WORKSHOP MANUAL

FRONTERA (UE)

FOREWORD

This manual includes special notes, important points, service data, precautions, etc. That are needed for the maintenance, adjustments, service, removal and installation of vehicle components.

All information, illustrations and specifications contained in this manual are based on the latest product information available at the time of publication.

All rights are reserved to make changes at any time without notice.

Arrangement of the material is shown in the table of contents on the right-hand side of this page. A black spot on the first page of each section can be seen on the edge of the book below each section title. These point to a more detailed table of contents preceding each section.

This manual applies to 1999 models.

General Repair Instruction

- If a floor jack is used, the following precautions are recommended.
Park vehicle on level ground, "block" front or rear wheels, set jack against the recommended lifting points (see "Lifting Instructions" in this section), raise vehicle and support with chassis stands and then perform the service operations.
- Before performing service operations, disconnect ground cable from the battery to reduce the chance of cable damage and burning due to short circuiting.
- Use a cover on body, seats and floor to protect them against damage and contamination.
- Brake fluid and anti-freeze solution must be handled with reasonable care, as they can cause paint damage.
- The use of proper tools and recommended essential and available tools, where specified, is important for efficient and reliable performance of service repairs.
- Use genuine Isuzu parts.
- Used cotter pins, plastic clips, gaskets, O-rings, oil seals, lock washers and self-locking nuts should be discarded and new ones should be installed, as normal function of the parts cannot be maintained if these parts are reused.
- To facilitate proper and smooth reassembly operation, keep disassembled parts neatly in groups. Keeping fixing bolts and nuts separate is very important, as they vary in hardness and design depending on position of installation.
- Clean the parts before inspection or reassembly. Also clean oil ports, etc. using compressed air, and make certain they are free from restrictions.
- Lubricate rotating and sliding faces of the parts with oil or grease before installation.
- When necessary, use a sealer on gaskets to prevent leakage.
- Carefully observe all specifications for bolt and nut torques.
- When removing or replacing parts that require refrigerant to be discharged from the air conditioning system, be sure to use the Vehicle Refrigerant Recovery and Recycling Equipment (VRRRE) to recover and recycle Refrigerant-134a.
- When a service operation is completed, make a final check to be sure the service has been done properly and the problem has been corrected.
- SUPPLEMENTAL RESTRAINT SYSTEM**
The vehicle is equipped with a Supplemental Restraint System (SRS) – Air Bags. This system is not to be serviced without consulting the appropriate service information. Consult Section 9J "SRS System" if work is to be done on the front of the vehicle such as bumper, sheet metal, seats, wiring, steering wheel or column. Also review SRS system information if any arc welding is to be done on the vehicle. The SRS system equipped vehicle can be identified by:
 - "AIR BAG" warning light on the instrument cluster.
 - A Code "J" for fifth digit of Vehicle Identification Number.

Illustration Arrows

Arrows are designed for specific purposes to aid your understanding of technical illustrations.

Arrow Type	Application

Arrow Type	Application
	<ul style="list-style-type: none"> Ambient/Clean air flow Cool air flow
	<ul style="list-style-type: none"> Gas other than ambient air Hot air flow
	<ul style="list-style-type: none"> Ambient air mixed with another gas Can indicate temperature change
	Motion or direction
	Lubrication point oil or fluid
	Lubrication point grease
	Lubrication point jelly

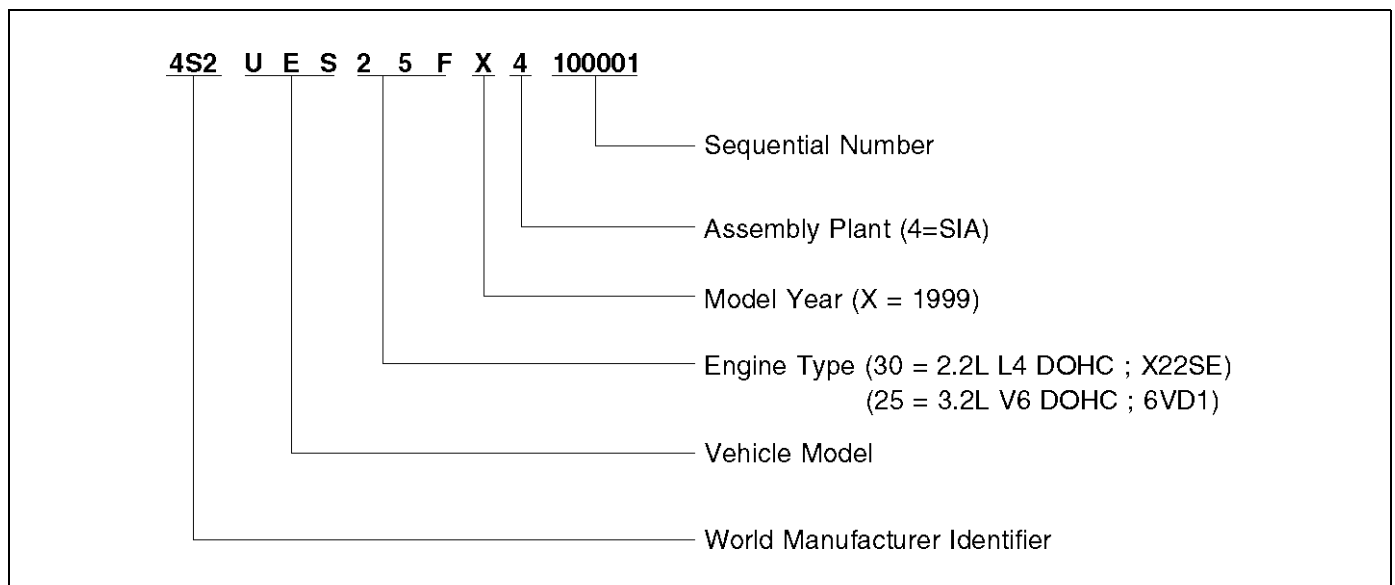

Identification

Vehicle Identification Number (VIN)

This is the legal identification of the vehicle. It is located on the left bottom of the windshield. It can be easily seen through the windshield from outside the vehicle.

F00RX016

F00RX017

0A-4 GENERAL INFORMATION

Engine Serial Number

- 6VD1 Engine

The gasoline engine serial number is stamped on the left rear lower area of the cylinder block above the starter.

F06RW001

- X22SE Engine

The gasoline engine serial number is stamped on the rear end raised area of the cylinder block left side.

035RW022

Transmission Serial Number

Manual : Stamped on the left side of the transmission intermediate plate.

220RS025

Automatic : Stamped on the identification plate, located on the left side of the transmission above the mode switch.

240RW019

Lifting Instructions

Lifting Points and Supportable Point Locations

4 Door Model

0A-6 GENERAL INFORMATION

2 Door Model

C00RX001

Lifting Point: Front

- When using a floor jack, lift on the Convex portion of the skid plate.

545RS001

Supportable Point: Front

- Position the chassis stands at the bottom of the frame sidemember, behind the front wheel.

501RS003

Lifting Point: Rear

- Position the floor jack at the center of the rear axle case when lifting the vehicle.

**Supportable Point: Rear**

- Position the chasis stands at the bottom of the rear axle case.

**Supportable Point: Rear**

- Position the chasis stands at the bottom of the frame sidemember, just behind the trailing link bracket.

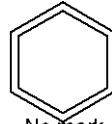

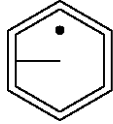

**Legend**

- (1) Trailing Link Bracket

0A-8 GENERAL INFORMATION

Standard Bolts Torque Specifications

The torque values given in the following table should be applied where a particular torque is not specified.

Strength Class	4.8	8.8		9.8
		Refined	Non-Refined	
Bolt Identification				
	 No Mark			
Bolt Diameter × Pitch (mm)				
M 6X1.0	4 – 8 N·m (3 – 6 lb ft)	5 – 10 N·m (4 – 7 lb ft)		–
M 8X1.25	8 – 18 N·m (6 – 13 lb ft)	12 – 23 N·m (9 – 17 lb ft)		17 – 30 N·m (12 – 22 lb ft)
M 10X1.25	21 – 34 N·m (15 – 25 lb ft)	28 – 46 N·m (20 – 34 lb ft)		37 – 63 N·m (27 – 46 lb ft)
* M10X1.5	20 – 33 N·m (14 – 25 lb ft)	28 – 45 N·m (20 – 33 lb ft)		36 – 60 N·m (27 – 44 lb ft)
M12X1.25	49 – 74 N·m (36 – 54 lb ft)	61 – 91 N·m (45 – 67 lb ft)		76 – 114 N·m (56 – 84 lb ft)
* M12X1.75	45 – 69 N·m (33 – 51 lb ft)	57 – 84 N·m (42 – 62 lb ft)		72 – 107 N·m (53 – 79 lb ft)
M14X1.5	77 – 115 N·m (56 – 85 lb ft)	93 – 139 N·m (69 – 103 lb ft)		114 – 171 N·m (84 – 126 lb ft)
* M14X2.0	72 – 107 N·m (53 – 79 lb ft)	88 – 131 N·m (65 – 97 lb ft)		107 – 160 N·m (79 – 118 lb ft)
M16X1.5	104 – 157 N·m (77 – 116 lb ft)	135 – 204 N·m (100 – 150 lb ft)		160 – 240 N·m (118 – 177 lb ft)
* M16X2.0	100 – 149 N·m (74 – 110 lb ft)	130 – 194 N·m (95 – 143 lb ft)		153 – 230 N·m (113 – 169 lb ft)
M18X1.5	151 – 226 N·m (111 – 166 lb ft)	195 – 293 N·m (144 – 216 lb ft)		230 – 345 N·m (169 – 255 lb ft)
M20X1.5	206 – 310 N·m (152 – 229 lb ft)	270 – 405 N·m (199 – 299 lb ft)		317 – 476 N·m (234 – 351 lb ft)
M22X1.5	251 – 414 N·m (185 – 305 lb ft)	363 – 544 N·m (268 – 401 lb ft)		425 – 637 N·m (313 – 469 lb ft)
M24X2.0	359 – 539 N·m (265 – 398 lb ft)	431 – 711 N·m (318 – 524 lb ft)		554 – 831 N·m (409 – 613 lb ft)

The asterisk * indicates that the bolts are used for female-threaded parts that are made of soft materials such as casting, etc.

Abbreviations Charts

List of automotive abbreviations which may be used in this manual

A — Ampere(s)	EEPROM — Electronically Erasable Programmable Read Only Memory
ABS — Antilock Brake System	EGR — Exhaust Gas Recirculation
AC — Alternating Current	EI — Electronic Ignition
A/C — Air Conditioning	ETR — Electronically Tuned Receiver
ACCEL — Accelerator	EVAP — Evaporation Emission
ACC — Accessory	Exh — Exhaust
ACL — Air Cleaner	° F — Degrees Fahrenheit
Adj — Adjust	Fed — Federal (All States Except Calif.)
A/F — Air Fuel Ratio	FF — Front Drive Front Engine
AIR — Secondary Air Injection System	FL — Fusible Link
Alt — Altitude	FLW — Fusible Link Wire
AMP — Ampere(s)	FP — Fuel Pump
ANT — Antenna	FRT — Front
ASM — Assembly	ft — Foot
A/T — Automatic Transmission/Transaxle	FWD — Front Wheel Drive
ATDC — After Top Dead Center	4WD — Four Wheel Drive
ATF — Automatic Transmission Fluid	4 x 4 — Four Wheel Drive
Auth — Authority	4 A/T — Four Speed Automatic Transmission/Transaxle
Auto — Automatic	Gal — Gallon
BARO — Barometric Pressure	GEN — Generator
Bat — Battery	GND — Ground
B+ — Battery Positive Voltage	Gov — Governor
Bbl — Barrel	g — Gram
BHP — Brake Horsepower	Harn — Harness
BPT — Backpressure Transducer	HC — Hydrocarbons
BTDC — Before Top Dead Center	HD — Heavy Duty
° C — Degrees Celsius	Hg — Hydrargyrum (Mercury)
CAC — Charge Air Cooler	HiAlt — High Altitude
Calif — California	HO2S — Heated Oxygen Sensor
cc — Cubic Centimeter	HVAC — Heater-Vent-Air-Conditioning
CID — Cubic Inch Displacement	IAC — Idle Air Control
CKP — Crankshaft Position	IAT — Intake Air Temperature
CL — Closed Loop	IC — Integrated Circuit / Ignition Control
CLCC — Closed Loop Carburetor Control	ID — Identification / Inside Diameter
CMP — Camshaft Position	IGN — Ignition
CO — Carbon Monoxide	INJ — Injection
Coax — Coaxial	IP — Instrument Panel
Conn — Connector	IPC — Instrument Panel Cluster
Conv — Converter	Int — Intake
Crank — Crankshaft	ISC — Idle Speed Control
Cu. In. — Cubic Inch	J/B — Junction Block
CV — Constant Velocity	kg — Kilograms
Cyl — Cylinder(s)	km — Kilometers
DI — Distributor Ignition	km/h — Kilometer per Hour
Diff — Differential	kpa — Kilopascals
Dist — Distributor	kV — Kilovolts (thousands of volts)
DLC — Data Link Connector	kW — Kilowatts
DOHC — Double Overhead Camshaft	KS — Knock Sensor
DTC — Diagnostic Trouble Code	L — Liter
DTM — Diagnostic Test Mode	lb ft — Foot Pounds
DTT — Diagnostic Test Terminal	lb in — Inch Pounds
DVM — Digital Voltmeter (10 meg.)	LF — Left Front
DVOM — Digital Volt Ohmmeter	LH — Left Hand
EBCM — Electronic Brake Control Module	LR — Left Rear
ECM — Engine Control Module	LS — Left Side
ECT — Engine Coolant Temperature	LWB — Long Wheel Base
	L-4 — In-Line Four Cylinder Engine
	MAF — Mass Air Flow
	MAN — Manual

0A-10 GENERAL INFORMATION

MAP — Manifold Absolute Pressure	ST — Start / Scan Tool
Max — Maximum	Sw — Switch
MC — Mixture Control	SWB — Short Wheel Base
MFI — Multiport Fuel Injection	SYN — Synchronize
MIL — Malfunction Indicator Lamp	Tach — Tachometer
Min — Minimum	TB — Throttle Body
mm — Millimeter	TBI — Throttle Body Fuel Injection
MPG — Miles Per Gallon	TCC — Torque Converter Clutch
MPH — Miles Per Hour	TCM — Transmission Control Module
M/T — Manual Transmission/Transaxle	TDC — Top Dead Center
MV — Millivolt	Term — Terminal
N — Newtons	TEMP — Temperature
NA — Natural Aspirated	TOD — Torque On Demand
NC — Normally Closed	TP — Throttle Position
N-M — Newton Meters	TRANS — Transmission/Transaxle
NO — Normally Open	TURBO — Turbocharger
NOX — Nitrogen, Oxides of	TVRS — Television & Radio Suppression
OBD — On-Board Diagnostic	TVV — Thermal Vacuum Valve
OD — Outside Diameter	TWC — Three Way Catalytic Converter
O/D — Over Drive	3 A/T — Three Speed Automatic Transmission/ Transaxle
OHC — Overhead Camshaft	2WD — Two Wheel Drive
OL — Open Loop	4 x 2 — Two Wheel Drive
O ₂ — Oxygen	U-joint — Universal Joint
O ₂ S — Oxygen Sensor	V — Volt(s)
PAIR — Pulsed Secondary Air Injection System	VAC — Vacuum
P/B — Power Brakes	VIN — Vehicle Identification Number
PCM — Powertrain Control Module	VRRRE — Vehicle Refrigerant Recovery and Recycling Equipment
PCV — Positive Crankcase Ventilation	V-ref — ECM Reference Voltage
PRESS — Pressure	VSS — Vehicle Speed Sensor
PROM — Programmable Read Only Memory	VSV — Vacuum Switch Valve
PNP — Park/Neutral Position	V-6 — Six Cylinder "V" Engine
P/S — Power Steering	V-8 — Eight Cylinder "V" Engine
PSI — Pounds per Square Inch	W — Watt(s)
PSP — Power Steering Pressure	w/ — With
Pt. — Pint	w/b — Wheel Base
Pri — Primary	w/o — Without
PWM — Pulse Width Modulate	WOT — Wide Open Throttle
Qt. — Quart	
REF — Reference	
RF — Right Front	
RFI — Radio Frequency Interference	
RH — Right Hand	
RPM — Revolutions Per Minute	
RPM Sensor — Engine Speed Sensor	
RPO — Regular Production Option	
RR — Right Rear	
RS — Right Side	
RTV — Room Temperature Vulcanizing	
RWAL — Rear Wheel Antilock Brake	
RWD — Rear Wheel Drive	
SAE — Society of Automotive Engineers	
Sec — Secondary	
SFI — Sequential Multiport Fuel Injection	
SI — System International	
SIR — Supplemental Inflatable Restraint System	
SOHC — Single Overhead Camshaft	
Sol — Solenoid	
SPEC — Specification	
Speedo — Speedometer	
SRS — Supplemental Restraint System

Maintenance Schedule List

Normal Vehicle Use

The maintenance instructions in this Maintenance Schedule are based on the assumption that the vehicle will be used as designed:

- to carry passengers and cargo within the limitations specified on the tire placard located on the inside of the glove compartment door;
- to be driven on reasonable road surfaces within legal operating limits;
- to be driven on a daily basis, as a general rule, for at least several miles/kilometers;
- to be driven on unleaded fuel

Unusual or severe operating conditions will require more frequent vehicle maintenance, as specified in the following sections.

Service and Maintenance

SERVICE AND MAINTENANCE

Maintenance schedule

I: Inspect and correct or replace as necessary A: Adjust
 R: Replace or change T: Tighten to specified torque L: Lubricate

- : Automatic transmission

Item	Interval	Condition				
		A	B	C	D	A+D
Differential oil	Change every 20,000 km (12,000 miles) after changing at initial 10,000 km (6,000 miles)		●			
Front Brake pads and discs	Inspect every 5,000 km (3,000 miles)	●	●	●		

Recommended Fluids and Lubricants

USAGE	FLUID/LUBRICANT
Engine	API SE, SF, SG, SH or ILSAC GF-1 Engine oil (See oil chart on the following page for proper viscosity)
Engine coolant	Mixture of water and good quality ethylene glycol base type antifreeze.
Brake system	DOT-3 hydraulic brake fluid.
Power steering system	DEXRON® II-E Automatic transmission fluid.
Automatic transmission	DEXRON® -III Automatic transmission fluid.
MUA Type Manual transmission & Transfer case	Engine oil (See oil chart on following page for proper viscosity)
Rear axle and front axle	GL-5 gear lubricant (Standard differential) GL-5 Limited slip differential gear lubricant together with limited slip differential lubricant additive (Part No. 8-01052-358-0) or equivalent (If equipped with optional limited slip differential) (See oil chart in this section for proper viscosity)
Clutch system a. Pivot points b. Clutch fork joint c. Master cylinder	Chassis grease Chassis grease DOT-3 hydraulic brake fluid
Hood latch assembly a. Pivots and spring anchor b. Release pawl	Engine oil Chassis grease
Hood and door hinges	Engine oil
Chassis lubrication	Chassis grease
Parking brake cables	Chassis grease
Front wheel bearings	Multipurpose grease
Shift on the fly system	GL-5 gear lubricant (SAE 75W-90)
Body door hinge pins and linkage, fuel door hinge, rear compartment lid hinges	Engine oil
Windshield washer solvent	Washer fluid
Key lock cylinder	Synthetic light weight engine oil (SAE 5W-30)
Accelerator linkage	Chassis grease

0B-10 MAINTENANCE AND LUBRICATION

Lubricant Viscosity Chart

Lubricants should be carefully selected according to the

lubrication chart. It is also important to select viscosity of lubricants according to the ambient temperature by referring to the following table.

Oil Viscosity Chart for Gasoline Engine

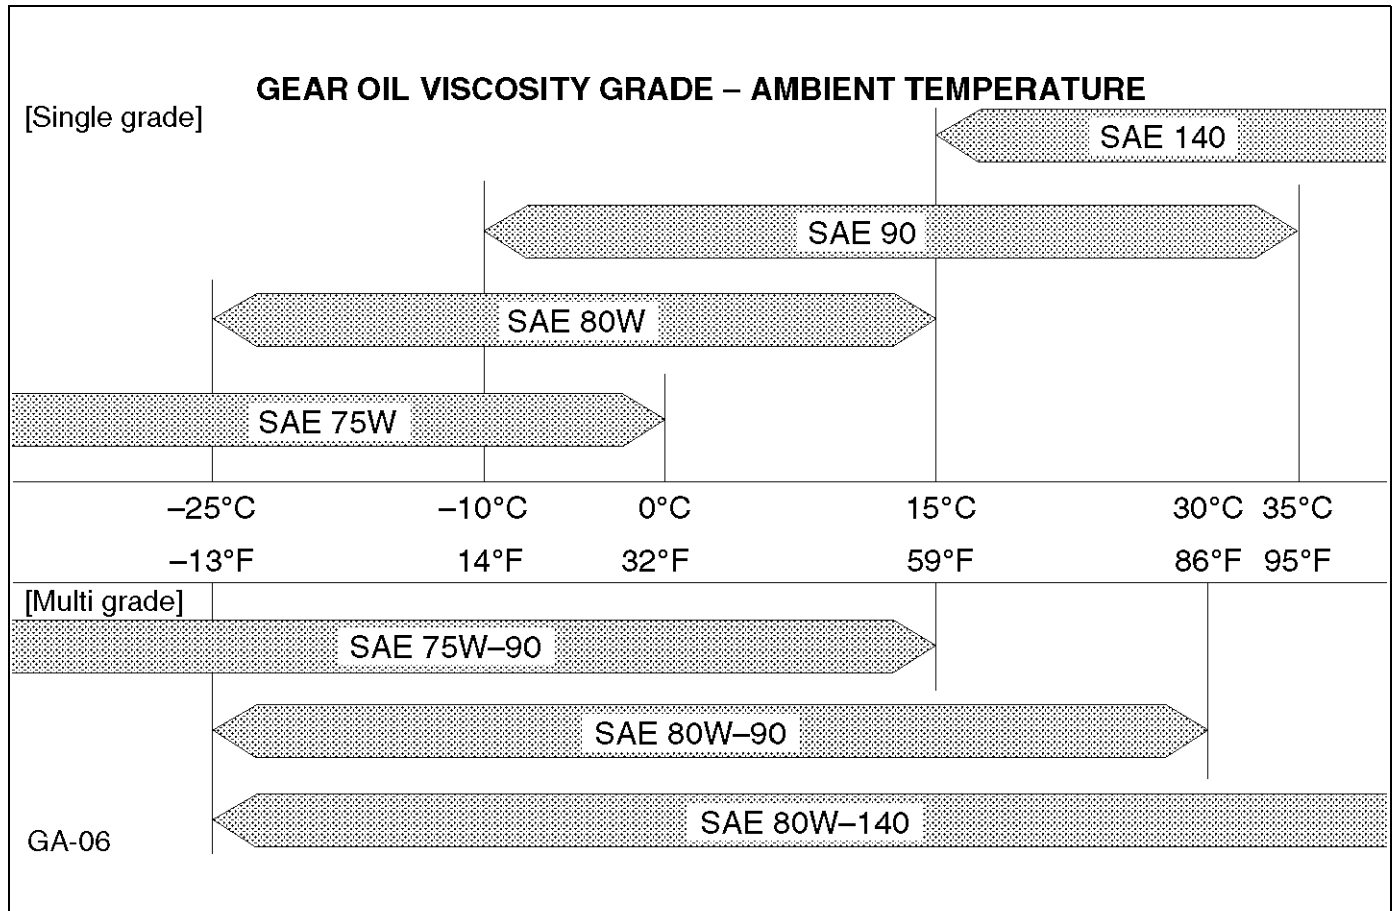

Oil Viscosity Chart for Manual Transmission and Transfer Case

Oil Viscosity Chart for Front Axle

Oil Viscosity Chart for Rear Axle

Recommended Liquid Gasket

Type	Brand Name	Manufacturer	Remarks
RTV* Silicon Base	Three Bond 1207B	Three Bond	For Engine Repairs
	Three Bond 1207C	Three Bond	
	Three Bond 1215	Three Bond	For Axle Case
	Three Bond 1280	Three Bond	Repairs T/M
	Three Bond 1281	Three Bond	Repairs T/M
Water Base	Three Bond 1141E	Three Bond	For Engine Repairs
Solvent	Three Bond 1104	Three Bond	For Engine Repairs
	Belco Bond 4	Isuzu	
	Belco Bond 401 Belco Bond 402	Isuzu Isuzu	
Anaerobic	LOCTITE 515 LOCTITE 518 LOCTITE 17430	Loctite Loctite Loctite	All

* RTV: Room Temperature Vulcanizer

NOTE:

1. It is very important that the liquid gaskets listed above or their exact equivalent be used on the vehicle.
2. Be careful to use the specified amount of liquid gasket. Follow the manufacturer's instructions at all times.
3. Be absolutely sure to remove all lubricants and moisture from the connecting surfaces before applying the liquid gasket. The connecting surfaces must be perfectly dry.
4. Do not apply LOCTITE 17430, LOCTITE 515 and LOCTITE 518 between two metal surfaces having a clearance of greater than 0.25 mm (0.01 in). Poor adhesion will result.

Recommended Thread Locking Agents

LOCTITE Type	LOCTITE Color
LOCTITE 242	Blue
LOCTITE 262	Red
LOCTITE 271	Red

Application Steps

1. Completely remove all lubricant and moisture from the bolts and the female-threaded surfaces of the parts to be joined.
The surfaces must be perfectly dry.
2. Apply LOCTITE to the bolts.

3. Tighten the bolts to the specified torque.
After tightening, be sure to keep the bolts free from vibration and torque for at least an hour until LOCTITE hardens.

NOTE: When the application procedures are specified in this manual, follow them.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Heating and Ventilation System

General Description

Heater

When the engine is warming up, the warmed engine coolant is sent out into the heater core. The heater system supplies warm air into the passenger compartment to warm it up.

Outside air is circulated through the heater core of the heater unit and then back into the passenger compartment. By controlling the mixture of outside air and heater core air, the most comfortable passenger compartment temperature can be selected and maintained.

The temperature of warm air sent to the passenger compartment is controlled by the temperature control knob. This knob acts to open and close the air mix door, thus controlling the amount of air passed through the heater core.

The air selector knob, with its different modes, also allows you to select and maintain the most comfortable temperature.

The air source select lever is used to select either "FRESH" for the introduction of the outside air, or "CIRC" for the circulation of the inside air. When the lever is set to "FRESH", the outside air is always taken into the passenger compartment. When setting the lever to "CIRC" position, the circulation of air is restricted only to the inside air with no introduction of the outside air and the air in the passenger compartment gets warm quickly. However, the lever is normally set to "FRESH" to prevent the windshield from clouding.

Heater and Ventilation Associated Parts

840RX007

Legend

| (4) Rear Heater Duct | (8) Evaporator Assembly (With A/C) |
| | (9) Blower Assembly |

Ventilation

Setting the air source select lever to "FRESH" position allows the heating system to work with sending the fresh air from outside.

The blower fan also serves to deliver fresh outside air to the passenger compartment to assure adequate ventilation.

1A-6 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

Control Lever Assembly

The control lever assembly has some cables to control the mode and temperature of the heater unit and the mode door for the air source of the blower assembly.

The fan control is used to control the amount of air sent out by the resistor at four levels from "LOW" to "HIGH".

Legend

- (1) Air Source Select Lever
- (2) Air Select Knob
- (3) Fan Control Lever (Fan Switch)

- (4) Air Conditioning (A/C) Switch (W/ A/C)
- (5) Temperature Control Knob
- (6) Middle Position

Air Source Select Lever

The intake of outside air and the circulation of inside air are controlled by sliding this lever left or right.

Fan Control Lever

This lever controls the blower motor speed to regulate the amount of air delivered to the defrost, foot, and ventilation ducts:

1. Low
2. Medium Low
3. Medium High
4. High

Temperature Control Knob

When the temperature control knob is in the "COLD" position, the air mix door closes to block the flow air to the heater core.

When the temperature control knob is in the "HOT" position, the air mix door opens to allow air to pass through the heater core and heat the passenger compartment.

Placing the knob in a intermediate position will cause a lesser or greater amount air to reach the heater core. In this mode the passenger compartment temperature can be regulated.

Flow of Each Position of the Air Select Dials

C01RX001

Air Select Knob

The air select knob allows you to direct heated air into the passenger compartment through different outlets.

- Vent** – In this position, air is discharged from the upper air outlet. Air quantity is controlled by the fan control lever.
- Bi-Level** – In this position, air flow is divided between the upper air outlets and the floor air outlets, with warmer air delivered to the floor outlets than the air delivered to the upper air outlets when the temp lever is in middle position.

- Foot** – In this position, air flow is delivered to the foot, while sending a small amount of air to the windshield.
- Def/Foot** – In this position, air flow is delivered to the foot, while sending approx. 40% of total amount of air to the windshield.
- Defrost** – In this position, most of the air is delivered to the windshield and a small amount is delivered to the side windows.

Moving the air source select lever to the "CIRC" position provides quickest heat delivery by closing the blower assembly mode door. In this position, outside air is not delivered to the passenger compartment.

Circuit Diagram

Diagnosis

Heating Cycle diagnosis

Condition	Possible cause	Correction
No heating or insufficient heating.	Blower motor does not run or runs improperly.	Refer to "FAN CONTROL LEVER (FAN SWITCH) DIAGNOSIS".
	Engine coolant temperature is low.	Check the engine coolant temperature after warming up the engine and check the thermostat. Replace as necessary.
	Insufficient engine coolant.	Add engine coolant as required.
	Circulation volume of engine coolant is insufficient.	Check if the water hose to the heater core is clogged, collapsed or twisted. Repair or replace as necessary.
	Heater core clogged or collapsed.	Clean or replace as necessary.
	The heater cores is not provided with air sent from the blower motor.	Repair the temperature control link unit or mode doors.
	Duct connections defective or unsealing.	Repair or replace as necessary.
Control lever moves but mode door does not operate.	Cable attaching clip is not correct.	Repair
	Link unit of heater or blower assembly defective.	Repair
The mode door cannot be set to the mode selected.	Link unit of heater unit or blower assembly defective.	Repair.
	Control cable is not adjusted.	Adjust.

1A-10 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

Fan Control Lever (Fan Switch) Diagnosis

Current flows to the blower motor through the heater relay (X-6) to activate the rotation of the blower motor by turning "ON" the fan control knob (fan switch). Blower motor speed is controlled in stages by the resistor, by operating the switch from "LOW" to "HIGH".

For the inspection of the relays, switches and units in each table, refer to "INDIVIDUAL INSPECTION" in this section.

D08RX250

Condition	Possible cause	Correction
Blower motor does not run.	—	Refer to Chart A
Blower motor does not run in certain position (s).	—	Refer to Chart B, C, D and E
Blower motor does not stop at "OFF" position.	—	Refer to Chart F

Chart "A" Blower Motor Does Not Run

Step	Action	Yes	No
1	Is relay (X-6) OK?	Go to Step 2	Replace
2	Is fuse F-4 (20A) OK?	Go to Step 3	Replace
3	Is resistor OK?	Go to Step 4	Replace
4	Is fan control lever OK?	Go to Step 5	Replace control lever assembly.
5	Is blower motor OK?	Go to Step 6	Replace
6	1. Turn the ignition switch "ON". 2. Turn fan control lever "ON". 3. Check to see if battery voltage is present at chassis side connector terminal No. B5-2 Is there a battery voltage?	Poor ground or open circuit either between chassis side connector terminal No. B5-1 and No. B3-2 or No. I23-1 and body ground (No. B-8).	Open circuit between No. F-4 (20A) fuse and No. B5-2.

Chart "B" Blower Motor Does Not Run At Low Position

Step	Action	Yes	No
1	Is resistor OK?	Go to Step 2	Replace
2	Is fan control lever (Fan Switch) OK?	Open circuit between chassis side connector terminal No. B3-1 and No. I23-2.	Replace control lever assembly.

Chart "C" Blower Motor Does Not Run At Medium Low Position

Step	Action	Yes	No
1	Is resistor OK?	Go to Step 2	Replace
2	Is fan control lever (Fan Switch) OK?	Open circuit between the chassis side connector terminal No. B3-4 and No. I23-3.	Replace control lever assembly.

Chart "D" Blower Motor Does Not Run At Medium High Position

Step	Action	Yes	No
1	Is resistor OK?	Go to Step 2	Replace
2	Is fan control lever (Fan Switch) OK?	Open circuit between chassis side connector terminal No. B3-6 and No. I23-4.	Replace control lever assembly.

1A-12 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)**Chart "E" Blower Motor Does Not Run At High Position**

Step	Action	Yes	No
1	Is resistor OK?	Go to Step 2	Replace
2	Is fan control lever (Fan Switch) OK?	Open circuit between chassis side connector terminal No. B3-3 and No. I23-5.	Replace control lever assembly.

Chart "F" Blower Motor Does Not Stop In The "OFF" Position

Step	Action	Yes	No
1	Is the fan control lever (Fan Switch) OK?	Short circuit between chassis side connector terminal No. B5-1 and No. B3-2, No. B3-3 and No. I23-5, No. B3-6 and No. I23-4, No. B3-4 and No. I23-3 or No. B3-1 and No. I23-2	Replace control lever assembly.

Individual Inspection

Blower Motor

1. Disconnect the blower motor (B-5) connector from the blower motor.
2. Connect the battery positive terminal to the No. 2 terminal of the blower motor and the negative to the No. 1.
3. Be sure to check to see if the blower motor operates correctly.

873RW008

Resistor

1. Disconnect the resistor (B-3) connector.
2. Check for continuity and resistance between the terminals of the resistor.

840RX013

Legend

- (1) Resistor Assembly
- (2) Connector Terminal (Resistor Side)
- (3) Position Switch

1A-14 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

Fan Control Lever (Fan Switch)

1. Check for continuity between the terminals of the fan switch.

Legend

- (1) Control Lever Connector Terminal (Control Lever Side)
- (2) Position Switch

Heater Relay

1. Disconnect the heater relay (X-6).
 - When removing the connector for relay, unfasten the tank lock of the connector by using a screwdriver, then pull the relay (1) out.

2. Check for continuity between the heater relay (X-6) terminals.

| (4) Heater Unit Assembly | (9) Ventilation Lower Duct |
| (5) Duct (W/O A/C) | (10) Instrument Panel Bracket |
| | (11) Cross Beam Assembly |

Removal

1. Disconnect the battery ground cable.
2. Drain the engine coolant.
3. Discharge and recover refrigerant (with air conditioning).
 - Refer to Refrigerant Recovery in this section.
4. Remove the Instrument panel assembly.
 - Refer to Instrument Panel Assembly in Body and Accessories section.
5. Remove instrument panel bracket.
 - Refer to Cross Beam Assembly in Body and Accessories section.
6. Cross Beam Assembly.
 - Refer to Cross Beam Assembly in Body and Accessories section.
7. Disconnect resistor connector.
8. Remove duct.
9. Remove evaporator assembly (A/C only).
 - Refer to Evaporator Assembly in this section.
10. Remove driver lap vent duct.
11. Remove ventilation lower duct.
12. Remove rear heater duct.
 - Remove foot rest, carpet and 3 clips.
13. Remove heater unit assembly.
 - Disconnect heater hoses at heater unit.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. When handling the PCM and the control unit, be careful not to make any improper connection of the connectors.

2. Adjust the control cables.

- Refer to Control Lever Assembly in this section.

3. When installing the heater unit, defroster nozzle and center vent duct, be sure that the proper seal is made, without any gap between them.
4. After putting engine coolant in remove the air well and confirm the quantity of coolant.

3. Discharge and recover refrigerant (with air conditioning)
 - Refer to Refrigerant Recovery in this section.
4. Remove heater unit.
 - Refer to Heater Unit in this section.
5. Remove the case (Mode control) from heater unit.
6. Remove washer and the mode main lever.
7. Remove rod.
8. Press the tab of the sub-lever inward, and take out the sub-lever.

860RW018

9. Pull out the door lever while raising up the catch of the door lever.
10. Remove clip.

Installation

To install, follow the remove steps in the reverse order, noting the following points:

1. Apply grease to the mode sub-lever and to the abrasive surface of the heater unit.
2. After installing the link unit, check to see if the link unit operates correctly.

Removal

1. Disconnect the battery ground cable.
2. Drain engine coolant.
3. Discharge and recover refrigerant (with air conditioning).
 - Refer to Refrigerant Recovery in this section.
4. Remove heater unit.
 - Refer to Heater Unit in this section.
5. Remove the case (Temperature control) from the heater unit.
6. Remove rod.
7. Remove sub-lever.
8. Pull out the door lever while raising up the catch of the door lever.
9. Remove clip.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Apply grease to the sub-lever and to the abrasive surface of the heater unit.
2. After installing the link unit, check to see if the link unit operates correctly.

Blower Assembly

Blower Assembly and Associated Parts

3. Remove meter cluster assembly.
 - Refer to Instrument Panel Assembly in Body Structure section.
4. Remove glove box.
5. Remove the control lever attaching screws.
6. Pull the control lever assembly out and disconnect the fan switch and air conditioning switch connectors.

865RX012

7. Remove control level assembly.
8. Disconnect control cables at each unit side.

865RX010

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Adjust the control cable.

865RX013

- Air source control cable.
 - 1 Slide the control lever to the left ("CIRC" position).
 - 2 Connect the control cable at the "CIRC" position of the link unit of the blower assembly and secure it with the clip.
 - Temperature control cable.
 - 1 Turn the control knob to the left ("MAX COLD" position).
 - 2 Connect the control cable at the "COLD" position of the temperature control link of the heater unit and secure it with the clip.
 - Air select control cable
 - 1 Turn the control knob to the right ("DEFROST" position).
 - 2 Connect the control cable at the "DEFROST" position of the mode control link of the heater unit and secure it with the clip.
2. Check the control cable operation.

Control Panel Illumination Bulb

| (8) Receiver/Drier | (16) Heater Unit |
| | (17) Mode (DEF) Control Door |

The refrigeration cycle includes the following four processes as the refrigerant changes repeatedly from liquid to gas and back to liquid while circulating.

Evaporation

The refrigerant is changed from a liquid to a gas inside

the evaporator. The refrigerant mist that enters the evaporator vaporizes readily. The liquid refrigerant removes the required quantity of heat (latent heat of vaporization) from the air around the evaporator core cooling fins and rapidly vaporizes. Removing the heat cools the air, which is then radiated from the fins and lowers the temperature of the air inside the vehicle.

The refrigerant liquid sent from the expansion valve and the vaporized refrigerant gas are both present inside the evaporator as the liquid is converted to gas.

With this change from liquid to gas, the pressure inside the evaporator must be kept low enough for vaporization to occur at a lower temperature. Because of that, the vaporized refrigerant is sucked into the compressor.

Compression

The refrigerant is compressed by the compressor until it is easily liquefied at normal temperature.

The vaporized refrigerant in the evaporator is sucked into the compressor. This action maintains the refrigerant inside the evaporator at a low pressure so that it can easily vaporize, even at low temperatures close to 0°C (32°F).

Also, the refrigerant sucked into the compressor is compressed inside the cylinder to increase the pressure and temperature to values such that the refrigerant can easily liquefy at normal ambient temperatures.

Condensation

The refrigerant inside the condenser is cooled by the outside air and changes from gas to liquid.

The high temperature, high pressure gas coming from the compressor is cooled and liquefied by the condenser with outside air and accumulated in the receiver/drier. The heat radiated to the outside air by the high temperature, high pressure gas in the compressor is called heat of condensation. This is the total quantity of heat (heat of vaporization) the refrigerant removes from the vehicle interior via the evaporator and the work (calculated as the quantity of heat) performed for compression.

Expansion

The expansion valve lowers the pressure of the refrigerant liquid so that it can easily vaporize.

The process of lowering the pressure to encourage vaporization before the liquefied refrigerant is sent to the evaporator is called expansion. In addition, the expansion valve controls the flow rate of the refrigerant liquid while decreasing the pressure.

That is, the quantity of refrigerant liquid vaporized inside the evaporator is determined by the quantity of heat which must be removed at a prescribed vaporization temperature. It is important that the quantity of refrigerant be controlled to exactly the right value.

Compressor

The compressor performs two main functions:

It compresses low-pressure and low-temperature refrigerant vapor from the evaporator into high-pressure and high-temperature refrigerant vapor to the condenser.

It pumps refrigerant and refrigerant oil through the air conditioning system.

This vehicle is equipped with a five-vane rotary compressor.

The specified amount of the compressor oil is 150cc (5.0fl.oz.).

The oil used in the HFC-134a system compressor differs from that used in R-12 systems.

Also, compressor oil to be used varies according to the compressor model. Be sure to avoid mixing two or more different types of oil.

If the wrong oil is used, lubrication will be poor and the compressor will seize or malfunction.

The magnetic clutch connector is a waterproof type.

Magnetic Clutch

The compressor is driven by the drive belt from the crank pulley of the engine. If the compressor is activated each time the engine is started, this causes too much load to the engine. The magnetic clutch transmits the power from the engine to the compressor and activates it when the air conditioning is ON. Also, it cuts off the power from the engine to the compressor when the air conditioning is OFF. Refer to Compressor in this section for magnetic clutch repair procedure.

Legend

- (1) Magnetic Clutch
- (2) Connector: Magnetic Clutch
- (3) Compressor

Condenser

The condenser assembly is located in front of the radiator. It provides rapid heat transfer from the refrigerant to the cooling fins.

Also, it functions to cool and liquefy the high-pressure and high-temperature vapor sent from the compressor by the radiator fan or outside air.

A condenser may malfunction in two ways: it may leak, or it may be restricted. A condenser restriction will result in excessive compressor discharge pressure. If a partial restriction is present, the refrigerant expands after passing through the restriction.

Thus, ice or frost may form immediately after the restriction. If air flow through the condenser or radiator is blocked, high discharge pressures will result. During normal condenser operation, the refrigerant outlet line will be slightly cooler than the inlet line.

The vehicle is equipped with the parallel flow type condenser. A larger thermal transmission area on the inner surface of the tube allows the radiant heat to increase and the ventilation resistance to decrease.

The refrigerant line connection has a bolt at the block joint, for easy servicing.

Legend

- (1) Pressure Switch
- (2) Receiver/Drier
- (3) Condenser & Receiver Tank Assembly
- (4) Condenser Fan (6VD1 A/T)

Receiver / Drier

The receiver/drier performs four functions:

- As the quantity of refrigerant circulated varies depending on the refrigeration cycle conditions, sufficient refrigerant is stored for the refrigeration cycle to operate smoothly in accordance with fluctuations in the quantity circulated.

- The liquefied refrigerant from the condenser is mixed with refrigerant gas containing air bubbles. If refrigerant containing air bubbles is sent to the expansion valve, the cooling capacity will decrease considerably. Therefore, the liquid and air bubbles are separated and only the liquid is sent to the expansion valve.
- The receiver/drier utilizes a filter and drier to remove the dirt and water mixed in the cycling refrigerant.
- The sight glass, installed atop the receiver/drier, show the state of the refrigerant.

A receiver/drier may fail due to a restriction inside the body of the unit. A restriction at the inlet to the receiver/drier will cause high pressure.

Outlet restrictions will be indicated by low pressure and little or no cooling. An excessively cold receiver/drier outlet may indicate a restriction.

The receiver/drier of this vehicle is made of aluminum with a smaller tank. It has a 300cc refrigerant capacity.

The refrigerant line connection has a bolt at the block joint, for easy servicing.

Dual Pressure Switch (V6,M/T)

The pressure switch (Dual pressure switch) is installed on the upper part of the receiver/drier, to detect excessively high pressure (high pressure switch) and prevent compressor seizure due to the refrigerant leaking (low pressure switch), so that the compressor is able to be turned "ON" or "OFF".

Compressor	ON (kPa/psi)	OFF (kPa/psi)
Low-pressure control	186.3±29.4 (27.0±4.3)	176.5±19.6 (25.6±2.8)
High-pressure control	2350.4±196.1 (340.7±28.4)	2942.0±196.1 (426.6±28.4)

Triple Pressure Switch (V6, A/T)

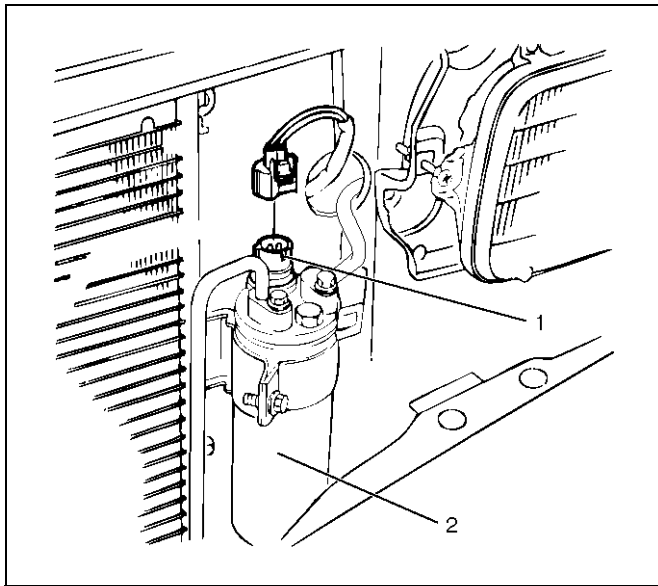

Triple pressure switch is installed on the upper part of the receiver/drier. This switch is constructed with a unitized type of two switches. One of them is a low and high pressure switch (Dual pressure switch) to switch "ON" or "OFF" the magnetic clutch as a result of irregularly high-pressure or low pressure of the refrigerant. The other one is a medium pressure switch (Cycling switch) to switch "ON" or "OFF" the condenser fan sensing the condenser high side pressure.

Compressor	ON (kPa/psi)	OFF (kPa/psi)
Low-pressure control	186.3±29.4 (27.0±4.3)	176.5±24.5 (25.6±3.6)
High-pressure control	2353.6±196.1 (341.3±28.4)	2942.0±196.1 (426.6±28.4)

Condenser fan	ON (kPa/psi)	OFF (kPa/psi)
Medium-pressure control	1471.0±98.1 (213.3±14.2)	1078.7±117.7 (156.4±17.1)

Pressure Sensor

The pressure sensor is installed on the upper part of the receiver/drier. This sensor converts high pressure detection of refrigerant to an electrical voltage signal and supplies it to the PCM. The PCM controls switching compressor idle speed and cooling fan operation by the electrical voltage signal.

Legend

- (1) Pressure Switch
- (2) Receiver Drier

Expansion Valve

This expansion valve is an external pressure type and it is installed at the evaporator intake port.

The expansion valve converts the high pressure liquid refrigerant sent from the receiver/drier to a low pressure liquid refrigerant by forcing it through a tiny port before sending it to the evaporator.

This type of expansion valve consists of a temperature sensor, diaphragm, ball valve, ball seat, spring adjustment screw, etc.

The temperature sensor contacts the evaporator outlet pipe, and converts changes in temperature to pressure. It then transmits these to the top chamber of the diaphragm.

The refrigerant pressure is transmitted to the diaphragm's bottom chamber through the external equalizing pressure tube.

The ball valve is connected to the diaphragm. The opening angle of the expansion valve is determined by

the force acting on the diaphragm and the spring pressure.

The expansion valve regulates the flow rate of the refrigerant. Accordingly, when a malfunction occurs to this expansion valve, both discharge and suction pressure get low, resulting in insufficient cooling capacity of the evaporator.

The calibration has been changed to match the characteristics of HFC-134a.

Legend

- (1) Expansion Valve
- (2) Evaporator Assembly

Evaporator

The evaporator cools and dehumidifies the air before the air enters the passenger compartment. High-pressure liquid refrigerant flows through the expansion valve into the low-pressure area of the evaporator. The heat in the air passing through the evaporator core is lost to the cooler surface of the core, thereby cooling the air.

As heat is lost between the air and the evaporator core surface, moisture in the vehicle condenses on the outside surface of the evaporator core and is drained off as water.

When the evaporator malfunctions, the trouble will show up as an inadequate supply of cool air. The cause is typically a partially plugged core due to dirt, or a malfunctioning blower motor.

The evaporator core with a laminate louver fin is a single-sided tank type where only one tank is provided under the core.

874RX007

Legend

- (1) Evaporator Core
- (2) Expansion Valve

874RX008

Legend

- (1) Thermo Sensor
- (2) Evaporator Core
- (3) Thermostat Unit

Electronic Thermostat (With Manual A/C)

The thermostat consists of the thermo sensor and thermostat unit which functions electrically to reduce the noises being generated while the system is in operation. The electronic thermo sensor is mounted at the evaporator core outlet and senses the surface temperature of the evaporator core. Temperature signals are input to the thermostat unit. This information is compared by the thermo unit and results in the output to operate the A/C thermostat relay and turn the magnetic clutch ON or OFF to prevent evaporator freeze-up.

A characteristic of the sensor is that the resistance decreases as the temperature increases and the resistance increases as the temperature decreases.

Refrigerant Line

Restriction in the refrigerant line will be indicated by:

1. Suction line — A restricted suction line will cause low suction pressure at the compressor, low discharge pressure and little or no cooling.
2. Discharge line — A restriction in the discharge line generally will cause the discharge line to leak.
3. Liquid line — A liquid line restriction will be evidenced by low discharge and suction pressure and insufficient cooling.

Refrigerant flexible hoses that have a low permeability to refrigerant and moisture are used. These low permeability hoses have a special nylon layer on the inside.

Circuit Diagram

Diagnosis

Air Conditioning Cycle Diagnosis

Condition	Possible cause	Correction
No cooling or insufficient cooling.	Magnetic clutch does not run.	Refer to "Magnetic Clutch Diagnosis" in this section.
	Compressor is not rotating properly. Drive belt is loosened or broken.	Adjust the drive belt to the specified tension or replace the drive belt.
	Compressor is not rotating properly. Magnetic clutch face is not clean and slips.	Clean the magnetic clutch face or replace.
	Compressor is not rotating properly. Incorrect clearance between magnetic drive plate and pulley.	Adjust the clearance. Refer to Compressor in this section.
	Compressor is not rotating properly. Compressor oil leaks from the shaft seal or shell.	Replace the compressor
	Compressor is not rotating properly. Compressor is seized.	Replace the compressor
	Insufficient or excessive charge of refrigerant.	Discharge and recover the refrigerant. Recharge to the specified amount.
	Leaks in the refrigerant system.	Check the refrigerant system for leaks and repair as necessary. Discharge and recover the refrigerant. Recharge to the specified amount.
	Condenser is clogged or insufficient radiation.	Clean the condenser or replace as necessary.
	Temperature control link unit of the heat unit is defective.	Repair the link unit.
	Unsteady operation due to a foreign substance in the expansion valve.	Replace the expansion valve.
	Poor operation of the electronic thermostat.	Check the electronic thermostat and replace as necessary.
Insufficient velocity of cooling air.	Evaporator clogged or frosted.	Check the evaporator core and replace or clean the core.
	Air leaking from the cooling unit or air duct.	Check the evaporator and duct connection, then repair as necessary.
	Blower motor does not rotate properly.	Refer to Fan Control Lever (Fan Switch) Diagnosis in this section.

*For the execution of the charging and discharging operation in the table above, refer to Recovery, Recycling, Evacuating and Charging in this section.

Checking The Refrigerant System With Manifold Gauge

Since Refrigerant-134a (HFC-134a) is used in the air conditioning system in this vehicle, be sure to use manifold gauges, charging hoses and other air conditioning service tools for HFC-134a when checking the refrigerant system.

Conditions:

- Run the engine at Idling
- Air conditioning switch is "ON"
- Run the blower motor at "HIGH" position
- Temperature control lever set to "MAX COLD"
- Air source selector lever at "CIRC"
- Open the engine hood
- Close all the doors
- At ambient temperature: approx. 25–30°C (77–86°F).

Normal Pressure:

- At low-pressure side: approx. 147.1–294.2 kPa (21.3–42.7 psi).
- At high-pressure side: approx. 1372.9–1863.3 kPa (199.1–270.2 psi).

Refer to the table on the refrigerant pressure-temperature relationship.

Pressure		Temperature	
(kPa)	(psi)	(°C)	(°F)
36	5.3	-20	-4.4
67	9.7	-15	5
104	15	-10	14
147	21	-5	23
196	28	0	32
255	37	5	41
314	45	10	50
392	57	15	59
471	68	20	68
569	82	25	77
677	98	30	86
785	114	35	95
912	132	40	104
1059	154	45	113
1216	176	50	122

1A-40 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

Connect The Manifold Gauge

Low-pressure hose (LOW) — Suction side

High pressure hose (HI) — Discharge side

Legend

(1) High Side

(2) Low Side

Condition	Possible cause	Correction
Discharge (High Gauge) Pressure Abnormally High	Condenser clogged or dirty.	Clean the condenser fins
	Cooling fan does not operate properly.	Check the cooling fan operation.
Discharge (High Gauge) Pressure Abnormally High. Insufficient cooling.	Excessive refrigerant in system.	Discharge and recover refrigerant. Recharge to specified amount.
Discharge (High Gauge) Pressure Abnormally High. High pressure gauge drop. (After stopping A/C, the pressure drops approx. 196 kPa (28 psi) quickly)	Air in system.	Evacuate and charge refrigerant system.
Discharge (High Gauge) Pressure Abnormally Low. Insufficient cooling	Insufficient refrigerant in system.	Check for leaks. Discharge and recover the refrigerant. Recharge to the specified amount.
Discharge (High Gauge) Pressure Abnormally Low. Low pressure gauge indicates vacuum.	Clogged or defective expansion valve.	Replace the expansion valve.
Discharge (High Gauge) Pressure Abnormally Low. Frost or dew on refrigerant line before and after the receiver/drier or expansion valve, and low pressure gauge indicates vacuum.	Restriction caused by debris or moisture in the receiver/drier.	Check system for restriction and replace the receiver/drier.
Discharge (High Gauge) Pressure Abnormally Low. High and low pressure gauge balanced quickly. (After turned off A/C)	Compressor seal defective	Repair or replace the compressor.
	Poor compression due to a defective compressor gasket.	Repair or replace the compressor.
Suction (Low Gauge) Pressure Abnormally High. Low pressure gauge (Low pressure gauge is lowered after condenser is cooled by water.)	Excessive refrigerant in system.	Discharge and recover refrigerant Recharge to specified amount.
Suction (Low Gauge) Pressure Abnormally High. Low pressure hose temperature. (Low pressure hose temperature around the compressor refrigerant line connector is lower than around evaporator.)	Unsatisfactory valve operation due to defective temperature sensor of expansion valve.	Replace the expansion valve.
	Expansion valve opens too long.	Replace the expansion valve.
Suction (Low Gauge) Pressure Abnormally High. High and low pressure gauge balanced quickly. (After turned off A/C)	Compressor gasket is defective.	Repair or replace the compressor.
Suction (Low Gauge) Pressure Abnormally Low. Insufficient cooling.	Insufficient refrigerant in system.	Check for leaks. Discharge and recover the refrigerant. Recharge to specified amount.
Suction (Low Gauge) Pressure Abnormally Low. Frost on the expansion valve inlet line	Expansion valve clogged.	Replace the expansion valve.

1A-42 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

Condition	Possible cause	Correction
Suction (Low Gauge) Pressure Abnormally Low Receiver/drier inlet and outlet refrigerant line temperature. (A distinct difference in temperature develops.)	Receiver/Drier clogged.	Replace the receiver/drier.
Suction (Low Gauge) Pressure Abnormally Low. Expansion valve outlet refrigerant line. (Not cold and low pressure gauge indicates vacuum.)	Expansion valve temperature sensor is defective.	Replace the expansion valve.
Suction (Low Gauge) Pressure Abnormally Low. When the refrigerant line is clogged or blocked, the low pressure gauge reading will decrease, or a vacuum reading may be shown.	Clogged or blocked refrigerant line.	Replace refrigerant line.
Suction (Low Gauge) Pressure Abnormally Low. Evaporator core is frozen.	Thermo switch defective.	Replace thermo switch.
Suction (Low Gauge) and Discharge (High Gauge) Pressure Abnormally High. Insufficient cooling.	Excessive refrigerant in system.	Discharge and recover the refrigerant, the Recharge to the specified amount.
	Condenser clogged or dirty.	Clean the condenser fin.
Suction (Low Gauge) and Discharge (High Gauge) Pressure Abnormally High. Suction (Low) pressure hose (Not cold).	Air in system.	Evacuate and charge refrigerant.
Suction (Low Gauge) and Discharge (High Gauge) Pressure Abnormally Low. Insufficient cooling	Insufficient refrigerant in system.	Check for leaks. Discharge and recover refrigerant. Recharge to specified amount.

A/C — Air Conditioning

Magnetic Clutch Diagnosis

PCM- Powertrain Control Module, A/C-S Air Conditioning

When the air conditioning switch and the fan control knob (fan switch) are turned on with the engine running,

current flows through the thermostat and the compressor relay to activate the magnetic clutch.

1A-44 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

The air conditioning can be stopped by turning of the air conditioning switch or the fan control knob (fan switch). However, even when the air conditioning is in operation, the electronic thermostat, the pressure switch or the Powertrain Control Module (PCM;V6-3.2L)/ Engine Control Module (ECM;L4-2.2L) is used to stop the air conditioning temporarily by turning off the magnetic

clutch in the prearranged conditions to reduce the engine load which is being caused by the rise in the engine coolant temperature, and the acceleration of the vehicle, etc.

For the inspection of the relays, switches and units in the table, refer to "Individual Inspection" in this section.

Magnetic Clutch Does Not Run

Step	Action	Value(s)	Yes	No
1	Is the fuse No. F-5 normal?	—	Go to Step 2	Replace the fuse
2	Are the relay No.X-6 (heater relay). No.X-5 (Thermostat relay) and No.X-4 (compressor relay) normal?	—	Go to Step 3	Replace the relay
3	Is pressure switch normal?	—	Go to Step 4	Place the pressure switch.
4	Are the air conditioner switch and the fan control switch normal?	—	Go to Step 5	Replace the A/C switch and fan control switch
5	1. Turn the ignition switch "ON" (the engine is run). 2. Turn the air conditioner switch and the fan control switch on. Is the battery voltage applied between harness side connector terminal No.E3-1 and ground?	Approx.12V	Go to Step 6	Go to Step 7
6	Repair an open circuit between compressor side terminal and ground or replace compressor. Is the action complete?	—	Varyify repair	—
7	Is there continuity between harness side connector terminal No.X4-1 and No.E3-1?	—	Go to Step 9	Go to Step 8
8	Repair an open circuit between terminal No.X4-1 and No.E3-1. Is the action complete?	—	Go to Step 7	—
9	Is the battery voltage applied between harness side connector terminal No.X4-2 and ground, No.X4-5 and ground?	Approx.12V	Go to Step 11	Go to Step 10
10	Repair and open circuit between terminal No.X4-2 and No.F-5 fuse, No.X4-5 and No.F-5 fuse. Is the action complete?	—	Go to Step 9	—
11	Is there continuity between harness side connector terminal No.X4-4 and No.C1-B14?	—	Go to Step 13	Go to Step 12
12	Repair an open circuit between terminal No.X4-4 and No.C1-B14. Is the action complete?	—	Go to Step 11	—
13	Is the battery voltage applied between harness side connector terminal No.I24-2 and ground?	Approx.12V	Go to Step 15	Go to Step 14
14	Repair an open circuit between terminal No.I24-2 and No.F-5 fuse. Is the action complete?	—	Go to Step 13	—
15	Is the battery voltage applied between harness side connector terminal No.B4-3 and ground?	Approx.12V	Go to Step 17	Go to Step 16

Magnetic Clutch Does Not Run (Cont's)

Step	Action	Value(s)	Yes	No
16	Repair an open circuit between terminal No.B4-3 and No.I24-1. Is the action complete?	—	Go to Step 15	—
17	Is there continuity between harness side connector terminal No.I23-6 and No.B-2?	—	Go to Step 19	Go to Step 18
18	Repair an open circuit between terminal No.I23-6 and No.B4-2. Is the action complete?	—	Go to Step 17	—
19	Is there continuity between harness side connector terminal No.I23-1 and ground (No.B-8)?	—	Go to Step 21	Go to Step 20
20	Repair an open circuit between terminal No.I23-1 and No.B-8. Is the action complete?	—	Go to Step 19	—
21	Is the battery voltage applied between harness side connector terminal No.C11-1 and ground?	—	Go to Step 23	Go to Step 22
22	Repair an open circuit between terminal No.C11-1 and No.F-5 fuse. Is the action complete?	—	Go to Step 21	—
23	Is the battery voltage applied between harness side connector terminal No.X5-2 and ground?	—	Go to Step 25	Go to Step 24
24	Repair an open circuit between terminal No.X5-2 and No.C11-2. Is the action complete?	—	Go to Step 23	—
25	Is the battery voltage applied between harness side connector terminal No.B4-1 and ground?	—	Go to Step 27	Go to Step 26
26	Repair an open circuit between terminal No.B4-1 and No.X5-4. Is the action complete?	—	Go to Step 25	—
27	Is there continuity between harness side connector terminal No.X5-1 and No.C3-E15?	—	Go to Step 29	Go to Step 28
28	Repair an open circuit between terminal No.X5-1 and No.C3-E15. Is the action complete?	—	Verify repair	—
29	Replace the PCM. Is the action complete?	—	Verify repair	—

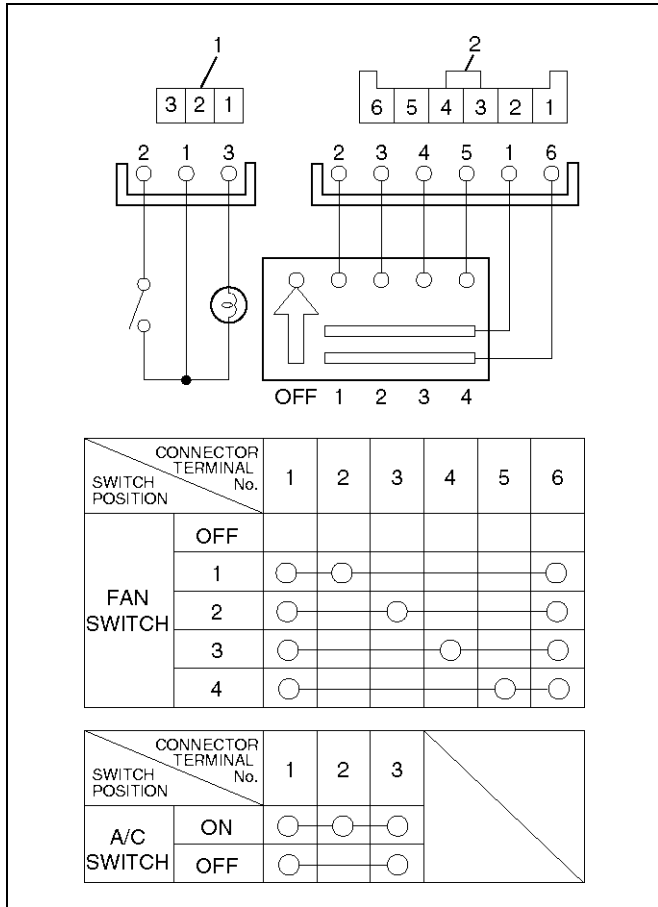

CAUTION: There are condition which air conditioner system dose not operate except trouble as follows.

1. The throttle is greater than 90%.
2. The ignition voltage is below 10.5 volts.
3. The engine speed is greater than 4500 RPM for 5 seconds or 5400 RPM.
4. The engine coolant temperature (ECT) is greater than 125°C (257°F).
5. The intake air temperature (IAT) is less than 5°C (41°F).
6. The power steering pressure switch signals a high pressure condition.

Individual Inspection

Fan Control Knob (Fan Switch) And Air Conditioning (A/C) Switch

1. Check for continuity between the fan switch and the A/C switch side connector terminals.

Legend

- (1) A/C Switch Connector (switch side)
- (2) Fan Switch Connector (switch side)

Heater (X-6), Thermostat (X-5), Condenser Fan (X-9) And Compressor (X-4) Relay

1. Disconnect relays and check for continuity and resistance between relay terminals.
 - For handling of these relays, refer to Heater Relay in this section.

Pressure Switch

1. Disconnect pressure switch connector and check for continuity between pressure switch side connector terminals (1) and (2).

General Repair Procedure

Precautions For Replacement or Repair of Air Conditioning Parts

There are certain procedures, practices and precautions that should be followed when servicing air conditioning systems:

- Keep your work area clean.
- Always wear safety goggles and protective gloves when working on refrigerant systems.
- Beware of the danger of carbon monoxide fumes caused by running the engine.
- Beware of discharged refrigerant in enclosed or improperly ventilated garages.
- Always disconnect the negative battery cable and discharge and recover the refrigerant whenever repairing the air conditioning system.
- When discharging and recovering the refrigerant, do not allow refrigerant to discharge too fast; it will draw compressor oil out of the system.
- Keep moisture and contaminants out of the system. When disconnecting or removing any lines or parts, use plugs or caps to close the fittings immediately. Never remove the caps or plugs until the lines or parts are reconnected or installed.
- When disconnecting or reconnecting the lines, use two wrenches to support the line fitting, to prevent from twisting or other damage.
- Always install new O-rings whenever a connection is disassembled.
- Before connecting any hoses or lines, apply new specified compressor oil to the O-rings.
- When removing and replacing any parts which require discharging the refrigerant circuit, the operations described in this section must be performed in the following sequence:
 - 1 Use the J-39500 (ACR⁴: HFC-134a Refrigerant Recovery / Recycling / Recharging / System) or equivalent to thoroughly discharge and recover the refrigerant.
 - 2 Remove and replace the defective part.
 - 3 After evacuation, charge the air conditioning system and check for leaks.

Repair Of Refrigerant Leaks

Refrigerant Line Connections

Install new O-rings, if required. When disconnecting or connecting lines, use two wrenches to prevent the connecting portion from twisting or becoming damaged.

852R5003

When connecting the refrigerant line at a block joint, securely insert the projecting portion of the joint portion into the connecting hole on the unit side and secure with a bolt. Apply the specified compressor oil to the O-rings prior to connecting.

CAUTION: Compressor (PAG) oil to be used varies according to the compressor model. Be sure to apply oil specified for the model of compressor.

850RW002

1A-48 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

O-rings (2) must be fitted in the groove (1) of refrigerant line.

Insert the nut into the union.

First, tighten the nut by hand as much as possible, then tighten the nut to the specified torque.

Leak Check

Inspection of refrigerant leak

Refrigerant leak may cause an adverse effect not only on the performance and durability of each component of the air-conditioner, but also on the global atmosphere. Therefore, it is most important to repair refrigerant leak when there is any leak found.

Inspection flow of refrigerant leak

Step	Action	Yes	No
1	1. Evacuate the refrigerant system. 2. Charge the refrigerant. Is there any refrigerant leak?	Repair refrigerant system.	Go to Step 2.
2	1. Operate the compressor for more than 5 minutes to raise the pressure on the high pressure side. Is there any refrigerant leak at high pressure components?	Repair refrigerant system.	Compressor operation to be confirmed.

Inspection Steps

Check the components of air-conditioner to see if there occurs any refrigerant leak along the flow of refrigerant.

- To avoid an error in the detection of refrigerant leak, make sure of there being no refrigerant vapor or cigarette smoke around the vehicle before conducting the inspection. Also, select a location where the refrigerant vapor will not get blown off with wind.
- Inspection should be conducted chiefly on the pipe connections and sections where a marked oil contamination is found. When refrigerant is leaking, oil inside is also leaking at the same time.
- It is possible to visually check the leak from inside the cooling unit. Follow the method below when checking. Remove the drain hose or resistor of the

cooling unit, and insert a leak detector to see if there occurs any leak.

High Pressure Side

- Discharger section of compressor.
- Inlet/outlet section of condenser.
- Inlet/outlet section of receiver driver.
- Inlet section of cooling unit.

Low Pressure Side

- Outlet section of cooling unit.
- Intake section of compressor.

Major Checking Points of Refrigerant Leak

Compressor

- Pipe connection
- Sealing section of shaft
- Mating section or cylinder

Condenser

- Pipe connection
- Welds of condenser body

Receiver driver

- Pipe connection
- Attaching section of pressure switch
- Section around the sight glass

Evaporator unit (cooling unit)

- Pipe connections
- Connections of expansion valve
- Brazed sections of evaporator
- The evaporator and expansion valve are contained in the case. Remove the drain hose or the resistor of the cooling unit and insert a leak detector when checking for any leak.

Flexible hose

- Pipe connection
- Caulking section of the hose
- Hose (cracks, pinholes, flaws)

Pipe

- Pipe connection
- Pipe (cracks, flaws)

Charge valve

- The charge valve, which is used to connect the gauge manifold, is normally provided with a resin cap. When the valve inside gets deteriorated, refrigerant will leak out.

Leak at Refrigerant Line Connections

1. Check the torque on the refrigerant line fitting and, if too loose, tighten to the specified torque.
 - Use two wrenches to prevent twisting and damage to the line.
 - Do not over tighten.
2. Perform a leak test on the refrigerant line fitting.
3. If the leak is still present, discharge and recover the refrigerant from the system.
4. Replace the O-rings.
 - O-rings cannot be reused. Always replace with

new ones.

- Be sure to apply the specified compressor oil to the new O-rings.
5. Retighten the refrigerant line fitting to the specified torque.
 - Use two wrenches to prevent twisting and damage to the line.
 6. Evacuate, charge and retest the system.

Leaks In The Hose

If the compressor inlet or outlet hose is leaking, the entire hose must be replaced. The refrigerant hose must not be cut or spliced for repair.

1. Locate the leak.
2. Discharge and recover the refrigerant.
3. Remove the hose assembly.
 - Cap the open connections at once.
4. Connect the new hose assembly.
 - Use two wrenches to prevent twisting or damage to the hose fitting.
 - Tighten the hose fitting to the specified torque.
5. Evacuate, charge and test the system.

Compressor Leaks

If leaks are located around the compressor shaft seal or shell, replace or repair the compressor.

Recovery, Recycling, Evacuation and Charging of HFC-134a

Air conditioning systems contain HFC-134a. This is a chemical mixture which requires special handling procedures to avoid personal injury.

- Always wear safety goggles and protective gloves.
- Always work in a well-ventilated area. Do not weld or steam clean on or near any vehicle-installed air conditioning lines or components.
- If HFC-134a should come in contact with any part of the body, flush the exposed area with cold water and immediately seek medical help.
- If it is necessary to transport or carry any container of HFC-134a in a vehicle, do not carry it in the passenger compartment.
- If it is necessary to fill a small HFC-134a container from a large one, never fill the container completely. Space should always be allowed above the liquid for expansion.
- HFC-134a and R-12 should never be mixed as their compositions are not the same.
- HFC-134a PAG oil tends to absorb moisture more quickly than R-12 mineral oil and, therefore, should be handled more carefully.
- Keep HFC-134a containers stored below 40°C (100°F).

1A-50 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

WARNING:

- SHOULD HFC-134A CONTACT YOUR EYE(S), CONSULT A DOCTOR IMMEDIATELY.
- DO NOT RUB THE AFFECTED EYE(S). INSTEAD, SPLASH QUANTITIES OF FRESH COLD WATER OVER THE AFFECTED AREA TO GRADUALLY RAISE THE TEMPERATURE OF THE REFRIGERANT ABOVE THE FREEZING POINT.
- OBTAIN PROPER MEDICAL TREATMENT AS SOON AS POSSIBLE. SHOULD THE HFC-134A TOUCH THE SKIN, THE INJURY MUST BE TREATED THE SAME AS SKIN WHICH HAS BEEN FROSTBITTEN OR FROZEN.

Refrigerant Recovery

The refrigerant must be discharged and recovered by using the J-39500 (ACR⁴:HFC-134a Refrigerant Recovery/Recycling/Recharging/System) or equivalent before removing or mounting air conditioning parts.

1. Connect the high and low charging hoses of the ACR⁴(or equivalent) as shown below.

Legend

- (1) High Side
- (2) Low Side

2. Recover the refrigerant by following the Manufacturer's Instructions.

3. When a part is removed, put a cap or a plug on the connecting portion so that dust, dirt or moisture cannot get into it.

Refrigerant Recycling

Recycle the refrigerant recovered by J-39500 (ACR⁴:HFC-134a Refrigerant Recovery / Recycling / Recharging / System) or equivalent.

For the details of the actual operation, follow the steps in the ACR⁴(or equivalent) Manufacturer's Instructions.

Evacuation of The Refrigerant System

Legend

- (1) High Side
- (2) Low Side

Explained below is a method using a vacuum pump. Refer to the ACR⁴(or equivalent) manufacturer's instructions when evacuating the system with a ACR⁴(or equivalent).

Air and moisture in the refrigerant will cause problems in the air conditioning system. Therefore, before charging the refrigerant, be sure to evacuate air and moisture thoroughly from the system.

1. Connect the gauge manifold.
 - High-pressure valve (HI) — Discharge-side.
 - Low-pressure valve (LOW) — Suction-side.
2. Discharge and recover the refrigerant.
3. Connect the center hose of the gauge manifold set to the vacuum pump inlet.
4. Operate the vacuum pump, open shutoff valve and then open both hand valves.
5. When the low-pressure gauge indicates approximately 750mmHg (30inHg), continue the evacuation for 5 minutes or more.
6. Close both hand valves and stop the vacuum pump.

7. Check to ensure that the pressure does not change after 10 minutes or more.
 - If the pressure changes, check the system for leaks.
 - If leaks occur, retighten the refrigerant line connections and repeat the evacuation steps.
8. If no leaks are found, again operate the vacuum pump for 20 minutes or more. After confirming that the gauge manifold pressure is at 750mmHg (30inHg), close both hand valves.
9. Close positive shutoff valve. Stop the vacuum pump and disconnect the center hose from the vacuum pump.

Charging The Refrigerant System

There are various methods of charging refrigerant into the air conditioning system.

These include using J-39500 (ACR⁴:HFC-134a Refrigerant Recovery/Recycling/Recharging/System) or equivalent and direct charging with a weight scale charging station.

Charging Procedure

• ACR⁴(or equivalent) Method

For the charging of refrigerant recovered by ACR⁴(or equivalent), follow the manufacturer's instruction.

Legend

- (1) High Side
- (2) Low Side

• Direct charging with a weight scale charging station method

1. Make sure the evacuation process is correctly completed.
2. Connect the center hose of the manifold gauge to the weight scale.
3. Connect the low pressure charging hose of the manifold gauge to the low pressure side service valve of the vehicle.
4. Connect the high pressure charging hose of the manifold gauge to the high pressure side service valve of the vehicle.

Legend

- (1) Weight Scale
- (2) Refrigerant Container
- (3) High Side
- (4) Low Side

5. Place the refrigerant container up right on a weight scale.

Note the total weight before charging the refrigerant.

- a Open the refrigerant container valve.
- b Open the low side valve on the manifold gauge set. Refer to the manufacturer's instructions for a weight scale charging station.

1A-52 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

6. Perform a system leak test:
 - Charge the system with approximately 200g (0.44lbs) of HFC-134a.
 - Make sure the high pressure valve of the manifold gauge is closed.
 - Check to ensure that the degree of pressure does not change.
 - Check for refrigerant leaks by using a HFC-134a leak detector.
 - If a leak occurs, recover the refrigerant. Repair the leak and start all over again from the first step of evacuation.
7. If no leaks are found, continue charging refrigerant to the air conditioning system.
 - Charge the refrigerant until the scale reading decreases by the amount of the charge specified.

Specified amount: 650g (1.43lbs)

- If charging the system becomes difficult:
 - 1 Run the engine at idle and close all the vehicle doors.
 - 2 Turn A/C switch "ON".
 - 3 Set the fan switch to its highest position.
 - 4 Set the air source selector lever to "CIRC".
 - 5 Slowly open the low side valve on the manifold gauge set.

WARNING: Be absolutely sure not to open the high pressure valve of the manifold gauge. Should the high pressure valve be opened, the high pressure refrigerant would flow backward, and this may cause the refrigerant container to burst.

8. When finished with the refrigerant charging, close the low pressure valve of the manifold gauge and container valve.
9. Check for refrigerant leaks.

Checking The A/C System

1. Run the engine and close all the vehicle doors.
2. Turn A/C switch "ON", set the fan switch to its highest position.
3. Set the air source lever to "CIRC", set the temperature lever to the full cool position.
4. Check the high and low pressure of the manifold gauge.
 - Immediately after charging refrigerant, both high and low pressures might be slightly high, but they settle down to the pressure guidelines shown below:
 - The ambient temperature should be between 25–30°C (77–86°F).
 - The pressure guideline for the high-pressure side is approximately 1372.9–1863.3kPa (199.1–270.2 psi).
 - The pressure guideline for the low-pressure side

is approximately 147.1–294.2kPa (21.3–42.7 psi).

- If an abnormal pressure is found, refer to Checking The Refrigerant System With Manifold Gauge in this section.
5. Put your hand in front of the air outlet and move the temperature control lever of the control panel to different positions. Check if the outlet temperature changes as selected by the control knob.

Reading Sight Glass

The sight glass provides accurate diagnosis only under the following conditions.

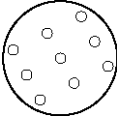

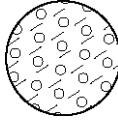

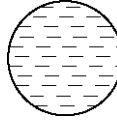

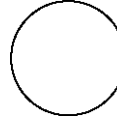

If the vehicle can be tested under these conditions, check the sight glass appearance and compare to the chart below.

- Engine speed idle
- A/C switch "ON"
- Blower fan operating at highest speed
- Air source selector lever at "RECIRC"
- Temperature control lever at coldest position
- Ambient temperature below 30°C (86°F) and humidity below 70% (See NOTE 1)
- High side pressure less than 1667.1 kPa (241.7 psi) (See NOTE 2)

NOTE: 1. If the vehicle cannot be moved to a testing location that meets these specifications, then the sight glass cannot be used for diagnosis. You must discharge and recover the refrigerant, then recharge the system with the specified amount of refrigerant.

Then continue checking the system performance.

NOTE: 2. If the high side pressure is greater than stated, the sight glass cannot be used for diagnosis. You must discharge and recover the refrigerant, then recharge the system with the specified amount of refrigerant. Then continue checking system performance.

<p>High and low pressure pipe temperature</p>	<p>The high pressure pipe is hot and the low pressure pipe is cold. There is a distinct difference in temperature between them.</p>	<p>The high pressure pipe is warm and the low pressure pipe is cool. Compressor Assembly

Compressor Assembly and Associated Parts (6VD1)

871RX021

Legend

- (1) Magnetic Clutch Harness Connector
- (2) Refrigerant Line Connector

- (3) Compressor
- (4) Serpentine Belt

Removal

1. Disconnect the battery ground cable.
2. Discharge and recover refrigerant
 - Refer to Refrigerant Recovery in this section.
3. Disconnect magnetic clutch harness connector.
4. Remove serpentine belt.
 - Move serpentine belt tensioner to loose side using wrench then remove serpentine belt.

850RX003

Legend

- (1) Tensioner
- (2) Idler Pulley
- (3) Cooling Fan Pulley
- (4) Serpentine Belt
- (5) Power Steering Oil Pump
- (6) Air Conditioner Compressor
- (7) Crankshaft Pulley
- (8) Generator

Installation

1. Install compressor.
 - Tighten the compressor fixing bolts to the specified torque.

Torque: 19N•m (14lb•ft)
2. Connect refrigerant line connector.
 - Tighten the refrigerant line connector fixing bolts to the specified torque.

Torque: 15N•m (11lb•ft)

 - O-rings cannot be reused. Always replace with new ones.
 - Be sure to apply new compressor oil to the O-rings when connecting refrigerant lines.
3. Install serpentine belt.
 - Move serpentine belt tensioner to loose side using wrench, then install serpentine belt to normal position.
4. Connect magnetic clutch harness connector.

5. Disconnect refrigerant line connector.
 - When removing the line connector, the connecting part should immediately be plugged or capped to prevent foreign matter from being mixed into the line.
6. Remove compressor.

Compressor Assembly and Associated Parts (X22SE)

871RX022

Legend

5. Disconnect refrigerant line connector.

- When removing the line connector, the connecting part should immediately be plugged or capped to prevent foreign matter from being mixed into the line.

6. Remove compressor.

- Move serpentine belt tensioner to loose side using wrench, then install serpentine belt to normal position.

4. Connect magnetic clutch harness connector.

New Compressor Installation

The new compressor is filled with 150cc (5.0fl.oz.) of compressor oil and nitrogen gas. When mounting the compressor on the vehicle, perform the following steps;

1. Gently release nitrogen gas from the new compressor.
 - Take care not to let the compressor oil flow out.
 - Inspect O-rings and replace if necessary.

871RX008

2. Turn the compressor several times by hand and release the compressor oil in the rotor.

3. When installing on a new system, the compressor should be installed as it is. When installing on a used system, the compressor should be installed after adjusting the amount of compressor oil. (Refer to Compressor in this section)

Installation

1. Install compressor.

- Tighten the compressor fixing bolts to the specified torque.

Torque: 19N•m (14lb•ft)

2. Connect refrigerant line connector.

- Tighten the refrigerant line connector fixing bolts to the specified torque.

Torque: 15N•m (11lb•ft)

- O-rings cannot be reused. Always replace with new ones.
- Be sure to apply new compressor oil to the O-rings when connecting refrigerant lines.

3. Install serpentine belt.

871RX013

Condenser Assembly

Condenser Assembly and Associated Parts

Legend

| (1) Engine Hood Lock | (4) Radiator Grille |
| (2) Pressure Switch Connector | (5) Engine Hood Front End Stay |
| (3) Refrigerant Line | (6) Condenser Assembly |

875RW008

Removal

1. Disconnect the battery ground cable.
2. Discharge and recover refrigerant.
 - Refer to Refrigerant Recovery in this section.
3. Remove radiator grille.
4. Remove engine hood front end stay.
5. Remove engine hood lock.
 - Apply setting mark to the engine hood lock fixing position before removing it.
6. Disconnect pressure switch connector.
7. Disconnect refrigerant line.
 - When removing the line connector, the connecting part should immediately be plugged or capped to prevent foreign matter from being mixed into the line.
8. Remove condenser assembly.
 - Handle with care to prevent damaging the condenser or radiator fin.

Installation

1. Install condenser assembly.
 - If installing a new condenser, be sure to add 30cc (1.0fl. oz.) of new compressor oil to a new one.
 - Tighten the condenser fixing bolts to the specified torque.

Torque: 6N•m (52lb in)

2. Connect refrigerant line.
 - Tighten the inlet line connector fixing bolt to the specified torque.

Torque: 15 N•m (11 lb ft)

- Tighten the outlet line connector fixing bolt to the specified torque.

Torque: 6 N•m (52 lb in)

- O-rings cannot be reused. Always replace with new ones.

- Be sure to apply new compressor oil to the O-rings when connecting the refrigerant line.
3. Connect pressure switch connector.
 4. Install engine hood lock.
 5. Install engine hood front end stay.
 6. Install radiator grille.

Condenser Fan Motor

Condenser Fan Motor and Associated Parts

**Legend**

- | | |
|----------------------------|---------------------|
| (1) Condenser Fan Assembly | (3) Radiator Grille |
| (2) Condenser Fan Motor | (4) Shroud |
| | (5) Fan |

875RW009

Removal

1. Disconnect the battery ground cable.
2. Discharge and recover refrigerant.
 - Refer to Refrigerant Recovery in this section.
3. Remove radiator grille.
4. Remove condenser fan assembly.
 - Disconnect the fan motor connector and remove the 4 fixing bolts.
5. Remove shroud.
 - Remove the 3 fixing nuts.
6. Remove fan.
 - Remove the fan fixing C-ring and plate.
7. Remove condenser fan motor.

Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Route the fan motor harness in its previous position, and fix it securely with clip and bracket.

Receiver / Drier

Receiver / Drier and Associated Parts

875RX001

Legend

- (1) Pressure Switch Connector
- (2) Pressure Switch
- (3) Refrigerant Line
- (4) Radiator Grille
- (5) Receiver / Drier
- (6) Bracket Bolt

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. If installing a new receiver/drier, be sure to add 30cc (1.0fl.oz.) of new compressor oil to a new one.
2. Put the receiver/drier in the bracket and connect with the refrigerant line. Check that no excessive force is imposed on the line. Fasten the bracket bolt to the receiver/drier.
3. Tighten the refrigerant line to the specified torque.

Torque: 6 N•m (52 lb in)

4. O-rings cannot be reused. Always replace with new ones.
5. Be sure to apply new compressor oil to the O-rings when connecting the refrigerant line.

Removal

1. Disconnect the battery ground cable.
2. Discharge and recover refrigerant.
 - Refer to Refrigerant Recovery in this section.
3. Remove radiator grille.
4. Disconnect pressure switch connector.
5. Disconnect refrigerant line.
 - When removing the line connected part, the connecting part should immediately be plugged or capped to prevent foreign matter from being mixed into the line.
6. Remove bracket bolt.
7. Remove receiver/drier.
 - Loosen the bolt, then, using care not to touch or bend the refrigerant line, carefully pull out the receiver/drier.

Pressure Switch

Pressure Switch and Associated Parts

875RX001

Legend

- (1) Pressure Switch Connector
- (2) Pressure Switch
- (3) Refrigerant Line
- (4) Radiator Grille
- (5) Receiver / Drier
- (6) Bracket Bolt

Installation

To install, follow the removal steps in the reverse order, noting the following point:

1. O-ring cannot be reused. Always replace with a new one.
2. Be sure to apply new compressor oil to the O-ring when connecting pressure switch.
3. Tighten the pressure switch to the specified torque.

Torque: 13 N•m (113 lb in)

Removal

1. Disconnect the battery ground cable.
2. Discharge and recover refrigerant.
 - Refer to "Refrigerant Recovery in this section.
3. Remove radiator grille.
4. Disconnect pressure switch connector.
5. Disconnect pressure switch.
 - When removing the switch connected part, the connecting part should immediately be plugged or capped to prevent foreign matter from being mixed into the line.

Evaporator Assembly

Evaporator Assembly and Associated Parts

874RX010

Legend

| (3) Resistor and Electronic Thermostat Connector | (7) Sill Plate |
| (4) Evaporator Assembly | (8) Pad: Dash Side Trim |
| | (9) Reinforcement: Inst Panel Lower |

Removal

1. Disconnect the battery ground cable.
2. Discharge and recover refrigerant.
 - Refer to Refrigerant Recovery in this section.
3. Remove glove box.

4. Disconnect resistor (2) and electronic thermostat connector (1).

840RW019

5. Disconnect drain hose.
6. Disconnect refrigerant line.
 - Use a back-up wrench when disconnecting and reconnecting the refrigerant lines.
 - When removing the refrigerant line connected part, the connecting part should immediately be plugged or capped to prevent foreign matter from being mixed into the line.
7. Remove evaporator assembly.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. To install a new evaporator assembly, add 50cc (1.7 fl. oz.) of new compressor oil to the new core.
2. Tighten the refrigerant outlet line to the specified torque.

Torque: 25 N•m (18 lb ft)

3. Tighten the refrigerant inlet line to the specified torque.

Torque: 15 N•m (11 lb ft)

4. O-rings cannot be reused. Always replace with new ones.
5. Be sure to apply new compressor oil to the O-rings when connecting lines.

Electronic Thermostat, Evaporator Core and/or Expansion Valve Disassembled View

874RX011

Legend

- | | |
|---------------------------|-------------------------|
| (1) Lining | (6) Attaching Screw |
| (2) Upper Case | (7) Clip |
| (3) Electronic Thermostat | (8) Lower Case |
| (4) Evaporator Core | (9) Evaporator Assembly |
| (5) Lining: Case | (10) O-ring |
| | (11) Expansion Valve |

Removal

1. Disconnect the battery ground cable.
2. Discharge and recover refrigerant.
 - Refer to Refrigerant Recovery in this section.
3. Remove evaporator assembly.
 - Refer to Evaporator Assembly in this section.
4. Remove the electronic thermostat sensor fixing clip. Pull the sensor from the evaporator assembly.
5. Remove clip.
6. Remove attaching screw.
7. Remove upper case.
8. Remove lower case.
 - Slit the case parting face with a knife since the lining is separated when removing the evaporator.

874RW034

- Lift to remove the upper case.

874RX013

9. Remove evaporator core.

874RX012

10. Remove expansion valve.

- Tear off the insulator carefully.
- Remove the sensor fixing clip.
- Use a back-up wrench when disconnecting all refrigerant pipes.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. The sensor is installed on the core with the clip.
2. The sensor must not interfere with the evaporator core.
3. When installing the new evaporator core, install the thermo sensor to the evaporator core specified position with the clip in the illustration.

874RX014

Legend

- (1) Evaporator Core
- (2) Thermo Sensor
- (3) Lower Case
- (4) Upper Case

4. O-rings cannot be reused. Always replace with new ones.
5. Be sure to apply new compressor oil to the O-rings when connecting lines.
6. Be sure to install the sensor and the insulator on the place where they were before.
7. To install a new evaporator core, add 50cc (1.7 fl. oz.) of new compressor oil to the new core.
8. Tighten the refrigerant lines to the specified torque. Refer to Main Data and Specifications for Torque Specifications in this section.
9. Apply an adhesive to the parting face of the lining when assembling the evaporator assembly.

Refrigerant Line

Refrigerant Line and Associated Parts

852RX009

Legend

- | | |
|--------------------------------------|---|
| (1) Clip and Clamp | (3) Discharge Line (High-Pressure Hose) |
| (2) Liquid Line (High-Pressure Pipe) | (4) Radiator Grille |
| | (5) Suction Line (Low-Pressure Pipe) |

Removal

1. Disconnect the battery ground cable.
2. Discharge and recover refrigerant.
 - Refer to Refrigerant Recovery in this section.
3. Remove radiator grille.
4. Remove clip and clamp.
5. Disconnect liquid line (High-pressure pipe).
6. Disconnect suction line (Low-pressure pipe) using a back-up wrench.
7. Disconnect suction line (Low-pressure hose) using a back-up wrench.
8. Disconnect discharge line (High-pressure hose) using a back-up wrench.
 - Use a backup wrench when disconnecting and reconnecting the refrigerant lines.
 - When removing the refrigerant line connecting part, the connecting part should immediately be

plugged or capped to prevent foreign matter from being mixed into the line.

Installation

To install, follow the removal steps in the reverse order, noting the following point:

1. O-rings cannot be reused. Always replace with new ones.
2. Be sure to apply new compressor oil to the O-rings when connecting lines.
3. Tighten the refrigerant line to the specified torque. Refer to Main Data and Specifications for Torque Specifications in this section.

Compressor

Service Precaution

WARNING: This vehicle has a Supplemental Restraint System (SRS). Refer to the SRS Component Location View in order to determine whether you are performing service on or near the SRS components or the SRS wiring. When you are performing service on or near the SRS components or the SRS wiring, refer to the SRS On-Vehicle Service Information. Failure to follow CAUTIONS could result in possible air bag deployment, personal injury, or otherwise unneeded SRS system repairs.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

When servicing the compressor, keep dirt or foreign material from getting on or into the compressor parts and system. Clean tools and a clean work area are important for proper service. The compressor connections and the outside of the compressor should be cleaned before any "On-Vehicle" repair, or before removal of the compressor. The parts must be kept clean at all times and any parts to be reassembled should be cleaned with Trichloroethane, naphtha, kerosene, or equivalent solvent, and dried with dry air. Use only lint free cloths to wipe parts.

The operations described below are based on bench overhaul with compressor removed from the vehicle, except as noted. They have been prepared in order of accessibility of the components. When the compressor is removed from the vehicle for servicing, the oil remaining in the compressor should be discarded and new compressor oil added to the compressor.

Compressor malfunction will appear in one of four ways: noise, seizure, leakage or low discharge pressure. Resonant compressor noises are not cause for alarm; however, irregular noise or rattles may indicate broken parts or excessive clearances due to wear. To check seizure, de-energize the magnetic clutch and check to

see if the drive plate can be rotated. If rotation is impossible, the compressor is seized. Low discharge pressure may be due to a faulty internal seal of the compressor, or a restriction in the compressor. Low discharge pressure may also be due to an insufficient refrigerant charge or a restriction elsewhere in the system. These possibilities should be checked prior to servicing the compressor. If the compressor is inoperative, but is not seized, check to see if current is being supplied to the magnetic clutch coil terminals.

The compressor oil used in the HFC-134a system compressor differs from that used in R-12 systems. Also, compressor oil to be used varies according to the compressor model. Be sure to avoid mixing two or more different types of oil.

If the wrong oil is used, lubrication will be poor and the compressor will seize or malfunction.

DKV-14D Type Compressor

DKV-14D is equipped with five-vane rotary compressor. These vanes are built into a rotor which is mounted on a shaft.

When the shaft rotates, the vanes built into the cylinder block assembly are operated by centrifugal force.

This changes the volume of the space formed by the rotor and cylinder, resulting in the intake and compression of the refrigerant gas. The discharge valve and the valve stopper, which protects the discharge valve, are built into the cylinder block assembly. There is no suction valve but a shaft seal is installed between the shaft and head; a trigger valve, which applies back pressure to the vanes, is installed in the cylinder block and a refrigerant gas temperature sensor is installed in the front head.

The specified quantity of compressor oil is contained in the compressor to lubricate the various parts using the refrigerant gas discharge pressure.

1A-72 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)**Diagnosis**

Condition	Possible cause	Correction
Noise from compression	Defective rotor/piston	Replace compressor/cylinder and shaft assembly
	Defective shaft	Replace compressor/cylinder and shaft assembly
Noise from magnetic clutch	Defective bearing	Replace magnetic clutch
	Defective clutch	Replace magnetic clutch
	Clearance between drive plate and pulley not standard	Adjust the clearance or replace magnetic clutch
Insufficient cooling	Defective gasket	Replace compressor/gasket
	Defective rotor/reed valve	Replace compressor/valve plate
	Defective trigger valve/suction valve	Replace compressor/suction valve
Not rotating	Defective rotor/piston	Replace compressor/cylinder and shaft assembly
	Defective shaft	Replace compressor/cylinder and shaft assembly
	Rotating parts seized due to insufficient oil	Replace compressor
Oil and/or gas leakage	Defective seal	Replace compressor/shaft seal
	Defective O-ring	Replace

Removal

1. Using drive plate holder J-33939 (1) to prevent the drive plate from rotating, then remove the drive plate bolt.

2. Remove drive plate by using drive plate puller J-33944-A (2) and forcing screw J-33944-4 (1).

901RX055

871RX016

1A-74 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

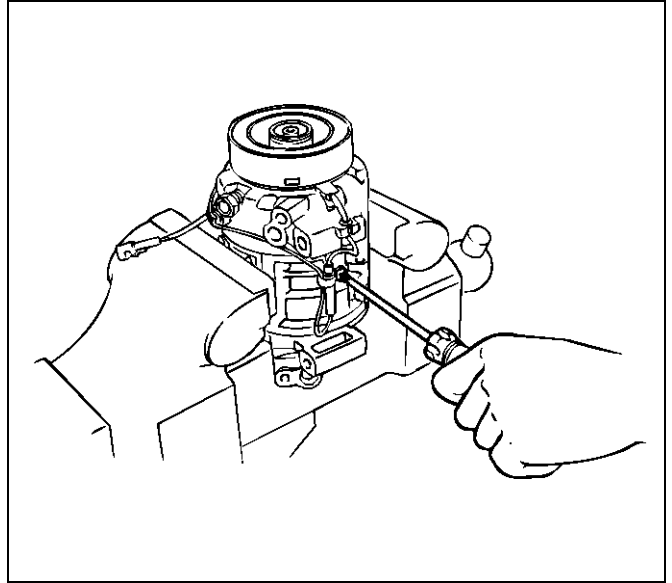

3. Remove shim (s).
4. Remove snap ring (1) by using snap ring pliers.

5. Remove pulley assembly by using pulley puller pilot J-38424, pulley puller J-8433 and pulley puller leg J-24092-2.

6. Loosen screw and disconnect the coil lead wire connector.

7. Loosen three screws and remove the field coil.

Inspection and Repair

Drive Plate

If the frictional surface shows signs of damage due to excessive heat, the drive plate and pulley should be replaced.

Pulley Assembly

Check the appearance of the pulley assembly. If the frictional surface of the pulley shows signs of excessive grooving due to slippage, both the pulley and drive plate should be replaced. The frictional surfaces of the pulley assembly should be cleaned with a suitable solvent before reinstallation.

Coil

Check coil for loose connector or cracked insulation.

Installation

1. Install field coil.
 - Align the located portion (1) of the field coil and compressor.

871RX010

- Tighten the mounting screw to the specified torque.

Torque: 5N-m (44 lb in)

2. Connect the lead wire connector with the rubber hold and tighten the screw.
3. Install pulley assembly by using pulley installer J-33940-A and drive handle J-8092.

871RS013

4. Install snap ring.
5. Install shim (s).
6. Install the drive plate to the compressor drive shaft together with the original shim(s)(1). Press the drive plate by hand.

871RX015

1A-76 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

7. Install drive plate bolt by using drive plate holder J-33939 (1) to prevent the drive plate from rotating.

901RX055

- Tighten the drive plate bolt to the specified torque.

Torque: 13 N·m (113 lb in)

- After tightening the drive plate bolt, check to be sure the pulley rotates smoothly.

- Check to be sure that the clutch clearance is between 0.3-0.6 mm (0.01-0.02 in.)

871RX014

- If necessary, install adjusting shim(s).
- Adjusting shims are available in the following thickness.

Thickness

- **0.1 mm (0.0039 in.)**
- **0.3 mm (0.0118 in.)**
- **0.5 mm (0.0197 in.)**

Compressor Oil

Oil Specification

- The HFC-134a system requires a synthetic (PAG) compressor oil whereas the R-12 system requires a mineral compressor oil. The two oils must never be mixed.
- Compressor (PAG) oil varies according to compressor model. Be sure to use oil specified for the model of compressor.
- **Always use HFC-134a Vane Rotary Type Compressor Oil (AIPDN Part No.2-90188-301-0)**

Handling of Oil

- The oil should be free from moisture, dust, metal powder, etc.
- Do not mix with other oil.
- The water content in the oil increases when exposed to the air. After use, seal oil from air immediately. (HFC-134a Vane Rotary Compressor Oil absorbs moisture very easily.)
- The compressor oil must be stored in steel containers, not in plastic containers.

Compressor Oil Check

The oil used to lubricate the compressor is circulating with the refrigerant.

Whenever replacing any component of the system or a large amount of gas leakage occurs, add oil to maintain the original amount of oil.

Oil Capacity

Capacity total in system: 150cc (5.0 fl.oz)

**Compressor (Service parts) charging amount:
150 cc (5.0 fl.oz)**

Checking and Adjusting Oil Quantity for Used Compressor

1. Perform oil return operation. Refer to Oil Return Operation in this section.
2. Discharge and recover refrigerant and remove the compressor.
3. Drain the compressor oil and measure the extracted oil with a measuring cylinder.

871RX020

4. If the amount of oil drained is much less than 90 cc (3.0 fl. oz.), some refrigerant may have leaked out. Conduct a leak tests on the connections of each system, and if necessary, repair or replace faulty parts.
5. Check the compressor oil contamination. (Refer to Contamination of Compressor Oil in this section.)
6. Adjust the oil level following the next procedure below.

(Charging Amount)	(Collected Amount)
more than 90cc (3.0 fl.oz)	same as collected amount
less than 90 cc (3.0 fl.oz)	90cc (3.0 fl.oz)

7. Install the compressor, then evacuate, charge and perform the oil return operation.

8. Check system operation.

When it is impossible to preform oil return operation, the compressor oil should be checked in the following order:

1. Discharge and recover refrigerant and remove the compressor.
2. Drain the compressor oil and measure the extracted oil with a measuring cylinder.
3. Check the oil for contamination.
4. If more than 90 cc (3.0 fl. oz.) of oil is extracted from the compressor, supply the same amount of oil to the compressor to be installed.
5. If the amount of oil extracted is less than 90 cc (3.0 fl. oz.), recheck the compressor oil in the following order.
6. Supply 90 cc (3.0 fl. oz.) of oil to the compressor and install it onto the vehicle.

1A-78 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

7. Evacuate and recharge with the proper amount of refrigerant.
8. Perform the oil return operation.
9. Remove the compressor and recheck the amount of oil.
10. Adjust the compressor oil, if necessary.

(Collected Amount)	(Charging Amount)
more than 90 cc (3.0 fl.oz)	same as collected amount
less than 90 cc (3.0 fl.oz)	90 cc (3.0 fl.oz)

Checking and Adjusting for Compressor Replacement

150 cc (5.0 fl.oz.) of oil is charged in compressor (service parts). So it is necessary to drain the proper amount of oil from the new compressor.

1. Perform oil return operation.
2. Discharge and recover the refrigerant and remove the compressor.
3. Drain the compressor oil and measure the extracted oil.
4. Check the compressor oil for contamination.
5. Adjust the oil level as required.

(Amount of oil drained from used compressor)	(Draining amount of oil from new compressor)
less than 90 cc (3.0 fl.oz)	Same as drained amount
more than 90 cc (3.0 fl.oz)	90 cc (3.0 fl.oz)

6. Evacuate, charge and perform the oil return operation.
7. Check the system operation.

Contamination of Compressor Oil

Unlike engine oil, no cleaning agent is added to the compressor oil. Even if the compressor runs for a long period of time (approximately one season), the oil never becomes contaminated as long as there is nothing wrong with the compressor or its method of use.

Inspect the extracted oil for any of the following conditions:

- The capacity of the oil has increased.
- The oil has changed to red.
- Foreign substances, metal powder, etc., are present in the oil.

If any of these conditions exists, the compressor oil is contaminated. Whenever contaminated compressor oil is discovered, the receiver/drier must be replaced.

Oil Return Operation

There is close affinity between the oil and the refrigerant. During normal operation, part of the oil recirculates with the refrigerant in the system. When checking the amount of oil in the system, or replacing any component of the system, the compressor must be run in advance for oil return operation. The procedure is as follows:

1. Open all the doors and the engine hood.
2. Start the engine and air conditioning switch to "ON" and set the fan control knob at its highest position.
3. Run the compressor for more than 20 minutes between 800 and 1,000 rpm in order to operate the system.
4. Stop the engine.

Replacement of Component Parts

When replacing the system component parts, supply the following amount of oil to the component parts to be installed.

(Component parts to be installed)	(Amount of Oil)
Evaporator	50 cc (1.7 fl. oz.)
Condenser	30 cc (1.0 fl. oz.)
Receiver/dryer	30 cc (1.0 fl. oz.)
Refrigerant line (one piece)	10 cc (0.3 fl. oz.)

Automatic Air Conditioning System

General Description

Using a variety of sensors, this automatic heater and air conditioner accurately senses outside air temperature, solar radiation quantity, evaporator's blowing temperature, and interior temperature, then enters these data to the automatic heater/air conditioner control unit (equipped with the built-in micro-computer). The data provided to the control unit enables to automatically control blow temperature and blow air

quantity, turn on or off the compressor and switch the blow port as well as switching between the fresh air intake and interior air circulation.

Resetting the automatic function allows you to switch to the manual control mode.

The self-diagnosis function of the automatic heater and air conditioner control unit (with the built-in micro-computer) allows the unit to access and diagnose a failed part easier and quicker.

Circuit Diagram
6VD1 Engine

Functions and Features

of this function, refer to the section titled "Self-Diagnosis").

Automatic interior temperature control

This function enables to maintain the interior temperature at the level specified from the temperature control switch despite of changes in factors such as vehicle speeds, outside air temperature and number of passengers.

Maximum cooling and heating function

You can select FC (Full cool, namely maximum cooling temperature) or FH (Full heat, maximum heating temperature) from the temperature control lever.

Automatic air flow control

Air flow is automatically and consecutively fine tuned according to the specified interior temperature and changes in aperture of the heater unit mix door.

Mode (blow port) control

This function automatically selects either one of the VENT, BI-LEVEL, FOOT or DEF mode for the blow port according to changes of temperature on the blow port. Using the mode switch allows you to select a desired blow port manually.

Intake (switching between the fresh air intake and circulation of interior air) control

The intake (switching between fresh air intake and circulation of interior air) mode automatically selects either FRESH (fresh air intake), MIX or RECIRC (interior air circulation) according to changes of the blow port temperature. Using the intake switch allows you to select a desired intake port manually (in the manual operation, FRESH and RECIRC modes alone are available). Pressing the DEF (defrost) mode switch selects the FRESH (fresh air intake).

Cooler start-up timing control

This function is used for maintaining the air flow at "LOW" level until the evaporator is sufficiently cooled down. It is intended to prevent a large volume of hot air being blowing into inside of a vehicle when the cooler is turned on in hot summer season.

Heater start-up timing control

This function is used for maintained the air flow at "LOW" level and also for maintaining the defrost mode until temperature of coolant in the heater core is sufficiently heated. It is intended to prevent a large volume of cool air being blown into inside of a vehicle when the heater is turned on in cold winter season.

Solar radiation quantity offset control

The photodiode on the solar radiation sensor determines solar radiation quantity accurately to offset interior temperature quickly.

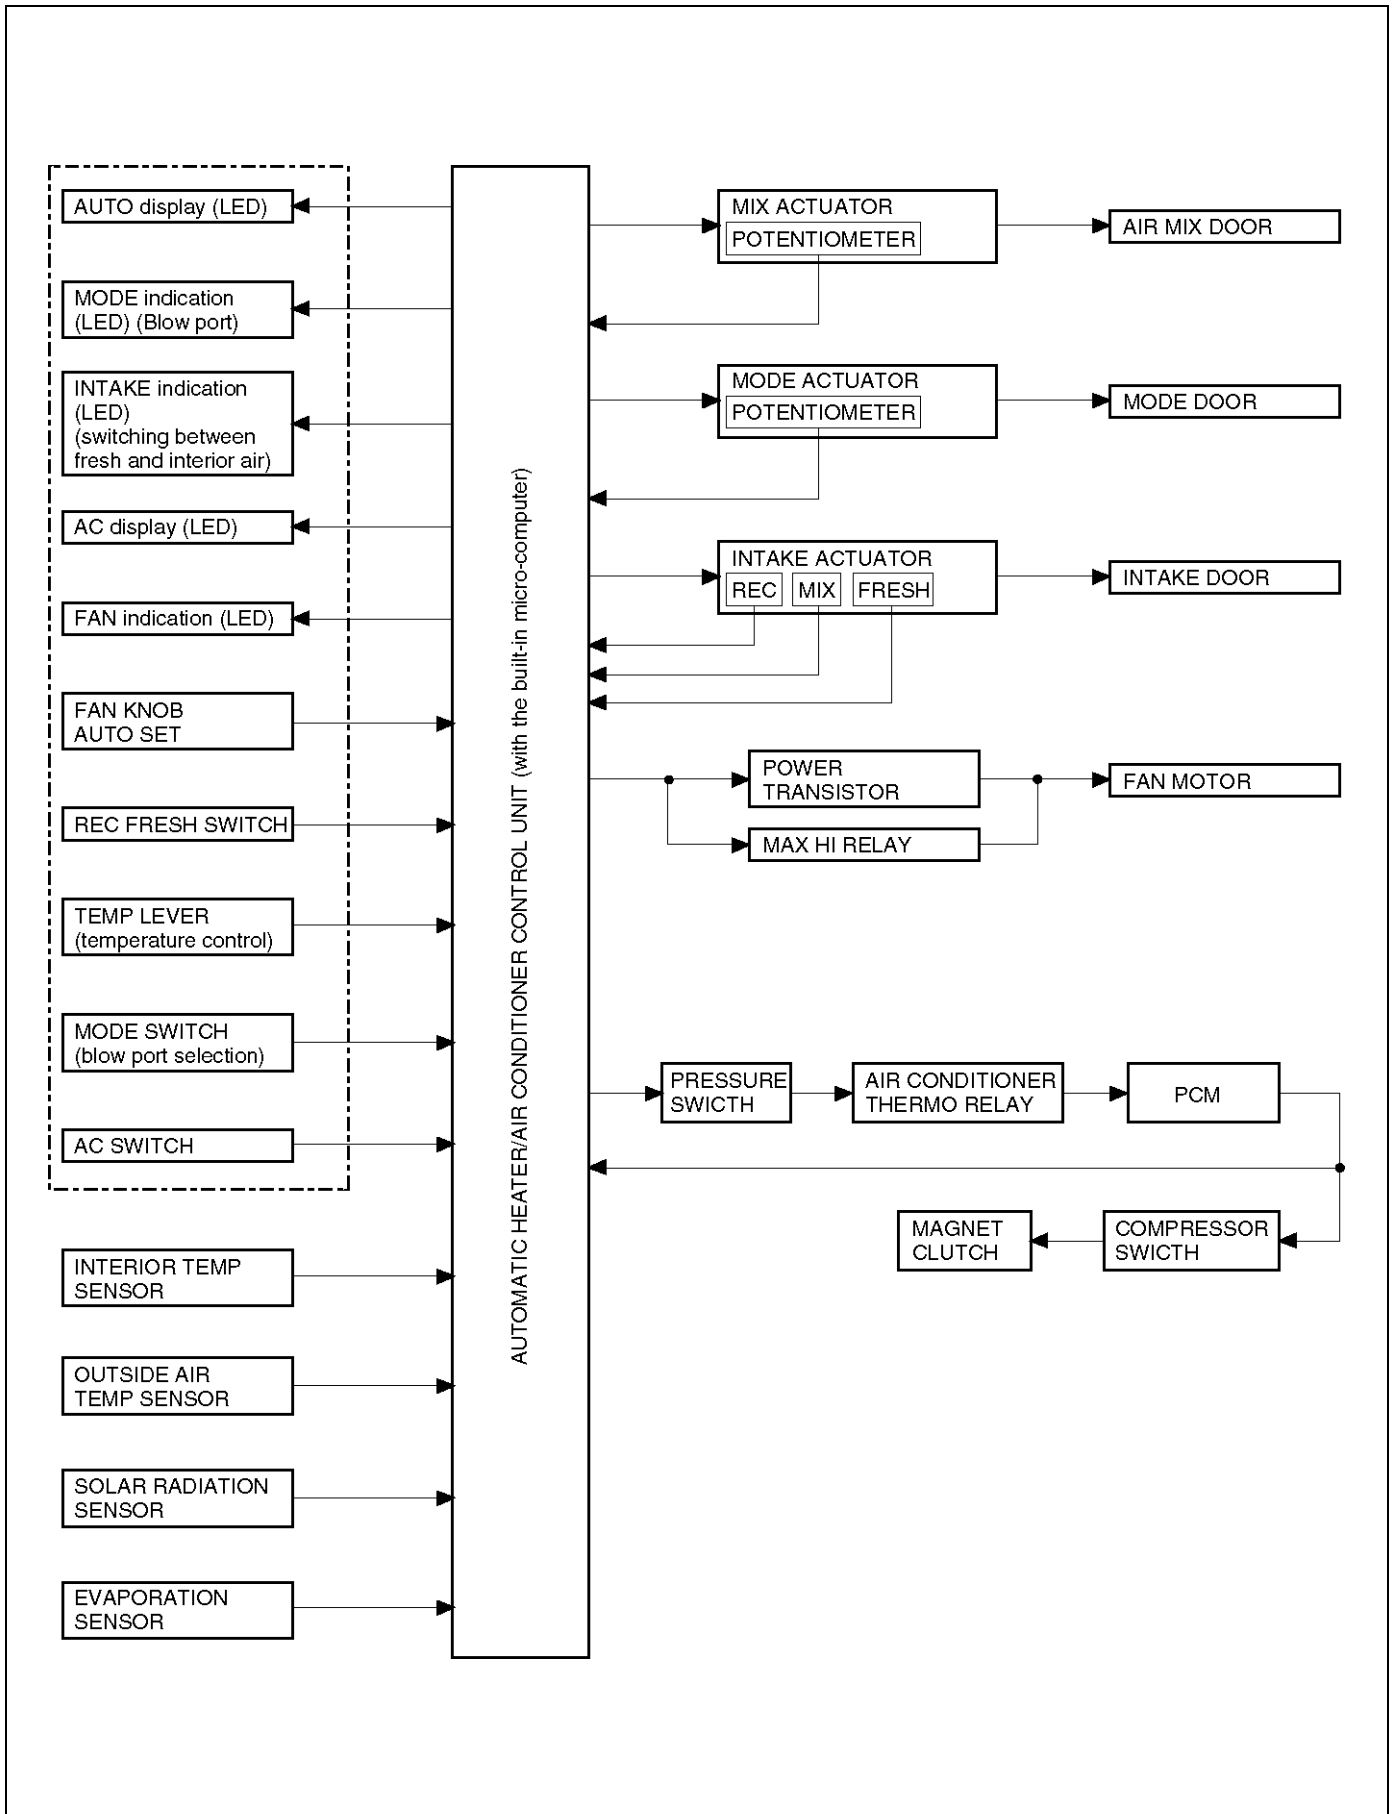

Switch position storing function

This function is used for storing switch positions being selected in the immediately preceding operation, namely the last time the ignition has been turned off. It simplifies the setup procedures when restarting the system.

Self-diagnosis function

The self-diagnosis function turned on from the panel switch makes your troubleshooting easier (for detail

Operation and Functions of Control Panel Switches

Auto Switch

1. Pressing this switch turns on the automatic control mode. It resets all manual switches except that for the fan control. However, when the Manual REC is selected for the intake or the Manual Open is selected, the modes are maintained.
2. It causes the A/C (air conditioner) to the ON mode (this function, however, available only when the fan is turned on and also the compressor is turned on because of the given outside air temperature level).

Indication

- The AUTO LED comes on.
- Currently selected mode for the Mode and Intake are respectively indicated.

- The A/C LED remains turned on even if the compressor has been turned off because of the given outside air temperature level. Pressing the air conditioning switch in this state turns off the A/C LED.

Mode Switch

1. Pressing the VENT, B/L or FOOT switch selects the corresponding mode.
2. When the Auto is selected for the Mode and Intake, pressing the mode switch fixes the Intake to the immediately preceding status.

Indication

- Turns off the Auto LED.
- Currently selected blow port is indicated.

DEF Switch

Press this switch to select the DEF mode.

Blow port	Intake port	A/C	MIX
DEF	Auto FRESH *1	ON mode *2	Auto

*1: When the manual REC is selected for the Intake, the manual REC is maintained.

*2: The ON mode is enabled only when the fan is turned on, and also the compressor is turned on because of the given outside air temperature level.

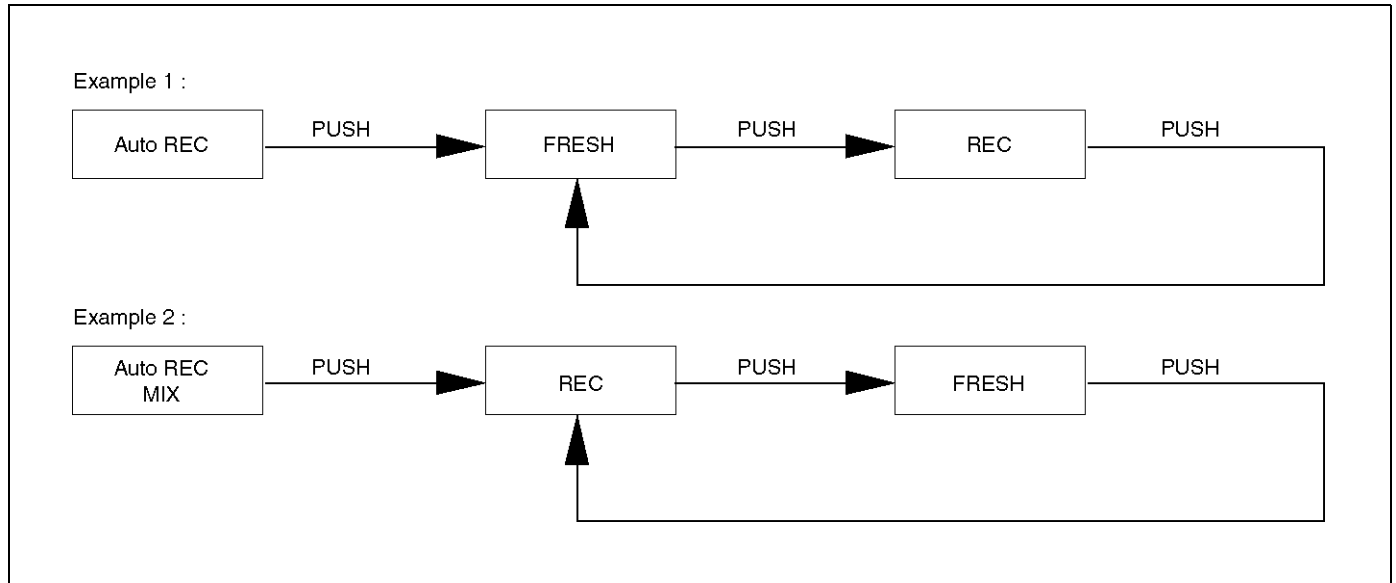

Indication

- The Auto LED is turned off.
- DEF is indicated for the blow port, A/C LED comes on (only when the fan is turned on), and status display is provided for the Intake and Cold Air Bypass.

Intake Switch

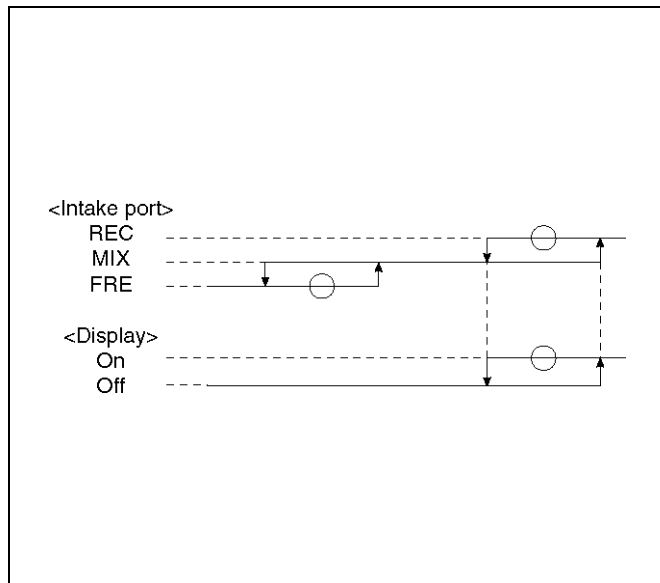

Pressing this switch sequentially selects a different intake port in the following order.

F01RX005

Indication

- The Auto LED maintains unaffected.
- Currently selected intake port is indicated.

F01RX007

Fan Switch

1. Sets the fan to the specified mode.
2. Even when the fan switch is turned off, status display for the Mode, Intake and Cold Air Bypass is maintained.

Temperature Control Knob

1. This knob is operable only when the fan is turned on. It may be used for the MAX control of each block except the fan.
2. When the manual mode is selected for the fan control, this manual mode is maintained.

MAX Control

	Mix	Fan	Mode	Intake	Cold air bypass	A/C
MAX/COOL	Full cool	MAX/HI	VENT	REC*1	OPEN*2	ON mode*3
MAX/HEAT	Full hot	AUTO/HI	FOOT*4	FRESH	CLOSE	Current status is maintained

1A-96 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

*1: In the A/C: OFF mode, FRESH shall be selected.

*2: When the fan is turned ON, CLOSE shall be selected.

*3: The ON mode is available only when ON is selected for the fan as well as for the cold outside air ON/OFF

selection.

*4: When the MAX control is selected from the DEF mode, this DEF mode shall be maintained.

F01RX008

Indication

- As long as the MAX control is selected, the immediately preceding indication shall be maintained for the AUTO.
- Status display is provided for others.

Air Conditioning Switch

Pressing this switch turns on or off the A/C (air conditioning) control. (The compressor remains turned off if the fan is turned off and also the compressor has been turned off because of the given outside air temperature level.)

Indication

1. The A/C LED remains turned on even if the compressor has been turned off because of the given outside air temperature level. In this case, however, the AUTO or DEF switch must be turned on and the A/C ON mode must also be turned on (by the MAX/C mode).
2. Pressing the A/C switch from the above state (1) turns off the A/C LED.

Overview of Construction, Movement and Control of Major Parts of Automatic Air Conditioner System

Automatic Heater/Air Conditioner Control Unit

Equipped with the built-in micro-computer, this control unit operates on signals from sensors and input signals from switches to offer total control of the blower fan, and actuators used for the mode door, intake door and air mix door.

Its self-diagnosis function enables quicker access to a failed part and its more accurate troubleshooting.

Interior Temperature Sensor

It is a sensor used for detecting room temperature of a vehicle. This sensor converts a given room temperature into a resistance value before entering the data to the automatic heater/air conditioner control unit.

This interior temperature sensor unites the power driven aspirator and the motor fan so that a small amount of room air may be constantly fed to the sensor.

This sensor is provided on the control panel.

- (1) Interior Temperature Sensor
- (2) Automatic Air Conditioner Control Unit

Outside Air Temperature Sensor

This sensor is used for detecting temperature outside the vehicle. It converts a given outside air temperature into a resistance value before entering the data to the automatic heater/air conditioner control unit.

Thermal effects from the condenser and radiator during idling after a run can be measured and offset the automatic amplifier.

This sensor is provided on the side plate situated at upper right side of the condenser.

845RX001

Legend

- (1) Outside Air Temperature Sensor

Evaporation Sensor

The evaporation sensor is the sensor to detect temperature change of the side of evaporator blower coming by fresh recirculation of intake door or "on" "off" of compressor.

The temperature is converted to resistant rate.

And it works as thermostat to control to prevent freezing of evaporator.

This sensor is installed in the upper case of evaporator.

874RX014

Legend

- (1) Evaporator Core
- (2) Evaporation Sensor
- (3) Lower Case
- (4) Upper Case

Solar Radiation Quantity Sensor

It is a photodiode used for detecting quantity of solar radiation. This sensor converts the offset signal generated by changes in the interior temperature (which results from fluctuations in solar radiation) into photoelectric current to enter into the automatic heater/air conditioner control unit.

This sensor is provided at top of the defroster grill.

865RW009

Legend

- (1) Solar Radiation Sensor

Power Transistor

Receiving base current from the automatic heater/air conditioner control unit, the power transistor implements stage-less speed change of the blower fan motor. This transistor is provided on the evaporator.

874RX015

Legend

- (1) Evaporator Assembly
(2) Power Transistor

Max Hi Relay

This relay turned on or off by the signal from the automatic heater/air conditioner control unit. As the Max Hi relay is turned on, supply voltage is directly fed to the blower fan motor to select the Max Hi mode.

860RW028

Legend

- (1) Blower Unit
(2) Max High Relay

Actuator

The actuators are power driven type containing a small motor. Receiving output current from the automatic heater/air conditioner control unit, actuators drive the heater and blower unit mode doors.

Actuators consist of the mode actuator used for switching the mode (blow port selection), the mix actuator used for changing aperture of the air mix door, the intake actuator used for switching the intake mode (fresh air/interior air) and the cold air bypassing actuator.

860RW029

Legend

- (1) Mix Actuator
- (2) Heater Unit
- (3) Intake Actuator
- (4) Mode Actuator
- (5) Blower Unit

The actuator changes the motor speed using the gear and drives each door rotating the output axis united with the sliding contact.

860RW026

Legend

- (1) Output Axis
- (2) Motor
- (3) Printed Circuit Board
- (4) Sliding Contact

The mode and mix actuators are common actuators with the built-in potentiometer. For the intake actuator, the contact switch type is selected.

The potentiometer is a register assembled to the printed circuit board of the mix and mode actuators. It detects the air mix door position specified by rotation of the output axis as a ratio of the variable terminal (VM) voltage against the reference voltage (VDD: 5V), then signals the value to the automatic heater/air conditioner control unit.

C01RX016

Movement of Mix Actuator

Position of the air mix door is determined by the controller on the automatic heater/air conditioner control unit.

As the heat or cool side of the controller is grounded, the transistor on the driver is activated and, thus, the motor rotation is turned on. The sliding contact connected to the motor sends the position detection signal from the potentiometer to the automatic heater/air conditioner control unit. As the set temperature and interior temperature are balanced, the controller returns to the neutral and the motor rotation is stopped.

C-45		Rotation direction	Remarks
(+) side	(-) side		
8	6	Clockwise	Full heat side
6	8	Counter clockwise	Full cool side

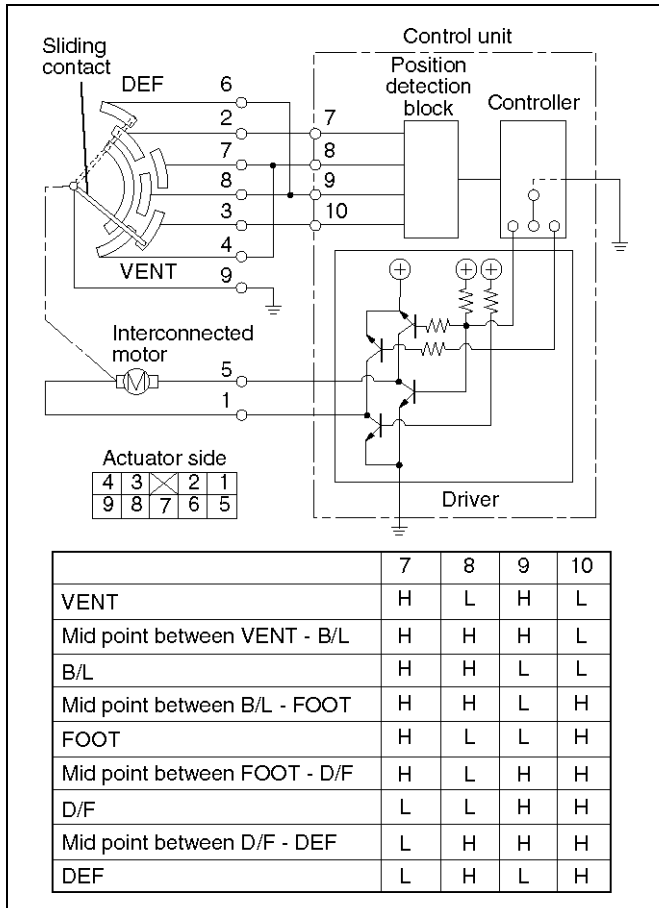

C01RX005

Movement of Mode Actuator

As target position of the mode door is decided on the controller of the control unit, the control unit reads the position detection signal from the actuator to select the clockwise or counter clockwise motor rotation direction. Grounding the controller VENT or DEF side after the direction selection activates the transistor on the driver, thus turning on the motor rotation. Accompanying the motor rotation, the sliding contact rotates, too. When the target position is reached, the controller on the control unit returns to the neutral and the motor stops.

Conduction pin		Rotation direction	Remarks
(+) side	(-) side		
5	1	Clockwise	VENT to DEF direction
1	5	Counter clockwise	DEF to VENT direction

Movement of Intake Actuator

The controller on the automatic heater/air conditioner control unit selects an intake mode to be used. As the Terminal No.5 B-26 is grounded via the sliding contact on the terminal plate, the transistor on the driver is activated, thus turning on the motor rotation. Then, accompanying move of the motor, the sliding contact rotates until grounding of the Terminal No.5 B-26 is

removed, thus stopping the motor.

Grounding terminal	Rotation direction	Remarks
No.5 B-26	Clockwise	RE-CIRCULATION → MIX → FRESH

Overview of Automatic Control of Automatic Air Conditioner

The automatic heater and air conditioner on this vehicle has the following features:

- Interior temperature control.
- Air flow control.
- Mode (blow port) control.
- Intake (switching between fresh air and interior air) control.
- Heater start timing control.
- Cooler start timing control.
- Compressor ON/OFF function according to outside air temperature level.
- Evaporator anti-freeze control.

Interior Temperature Control

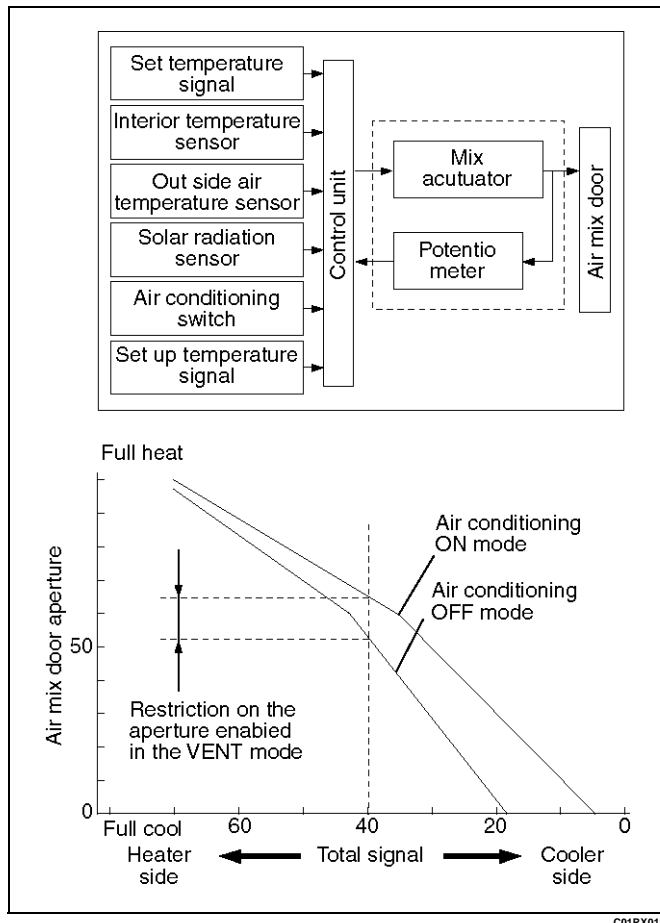

The automatic heater/air conditioner control unit operates on the setup temperature signal from the temperature control switch and other sensor signals to derive the total signal. Then, the control unit compares this signal against the signal from the potentiometer to determine rotation direction of the mix actuator. The mix actuator moves the air mix door to the aperture specified by the total signal so that the specified interior temperature is achieved.

If the compressor is turned off in the A/C (air conditioning) mode, aperture of the air mix door is offset

according to the outside air temperature or the specified interior temperature. This function removes the difference in the blowing temperature in this state and that of when the compressor is turned on.

When FH or FC is selected for the setup temperature, the air mix door is accordingly fixed to the Full Heat or Full Cool mode.

When the VENT mode is selected, aperture of the air mix door is controlled so that excessively heated air may not be blown from the VENT blow port.

Air Flow Control

In the Auto Mode

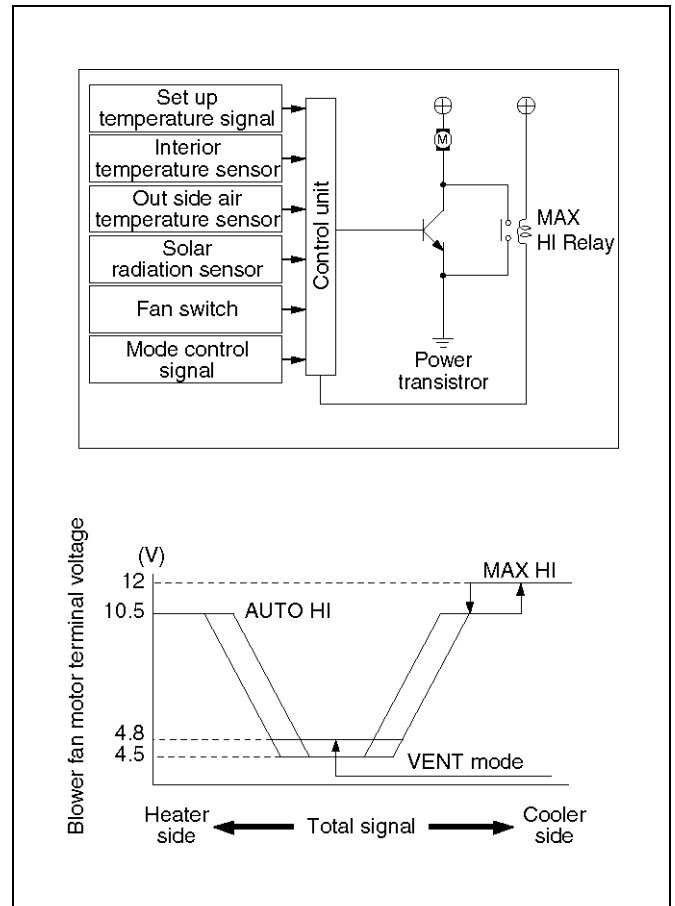

- The automatic heater/air conditioner control unit operates on the setup temperature signal and other sensor signals to derive the total signal. Then, the control unit adjusts base potential of the power transistor to match it to the voltage pattern of the target fan so that stage-less fan speed control can be achieved.

When solar radiation quantity is detected in the VENT or B/L mode, the control unit increases the minimum fan voltage to offset.

When FH or FC is selected from the temperature control switch, air flow is accordingly fixed to MAX HI or AUTO HI.

In the Manual Mode

- Air flow specified from the fan switch is entered to the automatic heater/air conditioner control unit as the manual signal. The signal modifies the air flow to the level specified from the fan switch so that the required fan voltage is attained.

Mode (Blow Port) Control

The automatic heater/air conditioner control unit operates on the setup temperature from the control switch, and temperature and solar radiation quantify from the sensors to determine the total mode control signal. According to the pattern specified by this signal, the control unit selects either one of the VENT, BI-LEVEL, FOOT or DEF/FOOT mode.

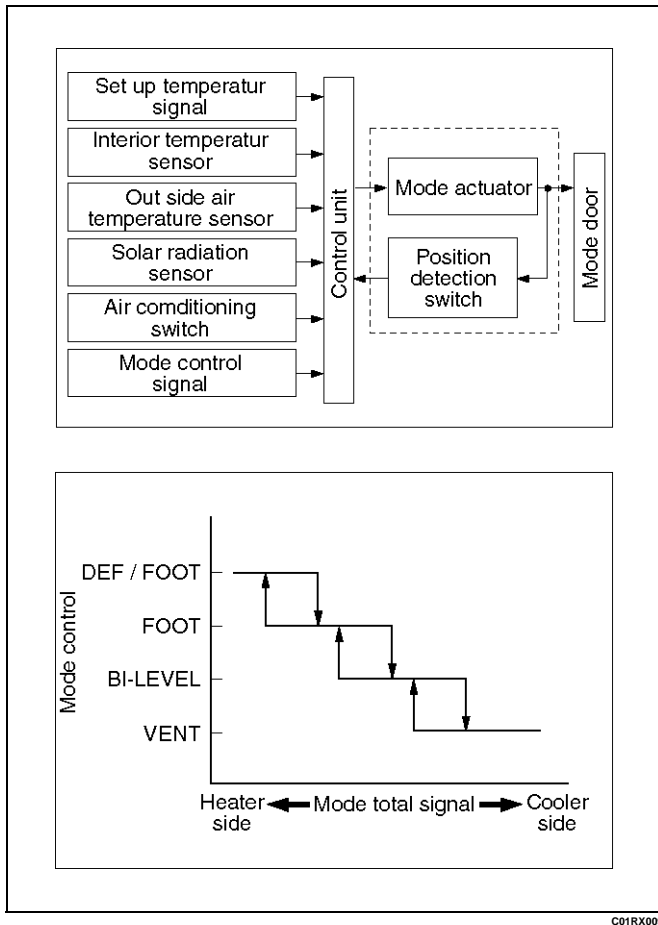

The mode actuator determines the rotation direction comparing the target position against the current position being determined by the position detection signal.

When FH or FC is selected for the temperature from the temperature control switch, mode is accordingly fixed to the VENT or FOOT.

- In the manual operation of the mode switch, you can select a desired blow port mode pressing the corresponding mode switch.

1A-102 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

- Operating the DEF mode switch selects the DEF for the blow port mode.

C01RX009

Intake (Fresh air/interior air switching) Control

In the Full Auto mode, the automatic heater/air conditioner control unit operates on the setup temperature signal and other sensor input signals to derive the total signal. According to the pattern specified by this signal, the control unit provides the intake control.

When the fan is turned off or the A/C (air conditioning) is turned off, the intake is fixed to the FRESH mode.

When FC or FH is selected from the control switch, the intake mode is accordingly fixed to the RECIRC or FRESH.

In the Manual Operation

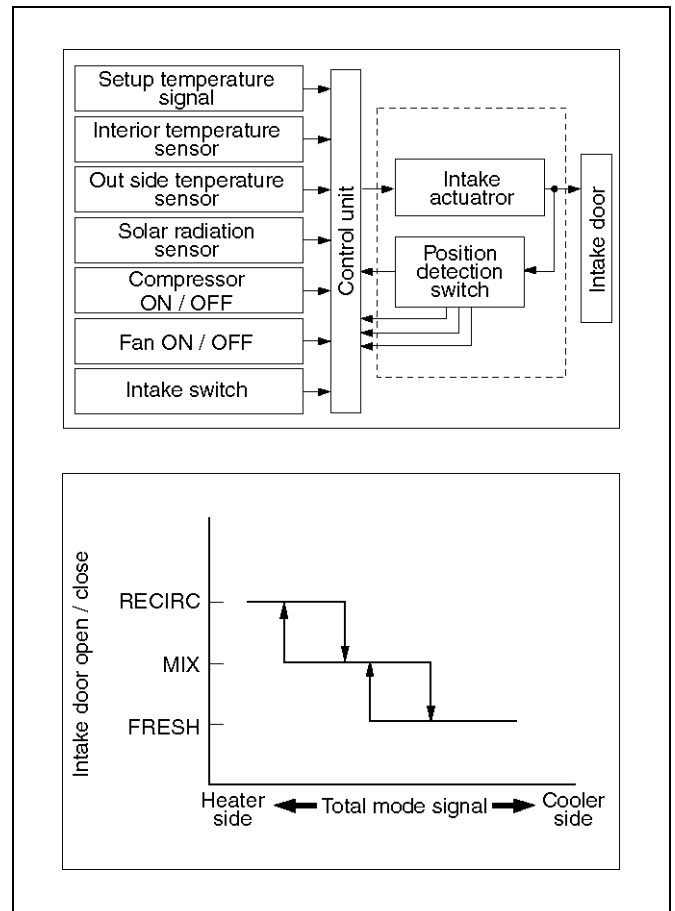

- Pressing the FRESH (fresh air intake) or the RECIRC (room air circulation) accordingly selects the FRESH or RECIRC mode.

When the DEF Mode Switch is depressed

- The intake mode is fixed to the FRESH. When the MANU REC is selected, however, the mode is fixed the RECIRC.

When the Mode Switch is depressed

- If the automatic intake control is selected, the intake is fixed to the currently selected mode.

C01RX008

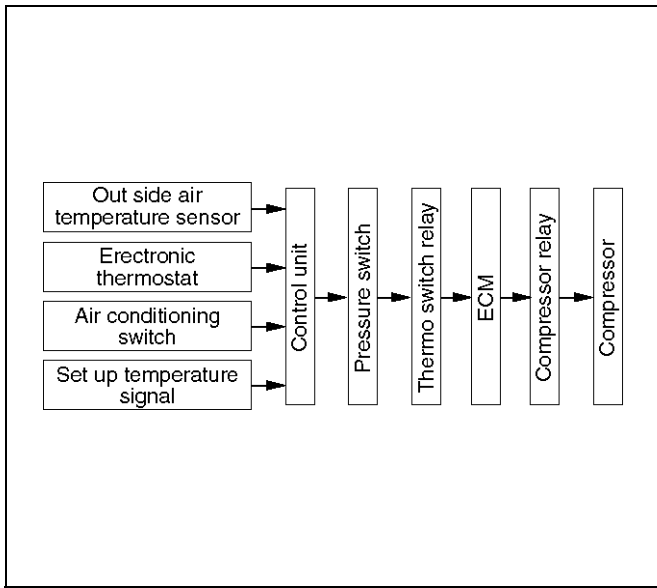

Compressor Control

In the automatic control mode, the automatic heater/air conditioner control unit turns on or off the compressor with the evaporator anti-freeze mechanism using the evaporation sensor. And, when outside air is detected to be low through the outside air temperature sensor signal, the control unit turns off the compressor using the compressor control function.

Manual Control

- In the automatic control mode, pressing the A/C (air conditioning) switch turns off the compressor.

- Pressing the DEF mode switch automatically turns on the compressor.

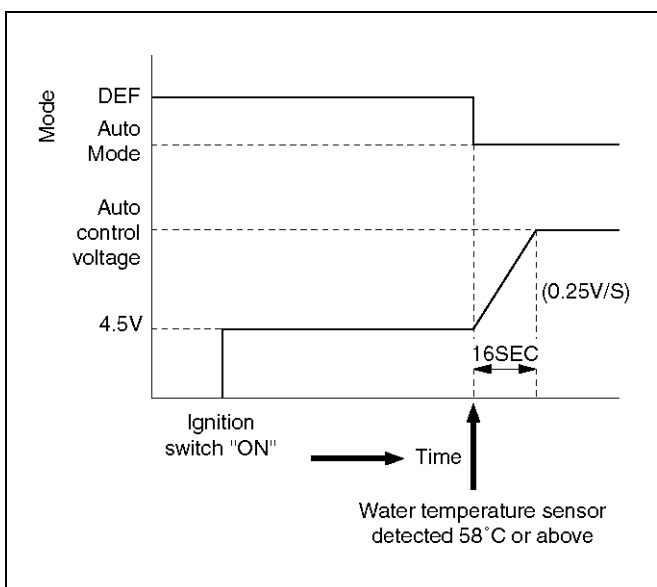

C01RX007

Heating Start Timing Control

When the automatic heater/air conditioner is started, heating is turned on only when the coolant temperature detected by the coolant temperature sensor is 18°C or less and total signal derived from the sensor signals has detected that the heating condition is met.

If the coolant temperature detected by the sensor is 18°C or less, 4.5V is set for the blower fan motor terminal voltage and the DEF is selected for the blow port mode.

When the temperature detected by the sensor is above 18°C, the blow port mode is switched to the Auto Control and the voltage across the blower fan motor terminal is linearly increased from 4.5V to auto control voltage (auto airflow).

840RX015

Cooling Start Timing Control

When the automatic heater/air conditioner is started, cooling is turned on only when the temperature detected by the interior temperature sensor is 30°C or above and the total signal derived from the sensor signals has detected that the cooling condition is met.

When the cooling condition has been met, the fan voltage across the blower fan motor terminal is set to 4.5V for 7 seconds maximum, then it is linearly increased up to the auto airflow level at the rate of 0.6V/sec.

C06RX003

Troubleshooting

Troubleshooting, Its Overview and Procedures

The automatic heater and air conditioner equips with the "Self-Diagnosis Function" to check its major components.

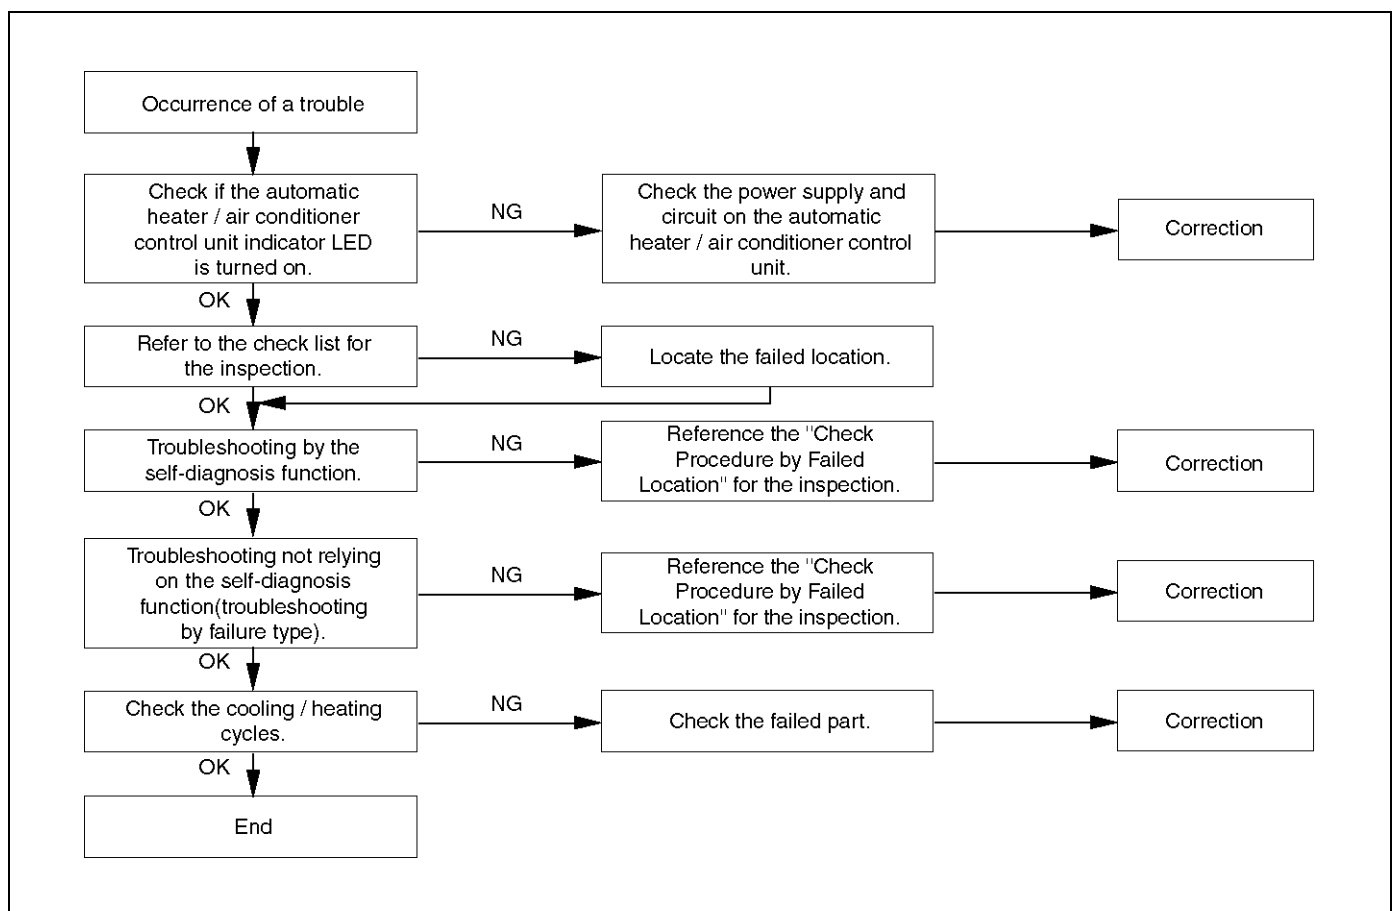

This function makes access to the sensors, actuators and blower fan motor system easier when checking them up and, when a failed part is located, this function restores its original performance.

When implementing the troubleshooting, this self-diagnosis function narrows the range to be

searched at the first step, then check relevant parts one by one according to the "Checking Procedures by Failed Location". As for a location this function is unappreciable, the system accurately determines characteristics of a given trouble and checks relevant parts according to the "Checking Procedures by Failed Location".

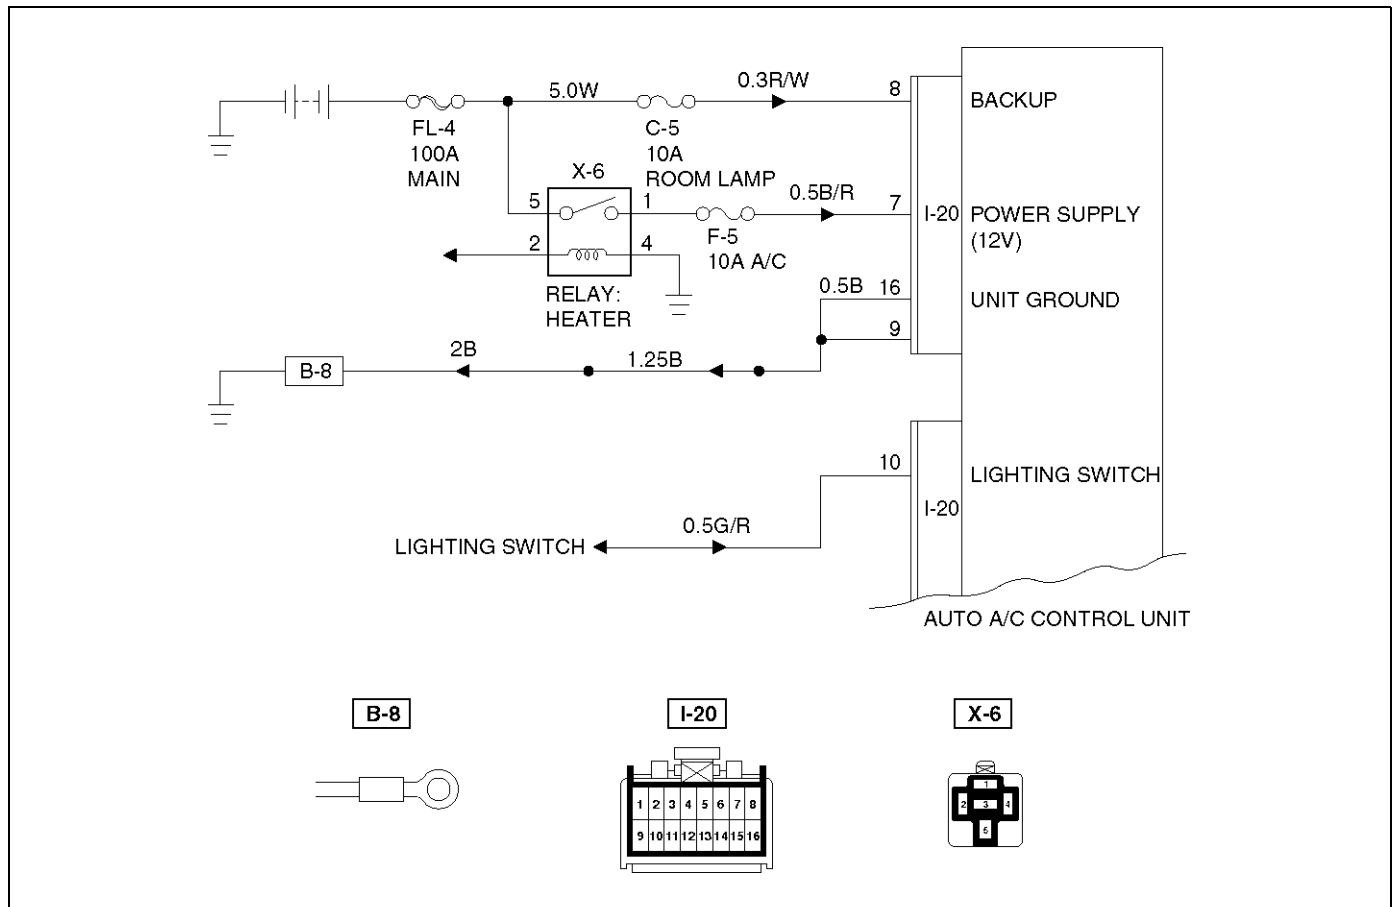

The following illustrates basic troubleshooting flow.

Basic Troubleshooting Flow

Auto Air Conditioner Control Unit Power Supply Diagnosis

This check is required because a trouble on the auto amplifier (control unit) power supply circuit or grounding circuit prevents accurate troubleshooting.

D08RX284

Condition	Possible cause	Correction
Power source does not supply to auto air conditioner control unit.	—	Refer to Chart A

1A-106 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)
Chart "A": Check of Auto Amplifier Power Supply System

Step	Action	Value(s)	Yes	No
1	Is the fuse C-5 normal?	—	Go to Step 2	Replace the fuse
2	Is the fuse F-5 normal?	—	Go to Step 3	Replace the fuse
3	Disconnect the auto A/C control unit connector I-20. Is the battery voltage applied between the harness side connector terminal No.I20-8 and the ground?	Approx. 12V	Go to Step 5	Go to Step 4
4	Repair an open circuit between the fuse C-5 and terminal No.I20-8. Is the action complete?	—	Go to Step 4	—
5	Is there continuity between the harness side connector terminal No.I20-16 and the ground?	—	Go to Step 7	Go to Step 6
6	Repair an open circuit between terminal No.I20-16 and the ground No.B-8. Is the action complete?	—	Go to Step 5	—

12	Repair an open circuit between the fuse F-5 and terminal No.I20-7. Is the action complete?	—	Verify repair	—

Performance and Movement checklist for Automatic Air Conditioner Related Parts

Start the engine, and when the engine coolant reached 50°C check performance and movement of the related parts according the following checklist.

Performance Check Using the Manual Switch

No.	Item	Checking Approach		Acceptance criteria
		Condition	Operation	
1	Blowing temperature (check movement of air mix door)	Auto switch must be turned on (FAN-AUTO MODE-AUTO)	1. Select FC for the setup temperature. 2. Select FH for the setup temperature. → Then, select the MAX Control.	1. Cold air shall be blown out. 2. Hot air shall be blown out.
2	Airflow volume (check movement of the mode door)	Set temperature to 25.0°C.	1. Turn the fan knob off. 2. Turn the fan knob from LOW to HI.	1. The fan shall be stopped, thus stopping air blow, too. 2. Airflow volume shall change from LOW to HI.
3	Blowing temperature (check movement of the mode door)	Set temperature to 25.0°C. Set the fan knob to HI.	Press the mode switch to change the blow port mode sequentially from the VENT through BI-LEVEL, FOOT up to DEF.	LED corresponding to each mode shall be turned on and the blow port mode shall be switched smoothly.
4	The interior/outside air switching mode (check movement of intake door)	Set temperature to 25.0°C.	Turn the LED off using the interior/outside air switch (this introduces the outside air intake mode). Then, the set fan knob to HI and press the interior/outside switch to turn on the LED.	The LED indication shall be switched from OFF to ON accompanying a change in air blowing sound.
5	Compressor	Set the temperature to 18.0°C (FC). (Outside air temperature is 0°C or above and interior temperature at ordinary temperature.)	Press the "OFF" switch. 1. Press the Auto switch. 2. Press the Air Conditioner switch.	1. As the fan knob is set to the Auto position, the A/C switch LED shall come on and the compressor shall be turned on. 2. As the A/C LED comes off, the compressor shall be turned off.

1A-108 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

Check of Auto Function

No.	Item	Checking Approach		Acceptance criteria
		Condition	Operation	
1	Auto function	FAN KNOB "AUTO" MODE SW "AUTO"	Select FC for the temperature.	The LED shall come on. Cold air shall be blown out. The following LEDs shall come on: <ul style="list-style-type: none"> • Blow port mode:  • Intake mode • Fan speed: MAX Hi • A/C
			Change the temperature gradually starting with 18°C up to 32°C.	The following phenomena shall be recognized. <ul style="list-style-type: none"> • Temperature of blown air: Cold air is changed to hot air. • Change in the air flow volume. • The blow port mode LED indication changes in the following sequence: <div style="text-align: center;">  (VENT) (BI-LEVEL) (FOOT) </div>
			Select FH for the temperature.	Cold air shall be blown out. The following LEDs shall come on. <ul style="list-style-type: none"> • Blow port mode: • Fan speed: Max. 

Troubleshooting With Self-Diagnosis Function

Overview of Self-Diagnosis Function

The self-diagnosis is implemented in 3 steps for each target. For detail of check procedure contained in each step, refer to the relevant section of "Check Procedure by Failed Location" listed in the Self-Diagnosis Operation Procedure.

For turning on the self-diagnosis function and switching of the check step, refer to the flow chart given below. You can reset the self-diagnosis function by turning the ignition switch off or turning the DEF switch on for 5 seconds.

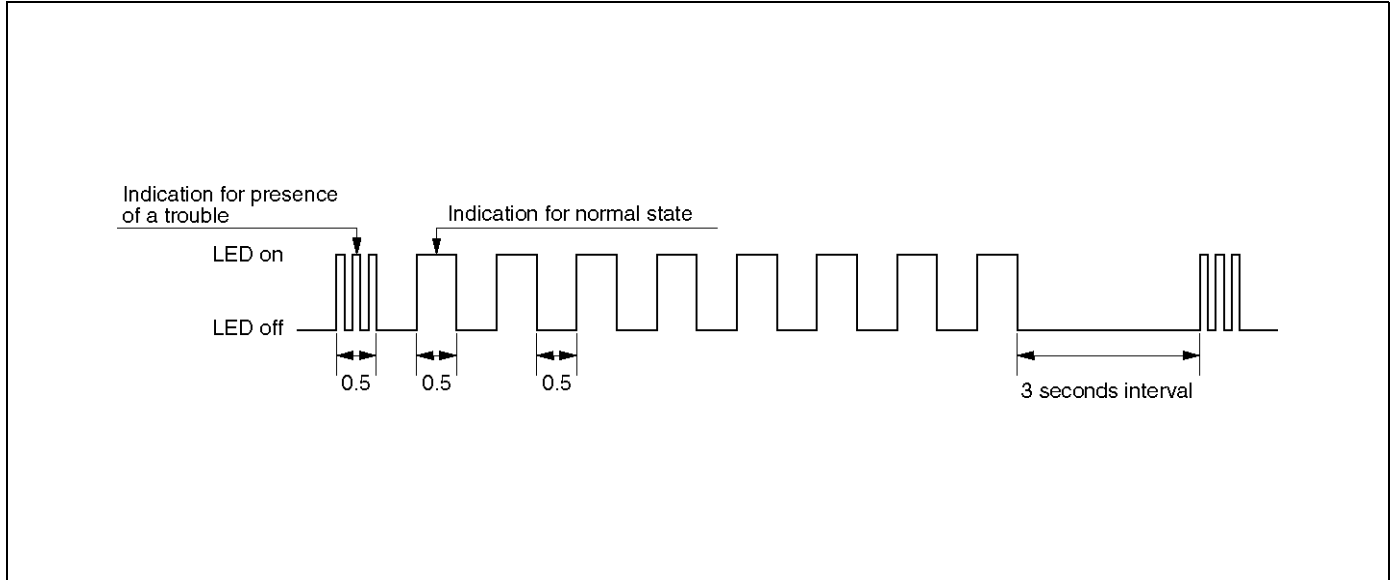

Self-Diagnosis Operation Procedure

Step	Action	Value(s)	Yes	No
1	1. Set the IG to the OFF position. 2. Apply 60W bulb light to the solar radiation sensor. 3. Set the temperature setting lever on the automatic heater/air conditioner panel to the center position (25°C). 4. Set the fan switch on the same panel to the Auto position. Is the action complete?	—	Go to Step 2	—
2	While holding both the Auto switch and the DEF switch on the automatic heater/air conditioner panel, turn the IG off and then on. Is the current trouble diagnosing function turned on approximately in 10 seconds?	—	Go to Step 3	—
3	Does the A/C LED flash every 0.5 second interval?	—	Go to Step 4	Refer to *1.
4	Press the A/C switch once. Does the A/C LED flash every 0.5 second interval?	—	Go to Step 5	Refer to *2.
5	Refer to *3 chart "Check of Output Equipment". Does each output equipment function normally according to operation of the temperature setting level?	—	Go to Step 6	Repair or replace the output equipment or repair the harness
6	Press the DEF switch for 5 seconds consecutively or turn on and off the IG. Is the action complete?	—	Go to Step 1	—

***1 Displaying the Current Trouble Diagnosing Table**

Start the engine while holding down both the Auto switch and the DEF switch on the control panel, and the table will appear in approximately 10 seconds to the indicator lamp (LED) of the air conditioning switch. Result of the diagnosis along the following 9 items will be shown one by one in 0.5 second interval irrespective of presence or absence of a trouble for a given item.

When the display 9 items is completed, it is repeated with 3 seconds of interval in between. A failed item is indicated by flashing of the LED that is repeated 3 times within 0.5 seconds. If a trouble is indicated, you can locate the failed section by knowing when in the total sequence it has been displayed.

F01RX010

Item for Current Trouble Diagnosis

Display pattern	Failed part
	Interior temperature sensor
	Outside air temperature
	Solar radiation sensor (Note 1)
	Evaporation sensor
	Temperature control sensor (Note 2)
	Fan switch (Note 3)
	Mix actuator
	Mode (blow port) control
	Intake (fresh air/interior air switching) control

F01RX014

As shown above, display of result along nine items is repeated with 3-second interval in between.

Note 1: When checking the solar radiation sensor, apply sufficient light using a 60W bulb. Otherwise, it can be diagnosed as failed.

Note 2: If the temperature setting lever is set on both

ends (one set to 18°C, blue scale = Full cool and the other to 31°C, red scale = Full hot), they can be diagnosed as failed.

Note 3: Likewise, the fan switch can be diagnosed as failed if set on both ends.

***2Displaying the Past Trouble Diagnosing Table**

The past trouble diagnosis displays only the items on which trouble has recurred 16 times in the past.

If you press the air conditioning switch once while the current trouble diagnosis is taking place, display of the past trouble diagnosis will appear on the indicator lamp (LED) of the air conditioning switch.

Results of the diagnosis along the following five items

are displayed one by one in 0.5 second interval irrespective of presence or absence of a trouble. A failed item is indicated by flashing of the LED that is repeated 3 times within 0.5 seconds. You can locate the failed section by counting in what sequence it has been displayed.

F01RX011

Display pattern	Failed part
<p>ON OFF</p>	Interior temperature sensor
	Outside air temperature sensor
	Solar radiation sensor
	Evaporation sensor
	Mix actuator

F01RX012

6	Repair an open circuit between terminal No.C45-7 and No.I44-5. Is the action complete?	—	Go to Step 5	—
7	Is there continuity between the harness side connector terminal No.C45-3 and No.I44-15?	—	Go to Step 9	Go to Step 8
8	Repair an open circuit between terminal No.C45-3 and No.I44-15. Is the action complete?	—	Go to Step 7	—
9	Is sum of the voltage between the following chassis harness side connector terminals approximately 5V? No.I44-15 and No.I52-5, No.I44-5 and No.I44-11	—	Go to Step 11	Go to Step 10
10	Replace the actuator. Is the action complete?	—	Verify repair	—
11	Replace the auto air conditioner control unit. Is the action complete?	—	Verify repair	—

Inspection of the Mode Actuator System

D08RX228

Condition	Possible cause	Correction
Does not work at all	—	Refer to Chart A
Control failure	—	Refer to Chart B

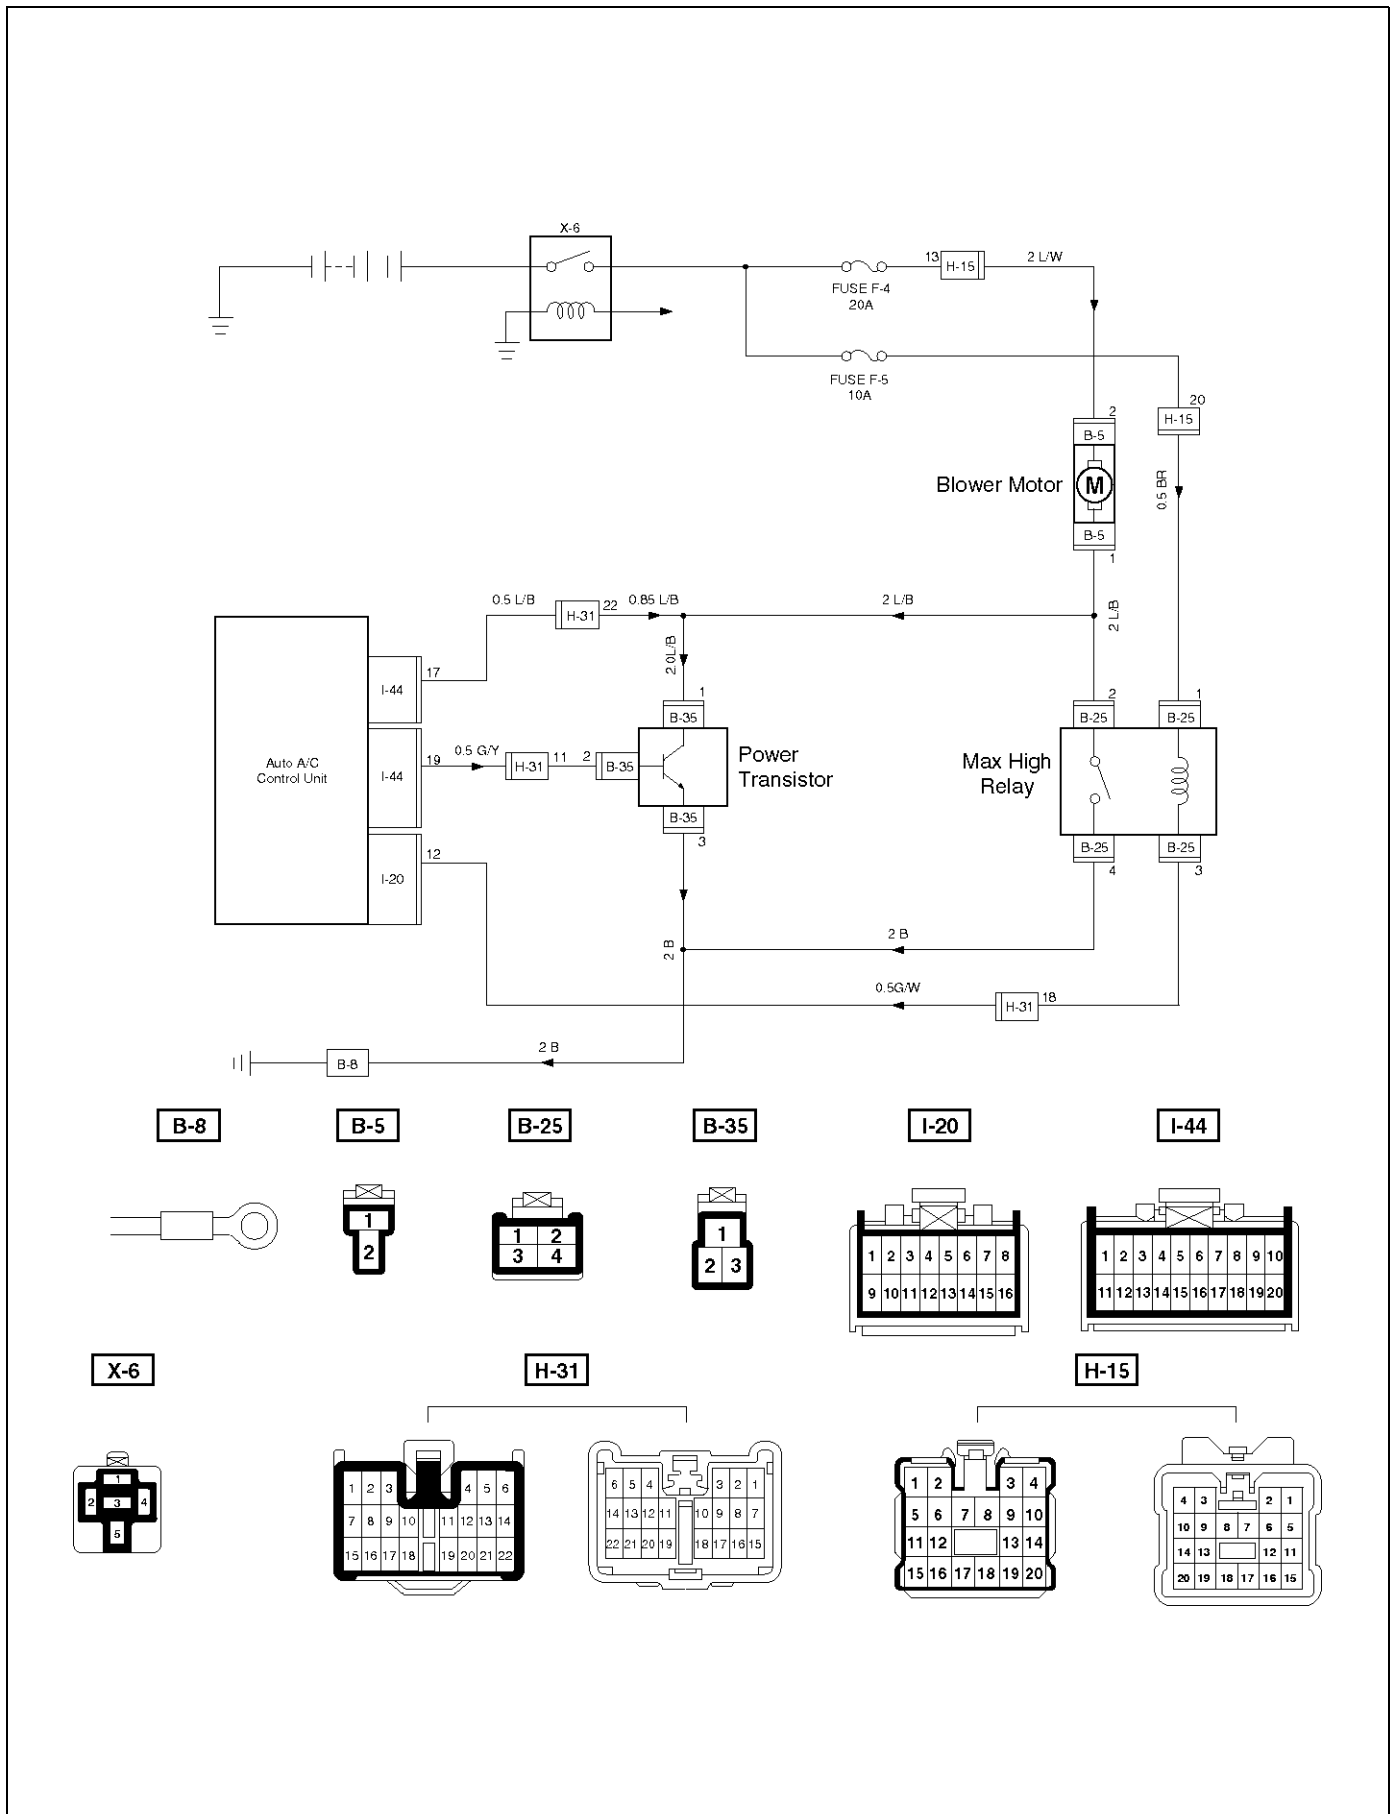

1A-124 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)**Chart A: Does Not Work At All**

Step	Action	Value(s)	Yes	No
1	1. Turn on the ignition switch (the engine is run). 2. Disconnect the mode actuator connector (C-48) 3. Select VENT pressing the mode actuator. Is the battery voltage provided on a regular interval between the harness side connector terminal No.C48-1 (+) and No.C48-5 (-)?	—	Go to Step 3	Go to Step 2
2	Replace the auto air conditioner control unit. Is the action complete?	—	Verify repair	—
3	Turn on the DEF mode switch. Is the battery voltage provided on a regular interval between the chassis side connector terminal No.C48-5 (+) and No.C48-1 (-)?	—	Go to Step 5	Go to Step 4
4	Replace the auto air conditioner control unit.	—	Verify repair	—
5	Is there continuity between the harness side connector terminal No.C48-1 and No.I20-4?	—	Go to Step 7	Go to Step 6
6	Repair an open circuit between terminal No.C48-1 and No.I20-4. Is the action complete?	—	Go to Step 5	—
7	Is there continuity between the harness side connector terminal No.C48-5 and No.I20-3?	—	Go to Step 9	Go to Step 8
8	Repair an open circuit between terminal No.C48-5 and No.I20-3. Is the action complete?	—	Verify repair	—
9	Replace the mode actuator.	—	Verify repair	—

Chart B: Mode Actuator Control Failure

Step	Action	Value(s)	Yes	No
1	Turn on the ignition switch (the engine is run). Dose the mode actuator fully stroke when the defrost mode and the vent mode are selected?	—	Go to Step 3	Go to Step 2
2	Repair or replace the mode door or the link unit. Is the action complete?	—	Go to Step 1	—
3	Is there continuity between the harness side connector terminal No.C48-9 and No.I44-11?	—	Go to Step 5	Go to Step 4
4	Repair an open circuit between terminal No.C48-9 and No.I44-11. Is the action complete?	—	Go to Step 3	—
5	Is there continuity between the harness side connector terminal No.C48-3 and No.I44-10?	—	Go to Step 7	Go to Step 6
6	Repair an open circuit between terminal No.C48-3 and No.I44-10. Is the action complete?	—	Go to Step 5	—
7	Is there continuity between harness side connector terminal No.C48-4 and No.I44-8?	—	Go to Step 9	Go to Step 8
8	Repair an open circuit between terminal No.C48-4 and No.I44-8. Is the action complete?	—	Go to Step 7	—
9	Is sum of the voltage between the following harness side connector terminal approximately 5V? Voltage between No.I44-8 and No.I44-10 plus voltage between No.I44-8 and No.I44-11	5V	Go to Step 11	Go to Step 10
10	Replace the actuator. Is the action complete?	—	Verify repair	—
11	Dose the mode actuator work normally through manual operation?	—	Go to Step 13	Go to Step 12
12	Replace the sensor. Is the action complete?	—	Verify repair	—
13	Replace the auto air conditioner control unit. Is the action complete?	—	Verify repair	—

5	Repair an open circuit between terminal No.B25-4 and ground (No.B-8). Is the action complete?	—	Go to Step 4	—
6	Is the battery voltage applied between the harness side connector terminal No.B25-1 and ground?	—	Go to Step 8	Go to Step 7
7	Repair an open circuit between terminal No.B25-1 and No.F-5 fuse. Is the action complete?	—	Go to Step 6	—
8	Is the battery voltage applied between the harness side connector terminal No.I20-12 and ground?	—	Go to Step 10	Go to Step 9
9	Repair an open circuit between terminal No.B25-3 and No.I20-12. Is the action complete?	—	Verify repair	—
10	Replace the auto air conditioner control unit. Is the action complete?	—	Verify repair	—

Chart C: Fan Does Not Rotate In Any Mode Other Than MAX HI

Step	Action	Value(s)	Yes	No
1	Is the power transistor performance normal? (Refer to the later section on "individual inspection")	—	Go to Step 2	Replace the power transistor
2	Is there continuity between the harness side connector terminal No.B5-1 and No.B35-1, No.B5-1 and No.I44-17?	—	Go to Step 4	Go to Step 3
3	Repair an open circuit between terminal. No.B5-1 and B35-1 No.B5-1 and I44-17	—	Go to Step 2	—
4	Is there continuity between the harness side connector terminal No.B35-3 and ground (No.B-8)?	—	Go to Step 6	Go to Step 5
5	Repair an open circuit between terminal No.B35-3 and ground. Is the action complete?	—	Go to Step 4	—
6	Is there continuity between the harness side connector terminal No.B35-2 and No.I44-19?	—	Go to Step 8	Go to Step 7
7	Repair an open circuit between terminal No.B35-2 and No.I44-19. Is the action complete?	—	Go to Step 6	—
8	Replace the auto air conditioner control unit. Is the action complete?	—	Verify repair	—

Chart D: Fan Does Not Stop

Step	Action	Value(s)	Yes	No
1	1. Disconnect the max high relay, the power transistor connector B-35 and the auto A/C control unit connector I-44. 2. Turn on the ignition switch. Does the blower motor stop?	—	Go to Step 3	Go to Step 2
2	Repair a short circuit between connector No.B5-1 and No.B25-2, No.B5-1 and No.B35-1, or No.B5-1 and I44-17. Is the action complete?	—	Verify repair	—
3	Is the max high relay normal? (Refer to the later section on "individual inspection".)	—	Go to Step 4	Replace the relay
4	Reinstall the max high relay. Does the blower motor start operating?	—	Go to Step 6	Go to Step 5
5	Repair a short circuit between connector No.B25-3 and No.I20-12. Is the action complete?	—	Go to Step 4	—
6	Is the power transistor normal? (Refer to the later section on "individual inspection".)	—	Go to Step 7	Replace the power transistor
7	Reinstall the power transistor. Does the blower motor start operating?	—	Replace the auto A/C control unit	—

Inspection of the Magnetic Clutch System
6VD1 Engine

Condition	Possible cause	Correction
Magnetic clutch does not work	—	Refer to Chart A

Chart A: Magnetic Clutch Does Not work

Step	Action	Value(s)	Yes	No
1	Is the fuse No.F-5 normal?	—	Go to Step 2	Replace the fuse
2	Is the relay No.X-4 (compressor relay) No.X-5 (A/C thermo relay) and No.X-6 (heater relay) normal?	—	Go to Step 3	Replace the fuse
3	Is the thermo unit normal?	—	Go to Step 4	Replace the thermo unit
4	Is the pressure switch normal?	—	Go to Step 5	Replace the pressure switch
5	1. Turn the ignition switch on. (the engine is run.) 2. Push the air conditioner switch on. Is the battery voltage applied between the harness side connector terminal No.E3-1 and the ground?	—	Go to Step 6	Go to Step 7
6	Repair or replace the magnetic clutch. Is the action complete?	—	Verify repair	—
7	Is there continuity between the harness side connector terminal No.X4-1 and No.E3-1?	—	Go to Step 9	Go to Step 8
8	Repair an open circuit between terminal No.X4-1 and No.E3-1. Is the action complete?	—	Go to Step 7	—
9	Is the battery voltage applied between the harness side connector terminal No.X4-5 and ground, No.X4-2 and ground?	—	Go to Step 11	Go to Step 10
10	Repair an open circuit between terminal No.X4-5 and fuse No.F-5, No.X4-2 and fuse No.F-5. Is the action complete?	—	Go to Step 9	—
11	Is the battery voltage applied between the harness side connector terminal No.I44-18 and ground?	—	Go to Step 13	Go to Step 12
12	Repair an open circuit between terminal No.I44-18 and No.X4-4. Is the action complete?	—	Go to Step 11	—
13	Is the battery voltage applied between the harness side connector terminal No.C11-2 and ground?	—	Go to Step 15	Go to Step 14
14	Repair an open circuit between terminal No.C11-2 and fuse No.F-5. Is the action complete?	—	Go to Step 13	—
15	Is the battery voltage applied between the harness side connector terminal No.X5-2 and ground, No.X5-5 and ground?	—	Go to Step 17	Go to Step 16
16	Repair an open circuit between terminal No.X5-2 and No.C11-1, No.X5-5 and fuse No.F-5. Is the action complete?	—	Go to Step 15	—
17	Is the battery voltage applied between the harness side connector terminal No.I20-14 and ground?	—	Go to Step 19	Go to Step 18
18	Repair an open circuit between terminal No.X5-4 and I20-14. Is the action complete?	—	Go to Step 17	—

1A-132 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

Chart A: Magnetic Clutch Does Not work (Cont'd)

Step	Action	Value(s)	Yes	No
19	Is there continuity between the harness side connector terminal No.I44-4 and ground?	—	Go to Step 21	Go to Step 20
20	Repair an open circuit between terminal No.I44-4 and No.E19-1. Is the action complete?	—	Go to Step 20	—
21	Dose the thermo relay "ON" when connecting ground to the harness connector terminal No.H17-5?	—	Go to Step 23	Go to Step 22
22	Failure on the auto air conditioner control unit. Is the action complete?	—	Verify repair	—

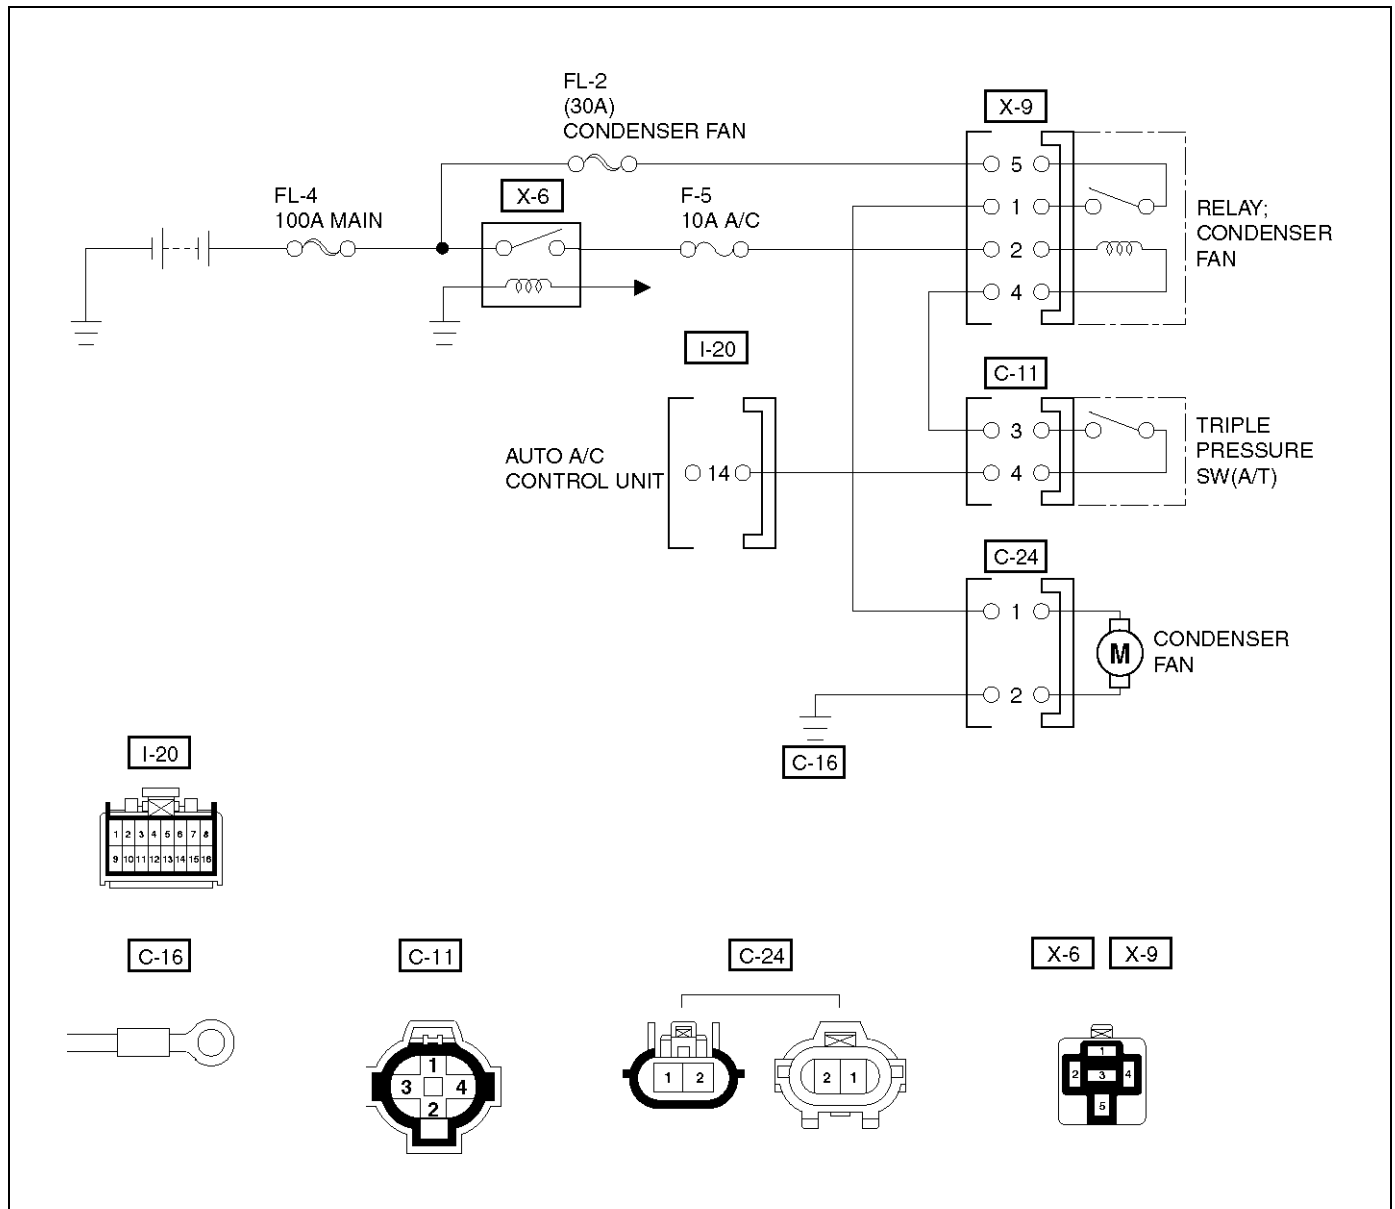

CAUTION: There are conditions which air conditioner system dose not operate except trouble as follows.

1. The throttle is griater than 90%.
2. The ignition voltage is below 10.5 volts.
3. The engine speed greater than 4500 RPM for 5 seconds or 5400 RPM.
4. The engine coolant temperature (ECT) is greater than 125°C (257°F).
5. The intake air temperature (IAT) is less than 5°C (41°F).
6. The power steering pressure switch signals a high pressure condition.

Condenser Fan Diagnosis

While the air conditioning is ON, the cycling switch in the triple pressure switch senses the refrigerant pressure, and activates the condenser fan to improve the cooling capacity of the condenser when the refrigerant pressure exceeds a set pressure value. The

condenser fan stops when the air conditioning is turned "OFF" or when the pressure goes down below the set pressure value.

D08RX255

Condition	Possible cause	Correction
Condenser fan does not run.	—	Refer to Chart A
Condenser fan does not stop.	—	Refer to Chart B

1A-134 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)
Chart "A" Condenser Fan Does Not Run

Step	Action	Value(s)	Yes	No
1	Is the fusible link No.FL-2 normal?	—	Go to Step 2	Replace the fusible link wire
2	Is the fuse No.F-5 normal?	—	Go to Step 3	Replace the fuse
3	Is the heater relay (No.X-6) and condenser fan relay (No.X-9) normal?	—	Go to Step 4	Replace the relay
4	1. Disconnect the condenser fan motor connector No.C-24. 2. Connect the motor side connector terminal No.C24-1 to the battery positive terminal and No.C24-2 to the battery negative terminal. Dose the fan operate?	—	Go to Step 6	Go to Step 5
5	Repair or replace the condenser fan motor. Is the action complete?	—	Go to Step 4	—
6	Is there continuity between the harness side connector terminal No.C24-2 and ground (C-16)?	—	Go to Step 8	Go to Step 7
7	Repair an open circuit between terminal No.C24-2 and No.C-16. Is the action complete?	—	Go to Step 6	—
8	Is there continuity between the harness side connector terminal No.C24-1 and No.X9-1?	—	Go to Step 10	Go to Step 9
9	Repair an open circuit between terminal No.C24-1 and No.X9-1. Is the action complete?	—	Verify repair	—
10	Is the battery voltage applied between the harness side connector terminal No.X9-5 and ground?	—	Go to Step 12	Go to Step 11
11	Repair an open circuit between terminal No.X9-5 and No.FL-2. Is the action complete?	—	Go to Step 10	—
12	Is the battery voltage applied between the harness side connector terminal No.C11-3 and ground?	—	Go to Step 14	Go to Step 13
13	Repair an open circuit between terminal No.X9-4 and No.C11-3. Is the action complete?	—	Go to Step 12	—
14	Is there continuity between the harness side connector terminal No.C11-4 and No.I20-14?	—	Go to Step 16	Go to Step 15
15	Repair an open circuit between terminal No.C11-4 and No.I20-14. Is the action complete?	—	Verify repair	—
16	Connect the harness side connector terminal No.C24-1 to the battery terminal and No.C24-2 to the battery negative terminal. Is the battery voltage between the pressure switch side connector terminal No.C24-4 and ground?	—	Go to Step 18	Go to Step 17
17	Replace the triple pressure switch. Is the action complete?	—	Verify repair	—
18	Replace the auto air conditioner control unit. Is the action complete?	—	Verify repair	—

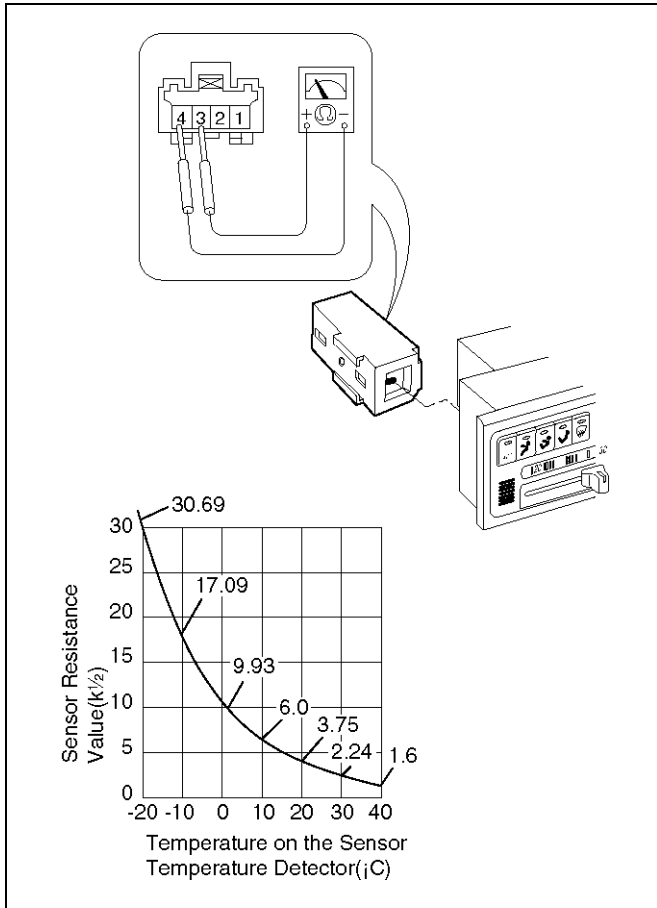

Chart "B" Condenser Fan Does Not Stop

Step	Action	Value(s)	Yes	No
1	1. Turn on the ignition switch "ON" (the engine is run). 2. Air conditioning switch "OFF". 3. Disconnect the triple pressure switch. Does the condenser fan stop?	—	Go to Step 2	Go to Step 3
2	Replace the triple pressure switch. Is the action complete?	—	Verify repair	—
3	Disconnect the relay. Is there continuity between the harness side connector terminal No.X9-4 and ground?	—	Go to Step 4	Go to Step 5
4	Repair short circuit between terminal No.X9-4 and No.C11-3. Is the action complete?	—	Verify repair	—
5	Replace the relay condenser fan. Is the action complete?	—	Verify repair	—

Individual Inspection

Interior Temperature Sensor

1. Disconnect the interior temperature sensor connector (I-4).
2. Measure resistance between the interior temperature sensor side terminal No.14-3 and No.14-4.

865RX007

Solar Radiation Sensor

1. Disconnect the solar radiation sensor connector (I-50).
2. Measure the current value on the solar radiation sensor when placed it approximately 15 cm away from 60W incandescent lamp.

C01RX013

Outside Air Temperature Sensor

1. Disconnect the connector (C-8) on the outside air temperature sensor.
2. Measure resistance between the outside air temperature sensor side terminals.

C01RX012

Power Transistor

1. Remove the power transistor connector (B-35) from the evaporator assembly.
2. Check the conduction between the power transistor side terminals.

Terminal No.	1	2	3	Conduction
Testing rod	-	+		Conducted (50½ maximum)
	-		+	Conducted (100½ maximum)
	+	-		Not conducted
	+	-		Conducted (220½ maximum)
		-	+	Not conducted
		+	-	Not conducted

C01RX015

MAX HI Relay

1. Remove the MAX – HI relay connector (B-25) from the blower assembly.
2. Check the conduction between the MAX – HI relay side terminals.

No conduction between terminals (2) and (4).

No.2 and No.4 are conducted when battery voltage is applied between (2) and (3).

C01RX014

Aspirator (Interior Temperature Sensor)

1. Turn on the ignition switch (the engine is started). Start the air conditioner in "Full Auto".
2. Make sure that the interior sensor suctions cigarette smokes and such.

Interior Temperature Sensor

1. Dismount the interior temperature sensor from the automatic heater/air conditioner control unit. Connect (+) end and (-) end of the battery to the aspirator motor side terminals No.14-1 and No.14-2, respectively, then check if the motor runs normally.

865RS017

Heater (X-6), Thermostat (X-5), Condenser Fan (X-9) And Compressor (X-4) Relay

1. Disconnect relays and check for continuity and resistance between relay terminals.
 - For handling of these relays, refer to Heater Relay in this section.

901RX071

Condenser Fan

1. Disconnect the condenser fan connector.
2. Connect the battery positive terminal to the condenser fan side connector terminal No.C24-2 and negative to the No.C24-1.
3. Check that condenser fan is rotating correctly.

875RW010

Triple Pressure Switch (V6, A/T)

1. Disconnect the connector and check for continuity between pressure switch side connector terminals (1) and (2).
2. Reconnect the connector to activate the A/C switch, and check to see if there is continuity between the chassis side connector terminal (3) and (4) and the fan operates.

Terminal	Conducted
1-2	ON ----- OFF ----- kpa 176.5 186.3 2353.6 2942.0 (psi) (25.6) (27.0) (341.3) (426.6)
3-4	ON ----- OFF ----- kpa 1078.7 1471.0 (psi) (156.4) (213.3)

Power Transistor

840RW028

Legend

- (1) Power Transistor Connector
- (2) Power Transistor
- (3) Glove Box
- (4) Reinforcement: Inst Panel Lower
- (5) Evaporator Assembly

Removal

1. Remove glove box.
2. Disconnect the power transistor connector.
3. Remove power transistor.

Installation

To install, follow the removal step in the reverse order.

Automatic Heater/Air Conditioner Control Unit

865RW016

Legend

- (1) Connector
- (2) Automatic Air Control Unit
- (3) Meter Cluster Assembly
- (4) Instrument Center Cluster
- (5) Instrument Lower Cover

Removal

1. Disconnect the battery ground cable.
2. Remove instrument lower cover.
3. Remove meter cluster assembly.
 - Refer to Instrument Panel Assembly in Body Structure section.
4. Remove the automatic heater/air conditioner control unit attaching screws.
5. Pull the automatic heater/air conditioner unit out and disconnect the connectors.

Installation

To install, follow the removal step in the reverse order.

Interior Temperature Sensor (Aspirator)

865RW014

Legend

- (1) Interior Temperature Sensor (Aspirator)
- (2) Automatic Air Control Unit

Removal

1. Disconnect the battery ground cable.
2. Remove the automatic heater/air conditioner control unit.
 - Refer to the automatic heater/air conditioner control unit section.
3. Remove Interior temperature sensor (Aspirator).

Installation

To install, follow the removal step in the reverse order.

Outside Air Temperature Sensor

875RW017

Legend

- (1) Out Side Air Temperature Sensor
- (2) Radiator Grille

Removal

1. Disconnect the battery ground cable.
2. Remove radiator grille.
 - Refer to Radiator Grille in Body Structure section.
3. Disconnect the outside air temperature sensor connector.
4. Remove the outside air temperature sensor.

Installation

To install, follow the removal step in the reverse order.

Solar Radiation Sensor

865RW009

Legend

- (1) Solar Radiation Sensor

Removal

1. Disconnect the battery ground cable.
2. Remove the solar radiation sensor.
3. Disconnect the solar radiation sensor connector.

Installation

To install, follow the removal step in the reverse order.

Electronic Thermostat

874RW027

Legend

- (1) Electronic Thermo Sensor
(2) Evaporator Assembly
(3) Thermostat Assembly

Removal

1. Disconnect the battery ground cable.
2. Remove evaporator assembly.
 - Refer to Evaporator Assembly section.
3. Remove electronic thermostat.

Installation

To install, follow the removal step in the reverse order.

Mode Actuator

860RW030

Legend

- (1) A/T Control Unit
- (2) Mode Actuator
- (3) Actuator Rod

Mix Actuator

860RW033

Legend

- (2) Instrument Center Cluster
- (3) Actuator Rod
- (4) Mix Actuator

Removal

1. Disconnect the battery ground cable.
2. Remove the PCM.
 - The connector shall remain connected.
3. Remove the actuator rod.
4. Remove the mode actuator.

Installation

To install, follow the remove step in the reverse order.

Removal

1. Disconnect the battery ground cable.
2. Remove the instrument panel assembly.
 - Refer to the Instrument Panel Assembly in Body Structure section.
3. Remove the instrument panel center bracket.
4. Remove the actuator rod.
5. Remove the mix actuator.

Installation

To install, follow the remove step in the reverse order.

Intake Actuator

860RW034

Legend

- (1) Evaporator Assembly
- (2) Intake Actuator
- (3) Intake Actuator Connector

Removal

1. Disconnect the battery ground cable.
2. Remove the blower assembly.
 - Refer to Blower Assembly section.
3. Disconnect the intake actuator connector.
4. Remove the intake actuator.

Installation

To install, follow the remove step in the reverse order.

