd:YAG laser with a nominal output energy of 3mJoules. The receiver uses an avalanche photodiode giving an operational range of up to 500 metres.

Unwanted nearby echoes may be gated out by a minimum range control which can be set to any range between 50 and 2000 metres. First/last target logic is also included.

The operation of the LP100 has been made as simple as possible with the number of controls reduced to a minimum. For ergonomic reasons the laser trigger button is mounted on the weapon. During operation of the rangefinder, all information is displayed in the sighting eyepiece. The range display shows the range to the target to the nearest five metres and there are other indicators to warn the operator if more than one target is detected, battery voltage is too low, start pulse is not present and no target is detected.

The reticle pattern can be designed to comply with various types of weapons and ammunition. Triggering the laser yields a range reading to the target. Simultaneously this range information is fed to the ballistic computer which controls an array of 36 LEDs along the vertical axis. The correct superelevation angle corresponding to this range is indicated by lighting up one of the diodes. This diode is then used for aiming when the weapon is fired. The ballistic computer also activates an indicator when the calculated time of flight for the projectile has elapsed. This information is used to estimate the lead angle applied when firing.

CHARACTERISTICS
Dimensions and weight: 75 × 105 × 240 mm; 1·2 kg
Minimum/maximum range: 50 to 5000 m
Transmitter: Nd:YAG
Wavelength: 1·064 μm
Output energy: 3 mJ (nominal)
Pulse rate: 12 pulses/m (30 intermittent)
Beam divergence: <2·0 mrad w/6x beam expander (90% energy)
Receiver
Field of view: 1 mrad
Aperture: 21 mm
Range resolution: 5 m
Telescope
Magnification: ×3
Field of view: 200 mils
Aperture: 21 mm
Reticle pattern: As required
Eye protection: Dichroic beamsplitter and absorption glass in eyepiece

STATUS
In production.

TC10 THERMAL IMAGER
The TC10 thermal imager is intended specifically for naval and coastal artillery use to provide high penetration of smoke, haze and camouflage. It is a passive system giving high resolution with a minimum resolvable temperature difference of 0·08°C for long-range detection and identification. Detection is independent of ambient light and the system operates by day and night. The thermal picture is displayed on a TV monitor.

The equipment consists of a thermal camera, signal processing unit and a TV monitor. In a typical shipborne application the thermal camera is mounted on a stabilised platform.
CHARACTERISTICS
Field of view: 1° horizontal, 3° vertical
Resolution: 0·22 mrad
Focusing range: 25 m – ∞
Detector: Cadmium Mercury Telluride
Spectral band: 8 - 12 μm
Detector cooling: Compressed gas
Mission time: 20 h with a 5 litre cooling bottle at 300 atmospheres
Weight: 8 kg (camera); 7·5 kg (signal processor)

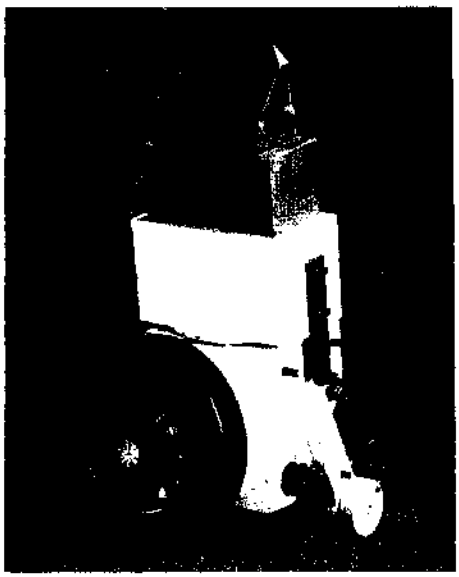
5704.193
E4020 MINIATURE COMBAT NIGHT SIGHT (MNV)
Equipped with an 18 mm second-generation image intensifier, the MNV night sight is optimised for small arms application in a variety of military operations.

The instrument has been evolved from extensive combat experience and features a fixed focus objective, and is instantly ready for aiming when switched on. The only adjustments required, prior to action, are boresight and eyepiece diopter setting.

Power supply is by means of two readily available penlight-type batteries. Boresight adjustment is incorporated in an integral quick-release type mounting bracket. Breech cover mounts for a variety of rifles are available.
CHARACTERISTICS
Length: 200 mm (excluding eyecup)
Magnification: ×2·6
Field of view: 16°
Entrance pupil: 40 mm
Exit pupil: 7 mm
Eye relief: 18 mm
Eyepiece adjustment: –4 to +4 diopters
Boresight range: 20 mils continuous, azimuth and elevation
Night vision range: 110 m – 8 line pairs 1·8 m at 30% contrast and reflectivity at 10^{-3} lux
Weight: 960g (without mount and batteries)
CONTRACTOR
Armscor, 224 Visagie Street, Pretoria, Republic of South Africa.

5705.193
E5010 LASER RANGEFINDER
The E5010 is a ruggedised laser rangefinder with up to 8 km ranging capability. Its low mass and small size make the instrument ideal for hand-held and support mounted ranging applications such as:
(1) fire control for mortars, artillery and armour
(2) target ranging for missiles and light anti-tank weapons
(3) air-to-ground ranging.



The design is based on a combined transmitter/receiver and sighting telescope optics. This ensures a compact and convenient-to-use instrument. Range is displayed instantaneously in the eyepiece on pressing the firing button with the telescope reticle laid on the target. A continuously adjustable minimum range gate is provided to gate out unwanted echoes. Multiple echo with range-to-first echo, and no-echo indications are also provided.
CHARACTERISTICS
Transmitter: Nd-YAG, beam divergence 0·7 mrad
Monocular sight: ×6 magnification, 6° field of view
Ocular adjustment: –4 to +4 diopters
Accuracy: ± 5 m
Minimum range adjustment: 200 – 3200 m continuous
Pulse energy: 8 mJ nominal
Dimensions: 125 × 160 × 70 mm nominal
Weight: 1·5 kg
CONTRACTOR
Armscor, 224 Visagie Street, Pretoria, Republic of South Africa.

5706.193
E2030 NIGHT DRIVERSCOPE
The E2030 passive night driverscope is a bi-ocular viewing wide-angle night periscope employing a second-generation image intensifier tube. The instrument enables vehicles to be driven by night at normal speed, without artificial lighting.

The special fixed focus bi-ocular eyepiece enables simultaneous viewing with both eyes to provide ease of observation and free head movement for instrument viewing. A fixed focus objective lens is used and adjustable gain setting of the image intensifier tube provides brightness control for high light levels.

The head prism is designed to be removed easily and fits into a standard NATO driver's day periscope mount, thereby making the periscope adaptable to a wide variety of armoured vehicles. A horizontal scanning mechanism provides manual scanning capability of 30° total in the horizontal plane. Instantaneous field of view is >40° in both horizontal and vertical planes.

CHARACTERISTICS
Magnification: ×0·92 ± 0·05
Field of view: > 40° horizontal and vertical
Horizontal scanning: ± 15°
Focus: Fixed 15 m
Periscopic height: 227 mm max
Exit pupil: >78 mm
Eye relief: 55 mm
Dioptre setting: –2 ±0·5 dioptres
Dimensions: 360 × 200 × 220 mm
Weight: 6·95 kg; 18 kg with case and accessories
CONTRACTOR

E2030 night driverscope

SPAIN

5707.193
ENOSA ELECTRO-OPTICAL SYSTEMS
A range of aiming sights and periscopes is manufactured by Empresa Nacional de Optica SA (ENOSA) of Madrid. These electro-optical instruments are intended primarily for the Spanish armed forces. In addition, as a result of a Franco-Spanish agreement, ENOSA manufactures the optical equipment for those AMX-30 tanks produced in Spain.

Brief details of the equipment range are as follows:
PP-01 Aiming Periscope
The PP-01 has been designed and developed to equip CETME TC-3 turrets mounted in armoured vehicles such as the BMR and M-113. It consists of a prism head and sight on a mounting stand. A reticle with cross-hairs in the display sight facilitates accurate aiming. Field of view is 43° horizontal and 11° vertical.

PP-02 Observation and Aiming Periscope
This sight consists of a prism head, binocular observation sight and a monocular telescope with a magnifying power of ×2 and ×6 respectively for land and air aiming. It has been designed for the BMR armoured vehicle turret but can be adapted to other automatic gun or machine-gun mounts.
M-92D Elbow Telescope
The M-92D is an optical aiming telescope for the CSR 106 mm gun. It has a ×3 magnifying power and can be used both by day and by night. Aiming by night can be carried out with illumination by either a dry battery or by photoluminiscence using tritium-phosphorus gas capsules.
106 mm Gun Night Aiming Sight
This is an elbow night sight using image intensifier techniques. Magnifying power is ×2·5 with a real field of view of 9·5°.

Grenade Night Aiming Sight
Designed for grenade launching at night, this image intensifier type sight is based on the 106 mm night aiming sight with broadly similar characteristics.
Grenade Launcher Sight
A standard optical sight for day and night use. Night illumination is provided by either a dry battery or by using tritium-phosphorus gas capsules.
AA 40/70 Bofors Gun Collimator Sight
A manually operated bi-ocular sight to cater for fire prediction against low-level aircraft attack.
Goniometric Aiming Devices
Goniometric aiming devices are available for 60, 81-105 and 120 mm mortars. They are based on a 'plumb-line' system whereby the aiming device, freely suspended from a tilted axle and on an assembly of high sensitivity balls, automatically and accurately guarantees the alignment in the vertical plane with the

mortar bore. The optical system is an elbow telescope, and reticle lighting is provided by means of a dry battery.

AMX-30E Tank Optics

As a result of agreements with a number of French companies, ENOSA manufactures the optical systems for the AMX-30E tanks being built in Spain. These systems include telescopes, rangefinders, periscopes and night driving equipment for aiming and observation under both day and night conditions.

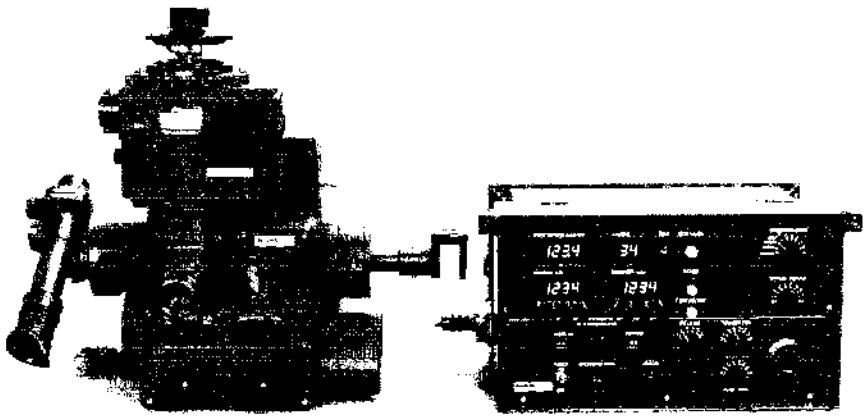
RIA GUNSIGHT

For modern guns and howitzers Philips Elektronikindustrier AB has developed an automatic electronic gunsight called RIA, which can be used both for indirect and direct firing. It has a very simple interface to the gun and can therefore easily be mounted on various types of guns.

RIA comprises the following main units:



Control and Display Unit: The panel has displays for presentation of firing data received from a fire control computer, knobs for different operating modes, and preset values. The unit also comprises electronics for necessary computations including compensation for tilt of the gun and servo-control circuitry for the sight.

Sighting Unit: This unit comprises a panoramic sight and an automatic levelling device. It includes a zero setting instrument for laying the gun in elevation, and also includes, as a reserve mode, mechanics and levelling bubbles for manual laying. The panoramic sight has a servo-driven setting of bearing.

Direct Sight: For laying the gun by direct firing.

The equipment receives firing data (bearing, elevation, fuze setting, and charge) from a fire control computer via a data link. Based on these data and the tilt of the gun, etc, RIA automatically calculates relative bearing and elevation.

In azimuth this information controls a servo-driven top-prism in the panoramic sight and thereby the line of sight. The reference for aiming in traverse can be sticks, plates, or a collimator. Gun laying in elevation is done with the aid of a zero-setting instrument. Setting in traverse and elevation can take place simultaneously.

RIA automatic gun sight for field artillery, and associated control and display unit

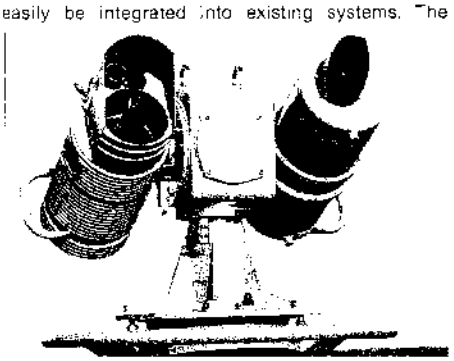
RIA has the following tactical functions:

(1) automatic reception of firing data
(2) presentation of firing data on the control and display unit
(3) settings of gun corrections in azimuth and elevation
(4) automatic computation of relative bearing and elevation, including automatic correction for the tilt of the gun
(5) automatic levelling of the sighting unit
(6) automatic control of the sight in azimuth including automatic setting of bearing
(7) reserve modes for use when the data transmission or the computation is out of order
(8) supervision of tactical and electrical functions by built-in test circuits.

STATUS

In service with the FH 77A in Sweden and the FH 77B gun in other countries.

CONTRACTOR



Philips Elektronikindustrier AB, 175 88 Järfälla, Sweden.

ERICSSON ANTI-AIRCRAFT LASER RANGEFINDER

The Ericsson high repetition rate anti-aircraft laser rangefinder is designed to be the ranging sensor in electro-optical fire control systems where the tracking is performed either automatically, by a TV or infra-red sensor, or manually. It can also be used in radar fire control systems to give range information under jamming conditions.

The laser rangefinder consists of a transceiver unit, a power module and a range counter, which can easily be integrated into existing systems. The transceiver unit contains the YAG-laser transmitter with its air-cooling system and the optical receiver.

Ericsson AA laser rangefinder (left) mounted on director with Saab-Scania TV camera

The YAG-transmitter of a high repetition rate laser rangefinder dissipates a considerable amount of heat and must be effectively cooled. The Ericsson anti-aircraft laser rangefinder uses forced air cooling, which is a simple and effective method. The transceiver unit is completely sealed. Via the fan, the air in the unit is circulated through the transmitter. The heated air is then cooled on the case by the cooling fins. This forced air cooling gives simplicity of construction, high reliability and easy maintenance.

CHARACTERISTICS

Range capability: 8-14 km depending on target size. Extinction value 50 dB

Coverage: 280-20 475 m (12-bit parallel form, TTL-level)

Accuracy: 4 m

Adjustable minimum range: 280 - 20 440 m (9-bit parallel form, TTL-level)

Range gate: Length 500 m (other values optional) or to the end of the range coverage

Transmitter

Laser: Nd-YAG

Wavelength: 1·06 μm

Beamwidth: 1·2 - 1·5 mrad

Repetition rate: 10 pulses/s

Receiver

Detector: Silicon avalanche diode

Area of optics: 80 cm²

Field of view: 1·5 mrad

Power

Supply: 3-phase 220/380V, 50 Hz

Max consumption: 250 VA during transmitting interval

Weights

Transceiver unit: 13 kg

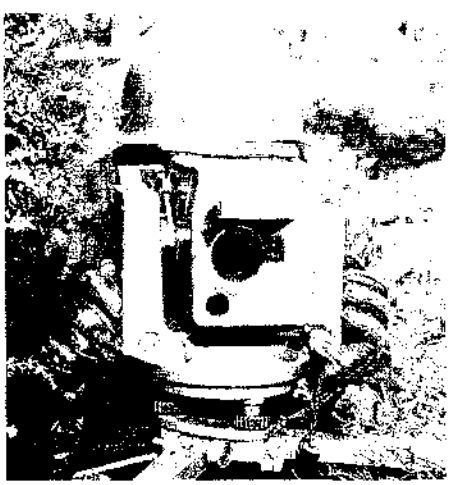
Power module and range counter: 12 kg

STATUS

In production. The Ericsson anti-aircraft laser rangefinder has been ordered by a large number of system manufacturers both in and outside Sweden. The total number of lasers ordered exceeds 300 systems.

CONTRACTOR

Ericsson Radio Systems AB, Defence and Space Systems Division, 431 26 Mölndal, Sweden.



3043.193

ERICSSON ARTILLERY LASER RANGEFINDER

The Ericsson artillery laser rangefinder is used by forward observers for range determination of stationary and mobile targets as well as ranging airbursts up to a distance of 5 to 6 km. The rangefinder, weighing less than 10 kg, consists of transceiver unit, goniometer, tripod and battery, and collapses easily for transport in a heavy duty glass-fibre container. The transceiver unit uses a neodymium-YAG transmitter enabling instant use and no limitation with respect to range measurement rate.

Manoeuvring controls are kept to a minimum in order to secure easy and rapid use which results in controls for three functions only:

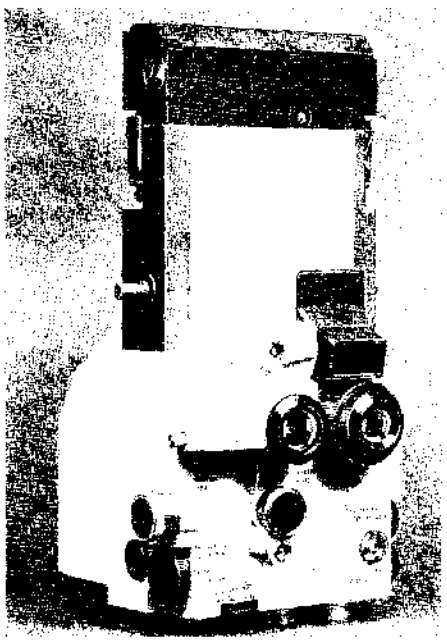
(1) trigger button
(2) a button to present blocking range in display and a dial for continuous adjustment of blocking range
(3) a dial for adjustment of reticle illumination

Ericsson artillery laser rangefinder

The rangefinder is equipped with two counters enabling two ranges to be measured simultaneously in the same line of sight. The goniometer is a precision instrument for measuring azimuth and elevation angles within an accuracy of one mrad.

STATUS
In production.
CONTRACTOR
Ericsson Radio Systems AB, Defence and Space Systems Division, 431 26 Mölndal, Sweden.

3044.193
INTEGRATED LASER FOR MAIN BATTLE TANKS



This integrated laser tank sight uses an advanced miniaturised neodymium YAG transmitter for maximum repetition rate and temperature independence. Boresighting of the laser to the gun bore is facilitated by the adjustable inner chassis of the laser sight. For operator's convenience the laser sight is equipped with a continuous blocking range. For night fighting purposes a mechanical filter, protecting the operator's eyes from light, is built in and is operated when the laser as well as the gun is triggered.

In addition to the normal eyepiece for gun firing, there is a large field of view sight for observation purposes. The laser rangefinder is designed to operate in co-operation with a ballistic computer. The result from the computer, the aiming mark, is presented in the gunner's sight as a red dot on the target (spot injection).

The laser trigger button is placed on the gunner's control handle.

The Ericsson laser rangefinder sight features:
(1) gunner's sight and laser rangefinder in one unit only
(2) spot injection for computer co-operation
(3) simple alignment of gunner's sight to the main gun of the vehicle
(4) easy and rapid installation in the vehicle.

STATUS
Initially developed for modernisation of the Centurion MBT, this sight is now in production and available for fitting in other tanks requiring updating. Orders have been received from two countries, one being Denmark for retrofit to Centurions.
CONTRACTOR
Ericsson Radio Systems AB, Defence and Space Systems Division, 431 26 Mölndal, Sweden.

Ericsson gunner's sight for main battle tanks, with integrated laser rangefinder and spot injection

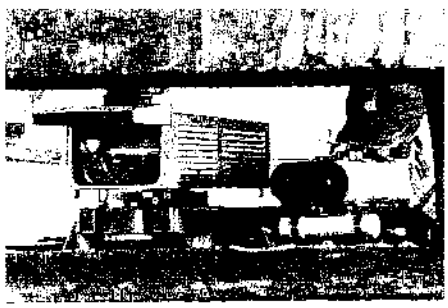
3836.093
ERICSSON LASER TRACKER

The Ericsson three-co-ordinate laser tracker has been designed for automatic target tracking and prediction. It is a neodymium-YAG type, with a wavelength of 1·06 microns, a beamwidth of 3 milliradians and a PRF of 25 Hz. It can be integrated into a wide variety of fire control systems (FCS), from relatively simple optical units to complex radar systems. The tracker is a further development of the anti-aircraft rangefinder (described in entry **3042.193**) and uses the same air-cooled transmitter and receiver range measuring circuits. It consists of three sub-units: transceiver, power supply and interface electronics. The interface is a communication link between the transceiver unit and the FCS.

The tracker simultaneously measures target range and angular offset in azimuth and elevation with high accuracy. The narrow beam and short wavelength of the tracker ensure that it is not affected by multipath effects.

STATUS
In development.
CONTRACTOR
Ericsson Radio Systems AB, Defence and Space Systems Division, 431 26 Mölndal, Sweden.



Ericsson laser tracker

3041.153
ERICSSON COAST ARTILLERY LASER RANGEFINDER

A successor to the UAL 10102 marine laser rangefinder (**1213.253** in 1979-80 and earlier editions), it is now in operational service with the Swedish and Norwegian naval forces. Few details concerning the system have been revealed apart from the following brief description.

The laser rangefinder consists of three units: the transceiver unit, the display unit, and the trigger pedal. The transceiver uses a high PRF neodymium-YAG air-cooled laser transmitter to permit rapid fall-of-shot measurements. The display unit, in addition to the main range display, has a memory display to assist in correction of gun fire. This coast laser rangefinder is designed to interface both electrically and mechanically with the UAL 10102.

STATUS
In production.

ERICSSON THERMAL IMAGER

This is a family of thermal imaging systems which is based on a number of common modules, and is suitable for use in a variety of land, sea and air applications for surveillance purposes, or can be integrated into fire control systems. The sensor can be equipped with one or two fields-of-view and has electronic magnification. A reticle is electronically generated in the image which is presented on a TV monitor. External synchronisation provides for direct picture changing on a monitor between the imager and other sensors.

The imager uses local, dynamic compression techniques which enhance details of the observed scene so that small objects are not lost against complex background variations. This enables early detection of targets. The system is TV compatible and can be easily integrated with a TV tracker.

CHARACTERISTICS
Spectral bandwidth: 8 - 12 μm
Total field of view: 4° × 2·6° (2° × 1·3° with electronic magnification)
Instantaneous field-of-view: 0·15 × 0·15 mrad
Detector: 8-element Sprite
Cooling: Stirling mini-cooler
Dimensions: 550 × 360 × 220 mm
Weight: 30 kg

STATUS
In production. The Swedish armed forces have ordered systems based on these sub-units for the RBS 70M air defence system, the army helicopter sight system (Helitow) and the naval fire control system Arte 726. The last named, known as the UAM 11103, is a complete all-in-one imaging system for detection and tracking.

SAAB IRS-700 IR SURVEILLANCE EQUIPMENT

The Saab IRS-700 is a passive infra-red surveillance equipment developed principally for anti-aircraft defence applications, although also suitable for other roles where an alternative to radar is required. Features emphasised by the manufacturers include passive operation, resistance to jamming, lightweight and small dimensions, high accuracy in bearing and elevation, and lower cost than comparable radar equipment. The sensor head and display/control unit can be separated by up to 1000 m. The main characteristics are tabulated below. No other technical details have been released.

CHARACTERISTICS
Elevation scan: 27° within -5 and +45°
Azimuth scan: 360°
Rotation rate: 30 rpm
Wavelength: 8 – 13 micron
Weight: Approx 65 kg (sensor head)

STATUS
Prototype developed under a contract from the Swedish Defence Materiel Administration.
CONTRACTOR

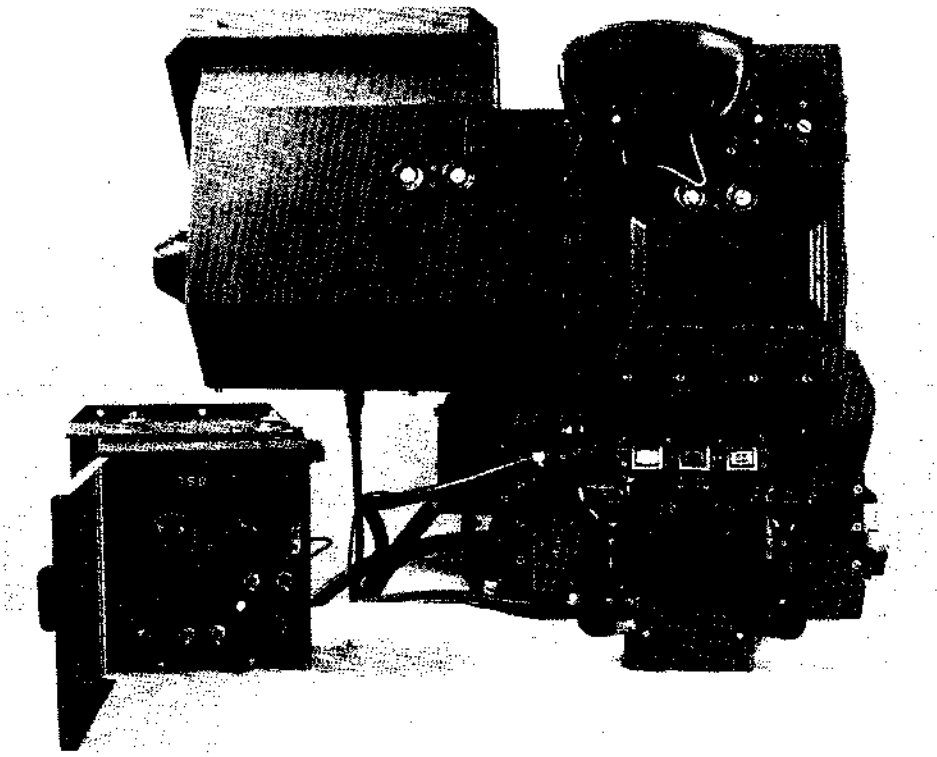
3813.093
TYPE L AA LASER SIGHT



The Bofors Aerotronics Type L AA fire control system is a day/night laser system, and is designed to be used for anti-aircraft applications. The system can be mounted on a separate tripod or on the gun platform. It can also be mounted on a vehicle or a ship.

The system can be operated at the platform (or the tripod) or be remote controlled by using an optional TV-transmission of the image. The fire control system is based on the principle of the independent line of sight. All optical channels use a common first mirror, which is servo-controlled in order to make the line of sight independent of gun or platform movements. The sight comprises a day sight and a night vision channel using an image intensifier tube.

The sight also incorporates laser transmitter and receiver channels. There is an optical exit where a standard TV camera can be attached. This interface enables the camera to transmit the day image or the image on the phosphorous screen of the image intensifier tube.

The stabilisation system is of a modular type. For measurement of the angular velocities there are two gyros on the platform and one gyro on the sub-platform.

CHARACTERISTICS
Day sight
Magnification: ×4 or ×10
Field of view: 15 or 6°
Exit pupil: 6 mm
Night sight
Objective diameter: 160 mm
Magnification: ×7
Field of view: 5°

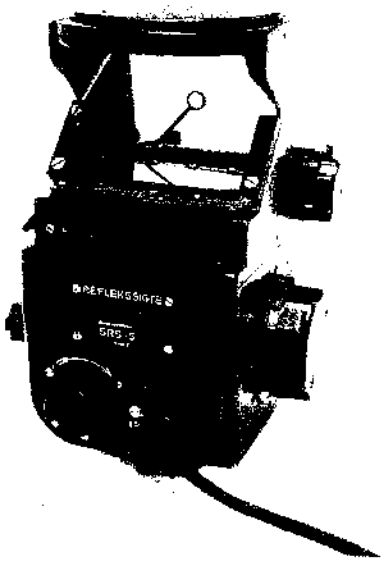
PKD-8/KOL-2 SIGHTING SYSTEM FOR ARTILLERY

PKD-8/KOL-2 is an optical sighting system designed to increase the mobility of field artillery by reducing the deployment time for indirect fire. The system combines a PKD-8 panoramic sight on the gun with an indpendent optical collimator (KOL-2) which provides the fixed reference needed for initial alignment and subsequent indirect firing.

The PKD-8 sight is a monocular panoramic instrument for use with either the KOL-2 collimator or conventional aiming references such as pre-surveyed posts or stakes. It has been designed for mounting on the elevation sighting equipment of new guns or retrofitting to existing weapons. Engraved glass scales operated through worm-screws, spring-loaded to eliminate backlash, ensure long-term accuracy.



The KOL-2 is a collimator used in combination with the PKD-8, or other traverse sights, and provides the aiming reference necessary for the initial alignment procedure. The instrument has a built-in traverse scale to allow its use for this purpose and also to allow the gun to be positioned anywhere in a 360° arc around the collimator to simplify deployment. A reticle designed as a symbol plate corresponding to the reticle of the PKD-8 sight is in the objective system of the collimator and is used in the alignment procedure. When the two instruments are used together, the same symbols are seen in the two reticles.

STATUS
In series production.

SRS-5 REFLECTING SIGHT
The SRS-5 instrument is an all-purpose reflecting sight for use with automatic guns against air and surface targets and can be used with both land based and naval anti-aircraft guns. The field of view is 600 mils in azimuth and 300 mils in elevation. A large objective diameter optical system of 96 mm allows the operator to use both eyes for observation. The reticle is projected directly on to the target and is free from parallax.
STATUS
In series production.

WILD HEERBRUGG ELECTRO-OPTICAL SYSTEMS
The Wild Heerbrugg organisation, which includes Ernst Leitz Wetzlar of Germany, manufactures a wide range of electro-optical defence orientated equipment. This includes instruments for survey and mapping, boresight and night vision equipment, data based computer systems for survey, gyro equipment for orientation and fixing when deploying missiles, guns, radars, etc, and the design and manufacture of special optical systems and sub-systems. Much of this equipment has been developed for civil applications but brief descriptions are given below of those instruments with specific military applications.

Aiming telescopes
The ZFM1 is a compact aiming telescope, which can be used for mortars, etc, with an erect image, field of view of 170 mils and a ×1·8 magnification. The ZFR2 is more suited for anti-tank type weapons, with an adjustable tritium illumination, ×2·5 magnification and field of view of 200 mils. The ZFK2 is a more sophisticated version with sighting curves according to ballistics. Field-of-view (FOV) is 200 mils with a magnification of ×2·3.

BIG2 night vision goggles
These goggles have high power optics and a second generation image intensifier tube. Weight is only 0·5 kg which includes the face mask and harness. A built-in IR source for short distances can be switched on if required.

Big3 night binoculars
These are ×3 magnification night binoculars using a second generation image intensifier tube. They are compact and lightweight, with a 13·7° FOV and can be used in a variety of applications.

Big21 low-light intensifier
Big 21 is a version of the Big2 goggles configured in a diving mask for use by underwater forces. Magnification is ×0·98 with an underwater FOV of 31°=1°.

BIF2 image intensifier telescopes
A range of telescopes for military and civil use. They have a variety of magnification and FOV factors and can be fitted to weapons and measuring instruments.

NAP5 night-driving periscope
A night periscope for use in armoured vehicles employing a second generation image intensifier tube. Magnification is ×0·9 with a FOV of 40° horizontal and 30° vertical.

GB6 binocular goniometer
A wide-angle direct reading measuring binocular instrument for use by military units. The GB6P version is equipped with a periscope for use in trenches, fox-holes, etc.

SG4 goniometer
A rugged tripod-mounted goniometer for use at ranges up to 20 km. It can be fitted with night vision equipment.

SPE2 trench periscope
A lightweight hand-held or mini-tripod periscope for use in forward observation and surveillance. Magnification is ×5 with a FOV of 170 mils.

SZR/SKS muzzle boresight
This consists of a telescope with an inclined eyepiece and a built-in reticle which projects the bore centreline on the target. Magnification is ×6 with a FOV of 85 mils.

FH 155-1 sighting device
This is a sighting device developed by Leitz to improve the fire performance of howitzers. It combines precise optics and mechanics with digital electronics. The FH-155-1 is in large scale production.

Tank sights and rangefinders
Leitz has developed a number of these equipments, including the FERO Z18 auxiliary telescope sight for the gunner in the Leopard 2 tank. All earlier Marder troop carriers and reconnaissance tanks were fitted with Leitz sighting periscopes for the guns. The company also developed a passive rangefinder for the Leopard 2.

UNION OF SOVIET SOCIALIST REPUBLICS

3437.193
SOVIET SIGHTS - NOTE
The Soviet Union has developed and deployed a wide range of night vision equipment for all types of equipment ranging from rifles, machine guns, anti-tank launchers, anti-tank guns to armoured vehicles. Most of this equipment is of the infra-red active type, although the APN-2 and NSP-2 can be used both actively and passively. Night vision equipment on the T-62 MBT includes an infra-red searchlight to the right of the main armament (maximum range 800 m), infra-red spotlight on the commander's cupola (maximum range 200 m), and an infra-red driving light for the driver (maximum range 60 m). It is thought that the T-64 (or T-72) MBT (**5112.102** in 1978 and earlier editions) is provided with passive night vision equipment. The USSR places great emphasis on night actions and spends between 30 and 40 per cent of exercise time on night training. Brief notes on specific types follow:

APN-2
This is mounted on anti-tank guns and has a maximum range of 900 m; it can be used both actively and passively.

APN-3
This infra-red sight is mounted on anti-tank guns and has a maximum range of 2000 m.

APN-57
This infra-red sight is mounted on anti-tank guns and has a maximum range of 700 m.

NSP-2
This is mounted on weapons such as the AK-47 assault rifle and the RPG-2 anti-tank weapon; it can be used either actively or passively.

PPN-1
This infra-red sight is mounted on machine guns and has a maximum range of 300 m.

PPN-2
This infra-red sight is mounted on machine guns and has a maximum range of 500 m.

TVN-1
This is an infra-red driving aid and is mounted on the glacis plate of MBTs such as the T-55. The driver is provided with a monocular observation piece.

TVN-2
This is an infra-red driving aid and is mounted on the glacis plate of MBTs such as the T-55. The driver is provided with a bi-ocular observation piece.

Infra-red Detection Equipment
The 7·62 mm SVD semi-automatic sniper's rifle and some field binoculars are provided with an infra-red detection system.

Artillery Laser Rangefinders
Soviet artillery has been using both tripod- and vehicle-mounted laser rangefinders for a number of years. The DAK-1 is one such system. It is a battery-powered unit with a maximum range of 20 km. Its practical range is about 10 km. Approximate dimensions are 600 mm long × 300 mm wide × 30 mm deep. It is normally tripod-mounted.

UNITED KINGDOM

4784.193
AV 62 COMMANDERS SIGHT

The AV 62 is a surveillance sight designed for fitment to lightweight cupolas in light armoured vehicles such as the Spartan and Striker. It is a daylight viewing monocular instrument with provision for a separate periscopic viewer for daytime which can be easily and rapidly replaced with an image intensifier device for night surveillance. The main day sight provides ×1 biocular vision and, optionally, by means of a switch, ×10 magnification through the left monocular. A night vision channel, Type L7A1 is a second generation modular unit designed specifically for use with the AV 62. It provides a ×1 magnification through a monocular eyepiece or, alternatively, through a biocular magnifier.

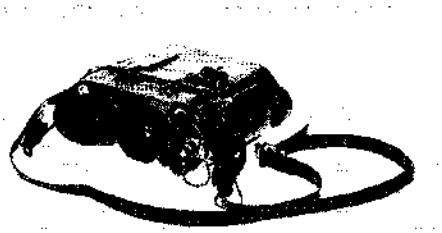
Avimo Limited, Rowbarton, Taunton, Somerset TA2 6HH, England.



4105.193
LH80 HAND-HELD LASER RANGEFINDER

The LH80 hand-held laser rangefinder is a military instrument, completely self-contained in a sturdy waterproof housing and built into the shape of a conventional binocular. Its ergonomic configuration and easily accessible controls allow unrestricted use even by operators with heavily gloved hands. It can range to targets from 150 to 9995 m with a resolution of 5 m. The maximum range is dependent on target size and shape as well as weather conditions. For a vehicle target, ranging can be obtained out to 5 to 6 km. Ranges out to 10 km are possible on large targets (eg buildings). To maintain this performance in all climatic conditions the rangefinder is desiccated, filled with dry nitrogen and fully sealed.

The target is viewed through the right hand ocular via the combined sighting and receiver telescope. This arrangement guarantees that the target seen by the operator is also imaged on to the detector. All lenses and prisms are manufactured to ensure undistorted viewing with excellent definition, and are anti-reflection coated throughout for maximum light transmission. The optical design incorporates the principle of fixed focus to ensure instant viewing capability and optimum surveillance at all normal ranges through extreme atmospheric conditions. A large exit pupil diameter, providing maximum light gathering qualities, greatly improves vision under low light conditions, while a long eye relief permits full use by observers wearing spectacles, goggles or a respirator. User protection is provided by the incorporation of a laser filter between the graticule and eyepiece. The graticule is illuminated by 'Betalight' for night use.

