

Objective

The nanotechnology is the manipulation of matter with at least one dimension sized from 1 to 100 nanometers and is the engineering of functional systems at the molecular scale. In its original sense, nanotechnology refers to the projected ability to construct items from the bottom up, using techniques and tools being developed today to make complete, high performance products. The impact of nanotechnology extends from medical, ethical, mental, legal and environmental applications, to fields such as engineering, biology, chemistry, computing etc. Major benefits of nanotechnology include nanomedicine, better food production methods, nutrition, improved manufacturing methods, water purification systems, energy systems etc. In the present conference, eminent pharmaceutical experts from international and national universities will focus and discuss about latest advances in nanosciences.
