Anatomie de *l'Écureuil*

L'écureuil roux

Il vit dans un nid construit dans un arbre

La queue de l'écureuil l'aide à garder l'équilibre et sert de couverture quand il dort.

L'écureuil est herbivore

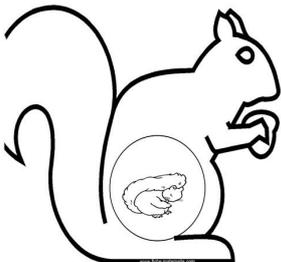

Il se déplace

Il marche, court, saute

L'écureuil est un mammifère, la femelle allaite ses petits.

L'écureuil râle, glousse, caquette, glapit, grogne,...