The transmitter is a miniaturised dye Q-switched neodymium-YAG laser of simple and reliable construction. It has been designed for single shot or low repetition rate operation and requires no special cooling. One short and very intense pulse of infra-red energy is generated for each range measurement. The receiver comprises a silicon avalanche photodiode optimised for the operational wavelength, and hybrid thick film circuitry which includes a programmed gain amplifier to accommodate the wide dynamic range of returned pulses. In addition, the circuitry includes filtering to prevent the registration of reflections from smoke and dust.

Range information is given to the observer to an accuracy of 5 m, by a four-digit light emitting diode (LED) array displayed in the left hand ocular. When viewed this display appears superimposed in the field of view of the sighting telescope.

Hand-held laser rangefinder

CHARACTERISTICS

Laser type: Dye Q-switched Nd-YAG
Wavelength: 1·064 microns
Output energy: Nominally 6 mJ
Pulse width: Approx 7×10^{-9} s
Beamwidth: 1·5 mrad (90% energy)
Pulse rate: 12/minute
Receiver field of view: 1·6 mrad
Effective aperture: 42 mm
Type of detector: Silicon avalanche diode
Range accuracy: ±5 m
Range discrimination: 30 m
Range presentation: 4-digit LED display
Minimum/max range: 150/9995 m
Minimum range setting: 150 – 3000 m
Magnification: ×7
Field of view: 7°
Effective aperture: 42 mm
Eyepiece: Fixed focus
Eye relief: 23 mm
Eye protection: Dichroic beam splitter and absorption glass on reticle
Interocular distance: 65 mm
Length: 180 mm
Width: 190 mm
Height: 85 mm
Weight: 2·2 kg (inc battery)

3091.193
LP3 LASER RANGEFINDER

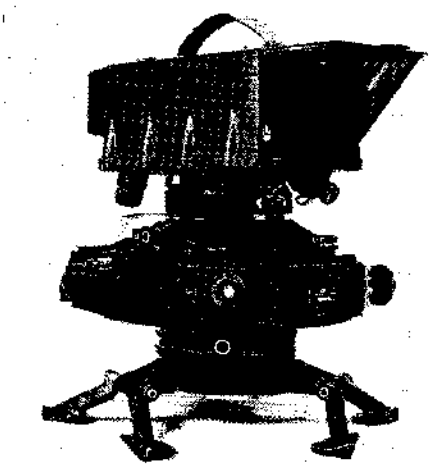
The LP3 laser rangefinder is a lightweight, man-portable instrument designed for use by artillery forward observers to obtain instantaneous measurements of range, azimuth, and elevation angles to targets. It can range at targets from 200 to 20 000 m with a resolution of 5 m. Azimuth and elevation angles can be determined to an accuracy of one mil.

The equipment consists of a laser transmitter and receiver system which are mounted as a unit with the associated control and counting circuits, and sighting telescope on a goniometer mounting which is supported in use by a tripod. The necessary battery power supply pack is carried on one of the tripod legs.

CHARACTERISTICS

Transmitter
Type: Q-switched Nd-doped glass laser
Wavelength: 1·06 microns
Peak power: 1·5 MW; 45 mJ
Pulse rate: 12/minute (continuous); 30/minute (intermittent)
Beamwidth (90% energy): 1 mrad
Receiver
Field of view: 1 mrad
Detector: PIN diode
Effective aperture: 70 mm
Range: 200 – 20 000 m
Resolution: 5 m
Range discrimination: 30 m
Range presentation: Numeric (LED) displays
Multiple target presentation: 2 ranges displayed
Time variable gain: Included
Optical
Magnification: ×7
Field of view: 7°
Effective aperture: 50 mm
Eye protection: Dichroic beamsplitter plus absorption glass
Quick aiming sight: Included
Total weight: 19·4 kg (with case)

CONTRACTOR



Avimo Limited, Rowbarton, Taunton, Somerset TA2 6HH, England.

4103.193
LP6 LASER RANGEFINDER

The LP6 laser rangefinder can be used for the rapid and accurate determination of target range by forward observers. It has been designed to interface with a variety of tripods, angulation heads and night observation devices. The LP6, used in conjunction with these devices, may be used to determine observer and target positions and to provide data for adjustment of fire even under low light conditions. It can also interface with existing field artillery computing systems. Target ranges can be measured from 200 to 20 000 m with a resolution of ±5 m.

CHARACTERISTICS

Operating temperature: -40 to +55° C
Magnification: ×7
Field of view: 6·5°
Effective aperture: 50 mm
Eye protection: Dichroic beamsplitter and absorption glass in eyepiece
Quick aiming sight: Included
Transmitter
Laser: Q-switched (rotary prism) Nd-doped glass
Wavelength: 1·06 microns
Radiant power: 1·5 MW
Pulse length (half width): 30×10^{-9} s, nominal
Quantity of radiant energy: 45 mJ
Pump energy (electrical): 15 J
Pulse rate: 12/minute continuous; 30/minute intermittent
Beamwidth (90% energy): 1 mrad
Receiver
Field of view: 1 mrad
Type of detector: PIN photodiode
Effective aperture: 70 mm
Clock frequency of counter: 29 973 MHz
Minimum/max range: 200/20 000 m (determined by range counter)
Resolution: ±5 m
Range discrimination: 30 m
Minimum range setting: 200 – 6000 m continuously
Range presentation: LED displays
Power supply: 24 V Ni-Cd battery
Overall depth: 230 mm
Overall height: 170 mm
Overall width: 120 mm
Weight (total): 15·3 kg (including transit case)

LV2 LASER RANGEFINDER

The Avimo-designed LV2 laser rangefinder is fully interchangeable with the existing Centurion tank gunner's sight and can therefore be readily fitted without modification to this range of armoured vehicle. The instrument is fitted with dual magnification to facilitate target acquisition and gun aiming, in addition to the integrated rangefinder capability. It is a completely self-contained unit, and among the design features of the LV2 are the following:

(1) time variable gain regulator to avoid false registration of unwanted natural phenomena
(2) inbuilt eye protection for the user
(3) remote display facility for use by the tank commander
(4) laser transmitter malfunction, and minimum range setting indicators
(5) additional targets other than first and second echoes indicator.

CHARACTERISTICS
Transmitter
Type: Q-switched Nd-doped glass laser
Wavelength: 1·06 microns
Peak power: 1·5 MW; 45 mJ
Pulse rate: 12/minute (continuous); 30/minute (intermittent)
Exit pupil diameter: 10 mm
Receiver
Field of view: 1 mrad
Detector: PIN diode
Effective aperture: 40 mm
Range: 200 - 20 000 m
Range accuracy: ±5 m up to max range
Range discrimination: 30 m
Range presentation: Numeric (LED) displays
Multiple target presentation: 2 ranges displayed
Time variable gain: Included
Optical
Magnification: ×8 and ×1·6
Field of view: 9° (×8), 45° (×1·6)
Exit pupil diameter: 5 mm
Total weight: 10·2 kg

3756.193
LV3 LASER RANGEFINDER

This is a laser rangefinder developed to meet Army requirements for a unit capable of being mounted externally on AFVs. A boresight is built into the LV3 to facilitate accurate boresighting to the carrier vehicle's armament. The control box and display unit is sited in a convenient position for use by the commander or gunner. Ranges on targets between 200 and 20 000 m can be measured with a resolution of 5 m. A continuously variable minimum range gate operative between 200 and 3000 m is incorporated. An additional display can be provided to give the commander and gunner individual information.

CHARACTERISTICS
Transmitter
Laser: Nd-glass
Wavelength: 1·06 micron
Output: 1·5 MW nominal
Pulse length: 30×10^{-9} s nominal
Pulses per minute: 12 continuous, 30 intermittent
Beamwidth (90% energy): 1 mrad
Receiver
Field of view: 0·7 mrad
Detector: PIN diode
Effective aperture: 70 mm
Sensitivity: 120 nW
Clock frequency: 29·973 MHz
Range discrimination: 30 m
Sight
Magnification: ×7
Field of view: 7°
Dimensions: 290 × 180 × 140 mm
Weight: 10 kg
Operating temperature range: -40 to +55° C

LV10 LASER RANGEFINDER

The Avimo LV10 is an integrated laser rangefinder/gunner's sight which has been designed and developed to provide full interchangeability with the existing gunner's sight on the Scorpion tank without modification to the vehicle. The instrument is capable of measuring the ranges of two targets simultaneously, provided they are both within the laser beam. The distances are displayed instantly in the eyepiece, and ranges can be measured from 200 to 10 000 m with an accuracy of ±5 m over the entire range. A minimum range gate is incorporated, continuously adjustable between 200 and 3000 m.

CHARACTERISTICS
Transmitter
Laser: Nd-glass
Wavelength: 1·06 micron
Power output: 1·5 MW
Pulse length: 30×10^{-9} s
Repetition rate: 12 continuous, 30 intermittent pulses/minute
Beamwidth: 1 mrad
Receiver
Detector: Avalanche photodiode
Field of view: 1 mrad
Effective aperture: 39 mm
Clock frequency: 29·973 MHz

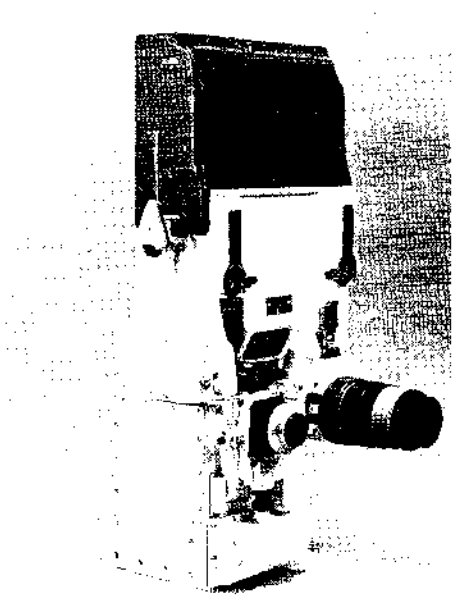
3759.193
LV15 LASER RANGEFINDER

The Avimo LV15 is a combined day and night sighting periscope with an integrated laser rangefinding facility. Although initially designed as a direct replacement for M32 periscopes on M48 and M60 tanks it can be readily fitted to a wide range of other AFVs with the minimum of vehicle modification. It provides both visual readouts and ballistic computer data outputs to interface with any desired level of fire control sophistication ranging from manual superelevation of the gun to a fully computerised fire control system. The sight may be additionally supplied with a spot injection unit (SIU) which provides an illuminated aiming mark when used in conjunction with a fire control computer. The complete instrument is suitable for interfacing with any type of fire control computer system.



The LV15 is a monocular-type instrument comprising three independent modules: a head assembly, a daylight elbow/laser rangefinder assembly and a second-generation passive night vision elbow assembly. These are so designed that the laser rangefinder may be used with either the daylight elbow or the night vision system. A remote control box provides all the necessary controls and readouts required to operate the laser rangefinder with the exception of the laser aiming marks which are contained in the relevant sighting elbows. Facilities can be provided for the injection of a moving aiming mark in the daylight elbow when the sight is used in conjunction with a fire control computer.

The head assembly contains a pivoting mirror, common to both sighting systems, which is driven by a mechanical linkage from the gun mounting via a drive mechanism. A unit power optical system provides the operator with a general observation facility.

The daylight elbow and laser rangefinder is a triaxial optical system to enable the visible light, laser transmitter and laser receiver to use the same basic optical path. Laser light is separated from the visual by means of dichroic beam splitters and absorption filters at the relevant points. A laser aiming mark and ballistic graticule are displayed in the eyepiece. Both of these may be illuminated for use in low light-level conditions.

The laser is capable of simultaneously measuring two separate ranges provided that the objects are in the line of the laser beam identified by the laser aiming mark. Ranges are displayed on a separate control box within the vehicle and may be duplicated on a remote range readout. Target ranges from 200 to 10 000 m can be measured with an accuracy of ±5 m. Graticules can be supplied with any ballistic pattern.

The night vision elbow incorporates a 25 mm image

LV15 laser rangefinder combined day/night periscope sight

intensifier tube which amplifies available light (such as moonlight or starlight) and provides the operator with a night fighting capability undetectable by enemy forces. The graticule is illuminated by a light emitting diode which permits a boresighting check at twilight and provides excellent brightness control at all light levels. The separate boresighting controls allow the night vision elbow to be adjusted to coincide with the daylight elbow thus enabling the laser rangefinder to be used in conjunction with the night sight

CHARACTERISTICS

Depth: 340 mm
Height: 632 mm
Width: 330 mm
Weight: 28 kg
Power supply: 24 V DC (vehicle supply)
Sight head elevation: 18° depression, 22° elevation
Magnification: ×1

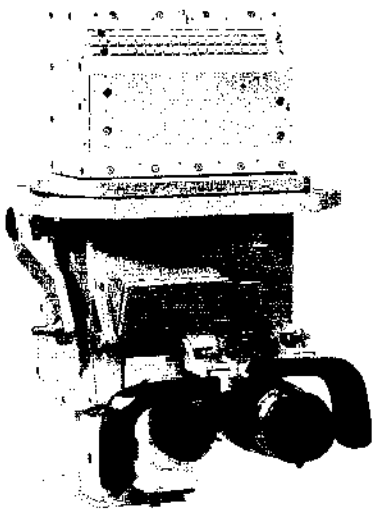
NVL53 DAY/NIGHT SIGHT AND RANGEFINDER

The NVL53 is a combined day and night sighting periscope with an integrated laser rangefinder facility. It is derived from the M32E1 periscope (**4155.193**) used on M48 and M60 battle tanks but is a more compact system suited for light armoured vehicles while still being capable of fitment to larger fighting vehicles. The NVL53 can be installed in both the gunner's and commander's positions, although the commander's sight normally has a daylight elbow fitted in place of the laser rangefinder and is designated NV53.



The instrument provides both visual readout and ballistic computer data outputs to interface with any desired level of fire control ranging from manual super-elevation of the gun to a fully computerised fire control system. The sight may additionally be supplied with a spot injection unit which provides an illuminated aiming mark when used in conjunction with a fire control computer.

The NVL53 is a monocular type instrument comprising three independent modules; a head assembly, a daylight elbow/laser rangefinder assembly and a passive night vision elbow assembly which incorporates a second-generation image intensifier tube. The laser rangefinder may be used with either the daylight elbow or the night vision system.

The daylight elbow and laser rangefinder is a triaxial optical system to enable visible light, laser transmitter and laser receiver to use the same basic optical path. Laser light is separated from visual by dichroic beam splitters and absorption filters. A four-digit LED display is projected into the sighting eyepiece and may be duplicated on a remote range readout. Target ranges from 200 up to 9995 m can be measured with a resolution of 5 m.

CHARACTERISTICS

Head assembly

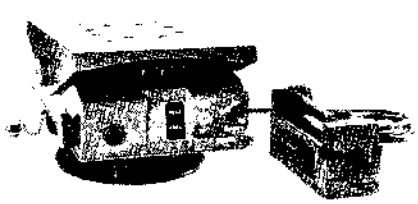
TL10-T ARTICULATED TELESCOPE LASER RANGEFINDER

The TL10-T laser rangefinder, when integrated into the 'T' series gunner's articulated telescope provides a compact neodymium-YAG laser ranging facility. It replaces the forward objective lens assembly on the existing telescope, thus providing accurate range measurement from under armour without mechanical modification to the vehicle.

The laser assembly incorporates an aiming mark injection facility to enable integration with a computerised fire control system. Range and aiming mark data are displayed in the secondary eyepiece assembly also provided. The basic operating controls are located on a remote panel assembly mounted on the body of the telescope adjacent to the eyepiece. The modified gunner's articulated telescope can then be directly installed in the 'T' series vehicles.

CONTRACTOR

Avimo Limited, Rowbarton, Taunton, Somerset TA2 6HH, England.



TL10-T laser rangefinder

4104.193
DIGITAL GONIOMETER

The Avimo digital goniometer may be used independently or as part of a system with a tripod, battery pack, laser rangefinder or other observation device. Typical functions include various survey tasks, such as those associated with artillery or rocket batteries, and a variety of other tasks such as target indication.

Initial levelling can be accomplished by means of three levelling screws and a bubble, after which switching the unit on puts it in the angle measuring mode. Normally at switch-on the azimuth counter will read 0000, or occasionally 6399 or an arbitrary count, and thus it may be necessary on occasions to reset the count to zero at switch-on by means of the reset button. Moving the adjustable platform through zero starts the elevation counter. The elevation display is not illuminated until the goniometer is traversed through the horizontal position. This is due to the horizontal datum being used to reset the elevation counter to zero. The azimuth counter may be zeroed at any position by actuating the reset button, thus the goniometer may be orientated and zeroed on any desired reference point. The goniometer provides digital readouts of elevation/depression and bearing relative to the original reference points. Fast target acquisition is facilitated by a slipping clutch arrangement incorporated in both elevation/depression and azimuth drives, permitting the user to over-ride the fine controls.

Avimo digital goniometer equipment

Options available include: an additional display for range information, plus status indicators for multiple target indication and laser power; a mechanical interface to suit customer's mounting requirements; and a computer interface for orientation (and range) information (additional electronics are required to produce serial data interface).

CHARACTERISTICS

Azimuth: 0 - 6399 mrad, ±1 mrad
Elevation: ±250 mrad, ±1 mrad
Display: Digital 4-character LED
Dimensions: 240 × 300 × 210 mm
Weight: 5·0 kg (goniometer), 2·2 kg (tripod), 1·5 kg (battery pack)
Operating temperature range: -30 to +55 C
Power supply: 24 V DC vehicle or Ni-Cd battery, 1 Ah (4 hours' operation)

CONTRACTOR

Avimo Limited, Rowbarton, Taunton, Somerset TA2 6HH, England

5727.093

GSL 22 GYRO STABILISED LASER RANGEFINDER

This instrument is a development of the LH80 rangefinder (**4105.193**) and is intended for use from mobile platforms such as vehicles, ships and aircraft. It has been developed by Avimo in collaboration with British Aerospace and combines the features of the LH80 with those of the Avimo GSH 21 gyro-stabilised surveillance aid. The equipment will provide a sight line which is stabilised against angular vibrations in pitch and yaw. An automatic steering device allows for intentional movement of the unit during target line-up and follow.

The gyroscopes control the attitude of a gimbal-mounted 45° mirror inserted in front of the objective lens of the laser. The surface area of the mirror is shared between the transmitted laser beam and the combined visual/receiver optics. The front window of the stabiliser module is angled to prevent retro-reflection of the transmitted beam into the receiver.

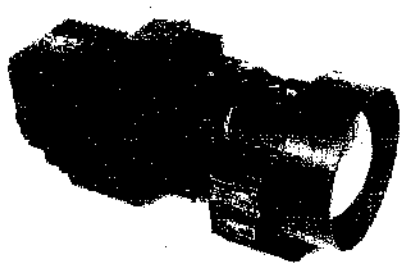
IR18 Mkll THERMAL SCANNER

The IR18 is a compact, lightweight, high performance thermal imager with television CCIR compatible video output of 625 or 525 lines. This imager, capable of seeing by day or night to a much greater degree than image intensifiers or low light level television systems, is wholly passive, independent of ambient light levels, sees through mist, smoke or shadow and is not blinded by sun glare, flares or searchlights.

It is modular in design and consists of a scan head, electronic processor, power supply unit, cooling system and auxiliary telescope.



The scan head contains the line and frame mechanisms, drive circuitry, syncs, detector, pre-amplifiers and bias circuits. It can be separated from the electronic unit. Without an auxiliary telescope it has a field of view of 38° × 25·5° with a 1·73 mrad resolution and has an afocal optical input which allows it to be coupled to a wide range of telescopes and short periscopes.

The electronic processor houses all the necessary circuitry to provide an output giving a 625 or 525 line display on a TV monitor of any size. Facilities are included to enable alpha-numerics, symbols or graticules to be injected into the output video signal.

The standard system operates with a Joule-Thompson mini cooler normally supplied from a remotely located pure air supply unit like the Barr & Stroud OK4 compressor or air bottle. Alternatively the imager can be run using a split Stirling cooling engine. The power supply unit provides all the required IR18 voltage lines when supplied with a nominal 24 volt dc input.

Telescopes have been manufactured with magnifications from × 1·5 to × 14, including dual field of view (typically ×9/×2·5 and ×14/×4). They can have focal athermalisation, remote focus control, an engraved graticule for sighting purposes (an alternative to an electronic graticule), and the external lens surfaces can be given a very hard coating (ARG4) suitable for use with a wiper in sand, mud or salt water conditions. A temperature reference can also be provided. Where an application requires a special telescope the company will undertake design to meet the specific requirements.

The IR18 can be used in two formats: assembled with a suitable telescope it is a thermal imaging scanner producing a TV compatible video output, or as a series of modules it can be incorporated into a large variety of weapon aiming and surveillance systems which employ thermal sensing. It is particularly suited for integration into sighting systems in armoured vehicles, helicopters and ships. It can be used to sight direct-line guns, guided weapons, or to control indirect artillery or mortar fire. The IR18 can also be used for identification at night or in poor visibility to help navigation of ships, hovercraft, aircraft, helicopter and land vehicles.

IR18 thermal imager with a × 9/× 2·5 telescope

CHARACTERISTICS

Basic scanner

Field of view: 38° × 25·5°

Resolution: 1·73 mrad

Pupil diameter: 14·5 mm

Detector: Mullard Sprite

MRT (at 0·289 c/mrad): Typically 0·17 – 0·35°C

Spectral bandwidth: 8 – 13 μm

Video output: CCIR compatible (or ETA composite video)

Display: 625/525 lines/frame

Field rate: 50/60 Hz

Frame rate: 25/30 Hz

Weight: 7·4 kg

STATUS

The IR18 has been in serial production since 1981. It is in service with UK MoD and has been sold worldwide. A helicopter version is described under **4785.193**.

THERMAL OBSERVATION GUNNERY SIGHT (TOGS)

TOGS is a thermal imaging system, operating in the 8 to 11·75 μm waveband, which completes the day/night gunnery capability of the UK Chieftain and Challenger main battle tanks. It is, however, sufficiently versatile to be fitted to other tanks. The system enables the operator to detect, track and engage potential targets by day and night, and in adverse weather. It provides both the commander and the gunner with a picture of the scene, enabling either to engage a target. A dual field of view telescope provides a target acquisition and vehicle navigation facility in the wide angle, and allows target recognition and gun aiming in the narrow angle. It has been designed for easy retrofit to all tanks and will operate in conjunction with the existing visual sighting system if this is retained.

The TOGS equipment comprises three separate elements; a Thermal Surveillance System (TSS), a Gunnery Sighting System (GSS) and a Test System. The TSS comprises a thermal imager sensor, a processor unit and TV standard displays for both commander and gunner. The thermal sensor is mounted externally on the tank in an armoured barbette and is servo-driven in elevation. When operating in the thermal mode the gunner acquires and engages the target using the display. The GSS element integrates the TSS into the tank fire control system and interfaces with the existing IFCS provision in Chieftain and Challenger. An important component of the GSS is the symbology processor unit which accepts information from the fire control system and generates aiming marks and other symbols for superimposition on the displays.

STATUS

TOGS is in full production and is being fitted to Challenger and retrofitted to Chieftain main battle tanks for the British Army.

TOGS on test

BARR & STROUD TANK LASER SIGHT

The tank laser sight, now with Nd-YAG laser rangefinder, has its origin in the Chieftain tank laser sight. Simplicity of design and replacement of off-mounted mini-modules by internally located ones has substantially reduced the mechanical and electrical problems of installation and made it suitable for a wide range of AFVs. The sight can also be used with thermal imaging systems.

A fundamental feature of the design is the in-built capability to accept a conversion kit which provides a graticule aiming mark projection system for integration within a computer-driven fire control system.

The tank laser sight unit houses the laser transmitter, the receiver system, and the optical sight. The line of sight in elevation is aligned to the axis of the gun by means of a precision parallel linkage, and in azimuth by coincident turret mounting. Boresighting is achieved using controls on the sight unit in conjunction with either a muzzle boresight or the muzzle reference system. Gun laying is achieved through a ballistic graticule or a laying mark provided by a fire control computer.

Laser ranging can be initiated by the gunner or remotely by the tank commander. The range is displayed in the left eyepiece of the sight unit, and remotely at the commander's station on the commander's range read-out unit.

When a target is partially obscured by smoke or other obstacles, the selection of 'last range' on the range unit allows the true range to be obtained by eliminating all received echoes other than the last echo, which comes from the target.

CHARACTERISTICS

System performance

Operating range: 300 – 10 000 m

Accuracy: ±20 m max error (±10 m for 90% of shots)

Read-out: First or last range, display logic, multiple station

Range gate: Preset

Firing rate: 1 pps

Capacitor charging time: <1 s

Optical system

Sighting telescope: ×10

Field of view: 8·5°

Exit pupil: 6 mm

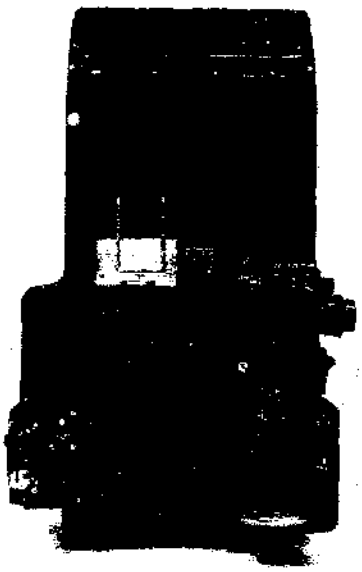
Graticule: Combining laser aiming mark and ballistic data

Boresighting adjustment: ±10 mrad in XY co-ordinates

Acquisition sight: ×1

Transmitter

Power output: 2 MW (nominal)



Pulse width: 6 ns

Beamwidth: 0·5 mrad

Wavelength: 1·064 micron

Receiver: Swept gain
Dimensions
Sight unit: 333 × 289 × 518 mm
Commander's range read-out: 152 × 54 × 60 mm
Weight
Sight unit: 21 kg
Commander's range read-out: 0·68 kg
AMEU: 7 kg
Power supplies
Nominal input voltage: 28 V DC

STATUS
The Barr & Stroud tank laser rangefinder equipment was developed under MoD contract as the standard gunner's laser sight for the British Army Chieftain MBT. It has since been fitted in Centurion, Leopard and Scorpion AFVs.

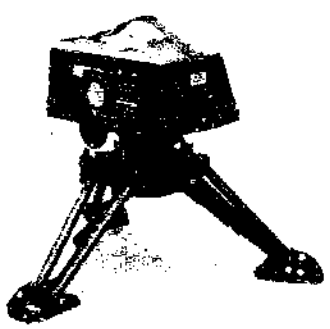
PASSIVE INFRA-RED SURVEILLANCE EQUIPMENT
British Aerospace Dynamics Group has been selected to develop passive infra-red surveillance equipment for use in low-level air defence systems to complement active detection systems such as radar. Radiating active surveillance systems will need to become increasingly more complex to counter the effects of jamming and other countermeasures likely to be used by an adversary in the future, and the use of radiating systems also exposes the defender to the risk of detection and location. One low-cost solution to these problems has been the development of a passive surveillance system with no detectable emissions, and since 1975 the Dynamics Group has been researching into the use of infra-red analogues of microwave radar systems.

To undertake the numerous field experiments to prove this concept, the equipment has been installed in a trailer and in the course of a two-week trial to prove its effectiveness, 96 per cent of engageable aircraft targets were observed and located passively at ranges which would have made engagement by a surface-to-air missile system entirely practicable. It was estimated that most of these targets would have been destroyed.
DEVELOPMENT
The company has spent about £3 million on this programme since 1975. The work has been carried out mostly in the Electro-optics Department at Stevenage with support from the Group's Bristol facilities.
STATUS
Development project. Hardware for the first model of the military version of the equipment was available in 1981 and was compact enough to be mounted on a Land-Rover vehicle. Design, development and manufacture will be carried out using the full facilities of British Aerospace Dynamics Group. The group has also developed a stabiliser, for hand-held laser rangefinders, consisting of a gyro-controlled mirror system.
CONTRACTOR
British Aerospace Dynamics Group, Six Hills Way, Stevenage, Hertfordshire SG1 2DA, England.



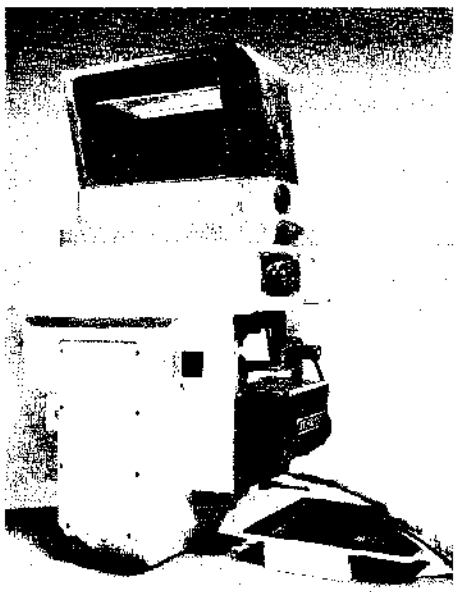
5906.193
TOTE MISSILE SIGHT
TOTE (Tracked Optical Thermally Enhanced) is designed to give the British Aerospace Tracked Rapier system (**2424.131**) a day and night capability. It will also allow the system to operate in an entirely passive mode by providing an automatic search with the surveillance radar switched off. The equipment combines the optical tracking facilities available on Tracked Rapier with a thermal imaging system using TICM II modules (**4280.193**). The optical tracker has been redesigned to accommodate three new units; a passive IR telescope scanner, an electronics pack to process the IR signals, and a monitor unit on which the target is displayed to the operator.

In the IR mode the target is detected by means of TOTE, which can traverse automatically in azimuth. The operator acquires the target and tracks it using the crosswires as in the optical system.

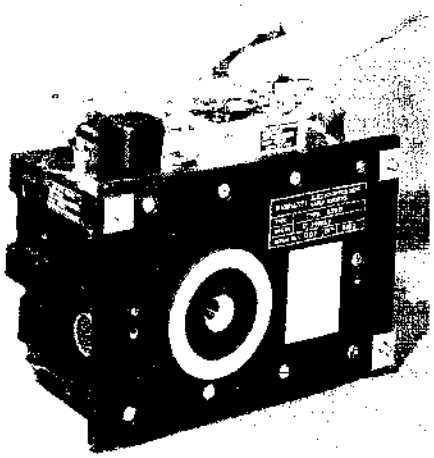
STATUS
In late development under a £34 million UK MoD contract for design, development and production. TOTE will be retrofitted to existing Tracked Rapiers.
CONTRACTOR
British Aerospace Dynamics Group, Six Hills Way, Stevenage, Hertfordshire SG1 2DA, England.

5713.193
TYPE 312 LASER BEACON AND TARGET SIMULATOR
A ground-based laser target simulator and navigation and recovery beacon for use with laser seeker equipped aircraft, the Type 312 employs a transmitter module identical with that of the Ferranti Type 306 laser designator/ranger (**1742.193**). Simple optics, which are easily attached to the unit, provide the differing fields of illumination required for the three main applications.

The equipment simulates a laser-designated target giving realistic ranges for airborne seekers operating on a wavelength of 1·06 μm. It may also be used as a navigation beacon to provide accurate updates to an aircraft navigational system and as an aircraft recovery aid to an airfield or landing strip where no navigation aid is available. The Type 312 is rugged, lightweight and man-portable and can be operated from standard army batteries or suitable vehicle power supplies. A data transfer module can be added to enable ground-to-air messages to be passed to the aircraft using the laser receiver in the aircraft.
CONTRACTOR
Ferranti Defence Systems Ltd, St. Andrew's Works, Robertson Avenue, Edinburgh EH11 1PX, Scotland.



Type 312 laser beacon and target simulator



5757.193
TYPE 520 LASER RANGEFINDER
The Type 520 laser system is intended for use in armoured fighting vehicles (AFV) and provides an accurate range to the target. Being a transceiver it can be retrofitted to existing AFV sights. The electronics unit provides the control logic for the power supply and converts return pulses to range data for display on either a commander's or gunner's display.

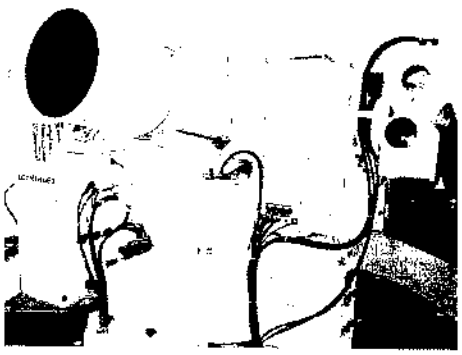
An integrated optical test system (IOTS) can also be supplied. This set can be used to test the Type 520 completely and to locate any sub-fault. The set can also perform a full serviceability check on the laser when fitted in an AFV sight.
CHARACTERISTICS
Laser type: Nd:YAG
Wavelength: 1·064 μm
Radiant peak power: 2 MW minimum
Emitted energy: 24 millijoules
PRF: 1 pulse/s continuous
Beam divergence (90% energy): 4 mrad maximum (giving 0·4 mrad with × 10 telescope)
Q-switch: Lithium Niobate Pockels cell
Ranging: 300 to 9995 m
Ranging accuracy: ±5m
Power supply: 19 to 32V DC (vehicle or battery)
Dimensions: 148 × 90 × 86 mm
Weight: 2·5 kg

CONTRACTOR
Ferranti Defence Systems Ltd, St. Andrew's Works, Robertson Avenue, Edinburgh EH11 1PX, Scotland.

Type 520 in Argus day/night sight for AFVs

Type 629D laser transceiver

4787.193
TYPE 518 AND TYPE 629D LASER SYSTEMS



The Type 518 laser rangefinder is a 1·06 μm Nd:YAG equipment, developed for fitting to kinetheodolites used on military test ranges to track the flight path of missiles and aircraft. It has a PRF of 30 Hz which enables the laser to match the very high accuracy of data provided by the equipment.

The Type 518 can range out to 99·9 km with an accuracy of 2 metres. Such ranges are made possible by the sensitivity of the receiver, the very high clock frequency (74.93 MHz), and by the wide aperture receiver optics. The transmitter optics have a variable beamwidth to allow close targets with a high angular movement past the kinetheodolite to be illuminated continually, while relatively slow distant targets can be tracked using a much narrower beam.

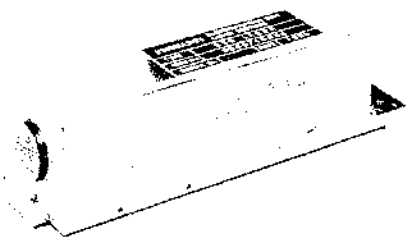
The Type 629D is another 1·06 μm Nd:YAG laser developed for fitment to the auto tracker in Rapier Laserfire. The very narrow beam provides excellent laser line-of-sight for command and guidance, and is proof against ECM.

STATUS
The Type 518 laser is in operational service. The Type 629D is a variant of the Type 629 and is in the post development stage.

CONTRACTOR
Ferranti Defence Systems Ltd, St. Andrew's Works, Robertson Avenue, Edinburgh EH11 1PX, Scotland.

Type 518 laser rangefinder

5905.193
TYPE 630 CO_2 LASER



The Type 630 is a transversely excited carbon dioxide laser which has been designed for a variety of military applications. The laser is sealed with an endurance of greater than 10^8 shots and incorporates valved filling ports recessed into the base. These ports allow the laser to be refilled and sealed without impairing the quality of the gas envelope seal or affecting the resonator alignment or bore sighting.

The module can be supplied in various options including high voltage rapid discharge circuitry, miniature high voltage power supply, or clock start detector and head amplifier.

CHARACTERISTICS
Wavelength: 10.59 microns
Peak output power: 250 KW
Polarisation: Plane
Pulse width: 44 ns
PRF: 2 Hz
Beam width: 6 mm
Beam divergence: 0.4 mrad
Dimensions: 196 × 48 × 56 mm
Weight: 0.86 kg

STATUS
In development. A number of other CO_2 lasers, including CW, pulsed and high PRF versions, are also in development.

CONTRACTOR
Ferranti Defence Systems Ltd, St Andrew's Works, Robertson Avenue, Edinburgh EH11 1PX, Scotland.

Type 630 CO_2 laser

1742.193
TYPE 306 LASER DESIGNATOR/RANGER

The Type 306 laser designator/ranger has been designed for forward air controllers to designate ground targets for either co-operating laser-seeker equipped ground attack aircraft, or for laser guided weapons. Aircraft using the airborne laser seeker counterpart are able to carry out low-level, high speed, single pass attacks without the pilot having to see the target. This concept greatly reduces exposure to ground defences and, at the same time, considerably improves weapon delivery accuracy since pilot tracking errors are eliminated.

The equipment also has built-in laser ranging for artillery and other purposes. When co-mounted with a thermal imager, a night observation capability is provided.

