I think you'd need to know more about things, portforwanding, and other stuff.

The second option would be to just rent a minecraft server. I have one for myself and 8 friends. It costs 5EUR per month. I can stop vanilla for a time and play an adventure game with them if I want.

I am playing on Mac. I wanted to create the server.properties directory to change the rules specified in the Map Description. After I completed the fourth line, however, nothing changed. I don't know where the server.properties.txt folder is located. I don't even know where the banned ips.txt, and banned-players.txt folders are located.

I don't know where to find the banned.ips.txt & banned-players.txt subfolders. Click to expand...

Did you restart the server and stop it again? This should create them automatically...

Johni0702 stated: You can also copy+paste it. To paste into the console, rightclick inside it then select "Paste". It will give you several IPs. Normaly, you want an IP that doesn't end with 0 or 1. Code: ipconfig /all > out.tmp & findstr "IPv4" out.tmp & del out.tmp

In my case my IP is 192.168.178.23 Here is what it looks like: Code: C:\Users\UserName>ipconfig /all > out.tmp & findstr "IPv4" out.tmp & del out.tmp IPv4-Adresse . . . . : 192.168.178.23(Bevorzugt) IPv4-Adresse . . . . : 192.168.56.1(Bevorzugt)

Click to expand...

All That I get is

IPv4 address. . . . . : 192.168.2.8 (preffered) IPv4 Address . . . . : 25.130.208.111 (preffered)

If you need to know how to make a server, I suggest what Watchig said. He said to rent a server, hypixel's servers are rented. I recommend mcprohosting. There are many dangers associated with hosting a server in your home. 1 you can be DDoS'd. I suggest using good hosts, like mcprohosting, because i'm pretty sure they offer DDoS prevention. They are also very affordable, so you don't have to burn out your computer battery.

Why "Mc pro Hosting's" why not peak "Hosting's" or something?

- Jun 14, 2013

Stone123 I don't know much about server hosts, but there are many bad ones. I'm trying to point him in a good direction regarding server hosts

First one is your LAN IP. LAN IPs always start with 192.168. The second one is probably hamachi (which uses IPs starting with 25. or 5.).

Ah, but I'm already supporting my build team and do not need to incur additional mounting costs. Also, I am trying set up a local network server.

- - #92

I host a server with 1GB Ram at Getvisible. The server is located in Germany and I pay 5EUR per month for a stable server that can support 7+ people.

They don't work.

- - #94

Barl LAN servers are only over your network. Anybody on your network, or using the wifi, can connect to your LAN servers. For a more detailed guide, see here.

Watchig this is a good deal. But remember, one player usually eats up around 75-130 megabytes.

For multiple people to connect through portals and such, you need a program like BungeeCord. And it's not a plugin. It's also quite expensive. You cannot host more than one server from one computer (unless your multi-homed machine is enabled). Mcprohosting hosts servers such as hypixel.

How can I update the server 1.4.7?

Please help

My friend, be patient. Just download the actual server.jar file from the mojang website. Once you have copied your map, you can now use it. Follow the Tutorial, but use your old server's map instead.