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or

fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Diagnosis

Since the problems in steering, suspension, wheels and tires involve several systems, they must all be considered when diagnosing a complaint. To identify the symptom, always road test the vehicle first. Proceed with the following preliminary inspections and correct any defects which are found.

1. Inspect tires for proper pressure and uneven wear.
2. Raise vehicle on a hoist, then inspect front and rear suspension and steering linkage for loose or damaged parts.
3. Spin the front wheels. Inspect for out-of-round tires, out-of-balance tires, loose and/or rough wheel bearings.

General Diagnosis

Condition	Possible cause	Correction
Vehicle Pulls	Mismatched or uneven tires.	Replace tire.
	Tires not adequately inflated.	Adjust tire pressure.
	Broken or sagging springs.	Replace spring.
	Radial tire lateral force.	Replace tire.
	Improper wheel alignment.	Adjust wheel alignment.
	Brake dragging in one wheel.	Repair brake.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension part(s).
	Faulty shock absorbers.	Replace shock absorber.
	Parts in power steering valve defective.	Replace power steering unit.
Abnormal or Excessive Tire Wear	Sagging or broken spring.	Replace spring.
	Tire out of balance.	Balance or replace tire.
	Improper wheel alignment.	Check front end alignment.
	Faulty shock absorber.	Replace shock absorber.
	Hard driving.	Replace tire.
	Overloaded vehicle.	Replace tire and reduce load.
	Tires not rotated periodically.	Replace or rotate tire.
	Worn or loose road wheel bearings.	Replace wheel bearing.
	Wobbly wheel or tires.	Replace wheel or tire.
Wheel Hop	Tires not adequately inflated.	Adjust the pressure.
	Blister or bump on tire.	Replace tire.
	Improper shock absorber operation.	Replace shock absorber.

Condition	Possible cause	Correction
Shimmy, Shake or Vibration	Tire or wheel out of balance.	Balance wheels or replace tire/or wheel.
	Loose wheel bearings.	Replace wheel bearing.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
	Excessive wheel run-out.	Repair or replace wheel and/or tire.
	Blister or bump on tire.	Replace tire.
	Excessive loaded radial run-out of tire/wheel assembly.	Replace tire or wheel.
	Improper wheel alignment.	Check wheel alignment.
	Loose or worn steering linkage.	Tighten or replace steering linkage.
	Loose steering unit.	Tighten steering unit.
	Tires not adequately inflated.	Adjust tire pressure.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension parts.
	Faulty shock absorber.	Replace shock absorber.
	Hub bearing preload misadjustment.	Adjust preload.
Parts in power steering valve defective.	Replace power steering unit.	
Hard Steering	Bind in steering linkage ball studs, upper or lower end ball joint.	Replace ball joint.
	Improper wheel alignment.	Check wheel alignment.
	Tire not adequately inflated.	Inflate tires to proper pressure.
	Bind in steering column or shaft.	Repair or replace.
	Improper power steering system operation.	Repair or replace. Refer to "Power steering system diagnosis"
Too Much Play In Steering	Wheel bearings worn.	Replace wheel bearings.
	Loose steering unit or linkage.	Retighten or repair.
	Worn or loose steering shaft universal joint.	Retighten or replace steering shaft.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
Poor Steering Wheel Returnability	Bind in steering linkage ball joints.	Replace ball joints.
	Bind in upper or lower end ball joints.	Replace ball joints.
	Bind in steering column and shaft.	Repair or replace.
	Bind in steering gear.	Check and repair steering gear.
	Improper wheel alignment.	Adjust wheel alignment.
	Tires not adequately inflated.	Adjust tire pressure.
	Loose steering wheel nut.	Retighten.
Worn wheel bearing.	Replace.	

2A-4 POWER-ASSISTED STEERING SYSTEM

Condition	Possible cause	Correction
Abnormal Noise	Worn, sticky or loose upper or lower ball joint, steering linkage ball joints or drive axle joints.	Replace.
	Faulty shock absorbers.	Replace.
	Worn upper or lower control arm bushing.	Replace.
	Loose stabilizer bar.	Retighten bolts or replace bushings.
	Loose wheel nuts.	Tighten nuts. Check for elongated wheel nut holes. Replace wheel if required.
	Loose suspension bolts or nuts.	Retighten suspension bolts or nuts.
	Broken or otherwise damaged wheel bearings.	Replace wheel bearing.
	Broken suspension springs.	Replace spring.
	Loose steering unit.	Retighten mounting bolt.
	Faulty steering unit.	Replace steering unit.
Wandering or Poor Steering Stability	Mismatched or unevenly worn tires.	Replace tire or inflate tires to proper pressure.
	Loose steering linkage ball joints.	Replace ball joints.
	Faulty shock absorbers.	Replace shock absorber.
	Loose stabilizer bar.	Tighten or replace stabilizer bar or bushings.
	Broken or sagging springs.	Replace spring (pairs).
	Improper wheel alignment.	Adjust wheel alignment.
Erratic Steering When Braking	Worn wheel bearings.	Replace wheel bearings.
	Broken or sagging springs.	Replace spring (pairs).
	Leaking caliper.	Repair or replace caliper.
	Warped discs.	Replace brake disc.
	Badly worn brake pads.	Replace brake pads.
	Tires are inflated unequally.	Inflate tires to proper pressure.

Power Steering System

There is some noise in all power steering systems. One of the most common is a hissing sound when the steering wheel is fully turned and the car is not moving. This noise will be most evident when the steering wheel is operated while the brakes are applied. There is no

relationship between this noise and steering performance. Do not replace the valve unless the "hissing" noise is extremely objectionable. A replacement valve will also have a slight noise, and is not always a cure for the condition.

Condition	Possible cause	Correction
Rattle or Chucking Noise	Pressure hose touching other parts of vehicle.	Adjust hose position. Do not bend tubing by hand.
	Tie rod ends loose.	Tighten or replace tie rod end.
	Loose steering unit mounting.	Tighten steering unit mounting.
Poor Return of Steering Wheel to Center	Improper front wheel alignment.	Adjust front wheel alignment.
	Wheel bearing worn.	Replace front wheel bearing.
	Tie rod end binding.	Replace tie rod end.
	Ball joint binding.	Replace ball joint.
	Tight or frozen steering shaft bearing.	Replace steering assembly.
	Sticky or plugged steering unit valve.	Flush or replace steering unit.
Momentary Increase In Effort When Turning Wheel Fast To Right or Left	Entry of air in the power steering system.	Bleed the system.
	High internal leakage.	Repair steering gear.
Steering Wheel Surges or Jerks When Turning Especially During Parking	Power steering fluid level low.	Replenish fluid.
	Insufficient pump pressure.	Repair pump assembly.
	Sticky steering unit valve.	Flush or replace steering unit.
Excessive Wheel Kick Back or Loose Steering	Power steering fluid level low.	Replenish fluid.
	Air in system.	Bleed hydraulic system.
	Tie rod end loose.	Tighten tie rod end.
Hard Steering or Lack of Power Assist	Wheel bearing worn.	Replace wheel bearing.
	Sticky steering unit valve.	Flush or replace steering unit.
	Insufficient pump pressure.	Repair pump assembly.
	Excessive internal pump leakage.	Repair pump assembly.
	Excessive internal steering gear leakage.	Repair steering gear.
Unstable Engine Idling or Stalling When Turning	Power steering fluid level low.	Replenish fluid.
	Pressure switch of the power steering pump or its harness is faulty.	Repair or replace.

2A-6 POWER-ASSISTED STEERING SYSTEM

Power Steering Pump

Foaming milky power steering fluid, low fluid level, and possible low pressure can be caused by air in the fluid, or loss of fluid due to internal pump leakage. Check for leak and correct. Bleed the system. Extremely cold

temperatures will cause air bubbles in the system if the fluid level is low. If the fluid level is correct and the pump still foams, remove the pump from the vehicle and check housing for cracks. If the housing is cracked, replace the pump housing.

Condition	Possible cause	Correction
Low Pressure Due to Steering Pump	Relief valve sticking or inoperative.	Replace relief valve.
	Side plate not flat against cam ring.	Replace side plate.
	Extreme wear of cam ring.	Replace cam ring.
	Scored side plate or rotor.	Replace side plate or rotor.
	Vanes sticking in rotor slots.	Repair or replace vanes and rotor.
	Cracked or broken side plate.	Replace side plate.
	High internal leakage.	Repair internal leakage.
Low Pressure Due to Steering Gear	Scored housing bore.	Replace housing.
Growling Noise In Steering Pump	Excessive back pressure in hoses or steering unit caused by restriction.	Repair steering unit or pump.
	Scored side plate or rotor.	Replace side plate or rotor.
	Worn cam ring.	Replace cam ring.
Groaning Noise In Steering Pump	Air in the fluid.	Bleed hydraulic system.
	Low fluid level.	Replenish fluid.
	Pump mounting loose.	Tighten mounting bolt.
Rattling Noise In Steering Pump	Vanes sticking in rotor slots.	Repair or replace vanes and rotor.
	Vane improperly installed.	Repair rotor and vane.
Swishing Noise In Steering Pump	Damaged relief valve.	Replace relief valve.
Whining Noise In Steering Pump	Scored side plate and vanes.	Replace side plate and vanes.

Steering Column Lock System

Condition	Possible cause	Correction
Will Not Unlock	Damaged lock cylinder.	Replace lock cylinder.
	Damaged park lock cable.	Replace park lock cable.
Will Not Lock	Lock spring broken or worn.	Replace lock cylinder.
	Damaged lock cylinder.	Replace lock cylinder.
	Ignition switch stuck.	Repair or replace ignition switch.
	Park lock cable damaged.	Replace park lock cable.
Key Cannot be Removed in "OFF-LOCK"	Ignition switch is not set correctly.	Correct ignition switch.
	Damaged lock cylinder.	Replace lock cylinder.
	Faulty shift lock mechanism.	Repair or replace the shift lock mechanism.

Column

Condition	Possible cause	Correction
Noise in Column	Universal joint loose.	Tighten joint.
	Shaft lock snap ring not seated.	Place snap ring in proper position.

Turn Signal Switch

to Turn Signal Switch in Electrical section for electrical diagnosis.

This diagnosis covers mechanical problems only. Refer

Condition	Possible cause	Correction
Turn Signal Will Not Stay In Turn Position	Foreign material or loose parts preventing movement of yoke.	Repair or replace signal switch.
	Broken or missing detent or canceling spring.	Replace signal switch.
Turn Signal Will Not Cancel	Loose switch mounting screws.	Tighten mounting screws.
	Switch or anchor bosses broken.	Replace turn signal switch.
	Broken, missing or out of position detent, return or canceling spring.	Replace turn signal switch.
	Worn canceling cam.	Replace turn signal switch.
Turn Signal Difficult To Operate	Turn signal switch arm loose.	Tighten arm screw.
	Broken or distorted yoke.	Replace turn signal switch.
	Loose or misplaced springs.	Replace turn signal switch.
	Foreign parts and/or material.	Repair turn signal switch.
	Loose turn signal switch mounting screws.	Tighten mounting screws.
Turn Signal Will Not Indicate Lane Change	Broken lane change pressure pad or spring hanger.	Replace turn signal switch.
	Broken, missing or misplaced lane change spring.	Replace turn signal switch.
	Base of wire damaged.	Replace turn signal switch.
Hazard Switch Cannot Be Turned Off	Foreign material between hazard switch to turn signal switch body.	Repair or replace hazard switch.
No Turn Signal Lights	Electrical failure in chassis harness.	Refer to Electrical section.
	Inoperative turn signal flasher unit.	Replace flasher unit.
	Loose chassis harness connector.	Repair loose connector.
Front or Rear Turn Signal Lights Not Flashing	Burned-out or damaged turn signal bulb.	Replace bulb.
	High resistance connection to ground at bulb socket.	Repair bulb socket.
	Loose chassis harness connector.	Repair loose connector.

2A-8 POWER-ASSISTED STEERING SYSTEM

General Description

The hydraulic power steering system consists of a pump, an oil reservoir, a steering unit, a pressure hose and a return hose.

Power Steering Unit

A02RW007

The power steering unit is rack and pinion type.
The toe-in angle can be adjusted by turning the rod on each side.
The steering housing cannot be disassembled.

Hydraulic Pump

A02RX002

The hydraulic pump is vane-type design. The submerged pump has housing and internal parts that are inside the reservoir and operate submerged in oil. There are two bore openings at the rear of the pump housing. The larger opening contains the cam ring, pressure plate, thrust plate, rotor and vane assembly, and end plate. The smaller opening contains the pressure line union, flow control valve and spring. The flow control orifice is part of the pressure line union. The pressure relief valve inside the flow control valve limits the pump pressure.

Steering Column

WARNING: TO AVOID DEPLOYMENT WHEN TROUBLE-SHOOTING THE SRS SYSTEM, DO NOT USE ELECTRICAL TEST EQUIPMENT, SUCH AS BATTERY-POWERED OR A/C-POWERED VOLT-METER, OHMMETER, ETC., OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN SPECIFIED IN THIS MANUAL. DO NOT USE A NON-POWERED PROBE-TYPE TESTER.

Pressure Switch

When hydraulic pressure reaches 3430 kPa (35 kg/cm²/500 psi), the pressure switch of the power steering pump closes causing the Engine Control Module (ECM) to actuate the idle air control valve, which increases the engine rpm to prevent the overload-induced engine speed slow down. The switch opens when hydraulic pressure drops to 2940 kPa (30 kg/cm²/430 psi).

INSTRUCTION IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT.

When servicing a vehicle equipped with Supplemental Restraint System, pay close attention to all WARNINGS and CAUTIONS.

For detailed explanation about SRS, refer to Restraints section.

2A-10 POWER-ASSISTED STEERING SYSTEM

The steering column has three important features in addition to the steering function:

1. The column is energy absorbing, designed to compress in a front-end collision to minimize the possibility of injury to the driver of the vehicle.
2. The ignition switch and lock are mounted conveniently on the column.
3. With the column mounted lock, the ignition and

steering operation can be locked to prevent theft of the vehicle.

The column can be disassembled and reassembled. However, to insure the energy absorbing action, use only the specified screws, bolts and nuts as designated, and tighten them to the specified torque.

Handle the column with care when it is removed from the vehicle. A sharp blow on the end of steering shaft or

Power Steering System Test Test Procedure

Legend

- | | |
|----------|-------------------------|
| (1) Bolt | (3) Power Steering Unit |
| (2) Hose | (4) Power Steering Pump |

Test of fluid pressure in the power steering system is performed to determine whether or not the oil pump and power steering unit are functioning normally. The power steering system test is used to identify and isolate hydraulic circuit difficulties. Prior to performing this test, the following inspections and corrections, if necessary, must be made.

- Inspect pump reservoir for proper fluid level.
- Inspect pump belt for proper tension.
- Inspect pump driver pulley condition.

1. Place a container under the pump to catch the fluid when disconnecting or connecting the hoses.
2. With the engine NOT running, disconnect the pressure hose at the power steering pump and install power steering tester 5-8840-0135-0 as shown in the illustration. The gage must be between the shutoff valve and pump. Open the shutoff valve.
3. Check the fluid level. Fill the reservoir with power steering fluid, to the "Full" mark. Start the engine, then turn the steering wheel and momentarily hold it against a stop (right or left). Turn the engine off and check the connections at tester for leakage.

4. Bleed the system. Refer to Bleeding the Power Steering System in this section.
5. Start the engine and check the fluid level. Add power steering fluid if required. When the engine is at normal operating temperature, increase engine speed to 1500 rpm.

CAUTION: Do not leave shutoff valve fully closed for more than 5 seconds, as the pump could become damaged internally.

6. Fully close the shutoff valve. Record the highest pressures.
 - If the pressure recorded is within 9300–9800 kPa (95–100 kg/cm²/1350–1420 psi), the pump is functioning within its specifications.
 - If the pressure recorded is higher than 9800 kPa (100 kg/cm²/1420 psi), the valve in the pump is defective.
 - If the pressure recorded is lower than 9300 kPa (95 kg/cm²/1350 psi), the valve or the rotating group in the pump is defective.
7. If the pump pressures are within specifications, leave the valve open and turn (or have someone else turn) the steering wheel fully in both directions. Record the highest pressures and compare with the maximum pump pressure recorded in step 6. If this pressure cannot be built in either side of the power steering unit, the power steering unit is leaking internally and must be replaced.
8. Shut the engine off, remove the testing gauge.
9. Reconnect the pressure hose, check the fluid level and make the needed repairs.
10. If the problem still exists, the steering and front suspension must be thoroughly examined.

Maintenance

The hydraulic system should be kept clean and fluid level in the reservoir should be checked at regular intervals and fluid added when required. Refer to Recommended Fluids and Lubricants in General Information section for the type of fluid to be used and the intervals for filling.

If the system contains some dirt, flush it as described in this section. If it is exceptionally dirty, the pump must be completely disassembled before further usage. (The steering unit cannot be disassembled.)

All tubes, hoses, and fittings should be inspected for leakage at regular intervals. Fittings must be tight. Make sure the clips, clamps and supporting tubes and hoses are in place and properly secured.

Power steering hoses and lines must not be twisted, kinked or tightly bent. Air in the system will cause spongy action and noisy operation. When a hose is disconnected or when fluid is lost, for any reason, the system must be bled after refilling. Refer to Bleeding the Power Steering System in this section.

- Inspect belt for tightness.

- Inspect pulley for looseness or damage. The pulley should not wobble with the engine running.
- Inspect hoses so they are not touching any other parts of the vehicle.
- Inspect fluid level and fill to the proper level.

Fluid Level

1. Run the engine until the power steering fluid reaches normal operating temperature, about 55°C (130°F), then shut the engine off.
2. Check the level of fluid in the reservoir.
3. If the fluid level is low, add power steering fluid as specified in General Information to the proper level and install the receiver cap.
4. When checking the fluid level after the steering system has been serviced, air must be bled from the system. Refer to Bleeding the Power Steering System in this section.

Bleeding The Power Steering System

When a power steering pump or unit has been installed, or an oil line has been disconnected, the air that has entered the system must be bled out before the vehicle is operated. If air is allowed to remain in the power steering fluid system, noisy and unsatisfactory operation of the system may result.

Bleeding Procedure

When bleeding the system, and any time fluid is added to the power steering system, be sure to use only power steering fluid as specified in General Information.

1. Fill the pump fluid reservoir to the proper level and let the fluid settle for at least two minutes.
2. Start the engine and let it run for a few seconds. Do not turn the steering wheel. Then turn the engine off.
3. Add fluid if necessary.
4. Repeat the above procedure until the fluid level remains constant after running the engine.
5. Raise and support the front end of the vehicle so that the wheels are off the ground.
6. Start the engine. Slowly turn the steering wheel right and left, lightly contacting the wheel stops.
7. Add power steering fluid if necessary.
8. Lower the vehicle, set the steering wheel at the straight forward position after turning it to its full steer positions 2 or 3 times, and stop the engine.
9. Check the fluid level and refill as required.
10. If the fluid is extremely foamy, allow the vehicle to set a few minutes, then repeat the above procedure.

Flushing The Power Steering System

1. Raise and support the front end of the vehicle off the ground until the wheels are free to turn.
2. Remove the fluid return line at the pump inlet connector and plug the connector port on the pump. Position the line toward a large container to catch the draining fluid.
3. While running the engine at idle, fill the reservoir with new power steering fluid. Turn the steering wheel in both directions. Do not contact or hold the steering wheel to the wheel stops. This will cause the pump to go to pressure relief mode, which may cause a sudden fluid overflow at the reservoir.
4. Install all the lines and hoses. Fill the system with new power steering fluid and bleed the system as described in Bleeding The Power Steering System. Operate the engine for about 15 minutes. Remove the pump return line at the pump inlet and plug the connection on the pump. While refilling the reservoir, check the draining fluid for contamination. If foreign material is still evident, replace all lines, disassemble and clean or replace the power steering system components. Do not re-use any drained power steering fluid.

Steering Wheel Free Play Inspection

1. With the tires in the straight-ahead position, check the amount of steering wheel play by turning the wheel in both directions until the tires begin to move.

NOTE: The wheel free play should be checked with the engine running.

Free play: 0 – 30mm (0 – 1.18in)

2. Also check the steering wheel for play and looseness in the mount by moving it back and forth and sideways. When test driving, check for hard steering, steering shimmy and tendency to pull to one side.

Front End Alignment Inspection and Adjustment

General Description

“Front End Alignment” refers to the angular relationship between the front wheels, the front suspension attaching parts and the ground.

Proper front end alignment must be maintained in order to insure efficient steering, good directional stability and to prevent abnormal tire wear.

The most important factors of front end alignment are wheel toe-in, wheel camber and axle caster.

Camber:

This illustration shows view from the front of the vehicle.

Camber is the vertical tilting inward or outward of the front wheels. When the wheels tilt outward at the top, the camber is positive (+). When the wheels tilt inward at the top, the camber is negative (-). The amount of tilt measured in degrees from the vertical is called the camber angle (1). If camber is extreme or unequal between the wheels, improper steering and excessive tire wear will result. Negative camber causes wear on the inside of the tire, while positive camber causes wear to the outside.

Caster:

This illustration shows view from the side of the vehicle.

Caster (1) is the vertical tilting of the wheel axis either forward or backward (when viewed from the side of the vehicle). A backward tilt is positive (+) and a forward tilt is negative (-). On the short and long arm type suspension you cannot see a caster angle without a special instrument, but if you look straight down from the top of the upper control arm to the ground, the ball joints do not line up (fore and aft) when a caster angle other than 0 degree is present. With a positive angle, the lower ball joint would be slightly ahead (toward the front of the vehicle) of the upper ball joint center line.

Toe-in:

This illustration shows view from the top of the vehicle.

Toe-in is the measured amount the front wheels are turn in. The actual amount of toe-in is normally a fraction of a degree. Toe-in is measured from the center of the tire treads or from the inside of the tires. The purpose of toe-in is to insure parallel rolling of the front wheels and to offset any small deflections of the wheel support system which occurs when the vehicle is rolling forward. Incorrect toe-in results in excessive toe-in and unstable steering. Toe-in is the last alignment to be set in the front end alignment procedure.

Inspection

Before making any adjustments affecting caster, camber or toe-in, the following front end inspection should be made.

1. Inspect the tires for proper inflation pressure. Refer to Main Data and Specifications in Wheel and Tire System section.
2. Make sure that the vehicle is unladen condition (With no passenger or loading).
3. Make sure that the spare tire is installed at the normal position.
4. Inspect the front wheel bearings for proper adjustment. Refer to Front Hub and Disc in Driveline section.
5. Inspect the ball joints and tie rod ends. If excessive looseness is noted, correct before adjusting. Refer to Steering Linkage in this section.
6. Inspect the wheel and tires for run-out. Refer to Wheel Replacement in Wheel and Tire System section.
7. Inspect the trim height. If not within specifications, the correction must be made before adjusting caster.
8. Inspect the steering unit for looseness at the frame.
9. Inspect shock absorbers for leaks or any noticeable noise. Refer to Shock Absorber in Suspension section.
10. Inspect the control arms or stabilizer bar attachment for looseness. Refer to Suspension section .
11. Inspect the front end alignment using alignment equipment. Follow the manufacturer's instructions.
12. Park the vehicle must be on a level surface.

Trim Height Adjustment

Adjust the trim height (1) by means of the adjusting bolt on the height control arms.

CAUTION: When adjusting front end alignment, be sure to begin with trim height first, as it may change other adjusted alignments.

450RS003

410RS001

1. Check and adjust the tire inflation pressures.
2. Park the vehicle on a level ground and move the front of the vehicle up and down several times to settle the suspension.
3. Make necessary adjustment with the adjusting bolt on the height control arms.

Trim height: 119 ± 5mm (4.69 ± 0.2in)

Caster Adjustment

The caster angle can be adjusted by means of the caster shims (1) installed between the chassis frame (2) and fulcrum pins.

Caster angle: 2°30' ± 1°

CAUTION: Left and right side must be equal within 30'.

450RW006

450RS002

NOTE: Difference of the caster shim front/rear thickness should be 3.6mm (0.142in) or less. Overall thickness of caster shim and camber shim should be 10.8mm (0.425in) or less.

Tighten the fulcrum pin bolt to the specified torque.

Torque: 152N·m (15.5kg·m/112lbft)

Camber Adjustment

The camber angle can be adjusted by means of the camber shims (2) installed in position between the chassis frame (1) and fulcrum pins

Camber angle: $0^{\circ} \pm 30'$

King pin inclination: $12^{\circ}30' \pm 30'$

CAUTION: Left and right side must be equal within 30'.

450RW007

450RS005

NOTE: Overall thickness of caster shim and camber shim should be 10.8mm (0.425 in) or less. Tighten the fulcrum pin bolt to the specified torque.

Torque: 152N·m (15.5kg·m/112lbft)

	Position of shims		Camber angle	Caster angle
	Front side	Rear side		
Caster shim	When added	When removed	Decreases	Decreases
	When removed	When added	Increases	Increases
	—	When removed	Unchanged	Decreases
	—	When added	Unchanged	Increases
Camber shim	When added		Decreases	Unchanged
	When removed		Increases	Unchanged

2A-16 POWER-ASSISTED STEERING SYSTEM

Toe-in Adjustment

1. To adjust the toe-in angle, loosen the lock nuts (2) on the tie rod (1) and turn the tie rod. Turn both rods the same amount, to keep the steering wheel centered .

Toe-in: $0 \pm 2\text{mm}$ ($0 \pm 0.08\text{in}$)

2. Tighten the lock nut to the specified torque.

Torque: 98N·m (10.0kg·m/72lbft)

Main Data and Specifications

General Specification

Caster		$2^{\circ}30' \pm 1^{\circ}$
Camber		$0^{\circ} \pm 30'$

Removal

1. Remove the stone guard.
2. Remove the transfer gear assembly.
Make a setting mark across the coupling flange and steering unit to ensure reassembly of the parts in the original position.
3. Drain power steering fluid.
4. Remove the tie rod end assembly from knuckle.
Use tie rod end remover 5-8840-2005-0.

901RW270

5. Disconnect the feed line and return line from steering unit.
Remove the clips on the crossmember and frame.
Wire the power steering line to frame.

NOTE: Take care to prevent foreign matter from entry when disconnect the power steering line.

6. Remove the torsion bar. Refer to Front Suspension in Suspension section.
7. Remove the lower control arm bolt (Frame side). Refer to Front Suspension in Suspension section.
8. Apply a setting mark across the crossmember and frame so parts can be reassembled in their original position.

6. Install tie-rod end assembly to knuckle.

Torque: 118N·m (12.0kg·m/87lbft)

7. Install transfer gear assembly.
Align the setting marks made at removal.

Torque: 31 N·m (3.2kg·m/23lbft)

8. Install the stone guard.

9. Bleed the system.
Refer to Bleeding the Power Steering System in this section.

431RX013

9. Remove the crossmember fixing bolt.
10. Remove the power steering unit with the crossmember.
11. Remove the power steering unit.

Installation

1. Install power steering unit to crossmember.
Tighten fixing bolt to specified torque.
Torque: 116N·m (11.8kg·m/85lbft)
2. Install power steering unit with crossmember to frame by aligning the setting marks made when removing.
Tighten crossmember mounting bolt to specified torque.
Torque: 190N·m (19.4kg·m/140lbft)
3. Install lower control arm bolt.
Refer to Front Suspension in Suspension section.
4. Install torsion bar.
Refer to Front Suspension in Suspension section.
5. Connect the feed line and return line.

Torque: 25N·m (2.5kg·m/18lbft)

Power Steering Unit Disassembled View

440RW005

Legend

| (3) Clip | (9) Valve Housing Assembly |
| (4) Bellows | (10) Mounting Rubber |
| (5) Band | (11) Dust Cover |
| (6) Tie-rod Assembly | |

Disassembly

NOTE: The valve housing is made of aluminum and care should be exercised when clamping in a vise, etc. to prevent distortion or damage.

1. Loosen lock nut and remove tie-rod end.
2. Remove clip and band, then remove bellows.
3. Remove tie-rod assembly.
To remove, move the boot toward the tie-rod end, then remove tab washer.
4. Remove oil line, mounting rubber and dust cover.

Inspection and Repair

Inspect the following parts for wear, damage or any abnormal conditions.

Tie-rod End

If looseness or play is found when checked by moving the end of ball joint at tie-rod end, replace tie-rod end.

Tie-rod Assembly

If the resistance is insufficient or play is felt when checked by moving the ball on the tie-rod, replace the tie-rod assembly.

Rubber Parts

If wear or damage is found through inspection, replace with new ones.

Reassembly

1. Install mounting rubber and dust cover (If removed).
2. Install oil line.

Torque: 13N·m (1.3kg·m/113lbin)

3. Install tie-rod assembly with tab washer.
Apply grease to ball joint, install tie-rod and tab washer, then tighten to specified torque.

Torque: 83N·m (8.5kg·m/61lbft)

After tightening, bend tab washer against width across flat of inner ball joint.

4. Apply a thin coat of grease to the shaft for smooth installation. Then install bellows.
5. Install band and clip.
6. Install tie-rod end and tighten lock nut.

Torque: 98N·m (10.0kg·m/72lbft)

Main Data and Specifications

Power Steering Pump

Power Steering Pump and Associated Parts

Legend

- | | |
|-------------------|--------------------|
| (1) Pump Assembly | (3) Hose, Flexible |
| (2) Hose, Suction | (4) Bolt |

436RX001

Removal

1. Remove the drive belt.
2. Place a drain pan below the pump.
3. Disconnect the suction hose.
4. Disconnect the flexible hose.
5. Remove the power steering fixing bolt and remove the pump assembly.

Installation

1. Install the pump assembly to the pump bracket, tighten the fixing bolt to the specified torque.
Torque: 46N-m (4.7kg-m/34lbft)
2. Install the flexible hose.
Tighten the eye bolt to specified torque.
Torque: 54N-m (5.5kg-m/40lbft)
3. Install the drive belt.
4. Connect the suction hose, then fill and bleed system.
Refer to Bleeding the Power Steering System in this section.

Power Steering Pump Disassembled View

442RX001

Legend

| (8) O-ring | (19) Relief Valve |
| (9) Side Plate | (20) O-ring |
| (10) Rotor and Vane | (21) Connector |
| (11) Pin | (22) Pressure Switch Assembly |

Disassembly

1. Clean the oil pump with solvent (plug the discharge and suction ports to prevent the entry of solvent). Be careful not to expose the oil seal of shaft assembly to solvent.
2. Remove the bolt, suction pipe and O-ring.
3. Remove the connector, O-ring, relief valve and spring.
4. Remove the pressure switch assembly.

5. Remove the bolt, rear housing and O-ring.
6. Remove the snap ring.
7. Remove the shaft assembly.
8. Remove the oil seal.

CAUTION: When removing the oil seal, be careful not to damage the housing.

9. Remove the pump cartridge assembly from the front housing.
10. Remove two O-rings.

Inspection and Repair

Make all necessary adjustments, repairs, and part replacements if wear, damage, or other problems are discovered during inspection.

Rotor

Check that the groove in the vane is free from excessive wear and that the vane slides smoothly. When part replacement becomes necessary, the pump cartridge should be replaced as a subassembly.

Vane

Sliding faces of the vane should be free from wear. (Particularly the curved face at the tip that contact with the cam should be free from wear and distortion). When part replacement becomes necessary, the pump cartridge should be replaced as a subassembly.

Cam

The inner face of the arm should have a uniform contact pattern without a sign of step wear. When part replacement becomes necessary, the pump cartridge should be replaced as a subassembly.

Side Plate

The sliding faces of parts must be free from step wear (more than 0.01 mm), which can be felt by the finger nail.

The parts with minor scores may be reused after lapping the face.

Relief Valve

The sliding face of the valve must be free from burrs and damage. The parts with minor scores may be reused after smoothing with emery cloth (#800 or finer).

Shaft

Oil seal sliding faces must be free from a step wear which can be felt by the finger nail. Bushing fitting face must be free from damage and wear.

O-ring, Oil Seal, Snap Ring

Be sure to discard used parts, and always use new parts for installation. Prior to installation, lubricate all seals and rings with power steering fluid.

Pressure Switch

Check the switch operation as follows:

With engine idling and A/C on, turn the steering wheel fully to the left; compressor should interrupt and engine idle speed will increase. Shut off A/C and again turn steering fully to the left; engine idle will increase. If system fails to function properly, disconnect connector at the pressure switch and repeat system check while testing continuity across disconnected SW connector.

Reassembly

1. Install oil seal to front housing. Be sure to discard used oil seal, and always use new parts for installation.

CAUTION: When installing the oil seal, be careful not to damage the oil seal contacting surface of the housing.

2. Install shaft assembly.

3. Install the vanes to roter with curved face in contact with the inner wall of cam.

4. Install roter and vanes to cam.
5. Install pin to front housing.
6. Install two new O-rings to front housing. Be sure to discard used O-ring.
7. Install side plate.

CAUTION: When installing side plate, be careful not to damage its inner surface. Damaged side plate may cause poor pump performance, pump seizure or oil leakage.

8. Install pump cartridge assembly to front housing.
9. Install snap ring to shaft end.
10. Install rear housing with a new O-ring. Be sure to discard used O-ring. Then install bolt and tighten it to specified torque.

Torque: 24N·m (2.4kg·m/17lbft)

11. Install suction pipe with a new O-ring. Be sure to discard used O-ring. Then install bolt and tighten it to specified torque.

Torque: 10N·m (1.0kg·m/87lb in)

12. Install relief valve and spring.
13. Install connector with a new O-ring. Be sure to discard used O-ring. Tighten the connector to specified torque.

Torque: 59N·m (6.0kg·m/43lbft)

14. Install pressure switch assembly and tighten it to specified torque.

Torque: 18N·m (1.8kg·m/13lbft)

|---|--|
| (1) Transfer Gear Assembly | (4) Shim |
| (2) Bolt, Universal Joint (Steering Shaft Side) | (5) Bolt, Universal Joint (Steering Unit Side) |
| (3) Fixing Bolt Nut | |

Removal

1. Apply a setting mark across the universal joint and transfer gear so parts can be reassembled in their original position.
2. Remove universal joint bolt (steering shaft side).
3. Remove universal joint bolt (steering unit side).
4. Loosen fixing bolt and nut and remove transfer gear assembly with shim.

Inspection and Repair

The transfer gear assembly cannot be disassembled. If damage or abnormal condition are found, replace to new ones.

Installation

1. Install transfer gear assembly with shim by aligning the setting marks made when removing.
2. Tighten bolt and nut to the specified torque.
Torque: 54N·m (5.5kg·m/40lbft)
3. Connect universal joint (both side) and tighten the bolt to the specified torque.
Torque: 31 N·m (3.2kg·m/23lbft)

Supplemental Restraint System Steering Wheel & Column

Service Precaution

This steering wheel and column repair section covers the Supplemental Restraint System (SRS) steering column. The following repair procedures are specific to SRS components. When servicing a vehicle equipped with Supplemental Restraint System, pay close attention to all WARNINGS and CAUTIONS.

For detailed explanation about SRS, refer to Restraints section.

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS. SAFE HANDLING OF INFLATOR MODULES REQUIRES FOLLOWING THE PROCEDURES DESCRIBED BELOW FOR BOTH LIVE AND DEPLOYED MODULES.

SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY (AIR BAG). AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY (AIR BAG) SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY-PRODUCT OF THE DEPLOYMENT REACTION, THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWDER ON THE AIR BAG ASSEMBLY (AIR BAG) IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY AN AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. WHEN PLACING A LIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE.

NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

TO AVOID DEPLOYMENT WHEN TROUBLESHOOTING THE SRS SYSTEM, DO NOT USE ELECTRICAL TEST EQUIPMENT, SUCH AS BATTERY-POWERED OR A/C-POWERED VOLT-METER, OHMMETER, ETC., OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN SPECIFIED IN THIS MANUAL. DO NOT USE A NON-POWERED PROBE-TYPE TESTER. INSTRUCTIONS IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT.

SRS Connectors

CAUTION: The special yellow color connectors are used for supplemental restraint system-air bag circuit.

When removing the cable harness, do not pull the cables. Otherwise, cable disconnection may occur. When connect the SRS connector, insert the connector completely. Imperfect locking may cause malfunction of SRS circuit.

Removal

To remove the connector, hold the cover insulator(1) and pull it. The cover insulator slides and lock will be released.

Do not hold the socket insulator(2).

827RW028

Installation

To install the connector, hold the socket insulator(1) and insert it. The cover insulator slides and connector will be locked.

Do not hold the cover insulator(2).

827RW027

Inflator Module

Inflator Module and Associated Parts

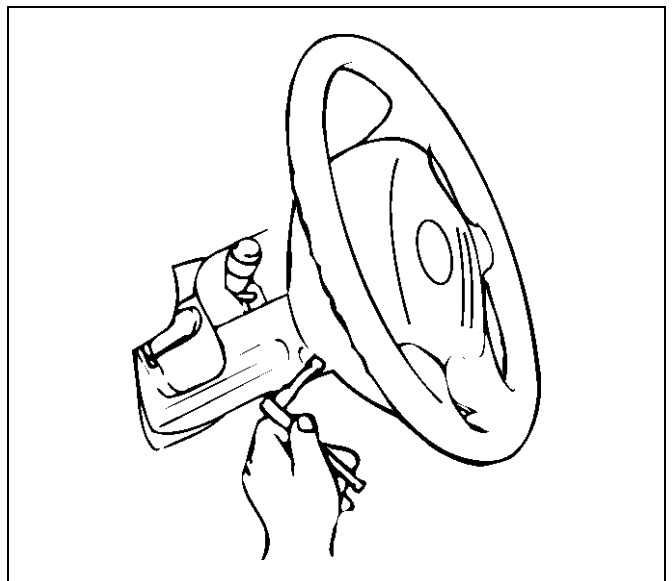

Legend

- | | |
|-------------------|---------------------|
| (1) Horn Lead | (3) Fixing Bolt |
| (2) SRS Connector | (4) Inflator Module |

Removal

1. Turn the steering wheel so that the vehicle's wheels are pointing straight ahead.
2. Turn the ignition switch to "LOCK".
3. Disconnect the battery "-" terminal cable, and wait at least 5 minutes.
4. Disconnect the yellow 2-way SRS connector located under the steering column.
5. Loosen the inflator module fixing bolt from behind the steering wheel assembly using a TORX® driver or equivalent until the inflator module can be released from steering assembly .

6. Disconnect the yellow 2-way SRS connector and horn lead located behind the inflator module.

827RW073

7. Remove inflator module.

Inspection and Repair

WARNING: THE INFLATOR MODULE SHOULD ALWAYS BE CARRIED WITH THE URETHANE COVER AWAY FROM YOUR BODY AND SHOULD ALWAYS BE LAID ON A FLAT SURFACE WITH THE URETHANE SIDE UP. THIS IS NECESSARY BECAUSE A FREE SPACE IS PROVIDED TO ALLOW THE AIR CUSHION TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY MAY RESULT .

827RW072

The inflator module consists of a cover, air bag, inflator, and retainer. Inspect the inflator module mainly for the following:

- Check for holes, cracks, severe blemishes and deformation on the cover.
- Check that the retainer is not deformed.
- Check for defects such as damage and breakage in the lead wire for the igniter.

If an abnormality is found as the result of the inspection, replace the inflator module with a new one.

Installation

1. Install inflator module.
2. Support the module and carefully connect the module connector and horn lead.

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of inflator to prevent lead wire from being pinched.

3. Tighten bolts to specified torque.

Torque: 9N·m (0.9kg·m/78lbin)

4. Connect the yellow 2-way SRS connector located under the steering column.
5. Connect the battery “-” terminal cable.
6. Set ignition to “ON” while watching warning light. Light should flash 7 times and then go off. If lamp does not operate correctly, refer to Restraints section.

Steering Wheel

Steering Wheel and Associated Parts

Legend

- | | |
|--------------------|-------------------------------|
| (1) Horn Lead | (4) Steering Wheel Fixing Nut |
| (2) SRS Connector | (5) Inflator Module |
| (3) Steering Wheel | |

CAUTION: Once the steering column is removed from the vehicle, the column is extremely susceptible to damage. Dropping the column assembly on its end could collapse the steering shaft or loosen the slide block which maintains column rigidity. Leaning on the column assembly could cause the jacket to bend or deform. Any of the above damage could impair the column's collapsible design. If it is necessary to remove the steering wheel, use only the specified steering wheel puller. Under no conditions should the end of the shaft be hammered upon, as hammering could loosen slide block which maintains column rigidity.

Removal

1. Turn the steering wheel so that the vehicle's wheels are pointing straight ahead.
2. Turn the ignition switch to "LOCK".
3. Disconnect the battery "-" terminal cable, and wait at least 5 minutes.
4. Disconnect the yellow 2-way SRS connector located under the steering column.

5. Loosen the inflator module fixing bolt from behind the steering wheel assembly using a TORX® driver or equivalent until the inflator module can be released from steering assembly.

827RW070

6. Disconnect the yellow 2-way SRS connector located behind the inflator module.

WARNING: THE INFLATOR MODULE SHOULD ALWAYS BE CARRIED WITH THE URETHANE COVER AWAY FROM YOUR BODY AND SHOULD ALWAYS BE LAID ON A FLAT SURFACE WITH THE URETHANE SIDE UP. THIS IS NECESSARY BECAUSE A FREE SPACE IS PROVIDED TO ALLOW THE AIR CUSHION TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY MAY RESULT.

827RW073

7. Disconnect horn lead.
8. Remove steering wheel fixing nut.

9. Apply a setting mark (1) across the steering wheel and shaft so parts can be reassembled in their original position, then remove steering wheel.

430RW021

10. Move the front wheels to the straight ahead position, then use steering wheel remover 5-8521-0016-0 to remove the steering wheel.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

430RX005

Installation

1. Install steering wheel by aligning the setting marks made when removing.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

2. Tighten the steering wheel fixing nut to the specified torque.

Torque: 34 N·m (3.5 kg·m/25 lb ft)

3. Connect horn lead.
4. Support the module and carefully connect the SRS connector.

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of inflator to prevent lead wire from being pinched.

5. Tighten bolts to specified torque.

Torque: 9 N·m (0.9 kg·m/78 lb in)

6. Connect the yellow 2-way SRS connector located under the steering column.
7. Connect the battery “-” terminal cable.
8. Turn the ignition switch to “ON” while watching warning light. Light should flash 7 times and then go off. If lamp does not operate correctly, refer to Restraints section.

Combination Switch

Combination Switch and Associated Parts

431RW028

Legend

- | | |
|---------------------------|--|
| (1) Steering Column Cover | (4) Combination Switch and SRS Coil Assembly |
| (2) Steering Wheel | (5) Instrument Panel Lower Cover |
| (3) Inflator Module | (6) Driver Knee Bolster (reinforcement) |

Removal

1. Turn the steering wheel so that the vehicle's wheels are pointing straight ahead.
2. Turn the ignition switch to "LOCK".
3. Disconnect the battery "-" terminal cable, and wait at least 5 minutes.
4. Disconnect the yellow 2-way SRS connector located under the steering column.

CAUTION: The wheels of the vehicle must be straight ahead and the steering column in the "LOCK" position before disconnecting the steering wheel. Failure to do so will cause the coil assembly to become uncentered which will cause damage to the coil assembly.

5. Remove the engine hood opening lever, then remove instrument panel lower cover.
6. Remove the driver knee bolster (reinforcement).

7. Loosen the inflator module fixing bolt from behind the steering wheel assembly using a TORX® driver or equivalent until the inflator module can be released from steering assembly. Disconnect the yellow 2-way SRS connector and horn lead located behind the inflator module, then remove inflator module.

827RW070

827RW073

WARNING: The INFLATOR MODULE SHOULD ALWAYS BE CARRIED WITH THE URETHANE COVER AWAY FROM YOUR BODY AND SHOULD ALWAYS BE LAID ON A FLAT SURFACE WITH THE URETHANE SIDE UP. THIS IS NECESSARY BECAUSE A FREE SPACE IS PROVIDED TO ALLOW THE AIR CUSHION TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY MAY RESULT.

827RW072

8. Apply a setting mark (1) across the steering wheel and shaft so parts can be reassembled in their original position. Move the front wheels to the straight ahead position, then use steering wheel remover 5-8521-0016-0 to remove the steering wheel.

430RW021

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

430RX005

9. Remove steering column cover.
10. Disconnect the wiring harness connectors located under the steering column then remove combination switch and SRS coil assembly.

NOTE: The SRS coil is a part of the combination switch assembly, which can not be replaced separately. Therefore, be sure not to remove the SRS coil from the combination switch assembly.

825RW288

Installation

1. Install combination switch and SRS coil assembly. After installation of combination switch assembly, connect the combination switch wiring harness connector and the SRS 2-way connector located under the steering column. Then turn the SRS coil counter clockwise to full, return about 3 turns and align the neutral mark.

CAUTION: When turning the SRS coil counter clockwise to full, stop turning if resistance is felt. Forced further turning may damage to the cable in the SRS coil.

825RW016

2A-38 POWER-ASSISTED STEERING SYSTEM

- When installing the steering column cover, be sure to route each wire harness as illustrated so that the harnesses do not catch on any moving parts.

Legend

- Steering Column Cover
- Starter Switch Harness
- Combination Switch Harness
- Inflator Module Harness

- Align the setting marks made when removing then install steering wheel.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

- Tighten the steering wheel fixing nut to the specified torque.

Torque: 34N-m (3.5kg-m/25lbft)

- Support the inflator module and carefully connect the SRS connector and horn lead.

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of inflator to prevent lead wire from being pinched.

- Tighten bolts to specified torque.

Torque: 9N-m (0.9kg-m/78lb in)

- Install driver knee bolster (reinforcement).
- Install instrument panel lower cover then Install the engine hood opening lever.
- Connect the SRS connector.
- Connect the battery "-" terminal cable.
- Turn the ignition switch to "ON" while watching warning light and check the light should flash 7 times and then go off. If lamp does not operate correctly, refer to Restraints section.

Lock Cylinder

Lock Cylinder and Associated Parts

431RW027

Legend

- | | |
|--|---|

| (4) Combination Switch and SRS Coil Assembly | (9) Driver Knee Bolster (reinforcement) |
| (5) Snap Ring | (10) Shift Lock Cable (for A/T) |

Removal

1. Turn the steering wheel so that the vehicle's wheels are pointing straight ahead.
2. Turn the ignition switch to "LOCK".
3. Disconnect the battery "-" terminal cable, and wait at least 5 minutes.
4. Disconnect the yellow 2-way SRS connector located under the steering column.

CAUTION: The wheels of the vehicle must be straight ahead and the steering column in the "LOCK" position before disconnecting the steering wheel. Failure to do so will cause the coil assembly to become uncentered which will cause damage to the coil assembly.

5. Remove the engine hood opening lever and steering lower cover.
6. Remove driver knee bolster (reinforcement).

7. Loosen the inflator module fixing bolt from behind the steering wheel assembly using a TORX® driver or equivalent until the inflator module can be released from steering assembly.

827RW070

8. Disconnect the yellow 2-way SRS connector and horn lead located behind the inflator module.

827RW073

9. Apply a setting mark (1) across the steering wheel and shaft so parts can be reassembled in their original position.

430RW021

10. Move the front wheels to the straight ahead position, then use steering wheel remover 5-8521-0016-0 to remove the steering wheel.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

430RX005

WARNING: THE INFLATOR MODULE SHOULD ALWAYS BE CARRIED WITH THE URETHANE COVER AWAY FROM YOUR BODY AND SHOULD ALWAYS BE LAID ON A FLAT SURFACE WITH THE URETHANE SIDE UP. THIS IS NECESSARY BECAUSE A FREE SPACE IS PROVIDED TO ALLOW THE AIR CUSHION TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY MAY RESULT.

827RW072

11. Remove steering column cover.
12. Disconnect the wiring harness connectors located under the steering column.
13. Remove the combination switch assembly with SRS coil.

NOTE: The SRS coil is a part of the combination switch assembly, which can not be replaced separately. Therefore, be sure not to remove the SRS coil from the combination switch assembly.

825RW288

14. Remove snap ring.
15. Remove cushion rubber.
16. Remove shift lock cable (for A/T).
17. Disconnect the starter switch harness connector located under the steering column then remove lock cylinder assembly.

Installation

1. Install lock cylinder assembly.
2. Install shift lock cable (for A/T).
3. Install cushion rubber.
4. Install snap ring.
5. Install Combination switch and SRS coil assembly. After installation of combination switch assembly, connect the combination switch wiring harness connector and the SRS 2-way connector located under the steering column.
6. Turn the SRS coil counter clockwise to full, return about 3 turns and align the neutral mark.

CAUTION: When turning the SRS coil counter clockwise to full, stop turning if resistance is felt. Forced further turning may damage the cable in the SRS coil.

825RW016

2A-42 POWER-ASSISTED STEERING SYSTEM

7. When installing the steering column cover, be sure to wire (through each harness) as illustrated so that the harnesses starter switch, combination switch and SRS coil may not catch wiring.

825RW017

Legend

- (1) Steering Column Cover
- (2) Starter Switch Harness
- (3) Combination Switch Harness
- (4) Inflator Module Harness

8. Install steering wheel by aligning the setting marks made during removal.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

9. Tighten the steering wheel fixing nut to the specified torque.

Torque: 34N·m (2.5kg·m/25lbft)

10. Support inflator module and carefully connect the SRS connector and horn lead, then install inflator module.

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of inflator to prevent lead wire from being pinched.

11. Tighten fixing bolts to specified torque.

Torque: 9N·m (0.9kg·m/78lb·in)

12. Install driver knee bolster (reinforcement).

13. Install instrument panel lower cover, then install the engine hood opening lever.

14. Connect the yellow 2-way SRS connector located under the steering column.

15. Connect the battery “-” terminal cable.

System Inspection

Turn the ignition switch to “ON” while watching warning light.

The light should flash 7 times and then go off. If lamp does not operate correctly, refer to Restraints section.

Steering Column

Steering Column and Associated Parts

Legend

- | | |
|--|--|
| (1) Inflator Module | (7) Lock Cylinder Assembly |
| (2) Steering Wheel | (8) Shift Lock Cable (For A/T) |

| (4) Combination Switch and SRS Coil Assembly | (10) Second Steering Shaft |
| (5) Snap Ring | (11) Instrument Panel Lower Cover |
| (6) Cushion Rubber | (12) Driver Knee Bolster (reinforcement) |

Removal

1. Turn the steering wheel so that the vehicle's wheels are pointing straight ahead.
2. Turn the ignition switch to "LOCK".
3. Disconnect the battery "-" terminal cable, and wait at least 5 minutes.

4. Disconnect the yellow 2-way SRS connector located under the steering column.

CAUTION: The wheel of the vehicle must be straight ahead and the steering column in the "LOCK" position before disconnecting the steering column from the steering gear. Failure to do so will cause the SRS coil assembly to become uncentered which will cause damage to the SRS coil assembly.

2A-44 POWER-ASSISTED STEERING SYSTEM

5. Remove the engine hood opening lever, then remove instrument panel lower cover.
6. Remove driver knee bolster (reinforcement).
7. Loosen the inflator module fixing bolt from behind the steering wheel assembly using a TORX® driver or equivalent until the inflator module can be released from steering assembly.

8. Disconnect the yellow 2-way SRS connector and horn lead located behind the inflator module.
9. Remove inflator module.

WARNING: THE INFLATOR MODULE SHOULD ALWAYS BE CARRIED WITH THE URETHANE COVER AWAY FROM YOUR BODY AND SHOULD ALWAYS BE LAID ON A FLAT SURFACE WITH THE URETHANE SIDE UP. THIS IS NECESSARY BECAUSE A FREE SPACE IS PROVIDED TO ALLOW THE AIR CUSHION TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY MAY RESULT.

10. Apply a setting mark (1) across the steering wheel and shaft so parts can be reassembled in their original position. Move the front wheels to the straight ahead position, then use steering wheel remover 5-8521-0016-0 to remove the steering wheel.

11. Remove steering column cover.
12. Disconnect the wiring harness connectors located under the steering column.

13. Remove the combination switch assembly with SRS coil.

NOTE: SRS coil is a part of combination switch assembly, which can not be replaced singly. Therefore, be sure not to remove the SRS coil from the combination switch assembly.

825RW288

14. Remove snap ring.

15. Remove cushion rubber.

16. Remove shift lock cable (For A/T).

17. Disconnect the starter switch harness connector located under the steering column, then remove lock cylinder assembly.

18. Apply a setting mark (1) across the universal joint and transfer gear to reassemble the parts in their original position, then remove steering column assembly and second shaft.

NOTE: A setting mark can be easily made if the shaft is withdrawn a little by loosening the steering shaft universal joint.

431RW009

Inspection

If the abnormal conditions are found through inspection, replace the steering column assembly.

Column Capsule

Check capsules on steering column bracket assembly; all must be securely seated in bracket slots and checked for any loose conditions when pushed or pulled by hand.

431RW030

Check clearance between capsule and bracket. It must be within 1mm (0.039 in).

431RW031

Column Tube

Check for collapses by measuring the distance as shown in the figure.

Standard distance: 162.2-165.8 mm (6.386-6.528 in)

431RW032

Column Universal Joint for Tilt Mechanism

If the resistance is felt when checked by rotate the joint, replace the steering column assembly.

Sheared Injected Plastic Pin

Check the sheared injected plastic pins for any loose conditions or damage.

431RW033

Shaft Length

Check the shaft length from the upper end of the slide joint to the end of the shaft. If column length is not in specifications, steering column should be replaced.

Standard length: 291.7-295.7 mm (11.484-11.642 in)

431RW034

Shaft Universal Joint (Lower End)

If the resistance is felt when checked by rotate the joint, replace the steering column assembly.

Shaft Bellows Pipe

Check the shaft bellows pipe for bend by using straight edge. Measure the clearance between the bellows pipe and the straight edge (at center of the bellows pipe).

Standard: Less than 1mm (0.039 in)

431RW035

Tilt Mechanism

Tilt mechanism should moves smoothly.

While locked the tilt mechanism, be sure the steering column latch securely by pushing the steering wheel upward and downward.

Installation

1. Install steering column assembly and second steering shaft.
2. Align the setting marks on the universal joint and transfer gear made during removal.
3. Tighten the steering column fixing bolt (dash panel) to the specified torque.

Torque: 20N·m (2.0kg·m/14lbft)

4. Tighten the steering column fixing nuts (cross beam) to the specified torque.

Torque: 17N·m (1.7kg·m/12lbft)

5. Tighten the universal joint to the specified torque.

Torque: 31N·m (3.2kg·m/23lbft)

6. Install lock cylinder assembly.
7. Install shift lock cable (For A/T).
8. Install cushion rubber.
9. Install snap ring.
10. Install combination switch and SRS coil assembly. After installation of combination switch assembly, connect the combination switch wiring harness connector and the SRS 2-way connector located under the steering column.

2A-48 POWER-ASSISTED STEERING SYSTEM

11. Turn the SRS coil counter clockwise to full, return about 3 turns and align the neutral mark.

CAUTION: When turning the SRS coil counter clockwise to full, stop turning if resistance is felt. Forced further turning may damage to the cable in the SRS coil.

12. When installing the steering column cover, be sure to route each wire harness as illustrated so that the harnesses do not catch any moving parts.

Legend

- (1) Steering Column Cover
- (2) Starter Switch Harness
- (3) Combination Switch Harness
- (4) Inflator Module Harness

13. Install steering wheel and align the setting marks made when removing.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

14. Tighten the steering wheel fixing nut to the specified torque.

Torque: 34N-m (3.5kg-m/25lbf)

15. Support the module and carefully connect the module connector and horn lead, then install inflator module.

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of inflator to prevent lead wire from being pinched.

16. Tighten bolts to specified torque.

Torque: 9N-m (0.9kg-m/78lbin)

17. Install driver knee bolster (reinforcement).
18. Install instrument panel lower cover.
19. Install the engine hood opening lever.
20. Connect the yellow 2-way SRS connector and horn lead located under the steering column.
21. Connect the battery "-" terminal cable.

System Inspection

Turn the ignition switch to "ON" while watching warning light.

The light should flash 7 times and then go off. If lamp does not operate correctly, refer to Restraints section.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

3C-2 FRONT SUSPENSION

General Description

The front suspension is designed to allow each wheel to compensate for changes in the road surface level without greatly affecting the opposite wheel. Each wheel is independently connected to the frame by a steering knuckle, ball joint assemblies, and upper and lower control arms. The front wheels are held in proper relationship to each other by two tie-rods which are connected to steering arms on the knuckles, and to a steering unit.

All models have a front suspension system consisting of control arms, stabilizer bar, shock absorber and a torsion bar. The front end of the torsion bar is attached to the lower control arm. The rear of the torsion bar is mounted into a height control arm at the crossmember. Vehicle trim height is controlled by adjusting this arm. Shock absorbers are mounted between the brackets on

the frame and the lower control arms. The lower portion of each shock absorber is attached to the lower control arm. The upper portion of each shock absorber extends through a frame bracket and is secured with two rubber bushings, two retainers and a nut.

Ball joint assemblies are bolted to the outer end of the upper and lower control arm and are attached to the steering knuckle.

The inner ends of the upper control arm have pressed in bushings. Bolts, passing through the bushing, attach the control arm to the frame. The inner ends of the lower control arm are attached to the frame by bolts passing through the bushings.

Side roll of the front suspension is controlled by a spring steel stabilizer bar. It is mounted in rubber bushings, which are held to the frame by brackets. The ends of the stabilizer bar are connected to the lower control arms by links.

Diagnosis

Condition	Possible cause	Correction
Vehicle Pulls	Mismatched or uneven tires.	Replace tire.
	Tires not adequately inflated.	Adjust tire pressure.
	Broken or sagging springs.	Replace spring.
	Radial tire lateral force.	Replace tire.
	Improper wheel alignment.	Adjust wheel alignment.
	Brake dragging in one wheel.	Repair brake.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension part(s).
	Faulty shock absorbers.	Replace shock absorber.
Abnormal or Excessive Tire Wear	Parts in power steering valve defective.	Replace power steering unit.
	Sagging or broken spring.	Replace spring.
	Tire out of balance.	Balance or replace tire.
	Improper wheel alignment.	Check front end alignment.
	Faulty shock absorber.	Replace shock absorber.
	Hard driving.	Replace tire.
	Overloaded vehicle.	Replace tire and reduce load.
	Tires not rotated periodically.	Replace or rotate tire.
	Worn or loose road wheel bearings.	Replace wheel bearing.
Wobbly wheel or tires.	Replace wheel or tire.	
Wheel Hop	Tires not adequately inflated.	Adjust the pressure.
	Blister or bump on tire.	Replace tire.
	Improper shock absorber operation.	Replace shock absorber.

Condition	Possible cause	Correction
Shimmy, Shake or Vibration	Tire or wheel out of balance.	Balance wheels or replace tire/or wheel.
	Loose wheel bearings.	Replace wheel bearing.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
	Excessive wheel runout.	Repair or replace wheel and/or tire.
	Blister or bump on tire.	Replace tire.
	Excessive loaded radial runout of tire/wheel assembly.	Replace tire or wheel.
	Improper wheel alignment.	Check wheel alignment.
	Loose or worn steering linkage.	Tighten or replace steering linkage.
	Loose steering unit.	Tighten steering unit.
	Tires not adequately inflated.	Adjust tire pressure.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension parts.
	Faulty shock absorber.	Replace shock absorber.
	Hub bearing preload misadjustment.	Adjust preload.
Parts in power steering valve defective.	Replace power steering unit.	
Hard Steering	Bind in steering linkage ball studs, upper or lower ball joint.	Replace ball joint.
	Improper wheel alignment.	Check wheel alignment.
	Tire not adequately inflated.	Inflate tires to proper pressure.
	Bind in steering column or shaft.	Repair or replace.
	Improper power steering system operation.	Repair or replace. Refer to Steering section.
Too Much Play In Steering	Wheel bearings worn.	Replace wheel bearings.
	Loose steering unit or linkage.	Retighten or repair.
	Worn or loose steering shaft universal joint.	Retighten or replace steering shaft.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
Poor Steering Wheel Returnability	Bind in steering linkage ball joints.	Replace ball joints.
	Bind in upper or lower ball joints.	Replace ball joints.
	Bind in steering column and shaft.	Repair or replace.
	Bind in steering gear.	Check and repair steering gear.
	Improper wheel alignment.	Adjust wheel alignment.
	Tires not adequately inflated.	Adjust pressure.
	Loose steering wheel nut.	Retighten.
Worn wheel bearing.	Replace.	

3C-4 FRONT SUSPENSION

Condition	Possible cause	Correction
Abnormal Noise	Worn, sticky or loose upper or lower ball joint, steering linkage ball joints or drive axle joints.	Replace.
	Faulty shock absorbers.	Replace.
	Worn upper or lower control arm bushing.	Replace.
	Loose stabilizer bar.	Retighten bolts or replace bushings.
	Loose wheel nuts.	Tighten nuts. Check for elongated wheel nut holes. Replace wheel if required.
	Loose suspension bolts or nuts.	Retighten suspension bolts or nuts.
	Broken or otherwise damaged wheel bearings.	Replace wheel bearing.
	Broken suspension springs.	Replace spring.
	Loose steering unit.	Retighten mounting bolt.
Faulty steering unit.	Replace steering unit.	
Wandering or Poor Steering Stability	Mismatched or unevenly worn tires.	Replace tire or inflate tires to proper pressure.
	Loose steering linkage ball joints.	Replace ball joints.
	Faulty shock absorbers.	Replace shock absorber.
	Loose stabilizer bar.	Tighten or replace stabilizer bar or bushings.
	Broken or sagging springs.	Replace spring (pairs).
	Improper wheel alignment.	Adjust wheel alignment.
Erratic Steering When Braking	Worn wheel bearings.	Replace wheel bearings.
	Broken or sagging springs.	Replace spring (pairs).
	Leaking caliper.	Repair or replace caliper.
	Warped discs.	Replace brake disc.
	Badly worn brake pads.	Replace brake pads.
	Tires are inflated unequally.	Inflate tires to proper pressure.
Low or Uneven Trim Height	Broken or sagging springs.	Replace springs (In pairs).
	Vehicle overloaded.	Reduce load.
	Incorrect springs.	Adjust or replace torsion bar.
Suspension Bottoms	Vehicle overloaded.	Reduce load.
	Faulty shock absorber.	Replace shock absorber.
	Incorrect, broken or sagging springs.	Replace springs.
Body Leans	Loose stabilizer bar.	Tighten stabilizer bar bolts or replace bushings.
	Faulty shock absorber, struts or mounting.	Replace shock absorber.
	Broken or sagging springs.	Replace springs (In pairs).
	Vehicle overloaded.	Reduce load.
Cupped Tires	Worn wheel bearings.	Replace wheel bearing.
	Excessive tire or wheel run out.	Replace tire or wheel.
	Worn ball joints.	Replace ball joints.
	Tire out of balance.	Adjust tire balance.

Shock Absorber

Shock Absorber and Associated Parts

450RW009

Legend

- | | |
|-------------------------------|-------------------------------|
| (1) Nut | (4) Shock Absorber |
| (2) Rubber Bushing and Washer | (5) Rubber Bushing and Washer |
| (3) Bolt and Nut | |

Removal

1. Raise the vehicle and support it with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel Replacement in this section.
3. Remove bolt and nut.
4. Remove nut.
5. Remove rubber bushing and washer.
6. Remove shock absorber.
7. Remove rubber bushing and washer.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

Check the following parts :

- Shock absorber
- Rubber bushing

Installation

1. Install rubber bushing and washer.
2. Install shock absorber.
3. Install rubber bushing and washer.
4. Install nut, then tighten it to the specified torque.

Torque: 20N·m (2.0kg·m/14lbft)

5. Install bolt and nut, then tighten to the specified torque.

Torque: 93N·m (9.5kg·m/69lbft)

Stabilizer Bar

Stabilizer Bar and Associated Parts

410RW007

Legend

- | | |
|--------------------|--------------------|
| (1) Rubber Bushing | (4) Nut |
| (2) Bracket | (5) Stabilizer Bar |
| (3) Link | |

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove the stone guard.
3. Remove wheel and tire assembly. Refer to Wheel Replacement in this section.
4. Remove nut.

CAUTION: Be careful not to break the ball joint boot.

5. Remove link.
6. Remove bracket.
7. Remove stabilizer bar.
8. Remove rubber bushing.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

Check the following parts :

- Stabilizer bar
- Rubber bushing
- Link ball joint

Installation

1. Install rubber bushing.
2. Install stabilizer bar.
3. Install bracket, then tighten it to the specified torque.

Torque: 25N-m (2.6kg-m/18lbft)

4. Install link.
5. Install nut, then tighten it to the specified torque.

Torque: 50N-m (5.1kg-m/37lbft)

Torsion Bar

Torsion Bar and Associated Parts

410RS003

Legend

- (1) Adjust Bolt, End Piece and Seat
- (2) Height Control Arm

- (3) Torsion Bar

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Apply the setting marks(1) to the adjust bolt and end piece, then remove adjust bolt, end piece and seat.

410RS004

3C-8 FRONT SUSPENSION

3. Apply the setting marks(2) to the height control arm and torsion bar, then remove height control arm.

410RS005

4. Apply the setting marks(3) to the torsion bar and lower control arm, then remove torsion bar.

410RS006

Installation

1. Apply grease to the serrated portions, then install torsion bar. Make sure the bars are on their correct respective sides and align the setting marks(3).

410RS007

410RS006

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

Check the following parts:

- Torsion bar
- Height control arm
- Adjust bolt
- Rubber seat

2. Apply grease to the portion that fits into the bracket then install height control arm and align the setting marks(2).

410RS005

3. Apply grease to the bolt portion of the end piece(4). Apply grease to the portion of the seat(5) that fits into the bracket.

410RS008

4. Apply grease to the serrated portions.
5. Install adjust bolt and seat, then turn the adjust bolt to the setting mark(1) applied during disassembly.

NOTE: Adjust the trim height. Refer to Front End Alignment Inspection and Adjustment in Steering section.

410RS004

Knuckle

Knuckle and Associated Parts

410RW006

Legend

- | | |
|----------------------|-------------------------|
| (1) Torsion Bar | (6) Needle Bearing |
| (2) Lower Ball Joint | (7) Thrust Washer |
| (3) Back Plate | (8) Oil Seal |
| (4) Knuckle Assembly | (9) Upper Ball Joint |
| (5) Knuckle | (10) Wheel Speed Sensor |

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel in this section.
3. Remove the brake caliper. Refer to Disc Brakes in Brake section.
4. Remove the hub assembly. Refer to Front Hub and Disk in this section.
5. Remove tie-rod end from the knuckle. Refer to Power Steering Unit in Steering section.
6. Remove the speed sensor from the knuckle.
7. Loosen torsion bar by height control arm adjust bolt, then remove torsion bar. Refer to Torsion Bar in this section.

8. Remove wheel speed sensor.
9. Remove back plate.
10. Remove lower ball joint by using remover 5-8840-2005-0.

CAUTION: Be careful not to damage the ball joint boot.

11. Remove upper ball joint by using remover 5-8840-2121-0.

CAUTION: Be careful not to damage the ball joint boot.

12. Remove knuckle assembly.
13. Remove oil seal.
14. Remove washer.

15. Remove needle bearing by using remover 5-8840-2000-0 and sliding hammer 5-8840-0019-0.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

Check the following parts:

- Knuckle
- Knuckle arm
- Needle bearing
- Thrust washer

Installation

1. Apply appropriate amount of multipurpose type grease to the new bearing (Approx. 5 g) and install needle bearing by using installer 5-8840-2128-0 and grip 5-8840-0007-0.

3C-12 FRONT SUSPENSION

2. Apply multipurpose type grease to the thrust washer, and install washer with chamfered side facing knuckle.
3. Use a new oil seal, and apply multipurpose type grease to the area surrounded by the lip (approx. 2 g). Then use installer 5-8840-2127-0 and grip 5-8840-0007-0 to install oil seal. After fitting the oil seal to the installer, drive it to the knuckle using a hammer or bench press until the tool front face contacts with the thrust washer.

4. Install knuckle assembly.
5. Install upper ball joint and tighten the nut to the specified torque, with just enough additional torque to align cotter pin holes. Install new cotter pin.

Torque: 98N·m (10.0kg·m/72lbft)

6. Install lower ball joint and tighten the nut to the specified torque, with just enough additional torque to align cotter pin holes. Install new cotter pin.

Torque: 147N·m (15.0kg·m/lbft)

7. Install back plate.
8. Install wheel speed sensor.
9. Install torsion bar, refer to Torsion Bar in this section.

NOTE: Adjust the trim height. Refer to Front End Alignment Inspection and Adjustment in Steering.

Upper Control Arm

Upper Control Arm and Associated Parts

450RW005

Legend

- | | |
|--------------------------------|-------------------------|
| (1) Bolt and Plate | (7) Bushing |
| (2) Camber Shims | (8) Plate |

| (4) Nut Assembly | (10) Speed Sensor Cable |
| (5) Upper Control Arm Assembly | (11) Nut and Cotter Pin |
| (6) Fulcrum Pin | (12) Upper Ball Joint |

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel in this section.
3. Remove the brake caliper and disconnect brake pipe. Refer to Disc Brakes in Brake section.
4. Support lower control arm with a jack.
5. Remove speed sensor cable.
6. Remove nut and cotter pin then remove knuckle using remover 5-8840-2121-0.

3C-14 FRONT SUSPENSION

CAUTION: Be careful not to damage the ball joint boot.

7. Remove upper ball joint.
8. Remove bolt and plate.
9. Remove nut assembly.
10. Remove camber shims and note the positions and number of shims.
11. Remove caster shims and note the positions and number of shims.
12. Remove upper control arm assembly.
13. Remove nut.
14. Remove plate.
15. Remove bushing by using remover 5-8840-0256-0.

16. Remove fulcrum pin.

Inspection and Repair

Make necessary parts replacement if wear, damage, corrosion or any other abnormal conditions are found through inspection.

Check the following parts:

- Upper control arm
- Bushing
- Fulcrum pin

Installation

1. Install fulcrum pin.
2. Install bushing by using installer 5-8840-0256-0 and 5-8840-2307-0.

901RW279

3. Install plate.

4. Install nut and tighten fulcrum pin nut finger-tight.

NOTE: Torque fulcrum pin nut after adjusting buffer clearance.

Buffer clearance: 22mm (0.87in)

Torque: 108N·m (11.0kg·m/80lbft)

450RS012

5. Install upper control arm assembly with the fulcrum pin projections turned inward.

450RS013

Legend

- (1) Projection
- (2) Outward

6. Install the caster shims(2) between the chassis frame and fulcrum pin.

7. Install the camber shims(1) between the chassis frame and fulcrum pin.

450RS014

3C-16 FRONT SUSPENSION

8. Install nut assembly.
9. Install bolt and plate, then tighten the bolt to the specified torque.

Torque: 152N·m (15.5kg·m/112lbft)

10. Install upper ball joint and tighten it to the specified torque.

Torque: 57N·m (5.8kg·m/42lbft)

11. Install nut and cotter pin then tighten the nut to the specified torque, with just enough additional torque to align cotter pin holes. Install new cotter pin.

Torque: 98N·m (10.0kg·m/72lbft)

12. Install speed sensor cable.

Lower Control Arm

Lower Control Arm and Associated Parts

450RW010

Legend

- | | |
|----------------------------|-----------------------------|
| (1) Nut, Front | (8) Bolt, Torsion Bar Arm |
| (2) Bush, Front | (9) Torsion Bar Arm Bracket |
| (3) Bolt, Front | (10) Torsion Bar |
| (4) Nut, Rear | (11) Lower Control Arm |
| (5) Bush, Rear | (12) Lower Ball Joint |
| (6) Bolt, Rear | (13) Shock Absorber |
| (7) Bolt, Lower Ball Joint | (14) Stabilizer Link |

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel in this section.
3. Remove the tie-rod end from the knuckle. Refer to Power Steering Unit in Steering section.
4. Remove the retaining ring from the front axle driving shaft to release the shaft from hub. Refer to Front Hub and Disc in Driveline/Axle section.
5. Support lower control arm with a jack.

3C-18 FRONT SUSPENSION

6. Remove front nut.
7. Remove rear nut.
8. Remove torsion bar, refer to Torsion Bar in this section.
9. Remove torsion bar arm bracket.
10. Disconnect the stabilizer link at the lower control arm.
11. Remove the shock absorber lower end from the lower control arm.
12. Remove the lower ball joint from the lower control arm.
13. Remove front bolt.
14. Remove rear bolt.
15. Remove lower control arm.
16. Remove torsion bar arm bolt.
17. Remove lower ball joint bolt.
18. Remove front bushing by using remover 5-8840-2123-0.

19. Remove rear bushing by using remover 5-8840-2124-0.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

Check the following parts:

- Lower control arm
- Bushing

Installation

1. Install rear bushing by using installer 5-8840-2124-0.

901RW053

2. Install front bushing by using installer 5-8840-2123-0.

901RW156

3. Install lower ball joint bolt.
4. Install torsion bar arm bolt.
5. Install lower control arm.
6. Install rear bolt.
7. Install front bolt.
8. Install lower ball joint and tighten it to the specified torque.
Torque: 116N-m (11.8kg-m/85lbft)
9. Install shock absorber and tighten it to the specified torque.
Torque: 93N-m (9.5kg-m/69lbft)
10. Install stabilizer link and tighten it to the specified torque.
Torque: 50N-m (5.1kg-m/37lbft)
11. Install torsion bar arm bracket and tighten it to the specified torque.
Torque: 116N-m (11.8kg-m/85lbft)
12. Install Torsion bar, refer to Torsion Bar in this section.
13. Install rear nut and tighten lower link nut finger-tight.

NOTE: Torque lower control arm nut after adjusting buffer clearance.

Buffer clearance: 22mm (0.87in)

Torque: 235N-m (24.0kg-m/174lbft)

450RS012

3C-20 FRONT SUSPENSION

14. Install front nut then tighten lower link nut finger-tight.

NOTE: Torque lower control arm nut after adjusting buffer clearance .

Buffer clearance: 22mm (0.87in)

Torque: 190N·m (19.4kg·m/140lbft)

NOTE: Adjust the trim height. Refer to Front End Alignment Inspection and Adjustment in Steering section.

450RS012

Upper Ball Joint

Upper Ball Joint and Associated Parts

Legend

- (1) Bolt and Nut
- (2) Upper Ball Joint

- (3) Nut and Cotter Pin

450RW004

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove the speed sensor from the knuckle.

3C-22 FRONT SUSPENSION

3. Remove upper ball joint nut and cotter pin, then use remover 5-8840-2121-0 to remove the upper ball joint from the knuckle.

CAUTION: Be careful not to damage the ball joint boot.

4. Remove bolt and nut.
5. Remove upper ball joint.

Inspection and Repair

Make necessary parts replacement if wear, damage, corrosion or any other abnormal conditions are found through inspection.

- Inspect the lower end boot for damage or grease leak. Move the ball joint as shown in the figure to confirm its normal movement.
- Inspect screw/taper area of ball for damage.
- If any defects are found by the above inspections, replace the ball joint assembly with new one.

- After moving the ball joint 4 or 5 times, attach nut then measure the preload.

Starting torque: 0.5 –3.2N·m (0.05–0.33kg·m/0.4–2.4lbft)

If the above limits specified are exceeded, replace the ball joint assembly.

Installation

1. Install upper ball joint.
2. Install bolt and nut, then tighten them to the specified torque.

Torque: 57N·m (5.8kg·m/42lbft)

3. Install nut and cotter pin, then tighten the nut to the specified torque with just enough additional torque to align cotter pin holes. Install new cotter pin.

Torque: 98N·m (10.0kg·m/72lbft)

Lower Ball Joint

Lower Ball Joint and Associated Parts

450RW011

Legend

- | | |
|----------------------|------------------------|
| (1) Bolt | (3) Nut |
| (2) Lower Ball Joint | (4) Nut and Cotter Pin |

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel in this section.
3. Remove the tie-rod end from the knuckle. Refer to Power Steering Unit in Steering section.
4. Remove the retaining ring from the front axle driving shaft to release the shaft from hub. Refer to Front Hub and Disc in Driveline/Axle section.
5. Support lower control arm with a jack.
6. Remove lower ball joint nut and cotter pin, then use remover 5-8840-2005-0 to remove the lower ball joint from the knuckle.

CAUTION: Be careful not to damage the ball joint boot.

901RW271

3C-24 FRONT SUSPENSION

7. Remove nut.
8. Remove bolt.
9. Remove lower ball joint.

Inspection and Repair

Make necessary parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

- Inspect the lower end boot for damage or grease leak. Move the ball joint as shown in the figure to confirm its normal movement .
- Inspect screw/taper area of ball for damage.
- If any defects are found by the above inspections, replace the ball joint assembly with new one.

- After moving the ball joint 4 or 5 times, attach nut then measure the preload.

Starting torque: 0.5–6.4 N·m (0.05–0.65 kg·m/0.4–4.7 lbft)

- If the above limits specified are exceeded, replace the ball joint assembly.

Installation

1. Install lower ball joint.
2. Install bolt.
3. Install nut and tighten it to the specified torque.
Torque: 116 N·m (11.8 kg·m/85 lbft)
4. Install ball joint nut, then tighten it to the specified torque with just enough additional torque to align cotter pin holes. Install new cotter pin.

Torque: 147 N·m (15.0 kg·m/108 lbft)

Main Data and Specifications

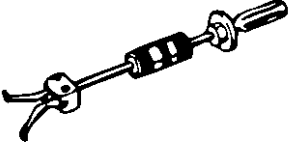

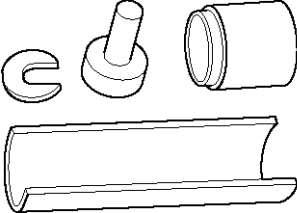

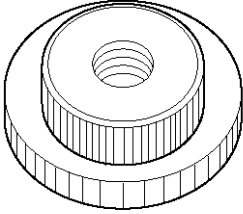

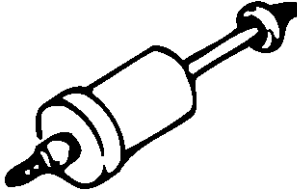

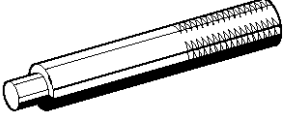

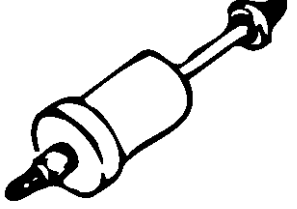

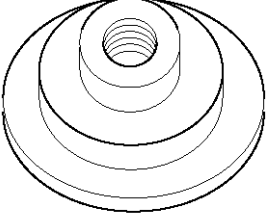

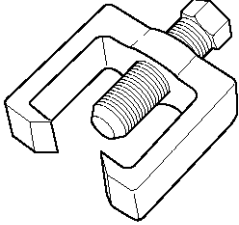

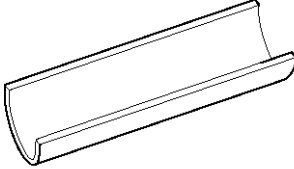

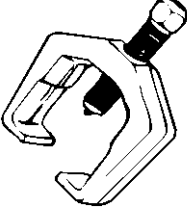

General Specifications

Front suspension	Type	Independent wishbone arms, torsion bar spring with stabilizer bar.
Torsion bar spring	Length	1142mm (45.0in)
	Diameter	Short wheel base: 27.0 mm (1.06 in) Long wheel base: 28.0 mm (1.10 in)
Front shock absorber	Type	Hydraulic, double acting, telescopic
	Piston diameter	30.0mm (1.18in)
	Stroke	125.0mm (4.92in)
	Compressed length	255.0mm (10.04in)
	Extended length	380.0mm (14.96in)
Stabilizer bar	Diameter	Short wheel base: 25.0 mm (0.98 in) Long wheel base: 24.0 mm (0.94 in)

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening

sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

The rear suspension is a 5-link, coil spring type suspension with a stabilizer bar, consisting of two trailing links, two upper links, lateral rod, shock absorber, and stabilizer. In this suspension, the links are specially arranged to enable the rear axle to move freely, thereby expanding suspension stroke, reducing friction, and improving lateral rigidity and roll control. All these result in improved stability, riding comfort, and rough road maneuverability.

Each link connects the axle housing with the frame through a runner bushing. The axle housing is supported by the trailing links and upper links longitudinally and by the lateral rod latitudinally.

3D-2 REAR SUSPENSION

Diagnosis

Condition	Possible cause	Correction
Vehicle Pulls	Mismatched or uneven tires.	Replace tire.
	Tires not adequately inflated.	Adjust tire pressure.
	Broken or sagging springs.	Replace spring.
	Radial tire lateral force.	Replace tire.
	Improper wheel alignment.	Adjust wheel alignment.
	Brake dragging in one wheel.	Repair brake.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension part(s).
	Faulty shock absorbers.	Replace shock absorber.
	Parts in power steering valve defective.	Replace power steering unit.
Abnormal or Excessive Tire Wear	Sagging or broken spring.	Replace spring.
	Tire out of balance.	Balance or replace tire.
	Improper wheel alignment.	Check front end alignment.
	Faulty shock absorber.	Replace shock absorber.
	Hard driving.	Replace tire.
	Overloaded vehicle.	Replace tire and reduce load.
	Tires not rotated periodically.	Replace or rotate tire.
	Worn or loose road wheel bearings.	Replace wheel bearing.
	Wobbly wheel or tires.	Replace wheel or tire.
Tires not adequately inflated.	Adjust the pressure.	
Wheel Hop	Blister or bump on tire.	Replace tire.
	Improper shock absorber operation.	Replace shock absorber.
Shimmy, Shake or Vibration	Tire or wheel out of balance.	Balance wheels or replace tire/or wheel.
	Loose wheel bearings.	Replace wheel bearing.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
	Excessive wheel runout.	Repair or replace wheel and/or tire.
	Blister or bump on tire.	Replace tire.
	Excessive loaded radial runout of tire/wheel assembly.	Replace tire or wheel.
	Improper wheel alignment.	Check wheel alignment.
	Loose or worn steering linkage.	Tighten or replace steering linkage.
	Loose steering unit.	Tighten steering unit.
	Tires not adequately inflated.	Adjust tire pressure.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension parts.
	Faulty shock absorber.	Replace shock absorber.
Hub bearing preload misadjustment.	Adjust preload.	
Parts in power steering valve defective.	Replace power steering unit.	

Condition	Possible cause	Correction
Hard Steering	Bind in steering linkage ball studs, upper or lower ball joint.	Replace ball joint.
	Improper wheel alignment.	Check wheel alignment.
	Tire not adequately inflated.	Inflate tires to proper pressure.
	Bind in steering column or shaft.	Repair or replace.
	Improper power steering system operation.	Repair or replace. Refer to Steering section.
Too Much Play In Steering	Wheel bearings worn.	Replace wheel bearings.
	Loose steering unit or linkage.	Retighten or repair.
	Worn or loose steering shaft universal joint.	Retighten or replace steering shaft.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
Poor Steering Wheel Returnability	Bind in steering linkage ball joints.	Replace ball joints.
	Bind in upper or lower ball joints.	Replace ball joints.
	Bind in steering column and shaft.	Repair or replace.
	Bind in steering gear.	Check and repair steering gear.
	Improper wheel alignment.	Adjust wheel alignment.
	Tires not adequately inflated.	Adjust pressure.
	Loose steering wheel nut.	Retighten.
	Worn wheel bearing.	Replace.
Abnormal Noise	Worn, sticky or loose upper or lower ball joint, steering linkage ball joints or drive axle joints.	Replace.
	Faulty shock absorbers.	Replace.
	Worn upper or lower control arm bushing.	Replace.
	Loose stabilizer bar.	Retighten bolts or replace bushings.
	Loose wheel nuts.	Tighten nuts. Check for elongated wheel nut holes. Replace wheel if required.
	Loose suspension bolts or nuts.	Retighten suspension bolts or nuts.
	Broken or otherwise damaged wheel bearings.	Replace wheel bearing.
	Broken suspension springs.	Replace spring.
	Loose steering unit.	Retighten mounting bolt.
	Faulty steering unit.	Replace steering unit.
Wandering or Poor Steering Stability	Mismatched or unevenly worn tires.	Replace tire or inflate tires to proper pressure.
	Loose steering linkage ball joints.	Replace ball joints.
	Faulty shock absorbers.	Replace shock absorber.
	Loose stabilizer bar.	Tighten or replace stabilizer bar or bushings.
	Broken or sagging springs.	Replace spring (pairs).
	Improper wheel alignment.	Adjust wheel alignment.

3D-4 REAR SUSPENSION

Condition	Possible cause	Correction
Erratic Steering When Braking	Worn wheel bearings.	Replace wheel bearings.
	Broken or sagging springs.	Replace spring (pairs).
	Leaking caliper.	Repair or replace caliper.
	Warped discs.	Replace brake disc.
	Badly worn brake pads.	Replace brake pads.
	Tires are inflated unequally.	Inflate tires to proper pressure.
Low or Uneven Trim Height	Broken or sagging springs.	Replace springs (In pairs).
	Vehicle overloaded.	Reduce load.
	Incorrect springs.	Adjust or replace torsion bar.
Suspension Bottoms	Vehicle overloaded.	Reduce load.
	Faulty shock absorber.	Replace shock absorber.
	Incorrect, broken or sagging springs.	Replace springs.
Body Leans	Loose stabilizer bar.	Tighten stabilizer bar bolts or replace bushings.
	Faulty shock absorber, struts or mounting.	Replace shock absorber.
	Broken or sagging springs.	Replace springs (In pairs).
	Vehicle overloaded.	Reduce load.
Cupped Tires	Worn wheel bearings.	Replace wheel bearing.
	Excessive tire or wheel run out.	Replace tire or wheel.
	Worn ball joints.	Replace ball joints.
	Tire out of balance.	Adjust tire balance.

Coil Spring

Coil Spring and Associated Parts

Legend

- | | |
|------------------------------------|--------------------|
| (1) Stabilizer Bar | (5) Insulator |
| (2) Upper Link Fixing Bolt and Nut | (6) Shock Absorbar |
| (3) Rubber Plate | (7) Breather Hose |
| (4) Coil Spring | |

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Support the rear axle case with a jack.
3. Disconnect brake hose at the crossmember.
4. Remove breather hose.
5. Remove upper link fixing bolt, nut and rubber plate on the rear axle case (left-side only).
6. Disconnect the stabilizer bar at the stabilizer link.
7. Remove the shock absorber from the axle case.
8. Remove spring insulator.
9. Remove the insulator and coil spring while lowering the rear axle case.

CAUTION: Be sure not to let the brake hose, parking brake cable, and breather hose extend to their full length.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

Check the following parts:

- Coil spring
- Insulator

Installation

1. Install coil spring and make sure that the coil spring is installed in the proper position. Paint mark(1) should be downward.

2. Fit the end of the coil spring to the coil spring seat and mount the coil spring on the rear axle case.

3. Install the insulator on the coil spring. Jack up the axle case gently with the top of the coil spring set to the spring seat on the frame side.

4. Install shock absorber and tighten the nut lightly, then retighten it to the specified torque after the vehicle is at curb height.

NOTE: When mounting shock absorber, be sure not to use grease on bushings or any other nearby part.

Torque: 78 N·m (8.0kg·m/58 lbft)

5. Install stabilizer bar.

Torque: 31 N·m (3.2kg·m/23 lbft)

6. Install upper link with rubber plate and tighten fixing bolt.

Torque: 137 N·m (14.0kg·m/101 lbft)

7. Install breather hose.

8. Connect brake hose and bleed the brake system. Refer to Bleeding the Brake Hydraulic System in Brake section.

Shock Absorber

Shock Absorber and Associated Parts

Legend

- (1) Nut, Bush and Washer
 (2) Shock Absorber

- (3) Nut and Washer

Removal

1. Remove shock absorber fixing nut, bush and washer (upper side).
2. Remove shock absorber fixing nut and washer (lower side).
3. Remove shock absorber.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

Check the following parts:

- Shock absorber
- Rubber bushing

NOTE: When mounting rubber bushings, be sure not to use grease on bushings or any other nearby part.

Installation

1. Install shock absorber. When mounting shock absorber, be sure not to use grease on bushings or any other nearby part.
2. Install nut and washer (lower side), then tighten the nut lightly. Retighten to the bolt and nut specified torque after the vehicle is at curb height.

Torque: 78N-m (8.0kg-m/58lbft)

3. Install nut, bush and washer (upper side), then tighten the nut lightly. Retighten to the nut specified torque after the vehicle is at curb height.

Torque: 20N-m (2.0kg-m/14lbft)

Trailing Link

Trailing Link and Associated Parts

460RW038

Legend

- | | |
|--------------------------------|-----------------------|
| (1) Bolt and Nut (Axle side) | (3) Bolt (Frame side) |
| (2) Protector (Left side only) | |

Removal

1. Remove the parking brake cable from the trailing link.
2. Remove the trailing link fixing bolt, nut and protector.
3. Remove trailing link.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

1. Trailing link
2. Rubber bushing
 - Remove the rubber bushing by using remover 5-8840-2298-0.

901RW280

- Install the rubber bushing by using installer 5-8840-2298-0.

NOTE: When mounting rubber bushings, be sure not to use grease on bushings or any other nearby part.

Installation

1. Install trailing link. Make sure that the trailing link is in its correct position.

NOTE: When mounting trailing link, be sure not to use grease on bushings or any other nearby part.

2. Install bolt, nut and protector. Tighten the bolts and nuts lightly, then retighten them to the specified torque after the vehicle is at curb height.

Torque: 137N·m (14.0kg·m/101lbft)

3. Install parking brake cable.

CAUTION: The parking brake cable should not be overstrained or slackened.

Upper Link

Upper Link and Associated Parts

460RW037-1

Legend

- | | |
|------------------------------|--------------------------------|
| (1) Bolt and Nut (Axle side) | (4) Protector (Left side only) |
| (2) Rubber Plate | (5) Bolt (Frame side) |
| (3) Upper Link | |

Removal

1. Remove fuel tank. Refer to Engine Fuel in Engine section.
2. Remove the speed sensor cable from the upper link.
3. Remove bolt, nut, rubber plate and protector.
4. Remove upper link.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

1. Upper link
2. Rubber bushing
 - Remove the rubber bushing by using remover 5-8840-2565-0.

901RW282

- Install the rubber bushing by using to installer 5-8840-2565-0.

NOTE: When mounting rubber bushings, be sure not to use grease on bushings or any other nearby part.

Installation

1. Install upper link. Make sure that the upper link is in its correct position.

NOTE: When mounting upper link, be sure not to use grease bushings or any other nearby part.

2. Install bolt, nut, rubber plate and protector. Tighten the bolts and nuts lightly, then retighten them to the specified torque after the vehicle is at curb height.

Torque: 137N·m (14.0kg·m/101lbft)

3. Install speed sensor cable.
4. Install fuel tank.

Lateral Rod

Lateral Rod and Associated Parts

460RW036

Legend

- (1) Bolt and Nut (Frame side)
 (2) Lateral Rod

- (3) Nut and Washer (Axle side)

Removal

1. Remove nut and washer.
2. Remove bolt and nut.
3. Remove lateral rod.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

1. Lateral rod
2. Rubber bushing (Frame side)
 - Remove the rubber bushing (Frame side) by using remover 5-8840-2299-0.

901RW284

- Install the rubber bushing (Frame side) by using Installer 5-8840-2299-0.

NOTE: When mounting rubber bushings, do not use grease on bushings or any other nearby parts.

3. Rubber bushing (Axle side)

- Remove the rubber bushing (Axle side) by using remover 5-8840-2327-0.

- Install the rubber bushing (Axle side) by using installer 5-8840-2327-0.

Installation

1. Install lateral rod and make sure that the lateral rod is in its correct position.

NOTE: When mounting lateral rod, be sure not to use grease on bushings or any other nearby part.

Legend

- (1) Frame Side
- (2) Axle Side

2. Install bolt and nut. Tighten the bolt and nut lightly, then retighten them to the specified torque after the vehicle is at curb height.

Torque: 137N-m (14.0kg-m/101lbft)

3. Install nut and washer. Tighten the nut lightly, then retighten the nut to the specified torque after the vehicle is at curb height.

Torque: 78N-m (8.0kg-m/58lbft)

Stabilizer Bar

Stabilizer Bar and Associated Parts

Legend

- | | |
|------------------|--------------------|
| (1) Bracket | (4) Stabilizer Bar |
| (2) Link | (5) Rubber Bushing |
| (3) Bolt and Nut | |

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel in this section.
3. Remove bolt and nut.
4. Remove link.

CAUTION: Be careful not to damage the ball joint boot.

5. Remove bracket.

6. Remove rubber bushing.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

Check the following parts:

- Stabilizer bar
- Rubber bushing
- Link

Installation

1. Install rubber bushing.
2. Install bracket to axle housing and tighten to the specified torque.

Torque: 25 N·m (2.5 kg·m/19 lbf)

3. Install link.
4. Install bolt and nut, then tighten the nut to the specified torque.

Torque: 31 N·m (3.2 kg·m/27 lbf)

460RW010

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

3E-2 WHEEL AND TIRE SYSTEM

General Description

Replacement wheels or tires must be equivalent to the originals in load capacity, specified dimension and mounting configuration. Improper size or type may affect bearing life, brake performance, speedometer/odometer calibration, vehicle ground clearance and tire clearance to the body and chassis. All model are equipped with metric sized tubeless steel belted radial tires. Correct tire pressures and driving habits have an important influence on tire life. Heavy cornering, excessively rapid acceleration and unnecessary sharp braking increase premature and uneven wear.

Diagnosis

Condition	Possible cause	Correction
Vehicle Pulls	Mismatched or uneven tires.	Replace tire.
	Tires not adequately inflated.	Adjust tire pressure.
	Broken or sagging springs.	Replace spring.
	Radial tire lateral force.	Replace tire.
	Improper wheel alignment.	Adjust wheel alignment.
	Brake dragging in one wheel.	Repair brake.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension part(s).
	Faulty shock absorbers.	Replace shock absorber.
	Parts in power steering valve defective.	Replace power steering unit.
Abnormal or Excessive Tire Wear	Sagging or broken spring.	Replace spring.
	Tire out of balance.	Balance or replace tire.
	Improper wheel alignment.	Check front end alignment.
	Faulty shock absorber.	Replace shock absorber.
	Hard driving.	Replace tire.
	Overloaded vehicle.	Replace tire and reduce load.
	Tires not rotated periodically.	Replace or rotate tire.
	Worn or loose road wheel bearings.	Replace wheel bearing.
	Wobbly wheel or tires.	Replace wheel or tire.
Tires not adequately inflated.	Adjust the pressure.	
Wheel Hop	Blister or bump on tire.	Replace tire.
	Improper shock absorber operation.	Replace shock absorber.
Shimmy, Shake or Vibration	Tire or wheel out of balance.	Balance wheels or replace tire/or wheel.
	Loose wheel bearings.	Replace wheel bearing.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
	Excessive wheel runout.	Repair or replace wheel and/or tire.
	Blister or bump on tire.	Replace tire.
	Excessive loaded radial runout of tire/wheel assembly.	Replace tire or wheel.
	Improper wheel alignment.	Check wheel alignment.
	Loose or worn steering linkage.	Tighten or replace steering linkage.
	Loose steering unit.	Tighten steering unit.
	Tires not adequately inflated.	Adjust tire pressure.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension parts.
	Faulty shock absorber.	Replace shock absorber.
Hub bearing preload misadjustment.	Adjust preload.	
Parts in power steering valve defective.	Replace power steering unit.	

Condition	Possible cause	Correction
Hard Steering	Bind in steering linkage ball studs, upper or lower ball joint.	Replace ball joint.
	Improper wheel alignment.	Check wheel alignment.
	Tire not adequately inflated.	Inflate tires to proper pressure.
	Bind in steering column or shaft.	Repair or replace.
	Improper power steering system operation.	Repair or replace. Refer to Steering section.
Too Much Play In Steering	Wheel bearings worn.	Replace wheel bearings.
	Loose steering unit or linkage.	Retighten or repair.
	Worn or loose steering shaft universal joint.	Retighten or replace steering shaft.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
Poor Steering Wheel Returnability	Bind in steering linkage ball joints.	Replace ball joints.
	Bind in upper or lower ball joints.	Replace ball joints.
	Bind in steering column and shaft.	Repair or replace.
	Bind in steering gear.	Check and repair steering gear.
	Improper wheel alignment.	Adjust wheel alignment.
	Tires not adequately inflated.	Adjust pressure.
	Loose steering wheel nut.	Retighten.
	Worn wheel bearing.	Replace.
Abnormal Noise	Worn, sticky or loose upper or lower ball joint, steering linkage ball joints or drive axle joints.	Replace.
	Faulty shock absorbers.	Replace.
	Worn upper or lower control arm bushing.	Replace.
	Loose stabilizer bar.	Retighten bolts or replace bushings.
	Loose wheel nuts.	Tighten nuts. Check for elongated wheel nut holes. Replace wheel if required.
	Loose suspension bolts or nuts.	Retighten suspension bolts or nuts.
	Broken or otherwise damaged wheel bearings.	Replace wheel bearing.
	Broken suspension springs.	Replace spring.
	Loose steering unit.	Retighten mounting bolt.
	Faulty steering unit.	Replace steering unit.
Wandering or Poor Steering Stability	Mismatched or unevenly worn tires.	Replace tire or inflate tires to proper pressure.
	Loose steering linkage ball joints.	Replace ball joints.
	Faulty shock absorbers.	Replace shock absorber.
	Loose stabilizer bar.	Tighten or replace stabilizer bar or bushings.
	Broken or sagging springs.	Replace spring (pairs).
	Improper wheel alignment.	Adjust wheel alignment.

Condition	Possible cause	Correction
Erratic Steering When Braking	Worn wheel bearings.	Replace wheel bearings.
	Broken or sagging springs.	Replace spring (pairs).
	Leaking caliper.	Repair or replace caliper.
	Warped discs.	Replace brake disc.
	Badly worn brake pads.	Replace brake pads.
	Tires are inflated unequally.	Inflate tires to proper pressure.
Low or Uneven Trim Height	Broken or sagging springs.	Replace springs (In pairs).
	Vehicle overloaded.	Reduce load.
	Incorrect springs.	Adjust or replace torsion bar.
Suspension Bottoms	Vehicle overloaded.	Reduce load.
	Faulty shock absorber.	Replace shock absorber.
	Incorrect, broken or sagging springs.	Replace springs.
Body Leans	Loose stabilizer bar.	Tighten stabilizer bar bolts or replace bushings.
	Faulty shock absorber, struts or mounting.	Replace shock absorber.
	Broken or sagging springs.	Replace springs (In pairs).
	Vehicle overloaded.	Reduce load.
Cupped Tires	Worn wheel bearings.	Replace wheel bearing.
	Excessive tire or wheel run out.	Replace tire or wheel.
	Worn ball joints.	Replace ball joints.
	Tire out of balance.	Adjust tire balance.

Irregular and Premature Wear

Irregular and/or premature wear has many causes. Some of them are incorrect inflation pressures, lack of tire rotation, poor driving habits or improper wheel alignment. Incorrect inflation is common cause of tire premature wear.

NOTE: Due to their design, radial tires tend to wear faster in the shoulder area, particularly on the front tires. This makes regular rotation especially necessary. After rotation, be sure to check wheel nut torque, and set tire pressures.

Tire Rotation

Tire rotation is recommended to equalize wear for longer tire life.

Legend

(1) Spare Tire

If the following conditions are noted, rotate the tires:

- Front tire wear is different from rear.
- Uneven wear exists across the tread of any tire.
- Left and right front tire wear is unequal.
- Left and right rear tire wear is unequal.

Check wheel alignment if the following conditions are noted:

- Left and right front tire wear is unequal.
- Wear is uneven across the tread of any front tire.
- Front tire treads have a scuffed appearance with "feather" edges on one side of the tread ribs or blocks.

Tread Wear Indicators

The original equipment tires have built-in tread wear indicators(1) to show when tires need replacement. These indicators may appear as wide bands. When the indicators appear in two or more grooves at three locations, tire replacement is recommended.

Inflation of Tires

Tire pressure, in cold condition (after vehicle has set for three hours or more, and driven less than one mile), should be checked monthly or before any extended trip. Tire pressure increases approximately 15% when the tires become hot during driving. Tire pressure specification is shown on the label located on the left door lock pillar.

NOTE: Check the tire pressure whenever irregular wear is found. Tire inflation greatly affects tire wear. If the alignment check does not reveal any alignment problems, check the condition of the shock absorbers and wheel/tire balance.

Diagnosis List

If the following conditions are noted, rotation is required.

1. Front tire wear is different from rear.
2. Uneven wear exists across the tread of any tire.
3. Left and right front tire wear is unequal.
4. Left and right rear tire wear is unequal.

If the following conditions are noted, check the wheel alignment.

1. Left and right front tire wear is unequal.
2. Uneven wear exists across the tread of any tire.
3. Front tire treads have scuffed appearance with "feather" edges on one side of tread ribs or blocks.
4. There is cupping, flat spotting etc.

Higher than recommended pressure can cause:

1. Hard ride.
2. Poor steering stability.
3. Rapid and uneven wear at center of the tread.

Lower than recommended pressure can cause:

1. Tire squeal on turns.
2. Hard steering.
3. Rapid and uneven wear on the edges of the tread.

4. Tire rim bruises and rupture.
5. Tire cord breakage.
6. High tire temperatures.
7. Reduced handling.
8. Reduced fuel economy.

Unequal pressure on same axle can cause:

1. Uneven braking.
2. Steering lead.
3. Reduced handling.
4. Swerve on acceleration.

Radial Tire Waddle

Waddle is side-to-side movement at the front and/or rear of the car. It can be caused by the steel belt not being straight within the tire, or by excessive lateral runout of the tire or wheel. It is most noticeable at low speed, about 8 to 48 km/h (5 to 30 mph). It may also cause rough ride at 80 to 113 km/h (50 to 70 mph). The car can be road tested to see which end of the car has the faulty tire. If the tire causing the waddle is on the rear, the rear end of the car will "waddle". From the driver's seat, it feels as if someone is pushing on the side of the car.

If the faulty tire is on the front, the waddle is more easily seen. The front sheet metal appears to be moving back and forth. It feels as if the driver's seat is the pivot point in the car.

Another more time-consuming method of determining the faulty tire is substituting tire and wheel assemblies that are known to be good. Follow these steps:

1. Drive the car to determine if the waddle is coming from the front or rear.
2. Install tire and wheel assemblies known to be good (from a similar car) in place of those on the end of the car which is waddling. If the waddle cannot be isolated to front or rear, start with the rear tires.

3E-8 WHEEL AND TIRE SYSTEM

3. Road test again. If improvement is noted, install the original tire and wheel assemblies one at a time until the faulty tire is found. If no improvement is noted, install tires known to be good in place of all four. Then, install the originals one at a time until the faulty tire is found.

Radial Tire Lead/Pull

"Lead/Pull" is vehicle deviation from a straight path, on a level road with no pressure on the steering wheel.

Lead is usually caused by:

1. Poorly manufactured radial tires.

2. Uneven brake adjustment.

3. Wheel alignment.

The way in which a tire is built can produce lead in a car. An example of this is placement of the belt. Off-center belts on radial tires can cause the tire to develop a side force while rolling straight down the road and the tire will tend to roll like a cone.

The "Radial Tire Lead/Pull Correction" chart should be used to make sure that front wheel alignment is not mistaken for tire lead.

Rear tires will not cause lead/pull.

Radial Tire Lead/Pull Correction Chart

Step	Action	Yes	No
1	1. Inflate tires to recommended pressure. 2. Road test vehicle on level uncrowned road. Was a problem corrected?	End.	Go to Step 2
2	Switch front tires side to side and road test again. Was a problem corrected?	If roughness results, replace tires.	Go to Step 3
3	Did the vehicle lead in same direction?	Go to Step 4	Go to Step 5
4	Put tires back in original position and check alignment. Was a problem corrected?	End.	Go to Step 5
5	Install known good tire on one front side. Was a problem corrected?	Replace tire.	Install a known good tire in place of other front tire. If lead corrected, replace tire.

Typical examples of abnormal tire ahead wear and major causes:

CAUTION: Similar wear patterns can be caused by worn suspension parts, misalignment of wheels and tires, and other suspension related problems.

Spotty wear – wear localized on shoulder sections, and in an extreme cases, the tire becomes polygonal in shape.

1. Tire or wheel out of round or distorted.
 2. Hub or knuckle out of round or distorted.
 3. Play in hub bearings or ball joint.
 4. Rotating parts out of balance.
- Tread wear one-sided.

480RW003

1. Rotating parts out of balance.
 2. Tire or wheel out of round.
 3. Hub or knuckle out of round or distorted.
- Localized tread wear.

480RW004

1. Once spotty wear develops in tread due to hard braking or abrupt starting, localized wear tends to be promoted.
- Shoulder wear (generally wear develops in outer shoulder):

480RW005

1. Camber or toe-in incorrect.
2. Shoulder wear caused by repeated hard-cornering. Wear in shoulders at points opposed to each other.

480RW006

3E-10 WHEEL AND TIRE SYSTEM

1. Tire or wheel out of round or distorted.
 2. Play in bearings or ball joint.
- Premature wear in shoulders.

480RW007

1. Flexing of tire excessive due to under-inflation.
- One sided feather edging.

480RW008

1. Wear caused by repeated hard cornering.
2. Camber or toe-in incorrect.

Wheel

Wheel and Associated Parts

480RX008

Legend

(1) Wheel Lug Nut

(2) Wheel and Tire

Removal

1. Loosen wheel lug nut by approximately 180° (half a rotation), then raise the vehicle and remove the nuts.
2. Remove wheel and tire.

NOTE: Never use heat to loosen a tight wheel lug nut. The application of heat to the hub can shorten the life of the wheel and may cause damage to wheel bearings.

Installation

1. Install wheel and tire.
2. Install wheel lug nut, and lower the vehicle. Tighten the wheel lug nuts to the specified torque in numerical order.

Torque: 118N·m (12.0kg·m/87lbft)

CAUTION: Before installing wheels, remove any build-up of corrosion on the wheel mounting surface and brake disc mounting surface by scraping and wire brushing. Installing wheels without good metal-to-metal contact at mounting surfaces can cause wheel nuts to loosen, which can later allow a wheel to come off while the vehicle is moving.

NOTE: Valve caps should be on the valve stems to keep dust and water out.

490RS020

Tire

Tire Replacement

When replacement is necessary, the original metric the size should be used. Most metric tire sizes do not have exact corresponding alphanumeric tire sizes. It is recommended that new tires be installed in pairs on the same axle. If necessary to replace only one tire, it should be paired with tire having the most tread, to equalize braking traction.

CAUTION: Do not mix different types of tires such as radial, bias and bias-belted tires except in emergencies, because vehicle handling may be seriously affected and may result in loss of control.

Tire Dismounting

Remove valve cap on valve step and deflate the tire. Then use a tire changing machine to mount or dismount tires.

Follow the equipment manufacturer's instruction. Do not use hand tools or tire lever alone to change tires as they may damage the tire beads or wheel rim.

Tire Mounting

Rim bead seats should be cleaned with a wire brush or coarse steel wool to remove lubricants, and light rust. Before mounting a tire, the bead area should be well lubricated with an approved tire lubricant.

After mounting, inflate the tire to 200kPa (2.0kg/cm², 28 psi) so that beads are completely seated. Inflate the air to specified pressure and install valve cap to the stem.

WARNING: NEVER STAND OVER TIRE WHEN INFLATING. BEAD MAY BREAK WHEN BEAD SNAPS OVER RIM'S SAFETY HUMP AND CAUSE SERIOUS PERSONAL INJURY.

NEVER EXCEED 240 KPA (2.4kg/cm², 35 PSI) PRESSURE WHEN INFLATING. IF 240 KPA (2.4kg/cm², 35 PSI) PRESSURE WILL NOT SEAT BEADS, DEFLATE, RE-LUBRICATE AND RE-INFLATE. OVER INFLATION MAY CAUSE THE BEAD TO BREAK AND CAUSE SERIOUS PERSONAL INJURY.

Tire Repair

There are many different materials on the market used to repair tires.

Manufacturers have published detailed instructions on how and when to repair tires. These instructions can be obtained from the tire manufacturer if they are not included with the repair kit.

Wheel Inspection

Damaged wheels and wheels with excessive run-out must be replaced.

Wheel run out at rim (Base on hub Bore):

Steel	Aluminum
1– Vertical play: Less than 1.5 mm (0.059 in)	1– Vertical play: Less than 0.7 mm (0.028 in)
2– Horizontal play: Less than 1.5 mm (0.059 in)	2– Horizontal play: Less than 0.7 mm (0.028 in)

480RS012

General Balance Procedure

Deposits of mud, etc. must be cleaned from the inside of the rim.

The tire should be inspected for the following: match mount paint marks, bent rims, bulges, irregular tire wear, proper wheel size and inflation pressure. Then balance according to the equipment manufacturer's recommendations.

There are two types of wheel and tire balance. Static balance is the equal distribution of weight around the wheel.

Assemblies that are statically unbalanced cause a bouncing action called tramp. This condition will eventually cause uneven tire wear.

480RS013

Legend

- (1) Heavy Spot Wheel Shimmy
- (2) Add Balance Weights Here

Dynamic balance is the equal distribution of weight on each side of the wheel center-line so that when the tire spins there is no tendency for the assembly to move from side to side. Assemblies that are dynamically unbalanced may cause shimmy.

480RS014

Legend

- (1) Heavy Spot Wheel Hop
- (2) Add Balance Weights Here

Balancing Wheel and Tire

On-vehicle Balancing

On-Vehicle balancing methods vary with equipment and tool manufacturers. Be sure to follow each manufacturer's instructions during balancing operation.

Off-vehicle Balancing

Most electronic off-vehicle balancers are more accurate than the on-vehicle spin balancers. They are easy to use and give a dynamic balance. Although they do not correct for drum or disc unbalance (as on-vehicle spin balancing does), they are very accurate.

480RS015

WARNING: STONES SHOULD BE REMOVED FROM THE TREAD TO AVOID OPERATOR INJURY DURING SPIN BALANCING AND TO OBTAIN A GOOD BALANCE.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Front Drive Axle

Diagnosis

Condition	Possible cause	Correction
Oil Leak At Front Axle	Worn or defective oil seal.	Replace the oil seal.
	Front axle housing cracked.	Repair or replace.
Oil Leak At Pinion Shaft	Too much gear oil.	Correct the oil level.
	Oil seal worn or defective.	Replace the oil seal.
	Pinion flange loose or damaged.	Tighten or replace.
Noises In Front Axle Drive Shaft Joint	Broken or worn drive shaft joints and bellows (BJ and DOJ).	Replace the drive shaft joints and bellows.
"Clank" When Accelerating From "Coast"	Loose drive shaft joint to output shaft bolts.	Tighten.
	Damaged inner drive shaft joint.	Replace.
Shudder or Vibration During Acceleration	Excessive drive shaft joint angle.	Repair.
	Worn or damaged drive shaft joints.	Replace.
	Sticking spider assembly (inner drive shaft joint).	Lubricate or replace.
	Sticking joint assembly (outer drive shaft joint).	Lubricate or replace.
Vibration At Highway Speeds	Out of balance or out of round tires.	Balance or replace.
	Front end out of alignment.	Align.
Noises in Front Axle	Insufficient gear oil.	Replenish the gear oil.
	Wrong or poor grade gear oil.	Replace the gear oil.
	Drive pinion to ring gear backlash incorrect.	Adjust the backlash.
	Worn or chipped ring gear, pinion gear or side gear.	Replace the ring gear, pinion gear or side gear.
	Pinion shaft bearing worn.	Replace the pinion shaft bearing.
	Wheel bearing worn.	Replace the wheel bearing.
	Differential bearing loose or worn.	Tighten or replace.
Wanders and Pulls	Wheel bearing preload too tight.	Adjust the wheel bearing preload.
	Incorrect front alignment.	Adjust the front alignment.
	Steering unit loose or worn.	Tighten or replace.
	Tire worn or improperly inflated.	Adjust the inflation or replace.
	Front or rear suspension parts loose or broken.	Tighten or replace.
Front Wheel Shimmy	Wheel bearing worn or improperly adjusted.	Adjust or replace.
	Incorrect front alignment.	Adjust the front alignment.
	Worn ball joint or bush.	Replace the ball joint or bush.
	Steering unit loose or worn.	Tighten or replace.
	Tire worn or improperly inflated.	Replace or adjust the inflation.
	Shock absorber worn.	Replace the shock absorber.

Pinion Shaft Oil Seal

Legend

- | | |
|----------------|------------------------|
| (1) Flange Nut | (4) Outer Bearing |
| (2) Flange | (5) Collapsible Spacer |
| (3) Oil Seal | |

Removal

1. Raise the vehicle and support it at the frame.
The hoist must remain under the front axle housing.
2. Drain the front axle oil by loosening the drain plug(1).

412RS001

4A1-4 DIFFERENTIAL (FRONT)

3. Remove the front propeller shaft. Refer to Front Propeller Shaft in this section.
4. Remove flange nut by using pinion flange holder 5-8840-2157-0.

5. Remove flange.
6. Remove oil seal.
7. Remove outer bearing by using remover 5-8840-2323-0.

8. Remove collapsible spacer.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection. Check the following parts.

1. Seal surface of the pinion.
2. Cage bore for burns.

Installation

1. Install collapsible spacer. Discard the used collapsible spacer and install a new one.
2. Install outer bearing.

NOTE: Do not drive in, but just temporarily set in the outer bearing by hand, which should be indirectly pressed in finally by tightening the flange nut.

3. Install oil seal, use oil seal installer 9-8522-1275-0 to install a new oil seal that has grease on seal lip.

4. Install flange.
5. Install flange nut, refer to Differential Assembly Overhaul for flange nut reassembly in this section.

NOTE: Discard the used nut and install a new one.

Front Drive Axle Assembly

Front Drive Axle Assembly and Associated Parts

Legend

| (3) Front Axle Case Assembly and Front Drive Shaft Assembly | (7) Knuckle and Back Plate |
| (4) Washer | (8) Hub and Disc Assembly |
| | (9) Suspension Crossmember |

4A1-6 DIFFERENTIAL (FRONT)

Removal

1. Jack up the vehicle and support it using jack stand.
2. Remove the tire and wheel.
3. Remove the stone guard.
4. Remove the brake caliper fixing bolt and hang the caliper. Refer to Disc Brakes in Brake section.
5. Remove the antilock brake system speed sensor. Refer to Front Wheel Speed Sensor in Brake section.
6. Remove the hub and disc assembly. Refer to Front Hub and Disc in this section.
7. Remove the propeller shaft, refer to Front Propeller Shaft in this section.
8. Loosen the height control arm of the torsion bar, then remove the torsion bar from lower control arm. refer to Torsion Bar in Suspension section.
9. Remove the suspension crossmember.
10. Remove the lower nut (1) of the stabilizer link.
11. Remove the lower bolt and nut (2) of the shock absorber.

12. Remove the tie-rod end from the knuckle. Refer to Power Steering Unit in Steering Section.
13. Disconnect the hose of the shift on the fly, at the hose clip portion (1).
14. Disconnect the shift switch connector (2).

15. Remove the bolts and nuts of the lower control arm (Frame side), then disconnect the lower control arm from frame.
16. Disconnect between the right side upper control arm and the knuckle, then remove the knuckle with lower control arm.

CAUTION: When removing the knuckle, be careful not to damage the oil seal inside of the knuckle.

17. Support the differential case by the jack.
18. Remove the front axle mounting bolts and nuts, lower the jack slowly. Remove the left side drive shaft end from the knuckle, then lower the axle assembly from the vehicle.

CAUTION:

1. During the work, be sure that the axle assembly is supported securely.
2. Be careful not to damage the bellows of the power steering unit by interference.
3. Be careful not to damage the hose bracket of the shift on the fly by interference.

Installation

1. Support the differential case by the jack.
2. Jack up the front drive axle assembly, install the left side drive shaft to the knuckle, then install the mount bolts and nuts.

CAUTION:

1. Be careful not to damage the bellows of the power steering unit by interference.
2. Be careful not to damage the hose bracket of the shift on the fly by interference.
3. When installing the drive shaft to the knuckle, be careful not to damage the oil seal inside of the knuckle.
3. Tighten the mounting bolts and nuts to the specified torque.

Torque: 168N·m (17.2kg·m/124 lbft)

4. Install the right side knuckle with lower control arm to the upper control arm.
Refer to Knuckle in Suspension section.

CAUTION: When insert the drive shaft to the knuckle, be careful not to damage the oil seal inside of the knuckle.

5. Align the bolt hole of the lower control arm, install the bolts and nuts.

NOTE: Adjust the buffer clearance before tighten the bolts and nuts of the lower control arm.

6. Install the hose of the shift on the fly (1).
7. Install the shift switch connector (2) of the shift on the fly.

8. Install the tie-rod end of the power steering unit to the knuckle, tighten the nut to the specified torque.

Torque: 118N·m (12.0kg·m/87 lbft)

9. Install lower bolts and nuts of the shock absorber, tighten it to the specified torque.

Torque: 93N·m (9.5kg·m/69 lbft)

10. Install lower nuts of the stabilizer link, tighten it to the specified torque.
11. Install the suspension crossmember.
12. Install the torsion bar.
Refer to Torsion Bar in Suspension section.
13. Install the front propeller shaft.
Refer to Front Propeller Shaft in this section.
14. Install the hub and disc assembly and adjust the bearing preload.
Refer to Front Hub and Disc in this section.
15. Install the wheel speed sensor of the antilock brake system.
16. Install the brake caliper. Tighten the bolt of the caliper bracket to the specified torque.
Torque: 50N·m (5.1kg·m/37 lbft)
17. Install the stone guard.
18. Install the tire and wheel.
19. Lower the vehicle, adjust the trim height.
Refer to Trim Height Adjustment in Steering section.
20. Tighten the bolts and nuts of the lower control arm to the specified torque.
Refer to Lower Control Arm in Suspension section.

Differential Assembly

Disassembled View

415RX003

Legend

- | | |
|-------------------------------|------------------------------|
| (1) Differential Assembly | (12) Collapsible Spacer |

| (9) Bearing Cap | (20) Bolt |
| (10) Bolt | (21) Axle Case |
| (11) Inner Bearing Outer Race | |

Disassembly

1. Remove differential carrier fixing bolt.
2. Remove differential assembly.
3. Using holding fixture 5-8840-0275-0 and holding fixture base 5-8840-0003-0, fix the differential assembly to the bench.

4. Remove bearing cap bolt.
5. Apply a setting mark to the side bearing cap and the differential carrier then remove bearing cap.

6. Remove differential cage assembly.
7. Remove side bearing outer race, after removal, keep the right and left hand side bearing assemblies separate to maintain inner and outer race combinations.
8. Remove side bearing, using remover 5-8840-0013-0, 5-8840-0014-0 and adapter 9-8521-1743-0.

9. Remove adjust shim, note the thickness and position of the shims removed.
10. Remove the flange nut using holding wrench 5-8840-2157-0 after raising up its staked parts completely.

4A1-10 DIFFERENTIAL (FRONT)

11. Remove flange.
12. Remove dust cover.
13. Remove the drive pinion assembly using a soft metal rod and a hammer.

14. Remove collapsible spacer.
15. Remove the inner bearing using remover 5-8840-0015-0 and a press.

16. Remove adjust shim.
17. Remove oil seal.
18. Remove outer bearing.
19. Remove the inner bearing outer race (1) and the outer bearing outer race (2) by using a brass bar and a hammer.

Reassembly

- Using installer 9-8522-1141-0 and grip 5-8840-0007-0, install outer bearing outer race.

415RW018

- Using installer 9-8522-1274-0 and grip 5-8840-0007-0, install Inner bearing outer race.

415RW017

- Install adjust shim and adjust drive pinion mounting distance:

- Apply gear oil to the inner and outer drive pinion bearing.
Clean the pinion setting gauge set.
Then install the gauge set together with the inner and outer bearings.
- Tighten the nut to the specified torque.

Torque: 2.3N-m (0.2kg-m/20lbin)

415RS009

Legend

- Pilot : 5-8840-2085-0
- Nut and Bolt: 5-8840-2089-0
- Gauge Plate : 5-8840-2087-0

- Clean the side bearing bores. Install the dial indicator with the discs and arbor. Install and tighten the bearing caps to the specified torque.

Torque: 98N-m (10kg-m/72lbf)

415RS010

Legend

- Dial Indicator: 5-8840-0126-0
- Disc (2 pcs.): 5-8840-2088-0
- Arbor: 5-8840-0128-0
- Gauge Plate: 5-8840-2087-0

4A1-12 DIFFERENTIAL (FRONT)

- Set the dial indicator to "0". Place it on the mounting post of the gauging arbor with the contact button touching the indicator pad. Force the dial indicator downward until the needle has made a half turn clockwise. Tighten down the dial indicator in this position.

Legend

- Dial Indicator
- Gauging Arbor
- Plunger
- Gauge Plate

- Position the plunger on the gauge plate. Move the gauging arbor slowly back and forth and locate the position at which the dial indicator shows the greatest deflection. At this point, once again set the dial indicator to "0". Repeat the procedure to verify the "0" setting.

- After the ZERO setting is obtained, rotate the gauging arbor until the dial indicator rod does not touch the gauging plate. Record the number the dial indicator needle points to.

Legend

- Example=Dial indicator reading of 0.085

- Record the pinion depth code on the head of the drive pinion. The number indicates a necessary change in the pinion mounting distance. A plus number indicates the need for a greater mounting distance (which can be achieved by decreasing the shim thickness). A minus number indicates the need for a smaller mounting distance (which can be achieved by increasing the shim thickness). If examination reveals pinion depth code "0", the pinion is "nominal".

8. Select the shim using chart;

Pinion marking	+10	+8	+6	+4	+2	0	-2	-4	-6	-8	-10

NOTE: When ordering shims, find the part number in the parts catalog by using the thickness of shims listed in the above table.

4A1-14 DIFFERENTIAL (FRONT)

- Place the shim on the drive pinion. Install the inner bearing onto the pinion using an installer 9-8522-1165-0 and a press.

NOTE: Do not apply pressure to the roller cage and apply pressure only to the inner race.

425RW067

- Discard the used collapsible spacer and install a new one.
- Install pinion gear.
- Install outer bearing.
- Use oil seal installer 9-8522-1275-0 to install a new oil seal that has been soaked in front axle lubricant.

NOTE: Take care to use a front differential oil seal, NOT the rear differential oil seal.

415RW024

- Install duct cover.
- Install flange.
- Install flange nut.
 - Apply lubricant to the pinion threads.
 - Tighten the nut to the specified torque using the pinion flange holder 5-8840-2157-0.

Torque: 177-275 N·m (18-28kg·m/130-203lbf)

NOTE: Discard used flange nut and install new one and do not over tighten the flange nut.

425RW057

- Adjust pinion bearing preload.
 - Measure the bearing preload by using a torque meter. Note the scale reading required to rotate the flange.
 - Continue tightening flange nut until the specified starting torque is obtained.

Starting torque:

New bearing: 0.7-1.1 N·m (6.5-11.5kg·cm/5.6-10lbin)

Used bearing: 0.4-0.5 N·m (3.3-5.7kg·cm/2.9-5.0lbin)

425RS027

4. Using punch 5-8840-2293-0, stake the flange nut at two points.

NOTE: When staking, be sure to turn the nut to insure that there is no change in bearing preload. Make sure of preload again as instructed in 3)

415RW019

Legend

- (1) 1.3mm or less

3. Using two sets of feeler gauges, insert a feeler stock of sufficient thickness between each bearing outer race and the carrier to remove all end play. Make certain the feeler stock is pushed to the bottom of the bearing bores. Mount the dial indicator 5-8840-0126-0 on the carrier so that the indicator stem is at right

12. Install adjust shim.

1. Attach the side bearing to the differential assembly without shims. Support the opposite side using a pilot to prevent bearing damage.

425RS029

Legend

- (1) Drive handle:5-8840-0007-0
 (2) Installer:9-8522-1164-0
 (3) Pilot:9-8521-1743-0

2. Insert the differential cage assembly with bearing outer races into the side bearing bores of the carrier.

425RS030

angles to a tooth on the ring gear.

425RS031

4. Adjust feeler gauge thickness from side to side until ring gear backlash is in the specified range.

Backlash: 0.13–0.18mm (0.005 –0.007 in)

425RS032

With zero end play and correct backlash established, remove the feeler gauge packs, determine the thickness of the shims required and add 0.05 mm (0.002 in) to each shim pack to provide side bearing preload. Always use new shims.

5. Use bearing remover 5-8840-0013-0, 5-8840-0014-0 and pilot 9-8521-1743-0 to remove side bearing.

415RW020

13. Install the side bearings together with the selected shims.

425RS029

Legend

- (1) Drive Handle: 5-8840-0007-0
 (2) Installer: 9-8522-1164-0
 (3) Pilot: 9-8521-1743-0

14. Install side bearing outer race.
15. Install differential cage assembly.
16. Install bearing cap then align the setting marks(1) applied at disassembly.

425RS035

17. Tighten the cap bolt to the specified torque.

Torque: 98N·m (10kg·m/72lbft)

425RS036

1. Measure the amount of run-out of the ring gear at its rear face.

Standard: 0.02 mm (0.001 in)

Limit: 0.05 mm (0.002 in)

425RS037

Gear Tooth Contact Pattern Check and Adjustment

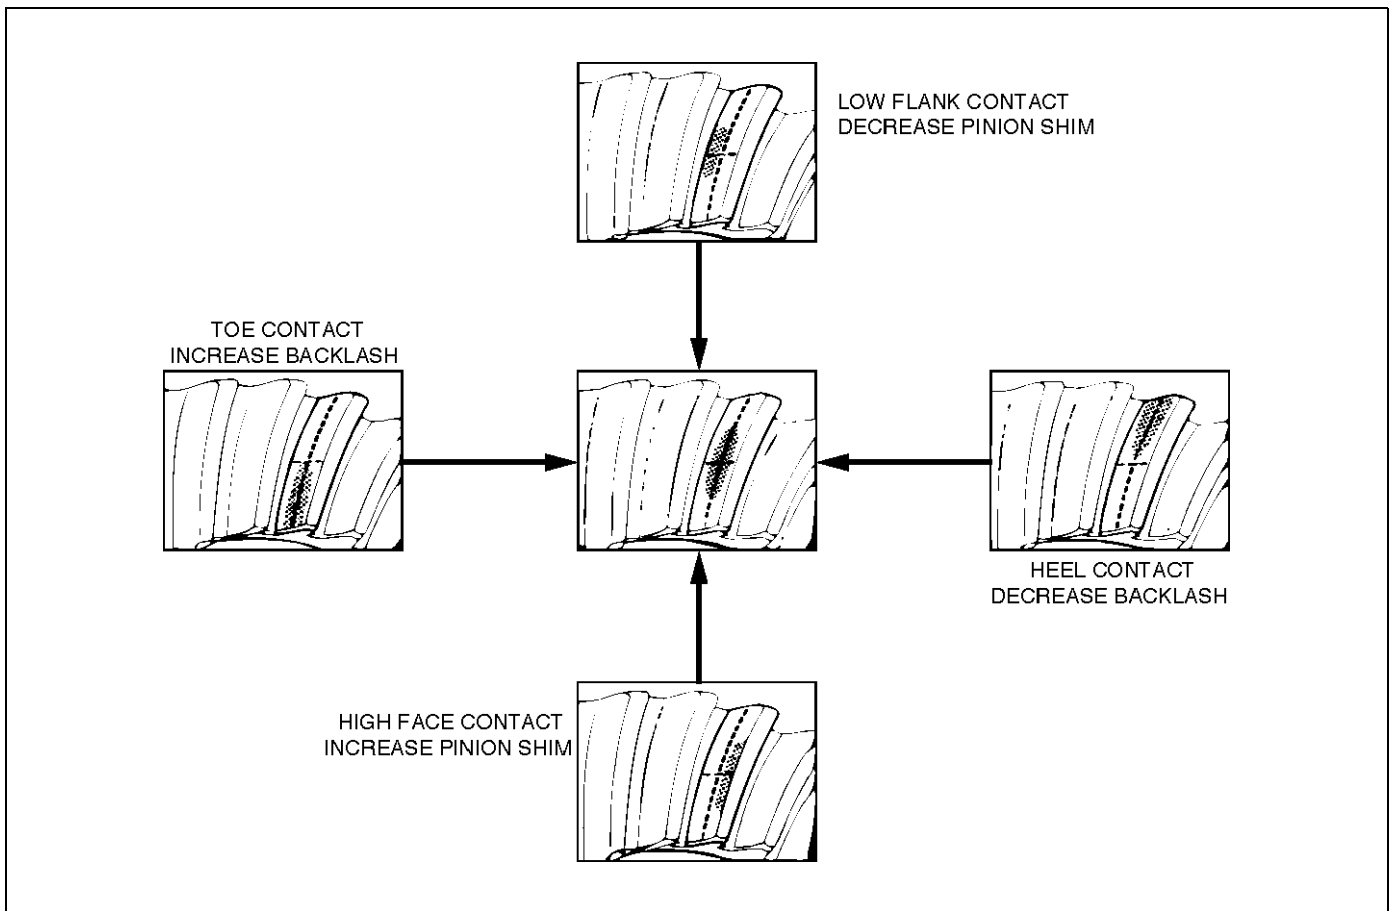

1. Apply a thin coat of prussian blue or equivalent to the faces of the 7-8 teeth of the ring gear. Check the impression of contact on the ring gear teeth and make necessary adjustment as described in illustration if the contact is abnormal.

425RS038

Legend

- (1) Heel
- (2) Toe
- (3) Concave Side(Coast)
- (4) Convex Side(Drive)

18. Install differential assembly.

1. Clean the faces of the front axle case and differential carrier.
Apply Three Bond TB1215 or equivalent to the sealing side of the axle case and the carrier.
2. Attach the differential case and the carrier assembly to the front axle case and tighten the nuts and bolts.

Torque: 25 N·m(2.5kg·m/19lbft)

415R5014

3. Fill the axle case with hypoid gear lubricant, to just below the filler hole.

Lubricant capacity: 1.4 liter(1.2 Imp qt/1.5 USqt)

Differential Cage Assembly

Disassembled View

415RS015

Disassembly

1. Remove bolt.
2. Remove ring gear.
3. Remove lock pin, break staking on the lock pin, using a 5mm (0.20 in) diameter drill.

425RS042

4. Remove the cross pin, using a soft metal rod and a hammer.

425RS043

5. Remove pinion gear.
6. Remove side gear.
7. Remove thrust washer.

415RS016

Clearance between the differential pinion and the cross pin measurement:

Standard: 0.06 - 0.12 mm (0.002 - 0.005 in)

Limit: 0.2 mm (0.008 in)

425RS045

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

Check the following parts.

1. Ring gear, pinion gear
2. Bearing
3. Side gear, pinion gear, cross pin
4. Differential cage, carrier
5. Thrust washer
6. Oil seal

Ring gear replacement:

1. The ring gear should always be replaced with the drive pinion as a set.
2. Discard used bolts and install new ones.
3. When installing the ring gear, apply LOCTITE 271 or equivalent to all the threaded area and half of the unthreaded area of the bolt.
4. Discard used bolts and install new ones..

Torque: 108N·m(11.0Kg·m/80lbft)

4A1-22 DIFFERENTIAL (FRONT)

Clearance between the side gear and the differential box:

Standard: 0.03 - 0.10 mm (0.001 - 0.004 in)

Limit: 0.15 mm (0.006 in)

425RS046

Legend

- (1) Side Gear
- (2) Differential Box

Play in splines between the side gear and the axle shaft:

Standard: 0.08 - 0.36 mm (0.003 - 0.014 in)

Limit: 0.5 mm (0.02 in)

425RS047

Reassembly

1. Install thrust washer.
2. Install side gear.
3. Install the pinion gear with thrust washer by engaging it with the side gears while turning both pinion gears simultaneously in the same direction.

425RS048

4. Install cross pin.

1. Be sure to install the cross pin so that it is in alignment with the lock pin hole in the differential cage.

425RS049

2. Adjust the backlash between the side gear and the pinion gear.

Backlash: 0.03 - 0.08 mm (0.001 - 0.003 in)

Thickness of thrust washers available:

1.00mm, 1.05mm, 1.10mm(0.039in, 0.041in, 0.043in)

425RS050

5. Install lock pin. After lock pin installation, stake the cage to secure the lock pin.

425RS051

Legend

- (1) Staked Portion
(2) Lock Pin

6. Clean the ring gear threaded holes to remove the locking agent. When installing the ring gear, apply LOCTITE 271 or equivalent to all the threaded area and half of the unthreaded area of the bolt.
7. Tighten the bolts in diagonal sequence as illustrated.

Torque: 108N·m(11.0kg·m/80lbf·ft)

NOTE: Discard used bolts and install new ones.

415RS016

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

4A2-2 DIFFERENTIAL (REAR)

General Description

The rear axle assembly is of the semi-floating type in which the vehicle weight is carried on the axle housing. The center line of the pinion gear is below the center line of the ring gear (hypoid drive).

All parts necessary to transmit power from the propeller shaft to the rear wheels are enclosed in a Salisbury type axle housing (a carrier casting with tubes pressed and welded into the carrier). A removable aluminum cover at the rear of the axle housing permits rear axle service without removal of the entire assembly from the vehicle. The 8.9 inch ring gear rear axle uses a conventional ring and pinion gear set to transmit the driving force of the engine to the rear wheels. This gear set transfers this driving force at a 90 degree angle from the propeller shaft to the drive shafts.

The axle shafts are supported at the wheel end of the shaft by a roller bearing.

The pinion gear is supported by two tapered roller bearings. The pinion depth is set by a shim pack located between the gear end of the pinion and the roller bearing that is pressed onto the pinion. The pinion bearing preload is set by crushing a collapsible spacer between the bearings in the axle housing.

The ring gear is bolted onto the differential case with 10 bolts.

The differential case is supported in the axle housing by two tapered roller bearings. The differential and ring gear are located in relationship to the pinion by using selective shims and spacers between the bearing and the differential case. To move the ring gear, shims are deleted from one side and an equal amount are added to the other side. These shims are also used to preload the bearings which are pressed onto the differential case. Two bearing caps are used to hold the differential into the rear axle housing.

The differential is used to allow the wheels to turn at different rates of speed while the rear axle continues to transmit the driving force. This prevents tire scuffing when going around corners and prevents premature wear on internal axle parts.

The rear axle is sealed with a pinion seal, a seal at each axle shaft end, and by a liquid gasket between the rear cover and the axle housing.

Limited Slip Differential (LSD)

The axle assembly may be equipped with an limited slip differential (LSD). It is similar to the standard differential except that part of the torque from the ring gear is transmitted through clutch packs between the side gears and differential case.

The LSD construction permits differential action when required for turning corners and transmits equal torque to both wheels when driving straight ahead. However, when one wheel tries to spin due to a patch of ice, etc., the clutch packs automatically provide more torque to the wheel which is not trying to spin.

In diagnosing customer complaints, it is important to

recognize two things:

1. If, both wheels slip, with unequal traction, the LSD has done all it can possibly do.
2. In extreme cases of differences in traction, the wheel with the least traction may spin after the LSD has transferred as much torque as possible to the non-slipping wheel.

Limited Slip Differentials impose additional requirements on lubricants, and require a special lubricant or lubricant additive. Use 80W90 GL-5 LSD lubricant.

Rear Axle Identification

The Bill of Material and build date information(1) is stamped on the right axle tube on the rearward side. The axle ratio is identified by a tag(3) which is secured by a cover bolt. If the axle has limited-slip differential, it also will be identified with a tag(2) secured by a cover bolt.

425RX001

Diagnosis

Many noises that seem to come from the rear axle actually originate from other sources such as tires, road surface, wheel bearings, engine, transmission, muffler, or body drumming. Investigate to find the source of the noise before disassembling the rear axle. Rear axles, like any other mechanical device, are not absolutely quiet but should be considered quiet unless some abnormal noise is present.

To make a systematic check for axle noise, observe the following:

1. Select a level asphalt road to reduce tire noise and body drumming.
2. Check rear axle lubricant level to assure correct level, and then drive the vehicle far enough to thoroughly warm up the rear axle lubricant.
3. Note the speed at which noise occurs. Stop the vehicle and put the transmission in neutral. Run the engine speed slowly up and down to determine if the noise is caused by exhaust, muffler noise, or other engine conditions.
4. Tire noise changes with different road surfaces; axle noises do not. Temporarily inflate all tires to 344 kPa (50 psi) (for test purposes only). This will change noise caused by tires but will not affect noise caused by the rear axle.
Rear axle noise usually stops when coasting at speeds under 48 km/h (30 mph); however, tire noise continues with a lower tone. Rear axle noise usually changes when comparing pull and coast, but tire noise stays about the same.
Distinguish between tire noise and rear axle noise by noting if the noise changes with various speeds or sudden acceleration and deceleration. Exhaust and axle noise vary under these conditions, while tire noise remains constant and is more pronounced at speeds of 32 to 48 km/h (20 to 30 mph). Further check for tire noise by driving the vehicle over smooth pavements or dirt roads (not gravel) with the tires at normal pressure. If the noise is caused by tires, it will change noticeably with changes in road surface.
5. Loose or rough front wheel bearings will cause noise which may be confused with rear axle noise; however, front wheel bearing noise does not change when comparing drive and coast. Light application of the brake while holding vehicle speed steady will often cause wheel bearing noise to diminish. Front wheel bearings may be checked for noise by jacking up the wheels and spinning them or by shaking the wheels to determine if bearings are loose.
6. Rear suspension rubber bushings and spring insulators dampen out rear axle noise when correctly installed. Check to see that there is no link or rod loosened or metal-to-metal contact.
7. Make sure that there is no metal-to-metal contact between the floor and the frame.

After the noise has been determined to be in the axle, the type of axle noise should be determined, in order to make any necessary repairs.

Gear Noise

Gear noise (whine) is audible from 32 to 89 km/h (20 to 55 mph) under four driving conditions.

1. In drive under acceleration or heavy pull.
2. Driving under load or under constant speed.
3. When using enough throttle to keep the vehicle from driving the engine while the vehicle slows down gradually (engine still pulls slightly).
4. When coasting with the vehicle in gear and the throttle closed. The gear noise is usually more noticeable between 48 and 64 km/h (30 and 40 mph) and 80 and 89 km/h (50 and 55 mph).

Bearing Noise

Bad bearings generally produce a rough growl or grating sound, rather than the whine typical of gear noise. Bearing noise frequently "wow-wows" at bearing rpm, indicating a bad pinion or rear axle side bearing. This noise can be confused with rear wheel bearing noise.

Rear Wheel Bearing Noise

Rear wheel bearing noise continues to be heard while coasting at low speed with transmission in the neutral. Noise may diminish by gentle braking. Jack up the rear wheels, spin them by hand and listen for noise at the hubs. Replace any faulty wheel bearings.

Knock At Low Speeds

Low speed knock can be caused by worn universal joints or a side gear hub counter bore in the cage that is worn oversize. Inspect and replace universal joints or cage and side gears as required.

Backlash Clunk

Excessive clunk on acceleration and deceleration can be caused by a worn rear axle pinion shaft, a worn cage, excessive clearance between the axle and the side gear splines, excessive clearance between the side gear hub and the counterbore in the cage, worn pinion and side gear teeth, worn thrust washers, or excessive drive pinion and ring gear backlash. Remove worn parts and replace as required. Select close-fitting parts when possible. Adjust pinion and ring gear backlash.

4A2-4 DIFFERENTIAL (REAR)

Rear Axle Noise

Condition	Possible cause	Correction
Noise in Drive	Excessive pinion to ring gear backlash.	Adjust.
	Worn pinion and ring gear.	Replace
	Worn pinion .bearings.	Replace.
	Loose pinion bearings.	Adjust.
	Excessive pinion end play.	Adjust.
	Worn side bearings.	Replace.
	Loose side bearings.	Adjust.
	Excessive ring gear run-out.	Replace.
	Low oil level.	Replenish.
	Wrong or poor grade oil.	Replace.
	Bent axle housing.	Replace.
Noisy when coasting	Axle noise heard when driving will usually be heard also on coasting, although not as loud.	Adjust or replace.
	Pinion and ring gear too tight (audible when slowing down and disappears when driving).	Adjust.
Intermittent noise	Warped bevel ring.	Replace.
	Loose differential case bolts.	Tighten.
Constant noise	Flat spot on pinion or ring gear teeth.	Replace.
	Flat spot on bearing.	Replace.
	Worn pinion splines.	Replace.
	Worn axle shaft dowel holes.	Replace.
	Worn hub studs.	Replace.
	Bent axle shaft.	Replace.
Noisy on turns	Worn differential side gears and pinions.	Replace.
	Worn differential shaft.	Replace.
	Worn axle shaft splines.	Replace.

Limited Slip Differential

Condition	Possible cause	Correction
Does not lock	Broken clutch plates.	Replace the clutch plates.
Chatters in turns	Lubricant contaminated.	Drain lube when hot. Wipe carrier clean. Refill with lube specified in Main Data and Specifications at the end of this section.
	Clutch plates dateriorated.	Replace clutch plates.
Noise (in addition to normal clutch engagement)	Broken clutch plates.	Replace clutch plates.
	Damaged case.	Replace unit.
	Broken differential gears.	Replace gears.

Axle Housing

Axle Housing and Associated Parts

420RW030

Legend

- | | |
|--------------------------|--------------------|
| (1) Lower Link | (6) Lateral Rod |
| (2) Stabilizer | (7) Brake Hose |
| (3) Upper Link | (8) Coil Spring |
| (4) Rear Propeller shaft | (9) Parking Cable |
| (5) Shock Absorber | (10) Axle Assembly |

Removal

1. Raise the vehicle and support it with suitable safety stands.
The hoist must remain under the rear axle housing.
2. Take out brake fluid. Refer to Hydraulic Brakes in Brake section.
3. Remove rear wheels and tires. Refer to Wheel Replacement in Suspension section.
4. Remove propeller shaft. Refer to Rear Propeller Shaft in this section.
5. Drain the rear axle oil into a proper container.
6. Remove parking brake cable, release the connection between the cable fixing clip equalizer. Refer to Parking Brakes in Brake section.
7. Move the clip aside and pull out the breather hose.
8. Disconnect the ABS connectors (1) and remove the brackets attached to the frame and center link.

350RW023

4A2-6 DIFFERENTIAL (REAR)

9. Loosen the brake tube flare nut, remove the clip and take out the brake tube.

10. Remove the shock absorber.
11. Remove the stabilizer linkage mounting bolts and nuts (2) from the frame side.

12. Remove the lateral rod fixing bolt and nut from the frame.
13. Remove the upper link mounting bolt and nut (3) from the axle housing.

14. Remove the lower link fixing bolt and nut (4) from the axle housing.

15. Jack down and remove the coil spring and insulator.
16. Axle housing assembly can be separated from the vehicle on completion of steps 1 – 15.
17. Remove the brake caliper fixing bolt, loosen the flare nut, release the clip and take out the brake caliper together with the flexible hose.
18. Remove brake disc.
19. Remove antilock brake system speed sensor fixing bolt and the clip and bracket on the axle housing.
20. Remove the brake pipe clip and fixing bolt on the axle housing and take out the brake pipe.

Installation

1. Install brake pipe.
2. Connect Antilock brake system (ABS) speed sensor and harness, refer to Anti-Lock Brake System in Brake section.
3. Install brake disc.
4. Install brake caliper. Refer to Disk Brakes in Brake section.
5. Install axle housing assembly.
6. Install coil spring and insulator.
7. Install the lower link fixing bolt and nut to the axle housing. For the procedures in items 7-11, refer to Suspension section.
8. Install the upper link bolt and nut to the axle

housing.

9. Install the lateral rod fixing nut and bolt to the frame side.
10. Install the stabilizer linkage mounting nut and bolt to the frame side.
11. Install the shock absorber.
12. Install brake tube flare nut, Refer to Disk Brakes in Brake section.
13. Install ABS connector and bracket.
14. Connect breather hose.
15. Install parking brake cable, Refer to Parking Brakes in Brake section.
16. Bleed brakes. Refer to Hydraulic Brakes in Brake section.

Axle Shaft, Oil Seal and Bearing

Axle Shaft and Associated Parts

420RW008

Legend

- (1) Axle Shaft
- (2) Backing Plate
- (3) Oil Seal
- (4) Bearing
- (5) Axle Housing
- (6) Lock Washer
- (7) Nut

Removal

1. Raise the vehicle.
2. Remove rear wheels and brake calipers or drums. Do not let calipers hang from the vehicle by the brake line or hose. Wire them to frame of vehicle to prevent damage.
3. Remove four nuts and lockwashers.
4. Remove shaft assembly from the axle housing.
5. Remove snap ring and bearing cup.
6. Break retainer ring with hammer and chisel.

420RS026

4A2-8 DIFFERENTIAL (REAR)

7. Break bearing cage with hammer and chisel.

8. Remove oil seal, retainer, and emergency brake assembly.

9. Remove inner race from shaft with OTC-1126 bearing splitter and press.

Inspection

- Shaft for spalling or grooves from seal wear.
- Retainer – bent or damaged.
- Replace items if required.

Installation

1. Emergency brake assembly.
2. Install retainer.
Note direction – do not install backwards.

3. Install oil seal. Note direction.

4. Install bearing assembly, using installer and press.

420RS030

5. Install retainer ring, using installer and press.

420RS033

NOTE: Install bearing with cup towards inboard side.

420RS031

6. Install snap ring.

7. Install axle shaft assembly into housing.

8. Install bolts, lockwashers, and nuts.

Tighten the retainer nuts to the specified torque.

Torque : 75N·m (7.6kg·m/55lbft)

Pinion Oil Seal

Pinion Oil Seal and Associated Parts

Legend

- | | |
|---------------------------|---|
| (1) Flange Nut and Washer | (4) Outer Oil Seal Slinger |
| (2) Flange | (5) Outer Pinion Bearing (Cup and Cone) |
| (3) Oil Seal | |

Removal

1. Remove the rear propeller shaft. Refer to Rear Propeller Shaft in this section.
2. Drain the rear axle oil.
3. Check and record preload with an inch pound torque wrench. This will give combined pinion bearing, seal, carrier bearing, axle bearing and seal preload.

4. Remove flange nut and washer by using pinion flange holder 5-8840-0133-0 after raising up its staked parts completely.

5. Remove flange by using 5-8840-0133-0.

- Have a suitable container in place to catch lubricant.

6. Remove oil seal.
7. Remove pinion oil seal slinger.
8. Remove outer bearing by using remover 5-8840-2323-0.

9. Remove collapsible spacer.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

Check the following parts.

1. Seal surface of the flange.
2. Cage bore for burns.

Installation

1. Install collapsible spacer, discard the used collapsible spacer and install a new one.
2. Install outer bearing.

4A2-12 DIFFERENTIAL (REAR)

NOTE: Do not drive in, but just temporarily set in the outer bearing by hand, which should be indirectly pressed in finally by tightening the flange nut.

3. By using the seal installer 5-8840-2165-0, install a new oil seal (1) that has grease on seal lip.

425RW050

4. Install flange.
5. The pinion washer and a new nut while holding the pinion flange with 5-8840-0133-0.
 - Tighten the nut until the pinion end play is just taken up. Rotate the pinion while tightening the nut to seat the bearings. Once there is not end play in the pinion, the preload torque should be checked.
 - Remove 5-8840-0133-0. Using an inch-pound torque wrench, check to make sure the pinion preload is equal to or slightly over the reading recorded during removal.

425RW018

6. Install propeller shaft to the frange.
7. Install bolt and nut. Tighten the bolt and nut to the specified torque.

Torque: 63N·m (6.4kg·m/46lbft)

4A2-14 DIFFERENTIAL (REAR)

- (30) Side Gear Thrust Washer
- (31) Pinion Mate Gears

- (32) Thrustwasher-Differential Pinion Mate Gear

Inspecting the Axle Before Disassembly

1. Remove the axle cover from the rear axle and drain the axle lubricant into a suitable container.
2. Check ring gear backlash. Refer to "BACKLASH ADJUSTMENT" in this section. This information can be used to determine the cause of the axle problem. It will also help when setting up the shim packs for locating and preloading the differential cage.
3. Check case for metal chips and shavings. Determine where these ships and shavings come from, such as a broken gear or bearing cage.
 - If possible, determine the cause of the axle problem before disassembly.

Disassembly

1. Remove axle shafts.
 - Refer to axle shaft replacement in this section.
2. Remove ABS sensor.
3. Remove bearing caps and bolts.
 - Mark the caps and the housing as left and right.

CAUTION: Bearing caps are machined with the housing and must be assembled in the same position as removed. Note the matched letter stamped on the caps and carrier. When assembled, the letters on the caps must agree in both the horizontal and vertical position with the letters on the carrier.

4. Remove Differential case.

- Pry the case from the axle housing at the differential "window".

5. Remove side bearing outer races and shims.

- Mark the races and shims as left and right, and place them with the bearing cups.

6. Remove differential side bearings using remover 5-8840-2587-0 and plug 5-8840-2585-0.

- Select insert ; 303174 and collet halves ; 44801 in remover kit 5-8840-2587-0.

7. Remove ring gear bolts.

- Ring gear bolts use right handed threads.

CAUTION: Do not pry the ring gear from the case. This will damage the ring and the differential case.

8. Remove ring gear from the differential.
 - Drive the ring gear off with a brass drift if necessary.
 - Check drive pinion bearing preload.

425RW018

- Check the pinion assembly for looseness by moving it back and forth. (Looseness indicates excessive bearing wear.)
9. Remove pinion flange nut and washer.
 - Use flange holder 5-8840-0133-0 to hold the pinion flange.
 10. Remove pinion flange.
 - Use flange holder 5-8840-0133-0 to remove the pinion flange.

415RW040

11. Remove pinion from the axle housing.
 - Thread the pinion nut halfway onto the pinion.
 - Drive the pinion out of the housing with a hammer and a soft drift.
 - Remove the nut and then remove the pinion.

12. Remove collapsible spacer(1).

415RW011

13. Remove outer seal, outer oil slinger and outer pinion bearing.
14. Remove inner bearing, inner oil slinger and shim from the pinion.
 - Press the bearing off the pinion using remover 5-8840-2587-0.

415RW042

- Select insert ; 303174 and collet halves ; 44801 in remover kit 5-8840-2587-0.
 - Remove the shim.
15. Remove bearing cups and baffle plate from the axle housing using a hammer and a punch.
 - Work the cups out of the housing evenly, moving the punch back and forth between one side of the cup and the other.
 - The baffle plate will be destroyed and should be replaced with a new one.

4A2-16 DIFFERENTIAL (REAR)

16. Remove exciter ring.

- Remove the exciter ring from the differential using a mallet or a brass hammer if it is required.

NOTE: Discard the exciter ring after removal.

Cleaning

Do not steam clean drive parts which have ground and polished surfaces such as gears, bearings, and shafts. These parts should be cleaned in a suitable solvent. All parts should be disassembled before cleaning. Parts should be thoroughly dried immediately after cleaning. Use soft, clean, lintless rags. Parts may be dried with compressed air. Do not allow the bearings to spin while drying them with compressed air.

Inspection and Repair

It is very important to carefully and thoroughly inspect all drive unit parts before reassembly. Thorough inspection of the drive parts for wear or stress and subsequent replacement of worn parts will eliminate costly drive component repair after reassembly.

Axle Housing

- The carrier bore for nicks or burrs that would prevent the outer diameter of the pinion seal from sealing. Remove any burrs that are found.
- The bearing cap bores for nicks or burrs. Remove any burrs that are found.
- The housing for cracks. Replace the housing if any cracks are found.
- The housing for foreign material such as metal chips, dirt, or rust.

Pinion and Ring Gear

- Pinion and ring gear teeth for cracking, chipping, scoring, or excessive wear.
- Pinion splines for wear.
- Pinion flange splines for wear.
- The sealing surface of the pinion flange for nicks, burrs, or rough tool marks which would cause damage to the seal's inside diameter and result in an oil leak.
- Replace all worn or broken parts.
- Ring and pinion gears are matched sets and are both replaced anytime a replacement of either is necessary.

Bearings

- Bearings visually and by feel.
- The bearings should feel smooth when oiled and rotated while applying as much hand pressure as possible. The large end of the bearing rollers for wear. This is where tapered roller bearing wear is most evident.
- Bearing cups for wear, cracks, brinelling and scoring.
- Bearing and cups are only replaced as sets.
- If the rear axle was operated for an extended period of time with very loose bearings, the ring gear and drive pinion will also require replacement.
- Low mileage bearings may have minute scratches and pits on the rollers and the bearing cups from the initial pre-load. Do not replace a bearing for this reason.
- Bearing cups for cracks or chips.

Shims

- Shims for cracks and chips. Damaged shims should be replaced with an equally sized service shim.

Reassembly

1. Install pinion bearing races and baffle plate using outer bearing race installer 5-8840-0008-0 / inner bearing race installer 5-8840-2569-0 and drive handle 5-8840-0007-0.

NOTE: Baffle plate must be installed, when install the inner pinion bearing race.

425RW073

425RW074

2. Clean all the gauge parts.
3. Lubricate the outer and inner bearings with axle lubricant.
4. Place the bearings into the pinion bearing races.
5. Place the inner oil slinger onto the inner pinion bearing.

NOTE: The inner oil slinger must be placed between gauge plate and inner pinion bearing when measuring the pinion depth.

6. Install gauge plate 5-8840-2578-0, inner pilot 5-8840-2573-0 stud and nut 5-8840-0127-0 and outer pilot 5-8840-2575-0 to the pinion bore.

420RW075

7. Hold the stud stationary at the flats of the stud (and).

Tighten the stud nut

Torque: 2.2N-m (0.2kg-m/1.6lbf)

8. Rotate the gauge plate and bearings several complete revolutions to seat the bearings.
9. Tighten the stud nut until a torque of 1.6 to 2.2 N-m (0.16 – 0.22kg-m/1.2 to 1.6lbf.) is required to keep the gauge plate in rotation.

4A2-18 DIFFERENTIAL (REAR)

10. Assemble discs 5-8840-2579-0, arbor 5-8840-0128-0 and dial indicator 5-8840-0126-0 to the side bearing bores.

NOTE: The bearing bores must be clean and burr-free.

420RW076

11. Install the side bearing caps and tighten the bolts to the specified torque.

Torque: 108N-m (11.0kg-m/80lbf)

12. Rotate the gauge plate until the gauging area is parallel with the discs.
13. Position the arbor assembly in the carrier so that the plunger is centered on the gauge area of the gauge plate.

14. Set the dial indicator to "0". Place it on the mounting post of the gauging arbor with the contact button touching the indicator pad.

Force the dial indicator downward until the needle has made a half turn clockwise. Tighten down the dial indicator in this position.

425RS020

Legend

- (1) Dial Indicator
- (2) Gauging Arbor
- (3) Plunger
- (4) Gaug Plate

15. Position the plunger on the gauge plate. Move the gauging arbor slowly back and forth and locate the position at which the dial indicator shows the greatest deflection. At this point, once again set the dial indicator to "0".

Repeat the procedure to verify the "0" setting.

425RS021

16. After the ZERO setting is obtained, rotate the gauging arbor until the dial indicator rod does not touch the gauging plate. Record the number the dial indicator needle points to.

425RS022

Legend

- (1) Example=Dial indicator reading of 0.085

17. Record the pinion depth code on the head of the drive pinion. The number indicates a necessary change in the pinion mounting distance. A plus number indicates the need for a greater mounting distance (which can be achieved by decreasing the shim thickness). A minus number indicates the need for a smaller mounting distance (which can be achieved by increasing the shim thickness). If examination reveals pinion depth code "0", the pinion is "nominal".

425RS023

4A2-20 DIFFERENTIAL (REAR)

18. Select the shim using the chart;

Dial Indicator Reading (inches)	Marking (inches)						
	+3	+2	+1	0	-1	-2	-3
0.027							0.030
0.028						0.030	0.031

0.055	0.052	0.053					
0.056	0.053						

19. Remove bearing caps and depth gauging tools.
20. Install the correct pinion shim and inner oil slinger onto pinion.

NOTE: Do not install pinion gear into housing at this time.

21. If the exciter ring was removed, install the new exciter ring onto the differential case by pressing using the ring gear as a pilot.

425RS047

22. Install ring gear(1) to the differential case(2)

425RW021

23. Install new ring gear bolts.

- Tighten the ring gear bolts alternately in stages, gradually pulling the ring gear onto the differential case.

Tighten the ring gear bolts in sequence

Torque: 108 N·m (11.0 kg·m/80 lbf·ft)

NOTE: Discard used bolts and install new ones.

415RS016

Side Bearing Preload Adjustment

1. The side bearing preload adjustment must be made before installing the pinion.
2. The side bearing preload is adjusted by changing the thickness of both the left and right shims equally. This maintains the original backlash.
3. Install master side bearings 5-8840-2584-0 onto the case.
Remove all nicks, burrs, dirt etc., from the hubs to allow the master bearings to rotate freely.

425RW077

4A2-22 DIFFERENTIAL (REAR)

4. Assemble the differential case into the housing (less pinion). Install bearing caps and finger tight bolts. Mount a dial indicator with a magnetic base to the housing and indicate on the flange or head of screw. Force the differential assembly as far as possible in the direction towards the indicator. With force still applied, set indicator at zero(0).

NOTE: Dial indicator set should be capable of a minimum travel of 5.08 mm (0.2in).

5. Force the differential assembly as far as it will go in the opposite direction. Repeat these steps until the same reading is obtained.
6. RECORD THE READING OF THE INDICATOR. This amount, in shims, will be included in the final assembly shim stack to establish side bearing preload and ring gear and pinion backlash.
7. After marking sure the readings are correct, remove the indicator and differential assembly from the housing.

Pinion Installation

- The bearing cups should have been installed in Pinion Depth Adjustment in this section.
1. Place the shim(1) and inner oil slinger(2) on the pinion gear, then install the pinion inner bearing(3) using installer 5-8840-2574-0.

- Drive the bearing until the bearing cone seats on the pinion shims.
2. Install a new collapsible spacer.
 - Lubricate the pinion bearings with axle lubricant.
3. Install pinion to the axle housing.
4. Install outer pinion bearing onto the pinion.
 - Hold the pinion forward from inside the case while driving the bearing onto the pinion.
5. Install oil seal slinger.
6. Install pinion oil seal using installer 5-8840-2165-0.
7. Install the pinion flange to the pinion by tapping it with a rawhide hammer until a few threads show through the pinion flange.
8. Install pinion washer and a new nut while holding the pinion flange with flange holder 5-8840-0133-0.
 - Tighten the nut until the pinion end play is just taken up. Rotate the pinion while tightening the nut to seat the bearings.

Torque:217-678N·m (22.1-69.1kg·m/160-500lbft)

Once there is no end play in the pinion, the preload torque should be checked.

- Remove flange holder 5-8840-0133-0. Using a torque wrench, check the pinion preload by rotating the pinion with the wrench.

425RW018

Preload should be at 1.0 to 1.6N·m (10.2-16.3kg·cm/8 to 14inlbs.) on new bearings, or 0.46 to 0.69N·m (4.7-7.0kg·cm/4 to 6inlbs.) for used bearings.

- If the preload torque is below the preloads given above, continue torquing the nut in small increments. Check the preload after each tightening. Each tightening increases the bearing preload by several pounds. If the bearing preload is exceeded, the pinion will have to be removed, and a new collapsible spacer installed.
- Once a preload of 1.0 to 1.4N·m (10.2-14.3kg·cm/8 to 12inlbs.) has been obtained, rotate the pinion several times to assure that the bearings have seated. Recheck the preload, and adjust if necessary.

Determination of Backlash & Preload Shims

1. Install master side bearings onto the case.
2. Install differential assembly into the carrier.
3. Install the bearing cap and finger tight bolts.
4. Set up the dial indicator.
5. Force the differential assembly away from the pinion gear until it is completely seated against the cross bore face of the carrier.
6. With force still applied to the differential case, place the tip of dial indicator on a machined surface of the differential case, if available, or on the head of a ring gear screw, and set the indicator at zero(0).

7. Force the ring gear to mesh with the pinion gear. Rock the ring gear slightly to make sure the gear teeth are meshed. Repeat this procedure several times until the same reading is obtained each time. Be sure the indicator reads zero(0) each time the ring gear is forced back into contact with the cross bore face. This reading will be the necessary amount of shims to be placed between the differential case and side bearing cone on the ring gear side.
8. The remaining amount of shims, which is the difference between the overall found in step 6 of Side Bearing Pre-load Adjustment and step(7) above, should be placed on the other side of the differential case, plus additional 0.38mm (0.015in) for obtaining preload and backlash.
9. Place the required amount of shims on each hub as determined in the previous steps and assemble side bearing cone by using installer 5-8840-2580-0 and handle 5-8840-0007-0.

425RW079

10. Total torque to rotate — Increase of pinion torque to rotate due to differential case assembly shall not exceed 3.4N·m (34.7kg·cm/30inlbs.) divided by the gear ratio.

4A2-24 DIFFERENTIAL (REAR)

11. Assemble the spreader 5-8840-2581-0 and indicator to the carrier as shown in figure. Spread the carrier 0.5 mm (0.02 in) for differential installation.

CAUTION: Do not spread the carrier over 0.5 mm (0.02 in).

12. Remove the indicator.

Backlash Adjustment

1. Install the differential case assembly and bearing caps.
2. Rotate the case several times to seat the bearings.
3. Remove the spreader.
4. Install the side bearing cap bolts.

Tighten side bearing cap bolts

Torque: 108N-m (11.0kg-m/80lbft)

5. Install a dial indicator to the case using a magnetic base.

6. Place the indicator stem at the heel end of a tooth.
 - Set the dial indicator so that the stem is in line with the gear rotation and perpendicular to the tooth angle.

7. Check and record the backlash at three points around the ring gear.
 - The pinion must be held stationary when checking backlash.
 - The backlash should be the same at each point within 0.07 mm (0.003 in). If the backlash varies more than 0.07 mm (0.003 in), check for burrs, a distorted case flange, or uneven bolting conditions.
8. Backlash at the minimum lash point measured should be between 0.13 and 0.20 mm (0.005 and 0.008 in) for all new gear sets.
9. If the backlash is not within specifications, move the ring gear in or out from the pinion by increasing the thickness of one shim, and decreasing the thickness of the other shim by the same amount. This will maintain the correct rear axis side bearing preload.
 - Moving 0.05 mm (0.002 in) worth of shim from one side of the differential to the other will change the backlash adjustment by 0.03 mm (0.001 in).
10. After obtaining correct tooth contact described in later, install ABS speed sensor.
11. Install the cover with sealant.

Torque: 42N-m (4.3kg-m/31lbft)
12. Fill the axle lubricant.

Gear Tooth Pattern Check

Checking the ring gear to pinion tooth pattern is to be done only after setting up the axle according to the methods in this section. The pattern check is NEVER to be used as an initial check, or instead of checking pinion depth and backlash adjustments.

This check is only to be used to verify the correct adjustment of the gear set after set up.

425R5038

Legend

- (1) Heel
- (2) Toe
- (3) Concave Side (Coast)
- (4) Convex Side (Drive)

1. Wipe all oil out of the carrier, and carefully clean each tooth of the ring gear.
2. Use gear marking compound 1052351 or equivalent and apply this mixture sparingly to all ring gear teeth, using a medium-stiff brush. When properly used, the area of pinion tooth contact will be visible when hand load is applied.
3. Tighten the bearing cap bolts to the specified torque.
4. Expand the brake shoes until a torque of 54 to 68N·m (5.5 to 6.9kg·m/40 to 50 lbft.) is required to turn the pinion. A test made without loading the gears will not give a satisfactory pattern. Turn the pinion flange with a wrench so that the ring gear rotates one full revolution, then reverse the rotation so that the ring gear rotates one revolution in the opposite direction.

4A2-26 DIFFERENTIAL (REAR)

5. Observe the pattern on the ring gear teeth and compare this with figure.

Adjustments Affecting Tooth Contact

Two adjustments can be made which will affect tooth contact pattern: backlash, and the position of the drive pinion in the case. The effects of bearing preloads are not readily apparent on head loaded tooth contact pattern tests; however, these adjustments should be within specifications before proceeding with backlash and drive pinion adjustments.

The position of the drive pinion is adjusted by increasing or decreasing the distance between the pinion head and the centerline of the ring gear.

Decreasing the distance will move the pinion closer to the centerline of the ring gear. Increasing the distance will move the pinion farther away from the centerline of the ring gear.

Backlash is adjusted by means of the side bearing adjusting shims which move the entire case and ring gear assembly closer to, or farther from, the drive pinion. (The adjusting shims are also used to set side bearing preload.)

If the thickness of the right shim is increased (along with decreasing the left shim thickness), backlash will increase.

The backlash will decrease if the left shim thickness is increased (along with a decrease in right shim thickness).

Differential Case Assembly

Disassembled View

425RW014

Legend

- | | |
|-------------------------------------|------------------------|
| (1) Thrust Washer (for Pinion Gear) | (5) Differential Shaft |
| (2) Pinion Mate Gear | (6) Lock Pin |
| (3) Thrust Washer (for Side Gear) | (7) Bolt |
| (4) Side Gear | (8) Differential Case |

Disassembly

1. Remove lock pin using a small drift.

425RS098

2. Remove the differential shaft by using a soft metal rod and a hammer.

425RS043

3. Remove pinion mate gear and thrust washer.
4. Remove side gear and thrust washer.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

Check the following parts.

- Ring gear, pinion gear
- Bearing
- Side gear, pinion mate gear, differential shaft
- Differential case, carrier
- Thrust washer
- Oil seal

Reassembly

1. Install side gear with thrust washer.
2. Install the pinion mate gear with thrust washer by engaging it with the side gears while turning both pinion mate gears simultaneously in the same direction.

425RS048

3. Install differential shaft.

1. Be sure to install the differential shaft so that it is in alignment with the lock pin hole in the differential case.

425RS049

4. Install lock pin.

After lock pin installation, stake the case to secure the lock pin.

4A2-30 DIFFERENTIAL (REAR)

4. Assemble clutch pack unloading tool 5-8840-2586-0.
 - a Install cap(3) to the bottom differential side gear.
 - b Install threaded screw cap(2) to top differential side gear. Thread forcing screws(1) into threaded screw cap until it becomes centered into the bottom cap.

- c Tighten forcing screw until tight enough to collapse dished spacers and allow looseness between side and pinion mate gears.
5. Both pinion mate gear thrust washers using a shim stock (1) of 0.51 mm (0.020 in.) or equivalent tool to push out washers.

6. Relieve tension of dished spacers by loosening forcing screw.

NOTE:

- You may have to adjust the forcing screw slightly to allow the case to rotate.

7. Assemble LSD service adapter 5-8840-2582-0 onto long drive handle 5-8840-0007-0. Insert it into differential shaft hole of case. Pull on handle and rotate case until pinion mate gears can be removed.

8. Remove pinion mate gears.
9. Hold side gear top clutch pack (1) with one hand and remove positraction unloading tools.

10. Remove top side gear and clutch pack.

NOTE:

- Keep the stack of plates and discs intact and in exactly the same position while they are being removed.
11. Remove case from holder. Turn case with flange or ring gear side up to allow side gear and clutch pack to be removed from case.

12. Remove differential plate retainer from both clutch packs to allow separation of the plates and discs.

NOTE:

- Keep the discs and plates in the same order as they were removed.

425RW009

Legend

- (1) Differential Plate
- (2) Differential Disc
- (3) Dished Spacer
- (4) Side Gear

Inspection and Repair**Cleaning**

- All parts with solvent.

Visual Inspection

- Clean all parts with solvent.
- Plates and Discs. If any one disc or plate in either stack shows evidence of excessive wear or scoring, the complete stack is to be replaced on both sides.
- Side Gears and Pinion Mate Gears. The gear teeth of these parts should be checked for extreme wear and possible cracks. The external teeth of the side gear, which retain the concentric groove discs, should also be checked for wear or cracks.
- If replacement of one gear is required due to wear, etc., then both side gears, pinion mate gears, and thrust washers are to be replaced.
- Differential Shaft. If excessive wear is evident, the differential shaft should be replaced.
- Differential Plate Retainers. If wear is evident on any one of the differential plate retainers, all four retainers must be replaced.
- Differential Case. If scoring, wear or metal pickup is evident on the machined surfaces, replacement of the case is necessary.

Reassembly

1. Lubricate thrust face of side gears, plates and discs with the proper limited slip rear axle lubricant.
2. Assemble plates and discs in exactly in the same position as they were removed, regardless of whether they are new or original.
3. Install differential plate retainer to ears of plates.

NOTE:

- Make sure both retainers are completely seated on ears of plates.
- 4. Install clutch pack and side gear into bottom side gear bore. Make sure clutch pack stays assembled to side gear splines, and that retainers are completely seated into pockets of case.

NOTE:

- To prevent clutch pack from falling out of case, hold clutch pack in place by hand while repositioning case on bench.
- 5. Install other side gear and clutch pack. Make sure clutch pack stays assembled to side gear splines, and retainers are completely seated into pockets of case.
- 6. Hold clutch pack in position and assemble screw cap(2), cap(3) and forcing screw(1). Tighten forcing screw into bottom cap to hold both clutch packs in position.
- 7. With tools assembled to case, position case on holder 5-8840-2583-0 by aligning splines of side gear with those of shaft. Tighten forcing screw to compress clutch packs in order to provide clearance for pinion mate gears.

901RW288

8. Install pinion mate gears.
 - Place the pinion mate gears into the differential 180 degrees apart.

4A2-32 DIFFERENTIAL (REAR)

9. While holding gears in place, insert LSD service adapter 5-8840-2582-0 with long drive handle 5-8840-0007-0 in differential shaft hole of case. Pull on long drive handle and rotate case, allowing gears to turn. Make sure that holes in pinion mate gears align with holes in case.

- It may be necessary to adjust tension on forcing screw to rotate case.
10. Tighten forcing screw to compress the clutch packs, to allow installation of spherical thrust washers.
11. Lubricate spherical thrust washers (2), and assemble into case (1). Use a small screw driver to push washers into place. Remove tools.

12. Position differential shaft in case and drive in with hammer. Be sure lock pin hole of differential shaft (5) is properly aligned to allow installation of lock pin (3). Be sure that thrust washers and differential pinion mate gears are aligned with the differential case (4). Install new lock pin to proper depth using a punch.

Stake metal of case over pin in two places, 180 degrees apart.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Shift On The Fly System

Outline of Shift on The Fly System

The shift on the fly system switches between 2 wheel drive (2WD) and 4 wheel drive (4WD) electrically by driver's pressing the 4WD switch (push button type) on instrument panel.

This system controls below operations. (Shifting between "4H" and "4L" must be performed by transfer control lever on the floor.)

1. Shifting the transfer front output gear (Connecting to, and disconnecting from, front propeller shaft by motor actuator).
2. Retrieval of shifting the transfer front output gear.
3. Connecting front wheels to, and disconnecting them from, the front axles by vacuum actuator.
4. Indicator on instrument panel.
5. 4WD out signal to other Electronic Hydraulic Control Unit.

System Diagrams

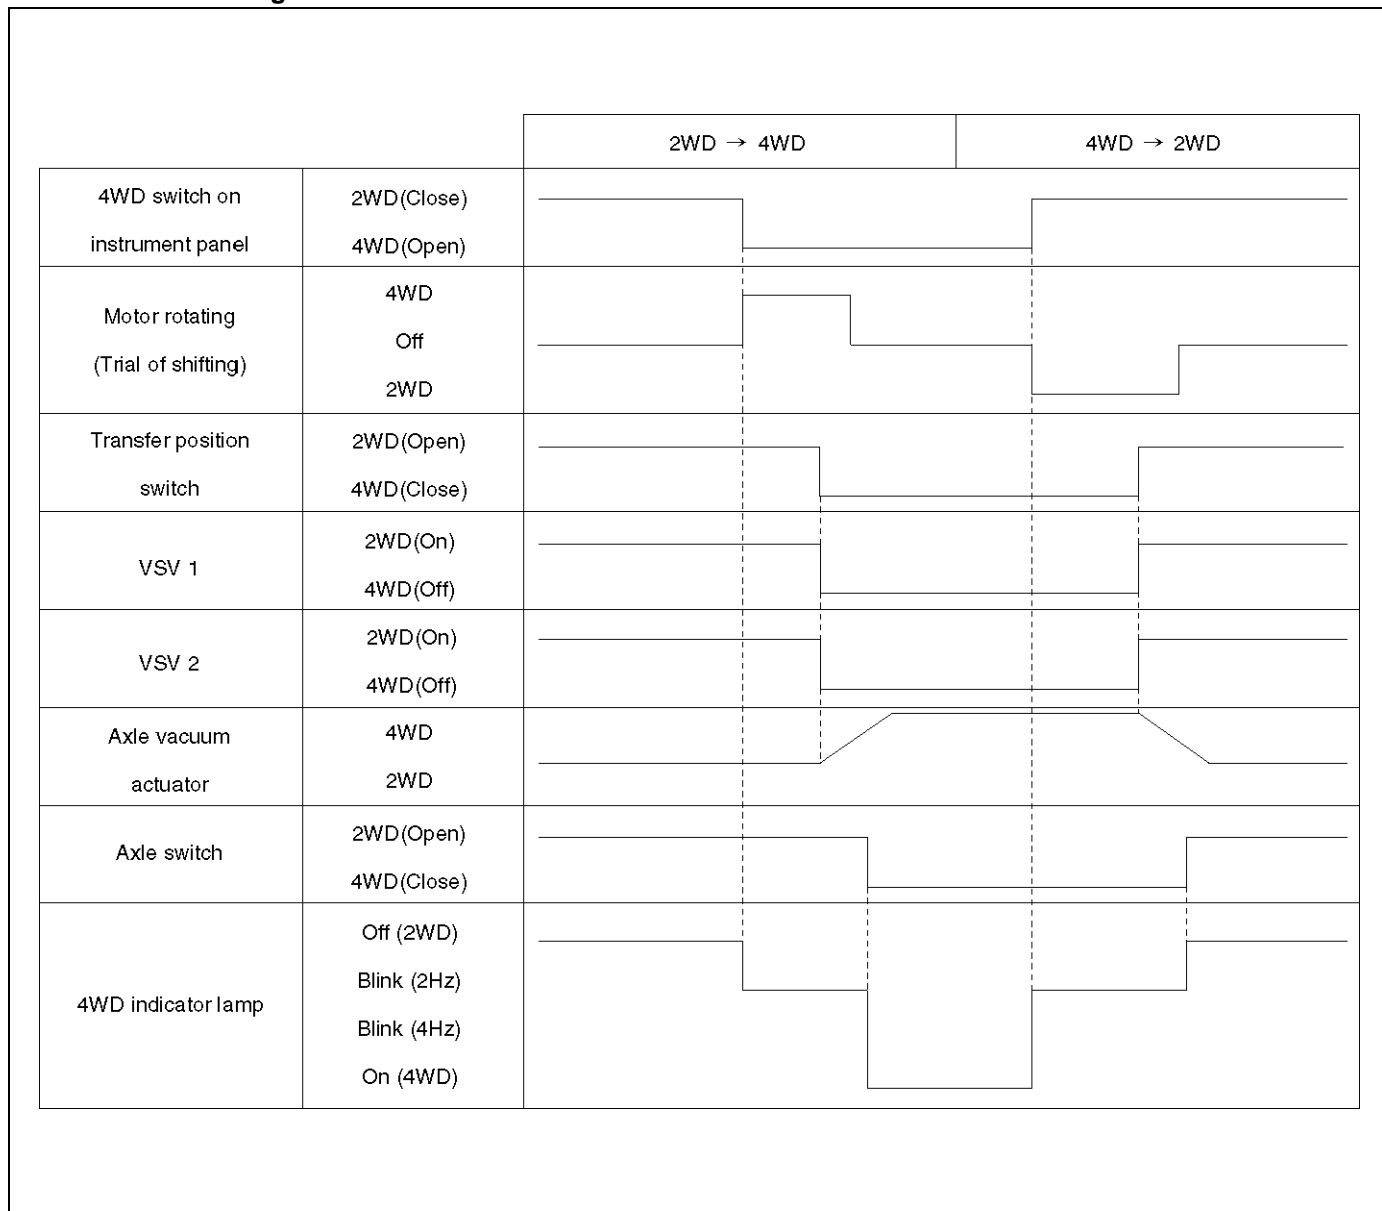

Normal Operation

The motor actuator mounted on transfer rear case is driven by signal from 4WD switch on instrument panel. After complete the connecting transfer front output gear to, or disconnecting it from, front propeller shaft,

condition of the transfer position switch changes. The vacuum solenoid valve (VSV) is driven by the signal from transfer position switch and the vacuum actuator connects front wheels to, or disconnect them from, front axles.

Time Chart of Shifting Under Normal Condition

4B-4 DRIVELINE CONTROL SYSTEM

Retrial

The motor actuator starts transfer gear shifting after signal from 4WD switch on instrument panel has been received. But the shifting may be impossible in cold weather or under high speed condition. When 2 seconds have passed since transfer gear shifting started and the transfer position switch does not turn on (the gear engagement is not completed), the motor reverses its rotation for 1.2 seconds and tries again to shift transfer gear. This procedure is repeated 3 times

in maximum. While this procedure, 4WD indicator lamp blinks by 2 Hz.

If the transfer position switch does not turn on after aforementioned procedure has been repeated 3 times, the gear shifting is stopped and 4WD indicator lamp's blinking changes from 2Hz to 4Hz to notify driver that the gear shifting is stopped. This blinking of indicator lamp continues until 4WD switch is returned from 4WD to 2WD.

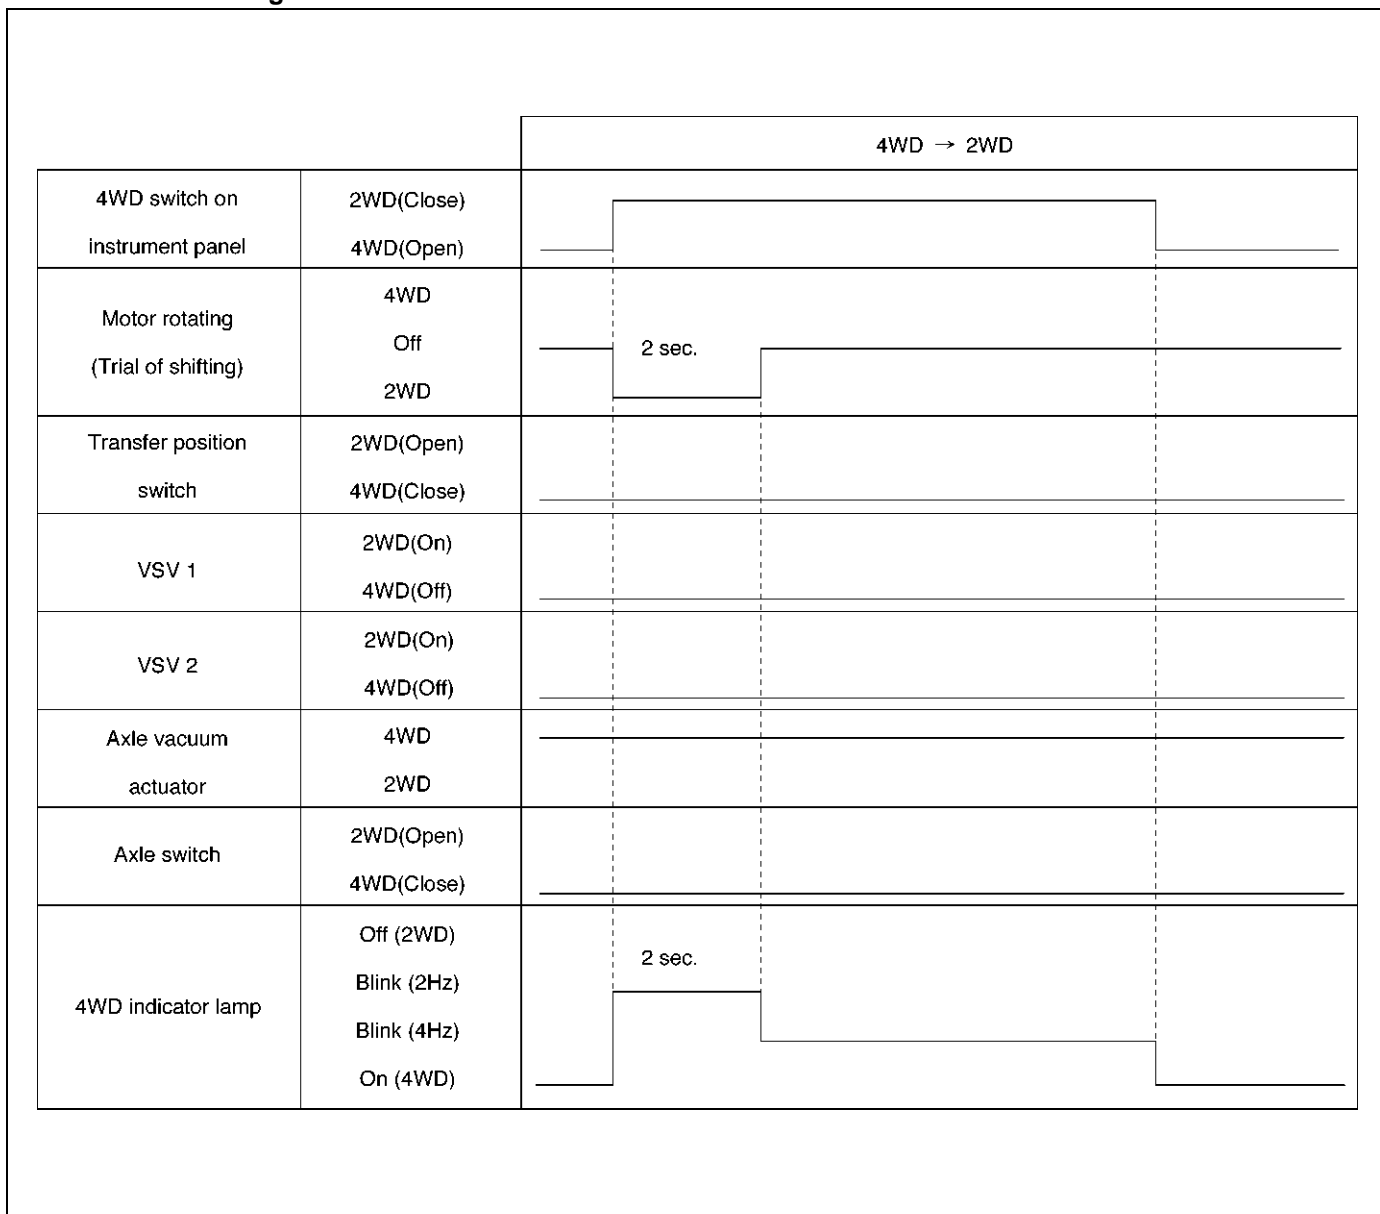

Time Chart of Shifting Under Severe Condition (retrial)

Warning at "4L" position :In view of the shifting mechanism of transfer, the gear shifting from 4WD to 2WD at "4L" condition is impossible. Therefore, the transfer position switch can not be turned off by 4WD

switch when vehicle is in "4L" condition. In the case this condition continues for 2 seconds, the shifting to 2WD is stopped and the indicator lamp's blinking changes from 2Hz to 4Hz to notify driver of wrong operation.

Time Chart of Shifting from 4WD to 2WD at "4L" Condition

F04RX005

4WD out signal to other Electronic Hydraulic

Control Unit : ECU of shift on the fly sends 4WD out signal to other Electronic Hydraulic Control Unit as below.

4WD out signal (Period)	Vehicle Condition	Transfer position switch	Front axle switch
120 ms	2WD	2WD (Open)	2WD (Open)
240 ms	4WD	4WD (Close)	4WD (Close)

4B-6 DRIVELINE CONTROL SYSTEM

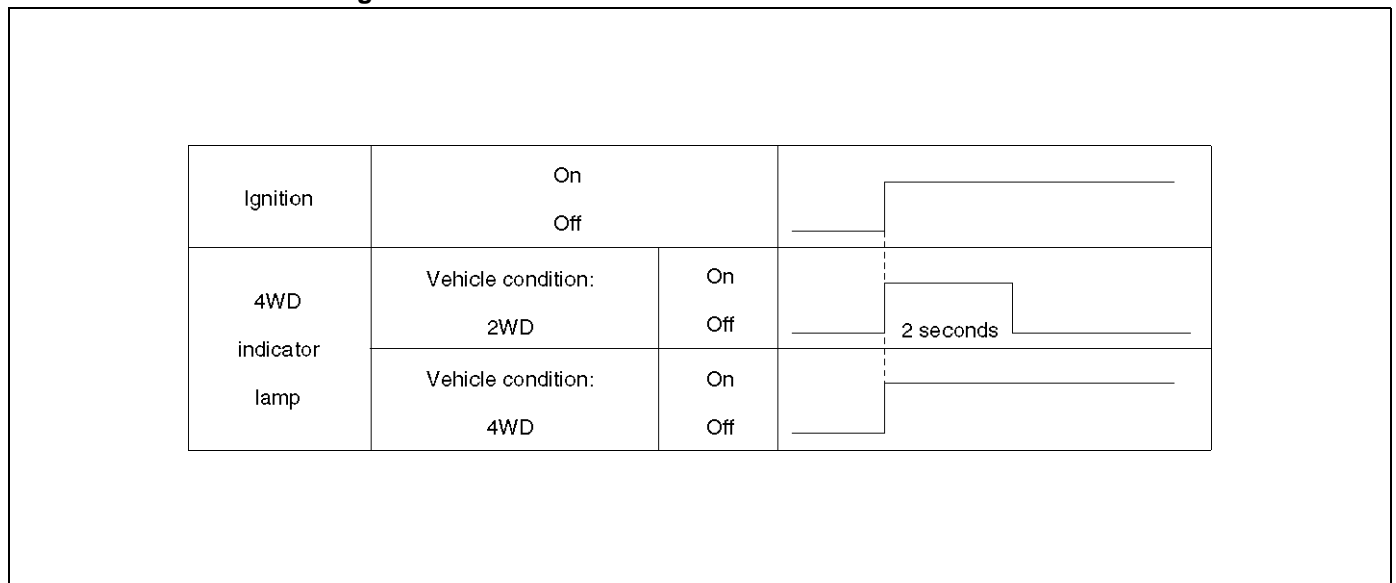

Functions of Indicator Lamp

Indication of vehicle condition : Indicator lamp is controlled by ECU of shift on the fly and shows vehicle conditions as below.

Indicator	Vehicle condition	4WD switch	Transfer position switch	Front axle switch
Off	2WD	Off (Close)	2WD (Open)	2WD (Open)
On	4WD	On (Open)	4WD (Close)	4WD (Close)
Blink (2Hz)	Operating	On (Open)	4WD (Close)	2WD (Open)
		Off (Close)	2WD (Open)	4WD (Close)
Blink (4Hz)	Stop operating	On (Open)	2WD (Open)	2WD (Open)
		Off (Close)	4WD (Close)	4WD (Close)

Bulb check : The bulb of indicator lamp is checked for 2 seconds when ignition key is turned on.

Time Chart of Bulb Checking

Retrials from 2WD to 4WD : In cold weather or under high speed condition, the gear shifting (engagement) sometimes dose not complete by 3 trials. In such case, the indicator lamp inform driver of this incident as aforementioned chart (shown at Retrial in Outline of shift on the fly system.)

Diagnosis

Before Judging That Troubles Occur (Unfaulty mode)

When Switching from 2WD to 4WD

1. **In case that blinking frequency of the 4WD indicator changes from 2Hz to 4Hz.**

When heavy synchronization load is needed, the motor actuator tries the shifting transfer gear three times including the activation shifting. While the motor actuator tries shifting, the indicator blinks by 2Hz. If the third shifting fails, the indicator's blinking changes from 2Hz to 4Hz at the same time that the motor actuator shifted back to 2WD.

Heavy synchronization load occurs by

- extremely lower temperature.
- higher speed.rotation difference of wheels during cornering.

Solution 1: Operate again after stop the vehicle or slow down.

2. **In case that the 4WD indicator continues blinking by 2Hz for more than 11.5 seconds.**

When there is rotation difference of wheels or there is phase difference between front wheels and axles, it is difficult to connect front wheels to front axles.

The blinking by 2Hz shows that shifting the transfer gear or connecting the front wheels is in the middle of operating. In above case, the indicator's blinking by 2Hz shows that connecting the front wheels is not completed (because the indicator's blinking changes to 4Hz when the shifting transfer gear is impossible.). And removal of rotation or phase difference make connecting the front wheels possible.

Solution 2: When vehicle is running, drive straight ahead while accelerating and decelerating. When vehicle is at a stop, move the vehicle forward and backward from 2 to 3 meters.

When Switching from 4WD to 2WD

1. **In case that the 4WD indicator continues blinking by 2Hz .**

The 4WD indicator continues blinking by 2Hz until both shifting the transfer gear and disconnecting the front wheels are completed when switching 4WD to 2WD. When drive line is loaded with torsional torque, the shifting transfer gear and disconnecting front wheels are impossible. In this case, removal of torsional torque on drive line make the shifting transfer gear and disconnecting front wheels possible.

Solution 3: When vehicle is running, drive straight ahead while accelerating and decelerating. When vehicle is at a stop, move the vehicle forward and backward from 2 to 3 meters.

2. **In case that the 4WD indicator's blinking changes from 2Hz to 4Hz.**

Check the position of transfer lever. Is it at "4L" position? In view of the shifting mechanism of transfer, the gear shifting from 4WD to 2WD at "4L" condition is impossible.

Solution 4: Push the 4WD switch to 4WD, shift the transfer lever to "High" position and re-operate the 4WD switch to 2WD.

Diagnosis of The Faults Based on the Status of 4WD Indicator Lamp, 4WD Switch and T/F Change Lever

Diagnosis charts are shown on below. If troubles can not be solved after every chart was traced, troubles may occur in the ECU. In this case, replace the ECU and trace every chart again.

Fault on Switching from 2WD to 4WD

1. In case that 4WD indicator's blinking changes from 2Hz to 4Hz after **Solution 1** is carried out. Faults occur in the motor actuator or the transfer case assembly. Remove the motor actuator and check function. If problem was found and it was repaired, try **Solution 1** again. After that, disassemble the transfer case assembly for check and repair or replace. If incident is not improved after above mentioned actions were taken, replace the ECU.
2. In case that 4WD indicator does not blink nor light, when switching from 2WD to 4WD.

Step	Action	Yes	No
1	Is ignition turned on?	Go to Step 2	Turn on the ignition and trace this chart from start.
2	Does the indicator light during two seconds initialization after ignition is turned on?	Go to Step 3	Burning out of indicator lamp or disconnection of harness wire. Trace this chart from the start after repair or replace.
3	Is the 4WD switch turned from 2WD to 4WD?	Short-circuit (body short) on harness of the 4WD switch. Fault of the 4WD switch (holding the closed condition). Trace this chart from the start after repair or replace.	Push the 4WD switch to 4WD.

4B-14 DRIVELINE CONTROL SYSTEM

3. Case that the indicator keeps blinking by 2Hz after aforementioned Solution 2 is carried out.

Step	Action	Yes	No
1	Check the air pressure and wear of all tires. Were problems found?	Try Solution 2 after adjust the air pressure and replace worn tires.	Go to Step 2
2	Can the transfer lever be operated from High to 4L or vice versa?	Go to Step 3	<p>Disconnection of the motor actuator harness wiring. Trace this chart from the start after repair or replace.</p> <p>Faults on the motor actuator. Trace this chart from the start after replace.</p> <p>Internal faults of transfer case. Disassemble the transfer case for check. Trace this chart from the start after repair or replace.</p>
3	Pull out the hoses from vacuum actuator and operate 4WD switch. Is there negative pressure on either of hoses?	Go to Step 4	<p>Faults on the transfer position switch or its harness. Trace this chart from the start after repair or replace.</p> <p>Faults on the VSV main body, its harness or vacuuming system. Trace the diagnosis chart in Front Axle ASM section. After that, trace this chart from the start.</p>

Step	Action	Yes	No
4	Check the axle switch. Were problems found?	Internal faults on axle switch. Trace this chart from the start after replace.	Disconnection on the axle harness. Trace this chart from the start after repair or replace. Faults on Front Axle ASM. Trace the diagnosis chart in Front Axle ASM section. After that, trace this chart from the start.

Fault on Switching from 4WD to 2WD

1. Case that indicator dose not blink nor turn out.

Step	Action	Yes	No
1	Does the indicator turn out by ignition off?	Go to Step 2	Short circuit of the indicator harness.
2	Is the 4WD switch on 2WD position?	Disconnection on the 4WD switch harness or breakdown of the 4WD switch in open state. Trace this chart from the start after repair or replace.	Turn the 4WD switch to 2WD position. Trace this chart from the start.

2. Case that indicator keeps 2Hz blinking after aforementioned Solution 3 is carried out.

Step	Action	Yes	No
1	Check the air pressure and wear of all tires. Were problems found?	Try Solution 3 after adjust the air pressure and replace worn tires.	Go to Step 2
2	Can the transfer lever be operated from High to 4L or vice versa?	<p>Faults on the harness wiring of motor actuator. Trace this chart from the start after repair or replace.</p> <p>Internal faults on transfer case.</p> <p>Disassemble the transfer case for check. Trace this chart from the start after repair or replace.</p> <p>Faults on the motor actuator. Trace this chart from the start after or replace.</p>	Go to Step 3
3	Pull out the hoses from vacuum actuator and operate 4WD switch. Is there negative pressure on either of hoses?	Go to Step 4	<p>Faults on the transfer position switch or its harness. Trace this chart from the start after repair or replace.</p> <p>Faults on the VSV main body, its harness or vacuuming system. Trace the diagnosis chart in Front Axle ASM section. After that, trace this chart from the start.</p>

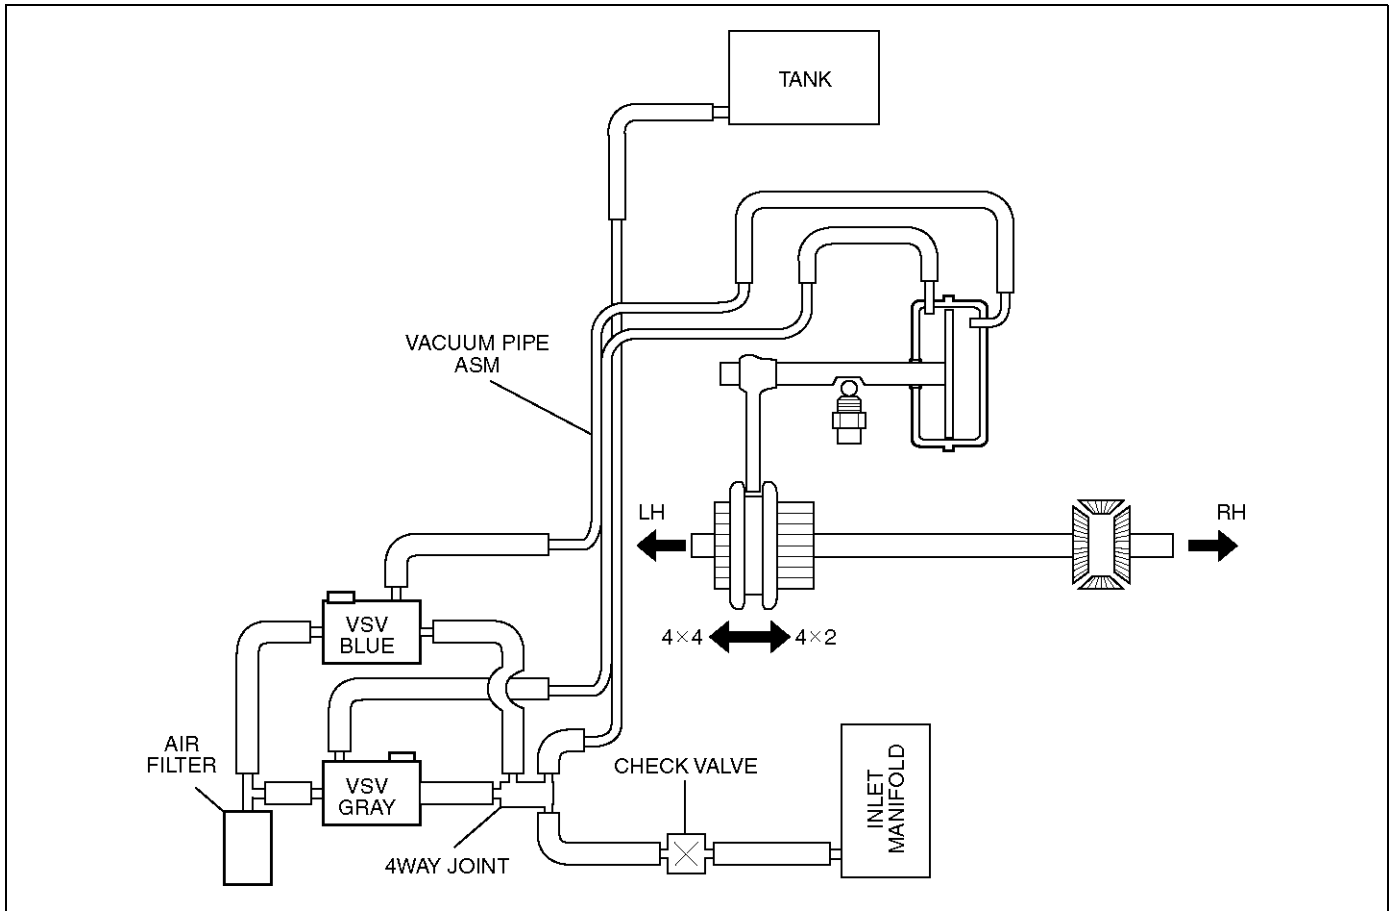

Step	Action	Yes	No
4	Check the axle switch. Were problems found?	Internal faults on axle switch. Trace this chart from the start after replace. Faults on Front Axle ASM. Trace the diagnosis chart in Front Axle ASM section. After that, trace this chart from the start.	Short circuit (body short) or disconnection of the axle harness. Trace this chart from the start after repair or replace.