The system consists of a main unit weighing approximately 9.5 kg, including cables, and a remote firing control. Overall lightness, compactness, ruggedness and reliability, coupled with high performance, are key design features.

The liquid cooled Nd:YAG laser target marker and ranger will range out to 10 km with an accuracy of ±5 m, and has an endurance to permit target marking

Type 306 laser designator/ranger in operation

for approximately 35 minutes (within a specified duty cycle) before battery recharging is required. The PRF can be either 10 or 20 pps.

OPERATION

The Type 306 is the ground element of the close air support system. The forward air controller aims the laser at the chosen target and calls in ground support aircraft by radio. When the attacking aircraft approaches, the laser is fired and the airborne marked target seeker acquires and tracks the scattered energy, driving the pilot's head-up display to indicate target position. The pilot may then carry out the attack without ever having seen the target. If laser guided weapons are released, the bomb or missile homes precisely on to the marked target.

Alternatively, the Type 306 can be used to provide designation for all the current range of NATO laser guided weapons, including laser guided bombs, the Copperhead 155 mm shell and the Hellfire missile.

STATUS

The Type 306 was developed under a UK MoD contract and is in service with the British Army and Oman.

CONTRACTOR

Ferranti Defence Systems Ltd, St. Andrew's Works, Robertson Avenue, Edinburgh EH11 1PX, Scotland.

5755.193

FORWARD OBSERVER LASER DESIGNATOR (FOLD)

With the emergence of weapons such as the Hellfire air-to-surface anti-armour missile and the Copperhead cannon-launched guided projectile, there is an increasing emphasis on moving targets such as battle tanks. To meet this requirement, Ferranti has developed a version of the Type 306 designator (**1742.193**) known as FOLD. The system uses a Vinten Type 1906 tracking mount which enables the designator to track and designate armoured fighting vehicles. For night use, a thermal imager is added, co-mounted with the designator. Although Ferranti does not stipulate the type of thermal imager, the company has used the Thorn EMI multi-role thermal imager. Weight of FOLD, minus the thermal imager, is 22 kg. See also BOLD (**5756.193**) and HELD (**5747.393**).

STATUS

In production.

CONTRACTOR

Ferranti Defence Systems Ltd, St. Andrew's Works, Robertson Avenue, Edinburgh EH11 1PX, Scotland.

FOLD system using Ferranti Type 306 designator, Vinten Type 1906 mount and Thorn EMI multi-role thermal imager

5756.193

BATTLEFIELD OPERATIONS LASER DESIGNATOR (BOLD)

BOLD is a lightweight laser designator system. The experience gained during the Falklands campaign highlighted the need for a lightweight, man-portable equipment. As with FOLD (**5755.193**), the system is based on the Type 306 laser designator (**1742.193**) mounted on a lightweight, low-cost tracking mount. The BOLD and FOLD tripods are interchangeable. A third system, known as HELD (**5747.393**) is a helicopter mounted version of BOLD and the basic Type 306 can be interchanged easily between ground and air use by unbolting from one mount on to the other.

STATUS

In production.

CONTRACTOR

Ferranti Defence Systems Ltd, St. Andrew's Works, Robertson Avenue, Edinburgh, EH11 1PX, Scotland.

BOLD in field use

3411.193

GSA SERIES GUNSIGHTS

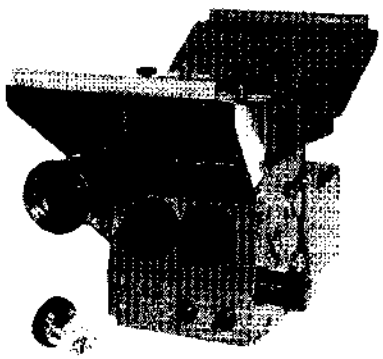
The GSA series of gunsights are designed to replace older fixed reticle gunsights on close-range anti-aircraft guns where the gunner had to judge by eye where to point his gun in order to hit a moving target.

The aiming allowances which have to be considered are for target motion, gravity drop of the ammunition and the effect of crosswind, but by far the most important is that for target motion. This allowance may be formulated in many ways using different parameters, but one that is particularly useful, in the absence of information about the target's speed and direction, is in terms of rate of rotation of the sight line which may be measured by a rate gyro within the gunsight. There is uncertainty about the time of flight of the shell, because of the gunner's limited ability to assess range, but rather than attempt to adjust the range input to the gunsight continuously throughout the attack, the principle adopted is to set into the gunsight a range through which the target must fly and so obtain, with sustained firing, hits at some period of attack – approximately at the time when the actual range equals that set-in. In the case of the GSA 400 series, any one of four ranges may be selected during the course of an attack and that selected is indicated to the gunner as a number in the collimated reticle pattern. For the GSA 200 series, two ranges are available, a maximum and minimum preset by the operator.

Range rate also appears in the aiming condition, but, in the formulation with sight-line rate of turn as a primary parameter, it does so only in a secondary way. The effect of actual range rate being different from a mean assumed value is merely to alter by a few per cent the range at which hits will be obtained.

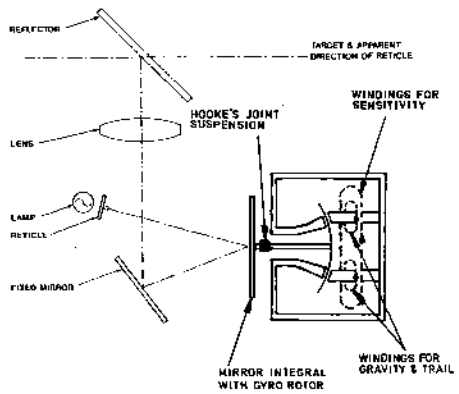
The principle of generating the aim-off angle as embodied in gyroscopic gunsights is shown diagrammatically nearby. The gyro rotor is free to deflect in both the horizontal and vertical planes about its suspension and the deflection from the symmetrical position is proportional to the rate of turn (precession) of the rotor axis in space. By attaching a mirror to one end of the rotor and reflecting a reticle from it, the optical system presents this deflection to the gunner as the required aim-off. The other end of the rotor is in the shape of a dome which rotates in a magnetic field produced by a current through the sensitivity windings and the interaction between the induced eddy currents and field provides the torque necessary to precess the gyro rotor in the direction of the target as the gunner tracks the target. By making the current in the sensitivity winding a suitable function of range, the rotor deflection from its position of symmetry as the gunner tracks the target will give a sight-line deflection equal to the aim-off requirement.

The gyro also has gravity windings which enable the rotor to be deflected statically so that the rest position of the sight-line can be compensated for the gravity drop of the ammunition as a function of range.



A lens in the optical path focuses the aiming reticle at infinity making a 'backsight and foresight' unnecessary. The reticle is reflected into the gunner's eye by a semi-reflecting glass through which the target may also be seen and so aligned with the reticle by rotating the gunsight.

The type of prediction embodied in the gunsight is known as 'disturbed sight-line' because the sight-line is not fixed in relation to the body of the gunsight or gun but lags behind it by a variable amount. It can only be moved, however, through the medium of the gun itself, which may create some difficulty for the gunner whose ability to track the target is clearly limited by the combined effect of the sight-line response and the servos which move the gun. Practical trials have shown that with modern gun servos the gunner can quickly learn to cope with the combined response and achieve a good standard of aiming. Moreover, there is the advantage that any errors in the servos do not affect the accuracy of prediction since they are within the aiming control loop.



The GSA is compatible with any gun with a calibre of 20 to 40 mm and the necessary ballistic data is inserted into the computation by means of an adjustment of trim potentiometers on the electronic card module of the unit. This gives the user the flexibility of having one gunsight for a number of guns of different calibre.

STATUS

Oerlikon-Bührle have adopted two variants of this gunsight as standard fit for their equipment - the GSA

Ferranti GSA Mk 3 sight

General arrangement of GSA gunsight

Mk 3 for field use with the GDF-B and the GSA Mk 3M for their naval GDM-A twin 35 mm AA guns. One African state has adapted the Bofors L40/60 guns in all its navy ships to accept the GSA 302 system. A South American state fits the GSA 32-JSW (a GSA 200 series type) to its twin 20 mm AA guns. The UK BMARC, a subsidiary of Oerlikon – Bührle, uses the GSA 201 on its GDM-A003 30 mm twin gun mountings. The equipment is now in quantity production for fitment to the Oerlikon-Bührle Type GDF-003 35 mm twin AA field gun and Type GDM-A 35 mm twin AA naval gun. A number of smaller orders have been received for use with optical fire directors and to update Bofors 40/60 40 mm guns for both field and naval applications. Several other countries should soon be fitting the GSA series, either as a stand-by sight or as the prime gunsight. A gunner's trainer, the TA500 series, is also available.

Ferranti Defence Systems Ltd, St. Andrew's Works, Robertson Avenue, Edinburgh EH11 1PX, Scotland.

4696.093

FERRANTI HELMET POINTING SYSTEM

The Ferranti helmet pointing system (HPS) is a target sighting equipment which directs weapons and sensors towards any target at which the wearer is looking. The HPS provides existing weapon systems with a high-speed visual acquisition mode which can be used when surveillance radar data is unavailable or when passive operation is required.

The HPS is a lightweight, easy-to-use and simple system consisting of the helmet-mounted sight and sensor, a fixed radiator, a signal processing unit, a control unit and a power supply. The observer's sight is light, unobtrusive and compatible with face masks.

When used with tracked Rapier, the commander (or observer) searches for possible targets. The sight has an illuminated aiming mark focused at infinity representing line-of-sight. A tiny sensor, integrated and pre-aligned with the optics, continuously monitors the sightline relative to a radiator fixed to the vehicle. The commander may operate the sight using either right or left eye, or can retract the sight when using binoculars. Once the commander has spotted a target he overlays it with the aiming mark as a means of designating his target. By pressing a button the sightline is transferred to the optical tracker instantaneously, directing it in azimuth and elevation to the target. The tracker operator then follows his normal procedure. The whole procedure takes from two to five seconds. In a more general case, the HPS may be adopted to transfer an observer's sightline to a weapon or sensor which is then instantly directed at the target. A variant of the system can be supplied for simultaneous dual observer operation using a common electronics unit.

Ferranti helmet pointing sight

DEVELOPMENT

The HPS was originally conceived as an aircraft aid and provides unlimited angular coverage and measures line-of-sight angles in azimuth, elevation and roll to an accuracy of 0·5° CEP. It is, however, as a land-based system that it gained its first contract as part of the BAe tracked Rapier missile system for the British Army.

STATUS

The Ferranti HPS is standard equipment on the British Aerospace tracked Rapier missile system and is in quantity production for that purpose. The system also has considerable potential in air and sea operations.

LP160 LASER RANGEFINDER

The Lasergage LP160 laser rangefinder is a small, compact and lightweight electro-optical instrument designed for use by artillery forward observers and mortar fire controllers. The instrument measures range, azimuth and elevation angle to the target with an accuracy that will facilitate first-round hits. The LP160 fits into modern computerised field artillery fire control systems but can also operate as a self-contained scouting unit for target observation and localisation.

CHARACTERISTICS
Laser: Nd-YAG
Wavelength: 1·064 microns
Output energy: 5 mJ nominal
Pulse width: 10 ns nominal
Pulses per minute: 12 (30 intermittent)
Beamwidth: 1·5 mrad
Q-switch: Saturable dye
Receiver
Field of view: 1·3 mrad nominal
Type of detector: Avalanche photodiode
Minimum/max range: 150/20 000 m
Range resolution: 5 m
Range discrimination: 30 m
Telescope
Aperture: 45 mm
Magnification: ×7
Field of view: 120 mils
Rangefinder and goniometer
Dimensions: 270 × 240 × 230 mm
Weight: 5·8 kg

STATUS
In production.

LT 1065 HAND-HELD THERMAL IMAGER

The LT 1065 hand-held thermal imager is a compact, lightweight instrument intended for use in surveillance, mortar fire control, weapon sighting at night, etc. The operational sensitivity of the equipment is such that differences of less than 1°C are indicated to the operator. The power source is a small battery pack. A range of lens options give differing fields of view and resolutions.

CHARACTERISTICS
Spectral waveband: 3 - 5 μm
Field of view: 21° azimuth; 16° elevation
Resolution: 2·3 mrad
Magnification: × 0·75
Detector: Thermoelectrically cooled CMT
Total number of lines: 96
Temperature sensitivity: 0·3°C
Display: Red LED
Weight: 3 kg

STATUS
In production.

CONTRACTOR
Lasergage Ltd, Newton Road, Hove, East Sussex BN3 7DL, England.

LT 1065 hand-held thermal imager

4780.193
LT 1085 THERMAL IMAGER

The LT 1085 is a lightweight man-portable thermal imager which has been designed for general surveillance purposes. When boresighted with the LP7 laser rangefinder (**3760.193**), the system is suitable for mortar fire control by day and night. The sight operates in the 8 to 13 μm band and has two fields of view which are optically aligned and switchable. The wide field of view may be used to detect a target and the narrow field of view is employed for recognition. The LT 1085 is designed around a 30-element CMT detector cooled to 77° K with a Joule-Thompson mini-cooler, the high pressure air in a 0·6-litre bottle giving four hours' operation under normal conditions.

CHARACTERISTICS
Detector: CMT cooled to 77° K
Waveband: 8 – 13 μm
Field of view: 12·5° × 9·2° (wide); 5° × 3·7° (narrow)
Resolution: 0·6 mrad (wide); 0·24 mrad (narrow)
Display: Miniature CRT; P21 phosphor
Dimensions: 210 × 225 × 120 mm (excluding battery and gas bottle)
Weight: 3 kg (excluding battery and gas bottle)

CONTRACTOR
Lasergage Ltd, Newtown Road, Hove, East Sussex BN3 7DL, England.

LT 1085 thermal imager

LV5 LASER RANGEFINDER

The Lasergage LV5 laser rangefinder is designed for external mounting on armoured fighting vehicles to improve their combat effectiveness by providing accurate range information for weapon aiming. The compact and low profile laser transmitter/receiver is mounted externally and accurately boresighted with the gun. A protective armoured cover with remotely operated front flap can be provided. The control/display unit is located inside the vehicle in a position where it may be seen and used by the gunner or commander. An additional display unit can be provided to give both these crew members range information.

CHARACTERISTICS
Transmitter
Laser: Nd-YAG
Wavelength: 1·054 micron
Pulse length: 10 ns
Output energy: 5 mJ (nominal)
Firing rate: 12 continuous; 30 intermittent pulses/minute
Beamwidth: 1·5 mrad
Receiver
Field of view: 1·3 mrad
Detector: Avalanche photodiode
Effective aperture: 45 mm
Minimum/max range: 200/10 000 m
Range accuracy: 5 m
Range discrimination: 30 m
Minimum range setting: 200 – 300 m continuously variable
Sight
Magnification: ×7
Weight: 2·4 kg (transmitter/receiver); 1·4 kg (control unit)

STATUS
In production.

LWS 1060 NIGHT SIGHT

The LWS 1060 is a second/third generation small weapons surveillance night sight and is designed for the latest generation of light support infantry weapons. It will accept either second or third generation image intensifiers and will fit most weapons, including SLR, FN, G3, M16 and AK47. An adjustable graticule of contrasting colour is provided for ease of weapon aiming and alternative graticule patterns can be made available. The sight has been tested successfully for identifying and hitting man-sized targets at 300 metres in very low light level conditions.

CONTRACTOR
Lasergage Ltd, Newtown Road, Hove, East Sussex BN3 7DL, England.

4700.193
NOD2 NIGHT OBSERVATION DEVICE

NOD2 is a second generation night observation device for long range surveillance. The instrument uses a 25 mm micro channel plate image intensifier tube for high performance down to very low light levels, and detects active IR devices as if they were white light. The system requires no illumination and when coupled to a laser rangefinder permits engagement at night with an 80 per cent hit probability. A tripod is included with accurately calibrated azimuth and elevation scales.

CHARACTERISTICS
Magnification: × 9·4
Field of view: 5·6°
Focal length of objective: 255 mm
Dimensions: 41·2 cm × 26 cm (diameter)
Weight: 11·62 kg

CONTRACTOR
Lasergage Ltd, Newtown Road, Hove, East Sussex BN3 7DL, England.

NOD2 sight

4698.193
PVS5A NIGHT VISION GOGGLES

The PVS5A second generation passive night vision goggles are intended to bring greater mobility and operational effectiveness to night operations. They include a built-in IR LED light source, and close focus adjustment allowing viewing at ranges from 25 cm to infinity. Muzzle flash protection prevents the tube from being damaged by high intensity short duration light flashes. Image intensification is achieved through 18 mm micro channel wafer image intensifiers.

CHARACTERISTICS
Magnification: × 1
Field of view: 40°
Range: 150 m (man-sized target)
Objective focal length: 26·6 mm
Weight: 0·86 kg

CONTRACTOR
Lasergage Ltd, Newtown Road, Hove, East Sussex BN3 7DL, England

PVS5A night vision goggles

4699.193
PVS4 and TVS5 WEAPONSIGHTS

These are lightweight passive night vision sights that use a 25 mm micro channel image intensifier tube. Both are second generation instruments using high quality optics, a variable gain tube technology and muzzle flash protection to prevent the tube from damage by high intensity short duration light flashes.

The PVS4 is an individually served weapon sight which is used for close to medium range sighting and can be attached to a number of weapons or hand held. Typical applications are night fighting and hand held night surveillance and it can be easily adapted for low-light level photography.

The TVS5 is intended for medium to long range sighting of targets for attachment to a number of crew served weapons such as machine guns and anti-tank weapons. A tripod attachment is fitted for night surveillance and reconnaissance.

CHARACTERISTICS

	PVS4	TVS5
Magnification	× 3·7	× 6·2
Field of view	14·5°	9°
Focus range	25m – ∞	25m – ∞
Weight	1·7 kg	3 kg

CONTRACTOR
Lasergage Ltd, Newtown Road, Hove, East Sussex BN3 7DL, England.

PVS4 weaponsight

TICM II THERMAL IMAGING SYSTEMS

TICM II thermal imaging systems are based on modules developed for the UK MoD under the Thermal Imaging Common Module programme. The modules are the 'building bricks' of TICM II systems. They are built to full military standard and use advanced optical and electronic components, including the Mullard 'SPRITE' detector, to give high resolution and sensitivity even at long range. The modular basis gives flexibility in system design coupled with ease of maintenance and repair for cost-effective use in both new weapons and for retrofit. Telescopes and displays can be selected by system designers to meet precise operational requirements.

These indirect view systems are fully television compatible and produce a high-quality video image which can be displayed on television monitors or head-up and head-down displays. Unique among thermal imagers, they are fully automatic in operation and always provide the best possible image, as well as allowing module replacement without any adjustment or set-up time. The systems are particularly suited to applications demanding the highest resolution and reliability such as pilot night vision, target detection and tracking, weapon aiming and surveillance.

CHARACTERISTICS

Spectral bandwidth: 8 – 13 μm

Field of view: 60 × 40° (625-line 50 Hz); 48·4 × 32·5° (525-line 60 Hz)

Resolution: 2·27 mrad (60° field of view)

Pupil diameter: 10 mm

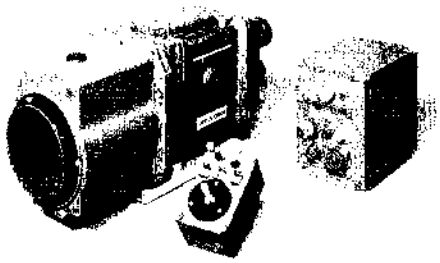
MRTD: Typically better than 0·1°C

Detector: 8 parallel CMT 'SPRITE'

Video output: CCIR Systems I/EIA-RS-170, compatible 625/525-line 50/60 Hz

Weight: 7·2 kg (modules)

STATUS



GEC Avionics and Rank Taylor Hobson are supplying modules for a wide variety of requirements, with large scale production for the UK MoD.

TICM II based imagers are being supplied as the standard thermal equipment for the British Army Chieftain and Challenger main battle tanks. TICM II also forms part of tracked Rapier's new night firing system 'TOTE' (**5906.193**).

4701.193

HHI-8 HAND-HELD THERMAL IMAGER

The HHI-8 hand-held thermal imager is a self-contained, compact equipment of light weight and small size. It is intended for reconnaissance operation in the battlefield by special patrol groups, covert operating groups and other intelligence gathering units. Although hand-held operation is the primary method of use, it can also be tripod-mounted.

The instrument functions in the 8 – 12 μm band to avoid normal obscuration (ie total darkness, fog, smoke, etc). It is simple to operate with supplies from readily rechargeable compressed air bottles and replaceable battery packs. The carrying handle serves as the replaceable battery pack and is quickly changed, as is the compressed air bottle.

The HHI-8 is operated by turning on the compressed air and electrical supplies by a single control. The imager is ready for use after a few seconds. The display image, which can be selected to show black-hot or white-hot scene details, is optimised by adjusting the focus by means of the front lens ring, and adjusting window and offset by using indented controls on top of the instrument.

CHARACTERISTICS

Spectral band: 8 – 12 μm

Field of view (fixed): 5° × 3°, magnification ×3

Field of view (switched): Wide 9·6° × 5·6°, magnification ×2; narrow 4° × 2·3°, magnification ×5

Detector cooling: Joule-Thompson minicooler using compressed air

Battery supply: Self-contained 12V lithium battery in handle. Alternative remote 24V NiCd battery

Air supply: Self-contained 0·24 or 0·6 litre bottle. Alternative remote compressor or bottle

Dimensions: 410 × 140 × 140 mm

Weight: 4·8 kg (including battery and air bottle)

CONTRACTOR

Marconi Command and Control Systems Ltd, Chobham Road, Frimley, Camberley, Surrey GU16 5PE, England.

HHI-8 hand held-thermal imager

5715.193

THERMAL IMAGER VEHICLE SIGHT

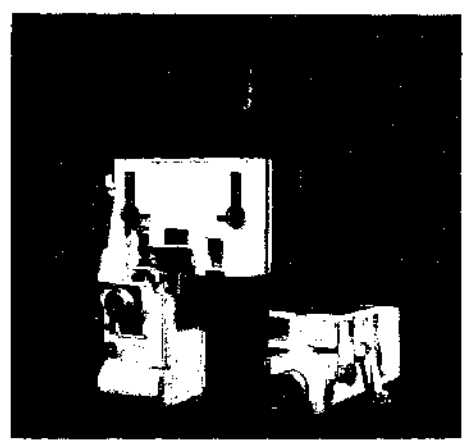
The Thermal Imaging Vehicle Sight (TIVS) is a gunner's sight designed to provide day and night observation and weapon aiming based on the normal thermal energy radiation. It is a plug-in unit suitable for the direct replacement of image intensifier night sights in a range of sight housings currently fitted to a large number of vehicles. For most vehicles, including M-series and T-series battle tanks, armour modifications are not necessary.

The TIVS operates in the 8 to 12 μ-band where high energy radiation from an object will penetrate smoke, mist and most fog, and will provide a high thermal contrast picture. The display may be optimised by adjusting the focus, brightness and contrast controls, and the image polarity may be changed from black-on-white to white-on-black. Incorporated within the sight are presettable controls for graticule and aiming marks. The magnification may be changed from ×2 to ×4·9. Suitable periscopic housings can be provided for a range of vehicles.

The display is presented on a CRT, allowing flexibility in layout within the vehicle. A parallel display for the commander can also be fitted.

CHARACTERISTICS

Waveband: 8–12 μ



Optics: Coated lens assembly with two fields of view

Field of view: Wide 9·6° × 5·6° magnification ×2; narrow 3·85 × 2·26° magnification ×4·9

Cooling system: Joule-Thompson mini-cooler, compressed air

CONTRACTOR

Marconi Command and Control Systems Ltd, Chobham Road, Frimley, Camberley, Surrey GU16 5PE, England.

Marconi thermal imager vehicle sight

3410.193

PPE PASSIVE DRIVING PERISCOPE

Pilkington PE Limited show producing a new passive driving periscope under contract to the UK MoD. The device enables drivers of armoured fighting vehicles to drive efficiently, hatch down, without the need of artificial illumination. The periscope incorporates a micro-channel plate intensifier tube manufactured in the UK by Mullard. The tube provides the high gain necessary to achieve good contrast image, particularly in low light-level conditions. In addition it is far less affected by bright lights (eg gun flash, street lights, etc) in the field of view than first generation (cascade tube) systems.

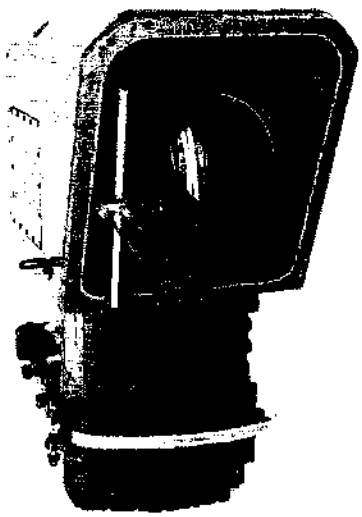
The optical design features a bi-ocular eyepiece which affords the driver considerable eye relief, minimising the risk of facial injury and reducing eye fatigue over a period of driving. The modular design ensures that the basic periscope fits a variety of armoured fighting vehicles. Assembly is effected by special vehicle mounting brackets and upper casings. The sight is interchangeable with existing day periscopes in a variety of vehicles.

The device is designed to fit the following range of armoured fighting vehicles, without modification: Leopard, Marder, Chieftain (ARV, AVRV, MBT versions), CVRT, CVRW (Scorpion, Scimitar, Striker, Spartan, Samson, Samaritan), 430 series, and all M series (M107, M109, M110, M113, M60) vehicles. In addition, with some modification to the vehicle, it will fit the French AMX-30 and Panhard AML series.

PPE passive driving periscope, universal model

CHARACTERISTICS
Magnification: ×1 bi-ocular
Field of view: 50° horizontal, 40° vertical
Eye relief: 100 mm
Image tube: Mullard 50/40 mm micro-channel plate
Weight: 7·5 kg

STATUS
In service with the British Army and overseas forces.
CONTRACTOR
Pilkington PE Ltd, Glascoed Road, St Asaph, Clwyd LL17 0LL, Wales.



PPE night driving periscope installed in Scorpion light tank

5710.193
COMMANDER'S DAY/NIGHT SIGHT (CONDOR)
This was designed originally for the Royal Ordnance Factory's main battle tank and provides the tank commander with a 24-hour capability for surveillance, target acquisition and firing of the main armament. It incorporates independent channels for day and night use and interfaces with the main armament via a reticle image projector (PRI) unit. The PRI injects into the sight in line-up a collimated ballistic graticule to enable the commander to engage the target. The unit will also inject the optimum target engagement data derived from the fire control system, if fitted, to improve probability of first round hit by day and night.

Condor is designed to fit the Vickers Mk III main battle tank and Centurion, and the ROF main battle tank. Fittings for other vehicles such as the Vickers Valiant, M47, M48, T54 etc, can be made available.

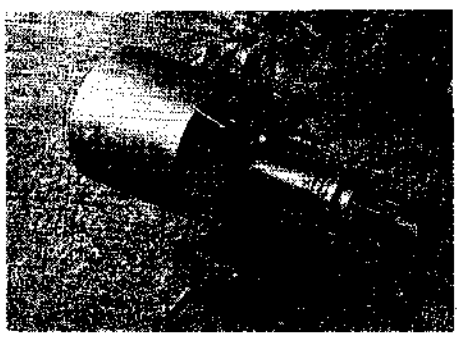
CHARACTERISTICS
Above armour height: 330 × 330 mm
Elevation range: -10 to +35°
Magnification: ×10 day channel; ×4 night channel; ×1 periscope
Field of view: 5° day channel; 8·9° night channel; 56° horizontal/11° vertical (×1 channel)
Weight: 56 kg
STATUS
In production for Vickers and ROF main battle tanks. In December 1980 a contract was awarded for over £6 million for the supply of units to fit in ROF main battle tanks. In March 1983 a further contract worth over $4 million was awarded by the UK MoD for the supply of nearly 1000 PRI units for the Chieftain main battle tank.
CONTRACTOR
Pilkington PE Ltd, Glascoed Road, St Asaph, Clwyd LL17 0LL, Wales.

Condor day/night sight

3403.193
No 63 PASSIVE NIGHT SIGHT (L3A1)
The No 63 sight was designed by PPE for use with the No 62 day sight in the No 16 cupola of the Spartan APC and other vehicles. It is also suitable for use in vehicles and other installations as a straight telescopic sight or as a periscopic sight, as on the 155 mm self-propelled gun.

The sight can be quickly detached from the No 62 sight and fitted to a tripod and periscopic mirror attachment for surveillance on foot.

The wide field of view and excellent range provide very effective surveillance capability coupled with accurate firing of the 7·62 mm cupola machine gun.
CHARACTERISTICS
Magnification: ×1·4 monocular; ×1·1 bi-ocular
Field of view: 20°
Image tube: 25 mm 3-stage cascade
Weight: 4·5 kg (7·5 kg with tripod)
STATUS
In production for the British Army.
CONTRACTOR
Pilkington PE Ltd, Glascoed Road, St Asaph, Clwyd LL17 0LL, Wales.



PPE passive night sight for Spartan shown in dismounted role

5908.193
RAVEN DAY/NIGHT SIGHT
Raven is a combined day/night sight and is intended primarily for the MCV80 battlefield transport vehicle being built by GKN Sankey. Each MCV80 will carry two sights, one for the commander and the other for the gunner, with the gunner's sight interfaced to the gun linkages. The sight will provide ×1 and ×8 day vision and ×2 and ×6 by night using image intensifier techniques. Ballistic information and all sight functions are operable over an angular range of +47° to -12° with respect to the line of sight.

STATUS
The Raven sight has been designed as a private venture development programme by Pilkington PE. A contract was awarded by the UK MoD in January 1985 for continued development with an anticipated initial production run of more than 400 sights.
CONTRACTOR
Pilkington PE Ltd, Glascoed Road, St. Asaph, Clwyd LL17 011, Wales.

3406.193
NIGHT OBSERVATION DEVICE NOD-A
The PPE NOD-A night observation device is a long-range system designed for the British Army for artillery fire control, but the equipment may be used in a number of roles where long-range surveillance is required. The device incorporates a catadioptric lens, 40 mm image intensifier and a bi-ocular eyepiece. This last feature enhances visual comfort by allowing the operator to view the night scene with both eyes simultaneously at a comfortable distance (100 mm) from the eyepiece.

In the British Army the NOD-A will be associated with an LP6 laser rangefinder supplied by Avimo Limited, both devices being carried on a common lightweight mounting, the precision angulation support system (PASS) produced by Marconi Avionics Limited.
CHARACTERISTICS
Magnification: ×5
Field of view: 7·2°
Eye relief: 100 mm
Image tube: 40 mm 3-stage cascade
Weight: 28 kg
Operating temperature: -34 to +70° C
STATUS
In service with the British Army.
CONTRACTOR
Pilkington PE Ltd, Glascoed Road, St Asaph, Clwyd LL17 0LL, Wales.

Night observation device NOD-A

4702.193
EAGLE LONG-RANGE NIGHT SIGHT

Eagle is a second generation night vision equipment developed to meet the increasing need for a lightweight hand-held long range device giving increased performance over first-generation equipment. The instrument acts as a long-range surveillance sight and can also be used in a wide variety of roles including artillery and anti-aircraft fire control systems. Range is such that a main battle tank can be recognised at 1000 metres in starlight conditions.

Eagle uses a binocular eyepiece and incorporates an illuminated graticule suitable for weapon firing and adjustment of fire. The equipment may also be mounted on a tripod. The device is fully compatible with nuclear, biological and chemical (NBC) defence equipment.

CHARACTERISTICS
Magnification: ×8
Field of view: 5°
Weight: Less than 3·5 kg
Power supply: 2 × 1·5V AA size batteries
STATUS
In production.
CONTRACTOR
Pilkington PE Ltd, Glascoed Road, St Asaph, Clwyd LL17 0LL, Wales.

Eagle night sight

3408.193
PPE POCKETSCOPE

The PPE Pocketscope incorporates a second-generation 18 mm micro-channel plate intensifier tube. Weighing only 0·8 kg the sight is designed for hand-held military/paramilitary surveillance duties, is easily stowable in pocket or pouch and effective in a wide range of artificial lighting conditions, eg counter insurgency, border patrol, etc. It also acts as a lightweight individual weapon sight for rifles, machine guns and anti-tank weapons.

CHARACTERISTICS
Magnification: ×2·4
Field of view: 15°
Eye relief: 26 mm
Image tube: 18 mm micro-channel plate
Operating temperature: –40 to +55° C
STATUS
In service with the British Army as a surveillance device and weapon sight.
CONTRACTOR
Pilkington PE Ltd, Glascoed Road, St Asaph, Clwyd LL17 0LL, Wales.

Pocketscope night sight in weapon aiming role

3409.193
PPE NIGHT VISION GOGGLES

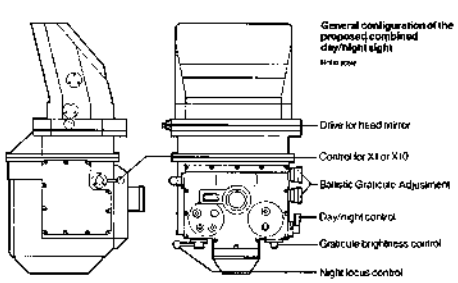
The Pilkington PE Nova night vision device has been developed for the UK MoD and employs the cost effective solution of using a single 18 mm micro-channel intensifier tube (second generation) with the display being viewed by a specially designed bi-ocular magnifier, affording large eye relief to both eyes simultaneously.

Nova goggles can be worn with a variety of service equipment including helmets, arctic and other combat clothing and are believed to be the first designed specifically for compatibility with nuclear, biological and chemical (NBC) equipment. Developed for a specific British Army requirement for a low cost, lightweight compact head-mounted night surveillance system, the goggles will be used primarily by patrol commanders and AFV commanders. Other roles include night driving of soft skinned vehicles; maintenance, mine laying, construction work, etc.

Power is supplied by a single internal 2·7 V battery (mercury or lithium) which can be easily replaced by the user.

CHARACTERISTICS
Field of view: 40°
Magnification: ×1
Eye relief: 29·5 mm
Weight: Approx 500 g
STATUS
A production contract worth over £1 million and covering more than 1000 goggles was awarded by the UK MoD in February 1983. A second contract was awarded in November 1984.
CONTRACTOR
Pilkington PE Ltd, Glascoed Road, St Asaph, Clwyd LL17 0LL, Wales.

PPE night vision goggles



3796.093
RANK DAY/NIGHT SIGHT

The Rank day/night sight, also known as Argus in some versions, is of periscopic configuration and is mounted in the roof of the turret giving a very low silhouette. The sight consists of an optical system which provides the operator with a ×10 fixed focus day system, a ×9 night vision with variable focus, and a ×1 fixed focus daylight facility.

The night sight system uses a 25 mm three-stage image intensifier tube. Change from one mode to another is activated by a hand operated lever.

The sight can be supplied for use in the gunner's and/or commander's position. Elevation of the line-of-sight is accomplished by the movement of a tilting head mirror. The gunner's sight is linked to the main armament for control of the elevation mirror, whereas the commander's sight is manually operated and is independent of the gunner's sight.

Either sight can be fitted with a laser rangefinder, as an optional extra. When fitted to the gunner's sight only, range information can be provided for the commander's sight. A thermal pointer device can be provided for up to 360° surveillance with an audible warning signal and an LED target indication signal supplied to the gunner's/commander's sight.

Rank day/night sight

CHARACTERISTICS

Day system	high magnification	unity magnification
Magnification	×10	×1
Field angle	6·4°	25° horizontal 10° vertical
Exit pupil	5 mm dia	—
Eye relief	28 mm	105 mm
Focus	fixed	fixed
Eyepiece	monocular (optional binocular)	viewing window (100 m × 35 mm)

Night system
Magnification: ×9
Field angle: 6·5°
Exit pupil: 5 mm dia
Eye relief: 28 mm
Focus: Variable, 50 m – ∞
Eyepiece: As day system
Image intensifier: 25 mm 3-stage
Graticule: As ×10 day system
Common features
Head mirror: –10 to +35°
Laser eye protection: Dichroic beam splitter and glass absorption filters
Height: 680 mm
Width: 230 mm
Depth: 280 mm
Weight: 28 kg
Optional extras
Laser rangefinder: Built-in laser optics suitable for SIMRAD LP6 laser. Range 200 – 15 000 m continuous. Range discrimination 30 m. Digital readout of range information

VARIANTS:

Numerous variants of the Argus sight have been designed for specific vehicles and applications; a summary of the principal ones follows:

SS125: Gunner's day/night sight with elevation link arm suitable for connection with the mantlet on CVR(T) Scorpion, horizontal monocular eyepiece and optical system suitably coated for use with the optional laser rangefinder (laser components may be added later).

SS126: Commander's day/night sight with manual elevation control, angled monocular eyepiece and optical system suitably coated for use with the optical

laser rangefinder (laser components may be added later).

