In the beginning, the hi-fi separates were made up of just a turntable, a cabinet and an amp. The cabinets were not designed to look great and blend well together. As years passed, improvements to these devices were made, and the technology was fine-tuned. Today, turntables, pre-amplifiers, and compressors can be added to just about any hi-fi set-up. The first improvement in the hi-fi system came about because of the inclusion of digital sources. Up until this point, analog sources were used in the soundboards of hi-fi systems. However, it was discovered that by combining the operation of a CD player with the operation of an amp, the possibility of reaching a true high frequency was realized. Thus, the hi-fi system began to incorporate a line input to connect the player with the amplifier. Soon, separate speakers were added to allow each input to be connected to a different speaker.

The turntables of today are among the most revolutionary developments in hi-fi history. They are capable of playing CD's without having to add an extra device to the soundboard. Audio Scaleurs improved turntables also have the option of using a direct drive system, which utilizes a belt drive for all of the mechanisms involved in spinning the vinyl.