3. Case that indicator's blinking changes to 4Hz after aforementioned Solution 4 is carried out.

Step	Action	Yes	No
1	Can the transfer lever be operated from High to 4L or vice versa?	Faults on the harness wiring of motor actuator. Trace this chart from the start after repair or replace. Faults on the motor actuator. Trace this chart from the start after replace. Internal faults on transfer case. Disassemble the transfer case for check. Trace this chart from the start after repair or replace.	Faults on the ECU. Trace this chart from the start after replace.

Shift On The Fly Vacuum Piping and Electrical Equipment

Vacuum Piping Diagram

C04RX001

Actuator Assembly

412RW024

Vacuum Tank

412RW025

Inspection and Repair

Vacuum Piping

C04RW004

1. Pull out the Hose A in figure and install a vacuum gauge.
2. Plug up Hose B in figure to prevent the leak of vacuum.
3. Start the engine and measure vacuum 2 or 3 minutes afterward.
4. Repeat 1) and 2) but with Hose A plugged and Hose B pulled out.
5. If vacuum measures -400mmHg , or if it shows a sudden drop immediately after engine stop, inspect the hose, tank, and pipe for damage.

NOTE: Be careful not to permit the entry of dust and water during inspection.

6. Pull out Hose D in above illustration.
7. Plug Hose E in above illustration.
8. Make sure that Hose D in above illustration is under atmospheric pressure.
9. Pull out Hose E and plug Hose D, and make sure that Hose E is under atmospheric pressure.
10. If Check 8) or 9) has revealed stoppage, check and see that there is no bend, foreign matter in the hose or in the filter. If there is trouble, repair or replace.

Check Valve

C04RS004

1. Apply vacuum from the orange colored side(1).

Vacuum: -400mmHg

2. Check leakage of vacuum.
3. Make sure that vacuum cannot be applied from the black colored side(2).
4. If vacuum is not applicable as much as -400mmHg , and if there is resistance on the intake side, replace with a new check valve.

VSV Assembly

Inspect the vehicle side harness as follows:

412RX008

Legend

- (1) Grey
- (2) Blue

1. Remove connector.
2. Shift transfer lever to 2H and start the engine.

NOTE: The vehicle should not be started, with the engine idling.

3. Make sure that there is continuity in the vehicle side of harness. If there is no continuity, check transfer shift switch and wiring.

Inspect the both VSVs as follows

F04RS004

1. With battery not connected (Usual).

A-C:There is continuity

B:Closed

2. With battery connected

A – B:There is continuity

C:Closed

3. If 1) and 2) fail, replace with a new VSV.

Functional Detective Switch

412RW067

1. With ball (1) being free

A-B:There is continuity

2. With ball forced into the switch

A-B:No continuity

3. If 1) and 2) fail, replace with a new switch.

Motor Actuator Assembly

Inspect the function of the motor actuator assembly as follows:

1. Disassemble the motor actuator from transfer rear case.

412RW037

Legend

- (3) Shift Rod
- (4) Connector

412RX002

Legend

- (1) 2WD
- (2) 4WD
- (3) Shift Rod
- (4) Connector

2. Connect the terminals as shown in figure.

Shift rod of the motor actuator moves and stops at 4WD position.

4. If 2) and 3) fail, replace with a new motor actuator.

Transfer Position Switch

412RX001

Legend

- (1) 2WD
- (2) 4WD
- (3) Shift Rod
- (4) Connector

3. Connect the terminals as shown in figure.

Shift rod of the motor actuator moves and stops at 2WD position.

412RW040

Legend

- (1) Ball

1. With ball being free.

A-B : There is continuity.

2. With ball forced into the switch.

A-B : No continuity.

3. If 1) and 2) fail, replace with a new switch.

4WD Control Unit

4WD Control Unit Associated Parts

412RW042

Legend

(1) Center Console Assembly

(2) 4WD Control Unit

Removal

1. Remove center console assembly.
Refer to Interior Trim in Body and Accessories section.
2. Remove two screws and harness connector (1) from 4WD control unit.

412RW041

Legend

- (1) Harness Connector

Installation

1. Connect harness connector, then install 4WD control unit.
2. Install center console assembly.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

4C-2 DRIVE SHAFT SYSTEM

General Description

This publication contains essential removal, installation, adjustment and maintenance procedures.

The front axle utilizes a central disconnect type front axle/transfer case system.

Diagnosis

The drive axles are completely flexible assemblies, consisting of inner and outer constant velocity (CV) drive shaft joints connected by an axle shaft.

For description of front propeller shaft and universal joint, refer to Front Propeller Shaft in this section.

Condition	Possible cause	Correction
Oil Leak At Front Axle	Worn or defective oil seal.	Replace the oil seal.
	Front axle housing cracked.	Repair or replace.
Oil Leak At Pinion Shaft	Too much gear oil.	Correct the oil level.
	Oil seal worn or defective.	Replace the oil seal.
	Pinion flange loose or damaged.	Tighten or replace.
Noises In Front Axle Drive Shaft Joint	Broken or worn drive shaft joints and bellows (BJ and DOJ).	Replace the drive shaft joints and bellows.
"Clank" When Accelerating From "Coast"	Loose drive shaft joint to output shaft bolts.	Tighten.
	Damaged inner drive shaft joint.	Replace.
Shudder or Vibration During Acceleration	Excessive drive shaft joint angle.	Repair.
	Worn or damaged drive shaft joints.	Replace.
	Sticking spider assembly (inner drive shaft joint).	Lubricate or replace.
	Sticking joint assembly (outer drive shaft joint).	Lubricate or replace.
Vibration At Highway Speeds	Out of balance or out of round tires.	Balance or replace.
	Front end out of alignment.	Align.
Noises in Front Axle	Insufficient gear oil.	Replenish the gear oil.
	Wrong or poor grade gear oil.	Replace the gear oil.
	Drive pinion to ring gear backlash incorrect.	Adjust the backlash.
	Worn or chipped ring gear, pinion gear or side gear.	Replace the ring gear, pinion gear or side gear.
	Pinion shaft bearing worn.	Replace the pinion shaft bearing.
	Wheel bearing worn.	Replace the wheel bearing.
	Differential bearing loose or worn.	Tighten or replace.
Wanders and Pulls	Wheel bearing preload too tight.	Adjust the wheel bearing preload.
	Incorrect front alignment.	Adjust the front alignment.
	Steering unit loose or worn.	Tighten or replace.
	Tire worn or improperly inflated.	Adjust the inflation or replace.
	Front or rear suspension parts loose or broken.	Tighten or replace.
Front Wheel Shimmy	Wheel bearing worn or improperly adjusted.	Adjust or replace.
	Incorrect front alignment.	Adjust the front alignment.
	Worn ball joint or bush.	Replace the ball joint or bush.
	Steering unit loose or worn.	Tighten or replace.
	Tire worn or improperly inflated.	Replace or adjust the inflation.
	Shock absorber worn.	Replace the shock absorber.

Front Hub and Disc

Disassembled View

411RW001

Legend

- | | |
|--------------------------------|---------------------------|
| (1) Bolt | (8) Bolt |
| (2) Cap | (9) Hub and Disc Assembly |
| (3) Snap Ring and Shim | (10) Wheel Pin |
| (4) Hub Flange | (11) ABS Sensor Ring |
| (5) Lock Washer and Lock Screw | (12) Inner Bearing |
| (6) Hub Nut | (13) Oil Seal |
| (7) Outer Bearing | |

Disassembly

1. Before disassembly, select the 2WD position with the 4WD switch.
2. Jack up the front of vehicle and support frame with jack stands.
3. Remove the disc brake caliper assembly and hang it on the frame with wires. Refer to Disk Brakes in Brake section.
4. Remove Bolt.
5. Remove cap.
6. Remove snap ring and shim.

4C-4 DRIVE SHAFT SYSTEM

7. Remove hub flange.
8. Remove lock washer and lock screw.
9. Use wrench 5-8840-2117-0, remove hub nut.

10. Remove hub and disc assembly.
11. Remove ABS sensor ring.
12. Remove outer bearing.
13. Remove oil seal.
14. Remove inner bearing.
15. Remove bolt, if necessary, replace the wheel pin in the following manner.
 - Apply a scribe mark(1) to disc to hub.
 - Clamp the hub and disc assembly in a vise, using protective pads. Remove the 6 disc-to-hub retaining bolts.

- Place hub on a suitable work surface and remove the studs by using a hammer.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

Check the following parts.

- Hub
- Hub bearing oil seal
- Knuckle spindle
- Disc
- Caliper
- Shift on the fly system parts (Cap, Hub flange, Shim, Snap ring)
- ABS sensor ring

For inspection and servicing of disc caliper and related parts, refer to Disc Brakes in Brake section.

Reassembly

1. Install wheel pin.

- Place the hub on a wood workbench or a block of wood approx. 6" by 6" to protect the wheel stud ends and threads.
 - Insert a wheel stud using a hammer.
- Be sure the wheel stud is started squarely and seats completely.

411RS005

2. Align scribe marks(1) and attach the hub to the disc, then tighten the bolts to the specified torque.

Torque: 103N·m (10.5kg·m/76lbft)

411RS005

3. Use installer 5-8840-2119-0 and grip 5-8840-0007-0, then install the inner bearing by driving it into the hub.

411RW006

4. Use installer 5-8840-2118-0 and grip 5-8840-0007-0 then install the outer bearing by driving it into the hub.

411RW007

4C-6 DRIVE SHAFT SYSTEM

5. Apply grease (NLGI No.2 or equivalent) to the lip portion, then install oil seal by using installer 5-8840-2120-0 and grip 5-8840-0007-0.

411RW008

6. Install ABS sensor ring, then tighten the bolts to the specified torque.

Torque: 18N·m (1.8kg·m/13lbf)

7. Install hub and disc assembly.

- Apply grease in the hub.
- Apply wheel bearing type grease NLGI No. 2 or equivalent to the outer and inner bearing.

Grease Amount

Hub: 35g (1.23oz)

Outer bearing: 10g (0.35oz)

Inner bearing: 15g (0.53oz)

411RS009

Legend

- (1) Inner Bearing
- (2) Hub
- (3) Outer Bearing

8. Install hub nut.

Turn to the place where there is a chamfer in the tapped hole to the outer side, then attach the nut by using front hub nut wrench 5-8840-2117-0.

411RW005

Preload Adjustment

1. Tighten the hub nut to 29 N·m (3.0kg·m/22lbf), then fully loosen the nut.
2. Tighten the hub nut to the value given below, using a spring scale on the wheel pin.

New bearing and New oil seal

Bearing Preload: 20– 25N (2.0– 2.5kg·m/4.4– 5.5lb)

Used bearing and New oil seal

Bearing Preload: 12– 18N (1.2– 1.8kg·m/2.6– 4.0lb)

If the measured bearing preload is outside the specifications, adjust it by loosening or tightening the bearing nut.

411RS011

9. Install lock washer and lock screw in the following manner.

- Turn the side with larger diameter of the tapered bore to the vehicle outer side, then attach the washer.
- If the bolt holes in the lock plate are not aligned with the corresponding holes in the nut, reverse the lock plate.
- If the bolt holes are still out of alignment, turn in the nut just enough to obtain alignment.
- Screw is to be fastened tightly so its head may come lower than the surface of the washer.

411R5012

10. Apply adhesive (LOCTITE 515 or equivalent) to both joining flange faces then install hub flange.

11. Install snap ring and shim.

- Adjust the clearance between the free wheeling hub body and the snap ring.

Clearance: 0mm–0.3mm (0in–0.012in)

Shims Available: 0.2mm, 0.3mm, 0.5mm, 1.0mm (0.008in, 0.012in, 0.020in, 0.039in)

411RW002

12. Install hub cap.

13. Tighten the bolts to the specified torque.

Torque: 59N-m (6.0kg-m/43lbft)

Front Drive Shaft Joint

Front Drive Shaft Joints Replacement

- Refer to Front Drive Axle Assembly Replacement in this section, and refer to Front Hub and Disc Overhaul in Suspension section.

Front Hub Bearing Preload Check

Check the hub bearing preload at the wheel pin.

New bearing and New oil seal:

20 – 25N (2.0 – 2.5kg-m/4.4 – 5.5lb)

Used bearing and New oil seal:

12 – 18N (1.2 – 1.8kg-m/2.6 – 4.0lb)

411RS011

Inspection Of Shift On The Fly System Gear Oil

412RW035

1. Open filler plug and make sure that the oil up to the plug port.
If the oil is short, replenish with gear oil GL-5 grade.
2. Tighten the filler plug to specified torque.

Torque: 78N-m (8.0kg-m/58lbft)

Front Axle Drive Shaft

Front Axle Drive Shaft and Associated Parts

| (11) Ball | |
| (12) Snap Ring | |

4C-10 DRIVE SHAFT SYSTEM

Disassembly

NOTE: For the left side, follow the same steps as right side.

1. Raise the hooked end of the band with a screwdriver or equivalent.

2. Remove band(1).
3. Pry off circlip (1) with a screwdriver or equivalent.

4. Remove drive shaft joint assembly.
5. Remove the six balls (1) with a screwdriver or equivalent.

6. Using snap ring pliers, remove the snap ring (1) fastening the ball retainer to the center shaft.

7. Remove ball retainer, ball guide and bellows.
8. Raise the hooked end of the band with a screwdriver or equivalent.

412RS014

9. Remove band(1).
10. Remove bellows.
11. Remove dust seal.
12. Remove BJ shaft assembly.
13. Remove the mounting bracket fixing bolts, and then remove DOJ case assembly from the axle case.
14. Remove snap ring and bearing.
15. Remove snap ring and oil seal.
16. Remove bracket.

Inspection And Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

Check the following parts.

1. Drive shaft joint assembly
2. DOJ case, ball, ball guide, ball retainer
3. Bellows
4. Bearing
5. Dust seal, oil seal

Bushing Replacement

- Remove the bushings using a remover 5-8840-2309-0 and hammer.

412RW051

- By using installer and base 5-8840-2309-0, press fit the bushings into the bracket.

412RW052

Reassembly

1. Install DOJ case to bracket.
2. Install oil seal and fix snap ring.
3. Install bearing and fix snap ring.
4. Install bracket to axle case. Tighten the bracket bolt to the specified torque.

Torque: 116N·m (11.8kg·m/85lbf)

5. Apply 150g of the specified grease in BJ.
6. Install dust seal.
7. Apply a thin coat of grease to the shaft for smooth installation then install bellows.

4C-12 DRIVE SHAFT SYSTEM

8. Install band. Note the setting direction. After installation, check that the bellows is free from distortion.

9. Install another bellows and fix band.
10. Install the ball guide with the smaller diameter side ahead onto the shaft.
11. Install ball retainer.
12. Using snap ring pliers, install the snap ring (1) securing the ball retainer to the shaft.

13. Align the track on the ball (1) retainer with the window in the cage, and install the six balls into position.

14. Pack 150g of the specified grease in DOJ case, then install drive shaft joint assembly. After reassembly, move the DOJ longitudinally several times to get to fit.
15. Install the circlip (1) so that open ends are positioned away from the ball groove.

412RS020

Legend

- (1) Outer Case
- (2) Circlip
- (3) Open Ends

16. Install bellows. Adjust the air pressure within the bellows by inserting a screwdriver or equivalent, so that it equals atmospheric pressure.

412RS021

17. Install band. After installation, check that the bellows is free from distortion.

Shift On The Fly System

Shift On The Fly System and Associated Parts

412RW031

Legend

- | | |
|-------------------------|---|
| (1) Filler Plug | (9) Clutch Gear |
| (2) Bolt | (10) Sleeve |

| (4) Snap Ring(External) | (12) Front Axle Drive Shaft(LH side) with Bracket |
| (5) Inner Shaft Bearing | (13) Bolt |
| (6) Snap Ring(Internal) | (14) Actuator Assembly |
| (7) Inner Shaft | (15) Bolt |
| (8) Needle Bearing | |

Disassembly

1. Remove filler plug and gasket, drain oil.
2. Loosen mounting bracket fitting bolts and remove front axle drive shaft from front axle case.
3. Remove actuator assembly and draw out actuator ASM.
4. Remove housing.
5. Remove sleeve.

6. Remove clutch gear.
7. Remove snap ring from front axle case by using snap ring pliers.

8. Take out inner shaft from front axle case.
9. Remove snap ring from inner shaft by using snap ring pliers.

10. Remove inner shaft bearing.

NOTE: Be careful not to damage the shaft.

11. Remove needle bearing from inner shaft by using a remover 5-8840-0027-0 and sliding hammer 5-8840-0084-0.

12. Remove oil seal from front axle case.

NOTE: Be careful not to damage the front axle case.

Inspection And Repair

Inspect the removed parts. If there are abnormalities such as wear and damage, take corrective action or replace.

Visual Check

1. Check and see if the inner shaft has such abnormalities as wear and damage.

2. When inspecting the inner shaft, be sure to check and see if its splined part is twisted, worn, or cracked. If so, replace with a new shaft. In case such an abnormality in its gear part (a slide with sleeve), replace the shaft.

Inner Shaft Run-Out

With both end centers supported, rotate the shaft slowly and measure deflection with a dial gauge.

Limit: 0.5mm (0.02in)

NOTE: Do not heat the shaft to correct its bend.

Inner Shaft Bearing

Legend

- (1) Inner Shaft Bearing
- (2) Inner Shaft
- (3) Clutch Gear

1. Inspect the state of inner shaft bearing. If any abnormality such as smoothness is found, replace with a new inner shaft bearing.
2. Insert a clutch gear and check the state of needle bearing.
3. If there is an abnormality such as smoothness, replace the needle bearing.

Sleeve Condition

Check and see that there is not wear damage, or cracking in the sleeve.

NOTE: Close inspection of the groove and inner gear are required because those are important parts.

Sleeve Function

Operate the sleeve with the inner shaft combined with the clutch gear and if smoothness is felt, replace the sleeve.

NOTE: Gear oil should be applied to the contact surface of gear.

Check the width of sleeve center groove.

Limit: 7.1 mm (1.28 in)

Clutch Gear Condition

Check and see that there is not wear, damage, crack, or any other abnormality in the clutch gear.

Clutch Gear Function

If there is an abnormality such as roughness when operated in combination with sleeve, replace the clutch gear.

NOTE: When inspecting, gear oil should be applied to the contact surface of gear.

Clutch Gear Journal Diameter

Make sure of the size illustrated.

Limit: 36.98mm (1.456 in)

Actuator

Check and see that there is no damage, cracking, or other abnormality.

Functional Check

412RW021

412RW007

Disconnect the shift position switch and make sure of function with a vacuum of -400 mmHg applied to Ports A and B, in accordance with the table below.

412RW013

State	Port A	Port B	Function
C	-400 mmHg	A/P	E
D	A/P	-400 mmHg	F

If there is an abnormality, replace the actuator as an assembly.

NOTE:

1. If the actuator works under -400mmHg or less, there is no functional problem.
2. Be careful not to permit the entry of water or dust into the ports of the actuator.

Dimensional Check

Measure illustrated sizes 1, 2, and 3.

Limit

1=64.1 mm (2.52 in)

2=6.7 mm (0.26 in)

3=6.7 mm (0.26 in)

Reassembly

1. Install the new oil seal which has been immersed in differential gear oil, by using an oil seal installer 5-8840-2407-0 and grip 5-8840-0007-0.

2. Check the oil seal installation position (from shaft end to oil seal).

Depth: 24.2-25.2mm(0.95-0.99in)

3. Force a new needle bearing into inner shaft by using a Installer 5-8840-2408-0 and grip 5-8840-0007-0.

4C-20 DRIVE SHAFT SYSTEM

- Place a new snap ring(internal) in inner shaft.
Force a new inner shaft bearing into the inner shaft.

412RS044

- Install snap ring(external).

NOTE: Be careful not to damage the inner shaft.

- Clean the housing contact surface of the front axle case and insert inner shaft assembly into the front axle case.

NOTE: Be careful not to damage seal.

- Install snap ring internal in the groove of front axle case.

NOTE: Be sure to install the snap ring properly.

412RW017

- Apply differential gear oil to clutch gear, then install clutch gear.
- Apply differential gear oil to sleeve, then install sleeve.
- Clean contact surface with the front axle and actuator mounting surface. Apply liquid gasket to the contact surface on the front axle case, then install in the housing.

412RW023

- Tighten bolts to specified torque.

Torque: 75N-m(7.6kg-m/55 lb ft)

- Clean the actuator contact surface with the housing then Install and tighten shift position switch to specified torque.

Torque: 39N-m (4.0kg-m/29 lb ft)

- Apply liquid gasket to the contact surface on the actuator side.

412RW012

14. Align shift arm with the groove of sleeve and install the actuator.
15. Tighten bolts to specified torque.
Torque: 9N·m(0.9kg·m/78lbin)
16. Install front axle drive shaft and mounting bracket.
Tighten fitting bolts to specified torque.
Torque: 116N·m (11.8kg·m/85lbft)
17. Pour specified amount of differential gear oil to filler plug.
Front Differential
Oil Capacity: 1.4lit (1.48USqt)
Actuator Housing
Oil Capacity: 0.12lit(0.13USqt)
18. Install filler plug through gasket and tighten to specified torque.
Torque: 78N·m (8.0kg·m/58lbft)

Main Data and Specifications

General Specifications

Front drive axle oil capacity	1.4 liter (1.48 US qt)(Differential)
	0.12 liter (0.13 US qt)(Actuator Housing:Shift on the fly)
Type of lubricant	GL-5 (75W-90) Refer to chart in General Information

Propeller Shaft

General Description

401RX026

Legend

- (1) Front Propeller Shaft (for 6VD1)
- (2) Front Propeller Shaft (for X22SE)
- (3) Rear Propeller Shaft;
Aluminum Tube Type
(for 6VD1, M/T model)
- (4) Rear Propeller Shaft;
Steel Tube Type
(for X22SE, M/T model and 6VD1, A/T model)

Torque is transmitted from the transmission to the axle through propeller shaft and universal joint assemblies. All propeller shafts are the balanced tubular type. A splined slip joint is provided in some drivelines.

- Since the propeller shaft is total balanced carefully, welding or any other modification are not permitted.
- Alignment marks should be applied to each propeller shaft before removal.
- Be sure vehicle is stopped, engine is not running, brake is secured and vehicle is secured to prevent injury.
- Be careful not to grip the propeller shaft tube too tightly in the vise as this will be cause deformation.

Phasing

The propeller shaft is designed and built with the yoke lugs (ears) in line with each other. This design produces the smoothest running shaft possible, called phasing. Vibration can be caused by an out-of-phase propeller shaft. The propeller shaft will absorb vibrations from speeding up and slowing down each time the universal joint goes around. This vibration would be the same as a person snapping rope and watching the "wave" reaction flow to the end. A propeller shaft working in phase would be similar to two persons snapping a rope at the same time, and watching the "waves" meet and cancel each other out. In comparison, this would be the same as the universal joints on a propeller shaft. A total cancellation of vibration produces a smooth flow of power in the driveline. It is very important to apply a reference mark to the propeller shaft before removal, to assure installation alignment.

Universal Joint

Legend

- (1) Spider
- (2) Yoke

A universal joint consists of two Y-shaped yokes connected by a crossmember called a spider. The spider is shaped like a cross. Universal joints are designed to handle the effects of various loadings and front or rear axle windup during acceleration. Within the designed angle variations, the universal joint will operate efficiently and safely. When the design angle is changed or exceeded the operational life of the joint may decrease.

The bearings used in universal joints are of the needle roller type. The needle rollers are held in place on the trunnions by round bearing cups. The bearing cups are held in the yokes by snap rings.

Diagnosis of Propeller Shaft and Universal Joint

Condition	Possible cause	Correction
Universal Joint Noise.	Worn universal joint bearings.	Replace.
	Improper lubrication.	Lubricate as directed.
	Loose flange bolts.	Tighten to specifications.
Ping, Snap, or Click in Drive Line (Usually Heard on Initial Load after the Transmission is in Forward or Reverse Gear)	Loose bushing bolts on the rear springs or upper and lower control arms.	Tighten the bolts to specified torque.
	Loose or out-of-phase end yoke.	Remove end yoke, turn 180 degrees from its original position, lubricate the splines and reinstall. Tighten the bolts and pinion nut to specified torque.
Knocking or Clanking Noise in the Driveline when in High or Neutral Gear at 16km/h(10mph)	Worn or damaged universal joint	Replace the universal joint.
Squeak	Lack of lubricant.	Lubricate joints and splines. Also check for worn or brinelled parts.
Shudder on Acceleration (Low Speed)	Loose or missing bolts at the flanges.	Replace or tighten bolts to specified torque.
	Incorrectly set front joint angle.	Install shim under the transmission support mount to change the front joint angle.
	Worn universal joint.	Replace.
Vibration	Incorrect shaft runout.	Replace.
	Shaft out of balance.	Adjust.
	Transmission rear housing bushing, transfer case housing bushing worn.	Replace.
	Yoke spline jammed.	Replace.
Excessive Leak at the Front Spline Yoke of Rear Propeller Shaft	Rough surface on splined yoke; burred nicked or worn.	Replace the seal. Minor burrs can be Smoothed by careful use of crocus cloth or fine stone honing. Replace the yoke if badly burred.
	Defective transmission rear oil seal.	Replace the transmission rear oil seal and replenish the transmission oil.

Front Propeller Shaft

Front Propeller Shaft and Associated Parts

401RW063

Legend

- | | |
|--|--|
| (1) Bolt, Nut and Washer (Front Axle Side) | (3) Bolt, Nut and Washer (Transfer Side) |
| (2) Front Propeller Shaft (Single Cardan Type) | (4) Front Propeller Shaft (Double Cardan Type) |

Removal

1. Raise the vehicle on a hoist.

NOTE: Apply alignment marks on the flange at the front propeller shaft both front and rear side.

401RS020

2. Remove bolt, nut and washer (Front axle side).
3. Remove bolt, nut and washer (Transfer side).
4. Remove front propeller shaft.

Installation

NOTE: Never install the shaft assembly backwards.
Never insert bar between yoke lugs when tightening or

removing bolts. Completely remove the black paint from the connecting surface of flange coupling on each end of propeller shaft. Clean so that no foreign matter will be caught in between.

1. Align the mark which is applied at removal. Install front propeller shaft and tighten the bolts to the specified torque.

Torque: 63N·m (6.4kg·m/46lbft)

Slip Joint Disassembly

Legend

- | | |
|--------------------------|-------------------|
| (1) Spline Yoke Assembly | (4) Clamp |
| (2) Clamp | (5) Tube Assembly |
| (3) Boot | |

1. Lay the shaft horizontally on a bench and secure.

2. Indicate the original assembled position (1) by marking the phasing of the shaft prior to disassembly.

401RW037

3. Using the flat blade of a screwdriver, pry the loose end of the boot clamp upwards and away from the propeller shaft boot. Be careful not to damage the boot.
4. When boot clamps becomes loose, remove by hand.
5. Repeat for the other boot clamp.
6. Remove the spline yoke assembly from the tube assembly, by securing the boot with one hand and pulling on the spline yoke.
7. Remove the boot from the tube assembly.

Universal Joint Disassembly (Single Cardan Type)

401RW031

Legend

- | | |
|-----------------|---------------------------|
| (1) Flange Yoke | (3) Spider |
| (2) Snap Ring | (4) Needle Roller Bearing |

1. Using a soft drift, tap the outside of the bearing cup assembly to loosen snap ring. Tap bearing only hard enough to break assembly away from snap ring.

Remove snap ring from yoke. Turn joint over, tap bearing away from snap ring, then remove opposite snap ring.

Apply alignment marks (1) on the yokes of the universal joint, then remove snap ring.

2. Set the yoke in the arbor press with a piece of tube stock beneath it. Place a solid plug on the upper bearing assembly and press it through to release the lower bearing assembly.

3. If the bearing assembly will not pull out by hand after pressing, tap the base of the lug near the bearing assembly to dislodge it.
4. To remove the opposite bearing, turn the yoke over and straighten the spider in the open hole. Then carefully press on the end of the spider so the remaining bearing moves straight out of the bearing spider hole. If the spider or bearing are cocked, the bearing will score the walls of the spider hole and ruin the yoke.
5. Repeat this procedure on the remaining bearing to remove the spider from the yoke.
6. Make sure of proper position for reinstallation by applying setting marks, then remove spider .

Universal Joint Disassembly (Double Cardan Type)

Legend

- | | |
|---------------------------|---------------------------|
| (1) Ball Stud Tube Yoke | (4) Spring |
| (2) Cross and Bearing Kit | (5) Cross and Bearing Kit |
| (3) Coupling Yoke | (6) Flange Yoke |

1. Using a soft drift, tap the outside of the bearing cup assembly to loosen snap ring. Tap bearing only hard enough to break assembly away from snap ring.
2. Remove snap ring from yoke. Turn joint over, tap bearing away from snap ring, then remove opposite snap ring.

401RW073

401RW084

3. Remove all snap rings from the yoke in similar manner.
4. Set the outboard side of the center yoke in the arbor press with a piece of tube stock beneath it. Place a solid plug on the upper bearing cup assembly and press it through to release the lower bearing cup assembly.
Press the center bearing cup assembly partially from the outboard side of the center yoke - enough to grasp the bearing cup by vise jaws.
Do not press the bearing cup assembly completely through.

5. Grasp the protruding bearing cup assembly by vise jaws. Tap the tube yoke with a mallet and drift to dislodge the bearing cup assembly from the yoke hole.

6. Flip the assembly and repeat steps 4 and 5 for removing the opposite side bearing cup assembly. This will allow removal of the cross centering kit assembly and spring.
Do not disassemble centering kit.

7. Press the remaining bearing cup assemblies out on the other cross as described above to complete disassembly.

NOTE: Tap in the center of the "H" yoke. Never strike the yokes at the bearing cup assembly holes because the snap ring grooves may collapse and make reassembly impossible.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition is found through inspection.

NOTE: When any part of the journal assembly (spider, needle roller bearing) requires replacement, be sure to replace the entire assembly.

Check the following parts for wear, damage, noise or any other abnormal conditions.

1. Spider
2. Needle roller bearing
3. Yoke
4. Flange
5. Boot

Spider pin for wear

Spider pin should be smooth and free from fretting or galling. Visible signs of needle presence is normal, but wear should not be felt.

401RW038

Propeller shaft runout

Support the propeller shaft on V-blocks (2) and check for runout by holding the probe of a dial indicator (1) in contact with the shaft.

Static runout limit:

0.13mm (0.005in)

TIR on the neck of the slip tube shaft (with a boot).

0.25mm (0.010in)

TIR on the ends of the tubing 3 inch from the welds.

0.38mm (0.015in)

TIR at the linear center of the tube.

0.38mm (0.015in)

TIR for the full length of tube with 30" or less of tubing.

(TIR : Total Indicator Reading)

401RS027

Spline

The nylon-coated spline should be free from nicks and dings and the underlying steel spline should not be visible.

After cleaning the nylon coating spline, the coating should exhibit only a slight indication of wear. Grease volume is approximately 10 grams of grease in total. Grease should be evenly applied to both the female and the male slip splines using a small brush. After assembly of the slip joint, the sliding joint should be fully worked from the full collapsed to the full extended position.

Play in the universal joint

Limit: Less than 0.15mm (0.006in)

401RW023

Preload of the universal joint

Preload should be 0 to 24.9 kg(0 to 11.3 lb). Joints should rotate smoothly and freely and should exhibit no rough or ratchety movement.

Boot

Check the boot for crack or damage. If necessary, replace the boot.

If abnormal conditions are found on the boot, inspect the grease for mixing of foreign material.

If the grease is in good condition, and the slip joint works well, replace the boot, replenish grease, and reassemble the slip joint.

If foreign material is found in the grease, check the spline for wear and damage.

Universal Joint Reassembly (Single Cardan Type)

1. Install spider to flange yoke. Be sure to install the spider by aligning the setting marks made during disassembly.
2. Pack the four grease cavities of the spider with a high quality, extreme pressure N.L.G.I. Grade 2 grease. Do not add additional grease to the bearing cup assembly.
3. Move one end of the spider to cause a trunnion to project through the spider hole beyond the outer machined face of the yoke lug. Place a bearing over the trunnion diameter and align it to the spider hole. Using an arbor press, hold the trunnion in alignment with the spider hole and place a solid plug on the upper bearing. Press the bearing into the spider hole enough to install a snap ring.

4. Install a snap ring.
Be sure the snap rings are properly seated in the grooves.
5. Repeat steps 3 and 4 to install the opposite bearing.
If the joint is stiff, strike the yoke ears with a soft hammer to seat needle bearings.
6. Align setting marks (1) and join the yokes.

7. Install snap ring.

Universal Joint Reassembly (Double Cardan Type)

1. Pack the four grease cavities of the cross with a high quality, extreme pressure N.L.G.I. Grade 2 grease. Do not add additional grease to bearing cup assembly.
2. Fit a cross into the tube yoke.

401RW069

3. Move an end of the cross to cause a trunnion to project through the cross hole beyond the outer machined face of the yoke lug. Place a bearing cup assembly over the trunnion diameter and align it to the cross hole. Using an arbor press, hold the trunnion in alignment with the cross hole and place a solid plug on the upper bearing cup assembly. Press the bearing cup assembly into the cross hole enough to install a snap ring.

401RW070

4. Install a snap ring.
5. Repeat steps 3 and 4 to install the opposite bearing cup assembly. If the joint is stiff, strike the yoke ears with a soft hammer to seat the needle bearing.

NOTE: Be sure the snap rings are properly seated in the grooves.

401RW071

6. Fit the center yoke ("H" Yoke) on the remaining two trunnions and press bearing assemblies in place, both sides as in steps 3 and 4 above. Install snap rings.

401RW086

7. Install the journal onto the flange as per steps 3 and 4 above.
8. Install the centering kit assembly inside the center yoke making sure the spring in the tube yoke is in place.

9. Fit the open trunnions of the flange assembly in to the center yoke holes and the bearing assemblies into the centering kit assembly.
10. Install bearings as per steps 3 and 4.
11. Check for proper assembly. Flex the double cardan joint beyond center. The joint should snap over center in both directions when all needle rollers and components are correctly assembled.

Slip Joint Reassembly

401RW075

Legend

|-----------------------|-------------------|
| (1) Spline Yoke shaft | (4) Clamp |
| (2) Clamp | (5) Tube Assembly |
| (3) Boot | |

1. Apply grease evenly to both the female and male splines.
2. Apply a small amount of grease by finger to the outer lips of the boot.
3. Slide the boot (smaller diameter side) onto the spline yoke shaft being careful not to damage the spline coating or boot.
4. Insert the spline yoke shaft into the tube assembly being careful to maintain proper phasing. The spider holes should be in line and as per originally marked prior to disassembly.
5. Position boot onto tube and yoke shaft in final position over boot grooves.

6. Attach boot clamps and secure using pliers.
7. Be sure clamp is properly seated and secure.

CAUTION: Use new clamp which is the same parts as original. Do not use other clamp to avoid bad balancing of shaft or the grease leakage.

Main Data and Specifications

General Specifications

4. When boot clamps becomes loose, remove by hand.
5. Repeat for the other boot clamp.
6. Remove the slip yoke assembly from the driveshaft, by securing the boot with one hand and pulling on the slip yoke.
7. Remove the boot from the shaft assembly.

Universal Joint Disassembly

Legend

- (1) Spider
- (2) Flange Yoke
- (3) Bearing
- (4) Snap Ring

NOTE: Aluminum is softer than steel. Care must be taken not to remove excessive material or damage bearing holes.
If the vehicle has aluminum tube type propeller shaft, flange yoke, boot kit, journal kit can be replaced. If other parts are damaged, replace propeller shaft as assembly.

1. Apply alignment marks on the yokes of the universal joint, then remove the snap ring.

401RW024

If the snap ring is stuck in position, remove paint from the hole in the yoke or tap around the edge of the bearing lightly with a soft drift.

401RW025

2. Set the yoke in the arbor press with a piece of tube stock beneath it. Place a solid plug on the upper bearing and press it through to release the lower bearing.

401RW027

3. If the bearing will not pull out by hand after pressing, tap the base of the lug near the bearing to dislodge it.
4. To remove the opposite bearing, turn the yoke over and straighten the spider in the open spider hole. Then carefully press on the end of the spider so the remaining bearing moves straight out of the bearing spider hole. If the spider or bearing are cocked, the bearing will score the walls of the spider hole and ruin it.

401RW026

5. Repeat this procedure on the remaining bearing to remove the spider from the yoke.

Inspection

- Propeller shaft for run-out Aluminum tube type.
Static run-out limit : 1.0mm(0.04in)

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

Transfer Case (for Manual Transmission)

Transfer Case (for Automatic Transmission)

A07RW001-1

The transfer case is used to provide a means of providing power flow to the front axle. The transfer case also provides a means of disconnecting the front axle, providing better fuel economy and quieter operation when the vehicle is driven on improved roads where four wheel drive is not required. In addition, the transfer case provides an additional gear reduction when placed in low range, which is useful when difficult off-road conditions are encountered.

A floor mounted shift lever is used to select the high-low range. When four wheel drive switch has been turned on, the four wheel drive indicator light is designed to come on and the front axle has been engaged.

Transfer Rear Oil Seal

Transfer Rear Oil Seal and Associated Parts

220RS015

Legend

(1) Rear Propeller Shaft

(2) End Nut and Rear Companion Flange

(3) Oil Seal

Removal

1. Disconnect the rear propeller shaft (1) from the transfer case side.
2. Remove end nut and rear companion flange (2), using the companion flange holder 5-8840-0133-0.

266RW026

3. Use the universal puller to remove the rear companion flange and O-ring.
4. Remove the oil seal from the transfer case.

Installation

1. Install oil seal and apply engine oil to the oil seal outer surfaces.
2. Apply the recommended grease (BESCO L2) or equivalent to the oil seal lip.
3. Use the oil seal installer 5-8840-2292-0 to install the rear seal (3) to the transfer rear case.

220RW105

4. Install the rear companion flange (2) and O-ring (2).
5. Use the companion flange holder 5-8840-0133-0 to install a new end nut (2) and tighten to the specified torque.

Torque: 167 N·m (17.0 kg·m/123 lb ft)

6. Use the punch 5-8840-2293-0 to stake the end nut at two spots.

NOTE: Be sure to confirm that there is no crack at the staked portion of the end nut (2) after staking.

266RW027

266RW002

7. Connect the rear propeller shaft to the transfer case and tighten to the specified torque.

| (4) Center Console | (8) Front Propeller Shaft |
| | (9) Transfer Case Assembly |

Removal

NOTE: Before removing transmission and transfer assembly from vehicle, change the transfer mode to 2WD using the 4WD push button switch on dash panel.

1. Disconnect battery ground cable.
2. Remove transfer control lever knob (1).
3. Remove lower cluster assembly (2).

4. Remove rear console (3).

5. Remove center console (4).

6. Remove grommet assembly and transfer control lever (5).

4D-8 TRANSFER CASE

7. Raise and support vehicle with suitable stands. Drain transfer case fluid.
8. Remove transfer protector (6).

9. Remove rear propeller shaft (7) and front propeller shaft (8).

NOTE: Apply alignment marks on the flange at both front and rear sides.

10. Disconnect harness connectors and clip.
Connector: transfer switch, 2WD-4WD actuator, speed sensor.
11. Support transmission case with a transmission jack.
12. Remove the top position bolt from transfer control lever hole and others under the floor.
Remove transfer case (9) from the vehicle.

Installation

1. Apply a thin coat of molybdenum disulfide grease to the input shaft spline as shown in the figure.

2. Install transfer case (9) to the transmission. Tighten transfer bolts as shown in the figure.

261RX001

3. Remove the transmission jack from transmission side.
4. Connect harness connectors and clip.
Connector: transfer switch, 2WD-4WD actuator, speed sensor.
5. Install rear propeller shaft (7) and front propeller shaft (8).

Torque: 63 N·m (6.4 kg·m/46 lb ft)

6. Install transfer protector (6).

150RX010

4D-10 TRANSFER CASE

7. Fill transfer case fluid.
8. Lower the vehicle.
Install grommet assembly and transfer control lever (5).

256RW007

9. Install center console (4), rear console (3) and lower cluster assembly (2).
10. Install transfer control lever knob (1).

Transfer Rear Case Assembly (A/T)

Transfer Rear Case Assembly (A/T) and Associated Parts

220RW133-1

Legend

| (3) Rear Companion Flange | (6) 2WD-4WD Actuator Assembly |
| | (7) Transfer Rear Cover Assembly |
| | (8) Transfer Case Assembly |

Removal

1. Remove the speedometer sensor (1).
2. Remove the plate (1).

3. Remove the speedometer driven gear bushing and driven gear (1).

NOTE: Apply a reference mark to the driven gear bushing before removal.

4D-12 TRANSFER CASE

4. Remove front companion flange (2) and rear companion flange (3), using the flange companion holder 5-8840-0133-0 to remove the end nut..

5. Remove the front and rear companion flange.

NOTE: Use the universal puller to remove the rear companion flange.

6. Disconnect the actuator breather hose and transfer breather hose from control box (4).
7. Remove control box assembly (4).
8. Disconnect the actuator breather hose and 2WD-4WD actuator heat protector (5) from the 2WD-4WD actuator assembly (6).

9. Remove the 2WD-4WD actuator assembly bolts.
10. Pull the 2WD-4WD actuator assembly (6) with 2WD-4WD shift rod.

Legend

- (12) Mode: 2WD

11. Off set the actuator assembly.

220RW028

12. Remove the actuator assembly (6).

220RW066

Legend

(13) Position: 4WD

(14) Mode: 2WD

13. Remove transfer rear cover assembly (7) from transfer case assembly.

Installation

1. Apply the recommended liquid gasket (LOCTITE 17430) or its equivalent to the transfer rear cover fitting faces.

220RS017

2. Install transfer rear cover assembly (7) to transfer case assembly (8).

3. Perform the following steps before fitting the transfer rear case.

1. Shift the high-low shift rod to the 4H side.
2. The cut-away portion of the select rod head (15) should align with that of the rear case hole's stopper (16).

230RW009

4D-14 TRANSFER CASE

4. Tighten the transfer rear case bolts to the specified torque.

Torque: 37 N-m (3.8 kg-m/27 lb ft)

5. Shift the 2WD-4WD shift rod (17) to the 4WD side.

6. Join the rod grooves of 2WD-4WD actuator assembly (6) and shift rod (17).

Legend

- (6) 2WD-4WD Actuator Assembly (Mode: 2WD)
- (7) Rear Cover Assembly
- (17) Shift Rod: 2WD-4WD (Position: 4WD)

7. Push the 2WD-4WD actuator assembly (6) with 2WD-4WD shift rod (17) till the shift rod (17) reaches the 2WD position.

Legend

- (18) Position: 2WD
- (19) Mode: 2WD

8. Tighten the 2WD-4WD actuator bolts to the specified torque.

Torque: 19 N-m (1.9 kg-m/14 lb ft)

9. Connect the actuator breather hose to actuator.

10. Install actuator heat protector (5).

11. Install control box assembly (4).

Torque: 19 N-m (1.9 kg-m/14 lb ft)

12. Connect breather hoses to control box (4).

13. Install rear companion flange (3) and front companion flange (2), using the companion flange holder 5-8840-0133-0 to tighten the flange nuts to the transfer case.

14. Tighten the new transfer flange nuts to the specified torque.

Torque

Rear companion flange: 167 N-m (17.0 kg-m/123 lb ft)

Front companion flange: 137 N-m (14.0 kg-m/101 lb ft)

15. Use the punch 5-8840-2293-0 to stake the rear companion flange nut (3) at two spots.

266RW027

266RW002

16. Stake the front companion flange nut (2) at one spot.

NOTE: Be sure to confirm that there is no crack at the staked portion of the flange nut after staking.

17. Install the O-ring (23) to the speedometer driven gear bushing (22).

18. Install the driven gear to the speedometer driven gear bushing (22).

19. Install the speedometer driven gear assembly to the transfer rear cover.

20. Install the plate (21) to the transfer rear case and tighten to the specified torque.

Torque: 15 N-m (1.5 kg-m/11 lb ft)

21. Install the speedometer sensor and tighten to the specified torque.

Torque: 26 N-m (2.7 kg-m/20 lb ft)

| | (9) Transfer Rear Cover (with oil seal) |

Disassembly

1. Remove bearing snap ring, use a pair of snap ring pliers to remove the snap ring (3).

226RS060

2. Remove the rear output shaft assembly (1) from the transfer rear cover (with oil seal) (9).
3. Remove ball bearing (8), using a bench press and the bearing remover 5-8840-0015-0.

226RW186

4. Remove speedometer drive gear (7).
5. Remove ball (6).
6. Remove bearing snap ring (5), using a pair of snap ring pliers.
7. Remove rear output shaft (2) from the ball bearing (4), using a bench press and the bearing remover 5-8840-0015-0.

226RW187

Inspection and Repair

Refer to "TRANSFER CASE ASSEMBLY" in this section for inspection and repair.

Reassembly

Transfer rear cover (with oil seal) (9). Oil seal replacement.

- Remove the oil seal from the transfer rear cover.
- Apply engine oil to the oil seal outer surfaces.
- Fill in recommended grease (BESCO L2) or equivalent in the oil seal lip.
- Use the oil seal installer 5-8840-2292-0 to install the rear oil seal to the transfer rear cover.

220RW104

1. Install ball bearing (4) to the rear output shaft (2), using the ball bearing installer 5-8840-2159-0 and the adapter 5-8840-2192-1.

262RW068

4D-18 TRANSFER CASE

2. Install bearing snap ring (5), using a pair of snap ring pliers.
3. Install ball (6).
4. Install speedometer drive gear (7).

226RS064

5. Use the ball bearing installer 5-8840-2159-0 to install the ball bearing (8).

226RW188

6. Install the rear output shaft assembly (1) to the transfer rear cover (9).
7. Install bearing snap ring (3).

NOTE: The snap ring must be fully inserted into the transfer rear cover snap ring groove.

Detent, Shift Arm, and Interlock Pin (Transfer Case Assembly)

Disassembled View

262RW005

Legend

| (8) 4WD Indicator Switch | (16) Transfer Case |

4D-20 TRANSFER CASE

Disassembly

1. Remove detent ball, spring and plug (1).
2. Use a spring pin remover to remove the spring pin (2) from the bridge (2).

262RW011

3. Remove spring (4).
4. Engage the 2WD-4WD sleeve with front output gear. Remove the spring pin (3) from the block (7). Remove the shift rod (5).

262RW022

5. Remove shift arm (6).
6. Remove shift block (7).
7. Remove 4WD indicator switch (8).
8. Use a magnetic tool to remove the interlock pin (9) and spring (10) from the transfer case (16).

262RS005

9. Remove select rod assembly (11).
10. Use a spring pin remover to remove the shift arm spring pin (12) from the shift arm (14) and shift block (15). Remove the high-low shift rod (13) from transfer case (16).

262RS006

11. Remove shift arm (14).
12. Remove shift block (15) from transfer case (16).

Inspection and Repair

Refer to "TRANSFER CASE ASSEMBLY" in this section for inspection and repair.

Reassembly

1. Place shift block (15) in transfer case (16).
2. Set shift arm (14) on the High-Low sleeve.
3. Push High-Low shift rod (13) through shift arm (14) and block (15).
4. Engage the High-Low sleeve with the 4H (1) side.
5. Install the spring pin (12) to the shift block (15) and shift arm (14).

262RW034

6. Install select rod assembly (11), joining its lever to shift block (15) groove.
7. Engage the High-Low sleeve with the 4H side and install the interlock pin (9) and spring (10) in the proper direction.
8. Place 2WD-4WD shift block (7) in the transfer case (16).
9. Set 2WD-4WD shift arm (6) on the 2WD-4WD sleeve.
10. Push 2WD-4WD shift rod (5) through 2WD-4WD shift arm (6) and 2WD-4WD shift block (7).
11. Install the 2WD-4WD shift rod (5) with interlock pin pushed in.

262RW035

Legend

- (18) 2WD-4WD
- (19) 4H Side

- (27) 4x2
- (28) 4x4

4D-22 TRANSFER CASE

12. Install 4WD indicator switch and gasket (8).
Tighten to the specified torque.

Torque: 39 N·m (4.0 kg·m/29 lb ft)

13. Install spring (4).
14. Engage the 2WD-4WD sleeve with the 4WD side and install the spring pin (3).

262RW022

15. Install spring pin (2) and bridge (2).
16. Install detent ball, spring and plug and tighten the plug to the specified torque.

Torque: 25 N·m (2.5 kg·m/18 lb ft)

Disassembly

1. Use a pair of snap ring pliers to remove the snap ring (1).
2. Use a bearing remover 5-8840-2155-0 and puller 5-8840-2027-0 to remove the ball bearing (2).

3. Install the front companion flange temporarily.
4. Use the Companion flange holder 5-8840-0133-0 and lock nut wrench 5-8840-2156-0 to remove the lock nut (3).

5. Remove the front companion flange.
6. Remove snap ring (4). (A/T)
7. Remove the input shaft assembly (5) from the transfer case (42). (A/T)

8. Use the universal puller to remove the high-low clutch hub and sleeve (6), and transfer input gear (7).

9. Remove needle bearing (8).
10. Remove bearing collar (9).

226RS071

11. Remove ball (10).
12. Remove plate (11).
13. Use a bench press and the ball bearing remover 5-8840-0015-0 to remove the ball bearing (12) from the input shaft (13). (A/T)

265RW013

14. Use a pair of snap ring pliers to remove the bearing snap ring (14).
15. Use a plastic hammer to tap the front output gear assembly (15) free.

262RS009

16. Remove bearing snap ring (16).
17. Use a bench press and the bearing remover 5-8840-0015-0 to remove the following parts.
18. Remove ball bearing (17), and bearing collar (18). Remove sub-gear snap ring (19), spacer (20), belleville spring (21), and sub-gear (anti-lash plate) (22). (M/T) Remove front output gear (23) and needle bearing (24).

262RW070

19. Remove inside ring (25).
20. Remove outside ring (26).
21. Remove block ring (27).
22. Use a bench press and bearing remover 5-8840-0015-0 to remove 2WD-4WD clutch hub and sleeve assembly (28) and stopper plate (29).

NOTE: Do not reuse the stopper plate.

4D-26 TRANSFER CASE

23. Disassemble the 2WD-4WD clutch hub and sleeve assembly (28).

- Springs (1)
- Inserts (2)
- Clutch Hub (3)
- Sleeve (4)

226RW133

24. Use a bench press and the ball bearing remover 5-8840-0015-0 to remove the ball bearing (30) from front output shaft (31).

262RW071

25. Remove bearing snap ring (32).
26. Remove the counter gear assembly (33) from the transfer case (42).
27. Use a pair of snap ring pliers to remove the snap ring (34).
28. Use a bench press and the bearing remover 5-8840-0015-0 to remove the ball bearing (35).
29. Use a pair of snap ring pliers to remove the snap ring (36).

30. Use a bench press and the bearing remover 5-8840-0015-0 to remove the ball bearing (37).

226RW208

31. Remove spacer (38).
32. Remove belleville spring (39).
33. Remove sub-gear (anti-lash plate) (40).
34. Remove counter gear (41).
35. Remove transfer case (with oil seal) (42), performing the following steps (M/T)
- Cover the shaft splines with adhesive tape (43).

A07RW022

Legend

- (43) Adhesive Tape
- (44) Oil Seal Lip
- (45) Oil Seal Collar
- (46) Bearing

- Remove the transfer case together with intermediate plate with gear assembly from the transmission case (M/T).

- Remove the transfer case from the intermediate plat with gear assembly (M/T).

Inspection and Repair

1. Make the necessary repair or parts replacement if wear, damage or any other abnormal conditions are found during inspection.
2. Wash all parts thoroughly in clean solvent. Be sure all old lubricant, metallic particles, dirt, or foreign material are removed from the surfaces of every part. Apply compressed air to each oil feed port and channel in each case half to remove any obstructions or cleaning solvent residue.

Gears

1. Inspect all the gear teeth for signs of excessive wear or damage and check all the gear splines for burrs, nicks, wear or damage. Remove the minor nicks or scratches on an oil stone. Replace any part exhibiting excessive wear or damage.

Front Output Gear Inside Diameter

1. Use an inside dial indicator to measure the gear inside diameter.
2. If the measured value exceeds the specified limit, the gear must be replaced.

Gear inside diameter

Standard : 48.000–48.013 mm (1.8898–1.8903 in)

Limit : 48.10 mm (1.894 in)

226RS040

Clutch Hub Spline Play

1. Set a dial indicator to the clutch hub to be measured.
2. Move the clutch hub as far as possible to both the right and the left.
Note the dial indicator reading.

3. If the measured value exceeds the specified limit, the clutch hub must be replaced.

Clutch hub spline play

Standard : 0–0.1 mm (0–0.004 in)

Limit : 0.2 mm (0.008 in)

226RS042

Bearings

1. Inspect the condition of all the needles and ball bearings. Wash bearings thoroughly in a cleaning solvent. Apply compressed air to the bearings.

NOTE: Do not allow the bearings to spin. Turn them slowly by hand. Spinning bearings may damage the rollers.

2. Lubricate the bearings with a light oil and check them for roughness by slowly turning the race by hand.

Ball Bearing Play

1. Use a dial indicator to measure the ball bearing play.
2. If the measured value exceeds the specified limit, the ball bearing must be replaced.

Limit : 0.2 mm (0.008 in)

226RS043

Synchronizers

The synchronizer hubs and sliding sleeves are a selected assembly and should be kept together as originally assembled.

Clean synchronizer components with clean solvent and air dry.

Inspect the components for the following:

- Teeth for wear, scuffs, nicks, burrs or breaks.
- Keys and springs for wear, cracks or distortion, replace if these conditions are present.
- If scuffed, nicked or burred conditions cannot be corrected with a soft stone or crocus cloth, replace the component.

Block Ring and Insert Clearance

1. Use a vernier caliper to measure the clearance between the block ring and the insert.
2. If the measured value exceeds the specified limit, the block ring and the insert must be replaced.

Block ring and insert clearance

Standard : 2.46–2.74 mm (0.097–0.108 in)

Limit : 3.0 mm (0.118 in)

2WD-4WD Synchronizer (3-Cone)

1. Use a thickness gauge to measure the clearance between the block ring and the dog teeth.
2. If the measured value exceeds the specified limit, the 2WD-4WD synchronizer assembly must be replaced.

Block ring and insert clearance

Standard : 1.5 mm (0.059 in)

Limit : 0.8 mm (0.031 in)

Clutch Hub and Insert Clearance

1. Use a thickness gauge to measure the clearance between the clutch hub and the insert.
2. If the measured value exceeds the specified limit, the clutch hub and the insert must be replaced.

Clutch hub and insert clearance

Standard : 0.01–0.19 mm (0.0004–0.0075 in)

Limit : 0.3 mm (0.012 in)

Detent Springs

1. Inspect the springs for distortion, cracks or wear.
Replace if these conditions are present.

Detent Spring Free Length

1. Use a vernier caliper to measure the detent spring free length.
2. If the measured value is less than the specified limit, the detent spring must be replaced.

Detent spring free length

Detent ball

Standard : 23.4 mm (0.921 in)

Limit : 22.8 mm (0.898 in)

Interlock pin

Standard : 15.9 mm (0.626 in)

Limit : 15.3 mm (0.602 in)

220RW035

Detent Spring Tension

1. Use a spring tester to measure the detent spring tension.
2. If the measured value is less than the specified limit, the detent spring must be replaced.

Detent ball

Compressed height : 18.7 mm (0.736 in)

Standard : 68.6–88.2 N (7.0–9.0 kg /15.4–19.8 lb)

Interlock pin

Compressed height : 11.5 mm (0.453 in)

Standard : 9.8 N (1.0 kg/2.2 lb)

220RS015

Shift Arm

1. Inspect the shift arms for wear, distortion or scoring.
Replace if these conditions are present.

Shift Arm Thickness

1. Use a micrometer to measure the shift arm thickness.
2. If the measured value is less than the specified limit, the shift arm must be replaced.

Shift arm thickness

Standard : 9.60–9.85 mm (0.378–0.388 in)

Limit : 9.0 mm (0.354 in)

230RS006

Reassembly

Input Shaft Oil Seal Replacement

1. Remove the oil seal from the transfer case.
2. Apply the engine oil to the oil seal outer surfaces.
3. Apply recommended grease (BESCO L2) or equivalent to the oil seal lip.
4. Use the oil seal installer 5-8840-2279-0 (A/T) 5-8840-2193-0 (M/T) and driver handle 5-8840-0007-0 to install the oil seal to the transfer case.

A/T

220RW130

Legend

- (47) Oil Seal

M/T

220RW132

Legend

- (48) Transmission Side Oil Seal
- (49) Transfer Side Oil Seal

Front Output Shaft Oil Seal Replacement

1. Remove the oil seal from the transfer case.
2. Apply engine oil to the oil seal outer surfaces.
3. Apply recommended grease (BESCO L2) or equivalent to the oil seal lip.
4. Use the oil seal installer 5-8840-2281-0 to install the oil seal to the transfer case.

220RW131

Legend

- (50) Front Output Shaft Oil Seal

1. Install the transfer case (with oil seal) (42), performing the following steps. (M/T)
 - Cover the shaft splines with adhesive tape (43). This will prevent damage to the oil seal lip (44).

A07RW022

Legend

- (43) Adhesive Tape
 (44) Oil Seal Lip
 (45) Oil Seal Collar
 (46) Bearing

- Apply recommended liquid gasket (LOCTITE 17430) or its equivalent to the transmission, intermediate plate and transfer case fitting surfaces (M/T).

220RS026

4D-32 TRANSFER CASE

Install the transfer case together with intermediate plate with gear assembly to transmission case (M/T).

Tighten the transfer case bolts to the specified torque a little at a time (M/T).

Torque : 37 N·m (3.8 kg·m/27 lb ft)

- Apply chassis grease (51) to the sub-gear (40) and the counter gear (41) thrust surfaces.

226RW155

- Install sub-gear (40) to counter gear (41).
- Install belleville spring (39).
- Install spacer.
- Install ball bearing, using a bench press.
- Select a snap ring that will allow the minimum axial play.

Clearance : 0-0.1 mm (0-0.004 in)

Snap ring availability:	
Thickness	Color-coding
1.50 mm (0.059 in)	White
1.55 mm (0.061 in)	Yellow
1.60 mm (0.063 in)	Blue

226RS170

226RS021

- Use a pair of snap ring pliers to install the snap ring (36) to the counter gear (41).

Sub-Gear (anti-lash plate) Preload

- Hook a length of piano wire (52) over one of the sub-gear (53) teeth.
- Attach the other end of the piano wire (52) to a spring balancer.
- Measure the sub-gear preload.

Preload : 59-98 N (6.0-10 kg/13-22 lb)

226RW156

9. Install ball bearing (35), using a bench press.
 10. Install snap ring (34).
 11. Install the counter gear assembly (33) to the transfer case (42).
 12. Use a pair of snap ring pliers to install the snap ring (32) to the transfer case (42).
- NOTE: The snap ring must be fully inserted into the transfer case snap ring groove.
13. Use a bench press to install the ball bearing (30) to the front output shaft (31).

262RS012

14. Assemble the 2WD-4WD clutch hub and sleeve assembly (28).

226RW140

15. Engage the springs in the same insert with the open ends away from each other.

226RW141

4D-34 TRANSFER CASE

16. Install a new stopper plate (29) and the clutch hub and sleeve assembly (28) to the front output shaft (31).

Legend

(54) Front Output Gear

17. The clutch hub face (with the heavy boss) must be facing the front output gear side.

18. Use a bench press to slowly force the clutch hub and sleeve assembly (28) together with the stopper plate (29) into place.

19. Align the inserts with the block ring insert grooves. Install the block ring (27) to the clutch sleeve and hub assembly (28).

20. Install the outside ring (26), inside ring (25) and needle bearing (24) to the front output gear (23) and bearing collar (18).

NOTE: Coat all parts with transmission oil before installing them.

21. Apply engine oil to the thrust surfaces of the sub-gear, the belleville spring, and the spacer (M/T).

22. Install sub-gear (anti-lash plate) (22), belleville spring (21) and spacer (20). (M/T)

23. Install sub-gear snap ring (19). (M/T)

24. Use a bench press to install the needle bearing collar together with the front output gear assembly, aligning inside ring claw with block ring groove.

- 25. Install ball bearing (17), using a bench press.
- 26. Select a snap ring (16) that will allow the minimum axial play.

Clearance : 0–0.1 mm (0–0.004 in)

226RS021

- 27. Use a pair of snap ring pliers to install the snap ring (16) to the output shaft (31).

Sub-gear (anti-lash plate) preload (M/T)

1. Hook a length of piano wire (52) over one of the sub-gear (53) teeth.
2. Attach the other end of the piano wire to (52) a spring balancer.
3. Measure the sub-gear preload.

Preload: 59–98 N (6.0–10 kg/13–22 lb)

226RW156

- 28. Install front output gear assembly (15) to transfer case (42).

- 29. Use a pair of snap ring pliers to install the snap ring (14) to the transfer case (42).

NOTE: The snap ring must be fully inserted into the transfer case snap ring groove.

- 30. Use a bench press to install the ball bearing (12) to the input shaft (13). (A/T)

265RS003

4D-36 TRANSFER CASE

31. Install plate (11), ball (10) and bearing collar (9).

NOTE: Put the snap ring (4) in the ball bearing side. (A/T)

32. Install needle bearing (8) and input gear (7).

33. The clutch hub face (with the heavy boss) must be facing the transfer input gear side (55).

34. Install high-low clutch hub and sleeve (6), using a bench press.

35. Install input shaft assembly (5) to transfer case (42). (A/T)

36. Install the snap ring (4) to the transfer case (42). (A/T)

NOTE: The snap ring must be fully inserted into the transfer case snap ring groove.

37. Install the front companion flange temporarily and use the flange holder 5-8840-0133-0 and lock nut wrench 5-8840-2156-0 to install the lock nut (3).

Torque: 137 N-m (14.0 kg-m/101 lb ft)

38. Use the punch to stake the lock nut (3) at one spot.

39. Use a suitable drift and hammer to install the ball bearing (2).

40. Install bearing snap ring (1).

Main Data and Specifications

General Specifications

Type	Synchronized type gears shifting between the 2 and 4 wheel drive mode. Constant mesh type gears shifting between "low" and "high".
Control method	Remote (A/T) and direct (M/T) control with the gear shift lever on the floor for gears shifting between "low" and "high". Electric control with the button switch on the instrument panel for gears shifting between the 2 and 4 wheel driver mode.
Gear ratio	High; 1.000 Low; 2.050
Oil capacity	1.45 lit. (1.53 U.S. quart)
Type of lubricant	Engine oil Refer to chart in Section 0

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

The Anti-lock Brake System (ABS) works on all four wheels. A combination of wheel speed sensor and Electronic Hydraulic Control Unit (EHCUC) can determine when a wheel is about to stop turning and adjust brake pressure to maintain best braking.

This system helps the driver maintain greater control of the vehicle under heavy braking conditions.

NOTE: The Electronic Hydraulic Control Unit (EHCUC) comprises the Hydraulic Unit (H/U) and the coil Integrated Module.

5A-4 BRAKE CONTROL SYSTEM

Functional Description

Hydraulic Unit (H/U)

Solenoid Valve

Legend

(1) Isolation Valve

(2) Dump valve

Normal Braking

During normal (non anti-lock) braking, the solenoid valves are without current and closed due to spring force.

Brake fluid travels through the centre of the normally open isolation valve around the normally closed dump valve and on to the brake pistons.

Legend

(1) Brake

(2) Master Cylinder

5A-6 BRAKE CONTROL SYSTEM

Pressure Isolation (Pressure Maintain)

The electro-hydraulic control unit is activated when the brakes are applied which sends a signal to the coil integrated module to prepare for a possible anti-lock stop.

If the information from the wheel speed sensors indicates excessive wheel deceleration (imminent lockup), the first step in the anti-lock sequence is to isolate the brake pressure being applied by the brake

pedal.

The microprocessor in the coil integrated module sends a voltage to the coil to energize and close the isolation valve. This prevents any additional fluid pressure applied by the brake pedal from reaching the wheel.

With the isolation valves closed, further unnecessary increase in the brake pressure is therefore prevented.

Legend

(1) Brake

(2) Master Cylinder

Pressure Reduction

Once the brake pressure is isolated, it must be reduced to allow the wheels to unlock. This is accomplished by dumping a portion of the brake fluid pressure into a low pressure accumulator.

The microprocessor activates the normally closed dump valve to open, allowing fluid from the wheels to be dumped into the accumulator. This is done with very short activation pulses opening and closing the dump valve passageway. Brake pressure is reduced at the

wheel and allows the wheel to begin rotating again. The fluid from the brake piston is stored in the accumulator against spring pressure and a portion of this fluid also primes the pump.

The dump valves are operated independently to control the deceleration of the wheel. At this point, the brake pedal is isolated from the base brake system, the hydraulic control unit pumps are primed and the attenuators are ready to pump fluid.

 Applied hydraulic pressure
 Released hydraulic pressure

Legend

(1) Brake

(2) Master Cylinder

5A-8 BRAKE CONTROL SYSTEM

Pressure Increase (Re-apply)

The re-apply sequence is initiated to achieve optimum braking. The isolation valve is momentarily opened to allow master cylinder and pump pressure to reach the brakes. This controlled pressure rise continues until the wheel is at optimum brake output or until the brake pressure is brought up to the master cylinder output pressure.

If more pressure is required, more fluid is drawn from the master cylinder and applied to the brakes. The

driver may feel slight pedal pulsations, or pedal drop, this is normal and expected.

As fluid is re-applied to the brakes, the wheel speed will reduce. If the wheels approach imminent lockup again, the module will isolate, dump and re-apply again. This cycle occurs in millisecond intervals, allowing several cycles to occur each second. It is a much faster and more controlled way of "pumping the pedal".

Legend

(1) Brake

(2) Master Cylinder

Brake Release

At the end of the anti-lock stop, when the brake pedal is released, the pump will remain running for a short time to help drain any fluid from the accumulators. As this fluid returns into the system, the spring forces the piston

back to its original position.

The isolation valve opens and fluid may return to the master cylinder. Conventional braking is then resumed.

Legend

(1) Brake

(2) Master Cylinder

System Components

Electronic Hydraulic Control Unit (EHCU), three Wheel Speed Sensors, Warning Light, and G-sensor.

Electronic Hydraulic Control Unit (EHCU)

The EHCU consists of ABS control circuits, fault detector, and a fail-safe. It drives the hydraulic unit according to the signal from each sensor, cancelling ABS to return to normal braking when a malfunction has occurred in the ABS.

The EHCU has a self-diagnosing function which can indicate faulty circuits during diagnosis.

The EHCU is mounted on the engine compartment rear right side. It consists of a Motor, Plunger Pump, Solenoid Valves.

Solenoid Valves: Reduces or holds the caliper fluid pressure for each front disc brake or both rear disc brakes according to the signal sent from the EHCU.

Reservoir: Temporarily holds the brake fluid that returns from the front and rear disc brake caliper so that pressure of front disc brake caliper can be reduced smoothly.

Plunger Pump: Feeds the brake fluid held in the reservoir to the master cylinder.

Motor: Drives the pump according to the signal from EHCU.

Check Valve: Controls the brake fluid flow.

ABS Warning Light

Vehicles equipped with the Anti-lock Brake System have an amber "ABS" warning light in the instrument panel. The "ABS" warning light will illuminate if a malfunction in the Anti-lock Brake System is detected by the Electronic Hydraulic Control Unit (EHCU). In case of an electronic malfunction, the EHCU will turn "ON" the "ABS" warning light and disable the Anti-lock braking function.

The "ABS" light will turn "ON" for approximately three

seconds after the ignition switch is to the "ON" position. If the "ABS" light stays "ON" after the ignition switch is the "ON" position, or comes "ON" and stays "ON" while driving, the Anti-lock Brake System should be inspected for a malfunction according to the diagnosis procedure.

Wheel Speed Sensor

It consists of a sensor and a rotor. The sensor is attached to the knuckle on the front wheels and to the rear axle case on the rear differential.

The rotor is press-fit in the axle shaft.

The flux generated from electrodes magnetized by a magnet in the sensor varies due to rotation of the rotor, and the electromagnetic induction generates alternating voltage in the coil. This voltage draws a "sine curve" with the frequency proportional to rotor speed and it allows detection of wheel speed.

G-Sensor

The G-sensor installed inside the EHCU detects the vehicle deceleration speed and sends a signal to the EHCU. In 4WD operation, all four wheels may be decelerated in almost the same phase, since all wheels are connected mechanically.

This tendency is noticeable particularly on roads with low friction coefficient, and the ABS control is adversely affected.

The G-sensor judges whether the friction coefficient of road surface is low or high, and changes the EHCU's operating system to ensure ABS control.

Normal and Anti-lock Braking

Under normal driving conditions, the Anti-lock Brake System functions the same as a standard power assisted brake system. However, with the detection of wheel lock-up, a slight bump or kick-back will be felt in the brake pedal. This pedal "bump" will be followed by a series of short pedal pulsations which occurs in rapid succession. The brake pedal pulsation will continue until there is no longer a need for the anti-lock function or until the vehicle is stopped. A slight ticking or popping noise may be heard during brake applications when the Anti-lock features is being used.

When the Anti-lock feature is being used, the brake pedal may rise even as the brakes are being applied. This is also normal. Maintaining a constant force on the pedal will provide the shortest stopping distance.

Brake Pedal Travel

Vehicles equipped with the Anti-lock Brake System may be stopped by applying normal force to the brake pedal. Although there is no need to push the pedal beyond the point where it stops or holds the vehicle, by applying more force the pedal will continue to travel toward the floor.

This extra brake pedal travel is normal.

General Diagnosis

General Information

ABS troubles can be classified into two types, those which can be detected by the ABS warning light and those which can be detected as a vehicle abnormality by the driver.

In either case, locate the fault in accordance with the "BASIC DIAGNOSTIC FLOWCHART" and repair.

Please refer to Section 5C for the diagnosis of mechanical troubles such as brake noise, brake judder (brake pedal or vehicle vibration felt when braking), uneven braking, and parking brake trouble.

ABS Service Precautions

Required Tools and Items:

- Box Wrench
- Brake Fluid
- Special Tool

Some diagnosis procedures in this section require the installation of a special tool.

5-8840-0366-0 High Impedance Multimeter

When circuit measurements are requested, use a circuit tester with high impedance.

Computer System Service Precautions

The Anti-lock Brake System interfaces directly with the Electronic Hydraulic Control Unit (EHCU) which is a control computer that is similar in some regards to the Powertrain Control Module. These modules are designed to withstand normal current draws associated with vehicle operation. However, care must be taken to avoid overloading any of the EHCU circuits. In testing for opens or shorts, do not ground or apply voltage to any of the circuits unless instructed to do so by the appropriate diagnostic procedure. These circuits should only be tested with a high impedance multimeter 5-8840-0366-0 or special tools as described in this section. Power should never be removed or applied to any control module with the ignition in the "ON" position. Before removing or connecting battery cables, fuses or connectors, always turn the ignition switch to the "OFF" position.

General Service Precautions

The following are general precautions which should be observed when servicing and diagnosing the Anti-lock Brake System and/or other vehicle systems. Failure to observe these precautions may result in Anti-lock Brake System damage.

- If welding work is to be performed on the vehicle using an electric arc welder, the EHCU and valve block connectors should be disconnected before the welding operation begins.
- The EHCU and valve block connectors should never be connected or disconnected with the ignition "ON".
- If only rear wheels are rotated using jacks or drum tester, the system will diagnose a speed sensor malfunction and the "ABS" warning light will illuminate. But actually no trouble exists. After inspection stop the engine once and re-start it, then make sure that the "ABS" warning light does not illuminate.

If the battery has been discharged

The engine may stall if the battery has been completely discharged and the engine is started via jumper cables. This is because the Anti-lock Brake System (ABS) requires a large quantity of electricity. In this case, wait until the battery is recharged, or set the ABS to a

non-operative state by removing the fuse for the ABS (60A). After the battery has been recharged, stop the engine and install the ABS fuse. Start the engine again, and confirm that the ABS warning light does not light.

Note on Intermittents

As with virtually any electronic system, it is difficult to identify an intermittent failure. In such a case duplicating the system malfunction during a test drive or a good description of vehicle behavior from the customer may be helpful in locating a "most likely" failed component or circuit. The symptom diagnosis chart may also be useful in isolating the failure. Most intermittent problems are caused by faulty electrical connections or wiring. When an intermittent failure is encountered, check suspect circuits for:

- Suspected harness damage.
- Poor mating of connector halves or terminals not fully seated in the connector body (backed out).
- Improperly formed or damaged terminals.

Test Driving ABS Complaint Vehicles

In case that there has been an abnormality in the lighting pattern of "ABS" warning light, the fault can be located in accordance with the "DIAGNOSIS BY "ABS" WARNING LIGHT ILLUMINATION PATTERN" . In case of such trouble as can be detected by the driver as a vehicle symptom, however, it is necessary to give a test drive following the test procedure mentioned below, thereby reproducing the symptom for trouble diagnosis on a symptom basis:

1. Start the engine and make sure that the "ABS" W/L goes OFF. If the W/L remains ON, it means that the Diagnostic Trouble Code (DTC) is stored. Therefore, read the code and locate the fault.

NOTE: The DTC cannot be cleared if the vehicle speed does not exceed 12 km/h (8 mph) at DTC, even though the repair operation is completed.

2. Start the vehicle and accelerate to about 30 km/h (19 mph) or more.
3. Slowly brake and stop the vehicle completely.
4. Then restart the vehicle and accelerate to about 40 km/h (25 mph) or more.
5. Brake at a time so as to actuate the ABS and stop the vehicle.
6. Be cautious of abnormality during the test. If the W/L is actuated while driving, read the DTC and locate the fault.
7. If the abnormality is not reproduced by the test, make best efforts to reproduce the situation reported by the customer.
8. If the abnormality has been detected, repair in accordance with the "SYMPTOM DIAGNOSIS" .

NOTE:

- Be sure to give a test drive on a wide, even road with

a small traffic.

- If an abnormality is detected, be sure to suspend the test and start trouble diagnosis at once.

"ABS" Warning Light

When ABS trouble occurs to actuate "ABS" warning light, the trouble code corresponding to the trouble is stored in the EHCUC. Only ordinary brake is available with ABS being unactuated. Even when "ABS" warning light is actuated, if the starter switch is set ON after setting it OFF once, the EHCUC checks up on the entire system and, if there is no abnormality, judges ABS to work currently and the warning light is lit normally even though the trouble code is stored.

NOTE: Illumination of the "ABS" warning light indicates that anti-lock braking is no longer available. Power assisted braking without anti-lock control is still available.

Normal Operation

"ABS" Warning Light

When the ignition is first moved from "OFF" to "RUN" , the amber "ABS" warning light will turn "ON" . The "ABS" warning light will turn "ON" during engine starting and will usually stay "ON" for approximately three seconds after the ignition switch is returned to the "ON" position. The warning light should remain "OFF" at all other times.

Tech 2 Scan Tool

scan tool user guide.

From 98 MY, Isuzu dealer service departments are recommended to use Tech 2. Please refer to Tech 2

**Legend**

- (1) PCMCIA Card
- (2) SAE 16/19 Adaptor
- (3) DLC Cable

- (4) Tech-2

5A-14 BRAKE CONTROL SYSTEM

Getting Started

- Before operating the Isuzu PCMCIA card with the Tech 2, the following steps must be performed:
 1. The Isuzu 98 System PCMCIA card inserts into the Tech 2.
 2. Connect the SAE 16/19 adapter to the DLC cable.
 3. Connect the DLC cable to the Tech 2.
 4. Make sure the vehicle ignition is off.
 5. Connect the Tech 2 SAE 16/19 adapter to the vehicle DLC (1).

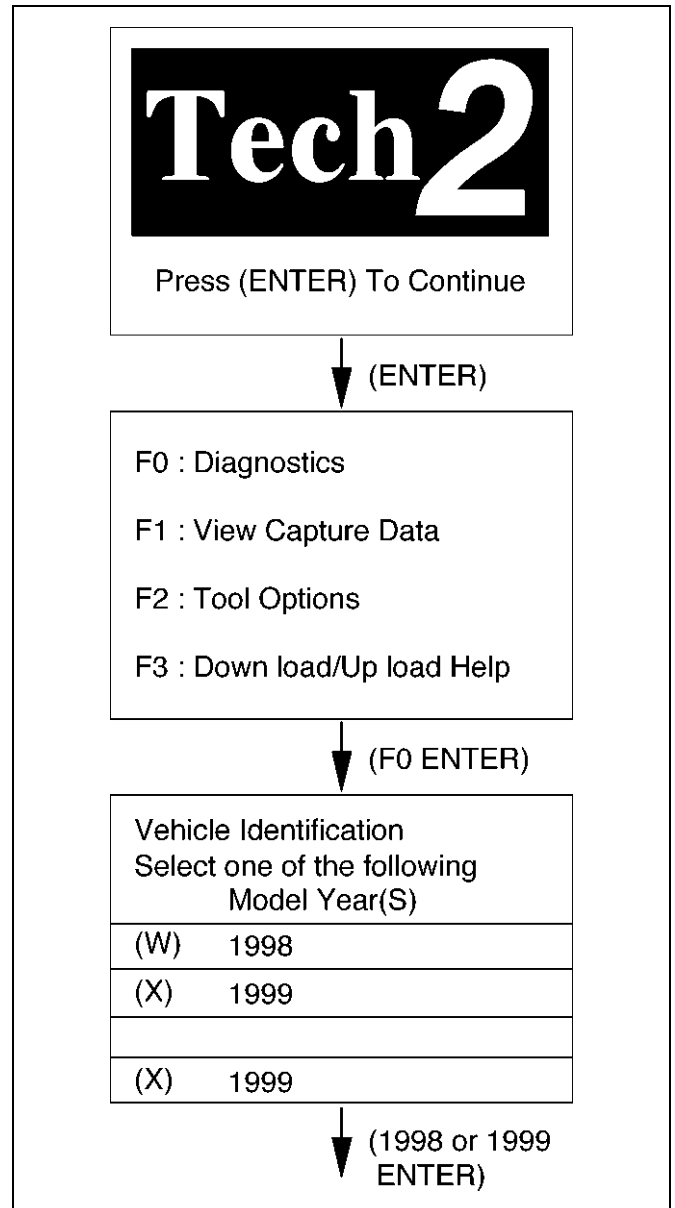

6. The vehicle ignition turns on.
7. Power up the Tech 2.
8. Verify the Tech 2 power up display.

Operating Procedure

The power up screen is displayed when you power up the tester with the Isuzu systems PCMCIA card. Follow the operating procedure below.

ACTUATOR TEST

This mode is used to exercise the ABS actuators and make sure they operate normally. Prior to the test, pay attention to the cautions below. (When checking the solenoid valve system, be sure to jack up the vehicle.)

CAUTION:

- Before testing, be sure that the brakes work normally.
- Make sure that the battery is fully charged.

Conduct the test by two persons (A TECH 2 operator and a vehicle checker).

- Be sure to start ACTUATOR TEST with the engine stopped.
- Before testing, make sure that electrical trouble, if any, has been completely repaired. Conducting tests of ABS solenoid with electrical circuit problem remaining uncorrected could damage the control unit.

To start brake bleed, push the soft key
under "Yes" box.

Basic Diagnostic Flow Chart

Step	Action	Yes	No
1	1. Customer complaint. 2. Questioning to customer. 3. Basic inspection (Refer to "Basic inspection procedure") Using TECH 2?	Go to Step 2	Go to Step 4
2	Make sure of DTC by mode "F0: Diagnostic Trouble Codes". Is EHCUC including DTC?	Clear code and check for repeatability. Go to Step 3	Go to Step 5
3	1. Repair of faulty part. 2. Elimination of DTC. 3. Inspection of "ABS" W/L Illumination pattern with ignition SW "ON". 4. Test drive. Does trouble repeat?	Repeat the diagnosis if the symptom or DTC appears again Go to Step 1	Go to Step 5
4	Check if the DTC is stored or not. Is EHCUC including DTC?	Clear code and check for repeatability Go to Step 3	Trouble diagnosis based on symptom (Refer to "SYMPTOM DIAGNOSIS") Go to Step 3
5	1. Reconnect all components. Ensure all component are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Finished	Go to Step 5

Basic Inspection Procedure**1. Basic Inspection of Service Brake**

Step	Action	Yes	No
1	Is the fluid level normal?	Go to Step 2	Replenish with fluid Go to Step 2
2	Does fluid leak?	Repair Go to Step 3	Go to Step 3
3	Is the booster function normal?	Go to Step 4	Repair Go to Step 4
4	Is the pad and rotor normal?	Go to Step 5	Repair Go to Step 5
5	Reconnect all components. Ensure all component are properly mounted. Was this step finished?	Finished	Go to Step 5

2. Ground Inspection

Step	Action	Yes	No
1	Does ABS—related ground points normally?	Go to Step 2	Repair Go to Step 2
2	Reconnect all components. Ensure all component are properly mounted. Was this step finished?	Finished	Go to Step 2

5A-24 BRAKE CONTROL SYSTEM

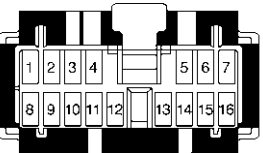

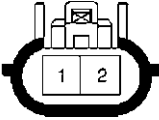

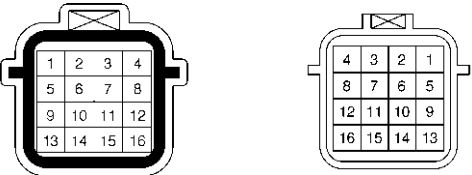

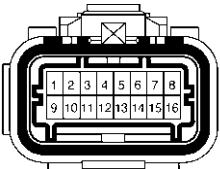

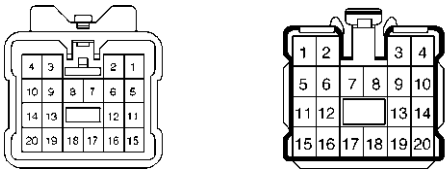

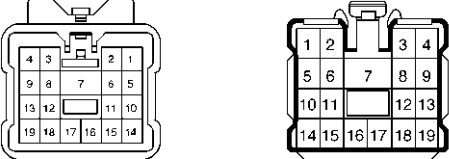

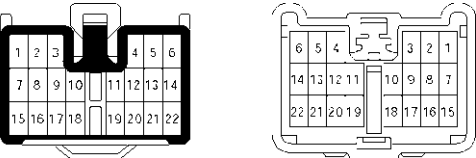

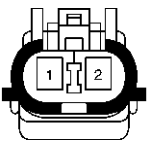

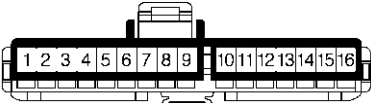

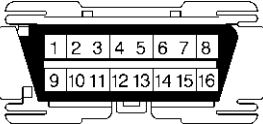

EHCU Connector Pin-out Checks

- Perform checks with high impedance digital multimeter 5-8840-0366-0 or equivalent.

- Disconnect Electronic Hydraulic Control Module.

No.	Circuit to be Tested	Ignition Switch Position	Multimeter Scale/Range	Measure between Pin Number	Nominal Value	Note
1	Power supply	OFF	20DCV	1 (C-5) 2 (C-5)	11.5V to 14.5V	
2	Ignition enable	OFF	20DCV	1 (C-4) 7 (C-4)	0V to 0.1V	
		ON	20DCV	1 (C-4) 7 (C-4)	11.5V to 14.5V	
3	Stoplight switch	OFF	20DCV	13 (C-4) 7 (C-4)	10.5V to 14.5V	Press brake pedal
4	Ground connection	OFF	200Ω	7 (C-4) Ground	Less than 2Ω	
		OFF	1Ω	2 (C-5) Ground	Less than 0.2Ω	
5	FL speed sensor	OFF	2kΩ	2 (C-4) 10 (C-4)	2.0kΩ to 2.8kΩ	Internal Resistance
		OFF	200kΩ	2 (C-4) 7 (C-4)	more than 100kΩ	Insulation Resistance
		OFF	200mACV	2 (C-4) 10 (C-4)	more than 200mV	Turn wheel at 1RPS

Symptom Diagnosis

The symptoms that cannot be indicated by warning light can be divided in the following five categories:

1. ABS works frequently but vehicle does not decelerate.
2. Uneven braking occurs while ABS works.
3. The wheels lock during braking.

4. Brake pedal feel is abnormal.
5. Braking sound (from EHCUC) is heard while not braking.

These are all attributable to problems which cannot be detected by EHCUC self-diagnosis. Use the customer complaint and a test to determine which symptom is present. Then follow the appropriate flow chart listed below.

No.	Symptom	Diagnostic Flow Charts	
		Without TECH 2	With TECH 2
1	ABS works frequently but vehicle does not decelerate.	Chart A-1	Chart TA-1
2	Uneven braking occurs while ABS works.	Chart A-2	Chart TA-2
3	The wheels are locked.	Chart A-3	Chart TA-3
4	Brake pedal feel is abnormal.	Chart A-4	—
5	Braking sound (from EHCUC) is heard while not braking.	Chart A-5	Chart TA-5

Chart A-1 ABS Works Frequently But Vehicle Does Not Decelerate

Step	Action	Yes	No
1	Is braking force distribution normal between front and rear of vehicle?	Go to Step 2	Repair brake parts. Go to Step 8
2	Are axle parts installed normally?	Go to Step 3	Repair axle parts. Go to Step 8
3	Is there play in each or any wheel speed sensor?	Repair wheel speed sensor. Go to Step 8	Go to Step 4
4	Is there damage, or powered iron sticking to each or any wheel speed sensor/sensor ring?	Replace sensor or sensor ring. Go to Step 8	Go to Step 5
5	Is the output of each wheel speed sensor normal? (Refer to chart C-1 or TC-1)	Go to Step 6	Replace wheel speed sensor or repair harness. Go to Step 7
6	Is the input of 4WD controller normal?	Go to Step 7	Replace controller or repair harness. Go to Step 7
7	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 7

Chart TA-1 ABS Works Frequently But Vehicle Does Not Decelerate (Use TECH 2)

Step	Action	Yes	No
1	1. Connect TECH 2. 2. Make sure of the output conditions of each sensor. Is the output of each sensor normal?	Go to Step 2	Replace wheel speed sensor. Go to Step 3
2	Return to Chart A-1. Was the Chart A-1 finished?	Go to Step 3	Go to Step 2
3	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

Chart A-2 Uneven Braking Occurs While ABS Works

Step	Action	Yes	No
1	Is there play in each or any sensor?	Repair. Go to Step 5	Go to Step 2
2	Damage or powdered iron sticking to each or any sensor/sensor ring?	Repair. Go to Step 5	Go to Step 3
3	Is the output of each sensor normal? (Refer to chart C-1 or TC-1)	Go to Step 4	Replace sensor or repair harness. Go to Step 5
4	Is brake pipe connecting order correct?	Replace H/U. Go to Step 5	Reconnect brake pipe correctly. Go to Step 5
5	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 5

Chart TA-2 Uneven Braking Occurs While ABS Works (Use TECH 2)

Step	Action	Yes	No
1	1. Connect TECH 2. 2. Make sure of the output conditions of each sensor. Is the output of each sensor normal?	Go to Step 2	Go to Step 3
2	Check piping by TECH 2 ACTUATOR TEST Is the piping normal?	Replace EHCJ. Go to Step 4	Repair the pipe. Go to Step 4
3	Repair and check the wheel speed sensor (Refer to chart B-20 to B-23 , C-1 or TC-1). Was the each chart finished?	Go to Step 4	Go to Step 3
4	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 4

5A-32 BRAKE CONTROL SYSTEM

Chart A-3, TA-3 The Wheels Are Locked

Step	Action	Yes	No
1	Is ABS working?	Go to Step 2	Go to Step 6
2	Is vehicle speed under 10 km/h (6mph)?	Normal.	Go to Step 3
3	Is sensor output normal? (Chart C-1 or TC-1)	Go to Step 4	Replace sensor or repair harness. Go to Step 6
4	Is front 4WD controller normal?	Go to Step 5	Replace 4WD controller or repair harness. Go to Step 6
5	Is hydraulic unit grounded properly?	Replace EHCU. Go to Step 6	Correct. Go to Step 6
6	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 6

Chart A-4 Brake Pedal Feed Is Abnormal

Step	Action	Yes	No
1	Is the stop light actuated when the brake pedal is depressed?	Go to Step 2	Go to Step 3
2	1. Turn the ignition switch off. 2. Disconnected EHCU connector. Is the check voltage EHCU connector terminals 13 to 7 when brake pedal is depressed than battery voltage?	Go to Step 4	Harness NG between brake SW and EHCU. Go to Step 6
3	Is stop light fuse normal?	Go to Step 5	Replace stop light fuse. Go to Step 6
4	Is the check continuity between EHCU connector terminals, 7 to body grounded?	Go to Step 6	Repair body grounded harness. Go to Step 6
5	Is brake SW normal?	Repair stop light harness. Go to Step 6	Replace brake SW. Go to Step 6
6	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 6

Chart A-5, TA-5 Braking Sound (From EHCU) Is Heard While Not Braking

Step	Action	Yes	No
1	Is this the first vehicle start after engine start?	It is self checking sound Normal.	Go to Step 2
2	Is vehicle speed under 10 km/h (6 mph)?	It is self checking sound Normal.	Go to Step 3
3	Check for the following condition: <ul style="list-style-type: none"> • At the time of shift down or clutch operation. • At the time of low road friction drive (ice or snow road) or rough road drive. • At the time of high-speed turn. • At the time of passing curb. • At the time of operating electrical equipment switches. • At the time of racing the engine (over 5000 rpm). Did it occur under any one condition above?	ABS may sometime be actuated even when brake pedal is not applied.	Go to Step 4
4	Is there play in each or any sensor/wheel speed sensor rings?	Repair. Go to Step 7	Go to Step 5
5	Damage or powdered iron sticking to each or any sensor/wheel speed sensor ring?	Repair. Go to Step 7	Go to Step 6
6	Is each sensor output normal? (Refer to chart C-1 or TC-1).	Check harness/ connector for suspected disconnection If no disconnection is found, replace Coil integrated module. Go to Step 7	Repair. Go to Step 7
7	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 7

Diagnostic Trouble Codes

Choose and trace an appropriate flowchart by the numbers listed below to find fault and repair.

Code		Diagnosis	Item	Chart No.
Flash out	Serial Communications			
12	—	—	—	—
13	C0285	2 WD Controller in 4WD Vehicle Controller	Wiring	B-8
14	C0271	RAM read/write error	Coil Integrated Module	B-2
	C0272	ROM checksum error		
	C0270	ALU function error		
	C0273	Inoperative isolation item		
	C0284	Loop time overrun		
15	C0277	Low ignition voltage	Wiring	B-3
	C0278	High ignition voltage		
17	C0269	Excessive dump time	Coil Integrated Module	B-4
18	C0274	Excessive isolation time		B-5
21	C0276	G-Sensor Failure		B-6
22	C0281	Brake switch Failure		B-7
24	C0282	Open or shorted 4x4 input signal	Wiring	B-8
32	C0267	Open motor circuit or shorted ECU output	Motor	B-9
	C0268	Stalled motor or open ECU output		
35	C0265	Open relay circuit	Relay	B-10
	C0266	Shorted relay circuit		
41	C0245	FL Open isolation solenoid or shorted ECU output	Solenoid	B-11
	C0247	FL Shorted isolation solenoid or open ECU output		
42	C0246	FL Open dump solenoid or shorted ECU output		B-12
	C0248	FL Shorted dump solenoid or open ECU output		
43	C0241	FR Open isolation solenoid or shorted ECU output		B-13
	C0243	FR Shorted isolation solenoid or open ECU output		
44	C0242	FR Open dump solenoid or shorted ECU output		B-14
	C0244	FR Shorted dump solenoid or open ECU output		
45	C0251	Rear Open isolation solenoid or shorted ECU output		B-15
	C0253	Rear Shorted isolation solenoid or open ECU output		
46	C0252	Rear Open dump solenoid or shorted ECU output		B-16
	C0254	Rear Shorted dump solenoid or open ECU output		

Code		Diagnosis	Item	Chart No.
Flash out	Serial Communications			
51	C0225	FL Open or shorted sensor	Sensor or Wiring	B-17
52	C0221	FR Open or shorted sensor		B-18
53	C0235	Rear Open or shorted sensor		B-19
61	C0226	FL Missing sensor signal		B-20
	C0227	FL Sensor signal dropout		
62	C0222	FR Missing sensor signal		B-21
	C0223	FR Sensor signal dropout		
63	C0236	Rear Missing sensor signal		B-22
	C0237	Rear Sensor signal dropout		
64	C0229	Simultaneous dropout of front sensor signal		B-23
65	C0238	Wheel speed error	Vehicle or Sensor	B-24
—	C0286	Shorted indicator lamp	Wiring	—

Diagnosis By "ABS" Warning Light Illumination Pattern

In the event that there is abnormality in the "ABS"

warning light illumination pattern while the key is in the ON position or if the warning light is actuated during driving, trouble should be diagnosed on a illumination pattern basis as follows:

No.	Condition	"ABS" Warning Light Illumination Pattern	Diagnostic
1	Warning light is actuated normally	<p>Warning light ON OFF Starter SW ON OFF Still not lit during driving</p>	Normal
2	Warning light is not lit	<p>Warning light ON OFF Starter SW ON OFF</p>	Warning light lighting circuit trouble→Go to Chart B-1
3	Warning light remains ON	<p>Warning light ON OFF Starter SW ON OFF</p>	Diagnostic trouble codes are stored. Display diagnostic trouble codes and diagnose on a code basis according to the flow charts.
4	Warning light is actuated while driving	<p>Warning light ON OFF Starter SW ON OFF During driving</p>	Diagnostic trouble codes are stored. Display diagnostic trouble codes and diagnose on a code basis according to the flow charts.
5	Warning light goes at 12 km/h (8 mph) or higher (After repairing the faulty part)	<p>Warning light ON OFF Starter SW ON OFF Speed 0 kph 12 km/h (8 mph)</p>	Even after repairing the faulty part the warning light (W/L) dose not go out it vehicle is at a stop. Turn the ignition switch to the ON position and drive the vehicle at 12 km/h (8 mph) or higher to make sure that the warning light goes out.

Diagnostic Trouble Codes (DTCs)

When the warning light in the meter remains ON, the EHCU stores the fault identification and disables the ABS.

How to display and erase DTCs:

NOTE:

- DTCs can be displayed also by TECH 2. Use "Diagnostic Trouble Codes" mode.

The DLC is located behind the driver side kick panel

350RX008

- Keep #12 terminal connected with #4 terminal or # 5 terminal (GND) during DTC display. (If #12 terminal is separated from #4 terminal or # 5 terminal (GND) during display, display will stop.)

2. DTC display:

- DTC is displayed by blinking warning light.
- Double-digit display.
- First, normal DTC 12 is displayed three times and then any other DTCs are displayed three times. (If no other DTCs have been stored, the display of

DTC 12 will be repeated.)

3. How to erase code:

- Conduct brake switch ON/OFF operation 6 or more times within 3 seconds of self-diagnosis startup.
- The code cannot be erased if more than 3 seconds have passed since self-diagnosis startup, or if self-diagnosis has started with brake switched on (brake pedaled).

B05RW005

5A-38 BRAKE CONTROL SYSTEM

4. Notes

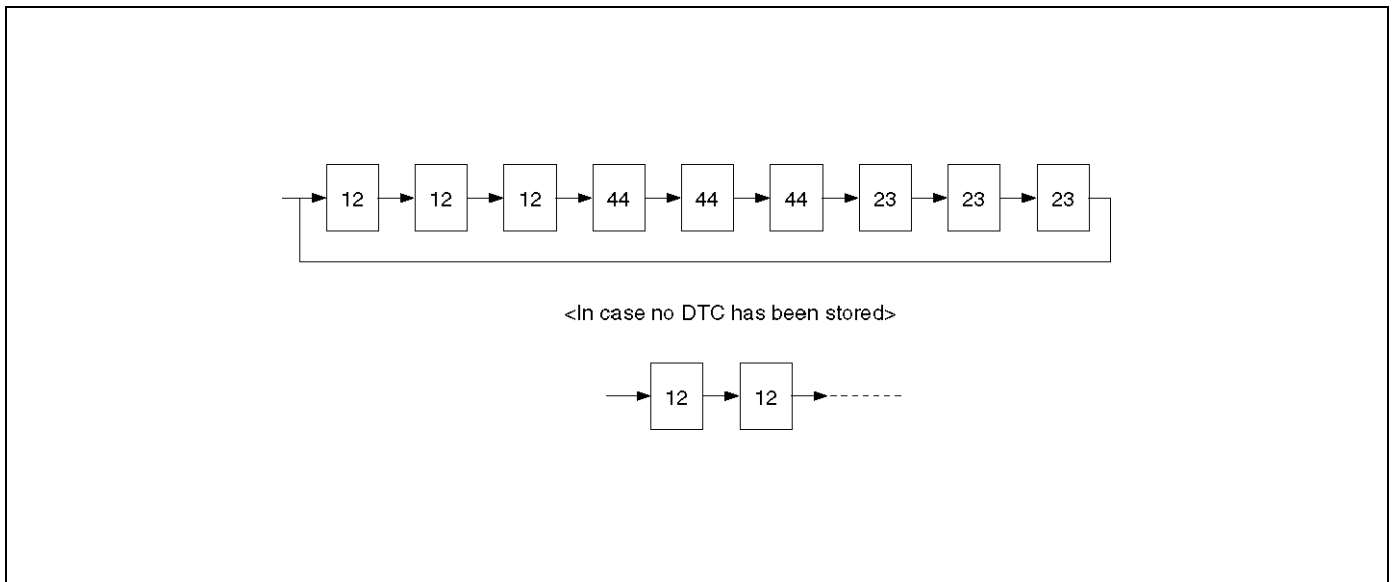

- If the following should occur during Diagnostic Trouble Code (DTC) display the display will be discontinued. After initial check, the status that is under the control of ABS will be returned :
 - The vehicle starts (The wheels turn) or the brake pedal is depressed.

- Up to 3 different codes can be stored.
- If the ABS should turn OFF due to an intermittent defect, the system will be restored at the next key cycle, if the initial check finds no abnormality (when IGN is switched from OFF to ON).

5. An example of DTC display Display of DTC 23

After displaying DTC 12 three times, one DTC after another is displayed, starting with the most recent one. (However, display is discontinued after 5 minutes.)

The DTC 12 is displayed repeatedly. (display is discontinued after about 5 minutes after)

Chart B-1 With the key in the ON position (Before starting the engine). Warning light (W/L) is not activated.

Step	Action	Yes	No
1	Is W/L fuse disconnected?	Replace fuse. Go to Step 5	Go to Step 2
2	Is W/L burnt out?	Replace W/L bulb. Go to Step 5	Go to Step 3
3	1. Turn the key off. 2. Disconnect coil integrated module connector (C-4). 3. Turn the key ON. Is the check voltage between coil integrated module connector (C-4) terminals 6 and 7 than battery voltage?	Go to Step 4	Repair harness and connector. Go to Step 5
4	Is the check continuity coil integrated module connector (C-4) terminals, 1 and 7 and body ground.	Check harness for suspected disconnection No fault found: Replace EHCU. Go to Step 5	Repair harness and connector. Go to Step 5
5	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 5

Chart B-2 CPU Error (DTC 14 (Flash out) / C0271, C0272, C0273, C0284 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnected coil integrated module connector. 3. Inspect coil integrated module ground. Is the check resistance between the coil integrated module connector terminals, 2 (C-5) and 7 (C-4) and body ground?	Go to Step 2	Repair the body ground harness. Go to Step 3
2	1. Turn the key off, connect the coil integrated module connector. 2. Erase the trouble code. 3. Turn Ignition off, then on, to perform system self-check. 4. If warning light remains on, display trouble codes once again. Is the check trouble code 14 (Flash out) / C0271, C0272, C0273, C0284 (Serial communications)?	Replace EHCU. Go to Step 3	Inspect in accordance with the DTC displayed.
3	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

5A-40 BRAKE CONTROL SYSTEM

Chart B-3 Low or High Ignition Voltage (DTC 15 (Flash out) / C0277, 0278 (Serial communications))

Step	Action	Yes	No
1	Is the check battery voltage normal? (Battery capacity check)	Go to Step 2	Charge or replace battery. Go to Step 2
2	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Turn the key on. Is the check voltage between coil integrated module connector (C-4) terminals 1 and 7, higher than 10V?	Check harness connector for suspected disconnection Fault found: Repair, and perform system self-check No fault found: replace EHCU. Go to Step 3	Repair harness or connector. Go to Step 3
3	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

Chart B-4 Excessive Dump Time (DTC 17 (Flash out) / C0269 (Serial communications))

Step	Action	Yes	No
1	Check for anything causing extended ABS activation, such as locked brakes or an erratic speed sensor signal. Was a problem found?	Repair or Replace	Go to Step 2
2	1. The key turned off. 2. Replace EHCU. 3. Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 2

Chart B-5 Excessive Isolation Time (DTC 18 (Flash out) / C0274 (Serial communications))

Step	Action	Yes	No
1	Check for anything causing extended ABS activation, such as locked brakes or an erratic speed sensor signal. Was a problem found?	Repair or Replace	Go to Step 2
2	1. The key turned off. 2. Replace EHCU. 3. Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 2

Chart B-6 G-Sensor Output Failure (DTC 21 (Flash out) / C0276 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Replace EHCUC. 3. Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 1

Chart B-7 Brake Switch Failure (DTC 22 (Flash out) / C0281 (Serial communications))

Step	Action	Yes	No
1	Is the stop light actuated when the brake pedal is depressed?	Go to Step 2	Go to Step 4
2	1. Turn the key off. 2. Disconnected coil integrated module connector. Is the check voltage coil integrated module connector (C-4) terminals 13 to 7 when brake pedal is depressed than battery voltage?	Go to Step 3	Harness between brake SW and coil integrated module is faulty. Go to Step 6
3	Is the check that pins C-5 connector 2, and C-4 connector 7 have good ground?	Check harness / connector for disconnection Fault found: Repair, and perform system self-check. No fault found: replace EHCUC. Go to Step 6	Repair. Go to Step 6
4	Is stop light fuse normal?	Go to Step 5	Replace. Go to Step 6
5	Is brake SW normal?	Abnormal harness in stop light circuit. Repair the harness. Go to Step 6	Replace. Go to Step 6
6	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 6

5A-42 BRAKE CONTROL SYSTEM

Chart B-8 2WD Controller in 4WD Vehicle Controller (DTC 13 (Flash out) / C0285 (Serial communications)), 4WD State Input Signal Failure (DTC 24 (Flash out) / C0282 (Serial communications))

Step	Action	Yes	No
1	Remove coil integrated module connector. Is the coil integrated module connector (C-4) terminal 8 line normally?	Go to Step 2	Repair. Go to Step 3
2	Is the 4WD controller normally?	Replace EHCU. Go to Step 3	Replace 4WD controller. Go to Step 3
3	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

Chart B-9 Pump Motor Failure (DTC 32 (Flash out) / C0267, C0268 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Measure the voltage between terminal 1 of the coil integrated module connector (C-5) and body ground. Is the voltage equal to the battery voltage?	Go to Step 2	Repair fuse/harness between battery and coil integrated module connector (C-5) terminal 1. Go to Step 5
2	Is the harness from the hydraulic unit connected to the coil integrated module connector?	Go to Step 3	Connect to the connector. Go to Step 3
3	Is the harness from the hydraulic unit normally?	Go to Step 4	Replace EHCU. Go to Step 5
4	Is the check resistance of hydraulic unit connector terminals 1 and 2 between 0.2 and 1.0 ohms?	Replace EHCU. Go to Step 5	Replace EHCU. Go to Step 5
5	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 5

Chart B-10 EHCUC Valve Relay Failure (DTC 35 (Flash out) / C0265, C0266 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Measure the voltage between terminal 1 of the coil integrated module connector (C-5) and body ground. Is the voltage equal to the battery voltage?	Replace EHCUC. Go to Step 2	Repair fuse and harness coil integrated module connector (C-5) terminal 1 and battery. Go to Step 2
2	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 2

Chart B-11 FL Isolation Solenoid Coil Failure (DTC 41 (Flash out) / C0245, C0247 (Serial communications))

Step	Action	Yes	No
1	Was the "EHCUC Connector Pin-out Checks" performed?	Go to Step 2	Go to "EHCUC Connector Pin-out Checks."
2	1. Turn the key switch to off. 2. Disconnect the 2-way EHCUC connector (C-5) from the EHCUC. 3. Inspect the connector for damage or corrosion. Is the connector free from damage or corrosion?	Go to Step 3	Repair the connector. Repeat the "Basic Diagnostic Flow Chart."
3	1. Replace the Coil Integrated Module. 2. Reconnect all component, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

Chart B-12 FL Dump Solenoid Coil Failure (DTC 42 (Flash out) / C0246, C0248 (Serial communications))

Step	Action	Yes	No
1	Was the "EHCUC Connector Pin-out Checks" performed?	Go to Step 2	Go to "EHCUC Connector Pin-out Checks."
2	1. Turn the key switch to off. 2. Disconnect the 2-way EHCUC connector (C-5) from the EHCUC. 3. Inspect the connector for damage or corrosion. Is the connector free from damage or corrosion?	Go to Step 3	Repair the connector. Repeat the "Basic Diagnostic Flow Chart."
3	1. Replace the Coil Integrated Module. 2. Reconnect all component, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

5A-44 BRAKE CONTROL SYSTEM

Chart B-13 FR Isolation Solenoid Coil Failure (DTC 43 (Flash out) / C0241, C0243 (Serial communications))

Step	Action	Yes	No
1	Was the "EHCUC Connector Pin-out Checks" performed?	Go to Step 2	Go to "EHCUC Connector Pin-out Checks."
2	1. Turn the key switch to off. 2. Disconnect the 2-way EHCUC connector (C-5) from the EHCUC. 3. Inspect the connector for damage or corrosion. Is the connector free from damage or corrosion?	Go to Step 3	Repair the connector. Repeat the "Basic Diagnostic Flow Chart."
3	1. Replace the Coil Integrated Module. 2. Reconnect all component, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

Chart B-14 FR Dump Solenoid Coil Failure (DTC 44(Flash out) / C0242, C0244 (Serial communications))

Step	Action	Yes	No
1	Was the "EHCUC Connector Pin-out Checks" performed?	Go to Step 2	Go to "EHCUC Connector Pin-out Checks."
2	1. Turn the key switch to off. 2. Disconnect the 2-way EHCUC connector (C-5) from the EHCUC. 3. Inspect the connector for damage or corrosion. Is the connector free from damage or corrosion?	Go to Step 3	Repair the connector. Repeat the "Basic Diagnostic Flow Chart."
3	1. Replace the Coil Integrated Module. 2. Reconnect all component, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

Chart B-15 Rear Isolation Solenoid Coil Failure (DTC 45 (Flash out) / C0251, C0253 (Serial communications))

Step	Action	Yes	No
1	Was the "EHCUC Connector Pin-out Checks" performed?	Go to Step 2	Go to "EHCUC Connector Pin-out Checks."
2	1. Turn the key switch to off. 2. Disconnect the 2-way EHCUC connector (C-5) from the EHCUC. 3. Inspect the connector for damage or corrosion. Is the connector free from damage or corrosion?	Go to Step 3	Repair the connector. Repeat the "Basic Diagnostic Flow Chart."
3	1. Replace the Coil Integrated Module. 2. Reconnect all component, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

Chart B-16 Rear Dump Solenoid Coil Failure (DTC 46 (Flash out) / C0252, C0254 (Serial communications))

Step	Action	Yes	No
1	Was the "EHCU Connector Pin-out Checks" performed?	Go to Step 2	Go to "EHCU Connector Pin-out Checks."
2	1. Turn the key switch to off. 2. Disconnect the 2-way EHCU connector (C-5) from the EHCU. 3. Inspect the connector for damage or corrosion. Is the connector free from damage or corrosion?	Go to Step 3	Repair the connector. Repeat the "Basic Diagnostic Flow Chart."
3	1. Replace the Coil Integrated Module. 2. Reconnect all component, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

Chart B-17 FL Speed Sensor Open or Shorted (DTC 51 (Flash out) / C0225 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Measure the resistance between coil integrated module connector (C-4) terminals 2 and 10. Is the resistance between 2.0k and 2.8k ohms?	Check for faults in harness between speed sensor and coil integrated module. Fault found: Repair, and perform system self-check. No fault found: Replace coil integrated module. Go to Step 3	Go to Step 2
2	Measure the FL speed sensor resistance at the sensor connector. Is the resistance between 2.0k and 2.8k ohms?	Repair harness abnormality between sensors and coil integrated module. Go to Step 3	Replace sensor. Go to Step 3
3	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

5A-46 BRAKE CONTROL SYSTEM

Chart B-18 FR Speed Sensor Open or Shorted (DTC 52 (Flash out) / C0221 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Measure the resistance between coil integrated module connector (C-4) terminals 3 and 11. Is the resistance between 2.0k and 2.8k ohms?	Check for faults in harness between speed sensor and coil integrated module. Fault found: Repair, and perform system self-check. No fault found: Replace coil integrated module. Go to Step 3	Go to Step 2
2	Measure the FR speed sensor resistance at the sensor connector. Is the resistance between 2.0k and 2.8k ohms?	Repair harness abnormality between sensors and coil integrated module. Go to Step 3	Replace sensor. Go to Step 3
3	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

Chart B-19 Rear Speed Sensor Open or Shorted (DTC 53 (Flash out) / C0235 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Measure the resistance between coil integrated module connector (C-4) terminals 4 and 12. Is the resistance between 1.2k and 2.0k ohms?	Check for faults in harness between speed sensor and coil integrated module. Fault found: Repair, and perform system self-check. No fault found: Replace EHCU. Go to Step 3	Go to Step 2
2	Measure the Rear speed sensor resistance at the sensor connector. Is the resistance between 1.2k and 2.0k ohms?	Repair harness abnormality between sensors and coil integrated module. Go to Step 3	Replace sensor. Go to Step 3
3	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

5A-48 BRAKE CONTROL SYSTEM

Chart B-20 FL Speed Sensor Missing (DTC 61 (Flash out) / C0226, C0227 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Measure the FL speed sensor resistance between coil integrated module connector (C-4) terminals 2 and 10. Is the resistance between 2.0k and 2.8k ohms?	Go to Step 2	Go to Step 3
2	Is there play sensor/sensor rotor?	Repair. Go to Step 6	Go to Step 4
3	Measure the FL speed sensor resistance at the sensor connector. Is the resistance between 2.0k and 2.8k ohms?	Repair harness abnormality between sensors and coil integrated module. Go to Step 6	Replace sensor. Go to Step 6
4	Damage and powered iron sticking to sensor/sensor ring?	Repair. Go to Step 6	Go to Step 5
5	Is sensor output normal? (Chart C-1-1 or TC-1)	Check for faults in harness between speed sensor and coil integrated module. Fault found: repair, and perform system self-check. No fault found: replace EHCU. Go to Step 6	Replace sensor. Go to Step 6
6	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 6

NOTE: Even after repairing the faulty part the warning light (W/L) does not go out if the vehicle is at a stop. Turn the ignition switch to the ON position and drive the vehicle at 12 km/h (8 mph) or higher to make sure that the warning light goes out.

Chart B-21 FR Speed Sensor Missing (DTC 62 (Flash out) / C0222, C0223 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Measure the FR speed sensor resistance between coil integrated module connector (C-4) terminals 3 and 11. Is the resistance between 2.0k and 2.8k ohms?	Go to Step 2	Go to Step 3
2	Is there play sensor/sensor rotor?	Repair. Go to Step 6	Go to Step 4
3	Measure the FR speed sensor resistance at the sensor connector. Is the resistance between 2.0k and 2.8k ohms?	Repair harness abnormality between sensors and coil integrated module. Go to Step 6	Replace sensor. Go to Step 6
4	Damage and powered iron sticking to sensor/sensor ring?	Repair. Go to Step 6	Go to Step 5
5	Is sensor output normal? (Chart C-1-2 or TC-1)	Check for faults in harness between speed sensor and coil integrated module. Fault found: repair, and perform system self-check. No fault found: replace EHCU. Go to Step 6	Replace sensor. Go to Step 6
6	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 6

NOTE: Even after repairing the faulty part the warning light (W/L) does not go out if the vehicle is at a stop. Turn the ignition switch to the ON position and drive the vehicle at 12 km/h (8 mph) or higher to make sure that the warning light goes out.

5A-50 BRAKE CONTROL SYSTEM

Chart B-22 Rear Speed Sensor Missing (DTC 63 (Flash out) / C0236, C0237 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Measure the Rear speed sensor resistance between coil integrated module connector (C-4) terminals 4 and 12. Is the resistance between 1.2k and 2.0k ohms?	Go to Step 2	Go to Step 3
2	Is there play sensor/sensor rotor?	Repair. Go to Step 6	Go to Step 4
3	Measure the rear speed sensor resistance at the sensor connector. Is the resistance between 1.2k and 2.0k ohms?	Repair harness abnormality between sensors and coil integrated module. Go to Step 6	Replace sensor. Go to Step 6
4	Damage and powered iron sticking to sensor/sensor ring?	Repair. Go to Step 6	Go to Step 5
5	Is sensor output normal? (Chart C-1-3 or TC-1)	Check for faults in harness between speed sensor and coil integrated module. Fault found: repair, and perform system self-check. No fault found: replace EHCU. Go to Step 6	Replace sensor. Go to Step 6
6	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 6

NOTE: Even after repairing the faulty part the warning light (W/L) does not go out if the vehicle is at a stop. Turn the ignition switch to the ON position and drive the vehicle at 12 km/h (8 mph) or higher to make sure that the warning light goes out.

Chart B-23 Simultaneous Drop-out of Front Speed Sensor Signal (DTC 64 (Flash out) / C0229 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Measure the FL speed sensor resistance between coil integrated module connector (C-4) terminals 2 and 10. Is the resistance between 2.0k and 2.8k ohms?	Go to Step 2	Go to Step 3
2	Measure the FR speed sensor resistance between coil integrated module connector (C-4) terminals 3 and 11. Is the resistance between 2.0k and 2.8 k ohms?	Go to Step 5	Go to Step 4
3	Measure the FL speed sensor resistance at the sensor connector. Is the resistance between 2.0k and 2.8k ohms?	Repair harness abnormality between sensors and coil integrated module. Go to Step 2	Replace sensor. Go to Step 2
4	Measure the FR speed sensor resistance at the sensor connector. Is the resistance between 2.0k and 2.8k ohms?	Repair harness abnormality between sensors and coil integrated module. Go to Step 5	Replace sensor. Go to Step 5
5	Damage and powered iron sticking to sensor/sensor ring?	Repair. Go to Step 6	Go to Step 6
6	Is there play sensor/sensor rotor?	Repair. Go to Step 7	Go to Step 7
7	Is sensor output normal? (Chart C-1-1&C-1-2 or TC-1)	Check for faults in harness between speed sensor and coil integrated module. Fault found: repair, and perform system self-check. No fault found: replace EHCU. Go to Step 8	Replace sensor. Go to Step 8
8	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat "Basic diagnostic flow chart"	Go to Step 8

NOTE: Even after repairing the faulty part the warning light (W/L) does not go out if the vehicle is at a stop. Turn the ignition switch to the ON position and drive the vehicle at 12 km/h (8 mph) or higher to make sure that the warning light goes out.

5A-52 BRAKE CONTROL SYSTEM

Chart B-24 Wheel Speed Input Abnormality (DTC 65 (Flash out) / C0238 (Serial communications))

Step	Action	Yes	No
1	Using TECH 2?	Go to Step 2	Go to Step 3
2	1. Connect TECH 2. 2. Select Snap shot manual trigger. 3. With wheel speed data displayed, run the vehicle when speed has arrived at 30 km/h (18 mph). 4. Check speed data on each wheel (refer to the criterion given below). * 1 Is the abnormal sensor condition found?	Replace. Go to Step 8	Go to Step 3 All the sensors should follow the following flowchart (without using TECH 2).
3	Is there play in sensor/sensor ring?	Repair. Go to Step 8	Go to Step 4
4	Is there powdered iron sticking to sensor/sensor ring?	Repair. Go to Step 8	Go to Step 5
5	Is there a broken tooth or indentation in sensor ring?	Replace sensor ring. Go to Step 8	Go to Step 6
6	Is there play in wheel bearing?	Adjust or repair. Go to Step 8	Go to Step 7
7	Is the check wiring between sensor and coil integrated module normal?	Replace EHCU. Go to Step 8	Repair, and perform system self-check. Go to Step 8
8	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat <FmSdata>[rsquor]Basic diagnostic flow chart"	Go to Step 8

Sensor Signal Abnormality Criteria using TECH 2

1. While driving, the speed of one or two wheels is 25% or more higher or lower than that of the other wheels.
2. The speed of one or two wheels is 10 km/h (6 mph) or more higher or lower than that of the other wheels.
3. During steady driving, wheel speed changes abruptly.

*1 The vehicle must run on a level paved road.

NOTE: Even after repairing the faulty part the warning light (W/L) does not go out if the vehicle is at a stop. Turn the ignition switch to the ON position and drive the vehicle at 12 km/h (8 mph) or higher to make sure that the warning light goes out.

It is important to verify that the correct tires are installed on vehicle.

Unit Inspection Procedure

This section describes the following inspection procedures referred to during "SYMPTOM DIAGNOSIS" and "DIAGNOSIS BY 'ABS' WARNING LIGHT ILLUMINATION PATTERN" :

	without TECH 2	with TECH 2
Sensor Output Inspection	Chart C-1-1 to C-1-3	Chart TC-1

Chart C-1-1 FL Sensor Output Inspection Procedure

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Jack up the vehicle with all four wheels off the ground. Measure the AC voltage between coil integrated module connector terminals while turning FL wheel at a speed of 1 RPS: Is the check between coil integrated module connector (C-4) terminals 2 and 10 than under 200 mV?	Go to Step 2	OK. Go to Step 3
2	1. Disconnect the wheel speed sensor. 2. Measure resistance between the wheel speed sensor connector terminals 1 and 2. Is the check between connector (C-13) terminals 1 and 2 within 2.0k - 2.8k ohms?	Connector is faulty, or open or short circuit of harness between wheel speed sensor connector and coil integrated module. Inspect and correct the connector or harness. Go to Step 3	Wheel speed sensor is faulty. Replace the wheel speed sensor. Go to Step 3
3	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

5A-54 BRAKE CONTROL SYSTEM

Chart C-1-2 FR Sensor Output Inspection Procedure

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Jack up the vehicle with all four wheels off the ground. Measure the AC voltage between coil integrated module connector terminals while turning FR wheel at a speed of 1 RPS: Is the check between coil integrated module connector (C-4) terminals 3 and 11 than under 200 mV?	Go to Step 2	OK. Go to Step 3
2	1. Disconnect the wheel speed sensor. 2. Measure resistance between the wheel speed sensor connector terminals 1 and 2. Is the check between connector (C-33) terminals 1 and 2 within 2.0k - 2.8k ohms?	Connector is faulty, or open or short circuit of harness between wheel speed sensor connector and coil integrated module. Inspect and correct the connector or harness. Go to Step 3	Wheel speed sensor is faulty. Replace the wheel speed sensor. Go to Step 3
3	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

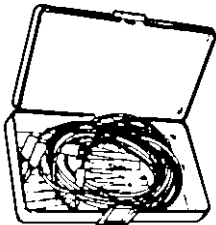

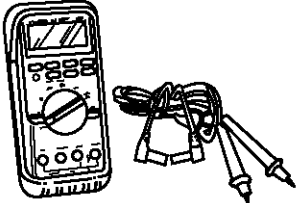

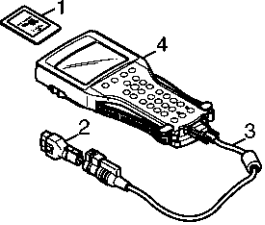

Chart C-1-3 Rear Sensor Output Inspection Procedure

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Jack up the vehicle with all four wheels off the ground measure the AC voltage between coil integrated module connector terminals while turning Rear wheel at a speed of 1 RPS: Is the check between coil integrated module connector (C-4) terminals 4 and 12 than under 200 mV?	Go to Step 2	OK. Go to Step 3
2	1. Disconnect the wheel speed sensor. 2. Measure resistance between the wheel speed sensor connector terminals 1 and 2. Is the check between connector (F-4) terminals 1 and 2 within 1.2k - 2.0k ohms?	Connector is faulty, or open or short circuit of harness between wheel speed sensor connector and coil integrated module. Inspect and correct the connector or harness. Go to Step 3	Wheel speed sensor is faulty. Replace the wheel speed sensor. Go to Step 3
3	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

Chart TC-1 Sensor Output Inspection Procedure

Step	Action	Yes	No
1	1. Connect TECH 2. 2. Check the wheel speed of each sensor by Data List. Is the vehicle speed normal?	Go to Step 6	Go to Step 2
2	Check the sensor harness for suspected disconnection (check while shaking harness/connector). Is the sensor harness connection normal?	Replace speed sensor. Go to Step 4	Repair. Go to Step 3
3	Check the wheel speed of each sensor by Data List. Is the vehicle speed normal?	Go to Step 6	Go to Step 4
4	Check the sensor rotor. Is the sensor rotor normal?	Replace speed sensor. Go to Step 5	Replace sensor rotor. Go to Step 5
5	Check the harness between coil integrated module and speed sensor. Is the harness connection normal?	Go to Step 6	Repair harness or connector between coil integrated module and speed sensor. Go to Step 6
6	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 6

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Electronic Hydraulic Control Unit

Electronic Hydraulic Control Unit and Associated Parts

350RW017

Legend

- | | |
|----------|------------------|
| (1) EHC | (3) Bracket |
| (2) Bolt | (4) Bolt and Nut |

Removal

1. Remove brake pipes.
 - After disconnecting brake pipe, cap or tape the openings of the brake pipe to prevent the entry of foreign matter.
2. Remove three bracket fixing bolts.
3. Disconnect red clip from harness connector.

350RW018

4. Remove harness connector.
5. Remove EHCU ASM.
6. Remove EHCU.

Disassembled View

Legend

- (1) Fixing Bolts
- (2) Coil Integrated Module
- (3) Hydraulic Unit (H/U)

Disassembly

1. Remove fixing bolts from EHCU.
2. Remove coil integrated module from hydraulic unit.

Reassembly

To reassembly, follow the disassembly steps in the reverse order, noting the following points:

Torque:

Fixing bolts: 4.4 N·m (4.5 kg·cm/39 lb in)

Installation

To install, follow the removal steps in the reverse order, noting the following points:

Torque:

Hydraulic unit fixing nuts : 22 N·m (2.2 kg·m/16 lbft)

Ground cable : 14 N·m (1.4 kg·m/10 lbft)

Brake pipe (joint bolts) : 16 N·m (1.6 kg·m/12 lbft)

- After installing the hydraulic unit, bleed brakes completely. See Hydraulic Brakes in Power-assisted brake system section.

Front Wheel Speed Sensor

Front Wheel Speed Sensor and Associated Parts

350R9033

Legend

- | | |
|---|------------------------------|
| (1) Speed Sensor Connector | (4) Speed Sensor Fixing Bolt |
| (2) Sensor Cable Fixing Bolt (Upper side) | (5) Speed Sensor |
| (3) Sensor Cable Fixing Bolt (Lower side) | |

Removal

1. Remove speed sensor connector.
2. Remove sensor cable fixing bolt (Upper side).
3. Remove sensor cable fixing bolt (Lower side).
4. Remove the speed sensor cable fixing bolt.
5. Remove speed sensor.

Inspection and Repair

1. Check the speed sensor pole piece for presence of foreign materials; remove any dirt, etc.
2. Check the pole piece for damage; replace speed sensor if necessary.
3. Check the speed sensor cable for short or open circuit, and replace with a new one if necessary. To check for cable short or open, bend or stretch the cable while checking for continuity.
4. Check the sensor ring for damage including tooth chipping, and if damaged, replace the sensor ring

assembly. Refer to removal of the sensor ring in Section 4D "Front hub and disc".

Installation

1. Install speed sensor and take care not to hit the speed sensor pole piece during installation.
2. Install speed sensor fixing bolt and tighten the fixing bolt to the specified torque.

Torque: 7 N·m (0.7 kg-m/61 lbin)

3. Install speed sensor cable fixing bolt (Lower side) and tighten the fixing bolt to the specified torque.

Torque : 20 N·m (2.0 kg-m/14 lbft)

4. Install speed sensor cable fixing bolt (Upper side) and tighten the fixing bolt to the specified torque.

Torque : 6 N·m (0.6 kg-m/52 lbft)

NOTE: Confirm that a white line marked on the cable is not twisted when connecting the speed sensor cable.

5. Install speed sensor connector.

Rear Wheel Speed Sensor

Removal

1. Disconnect harness connector (1).
2. Remove sensor fixing bolt (2) .
3. Remove speed sensor (3).

350RX003

Installation

1. Install speed sensor (3).
2. Tighten the sensor fixing bolt (2) to the specified torque.

Torque : 24 N·m (2.4 kg·m/17 lbft)

3. Connect harness connector (1).

350RX003

Inspection and Repair

1. Check speed sensor pole piece for presence of foreign materials; remove any dirt, etc.
2. Check the pole piece for damage, and replace speed sensor if necessary.
3. Check speed sensor cable for short or open, and replace with a new one if necessary. To check for cable short or open, bend or stretch the cable while checking for continuity.
4. Check the sensor ring for damage including tooth chipping, and if damaged, replace the axle shaft assembly. Refer to removal of the sensor ring in Section 4A2 "Differential (Rear)".

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

Master Cylinder Assembly

330RS001

The master cylinder contains two pistons that supply the hydraulic pressure for a dual-circuit braking system. The primary piston provides the fluid pressure to the front brakes, while the secondary piston provides the fluid pressure to the rear brakes. If the pressure is lost from either system, the remaining system will function to stop the vehicle.

CAUTION:

1. The master cylinder is not repairable. If found defective, it must be replaced as a complete assembly.
2. If any hydraulic component is removed or disconnected, it may be necessary to bleed all or part of the brake system. (Refer to "Bleeding Brake Hydraulic System" in this section.)
3. The torque values specified are for dry, unlubricated fasteners.
4. Perform service operations on a clean bench free from all mineral oil materials.

Brake Booster

This booster is a tandem vacuum unit with a diaphragm effective diameter 205mm + 230mm. In normal operating mode, with the service brakes in the released position, the tandem vacuum booster operates with vacuum on both sides of its diaphragms. When the brakes are applied, air at atmospheric pressure is admitted to one side of each diaphragm to provide the power assist. When the service brake is released, the atmospheric air is shut off from the one side of each diaphragm. The air is then drawn from the booster through the vacuum check valve to the vacuum source.

CAUTION:

1. If any hydraulic component is removed or disconnected, it may be necessary to bleed all or part of the brake system.
2. The torque values specified are for dry, unlubricated fasteners.
3. The vacuum booster is not repairable and must be replaced as complete assembly.

Disc Brake

Front Disc Brake

A05RW001

Rear Disc Brake

A05RW002

The disc brake assembly consists of a caliper, piston, rotor, pad assembly and support bracket. The caliper assembly has a single bore and is mounted to the support bracket with two mounting bolts. The support bracket allows the caliper to move laterally against the rotor. The caliper is a one-piece casting with the inboard side containing the piston bore. A square cut rubber seal is located in a groove in the piston bore which provides the hydraulic seal between the piston and the cylinder wall.

NOTE:

1. Replace all components included in repair kits used to service this caliper.
2. Lubricate rubber parts with clean brake fluid to ease assembly.
3. If any hydraulic component is removed or disconnected, it may be necessary to bleed all or

part of the brake system.

4. Replace pads in axle sets only.
5. The torque values specified are for dry, unlubricated fasteners.
6. Perform the service operation on a clean bench free from all mineral oil materials.

Operation

Hydraulic pressure, created by applying the brake pedal, is converted by the caliper to a stopping force. This force acts equally against the piston and the bottom of the caliper bore to move the piston outward and to move (slide) the caliper inward resulting in a clamping action on the rotor. This clamping action forces the linings against the rotor, creating friction to stop the vehicle.

Diagnosis

Road Testing The Brakes

Brake Test

Brakes should be tested on a dry, clean, reasonably smooth and level roadway. A true test of brake performance cannot be made if the roadway is wet, greasy or covered with loose dirt so that all tires do not grip the road equally. Testing will also be adversely affected if the roadway is crowned so as to throw the weight of the vehicle toward wheels on one side or if the roadway is so rough that wheels tend to bounce. Test the brakes at different vehicle speeds with both light and heavy pedal pressure; however, avoid locking the wheels and sliding the tires. Locked wheels and sliding tires do not indicate brake efficiency, since heavily braked but turning wheels will stop the vehicle in less distance than locked wheels. More tire-to-road friction is present with a heavily braked turning tire than with a sliding tire.

The standard brake system is designed and balanced to avoid locking the wheels except at very high deceleration levels.

It is designed this way because the shortest stopping distance and best control is achieved without brake lock-up.

Because of high deceleration capability, a firmer pedal may be felt at higher deceleration levels.

External Conditions That Affect Brake Performance

1. Tires: Tires having unequal contact and grip on the road will cause unequal braking. Tires must be equally inflated, identical in size, and the thread pattern of right and left tires must be approximately equal.
2. Vehicle Loading: A heavily loaded vehicle requires more braking effort.
3. Wheel Alignment: Misalignment of the wheels, particularly in regard to excessive camber and caster, will cause the brakes to pull to one side.

Brake Fluid Leaks

With engine running at idle and the transmission in "Neutral", depress the brake pedal and hold a constant foot pressure on the pedal. If pedal gradually falls away with the constant pressure, the hydraulic system may be leaking.

Check the master cylinder fluid level. While a slight drop in the reservoir level will result from normal lining wear, an abnormally low level in reservoir indicates a leak in the system. The hydraulic system may be leaking internally as well as externally. Refer to "Master Cylinder Inspection". Also, the system may appear to pass this test but still have slight leakage. If fluid level is normal, check the vacuum booster push rod length. If an incorrect length push rod is found, adjust or replace the push rod. Check the brake pedal travel and the parking brake adjustment.

When checking the fluid level, the master cylinder fluid level may be low from the "MAX" mark if the front and rear linings are worn. This is not abnormal.

Warning Light Operation

When the ignition switch is in the START position, the "BRAKE" warning light should turn on and go off when the ignition switch returns to the ON position.

The following conditions will activate the "BRAKE" light:

1. Parking brake applied. The light should be on whenever the parking brake is applied and the ignition switch is on.
2. Low fluid level. A low fluid level in the master cylinder will turn the "BRAKE" light on.
3. During engine cranking the "BRAKE" light should remain on. This notifies the driver that the warning circuit is operating properly.

General Diagnosis

Condition	Possible cause	Correction
Brake Pull	Tire inflation pressure is unequal.	Adjust
	Front wheel alignment is incorrect.	Adjust
	Unmatched tires on same axle.	Tires with approx. the same amount of tread should be used on the same axle.
	Restricted brake pipes or hoses.	Check for soft hoses and damaged lines. Replace with new hoses and new double-walled steel brake piping.
	Water or oil on the brake pads.	Clean or replace.
	Brake pads hardened.	Replace
	Brake pads worn excessively.	Replace
	Brake rotor worn or scored.	Grind or replace.
	Disc brake caliper malfunctioning.	Clean or replace.
	Front hub bearing preload incorrect.	Adjust or replace.
	Loose suspension parts.	Check all suspension mountings.
	Loose calipers.	Check and tighten the bolts to specifications.
Brake Roughness or Chatter (Pulsates)	Excessive lateral runout.	Check per instructions. If not within specifications, replace or machine the rotor.
	Parallelism not within specifications.	Check per instructions. If not within specifications, replace or machine the rotor.
	Wheel bearings not adjusted.	Adjust wheel bearings to correct specifications
	Pad reversed (steel against iron).	Replace the brake pad and machine rotor to within specifications.
Excessive Pedal Effort	Malfunctioning vacuum booster.	Check the vacuum booster operation and repair, if necessary.
	Partial system failure.	Check the front and rear brake system for failure and repair. Also, check the brake warning light. If a failed system is found, the light should indicate failure.
	Excessively worn pad.	Check and replace pads in sets.
	Piston in caliper stuck or sluggish.	Remove caliper and rebuild.
	Fading brakes due to incorrect pad.	Remove and replace with original equipment pad or equivalent.
	Vacuum leak to vacuum booster.	Check for ruptured or loose hose.
	Check the direction of check valve within vacuum hose.	Correct vacuum hose direction.
	Grease on the brake pads.	Replace or clean.

Condition	Possible cause	Correction
Excessive Brake Pedal Travel	Air in hydraulic circuit.	Bleed the hydraulic circuit.
	Level of brake fluid in the reservoir too low.	Replenish brake fluid reservoir to specified level and bleed hydraulic circuit as necessary.
	Master cylinder push rod clearance excessive.	Adjust
	Leakage in hydraulic system.	Correct or replace defective parts.
Brake Drag	Master cylinder pistons not returning correctly.	Adjust the stop light switch and vacuum booster push rod. If necessary, rebuild.
	Restricted brake pipes or hoses.	Check for soft hoses or damaged pipes, and replace with new hoses and new double-walled steel brake piping.
	Parking brake maladjusted.	Adjust
	Parking brake lining clearance insufficient.	Adjust
	Brake pedal free play insufficient.	Adjust the brake pedal height or power cylinder operating rod.
	Piston in the master cylinder sticking.	Replace
	Piston in the disc brake caliper sticking.	Replace piston seals.
	Brake pads sticking in caliper.	Clean
	Return spring weakened.	Replace
	Parking brake binding.	Overhaul the parking brakes and correct.
	Front hub bearing preload incorrect.	Adjust or replace.
	Parking brake shoes not returning.	Correct or replace the brake back plate and brake shoe as necessary.
	Obstructions in hydraulic circuit.	Clean
	Rotor warped excessively.	Grind or replace.
	Rear brake drum distorted.	Grind or replace.
Parking cable sticking.	Grind or replace.	
Grabbing or Uneven Braking Action (All conditions listed under "Pulls")	Malfunctioning vacuum booster.	Check operation and correct as necessary.
	Binding brake pedal mechanism.	Check and lubricate, if necessary.
	Corroded caliper assembly.	Clean and lubricate.

5C-8 POWER-ASSISTED BRAKE SYSTEM

Condition	Possible cause	Correction
Brake Noisy	Brake pads are worn.	Replace
	Brake pads are hardened.	Replace
	Brake pads are in poor contact with rotor.	Correct
	Brake disc(s) warped, worn or damaged.	Grind or replace.
	Disc brake anti-squeak shims fatigued.	Replace
	Front hub bearings are loose or preload is incorrect.	Adjust or replace.
	Brake disc is rusted.	Grind or replace.
Poor Brake Action	Master cylinder faulty.	Correct or replace.
	Vacuum booster faulty.	Correct or replace.
	Level of brake fluid in reservoir too low.	Replenish and bleed.
	Air in hydraulic circuit.	Bleed
	Disc brake caliper faulty.	Clean or replace.
	Water or oil on brake pads.	Clean or replace.
	Brake pads in poor contact with the rotor.	Correct
	Brake pads worn.	Replace
	Brake disc rusted.	Grind or replace.
	Check valve in vacuum hose faulty.	Correct or replace.

Hydraulic Brakes

Filling Master Cylinder Reservoir

CAUTION: Use only specified brake fluid. Do not use any fluid which contains a petroleum base. Do not use a container which has been used for petroleum based fluids or a container which is wet with water. Petroleum based fluid will cause swelling and distortion of rubber parts in the hydraulic brake system. Water mixed with brake fluid lowers the fluid boiling point. Keep all fluid containers capped to prevent contamination. Always fill the master cylinder reservoir when the engine is cold.

Never allow the brake fluid to come in contact with the painted surfaces.

The master cylinder reservoir must be kept properly filled to ensure adequate reserve and to prevent air and moisture from entering the hydraulic system.

However, because of expansion due to heat absorbed from the brakes and the engine, the reservoir must not be overfilled. The brake fluid reservoir is on the master cylinder, which is located under the hood on the left side of the cowl.

Thoroughly clean reservoir cap before removal to avoid getting dirt into reservoir. Remove the diaphragm. Add fluid as required to bring level to the "MAX" mark on the reservoir tank. Use "DOT 3" Hydraulic Brake Fluid. If the fluid cap diaphragm is stretched, return it to the original position before installing.

Deterioration of Brake Fluid

Using any other brake fluid than specified or brake fluid with mineral oil or water mixed in will drop the boiling point of brake fluid. It may, in turn, result in vapor lock or deteriorated rubber parts of the hydraulic system. Be sure to change the brake fluid at specified intervals. If the rubber parts are deteriorated, remove all the system parts and clean them with alcohol. Prior to reassembly, dry the cleaned parts with air to remove the alcohol. Replace all the hoses and rubber parts of the system.

Leakage of Brake Fluid

With engine idling, set shift lever in the neutral position and continue to depress brake pedal at a constant pedal application force.

Should the pedal stroke become deeper gradually, leakage from the hydraulic pressure system is possible. Make sure by visual check that there is no leak.

Bleeding Brake Hydraulic System

A bleeding operation is necessary to remove air from the hydraulic brake system whenever air is introduced into the hydraulic system. It may be necessary to bleed the hydraulic system at all four brakes if air has been

introduced through a low fluid level or by disconnecting brake pipes at the master cylinder. If a brake pipe is disconnected at one wheel, only that wheel cylinder/caliper needs to be bled. If the pipes are disconnected at any fitting located between the master cylinder and brakes, then the brake system served by the disconnected pipe must be bled.

1. For 4-Wheel Antilock Brake System (ABS) equipped vehicle, be sure to remove the ABS main fuse 60A located at the relay and fuse box before bleeding air. If you attempt to bleed air without removing the main fuse, air cannot be let out thoroughly, and this may cause damage to the hydraulic unit. After bleeding air, be sure to replace the ABS main fuse back to its original position.
2. Set the parking brake completely, then start the engine.

NOTE: The vacuum booster will be damaged if the bleeding operation is performed with the engine off.

3. Remove the master cylinder reservoir cap.
4. Fill the master cylinder reservoir with brake fluid. Keep the reservoir at least half full during the air bleeding operation
5. Always use new brake fluid for replenishment.
6. In replenishing brake fluid, take care that air bubbles do not enter the brake fluid. When the master cylinder is replaced or overhauled, first bleed the air from the master cylinder, then from each wheel cylinder and caliper following the procedures described below.

Bleeding the Master Cylinder

7. Disconnect the rear wheel brake pipe (1) from the master cylinder. Check the fluid level and replenish as necessary. If replenished, leave the system for at least one minute.
8. Depress the brake pedal slowly once and hold it depressed.
9. Completely seal the delivery port of the master cylinder with your finger, where the pipe was disconnected then release the brake pedal slowly.
10. Release your finger from the delivery port when the brake pedal returns completely.
11. Repeat steps 8 through 10 until the brake fluid comes out of the delivery port during step 8.

NOTE: Do not allow the fluid level in the reservoir to go below the half-way mark.

12. Reconnect the brake pipe (1) to the master cylinder and tighten the pipe.
13. Depress the brake pedal slowly once and hold it depressed.
14. Loosen the rear wheel brake pipe (1) at the master cylinder.

15. Retighten the brake pipe, then release the brake pedal slowly.
16. Repeat steps 13 through 15 until no air comes out of the port when the brake pipe is loosened

NOTE: Be very careful not to allow the brake fluid to come in contact with painted surfaces.

17. Bleed the air from the front wheel brake pipe connection (2) by repeating steps 7 through 16.

Bleeding the Caliper

18. Bleed the air from each wheel in the order listed below:

- Right rear caliper or wheel cylinder
- Left rear caliper or wheel cylinder
- Right front caliper
- Left front caliper

Conduct air bleeding from the wheels in the above order. If no brake fluid comes out, it suggests that air is mixed in the master cylinder. In this case, bleed air from the master cylinder. In this case, bleed air from the master cylinder in accordance with steps 7 through 17, and then bleed air from the caliper or wheel cylinder.

19. Place the proper size box end wrench over the bleeder screw.
20. Cover the bleeder screw with a transparent tube, and submerge the free end of the transparent tube in a transparent container containing brake fluid.
21. Pump the brake pedal slowly three (3) times (once/sec), then hold it depressed.
22. Loosen the bleeder screw until fluid flows through the tube.
23. Retighten the bleeder screw.
24. Release the brake pedal slowly.
25. Repeat steps 21 through 24 until the air is completely removed.
It may be necessary to repeat the bleeding

procedure 10 or more times for front wheels and 15 or more times for rear wheels.

26. Go to the next wheel in the sequence after each wheel is bled.
Be sure to monitor reservoir fluid level.
27. Depress the brake pedal to check if you feel "sponginess" after the air has been removed from all wheel cylinders and calipers.
If the pedal feels "spongy", the entire bleeding procedure must be repeated.
28. After the bleeding operation is completed on the each individual wheel, check the level of the brake fluid in the reservoir and replenish up to the "MAX" level as necessary.
29. Attach the reservoir cap.
If the diaphragm inside the cap is deformed, reform it and install.
30. Stop the engine.

Flushing Brake Hydraulic System

It is recommended that the entire hydraulic system be thoroughly flushed with clean brake fluid whenever new parts are installed in the hydraulic system.

Approximately one quart of fluid is required to flush the hydraulic system.

The system must be flushed if there is any doubt as to the grade of fluid in the system or if fluid has been used which contains the slightest trace of mineral oil. All rubber parts that have been subjected to a contaminated fluid must be replaced.

Brake Pipes and Hoses

The hydraulic brake system components are interconnected by special steel piping and flexible hoses. Flexible hoses are used between the frame and the front calipers, the frame and rear axle case and the rear axle and the rear calipers.

When the hydraulic pipes have been disconnected for any reason, the brake system must be bled after reconnecting the pipe. Refer to "Bleeding the Brake Hydraulic System" in this section.

Brake Hose Inspection

The brake hose should be inspected at least twice a year. The brake hose assembly should be checked for road hazard, cracks and chafing of the outer cover, and for leaks and blisters. Inspect for proper routing and mounting of the hose. A brake hose that rubs on suspension components will wear and eventually fail. A light and mirror may be needed for an adequate inspection. If any of the above conditions are observed on the brake hose, adjust or replace the hose as necessary.

CAUTION: Never allow brake components such as calipers to hang from the brake hoses, as damage to the hoses may occur.

Front Caliper Brake Hose

Front Caliper Brake Hose and Associated Parts

Legend

- (1) Bolt and Gasket
- (2) Clip
- (3) Hose
- (4) Brake Pipe

Removal

1. Raise the vehicle and support it with suitable safety stands.
2. Remove the wheel and tire assembly.
3. Clean dirt, grease, and other foreign material off the hose fittings at both ends.
4. Disconnect brake pipe.
5. Remove clip.
6. Remove bolt and gasket.
7. Remove hose.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Tighten the brake pipes to the specified torque

Torque: 16 N·m (1.6 kg·m/12 lbft)

2. Tighten the bolt to the specified torque.

Torque: 34 N·m (3.5 kg·m/25 lbft)

NOTE: Always use new gaskets and be sure to put the hooked edge of the flexible hose end into the anti-rotation cavity.

After installing the brake hoses, bleed the brakes as described in this section.

Rear Axle Brake Hose

Rear Axle Brake Hose and Associated Parts

352RW002

Legend

- (1) Brake Pipe
- (2) Clip
- (3) Bolt
- (4) Brake Pipe
- (5) Hose

Removal

1. Raise the vehicle and support it with suitable safety stands.
2. Remove wheel and tire assembly.
3. Clean dirt, grease, and other foreign material off the hose fittings at both ends.
4. Disconnect brake pipe.
5. Remove clip.
6. Remove brake pipe.
7. Remove bolt.
8. Remove hose.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Tighten the brake pipes to the specified torque

Torque: 16 N·m (1.6 kg·m/12 lbft)

2. Tighten the bolt to the specified torque.

Torque: 15 N·m (1.5 kg·m/11 lbft)

After installing the brake hoses, bleed the brakes as described in this section.

Brake Pipe

Removal

1. Raise the vehicle and support it with suitable safety stands.
2. Remove wheel and tire assembly as necessary.
3. Clean dirt, grease, and other foreign material off the pipe fittings at both ends.
4. Remove brake pipe (1).

330RW011

5. Remove plastic clip (2).

330RW002

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Tighten the brake pipes to the specified torque.

Master cylinder and P&B valve sides

Torque: 12 N·m (1.2 kg·m/104 lbin)

Others

Torque: 16 N·m (1.6 kg·m/12 lbft)

After installing the brake pipes, bleed the brakes as described in this section.

P & B (Proportioning and Bypass) Valve

P & B (Proportioning and Bypass) Valve Sectional View

350RW014

Legend

- (1) Master Cylinder (Secondary)
- (2) Master Cylinder (Primary)
- (3) Rear Brake
- (4) Front Brake

The P&B valve contains two sections, each serving a different function.

The proportioning section of the P&B valve proportions outlet pressure to the rear brakes after a predetermined rear input pressure has been reached. This is done to prevent rear wheel lock up on the vehicles with light rear wheel loads. The valve has a by-pass feature which assures full system pressure to the rear brakes in the event of front brake system malfunction. Also full front pressure is retained in the event of rear brake malfunction.

The P&B valve is not repairable and must be replaced as complete assembly.

Removal

1. The P&B valve is not repairable and must be replaced as a complete assembly. Care must be taken to prevent brake fluid from contacting any painted surface.
2. Remove hydraulic pipes (1) and plug the pipes (1) to prevent the loss of fluid or the entrance of dirt.
3. Remove bolt (3).
4. Remove P&B valve (2).

350RW026

Installation

1. Install P&B valve (2).
2. Install bolt (3) and tighten the bolt to the specified torque.
Torque: 22 N·m (2.2 kg·m/16 lbft)
3. Install hydraulic pipes (1) and tighten the bolt to the specified torque.
Torque: 12 N·m (1.2 kg·m/104 lb in)
4. After installing the brake pipes, bleed the brakes as refer to Bleeding Brake Hydraulic System in this section.

Main Data and Specifications

Torque Specifications

Brake Pedal

Checking Pedal Height

The push rod serves as the brake pedal stopper when the pedal is fully released. Brake pedal height adjustment should be performed as follows:

Adjust Brake Pedal

1. Measure the brake pedal height after making sure the pedal is fully returned by the pedal return spring. Pedal height must be measured after starting the engine and receiving it several times.

Pedal Free Play: 8-11 mm (0.31-0.43 in)

Pedal Height: 193-203 mm (7.60-7.99 in)

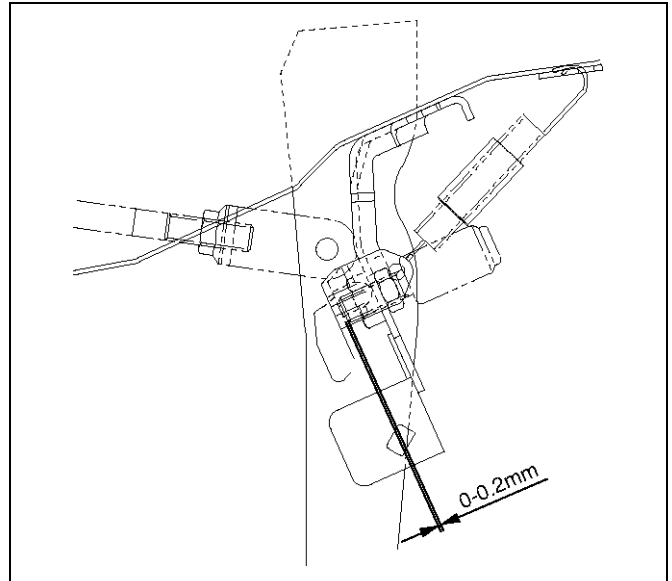

NOTE: Pedal free play must be measured after turning off the engine and stepping on the brake pedal firmly five times or more.

2. If the measured value is not within the above range, adjust the brake pedal as follows:
 - a Disconnect the stoplight switch connector.
 - b Loosen the stoplight switch lock nut.
 - c Rotate the stoplight switch so that it moves away from the brake pedal.
 - d Loosen the lock nut (1) on the push rod.
 - e Adjust the brake pedal to the specified height by rotating the push rod in the appropriate direction.
 - f Tighten the lock nut to the specified torque.

Torque: 20 N·m (2.0 kg·m/15 lbft)

- g Adjust the stoplight switch (2) to the specified clearance (between the switch housing and the brake pedal) by rotating the switch housing.

Clearance: 0-0.2 mm (0-0.008 in)

NOTE: While adjusting the stoplight switch, make sure that the threaded part of the stoplight switch does not push the brake pedal.

- h Tighten the stoplight switch lock nut.
- i Connect the stoplight switch connector.

Checking Pedal Travel

1. Pedal height must be measured after starting the engine and revving it several times to apply vacuum to the vacuum booster fully.

NOTE: Pedal height must be 50 mm (1.97 in) or more when about 490N (50kg/110lb) of stepping force is applied.

2. If the measured value is lower than the above range, air existing in the hydraulic system is suspected. Perform the bleeding procedure.

310RW023

Removal

1. Disconnect the battery “-” terminal cable, and wait at least 5 minutes.
2. Disconnect the yellow 3 way SRS connector located under the steering column.
3. Remove the engine hood opening lever.
4. Remove lower cover (8).
5. Remove driver knee bolster (10).
6. Disconnect the stop light switch connector (3). Disconnect the anti-theft control module connector. Refer to Body and Accessories section.
7. Remove snap pin (4) and push rod pin (7).
8. Remove the steering column shaft fixing bolt and nut (9) on the steering wheel side, and lower the steering column shaft.
9. Remove the brake pedal bracket assembly (1).

10. Remove return spring (5).

11. Remove fulcrum pin and nut (2).
12. Remove pedal assembly (6).

Installation

1. Apply grease to the entire circumference of the fulcrum pin.
2. Install pedal assembly (6) and fulcrum pin and nut (2). Tighten the nut (2) to the specified torque.
Torque: 35 N·m (3.6 kg-m/26 lbft)
3. Install the brake pedal bracket assembly (1). Tighten the bolts and nuts soecified torque.
Torque: 15 N·m (1.5 kg-m/11 lbft)
4. Install return spring (5).

5C-18 POWER-ASSISTED BRAKE SYSTEM

- Adjust pedal free travel.
Refer to Brake Pedal Adjustment in this section.
- Tighten the steering column fixing bolt (9) (dash panel) to the specified torque.
Torque: 20 N·m (2.0 kg·m/14 lb ft)
- Tighten the steering column fixing nut (9) (Cross Beam) to the specified torque.
Torque: 17 N·m (1.7 kg·m/12 lb ft)
- Apply grease to the entire circumference of the Push rod pin (7).

- Install push rod pin (7).
- Install snap pin (4).
- Connect the anti-theft control module connector.
Refer to Body and Accessories section.
- Connect the stop light switch connector (3).
- Install driver knee bolster (10) and lower cover (8).
- Install the engine hood opening lever.
- Connect the yellow 3 way SRS connector located under the steering column.
- Connect the battery “-” terminal cable.

Stoplight Switch

Parts Location

310RW024

Legend

- (1) Connector
- (2) Switch
- (3) Lock Nut

Removal

- Disconnect connector (1)
- Remove lock nut (3).
- Remove switch (2).

Installation

- Adjust the stop light switch to the specified clearance (between switch housing and brake pedal) by rotating the switch housing.

Clearance : 0-0.2 mm (0-0.008 in)

NOTE: Do not attempt to force the push rod into position during the stop light switch installation and adjustment procedure.

310RW022

- Connect connector (1).
- Install lock nut (3).

Main Data and Specifications

General Specifications

Pedal free play	6–10 mm (0.23 –0.39 in)
Pedal Height	173–185 mm (6.81–7.28 in)

Fluid Reservoir Tank

Fluid Reservoir Tank and Associated Parts

Legend

- (1) Fluid Reservoir
- (2) Electrical Connector

- (3) O-ring
- (4) Retainer

330RW003

Removal

NOTE: Before removing the fluid reservoir, remove the brake fluid from the fluid reservoir.

1. Disconnect electrical connector.
2. Remove retainer (1).

330RW004

3. Remove fluid reservoir and the fluid level sensor built into the fluid reservoir. The fluid level sensor cannot be removed for servicing.

4. Remove O-ring.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

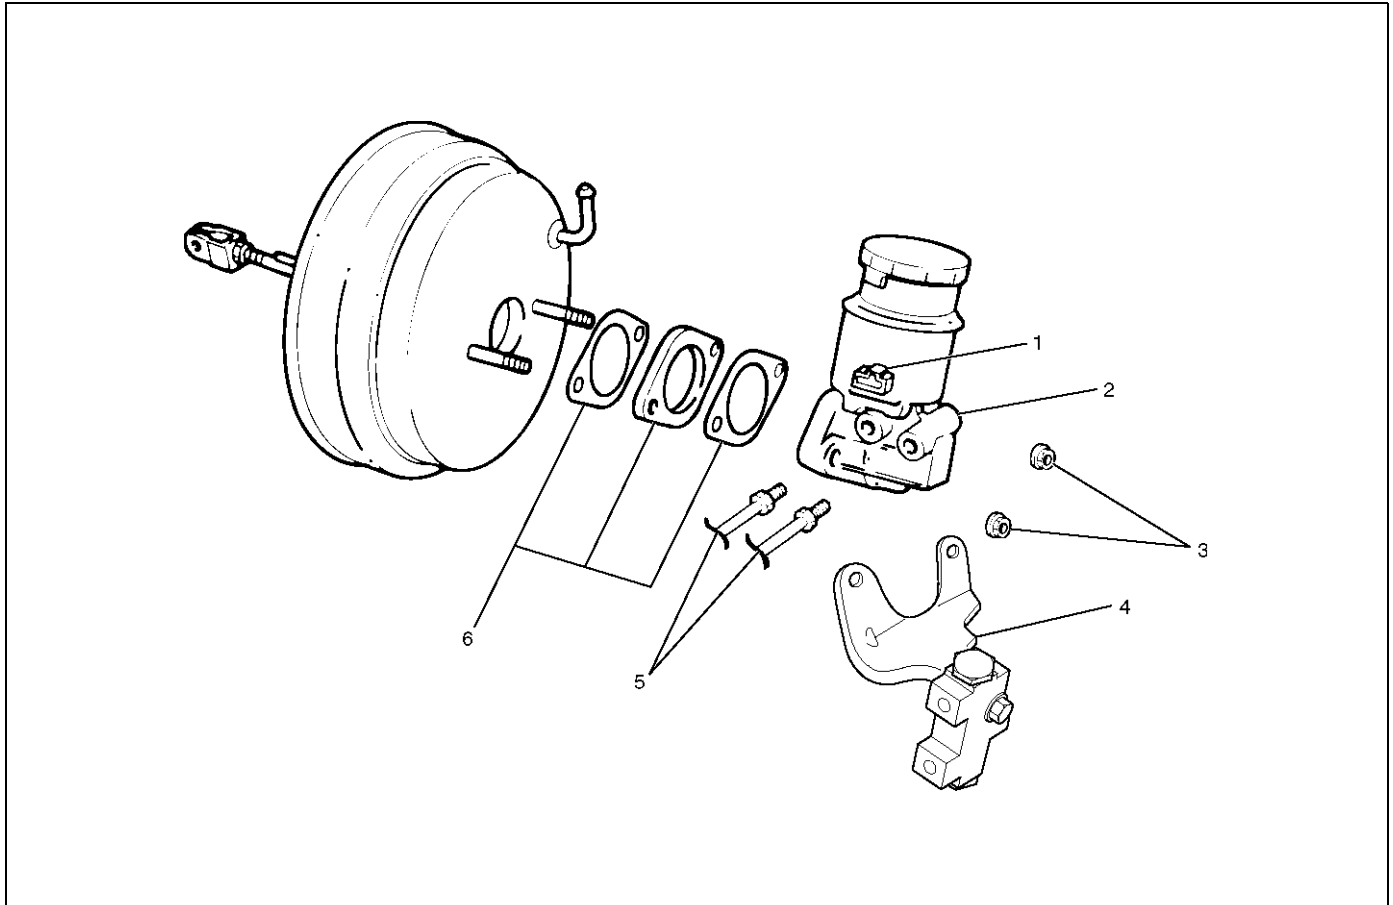

1. O-ring (1) must be set onto the fluid reservoir (2), before installing fluid reservoir.

330RW005

Master Cylinder Assembly

Master Cylinder Assembly and Associated Parts

Legend

- | | |
|--------------------------|---------------------------|
| (1) Electrical Connector | (4) P&B Valve and Bracket |
| (2) Master Cylinder | (5) Brake Pipes |
| (3) 2 attaching Nuts | (6) Spacer and 2 gaskets |

Removal

CAUTION: When removing the master cylinder from the vacuum booster, be sure to get rid of the internal negative pressure of the vacuum booster (by, for instance, disconnecting the vacuum hose) in advance.

If any negative pressure remains in the vacuum booster, the piston may possibly come out when the master cylinder is being removed, letting the brake fluid run out.

While removing the master cylinder, further, do not hold the piston as it can be easily pulled out.

Outside surface of the piston is the surface on which seals are to slide. Care should be taken to keep the surface free of cuts and dents.

1. Disconnect electrical connector.
2. Remove brake pipes and after disconnecting the

brake pipe, cap or tape the openings of the brake pipe to prevent the entry of foreign matter.

3. Remove 2 attaching nuts.
4. Remove P&B valve and bracket.
5. Remove master cylinder.
6. Remove spacer and the 2 gaskets.

Inspection and Repair

Master Cylinder

The master cylinder is not repairable and must be replaced as a complete assembly if found defective.

Inspection

Excessive brake pedal travel, malfunction or dragging brake suggests that the master cylinder is defective. In

5C-22 POWER-ASSISTED BRAKE SYSTEM

such cases perform the following visual check:

Visual Check

Make parts replacement as required if wear, distortion, nicks, cuts, corrosion, or other abnormal conditions are found through the following parts inspection:

- Master cylinder body
- Fluid reservoir
- O-ring

Functional Inspection of Master Cylinder Piston

Push the primary piston (1) with your fingers to check that it travels smoothly. If the motion is questionable, replace the master cylinder as a complete assembly.

Functional Inspection of Master Cylinder

Inspect the master cylinder for function as follows. If any abnormal function is found, replace with a new one. Install the primary piston holder (3) 5-8840-2306-0 (including the master cylinder attachment (5) and master cylinder plug (7)) onto the master cylinder (4). Make sure the spacer (2) (2 bolts) with its adjusting bolt is screwed in up to the "0" line

Connect the master cylinder attachment (5) 5-8840-2306-0 with the end of the radiator cap tester (6) 5-8840-0277-0, and apply air pressure with the cap tester. Make sure there is no rise in pressure and that with the adjusting bolt further screwed in 5mm (align the adjusting bolt to the "5" line). There should be a pressure increase of 0.5 kg/cm² or more.

NOTE: When checking the front (or primary) side, be sure to mount the master cylinder plug in the rear (or secondary) port.

Remarks	Checks port into the atmospheric pressure chamber	Checks air tightness of the pressure chamber

NOTE:

- Do not use an air compressor, as the air from the compressor is mixed with compressor oil.
- When installing the master cylinder onto the vacuum booster, always adjust the vacuum booster push rod. (Refer to "Vacuum Booster" in this section).
- After the master cylinder is installed onto the vehicle, check for leakage, pedal travel and pedal free play.

Installation

- Install spacer and the 2 gaskets.
- Install master cylinder.
When replacing the master cylinder or vacuum booster or both, always measure the vacuum booster push rod protrusion and adjust it as necessary (Refer to "Vacuum Booster" in section).
- Install P&B valve and bracket.
- Install 2 attaching nuts and tighten the attaching nuts to the specified torque.

Torque: 13 N·m (1.3 kg·m/113 lbin)

- Install brake pipes and tighten the brake pipe to the specified torque.

Master cylinder and P&B valve sides

Torque: 12 N·m (1.2 kg·m/104 lbin)

Others

Torque: 16 N·m (1.6 kg·m/12 lbin)

Vacuum Booster Assembly

Vacuum Booster Assembly and Associated Parts

Legend

- | | |
|-------------------------------|--------------------|
| (1) Pin | (5) Vacuum Booster |
| (2) Vacuum Booster Fixing Nut | (6) Snap Pin |
| (3) Vacuum Hose | |
| (4) Master Cylinder | |

Removal

1. Before removing the vacuum booster assembly, disconnect and remove the brake pipes.
2. Remove master cylinder, refer to "Master Cylinder Removal" in this section.

CAUTION: When removing the master cylinder from the vacuum booster, be sure to get rid of the internal negative pressure of the vacuum booster (by, for instance, disconnecting the vacuum hose) in advance.

If any negative pressure remains in the vacuum booster, the piston may possibly come out when the master cylinder is being removed, letting the brake fluid run out.

While removing the master cylinder, further, do not hold the piston as it can be easily pulled out.

Outside surface of the piston is the surface on which seals are to slide. Care should be taken to keep the surface free of cuts and dents.

3. Remove vacuum hose.
4. Disconnect the yoke clevis from the brake pedal.
5. Remove vacuum booster fixing nut.
6. Remove vacuum booster.

Inspection and Repair

Vacuum Hose

1. Inspect the check valve (2), which is installed inside the vacuum hose.
2. Air should pass freely from the vacuum booster (3) to the engine (1).

3. Air should not pass from the engine (1) to the vacuum booster (3). If it does, the check valve is inoperative and must be replaced.

360RW001

installing a push rod gauge on the vacuum booster.

331RW012

4. Measure dimension (4).

Dimension (4) (Standard): -0.1-0.1 mm (-0.0039-0.0039 in)

Installation

1. Perform vacuum booster and vacuum booster push rod adjustment.

NOTE: When replacing either the master cylinder or vacuum booster, be sure to measure push rod, and adjust if required.

2. Remove retainer from vacuum booster front shell using a small screwdriver. Then gently draw plate and seal assembly out of the shell inside.

331RS003

3. Set push rod gauge 5-8840-2300-0 on vacuum booster, and apply negative pressure by means of vacuum pump 5-8840-0279-0 so that the pressure in the vacuum booster becomes 500 mm Hg.

NOTE: Be sure to apply NEGATIVE pressure after

331RW013

5C-26 POWER-ASSISTED BRAKE SYSTEM

5. If dimension (4) is out of the standard range, adjust push rod using the Push Rod Support 5-8840-2305-0.

331RW014

6. Mount plate and seal assembly in vacuum booster front shell. Then install the retainer.
7. Install vacuum booster fixing nut and tighten the specified torque.
Torque: 15 N-m (1.5 kg-m/11 lbft)
8. Install yoke clevis.
9. Connect vacuum hose and make sure that the arrow on the hose points in the direction of the engine.
10. Install master cylinder, refer to "Master Cylinder Installation" in this section.

331RW006

Removal

1. Remove master cylinder. Refer to "Master Cylinder" in this section.
2. Remove vacuum booster. Refer to "Vacuum Booster" in this section.
3. Remove yoke clevis.
4. Remove lock nut.
5. Remove retaining clip.
6. Remove valve body guard.
7. Remove silencer.
8. Remove filter.
9. Remove 2 gaskets and spacer.

5C-28 POWER-ASSISTED BRAKE SYSTEM

10. Remove retainer, using a small screwdriver to pry out the retainer. Gently pull out the plate and seal assembly from the shell.

331RS003

Inspection and Repair

Visual Check

Make necessary parts replacement if cuts, nicks, excessive wear, or other abnormal conditions are found

through inspection. Check the following parts:

- Yoke clevis
- Valve body guard
- Silencer
- Filter plate and seal assembly

Installation

1. Install plate and seal assembly.
2. Install retainer.
3. Install 2 gaskets and spacer.
4. Install filter.
5. Install silencer.
6. Install valve body guard.
7. Install retainer.
8. Install lock nut and yoke clevis and tighten to the specified torque.

Torque: 20 N·m (2.0 kg·m/15 lbft)

9. Install vacuum booster, refer to "Vacuum Booster" in this section.
10. Install master cylinder, refer to "Master Cylinder" in this section and after installation, perform brake pedal check and adjustment. Refer to "Brake Pedal" in this section.

Vacuum Booster Overhaul

Vacuum Booster

The vacuum booster cannot be disassembled for repair. Replace a defective vacuum booster with a new one.

Main Data and Specifications

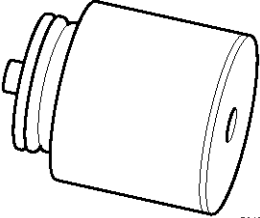

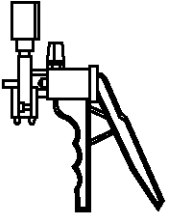

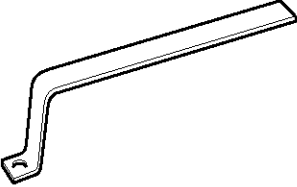

General Specifications

Vacuum booster diaphragm diameter (Front)	205 mm (8.07 in)
Vacuum booster diaphragm diameter (Rear)	230 mm (9.06 in)
Push rod stroke	More than 32.0 mm (1.26 in)
Plunger diameter	10.25 mm (0.40 in)
Push rod diameter	27.4 mm (1.08 in)

Front Disc Brake Pads

Front Disc Brake Pads Inspection

Check the outer pad by looking at each caliper from above. Check the thickness on the inner pad by looking down through the inspection hole in the top of the caliper. Whenever the pad is worn to about the thickness of the pad base, the pad should be removed for further measurements. The pad should be replaced anytime the pad thickness (1) is worn to within 1.00 mm (0.039 in) of the pad itself.

The disc pads have a wear indicator that makes a noise when the pad wears to where the replacement is required.

Minimum limit (1): 1.0 mm (0.039 in)

302RS002

Legend

- | | |
|----------------------|----------------|
| (1) Lock Bolt | (4) Clip |
| (2) Caliper Assembly | (5) Outer Side |
| (3) Pad Assembly | |

Removal

NOTE: If a squealing noise occurs from the front brake while driving, check the pad wear indicator plate. If the indicator plate contacts the rotor, the disc pad assembly should be replaced.

- Draw out two-thirds of the brake fluid from the reservoir.
 - Raise the vehicle and support it with suitable safety stands.
1. Remove wheel and tire assembly, refer to "Wheels and Tires System" in Section 3E.
 2. Remove lock bolt (1).

302RW004

3. Rotate caliper assembly and support the caliper assembly so that the brake hose is not stretched or damaged.
4. Remove pad assembly with shim.
5. Remove Clip.

Installation

1. Install clip.

302RS005

2. Apply special grease (approximately 0.2g) to both contacting surfaces of the inner shims (2). Wipe off extruded grease after installing. Install pad assembly with shim.

302RW005

Legend

- (2) Inner Shim
- (3) Wear Indicator
- (4) Inner Side

3. Use adjustable pliers to bottom the piston into the caliper bore. Be careful do not damage the piston boot and do not damage the flexible hose by twisting or pulling it.
Install caliper assembly.
Set caliper assembly in place.

5. Install wheel and tire assembly, refer to "Wheels and Tires System" in Section 3E.
6. Pump the brake pedal several times to make sure that the pedal is firm. Check the brake fluid level in the reservoir after pumping the brakes.

4. Install lock bolt (5) and tighten the bolt to the specified torque.

Torque: 74 N-m (7.5 kg-m/54 lbft)

Front Disc Brake Rotor

Inspection

In the manufacturing of the brake rotor, all the tolerances regarding surface finish, parallelism and lateral runout are held very closely. Maintaining these tolerances provides the surface necessary to assure smooth brake operation.

Lateral Runout

Lateral runout is the movement of the rotor from side to side as it rotates on the spindle. This could also be referred to as "rotor wobble". This movement causes the piston to be knocked back into its bore. This results in additional pedal travel and a vibration during braking.

Checking Lateral Runout

1. Adjust the wheel bearing correctly, refer to "Differential" in Section 4A.
2. Attach a dial indicator to some portion of the suspension so that the stem contacts the rotor face about 29 mm (1.14 in) from the rotor edge.
3. Move the rotor one complete rotation and the lateral runout should not exceed 0.13 mm (0.005 in).

Maximum runout: 0.13 mm (0.005 in)

411RS019

Parallelism

Parallelism is the measurement of thickness of the rotor at four or more points around the circumference of the rotor. All measurement must be made at 29 mm (1.14 in) from the edge of the rotor. The rotor thickness must not vary more than 0.010 mm (0.0004 in) from point to point.

Maximum runout: 0.010 mm (0.0004 in)

411RS018

Replacing Brake Rotors

When installing new brake rotors, do not refinish the surfaces. These parts are at the correct level of surface finish.

Refinishing Brake Rotors

Accurate control of the rotor tolerances is necessary for proper performance of the disc brakes. Machining of the rotor should be done only with precision equipment. All brake rotors have a minimum thickness dimension cast into them. This dimension is the minimum wear dimension and not a refinish dimension. The minimum wear dimension is 24.60 mm (0.969 in). The minimum refinish dimension is 24.97 mm (0.983 in).

When refinishing rotors, always use sharp cutting tools or bits. Dull or worn tools leave a poor surface finish which will affect initial braking performance. Vibration dampening attachments should always be used when refinishing braking surfaces. These attachments eliminate tool chatter and will result in better surface finish.

After refinishing, replace any rotor that does not meet the minimum thickness of 24.97 mm (0.983 in). Do not use a brake rotor that will not meet the specification.

Minimum wear dimension: 24.60 mm (0.969 in)

Refinish dimension: 24.97 mm (0.983 in)

411RW003

| (2) Brake Flexible Hose | (6) Support Bracket with Pad Assembly |
| (3) Lock Bolt | (7) Pad Assembly |
| (4) Caliper Assembly | |

Removal

1. Raise the vehicle and support with suitable safety stands.
2. Concerning wheel and tire assembly, refer to "Wheels and Tires System" in Section 3E.
3. Remove the bolt and gaskets, then disconnect the flexible hose from the caliper and after disconnecting the flexible hose (1), cap or tape the openings to prevent entry of foreign material.

302RW009

4. Since the brake fluid flows out from the connecting coupler, place a drain pan under the vehicle.
5. Remove guide bolt (2).
6. Remove lock bolt (3).

302RW010

7. Remove caliper assembly.
8. Remove support bracket with pad assembly and take care not to damage the flexible brake hose when removing the support bracket.
9. Remove pad assembly with shim and mark the lining locations if they are to be reinstalled.
10. Remove clip.

Installation

1. Install clip.

302RS005

2. Apply special grease (approximately 0.2 g) to both contacting surfaces of the inner shims (4). Wipe off extruded grease after installing. Install pad assembly with shim.

302RW011

Legend

- (4) Inner Shim
- (5) Wear Indicator
- (6) Inner Side

3. Install support bracket and tighten the bolt (7) to the specified torque.

Torque: 155 N·m (15.8 kg·m/115 lbft)

302RW012

4. Install caliper assembly.
5. Install lock bolt (9) and guide bolt (8) and tighten the bolt to the specified torque.

Torque: 74 N·m (7.5 kg·m/54 lbft)

302RW013

6. Install brake flexible hose, always use new gaskets and be sure to put the hooked edge of the flexible hose end into the anti-rotation cavity then tighten the I-bolt (10) to the specified torque.

Torque: 34 N-m (3.5 kg-m/25 lb ft)

302RW014

7. Install wheel and tire assembly, referring to "Wheels and Tires System" in Section 3E.
8. Bleed brakes. Refer to "Hydraulic Brakes" in this section.

Front Disc Brake Caliper

Front Disc Brake Caliper Disassembled View

302RW015

Legend

|---|-----------------------|
| (1) Guide Bolt | (6) Piston Seal |
| (2) Lock Bolt | (7) Piston |
| (3) Bleeder with Cap | (8) Dust Boot: Piston |
| (4) Caliper Body | (9) Dust Boot Ring |
| (5) Dust Boot: Guide Bolt and Lock Bolt | |

Disassembly

1. Remove guide bolt.
2. Remove lock bolt.
3. Remove dust boot: guide bolt and lock bolt.

4. Remove dust boot ring, using a small screwdriver.

302RS016

5. Insert a block of wood into the caliper and force out the piston by blowing compressed air into the caliper at the flexible hose attachment. This procedure must be done prior to removal of the dust boot. Remove piston.

WARNING: Do not place your fingers in front of the piston in an attempt to catch or protect it when applying compressed air. This could result in personal injury.

CAUTION: Use just enough air to ease the piston out of the bore. If the piston is blown out, it may be damaged.

302RS017

6. Remove dust boot: piston.
7. Remove piston seal.
8. Remove bleeder with cap.
9. Remove caliper body.

Inspection and Repair

Make necessary parts replacement, if wear, damage, corrosion or any other abnormal conditions are found through inspection.

Check the following parts:

- Rotor
- Cylinder body
- Cylinder bore
- Piston
- Guide bolt, lock bolt
- Support bracket

NOTE: The piston seal, boot ring and dust boot are to be replaced each time the caliper is overhauled. Discard these used rubber parts and replace them with new ones.

Reassembly

1. Install caliper body.
2. Install bleeder with cap and tighten the cap to the specified torque.

Torque: 8 N-m (0.8 kg-m/69 lbin)

3. Apply special rubber grease to the piston seal and cylinder wall, then insert the piston seal into the cylinder. The special rubber grease is included in the repair kit.

302RS018

4. When inserting the piston into the cylinder, use finger pressure only and do not use a mallet or other impact tool, since damage to the cylinder wall or piston seal can result. Install piston.

302RS019

5. Apply special grease (approximately 1 g) to the piston and attach the dust boot to the piston and caliper. Insert the dust boot ring into the dust boot.

302RS021

8. Install lock bolt and guide bolt and tighten the bolt to the specified torque.

Torque: 74 N·m (7.5 kg·m/54 lbft)

302RS020

6. Install guide bolt and lock bolt dust boot.
7. Install the dust boot on the support bracket after applying special grease (approximately 1 g) onto the dust boot inner surface. Apply special grease onto the lock bolt and guide bolt setting hole of the support bracket.

Removal

NOTE: If a squealing noise occurs from the rear brake while driving, check the pad wear indicator plate. If the indicator plate contacts the rotor, the disc pad assembly should be replaced.

- Draw out two-thirds of the brake fluid from the reservoir.
 - Raise the vehicle and support it with suitable safety stands.
1. Remove wheel and tire assembly, referring to "Wheels and Tires System" in Section 3E.
 2. Remove lock bolt (1)

3. Rotate caliper assembly and support the caliper assembly so that the brake hose is not stretched or damaged.
4. Remove pad assembly with shim.
5. Remove clip.

Installation

1. Install clip (2).

2. Apply special grease (approximately 0.2g) to both contacting surfaces of the inner shims. Wipe off extruded grease after installing. Install pad assembly with shim.

Legend

- (3) Inner Shim
- (4) Wear Indicator

3. Use adjustable pliers to bottom the piston into the caliper bore. Be careful not to damage the piston dust boot and do not damage the flexible hose by twisting or pulling it. Install caliper assembly. Set caliper assembly in place.

4. Install lock bolt (5) and tighten the bolt to the specified torque.
Torque: 43 N·m (4.4 kg·m/32 lbft)
5. Install wheel and tire assembly, referring to "Wheels and Tires System" in Section 3E.
6. Pump the brake pedal several times to make sure that the pedal is firm. Check the brake fluid level in the reservoir after pumping the brakes.

Rear Disc Brake Rotor

Inspection

In the manufacturing of the brake rotor, all the tolerances regarding surface finish, parallelism and lateral runout are held very closely. Maintaining these tolerances provides the surface necessary to assure smooth brake operation.

Lateral Runout

Lateral runout is the movement of the rotor from side to side as it rotates on the spindle. This could also be referred to as "rotor wobble". This movement causes the piston to be knocked back into its bore. This results in additional pedal travel and a vibration during braking.

Checking Lateral Runout

1. Adjust the wheel bearing correctly. Refer to Drive Shaft System section.
2. Attach a dial indicator to some portion of the suspension so that the stem contacts the rotor face about 29 mm (1.14 in) from the rotor edge.
3. Move the rotor one complete rotation. The lateral runout should not exceed 0.13 mm (0.005 in)

Maximum runout: 0.13 mm (0.005 in)

411RS019

Parallelism

Parallelism is the measurement of thickness of the rotor at four or more points around the circumference of the rotor. All measurement must be made at 22 mm (0.87 in) from the edge of the rotor.

The rotor thickness must not vary more than 0.010 mm (0.0004 in) from point to point.

Maximum parallelism: 0.010 mm (0.0004 in)

420RS013

Replacing Brake Rotors

When installing new brake rotors, do not refinish the surfaces. These parts are at the correct level of surface finish.

Refinishing Brake Rotors

Accurate control of the rotor tolerances is necessary for proper performance of the disc brakes. Machining of the rotor should be done only with precision equipment. All brake rotors have a minimum thickness dimension cast into them. This dimension is the minimum wear dimension and not a refinish dimension. The minimum wear dimension is 16.6 mm (0.654 in). The minimum refinish dimension is 16.97 mm (0.668 in).

When refinishing rotors, always use sharp cutting tools or bits. Dull or worn tools leave a poor surface finish which will affect initial braking performance. Vibration dampening attachments should always be used when refinishing braking surfaces. These attachments eliminate tool chatter and will result in better surface finish.

After refinishing, replace any rotor that does not meet the minimum thickness of 16.97 mm (0.668 in). Do not use a brake rotor that will not meet the specification.

Minimum wear dimension: 16.6 mm (0.654 in)

Refinish dimension: 16.97 mm (0.668 in)

420RW002

Rear Drum (In Disc) Inside Diameter Check

Check the rear drum inside diameter by measuring at more than two portions as shown in the illustration. If the inside diameter is greater than the limit, replace the rear rotor.

Standard: 210.0 mm (8.27 in)

Limit: 211.4 mm (8.32 in)

420RS035

| (3) Bleeder with Cap | (8) Dust Boot Ring |
| (4) Caliper Body | (9) Dust Boot: Guide Bolt and Lock Bolt |
| (5) Piston Seal | |

Disassembly

1. Remove guide bolt.
2. Remove lock bolt.
3. Remove dust boot; guide bolt and lock bolt.
4. Remove dust boot ring, using a small screwdriver.

302RS016

5. Insert a block of wood into the caliper and force out the piston by blowing compressed air into the caliper at the flexible hose attachment. This procedure must be done prior to removal of the dust boot. Remove piston.

WARNING: Do not place your fingers in front of the piston in an attempt to catch or protect it when applying compressed air. This could result in personal injury.

CAUTION: Use just enough air to ease the piston out of the bore. If the piston is blown out, it may be damaged.

302RS017

6. Remove dust boot: piston.
7. Remove piston seal.
8. Remove bleeder with cap.
9. Remove caliper body.

Inspection and Repair

Make necessary parts replacement, if wear, damage, corrosion or any other abnormal conditions are found through inspection.

Check the following parts:

- Rotor
- Cylinder body
- Cylinder bore
- Piston
- Guide bolt, lock bolt
- Support bracket

NOTE: The piston dust seal and dust boot are to be replaced each time the caliper is overhauled. Discard these used rubber parts and replace with new ones.

Reassembly

1. Install caliper body.
2. Install bleeder with cap and tighten the cap to the specified torque.

Torque: 8 N-m (0.8 kg-m/69 lbft)

3. Install piston seal and apply special rubber grease to the piston seal and cylinder wall, then insert the piston seal into the cylinder. The special rubber grease is included in the repair kit.

302RS018

4. When inserting the piston into the cylinder, use finger pressure only and do not use a mallet or other impact tool, since damage to the cylinder wall or piston seal can result. Install piston.

302RS019

5. Apply special grease (approximately 1g) to the piston and attach the dust boot to the piston and caliper. Insert the dust boot ring into the dust boot.

302RS021

8. Install lock bolt and guide bolt and tighten the bolt to the specified torque.

Torque: 43 N·m (4.4 kg·m/32 lbft)

302RS020

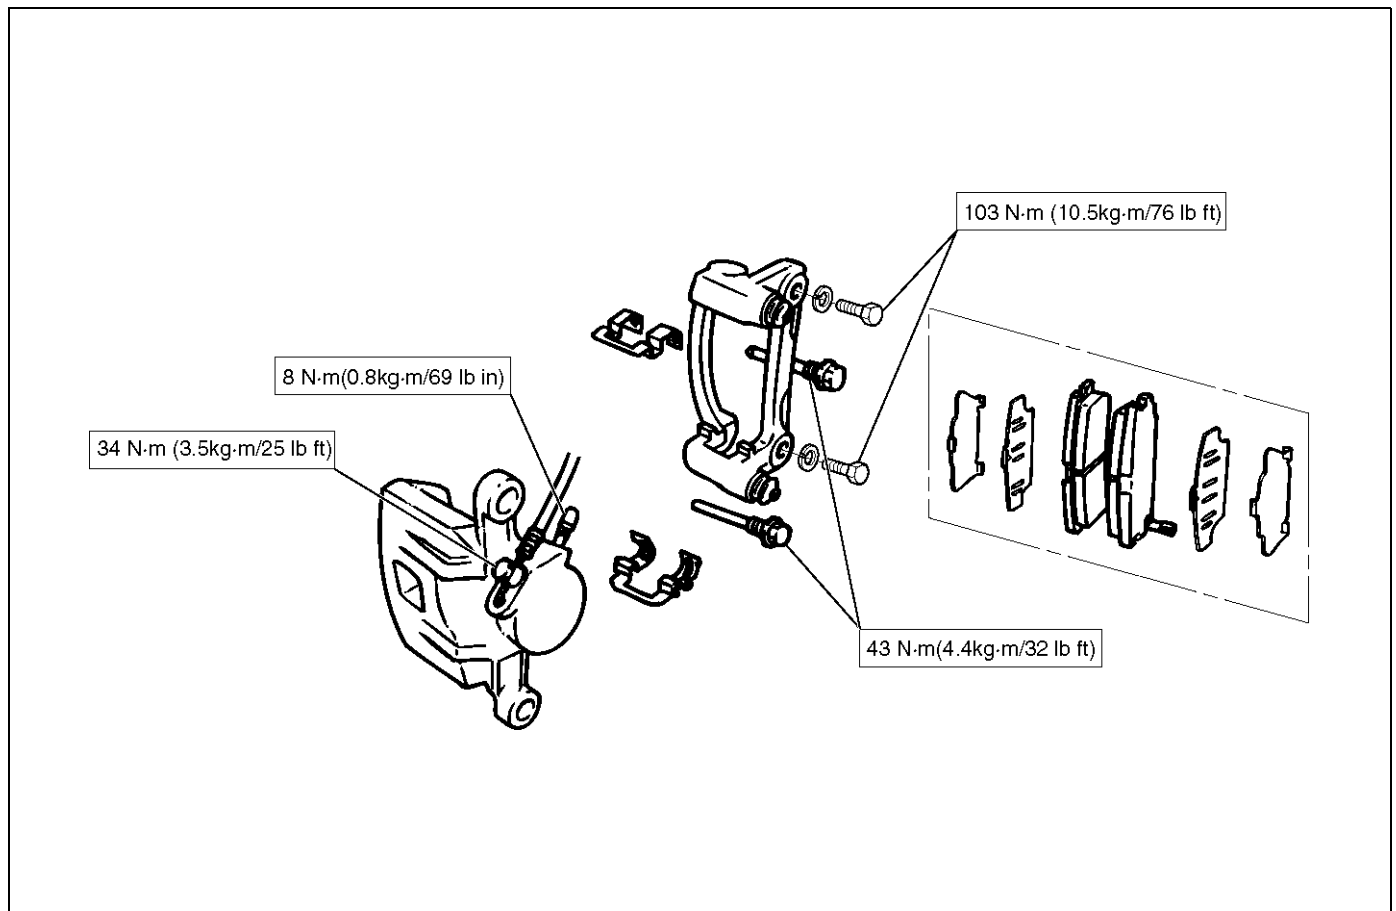

6. Install guide bolt and lock bolt dust boot.
7. Install the dust boot on the support bracket after applying special grease (Approx. 1g) onto the dust boot inner surface. Also apply special grease onto the lock bolt and guide bolt setting hole of the support bracket.

Main Data and Specifications

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fasteners joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fasteners. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

Pulling up the parking brake lever by hand will set the parking brake. By means of a ratchet type lock, the lever can be held in that position until it is released. The position of the lever is transmitted through cable/lever systems to the rear wheels. These parts are designed to obtain sufficient braking force even when parking on slopes. When the parking brake is set, or when the ignition SW is in the "ON" position, the brake warning light illuminates. The rear wheel parking brake is a duo-servo brake (mechanical inside expansion type) built in the rear disc brake. Parking brake adjustment is made through the adjusting hole (bored through back plate). Parking brake lever stroke should be adjusted to 6-8 notches. Refer to "Parking Brake Adjustment" in this section.

5D-2 PARKING BRAKE SYSTEM

Operation

When pulled in the direction "A", the parking lever presses the secondary shoe against the brake drum using the lever/shoe joint "B" as a fulcrum and pushes the strut in the direction "C". The strut, in turn, presses the primary shoe against the brake drum. Counter force "D" to the primary shoe is transmitted again to the secondary shoe

through the fulcrum "B". The secondary shoe contacts the drum thereby producing braking effect. Clearance which may result from worn parking brake shoe lining can be adjusted by turning the adjusting screw. Refer to "Parking Brake Adjustment" in this Section.

| (2) Switch Connector | (6) Equalizer |
| (3) Bolt | (7) Parking Brake Rear Cable |
| (4) Adjust Nut and Lock Nut | (8) Parking Brake Lever |

Removal

1. Remove rear console (1).
 - Refer to Body and Accessories section.
2. Disconnect switch connector (2).
3. Remove bolt (3).
4. Remove adjust nut and lock nut (4).
5. Pull out equalizer (6) from trunnion pin (5).
6. Disconnect trunnion pin (5) from Parking brake lever (8).
7. Disconnect parking brake rear cable (7).

Installation

1. Apply grease (BESCO L-2 or equivalent) to the connecting portion of the rear cable (7) and equalizer (6).
2. Connect parking brake rear cable (7) to equalizer
3. Install trunnion pin (5) to parking brake lever (8).
4. Insert equalizer (6) into trunnion pin (5) and tighten adjust nut and lock nut (4).
 - To adjust the parking brake lever, see "Parking Brake Adjustment" in this section.
- Lock Nut Torque: 13 N·m (1.3 kg·m/113 lb in)**
5. Tighten the parking brake lever fixing bolt (3) to the specified torque.
 - Torque: 15 N·m (1.5 kg·m/11 lb ft)**
6. Connect switch connector (2).
7. Install rear console (1).
 - Refer to Body and Accessories section.

Parking Brake Rear Cable

Parking Brake Rear Cable and Associated Parts

| (5) Upper Return Spring | (12) Nut |
| (6) Lower Return Spring | (13) Nut |
| (7) Shoe Assembly | (14) Retainer |
| | (15) Rear Cable |

Removal

1. Remove rear wheels (1).
2. Remove 2 bolts to remove the caliper assembly (2) from the support bracket. Refer to "Rear Disc Brakes" in Power Assisted Brake System section. Temporarily hang the caliper with wire etc.
3. Remove rotor (drum) (3).
4. Remove holding spring (4), upper return spring (5) and lower return spring (6).
5. Previously remove the rear cable from the parking brake lever, then remove the brake shoe assembly (7).

308RW004

Legend

- (1) Parking Brake Lever

6. Remove cable fixing bolt (8) and bolt (9) (10) (11).
7. Remove nut (12).
8. Remove nut (13) and retainer (14).
9. Remove rear cable (15).

Installation

1. Apply grease (BESCO L-2 or equivalent) to the connecting portion of the rear cable and equalizer. Install rear cable (15).
2. Install retainer (14).
 - Tighten nut (13) to the specified torque.

Torque: 41N·m (4.2 kg·m/30lb ft)
3. Tighten nut (12) to the specified torque.

Torque: 15N·m (1.5 kg·m/11lb ft)
4. Tighten bolt (11) (10) (9) to the specified torque.

Torque: 6.5N·m (0.66 kg·m/57lb in)

 - To adjust the parking brake, refer to "Parking Brake Adjustment" in this section.
5. Tighten the cable fixing bolt (8) to the specified

Torque: 6.5N·m (0.66 kg·m/57lb in)

6. Install shoe assembly (7).

After installation of the shoe and cable assembly, apply special grease (included in the repair kit) to the following portions indicated in the figure.

308RS005

7. Install lower return spring (6) and upper return spring (5).

The parking brake lever side (secondary side) return spring must be installed on the outer side of the primary side return spring.

308RS003

Legend

- (1) Outer Side
(2) Parking Lever

8. Install holding spring (4).
9. Install rotor (drum) (3).
10. Install caliper assembly (2).
11. Install rear wheels (1).

5D-6 PARKING BRAKE SYSTEM

Inspection and Repair

Parking Brake Lining Inspection

Check the shoe assemblies for wear by removing the brake drum.

Replace the shoe assemblies if the lining thickness is less than 1.0 mm (0.039 in).

Minimum limit: 1.0 mm (0.039 in)

308RS004

Parking Brake Rotor (Drum) Inspection

Refer to "Rear Disc Brakes" in Power-Assisted Brake System section for inspection procedure of the rotor (drum).

Parking Brake Adjustment

1. Prior to lever stroke adjustment, adjust rear brake shoe/rotor (drum) gap. Perform this procedure with loosening the adjust nut of the hand brake lever.
2. Remove the adjusting hole plug (rubber) and turn the shoe adjusting screw downward with a small screwdriver so that shoes will expand until they get into close touch with the rotor. (Turn down the adjusting screw notch by notch until the rotor does not turn.)
3. Turn the adjusting screw in the opposite direction (upward) until the rotor can be turned lightly. Standard number of notches to turn upward: 7 or 8
Turn the rotor and make sure that there is no brake dragging.
4. After the rear brake shoe/rotor (drum) gap has been adjusted, perform parking brake cable adjustment.
5. Turn the adjusting nut so that the parking brake lever travels 6–8 notches when pulled up with a force of 30 kg (66 lb).
6. Make sure there is no brake dragging. Then tighten the cable lock nut

Torque : 13 N·m (113 lb in)

7. When poor braking effect possibly resulting from insufficient break-in is felt, or just after replacement of parking brake shoe, be sure to conduct break-in as follows:

8. Forward 50 km/h (30 mph) × 400 m (About 30 seconds) with a lever pull force of 15 kg (33 lb).
9. Backward 10 km/h (6 mph) × 50 m (About 18 seconds) with a lever pull force of 15 kg (33 lb).

NOTE: Break-in procedures must be performed under safe conditions and traffic rules.

- If braking effect still remains poor after the above break-in, wait for some time until parking brake shoe cools down and repeat the procedures 8. and 9. noted above.
- On completion of break-in, inspect parking brake lever stroke, and if the lever does not come within the specified number of notches when pulled up, readjust.
- Excessive break-in may cause premature wear of the parking brake lining.

Main Data and Specifications

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

Engine Cleanliness And Care

An automobile engine is a combination of many machined, honed, polished and lapped surfaces with tolerances that are measured in the thousandths of a millimeter (ten thousandths of an inch). Accordingly, when any internal engine parts are serviced, care and cleanliness are important. Throughout this section, it should be understood that proper cleaning and protection of machined surfaces and friction areas is part of the repair procedure. This is considered standard shop practice even if not specifically stated.

- A liberal coating of engine oil should be applied to all friction areas during assembly to protect and lubricate the surfaces on initial operation.
- Whenever valve train components, pistons, piston rings, connecting rods, rod bearings, and crankshaft journal bearings are removed for service, they should be retained in order.
- At the time of installation, they should be installed in the same locations and with the same mating surfaces as when removed.
- Battery cables should be disconnected before any major work is performed on the engine. Failure to disconnect cables may result in damage to wire

harness or other electrical parts.

- The four cylinders of this engine are identified by numbers; cylinders 1, 2, 3 and 4, as counted from crankshaft pulley.

General Information on Engine Service

The following information on engine service should be noted carefully, as it is important in preventing damage and contributing to reliable engine performance:

- When raising or supporting the engine for any reason, do not use a jack under the oil pan. Due to the small clearance between the oil pan and the oil pump strainer, jacking against the oil pan may cause damage to the oil pick up unit.
- The 12-volt electrical system is capable of damaging circuits. When performing any work where electrical terminals could possibly be grounded, the ground cable of the battery should be disconnected at the battery.
- Any time the intake air duct or air cleaner is removed, the intake opening should be covered. This will protect against accidental entrance of foreign material into the cylinder which could cause extensive damage when the engine is started.

Cylinder Block

The cylinder block is made of cast iron. The crankshaft is supported by five bearings. The bearing cap is made of nodular cast iron.

Cylinder Head

The cylinder head is made of aluminum alloy casting with a spark plug in the center.

Valve Train

Valve system is direct-acting inverted bucket tappet. The valves clearance adjustment are hydraulic. Hydraulic valve lash adjustment, no adjustment necessary.

Intake Manifold

The intake manifold is made of aluminum alloy.

Exhaust Manifold

The exhaust manifold is made of high Si-Mo nodular iron.

Pistons and Connecting Rods

Aluminum pistons are used after selecting the grade that meets the cylinder bore diameter. Each piston has two compression rings and one oil ring. The piston pin is made of case-hardened steel. The connecting rods are made of cast iron. The connecting rod bearings are made of steel backed with babbitt metal.

Crankshaft and Bearings

The crankshaft is made of nodular cast iron. Pins and journals are graded for correct size selection for their bearing.

Balance Shaft

Type is lanchester (twin counter-rotating shafts). The balance shafts are made of cast iron and gears are hard faced. The housing is made of cast iron. Backlash adjustment method is shim-balancer housing to block (selective fit).

Engine Diagnosis

Hard Starting

1. Starting Motor Does Not Turn Over

Trouble Shooting Procedure

Turn on headlights and starter switch.

Condition	Possible cause	Correction
Headlights go out or dim considerably	Battery run down or under charged	Recharge or replace battery
	Terminals poorly connected	Clean battery posts and terminals and connect properly
	Starting motor coil circuit shorted	Overhaul or replace
	Starting motor defective	Overhaul or replace

2. Ignition Trouble — Starting Motor Turns Over But Engine Does Not Start

Spark Test

Disconnect a high tension cable from any spark plug.

Connect the spark plug tester J-26792 (ST-125), crank

the engine, and check if a spark is generated in the spark plug tester. Before cranking the engine, make sure that the spark plug tester is properly grounded. To avoid electrical shock, do not touch the high tension cable while the engine is running.