SS127: Gunner's day/night sight as SS125, but without provisions for addition of laser rangefinder.

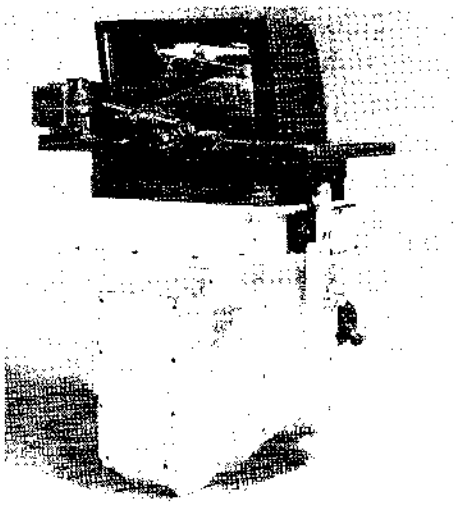
SS128: Commander's day/night sight as SS126, but without provisions for addition of laser rangefinder.

SS111: Plain adaptor for fitment of SS125 or SS127 to gunner's position on CVR(T) Scorpion.

SS117: Azimuth slew ring for fitment of SS126 or SS128 to commander's position on CVR(T) Scorpion.

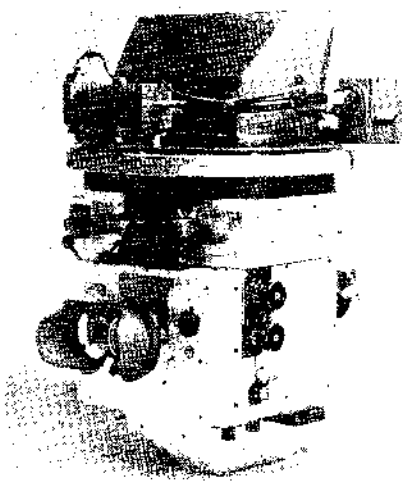
SS122: A series of day/night sights featuring adaptor plates for fitment to the turret of most armoured vehicles. The SS122 is also available with an integrated laser rangefinder and a fire control computer.

SS123: Gunner's day/night sight as SS125 but complete with laser rangefinder components SS129 installed.



SS124: Commander's day/night sight as SS126 but complete with laser rangefinder SS129 components installed.

STATUS



Specified for the 105 mm autonomous naval patrol gun (**3659.203** in 1982-83 and earlier editions) and other applications.

SS100/110 NIGHT SIGHT

The designation SS100/110 refers to the two versions of the image intensifier night sight produced for the Fox and Scorpion AFVs. They have the British Army designations of SPAV L2A1 and SPAV L3A1, respectively.

The equipment is turret-mounted in front of the gunner and alongside the main armament. It enables gunners to locate, identify, and engage targets at night without the use of any artificial lighting, and it is also used for general surveillance. A dual role capability is achieved by the use of two objectives, mounted one within the other. The outer objective gives a magnification of ×5·8, while the inner, for surveillance, has a magnification of ×1·6. When high magnification is in use, a shutter isolates the low magnification objective. When the other magnification is selected, an iris diaphragm isolates the high magnification objective.

The image intensifier tube is protected from the effects of gun muzzle flash by a shutter which is operated electrically from the gun firing circuit. An illuminated ballistic graticule with brightness control is injected automatically into the optical system when high magnification is selected, and this is used for laying the main armament. Automatic brightness control for the image intensifier tube is provided.

CHARACTERISTICS

Fox night sight

Magnification: ×5·8 and ×1·6

Field of view: 142 mils (8°) and 498 mils (28°)

Objective focus: Variable 50 m – ∞ and fixed at 30 m

Length: 112 cm

Height: 355 mm

Width: 305 mm

Weight: 59 kg

Scorpion night sight

Magnification: ×5·8 and ×1·6

Field of view: 142 mils (8°) and 498 mils (28°)

Objective focus: Variable 50 m – ∞ and fixed at 30 m

Length: 112 cm

Height: 400 mm

Width: 355 mm

Weight: 59 kg

Rank Pullin Controls Ltd, Langston Road, Debden, Loughton, Essex, England.

4791.193

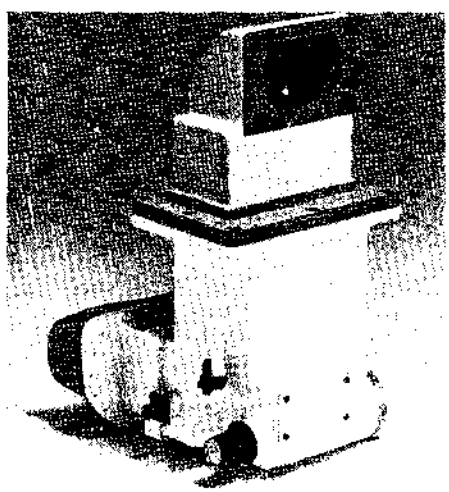
SS120 NIGHT SIGHT

The SS120 is designed for use in the Chieftain tank to provide the commander with night surveillance, target acquisition and assistance in laying the main armament. It employs a second generation image intensifier tube. The sight is made up of components built up as discrete assemblies which, for ease of maintenance, can easily be broken into four main sub-assemblies

CONTRACTOR

Rank Pullin Controls Ltd, Langston Road, Loughton, Essex IG10 3TW, England.

3817.193



SS130 DRIVING PERISCOPE

The SS130 periscopic vehicle driver's night vision equipment enables drivers of AFCVs to have passive night vision without needing IR lighting. It is suitable for fitting into the sight aperture of many existing military vehicles and patrol boats. The general configuration can be seen from the photograph.

The SS130 uses a second-generation intensifier tube, and has a field of view 50° (horizontal) by 40° (vertical).

SS141, SS142, AND SS162 COMMANDER SERIES SIGHTS

These are compact periscopic sights designed specifically for the commander's position in small armoured vehicles. The SS141 and SS142 night sights are virtually identical, the only difference being that the head mirror of the latter can be elevated up to 20 degrees for the rapid identification of low flying aircraft. Both sights are based on a second generation image intensifier tube and carry integrated filters to allow daylight use in an emergency. The bi-ocular eyepiece provides × 2·7 magnification which gives a target detection of 1300 metres at night.

The SS162 is a day sight which is interchangeable with the SS142.

CONTRACTOR

Rank Pullin Controls Ltd, Langston Road, Loughton, Essex IG10 3TW, England.

4788.193

SS200 FIRE CONTROL SYSTEM

The SS200 is a computerised fire control system based on the various versions of the Rank Argus day/night sight. It is intended to enhance the fighting capability of armoured vehicles and can be designed to meet customer requirements.

The system incorporates a laser rangefinder and a fire control computer, designed by Rank Pullin, which is coupled to a moving aiming mark within the sight. It takes into account four main parameters: range of target from the laser rangefinder, trunnion tilt of the gun, type of ammunition selected and the crossing speed of the target. The sighting system avoids the use of a ballistic reticle, thereby preventing a misinterpretation or incorrect interpolation when using the latter. The cross-shaped aiming mark is automatically adjusted by the computer during the complete tracking and firing sequence. The reticle is retained as a reversionary mode.

The fire control system has five elements:

(1) the computer which is the ballistic calculator and provides interface between system, gun, laser, sensors, position encoder, sight displays and crew

(2) the commander's control panel which includes a range display panel and position switches for designation of ammunition type

(3) the trunnion tilt sensor

(4) turret angle sensor which measures the angle turned by the turret over a measured time

(5) the gunner's sight which has a day/night capability with an integral laser rangefinder.

The SS200 is intended primarily for the retrofit market, for both medium and small battle tanks, and also for vehicles such as armoured personnel carriers which mount a gun

Rank Pullin Controls Ltd, Langston Road, Loughton, Essex IG10 3TW, England.

4790.193
SS500 ARMOURED VEHICLE THERMAL SIGHT

The SS500 is a thermal sight based on the Rank Pullin Argus sight (**3796.0930**), and the thermal imager (**4789.193**) under development by the company. It operates in the commander or gunner position and is instantly switchable from day to thermal imager use to allow 24-hour engagement of targets. A dual magnification thermal channel is provided with a remote TV display option. An integral laser rangefinder is available.

CHARACTERISTICS

Weight: 36 kg

Thermal imager

Wavelength: 8 – 13 μm

Field of view: 16° × 12° (wide); 5·7° × 4·3° (narrow)

Magnification: ×7 (wide) or ×2·5 (narrow)

Day system

Field of view: 17° × 10° (wide); 6° (narrow)

Magnification: ×1 (wide) or ×9 (narrow)

STATUS

In development.

CONTRACTOR

Rank Pullin Controls Ltd, Langston Road, Loughton, Essex IG10 3TW, England.

4789.193
RANK PULLIN THERMAL IMAGER

The Rank Pullin thermal imager is a mobile, compact lightweight unit designed to operate effectively under battlefield conditions. It uses the SPRITE detector technology to produce a TV/video display with high thermal and spatial resolution.

The imager consist of six basic elements:

(1) the scanner unit containing the scan mechanism and associated optics, the SPRITE detector and cryogenic cooling head, the scanner drive and detector head amplifier modules
(2) a telescopic unit; a variety of single and dual field of view telescopes are available
(3) the processing electronics unit
(4) a display unit
(5) a control unit (alternatively the controls may be incorporated in the display unit
(6) cooling services for the detector.

The thermal imager is designed for surveillance but alternative configurations are available for vehicle or airborne applications.

CONTRACTOR

Rank Pullin Controls Ltd, Langston Road, Loughton, Essex IG10 3TW, England.

5716.193
RANK PULLIN SIGHTS

In addition to the individual sights manufactured by Rank Pullin Controls which are described in this section, the company has produced a considerable range of optical instruments for military use. These include night and day sights and a brief summary of these devices follows:

SS20 Night Sight

This is a hand-held surveillance night sight with fixed eyepiece focus and simplified controls. It employs a 25 mm cascade image intensifier tube giving a range in clear starlight of 700 metres for detection, 500 metres for recognition and 300 metres for identification. Weight is 2·78 kg.

SS30 Crew-served Weapon Sight

The SS30 is intended for fitment to anti-tank weapons, howitzers and field artillery. A right angle eyepiece and graticules specific to requirements are available.

SS32 Night Observation Device

The SS32 long-range NOD, also known as 'Twiggy', uses a first generation cascade image intensifier to provide a range out to 1800 metres in clear starlight. Several thousand SS32 devices are in service throughout the world.

SS59 Crew-served Weapon Sight

This second generation device gives a range out to 1400 metres in clear starlight. It has a fixed eyepiece focus and is intended for fitment to anti-tank weapons, field artillery and howitzers.

SS69 Night Observation Device

The SS69 is a second generation version of the SS32 and provides approximately the same performance. Mechanical construction is very similar but it is about 100 mm shorter.

SS80 Lightweight Night Sight

The SS80 is Rank's latest development in small arms night vision. It weighs less than 1 kg, uses a second generation tube and is suitable for mounting on any automatic weapon or anti-tank gun. Magnification is ×3·8 and recognition range of a standing man in clear starlight is 400 metres.

SS82 Night Pocketscope

A development of the SS80, the SS82 pocketscope can be either hand-held or mounted on a small arms weapon. Magnification is ×2 and the recognition range of a standing man in clear starlight is 210 metres.

Rank Pullin Controls Ltd, Langston Road, Loughton, Essex IG10 3TW, England.

4260.193
THORN EMI MULTI-ROLE THERMAL IMAGER

The Multi-Role Thermal Imager (MRTI) is one of a number of thermal imagers developed by Thorn EMI under the UK MoD Thermal Imaging Common Modules (TICM) programme. The MRTI uses Class 1 modules from this and has been developed as direct and indirect view systems. Both systems are now in use with the British Army and the Royal Navy. MRTI is suited to a wide range of applications on the battlefield, for offshore patrol, airborne surveillance, weapon aiming and observation of mortar and artillery fire.

Thermal radiation is detected by the cadmium mercury telluride detector array which is scanned across the scene in a series-parallel mode. The detector array operates at 80°K and can be cooled to its working temperature by either a Joule-Thompson cooler using compressed air or by a closed-cycle cooling engine. MRTI is configured to use a 0·6 litre air bottle which, when charged to a pressure of 300 atmospheres, will cool the detector for up to 4·5 hours. The alternative closed cycle cooler has a power consumption of about 40 watts. Power to the rest of the imager can be supplied at voltages between 10 and 30 volts, with a consumption of less than 7 watts.

The system operates in the 8 – 13 μm band and two telescope fields of view are provided. Alternative telescopes are available to give enhanced performances. The equipment maintains focus when switched from one field of view to another. Controls for temperature offset and temperature window are provided and enable the operator to emphasise different temperature ranges within the scene under view. Hot-white or cold-white is switch selectable.

When used in the direct role the thermal scene is reconstructed using a scanned LED array. By adding another module to the direct view system a TV Compatible (CCIR) output to a remote display can be obtained to form the indirect view system. The TV monitor can be either mounted on the imager or remoted.

MRTI in use in the field

CHARACTERISTICS

Waveband: 8 – 13 μm

Temperature sensitivity: 0·1°K

Field of view: 4·9° × 3·2° narrow; 12·9° × 8° (wide)

Focusing range: 10 m – ∞ (wide); 30 m – ∞ (narrow)

Display: Red LED raster with illuminated graticule and warning symbols for low battery and low air supply.

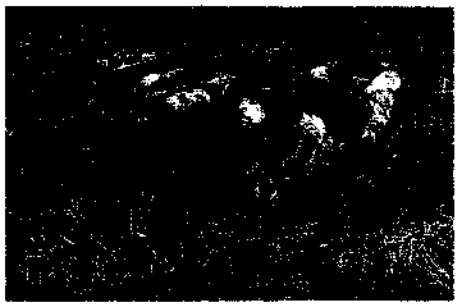
Dimensions: 480 × 280 × 190 mm

Weight: Thermal imager 10·7 kg (including bottle and battery); remote viewing unit 1·3 kg

STATUS

In production. The equipment is also being developed as a weapon fire control system on helicopters. Trials have been conducted on an Army Air Corps Scout helicopter. British Aerospace are offering the MRTI for use on the Swingfire missile to allow use at night or in poor visibility. Thorn EMI is co-operating with OIP Optics, Belgium in the production of a thermal imager, based on the MRTI, for integration with the LRS-5 fire control system (**4744.193**). Thorn EMI has also been awarded an £18 million contract to supply general purpose thermal imager repair equipments to the British Army.

CONTRACTOR



Thorn EMI Electronics Ltd, Defence Systems Division, Victoria Road, Feltham, Middlesex TW13 7DZ, England.

4703.193
OBSERVER THERMAL IMAGING SYSTEM (OTIS)
OTIS is an adaption of the multi-role thermal imager (MRTI) (**4260.193**) together with a laser rangefinder and angulation head. The MRTI and the laser rangefinder are mutually boresighted. The equipment is man-portable and is intended for application in battlefield surveillance, observation and control of artillery and mortar fire and target tracking for laser guided weapons.

Azimuth and elevation readings are available as mechanical slipping scales or digital readouts. All other technical characteristics are as given for the MRTI.

STATUS
In production for the UK MoD under a contract worth almost £15 million.

CONTRACTOR
Thorn EMI Electronics Ltd, Defence Systems Division, Victoria Road, Feltham, Middlesex TW13 7DZ, England.

OTIS system in use in the field

4704.193
THORN EMI HAND-HELD THERMAL IMAGER
The Thorn-EMI hand-held thermal imager is a compact lightweight unit intended for use by reconnaissance troops and forward observation officers, as well as a wide range of civil applications. The equipment uses modules developed from the UK Class 1 thermal imaging common module programme and employs a great deal of the technology which led to the MRTI (**4260.193**) and OTIS (**4703.193**) thermal imagers.

It is, however, considerably lighter than either of those equipments, with the electronics having been hybridised to reduce the weight, but maintains considerable commonality to reduce spares holdings and ease maintenance.

CHARACTERISTICS
Waveband: 8 – 12 μm
Detector: Series/parallel Cadmium Mercury Telluride
Field of view: Wide 20° × 8·6° (× 2 magnification); Narrow 8° × 3·4° (×5 magnification)
Focusing range: 5m – ∞
Display: Red LED raster with illuminated graticule and warning symbols for low battery and low air bottle supply
Minimum resolvable temperature difference: 0·3°K
Dimensions: 470 × 210 × 160 mm
Weight: 5 kg (including cooling air bottle and battery)

STATUS
In production. Contracts worth over £18 million have been awarded by the UK MoD in June 1984 for the supply of a large number of this hand-held imager to the British Army.

CONTRACTOR
Thorn EMI Electronics Ltd, Defence Systems Division, Victoria Road, Feltham, Middlesex TW13 7DZ, England.

Thorn EMI hand-held thermal imager

4783.193
UNITED SCIENTIFIC ELECTRO-OPTICAL PRODUCTS
United Scientific Instruments manufactures a number of electro-optical devices. The company is a member of the United Scientific Group and works in collaboration with Avimo, a member of the same group. Brief details are given below of other equipments in the group's range:

LH-83 Hand-held Laser Rangefinder
The LH-83 provides laser rangefinder capability in a hand-held system configuration. The small, lightweight battery operated device is designed to withstand field operating environments.

CHARACTERISTICS
Range: 100 – 4000 m
Range resolution: 5 m
Magnification: ×6
Field of view: 5°
Dimensions: 65 × 165 × 198 mm
Weight: 1·5 kg

VML 23 Vehicle Mounted Laser
The VML 23 is designed for external mounting on armoured fighting vehicles. It is normally mounted on the gun mantlet and protected by an armoured cover. Alignment with the gun bore permits use of the vehicle standard gunner sight for aiming the laser. The instrument is capable of measuring two separate ranges concurrently.

CHARACTERISTICS
Laser: Dye Q-switched Nd:YAG
Wavelength: 1·064 μm
Radiant energy: 45 mJ
Magnification: ×7
Field of view: 7°
Range: 200 – 9995 m
Range resolution: 5 m

NV39T Driver's Night Vision Viewer
The NV39T provides the 'T' series battle tanks with a complete night driving capability. It has been designed to mount in the vehicle as a direct replacement for the daylight periscope and uses a second generation tube.

NV40 Passive Night Vision Periscope
The NV40 night vision periscope comprises a night vision elbow, a periscope head and a mount. The night vision elbow is a modified and improved version of the standard US Army elbow. The persicope head is similar to the existing IR sight but all the optics have high efficiency coatings to prevent glare and improve image contrast.

NV44 Tank Periscope
The NV44 periscope is intended as a replacement for the M20 daylight periscope on the M41 and M47 tanks and provides both day and night fire control by adapting the fire control module of the M60A1 tank. The day body contains a ×9 power telescope with a unit vision window. The passive night elbow mounts onto the day body and uses a second generation image intensifier.

NV46 Passive Night Vision Periscope
The NV46 provides passive night vision for the commander in the T54, T55 and T59 battle tanks. The instrument employs a second generation image intensifier and is directly interchangeable with the existing IR sight. It provides a magnification of ×4·4 and a field of view of 11 degrees.

AN/PAQ-4 IR Laser Aiming Light
The AN/PAQ-4 uses an IR laser to provide an accurate method of convert weapon aiming and target-spotting during night operations. It is mounted directly on the weapon and the pulsed laser light is viewed through night vision goggles or other IR sensitive systems.

AN/PVS-5A Passive Night Vision Goggles
These goggles use 18 mm microchannel wafer second generation image intensifiers to provide night vision for general purpose observation and firing. The user can view at ranges from 25 cm to infinity by means of a focus adjustment.

United Scientific Instruments Ltd, 10 Fitzroy Square, London W1P 6AB, England.

Vickers/GEC CO_2 tank laser rangefinder

5725.193
VICKERS/GEC CO_2 TANK LASER RANGEFINDER
This is a development, by Vickers Instruments and GEC Avionics, as part of a study to prove the advantages of CO_2 lasers in the penetration of smoke and fog. It is based on the CO_2 TEA laser (transversely-excited laser) which operates near atmospheric pressure and transmits very short pulses of radiation at high power. The study is intended to provide a laser rangefinder as part of a new battle tank sighting system.

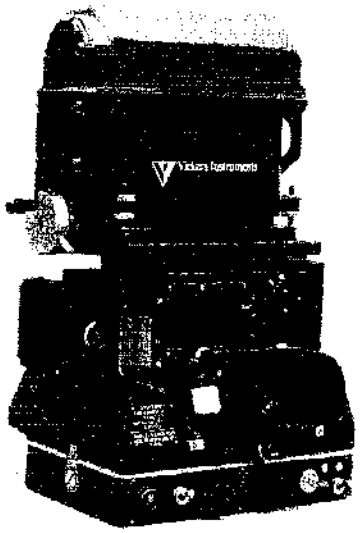
The 10 micron wavelength of the laser rangefinder is compatible with that of thermal imagers and consequently offers advantages in operational use and in optical design. The CO_2 laser is also intrinsically superior in the penetration of smoke, mist and fog compared with the currently used ruby and neodymium-YAG lasers.

The periscopic upper sight has been developed by Vickers Instruments and the laser rangefinder by GEC Avionics.

DEVELOPMENT
Early research into CO_2 lasers was carried out in the UK by the Royal Signals and Radar Establishment. This latest development is part of a contract placed on Vickers Instruments by the UK MoD for the design of a prototype battle tank sight for the Chieftain and Challenger.

STATUS
In development. Successful trials have been carried out in a main battle tank.

CONTRACTORS
Vickers Instruments, Haxby Road, York YO3 7SD, England.



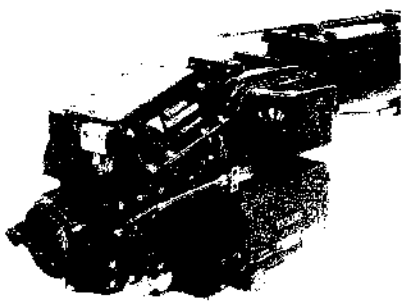
GEC Avionics Ltd, Applied Physics Division, Elstree Way, Borehamwood, Hertfordshire, England.

4705.193
L20 LASER RANGEFINDER

The L20 laser rangefinder provides a modular system periscope monocular sight which can be fitted to most main battle tanks. Modules are available for new installation and for retrofit on Chieftain, Challenger, Vickers Mk.3, M41, MBT and CVR(T) Scorpion tanks.

The L20 consists of three interchangeable modules: optics, laser and electronics. The laser and electronics modules can be removed without dismantling the sight, allowing the latter to be used in a reversionary mode should any of the modules be damaged. A Nd:YAG transceiver provides range readout display in the eyepiece. The CRT gives a computer-controlled aiming mark when linked to fire control systems. In addition the CRT displays output from a remote thermal imager or low-light level TV camera. A ×10 sight for gunnery and an integral periscope for general surveillance are incorporated.

CHARACTERISTICS
Type: 2nd generation Nd:YAG
Wavelength: 1·064 μm
Q-switch: Electro-optic
Transmitted energy: 20 mJ
Clock frequency: 30 MHz
Beam divergence: 0·4 mils
Field of view: 0·8 mils
Range limits: 300 to 10 000 m
Range accuracy: 5 m
PRR: 1 pps
STATUS
A £1 million order for L20 sights was received in mid-1984 from an unspecified African country.
CONTRACTOR
Vickers Instruments, Haxby Road, York YO3 7SD, England.



L20 laser rangefinder

4706.193
L50 SIGHT LASER RANGEFINDER

The L50 sight laser rangefinder is a telescopic gunners sight designed and developed for the main battle tanks T55 and T59. The sight is available in two versions: to provide a laser rangefinding capability for conventional mechanical fire control systems, or for laser rangefinding and aiming mark injection for available computer-based fire control systems. The sight rangefinder can be interchanged with the existing telescope, using the turret aperture without modification to armour, turret or eyepiece.

The L50 is modular in construction and consists of an optics or a laser module, range display and control, aiming mark injection and foot firing pedal. A commander's display module is also available.

CHARACTERISTICS
Type: 2nd generation Nd:YAG
Wavelength: 1·064 μm
Beam divergence: 0·4 mils
Field of view: 0·8 mils
Range limits: 300 to 10 000 m
CONTRACTOR
Vickers Instruments, Haxby Road, York YO3 7SD, England.

L50 laser rangefinder

4708.193
WESTON OPTRONICS NIGHT VISION SYSTEMS

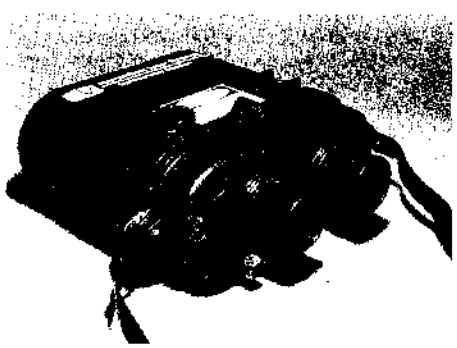
Weston Optronics has developed a number of image intensified night vision systems for a variety of applications. These include the LIVE (Low Light Intensified Vision Equipment) series, the WINS 1801 and the Modulux system.

The LIVE series consists of two equipments – LIVE 172 and LIVE 062. Both are designed for military use for general observation and target acquisition/recognition. LIVE 172 is a long-range man-portable device for observation from static locations or vehicles. LIVE 062 is a shorter-range equipment for observation while on foot or when long-range is not required.

The WINS 1801 is an image-intensifier night sight, for use with rifles or, with the addition of a pistol grip, as a hand-held viewer. The sight is 204 mm long, 63 mm in diameter and weighs 1·2 kg. Magnification is ×2·8 giving a field view of 14·6°.

Modulux is a high performance modular night vision equipment intended primarily for security and police forces. It is available with either a first or second generation intensifier tube.

CONTRACTOR
Weston Optronics, 580 Great Cambridge Road, Enfield, Middlesex EN1 3RX, England.



UNITED STATES OF AMERICA

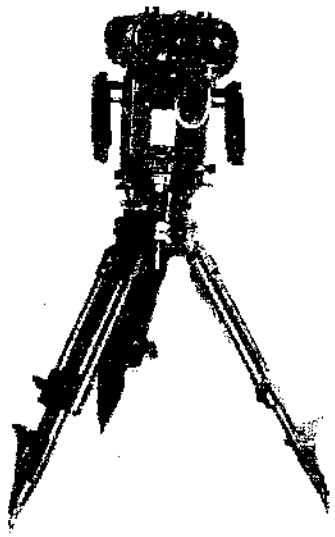
4281.193
LRR-104 Mk IV LASER RANGEFINDERS

The LRR-104 Mark IV is a self-contained, hand-held rangefinder used primarily by artillery forward observers, mortar fire controllers, infantry units and reconnaissance patrols. The Mark IV is rugged, waterproof and fully tested to operate under the most adverse battlefield conditions.

The device operates with any one of three battery types (Alkaline, Lithium or N Cad), all three of which are available worldwide. An optional multi-pin remote connector located below the right eyepiece expands the capabilities to include integration with accessories such as a remote display and control unit, artillery tripod/goniometer, battery charger and computerised fire control systems.

CHARACTERISTICS
Type: Nd:YAG
Wavelength: 1·064 μm
Output energy: 3 mJ
Detector: Silicon avalanche photodiode
Field of view: 2·6 mrad
Range: 50 – 9995 m
Range accuracy: 3 m
Dimensions: 190 × 216 × 79 mm
Weight: 2 kg
CONTRACTOR
International Laser Systems Inc, 3404 N Orange Blossom Trail, Orlando, Florida 32804, USA.

ILS LRR-104 Mk IV hand-held laser rangefinder



4709.193
LRR 104 MARK V LASER RANGEFINDER

The Mark V is the fifth model in the ILS series of LRR-104 hand-held rangefinders. Although smaller and lighter than the Mark IV the latest design retains the critical performance of its predecessor. The Mark V is approximately the size of a pair of 7 × 35 binoculars. In addition to the use by forward observers and artillery units for direct and indirect fire control, the Mark V fills a need of many special forces for an extremely small rangefinder. Instant range operation enables the operator to distinguish moving targets up to 10 km away. Range data and operational indicators are displayed in the sighting optics.

CHARACTERISTICS
Type: Nd:YAG
Wavelength: 1·064 μm
Output energy: 4 mJ nominal
Detector: Silicon avalanche photodiode
Aperture: 35 mm
Field of view: 5 mrad
Range: 50 – 9995 m
Accuracy: 3 m
Dimensions: 127 × 182 × 44 mm
Weight: 2 kg
CONTRACTOR
International Laser Systems Inc, 3404 N Orange Blossom Trail, Orlando, Florica 32804, USA.

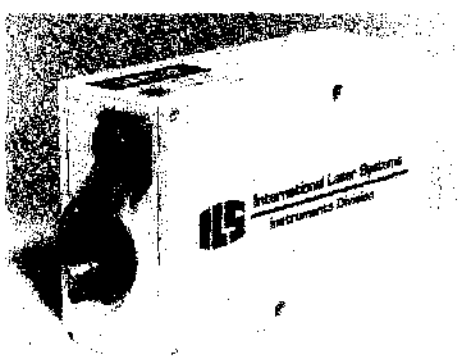
4710.193
LRR-104/20 ARTILLERY RANGEFINDER
The LRR-104/20 has been designed using the same basic components as found in the LRR-104 Mark IV (**4281.193**). The unit is identical to the Mark IV in size, weight and durability. The tripod/goniometer assembly features azimuth and elevation indicators to one mil accuracy. The pistol grip handles contain Power and Fire buttons for remote operation of the rangefinder and provide easy manipulation of scan in azimuth and elevation.

CHARACTERISTICS
Type: Nd:YAG
Wavelength: 1·064 μm
Output energy: 12 mJ
Detector: Silicon avalanche photodiode
Field of view: 2·6 mrad
Range: 50 – 199 995 m
Accuracy: 3 m
Dimensions: 190 × 216 × 79 mm
Weight: 2 kg
CONTRACTOR
International Laser Systems Inc, 3404 N Orange Blossom Trail, Orlando, Florida 32804, USA.

LRR-104/20 artillery rangefinder

3200.193
AN/GVS-5 LASER RANGEFINDER
The AN/GVS-5 is a portable, hand-held laser rangefinder resembling, and about the same size as, a pair of binoculars. The unit is completely self-contained and incorporates an internal power supply in the form of a Ni-Cd battery. A neodymium-YAG laser is employed, Q-switched by a chemical Q-switch wafer. The latter consists of a saturable absorbing dye in acrylic plastic which becomes transparent at the correct power level to produce the laser pulse.

The transmitter and receiver optics are combined into a single group comprising the housing, transmitter telescope, and receiver/sighting telescope. This is essentially like one half of a normal binocular assembly with an objective lens and an eyepiece. However, a beam splitter in the optical path provides a means for projection of a reticle and LED range display to the eyepiece, and for providing an optical path to the photodiode detector for the returned laser energy.

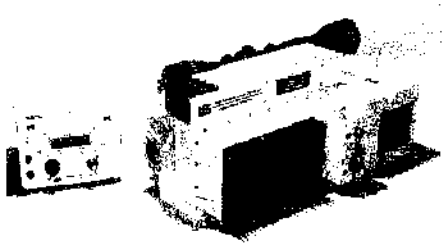


CHARACTERISTICS
Type: AN/GVS-5
Laser: Nd-YAG, Q-switched
Wavelength: 1·06 microns
Energy output: <15 mJ
Max range: Classified
Range gate: Continuously adjustable to 5 km
Beam divergence: <1 mrad
Time to range: 1 s
Ranges per battery charge: 700 at 24°C; 350 at 71°C; 200 at -32°C
Operating temperature range: -46 to +71°C
Weight: 2·27 kg
DEVELOPMENT
Development was commenced by the US Army Electronics Command. In 1974 RCA was awarded a $1·5 million contract for development of an initial batch of 20 ED models for test and evaluation; type classification was completed in July 1977 and a production contract was awarded to RCA in December 1977.
STATUS
RCA has been awarded several contracts since 1977 which have totalled over 6000 units.
CONTRACTOR
RCA Automated Systems, Burlington, Massachusetts, USA.

AN/GVS-5 laser rangefinders undergo final inspection

4711.093
TK-640 LASER RANGEFINDER
The TK-640 is readily adaptable for use as an onboard fire control system for battle tanks, assault vehicles and landing craft. It uses a Nd:YAG laser beam to determine accurate range of both day and night targets. The range data determined is provided in the form of electronic signals to drive a 4-digit, 7-segment LED display.

CHARACTERISTICS
Type: Nd:YAG
Wavelength: 1·064 μm
Beam divergence: 0·7 mrad nominal
Output energy: 6 mJ nominal
Detector: Silicon avalanche photodiode
Range: 50 – 9990 m
Range accuracy: 5 m
Dimensions: 190 × 56 × 102 mm
Weight: 2·3 kg
CONTRACTOR
International Laser Systems Inc, 3404 N Orange Blossom Trail, Orlando, Florida 32804, USA.



TK-640 laser rangefinder

4712.093
N-90 SERIES LASER
The N-90 laser was originally designed as a laboratory or industrial system but various options and combinations are available for use in military applications. When combined with an ILS high or medium sensitivity receiver and range counter, the NT-90 becomes a high performance rangefinder with range capabilities out to 20 to 40 km. In this option, the high sensitivity receiver is intended for use against small, long-range targets or when the use of a low laser power is required. The medium sensitivity receiver provides for normal ranging applications.

The addition of an ILS Simulator Module to the basic laser results in a low-cost target simulator for use in verifying aircraft sensor systems and pilot training.

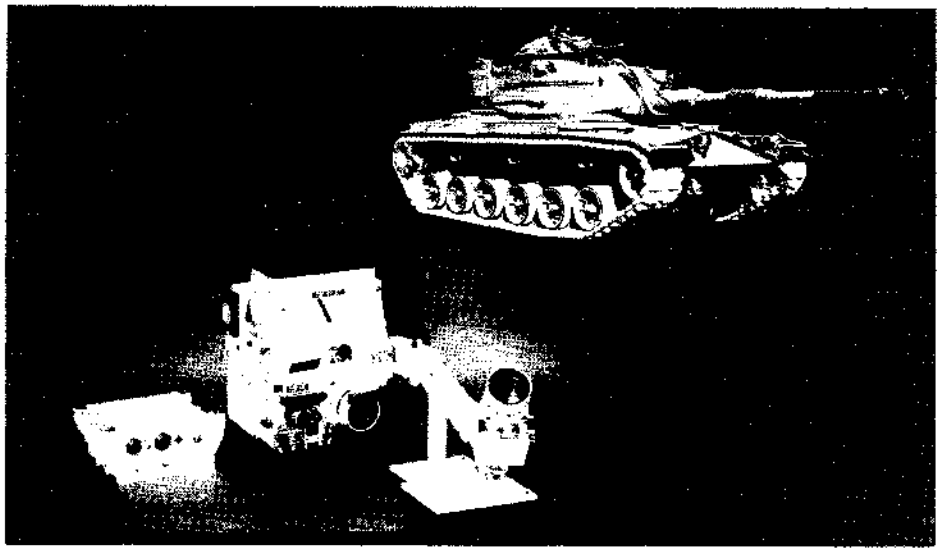
A number of other models are available for specific purposes and various power output options.

CHARACTERISTICS
Wavelength: 1·064 μm
Max energy: 90 mJ
Max repetition rate: 20 pps
Pulse width: 18 ±4 ns
Beam divergence: 2·5 mrads raw beam; 0·5 mrad collimated
Beam diameter: 6·3 mm raw beam; 38 mm collimated
Dimensions: 457 × 254 × 152 mm
Weight: 10 kg
CONTRACTOR
International Laser Systems Inc, 3404 N Orange Blossom Trail, Orlando, Florida 32804, USA

NT-90 MSR receiver and HRC counter

4112.193
AN/VSG-2 TANK THERMAL SIGHT

The AN/VSG-2 is a thermal imaging infra-red device designed for fitting in US Army M60 tanks as part of an upgrading programme for that series of vehicles. New production M60 tanks have been designated M60A3 since February 1978 when the AN/VVG-2 laser rangefinder and a solid-state ballistics computer were introduced to the tank's fire control system, and the AN/VSG-2 thermal imaging equipment replaced the gunner's passive night vision periscope from mid-1979 onward.



Technical details and performance data have not been released but the latter may reasonably be expected to be no less than those achieved by other land battlefield IR systems based on the range of infra-red 'common modules' developed by Texas Instruments (eg AN/TAS-4, AN/TAS-5, AN/TAS-6).

STATUS

In 1983 total procurement of AN/VSG-2 tank thermal sight equipment had exceeded 7000 units to fulfil M60 tank requirements. The US Army plans to convert all M60A3 passive tank sights to thermal imaging and to upgrade a large number of M60A1 vehicles to the same system.

CONTRACTOR

Texas Instruments Incorporated, PO Box 226015, Dallas, Texas 75266, USA.

