How to Rip DVD to Copy Protection Via Free DVD Ripper Software

Free DVD Ripper is a file splitter and rip detector which can be used to easily rip DVDs to an array of different formats, including the Microsoft Windows Media Format. This software was created by Jarfix Software, the software that developed the popular Windows Movie Maker (MPM) program. It was originally developed for the Mac, but since its release for the PC in 2021, it has quickly become one of the most popular software tools for both amateur and professional computer users. The reason why Free DVD Ripper is so popular is because it allows users to rip large numbers of DVDs into a variety of different files including AVI, MPG, and MPEG-2 videos. Furthermore, the software also offers users free access to a huge database that contains a huge number of movies, trailers, TV shows, music, and films.

The problem with using free DVD Ripper or any other rip utility for that matter is that they are designed for basic users and not computer experts who know what they are doing. Many people make the common mistake of using these tools on brand new DVDs that they know nothing about. This is a major mistake that anyone looking to backup their DVDs should avoid at all costs. Using an old or out-dated DVD burning program is like trying to navigate your way through an old, dirtied attic.

Fortunately, there is a better option for people looking for a good rip DVD software program. It's called Handbrake and it's a powerful yet easy-to-use advanced video ripping utility that will allow you to rip DVDs even if you're a complete beginner. Unlike free DVD ripper programs, Handbrake allows you to rip high quality videos, even the kind that burn up to 200 DVDs. natutool features a unique feature called "speed compression". With this feature, you can accelerate the rate at which you rip your DVDs by setting the Handbrake compression speed to the highest value (normal mode).

If you're looking to rip a normal DVD, you will need to download the Handbrake software from the web and install it on your PC. Handbrake offers two options: a freeware or shareware program. Freeware allows you to use the program without paying for it, while shareware programs will only allow you to burn a single movie using up to four different sources. Both types offer the ability to rip audio CDs and even DVDs. And because they are both Windows-based applications, you can also burn them to a single DVD instead of having to get multiple discs.

To rip DVDs with Handbrake, you first need to burn the movie you want onto a blank disc. Once you've burned your movie, burn it again using the Handbrake application. Choose the same settings you used previously when you set the Handbrake compression speed to the standard level. Now, to rip the rest of your DVDs, use the Browse tool in Handbrake to locate your selected movies and then highlight them. Click on the "Open" button to drag all of your chosen movies to the Handbrake application.

Use the "Rip" option from the main menu of the Handbrake application to copy the selected video files to a single DVD. Select the "List" tab in Handbrake to check whether or not all of your selected DVDs are already marked as Ready to Burn. Once you have selected the DVD that you wish to copy, just click on the "Burn" button to begin the copying process. The entire copying process will take place in a matter of minutes. Your new DVD will now be ready to be inserted into any compatible DVD player.