Condition	Possible cause	Correction
Spark jumps across gap	Spark plug defective	Clean, adjust spark gap or replace
	Ignition timing incorrect	Refer to Ignition System
	Fuel not reaching fuel injector(s) or engine	Refer to item 3 (Trouble in fuel system)
	Valve timing incorrect	Adjust
	Engine lacks compression	Refer to item 4 (Engine lacks compression)
No sparking takes place	Ignition coil disconnected or broken	Connect properly or replace
	Electronic Ignition System with module	Replace
	Poor connections in engine harness	Correct
	Powertrain Control Module cable disconnected or defective	Correct or replace

3. Trouble In Fuel System

Condition	Possible cause	Correction
Starting motor turns over and spark occurs but engine does not start.	Fuel tank empty	Fill
	Water in fuel system	Clean
	Fuel filter clogged	Replace filter
	Fuel pipe clogged	Clean or replace
	Fuel pump defective	Replace
	Fuel pump circuit open	Correct or replace
	Evaporative Emission Control System circuit clogged	Correct or replace
	Multipoint Fuel Injection System faulty	Refer to "Electronic Fuel Injection" section

4. Engine Lacks Compression

Condition	Possible cause	Correction
Engine lacks compression	Spark plug loosely fitted or spark plug gasket defective	Tighten to specified torque or replace gasket
	Valve timing incorrect	Adjust
	Cylinder head gasket defective	Replace gasket
	Valve incorrectly seated	Lap valve
	Valve stem seized	Replace valve and valve guide
	Valve spring weakened	Replace
	Cylinder or piston rings worn	Overhaul engine
	Piston ring seized	Overhaul engine.

Engine Compression Test Procedure

1. Start and run the engine until the engine reaches normal operating temperature.
2. Turn the engine off.
3. Remove all the spark plugs.
4. Remove ignition coil fuse (15A) and disable the ignition system.
5. Remove the fuel pump relay from the relay and fuse box.
6. Engage the starter and check that the cranking speed is approximately 300 rpm.
7. Install cylinder compression gauge into spark plug hole.
8. With the throttle valve opened fully, keep the starter engaged until the compression gage needle reaches the maximum level. Note the reading.
9. Repeat the test with each cylinder.
The pressure difference between the individual cylinders should not exceed 100kPa (14.5psi).

6A-6 ENGINE MECHANICAL (X22SE 2.2L)

Rough Engine Idling or Engine Stalling

Condition	Possible cause	Correction
Trouble in fuel injection system	Idle air control valve defective	Replace
	Throttle shutting off incomplete	Correct or replace
	Throttle position sensor circuit open or shorted	Correct or replace
	Fuel injector circuits open or shorted	Correct or replace
	Fuel injectors damaged	Replace
	Fuel pump relay defective	Replace
	Manifold Absolute Pressure Sensor cable disconnected or broken	Correct or replace
	Manifold Absolute Pressure Sensor defective	Replace
	Engine Coolant Temperature Sensor cable disconnected or broken	Correct or replace
	Engine Coolant Temperature Sensor defective	Replace
	Intake Air Temperature sensor cable disconnected or broken	Correct or replace
	Intake Air Temperature sensor defective	Replace
	Knock Sensor (KS) circuits open or shorted	Correct or replace
	KS defective	Replace
	KS Module circuits open or ground	Correct or replace
	KS Module defective	Replace
	Vehicle Speed Sensor circuit open or shorted	Correct or replace
	Vehicle Speed Sensor defective	Replace
Trouble in emission control system	Powertrain Control Module defective	Replace
	Exhaust Gas Recirculation Valve faulty	Replace
	Canister purge solenoid circuit open	Correct
	Canister purge solenoid defective	Replace
	Evaporative Emission Canister Purge control valve defective	Replace
	Trouble in ignition system	Refer to Hard Start Troubleshooting Guide
Others	Engine lacks compression	Refer to Hard Start Troubleshooting Guide
	Valve incorrectly seated	Lap valve
	Air Cleaner Filter clogged	Replace filter element
	Valve timing incorrect	Readjust
	Idle air control valve broken	Replace

Rough Engine Running

Condition	Possible cause	Correction
Engine misfires regularly	Ignition coil layer shorted	Replace
	Spark plugs fouling	Clean or install hotter type plug
	Spark plug(s) insulator nose leaking	Replace
	Fuel injector(s) defective	Replace
	Engine control module faulty	Replace
Engine knocks regularly	Spark plugs running too hot	Install colder type spark plugs
	Powertrain control module faulty	Replace
Engine lacks power	Spark plugs fouled	Clean
	Fuel injectors defective	Replace
	Manifold Absolute Pressure (MAP) Sensor or Manifold Absolute Pressure Sensor circuit defective	Correct or replace
	Engine Coolant Temperature Sensor or Engine Coolant Temperature Sensor circuit defective	Correct or replace
	Engine Control Module faulty	Replace
	Intake Air Temperature Sensor or Intake Air Temperature Sensor circuit defective	Correct or replace
	Throttle Position Sensor or Throttle Position Sensor circuit defective	Correct or replace
	Knock Sensor or Knock Sensor circuits defective	Correct or replace
	Knock Sensor Module or Knock Sensor Module circuits defective	Correct or replace

6A-8 ENGINE MECHANICAL (X22SE 2.2L)
Hesitation

Condition	Possible cause	Correction
Hesitation on acceleration	Throttle Position Sensor adjustment incorrect	Replace throttle valve assembly
	Throttle Position Sensor circuit open or shorted	Correct or replace
	Excessive play in accelerator linkage	Adjust or replace
	Manifold Absolute Pressure (MAP) Sensor circuit open or shorted	Correct or replace
	MAP Sensor defective	Replace
	Intake Air Temperature (IAT) Sensor circuit open or shorted	Correct or replace
	Knock Sensor (KS) Circuit open or shorted	Correct or replace
	KS defective	Replace
	KS Module circuits open or shorted	Correct or replace
	KS Module defective	Replace
	IAT Sensor defective	Replace
Hesitation at high speeds (Fuel pressure too low)	Fuel tank strainer clogged	Clean or replace
	Fuel pipe clogged	Clean or replace
	Fuel filter clogged	Replace
	Defective fuel pump system	Check and replace
	Fuel Pressure Control Valve leaking	Replace
Hesitation at high speeds (Fuel injector not working normally)	Power supply or ground circuit for Multiport Fuel Injection System shorted or open	Check and correct or replace
	Cable of Multiport Fuel Injection System disconnected or defective	Correct or replace
Hesitation at high speeds	Engine Control Module defective	Replace
	Throttle Position Sensor circuit open or shorted	Correct or replace
	Throttle Position Sensor defective	Replace
	Engine Coolant Temperature Sensor circuit open or shorted	Correct or replace
	Engine Coolant Temperature Sensor defective	Replace
	MAP Sensor cable open or shorted	Correct or replace
	MAP Sensor defective	Replace
	IAT Sensor circuit open or shorted	Correct or replace
	IAT Sensor defective	Replace
	KS Circuit open or shorted	Correct or replace
	KS defective	Replace
	KS Module circuit open or shorted	Correct or replace
	KS Module defective	Replace
	Throttle valve not wide opened	Check and correct or replace
	Air Cleaner Filter clogged	Replace filter element
Power supply voltage too low	Check and correct or replace	

Engine Lacks Power

Condition	Possible cause	Correction
Trouble in fuel system	Fuel Pressure Control Valve not working normally	Replace
	Fuel injector clogged	Clean or replace
	Fuel pipe clogged	Clean
	Fuel filter clogged or fouled	Replace
	Fuel pump drive circuit not working normally	Correct or replace
	Fuel tank not sufficiently breathing due to clogged Evaporative Emission Control System circuit	Clean or replace
	Water in fuel system	Clean
	Inferior quality fuel in fuel system	Use fuel of specified octane rating
	Engine Control Module supplied poor voltage	Correct circuit
	Throttle Position Sensor cable disconnected or broken	Correct or replace
	Throttle Position Sensor defective	Replace
	Manifold Absolute Pressure Sensor not working normally	Replace
	Intake Air Temperature Sensor not working normally	Replace
	Engine Coolant Temperature Sensor circuit open or shorted	Correct or replace
	Engine Coolant Temperature Sensor defective	Replace
Engine Control Module defective	Replace	
Trouble in intake or exhaust system	Air Cleaner Filter clogged	Replace filter element
	Air duct kinked or flattened	Correct or replace
Ignition failure	—————	Refer to Hard Start Troubleshooting Guide
	Heat range of spark plug inadequate	Install spark plugs of adequate heat range
	Electronic Ignition System with module	Replace

6A-10 ENGINE MECHANICAL (X22SE 2.2L)

Condition	Possible cause	Correction
Engine overheating	Level of Engine Coolant too low	Replenish
	Thermo switch or fan motor defective	Replace
	Thermostat defective	Replace
	Engine Coolant pump defective	Correct or replace
	Radiator clogged	Clean or replace
	Radiator filler cap defective	Replace
	Level of oil in engine crankcase too low or wrong oil in engine	Change or replenish
	Resistance in exhaust system increased	Clean exhaust system or replace defective parts
	Throttle Position Sensor adjustment incorrect	Adjust Wide Open Throttle switch setting
	Throttle Position Sensor circuit open or shorted	Correct or replace
Cylinder head gasket damaged	Replace	
Engine overcooling	Thermostat defective	Replace (Use a thermostat set to open at 92°C (197.6°F))
Engine lacks compression	—————	Refer to Hard Start
Others	Tire inflation pressure abnormal	Adjust to recommend pressures
	Brake drag	Adjust
	Clutch slipping	Adjust or replace
	Level of oil in engine crankcase too high	Correct level of engine oil
	Exhaust Gas Recirculation Valve defective	Replace

Engine Noisy

Abnormal engine noise often consists of various noises originating in rotating parts, sliding parts and other

moving parts of the engine. It is, therefore, advisable to locate the source of noise systematically.

Condition	Possible cause	Correction
Noise from crank journals or from crank bearings (Faulty crank journals and crank bearings usually make dull noise that becomes more evident when accelerating)	Oil clearance increased due to worn crank journals or crank bearings	Replace crank bearings and crankshaft or regrind crankshaft and install the over size bearing
	Crankshaft out of round	Replace crank bearings and crankshaft or regrind crankshaft and install the over size bearing
	Crank bearing seized	Crank bearing seized Replace crank bearings and crankshaft or regrind crankshaft and install the over size bearing

Troubleshooting Procedure

Short out each spark plug in sequence using insulated spark plug wire removers. Locate cylinder with defective bearing by listening for abnormal noise that stops when spark plug is shorted out.

Condition	Possible cause	Correction
Noise from connecting rods or from connecting rod bearings (Faulty connecting rods or connecting rod bearings usually make an abnormal noise slightly higher than the crank bearing noise, which becomes more evident when engine is accelerated)	Bearing or crankshaft pin worn	Replace connecting rod bearings and crankshaft or regrind crankshaft and install the under size bearing
	Crankpin out of round	Replace connecting rod bearings and crankshaft or regrind crankshaft and install the under size bearing
	Connecting rod bent	Correct or replace
	Connecting rod bearing seized	Replace connecting rod bearings and crankshaft or regrind crankshaft and install the under size bearing

Troubleshooting Procedure

Abnormal noise stops when the spark plug on the cylinder with defective part is shorted out.

Condition	Possible cause	Correction
Piston and cylinder (Faulty piston or cylinder usually makes a combined mechanical thumping noise which increases when engine is suddenly accelerated but diminishes gradually as the engine warms up)	Piston clearance increased due to cylinder wear	Replace piston and cylinder body
	Piston seized	Replace piston and cylinder body
	Piston ring broken	Replace piston and cylinder body
	Piston defective	Replace pistons and others

Troubleshooting Procedure

Short out each spark plug and listen for change in engine noise.

Condition	Possible cause	Correction
Piston pin noise (Piston makes noise each time it goes up and down)	Piston pin or piston pin hole worn	Replace piston, piston pin and connecting rod assy

6A-12 ENGINE MECHANICAL (X22SE 2.2L)**Troubleshooting Procedure**

The slapping sound stops when spark plug on bad cylinder is shorted out.

Condition	Possible cause	Correction
Timing belt noise	Timing belt tension is incorrect	Replace pusher or adjust the tension pulley or replace timing belt
	Tensioner bearing defective	Replace
	Timing belt defective	Replace
	Timing wheels defective	Replace
	Timing belt comes in contact with timing cover	Replace timing belt and timing cover
Valve noise	Valve and valve guide seized	Replace valve and valve guide
	Valve spring broken	Replace
	Valve seat off-positioned	Correct
Crankshaft noise	Crankshaft end play excessive (noise occurs when clutch is engaged)	Replace thrust bearing
Engine knocking	Preignition due to use of spark plugs of inadequate heat range	Install Spark Plugs of adequate heat range
	Fuel too low in octane rating	Replace fuel
	Wide Open Throttle enrichment system failure	Refer to Section 6E
	Selection of transmission gear incorrect	Caution operator of incorrect gear selection
	Engine overheating	Refer to "Engine Lacks Power"
Others	Water pump defective	Replace
	Drive belt slipping	Adjust tension of drive belt or replace drive belt

Abnormal Combustion

Condition	Possible cause	Correction
Trouble in fuel injection system	Fuel pressure control valve defective	Replace
	Fuel filter clogged	Replace
	Fuel pump clogged	Clean or replace
	Fuel tank or fuel pipe clogged	Clean or replace
	Fuel injector clogged	Clean or replace
	Fuel pump relay defective	Replace
	Power supply cable for fuel pump loosely connected or defective	Reconnect, correct or replace
	Manifold Absolute Pressure Sensor circuit open or shorted	Correct or replace
	Manifold Absolute Pressure Sensor defective	Replace
	Engine Coolant Temperature (ECT) Sensor circuit open or shorted	Correct or replace
	ECT Sensor defective	Replace
	Throttle Position Sensor adjustment incorrect	Reconnect
	Throttle Position Sensor defective	Replace
	Throttle Position Sensor connector loosely connected	Reconnect
	Vehicle Speed Sensor cable loosely connected or defective	Correct or replace
	Vehicle Speed Sensor loosely fixed	Fix tightly
	Vehicle Speed Sensor in wrong contact or defective	Replace
Engine Control Module cable loosely connected or defective	Correct or replace	
Trouble in emission control system	Heated Oxygen Sensor circuit open	Correct or replace
	Heated Oxygen Sensor defective	Replace
	Signal vacuum hose loosely fitted or defective	Correct or replace
	Exhaust Gas Recirculation Valve defective	Replace
	ECT Sensor circuit open or shorted	Correct or replace
	ECT Sensor defective	Replace
	Evaporator system	Refer to Section 6E
Trouble in ignition system	—————	Refer to "Engine Lacks Power"
Trouble in cylinder head parts	Carbon deposits in combustion chamber	Remove carbon
	Carbon deposit on valve, valve seat and valve guide	Remove carbon

6A-14 ENGINE MECHANICAL (X22SE 2.2L)

Engine Oil Consumption Excessive

Condition	Possible cause	Correction
Oil leaking	Oil pan drain plug loose	Retighten or replace gasket
	Oil pan setting bolts loosened	Retighten
	Oil pan gasket broken	Replace gasket
	Front cover retaining bolts loose or gasket broken	Retighten or replace gasket
	Head cover retaining bolts loose or gasket broken	Retighten or replace gasket
	Oil filter adapter cracked	Replace
	Oil filter attachings bolt loose or rubber gasket broken	Retighten or replace oil filter
	Crankshaft front or rear oil seal defective	Replace oil seal
	Oil pressure unit loose or broken	Retighten or replace
	Blow-by gas hose broken	Replace hose
Engine/Transmission coupling area	Replace oil seal	
Oil leaking into combustion chambers due to poor seal in valve system	Valve stem oil seal defective	Replace
	Valve stem or valve guide worn	Replace valve and valve guide
Oil leaking into combustion chambers due to poor seal in cylinder parts	Cylinders and pistons worn excessively	Rebore cylinder and replace pistons and others
	Piston ring gaps incorrectly positioned	Correct
	Piston rings set with wrong side up	Correct
	Piston ring sticking	Rebore cylinder and replace pistons and others
	Piston ring and ring groove worn	Replace pistons and others
	Return ports in oil rings clogged	Clean piston and replace rings
Crank case ventilation, Positive Crankcase Ventilation System malfunctioning	Positive Crankcase Ventilation Hose clogged	Clean
Others	Improper oil viscosity	Use oil of recommended S.A.E. viscosity
	Continuous high speed driving and/or severe usage such as trailer towing	Continuous high speed operation and/or severe usage will normally cause increased oil consumption

Fuel Consumption Excessive

Condition	Possible cause	Correction
Trouble in fuel system	Mixture too rich or too lean due to trouble in fuel injection system	Refer to "Abnormal Combustion"
	Fuel cut function does not act	Refer to "Abnormal Combustion"
Trouble in ignition system	Misfiring or abnormal combustion due to trouble in ignition system	Refer to Hard Start or Abnormal Combustion Troubleshooting Guide
Others	Engine idle speed too high	Reset Idle Air Control Valve
	Returning of accelerator control sluggish	Correct
	Fuel system leakage	Correct or replace
	Clutch slipping	Correct
	Brake drag	Correct
	Selection of transmission gear incorrect	Caution operator of incorrect gear selection
	Excessive Exhaust Gas Recirculation flow due to trouble in Exhaust Gas Recirculation system	Refer to Abnormal Combustion

Oil Problems

Condition	Possible cause	Correction
Oil pressure too low	Wrong oil in use	Replace with correct engine oil
	Relief valve sticking	Replace
	Oil pump not operating properly	Correct or replace
	Oil pump strainer clogged	Clean or replace strainer
	Oil pump worn	Replace
	Oil pressure gauge defective	Correct or replace
	Crankshaft bearing or connecting rod bearing worn	Replace
Oil contamination	Wrong oil in use	Replace with new engine oil
	Oil filter clogged	Replace oil filter
	Cylinder head gasket damage	Replace gasket
	Burned gases leaking	Replace piston and piston rings or rebore cylinders
Oil not reaching valve system	Oil passage in cylinder head or cylinder body clogged	Clean or correct

Engine Oil Pressure Check

1. Check for dirt, gasoline or water in the engine oil.
 - a Check the viscosity of the oil.
 - b Change the oil if the viscosity is outside the specified standard.
 - c Refer to the "Maintenance and Lubrication" section of this manual.
2. Check the engine oil level.
The level should fall somewhere between the "ADD" and the "FULL" marks on the oil level dipstick. If the oil level does not reach the "ADD" mark on the oil level dipstick, engine oil must be added.

3. Remove the oil pressure unit.
4. Install an oil pressure gauge.
5. Start the engine and allow the engine to reach normal operating temperature (About 80°C).
6. Measure the oil pressure.
**Oil pressure should be:
150 kPa (21.8 psi) at idle speed.**
7. Stop the engine.
8. Remove the oil pressure gauge.
9. Install the oil pressure unit.
10. Start the engine and check for leaks.

Malfunction Indicator Lamp

The instrument panel "CHECK ENGINE" Malfunction Indicator Lamp (MIL) illuminates by self diagnostic system when the system checks the starting of engine, or senses malfunctions.

Condition	Possible cause	Correction
"CHECK ENGINE" MIL does not illuminate at the starting of engine	Bulb defective	Replace
	MIL circuit open	Correct or replace
	Command signal circuit to operate self diagnostic system shorted	Correct or replace
	Powertrain Control Module (PCM) cable loosely connected, disconnected or defective	Correct or replace
	PCM defective	Replace
"CHECK ENGINE" MIL illuminates, and stays on	Deterioration heated oxygen sensor of internal element	Replace
	Heated oxygen sensor connector terminal improper contact	Reconnect properly
	Heated oxygen sensor lead wire shorted	Correct
	Heated oxygen sensor circuit open	Correct or replace
	Deterioration engine coolant temperature sensor of internal element	Replace
	Engine coolant temperature sensor connector terminal improper contact	Reconnect properly
	Engine coolant temperature sensor lead wire shorted	Correct
	Engine coolant temperature sensor circuit open	Correct or replace
	Throttle position sensor open or shorted circuits	Correct or replace
	Deterioration of crankshaft position sensor	Replace
	Crankshaft position sensor circuit open or shorted	Correct or replace
	Vehicle speed sensor circuit open	Correct or replace
	Manifold absolute pressure sensor circuit open or shorted	Correct or replace
	Intake air temperature sensor circuit open or shorted	Correct or replace
	Fuel injector circuit open or shorted	Correct or replace
	PCM driver transistor defective	Replace PCM
	Malfunctioning of PCM RAM (Random Access Memory) or ROM (Read Only Memory)	Replace PCM

Cylinder Head Cover

Removal

1. Disconnect battery ground cable.
2. Disconnect PCV hose from cylinder head cover.
3. Remove intake duct.
4. Remove left side ground cable from cylinder head cover and disconnect ground cable connector on the left side wheel arch. Remove right side ground cable from generator stay and disconnect ground cable connector on the right side wheel arch.
5. Disconnect three (black, green and blue colors) engine wire harness connectors from chassis harness of left rear side of compartment.
6. Disconnect cooling fan wire harness connector from cooling fan on left side top of fan shroud.
7. Move drive belt tensioner to loose side using wrench then remove drive belt.

033RW001

8. Remove PCV hose from cylinder block.
9. Remove intake duct stay from cylinder head.
10. Remove two bolts for remove ignition cable cover from cylinder head cover.
11. Disconnect ignition cable from ignition plug.
12. Disconnect camshaft position sensor harness and crankshaft angle sensor harness from behind generator.

13. Remove four bolts and remove the crankshaft pulley

020RW014

14. Remove timing belt front cover.
15. Loose fixing bolt of timing belt rear cover then remove the camshaft angle sensor.

020RW012

16. Remove ten cylinder head cover fixing bolts and remove the cylinder head cover.

Installation

1. Install the camshaft position sensor and tighten timing rear cover bolt.

Torque: 8 N-m (0.8Kg-m/5.9 lbft)

2. Install the cylinder head cover and tighten bolts to the specified torque.

Torque: 8 N-m (0.8Kg-m/5.9lbft)

3. Install the timing belt front cover then tighten fixing bolts to the specified torque.

Torque: 6 N-m (0.6Kg-m/4.4lbft)

4. Install the crankshaft pulley, tighten fixing bolts to the specified torque.

Torque: 20 N-m (1.4Kg-m/14lbft)

5. Move drive belt tensioner to loose side using wrench then install the drive belt to normal position.

6. Connect ignition cable to ignition plug.

7. Install ignition cable cover to cylinder head cover and tighten two bolt to the specified torque.

Torque: 3 N-m (0.3Kg-m/2lbft)

8. Install intake duct bracket to cylinder block.

9. Install PCV hose flange to cylinder block to the specified torque.

Torque: 25 N-m (2.5Kg-m/18lbft)

10. Connect cooling fan wire harness connector to cooling fan on left side top of fan shroud.

11. Connect left side ground cable to cylinder head cover and connect other side connector to left side wheel arch terminal.

Connect right side ground cable to generator stay and connect other side connector to right side wheel arch terminal.

12. Connect three (black, green and blue colors) engine wire harness connector to chassis harness of left rear side of engine compartment.

13. Install intake duct.

14. Connect PCV hose to cylinder head cover.

15. Connect battery ground cable.

Exhaust Manifold

Removal

1. Disconnect battery ground cable.
2. Disconnect PCV hose from air intake duct.
3. Remove a nut from air intake duct bracket and loosen hose clamp on throttle body. Remove air intake duct assembly with air cleaner cover.
4. Remove air intake duct bracket with ground cable.
5. Remove four fixing bolts on exhaust manifold heat protector.
6. Remove fixing four nuts from flange of front exhaust pipe and remove fixing bolts from silencer side.

7. Remove ten exhaust manifold fixing nuts then remove exhaust manifold.

2. Install front exhaust pipe to exhaust manifold and tighten fixing nut to the specified torque.

Torque: 25 N·m (2.6Kg·m/18 lbft)

3. Tighten silencer side bolt to the specified torque.

Torque: 68 N·m (6.9Kg·m/50 lbft)

4. Install exhaust manifold heat protector and tighten bolt.

Torque: 8 N·m (0.8Kg·m/5.9 lbft)

5. Install intake duct bracket with ground cable.

6. Install intake duct assembly to throttle body and air

Installation

1. Install exhaust manifold and tighten fixing nuts to be tightened in three steps.

- **Tightening sequence:**

Step1: J G H B D C J G B D

Step2: A B C D E F G H J K

Step3: A B C D E F G H J K

- **Tightening torque:**

Step1: 14 N·m (10 lbft)

Step2: 20 N·m (14 lbft)

Step3: 20 N·m (14 lbft)

cleaner then tighten nut to the intake duct bracket and clamp on the throttle body side, also clamp air cleaner cover.

7. Connect PCV hose to air intake duct.
8. Connect battery ground cable.

Crankshaft Pulley

Removal

1. Disconnect battery ground cable.
2. Move drive belt tensioner to loose side by using wrench then remove drive belt.

033RW001

3. Remove four crankshaft pulley fixing bolts, remove crankshaft pulley.

020RW014

Installation

1. Install the crankshaft pulley to crankshaft flange.
2. Tighten four bolt to the specified torque.

Torque: 20 N·m (2.0Kg·m/14lbf)

020RW014

3. Move drive belt tensioner to loose side by using wrench, then install drive belt to normal position.

033RW001

4. Connect battery ground cable.

Intake Manifold

Removal

1. Disconnect battery ground cable.
2. Remove PCV hose from air intake duct.
3. Remove a nut from air intake duct bracket and loosen hose clamp on throttle body. Remove air intake duct assembly with air cleaner cover.
4. Drain engine coolant.
5. Remove water hoses from throttle body.
6. Disconnect the connector for throttle position sensor, idle air control valve sensor from throttle body.
7. Remove fuel pipe joint eye bolts from fuel rail and disconnect wire harness from fuel injector.

8. Disconnect hose from fuel pressure regulator then remove fuel rail assembly.
9. Remove throttle valve control cable from throttle body.
10. Remove fixing bolts for generator bracket.

11. Remove water pipe fixing bolt then remove water pipe.
12. Remove fixing bolt from bracket (Between cylinder block and intake manifold) of intake manifold side.

6A-22 ENGINE MECHANICAL (X22SE 2.2L)

13. Remove ignition coil bracket fixing bolt.
14. Remove bolt and seven nuts, and remove intake manifold.

4. Install water pipe to intake manifold.
5. Install generator bracket and tighten generator bracket bolts.

Torque

Long bolts: 35 N·m (3.6Kg·m/25lbft)

Short bolts: 20 N·m (2.0Kg·m/14lbft)

Installation

1. Install intake manifold with gasket to cylinder head, tighten bolt and nuts to the specified torque.

Torque: 22 N·m (2.2Kg·m/16lbft)

2. Install ignition coil bracket fixing bolt.
3. Install intake manifold bracket, tighten bolt.

Torque: 22 N·m (2.2Kg·m/16lbft)

6. Install fuel rail assembly to intake manifold and connect hose between fuel pressure regulator and throttle body.
7. Install fuel pipe and tighten joint eye bolt and connect fuel injector harness.

Torque: 25 N·m (2.5Kg·m/18lbft)

8. Connect the connector for throttle position sensor and idle air control valve sensor to throttle body.
9. Install water hoses to throttle body.
10. Install intake duct assembly to throttle body and air cleaner then tighten nut to the intake duct bracket and clamp on the throttle body side and air cleaner side.

Torque: 7 N·m (0.7Kg·m/5.1lbft)

11. Install PCV hose to air intake duct.
12. Install throttle valve control cable to throttle body.
13. Confirm the free play of throttle valve control cable.

Free play: 5.7 to 6.3 mm

14. Fill engine coolant to full level from radiator filler neck.
15. Connect battery ground cable.

Cylinder Head Assembly

Removal

1. Disconnect battery ground cable.
2. Disconnect connector of intake air temperature sensor from intake air duct.
3. Remove PCV hose from air intake duct.
4. Remove nut from air intake duct bracket and loosen hose clamp on throttle body. Remove air intake duct assembly with air cleaner cover.
5. Remove intake air duct bracket from cylinder head.
6. Drain engine coolant.
7. Move drive belt tensioner to loose side using wrench then remove drive belt.

033RW001

8. Remove radiator upper hose from engine side.
9. Remove four nuts of exhaust front pipe.

10. Remove three bolts from generator bracket then remove the generator with brackets.

065RW025

11. Disconnect crankshaft angle sensor connector.
12. Disconnect knock sensor connector.
13. Remove heater hose from adapter side.
14. Remove heater hose from water pipe side.
15. Remove water hose between water pipe and throttle body.
16. Remove fuel pipe joint eye bolts from fuel rail assembly and remove fuel pipe bracket with electric ground cable.

042RW001

17. Disconnect connector for evaporation valve.
18. Remove canister hose.
19. Remove fixing nut of intake manifold stay from cylinder block side.

025RW002

20. Remove two bolts from intake manifold for water pipe support and remove cylinder head assembly.
21. Remove engine harness cover and disconnect three connectors from chassis harness on left rear side engine compartment.
22. Disconnect connector for power steering pump pressure switch.
23. Remove four bolts and remove crankshaft pulley.

020RW014

24. Remove two bolts and nut then remove timing belt front cover.
25. Remove ventilation hose from cylinder block side and from cylinder head side.
26. Remove two bolts, ignition cable cover and remove ignition cables from spark plug.

27. Disconnect camshaft angle sensor connector.
28. Remove ten bolts and remove cylinder head cover.
29. Remove fixing bolt of timing belt tensioner then remove timing belt tensioner.

020RW010

30. Remove timing belt.

CAUTION:

- Do not bend or twist belt, otherwise its core could be damaged. The belt should not be bent at a radius less than 30 mm.
- Timing belt drive gear counterhold with 5-8840-2598-0.
- Do not allow oil or other chemical substances to come in contact with the belt. They will shorten the life.
- Do not attempt to pry or stretch the belt with a screw driver or any other tool during installation.
- Store timing belt in cool and dark place. Never expose the belt direct sunlight or heat.

31. Remove two idle pulleys, the left side with idle pulley bracket.
32. Remove two bolts and stud bolt and remove timing belt rear cover.
33. Remove camshaft angle sensor

34. Disconnect engine oil pressure switch connector.

050RW005

35. Remove camshaft assembly exhaust side.

36. Use 5-8840-2600-0 to remove ten cylinder head fixing bolts

012RW007

Installation

1. Put cylinder head gasket on the cylinder block.

012RW011

2. Install the cylinder head assembly, tighten cylinder head bolts by four steps tightening method in the following sequence to the specified torque.(use 5-8840-2600-0)

Torque: 25 N·m (2.5Kg·m/18lbft) + 90° + 90° + 90°

012RW006

3. Install camshaft assembly exhaust side and tighten camshaft bracket bolts in the sequence to the specified torque.

Torque: 8 N-m (0.8Kg-m/5.9lbft)

015RW014

4. Connect engine oil pressure switch connector.
5. Install camshaft angle sensor.
6. Install the timing belt rear cover and tighten three bolts to the specified torque.

Torque

M6 bolt: 6 N-m (0.6Kg-m/4.4lbft)

M8 bolt: 8 N-m (0.8Kg-m/5.8lbft)

020RW012

7. Install left side idle pulley with idle pulley bracket, tighten to the specified torque and install right side idle pulley and tighten to the specified torque.

Torque: 25 N-m (2.5Kg-m/18lbft)

020RW016

8. Install timing belt tensioner then tighten it temporarily until make alignment timing belt.
9. Install the cylinder head cover and tighten fixing bolt temporarily.
10. Install the timing belt and perform timing belt setting procedure as follows.

1. Bring the engine top dead center No.1 cylinder compression stroke by rotating the engine in the direction of normal operation.

The engine is in this position when the notches on the camshaft pulleys align with the marks on the cylinder head cover(1), Check the crankshaft pulley timing mark is aligned (2) also check for water pump positioning ensure tabs are aligned (3).

- Rotate the engine two full turns in the direction of normal operation until the engine is again at top dead centre, No.1 cylinder firing being careful that all movement is in a clockwise direction.

6A-28 ENGINE MECHANICAL (X22SE 2.2L)

- If the engine is turned too far, do not turn backwards, but continue to turn in the same direction until the marks are again in line.

2. Place 5-8840-2659-0 to between intake and exhaust of camshaft drive gear to prevent camshaft drive gear movement during timing belt setting.

3. Set the timing belt shown in the illustration, ensure that tension side of the timing belt is taut and move the timing belt tension adjustment lever clockwise, until the pointer of the tensioner is flowing.

014RX061

For used timing belt(over 60 minutes from new): the pointer will be approx. 4 mm(0.16 in) to the left of the center of the "V" notch when viewed from the front of the engine.

014RW069

For new timing belt: The pointer must be at the center of "V" notch when viewed from the front of the engine.

014RW062

4. Tighten fixing bolt of timing belt tensioner to the specified torque.

Torque: 25 N-m (2.5Kg-m/18lbf)

020RW010

11. Tighten cylinder head cover to the specified torque.
Torque: 8 N-m (0.8Kg-m/5.9lbf)
12. Connect camshaft angle sensor connector.
13. Install the ignition cable to spark plug.
14. Install ignition cable cover and tighten two bolts.
Torque: 3 N-m (0.3Kg-m/2lbf)
15. Install ventilation hoses to cylinder block side and cylinder head side.
16. Install timing belt front cover and tighten two bolts to the specified torque.
Torque: 6 N-m (0.6Kg-m/4.4lbf)

6A-30 ENGINE MECHANICAL (X22SE 2.2L)

17. Install crankshaft pulley and tighten four bolts.

Torque: 20 N-m (2.0Kg-m/14lbft)

020RW014

18. Connect connector for power steering pump pressure switch.

19. Connect engine harness connector to chassis harness of the left rear of engine compartment and install engine harness cover.

20. Install two bolts to intake manifold for water pipe support.

21. Install fixing nut of intake manifold stay to cylinder block.

025RW002

22. Install canister hose.

23. Connect connector for evaporation valve.

24. Install fuel pipe joint eye bolts to fuel rail assembly and install fuel pipe bracket with electric ground cable.

Torque: 25 N-m (2.5Kg-m/18lbft)

042RW001

25. Install water hose between water pipe and throttle body.

26. Install heater hose to water pipe side.

27. Install heater hose to adapter side.

28. Connect knock sensor connector.

29. Connect crankshaft angle sensor connector.

30. Install generator with bracket and tighten three bolts.

Torque

35 N-m (3.6Kg-m/25lbft) for Long bolt

20 N-m (2.0Kg-m/14lbft) for Short bolt

065RW025

31. Install exhaust front pipe to exhaust manifold and tighten four nuts to the specified torque.

Torque: 25 N·m (2.5Kg-m/18lbft)

027RW005

32. Install radiator upper hose to engine.
33. Move drive belt tensioner to loose side using wrench then install the drive belt to normal position.

033RW001

34. Install intake air duct bracket to cylinder head.
35. Install air intake duct assembly with air cleaner cover to throttle body and tighten nut to the air intake duct bracket then tighten hose clamp.

Torque

7 N·m (0.7Kg-m/5.1lbft) for nut

3 N·m (0.3Kg-m/2.2lbft) for hose clamp bolt

36. Install PCV hose to air intake duct.
37. Connect connector of intake air temperature sensor on intake air duct.
38. Connect battery ground cable.
39. Fill engine coolant to full level in the engine coolant reservoir tank.

Timing Belt

Removal

1. Disconnect battery ground cable.
2. Move drive belt tensioner to loose side using wrench then remove drive belt.

033RW001

3. Remove engine harness cover and disconnect three connectors from left rear side of engine compartment.
4. Remove four bolts and remove crankshaft pulley.

020RW014

5. Disconnect three connectors of engine harness from chassis harness of left rear side of engine compartment.
6. Remove nut and remove engine harness cover from front of engine.
7. Remove two bolts then remove timing belt front cover.
8. Remove fixing bolt of timing belt tensioner then remove timing belt tensioner (1).

020RW010

9. Remove timing belt.

CAUTION:

- Do not bend or twist belt, otherwise its core could be damaged. The belt should not be bent at a radius less than 30 mm.
- Timing belt drive gear counterhold with 5-8840-2598-0.
- Do not allow oil or other chemical substances to come in contact with the belt. They will shorten the life.
- Do not attempt to pry or stretch the belt with a screw driver or any other tool during installation.
- Store timing belt in cool and dark place. Never expose the belt direct sunlight or heat.

Installation

1. Install timing belt tensioner then tighten it temporarily until make alignment timing belt.

020RW010

014RW066

2. Install the timing belt and perform timing belt setting procedure as follows:

1. Bring the engine top dead center No.1 cylinder compression stroke by rotating the engine in the direction of normal operation. The engine is in this position when the notches on the camshaft pulleys align with the marks on the cylinder head cover(1), Check the crankshaft pulley timing mark is aligned (2) also check for water pump positioning ensure tabs are aligned (3).

014RW063

014RW067

6A-34 ENGINE MECHANICAL (X22SE 2.2L)

2. Place 5-8840-2659-0 between intake and exhaust of camshaft drive gear for prevent to camshaft drive gear movement during timing belt setting.

014RW065

3. Set the timing belt shown in the illustration, ensure that tension side of the timing belt is taut and move the timing belt tension adjustment lever clockwise, until the pointer of the tensioner is flowing.

014RW064

014RX061

For used timing belt(over 60 minutes from new):
The pointer will be approx. 4 mm(0.16 in) to the left of the center of the "V" notch when viewed from the front of the engine.

014RW069

For new timing belt: The pointer must be at the center of "V" notch when viewed from the front of the engine.

014RW062

3. Tighten fixing bolt (1) of timing belt tensioner to the specified torque.

Torque: 25 N·m (2.5Kg·m/18lbft)

020RW010

4. Install timing belt front cover and tighten two bolts to the specified torque.

Torque: 6 N·m (0.6Kg·m/4.4lbft)

5. Install engine harness cover to front top of engine and tighten nut to the specified torque.

Torque: 6 N·m (0.6Kg·m/4.4lbft)

6. Install crankshaft pulley and tighten four bolts.

Torque: 20 N·m (2.0Kg·m/14lbft)

020RW014

7. Move drive belt tensioner to loose side using wrench then install drive belt to normal position.

033RW001

8. Connect engine harness three connector to chassis harness of left rear side of engine compartment.

9. Connect battery ground cable.

Camshaft

Removal

1. Disconnect battery ground cable.
2. Remove cylinder head cover.
Refer to removal procedure for Cylinder Head Cover in this manual.
3. Remove timing belt tensioner and remove timing belt.

020RW010

4. Use adjustable wrench to hexagonal portion of camshaft, and remove fixing bolt from front end of camshaft.

014RW074

5. Remove camshaft drive gear from intake and exhaust camshaft.
6. Remove twenty fixing bolts from intake and exhaust camshaft bracket on the cylinder head, then remove camshafts.

011RW015

CAUTION:

- Do not damage camshaft lobe and journal.
- Do not damage hydraulic lash adjuster(HLA) and do not allow into foreign materials into cylinder head.

7. Remove oil seal from camshaft.

Installation

1. Clean surface of camshaft bracket and HLA.
2. Apply engine oil to journal surface of camshaft bracket and HLA.
3. Install camshaft to cylinder head.
4. Install camshaft bracket according to numerical as shown in the illustration.
The bracket number is:
 - Exhaust: 1 to 5 from front
 - Intake: 6 to 10 from front.

Camshaft oil seal installation area on the cylinder body of No.1, No.6 and camshaft bracket rear side plug portion must be applied HN1023 or equivalent as in the illustration.

5. Tighten camshaft bracket bolts to the specified torque by sequence in the illustration.

Torque: 8 N·m (0.8Kg·m/5.9lbf)

6. Use 5-8840-2658-0 for installation camshaft oil seal.

014RW071

7. Install the camshaft drive gear. Align the timing mark between notch on the camshaft drive gear(1) and lug on the camshaft bracket(2).

014RW076

Also align a guide hole on the camshaft drive gear marked "IN" for intake and "EX" for exhaust to guide pin on the camshaft when installing the camshaft drive gear.

014RW072

8. Tighten camshaft bracket fixing bolt to the specified torque.

Torque: 50 N·m (5.1Kg·m/36lbf)

015RW014

9. Install timing belt.
Refer to installation procedure for Timing Belt in this manual.
10. Install cylinder head cover.
Refer to installation procedure for Cylinder Head Cover in this manual.
11. Connect battery ground cable.

Engine Assembly

Engine and Associated Parts

755RX032

Removal

1. Disconnect battery ground and positive cable.
2. Remove battery.
3. Make alignment mark on the engine hood and hinges before removal in order to return the hood to original position exactly.
4. Remove engine hood.
5. Drain engine coolant from radiator.
6. Disconnect throttle valve control cable from throttle valve on intake manifold.
7. Remove air duct with air cleaner cover.
8. Remove air cleaner assembly.
9. Disconnect three engine harness connectors from chassis harness of left rear side engine compartment.
10. Disconnect vacuum hose on the brake booster.
11. Disconnect cooling fan harness connector on the left of fan shroud.
12. Disconnect ground cable connector from left and right of front wheel arch upper side.
13. Remove clutch piping bracket from right side of clutch housing.
14. Remove fuel piping bracket from transmission.
15. Remove four nuts from exhaust front pipe exhaust manifold side and remove two bolts from rear side of exhaust front pipe. Remove exhaust front pipe.

027RW005

6A-40 ENGINE MECHANICAL (X22SE 2.2L)

16. Remove transmission mounting fixing bolts and nut from cross member.

022RW014

17. Remove transmission front under cover from front portion of clutch housing.
18. Disconnect two fuel pipes at right side of transmission by quick type fuel hose connector.

CAUTION: Plug fuel pipe on engine side and fuel hose from fuel tank.

19. Disconnect canister hose next to fuel piping connector.
20. Remove propeller shaft fixing bolt from rear side transmission.
21. Remove fixing bolts between clutch housing and transmission, then move transmission.
22. Remove power steering pump assembly then place the power steering pump along with piping.
23. Disconnect two chassis harness connectors from right rear side engine compartment (under fuse box) and remove two harness clips.
24. Remove engine ground cable from chassis frame.
25. Remove radiator lower hose from engine side.
26. Remove two heater hoses from right side panel.
27. Remove radiator grille.
28. Remove harness clip from behind right horn.

29. Remove engine mounting bolt from chassis frame side.

022RW005

022RW006

30. Lift up the engine assembly.

Installation

CAUTION: When assembling the engine and transmission, confirm that dowels have been mounted in the specified positions at the engine side. If assembled in the condition that dowels have not been mounted in the specified position, transmission damage can result.

1. position the engine assembly in the engine compartment.
2. Tighten engine mounting bolt to frame side to the specified torque.

Torque: 41 N·m (4.2Kg·m/30lbf)

022RW005

022RW006

3. Install harness clip behind right horn.
4. Install the radiator grille and install flasher lamp assembly.
5. Install two heater hoses to right side panel.
6. Install radiator lower hose to engine.
7. Install engine ground cable to chassis frame.
8. Connect two chassis harness connectors to right rear side engine room (under fuse box) and install two harness clips.
9. Install power steering pump assembly and tighten fixing bolts.
10. Install transmission assembly, refer to installation procedure for Transmission section in this manual.
11. Install propeller shaft, refer to installation procedure for Propeller section in this manual.
12. Connect canister hose next to fuel piping connector.
13. Connect two fuel pipes at right side transmission by quick type connector.
14. Install transmission front under cover to front portion of clutch housing.
15. Install transmission mounting fixing bolts and nuts to cross member.

Torque: 50 N·m (5.1Kg·m/36lbf)

022RW014

6A-42 ENGINE MECHANICAL (X22SE 2.2L)

16. Install exhaust front pipe to exhaust manifold and silencer, then tighten fixing nuts and bolts to the specified torque.

Torque

25 N·m (2.5Kg-m/18lbft) for nut

68 N·m (6.9Kg-m/50lbft) for bolt

027RW005

17. Install fuel piping bracket to transmission.

18. Install clutch piping bracket to right side of clutch housing.

19. Connect ground cable connector to left and right of front wheel arch upper side.

20. Connect cooling fan harness connector on the left of fan shroud.

21. Connect vacuum hose to the brake booster.

22. Connect three engine harness connectors to chassis harness of left rear side of engine compartment.

23. Install air cleaner assembly.

24. Install air duct with air cleaner cover to specified torque.

Torque

7 N·m (0.7Kg-m/5.1lbft) for air duct fixing

3 N·m (0.3Kg-m/2.2lbft) for air duct clamp bolt

25. Connect throttle valve control cable to throttle valve on the intake manifold.

Confirm the free play of throttle valve control cable.

Free play: 5.7 to 6.3 mm

26. Install engine hood to original position.

Refer to installation procedure for Body section in this manual.

27. Install battery, connect positive cable and ground cable.

28. Fill engine coolant to full level in the coolant reservoir tank.

Cylinder Head

Cylinder Head and Associated Parts

011RW010

Legend

- | | |
|---------------------------------|---|
| (1) Cylinder Head Bolt | (7) Camshaft Intake |
| (2) Camshaft Pulley Fixing Bolt | (8) Tappet (HLA) |
| (3) Camshaft Pulley | (9) Split Collar |
| (4) Camshaft Oil Seal | (10) Valve Spring and Spring Upper Seat |
| (5) Camshaft Bracket Bolt | (11) Valve |
| (6) Camshaft Exhaust | |

Disassembly

NOTE:

- During disassembly, be sure that the valve train components are kept together and identified so that they can be reinstalled in their original locations.
- Before removing the cylinder head from the engine

and before disassembling the valve mechanism, perform a compression test and note the results.

1. Remove camshaft pulley fixing bolt (2), then pulley (3).
2. Remove camshaft bracket fixing bolt (5), camshaft bracket, then camshaft exhaust (6), and intake side (7).

6A-44 ENGINE MECHANICAL (X22SE 2.2L)

3. Remove cylinder head.
Use 5-8840-2600-0.
4. Valve spring, valve spring caps, compress valve spring — use 5-8840-2546-0 (1) and Adapter 5-8840-2662-0 (2).
Valve keepers.

5. Valves, valve stem seals — use commercially available remover pliers. Valve spring seats from cylinder head.

Inspection and Repair

1. Check length and width of cylinder head sealing surfaces for deformation and diagonals for warpage — use straight edge and feeler gauge.

2. Height of cylinder head (sealing surface to sealing surface).

Dimension (I) – 134 mm

Reassembly

1. Valves, valve stem seals. Refer to Valve Spring, Oil Controller, Valve, Valve Guide in this section.
2. Valve spring, valve spring caps. Refer to Valve Spring, Oil Controller, Valve, Valve Guide in this section.
3. Install tappet (HLA).
4. Cylinder head with new cylinder head bolts to cylinder block.
Tighten the bolts in 4 steps.

1st step: 25 N-m (2.5Kg-m/18lbft)

2nd step: 90°

3rd step: 90°

4th step: 90°

011RW014

5. Camshaft in cylinder head. Refer to Camshaft in this section.
6. Camshaft pulley. Refer to Camshaft in this section.

Valve Spring, Valve, Valve Guide

Valve Spring, Valve, Valve Guide and Associated Parts

Legend

- | | |
|----------------------------------|------------------------|
| (1) Camshaft Pulley Fixing Bolts | (9) Split Collar |
| (2) Camshaft Pulley | (10) Spring Upper Seat |
| (3) Camshaft Bracket Fixing Bolt | (11) Valve Spring |
| (4) Camshaft Assembly Intake | (12) Oil Seal |
| (5) Camshaft Assembly Exhaust | (13) Spring Lower Seat |
| (6) Cylinder Head Bolt | (14) Valve Guide |
| (7) Cylinder Head | (15) Valve |
| (8) Tappet | |

Disassembly

1. Remove camshaft pulley (1), (2).
2. Remove camshaft assembly (Intake) (3), (4).
3. Remove camshaft assembly (Exhaust side) (5).
4. Remove cylinder head (6), (7).
5. Remove tappet (8).
6. Use 5-8840-2546-0 valve spring compressor and 5-8840-2662-0 adapter to remove split collar (9).

7. Remove spring upper seat and valve spring (10), (11).
8. Valve, valve guide – use commercially available remover pliers. Valve spring lower seat from cylinder head.

Inspection and Repair

1. Use an internal micrometer to measure the diameter valve guide.

Valve stem play

Intake : 0.03 to 0.057 mm (0.0012 to 0.0022 in)

Exhaust : 0.04 to 0.067 mm (0.0016 to 0.0026 in)

Valve Guide

CAUTION: Taking care not to damage the valve seat contact surface, when removing carbon adhering to the valve head. Carefully inspect the valve stem for scratching or abnormal wear. If these conditions are present, the valve and the valve guide must be replaced as a set.

Valve Seat

Valve seat width in cylinder head

Intake: 1.0 to 1.5 mm (0.039 to 0.0585 in)

Exhaust: 1.7 to 2.2 mm (0.0663 to 0.0858 in)

Valve Seat Insert Correction

Remove the carbon from the valve seat insert surface.

Valve Seat Insert Replacement

1. Arc weld the rod at several points. Be careful not to damage the aluminum section.
2. Allow the rod to cool for a few minutes. This will cause the valve seat to shrink.

3. Strike the rod and pull it out.

014RS015

4. Carefully clean the valve seat press-fit section on the cylinder head side.
5. Heat the press-fit section with steam or some other means to cause expansion. Cool the valve seat with dry ice or some other means.
6. Insert the press-fit section into the valve seat horizontally.
7. Lap the valve and the seat.

Reassembly

1. Install oil controller (3) and spring lower seat (2).
Using oil controller replacer 5-8840-2663-0, drive in a new oil controller.

014RS019

2. Install valve to valve guide. Before install valve guide apply engine oil to the outside of the valve stem.
3. Install valve spring to cylinder head. Attach the valve spring to the lower spring seat.
4. Install lower valve spring seat, valve spring and upper valve spring seat then put split collars on the upper spring seat, using 5-8840-2546-0 valve spring compressor for install the split collars.

011RW014

5. Install tappet.
6. Install camshaft assembly.
 - Refer to installation procedure for Camshaft in this manual.

Camshaft

Camshaft and Associated Parts

011RW023

Legend

- | | |
|---------------------------------|----------------------------------|
| (1) Camshaft Pulley Fixing Bolt | (5) Camshaft Bracket Fixing Bolt |
| (2) Camshaft Pulley | (6) Camshaft Assembly Exhaust |
| (3) Oil Seal | (7) Camshaft Assembly Intake |
| (4) Camshaft Bracket | |

Disassembly

1. Remove fixing bolt (1) for camshaft pulley (2).
2. Remove oil seal (3).

014RW035

3. Remove oil seal (3).
4. Remove twenty fixing bolts (5) from inlet and exhaust camshaft bracket, then camshaft brackets (4).

011RW015

5. Remove camshaft assembly (6), (7).

Reassembly

1. Install camshaft drive gear assembly and tighten three bolts to specified torque.
Torque: 50 N·m (5.1Kg·m/37lbft) + 60° + 15°
2. Install camshaft assembly and camshaft brackets, tighten twenty bolts on one side bank to the specified torque.
 1. Apply engine oil to camshaft journal and bearing surface of camshaft bracket.
 2. Align timing mark on intake camshaft and exhaust camshaft to timing mark on camshaft drive gear (one dot).
 3. Tighten twenty bolts on numerical order one side bank shown in the illustration.

Torque: 8 N·m (0.8Kg·m/6lbft)

4. If it required to replace oil seal of camshaft drive gear, use 5-8840-2658-0 for install the oil seal.
5. Tighten bolt for camshaft drive gear assembly pulley to the specified torque.

Torque: 50 N·m (5.1Kg·m/37lbft) + 60° + 15°

014RW036

Crankshaft

Crankshaft and Associated Parts

015RW008

Legend

- | | |
|----------------------------|--|
| (1) Cylinder Head Assembly | (6) Balance Unit Assembly |
| (2) Oil Pump Assembly | (7) Piston and Connecting Rod Assembly |
| (3) Pan | (8) Main Bearing Cap |
| (4) Pan Support | (9) Crankshaft |
| (5) Oil Strainer | (10) Cylinder Block Assembly |

Disassembly

1. Remove cylinder head assembly (1). Refer to "Cylinder head" in this manual.
2. Remove oil pan (3).

CAUTION: Take care not to damage or deform the sealing flange surface of crankcase.

3. Remove oil pan support (4).
4. Remove oil strainer (5).
5. Remove oil pump assembly (5).
6. Balance unit assembly.
7. Remove piston and connecting rod assembly (7). Refer to "Piston, Piston Ring and Connecting Rod" in this manual.

8. Remove flywheel.
9. Remove rear oil seal and oil baffle plate.
10. Remove main bearing cap (8).
11. Remove crankshaft (9).
12. Remove crankshaft pulse pickup sensor disc.

Inspection and Repair

1. Crankshaft

Set the dial indicator as shown in the illustration and measure the crankshaft thrust clearance. If the thrust clearance exceeds the specified limit, replace the thrust bearings as a set.

Thrust Clearance

Standard : 0.01 mm–0.02 mm

(0.0004 in–0.0008 in)

Limit : 0.21 mm (0.0118 in)

Main Bearing Clearance

1. Remove the bearing caps and measure the oil clearance.
2. Remove the main bearing cap fixing bolts. Arrange the removed main bearing caps in the cylinder number order. Remove the main bearings.
3. Remove the crankshaft. Remove the main bearings.

4. Clean the upper and lower bearings as well as the crankshaft main journal.
5. Check the bearings for damage or excessive wear. The bearings must be replaced as a set if damage or excessive wear is discovered during inspection.
6. Set the upper bearings and the thrust washers to their original positions. Carefully install the crankshaft.
7. Set the lower bearings to the bearing cap original position.
8. Apply plastigage to the crankshaft journal unit as shown in the illustration.

9. Install main bearing caps, and tighten each bolt to the specified torque.

Main bearing caps bolts.

Torque:

1st step: 50 N·m (5.1Kg·m/37lbft)

2nd step: 45°

3rd step: 15°

Torque : 39 N·m (4.0Kg·m/29lbft)

10. Measure the plastigage width and determine the oil clearance. If the oil clearance exceeds the specified limit, replace the main bearings as a set and/or replace the crankshaft.

Standard : 0.015 mm–0.04 mm

(0.0007 in–0.0016 in)

Limit : 0.12 mm (0.0047 in)

014RW077

11. Clean the plastigage from the bearings and the crankshaft.
Remove the crankshaft and the bearings.

Crankshaft (12) Inspection

Inspect the surface of the crankshaft journal and crank pins for excessive wear and damage. Inspect the oil seal fitting surfaces for excessive wear and damage. Inspect the oil ports for obstructions.

Inspection and Repair

1. Carefully set the crankshaft. Slowly rotate the crankshaft and measure the runout. If the crankshaft runout exceeds the specified limit, the crankshaft must be replaced.

Runout : 0.03 mm (0.0012 in)

014RW078

2. Measure the diameter and the uneven wear of main journal and crank pin. If the crankshaft wear exceeds the specified limit, crankshaft must be replaced.

Main journal diameter : 57.934 mm–57.980 mm

(2.259 in–2.261 in)

Crank pin diameter : 48.939 mm–48.982 mm

(1.909 in.–1.91 in.)

015RS009

Crankshaft Bearing Selection

When installing new crankshaft bearings or replacing bearings, refer to the selection table below. Select and install the new crankshaft bearings.

Crankshaft grinding dimensions	mm (in)
Production and Service Crankshaft bearing journal dia.	
Standard size	
white	57.974 to 57.981 (2.260–2.261)
green	57.981 to 57.988 (2.261–2.2615)
brown	57.988 to 57.995 (2.2615–2.2618)
Undersize 0.25 (0.0097)	
green/blue	57.732 to 57.738 (2.2515–2.2517)
brown/blue	57.738 to 57.745 (2.2517–2.252)
Undersize 0.5 (0.0195)	
green/white	57.482 to 57.488 (2.2418–2.242)
brown/white	57.488 to 57.495 (2.242–2.2423)
Guide bearing width	
Standard size	25.950 to 26.002 (1.012–1.014)
Undersize 0.25 (0.0097)	26.150 to 26.202 (1.019–1.021)
Undersize 0.5 (0.0195)	26.350 to 26.402 (1.027–1.029)

NOTE: Take care to ensure the bearings are positioned correctly.

Crankshaft pulse pickup sensor disc inspection and repair.

Inspect the crankshaft pulse pickup sensor disc for excessive wear and damage.

Replace the crankshaft pulse pickup sensor disc if the inspection exceeds wear and damage.

015RW039

Reassembly

1. Crankshaft (12).

- Install the crankshaft pulse pickup sensor disc.

Torque: 13 N·m (1.3Kg·m/10lbft)

- Install the main bearings to the cylinder block and the main bearing caps.
- Be sure that they are positioned correctly.
- Apply new engine oil to the upper and lower main bearing faces.

NOTE: Do not apply engine oil to the main bearing back faces.

- Carefully mount the crankshaft.
- Apply engine oil to the thrust washer.
- Assemble the thrust washer to the No.3 bearing journal. The oil grooves must face the crankshaft.
- Tighten the crankshaft bearing cap bolts in 3 steps:

1st step: 50 N·m (5.1Kg·m/36lbft)

2nd step: 45°

3rd step: 15°

2. Rear oil seal (10).

- Coat lip of seal rings thinly with protective grease.
- Install seal ring into cylinder block, use 5-8840-2660-0 (1) and 5-8840-2597-0 (2).

015RW009

3. Flywheel (9).

1. Thoroughly clean and remove the oil from the threads of crankshaft.
2. Remove the oil from the crankshaft and flywheel mounting faces.
3. Mount the flywheel on the crankshaft and then install the washer.
4. Use stopper (5-8840-2661-0) to hold the crankshaft.

015RW010

5. Prevent from rotating.

Tighten the flywheel bolts in 3 steps:

1st step: 65 N·m (6.6Kg·m/48lbf)

2nd step: 30°

3rd step: 15°

NOTE: Do not reuse the bolt.

4. Piston and connecting rod assembly (8)

- Apply engine oil to the cylinder bores, the connecting rod bearings and the crankshaft pins. Check to see that the piston ring end gaps are correctly positioned.
- Piston rings position (A) every 180°. Oil scraper rings (B) — offset 25 to 50 mm/1 to 2 in. to left and right from gap of intermediate ring.

015RW026

- Insert the piston/connecting rod assemblies into each cylinder with the piston ring compressor. The front marks must be facing the front of the engine.
- Match the numbered caps with the numbers on the connecting rods. Align the punched marks on the connecting rods and caps.
- Arrow (1) on piston head points to engine timing side, bead on connecting rod points to flywheel side.

015RW038

- Tighten the bolts in 3 steps:

1st step: 35 N·m (3.6Kg·m/25lbft)

2nd step: 45°

3rd step: 15°

5. Install the balance unit assembly and tighten the bolts in 2 steps:

1st step: 20 N·m (2.0Kg·m/14lbft)

2nd step: 45°

Refer to the "Balance Unit Assembly" section of this manual.

6. Install oil pump assembly (5), refer to "Oil Pump" in this manual.

7. Install oil strainer.

Torque: 8 N·m (0.8Kg·m/5.8lbft)

8. Install oil pan support and tighten the bolts to the specified torque.

Torque: 20 N·m (2.0Kg·m/14lbft)

9. Install oil pan.

1. Completely remove all residual sealant, lubricant and moisture from the sealing surfaces. The surfaces must be perfectly dry.
2. Apply a correct width bead of sealant (TB-1207C or its equivalent) to the contact surfaces of the oil pan. There must be no gaps in the bead.
3. The oil pan support must be installed within 5 minutes after sealant application.
4. Tighten the bolts in to steps.

1st step: 8 N·m (0.8Kg·m/5.8lbft)

2nd step: 30°

10. Install cylinder head assembly, refer to "Cylinder Head" in this manual.

Piston and Connecting Rod

Piston, Connecting Rod and Associate Parts

015RW037

Legend

- | | |
|----------------------------|--|
| (1) Cylinder Head Assembly | (7) Piston and Connecting Rod Assembly |
| (2) Cylinder Head Gasket | (8) Piston Ring |
| (3) Oil Pan Assembly | (9) Piston Pin |
| (4) Pan Support | (10) Piston |
| (5) Oil Strainer | (11) Connecting Rod |
| (6) Balance Unit Assembly | (12) Connecting Rod Cap |

Disassembly

1. Remove cylinder head assembly (1), refer to "Cylinder Head Removal" in this manual.
2. Remove cylinder head gasket (2).
3. Remove oil pan assembly and oil pan support (3) refer to "Oil Pan and Oil Pan Support" in this manual.
4. Remove oil strainer.
5. Remove balance unit assembly.
6. Remove connecting rod cap with connecting rod lower.

7. Remove piston and connecting rod assembly (7).

NOTE: Before removing piston and connecting rod assembly, measure thrust clearance.

- Remove any ridge or carbon build up from the top end of the cylinder.
8. Remove the piston rings (8) with a piston ring expander. Arrange the removed piston rings in the cylinder number order.

015RW024

9. Remove the piston pin (9).

- Heat the connecting rod and the piston pin with oil heater, when it temperature is keep at 280°X–320°C.
- Push the piston pin with brass bar.

NOTE: Keep the parts removed from each cylinder separate. All parts must be reinstalled in their original positions.

10. Piston (10).

11. Connecting rod (11).

Inspection and Repair

Pistons (10)

Carefully clean away all the carbon adhering to the piston head and the piston ring grooves.

NOTE: Never use a wire brush to clean the pistons. Damage will result. Visually check each piston for cracking, scoring, and other signs of excessive wear. If any of the above conditions are found, the piston must be replaced.

Piston Rings (8)

Any worn or damaged part discovered during engine overhaul must be replaced with a new one.

1. Ring end gap measurement

- Insert the piston ring into the bore.
- Push the ring by the piston, at a right angle to the wall, into the point at which the cylinder bore diameter is the smallest.
- Measure the ring end gap.

Compression Ring

1st ring

Standard: 0.30 mm–0.50 mm
(0.0118 in–0.0195 in)

2nd ring

Standard: 0.30 mm–0.50 mm
(0.0118 in–0.0195 in)

Oil ring

Standard: 0.40 mm–1.40 mm
(0.0156 in–0.0546 in)

2. Measure the clearance between the piston ring groove and the piston ring with a feeler gauge. If the piston ring groove / piston ring clearance exceeds the specified limit, the piston must be replaced.

Compression Ring Clearance

Standard : 0.02 mm–0.04 mm
(0.0008 in.–0.0016 in)

015RW025

Piston Pin (9)

NOTE: Do not reuse the old piston pin.

1. Use a micrometer to measure the new piston pin outside diameter in both directions at three different positions.
2. Measure the inside diameter of the connecting rod small end. If the fitting interference between the small end and pin does not conform to the specified value, the connecting rod must be replaced.

Standard : 0.02 mm–0.041 mm

(0.0008 in–0.0016 in)

3. Insert the new pin into the piston and rotate it. If the pin rotates smoothly with no backlash, the clearance is normal. If there is backlash or roughness, measure the clearance. If the clearance exceeds the specified limit, the piston must be replaced.

Clearance

Standard : 0.011 mm–0.014 mm

(0.0004 in.–0.0005 in)

Connecting Rods (11)

1. Measure the oil clearance between the connecting rod and the crankshaft.

1. Remove the connecting rod cap nuts and the rod caps (12).
Arrange the removed rod caps in the cylinder number order.
2. Clean the rod bearings and the crankshaft pins.
3. Carefully check the rod bearings. If even one bearing is found to be damaged or badly worn, the entire bearing assembly must be replaced as a set. Reinstall the bearings in their original positions. Apply plastigage to the crank pin.
4. Reinstall the rod caps (12) to their original positions.
Tighten the rod cap nuts.

1st step: 35 N·m (3.6Kg·m/26lbft)

2nd step: 45°

3rd step: 15°

NOTE: Do not allow the crankshaft to rotate.

5. Remove the rod caps.
6. Measure the width of the plastigage and determine the oil clearance. If the oil clearance exceeds the limit, replace the rod bearing as a set.

Standard : 0.006 mm–0.031 mm

(0.0002 in–0.0012 in)

Limit : 0.12 mm (0.0047 in)

7. Clean the plastigage from the bearings and the crankshaft pins.

Crankshaft grinding dimensions	mm (in)

Undersize 0.5 (0.0195)	
white	48.470 to 48.488 (1.8903–1.891)
Con-rod bearing journal width	
Standard size	
(no color code)	26.460 to 26.580 (1.0319–1.036)
Undersize 0.25 (0.0097)	
blue	26.460 to 26.580 (1.0319–1.036)
Undersize 0.5 (0.0195)	
white	26.460 to 26.580 (1.0319–1.036)
Con-rod width	26.338 to 26.390 (1.0271–1.0292)

Reassembly

1. Install connecting rod
2. Install piston
3. Install piston pin
 - Apply a thin coat of engine oil to the piston pin. Try to insert the piston pin into the piston pin hole with normal finger pressure.

NOTE: When changing piston / connecting rod combinations, do not change the piston / piston pin combination and do not reuse the old piston pin.

- Attach the piston to the connecting rod with the piston front mark and the connecting rod front mark on the same side.
 - Heat the connecting rod small end to a suitable temperature to ensure smooth installation.
4. Install piston ring with the piston ring expander.
 - New piston rings with "Top" uppermost — use commercially available pliers.
 - Position ring gaps:
 - 1 — Compression rings 180° to each other as illustrated.
 - 2 — Offset oil control rings 25 to 50 mm/1 to 2 in. from gap of second compression ring.

- After installation, apply engine oil to the entire circumference of the piston rings. Check to see that all the rings rotate smoothly.
5. Install piston and connecting rod assembly.
 - Insert the bearings into the connecting rods and caps. Apply new engine oil to the bearing faces and nuts.
 - Tighten the connecting rod cap nuts in 3 steps:
 - 1st step : 35 N·m (3.6Kg·m/26lbft)**
 - 2nd step: 45°**
 - 3rd step: 15°**

NOTE: Do not apply engine oil to the bearing back faces.

6. Oil gallery, refer to "Crankshaft and Main Bearing" in this manual.
7. Oil strainer and O-ring.
8. Install balance unit assembly, refer to "Balance Unit Assembly: in this manual.

9. Install oil pan support assembly, refer to "Oil Pan and Oil Pan Support" in this manual.

10. Install cylinder head gasket.

11. Install cylinder head assembly.

- Refer to "Cylinder Head" in this manual.

Cylinder Block

Cylinder Block and Associated Parts

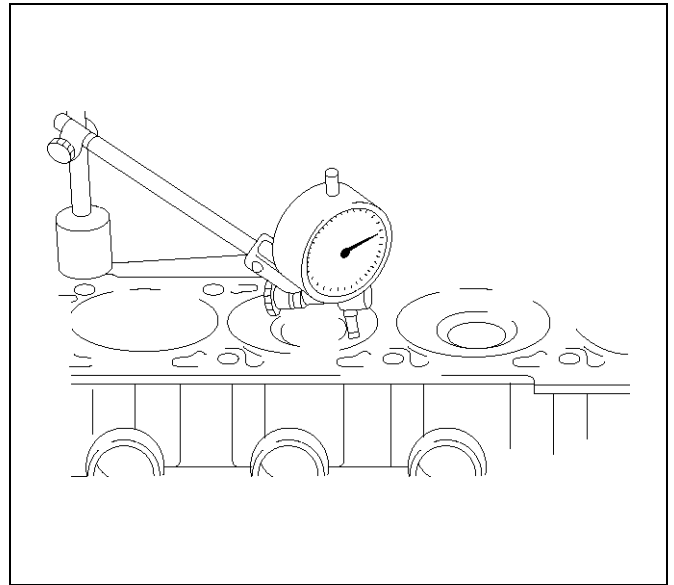

Legend

- | | |
|----------------------------|--|
| (1) Cylinder Head Assembly | (6) Balance Unit Assembly |
| (2) Oil Pump Assembly | (7) Piston and Connecting Rod Assembly |
| (3) Oil Pan | (8) Main Bearing Cap |
| (4) Oil Pan Support | (9) Crankshaft |
| (5) Oil Strainer | (10) Cylinder Block |

Disassembly

1. Remove cylinder head assembly.
2. Remove cylinder head gasket.
3. Remove oil pan assembly.
4. Remove oil pan support.
5. Remove oil strainer.
6. Remove oil pump assembly.
7. Remove balance unit assembly.
8. Remove piston and connecting rod assembly.
9. Remove flywheel.
10. Remove rear oil seal retainer assembly.
11. Remove main bearing cap.
12. Remove crankshaft.
13. Remove cylinder block.

012RW013

Inspection and Repair

1. Remove the cylinder head gasket and any other material adhering to the upper surface of the cylinder block. Be very careful not to allow any material to accidentally drop into the cylinder block. Be very careful not to scratch the cylinder block.
2. Carefully remove the oil pump, rear oil seal retainer, and crankcase assembly installation surface seal.
3. Wipe the cylinder block clean.
4. Visually inspect the cylinder block. If necessary, use a flaw detector to perform a dye penetrate and hydraulic (or air pressure) test. If cracking or other damage is discovered, the cylinder block must either be repaired or replaced.

Flatness

1. Using a straight edge and feeler gauge, check that the upper surface of the cylinder block is not warped.

CAUTION: Be very careful not to allow any material to accidentally drop into the upper surface of the cylinder block. Be very careful not to scratch the upper surface of the cylinder block.

2. The cylinder block must be reground or replaced if the warpage exceeds the limit.

Warpage

Limit : 0.40 mm (0.0156 in)

Maximum repairable limit: 0.40 mm (0.0156 in)

Cylinder Bore

Use a cylinder gauge to measure the cylinder bore diameter in both the axial and thrust directions. Each measurement should be made at six points.

CAUTION: Be very careful not to allow any material to accidentally drop into the upper surface of the cylinder block. Be very careful not to scratch the upper surface of the cylinder block.

If the measurement exceeds the specified limit, the cylinder block must be replaced.

Diameter

Grade 1 : 85.975 mm–85.985 mm

(3.3530 in–3.3534 in)

Grade 2 : 85.985 mm–86.025 mm

(3.3534 in–3.3550 in)

Oversize : 0.5 mm (0.0195 in)

NOTE: For information on piston diameter, please refer to the section "Inspection of the Piston and Connecting Rod Assembly" in this manual.

Reassembly

1. Install cylinder block.
2. Install crankshaft.
 - Install the main bearings to the cylinder block and the main bearing caps.
 - Be sure that they are positioned correctly.
 - Apply new engine oil to the upper and lower main bearing faces.

NOTE: Do not apply engine oil to the bearing back faces.

- Carefully mount the crankshaft.
 - Apply engine oil to the thrust washer.
3. Install rear oil seal.
 - Coat lip of seal rings thinly with protective grease.
 - Install seal ring into cylinder block, use 5-8840-2660-0 (1) and 5-8840-2597-0 (2).

015RW009

4. Install flywheel

1. Thoroughly clean and remove the oil from the threads of crankshaft.
2. Remove the oil from the crankshaft and flywheel mounting faces.
3. Mount the flywheel on the crankshaft and then install the washer.
4. Use stopper (5-8840-2661-0) to hold the crankshaft. Prevent from rotating.
Tighten the flywheel bolts in 3 steps:

1st step: 65 N·m (6.6Kg·m/48lbft)

2nd step: 30°

3rd step: 15°

NOTE: Do not reuse the bolt.

015RW010

5. Install piston and connecting rod assembly.

- Apply engine oil to the cylinder bores, the connecting rod bearings and the crankshaft pins.

NOTE: Do not apply engine oil to the bearing back faces.

- Position ring gaps:
 - 1 — Compression rings 180° to each other as illustrated (A).
 - 2 — Offset oil control rings 25 to 50 mm/1 to 2 in. from gap of second compression ring (B).

015RW026

6. Install balance unit assembly and tighten the bolts in 2 steps in the order shown:

1st step : 20 N·m (2.0Kg·m/14lbft)

2nd step : 45°

7. Install oil pump assembly, refer to "Oil Pump" in this manual.

8. Install oil strainer.

6A-64 ENGINE MECHANICAL (X22SE 2.2L)

9. Install oil pan support.
10. Install oil pan assembly.
 1. Completely remove all residual sealant, lubricant and moisture from the sealing surfaces. The surfaces must be perfectly dry.
 2. Apply a correct width bead of sealant (TB-1207C or its equivalent) to the contact surfaces of the crankcase. There must be no gaps in the bead.
 3. The oil pan must be installed within 5 minutes after sealant application.
4. Tighten the bolts and nuts to the specified torque in 2 steps:
 - 1st step : 8 N·m (0.8Kg·m/5.8lbft)**
 - 2nd step : 30°**
11. Install cylinder head gasket.
12. Install cylinder head assembly, refer to "Cylinder Head" in this manual.

Cylinder Head Cover

Cylinder Head Cover and Associated parts

Legend

- | | |
|--------------------------|-------------------------|
| (1) Ignition Cable Cover | (3) Cylinder Head Cover |
| (2) Spark Plug | |

Removal

1. Remove two bolts and remove ignition cable cover (1) from cylinder head cover (3).
2. Disconnect ignition cable and remove spark plug (2).
3. Disconnect ignition cable from ignition plug.
4. Disconnect camshaft angle sensor harness and crankshaft angle sensor harness from behind generator.
5. Remove four bolts and remove the crankshaft pulley.

020RW014

6. Remove timing belt front cover.
7. Loosen fixing bolt of timing belt rear cover, then remove the camshaft angle sensor.

020RW012

8. Remove ten cylinder head cover fixing bolts and remove the cylinder head cover.

Installation

1. Install the camshaft angle sensor and tighten timing rear cover bolt.

Torque: 8 N-m (0.8Kg-m/5.9lbf)

020RW012

2. Install the cylinder head cover and tighten bolts to the specified torque.

Torque: 8 N-m (0.8Kg-m/5.9lbf)

3. Install the timing belt front cover then tighten fixing bolts to the specified torque.

Torque: 6 N-m (0.6Kg-m/4.4lbf)

4. Install the crankshaft pulley, tighten fixing bolts to the specified torque.

Torque: 20 N-m (2.0Kg-m/14lbf)

020RW014

6A-66 ENGINE MECHANICAL (X22SE 2.2L)

5. Move drive belt tensioner to loose side using wrench then install the drive belt to normal position.

033RW001

6. Connect ignition cable to ignition plug.
7. Install ignition cable cover to cylinder head cover and tighten two bolts to the specified torque.

Torque: 3 N·m (0.3Kg·m/2lbf)

Balance Unit Assembly

Balance Unit Assembly Associated Parts

Legend

- | | |
|---------------------|---------------------------|
| (1) Oil Pan | (4) Balance Unit Assembly |
| (2) Oil Pan Support | (5) Shim |
| (3) Oil Strainer | |

Disassembly

1. Remove the oil pan.
2. Remove the oil pan support.
3. Remove the oil strainer (1) from oil pump and the oil baffle plate (2).

051RW009

Adjustment

1. Turn crankshaft in engine rotational direction to alignment mark (2) 1st cylinder "TDC".

014RW066

2. In this crankshaft position, the flattened side (arrows) of both balancer shafts must face downward and must be on a horizontal line.

051RW010

3. Screw measuring device 5-8840-2671-0 (3) with long knurled bolt (1) into 1st balancer shaft (intake side) and tighter hard-tight measuring arm (5) must point in "9 o'clock" direction shown in this illustration. Install dial gauge holder with dial gauge (4) on cylinder block.

051RW007

4. Place pre tensioned probe (6) of gauge on measuring arm of measuring device 5-8840-2671-0. The probe must be set precisely between the notch marks, square to the plane surface (7).

051RW006

5. Determine the left and right stops by turning the knurled bolt (2). Set the dial of the gauge to zero. Use the knurled bolt (2) to move the 2nd balancer shaft (exhaust side) back and forth. Again — simultaneously read off the tooth backlash from the gauge. The permissible tooth backlash is: 0.02 mm to 0.06 mm (0.0008 to 0.0024 in).

051RW007

6. The tooth backlash must be measured in 4 different positions — turn the crankshaft further at the fastening bolt of the timing belt drive gear by 45° in the engine rotational direction until the measuring arm (2) is at "6 o'clock".

051RW008

7. Then loosen the knurled bolt (3) fix the measuring arm at "9 o'clock" again and repeat the measurement.

051RW007

8. If the value determined in one of the 4 measurements lies outside the tolerance 0.02 mm to 0.06 mm (0.0008 to 0.0024 in), the tooth backlash must be adjusted.

6A-70 ENGINE MECHANICAL (X22SE 2.2L)

9. Remove balance unit from cylinder block/crankshaft bearing caps and remove with balancer piece. The balancer piece has a number (code), for easy assignment. The tooth backlash can be adjusted by using a balancer piece with a different thickness.

Code	Thickness of balancer piece in mm
55	0.535 to 0.565
58	0.565 to 0.595
61	0.595 to 0.625
64	0.625 to 0.655
67	0.655 to 0.685
70	0.685 to 0.715
73	0.715 to 0.745
76	0.745 to 0.775
79	0.775 to 0.805
82	0.805 to 0.835
85	0.835 to 0.865

CAUTION: The next larger or smaller balancer alters the tooth backlash by 0.02mm (0.0008 in).
Example of selection of balancer piece: The installed balancer piece with the code "70" gave a tooth backlash of 0.08mm (0.0031 in).
If a balancer piece with the code "67" is now installed, the tooth backlash will be approx. 0.06mm (0.0024 in).

NOTE: Only one balancer piece may be installed.

Reassembly

1. Turn crankshaft in engine rotational direction to alignment mark (2) 1st cylinder "TDC".

014RW066

2. Turn balancer shafts until the flattened sides (arrows) of both balancer shafts face downward and are on a horizontal line.

051RW010

3. Install selected balancer piece (2) with balancer shaft unit to cylinder block/crankshaft bearing cap — tighten all fixing bolts to the specified torque.

Torque: 20 N·m (2.0Kg·m/15lbft)

4. After installing the balancer shaft unit, recheck the tooth backlash and readjust if necessary.

CAUTION: If the balancer shaft unit has to be replaced, use the thickest balancer piece with the code "85" for the initial assembly — this guarantees tooth backlash in all conditions.

5. Install oil strainer to oil pump with new seal ring and insert fixing bolts with locking agent to the specified torque.

Torque: 8 N·m (0.8Kg·m/6lbft)

6. Install oil pan support.

Torque: 20 N·m (2.0Kg·m/14lbft)

- Adjust surfaces of the cylinder block and the oil pan support.

035RW026

7. Install oil pan.

1st step: 8 N·m (0.8Kg·m/5.8lbft)

2nd step: 30°

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

111RW001

Legend

- | | |
|------------------|-----------------------------|
| (1) Water Pump | (5) Coolant Distributor |
| (2) Thermostat | (6) Cylinder Block and Head |
| (3) Radiator | (7) Throttle Body |
| (4) Reserve Tank | (8) Heater |

The Cooling System is a pressurized type, where the water pump, which is cambelt driven, forces the circulation of the coolant through the cylinder block and head. The thermostat regulates the flow of coolant between the radiator and the bypass circuit. The heater is part of the bypass circuit. The throttle body pre-heat is a separate circuit which is not regulated by the thermostat. An oil cooler may be fitted as part of this circuit.

Water Pump

The water pump is centrifugal type and is driven by timing belt.

030RW003

Thermostat

The thermostat is a bypass type and is a wax pellet type with a air hole (1).

031RW003

Radiator

The radiator is a flow type with corrugated fins.

110RX005

Antifreeze Solution

- Relation between Mixing ratio and Freezing temperature of the engine coolant varies with the ratio of antifreeze solution in water. Proper mixing ratio can be determined by referring to the chart. Supplemental inhibitors or additives claiming to increase cooling capability that have not been specifically approved by Isuzu are not recommended for addition to the cooling system.

- Calculating mixing ratio

$$\text{Mixing ratio} = \frac{\text{Anti freeze solution (Lit/gal.)}}{\text{Anti freeze solution (Lit/gal.) + Water (Lit/gal.)}}$$

F06RW005

NOTE: Antifreeze solution + Water = Total cooling system capacity.

Total Cooling System Capacity

7.2Lit (1.90US gal)

111RW002

- Mixing ratio
Check the specific gravity of engine coolant in the cooling system temperature ranges from 0°X to 50°X υσιτυα συχτιον type hydrometer, then determine the density of the engine coolant by referring to the table.

Diagnosis

Engine Cooling Trouble

Condition	Possible cause	Correction
Engine Cooling Trouble		
Engine overheating	Low Engine Coolant level	Replenish
	Thermo mater unit faulty	Replace
	Faulty thermostat	Replace
	Faulty Engine Coolant temperature sensor	Repair or replace
	Clogged radiator	Clean or replace
	Faulty radiator cap	Replace
	Low engine oil level or use of improper engine oil	Replenish or change oil
	Clogged exhaust system	Clean exhaust system or replace faulty parts
	Faulty Throttle Position sensor	Replace throttle valve assembly
	Open or shorted Throttle Position sensor circuit	Repair or replace
	Damaged cylinder head gasket	Replace
Engine overcooling	Faulty thermostat	Replace
Engine slow to warm-up	Faulty thermostat	Replace
	Thermo unit faulty	Replace

Draining and Refilling Cooling System

Before draining the cooling system, inspect the system and perform any necessary service to ensure that it is clean, does not leak and is in proper working order. The engine coolant (EC) level should be between the "MIN" and "MAX" lines of reserve tank when the engine is cold. If low, check for leakage and add EC up to the "MAX" line.

There should not be any excessive deposit of rust or scales around the radiator cap or radiator filler hole, and the EC should also be free from oil.

Replace the EC if excessively dirty.

1. Completely drain the cooling system by opening the drain plug at the bottom of the radiator.
2. Remove the radiator cap.

WARNING: To avoid the danger of being burned, do not remove the cap while the engine and radiator are still hot. Scalding fluid and steam can be blown out under pressure.

3. Disconnect all hoses from the EC reserve tank. Scrub and clean the inside of the reserve tank with soap and water. Flush it well with clean water, then drain it. Install the reserve tank and hoses.
4. Refill the cooling system with the EC using a solution that is at least 50 percent antifreeze but no more than 70 percent antifreeze.
4. Refill the cooling system with the EC using a solution that is at least 50 percent antifreeze but no

more than 70 percent antifreeze.

5. Fill the radiator to the base of the filler neck. Fill the EC reserve tank to "MAX" line when the engine is cold.
6. Block the drive wheels and firmly apply the parking brake. Shift an automatic transmission to "P" (Park) or a manual transmission to neutral.
7. Remove the radiator cap. Start the engine and warm it up at 2,500 ~ 3,000 rpm for about 30 minutes.
8. When the air comes out from the radiator filler neck and the EC level has gone down, replenish with the EC. Repeat this procedure until the EC level does not go down. Then stop the engine and install the radiator cap. Let the engine cool down.
9. After the engine has cooled, replenish with EC up to the "MAX" line of the reserve tank.
10. Start the engine. With the engine running at 3,000 rpm, make sure there is no running water sound from the heater core (behind the center console).
11. If the running water sound is heard, repeat steps 8 to 10.

Water Pump

Water Pump and Associated Parts

030RW004

Legend

- | | |
|-------------------------|----------|
| (1) Water Pump Assembly | (3) Bolt |
| (2) O Ring | |

Removal

1. Disconnect battery ground cable.
2. Drain coolant.
3. Radiator hose (on inlet pipe side).
4. Remove timing belt, refer to "Timing Belt" in this manual.
5. Remove water pump assembly.

Inspection

Make necessary repair and parts replacement if extreme wear or damage is found during inspection. Should any of the following problems occur, the entire water pump assembly must be replaced:

- Crack in the water pump body
- Engine Coolant (EC) leakage from the seal unit
- Play or abnormal noise in the bearing
- Cracks or corrosion in the impeller

Installation

1. Before installing water pump, coat sealing surface with silicon grease.
2. Install water pump assembly and tighten bolts to the specified torque.
Torque: 25 N·m (2.5 kg·m/18 lb ft)
3. Timing belt
 - Install timing belt, refer to timing belt installation step in "Timing Belt" in this manual.
4. Connect radiator hose and replenish EC.
5. Connect battery ground cable.

Thermostat

Removal

1. Disconnect battery ground cable.
2. Drain engine coolant from the radiator and engine.
3. Disconnect radiator hose from the inlet pipe.
4. Remove thermostat housing.

031RW012

Inspection

Suspend the thermostat in a water-filled container using thin wire. Place a thermometer next to the thermostat.

Do not directly heat the thermostat.

Gradually increase the water temperature. Stir the water so that the entire water is same temperature.

Confirm the temperature when the valve first begins to open.

Valve opening temperature 92°C (197.6°F)

Confirm the temperature when the valve is fully opened.

Valve full open temperature 107°C (224.6°F)

Make necessary repair and parts replacement if extreme wear or damage is found during inspection.

Installation

1. Before installing thermostat, coat sealing surface with silicon grease.
2. Install gasket.
3. Install thermostat housing and tighten bolts to the specified torque.

Torque: 15 N·m (1.5 kg·m/11 lb ft)

4. Installation rubber hose.
5. Replenish engine coolant (EC).
6. Start engine and check for EC leakage.

Radiator

Radiator and Associated Parts

110RX004

Legend

- | | |
|--------------------------|---------------------|
| (1) Radiator | (4) Radiator Cap |
| (2) Bracket | (5) Radiator Hose |
| (3) Cooling Fan Assembly | (6) Lower Fan Guide |

Removal

1. Disconnect battery ground cable.
2. Disconnect cooling fan motor connector.
3. Loosen a drain plug to drain engine coolant.
4. Disconnect radiator inlet hose and outlet hose from the engine.
5. Remove fan guide, clips on both sides and the bottom lower with fan shroud.
6. Disconnect the reserve tank hose from radiator.
7. Remove bracket(2).

110RX003

- Lift out the radiator assembly with hose, taking care not to damage the radiator core with fan blade.
- Remove rubber cushions on both sides at the bottom.

Inspection

Radiator Cap

Measure the valve opening pressure of the pressurizing valve with a radiator filler cap tester.

Replace the cap if the valve opening pressure is outside the standard range.

Valve opening pressure kPa (psi) 93.3 ~ 122.7 (13.5 ~17.8)

Cap tester: 5-8840-0277-0

Adapter: 5-8840-2603-0

Check the condition of the vacuum valve in the center of the valve seat side of the cap. If considerable rust or dirt is found, or if the valve seat cannot be moved by hand, clean or replace the cap.

Valve opening vacuum kPa (psi) 1.96 ~ 4.91 (0.28 ~ 0.71)

Radiator Core

- A bent fin may result in reduced ventilation and overheating may occur. All bent fins must be straightened. Pay close attention to the base of the fin when it is being straightened.
- Remove all dust, bugs and other foreign material.

Flushing the Radiator

Thoroughly wash the inside of the radiator and the engine coolant passages with cold water and mild detergent. Remove all sign of scale and rust.

Cooling System Leakage Check

Use a radiator cap tester to force air into the radiator through the filler neck at the specified pressure of 196 kPa (28.5 psi) with a cap tester:

- Leakage from the radiator
- Leakage from the coolant pump
- Leakage from the water hoses
- Check the rubber hoses for swelling.

Cap tester: 5-8840-0277-0

Adapter: 5-8840-2603-0

Installation

- Install rubber cushions on both sides of radiator bottom.
- Install radiator assembly with hose, taking care not to damage the radiator core with a fan blade.
- Install bracket and support the radiator upper tank with the bracket and secure the radiator.
- Connect reserve tank hose.
- Install lower fan guide (6).

6. Connect radiator inlet hose and outlet hose to the engine.

110RX003

7. Connect battery ground cable.
8. Pour engine coolant up to filler neck of radiator, and up to MAX mark of reserve tank.
Important operation (in case of 100% engine coolant change) procedure for filling with engine coolant.
1. To change engine coolant, make sure that the engine is cool.

WARNING: When the coolant is heated to a high temperature, be sure not to loosen or remove the radiator cap. Otherwise you might get scalded by hot vapor or boiling water. To open the radiator cap, put a piece of thick cloth on the cap and loosen the cap slowly to reduce the pressure when the coolant has become cooler.

2. Open radiator cap and drain the cooling system by loosening the drain valve on the radiator and on the cylinder body.

NOTE: For best result it is suggested that the engine cooling system be flushed at least once a year. It is advisable to flush the interior of the cooling system including the radiator before using anti-freeze (ethylene-glycol based).

Replace damaged rubber hoses as the engine anti-freeze coolant is liable to leak out even minor cracks.

Isuzu recommends to use Isuzu genuine anti-freeze (ethylen-glycol based) or equivalent, for the cooling system and not add any inhibitors or additives.

CAUTION: A failure to correctly fill the engine cooling system in changing or topping up coolant may sometimes cause the coolant to overflow from the filler neck even before the engine and radiator are completely full.

If the engine runs under this condition, shortage of coolant may possibly result in engine overheating.

To avoid such trouble, the following precautions should be taken in filling the system.

3. To refill engine coolant, pour coolant up to filler neck using a filling hose which is smaller in outside diameter of the filler neck. Otherwise air between the filler neck and the filling hose will block entry, preventing the system from completely filling up.
4. Keep a filling rate of 9 liter/min or less. Filling over this maximum rate may force air inside the engine and radiator.
And also, the coolant overflow will increase, making it difficult to determine whether or not the system is completely full.
5. After filling the system to the full, pull out the filling hose and check to see if air trapped in the system is dislodged and the coolant level goes down. Should the coolant level go down, repeat topping-up until there is no more drop in the coolant level.
6. After directly filling the radiator, fill the reservoir to the maximum level.
7. Install and tighten radiator cap and start the engine. After idling for 2 to 3 minutes, stop the engine and reopen radiator cap. If the water level is lower, replenish.

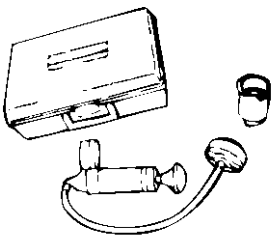

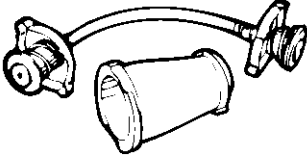

WARNING: When the coolant is heated to a high temperature, be sure not to loosen or remove the radiator cap. Otherwise you might get scalded by hot vapor or boiling water. To open the radiator cap, put a piece of thick cloth on the cap and loosen the cap slowly to reduce the pressure when the coolant has become cooler.

8. After tightening radiator cap, warm up the engine at about 2,000 rpm.
Set heater adjustment to the highest temperature position, and let the coolant circulate also into heater water system.
9. Check to see the thermostat has opened through the needle position of water thermometer, conduct a 5-minute idling again and stop the engine.

Main Data and Specifications
General Specifications

Cooling system	Engine Coolant forced circulation
Radiator	(1 tube in row) Tube type corrugated
Heat radiation capacity	54,000 kcal/h (62.8 kw)
Heat radiation area	7.677m ² (0.878ft ²)
Radiator front area	0.264m ² (0.028ft ²)
Radiator dry weight (with fan)	32N (7.2lb)
Radiator cap valve opening pressure	93.3 ~ 122.7kpa (13.5 ~ 17.8psi)
Engine coolant capacity	1.8lit (0.48 US gal)
Engine coolant pump	Centrifugal type
Thermostat	Bypass type
Engine coolant total capacity	7.2lit (1.9 US gal)

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

140RX019

Legend

- | | |
|-----------------------------------|---------------------------------|
| (1) Fuel Filter Cap | (7) Intake Manifold |
| (2) Fuel Tank | (8) Fuel Pressure Control Valve |
| (3) Rollover Valve | (9) Throttle Valve |
| (4) Fuel Pump and Sender Assembly | (10) Canister |
| (5) Fuel Filter | (11) Evapo Pipe |
| (6) Fuel Rail | |

When working on the fuel system, there are several things to keep in mind:

- Any time the fuel system is being worked on, disconnect the negative battery cable except for those tests where battery voltage is required.
- Always keep a dry chemical (Class B) fire extinguisher near the work area.
- Replace all pipes with the same pipe and fittings that were removed.
- Clean and inspect "O" rings. Replace if required.
- Always relieve the line pressure before servicing any fuel system components.
- Do not attempt repairs on the fuel system until you have read the instructions and checked the pictures relating to that repair.
- Adhere to all Notices and Cautions.

All gasoline engines are designed to use only unleaded gasoline. Unleaded gasoline must be used for proper emission control system operation.

Its use will also minimize spark plug fouling and extend engine oil life. Using leaded gasoline can damage the emission control system and could result in loss of emission warranty coverage.

All cars are equipped with an Evaporative Emission Control System. The purpose of the system is to minimize the escape of fuel vapors to the atmosphere.

Fuel Metering

The Powertrain Control Module (PCM) is in complete control of this fuel delivery system during normal driving conditions.

The intake manifold function, like that of a diesel, is used only to let air into the engine. The fuel is injected by separate injectors that are mounted over the intake manifold.

The Manifold Absolute Pressure (MAP) sensor measures the changes in the intake manifold pressure which result from engine load and speed changes, which the MAP sensor converts to a voltage output. This sensor generates the voltage to change corresponding to the flow of the air drawn into the engine.

The changing voltage is transformed into an electric signal and provided to the PCM.

With receipt of the signals sent from the MAP sensor, Intake Air Temperature sensor and others, the PCM determines an appropriate fuel injection pulse width feeding such information to the fuel injector valves to effect an appropriate air/fuel ratio.

The Multiport Fuel Injection system utilizes an injection system where the injectors turn on at every crankshaft revolution. The PCM controls the injector on time so that the correct amount of fuel is metered depending on driving conditions.

Two interchangeable "O" rings are used on the injector that must be replaced when the injectors are removed. The fuel rail is attached to the top of the intake manifold and supplies fuel to all the injectors.

Fuel is recirculated through the rail continually while the engine is running. This removes air and vapors from the fuel as well as keeping the fuel cool during hot weather operation.

The fuel pressure control valve that is mounted on the fuel rail maintains a pressure differential across the injectors under all operating conditions. It is accomplished by controlling the amount of fuel that is recirculated back to the fuel tank based on engine demand.

See Section "Driveability and Emission" for more information and diagnosis.

Fuel Filter

Fuel Filter and Associated Parts

Legend

- | | |
|-----------------|------------------------|
| (1) Fuel Hose | (3) Fuel Filter Holder |
| (2) Fuel Filter | (4) Fuel Hose |

140RX018

Removal

CAUTION: When repair to the fuel system has been completed, start engine and check the fuel system for loose connections or leakage. For the fuel system diagnosis, see Section "Driveability and Emission".

1. Disconnect battery ground cable.
2. Remove fuel filler cap.
3. Disconnect fuel hoses(1) from fuel filter on both engine side and fuel tank side.
4. Fuel filter fixing bolt.
 - Remove the fuel filter fixing bolt on fuel filter holder(3).
5. Remove fuel filter(2).

Inspection

1. Replace the fuel filter if the fuel leaks from fuel filter body or if the fuel filter body itself is damaged.
2. Replace the filter if it is clogged with dirt or sediment.
3. Check the drain and if it is clogged with dust, clean it out with air.

Installation

1. Install the fuel filter in the proper direction.
2. Install fuel filter holder fixing bolt.
3. Connect fuel hoses on engine side and fuel tank side.
4. Install fuel filler cap
5. Connect the battery ground cable.

Inspection

After installation, start engine and check for fuel leakage.

In-Tank Fuel Filter

The filter is located on the lower end of the fuel pickup tube in the fuel tank. It prevents dirt from entering the fuel pipe and also stops water unless the filter is completely submerged in the water. It is a self cleaning type, not requiring scheduled maintenance. Excess water and sediment in the tank restricts fuel supply to the engine, resulting in engine stop. In such a case, the tank must be cleaned thoroughly.

Fuel Pump Flow Test

If reduction of fuel supply is suspected, perform the following checks.

1. Make sure that there is fuel in the tank.
2. With the engine running, check the fuel feed pipe and hose from fuel tank to injector for evidence of leakage. Retighten, if pipe or hose connection is loose. Also, check pipes and hoses for squashing or clogging.

3. Insert the hose from fuel feed pipe into a clean container, and check for fuel pump flow rate.
4. Connect the pump relay terminals with a jumper wire(1) as shown and start the fuel pump to measure delivery.

140RW015

CAUTION: Never generate sparks when connecting a jumper wire.

Delivery	Delivery
15 seconds	0.38 liters minimum

If the measure value is out of standard, conduct the pressure test.

Pressure test

For the pressure test to the fuel system, see Section 6E "Fuel Control System".

Fuel Pump

Fuel Pump and Associated Parts

| (5) Connector; Fuel Feed Pump | (12) Fuel Feed Hose |
| (6) Connector; Fuel Level Sensor | (13) Fuel Tank Assembly |
| (7) Fuel pump lock | |

Removal

CAUTION: When repair to the fuel system has been completed, start engine and check the fuel system for loose connection or leakage. For the fuel system diagnosis, see Section "Driveability and Emission".

1. Disconnect battery ground cable.
2. Loosen fuel filler cap.
3. Support underneath of the fuel tank assembly (13) with a lifter.

4. Remove fuel tank assembly (13). Refer to "Fuel Tank Removal" in this section.

5. Remove Fuel Tube/Quick Connector (2).

NOTE: Handling of the fuel tube sure to refer "Fuel Tube/Quick Connector Fittings" in this section.

6. Remove fuel pump and sender (FPAS) assembly(4) using 5-8840-2602-0.

**NOTE:**

- After removing pump assembly (4), cover fuel tank to prevent any dust entering.

Installation

1. Install FPAS assembly(4) using 5-8840-2602-0.
2. Install Fuel Tube/Quick Connector (2).

NOTE: Handling of the fuel tube sure to refer "Fuel Tube/Quick Connector Fittings" in this section.

3. Install fuel tank assembly(11). Refer to "Fuel Tank Installation".
4. Fill the tank with fuel and tighten fuel filler cap.
5. Connect battery ground cable.

Fuel Tube / Quick – Connector Fittings

Precautions

- Lighting of Fires Prohibited.
- Keep flames away from your work area to prevent the inflammable from catching fire.
- Disconnect the battery negative cable to prevent shorting during work.
- When welding or conducting other heat-generating work on other parts, be sure to provide pretreatment to protect the piping system from thermal damage or spattering.

Cautions During Work

Do not expose the assembly to battery electrolyte or do not wipe the assembly with a cloth used to wipe off spilt battery electrolyte.

The piping wet with battery electrolyte cannot be used. Be careful not to give a bending or twisting force to the piping during the work. If deformed, replace with a new piping.

Removal

1. Open the fuel cap to relieve the fuel pressure in the tank.
If the fuel quick-connect fittings are dusty, clean with an air blower, etc. and then remove it.

As some pressure may remain in the piping, cover the connector with a cloth, etc. to prevent the splashing of fuel in the first disconnection of the piping.

2. For removal of the delivery pipe (feeding fuel to the engine), hold the connector in one hand, and hold the retainer tab with the other hand and pull out the connector, as illustrated. The pipe can be removed with the retainer attached.

3. For removal of the return pipe (returning fuel to the tank), hold the pipe in one hand, and pull out the connector with the other hand while pressing the square relieve button of the retainer, as illustrated.

This work should be done by hands. Do not use any tools. Should the pipe can hardly be removed from the connector, use a lubricant (light oil) and/or push and pull the connector longitudinally until the pipe is removed.

141RW021

When reusing the delivery pipe retainer, reuse without removing the retainer from the pipe. If the retainer is damaged or deformed, however, replace with a new retainer.

Cover the connectors removed with a plastic bag, etc. to prevent the entry of dust or rain water.

141RX005

Reuse of Quick-Connector

- Replace the pipe and connector if scratch, dent or crack is found.
- Remove mud and dust from the pipe and make sure that the end including spool is free of defects, such as scratch, rust, and dent, which may cause poor sealability. If defective, replace with a new pipe.
- If the retainer removed according to the removal step above is attached to the pipe, clean and insert it straight into the quick-connector till it clicks. After it clicks, try pulling it out to make sure that it is not drawn and is securely locked.

The retainer, once removed from the pipe, cannot be reused. Just replace with a new retainer. Insert the new retainer into the connector side until it clicks, and connect the pipe as inserting it into the retainer until it clicks.

141RW018

Assembling Advice

Application of engine oil or light oil to the pipe facilitates connecting work. The work should be started immediately after lubrication, since dust may stick to the pipe surface to cause poor sealability if a long time passes after lubrication.

Test/Inspection After Assembling

1. Reconnect the battery negative cable.
2. Turn the ignition key to the "ON" position and check pump startup sound. As the pump is actuated to raise fuel pressure, check and see fuel leak from the piping system.
3. Make sure of no fuel leakage by conducting the above fuel leak check a few times.
4. Start the engine and make sure of stable idling speed and normal vehicle run. The entry of dust during the work may sometimes affect the fuel injection system.

Fuel Pump Relay

General Description

In order to control the FPAS operation, the FPAS relay is provided. When the starter switch is turned to "ON" position, the FPAS relay operates the FPAS for 2

seconds.

When it is turned to "START" position, the Engine Control Module receives the reference pulse from the Ignition Control Module and it operates the relay, again causing the FPAS to feed fuel.

Fuel Tank

Fuel Tank and Associated Parts

Legend

- | | |
|-----------------------------------|----------------------------------|
| (1) Fuel Feed Port | (9) Hose; Air Breather |
| (2) Fuel Tube/Quick Connector | (10) Hose; Fuel Filler |
| (3) Fuel Return Port | (11) Fuel Return Hose |
| (4) Fuel Pump and Sender Assembly | (12) Fuel Feed Hose |
| (5) Connector; Fuel Feed Pump | (13) Band; Fuel Tank Asm Fixing |
| (6) Connector; Fuel Level Sender | (14) Bolt; Fuel Tank Asm. Fixing |
| (7) Fuel Pump Lock | (15) Protector; Fuel Tank |
| (8) Hose; Evaporative Fuel | (16) Fuel Tank Assembly |

Removal

CAUTION: When repair to the fuel system has been completed, start engine and check the fuel system for loose connection or leakage. For the fuel system diagnosis, see Section "Driveability and Emission".

1. Disconnect battery ground cable.
2. Loosen fuel filler cap.
3. Support underneath of the fuel tank protector (15) with a lifter.
4. Disconnect evaporative fuel hose (8) at the canister.
5. Disconnect fuel feed hose (12) and fuel return hose (11) near the fuel filter.

NOTE: Plug both ends of the fuel hoses to prevent fuel leakage.

6. Disconnect air breather hose (9) and fuel filler hose (10) at the fuel filler neck.

NOTE: Cover fuel hose to prevent any dust entering.

7. Remove the four fuel tank assembly fixing bolts (14) at four corners of the tank.
8. Let down the tank (16) and disconnect the wiring connectors (5,6) and the emission hose at the emission port on the fuel pump and sending assembly (4).
9. Remove fuel tank assembly along with protectors (15).
10. Remove Fuel Tube/Quick Connector (2).

NOTE: Handling of fuel tube sure to refer "Fuel Tube/Quick Connector Fittings" in this section.

11. Remove fuel pump and sender assembly (4) using 5-8840-2602-0.
12. Remove protectors (15) by removing the band fixing bolts (13).

Installation

1. Install protectors (15) and tighten the band fixing bolts to the specified torque.

Torque: 68 N·m (6.9 kg·m/50 lb ft)

2. Install fuel pump and sender (4) using 5-8840-2602-0.
3. Install Fuel Tube/Quick Connector (2).

NOTE: Handling of fuel tube sure to refer "Fuel Tube/Quick Connector Fittings" in this section.

4. Lift up fuel tank assembly (16) and connect the emission hose to the emission port and the wiring connectors (5,6) on the fuel pump and sending assembly (4).
5. Install fuel tank assembly along with protectors and tighten the four fixing bolts (14) to the specified torque.

Torque: 68 N·m (6.9 kg·m/50 lb ft)

6. Connect fuel filler hose (10) and air breather hose (9), and clip them firmly.
7. Connect fuel feed hose (12) and fuel return hose (11), and clip them firmly.
8. Connect evaporative fuel hose (8).
9. Tighten fuel filler cap.
10. Connect battery ground cable.

Fuel Gage Unit

Removal and Installation

As for removal and installation of the Fuel Gauge Unit, refer to "Fuel Tank" of this section 6C as the fuel gauge unit is combined with the fuel pump and sender assembly.

Fuel Filler Cap

General Description

Fuel filler cap includes vacuum valve.

In case any high vacuum happen in tank, the valve works to adjust the pressure to prevent the tank from being damaged.

060RW098

Legend

- (1) Vacuum Valve
- (2) Fuel Filler Cap

Inspection

Check the seal ring in the filler cap for presence of any abnormality and for seal condition.

Replace the filler cap, if abnormal.

CAUTION:

The fuel filler cap valve has characteristics.

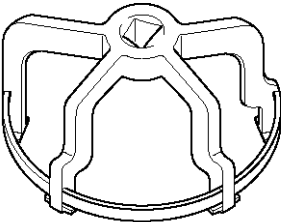

A defective valve, no valve at all or a valve with the wrong characteristics will do a lot of harm to engine operating characteristics; be sure to use the same fuel filler cap as installed in this vehicle.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Battery

General Description

There are six battery fluid caps on top of the battery. These are covered by a paper label. The battery is completely sealed except for the six small vent holes on the side. These vent holes permit the escape of small amounts of gas generated by the battery.

This type of battery has the following advantages over conventional batteries:

1. There is no need to add water during the entire service life of the battery.
2. The battery protects itself against overcharging. The battery will refuse to accept an extensive charge. (A conventional battery will accept an excessive charge, resulting in gassing and loss of battery fluid.)
3. The battery is much less vulnerable to self discharge than a conventional type battery.

Diagnosis

1. Visual Inspection

Inspect the battery for obvious physical damage, such as a cracked or broken case, which would permit electrolyte loss.

Replace the battery if obvious physical damage is discovered during inspection.

Check for any other physical damage and correct it as necessary.

2. Hydrometer Check

There is a built-in hydrometer (Charge test indicator(1)) at the top of the battery. It is designed to be used during diagnostic procedures.

Before trying to read the hydrometer, carefully clean the upper battery surface.

If your work area is poorly lit, additional light may be necessary to read the hydrometer.

- a BLUE RING OR DOT VISIBLE(5) – Go to Step 4.

- b BLUE RING OR DOT NOT VISIBLE(4) – Go to Step 3.

061RX001

3. Fluid Level Check

The fluid level should be between the upper level line(2) and lower level line(3) on side of battery.

- a CORRECT FLUID LEVEL – Charge the battery.
b BELOW LOWER LEVEL – Replace battery.

061RX001

4. Voltage Check

1. Put voltmeter test leads to battery terminals.
 - a VOLTAGE IS 12.4V OR ABOVE – Go to Step 5.
 - b VOLTAGE IS UNDER 12.4V – Go to procedure (2) below.
2. Determine fast charge amperage from specification. (See Main Data and Specifications in this section). Fast charge battery for 30 minutes at amperage rate no higher than specified value. Take voltage and amperage readings after charge.
 - a VOLTAGE IS ABOVE 16V AT BELOW 1/3 OF AMPERAGE RATE – Replace battery.
 - b VOLTAGE IS ABOVE 16V AT ABOVE 1/3 OF AMPERAGE RATE – Drop charging voltage to 15V and charge for 10 – 15 hours. Then go to Step 5.
 - c VOLTAGE IS BETWEEN 12V AND 16V – Continue charging at the same rate for an additional 3-1/2 hours. Then go to Step 5.
 - d VOLTAGE BELOW 12V – Replace Battery.

5. Load Test

1. Connect a voltmeter and a battery load tester across the battery terminals.
2. Apply 300 ampere load for 15 seconds to remove surface charge from the battery. Remove load.
3. Wait 15 seconds to let battery recover. Then apply specified load from specifications (See Main Data and Specifications in this section). Read voltage after 15 seconds, then remove load.
 - a VOLTAGE DOES NOT DROP BELOW THE MINIMUM LISTED IN THE TABLE – The battery is good and should be returned to service.
 - b VOLTAGE IS LESS THAN MINIMUM LISTED – Replace battery.

ESTIMATED TEMPERATURE		MINIMUM VOLTAGE
°F	°C	V
70	21	9.6
60	16	9.5
50	10	9.4
40	4	9.3
30	-1	9.1
20	-7	8.9
10	-12	8.7
0	-18	8.5

The battery temperature must be estimated by feel and by the temperature the battery has been exposed to for the preceding few hours.

Battery Charging

Observe the following safety precautions when charging the battery:

1. Never attempt to charge the battery when the fluid level is below the lower level line on the side of the battery. In this case, the battery must be replaced.
2. Pay close attention to the battery during charging procedure. Battery charging should be discontinued or the rate of charge reduced if the battery feels hot to the touch. battery charging should be discontinued or the rate of charge reduced if the battery begins to gas or spew electrolyte from the vent holes.
3. In order to more easily view the hydrometer blue dot or ring, it may be necessary to jiggle or tilt the battery.
4. Battery temperature can have a great effect on battery charging capacity.
5. The sealed battery used on this vehicle may be either quick charged or slow charged in the same manner as other batteries. Whichever method you decide to use, be sure that you completely charge the battery. Never partially charge the battery.

Jump Starting

Jump Starting with an Auxiliary (Booster) Battery

CAUTION: Never push or tow the vehicle in an attempt to start it. Serious damage to the emission system as well as other vehicle parts will result. Treat both the discharged battery and the booster battery with great care when using jumper cables. Carefully follow the jump starting procedure, being careful at all times to avoid sparking.

WARNING: FAILURE TO CAREFULLY FOLLOW THE JUMP STARTING PROCEDURE COULD RESULT IN THE FOLLOWING:

1. Serious personal injury, particularly to your eyes.
2. Property damage from a battery explosion, battery acid, or an electrical fire.
3. Damage to the electronic components of one or both vehicles particularly.

Never expose the battery to an open flame or electrical spark. Gas generated by the battery may catch fire or explode.

Remove any rings, watches, or other jewelry before working around the battery. Protect your eyes by wearing an approved set of goggles.

Never allow battery fluid to come in contact with your eyes or skin.

Never allow battery fluid to come in contact with fabrics or painted surfaces.

Battery fluid is a highly corrosive acid.

6D1-4 ENGINE ELECTRICAL (X22SE 2.2L)

Should battery fluid come in contact with your eyes, skin, fabric, or a painted surface, immediately and thoroughly rinse the affected area with clean tap water. Never allow metal tools or jumper cables to come in contact with the positive battery terminal, or any other metal surface of the vehicle. This will protect against a short circuit.

Always keep batteries out of reach of young children.

Jump Starting Procedure

1. Set the vehicle parking brake.
If the vehicle is equipped with an automatic transmission, place the selector level in the "PARK" position.
If the vehicle is equipped with a manual transmission place the shift lever in the "NEUTRAL" position.
Turn "OFF" the ignition.
Turn "OFF" all lights and any other accessory requiring electrical power.
2. Look at the built-in hydrometer.
If the indication area of the built-in hydrometer is completely clear, do not try to jump start.
3. Attach the end of one jumper cable to the positive terminal of the booster battery.
Attach the other end of the same cable to the positive terminal of the discharged battery.
Do not allow the vehicles to touch each other. This will cause a ground connection, effectively neutralizing the charging procedure.
Be sure that the booster battery has a 12 volt rating.
4. Attach one end of the remaining cable to the negative terminal of the booster battery.
Attach the other end of the same cable to a solid engine ground (such as the air conditioning compressor bracket or the generator mounting bracket) of the vehicle with the discharged battery.
The ground connection must be at least 450 mm (18 in.) from the battery of the vehicle whose battery is being charged.

WARNING: NEVER ATTACH THE END OF THE JUMPER CABLE DIRECTLY TO THE NEGATIVE TERMINAL OF THE DEAD BATTERY.

5. Start the engine of the vehicle with the good battery.
Make sure that all unnecessary electrical accessories have been turned "OFF".
6. Start the engine of the vehicle with the dead battery.
7. To remove the jumper cables, follow the above directions in reverse order.
Be sure to first disconnect the negative cable from the vehicle with the discharged battery.

Battery Removal

1. Remove negative cable (1).
2. Remove positive cable (2).
3. Remove retainer screw and rods (3).

4. Remove retainer (4).
5. Remove battery (5).

061RX002

Battery Installation

1. Install battery (5).
2. Install retainer (4).
3. Install retainer screw and rods (3).

Make sure that the rod is hooked on the body side.

4. Install positive cable (2).
5. Install negative cable (1).

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

Ignition is done by the Ignition Module that fires. Since the cylinder on exhaust stroke requires less energy to fire its spark plug, energy from the ignition coils can be utilized to fire the mating cylinder on compression stroke.

A notch in the timing disc on the crankshaft activates the crank angle sensor which then sends information such as firing order and starting timing of ignition coil to the PCM.

By receiving signals such as crank position, engine speed, water temperature and Manifold Absolute Pressure (MAP), the PCM controls the ignition timing.

Diagnosis

Refer to Section Drivability and Emissions for the diagnosis to electronic ignition system (EI system).

Ignition Module

Removal

1. Disconnect battery ground cable.
2. Remove ABS hydraulic unit assembly.
3. Remove master Vac and brake booster assembly.
4. Remove heater hoses from water rail.
5. Disconnect ignition coil cable from ignition module.
6. Remove connector from ignition module.
7. Remove ignition module assembly with bracket (1).

080RW001

Installation

1. Install the ignition module assembly with bracket (1).
2. Connect ignition module connector and ignition coil, then tighten bolt to the specified torque.

Torque: 20 N·m (2.0 kg·m/15 lb ft)

3. Connect ignition coil cable.
4. Install heater hoses.
5. Install master Vac and brake booster assembly.
6. Install ABS hydraulic unit assembly.
7. Bleed Air, brake system.

080RW001

8. Connect battery ground cable.

Spark Plug

Removal

1. Remove spark plugs.

Inspection and Repair

The spark plug affects entire engine performance and therefore its inspection is very important.

- Check electrode and insulator for presence of cracks, and replace if any.
- Check electrode for wear, and replace if necessary.
- Check gasket for damage, and replace if necessary.
- Measure insulation resistance with an ohmmeter, and replace if faulty.
- Adjust spark plug gap to 0.7 mm (0.027 in) ~ 0.8 μm (0.031 in).
- Check fuel and electrical systems if spark plug is extremely dirty.

- Use spark plugs having low heat value (hot type plug) if fuel and electrical systems are normal.
- Use spark plugs having high heat value (cold type plug) if insulator and electrode are extremely burned.

Sooty Spark Plugs

Much deposit of carbon or oil on the electrode and insulator of spark plug reduces the engine performance.

Possible causes:

- Too rich mixture
- Presence of oil in combustion chamber
- Incorrectly adjusted spark plug gap

Burning Electrodes

This fault is characterized by scorched or heavily oxidized electrode or blistered insulator nose.

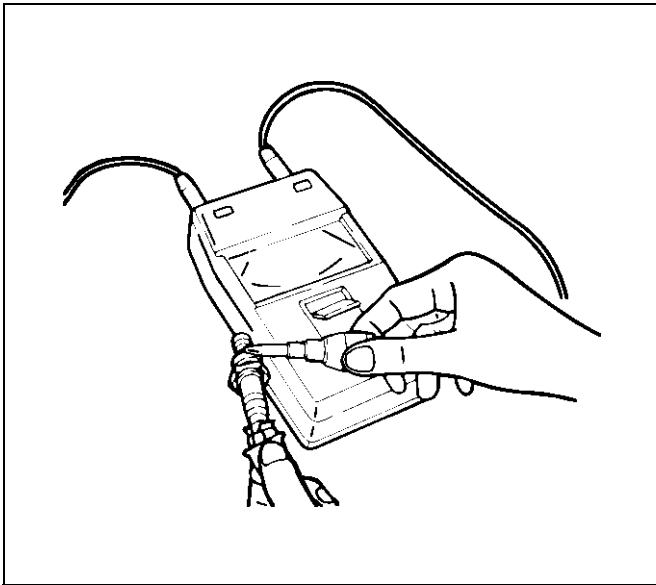

Possible causes:

- Too lean mixture
- Improper heat value

Measuring Insulation Resistance

- Measure insulation resistance using a 500 volt megaohm meter.
- Replace spark plugs if measured value is out of standard.

Insulation resistance: 50 MΩ or more

011RS010

011RS011

Installation

1. Spark plugs
 - Tighten spark plugs to the specified torque.

Torque: 25 N·m (2.5 kg·m/18 lb ft)

Cleaning Spark Plugs

- Clean spark plugs with a spark plug cleaner.
- Raise the ground electrode to an angle of 45 to 60 degrees. If electrode is wet, dry it before cleaning.
- After spark plug is thoroughly cleaned, check insulator for presence of cracks.
- Clean threads and metal body with a wire brush.
- File the electrode tip if electrode is extremely worn.
- Bend the ground electrode to adjust the spark plug gap.

Crankshaft Angle Sensor

Removal

1. Disconnect battery ground cable
2. Wiring connector from crankshaft angle sensor.
3. Remove crankshaft angle sensor from cylinder block.

015RW021

Installation

1. Install crankshaft angle sensor into the cylinder block.
Before installation, apply small amount of engine oil to the O-ring.

Torque: 6 N·m (0.6 kg·m/4 lb ft)

2. Reconnect wiring connector to crankshaft angle sensor.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Starting System

General Description

Cranking Circuit

The cranking system consists of a battery, starter, starter switch, starter relay, etc. These main components are connected.

Starter

The cranking system employs a magnetic type reduction starter in which the motor shaft is also used

as a pinion shaft. When the starter switch is turned on, the contacts of magnetic switch are closed, and the armature rotates. At the same time, the plunger is attracted, and the pinion is pushed forward by the shift lever to mesh with the ring gear.

Then, the ring gear runs to start the engine. When the engine starts and the starter switch is turned off, the plunger returns, the pinion is disengaged from the ring gear, and the armature stops rotation. When the engine speed is higher than the pinion, the pinion idles, so that the armature is not driven.

Diagnosis

Condition	Possible cause	Correction
Starter does not run	Charging failure	Repair charging system
	Battery Failure	Replace Battery
	Terminal connection failure	Repair or replace terminal connector and/or wiring harness
	Starter switch failure	Repair or replace starter switch
	Starter failure	Repair or replace starter

Starter

Removal

1. Battery ground cable.
2. Remove harness connectors (1) and (2).

065RW022

3. Remove bolts from starter (1), (2).

065RW024

065RW024

3. Connect harness.
4. Reconnect the battery ground cable.

Installation

1. Install starter assembly(6).
2. Install mounting bolts and tighten bolts to specified torque (1), (2).

Torque: 25 N-m (2.5 kg-m/18 lb ft)

Inspection and Repair

Repair or replace necessary parts if extreme wear or damage is found during inspection.

Armature

Check for continuity between commutator and segment. Replace commutator if there is no continuity (i.e., disconnected).

065RS015

Check for continuity between commutator and shaft. Also, check for continuity between commutator and armature core, armature core and shaft. Replace commutator if there is continuity (i.e., internally grounded).

065RS016

Brush

Measure the length of brush. Replace with a new one, if it is below the limit.

Brush Holder

Check for continuity between brush holder (+) (4) and base (-). Replace, if there is continuity (i.e., insulation is broken).

065RW015

Magnetic Switch

Check for continuity of shunt coil between terminals S and M.

Replace, if there is no continuity (i.e., coil is disconnected).

065RW016

Continuity of Series Coil

Check for continuity between terminals S and M. Replace, if there is no continuity (i.e., coil is disconnected).

065RW017

Continuity of Contacts

With the plunger faced downward, push down the magnetic switch. In this state, check for continuity between terminals B and M. Replace, if there is no continuity (i.e., contacts are faulty).

065RW018

Pinion

Check if the pinion rotates smoothly in drive direction by hand, or if it is locked when it is rotated in reverse. If not, replace the pinion.

065RS025

Characteristic Test

For easily confirming the characteristics, conduct the no-load test as follows:

Rating as short as 30 seconds requires rapid testing. Fix the starter on the test bench, and wire as shown in illustration. When the switch is closed, the current flows and the starter runs under no load. At this time, measure current, voltage and speed to check if they satisfy the standard.

Charging System

General Description

The charging system is an IC integral regulator charging system and its main components are connected as shown in illustration.

The regulator is a solid state type and it is mounted along with the brush holder assembly inside the generator installed on the rear end cover.

The generator does not require particular maintenance such as voltage adjustment. The rectifier connected to the stator coil has eight diodes to transform AC voltage into DC voltage.

This DC voltage is connected to the output terminal of generator.

General On-Vehicle Inspection

The operating condition of charging system is indicated by the charge warning lamp. The warning lamp comes on when the starter switch is turned to "ON" position.

The charging system operates normally if the lamp goes off when the engine starts.

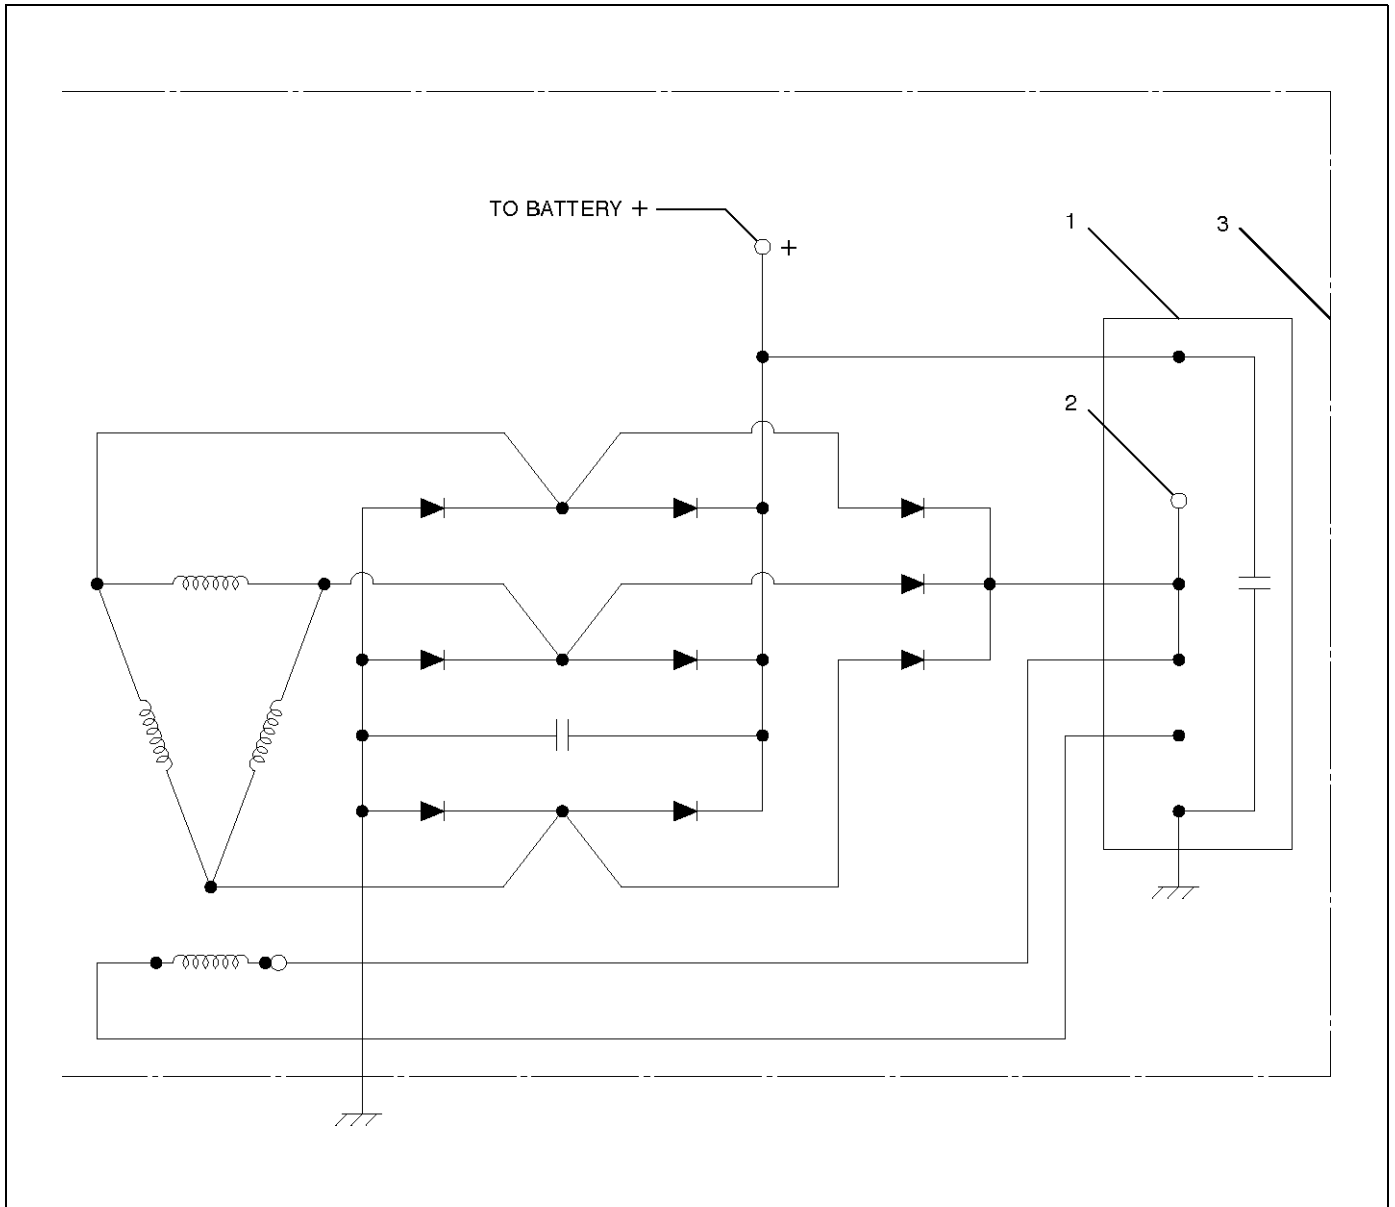

If the warning lamp shows abnormality or if undercharged or overcharged battery condition is suspected, perform diagnosis by checking the charging system as follows:

1. Check visually the belt and wiring connector.

6D3-8 STARTING AND CHARGING SYSTEM (X22SE 2.2L)

2. With the engine stopped, turn the stator switch to "ON" position and observe the warning lamp.
If lamp does not come on:
Disconnect wiring connector from generator, and

ground the terminal "L" on connector side.
If lamp comes on:
Repair or replace the generator.

Legend

- (1) Regulator
- (2) Indicator Lamp
- (3) Generator Assembly

Generator

Removal

1. Disconnect battery ground cable.
2. Move drive belt tensioner to loose side using wrench then remove drive belt.
3. Disconnect terminal "B" wiring connector and connector.
4. Remove generator bracket (1), (2) and remove generator assembly.

065RW025

Inspection

Generator Power and Circuit Diagram

Legend

- (1) Load resistor, set parallel to battery
- (2) Battery
- (3) Voltmeter
- (4) Ammeter
- (5) Ignition Lock
- (6) Charge Telltale
- (7) Generator

1. Disconnect battery.
2. Close off connecting cable from alternator terminal "B+".
3. Set ammeter (measuring range 100A) in disconnected line.
4. Connect controllable load resistor to battery terminal.
5. Set resistor in front of connection to "0"; connect first to battery, then to resistor.
6. Connect tachometer.
7. Connect oscilloscope according to manufacturer's instructions.
8. Connect battery.
9. Start engine and read off resulting current at various engine speeds.

Generator Power

1. Adjust load resistor, if the required load currents are not attained.
2. The shape of the voltage curves on oscilloscope curve should be regular.
3. Test value: 5 to 7A.
4. If the required minimum current intensity is not attained, or if the oscilloscope picture shows variations, the alternator should be overhauled.

066RW018

Regulated Voltage Circuit Diagram

- (2) Ignition Lock
- (3) Charge Telltale
- (4) Resistor, for attainment of load current with the battery set in series
- (5) Voltmeter
- (6) Ammeter
- (7) Generator

Installation

1. Install generator assembly and bring generator assembly to the position to be installed.
2. Install generator bracket (1), (2) and tighten to the specified torque.

Torque:

Long bolt: 35 N·m (3.6 kg·m/26 lb ft)

Short bolt: 20 N·m (2.0 kg·m/15 lb ft)

065RW025

3. Connect wiring harness connector.
4. Move drive belt tensioner to loose side using wrench, then install drive belt to normal position.
5. Reconnect battery ground cable.

Disassembly

1. Belt pulley nut.

066RW016

- 2. Spring ring, washer, belt pulley halves, spacing ring, fan pinion, pulley spring.
- 3. Voltage regulator with brush holder.

066RW014

- 4. Drive bearing with clawpole armature.
- 5. Mark housing halves.
- 6. 4 fastening bolts.

066RW015

- 7. Clawpole armature from drive bearing.
- 8. Lay suitable pipe piece (1) underneath.

066RW013

- 9. Bearing cover of drive bearing.
- 10. Ball bearing from drive bearing.

066RW017

11. Ball bearing from armature shaft.

066RW012

12. Nut from connecting pins "B+" and "D+".

13. Washers and insulating material.

14. Diode plate.

15. Remove together with stator winding from slip ring bearing.

066RW008

16. Spray sleeve (if present).

17. Carefully bend off diode plate.

18. Unsolder stator winding from diode plate.

066RW010

Inspection and Repair

Repair or replace necessary parts if extreme wear or damage is found during inspection.

Rotor Assembly

1. Check the rotor slip ring surfaces for contamination and roughness. If rough, polish with #500-600 sandpaper.

066RS014

2. Measure the slip ring diameter, and replace if it exceeds the limit.

066RS015

3. Check resistance between slip rings, and replace if there is no continuity.

066RS016

4. Check for continuity between slip ring and rotor core.
In case of continuity, replace the rotor assembly.

066RS017

Stator Coil

1. Measure resistance between respective phases.
2. Measure insulation resistance between stator coil and core with a mega-ohmmeter.
If less than standard, replace the coil.

066RS018

Brush

Measure the brush length.
If more than limit, replace the brush.

Standard: 5 mm (0.20 in)

066RW009

Clamp pulley to the vise, and tighten nut to the specified torque.

Torque: 40 N·m (4.1 kg·m/30 lbft)

066RS010

Rectifier Assembly

Check for continuity across "1" and "2" in the $\times 100W$ range of multimeter.

066RW011

Change polarity, and make sure that there is continuity in one direction, and not in the reverse direction. In case of continuity in both directions, replace the rectifier assembly.

Reassembly

To reassemble, follow the disassembly steps in the reverse order, noting the following points:

1. Install pulley on the rotor.

COMPONENT LOCATOR

Engine Component Locator Table

Number	Name	Location
1	Engine Coolant Temperature (ECT) Sensor	Rear of engine, near ignition coils
2	Linear Exhaust Gas Recirculation (EGR) Valve	On the left rear of the engine at the bulkhead
3	Heated Oxygen Sensor (HO2S), Bank 1, Sensor 1	On the exhaust pipe, left side of engine, immediately behind the exhaust manifold
4	Air Cleaner	Left front of the engine bay
5	Intake Air Temperature (IAT) Sensor	On the intake air duct near the air cleaner
6	Camshaft Position (CMP) Sensor	Inside the front cover assembly
7	Positive Crankcase Ventilation (PCV) Port	On the right front corner of the valve cover
8	Fuel Pressure Regulator	On the forward end of the fuel rail, to the right of the PVC port
9	Throttle Body	Between the intake air duct and the intake manifold
10	Fuse/Relay Box	Along the inside of the right fender
11	Throttle Position (TP) Sensor	On the front of the throttle body
12	Idle Air Control (IAC) Valve	On the rear of the throttle body
13	Ignition Control Module (ICM)	Mounted on a heat sink on the lower right side of the engine block, above the starter motor
14	Manifold Absolute Pressure (MAP) Sensor	Bolted to the front edge of the intake manifold, under the fuel rail
15	High Fan Relay	In the relay box
16	Low Fan Relay	In the relay box

010RX001

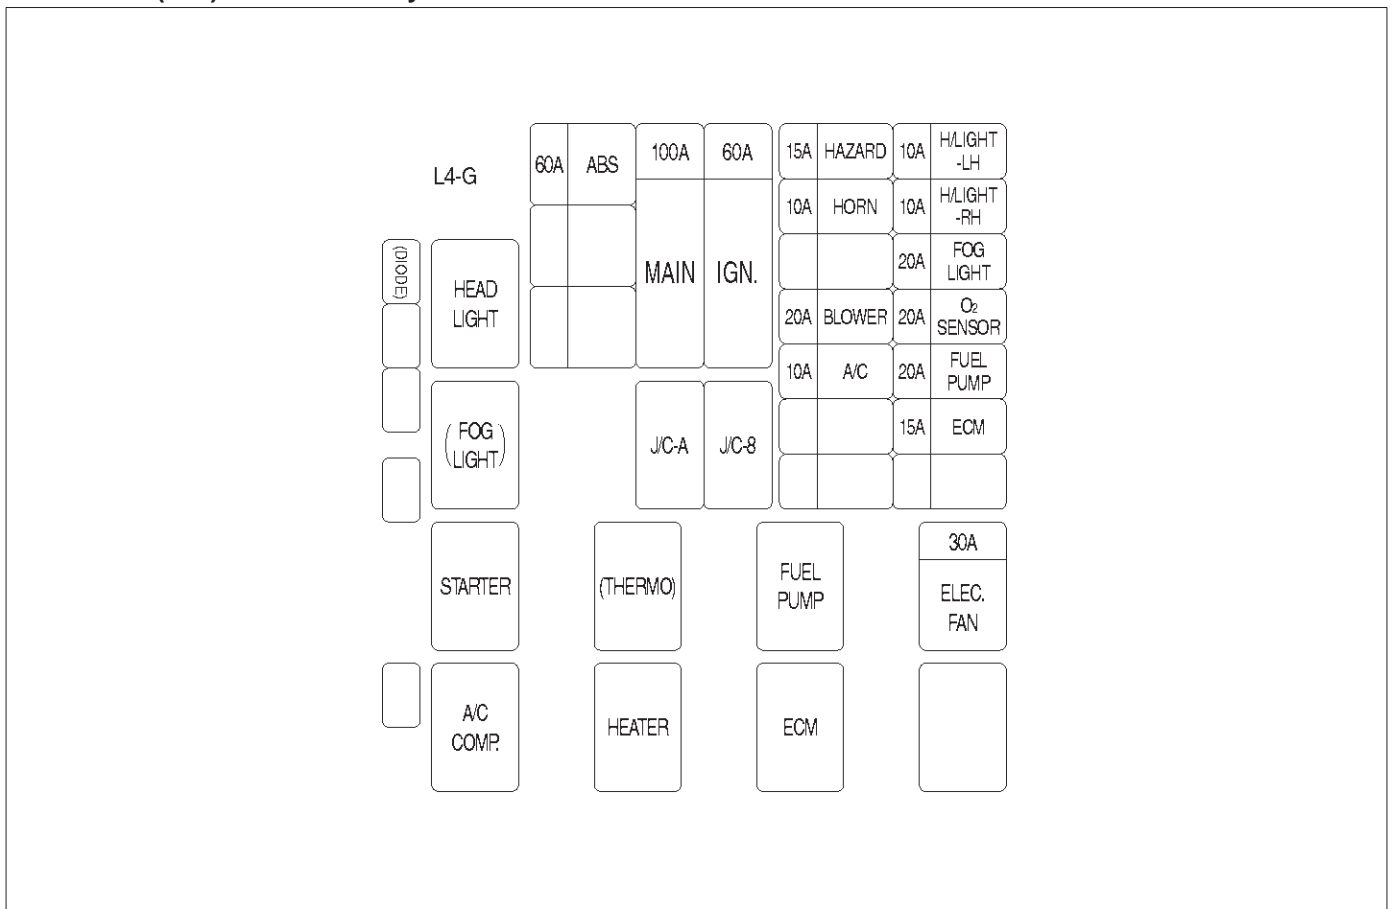

028RX001

Undercarriage Component Locator Table

Name	Location
Fuel Pump Assembly	Installed in the top of the fuel tank
EVAP Canister	Behind rear axle, near fuel tank filler nozzle
EVAP Canister Purge Valve Solenoid	Behind rear axle, near fuel tank filler nozzle
Vehicle Speed Sensor (VSS)	Protrudes from the right side of the transmission housing, near the output shaft
Crankshaft Position (CKP) Sensor	Lower left hand front of engine, behind power steering pump bracket

Fuse And Relay Panel (Underhood Electrical Center)

Underhood (U/H) Fuse and Relay Panel

DIAGNOSIS Strategy-Based Diagnostics

Strategy-Based Diagnostics

The strategy-based diagnostic is a uniform approach to repair all Electrical/Electronic (E/E) systems. The diagnostic flow can always be used to resolve an E/E system problem and is a starting point when repairs are necessary. The following steps will instruct the technician how to proceed with a diagnosis:

1. Verify the customer complaint.
 - To verify the customer complaint, the technician should know the normal operation of the system.
2. Perform preliminary checks.
 - Conduct a thorough visual inspection.
 - Review the service history.
 - Detect unusual sounds or odors.
 - Gather diagnostic trouble code information to achieve an effective repair.
3. Check bulletins and other service information.
 - This includes videos, newsletters, etc.
4. Refer to service information (manual) system check(s).
 - "System checks" contain information on a system that may not be supported by one or more DTCs. System checks verify proper operation of the system. This will lead the technician in an organized approach to diagnostics.
5. Refer to service diagnostics.

DTC Stored

Follow the designated DTC chart exactly to make an effective repair.

No DTC

Select the symptom from the symptom tables. Follow the diagnostic paths or suggestions to complete the repair. You may refer to the applicable component/system check in the system checks.

No Matching Symptom

1. Analyze the complaint.
2. Develop a plan for diagnostics.
3. Utilize the wiring diagrams and the theory of operation.

Combine technician knowledge with efficient use of the available service information.

Intermittents

Conditions that are not always present are called intermittents. To resolve intermittents, perform the following steps:

1. Observe history DTCs, DTC modes, and freeze-frame data.
2. Evaluate the symptoms and the conditions described by the customer.

3. Use a check sheet or other method to identify the circuit or electrical system component.
4. Follow the suggestions for intermittent diagnosis found in the service documentation.

Most Scan Tools, such as the Tech 2, have data-capturing capabilities that can assist in detecting intermittents.

No Trouble Found

This condition exists when the vehicle is found to operate normally. The condition described by the customer may be normal. Verify the customer complaint against another vehicle that is operating normally. The condition may be intermittent. Verify the complaint under the conditions described by the customer before releasing the vehicle.

1. Re-examine the complaint.

When the complaint cannot be successfully found or isolated, a re-evaluation is necessary. The complaint should be re-verified and could be intermittent as defined in *Intermittents*, or could be normal.

2. Repair and verify.

After isolating the cause, the repairs should be made. Validate for proper operation and verify that the symptom has been corrected. This may involve road testing or other methods to verify that the complaint has been resolved under the following conditions:

- Conditions noted by the customer.
- If a DTC was diagnosed, verify a repair by duplicating conditions present when the DTC was set as noted in the Failure Records or Freeze Frame data.

Verifying Vehicle Repair

Verification of the vehicle repair will be more comprehensive for vehicles with OBD II system diagnostics. Following a repair, the technician should perform the following steps:

IMPORTANT: Follow the steps below when you verify repairs on OBD II systems. Failure to follow these steps could result in unnecessary repairs.

1. Review and record the Failure Records and the Freeze Frame data for the DTC which has been diagnosed (Freeze Frame data will only be stored for an A or B type diagnostic and only if the MIL ("Check Engine" lamp) has been requested).
2. Clear the DTC(s).
3. Operate the vehicle within conditions noted in the Failure Records and Freeze Frame data.
4. Monitor the DTC status information for the DTC which has been diagnosed until the diagnostic test associated with that DTC runs.

GENERAL SERVICE INFORMATION

Non-OEM Parts

All of the OBD diagnostics have been calibrated to run with OEM parts. Something as simple as a high-performance exhaust system that affects exhaust system back pressure could potentially interfere with the

operation of the EGR valve and thereby turn on the MIL ("Check Engine" lamp). Small leaks in the exhaust system near the post catalyst oxygen sensor can also cause the MIL ("Check Engine" lamp) to turn on.

Aftermarket electronics, such as transceiver, stereos, and anti-theft devices, may radiate EMI into the control system if they are improperly installed. This may cause a false sensor reading and turn on the MIL ("Check Engine" lamp).

Environment

Temporary environmental conditions, such as localized flooding, will have an effect on the vehicle ignition system. If the ignition system is rain-soaked, it can temporarily cause engine misfire and turn on the MIL ("Check Engine" lamp).

Emissions Control Information Label

The engine compartment "Vehicle Emissions Control Information Label" contains important emission specifications and setting procedures. In the upper left corner is exhaust emission information. There is also an illustrated emission components and vacuum hose schematic.

This label is located in the engine compartment of every vehicle. If the label has been removed it should be replaced, it can be ordered from Isuzu Dealer ship.

Maintenance Schedule

Refer to the Maintenance Schedule.

Visual/Physical Engine Compartment Inspection

Perform a careful visual and physical engine compartment inspection when performing any diagnostic procedure or diagnosing the cause of an emission test failure. This can often lead to repairing a problem without further steps. Use the following guidelines when performing a visual/physical inspection:

- Inspect all vacuum hoses for pinches, cuts, disconnection, and Droper routing.
- Inspect hoses that are difficult to see behind other components.
- Inspect all wires in the engine compartment for proper connections, burned or chafed spots, pinched wires, contact with sharp edges or contact with hot exhaust manifolds or pipes.

Basic Knowledge Of Tools Required

NOTE: Lack of basic knowledge of this powertrain when performing diagnostic procedures could result in an incorrect diagnosis or damage to powertrain components. Do not attempt to diagnose a powertrain problem without this basic knowledge.

A basic understanding of hand tools is necessary to effectively use this section of the Service Manual.

SERIAL DATA COMMUNICATIONS

Class II Serial Data Communications

Government regulations require that all vehicle manufacturers establish a common communication system. This vehicle utilizes the "Class II" communication system. Each bit of information can have one of two lengths: long or short. This allows vehicle wiring to be reduced by transmitting and receiving multiple signals over a single wire. The messages carried on Class II data streams are also prioritized. If two messages attempt to establish communications on the data line at the same time, only the message with higher priority will continue. The device with the lower priority message must wait. The most significant result of this regulation is that it provides Tech 2 manufacturers with the capability to access data from any make or model vehicle that is sold.

The data displayed on the other Tech 2 will appear the same, with some exceptions. Some Scan Tools will only be able to display certain vehicle parameters as values that are a coded representation of the true or actual value. For more information on this system of coding, refer to Decimal/Binary/Hexadecimal Conversions. On this vehicle the Tech 2 displays the actual values for vehicle parameters. It will not be necessary to perform any conversions from coded values to actual values.

ON-BOARD DIAGNOSTIC (OBD)

On-Board Diagnostic Tests

A diagnostic test is a series of steps, the result of which is a pass or fail reported to the diagnostic executive. When a diagnostic test reports a pass result, the diagnostic executive records the following data:

- The diagnostic test has been completed since the last ignition cycle.
- The diagnostic test has passed during the current ignition cycle.
- The fault identified by the diagnostic test is not currently active.

When a diagnostic test reports a fail result, the diagnostic executive records the following data:

- The diagnostic test has been completed since the last ignition cycle.
- The fault identified by the diagnostic test is currently active.
- The fault has been active during this ignition cycle.
- The operating conditions at the time of the failure.

Remember, a fuel trim DTC may be triggered by a list of vehicle faults. Make use of all information available (other

DTCs stored, rich or lean condition, etc.) when diagnosing a fuel trim fault.

Comprehensive Component Monitor Diagnostic Operation

Input Components:

Input components are monitored for circuit continuity and out-of-range values. This includes rationality checking. Rationality checking refers to indicating a fault when the signal from a sensor does not seem reasonable, i.e. Throttle Position (TP) sensor that indicates high throttle position at low engine loads or MAP voltage). Input components may include, but are not limited to the following sensors:

- Vehicle Speed Sensor (VSS)
- Crankshaft Position (CKP) sensor
- Throttle Position (TP) sensor
- Engine Coolant Temperature (ECT) sensor
- Camshaft Position (CMP) sensor
- Manifold Absolute Pressure (MAP) sensor

In addition to the circuit continuity and rationality check the ECT sensor is monitored for its ability to achieve a steady state temperature to enable "Closed Loop" fuel control.

Output Components:

Output components are diagnosed for proper response to control module commands. Components where functional monitoring is not feasible will be monitored for circuit continuity and out-of-range values if applicable. Output components to be monitored include, but are not limited to the following circuit:

- Idle Air Control (IAC) Motor
- EVAP Canister Purge Valve Solenoid
- A/C relays
- Cooling fan relay(s)
- VSS output
- MIL control

Refer to ECM and Sensors in General Descriptions.

Passive and Active Diagnostic Tests

A passive test is a diagnostic test which simply monitors a vehicle system or component. Conversely, an active test, actually takes some sort of action when performing diagnostic functions, often in response to a failed passive test. For example, the EGR diagnostic active test will force the EGR valve open during closed throttle decel and/or force the EGR valve closed during a steady state. Either action should result in a change in manifold pressure.

Intrusive Diagnostic Tests

This is any on-board test run by the Diagnostic Management System which may have an effect on vehicle performance or emission levels.

Warm-Up Cycle

A warm-up cycle means that engine at temperature must reach a minimum of 70°C (160°F) and rise at least 22°C (40°F) over the course of a trip.

Freeze Frame

Freeze Frame is an element of the Diagnostic Management System which stores various vehicle information at the moment an emissions-related fault is stored in memory and when the MIL is commanded on. These data can help to identify the cause of a fault. Refer to Storing And Erasing Freeze Frame Data for more detailed information.

Failure Records

Failure Records data is an enhancement of the OBD Freeze Frame feature. Failure Records store the same vehicle information as does Freeze Frame, but it will store that information for any fault which is stored in on-board memory, while Freeze Frame stores information only for emission-related faults that command the MIL ON.

Common OBD Terms

Diagnostic

When used as a noun, the word diagnostic refers to any on-board test run by the vehicle's Diagnostic Management System. A diagnostic is simply a test run on a system or component to determine if the system or component is operating according to specification. There are many diagnostics, shown in the following list:

- Oxygen sensors
- Oxygen sensor heaters
- EGR

Enable Criteria

The term "enable criteria" is engineering language for the conditions necessary for a given diagnostic test to run. Each diagnostic has a specific list of conditions which must be met before the diagnostic will run. "Enable criteria" is another way of saying "conditions required". The enable criteria for each diagnostic is listed on the first page of the DTC description in Section 6E under the heading "Conditions for Setting the DTC". Enable criteria varies with each diagnostic, and typically includes, but is not limited to the following items:

- engine speed
- vehicle speed
- ECT
- MAP
- barometric pressure
- IAT
- TP
- A/C ON

Trip

Technically, a trip is a key on–run–key off cycle in which all the enable criteria for a given diagnostic are met, allowing the diagnostic to run. Unfortunately, this concept is not quite that simple. A trip is official when all the enable criteria for a given diagnostic are met. But because the enable criteria vary from one diagnostic to another, the definition of trip varies as well. Some diagnostics are run when the vehicle is at operating temperature, some when the vehicle first starts up; some require that the vehicle be cruising at a steady highway speed, some run only when the vehicle is at idle; some diagnostics function with the TCC disabled. Some run only immediately following a cold engine start–up.

A trip then, is defined as a key on–run–key off cycle in which the vehicle was operated in such a way as to satisfy the enabling criteria for a given diagnostic, and this diagnostic will consider this cycle to be one trip. However, another diagnostic with a different set of enable criteria (which were not met) during this driving event, would not consider it a trip. No trip will occur for that particular diagnostic until the vehicle is driven in such a way as to meet all the enable criteria.

The Diagnostic Executive

The Diagnostic Executive is a unique segment of software which is designed to coordinate and prioritize the diagnostic procedures as well as define the protocol for recording and displaying their results. The main responsibilities of the Diagnostic Executive are listed as follows:

- Commanding the MIL ("Check Engine" lamp) ON and OFF
- DTC logging and clearing
- Freeze Frame data for the first emission related DTC recorded
- Non–emission related Service Lamp (future)
- Operating conditions Failure Records buffer, (the number of records will vary)
- Current status information on each diagnostic
- System Status (I/M ready)

The Diagnostic Executive records DTCs and turns ON the MIL when emission–related faults occur. It can also turn OFF the MIL if the conditions cease which caused the DTC to set.

Diagnostic Information

The diagnostic charts and functional checks are designed to locate a faulty circuit or component through a process of logical decisions. The charts are prepared with the requirement that the vehicle functioned correctly at the time of assembly and that there are no multiple faults present.

There is a continuous self–diagnosis on certain control functions. This diagnostic capability is complimented by the diagnostic procedures contained in this manual. The language of communicating the source of the malfunction is a system of diagnostic trouble codes. When a malfunction is detected by the control module, a diagnostic trouble code is set and the Malfunction Indicator Lamp (MIL) ("Check Engine" lamp) is illuminated.

Malfunction Indicator Lamp (MIL)

The Malfunction Indicator Lamp (MIL) looks the same as the MIL you are already familiar with ("Check Engine" lamp). However, OBD requires that it illuminate under a strict set of guide lines.

Basically, the MIL is turned ON when the ECM detects a DTC that will impact the vehicle emissions.

The MIL is under the control of the Diagnostic Executive. The MIL will be turned ON if an emissions–related diagnostic test indicates a malfunction has occurred. It will stay ON until the system or component passes the same test, for three consecutive trips, with no emissions–related faults.

Extinguishing the MIL

When the MIL is ON, the Diagnostic Executive will turn OFF the MIL after *three (3) consecutive* trips that a "test passed" has been reported for the diagnostic test that originally caused the MIL to illuminate.

Although the MIL has been turned OFF, the DTC will remain in the ECM memory (both Freeze Frame and Failure Records) until *forty(40) warm–up cycles after no faults* have been completed.

If the MIL was set by either a fuel trim or misfire–related DTC, additional requirements must be met. In addition to the requirements stated in the previous paragraph, these requirements are as follows:

- The diagnostic tests that are passed must occur with 375 RPM of the RPM data stored at the time the last test failed.
- Plus or minus ten (10) percent of the engine load that was stored at the time the last test failed.
- Similar engine temperature conditions (warmed up or warming up) as those stored at the time the last test failed.

Meeting these requirements ensures that the fault which turned on the MIL has been corrected.

The MIL ("Check Engine" lamp) is on the instrument panel and has the following functions:

- It informs the driver that a fault that affects vehicle emission levels has occurred and that the vehicle should be taken for service as soon as possible.
- As a bulb and system check, the MIL will come ON with the key ON and the engine not running. When the engine is started, the MIL will turn OFF.
- When the MIL remains ON while the engine is running, or when a malfunction is suspected due to a driveability or emissions problem, a Powertrain On–Board Diagnostic (OBD) System Check must be performed. The procedures for these checks are given in On–Board Diagnostic (OBD) System Check. These checks will expose faults which may not be detected if other diagnostics are performed first.

DTC Types

Each DTC is directly related to a diagnostic test. The Diagnostic Management System sets DTC based on the failure of the tests during a trip or trips. Certain tests must fail two (2) consecutive trips before the DTC is set. The following are the four (4) types of DTCs and the characteristics of those codes:

- Type A
 - Emissions related
 - Requests illumination of the MIL of the first trip with a fail
 - Stores a History DTC on the first trip with a fail
 - Stores a Freeze Frame (if empty)
 - Stores a Fail Record
 - Updates the Fail Record each time the diagnostic test fails
- Type B
 - Emissions related
 - "Armed" after one (1) trip with a fail
 - "Disarmed" after one (1) trip with a pass
 - Requests illumination of the MIL on the *second consecutive trip* with a fail
 - Stores a History DTC on the second consecutive trip with a fail (The DTC will be armed after the first fail)
 - Stores a Freeze Frame on the second consecutive trip with a fail (if empty)
 - Stores a Fail Record when the first test fails (not dependent on *consecutive trip* fails)
 - Updates the Fail Record each time the diagnostic test fails

(Some special conditions apply to misfire and fuel trim DTCs)

- Type C (if the vehicle is so equipped)
 - Non-Emissions related
 - Requests illumination of the Service Lamp or the service message on the Drive Information Center (DIC) on the *first trip* with a fail
 - Stores a History DTC on the *first trip* with a fail
 - *Does not* store a Freeze Frame
 - Stores Fail Record when test fails
 - Updates the Fail Record each time the diagnostic test fails
- Type D. (*Type D* non-emissions related are not utilized on certain vehicle applications).
 - Non-Emissions related
 - Does not request illumination of any lamp
 - Stores a History DTC on the *first trip* with a fail
 - *Does not* store a Freeze Frame
 - Stores Fail Record when test fails
 - Updates the Fail Record each time the diagnostic test fails

IMPORTANT: Only four Fail Records can be stored. Each Fail Record is for a different DTC. It is possible that there will not be Fail Records for every DTC if multiple DTCs are set.

Storing and Erasing Freeze Frame Data and Failure Records

Government regulations require that engine operating conditions be captured whenever the MIL is illuminated. The data captured is called Freeze Frame data. The Freeze Frame data is very similar to a single record of operating conditions. Whenever the MIL is illuminated, the corresponding record of operating conditions is recorded to the Freeze Frame buffer.

Freeze Frame data can only be overwritten with data associated with a misfire or fuel trim malfunction. Data from these faults take precedence over data associated with any other fault. The Freeze Frame data will not be erased unless the associated history DTC is cleared.

Each time a diagnostic test reports a failure, the current engine operating conditions are recorded in the *Failure Records* buffer. A subsequent failure will update the recorded operating conditions. The following operating conditions for the diagnostic test which failed *typically* include the following parameters:

- Engine Speed
- Engine Load
- Engine Coolant Temperature
- Vehicle Speed
- TP
- MAP/BARO
- Injector Base Pulse Width
- Loop Status

Intermittent Malfunction Indicator Lamp

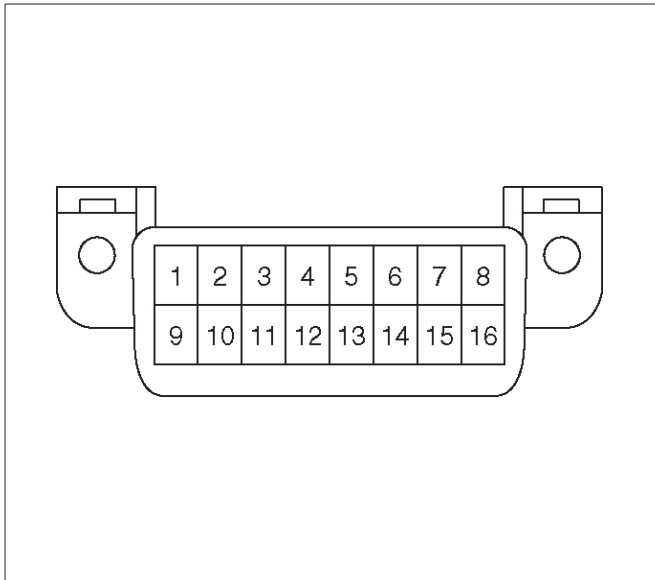

In the case of an "intermittent" fault, the MIL ("Check Engine" lamp) may illuminate and then (after three trips) go OFF. However, the corresponding diagnostic trouble code will be stored in the memory. When unexpected diagnostic trouble codes appear, check for an intermittent malfunction.

A diagnostic trouble code may reset. Consult the "Diagnostic Aids" associated with the diagnostic trouble code. A physical inspection of the applicable sub-system most often will resolve the problem.

Data Link Connector (DLC)

The provision for communicating with the control module is the Data Link Connector (DLC). It is located at the lower left of the instrument panel. The DLC is used to connect to the Tech 2 Scan tool. Some common uses of the Tech 2 are listed below:

- Identifying stored Diagnostic Trouble Codes (DTCs)
- Clearing DTCs
- Performing output control tests
- Reading serial data

TS24064

When a Tech 2 is not available, DTCs can also be cleared by disconnecting one of the following sources for at least thirty (30) seconds.

NOTE: To prevent system damage, the ignition key must be OFF when disconnecting or reconnecting battery power.

- The power source to the control module. Examples: fuse, pigtail at battery ECM connectors etc.
- The negative battery cable. (Disconnecting the negative battery cable will result in the loss of other on-board memory data, such as preset radio tuning).

Verifying Vehicle Repair

Verification of vehicle repair will be more comprehensive for vehicles with OBD II system diagnostics. Following a repair, the technician should perform the following steps:

1. Review and record the Fail Records and/or Freeze Frame data for the DTC which has been diagnosed (Freeze Frame data will only be stored for an A or B type diagnostic and only if the MIL has been requested).
2. Clear DTC(s).
3. Operate the vehicle within conditions noted in the Fail Records and/or Freeze Frame data.
4. Monitor the DTC status information for the DTC which has been diagnosed until the diagnostic test associated with that DTC runs.

Following these steps are very important in verifying repairs on OBD systems. Failure to follow these steps could result in unnecessary repairs.

Reading Diagnostic Trouble Codes Using A Tech 2 Scan Tool

The procedure for reading diagnostic trouble code(s) is to use a diagnostic Scan tool. When reading DTC(s), follow instructions supplied by tool manufacturer.

Clearing Diagnostic Trouble Codes

IMPORTANT: Do not clear DTCs unless directed to do so by the service information provided for each diagnostic procedure. When DTCs are cleared, the Freeze Frame and Failure Record data which may help diagnose an intermittent fault will also be erased from memory.

If the fault that caused the DTC to be stored into memory has been corrected, the Diagnostic Executive will begin to count the "warm-up" cycles with no further faults detected, the DTC will automatically be cleared from the ECM memory.

To clear Diagnostic Trouble Codes (DTCs), use the diagnostic Scan tool "clear DTCs" or "clear information" function. When clearing DTCs follow instructions supplied by the tool manufacturer.

Tech 2

From 98 MY, Isuzu dealer service departments are recommended to use the Tech 2 scan tool. Please refer to the Tech 2 user guide.

Legend

- | | |
|------------------------------|-----------------------|
| (1) PCMCIA Card | (3) SAE 16/19 Adaptor |
| (2) R232 Loop Back Connector | (4) DLC Cable |
| | (5) Tech 2 |

Tech 2 Features

1. Tech 2 is a 12 volt system. Do not apply 24 volt.
2. After connecting and/or installing, the Vehicle Communications Interface (VCI) module, PCMCIA card and DLC connector to the Tech 2, connect the tool to the vehicle DLC.
3. Make sure the Tech 2 is powered OFF when removing or installing the PCMCIA card.
4. The PCMCIA card has a capacity of 10 Megabytes which is 10 times greater than the memory of the Tech 1 Mass Storage Cartridge.
5. The Tech 2 has the capability of two snapshots.
6. The PCMCIA card is sensitive to magnetism and static electricity, so care should be taken in the handling of the card.
7. The Tech 2 can plot a graph when replaying a snapshot.
8. Always return to the Main Menu by pressing the EXIT key several times before shutting down.
9. To clear Diagnostic Trouble Codes (DTCs), open Application Menu and press "F1: Clear DTC Info".

Getting Started

- Before operating the Isuzu PCMCIA card with the Tech 2, the following steps must be performed:
 1. The Isuzu 99 System PCMCIA card (1) inserts into the Tech 2 (5).
 2. Connect the SAE 16/19 adapter (3) to the DLC cable (4).
 3. Connect the DLC cable to the Tech 2 (5)
 4. Make sure the vehicle ignition is off.
 5. Connect the Tech 2 SAE 16/19 adapter to the vehicle DLC.

810RW317

6. Turn on the vehicle ignition.
7. Power the Tech 2 ON and Verify the Tech 2 power up display.

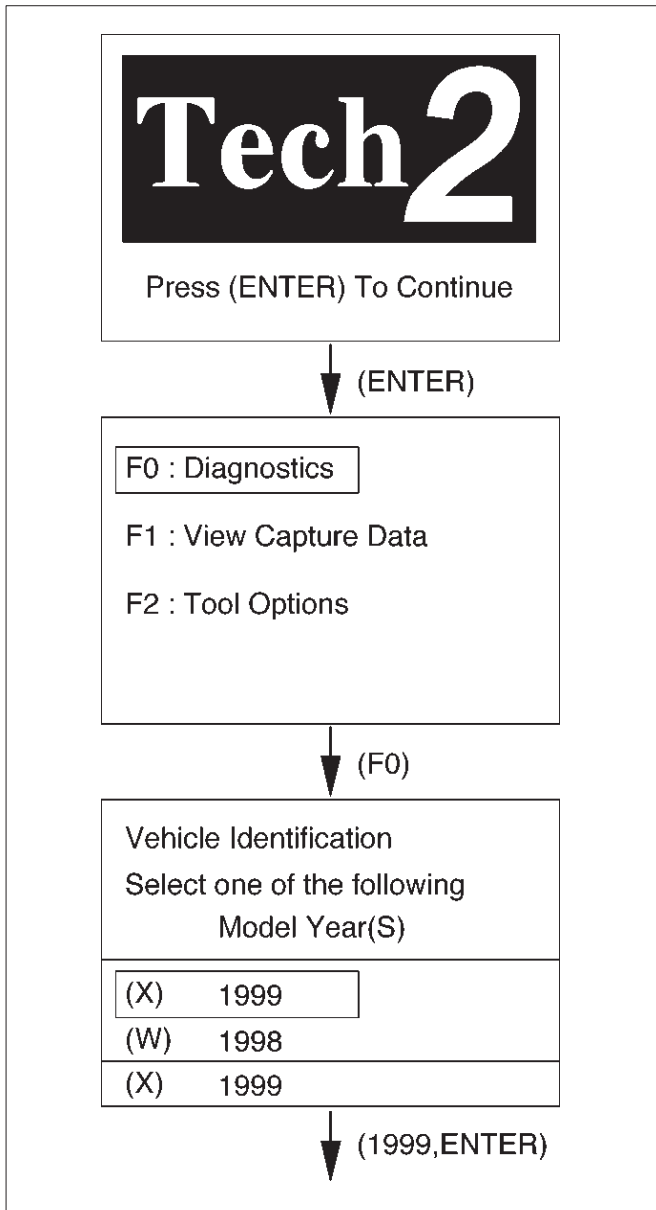

060RW009

NOTE: The RS232 Loop back connector is only to use for diagnosis of Tech 2 and refer to user guide of the Tech 2.

Operating Procedure (Example)

The power up screen is displayed when you power up the tester with the Isuzu system PCMCIA card. Follow the operating procedure below.

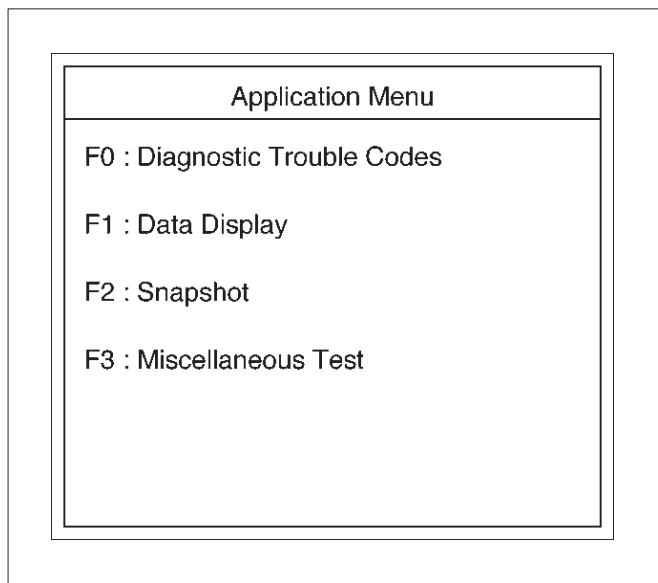

060RX060

060RX058

Menu

- The following table shows which functions are used for the available equipment versions.

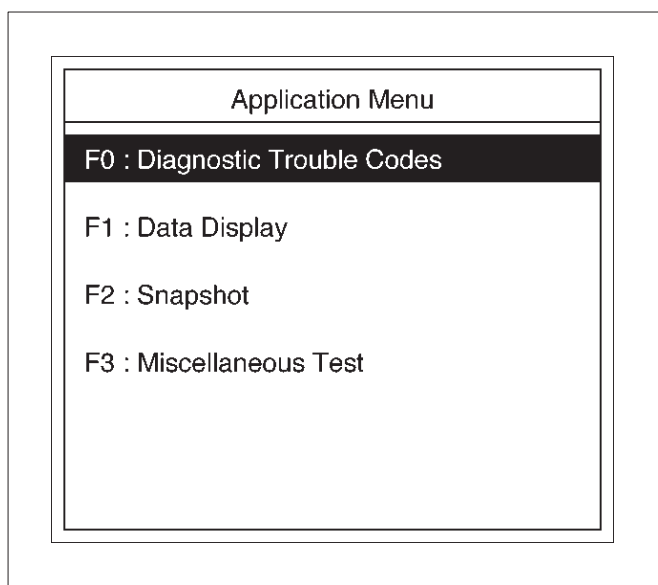

060RW224

060RW223

The following is a brief description of each of the sub menus in DTC Info and DTC. The order in which they appear here is alphabetical and not necessarily the way they will appear on the Tech 2.

DTC Modes

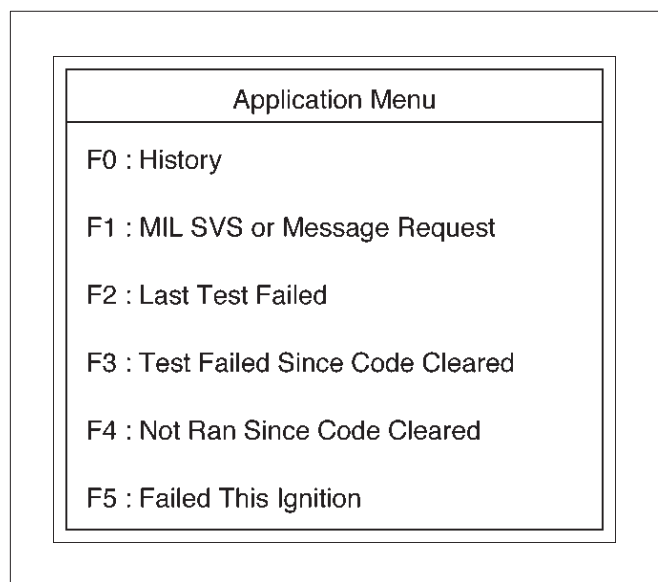

060RW229

On OBD II vehicles there are five options available in Tech 2 DTC mode to display the enhanced information available. After selecting DTC, the following menu appears:

- DTC Info
- Freeze Frame
- Fail Records (not all applications)
- Clear Info

DTC Information Mode

Use the DTC info mode to search for a specific type of stored DTC information. There are six choices. The service manual may instruct the technician to test for DTCs in a certain manner. Always follow published service procedures.

060RW221

DTC Status

This selection will display any DTCs that have not run during the current ignition cycle or have reported a test failure during this ignition up to a maximum of 33 DTCs. DTC tests which run and pass will cause that DTC number to be removed from Tech 2 screen.

Fail This Ignition

This selection will display all DTCs that have failed during the present ignition cycle.

History

This selection will display only DTCs that are stored in the ECM's history memory. It will display all type A and B DTCs that have requested the MIL and have failed within the last 40 warm-up cycles. In addition, it will display all type C and type D DTCs that have failed within the last 40 warm-up cycles.

Last Test Failed

This selection will display only DTCs that have failed the last time the test run. The last test may have run during a previous ignition cycle if a type A or type B DTC is displayed. For type C and type D DTCs, the last failure must have occurred during the current ignition cycle to appear as Last Test Fail.

MILSVC or Message Request

This selection will display only DTCs that are requesting the MIL. Type C and type D DTCs cannot be displayed using this option. This selection will report type B DTCs only after the MIL has been requested.

Not Run Since Code Cleared

This option will display up to 33 DTCs that have not run since the DTCs were last cleared. Since any displayed DTCs have not run, their condition (passing or failing) is unknown.

Test Failed Since Code Cleared

This selection will display all active and history DTCs that have reported a test failure since the last time DTCs were cleared. DTCs that last failed more than 40 warm-up cycles before this option is selected will not be displayed.

Miscellaneous Test

This test consists of eight menus-Lights, Relays, EVAP, IAC System, Fuel System, EGR Control, Variable Intake Manifold Solenoid, and Injector Balance Tests.

In these tests, Tech 2 sends operating signals to the systems to confirm their operations thereby to judge the normality of electric circuits.

To judge intermittent trouble,

1. Confirm DTC freeze frame data, and match the freeze frame data as test conditions with the data list displayed by Miscellaneous Test.
2. Confirm DTC setting conditions, and match the setting conditions as test conditions with the data list displayed by Miscellaneous Test.

Lamps Test

This test is conducted check MIL and Low Fuel Lamp for its working.

Tech2 must be used for this test.

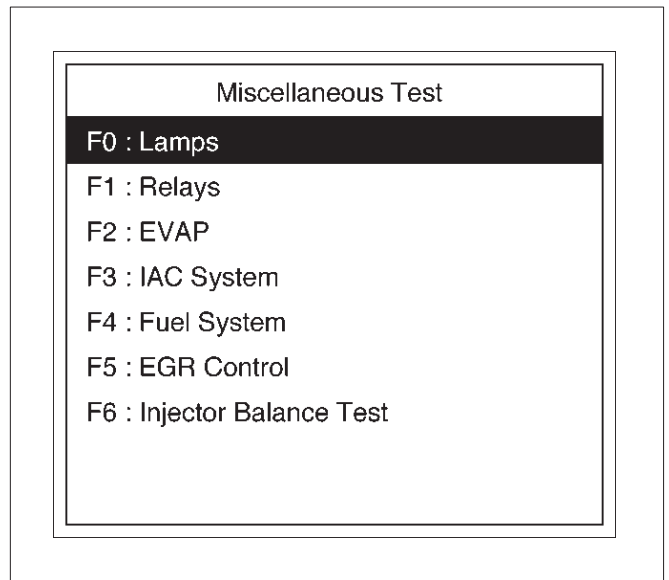

Test Procedure:

1. Connect Tech 2 to the vehicle DLC.
2. Run the Engine at idle.
3. Select F3: Miscellaneous Test in the Application Menu.

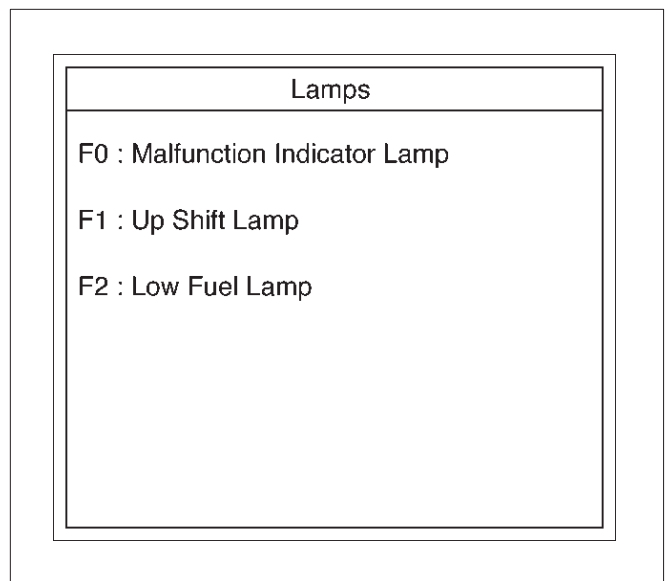

060RW228

4. Select F0:Lamps Test in the Miscellaneous Test.

060RX043

060RX044

6E1-38 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

5. Select F0:Malfunction Indicator Lamp.

060RX019

4. Select F1:Relay Test in the Miscellaneous Test.

060RX046

6. Push "On" soft key.
7. Make sure Lamp illuminates.
8. If lamp illuminates, the Lamp is operating correctly.
 - F1; Up Shift Lamp = Not Used
 - F2; Low Fuel Lamp = Not Used

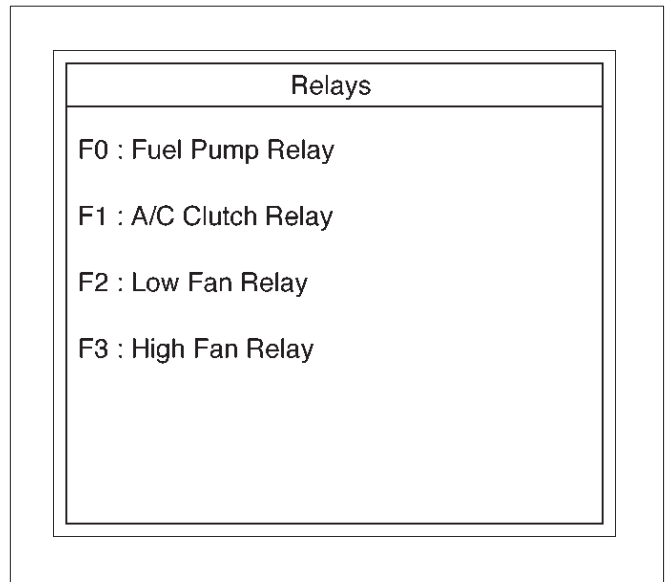

Relays Test

This test is conducted to check Fuel Pump Relay, A/C Clutch Low Fan and High Fan for prepor operation. Tech 2 must be used for this test.

Test Procedure:

1. Connect Tech 2 to the vehicle DLC.
2. Ignition SW is "On".
3. Select F3: Miscellaneous Test in the Application Menu.

5. Select F0:Fuel Pump Relay.

060RX047

060RW228

6. Push "On" soft key.

Fuel Pump Relay	
Engine Speed	750 RPM
Desired Idle Speed	750 RPM
Engine Coolant Temperat	75 °C
Start Up ECT(Engine Co	20 °C
Intake Air Temperature	20 °C
Start Up IAT(Intake Ai	20 °C
Manifold Absolute Press	19 KPa
Fuel Pump	On
Quit	Off
On	

060RX022

7. Control Fuel Pump Relay and check a data list.
8. If the data list changes, the Fuel Pump Relay is normal.
9. Select F1:A/C Clutch Relay.
10. *Run the Engine at idle.
11. Turn on Air Conditioning.

A/C Clutch Relay
Turn On Air Conditioning !

060RX023

12. Push "On" and "Off" of soft key.
13. Control A/C Clutch Relay and check a data list.
14. If the data list changes, the A/C Clutch Relay is normal.

15. Select F2: Low Fan Relay.

Low Fan Relay	
Engine Speed	750 RPM
Desired Idle Speed	750 RPM
Engine Coolant Temperat	75 °C
Start Up ECT(Engine Co	20 °C
Intake Air Temperature	20 °C
Start Up IAT(Intake Ai	20 °C
Manifold Absolute Press	19 KPa
Low Fan	On
Quit	Off
On	

060RX048

16. Push "On" and "Off" of soft key.
17. Control Low Fan Relay and check a data list.
18. If the data list changes, the Low Fan Relay is normal.
19. Run the Fan Motor.
20. Select F3: High Fan Relay.

High Fan Relay	
Engine Speed	750 RPM
Desired Idle Speed	750 RPM
Engine Coolant Temperat	75 °C
Start Up ECT(Engine Co	20 °C
Intake Air Temperature	20 °C
Start Up IAT(Intake Ai	20 °C
Manifold Absolute Press	19 KPa
High Fan	On
Quit	Off
On	

060RX049

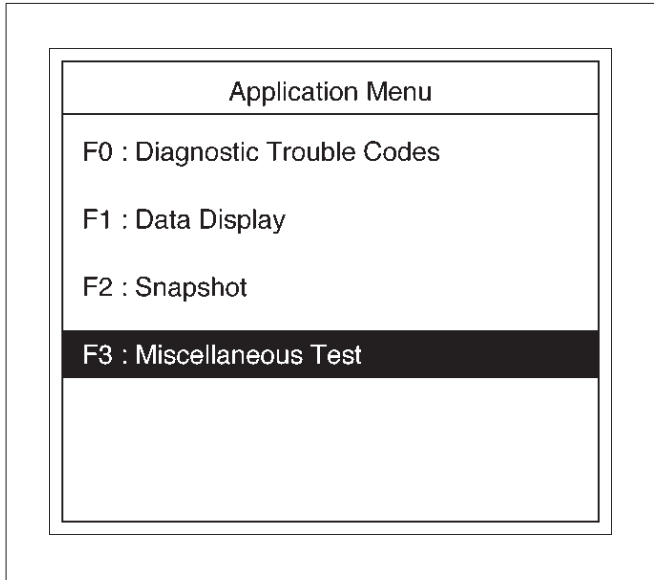

21. Push "On" and "Off" of soft key.
22. Control High Fan Relay and check a data list.
If the data list changes, the High Fan Relay is normal.
23. Run the Fan Motor.

EVAP Test

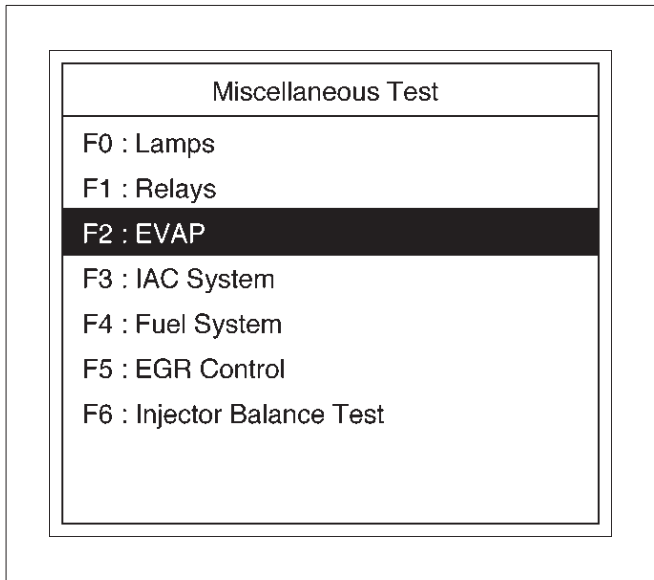

This test is conducted check EVAP system for its working. Tech 2 must be used for this test.

Test Procedure:

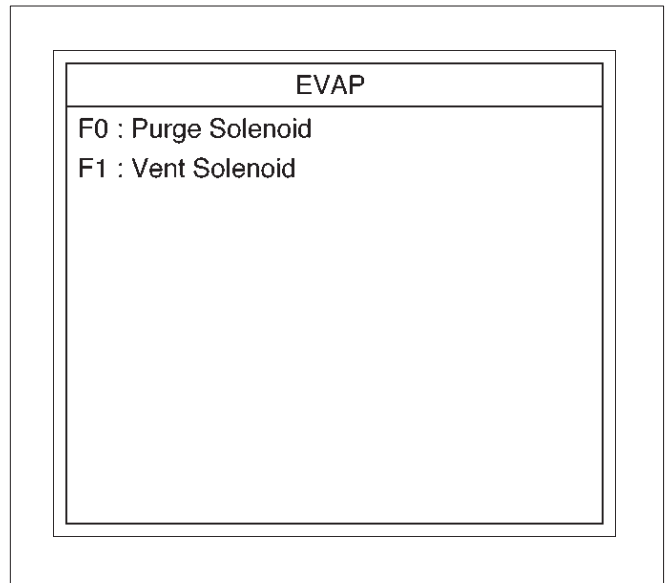

1. Connect Tech 2 to the vehicle DLC.
2. Run the Engine at idle.
3. Select F3: Miscellaneous Test in the Application Menu.

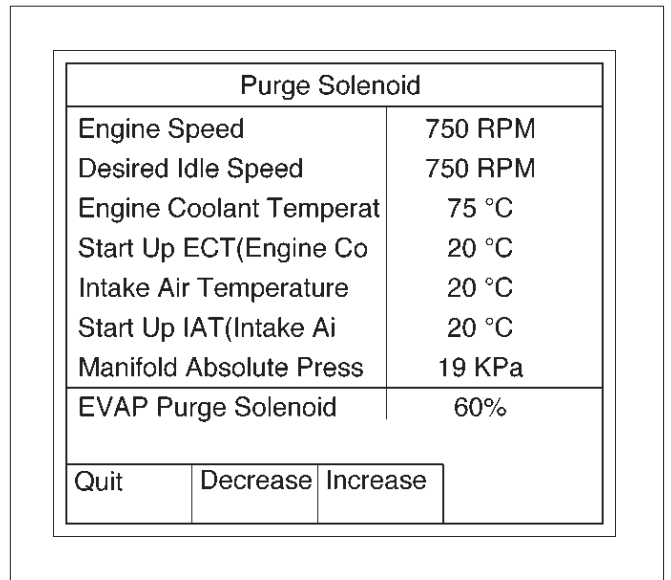

4. Select F2:EVAP Test in the Miscellaneous Test.

5. Select F0: Purge Solenoid.

6. Push "Decrease" or "Increase" soft key.

7. Control EVAP Purge Solenoid and check a data list.
8. If the data list changes, the purge Solenoid is normal. Ignition SW is "On".
 - F1; Vent Solenoid = Not Used

Idle Air Control System Test

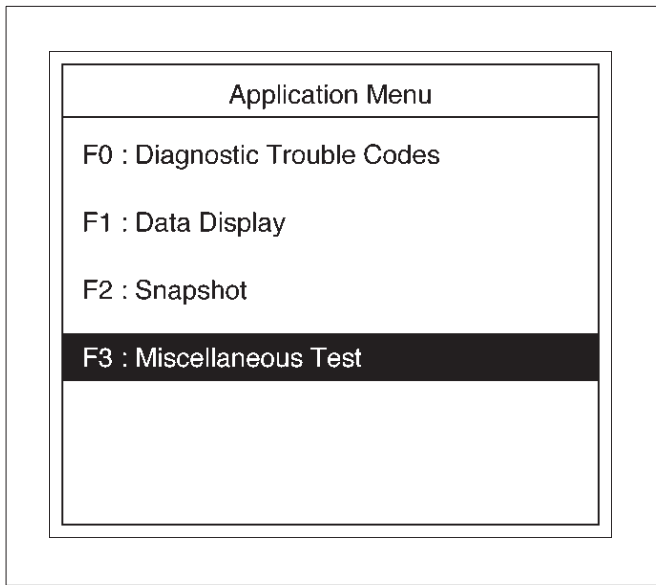

This test is conducted check to IAC system for proper operation.

Tech 2 must be used for this test.

Test Procedure:

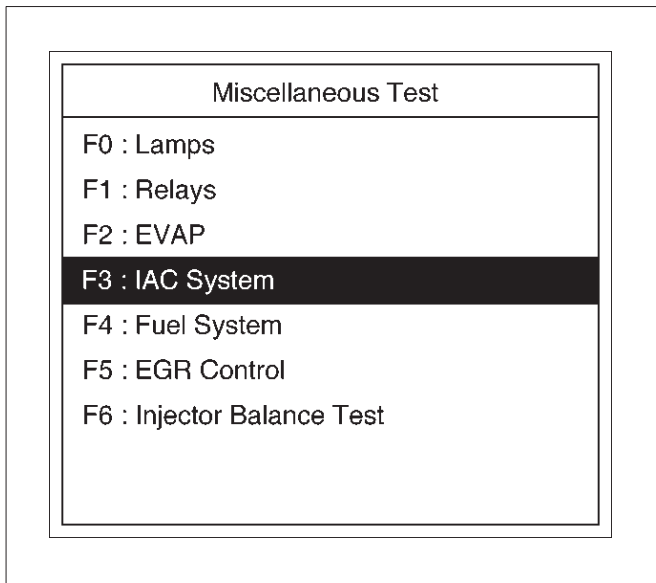

1. Connect Tech 2 to the vehicle DLC.
2. Run the Engine at idle.

3. Select F3: Miscellaneous Test in the Application Menu.

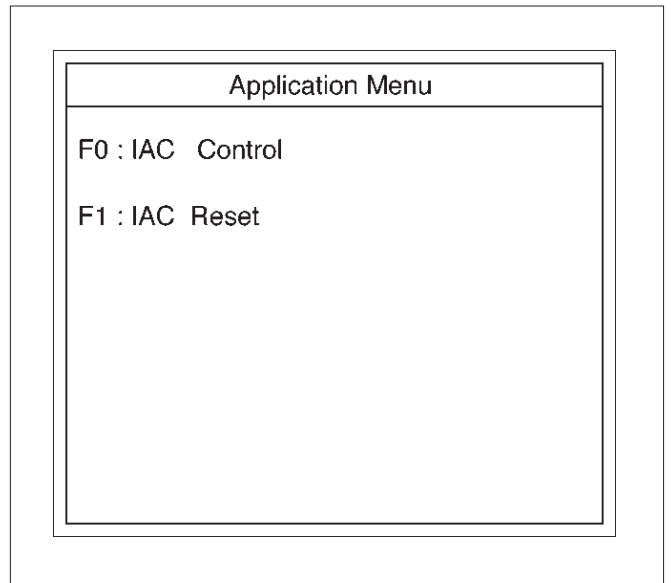

060RW228

4. Select F3: IAC System Test in the Miscellaneous Test.

060RX051

5. Select F1: IAC Control Test.

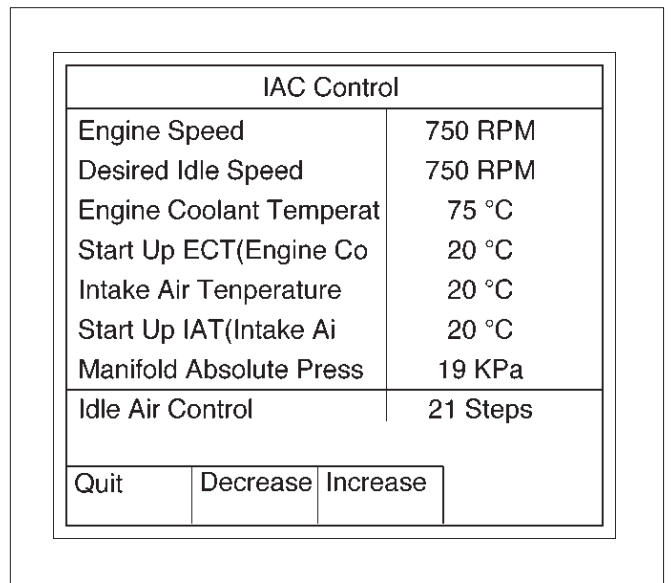

060RX052

6. Push "Increase" or "Decrease" soft key.

7. Control IAC system and check a data list.

- F0: IAC Control

060RX015

8. Select F1: IAC Reset.

9. Push "Reset IAC" soft key.

10. Control IAC Reset and check data list.

11. If data list changes, the IAC has been Reset.

IAC Reset	
Engine Speed	750 RPM
Desired Idle Speed	750 RPM
Engine Coolant Temperat	75 °C
Start Up ECT(Engine Co	20 °C
Intake Air Temperature	20 °C
Start Up IAT(Intake Ai	20 °C
Manifold Absolute Press	19 KPa
Idle Air Control	21 Steps
Quit	Reset IAC

060RW231-1

4. Select F4: Fuel System in the Miscellaneous Menu.

Miscellaneous Test
F0 : Lamps
F1 : Relays
F2 : EVAP
F3 : IAC System
F4 : Fuel System
F5 : EGR Control
F6 : Injector Balance Test

060RX053

Fuel System Test

This test is conducted check Fuel Level Gauge for proper operation.

Tech 2 must be used for this test.

Test Procedure:

1. Connect Tech 2 to the vehicle DLC.
2. Ignition SW is "On".
3. Select F3: Miscellaneous Test in the Application Menu.

5. Select F0: Fuel Trim Reset.

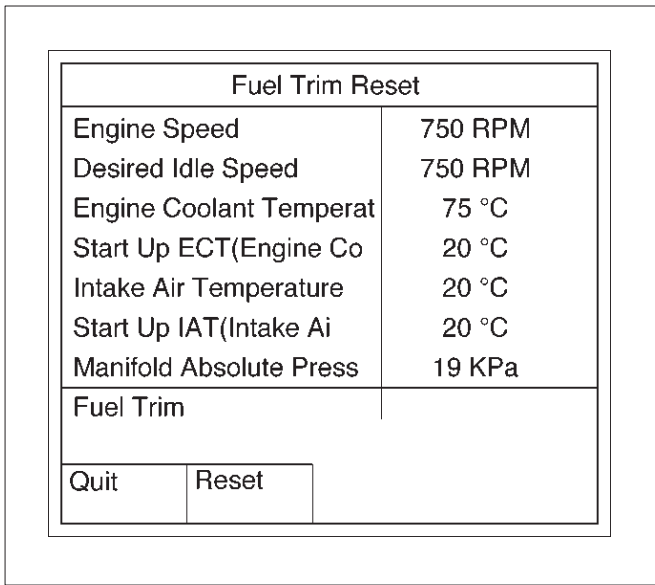

Fuel System
F0 : Fuel Trim Reset
F1 : Fuel Gauge Level

060RX028

Application Menu
F0 : Diagnostic Trouble Codes
F1 : Data Display
F2 : Snapshot
F3 : Miscellaneous Test

060RW228

6. Push "Reset" of soft key.

060RX029

- F1; Fuel Gauge Level = Not Used

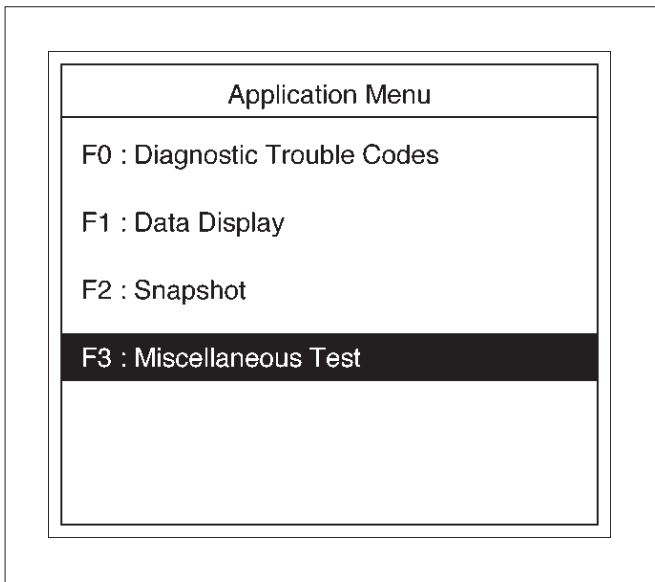

EGR Control Test

This test is conducted to check EGR valve for proper operation.

Tech 2 must be used for this test.

Test Procedure:

1. Connect Tech 2 to the vehicle DLC.
2. Run the Engine at idle.
3. Select F3: Miscellaneous Test in the Application Menu.

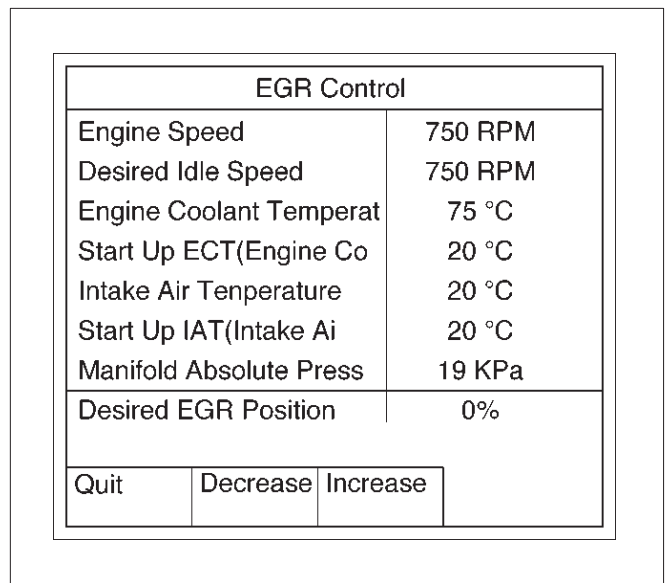

060RW228

4. Select F5: EGR Control Test in the Miscellaneous Test.

060RX054

5. Control EGR Valve and check data list.

060RX017

6. If the change, the EGR Control is normal.

Injector Balance Test

This test is conducted to make sure the appropriate electric signals are being sent to injectors Nos. 1-6.

Tech 2 must be used for this test.

Test Procedure:

1. Connect Tech 2 to the vehicle DLC.
2. Run the Engine at idle.

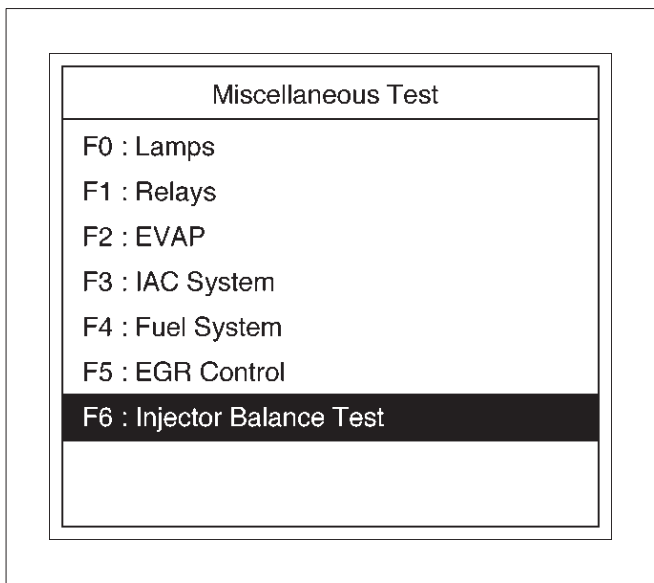

6E1-44 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

3. Select F3: Miscellaneous Test in the Application Menu.

060RW228

4. Select F6: Injector Balance Test in the Miscellaneous Test.

060RX055

5. Select injector number and push "injector off" of soft key.

060RW230-1

6. Make sure of engine speed change.

7. If engine speed changes, the injector electric circuit is normal.

If engine speed does not change, the injector electric circuit or the injector itself is not normal.