Texas Instruments AN/VSG-2 thermal sight for M60 series

1803.193
AN/VVS-1 TANK LASER SYSTEM

This system was developed by Hughes for the US Army M60A1 main battle tank. It consists of a laser rangefinder integrated with a complete fire control system which includes its own computer and the relevant sensors for ballistic calculations. The project was undertaken in the early 1970s to increase the first-round hit capability of the M60A1's 105 mm gun, against both standing and moving targets. Tanks converted by addition of the new fire control system are designated M60A3.

The target range data is processed in the solid-state computer together with crosswind component, gun trunnion cant, bore wear, air temperature, altitude, and tracking rate to provide the correct azimuth and elevation firing values. The computer can provide computation for nine types of ammunition, and the system incorporates self-test facilities.

STATUS

By the end of 1983 Hughes had delivered more than 2000 of these systems for M60A3 tanks. They are now being produced by Kollsman Instrument Company. It was announced in April 1983 that the Spanish Army had selected a version of the M60A3 system for its M48 tanks. The new version uses 70 per cent of the MA60A3 system plus key modules from the M1 rangefinder (**3814.193**).

Kollsman received a contract in January 1984 to produce 461 systems for the US Army M60 tanks. In addition, 94 will be built for tanks for Egypt and 100 will be produced for Saudi Arabia.

CONTRACTORS

Hughes Aircraft Company, PO Box 902, El Segundo, California 90245, USA.

3048.193
AN/VVS-2 DRIVER'S NIGHT VISION VIEWER

The VVS-2 is a passive night vision device for drivers of AFVs and has been developed for use by the US Army, initially in M60 tanks. Unlike systems such as the active infra-red M19 and M24 drivers' viewers, the VVS-2 image-intensifier equipment is a totally passive system requiring no active illumination, such as IR searchlights, or headlights. The new system is also claimed to offer a 65 per cent greater field of view than earlier devices. Another advantage is the 'bi-ocular' display which allows the driver to view the scene with both eyes through one, large diameter, eyepiece from a distance of several inches. The oval-shaped field of view of 45° horizontal by 38° vertical is presented with unity magnification. All objects located more than four metres from the tank are presented in focus. The

Three current production versions of Baird Corporation AN/VVS-2(V) night vision driving equipment, (left to right): Model AN/VVS-2(V)1A for M60A3, Model AN/VVS-2(V)2A for M1 tank, and Model 1924 which can be mounted on M60A1/2, M48, M47, M41, M113 and LVTP-7 vehicles

head prism protruding from the tank hull is tilted to prevent reflection of enemy searchlights. There are different versions of the AN/VVS-2 viewer for specific tank models: the AN/VVS-2(V)1A is designed for the M60A3, the AN/VVS-2(V)2A is designed for the M1, and the AN/VVS-2(V)3 is designed for the M2 and M3 series tanks. These viewers have the 'internal azimuth rotational mount.' This mount is engineered to provide a water-tight seal, easy viewer installation and removal, and a reliable azimuth rotation. These versions are specified by the US Army as standard items for the designated vehicles and fit directly without modifications.

For other US armoured vehicles such as M60A1, M60A2, M48, M47, M41, M113, and LVTP-7, Baird developed the NDS-2 Model 1924. This viewer is an exact replacement for the M19 and M24 active IR viewers. No vehicle modification is required and the viewer installation can be accomplished in the field. All vehicles that use the NDS-2 model 1924 mount can be field retrofitted with a modified tank hatch insert that will accept the 'internal azimuth rotation mount'.

NDS-2

This is the designation given to an export package version of the VVS-2. It provides a rotatable 45° field of view and incorporates a second generation image intensifier. NDS-2 night driving system packages are configured to suit specific AFV types and consist of a vehicle modification kit and test equipment to support the viewer. Baird has designed NDS-2 packages for both US and foreign vehicles.

CHARACTERISTICS

Field of view: 45 × 38°
Total field coverage: 135° horizontal × 38° vertical
Depth of focus: 4 m – ∞
System resolution: 1·2 mils
System magnification: ×1
Linear distortion: <4%
Image brightness: Variable
Objective lens: f1·09, 33·5 mm focal length
Image intensifier: 25 mm with automatic gain control and bright source protection
Image tube gain: 25 000 minimum
Bi-ocular magnifier: 45°, fixed focus

STATUS

In production. Baird has delivered a modified, requalified version of the AN/VVS-2 to the US Army for use on the M1 tank. Versions have also been engineered for US M2 and M3 armoured vehicles.

CONTRACTOR

Baird Corporation, 125 Middlesex Turnpike, Bedford, Massachusetts 01730, USA.

4155.193

M32E1 MODEL 9880 NIGHT VISION ELBOW

The M32E1 Model 9880 passive elbow provides a visually secure night fire control capability for a number of armoured vehicle types. It is designed as an interchangeable replacement for the infra-red M32 and M36 elbows with no vehicle modification required. The configuration and performance of the elbow is in accordance with the current revision of the US Army specification MIL-E-48441.

The equipment uses a 25 mm second-generation image intensifier tube also produced by Varo. Image tube gain and reticle brightness are manually adjustable to compensate for different levels of ambient lighting. Automatic gain control circuitry is employed to maintain automatically the viewed scene illumination at a constant level during periods of changing light level conditions such as the period from sunset to full darkness. This allows the operator of the sight to use the sight without having to re-adjust the tube gain control every few minutes during this period. The tube features muzzle-flash protection which prevents the tube from being damaged by high intensity short duration flashes of light. The flash protection circuit is designed to recover in time for the observer to see the round hit the target.

CHARACTERISTICS

Optical
Magnification: ×7·2
Field of view: 7·1°
System resolution
At 3 × 10^{-3} ft L: 5·6 lp/mr
At 3 × 10^{-5} ft L: 2·7 lp/mr
Objective focal length: 200 mm
Focus range: 50 m – ∞
Eyepiece focal length: 27·9 mm
Eyepiece dioptre focus: +4 to –4

CONTRACTOR

Varo Inc, Integrated Systems Division, 2201 W Walnut St, PO Box 401267, Garland, Texas 75040, USA.

4154.193

MODEL 9891 COMMANDER'S PERISCOPE

The Model 9891 commander's periscope was developed as a direct replacement for the TKN-1 used by the commander in the Soviet-designed T55 and T62 tanks to provide both day and night viewing capability. The image intensifier tube features muzzle-flash protection which prevents the tube from being damaged by high intensity short duration flashes of light. The flash protection circuit is designed to recover in time for the observer to see the round hit the target. Automatic brightness control is a standard feature, and permits viewing during the twilight hours of dusk and dawn and protects the tube against bright flashes of light.

The periscope features a stabilised head mirror to provide the commander with improved on-the-move viewing capability. An illuminated projected reticle permits range information from Varo Model 9897 laser rangefinder (**4151.193**) to be displayed in the field of view.

CHARACTERISTICS

4153.193

MODEL 9892 DRIVER'S VIEWER

The Varo Model 9892 driver's viewer was developed to provide night-time operational capability for a wide range of Soviet-designed armoured vehicles such as the T54, T55 and T62. It complements Varo's Model 9894 gunner's periscope to provide an effective night fire control system capability. The periscope was developed as a direct replacement for the TVN-2 IR driver's viewer and mounts interchangeably with the existing daylight vision block. Two-channel binocular viewing provides maximum stereoscopic viewing for added depth perception and increased user comfort.

CHARACTERISTICS

Optical
Magnification: ×1

4150.193

MODEL 9894 GUNNER'S PERISCOPE

The Model 9894 integrated gunner's day/night periscope was developed as a direct replacement for the TPN-1 gunner's periscope used in Soviet-designed T55 and T62 tanks. Installation in these tanks can be accomplished without modification. When integrated with Varo's Model 9895 ballistic computer system (**4156.181**), it provides a full solution fire control system. The major components of the Model 9894 gunner's periscope include: a head/mount assembly with stabilised head mirror for improved viewing and increased ranging accuracy while moving; Model 9880 passive night vision elbow; and a Model 9897 daylight elbow with an integrated laser rangefinder for fast, accurate (±5 m) ranging. Range data is displayed in both day and night fields of view. Apart from the mechanical changes necessary to accommodate the Soviet tank design, this equipment is virtually the same as the Model 9898 (**4149.193**).

CHARACTERISTICS

Magnification: ×7 (night); ×8 (day)
Field of view: 7·5° (night); 8° (day)
Objective focal length: 200 mm (night)
Focus range: 50 m – ∞ (night); fixed (day)
Eyepiece dioptre focus: ±4 (night/day)
Image intensifier tube: 25 mm MCP

Performance (night elbow)*	Light Level	
	10^{-1} lux	10^{-3} lux
Man	1316 m	626 m
Jeep	2100 m	1000 m
Tank	3220 m	1533 m

*Range is calculated based on a 30% contrast target and 3 resolution elements required for detection

CONTRACTOR

4152.193
MODEL 9896 NIGHT VISION ELBOW

The Model 9896 passive elbow provides fire control capability for armoured vehicles where space is limited and a small compact periscope with high performance is required. It was specifically developed to fulfil the night vision requirements of the M41, M47, and M48 tanks currently using the M20 daylight periscope. The Model 9896 passive elbow can be used with the existing M20 daylight periscope to provide both day and night viewing capability.

The passive elbow features an illuminated projected reticle that is fully adjustable to compensate for varying scene brightness and target contrasts. The standard NATO reticle is provided unless otherwise specified. The tube features muzzle-flash protection which prevents the tube from being damaged by high intensity short duration flashes of light. The flash protection circuit is designed to recover in time for the observer to see the round hit the target. Automatic brightness control is a standard feature. This feature permits viewing during the twilight hours of dusk and dawn and protects the tube against bright flashes of light. The equipment is designed to operate from vehicle power under normal conditions or from a single 2·7 V mercury battery under emergency conditions.

CHARACTERISTICS
Optical
Magnification: ×5·2
Field of view: 10·5°
Objective focal length: 135 mm
Objective f number: 1·5
Focus range: 25 m – ∞
Eyepiece dioptre focus: 2 to −5
Image intensifier tube
Type: 25 mm micro-channel inverter
Typical resolution: 28 lp/mm
Photocathode response: S-20VR

4151.193
MODEL 9897 LASER RANGEFINDER

The Model 9897 daylight elbow/laser rangefinder was developed as a major component of Models 9894 and 9898 (**4150.193** and **4149.193**) gunner's periscopes and is a direct replacement in the US Army's M32 periscope. The elbow features a ×8 visual optical system and a tri-axial laser rangefinder. Range data from the laser rangefinder is automatically displayed in both the day and night elbow fields of view and can be remotely displayed to the commander's periscope.

CHARACTERISTICS
Optical
Magnification: ×8
Field of view: 8°
Range focus: Fixed
Eyepiece dioptre focus: ±4
Laser rangefinder transmitter
Type: Nd-YAG
Beam divergence: ≤5 mil
Logic: First/last pulse
Power: 1 MW, 6 mJ
Laser rangefinder receiver
Field of view: 1 mil
Minimum range: 400 m
Max range: 10 000 m
Range accuracy: ±5 m

4149.193
MODEL 9898 GUNNER'S PERISCOPE

The Model 9898 integrated gunner's day/night periscope was developed as a direct replacement for the M32 gunner's periscope used in the M60 and M48 series tanks. It can be used in many other armoured vehicles, such as the M47 and Centurian tanks, by minor modification to the tank. When integrated with Varo's Model 9895 ballistic computer system, it provides a full solution fire control system (**4156.181**). The major components of the Model 9898 gunner's periscope include: the head/mount assembly with stabilised head mirror for improved viewing and increased ranging accuracy while moving; passive night vision elbow (Model 9880); and a Model 9897 daylight elbow with an integrated laser rangefinder for fast, accurate (±5 m) ranging. Range data is displayed in both day and night fields of view.

CHARACTERISTICS
Magnification: ×7 (night); ×8 (day)
Field of view: 7·5° (night); 8° (day)
Objective focal length: 200 mm (night)
Focus range: 50 m – ∞ (night); fixed (day)
Eyepiece dioptre focus: ±4 (night/day)
Image intensifier tube: 25 MCP

Performance (night elbow)*	Light Level	
	10^{-1} lux	10^{-3} lux
Man	1316 m	626 m

5719.193
KOLLMORGEN ELECTRO-OPTICAL SYSTEMS

The Kollmorgen Corporation manufactures a wide variety of land-based electro-optical systems for infantry and armoured vehicle use. Brief details of the main equipments are as follows:

Model 317 M20 Night Vision Kit

The Model 317 night vision kit incorporates a passive night vision channel into the standard M20 sight to provide day/night operation of the periscope. The channel includes an objective lens, a GEN II image intensifier, relay lenses, a day/night mirror assembly and is equipped with a power supply. The kit can also be installed with or without a 1:1 vision block prism.

Model 317 night vision kit

CHARACTERISTICS
Magnification: ×6
Aperture: 3 cm (day); 4·5 cm (night)
Field of view: 8°

Model 332 Day/Night Viewing Periscope

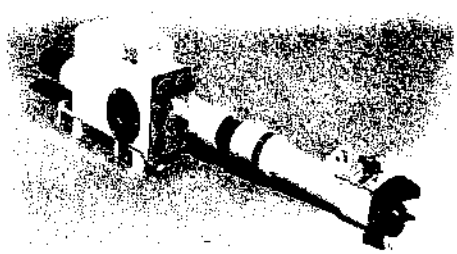
The Model 332 is for use in those applications which require a high performance sight but which have limited space available. The Model 332 offers a narrow interface which adapts either the M32E1 day elbow telescope with a X1 vision block, or the M36E1 night elbow, to provide, alternately, a day sight and a night sight with quick connect/disconnect interchangeability. The unit uses the full aperture of the night vision elbow for improved low light level performance. The primary application of the Model 332 is as a fire control sight for small to mid-calibre combat vehicle gun arrangements.

Although the M332 is designed for the M32E1 daylight elbow and the M36E11 night elbow, the modular construction of the unit is such that adaptors can be designed for many elbow-type telescopes.

Model 910 Integrated Sight

The Model 910 Integrated Sight is a small stabilised system designed to mount on the turret of a tracked vehicle. The sight supplies a reconnaissance capability, or accurate weapon positioning and control to the gunner. Gyro stabilised viewing is provided with two magnifications, ×2 and ×8, and with fields of view of 28° and 7° respectively. The unit can be used independently or can be the master or slave to other subsystems on the vehicle. Regardless of mode, boresight information is generated at all times by the periscope.

Model 910 has almost unlimited access to the visible hemisphere above the vehicle. By means of a gimballed prism, the line of sight can be depressed to −10°, elevated to +85°, and rotated continuously 360° in azimuth. The sight is mounted on a separate plate secured to the vehicle deck. A low power laser can be fitted to the sight.



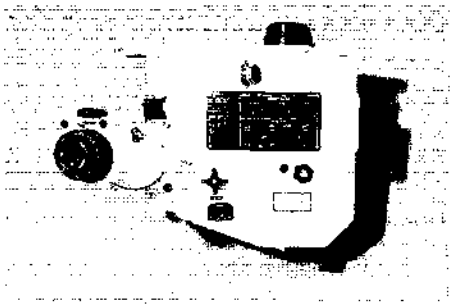
Model 938 Commander's Weapon Station Sight

This is a ×3 power monocular daylight periscope used as a sighting device for the commander's weapon. The instrument is mounted near, and mechanically linked to, the weapon. The line of sight is capable of movement in the vertical plane from −10 to +65°, via a mechanical link to the weapon. A reticle pattern is presented in the field of view.

CHARACTERISTICS
Magnification: ×3
Field of view: 21°
Entrance pupil: 18 mm
Exit pupil: 6 mm

Model 939 Gunner's Auxiliary Sight

The gunner's auxiliary sight is a sealed and pressurised ×8 power optical device that can be used as a primary or back-up sight for the main coaxial armament. The instrument is mounted coaxially with the main gun and is articulated to minimise eyepiece movement when the main/coax weapon is elevated or depressed. A dioptre adjustment is provided to accommodate focal variations between individual observers. Individual reticle patterns may be presented in the field of view. A switchable ND filter is provided to allow use of the sight during high brightness conditions.



Model 939 gunner's auxiliary sight

CHARACTERISTICS
Magnification: ×8
Field of view: 8°
Entrance pupil: 48 mm
Exit pupil: 6 mm

Model 957 Squad Leader's Search Periscope
This instrument is a sealed single magnification optical device that is used as a target acquisition and vehicle protective surveillance sight for the armoured personnel carrier squad commander. The instrument is mounted on the inside of the top deck of the APC with viewing and control functions internal to the vehicle.
CHARACTERISTICS
Magnification: ×4 minimum
Field of view: 12·5°
Exit pupil: 4·5 mm minimum

Model 972 Gunsight Telescope
The gunsight telescope provides the primary interface with the crew when the mobile gun system is operated in the optical track mode. It also integrates the laser rangefinder to share the optical aperture provided by the stabilised sight unit. The telescope contains both day and night viewing capability, has dual eyepieces so that both gunner and squad leader may view the target simultaneously, and relays the image through an interface to a TV scoring camera.
CHARACTERISTICS
Magnification: ×12 (day channel); ×16 (night channel); ×2·5 (laser channel)
Field of view: 5° (day channel); 3° (night channel); 3 mrad (laser channel)
Entrance pupil: 84 mm (day channel); 100 mm (night channel)
Exit pupil: 7 mm

Model 973 periscopic telescope

Model 973 Squad Leader's Periscope Telescope
The squad leader's periscope telescope interfaces with a stabilised sight unit to provide visual interface with the crew when the mobile gun system is operated in the optical acquisition mode. The telescope contains both day and night viewing capability.
CHARACTERISTICS
Magnification: ×3 (day) ×4 (night channel)
Field of view: 20° (day); 12° (night channel)
Entrance pupil: 21 mm (day); 50 mm (night channel)
Exit pupil: 7 mm

Model 998 Fire Control Back-up Sight
This is a ballistic periscope fixed-power daylight monocular sight with a range estimating capability. The sight was designed for sighting and firing the primary 25 mm weapon from the electrically stabilised turret of an M2/M3 tracked vehicle. The sight is purely mechanically linked and will allow either the gunner or the commander secondary gun sighting capability in the event of failure of the primary. The sight has laser protection and an armoured head.

3571.193
AN/VVS-501 NIGHT DRIVING/OBSERVATION VIEWER
The VVS-501 has been developed for the Canadian Defence Forces for use by the drivers and commanders of AFVs. Similar to the US Army VVS-2 (**3048.193**), the VVS-501 is a passive night vision device employing the 25 mm micro-channel intensifier. Thus it requires no supplementary illumination such as for active IR viewers and provides variable gain within the field not available in viewers based on first-generation tubes. This latter fact is most important when lights or fires appear in the field of view.

The VVS-501 is mounted by replacing the day vision block of the driver's and commander's stations of the Leopard tank and the identical day vision block of the driver's station of the General Motors Canada AVGP. The entrance assembly interfaces with the Leopard windshield wiper and the eyepiece assembly is identical to the VVS-2. A stowage case is provided for the viewer or day vision block when not in use. Vehicle power or batteries may be used.

CHARACTERISTICS
Field of view: 45 × 38°
Total field coverage: 135° horizontal × 38° vertical
Depth of focus: 4 m – ∞
System magnification: ×1
Linear distortion: <4%
Image brightness: Variable
Objective lens: f1·08, 33·6 mm focal length
Image intensifier: 25 mm with automatic gain control and bright source protection
Image tube gain: 25 000 minimum
Bi-ocular magnifier: 45°, fixed focus
STATUS
Contracts with GLS Division of Krause-Maffei, Munich, West Germany for Leopard 1 and 2 tanks and DSS Canada for AVGP. Item fully integrated into NATO logistic systems.
CONTRACTOR
Baird Corporation, 125 Middlesex Turnpike, Bedford, Massachusetts 01730, USA.

Baird Corporation AN/VVS-501 night driving observation viewer for Leopard 2 tank

3822.193
MODEL 350 NIGHT DRIVING SIGHT
The Model 350 night driving viewer is a unity power night vision periscope for the operation of armoured vehicles in total darkness. It is passive in operation, requiring no artificial light sources to generate images on the darkest nights.

Electronically enhanced images are presented to the driver on a large bi-ocular viewer, which provides a 44° field of view. The entire system can be easily rotated left and right to cover a 135° field. The Model 350 can be operated on its own internal battery or connected to the vehicle electrical system. An automatic brightness control maintains constant image brightness despite variations in external illumination. A variable gain control allows the driver to select optimum scene brightness over a wide scale. Bright flash protection circuitry momentarily shuts the unit off during high intensity light bursts or muzzle flashes, with instantaneous restoration of a fully detailed image.

Interchangeable mounts are available for all currently operational combat vehicles.

CHARACTERISTICS
Optical
Magnification: ×1
Field of view: 44° horizontal, 35° vertical
Field coverage: 135° horizontal
Focus range: Fixed focus at 12 m
Depth of field: 4 m – ∞
Weight: 7·27 kg
Image tube gain: 25 000 minimum
Type: 25 mm 2nd generation intensifier
Resolution: 28 lp/mm
Photocathode: S-20R

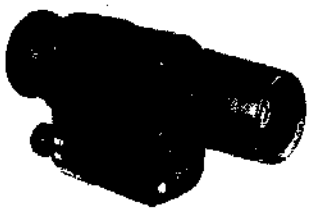
5720.193
LITTON NIGHT VISION PRODUCTS

Litton designs and manufactures a range of small night vision products which includes goggles, pocketscopes and small arms sights. These provide passive viewing under minimal lighting conditions and amplify moonlight and starlight up to 600 times. Second generation image intensifier tubes are used throughout.

AN/PVS-5A night vision goggles



These goggles employ two second generation wafer type image intensifier tube assemblies, each having an 18 mm image format. Magnification is ×1 with a field of view of 40°. Range for a 6-foot (1·83-metre) object is given as 150 metres. Weight is 0·85 kg.

M-826 pocketscope

This sight contains a ×1 power military lens and housing. It is designed for general observation in applications where environmental factors can be a concern. The sight allows recognition of a man at approximately 300 metres under dark night conditions.

M-845 weapons sight

This sight is used for small arms, including 5·56 to 7·62 mm calibres, to give passive night vision sighting and aiming. Magnification is ×1·55 and weight is 0·98 kg.

Model M-906 pocketscope

M-906 pocketscope

The M-906 is a variant of the M-826 designed specially for desert and battlefield use with a special dust cover to protect the unit from sand, dust and grime.

M-907 pocketscope

This is a longer range version with a ×3 magnification lens and housing. It extends the observation range to 700 metres.

M-909 goggles

These goggles are based on the AN/PVS-5A but incorporate an improved objective lens, and higher gain, brighter image intensifiers. These improvements give the M-909 twice the system gain and a 33 per cent increase in useful range. Range on a 6-foot (1·83-metre) object is given as 230 metres with a field of view of 40°. Weight is 0·88 kg.

M-911 pocketscope

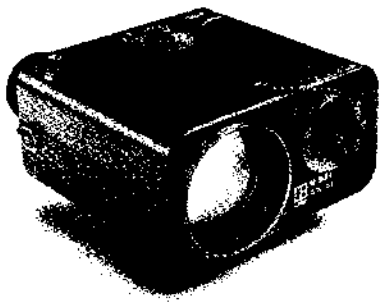
This is a small pocketscope used for observation purposes and in conjunction with camera systems. Either a 26·8 or 75 mm lens is available for the sight, giving ×1 and ×3 magnification, and weights of 0·51 and 0·79 kg, respectively.

M-931 nightscope

This is described under entry **5909.193**

CONTRACTOR

Litton Systems Inc, Electron Devices Division, 1215 South 52nd Street, Tempe, Arizona 85281, USA.



5909.193
M-931 RANGING NIGHTSCOPE

The M-931 ranging nightscope is a medium-range hand-held monocular night viewing system and laser rangefinder. It is designed to satisfy a requirement for a simple passive nightscope and a covert laser rangefinder. The M-931 system uses a high-performance second generation image intensifier assembly. The tube has been specifically designed to operate as part of the target ranging function, as well as providing higher resolution light amplification and output brightness than is normally available in standard second generation image intensifiers. Range is provided on a three-digit LED display located on the back on the unit.

CHARACTERISTICS
Magnification: ×3
Field of view: 13·6°
Recognition range: 700 m
Laser material: Gallium arsenide
Wavelength: 850 mm
Average power: 5 mW
Laser range: 20 – 1000 m
Dimensions: 170 × 140 × 70 mm
Weight: 1·3 kg

CONTRACTOR

Litton Systems Inc, Electron Devices Division, 1215 South 52nd Street, Tempe, Arizona 85281, USA.

3572.193
BER-40-4 BI-OCULAR EYEPIECE

The BER-40-4 is a new bi-ocular eyepiece lens for image intensification devices and small CRT displays, and is the latest in the Baird family of 25 and 40 mm input format bi-oculars for dual-eyed viewing of a single image. This method of viewing has been proved advantageous for long-term surveillance or viewing normal or low-light television images in physically constrained situations, and for minimising high ambient light reflection problems. The unit is currently being supplied for retrofitting to the AN/TVS-4 night observation device, on which it replaces the original monocular eyepiece. The AN/TVS-4 is a tripod-mounted, medium-range image intensifier surveillance equipment, and the bi-ocular feature allows the observer (or two observers) to view the magnified 40 mm image tube format with both eyes simultaneously. Although the CRT is about 10 cm from the outside glass element of the lens the apparent image is over 40 cm inside the lens. The BER-40-4 lens can be used to magnify one- or two-inch (25 or 50 mm) CRT displays to achieve the apparent equivalent of five- and nine-inch (127 and 228 mm) displays, respectively.

CHARACTERISTICS
Diameter: 97 mm
Weight: 1·5 kg
Resolution: 36 lp/mm
Linear distortion: <4% barrel
Transmission: >85%
Field flatness: 1/8 dioptre
Focal adjustment: Fixed focus
Magnification: ×4·3
Apparent image distance: 406 mm
MTF on axis: 60% at 40 lp/mm

STATUS

In operational use with the US Army and other defence forces.

Baird 40 mm format bi-ocular eyepiece (BER-40-4) on AN/TVS-4 night observation device

CONTRACTOR

Baird Corporation, 125 Middlesex Turnpike, Bedford, Massachusetts 01730, USA.

4122.193
BER-47-1 BI-OCULAR EYEPIECE

The BER-47-1 is a specially designed bi-ocular eyepiece lens for the AN/VVS-2 night vision driver's viewer for US Army AFVs. The AN/VVS-2 is standard equipment on American M60, XM1, M2, and M3 armoured vehicles. The BER-47-1 bi-ocular eyepiece is also used on the AN/VVS-501 night vision driver's viewer for Canadian Leopard I and Mowag series of armoured vehicles and on Baird's NDS-2 night driving systems series of viewers for foreign armoured vehicles.

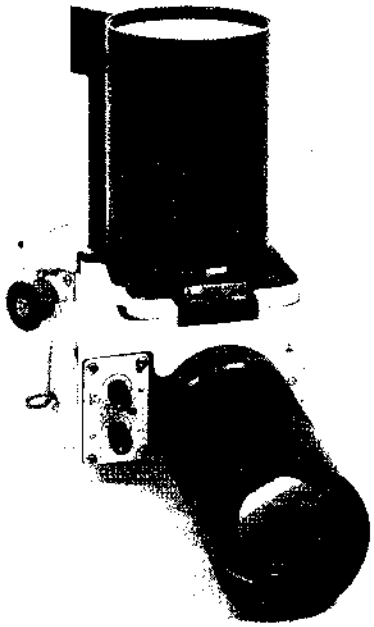
The BER-47-1 is a 47 mm format bi-ocular eyepiece compatible with a 25 mm format second-generation image intensifier bonded to a fibre optic magnifier that expands the image from 25 mm format to 47 mm format. The bi-ocular eyepiece display permits the operator to view the scene with both eyes simultaneously through one large diameter eyepiece from several inches away. This improves overall performance of the device and provides maximum safety and long-term viewing comfort.

CHARACTERISTICS
Diameter: 100 mm
Weight: 2·6 kg
Resolution: 20 lp/mm
Linear distortion: Varies with application
Transmission: >80%
Field flatness: 1/4 dioptre
Focus adjustment: Fixed focus
Magnification: ×3·75 – 4
Apparent image distance: 482 mm
MTF on axis: 60% at 40 lp/mm

CONTRACTOR

Baird Corporation, 125 Middlesex Turnpike, Bedford, Massachusetts 01730, USA.

4121.193
BER-25 SERIES BI-OCULAR EYEPIECES



The BER-25 is a series of bi-ocular eyepieces designed to be used with first- or second-generation, 25 mm format, image intensifier assemblies. The BER-25 series offers the same long-term viewing comfort and safety as the BER-40-4 (**3572.193**) and the BER-47-1 bi-ocular eyepieces (**4122.193**).

Model BER-25-1 replaces the monocular eyepiece on AN/PVS-2 individual-served weapon sight and AN/TVS-2 crew-served weapon sight. Model BER-25-2 replaces the monocular eyepiece on AN/PVS-4 individual-served weapon sight and AN/TVS-5 crew-served weapon sight. Model BER-25-5 replaces the monocular eyepiece on the passive elbow (MIL-E-48441) for M32/M35/M36 gunner and commander tank periscopes.

CHARACTERISTICS
Diameter: 84 mm
Weight: 0·8 kg
Resolution: 36 lp/mm
Linear distortion: <4% barrel
Transmission: >85%
Field flatness: 1/8 dioptre
Focus adjustment: Fixed focus
Magnification: ×4·5
Apparent image distance: 406 mm
MTF on axis: 60% at 40 lp/mm
CONTRACTOR
Baird Corporation, 125 Middlesex Turnpike, Bedford, Massachusetts 01730, USA.

Baird 25 mm format bi-ocular eyepiece (BER-25-2) on AN/TVS-5 crew-served weapon sight

4713.193
GP/NVG-1 NIGHT VISION GOGGLES

These small, lightweight night vision goggles are intended for long range observation and surveillance. The goggles consist of two main assemblies, a viewer and a face mask. The viewer can be operated independently or mounted on the face mask or helmet. Included in the view assembly is a three-position switch with ON/OFF/LED for map reading and other tasks requiring auxiliary lighting.

The objective lens has a very large aperture to gather the maximum amount of light to the image intensifier tube which is a Litton second generation 18 mm device. The remainder of the optical chain consists of a collimator lens to gather the output of the image intensifier, mirrors to split this in half, and imager lens and corner mirrors to carry the image to each eyepiece.

A night vision aiming light intended for mounting on an M16 rifle is designed for use with the goggles for night time operation. The aiming light, which produces a narrow beam of pulsed energy, is bore sighted to the weapon and the operator uses the goggles to detect the spot and aim the weapon. The aiming light is also available with different mounts to fit on other weapons.

CHARACTERISTICS
Magnification: ×1
Field of view: 40°
Brightness gain: × 2500
Weight: 643 g (complete assembly of viewer, mask and battery)
Aiming light
Dimensions: 160 × 50 mm
Weight: 170 g
Radiation source: Pulsed diode
STATUS
In production.

Baird Corporation, 125 Middlesex Turnpike Bedford, Massachusetts 01730, USA.

GP/NVG-1 night vision goggles

4714.193
GP/NVB-4 AND -6 NIGHT VISION BINOCULARS

The GP/NVB-4 and GP/NVB-6 are general purpose night vision binoculars for long range observation and surveillance. The GP/NVB-4 has a 95 mm focal length objective lens and ×4 magnification. The GP/NVB-6 has a 155 mm focal length lens and a ×6 magnification. Both systems provide the high performance of second generation image intensifier tubes. The eyepieces can be individually focused for various eye prescriptions and a focus mechanism allows the operator to refocus quickly on a new target.

CHARACTERISTICS

	GP/NVB-4	GP/NVB-6
Magnification	×4	×6
Field of view	10·5°	6·5°
Resolution	0·4 mrads	0·25 mrads
Brightness gain	×1000	×1000
Weight	1·13 kg	3·18 kg
Dimensions	225×145 mm	305×155 mm

COMMANDO DAY-NIGHT VISION SYSTEM

The Cadillac Gage Company has developed this equipment as a modular passive day-night main gun sight for fitting to many current AFVs with little modification to existing turrets. The sight will fit all Commando V 150 large turreted vehicles, the LVTP 7, and the M47 and M48 tanks.

Day and night vision capabilities are obtained by the use of interchangeable telescopes. The sight body will accept either a ×8 power day telescope or a ×5·5 power night telescope. These can be changed rapidly without disturbing the sight body or gun zero. The sight also incorporates a unity power periscope with a projected reticle. This offers a wide field of view for such purposes as target acquisition and firing the coaxial machine-gun while on the move.

CHARACTERISTICS
Day sight
Magnification: ×8
True field: 6°
Scan: −10 to +60°
Eyepiece: Adjustment −3 to +3 dioptres. Defogging. Laser safe
Night sight
Magnification: ×5·5
True field: 9°
Scan: −10 to +60°
Eyepiece: 4 to −4 dioptres
Image tube: 25 mm electrostatic

Focusing: 10 m - ∞
Unity power periscope
Magnification: ×1
Field: Bi-ocular, 24 (horizonta.) × 20° (vertica.)
Scan: -10 to +60°
Reticle: Infinity projected, illuminated

Mk IIIm STEDI-EYE STABILISED MONOCULAR
The Mk IIIm Stedi-eye is a ×8 magnification, lightweight, stabilised monocular that eliminates image motion due to hand movement and platform vibration. It has been designed, like its companions the Mk IIImg and the Mk V, for military applications but is small and light enough to put in a jacket pocket. The optical components are specifically designed to give the observer an extra-wide field of view, long eye-relief, and superior resolution. The instrument is completely passive and does not use electrical power.
CHARACTERISTICS
Magnification: ×8
Objective diameter: 36 mm
Field of view: 10°
Weight: 595 g
STATUS
In service with the USMC, Israeli Air Force, Canadian Forces and South African Air Force.
CONTRACTOR
Fraser-Volpe Corporation, 1025 Thomas Drive, Warminster Industrial Park, Warminster, Pennsylvania 18974, USA.

4257.193
Mk IIImg STEDI-EYE STABILISED MONOCULAR
The Mk IIImg is a ×10 magnification stabilised monocular, also designated the XM-21 by the US Army. It eliminates image motion due to hand movement and platform vibration and, like the Mk V to which it is very similar (**4258.193**), has been designed for military applications. Power is supplied by a standard 'D' cell battery giving 30 hours' operation
CHARACTERISTICS
Magnification: ×10
Objective diameter: 43 mm
Field of view: 7·7°
Resolution: 6"
Transmission: 65% minimum
Max stabilised scan rate: 5/s with other optional rates
Weight: 1·58 kg
STATUS
The XM-21 has been type tested by the US Army and about 160 units have been supplied for use aboard OH-58 Scout helicopters.
CONTRACTOR
Fraser-Volpe Corporation, 1025 Thomas Drive, Warminster Industrial Park, Warminster, Pennsylvania 18974, USA.

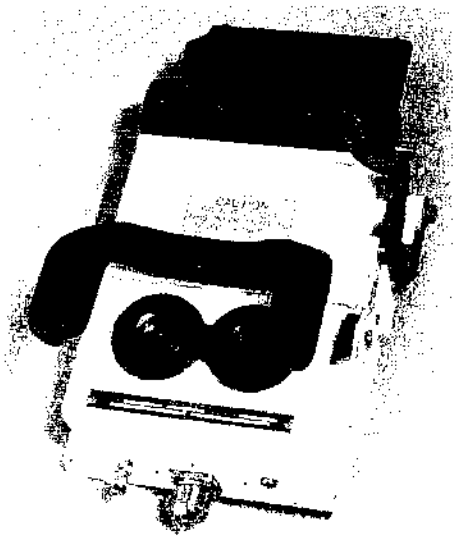
Mk IIImg stabilised monocular

4258.193
Mk V STEDI-EYE STABILISED DAY/NIGHT MONOCULAR
This is a power stabilised monocular that eliminates image motion due to hand movement and platform vibration. It has been designed for day and night military applications and also as a compact low-cost instrument for use from aircraft, boats and surface vehicles.

A gimballed erecting prism array is stabilised by a small internal gyroscope and this removes up to 98 per cent of all input motions. Two controls only are needed: power and stabilisation on/off. There is a choice of an internal battery supply or external 14 to 28 V DC. Use of the monocular at night is achieved by the exchange of eyepieces and can be carried out in less than one minute. The night eyepiece contains a Gen 2, 18 mm image intensifier.

A standard SLR camera can be attached with a simple adaptor allowing hand-held telephoto pictures to be taken from moving platforms. The Mk V used in this fashion increases the focal length of the camera 15 times so that a 50 mm lens becomes effectively 750 mm
CHARACTERISTICS
Magnification: ×1·5 (day); ×8·4 (night)
Objective diameter: 55 mm
Field of view: 5·3° (day); 4·5° (night)
Resolution: 5" (day); 40" (night)
Transmission: 65% minimum
Max stabilised scan rate: 10°/s
Weight: 1·81 kg
STATUS
In service with US Navy LAMPS helicopters.
CONTRACTOR
Fraser-Volpe Corporation, 1025 Thomas Drive, Warminster Industrial Park, Warminster, Pennsylvania 18974, USA.

