

What are lice and their types?

Lice can be called the small parasites, and these parasites are the ones which will come and then make their home in the host's or the human's hair this is because this is one of the places where they can hardly get seen by anyone, and so they select the hair to stay in, and when they are staying there they tend to get stuck on the hairs roots and then when they reach the bottom of the hair strand they dig a hole in the root, and then they start feeding on the human blood that is there in the head through the roots of the hair.

Lice are known to be the plural form of a louse, and these are small insects that are white. And the thing about them is that they are wingless insects, but they can spread to one person from another if they are in close contact very easily, and this is why when someone has lice in their hair, the doctors suggest them to take some medicines and then take some rest in their home that to living away from everyone so that the lice do not spread over to them and it is a good or the best thing to do at that moment.

Lice can be a serious headache to remove because they have a very tight grip at the roots, and the more you try to remove them, the more it will hurt because they have stuck their feeders inside of the host's hair roots, and if you force and remove them using a comb then it will be a very painful process because in this process you might even just yank out some hair from the roots which will be very painful for the person who is experiencing it and this is a bad thing to do.

So, this is why everyone should use a [lice treatment kit](#) if they have lice themselves in their hair or if any other person they know has lice in their hair they should use this kit because it is the best remedy which can remove any kind of life from your hair and it won't even pain that much like the regular comb method, and this is a good thing. This will remove the lice and prevent them from coming again.