Plotting Snapshot Graph

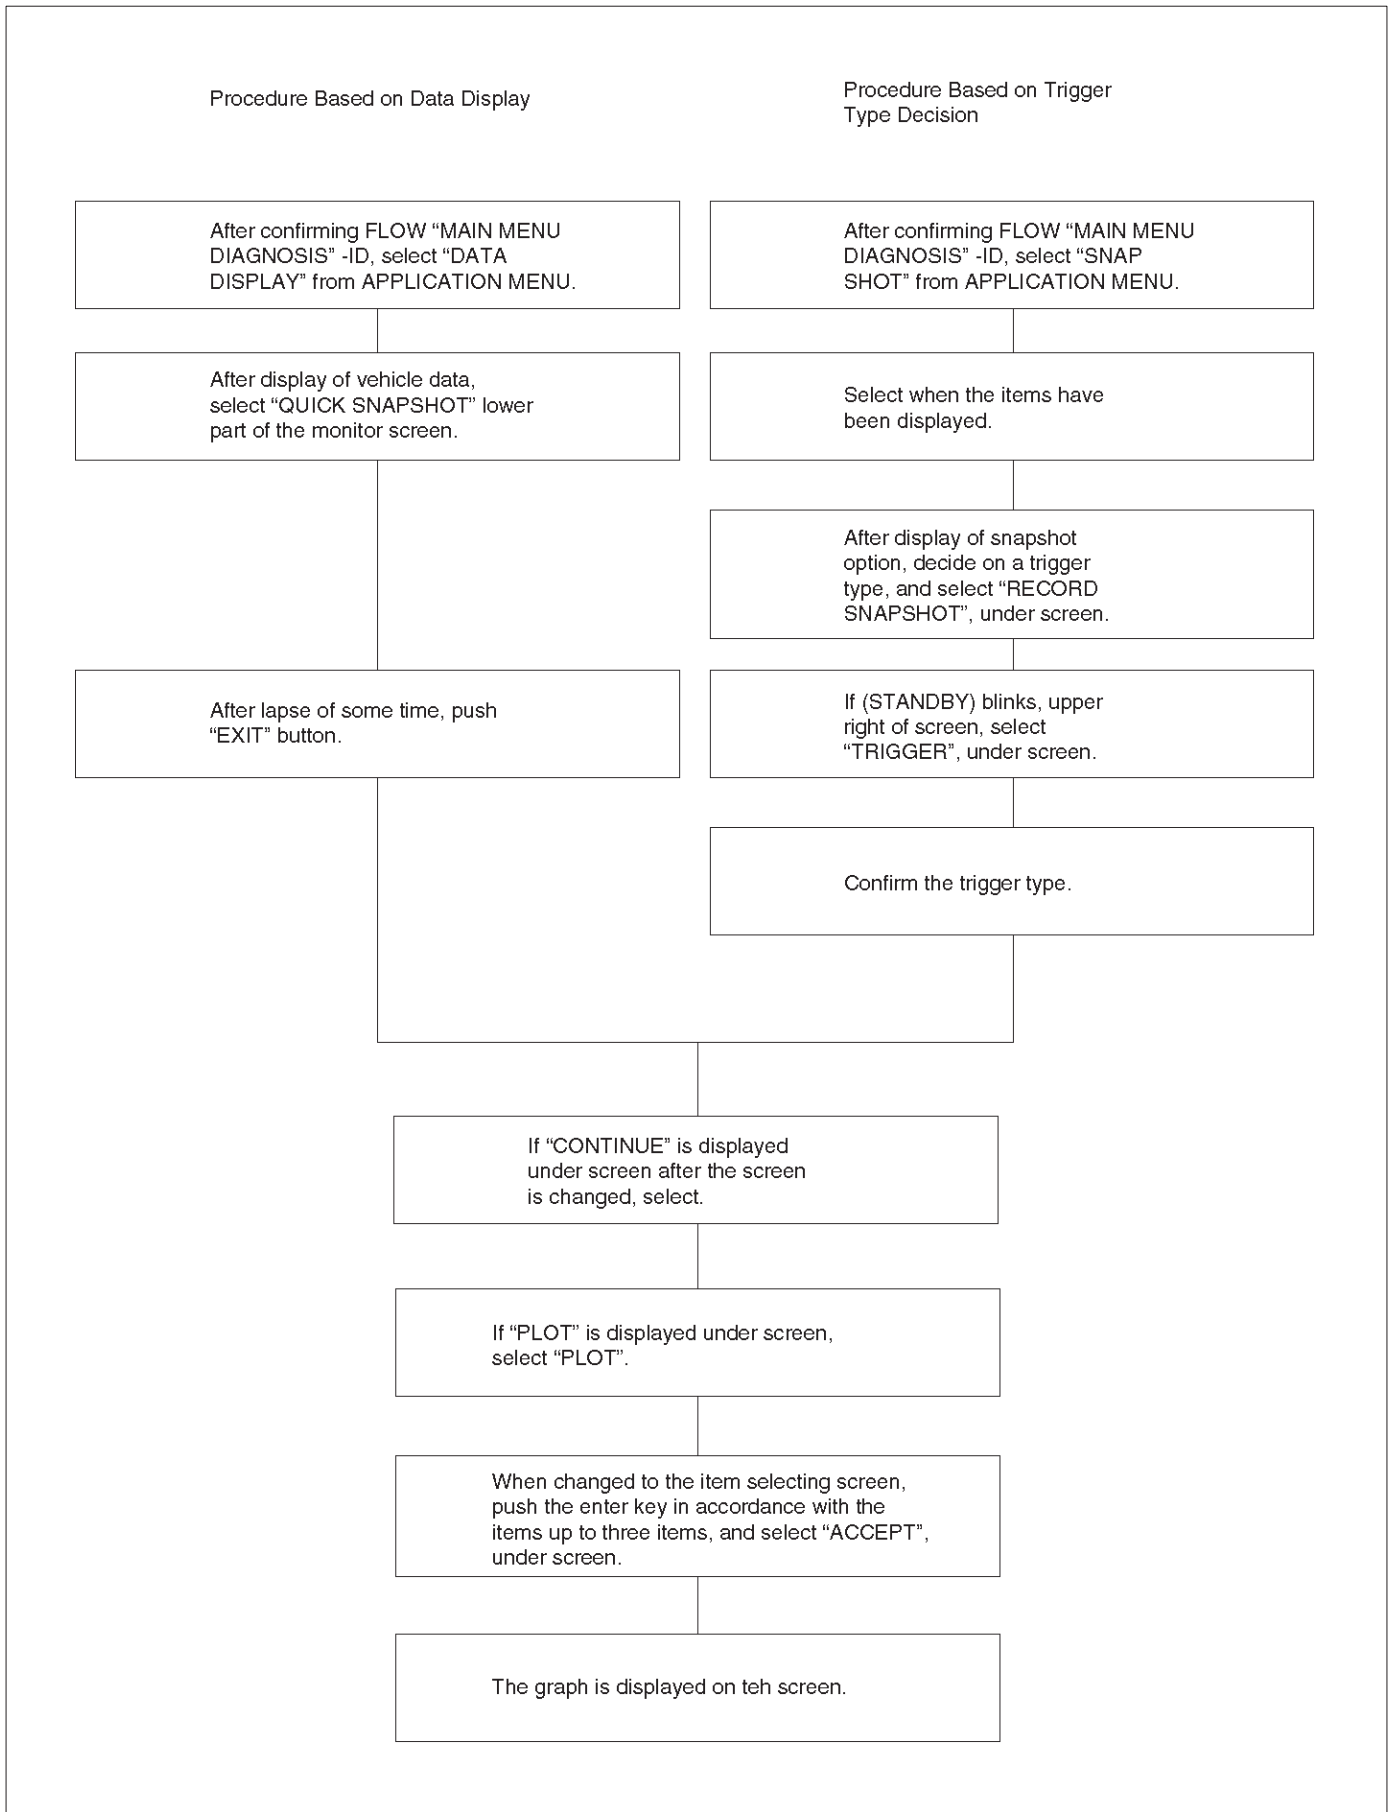

This test selects several necessary items from the data list to plot graphs and makes data comparison on a long term basis. It is an effective test particularly in emission related evaluations.

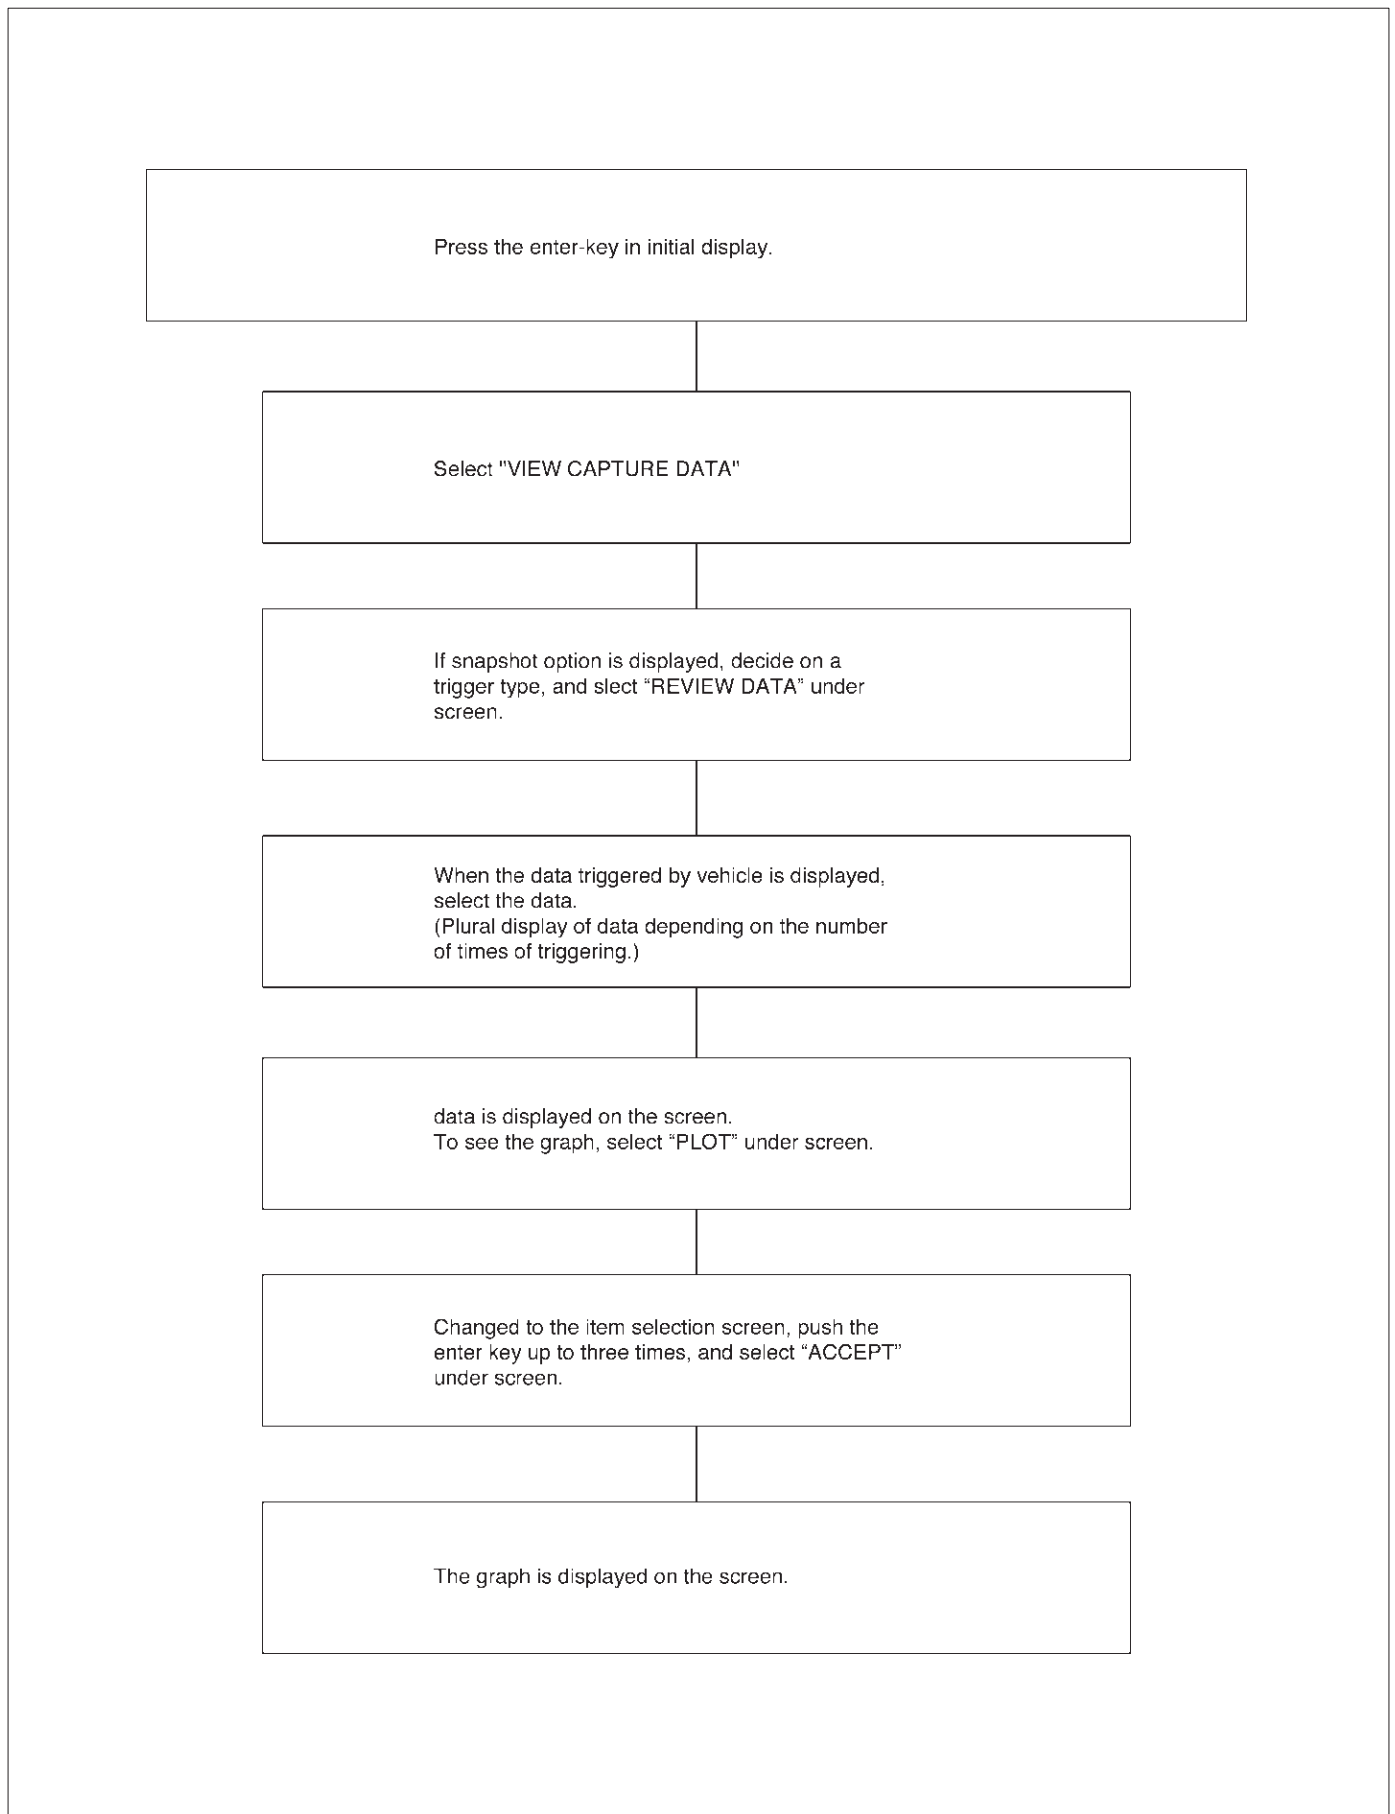

060RX037

For trouble diagnosis, you can collect graphic data (snapshot) directly from the vehicle. You can replay the snapshot data as needed. There fore, accurate diagnosis is possible, even though the vehicle is not available.

Plotting Graph Flow Chart (Plotting graph after obtaining vehicle information)

Flow Chart for Snapshot Replay (Plotting Graph)

PRIMARY SYSTEM-BASED DIAGNOSTICS

Primary System-Based Diagnostics

There are primary system-based diagnostics which evaluate system operation and its effect on vehicle emissions. The primary system-based diagnostics are listed below with a brief description of the diagnostic function:

Oxygen Sensor Diagnosis

The fuel control heated oxygen sensor (HO2S 1) is diagnosed for the following conditions:

- Heater performance (time to activity on cold start)
- Slow response
- Response time (time to switch R/L or L/R)
- Inactive signal (output steady at bias voltage – approx. 450 mV)
- Signal fixed high
- Signal fixed low

The catalyst monitor heated oxygen sensor (HO2S 2) is diagnosed for the following conditions:

- Heater performance (time to activity on cold start).
- Signal fixed low during steady state conditions or power enrichment (hard acceleration when a rich mixture should be indicated).
- Signal fixed high during steady state conditions or deceleration mode (deceleration when a lean mixture should be indicated).
- Inactive sensor (output steady at approx. 438 mV).

If the oxygen sensor pigtail wiring, connector or terminal are damaged, the entire oxygen sensor assembly must be replaced. DO NOT attempt to repair the wiring, connector or terminals. In order for the sensor to function properly, it must have clean reference air provided to it. This clean air reference is obtained by way of the oxygen sensor wire(s). Any attempt to repair the wires, connector or terminals could result in the obstruction of the reference air and degrade oxygen sensor performance. Refer to On-Vehicle Service, Heated Oxygen Sensors.

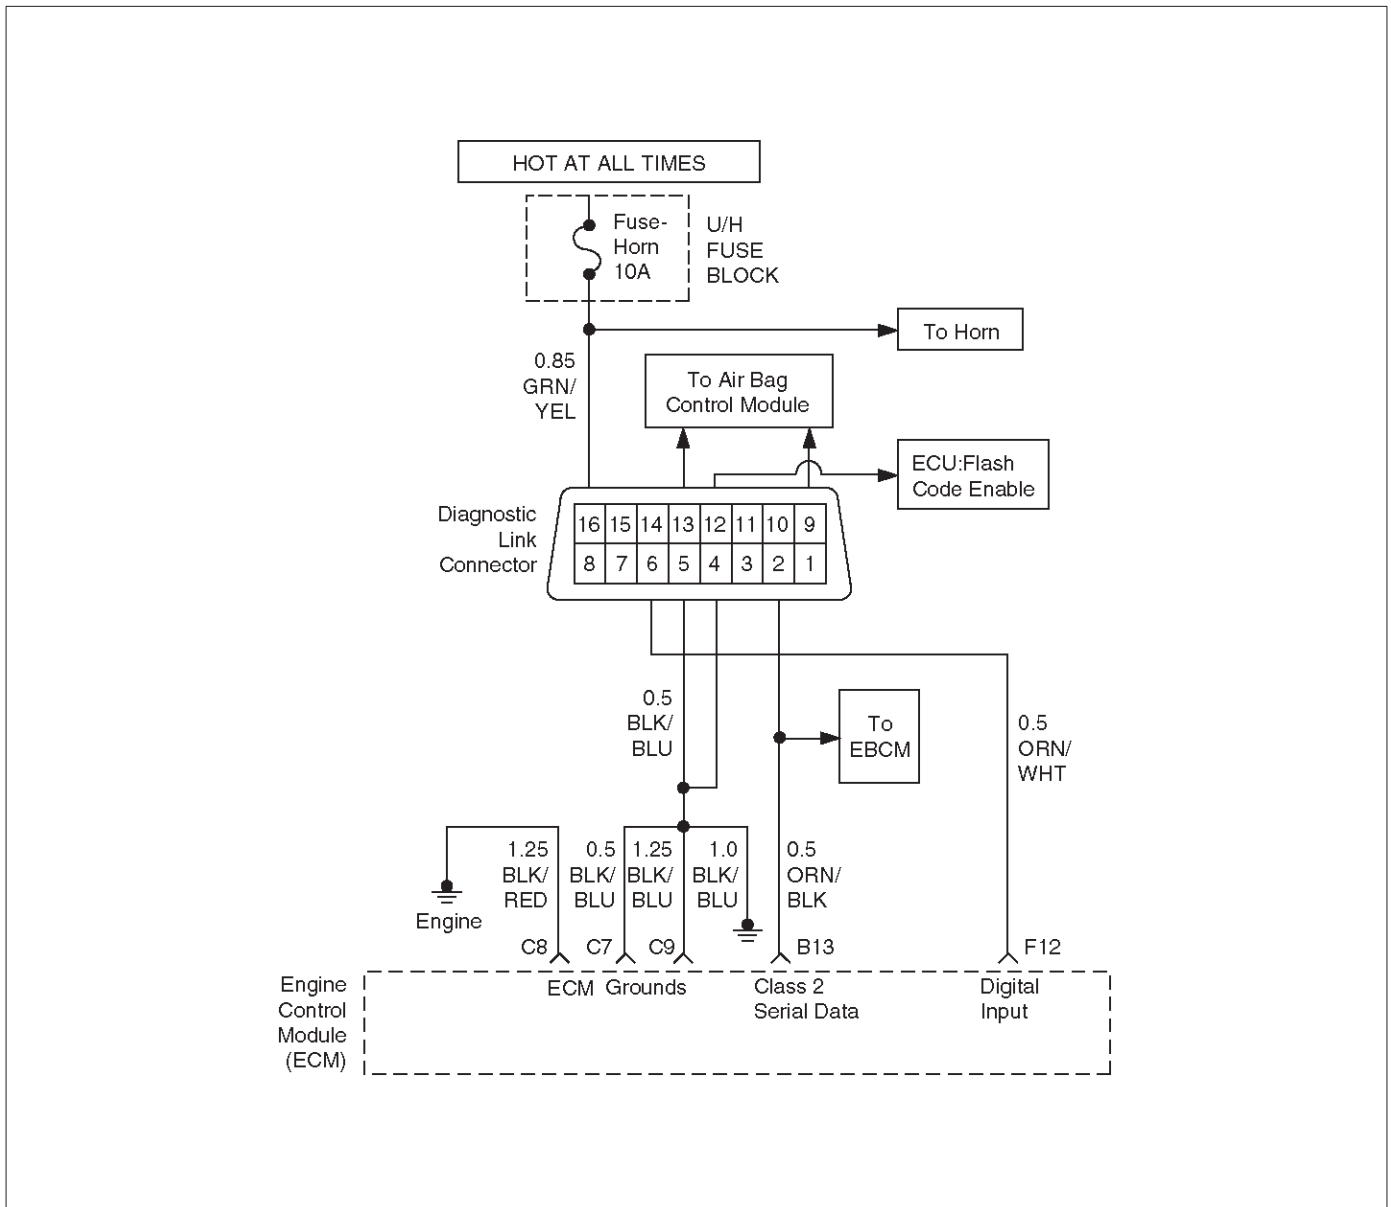

Fuel Control Heated Oxygen Sensors

The main function of the fuel control heated oxygen sensors is to provide the control module with exhaust stream oxygen content information to allow proper fueling and maintain emissions within mandated levels. After it reaches operating temperature, the sensor will generate a voltage, inversely proportional to the amount of oxygen present in the exhaust gases. The control module uses the signal voltage from the fuel control heated oxygen sensors while in "Closed Loop" to adjust fuel injector pulse width. While in "Closed Loop", the ECM can adjust fuel delivery to maintain an air/fuel ratio which allows the best combination of emission control and driveability. The fuel control heated oxygen sensors are also used to determine catalyst efficiency.

HO2S Heater

Heated oxygen sensors are used to minimize the amount of time required for "Closed Loop" fuel control to begin operation and to allow accurate catalyst monitoring. The oxygen sensor heater greatly decreases the amount of time required for fuel control sensor (HO2S 1) to become active. Oxygen sensor heaters are required by the catalyst monitor sensor (HO2S 2) to maintain a sufficiently high temperature which allows accurate exhaust oxygen content readings further away from the engine.

ON-BOARD DIAGNOSTIC (OBD) SYSTEM CHECK

D06RX108

Circuit Description

The on-board diagnostic system check is the starting point for any driveability complaint diagnosis. Before using this procedure, perform a careful visual/physical check of the ECM and engine grounds for cleanliness and tightness.

The on-board diagnostic system check is an organized approach to identifying a problem created by an electronic engine control system malfunction.

Diagnostic Aids

An intermittent may be caused by a poor connection, rubbed-through wire insulation or a wire broken inside the insulation. Check for poor connections or a damaged harness. Inspect the ECM harness and connectors for improper mating, broken locks, improperly formed or damaged terminals, poor terminal-to-wire connection, and damaged harness.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

1. The MIL ("Check Engine" lamp) should be ON steady with the ignition ON/engine OFF. If not, isolate the malfunction in the MIL circuit.
2. Checks the Class 2 data circuit and ensures that the ECM is able to transmit serial data.
3. This test ensures that the ECM is capable of controlling the MIL and the MIL driver circuit is not shorted to ground.
4. If the engine will not start, the Cranks But Will Not Run chart should be used to diagnose the condition.
7. A Tech 2 parameter which is not within the typical range may help to isolate the area which is causing the problem.

On-Board Diagnostic (OBD) System Check

Step	Action	Value(s)	Yes	No
1	1. Ignition ON, engine OFF. 2. Observe the malfunction indicator lamp (MIL or "Check Engine lamp"). Is the MIL ("Check Engine lamp") ON?	—	Go to Step 2	Go to No MIL
2	1. Ignition OFF. 2. Install a Tech 2. 3. Ignition ON. 4. Attempt to display ECM engine data with the Tech 2. Does the Tech 2 display ECM data?	—	Go to Step 3	Go to Step 8
3	1. Using the Tech 2 output tests function, select MIL dash lamp control and command the MIL OFF. 2. Observe the MIL. Did the MIL turn OFF?	—	Go to Step 4	Go to MIL ("Check Engine Lamp") On Steady
4	Attempt to start the engine. Did the engine start and continue to run?	—	Go to Step 5	Go to Cranks But Will Not Run
5	Select "Display DTCs" with the Tech 2. Are any DTCs stored?	—	Go to Step 6	Go to Step 7
6	Are two or more of the following DTCs stored? P0107, P0113, P0118, P0122, P0123.	—	Go to "Multiple ECM Information Sensor DTCs Set"	Go to applicable DTC table
7	Compare ECM data values displayed on the Tech 2 to the typical engine scan data values. Are the displayed values normal or close to the typical values?	—	Go to "Typical Scan" Data Value	Go to indicated Component System Checks
8	1. Ignition OFF, disconnect the ECM. 2. Ignition ON, engine OFF. 3. Check the Class 2 data circuit for an open, short to ground, or short to voltage. Also, check the DLC ignition feed circuit for an open or short to ground and the DLC ground circuits for an open. 4. If a problem found, repair as necessary. Was a problem found?	—	Go to Step 2	Go to Step 9
9	1. Attempt to reprogram the ECM. Refer to Engine Control Module (ECM) in On-Vehicle Service. 2. Attempt to display ECM data with the Tech 2. Does the Tech 2 display ECM engine data?	—	Go to Step 2	Go to Step 10
10	Replace the ECM. Is the action complete?	—	Verify repair	—

A/C CLUTCH CONTROL CIRCUIT DIAGNOSIS

D06RX107

Circuit Description

When air conditioning and blower fan are selected, and if the system has a sufficient refrigerant charge, a 12-volt signal is supplied to the A/C request input of the engine control module (ECM). The A/C request signal may be temporarily cancelled during system operation by the electronic thermostat in the evaporator case. The electronic thermostat may intermittently remove the control circuit ground for the A/C thermostat relay to prevent the evaporator from forming ice. When the A/C request signal is received by the ECM, the ECM supplies a ground from the compressor clutch relay if the engine operating conditions are within acceptable ranges. With the A/C compressor relay energized, battery voltage is supplied to the compressor clutch coil.

The ECM will enable the compressor clutch to engage whenever A/C has been selected with the engine running, unless any of the following conditions are present:

- The throttle is greater than 90%.
- The ignition voltage is below 10.5 volts.
- The engine speed is greater than 4500 RPM for 5 seconds or 5400 RPM.
- The engine coolant temperature (ECT) is greater than 125°C (257°F)
- The intake air temperature (IAT) is less than 5°C (41°F).
- The power steering pressure switch signals a high pressure condition position.

Diagnostic Aids

To diagnose an intermittent fault, check for the following conditions:

- Poor connection at the ECM – Inspect harness connections for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.

- Damaged harness – Inspect the wiring harness for damage; shorts to ground, shorts to battery voltage, and open circuits. If the harness appears to be OK, observe the A/C clutch while moving connectors and wiring harnesses related to the A/C. A sudden clutch malfunction will indicate the source of the intermittent.

be used in diagnosing the system. The Tech 2 has the ability to read the A/C request input to the ECM. The Tech 2 can display when the ECM has commanded the A/C clutch ON. The Tech 2 should have the ability to override the A/C request signal and energize the A/C compressor relay.

A/C Clutch Diagnosis

This chart should be used for diagnosing the electrical portion of the A/C compressor clutch circuit. A Tech 2 will

A/C Clutch Control Circuit Diagnosis

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	1. Ignition ON, engine OFF. 2. Review and record Tech 2 Failure Records data, then clear the DTCs. 3. Operate the vehicle within the Failure Records conditions as noted. 4. Using the Tech 2, monitor "DTC" info for DTC P1546. Does the Tech 2 indicate DTC P1546 "Ran and Passed"?	—	Refer to Diagnostic Aids	Go to Step 3
3	1. Ignition OFF. 2. Remove the A/C Compressor Relay from the Underhood Electrical Center. 3. Ignition ON, engine OFF. 4. Using a Digital Voltmeter (DVM), check for voltage on the Fused pins of the A/C Compressor Clutch Relat connector. Does the DVM read the following value?	12 Volts	Go to Step 5	Go to Step 4
4	Check the suspect circuit(s) between the A/C Compressor Clutch Relay connector and the Fuse for the following conditions: <ul style="list-style-type: none"> ● A short to ground ● An open circuit ● A short to voltage Was the problem found?	—	Verify repair	—
5	1. Ignition OFF. 2. Disconnect the Engine Controlm Module (ECM) connectors from the ECM. 3. Check the A/C Compressor Clutch Relay control circuit between the ECM and Underhood Electrical Center for the following conditions: <ul style="list-style-type: none"> ● A short to ground ● An open circuit ● A short to voltage Was the problem found?	—	Verify repair	Go to Step 6

A/C Clutch Control Circuit Diagnosis (Cont'd)

Step	Action	Value(s)	Yes	No
6	1. Reinstall the A/C Compressor Clutch Relay. 2. Using a fused jumper, ground the A/C Compressor Clutch Relay control circuit at the ECM connector. 3. Ignition ON, engine OFF. Does the A/C Compressor turn ON?	—	Go to Step 9	Go to Step 7
7	1. Ignition OFF. 2. Check the A/C Compressor Clutch circuit between the A/C Compressor Clutch Relay and A/C Compressor Clutch for the following conditions: <ul style="list-style-type: none"> ● A short to ground ● An open circuit ● A short to voltage Was the problem found?	—	Verify repair	Go to Step 8
8	Replace the A/C Compressor Clutch Relay. Is the action complete?	—	Verify repair	—
9	Replace the ECM. Verify repair.	—	—	—

ELECTRONIC IGNITION SYSTEM DIAGNOSIS

If the engine cranks but will not run or immediately stalls, the Engine Cranks But Will Not Start chart must be used to determine if the failure is in the ignition system or the fuel system.

VISUAL CHECK OF THE EVAPORATIVE EMISSION CANISTER

014RX001

- If the canister is cracked or damaged, replace the canister.
- If fuel is leaking from the canister, replace the canister and check hoses and hose routing.

IDLE AIR CONTROL (IAC) VALVE

0006

The Tech 2 displays the IAC pintle position in counts. A count of "0" indicates the ECM is commanding the IAC pintle to be driven all the way into a fully-seated position. This is usually caused by a vacuum leak.

The higher the number of counts, the more air is being commanded to bypass the throttle blade. In order to diagnose the IAC system, refer to IAC System Check.

For other possible causes of idle problems, refer to Rough, Unstable, or Incorrect Idle, Stalling in Symptoms.

ENGINE CONTROL MODULE (ECM) DIAGNOSIS

014RX002

To read and clear diagnostic trouble codes, use a Tech 2.

901RX031

IMPORTANT: Use of a Tech 2 is recommended to clear diagnostic trouble codes from the ECM memory. Diagnostic trouble codes can also be cleared by turning the ignition OFF and disconnecting the battery power from the ECM for 30 seconds. Turning off the ignition and disconnecting the battery power from the ECM will cause all diagnostic information in the ECM memory to be cleared. Therefore, all the diagnostic tests will have to be re-run.

Since the ECM can have a failure which may affect only one circuit, following the diagnostic procedures in this section will determine which circuit has a problem and where it is.

If a diagnostic chart indicates that the ECM connections or the ECM is the cause of a problem, and the ECM is replaced, but this does not correct the problem, one of the following may be the reason:

- There is a problem with the ECM terminal connections. The terminals may have to be removed from the connector in order to check them properly.
- The problem is intermittent. This means that the problem is not present at the time the system is being checked. In this case, make a careful physical inspection of all components and wiring associated with the affected system and refer to the Symptoms portion of the manual.
- There is a shorted solenoid, relay coil, or harness. Solenoids and relays are turned ON and OFF by the ECM using internal electronic switches called drivers. A shorted solenoid, relay coil, or harness will not damage the ECM but will cause the solenoid or relay to be inoperative.

MULTIPLE ECM INFORMATION SENSOR DTCs SET

Circuit Description

The engine control module (ECM) monitors various sensors to determine the engine operating conditions. The ECM controls fuel delivery, spark advance, and emission control device operation based on the sensor inputs.

The ECM provides a sensor ground to all of the sensors. The ECM applies 5 volts through a pull-up resistor, and determines the status of the following sensors by monitoring the voltage present between the 5-volt supply and the resistor:

- The Fuel Tank Vapor Pressure Sensor
- The throttle position (TP) sensor
- The manifold absolute pressure (MAP) sensor

The ECM provides the following sensors with a 5-volt reference and a sensor ground signal:

- The Linear exhaust gas recirculation (EGR) valve
- The A/C Pressure Sensor

The ECM monitors the separate feedback signals from these sensors in order to determine their operating status.

Diagnostic Aids

Be sure to inspect ECM and engine grounds for being secure and clean.

A short to voltage in one of the sensor input circuits may cause one or more of the following DTCs to be set:

- P0108
- P0113
- P0118
- P0123

If a sensor input circuit has been shorted to voltage, ensure that the sensor is not damaged. A damaged sensor will continue to indicate a high or low voltage after the affected circuit has been repaired. If the sensor has been damaged, replace it.

An open in the sensor ground circuit between the ECM and the splice will cause one or more of the following DTCs to be set:

- P0108
- P0113
- P0118
- P0123

A short to ground in the 5-volt reference A circuit will cause one or more of the following DTCs to be set:

- P0107
- P0122
- P0112
- P0117
- P0454
- P0405
- P0532

Check for the following conditions:

- **Poor connection at ECM.** Inspect the harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and a poor terminal-to-wire connection.
- **Damaged harness.** Inspect the wiring harness for damage. If the harness is not damaged, observe an affected sensor's displayed value on the Tech 2 with the ignition ON and the engine OFF while you move the connectors and the wiring harnesses related to the following sensors:
 - IAT
 - ECT
 - TP
 - MAP
 - EGR
 - A/C Pressure Sensor

Multiple ECM Information Sensor DTCs Set

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	1. Turn the ignition OFF, disconnect the ECM. 2. Turn the ignition ON, check the 5 volt reference circuits for the following conditions: <ul style="list-style-type: none"> ● A poor connection at the ECM. ● An open between the ECM connector and the splice. ● A short to ground. ● A short to voltage. Is there an open or short?	—	Go to Step 3	Go to Step 4
3	Repair the open or short. Is the action complete?	—	Verify repair	—
4	Check the sensor ground circuit for the following conditions: <ul style="list-style-type: none"> ● A poor connection at the ECM or the affected sensors. ● An open between the ECM connector and the affected sensors. Is there an open or a poor connection?	—	Go to Step 5	Go to Step 6
5	Repair the open or the poor connection. Is the action complete?	—	Verify repair	—
6	Measure the voltage between the EGR pintle position sensor signal circuit at the ECM harness connector and ground. Does the voltage measure near the specified value?	0 V	Go to Step 7	Go to Step 13
7	Measure the voltage between the MAP sensor signal circuit at the ECM harness connector and ground. Does the voltage measure near the specified value?	0 V	Go to Step 8	Go to Step 14
8	Measure the voltage between the TP sensor signal circuit at the ECM harness connector and ground. Does the voltage measure near the specified value?	0 V	Go to Step 9	Go to Step 15
9	Measure the voltage between the IAT sensor signal circuit at the ECM harness connector and ground. Does the voltage measure near the specified value?	0 V	Go to Step 10	Go to Step 16
10	Measure the voltage between the ECT sensor signal circuit at the ECM harness connector and ground. Does the voltage measure near the specified value?	0 V	Go to Step 20	Go to Step 17
11	Measure the voltage between the A/C Pressure Sensor circuit at the ECM harness connector and ground. Does the voltage measure near the specified value?	0 V	Go to Step 13	Go to Step 19

Multiple ECM Information Sensor DTCs Set (Cont'd)

Step	Action	Value(s)	Yes	No
12	1. Disconnect the EGR valve. 2. Measure the voltage between the EGR pintle position sensor signal circuit at the ECM harness connector and ground. Does the voltage measure near the specified value?	0 V	Go to Step 12	Go to Step 17
13	Replace the EGR valve. Is the action complete?	—	Verify repair	—
14	Locate and repair the short to voltage in the MAP sensor signal circuit. Is the action complete?	—	Verify repair	—
15	Locate and repair the short to voltage in the TP sensor signal circuit. Is the action complete?	—	Verify repair	—
16	Locate and repair the short to voltage in the IAT sensor signal circuit. Is the action complete?	—	Verify repair	—
17	Locate and repair the short to voltage in the ECT sensor signal circuit. Is the action complete?	—	Verify repair	—
18	Locate and repair the short to voltage in the A/C Pressure Sensor circuit. Is the action complete?	—	Verify repair	—
19	Locate and repair the short to voltage in the EGR pintle position sensor signal circuit. Is the action complete?	—	Verify repair	—
20	Replace the ECM. Is the action complete?	—	Go to OBD System Check	—

EXHAUST GAS RECIRCULATION (EGR) DIAGNOSIS

057RX001

An EGR flow check diagnosis of the linear EGR system is covered by DTC P0401, P0404, and P0405. If EGR diagnostic trouble code P0401 is encountered, refer to the DTC charts.

ENGINE Tech 2 DATA DEFINITIONS AND RANGES

A/C CLUTCH – Tech 2 Displays ON or OFF

Indicates whether the ECM has commanded the A/C clutch ON. Used in A/C system diagnostics.

A/C REQUEST – Tech 2 Displays YES or NO

Indicates the state of the A/C request input circuit from the HVAC controls. The ECM uses the A/C request signal to determine whether A/C compressor operation is being requested.

AIR/FUEL RATIO – Tech 2 Range 0.0–25.5

Air/fuel ratio indicates the ECM commanded value. In "Closed Loop", the air/fuel ratio should normally be displayed around "14.2–14.7." A lower air/fuel ratio indicates a richer commanded mixture, which may be seen during power enrichment or TWC protection modes. A higher air/fuel ratio indicates a leaner commanded mixture. This can be seen during deceleration fuel mode.

BARO kPa – Tech 2 Range 10–105 kPa/0.00–5.00 Volts

The barometric pressure reading is determined from the MAP sensor signal monitored during key up and wide open throttle (WOT) conditions. The barometric pressure is used to compensate for altitude differences and is normally displayed around "61–104" depending on altitude and barometric pressure.

CMP ACT. COUNTER – Cam Position Activity

DECEL FUEL MODE – Tech 2 Displays ACTIVE or INACTIVE

"ACTIVE" displayed indicates that the ECM has detected conditions appropriate to operate in deceleration fuel mode. The ECM will command the deceleration fuel mode when it detects a closed throttle position while the vehicle is traveling over 20 mph. While in the deceleration fuel mode, the ECM will decrease the amount of fuel delivered by entering "Open Loop" and decreasing the injector pulse width.

DESIRED EGR POS. – Tech 2 Range 0%–100%

Represents the EGR pintle position that the ECM is commanding.

DESIRED IDLE – Tech 2 Range 0–3187 RPM

The idle speed that the ECM is commanding. The ECM will compensate for various engine loads based on engine coolant temperature, to keep the engine at the desired speed.

ECT – (Engine Coolant Temperature) Tech 2 Range –40°C to 151°C (–40°F to 304°F)

The engine coolant temperature (ECT) is mounted in the coolant stream and sends engine temperature information to the ECM. The ECM applies 5 volts to the ECT sensor circuit. The sensor is a thermistor which changes internal resistance as the temperature changes. When the sensor is cold (high resistance), the ECM monitors a high signal voltage and interprets that as a cold engine. As the sensor warms (decreasing resistance), the voltage signal will decrease and the ECM will interpret the lower voltage as a warm engine.

EGR DUTY CYCLE – Tech 2 Range 0%–100%

Represents the EGR valve driver PWM signal from the ECM. A duty cycle of 0% indicates that no EGR flow is being commanded; a 100% duty cycle indicates maximum EGR flow commanded.

EGR FEEDBACK – Tech 2 Range 0.00–5.00 Volts

Indicates the EGR pintle position sensor signal voltage being monitored by the ECM. A low voltage indicates a fully extended pintle (closed valve); a voltage near 5 volts indicates a retracted pintle (open valve).

EGR TEST COUNT – Tech 2 Range 0–255

Indicates the number of EGR flow test samples collected during the current ignition cycle. Under normal operation, only one sample is allowed during an ignition cycle. If the ECM battery feed has been disconnected or a DTC P0401 has been cleared, 10 EGR flow test samples will be allowed during the ignition cycle. This is to allow repair verification during a single ignition cycle.

ENGINE LOAD – Tech 2 Range 0%–100%

Engine load is calculated by the ECM from engine speed and MAP sensor readings. Engine load should increase with an increase in RPM or air flow.

ENGINE RUN TIME – Tech 2 Range 00:00:00–99:99:99 Hrs:Min:Sec

Indicates the time elapsed since the engine was started. If the engine is stopped, engine run time will be reset to 00:00:00.

ENGINE SPEED – Range 0–9999 RPM

Engine speed is computed by the ECM from the 58X reference input. It should remain close to desired idle under various engine loads with engine idling.

FUEL PUMP – Tech 2 Displays ON or OFF

Indicates the ECM commanded state of the fuel pump relay driver circuit.

FUEL TRIM CELL – Tech 2 Range 0–21

The fuel trim cell is dependent upon engine speed and MAF sensor readings. A plot of RPM vs. MAF is divided into 22 cells. Fuel trim cell indicates which cell is currently active.

FUEL TRIM LEARN – Tech 2 Displays NO or YES

When conditions are appropriate for enabling long term fuel trim corrections, fuel trim learn will display YES. This indicates that the long term fuel trim is responding to the short term fuel trim. If the fuel trim learn displays NO, then long term fuel trim will not respond to changes in short term fuel trim.

HO2S BANK 1, SEN. 1 – Tech 2 Range 0–1000 mV

Represents the fuel control exhaust oxygen sensor output voltage. Should fluctuate constantly within a range between 10 mV (lean exhaust) and 1000 mV (rich exhaust) while operating in "Closed Loop".

HO2S BANK 1, SEN. 1 – Tech 2 Displays NOT READY or READY

Indicates the status of the exhaust oxygen sensor. The Tech 2 will indicate that the exhaust oxygen sensor is ready when the ECM detects a fluctuating HO2S voltage sufficient to allow "Closed Loop" operation. This will not occur unless the exhaust sensor is warmed up.

HO2S WARM UP TIME BANK 1, SEN. 1 – Tech 2 Range 00:00:00–99:99:99 HRS:MIN:SEC

Indicates warm-up time for each HO2S. The HO2S warm-up time is used for the HO2S heater test. The ECM will run the heater test only after a cold start (determined by engine coolant and intake air temperature at the time of start-up) and only once during an ignition cycle. When the engine is started the ECM will monitor the HO2S voltage. When the HO2S voltage indicates a sufficiently active sensor, the ECM looks at how much time has elapsed since start-up. If the ECM determines that too much time was required for the HO2S to become active, a DTC will set. If the engine was warm when started, HO2S warm-up will display "00:00:00."

IAC POSITION – Tech 2 Range 0–255 Counts

Displays the commanded position of the idle air control pintle in counts. A larger number of counts means that more air is being commanded through the idle air passage. Idle air control should respond fairly quickly to changes in engine load to maintain desired idle RPM.

IAT (INTAKE AIR TEMPERATURE) – Tech 2 Range –40°C to 151°C (–40°F to 304°F)

The ECM converts the resistance of the intake air temperature sensor to degrees. Intake air temperature (IAT) is used by the ECM to adjust fuel delivery and spark timing according to incoming air density.

IGNITION 1 – Tech 2 Range 0–25.5 Volts

This represents the system voltage measured by the ECM at its ignition feed.

INJ. PULSE BANK 1 – Tech 2 Range 0–1000 msec.

Indicates the amount of time the ECM is commanding each injector ON during each engine cycle. A longer injector pulse width will cause more fuel to be delivered. Injector pulse width should increase with increased engine load.

MAP – Tech 2 Range 10–105 kPa (0.00–4.97 Volts)

The manifold absolute pressure (MAP) sensor measures the change in the intake manifold pressure from engine load, EGR flow, and speed changes. As intake manifold pressure increases, intake vacuum decreases, resulting in a higher MAP sensor voltage and kPa reading. The MAP sensor signal is used to monitor intake manifold pressure changes during the EGR flow test, to update the BARO reading, and as an enabling factor for several of the diagnostics.

MIL – Tech 2 Displays ON or OFF

Indicates the ECM commanded state of the malfunction indicator lamp ("Check Engine Lamp").

POWER ENRICHMENT – Tech 2 Displays ACTIVE or INACTIVE

"ACTIVE" displayed indicates that the ECM has detected conditions appropriate to operate in power enrichment mode. The ECM will command power enrichment mode when a large increase in throttle position and load is detected. While in the power enrichment mode, the ECM will increase the amount of fuel delivered by entering "Open Loop" and increasing the injector pulse width. This is done to prevent a possible sag or hesitation from occurring during acceleration.

SPARK – Tech 2 Range –64° to 64°

Displays the amount of spark advance being commanded by the ECM on the IC circuit.

START-UP ECT – Tech 2 Range –40°C to 151°C (–40°F to 304°F)

Indicates the engine coolant temperature at the time that the vehicle was started. Used by the HO2S diagnostic to determine if the last start-up was a cold start.

START-UP ECT – Tech 2 Range –40°C to 151°C (–40°F to 304°F)

Indicates the intake air temperature at the time that the vehicle was started. Used by the HO2S diagnostic to determine if the last start-up was a cold start.

TP ANGLE – Tech 2 Range 0%–100%

TP (throttle position) angle is computed by the ECM from the TP sensor voltage. TP angle should display "0%" at idle and "100%" at wide open throttle.

TP SENSOR – Tech 2 Range 0.00–5.00 Volts

The voltage being monitored by the ECM on the TP sensor signal circuit.

VEHICLE SPEED – Tech 2 Range 0–255 km/h (0–155 mph)

The vehicle speed sensor signal is converted into km/h and mph for display.

WEAK CYLINDER – Tech 2 Displays Cylinder Number

This indicates that the ECM has detected crankshaft speed variations that indicate 2% or more cylinder firing events are misfires.

TYPICAL SCAN DATA VALUES

Use the Typical Scan Data Values Table only after the On-Board Diagnostic System Check has been completed, no DTC(s) were noted, and you have determined that the on-board diagnostics are functioning properly. Tech 2 values from a properly-running engine may be used for comparison with the engine you are diagnosing. The typical scan data values represent values that would be seen on a normally-running engine.

NOTE: A Tech 2 that displays faulty data should not be used, and the problem should be reported to the Tech 2 manufacturer. Use of a faulty Tech 2 can result in misdiagnosis and unnecessary replacement of parts.

2.2L L-4 Engine

Only the parameters listed below are referred to in this service manual for use in diagnosis. For further information on using the Tech 2 to diagnose the ECM and related sensors, refer to the applicable reference section listed below. If all values are within the typical range described below, for diagnosis, refer to the Symptoms section.

Test Conditions

Engine running, lower radiator hose hot, transmission in park or neutral, "Closed Loop", accessories OFF, brake not applied and air conditioning OFF.

Tech 2 Parameter	Data List	Units Displayed	Typical Data Values (IDLE)	Typical Data Values (2500 RPM)	Refer To

NO MALFUNCTION INDICATOR LAMP (MIL)

Circuit Description

The "Check Engine" lamp (MIL) should always be illuminated and steady with the ignition ON and the engine stopped. Ignition feed voltage is supplied to the MIL bulb through the meter fuse. The engine control module (ECM) turns the MIL ON by grounding the MIL driver circuit.

Diagnostic Aids

An intermittent MIL may be caused by a poor connection, rubbed-through wire insulation, or a wire broken inside the insulation. Check for the following items:

- Inspect the ECM harness and connections for improper mating, broken locks, improperly formed or damaged terminals, poor terminal-to-wire connection, and damaged harness.
- If the engine runs OK, check for a faulty light bulb, an open in the MIL driver circuit, or an open in the instrument cluster ignition feed.

- If the engine cranks but will not run, check for an open ECM ignition or battery feed, or a poor ECM to engine ground.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

2. A "No MIL" condition accompanied by a no-start condition suggests a faulty ECM ignition or battery feed circuit.
9. Using a test light connected to B+, probe each of the ECM ground terminals to ensure that a good ground is present. Refer to ECM Terminal End View for terminal locations of the ECM ground circuits.
12. In this step, temporarily substitute a known good relay for the ECM relay. The horn relay is nearby, and it can be verified as "good" simply by honking the horn. Replace the horn relay after completing this step.

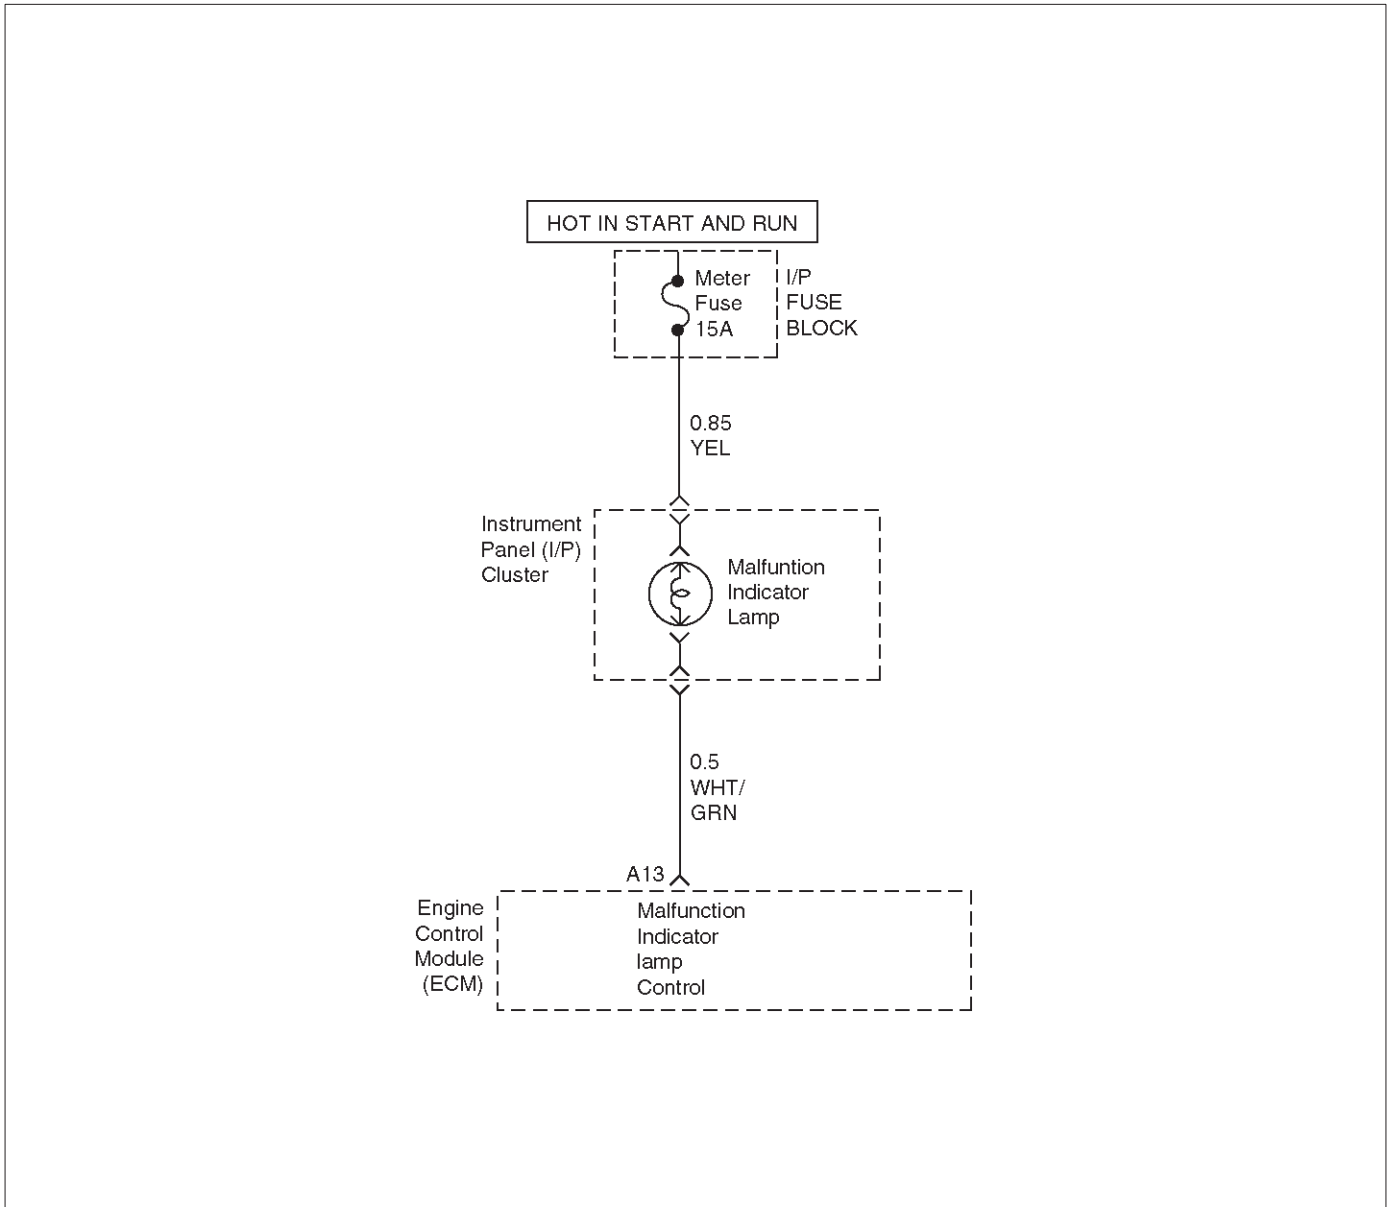

No Malfunction Indicator Lamp (MIL)

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	Attempt to start the engine. Does the engine start?	—	Go to Step 3	Go to Step 6
3	Check the meter fuse for the instrument cluster ignition feed circuit. Is the fuse OK?	—	Go to Step 4	Go to Step 16
4	1. Ignition ON. 2. Engine OFF. 3. Probe the ignition feed circuit at the cluster connector with a test light to ground. Is the test light ON?	—	Go to Step 5	Go to Step 13
5	1. Ignition OFF. 2. Disconnect the ECM. 3. Jumper the MIL driver circuit at the ECM connector to ground. 4. Ignition ON. Is the MIL ON?	—	Go to Step 10	Go to Step 11
6	Check the ECM ignition feed and battery feed fuses (15A Engine fuse and 15A ECM fuse). Are both fuses OK?	—	Go to Step 7	Go to Step 15
7	1. Ignition OFF. 2. Disconnect the ECM. 3. Ignition ON. 4. Probe the ignition feed circuit at the ECM harness connector with a test light to ground. Is the test light ON?	—	Go to Step 8	Go to Step 12
8	Probe the battery feed circuit at the ECM harness connector with a test light to ground. Is the test light ON?	—	Go to Step 9	Go to Step 14
9	Check for a faulty ECM ground connection. Was a problem found?	—	Verify repair	Go to Step 10
10	Check for damaged terminals at the ECM. Was a problem found?	—	Verify repair	Go to Step 17
11	Check for an open MIL driver circuit between the ECM and the MIL. Was a problem found?	—	Verify repair	Go to Step 18
12	Substitute a known "good" relay for the ECM main relay. Was the malfunction fixed?	—	Verify repair	Go to Step 13
13	Repair the open in the ignition feed circuit. Is the action complete?	—	Verify repair	—
14	Locate and repair the open ECM battery feed circuit. Is the action complete?	—	Verify repair	—

No Malfunction Indicator Lamp (MIL) (Cont'd)

Step	Action	Value(s)	Yes	No
15	Locate and repair the short to ground in the ECM ignition feed circuit or ECM battery feed circuit. Is the action complete?	—	Verify repair	—
16	Locate and repair the short to ground in the ignition feed circuit to the instrument cluster, and replace the fuse. Is the action complete?	—	Verify repair	—
17	Replace the ECM. Is the action complete?	—	Verify repair	—
18	Check the MIL driver circuit for a poor connection at the instrument panel connector. Was a problem found?	—	Verify repair	Go to Instrument Panel in Electrical Diagnosis

MALFUNCTION INDICATOR LAMP (MIL) ON STEADY

D06RX110

Circuit Description

The malfunction indicator lamp (MIL) should always be illuminated and steady with the ignition ON and the engine stopped. Ignition feed voltage is supplied directly to the MIL indicator. The engine control module (ECM) turns the MIL ON by grounding the MIL driver circuit. The MIL should not remain ON with the engine running and no DTC(s) set. A steady MIL with the engine running and no DTC(s) suggests a short to ground in the MIL driver circuit.

Diagnostic Aids

An intermittent may be caused by a poor connection, rubbed-through wire insulation, or a wire broken inside the insulation. Check for the following items:

- Poor connection or damaged harness – Inspect the ECM harness and connectors for improper mating, broken locks, improperly formed or damaged terminals, poor terminal-to-wire connection, and damaged harness.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

2. If the MIL does not remain ON when the ECM is disconnected, the MIL driver wiring is not faulty.
3. If the MIL driver circuit is OK, the instrument panel cluster is faulty.

Malfunction Indicator Lamp (MIL) ON Steady

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	1. Ignition OFF, disconnect the ECM. 2. Ignition ON, observe the MIL (Service Engine Soon lamp). Is the MIL ON?	—	Go to Step 3	Go to Step 5
3	1. Ignition OFF, disconnect the instrument panel cluster. 2. Check the MIL driver circuit between the ECM and the instrument panel cluster for a short to ground. 3. If a problem is found, repair as necessary. Was the MIL driver circuit shorted to ground?	—	Go to OBD System Check	Go to Step 4
4	Replace the instrument panel cluster. Is the action complete?	—	Go to OBD System Check	—
5	1. Ignition OFF, reconnect the ECM. 2. Ignition ON, reprogram the ECM. Refer to On-Vehicle Service in Engine Control Module and Sensors for procedures. 3. Using the Tech 2 output controls function, select MIL dash lamp control and command the MIL OFF. Did the MIL turn OFF?	—	Go to OBD System Check	Go to Step 6
6	Replace the ECM. Is the action complete?	—	Go to OBD System Check	—

ENGINE CRANKS BUT WILL NOT RUN

Circuit Description

The electronic ignition system uses a dual coil method of spark distribution. In this type of ignition system, the engine control module (ECM) triggers the correct driver inside the ignition control module (ICM), which then triggers the correct ignition coil based on the 58X signal received from the crankshaft position sensor (CKP). The spark plug connected to the coil fires when the ICM opens the ground circuit for the coil's primary circuit.

During crank, the ECM monitors the CKP 58X signal. The CKP signal is used to determine which cylinder will fire first. After the CKP 58X signal has been processed by the ECM, it will command all four injectors to allow a priming shot of fuel for all the cylinders. After the priming, the injectors are left OFF during the next four 58X reference pulses from the CKP. This allows each cylinder a chance to use the fuel from the priming shot. During this waiting period, a camshaft position (CMP) signal pulse will have been received by the ECM. The CMP signal allows the ECM to operate the injectors sequentially based on camshaft position. If the camshaft position signal is not present at start-up, the ECM will begin sequential fuel delivery with a 1-in-4 chance that fuel delivery is correct. The engine will run without a CMP signal, but will set a DTC code.

Diagnostic Aids

An intermittent problem may be caused by a poor connection, rubbed-through wire insulation or a wire broken inside the insulation. Check for the following items:

- Poor connection or damaged harness – Inspect the ECM harness and connectors for improper mating, broken locks, improperly formed or damaged terminals, poor terminal-to-wire connection, and damaged harness.
- Faulty engine coolant temperature sensor – Using a Tech 2, compare engine coolant temperature with intake air temperature on a completely cool engine. Engine coolant temperature should be within 10°C of intake air temperature. If not, replace the ECT sensor.

Engine Cranks But Will Not Run

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	Use the Tech 2 and check for any DTC's. Are any DTC's stored?	—	Go to Applicable DTC Table	Go to Step 3
3	Check the 15A ignition coil fuse, the 15A engine device fuse, and the 15A ECM fuse. Was a fuse blown?	—	Go to Step 4	Go to Step 5
4	Check for a short to ground and replace the fuse. Is the action complete?	—	Verify repair	—
5	1. Ignition ON. 2. Use a grounded test lamp to verify that B+ is available at the ignition coil fuse, the engine device fuse, and the ECM fuse. Was B+ available at the fuses?	—	Go to Step 7	Go to Step 6
6	Repair the open ignition feed circuit.	—	Go to Fuel System Electrical Test	Go to Fuel System Diagnosis
7	1. Disconnect the ignition secondary wire at the No.1. 2. Install a spark tester 5-8840-0279-0 at the end of the disconnected ignition coil. 3. Clip the spark tester 5-8840-0279-0 to a good ground (not near the battery). 4. Observe the spark tester while the engine is cranking. Was a crisp blue spark observed? (Only one or two sparks followed by no result is considered the same as "No Spark.")	—	Go to Step 16	Go to Step 8
8	1. Disconnect the ignition module harness connector. 2. Check for an open or short circuit between the ignition control module and the ECM? Was a problem found?	—	Go to Step 9	Go to Step 10
9	Repair the faulty circuit.	—	Verify repair	—
10	1. Ignition ON. 2. Using a Digital Voltmeter (DVM) check the ignition wire coil at the ignition module harness connector? Was the voltage equal to the specified value?	B+	Go to Step 12	Go to Step 11
11	Repair the open circuit.	—	Verify repair	—
12	1. Ignition OFF. 2. With DVM, check for an open in the ground wire at the ignition module harness connector. Was the ground wire OK?	—	Go to Step 14	Go to Step 13
13	Repair the faulty wire.	—	Verify repair	—

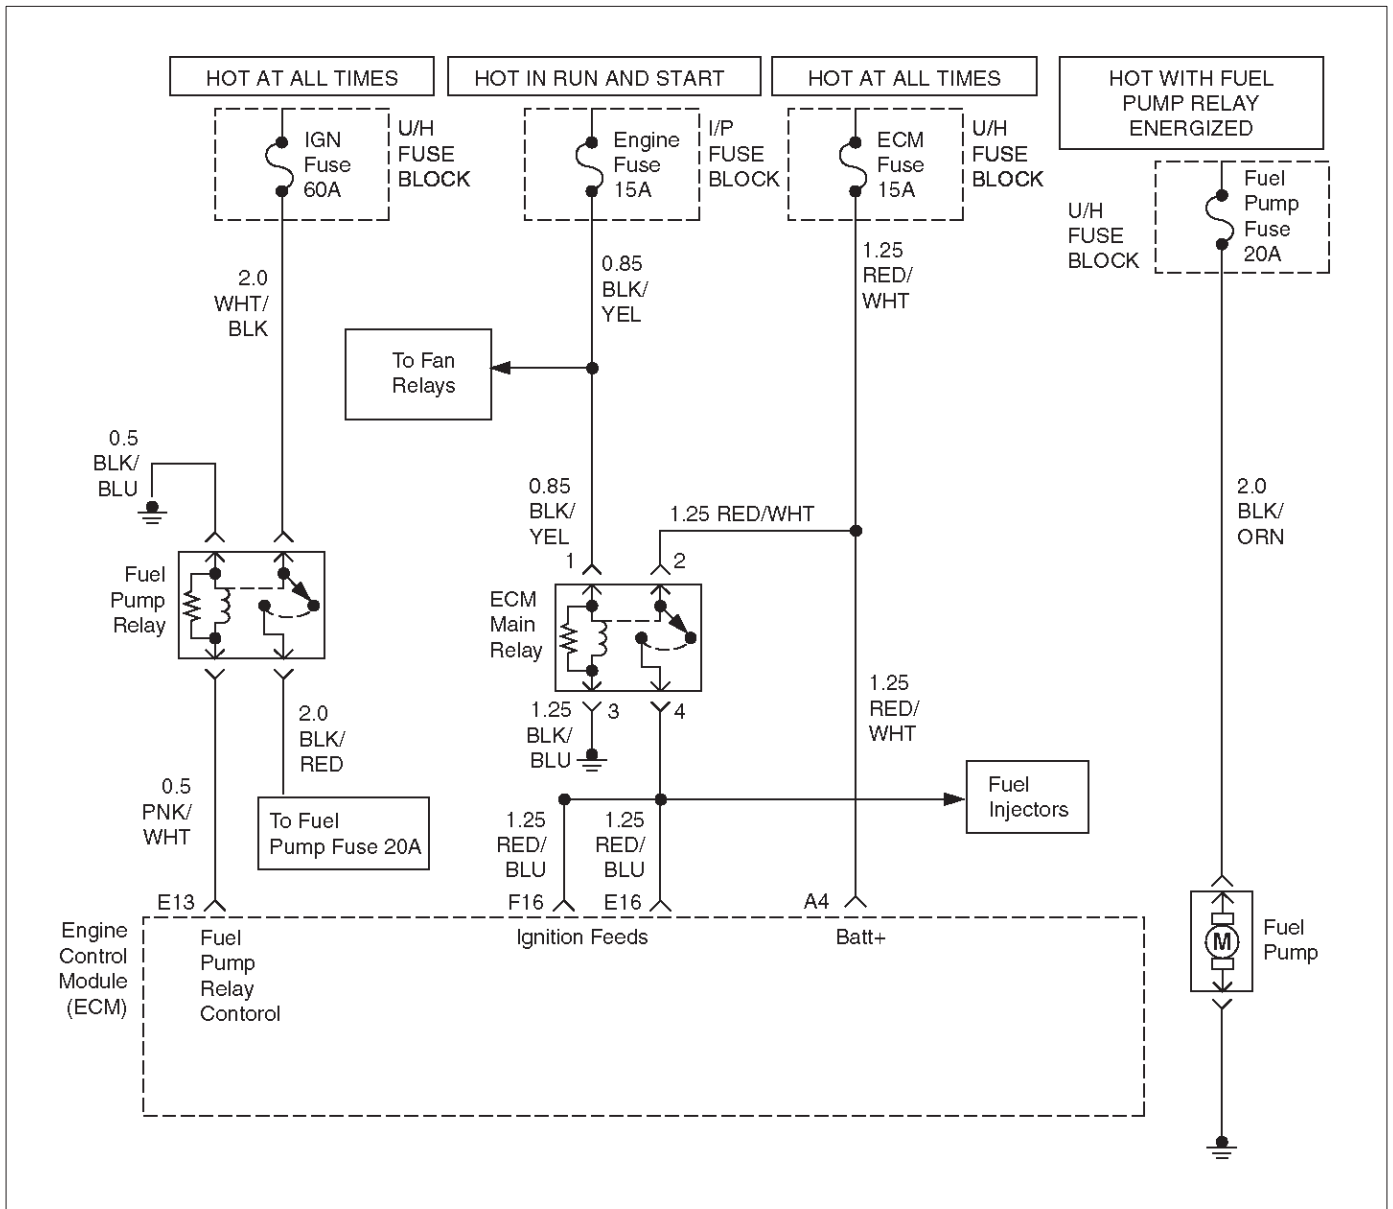

Engine Cranks But Will Not Run (Cont'd)

Step	Action	Value(s)	Yes	No
14	Replace the ignition module, verify the repair. Attempt to start the engine. Is there still a problem?	—	Go to Step 15	Verify repair
15	Replace the ECM. Is the action complete?	—	Verify repair	—
16	Use an ohmmeter to check the ignition coil primary winding resistance. Was the primary winding resistance approximately equal to the specified value?	0.8–18 Ω	Go to Step 17	Go to Step 18
17	Use an ohmmeter to check the ignition coil secondary winding resistance. Was the secondary winding resistance equal to the specified value?	9,000–12,000 Ω	Go to Step 19	Go to Step 18
18	Replace the ignition coil.	—	Verify repair	—
19	Test the resistance of the coil-to-spark plug secondary ignition wire. Was the resistance greater than the specified value?	10,000 Ω per foot	Go to Step 20	Go to Step 21
20	Replace the coil-to-spark plug secondary ignition wire and any other secondary wires which exceed the specified value. Is there still a problem?	10,000 Ω per foot	Go to Step 21	Verify repair
21	1. Remove the spark plugs from all cylinders. 2. Visually inspect the spark plug electrodes. 3. Replace any spark plugs with loose or missing electrodes or cracked insulators. Did your inspection reveal any spark plugs exhibiting excessing fouling?	—	Correct the fouling condition	Go to Step 30
22	Verfiy repair. Attempt to start the engine. Is there still a problem?	—	Go to Step 23	Go to Step 22
23	1. Ignition OFF, install a fuel pressure gauge at the test fitting on the fuel supply line in the engine compartment. CAUTION: Use a shop cloth to absorb any fuel leakage while making the connection. 2. Check the engine and observe the fuel pressure. Is the fuel pressure within the specified values, and does it hold steady for 2 seconds?	285–375 kPa (43–55 psi)	Go to Step 25	Go to Step 24
24	Is any fuel pressure indicated?	—	Go to Fuel System Electrical Test	Go to Fuel System Diagnosis

Engine Cranks But Will Not Run (Cont'd)

Step	Action	Value(s)	Yes	No
25	1. Raise the vehicle and disconnect the CKP sensor harness. 2. Ignition ON. 3. With a test light to ground, probe the CKP ignition feed harness terminal. Did the light illuminate?	—	Go to Step 26	Go to Step 27
26	1. Ignition ON. 2. At the CKP harness connector, connect a test lamp between the ignition and ground terminals. Did the lamp illuminate?	—	Go to Step 28	Go to Step 29
27	Check the CKP High circuit between the sensor and the ECM for a short to ground or open circuit. Was a problem found?	—	Verify repair	Go to Step 30
28	Replace the CKP position sensor. Is there still a problem?	—	Go to Step 31	—
29	Check the CKP Low circuit between the sensor and the ECM for: an open circuit, a short to ground, or short to voltage. Was the problem found?	—	Verify repair	Go to Step 30
30	Replace the ECM.	—	Verify repair	—
31	1. Test the fuel for contamination. 2. If a problem is found, clean the fuel system and correct the contaminated fuel condition as necessary. Replace the fuel filter and replace any injectors that are not delivering fuel (see Injector Balance Test). Was a problem found?	—	Verify repair	Go to Step 32
32	To diagnose the following conditions, refer to Engine Mechanical: <ul style="list-style-type: none"> ● Slipped camshaft drive belt. ● Leaking or sticky valves or rings. ● Excessive valve deposits. ● Loose or worn rocker arms. ● Weak valve springs ● Leaking head gasket. Is the action complete?	—	Verify repair	—

FUEL SYSTEM ELECTRICAL TEST

D06RX111

Circuit Description

When the ignition switch is first turned ON, the powertrain control module (ECM) energizes the fuel pump relay which applies power to the in-tank fuel pump. The fuel pump relay will remain ON as long as the engine is running or cranking and the ECM is receiving 58X crankshaft position pulses. If no 58X crankshaft position pulses are present, the ECM de-energizes the fuel pump relay within 2 seconds after the ignition is turned ON or the engine is stopped.

The fuel pump delivers fuel to the fuel rail and injectors, then to the fuel pressure regulator. The fuel pressure regulator controls fuel pressure by allowing excess fuel to be returned to the fuel tank. With the engine stopped and ignition ON, the fuel pump can be turned ON by using a command by the Tech 2.

Diagnostic Aids

An intermittent may be caused by a poor connection, rubbed-through wire insulation, or a wire broken inside the insulation. Check for the following items:

- Poor connection or damaged harness – Inspect the ECM harness and connectors for improper mating, broken locks, improperly formed or damaged terminals, poor terminal-to-wire connection, and damaged harness.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

2. If the fuel pump is operating but incorrect pressure is noted, the fuel pump wiring is OK and the "Fuel System Pressure Test" chart should be used for diagnosis.

6E1-74 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

CAUTION: To reduce the risk of fire and personal injury:

- It is necessary to relieve fuel system pressure before connecting a fuel pressure gauge. Refer to Fuel Pressure Relief Procedure, below.
- A small amount of fuel may be released when disconnecting the fuel lines. Cover fuel line fittings with a shop towel before disconnecting, to catch any fuel that may leak out. Place the towel in an approved container when the procedure is completed.

Fuel Pressure Relief Procedure

1. Remove the fuel cap.

2. Remove the fuel pump relay from the underhood relay center.
3. Start the engine and allow it to stall.
4. Crank the engine for an additional 3 seconds.

Fuel Gauge Installation

1. Remove the shoulder fitting cap.
2. Install fuel gauge 5-8840-0378-0 to the fuel feed line located in front of and above the right side valve cover.
3. Reinstall the fuel pump relay.

Fuel System Electrical Test

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	1. Read the "Caution" above. 2. Relieve the fuel system pressure and install the fuel pump pressure gauge to the test fitting. 3. Use a Tech 2 to command the fuel pump ON. Is there an immediate pressure build-up which indicates the pump is running?	—	Go to Step 3	Go to Step 4
3	1. Verify that the pump is not running by removing the fuel filler cap and listening. 2. Command the pump ON with the Tech 2. Did the pump turn OFF after 2 seconds?	—	Test completed	Go to Step 12
4	1. Ignition OFF. 2. Remove the fuel pump relay. 3. Ignition SW "On", Engin Off. 4. Using a test light connected to ground, probe the battery feed to the relay. Did the light illuminate?	—	Go to Step 6	Go to Step 5
5	Repair short or open battery feed to fuel pump relay. Is the action complete?	—	Verify repair	—
6	1. Connect a test light between the two wires that connect to the fuel pump relay pull-in coil. 2. Ignition ON. Did the test light illuminate for 2 seconds and then turn off?	—	Go to Step 12	Go to Step 7
7	1. With a test light connected to battery (-), probe the fuel pump relay connector at the wire which runs from the relay pull-in coil to the ECM. 2. Ignition ON. Did the test light illuminate for 2 seconds and then turn off?	—	Go to Step 8	Go to Step 9
8	Locate and repair open in the fuel pump relay ground circuit. Is the action complete?	—	Verify repair	—

Fuel System Electrical Test (Cont'd)

Step	Action	Value(s)	Yes	No
9	Check for short or open between the ECM and the fuel pump relay. Was a problem found?	—	Verify repair	Go to Step 10
10	1. Check the fuel pump relay circuit for a poor terminal connection at the ECM. 2. If a problem is found, replace terminal as necessary. Was a problem found?	—	Verify repair	Go to Step 11
11	Replace the ECM. Is the action complete?	—	Verify repair	—
12	1. Reconnect the fuel pump relay. 2. Disconnect the fuel pump electrical connector at the fuel tank. 3. Using a test light connected to ground, probe the fuel pump feed wire (harness side). 4. Command the fuel pump ON with a Tech 2. Did the light illuminate for 2 seconds?	—	Go to Step 15	Go to Step 13
13	1. Honk the horn to verify that the horn relay is functioning. 2. Substitute the horn relay for the fuel pump relay. 3. Leave the test light connected as in step 12. 4. Command the fuel pump ON with the Tech 2. Did the test light illuminate for 2 seconds when the fuel pump was commanded ON?	—	Go to Step 17	Go to Step 14
14	1. Re-connect the horn relay in its proper location. 2. Check for a short circuit, blown fuse or open circuit between the relay and the fuel tank. Is the action complete?	—	Verify repair	—
15	1. With the fuel pump electrical connector at the fuel tank disconnected, connect a test light between the feed wire and the ground wire (harness side). 2. Command the fuel pump ON with a Tech 2. Did the test light illuminate for 2 seconds?	—	Go to Step 18	Go to Step 16
16	Repair the open circuit in the fuel pump ground wire. Is the action complete?	—	Verify repair	—
17	1. Re-connect the horn relay in its proper location. 2. Replace the fuel pump relay. Is the action complete?	—	Verify repair	—
18	Replace the fuel pump. Is the action complete?	—	Verify repair	—

FUEL SYSTEM DIAGNOSIS

D06RX111

Circuit Description

When the ignition switch is turned ON, the engine control module (ECM) will turn ON the in-tank fuel pump. The in-tank fuel pump will remain ON as long as the engine is cranking or running and the ECM is receiving 58X crankshaft position pulses. If there are no 58X crankshaft position pulses, the ECM will turn the in-tank fuel pump OFF 2 seconds after the ignition switch is turned ON or 2 seconds after the engine stops running.

The in-tank fuel pump is an electric pump within an integral reservoir. The in-tank fuel pump supplies fuel through an in-line fuel filter to the fuel rail assembly. The fuel pump is designed to provide fuel at a pressure above the pressure needed by the fuel injectors. A fuel pressure regulator, attached to the fuel rail, keeps the fuel available to the fuel injectors at a regulated pressure. Unused fuel is returned to the fuel tank by a separate fuel return line.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

2. Connect the fuel pressure gauge to the fuel feed line as shown in the fuel system illustration. Wrap a shop towel around the fuel pressure connection in order to absorb any fuel leakage that may occur when installing the fuel pressure gauge. With the ignition switch ON and the fuel pump running, the fuel pressure indicated by the fuel pressure gauge should be 283–376 kPa (41–55 psi). This pressure is controlled by the amount of pressure the spring inside the fuel pressure regulator can provide.
3. A fuel system that cannot maintain a constant fuel pressure has a leak in one or more of the following areas:
 - The fuel pump check valve.
 - The fuel pump flex line.

- The valve or valve seat within the fuel pressure regulator.
 - The fuel injector(s)
4. Fuel pressure that drops off during acceleration, cruise, or hard cornering may cause a lean condition. A lean condition can cause a loss of power, surging, or misfire. A lean condition can be diagnosed using a Tech 2. If an extremely lean condition occurs, the oxygen sensor(s) will stop toggling. The oxygen sensor output voltage(s) will drop below 500 mV. Also, the fuel injector pulse width will increase.

IMPORTANT: Make sure the fuel system is not operating in the "Fuel Cut-Off Mode."

When the engine is at idle, the manifold pressure is low (high vacuum). This low pressure (high vacuum) is applied to the fuel pressure regulator diaphragm. The low pressure (high vacuum) will offset the pressure being applied to the fuel pressure regulator diaphragm by the spring inside the fuel pressure regulator. When this happens, the result is lower fuel pressure. The fuel pressure at idle will vary slightly as the barometric pressure changes, but the fuel pressure at idle should always be less than the fuel pressure noted in step 2 with the engine OFF.

16. Check the spark plug associated with a particular fuel injector for fouling or saturation in order to determine if that particular fuel injector is leaking. If checking the spark plug associated with a particular fuel injector for fouling or saturation does not determine that a particular fuel injector is leaking, use the following procedure:
- Remove the fuel rail, but leave the fuel lines and injectors connected to the fuel rail. Refer to Fuel Rail Assembly in On-Vehicle Service.
 - Lift the fuel rail just enough to leave the fuel injector nozzles in the fuel injector ports.

CAUTION: In order to reduce the risk of fire and personal injury that may result from fuel spraying on the engine, verify that the fuel rail is positioned over the fuel injector ports and verify that the fuel injector retaining clips are intact.

- **Pressurize the fuel system by connecting a 10 amp fused jumper between B+ and the fuel pump relay connector.**
- **Visually and physically inspect the fuel injector nozzles for leaks.**

17. A rich condition may result from the fuel pressure being above 376 kPa (55 psi). A rich condition may cause a DTC P0132 or a DTC P0172 to set. Driveability conditions associated with rich conditions can include hard starting (followed by black smoke) and a strong sulfur smell in the exhaust.

20. This test determines if the high fuel pressure is due to a restricted fuel return line or if the high fuel pressure is due to a faulty fuel pressure regulator.
21. A lean condition may result from fuel pressure below 333 kPa (48 psi). A lean condition may cause a DTC P0131 or a DTC P0171 to set. Driveability conditions associated with lean conditions can include hard starting (when the engine is cold), hesitation, poor driveability, lack of power, surging, and misfiring.
22. Restricting the fuel return line causes the fuel pressure to rise above the regulated fuel pressure. Command the fuel pump ON with the Tech 2. The fuel pressure should rise above 376 kPa (55 psi) as the fuel return line becomes partially closed.

NOTE: Do not allow the fuel pressure to exceed 414 kPa (60 psi). Fuel pressure in excess of 414 kPa (60 psi) may damage the fuel pressure regulator.

CAUTION: To reduce the risk of fire and personal injury:

- **It is necessary to relieve fuel system pressure before connecting a fuel pressure gauge. Refer to Fuel Pressure Relief Procedure, below.**
- **A small amount of fuel may be released when disconnecting the fuel lines. Cover fuel line fittings with a shop towel before disconnecting, to catch any fuel that may leak out. Place the towel in an approved container when the procedure is completed.**

Fuel Pressure Relief Procedure

1. Remove the fuel cap.
2. Remove the fuel pump relay from the underhood relay center.
3. Start the engine and allow it to stall.
4. Crank the engine for an additional 3 seconds.

Fuel Gauge Installation

1. Remove the shoulder fitting cap.
2. Install fuel gauge 5-8840-0378-0 to the fuel feed line located on the upper right side of the engine near the EGR valve.
3. Reinstall the fuel pump relay.

Fuel System Diagnosis

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	1. Turn the ignition OFF. 2. Turn the air conditioning system OFF. 3. Relieve fuel system pressure and install the fuel pressure gauge. 4. Turn the ignition ON. NOTE: The fuel pump will run for approximately 2 seconds. Use the Tech 2 to command the fuel pump ON. 5. Observe the fuel pressure indicated by the fuel pressure gauge with the fuel pump running. Is the fuel pressure within the specified limits?	283-376 kPa (41-55 psi)	Go to Step 3	Go to Step 17
3	NOTE: The fuel pressure will drop when the fuel pump stops running, then it should stabilize and remain constant. Does the fuel pressure indicated by the fuel pressure gauge remain constant?	—	Go to Step 4	Go to Step 12
4	1. When the vehicle is at normal operating temperature, turn the ignition ON to build fuel pressure and observe the measurement on the gauge. 2. Start the engine and observe the fuel pressure gauge. Did the reading drop by the amount specified after the engine was started?	21-105 kPa (3-15 psi)	Go to Step 5	Go to Step 9
5	Is fuel pressure dropping off during acceleration, cruise, or hard cornering?	—	Go to Step 6	Check for improper fuel
6	Visually and physically inspect the following items for a restriction: <ul style="list-style-type: none"> ● The in-pipe fuel filter. ● The fuel feed line. Was a restriction found?	—	Verify repair	Go to Step 7
7	Remove the fuel tank and visually and physically inspect the following items: <ul style="list-style-type: none"> ● The fuel pump strainer for a restriction. ● The fuel line for a leak. ● Verify that the correct fuel pump is in the vehicle. Was a problem found in any of these areas?	—	Verify repair	Go to Step 8
8	Replace the fuel pump. Is the action complete?	—	Verify repair	—
9	1. Disconnect the vacuum hose from the fuel pressure regulator. 2. With the engine idling, apply 12-14 inches of vacuum to the fuel pressure regulator. Does the fuel pressure indicated by the fuel pressure gauge drop by the amount specified?	21-105 kPa (3-15 psi)	Go to Step 10	Go to Step 11

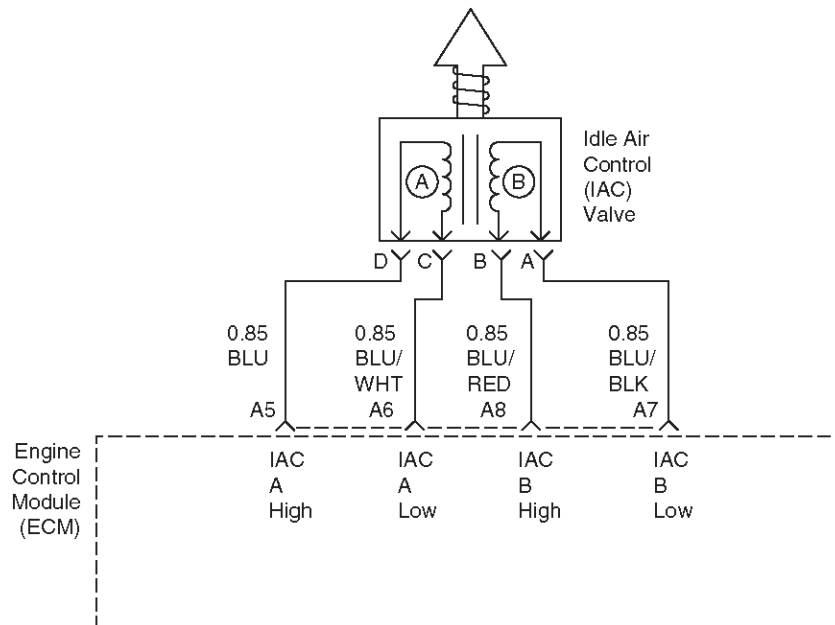

Fuel System Diagnosis (Cont'd)

Step	Action	Value(s)	Yes	No
10	Locate and repair the loss of vacuum to the fuel pressure regulator. Is the action complete?	—	Verify repair	—
11	Replace the fuel pressure regulator. Is the action complete?	—	Verify repair	—
12	1. Run the fuel pump with the Tech 2. 2. After pressure has built up, turn off the pump and clamp the supply hose shut with suitable locking pliers which will not damage the hose. Does the fuel pressure indicated by the fuel pressure gauge remain constant?	—	Go to Step 13	Go to Step 15
13	Visually inspect the fuel supply line and repair any leaks. Was a problem found?	—	Verify repair	Go to Step 14
14	Remove the fuel tank and inspect for leaky hose or in-tank fuel line. Was a problem found?	—	Verify repair	Go to Step 8
15	1. If the pliers are still clamped to the fuel supply hose, remove the locking pliers. 2. With suitable locking pliers which will not damage the hose, clamp the fuel return line to prevent fuel from returning to the fuel tank. 3. Run the fuel pump with the Tech 2. 4. After pressure has built up, remove power to the pump. Does the fuel pressure indicated by the fuel pressure gauge remain constant?	—	Go to Step 11	Go to Step 16
16	Locate and replace any leaking fuel injector(s). Is the action complete?	—	Verify repair	—
17	Is the fuel pressure indicated by the fuel pressure gauge above the specified limit?	376 kPa (55 psi)	Go to Step 18	Go to Step 21
18	1. Relieve the fuel pressure. Refer to the Fuel Pressure Relief. 2. Disconnect the fuel return line from the fuel rail. 3. Attach a length of flexible hose to the fuel rail return outlet passage. 4. Place the open end of the flexible hose into an approved gasoline container. 5. Run the fuel pump with the Tech 2. 6. Observe the fuel pressure indicated by the fuel pressure gauge with the fuel pump running. Is the fuel pressure within the specified limits?	290–376 kPa (42–55 psi)	Go to Step 19	Go to Step 20
19	Locate and correct the restriction in the fuel return line. Is the action complete?	—	Verify repair	—
20	Visually and physically inspect the fuel rail outlet passages for a restriction. Was a restriction found?	—	Verify repair	Go to Step 11

Fuel System Diagnosis (Cont'd)

Step	Action	Value(s)	Yes	No
21	Is the fuel pressure indicated by the fuel pressure gauge above the specified value?	0 kPa (0 psi)	Go to Step 22	Go to Step 23
22	1. Command the fuel pump ON with the Tech 2. 2. Using suitable pliers which will not damage the fuel hose, gradually apply pressure with the pliers to pinch the flexible fuel return hose closed. CAUTION: Do not let the fuel pressure exceed the second specified value. Does the fuel pressure indicated by the fuel pressure gauge rise above the first specified value?	414 kPa (60 psi)	Go to Step 11	Go to Step 7
23	1. Command the fuel pump ON with the Tech 2. 2. Remove the fuel filler cap and listen for the sound of the fuel pump running. 3. Turn the pump off. Was the fuel pump running?	—	Go to Step 7	Go to Fuel System Electrical Test Chart

IDLE AIR CONTROL (IAC) SYSTEM CHECK

Circuit Description

The engine control module (ECM) controls engine idle speed with the idle air control (IAC) valve. To increase idle speed, the ECM retracts the IAC valve pintle away from its seat, allowing more air to bypass the throttle bore. To decrease idle speed, it extends the IAC valve pintle towards its seat, reducing bypass air flow. A Tech 2 will read the ECM commands to the IAC valve in counts. Higher counts indicate more air bypass (higher idle). Lower counts indicate less air is allowed to bypass (lower idle).

Diagnostic Aids

A slow, unstable, or fast idle may be caused by a non-IAC system problem that cannot be overcome by the IAC valve. Out of control range IAC Tech 2 counts will be

above 60 if idle is too low, and zero counts if idle is too high. The following checks should be made to repair a non-IAC system problem:

- Vacuum leak (high idle) – If idle is too high, stop the engine. Fully extend (low) IAC with the Tech 2. Start the engine. If idle speed is above 800 RPM, locate and correct the vacuum leak, including the PCV system. Check for binding of the throttle blade or linkage.
- Lean heated oxygen sensor signal (high air/fuel ratio) – The idle speed may be too high or too low. Engine speed may vary up and down, and disconnecting the IAC valve does not help. Diagnostic trouble codes P0131, P0151, P0171, may be set. Tech 2 oxygen (O₂) voltage will be less than 100 mV (0.1 V). Check for low regulated fuel pressure, water in fuel, or a restricted injector.

- Rich heated oxygen sensor signal (low air/fuel ratio) – The idle speed will be too low. Tech 2 IAC counts will usually be above 80. The system is obviously rich and may exhibit black smoke in the exhaust.
Tech 2 O2 voltage will be fixed at about 750 mV (0.75 V). Check for high fuel pressure, or a leaking or sticking injector. A silicon-contaminated heated oxygen sensor will show an O2 voltage slow to respond on Tech 2.
- Throttle body – Remove the IAC valve and inspect the bore for foreign material.
- IAC valve electrical connections – IAC valve connections should be carefully checked for proper contact.
- PCV valve – An incorrect or faulty PCV valve may result in an incorrect idle speed. Refer to *Diagnosis, Rough Idle, Stalling*. If intermittent poor driveability or idle symptoms are resolved by disconnecting the IAC, carefully recheck the connections and valve terminal resistance, or replace the IAC.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

1. The Tech 2 is used to extend and retract the IAC valve. Valve movement is verified by an engine speed change. If no change in engine speed occurs, the valve can be resettled when removed from the throttle body.
2. This step checks the quality of the IAC movement in step 1. Between 700 revolutions per minute (RPM) and about 1500 RPM, the engine speed should change smoothly with each flash of the tester light in both extend and retract. If the IAC valve is retracted beyond the control range (about 1500 RPM), it may take many flashes to extend the IAC valve before engine speed will begin to drop. This is normal on certain engines. Fully extending the IAC may cause engine stall. This may be normal.

Idle Air Control (IAC) System Check

Step	Action	Value(s)	Yes	No
1	1. Ignition "OFF." 2. Connect the Tech 2. 3. Set the parking brake. 4. Block the wheels. 5. Turn the air conditioning "OFF." 6. Idle the engine in Park (A/T) or Neutral (M/T). 7. Operate the IAC test. 8. The engine speed should decrease and increase as the IAC is cycled. Does the RPM change?	—	Go to Step 2	Go to Step 3
2	RPM should change smoothly. Does the RPM change within the range specified?	700-1500 RPM	—	Go to Step 3
3	Check the IAC passages. Are the IAC passages OK?	—	Go to Step 4	Go to Step 5
4	Clear any obstruction from the IAC passages. Is the action complete?	—	Verify repair	—
5	Replace the IAC. Refer to <i>On-Vehicle Service, Idle Air Control Valve</i> . Is the action complete?	—	Verify repair	—

EXHAUST GAS RECIRCULATION (EGR) SYSTEM CHECK

D06RX113

Circuit Description

A properly operating exhaust gas recirculation (EGR) system will directly affect the air/fuel requirements of the engine. Since the exhaust gas introduced into the air/fuel mixture is an inert gas (contains very little or no oxygen), less fuel is required to maintain a correct air/fuel ratio. Introducing exhaust gas into the combustion chamber lowers combustion temperatures and reduces the formation of oxides of nitrogen (NO_x) in the exhaust gas. Lower combustion temperatures also prevent detonation. If the EGR pintle were to stay closed, the inert exhaust gas would be replaced with air and the air/fuel mixture would be leaner. The powertrain control module (ECM) would compensate for the lean condition by adding fuel, resulting in higher long term fuel trim values.

Diagnostic Aids

The EGR valve chart is a check of the EGR system. An EGR pintle constantly in the closed position could cause detonation and high emissions of NO_x. It could also result in high long term fuel trim values in the open throttle cell, but not in the closed throttle cell. An EGR pintle constantly in the open position would cause rough idle. Also, an EGR valve mounted incorrectly (rotated 180°) could cause a rough idle without setting an EGR DTC. Check for the following items:

- EGR passages – Check for restricted or blocked EGR passages.
- Manifold absolute pressure sensor – A manifold absolute pressure sensor may shift in calibration enough to affect fuel delivery. Refer to Manifold Absolute Pressure Output Check.

Exhaust Gas Recirculation (EGR) System Check

Step	Action	Value(s)	Yes	No
1	Check the EGR valve for looseness. Is the EGR valve loose?	—	Go to Step 2	Go to Step 3
2	Tighten the EGR valve. Is the action complete?	—	Verify repair	—
3	1. Place the transmission selector in Park or Neutral. 2. Start the engine and idle until warm ("Closed Loop"). 3. Using a Tech 2, command EGR "50% ON." Does the engine idle rough and lose RPMs?	—	EGR system working properly. No problem found.	Go to Step 4
4	1. Engine OFF. 2. Ignition ON. 3. Using a test light to ground, check the EGR harness between the ignition feed and ground. Does the test light illuminate?	—	Go to Step 6	Go to Step 5
5	Repair the EGR harness ignition feed. Was the problem corrected?	—	Verify repair	Go to Step 6
6	1. Remove the EGR valve. 2. Visually and physically inspect the EGR valve pintle, valve passages and adapter for excessive deposits, obstructions or any restrictions. Does the EGR valve have excessive deposits, obstructions or any restrictions?	—	Go to Step 7	Go to Step 8
7	Clean or replace EGR system components as necessary. Was the problem corrected?	—	Verify repair	Go to Step 8
8	1. Ground the EGR valve metal case to battery (-). 2. Using a Tech 2, command EGR ON and observe the EGR valve pintle for movement. Does the EGR valve pintle move according to command?	—	Go to Step 9	Go to DTC P0404 chart
9	1. Remove the EGR inlet and outlet pipes from the intake and exhaust manifolds. 2. Visually and physically inspect manifold EGR ports and EGR inlet and outlet pipes for blockage or restriction caused by excessive deposits or other damage. Do the manifold EGR ports or inlet and outlet pipes have excessive deposits, obstructions, or any restrictions?	—	Go to Step 10	EGR system working properly. No problem found.
10	Clean or replace EGR system components as necessary. Is the action complete?	—	Verify repair	—

MANIFOLD ABSOLUTE PRESSURE (MAP) OUTPUT CHECK

D06RX114

Circuit Description

The manifold absolute pressure (MAP) sensor measures the changes in the intake MAP which result from engine load (intake manifold vacuum) and engine speed changes; and converts these into a voltage output. The powertrain control module (ECM) sends a 5-volt reference voltage to the MAP sensor. As the MAP changes, the output voltage of the sensor also changes. By monitoring the sensor output voltage, the ECM knows the MAP. A lower pressure (low voltage) output voltage will be about 1–2 volts at idle. Higher pressure (high voltage) output voltage will be about 4–4.8 volts at wide open throttle. The MAP sensor is also used, under certain conditions, to measure barometric pressure, allowing the ECM to make adjustments for different altitudes. The ECM uses the MAP sensor to diagnose proper operation of the EGR system, in addition to other functions.

Test Description

IMPORTANT: Be sure to use the same diagnostic test equipment for all measurements.

The number(s) below refer to the step number(s) on the Diagnostic Chart:

1. When you compare the Tech 2 readings to a known good vehicle, it is important to compare vehicles that use MAP sensors that have the same part number.
 2. Applying 34 kPa (10 Hg) vacuum to the MAP sensor should cause the voltage to be 1.5–2.1 volts less than the voltage at step 1. Upon applying vacuum to the sensor, the change in voltage should be instantaneous. A slow voltage change indicates a faulty sensor.
 3. Check the vacuum hose to the sensor for leaking or restriction. Be sure that no other vacuum devices are connected to the MAP hose.
- IMPORTANT:** Make sure the electrical connector remains securely fastened.
4. Disconnect the sensor from the bracket. Twist the sensor with your hand to check for an intermittent connection. Output changes greater than 0.10 volt indicate a bad sensor.

Manifold Absolute Pressure (MAP) Output Check

Step	Action	Value(s)	Yes	No
1	1. Turn the ignition OFF and leave it OFF for 15 seconds. 2. Ignition ON. Do not crank engine. 3. The Tech 2 should indicate a manifold absolute pressure (MAP) sensor voltage. 4. Compare this scan reading to the scan reading of a known good vehicle obtained using the exact same procedure as in Steps 1-4. Is the voltage reading the same +/- 0.40 volt?	—	Go to Step 2	Go to Step 5
2	1. Disconnect the vacuum hose at the MAP sensor and plug the hose. 2. Connect a hand vacuum pump to the MAP sensor. 3. Start the engine. 4. Apply 34 kPa (10 Hg) of vacuum and note the voltage change. Is the voltage change 1.5-2.1 volts less than step 1?	—	Go to Step 3	Go to Step 4
3	Check the sensor hose for leakage or restriction. Does the hose supply vacuum to the MAP sensor only?	—	Go to Step 5	Go to Step 4
4	Repair the hose to ensure the hose supplies vacuum to the MAP sensor only. Is the action complete?	—	Verify repair	—
5	Check the sensor connection. Is the sensor connection good?	—	Go to Step 6	Go to Step 7
6	Refer to On-Vehicle Service, MAP Sensor. Is the action complete?	—	Verify repair	—
7	Repair the poor connection. Is the action complete?	—	Verify repair	—

ECM DIAGNOSTIC TROUBLE CODES

The following table lists the diagnostic trouble codes supported by this vehicle application. If any DTCs not listed here are displayed by a Scan Tool, the Tech 2 data

may be faulty; notify the Tech 2 manufacturer of any DTCs displayed that are not included in the following table.

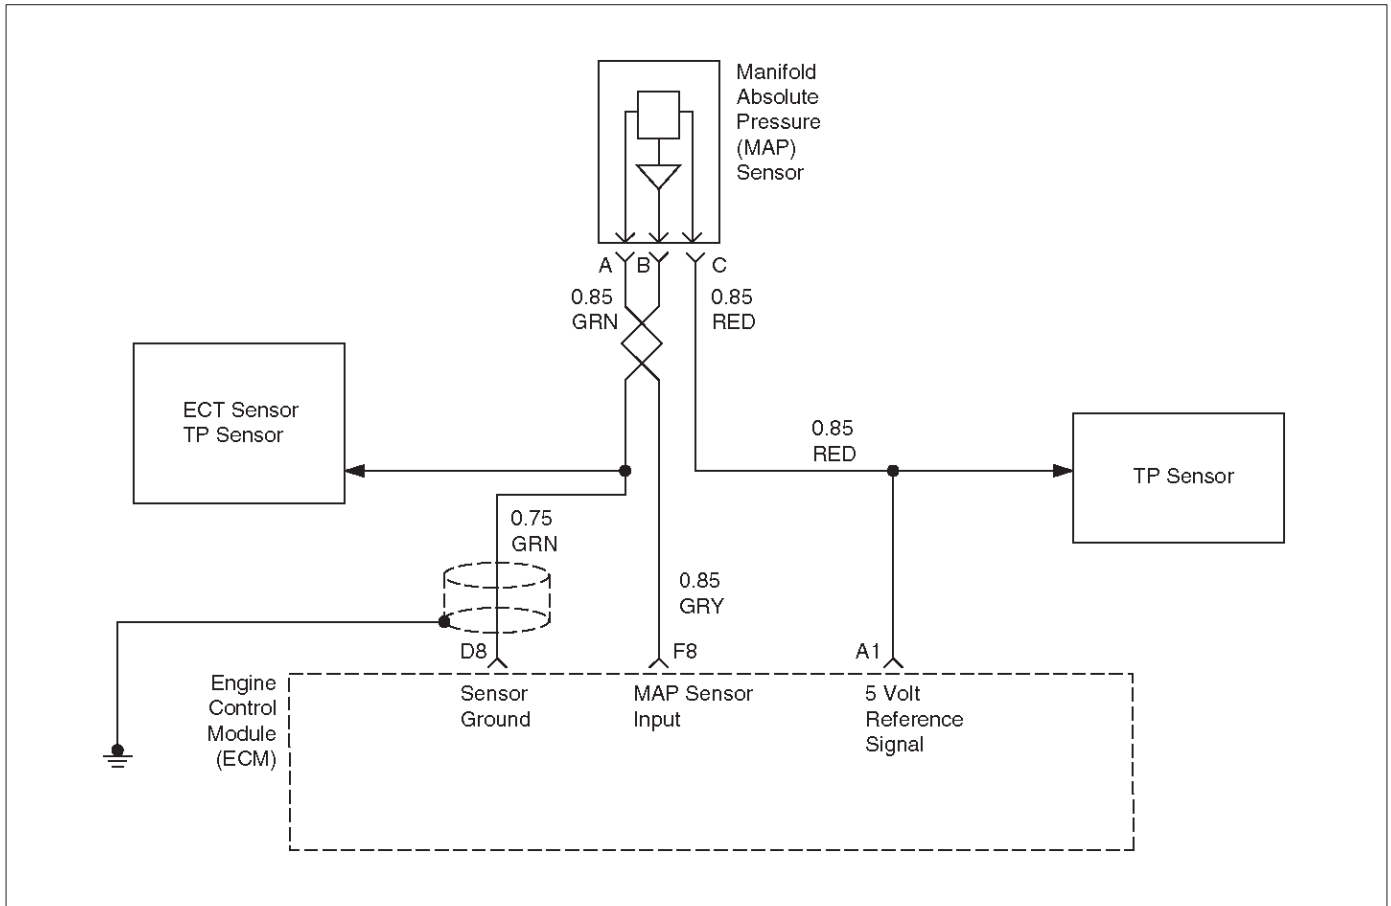

ECM Diagnostic Trouble Codes

DTC	Description	Type	Illuminate MIL
P0106	MAP Circuit/Range Performance Problem	B	Yes
P0107	MAP Sensor Circuit Low Input	A	Yes
P0108	MAP Sensor Circuit High Input	A	Yes
P0112	IAT Sensor Circuit Low Input	A	Yes
P0113	IAT Sensor Circuit High Input	A	Yes
P0117	ECT Sensor Circuit Low Input	A	Yes
P0118	ECT Sensor Circuit High Input	A	Yes
P0121	TP Sensor Circuit Range/Performance Problem	D	No
P0122	TP Sensor Circuit Low Input	A	Yes
P0123	TP Sensor Circuit High Input	A	Yes
P0131	O2 Sensor Circuit Low Voltage (Bank 1 Sensor 1)	A	Yes
P0132	O2 Sensor Circuit High Voltage (Bank 1 Sensor 1)	A	Yes
P0134	O2 Sensor Circuit No Activity Detected (Bank Sensor 1)	A	Yes
P0135	O2 Sensor Heater Circuit Malfunction (Bank 1 Sensor 1)	B	Yes
P0171	Fuel Trim System Too Lean (Bank 1)	B	Yes
P0172	Fuel Trim System Too Rich (Bank 1)	B	Yes
P0201	Injector Circuit Malfunction – Cylinder 1	A	Yes
P0202	Injector Circuit Malfunction – Cylinder 2	A	Yes
P0203	Injector Circuit Malfunction – Cylinder 3	A	Yes
P0204	Injector Circuit Malfunction – Cylinder 4	A	Yes
P0325	Knock Sensor Circuit Malfunction	B	Yes
P0327	Knock Sensor Circuit Low Input	B	Yes
P0336	CKP Sensor Circuit Range/Performance	B	Yes
P0337	CKP Sensor Circuit Low Input	B	Yes
P0341	CMP Sensor Circuit Range/Performance	B	Yes
P0342	CMP Sensor Circuit Low Input	B	Yes
P0351	Ignition Coil "A" Primary/Secondary	A	Yes
P0352	Ignition Coil "B" Primary/Secondary	A	Yes
P0401	EGR Flow Insufficient Detected	A	Yes
P0402	EGR Excessive Flow Detected	B	Yes
P0404	EGR Circuit Range/Performance	B	Yes
P0405	EGR Sensor Circuit Low	A	Yes
P0406	EGR Sensor Circuit High	A	Yes
P0443	EVAP Control System Purge Control Valve Circuit Malfunction	A	Yes
P0480	Cooling Fan 1 Control Circuit Malfunction	D	No
P0481	Cooling Fan 2 Control Circuit Malfunction	D	No
P0502	VSS Circuit Low Input	B	Yes
P0506	Idle Control System RPM Lower than expected	B	Yes

6E1-88 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

DTC	Description	Type	Illuminate MIL
P0507	Idle Control System RPM Higher than expected	B	Yes
P0563	System Voltage High	A	Yes
P0601	Internal Control Module Memory Check Sum Error	A	Yes
P1106	MAP Sensor Circuit Intermittent High Voltage	D	No
P1107	MAP Sensor Circuit Intermittent Low Voltage	D	No
P1111	IAT Sensor Circuit Intermittent High Voltage	D	No
P1112	IAT Sensor Circuit Intermittent Low Voltage	D	No
P1114	ECT Sensor Circuit Intermittent Low Voltage	D	No
P1115	ECT Sensor Circuit Intermittent High Voltage	D	No
P1121	TP Sensor Circuit Intermittent High Voltage	D	No
P1122	TP Sensor Circuit Intermittent Low Voltage	D	No
P1171	Fuel System Lean During Acceleration	A	Yes
P1404	EGR Closed Valve	B	Yes
P1625	PCM Unexpected Reset	D	Yes
P1627	PCM A/D Conversion Malfunction	A	Yes
P1635	5 Volt Reference Voltage Circuit Malfunction	A	Yes
P1640	ODM Output Circuit Fault	D	No

DIAGNOSTIC TROUBLE CODE (DTC) P0106 MANIFOLD ABSOLUTE PRESSURE (MAP) CIRCUIT/RANGE PERFORMANCE PROBLEM

D06RX114

Circuit Description

The manifold absolute pressure (MAP) sensor responds to changes in intake manifold pressure. The MAP sensor signal voltage to the engine control module (ECM) varies from below 2 volts at idle (low manifold pressure) to above 4 volts with the ignition ON engine not running or at wide-open throttle (high manifold pressure).

A "speed density" method of determining engine load is used on the 2.2L engine. This is calculated using inputs from the MAP sensor, RPM, CKP Sensor, and the Intake Air Temperature (IAT) sensor. The MAP sensor is the main sensor used in this calculation, and measuring engine load is its main function. The MAP sensor is also used to determine manifold pressure changes while the exhaust gas recirculation (EGR) flow test diagnostic is being run, to determine engine vacuum level for some other diagnostics and to determine barometric pressure (BARO). Refer to DTC P0401.

The ECM monitors the MAP signals for voltages outside the normal range (10–104 kPa) of the MAP sensor. If the ECM detects a MAP signal voltage that is excessively low, Diagnostic Trouble Code P0106 will be set. Diagnostic Trouble Code P0106 is a Type B Code.

Conditions for Setting the DTC

- No ECT, CKP, EGR, EVAP, MAP or TP sensor DTC's present.
- Engine speed is steady, changing less than 20 RPM.

- Throttle position is steady, throttle angle changes less than 5%.
- EGR flow rate is steady, changing less than 2%.
- IAC valve counts are steady, changing less than 3 counts.
- Engine speed is between 1000 RPM and 4000 RPM.
- ECT is above -10°C (14°F).
- No change in brake switch, A/C clutch, 3 or power steering pressure switch status.

The above conditions are met for longer than 1.5 seconds and the following condition is met in two consecutive trips:

- Actual MAP value varies more than 10 kPa.
- The MAP value must vary for a total of 10 seconds over a 20-second period of time that the samples were monitored.

Action Taken When the DTC Sets

- The ECM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The ECM will default to a BARO value of 79.3 kPa.
- The ECM will store conditions which were present when the Diagnostic Trouble Code was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The ECM will turn the MIL OFF on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history Diagnostic Trouble Code P0106 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code P0106 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at ECM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- The MAP sensor shares a 5 Volt Reference with the TP sensor and Fuel Pressure sensor.

If these codes are also set, it could indicate a problem with the 5 Volt reference circuit.

- The MAP sensor shares a ground with the TP sensor and Fuel Pressure sensor.
- Damaged harness – Inspect the wiring harness for damage; an open circuit, a short to ground, or a short to voltage. If the harness appears to be OK, observe the MAP display on the Tech 2 while moving connectors and wiring harnesses related to the sensor. A change in the display will indicate the location of the fault.

If Diagnostic Trouble Code P0106 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the Diagnostic Trouble Code was last set. If it is determined that the Diagnostic Trouble Code occurs intermittently, performing the Diagnostic Trouble Code P1106 or P1107 Diagnostic Chart may isolate the cause of the fault.

DTC P0106 MAP Circuit/Range Performance Problem

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	1. Ignition ON, engine OFF 2. Review and record Tech 2 Failure Records data, then clear the DTC's. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor "DTC" info for Diagnostic Trouble Code P0106. Does the Tech 2 indicate that DTC P0106 ran and passed?	—	Go to Step 3	Go to Step 4
3	1. Check for the following condition: <ul style="list-style-type: none"> • Vacuum hoses disconnected, damaged, or incorrectly routed? • Intake manifold vacuum leaks; • Vacuum leaks at throttle body; • Vacuum leaks at EGR valve flange and pipes; 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Refer to Diagnostic Aids
4	1. Disconnect the Manifold Absolute Pressure (MAP) sensor electrical connector. 2. Observe the MAP value displayed on the Tech 2. Is the MAP value near the specified value?	0 V 10.3 kPa	Go to Step 6	Go to Step 5
5	Check the MAP sensor signal circuit; between the MAP sensor and the Engine Control Module (ECM), for a short to voltage?	—	Verify repair	Go to Step 12
6	Check the MAP sensor circuit, between the MAP sensor and the ECM, the following conditions: <ul style="list-style-type: none"> • A short to ground • An open circuit Was the problem found?	—	Verify repair	Go to Step 7

DTC P0106 MAP Circuit/Range Performance Problem (Cont'd)

Step	Action	Value(s)	Yes	No
7	<p>Check the 5 volt signal circuit, between the MAP sensor and the ECM, for the following conditions:</p> <ul style="list-style-type: none"> ● An open circuit ● A short to ground ● A short to voltage <p>Was the problem found?</p>	—	Verify repair	Go to Step 8
8	<p>1. Ignition OFF. 2. Place a fused jumper between the MAP sensor circuit and the 5 volt signal circuit, both at the wiring harness' MAP sensor connector. 3. Ignition ON, engine OFF. 4. Observe the MAP value displayed on the Tech 2? Does the Tech 2 read the following value? (if no, start with the diagnosis chart for other sensors in the circuit and see if 5V returns.)</p>	5 volts 104 kPa	Go to Step 9	Go to Step 12
9	<p>Check the MAP sensor ground circuit, between the MAP sensor and the ECM, for the following conditions:</p> <ul style="list-style-type: none"> ● An open circuit ● A short to ground ● A short to voltage <p>Was the problem found?</p>	—	Verify repair	Go to Step 10
10	<p>1. Ignition OFF. 2. Place a Digital Multimeter (DVM), set to measure voltage, between the ground circuit and the 5 volt signal circuit, both at the wiring harness' MAP sensor connector. 3. Ignition ON, engine OFF. 5 volts Does the DVM read the following value?</p>	—	Go to Step 11	Go to Step 12
11	<p>Replace the MAP sensor. Verify repair.</p>	—	—	—
12	<p>Replace the ECM.</p>	—	—	—

DIAGNOSTIC TROUBLE CODE (DTC) P0107 MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR CIRCUIT LOW INPUT

D06RX114

Circuit Description

The manifold absolute pressure (MAP) sensor responds to changes in intake manifold pressure. The MAP sensor signal voltage to the powertrain control module (ECM) varies from below 2 volts at idle (low manifold pressure) to above 4 volts with the ignition ON, engine not running or at wide-open throttle (high manifold pressure).

A "speed density" method of determining engine load is used on the 2.2L engine. This is calculated using inputs from the MAP sensor, the CKP Sensor, and the Intake Air Temperature (IAT) sensor. The MAP sensor is the main sensor used in this calculation, and measuring engine load is its main function. The MAP sensor is also used to determine manifold pressure changes while the exhaust gas recirculation (EGR) flow test diagnostic is being run, to determine engine vacuum level for some other diagnostics and to determine barometric pressure (BARO). Refer to DTC P0401.

The ECM monitors the MAP signals for voltages outside the normal range (10–104 kpa) of the MAP sensor. If the ECM detects a MAP signal voltage that is excessively low, Diagnostic Trouble Code P0107 will be set. DTC P0107 is a Type A Code.

Conditions for Setting the DTC

- No TP sensor Diagnostic Trouble Codes present.
- Engine is running.

- System voltage greater than 11 volts.
- Throttle angle is above 0% if engine speed is less than or equal to 1300 RPM.
- Throttle angle is above 5% if engine speed is above 1300 RPM.
- The MAP sensor indicates manifold absolute pressure below 11 kPa for a total of approximately 10 seconds over a 16-second period.

Action Taken When the DTC Sets

- The ECM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The ECM will default to a BARO value of 79.3 kPa.
- The ECM will use a MAP value based on speed density calculation.
- The ECM will store conditions which were present when the Diagnostic Trouble Code was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The ECM will turn the MIL OFF on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0107 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code P0107 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at ECM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- The MAP sensor shares a 5 Volt Reference with the TP sensor and Fuel Pressure sensor.

If these codes are also set, it could indicate a problem with the 5 Volt reference circuit.

- The MAP sensor shares a ground with the TP sensor and Fuel Pressure sensor.
- Damaged harness – Inspect the wiring harness for damage, shorts to ground, shorts to battery positive, and open circuits. If the harness appears to be OK,

observe the MAP display on the Tech 2 while moving connectors and wiring harnesses related to the sensor. A change in the display will indicate the location of the fault.

- A faulty 5 volt reference circuit could also set a TP Sensor Diagnostic Trouble Code because the two sensors share the same 5 volt reference pin at the ECM.

If Diagnostic Trouble Code P0107 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the Diagnostic Trouble Code was last set. If it is determined that the Diagnostic Trouble Code occurs intermittently, performing the Diagnostic Trouble Code P0107 Diagnostic Chart may isolate the cause of the fault.

DTC P0107 – MAP Sensor Circuit Low Input

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	1. Ignition ON, engine OFF. 2. With the throttle closed, observe the MAP value displayed on the Tech 2. Is the MAP value near the specified value?	0V 10.3 kPa at sea level	Go to Step 4	Go to Step 3
3	1. Ignition ON, engine OFF. 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor «Diagnostic Trouble Code» info for Diagnostic Trouble Code P0107. Does the Tech 2 indicate Diagnostic Trouble Code P0107 failed?	—	Go to Step 4	Refer to Diagnostic Aids
4	1. Ignition OFF. 2. Disconnect the MAP sensor electrical connector. 3. Jumper the 5 volt reference circuit and the MAP signal together at the MAP sensor harness connector. 4. Ignition ON. 5. Observe the MAP value displayed on the Tech 2. Is the MAP value near the specified value? (if no, start with the diagnosis chart for other sensors in the circuit and see if 5V returns.)	5 V 104 kPa	Go to Step 10	Go to Step 5
5	1. Disconnect the jumper. 2. Connect a fused jumper between the 5 Volt signal circuit and the MAP sensor signal circuit at the MAP sensor harness connector. 3. Observe the MAP value displayed on the Tech 2. Is the MAP value near the specified value?	5 V 104 kPa	Go to Step 6	Go to Step 8

DTC P0107 – MAP Sensor Circuit Low Input (Cont'd)

Step	Action	Value(s)	Yes	No
6	1. Ignition OFF. 2. Disconnect the ECM and check the 5 volt reference circuit for an open or short to ground. 3. If the 5 volt reference circuit is open or shorted to ground, repair it as necessary. Was the 5 volt reference circuit open or shorted to ground?	—	Verify repair	Go to Step 7
7	Check the 5 volt reference circuit for a poor connection at the ECM and replace the terminal if necessary. Did the terminal require replacement?	—	Verify repair	Go to Step 11
8	1. Ignition OFF. 2. Disconnect the ECM, and check the MAP signal circuit for an open, short to ground, or short to the sensor ground circuit. 3. If the MAP sensor signal circuit is open or shorted to ground, repair it as necessary. Was the MAP signal circuit open or shorted to ground?	—	Verify repair	Go to Step 9
9	Check the MAP sensor signal circuit for a poor connection at the ECM and the MAP sensor; replace the terminal if necessary. Did the terminal require replacement?	—	Verify repair	Go to Step 11
10	Replace the MAP sensor. Is the action complete?	—	Verify repair	—
11	Replace the ECM. Is the action complete?	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0108 MANIFOLD ABSOLUTE PRESSURE (MAP) CIRCUIT HIGH INPUT

D06RX114

Circuit Description

The manifold absolute pressure (MAP) sensor responds to changes in intake manifold pressure. The MAP sensor signal voltage to the powertrain control module (ECM) varies from below 2 volts at idle (low manifold pressure) to above 4 volts with the ignition ON, engine not running or at wide-open throttle (high manifold pressure).

A "speed density" method of determining engine load is used on the 2.2L engine. This is calculated using inputs from the MAP sensor, RPM, CKP Sensor, and the Intake Air Temperature (IAT) sensor. The MAP sensor is the main sensor used in this calculation, and measuring engine load is its main function. The MAP sensor is also used to determine manifold pressure changes while the exhaust gas recirculation (EGR) flow test diagnostic is being run, to determine engine vacuum level for some other diagnostics and to determine barometric pressure (BARO). Refer to DTC P0401.

The ECM monitors the MAP signals for voltages outside the normal range (10–104 kpa) of the MAP sensor. If the ECM detects a MAP signal voltage that is excessively low, Diagnostic Trouble Code P0108 will be set. DTC P0108 is a Type A Code.

Conditions for Setting the DTC

- No TP sensor Diagnostic Trouble Codes present.
- Engine is running.

- Throttle position is below 2.7% if engine speed is below 1000 RPM.
- Throttle position is below 10% if engine speed is above 1000 RPM.
- The MAP sensor indicates manifold absolute pressure above 90 kPa for a total of approximately 10 seconds over a 16-second period.

Action Taken When the DTC Sets

- The ECM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The ECM will default to a BARO value of 79.3 kPa.
- The ECM will store conditions which were present when the Diagnostic Trouble Code was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The ECM will turn the MIL OFF on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history Diagnostic Trouble Code P0108 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code P0108 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

6E1-96 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

- Poor connection at ECM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- The MAP sensor shares a 5 Volt Reference with the TP sensor and Fuel Pressure sensor.
 - If these codes are also set, it could indicate a problem with the 5 Volt reference circuit.
- The MAP sensor share a ground with the TP sensor and Fuel Pressure sensor.
- Damaged harness – Inspect the wiring harness for damage; an open circuit, a short to ground, or a short to voltage. If the harness appears to be OK, observe the MAP display on the Tech 2 while moving connectors and wiring harnesses related to the sensor. A change in the display will indicate the location of the fault.
 - If Diagnostic Trouble Code P0108 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the Diagnostic Trouble Code was last set.

DTC P0108 MAP Sensor Circuit High Input

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	1. If the engine idle is rough, unstable or incorrect, repair the idle problem before using this chart. Refer to Symptoms section. 2. With the engine idling, note the MAP value on the Tech 2. Is the MAP reading above the specified value?	About 4V 90 kPa	Go to Step 4	Go to Step 3
3	1. Ignition ON engine OFF 2. Review and record Tech 2 Failure Records data, then clear the DTC's. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using the Tech 2, monitor "DTC" info for Diagnostic Trouble Code P0108. Does the Tech 2 indicate that DTC P0108 failed this ignition?	—	Go to Step 4	Refer to Diagnostic Aids
4	1. Ignition OFF. 2. Disconnect the MAP sensor electrical connector. 3. Ignition ON. 4. Observe the MAP value displayed on the Tech 2. Is the MAP value near the specified value? (if no, start with the diagnosis chart for other sensors in the circuit and see if 5V returns.)	0 V 10.3 kPa	Go to Step 5	Go to Step 6
5	Check the MAP sensor signal circuit; between the MAP sensor and the Engine Control Module (ECM), for a short to voltage. Was the problem found?	—	Verify repair	Go to Step 12
6	Check the MAP sensor circuit, between the MAP sensor and the ECM, the following conditions: <ul style="list-style-type: none"> • A short to ground • An open circuit Was the problem found?	—	Verify repair	Go to Step 7
7	Check the 5 volt signal circuit, between the MAP sensor and the ECM for the following conditions: <ul style="list-style-type: none"> • An open circuit • A short to ground • A short to voltage Was the problem found?	—	Verify repair	Go to Step 8

DTC P0108 MAP Sensor Circuit High Input (Cont'd)

Step	Action	Value(s)	Yes	No
8	1. Ignition OFF. 2. Place a fused jumper between the MAP sensor circuit and the 5 volt signal circuit, both at the wiring harness' MAP sensor connector. 3. Ignition ON, Engine OFF. 4. Observe the MAP value displayed on the Tech 2? Does the Tech 2 read the following value?	5 volts 104 kPa	Go to Step 9	Go to Step 12
9	Check the MAP sensor ground circuit, between the MAP sensor and the ECM, for the following conditions: <ul style="list-style-type: none"> ● An open circuit ● A short to ground ● A short to voltage Was the problem found?	—	Verify repair	Go to Step 10
10	1. Ignition OFF. 2. Place a Digital Multimeter (DVM), set to measure voltage, between the ground circuit and the 5 volt signal circuit, both at the wiring harness' MAP sensor connector. 3. Ignition ON, Engine OFF. Does the DVM read the following value?	5 Volts	Go to Step 11	Go to Step 12
11	Replace the MAP sensor. Verify repair.	—	—	—
12	Replace the ECM. Verify repair.	—	—	—

DIAGNOSTIC TROUBLE CODE (DTC) P0112 INTAKE AIR TEMPERATURE (IAT) SENSOR CIRCUIT LOW INPUT

D06RX116

Circuit Description

The intake air temperature (IAT) sensor is a thermistor which measures the temperature of the air entering the engine. The engine control module (ECM) applies 5 volts through a pull-up resistor to the IAT sensor. When the intake air is cold, the sensor resistance is high and the ECM will monitor a high signal voltage on the IAT signal circuit. If the intake air is warm, the sensor resistance is lower, causing the ECM to monitor a lower voltage. Diagnostic Trouble Code P0112 will set when the ECM detects an excessively low signal voltage (short to ground) on the intake air temperature sensor signal circuit. DTC P0112 is a Type A Code.

Conditions for Setting the DTC

- The engine has been running for over 2 minutes.
- Vehicle speed is greater than 48 km/h (30 mph).
- IAT signal voltage less than 0.10 volts for a total of 12.5 seconds over a 25-second period of time.

The above conditions are met for at least 2 seconds.

Action Taken When the DTC Sets

- The ECM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The ECM will use a default IAT valve based on ECM inputs and engine run time.

- The ECM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The ECM will turn the MIL OFF on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0112 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0112 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at ECM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage, shorts to ground, shorts to battery and open circuits. If the harness appears to be OK, observe the IAT display on the Tech 2 while moving connectors and wiring harnesses related to the IAT sensor. A change in the IAT display will indicate the location of the fault.

If Diagnostic Trouble Code P0112 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the Diagnostic Trouble Code was last set.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

- 2. Verifies that the fault is present.
- 3. If Diagnostic Trouble Code P0112 can be repeated only by duplicating the Failure Records condition, refer to the Temperature vs. Resistance Value table.

The table may be used to test the IAT sensor at various temperatures to evaluate the possibility of a "shifted" sensor that may be stored above or below a certain temperature. If this is the case, replace the IAT sensor. If the IAT sensor appears to be OK, the fault is intermittent; refer to Diagnostic Aids.

DIAGNOSTIC TROUBLE CODE (DTC) P0113 INTAKE AIR TEMPERATURE (IAT) SENSOR CIRCUIT HIGH INPUT

D06RX118

Circuit Description

The intake air temperature (IAT) sensor is a thermistor which measures the temperature of the air entering the engine. The engine control module (ECM) applies 5 volts through a pull-up resistor to the IAT sensor. When the intake air is cold, the sensor resistance is high and the ECM will monitor a high signal voltage on the IAT signal circuit. If the intake air is warm, the sensor resistance is lower causing the ECM to monitor a lower voltage. Diagnostic Trouble Code P0113 will set when the ECM detects an excessively high signal voltage on the intake air temperature sensor signal circuit. DTC P0113 is a Type A Code.

Conditions for Setting the DTC

- The engine has been running for over 4 minutes.
- Vehicle speed is less than 32 km/h (20 mph).
- ECT signal temperature is above 60°C (140°F).
- Mass air flow is less than 20g/second.
- IAT signal voltage almost 5 volts which indicates an intake air temperature less than -39°C (-38°F) for a total of 12.5 seconds over a 25-second period.

Action Taken When the DTC Sets

- The ECM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The ECM will use a default IAT valve based on ECM inputs and engine run time.

- The ECM will store conditions which were present when the Diagnostic Trouble Code was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The ECM will turn the MIL OFF on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history Diagnostic Trouble Code P0113 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code P0113 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at ECM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage, shorts to ground, shorts to battery positive, and open circuits. If the harness appears to be OK, observe the IAT display on the Tech 2 while moving connectors and wiring harnesses related to the IAT sensor. A change in the IAT display will indicate the location of the fault.

If Diagnostic Trouble Code P0113 cannot be duplicated, the information included in the Failure Records data can

6E1-102 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

be useful in determining vehicle mileage since the Diagnostic Trouble Code was last set.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

2. Verifies that the fault is present.

3. If Diagnostic Trouble Code P0113 can be repeated only by duplicating the Failure Records conditions, refer to the "Temperature vs. Resistance Values" table.

The table may be used to test the IAT sensor at various temperatures to evaluate the possibility of a "shifted" sensor that may be open above or below a certain temperature. If this is the case, replace the IAT sensor. If the IAT sensor appears to be OK, the fault is intermittent; refer to Diagnostic Aids.

DIAGNOSTIC TROUBLE CODE (DTC) P0117 ENGINE COOLANT TEMPERATURE (ECT) SENSOR CIRCUIT LOW INPUT

D06RX117

Circuit Description

The engine coolant temperature (ECT) sensor is a thermistor mounted in the engine coolant stream. The engine control module (ECM) applies a voltage (about 5 volts) through a pull-up resistor to the ECT signal circuit. When the engine coolant is cold, the sensor (thermistor) resistance is high, therefore the ECM will measure a high signal voltage. As the engine coolant warms, the sensor resistance becomes lower, and the ECT signal voltage measured at the ECM drops. With a fully warmed-up engine, the ECT signal voltage should measure about 1.5 to 2.0 volts. DTC P0117 is a Type A Code.

Conditions for Setting the DTC

- Engine running time is longer than two minutes.
- The ECT sensor signal indicates an engine coolant temperature greater than 150°C (302°F) (about 0.14 V) for a total of 12.5 seconds over a 25-second period.

Action Taken When the DTC Sets

- The ECM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The ECM will substitute the ECT reading with a default engine coolant temperature value. The default value is based on start-up intake air temperature and running time.

- The ECM will store conditions which were present when the Diagnostic Trouble Code was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The ECM will turn the MIL OFF on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history Diagnostic Trouble Code P0117 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code P0117 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at ECM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage, shorts to ground, shorts to battery positive, and open circuits. If the harness appears to be OK, observe the ECT display on the Tech 2 while moving connectors and wiring harnesses related to the ECT sensor. A change in the ECT display will indicate the location of the fault.

If Diagnostic Trouble Code P0117 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the

Diagnostic Trouble Code was last set. If it is determined that the Diagnostic Trouble Code occurs intermittently, performing the Diagnostic Trouble Code P1114 Diagnostic Chart may isolate the cause of the fault.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

- 2. Verifies that the fault is present.
- 3. If Diagnostic Trouble Code P0117 can be repeated only by duplicating the Failure Records conditions, refer to the "Temperature vs. Resistance Values" table.

The table may be used to test the ECT sensor at various temperatures to evaluate the possibility of a "shifted" sensor that may be shorted above or below a certain temperature. If this is the case, replace the ECT sensor. If the ECT sensor appears to be OK, the fault is intermittent; refer to Diagnostic Aids.

7	Replace the ECM. Is the action complete?	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0118 ENGINE COOLANT TEMPERATURE (ECT) SENSOR CIRCUIT HIGH INPUT

D06RX117

Circuit Description

The engine coolant temperature (ECT) sensor is a thermistor mounted in the engine coolant stream. The engine control module (ECM) applies a voltage (about 5 volts) through a pull-up resistor to the ECT signal circuit. When the engine coolant is cold, the sensor (thermistor) resistance is high, therefore the ECM will measure a high signal voltage. As the engine coolant warms, the sensor resistance becomes less, and the ECT signal voltage measured at the ECM drops. With a fully warmed up engine, the ECT signal voltage should measure about 1.5 to 2.0 volts. If the ECM detect a continuous open in the ECT sensor or circuit, then a code P0118 will set. DTC P0118 is a type A code.

Conditions for Setting the DTC

- Engine running time is longer than 2.5 minutes.
- The ECT sensor signal indicates an engine coolant temperature of -39°C (-38°F) or less (about 5 volts) for a total of 12.5 seconds over a 25-second period.

Action Taken When the DTC Sets

- The ECM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The ECM will substitute the ECT reading with a default engine coolant temperature value. The default value is based on start-up intake air temperature and running time.

- The ECM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The ECM will turn the MIL OFF on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history Diagnostic Trouble Code P0118 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code P0118 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at ECM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage, shorts to ground, shorts to battery positive, and open circuit. If the harness appears to be OK, observe the ECT display on the Tech 2 while moving connectors and wiring harnesses related to the ECT sensor. A change in the ECT display will indicate the location of the fault.

If Diagnostic Trouble Code P0118 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the

Diagnostic Trouble Code was last set. If it is determined that the Diagnostic Trouble Code occurs intermittently, performing the DTC P1115 Diagnostic Chart may isolate the cause of the fault.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

- 2. Verifies that the fault is present.
- 3. If Diagnostic Trouble Code P0118 can be repeated only by duplicating the Failure Records condition, refer to the "Temperature vs. Resistance Value" table.

The table may be used to test the ECT sensor at various temperatures to evaluate the possibility of a "shifted" sensor that may be shorted above or below a certain temperature. If this is the case, replace the ECT sensor. If the ECT sensor appears to be OK, the fault is intermittent; refer to Diagnostic Aids.

DIAGNOSTIC TROUBLE CODE (DTC) P0121 THROTTLE POSITION (TP) SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM

D06RX118

Circuit Description

The throttle position (Throttle Position) sensor circuit provides a voltage signal that changes relative to throttle blade angle. The signal voltage will vary from about 0.25 volts at closed throttle to about 4.75 volts at wide open throttle (WOT).

The Throttle Position (TP) signal is used by the powertrain control module (ECM) for fuel control and most of the ECM-controlled outputs. The ECM monitors throttle position and compares actual throttle positions from the TP sensor to a predicted TP value calculated from engine speed. If the ECM detects an out-of-range condition, then a DTC code P0121 will set. DTC P0121 is type A code.

Conditions for Setting the DTC

- The Engine is running.
- No MAP, ECT, TP, CKP, EGR, EVAP or DTC's are set.
- IAC is between 10 and 160 counts.
- ECT is above -10°C (14°F).
- The MAP value changes by less than 2 kPa.

All the above mentioned conditions are met, and one of the following conditions occurs for a total of 12.5 seconds over a 25-second period of time.

Stuck High-

- MAP value is below 55 kPa.

- Actual TP value is greater than the ECM's estimated TP value (Estimated TP value is based on MAP and RPM).

Stuck Low-

- MAP value is below 50 kPa.
- Actual TP value is less than the ECM's estimated TP value (Estimated TP value is based on MAP and RPM).

Action Taken When the DTC Sets

- The ECM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The ECM will store conditions which were present when the Diagnostic Trouble Code was set as Freeze Frame and in the Failure Records data.
- The ECM will use a default throttle position based on MAP and RPM.

Conditions for Clearing the MIL/DTC

- The ECM will turn the MIL OFF on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history Diagnostic Trouble Code P0121 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0121 can be cleared by using the Scan Tool's "Clear Info" function.

6E1-110 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

Diagnostic Aids

Check for the following conditions:

- Skewed MAP signal or faulty MAP sensor – An incorrect MAP signal may cause the ECM to incorrectly calculate the predicted TP sensor value during high engine load situations. Check for an unusually low MAP reading. This condition can cause DTC P0121 to be set.
- The TP sensor shares a 5 Volt reference with the MAP sensor and Fuel Pressure sensor.
If these codes are also set, it could indicate a problem with the 5 Volt reference circuit.
- The TP sensor shares a ground with the MAP sensor and the Fuel Pressure sensor.
- Poor connection at ECM – Inspect harness connectors for backed-out terminals, improper mating, broken

locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.

- Damaged harness – Inspect the wiring harness for damage; an open circuit, a short to ground, or a short to voltage. If the harness appears to be OK, observe the MAP display on the Tech 2 while moving connectors and wiring harnesses related to the sensor. A change in the display will indicate the location of the fault.

If DTC P0121 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the DTC was last set. If it is determined that the DTC occurs intermittently, performing the DTC P1122 or P1121 Diagnostic Chart may isolate the cause of the fault.

DTC P0121 TP Sensor/Range Performance Problem

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	1. Ignition ON engine OFF 2. Review and record Tech 2 Failure Records data, then clear the DTC's. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor "DTC" info for DTC P0121. Does the Tech 2 indicate that DTC P0121 "Ran and Passed?"	—	Refer to Diagnostic Aids	Go to Step 3
3	1. Ignition ON, engine OFF. 2. Monitor the TP value on the Tech 2 while moving the throttle between 0% and 100%. Does the TP value on the Tech 2 move smoothly from 0% (0.25 volts) to 100% (4.75 volts)? (if no, start with the diagnosis chart for other sensors in the circuit and see if 5V returns.)	—	Go to Step 4	Go to Step 11
4	1. Ignition OFF. 2. Disconnect the Throttle Position (TP) Sensor electrical connector, located on the RH side of the Throttle body. 3. Start the vehicle, and monitor the TP value with the Tech 2. DIAGNOSTIC TROUBLE CODE (DTC) P0122 THROTTLE POSITION (TP) SENSOR CIRCUITLOW INPUT

Circuit Description

The throttle position (TP) sensor circuit provides a voltage signal that changes relative to throttle blade angle. The signal voltage will vary from below 1 volt at closed throttle to about 4 volts at wide open throttle (WOT).

The TP signal is used by the engine control module (ECM) for fuel control and most of the ECM-controlled outputs. If the ECM detects a continuous short to ground in the TP sensor or circuit, then a code P0122 will set. Diagnostic Trouble Code P0122 is type A code.

Conditions for Setting the DTC

- The ignition is ON.
- Throttle Position sensor signal voltage is less than 0.22 volt for a total of 0.78 second over a 1.5-second period.

Action Taken When the DTC Sets

- The ECM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The ECM will store conditions which were present when the Diagnostic Trouble Code was set as Freeze Frame and in the Failure Records data.
- The ECM will use a default throttle position based on MAP and RPM.

Conditions for Clearing the MIL/DTC

- The ECM will turn the MIL OFF on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.

- A history Diagnostic Trouble Code P0122 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code P0122 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

- Poor connection at ECM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- The TP sensor shares a 5 Volt reference with the MAP sensor and Fuel Pressure sensor.
If these codes are also set, it could indicate a problem with the 5 Volt reference circuit or components itself.
- The TP sensor share a ground with the MAP and the Fuel Pressure sensor.
- Damaged harness – Inspect the wiring harness for damage, shorts to ground, shorts to battery positive, and open circuits. If the harness appears to be OK, observe the throttle position display on the Tech 2 while moving connectors and wiring harnesses related to the TP sensor. A change in the display will indicate the location of the fault.

If Diagnostic Trouble Code P0122 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the Diagnostic Trouble Code was last set. If it is determined that the Diagnostic Trouble Code occurs intermittently,

performing the Diagnostic Trouble Code P1122 Diagnostic Chart may isolate the cause of the fault.

DTC P0122 – TP Sensor Circuit Low Input

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	1. Ignition ON engine OFF. 2. With the throttle closed, observe the "Throttle Position Sensor" display on the Tech 2. Is the "Throttle Position Sensor" below the specified value?	0.22 V	Go to Step 4	Go to Step 3
3	1. Ignition ON engine OFF. 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor the "Diagnostic Trouble Code" info for Diagnostic Trouble Code P0122. Does the Tech 2 indicate DTC P0122 failed?	—	Go to Step 4	Refer to Diagnostic Aids
4	1. Ignition OFF. 2. Disconnect the TP sensor electrical connector. 3. Jumper the 5 volt reference circuit and the Throttle Position signal together at the Throttle Position sensor harness connector. 4. Ignition ON. Observe the "Throttle Position Sensor" display on the Tech 2. Is the "Throttle Position Sensor" at the specified value?	5 V	Go to Step 10	Go to Step 5
5	1. Disconnect jumper. 2. Connect a test light between B+ and the Throttle Position sensor signal circuit at the Throttle Position sensor harness connector. Observe the "Throttle Position Sensor" display on the Tech 2. Is the "Throttle Position Sensor" at the specified value? (if no, start with the diagnosis chart for other sensors in the circuit and see if 5V returns.)	5 V	Go to Step 6	Go to Step 8
6	1. Ignition OFF. 2. Disconnect the ECM and check the 5 volt reference circuit for an open or short to ground. 3. If the 5 volt reference circuit is open or shorted to ground, repair it as necessary. Was the 5 volt reference circuit open or shorted to ground?	—	Verify repair	Go to Step 7
7	Check the 5 volt reference circuit for a poor connection at the ECM and replace the terminal if necessary. Did the terminal require replacement?	—	Verify repair	Go to Step 12

DTC P0122 – TP Sensor Circuit Low Input (Cont'd)

Step	Action	Value(s)	Yes	No
8	1. Ignition OFF. 2. Disconnect the ECM, and check the TP signal circuit for an open, short to ground, or short to the sensor ground circuit. 3. If the TP sensor signal circuit is open or shorted to ground, repair it as necessary. Was the TP signal circuit open or shorted to ground?	—	Verify repair	Go to Step 9
9	Check the TP sensor signal circuit for a poor connection at the ECM and replace the terminal if necessary. Did the terminal require replacement?	—	Verify repair	Go to Step 12
10	Check the TP sensor signal circuit for a poor connection at the TP sensor and replace the terminal if necessary. Did the terminal require replacement?	—	Verify repair	Go to Step 11
11	Replace the TP sensor. Is the action complete?	—	Verify repair	—
12	Replace the ECM. Is the action complete?	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0123 THROTTLE POSITION (TP) SENSOR CIRCUIT HIGH INPUT

D06RX118

Circuit Description

The throttle position (TP) sensor circuit provides a voltage signal that changes relative to throttle blade angle. The signal voltage will vary from below 1 volt at closed throttle to about 4 volts at wide open throttle (WOT).

The TP signal is used by the engine control module (ECM) for fuel control and most of the ECM-controlled outputs. If the ECM detect a continuous open in the TP sensor or circuit, then a code P0123 will set. DTC P0123 is a type A code.

Conditions for Setting the DTC

- The ignition is ON.
- Throttle Position sensor signal voltage is greater than 4.78 volts for a total of 0.78 second over a 1.5-second period.

Action Taken When the DTC Sets

- The ECM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The ECM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.
- The ECM will use a default throttle position based on MAP and RPM.

Conditions for Clearing the MIL/DTC

- The ECM will turn the MIL OFF on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history Diagnostic Trouble Code P0123 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code P0123 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at ECM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- The TP sensor shares a 5 Volt reference with the MAP sensor and Fuel Pressure sensor.
 - If these codes are also set, it could indicate a problem with the 5 Volt reference circuit or components itself.
- The TP sensor share a ground with the MAP and the Fuel Pressure sensor.
- Damaged harness – Inspect the wiring harness for damage, shorts to ground, shorts to battery positive and open circuits. If the harness appears to be OK, observe the Throttle Position sensor display on the Tech 2 while moving connectors and wiring harnesses related to the TP sensor. A change in the display will indicate the location of the fault.

6E1-116 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

- Faulty Throttle Position sensor – With the ignition key ON engine OFF observe the TP sensor display on the Tech 2 while slowly depressing the accelerator to wide open throttle. If a voltage over 4.88 volts is seen at any point in normal accelerator travel, replace the TP sensor.

If Diagnostic Trouble Code P0123 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the Diagnostic Trouble Code was last set. If it is determined that the Diagnostic Trouble Code occurs intermittently, performing the Diagnostic Trouble Code P1121 Diagnostic Chart may isolate the cause of the fault.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

7. Components that share the TP sensor 5 volt reference circuit include the following devices:

- EGR valve
- MAP sensor

Disconnect the component while observing the Throttle Position sensor display on the Tech 2. If the reading changes drastically when this component is disconnected, replace the component that affected the reading.

DTC P0123 – TP Sensor Circuit High Input

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	1. Ignition ON, engine OFF. 2. With the throttle closed, observe the "Throttle Position Sensor" display on the Tech 2. Is the "Throttle Position Sensor" above the specified value?	4.78 V	Go to Step 4	Go to Step 3
3	1. Ignition ON, engine OFF. 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor "Diagnostic Trouble Code" info for Diagnostic Trouble Code P0123. Does the Tech 2 indicate Diagnostic Trouble Code P0123 failed.	—	Go to Step 4	Refer to Diagnostic Aids
4	1. Disconnect the Throttle Position sensor electrical connector. 2. Observe the "Throttle Position Sensor" display on the Tech 2. Is the "Throttle Position Sensor" near the specified value? (if no, start with the diagnosis chart for other sensors in the circuit and see if 5V returns.)	0 V	Go to Step 5	Go to Step 6
5	Probe the sensor ground circuit at the Throttle Position sensor harness connector with a test light connected to B+. Is the test light ON?	—	Go to Step 7	Go to Step 10
6	1. Ignition OFF disconnect the ECM. 2. Ignition ON engine OFF. 3. Check for a short to voltage on the TP sensor signal circuit. 4. If the TP sensor signal circuit is shorted, repair it as necessary. Was the TP sensor signal circuit shorted?	—	Verify repair	Go to Step 12

DTC P0123 – TP Sensor Circuit High Input (Cont'd)

Step	Action	Value(s)	Yes	No
7	1. Ignition ON. 2. Monitor the "Throttle Position Sensor" Tech 2 display while disconnecting each of the components that share the 5 volt reference circuit (one at a time). 3. If the "Throttle Position Sensor" Tech 2 display changes, service the component(s) that caused the display to change when disconnected. Does disconnecting any of these components cause the "Throttle Position Sensor" display to change?	—	Verify repair	Go to Step 8
8	1. Ignition OFF disconnect the ECM. 2. Ignition ON, engine OFF. 3. Check for a short to B+ on the 5 volt reference circuit. 4. If the 5 volt reference circuit is shorted, repair it as necessary. Was the 5 volt reference circuit shorted?	—	Verify repair	Go to Step 9
9	Check for poor electrical connections at the Throttle Position sensor and replace terminals if necessary. Did any terminals require replacement?	—	Verify repair	Go to Step 11
10	1. Ignition OFF. 2. Disconnect the ECM, and check for an open sensor ground circuit to the Throttle Position sensor. 3. If a problem is found, repair it as necessary. Was the sensor ground circuit to the Throttle Position sensor open?	—	Verify repair	Go to Step 12
11	Replace the Throttle Position sensor. Is the action complete?	—	Verify repair	—
12	Replace the ECM. Is the action complete?	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0131 O2 SENSOR CIRCUIT LOW VOLTAGE (BANK 1 SENSOR 1)

Circuit Description

The engine control module (ECM) supplies a bias voltage of about 450 mV between the heated oxygen sensor (HO₂S) signal and low circuits. When measured with a 10 mega Ω digital voltmeter, this may display as low as 350 mV. The oxygen sensor varies the voltage within a range of about 1000 mV when the exhaust is rich, down through about 10 mV when exhaust is lean. The ECM constantly monitors the HO₂S signal during "Closed Loop" operation and compensates for a rich or lean condition by decreasing or increasing injector pulse width as necessary. If the Bank 1 HO₂S 1 voltage remains excessively low for an extended period of time, Diagnostic Trouble Code P0131 will be set. DTC P0131 is a type A code.

Conditions for Setting the DTC

- No related Diagnostic Trouble Codes.
- Vehicle is operating in "Closed Loop".
- Engine coolant temperature is above 60°C (140°F)
- "Closed Loop" commanded air/fuel ratio is between 14.5 and 14.8.
- Throttle angle is between 3% and 19%.

All above conditions met for 0.3 seconds and the following condition is met:

- Bank 1 HO₂S 1 signal voltage remains below 22 mV during normal "Closed Loop" operation for a total of 76.5 seconds over a 90-second period of time.

Action Taken When the DTC Sets

- The ECM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The ECM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.
- "Open Loop" fuel control will be in effect.

Conditions for Clearing the MIL/DTC

- The ECM will turn the MIL OFF on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history Diagnostic Trouble Code P0131 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code P0131 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Heated oxygen sensor wiring – The sensor pigtail may be routed incorrectly and/or contacting the exhaust system. Also, check for shorts to ground, shorts to battery positive and open circuits.
- Poor ECM to engine block grounds.
- Fuel pressure – The system will go lean if pressure is too low. The ECM can compensate for some decrease. However, if fuel pressure is too low, a Diagnostic

Trouble Code P0131 may be set. Refer to Fuel System Diagnosis.

- Lean injector(s) – Perform "Injector Balance Test."
- Vacuum leaks – Check for disconnected or damaged vacuum hoses and for vacuum leaks at the intake manifold, throttle body, EGR system, and PCV system.
- Exhaust leaks – An exhaust leak may cause outside air to be pulled into the exhaust gas stream past the HO2S, causing the system to appear lean. Check for exhaust leaks that may cause a false lean condition to be indicated.
- Fuel contamination – Water, even in small amounts, can be delivered to the fuel injectors. The water can cause a lean exhaust to be indicated. Excessive alcohol in the fuel can also cause this condition. For the procedure to check for fuel contamination, Refer to Fuel System Diagnosis.

If none of the above conditions are present, replace the affected HO2S.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

3. Diagnostic Trouble Code P0131 failing during operation may indicate a condition described in the "Diagnostic Aids" above. If the Diagnostic Trouble Code P0131 test passes while the Failure Records conditions are being duplicated, an intermittent condition is indicated.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the Diagnostic Trouble Code to be set occurs. This may assist in diagnosing the condition.

DTC P0131 – O2 Sensor Circuit Low Voltage (Bank 1 Sensor 1)

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	1. Install the Tech 2. 2. Run the engine at operating temperature. 3. Operate the vehicle within the parameters specified under "Conditions for Setting the Diagnostic Trouble Code" criteria included in Diagnostic Support. 4. Using a Tech 2, monitor Bank 1 HO2S 1 voltage. Does the Bank 1 HO2S 1 voltage remain below the specified value?	300 mV	Go to Step 4	Go to Step 3
3	1. Ignition ON engine OFF review and record Tech 2 Failure Records data and note parameters. 2. Operate the vehicle within Failure Records conditions as noted. 3. Using a Tech 2, monitor "Diagnostic Trouble Code" info for Diagnostic Trouble Code P0131 until the Diagnostic Trouble Code P0131 test runs. Note test result. Does Tech 2 indicate DTC P0131 failed this ignition?	—	Go to Step 4	Refer to Diagnostic Aids
4	1. Turn the ignition OFF. 2. Disconnect the ECM. 3. Check the Bank 1 HO2S 1 high and low circuits for a short to ground or a short to the heater ground circuit. Are the Bank 1 HO2S 1 signal circuits shorted to ground?	—	Go to Step 5	Go to Step 6
5	Repair the Bank 1 HO2S 1 signal circuit. Is the action complete?	—	Verify repair	—
6	1. Turn the ignition OFF HO2S 1 and ECM disconnected. 2. Check for continuity between the high and low signal circuits. Was there continuity between the high and low circuits?	—	Go to Step 7	Go to Step 8
7	Repair the short between the high and low circuits. Is the action complete?	—	Verify repair	—
8	1. Ignition OFF. 2. Reconnect the ECM, leave the sensor disconnected. 3. Ignition ON. Does the Tech 2 indicate Bank 1 HO2S 1 voltage near the specified value?	430–450 mV	Refer to Diagnostic Aids	Go to Step 9
9	Replace the ECM. Is the action complete?	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0132 O2 SENSOR CIRCUIT HIGH VOLTAGE (BANK 1 SENSOR 1)

D06RX119

Circuit Description

The engine control module (ECM) supplies a bias voltage of about 450 mV between the heated oxygen sensor (HO₂S) signal and low circuits. When measured with a 10 mega Ω digital voltmeter, this may display as low as 320 mV. The oxygen sensor varies the voltage within a range of about 1000 mV when the exhaust is rich, down through about 10 mV when exhaust is lean. The ECM constantly monitors the HO₂S signal during "Closed Loop" operation and compensates for a rich or lean condition by decreasing or increasing injector pulse width as necessary. If the Bank 1 HO₂S 1 voltage remains excessively high for an extended period of time, Diagnostic Trouble Code P0132 will be set. DTC P0132 is a type A code.

Conditions for Setting the DTC

- No related Diagnostic Trouble Codes.
- Engine coolant temperature is above 60°C (140°F).
- "Closed Loop" commanded air/fuel ratio is between 14.5 and 14.8.
- Throttle angle is between 3% and 19%.

All above conditions met for 0.3 seconds or vehicle in Deceleration Fuel Cut-Off (DFCO) mode for 3 seconds, and one of the following two conditions met:

- Bank 1 HO₂S 1 signal voltage remains above 952 mV during normal "Closed Loop" operation for a total of 76.5 seconds over a 90-second period.

OR

- Bank 1 HO₂S 1 signal voltage remains above 500 mV during "deceleration fuel cutoff mode" (DFCO) operation for 5 seconds.

Action Taken When the DTC Sets

- The ECM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The ECM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.
- "Open Loop" fuel control will be in effect.

Conditions for Clearing the MIL/DTC

- The ECM will turn the MIL OFF on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history Diagnostic Trouble Code P0132 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code P0132 can be cleared by using the Scan Tool's "Clear Info" function or by disconnecting the ECM battery feed.

Diagnostic Aids

Check the following items:

- Fuel pressure – The system will go rich if pressure is too high. The ECM can compensate for some increase. However, if fuel pressure is too high, a

6E1-122 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

Diagnostic Trouble Code P0132 may be set. Refer to Fuel System Diagnosis.

- Perform "Injector Balance Test" – Refer to Fuel System Diagnosis.
- Check the EVAP canister for fuel saturation – If full of fuel, check canister control and hoses. Refer to Evaporative (EVAP) Emission Control System.
- Check for a leak in the fuel pressure regulator diaphragm by checking the vacuum line to the regulator for the presence of fuel.
- An intermittent TP sensor output will cause the system to go rich due to a false indication of the engine accelerating.
- Silicon contamination of the HO2S can also cause a high HO2S voltage to be indicated. This condition is indicated by a powdery white deposit on the portion of the HO2S exposed to the exhaust stream. If contamination is noticed, replace the affected HO2S.
- Operate the vehicle while monitoring the HO2S voltage with a Tech 2. If the HO2S voltage is limited within a range between 300 mV to 600 mV, check the HO2S high and low circuit wiring and associated terminal connections. If the wiring and connections are OK, replace the HO2S.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

3. Diagnostic Trouble Code P0132 failing during "deceleration fuel cutoff mode" operation may indicate a condition described in the "Diagnostic Aids" above. If the Diagnostic Trouble Code P0132 test passes while the Failure Records conditions are being duplicated, an intermittent condition is indicated. Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the Diagnostic Trouble Code to be set occurs. This may assist in diagnosing the condition.

DTC P0132 – O2 Sensor Circuit High Voltage (Bank 1 Sensor 1)

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	1. Install the Tech 2. 2. Run the engine at operating temperature. 3. Operate the vehicle within parameters specified under "Conditions for Setting the DTC" included in Diagnostic Support. 4. Using a Tech 2, monitor Bank 1 HO2S 1 voltage. Does the Bank 1 HO2S 1 voltage remain above the specified value?	952 mV (500 mV in deceleration fuel cutoff mode)	Go to Step 4	Go to Step 3
3	1. Ignition ON review and record Tech 2 Failure Records data. 2. Operate the vehicle within Failure Records conditions as noted. 3. Using a Tech 2, monitor "Diagnostic Trouble Code" info for Diagnostic Trouble Code P0132 until the Diagnostic Trouble Code P0132 test runs. 4. Note the test result. 8	Replace Bank 1 HO2S 1. Is the action complete?	—	Verify repair	—
9	Replace the ECM. Is the action complete?	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0134 O₂ SENSOR CIRCUIT NO ACTIVITY DETECTED (BANK 1 SENSOR 1)

D06RX119

Circuit Description

The engine control module (ECM) supplies a bias voltage of about 450 mV between the heated oxygen sensor (HO₂S) high and low circuits. When measured with a 10 MΩ digital voltmeter, this may display as low as 320 mV. The oxygen sensor varies the voltage within a range of about 1000 mV when the exhaust is rich, down through about 10 mV when exhaust is lean. The ECM constantly monitors the HO₂S signal during "Closed Loop" operation and compensates for a rich or lean condition by decreasing or increasing injector pulse width as necessary. If the Bank 1 HO₂S 1 voltage remains at or near the 450 mV bias for an extended period of time, Diagnostic Trouble Code P0134 will be set, indicating an open sensor signal or sensor low circuit. DTC P0134 is a type B code.

Conditions for Setting the DTC

- No related Diagnostic Trouble Codes.
- Engine run time is longer than 120 seconds.
- Oxygen sensor heater has been determined to be functioning properly, and the oxygen sensor has warmed to operating temperature.

All the above conditions are met and the following condition is met:

- Bank 1 HO₂S 1 signal voltage remains between 400 mV and 500 mV for a total of 76.5 seconds over a 90-second period of time.

Action Taken When the DTC Sets

- The ECM will illuminate the malfunction indicator lamp (MIL) the second time the fault is detected.
- The ECM will store conditions which were present when the Diagnostic Trouble Code was set as Freeze Frame and in the Failure Records data.
- "Open Loop" fuel control will be in effect.

Conditions for Clearing the MIL/DTC

- The ECM will turn the MIL OFF on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history Diagnostic Trouble Code P0134 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code P0134 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection or damaged harness – Inspect the harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, poor terminal-to-wire connection, and damaged harness.
- Faulty HO₂S heater or heater circuit – With the ignition ON engine OFF after a cooldown period, the HO₂S 1 voltage displayed on the Tech 2 is normally 455–460 mV. A reading over 1000 mV indicates a signal line shorted to voltage. A reading under 5 mV indicates a

signal line shorted to ground or signal lines shorted together. Disconnect the HO2S and connect a test light between the HO2S ignition feed and heater ground circuits. If the test light does not light for 2 seconds when the ignition is turned on, repair the open ignition feed or sensor ground circuit as necessary. If the test light lights and the HO2S signal and low circuits are OK, replace the HO2S.

- Intermittent test – With the ignition ON monitor the HO2S signal voltage while moving the wiring harness

and related connectors. If the fault is induced, the HO2S signal voltage will change. This may help isolate the location of the malfunction.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the Diagnostic Trouble Code to be set occurs. This may assist in diagnosing the condition.

DTC P0134 – O2 Sensor Circuit No Activity Detected (Bank 1 Sensor 1)

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	1. Install the Tech 2. 2. Run the engine at operating temperature. 3. Operate the engine above 1200 RPM for three minutes. Does the Tech 2 indicate Bank 1 HO2S 1 voltage varying outside the specified values?	400-500 mV	Go to Step 3	Go to Step 4
3	1. Ignition ON, engine OFF review and record Tech 2 Failure Records data and note parameters. 2. Operate the vehicle within Failure Records conditions as noted. 3. Using a Tech 2, monitor "Diagnostic Trouble Code" info for Diagnostic Trouble Code P0134 until the Diagnostic Trouble Code P0134 test runs. 4. Note the test result. Does the Tech 2 indicate Diagnostic Trouble Code P0134 failed this ignition?	—	Go to Step 4	Refer to Diagnostic Aids
4	Check for a damaged harness. Was a problem found?	—	Verify repair	Go to Step 5
5	Check for poor Bank 1 HO2S 1 high and low circuit terminal connections at the Bank 1 HO2S 1 harness connector and replace terminal(s) if necessary. Did any terminals require replacement?	—	Verify repair	Go to Step 6
6	Check for poor Bank 1 HO2S 1 high and low circuit terminal connections at the ECM and replace terminals if necessary. Did any terminals require replacement?	—	Verify repair	Go to Step 7
7	1. Ignition OFF. 2. With the ECM disconnected, check continuity of the Bank 1 HO2S 1 high circuit. 3. If the Bank 1 HO2S 1 high circuit measures over 0.5 Ω, repair open or poor connection as necessary. Was a Bank 1 HO2S 1 high circuit problem found and corrected?	—	Verify repair	Go to Step 8

DTC P0134 – O2 Sensor Circuit No Activity Detected (Bank 1 Sensor 1) (Cont'd)

Step	Action	Value(s)	Yes	No
8	1. Ignition OFF. 2. With the ECM disconnected, check continuity of the Bank 1 HO2S 1 low circuit. 3. If the Bank 1 HO2S 1 low circuit measures over 5 Ω , repair open or poor connection as necessary. Was a Bank 1 HO2S 1 low circuit problem found and corrected?	—	Verify repair	Go to Step 9
9	1. Ignition ON, engine OFF. 2. Disconnect Bank 1 HO2S 1 and jumper the HO2S high and low circuits (ECM side) to ground. 3. Using a Tech 2, monitor Bank 1 HO2S 1 voltage. Is Bank 1 HO2S 1 voltage approximately equal to the specified value?	10 mV	Go to Step 10	Go to Step 11
10	Replace Bank 1 HO2S 1. Is the action complete?	—	Verify repair	—
11	Replace the ECM. Is the action complete?	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0135 O2 SENSOR HEATER CIRCUIT MALFUNCTION

D06RX119

Circuit Description

Heated oxygen sensors are used to minimize the amount of time required for "Closed Loop" fuel control operation and to allow accurate catalyst monitoring. The oxygen sensor heater greatly decreases the amount of time required for fuel control sensors Bank 1 HO2S 1.

The engine control module (ECM) will run the heater test only after a cold start (determined by engine coolant and intake air temperature at the time of start-up) and only once during an ignition cycle. When the engine is started the ECM will monitor the HO2S voltage. When the HO2S voltage indicates a sufficiently active sensor, the ECM looks at how much time has elapsed since start-up. If the ECM determines that too much time was required for the Bank 1 HO2S 1 to become active, a Diagnostic Trouble Code P0135 will set. DTC P0135 is a type B code.

Conditions for Setting the DTC

- No related Diagnostic Trouble Codes.
- Intake air temperature (IAT) is less than 32°C (90°F) at start-up.
- Engine coolant temperature (ECT) is less than 32°C (90°F) at start-up.
- IAT and ECT are within 5°C (9°F) of each other at start-up.
- Ignition voltage is between 11 and 16.6 V.
- Average calculated air flow is less than 18 g/second during sample period.

- Throttle angle is less than 40%.
- Bank 1 HO2S 1 voltage does not change more than 148 mV from the bias voltage (between 400 mV and 500 mV) for a longer amount of time than it should. The maximum amount of time to come up to operating range is 240 seconds. This warm-up time depends on the engine coolant temperature at start-up and intake air temperature at start-up.

Action Taken When the DTC Sets

- The ECM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The ECM will store conditions which were present when the Diagnostic Trouble Code was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The ECM will turn the MIL OFF on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history Diagnostic Trouble Code P0135 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code P0135 can be cleared by using the Scan Tool's "Clear Info" function.

6E1-128 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

Diagnostic Aids

Check for the following conditions:

- Poor connection at ECM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage; shorts to ground, shorts to battery positive and open circuits. If the harness appears to be OK, observe the ECT display on the Tech 2 while moving connectors and wiring harnesses related to the sensor. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the Diagnostic Trouble Code to be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

2. The HO2S should be allowed to cool before performing this test. If the HO2S heater is functioning, the signal voltage will gradually increase or decrease as the sensor element warms. If the heater is not functioning, the HO2S signal will remain near the 450 mV bias voltage.
4. Ensures that the ignition feed circuit to the HO2S is not open or shorted. The test light should be connected to a good chassis ground, in case the HO2S low or HO2s heater ground circuit is faulty.
5. Checks the HO2S heater ground circuit.
6. Checks for an open or shorted HO2S heater element.
10. An open HO2S signal or low circuit can cause the HO2S heater to appear faulty. Check these circuits before replacing the sensor.

DTC P0135 – O2 Sensor Heater Circuit Malfunction

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	NOTE: If the engine has just been operating, allow engine to cool for about one half hour before proceeding. 1. Ignition OFF, engine OFF. 2. Install a Tech 2. 3. Ignition ON engine OFF monitor the Bank 1 HO2S 1 voltage. Does the HO2S voltage go from bias voltage to above and below the specified values?	Above 650 mV or below 250 mV	Refer to Diagnostic Aids	Go to Step 3
3	Inspect the fuse for the Bank 1 HO2S 1 ignition feed. Is the fuse open?	—	Go to Step 15	Go to Step 4
4	1. Ignition OFF. 2. Raise the vehicle. 3. Disconnect the Bank 1 HO2S 1 electrical connector. 4. Using a test light connected to a good ground (do not use Bank 1 HO2S 1 heater ground or Bank 1 HO2S 1 low), probe the ignition feed circuit at the Bank 1 HO2S 1 electrical connector (ECM harness side). Does the test light illuminate?	—	Go to Step 5	Go to Step 7
5	Connect the test light between the Bank 1 HO2S 1 ignition feed and the Bank 1 HO2S 1 heater ground. Does the test light illuminate?	—	Go to Step 6	Go to Step 8

DTC P0135 – O2 Sensor Heater Circuit Malfunction (Cont'd)

Step	Action	Value(s)	Yes	No
6	<p>1. Allow the HO2S to cool for at least 10 minutes.</p> <p>2. Using a Digital Voltmeter (DVM), measure the resistance between the Bank 1 HO2S 1 ignition feed and the Bank 1 HO2S 1 heater ground at the Bank 1 HO2S 1 pigtail.</p> <p>Is the HO2S heater resistance within the specified values?</p>	3–6 ohms	Go to Step 9	Go to Step 10
7	<p>Repair the open Bank 1 HO2S 1 ignition feed circuit to Bank 1 HO2S 1.</p> <p>Is the action complete?</p>	—	Verify repair	—
8	<p>Repair the open Bank 1 HO2S 1 heater ground circuit to Bank 1 HO2S 1.</p> <p>Is the action complete?</p>	—	Verify repair	—
9	<p>1. Check for a poor connection at the Bank 1 HO2S 1 harness terminals.</p> <p>2. If a poor connection is found, replace terminals.</p> <p>Was a poor connection found?</p>	—	Verify repair	Go to Step 10
10	<p>Check for a poor Bank 1 HO2S 1 high or low circuit terminal connection at the Bank 1 HO2S 1 harness connector and replace terminal(s) if necessary.</p> <p>Did any terminals require replacement?</p>	—	Verify repair	Go to Step 11
11	<p>1. Ignition OFF.</p> <p>2. Disconnect the ECM and check the continuity of the Bank 1 HO2S 1 signal circuit and the Bank 1 HO2S 1 low circuit.</p> <p>3. If the Bank 1 HO2S 1 high circuit or HO2S low circuit measures over 5 Ω, repair open or poor connection as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to Step 12
12	<p>Check for a poor Bank 1 HO2S 1 low circuit terminal connection at the ECM and replace the terminal if necessary.</p> <p>Did the terminal require replacement?</p>	—	Verify repair	Go to Step 13
13	<p>Check for a poor Bank 1 HO2S 1 high circuit terminal connection at the ECM and replace the terminal if necessary.</p> <p>Did the terminal require replacement?</p>	—	Verify repair	Go to Step 14
14	<p>Replace the Bank 1 HO2S 1.</p> <p>Is the action complete?</p>	—	Verify repair	—
15	<p>Locate and repair the short to ground in Bank 1 HO2S 1 ignition feed circuit and replace the fault fuse.</p> <p>Is the action complete?</p>	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0171 SYSTEM TOO LEAN (BANK 1)

D06RX119

Circuit Description

To provide the best possible combination of driveability, fuel economy, and emission control, a "Closed Loop" air/fuel metering system is used. While in "Closed Loop", the engine control module (ECM) monitors the Bank 1 HO2S 1 signal and adjusts fuel delivery based upon the HO2S signal voltage. A change made to fuel delivery will be indicated by the long and short term fuel trim values which can be monitored with a Tech 2. Ideal fuel trim values are around 0%; if the HO2S signal indicates a lean condition the ECM will add fuel, resulting in fuel trim values above 0%. If a rich condition is detected, the fuel trim values will be below 0%, indicating that the ECM is reducing the amount of fuel delivered. If an excessively lean condition is detected on Bank 1, the ECM will set Diagnostic Trouble Code P0171. DTC P0171 is a type B code.

The ECM's maximum authority to control long term fuel trim allows a range between -14% and +20%. The ECM monitors fuel trim under various engine speed/load fuel trim cells before determining the status of the fuel trim diagnostic.

Conditions for Setting the DTC

- No Tech 2 test is being run.
- None of the following: EGR Diagnostic Trouble Codes, HO2S Diagnostic Trouble Codes, (response, transition, open, low volts, no activity), TP sensor Diagnostic Trouble Codes, MAP Diagnostic Trouble

Codes, IAT Diagnostic Trouble Codes, canister purge Diagnostic Trouble Codes, EVAP Diagnostic Trouble Codes, injector circuit Diagnostic Trouble Codes, or misfire Diagnostic Trouble Codes.

- Engine coolant temperature is between 65°C (149°F) and 104°C (219°F).
- Intake air temperature is between -40°C (-40°F) and 120°C (248°F).
- Manifold absolute pressure is between 23.75 kPa and 99 kPa.
- Engine speed is between 400 and 6000 RPM.
- Barometric pressure is greater than 72.3 kPa.
- System voltage is greater than 9.5v.
- Engine is operating in "Closed Loop".
- The average of the short term fuel trim samples is greater than 0.97 and the average of adaptive index multiplier samples is greater than 1.21.

Action Taken When the DTC Sets

- The ECM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The ECM will store conditions which were present when the Diagnostic Trouble Code was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The ECM will turn the MIL OFF on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history Diagnostic Trouble Code P0171 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code P0171 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at ECM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage; shorts to ground, shorts to battery positive and open circuits. If the harness appears to be OK, observe the Bank 1 HO2S 1 display on the Tech 2 while moving connectors and wiring harnesses related to the engine harness. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the Diagnostic Trouble Code to be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

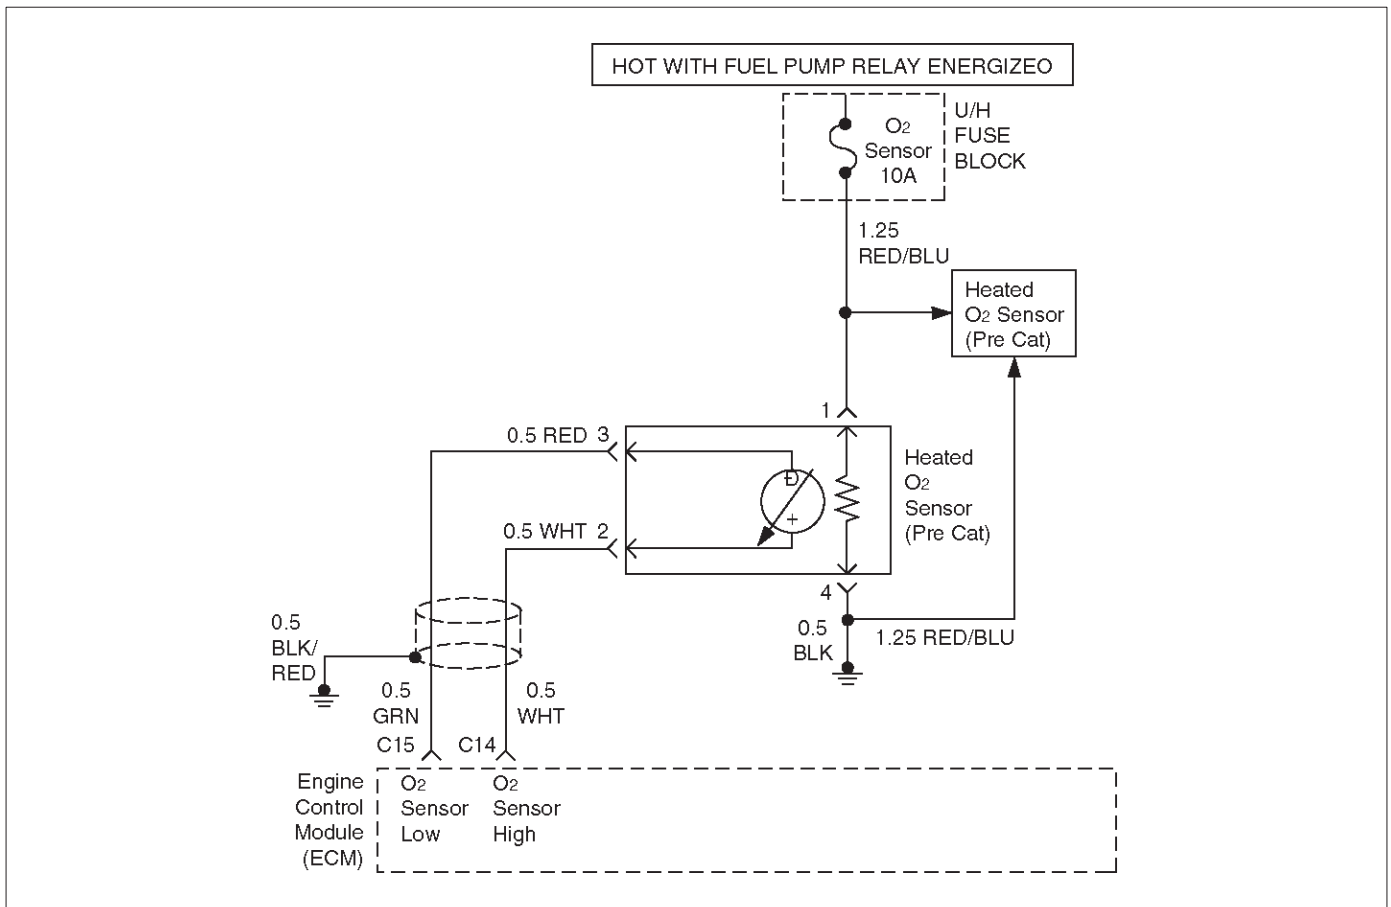

2. Diagnostic Trouble Codes other than P0171 may indicate a condition present which may cause a lean condition. If this is the case, repairing the condition which caused the other Diagnostic Trouble Code will most likely correct the Diagnostic Trouble Code P0171.
4. If the Diagnostic Trouble Code P0171 test passes while the Failure Records conditions are being duplicated, the lean condition is intermittent. Refer to Diagnostic Aids or Symptoms for additional information on diagnosing intermittent problems.

DTC P0171 – System Too Lean (Bank 1)

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	Are any DTCs set other than P0171?	—	Go to the applicable DTC charts and repair the other DTCs before proceeding with this chart.	Go to Step 3
3	1. Start the engine and operate the vehicle in "Closed Loop". 2. Observe the "BANK 1 L.T. FUEL TRIM" and display on the Tech 2. Are the displayed values greater than the specified values?	L.T. Fuel Trim: 20%	Go to Step 5	Go to Step 4
4	1. Review and record the Tech 2 Failure Records data. 2. Clear the Diagnostic Trouble Code P0171 and operate the vehicle to duplicate the Failure Records conditions. 3. Monitor the Tech 2 "Diagnostic Trouble Code" info for Diagnostic Trouble Code P0171 while operating the vehicle to duplicate the Failure Records conditions. 4. Continue operating the vehicle until the Diagnostic Trouble Code P0171 test runs and note the test result. Does the Tech 2 indicate Diagnostic Trouble Code P0171 failed this ignition?	—	Go to Step 5	The lean condition is not present. If a driveability symptom still exists, refer to Symptoms section.
5	Visually and physically inspect the vacuum hoses for disconnects, splits, kinks, improper routing and improper connections and repair any problem found. Did your inspection reveal a problem requiring repair?	—	Verify repair	Go to Step 6
6	Visually and physically inspect the crankcase ventilation valve for proper installation and repair any problem found (refer to Crankcase Ventilation System). Did your inspection reveal a problem requiring repair?	—	Verify repair	Go to Step 7
7	Start the engine and note the idle quality. Is a high or unsteady idle being experienced?	—	Go to Step 8	Go to Step 10
8	With the engine idling, observe the "IDLE AIR CONTROL" display on the Tech 2. Is the displayed value above the specified value?	Above 5 counts	Go to Step 10	Go to Step 9
9	1. Visually and physically inspect the throttle body, intake manifold, EGR valve and the EGR feed pipe for vacuum leaks. 2. Repair any vacuum leaks as necessary. Did your inspection reveal a vacuum leak?	—	Verify repair	Go to Step 10

DTC P0171 – System Too Lean (Bank 1) (Cont'd)

Step	Action	Value(s)	Yes	No
10	Perform the "Idle Air Control (IAC) Valve Check" and correct any IAC problem as necessary. Did this test isolate a problem requiring repair?	—	Verify repair	Go to Step 11
11	Check the fuel for excessive water, alcohol, or other contaminants (see Diagnosis in Engine Fuel for the procedure) and correct the contaminated fuel condition if present (see Engine Fuel). Was the fuel contaminated?	—	Verify repair	Go to Step 12
12	1. Visually and physically inspect the ECM injector grounds, power grounds and sensor grounds to ensure that they are clean, tight, and in their proper locations. 2. If a faulty ground condition is present, correct it as necessary. Did your inspection reveal a condition requiring repair?	—	Verify repair	Go to Step 13
13	Perform the procedure in "Fuel System Pressure Test" and repair fuel system problem if necessary. Did the test isolate a condition requiring repair?	—	Verify repair	Go to Step 14
14	Perform the "Evaporative Emissions Control (EVAP) Canister Purge Valve Check" and repair EVAP system problem if necessary. Did the test isolate a problem?	—	Verify repair	Go to Step 15
15	1. Visually and physically inspect the intake manifold, injector O-rings, EGR adapter, EGR valve and the EGR feed pipes for vacuum leaks. 2. Repair any problem that is found. Did your inspection reveal a problem?	—	Verify repair	Go to Step 16
16	Visually and physically inspect the Bank 1 exhaust manifold for leaks and loose or missing hardware and correct any problem found. Did your inspection reveal a problem?	—	Verify repair	Go to Step 17
17	Perform the "Injector Balance Test," and correct any problem found (refer to Fuel Metering System). Did the test isolate a problem?	—	Verify repair	Go to Step 18
18	1. Visually and physically inspect the Bank 1 HO2S 1 to ensure that it is installed securely and that the Bank 1 HO2S 1 pigtail and wiring harness are not contacting the exhaust or otherwise damaged. 2. If a problem is found, correct it as necessary. Did your inspection reveal a problem?	—	Verify repair	Refer to Diagnostic Aids

DIAGNOSTIC TROUBLE CODE (DTC) P0172 SYSTEM TOO RICH (BANK 1)

D06RX119

Circuit Description

To provide the best possible combination of driveability, fuel economy, and emission control, a "Closed Loop" air/fuel metering system is used. While in "Closed Loop", the engine control module (ECM) monitors the Bank 1 heated oxygen sensor (HO2S) 1 and adjusts fuel delivery based upon the HO2S signal voltages. A change made to fuel delivery will be indicated by the long and short term fuel trim values which can be monitored with a Tech 2. Ideal fuel trim values are around 0%; if the HO2S signals are indicating a lean condition the ECM will add fuel, resulting in fuel trim values above 0%. If a rich condition is detected, the fuel trim values will be below 0%, indicating that the ECM is reducing the amount of fuel delivered. If an excessively rich condition is detected on Bank 1, the ECM will set Diagnostic Trouble Code P0172. DTC P0172 is a type B code.

The ECM's maximum authority to control long term fuel trim allows a range between -14% and +20%. The ECM's maximum authority to control short term fuel trim allows a range between -11% and +20%. The ECM monitors fuel trim under various engine speed/load fuel trim cells before determining the status of the fuel trim diagnostic.

Conditions for Setting the DTC

- No Tech 2 test is being run.
- None of the following was set: EGR Diagnostic Trouble Codes, HO2S Diagnostic Trouble Codes, (response, transition, open, low volts, no activity), TPS Diagnostic Trouble Codes, MAP Diagnostic Trouble Codes, IAT

Diagnostic Trouble Codes, canister purge Diagnostic Trouble Codes, EVAP Diagnostic Trouble Codes, injector circuit Diagnostic Trouble Codes, or misfire Diagnostic Trouble Codes.

- Engine coolant temperature is between 65°C (149°F) and 104°C (219°F).
- Intake air temperature is between -40°C (-40°F) and 120°C (248°F).
- Manifold absolute pressure is between 23.75 kPa and 99 kPa.
- System voltage is greater than 9.5 volts.
- Engine speed is between 400 and 6000 RPM.
- Barometric pressure is greater than 72.3 kPa.
- Engine is operating in "Closed Loop".
- The average of the long term full trim samples is less than 1.03 and the average of the adaptive index multiplier samples is less than or equal to 0.82.

Action Taken When the DTC Sets

- The ECM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The ECM will store conditions which were present when the Diagnostic Trouble Code was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The ECM will turn the MIL OFF on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.

- A history Diagnostic Trouble Code P0172 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code P0172 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at ECM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage; shorts to ground, shorts to battery positive and open circuits. If the harness appears to be OK, observe the Bank 1 HO2S 1 display on the Tech 2 while moving connectors and wiring harnesses related to the engine harness. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

2. Diagnostic Trouble Codes other than P0172 may indicate a condition present which may cause a lean condition. If this is the case, repairing the condition which caused the other DTC will most likely correct the DTC P0172.
4. If the Diagnostic Trouble Code P0172 test passes while the Failure Records conditions are being duplicated, the rich condition is intermittent. Refer to Diagnostic Aids or Symptoms for additional information on diagnosing intermittent problems.

DTC P0172 – System Too Rich (Bank 1)

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	Are any Diagnostic Trouble Codes set other than P0172?	—	Go to the applicable DTC charts and repair the other DTCs before proceeding with this chart.	Go to Step 3
3	1. Start the engine and operate the vehicle in "Closed Loop". 2. Observe "BANK 1 L.T. FUEL TRIM" display on the Tech 2. Are the displayed values more negative than the specified values?	L.T. Fuel Trim: -14%	Go to Step 5	Go to Step 4
4	1. Review and record the Tech 2 Failure Records data. 2. Clear the Diagnostic Trouble Code P0172 and operate the vehicle to duplicate the Failure Records conditions. 3. Monitor the Tech 2 "Diagnostic Trouble Code" info for Diagnostic Trouble Code P0172 while operating the vehicle to duplicate the Failure Records conditions. 4. Continue operating the vehicle until the Diagnostic Trouble Code P0172 test runs and note test result. Does the Tech 2 indicate Diagnostic Trouble Code P0172 failed this ignition?	—	Go to Step 5	The rich condition is not present. If a driveability symptom still exists, refer to Symptoms.
5	Visually and physically inspect the air filter element and replace it if necessary. Did the air filter require replacement?	—	Verify repair	Go to Step 6
6	Visually and physically inspect the air intake duct for collapse or restriction and repair if necessary. Did your inspection reveal a condition requiring repair?	—	Verify repair	Go to Step 7
7	Start the engine and note the idle quality. Is a low or unsteady idle being experienced?	—	Go to Step 8	Go to Step 10
8	With the engine idling, observe the "IDLE AIR CONTROL" display on the Tech 2. Is the "IDLE AIR CONTROL" value below the specified value?	Below 100 counts	Go to Step 10	Go to Step 9
9	1. Ignition OFF. 2. Physically inspect the throttle body bore, throttle plate, and IAC passages for coking and foreign objects. 3. If a problem was found, repair as necessary. Did your inspection reveal a condition requiring repair?	—	Verify repair	Go to Step 10

DTC P0172 – System Too Rich (Bank 1) (Cont'd)

Step	Action	Value(s)	Yes	No
10	1. Perform the "Idle Air Control (IAC) Valve Check." 2. If a problem is found, repair as necessary. Did the test isolate a problem requiring repair?	—	Verify repair	Go to Step 11
11	1. Disconnect the vacuum hose from the fuel pressure regulator and inspect the hose for the presence of fuel. 2. If fuel is present in the vacuum hose, replace the fuel pressure regulator (refer to Fuel Metering System). Did the fuel pressure regulator require replacement?	—	Verify repair	Go to Step 12
12	Ignition ON engine OFF monitor the TP Angle display on the Tech 2 while slowly depressing the accelerator pedal. Does the TP Angle display increase steadily and evenly from minimum value at closed throttle to maximum value at wide-open throttle?	Minimum 0% Maximum 100%	Go to Step 13	Go to Step 17
13	1. Perform the "Fuel System Pressure Test." 2. If the test isolates a problem, repair as necessary (refer to Engine Fuel or Fuel Metering System). Did the test isolate a problem requiring repair?	—	Verify repair	Go to Step 14
14	1. Perform the "Evaporative Emissions Control (EVAP) Canister Purge Valve Check." 2. If the test isolates a problem, repair as necessary. Did the test isolate a problem requiring repair?	—	Verify repair	Go to Step 15
15	1. Perform the "Injector Balance Test." 2. If the test isolates a problem, repair as necessary (refer to Fuel Metering System). Did the test isolate a problem requiring repair?	—	Verify repair	Go to Step 16
16	1. Remove and visually/physically inspect the Bank 1 HO2S 1 for silicon contamination. This will be indicated by a powdery white deposit on the portion of the HO2S that is exposed to the exhaust stream. 2. If contamination is evident on the Bank 1 HO2S 1, replace the contaminated sensors. Did the sensor require replacement?	—	Verify repair	Refer to Diagnostic Aids
17	1. Check the TP sensor mounting screws and tighten or replace them as necessary if they are loose or missing. 2. If the screws are OK, replace the TP sensor. Is the action complete?	—	Verify repair	—

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

- 3. This step determines if Diagnostic Trouble Code P0201 is the result of a hard failure or an intermittent condition.
- 5. This step tests the harness wiring and ECM control of the injectors using a test light.

The fuel injector test connector is a gray 5 pin connector at the right rear of the valve cover. It can be identified by a blue connector lock which is tethered to the harness.

5-8840-2606-0 is a test light with one light for each cylinder. The test light fits on the injector test connector.

If the test light is ON steady before cranking the engine as well as while cranking the engine, then the injector driver circuit is shorted to voltage.

If the test light blinks, the ECM and the wiring to the injectors are OK. Fuel Injector Coil Test Procedure will check if the injectors are faulty.
- 7. Because the test light was ON steady, voltage to the injector is OK, but the driver circuit is grounded at all times. This step determines if the circuit is shorted to ground or the ECM is faulty.

901RX032

- 13. Normal injector resistance is slightly more than if tested directly at the injector because it includes resistance of the harness wires. The normal value is about 13.5 Ω.

DTC P0201 – Injector Circuit Malfunction – Cylinder 1

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	Will the engine start?	—	Go to Step 3	Go to Engine Cranks But Will Not Run Chart
3	1. Install the Tech 2. Clear the Diagnostic Trouble Code. 2. Idle the engine for one minute. Does Diagnostic Trouble Code P0201 reset?	—	Go to Step 5	Go to Step 4
4	1. Review the Freeze Frame data with the ignition ON and the engine OFF and note the parameters. 2. Operate the vehicle within the Freeze Frame conditions as noted. Does P0201 reset?	—	Go to Step 5	Go to Diagnostic Aids
5	1. Ignition OFF. 2. Disconnect the injector test connector. 3. Install the injector test light 5-8840-2606-0 on the injector test connector. 4. Crank the engine while observing the light for cylinder 1. Does the injector test light blink?	—	Go to Fuel Injector Coil Test Procedure	Go to Step 6

DTC P0201 – Injector Circuit Malfunction – Cylinder 1 (Cont'd)

Step	Action	Value(s)	Yes	No
6	Note whether the injector test light was OFF or ON steady in step 5. Was the test light ON steady while cranking the engine?	—	Go to Step 7	Go to Step 10
7	1. Disconnect the ECM connector for the affected injectors. 2. With a test light connected to B+, probe the affected injector driver circuit. Does the test light illuminate?	—	Go to Step 8	Go to Step 9
8	Repair short to ground in the injector driver circuit. Is the action complete?	—	Go to OBD System Check	—
9	Replace the ECM. Is the action complete?	—	Go to OBD System Check	—
10	1. Disconnect the injector test connector. 2. Ignition ON. 3. Use a test light connected to ground to probe each terminal on the ECM side of the injector test connector. Only the Ign+ terminal should illuminate the test light. Besides the Ign+, did any other terminal illuminate the test light?	—	Go to Step 11	Go to Step 12
11	Repair the short to voltage in the injector driver circuit.	—	Verify repair	—
12	1. Disconnect the injector test connector. 2. Ignition ON. 3. Use a test light connected to ground to probe each pin on the injector side of the connector. Did any terminal illuminate the test light?	—	Go to Step 11	Go to Step 13
13	1. Disconnect the injector test connector. 2. Ignition OFF. 3. Clip one lead of an ohmmeter to the ignition pin on the injector side of the test connector. 4. Touch the other lead to each of the other four pins in the test connector, one pin at a time. Instead of normal injector resistance, did the ohmmeter indicate an open in one of the injector circuits?	—	Go to Step 14	Go to Step 15
14	Repair the open circuit or open injector.	—	Verify repair	—
15	Check for an open circuit between the injector test connector and the ECM connector for the Injector 1 control circuit. Was there an open circuit?	—	Go to Step 16	Go to Step 9
16	Repair the open circuit.	—	Verify repair	—

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

3. This step determines if Diagnostic Trouble Code P0202 is the result of a hard failure or an intermittent condition.

5. This step tests the harness wiring and ECM control of the injectors using a test light.

The fuel injector test connector is a gray 5 pin connector at the right rear of the valve cover. It can be identified by a blue connector lock which is tethered to the harness.

5-8840-2606-0 is a test light with one light for each cylinder. The test light fits on the injector test connector.

If the test light is ON steady before cranking the engine as well as while cranking the engine, then the injector driver circuit is shorted to voltage.

If the test light blinks, the ECM and the wiring to the injectors are OK. Fuel Injector Coil Test Procedure will check if the injectors are faulty.

7. Because the test light was ON steady, voltage to the injector is OK, but the driver circuit is grounded at all times. This step determines if the circuit is shorted to ground or the ECM is faulty.

901RX033

13. Normal injector resistance is slightly more than if tested directly at the injector because it includes resistance of the harness wires. The normal value is about 13.5 Ω.

DTC P0202 – Injector Circuit Malfunction – Cylinder 2

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	Will the engine start?	—	Go to Step 3	Go to Engine Cranks But Will Not Run Chart
3	1. Install the Tech 2. Clear the Diagnostic Trouble Code. 2. Idle the engine for one minute. Does Diagnostic Trouble Code P0202 reset?	—	Go to Step 5	Go to Step 4
4	1. Review the Freeze Frame data with the ignition ON and the engine OFF and note the parameters. 2. Operate the vehicle within the Freeze Frame conditions as noted. Does P0202 reset?	—	Go to Step 5	Go to Diagnostic Aids
5	1. Ignition OFF. 2. Disconnect the injector test connector. 3. Install the injector test light 5-8840-2606-0 on the injector connector. 4. Crank the engine while observing the light for cylinder 2. Does the injector test light blink?	—	Go to Fuel Injector Coil Test Procedure	Go to Step 6

DTC P0202 – Injector Circuit Malfunction – Cylinder 2 (Cont'd)

Step	Action	Value(s)	Yes	No
6	Note whether the injector test light was OFF or ON steady in step 5. Was the test light ON steady while cranking the engine?	—	Go to Step 7	Go to Step 10
7	1. Disconnect the ECM connector for the affected injectors. 2. With a test light connected to B+, probe the affected injector driver circuit. Does the test light illuminate?	—	Go to Step 8	Go to Step 9
8	Repair short to ground in the injector driver circuit. Is the action complete?	—	Go to OBD System Check	—
9	Replace the ECM. Is the action complete?	—	Go to OBD System Check	—
10	1. Disconnect the injector test connector. 2. Ignition ON. 3. Use a test light connected to ground to probe each terminal on the ECM side of the injector test connector. Only the Ign+ terminal should illuminate the test light. Besides the Ign+, did any other terminal illuminate the test light?	—	Go to Step 11	Go to Step 12
11	Repair the short to voltage in the injector driver circuit.	—	Verify repair	—
12	1. Disconnect the injector test connector. 2. Ignition ON. 3. Use a test light connected to ground to probe each pin on the injector side of the connector. Did any terminal illuminate the test light?	—	Go to Step 11	Go to Step 13
13	1. Disconnect the injector test connector. 2. Ignition OFF. 3. Clip one lead of an ohmmeter to the ignition pin on the injector side of the test connector. 4. Touch the other lead to each of the other four pins in the test connector, one pin at a time. Instead of normal injector resistance, did the ohmmeter indicate an open in one of the injector circuits?	—	Go to Step 14	Go to Step 15
14	Repair the open circuit or open injector.	—	Verify repair	—
15	Check for an open circuit between the injector test connector and the ECM connector for the Injector 2 control circuit. Was there an open circuit?	—	Go to Step 16	Go to Step 9
16	Repair the open circuit.	—	Verify repair	—

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

- 3. This step determines if Diagnostic Trouble Code P0203 is the result of a hard failure or an intermittent condition.
- 5. This step tests the harness wiring and ECM control of the injectors using a test light.

The fuel injector test connector is a gray 5 pin connector at the right rear of the valve cover. It can be identified by a blue connector lock which is tethered to the harness.

5-8840-2606-0 is a test light with one light for each cylinder. The test light fits on the injector test connector.

If the test light is ON steady before cranking the engine as well as while cranking the engine, then the injector driver circuit is shorted to voltage.

If the test light blinks, the ECM and the wiring to the injectors are OK. Fuel Injector Coil Test Procedure will check if the injectors are faulty.

- 7. Because the test light was ON steady, voltage to the injector is OK, but the driver circuit is grounded at all times. This step determines if the circuit is shorted to ground or the ECM is faulty.

901RX034

- 13. Normal injector resistance is slightly more than if tested directly at the injector because it includes resistance of the harness wires. The normal value is about 13.5 Ω.

DTC P0203 – Injector Circuit Malfunction – Cylinder 3

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	Will the engine start?	—	Go to Step 3	Go to Engine Cranks But Will Not Run Chart
3	1. Install the Tech 2. Clear the Diagnostic Trouble Code. 2. Idle the engine for one minute. Does Diagnostic Trouble Code P0203 reset?	—	Go to Step 5	Go to Step 4
4	1. Review the Freeze Frame data with the ignition ON and the engine OFF and note the parameters. 2. Operate the vehicle within the Freeze Frame conditions as noted. Does P0203 reset?	—	Go to Step 5	Go to Diagnostic Aids
5	1. Ignition OFF. 2. Disconnect the injector test connector. 3. Install the injector test light 5-8840-2606-0 on the injector connector. 4. Crank the engine while observing the light for cylinder 3. Does the injector test light blink?	—	Go to Fuel Injector Coil Test Procedure	Go to Step 6

DTC P0203 – Injector Circuit Malfunction – Cylinder 3 (Cont'd)

Step	Action	Value(s)	Yes	No
6	Note whether the injector test light was OFF or ON steady in step 5. Was the test light ON steady while cranking the engine?	—	Go to Step 7	Go to Step 10
7	1. Disconnect the ECM connector for the affected injectors. 2. With a test light connected to B+, probe the affected injector driver circuit. Does the test light illuminate?	—	Go to Step 8	Go to Step 9
8	Repair short to ground in the injector driver circuit. Is the action complete?	—	Go to OBD System Check	—
9	Replace the ECM. Is the action complete?	—	Go to OBD System Check	—
10	1. Disconnect the injector test connector. 2. Ignition ON. 3. Use a test light connected to ground to probe each terminal on the ECM side of the injector test connector. Only the Ign+ terminal should illuminate the test light. Besides the Ign+, did any other terminal illuminate the test light?	—	Go to Step 11	Go to Step 12
11	Repair the short to voltage in the injector driver circuit.	—	Verify repair	—
12	1. Disconnect the injector test connector. 2. Ignition ON. 3. Use a test light connected to ground to probe each pin on the injector side of the connector. Did any terminal illuminate the test light?	—	Go to Step 11	Go to Step 13
13	1. Disconnect the injector test connector. 2. Ignition OFF. 3. Clip one lead of an ohmmeter to the ignition pin on the injector side of the test connector. 4. Touch the other lead to each of the other four pins in the test connector, one pin at a time. Instead of normal injector resistance, did the ohmmeter indicate an open in one of the injector circuits?	—	Go to Step 14	Go to Step 15
14	Repair the open circuit or open injector.	—	Verify repair	—
15	Check for an open circuit between the injector test connector and the ECM connector for the Injector 3 control circuit. Was there an open circuit?	—	Go to Step 16	Go to Step 9
16	Repair the open circuit.	—	Verify repair	—

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

- 3. This step determines if Diagnostic Trouble Code P0204 is the result of a hard failure or an intermittent condition.
- 5. This step tests the harness wiring and ECM control of the injectors using a test light.

The fuel injector test connector is a gray 5 pin connector at the right rear of the valve cover. It can be identified by a blue connector lock which is tethered to the harness.

5-8840-2606-0 is a test light with one light for each cylinder. The test light fits on the injector test connector.

If the test light is ON steady before cranking the engine as well as while cranking the engine, then the injector driver circuit is shorted to voltage.

If the test light blinks, the ECM and the wiring to the injectors are OK. Fuel Injector Coil Test Procedure will check if the injectors are faulty.

- 7. Because the test light was ON steady, voltage to the injector is OK, but the driver circuit is grounded at all times. This step determines if the circuit is shorted to ground or the ECM is faulty.

901RX035

- 13. Normal injector resistance is slightly more than if tested directly at the injector because it includes resistance of the harness wires. The normal value is about 13.5 Ω.

DTC P0204 – Injector Circuit Malfunction – Cylinder 4

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	Will the engine start?	—	Go to Step 3	Go to Engine Cranks But Will Not Run Chart
3	1. Install the Tech 2. Clear the DTC. 2. Idle the engine for one minute. Does DTC P0204 reset?	—	Go to Step 5	Go to Step 4
4	1. Review the Freeze Frame data with the ignition ON and the engine OFF and note the parameters. 2. Operate the vehicle within the Freeze Frame conditions as noted. Does P0204 reset?	—	Go to Step 5	Go to Diagnostic Aids
5	1. Ignition OFF. 2. Disconnect the injector test connector. 3. Install the injector test light 5-8840-2606-0 on the injector connector. 4. Crank the engine while observing the light for cylinder 4. Does the injector test light blink?	—	Go to Fuel Injector Coil Test Procedure	Go to Step 6
6	Note whether the injector test light was OFF or ON steady in step 5. Was the test light ON steady while cranking the engine?	—	Go to Step 7	Go to Step 10

DTC P0204 – Injector Circuit Malfunction – Cylinder 4 (Cont'd)

Step	Action	Value(s)	Yes	No
7	1. Disconnect the ECM connector for the affected injectors. 2. With a test light connected to B+, probe the affected injector driver circuit. Does the test light illuminate?	—	Go to Step 8	Go to Step 9
8	Repair short to ground in the injector driver circuit. Is the action complete?	—	Go to OBD System Check	—
9	Replace the ECM. Is the action complete?	—	Go to OBD System Check	—
10	1. Disconnect the injector test connector. 2. Ignition ON. 3. Use a test light connected to ground to probe each terminal on the ECM side of the injector test connector. Only the Ign+ terminal should illuminate the test light. Besides the Ign+, did any other terminal illuminate the test light?	—	Go to Step 11	Go to Step 12
11	Repair the short to voltage in the injector driver circuit.	—	Verify repair	—
12	1. Disconnect the injector test connector. 2. Ignition ON. 3. Use a test light connected to ground to probe each pin on the injector side of the connector. Did any terminal illuminate the test light?	—	Go to Step 11	Go to Step 13
13	1. Disconnect the injector test connector. 2. Ignition OFF. 3. Clip one lead of an ohmmeter to the ignition pin on the injector side of the test connector. 4. Touch the other lead to each of the other four pins in the test connector, one pin at a time. Instead of normal injector resistance, did the ohmmeter indicate an open in one of the injector circuits?	—	Go to Step 14	Go to Step 15
14	Repair the open circuit or open injector.	—	Verify repair	—
15	Check for an open circuit between the injector test connector and the ECM connector for the Injector 3 control circuit. Was there an open circuit?	—	Go to Step 16	Go to Step 9
16	Repair the open circuit.	—	—	Verify repair

DIAGNOSTIC TROUBLE CODE (DTC) P0325 KNOCK SENSOR (KS) CIRCUIT MALFUNCTION

D06RX121

Circuit Description

The knock sensor (KS) system is used to detect engine detonation. The knock sensor produced an AC voltage signal. The knock sensor sends this signal to the ECM. The amplitude and the frequency of the AC voltage signal depends upon the knock level being detected. The ECM will then retard the spark timing based on the signals from the Knock Sensor. DTC P0325 is a type B code.