4259.193
M61 FIRE CONTROL LEAD COMPUTING SIGHT
The M61 is a visually-aimed lead computing gyro sight for weapon aiming. The sight is a sealed unit containing a lead computing gyro, range magnet, optical system, synchro transmitters and caging device. The range magnet applies the lead computing precession to the gyro while a separate torque motor applies gravity drop corrections. Synchro transmitters provide angular signals to the fire control computer and range-only radar. The fire control computer also supplies signals to the sight to enable it to generate a lead angle and super-elevation.



The main application of the M61 is as part of the Vulcan air defence system (**2850.131**) and the contractor has developed a similar sight for the PIVADS (**4015.131**) product improved Vulcan air defence system.
CHARACTERISTICS
Magnification: ×1
Lead angle: ±25°
Weight: 15·9 kg
Power: 115 V, 400 Hz; 28 V DC
STATUS
In service with US Army and Republic of Korea. More than 800 M61 sights have been manufactured for use in Vulcan and PIVADS.
CONTRACTOR
Fraser-Volpe Corporation, 1025 Thomas Drive, Warminster Industrial Park, Warminster, Pennsylvania 18974, USA.

5717.193
M19A1 DRIVER'S NIGHT PERISCOPE

The M19A1 periscope sight is a sealed unit for night driving. The vehicle is equipped with infra-red or spot lights and the reflected rays are picked up by the periscope. Within the instrument an image converter tube changes the infra-red rays to visible light images which can be seen through the two eyepieces.

The instrument consists of two main parts: the head assembly projecting through the body armour of the vehicle, and the body assembly. The former contains a large prism which directs the incoming infra-red rays down to the body assembly where the objective lens and image converter are situated. The M19A1 has been adapted to all types of vehicle in service with the US Army, including combat tanks, personnel carriers etc. Recent modifications have considerably increased the reliability of the converter tubes.

CHARACTERISTICS
Magnification: ×1
Eyepiece focus: 0·75 to −1 dioptre
Objective focus: ∞
Resolution: 4 minutes arc
Weight: 6·35 kg including head assembly
STATUS
In operational service with the US Army.
CONTRACTOR
Fraser-Volpe Corporation, 1025 Thomas Drive, Warminster Industrial Park, Warminster, Pennsylvania 18974, USA.

M19A1 night periscope

3814.193
M1 LASER RANGEFINDER

Hughes Aircraft Company has developed a laser rangefinder for the US Army's M1 Abrams main battle tank, this work proceeding in conjunction with the company's development of a thermal imaging system (**3570.193**) for the M1. Both equipments are integrated into the tank's fire control system.

The laser rangefinder consists of a transmitter, receiver, power supply, timing and logic circuitry. It includes a 'safe-switch' that allows the entire fire control system to operate without firing the laser, to guarantee safety during training exercises. Built-in test equipment is used to isolate faults to individual sub-assemblies, which speeds and simplifies maintenance. Designed for extreme reliability, the M1 laser system exceeds 1800 hours mean time between failure.

In action, a tank crew member aims at a target and fires the laser. Its beam travels to the target which reflects the beam back to a receiving telescope. Elapsed time of beam travel to and from the target provides accurate range information to the tank fire control computer almost instantaneously. The computer processes this information in milliseconds, together with other data such as crosswind velocity, air temperature, gun trunnion position, air density, target tracking rate and ammunition ballistics. The computer then delivers correct azimuth and elevation firing commands to the target turret and main gun.

A significant development is a change from a pink ruby as the lasing medium to the more recently developed neodymium-doped yttrium aluminium garnet (Nd-YAG) rods. Not only are the latter significantly smaller and lighter, but their power consumption is lower than ruby lasers because they require less energy to produce a laser beam.

The system is capable of distinguishing between two targets separated by as little as 15 m in range. It also allows the fire control system to differentiate between close-up and far-off targets, by allowing the gunner to select the first reflection (close target) or last reflection (far target).
CHARACTERISTICS
Laser: Nd-YAG
Range: 200 – 7990 m
Range accuracy: ±10 m
Firing rate: 30 pulses/minute
Power supply: 18 – 30 V DC
Weight: 11·3 kg
STATUS
The laser rangefinder programme started in February 1978 and deliveries began in the latter half of 1979. Over 2000 rangefinders and thermal imagers had been delivered by early 1984. M1 Abrams tanks were deployed in Europe for training in 1981 and two went to Switzerland for evaluation by the Swiss Army.
CONTRACTOR
Hughes Aircraft Company, PO Box 902, El Segundo, California 90245, USA.

M1 Abrams tank gunner's primary sight incorporating integrated laser rangefinder and thermal imaging systems produced by Hughes

3570.193
M1 THERMAL IMAGING SYSTEM (TIS)

Hughes Aircraft Company developed and is producing the thermal imaging system (TIS) to enable the crews of the new US Army M1 Abrams tank to see through darkness, smoke or haze. It produces an image by sensing the small differences in infra-red heat radiated by objects within view and converting the detected energy into electrical signals which can be displayed on a cathode ray tube similar to a normal television picture. The image displayed is projected into the eyepiece of the M1 tank's gunner.

In addition, the sight gives the gunner target range information and indicates the existence of more than one target – data which is received from the M1 laser rangefinder (also a Hughes product). Ready-to-fire indication and confirmation that systems are working properly are also provided.

The thermal imaging system generates cross-hairs bore-sighted to the laser rangefinder, as well as computer symbology. This allows the gunner to operate the TIS just as he would the day sight.

The infra-red sight will be housed under armour on the M1 to help it withstand the rigours of the tank environment. However the same system can be packaged for use in lighter vehicles, due to flexibility which allows use of multiple or remote displays. This feature results from replacement of the LED direct-viewing display, commonly used in infra-red imaging systems, with a cathode ray tube.
STATUS
M1 sight development began in late 1976. The first prototype system was delivered nine months after award of the contract. The system is in full production and, as of early 1984, more than 2000 M1 laser rangefinders and thermal imagers had been delivered under contracts with the prime contractor, General Dynamics Corporation and the US Army.
CONTRACTOR
Hughes Aircraft Company, PO Box 902, El Segundo, California 90245, USA.

Replacing electronic circuit card of receiver unit of Hughes thermal imaging system for M1 Abrams tank

5912.193
ROKIT TANK SIGHT

A new tank sight which is based largely on the thermal imager (**3570.193**) and laser rangefinder (**3814.193**) designed for the M1 Abrams tank and the West German Leopard 2 has been developed by Hughes for the Republic of Korea indigenous Tank (ROKIT). The sight will be stabilised in both azimuth and elevation to enable the gunner to shoot on the move. Also included in the sight are the associated electronics and a vertical sensor.
STATUS
Two development models have been undergoing trials for some time and production was due to commence in 1985. The first prototype ROKIT tank, built by General Dynamics, is currently undergoing trials.
CONTRACTOR
Hughes Aircraft Company, PO Box 902, El Segundo, California 90245, USA.

3051.193
HUGHES GROUND/VEHICULAR LASER LOCATOR DESIGNATOR AN/TVQ-2

Hughes Aircraft Company is producing the AN/TVQ-2 ground/vehicular laser locator designator (G/VLLD) for the US Army Missile Command. It is designed for use by ground troops to enable them to direct laser-guided missiles, bombs, or artillery shells on to targets designated by the ground forces.

The equipment is a lightweight, tripod-mounted unit containing a laser, a rangefinder, a telescopic sight, and a tracking unit. The rangefinder/designator weighs 12·7 kg, the total system weight is 23·2 kg. It is man-portable in the field by a crew of two, only one of whom is needed to operate the equipment. It can also be vehicle-mounted.

The operational procedure is to use the telescopic sight to scan and search for 'hard' targets such as tanks or bunkers. When a suitable target has been identified, the laser is used to obtain range and bearing data. In co-operation with units deploying laser guided weapons to whom the target has been assigned, the laser is then used to mark the target at the desired impact point to provide guidance for the bomb, missile, or other munition. Provision is made for coding the marking laser energy in wavelength and PRF to permit weapons to differentiate between G/VLLDs.

STATUS

In production and in service with the US Army.

CONTRACTOR

Hughes Aircraft Company, PO Box 902, El Segundo, California 90245, USA.

AN/TVQ-2 ground/vehicular laser locator designator. Picture shows tripod-mounted version but combined laser designator and rangefinder can also be mounted on M113 fire support team armoured vehicles

3157.193
AN/PAQ-1 LASER TARGET DESIGNATOR

The AN/PAQ-1 laser target designator (LTD) is a laser target marker developed as a hand-held instrument for use by ground troops. In addition to its use for target designation to supporting ground attack aircraft and helicopters, the LTD is seen as suitable for such applications as a means of making their position known to rescue or supply aircraft by troops who may have been cut off by opposing ground forces.

The equipment is also compatible with the AN/TVS-5 night vision sight, and so may be used in darkness as well as by day.

The LTD consists of three easily-replaceable modules designed to withstand rough field handling. The transmitter module is a sealed unit which is dry nitrogen purged to provide a clean environment for the laser and optical elements. It can be easily detached without disturbing the optical alignment or the seal.

The electronics module houses the power supply and control circuitry, code-set panel, external cooling air blower and ducting, heat exchanger and trigger assembly.

A quick detachable battery module completes the basic unit. It is completely sealed and shaped to function as part of the rifle stock, forming the butt end.

When the LTD is operated from an auxiliary power source, the power is supplied through the battery interface connectors, terminated in a module identical to the battery module so that the overall LTD configuration is maintained.

No technical details of the LTD have been released.

STATUS

In production, 177 sets have been delivered to the US armed forces (152 to the Army and 25 to the USAF).

CONTRACTOR

Hughes Aircraft Company, PO Box 902, El Segundo, California 90245, USA.

AN/PAQ-1 laser target designator marking target for aircraft equipped with Pave Penny laser tracker during USAF tests

3816.193
MODULAR UNIVERSAL LASER EQUIPMENT (MULE)

The MULE is based on the AN/PAQ-1 laser target designator (**3157.193**), AN/GVS-5 hand-held laser rangefinder (**3200.193**), plus tripod design concepts from the AN/TVQ-2 ground laser locator designator (**3051.193**). This results in significant cost of ownership savings over the life of the equipment, since a large percentage of MULE components are interchangeable, directly, with items from the other programmes. The laser transmitter and electronics from the AN/PAQ-1 are used, with a change in output optics to meet different beam characteristic needs. Rangefinder components carried over from the AN/GVS-5 include detector, video amplifier, range counter/display and low voltage power supply. MULE features built-in test circuits that monitor its own operation automatically. They warn the operator when the battery pack voltage is getting low, when the laser output falls below the laser threshold and certifies other functions. Weighing about 17 kg, the system consists of laser designator/rangefinder and stabilised tracking tripod modules. MULE can be carried readily by two-man forward observer teams over rough terrain into battle areas and set up for use in less than five minutes. For instant target ranging, an observer trains MULE on a target manually, using its telescopic sight for precise aim. He fires a laser beam and MULE measures the time it takes the beam to reach the target and return. The system's computer multiplies half the elapsed time by the speed of light and displays the range immediately on a digital readout. The tripod automatically determines and displays azimuth and elevation co-ordinates. This information, along with range, can be sent quickly in digital form to a fire control centre via a digital communication terminal, or relayed to an artillery battery by voice channel. To illuminate targets for laser guided weapons, the observer simply trains his sights on the target and triggers the laser beam. Laser-homing missiles, projectiles (and aircraft with laser spot trackers) follow the reflected beam to the target.

Hughes modular universal laser equipment (MULE) deployed in the field

Sperry has developed a new lightweight, low cost gyrocompass for use in the MULE system, and known as a north finding module (NFM). It is an automatic gyrocompass with digital readout which uses a micro-computer to determine automatically the angle from true north without pre-orientation or insertion of latitude. The NFM will provide precise azimuth data on targets and this unit is also being evaluated for use with the US Army's AN/TVQ-2 ground/vehicular laser locator designator (G/VLLD) (**3051.193**), the Hughes Firefinder radars (**2848.153** and **1976.153**), and other systems.

The NFM weighs less than 1·8 kg and provides an accuracy of two mils within two minutes and 0·3 mils within ten minutes. There are LED and digital outputs.

STATUS

MULE is in production under a contract for 131 systems for the US Marine Corps.

CONTRACTOR

Hughes Aircraft Company, PO Box 902, El Segundo, California 90245, USA.

5910.193
AN/VAS-3 DRIVER'S THERMAL VIEWER

The AN/VAS-3 is a periscopic-based thermal imaging system operating in the 7·5 to 12 μm spectrum, configured as a bi-ocular display driver's viewer. It is designed for a closed-hatch combat vehicle driving and provides the driver with the means to continue during darkness and battlefield conditions of degraded visibility, such as smoke, haze, fog, etc. IR energy entering through the IR optics of the periscopic sight is mechanically scanned to obtain a rectangular field-of-view. An array of cooled mercury cadmium telluride detectors photoconductively transduce the scanned IR radiation into electrical signals. The signals are multiplexed and processed into visible light by means of a CRT, and then presented into the bi-ocular eyepiece in real-time.

CHARACTERISTICS

Spectral band: 7·5 – 12 μm
Field-of-view: Azimuth 40°, elevation 20°
Magnification: ×1
Size: 450 inches^3 (7374·18 cm^3)
Weight: 11·4 kg

CONTRACTOR

Hughes Aircraft Company, Electro-Optical & Data Systems Group, PO Box 902, El Segundo, California 90245, USA.

5911.193
MELIOS HAND-HELD LASER RANGEFINDER

Melios is a hand-held, eye-safe Raman shifted neodymium-YAG laser rangefinder operating at a wavelength of 1·54 microns, and is approximately the size of a pair of binoculars. It is designed as a low cost unit to determine ranges from 80 to 4000 metres and has a field of view of 7½. Melios is capable of continuous operation at 20 pulses per minute, with higher burst availability, and will operate in both first and last reply modes. It is battery powered and will fire 400 rangefinding pulses before needing to be recharged. The complete system consists of the rangefinder, a tripod, battery and a carrying case.

STATUS
Hughes has produced 12 development models for trial purposes by the US Army.

CONTRACTOR
Hughes Aircraft Company, Electro-Optical & Data Systems Group, PO Box 902, El Segundo, California 90245, USA.

3054.053
LASER OPTICAL RANGING AND DESIGNATION SYSTEM (LORADS)

LORADS was originally designed to fulfil the requirement for a one-man portable rangefinder and designator system. The equipment is used primarily by forward observers for indirect fire control and marking of targets for laser seeking weapons. With a range capability of up to 20 km and a resolution of 5 metres, LORADS can range to or designate any ground target encountered on the battlefield. It is effective against both moving and stationary targets and is compatible with most existing weapon systems.

LORADS consists of a laser designator, range receiver, control panel, tracking mount and tripod. The control panel has provisions for selectable PRF codes, built-in-test and remote operation up to five km. The tracking mount is a heavy-duty design with exceptionally smooth tracking characteristics. The tripod is all terrain with a standard low silhouette. Range readout is in the eyepiece.

CHARACTERISTICS
Type: Nd:YAG
Wavelength: 1·064 μm
Pulse width: 20 ±5 ns
Output energy: 100 mJoules
Detector: Silicon avalanche photodiode
Maximum range: 20 km
Range accuracy: 5 m
Telescope
Magnification: ×7
Field of view: 7°

STATUS
In production.

3823.093
MCTNS MAN-PORTABLE COMMON THERMAL NIGHT SIGHTS

Under US Army sponsorship, American manufacturers have evolved a range of basic elements for night sight equipments used with man-portable weapon systems, such as TOW and Dragon. This system of modular equipment is formally known as the man-portable common thermal night sights family of units. Texas Instruments has designed the basic receiver, based on common modules.

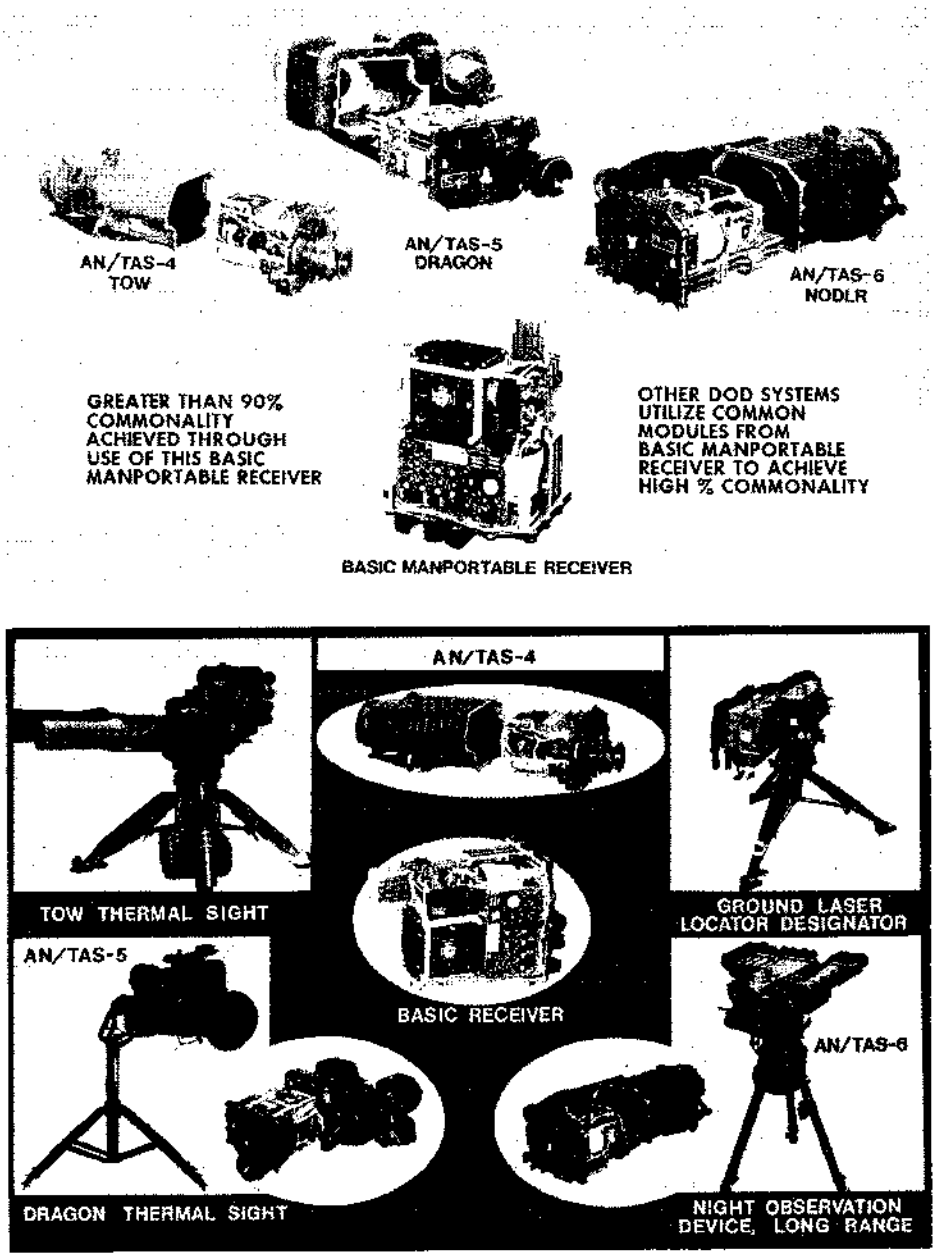
Man-portable common modules are assembled into a chassis to become the basic man-portable receiver. This receiver provides the essential FLIR functions for all of the man-portable night sight equipments.

The AN/TAS-4 sight (**3824.193**) is used on the TOW weapon system and the ground/vehicular laser locator designator (G/VLLD) (**3051.193**) system. For these applications, the basic receiver is inserted into a combination case, a focal telescope, and mount. The basic receiver is inverted and used with a different case (afocal telescope) and mount to provide an AN/TAS-5 (Dragon) night sight (**3825.193**). With its optical display removed, the basic receiver is used with an afocal telescope, cover, mount, and bi-ocular/image intensifier to provide an AN/TAS-6 night observation device, long range (NODLR) (**3826.193**).

The FLIR common modules are the foundation of the commonality concept exemplified by the man-portable sights, but they are also applicable to many other uses for army, air force and navy systems and equipment. The common modules are assembled into the receiver to convert an image formed in the infra-red (IR) spectral band into a visible image displayed to the operator. The modules are:

Mechanical scanner: collects IR energy emitted from a scene or object, and displays visible energy from the LED array to the operator.

IR Imager: focuses energy collected by the scanner and transfers it to the detector/dewar module.



Detector dewar: detects IR energy from the image and processes the signals into electronic energy for the amplifiers. This is a 60-element array, 120 or 180 element arrays being available for other applications.

Preamplifiers/postamplifiers: boost the low level electrical signals from the detector array to a level sufficient to drive the LEDs.

LED array: changes the amplified detector signals into a visible image.

Visual collimator: projects the light from the LED display to the operator.

Video auxiliary control: provides the interface function between the controls and the postamplifiers for such functions as brightness and contrast.

Examples of US Army's thermal imaging night sights and range of man-portable common modules employed in forming these equipments (above and below)

30 Hz scan/interface: provides electronic control for the scanner.

Among the non-man-portable sight applications is the AN/VGS-2 tank thermal sight for the M60 MBT which is now in series production by Texas Instruments; for the USN, the AN/AAS-36 IR detecting set uses TI IR technology, as does the USAF's AN/AAQ-9 FLIR equipment. (Both of the latter are airborne equipments).

STATUS

Series production by at least two sources (see below) and probably licensed overseas. In February 1983, a contract worth over $24 million was awarded to Kollsman for 300 SU-108 man-portable receivers and 1000 AN/TAS-4 sights for the US Army. Delivery commenced in early 1984.

CONTRACTORS

Texas Instruments Inc, Electro-Optical Division, PO Box 226015, Dallas, Texas 75266, USA. Designers and main contractor.

Kollsman Instrument Company, Daniel Webster Highway South, Merrimack, New Hampshire 03054, USA. Second source manufacturer.

3824.193

AN/TAS-4 TOW NIGHT SIGHT

The AN/TAS-4 night sight provides a night operating capability for the TOW weapon system. The night sight can be rapidly mounted on and removed from the TOW weapon system by simple movement of the interface locking handle. This quick mount/dismount capability allows the soldier to adapt his TOW weapon system to night and degraded visibility conditions rapidly and without modification to existing hardware. The sight is based on the basic man-portable IR receiver (see **3823.093**, US Army designation SU-108/TAS).

A gas bottle provides cryogenic cooling of the detector. The use of compressed air eliminates hazards associated with more exotic coolants. This bottle will provide two hours of system operation and can be replaced rapidly.

System electrical power is provided by a rechargeable battery package which will power the night sight for two hours and is also quickly replaceable. Combining the consumable elements of the AN/TAS-4 into small self-contained, replenishable components allows the night sight to be truly man-portable and virtually self-contained within a weight of less than 7·2 kg.

The AN/TAS-4 when mounted, provides an additional eyeport for the gunner to detect, identify, track and classify targets directly. Since the night sight detects heat energy emissions, it does not depend upon visible light and can 'see' in degraded visual conditions such as smoke, haze, darkness, camouflage, and foliage.

The AN/TAS-4 has been designed and tested to meet the environments encountered by the TOW weapon system and places no special operating constraints upon the use of the TOW.

DEVELOPMENT

Texas Instruments received an Engineering Development Programme (Phase 1) contract from the Night Vision Laboratory in 1973, to provide a FLIR for the TOW weapon system. This equipment was to extend the operating capability of the system to the night environment. Using the 'common-module concept' (developed by TI in conjunction with the Department of Defense), a lightweight (man-portable) self-contained far IR device was developed. Phase 1 of the programme culminated in a Research Development Acceptance Test in which the TI system was field tested in competition. Success in these tests resulted in the Phase II contract award to TI in 1975.

In 1981, Texas Instruments was placed under contract by the US Army to develop improved operational capabilities to accommodate the TOW 2 missile system. This initially involved developing the revisions necessary to provide the night sight to the TOW 2 missile. A subsequent improvement was the elimination of the gas bottle cooling through use of a closed cycle cooler. This improvement has been included in the same configuration. The improved night sight, designated AN/TAS-4A, is in production with Texas Instruments the sole supplier.

AN/TAS-4A night sight for TOW 2 missile system

STATUS

Production. In February 1983, Kollsman was awarded a $24 million contract by the US Army for the production of almost 1000 AN/TAS-4 sights and over 300 SU-108 receivers. Delivery commenced early 1984. In May 1985 Kollsman received a contract worth more than £40 million for 775 AN/UAS-12A TOW 2 night equipment sets. These sets include the AN/TAS-4A IR sight and ancillary equipment.

Texas Instruments Inc, Electro-Optical Division, PO Box 226015, Dallas, Texas 75266, USA.

Kollsman Instrument Company, Daniel Webster Highway South, Merrimack, New Hampshire 03054, USA.

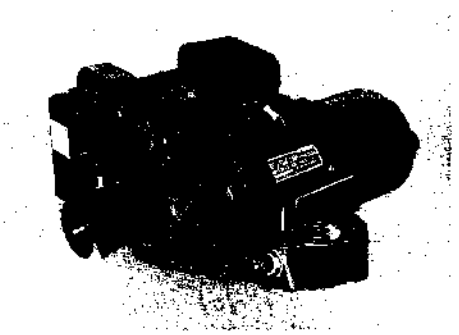
3825.193

AN/TAS-5 DRAGON NIGHT SIGHT

The AN/TAS-5 Dragon night sight provides night operating capability for the Dragon weapon system. The night sight can be rapidly mounted on and removed from the missile launch tube. An IR missile tracker is an integral part of the night sight. The equipment is based on the basic man-portable IR receiver (**3823.093**) (US Army designation SU-108/TAS); in this application it is inverted from its usual position, see below.

The night sight AN/TAS-4 gas bottle is located at the centre, and the integral weapon system tracker at the left. To provide the weapon gunner with access to the eyepiece, the basic man-portable receiver is mounted in an inverted position.

Boresighting the AN/TAS-5 in the field is not necessary, since this operation is performed at the depot or factory level. After the weapon is fired, the night sight/weapon system tracker is removed from the launch tube and used on the next missile to be fired.



STATUS

Production.

AN/TAS-6 (AN/UAS-11) NIGHT OBSERVATION DEVICE, LONG RANGE

The AN/TAS-6 night observation device, long range (NODLR) provides night observation post capability to the soldier on the battlefield. This night sight is provided with a tripod, with no need for tools for mounting and dismounting. When used in conjunction with the AN/GVS-5 hand-held laser rangefinder (**3200.193**) this night sight can provide information to supporting artillery in degraded battlefield conditions. The complete system is known as the AN/UAS-11.

The AN/TAS-6, in conjunction with its tripod, the AN/GVS-5 hand-held laser rangefinder, and a boresight mechanism, can provide a two-man team with a versatile man-portable forward observation post, which allows operating capabilities in the presence of degraded conditions such as smoke, haze, darkness, camouflage, and foliage.

The AN/TAS-6 is based on the basic man-portable IR receiver (**3823.093**) and uses the same compressed air gas bottle and rechargeable battery pack as the other man-portable systems (AN/TAS-4, AN/TAS-5). This allows the use of the same logistics supply facilities, thereby increasing support flexibility.

The AN/TAS-6 and the AN/GVS-5, are mounted together with the AN/TAS-6 at the left. The bi-ocular eyepiece is covered with a dual eye shroud which provides visual security for the display. This display is green in colour and is produced by an image intensifier tube.

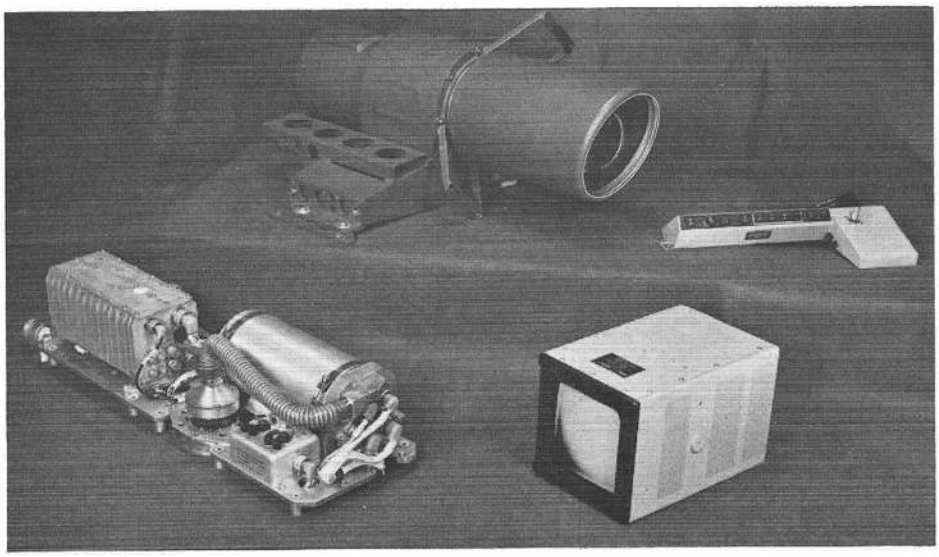
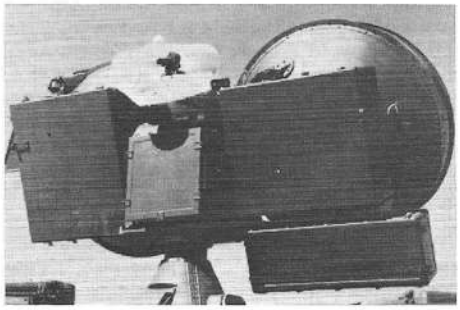
TAS TRACKING ADJUNCT SYSTEM (HAWK)

The Tracking Adjunct System (TAS) is an electro-optical tracking system developed as a product improvement for the Hawk surface-to-air missile (**4177.131**) air defence fire control system. It was derived from the TISEO (target identification system, electro-optical) equipment (**1806.363**) which is currently in production and being used by the USAF and a number of foreign countries. TAS provides a passive tracking capability to the Hawk fire control system radar with remote real-time video presentation. It is designed as a complement to the tracking radar. Optical tracking can be coincident or independent of the radar line-of-sight. Manual, automatic acquisition and tracking, rate memory and preferential illumination are key features of the system.



The system also enhances the tracking radar by providing facilities for positive identification, threat assessment, kill assessment, spectre recognition, tracking with minimum doppler, silent tracking and independent tracking. These capabilities represent a positive advantage in a countermeasures environment. More details of the Improved Hawk missile system and its relationship with TAS, along with illustrations of items of TAS hardware, will be found in the entry for that system (**4177.131**) in the Systems Section of this volume. Additional information on the basic TISEO equipment is contained in the Electro-Optical (Air) pages of this section, which follow.

STATUS



Development of the Tracking Adjunct System began in 1976 and production for the US Army and Marine Corps was started in March 1980. The system is available as a Phase II product improvement for foreign operators of the Hawk missile system.

LH-81/83 LASER RANGEFINDERS

The LH-81 is a lightweight hand-held laser rangefinder using a single eyepiece, the range being displayed by LED digits superimposed on the lower area of the target sight. Should multiple targets be sighted, ambiguities can be resolved by selecting first or last target gating.

The LH-83 is identical in appearance to the LH-81 but uses a somewhat longer wavelength to ensure eye-safe operation. The wavelength is given as approximately 1·54 microns and it is assumed that this device uses Raman shifted techniques to alter the basic 1·06 micron neodymium-glass wavelength.

CHARACTERISTICS

Laser: Nd:glass
Magnification: ×6
Range: 100 - 6000 m (up to 9995 m for LH-83)
Accuracy: 5 m
Dimensions: 198 × 165 × 65 mm
Weight: LH-81 1·3 kg; LH-83 1·5 kg

STATUS

In production.

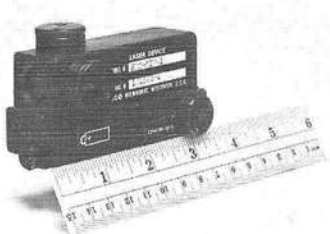
MINI ELECTRO-OPTICAL IMAGING SYSTEM

This device is for either coastal/border surveillance or for forward control/battle management. It can be used in a fixed ground installation, on a helicopter mast mount, in an RPV or piloted aircraft (side or forward looking). It is intended to complement radar by evaluating targets already detected or to detect 'soft' targets.

The imaging system has a high acquisition rate and is capable of 1 metre resolution at a range of 15 km. When used with a large aperture F/1 lens, it operates at maximum at light levels equivalent to twilight under overcast skies with visibility as poor as 1 km, or at full moonlight levels with clear skies. A 2·048 element solid-state image detector is used with a variety of lenses from 18 to 70 cm lengths.

CONTRACTOR



Litton Industries, 10 Maguire Road, Lexington, Massachusetts 012173, USA.

Mini electro-optical imaging system

5721.193
SECO ELECTRO-OPTICAL SYSTEMS

The Standard Equipment Company (SECO) produces a wide range of laser, thermal imaging and electro-optical devices for battlefield use. Brief details of the company's systems are as follows:

AIM-1 infra-red mini designator

AIM-1 Infra-red Mini-designator

This is a very small laser designator which provides designation and aiming at ranges up to 800 metres under night conditions. It has an inherent light halo visible to the operator only, to assist in identifying the target, and is designed for boresighting with weapons such as rifles, machine guns, short-range anti-tank missiles, revolvers and pistols by means of elevation and deflection drums.

CHARACTERISTICS

Radiated power: 8 mW
Dimensions: 35 × 42 × 53 mm
Weight: 0·264 kg

LRF-1 Laser Rangefinder

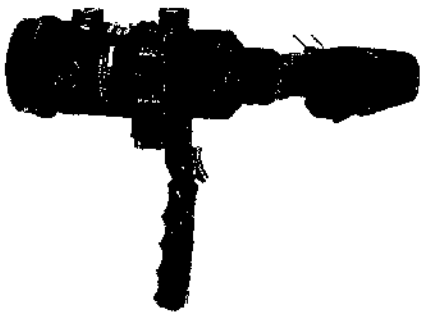
This is a rangefinder for use by artillery forward observers, etc, and is the size of a standard 7 × 50 binocular. It is designed for hand-holding and uses a miniaturised Q-switched Nd-YAG laser transmitter. A four-digit range LED display is provided in the eyepiece.

CHARACTERISTICS

Laser wavelength: 1064 microns
Beamwidth: 1·5 mrad
Range: 8995 m
Accuracy: ± 5 m
Dimensions: 200 × 200 × 90 mm
Weight: 2 kg

Sharp Ray S-8 Target Illuminator

Sharp Ray S-8 is a visible or infra-red illuminator for fast aiming of weapons by spotting the target. It is a self-powered designator which is mounted on the weapon, being aligned together with it, and is designed for boresighting on rifles, sub-machine guns and shotguns by means of elevation and deflection drums.



SECO Vision 220

This is a portable thermal imaging system comprising an infra-red thermal viewer and a video interface unit. It features four-stage thermo-electric cooling and

provides real-time two dimensional images to a standard TV or composite video in 525 or 625 lines.

AD-NDV-2 (AN/VVS-2) Night Vision Driver's Viewer
This is a multi-vehicle passive night vision surveillance and reconnaissance sight which can be mounted in most types of armoured vehicles. It includes a 25 mm second-generation image intensifier with a large diameter binocular display.
CHARACTERISTICS
Magnification: ×1
Field of view: 44° horizontal; 35° vertical
Field coverage: 135° horizontal; 35° vertical

V-NOD-2 Night Observation Device
The V-NOD-2 is a tripod-mounted night vision sight used for long-range surveillance. It uses a 25 mm micro-channel plate image intensifier tube to allow viewing during the twilight hours of dawn and dusk such that a man can be distinguished at ranges in excess of 1000 metres in light levels of 10^{-3} lux. A laser rangefinder can be supplied as an optional extra.
CHARACTERISTICS
Magnification (optical): × 9·4
Field of view: 5·6°
Performance: At 10^{-3} lux a man can be distinguished at more than 100 metres, a Jeep at more than 1700 metres and a tank at 4000 metres

G2-4 passive binocular sight

G2-4 Passive Binocular
The G2-4 is a hand-held passive binocular sight for night observation and long-range viewing. With its high intensity second-generation image intensifier tube the instrument is capable of detecting a man at nearly 1000 metres.

AN/PVS-4 Starlight Scope
This is a second-generation passive night vision sight using a 25 mm micro-channel plate inverter intensifier tube. The sight is intended to be attached to a variety of different weapons or may be hand-held for night reconnaissance. An adjustable internally protected reticle and interchangeable reticle patterns allow the sight to be boresighted to various weapons without having to move the sight.
CHARACTERISTICS
Magnification: × 3·7
Field of view: 14·5°
Focus range: 25 m - ∞

AN/TVS-5 Crew Served Weapon Sight
This is a similar equipment to the AN/PVS-4 and is a lightweight passive night vision sight which can be attached to a variety of weapons or can be tripod-mounted for night reconnaissance.
CHARACTERISTICS
Magnification: × 6·2
Field of view: 9°
Focus range: 25 m - ∞

M1A1 Collimator
The M1A1 collimator is used as an infinity reference by artillery gunners to replace aiming posts and lights. It employs a tritium activated light source which requires no batteries or incandescent lamps.
CONTRACTOR
Standard Equipment Company, 9240 No. 107th Street, PO Box 23060, Milwaukee, Wisconsin 53224, USA.

5913.193
PILAR FIRE CONTROL SYSTEM
PILAR (Periscope Integrated Laser Rangefinder) is a tank fire control system designed for retrofitting to existing fighting vehicles. Although intended primarily for the M48, M60 and T-series tanks its modular design allows adaption to a wide variety of turrets.

The standard features of PILAR include:
(1) US Army standard M1 digital ballistic computer
(2) computer controlled weapon/turret system
(3) automatic electronic sensing of weapon elevation, cant, pitch, azimuth angle and tracking rate
(4) integrated triaxial laser rangefinder
(5) computer controlled boresighting and zeroing
(6) stored ballistic data for any calibre main weapon and coaxial machine gun.

A number of optional features can be provided such as thermal imaging with an IR elbow and integration of a two-axis weapon stabilisation system.

STATUS
The PILAR system has been successfully evaluated by the US Army in an M48 tank.

Emerson Electrical Company, Government & Defense Group, 8100 West Florissant Avenue, St Louis, Missour 63136, USA.

YUGOSLAVIA

3581.093
RLD HAND-HELD LASER RANGEFINDER
The RLD hand-held laser rangefinder can also be goniometer- and/or tripod-mounted, and is intended for forward artillery observation, anti-tank weapons and for infantry use. In use, the operator centres the cross-hair on the target through the right-hand ocular. By pressing the trigger button the laser is fired and the distance is displayed in the left-hand ocular. The display also has two indicator lamps: one shows if there is more than one target in the laser beam; and the other shows the existence of targets within the blocked range. The display is switched off automatically five seconds after laser firing. Continuously adjustable minimum range between 200 and 3000 metres permits selection between various targets.

CHARACTERISTICS
Laser type: Nd-YAG
Peak power: 0·5 - 1 MW
Beam divergence: <1 mrad
Pulse rate: 30/minute
Range (minimum/max): 150/10 000 m
Accuracy: ±5 m
Resolution: Better than 40 m
Blocking: Continuous to 3000 m
Detector: Silicon avalanche diode
Receiver field of view: Approx 1 mrad
Telescope
Magnification: ×7
Field of view: 7°
Eyepiece adjustment: +5 dioptres
Power supply: 12 V DC
Weight: Approx 2 kg

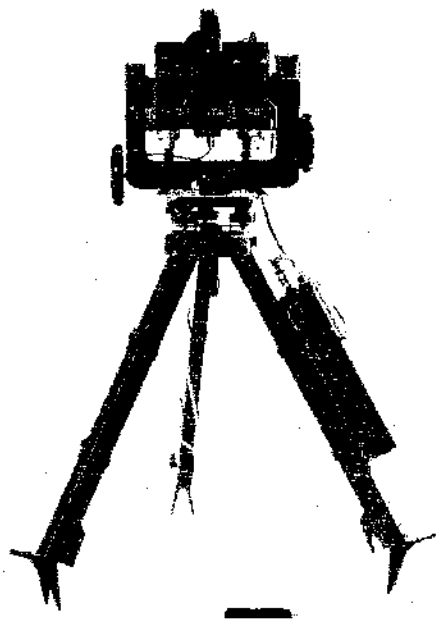
3582.193
T-LMD-2 AND -3 TANK LASER RANGEFINDERS
The T-LMD-2 and -3 laser rangefinders were specially designed for Soviet T-type battle tanks (T-34, T-54, T-55 and T-62 for the -2 version, and T-54, T-55, T-62 and T-72 for the -3), and considerably enhance the fire control capability of these vehicles. The equipments consist of a single unit.

The optical periscope sight is integrated in the laser which is powered from the tank battery. The T-LMD-2 or -3 is mounted in the commander's cupola and the existing commander's periscope is removed from its pivot suspension and replaced by the laser. Connection of a suitable power supply is the only other change necessary. A remote display for the gunner is provided.

CHARACTERISTICS
Laser: Nd-YAG
Max range: Up to 20 000 m, depending upon weather conditions and target.
Range accuracy: ±5 m (-2 version); ±7 m (-3 version)
Radial resolution: 30 m
Number of targets measured: 2
Number of targets displayed: 1
Blocking range: Continuous 200 - 3000 m
Pulse rate: 30/minute
Telescope
Magnification: ×7
Field of view: 5°
Eyepiece adjustment: ±5 dioptres
Power supply: 18 - 29 V DC, approx 20 W
Computer output: BCD code
Weight: Approx 10 kg
CONTRACTOR
Iskra, Centre za Elektrooptiko, Ljubljana, Yugoslavia.



Iskra T-LMD-2 integrated laser rangefinder for tanks

5723.193
SUVOA ARTILLERY FIRE CONTROL SYSTEM
SUVOA is a tripod-mounted optical fire control system for use with coastal or field gun batteries. It is designed to give range to the target from 1000 to 50 000 metres, depending upon the altitude of the observation post. Information on ranges is transmitted to the gun by a transmission system. A radar equipment is co-sited with the instrument in order to provide range and bearing information in poor visibility or by night.
CHARACTERISTICS
Range: 1000 - 50 000 m
Accuracy: 50 m up to 10 000 m; 200 m up to 20 000 m; 3% up to 50 000 m
Measuring telescope
Magnification: × 18
Field of view: 4°
Observation telescope
Magnification: Variable from ×3 to ×10
Field of view: Variable from 6 - 20°
CONTRACTOR
Federal Directorate of Supply and Procurement, PO Box 308, Knez Mihailova 6, Beograd, Yugoslavia.

5724.193
M61 STEREOSCOPIC RANGEFINDER
The M61 rangefinder is an optical instrument used on artillery observation posts to measure ranges, angles and variation of shot, and for general reconnaissance of the battlefield. It is tripod-mounted and is provided with movable indexes to measure ranges from 400 to 16 000 metres. A co-ordinate computer is normally combined with the instrument to calculate the X and Y co-ordinates.
CHARACTERISTICS
Magnification: ×14
Inlet pupil diameter: 56 mm; 30 mm with visor for day measuring
Exit pupil diameter: 2·1 mm for day measuring; 4 mm for twilight
Field of view: 4·5° at 1000 m
Weight: 14·5 kg for basic instrument; 73 kg including tripod, computer, night vision accessories and carrying boxes
CONTRACTOR
Federal Directorate of Supply and Procurement, PO Box 308, Knez Mihailova 6, Beograd, Yugoslavia.

3583.193
ALD-M2 LIGHTWEIGHT LASER RANGEFINDER
The ALD-M2 lightweight laser rangefinder provides measurements of range, azimuth, and elevation to targets, and can be used by forward observers for the detection and observation of targets, and to determine the positions of such targets. It can be operated independently or as a component part of a fire control system, and can be mounted on vehicles, night observation devices, weapons, or on its own tripod.
The complete equipment consists of the laser rangefinder with a goniometer, tripod, rechargeable batteries, cables, and transport box. The upper part of the rangefinder is equipped with a coarse sight for rapid aiming at targets that appear only briefly.
CHARACTERISTICS
Laser: Nd-YAG
Wavelength: 1·06 micron
Peak power: 1 - 2 MW
Output beamwidth: Approx 0·7 mrad
Receiver: Silicon avalanche diode
Receiver field of view: 0·9 mrad
Range (minimum/max): 200/20 000 m
Range accuracy: ±5 m
Resolution: Better than 30 m
Pulse rate: 30/minute
Number of measured targets: 2
Number of displayed targets: 2
Blocking: Continuous 200 - 3000 m
Telescope
Field of view: 7°
Magnification: ×8
Eyepiece adjustment: ±5 dioptres
Computer output: BCD
Power supply: 22 - 28 V DC
Weight: Approx 12 kg
CONTRACTOR
Iskra, Centre za Elektrooptiko, Ljubljana, Yugoslavia.

Iskra ALD-M2 artillery laser rangefinder

5914.193
OMU ARTILLERY LASER RANGEFINDER
OMU is a laser rangefinder with an integrated binocular telescope of ×2 magnification mounted on the electronic goniometer. Its primary use is battlefield observation, and the rapid and precise measurement of distances and angles. Data can be fed to a central fire control computer.
CHARACTERISTICS
Laser: Nd:YAG, passive Q-switch
Range: Up to 30 000 m
Accuracy: 5 m
Repetition rate: 30 measurements per minute
Peak power: 2MW
Magnification: ×10 and ×20
CONTRACTOR
Federal Directorate of Supply and Procurement, 9 Nemanjina St, 11001 Beograd, Yugoslavia.

4715.193
SPDR SIGHTING DEVICES
In addition to the equipment described above, the Yugoslavian Federal Directorate of Supply and Procurement produces sighting devices for various weapons. Brief details of some of these are given below.

Optical Sight ON-M76
This sight is intended for sighting of single stationary, moving, open or camouflaged targets when firing with the M76 7·9 mm rifle, both by day and night. Magnification is ×4, field of view is 5·17 degrees and detection range of an IR source is over 300 metres.

Optical Sighting Device ON-M80
The ON-M80 is used for sighting on targets when firing the RB-44 mm M-80 hand launcher, and also for detecting the sources of IR radiation. Magnification is ×3, field of view is 12 degrees and detection of IR source is over 300 metres.

Sighting Device NSB-4A
The NSB-4A is used to sight moving and stationary targets for the M71 128 mm light rocket launcher. Sighting is performed through a right angle telescope. Field of view of the instrument is 150 mil and magnification is ×3·7.

Sighting Device NSB-4B
The NSB-4B serves to sight targets when firing the M75 120 mm light mortar in both day and night conditions. The instrument can also be used with mortars of other calibres. Magnification is ×1·82 and field of view is 8 degrees.

M79 Sighting Device
An optical firing sight for the M79 90 mm hand rocket launcher is available. It can be used both by day and night, has a magnification of ×4 and a field of view of 10 degrees.

Periscope Aiming Circle PB-1 and PB-2
The Periscope Aiming Circle PB-1 and PB-2 are optical instruments used for the measurement of horizontal and vertical angles, magnetic azimuths and ranges. It is normally used on observation posts and firing positions of artillery and mortar units for the correction of fire.
CONTRACTOR
Federal Directorate of Supply and Procurement, PO Box 308, Knez Mihailova 6, Beograd, Yugoslavia.

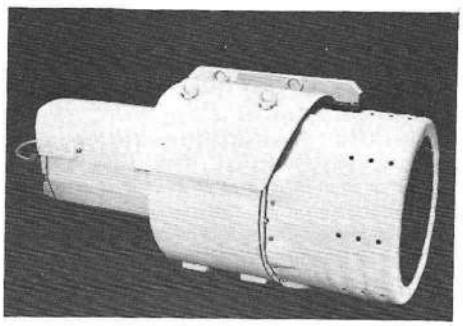
ELECTRO-OPTICAL EQUIPMENT (SEA)

DENMARK

3857.293
TYPE 771 LOW LIGHT TV CAMERA

The Type 771 low light-level television camera was developed under a Royal Danish Navy contract. It is designed to conform to DEF 133N2 and to be used in conjunction with a television tracking system for automatic fire control applications. A filter wheel permits use over a wide range of ambient lighting conditions, the extremes of attenuation provided being from zero to 10^6. The sensor employed is an ISIT (intensified silicon intensifier target) tube which enables useful pictures to be obtained down to face-plate illumination levels of 5×10^{-4} lux. Lenses are selected to meet user requirements, as are the housings. A window with conductive coating and a washer/wiper are incorporated for protection.

CHARACTERISTICS



Sensor: RCA 4849H, EEV P8065, or Westinghouse WX 32890
Limiting resolution: 550 lines
Scanning: 625 lines 50 Hz 2:1 interlaced CCIR or 525 lines 60 Hz 2:1 interlaced EIA
Black level control: Automatic
AGC amplifier: Normal range 10 dB, max 20 dB
Weight: 11 kg camera with filter wheel; 22 kg lens with housing

STATUS

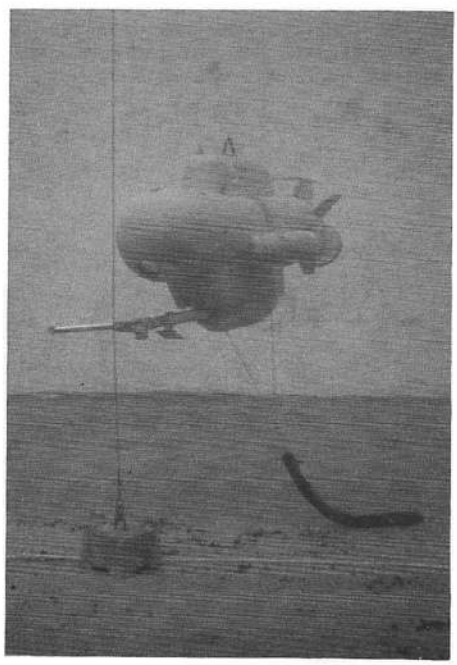
'Willesmoes' class fast patrol boats of the Royal Danish Navy are equipped with fire control systems that incorporate the Type 771 camera in a target tracking facility and this camera is also known to have been associated with the Sperry Sapphire naval FCS.

CONTRACTOR

JAI (Jorgen Andersen Ingeniorfirma AS), Produktionsvej 1, 2600 Glostrup, Copenhagen, Denmark.

JAI Type 771 low light TV camera

FRANCE



3064.293
FRENCH NAVAL OPTO-ELECTRONIC SYSTEMS

For the French Navy, opto-electronic systems are seen as providing valuable assistance to the present systems for detection, tracking, guidance, display and thermal imaging, and DTCN (the Technical Department for Naval Construction) is energetically continuing R & D along several lines. These include the use of lasers for telemetry, guidance, aiming, illumination, and communications; passive infra-red for guidance, tracking, detection, thermal imaging, and surveillance. Light intensification and low light-level television techniques are being developed and manufactured, as are the uses of thermal imaging for surveillance, target designation, and guidance.

Laser programmes in progress for DTCN consist of rangefinders for naval fire control systems, and two projects concerned with laser tracking and guidance.

LASER RANGEFINDER

The laser rangefinder for ships is designed as a compact and high data rate unit for installation on all old and new rangefinding turrets to provide accurate range information which can be used directly by the gunnery control computer under the supervision of a single operator at the gun fire control console. A fleet-compatible prototype of this laser rangefinder has been built by Compagnie Générale d'Electricité to STCAN specifications. TAON (télémétrie d'artillerie optronique pour navire) equipment is designed for TTAC remote aiming turrets. Its main functions are ranging of air targets and shore targets. Rangefinding is possible between 1·5 and 16 km to an accuracy of ±5 metres. Beamwidth is one milliradian and pulse rate 30 pulses/second. The equipment weighs about 15 kg.

A submersible optronic system used in mine disposal operations

IR RADAR (IRDAR)

DTCN is already considering using a 10·6 micron (ie infra-red) laser source and a heterodyne receiver. This would be a pulse doppler laser radar operating in the infra-red. Although the source and receiver are still at the design stage, the experimental prototype IRDAR equipment was delivered to DTCN by SAT for tests in late 1980 as an exploratory development.

Passive infra-red developments pursued by DTCN include the VAMPIR system for surveillance and detection, and PIRANA for guidance and tracking. The decision to adopt both these equipments for French Navy anti-aircraft corvettes was taken at the beginning of 1980. The final versions are being fitted to the corvettes and were due to be operational in 1984.

INFRA-RED SURVEILLANCE (VAMPIR)

The designation VAMPIR derives from the French for infra-red panoramic air-sea surveillance: veille air mer panoramique infra-rouge. It is a low field and low altitude panoramic detection system intended for the detection of anti-ship missiles at ranges of 10 km or more, even during radar silence (see entry **4106.293**).

INFRA-RED TRACKING (PIRANA)

The PIRANA (pointeur infra-rouge pour l'artillerie navale) is an infra-red aiming unit for naval guns, designed by STCAN and constructed by SAT. The dimensions specified permit simple mounting on existing French Navy gun fire control radars. Its function is to permit these radars to continue accurate tracking at low elevation angles when reflection from the sea surface might degrade radar tracking. This also allows for continued tracking in the face of ECM or under radar silence. The field of view is about 1°, operating wavelength four microns, and the tracking range against a head-on air target is quoted as more than 10 km.

Three versions of PIRANA have evolved, the first two of which were experimental trials equipments, leading to PIRANA 3 which is in production (see entry **3427.293**).

VOLCAN

VOLCAN (viseur optronique leger pour conduite d'arme navale) is an exploratory infra-red bi-spectral sensor for naval surveillance and/or fire control applications. The experimental prototype was built for DTCN by SAGEM, aided by SAT, CILAS, CSEE and SOFRETEC who provided the optronic sensors. The equipment has been designed to be suitable for mounting on ships of any size, and with sensors weighs about 80 kg. It takes the form of a small turret, within which are housed eight and twelve micron wavelength infra-red cameras, a one-inch vidicon television camera, and a laser rangefinder. The last of these is capable of pulse rates of 2 to 20 Hz using a YAG laser. The equipment also includes an automatic tracking system for night and day optical surveillance, tracking of air targets, aircraft and missile control, particularly low-altitude weapons. The VOLCAN sight includes its own gyroscopic stabilisation.

CONDOR

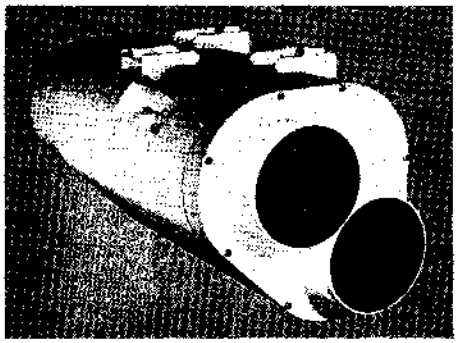
CONDOR is the French acronym for radar target designation optronic night camera, and its function is to replace turret operators, to enable a target to be designated and identified, and enable a laser to be laid on. In addition, and in the context of comprehensive integration with radar, it can provide sighting facilities or automatic tracking in the event of radar failure, radar silence, loss of track or loss of accuracy at low elevation.

DTCN has designed the operational version of CONDOR. Now in production by SINTRA, it is a TV camera with two different optical paths: one for daylight, a vidicon, and for night use (ISIT). These cameras are to equip all the new French Navy frigates, corvettes and Avisos.

In addition to these lines of research, DTCN is studying potential applications for light amplification and image intensification techniques such as night surveillance from ships and commando operations.

IR PERISCOPE

To increase the capabilities of conventional submarine periscopes, STCAN has designed and is producing a new periscope that permits night vision. PIVAIR (périscope intégré de veille à infra-rouge) has been built by SAGEM in collaboration with SOPELEM to STCAN specifications and is fitted to all new type French Navy submarines and will be retrofitted to others. It provides optical surveillance by night or day, and there is two-axis stabilisation of the optical and IR channels. The former channel provides magnifications of ×1·5 and ×6 and the IR field of view is −3 × 6°. The operating wavelength of PIVAIR is eight to twelve microns.



Thermal imaging by infra-red has appreciable potential, especially where hot-spots and temperature contrasts can be expected, and there is considerable interest in this area of opto-electronics also. A development contract awarded to SAGEM includes a SAT thermal camera operating in the eight to twelve microns band with parallel scanning for target detection over 360° in azimuth in the surveillance mode and target identification in the thermal imaging mode.

3427.293
PIRANA INFRA-RED TRACKER

The PIRANA infra-red tracker has been developed for use on combined electro-optical naval fire control equipments such as the CSEE Totem (**3424.293**), in which it is employed with television and a laser rangefinder for the direction of anti-aircraft weapons, or for use on its own as an ancillary to autonomous weapons. The equipment provides a means of passive search, acquisition and target tracking, especially useful in low-altitude low elevation engagements. It has two IR channels for simultaneous tracking at two different wavelengths.

The configuration of the PIRANA equipment can be seen from the nearby illustration and it will be carried on one side of the Totem E-O director unit. The main modules of the infra-red unit are the receiver optical assembly, analysis section, IR detector, cooling, and tracking electronics module. Power supply unit and control panel are located below deck.

CHARACTERISTICS
Optical aperture: 170 mm
Field of view: ±8 mrad
Wavelength: 4 – 5 and 8 – 12 micron bands

SAT PIRANA III, operational version, IR tracking system (without turret)

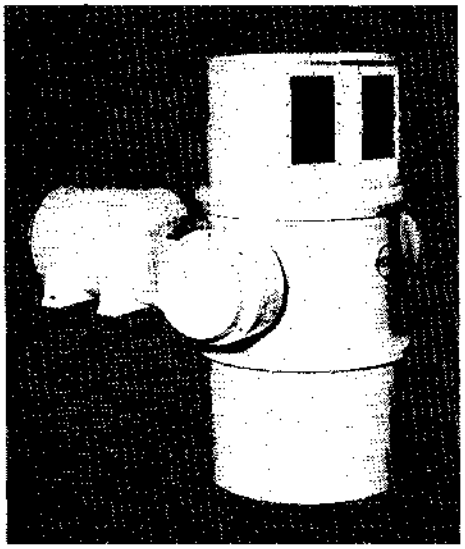
Range: 10 20 km, depending on type of target
Cooling: Joule Thomson cycle to about 80° K
Dimensions: 75 × 41 × 41 cm
Weight: 70 kg
Power supply: 115 V 400 Hz 1 kVA

DEVELOPMENT
Development was initiated in collaboration with the French Naval authorities in the late 1960s and early 1970s. (See entry **3064.293** at the start of this section for further historical details on this and related naval opto-electronic projects.)

STATUS
Experience with the PIRANA I and II resulted in the PIRANA III version which is now operational with the French Navy. This version is a bi-spectral equipment with two channels working simultaneously together with appropriate signal processing to achieve minimal sensitivity to jamming and environmental noise.

CONTRACTOR
SAT (Société Anonyme de Télécommunications), 41 rue Cantagrel, 75624 Paris Cedex 13, France.

4106.293
VAMPIR SURVEILLANCE EQUIPMENT



VAMPIR (veille air mer panoramique infra-rouge) is a passive infra-red naval surveillance equipment which provides for surveillance and search of both air and surface targets. It is also capable of target designation to either radar or optronic fire control/director systems or equipment.

The configuration of the equipment consists of a cylindrical housing carried on a vertically stabilised mount which is designed to be fixed on the ship's superstructure in a high position to ensure maximum range and freedom from obstruction. Stabilisation of the housing automatically compensates against ship motion, while the optical head rotates at a rate of about 60 rpm to provide all-round scanning of the horizon. The stabilisation horizontal datum can be adjusted up to a maximum elevation of +20°. The equipment is a bi-spectral device operating in two distinct IR bands, thus achieving a very low false alarm rate in the presence of environmental noise. The two separate channels also enable target detection in a variety of meteorological conditions. Signal processing is performed by a sub-system provided by CSEE.

CHARACTERISTICS
Wavelength: 4 – 5 and 8 – 13 micron (simultaneous channels)
Field of view: 360° × 0–20° elevation
Detection range: At least 10 km for frontal attack by missile or aircraft
Target designation accuracy: 1 mrd in elevation and bearing
Sensor cooling: Joule Thomson cycle to about 80° K
Dimensions of stabilised unit: 125 × 60 cm diameter
Rotation rate: 60 rpm
Weight: 400 kg
Power: 115 V 400 Hz 300 VA

STATUS
In production and fitted to French Navy corvettes.

CONTRACTOR
SAT (Société Anonyme de Télécommunications), 41 rue Cantagrel, 75624 Paris Cedex 13, France.

SAT VAMPIR showing stabilised housing for mounting high on ship's superstructure and upper, rotating portion containing bi-spectral sensor units. It provides continuous passive surveillance facilities

5916.293
SAMOS ANTI-MISSILE OPTRONIC SYSTEM

Samos has been designed as a fully optronic system to perform automatic or semi-automatic anti-aircraft or anti-sea-skimming missile defence. It has a very fast response, is effective in a jamming environment and operates at low elevation and in strong sea clutter.

The basic system consists of a multispectral IR passive surveillance system (Vampir), a lightweight optronic fire control system, associated electronic control and display units, and a combined gun and missiles mount. The equipment is modular in design, small and lightweight, and can be installed on virtually all types of vessels. Samos can also be integrated with radar, an ESM system and a chaff launcher.

STATUS
In operational service with the French Navy.

CONTRACTOR
SAGEM (Société d'Applications Générales d'Electricité et de Mécanique), Département Marine, 6 avenue d'Iéna, 75783 Paris Cedex 16, France.

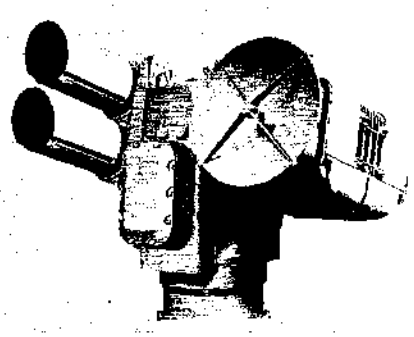
3566.293
TRS 906 LIGHTWEIGHT ELECTRO-OPTICAL DIRECTOR

This equipment is a line-of-sight stabilised E-O director designed for use aboard warships for surveillance, target indication, fire control or missile guidance purposes.

It comprises a two-axis director stabilised by rate gyros, and a servo control box. The director consists of a fixed pedestal in which is centred a bearing rotating unit which supports the elevation axle actuator. The elevation axle is fitted at both ends with flanges to provide the mechanical interface with the E-O sensor units.

The director is fitted with a joystick, and with a collimated grid sight for local control. The director can be controlled by:

(1) a deck operator, using the joystick
(2) a remote control unit
(3) the elevation and bearing errors signals generated by the E-O equipment.



Slewing speeds and accelerations are 3 rad/s and 7 rad/s² in bearing and 1 rad/s and 3 rad/s² in elevation. Slewing time for 180° is 1·8 s in bearing. Pointing stability is better than 0·2 mrad rms. Data take-off accuracy is 0·5 mrad peak.

A variety of options exist for using various sensor combinations; in addition to television trackers, infra-red automatic tracking with laser rangefinding or a K-band (millimetric waveband) radar can be employed (see Canopus fire control system **3102.281**).

CHARACTERISTICS
Director (fitted with a TV camera)
Height: 0·77 m
Rotation diameter: 0·8 m
Weight: 120 kg
Servo control box: 0·86 × 0·6 × 0·3 m
Weight: 80 kg

STATUS
In production.

CONTRACTOR
Thomson-CSF, Division Systèmes, Défense et Contrôle, 40 rue Grange Dame Rose, BP34, 92360 Meudon-la-Foret, France.

TRS 906 lightweight naval director with TV and IR cameras

3426.293

LYNX OPTICAL SIGHT

The CSEE Lynx is a self contained lightweight optical sight designed for use aboard surface ships of all sizes. It provides for air and surface surveillance and may be used in conjunction with other optical equipments or with a ship's command information centre, and can also be employed for weapon control. In the RADOP 10 naval fire control system (**4049.261**), Lynx is the main sighting element.

Targets are sighted through an optical assembly comprising a binocular sight with choice of two magnifications and a mirror in the elevation plane. A viewer, linked to the scanning mirror, is used to preposition the sight in the direction of a designated point, thereby aiding rapid acquisition. The mirror is electrically driven in elevation to provide a scan of -25 to +65°. In azimuth, rotation is unlimited, with manual drive. The line-of-sight is stabilised in elevation by means of a rate gyro acting on the mirror.

Relative angular target co-ordinates are transmitted for target designation by a fine and/or coarse precision gyro. Alternatively, angular firing co-ordinates taking into account parallax and elevation corrections can be transmitted by a fine and coarse precision synchro to the controlled weapon. Data and signal links can be provided to other equipment or to the CIC.

The Lynx director may also be equipped with a television camera and a monitor.

CHARACTERISTICS

Magnification: ×2·5 or ×8

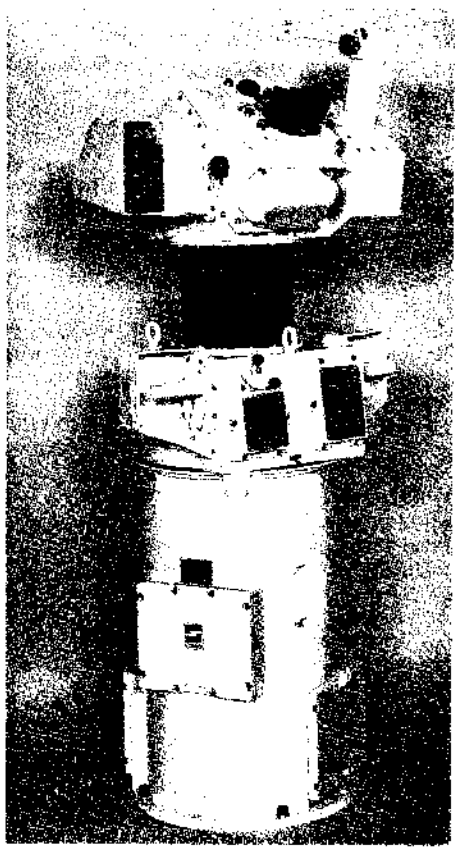
Field of view: ±9·5° or ±3°

Scanning field: Unlimited in azimuth, -15 to +75° in elevation

Max speed in elevation: 1 rad/s

Max acceleration: 2 rad/s² (elevation)

Height of eyepieces: Adjustable 1·38 – 1·63 m



Weight: 135 kg

STATUS

In production for Bahrain and Kuwait.

CONTRACTOR

CSEE (Compagnie de Signaux et d'Entreprises Electriques), 17 place Etienne Pernet, 75738 Paris Cedex 15, France.

CSEE Lynx optical director

3425.293

PANDA MK2 OPTICAL DIRECTOR

This is a naval optical director equipment capable of use for weapon control, air and surface target search and designation, and for practice firing observation. It is the main optical sight and director of the RADOP 20 naval fire control system (**4049.261**). The general arrangement of the unit can be seen from the accompanying illustration. The deck-mounted sight is provided with power driven azimuth movement and a stabilised line-of-sight by means of integral rate gyros. There is also provision for remote control of the sight to enable it to be laid on from an external reference.

When operating in the weapon control mode the sight is used to track the target. The co-ordinates transmitted by the sight convey all the necessary firing corrections based on target velocity, weapon characteristics and parallax between weapon and sight. In the search mode of operation the sight scans the surveillance zone in bearing and elevation.

CHARACTERISTICS

Magnification: ×8 and ×2·66

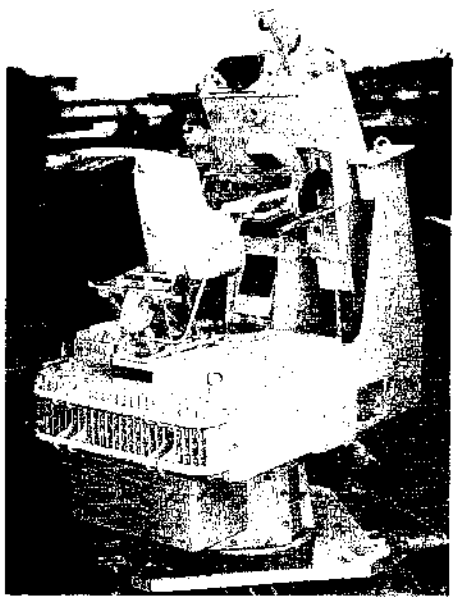
Fields of view: 13° and 4·9°

Azimuth aiming arc: Unlimited

Elevation arc: -25 to +65° (relative to deck)

Max velocity: 1 rad/s (bearing); 0·5 rad/s (elevation)

Weight: <330 kg



The above description applies to the basic optical version of this director, which is referred to as the Panda. A more sophisticated version, with additional facilities such as laser rangefinder, automatic tracking, local/remote control transfer, multiple weapon capability etc, is also produced as the Naja electro-optical director (**3561.293**).

STATUS

In production for 16 navies.

CONTRACTOR

CSEE (Compagnie de Signaux et d'Entreprises Electriques), 17 place Etienne Pernet, 75738 Paris Cedex 15, France.

CSEE Panda Mk2 optical director

3561.293

NAJA ELECTRO-OPTICAL DIRECTOR

This is a naval electro-optical director equipment usable for air and surface surveillance, automatic TV tracking at high and low altitude, and accurate fire control by laser telemetry. The Naja equipment contributes to the self-defence of surface ships against aircraft or missile attacks.

In addition to being employed on its own, the Naja director is the principal fire control element of the RADOP 30 naval weapon control system (**4049.261**).

The general arrangement of the unit can be seen from the accompanying illustration.

The deck mounting is provided with a power-driven azimuth movement and a stabilised line-of-sight by means of integral rate gyros. The trainable assembly includes mainly the optical unit, the TV camera, the laser rangefinder, the training and elevation kinematic circuits, the analysis unit, the firing computer and the control and signalling units.

When operating in the fire control mode, the operator acquires the target which is tracked automatically by TV. The Naja analogue computer using the gyro and laser data provides all the necessary firing adjustments based on target velocity, angle of elevation, parallax, ballistics and slope.

The Naja director can be remotely controlled.

CHARACTERISTICS

Optical equipment

Magnification: ×2·5 (field ±9·5°); ×8 (field ±3°)

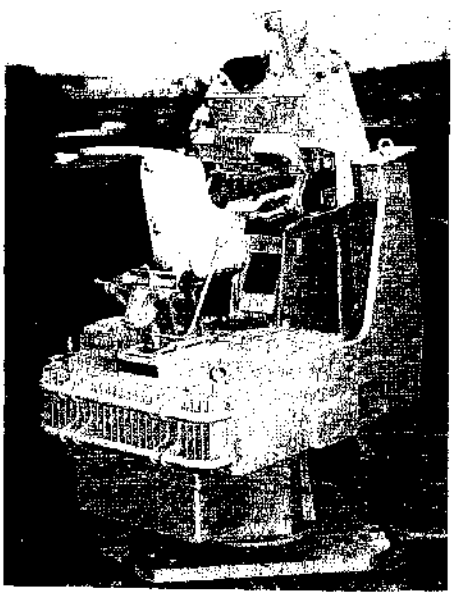
Daylight camera or LLTV camera

CILAS laser

Azimuth aiming arc: Unlimited

Elevation arc: -25 to +70°

Max velocity: 60°/s (bearing); 60°/s (elevation)



Weight: 500 kg approx

STATUS

In production. The Naja director has also been offered as part of a land-based air defence system based on the Breda twin 40 mm naval system.

CONTRACTOR

CSEE (Compagnie de Signaux et d'Entreprises Electriques), 17 place Etienne Pernet, 75738 Paris Cedex 15, France.

CSEE Naja electro-optical director

4255.293
NAJIR ELECTRO-OPTICAL DIRECTOR

The Najir director contributes to the self defence of surface ships of any displacement against aircraft or missile attacks. It can be used against naval or land targets by night or day. It is unaffected by enemy jamming.

The Najir director operates as an autonomous unit with integrated stabilisation and a digital computer. It is manned by a single operator in two principal modes: surveillance and target tracking, or fire control of several weapons of different calibres.

In the former mode the operator can receive and re-copy a target designation transmitted by other surveillance equipment; by means of the auxiliary sight, immediately acquire a target designated by a watch keeper; quickly identify the target (optical or IR display); decide to select automatic tracking either TV by day or IR by night (or by day in disturbed atmosphere); obtain the target range by laser rangefinder.

In the fire control mode the operator can select the firing mode (against aircraft or floating target), order the simultaneous coupling of two guns, decide to open fire on receipt of 'gun ready' and 'target within range' information and observe the results of firing.

The Najir comprises a fixed structure, a trainable assembly, a tracking system and a remote control station. It can be operated from a remote control station and can be easily integrated with a radar fire control or a centralised tactical data system, due to its digital interface. In the RADOP 40 system, the Najir is associated with a Racal radar.