Conditions for Setting the DTC

- Engine run time is greater than 10 seconds.
 - No P0327 Diagnostic Trouble Code set.
 - Engine speed is above 2500 rpm.
- All the above mentioned conditions are met, and the following conditions are met for 8.75 seconds within a 10 second monitoring period:
- Any of the four A/D voltages exceeds 1.5625 Volts.
 - Instantaneous A/D delta Voltage falls below 0.019531 Volts.

Action Taken When the DTC Sets

- The Malfunction Indicator Lamp (MIL) will illuminate the second time the fault is detected.
- The ECM will record operating conditions at the time the diagnostic fails.
- A history Diagnostic Trouble Code is stored.

- The ECM will use a calculated spark retard value in order to minimize the knock during the conditions when the knock is likely to occur. The calculated value will vary based on the engine speed and load.

Conditions for Clearing the MIL/DTC

- The MIL will turn off after 3 consecutive ignition cycles in which the diagnostic runs without a fault.
- A history Diagnostic Trouble Code will clear after 40 consecutive warm up cycles without a fault.
- A Tech 2 can clear the Diagnostic Trouble Codes.

Diagnostic Aids

Correct any abnormal engine noise before using the diagnostic table.
Check for an open ignition feed circuit.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

1. The Powertrain OBD System Check prompts the technician to complete some basic checks and store the freeze frame data and failure records data on the Tech 2 if applicable. This creates an electronic copy of the data taken when the malfunction occurred. The information is then stored on the Tech 2 for later reference.

2. If the conditions for the test as described above are met, a Diagnostic Trouble Code P0325 will set and MIL will illuminate.
4. If the engine has an internal knock or audible noise that causes a knocking type noise on the engine block, the knock sensor may be responding to the noise.
6. The Tech 2 displays knock sensor activity in counts, approximately 20–50 at idle. The counts should increase when engine speed is increased and the counts should decrease when engine speed is decreased.
7. Any circuitry, that is suspected as causing the complaint, should be thoroughly checked for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, poor terminal to wiring connections or physical damage to the wiring harness.
8. If the KS module was previously replaced and the Diagnostic Trouble Code resets, a malfunctioning ECM is indicated.
9. Checking the internal resistance of the knock sensor verifies if the knock sensor or the wiring to the knock sensor is OK.

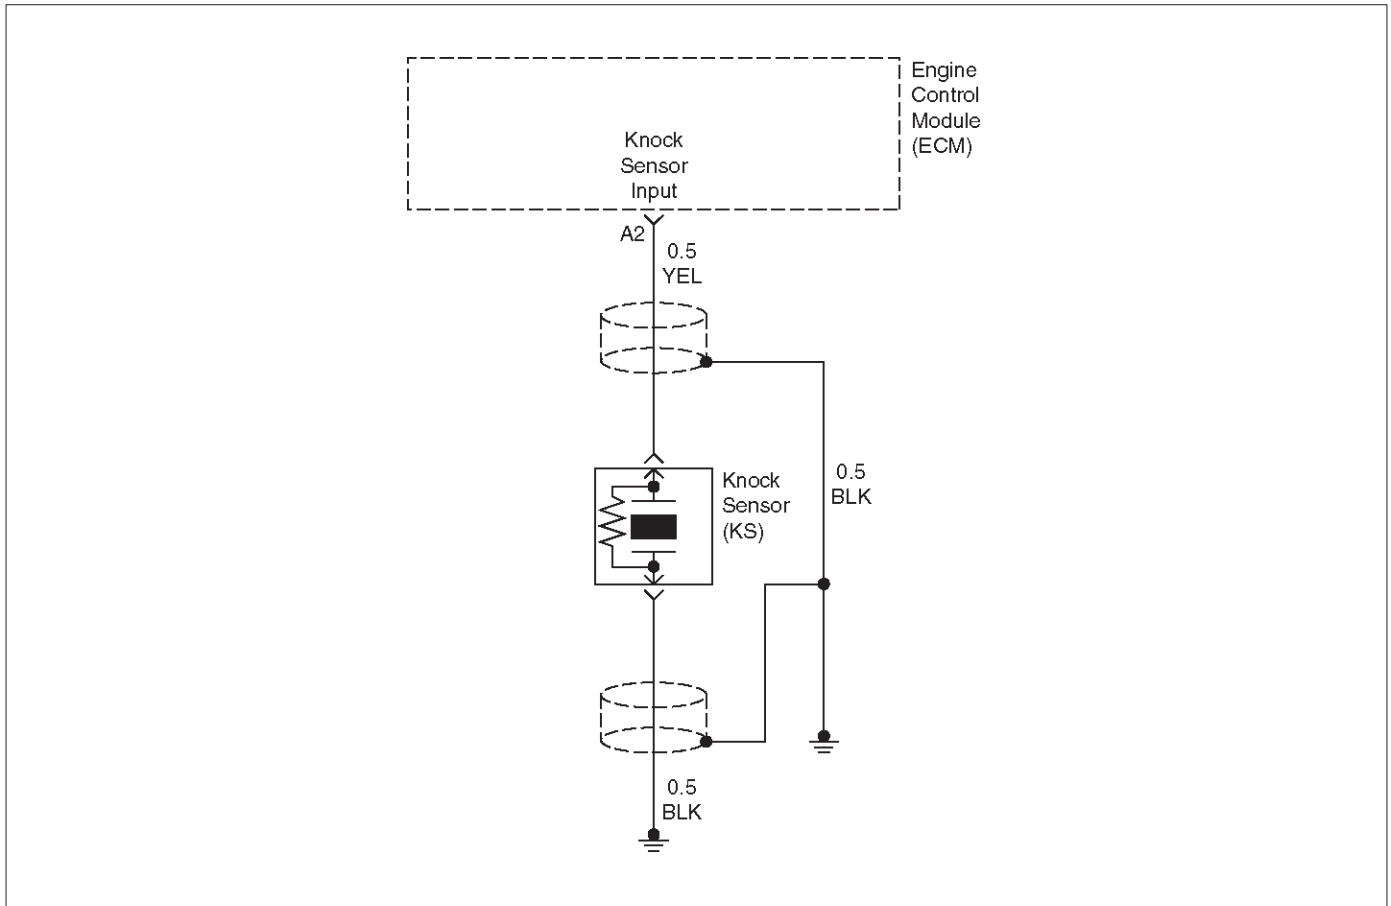

DTC P0325 KS Circuit Malfunction

Step	Action	Value(s)	Yes	No
1	Was the Powertrain "On-Board Diagnostic (OBD) System Check" performed? —	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Start the engine. 2. Install a Tech 2. 3. Clear the Diagnostic Trouble Codes. 4. Run the engine at slightly more than 10% throttle angle. Does the Malfunction Indicator Lamp (MIL) illuminate?	—	Go to Step 4	Go to Step 3
3	1. Turn the ignition switch ON, with engine OFF. 2. Review the Freeze Frame data and note the parameters. 3. Operate the vehicle within the Conditions and Conditions for Setting the DTC as noted. Does the Malfunction Indicator Lamp (MIL) illuminate?	—	Go to Step 4	Go to Step 13
4	Listen to the engine while raising and lowering the engine speed. Is a knock or audible noise present?	—	Go to Step 5	Go to Step 6
5	Repair the mechanical engine problem or a loose bracket or component. Is the action complete?	—	Go to Step 13	—
6	Slowly increase the engine speed to the specified value. Does the KS Activity increase with the engine speed?	2500 RPM	Go to Step 7	Go to Step 11
7	Check for a poor connection at the ECM connector, Knock sensor signal circuit and repair as necessary. Was a repair necessary?	—	Go to Step 13	Go to Step 8
8	Replace the ECM. Is the action complete?	—	Go to Step 13	—
9	1. Turn the ignition switch OFF. 2. Disconnect the ECM connectors at the ECM. 3. With a Digital Voltmeter (DVM) connected to ground, measure the resistance of the knock sensor through the knock sensor signal circuit. Is the measured value within the specified value?	90K – 110K Ω	Go to Step 7	Go to Step 10

DTC P0325 KS Circuit Malfunction (Cont'd)

Step	Action	Value(s)	Yes	No
10	Check the knock sensor electrical connector for a poor connection and repair as necessary. Was a repair necessary?	—	Go to Step 13	Go to Step 11
11	Check the knock sensor signal circuit for an open or a short to ground or to voltage and repair as necessary. Was a repair necessary?	—	Go to Step 13	Go to Step 12
12	Replace the Knock Sensor (KS). Is the action complete?	—	Go to Step 13	—
13	1. Using the Tech 2, clear the Diagnostic Trouble Codes. 2. Start the engine and idle at normal operating temperature. 3. Operate the vehicle within the conditions for setting this Diagnostic Trouble Code as specified in the supporting text. Does the Tech 2 indicate that this diagnostic has ran and passed?	—	Go to Step 14	Go to Step 2
14	Check is any additional Diagnostic Trouble Codes are set. Are any Diagnostic Trouble Codes displayed that have not been diagnosed?	—	Go to applicable DTC table	System OK

DIAGNOSTIC TROUBLE CODE (DTC) P0327 KNOCK SENSOR (KS) CIRCUIT LOW INPUT

D06RX121

Circuit Description

The ECM uses the Knock Sensor (KS) in order to detect engine detonation. This allows the ECM to retard the Ignition Control (IC) spark timing based on the KS signal the ECM receives. The circuitry within the knock sensor pulls down the ECM-supplied 5 volt signal, so that under a no knock condition the signal on the KS circuit measures about 1.3 volts. The knock sensors produce an AC signal that rides on the 1.3 volts DC. The signal's amplitude and frequency are dependent upon the amount of the knock being experienced.

The ECM determines whether the knock is occurring by comparing the signal level on the KS circuit with a voltage level on the noise channel. The noise channel allows the CM to reject any false knock signal by indicating the amount of normal engine mechanical noise present. The normal engine noise varies depending on the engine speed and load. Then the ECM determines that an abnormally high noise channel voltage level is being experienced, a Diagnostic Trouble Code P0327 sets. This DTC is a type B DTC.

Conditions for Setting the DTC

A/D Test

The following conditions are met for 7.5 seconds within a 10 second monitoring period:

- Engine speed is equal to or greater than 2000 RPM.
- A/D Voltage is less than or equal to 0.0977 Volts.

Gain Test

The following conditions are met for 7.5 seconds within a 10 second monitoring period:

- Engine speed is greater than 2500 RPM.
- Gain is equal to or greater than 23.875 dB.

Action Taken When the DTC Sets

- The ECM will illuminate the MIL the second time the fault is detected.
- The ECM will store the conditions which were present then the Diagnostic Trouble Code set.
- The ECM will use a calculated spark retard value in order to minimize the knock during the conditions when the knock is likely to occur. The calculated value will vary based on the engine speed and load.

Conditions for Clearing the MIL/DTC

- A history Diagnostic Trouble Code will clear after 40 consecutive warm-up cycles have occurred without a fault.
- The Tech 2 "Clear Info" will clear the Diagnostic Trouble Code.

Diagnostic Aids

Check for the following conditions:

A poor connection at the ECM. Inspect the knock sensor and the ECM connectors for: , broken locks, improperly formed or damaged terminals.

- Backed out terminals

6E1-154 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

- Broken locks
 - Improperly formed or damaged terminals
- Also, check the wiring harness for: shorts to ground, shorts to battery positive, and open circuits.
- A misrouted harness. Inspect the knock sensor harness in order to ensure that it is not routed too close to high voltage wires such as spark plug leads.
 - Improper Knock Sensor torque specification. Torque the Knock Sensor to 19N·m (1.9kg·m/14 lbs·ft). Refer to Fastener Notice.

Review the Fail Records vehicle mileage since the diagnostic test last failed in order to help determine how

often the conditions that caused the DTC to set occur. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

2. Ensures that the fault is present.
6. Ensures that the knock sensor is capable of detecting detonation.

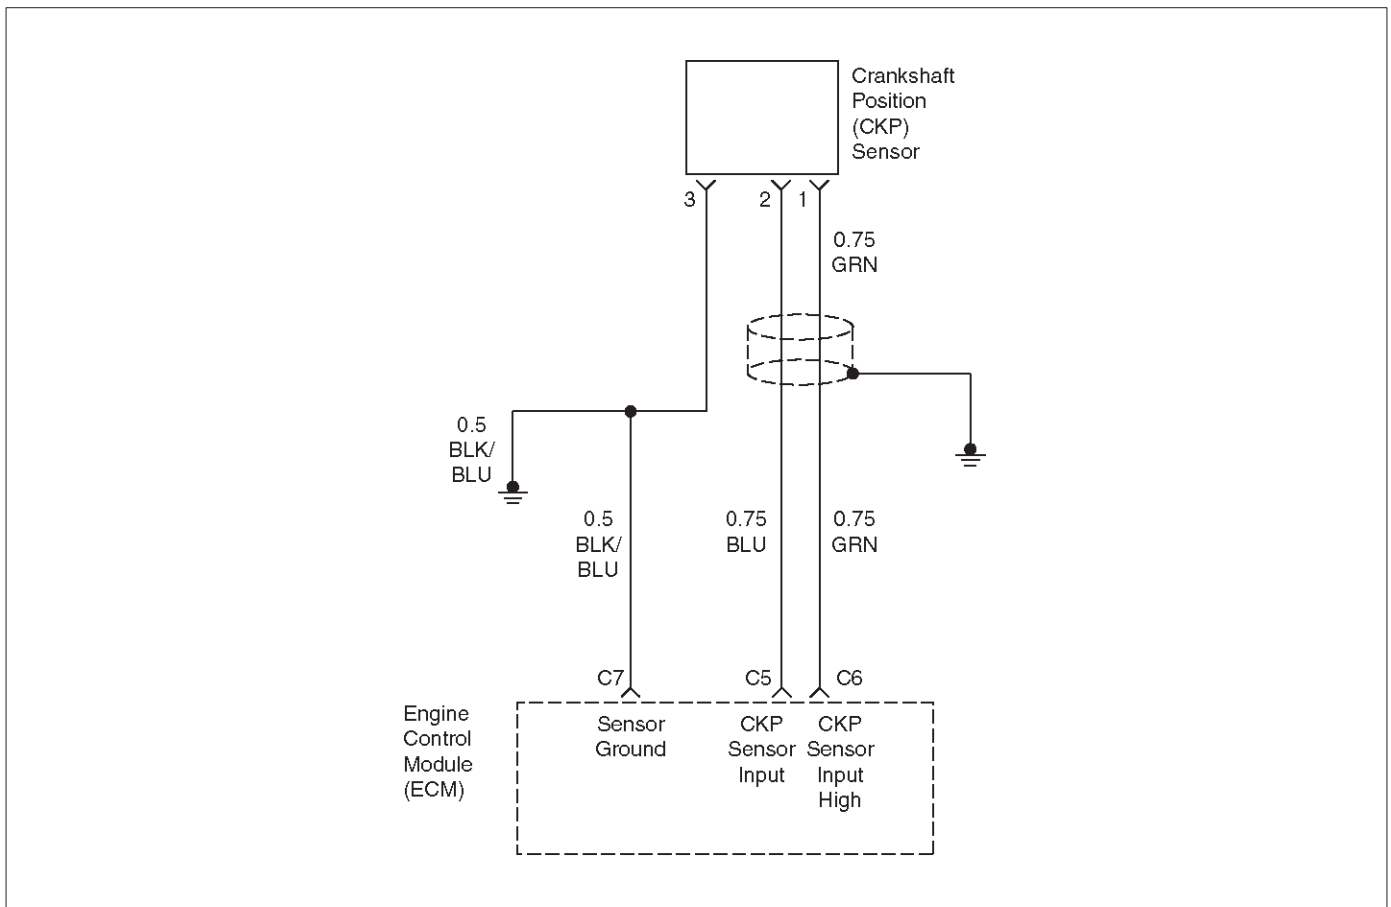

DTC P0327 KS Circuit Low Input

Step	Action	Value(s)	Yes	No
1	Was the Powertrain "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	<ol style="list-style-type: none"> 1. Operate the engine within the conditions specified in the diagnostic support Conditions for Setting the DTC. 2. Using a Tech 2, monitor the Diagnostic Trouble Code information for Diagnostic Trouble Code P0327 until the Diagnostic Trouble Code P0327 test runs. 3. Observe the test results. Does the Tech 2 indicate the DTC P0327 failed this ignition?	—	Go to Step 4	Go to Step 3
3	<ol style="list-style-type: none"> 1. Turn ON the Ignition leaving the engine OFF. 2. Review the Tech 2 Fail Records data. 3. <p>IMPORTANT: Before clearing the DTCs, use the Tech 2 to record the Freeze Frame and the Failure Records for reference. This data will be lost when the Clear Info function is used.</p> <ol style="list-style-type: none"> 4. Record the Tech 2 Fail Records data. 5. Operate the vehicle within the Fail Records conditions. 6. Using a Tech 2, monitor the DTC info for the DTC P0327 until the DTC P0327 test runs. 7. Observe the test results. Does the Tech 2 indicate the DTC P0327 Failed This Ignition?	—	Go to Step 4	Go to Diagnostic Aids
4	<ol style="list-style-type: none"> 1. Disconnect the KS Sensor electrical connector. 2. Using a Digital Voltmeter (DVM), measure the voltage between the KS signal circuit at the knock sensor harness connectors and ground. Is the voltage at the specified value?	Approx. 5.0 V	Go to Step 5	Go to Step 8
5	Measure the resistance of the KS sensor by connecting the between the KS sensor terminal and the engine block. Is the resistance of the KS sensor near the specified value?	100K Ω	Go to Step 6	Go to Step 9

DTC P0327 KS Circuit Low Input (Cont'd)

Step	Action	Value(s)	Yes	No
6	1. Check the KS signal circuit for a poor terminal connection at the knock sensor. 2. If a problem is found, repair as necessary. Refer to Wiring Repairs in Engine Electrical. Was a problem found?	—	Go to Step 7	Go to Step 9
7	1. Re-Connect the KS Sensor in order to monitor the voltage between the KS sensor terminal and the engine ground. 2. Tap on the engine lift bracket, near the KS Sensor, while observing the signal indicated on the Tech 2. Is any signal indicated on the while tapping on the engine lift bracket?	—	Go to Step 11	Go to Step 8
8	1. Turn OFF the ignition. 2. Disconnect the ECM. 3. Turn ON the ignition. 4. Check the KS signal circuit between the ECM and the KS sensor connector for an open, a short to voltage, or a short to ground. 5. If a wiring problem is found, repair as necessary. Was a problem found?	—	Go to Step 11	Go to Step 10
9	Replace the KS Sensor. Refer to Knock Sensor. Is the action complete?	—	Go to Step 11	—
10	Replace the ECM. Is the action complete?	—	Go to Step 11	—
11	1. Using the Tech 2, select the DTC and the Clear Info. 2. Start the engine. 3. Idle at the normal operating temperature. 4. Select the DTC and the Specific. 5. Enter the DTC number which was set. 6. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text. Does the Tech 2 indicate that this diagnostic ran and passed?	—	Go to Step 12	Go to Step 2
12	Using the Tech 2, select the Capture Info and the Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to applicable DTC table	System OK

DIAGNOSTIC TROUBLE CODE (DTC) P0336 CRANKSHAFT POSITION (CKP) SENSOR CIRCUIT RANGE/PERFORMANCE

D06RX122

Circuit Description

The 58X reference signal is produced by the crankshaft position (CKP) sensor. During one crankshaft revolution, 58 crankshaft pulses will be produced. The engine control module (ECM) uses the 58X reference signal to calculate engine RPM and crankshaft position. The ECM constantly monitors the number of pulses on the 58X reference circuit and compares them to the number of camshaft position (CMP) signal pulses being received. If the ECM receives an incorrect number of pulses on the 58X reference circuit, Diagnostic Trouble Code P0336 will set. Diagnostic Trouble Code P0336 is a type B code.

Conditions for Setting the DTC

- Engine is running.
- Extra or missing pulse is detected between consecutive 58X reference pulses.
- Above condition is detected in 10 of 100 crankshaft rotations.

Action Taken When the DTC Sets

- The ECM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The ECM will store conditions which were present when the Diagnostic Trouble Code was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The ECM will turn the MIL OFF on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history Diagnostic Trouble Code P0336 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code P0336 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

An intermittent may be caused by a poor connection, rubbed-through wire insulation or a wire broken inside the insulation. Check for:

- Poor connection – Inspect the ECM harness and connectors for improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage; shorts to ground, shorts to battery positive and open circuits. If the harness appears to be OK, disconnect the ECM, turn the ignition on and observe a voltmeter connected to the 58X reference circuit at the ECM harness connector while moving connectors and wiring harnesses related to the ECM. A change in voltage will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the Diagnostic Trouble Code to

be set occurs. This may assist in diagnosing the condition.

DTC P0336 – CKP Sensor Circuit Range/Performance

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	Attempt to start the engine. Does the engine start?	—	Go to Step 3	Refer to Engine Cranks But Will Not Run chart
3	1. Review and record Failure Records information. 2. Clear Diagnostic Trouble Code P0336. 3. Start the engine and idle for 1 minute. 4. Observe Diagnostic Trouble Codes. Is Diagnostic Trouble Code P0336 set?	—	Go to Step 4	Refer to Diagnostic Aids
4	1. Disconnect the ECM and CKP sensor. 2. Check for an open or a short to ground in the 58X reference circuit between the CKP sensor connector and the ECM harness connector. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 5
5	1. Reconnect the ECM and CKP sensor. 2. Connect a Digital Voltmeter (DVM) to measure voltage on the 58X reference circuit at the ECM connector. 3. Observe the voltage while cranking the engine. Is the voltage near the specified value?	2.5 V	Go to Step 8	Go to Step 6
6	Check the connections at the CKP sensor and replace the terminals if necessary. Did any terminals require replacement?	—	Verify repair	Go to Step 7
7	Replace the CKP sensor. Is the action complete?	—	Verify repair	—

9	Replace the ECM. Is the action complete?	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0337 CRANKSHAFT POSITION (CKP) SENSOR CIRCUIT LOW INPUT

D06RX122

Circuit Description

The 58X reference signal is produced by the crankshaft position (CKP) sensor. During one crankshaft revolution, 58 crankshaft reference pulses will be produced. The engine control module (ECM) uses the 58X reference signal to calculate engine RPM and crankshaft position. The ECM constantly monitors the number of pulses on the 58X reference circuit and compares them to the number of camshaft position (CMP) signal pulses being received. If the ECM does not receive pulses on the 58X reference circuit, Diagnostic Trouble Code P0337 will set. Diagnostic Trouble Code P0337 is a type B code.

Conditions for Setting the DTC

- No camshaft position (CMP) sensor DTCs are set.
- Engine cranking.
- Crankshaft position (CKP) sensor signal is not present between two cam pulses.
- CKP reference pulse is not detected within 24 CMP pulses.

Action Taken When the DTC Sets

- The ECM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The ECM will store conditions which were present when the Diagnostic Trouble Code was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The ECM will turn the MIL OFF on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history Diagnostic Trouble Code P0337 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code P0337 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

An intermittent may be caused by a poor connection, rubbed-through wire insulation or a wire broken inside the insulation. Check for:

- Poor connection – Inspect the ECM harness and connectors for improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage; shorts to ground, shorts to battery positive and open circuits. If the harness appears to be OK, disconnect the ECM, turn the ignition on and observe a voltmeter connected to the 58X reference circuit at the ECM harness connector while moving connectors and wiring harnesses related to the ECM. A change in voltage will indicate the location of the fault.

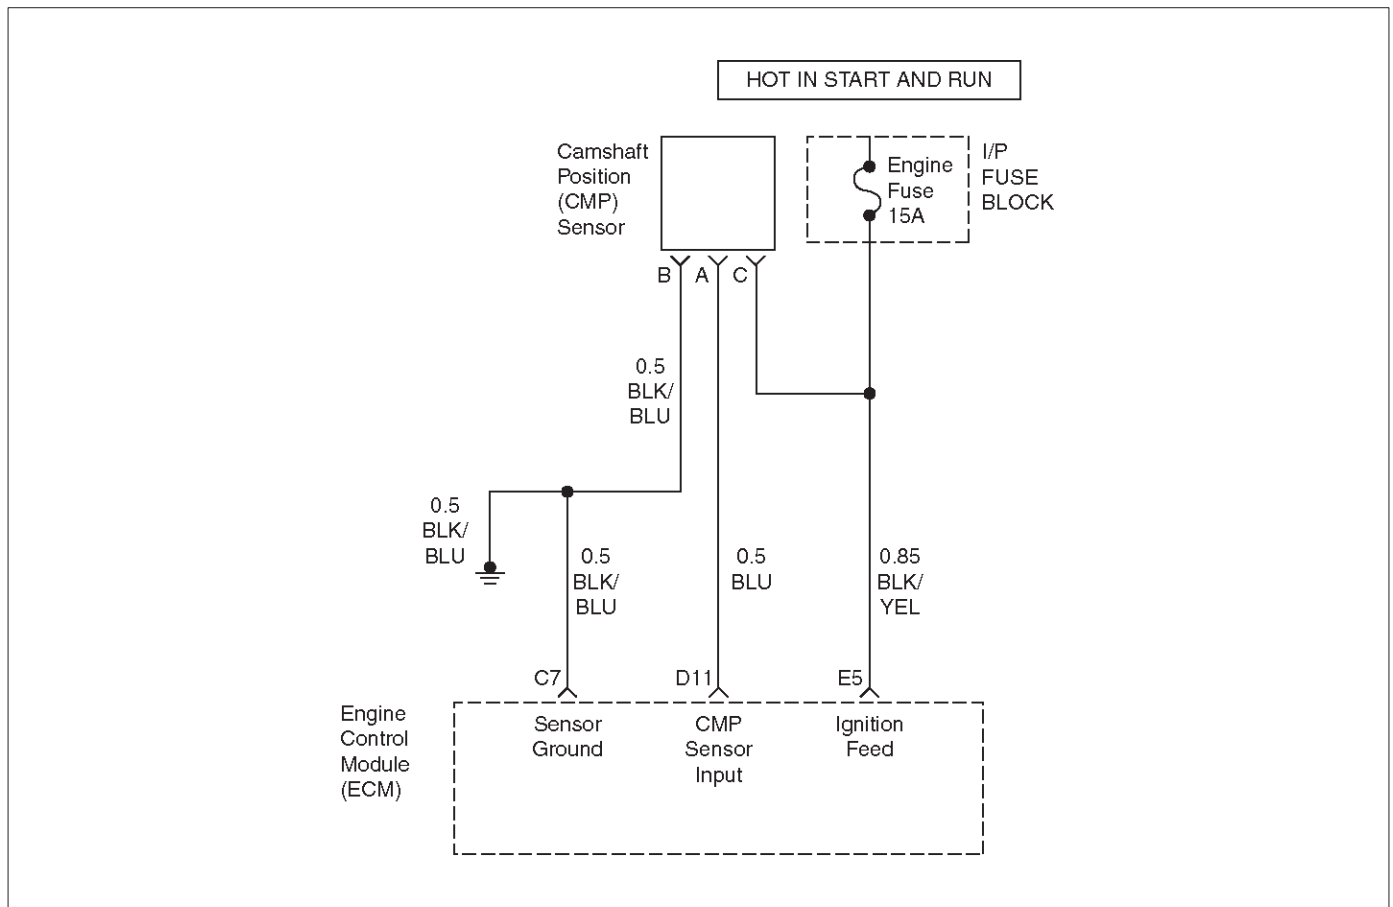

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the Diagnostic Trouble Code to

be set occurs. This may assist in diagnosing the condition.

DTC P0337 – CKP Sensor Circuit Low Input

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	1. Disconnect the CKP sensor. 2. Ignition ON. 3. Using a Digital Voltmeter (DVM), verify that 5 V reference and ground are being supplied at the sensor connector (ECM side). Are 5 V and ground being supplied to the sensor?	—	Go to Step 5	Go to Step 3
3	1. Ignition ON. 2. With a DVM, backprobe the ECM connector 5 V reference and ground connections. Are 5 V reference and ground available at the ECM?	—	Go to Step 4	Go to Step 9
4	Check 5 V reference or ground between the CKP sensor and ECM and repair the open circuit, short to ground or short to voltage. Is the action complete?	—	Verify repair	—
5	1. Ignition OFF. 2. Disconnect the ECM and CKP sensor. 3. Check for an open or a short to ground in the 58X reference circuit between the CKP sensor connector and the ECM harness connector. 4. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 6
6	1. Reconnect the ECM and CKP sensor. 2. Connect a DVM to measure voltage on the 58X reference circuit at the ECM connector. 3. Observe the voltage while cranking the engine. Is the voltage near the specified value?	2.5 V	Go to Step 9	Go to Step 7
7	Check the connections at the CKP sensor and replace the terminals if necessary. Did any terminals require replacement?	—	Verify repair	Go to Step 8
8	Replace the CKP sensor. Is the action complete?	—	Verify repair	—
9	Check the connections at the ECM and replace the terminals if necessary. Did any terminals require replacement?	—	Verify repair	Go to Step 10
10	Replace the ECM. Is the action complete?	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0341 CAMSHAFT POSITION (CMP) SENSOR CIRCUIT RANGE/PERFORMANCE

D06RX123

Circuit Description

The camshaft position (CMP) sensor signal is produced by the CMP sensor pulses when the engine is running and crankshaft position (CKP) sync pulses are also being received. The engine control module (ECM) uses the CMP signal pulses to initiate sequential fuel injection. The ECM constantly monitors the number of pulses on the CMP signal circuit and compares the number of CMP pulses to the number of 58X reference pulses received. If the ECM receives an incorrect number of pulses on the CMP reference circuit, Diagnostic Trouble Code P0341 will set and the ECM will initiate injector sequence without the CMP signal with a one in four chance that injector sequence is correct. The engine will continue to start and run normally, although the misfire diagnostic will be affected if a misfiring condition occurs. DTC P0341 is a type B code.

Conditions for Setting the DTC

- The engine is running (CMP reference pulses are being received).
- Above condition fails for 10 occurrences within 100 test samples (15.6 m/s).

Action Taken When the DTC Sets

- The ECM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.

- The ECM will initiate injector sequence without the CMP signal with a one in four chance that injector sequence is correct.
- The ECM will store conditions which were present when the Diagnostic Trouble Code (DTC) was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The ECM will turn the MIL OFF on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history Diagnostic Trouble Code (DTC) P0341 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code (DTC) P0341 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

- If a CKP Diagnostic Trouble Code (DTC) is also indicated, there may be a problem with the ground circuit because the CMP ground is spliced to the CKP ground wire.
- If a fuel injector Diagnostic Trouble Code (DTC) is also indicated, there may be a problem with the power supply to the CMP. The wire supplying CMP power is spliced to the wire supplying power to the fuel injectors. An intermittent may be caused by a poor connection, rubbed-through wire insulation or a wire broken inside the insulation. Check for the following conditions:

- Poor connection – Inspect the ECM harness and connectors for improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage; shorts to ground, shorts to battery positive and open circuits. If the harness appears to be OK, disconnect the ECM, turn the ignition ON and observe a voltmeter connected to the CMP signal circuit at the

ECM harness connector while moving connectors and wiring harnesses related to the CMP sensor. A change in voltage will indicate the location of the fault. Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the Diagnostic Trouble Code (DTC) to be set occurs. This may assist in diagnosing the condition.

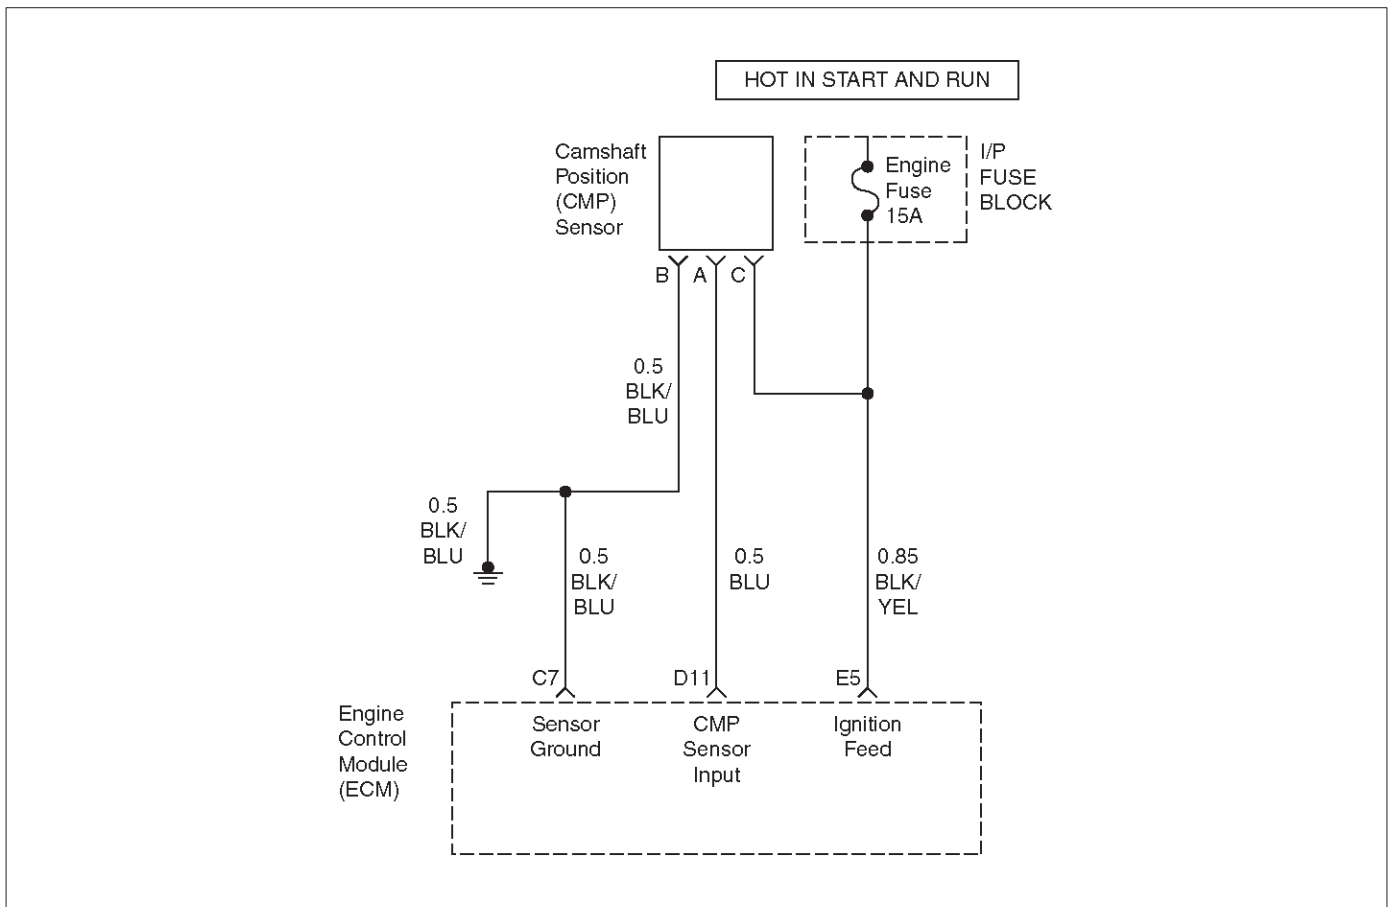

DTC P0341 – CMP Sensor Circuit Range/Performance

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	1. Ignition ON. 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within the Failure Records conditions as noted. 4. Using a Tech 2, monitor "DTC" information for DTC P0341 until the DTC P0341 test runs. Does the Tech 2 indicate DTC P0341 failed this ignition cycle?	—	Go to Step 3	Refer to Diagnostic Aids
3	1. Monitor voltage on the CMP signal circuit while cranking the engine. Does the voltage toggle between the specified values?	0-4 V	Go to Step 4	Go to Step 7
4	Check for a poor connection of the CMP signal wire at the ECM terminal. Was a poor connection found?	—	Go to Step 5	Go to Step 6
5	Repair the damaged pin or terminal at the ECM.	—	Verify repair	—
6	Replace the ECM Is the repair complete?	—	—	Verify repair
7	1. Disconnect the CMP connector from the CMP Sensor. 2. Ignition ON. 3. At the CMP connector, use a Digital Voltmeter (DVM) to check the voltage between the voltage signal wire and sensor ground. Does the DVM indicate the specified value?	B+	Go to Step 12	Go to Step 8
8	1. Ignition ON. 2. Use a DVM to measure between the ground and the CMP positive connector. Does the DVM indicate the specified value?	B+	Go to Step 10	Go to Step 9
9	Repair the open circuit. Is the repair complete?	—	Verify repair	—
10	1. Ignition ON. 2. Use a DVM to measure at the CMP connector between the battery + and the CMP ground wire. Does the DVM indicate the specified value?	B+	Go to Step 12	Go to Step 11
11	Repair the open ground wire. Is the repair complete?	—	Verify repair	—

DTC P0341 – CMP Sensor Circuit Range/Performance (Cont'd)

Step	Action	Value(s)	Yes	No
12	Use an ohmmeter to check continuity of the signal wire between the CMP and the ECM. Was there an open circuit?	—	Go to Step 13	Go to Step 14
13	Repair the open signal wire. Is the action complete?	—	Verify repair	—
14	1. Ignition ON. 2. Check the signal wire for a short to ground or a short to voltage. Was a problem found?	—	Go to Step 15	Go to Step 16
15	Repair the signal circuit problem. Is the action complete?	—	Verify repair	—
16	Replace the CMP Sensor. Is the action complete?	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0342 CAMSHAFT POSITION (CMP) SENSOR CIRCUIT LOW INPUT

Circuit Description

The camshaft position (CMP) sensor signal is produced by the CMP sensor pulses when the engine is running and crankshaft position (CKP) sync pulses are also being received. The ECM uses the CMP signal pulses to initiate sequential fuel injection. The ECM constantly monitors the number of pulses on the CMP signal circuit and compares the number of CMP pulses to the number of 58X reference pulses received. If the ECM does not receive pulses on the CMP reference circuit, Diagnostic Trouble Code (DTC) P0342 will set and the ECM will initiate injector sequence without the CMP signal with a one in four chance that injector sequence is correct. The engine will continue to start and run normally, although the misfire diagnostic will be affected if a misfiring condition occurs. Diagnostic Trouble Code (DTC) P0342 is a type B code.

Conditions for Setting the DTC

- The engine is running.
- The CMP sensor signal is not received by the ECM once every 4 cylinders.
- The above condition occurs for 10 seconds.

Action Taken When the DTC Sets

- The ECM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.

- The ECM will initiate injector sequence without the CMP signal with a one in four chance that injector sequence is correct.
- The ECM will store conditions which were present when the Diagnostic Trouble Code (DTC) was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The ECM will turn the MIL OFF on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history Diagnostic Trouble Code (DTC) P0342 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code (DTC) P0342 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

- If a CKP Diagnostic Trouble Code (DTC) is also indicated, there may be a problem with the ground circuit because the CMP ground is spliced to the CKP ground wire.
- If a fuel injector Diagnostic Trouble Code (DTC) is also indicated, there may be a problem with the power supply to the CMP. The wire supplying CMP power is spliced to the wire supplying power to the fuel injectors. An intermittent may be caused by a poor connection, rubbed-through wire insulation or a wire broken inside the insulation. Check for the following:

6E1-164 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

- Poor connection – Inspect the ECM harness and connectors for improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage; shorts to ground, shorts to battery positive and open circuits. If the harness appears to be OK, disconnect the ECM, turn the ignition ON and observe a voltmeter connected to the CMP signal circuit at the

ECM harness connector while moving connectors and wiring harnesses related to the CMP sensor. A change in voltage will indicate the location of the fault.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

2. Ensures that the fault is present.

DTC P0342 – Camshaft Position Sensor Circuit Low Input

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	1. Ignition ON. 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor "DTC" information for DTC P0342 until the DTC P0342 test runs. Did the Tech 2 indicate DTC P0342 failed this ignition cycle?	—	Go to Step 3	Refer to Diagnostic Aids
3	1. Use a Digital Voltmeter (DVM) to monitor voltage on the CMP signal circuit while cranking the engine. Does the voltage toggle between the specified values?	0-4 V	Go to Step 4	Go to Step 7
4	Check for a poor connection of the CMP signal wire at the ECM terminal. Was a poor connection found?	—	Go to Step 5	Go to Step 6
5	Repair the damaged pin or terminal at the ECM.	—	Verify repair	—
6	Replace the ECM. Is the repair complete?	—	Verify repair	—
7	1. Disconnect the CMP connector from the CMP Sensor. 2. Ignition ON. 3. At the CMP connector, check the voltage between the voltage signal wire and sensor ground. Does the DVM indicate the specified value?	B+	Go to Step 12	Go to Step 8
8	1. Ignition ON. 2. Use a DVM to measure between the ground and the CMP positive connector. Does the DVM indicate the specified value?	B+	Go to Step 10	Go to Step 9
9	Repair the open circuit. Is the repair complete?	—	Verify repair	—
10	1. Ignition ON. 2. Use a DVM to measure at the CMP connector between the battery + and the CMP ground wire. Does the DVM indicate the specified value?	B+	Go to Step 12	Go to Step 11
11	Repair the open ground wire. Is the repair complete?	—	Verify repair	—

DTC P0342 – Camshaft Position Sensor Circuit Low Input (Cont'd)

Step	Action	Value(s)	Yes	No
12	Use an ohmmeter to check continuity of the signal wire between the CMP and the ECM. Was there an open circuit?	—	Go to Step 13	Go to Step 14
13	Repair the open signal wire. Is the action complete?	—	Verify repair	—
14	1. Ignition ON. 2. Check the signal wire for a short to ground or a short to voltage. Was a problem found?	—	Go to Step 15	Go to Step 16
15	Repair the signal circuit problem. Is the action complete?	—	Verify repair	—
16	Replace the CMP Sensor. Is the action complete?	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0351 IGNITION COIL "A" PRIMARY/SECONDARY CIRCUIT MALFUNCTION

D06RX124

Circuit Description

The ignition control circuit provides a zero volt or a 5 volt signal to the ignition control module. The normal circuit voltage is zero volts. When the module receives the 5 volt signal from the engine control module (ECM), it provides a ground path for the B+ voltage supplied to the ignition primary coil. When the ECM turns off the 5 volts to the module, the module will remove the ground path of the ignition primary coils; causing the magnetic field produces a voltage in the secondary coils which fires the spark plug.

The circuit between the ECM and the ignition control module is monitored for an open circuit, short to voltage, and short to ground. When the ECM detects a problem in the ignition control circuit, it will set DTC P0351. DTC P0351 is a type A code.

Conditions for Setting the DTC

- Ignition ON.
- Output voltage is not equal to 5 volts when output is ON.
- Output voltage is not equal to 0 volt when output is OFF.
- Twenty test failures within 40 samples of continuous circuit monitoring.

Action Taken When the DTC Sets

- The ECM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The ECM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The ECM will turn the MIL OFF on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0351 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0351 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at the ECM – Inspect the harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connections.
- Damaged harness – Inspect the wiring harness for damage; Open circuits, shorts to ground, or shorts to Voltage. If the harness appears to be OK, observe the Tech 2 display related to DTC P0351 while moving the connector and wiring related to the ignition system. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often

the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P0351 Ignition Coil "A" Primary/Secondary Circuit Malfunction

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	Check for a faulty connection or damaged terminals at the ignition control module. Was a problem found?	—	Verify Repair	Go to Step 3
3	Check for a faulty connection or damaged terminals at the ECM connector. Was a problem found?	—	Verify Repair	Go to Step 4
4	1. Ignition OFF. 2. Disconnect the ECM and the ignition control module. 3. Check the ignition control circuit for a short to voltage. Was a problem found?	—	Verify Repair	Go to Step 5
5	Check the ignition control circuit for a short to voltage. Was a problem found?	—	Verify Repair	Go to Step 6
6	Check for an open in the ignition control circuit. Was a problem found?	—	Verify Repair	Go to Step 7
7	Replace the ignition control module. Verify repair. Is there still a problem?	—	Go to Step 8	—
8	Replace the ECM. Is the repair complete?	—	Verify Repair	—

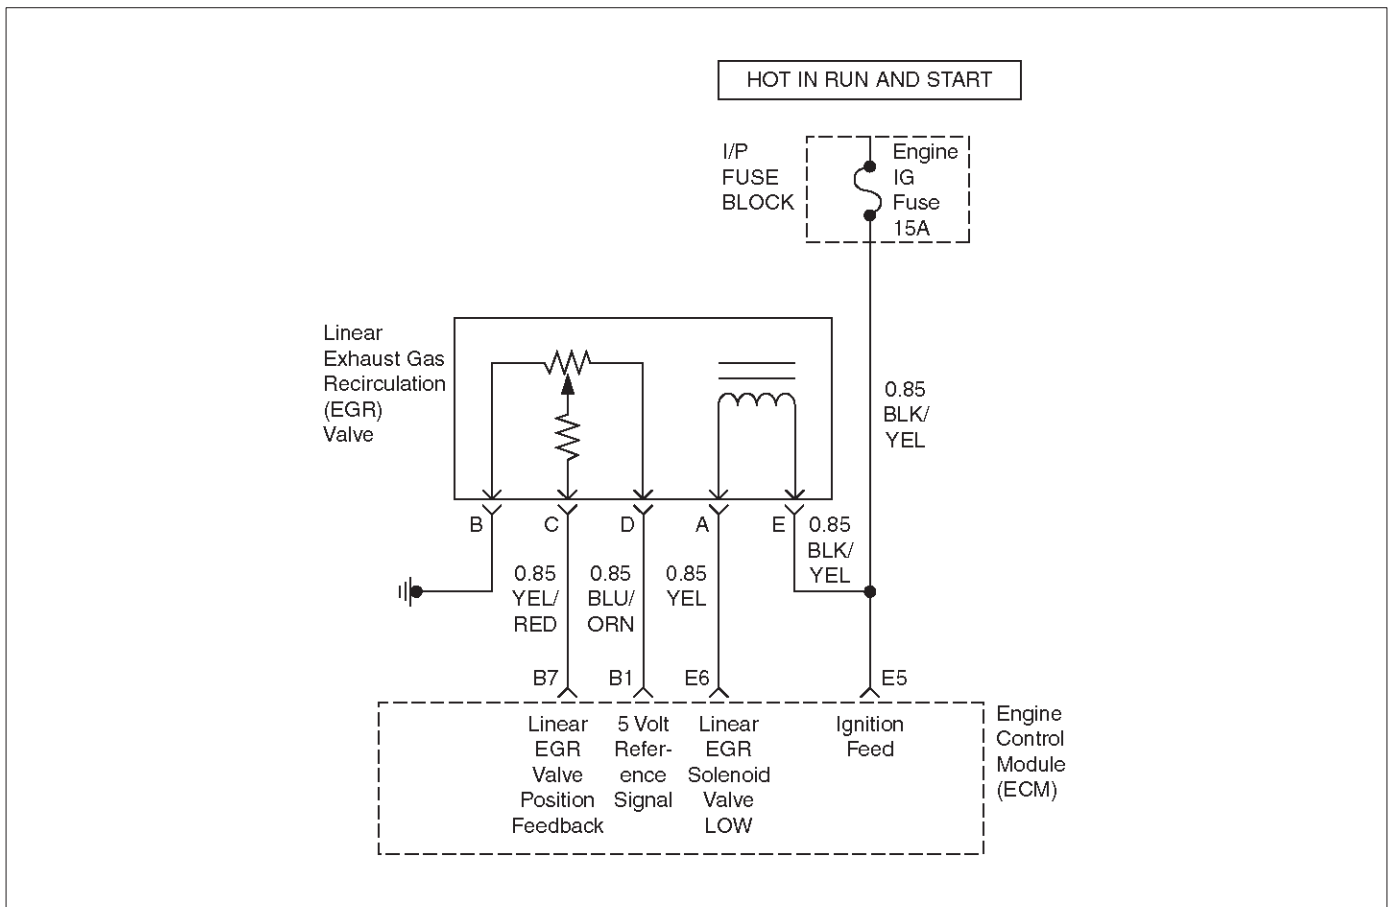

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often

the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P0352 Ignition Coil "B" Primary/Secondary Circuit Malfunction

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	Check for a faulty connection or damaged terminals at the ignition control module. Was a problem found?	—	Verify Repair	Go to Step 3
3	Check for a faulty connection or damaged terminals at the ECM connector. Was a problem found?	—	Verify Repair	Go to Step 4
4	1. Ignition OFF. 2. Disconnect the ECM and the ignition control module. 3. Check the ignition control circuit for a short to voltage. Was a problem found?	—	Verify Repair	Go to Step 5
5	Check the ignition control circuit for a short to voltage. Was a problem found?	—	Verify Repair	Go to Step 6
6	Check for an open in the ignition control circuit. Was a problem found?	—	Verify Repair	Go to Step 7
7	Replace the ignition control module. Verify repair. Is there still a problem?	—	Go to Step 8	—
8	Replace the ECM. Is the repair complete?	—	Verify Repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0401 EXHAUST GAS RECIRCULATION (EGR) FLOW INSUFFICIENT DETECTED

D06RX113

Circuit Description

The engine control module (ECM) tests the exhaust gas recirculation (EGR) system during deceleration by momentarily commanding the EGR valve to open while monitoring the manifold absolute pressure (MAP) sensor signal. When the EGR valve is opened, the ECM monitors the change in MAP input signal. The ECM compares the MAP change to a RPM vs. BARO table. When the ECM interprets the change in MAP to be out of limits, the ECM will set DTC P0401. The number of test samples required to accomplish this may vary according to the severity of the detected flow error.

Normally, the ECM will only allow one EGR flow test sample to be taken during an ignition cycle. To aid in verifying a repair, the ECM allows twelve test samples during the first ignition cycle following a Tech 2 "Clear Info" or a battery disconnect. Between nine and twelve samples should be sufficient for the ECM to determine adequate EGR flow and pass the EGR test. DTC P0401 is a type A code.

Conditions for Setting the DTC

- No TP sensor, VSS, EVAP Purge, IAC, IAT sensor, MAP sensor, EGR Pintle Position sensor, ECT sensor, misfire DTCs set.
- Barometric pressure is above 72 kPa.

- Engine coolant temperature is greater than 60°C (140°F).
- System voltage is between 11.5 and 16 volts.
- Vehicle speed is greater than 23 km/h (14 mph).
- IAC position is steady, changing less than 5 counts.
- A/C clutch status is unchanged.

Start Test

- TP angle is less than 0.8%.
- EGR duty cycle is less than 1%.
- MAP is steady, changing less than 1 kPa.
- Engine speed is between 1200 RPM and 2000 RPM.
- Compensated MAP between 10.3 kPa and 49.8 kPa.

Run Test

- Delta MAP is recorded during valve open conditions.
 - EGR valve is ramped over a time interval.
- Run Test will be aborted if any of the following are true:
- Vehicle speed changes by greater than 16 km/h (10mph).
 - Engine RPM changes by greater than 100 rpm.
 - EGR is opened less than 95% of the commanded amount.

During the Start Test and the Run Test, the EGR is closed then opened. The associated change in MAP is compared with the ECM's expected change value. If the

difference between the two values exceeds the ECM's internal limit, a Diagnostic Trouble Code P0401 will set. DTC P0401 is a type A code.

NOTE: Several deceleration cycles will be necessary to run a sufficient number of EGR flow tests to determine a "pass" or "fail" condition.

Action Taken When the DTC Sets

- The Malfunction Indicator Lamp (MIL) will illuminate the first time the fault is detected.
- A history Diagnostic Trouble Code is stored.
- A history Diagnostic Trouble Code will clear after 40 consecutive warm up cycles without a fault.
- The MIL will turn OFF after three consecutive ignition cycles in which the diagnostic runs without a fault.

Conditions for Clearing the DTC

- The MIL will turn OFF after three consecutive ignition cycles in which the diagnostic runs without a fault.
- A history Diagnostic Trouble Code will clear after 40 consecutive warm up cycles without a fault.
- Diagnostic Trouble Codes can be cleared by using the Tech 2.

Diagnostic Aids

Check for the following conditions:

- Poor connection or damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the Actual EGR Position display on the Tech 2 while moving connectors and wiring harnesses related to the EGR valve. A change in the display will indicate the location of the fault.
- Ensure EGR valve is correctly mounted. See On-Vehicle Service.

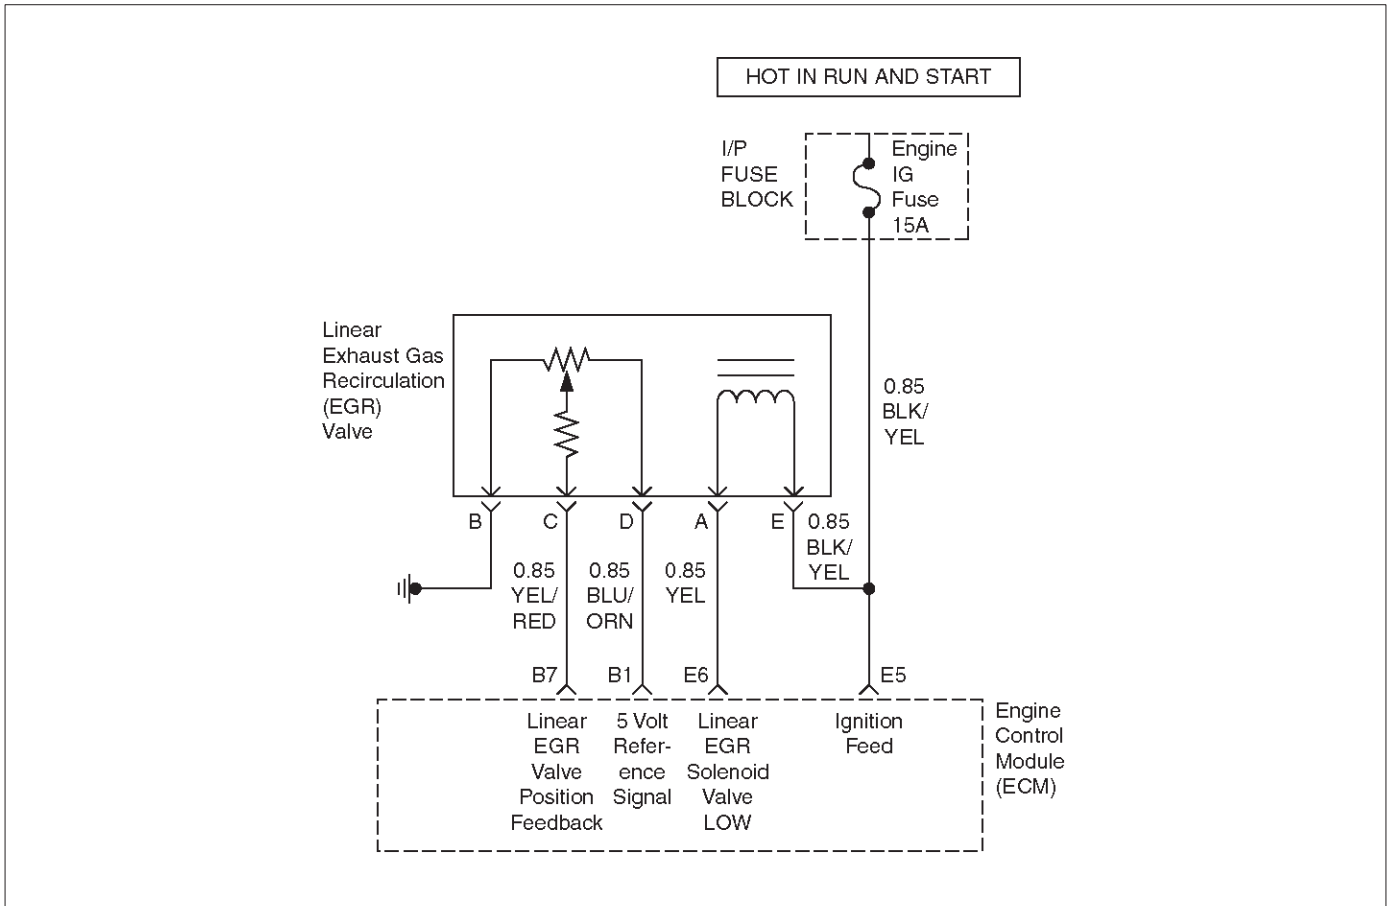

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the Diagnostic Trouble Code to be set occurs. This may assist in diagnosing the condition.

NOTE: If the EGR valve shows signs of excessive heat, check the exhaust system for blockage (possibly a plugged catalytic converter) using the "Restricted Exhaust System Check."

DTC P0401 – Exhaust Gas Recirculation Flow Insufficient Detected

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	1. Start the engine. 2. Monitor the MAP signal with a Tech 2 while idling. 3. While idling, depress the accelerator pedal about halfway down and immediately let the engine return to idle. Did the MAP value on the Tech 2 show an immediate large change?	—	Go to Step 4	Go to Step 3
3	Replace the MAP sensor.	—	Verify repair	—
4	1. Inspect the exhaust system for modification of original installed parts or leaks. 2. If a problem was found, repair exhaust system as necessary. Was a condition present that required repair?	—	Go to Step 7	Go to Step 5
5	1. Remove the EGR valve. 2. Visually and physically inspect the pintle, valve passages and the adapter for excessive deposits or any kind of a restriction. 3. If a problem is found, clean or replace EGR system components as necessary. Was a condition present that required repair?	—	Go to Step 7	Go to Step 6
6	1. Remove the EGR inlet and outlet pipes from the exhaust manifold and the intake manifold. 2. Inspect the manifold EGR ports and the EGR inlet and outlet pipes for a blockage caused by excessive deposits or other damage. 3. If a problem is found, correct the condition as necessary. Was a condition present that required repair?	—	Go to Step 7	Refer to Diagnostic Aids
7	1. Review and record the Tech 2 Failure Records data. 2. Clear Diagnostic Trouble Code and monitor the Tech 2 System Info Screen while operating the vehicle as specified in "Diagnostic Aids." 3. Using a Tech 2, monitor "Diagnostic Trouble Code" info for Diagnostic Trouble Code P0401 until the Diagnostic Trouble Code P0401 test runs. 4. Note the test result. Does the Tech 2 indicate Diagnostic Trouble Code P0401 failed this ignition?	—	—	Repair complete

DIAGNOSTIC TROUBLE CODE (DTC) P0402 EXHAUST GAS RECIRCULATION (EGR) EXCESSIVE FLOW DETECTED

Circuit Description

The Engine Control Module (ECM) closes the Exhaust Gas Recirculation (EGR) system on engine start-up to test for excessive (any) flow. If the ECM determines that EGR flow occurred on start-up, in two consecutive trips, then DTC P0402 will set. DTC P0402 is a type B code.

Conditions for Setting the DTC

- Intake Air Temperature (IAT) is above 5°C (41°F).
 - Engine RPM is less than 500 RPM.
 - EGR Pintle Position if greater than 55 counts.
- The above mentioned conditions must be met for 0.6 seconds during engine start-up on two consecutive trips.

Diagnostic Aids

Check for the following conditions:

- Poor connection or damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the Actual EGR Position display on the Tech 2 while moving connectors and wiring harnesses related to the EGR valve. A change in the display will indicate the location of the fault.
- Ensure EGR valve is correctly mounted. See On-Vehicle Service.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

NOTE: If the EGR valve shows signs of excessive heat, check the exhaust system for blockage (possible a plugged catalytic converter) using the "Restricted Exhaust System Check."

DTC P0402 EGR Excessive Flow Detected

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	<ol style="list-style-type: none"> Review and record the Tech 2 Failure Records data. Clear Diagnostic Trouble Code and monitor the Tech 2 System Info Screen while operating the vehicle as specified in "Diagnostic Aids." Using a Tech 2, monitor "Diagnostic Trouble Code" info for Diagnostic Trouble Code P0401 until the Diagnostic Trouble Code P0401 test runs. Note the test result. Does the Tech 2 indicate Diagnostic Trouble Code P0401 failed this ignition?	—	Go to Diagnostic Aids	Go to Step 3
3	<ol style="list-style-type: none"> Inspect the exhaust system for modification of original installed parts or leaks. If a problem was found, repair exhaust system as necessary. Was a condition present that required repair?	—	Verify repair	Go to Step 4
4	<ol style="list-style-type: none"> Remove the EGR valve. Visually and physically inspect the pintle, valve passages and the adapter for excessive deposits or any kind of a restriction. If a problem if found, clean or replace EGR system components as necessary. Was a condition present that required repair?	—	Verify repair	Go to Step 5
5	<ol style="list-style-type: none"> Remove the EGR inlet and outlet pipes from the exhaust manifold and the intake manifold. Inspect the manifold EGR ports and the EGR inlet and outlet pipes for a blockage caused by excessive deposits or other damage. If a problem is found, correct the condition as necessary. Was a condition present that required repair?	—	Verify repair	Refer to Diagnostic Aids

DIAGNOSTIC TROUBLE CODE (DTC) P0404 EXHAUST GAS RECIRCULATION (EGR) CIRCUIT RANGE/PERFORMANCE

D06RX113

Circuit Description

An Exhaust Gas Recirculation (EGR) system is used to lower Oxides of Nitrogen (NO_x) emission levels caused by high combustion temperatures. It accomplishes this by feeding small amounts of exhaust gases back into the combustion chamber. When the air/fuel mixture is diluted with the exhaust gases, combustion temperatures are reduced.

A linear EGR valve is used on this system. The linear EGR valve is designed to accurately supply exhaust gases to the engine without the use of intake manifold vacuum. The valve controls exhaust flow going into the intake manifold from the exhaust manifold through an orifice with a ECM controlled pintle. The ECM controls the pintle position using inputs from the Throttle Position (TP) and Manifold Absolute Pressure (MAP) sensors. The ECM then commands the EGR valve to operate when necessary by controlling an ignition signal through the ECM. This can be monitored on a Tech 2 as the Desired EGR Position.

The ECM monitors the results of its command through a feedback signal. By sending a 5 volt reference and a ground to the EGR valve, a voltage signal representing the EGR valve pintle position is sent to the ECM. This feedback signal can also be monitored on a Tech 2 and is the actual position of the EGR pintle. The Actual EGR position should always be near the commanded or Desired EGR Position.

If the ECM detects a large difference between the desired EGR position and actual EGR position, then Diagnostic Trouble Code P0404 will set. DTC P0404 is a type B code.

Conditions for Setting the DTC

- IAT is greater than 5°C (41°F).
- EGR commanded ON (Desired EGR Position is greater than 0%).
- Actual EGR Position differs from Desired EGR Position by more than 15% for 5 seconds.

Action Taken When the DTC Sets

- Malfunction Indicator Lamp (MIL) will illuminate the second time the fault is detected.
- The ECM will record operating conditions at the time the diagnostic fails.
- A history Diagnostic Trouble Code is stored.
- The EGR Valve is disabled.

Conditions for Clearing the MIL/DTC

- The MIL will turn OFF after three consecutive ignition cycles in which the diagnostic runs without a fault.
- Diagnostic Trouble Code(s) can be cleared by using a Tech 2.

Diagnostic Aids

Due to the moisture associated with exhaust systems, the EGR valve may freeze and stick in colder weather at times. After the vehicle is brought into a warm shop for repairs, the valve warms and the problem disappears. By watching the Actual EGR and Desired EGR Positions on a cold vehicle with a Tech 2, the fault can be verified easily. Check the freeze frame data to determine if the Diagnostic Trouble Code was set when the vehicle was cold by viewing the Engine Coolant Temperature (ECT).

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

1. The Powertrain OBD System Check prompts the technician to complete some basic checks and store the freeze frame and failure records data on the Tech 2 if applicable. This created an electronic copy of the data taken when the fault occurred. The information is then stored on the Tech 2 for later reference.
2. Commanding the EGR valve open determines whether the EGR system can control the EGR valve accurately and if the fault is present.
3. When the EGR valve electrical connector is disconnected, the Tech 2 should display the Actual EGR Position as 0%. If it does not, the fault lies either in the EGR signal circuit or the ECM.
4. A test light, when connected to ground, will glow dimly when the EGR valve is commanded to 25%, and brighter as the EGR valve is commanded to 100%. If the test light flashes, check the sensor ground for an open.
5. An open or poor connection condition may have caused this Diagnostic Trouble Code to set. Be sure to check the terminals for being backed out, improperly formed or damaged, and for poor tension.
7. The test light will have glowed brightly in the previous step if the EGR control circuit was shorted to B+ and the Actual EGR Position on the Tech 2 will display 100%. A test light that did not illuminate, indicates that the circuit may be open or shorted to ground.
9. If the EGR valve 5 volt reference is shorted to voltage, the DVM will read battery voltage and additional Diagnostic Trouble Codes may be set and engine performance will be poor.
13. Although the circuitry acted correctly when checked, a problem may still lie within the terminals which would not show up in probe type testing. Be sure to check the terminals for being backed out, improperly formed or damaged, and for poor tension.
17. All circuits to the EGR valve are OK at this point. The fault lies internally in the EGR valve and therefore must be replaced. Be sure all gasket material is removed from the EGR mounting surface. Even a small amount of material may cause a Diagnostic Trouble Code P0401 to set. For on vehicle service of the EGR Valve, refer to EGR Valve.
18. Check the terminals for being backed out, improperly formed or damaged, and for poor tension.
19. Clearing the Diagnostic Trouble Codes is a very important step for this diagnostic. The clearing function allows the EGR valve to relearn a new pintle position as the old position was inaccurate due to the malfunction that caused the Diagnostic Trouble Code. The Diagnostic Trouble Code must be cleared with the ignition switch ON, with the engine OFF or when the engine is idling. If the ECM sees a EGR command, the new pintle position will not be learned.

DTC P0404 EGR Circuit Range/Performance

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Turn the ignition switch ON, with the engine OFF. 2. Install a Tech 2. 3. Command the EGR valve to the specified values. Does the Actual EGR Position follow the Desired EGR Position?	25%, 50%, 75%, 100%	Go to Step 19	Go to Step 3
3	1. Turn the ignition switch ON, with the engine OFF. 2. Disconnect the EGR valve electrical connector. 3. With a test light connected to B+, probe the ground circuit to the EGR valve. Does the light illuminate?	—	Go to Step 4	Go to Step 5
4	1. Connect the test light to ground. 2. Probe the EGR control circuit to the EGR valve. 3. Command the EGR valve to the specified values using a Tech 2. As the command is raised, does the test light glow brighter, flash or maintain a steady glow?	25%, 50%, 75%, 100%	Go to Step 6	Go to Step 7
5	Repair the open or poor connection in the EGR ground circuit. Is the action complete?	—	Go to Step 19	—
6	With the test light still connected to ground, probe the signal circuit. Is the action complete?	—	Go to Step 8	Go to Step 9
7	With the test light still connected to ground, again probe the control circuit without commanding the EGR valve with the Tech 2. Does the test light illuminate?	—	Go to Step 10	Go to Step 11
8	Check the signal circuit for a short to voltage and repair as necessary. Was a repair necessary?	—	Go to Step 19	Go to Step 12
9	With a Digital Voltmeter (DVM) connected to ground, probe the 5 V reference circuit. Is the voltage measured near the specified value?	5 V	Go to Step 13	Go to Step 14
10	Check the control circuit for a short to voltage and repair as necessary. Was a repair necessary?	—	Go to Step 19	Go to Step 12
11	Connect the test light to B+ and again probe the control circuit. Does the light illuminate?	—	Go to Step 15	Go to Step 16
12	Replace the ECM. Is the action complete?	—	Go to Step 19	—

DTC P0404 EGR Circuit Range/Performance (Cont'd)

Step	Action	Value(s)	Yes	No
13	Check the EGR ground circuit for a poor connection or proper terminal tension at the ECM and repair as necessary. Was a repair necessary?	—	Go to Step 19	Go to Step 17
14	Check the 5 V reference circuit for a short to voltage and repair as necessary. Was a repair necessary?	—	Go to Step 19	Go to Step 12
15	Check the control circuit for a short to ground and repair as necessary? Was a repair necessary?	—	Go to Step 19	Go to Step 12
16	Check the control circuit for an open or poor connection at the EGR valve electrical connector and repair as necessary. Was a repair necessary?	—	Go to Step 19	Go to Step 18
17	Replace the EGR valve. Is the action complete?	—	Go to Step 19	—
18	Check the ECM electrical connector for a poor connection and repair as necessary. Was a repair necessary?	—	Go to Step 19	Go to Step 12
19	1. Using the Tech 2, clear Diagnostic Trouble Codes. 2. Start engine and idle at normal operating temperature. 3. Operate vehicle within the conditions for setting this Diagnostic Trouble Code as specified in the supporting text. Does the Tech 2 indicate that this diagnostic "Ran and Passed?"	—	Verify repair	Go to Step 2

DIAGNOSTIC TROUBLE CODE (DTC) P0405 EXHAUST GAS RECIRCULATION (EGR) SENSOR CIRCUIT LOW

Circuit Description

An Exhaust Gas Recirculation (EGR) system is used to lower Oxides of Nitrogen (NO_x) emission levels caused by high combustion temperatures. It accomplishes this by feeding small amounts of exhaust gases back into the combustion chamber. When the air/fuel mixture is diluted with the exhaust gases, combustion temperatures are reduced.

A linear EGR valve is used on this system. The linear EGR valve is designed to accurately supply exhaust gases to the engine without the use of intake manifold vacuum. The valve controls exhaust flow going into the intake manifold from the exhaust manifold through an orifice with a ECM controlled pintle. The ECM controls the pintle position using inputs from the Throttle Position (TP) and Manifold Absolute Pressure (MAP) sensors. The ECM then commands the EGR valve to operate when necessary by controlling an ignition signal through the ECM. This can be monitored on a Tech 2 as the Desired EGR Position.

The ECM monitors the results of its command through a feedback signal. By sending a 5 volt reference and a ground to the EGR valve, a voltage signal representing the EGR valve pintle position is sent to the ECM. This feedback signal can also be monitored on a Tech 2 and is the actual position of the EGR pintle. The Actual EGR Position should always be near the commanded or Desired EGR Position.

If the ECM detects a continuous short to ground in the signal circuit or the sensor, then Diagnostic Trouble Code P0405 will set. DTC P0405 is a type A code.

Conditions for Setting the DTC

- IAT is greater than 5°C (41°F).
- The ECM sees less than 0.10 voltage from the EGR valve sensor.
- A malfunction is present for 10 seconds.

Action Taken When the DTC Sets

- The Malfunction Indicator Lamp (MIL) will illuminate the first time the malfunction is detected.
- The ECM will record operating conditions at the time the diagnostic fails.
- A history Diagnostic Trouble Code is stored.
- The EGR Valve is disabled.

Conditions for Clearing the MIL/DTC

- The MIL will turn OFF after three consecutive ignition cycles in which the diagnostic runs without a fault.
- A history Diagnostic Trouble Code will clear after 40 consecutive warm up cycles without a fault.
- Diagnostic Trouble Codes can be cleared by using the Tech 2.

Diagnostic Aids

Due to the moisture associated with exhaust systems, the EGR valve may freeze and stick in colder weather at times. After the vehicle is brought into a warm shop for repairs, the valve warms and the problem disappears. By watching the Actual EGR and Desired EGR Positions on a cold vehicle with a Tech 2, the fault can be verified easily. Check the freeze frame data to determine if the Diagnostic Trouble Code set when the vehicle was cold by viewing the Engine Coolant Temperature (EGR).

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

1. The Powertrain OBD System Check prompts the technician to complete some basic checks and store the freeze frame and failure records data on the Tech 2 if applicable. This creates an electronic copy of the data taken when the fault occurred. The information is then stored on the Tech 2 for later reference.
2. Commanding the EGR valve open determines whether the EGR system can control the EGR valve accurately and if the fault is present.
3. If the EGR valve 5 volt reference is shorted to ground, the DVM will read no voltage and an additional Diagnostic Trouble Code will be set and engine performance will be poor. When this circuit is open, only a Diagnostic Trouble Code P0405 will be set.
4. Jumping the 5 volt reference circuit to the signal circuit checks the signal circuit and ECM. The Tech 2 should display the Actual EGR Position as 100% if the signal circuit and ECM are OK.
6. Although the ECM and circuitry acted correctly in the previous step, a problem may still lie within the terminals which would not show up in probe type testing. Check the terminals for being backed out, improperly formed or damaged, and for poor tension.
10. All circuits to the EGR valve are OK at this point. The fault lies internally in the EGR valve and therefore must be replaced. Be sure all gasket material is removed from the EGR mounting surface. Even a small amount of material may cause a Diagnostic Trouble Code P0405 to set. Refer the EGR Valve for on vehicle service of the EGR valve.
14. Check the terminals for being backed out, improperly formed or damaged, and for poor tension.

DTC P0405 – EGR Sensor Circuit Low

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Turn the ignition switch ON, with the engine OFF. 2. Install a Tech 2. 3. Command the EGR valve to the specified values. Does the Actual EGR Position follow the Desired EGR Position?	25%, 50%, 75%, 100%	Go to Step 15	Go to Step 3
3	1. Turn the ignition switch ON, with the engine OFF. 2. Disconnect the EGR valve electrical connector. 3. With a Digital Voltmeter (DVM) connected to ground, probe the 5 V reference circuit to the EGR valve. Does the DVM read near the specified value?	5 V	Go to Step 4	Go to Step 5
4	Jumper the EGR valve 5 volt reference circuit to the signal circuit. Does the Actual EGR Position display the specified value?	100%	Go to Step 6	Go to Step 7
5	1. Connect the test light to B+. 2. Probe the 5 V reference circuit to the EGR valve. Does the test light illuminate?	—	Go to Step 8	Go to Step 9

DTC P0405 – EGR Sensor Circuit Low (Cont'd)

Step	Action	Value(s)	Yes	No
6	Check the 5 V reference and signal circuit's for a poor connection or proper terminal tension and repair as necessary. Was a repair necessary?	—	Go to Step 15	Go to Step 10
7	1. Connect the test light to B+. 2. Probe the signal circuit to the EGR valve. Does the light illuminate?	—	Go to Step 11	Go to Step 12
8	Check for a short to ground in the EGR valve 5 V reference circuit and repair as necessary. Was a repair necessary?	—	Go to Step 15	Go to Step 13
9	Check for an open in the EGR valve 5 V reference circuit and repair as necessary. Was a repair necessary?	—	Go to Step 15	Go to Step 14
10	Replace the EGR valve. Is the action complete?	—	Go to Step 15	—
11	Check for a short to ground in the EGR valve signal circuit and repair as necessary. Was a repair necessary?	—	Go to Step 15	Go to Step 13
12	Check for an open in the EGR valve signal circuit and repair as necessary. Was a repair necessary?	—	Go to Step 15	Go to Step 14
13	Replace the ECM. Is the action complete?	—	Go to Step 15	—
14	Check the affected circuit for a poor connection or proper terminal at the ECM and repair as necessary. Was a repair necessary?	—	Go to Step 15	Go to Step 13
15	1. Using the Tech 2, clear the Diagnostic Trouble Codes. 2. Start engine and idle at normal operating temperature. 3. Operate vehicle within the conditions for setting this Diagnostic Trouble Code as specified in the supporting text. Does the Tech 2 indicate that this diagnostic ran and passed?	—	Verify repair	Go to Step 2

DIAGNOSTIC TROUBLE CODE (DTC) P0406 EXHAUST GAS RECIRCULATION (EGR) SENSOR CIRCUIT HIGH

D06RX113

Circuit Description

An Exhaust Gas Recirculation (EGR) system is used to lower Oxides of Nitrogen (NO_x) emission levels caused by high combustion temperatures. It accomplishes this by feeding small amounts of exhaust gases back into the combustion chamber. When the air/fuel mixture is diluted with the exhaust gases, combustion temperatures are reduced.

A linear EGR valve is used on this system. The linear EGR valve is designed to accurately supply exhaust gases to the engine without the use of intake manifold vacuum. The valve controls exhaust flow going into the intake manifold from the exhaust manifold through an orifice with a ECM controlled pintle. The ECM controls the pintle position using inputs from the Throttle Position (TP) and Manifold Absolute Pressure (MAP) sensors. The ECM then commands the EGR valve to operate when necessary by controlling an ignition signal through the ECM. This can be monitored on a Tech 2 as the Desired EGR Position.

The ECM monitors the results of its command through a feedback signal. By sending a 5 volt reference and a ground to the EGR valve, a voltage signal representing the EGR valve pintle position is sent to the ECM. This feedback signal can also be monitored on a Tech 2 and is the actual position of the EGR pintle. The Actual EGR Position should always be near the commanded or Desired EGR Position.

If the ECM detects a continuous short to ground in the signal circuit or the sensor, then DTC P0406 will set. Diagnostic Trouble Code P0406 is a type A code.

Conditions for Setting the DTC

- IAT is greater than 5°C (41°F).
- The ECM sees less than 0.10 voltage from the EGR valve sensor.
- A malfunction is present for 10 seconds.

Action Taken When the DTC Sets

- The Malfunction Indicator Lamp (MIL) will illuminate.
- The ECM will record operating conditions at the time the diagnostic fails.
- A history Diagnostic Trouble Code is stored.
- The EGR Valve is disabled.

Conditions for Clearing the MIL/DTC

- The MIL will turn OFF after three consecutive ignition cycles in which the diagnostic runs without a fault.
- A history Diagnostic Trouble Code will clear after 40 consecutive warm-up cycles without a fault.
- Diagnostic Trouble Code(s) can be cleared by using the Tech 2.

Diagnostic Aids

Due to the moisture associated with exhaust systems, the EGR valve may freeze and stick in colder weather at

times. After the vehicle is brought into a warm shop for repairs, the valve warms and the problem disappears. By watching the Actual EGR and Desired EGR Positions on a cold vehicle with a Tech 2, the fault can be verified

easily. Check the freeze frame data to determine if the Diagnostic Trouble Code set when the vehicle was cold by viewing the Engine Coolant Temperature (EGR).

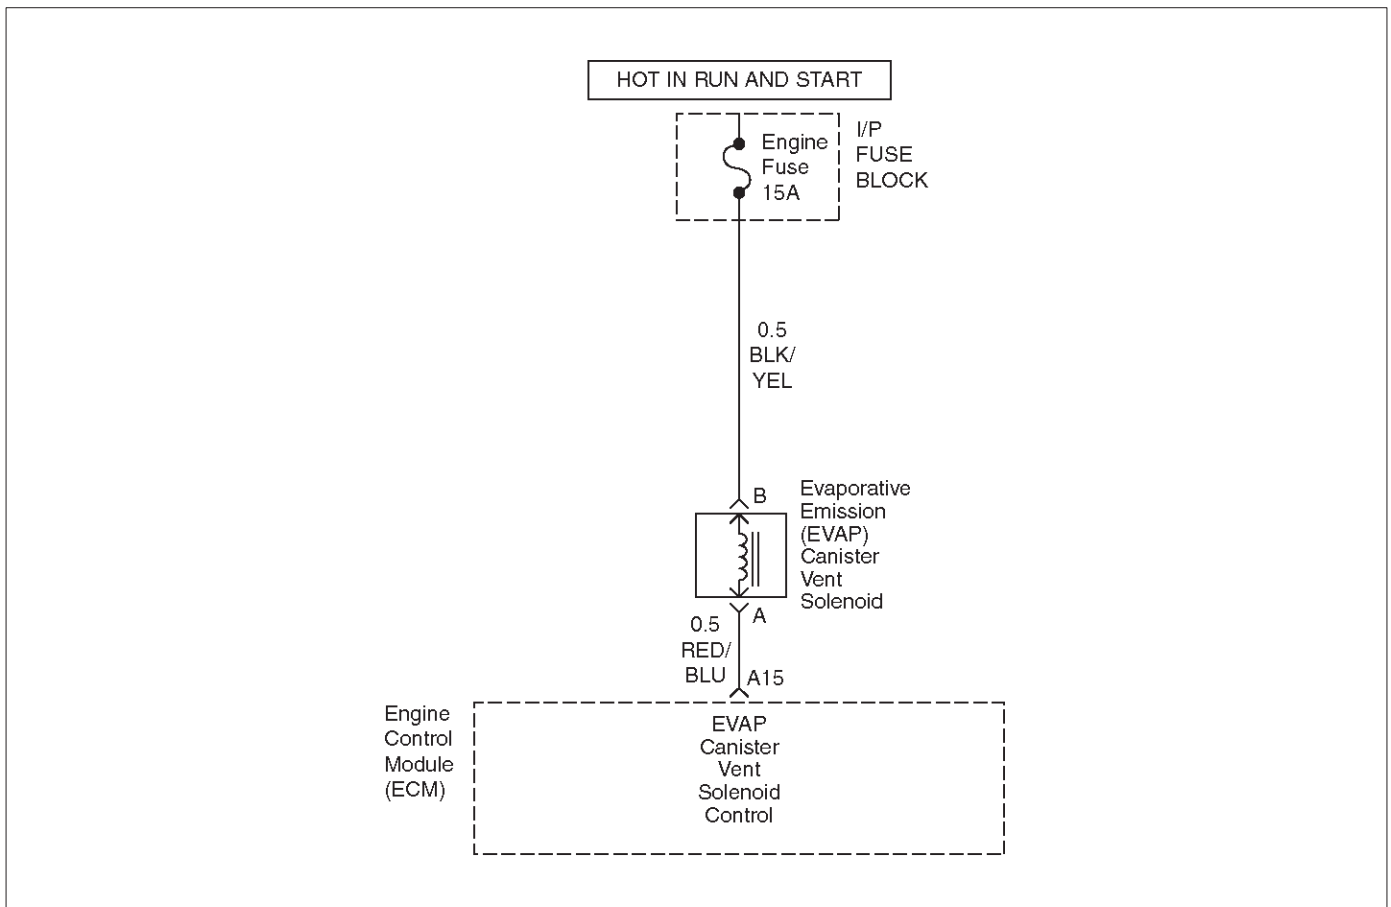

DTC P0406 EGR Sensor Circuit High

Step	Action	Value(s)	Yes	No
1	Was the Powertrain "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Turn the ignition switch ON, with the engine OFF. 2. Review and record Tech 2 Failure Records data, then clear the DTC's. 3. Operate the vehicle within the Failure Records conditions as noted. 4. Using the Tech 2, monitor "DTC" info for DTC P0406. Does the Tech 2 indicate DTC P0406 "Ran and Passed?"	—	Refer to Diagnostic Aids	Go to Step 3
3	1. Ignition OFF. 2. Disconnect the Linear Exhaust Gas Recirculation (EGR) Valve from the wiring harness. 3. Ignition ON, Engine OFF. 4. Using a Digital Voltmeter (DVM), check for voltage on the ignition feed circuit at the Linear Exhaust Gas Recirculation (EGR) Valve wiring harness connector. Does the DVM read the following value?	12 Volts	Go to Step 6	Go to Step 4
4	Check the ignition feed circuit, between the EGR sensor and the "Engine IG." fuse, for the following conditions: <ul style="list-style-type: none"> ● An open circuit ● A short to ground Was the problem found?	—	Verify repair	—
5	Using a DVM, check the resistance of the EGR solenoid. Does the DVM read the following value?	less than 5 Ω	Go to Step 6	Go to Step 14
6	Check the EGR solenoid valve Low circuit, between the EGR sensor and the ECM, for the following conditions: <ul style="list-style-type: none"> ● An open circuit ● A short to ground ● A short to voltage Was the problem found?	—	Verify repair	Go to Step 15
7	1. Ignition OFF. 2. Disconnect the Linear Gas Recirculation (EGR) Valve from the wiring harness. 3. Ignition ON, Engine OFF. 4. Observe the EGR value on the Tech 2. Does the Tech 2 display the following value(s)?	0 Volts 0%	Go to Step 9	Go to Step 8

DTC P0406 EGR Sensor Circuit High (Cont'd)

Step	Action	Value(s)	Yes	No
8	Check the EGR position feedback circuit, between the EGR sensor and the ECM, for the following conditions: <ul style="list-style-type: none"> • An open circuit • A short to ground • A short to voltage Was the problem found?	—	Verify repair	Go to Step 15
9	1. Ignition ON, Engine OFF. 2. Using a Digital Voltmeter (DVM), check for voltage on the 5 volt Reference signal circuit at the Linear Exhaust Gas Recirculation (EGR) Valve wiring harness connector. Does the DVM read the following value?	about 5 volts	Go to Step 11	Go to Step 10
10	Check the 5 volt Reference signal circuit, between the EGR and the ECM, for the following conditions: <ul style="list-style-type: none"> • An open circuit • A short to ground • A short to voltage Was the problem found?	—	Verify repair	Go to Step 11
11	1. Ignition OFF. 2. Place a DVM between the 5 volt Reference signal circuit and the 5 volt signal return (ground) circuit at the EGR wiring harness connector. 3. Ignition ON, Engine OFF. Does the DVM read the following value?	about 5 volts	Go to Step 13	Go to Step 12
12	Check the 5 volt signal return (ground) circuit, between the EGR and the ECM, for the following conditions: <ul style="list-style-type: none"> • An open circuit • A short to ground • A short to voltage Was the problem found?	—	Verify repair	Go to Step 15
13	1. Ignition OFF. 2. Place a fused jumper wire between the 5 volt Reference signal circuit and the EGR valve position feedback circuit at the EGR wiring harness connector. 3. Ignition ON, Engine OFF. 4. Observe the EGR value on the Tech 2. Does the Tech 2 display the following value(s)?	5 volts 100%	Go to Step 14	Go to Step 15
14	Replace the Linear Exhaust Gas Recirculation (EGR) Valve. Verify Repair.	—	—	—
15	Replace the ECM. Verify repair.	—	—	—

DIAGNOSTIC TROUBLE CODE (DTC) P0443 EVAPORATIVE EMISSION (EVAP) CONTROL SYSTEM PURGE CONTROL VALVE CIRCUIT MALFUNCTION

D06RX115

Circuit Description

The Engine Control Module (ECM) controls the Evaporative Emission (EVAP) Canister Purge Solenoid Valve through the use of a control (ground) circuit. If the ECM commands the Purge solenoid to maximum duty cycle (100%) but the voltage remains High (12 Volts); or, if the ECM commands the Purge solenoid to minimum duty cycle (0%) but the voltage remains Low (0 volts), then DTC P0443 will set. DTC P0443 is a type A code.

Conditions for Setting the DTC

- Ignition voltage is greater than 10 volts
 - Engine run time is greater than 32 seconds
- The above mentioned conditions are met and one of the following two conditions are met for 25 seconds within a 50 seconds test sample:
- ECM senses voltage is High with the EVAP Canister Purge Solenoid commanded ON.
 - ECM senses voltage is Low with the EVAP Canister Purge Solenoid commanded OFF.

Action Taken When the DTC Sets

- The ECM will illuminate the Malfunction Indicator Lamp (MIL) the first time the fault is detected.
- The ECM will store the conditions that were present when the DTC was set as Freeze Frame and in Failure Records.

Conditions for Clearing the MIL/DTC

- The ECM will turn OFF the MIL after three consecutive trips without a reported failure.
- A History DTC will clear after 40 consecutive trips without a reported failure.
- The DTC can be cleared using the Scan Tool's "Clear Info" function.

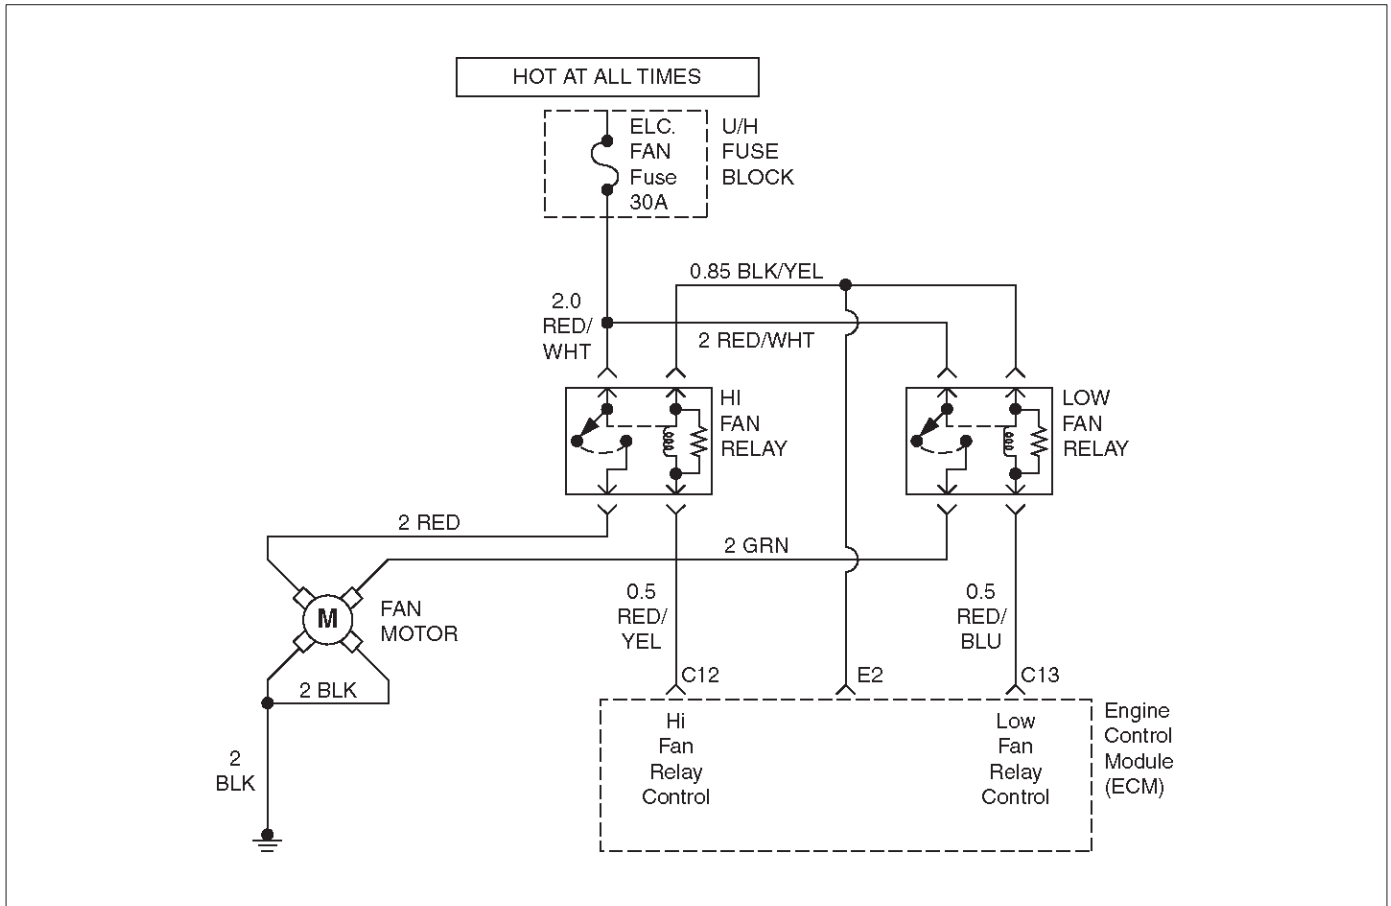

Diagnostic Aids

- Poor connections, or a damaged harness – Inspect the harness connectors for: backed-out terminals, improper mating or damaged terminals. Also check for open circuits, shorts to ground, and shorts to voltage.

DTC P0443 EVAP Control System Purge Control Valve Circuit Malfunction

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	1. Ignition ON, Engine OFF. 2. Review and record Tech 2 Failure Records data, then clear the DTC's. 3. Operate the vehicle within the Failure Records conditions as noted. 4. Using the Tech 2, monitor "DTC" info for DTC P0443. Does the Tech 2 indicate DTC P0443 "Ran and Passed?"	—	Refer to Diagnostic Aids	Go to Step 3
3	1. Ignition OFF. 2. Disconnect the EVAP Canister Purge Solenoid from the wiring harness connector from the EVAP Canister Purge Solenoid. 3. Ignition ON, Engine OFF. 4. Using a Digital Voltmeter (DVM), check for voltage on the "Engine IG." Fuse pin of the EVAP Canister Purge Solenoid wiring harness connector. Does the DVM read the following value?	12 Volts	Go to Step 5	Go to Step 4
4	Check the suspect circuit between the EVAP Canister Purge Solenoid connector and the "Engine IG." Fuse for the following conditions: <ul style="list-style-type: none"> ● A short to ground ● An open circuit ● A short to voltage Was the problem found?	—	Verify repair	—
5	Using a DVM, check the resistance of the EVAP Canister Purge Solenoid. Does the DVM read the following value?	less than 5 Ω	Go to Step 6	Go to Step 7
6	1. Ignition OFF. 2. Disconnect the Engine Control Module (ECM) connectors from the ECM. 3. Check the EVAP Canister Purge Solenoid control circuit between the ECM and EVAP Canister Purge Solenoid for the following conditions: <ul style="list-style-type: none"> ● A short to ground ● An open circuit ● A short to voltage Was the problem found?	—	Verify repair	Go to Step 8
7	Replace the EVAP Canister Purge Solenoid. Verify Repair.	—	—	—
8	Replace the ECM.	—	—	—

DIAGNOSTIC TROUBLE CODE (DTC) P0480 COOLING FAN 1 CONTROL CIRCUIT MALFUNCTION

060RX090

Circuit Description

The Engine Control Module (ECM) controls the engagement of the cooling fan Low speed through the use of a relay and a control circuit. If the ECM commands the fan to Low speed and then senses that the fan did not turn ON, or if the ECM commands the fan OFF from Low speed and then senses that the fan did not turn OFF, the ECM will set a DTC P0480. DTC P0480 is a type D code.

Conditions for Setting the DTC

- Ignition voltage is greater than 10 volts.
 - Engine run time is greater than 32 seconds.
- The above conditions are met and one of the following conditions are met for 25 seconds within a 50 second test sample:
- ECM sensed voltage is High with the Low Speed Fan OFF.
- OR
- ECM sensed voltage is Low with the Low Speed Fan ON.

Action Taken When the DTC Sets

- The ECM will not turn on the Malfunction Indicator Lamp.
- The ECM will store the conditions that were present when the DTC was set as Freeze Frame and in Failure Records.

Conditions for Clearing the DTC

- A history DTC will clear after 40 consecutive trips without a reported failure.
- The DTC can be cleared using the Scan Tool's Clear Info" function.

Diagnostic Aids

- Poor connections or a damaged harness – Inspect the harness connectors for: backed out terminals, improper mating or damaged terminals. Also check for open circuits, shorts to ground, and shorts to voltage.

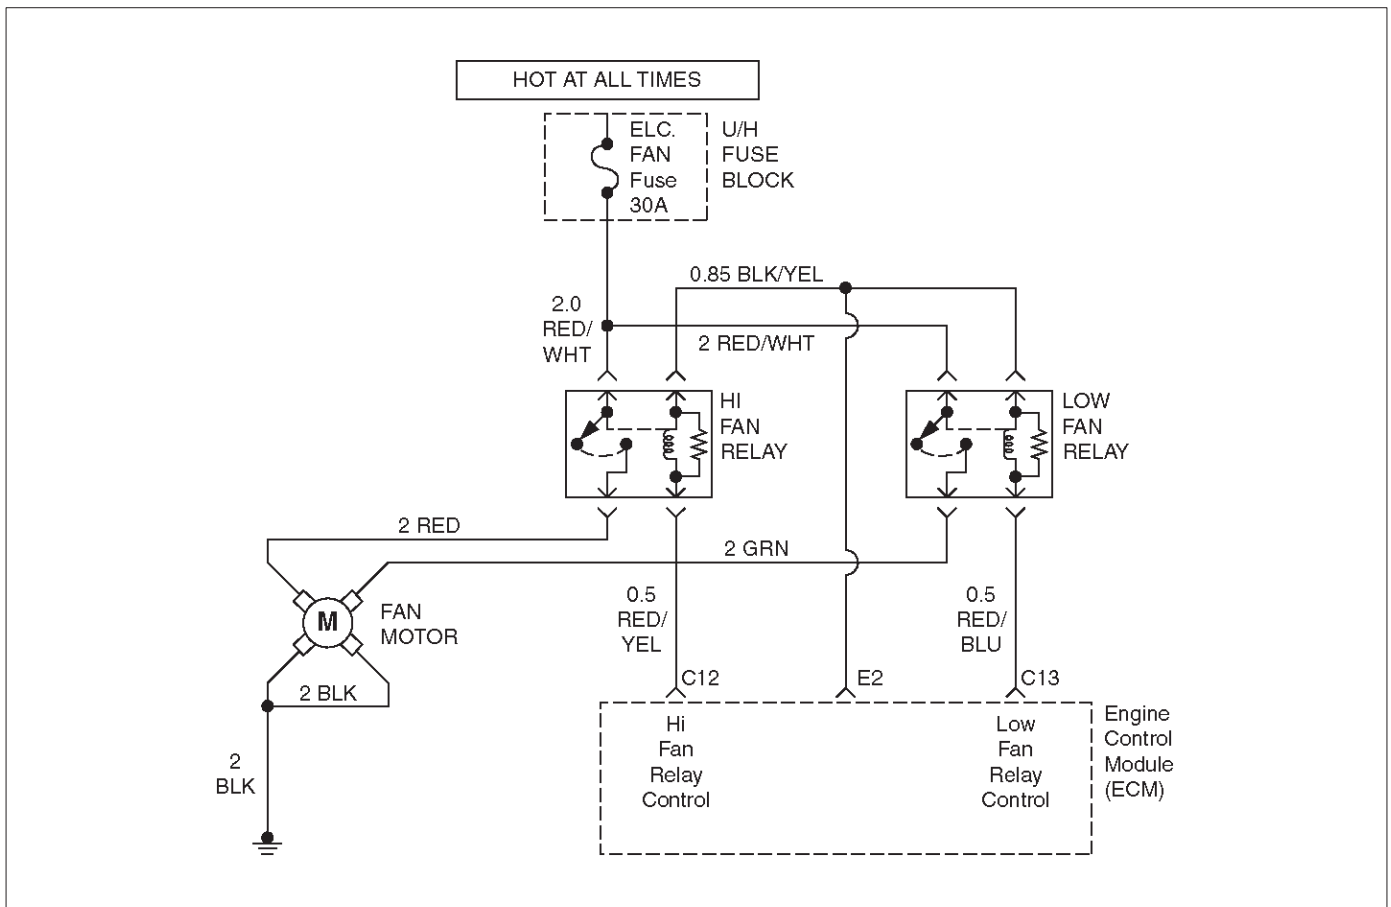

DTC P0480 Cooling Fan 1 Control Circuit Malfunction

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	1. Ignition ON, Engine OFF. 2. Review and record Tech 2 Failure Records data, then clear the DTCs. 3. Operate the vehicle within the Failure Records conditions as noted. 4. Using the Tech 2, monitor "DTC" info for DTC P0480. Does the Tech 2 indicate that DTC P0480 "Ran and Passed?"	—	Refer to Diagnostic Aids	Go to Step 3
3	1. Ignition OFF. 2. Remove the Low Fan Relay from the Underhood Electrical Center. 3. Ignition OFF. 4. Using a Digital Voltmeter (DVM), check for voltage on the "ELEC. FAN" Fuse pin of the Low fan Relay connector. Does the DVM read the following value?	12 Volts	Go to Step 4	Go to Step 3
4	1. Ignition ON. 2. Using a DVM, check for voltage on the "ENGINE FAN" Fuse pin of the Low Fan Relay connector. Does the DVM read the following value?	12 Volts	Go to Step 6	Go to Step 5
5	Check the suspect circuit between the Low Fan Relay connector and Fuse for the following conditions: <ul style="list-style-type: none"> ● A short to ground ● An open circuit ● A short to voltage Was the problem found?	—	Verify repair	—
6	1. Ignition OFF. 2. Disconnect the Engine Control Module (ECM) connectors from the ECM. 3. Check the Low Fan Relay control circuit between the ECM and Underhood Electrical Center for the following conditions: <ul style="list-style-type: none"> ● A short to ground ● An open circuit ● A short to voltage Was the problem found?	—	Verify repair	Go to Step 7
7	1. Reinstall the Low Fan Relay. 2. Using a fused jumper, ground the Low Fan Relay control circuit at the ECM connector. 3. Ignition ON, Engine OFF. Does the fan run at low speed?	—	Go to Step 9	Go to Step 8

DTC P0480 Cooling Fan 1 Control Circuit Malfunction (Cont'd)

Step	Action	Value(s)	Yes	No
8	Replace the Low Fan Relay. Is the action complete?	—	Verify repair	—
9	Replace the ECM. Verify repair.	—	—	—

DIAGNOSTIC TROUBLE CODE (DTC) P0481 COOLING FAN 2 CONTROL CIRCUIT MALFUNCTION

060RX090

Circuit Description

The Engine Control Module (ECM) controls the engagement of the cooling fan Low speed through the use of a relay and a control circuit. If the ECM commands the fan to Low speed and then senses that the fan did not turn ON, or if the ECM commands the fan OFF from Low speed and then senses that the fan did not turn OFF, the ECM will set a DTC P0481. DTC P0481 is a type D code.

Conditions for Setting the DTC

- Ignition voltage is greater than 10 volts.
 - Engine run time is greater than 32 seconds.
- The above conditions are met and one of the following conditions are met for 25 seconds within a 50 second test sample:
- ECM sensed voltage is High with the High Speed Fan OFF.
- OR
- ECM sensed voltage is High with the High Speed Fan ON.

Action Taken When the DTC Sets

- The ECM will not turn on the Malfunction Indicator Lamp.
- The ECM will store the conditions that were present when the DTC was set as Freeze Frame and in Failure Records.

Conditions for Clearing the DTC

- A history DTC will clear after 40 consecutive trips without a reported failure.
- The DTC can be cleared using the Scan Tool's "Clear Info" function.

Diagnostic Aids

- Poor connections or a damaged harness – Inspect the harness connectors for: backed out terminals, improper mating or damaged terminals. Also check for open circuits, shorts to ground, and shorts to voltage.

DTC P0481 Cooling Fan 2 Control Circuit Malfunction

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	1. Ignition ON, Engine OFF. 2. Review and record Tech 2 Failure Records data, then clear the DTCs. 3. Operate the vehicle within the Failure Records conditions as noted. 4. Using the Tech 2, monitor "DTC" info for DTC P0480. Does the Tech 2 indicate that DTC P0480 "Ran and Passed?"	—	Refer to Diagnostic Aids	Go to Step 3
3	1. Ignition OFF. 2. Remove the Low Fan Relay from the Underhood Electrical Center. 3. Ignition OFF. 4. Using a Digital Voltmeter (DVM), check for voltage on the "ELEC. FAN" Fuse pin of the Low fan Relay connector. Does the DVM read the following value?	12 Volts	Go to Step 4	Go to Step 3
4	1. Ignition ON. 2. Using a DVM, check for voltage on the "ENGINE FAN" Fuse pin of the Low Fan Relay connector. Does the DVM read the following value?	12 Volts	Go to Step 6	Go to Step 5
5	Check the suspect circuit between the Low Fan Relay connector and Fuse for the following conditions: <ul style="list-style-type: none"> ● A short to ground ● An open circuit ● A short to voltage Was the problem found?	—	Verify repair	—
6	1. Ignition OFF. 2. Disconnect the Engine Control Module (ECM) connectors from the ECM. 3. Check the Low Fan Relay control circuit between the ECM and Underhood Electrical Center for the following conditions: <ul style="list-style-type: none"> ● A short to ground ● An open circuit ● A short to voltage Was the problem found?	—	Verify repair	Go to Step 7
7	1. Reinstall the High Fan Relay. 2. Using a fused jumper, ground the High Fan Relay control circuit at the ECM connector. 3. Ignition ON, Engine OFF. Does the fan run at High speed?	—	Go to Step 9	Go to Step 8

DTC P0481 Cooling Fan 2 Control Circuit Malfunction (Cont'd)

Step	Action	Value(s)	Yes	No
8	Replace the High Fan Relay. Is the action complete?	—	Verify repair	—
9	Replace the ECM. Verify repair.	—	—	—

DIAGNOSTIC TROUBLE CODE (DTC) P0502 VEHICLE SPEED SENSOR (VSS) CIRCUIT LOW INPUT

D06RX125

Circuit Description

The vehicle speed sensor has a magnet rotated by the transmission output shaft. Attached to the sensor is a hall effect circuit that interacts with the magnetic field created by the rotating magnet. A 12-volt operating supply for the speed sensor hall circuit is supplied from the meter fuse. The VSS pulses to ground the 5-volt signal sent from the engine control module (ECM) on the reference circuit. The ECM interprets vehicle speed by the number of pulses to ground per second on the reference circuit. DTC P0502 is a type B code.

Conditions for Setting the DTC

- Engine is running.
- Engine coolant temperature is above 60°C (140°F).
- System voltage is between 10 and 16 volts.

When the above conditions are met, one of the following tests will run:

Decel Test

- MAP is less than 35 kPa.
 - Throttle Position is less than 0.8%.
 - Engine Speed is between 1500 RPM and 3500 RPM.
- The Decel Test will fail if vehicle speed is less than 8 km/h (5mph).

The Decel Test will pass if vehicle speed is greater than 24 km/h (15mph).

Power Test

- MAP is greater than 50 kPa.
 - Throttle Position is between 25% and 70%.
 - Engine Speed is between 2700 RPM and 4400 RPM.
- The Power Test will fail if vehicle speed is less than 8 km/h (5 mph).

The Power Test will pass if vehicle speed is greater than 8km/h (5mph) without any VSS DTC's present, or if vehicle speed is greater than 49 km/h (30mph) with VSS Diagnostic Trouble Codes present.

Action Taken When the DTC Sets

- The ECM will illuminate the malfunction indicator lamp (MIL) the second time the fault is detected.
- Base shift logic on RPM only.
- The ECM will store conditions which were present when the Diagnostic Trouble Code was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The ECM will turn the MIL OFF on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history Diagnostic Trouble Code P0502 will clear after 40 consecutive warm-up cycles have occurred without a fault.

6E1-194 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

- Diagnostic Trouble Code P0502 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

- Poor connection at ECM: Inspect harness connectors for backed out terminals, improper mating, broken

locks, improperly formed or damaged terminals, and poor terminal to wire connection.

- Damaged harness: Inspect the wiring harness to the EVAP vent solenoid, the EVAP purge solenoid, and the fuel tank pressure sensor for an intermittent open or intermittent short circuit.

DTC P0502 – VSS Circuit Low Input

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	1. Ignition OFF. 2. Disconnect the VSS connector. 3. Using a test light to battery +, probe the connector ground wire. Did the light illuminate?	—	Go to Step 4	Go to Step 3
3	Repair the open in the sensor ground circuit.	—	Verify repair	—
4	1. Ignition ON, sensor disconnected. 2. Using a Digital Voltmeter (DVM), measure at the VSS connector between ground and voltage supply. Was the measurement near the specified value?	Battery voltage	Go to Step 6	Go to Step 5
5	Repair the open or short to ground in the VSS sensor circuit.	—	Verify repair	—
6	1. Ignition OFF. 2. Check the BLU/BLK wire between the VSS sensor connector and the ECM for the following conditions: <ul style="list-style-type: none"> An open circuit A short to ground Was the faulty condition located?	—	Verify repair	Go to Step 9
7	Using a DVM, measure the resistance between the VSS sensor body and transmission case (ground). Is the resistance above the specified value?	10 K Ω	Verify repair	Go to Step 9
8	1. Remove the VSS from the transmission case. 2. Visually inspect the VSS for damage. Does the VSS appear to be OK?	—	Verify repair	—
9	Replace the VSS.	—	Verify repair	—
10	Replace the ECM. Is the action complete?	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0506 IDLE CONTROL SYSTEM RPM LOWER THAN EXPECTED

D06RX112

Circuit Description

The engine control module (ECM) controls engine idle speed by adjusting the position of the idle air control (IAC) motor pintle. The IAC is a bi-directional stepper motor driven by two coils. The ECM applies current to the IAC coils in steps (counts) to extend the IAC pintle into a passage in the throttle body to decrease air flow. The ECM reverses the current to retract the pintle, increasing air flow. This method allows highly accurate control of idle speed and quick response to changes in engine load. If the ECM detects a condition where too low of an idle speed is present and the ECM is unable to adjust idle speed by increasing the IAC counts, DTC P0506 will set, indicating a problem with the idle control system. DTC P0506 is a type B code.

Conditions for Setting the DTC

- No intrusive tests being run.
- Engine run time is more than 125 seconds.
- No TPS, VSS, ECT, EGR, MAP, IAT, low voltage, fuel system or canister purge Diagnostic Trouble Codes are set.
- Barometric pressure is greater than 72.7 kPa.
- Canister purge duty cycle is above 0%.
- Engine coolant temperature (ECT) is above 50°C (122°F).
- Intake air temperature above -40°C (-40°F).

- MAP is less than 60 kPa.
- Ignition voltage is between 9.5 volts and 16 volts.
- The throttle is closed.
- All conditions are met for 10 seconds.
- Engine speed is at least 100 RPM lower than desired idle, based upon ECM expectations.

Action Taken When the DTC Sets

- The ECM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The ECM will store conditions which were present when the Diagnostic Trouble Code was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- Diagnostic Trouble Code P0506 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at ECM or IAC motor – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.

6E1-196 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

- Damaged harness – Inspect the wiring harness for damage; shorts to ground, shorts to battery positive, and open circuits.
- Restricted air intake system – Check for a possible collapsed air intake duct, restricted air filter element, or foreign objects blocking the air intake system.
- Throttle body – Check for objects blocking the IAC passage or throttle bore, excessive deposits in the IAC passage and on the IAC pintle, and excessive deposits in the throttle bore and on the throttle plate.
- Large vacuum leak – Check for a condition that causes a large vacuum leak, such as an incorrectly installed or faulty PCV valve or brake booster hose disconnected. Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the Diagnostic Trouble Code to be set occurs. This may assist in diagnosing the condition.

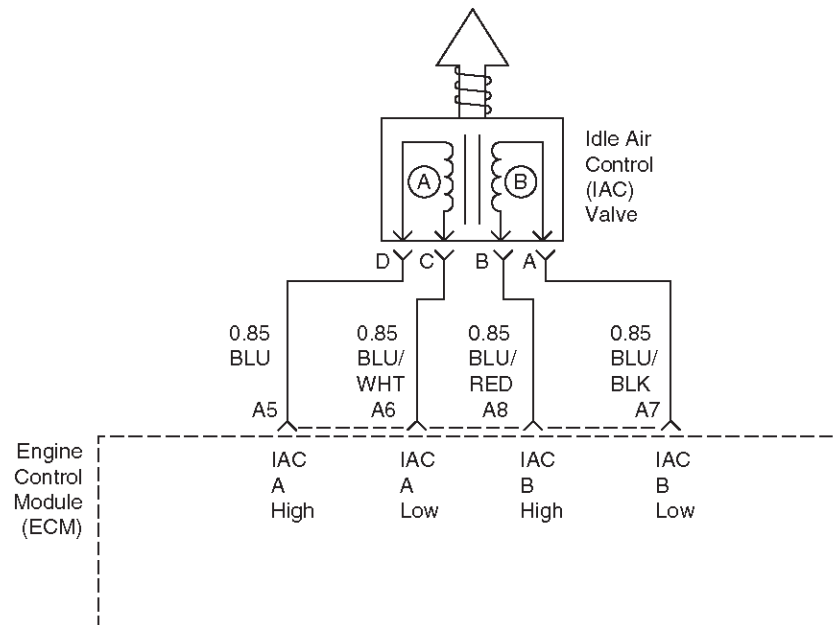

DTC P0506 – Idle Control System RPM Lower Than Expected

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	Are any other Diagnostic Trouble Codes set?	—	Go to other Diagnostic Trouble Code first	Go to Step 3
3	1. Start the engine. 2. Turn all accessories OFF (A/C, rear defroster, etc.) 3. Using a Tech 2, command RPM up to 1500, down to 500, and then up to 1500 while monitoring "Engine Speed" on the Tech 2. Does the "Engine Speed" remain within the specified value of "Desired Idle" for each RPM command?	+/-50 RPM	No trouble found. Go to Diagnostic Aids	Go to Step 4
4	1. Check the following circuits for an open, short to voltage, short to ground, or poor connection at the PCM: <ul style="list-style-type: none"> • IAC "A" low • IAC "A" high • IAC "B" low • IAC "B" high 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 5
5	Visually/physically inspect for the following conditions: <ul style="list-style-type: none"> • Throttle body tampering (adjustment screw plug removed). • Restricted air intake system. Check for a possible collapsed air intake duct, restricted air filter element, or foreign objects blocking the air intake system. • Throttle body. Check for objects blocking the IAC passage or throttle bore, excessive deposits in the IAC passage and on the IAC pintle, and excessive deposits in the throttle bore and on the throttle plate. Do any of the above require a repair?	—	Refer to appropriate section for on-vehicle service	Go to Step 6
6	1. Check for a poor connection at the IAC harness connector. 2. If a problem is found, replace faulty terminals as necessary. Was a problem found?	—	Verify repair	Go to Step 7

DTC P0506 – Idle Control System RPM Lower Than Expected (Cont'd)

Step	Action	Value(s)	Yes	No
7	Using a Digital Voltmeter (DVM), check the IAC valve solenoids (A and B) for the following conditions: <ul style="list-style-type: none"> ● An open circuit ● A short to ground (the IAC body) ● A short together Was the problem found?	—	Go to Step 8	Go to Step 9
8	Replace the IAC valve. Is the action complete?	—	Verify repair	—
9	Replace the ECM. Is the action complete?	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0507 IDLE CONTROL SYSTEM RPM HIGHER THAN EXPECTED

D06RX112

Circuit Description

The engine control module (ECM) controls engine idle speed by adjusting the position of the idle air control (IAC) motor pintle. The IAC is a bi-directional stepper motor driven by two coils. The ECM applies current to the IAC coils in steps (counts) to extend the IAC pintle into a passage in the throttle body to decrease air flow. The ECM reverses the current to retract the pintle, increasing air flow. This method allows highly accurate control of idle speed and quick response to changes in engine load. If the ECM detects a condition where too high of an idle speed is present and the ECM is unable to adjust idle speed by increasing the IAC counts, Diagnostic Trouble Code P0507 will set, indicating a problem with the idle control system. DTC P0507 is a type B code.

Conditions for Setting the DTC

- No intrusive tests being run.
- Engine run time is more than 125 seconds.
- No TPS, VSS, ECT, EGR, MAP, IAT, low voltage, fuel system or canister purge DTCs are set.
- Barometric pressure is greater than 72.7 kPa.
- Canister purge duty cycle is above 0%.
- Intake air temperature above -40°C (-40°F).
- Engine coolant temperature (ECT) is above 50°C (122°F).
- Ignition voltage is between 9.5 volts and 16 volts.
- The throttle is closed.

- All conditions are met for 10 seconds.
- MAP is less than 60 kPa.
- Engine speed is at least 200 RPM lower than desired idle, based upon PCM's expectations.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history Diagnostic Trouble Code P0507 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code P0507 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM or IAC motor – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.

- Damaged harness – Inspect the wiring harness for damage; shorts to ground, shorts to battery positive, and open circuits.
- Vacuum leak – Check for a condition that causes a vacuum leak, such as disconnected or damaged hoses, leaks at EGR valve and EGR pipe to intake manifold, leak at the throttle body, a faulty or incorrectly installed PCV valve, leaks at the intake manifold, etc.
- Throttle body – Check for sticking throttle plate. Also inspect the IAC passage for deposits or objects which

will not allow the IAC pintle to fully extend or properly seat.

If Diagnostic Trouble Code P0507 cannot be duplicated, reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the Diagnostic Trouble Code to be set occurs. This may assist in diagnosing the condition.

DTC P0507 – Idle Control System RPM Higher Than Expected

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	Are any other Diagnostic Trouble Codes set?	—	Go to other Diagnostic Trouble Code first	Go to Step 3
3	1. Start the engine. 2. Turn all accessories OFF (A/C, rear defroster, etc.) 3. Using a Tech 2, command RPM up to 1500, down to 500, and then up to 1500 while monitoring "Engine Speed" on the Tech 2. Does the "Engine Speed" remain within the specified value of "Desired Idle" for each RPM command?	+/-50 RPM	No trouble found. Go to Diagnostic Aids	Go to Step 4
4	1. 5	Visually/physically inspect for the following conditions: <ul style="list-style-type: none"> • Vacuum leaks • Throttle body tampering (adjustment screw plug removed). • Throttle plate or throttle shaft for binding. • Accelerator and cruise control cables for being mis-adjusted or for binding. • Faulty, missing, or incorrectly installed PCV valve. Do any of the above require a repair?	—	Refer to appropriate section for on-vehicle service	Go to Step 6
6	1. Check for a poor connection at the IAC harness connector. 2. If a problem is found, replace faulty terminals as necessary. Was a problem found?	—	Verify repair	Go to Step 7

DTC P0507 – Idle Control System RPM Higher Than Expected (Cont'd)

Step	Action	Value(s)	Yes	No
7	Using a Digital Voltmeter (DVM), check the IAC valve solenoids (A and B) for the following conditions: <ul style="list-style-type: none">• An open circuit• A short to ground (the IAC body)• A short together Was the problem found?	—	Go to Step 8	Go to Step 9
8	Replace the IAC valve. Is the action complete?	—	Verify repair	—
9	Replace the ECM. Is the action complete?	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0563 SYSTEM VOLTAGE HIGH

D06RX127

Circuit Description

The engine control module (ECM) monitors the system voltage on the ignition feed terminals to the ECM. A system voltage Diagnostic Trouble Code will set whenever the voltage is above a calibrated value. DTC P0563 is a type A code.

Conditions for Setting the DTC

- Ignition ON.
- System voltage is above 16.

Action Taken When the DTC Sets

- The ECM will not illuminate the malfunction indicator lamp (MIL) for the first time the malfunction is detected.
- The ECM will store as Failure Records conditions which were present when the Diagnostic Trouble Code was set. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- A history Diagnostic Trouble Code P0563 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code P0563 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

Check for a faulty charging system components.

DTC P0563 System Voltage High

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	1. Ignition OFF, engine OFF. 2. Using a Digital Voltmeter (DVM), measure the battery voltage at the battery. Is the battery voltage greater than the specified value?	16 V	Go to Step 3	Go to Step 4
3	1. Charge the battery and clean the battery terminals. 2. Clean the battery ground cable connection if corrosion is indicated. Is the battery voltage greater than the specified value?	16 V	Replace battery	Go to Step 4
4	1. Turn OFF all the accessories. 2. Install the Tech 2. 3. Select the ignition voltage parameter on the data list. 4. Start the engine and raise the engine speed to 2000 RPM. Is the voltage above the specified value?	16 V	Go to Step 5	Go to Step 6
5	Replace or repair the generator (see Charging System). Is a malfunction present?	—	Verify repair	—
6	Replace the ECM. Is the action complete?	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0601 INTERNAL CONTROL MODULE MEMORY CHECK SUM ERROR

014RX002

Circuit Description

The engine control module (ECM) used in this vehicle utilizes an electrically erasable programmable read-only memory (EEPROM). The EEPROM contains program information and the calibrations required for engine, transmission, and powertrain diagnostics operation.

Unlike the PROM used in past applications, the EEPROM is not replaceable.

If the ECM detects a check sum error then DTC P0601 will set. DTC P0601 is a type A code.

Conditions for Setting the DTC

- The ECM detects an internal program fault (check sum error).

Action Taken When the DTC Sets

- The ECM will illuminate the malfunction indicator lamp (MIL) the first time the malfunction is detected.
- The ECM will store conditions which were present when the Diagnostic Trouble Code was set in the Failure Records data only.

Conditions for Clearing the MIL/DTC

- The ECM will turn the MIL OFF on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history Diagnostic Trouble Code P0601 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code P0601 can be cleared by using the Scan Tool's "Clear Info" function.

DTC P0601 Internal Control Module Memory Check Sum Error

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	Replace the ECM. Is the action complete?	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P1106 MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR CIRCUIT INTERMITTENT HIGH VOLTAGE

D06RX114

Circuit Description

The manifold absolute pressure (MAP) sensor responds to changes in intake manifold pressure. The MAP sensor signal voltage to the ECM varies from below 2 volts at idle (low manifold pressure) to above 4 volts with the ignition ON, engine not running or at wide-open throttle (high manifold pressure).

A "speed density" method of determining engine load is used on the 2.2L engine. This is calculated using inputs from the MAP sensor, RPM, the CKP sensor, and the Intake Air Temperature (IAT) sensor. The MAP sensor is the main sensor used in this calculation, and measuring engine load is its main function.

The MAP sensor is also used to determine manifold pressure changes while the linear EGR flow test diagnostic is being run, to determine engine vacuum level for some other diagnostics and to determine barometric pressure (BARO). Refer to Diagnostic Trouble Code 401. The ECM compares the MAP sensor signal to a calculated MAP based on throttle position and various other engine load factors. If the ECM detects a MAP signal that is intermittently above the calculated value, Diagnostic Trouble Code P1106 will set. DTC P1106 is a type D code.

Conditions for Setting the DTC

- No TP sensor Diagnostic Trouble Codes are present.
- Engine is running.

- Throttle angle is below 2.7% if engine speed is below 1000 RPM.
- Throttle angle is below 10% if engine speed is above 1000 RPM.
- The MAP sensor indicates an intermittent manifold absolute pressure above 90 kPa for a total of approximately 5 seconds over a 16-second period of time.

Action Taken When the DTC Sets

- The ECM will not illuminate the malfunction indicator lamp (MIL).
- The ECM will store conditions which were present when the Diagnostic Trouble Code was set as Failure Records data only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the DTC

- A history Diagnostic Trouble Code P1106 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code P1106 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Leaking or plugged vacuum supply line to the MAP sensor.
- Inspect ECM harness connectors for backed-out terminals, improper mating, broken locks, improperly

formed or damaged terminals, and poor terminal-to-wire connection.

- The MAP sensor shares a 5 Volt Reference with the TP sensor and Fuel Pressure sensor.
If these codes are also set, it could indicate a problem with the 5 Volt reference circuit.
- The MAP sensor shares a ground with the TP sensor and Fuel Pressure sensor.
- Inspect the wiring harness for damage; shorts to ground, shorts to battery positive, and open circuits. If

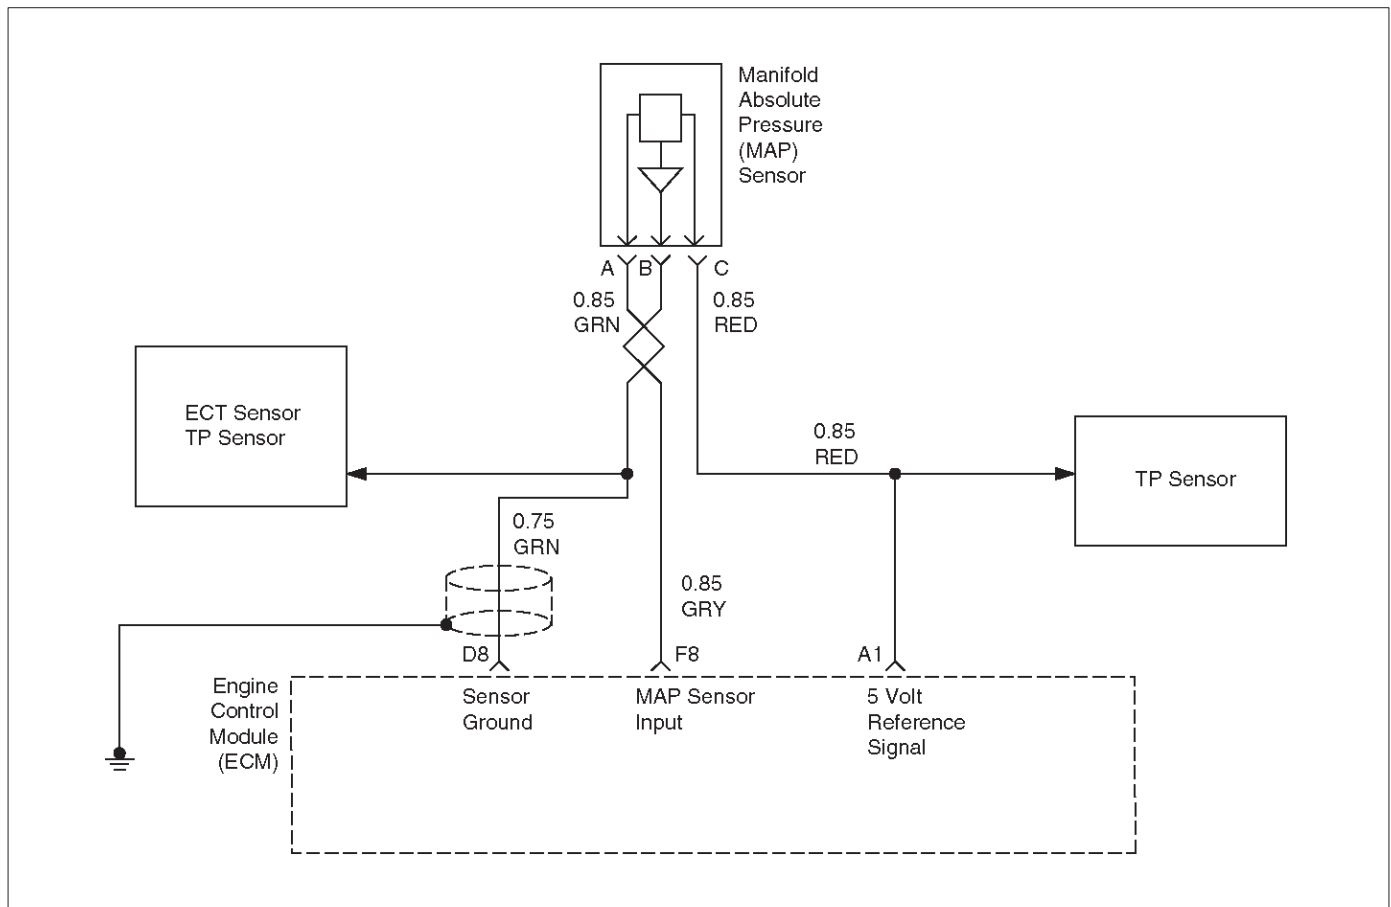

the harness appears to be OK, observe the MAP display on the Tech 2 while moving connectors and wiring harnesses related to the sensor. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the Diagnostic Trouble Code to be set occurs. This may assist in diagnosing the condition.

DTC P1106 – MAP Sensor Circuit Intermittent High Voltage

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	Is DTC P0108 also set?	—	Go to DTC P0108 chart first	Go to Step 3
3	Are Diagnostic Trouble Code P0463, and/or P1121 also set?	—	Go to Step 6	Go to Step 4
4	Check for a poor sensor ground circuit terminal connection at the MAP sensor. Was a problem found?	—	Go to Step 9	Go to Step 5
5	Check the MAP signal circuit between the MAP sensor connector and the ECM for an intermittent short to voltage. Was a problem found?	—	Go to Step 10	Go to Step 8
6	Check for an intermittent short to voltage on the 5 volt reference circuit between the ECM and the following components: <ul style="list-style-type: none"> ● Fuel Tank Vapor Pressure Sensor ● TP sensor Was a problem found?	—	Go to Step 10	Go to Step 7
7	Check for a poor sensor ground circuit terminal connection at the ECM. Was a problem found?	—	Go to Step 9	Go to Step 8
8	Check for an intermittent open or a faulty splice in the sensor ground circuit. Was a problem found? (if no, start with the diagnosis chart for other sensors in the circuit and see if 5V returns.)	—	Go to Step 10	Refer to Diagnostic Aids
9	Replace the faulty harness connector terminal for the sensor ground circuit. Is the action complete?	—	Verify repair	—
10	Locate and repair the intermittent open/short circuit in the wiring harness as necessary. Is the action complete?	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P1107 MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR CIRCUIT INTERMITTENT LOW VOLTAGE

D06RX114

Circuit Description

The manifold absolute pressure (MAP) sensor responds to changes in intake manifold pressure. The MAP sensor signal voltage to the engine control module (ECM) varies from below 2 volts at idle (low manifold pressure) to above 4 volts with the ignition ON, engine not running or at wide-open throttle (high manifold pressure).

A "speed density" method of determining engine load is used on the 2.2L engine. This is calculated using inputs from the MAP sensor, the CKP sensor, and the Intake Air Temperature (IAT) sensor. The MAP sensor is the main sensor used in this calculation, and measuring engine load is its main function.

The MAP sensor is also used to determine manifold pressure changes while the linear EGR flow test diagnostic is being run, to determine engine vacuum level for some other diagnostics and to determine barometric pressure (BARO). Refer to DTC P0401.

The ECM compares the MAP sensor signal to a calculated MAP based on throttle position and various other engine load factors. If the ECM detects a MAP signal that is intermittently below the calculated value, DTC P1107 will set. DTC P1107 is a type D code.

Conditions for Setting the DTC

- No TP sensor Diagnostic Trouble Codes are present.
- Engine is running.

- Throttle angle is below 0% if engine speed is less than 1300 RPM.
- Throttle angle is below 5% if engine speed is above 1300 RPM.
- The MAP sensor indicates an intermittent manifold absolute pressure above 11 kPa for a total of approximately 5 seconds over a 16-second period of time.

Action Taken When the DTC Sets

- The ECM will not illuminate the malfunction indicator lamp (MIL).
- The ECM will store conditions which were present when the Diagnostic Trouble Code was set as Failure Records data only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the DTC

- A history Diagnostic Trouble Code P1107 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code P1107 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at ECM – Inspect harness connectors for backed-out terminals, improper mating, broken

locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.

- The MAP sensor shares a 5 Volt Reference with the TP sensor and Fuel Pressure sensor.
If these codes are also set, it could indicate a problem with the 5 Volt reference circuit.
- The MAP sensor shares a ground with the TP sensor and Fuel Pressure sensor.
- Damaged harness – Inspect the wiring harness for damage; shorts to ground, shorts to battery positive,

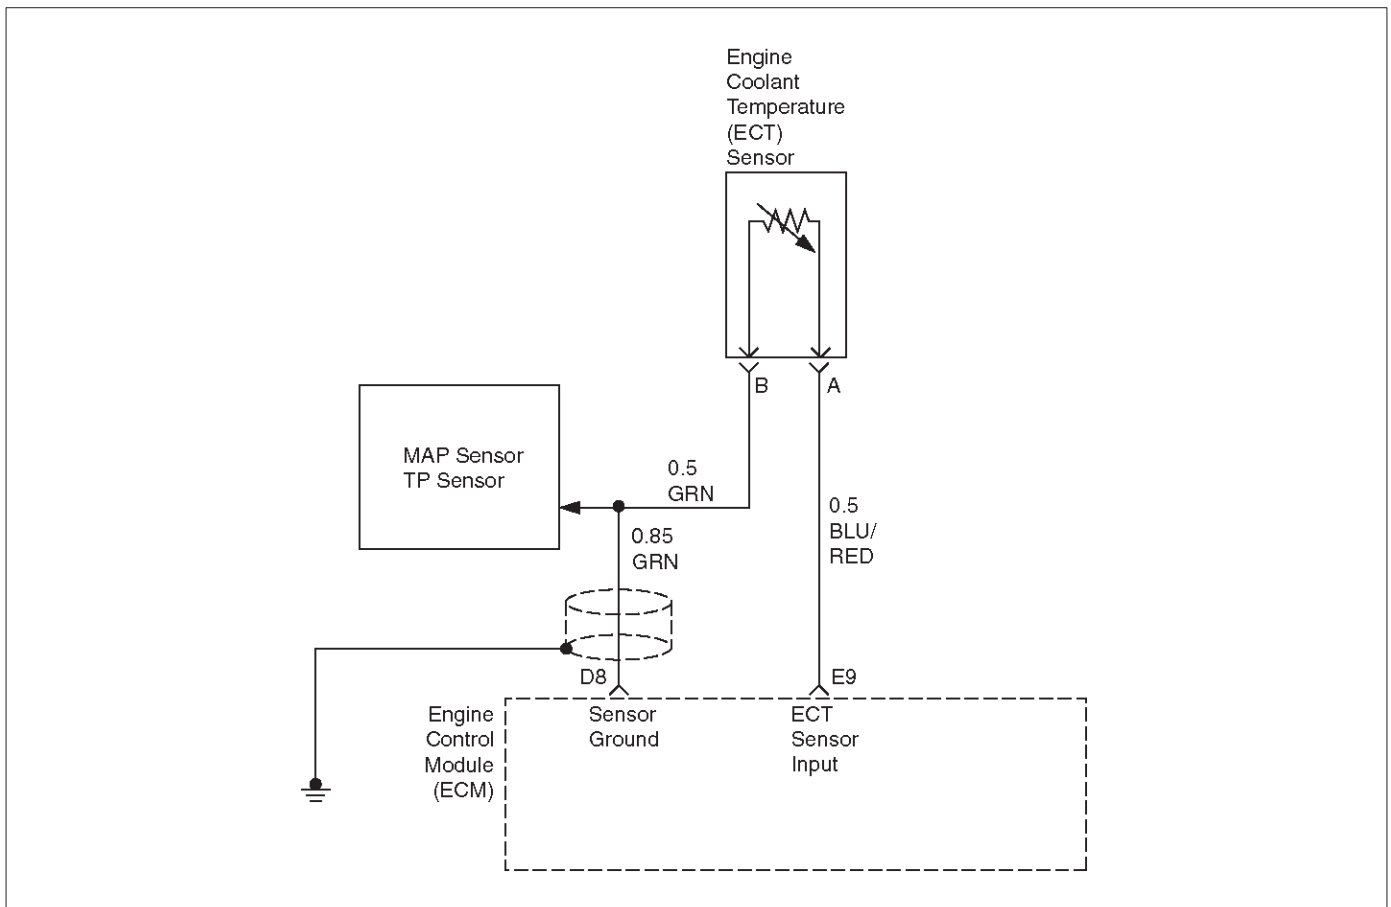

and open circuits. If the harness appears to be OK, observe the MAP display on the Tech 2 while moving connectors and wiring harnesses related to the sensor. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the Diagnostic Trouble Code to be set occurs. This may assist in diagnosing the condition.

DTC P1107 – MAP Sensor Circuit Intermittent Low Voltage

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	Is DTC P0107 also set?	—	Go to DTC P0107 chart first	Go to Step 3
3	Is DTC P1122 and/or P0462 also set?	—	Go to Step 6	Go to Step 4
4	Check for a poor 5 volt reference circuit terminal connection at the MAP sensor. Was a problem found?	—	Go to Step 9	Go to Step 5
5	Check the MAP signal circuit between the MAP sensor connector and the PCM for an intermittent open or short to ground. Was a problem found?	—	Go to Step 10	Go to Step 8
6	Check for an intermittent short to ground on the 5 volt reference circuit between the ECM and the following components: ● Fuel Tank Vapor Pressure Sensor ● TP sensor Was a problem found?	—	Go to Step 10	Go to Step 7
7	Check for a poor 5 volt reference terminal connection at the ECM. Was a problem found?	—	Go to Step 9	Go to Step 8
8	Check for an intermittent open or a faulty splice in the 5 volt reference circuit. Was a problem found? (if no, start with the diagnosis chart for other sensors in the circuit and see if 5V returns.)	—	Go to Step 10	Refer to Diagnostic Aids
9	Replace the faulty harness connector terminal for the 5 volt reference circuit and/or the MAP signal circuit as necessary. Is the action complete?	—	Verify repair	—
10	Repair the intermittent open/short circuit in the wiring harness as necessary. Is the action complete?	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P1111 INTAKE AIR TEMPERATURE (IAT) SENSOR CIRCUIT INTERMITTENT HIGH VOLTAGE

D06RX117

Circuit Description

The intake air temperature (IAT) sensor is a thermistor which measures the temperature of the air entering the engine. The engine control module (ECM) applies 5 volts through a pull-up resistor to the IAT sensor. When the intake air is cold, the sensor resistance is high and the ECM will monitor a high signal voltage on the IAT signal circuit. If the intake air is warm, the sensor resistance is lower causing the ECM to monitor a lower voltage. Diagnostic Trouble Code P1111 will set when the ECM intermittently detects an excessively high signal voltage on the intake air temperature sensor signal circuit. DTC P1111 is a type D code.

Conditions for Setting the DTC

- The engine has been running for over 4 minutes.
- Vehicle speed is less than 32 km/h (20 mph).
- Engine coolant temperature is above 60°C (140°F).
- Calculated air flow is less than 20g/second.
- IAT signal voltage indicates an intake air temperature intermittently less than -39°C (-38°F) (4.94 volts) for approximately 2.5 seconds over a 25-second period of time.

Action Taken When the DTC Sets

- The ECM will substitute a default value for intake air temperature.

- The ECM will store conditions which were present when the Diagnostic Trouble Code set as Failure Records data only. This information will not be stored as Freeze Frame data.
- Diagnostic Trouble Code P1111 does not illuminate the MIL.

Conditions for Clearing the DTC

- A history DTC P1111 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code P1111 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at ECM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage; shorts to ground, shorts to battery positive, and open circuits. If the harness appears to be OK, observe the IAT display on the Tech 2 while moving connectors and wiring harnesses related to the IAT sensor. A change in the IAT display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the Diagnostic Trouble Code to

be set occurs. This may assist in diagnosing the condition.

DIAGNOSTIC TROUBLE CODE (DTC) P1112 INTAKE AIR TEMPERATURE (IAT) SENSOR CIRCUIT INTERMITTENT LOW VOLTAGE

D06RX117

Circuit Description

The intake air temperature (IAT) sensor is a thermistor which measures the temperature of the air entering the engine. The engine control module (ECM) applies 5 volts through a pull-up resistor to the IAT sensor. When the intake air is cold, the sensor resistance is high and the ECM will monitor a high signal voltage on the IAT signal circuit. If the intake air is warm, the sensor resistance becomes lower, causing the ECM to monitor a lower voltage. Diagnostic Trouble Code P1112 will set when the ECM intermittently detects an excessively low signal voltage on the intake air temperature sensor signal circuit. DTC P1112 is a type D code.

Conditions for Setting the DTC

- The engine has been running for over 2 minutes.
- Vehicle speed is greater than 48 km/h (30 mph).
- IAT signal voltage is greater than 148°C (298°F) (about 0.10 volt) for a total of 2.5 seconds over a 25-second period of time.

Action Taken When the DTC Sets

- The ECM will not illuminate the malfunction indicator lamp (MIL).
- The ECM will store conditions which were present when the Diagnostic Trouble Code set as Failure

Records data only. This information will not be stored as Freeze Frame data.

- The ECM will substitute a default value for intake air temperature.

Conditions for Clearing the DTC

- A history Diagnostic Trouble Code P1112 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code P1112 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at ECM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage; shorts to ground, shorts to battery positive, and open circuits. If the harness appears to be OK, observe the IAT display on the Tech 2 while moving connectors and wiring harnesses related to the IAT sensor. A change in the IAT display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the Diagnostic Trouble Code to

6E1-212 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. Verifies that the fault is present.
3. If DTC P1112 can be repeated only by duplicating the Failure Records conditions, refer to the "Temperature vs. Resistance Value Chart."

The chart may be used to test the IAT sensor at various temperatures to evaluate the possibility of a "shifted" sensor that may be shorted above or below a certain temperature. If this is the case, replace the IAT sensor.

DIAGNOSTIC TROUBLE CODE (DTC) P1114 ENGINE COOLANT TEMPERATURE (ECT) SENSOR CIRCUIT INTERMITTENT LOW VOLTAGE

D06RX117

Circuit Description

The engine coolant temperature (ECT) sensor is a thermistor mounted in the engine coolant stream. The engine control module (ECM) applies a voltage (about 5.0 volts) through a pull-up resistor to the ECT signal circuit. When the engine coolant is cold, the sensor (thermistor) resistance is high, therefore the ECM will measure a high signal voltage. As the engine coolant warms, the sensor resistance becomes less, and the ECT signal voltage measured at the ECM drops. With a fully warmed up engine, the ECT signal voltage should measure about 1.5 to 2.0 volts. If the ECM detects an ECT signal that is intermittently below the range of the ECT sensor, Diagnostic Trouble Code P1114 will set. DTC P1114 is a type D code.

Conditions for Setting the DTC

- Engine run time longer than 2 minutes.
- The ECT sensor signal is intermittently greater than 150°C (302°F) (about 0.10 volt) for a total of 10 seconds over a 100-second period.

Action Taken When the DTC Sets

- The ECM will not illuminate the malfunction indicator lamp (MIL).
- The ECM will store conditions which were present when the Diagnostic Trouble Code set as Failure

Records data only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the DTC

- A history Diagnostic Trouble Code P1114 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code P1114 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at ECM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage; shorts to ground, shorts to battery positive, and open circuits. If the harness appears to be OK, observe the ECT display on the Tech 2 while moving connectors and wiring harnesses related to the ECT sensor. A change in the ECT display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the Diagnostic Trouble Code to be set occurs. This may assist in diagnosing the condition.

DIAGNOSTIC TROUBLE CODE (DTC) P1115 ENGINE COOLANT TEMPERATURE (ECT) SENSOR CIRCUIT INTERMITTENT HIGH VOLTAGE

D06RX117

Circuit Description

The engine coolant temperature (ECT) sensor is a thermistor mounted in the engine coolant stream. The engine control module (ECM) applies a voltage (about 5.0 volts) through a pull-up resistor to the ECT signal circuit. When the engine coolant is cold, the sensor (thermistor) resistance is high, therefore the ECM will measure a high signal voltage. As the engine coolant warms, the sensor resistance becomes less, and the ECT signal voltage measured at the ECM drops. With a fully warmed up engine, the ECT signal voltage should measure about 1.5 to 2.0 volts. If the PCM detects an ECT signal that is intermittently above the range of the ECT sensor, Diagnostic Trouble Code P1115 will set. Diagnostic Trouble Code P1115 is a type D code.

Conditions for Setting the DTC

- Engine run time longer than 180 seconds.
- The ECT sensor signal is intermittently greater than -39°C (-38°F) (4.94 volts) for a total of 10 seconds over a 100-second period.

Action Taken When the DTC Sets

- The ECM will not illuminate the malfunction indicator lamp (MIL).
- The ECM will store conditions which were present when the Diagnostic Trouble Code set as Failure

Records data only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the DTC

- A history Diagnostic Trouble Code P1115 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code P1115 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at ECM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage; shorts to ground, shorts to battery positive, and open circuits. If the harness appears to be OK, observe the ECT display on the Tech 2 while moving connectors and wiring harnesses related to the ECT sensor. A change in the ECT display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the Diagnostic Trouble Code to be set occurs. This may assist in diagnosing the condition.

DIAGNOSTIC TROUBLE CODE (DTC) P1121 THROTTLE POSITION (TP) SENSOR CIRCUIT INTERMITTENT HIGH VOLTAGE

D06RX118

Circuit Description

The throttle position (TP) sensor circuit provides a voltage signal that changes relative to the throttle blade angle. The signal voltage will vary from less than 1 volt at closed throttle to more than 4 volts at wide open throttle (WOT). The TP signal is used by the engine control module (ECM) for fuel control and for most of the ECM controlled outputs. If the ECM detects a TP signal that is intermittently above the range of the TP sensor, Diagnostic Trouble Code P1121 will be set. DTC P1121 is a type D code.

Conditions for Setting the DTC

- The ignition is ON.
- TP sensor indicates a throttle position voltage intermittently greater than 4.88 volts for a total of 0.15 seconds over a 1.5-second period.

Action Taken When the DTC Sets

- The ECM will not illuminate the malfunction indicator lamp (MIL).
- The ECM will store conditions which were present when the Diagnostic Trouble Code set as Failure Records data only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the DTC

- A history Diagnostic Trouble Code P1121 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code P1121 can be cleared by using the Scan Tool's "Clear Info" function or by disconnecting the ECM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at ECM – Inspect the harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- The TP sensor shares a 5 Volt reference with the MAP sensor and Fuel Pressure sensor.
If these codes are also set, it could indicate a problem with the 5 Volt reference circuit or components itself.
- The TP sensor share a ground with the MAP and the Fuel Pressure sensor.
- Damaged harness – Inspect the wiring harness for damage; shorts to ground, shorts to battery positive, and open circuits. If the harness appears to be OK, observe the throttle position display on the Tech 2 while moving connectors and wiring harnesses related to the TP sensor. A change in the display will indicate the location of the fault.

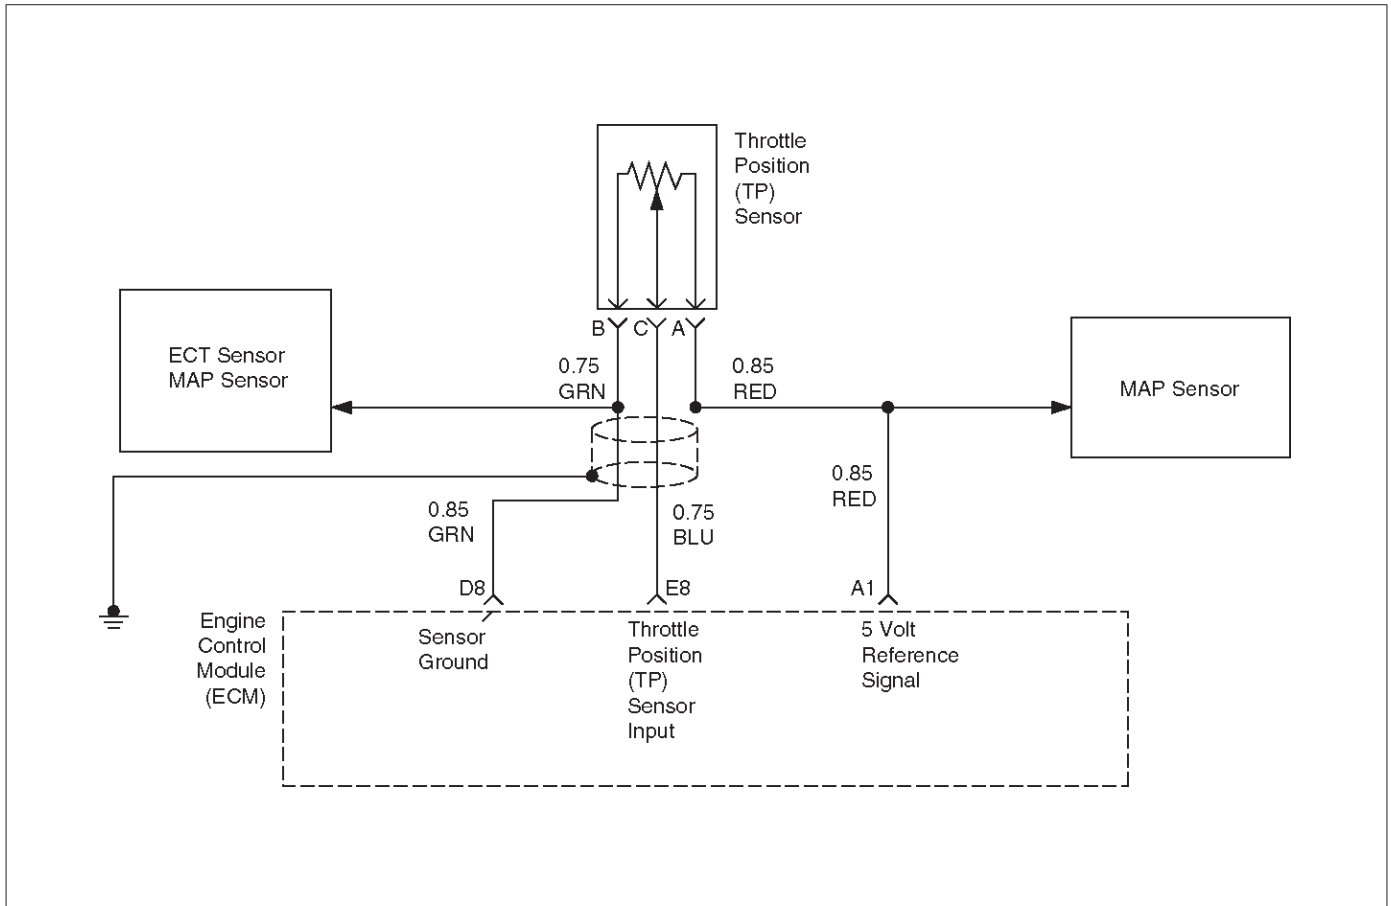

If Diagnostic Trouble Code P1121 cannot be duplicated, reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help to determine how often

the condition that caused the Diagnostic Trouble Code to be set occurs. This may assist in diagnosing the condition.

DTC P1121 – TP Sensor Circuit Intermittent High Voltage

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	Is Diagnostic Trouble Code P0123 also set?	—	Go to DTC P0123 first	Go to Step 3
3	Is Diagnostic Trouble Code P1106 also set?	—	Go to Step 6	Go to Step 4
4	Check for a poor sensor ground circuit terminal connection at the TP sensor. Was a problem found?	—	Go to Step 9	Go to Step 5
5	Check the TP signal circuit between the TP sensor connector and the ECM for an intermittent short to voltage. Was a problem found?	—	Go to Step 10	Go to Step 8
6	Check for an intermittent short to voltage on the 5 volt reference circuit between the ECM and the following components: • MAP Sensor Was a problem found?	—	Go to Step 10	Go to Step 7
7	Check for a poor sensor ground terminal connection at the ECM. Was a problem found?	—	Go to Step 9	Go to Step 8
8	Check for an intermittent open or a faulty splice in the sensor ground circuit. Was a problem found? (if no, start with the diagnosis chart for other sensors in the circuit and see if 5V returns.)	—	Go to Step 10	Refer to Diagnostic Aids
9	Replace the faulty harness connector terminal for the sensor ground circuit. Is the action complete?	—	Verify repair	—
10	Repair intermittent open/short circuit in wiring harness as necessary. Is the action complete?	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P1122 THROTTLE POSITION (TP) SENSOR CIRCUIT INTERMITTENT LOW VOLTAGE

D06RX118

Circuit Description

The throttle position (TP) sensor circuit provides a voltage signal that changes relative to the throttle blade angle. The signal voltage will vary from less than 1 volt at closed throttle to more than 4 volts at wide open throttle (WOT). The TP signal is used by the engine control module (ECM) for fuel control and for most of the ECM controlled outputs. If the ECM detects a TP signal that is intermittently above the range of the TP sensor, Diagnostic Trouble Code P1122 will be set. DTC P1122 is a type D code.

Conditions for Setting the DTC

- The ignition is ON.
- TP sensor indicates a throttle position signal intermittently less than 0.10 volt for a total of 0.15 seconds over a 1.5-second period.

Action Taken When the DTC Sets

- The ECM will not illuminate the malfunction indicator lamp (MIL).
- The ECM will store conditions which were present when the Diagnostic Trouble Code set as Failure Records data only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the DTC

- A history Diagnostic Trouble Code P1122 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code P1122 can be cleared by using the Scan Tool's "Clear Info" function or by disconnecting the ECM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at ECM – Inspect the harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage; shorts to ground, shorts to battery positive, and open circuits. If the harness appears to be OK, observe the throttle position display on the Tech 2 while moving connectors and wiring harnesses related to the TP sensor. A change in the display will indicate the location of the fault.
- The TP sensor shares a 5 Volt reference with the MAP sensor and Fuel Pressure sensor.
If these codes are also set, it could indicate a problem with the 5 Volt reference circuit or components itself.
- The TP sensor share a ground with the MAP and the Fuel Pressure sensor.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help to determine how often the condition that caused the Diagnostic Trouble Code to

be set occurs. This may assist in diagnosing the condition.

DTC P1122 – TP Sensor Circuit Intermittent Low Voltage

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	Is DTC P0122 also set?	—	Go to DTC P0122 first	Go to Step 3
3	Is DTC P1107 also set?	—	Go to Step 6	Go to Step 4
4	Check for a poor 5 volt reference circuit or TP signal circuit terminal connection at the TP sensor. Was a problem found?	—	Go to Step 9	Go to Step 5
5	Check the TP signal circuit between the TP sensor connector and the ECM for an intermittent short to ground. Was a problem found?	—	Go to Step 10	Go to Step 8
6	Check for an intermittent short to ground on the 5 volt reference circuit between the ECM and the following components: • MAP Sensor Was a problem found?	—	Go to Step 9	Go to Step 8
7	Check for a poor 5 volt reference circuit terminal connection at the ECM. Was a problem found?	—	Go to Step 9	Go to Step 8
8	Check for an intermittent open or a faulty splice in the 5 volt reference circuit. Was a problem found? (if no, start with the diagnosis chart for other sensors in the circuit and see if 5V returns.)	—	Go to Step 10	Refer to Diagnostic Aids
9	Replace the faulty harness connector terminal(s) for the 5 volt reference circuit and/or the TP signal circuit as necessary. Is the action complete?	—	Repair complete. If a driveability symptom still exists, refer to Symptoms.	—
10	Repair intermittent open/short circuit in wiring harness as necessary. Is the action complete?	—	Repair complete. If a driveability symptom still exists, refer to Symptoms.	—

DIAGNOSTIC TROUBLE CODE (DTC) P1171 FUEL SYSTEM LEAN DURING ACCELERATION

D06RX119

Circuit Description

The engine control module (ECM) internal circuitry can identify if the vehicle fuel system is capable of supplying adequate amounts of fuel during heavy acceleration (power enrichment). The ECM monitors the voltage of the oxygen sensor during power enrichment. When a power enrichment mode of operation is requested during "Closed Loop" operation (by heavy acceleration), the ECM will provide more fuel to the engine. Under these conditions the ECM should detect a "rich" condition (high oxygen sensor voltage). If this "rich" exhaust is not detected at this time, a Diagnostic Trouble Code P1171 will set. A plugged fuel filter or restricted fuel line can prevent adequate amounts of fuel from being supplied during power enrichment mode. DTC P1171 is a type A code.

Conditions for Setting the DTC

- No related Diagnostic Trouble Codes.
- Engine is operating in "Closed Loop".
- Engine coolant temperature is above 60°C (140°F).
- While in "power enrichment" mode the oxygen sensor voltage remains below 400 mV for 3 seconds.

Action Taken When the DTC Sets

- The ECM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The ECM will store conditions which were present when the Diagnostic Trouble Code was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The ECM will turn the MIL OFF on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history Diagnostic Trouble Code P1171 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- Diagnostic Trouble Code P1171 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

- A restricted fuel filter or fuel line can supply adequate amounts of fuel at idle, but may not be able to supply enough fuel during heavy acceleration.
- Water or alcohol in the fuel may cause low HO₂S voltage during acceleration.
- Check for faulty or plugged fuel injector(s).
- Check for low fuel.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

4. When the engine is idling or at steady cruise, the HO₂S voltage should vary from between approximately 100 mV to 900 mV. During "power enrichment" mode, more fuel is needed and the HO₂S voltage should rise above 447 mV. This step checks to see if the HO₂S is operating properly.
5. Wrap a shop towel around the fuel pressure connector to absorb any small amount of fuel leakage that may occur when installing the gauge. Ignition ON, pump pressure should be 235–320 kPa.
7. Add Caution: Use correct pliers so damage to fuel lines will not occur.

DTC P1171 – Fuel System Lean During Acceleration

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	Are any component-related Diagnostic Trouble Codes set?	—	Go to component DTC charts	Go to Step 3
3	1. Check the vehicle's fuel tank for an adequate amount of fuel. 2. Add fuel to the vehicle's fuel tank if the tank is almost empty. Was fuel added to the vehicle's fuel tank?	—	Go to Step 4	Go to Step 5
4	1. Using a Tech 2, observe HO2S 1 voltage while running warm engine(75°C–95°C [167°F–203°F]) at 1200 RPM. 2. HO2S 1 voltage should vary within the specified range. Does the voltage toggle back and forth within the specified range?	100– 900 mV	Go to Diagnostic Aids	Go to Step 5
5	1. Disconnect the fuel pump relay and crank the engine to relieve the fuel pressure. 2. Install the fuel pressure gauge. 3. Start the engine and idle at normal operating temperature. 4. Disconnect the vacuum line going to the fuel pressure regulator. With the engine running, is the fuel pressure within the specified range?	284– 325 kPa	Go to OBD System Check	Go to Step 6
6	Check for restricted fuel lines or restricted in-line filter. Was a problem found?	—	Verify repair	Go to Step 7
7	1. Ignition OFF. 2. Ignition ON, engine OFF. 3. Using a Tech 2, enable the fuel pump to operate. 4. Using pliers, slowly close the return line (do not exceed the first specified value). Using the pliers, can the fuel pressure be manipulated to exceed the second specified value?	414 kPa 325 kPa	Go to Diagnostic Aids	Go to Step 8
8	Check for: <ul style="list-style-type: none"> ● Faulty fuel pump ● Restricted fuel pump strainer (sock) ● Incorrect fuel pump ● Incorrect fuel being used ● Hot fuel 	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) 1404 EXHAUST GAS RECIRCULATION (EGR) CLOSED VALVE

Circuit Description

The engine control module (ECM) monitors the exhaust gas recirculation (EGR) valve pintle position input to ensure that the valve responds properly to commands from the ECM to detect a fault if the pintle position sensor and control circuits are open or shorted. If the ECM detects a pintle position signal voltage below the normal range of the pintle position sensor, or a signal voltage that is not within a tolerance considered acceptable for proper EGR control system operation, the ECM will set a DTC P1404.

Conditions for Setting the DTC

- IAT is above 5°C (41°)
- EGR actual position is 16 counts below the EGR low threshold for at least 6.3 seconds.

Action Taken When the DTC Sets

- The ECM will illuminate the Malfunction Indicator Lamp (MIL) after the second consecutive trip in which the fault is detected.
- The ECM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The ECM will turn the MIL OFF on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.

- A history DTC P1404 will clear after 40 consecutive warm up cycles without a fault.
- DTC P1404 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Excessive deposits on EGR valve pintle or seat – Check for deposits that may interfere with the EGR valve pintle extending completely or cause the pintle to stick.
- Poor connection or damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the EGR actual position display on the Tech 2 while moving connectors and wiring harnesses related to the EGR valve. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

NOTE: If the EGR valve show signs of excessive heat, check the exhaust system for blockage (possible a plugged catalytic converter) using the "Restricted Exhaust System Check".

DTC P1404 EGR Closed Valve

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to OBD System Check
2	1. Turn the ignition switch ON, with the engine OFF. 2. Review and record the Tech 2 Failure Records data, the clear the DTCs. 3. Operate the vehicle within the Failure Records conditions noted. 4. Using the Tech 2, monitor "DTC" info for DTC P1404. Does the Tech 2 indicate DTC P1404 "Ran and Passed"	—	Refer to Diagnostic Aids	Go to Step 3
3	1. Ignition OFF. 2. Disconnect the Linear Exhaust Gas Recirculation (EGR) Valve from the wiring harness. 3. Ignition ON, Engine OFF. 4. Using a Digital Voltmeter (DVM), check for voltage on the Ignition feed circuit at the Linear Exhaust Gas Recirculation (EGR) Valve wiring harness connector. Does the DVM read the following value?	12 volts	Go to Step 6	Go to Step 4
4	Check the Ignition feed circuit, between the EGR sensor and the "Engine IG." fuse, for the following conditions: <ul style="list-style-type: none"> ● An Open circuit ● A short to ground Was the problem found?	—	Verify repair	—
5	Using a DVM, check the resistance of the EGR solenoid. Does the DVM read the following value?	less than 5 Ω	Go to Step 6	Go to Step 14
6	Check the EGR solenoid valve Low circuit, between the EGR sensor and the ECM, for the following conditions: <ul style="list-style-type: none"> ● An Open circuit ● A short to ground Was the problem found?	—	Verify repair	Go to Step 15
7	1. Ignition OFF. 2. Disconnect the Linear Exhaust Gas Recirculation (EGR) Valve from the wiring harness. 3. Ignition ON, Engine OFF. 4. Observe the EGR value on the Tech 2. Does the Tech 2 display the following value(s)?	0 volts 0%	Go to Step 9	Go to Step 8
8	Check the EGR position feedback circuit, between the EGR sensor and the ECM, for the following conditions: <ul style="list-style-type: none"> ● An Open circuit ● A short to ground Was the problem found?	—	Verify repair	Go to Step 15

DTC P1404 EGR Closed Valve (Cont'd)

Step	Action	Value(s)	Yes	No
9	1. Ignition ON, engine OFF. 2. Using a Digital Voltmeter (DVM), check for voltage on the 5 volt Reference signal circuit at the Linear Exhaust Gas Recirculation (EGR) Valve wiring harness connector. Does the DVM read the following value?	about 5 volts	Go to Step 11	Go to Step 10
10	Check the 5 volt reference signal circuit, between the EGR and the ECM, for the following conditions: <ul style="list-style-type: none"> ● An Open circuit ● A short to ground Was the problem found?	—	Verify repair	Go to Step 11
11	1. Ignition OFF. 2. Place a DVM between the 5 volt reference signal circuit and the 5 volt signal return (ground) circuit at the EGR wiring harness connector. 3. Ignition ON, Engine OFF. Does the DVM read the following value?	about 5 volts	Go to Step 13	Go to Step 12
12	Check the 5 volt signal return (ground) circuit, between the EGR and the ECM, for the following conditions: <ul style="list-style-type: none"> ● An Open circuit ● A short to ground Was the problem found?	—	Verify repair	Go to Step 15
13	1. Ignition OFF. 2. Place a fused jumper wire between the 5 volt reference signal circuit and the EGR valve position feedback circuit at the EGR wiring harness connector. 3. Ignition ON, Engine OFF. 4. Observe the EGR value on the Tech 2. Does the Tech 2 display the following value?	5 volts 100%	Go to Step 14	Go to Step 15
14	Replace the Linear Exhaust Gas Recirculation (EGR) Valve. Verify repair.	—	—	—
15	Replace the ECM. Verify repair.	—	—	—

DIAGNOSTIC TROUBLE CODE (DTC) P1625 ECM UNEXPECTED RESET

014RX002

Circuit Description

The engine control module (ECM) monitors unexpected ECM reset. This will not turn on MIL light on, only records code DTC P1625.

Conditions for Setting the DTC

- Clock or COP (Computer Operating Properly) reset.

Action Taken When the DTC Sets

- The ECM will not illuminate the malfunction indicator lamp (MIL).
- The ECM will store conditions which were present when the DTC was set as Failure Records only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the DTC

- The ECM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.

- A history DTC P1625 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1625 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the ECM battery feed.

Diagnostic Aids

Check for the following conditions:

- P1625 alone stored does not need diagnosis. Clear DTC code.

NOTE: DTC P1625 is a DTC to record a ECM reset history. If DTC P1625 is not reset and no engine abnormality is found after clearance of DTC, it is not necessary to do any farther processing.

DTC P1625–ECM Unexpected Reset

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to Step 2	Go to OBD System Check
2	1. Ignition is “On”. 2. Install the Tech 2. 3. Start the engine at let it Idle. 4. On the Tech 2, select “DTC info”. Does the Tech 2 indicate DTC P1625 failed?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Ignition is “On”. 2. Clear DTC P1625 by using the Tech 2 “Clear Info”. 3. Start the engine at let it Idle. 4. On the Tech 2, select “DTC info”. Does the Tech 2 indicate DTC P1625 failed?	—	Go to Step 4	Go to Diagnostic Aids
4	1. Check for aftermarket electronics, such as transceiver stereos, and anti theft devices, they may radiate EMI into the control system if they are improperly installed. (This may cause a false sensor reading and turn on the MIL.) 2. If a problem is found, repair as necessary. Was the problem found?	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P1627 PCM A/D CONVERSION MALFUNCTION

014RX002

Circuit Description

The Engine Control Module (ECM) monitors the 5 volt reference signal when the Ignition is ON. If the ECM senses an Analog to Digital (A/D) conversion error within the ECM, then DTC P1627 will set. DTC P1627 is a type A code.

Conditions for Setting the DTC

- Engine is running.
- Any A/D DTC's set.

Action Taken When the DTC Sets

- The ECM will illuminate the Malfunction Indicator Lamp (MIL) the first time the fault is detected.
- The ECM will store the conditions that were present when the DTC was set as Freeze Frame and in Failure Records.

Conditions for Clearing the MIL/DTC

- The ECM will turn OFF the MIL on the third consecutive trip without a reported failure.
- A History DTC will clear after 40 consecutive trips without a reported failure.
- The DTC can be cleared using the Scan Tool's "Clear Info" function.

Diagnostic Aids

- Poor connections, or a damaged harness – Inspect the harness connectors for: backed-out terminals, improper mating or damaged terminals. Also, check for open circuits, shorts to ground, and shorts to voltage.

DTC P1627 PCM A/D Conversion Malfunction

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	1. Ignition ON, Engine OFF. 2. Review and record Tech 2 Failure Records data, then clear the DTCs. 3. Operate the vehicle within the Failure Records conditions as noted. 4. Using the Tech 2, monitor "DTC" info for DTC P1627. Does the Tech 2 indicate DTC P1627 "Ran and Passed?"	—	Refer to Diagnostic Aids	Go to Step 3
3	Check the suspect 5 volt reference circuit(s) for the following conditions: <ul style="list-style-type: none"> ● A short to ground ● An open circuit ● A short to voltage Was the problem found?	—	Verify repair	Go to Step 4
4	Replace the ECM.	—	—	—

DIAGNOSTIC TROUBLE CODE (DTC) P1635 5 VOLT REFERENCE VOLTAGE CIRCUIT MALFUNCTION

014RX002

Circuit Description

The Engine Control Module (ECM) monitors the 5 volt reference signal when the Ignition is ON. If the ECM senses the 5 volt reference signal circuit is above 5.12 volts or below 4.88 volts, then DTC P1635 will set. DTC P1635 is a type A code.

Conditions for Setting the DTC

- Ignition voltage is greater than 6.3 volts.
 - Engine is running.
- The above mentioned conditions are met and one of the following two conditions are met for 5 seconds within a 10 second test sample:
- ECM senses the 5 volt reference signal circuit is above 5.12 volts.
- OR
- ECM senses the 5 volt reference signal circuit is below 4.88 volts.

Action Taken When the DTC Sets

- The ECM will illuminate the Malfunction Indicator Lamp (MIL) the first time the fault is detected.
- The ECM will store the conditions that were present when the DTC was set as Freeze Frame and in Failure Records.

Conditions for Clearing the MIL/DTC

- The ECM will turn OFF the MIL on the third consecutive trip without a reported failure.
- A History DTC will clear after 40 consecutive trips without a reported failure.
- The DTC can be cleared using the Scan Tool's "Clear Info" function.

Diagnostic Aids

Poor connections, or a damaged harness – Inspect the harness connectors for: backed-out terminals, improper mating or damaged terminals. Also, check for open circuits, shorts to ground, and shorts to voltage.

DTC P1635 5 Volt Reference Voltage Circuit Malfunction

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	1. Ignition ON, Engine OFF. 2. Review and record Tech 2 Failure Records data, then clear the DTCs. 3. Operate the vehicle within the Failure Records conditions as noted. 4. Using the Tech 2, monitor "DTC" info for DTC P1635. Does the Tech 2 indicate DTC P1635 "Ran and Passed?"	—	Refer to Diagnostic Aids	Go to Step 3
3	Check the suspect 5 volt reference circuit(s) for the following conditions: <ul style="list-style-type: none"> ● A short to ground ● An open circuit ● A short to voltage Was the problem found?	—	Verify repair	Go to Step 4
4	Replace the ECM.	—	—	—

DIAGNOSTIC TROUBLE CODE (DTC) P1640 ODM OUTPUT CIRCUIT FAULT

014RX002

Circuit Description

Output driver modules (ODMs) are used by the engine control module (ECM) to turn ON many of the current driven devices that are needed to control various engine and transmission functions. Each ODM is capable of controlling up to 11 separate outputs by applying ground to the device which the ECM is commanding ON.

ODMs have the capability of diagnosing each output circuit individually. DTC P1640 set indicates an improper voltage level has been detected on an ODM output.

If the ECM detects an open circuit condition and a shorted to voltage circuit condition on the same circuit at the same time, then DTC P1640 will set. DTC P1640 is a type D code.

Conditions for Setting the DTC

- Ignition ON.
- Above conditions occur for at least 2.5 seconds.
- The ECM detects an open circuit condition and a shorted to voltage circuit condition on the same circuit at the same time.

Action Taken When the DTC Sets

- The ECM will not illuminate the malfunction indicator lamp (MIL).
- The ECM will store conditions which were present when the DTC was set as Failure Records only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the DTC

- A history DTC P1640 will clear after 40 consecutive warm up cycles occur without a fault.
- DTC P1640 can be cleared by using the Scan Tool's "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at ECM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness Inspect the wiring harness for damage. If the harness appears to be OK, disconnect the ECM, turn the ignition ON and observe a voltmeter connected to the MIL driver circuit at the ECM harness connector while moving connectors and wiring harnesses relates to the MIL. A change in voltage will indicate the location of the fault.
- Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

The following ECM pins are controlled by output driver modules (ODMs):

- A13 MIL LAMP
- A14 Rear Defogger
- B14 A/C Clutch
- B16 EVAP Canister Purge Solenoid

- A1 2 Low Fuel
- C10 Tacho Meter
- C11 Fuel Gauge
- C13 Fan Low
- C12 Fan High

2. The Tech 2 Driver Module Status indicates the ECM pin that is affected.
9. The Tech 2 may indicate "short circuit" even when the problem is an open circuit. The cause of an open circuit may be in the component itself.
11. A short to ground on the ignition side of the component will blow the fuse. Since the fuse was checked in Step 2, a short to ground would be between the affected component and the ECM.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

DTC P1640 –Output Driver Module (ODM) “A” Fault

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	Check the fuse for the driver circuit that was shown as faulty. Was the fuse blown?	—	Go to Step 3	Go to Step 4
3	1. Check for a short to ground between the fuse and the affected component. 2. Replace the fuse after making any necessary repairs. Is the action complete?	—	Verify repair	—
4	1. Disconnect the ECM connector for the affected driver circuit. Is there any damage to the ECM pin or connector?	—	Go to Step 5	Go to Step 6
5	Repair the damaged pin or terminal. Is the action complete?	—	Verify repair	—
6	Was the Lamp of circuit for "Check Engine"?	—	Go to Step 7	Go to Step 13
7	1. Leave the ECM connector for the lamp driver circuit disconnected. 2. Ignition "ON." 3. Using a DVM, check the voltage at the ECM connector for the affected lamp driver circuit. Was the voltage equal to the specified value?	B+	Go to Step 15	Go to Step 8
8	1. Ignition "ON." 2. Check for battery voltage at the fuse for the affected lamp circuit. Was battery voltage available at the fuse?	—	Go to Step 10	Go to Step 9
9	Repair the open circuit between the ignition switch and the fuse. Is the action complete?	—	Verify repair	—
10	1. Ignition "OFF." 2. Disconnect the ECM connector for the affected driver terminal. 3. Connect an ohmmeter between a good ground and the ECM connector for the affected driver. Did the ohmmeter indicate continuity?	—	Go to Step 11	Go to Step 12
11	Repair the short to ground between the affected component and its ECM driver terminal. Is the action complete?	—	Verify repair	—

DTC P1640 –Output Driver Module (ODM) “A” Fault (Cont’d)

Step	Action	Value(s)	Yes	No
12	Repair the open circuit between the fuse and the ECM driver terminal for the affected circuit. Is the action complete?	—	Verify repair	—
13	1. Connect the ECM. 2. Start the engine and let it idle. 3. Backprobe the affected terminal at the ECM with a DVM. Was the voltage equal to the specified value?	B+	Go to Step 15	Go to Step 14
14	1. Run the engine at idle. 2. Check for battery voltage at the fuse for the affected circuit. Was battery voltage available at the fuse?	—	Go to Step 10	Go to Step 9
15	Replace the ECM. Is the action complete?	—	Verify repair	—

SYMPTOM DIAGNOSIS

PRELIMINARY CHECKS

Before using this section, perform the "On-Board Diagnostic (OBD) System Check" and verify all of the following items:

- The engine control module (ECM) and malfunction indicator lamp (MIL)(Check Engine lamp) are operating correctly.
- There are no DTC(s) stored.
- Tech 2 data is within normal operating range. Refer to Typical Scan Data Values.
- Verify the customer complaint and locate the correct symptom in the table of contents. Perform the procedure included in the symptom chart.

VISUAL/PHYSICAL CHECK

Several of the symptom procedures call for a careful visual/physical check. This can lead to correcting a problem without further checks and can save valuable time. This check should include the following items:

- ECM grounds for cleanliness, tightness and proper location.
- Vacuum hoses for splits, kinks, and proper connections, as shown on the "Vehicle Emission Control Information" label. Check thoroughly for any type of leak or restriction.
- Air intake ducts for collapsed or damaged areas.
- Air leaks at throttle body mounting area, manifold absolute pressure (MAP) sensor and intake manifold sealing surfaces.
- Ignition component for cracking, hardness, and carbon tracking.
- Wiring for proper connections, pinches and cuts.

INTERMITTENTS

An intermittent problem may or may not turn on the malfunction indicator lamp (MIL) or store a Diagnostic Trouble Code. DO NOT use the Diagnostic Trouble Code (DTC) charts for intermittent problems. The fault must be present to locate the problem.

Most intermittent problems are caused by faulty electrical connections or wiring. Perform a careful visual/physical check for the following conditions:

- Poor mating of the connector halves or a terminal not fully seated in the connector (backed out).
- Improperly formed or damaged terminal.
- All connector terminals in the problem circuit should be carefully checked for proper contact tension.
- Poor terminal-to-wire connection. This requires removing the terminal from the connector body to check.

Road test the vehicle with a J 39200 Digital Multimeter connected to a suspected circuit. An abnormal voltage when the malfunction occurs is a good indication that there is a fault in the circuit being monitored.

Use a Tech 2 to help detect intermittent conditions.

The Scan Tools have several features that can be used to locate an intermittent condition. Use the following feature to find intermittent faults:

- Using a Scan Tool's "Freeze Frame" buffer or "Failure Records" buffer can aid in locating an intermittent condition. Review and record the information in the freeze frame or failure record associated with the intermittent DTC being diagnosed. The vehicle can be driven within the conditions that were present when the DTC originally set.

To check for loss of diagnostic code memory, disconnect the MAP sensor and idle the engine until the MIL (Check Engine lamp) comes on. Diagnostic Trouble Code P0107 should be stored and kept in memory when the ignition is turned OFF. If not, the ECM is faulty. When this test is completed, make sure that you clear the Diagnostic Trouble Code P0107 from memory.

An intermittent MIL (Check Engine lamp) with no stored Diagnostic Trouble Code may be caused by the following:

- Ignition coil shorted to ground and arcing at ignition wires or plugs.
- MIL (Check Engine lamp) wire to ECM shorted to ground.
- Poor ECM grounds. Refer to the ECM wiring diagrams.

Check for improper installation of electrical options such as lights, cellular phones, etc. Check all wires from the ECM to the ignition coils for poor connections.

Check for an open diode across the A/C compressor clutch and check for other open diodes (refer to wiring diagrams in Electrical Diagnosis).

If problem has not been found, refer to ECM Connector Symptom tables.

6E1-238 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

HARD START SYMPTOM

DEFINITION:

Engine cranks, but does not start for a long time. Does eventually run, or may start but immediately stalls.

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to Step 3
3	Was a visual/physical check performed?	—	Go to Step 4	Go to Visual / Physical Check
4	Check engine coolant temperature (ECT) sensor for shift in value. 1. After 8 hours with the hood up and the engine not running, connect the Tech 2. 2. Ignition ON, engine not running. 3. Using the Tech 2, compare Engine Coolant Temperature to Intake Air Temperature. Are ECT and IAT within the specified value of each other?	$\pm 5^{\circ}\text{C}$ ($\pm 9^{\circ}\text{F}$)	Go to Step 8	Go to Step 5
5	1. Using a Tech 2, display the engine coolant temperature and note the value. 2. Check the resistance of the engine coolant temperature sensor. 3. For resistance specifications, refer to Temperature vs. Resistance chart in DTC P0118. Is the actual resistance near the resistance value in the chart for the temperature that was noted?	—	Go to Step 7	Go to Step 6
6	Replace the ECT sensor. Is the action complete?	—	Verify repair	—
7	Locate and repair high resistance or connection in the ECT signal circuit or the ECT signal circuit or the ECM sensor ground.	—	Verify repair	—
8	Check for a faulty, plugged, or incorrectly installed PCV valve. Was a problem found?	—	Verify repair	Go to Step 9
9	Visually/Physically inspect the secondary ignition wires. Check for the following conditions: <ul style="list-style-type: none"> • Verify that all ignition wire resistance are less than the specified value. • Verify that ignition wires are correctly routed to eliminate cross-firing. • Verify that ignition wires are not arcing to ground. Spraying the secondary ignition wires with a light mist of water may help locate an intermittent problem. Was a problem found?	22.4 k Ω	Verify repair	Go to Step 10

X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION 6E1-239

Step	Action	Value(s)	Yes	No
10	Check for proper ignition voltage output with a spark tester5-8840-0383-0. Was a problem found?	—	Verify repair	Go to Step 11
11	1. Remove the spark plugs and check for gas or oil fouling cracks, wear, improper gap, burned electrodes, heavy deposits, or improper heat range. 2. If spark plugs are fouled, the cause of fouling must be determined before replacing the spark plugs. Was a problem found?	—	Verify repair	Go to Step 12
12	Check for a loose ignition control module ground. Was a problem found?	—	Verify repair	Go to Step 13
13	1. Check the ignition coil secondary resistance. 2. Replace the coil if it is not within the specified range of resistance. Did the coil require replacement?	9 kΩ–12 kΩ	Verify repair	Go to Step 14
14	Check IAC operation. Perform the procedure in the diagnostic chart DTC P0506, Step 6. Was a problem found?	—	Verify repair	Go to Step 15
15	Check for water or alcohol contaminated fuel. Was a problem found?	—	Verify repair	Go to Step 16
16	Perform the procedure in Fuel System Pressure Test to determine if there is a problem with fuel delivery. Was a problem found?	—	Verify repair	Go to Step 17
17	Check for the following engine mechanical problems (refer to Engine Mechanical): <ul style="list-style-type: none"> ● Low compression ● Leaking cylinder head gaskets ● Worn camshaft ● Camshaft drive belt slipped or stripped Was a problem found?	—	Verify repair	Go to Step 18
18	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: <ul style="list-style-type: none"> ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records buffer ● All electrical connections within a suspected circuit and/or system Was a problem found?	—	Verify repair	Contact Technical Assistance

6E1-240 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

SURGES AND/or CHUGGLES SYMPTOM

DEFINITION:

Engine power variation under steady throttle or cruise.
Feels like the vehicle speeds up and slows down with no change in the accelerator pedal.

Step	Action	Value(s)	Yes	No
1	Was the On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to OBD System Check
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to Step 3
3	Was a visual/physical check performed?	—	Go to Step 4	Go to Visual / Physical Check
4	Be sure that the driver understands A/C compressor operation as explained in the owner's manual. Inform the customer how the A/C clutch operate. Is the customer experiencing a normal condition?	—	System OK	Go to Step 5
5	Check the fuel control Heated Oxygen Sensor (HO2S1). When monitored on the Tech 2, the HO2S1 should respond quickly to different throttle positions. If it doesn't check for silicon or other contaminants from fuel or use of improper RTV sealant. The sensors may have a white powdery coating. Silicone contamination sends a rich exhaust signal which causes the ECM to command an excessively lean air/fuel mixture. Was a problem found?	—	Verify repair	Go to Step 6
6	Check the fuel pressure. Refer to Fuel System Pressure Test. Was a problem found?	—	Verify repair	Go to Step 7
7	Monitor "Long Term Fuel Trim" on the Tech 2. Is "Long Term Fuel Trim" in the negative range (rich condition)?	—	Go to Step 8	Go to Step 9
8	Check items that can cause the engine to run rich. Refer to Diagnostic Aids in DTC P0172. Was a problem found?	—	Verify repair	Go to Step 10
9	Check items that can cause the engine to run lean. Refer to Diagnostic Aids in DTC P0171. Was a problem found?	—	Verify repair	Go to Step 10
10	Check for proper ignition voltage output with the spark tester 5-8840-0383-0. Was a problem found?	—	Verify repair	Go to Step 11
11	Check for a loose ignition control module ground. Was a problem found?	—	Verify repair	Go to Step 12

X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION 6E1-241

Step	Action	Value(s)	Yes	No
12	<p>Visually/Physically inspect the secondary ignition wires. Check for the following conditions.</p> <ul style="list-style-type: none"> ● Verify that all ignition wire resistance are less than the specified value. ● Verify that ignition wires are correctly routed to eliminated cross-firing. ● Verify that ignition wires are not arcing to ground. 6E1-244 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

DETONATION/SPARK KNOCK SYMPTOM

DEFINITION:

A mild to severe ping, usually worse under acceleration. The engine makes sharp metallic knocks that change with throttle opening.

Step	Action	Value(s)	Yes	No
1	Was the On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to OBD System Check
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to Step 3
3	Was a visual/physical check performed?	—	Go to Step 4	Go to Visual / Physical Check
4	1. If Tech 2 readings are normal and there are no engine mechanical faults, fill the fuel tank with a known quality gasoline that has a minimum octane rating of 87. Refer to Typical Scan Values. 2. Re-evaluate the vehicle performance. Is detonation present?	—	Go to Step 5	Verify repair
5	1. Check for obvious overheating problems: <ul style="list-style-type: none"> ● Low engine coolant. ● Restricted air flow to radiator, or restricted water flow through radiator. ● Incorrect coolant solution. It should be a 50/50 mix of approved antifreeze/water. ● Incorrect EGR operation. Refer to DTC P0401. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 6
6	Check fuel pressure. Refer to Fuel System Pressure Test. Was a problem found?	—	Verify repair	Go to Step 7
7	Check items that can cause an engine to run lean. Refer to Diagnostic Aids in DTC P0171. Was a problem found?	—	Verify repair	Go to Step 8
8	Check spark plugs for proper heat range. Refer to General Information. Were incorrect spark plugs installed?	—	Verify repair	Go to Step 9
9	1. Remove excessive carbon buildup with a top engine cleaner. Refer to instructions on the top engine cleaner can. 2. Re-evaluate vehicle performance. Is detonation still present?	—	Go to Step 10	Verify repair

X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION 6E1-245

Step	Action	Value(s)	Yes	No
10	Check for an engine mechanical problem. Perform a cylinder compression check. Refer to Engine Mechanical. Was a problem found?	—	Verify repair	Go to Step 11
11	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: <ul style="list-style-type: none">● Visual/physical inspection● Tech 2 data● Freeze Frame data/Failure Records buffer● All electrical connections within a suspected circuit and/or system Was a problem found?	—	Verify repair	Contact Technical Assistance

6E1-246 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

ROUGH, UNSTABLE, OR INCORRECT IDLE, STALLING SYMPTOM

DEFINITION:

Engine runs unevenly at idle. If severe, the engine or vehicle may shake. Engine idle speed may vary in RPM. Either condition may be severe enough to stall the engine.

Step	Action	Value(s)	Yes	No
1	Was the On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to OBD System Check
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to Step 3
3	Was a visual/physical check performed, including the rotor, ignition coil and secondary ignition wires?	—	Go to Step 4	Go to Visual / Physical Check
4	Verify that the EGR valve is not mounted backwards. Was a problem found?	—	Verify repair	Go to Step 5
5	1. Check for incorrect idle speed. Ensure that the following conditions are present: <ul style="list-style-type: none"> ● Engine fully warm. ● Accessories are OFF. 2. Using a Tech 2, monitor IAC position. Is the IAC position within the specified values?	Between 10 and 50 counts	Go to Step 8	Go to Step 7
6	1. Visually/physically inspect for the following conditions: <ul style="list-style-type: none"> ● Restricted air intake system. Check for a restricted air filter element, or foreign objects blocking the air intake system. ● Check for objects blocking the IAC passage or throttle bore, excessive deposits in the IAC passage and on the IAC pintle, and excessive deposits in the throttle bore and on the throttle plate. ● Check for a condition that causes a large vacuum leak, such as an incorrectly installed or faulty crankcase ventilation valve brake booster hose. Was a problem found?	—	Verify repair	Go to Step 7
7	Using a Tech 2, monitor TP angle with the engine idling. Is the TP angle at the specified value and steady?	0%	Go to Step 8	For further diagnosis, refer to DTC P0123
8	Check for proper ignition voltage output with the spark tester 5-8840-0383-0. Was a problem found?	—	Verify repair	Go to Step 9
9	1. Remove the spark plugs and check for gas or oil fouling, cracks, wear, improper gap, burned electrodes, heavy deposits or improper heat range. 2. If spark plugs are fouled, the cause of the fouling must be determined before replacing the spark plugs. Was a problem found?	—	Verify repair	Go to Step 10

X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION 6E1-247

Step	Action	Value(s)	Yes	No
10	Check for a loose ignition control module ground. Refer to Electrical Ignition System. Was a problem found?	—	Verify repair	Go to Step 11
11	Monitor "Long Term Fuel Trim" on the Tech 2. Is "Long Term Fuel Trim" in the negative range (rich condition)?	—	Go to Step 12	Go to Step 13
12	Check the items that can cause the engine to run rich. Refer to Diagnostic Aids in DTC P0172. Was a problem found?	—	Verify repair	Go to Step 13
13	Is "Long Term Fuel Trim" significantly in the positive range (lean condition)? —	—	Go to Step 14	Go to Step 15
14	Check items that can cause the engine to run leading. Refer to "Diagnostic Aids" in DTC P0171. Was a problem found?	—	Verify repair	Go to Step 14
15	Check the injector connections. If any of the injectors are connected to an incorrect cylinder, correct as necessary. Was a problem found?	—	Verify repair	Go to Step 16
16	Perform the Injector Coil/Balance Test. Was a problem found?	—	Verify repair	Go to Step 17
17	1. Check the following engine mechanical problems: <ul style="list-style-type: none"> ● Low compression ● Leaking cylinder head gasket ● Worn or incorrect camshaft ● Sticking or leaking valves ● Valve timing ● Broken valve springs ● Camshaft drive belt slipped or stripped. Was a problem found?	—	Verify repair	Go to Step 18
18	1. Check for faulty motor mounts. Refer to Engine Mechanical for inspection of mounts. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 19
19	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: <ul style="list-style-type: none"> ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records buffer ● All electrical connections within a suspected circuit and/or system Was a problem found?	—	Verify repair	Contact Technical Assistance

6E1-248 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

POOR FUEL ECONOMY SYMPTOM

DEFINITION:

Fuel economy, as measured by an actual road test, is noticeably lower than expected. Also, economy is noticeably lower than it was on this vehicle at one time, as previously shown by an actual road test.

Step	Action	Value(s)	Yes	No
1	Was the On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to OBD System Check
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to Step 3
3	Was a visual/physical check performed?	—	Go to Step 4	Go to Visual / Physical Check
4	Check owner's driving habits. <ul style="list-style-type: none"> ● Is the A/C ON full time (defroster mode ON)? ● Are tires at the correct pressure? ● Are excessively heavy loads being carried? ● Is acceleration too much, too often? 	—	Go to Step 5	Go to Step 6
5	Review the items in Step 4 with the customer and advise as necessary. Is the action complete?	—	System OK	—
6	1. Visually/physically check: Vacuum hoses for splits, kinks, and improper connections and routing as shown on the "Vehicle Emission Control Information" label. Was a problem found?	—	Verify repair	Go to Step 7
7	Remove and check the air filter element for dirt or for restrictions. Was a problem found?	—	Verify repair	Go to Step 8
8	1. Remove the spark plugs and check for gas or oil fouling, cracks, wear, improper gap, burned electrodes or heavy deposits. 2. If spark plugs are fouled, the cause of fouling must be determined before replacing the spark plugs. Was a problem found?	—	Verify repair	Go to Step 9
9	Check for low engine coolant level. Was a problem found?	—	Verify repair	Go to Step 10
10	Check for an incorrect or faulty engine thermostat. Refer to Engine Cooling. Was a problem found?	—	Verify repair	Go to Step 11
11	Check for low engine compression. Refer to Engine Mechanical. Was a problem found?	—	Verify repair	Go to Step 12

X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION 6E1-249

Step	Action	Value(s)	Yes	No
12	<p>Check for excessive exhaust system back–pressure. Refer to Restricted Exhaust System Check. Possible problems could be:</p> <ul style="list-style-type: none"> ● Damaged or collapsed pipes. ● Internal muffler failure. ● Plugged catalytic converter. <p>Was a problem found?</p>	—	Verify repair	Go to Step 13
13	<p>Check for proper calibration of the speedometer.</p> <p>Does the speed indicated on the speedometer closely match the vehicle speed displayed on the Tech 2?</p>	—	Go to Step 15	Go to Step 14
14	<p>Diagnose and repair the inaccurate speedometer condition as necessary. Refer to Vehicle Speed Sensor in Electrical Diagnosis.</p>	—	Verify repair	—
15	<p>Check the air intake system and the crankcase for air leaks.</p> <p>Was a problem found?</p>	—	Verify repair	Go to Step 16
16	<p>1. Review all the diagnostic procedures within this table.</p> <p>2. If all procedures have been completed and no malfunctions have been found, review/inspect the following:</p> <ul style="list-style-type: none"> ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records buffer ● All connections within a suspected circuit and/or system <p>Was a problem found?</p>	—	Verify repair	Go to Step 17
17	<p>Perform the procedure in Fuel System Pressure Test.</p> <p>Was the fuel pressure normal?</p>	—	Contact Technical Assistance	Verify repair

6E1-250 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

EXCESSIVE EXHAUST EMISSIONS OR ODORS SYMPTOM

DEFINITION:

Vehicle fails an emission test. There is excessive "rotten egg" smell. (Excessive odors do not necessarily indicate excessive emissions.)

Step	Action	Value(s)	Yes	No
1	Was the On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to OBD System Check
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Go to Step 13	Go to Step 3
3	Was visual/physical check performed?	—	Go to Step 4	Go to Visual / Physical Check
4	Check for vacuum leaks (vacuum lines, intake manifold, throttle body, etc.) Were any vacuum leaks found?	—	Go to Step 13	Go to Step 5
5	1. Check fuel cap for proper installation. 2. Secure the fuel cap if necessary. Was a problem found?	—	Go to Step 13	Go to Step 6
6	1. Check the fuel pressure. Refer to Fuel System Pressure Test. Was a problem found?	—	Go to Step 13	Go to Step 7
7	1. Check for faulty, plugged or incorrectly installed PCV valve. 2. Verify that the PCV system is not plugged. Was a problem found?	—	Go to Step 13	Go to Step 8
8	Check the injector connections. If any of the injectors are connected to an incorrect cylinder, correct as necessary. Was a problem found?	—	Go to Step 13	Go to Step 9
9	Perform the Injector Balance Test by Tech 2. Was a problem found?	—	Go to Step 13	Go to Step 10
10	Check for a problem with the engine cooling system. Was a problem found?	—	Go to Step 13	Go to Step 11
11	Check the EVAP canister for fuel loading. Refer to Evaporative Emission Control System. Was a problem found?	—	Go to Step 13	Go to Step 12
12	1. Remove excessive carbon build-up with a top engine cleaner. Refer to the instructions on the top engine cleaner can. 2. Perform the exhaust emission test. Does the vehicle pass the test?	—	System OK	Go to Step 14
13	Perform the exhaust emission test. Does the vehicle pass the test?	—	System OK	Go to Step 14
14	Does the exhaust emission test indicate excessive HC levels, or is "Long Term Fuel Trim" significantly in the negative range (rich condition)?	—	Go to Step 15	Go to Step 16

X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION 6E1-251

Step	Action	Value(s)	Yes	No
15	<p>1. Check items that can cause the engine to run rich. Refer to Diagnostic Aids in DTC P0172 Diagnostic Support. Make any necessary repairs.</p> <p>2. Perform the exhaust emission test. Does the vehicle pass the test?</p>	—	System OK	Go to Step 17
16	<p>1. Check items that can cause the engine to run lean. Refer to Diagnostic Aids in DTC P0171. Make any necessary repairs.</p> <p>2. Perform the exhaust emission test. Does the vehicle pass the test?</p>	—	System OK	Go to Step 17
17	<p>Check the EGR system (refer to DTC P0401). Was a problem found?</p>	—	Verify repair	Go to Step 18
18	<p>Check for the following engine mechanical problems.</p> <ul style="list-style-type: none"> ● Low compression ● Leaking cylinder head gasket ● Worn or incorrect camshaft ● Sticking or leaking valves ● Valve timing ● Broken Valve springs <p>Was a problem found?</p>	—	Verify repair	Go to Step 19
19	<p>1. Review all the diagnostic procedures within this table.</p> <p>2. If all procedures have been completed and no malfunctions have been found, review/inspect the following:</p> <ul style="list-style-type: none"> ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records buffer ● All electrical connections within a suspected circuit and/or system <p>Was a problem found?</p>	—	Verify repair	Contact Technical Assistance

6E1-252 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION**DIESELING, RUN-ON SYMPTOM****DEFINITION:**

Engine continues to run after key is turned OFF, but runs very rough. If engine runs smoothly, check the ignition switch and adjustment.

Step	Action	Value(s)	Yes	No
1	Was the On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to OBD System Check
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to Step 3
3	Was a visual/physical check performed?	—	Go to Step 4	Go to Visual / Physical Check
4	1. Check for a short between B+ and the ignition feed circuit. Was a problem found?	—	Verify repair	Go to Step 5
5	1. Review all the diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: <ul style="list-style-type: none">● Visual/physical inspection● Tech 2 data● Freeze Frame data/Failure Records buffer● All connections within a suspected circuit and/or system Was a problem found?	—	Verify repair	Contact Technical Assistance

BACKFIRE SYMPTOM

DEFINITION:

Fuel ignites in the intake manifold, or in the exhaust system, making a loud popping noise.

Step	Action	Value(s)	Yes	No
1	Was the On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to OBD System Check
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to Step 3
3	Was a visual/physical check performed?	—	Go to Step 4	Go to Visual / Physical Check
4	Check for proper ignition voltage output with spark tester 5-8840-0383-0. Was a problem found?	—	Verify repair	Go to Step 5
5	1. Remove the spark plugs and check for gas or oil fouling, cracks, wear, improper gap, burned electrodes or heavy deposits. 2. If spark plugs are fouled, the cause of fouling must be determined before replacing the spark plugs. Was a problem found?	—	Verify repair	Go to Step 6
6	1. Visually/physically inspect the secondary ignition wires. Check for the following conditions: <ul style="list-style-type: none"> • Verify that all ignition wire resistances are less than the specified value. • Verify that ignition wires are correctly routed to eliminate cross-firing. • Verify that ignition wires are not arcing to ground. Spraying the secondary ignition wires with a light mist of water may help locate an intermittent problem. Was a problem found?	—	Verify repair	Go to Step 7
7	Check for an intermittent ignition system malfunction: <ul style="list-style-type: none"> • Intermittent CKP 58X signal. • Intermittent ignition feed circuit or sensor ground circuit to the crankshaft position sensor. Was a problem found?	—	Verify repair	Go to Step 8
8	To determine if there is a problem with fuel delivery, refer to Fuel System Diagnosis. Was a problem found?	—	Verify repair	Go to Step 9
9	1. Check for the following engine mechanical problems: <ul style="list-style-type: none"> • Low compression • Leaking cylinder head gasket • Worn or incorrect camshaft • Incorrect valve timing • Sticking or leaking valves • Camshaft drive belt slipped or stripped. Was a problem found?	—	Verify repair	Go to Step 10

6E1-254 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

Step	Action	Value(s)	Yes	No
10	Check the intake and exhaust manifold(s) for casting flash. Refer to Engine Mechanical. Was a problem found?	—	Verify repair	Go to Step 11
11	1. Review all the diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: <ul style="list-style-type: none">● Visual/physical inspection● Tech 2 data● Freeze Frame data/Failure Records buffer● All electrical connections within a suspected circuit and/or system Was a problem found?	—	Verify repair	Contact Technical Assistance

CUTS OUT, MISSES SYMPTOM

DEFINITION:

Steady pulsation or jerking that follows engine speed; usually more pronounced as engine load increases.