CHARACTERISTICS

Aiming arcs: Unlimited (bearing); -20 to +70° (elevation)

Max velocity: 60°/s (bearing); 60°/s (elevation)

Max acceleration: 60°/s² (bearing); 60°/s² (elevation)

Optical equipment

Binocular telescope: ×2·5 (field ±9·5°); or ×8 (field ±3°)

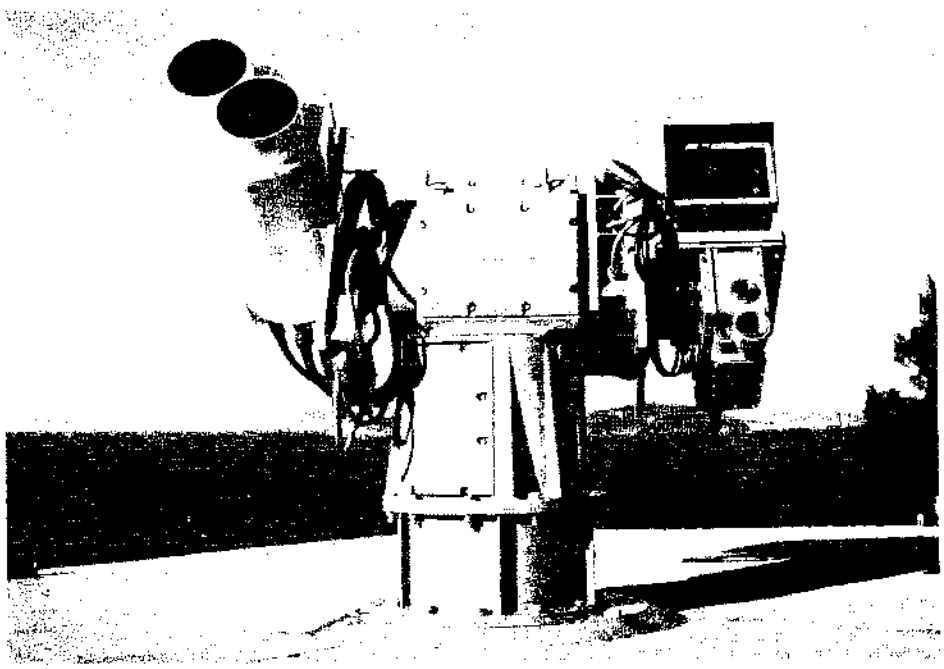
CSEE Najir electro-optical director



3424.293
TOTEM NAVAL FIRE CONTROL EQUIPMENT

The Totem electro-optical fire control director has been developed by CSEE to provide naval vessels with a passive means of air defence surveillance, target designation and tracking for use in conjunction with air defence weapons such as anti-aircraft guns. The general arrangement of the above-deck equipment can be seen from the adjacent photograph. A rotating turret carries an elevating head on which are mounted a passive infra-red tracker, a laser rangefinder, and either a normal or low light-level television camera with automatic tracker. Below decks are the servo rack and control and monitoring panels. The former includes three units: one for low-level data processing (ie data representing various parameters from sensor or command transmitters), and servo amplifiers for each axis (vertical and horizontal). The control and monitor panels may be incorporated in the weapon consoles of the related gun or missile systems associated with the Totem director.

The Totem sensor head is provided with stabilisation by means of integral gyros, and the principal mechanical characteristics are tabulated below. The infra-red tracker employed is the SAT PIRANA equipment (**3064.293** and **3427.293**) which is also suitable for mounting on guns or separately. The television sub-system is of SINTRA manufacture, and a CILAS laser rangefinder is employed. Sensors of alternative manufacture may be substituted for the above and CSEE has a combined electro-optical/radar version of the Totem FCS under development; the radar is a Ka-band equipment manufactured by Thomson-CSF, similar to that used in the TRS 906 (**3566.293**).

CHARACTERISTICS

Turret weight: <200 kg (plus weight of sensors)

CSEE Totem electro-optical fire control system with SAT infra-red tracker (left) and LLTV and laser rangefinder (right)

Max slewing speed: 2 rad/s² (elevation and azimuth)

Max slewing acceleration: 2 rad/s (elevation and azimuth)

Angular tracking accuracy: 1'

Power supply: 115 V 3 phase 3 kVA

STATUS

Production.

CSEE (Compagnie de Signaux et d'Entreprises Electriques), 17 place Etienne Pernet, 75738 Paris Cedex 15, France.

4716.293
VISON OPTICAL DIRECTOR

As a periscopic optical director, Vison carries out surveillance, target designation and acquisition functions, and automatic tracking of targets. With the incorporation of an optional fire computer it can also be used as a fire control system.

The basic system consists of a periscope providing an optical channel from an exterior-mounted stabilised mobile head. The orientation in bearing and elevation of the mobile head line of sight is controlled from a data processing console at the foot of the periscope. The operator uses a control stick to control the head and an eyepiece which provides optical observation of the surveyed sector (30° or 7·5° according to magnification). In addition to direct optical observation, a TV camera is installed in the optical path and provides a video screen display to the operator. Automatic TV tracking of the target can be used when available.

With the reduced dimensions of Vison, installation of the complete system in the ship structure is relatively simple.

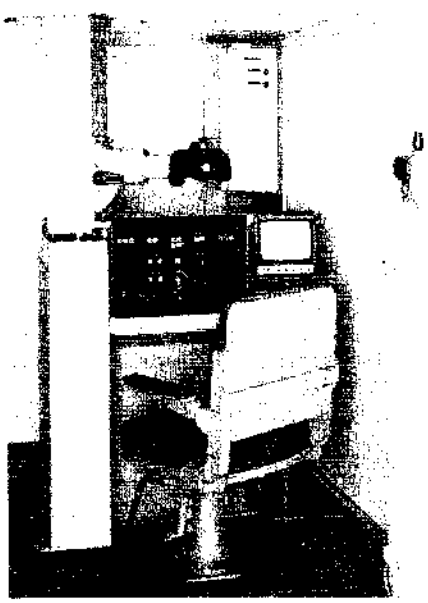
CHARACTERISTICS

Magnification: ×2 or ×8

Field of view: 30° or 7·5°

Bearing scan: Unlimited

Elevation scan: -25 to +70°



Weight: Approx 120 kg (sub-assembly head and periscope); 300 kg (complete system)

STATUS

In development.

4717.293
COTOL OPTRONIC FIRE CONTROL SYSTEM

Cotol is a lightweight optronic fire control equipment derived from the Totem system (**3424.293**), and is used for the control of guns of all calibres against both air and surface targets. The system is normally installed as part of the ship's overall anti-aircraft defence system, particularly against low flying aircraft, but it can also be used as a control unit against surface targets. The equipment is fully self-contained, with TV and IR cameras, a laser rangefinder and a remote control console. Facilities provided include target acquisition, automatic IR or TV tracking, memory tracking, computation of firing data for two weapons, and control and firing of the guns.

CHARACTERISTICS
Bearing scan: Unlimited
Elevation scan: -30 to +85°
Weight: 370 kg
STATUS
In production.

TAON TMY83 LASER RANGEFINDER/ILLUMINATOR

The TMY83 TAON (télémètre d'artillerie optronique pour navire) is a Nd-YAG laser rangefinder developed for naval applications such as integration into electro-optical fire control systems for air defence weapons. The rangefinder and its power supply are housed within a single casing, which is designed for ease of fitting to director mounts or directly on to weapons such as guns. The laser repetition rate is adjustable between ten and twenty pulses per second.

CHARACTERISTICS
Laser type: Nd-YAG, electro-optical Q-switching
Wavelength: 1·06 micron
Pulse duration: ≤20 × 10⁻⁹ s
Output: ≥5 MW
Beam divergence: 0·5 mrad
Range: 500 - 20 000 m
Range resolution: ±5 m
Dimensions: 460 × 265 × 160 mm
Weight: 15 kg

DEVELOPMENT
Design and development has been carried out under contract from the French Navy.
STATUS
The TMY83 replaces the TMV26 naval laser rangefinder (**1799.293** in 1976 and earlier editions).
CONTRACTOR
CILAS (Compagnie Industrielle des Lasers), route de Nozay, 91460 Marcoussis, France.

TMY113 LASER RANGEFINDER/ILLUMINATOR

The TMY113 is a high repetition rate laser rangefinder designed for integration into the Naja naval electro-optical fire director equipment (**3561.293**). The rangefinder, electronic timing clock, and power supply are all housed within the same casing.

CHARACTERISTICS
Laser material: Nd-YAG
Wavelength: 1·06 micron
Pulse duration: 20 × 10⁻⁹ s
Peak power: ≥5 MW
PRF: 20 pps
Detector: Avalanche photodiode
Detector field: 2 mrad
Dimensions: 470 × 230 × 170 mm
Weight: <14 kg
Power supply: 115 V/400 Hz, 3-phase
STATUS
Series production.
CONTRACTOR
CILAS (Compagnie Industrielle des Lasers), route de Nozay, 91460 Marcoussis, France.

CILAS TMY113 laser rangefinder/target illuminator for Naja naval electro-optical fire director equipment

5918.293
TMY 156 LASER RANGEFINDER

The TMY 156 is a high repetition rate laser rangefinder/target illuminator designed for integration into target designation optronic systems. It can be used for acquisition, designation and tracking of air, surface and land targets. The equipment consists of a single unit containing the rangefinder and power supply.

CHARACTERISTICS
Laser type: Nd:YAG; Q-switched
Wavelength: 1·06 μm
Pulse duration: 20×10^{-9} s
Detector: Avalanche diode
Field angle: 1 mrad
Dimensions: 600 × 225 × 195 mm
Weight: 25 kg

STATUS
Prototype.
CONTRACTOR
CILAS (Compagnie Industrielle des Lasers), route de Nozay, 91460 Marcoussis, France.

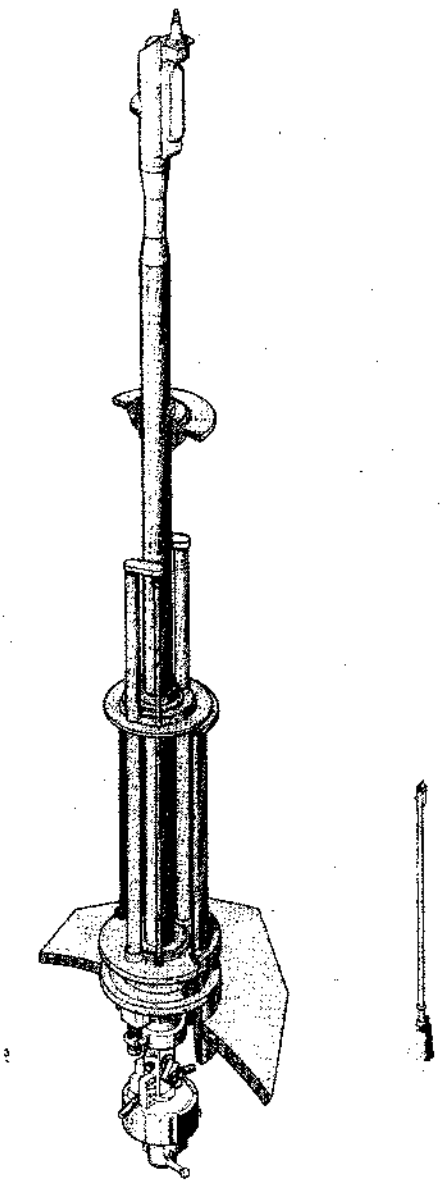
SOPELEM SUBMARINE PERISCOPES

SOPELEM designs and manufactures all types of submarine periscope, and while details of specific equipments have not been obtained, current production includes the following basic categories:

Surveillance Periscopes



Periscopes of this type provide for observation at fixed navigation periscope depth and can be fitted with a rangefinding radar antenna and a radar search scanner, and several electro-optical sensors. They are designed for day and night observation and may be fitted with a gyro-sextant for star sighting navigational purposes. These periscopes are generally equipped with a recording photographic camera.

Attack Periscopes

With such instruments the crew is able to make an observation of the surface area in all directions from position fixes at all submarine navigation periscope depths. The periscope is completely controlled by hydraulic means giving maximum flexibility and speed of operation. The periscope upper section is of very small cross-section and thus creates minimum wake and also makes detection by radar much more difficult.

All these periscopes are designed and manufactured by SOPELEM which also produces the hydraulic controls and the associated electronic equipment. They equip all submarines of the 'Daphne', '1200 T Agosta' classes, and French nuclear powered submarines.

STATUS
In production.

4718.293
GYRO STABILISED SIGHTING SYSTEM

The Gyro Stabilised Sighting System (GSSS) is used for surveillance, identification and target tracking. The system consists of a dual magnification periscope with a gyro-stabilised upper mirror. The mirror coating is effective over a wide spectral range from the visual to near infra-red, and permits optional use of laser or infra-red trackers in parallel with the visual path. High magnification by the stabilised optics enables the observer to identify and lock-on to the target at considerable distances.

The sight is an optical periscope, roof or floor mounted with its rotating viewing head outside. The head includes the upper periscope mirror which is free to rotate in azimuth and elevation. The system can be integrated with a laser rangefinder and/or a low light TV camera.

CHARACTERISTICS
Magnification: × 10 or × 2·5
Field of view: 5° or 20°
Scan: 360° azimuth; -30 to +60° elevation
Tracking rate: 30°/s (azimuth and elevation)
Weight: 65 kg

Israel Aircraft Industries Ltd, Tamam Precision Instruments, Ben Gurion Airport, Israel.

5921.293
DS-35 (SPIRTAS) TARGET ACQUISITION SYSTEM

The SPIRTAS passive IR target acquisition system (designated DS-35) is a thermal detection equipment designed for ship protection against sea-skimming missiles. It operates in the three to five micron wavelength band using a multi-element array detector head, cooled by a closed-circuit cryogenic cooler.

The system consists of a sensor mounted at masthead which contains the stabilised scanning head, a below-decks control and display console and an auxiliary electronics unit. The console contains signal processing units, a TV video screen, and a control panel. The monitor screen can present three types of information: a low resolution situation display, an enlarged FLIR type thermal display and an auxiliary display. The latter will provide a variety of data including, the IR intensity behaviour of selected targets, information transmitted to other on-board systems, thermal image position and cursor position.

CHARACTERISTICS
Wavelength: 3 - 5 microns
Scanner coverage: Azimuth 360°; elevation -2 to +20° in full search mode
Scan period: Full search mode 8s; anti-missile mode 1·25s
Accuracy: 7 mrads in both azimuth and elevation
Dimensions: Sensor unit: 1·2 m high; 0·8 m wide
Weight: Sensor unit 120 kg; control/display console 170 kg; electronics unit 90 kg
STATUS
Believed to be in production for the Israeli Navy for a number of warships.
CONTRACTOR

3585.293
OGR7/2 OPTICAL DIRECTOR

The optical director Type OGR7 is a shipborne equipment of small size and weight for the control of up to 3 inch calibre guns against air and surface targets. It consists of a tracking system, provided with telescope and open sight, and a computer through which the train and elevation lead angles and the super-elevation are computed with high accuracy. A single gunlayer/operator controls the speed in train and elevation by means of a joystick. The line-of-sight is stabilised so that the operator has only to account for the motion of the target.

The OGR7/2 consists essentially of a revolving platform, supported by a base fixed on the deck, on which is fitted a frame holding the telescope and containing the mechanical, electrical and electronic sub-units of the equipment. The train motion is provided by an electro-hydraulic unit. The motion for the elevation search is provided by a servo which moves the prism of the telescope. The computer is located in the revolving part of the director and consists of transistorised amplifiers and mechanical assemblies including servomotors, potentiometers, resolvers and the control transmitters of gun orders. A high luminosity binocular telescope with fixed eyepieces is used as the optical aiming device. Two concentric aiming circles appear in the left eyepiece. The telescope is provided with coloured filters that can be inserted by turning a knob. By means of a lever the magnifications can be changed from ×2·3 to ×7. An open sight is located at the left side of the telescope. A servo provides for vertical search motion, keeping it parallel to the line of sight of the telescope.

Stabilisation compensates for the variation of the train and elevation angles due to course alterations or to the pitch and roll of the ship. For this purpose, gyro units are installed. One gyro measures the yaw speed of the ship; two other gyros, located on the director rotating platform, measure the level and cross-level speed, respectively.

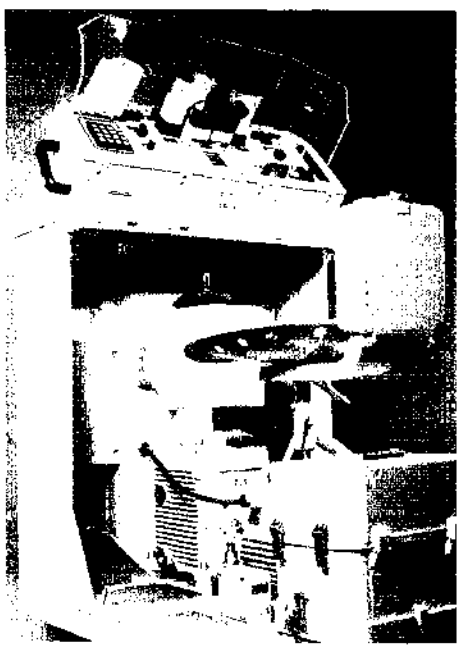
The control panel contains: the main switch; the switch to activate the circuit for starting the guns from the director; fire selector for the guns; push-buttons to start and stop the guns; selector for air target or surface target; two knobs and associated dials to introduce the target speed and the cross range of the air target; knob and associated dial to introduce target range in 'surface target'.

CHARACTERISTICS
Telescope
Magnification: ×2·3 and ×7
Optical field: 30° and 10°
Max train speed: 100°/s
Max elevation speed: 60°/s
Max train lead angle: ±25°
Max elevation lead angle: ±20°
Crossing range limits: 100 – 2000 m
Target speed limits: 60 – 350 m/s

STATUS
More than 250 sets of the OGR7 series have been supplied to main navies, among them those of West Germany, Greece and Peru. A special version of the OGR7, known as the OGR7 Seacat, has been developed which provides an additional telescope for Seacat missile guidance as well as gunfire direction. This model also bears the designation OG20. A later development, the OGR7/2-A, is described under entry **5919.293**.

CONTRACTOR
Officine Galileo, Via Einstein 35, 50013 Campi Bisenzio, Florence, Italy.

5919.293
OGR7/2-A OPTICAL DIRECTOR



The optical director OGR7/2-A is the latest version of the OGR7/2 equipment (**3585.293**), and is a shipborne lightweight fire control system (FCS) mounted on a revolving platform and manned by a single operator. It consists basically of a pedestal on which an optical head with an external image intensifier, an autonomous integrated two-axis stabilisation system and a digital computer for lead angle computation and FCS management are mounted. The azimuth movement is provided by an electro-hydraulic unit while elevation is controlled by a servo.

The operator carries out azimuth and elevation line-of-sight speed by means of a joystick, and performs air and surface surveillance, autonomous detection, target angular tracking and designation and inter-designation to provide air and surface control for weapons up to 3-inch calibre. In both anti-aircraft and anti-surface modes, range information can be introduced either manually by the operator or automatically by CIC designation equipment.

CHARACTERISTICS
Telescope
Magnification: ×2·3 and ×7
Optical field: 30° and 10°
Maximum train speed: 100°/s
Maximum elevation speed: 60°/s
Target speed limits: 60 – 350 m/s

STATUS
In production for the Italian Navy.

OGR7/2-A optical director

4262.293
OG30B SHIPBORNE THERMAL IMAGER

The OG30B thermal imaging equipment has been developed for integration with the Selenia-Elsag 30B radar tracker pedestal (**3861.281**). It can also be fitted to any fire control system to perform panoramic surveillance, observation and identification, and acquisition and automatic tracking of both surface and airborne targets. These functions are achieved by transmitting the thermal image of the target(s) on to an appropriate display on the control console. By converting the imager video into a conventional TV signal format, automatic TV tracking techniques can be employed.

The system consists of an IR camera, compressor, digital video converter, TV contrast tracker and a panoramic surveillance signal processor. The camera comprises a hard carbon coated optical head, a scanner of the parallel scan type with two servoed mirrors providing 25 frames per second image scanning, a detector-dewar-cryoengine assembly, pre-amplifiers and control electronics. The panoramic surveillance function is performed by circular scanning of the IR scene. The cooling system is of the closed circuit type with one fluid compressor and one cooling unit.

CHARACTERISTICS
Wavelength: 4 – 14 microns
Image format: 1:2
Instantaneous field of view: 0·25 mrad
Frame rate: 25 Hz
Lines per frame: 200
IR detector: CMT linear array
System weight: 65 kg

STATUS
In service with the Italian Navy

LIOD LIGHTWEIGHT OPTRONIC DIRECTOR

To offset the increasing use of electronic warfare as a means of degrading radar-based weapon control systems on board ships, Signaal has developed an E-O (electro-optical) sensor system which is passive in operation, insensitive to ECM, and practically undetectable. The LIOD (lightweight optronic director) is an unmanned remotely controlled director for the automatic tracking of air and surface targets.

Tracking is by the optical contrast technique whereby the target is tracked against its background as viewed by a TV or infra-red camera. Alternatively a correlation tracker can be implemented which is capable of automatic target acquisition. Range information is provided by a laser rangefinder. Alternatively a 3-D laser-tracker can be fitted. Both the camera and rangefinder are co-mounted on the director head unit, which is provided with appropriate servos and anti-vibration mountings.

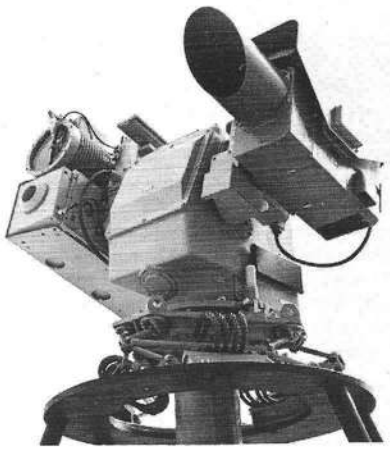
The director head is also used as a mounting for combined radar and E-O sensors in the LIROD (**3767.281**), to provide all-weather capability.

Because of its modular design, LIOD can be used for autonomous or integrated weapon control systems, as an auxiliary sensor for various weapon control or data systems.

The daylight version is fitted with a TV camera and laser, while the high-performance model has a TV camera, infra-red camera and laser rangefinder.

With its independent computer capacity and operational control facilities, it could well be used as an autonomous short-range gun control system.

The LIOD sensor, in its basic version, employed as an autonomous weapon control system, is capable of performing the following functions:



(1) optical surveillance for air and surface targets
(2) target designation for anti-air and anti-surface engagements
(3) air or surface fire control
(4) automatic or rate-aided tracking of one air or surface target
(5) air or surface target gun prediction calculation
(6) simultaneous control of two dual-purpose guns of the same or different calibre
(7) engagement monitoring, kill assessment, and gun fire correction
(8) system status monitoring.

STATUS

In production and delivered to various naval forces.

CONTRACTOR

Hollandse Signaalapparaten BV, PO Box 42, 7550 GD Hengelo, Netherlands.

LIOD lightweight optronic director

5722.293
IRSCAN INFRA-RED SURVEILLANCE SYSTEM

IRSCAN is a fast-reaction infra-red surveillance system for air and surface targets. It has been developed for naval applications but can also be used in the land-based role. The scanner is of modular construction with three sensors covering 3 to 5 and 8 to 12 μm wavelengths, and includes elevation drive, self-supporting closed-cycle stirling-type coolers and is mounted on an azimuth drive. In the naval role a stabilisation system is normally provided with shock and vibration isolating mounting.

The system has a dual wavelength capability to cover a variety of infra-red target signatures and environmental conditions, and special techniques for spatial filtering and signal correlation are used to give the system a highly reliable and accurate target detection and tracking performance. A large number of air targets can be auto-tracked while scanning. A display console is equipped with a 15-inch (38 cm) TV monitor, memory supported with alpha-numeric data presentation and light-pen control keys. The console also contains the system computer and all signal processing.

IRSCAN can be used with systems such as LIOD (**3143.293**), LIROD (light-weight radar optronic director) and Goalkeeper (**3616.231**), as well as other anti-missile defence systems.

CHARACTERISTICS

Horizontal coverage: 360°
Elevation scan patterns: Low, medium, high (up to 40°)
System weight: 850 kg
Stabilisation: 2-axis gimbal for roll and pitch

STATUS

The naval version has been developed for the Royal Netherlands Navy and successful sea trials were carried out on Hr MS Piet Heyn, an S-frigate of the RNN.

CONTRACTOR

Hollandse Signaalapparaten BV, PO Box 42, 7550 GD Hengelo, Netherlands.

IRSCAN scanner in naval configuration

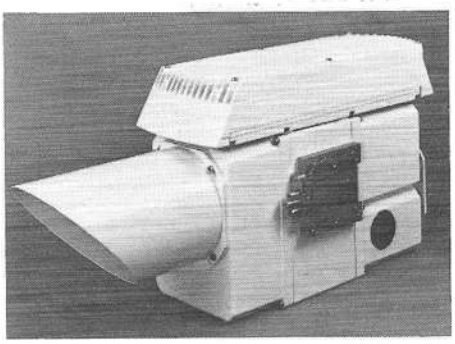
TYPE UA 9053 THERMAL IMAGING CAMERA

The UA 9053 camera has been designed to enable passive target tracking by both day and night. Its application is either as an auxiliary E-O sensor readily integrated in a radar weapon control system, or as a sensor for an autonomous short-range weapon control system.



The camera produces a standard CCIR video output. Resolution and sensitivity are such that small low-flying targets can be observed and tracked. Tracking of surface targets is also possible. The sensor is equipped with a closed cycle cryo-generator, Philips type UA 7011. The equipment has been designed for application in maritime environments and operates for long periods without maintenance.

CHARACTERISTICS

Field of view: 42 × 23 mrad (azimuth × elevation)
Instantaneous field of view: 0·2 × 0·2 mrad
Detector cooling: Closed cycle type UA 7011
Cool-down time: Approx 10 minutes
Output signal: CCIR compatible
Input power: +24 V DC, -24 V DC
Power consumption: 250 VA
Dimensions: 470 × 275 × 350 mm
Weight: ⩽37 kg

CONTRACTOR

Philips Usfa BV, Meerenakkerweg 1, PO Box 218, 5600 MD Eindhoven, Netherlands.

Type UA 9053 infra-red camera

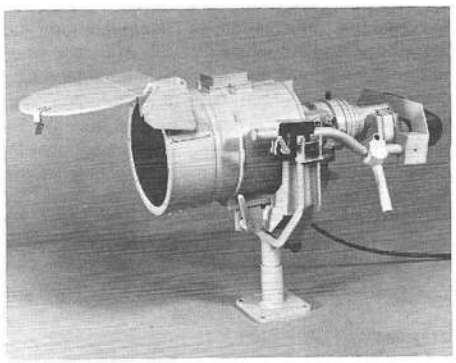
TYPE MS7TS MARINE NIGHT SIGHT

The MS7TS marine night observation device is an image intensifier system for medium- and long-range night observation at sea. Unlike radar it gives a visual presentation of a ship's silhouette facilitating discrimination between classes of vessels. It makes unilluminated objects immediately recognisable, for instance a blind fishing boat, a floating trunk, rocks, buoys.

The double-hinged bracket permits fast scanning of the horizon from a pedestal on the bridge or on deck. The night observation device is suitable for use on board all kinds of seagoing ship. Its versatile and sturdy design is well adapted to internal and outside use. The system comprises a high speed mirror objective, a three-stage fibre-coupled image intensifier with power supply, a bi-ocular system for comfortable viewing, or if desired a monocular eyepiece. The nickel cadmium battery can be recharged by a special battery charging unit. It is also possible to feed the observation device from the ship's main supply (optional).

A distortion-compensated image over the entire field of view is offered. The device is provided with an automatic brightness control. Detection of unilluminated ships ranges from 8 to 12 km, depending on ambient conditions. The weight is less than 20 kg.

CHARACTERISTICS



Magnification: ×7
Field of view: 7°
Focus: adjustable, 50 m - infinity
Detection range: 8 - 12 km for unilluminated ships

STATUS

In production.

CONTRACTOR

Oldelft (NV Optische Industrie De Oude Delft), PO Box 72, 2600 MD Delft, Netherlands.

Type MS7TS marine night sight

NORWAY

TC10 THERMAL IMAGER

The TC10 is a thermal imager designed specifically for naval applications to provide high penetration of smoke, haze and camouflage. It is a passive system giving high resolution with a minimum resolvable temperature difference of 0·03° C which offers long-range detection and identification. Detection is independent of ambient light and the system will, therefore, operate as efficiently by night as by day. The thermal picture is displayed on a TV monitor.

The TC10 consists of a thermal camera, signal processing unit and a TV monitor. In the shipboard application it is normally mounted on a stabilised platform.

CHARACTERISTICS
Field of view: 1° (vertical); 3° (horizontal)
Resolution: 0·25 mrad
Focusing: 25 m – infinity
Detector: Cadmium mercury telluride
Spectral band: 8 – 12 μm
Mission time: 20 hours with 5 litre cooling bottle at 300 atmospheres
Detector cooling: Compressed gas
Weight: 8 kg (thermal camera); 7·5 kg (signal processing unit)

CONTRACTOR
Simrad Optronics, PO Box 6474, Etterstad, Oslo 6, Norway.

SAAB TVT-300 AUTOMATIC TV TRACKER

The TVT-300 is a system for automatic tracking of objects, in which the optical contrasts of the object against its background as seen by a TV camera are utilised. The basic system consists of a TV camera on a gyro-stabilised platform, a monitor, and an electronics unit containing video processing and servo control circuits. The equipment can be engineered and assembled to serve either fire control or missile guidance applications.

OPERATION
With the target within the view of the TV camera the operator places an electronic 'window' on the target by means of a joystick. The operator then initiates automatic tracking whereby the servo control circuits keep the 'window' centred on the target contrast and also align the target to the centre of the camera field of view.

Signals corresponding to the deviation of the 'window' from the optical axis of the camera are used to control the platform servo motors which, triggered by the deviation signals, train the platform to keep the camera continuously directed towards the selected target. Tracking can be performed on dark or bright contrasts, or on very slight contrast levels. The platform angular positions in bearing and elevation are used for automatic tracking of the guns.

In the Saab TVT-300 the TV camera bearing and elevation values are used to control directly the aiming of AA guns which are slaved to the system. The system replaces the conventional fire direction and correction devices. Target acquisition and corrections are quickly and accurately made from a close-up view of the target seen on the TV monitor.

STATUS
The Saab TVT-300 is operational in several navies.

CONTRACTOR
Saab Missiles AB, 58188 Linköping, Sweden.

Saab TVT-300 automatic TV tracker on board a Swedish fast patrol boat. Other versions are used in the Kalle system and those of other users. Various laser rangefinders are employed

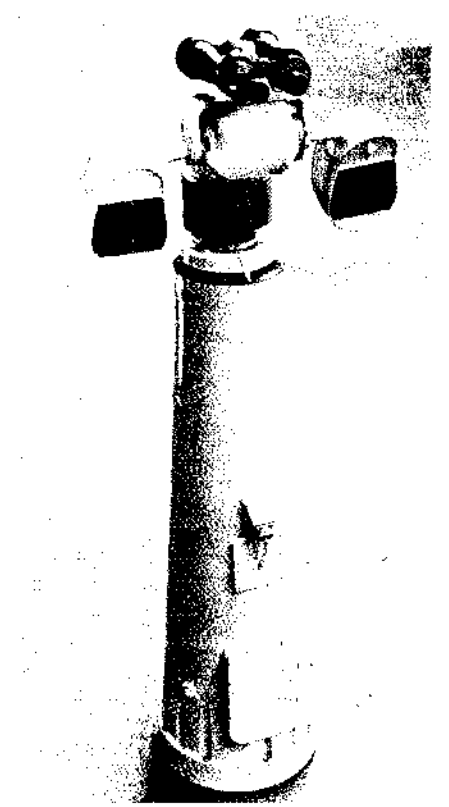
SHORTS TARGET DESIGNATION SIGHT

The target designation sight is used for visual acquisition and tracking of surface and air targets. The sight consists of a binocular mounted on a sight head fitted to a pedestal which is bolted to the deck. The binocular platform is fitted with handgrips with which the binocular may be rotated and the sight head raised or lowered on an elevating shaft to provide height adjustment.



OPERATION
On acquiring the target in the binocular field of view and centring it on the cross-marking, the operator presses the designated arm switch on his right hand-grip. The target bearing and elevation information is transmitted automatically to the control centre by two synchro elements, one in the pedestal for bearing, the other in the sight head for elevation.

A number of different versions, fitted with twin and tandem synchros and other variations have been supplied.

DEVELOPMENT
This equipment has been evolved from an element of the Seacat missile system (**1019.231**), and is a modification of the pedestal-mounted visual director used with that system.

STATUS
In production.

CONTRACTOR
Short Brothers Limited, PO Box 241, Airport Road, Belfast BT3 9DZ, Northern Ireland.

Shorts target designation sight

3055.293
LSDS OPTICAL FIRE DIRECTOR

The LSDS optical fire director (OFD) is a lightweight, line-of-sight stabilised director fitted with binoculars for operation by a standing operator.

The design concept of the OFD is to produce a low weight, simply constructed director that is easy to install and maintain in ships ranging in size from fast patrol boats to the largest warship. It may be used as a main gun fire/missile control system or as a back-up to more elaborate weapons systems.

The director has duplicate sets of coarse-fine synchro transmissions for both training and elevation and can therefore be used to control two separate weapons or alternatively provide independent transmissions to one weapon for damage control purposes. It may be remotely controlled in either training and elevation or both via coarse-fine synchro transmissions. Stabilisation about the line of sight is controlled by two rate integrating gyroscopes. The director may be operated in an unstabilised mode.

The operator standing on the variable height platform is provided with a safety harness and plug and socket connection for a communications head set and heated suit if required.

OPERATION
The control of the director locally is by means of a thumb-operated two-axis joystick. In the local control mode the operator controls the director from two pistol-type handgrips. The right hand is used to override the deadman's handgrip and to control the two-axis joystick. The left handgrip is used to control a rate selection switch, a rate doubling button, a target acquisition button, and a firing trigger. Having selected a suitable training and elevation rate, operation of the joystick will cause the line of sight to train and elevate smoothly from zero to the rate selected. Velocity or rate-aided tracking is operator selected. If it is necessary to increase momentarily the selected rate this can be achieved by pressing the rate doubling button. Pre-selected controls both for the OFD and the weapons it is controlling are easily accessible on the panel mounted between the two handgrips.

For remote operation the OFD can be controlled by two separate methods:

(1) by synchro drive from the ship's surveillance radar (target indication, training only) or tracking radar (training and elevation)
(2) by a joystick from a below deck station using a CCTV/IR monitor link for viewing.

In addition to the standard 7 × 50 mm binocular fit, facilities exist for fitting an image intensifier, an infra-red camera for blind-fire capability or a laser rangefinder. A below-decks remote control facility exists employing a CCTV or infra-red camera on the mounting to provide an automatic gun laying capability with the aid of an auto track unit deployed in the CCTV/IR-servo/mount loop. An on-mount digital predictor is available to provide lead angle predictions for enhanced hit probability.

CONSTRUCTION:
The LSDS OFD is constructed from cast aluminium, non-magnetic stainless steel and GRP thus minimising its weight and magnetic signature. The

design meets DEF specification 133, Table N2, shipborne equipment - exposed. The director is self contained apart from a switch/fuse and distribution box which is fitted below deck.

CHARACTERISTICS

Electrical requirements: To DEF standards 61-5 (Part 1)/1

(a) 440 V 3-phase 50-60 Hz or 115 V 3-phase 50-60 Hz, 1 kVA

(b) 115 V/400 Hz, single-phase, 50 VA

(c) 24 V DC, 10 A (including heated suit)

(d) 115 V/50 or 60 Hz conditioning heater supply

Training system performance

Arc: Unlimited

Max velocity: 80°/s

Max acceleration: 150°/s²

Elevation system performance

Arc: -20 to +70°

Max velocity: 120°/s

Max acceleration: 150°/s²

Weight (including platform): 475 kg

Synchro transmission from the director

Two coarse/fine outputs are available in both training and elevation. Coarse/fine ratios available are: 36:1, 16:1, 9:1, or a combination of these

Synchro-transmission to director

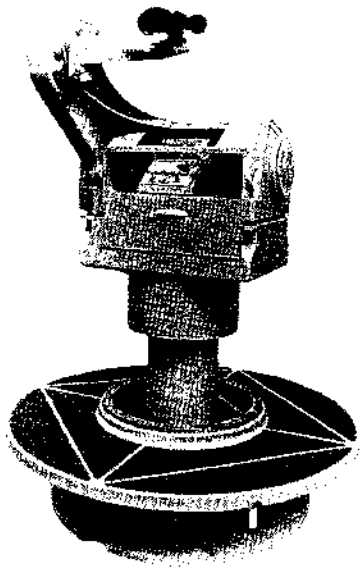
One coarse/fine system on both training and elevation. Coarse/fine ratios: 36:1, 16:1, 9:1, or a combination of these

Open sight

A ring and bead open sight is mounted adjacent to the binoculars

Dimensions

Overall height: 2110 mm



Swept radius: 762 mm

STATUS

Design and development was a private venture project. Recently adopted by the Royal Navy as a director for the GSA7 fire control system, this director has also been selected by ten overseas navies.