Step	Action	Value(s)	Yes	No
1	Was the On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to OBD System Check
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to Step 3
3	Was a visual/physical check performed?	—	Go to Step 4	Go to Visual / Physical Check
4	Check the ECM grounds to verify that they are clean and tight. Refer to the ECM wiring diagrams in Electrical Diagnosis. Was a problem found?	—	Verify repair	Go to Step 5
5	Monitor "Long Term Fuel Trim" on the Tech 2. Is the "Long Term Fuel Trim" in the negative range (rich condition)?	—	Go to Step 6	Go to Step 7
6	Check items that can cause the engine to run rich. Refer to "Diagnostic Aids" in DTC P0172. Was a problem found?	—	Verify repair	Go to Step 9
7	Is the long term fuel trim significantly in the positive range (lean condition)?	—	Go to Step 8	Go to Step 9
8	Check items that can cause the engine to run lean. Refer to Diagnostic Aids in DTC P0171. Was a problem found?	—	Verify repair	Go to Step 9
9	1. Check for incorrect idle speed. Ensure that the following conditions are present: <ul style="list-style-type: none"> ● Engine fully warm. ● Accessories are OFF. 2. Using a Tech 2, monitor the IAC position. Is the IAC position within the specified values?	Between 5 and 50 counts	Go to Step 11	Go to Step 10
10	1. Visually/physically inspect for the following conditions: <ul style="list-style-type: none"> ● Restricted air intake system. Check for a restricted air filter element, or foreign objects blocking the air intake system. ● Check for objects blocking the IAC passage or throttle bore, excessive deposits in the IAC passage and on the IAC pintle, and excessive deposits in the throttle bore and on the throttle plate. ● Check for a condition that causes a large vacuum leak, such as an incorrectly installed or faulty crankcase ventilation valve or brake booster hose disconnected. Was a problem found?	—	Verify repair	Go to Step 11

6E1-256 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

Step	Action	Value(s)	Yes	No
11	Check the injector connections. If any of the injectors are connected to an incorrect cylinder, correct as necessary. Was a problem found?	—	Verify repair	Go to Step 12
12	1. Perform the Injector Coil/Balance Test. Was a problem found?	—	Verify repair	Go to Step 13
13	1. Check for fuel in the pressure regulator vacuum hose. 2. If fuel is present, replace the fuel pressure regulator assembly. Was a problem found?	—	Verify repair	Go to Step 14
14	Check for proper ignition voltage output with spark tester J 26792. Was a problem found?	—	Verify repair	Go to Step 15
15	1. Remove spark plugs and check for gas or oil fouling, cracks, wear, improper gap, burned electrodes or heavy deposits. 2. If spark plugs are fouled, the cause of fouling must be determined before replacing the spark plugs. Was a problem found?	—	Verify repair	Go to Step 16
16	Check for a loose ignition control module ground. Was a problem found?	—	Verify repair	Go to Step 17
17	Using a Tech 2, monitor the TP angle with the engine idling. Is the TP angle at the specified value and steady?	0%	Go to Step 18	For further diagnosis, refer to DTC P0123
18	Check the PCV valve for proper operation. Was a problem found?	—	Verify repair	Go to Step 19
19	Check for the following engine mechanical problems: <ul style="list-style-type: none"> ● Low compression ● Leaking cylinder head gasket ● Worn or incorrect camshaft ● Incorrect valve timing ● Sticking or leaking valves ● Camshaft drive belt slipped or stripped. Was a problem found?	—	Verify repair	Go to Step 20
20	Check for faulty motor mounts. Refer to Engine Mechanical for inspection of the mounts. Was a problem found?	—	Verify repair	Go to Step 21
21	1. Review all the diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: <ul style="list-style-type: none"> ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records buffer ● All electrical connections within a suspected circuit and/or system Was a problem found?	—	Verify repair	Contact Technical Assistance

HESITATION, SAG, STUMBLE SYMPTOM

DEFINITION:

Momentary lack of response as the accelerator is pushed down. Can occur at any vehicle speed. Usually most pronounced when first trying to make the vehicle move, as from a stop sign. May cause the engine to stall if severe enough.

Step	Action	Value(s)	Yes	No
1	Was the On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to OBD System Check
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to Step 3
3	Was a visual/physical check performed?	—	Go to Step 4	Go to Visual / Physical Check
4	1. Check the fuel control heated oxygen sensor (HO2S1). The HO2S1 should respond quickly to different to throttle positions. If it doesn't, check for silicon or other contaminants from fuel or use of improper RTV sealant. The sensors may have a white powdery coating. Silicon contamination sends a rich exhaust signal which causes the ECM to command an excessively lean air/fuel mixture. Was a problem found?	—	Verify repair	Go to Step 5
5	Check the fuel pressure. Refer to Fuel System Pressure Test. Was a problem found?	—	Verify repair	Go to Step 6
6	Observe the "TP angle" display on the Tech 2 while slowly increasing throttle pedal. Does the TP angle display steadily increase from 0% at closed throttle to 100% at WOT?	—	Go to Step 7	Go to Step 13
7	Monitor "Long Term Fuel Trim" on the Tech 2. Is the "Long Term Fuel Trim" in the negative range (rich condition)?	—	Go to Step 8	Go to Step 9
8	Check items that can cause the engine to run rich. Refer to Diagnostic Aids in DTC P0172. Was a problem found?	—	Verify repair	Go to Step 10
9	Check items that can cause the engine to run lean. Refer to Diagnostic Aids in DTC P0171. Was a problem found?	—	Verify repair	Go to Step 10
10	Check for proper ignition voltage output with spark tester 5-8840-0383-0. For the procedure, refer to Electronic Ignition System. Was a problem found?	—	Verify repair	Go to Step 11
11	Check for a loose ignition control module ground. Was a problem found?	—	Verify repair	Go to Step 12

6E1–258 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

Step	Action	Value(s)	Yes	No
12	<p>Visually/physically inspect the secondary ignition wires. Check for the following conditions:</p> <ul style="list-style-type: none"> ● Verify that all ignition wire resistances are less than the specified value. ● Value that ignition wires are correctly routed to eliminate cross-firing. ● Verify that ignition wires are not arcing to ground. Spraying the secondary ignition wires with a light mist of water may help locate an intermittent problem. <p>Was a problem found?</p>	30,000 Ω	Verify repair	Go to Step 14
13	<p>Replace the TP sensor.</p> <p>Was a problem found?</p>	—	Verify repair	—
14	<p>1. Check the ignition coil secondary resistance. 2. Replace the coil if it is not within the specified value.</p> <p>Was a problem found?</p>	9 kΩ– 12kΩ	Verify repair	Go to Step 15
15	<p>1. Remove the spark plugs and check for gas or oil fouling, cracks, wear, improper gap, burned electrodes of heavy deposits. 2. If spark plugs are fouled, the cause of fouling must be determined before replacing the spark plugs.</p> <p>Was a problem found?</p>	—	Verify repair	Go to Step 16
16	<p>Check the ECM grounds to verify that they are clean and tight. Refer to the ECM wiring diagrams in Electrical Diagnosis.</p> <p>Was a problem found?</p>	—	Verify repair	Go to Step 17
17	<p>Visually/physically check vacuum hoses for splits, kinks, and proper connections and routing as shown on the Vehicle Emission Control Information label.</p> <p>Was a problem found?</p>	—	Verify repair	Go to Step 18
18	<p>1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following:</p> <ul style="list-style-type: none"> ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records buffer ● All electrical connections within a suspected circuit and/or system <p>3. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Contact Technical Assistance

RESTRICTED EXHAUST SYSTEM CHECK

Step	Action	Value(s)	Yes	No
1	Was the On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to OBD System Check
2	1. Remove the HO2S2. <ul style="list-style-type: none"> ● For removal procedures, refer to Heated Oxygen Sensors in On-Vehicle Service. 2. Install the Exhaust Backpressure Tester in place of the Bank 1 HO2S. 3. Idle the engine at normal operating temperature. Does the reading on the gauge exceed the specified value?	8.62 kPa (1.25 psi)	Go to Step 5	Go to Step 3
3	With the exhaust back-pressure tester in place of HO2S, and the engine at normal operating temperature: Increase the engine speed to 2000 RPM while observing the gauge. Does the reading exceed the amount of the value column?	8.62 kPa (1.25 psi)	Go to Step 5	Go to Step 4
4	1. Re-install the HO2S2. (Refer to Heated Oxygen Sensors in On-Vehicle Service for installation procedure.) 2. Remove the HO2S1. 3. Install the Exhaust Back-Pressure Tester BT8515V or equivalent in place of the HO2S1. 4. Bring the engine to normal operating temperature while observing the gauge. 5. Increase the engine speed to 2000 RPM (allow 10 seconds for pressure build) and observe the gauge. Did the reading exceed the specified value?	8.62 kPa (1.25 psi)	Go to Step 6	System OK
5	Repair a restriction in the exhaust system after the catalytic converter. Possible faults include: <ul style="list-style-type: none"> ● Collapsed pipe ● Internal muffler failure 	—	Verify repair	—
6	Replace the restricted catalytic converter.	—	Verify repair	—

NOTE: Diagnostic Trouble Codes will be set by running the vehicle to normal operating temperature after a cold start with the O2 sensor disconnected. After performing these tests, use the Tech 2 to erase the Diagnostic Trouble Codes that were set by the lack of O2 sensor activity.

DEFAULT MATRIX TABLE

SERVICE PROCEDURE DEFAULT STRATEGY

A referral strategy has been established to assist the technician with additional information when the cause of the failure cannot be determined. If no problem is found after performing diagnostics, then for further diagnostic information, refer to the default matrix table.

DEFAULT MATRIX TABLE

Strategy Based Diagnostic Charts	Initial Diagnosis	Default Section(s)
On-Board Diagnostic (OBD) System Check	Vehicle does not enter diagnostics.	Chassis Electrical
On-Board Diagnostic (OBD) System Check	Vehicle enters diagnostics and communicates with the Tech 2. MIL is ON in diagnostics. Engine does not start and run.	Ignition System Check
On-Board Diagnostic (OBD) System Check	Engine starts and runs, no ECM codes set. Customer complains of vibration.	—

Camshaft Position (CMP) Sensor

Removal Procedure

1. Disconnect the negative battery cable.
2. Remove spark plug cover on top of valve cover by removing four retaining bolts.
3. Disconnect electrical connector from the sensor.

4. Remove drive belt. Refer to Engine Mechanical Section.
5. Remove top harness cover installed on timing belt cover by removing a retaining screw.
6. Remove the retaining bolts holding crankshaft pulley, and pull crankshaft pulley while wiggling. Refer to Engine Mechanical Section.
7. Remove the retaining screws for timing belt cover and timing belt cover.

8. Remove the retaining bolt for the sensor and pull up camshaft position sensor.

Installation Procedure

1. Insert camshaft position sensor in position.
2. Install retaining bolt.

3. Install the timing belt cover and the retaining screws.
4. Install the crank shaft pulley and the mounting bolts. Holes for mounting bolts are off the pitch. The pulley can be mounted only one way to install all mounting bolts. Tighten the bolts. Refer to Engine Mechanical section.

5. Install the drive belt. Refer to Engine Mechanical Section.

014RX005

6. Install the top harness cover onto timing belt cover.
7. Connect electrical connector to the sensor and securely lock it.
8. Install the spark plug cover.
9. Connect the negative battery cable.

014RX004

Crankshaft Position (CKP) Sensor

Removal Procedure

1. Disconnect the negative battery cable.
2. Remove the drive belt. Refer to Engine Mechanical Section.

014RX003

3. Remove the power steering pump and mounting-bracket from engine. Refer to Engine Mechanical Section.
4. Disconnect electrical connector from the sensor.

014RX006

5. Remove the retaining bolt and sensor from the engine block.

NOTE: Use caution to avoid any hot oil that might drip out.

3. Reinstall the power steering pump and bracket to the engine.

4. Reinstall the accessory drive belt.
5. Connect the negative battery cable.

Installation Procedure

1. Install the crank shaft position sensor to its position.
2. Install and tighten the mounting bolt. Refer to Engine Mechanical Section.

EEPROM

EEPROM

The Electronically Erasable Programmable Read Only Memory (EEPROM) is a permanent memory that is physically soldered within the ECM. The EEPROM contains program and calibration information that the ECM needs to control Powertrain operation.

014RX002

901RX031

Functional Check

1. Perform the On-Board Diagnostic System Check.
2. Start the engine and run for least one minute.
3. Check for DTCs using Tech 2.
4. If the ECM fails to program, proceed as follow:
 - Ensure that all ECM connections are OK.
 - Check the ITCS for latest version software.
 - Attempt to program ECM again. If ECM still cannot be programmed properly, replace ECM. The replacement ECM must be programmed.

Engine Coolant Temperature (ECT) Sensor

Removal Procedure

1. Disconnect the negative battery cable.
2. Drain enough engine coolant so that the coolant level will be below the ECT sensor.
3. Remove electrical connector from the sensor located on the intake manifold above the ignition coil.
4. Unscrew the sensor from the manifold.

014RX008

Installation Procedure

1. Install the sensor into the intake manifold. Do not over tighten.
2. Connect electrical connector.

3. Add engine coolant to required level. Refer to Engine Cooling System Section.
4. Connect the negative battery cable.

Heated Oxygen Sensor (HO2S)

Removal Procedure

1. Disconnect the negative battery cable.
2. Locate the two oxygen sensors.
 - Bank 1 sensor 1 is mounted on the exhaust pipe ahead of the catalytic converter.
 - Bank 1 sensor 2 is mounted on the exhaust pipe behind the catalytic converter.
3. Disconnect pig tail electrical connector.

IMPORTANT: The pigtail is permanently attached to the sensor. Be careful not to pull the wires out.

4. Unscrew sensors from the exhaust pipe. Because of the expansion and contraction of the metal in the exhaust system over time, this may be difficult if the engine temperature is below 48 degree C.

Inspection Procedure

NOTE: Both sensors are identical. Inspect each in the same way.

1. Inspect the pigtail and the electrical connector for grease, dirt, corrosion and bare wire or worn insulation.
2. Inspect the louvered end of the sensor for grease, dirt, excessive carbon build up or other contaminants.

Installation Procedure

NOTE: If HO2S is reinstalled after removal, special anti-seize compound or the equivalent should be applied to the threads. Special anti-seize compound, (P/N 5613695), is used on the HO2S threads. This compound consists of glass beads suspended in a liquid graphite solution. The graphite burns away with exhaust heat, but the glass beads will remain, making the sensor easier to remove.

6E1-268 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

1. Apply anti-seize compound or the equivalent to the thread.

TS23739

2. Install HO2S on the exhaust pipe.
3. Tighten the sensor to 55 Nm (5.6 kg-m/40 lb ft)
4. Connect the pig tail to the wiring harness.
5. Connect the negative battery cable.

(Pre-Catalytic Converter Heater Oxygen Sensor Location)

014RX010

(Post-Catalytic Converter Heater Oxygen Sensor Location)

014RX009

Intake Air Temperature (IAT) Sensor

Removal Procedure

1. Disconnect the negative battery cable.
2. The IAT sensor is located in the intake air duct between the air filter and the throttle body.

014RX011

3. Disconnect the electrical connector from the sensor.
4. Remove the sensor from intake air duct by using a rocking motion while pulling the sensor.

0018

Installation Procedure

1. Install the IAT sensor into intake air duct. Make sure the sensor is pushed all the way into the intake air duct.
2. Connect electrical connector.
3. Connect the negative battery cable.

014RX011

Manifold Absolute Pressure (MAP) Sensor

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the electrical connector from the sensor. (The MAP sensor is located on the intake manifold behind throttle body.)

3. Remove a mounting bolt securing the sensor to the manifold.
4. Remove the sensor from the intake manifold using rocking motion while pulling the sensor.

014RX012

Installation Procedure

1. Push MAP sensor into the manifold. Make sure the sensor is pushed always into its position.
2. Install a mounting bolts and tighten.
3. Connect electrical connector.
4. Connect the negative battery cable.

014RX013

Malfunction Indicator Lamp (MIL)

Malfunction Indicator Lamp (MIL)

Refer to Instrument Panel Removal Procedure.

Engine Control Module (ECM)

Electrostatic Discharge (ESD) Damage

Electronic components used in the control system are often designed to carry very low voltage. Electronic components are susceptible to damage caused by electrostatic discharge. Less than 100 volts of static electricity can cause damage to some electronic components. By comparison, it takes as much as 4000 volts for a person to even feel the zap of a static discharge. There are several way for a person to become statically charged. The most common methods of charging are by friction and by induction. An example of charging by friction is a person sliding across a car seat. Charging by induction occurs when a person with well insulated shoes stands near a highly charged object and momentarily touches ground. Charge of the same polarity are drained off leaving the person highly charged with opposite polarity. Static charge can cause damage, therefore, it is important to use care when handling and testing electronic components.

NOTE: To prevent possible Electrostatic Discharge damage, follow these guidelines:

- Do not touch the control module connector pins or soldered components on the control module circuit board.
- Do not open the replacement part package until the part is ready to be installed.
- Before removing the parts from the package, ground the package to a known good ground on the vehicle.
- If the parts been handled while sliding across the seat, or while sitting from standing position, or walking a distance, touch a known good ground before installing the parts.

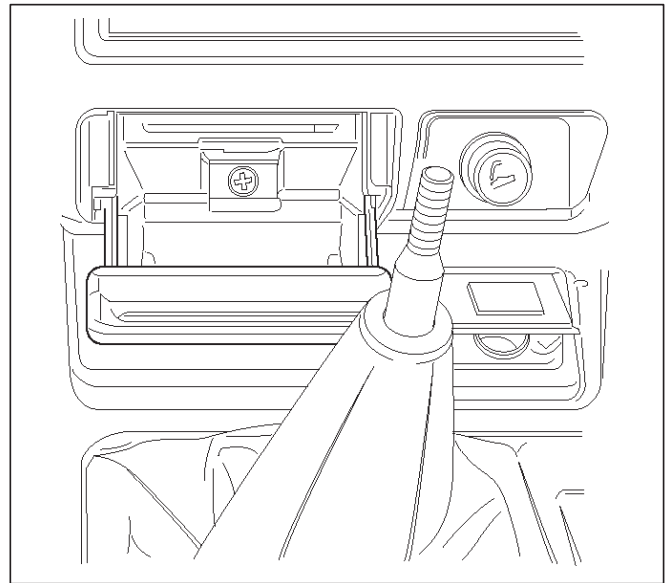

014RX002

NOTE: To prevent internal ECM damage, the ignition must be OFF position in order to disconnect or reconnect power to the ECM (for example: battery cable, pig tail, ECM fuse, jumper cable, etc.).

IMPORTANT: When replacing the production ECM with a service ECM, it is important to transfer the broadcast code and production ECM number to the service ECM label. This will allow positive identification of ECM parts throughout the service life of the vehicle. Do not record this information on ECM metal cover.

Removal Procedure

1. Disconnect the negative battery cable.
2. Block the wheels.
3. Remove ashtray inner.
4. Remove a screw located behind ashtray.

014RX014

5. Pull out Face trim of console.
6. Remove two screws located inside of center console storage box and pull up rear part of center console.

014RX015

7. Unscrew the shift knob.
8. Remove four screw holding front part of the console and pull the console up.

9. Disconnect the red, white and blue electrical connector at the ECM.

014RX016

10. Remove two nuts in the front of ECM.

11. Remove two nuts in the rear of ECM.

12. Pull the ECM out from dashboard.

014RX002

Installation Procedure

1. Place ECM into its position and secure by four mounting screws.

014RX002

2. Connect all three connectors to ECM. All connectors are color keyed. Same color male and female connectors join together.

014RX017

6E1-272 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

3. Install the front center console and secure by four retaining screws.

014RX016

4. Install the rear center console and secure it by two retaining screw into storage box.

014RX015

5. Snap face plate into its position and secure it by a screw.
6. Insert ashtray inner.
7. Insert the shift knob.
8. Connect the negative battery cable.

9. Remove wheel blocks.

014RX014

Throttle Position (TP) Sensor

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the TPS electrical connector.
3. Remove the two screws and TP sensor from the throttle body.

NOTE: Do not clean the TP sensor by soaking it in solvent. The sensor will be damaged as a result.

101RX002

Function Check

Use a Tech 2 to check the TP sensor output voltage at closed throttle.

- The voltage should be under 0.25 volts.
- If the reading is greater than 0.25 volts, check the throttle shaft to see if it is binding. Check that the throttle cable is properly adjusted, also. Refer to Throttle Cable Adjustment.
- If the throttle shaft is not binding and the throttle cable is properly adjusted, install a new TP sensor.

101RX003

Installation Procedure

1. Install the TP sensor on the throttle body with two screws.

101RX003

2. Connect the electrical connector.

3. Connect the negative battery cable.

101RX002

Vehicle Speed Sensor (VSS)

Removal Procedure

1. Disconnect the negative battery cable.
2. VSS is located on the right side of the transmission case just ahead of the rear propeller shaft. Disconnect the VSS electrical connector.
3. Remove the bolt and the VSS from the transmission case by wiggling it slightly and pulling it straight out.

IMPORTANT: Have a container ready to catch any fluid that leaks out when the VSS is removed from the transfer case.

014RX020

Inspection Procedure

1. Inspect the electrical connector for signs of corrosion or warping. Replace the VSS if the electrical connector is corroded or warped.
2. Inspect the VSS driven gear for chips, breaks, or worn condition. Replace the VSS if the driven gear is chipped, broken or worn.
3. Inspect the O-ring for wear, nicks, tears, or looseness. Replace the O-ring if necessary.

Installation Procedure

1. Install the VSS in the transmission case with the notch for the connector facing the rear.
2. Secure the VSS with mounting bolt. Tighten the bolt to 16 Nm (12 lb ft).

3. Connect electrical connector to the VSS.
4. Check the transmission oil level. Add oil if necessary.
5. Connect the negative battery cable.

Air Filter

Removal Procedure

1. Disconnect electrical connector at the IAT sensor.
2. Release the four latches securing the lid to the air cleaner housing.
3. Remove the air cleaner lid.

4. Remove the air filter element.

4. Connect the electrical connector to the IAT sensor.

Installation Procedure

1. Install the air filter element in the air cleaner housing.

2. Install the air cleaner lids.

3. Secure the three latches, holding the lid on the air cleaner housing.

Idle Air Control (IAC) Valve

Removal Procedure

1. Disconnect the negative battery cable.

2. Disconnect the IAC electrical connector.

3. Remove the two screws and IAC valve from the throttle body.

6E1-276 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

NOTE: Do not clean the IAC valve by soaking it in solvent. The valve will be damaged as a result.

014RX022

Cleaning and Inspection Procedure

- Clean the IAC valve O-ring sealing surface, pintle valve seat and air passage.
- Use carburetor cleaner and a parts cleaning brush to remove carbon deposit. Do not use a cleaner that contain methyl ethyl ketone. This is an extremely strong solvent and not necessary for this type of deposit.
- Shiny spots on the pintle are normal and do not indicate misalignment or a bent pintle shaft.
- Inspect the IAC valve O-ring for cuts, cracks or distortion. Replace the O-ring if damaged.

0006

Measurement Procedure

- In order to install a new IAC valve, measure the distance between the tip of the pintle and the mounting flange. If that measurement is 28 mm or less, the valve need no adjustment. If the measurement is greater than 28 mm, apply finger pressure and retract the valve. The force required to retract the pintle on a new valve will not damage the valve, shaft or pintle.

NOTE: Do not push or pull on the IAC valve pintle on IAC valve that have been in service. The force required to move the pintle may damage it.

IMPORTANT: Use an identical replacement part in order to replace a valve. IAC valve pintle shape and diameter are designed for the specific application.

TS23746

Installation Procedure

1. Install IAC valve on the throttle valve body with the two screws. Tighten the screw to 1 Nm (9 lb in).

014RX022

2. Connect electrical connector to IAC valve.
3. Connect the negative battery cable.

101RX002

4. Loosen retaining clamps at the throttle body and at the air filter box.
5. Disconnect brake booster vacuum hose at intake manifold and at brake booster.

014RX025

Intake Air Duct

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect electrical connector at IAT sensor.
3. Remove the IAT sensor if necessary. Refer to Intake Air Temperature Sensor Removal.

014RX011

6. Remove retaining nut at the intake air duct bracket at top of valve cover.
7. Disconnect the intake air duct from the throttle body and at the air filter box.

014RX019

Installation Procedure

1. Connect the intake air duct at the throttle body and at the air filter box. Make sure retaining hole is inserted to the intake air duct bracket.

2. Tighten retaining clamp at the throttle body and at the air filter box.
3. Install a nut to the intake air duct bracket and tighten.
4. Connect brake booster vacuum hose to intake manifold and to brake booster and secure them with clamps.

5. Install IAT sensor if necessary. Refer to Intake Air Temperature Sensor Installation.
6. Connect electrical connector at IAT sensor.
7. Connect the negative battery cable.

IMPORTANT: Use an identical replacement part in order to replace a valve. IAC valve pintle shape and diameter are designed for the specific application.

Knock Sensor

Removal Procedure

1. Disconnect negative battery cable.
2. Disconnect pig tail electrical connector at near the top of generator.

3. Unscrew retaining bolt from Knock Sensor located passenger side of engine block just front of starter.

4. Remove Knock Sensor with retaining bolt.

Installation Procedure

1. Install Knock Sensor with retaining bolt.
2. Connect pig tail electrical connector.
3. Connect battery negative cable.

Oil Pressure Switch

Removal Procedure

1. Disconnect battery negative cable.
2. Disconnect electrical connector at Oil Pressure Switch.

3. Unscrew Oil Pressure Switch from Oil Filter Mounting Housing.

Installation Procedure

1. Install Oil Pressure Switch into Oil Filter Mounting Housing and tighten.
2. Connect electrical connector.
3. Connect battery negative cable.

FUEL METERING SYSTEM Accelerator Cable Assembly

Removal Procedure

1. Loosen the adjusting nut on the cable bracket mounting on the throttle body.
2. Remove the cable clip from holding bracket.

3. Remove accelerator control cable (on the throttle valve end).

4. Remove the accelerator control cable (on the accelerator pedal end).
5. Remove the grommet.
6. Remove the accelerator control cable.

Inspection Procedure

Check the following items, and replace the control cable if any abnormality is found:

- The control cable should move smoothly.
- The control cable should not be bent or kinked.
- The control cable should be free of damage and corrosion.

Installation Procedure

1. Install the accelerator control cable.
2. Install the grommet.
3. Install the accelerator control cable on the accelerator pedal.

014RX032

4. Install the accelerator control cable on the throttle valve.

101RW006

5. Install the cable clip to the holding bracket.

6. Adjust the accelerator cable. Refer to Accelerator Cable Adjustment Section.

014RX026

Accelerator Cable Adjustment

Adjustment Procedure

1. Loosen the adjusting nut.
2. Loosen the jam nut.
3. Pull the outer cable while fully closing the throttle valve.
4. Tighten the adjusting nut.
5. Tighten the jam nut.
6. Loosen the adjusting nut by three turns.
7. Tighten the jam nut again.
8. Manually operate valve.

IMPORTANT: The valve lever must return up to the stopper screw. If the valve lever does not reach the stopper screw, repeat the procedure again from Step 1.

014RX026

Accelerator Pedal Replacement

Removal Procedure

1. Disconnect the accelerator pedal control cable from the accelerator pedal assembly.
2. Remove the two screws retaining the accelerator pedal to the bulkhead.
3. Remove the accelerator pedal from the bulkhead.

014RX033

Installation Procedure

1. Install the accelerator pedal assembly to the bulkhead with two screws.
2. Connect the accelerator control cable to the accelerator pedal assembly.
3. Adjust accelerator cable if necessary. Refer to Accelerator Cable Adjustment Section.

014RX034

Fuel Filler Cap

Fuel Filler Cap

The Fuel filter cap includes a vacuum valve and a pressure valve. If high vacuum or pressure occurs in the fuel tank, each valve works to adjust the pressure in order to prevent damage to the tank at the EGR valve.

Inspection Procedure

NOTE: Replace the fuel filler cap with the same type of filler cap that was originally installed on the vehicle.

- Check the seal ring in the filler cap for any abnormality and for seal condition.
- Replace the filler cap if any abnormality is found.

TS29767

Fuel Filter

Removal Procedure

1. Disconnect the negative battery cable.

2. Remove the fuel filler cap.

041RW005

3. Disconnect the fuel lines from the fuel filter on the engine side.

4. Disconnect the fuel line from the fuel filter on the fuel tank side.

041RW006

5. Remove the bolt on the fuel filter holder.

6. Remove the fuel filter.

041RW007

Inspection Procedure

1. Replace the fuel filter when the following occur:

- Fuel leaks from the fuel filter body
- The fuel filter body is damaged
- The fuel filter is clogged with dust or sediment

2. If the drain hole is clogged at filler neck is clogged with dust, clean the drain hole with air.

041RW008

Installation Procedure

1. Install the fuel filter in the correct direction.
2. Install the bolt on the fuel filter holder.
3. Connect the fuel line on the engine side.
4. Connect the fuel line on the fuel tank side.
5. Install the fuel filler cap.
6. Connect the negative battery cable.

Fuel Injectors

Removal Procedure

NOTE: If the fuel injectors are leaking, the engine oil may be contaminated with fuel. Check the oil for signs of contamination and change the oil and filter if necessary.

NOTE: Use care in removing the fuel injector in order to prevent damage to the fuel injector electrical connector pins or fuel injector nozzles. The fuel injector is an electrical component and should not be immersed in any type of cleaner as this may damage the fuel injector.

IMPORTANT: Fuel injectors are serviced as complete assembly only.

1. Disconnect the negative battery cable.

2. Disconnect electrical connector from fuel injector.
3. Remove the fuel rail. Refer to Fuel Rail Removal Procedure.

4. Remove the fuel injector retainer clip.
5. Remove fuel injector assembly from fuel rail.
6. Remove O-ring from the fuel injector.

7. Remove O-ring backup from fuel injector.

014RX037

8. Connect the negative battery cable.

014RX035

Inspection Procedure

1. Inspect O-ring for crack, damage or leaks.
2. Replace worn or damaged O-ring.
3. Lubricate the new O-rings with engine oil before installation.

Installation Procedure

1. Lubricate the new O-ring with engine oil.
2. Install the O-ring backup on the fuel injector.
3. Install new O-ring on the fuel injector.
4. Install all four injector on the fuel rail.
5. Use new injector retainer clip to retain the injector to the fuel rail.
6. Coat the end of the fuel injector with engine oil.

014RX037

7. Install fuel rail assembly. Refer to Fuel Rail Installation Procedure.

Fuel Pressure Regulator

Removal Procedure

CAUTION: To reduce the risk of fire and personal injury, it is necessary to relieve the fuel system pressure before servicing the fuel system components.

CAUTION: After relieving the fuel system pressure, a small amount of fuel may be released when servicing fuel lines or connections. Reduce the chance of personal injury by covering the fuel line fitting with a shop towel before disconnecting the fittings. The towel will absorb any fuel that may leak out. When the disconnect is completed, place the towel in an approved container.

NOTE: Compressed air must never be used to test or clean a fuel pressure regulator, as damage to the fuel pressure regulator may occur.

014RX035

6E1-286 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

NOTE: To prevent damage to the fuel pressure regulator, do not immerse the pressure regulator in solvent.

1. Depressurize the fuel system. Refer to Fuel Pressure Relief Procedure.
2. Disconnect the negative battery cable.
3. Remove the fuel pump relay.
4. Disconnect the vacuum line from fuel pressure regulator.

014RX038

5. Remove the fuel pressure regulator retaining screw.
6. Remove the fuel pressure regulator retaining bracket.
7. Remove the fuel pressure regulator from fuel rail.

014RX039

Installation Procedure

1. Insert the fuel pressure regulator into the fuel rail.

014RX039

2. Install the fuel pressure regulator retaining bracket and tighten with a screw.
3. Connect vacuum line onto the fuel pressure regulator.

014RX038

4. Install the fuel pump relay.
5. Connect the negative battery cable.

6. Crank the engine until it starts. Cranking the engine may take longer than usual due to trapped air in the fuel line.

014RX035

Fuel Pressure Relief Procedure

CAUTION: To reduce the risk of fire and personal injury, it is necessary to relieve the fuel system pressure before servicing the fuel system components.

CAUTION: After relieving the fuel system pressure, a small amount of fuel may be released when servicing fuel lines or connections. Reduce the chance of personal injury by covering the fuel line fitting with a shop towel before disconnecting the fittings. The towel will absorb any fuel that may leak out. When the disconnect is completed, place the towel in an approved container.

1. Remove the fuel filler cap.

041RW005

2. Remove the fuel pump relay from the underhood relay box.
3. Start the engine and allow it to stall.

4. Crank the engine for about 30 seconds.
5. Disconnect the negative battery cable.

014RW089

Fuel Pump Assembly

Removal Procedure

1. Disconnect the negative battery cable.
2. Drain all fuel from fuel tank from filler neck.
3. Remove the fuel pump relay from the fuse and relay box at right side of engine room.

014RW089

6E1-288 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

4. Remove fuel tank. Refer to Fuel Tank Removal Procedure.
5. Using J-39763, twist the fuel pump counter-clockwise to release from fuel tank.

041RX001

6. Lift fuel pump to remove from fuel tank.

041RX002

Inspection Procedure

Inspect in-tank fuel filter for tears, damage or evidence of dirt, debris or water in the fuel. If any of these conditions exist, replace the in-tank fuel filter.

041RX003

Installation Procedure

1. Insert the fuel pump assembly into fuel tank and place them at its position.

041RX002

- Using J-39763, twist fuel pump assembly clock wise into the lock.

901RX036

- Install the fuel tank. Refer to Fuel Tank Installation Procedure.
- Install the fuel pump relay.
- Connect the negative battery cable.

041RX004

Fuel Pump Relay

Removal Procedure

- Remove the fuse and relay box cover located right side of engine room.
- Determine correct relay by consulting to the diagram on the cover.
- Insert a small screwdriver or use thumb pressure to release the retainer of the relay.
- Pull the relay straight up and out of the fuse and relay box.

Installation Procedure

- Inserts the relay into the correct place in the fuse and relay box with the catch slot aligned to retainer.
- Press down until the catch of retainer engages.
- Install fuse and relay box cover.

014RW089

Fuel Rail Assembly

Removal Procedure

NOTE:

- Use care when removing the fuel rail assembly in order to prevent damage to the injector electrical connector terminal and the injector spray tips.
- Fitting should be capped and holes plugged during servicing to prevent dirt and other contaminants from entering open lines and passage.

6E1-290 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

IMPORTANT: An eight-digit identification number is stamped on side of the fuel rail. Refer to this number when you service the fuel rail or when a replacement part is required.

1. Depressurize the fuel system. Refer to Fuel Pressure Relief Procedure.
2. Disconnect the fuel inlet at the rear of the engine.
3. Disconnect the fuel return line at front of the engine.
4. Disconnect the injector electrical connectors.
5. Remove the nuts holding wiring harness onto fuel rail.
6. Remove the bolts retaining fuel rail to the intake manifold.

Lift up the injectors carefully to separate them from intake manifold.

Lift up the fuel rail with injectors as assembly. Do not separate the fuel injectors from fuel rail.

If an injector become separated from fuel rail, injector backup O-ring and injector retainer clip must be replaced.

Drain residual fuel from fuel rail into an approved container.

7. If removal of fuel pressure regulator is necessary. Refer to Fuel Pressure Regulator Removal Procedure.
8. If removal of fuel injector is necessary. Refer to Fuel Injectors Removal Procedure.

Installation Procedure

1. Install the fuel injectors if necessary. Refer to Fuel Injector Installation Procedure.
2. Install the fuel pressure regulator if necessary. Refer to Fuel Pressure Regulator Installation Procedure.
3. Place the fuel injector rail assembly on the manifold and insert the injectors into each port by pushing fuel rail.

4. Install two fuel rail retaining bolts. Tighten fuel rail retaining bolts to 19 Nm (14 lb ft)
5. Place wiring harness in its place and secure it with two nuts.

6. Connect electrical connector to each fuel injector.

014RX036

7. Connect the fuel supply line securely. Do not over tighten.
8. Connect the fuel return line securely. Do not over tighten.
9. Connect the negative battery cable.
10. Crank the engine until it start. Cranking the engine may take longer than usual due to trapped air in the fuel system. Check for leak. If fuel leak is observed, stop engine immediately. Before correct fuel leak, be sure to depressurize system again.

014RX035

Fuel Tank

Removal Procedure

1. Disconnect the negative battery cable.
2. Remove fuel filler cap.

3. Drain the fuel from fuel filler neck.
4. Disconnect the fuel filler hose at fuel tank.
5. Disconnect the air breather hose at the fuel tank.
6. Disconnect the evaporator hose at the fuel tank.
7. Hold entire fuel tank at the bottom with stands.
8. Disconnect fuel supply lines and fuel return line at near the fuel filter inside of body frame.

041RX005

9. Remove four bolts (two in front and two in rear) holding fuel tank to the frame.
10. Lower tank assembly from the vehicle a little to make access space on top.
11. Disconnect two electrical connectors at fuel pump.

041RX006

12. Remove fuel tank assembly from the vehicle.
13. Remove four nuts retaining tank under guard to the tank.

14. Remove the tank from the guard.

Installation Procedure

1. Secure fuel tank into under guard with four retaining bolts, if necessary.
2. Place the fuel tank assembly onto stands.
3. Lift the fuel tank assembly near the position.
4. Connect two electrical connectors at fuel pump.
5. Lift the fuel pump to its position and secure it with four mounting bolts. Make sure that all hoses and fuel lines are out of way between the fuel tank and the fuel tank bracket. Tighten the fuel tank retaining bolts to 36 Nm (27 lb ft).

6. Connect fuel supply and return lines.

7. Connect the fuel filler hose, the air breather hose and EVAP hose onto fuel tank and secure them with clamps.

8. Pour fuel into fuel tank.
9. Install fuel filler cap securely.
10. Connect the battery negative cable.

Throttle body (TB)

Removal Procedure

1. Disconnect the negative battery cable.
2. Drain the cooling system. Refer to Cooling System.
3. Remove the air intake duct. Refer to Air Intake Duct Removal Procedure.
4. Remove the accelerator cable from throttle. Refer to Accelerator Cable Assembly Removal Procedure.

5. Disconnect the electrical connectors from the throttle position sensor and the idle air control valve solenoid.
6. Disconnect all vacuum hoses below air horn.
7. Disconnect coolant lines.

014RX025

8. Remove the mounting bolts retaining the throttle body the intake manifold.
9. Lift up the throttle body from the intake manifolds.

014RX040

10. Remove the gaskets from the intake manifolds.
11. Remove the IAC. Refer to Idle Air Control Valve Solenoid Removal Procedure.
12. Remove TPS. Refer to Throttle Position Sensor Removal Procedure.

Inspection Procedure

NOTE: Do not use solvent of any type when you clean the gasket surfaces on the intake manifold and the throttle body assembly. The gasket surface and the throttle body assembly may be damaged as results.

1. If the throttle body gasket needs to be released, remove any gasket material that may be stuck to the mating surfaces of the manifold.
2. Do not leave any scratches in the aluminum casting.

014RX041

Installation Procedure

1. Install IAC valve onto the throttle body. Refer to Idle Air Control Valve Solenoid Installation Procedure.
2. Install TPS onto the throttle body if necessary. Refer to TPS Installation Procedure.
3. Place the gasket then the throttle body on the manifold.
4. Install four mounting bolt. Tighten the throttle body mounting bolt to 13.5 Nm (10 lb ft).

014RX041

5. Connect coolant line and secure them with clamps.
6. Connect all vacuum hoses and secure them with clamps if necessary.
7. Install accelerator control cable bracket onto the throttle body.

8. Connect accelerator control cable to throttle plate.

014RX025

9. Connect electrical connector at IAC valve and TPS.
10. Install the air intake duct. Refer to Air Intake Duct Installation Procedure.
11. Fill the cooling system with required coolant. Refer to Engine Cooling System.
12. Connect the negative battery cable.

101RX002

ELECTRONIC IGNITION SYSTEM Ignition Control Module (ICM)

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the electrical connector from the ignition control module.
3. Remove the two attaching screws.
4. Remove the ignition control module from the engine block.

Installation Procedure

1. Fasten the module to the engine block with two screws.
2. Reconnect the electrical connector.
3. Reconnect the negative battery terminal.

041RX042

Ignition Coil

Removal Procedure

1. Disconnect the negative battery cable.
2. Drain the cooling system. Refer to Engine Cooling System.
3. Remove the heater supply and return hose.
4. Remove the coolant return hose.
5. Disconnect all four spark plug cables from the coil.
6. Disconnect electrical connector from the ignition coil.
7. Remove three mounting bolt from the ignition coil.
8. Remove the ignition coil from the bracket.

Spark Plugs

Removal Procedure

Type: NGK BPR6ES-11

Spark Gap : 1.05 MM (0.040")

Spark Plug Torque : 25 Nm (2.6 kg-m/18 lb ft)

1. Disconnect the negative battery cable.
2. Remove four bolt holding spark plug cover plate to top of valve cover, and remove the cover plate.
3. Pull ignition wire using hocks attached to end of spark plug cable.

Installation Procedure

1. Install the ignition coil onto the bracket with three mounting bolts.
2. Connect electrical connector at the ignition coil.
3. Connect spark plug cable to the ignition coil.
4. Connect heater supply and return hose and secure them with clamps.
5. Connect coolant return line and secure them with clamps.
6. Fill the cooling system with required coolant. Refer to Engine Cooling System.
7. Connect the negative battery cable.

4. Remove the spark plug.

014RX045

Inspection Procedure

1. Check the insulator for cracks. Replace the spark plug if crack are present.
2. Check the electrode condition and replace the spark plug if necessary.

014RX046

If the spark plug electrodes and insulators are fouled with carbon or oil, the engine will not operate efficiently. There are number of possible causes:

- Fuel mixture is too rich.
- Oil in the combustion chamber.
- The spark plug gap is not set correctly.

If spark plug fouling is excessive, check the fuel and electrical system for possible causes of trouble. If fuel and electrical system are normal, install spark plug of a higher heat range which have the same physical dimensions as the original equipment spark plug. The following symptoms are characteristics of spark plugs that are running too hot:

- Fuel mixture is too lean.
- Heat range is incorrect.

014RX047

If vehicle usage does not conform to normal driving conditions, a more suitable spark plug may be substituted.

If fuel and electrical system are normal, in most cases of this sort, the problem can be corrected by using a colder type spark plug with the same physical dimensions as the original equipment spark plug.

3. Check the gaskets for damage and replace if necessary.
4. Measure the spark plug gap. The specification is 1.05 mm (0.040").
5. Adjust the spark gap by bending the grounded electrode.

014RX048

Installation Procedure

1. Tighten the spark plug to the 25 Nm (2.6 kg-m/18 lb ft).
2. Push the spark plug cable in until it snaps in.

3. Install spark plug cover onto valve cover and secure it with four retaining bolts.

014RX049

Spark Plug Cables

Spark Plug Cables

The cable contains a synthetic conductor which is easily damaged. Never stretch or kink the cable. Disconnect the cable from spark plug and the ignition coil.

The original equipment cables and the ignition coil are marked to show correct location of the cables. If spark plug cables or the ignition coil are replaced previously, before cables are removed from the ignition coil, mark the cables and the coil so they can be reconnected in the same position.

014RX050

Inspection Procedure

NOTE: Never puncture the spark plug cable's insulation with a needle or the pointed end of a probe into the cable. An increase in resistance would be created which would cause the cable to become defective.

1. If the cable has broken or cracked insulation, it must be replaced.
2. If the terminals are corroded or loose, the cable must be replaced.
3. Check that the cable resistance does not exceed 10 k Ω per foot.

014RX051

EMISSIONS Catalytic Converter

Catalytic Converter

Refer to Engine Exhaust.

Air Conditioning Relay

Removal Procedure

1. Remove the fuse and relay box cover at right side of engine room.
2. Refer to the diagram on the cover to determine which is the correct relay.
3. Insert small screwdriver or use thumb pressure to release the retainer of the relay.

4. Pull the relay straight up and out of the fuse and relay box.

Installation Procedure

1. Insert the relay into the correct place in the fuse and relay box with the catch slot aligned to retainer.
2. Press down until the catch of retainer engages.
3. Install fuse and relay box cover.

Ignition Timing Adjustment

Ignition Timing Adjustment

There is no timing adjustment. The timing signal is furnished by the CKP and the CMP signal. ECM control the ignition timing.

EVAP Canister Hoses

EVAP Canister Hoses

To see the routing of the EVAP canister hoses, refer to Vehicle Emission Control Information in Diagnosis or Emission Label located bottom side of the hood. Use 6148M or equivalent when you replace the EVAP canister hoses.

EVAP Canister

Removal Procedure

1. Disconnect all hoses.
2. Remove two mounting bracket nuts.

Inspection Procedure

1. Inspect the hoses for cracks, damage and leaks.

2. Inspect the canister for damages.

Installation Procedure

1. Install EVAP canister onto crossmember with two mounting bolts.
2. Connect all hoses and secure them with clamps.

Linear Exhaust Gas Recirculation (EGR) Valve

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect electrical connector at EGR valve.
3. Disconnect the electrical connector at Intake Air Temperature Sensor.
4. Remove air intake duct. Refer to Air Intake Duct Removal Procedure.
5. Remove crankshaft breather hose.

6. Remove two bolts holding EGR valve.
7. Remove EGR valve and gasket from the manifold.

057RX001

5. Install the air intake duct. Refer to Air Intake Duct Installation Procedure.
6. Connect the negative battery cable.

014RX057

Inspection Procedure

1. Inspect the air passage for a restriction. If there is restriction, remove the object. Do not use any type of solvent, it may damage electrical system of EGR valve.
2. Inspect restriction for valve movement. If there is restriction remove the object.

014RX056

Installation Procedure

1. Place the gasket and EGR valve on to the intake manifold.
2. Install mounting bolts and tighten.
3. Connect electrical connector at EGR valve
4. Connect the crankshaft breather hose and secure it with clamps.

Wiring and Connectors

Wiring Harness Service

The control module harness electrically connects the control module to the various solenoids, switches and sensors in the vehicle engine compartment and passenger compartment.

Replace wire harnesses with the proper part number replacement.

Because of the low amperage and voltage levels utilized in powertrain control systems, it is essential that all wiring in environmentally exposed areas be repaired with crimp and seal splice sleeves.

The following wire harness repair information is intended as a general guideline only. Refer to Chassis Electrical for all wire harness repair procedures.

ECM Connectors And Terminals

Removal Procedure

1. Remove the connector terminal retainer.
2. Push the wire connected to the affected terminal through the connector face so that the terminal is exposed.
3. Service the terminal as necessary.

Installation Procedure

1. Bend the tab on the connector to allow the terminal to be pulled into position within the connector.
2. Pull carefully on the wire to install the connector terminal retainer.

Connectors And Terminals

Connectors And Terminals

Use care when probing a connector and when replacing terminals. It is possible to short between opposite terminals. Damage to components could result. Always use jumper wires between connectors for circuit checking. NEVER probe through Weather-Pack seals. Use an appropriate connector test adapter kit which contains an assortment of flexible connectors used to probe terminals during diagnosis. Use an appropriate fuse remover and test tool for removing a fuse and to adapt the fuse holder to a meter for diagnosis.

Open circuits are often difficult to locate by sight because oxidation or terminal misalignment are hidden by the connectors. Merely wiggling a connector on a sensor, or in the wiring harness, may temporarily correct the open circuit. Intermittent problems may also be caused by oxidized or loose connections.

Be certain of the type of connector/terminal before making any connector or terminal repair. Weather-Pack and Com-Pack III terminals look similar, but are serviced differently.

Wire Harness Repair: Twisted Shielded Cable

Removal Procedure

1. Remove the outer jacket.
2. Unwrap the aluminum/mylar tape. Do not remove the mylar.

047

3. Untwist the conductors.
4. Strip the insulation as necessary.

048

Installation Procedure

1. Splice the wires using splice clips and rosin core solder.
2. Wrap each splice to insulate.
3. Wrap the splice with mylar and with the drain (uninsulated) wire.

049

4. Tape over the whole bundle to secure.

050

Twisted Leads

Removal Procedure

1. Locate the damaged wire.
2. Remove the insulation as required.

051

Installation Procedure

1. Use splice clips and rosin core solder in order to splice the two wires together.

052

2. Cover the splice with tape in order to insulate it from the other wires.

053

3. Twist the wires as they were before starting this procedure.

054

4. Tape the wires with electrical tape.

055

Weather-Pack Connector

Tools Required

5-8840-0388-0 Weather-Pack II Terminal Remover

Removal Procedure

A Weather-Pack connector can be identified by a rubber seal at the rear of the connector. This engine room connector protects against moisture and dirt, which could form oxidation and deposits on the terminals. This protection is important, because of the low voltage and the low amperage found in the electronic systems.

1. Open the secondary lock hinge on the connector.

070

2. Use tool 5-8840-0388-0 or the equivalent to remove the pin and the sleeve terminals. Push on 5-8840-0388-0 to release.

NOTE: Do not use an ordinary pick or the terminal may be bent or deformed. Unlike standard blade terminals, these terminals cannot be straightened after they have been improperly bent.

071

3. Cut the wire immediately behind the cable seal.

072

Installation Procedure

Make certain the connectors are properly seated and all of the sealing rings are in place when you reconnect the leads. The secondary lock hinge provides a backup locking feature for the connector. The secondary lock hinge is used for added reliability. This flap should retain the terminals even if the small terminal lock tangs are not positioned properly.

Do not replace the Weather-Pack connections with standard connections. Read the instructions provided with the Weather-Pack connector and terminal packages.

1. Replace the terminal.
2. Slip the new seal onto the wire.
3. Strip 5 mm (0.2") of insulation from the wire.
4. Crimp the terminal over the wire and the seal.

073

5. Push the terminal and the connector to engage the locking tangs.
6. Close the secondary locking hinge.

Com-Pack III

Com-Pack III

The Com-Pack III terminal looks similar to some Weather-Pack terminals. This terminal is not sealed and is used where resistance to the environment is not required. Use the standard method when repairing a terminal. Do not use the Weather-Pack terminal tool 5-8840-0388-0 or equivalent. These will damage the terminals.

070

Metri-Pack

Tools Required

5-8840-0632-0 Terminal Remover

Removal Procedure

Some connectors use terminals called Metri-Pack Series 150. These may be used at the engine coolant temperature (ECT) sensor.

1. Slide the seal (1) back on the wire.
2. Insert the 5-8840-0632-0 tool or equivalent (3) in order to release the terminal locking tang (2).
3. Push the wire and the terminal out through the connector. If you reuse the terminal, reshape the locking tang.

Installation Procedure

Metri-Pack terminals are also referred to as "pull-to-seat" terminals.

1. In order to install a terminal on a wire, the wire must be inserted through the seal (2) and through the connector (3).
2. The terminal (1) is then crimped onto the wire.
3. Then the terminal is pulled back into the connector to seat it in place.

GENERAL DESCRIPTION — ECM AND SENSORS

58X Reference ECM Input

The engine control module (ECM) uses this signal from the crankshaft position (CKP) sensor to calculate engine RPM and crankshaft position at all speeds. The ECM also uses the pulses on this circuit to initiate injector pulses. If the ECM receives no pulses on this circuit, DTC P0337 will set. If the ECM receives a number of pulses

other than the expected amount, DTC P0336 will set. The engine will not start and run without using the 58X reference signal.

A/C Request Signal

This signal tells the ECM when the A/C mode is selected at the A/C control switch. The ECM uses this signal to adjust the idle speed before turning ON the A/C clutch. The A/C compressor will be inoperative if this signal is not available to the ECM.

For A/C wiring diagrams and diagnosis for the A/C electrical system, refer to A/C Clutch Circuit Diagnosis.

Crankshaft Position (CKP) Sensor

The crankshaft position (CKP) sensor provides a signal used by the powertrain control module (ECM) to calculate the ignition sequence. The CKP sensor initiates the 58X reference pulses which the ECM uses to calculate RPM and crankshaft position. For additional information, refer to Electronic Ignition System.

Camshaft Position (CMP) Sensor And Signal

The camshaft position (CMP) sensor sends a signal to the ECM. The ECM uses this signal as a "sync pulse" to trigger the injectors in the proper sequence. The ECM uses the CMP signal to indicate the position of the #1 piston during its power stroke. The CMP allows the ECM to calculate true sequential fuel injection (SFI) mode of operation. If the ECM detects an incorrect CMP signal while the engine is running, DTC P0341 will set.

If the CMP signal is lost while the engine is running, the fuel injection system will shift to a calculated sequential fuel injection mode based on the last fuel injection pulse, and the engine will continue to run. It will run in the calculated sequential mode with a 1-in-4 chance of the injector sequence being correct.

For further information, refer to
DTC P0341
DTC P0342.

014RX007

Engine Coolant Temperature (ECT) Sensor

The engine coolant temperature (ECT) sensor is a thermistor (a resistor which changes value based on temperature) mounted in the engine coolant stream. Low coolant temperature produces a high resistance of about 100,000 Ω at -40°C (-40°F). High temperature causes a low resistance of about 70 Ω at 130°C (266°F).

The ECM supplies a 5-volt signal to the ECT sensor through resistors internal to the ECM and then measures the voltage after the internal resistor. This signal voltage will be high when the engine is cold and low when the engine is hot. By measuring the voltage, the ECM calculates the engine coolant temperature. Engine coolant temperature affects most of the systems that the ECM controls.

The Tech 2 displays engine coolant temperature in degrees. After engine start-up, the temperature should rise steadily to about 85°C (185°F). It then stabilizes when the thermostat opens. If the engine has not been run for several hours (overnight), the engine coolant temperature and intake air temperature displays should be close to each other. A hard fault in the engine coolant sensor circuit will set DTC P0117 or DTC P0118. An intermittent fault will set a DTC P1114 or P1115.

0016

Electrically Erasable Programmable Read Only Memory (EEPROM)

The electrically erasable programmable read only memory (EEPROM) is a permanent memory chip that is physically soldered within the ECM. The EEPROM contains the program and the calibration information that the ECM needs to control powertrain operation.

Unlike the PROM used in past applications, the EEPROM is not replaceable.

Fuel Control Heated Oxygen Sensor (Pre Catalyst)

The fuel control heated oxygen sensor (Bank 1 HO2S 1) is mounted in the exhaust stream where it can monitor the oxygen content of the exhaust gas. The oxygen present in the exhaust gas reacts with the sensor to produce a voltage output. This voltage should constantly fluctuate from approximately 100 mV to 900 mV. The heated oxygen sensor voltage can be monitored with a Tech 2. By monitoring the voltage output of the oxygen sensor, the ECM calculates the pulse width command for the injectors to produce the proper combustion chamber mixture.

- Low HO2S voltage is a lean mixture which will result in a rich command to compensate.
- High HO2S voltage is a rich mixture which will result in a lean command to compensate.

An open Bank 1 HO2S 1 signal circuit will set a DTC P0134 and the Tech 2 will display a constant voltage between 400–500 mV. A constant voltage below 300 mV in the sensor circuit (circuit grounded) will set DTC P0131. A constant voltage above 800 mV in the circuit will set DTC P0132. The ECM can also detect HO2S response problems. If the response time of an HO2S is determined to be too slow, the ECM will store a DTC that indicates degraded HO2S performance.

Intake Air Temperature (IAT) Sensor

The intake air temperature (IAT) sensor is a thermistor which changes its resistance based on the temperature of air entering the engine. Low temperature produces a high resistance of about 100,000 Ω at -40°C (-104°F). High temperature causes low resistance of about 70 Ω at 130°C (266°F). The ECM supplies a 5-volt signal to the sensor through a resistor internal to the ECM, and then monitors the signal voltage. The voltage will be high when the incoming air is cold. The voltage will be low when the incoming air is hot. By measuring the voltage, the ECM calculates the incoming air temperature. The IAT sensor signal is used to adjust spark timing according to the incoming air density.

The Tech 2 displays the temperature of the air entering the engine. The temperature should read close to the ambient air temperature when the engine is cold and rise as underhood temperature increases. If the engine has not been run for several hours (overnight), the IAT sensor temperature and engine coolant temperature should read close to each other. A failure in the IAT sensor circuit will set DTC P0112, or DTC P0113.

Linear Exhaust Gas Recirculation (EGR) Control

The ECM monitors the exhaust gas recirculation (EGR) actual position and adjusts the pintle position accordingly. The ECM uses information from the following sensors to control the pintle position:

- Engine coolant temperature (ECT) sensor.
- Throttle position (TP) sensor.
- Manifold Absolute Pressure (MAP) sensor.

Manifold Absolute Pressure (MAP) Sensor

The manifold absolute pressure (MAP) sensor responds to changes in intake manifold pressure (vacuum). The MAP sensor signal voltage to the ECM varies from below 2 volts at idle (high vacuum) to above 4 volts with the ignition ON, engine not running or at wide-open throttle (low vacuum).

The MAP sensor is used to determine the following:

- Manifold pressure changes while the linear EGR flow test diagnostic is being run. Refer to DTC P0401.
- Engine vacuum level for other diagnostics.
- Barometric pressure (BARO).

If the ECM detects a voltage that is lower than the possible range of the MAP sensor, DTC P0107 will be set. A signal voltage higher than the possible range of the sensor will set DTC P0108. The ECM can detect a shifted MAP sensor. The ECM compares the MAP sensor signal to a calculated MAP based on throttle position and various engine load factors.

Engine Control Module (ECM)

The engine control module (ECM) is located in the passenger compartment below the center console. The ECM controls the following:

- Fuel metering system.
- Ignition timing.
- On-board diagnostics for powertrain functions.

The ECM constantly observes the information from various sensors. The ECM controls the systems that affect vehicle performance. The ECM performs the diagnostic function of the system. It can recognize operational problems, alert the driver through the Check Engine lamp, and store diagnostic trouble codes (DTCs). DTCs identify the problem areas to aid the technician in making repairs.

014RX002

ECM Function

The ECM supplies either 5 or 12 volts to power various sensors or switches. The power is supplied through resistors in the ECM which are so high in value that a test light will not light when connected to the circuit. In some cases, even an ordinary shop voltmeter will not give an accurate reading because its resistance is too low. Therefore, a digital voltmeter with at least 10 meg Ω input impedance is required to ensure accurate voltage readings. Tool J 39200 meets this requirement.

The ECM controls output circuits such as the injectors, IAC, cooling fan relays, etc., by controlling the ground or the power feed circuit through transistors or through either of the following two devices:

- Output Driver Module (ODM)
- Quad Driver Module (QDM)

ECM Components

The ECM is designed to maintain exhaust emission levels to government mandated standards while providing excellent driveability and fuel efficiency. The ECM monitors numerous engine and vehicle functions via electronic sensors such as the throttle position (TP) sensor, heated oxygen sensor (HO2S), and vehicle

speed sensor (VSS). The ECM also controls certain engine operations through the following:

- Fuel injector control
- Ignition control module
- Evaporative emission (EVAP) purge
- A/C clutch control

ECM Voltage Description

The ECM supplies a buffered voltage to various switches and sensors. It can do this because resistors in the ECM which are so high in value that a test light may not illuminate when connected to the circuit. An ordinary shop voltmeter may not give an accurate reading because the voltmeter input impedance is too low. Use a 10-megohm input impedance digital voltmeter (such as J 39200) to assure accurate voltage readings.

The input/output devices in the ECM include analog-to-digital converters, signal buffers, counters, and special drivers. The ECM controls most components with electronic switches which complete a ground circuit when turned ON. These switches are arranged in groups of 4 and 7, called either a quad driver module (QDM), which can independently control up to 4 output terminals, or Output Driver Module (ODM) which can independently control up to 7 outputs. Not all outputs are always used.

ECM Inputs/Outputs

Inputs – Operating Conditions Read

- Air Conditioning Compressor Clutch ON or OFF
- Engine Coolant Temperature
- Crankshaft Position
- Exhaust Oxygen Content
- Manifold Absolute Pressure
- Battery Voltage
- Throttle Position
- Fuel Tank Vapor Pressure
- Fuel Tank Level
- Exhaust Gas Recirculation (EGR) Feedback
- Knock
- Vehicle Speed
- Fuel Pump Voltage
- Power Steering Pressure
- Intake Air Temperature
- Camshaft Position

Outputs – Systems Controlled

- EVAP Canister Purge Solenoid
- Exhaust Gas Recirculation (EGR)
- Ignition Control
- Fuel Injector Control
- Idle Air Control
- Coolant Fan Relays
- Electric Fuel Pump Relay Compressor Clutch Relay
- Air Conditioning

- Diagnostics
 - OBD II Malfunction Indicator Lamp (Check Engine lamp)
 - Data Link Connector (DLC)
 - Data Output
- Tachometer Signal

ECM Service Precautions

The ECM is designed to withstand normal current draws associated with vehicle operation. Avoid over loading any circuit. When testing for opens and shorts, do not ground or apply voltage to any of the ECM's circuits unless instructed to do so. These circuits should only be tested using digital voltmeter J 39200. The ECM should remain connected to the ECM or to a recommended breakout box.

Throttle Position (TP) Sensor

The throttle position (TP) sensor is a potentiometer connected to the throttle shaft on the throttle body. The ECM monitors the voltage on the signal line and calculates throttle position. As the throttle valve angle is changed (accelerator pedal moved), the TP sensor signal also changes. At a closed throttle position, the output of the TP sensor is about 0.25 volts. As the throttle valve opens, the output increases so that at wide open throttle (WOT), the output voltage should be about 4.75 volts. The ECM calculates fuel delivery based on throttle valve angle (driver demand). A broken or loose TP sensor may cause intermittent bursts of fuel from an injector and unstable idle because the ECM thinks the throttle is moving. A hard failure in the TP sensor 5-volt reference or signal circuits will set either a DTC P0122 or DTC P0123. A hard failure with the TP sensor ground circuit may set DTC P0123 and DTC P0122. Once a DTC is set, the ECM will use an artificial default value based on engine RPM and mass air flow for the throttle position, and some vehicle performance will return. A high idle may result when either DTC P0122 or DTC P0123 is set. The ECM can detect intermittent TP sensor faults.

Transmission Range Switch

IMPORTANT: The vehicle should not be driven with the transmission range switch disconnected; idle quality will be affected.

The four inputs from the transmission range switch indicate to the ECM which position is selected by the transmission selector lever. This information is used for ignition timing, EVAP canister purge, EGR and IAC valve operation.

For more information on the transmission range switch, refer to 4L30-E Automatic Transmission.

Vehicle Speed Sensor (VSS)

The ECM determines the speed of the vehicle by converting a pulsing voltage signal from the vehicle speed sensor (VSS) into miles per hour. The ECM uses this signal to operate the speedometer.

Use of Circuit Testing Tools

Do not use a test light to diagnose the powertrain electrical systems unless specifically instructed by the

diagnostic procedures. Use Connector Test Adapter Kit J 35616 whenever diagnostic procedures call for probing connectors.

Aftermarket Electrical And Vacuum Equipment

Aftermarket (add-on) electrical and vacuum equipment is defined as any equipment which connects to the vehicle's electrical or vacuum systems that is installed on a vehicle after it leaves the factory. No allowances have been made in the vehicle design for this type of equipment.

NOTE: No add-on vacuum equipment should be added to this vehicle.

NOTE: Add-on electrical equipment must only be connected to the vehicle's electrical system at the battery (power and ground).

Add-on electrical equipment, even when installed to these guidelines, may still cause the powertrain system to malfunction. This may also include equipment not connected to the vehicle electrical system such as portable telephones and radios. Therefore, the first step in diagnosing any powertrain problem is to eliminate all aftermarket electrical equipment from the vehicle. After this is done, if the problem still exists, it may be diagnosed in the normal manner.

Electrostatic Discharge Damage

Electronic components used in the ECM are often designed to carry very low voltage. Electronic components are susceptible to damage caused by electrostatic discharge. Less than 100 volts of static electricity can cause damage to some electronic components. By comparison, it takes as much as 4000 volts for a person to feel even the zap of a static discharge.

There are several ways for a person to become statically charged. The most common methods of charging are by friction and induction.

- An example of charging by friction is a person sliding across a vehicle seat.
- Charge by induction occurs when a person with well-insulated shoes stands near a highly charged object and momentarily touches ground. Charges of the same polarity are drained off leaving the person highly charged with the opposite polarity. Static charges can cause damage, therefore it is important to use care when handling and testing electronic components.

TS23795

NOTE: To prevent possible electrostatic discharge damage, follow these guidelines:

- Do not touch the ECM connector pins or soldered components on the ECM circuit board.
- Do not touch any electronic sensor module component leads.
- Do not open the replacement part package until the part is ready to be installed.
- Before removing the part from the package, ground the package to a known good ground on the vehicle.
- If the part has been handled while sliding across the seat, while sitting down from a standing position, or while walking a distance, touch a known good ground before installing the part.

GENERAL DESCRIPTION — AIR INDUCTION

Air Induction System

The air induction system filters contaminants from the outside air, and directs the progress of the air as it is drawn into the engine. A remote-mounted air cleaner prevents dirt and debris in the air from entering the engine. The air duct assembly routes filtered air to the throttle body. Air enters the engine by the following steps:

1. Through the throttle body.
2. Into the intake manifold.
3. Through the cylinder head intake ports.
4. Into the cylinders.

GENERAL DESCRIPTION — FUEL METERING

Acceleration Mode

The ECM provides extra fuel when it detects a rapid increase in the throttle position and the air flow.

Accelerator Controls

The accelerator control system is a cable-type system with specific linkage adjustments. Refer to Cable Adjustment.

Battery Voltage Correction Mode

When battery voltage is low, the ECM will compensate for the weak spark by increasing the following:

- The amount of fuel delivered.
- The idle RPM.

CMP Signal

The ECM uses the camshaft position (CMP) sensor signal to determine the position of the number 1 piston during its power stroke, allowing the ECM to calculate true sequential multiport fuel injection (SFI). Loss of this signal will set a DTC P0341 or DTC P0342. If the CMP signal is lost while the engine is running, the fuel injection system will shift to a calculated sequential fuel injection based on the last fuel injection pulse, and the engine will continue to run. The engine can be restarted and will run in the calculated sequential mode with the fault is present, with a 1-in-4 chance of being correct.

Clear Flood Mode

Clear a flooded engine by pushing the accelerator pedal down all the way. The ECM then de-energizes the fuel injectors. The ECM holds the fuel injectors de-energized as long as the throttle remains above 80% and the engine speed is below 800 RPM. If the throttle position becomes less than 80%, the ECM again begins to pulse the injectors ON and OFF, allowing fuel into the cylinders.

Deceleration Fuel Cutoff (DFCO) Mode

The ECM reduces the amount of fuel injected when it detects a decrease in the throttle position and the air flow. When deceleration is very fast, the ECM may cut off fuel completely for short periods.

Engine Speed/Vehicle Speed/ Fuel Disable Mode

The ECM monitors engine speed. It turns off the fuel injectors when the engine speed increases above 6000 RPM. The fuel injectors are turned back on when engine speed decreases below 5750 RPM.

Fuel Cutoff Mode

No fuel is delivered by the fuel injectors when the ignition is OFF. This prevents engine run-on. In addition, the ECM suspends fuel delivery if no reference pulses are detected (engine not running) to prevent engine flooding.

Fuel Injector

The sequential multiport fuel injection (SFI) fuel injector is a solenoid-operated device controlled by the ECM. The ECM energizes the solenoid, which opens a valve to allow fuel delivery.

The fuel is injected under pressure in a conical spray pattern at the opening of the intake valve. Excess fuel not used by the injectors passes through the fuel pressure regulator before being returned to the fuel tank.

A fuel injector which is stuck partly open will cause a loss of fuel pressure after engine shut down, causing long crank times.

Fuel Metering System Components

The fuel metering system is made up of the following parts:

- The fuel injectors.
- The throttle body.
- The fuel rail.
- The fuel pressure regulator.
- The ECM.
- The crankshaft position (CKP) sensor.

- The camshaft position (CMP) sensor.
- The idle air control (IAC) valve.
- The fuel pump.
- The fuel pump relay.

Basic System Operation

The fuel metering system starts with the fuel in the fuel tank. An electric fuel pump, located in the fuel tank, pumps fuel to the fuel rail through an in-line fuel filter. The pump is designed to provide fuel at a pressure above the pressure needed by the injectors. A fuel pressure regulator in the fuel rail keeps fuel available to the fuel injectors at a constant pressure. A return line delivers unused fuel back to the fuel tank. Refer to Section 6C for further information on the fuel tank, line filter, and fuel pipes.

Fuel Metering System Purpose

The basic function of the air/fuel metering system is to control the air/fuel delivery to the engine. Fuel is delivered to the engine by individual fuel injectors mounted in the intake manifold near each intake valve.

The main control sensor is the heated oxygen sensor (HO₂S) located in the exhaust system. The HO₂S tells the ECM how much oxygen is in the exhaust gas. The ECM changes the air/fuel ratio to the engine by controlling the amount of time that the fuel injector is ON. The best mixture to minimize exhaust emissions is 14.7 parts of air to 1 part of gasoline by weight, which allows the catalytic converter to operate most efficiently. Because of the constant measuring and adjusting of the air/fuel ratio, the fuel injection system is called a "Closed Loop" system.

The ECM monitors signals from several sensors in order to determine the fuel needs of the engine. Fuel is delivered under one of several conditions called "modes." All modes are controlled by the ECM.

Fuel Pressure Regulator

The fuel pressure regulator is a diaphragm-operated relief valve mounted on the fuel rail with fuel pump pressure on one side and manifold pressure on the other side. The fuel pressure regulator maintains the fuel pressure available to the injector at three times barometric pressure adjusted for engine load. It may be serviced separately.

If the pressure is too low, poor performance and a DTC P0171, or DTC P1171 will be the result. If the pressure is too high, a DTC P0172 will be the result. For information on diagnosing fuel pressure conditions, refer to Fuel System Diagnosis.

014RX036

Fuel Pump Electrical Circuit

When the key is first turned ON, the ECM energizes the fuel pump relay for two seconds to build-up the fuel pressure quickly. If the engine is not started within two seconds, the ECM shuts the fuel pump off and waits until the engine is cranked. When the engine is cranked and the 58X crankshaft position signal has been detected by the ECM, the ECM supplies 12 volts to the fuel pump relay to energize the electric in-tank fuel pump.

An inoperative fuel pump will cause a "no-start" condition. A fuel pump which does not provide enough pressure will result in poor performance.

Fuel Rail

The fuel rail is mounted to the top of the engine and distributes fuel to the individual injectors. Fuel is delivered to the fuel inlet tube of the fuel rail by the fuel lines. The fuel goes through the fuel rail to the fuel pressure regulator. The fuel pressure regulator maintains a constant fuel pressure at the injectors. Remaining fuel is then returned to the fuel tank.

014RX036

Idle Air Control (IAC) Valve

The purpose of the idle air control (IAC) valve is to control engine idle speed, while preventing stalls due to changes in engine load. The IAC valve, mounted in the throttle body, controls bypass air around the throttle plate. By moving the conical valve (pintle) in (to decrease air flow) or out (to increase air flow), a controlled amount of air can move around the throttle plate. If the RPM is too low, the ECM will retract the IAC pintle, resulting in more air moving past the throttle plate to increase the RPM. If the RPM is too high, the ECM will extend the IAC pintle, allowing less air to move past the throttle plate, decreasing the RPM.

The IAC pintle valve moves in small steps called counts. During idle, the proper position of the IAC pintle is calculated by the ECM based on battery voltage, coolant temperature, engine load, and engine RPM. If the RPM drops below a specified value, and the throttle plate is closed, the ECM senses a near-stall condition. The ECM will then calculate a new IAC pintle valve position to prevent stalls.

If the IAC valve is disconnected and reconnected with the engine running, the idle RPM will be wrong. In this case, the IAC must be reset. The IAC resets when the key is cycled ON then OFF. When servicing the IAC, it should only be disconnected or connected with the ignition OFF. The position of the IAC pintle valve affects engine start-up and the idle characteristics of the vehicle. If the IAC pintle is fully open, too much air will be allowed into the manifold. This results in high idle speed, along with possible hard starting and a lean air/fuel ratio. DTC P0507 may set. If the IAC pintle is stuck closed, too little air will be allowed in the manifold. This results in a low idle speed, along with possible hard starting and a rich air/fuel ratio. DTC P0506 may set. If the IAC pintle is stuck part-way open, the idle may be high or low and will not respond to changes in the engine load.

0006

Run Mode

The run mode has the following two conditions:

- Open Loop
- Closed Loop

When the engine is first started, the system is in "Open Loop" operation. In "Open Loop," the ECM ignores the signal from the heated oxygen sensor (HO2S). It calculates the air/fuel ratio based on inputs from the TP, ECT, and MAP sensors.

The system remains in "Open Loop" until the following conditions are met:

- The HO2S has a varying voltage output showing that it is hot enough to operate properly (this depends on temperature).
- The ECT has reached a specified temperature.
- A specific amount of time has elapsed since starting the engine.
- Engine speed has been greater than a specified RPM since start-up.

The specific values for the above conditions vary with different engines and are stored in the programmable read only memory (PROM). When these conditions are met, the system enters "Closed Loop" operation. In "Closed Loop", the ECM calculates the air/fuel ratio (injector on-time) based on the signal from the HO2S. This allows the air/fuel ratio to stay very close to 14.7:1.

Starting Mode

When the ignition is first turned ON, the ECM energizes the fuel pump relay for two seconds to allow the fuel pump to build up pressure. The ECM then checks the engine coolant temperature (ECT) sensor and the throttle position (TP) sensor to determine the proper air/fuel ratio for starting.

The ECM controls the amount of fuel delivered in the starting mode by adjusting how long the fuel injectors are energized by pulsing the injectors for very short times.

Throttle Body Unit

The throttle body has a throttle plate to control the amount of air delivered to the engine. The TP sensor and IAC valve are also mounted on the throttle body.

Vacuum ports located behind the throttle plate provide the vacuum signals needed by various components. Engine coolant is directed through a coolant cavity in the throttle body to warm the throttle valve and to prevent icing.

014RX040

GENERAL DESCRIPTION — ELECTRONIC IGNITION SYSTEM

Camshaft Position (CMP) Sensor

The camshaft position (CMP) sensor sends a signal to the ECM. The ECM uses this signal as a "sync pulse" to trigger the injectors in the proper sequence. The ECM uses the CMP signal to indicate the position of the #1 piston during its power stroke. The CMP allows the ECM to calculate true sequential fuel injection (SFI) mode of operation. If the ECM detects an incorrect CMP signal while the engine is running, DTC P0341 will set.

If the CMP signal is lost while the engine is running, the fuel injection system will shift to a calculated sequential fuel injection mode based on the last fuel injection pulse, and the engine will continue to run. It will run in the calculated sequential mode with a 1-in-4 chance of the injector being correct.

For additional information, refer to DTC P0342.

014RX007

Crankshaft Position (CKP) Sensor

The crankshaft position (CKP) sensor provides a signal used by the engine control module (ECM) to calculate the ignition sequence. The sensor initiates the 58X reference pulses which the ECM uses to calculate RPM and crankshaft position. For additional information, refer to Electronic Ignition System.

Electronic Ignition

The electronic ignition system controls fuel combustion by providing a spark to ignite the compressed air/fuel mixture at the correct time. To provide optimum engine performance, fuel economy, and control of exhaust emissions, the ECM controls the spark advance of the ignition system. Electronic ignition has the following advantages over a mechanical distributor system:

- No moving parts.
- Less maintenance.
- Remote mounting capability.
- No mechanical load on the engine.

- More coil cooldown time between firing events.
- Elimination of mechanical timing adjustments.
- Increased available ignition coil saturation time.

0013

Ignition Coils

The 2.2L engine uses 2 ignition coils, 1 per 2 cylinders. A two-wire connector provides a 12-volt primary supply through the 15-amp ignition coil fuse, and the ground wire is connected to a ground-switching ignition module. Radio frequency interference produced by the coil is controlled by a condenser which is mounted near the ignition coil.

014RX044

Ignition Control

The ignition control (IC) spark timing is the ECM's method of controlling the spark advance and the ignition dwell. The IC spark advance and the ignition dwell are calculated by the ECM using the following inputs:

- Engine speed.
- Crankshaft position (58X reference).
- Camshaft position (CMP) sensor.

6E1-314 X22SE 2.2L ENGINE DRIVEABILITY AND EMISSION

- Engine coolant temperature (ECT) sensor.
- Throttle position (TP) sensor.
- Vehicle speed (vehicle speed sensor).
- ECM and ignition system supply voltage.

Ignition Control Module (ICM)

The engine control module (ECM) controls engine ignition through a solid-state switching unit called the ignition control module (ICM). The software in the ECM uses input from several sensors to determine the timing, duration, and strength of the spark.

- The crankshaft position (CKP) sensor sends the ECM a 58X signal related to the exact position of the crankshaft.

- The camshaft position (CMP) sensor sends a signal related to the position of the camshaft.

Based on these sensor signals, as well as engine load and engine coolant temperature information, the ECM controls the switching function of the ICM by sending it a 5V signal. As long as the ICM receives the signal, it allows battery voltage to the ignition coil. That voltage allows a magnetic field to build in the coil.

When the ECM requires a spark plug to fire, it shuts off the 5V signal to the ICM grounding it internally. This triggers the ICM to switch off the battery voltage to the ignition coil, which causes the field to collapse. The lines of magnetic force pass through the secondary portion of the coil as they collapse. As they intersect the coil, they induce high voltage in the secondary ignition circuit which travels toward ground through the spark plug.

Ignition Control ECM Output

The ECM provides a zero volt (actually about 100 mV to 200 mV) or a 5-volt output signal to the ignition control (IC) module. When the ignition control (IC) module receives the 5-volt signal from the ECM, it provides a ground path for the B+ supply to the primary side of the coil and creates a magnetic field in the coil. When the ECM shuts off the 5-volt signal to the ignition control module, the ground path for the primary coil is broken. The magnetic field collapses and induces a high voltage secondary impulse which fires the spark plug and ignites the air/fuel mixture.

Engine Control Module (ECM)

The ECM is responsible for maintaining proper spark and fuel injection timing for all driving conditions. To provide optimum driveability and emissions, the ECM monitors the input signals from the following components in order to calculate spark timing:

- Engine coolant temperature (ECT) sensor.
- Intake air temperature (IAT) sensor.
- Throttle position (TP) sensor.
- Vehicle speed sensor (VSS).
- Crankshaft position (CKP) sensor.

Spark Plug

Although worn or dirty spark plugs may give satisfactory operation at idling speed, they frequently fail at higher engine speeds. Faulty spark plugs may cause poor fuel economy, power loss, loss of speed, hard starting and generally poor engine performance. Follow the scheduled maintenance service recommendations to ensure satisfactory spark plug performance. Refer to Maintenance and Lubrication.

Normal spark plug operation will result in brown to grayish-tan deposits appearing on the insulator portion of the spark plug. A small amount of red-brown, yellow, and white powdery material may also be present on the insulator tip around the center electrode. These deposits are normal combustion by-products of fuels and lubricating oils with additives. Some electrode wear will also occur.

Carbon fouling of the spark plug is indicated by dry, black carbon (soot) deposits on the portion of the spark plug in the cylinder. Excessive idling and slow speeds under light engine loads can keep the spark plug temperatures so low that these deposits are not burned off. Very rich fuel mixtures or poor ignition system output may also be the cause. Refer to DTC P0172.

Oil fouling of the spark plug is indicated by wet oily deposits on the portion of the spark plug in the cylinder, usually with little electrode wear. This may be caused by oil during break-in of new or newly overhauled engines. Deposit fouling of the spark plug occurs when the normal red-brown, yellow or white deposits of combustion by-products become sufficient to cause misfiring. In some cases, these deposits may melt and form a shiny glaze on the insulator around the center electrode. If the fouling is found in only one or two cylinders, valve stem clearances or intake valve seals may be allowing excess lubricating oil to enter the cylinder, particularly if the deposits are heavier on the side of the spark plug facing the intake valve.

TS23995

Excessive gap means that the air space between the center and the side electrodes at the bottom of the spark plug is too wide for consistent firing. This may be due to improper gap adjustment or to excessive wear of the electrode during use. A check of the gap size and comparison to the gap specified for the vehicle in Maintenance and Lubrication will tell if the gap is too wide. A spark plug gap that is too small may cause an unstable idle condition. Excessive gap wear can be an indication of continuous operation at high speeds or with engine loads, causing the spark to run too hot. Another possible cause is an excessively lean fuel mixture.

TS23992

Low or high spark plug installation torque or improper seating can result in the spark plug running too hot and can cause excessive center electrode wear. The plug and the cylinder head seats must be in good contact for proper heat transfer and spark plug cooling. Dirty or damaged threads in the head or on the spark plug can keep it from seating even though the proper torque is applied. Once spark plugs are properly seated, tighten them to the torque shown in the Specifications Table. Low torque may result in poor contact of the seats due to a loose spark plug. Overtightening may cause the spark plug shell to be stretched and will result in poor contact between the seats. In extreme cases, exhaust blow-by and damage beyond simple gap wear may occur.

Cracked or broken insulators may be the result of improper installation, damage during spark plug re-gapping, or heat shock to the insulator material. Upper insulators can be broken when a poorly fitting tool is used during installation or removal, when the spark plug is hit from the outside, or is dropped on a hard surface. Cracks in the upper insulator may be inside the shell and not visible. Also, the breakage may not cause problems until oil or moisture penetrates the crack later.

TS23994

A broken or cracked lower insulator tip (around the center electrode) may result from damage during re-gapping or from "heat shock" (spark plug suddenly operating too hot).

TS23993

- Damage during re-gapping can happen if the gapping tool is pushed against the center electrode or the insulator around it, causing the insulator to crack. When re-gapping a spark plug, make the adjustment by bending only the ground side terminal, keeping the tool clear of other parts.
- "Heat shock" breakage in the lower insulator tip generally occurs during several engine operating conditions (high speeds or heavy loading) and may be caused by over-advanced timing or low grade fuels. Heat shock refers to a rapid increase in the tip temperature that causes the insulator material to crack.

Spark plugs with less than the recommended amount of service can sometimes be cleaned and re-gapped, then returned to service. However, if there is any doubt about the serviceability of a spark plug, replace it. Spark plugs with cracked or broken insulators should always be replaced.

A/C CLUTCH DIAGNOSIS

A/C Clutch Circuit Operation

A 12-volt signal is supplied to the A/C request input of the ECM when the A/C is selected through the A/C control switch.

The A/C compressor clutch relay is controlled through the ECM. This allows the ECM to modify the idle air control position prior to the A/C clutch engagement for better idle quality. If the engine operating conditions are within their specified calibrated acceptable ranges, the ECM will enable the A/C compressor relay. This is done by providing a ground path for the A/C relay coil within the ECM. When the A/C compressor relay is enabled, battery voltage is supplied to the compressor clutch coil. The ECM will enable the A/C compressor clutch whenever the engine is running and the A/C has been requested. The ECM will not enable the A/C compressor clutch if any of the following conditions are met:

- The engine speed is greater than 6315 RPM.
- The ECT is greater than 119°C (246°F).
- The throttle is more than 80% open.

A/C Clutch Circuit Purpose

The A/C compressor operation is controlled by the engine control module (ECM) for the following reasons:

- It improves idle quality during compressor clutch engagement.
- It improves wide open throttle (WOT) performance.
- It provides A/C compressor protection from operation with incorrect refrigerant pressures.

The A/C electrical system consists of the following components:

1. The A/C control switch.
2. The A/C refrigerant pressure switches.
3. The A/C compressor clutch.
4. The A/C compressor clutch relay.
5. The ECM.

A/C Request Signal

This signal tells the ECM when the A/C mode is selected at the A/C control switch. The ECM uses this input to adjust the idle speed before turning on the A/C clutch. The A/C compressor will be inoperative if this signal is not available to the ECM.

For A/C wiring diagrams and diagnosis for the A/C electrical system, refer to A/C Clutch Circuit Diagnosis.

GENERAL DESCRIPTION — EVAPORATIVE EMISSION (EVAP) SYSTEM

EVAP Emission Control System Purpose

The basic evaporative emission (EVAP) control system used on all vehicles is the charcoal canister storage method. Gasoline vapors from the fuel tank flow into the canister through the inlet labeled "TANK." These vapors are absorbed into the activated carbon (charcoal) storage

device (canister) in order to hold the vapors when the vehicle is not operating. The canister is purged by ECM control when the engine coolant temperature is over 60°C (140°F), the IAT reading is over 10°C (50°F), and the engine has been running. Air is drawn canister through the air inlet grid. The air mixes with the vapor and the mixture is drawn into the intake manifold.

EVAP Emission Control System Operation

The EVAP canister purge is controlled by a solenoid valve that allows the manifold vacuum to purge the canister. The Engine Control Module (ECM) supplies a ground to energize the solenoid valve (purge on). The EVAP purge solenoid control is pulse-width modulated (PWM) (turned on and off several times a second). The duty cycle (pulse width) is determined by engine operating conditions including load, throttle position, coolant temperature and ambient temperature. The duty cycle is calculated by the ECM. The output is commanded when the appropriate conditions have been met. These conditions are:

- The engine is fully warmed up.
- The engine has been running for a specified time.
- The IAT reading is above 10°C (50°F).

Poor idle, stalling and Poor driveability can be caused by:

- A malfunctioning purge solenoid.
- A damaged canister.
- Hoses that are split, cracked, or not connected properly.

GENERAL DESCRIPTION — EXHAUST GAS RECIRCULATION (EGR) SYSTEM

EGR Purpose

The exhaust gas recirculation (EGR) system is used to reduce emission levels of oxides of nitrogen (NOx). NOx emission levels are caused by a high combustion temperature. The EGR system lowers the NOx emission levels by decreasing the combustion temperature.

Linear EGR Valve

The main element of the system is the linear EGR valve. The EGR valve feeds small amounts of exhaust gas back into the combustion chamber. The fuel/air mixture will be diluted and combustion temperatures reduced.

Linear EGR Control

The ECM monitors the EGR actual position and adjusts the pintle position accordingly. The ECM uses information from the following sensors to control the pintle position:

- Engine coolant temperature (ECT) sensor.
- Throttle position (TP) sensor.

Linear EGR Valve Operation And Results Of Incorrect Operation

The linear EGR valve is designed to accurately supply EGR to the engine independent of intake manifold

vacuum. The valve controls EGR flow from the exhaust to the intake manifold through an orifice with a ECM-controlled pintle. During operation, the ECM controls pintle position by monitoring the pintle position feedback signal. The feedback signal can be monitored with a Tech 2 as "Actual EGR Pos." "Actual EGR Pos." should always be near the commanded EGR position ("Desired EGR Pos."). The ECM also tests for EGR flow. If incorrect flow is detected, DTC P0401 will set. If DTC P0401 is set, refer to the DTC charts.

The linear EGR valve is usually activated under the following conditions:

- Warm engine operation.
- Above-idle speed.

Too much EGR flow at idle, cruise or cold operation may cause any of the following conditions to occur:

- Engine stalls after a cold start.
- Engine stalls at idle after deceleration.
- Vehicle surges during cruise.
- Rough idle.
- DTC P0300 (misfire detected).

Too little or no EGR flow may allow combustion temperatures to get too high. This could cause:

- Spark knock (detonation).
- Engine overheating.
- Emission test failure.
- DTC P0401 (EGR Flow Insufficient detected).
- Poor fuel economy.

0017

EGR Pintle Position Sensor

The ECM monitors the EGR valve pintle position input to ensure that the valve responds properly to commands from the ECM and to detect a fault if the pintle position sensor and control circuits are open or shorted. If the ECM detects a pintle position signal voltage outside the normal range of the pintle position sensor, or a signal voltage that is not within a tolerance considered

acceptable for proper EGR system operation, the ECM will set DTC P0404.

GENERAL DESCRIPTION — POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM

Crankcase Ventilation System Purpose

The crankcase ventilation system is used to consume crankcase vapors in the combustion process instead of venting them to the atmosphere. Fresh air from the throttle body is supplied to the crankcase and mixed with blow-by gases. This mixture is then passed through the positive crankcase ventilation (PCV) port into the intake manifold.

While the engine is running, exhaust gases and small amounts of the fuel/air mixture escape past the piston rings and enter the crankcase. These gases are mixed with clean air entering through a tube from the air intake duct.

During normal, part-throttle operation, the system is designed to allow crankcase gases to flow through the PCV valve into the throttle body to be consumed by normal combustion.

A plugged valve or PCV hose may cause the following conditions:

- Rough idle.
- Stalling or slow idle speed.
- Oil leaks.
- Sludge in the engine.

A leaking PCV hose would cause:

- Rough idle.
- Stalling.
- High idle speed.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

150RX013

When inspecting or replacing exhaust system components, make sure there is adequate clearance from all points on the underbody to prevent overheating the floor pan and possible damage to the passenger compartment insulation and trim materials. Check complete exhaust system and nearby body areas and rear compartment lid for broken, damaged, missing or mispositioned parts, open seams, holes, loose connections or other deterioration which could permit exhaust fumes to seep into the rear compartment or passenger compartment. Dust or water in the rear compartment may be an indication of a problem in one of these areas. Any faulty areas should be corrected immediately.

Hangers

Various types of hangers are used to support exhaust system(s). These include conventional rubber straps, rubber rings, and rubber blocks. The installation of exhaust system supports is very important, as improperly installed supports can cause annoying vibrations which can be difficult to diagnose.

Three Way Catalytic Converter

The three way catalytic converter is an emission control device added to the exhaust system to reduce pollutants from the exhaust gas stream.

CAUTION: The catalytic converter requires the use

of unleaded fuel only.

Periodic maintenance of the exhaust system is not required. If the vehicle is raised for other service, it is advisable to check the condition of the complete exhaust system.

A dual bed monolith catalytic converter is used in combination with three way catalytic converter.

Catalytic Types:

Three way (Reduction/Oxidation) catalyst

The catalyst coating on the three way (reduction) converter contains platinum and rhodium which lowers the levels of nitrous oxide (NO_x) as well as hydrocarbons (HC) and carbon monoxide (Co).

Gasket

The gasket must be replaced whenever a new exhaust pipe, muffler or catalytic converter is installed.

Front Exhaust Pipe

Front Exhaust Pipe and Associated Parts

150RX012

Legend

| (2) O2 Sensor | (6) Front Exhaust Pipe Fixing Bolt (Clamp) |
| (3) Front Exhaust Pipe with Three Way Catalytic Converter | (7) Front Exhaust Pipe Mounting Bracket |
| (4) Front Exhaust Pipe Mounting Rubber | |

Removal

1. Disconnect battery ground cable.
2. Raise the vehicle and support with suitable safety stands.
3. Disconnect O2 sensor harness connector and remove front side O2 sensor (2).
4. Remove front exhaust pipe fixing bolts (6),(7).
5. Remove front exhaust pipe fixing four stud nuts from exhaust manifold (1).
6. Remove front exhaust pipe (3).

nuts (1) and two bolts (6) to the specified torque:

Torque:

Stud Nuts : 28 N·m (2.9 kg·m/21 lbft)

Bolts (6) : 43 N·m (4.4 kg·m/32 lbft)

Bolts (7) : 23 N·m (2.3 kg·m/17 lbft)

2. Tighten front side O2 sensor and reconnect O2 sensor harness connector.

Torque : 55 N·m (5.6 kg·m/41 lbft)

Installation

1. Install front exhaust pipe (3) and tighten four stud

Exhaust Silencer

Exhaust Silencer and Associated Parts

| (5) Mounting Rubber | |

Removal

1. Disconnect battery ground cable.
2. Raise the vehicle and support with suitable safety stands.
3. Remove exhaust silencer fixing nuts (3) then disconnect rear exhaust pipe from exhaust silencer.
4. Remove exhaust silencer fixing nuts (2) then disconnect exhaust silencer from front exhaust pipe (5).
5. Remove exhaust silencer mounting nuts (8) from chassis side then remove exhaust silencer (1).

Installation

1. Install the exhaust silencer (1) chassis side and tighten two nuts (8) to the specified torque.
Nuts: 15 N·m (1.5 kg·m/11 lbft)
2. Install the exhaust silencer and tighten two Bolts (2) on front exhaust pipe to specified torque.
Bolts: 43 N·m (4.4 kg·m/32 lbft)
3. Install the rear exhaust pipe and tighten two nuts (3) on exhaust silencer to specified torque.
Nuts: 43 N·m (4.4 kg·m/32 lbft)

| (5) Mounting Rubber | |

Removal

Nuts: 43 N·m (4.4 kg·m/32 lbft)

1. Disconnect battery ground cable.
2. Raise the vehicle and support with suitable safety stands.
3. Remove rear exhaust pipe fixing nuts (3), then disconnect rear exhaust pipe from exhaust silencer.
4. Remove mounting rubber (5), (6).
5. Remove rear exhaust pipe (4).

Installation

1. Install the mounting rubber (5), (6).
2. Install the exhaust pipe (4) and tighten two nuts (3) on exhaust silencer to specified torque.

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

A gear-type oil pump is directly driven by the crankshaft and draws oil from the oil pan, via the suction pipe. It then passes the pressured oil through a full-flow disposable oil filter, to the main oil gallery in the cylinder block. An oil pump pressure relief valve and oil filter bypass valve are incorporated in the system. From the main oil gallery in the cylinder block, the cylinder head and crankshaft main bearings are

supplied with oil. The camshaft bearings and hydraulic tappets are supplied through the main feed galleries in the cylinder head. Vent valves allow air to be expelled from the oil galleries in the cylinder head. The balance shaft journals are directly fed from the crankshaft main bearings. The connecting rod bearings are fed via passages in the crankshaft. The oil returns to the oil pan via passages in the cylinder block.

Oil Pump

Oil Pump and Associated Parts

051RW004

Legend

- (1) Oil Pump Assembly
- (2) Oil Pressure Switch
- (3) Gasket

- (4) Sleeve

Disassembly

1. Remove crankshaft timing pulley.
2. Remove oil pan.
3. Remove oil pan support.
4. Remove oil strainer.
5. Remove oil pump assembly.
6. Remove oil pressure switch.
7. Remove gasket.
8. Remove sleeve.

Inspection and Repair

CAUTION: Make necessary correction or parts replacement if wear, damage or any other abnormal conditions are found through inspection.

Body and Gears

The pump assembly must be replaced if one or more of the conditions below is discovered during inspection:
Indentation of gear pair — use feeler strip and straight edge.

**Dimension : 0.03 mm to 0.10 mm
(0.0012 to 0.0039 in)**

051RW014

Oil Strainer

Check the oil strainer for cracking and scoring. If cracking and scoring are found, the oil strainer must be replaced.

051RW013

Reassembly

1. Install oil pressure switch to the oil pump.
Torque : 40 N·m (4.1 kg·m/37 lbft)
2. Install the oil pump with the sleeve and the gasket.
Torque : 6 N·m (0.6 kg·m/4.4 lbft)
3. Install oil strainer.
Torque : 8 N·m (0.8 kg·m/5.8 lbft)
4. Install Oil pan support.
Torque : 20 N·m (2.0 kg·m/14 lbft)
5. Install the oil pan.
Tighten the bolts in 2 steps:
1st step: 8 N·m (0.8 kg·m/5.8 lbft)
2nd step: 30°
6. Install crankshaft timing pulley.
Tighten the bolts in 2 steps:
1st step: 130 N·m (13.2 kg·m/94 lbft)
2nd step: 45°

Accelerator Pedal Control Cable

035RX004

Removal

1. Loosen the nut(5) on the cable bracket mounted.
2. Remove cable clip(3).
3. Disconnect accelerator pedal (AP) control cable(6). (on throttle valve side)
4. Disconnect AP control cable(1). (on AP pedal(7) side)
5. Remove grommet(2).
6. Remove AP control cable(4).

2. Pull outer cable while closing fully the throttle valve.
3. Tighten adjusting nut and lock nut temporarily.
4. Loosen adjusting nut by three turns and tighten lock nut.

Then, manually operating the throttle valve, make sure that the valve lever returns up to the stopper screw.

If it does not reach the stopper screw, repeat from step 1.

Inspection

Check the following items, and replace the control cable if any abnormality is found:

- The control cable should move smoothly.
- The control cable should not be bent or kinked.
- The control cable should be free of damage and corrosion.

Installation

1. Install AP control cable(4).
2. Install grommet(2).
3. Connect AP control cable(1). (on AP pedal(7) side)
4. Connect AP control cable(6). (on throttle valve side)
5. Install cable clip(3).
6. Install nut(5).

035RX014

Legend

- (1) Clearance (2 – 3.5 mm)
- (2) Lock Nut
- (3) Adjusting Nut

Adjustment

1. Loosen adjusting nut and lock nut.

Accelerator Pedal

Accelerator Pedal and Associated Parts

Legend

- (1) Accelerator Pedal Control Cable
- (2) Accelerator Pedal Assembly

Adjustment

Manual Transmission:

- Rotate counterclockwise to loosen the lock nut and screw the stopper bolt in sufficiently.
- Fully depress the pedal and hold it there by hand. Next, rotate the stopper bolt until it hits the stopper of pedal bracket. Then, lock the stopper bolt there.

Removal

1. Accelerator pedal control cable(1).
2. Accelerator pedal assembly(2).

Installation

1. Accelerator pedal assembly (2).
2. Accelerator pedal control cable (1).

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Air Cleaner Filter

Removal

1. Remove positive ventilation hose connector (1).
2. Remove intake air temperature sensor (2).
3. Remove air cleaner duct assembly (3).
4. Remove air cleaner element (4).

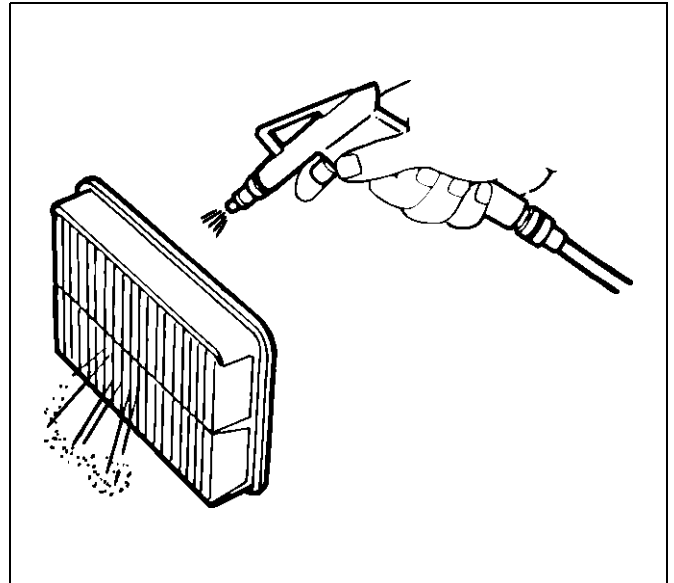

Inspection

Check the air cleaner filter for damage or dust clogging. Replace if it is damaged, or clean if it is clogged.

Cleaning Method

Tap the air cleaner filter gently so as not to damage the paper filter, or clean the element by blowing with compressed air of about 490 kPa (71 psi) from the clean side if it is extremely dirty.

Installation

1. Install air cleaner element.
2. Attach the air cleaner duct cover to the body completely, then clamp it with the clip.
3. Install mass air temperature sensor.
4. Install positive crankcase ventilation hose connector.

Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

Engine Cleanliness And Care

An automobile engine is a combination of many machined, honed, polished and lapped surfaces with tolerances that are measured in the thousandths of a millimeter (ten thousandths of an inch). Accordingly, when any internal engine parts are serviced, care and cleanliness are important. Throughout this section, it should be understood that proper cleaning and protection of machined surfaces and friction areas is part of the repair procedure. This is considered standard shop practice even if not specifically stated.

- A liberal coating of engine oil should be applied to all friction areas during assembly to protect and lubricate the surfaces on initial operation.
- Whenever valve train components, pistons, piston rings, connecting rods, rod bearings, and crankshaft journal bearings are removed for service, they should be retained in order.
- At the time of installation, they should be installed in the same locations and with the same mating surfaces as when removed.
- Battery cables should be disconnected before any major work is performed on the engine. Failure to disconnect cables may result in damage to wire harness or other electrical parts.
- The six cylinders of this engine are identified by numbers; Right side cylinders 1, 3 and 5, Left side cylinders 2, 4 and 6, as counted from crankshaft pulley side to flywheel side.

General Information on Engine Service

The following information on engine service should be noted carefully, as it is important in preventing damage and contributing to reliable engine performance:

- When raising or supporting the engine for any reason, do not use a jack under the oil pan. Due to the small clearance between the oil pan and the oil pump strainer, jacking against the oil pan may cause damage to the oil pick-up unit.
- The 12-volt electrical system is capable of damaging circuits. When performing any work where electrical terminals could possibly be grounded, the ground cable of the battery should be disconnected at the battery.
- Any time the intake air duct or air cleaner is removed, the intake opening should be covered. This will protect against accidental entrance of foreign material into the cylinder which could cause extensive damage when the engine is started.

Cylinder Block

The cylinder block is made of aluminum die-cast casting for 75° V-type six cylinders. It has a rear plate integrated structure and employs a deep skirt. The cylinder liner is cast and the liner inner diameter and crankshaft journal diameter are classified into grades. The crankshaft is supported by four bearings of which width of No.3 bearing on the body side is different in order to support the thrust bearing. The bearing cap is made of nodular cast iron and each bearing cap uses four bolts and two side bolts.

Cylinder Head

The cylinder head, made of aluminum alloy casting employs a pent-roof type combustion chamber with a spark plug in the center. The intake and exhaust valves are placed in V-type design. The ports are cross-flow type.

Valve Train

Intake and exhaust camshaft on the both side of banks are driven through an camshaft drive gear by timing belt. The valves are operated by the camshaft and the valve clearance is adjusted to select suitable thickness shim.

Intake Manifold

The intake manifold system is composed of the aluminum cast common chamber and intake manifold attached with six fuel injectors.

Exhaust Manifold

The exhaust manifold is made of nodular cast iron.

Pistons and Connecting Rods

Aluminum pistons are used after selecting the grade that meets the cylinder bore diameter. Each piston has two compression rings and one oil ring. The piston pin is made of chromium steel is offset 1mm toward the thrust side, and the thrust pressure of piston to the cylinder wall varies gradually as the piston travels. The connecting rods are made of forged steel. The connecting rod bearings are graded for correct size selection.

Crankshaft and Bearings

The crankshaft is made of Ductile cast-iron. Pins and journals are graded for correct size selection for their bearing.

Engine Lubrication

The oil discharged by a trochoid-type oil pump driven by the crankshaft is fed through full-flow oil filter and to the oil gallery provided under the crankshaft bearing cap. The oil is then led to the crankshaft journals and cylinder head. The crank pins are lubricated with oil from crankshaft journals through oil holes. Also, an oil jet is fed to each cylinder from crankshaft journals on the connecting rod for piston cleaning. The oil pan flange is dealt with liquid packing only; do not deform or damage the flange surface during removal or installation.

Engine Diagnosis

Hard Starting

1. Starting Motor Does Not Turn Over

Troubleshooting Procedure

Turn on headlights and starter switch.

Condition	Possible cause	Correction
Headlights go out or dim considerably	Battery run down or under charged	Recharge or replace battery
	Terminals poorly connected	Clean battery posts and terminals and connect properly
	Starting motor coil circuit shorted	Overhaul or replace
	Starting motor defective	Overhaul or replace

2. Ignition Trouble — Starting Motor Turns Over But Engine Does Not Start

Spark Test

Disconnect an igniton coil from any spark plug. Connect the spark plug tester J-26792 (ST-125), start the engine, and check if a spark is generated in the spark plug tester.

Before starting the engine, make sure that the spark plug tester is properly grounded. To avoid electrical shock, do not touch the part where insulation of the igniton coil is broken while the engine is running.

Condition	Possible cause	Correction
Spark jumps across gap	Spark plug defective	Clean, adjust spark gap or replace
	Ignition timing incorrect	Refer to Ignition System
	Fuel not reaching fuel injector(s) or engine	Refer to item 3 (Trouble in fuel system)
	Valve timing incorrect	Adjust
	Engine lacks compression	Refer to item 4 (Engine lacks compression)
No sparking takes place	Ignition coil disconnected or broken	Connect properly or replace
	Electronic Ignition System with module	Replace
	Poor connections in engine harness	Correct
	Powertrain Control Module cable disconnected or defective	Correct or replace

3. Trouble In Fuel System

Condition	Possible cause	Correction
Starting motor turns over and spark occurs but engine does not start.	Fuel tank empty	Fill
	Water in fuel system	Clean
	Fuel filter clogged	Replace filter
	Fuel pipe clogged	Clean or replace
	Fuel pump defective	Replace
	Fuel pump circuit open	Correct or replace
	Evaporative Emission Control System circuit clogged	Correct or replace
	Multipoint Fuel Injection System faulty	Refer to "Electronic Fuel Injection" section

4. Engine Lacks Compression

Condition	Possible cause	Correction
Engine lacks compression	Spark plug loosely fitted or spark plug gasket defective	Tighten to specified torque or replace gasket
	Valve timing incorrect	Adjust
	Cylinder head gasket defective	Replace gasket
	Valve incorrectly seated	Lap valve
	Valve stem seized	Replace valve and valve guide
	Valve spring weakened or broken	Replace
	Cylinder or piston rings worn	Overhaul engine
	Piston ring seized	Overhaul engine.

Engine Compression Test Procedure

1. Start and run the engine until the engine reaches normal operating temperature.
2. Turn the engine off.
3. Remove all the spark plugs.
4. Remove ignition coil fuse (15A) and disable the ignition system.
5. Remove the fuel pump relay from the relay and fuse box.
6. Engage the starter and check that the cranking speed is approximately 300 rpm.
7. Install cylinder compression gauge into spark plug hole.
8. With the throttle valve opened fully, keep the starter engaged until the compression gage needle reaches the maximum level. Note the reading.
9. Repeat the test with each cylinder.
If the compression pressure obtained falls below the limit, engine overhaul is necessary.

Limit; 1000 kPa (145 psi)

Rough Engine Idling or Engine Stalling

Condition	Possible cause	Correction
Trouble in fuel injection system	Idle air control valve defective	Replace
	Throttle shutting off incomplete	Correct or replace
	Throttle position sensor circuit open or shorted	Correct or replace
	Fuel injector circuits open or shorted	Correct or replace
	Fuel injectors damaged	Replace
	Fuel pump relay defective	Replace
	Mass Air flow (MAF) Sensor circuit open or poor connections	Correct or replace
	MAF Sensor defective	Replace
	Manifold Absolute Pressure (MAP) Sensor circuit open or poor connections	Correct or replace
	MAP Sensor defective	Replace
	Engine Coolant Temperature (ECT) Sensor circuit open or poor connections	Correct or replace
	ECT Sensor defective	Replace
	Intake Air Temperature (IAT) sensor circuit open or poor connections	Correct or replace
	IAT sensor defective	Replace
	Knock Sensor (KS) cable broken or poor connections	Correct or replace
	KS defective	Replace
	KS Module circuits open or ground	Correct or replace
	KS Module defective	Replace
Vehicle Speed Sensor (VSS) circuit open or shorted	Correct or replace	
VSS defective	Replace	
Trouble in emission control system	Powertrain Control Module defective	Replace
	Exhaust Gas Recirculation (EGR) Valve circuit open or poor connections	Correct or replace
	EGR Valve faulty	Replace
	Canister purge valve circuit open or poor connections	Correct or replace
	Canister purge valve defective	Replace
	Evaporative Emission Canister Purge control valve defective	Replace
	Trouble in ignition system	Refer to "Hard Start"

Condition	Possible cause	Correction
Others	Engine lacks compression	Refer to "Hard Start"
	Valve incorrectly seated	Lap valve
	Air Cleaner Filter clogged	Replace filter element
	Valve timing incorrect	Readjust
	Idle air control valve broken	Replace
	Fast idle solenoid defective	Replace
	Positive Crankcase Ventilation valve defective or clogged	Replace

Rough Engine Running

Condition	Possible cause	Correction
Engine misfires periodically	Ignition coil layer shorted	Replace
	Spark plugs fouling	Clean or install hotter type plug
	Spark plug(s) insulator nose leaking	Replace
	Fuel injector(s) defective	Replace
	Powertrain control module faulty	Replace
Engine knocks periodically	Spark plugs running too hot	Install colder type spark plugs
	Powertrain control module faulty	Replace
Engine lacks power	Spark plugs fouled	Clean
	Fuel injectors defective	Replace
	Mass Air flow Sensor or Intake Airflow Sensor circuit defective	Correct or replace
	Manifold Absolute Pressure (MAP) Sensor or Manifold Absolute Pressure Sensor circuit defective	Correct or replace
	Engine Coolant Temperature (ECT) Sensor or ECT Sensor circuit defective	Correct or replace
	Powertrain Control Module faulty	Replace
	Intake Air Temperature (IAT) Sensor or IAT Sensor circuit defective	Correct or replace
	Throttle Position Sensor (TPS) or TPS circuit defective	Correct or replace
	Knock Sensor (KS) or KS circuits defective	Correct or replace
	KS Module or KS Module circuits defective	Correct or replace

Hesitation

Condition	Possible cause	Correction
Hesitation on acceleration	Throttle Position Sensor (TPS) adjustment incorrect	Replace throttle valve assembly
	TPS circuit open or shorted	Correct or replace
	Excessive play in accelerator linkage	Adjust or replace
	Mass Air flow (MAF) Sensor circuit open or poor connections	Correct or replace
	MAF Sensor defective	Replace
	Manifold Absolute Pressure (MAP) Sensor circuit open or shorted	Correct or replace
	MAP Sensor defective	Replace
	Intake Air Temperature (IAT) Sensor circuit open or shorted	Correct or replace
	Knock Sensor (KS) Circuit open or poor connections	Correct or replace
	KS defective	Replace
	KS Module circuits open or shorted	Correct or replace
	KS Module defective	Replace
	IAT Sensor defective	Replace
Hesitation at high speeds (Fuel pressure too low)	Fuel tank strainer clogged	Clean or replace
	Fuel pipe clogged	Clean or replace
	Fuel filter clogged	Replace
	Defective fuel pump system	Check and replace
	Fuel Pressure Control Valve leaking	Replace
Hesitation at high speeds (Fuel injector not working normally)	Power supply or ground circuit for Multiport Fuel Injection System shorted or open	Check and correct or replace
	Fuel Injector defective	Replace
	Cable of Multiport Fuel Injection System circuit open or poor connections	Correct or replace

Condition	Possible cause	Correction
Hesitation at high speeds	Powertrain Control Module defective	Replace
	Throttle Position Sensor (TPS) cable broken or poor connections	Correct or replace
	TPS defective	Replace
	Engine Coolant Temperature (ECT) Sensor circuit open or shorted	Correct or replace
	ECT Sensor defective	Replace
	Mass Air flow (MAF) Sensor circuit open or poor connections	Correct or replace
	MAF Sensor defective	Replace
	MAP Sensor cable broken or poor connections	Correct or replace
	MAP Sensor defective	Replace
	IAT Sensor circuit open or poor connections	Correct or replace
	IAT Sensor defective	Replace
	KS circuit open or poor connections	Correct or replace
	KS defective	Replace
	KS Module circuit open or shorted	Correct or replace
	KS Module defective	Replace
	Throttle valve not fully opened	Check and correct or replace
Air Cleaner Filter clogged	Replace filter element	
Power supply voltage too low	Check and correct or replace	

6A-10 ENGINE MECHANICAL (6VD1 3.2L)

Engine Lacks Power

Condition	Possible cause	Correction
Trouble in fuel system	Fuel Pressure Control Valve not working normally	Replace
	Fuel injector clogged	Clean or replace
	Fuel pipe clogged	Clean
	Fuel filter clogged or fouled	Replace
	Fuel pump drive circuit not working normally	Correct or replace
	Fuel tank not sufficiently breathing due to clogged Evaporative Emission Control System circuit	Clean or replace
	Water in fuel system	Clean
	Inferior quality fuel in fuel system	Use fuel of specified octane rating
	Powertrain Control Module supplied poor voltage	Correct circuit
	Throttle Position Sensor cable broken or poor connections	Correct or replace
	Throttle Position Sensor defective	Replace
	Mass Air flow Sensor not working normally	Replace
	Manifold Absolute Pressure Sensor not working normally	Replace
	Intake Air Temperature Sensor not working normally	Replace
	Engine Coolant Temperature (ECT) Sensor circuit open or shorted	Correct or replace
	ECT Sensor defective	Replace
Powertrain Control Module defective	Replace	
Trouble in intake or exhaust system	Air Cleaner Filter clogged	Replace filter element
	Air duct kinked or flattened	Correct or replace
Ignition failure	_____	Refer to Hard Start Troubleshooting Guide
	Heat range of spark plug inadequate	Install spark plugs of adequate heat range
	Ignition coil defective	Replace

Condition	Possible cause	Correction
Engine overheating	Level of Engine Coolant too low	Replenish
	Fan clutch defective	Replace
	Incorrect fan installed	Replace
	Thermostat defective	Replace
	Engine Coolant pump defective	Correct or replace
	Radiator clogged	Clean or replace
	Radiator filler cap defective	Replace
	Level of oil in engine crankcase too low or wrong engine oil	Change or replenish
	Resistance in exhaust system increased	Clean exhaust system or replace defective parts
	Throttle Position Sensor (TPS) adjustment incorrect	Replace with Throttle Valve ASM
	TPS circuit open or shorted	Correct or replace
	Cylinder head gasket damaged	Replace
Engine overcooling	Thermostat defective	Replace (Use a thermostat set to open at 82°C (180°F))
Engine lacks compression	—————	Refer to Hard Start
Others	Tire inflation pressure abnormal	Adjust to recommended pressures
	Brake drag	Adjust
	Clutch slipping	Adjust or replace
	Level of oil in engine crankcase too high	Correct level of engine oil
	Exhaust Gas Recirculation Valve defective	Replace

6A-12 ENGINE MECHANICAL (6VD1 3.2L)

Engine Noisy

Abnormal engine noise often consists of various noises originating in rotating parts, sliding parts and other moving parts of the engine. It is, therefore, advisable to locate the source of noise systematically.

Condition	Possible cause	Correction
Noise from crank journals or from crank bearings (Faulty crank journals and crank bearings usually make dull noise that becomes more evident when accelerating)	Oil clearance increased due to worn crank journals or crank bearings	Replace crank bearings and crankshaft or regrind crankshaft and install the undersize bearing
	Crankshaft out of round	Replace crank bearings and crankshaft or regrind crankshaft and install the undersize bearing
	Crank bearing seized	Crank bearing seized. Replace crank bearings and crankshaft or regrind crankshaft and install the undersize bearing

Troubleshooting Procedure

Short out each spark plug in sequence using insulated spark plug wire removers. Locate cylinder with defective bearing by listening for abnormal noise that stops when spark plug is shorted out.

Condition	Possible cause	Correction
Noise from connecting rods or from connecting rod bearings (Faulty connecting rods or connecting rod bearings usually make an abnormal noise slightly higher than the crank bearing noise, which becomes more evident when engine is accelerated)	Bearing or crankshaft pin worn	Replace connecting rod bearings and crankshaft or regrind crankshaft pin and install the undersize bearing
	Crankpin out of round	Replace connecting rod bearings and crankshaft or regrind crankshaft pin and install the undersize bearing
	Connecting rod bent	Correct or replace
	Connecting rod bearing seized	Replace connecting rod bearings and crankshaft or regrind crankshaft pin and install the undersize bearing

Troubleshooting Procedure

Abnormal noise stops when the spark plug on the cylinder with defective part is shorted out.

Condition	Possible cause	Correction
Piston and cylinder noise (Faulty piston or cylinder usually makes a combined mechanical thumping noise which increases when engine is suddenly accelerated but diminishes gradually as the engine warms up)	Piston clearance increased due to cylinder wear	Replace piston and cylinder body
	Piston seized	Replace piston and cylinder body
	Piston ring broken	Replace piston and cylinder body
	Piston defective	Replace pistons and others

Troubleshooting Procedure

Short out each spark plug and listen for change in engine noise.

Condition	Possible cause	Correction
Piston pin noise (Piston makes noise each time it goes up and down)	Piston pin or piston pin hole worn	Replace piston, piston pin and connecting rod assy

Troubleshooting Procedure

The slapping sound stops when spark plug on bad cylinder is shorted out.

Condition	Possible cause	Correction
Timing belt noise	Timing belt tension is incorrect	Replace pusher or adjust the tension pulley or replace timing belt
	Tensioner bearing defective	Replace
	Timing belt defective	Replace
	Timing pulley defective	Replace
	Timing belt comes in contact with timing cover	Replace timing belt and timing cover
Valve noise	Valve clearance incorrect	Replace adjusting shim
	Valve and valve guide seized	Replace valve and valve guide
	Valve spring broken or weakened	Replace
	Valve seat off-positioned	Correct
	Camshaft worn out	Replace
Crankshaft noise	Crankshaft end play excessive (noise occurs when clutch is engaged)	Replace thrust bearing
Engine knocking	Preignition due to use of spark plugs of inadequate heat range	Install Spark Plugs of adequate heat range
	Carbon deposits in combustion chambers	Clean
	Fuel too low in octane rating	Replace fuel
	Wide Open Throttle enrichment system failure	Refer to Section 6E
	Selection of transmission gear incorrect	Caution operator of incorrect gear selection
	Engine overheating	Refer to "Engine Lacks Power"
Others	Water pump defective	Replace
	Drive belt slipping	Replace auto tensioner or drive belt

6A-14 ENGINE MECHANICAL (6VD1 3.2L)

Abnormal Combustion

Condition	Possible cause	Correction
Trouble in fuel system	Fuel pressure control valve defective	Replace
	Fuel filter clogged	Replace
	Fuel pump clogged	Clean or replace
	Fuel tank or fuel pipe clogged	Clean or replace
	Fuel injector clogged	Clean or replace
	Fuel pump relay defective	Replace
	Power supply cable for fuel pump broken or poor connections	Reconnect, correct or replace
	Mass Air flow (MAF) sensor circuit open or defective	Correct or replace
	MAF Sensor defective	Replace
	Manifold Absolute Pressure (MAP) Sensor circuit open or shorted	Correct or replace
	MAP Sensor defective	Replace
	Engine Coolant Temperature (ECT) Sensor circuit open or shorted	Correct or replace
	ECT Sensor defective	Replace
	Throttle Position Sensor (TPS) adjustment incorrect	Readjust
	TPS defective	Replace
	TPS connector poor connections	Reconnect
	Vehicle Speed Sensor (VSS) cable poor connections or defective	Correct or replace
	VSS loosely fixed	Fix tightly
	VSS in wrong contact or defective	Replace
	Powertrain Control Module cable poor connections or defective	Correct or replace
Trouble in emission control system	Heated Oxygen (O ₂) Sensor circuit open	Correct or replace
	O ₂ Sensor defective	Replace
	Signal vacuum hose loosely fitted or defective	Correct or replace
	Exhaust Gas Recirculation (EGR) Valve circuit open or shorted	Correct or replace
	EGR Valve defective	Replace
	Engine Coolant Temperature (ECT) Sensor circuit open or shorted	Correct or replace
	Canister Purge Valve circuit open or shorted	Correct or replace
	Canister Purge Valve defective	Replace
	ECT Sensor defective	Replace
	Positive Crankcase Ventilation (PCV) valve and hose clogged	Correct or replace
	Evaporator system	Refer to Section 6E
Trouble in ignition system	—————	Refer to "Engine Lacks Power"

Condition	Possible cause	Correction
Trouble in cylinder head parts	Carbon deposits in combustion chamber	Remove carbon
	Carbon deposit on valve, valve seat and valve guide	Remove carbon

Engine Oil Consumption Excessive

Condition	Possible cause	Correction
Oil leaking	Oil pan drain plug loose	Retighten or replace gasket
	Crankcase fixing bolts loosened	Retighten
	Oil pan setting bolts loosened	Retighten
	Oil pan gasket broken	Replace gasket
	Front cover retaining bolts loose or gasket broken	Retighten or replace gasket
	Head cover fixing bolts loose or gasket broken	Retighten or replace gasket
	Oil cooler adapter cracked	Replace
	Oil cooler center bolt loose	Retighten
	Oil cooler O-ring broken	Replace
	Oil cooler piping loose or broken	Retighten or replace
	Oil filter adapter cracked	Replace
	Oil filter attaching bolt loose or rubber gasket broken	Retighten or replace oil filter
	Oil cooler broken	Replace
	Crankshaft front or rear oil seal defective	Replace oil seal
	Oil pressure unit loose or broken	Retighten or replace
	Blow-by gas hose broken	Replace hose
Positive Crankcase Ventilation Valve clogged	Clean	
Engine/Transmission coupling failed	Replace oil seal	
Oil leaking into combustion chambers due to poor seal in valve system	Valve stem oil seal defective	Replace
	Valve stem or valve guide worn	Replace valve and valve guide
Oil leaking into combustion chambers due to poor seal in cylinder parts	Cylinders and pistons worn excessively	Replace cylinder body assembly and pistons
	Piston ring gaps incorrectly positioned	Correct
	Piston rings set with wrong side up	Correct
	Piston ring sticking	Replace cylinder body assembly and pistons
	Piston ring and ring groove worn	Replace pistons and others
	Return ports in oil rings clogged	Clean piston and replace rings
Positive Crankcase Ventilation System malfunctioning	Positive Crankcase Ventilation Valve clogged	Clean

6A-16 ENGINE MECHANICAL (6VD1 3.2L)

Condition	Possible cause	Correction
Others	Improper oil viscosity	Use oil of recommended S.A.E. viscosity
	Continuous high speed driving and/or severe usage such as trailer towing	Continuous high speed operation and/or severe usage will normally cause increased oil consumption

Fuel Consumption Excessive

Condition	Possible cause	Correction
Trouble in fuel system	Mixture too rich or too lean due to trouble in fuel injection system	Refer to "Abnormal Combustion"
	Fuel cut function does not work	Refer to "Abnormal Combustion"
Trouble in ignition system	Misfiring or abnormal combustion due to trouble in ignition system	Refer to "Hard Start" or "Abnormal Combustion"
Others	Engine idle speed too high	Reset Idle Air Control Valve
	Returning of accelerator control sluggish	Correct
	Fuel system leakage	Correct or replace
	Clutch slipping	Correct
	Brake drag	Correct
	Selection of transmission gear incorrect	Caution operator of incorrect gear selection
	Excessive Exhaust Gas Recirculation (EGR) flow due to trouble in EGR system	Refer to "Abnormal Combustion"

Lubrication Problems

Condition	Possible cause	Correction
Oil pressure too low	Wrong oil in use	Replace with correct engine oil
	Relief valve sticking	Replace
	Oil pump not operating properly	Correct or replace
	Oil pump strainer clogged	Clean or replace strainer
	Oil pump worn	Replace
	Oil pressure gauge defective	Correct or replace
	Crankshaft bearing or connecting rod bearing worn	Replace
Oil contamination	Wrong oil in use	Replace with correct engine oil
	Oil filter clogged	Replace oil filter
	Cylinder head gasket damage	Replace gasket
	Burned gases leaking	Replace piston and piston rings or cylinder body assembly
Oil not reaching valve system	Oil passage in cylinder head or cylinder body clogged	Clean or correct

Engine Oil Pressure Check

1. Check for dirt, gasoline or water in the engine oil.
 - a. Check the viscosity of the oil.
 - b. Change the oil if the viscosity is outside the specified standard.
 - c. Refer to the "Maintenance and Lubrication" section of this manual.
2. Check the engine oil level.

The level should fall somewhere between the "ADD" and the "FULL" marks on the oil level dipstick.

If the oil level does not reach the "ADD" mark on the oil level dipstick, engine oil must be added.

3. Remove the oil pressure unit.
4. Install an oil pressure gauge.
5. Start the engine and allow the engine to reach normal operating temperature (About 80°C).
6. Measure the oil pressure.

Oil pressure should be:
392–550 kPa (56.9–80.4 psi) at 3000 rpm.
7. Stop the engine.
8. Remove the oil pressure gauge.
9. Install the oil pressure unit.
10. Start the engine and check for leaks.

Malfunction Indicator Lamp

The instrument panel "CHECK ENGINE" Malfunction Indicator Lamp (MIL) illuminates by self diagnostic system

when the system checks the starting of engine, or senses malfunctions.

Condition	Possible cause	Correction
"CHECK ENGINE" MIL does not illuminate at the starting of engine	Bulb defective	Replace
	MIL circuit open	Correct or replace
	Command signal circuit to operate self diagnostic system shorted	Correct or replace
	Powertrain Control Module (PCM) cable loosely connected, disconnected or defective	Correct or replace
	PCM defective	Replace

6A-18 ENGINE MECHANICAL (6VD1 3.2L)

Condition	Possible cause	Correction
"CHECK ENGINE" MIL illuminates, and stays on	Deterioration of heated oxygen sensor internal element	Replace
	Heated oxygen (O ₂) sensor connector terminal improper contact	Reconnect properly
	O ₂ sensor lead wire shorted	Correct
	O ₂ sensor circuit open	Correct or replace
	Deterioration of Engine Coolant Temperature (ECT) sensor internal element	Replace
	ECT sensor connector terminal improper contact	Reconnect properly
	ECT sensor lead wire shorted	Correct
	ECT sensor circuit open	Correct or replace
	Throttle position sensor open or shorted circuits	Correct or replace
	Deterioration of crankshaft position sensor	Replace
	Crankshaft position sensor circuit open or shorted	Correct or replace
	Vehicle speed sensor circuit open	Correct or replace
	Manifold absolute pressure sensor circuit open or shorted	Correct or replace
	Intake air temperature sensor circuit open or shorted	Correct or replace
	Fuel injector circuit open or shorted	Correct or replace
	PCM driver transistor defective	Replace PCM
Malfunctioning of PCM RAM (Random Access Memory) or ROM (Read Only Memory)	Replace PCM	

Cylinder Head Cover LH

Removal

1. Disconnect battery ground cable.
2. Drain engine coolant from faucet bottom of radiator.
3. Remove engine cover from the dowels on the common chamber.

F06RW018

4. Remove air cleaner duct assembly (3) and air cleaner element (4).

130RW001

Legend

- (1) Positive Crankcase Ventilation Hose Connector
- (2) Intake Air Temperature Sensor
- (3) Air Cleaner Duct Assembly
- (4) Air Cleaner Element
- (5) Mass Air Flow Sensor

5. Disconnect following wiring connectors and bonding cable:
 - Manifold Absolute Pressure (MAP) sensor
 - Vacuum Switching Valve (VSV) for Induction Air Control Valve (IACV) actuator
 - Ignition coils for left bank
 - Fuel injectors for left bank
 - Idle air control (IAC) valve
 - Throttle position sensor (TPS)
 - Bonding cable
 - Others as necessitated
6. Disconnect following vacuum hoses:
 - Brake master VAC
 - Canister
 - VSV for IACV actuator
 - Duty solenoid valve
 - PCV
7. Disconnect radiator upper and lower hoses
8. Remove engine harness from the cylinder head cover.
9. Remove the upper fan guide.
10. Remove cooling fan and clutch assembly.
11. Remove drive belt by pushing down the auto tensioner using spanner as illustrated.

F06RW019

NOTE: Disconnect the mass air flow (MAF) sensor connector, intake air temperature (IAT) sensor connector, and positive crankcase ventilation (PCV) hose before hand the air cleaner duct assembly is removed.

6A-20 ENGINE MECHANICAL (6VD1 3.2L)

Legend

- (1) Crankshaft Pulley
- (2) Generator
- (3) Auto Tensioner
- (4) Idle Pulley
- (5) Cooling Fan Pulley
- (6) Power Steering Oil Pump
- (7) Drive Belt
- (8) Air Conditioner Compressor

12. Remove power steering oil pump pulley.
13. Remove fan pulley and bracket assembly.
14. Remove idle pulley assembly.
15. Remove auto tensioner assembly.
16. Remove crankshaft pulley using 5-8840-0133-0 crankshaft holder.
17. Remove timing belt covers from the right bank side to the left bank side in order.
18. Remove ignition coil assemblies for the left side bank.

Legend

- (1) Ignition Coil Connectors
- (2) Bolts
- (3) Ignition Coil Assemblies

19. Remove cylinder head cover assembly.

Installation

1. Install cylinder head cover.
 - Clean the sealing surface of cylinder head and cylinder head cover to remove oil and sealing materials completely.
 - Apply sealant (TB-1207B or equivalent) of bead diameter 2-3 mm at eight place of arched area of camshaft bracket on front and rear sides.

- The cylinder head cover must be installed within 5 minutes after sealant application to prevent premature hardening of sealant.

- Tighten bolts to the specified torque.

Torque : 9 N-m (0.9 Kg-m/78 lb in)

2. Install ignition coil assemblies and tighten the fixing bolts to the specified torque.

Torque : 4 N-m (0.4 Kg-m/35 lb in)

3. Install timing belt covers from left bank side to right bank side, and tighten the fixing bolts and nut to the specified torque.

Torque : 19 N-m (1.9 Kg-m/14 lb ft)

4. Install crankshaft pulley and tighten the fixing bolt using 5-8840-0133-0 crankshaft holder to the specified torque.

Torque : 167 N-m (17.0 Kg-m/123 lb ft)

5. Install auto tensioner assembly and tighten the fixing bolts to the specified torque.
Torque :
Shorter Bolt : 20 N·m (2.0 Kg-m/14 lb ft)
Longer Bolt : 39 N·m (4.0 Kg-m/29 lb ft)
6. Install idle pulley and bracket assembly and tighten the fixing bolt to the specified torque.
Torque : 52 N·m (5.3 Kg-m/38 lb ft)
7. Install fan pulley and bracket assembly and tighten the fixing bolts and nut to the specified torque.
Torque : 22 N·m (2.2 Kg-m/16 lb ft)
8. Install power steering oil pump pulley and tighten the fixing bolt to the specified torque.
Torque : 78 N·m (8.0 Kg-m/58 lb ft)
9. Install drive belt by pushing down the auto tensioner using spanner as shown in the removal step of drive belt.
10. Install cooling fan and clutch assembly and tighten the fixing bolts to the specified torque.
Torque : 10 N·m (1.0 Kg-m/87 lb in)
11. Install upper fan guide and clip both side and tighten the fixing bolts to the specified torque.
Torque : 4 N·m (0.4 Kg-m/35 lb in)
12. Install engine harness and tighten the fixing bolts of the retaining clip and bracket to the specified torque.
Torque : 4 N·m (0.4 Kg-m/35 lb in)
13. Connect radiator upper and lower hoses and clip them securely.
14. Connect vacuum hoses of those which were disconnected in the removal step.
15. Connect wiring connectors and bonding cable of those which were disconnected in the removal step.
16. Install air cleaner element and air cleaner duct assembly, and clip the both end securely.
17. Connect Mass Air Flow (MAF) sensor connector, Intake Air Temperature (IAT) sensor connector and Positive Crankcase Ventilation (PCV) hose.
18. Install engine cover mating with the dowels.

Cylinder Head Cover RH

Removal

1. Disconnect battery ground cable.
2. Remove battery from the vehicle.
3. Drain engine coolant from faucet bottom of radiator.
4. Remove engine cover from the dowels on the common chamber.

F06RW016

5. Remove air cleaner duct assembly (3) and air cleaner element (4).

130RW001

Legend

- (1) Positive Crankcase Ventilation Hose Connector
- (2) Intake Air Temperature Sensor
- (3) Air Cleaner Duct Assembly
- (4) Air Cleaner Element
- (5) Mass Air Flow Sensor

NOTE: Disconnect the mass air flow (MAF) sensor connector, intake air temperature (IAT) sensor connector, and positive crankcase ventilation (PCV) hose before hand the air cleaner duct assembly is removed.

6. Disconnect following wiring connectors and bonding cable:
 - Exhaust Gas Recirculation (EGR) valve
 - Fuel injectors for right bank
 - Ignition coils for right bank
 - Bonding cable
 - Othres as necessitated
7. Disconnect radiator upper and lower hoses.
8. Remove engine harness from the cylinder head cover.
9. Remove the upper fan guide.
10. Remove cooling fan and clutch assembly.
11. Remove drive belt by pushing down the auto tensioner using spanner as illustrated.

F06RW019

Legend

- (1) Crankshaft Pulley
- (2) Generator
- (3) Auto Tensioner
- (4) Idle Pulley
- (5) Cooling Fan Pulley
- (6) Power Steering Oil Pump
- (7) Drive Belt
- (8) Air Conditioner Compressor

12. Remove fan pulley and bracket assembly.
13. Remove idle pulley assembly.
14. Remove auto tensioner assembly.
15. Remove crankshaft pulley using 5-8840-0133-0 crankshaft holder.

16. Remove timing belt covers for right bank side.
17. Reomve timing belt covers for right bank side.

060RW001

Legend

- (1) Ignition Coil Connectors
- (2) Bolts
- (3) Ignition Coil Assemblies

18. Remove ignition coil assemblies for the right side bank.
19. Remove cylinder head cover assembly.

Installation

1. Install cylinder head cover.
 - Clean the sealing surface of cylinder head and cylinder head cover to remove oil and sealing materials completely.
 - Apply sealant (TB-1207B or equivalent) of bead diameter 2-3 mm at eight place of arched area of camshaft bracket on front and rear sides.
 - The cylinder head cover must be installed within 5 minutes after sealant application before the sealant hardens.

014RW145

- Tighten bolts in turn to the specified torque.

Torque : 8.8 N-m (0.9 Kg-m/78 lb in)

010RW007

2. Install ignition coil assemblies and tighten the fixing bolts to the specified torque.

Torque : 4 N-m (0.4 Kg-m/35 lb in)
3. Install timing belt cover and tighten the fixing bolts and nut to the specified torque.

Torque : 19 N-m (1.9 Kg-m/14 lb ft)
4. Install crankshaft pulley and tighten the fixing bolt using 5-8840-0133-0 crankshaft holder to the specified torque.

Torque : 167 N-m (17 Kg-m/123 lb ft)
5. Install auto tensioner assembly and tighten the fixing bolts to the specified torque.

Torque :

Shorter Bolt : 20 N-m (2.0 Kg-m/14.8 lb ft)

Longer Bolt : 39 N-m (4.0 Kg-m/28.8 lb ft)

6A-24 ENGINE MECHANICAL (6VD1 3.2L)

6. Install idle pulley assembly and tighten the fixing bolt to the specified torque.

Torque : 52 N·m (5.3 Kg·m/38.4 lb ft)

7. Install fan pulley and bracket assembly and tighten the fixing bolts and nut to the specified torque.

Torque : 22 N·m (2.2 Kg·m/16.2 lb ft)

8. Install drive belt by pushing down the auto tensioner using spanner as shown in the removal step of drive belt.

9. Install cooling fan clutch assembly and tighten the fixing bolts to the specified torque.

Torque : 10 N·m (1.0 Kg·m/88.5 lb in)

10. Install upper fan guide and clip both side and tighten the fixing bolts to the specified torque.

Torque : 4 N·m (0.4 Kg·m/35.4 lb in)

11. Install engine harness and tighten the fixing bolts of the retaining clip and brackets to the specified torque.

Torque : 4 N·m (0.4 Kg·m/35.4 lb in)

12. Connect radiator upper and lower hoses and clip them securely.

13. Connect wiring connectors and bonding cable of those which were disconnected in the removal step.

14. Install air cleaner element and air cleaner duct assembly, and the clip both end securely.

15. Connect Mass Air Flow (MAF) sensor connector, Intake Air Temperature (IAT) sensor connector and Positive Crankcase Ventilation (PCV) hose.

16. Install engine cover mating with the dowels.

Common Chamber

Removal

1. Disconnect battery ground cable.
2. Remove air cleaner duct assembly.

Legend

- (1) Positive Crankcase Ventilation Hose Connector
- (2) Intake Air Temperature Sensor
- (3) Air Cleaner Duct Assembly
- (4) Air Cleaner Element
- (5) Air Flow Sensor

3. Disconnect accelerator pedal cable from throttle body and cable bracket.
4. Disconnect vacuum booster hose from common chamber.
5. Disconnect connector from manifold absolute pressure sensor, idle air control valve, throttle position sensor, solenoid valve, electric vacuum sensing valve, and EGR valve.
6. Disconnect vacuum hose on canister Vacuum Switching Value (VSV) and positive crankcase ventilation hose, fuel rail assembly with pressure control valve bracket.
7. Remove ventilation hose from throttle valve and intake duct and remove water hose.
8. Remove the four throttle body fixing bolts.
9. Remove exhaust gas recirculation valve assembly fixing bolt and nut on common chamber and remove EGR valve assembly.
10. Remove two bolts from common chamber rear side for remove fuel hose bracket.
11. Remove common chamber four bolts and four nuts then remove the common chamber.

Legend

- (1) Common Chamber
- (2) Throttle Valve Assembly
- (3) Bolt

Installation

1. Install common chamber and tighten bolts and nuts to the specified torque.

Torque :
Bolt : 25 N·m (2.5 Kg-m/18 lb ft)
Nut : 25 N·m (2.5 Kg-m/18 lb ft)
2. Install fuel hose bracket and tighten bolts to specified torque.

Torque : 10 N·m (1.0 Kg-m/89 lb in)
3. Install exhaust gas recirculation valve assembly and tighten bolt and nut to the specified torque.

Torque : 25 N·m (2.5 Kg-m/18 lb ft)
4. Install throttle body and tighten bolts to the specified torque.

Torque : 25 N·m (2.5 Kg-m/18 lb ft)
5. Install ventilating hose to throttle valve and intake duct.
6. Connect vacuum hoses on canister VSV and positive crankcase ventilation hose. Tighten bolts for fuel rail assembly with pressure control valve bracket.

Torque : 25 N·m (2.5 Kg-m/18 lb ft)
7. Connect each connector without fail.
8. Connect vacuum booster hose.
9. Connect accelerator pedal cable.

6A-26 ENGINE MECHANICAL (6VD1 3.2L)

10. Install air cleaner duct assembly.

130RW001

Legend

- (1) Positive Crankcase Ventilation Hose Connector
 - (2) Intake Air Temperature Sensor
 - (3) Air Cleaner Duct Assembly
 - (4) Air Cleaner Element.
 - (5) Mass Air Flow Sensor
-

Exhaust Manifold LH

Removal

1. Disconnect battery ground cable.
2. Remove air cleaner duct assembly.

130RW001

Legend

- (1) Positive Crankcase Ventilation Hose Connector
- (2) Intake Air Temperature Sensor
- (3) Air Cleaner Duct Assembly
- (4) Air Cleaner Element
- (5) Mass Air Flow Sensor

3. Disconnect heated oxygen (O₂) sensor connector.
4. Remove exhaust front pipe three stud nuts from exhaust side and two nuts from rear end of exhaust front pipe.

150RX014

Legend

- (1) O₂ Sensor
- (2) Exhaust Front Pipe LH

5. Remove heat protector two fixing bolts then the heat protector.
6. Remove a bolt on engine LH side for air conditioner (A/C) compressor bracket and loosen two bolts for A/C compressor then move A/C compressor to front side.
7. Remove exhaust manifold eight fixing nuts and remove exhaust manifold from the engine.

Installation

1. Install exhaust manifold and tighten exhaust manifold fixing nuts to the specified torque with new nuts.

Torque: 57 N·m (5.8 Kg·m/42 lb ft)

2. Install heat protector.
3. Install exhaust front pipe and tighten three stud nuts and two nuts to the specified torque.

Torque :

Stud nuts: 67 N·m (6.8 Kg·m/49 lb ft)

Nuts: 43 N·m (4.4 Kg·m/32 lb ft)

150R014

Legend

- (1) O₂ Sensor
- (2) Exhaust Front Pipe LH

4. Set A/C compressor to normal position and tighten two bolts and a bolt to the specified torque.

Torque : 40 N·m (4.1 Kg·m/30 lb ft)

5. Reconnect O₂ sensor connector.
6. Install air cleaner duct assembly.

Exhaust Manifold RH

Removal

1. Disconnect battery ground cable.
2. Remove torsion bar. Refer to removal procedure in Front Suspension section.
3. Remove exhaust front pipe three stud nuts and two nuts then disconnect exhaust front pipe.

Legend

- (1) Exhaust Front Pipe RH
- (2) Heated Oxygen (O₂) Sensor

4. Remove heat protector two fixing bolts then the heat protector.
5. Remove exhaust gas recirculation (EGR) pipe fixing bolt and nut from exhaust manifold, remove a nut from EGR valve and a bolt from rear side of cylinder head for bracket of EGR pipe then remove the EGR pipe.

Legend

- (1) EGR Valve
- (2) EGR Pipe

6. Remove exhaust manifold eight fixing nuts then the exhaust manifold.

Installation

1. Install exhaust manifold and tighten bolts to the specified torque.
Torque : 57 N·m (5.8 Kg-m/42 lb ft)
2. Install the EGR pipe, tighten bolt and nut on exhaust manifold to specified torque.
Torque : 28 N·m (2.9 Kg-m/21 lb ft)
Tighten nut to EGR valve to the specified torque.
Torque : 44 N·m (4.5 Kg-m/33 lb ft)
Tighten the bolt for EGR pipe bracket to specified torque.
Torque : 25 N·m (2.5 Kg-m/18 lb ft)
3. Install heat protector
4. Install exhaust front pipe and tighten three stud nuts and two nuts to the specified torque.
Torque:
Stud nuts: 67 N·m (6.8 Kg-m/49 lb ft)
Nuts: 43 N·m (4.4 Kg-m/32 lb ft)
5. Install the torsion bar and readjust the vehicle height. Refer to installation and vehicle height adjustment procedure for Front Suspension.

Crankshaft Pulley

Removal

1. Disconnect battery ground cable.
2. Remove air cleaner assembly.

Legend

- (1) Positive Crankcase Ventilation Hose Connector
- (2) Intake Air Temperature Sensor
- (3) Air Cleaner Duct Assembly
- (4) Air Cleaner Element
- (5) Mass Air Flow Sensor

3. Remove radiator upper fan shroud from radiator.
4. Move serpentine belt tensioner to loose side using wrench then remove serpentine belt.

Legend

- (1) Crankshaft Pulley
- (2) Cooling Fan Pulley
- (3) Tensioner
- (4) Generator
- (5) Air Conditioner Compressor
- (6) Power Steering Oil Pump
- (7) Serpentine Belt

5. Remove cooling fan assembly four fixing nuts, then the cooling fan assembly.
6. Remove crankshaft pulley assembly using 5-8840-0133-0 crankshaft holder, hold crankshaft pulley then remove center bolt and pulley.

Installation

1. Install crankshaft pulley using 5-8840-0133-0 crankshaft holder, hold the crankshaft pulley and tighten center bolt to the specified torque.

Torque : 167 N·m (17.0 Kg·m/123 lb ft)

2. Install cooling fan assembly and tighten bolts/nuts to the specified torque.

Torque : 22 N·m (2.2 Kg·m/16 lb ft) for fan pulley and fan bracket.

Torque : 10 N·m (1.0 Kg·m/88.5 lb in) for fan and clutch assembly.

3. Move serpentine belt tensioner to loose side using wrench, then install serpentine belt to normal position.
4. Install radiator upper fan shroud.
5. Install air cleaner assembly.

Timing Belt

Removal

1. Disconnect battery ground cable.
2. Remove air cleaner assembly.
3. Remove radiator upper fan shroud from radiator.
4. Move drive belt tensioner to loose side using wrench then remove drive belt.

Legend

- (1) Crankshaft Pulley
- (2) Cooling Fan Pulley
- (3) Tensioner
- (4) Generator
- (5) Air Conditioner Compressor
- (6) Power Steering Oil Pump
- (7) Drive Belt

5. Remove cooling fan assembly four nuts, then the cooling fan assembly.
6. Remove cooling fan drive pulley assembly.
7. Remove idle pulley assembly.
8. Remove serpentine belt tensioner assembly.
9. Remove power steering pump assembly.
10. Remove crankshaft pulley assembly using 5-8840-0133-0 crankshaft holder, hold crankshaft pulley remove center bolt, then the pulley.

11. Remove right side timing belt cover then left side timing belt cover.
12. Remove lower timing belt cover
13. Remove pusher.

CAUTION: The pusher prevents air from entering the oil chamber. Its rod must always be facing upward.

Legend

- (1) Up Side
- (2) Down Side
- (3) Direction For Installation
- (4) Locking Pin

14. Remove timing belt.

CAUTION:

1. Do not bend or twist the belt, otherwise its core could be damaged. The belt should not be bent at a radius less than 30 mm.
2. Do not allow oil or other chemical substances to come in contact with the belt. They will shorten the life.
3. Do not attempt to pry or stretch the belt with a screw driver or any other tool during installation.
4. Store timing belt in a cool and dark place. Never expose the belt direct sunlight or heat.

Installation

NOTE: For correct belt installation, the letter on the belt must be able to be read as viewed from the front of the vehicle.

014RY00042

Legend

6A-32 ENGINE MECHANICAL (6VD1 3.2L)

- Align the alignment mark on the RH bank camshaft drive gear pulley (2) to the alignment mark of the cylinder head cover RH (3).
- Align the alignment mark (white line) on the timing belt (1) with alignment mark on the RH bank camshaft drive gear pulley (2) (on the left side as viewed from the front of the vehicle) and put the timing belt on the camshaft drive gear pulley. Secure the belt with a double clip or equivalent clip.

014RW0004

Legend

- Alignment Mark on Timing Belt (White line).
- Alignment Mark on Camshaft Drive Gear Pulley.
- Alignment Mark on Cylinder Head Cover RH.

- Align the alignment mark on the LH bank camshaft drive gear pulley (2) to the alignment mark of the cylinder head cover LH (3).
- Align the alignment mark (white line) on the timing belt (1) with the alignment mark on the LH bank camshaft drive gear pulley (2).

When aligning the timing marks, use a wrench to turn the camshaft drive gear pulley, then set the timing mark between timing belt and camshaft drive gear pulley and put the timing belt on the camshaft drive gear pulley.

Secure the belt with a double clip or equivalent clip.

NOTE: It is recommended for easy installation that the belt be secured with a double clip or equivalent clip after it is installed the timing belt to each pulley.

014RW0005

Legend

- Alignment Mark on Timing Belt (White line).
- Alignment Mark on Camshaft Drive Gear Pulley.
- Alignment Mark on Cylinder Head Cover LH.

- Install crankshaft pulley temporarily and tighten center bolt by hand (do not use a wrench).

Turn the crankshaft pulley clockwise to give some belt slack between the crankshaft timing pulley and the RH bank camshaft drive gear pulley.

- Install pusher and tighten bolt to the specified torque.

Torque : 25 N·m (2.5 Kg·m/18 lb ft)

- Install the pusher while pushing the tension pulley to the belt.
- Pull out pin from the pusher.

NOTE: When reusing the pusher, press the pusher with approximately 100Kg to retract the rod, and insert a pin (1.4 mm piano wire).

014RW011

Legend

- (1) Up Side
- (2) Down Side
- (3) Direction for Installation
- (4) Locking Pin

3. Remove double clips or equivalent clips, from timing belt pulleys.
Turn the crankshaft pulley clockwise by two turns.
3. Install timing belt cover.
Remove crankshaft pulley that was installed in step 1 item 5.
Tighten bolts to the specified torque.

Torque: 19 N-m (1.9 Kg-m/14 lb ft)

020RW004

4. Install crankshaft pulley using 5-8840-0133-0, hold the crankshaft pulley and tighten center bolt to the specified torque.

Torque : 167 N-m (17.0 Kg-m/123 lb ft)

5. Install fan pulley bracket and tighten fixing bolts to the specified torque.

Torque : 22 N-m (2.2 Kg-m/16 lb ft)

6. Install power steering pump assembly and tighten to the specified torque.

Torque :

M8 bolt : 22 N-m (2.2 Kg-m/16 lb ft)

M10 bolt : 46 N-m (4.7 Kg-m/34 lb ft)

7. Install cooling fan assembly and tighten bolts/nuts to the specified torque.

Torque : 22 N-m (2.2 Kg-m/16 lb ft) for fan pulley and fan bracket.

Torque : 10 N-m (1.0 Kg-m/88.5 lb in) for fan and clutch assembly.

8. Move drive belt tensioner to loose side using wrench, then install drive belt to normal position.

850RW001

- (8) Drive Belt

9. Install radiator upper fan shroud.
10. Install air cleaner assembly.

Camshaft

Removal

1. Disconnect battery ground cable.
2. Remove crankshaft pulley.
 - Refer to removal procedure for Crankshaft Pulley in this manual.
3. Remove timing belt.
 - Refer to removal procedure for Timing Belt in this manual.
4. Remove cylinder head cover LH.
 - Refer to removal procedure for Cylinder Head Cover LH in this manual.
5. Remove cylinder head cover RH.
 - Refer to removal procedure for Cylinder Head Cover RH in this manual.
6. Remove twenty fixing bolts from inlet and exhaust camshaft bracket on one side bank, then camshaft brackets.

014RW027

7. Remove camshaft assembly.
8. Remove fixing bolt for camshaft drive gear pulley.
9. Remove three fixing bolts from camshaft drive gear retainer, then camshaft drive gear assembly.

014RW026

Legend

- (1) Right Bank
- (2) Left Bank
- (3) Timing Mark on Retainer

Installation

1. Install camshaft drive gear assembly and tighten three bolts to the specified torque.

Torque : 10 N·m (1.0 Kg·m/89 lb in)

2. Tighten bolt for camshaft drive gear assembly pulley to the specified torque.

Torque : 98 N·m (10.0 Kg·m/72 lb ft)

3. Tighten sub gear setting bolt.

1. Use the 5-8840-2443-0 gear spring lever to turn sub gear to right direction until it aligns with the M5 bolt hole between camshaft driven gear and sub gear.
2. Tighten the M5 bolt to a suitable torque to prevent the sub gear from moving.

014RW041

4. Install camshaft assembly and camshaft brackets, tighten twenty bolts on one side bank to the specified torque.

1. Apply engine oil to camshaft journal and bearing surface of camshaft bracket.
2. Align timing mark on intake camshaft (one dot for right bank, two dot for left bank) and exhaust camshaft (one dot for right bank, two dots for left bank) to timing mark on camshaft drive gear (one dot).

3. Tighten twenty bolts on numerical order an one side bank as shown in the illustration.

Torque : 10 N·m (1.0 Kg·m/89 lb in)

014RW031

- 5. Install cylinder head cover RH.
 - Refer to installation procedure for CYLINDER HEAD COVER RH in this manual.
- 6. Install cylinder head cover LH.
 - Refer to installation procedure for CYLINDER HEAD COVER LH in this manual.
- 7. Install timing belt.
 - Refer to installation procedure for TIMING BELT in this manual.
- 8. Install crankshaft pulley.
 - Refer to installation procedure for CRANKSHAFT PULLEY in this manual.
- 9. Install accelerator pedal cable.

Cylinder Head

Removal

1. Remove engine hood.
2. Disconnect battery ground cable.
3. Drain radiator coolant.
4. Drain engine oil.
5. Remove crankshaft pulley.
 - Refer to removal procedure for Crankshaft Pulley in this manual.
6. Remove timing belt.
 - Refer to removal procedure for Timing Belt in this manual.
7. Remove cylinder head cover LH.
 - Refer to removal procedure for Cylinder Head Cover LH in this manual.
8. Remove cylinder head cover RH.
 - Refer to removal procedure for Cylinder Head Cover RH in this manual.
9. Remove common chamber.
 - Refer to removal procedure for Common Chamber in this manual.
10. Remove cylinder head assembly.
 1. Loosen eights bolts for tight cylinder head.
 2. Remove cylinder head assembly.

014RW028

Legend

- (1) Cylinder Head
- (2) Cylinder Head Bolt
- (3) Camshaft

Installation

1. Install cylinder head assembly to cylinder block.
 1. Put cylinder head gasket on the cylinder block.

NOTE: There is discrimination mark "R" for right bank and "L" for left bank on the cylinder head gasket as shown in the illustration.

Do not reuse cylinder head gasket.

011RW005

2. Align dowel pin hole to dowel pin on the cylinder block.
3. Tighten two bolts temporarily by hand to prevent the cylinder head assembly from moving.
4. Using 9-8511-4209-0 cylinder head bolt wrench, tighten bolts in numerical order as shown in the illustration to the specified torque.

NOTE: Do not reuse cylinder head bolts.

Do not apply any lubricant to the cylinder head bolts.

Torque :

Temporary : 29 N-m (3.0 Kg-m/21 lb ft)

Final : 64 N-m (6.5 Kg-m/47 lb ft)

014RW029

6A-38 ENGINE MECHANICAL (6VD1 3.2L)

2. Install common chamber.
 - Refer to installation procedure for Common Chamber in this manual.
3. Install cylinder head cover RH.
 - Refer to installation procedure for Cylinder Head Cover RH in this manual.
4. Install cylinder head cover LH.
 - Refer to installation procedure for Cylinder Head Cover LH in this manual.
5. Install timing belt.
 - Refer to installation procedure for Timing Belt in this manual.
6. Install crankshaft pulley.
 - Refer to installation procedure for Crankshaft Pulley in this manual.
7. Install accelerator pedal cable.

Valve Stem Oil Controller , Valve Spring and Valve Guide

Removal

1. Disconnect battery ground cable.
2. Drain engine oil.
 - Drain engine coolant.
3. Remove cylinder head assembly.
 - Refer to removal procedure for Cylinder Head in this manual.
4. Remove camshaft.
 - Refer to removal procedure for Camshaft in this manual.
5. Remove tappets with shim.

NOTE: Do not damage shim surface.

6. Remove valve springs using 5-8840-2446-0 valve spring compressor and 5-8840-2547-0 valve spring compressor adapter then remove upper valve spring seat and lower seat.

7. Remove oil controller using 5-8840-0623-0 oil controller remover, remove each valve stem oil controller.
8. Remove valve guide using 5-8840-2549-0 valve guide replacer.

Installation

1. Install valve guide using 5-8840-2442-0 valve guide installer.
2. Install oil controller using 5-8840-0624-0 oil controller installer.
3. Install lower valve spring seat, valve spring and upper valve spring seat then put split collars on the upper spring seat, using 5-8840-2446-0 valve spring compressor and 5-8840-2547-0 valve spring compressor adapter to install the split collars.
4. Install tappet with shim.
5. Install camshaft assembly.
 - Refer to installation procedure for Camshaft in this manual.
6. Install cylinder head assembly.
 - Refer to installation procedure for Cylinder Head in this manual.
7. Fill engine oil until full level.
8. Fill engine coolant.

Piston, Piston Ring and Connecting Rod

Removal

Legend

- | | |
|----------------------------|---|
| (1) Cylinder Head | (4) Oil Strainer |
| (2) Crankcase with Oil Pan | (5) Oil Gallery |
| (3) Oil Pipe | (6) Piston with Connecting Rod Assembly |

1. Remove cylinder head assembly.

- Refer to removal procedure for Cylinder Head in this manual.

2. Remove crankcase with Oil Pan.

- Refer to removal procedure for Oil Pan and Crankcase in this manual.

6A-40 ENGINE MECHANICAL (6VD1 3.2L)

3. Remove oil strainer fixing bolts, remove oil strainer assembly with O-ring.

050RW002

Legend

- (1) Oil Pump
- (2) Oil Strainer
- (3) Oil Gallery
- (4) From Oil Filter
- (5) To Oil Filter

4. Remove three fixing bolts, oil pipe with O-ring.
5. Remove eight fixing bolts, oil gallery.
6. Remove piston with connecting rod assembly, before removing the bearing cap, remove carbon on the top of cylinder bore and push piston with connecting rod out from the top of cylinder bore.

Installation

1. Install piston with connecting rod assembly.
 - Apply engine oil to cylinder bore, connecting rod bearing and crank pin. When installing the piston, its front mark must face the engine front side.
 - The bearing cap number must be the same as connecting rod number.
 - Apply engine oil to the thread and seating surface of each nut.
 - Tighten nuts to the specified torque.

Torque : 54 N·m (5.5 Kg·m/40 lb ft)

- After tightening the nuts, make sure that the crankshaft rotates smoothly.

NOTE: Do not apply engine oil to the bearing back faces and connecting rod bearing fitting surfaces.

015RW003

Legend

- (1) Piston Front Mark
- (2) Piston Grade
- (3) Connecting Rod Front Mark

2. Install oil gallery and tighten the bolts in two steps, in the order shown in illustration.

Torque :

1st step : 29 N·m (3.0 Kg·m/21 lb ft)

2nd step : 55°-65°

051RS009

3. Install oil pipe with O-ring.

Torque : 10 N·m (1.0 Kg·m/89 lb in)

4. Install oil strainer assembly with O-ring.

Torque : 25 N·m (2.5 Kg·m/18 lb ft)

5. Install crankcase with Oil Pan.

- Refer to installation procedure for Oil Pan and Crankcase in this manual.

6. Install cylinder head assembly.

- Refer to installation procedure for Cylinder Head in this manual.

Crankshaft and Main Bearings

Removal

F06RW010

Legend

- | | |
|----------------------------|----------------------------------|
| (1) Engine Assembly | (8) Oil Pump Assembly |

| (7) Oil Strainer | (14) Crankshaft Main Bearing Cap |
| | (15) Crankshaft and Main Bearing |

1. Remove engine assembly.

- Refer to removal procedure for Engine Assembly in this manual.

2. Remove timing belt.

- Refer to removal procedure for Timing Belt in this manual.

3. Remove oil pan and crankcase.

- Refer to removal procedure for Oil Pan and Crankcase in this manual.

4. Remove oil pipe with O-ring.

5. Remove oil strainer assembly with O-ring.

6A-42 ENGINE MECHANICAL (6VD1 3.2L)

6. Remove oil pump assembly.
 - Refer to removal procedure for Oil Pump in this manual.
7. Remove cylinder body side bolts.
8. Remove oil gallery.
9. Remove flywheel.
10. Remove rear oil seal retainer.
 - Refer to removal procedure for Rear Oil Seal in this manual.
11. Remove connecting rod caps.
12. Remove crankshaft main bearing caps.
13. Remove crankshaft and main bearings.

Installation

1. Install crankshaft and main bearings.
 - Install main bearing in the cylinder block and main bearing cap respectively.
Apply new engine oil to upper and lower main bearings.

NOTE:

- Do not apply engine oil to the bearing back faces.
- Make sure that main bearings are in correct position.
- Install crankshaft with care.
- Apply engine oil to the thrust washer.
- Install thrust washer on No.3 journal.
- Oil grooves in thrust washer must face the crankshaft.

2. Install crankshaft main bearing caps.
 - Apply engine oil to the thread and seating surface of each bearing cap fixing bolt.

NOTE:

- Do not apply engine oil to the bearing back faces.
- Install bearing caps in the order of numbers, starting with cylinder block front side.
- Tighten main bearing fixing bolts to the specified torque.

Torque : 39 N·m (4.0 Kg·m/29 lb ft)

- After tightening the bolts, make sure that the crankshaft rotates smoothly.

3. Install connecting rod caps.

- The cap number must be same as connecting rod number.
- Apply engine oil to the thread and seating surface of each nut.
- Tighten nuts to the specified torque.

Torque : 54 N·m (5.5 Kg·m/40 lb ft)

- After tightening the nuts, make sure that the crankshaft rotates smoothly.

4. Install rear oil seal retainer.

- Remove oil on cylinder block and retainer fitting surface.
- Apply sealant (TB1207B or equivalent) to retainer fitting surface as shown in illustration.

- The oil seal retainer must be installed within 5 minutes after sealant application before the sealant hardens.

015RW002

Legend

- (1) Around Bolt Holes
- (2) Around Dowel Pin

- Apply engine oil to oil seal lip and align a dowel pin hole in the cylinder block with that in the retainer.
- Tighten retainer fixing bolts to the specified torque.

Torque : 18 N-m (1.8 Kg-m/13 lb ft)

015RW001

5. Install flywheel.

- Clean tapped holes in the crankshaft.
- Remove oil on crankshaft and flywheel fitting surface.

NOTE:

- Do not reuse the bolts.
- Do not apply oil or thread lock to the bolts.

- Tighten fixing bolts to the specified torque.

Torque : 54 N-m (5.5 Kg-m/40 lb ft)

015RS018

6. Install oil gallery.

- Clean contact surface of oil gallery and main bearing cap. Apply engine oil to oil gallery fixing bolts and tighten the bolts in two steps, in the order shown in illustration.

Torque :

1st step : 29 N-m (3.0 Kg-m/21 lb ft)

2nd step : 55°-65°

- 7. Install cylinder body side bolts and tighten bolts in order to the specified torque.

Torque : 39 N-m (4.0 Kg-m/29 lb ft)

NOTE: Do not apply the oil to the bolts.

○ : Oil gallery fixing bolts

□ : Crankcase bolts

012RS007

8. Install oil pump assembly.

- Remove oil on cylinder block and oil pump mounting surface.

6A-44 ENGINE MECHANICAL (6VD1 3.2L)

- Apply sealant (TB1207B or equivalent) to the oil pump mounting surface.
- The oil pump assembly must be installed within 5 minutes after sealant application before the sealant hardens.
- Apply engine oil to oil seal lip.
- Install oil pump in the cylinder block and tighten fixing bolts to the specified torque.

Torque : 25 N·m (2.5 Kg·m/18 lb ft)

051RW002

Legend

- (1) Around Bolt Holes
- (2) Around Dowel Pin

051RW001

9. Install oil strainer with O-ring, tighten to the specified torque.

Torque : 25 N·m (2.5 Kg·m/18 lb ft)

10. Install oil pipe with O-ring, tighten fixing bolts to the specified torque.

Torque : 25 N·m (2.5 Kg·m/18 lb ft)

11. Install crankcase.

- Remove oil on crankcase mounting surface and dry the surface.
- Properly apply a 4.5 mm (0.7 in) wide bead of sealant (TB1207C or equivalent) to the crankcase mounting surface. The bead must be continuous.
- The crankcase must be installed within 5 minutes after sealant application before the sealant hardens.
- Tighten fixing bolts to the specified torque.

Torque : 10 N·m (1.0 Kg·m/89 lb in)

013RW010

013RW004

12. Install oil pan

- Remove oil on oil pan mounting surface and dry the surface.
- Properly apply a 4.5 mm (0.7 in) wide bead of sealant (TB1207C or equivalent) to the oil pan mounting surface. The bead must be continuous.
- The oil pan must be installed within 5 minutes after sealant application to prevent premature hardening of sealant.

- Tighten fixing bolts to the specified torque.

Torque : 25 N·m (2.5 Kg·m/18 lb ft)

013RW003

013RW002

13. Install timing belt.

- Refer to installation procedure for Timing Belt in this manual.

14. Install engine assembly.

- Refer to installation procedure for Engine in this manual.

Rear Oil Seal

Removal

1. Remove transmission assembly.
 - Refer to removal procedure for Transmission section in this manual.
2. Remove flywheel.
3. Remove rear oil seal using a seal remover.

NOTE: Take care not to damage the crankshaft or oil seal retainer when removing oil seal.

Installation

1. Apply engine oil to oil seal lip and install oil seal using 5-8840-2286-0.

2. Install flywheel.
 - Clean tapped holes in the crankshaft.
 - Remove oil on the crankshaft and flywheel mounting surface.
 - Tighten fixing bolts to the specified torque.

NOTE: Do not reuse the bolts and do not apply oil or thread lock to the bolts.

Torque : 54 N·m (5.5 Kg·m/40 lb ft)

3. Install transmission.
 - See Transmission section in this manual.

CAUTION: When assembling the engine and transmission, confirm that dowels have been mounted in the specified positions at the engine side. Take care that dowel positions are different between the manual transmission and the automatic transmission.

Otherwise, the transmission may be damaged.

Engine Assembly

Removal

515RX013

1. Disconnect battery ground and positive cable.
 2. Remove battery.
 3. Make alignment mark on the engine hood and hinges before removal in order to return the hood to original position exactly.
 4. Remove engine hood.
 5. Drain radiator coolant.
 6. Disconnect accelerator cable and automatic cruise control cable from throttle valve on common chamber.
 7. Disconnect air duct with air cleaner cover.
 8. Remove air cleaner assembly.
 9. Disconnect canister vacuum hose.
 10. Disconnect vacuum booster hose.
 11. Disconnect three engine harness connectors.
 12. Disconnect harness connector to transmission (left front side of engine compartment), disconnect shift on the fly harness connector from front side of front axle and remove transmission harness bracket from engine left side.
 13. Disconnect ground cable between engine and frame.
 14. Disconnect bonding cable connector on the back of right dash panel.
 15. Disconnect bonding cable terminal on the left bank.
 16. Disconnect starter harness connector from starter.
 17. Disconnect generator harness connector from generator.
 18. Disconnect coolant reserve tank hose from radiator.
 19. Remove radiator upper and lower hoses.
 20. Remove upper fan shroud.
 21. Remove cooling fan assembly four fixing nuts, then the cooling fan assembly.
 22. Move drive belt tensioner to loose side using wrench then remove drive belt.
 23. Remove power steering pump fixing bolts, then power steering pump. Place the power steering pump along with piping on the body side.
 24. Remove air conditioning compressor fixing bolts from bracket and place the compressor along with piping on the body side.
 25. Remove O₂ sensor harness connectors from exhaust front pipe.
 26. Remove three exhaust pipe fixing nuts from each bank.
 27. Remove two exhaust pipe fixing nuts from each exhaust pipe, then move exhaust pipe to rear side of vehicle.
 28. Remove flywheel dust covers.
 29. Disconnect two heater hoses from engine.
 30. Disconnect fuel hoses from right side of transmission.
- CAUTION: Plug fuel pipes on engine side and fuel hoses from fuel tank.**
31. Remove transmission assembly. Refer to Transmission section in this manual.
 32. Support the engine by engine hoist.
 33. Remove two left side engine mount fixing bolts from engine mount on chassis side.
 34. Remove two right side engine mount fixing bolts from engine mount on chassis side.
 35. Remove engine assembly.

Installation

CAUTION: When assembling the engine and transmission, confirm that dowels have been mounted in the specified positions at the engine side. Take care that dowel positions are different between the manual transmission and the automatic transmission.

6A-48 ENGINE MECHANICAL (6VD1 3.2L)

If the engine is assembled in the condition that the dowels have not been mounted in the specified positions, the transmission may be damaged the transmission.

1. Install engine assembly. Tighten engine mount fixing bolts to frame to the specified torque.

Torque: 41 N·m (4.2 Kg·m/30 lb ft)

2. Reconnect fuel hose to fuel pipe on engine.

3. Install transmission assembly. Refer to Transmission section in this manual.

4. Reconnect two heater hoses to engine.

5. Install flywheel dust covers.

6. Install exhaust pipe and temporarily tighten two (each bank) rear exhaust flange nuts then tighten three stud nuts (each bank) between exhaust manifold and exhaust pipe, finally tighten rear side nuts to the specified torque.

Torque:

Nuts: 43 N·m (4.4 Kg·m/32 lb ft)

Stud nuts: 67 N·m (6.8 Kg·m/49 lb ft)

Legend

- (1) Exhaust Front Pipe RH
- (2) O2 Sensor

Legend

- (1) O2 Sensor
- (2) Exhaust Front Pipe LH

7. Reconnect O2 sensor connector.

8. Install cooling fan assembly and tighten bolts/nuts to the specified torque.

Torque : 22 N·m (2.2 Kg·m/16 lb ft) for fan pulley and fan bracket.

Torque : 10 N·m (1.0 Kg·m/88.5 lb in) for fan and clutch assembly.

9. Install air conditioner compressor to engine and tighten to the specified torque.

Torque :

M8 bolts : 22 N·m (2.2 Kg-m/16 lb ft)

M10 bolts : 43 N·m (4.4 Kg-m/32 lb ft)

10. Install power steering pump, tighten fixing bolt to the specified torque.

Torque :

M8 bolts : 22N·m (2.2 Kg-m/16 lb ft)

M10 bolts : 46 N·m (4.7 Kg-m/34 lb ft)

11. Move drive belt tensioner to loose side using wrench, then install drive belt to normal position.

850RW001

Legend

- (1) Crankshaft Pulley
- (2) Cooling Fan Pulley
- (3) Tensioner
- (4) Generator
- (5) Air Conditioner Compressor
- (6) Power Steering Oil Pump
- (7) Drive Belt

- 12. Install upper fan shroud.
- 13. Reconnect radiator upper and lower hoses.
- 14. Reconnect coolant reserve tank hose to radiator.
- 15. Reconnect generator harness connector.
- 16. Reconnect starter harness connector.

- 17. Reconnect bonding cable terminal on left bank
- 18. Reconnect bonding cable terminal on the back of right dash panel.
- 19. Reconnect ground cable between engine and chassis.
- 20. Reconnect harness connector to transmission and install transmission harness bracket on engine left side.
- 21. Reconnect three engine harness connectors.
- 22. Reconnect vacuum booster hose.
- 23. Reconnect canister vacuum hose.
- 24. Install air cleaner assembly.
- 25. Reconnect air duct.
- 26. Reconnect accelerator cable and automatic cruise control cable to throttle valve on common chamber.

035RW007

Legend

- (1) Throttle Valve Assembly
- (2) Throttle Lever
- (3) Idle Air Control Valve
- (4) Throttle Position Sensor

- 27. Install engine hood to the original position.
 - Refer to installation procedure for Body section in this manual.
- 28. Install accelerator pedal cable.

Cylinder Head

Cylinder Head and Associated Parts

011RW008

Legend

- | | |
|--|---|
| (1) Spark Plug | (8) Camshaft Intake |
| (2) Cylinder Head Bolt | (9) Retainer Fixing Bolt |
| (3) Camshaft Drive Gear Pulley Fixing Bolt | (10) Retainer Assembly |
| (4) Camshaft Drive Gear Pulley | (11) Tappet with Shim |
| (5) Camshaft Bracket Fixing Bolt | (12) Split Collar |
| (6) Camshaft Bracket | (13) Valve Spring and Spring Upper Seat |
| (7) Camshaft Exhaust | (14) Valve |

Disassembly

NOTE:

- During disassembly, be sure that the valve train components are kept together and identified so that they can be reinstalled in their original locations.

- Before removing the cylinder head from the engine and before disassembling the valve mechanism, perform a compression test and note the results.

1. Remove camshaft drive gear pulley fixing bolt (3), then pulley (4).

2. Remove camshaft bracket fixing bolt (5), camshaft bracket (6), then camshaft exhaust (7), and intake side (8).
3. Remove tappet with shim (11).
4. Use the 5-8840-2446-0 valve spring compressor and 5-8840-2547-0 valve spring compressor adapter to remove the split collar (12), valve spring with upper seat (13) and valve (14).

014RW042

5. Remove spark plug (1).

CAUTION: Do not remove the spark plugs when the head and plugs are hot. Clean dirt and debris from spark plug recess areas before removal.

Clean

Cylinder head

Carefully remove all varnish, soot and carbon from the bare metal. Do not use a motorized wire brush on any gasket sealing surface.

Inspection and Repair

1. Cylinder head gasket and mating surfaces for leaks, corrosion and blow-by. If the gasket has failed, determine the cause.
 - Insufficient torque on head bolts.
 - Improper installation
 - Loose or warped cylinder head
 - Missing dowel pins
 - Warped case surface
2. Cylinder head for cracks, especially between valve seats and in the exhaust ports.

3. Cylinder head deck for corrosion, sand particles in head and porosity.

CAUTION:

- Do not attempt to weld the cylinder head. Replace it.
 - Do not reuse cylinder head bolts.
4. Cylinder head deck, common chamber and exhaust manifold mating surfaces for flatness. These surfaces may be reconditioned by milling. If the surfaces are "out of flat" by more than specification, the surface should be ground to within specifications. Replace the head if it requires machining beyond the repairable limit.

Head surface and manifold surface

Standard: 0.05 mm (0.002 in) or less

Warpage limit: 0.2 mm (0.0079 in)

Maximum Repairable limit: 0.2 mm (0.0079 in)

Head height

Standard height : 133.2 mm (5.2441 in)

Warpage limit : 0.2 mm (0.0079 in)

Maximum Repairable limit : 133.0 mm (5.2362 in)

011RW019

5. Water jacket sealing plugs seating surfaces.

Reassembly

1. Install Spark plug and tighten all the spark plugs to specified torque.

Torque: 18 N-m (1.8 Kg-m/13 lb ft)
2. Tighten sub gear setting bolt.
 1. Use 5-8840-2443-0 gear spring lever to turn sub gear to right direction until the M5 bolt aligns with the hole between camshaft driven gear and sub gear.

6A-52 ENGINE MECHANICAL (6VD1 3.2L)

- Tighten the M5 bolt to a suitable torque to prevent the sub gear from moving .

014RW025

- Install camshaft drive gear assembly and tighten three bolts to the specified torque.

Torque: 10 N·m (1.0 Kg·m/89 lb in)

- Install camshaft assembly and camshaft brackets, tighten twenty bolts on one side bank to the specified torque.

- Apply engine oil to camshaft journal and bearing surface of camshaft bracket.
- Align timing mark on intake camshaft (one dot for right bank, two dots for left bank) and exhaust camshaft (one dot for right bank, two dots for left bank) to timing mark on camshaft drive gear (one dot).

014RW020

Legend

3. Tighten twenty bolts in numerical order on one side bank as shown in the illustration.

Torque: 10 N·m (1.0 Kg·m/89 lb in)

014RW031

5. Tighten bolt for camshaft drive gear assembly pulley to the specified torque.

Torque: 98 N·m (10.0 Kg·m/72 lb ft)

Valve Spring, Oil Controller, Valve, Valve Guide

Valve Spring, Oil Controller, Valve, Valve Guide and Associated Parts

014RW039

Legend

- | | |
|-----------------------------------|------------------------|
| (1) Camshaft Bracket Fixing Bolts | (7) Spring Upper Seat |
| (2) Camshaft Assembly Inlet | (8) Valve Spring |
| (3) Camshaft Assembly Exhaust | (9) Oil Controller |
| (4) Shim | (10) Spring Lower Seat |
| (5) Tappet | (11) Valve Guide |
| (6) Split Collar | (12) Valve |

Disassembly

1. Remove camshaft bracket fixing bolts (1).
2. Remove camshaft assembly (intake).
3. Remove camshaft assembly (Exhaust side).
4. Remove shim (4) and tappet (5).

- Use 5-8840-2446-0 valve spring compressor and 5-8840-2547-0 valve spring compressor adapter to remove split collar.

014RW042

- Remove valve spring.
- Remove valve.
- Remove oil controller and spring lower seat.
- Remove the valve guide using the 5-8840-2442-0 valve guide replacer.

Inspection and Repair

Valve Spring

CAUTION: Visually inspect the valve springs and replace them if damage or abnormal wear is evident.

- Measure the free height of the springs. The springs must be replaced if the free height is below the specified limit.

Standard : 44.6 mm (1.7559 in)

Limit : 43.6 mm (1.7165 in)

014RS004

- Measure the valve spring squareness with a steel square and replace the valve springs if the measured value exceeds the specified limit.

Limit : 2 mm (0.0787 in)

014RS005

- Using a spring tester to compress the springs to the installed height, measure the compressed spring tension, and replace the springs if the measured tension is below the specified limit.

At installed height: 35.0 mm (1.38 in)

Standard: 196 N (44 lb)

Limit: Less than 181 N (41 lb)

014RS006

Valve Guide

CAUTION: Take care not to damage the valve seat contact surface, when removing carbon adhering to the valve head. Carefully inspect the valve stem for scratches or abnormal wear. If these conditions are present, the valve and the valve guide must be replaced as a set.

6A-56 ENGINE MECHANICAL (6VD1 3.2L)

1. Measure the valve stem diameter with a micrometer. If the valve stem diameter is less than the specified limit, the valve and the valve guide must be replaced as a set.

Diameter of Valve Stem

Intake

Standard : 5.977 mm–5.959 mm
(0.2353 in–0.2346 in)

Limit : 5.90 mm (0.2323 in)

Exhaust

Standard : 5.952 mm–5.970 mm
(0.2343 in–0.2350 in)

Limit : 5.90 mm (0.2323 in)

2. Measure the inside diameter of the valve guide with a micrometer. Subtract the measured outer diameter of the valve stem from the measured inner diameter of the valve guide. If the value exceeds the specified limit, the valve and the valve guide must be replaced as a set.

Inside Diameter of the Valve Guide

Inlet clearance

Standard : 0.023 mm–0.056 mm
(0.0009 in–0.0002 in)

Limit : 0.20 mm (0.00787 in)

Exhaust clearance

Standard : 0.030 mm–0.063 mm
(0.0012 in–0.0025 in)

Limit : 0.20 mm (0.00787 in)

Valve Guide Replacement

1. Using Valve guide replacer: 5-8840-2442-0, drive out the valve guide from the combustion chamber side.

2. Apply engine oil to the outside of the valve guide. Using valve guide replacer 5-8840-2442-0, drive in a new valve guide from the camshaft side, and check the valve guide height.

Valve guide upper end height: 13.0 mm (0.5118 in)

(Measured from the cylinder head upper face)

3. Check the clearance. If the clearance is less than the specified value, ream the inside diameter of valve guide. Using a sharp 6 mm reamer, ream the valve guide to obtain the specified clearance.

Valve Seat

1. Measure the protrusion of the valve stem when a new valve is installed in the cylinder head. If the protrusion of the valve stem exceeds the limit, replace the valve seat insert or the cylinder head assembly.

Protrusion of valve stem

Intake

Standard: 39.32 mm (1.5480 in)

Limit: 39.47 mm (1.5539 in)

Exhaust

Standard: 39.30 mm (1.5472 in)

Limit: 39.45 mm (1.5531 in)

014RW047

2. Measure the valve seat contact width. Make the necessary corrections if the seat contact surface is damaged or rough or if the contact width wear exceeds the limit.

Valve seat contact width

Standard: 1.1 mm (0.0433 in)

Limit: 1.7 mm (0.0669 in)

014RS011

Contact Surface Angle on Valve Seat on Valve

1. Measure contact surface angle on valve seat.

2. If the measured value exceeds the limit, replace valve, valve guide and valve seat as a set.

Valve contact surface angle: 45°

014RS012

Valve Seat Insert Correction

1. Remove the carbon from the valve seat insert surface.
2. Use a valve cutter to minimize scratches and other rough areas. This will bring the contact width back to the standard value. Remove only the scratches and rough areas. Do not cut away too much. Take care not to cut away unblemished areas of the valve seat surface.

Valve seat angle degree: 90°

014RW059

3. Apply abrasive compound to the valve seat insert surface.
4. Insert the valve into the valve guide.
5. Turn the valve while lapping it to fit the valve seat insert.

6A-58 ENGINE MECHANICAL (6VD1 3.2L)

6. Check that the valve contact width is correct.
7. Check that the valve seat insert surface is in contact with the entire circumference of the valve.

Valve Seat Insert Replacement

1. Arc weld the rod at several points. Be careful not to damage the aluminum section.
2. Allow the rod to cool for a few minutes. This will cause the valve seat to shrink.
3. Strike the rod and pull it out.

4. Carefully clean the valve seat press-fit section on the cylinder head side.
5. Heat the press-fit section with steam or some other means to cause expansion. Cool the valve seat with dry ice or some other means.
6. Insert the press-fit section into the valve seat horizontally.

Standard fitting interference: 0.14 mm–0.09 mm (0.0055 in–0.0035 in)

7. After insertion, use a seat grinder to grind finish the seating face. Carefully note the seating angle, the contact width, and the depression.
8. Lap the valve and the seat.

Reassembly

1. Install valve guide (1) to cylinder head. Apply engine oil to the outside of the valve guide. Using valve guide replacer 5-8840-2442-0, drive in a new valve guide from the camshaft side.
2. Install oil controller (3) and spring lower seat (2). Using oil controller replacer 5-8840-0623-0, drive in a new oil controller.

3. Install valve to valve guide. Before install valve guide apply engine oil to the outside of the valve stem.
4. Install valve spring to cylinder head. Attach the valve spring to the lower spring seat. The painted area of the valve spring should be facing downward.

5. Install lower valve spring seat, valve spring and upper valve spring seat then put split collars on the upper spring seat, using the 5-8840-2446-0 valve spring compressor and 5-8840-2547-0 valve spring compressor adapter to install the split collars.

014RW042

6. Install tappet with shim.

7. Install camshaft assembly.

- Refer to installation procedure for Camshaft in this manual.

Valve Clearance Adjustments

NOTE: To adjust valve clearance, apply engine oil to the cam as well as to the adjusting shim (2) with the cylinder head built on the cylinder block, give a few turns to the camshaft by means of timing pulley tightening bolt, and measure valve clearance when the nose of cam is just opposite to maximum cam lift (1) as shown in illustration below.

014RW081

Legend

- (1) Cam
- (2) Shim
- (3) Tappet

Valve Clearance Standard Value (cold)

Intake: 0.23 mm–0.33 mm
(0.0091 in–0.0130 in)

Exhaust: 0.25 mm–0.35 mm
(0.0098 in–0.0138 in)

Selection of Adjusting Shim

Shim to be selected = (Thickness of removed shim) + (Valve clearance measurement – Standard valve)

Based on the above formula, the best suited shim should be selected from 41 sorts of shim (differently thick at 0.02mm (0.0008 in) intervals from 2.40mm (0.0945 in) through 3.2mm (0.1260 in) thick). Install the shim and check valve clearance.

6A-60 ENGINE MECHANICAL (6VD1 3.2L)

Replacement of Shim

Let the cam push down the edge of tappet by using 5-8840-2444-0 valve clearance adjusting tool and push out the shim with a flat blade screw driver as shown in illustrations below.

Camshaft

Camshaft and Associated Parts

014RW040

Legend

- | | |
|----------------------------------|--------------------------------|
| (1) Camshaft Bracket Fixing Bolt | (6) Camshaft Drive Gear Pulley |
| (2) Camshaft Bracket | (7) Retainer Fixing Bolt |
| (3) Camshaft Assembly Intake | (8) Retainer |
| (4) Camshaft Assembly Exhaust | (9) Camshaft Drive Gear |
| (5) Pulley Fixing Bolt | (10) Oil Seal |

Disassembly

1. Remove fixing bolt (5) for camshaft drive gear pulley using the 5-8840-2447-0 universal holder.

014RW060

2. Remove twenty fixing bolts from inlet and exhaust camshaft bracket on one side bank, then camshaft brackets (2).

014RW027

3. Remove camshaft assembly (3), (4).
4. Remove three fixing bolts (7) from camshaft drive gear retainer (8), then camshaft drive gear assembly.

Inspection and Repair

1. Use a micrometer to measure the cam lobe height and uneven wear. Replace the camshaft if either the lobe height or the uneven wear exceeds the specified limit.

Lobe height : 44.709 mm (1.7602 in)

Uneven wear : 0.05 mm (0.0020 in)

014RW045

2. Use a micrometer to measure the diameter and the uneven wear of the camshaft journals. Replace the camshaft if the diameter or the uneven wear exceeds the specified limit.

Journal Diameter

**Standard : 25.972 mm–25.993 mm
(1.0225 in–1.0233 in)**

Limit : 25.8 mm (1.0157 in)

Uneven wear : 0.05 mm (0.0020 in)

014RS023

3. Place the camshaft on V-blocks. Slowly rotate the camshaft and measure the runout with a dial indicator. Replace the camshaft if the runout exceeds the specified limit.

Runout

Limit : 0.1 mm (0.0039 in)

014RW044

4. Measure the camshaft journal oil clearance.

1. Measure the camshaft bracket housing inside diameter.

NOTE: Tighten camshaft bracket (2) to specified torque before measuring the camshaft bracket inside diameter.

Torque : 10 N·m (1.0 Kg·m/89 lb in)

014RW031

2. Subtract the camshaft outside diameter from the camshaft bracket housing inside diameter.

Oil Clearance

**Standard : 0.027 mm–0.078 mm
(0.0011 in–0.0031 in)**

Limit : 0.11 mm (0.0043 in)

014RW037

5. Replace the cylinder head and/or camshaft if the measured oil clearance exceeds the specified limit.

1. Carefully clean the camshaft journal, the camshaft bracket, and the cylinder head.
2. Install camshaft assembly and camshaft brackets (2), tighten twenty bolts (1) on one side bank to the specified torque.

Torque: 10 N·m (1.0 Kg·m/89 lb in)

014RW031

3. Measure the camshaft thrust clearance with a dial indicator. Replace the camshaft and/or the cylinder head if the camshaft thrust clearance exceeds the specified limit.

6A-64 ENGINE MECHANICAL (6VD1 3.2L)

Camshaft thrust Clearance

**Standard : 0.03 mm–0.08 mm
(0.0012 in.–0.0031 in.)**

Limit : 0.12 mm (0.0047 mm)

014RW035

Reassembly

1. Install camshaft drive gear assembly and tighten three bolts to specified torque.

Torque: 10 N·m (1.0 Kg·m/89 lb in)

2. Tighten sub gear setting bolt.
 1. Use 5-8840-2443-0 to turn sub gear to right direction until the M5 bolt hole aligns between camshaft driven gear and sub gear.
 2. Tighten M5 bolt suitable torque for prevent moving the sub gear.

014RW041

3. Install camshaft assembly and camshaft brackets, tighten twenty bolts on one side bank to the specified torque.

1. Apply engine oil to camshaft journal and bearing surface of camshaft bracket.

2. Align timing mark on intake camshaft (one dot for right bank, two dots for left bank) and exhaust camshaft (one dot for right bank, two dots for left bank) to timing mark on camshaft drive gear (one dot).

014RW020

| (5) Oil Pump Assembly | (12) Crankshaft |
| (6) Cylinder Block Side Bolts | (13) Main Bearing Cap Fixing Bolts |
| (7) Oil Gallery | (14) Oil Gallery Fixing Bolts |

Disassembly

1. Remove cylinder head assembly (1). Refer to "Cylinder Head" in this manual.
2. Remove crankcase with oil pan (2). Refer to "Oil Pan and Crankcase" in this manual.

CAUTION: Take care not to damage or deform the sealing flange surface of crankcase.

3. Remove oil pipe and O-ring (3).
4. Remove oil strainer and O-ring (4).
5. Remove oil pump assembly (5).
6. Remove crankcase side bolts (6).

6A-68 ENGINE MECHANICAL (6VD1 3.2L)

7. Remove oil gallery (7).
8. Remove piston and connecting rod assembly (8). Refer to "Piston, Piston Ring and Connecting Rod" in this manual.
9. Remove flywheel (9).
10. Remove rear oil seal retainer (10).
11. Remove main bearing cap (11).
12. Remove crankshaft (12).

Inspection and Repair

1. Crankshaft

Set the dial indicator as shown in the illustration and measure the crankshaft thrust clearance. If the thrust clearance exceeds the specified limit, replace the thrust bearings as a set.

Thrust Clearance

**Standard : 0.06 mm–0.24 mm
(0.0024 in–0.0094 in)**

Limit : 0.30 mm (0.0118 in)

Main Bearing Clearance

1. Remove the bearing caps and measure the oil clearance.
2. Remove the main bearing cap fixing bolts in the sequence shown in the illustration. Arrange the removed main bearing caps in the cylinder number order. Remove the main bearings.

3. Remove the crankshaft.
Remove the main bearings.
4. Clean the upper and lower bearings as well as the crankshaft main journal.
5. Check the bearings for damage or excessive wear. The bearings must be replaced as a set if damage or excessive wear is discovered during inspection.
6. Set the upper bearings and the thrust washers to their original positions.
Carefully install the crankshaft.
7. Set the lower bearings to the bearing cap original position.
8. Apply plastigage to the crankshaft journal unit as shown in the illustration.

NOTE: Do not set the plastigage on the oil hole.

9. Install main bearing caps, oil gallery and crank case bolts in the order shown, and tighten each bolt to the specified torque.

NOTE: Do not apply engine oil to the crank case side bolts.

Main bearing cap bolts.

Torque: 39 N·m (4.0 Kg·m/29 lb ft)

Oil gallery fixing bolts.

Torque:

1st step: 29 N·m (3.0 Kg·m/21 lb ft)

2nd step 55° ~ 65°

Crank case side bolts

Torque : 39 N·m (4.0 Kg·m/29 lb ft)

NOTE: Do not allow the crankshaft to rotate.

10. Remove the main bearing caps in the sequence shown in the illustration.

11. Measure the plastigage width and determine the oil clearance. If the oil clearance exceeds the specified limit, replace the main bearings as a set and/or replace the crankshaft.

**Standard : 0.019 mm–0.043 mm
(0.0007 in–0.0017 in)**

Limit : 0.08 mm (0.0031 in)

12. Clean the plastigage from the bearings and the crankshaft.

Remove the crankshaft and the bearings.

Crankshaft Inspection

Inspect the surface of the crankshaft journal and crank pins for excessive wear and damage. Inspect the oil seal fitting surfaces for excessive wear and damage. Inspect the oil ports for obstructions.

Inspection and Repair

1. Carefully set the crankshaft on the V-blocks. Slowly rotate the crankshaft and measure the runout. If the crankshaft runout exceeds the specified limit, the crankshaft must be replaced.

Runout : 0.04 mm (0.0016 in)

6A-70 ENGINE MECHANICAL (6VD1 3.2L)

2. Measure the diameter and the uneven wear of main journal and crank pin. If the crankshaft wear exceeds the specified limit, crankshaft must be replaced.

**Main journal diameter : 63.918 mm–63.933 mm
(2.5165 in–2.5170 in)**

**Crank pin diameter : 53.922 mm–53.937 mm
(2.1229 in.–2.1235 in.)**

Uneven wear limit : 0.005 mm (0.0002 in)

Crankshaft Bearing Selection

When installing new crankshaft bearings or replacing bearings, refer to the selection table below. Select and install the new crankshaft bearings, paying close attention to the cylinder block journal hole.

1. Diameter size mark (1) and the crankshaft journal.

2. Diameter size mark (1).

The diameter size marks are stamped on the No.1 crankshaft balancer as shown in the illustration.

NOTE: Take care to ensure the bearings are positioned correctly.

Legend

- (1) Number 1 and 4 main bearing upper and lower
- (2) Number 2 and 3 main bearing upper
- (3) Number 2 and 3 main bearing lower

1 Size Mark	Main Bearing Bore Diameter	Crank Shaft Main Journal Diameter	2 Size Mark	Crank Shaft Bearing Size Mark (Upper Side)	Crank Shaft Bearing Size Mark (Lower Side)	Oil Clearance (Reference)

		63.926-63.933 (2.5168-2.5170)	1			0.026-0.045 (0.0010-0.0018)

Reassembly

1. Crankshaft

- Install the main bearings to the cylinder block and the main bearing caps.
- Be sure that they are positioned correctly.
- Apply new engine oil to the upper and lower main bearing faces.

NOTE: Do not apply engine oil to the main bearing back faces.

- Carefully mount the crankshaft.

- Apply engine oil to the thrust washer.
- Assemble the thrust washer to the No.3 bearing journal. The oil grooves must face the crankshaft.

2. Rear oil seal

- Remove the oil from the cylinder block and the retainer mounting surface.
- Apply sealant (TB-1207B or equivalent) to the retainer mounting surface, following the pattern shown in the illustration.

The retainer must be installed within 5 minutes after sealant application before the sealant hardens.

015RW002

Legend

- (1) Around Bolt Holes
- (2) Around Dowel Pin

- Apply engine oil to the oil seal lip.
- Align the cylinder block dowel pin holes with the rear retainer dowel pins.
- Tighten the rear retainer fixing bolts. New bolts should be used when installing rear retainer.

Torque: 18 N-m (1.8 Kg-m/13 lb ft)

NOTE: Be very careful not to disengage the oil seal garter spring during installation of the rear retainer.

If the seal was removed from retainer for replacement, apply engine oil to the oil seal lip and install the oil seal using 5-8840-2286-0 oil seal installer.

015RW001

015RS017

3. Flywheel

1. Thoroughly clean and remove the oil from the threads of crankshaft.
2. Remove the oil from the crankshaft and flywheel mounting faces.
3. Mount the flywheel on the crankshaft and then install the washer.
4. Hold the crankshaft to prevent from rotating then install the bolts in the order shown to the specified torque.

Torque: 54 N-m (5.5 Kg-m/40 lb ft)

NOTE: Do not reuse the bolt and do not apply oil or thread lock to the bolt.

015RS018

4. Piston and connecting rod assembly (8)

- Apply engine oil to the cylinder bores, the connecting rod bearings and the crankshaft pins. Check to see that the piston ring end gaps are correctly positioned.

015RX003

Legend

- (1) No.1 Compression Ring
- (2) No.2 Compression Ring
- (3) Oil Ring Side Rail Upper
- (4) Oil Ring Side Rail Lower
- (5) Piston Front Mark

- Insert the piston/connecting rod assemblies into each cylinder with the piston ring compressor. The front marks must be facing the front of the engine.
- Match the numbered caps with the numbers on the connecting rods. Align the punched marks on the connecting rods and caps.
- Apply engine oil to the threads and seating faces of the nuts.
- Tighten the nuts.

Torque: 54 N·m (5.5 Kg·m/40 lb ft)

After tightening the cap nuts, check to see that the crankshaft rotates smoothly.

NOTE: Do not apply engine oil to the bearing back faces.

015RS020

- 5. Install oil gallery (7) and tighten the bolts in 2 steps, in the order shown.

1st step: 29 N·m (3.0 Kg·m/22 lb ft)

2nd step: 55° ~ 65°

051RS009

- 6. Cylinder block side bolts

- Tighten all the bolts to the specified torque in the order shown.

NOTE: Do not apply engine oil to the crank case side bolts.

Torque: 39 N·m (4.0 Kg·m/29 lb ft)

Legend

- (1) Portion Between Bolt Holes
- (2) Bolt Hole Portion

11. Install cylinder head assembly, refer to "Cylinder head" in this manual.

7. Install oil pump assembly (5), refer to "Oil pump" in this manual.

8. Install oil strainer and O-ring (4).

9. Install oil pipe and O-ring (3) and tighten the bolts.

Torque: 25 N·m (2.5 Kg·m/18 lb ft)

10. Install crankcase with oil pan.

1. Completely remove all residual sealant, lubricant and moisture from the sealing surfaces. The surfaces must be perfectly dry.
2. Apply a correct width bead of sealant (TB—1207C or its equivalent) to the contact surfaces of the oil pan. There must be no gaps in the bead.
3. The crankcase assembly must be installed within 5 minutes after sealant application to prevent premature hardening of the sealant.
4. Tighten the bolts and nuts to the specified torque.

Torque : 10 N·m (1.0 Kg·m/89 lb in)

Piston and Connecting Rod

Piston, Connecting Rod and Associate Parts

Legend

- | | |
|-----------------------------|--|
| (1) Cylinder Head Assembly | (7) Piston and Connecting Rod Assembly |
| (2) Cylinder Head Gasket | (8) Piston Ring |

| (4) Oil Pipe and O-Ring | (10) Piston |
| (5) Oil Strainer and O-Ring | (11) Connecting Rod |
| (6) Oil Gallery | (12) Connecting Rod Cap |

Disassembly

1. Remove cylinder head assembly (1). Refer to "Cylinder Head Removal" in this manual.
2. Remove cylinder head gasket (2).
3. Remove crankcase with oil pan (3). Refer to "Oil Pan and Crankcase" in this manual.
4. Remove oil pipe and O-ring (4).
5. Remove oil strainer and O-ring (5).
6. Remove oil gallery (6).
7. Remove connecting rod cap with connecting rod lower bearing (12).
8. Remove piston and connecting rod assembly (7).

NOTE: Before removing piston and connecting rod assembly, measure thrust clearance.

015RS031

- Remove any ridge or carbon build up from the top end of the cylinder.

9. Remove the piston rings (8) with a piston ring expander. Arrange the removed piston rings in the cylinder number order.

015RS022

10. Remove the piston pin (9) using 5-8840-0551-0 piston pin service set and piston support with a press.

NOTE: Keep the parts removed from each cylinder separate. All parts must be reinstalled in their original positions. Heating the connecting rod will permit easy removal of the piston pin.

015RX001

Legend

- (1) Press Ram
- (2) Piston
- (3) Connecting Rod
- (4) Piston Pin

- 11. Piston (10)
- 12. Connecting rod (11)

Inspection and Repair

Pistons

Carefully clean away all the carbon adhering to the piston head and the piston ring grooves.

NOTE: Never use a wire brush to clean the pistons. Damage will result. Visually check each piston for cracking, scoring, and other signs of excessive wear. If any of the above conditions are found, the piston must be replaced.

Piston Diameter

1. Measure the piston outside diameter with micrometer at the piston grading position and a right angle to the piston pin.

Piston grading position (from piston head)

Piston grading position : 43.0 mm (1.6929 in)

015RV014

The size mark (1) for piston outside diameter is represented as shown in illustration below.

Outside Diameter

**Size Mark A : 93.360 mm–93.370 mm
(3.6756 in–3.6760 in)**

**Size Mark B : 93.371 mm–93.380 mm
(3.6760 in–3.6764 in)**

**Size Mark C : 93.381 mm–93.390 mm
(3.6764 in–3.6768 in)**

015RX002

Measure the cylinder bore inside diameter (refer to “Cylinder Block” in this manual).

012RS002

Piston Rings

Any worn or damaged part discovered during engine overhaul must be replaced with a new one.

1. Ring end gap measurement

- Insert the piston ring into the bore.
- Push the ring by the piston, at a right angle to the wall, into the point at which the cylinder bore diameter is the smallest.
- Measure the ring end gap.

Compression Ring

1st ring

**Standard: 0.300 mm–0.400 mm
(0.0118 in–0.0157 in)**

Limit: 1.0 mm (0.0394 in)

2nd ring

**Standard: 0.450 mm–0.600 mm
(0.0177 in–0.0236 in)**

Limit: 1.2 mm (0.0472 in)

Oil ring

**Standard: 0.150 mm–0.450 mm
(0.0059 in–0.0177 in)**

Limit: 1.05 mm (0.0413 in)

015RS026

- Positioning mark (1) is painted as shown in the illustration.

Marked T : No.1 Compression ring

Marked T2 : No.2 Compression ring

015RS027

2. Measure the clearance between the piston ring groove and the piston ring with a feeler gauge. If the piston ring groove / piston ring clearance exceeds the specified limit, the piston must be replaced.

Compression Ring Clearance

**Standard : 0.016 mm–0.038 mm
(0.0006 in.–0.0015 in)**

Limit : 0.15mm (0.0059 in)

015RS028

Piston Pin

NOTE: Do not reuse the old piston pin.

1. Use a micrometer to measure the new piston pin outside diameter in both directions at three different positions.
2. Measure the inside diameter of the connecting rod small end. If the fitting interference between the small end and pin does not conform to the specified value, the connecting rod must be replaced.

Standard : 0.023 mm–0.038 mm (0.0009 in–0.0015 in)

015RS029

3. Insert the new pin into the piston and rotate it. If the pin rotates smoothly with no backlash, the clearance is normal. If there is backlash or roughness, measure the clearance. If the clearance exceeds the specified limit, the piston must be replaced.

Clearance

**Standard : 0.010 mm–0.017 mm
(0.0004 in.–0.0007 in)**

Limit : 0.040 mm (0.0016 in)

Connecting Rods

1. Check the connecting rod alignment. If either the bend or the twist exceeds the specified limit, the connecting rod must be replaced.

Bend per 100 mm (3.937 in)

Limit: 0.15 (0.0059)

Twist per 100 mm (3.937 in)

Limit: 0.20 (0.0078)

015RS030

2. Measure the connecting rod thrust clearance. Use a feeler gauge to measure the thrust clearance at the large end of the connecting rod. If the clearance exceeds the specified limit, the connecting rod must be replaced.

Standard : 0.16 mm–0.35 mm

(0.0063 in.–0.0138 in)

Limit : 0.40 mm (0.0157 in)

015RS031

3. Measure the oil clearance between the connecting rod and the crankshaft.

1. Remove the connecting rod cap nuts and the rod caps (12).

Arrange the removed rod caps in the cylinder number order.

2. Clean the rod bearings and the crankshaft pins.
3. Carefully check the rod bearings. If even one bearing is found to be damaged or badly worn, the entire bearing assembly must be replaced as a set. Reinstall the bearings in their original positions. Apply plastigage to the crank pin.

015RS032

6A-80 ENGINE MECHANICAL (6VD1 3.2L)

- Reinstall the rod caps (12) to their original positions.
Tighten the rod cap nuts.

Torque: 54 N·m (5.5 Kg·m/40 lb ft)

NOTE: Do not allow the crankshaft to rotate.

- Remove the rod caps.
- Measure the width of the plastigage and determine the oil clearance. If the oil clearance exceeds the limit, replace the rod bearing as a set.

**Standard : 0.019 mm–0.043 mm
(0.0007 in–0.0017 in)**

Limit : 0.08 mm (0.003 in)

- Clean the plastigage from the bearings and the crankshaft pins.

Con-rod Bearing Selection

Select and install the new connecting rod bearings, paying close attention to the connecting rod big end diameter size mark (1).

NOTE: Take care not to confuse the alignment mark (2) and the size mark (1) during the installation procedure.

1 Size Mark	Big end Bore Diameter	Crankshaft Pin Diameter	Connecting Rod Bearing Thickness (Reference)	Color of Size Mark	Oil Clearance (Reference)
A	56.994-57.000 (2.2439-2.2441)	53.922-53.937 (2.1229-2.1235)	1.512-1.516 (0.0595-0.0597)	Yellow	0.025-0.054 (0.0010-0.0021)
B	56.988-56.994 (2.2436-2.2439)		1.508-1.512 (0.0594-0.0595)	Green	0.027-0.056 (0.0011-0.0022)
C	56.982-56.988 (2.2434-2.2436)		1.504-1.508 (0.0592-0.0594)	Pink	0.029-0.058 (0.0011-0.0023)

Reassembly

- Install connecting rod
- Install piston

- Install piston pin

- Apply a thin coat of engine oil to the piston pin. Try to insert the piston pin into the piston pin hole with normal finger pressure.

NOTE: When changing piston / connecting rod combinations, do not change the piston / piston pin combination and do not reuse the old piston pin.

- Attach the piston to the connecting rod with the piston front mark and the connecting rod front mark on the same side.

015RS036

- With 5-8840-0551-0 Piston pin service set and a press, press fit the piston pin.

NOTE: Heat the connecting rod small end to a suitable temperature to ensure smooth installation.

015RX001

Legend

- (1) Press Ram
- (2) Piston
- (3) Connecting Rod
- (4) Piston Pin

- 4. Install piston ring with the piston ring expander. The compression ring must be set with the T mark (1) facing up.

- Marked T : No.1 Compression ring**
- Marked T2 : No.2 Compression ring**

015RS027

- Install piston rings in the following sequence.

1. Oil ring
 1. Expander ring
 2. Upper side rail
 3. Lower side rail
2. 2nd compression ring
3. 1st compression ring

- The compression rings must be set with the T or T2 mark facing up.

Marked T : No.1 Compression ring

Marked T2 : No.2 Compression ring

- After installation, apply engine oil to the entire circumference of the piston rings. Check to see that all the rings rotate smoothly.

015RS038

6A-82 ENGINE MECHANICAL (6VD1 3.2L)

5. Install piston and connecting rod assembly.
 - Insert the bearings into the connecting rods and caps. Apply new engine oil to the bearing faces and nuts.
 - Tighten the connecting rod cap nuts

Torque : 54 N·m (5.5 Kg·m/40 lb ft)

NOTE: Do not apply engine oil to the bearing back faces.

6. Oil gallery, refer to “Crankshaft and main bearing” in this manual.
7. Oil strainer and O-ring.
8. Oil pipe and O-ring.
9. Install crankcase with oil pan, refer to “Oil pan and Crankcase” in this manual.
10. Install cylinder head gasket.
11. Install Cylinder head assembly.
 - Refer to “Cylinder head” in this manual.

Cylinder Block

Cylinder Block and Associated Parts

012RW010

Legend

- | | |
|-------------------------------|--|
| (1) Cylinder Head Assembly | (8) Oil Gallery |
| (2) Cylinder Head Gasket | (9) Piston and Connecting Rod Assembly |
| (3) Crankcase with Oil Pan | (10) Flywheel |
| (4) Oil Pipe and O-Ring | (11) Rear Oil Seal Retainer Assembly |
| (5) Oil Strainer and O-Ring | (12) Main Bearing Cap |
| (6) Oil Pump Assembly | (13) Crankshaft |
| (7) Cylinder Block Side Bolts | (14) Cylinder Block |

Disassembly

1. Remove cylinder head assembly.
2. Remove cylinder head gasket.
3. Remove crankcase with oil pan.
4. Remove oil pipe and O-ring.
5. Remove oil strainer and O-ring.
6. Remove oil pump assembly.
7. Remove crankcase side bolts.
8. Remove oil gallery.
9. Remove piston and connecting rod assembly.
10. Remove flywheel.

11. Remove rear oil seal retainer assembly.
12. Remove main bearing cap.
13. Remove crankshaft.
14. Remove cylinder block.

Inspection and Repair

1. Remove the cylinder head gasket and any other material adhering to the upper surface of the cylinder block. Be very careful not to allow any material to accidentally drop into the cylinder block. Be very careful not to scratch the cylinder block.
2. Carefully remove the oil pump, rear oil seal retainer, and crankcase assembly installation surface seal.
3. Wipe the cylinder block clean.
4. Visually inspect the cylinder block. If necessary, use a flaw detector to perform a dye penetrate and hydraulic (or air pressure) test. If cracking or other damage is discovered, the cylinder block must either be repaired or replaced.

Flatness

1. Using a straight-edge and feeler gauge, check that the upper surface of the cylinder block is not warped.

CAUTION: Be very careful not to allow any material to accidentally drop into the upper surface of the cylinder block. Be very careful not to scratch the upper surface of the cylinder block.

2. The cylinder block must be reground or replaced if the warpage exceeds the limit.

Warpage

Limit : 0.15 mm (0.0059 in)

Maximum repairable limit: 0.15 mm (0.0059 in)

012RS004

Cylinder Bore

Use a cylinder gauge to measure the cylinder bore diameter in both the axial and thrust directions. Each measurement should be made at six points.

CAUTION: Be very careful not to allow any material to accidentally drop into the upper surface of the cylinder block. Be very careful not to scratch the upper surface of the cylinder block.

Cylinder Bore Inside Diameter

Limit : 93.530 (3.6823)

If the measurement exceed the specified limit, the cylinder block must be replaced.

Diameter

**Grade A : 93.400 mm–93.410 mm
(3.6772 in–3.6776 in)**

**Grade B : 93.411 mm–93.420 mm
(3.6776 in–3.6779 in)**

**Grade C : 93.421 mm–93.430 mm
(3.6780 in–3.6783 in)**

012RS005

NOTE: For information on piston diameter, please refer to the section "Inspection of the Piston and Connecting Rod Assembly" in this manual.

- The "Grade" mark (1) is stamped at the position illustrated.

012RS006

Reassembly

1. Install cylinder block.
2. Install crankshaft.
 - Install the main bearings to the cylinder block and the main bearing caps.
 - Be sure that they are positioned correctly.
 - Apply new engine oil to the upper and lower main bearing faces.

NOTE: Do not apply engine oil to the bearing back faces.

015RS012

Legend

- (1) Number 1 and 4 main bearing upper and lower.
- (2) Number 2 and 3 main bearing upper.
- (3) Number 2 and 3 main bearing lower.

- Carefully mount the crankshaft.
- Apply engine oil to the thrust washer.

- Assemble the thrust washer to the No. 3 bearing journal. The oil grooves must face the crankshaft.

015RS013

3. Install rear oil seal retainer.

- Remove oil on cylinder block and retainer fitting surface.
- Apply sealant (TB1207B or equivalent) to retainer fitting surface as shown in illustration.
- The oil seal retainer must be installed within 5 minutes after sealant application before the sealant hardens.

015RW002

Legend

- (1) Around Bolt Holes
- (2) Around Dowel Pin

- Apply engine oil to oil seal lip and align a dowel pin hole in the cylinder block with that in the retainer.
- Tighten retainer fixing bolts to the specified torque.

Torque: 25 N·m (2.5 Kg·m/18.4 lb ft)

015RW001

4. Install flywheel

1. Thoroughly clean and remove the oil from the threads of crankshaft.
2. Remove the oil from the crankshaft and flywheel mounting faces.
3. Mount the flywheel on the crankshaft and then install the washer.
4. Holding the crankshaft stationary, tighten the flywheel bolts in the order shown.

Torque: 54 N·m (5.5 Kg·m/40 lb ft)

NOTE: Do not reuse the bolts and do not apply oil or thread lock to the bolts.

015RS018

5. Install piston and connecting rod assembly.

- Apply engine oil to the cylinder bores, the connecting rod bearings and the crankshaft pins.

NOTE: Do not apply engine oil to the bearing back faces.

- Check to see that the piston ring end gaps are correctly positioned.

015RX003

Legend

- (1) No.1 Compression Ring
- (2) No.2 Compression Ring
- (3) Oil Ring Side Rail Upper
- (4) Oil Ring Side Rail Lower
- (5) Piston Front Mark

- Insert the piston/connecting rod assemblies into each cylinder with the piston ring compressor.
- The front marks (1) must be facing the front of the engine.

015RS020

6. Install oil gallery and tighten the bolts in 2 steps in the order shown.

1st step : 29 N·m (3.0 Kg·m/22 lb ft)

2nd step : 55° ~ 65°

7. Install cylinder block side bolts (1) and tighten crankcase bolts in sequence shown in the illustration.

Torque : 39 N·m (4.0 Kg·m/29 lb ft)

8. Install oil pump assembly. Refer to "Oil Pump" in this manual.

9. Install oil strainer and O-ring.

10. Install oil pipe and O-ring.

11. Install crankcase with oil pan.

1. Completely remove all residual sealant, lubricant and moisture from the sealing surfaces. The surfaces must be perfectly dry.
2. Apply a correct width bead of sealant (TB- 1207C or its equivalent) to the contact surfaces of the crankcase. There must be no gaps in the bead.
3. The oil pan must be installed within 5 minutes after sealant application to prevent premature hardening of sealant.
4. Tighten the bolts and nuts to the specified torque.

Torque : 10 N·m (1.0 Kg·m/89 lb in)

Legend

- (1) Portion Between Both Holes
- (2) Bolt Hole Portions

12. Install cylinder head gasket.

13. Install cylinder head assembly. Refer to "Cylinder Head" in this manual.

Main Data and Specification

General Specification

Item	Specifications
	6VD1
Engine type, number of cylinders and arrangement	Water cooled, four cycle V6
Form of combustion chamber	Pent roof type
Valve mechanism	4-Cams, 4-Valves, DOHC Gear & Belt Drive
Cylinder liner type	Casted in cylinder drive
Total piston displacement	3165 cc
Cylinder bore x stroke	93.4mm x 77.0mm (3.6772 in x 3.0315 in)
Compression ratio	9.1 : 1
Compression pressure at 300rpm	14.0 Kg/cm ²
Engine idling speed rpm	Non adjustable (750)
Valve clearance	Intake: 0.28 mm (0.11 in)
	Exhaust: 0.30mm (0.12in)
Oil capacity	5.3 liters
Ignition timing	Non adjustable 16° BTDC at idle rpm)
Spark plug	K16PR-P11, PK16PR11, RC10PYP4
Plug gap	1.0 mm-1.1 mm(0.0394 in – 0.0433 in)

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS), REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

| (5) Cooling Fan | (11) Cylinder Head |
| (6) Cylinder Block | (12) Left Bank |
| | (13) Heater |

The cooling system is a pressurized Engine Coolant (EC) forced circulation type which consists of a water pump, thermostat cooling fan, radiator and other components. The automatic transmission fluid is cooled by the EC in radiator.

Water Pump

The EC pump is a centrifugal impeller type and is driven by a timing belt.

030RS001

Thermostat

The thermostat is a wax pellet type with a air hole(1) and is installed in the thermostat housing.

031RW002

Radiator

The radiator is a tube type with corrugated fins. In order to raise the boiling point of the coolant, the radiator is fitted with a cap in which the valve is operated at 88.2 ~ 117.6 kPa (12.8 ~ 17.0 psi) pressure. (No oil cooler provided for M/T)

110RW023

Anti Freeze Solution

- Relation between the mixing ratio and freezing temperature of the Engine Coolant varies with the ratio of anti-freeze solution in water. Proper mixing ratio can be determined by referring to the chart. Supplemental inhibitors or additives claiming to increase cooling capability that have not been specifically approved by Isuzu are not recommended for addition to the cooling system.
- Calculating mixing ratio

$$\text{Mixing ratio} = \frac{\text{Anti freeze solution (Lit/gal.)}}{\text{Anti freeze solution (Lit/gal.)} + \text{Water (Lit/gal.)}}$$

F06RW005

NOTE: Antifreeze solution + Water = Total cooling system capacity.

- **Total Cooling System Capacity**
- **M/T 8.8Lit (2.32Us gal)**
- **A/T 8.4Lit (2.22Us gal)**

6B-4 ENGINE COOLING

B06RW002

B06RW003

● Mixing ratio

Check the specific gravity of engine coolant in the cooling system temperature ranges from 0°C to 50°C using a suction type hydrometer, then determine the density of the engine coolant by referring to the table.

NOTE:

1. Even in the areas where the atmospheric temperature is higher than 0°C, be sure not to use antifreeze solution at a mixing ratio lower than 20% so that the inside of the engine may not be corroded.
2. If antifreeze solution is used at a mixing ratio higher than 60%, the specific heat of the coolant falls and the engine may be overheated. Moreover, antifreeze performance drop and the coolant may be frozen. The density of the solution must be adjusted as occasion calls.

Antifreeze solution lower than 20% may not have sufficient anticorrosive performance, and therefore, please never fail to adjust as occasion demands within the range of 20% to 60%.

Diagnosis

Engine Cooling Trouble

Engine overheating	Low Engine Coolant level	Replenish
	Incorrect fan installed	Replace
	Thermo meter unit faulty	Replace
	Faulty thermostat	Replace
	Faulty Engine Coolant temperature sensor	Repair or replace
	Clogged radiator	Clean or replace
	Faulty radiator cap	Replace
	Low engine oil level or use of improper engine oil	Replenish or change oil
	Clogged exhaust system	Clean exhaust system or replace faulty parts
	Faulty Throttle Position sensor	Replace throttle valve assembly
	Open or shorted Throttle Position sensor circuit	Repair or replace
Damaged cylinder head gasket	Replace	
Engine overcooling	Faulty thermostat	Replace
Engine slow to warm-up	Faulty thermostat	Replace
	Thermo unit faulty	Replace

Draining and Refilling Cooling System

Before draining the cooling system, inspect the system and perform any necessary service to ensure that it is clean, does not leak and is in proper working order. The engine coolant (EC) level should be between the "MIN" and "MAX" lines of reserve tank when the engine is cold. If low, check for leakage and add EC up to the "MAX" line. There should not be any excessive deposit of rust or scales around the radiator cap or radiator filler hole, and the EC should also be free from oil. Replace the EC if excessively dirty.

Engine coolant change

1. To change engine coolant, make sure that the engine is cool.

WARNING: WHEN THE COOLANT IS HEATED TO A HIGH TEMPERATURE, BE SURE NOT TO LOOSEN OR REMOVE THE RADIATOR CAP. OTHERWISE YOU MIGHT GET SCALDED BY HOT VAPOR OR BOILING WATER. TO OPEN THE RADIATOR CAP, PUT A PIECE OF THICK CLOTH ON THE CAP AND LOOSEN THE CAP SLOWLY TO REDUCE THE PRESSURE WHEN THE COOLANT HAS BECOME COOLER.

2. Open radiator cap and drain the cooling system by loosening the drain valve on the radiator and on the cylinder body.

NOTE: For best result it is suggested that the engine cooling system be flushed at least once a year. It is advisable to flash the interior of the cooling system including the radiator before using anti-freeze (ethylene-glycol based).

Replace damaged rubber hoses as the engine anti-freeze coolant is liable to leak out even minor cracks.

Isuzu recommends to use Isuzu genuine anti-freeze (ethylene-glycol based) or equivalent, for the cooling system and not add any inhibitors or additives.

CAUTION: A failure to correctly fill the engine cooling system in changing or topping up coolant may sometimes cause the coolant to overflow from the filler neck even before the engine and radiator are completely full.

If the engine runs under this condition, shortage of coolant may possibly result in engine overheating. To avoid such trouble, the following precautions should be taken in filling the system.

3. To refill engine coolant, pour coolant up to filler neck using a filling hose which is smaller in outside diameter of the filler neck. Otherwise air between the filler neck and the filling hose will block entry, preventing the system from completely filling up.
4. Keep a filling rate of 9 liter/min. or less. Filling over this maximum rate may force air inside the engine and radiator.

And also, the coolant overflow will increase, making it difficult to determine whether or not the system is completely full.

5. After filling the system to the full, pull out the filling hose and check to see if air trapped in the system is dislodged and the coolant level goes down. Should the coolant level go down, repeat topping-up until there is no more drop in the coolant level.
6. After directly filling the radiator, fill the reservoir to the maximum level.
7. Install and tighten radiator cap and start the engine. After idling for 2 to 3 minutes, stop the engine and reopen radiator cap. If the water level is lower, replenish.

WARNING: WHEN THE COOLANT IS HEATED TO A HIGH TEMPERATURE, BE SURE NOT TO LOOSEN OR REMOVE THE RADIATOR CAP. OTHERWISE YOU MIGHT GET SCALDED BY HOT VAPOR OR BOILING WATER. TO OPEN THE RADIATOR CAP, PUT A PIECE OF THICK CLOTH ON THE CAP AND LOOSEN THE CAP SLOWLY TO REDUCE THE PRESSURE WHEN THE COOLANT HAS BECOME COOLER.

8. After tightening radiator cap, warm up the engine at about 2,000 rpm.
Set heater adjustment to the highest temperature position, and let the coolant circulate also into heater water system.
9. Check to see the thermostat has opened through the needle position of water thermometer, conduct a 5-minute idling again and stop the engine.
10. When the engine has been cooled, check filler neck for water level and replenish if required. Should extreme shortage of coolant is found, check the coolant system and reservoir tank hose for leakage.
11. Fill the coolant into the reservoir tank up to "MAX" line.

Water Pump

Water Pump and Associated Parts

030RS002

Legend

- (1) Timing Belt
- (2) Idle Pulley

- (3) Water Pump Assembly
- (4) Gasket

Removal

1. Disconnect battery ground cable.
2. Drain coolant.
3. Radiator hose (on inlet pipe side).
4. Remove timing belt. Refer to "Timing Belt" in this manual.
5. Remove Idle pulley.
6. Remove water pump assembly.
7. Remove gasket.

2. Install water pump assembly and tighten bolts to the specified torque.

Torque: 25 N·m (2.5 Kg·m/18 lb ft)

• Tightening order

The tightening order are in the illustrate.

NOTE: To prevent the oil leakage, apply the LOCTITE 262 or an equivalent, to the arrow marked fixing bolt thread.

Inspection

Make necessary repair and parts replacement if extreme wear or damage is found during inspection. Should any of the following problems occur, the entire water pump assembly must be replaced:

- Crack in the water pump body
- EC leakage from the seal unit
- Play or abnormal noise in the bearing
- Cracks or corrosion in the impeller.

Installation

1. Install gasket, clean the mating surface of gasket before installation.

030RW006

6B-8 ENGINE COOLING

3. Idle pulley

- Install idle pulley and tighten bolt to the specified torque.

Torque: 52 N-m (5.3 Kg-m/38 lb ft)

4. Timing belt

- Install timing belt. Refer to timing belt installation step in "Timing Belt" in this manual.

5. Connect radiator inlet hose and replenish EC.

6. Connect battery ground cable.

Thermostat

Thermostat and Associated Parts

031RW001

Legend

- (1) Thermostat Housing
- (2) Thermostat
- (3) Outlet Pipe

Removal

1. Disconnect battery ground cable.
2. Drain engine coolant from the radiator and engine.
3. Disconnect radiator hose from the inlet pipe.
4. Remove thermostat housing.
5. Remove thermostat(2).

Inspection

Suspend the thermostat in a water-filled container using thin wire. Place a thermometer next to the thermostat. Do not directly heat the thermostat. Gradually increase the water temperature. Stir the water so that the entire water is same temperature.

031RS003

Confirm the temperature when the valve first begins to open.

**Valve opening temperature 74.5C ~ 78.5°C
(166.1°F ~ 173.3°F)**

Confirm the temperature when the valve is fully opened.

**Valve full open temperature and lift More than
8.5mm (0.33 in) at 90°C (194°F)**

Make necessary repair and parts replacement if extreme wear or damage is found during inspection.

Installation

1. Install thermostat into the outlet pipe(4) making sure that the air hole is in the up position.
2. Install thermostat housing and tighten bolts to the specified torque.
Torque: 25 N-m (2.5 Kg-m/18 lb ft)
3. Install rubber hose.
4. Replenish engine coolant (EC).
5. Start engine and check for EC leakage.

Radiator

Radiator and Associated Parts

110RW010

Legend

- | | |
|--|-----------------------|
| (1) Oil Cooler Hose For Automatic Transmission | (4) Reserve Tank Hose |
| (2) Radiator Hose | (5) Radiator Assembly |
| (3) Fan Guide, Lower | (6) Reserve Tank |

Removal

1. Disconnect battery ground cable.
2. Loosen a drain plug (2) to drain Engine Coolant.
3. Disconnect oil cooler hose(1) on automatic transmission (A/T).
4. Disconnect radiator inlet hose and outlet hose from the engine.

5. Remove fan guide(1), clips (2) on both sides and the bottom lock, then remove lower fan guide(3) with fan shroud(4).

110RW002

110RW001

6B-10 ENGINE COOLING

6. Disconnect the reserve tank hose(4) from radiator.
7. Remove bracket.

8. Lift up and remove the radiator assembly with hose, taking care not to damage the radiator core with a fan blade.
9. Remove rubber cushions on both sides at the bottom.

Inspection

Radiator Cap

Measure the valve opening pressure of the pressurizing valve with a radiator filler cap tester. Replace the cap if the valve opening pressure is outside the standard range.

Valve opening pressure kPa (psi) 88.3 ~ 117.7 (12.8 ~17.1)

Cap tester: 5-8840-0277-0

Adapter: 5-8840-2603-0

Check the condition of the vacuum valve in the center of the valve seat side of the cap. If considerable rust or dirt is found, or if the valve seat cannot be moved by hand, clean or replace the cap.

Valve opening vacuum kPa (psi) 1.96 ~ 4.91 (0.28 ~ 0.71)

Radiator Core

1. A bent fin may result in reduced ventilation and overheating may occur. All bent fins must be straightened. Pay close attention to the base of the fin when it is being straightened.
2. Remove all dust, bugs and other foreign material.

Flushing the Radiator

Thoroughly wash the inside of the radiator and the engine coolant passages with cold water and mild detergent. Remove all signs of scale and rust.

Cooling System Leakage Check

Use a radiator cap tester to force air into the radiator through the filler neck at the specified pressure of 196 kPa (28.5 psi) with a cap tester:

- Leakage from the radiator
- Leakage from the coolant pump
- Leakage from the water hoses
- Check the rubber hoses for swelling.

Cap tester: 5-8840-0277-0
 Adapter: 5-8840-2603-0

110RS005

Installation

1. Install rubber cushions on both sides of radiator bottom.
2. Install radiator assembly with hose, taking care not to damage the radiator core with a fan blade.
3. Install bracket and support the radiator upper tank with the bracket and secure the radiator.
4. Connect reserve tank hose (4).
5. Install lower fan guide (3).
6. Connect radiator inlet hose and outlet hose to the engine.
7. Connect oil cooler hose (1) to automatic transmission.

110RX001

8. Connect battery ground cable.
9. Pour engine coolant up to filler neck of radiator, and up to MAX mark of reserve tank.

111RS001

Important operation (in case of 100% engine coolant change) procedure for filling with engine coolant.

1. Make sure that the engine is cool.
2. Open radiator cap pour coolant up to filler neck.
3. Pour coolant into reservoir tank up to "MAX" line.
4. Tighten radiator cap and start the engine. After idling for 2 to 3 minutes, stop the engine and reopen radiator cap. If the water level is lower, replenish.

WARNING: WHEN THE COOLANT IS HEATED TO A HIGH TEMPERATURE, BE SURE NOT TO LOOSEN OR REMOVE THE RADIATOR CAP. OTHERWISE YOU MIGHT GET SCALDED BY HOT VAPOR OR BOILING WATER. TO OPEN THE RADIATOR CAP, PUT A PIECE OF THICK CLOTH ON THE CAP AND LOOSEN THE CAP SLOWLY TO REDUCE THE PRESSURE WHEN THE COOLANT HAS BECOME COOLER.

5. After tightening radiator cap, warm up the engine at about 2000 rpm. Set heater adjustment to the highest temperature position, and let the coolant circulate also into heater water system.
6. Check to see the thermostat has opened through the needle position of water thermometer, conduct a 5-minute idling again and stop the engine.
7. When the engine has been cooled, check filler neck for water level and replenish if required. Should extreme shortage of coolant is found, check the cooling system and reservoir tank hose for leakage.
8. Pour coolant into reservoir tank up to "MAX" line.

Drive Belt and Cooling Fan

Drive Belt and Associated Parts

015RW005

Legend

- | | |
|-------------------------|---------------------------------------|
| (1) Crankshaft Pulley | (4) Water Pump and Cooling Fan Pulley |
| (2) Generator | (5) Idle Pulley |
| (3) Power Steering Pump | (6) Tension Pulley |
| | (7) Drive Belt |

The drive belt adjustment is not required as automatic drive belt tensioner is equipped.

Inspection

Check drive belt for wear or damage, and replace with a new one as necessary.

Installation

Install cooling fan assembly and tighten bolts/nuts to the specified torque.

Torque : 22 N·m (2.2 Kg·m/16 lb ft) for fan pulley and fan bracket.

Torque : 10 N·m (1.0 Kg·m/88.5 lb in) for fan and clutch assembly.

Main Data and Specifications

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

140RW066

Legend

- | | |
|-----------------------------------|----------------------------------|
| (1) Fuel Filler Cap | (8) Fuel Rail Left |
| (2) Fuel Tank | (9) Left Bank |
| (3) Rollover Valve | (10) Fuel Pressure Control Valve |
| (4) Fuel Pump and Sender Assembly | (11) Common Chamber |
| (5) Fuel Filter | (12) Duty Solenoid Valve |
| (6) Fuel Rail Right | (13) Throttle Valve |
| (7) Right Bank | (14) Canister |
| | (15) Evapo Pipe |

When working on the fuel system, there are several things to keep in mind:

- Any time the fuel system is being worked on, disconnect the negative battery cable except for those tests where battery voltage is required.
- Always keep a dry chemical (Class B) fire extinguisher near the work area.
- Replace all pipes with the same pipe and fittings that were removed.
- Clean and inspect "O" rings. Replace if required.
- Always relieve the line pressure before servicing any fuel system components.
- Do not attempt repairs on the fuel system until you have read the instructions and checked the pictures relating to that repair.

- Adhere to all Notices and Cautions.

All gasoline engines are designed to use only unleaded gasoline. Unleaded gasoline must be used for proper emission control system operation.

Its use will also minimize spark plug fouling and extend engine oil life. Using leaded gasoline can damage the emission control system and could result in loss of emission warranty coverage.

All cars are equipped with an Evaporative Emission Control System. The purpose of the system is to minimize the escape of fuel vapors to the atmosphere.

Fuel Metering

The Powertrain Control Module (PCM) is in complete control of this fuel delivery system during normal driving conditions.

The intake manifold function, like that of a diesel, is used only to let air into the engine. The fuel is injected by separate injectors that are mounted over the intake manifold.

The Manifold Absolute Pressure (MAP) sensor measures the changes in the intake manifold pressure which result from engine load and speed changes, which the MAP sensor converts to a voltage output.

This sensor generates the voltage to change corresponding to the flow of the air drawn into the engine. The changing voltage is transformed into an electric signal and provided to the PCM.

With receipt of the signals sent from the MAP sensor, Intake Air Temperature sensor and others, the PCM determines an appropriate fuel injection pulse width feeding such information to the fuel injector valves to effect an appropriate air/fuel ratio.

The Multiport Fuel Injection system utilizes an injection system where the injectors turn on at every crankshaft revolution. The PCM controls the injector on time so that the correct amount of fuel is metered depending on driving conditions.

Two interchangeable "O" rings are used on the injector that must be replaced when the injectors are removed.

The fuel rail is attached to the top of the intake manifold and supplies fuel to all the injectors.

Fuel is recirculated through the rail continually while the engine is running. This removes air and vapors from the fuel as well as keeping the fuel cool during hot weather operation.

The fuel pressure control valve that is mounted on the fuel rail maintains a pressure differential across the injectors under all operating conditions. It is accomplished by controlling the amount of fuel that is recirculated back to the fuel tank based on engine demand.

See Section "Driveability and Emission" for more information and diagnosis.

Fuel Filter

Removal

CAUTION: When repair to the fuel system has been completed, start engine and check the fuel system for loose connection or leakage. For the fuel system diagnosis, see Section "Driveability and Emission".

Legend

- (1) Fuel Filler Cap

1. Disconnect battery ground cable.
2. Remove Fuel filler cap(1).

Legend

- (1) Fuel Hose
 (2) Fuel Filter Fixing Bolt
 (3) Fuel Filter

3. Disconnect fuel hoses(1) from fuel filter on both engine side and fuel tank side.
4. Fuel filter fixing bolt(2).
 - Remove the fuel filter fixing bolt(2) on fuel filter holder.
5. Remove fuel filter(3).

Inspection

1. Replace the fuel filter if the fuel leaks from fuel filter body or if the fuel filter body itself is damaged.
2. Replace the filter if it is clogged with dirt or sediment.
3. Check the drain of receive rubber and if it is clogged with dust, clean it up with air.

Installation

1. Install the fuel filter in the proper direction.
2. Install fuel filter holder fixing bolt.
3. Connect fuel hoses on engine side(1) and fuel tank side(2).

4. Install fuel filler cap
5. Connect the battery ground cable.

Inspection

After installation, start engine and check for fuel leakage.

In-Tank Fuel Filter

The filter is located on the lower end of fuel pickup tube in the fuel tank. It prevents dirt from entering the fuel pipe and also stops water unless the filter is completely submerged in the water. It is a selfcleaning type, not requiring scheduled maintenance. Excess water and sediment in the tank restricts fuel supply to the engine, resulting in engine stoppage. In such a case, the tank must be cleaned thoroughly.

Fuel Pump Flow Test

If reduction of fuel supply is suspected, perform the following checks.

1. Make sure that there is fuel in the tank.
2. With the engine running, check the fuel feed pipe and hose from fuel tank to injector for evidence of leakage. Retighten, if pipe or hose connection is loose. Also, check pipes and hoses for squashing or clogging.
3. Insert the hose from fuel feed pipe into a clean container, and check for fuel pump flow rate.
4. Connect the pump relay terminals with a jumper wire(1) as shown and start the fuel pump to measure delivery.

140RX020

CAUTION: Never generate sparks when connecting a jumper wire.

Delivery	Delivery
15 seconds	0.38 liters minimum

If the measure value is out of standard, conduct the pressure test.

Pressure test

For the pressure test to the fuel system, see Section 6E "Fuel Control System".

Fuel Pump

Fuel Pump and Associated Parts

140RX004

| (4) Fuel Pump and Sender Assembly | (9) Hose; Air Breather |
| (5) Connector; Fuel Feed Pump | (10) Hose; Fuel Filler |
| | (11) Fuel Tank Assembly |

Removal

CAUTION: When repair to the fuel system has been completed, start engine and check the fuel system for loose connection or leakage. For the fuel system diagnosis, see Section "Driveability and Emission".

1. Disconnect battery ground cable.
2. Loosen fuel filler cap.
3. Support underneath of the fuel tank assembly (11) with a lifter.
4. Remove fuel tank assembly(11). Refer to "Fuel Tank Removal" in this section.
5. Remove Fuel Tube/Quick Connector (2).

NOTE: Handling of the fuel tube sure to refer "Fuel Tube/Quick Connector Fittings" in this section.

6. Remove fuel pump and sender (FPAS) assembly (4) fixing snap ring and remove the FPAS assembly.

NOTE: After removing pump assembly (4), cover fuel tank to prevent any dust entering.

Installation

1. Install FPAS assembly(4).
2. Install Fuel Tube/Quick Connector (2).

NOTE: Handling of the fuel tube sure to refer "Fuel Tube/Quick Connector Fittings" in this section.

3. Install fuel tank assembly(11). Refer to "Fuel Tank Installation".
4. Fill the tank with fuel and tighten fuel filler cap.
5. Connect battery ground cable.

Fuel Tube / Quick – Connector Fittings

Precautions

- Lighting of Fires Prohibited.
- Keep flames away from your work area to prevent the inflammable from catching fire.
- Disconnect the battery negative cable to prevent shorting during work.
- When welding or conducting other heat-generating work on other parts, be sure to provide pretreatment to protect the piping system from thermal damage or spattering.

Cautions During Work

Do not expose the assembly to battery electrolyte or do not wipe the assembly with a cloth used to wipe off spilt battery electrolyte.

The piping wet with battery electrolyte cannot be used. Be careful not to give a bending or twisting force to the piping during the work. If deformed, replace with a new piping.

Removal

1. Open the fuel cap to relieve the fuel pressure in the tank.

If the fuel quick-connect fittings are dusty, clean with an air blower, etc. and then remove it.

141RW036

As some pressure may remain in the piping, cover the connector with a cloth, etc. to prevent the splashing of fuel in the first disconnection of the piping.

2. For removal of the delivery pipe (feeding fuel to the engine), hold the connector in one hand, and hold the retainer tab with the other hand and pull out the connector, as illustrated. The pipe can be removed with the retainer attached.

141RW019

3. For removal of the return pipe (returning fuel to the tank), hold the pipe in one hand, and pull out the connector with the other hand while pressing the square relieve button of the retainer, as illustrated.

141RW020

6C-8 ENGINE FUEL (6VD1 3.2L)

NOTE: This work should be done by hands. Do not use any tools. Should the pipe can hardly be removed from the connector, use a lubricant (light oil) and/or push and pull the connector longitudinally until the pipe is removed.

141RW021

When reusing the delivery pipe retainer, reuse without removing the retainer from the pipe. If the retainer is damaged or deformed, however, replace with a new retainer.

Cover the connectors removed with a plastic bag, etc. to prevent the entry of dust or rain water.

141RW022

Reuse of Quick-Connector

(Delivery Pipe)

- Replace the pipe and connector if scratch, dent or crack is found.
- Remove mud and dust from the pipe and make sure that the end including spool is free of defects, such as scratch, rust, and dent, which may cause poor sealability. If defective, replace with a new pipe.
- If the retainer removed according to the removal step above is attached to the pipe, clean and insert it straight into the quick-connector till it clicks. After it clicks, try pulling it out to make sure that it is not drawn and is securely locked.

NOTE: The retainer, once removed from the pipe, cannot be reused. Just replace with a new retainer. Insert the new retainer into the connector side until it clicks, and connect the pipe as inserting it into the retainer until it clicks.

141RW018

(Return Pipe)

- Replace the pipe and connector if scratch, dent or crack is found.
- Remove mud or dust from the pipe and make sure that the end including spool is free from defects, such as scratch, rust, and dent, which may cause poor sealability. If defective, replace with a new pipe.

- After cleaning the pipe, insert it straight into the connector until it clicks. After it clicks, try pulling it out to make sure that it is not drawn and is securely locked.

Assembling Advice

Application of engine oil or light oil to the pipe facilitates connecting work. The work should be started immediately after lubrication, since dust may stick to the pipe surface to cause poor sealability if a long time passes after lubrication.

Test/Inspection After Assembling

1. Reconnect the battery negative cable.
2. Turn the ignition key to the "ON" position and check pump startup sound. As the pump is actuated to raise fuel pressure, check and see fuel leak from the piping system.
3. Make sure of no fuel leakage by conducting the above fuel leak check a few times.
4. Start the engine and make sure of stable idling speed and normal vehicle run. The entry of dust during the work may sometimes affect the fuel injection system.

Fuel Pump Relay

General Description

In order to control the FPAS operation, the FPAS relay is provided. When the starter switch is turned to "ON" position, the FPAS relay operates the FPAS for 2 seconds.

When it is turned to "START" position, the Engine Control Module receives the reference pulse from the Ignition Control Module and it operates the relay, again causing the FPAS to feed fuel.

Removal

CAUTION: When repair to the fuel system has been completed, start engine and check the fuel system for loose connection or leakage. For the fuel system diagnosis, see Section "Driveability and Emission".

1. Disconnect battery ground cable.
2. Loosen fuel filler cap.
3. Support underneath of the fuel tank protector (15) with a lifter.
4. Disconnect evaporative fuel hose (3) at the canister.
5. Disconnect fuel feed hose (17) and fuel return hose (18) near the fuel filter.

NOTE: Plug both ends of the fuel hoses to prevent fuel leakage.

6. Disconnect air breather hose (4) and fuel filler hose (5) at the fuel filler neck.

NOTE: Cover fuel hose to prevent any dust entering.

7. Remove the four fuel tank assembly fixing bolts (14) at four corners of the tank.
8. Let down the tank and disconnect the wiring connectors (8,9).
9. Remove fuel tank assembly along with protectors (15,19) .
10. Remove retaining cover (2) and roll over & float valve (1) along with the evaporative fuel hose and pipe (3).

11. Remove Fuel Tube/Quick Connector (12).

NOTE: Handling of the fuel tube sure to refer "Fuel Tube/Quick Connector Fittings" in this section.

12. Remove fuel pump and sender assembly (10) by removing the snap ring (7) along with the fuel hoses (17,18).

13. Remove protectors (15,19) by removing the six fixing bolts (6).

Installation

1. Install protectors (15,19) and tighten the six fixing bolts to the specified torque.

Torque: 68 N·m (7.0 kg·m/50 lb ft)

2. Install fuel pump and sender assembly by fitting in of the snap ring (7).

3. Install Fuel Tube/Quick connector (12).

NOTE: Handling of the fuel tube sure to refer "Fuel Tube/Quick Connector Fittings" in this section.

4. Install roll over & float valve (1) by fitting in of the retaining cover (2).

5. Lift up fuel tank assembly and connect the wiring connectors (8,9).

6. Install fuel tank assembly along with protectors and tighten the four fixing bolts to the specified torque.

Torque: 68 N·m (7.0 kg·m/50 lb ft)

7. Connect fuel filler hose (5) and air breather hose (4), and clip them firmly.

8. Connect fuel feed hose (17) and fuel return hose (18), and clip them firmly.

9. Connect evaporative fuel hose (3).

10. Tighten fuel filler cap.

11. Connect battery ground cable.

Fuel Gauge Unit

Removal and Installation

As for removal and installation of the Fuel Gauge Unit, refer to "Fuel Tank" of this section 6C as the fuel gauge unit is combined with the fuel pump and sender assembly.

Fuel Filler Cap

General Description

Fuel filler cap includes vacuum valve. In case any high vacuum happen in tank, the valve works to adjust the pressure to prevent the tank from being damaged.

140RW014

Legend

- (1) Vacuum Valve
- (2) Fuel Filler Cap

Inspection

Check the seal ring in the filler cap for presence of any abnormality and for seal condition. Replace the filler cap, if abnormal.

CAUTION:

The fuel filler cap valve has characteristics.

A defective valve, no valve at all or a valve with the wrong characteristics will do a lot of harm to engine operating characteristics; be sure to use the same fuel filler cap as installed in this vehicle.

Battery Charging	6D1-3		

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS), REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Battery

General Description

There are six battery fluid caps on top of the battery. These are covered by a paper label.

The battery is completely sealed except for the six small vent holes on the side. These vent holes permit the escape of small amounts of gas generated by the battery. This type of battery has the following advantages over conventional batteries:

1. There is no need to add water during the entire service life of the battery.
2. The battery protects itself against overcharging. The battery will refuse to accept an extensive charge. (A conventional battery will accept an excessive charge, resulting in gassing and loss of battery fluid.)
3. The battery is much less vulnerable to self discharge than a conventional type battery.

Diagnosis

1. Visual Inspection

Inspect the battery for obvious physical damage, such as a cracked or broken case, which would permit electrolyte loss.

Replace the battery if obvious physical damage is discovered during inspection.

Check for any other physical damage and correct it as necessary.

2. Hydrometer Check

There is a built-in hydrometer (Charge test indicator(1)) at the top of the battery. It is designed to be used during diagnostic procedures.

Before trying to read the hydrometer, carefully clean the upper battery surface.

If your work area is poorly lit, additional light may be necessary to read the hydrometer.

- a. BLUE RING OR DOT VISIBLE(5) – Go to Step 4.
- b. BLUE RING OR DOT NOT VISIBLE(4) – Go to Step 3.

061RW001

3. Fluid Level Check

The fluid level should be between the upper level line(2) and lower level line(3) on side of battery.

- a. CORRECT FLUID LEVEL – Charge the battery.
- b. BELOW LOWER LEVEL – Replace battery.

061RW001

4. Voltage Check

1. Put voltmeter test leads to battery terminals.
 - a. VOLTAGE IS 12.4V OR ABOVE – Go to Step 5.
 - b. VOLTAGE IS UNDER 12.4V – Go to procedure (2) below.
2. Determine fast charge amperage from specification. (See Main Data and Specifications in this section). Fast charge battery for 30 minutes at amperage rate no higher than specified value. Take voltage and amperage readings after charge.
 - a. VOLTAGE IS ABOVE 16V AT BELOW 1/3 OF AMPERAGE RATE – Replace battery.
 - b. VOLTAGE IS ABOVE 16V AT ABOVE 1/3 OF AMPERAGE RATE – Drop charging voltage to 15V and charge for 10–15 hours. Then go to Step 5.
 - c. VOLTAGE IS BETWEEN 12V AND 16V – Continue charging at the same rate for an additional 3–1/2 hours. Then go to Step 5.
 - d. VOLTAGE BELOW 12V – Replace Battery.

5. Load Test

1. Connect a voltmeter and a battery load tester across the battery terminals.
2. Apply 300 ampere load for 15 seconds to remove surface charge from the battery. Remove load.
3. Wait 15 seconds to let battery recover. Then apply specified load from specifications (See Main Data and Specifications in this section). Read voltage after 15 seconds, then remove load.

- a. VOLTAGE DOES NOT DROP BELOW THE MINIMUM LISTED IN THE TABLE – The battery is good and should be returned to service.
- b. VOLTAGE IS LESS THAN MINIMUM LISTED – Replace battery.

ESTIMATED TEMPERATURE		MINIMUM VOLTAGE
°F	°C	V
70	21	9.6
60	16	9.5
50	10	9.4
40	4	9.3
30	-1	9.1
20	-7	8.9
10	-12	8.7
0	-18	8.5

The battery temperature must be estimated by feel and by the temperature the battery has been exposed to for the preceding few hours.

Battery Charging

Observe the following safety precautions when charging the battery:

- Never attempt to charge the battery when the fluid level is below the lower level line on the side of the battery. In this case, the battery must be replaced.
- Pay close attention to the battery during charging procedure.
Battery charging should be discontinued or the rate of charge reduced if the battery feels hot to the touch.
Battery charging should be discontinued or the rate of charge reduced if the battery begins to gas or spew electrolyte from the vent holes.
- In order to more easily view the hydrometer blue dot or ring, it may be necessary to jiggle or tilt the battery.
- Battery temperature can have a great effect on battery charging capacity.
- The sealed battery used on this vehicle may be either quick charged or slow charged in the same manner as other batteries.
Whichever method you decide to use, be sure that you completely charge the battery. Never partially charge the battery.

Jump Starting

Jump Starting with an Auxiliary (Booster) Battery

CAUTION: Never push or tow the vehicle in an attempt to start it. Serious damage to the emission system as well as other vehicle parts will result.

Treat both the discharged battery and the booster battery with great care when using jumper cables. Carefully follow the jump starting procedure, being careful at all times to avoid sparking.

WARNING: FAILURE TO CAREFULLY FOLLOW THE JUMP STARTING PROCEDURE COULD RESULT IN THE FOLLOWING:

- Serous personal injury, particularly to your eyes.
- Property damage from a battery explosion, battery acid, or an electrical fire.
- Damage to the electronic components of one or both vehicles particularly.

Never expose the battery to an open flame or electrical spark. Gas generated by the battery may catch fire or explode.

Remove any rings, watches, or other jewelry before working around the battery. Protect your eyes by wearing an approved set of goggles.

Never allow battery fluid to come in contact with your eyes or skin.

Never allow battery fluid to come in contact with fabrics or painted surfaces.

Battery fluid is a highly corrosive acid.

Should battery fluid come in contact with your eyes, skin, fabric, or a painted surface, immediately and thoroughly rinse the affected area with clean tap water.

Never allow metal tools or jumper cables to come in contact with the positive battery terminal, or any other metal surface of the vehicle. This will protect against a short circuit.

Always keep batteries out of reach of young children.

Jump Starting Procedure

- Set the vehicle parking brake.
If the vehicle is equipped with an automatic transmission, place the selector level in the "PARK" position.
If the vehicle is equipped with a manual transmission, place the shift lever in the "NEUTRAL" position.
Turn "OFF" the ignition.
Turn "OFF" all lights and any other accessory requiring electrical power.
- Look at the built-in hydrometer.
If the indication area of the built-in hydrometer is completely clear, do not try to jump start.
- Attach the end of one jumper cable to the positive terminal of the booster battery.
Attach the other end of the same cable to the positive terminal of the discharged battery.
Do not allow the vehicles to touch each other. This will cause a ground connection, effectively neutralizing the charging procedure.
Be sure that the booster battery has a 12 volt rating.

6D1-4 ENGINE ELECTRICAL

4. Attach one end of the remaining cable to the negative terminal of the booster battery.

Attach the other end of the same cable to a solid engine ground (such as the air conditioning compressor bracket or the generator mounting bracket) of the vehicle with the discharged battery.

The ground connection must be at least 450 mm (18 in.) from the battery of the vehicle whose battery is being charged.

WARNING: NEVER ATTACH THE END OF THE JUMPER CABLE DIRECTLY TO THE NEGATIVE TERMINAL OF THE DEAD BATTERY.

5. Start the engine of the vehicle with the good battery.
Make sure that all unnecessary electrical accessories have been turned "OFF".
6. Start the engine of the vehicle with the dead battery.
7. To remove the jumper cables, follow the above directions in reverse order.
Be sure to first disconnect the negative cable from the vehicle with the discharged battery.

Battery Removal

061RX002

1. Remove negative cable (1).
2. Remove positive cable (2).
3. Remove retainer screw and rods (3).
4. Remove retainer (4).
5. Remove battery (5).

Battery Installation

1. Install battery (5).
2. Install retainer (4).
3. Install retainer screw and rods (3).

NOTE: Make sure that the rod is hooked on the body side.

4. Install positive cable (2).
5. Install negative cable (1).

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

6D2-2 IGNITION SYSTEM

General Description

Ignition is done by the electronic ignition (EI) that directly fires the spark plugs from ignition coils through spark plug wires without using a distributor. A pair of ignition coils for the cylinders having different phases by 360° (No.1 and No.4, No.2 and No.5, No.3 and No.6) are fired simultaneously.

Since the cylinder on exhaust stroke requires less energy to fire its ignition plug, energy from the ignition coils can be utilized to fire the mating cylinder on compression stroke. After additional 360° rotation, respective cylinder strokes are reversed.

The EI consists of six ignition coils, ignition control module, crank angle sensor, powertrain control module (PCM) and other components.

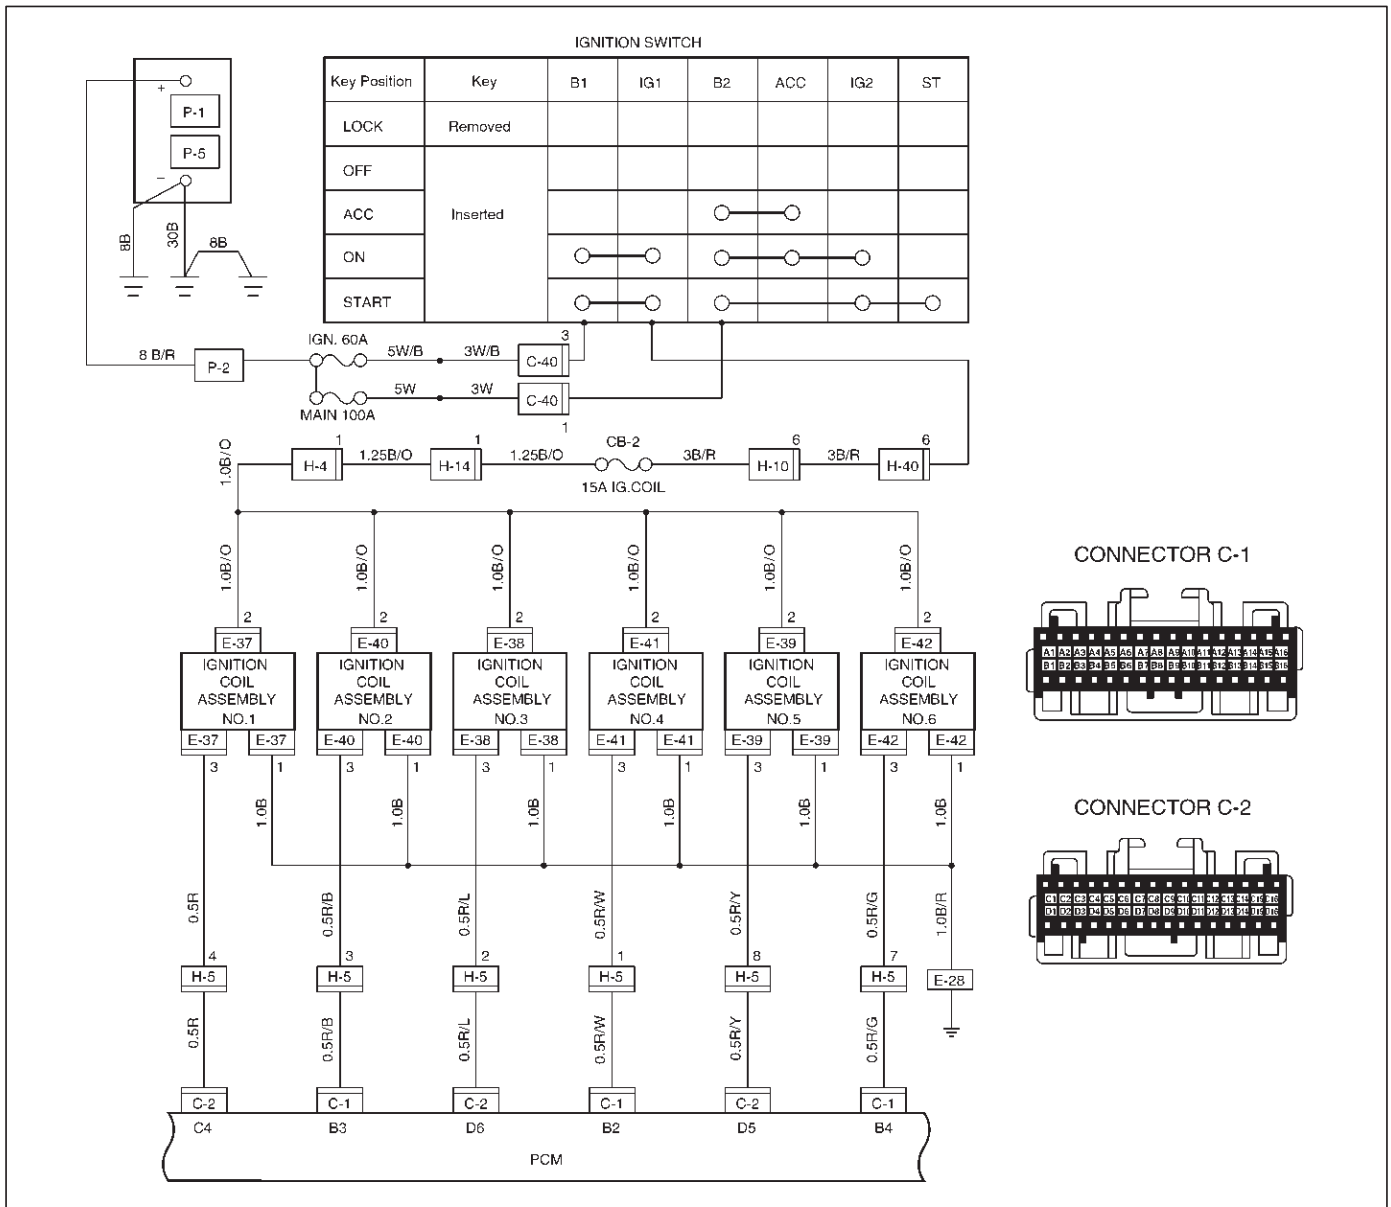

The ignition coils are connected with the PCM by means of a 32 pin connector.

The ignition control module turns on/off the primary circuit of ignition coils, and also it controls the ignition timing at the engine speed below 538 rpm.

A notch in the timing disc on the crankshaft activates the crank angle sensor which then sends information such as firing order and starting timing of each ignition coil to the PCM.

Further, the EI employs ignition control (IC) to control similar to a distributor system.

By receiving signals such as crank position, engine speed, water temperature and Manifold Absolute Pressure (MAP), the PCM controls the ignition timing.

Diagnosis

Refer to Section Drivability and Emissions for the diagnosis to electronic ignition system (EI system).

Ignition Coil

Removal

1. Disconnect battery ground cable.
2. Ignition coil connector and ignition coil.
 - Disconnect three connector from ignition coil.
 - Remove harness bracket bolt on cylinder head cover.
 - Remove fixing bolts on ignition coil.

Legend

- (1) Ignition Coil Connector
- (2) Bolt
- (3) Ignition Coil Assembly

Inspection and Repair

Check the ignition coil assembly for insulation. Check terminals for corrosion or damage, and replace as necessary.

Measuring resistance of ignition coil assembly.

Terminal No.	Limit
1 to 2	Without 0 ohm or infinity maximum ohm.
1 to 3	Same as above
2 to 3	Same as above

Measure resistance of ignition coil assembly, and replace the ignition coil assembly if its value exceeds the standard.

Installation

1. Install the ignition coil assembly (3).
Connect ignition coil connector (1) and ignition coil (3), then tighten bolt (2) to the specified torque.

Torque: 4 N·m (0.4 Kg·m/35 lb in)

2. Connect battery ground cable.

Spark Plug

Removal

1. Remove spark plugs.

Inspection and Repair

The spark plug affects entire engine performance and therefore its inspection is very important.

- Check electrode and insulator for presence of cracks, and replace if any.
- Check electrode for wear, and replace if necessary.
- Check gasket for damage, and replace if necessary.
- Measure insulation resistance with an ohmmeter, and replace if faulty.
- Adjust spark plug gap to 1.0 mm (0.04 in) ~ 1.1 mm (0.043 in).
- Check fuel and electrical systems if spark plug is extremely dirty.
- Use spark plugs having low heat value (hot type plug) if fuel and electrical systems are normal.
- Use spark plugs having high heat value (cold type plug) if insulator and electrode are extremely burned.

Sooty Spark Plugs

Much deposit of carbon or oil on the electrode and insulator of spark plug reduces the engine performance.

Possible causes:

- Too rich mixture
- Presence of oil in combustion chamber
- Incorrectly adjusted spark plug gap

Burning Electrodes

This fault is characterized by scorched or heavily oxidized electrode or blistered insulator nose.

Possible causes:

- Too lean mixture
- Improper heat value

Measuring Insulation Resistance

- Measure insulation resistance using a 500 volt megaohm meter.
- Replace spark plugs if measured value is out of standard.

Insulation resistance: 50 MΩ or more

011RS010

Cleaning Spark Plugs

- Clean spark plugs with a spark plug cleaner.
- Raise the ground electrode to an angle of 45 to 60 degrees. If electrode is wet, dry it before cleaning.
- After spark plug is thoroughly cleaned, check insulator for presence of cracks.
- Clean threads and metal body with a wire brush.
- File the electrode tip if electrode is extremely worn.
- Bend the ground electrode to adjust the spark plug gap.

011RS011

Installation

1. Spark plugs
 - Tighten spark plugs to the specified torque.
- Torque: 18 N·m (1.8 Kg·m/13 lb ft)**

Crankshaft Position Sensor

Removal

1. Disconnect battery ground cable
2. Wiring connector from crankshaft angle sensor.
3. Remove crankshaft angle sensor from cylinder block.

Installation

1. Install crankshaft angle sensor into the cylinder block.
Before installation, apply small amount of engine oil to the O-ring.

Torque: 10 N·m (1.0 Kg·m/89 lb in)

2. Reconnect wiring connector to crankshaft position sensor.

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS), REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Starting System

General Description

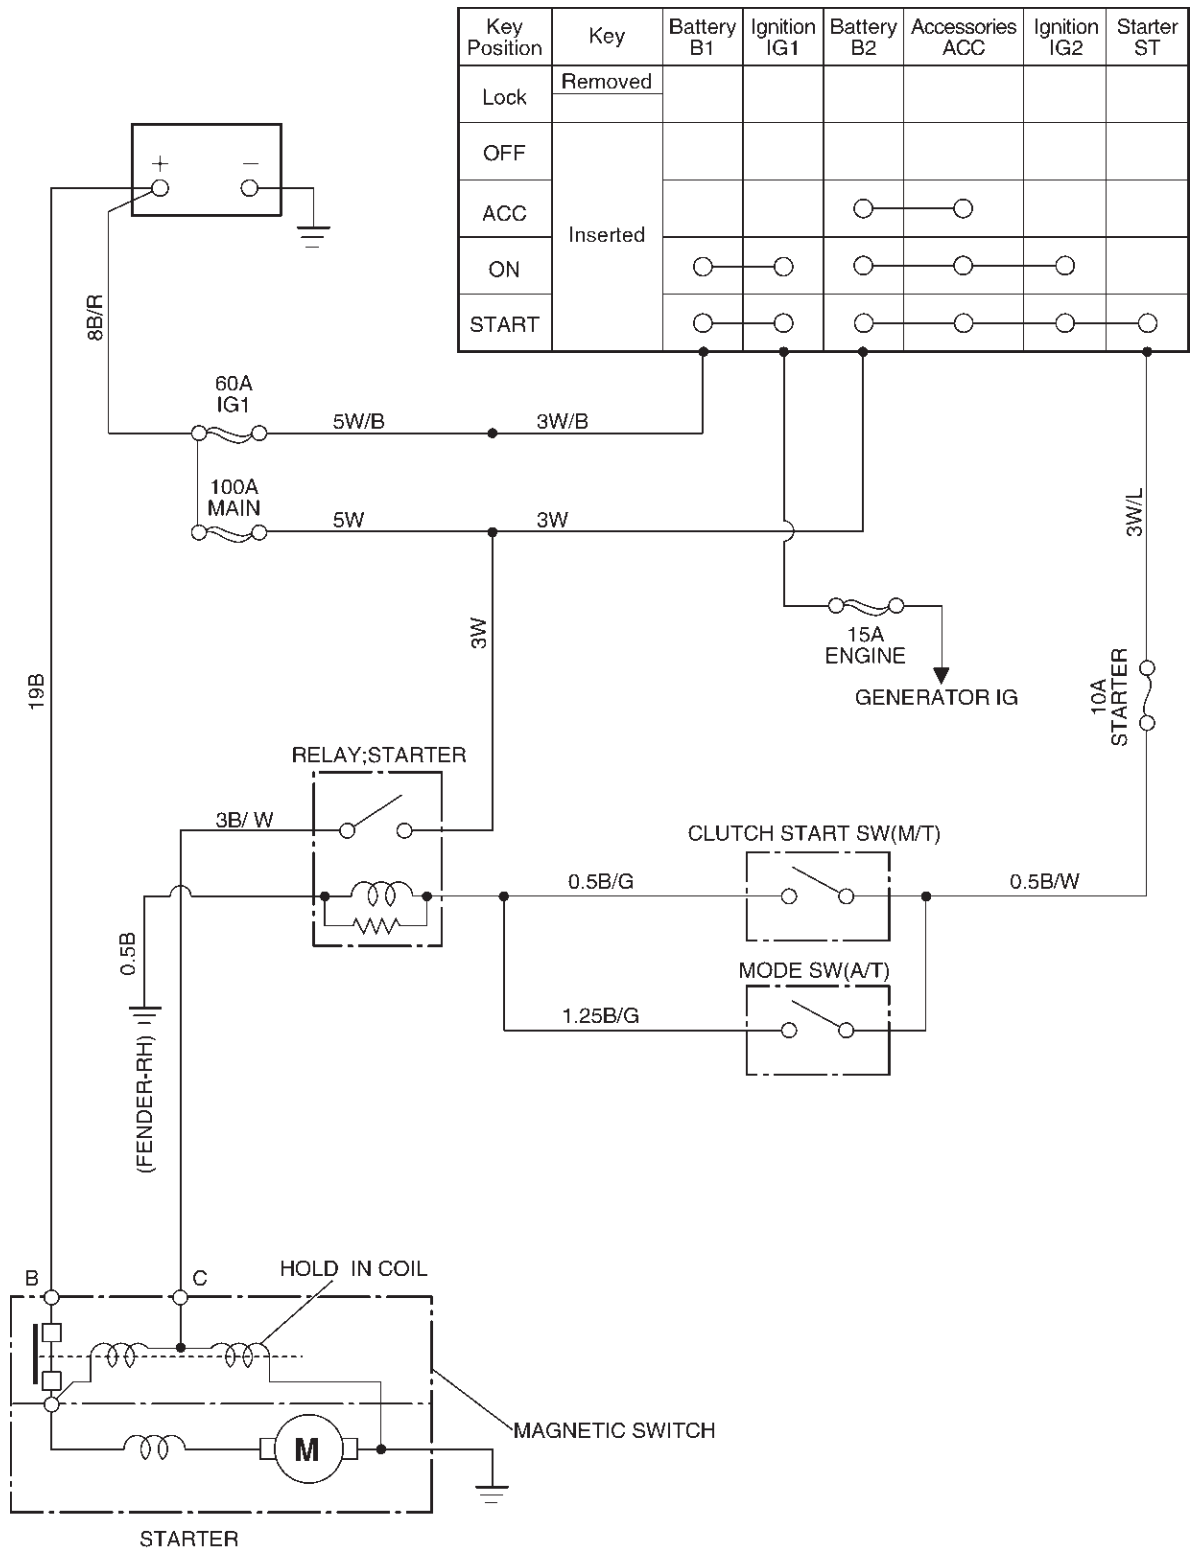

Cranking Circuit

The cranking system consists of a battery, starter, starter switch, starter relay, etc. These main components are connected.

Starter

The cranking system employs a magnetic type reduction starter in which the motor shaft is also used as a pinion shaft. When the starter switch is turned on, the contacts of magnetic switch are closed, and the armature rotates. At the same time, the plunger is attracted, and the pinion is pushed forward by the shift lever to mesh with the ring gear.

Then, the ring gear runs to start the engine. When the engine starts and the starter switch is turned off, the plunger returns, the pinion is disengaged from the ring gear, and the armature stops rotation. When the engine speed is higher than the pinion, the pinion idles, so that the armature is not driven.

6D3-4 STARTING AND CHARGING SYSTEM

Diagnosis

Starter does not run	Charging failure	Repair charging system
	Battery Failure	Replace Battery
	Terminal connection failure	Repair or replace terminal connector and/or wiring harness
	Starter switch failure	Repair or replace starter switch
	Starter failure	Repair or replace starter

Starter

Removal

1. Battery ground cable.
2. Disconnect heated oxygen (O₂) sensor connector (1).
3. Remove exhaust front left pipe(2).

4. Remove heat protector(3).
5. Disconnect starter wiring connector from terminals "B" and "S"(4).
6. Remove starter assembly mounting bolts on inside and outside(5).
7. Remove starter assembly toward the bottom of engine(6).

Installation

1. Install starter assembly(6).

2. Install mounting bolts and tighten bolts to specified torque(5).

Torque: 40 N-m (4.1 Kg-m/30 lb ft)

3. Reconnect the connectors to terminals "B" and "S" and tighten Terminals "B" to specified torque.

Torque: 9 N-m (0.9 Kg-m/80 lb in)

4. Install heat protector(3).

5. Install exhaust front left pipe and tighten bolts and nuts to specified torque(2).

Stud Nuts

Torque: 67 N-m (6.8 Kg-m/49 lb ft)

Nuts

Torque: 43 N-m (4.4 Kg-m/32 lb ft)

6. Connect O₂ sensor connector (2).

7. Reconnect the battery ground cable.

Disassembled View

065RW002

Legend

| (12) E-Ring | (25) Screw (2 pcs) |
| (13) Thrust Washer (2) | (26) Through Bolt (2 pcs) |

Disassembly

1. Loosen the nut(1) on terminal "M" of magnetic switch and disconnect the connector cable.
2. Remove bolt (2 pcs) (2).

3. Remove magnetic switch(5).
4. Remove dust cover(4).
5. Remove torsion spring bolts, then the magnetic switch assembly.
6. Remove torsion spring(3) from magnetic switch assembly(5).

7. Remove screw (2 pcs) (8).
8. Remove through bolt (2 pcs) (7).

9. Remove screws and through bolts, then the rear cover(9) then remove thrust washer(10).
10. Remove brush holder(6).

11. Raise a brush spring to detach brushes (4 pcs) from the commutator face and pull off the brush holder(12) and brush(11).

12. Remove yoke assembly(14).
13. Remove armature(15).
14. Pull off the yoke assembly, then remove armature, washer and center bracket.(A) (13).

6D3-8 STARTING AND CHARGING SYSTEM

NOTE: In disassembling the yoke assembly, hold the armature and pull off slowly the yoke assembly. Because of strong magnetic force, avoid placing a metallic part near armature.

15. Remove dust cover(17).

16. Remove a dust cover and shift lever(16) from the gear case.

17. Remove ball bearing(19).

18. Remove bearing cover(20).

19. Remove a ball bearing and bearing cover from the gear case(18).

20. Internal gear(21).

21. Remove internal gear and planet gear(3) (22).

22. Remove an E-ring(23) from the pinion shaft using a flat blade screwdriver.

23. Holding the pinion shaft, push pinion toward the center bracket, and turn the pinion clockwise or counterclockwise by one tooth of spline, then pull off the pinion.

24. Remove thrust washer(24).

25. Remove center bracket

26. Remove pinion shaft.

Inspection and Repair

Repair or replace necessary parts if extreme wear or damage is found during inspection.

Armature

Measure the outer diameter of commutator, and replace with a new one if it is out of the limit.

Standard: 33.0 mm (1.30 in)

Limit: 32.0 mm (1.26 in)

Check for continuity between commutator and segment. Replace commutator if there is no continuity (i.e., disconnected).

6D3-10 STARTING AND CHARGING SYSTEM

Check for continuity between commutator and shaft. Also, check for continuity between commutator and armature core, armature core and shaft. Replace commutator if there is continuity (i.e., internally grounded).

065RS016

Measure runout of armature core and commutator with a dial gauge. Repair or replace, if it exceeds the limit.

Armature

Standard: 0.05 mm (0.002 in) Max.

Limit: 0.10 mm (0.004 in)

Commutator

Standard: 0.05 mm (0.002 in) Max.

Limit: 0.10 mm (0.004 in)

065RS017

Polish the commutator surface with sandpaper #500 to #600 if it is rough.

065RW012

Measure the depth of insulator in commutator. Repair, if it is below the limit.

Standard: 0.05 mm to 0.8 mm (0.02 in to 0.03 in)

Limit: 0.2 mm (0.008 in)

065RW013

Legend

- (1) Steel Saw
- (2) Insulator
- (3) Commutator Segments

Brush

Measure the length of brush.
 Replace with a new one, if it is below the limit.

Standard: 16 mm (0.63 in)

Limit: 11 mm (0.43 in)

065RW014

Brush Holder

Check for continuity between brush holder (+) (4) and base (-). Replace, if there is continuity (i.e., insulation is broken).

065RW015

Magnetic Switch

Check for continuity of shunt coil between terminals S and M.

Replace, if there is no continuity (i.e., coil is disconnected).

065RW016

Continuity of Series Coil

Check for continuity between terminals S and M.

Replace, if there is no continuity (i.e., coil is disconnected).

065RW017

6D3-12 STARTING AND CHARGING SYSTEM

Continuity of Contacts

With the plunger faced downward, push down the magnetic switch. In this state, check for continuity between terminals B and M. Replace, if there is no continuity (i.e., contacts are faulty).

Pinion

Check if the pinion rotates smoothly in drive direction by hand, or if it is locked when it is rotated in reverse. If not, replace the pinion.

Yoke Assembly

Check a magnet inside the yoke.
Replace the yoke assembly if it is broken.

Ball Bearing

Clamp the inner race of the ball bearing with your finger, and check for sticking or play when rotating the outer race.

Replace, if abnormality is found.

Measure inner diameter of bushing in the rear cover, and replace if it exceeds the limit.

Standard: 12.50 mm to 12.527 mm (0.492 in to 0.4932 in)

Limit: 12.60 mm (0.4961 in)

065RS028

Measure inner diameter of bushing in the center bracket (P), and replace if it exceeds the limit.

Standard: 18.01 mm to 18.127 mm (0.7091 in to 0.7137 in)

Limit: 18.15 mm (0.7146 in)

065RS029

Reassembly

To install, follow the removal steps in the reverse order, noting the following points:

Grease application places

- Bushing in rear cover and center bracket
- Gears in reduction gear
- Shift lever operating portion
- Sliding portion of pinion
- Plunger sliding portion of magnetic switch

Reassembling Yoke Assembly

Before reassembly, make sure that no metallic parts attach to the yoke assembly. Because of strong magnetic force, hold the yoke assembly and insert it slowly into the armature.

Torque

Torque for each part (See Torque Specifications in this section)

Pinion Jump-out Dimension

Connect the “+” cable of battery to terminal S and the “-” cable to terminal M. Turn the switch on, and measure pinion travel dimension in thrust direction from the jump-out position.

In measuring the dimension, pull the pinion out a little in the arrow direction.

Dimension(L): 0.05 mm to 1.5 mm (0.002 in to 0.06 in)

065RS030

6D3-14 STARTING AND CHARGING SYSTEM

If the measured value is out of standard, insert dust cover, or disassemble and adjust.

065RW019

Characteristic Test

For easily confirming the characteristics, conduct the no load test as follows:

Rating as short as 30 seconds requires rapid testing.

Fix the starter on the test bench, and wire as shown in illustration. When the switch is closed, the current flows and the starter runs under no load. At this time, measure current, voltage and speed to check if they satisfy the standard.

065RW020

STARTING AND CHARGING SYSTEM 6D3-17

N·m (Kg·m/lb ft)

Charging System

General Description

The IC integral regulator charging system and its main components are connected as shown in illustration.

The regulator is a solid state type and it is mounted along with the brush holder assembly inside the generator installed on the rear end cover.

The generator does not require particular maintenance such as voltage adjustment.

The rectifier connected to the stator coil has diodes to transform AC voltage into DC voltage.

This DC voltage is connected to the output terminal of generator.

General On-Vehicle Inspection

A basic wiring diagram is shown in the illustration. When operating normally, the indicator bulb will come on when the switch is turned on, and will then go out when the engine starts. If the indicator operates abnormally, or if an undercharged or overcharged battery condition occurs, the following procedure may be used to diagnose the charging system. Remember that an undercharged battery is often caused by accessories being left on overnight, or by a defective switch which allows a bulb, such as a trunk or glove box light, to stay on.

OBSERVE THE FOLLOWING PROCEDURE:

1. Visually check belt and wiring.
2. Go to step 5. for vehicles without charge indicator light.
3. Switch on, engine stopped, light should be on. If not, detach harness at generator, ground "L" terminal lead.
 - a. Lamp lights, replace or repair generator.
 - b. Lamp does not light, locate open circuit between grounding lead and ignition switch. Bulb may be open.
4. Switch on, engine running at moderate speed. Light should be off. If not, detach wiring harness at generator.
 - a. If light goes off, replace or repair generator.
 - b. If light stays on, check for grounded "L" terminal wire in harness.
5. Battery undercharged or overcharged.
 - a. Detach wiring harness connector from generator.
 - b. With switch on, engine not running connect voltmeter from ground to "L" terminal in wiring harness, and to "IG" terminal. If used. Wiring harness may connect to either "L" or "IG" or both.
 - c. Zero reading indicates open circuit between terminal and battery. Connect as required.

- d. Re-connect harness connector to generator, run engine at moderate speed, with electrical accessories turned off.
 - e. Measure voltage across battery. If above 16.0V, replace or repair generator.
 - f. Connect ammeter at generator output terminal. Turn on accessories, load battery with carbon pile to obtain maximum amperes output. Maintain voltage at 13.0V or above.
1. If within 15 amperes of rated output, generator is OK.

2. If not within 15 amperes of rated output, replace or repair generator.

Generator

Removal

1. Disconnect battery ground cable.
2. Move drive belt tensioner to loose side using wrench then remove drive belt (1).
3. Disconnect the wire from terminal "B" and disconnect the connector (4).
4. Remove generator fixing bolt (3).
5. Remove generator assembly (2).

060RW002

Inspection

1. Disconnect the wiring connector from generator.
2. With the engine stopped, turn starter switch to "on" and connect a voltmeter between connector terminal L (1) and ground or between terminal IG (2) and ground.

066RX002

If voltage is not present, the line between battery and connector is disconnected and so requires repair.

3. Reconnect the wiring connector to the generator, run the engine at middle speed, and turn off all electrical devices other than engine.
4. Measure battery voltage. If it exceeds 16V, repair or replace the generator.
5. Connect an ammeter to output terminal of generator, and measure output current under load by turning on the other electrical devices (eg., headlights). At this time the amperes must not be less than 15A and the voltage must not be less than 13V.

6D3-20 STARTING AND CHARGING SYSTEM

Installation

1. Install generator assembly to the position.
2. Install generator assembly and tighten the fixing bolts to the specified torque.

Torque:

M10 bolt: 41 N-m (30 lb ft)

M8 bolt: 21 N-m (15 lb ft)

3. Connect wiring harness connector and direct terminal "B".

4. Move drive belt tensioner to loose side using wrench, then install drive belt to normal position.
5. Reconnect battery ground cable.

Disassembled View

Legend

|--------------------------|----------------------------|
| (1) Pulley Nut | (7) Nut |
| (2) Pulley | (8) Terminal Insulator |
| (3) Front Cover Assembly | (9) Rear Cover Assembly |
| (4) Rotor Assembly | (10) Rectifier |
| (5) Stator Assembly | (11) Brush Holder Assembly |
| (6) Through Bolt | (12) Regulator Assembly |

Disassembly

1. Remove the through bolt.

Insert the tip of a pry bar into the gaps between the front cover and the stator core.

Pry apart and separate the front cover, rotor, the rear cover and stator.

NOTE: Take care not to scratch or otherwise damage the stator coil with pry bar.

F06RT021

2. Clamp the rotor in a vise and then remove the nut and pulley.

3. Remove the rotor assembly from front cover.

F06RT022

4. Remove screws with bearing retainer from front cover and remove bearing.

F06RT023

5. Remove the mounting nuts holding the "B" terminal, the diode, and the brush holder.

6. Separate the rear cover from the stator.

F06RT024

6D3-22 STARTING AND CHARGING SYSTEM

7. Remove bolts which secure stator terminal to rectifier terminal, and remove stator.

066RS030

8. Remove Bolts which secure regulator, rectifier and brush-holder, and separate these parts.

NOTE: Do not apply a shock or load to regulator, rectifier and brush holder.

066RW025

Inspection and Repair

Repair or replace necessary parts if extreme wear or damage is found during inspection.

Rotor Assembly

1. Check the face of the slip rings for contamination and roughness. If found to be scored, dress with a fine sandpaper (#500 –600). If found to be contaminated, clean with a cloth saturated with alcohol.
2. Measure the outside diameter of the slip rings.

Standard: 27mm (1.06in)

Limit: 26mm (1.02in)

066RS032

3. Check resistance between slip rings, and replace if there is no continuity.

Standard: 3.75Ω or less

066RS033

4. Check for continuity between slip ring and rotor core. In case of continuity, replace the rotor assembly.

066RS017

Stator Coil

1. Check for continuity across the stator coils. If no continuity exists, replace the coils. Resistance value at 20°C.
Standard: Approx. 0.07Ω

066RS034

2. Check for continuity across one of the stator coils and stator core. If a continuity exists, replace the coil.
Standard: More than 1MΩ

066RS035

Brush

- Measure the brush length. If more than limit, replace the brush.
Standard: 18.0mm (0.709in)
Limit: 5.5mm (0.217in)

066RW024

Rectifier Assembly

1. Measure the resistance between each diode terminal and aluminum diode fin in forward and reverse directions with the connection of the tester leads switched. The diodes are normal if resistance is nearly zero ohms in one direction and is infinitely high in the other direction.
2. If a diode has no resistance or equal resistance in both directions, it is defective and should be replaced together with the holder.

6D3-24 STARTING AND CHARGING SYSTEM

IC Regulator Assembly

Connect a variable resistor, two 12V batteries, a fixed resistor, and a voltmeter to the IC regulator as shown in illustration.

- a. Measuring equipment specifications
 1. Fixed resistor (R1) : 10 Ohms /3W
 2. Variable resistor (Rv) : 0-300 Ohms/12W
 3. Batteries (BAT1, BAT2) : 12V (2 Batteries)
 4. DC voltmeter : 0-50V/0.5 steps (4 Check points)
- b. Measuring procedure
 1. Measure the voltage "V1" across the first battery (BAT1). If the reading is between 10 and 13 volts, the battery is normal.
 2. Measure the voltage "V3" across both the batteries (BAT1, BAT2). If the reading is between 20 and 26 volts, the batteries are normal.
 3. Gradually increase the resistance of the variable resistor from zero. Measure the voltage "V2" (the voltage across the F and E terminals).

Check to see that the voltage across "V1" changes at this time. If there is no change, the voltage regulator is faulty and must be replaced.

4. Measure the voltage at "V4" (the voltage across the variable resistor center tap and terminal E with the variable resistor resistance held constant). The measure voltage should be within the specified (14.4 ± 0.3 volts) limits. If it is not, the regulator must be replaced.

Reassembly

To reassemble, follow the disassembly steps in the reverse order, noting the following points:

NOTE:

- Never make battery connections with polarities reversed, or battery will be shorted via the diodes. This will cause damage to the diodes.
- Do not connect generator B terminal to ground; it is connected directly to the battery. This cable will burn if it is connected to ground.
- Make sure to disconnect the positive (+) terminal of the battery when quick-charging battery. Diodes may be damaged due to abnormal pulse voltage generated by the quick charger.
- When reassembling the front section to rear section, insert a stiff wire into hole in the rear face of the rear cover from the outboard side to support the brush in raised position, then insert the front section to which rotor is assembled.
- Reassemble parts carefully to be sure they fit into their original position, paying attention to the insulated portions.
- Wipe insulating tubes, washers and plates clean and install them in position carefully to avoid getting oil or grease on them.

1. Using a press with a socket wrench attached, reassemble rotor and rear end cover assembly in the front cover.

066RS022

2. Install pulley on the rotor.

Secure the pulley directly in the vise between two copper plates, and tighten nut to the specified torque.

Torque: 111 N·m (82 lb ft)

066RS010

Bench Test

Conduct a bench test of the generator.

066RS023

Preparation

Remove generator from the vehicle (see "Generator removal").

1. Secure generator to the bench test equipment and connect wires.
 - Terminal "IG" for energization
 - Terminal "L" for neutral (warning lamp)
 - Terminal "B" for output
2. Conduct the generator characteristic test.
 - Characteristics of generator are shown in illustration.
 - Repair or replace the generator if its outputs are abnormal.

Diagnosis

Strategy-Based Diagnostics

Strategy-Based Diagnostics

The strategy-based diagnostic is a uniform approach to repair all Electrical/Electronic (E/E) systems. The diagnostic flow can always be used to resolve an E/E system problem and is a starting point when repairs are necessary. The following steps will instruct the technician how to proceed with a diagnosis:

1. Verify the customer complaint.
 - To verify the customer complaint, the technician should know the normal operation of the system.
2. Perform preliminary checks.
 - Conduct a thorough visual inspection.
 - Review the service history.
 - Detect unusual sounds or odors.
 - Gather diagnostic trouble code information to achieve an effective repair.
3. Check bulletins and other service information.
 - This includes videos, newsletters, etc.
4. Refer to service information (manual) system check(s).
 - "System checks" contain information on a system that may not be supported by one or more DTCs. System checks verify proper operation of the system. This will lead the technician in an organized approach to diagnostics.
5. Refer to service diagnostics.

DTC Stored

Follow the designated DTC chart exactly to make an effective repair.

No DTC

Select the symptom from the symptom tables. Follow the diagnostic paths or suggestions to complete the repair. You may refer to the applicable component/system check in the system checks.

No Matching Symptom

1. Analyze the complaint.
2. Develop a plan for diagnostics.
3. Utilize the wiring diagrams and the theory of operation.

Combine technician knowledge with efficient use of the available service information.

Intermittents

Conditions that are not always present are called intermittents. To resolve intermittents, perform the following steps:

1. Observe history DTCs, DTC modes, and freeze-frame data.
2. Evaluate the symptoms and the conditions described by the customer.

3. Use a check sheet or other method to identify the circuit or electrical system component.
4. Follow the suggestions for intermittent diagnosis found in the service documentation.

Most scan tools, such as the Tech 2, have data-capturing capabilities that can assist in detecting intermittents.

No Trouble Found

This condition exists when the vehicle is found to operate normally. The condition described by the customer may be normal. Verify the customer complaint against another vehicle that is operating normally. The condition may be intermittent. Verify the complaint under the conditions described by the customer before releasing the vehicle.

1. Re-examine the complaint.

When the complaint cannot be successfully found or isolated, a re-evaluation is necessary. The complaint should be re-verified and could be intermittent as defined in *Intermittents*, or could be normal.
2. Repair and verify.

After isolating the cause, the repairs should be made. Validate for proper operation and verify that the symptom has been corrected. This may involve road testing or other methods to verify that the complaint has been resolved under the following conditions:

 - Conditions noted by the customer.
 - If a DTC was diagnosed, verify a repair by duplicating conditions present when the DTC was set as noted in the Failure Records or Freeze Frame data.

Verifying Vehicle Repair

Verification of the vehicle repair will be more comprehensive for vehicles with OBD II system diagnostics. Following a repair, the technician should perform the following steps:

IMPORTANT: Follow the steps below when you verify repairs on OBD II systems. Failure to follow these steps could result in unnecessary repairs.

1. Review and record the Failure Records and the Freeze Frame data for the DTC which has been diagnosed (Freeze Frame data will only be stored for an A or B type diagnostic and only if the MIL ("Check Engine" lamp) has been requested).
2. Clear the DTC(s).
3. Operate the vehicle within conditions noted in the Failure Records and Freeze Frame data.
4. Monitor the DTC status information for the DTC which has been diagnosed until the diagnostic test associated with that DTC runs.

General Service Information

Non-OEM Parts

All of the OBD II diagnostics have been calibrated to run with OEM parts. Something as simple as a high-performance exhaust system that affects exhaust system back pressure could potentially interfere with the operation of the EGR valve and thereby turn on the MIL

(“Check Engine” lamp). Small leaks in the exhaust system near the post catalyst oxygen sensor can also cause the MIL (“Check Engine” lamp) to turn on.

Aftermarket electronics, such as transceiver, stereos, and anti-theft devices, may radiate EMI into the control system if they are improperly installed. This may cause a false sensor reading and turn on the MIL (“Check Engine” lamp).

Environment

Temporary environmental conditions, such as localized flooding, will have an effect on the vehicle ignition system. If the ignition system is rain-soaked, it can temporarily cause engine misfire and turn on the MIL (“Check Engine” lamp).

Emissions Control Information Label

The engine compartment “Vehicle Emissions Control Information Label” contains important emission specifications and setting procedures. In the upper left corner is exhaust emission information. There is also an illustrated emission components and vacuum hose schematic.

This label is located in the engine compartment of every vehicle. If the label has been removed it should be replaced. It can be ordered from Isuzu Dealer ship.

Maintenance Schedule

Refer to the *Maintenance Schedule*.

Visual/Physical Engine Compartment Inspection

Perform a careful visual and physical engine compartment inspection when performing any diagnostic procedure or diagnosing the cause of an emission test failure. This can often lead to repairing a problem without further steps. Use the following guidelines when performing a visual/physical inspection:

- Inspect all vacuum hoses for pinches, cuts, disconnections, and proper routing.
- Inspect hoses that are difficult to see behind other components.
- Inspect all wires in the engine compartment for proper connections, burned or chafed spots, pinched wires, contact with sharp edges or contact with hot exhaust manifolds or pipes.

Basic Knowledge of Tools Required

NOTE: Lack of basic knowledge of this powertrain when performing diagnostic procedures could result in an incorrect diagnosis or damage to powertrain components. Do not attempt to diagnose a powertrain problem without this basic knowledge.

A basic understanding of hand tools is necessary to effectively use this section of the Service Manual.

Serial Data Communications

Class II Serial Data Communications

Government regulations require that all vehicle manufacturers establish a common communication system. This vehicle utilizes the “Class II” communication system. Each bit of information can have one of two lengths: long or short. This allows vehicle wiring to be reduced by transmitting and receiving multiple signals over a single wire. The messages carried on Class II data streams are also prioritized. If two messages attempt to establish communications on the data line at the same time, only the message with higher priority will continue. The device with the lower priority message must wait. The most significant result of this regulation is that it provides Tech 2 manufacturers with the capability to access data from any make or model vehicle that is sold.

The data displayed on the other Tech 2 will appear the same, with some exceptions. Some scan tools will only be able to display certain vehicle parameters as values that are a coded representation of the true or actual value. For more information on this system of coding, refer to *Decimal/Binary/Hexadecimal Conversions*. On this vehicle the Tech 2 displays the actual values for vehicle parameters. It will not be necessary to perform any conversions from coded values to actual values.

On-Board Diagnostic (OBD)

On-Board Diagnostic Tests

A diagnostic test is a series of steps, the result of which is a pass or fail reported to the diagnostic executive. When a diagnostic test reports a pass result, the diagnostic executive records the following data:

- The diagnostic test has been completed since the last ignition cycle.
- The diagnostic test has passed during the current ignition cycle.
- The fault identified by the diagnostic test is not currently active.

When a diagnostic test reports a fail result, the diagnostic executive records the following data:

- The diagnostic test has been completed since the last ignition cycle.
- The fault identified by the diagnostic test is currently active.
- The fault has been active during this ignition cycle.
- The operating conditions at the time of the failure.

Remember, a fuel trim DTC may be triggered by a list of vehicle faults. Make use of all information available (other DTCs stored, rich or lean condition, etc.) when diagnosing a fuel trim fault.

Comprehensive Component Monitor Diagnostic Operation

Input Components:

Input components are monitored for circuit continuity and out-of-range values. This includes rationality checking. Rationality checking refers to indicating a fault when the signal from a sensor does not seem reasonable, i.e. Throttle Position (TP) sensor that indicates high throttle position at low engine loads or MAP voltage. Input components may include, but are not limited to the following sensors:

- Vehicle Speed Sensor (VSS)
- Crankshaft Position (CKP) Sensor
- Knock Sensor (KS)
- Throttle Position (TP) Sensor
- Engine Coolant Temperature (ECT) Sensor
- Camshaft Position (CMP) Sensor
- Manifold Absolute Pressure (MAP) Sensor
- Mass Air Flow (MAF) Sensor

In addition to the circuit continuity and rationality check the ECT sensor is monitored for its ability to achieve a steady state temperature to enable closed loop fuel control.

Output Components:

Output components are diagnosed for proper response to control module commands. Components where functional monitoring is not feasible will be monitored for circuit continuity and out-of-range values if applicable. Output components to be monitored include, but are not limited to, the following circuit:

- Idle Air Control (IAC) Motor
- Control module controlled EVAP Canister Purge Valve
- Electronic Transmission controls
- A/C relays
- Cooling fan relay
- VSS output
- MIL control

Refer to PCM and Sensors in General Descriptions.

Passive and Active Diagnostic Tests

A passive test is a diagnostic test which simply monitors a vehicle system or component. Conversely, an active test, actually takes some sort of action when performing diagnostic functions, often in response to a failed passive test. For example, the EGR diagnostic active test will force the EGR valve open during closed throttle decel and/or force the EGR valve closed during a steady state. Either action should result in a change in manifold pressure.

Intrusive Diagnostic Tests

This is any on-board test run by the Diagnostic Management System which may have an effect on vehicle performance or emission levels.

Warm-Up Cycle

A warm-up cycle means that engine at temperature must reach a minimum of 70°C (160°F) and rise at least 22°C (40°F) over the course of a trip.

Freeze Frame

Freeze Frame is an element of the Diagnostic Management System which stores various vehicle information at the moment an emissions-related fault is stored in memory and when the MIL is commanded on. These data can help to identify the cause of a fault. Refer to *Storing And Erasing Freeze Frame Data* for more detailed information.

Failure Records

Failure Records data is an enhancement of the OBD II Freeze Frame feature. Failure Records store the same vehicle information as does Freeze Frame, but it will store that information for any fault which is stored in on-board memory, while Freeze Frame stores information only for emission-related faults that command the MIL on.

Common OBD Terms

Diagnostic

When used as a noun, the word diagnostic refers to any on-board test run by the vehicle's Diagnostic Management System. A diagnostic is simply a test run on a system or component to determine if the system or component is operating according to specification. There are many diagnostics, shown in the following list:

- Oxygen sensors
- Oxygen sensor heaters
- EGR

Enable Criteria

The term "enable criteria" is engineering language for the conditions necessary for a given diagnostic test to run. Each diagnostic has a specific list of conditions which must be met before the diagnostic will run. "Enable criteria" is another way of saying "conditions required". The enable criteria for each diagnostic is listed on the first page of the DTC description in Section 6E under the heading "Conditions for Setting the DTC". Enable criteria varies with each diagnostic, and typically includes, but is not limited to the following items:

- engine speed
- vehicle speed
- ECT
- MAF/MAP
- barometric pressure
- IAT

- TP
- TCC enabled
- A/C on

Trip

Technically, a trip is a key on-run-key off cycle in which all the enable criteria for a given diagnostic are met, allowing the diagnostic to run. Unfortunately, this concept is not quite that simple. A trip is official when all the enable criteria for a given diagnostic are met. But because the enable criteria vary from one diagnostic to another, the definition of trip varies as well. Some diagnostic are run when the vehicle is at operating temperature, some when the vehicle first starts up; some require that the vehicle be cruising at a steady highway speed, some run only when the vehicle is idle; some diagnostics function with the TCC disables. Some run only immediately following a cold engine start-up.

A trip then, is defined as a key on-run-key off cycle in which the vehicle was operated in such a way as to satisfy the enabling criteria for a given diagnostic, and this diagnostic will consider this cycle to be one trip. However, another diagnostic with a different set of enable criteria (which were not met) during this driving event, would not consider it a trip. No trip will occur for that particular diagnostic until the vehicle is driven in such a way as to meet all the enable criteria.

The Diagnostic Executive

The Diagnostic Executive is a unique segment of software which is designed to coordinate and prioritize the diagnostic procedures as well as define the protocol for recording and displaying their results. The main responsibilities of the Diagnostic Executive are listed as follows:

- Commanding the MIL ("Check Engine" lamp) on and off
- DTC logging and clearing
- Freeze Frame data for the first emission related DTC recorded
- Non-emission related Service Lamp (future)
- Operating conditions Failure Records buffer, (the number of records will vary)
- Current status information on each diagnostic
- System Status (I/M ready)

The Diagnostic Executive records DTCs and turns on the MIL when emission-related faults occur. It can also turn off the MIL if the conditions cease which caused the DTC to set.

Diagnostic Information

The diagnostic charts and functional checks are designed to locate a faulty circuit or component through a process of logical decisions. The charts are prepared with the requirement that the vehicle functioned correctly at the time of assembly and that there are no multiple faults present.

There is a continuous self-diagnosis on certain control functions. This diagnostic capability is complemented by the diagnostic procedures contained in this manual. The language of communicating the source of the malfunction is a system of diagnostic trouble codes. When a malfunction is detected by the control module, a diagnostic trouble code is set and the Malfunction Indicator Lamp (MIL) ("Check Engine" lamp) is illuminated.

Malfunction Indicator Lamp (MIL)

The Malfunction Indicator Lamp (MIL) looks the same as the MIL you are already familiar with ("Check Engine" lamp). However, OBD requires that it illuminate under a strict set of guide lines.

Basically, the MIL is turned on when the PCM detects a DTC that will impact the vehicle emissions.

The MIL is under the control of the Diagnostic Executive. The MIL will be turned on if an emissions-related diagnostic test indicates a malfunction has occurred. It will stay on until the system or component passes the same test, for three consecutive trips, with no emission related faults.

Extinguishing the MIL

When the MIL is on, the Diagnostic Executive will turn off the MIL after *three(3) consecutive* trips that a "test passed" has been reported for the diagnostic test that originally caused the MIL to illuminate.

Although the MIL has been turned off, the DTC will remain in the PCM memory (both Freeze Frame and Failure Records) until *forty(40) warm-up cycles after no faults* have been completed.

If the MIL was set by either a fuel trim or misfire-related DTC, additional requirements must be met. In addition to the requirements stated in the previous paragraph, these requirements are as follows:

- The diagnostic tests that are passed must occur with 375 RPM of the RPM data stored at the time the last test failed.
- Plus or minus ten (10) percent of the engine load that was stored at the time the last failed.
- Similar engine temperature conditions (warmed up or warming up) as those stored at the time the last test failed.

Meeting these requirements ensures that the fault which turned on the MIL has been corrected.

The MIL ("Check Engine" lamp) is on the instrument panel and has the following functions:

- It informs the driver that a fault that affects vehicle emission levels has occurred and that the vehicle should be taken for service as soon as possible.
- As a bulb and system check, the MIL will come "ON" with the key "ON" and the engine not running. When the engine is started, the MIL will turn "OFF."
- When the MIL remains "ON" while the engine is running, or when a malfunction is suspected due to a driveability or emissions problem, a Powertrain On-Board Diagnostic (OBD) System Check must be performed. The procedures for these checks are given in On-Board Diagnostic (OBD) System Check. These checks will expose faults which may not be detected if other diagnostics are performed first.

DTC Types

Each DTC is directly related to a diagnostic test. The Diagnostic Management System sets DTC based on the failure of the tests during a trip or trips. Certain tests must fail two (2) consecutive trips before the DTC is set. The following are the four (4) types of DTCs and the characteristics of those codes:

- Type A
 - Emissions related
 - Requests illumination of the MIL of the first trip with a fail
 - Stores a History DTC on the first trip with a fail
 - Stores a Freeze Frame (if empty)
 - Stores a Fail Record
 - Updates the Fail Record each time the diagnostic test fails
 - Type B
 - Emissions related
 - “Armed” after one (1) trip with a fail
 - “Disarmed” after one (1) trip with a pass
 - Requests illumination of the MIL on the *second consecutive trip* with a fail
 - Stores a History DTC on the second consecutive trip with a fail (The DTC will be armed after the first fail)
 - Stores a Freeze Frame on the second consecutive trip with a fail (if empty)
 - Stores a Fail Record when the first test fails (not dependent on *consecutive trip* fails)
 - Updates the Fail Record each time the diagnostic test fails
- (Some special conditions apply to misfire and fuel trim DTCs)
- Type C (if the vehicle is so equipped)
 - Non-Emissions related
 - Requests illumination of the Service Lamp or the service message on the Drive Information Center (DIC) on the *first trip* with a fail
 - Stores a History DTC on the *first trip* with a fail
 - *Does not* store a Freeze Frame
 - Stores Fail Record when test fails
 - Updates the Fail Record each time the diagnostic test fails
 - Type D (*Type D* non-emissions related are not utilized on certain vehicle applications).
 - Non-Emissions related
 - Does not request illumination of any lamp
 - Stores a History DTC on the *first trip* with a fail
 - *Does not* store a Freeze Frame
 - Stores Fail Record when test fails
 - Updates the Fail Record each time the diagnostic test fails

Only four Fail Records can be stored. Each Fail Record is for a different DTC. It is possible that there will not be Fail Records for every DTC if multiple DTCs are set.

Storing and Erasing Freeze Frame Data and Failure Records

Government regulations require that engine operating conditions be captured whenever the MIL is illuminated. The data captured is called Freeze Frame data. The Freeze Frame data is very similar to a single record of operating conditions. Whenever the MIL is illuminated, the corresponding record of operating conditions is recorded to the Freeze Frame buffer.

Freeze Frame data can only be overwritten with data associated with a misfire or fuel trim malfunction. Data from these faults take precedence over data associated with any other fault. The Freeze Frame data will not be erased unless the associated history DTC is cleared.

Each time a diagnostic test reports a failure, the current engine operating conditions are recorded in the *Failure Records* buffer. A subsequent failure will update the recorded operating conditions. The following operating conditions for the diagnostic test which failed *typically* include the following parameters:

- Air Fuel Ratio
- Air Flow Rate
- Engine Speed
- Engine Load
- Engine Coolant Temperature
- Vehicle Speed
- TP
- MAP/BARO
- Injector Base Pulse Width
- Loop Status

Intermittent Malfunction Indicator Lamp

In the case of an “intermittent” fault, the MIL (“Check Engine” lamp) may illuminate and then (after three trips) go “OFF”. However, the corresponding diagnostic trouble code will be stored in the memory. When unexpected diagnostic trouble codes appear, check for an intermittent malfunction.

A diagnostic trouble code may reset. Consult the “Diagnostic Aids” associated with the diagnostic trouble code. A physical inspection of the applicable sub-system most often will resolve the problem.

Data Link Connector (DLC)

The provision for communication with the control module is the Data Link Connector (DLC). It is located at the lower left of the instrument panel. The DLC is used to connect to the Tech 2 Scan Tool. Some common uses of the Tech 2 are listed below:

- Identifying stored Diagnostic Trouble Codes (DTCs).
- Clearing DTCs.
- Performing output control tests.

- Reading serial data.

TS24064

To clear Diagnostic Trouble Codes (DTCs), use the diagnostic Scan Tool “clear DTCs” or “clear information” function. When clearing DTCs follow instructions supplied by the tool manufacturer.

When a Tech 2 is not available, DTCs can also be cleared by disconnecting *one* of the following sources for at least thirty (30) seconds.

NOTE: To prevent system damage, the ignition key must be “OFF” when disconnecting or reconnecting battery power.

- The power source to the control module. Examples: fuse, pigtail at battery PCM connectors etc.
- The negative battery cable. (Disconnecting the negative battery cable will result in the loss of other on-board memory data, such as preset radio tuning).

Verifying Vehicle Repair

Verification of vehicle repair will be more comprehensive for vehicles with OBD II system diagnostic. Following a repair, the technician should perform the following steps:

1. Review and record the Fail Records and/or Freeze Frame data for the DTC which has been diagnosed (Freeze Frame data will only be stored for an A or B type diagnostic and only if the MIL has been requested).
2. Clear DTC(s).
3. Operate the vehicle within conditions noted in the Fail Records and/or Freeze Frame data.
4. Monitor the DTC status information for the DTC which has been diagnosed until the diagnostic test associated with that DTC runs.

Following these steps are very important in verifying repairs on OBD systems. Failure to follow these steps could result in unnecessary repairs.

Reading Diagnostic Trouble Codes Using the TECH 2 Scan Tool

The procedure for reading diagnostic trouble code(s) is to use a diagnostic Scan Tool. When reading DTC(s), follow instructions supplied by tool manufacturer.

For the 1998 model year, Isuzu dealer service departments will continue to use Tech 2.

Clearing Diagnostic Trouble Codes

IMPORTANT: Do not clear DTCs unless directed to do so by the service information provided for each diagnostic procedure. When DTCs are cleared, the Freeze Frame and Failure Record data which may help diagnose an intermittent fault will also be erased from memory.

If the fault that caused the DTC to be stored into memory has been corrected, the Diagnostic Executive will begin to count the “warm-up” cycles with no further faults detected, the DTC will automatically be cleared from the PCM memory.

Tech 2

From 98 MY, Isuzu dealer service departments are recommended to use the Tech 2 Scan Tool. Please refer to the Tech 2 user guide.

Legend

- | | |
|--------------------------------|-----------------------|
| (1) PCMCIA Card | (3) SAE 16/19 Adaptor |
| (2) RS 232 Loop Back Connector | (4) DLC Cable |
| | (5) Tech-2 |

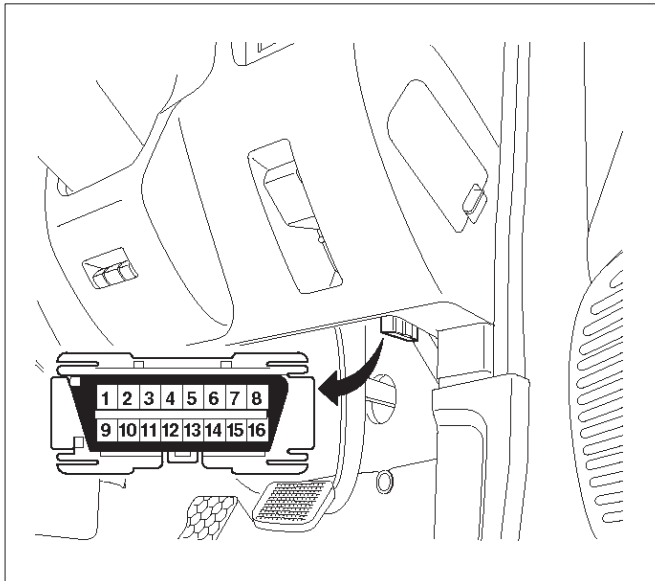

Tech 2 Features

1. Tech 2 is a 12 volt system. Do not apply 24 volt.
2. After connecting and/or installing, the Vehicle Communications Interface (VCI) module, PCMCIA card and DLC connector to the Tech 2, connect the tool to the vehicle DLC.
3. Make sure the Tech 2 is powered OFF when removing or installing the PCMCIA card.
4. The PCMCIA card has a capacity of 10 Megabytes which is 10 times greater than the memory of the Tech 1 Mass Storage Cartridge.
5. The Tech 2 has the capability of two snapshots.
6. The PCMCIA card is sensitive to magnetism and static electricity, so care should be taken in the handling of the card.
7. The Tech 2 can plot a graph when replaying a snapshot.
8. Always return to the Main Menu by pressing the EXIT key several times before shutting down.

9. To clear Diagnostic Trouble Codes (DTCs), open Application Menu and press "F1: Clear DTC Info".

Getting Started

- Before operating the Isuzu PCMCIA card with the Tech 2, the following steps must be performed:
 1. The Isuzu 99 System PCMCIA card (1) inserts into the Tech 2 (5).
 2. Connect the SAE 16/19 adapter (3) to the DLC cable (4).
 3. Connect the DLC cable to the Tech 2 (5)
 4. Make sure the vehicle ignition is off.
 5. Connect the Tech 2 SAE 16/19 adapter to the vehicle DLC.

810RW317

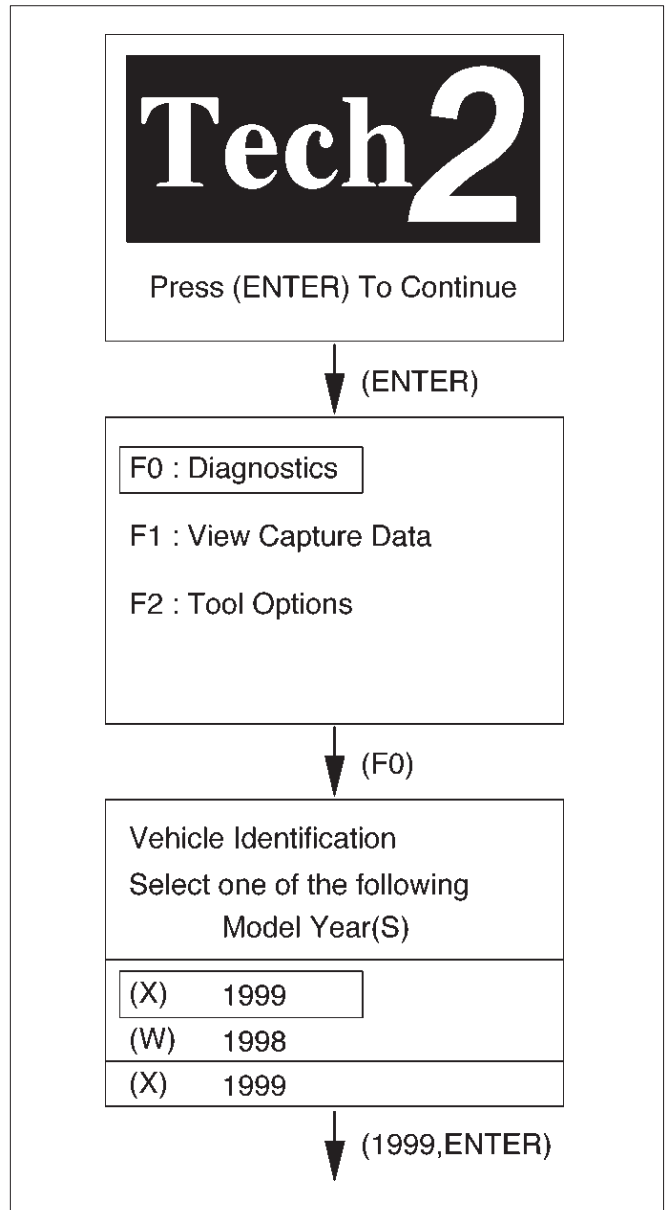

6. Turn on the vehicle ignition.
7. Power the Tech 2 ON and Verify the Tech 2 power up display.

060RW009

Operating Procedure (For Example)

The power up screen is displayed when you power up the tester with the Isuzu systems PCMCIA card. Follow the operating procedure below.

060RX060

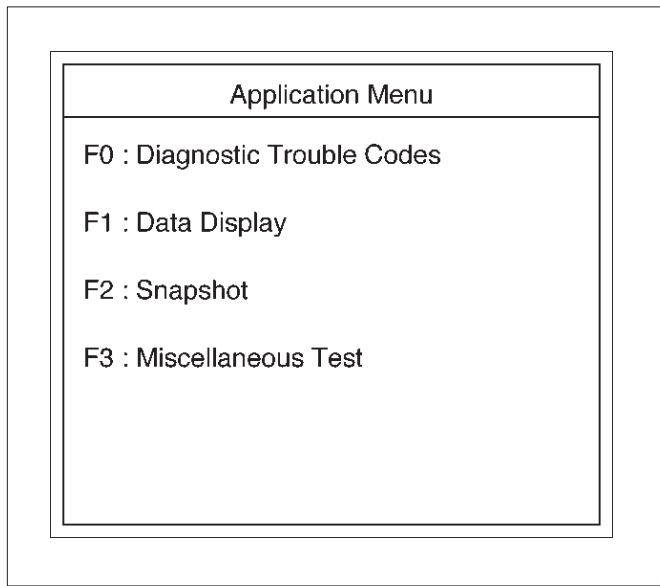

NOTE: The RS232 Loop back connector is only to use for diagnosis of Tech 2. Refer to user guide of the Tech 2.

060RX086

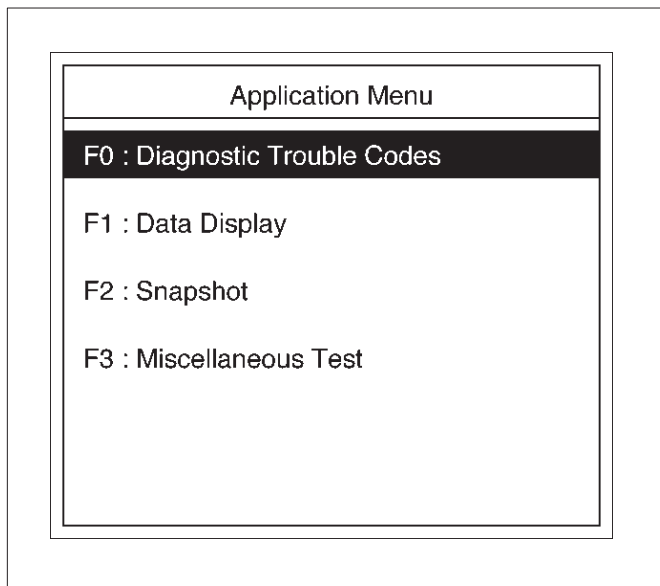

Menu

- The following table shows which functions are used for the available equipment versions.

060RW224

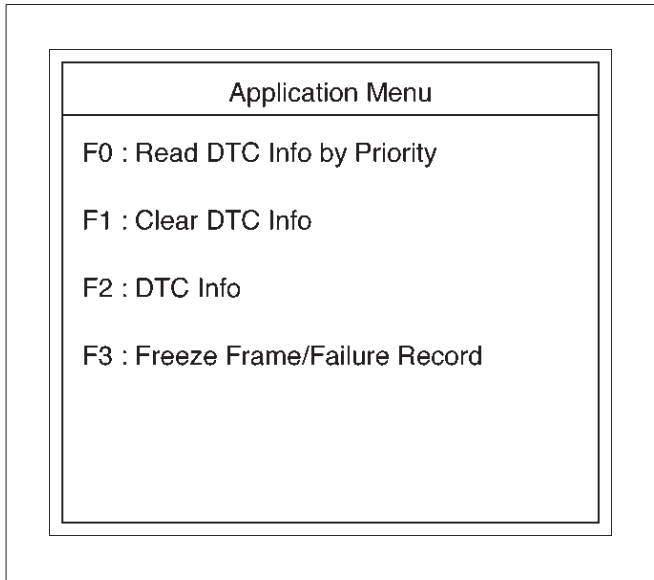

DTC Modes

060RW229

On OBD II vehicles there are five options available in Tech 2 DTC mode to display the enhanced information available. After selecting DTC, the following menu appears:

- DTC Info
- Freeze Frame
- Fail Records (not all applications)
- Clear Info

060RW223

The following is a brief description of each of the sub menus in DTC Info and DTC. The order in which they appear here is alphabetical and not necessarily the way they will appear on the Tech 2.

DTC Information Mode

Use the DTC info mode to search for a specific type of stored DTC information. There are six choices. The service manual may instruct the technician to test for DTCs in a certain manner. Always follow published service procedures.

060RW221

DTC Status

This selection will display any DTCs that have not run during the current ignition cycle or have reported a test failure during this ignition up to a maximum of 33 DTCs. DTC tests which run and pass will cause that DTC number to be removed from Tech 2 screen.

Fail This Ignition

This selection will display all DTCs that have failed during the present ignition cycle.

History

This selection will display only DTCs that are stored in the PCM's history memory. It will display all type A and B DTCs that have requested the MIL and have failed within the last 40 warm-up cycles. In addition, it will display all type C and type D DTCs that have failed within the last 40 warm-up cycles.

Last Test Failed

This selection will display only DTCs that have failed the last time the test ran. The last test may have run during a previous ignition cycle if a type A or type B DTC is displayed. For type C and type D DTCs, the last failure must have occurred during the current ignition cycle to appear as Last Test Fail.

MILSVC or Message Request

This selection will display only DTCs that are requesting the MIL. Type C and type D DTCs cannot be displayed using this option. This selection will report type B DTCs only after the MIL has been requested.

Not Run Since Code Cleared

This option will display up to 33 DTCs that have not run since the DTCs were last cleared. Since any displayed DTCs have not run, their condition (passing or failing) is unknown.

Test Failed Since Code Cleared

This selection will display all active and history DTCs that have reported a test failure since the last time DTCs were cleared. DTCs that last failed more than 40 warm-up cycles before this option is selected will not be displayed.

Miscellaneous Test

This test consists of eight menus-Lights, Relays, EVAP, IAC System, Fuel System, EGR Control, Variable Intake Manifold Solenoid, and Injector Balance Tests.

In these tests, Tech 2 sends operating signals to the systems to confirm their operations thereby to judge the normality of electric circuit.

To judge intermittent trouble,

1. Confirm DTC freeze frame data, and match the freeze frame data as test conditions with the data list displayed by Miscellaneous Test.
2. Confirm DTC setting conditions, and match the setting conditions as test conditions with the data list displayed by Miscellaneous Test.
3. Refer to the latest Service Bulletin.

Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM.

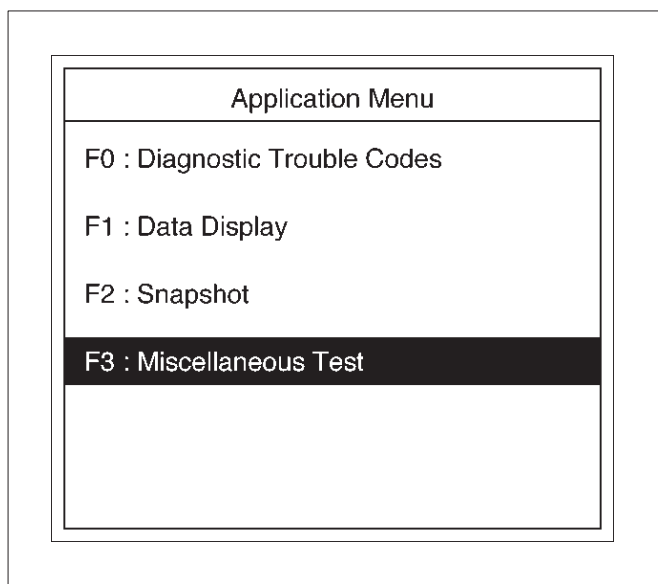

Lamps Test

This test is conducted check MIL and Low Fuel Lamp for its working.

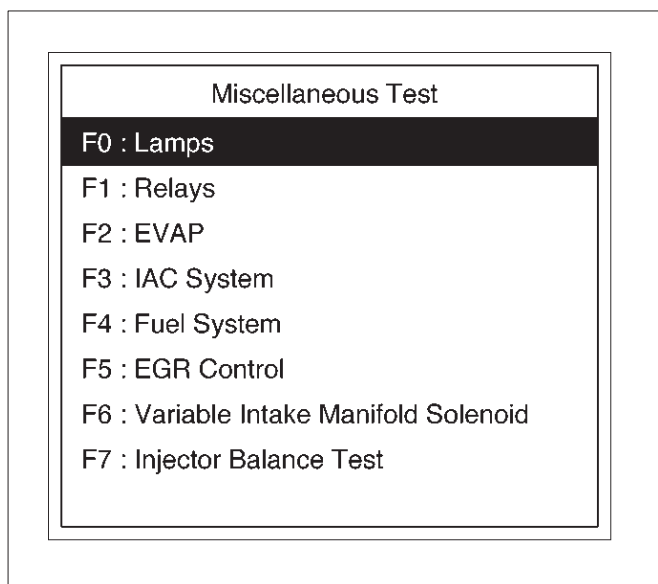

Tech2 must be used for this test.

Test Procedure:

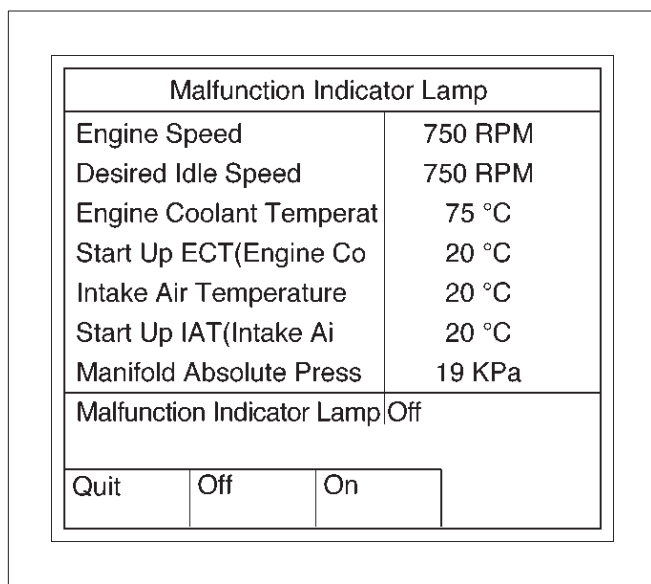

1. Connect Tech 2 to the vehicle DLC.
2. Run the Engine at idle.
3. Select F3: Miscellaneous Test in the Application Menu.

4. Select F0:Lamps Test in the Miscellaneous Test.

5. Select F0:Malfunction Indicator Lamp.

6. Push "On" soft key.
 7. Make sure Lamp illuminates.
 8. If lamp illuminates, the Lamp is operating correctly.
- F1: Low Fuel Lamp is not used.

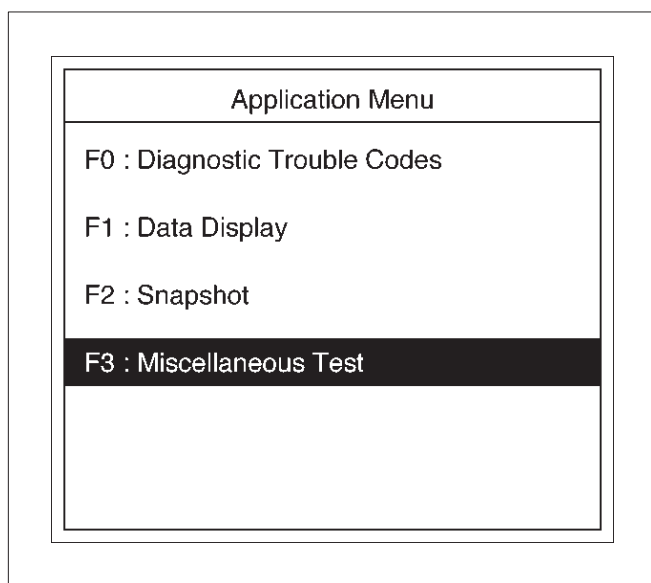

Relays Test

This test is conducted to check Fuel Pump Relay and A/C Clutch for proper operation.

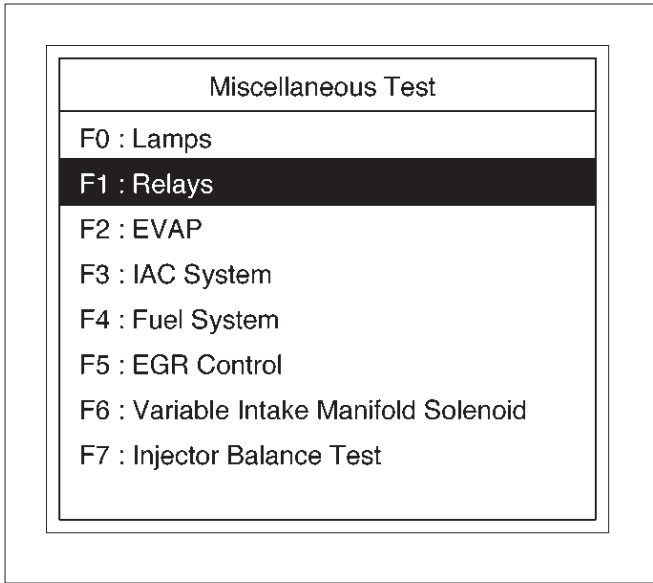

Tech 2 must be used for this test.

Test Procedure:

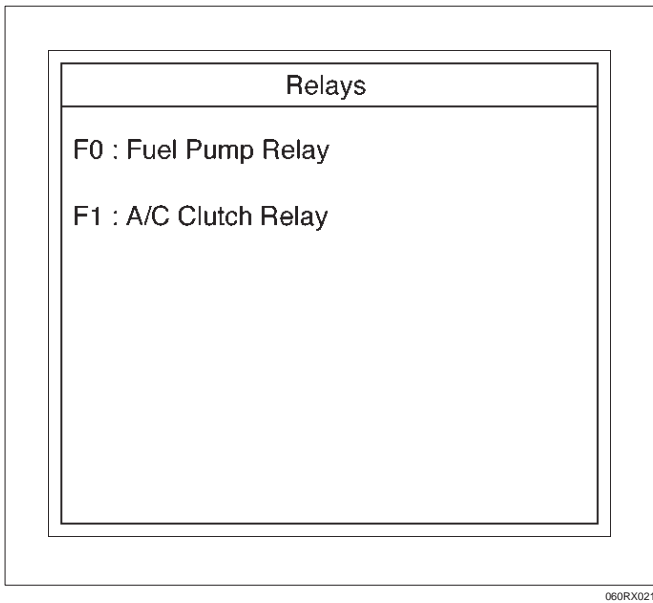

1. Connect Tech 2 to the vehicle DLC.
2. Ignition SW is "On".
3. Select F3: Miscellaneous Test in the Application Menu.

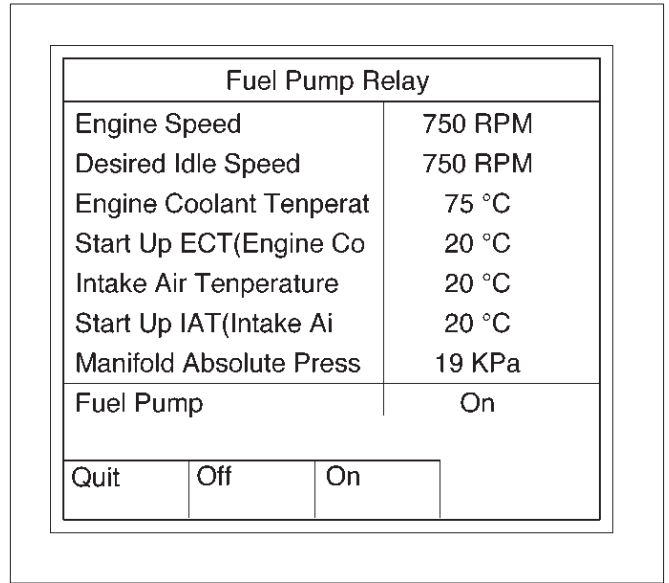

4. Select F1:Relay Test in the Miscellaneous Test.

5. Select F0:Fuel Pump Relay.

6. Push "On" soft key.

7. Control Fuel Pump Relay and check data list.

8. If the data list changes, the Fuel Pump Relay is normal.

9. Select F1:A/C Clutch Relay.

10. *Run the Engine at idle.

11. Turn on Air Conditioning.

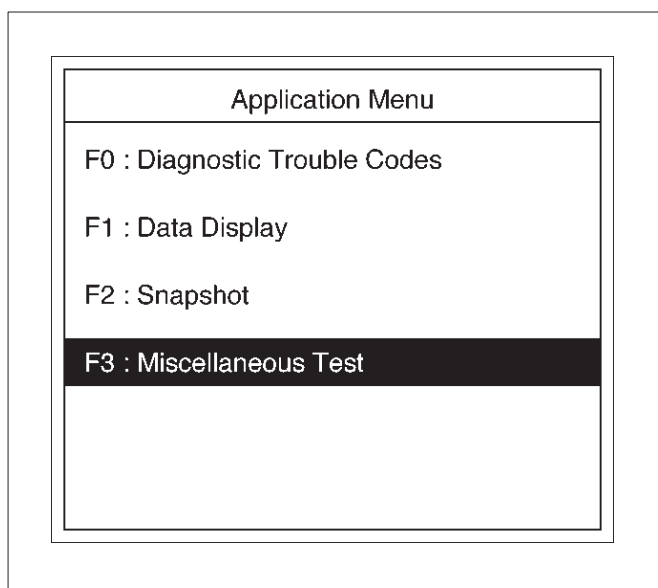

12. Push "On" and "Off" soft keys.
13. Control A/C Clutch Relay and check data list.
14. If the data list changes, the A/C Clutch Relay is normal.

EVAP Test

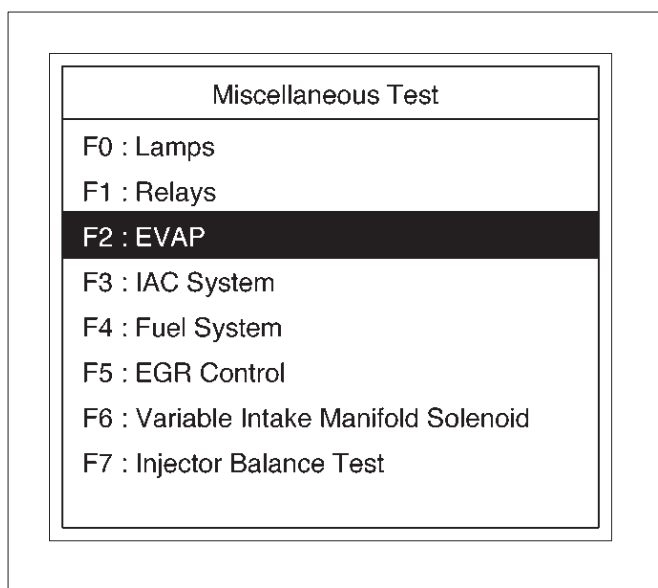

This test is conducted check EVAP system for its working. Tech 2 must be used for this test.

Test Procedure:

1. Connect Tech 2 to the vehicle DLC.
2. Run the Engine at idle.
3. Select F3: Miscellaneous Test in the Application Menu.

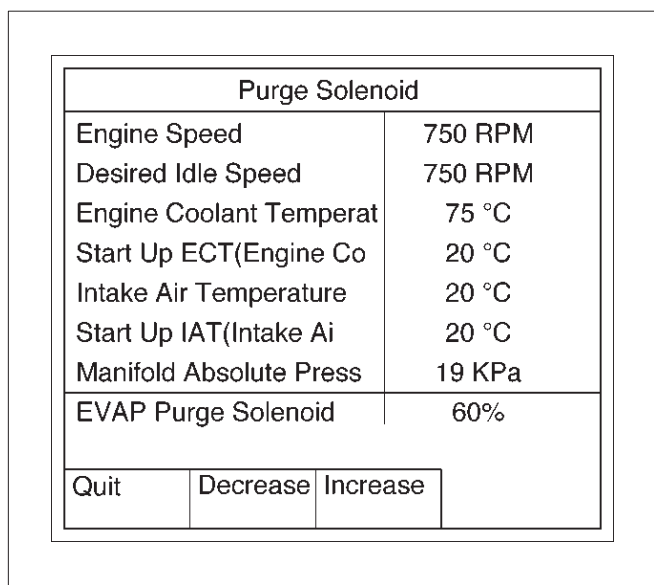

4. Select F2:EVAP Test in the Miscellaneous Test.

5. Select F0: Purge Solenoid.

6. Push "Decrease" or "Increase" soft key.

7. Control EVAP Purge Solenoid and check data list.
8. If the data list changes, the Purge Solenoid is normal. F1: Vent Solenoid is not used.

Idle Air Control System Test

This test is conducted to check IAC system for proper operation.

Tech 2 must be used for this test.

Test Procedure:

1. Connect Tech 2 to the vehicle DLC.
2. Run the Engine at idle.

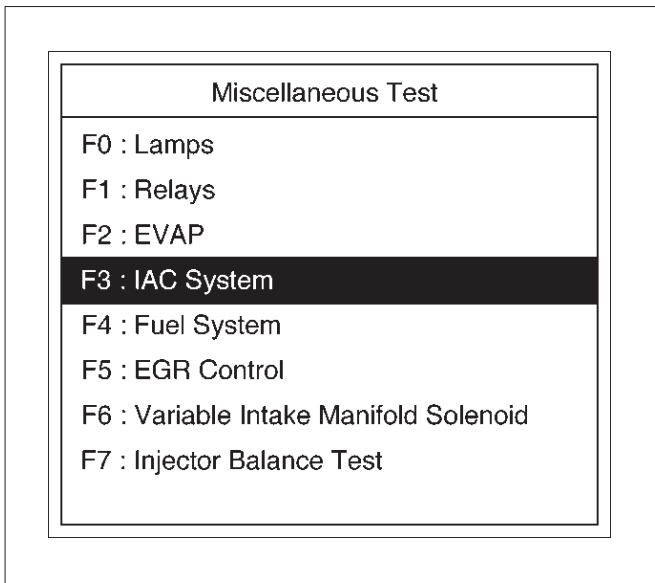

6E2-38 6VD1 3.2L ENGINE DRIVEABILITY AND EMISSIONS

3. Select F3: Miscellaneous Test in the Application Menu.

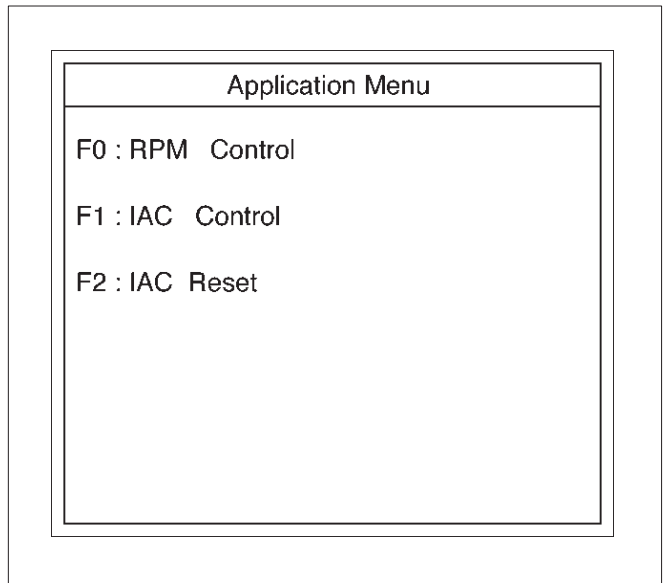

060RW228

4. Select F3: IAC System Test in the Miscellaneous Test.

060RX007

5. Select F1: IAC Control Test.

060RW235

6. Push "Increase" or "Decrease" soft key.
7. Instruct IAC system and check data list.

060RX015

8. If the data list changes, the IAC control is normal.

9. Select F0: RPM Control Test

RPM Control	
Engine Speed	1000 RPM
Desired Idle Speed	1000 RPM
Engine Coolant Temperat	75 °C
Start Up ECT(Engine Co	20 °C
Intake Air Temperature	20 °C
Start Up IAT(Intake Ai	20 °C
Manifold Absolute Press	19 KPa
Desired Idle Speed	750 RPM
Quit	Decrease Increase

060RX016

10. Push "Increase" or "Decrease" soft key.
11. Control RPM and check data list.
12. If the data list changes, the RPM control is normal.
13. Select F2: IAC Reset.
14. Push "Reset IAC" soft key.
15. Control IAC Reset and check data list.
16. If data list changes, the IAC has been Reset.

IAC Reset	
Engine Speed	750 RPM
Desired Idle Speed	750 RPM
Engine Coolant Temperat	75 °C
Start Up ECT(Engine Co	20 °C
Intake Air Temperature	20 °C
Start Up IAT(Intake Ai	20 °C
Manifold Absolute Press	19 KPa
Idle Air Control	21 Steps
Quit	Reset IAC

060RW231-1

Fuel System Test

This test is conducted check Fuel Level Gauge for proper operation.

Tech 2 must be used for this test.

Test Procedure:

1. Connect Tech 2 to the vehicle DLC.
2. Ignition SW is "On".
3. Select F3: Miscellaneous Test in the Application Menu.

Application Menu
F0 : Diagnostic Trouble Codes
F1 : Data Display
F2 : Snapshot
F3 : Miscellaneous Test

060RW228

4. Select F4: Fuel System in the Miscellaneous Menu.

Miscellaneous Test
F0 : Lamps
F1 : Relays
F2 : EVAP
F3 : IAC System
F4 : Fuel System
F5 : EGR Control
F6 : Variable Intake Manifold Solenoid
F7 : Injector Balance Test

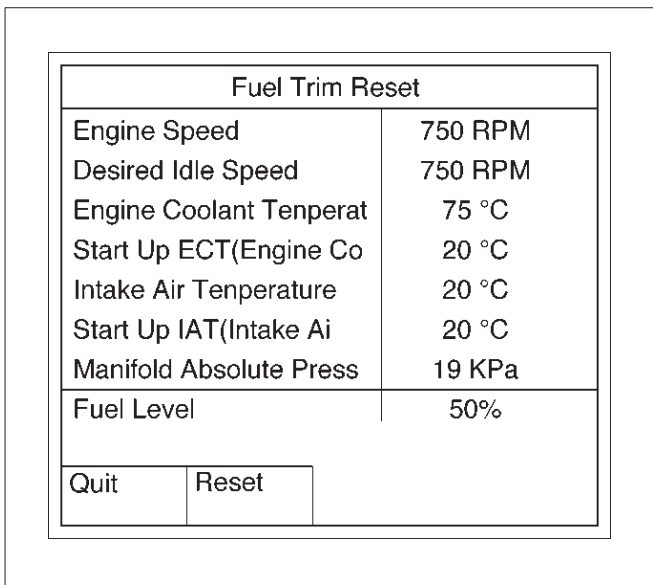

060RX032

5. Select F0: Fuel Trim Reset.

060RX028

F1: Fuel Gauge Level is not used.
6. Push "Reset" soft key.

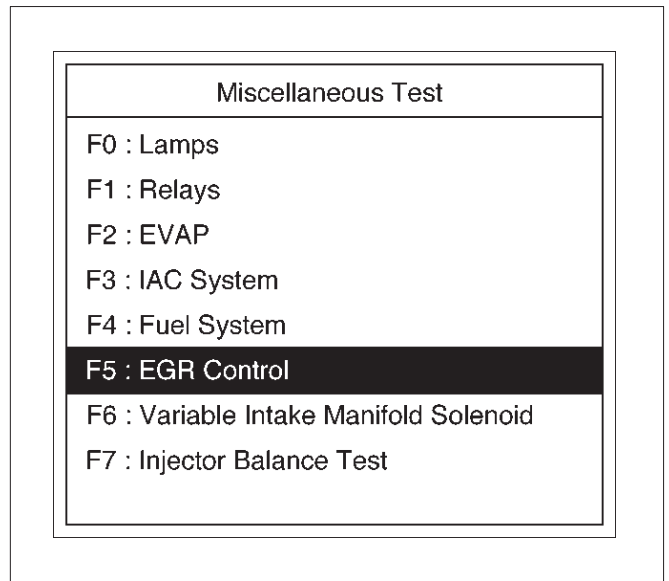

060RX029

3. Select F3: Miscellaneous Test in the Application Menu.

060RW228

4. Select F5: EGR Control Test in the Miscellaneous Test.

060RX008

EGR Control Test

This test is conducted check EGR valve for proper operation.

Tech 2 must be used for this test.

Test Procedure:

1. Connect Tech 2 to the vehicle DLC.
2. Run the Engine at idle.

5. Control EGR Valve and check data list.

EGR Control	
Engine Speed	750 RPM
Desired Idle Speed	750 RPM
Engine Coolant Temperat	75 °C
Start Up ECT(Engine Co	20 °C
Intake Air Temperature	20 °C
Start Up IAT(Intake Ai	20 °C
Manifold Absolute Press	19 KPa
Desired EGR Position	0%
Quit	Decrease Increase

060RX017

6. If data list changes, the EGR Control is normal.

4. Select F6: Variable Intake Manifold Solenoid Test.

Miscellaneous Test
F0 : Lamps
F1 : Relays
F2 : EVAP
F3 : IAC System
F4 : Fuel System
F5 : EGR Control
F6 : Variable Intake Manifold Solenoid
F7 : Injector Balance Test

060RX033

5. Push "On" or "Off" soft key.

Variable Intake Manifold Solenoid Test

This test is conducted check VIM Solenoid for proper operation.

Tech 2 must be used for this test.

Test Procedure:

1. Connect Tech 2 to the vehicle DLC.
2. Ignition SW is "On".
3. Select F3: Miscellaneous Test in the Application Menu.

Application Menu
F0 : Diagnostic Trouble Codes
F1 : Data Display
F2 : Snapshot
F3 : Miscellaneous Test

060RW228

Fuel System
F0 : Fuel Trim Reset
F1 : Fuel Gauge Level

060RX028

6. Control VIM Solenoid and check data list.

7. If data list changes, the VIM Solenoid is normal.

Injector Balance Test

This test is conducted to make sure the appropriate electric signals are being sent to injectors Nos. 1-6. Tech 2 must be used for this test.

Test Procedure:

1. Connect Tech 2 to the vehicle DLC.
2. Run the Engine at idle.

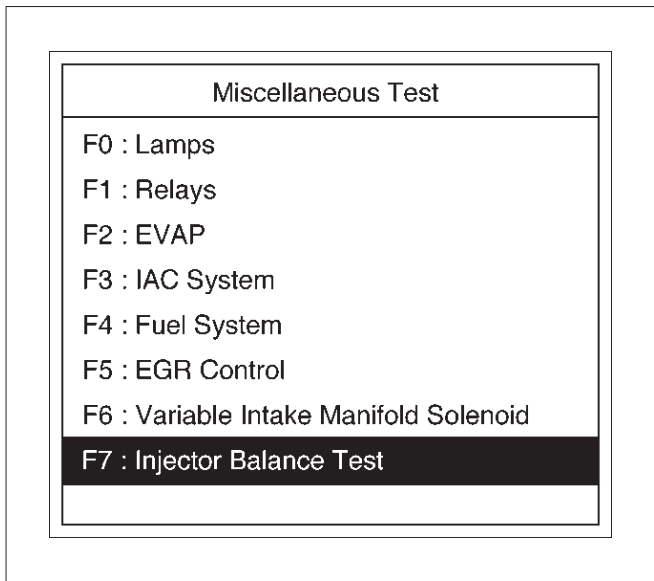

6E2-42 6VD1 3.2L ENGINE DRIVEABILITY AND EMISSIONS

3. Select F3: Miscellaneous Test in the Application Menu.

060RW228

4. Select F7: Injector Balance Test in the Miscellaneous Test.

060RX006

5. Select injector number and push "injector off" of soft key.

060RW230-1

6. Make sure of engine speed change.

7. If engine speed changes, the injector electric circuit is normal.

If engine speed does not changes, the injector electric circuit or the injector itself is not normal.

Plotting Snapshot Graph

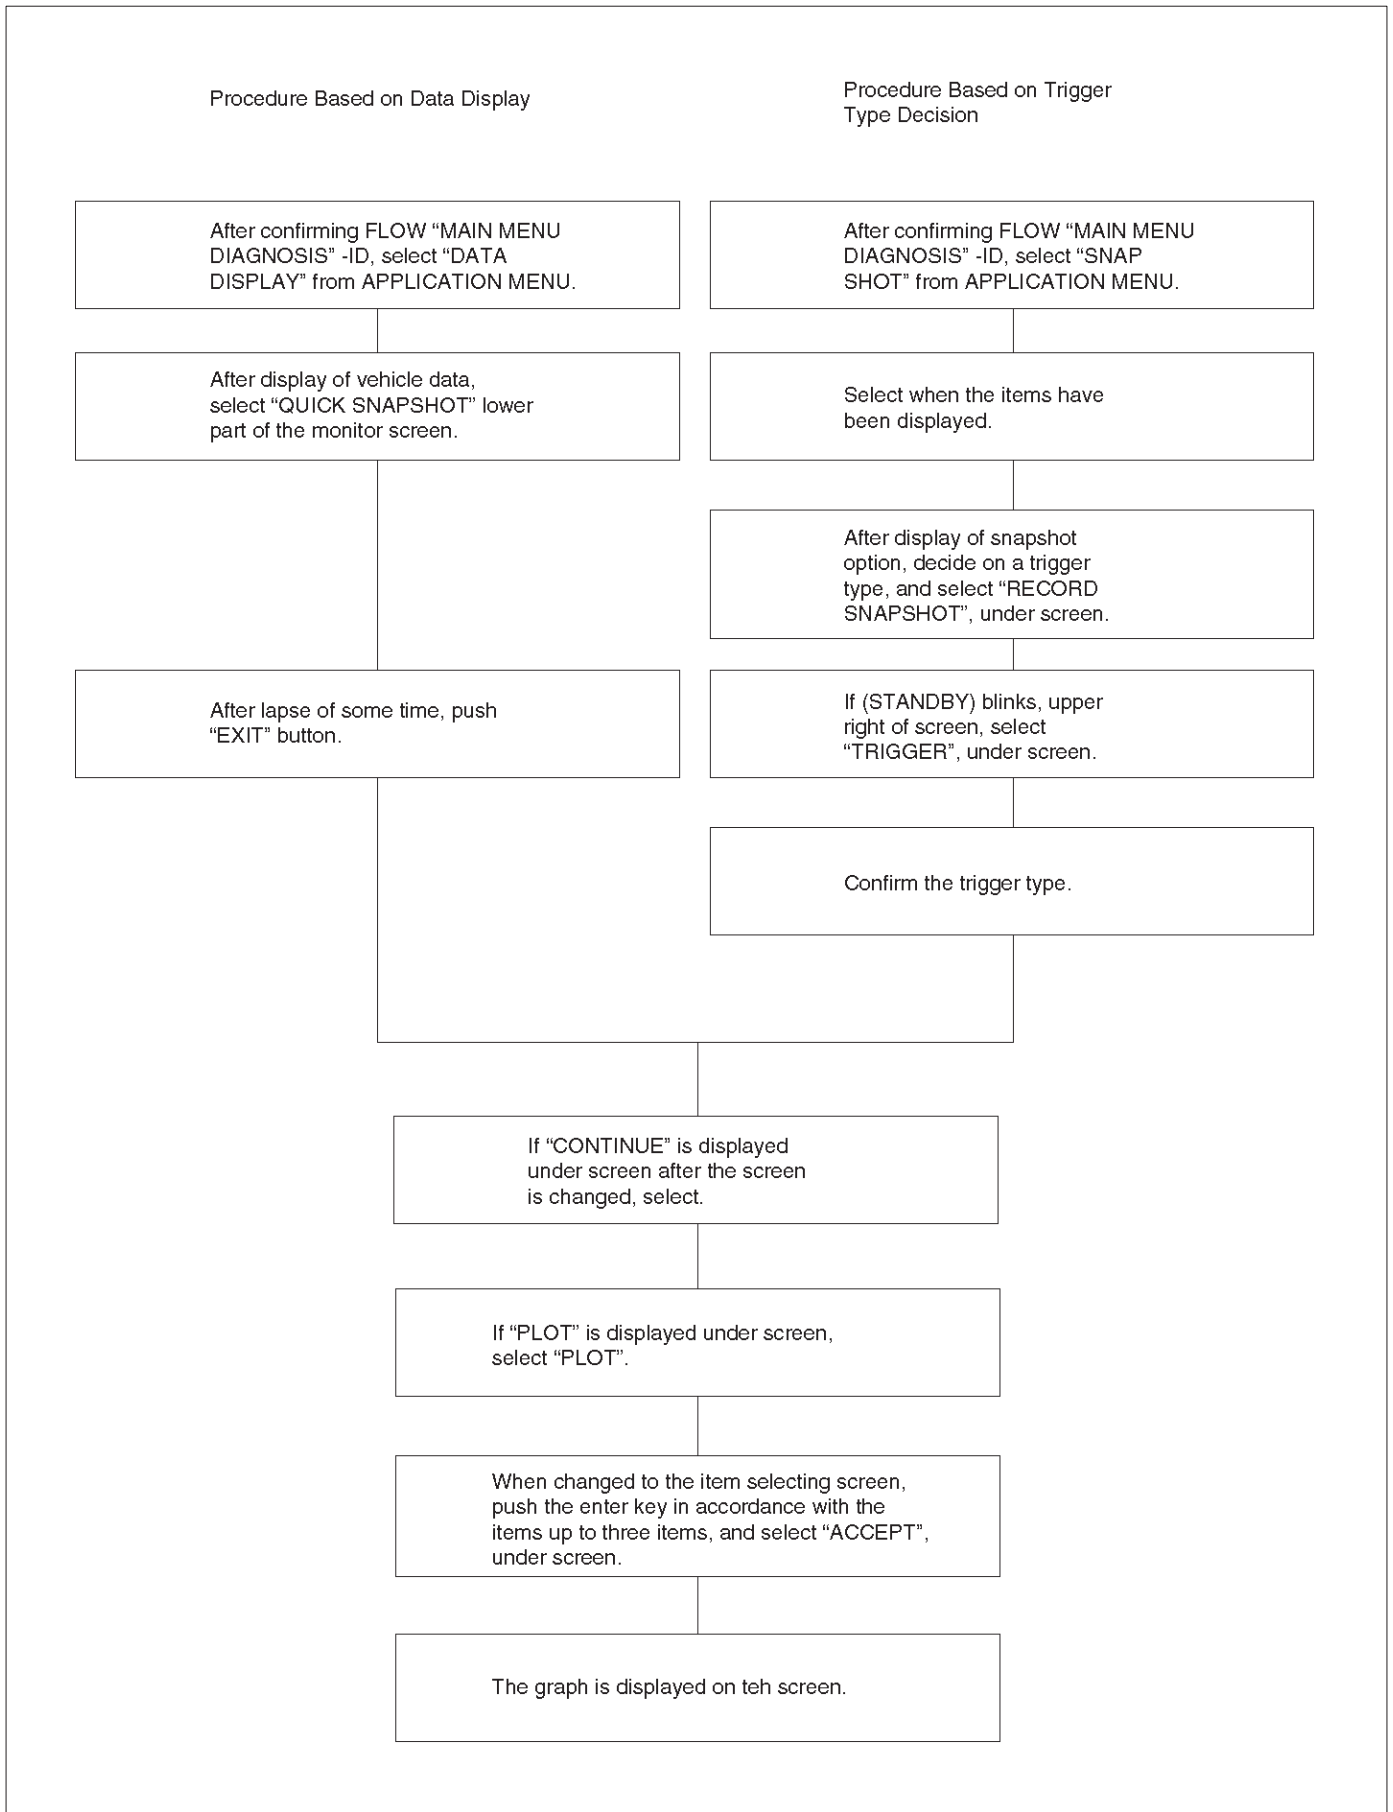

This test selects several necessary items from the data list to plot graphs and makes data comparison on a long term basis. It is an effective test particularly in emission related evaluations.

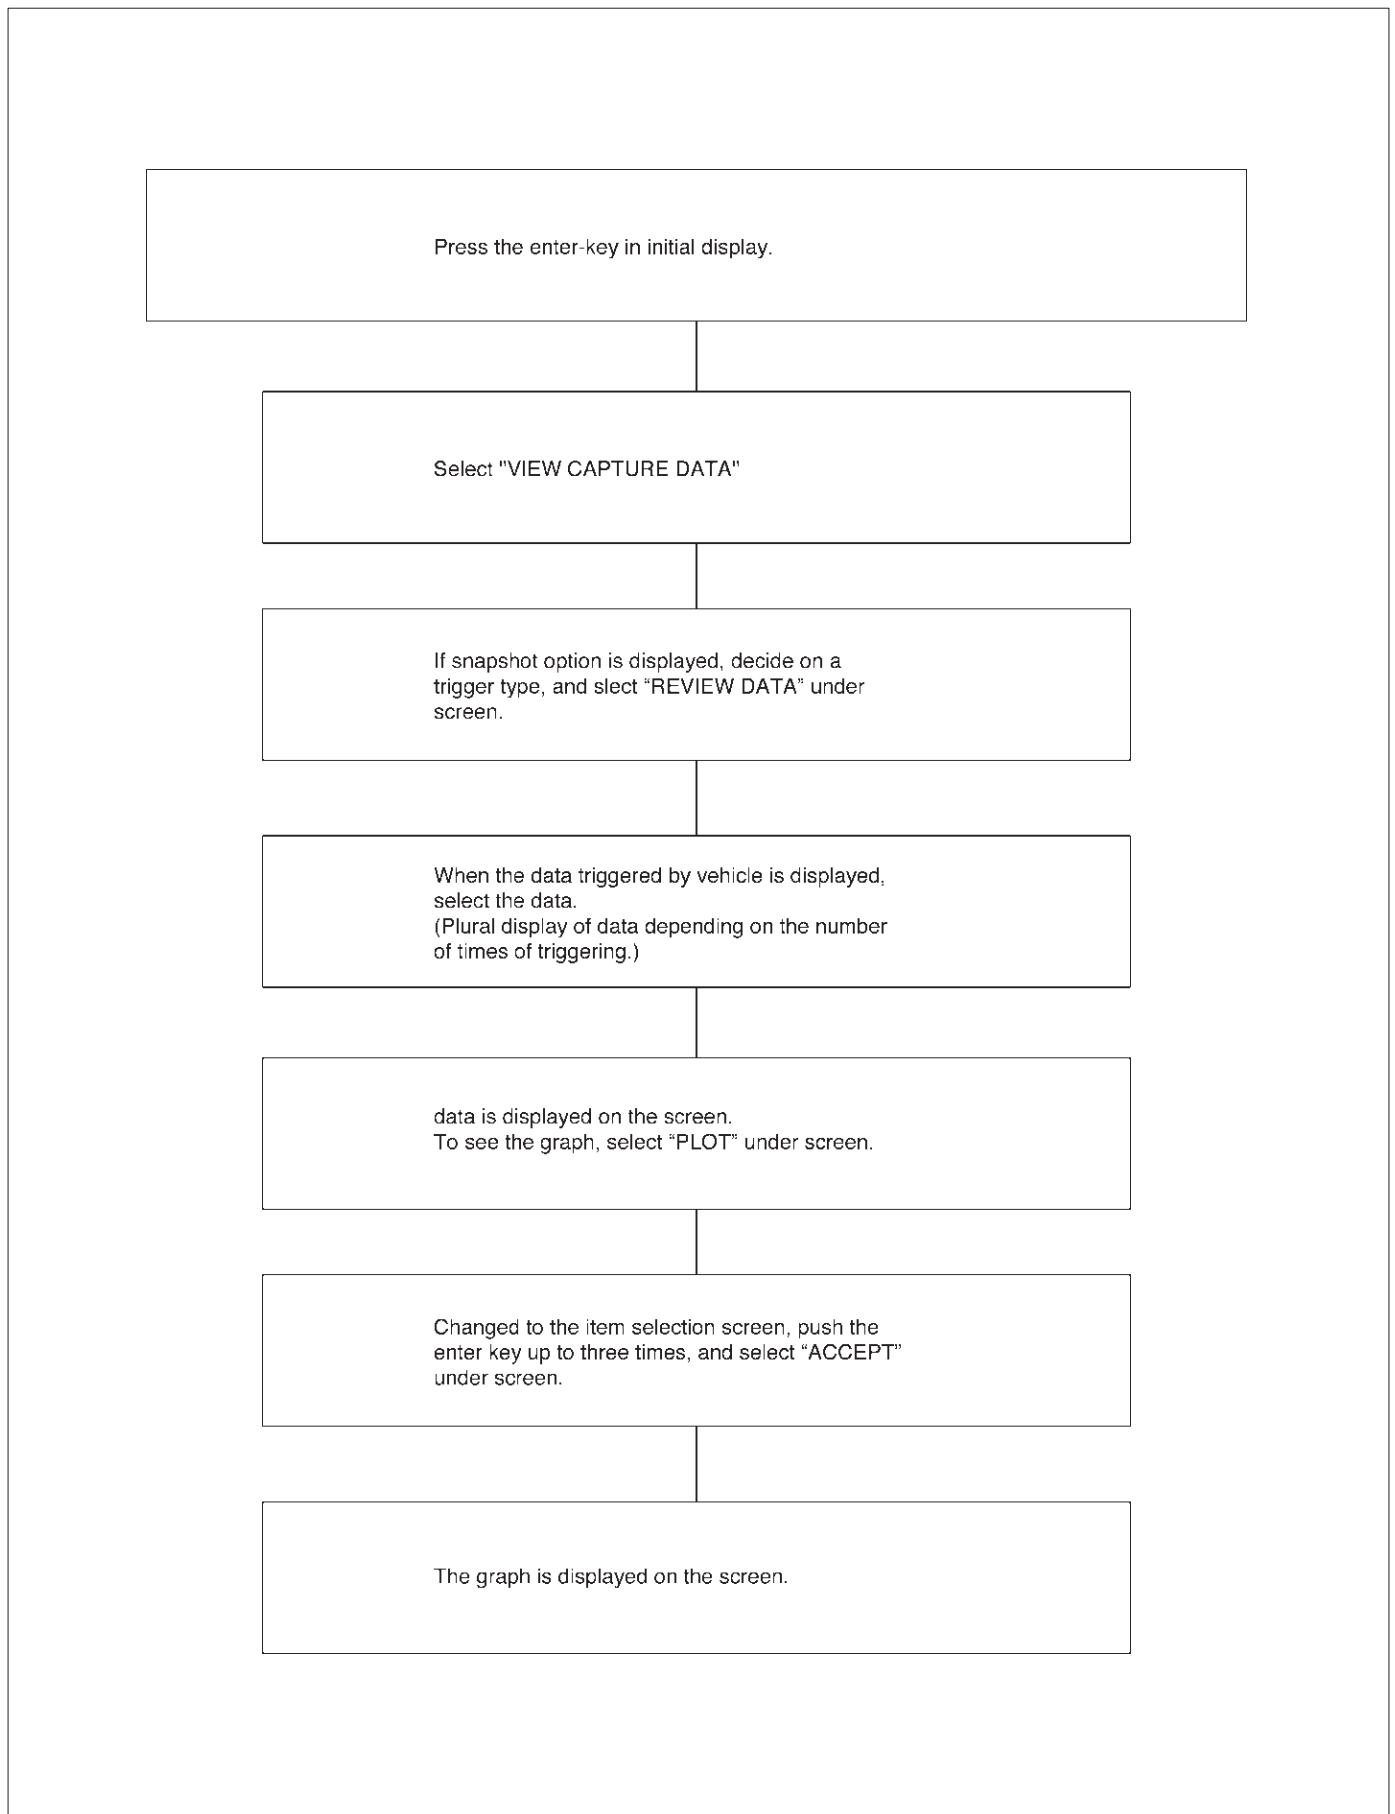

060RX037

For trouble diagnosis, you can collect graphic data (snapshot) directly from the vehicle. You can replay the snapshot data as needed. Therefore, accurate diagnosis is possible, even though the vehicle is not available.

Plotting Graph Flow Chart (Plotting graph after obtaining vehicle information)

Flow Chart for Snapshot Replay (Plotting Graph)

Primary System-Based Diagnostics

Primary System-Based Diagnostics

There are primary system-based diagnostics which evaluate system operation and its effect on vehicle emissions. The primary system-based diagnostics are listed below with a brief description of the diagnostic function:

Oxygen Sensor Diagnosis

The fuel control heated oxygen sensors (Bank 1 HO2S 1 and Bank 2 HO2S 1) are diagnosed for the following conditions:

- Heater performance (time to activity on cold start)
- Slow response
- Response time (time to switch R/L or L/R)
- Inactive signal (output steady at bias voltage – approx. 450 mV)
- Signal fixed high
- Signal fixed low

If the oxygen sensor pigtail wiring, connector or terminal are damaged, the entire oxygen sensor assembly must be replaced. DO NOT attempt to repair the wiring, connector or terminals. In order for the sensor to function properly, it must have clean reference air provided to it. This clean air reference is obtained by way of the oxygen sensor wire(s). Any attempt to repair the wires, connector or terminals could result in the obstruction of the reference air and degrade oxygen sensor performance. Refer to *On-Vehicle Service Heated Oxygen Sensors*.

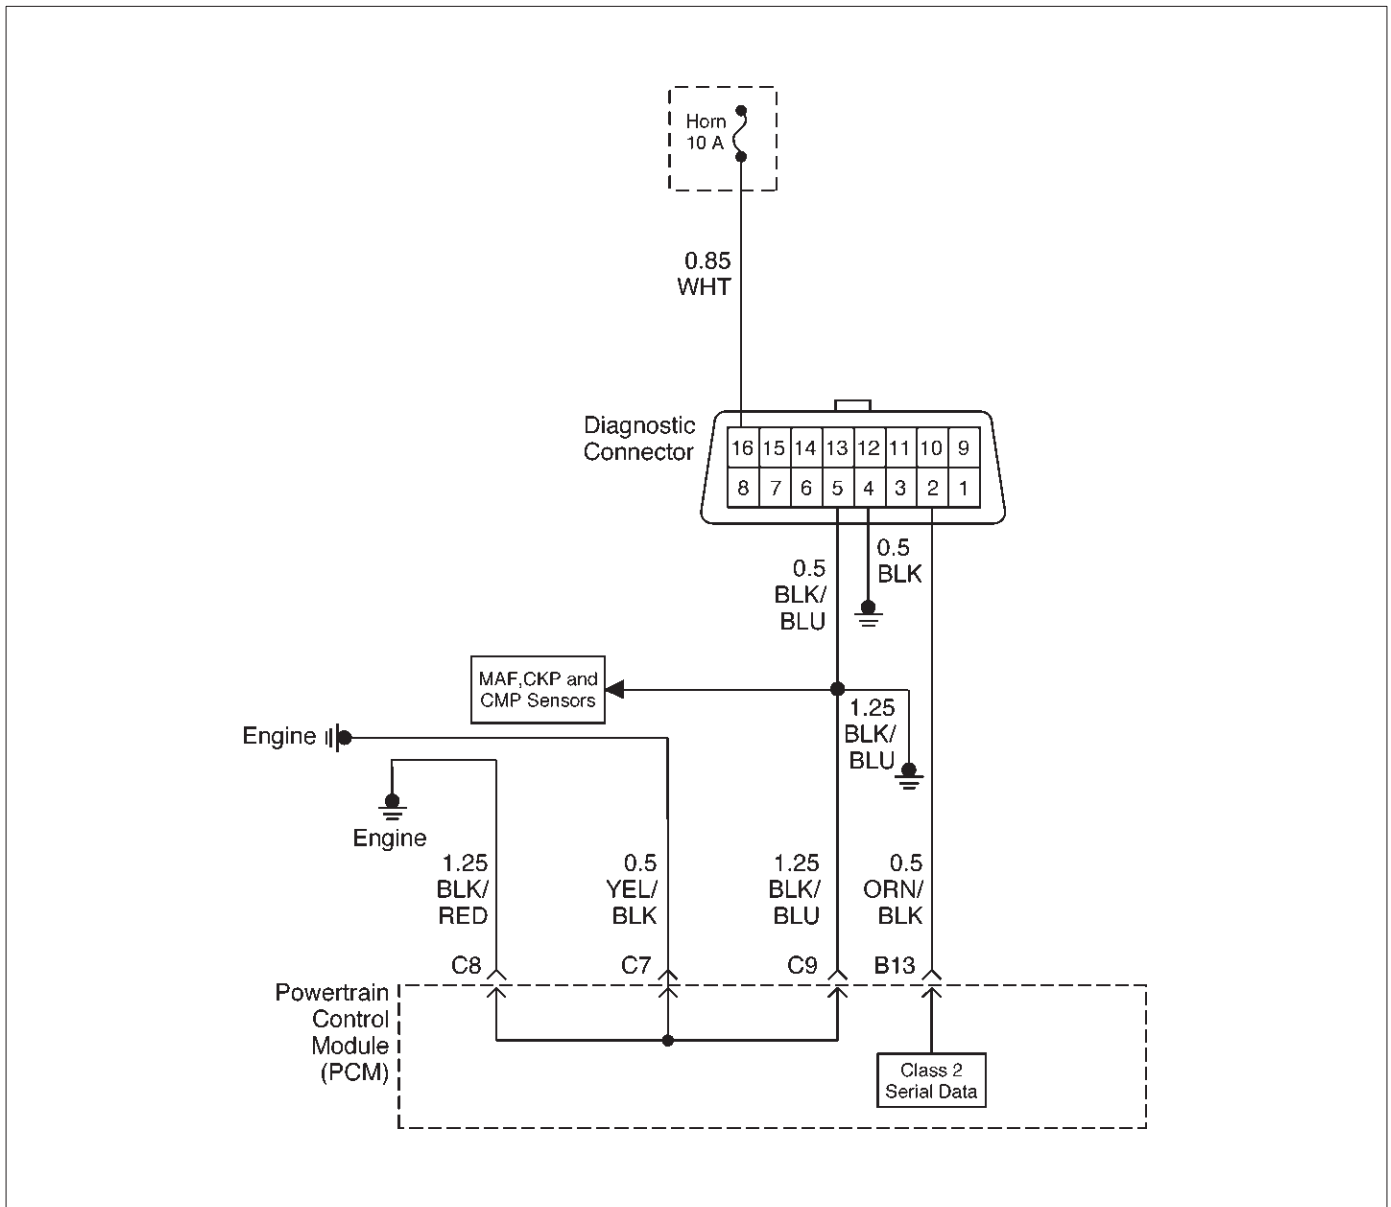

Fuel Control Heated Oxygen Sensors

The main function of the fuel control heated oxygen sensors is to provide the control module with exhaust stream oxygen content information to allow proper fueling and maintain emissions within mandated levels. After it reaches operating temperature, the sensor will generate a voltage, inversely proportional to the amount of oxygen present in the exhaust gases. The control module uses the signal voltage from the fuel control heated oxygen sensors while in closed loop to adjust fuel injector pulse width. While in closed loop, the PCM can adjust fuel delivery to maintain an air/fuel ratio which allows the best combination of emission control and driveability. The fuel control heated oxygen sensors are also used to determine catalyst efficiency.

HO2S Heater

Heated oxygen sensors are used to minimize the amount of time required for closed loop fuel control to begin operation and to allow accurate catalyst monitoring. The oxygen sensor heater greatly decreases the amount of time required for fuel control sensors (Bank 1 HO2S 1 and Bank2 HO2S 1) to become active.

On-Board Diagnostic (OBD) System Check

D06RX010

Circuit Description

The on-board diagnostic system check is the starting point for any driveability complaint diagnosis. Before using this procedure, perform a careful visual/physical check of the PCM and engine grounds for cleanliness and tightness.

The on-board diagnostic system check is an organized approach to identifying a problem created by an electronic engine control system malfunction.

Diagnostic Aids

An intermittent may be caused by a poor connection, rubbed-through wire insulation or a wire broken inside the insulation. Check for poor connections or a damaged harness. Inspect the PCM harness and connector for improper mating, broken locks, improperly formed or damaged terminals, poor terminal-to-wire connection, and damaged harness.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

1. The MIL ("Check Engine" lamp) should be "ON" steady with the ignition "ON"/engine "OFF." If not, the "No MIL" chart should be used to isolate the malfunction.
2. Checks the Class 2 data circuit and ensures that the PCM is able to transmit serial data.
3. This test ensures that the PCM is capable of controlling the MIL ("Check Engine" lamp) and the MIL ("Check Engine" lamp) driver circuit is not shorted to ground.
4. If the engine will not start, the *Cranks But Will Not Run* chart should be used to diagnose the condition.
7. A Tech 2 parameter which is not within the typical range may help to isolate the area which is causing the problem.

On- Board Diagnostic (OBD) System Check

Step	Action	Value(s)	Yes	No
1	1. Ignition "ON," engine "OFF." 2. Observe the malfunction indicator lamp (MIL or "Check Engine lamp"). Is the MIL ("Check Engine lamp") "ON?"	—	Go to Step 2	Go to No MIL ("Check Engine" lamp)
2	1. Ignition "OFF." 2. Install Tech 2. 3. Ignition "ON." 4. Attempt to display PCM engine data with the Tech 2. Does the Tech 2 display PCM data?	—	Go to Step 3	Go to Step 8
3	1. Using the Tech 2 output tests function, select MIL ("Check Engine lamp") dash lamp control and command the MIL ("Check Engine lamp") "OFF." (Refer to Miscellaneous Test) 2. Observe the MIL ("Check Engine lamp"). Did the MIL ("Check Engine lamp") turn "OFF?"	—	Go to Step 4	Go to MIL ("Check Engine" lamp) On Steady
4	Attempt to start the engine. Did the engine start and continue to run?	—	Go to Step 5	Go to Cranks But Will Not Run
5	Select "Display DTCs" with the Tech 2. Are any DTCs stored?	—	Go to Step 6	Go to Step 7
6	Are two or more of the following DTCs stored? P0107, P0108, P0113, P0118, P0122, P0123, P0712, P1404.	—	Go to "Multiple PCM Information Sensor DTCs Set"	Go to applicable DTC table
7	Compare PCM data values displayed on the Tech 2 to the typical engine scan data values. Are the displayed values normal or close to the typical values?	—	Go to Symptom	Refer to indicated Component System Checks
8	1. Ignition "OFF," disconnect the PCM. 2. Ignition "ON," engine "OFF." 3. Check the Class 2 data circuit for an open, short to ground, or short to voltage. Also, check the DLC ignition feed circuit for an open or short to ground and the DLC ground circuit for an open. 4. If a problem is found, repair as necessary. Was a problem found?	—	Go to Step 2	Go to Step 9
9	Replace the PCM. Is the action complete?	—	Go to Step 2	—

Circuit Description

When air conditioning and blower fan are selected, and if the system has a sufficient refrigerant charge, a 12-volt signal is supplied to the A/C request input of the powertrain control module (PCM). The A/C request signal may be temporarily canceled during system operation by the electronic thermostat in the evaporator case. The electronic thermostat may intermittently remove the control circuit ground for the A/C thermostat relay to prevent the evaporator from forming ice. When the A/C request signal is received by the PCM, the PCM supplies a ground from the compressor clutch relay if the engine operating conditions are within acceptable ranges. With the A/C compressor relay energized, voltage is supplied to the compressor clutch coil. The PCM will enable the compressor clutch to engage whenever A/C has been selected with the engine running, unless any of the following conditions are present:

- The throttle is greater than 90%.
- The ignition voltage is below 10.5 volts.
- The engine speed is greater than 4500 RPM for 5 seconds or 5400 RPM.
- The engine coolant temperature (ECT) is greater than 125 °C (257 °F).
- The intake air temperature (IAT) is less than 5°C (41 °F).
- The power steering pressure switch signals a high pressure condition.

Diagnostic Aids

To diagnose an intermittent fault, check for the following conditions:

- Poor connection at the PCM—Inspect connections for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness—Inspect the wiring harness for damage. If the harness appears to OK, observe the A/C clutch while moving connectors and wiring harnesses related to the A/C. A sudden clutch malfunction will indicate the source of the intermittent fault.

A/C Clutch Diagnosis

This chart should be used for diagnosing the electrical portion of the A/C compressor clutch circuit. A Tech 2 will be used in diagnosing the system. The Tech 2 has the ability to read the A/C request input to the PCM. The Tech 2 can display when the PCM has commanded the A/C clutch “ON.” The Tech 2 should have the ability to override the A/C request signal and energize the A/C compressor relay.

Test Description

IMPORTANT: Do not engage the A/C compressor clutch with the engine running if an A/C mode is not selected at the A/C control switch.

The numbers below refer to the step numbers on the Diagnostic Chart:

3. This a test determine is the problem is with the refrigerant system. If the switch is open, A/C pressure gauges will be used to determine if the pressure switch is faulty or if the system is partially discharged or empty.
4. Although the normal complaint will be the A/C clutch failing to engage, it is possible for a short circuit to cause the clutch to run when A/C has not been selected. This step is a test for that condition.
7. There is an extremely low probability that both relays will fail at the same time, so the substitution process is one way to check the A/C Thermostat relay. Use a known good relay to do a substitution check.
9. The blower system furnishes a ground for the A/C control circuit, and it also shares a power source through the Heater and A/C Relay. The blower must be “ON” in order to test the A/C system.

A/C Clutch Control Circuit Diagnosis

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Are any other DTCs stored?	—	Go to the other DTC chart(s) first	Go to Step 3
3	1. Disconnect the electrical connector at the pressure switch located on the receiver/drier. 2. Use an ohmmeter to check continuity across the pressure switch (BRN to GRN/WHT). Is the pressure switch open?	—	Go to Air Conditioning to diagnose the cause of the open pressure switch	Go to Step 4

A/C Clutch Control Circuit Diagnosis (Cont'd)

Step	Action	Value(s)	Yes	No
4	<p>IMPORTANT: Before continuing with the diagnosis, the following conditions must be met:</p> <ul style="list-style-type: none"> ● The intake air temperature must be greater than 15°C. (60°F). ● The engine coolant temperature must be less than 119°C (246°F). <p>1. A/C "OFF." 2. Start the engine and idle for 1 minute. 3. Observe the A/C compressor.</p> <p>Is the A/C compressor clutch engaged even though A/C has not been requested?</p>	—	Go to <i>Step 45</i>	Go to <i>Step 5</i>
5	<p>1. Idle the engine. 2. A/C "ON". 3. Blower "ON". 4. Observe the A/C compressor.</p> <p>Is the A/C compressor magnetic clutch engaged?</p>	—	Refer to <i>Diagnostic Aids</i>	Go to <i>Step 6</i>
6	<p>1. Engine idling. 2. A/C "ON". 3. Blower "ON". 4. Observe the "A/C Request" display on the Tech 2. (Refer to the miscellaneous test)</p> <p>Does the "A/C Request" display indicate "Yes?"</p>	—	Go to <i>Step 34</i>	Go to <i>Step 7</i>
7	<p>Temporarily substitute the A/C compressor relay in place of the A/C thermostat relay, then repeat Step 5.</p> <p>Did the "A/C Request" display indicate "Yes?"</p>	—	Go to <i>Step 8</i>	Go to <i>Step 9</i>
8	<p>Replace the original A/C thermostat relay.</p> <p>Is the action complete?</p>	—	Verify repair	—
9	<p>Does the blower operate?</p>	—	Go to <i>Step 10</i>	Go to <i>Step 11</i>
10	<p>Repair the blower.</p> <p>Is the action complete?</p>	—	Verify repair	—
11	<p>Check for a faulty 10A A/C fuse in the passenger compartment fuse panel.</p> <p>Was the 10A fuse OK?</p>	—	Go to <i>Step 13</i>	Go to <i>Step 12</i>
12	<p>Check for short circuit and make repairs if necessary. Replace the 10A A/C fuse.</p> <p>Is the action complete?</p>	—	Verify repair	—
13	<p>1. Ignition "ON." 2. Use a DVM to check voltage at the positive A/C switch wire (BRN).</p> <p>Was voltage equal to the specified value?</p>	B+	Go to <i>Step 15</i>	Go to <i>Step 14</i>
14	<p>Repair the open wire (BRN) between the A/C switch and the A/C fuse.</p> <p>Is the action complete?</p>	—	Verify repair	—

A/C Clutch Control Circuit Diagnosis (Cont'd)

Step	Action	Value(s)	Yes	No
15	1. Remove the glove box to gain access to the A/C thermostat. 2. Disconnect the thermostat connector. 3. Attach a fused jumper between ground and the GRN/RED wire at the thermostat. 4. A/C "ON." 5. Blower "ON." Dose A/C request indicate "YES" on the Tech 2?	—	Go to Step 16	Go to Step 23
16	1. Ignition "ON." 2. A/C switch "ON". 3. Use a DVM to check voltage at the electronic A/C thermostat. Was voltage equal to the specified value?	B+	Go to Step 20	Go to Step 17
17	Check for an open (LT GRN/BLK) wire between the thermostat and the A/C switch. Was the wire open?	—	Go to Step 18	Go to Step 19
18	Repair the open wire (LT GRN/BLK) between the thermostat and the A/C switch. Is the action complete?	—	Verify repair	—
19	Replace the A/C switch. Is the action complete?	—	Verify repair	—
20	Use an ohmmeter to check continuity between the electronic A/C thermostat and the blower switch. Was there an open circuit?	—	Go to Step 21	Go to Step 22
21	Repair the open wire (WHT) between the thermostat and the blower switch. Is the action complete?	—	Verify repair	—
22	Replace the electronic A/C thermostat. Is the an action complete?	—	Verify repair	—
23	Check for an open circuit between A/C thermostat relay and PCM A/C request terminal (E-15). Was there an open circuit?	—	Go to Step 24	Go to Step 25
24	Repair the open circuit between the PCM and A/C thermostat relay. Is the action complete?	—	Verify repair	—
25	Check for an open circuit between the engine device fuse and the A/C thermostat relay (WHT/GRN). Was there an open circuit?	—	Go to Step 26	Go to Step 27
26	Repair the open circuit between the engine device fuse and the A/C thermostat relay. Is the action complete?	—	Verify repair	—
27	1. Ignition "ON." 2. Use a DVM to check voltage at the A/C pressure switch (BRN). Was voltage equal to the specified value?	B+	Go to Step 29	Go to Step 28

A/C Clutch Control Circuit Diagnosis (Cont'd)

Step	Action	Value(s)	Yes	No
28	Repair the open circuit between the 10A A/C fuse and the pressure switch. Is the action complete?	—	Verify repair	—
29	Use an ohmmeter to check continuity between the pressure switch (GRN/WHT) and the A/C thermostat relay (GRN/WHT). Was the circuit open?	—	Go to Step 30	Go to Step 31
30	Repair the open circuit between the pressure switch and the A/C thermostat relay. Is the action complete?	—	Verify repair	—
31	Check for damaged pin or terminal at E-15 of the PCM. Was a damaged pin or terminal found?	—	Go to Step 32	Go to Step 33
32	Repair the damaged pin or terminal. Is the action complete?	—	Verify repair	—
33	Replace the PCM. Is the action complete?	—	Verify repair	—
34	1. Remove the A/C compressor relay. 2. Ignition "ON." 3. Use a DVM to check voltage at both of the BRN wires at the A/C compressor relay socket. Is the voltage equal to the specified value?	B+	Go to Step 36	Go to Step 35
35	Repair the faulty BRN wire between the A/C fuse and the A/C compressor relay . Is the action complete?	—	Verify repair	—
36	1. A/C compressor relay removed. 2. Engine idling. 3. A/C "ON." 4. Blower "ON." 5. Use a DVM to measure voltage between the GRY/RED wire at the A/C compressor relay socket and battery+. Did the DVM indicate the specified value?	B+	Go to Step 40	Go to Step 37
37	Check for an open GRY/RED wire between PCM terminal B-14 and the A/C compressor relay. Was the wire open?	—	Go to Step 38	Go to Step 39
38	Repair the open GRY/RED wire between the PCM and the A/C compressor relay. Is the action complete?	—	Verify repair	—
39	Check for a damaged pin or terminal at B-14 of the PCM. Was a damaged pin or a terminal found?	—	Go to Step 32	Go to Step 33

A/C Clutch Control Circuit Diagnosis (Cont'd)

Step	Action	Value(s)	Yes	No
40	1. A/C compressor relay removed. 2. Connect a fused jumper at the A/C compressor relay socket between either BRN wire and the BRN/YEL wire. 3. Engine idling. 4. A/C "ON." 5. Blower "ON." Did the compressor magnetic clutch engage?	—	Go to <i>Step 41</i>	Go to <i>Step 42</i>
41	Repair the A/C compressor relay. Is the action complete?	—	Verify repair	—
42	Check for an open circuit between the A/C compressor relay and the A/C clutch. Was an open circuit found?	—	Go to <i>Step 43</i>	Go to <i>Step 44</i>
43	Repair the open circuit between the compressor Clutch and the A/C compressor relay. Is the action complete?	—	Verify repair	—
44	Service the compressor clutch or replace the compressor due to a faulty internal overheat switch. Is the action complete?	—	Verify repair	—
45	1. Remove the A/C compressor relay. 2. Idle the engine. Is the compressor clutch still engaged when A/C is not selected?	—	Go to <i>Step 46</i>	Go to <i>Step 47</i>
46	Repair the short to voltage between the A/C clutch and A/C compressor relay. Is the action complete?	—	Verify repair	—
47	1. Reinstall the A/C compressor relay. 2. Remove the A/C thermostat relay. 3. Engine idling. Is the compressor clutch still engaged when A/C is not selected?	—	Go to <i>Step 48</i>	Go to <i>Step 50</i>
48	Use a DVM to check for a short to ground between the A/C compressor relay and B-14 of the PCM. Was a short detected?	—	Go to <i>Step 49</i>	Go to <i>Step 33</i>
49	Repair the short to ground between the PCM and A/C compressor relay. Is the action complete?	—	Verify repair	—
50	Repair the short to ground between the A/C thermostat relay and the electronic thermostat. Is the action complete?	—	Verify repair	—

Electronic Ignition System Diagnosis

If the engine cranks but will not run or immediately stalls, the Engine Cranks But Will Not Start chart must be used to determine if the failure is the ignition system or the fuel system.

Visual Check of The Evaporative Emission Canister

- If the canister is cracked or damaged, replace the canister.
- If fuel is leaking from the canister, replace the canister and check hoses and hose routing.

Fuel Metering System Check

Some failures of the fuel metering system will result in an "Engine Cranks But Will Not Run" symptom. If this condition exists, refer to the *Engine Cranks But Will Not Run* chart. This chart will determine if the problem is caused by the ignition system, the PCM, or the fuel pump electrical circuit.

Refer to *Fuel System Electrical Test* for the fuel system wiring schematic.

If there is a fuel delivery problem, refer to *Fuel System Diagnosis*, which diagnoses the fuel injectors, the fuel pressure regulator, and the fuel pump. If a malfunction occurs in the fuel metering system, it usually results in either a rich HO₂S signal or a lean HO₂S signal. This condition is indicated by the HO₂S voltage, which causes the PCM to change the fuel calculation (fuel injector pulse width) based on the HO₂S reading. Changes made to the fuel calculation will be indicated by a change in the long term fuel trim values which can be monitored with a Tech 2. Ideal long term fuel trim values are around 0%; for a lean HO₂S signal, the PCM will add fuel, resulting in a fuel trim value above 0%. Some variations in fuel trim values are normal because all engines are not exactly the same. If the evaporative emission canister purge is "ON," the long term fuel trim may be as low as -38%. If the fuel trim values are greater than +23%, refer to *DTC P0131, DTC P0151, DTC P0171, and DTC 1171* for items which can cause a lean HO₂S signal.

Idle Air Control (IAC) Valve

The Tech 2 displays the IAC pintle position in counts. A count of "0" indicates the PCM is commanding the IAC pintle to be driven all the way into a fully-seated position. This is usually caused by a large vacuum leak.

The higher the number of counts, the more air is being commanded to bypass the throttle blade. Refer to IAC System Check in order to diagnose the IAC system. Refer to *Rough, Unstable, or Incorrect Idle, Stalling* in *Symptoms* for other possible causes of idle problems.

Knock Sensor Diagnosis

The Tech 2 has two data displays available for diagnosing the knock sensor (KS) system. The two displays are described as follows:

- "Knock Retard" indicates the number of degrees that the spark timing is being retarded due to a knock condition.
- "KS Noise Channel" indicates the current voltage level being monitored on the noise channel.

DTCs P0325 and P0327 are designed to diagnose the KS module, the knock sensor, and the related wiring. The problems encountered with the KS system should set a DTC. However, if no DTC was set but the KS system is suspect because of a detonation complaint, refer to *Detonation/Spark Knock* in *Symptoms*.

Powertrain Control Module (PCM) Diagnosis

To read and clear diagnostic trouble codes, use a Tech 2.

IMPORTANT: Use of a Tech 2 is recommended to clear diagnostic trouble codes from the PCM memory. Diagnostic trouble codes can also be cleared by turning the ignition "OFF" and disconnecting the battery power from the PCM for 30 seconds. Turning off the ignition and disconnecting the battery power from the PCM will cause all diagnostic information in the PCM memory to be cleared. Therefore, all the diagnostic tests will have to be re-run.

Since the PCM can have a failure which may affect only one circuit, following the diagnostic procedures in this section will determine which circuit has a problem and where it is.

If a diagnostic chart indicates that the PCM connections or the PCM is the cause of a problem, and the PCM is replaced, but this does not correct the problem, one of the following may be the reason:

- There is a problem with the PCM terminal connections. The terminals may have to be removed from the connector in order to check them properly.
- The problem is intermittent. This means that the problem is not present at the time the system is being checked. In this case, refer to the *Symptoms* portion of the manual and make a careful physical inspection of all components and wiring associated with the affected system.
- There is a shorted solenoid, relay coil, or harness. Solenoids and relays are turned "ON" and "OFF" by the PCM using internal electronic switches called drivers. A shorted solenoid, relay coil, or harness will not damage the PCM but will cause the solenoid or relay to be inoperative.

Multiple PCM Information Sensor DTCS Set

Circuit Description

The powertrain control module (PCM) monitors various sensors to determine the engine operating conditions. The PCM controls fuel delivery, spark advance, transmission operation, and emission control device operation based on the sensor inputs.

The PCM provides a sensor ground to all of the sensors. The PCM applies 5 volts through a pull-up resistor, and determines the status of the following sensors by

monitoring the voltage present between the 5-volt supply and the resistor:

- The engine coolant temperature (ETC) sensor
- The intake air temperature (IAT) sensor
- The transmission fluid temperature (TFT) sensor

The PCM provides the following sensors with a 5-volt reference and a sensor ground signal:

- The exhaust gas recirculating (EGR) pintle position sensor
- The throttle position (TP) sensor
- The manifold absolute pressure (MAP) sensor

The PCM monitors the separate feedback signals from these sensors in order to determine their operating status.

Diagnostic Aids

IMPORTANT: Be sure to inspect PCM and engine grounds for being secure and clean.

A short to voltage in one of the sensor input circuits may cause one or more of the following DTCs to be set:

- P0108
- P0113
- P0118
- P0123
- P0712

IMPORTANT: If a sensor input circuit has been shorted to voltage, ensure that the sensor is not damaged. A damaged sensor will continue to indicate a high or low voltage after the affected circuit has been repaired. If the sensor has been damaged, replace it.

An open in the sensor ground circuit between the PCM and the splice will cause one or more of the following DTCs to be set:

- P0108
- P0113
- P0118
- P0123
- P0712

A short to ground in the 5-volt reference A or B circuit will cause one or more of the following DTCs to be set:

- P0107

- P0122

An open in the 5-volt reference circuit A, between the PCM and the splice will cause one or more of the following DTCs to be set:

- P0122

An open in the 5-volt reference circuit B, between the PCM and the splice will cause one or more of the following DTCs to be set:

- P0107

Check for the following conditions:

- **Poor connection at PCM.** Inspect the harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and a poor terminal-to-wire connection.
- **Damaged harness.** Inspect the wiring harness for damage. If the harness is not damaged, observe an affected sensor's displayed value on the Tech 2 with the ignition "ON" and the engine "OFF" while you move the connectors and the wiring harnesses related to the following sensors:

- IAT
- ECT
- TP
- MAP
- EGR
- TFT

Test Description

9. A faulty EGR valve can leak a small amount of current from the ignition feed circuit to the 5-volt reference A circuit. If the problem does not exist with the EGR valve disconnected, replace the EGR valve.
- 11-15. If a sensor input circuit has been shorted to voltage, ensure that the sensor has not been damaged. A damaged IAT or ECT sensor will continue to indicate a high voltage or a low temperature after the affected circuit has been repaired. A damaged TP, MAP, fuel tank pressure, or EGR pintle position sensor will indicate a high voltage, a low voltage, or a fixed value after the affected circuit has been repaired. If the sensor has been damaged, replace it.

Multiple PCM Information Sensor DTCs Set

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	1. Turn the ignition "OFF," disconnect the PCM. 2. Turn the ignition "ON," check the 5 volt reference A circuit for the following conditions: <ul style="list-style-type: none"> ● A poor connection at the PCM. ● An open between the PCM connector and the splice. ● A short to ground. ● A short to voltage. Is there an open or short?	—	Go to <i>Step 3</i>	Go to <i>Step 4</i>
3	Repair the open or short. Is the action complete?	—	Verify repair	—
4	Check the sensor ground circuit for the following conditions: <ul style="list-style-type: none"> ● A poor connection at the PCM or the affected sensors. ● An open between the PCM connector and the affected sensors. Is there an open or a poor connection?	—	Go to <i>Step 5</i>	Go to <i>Step 6</i>
5	Repair the open or the poor connection. Is the action complete?	—	Verify repair	—
6	Measure the voltage between the EGR pintle position sensor signal circuit at the PCM harness connector and ground. Does the voltage measure near the specified value?	0 V	Go to <i>Step 7</i>	Go to <i>Step 11</i>
7	Measure the voltage between the MAP sensor signal circuit at the PCM harness connector and ground. Does the voltage measure near the specified value?	0 V	Go to <i>Step 8</i>	Go to <i>Step 14</i>
8	Measure the voltage between the TP sensor signal circuit at the PCM harness connector and ground. Does the voltage measure near the specified value?	0 V	Go to <i>Step 9</i>	Go to <i>Step 15</i>
9	Measure the voltage between the IAT sensor signal circuit at the PCM harness connector and ground. Does the voltage measure near the specified value?	0 V	Go to <i>Step 10</i>	Go to <i>Step 16</i>
10	Measure the voltage between the ECT sensor signal circuit at the PCM harness connector and ground. Does the voltage measure near the specified value?	0 V	Go to <i>Step 11</i>	Go to <i>Step 17</i>
11	1. Disconnect the EGR valve. 2. Measure the voltage between the EGR pintle position sensor signal circuit at the PCM harness connector and ground. Does the voltage measure near the specified value?	0 V	Go to <i>Step 13</i>	Go to <i>Step 18</i>
12	Measure the voltage between the TFT sensor signal circuit at the PCM harness connector and ground. Does the voltage measure near the specified value?	0 V	Go to <i>Step 20</i>	Go to <i>Step 19</i>

Multiple PCM Information Sensor DTCs Set (Cont'd)

Step	Action	Value(s)	Yes	No
13	Replace the EGR valve. Is the action complete?	—	Verify repair	—
14	Locate and repair the short to voltage in the MAP sensor signal circuit. Is the action complete?	—	Verify repair	—
15	Locate and repair the short to voltage in the TP sensor signal circuit. Is the action complete?	—	Verify repair	—
16	Locate and repair the short to voltage in the IAT sensor signal circuit. Is the action complete?	—	Verify repair	—
17	Locate and repair the short to voltage in the ECT sensor signal circuit. Is the action complete?	—	Verify repair	—
18	Locate and repair the short to voltage in the EGR pintle position sensor signal circuit. Is the action complete?	—	Verify repair	—
19	Locate and repair the short to voltage in the TFT sensor signal circuit. Is the action complete?	—	Verify repair	—
20	Replace the PCM. Is the action complete?	—	Go to <i>OBD System Check</i>	—

Exhaust Gas Recirculation (EGR) Diagnosis

Pintle position error diagnosis is covered by DTC P0402, P0404, P1404, P0405, P0406. If EGR diagnostic trouble codes P0402, P0404, P1404, P0405, P0406 are encountered, refer to the DTC charts.

Engine Tech 2 Data Definitions and Ranges

A/C CLUTCH—Tech 2 Displays ON or OFF—

Indicates whether the PCM has commanded the A/C clutch ON. Used in A/C system diagnostic.

A/C REQUEST — Tech 2 Displays YES or NO —

Indicates the state of the A/C request input circuit from the HVAC controls. The PCM uses the A/C request signal to determine whether A/C compressor operation is being requested.

AIR/FUEL RATIO — Tech 2 Range 0.0-25.5 —

Air/fuel ratio indicates the PCM commanded value. In closed loop, the air/fuel ratio should normally be displayed around "14.2–14.7." A lower air/fuel ratio indicates a richer commanded mixture, which may be seen during power enrichment or TWC protection modes. A higher air/fuel ratio indicates a leaner commanded mixture. This can be seen during deceleration fuel mode.

BARO kPa — Tech 2 Range 10-105 kPa/0.00-5.00 Volts —

The barometric pressure reading is determined from the MAP sensor signal monitored during key up and wide open throttle (WOT) conditions. The barometric pressure is used to compensate for altitude differences and is normally displayed around "61-104" depending on altitude and barometric pressure.

CHECK TRANS LAMP—AUTO TRANSMISSION—

Indicates the need to check for a DTC with the Tech 2 when the lamp is flashing 0.2 seconds ON and 0.2 seconds OFF.

CMP ACT. COUNTER —Cam Position

ActivityDECEL FUEL MODE—Tech 2 Display ACTIVE or INACTIVE—

"ACTIVE" displayed indicates that the PCM has detected conditions appropriate to operate in deceleration fuel mode. The PCM will command the deceleration fuel mode when it detects a closed throttle position while the vehicle is traveling over 20 mph. While in the decreasing fuel mode, the PCM will decrease the amount of fuel delivered by entering open loop and decreasing the injector pulse width.

DESIRED EGR POS.—Tech 2 Range 0%-100%—

Represents the EGR pintle position that the PCM is commanding.

DESIRED IDLE — Tech 2 Range 0-3187 RPM —

The idle speed that the PCM is commanding. The PCM will compensate for various engine loads based on engine coolant temperature, to keep the engine at the desired speed.

ECT — (Engine Coolant Temperature) Tech 2 Range -40°C to 151°C (-40°F to 304°F) —

The engine coolant temperature (ECT) is mounted in the coolant stream and sends engine temperature information to the PCM. The PCM applies 5 volts to the ECT sensor circuit. The sensor is a thermistor which changes internal resistance as temperature changes. When the sensor is cold (high resistance), the PCM monitors a high signal voltage and interprets that as a cold engine. As the sensor warms (decreasing resistance), the voltage signal will decrease and the PCM will interpret the lower voltage as a warm engine.

EGR DUTY CYCLE — Tech 2 Range 0%-100% —

Represents the EGR valve driver PWM signal from the PCM. A duty cycle of 0% indicates that no EGR flow is being commanded; a 100% duty cycle indicates maximum EGR flow commanded.

EGR FEEDBACK — Tech 2 Range 0.00-5.00 Volts —

Indicates the EGR pintle position sensor signal voltage being monitored by the PCM. A low voltage indicates a fully extended pintle (closed valve); a voltage near 5 volts indicates a retracted pintle (open valve).

ENGINE LOAD — Tech 2 Range 0%-100% —

Engine load is calculated by the PCM from engine speed and MAF sensor readings. Engine load should increase with an increase in RPM or air flow.

ENGINE RUN TIME — Tech 2 Range 00:00:00-99:99:99 Hrs:Min:Sec —

Indicates the time elapsed since the engine was started. If the engine is stopped, engine run time will be reset to 00:00:00.

ENGINE SPEED — Range 0-9999 RPM —

Engine speed is computed by the PCM from the 58X reference input. It should remain close to desired idle under various engine loads with engine idling.

EVAP PURGE PWM — Tech 2 Range 0%-100% —

Represents the PCM commanded PWM duty cycle of the EVAP purge solenoid valve. "0%" displayed indicates no purge; "100%" displayed indicates full purge.

EVAP VENT VALVE— Tech 2 Displays PURGE or NO PURGE—

The EVAP purge vacuum valve is a normally closed valve positioned in the purge line between the canister and the EVAP purge solenoid. The EVAP purge vacuum valve will open when vacuum increases to greater than 5 inches of water in the purge line. The EVAP purge vacuum valve is used by the PCM to monitor EVAP canister purge solenoid operation and purge system integrity. The EVAP purge vacuum valve should be closed to ground with no vacuum present (0% EVAP purge PWM). With EVAP purge PWM at 25% or greater, the EVAP purge vacuum valve should be open and "PURGE" should be indicated.

FUEL TRIM CELL — Tech 2 Range 0-21 —

The fuel trim cell is dependent upon engine speed and MAF sensor readings. A plot of RPM vs. MAF is divided into 22 cells. Fuel trim cell indicates which cell is currently active.

FUEL TRIM LEARN — Tech 2 Displays NO or YES

When conditions are appropriate for enabling long term fuel trim corrections, fuel trim learn will display "YES." This indicates that the long term fuel trim is responding to the short term fuel trim. If the fuel trim learn displays "NO," then long term fuel trim will not respond to changes in short term fuel trim.

HO2S BANK 1, SEN. 1—Tech 2 Range 0-1132 mV—

Represents the fuel control exhaust oxygen sensor output voltage. Should fluctuate constantly within a range between 10 mV (lean exhaust) and 1000 mV (rich exhaust) while operating in closed loop.

HO2S BANK2, SEN. 1—Tech 2 Range 0–1132 mV—

Represents the fuel control exhaust oxygen sensor output voltage. Should fluctuate constantly within a range between 10mV (lean exhaust) and 1000 mV (rich exhaust) while operating in closed loop.

HO2S BANK 1, SEN. 1—Tech 2 Displays READY YES/NO—

Indicates the status of the exhaust oxygen sensor. The Tech 2 will indicate that the exhaust oxygen sensor is ready when the PCM detects a fluctuating HO2S voltage sufficient to allow closed loop operation. This will not occur unless the exhaust oxygen sensor is warmed up.

HO2S BANK 2, SEN. 1—Tech 2 Displays READY YES/NO—

Indicates the status of the exhaust oxygen sensor. The Tech 2 will indicate that the exhaust oxygen sensor is ready when the PCM detects a fluctuating HO2S voltage sufficient to allow closed loop operation. This will not occur unless the exhaust oxygen sensor is warmed up.

IAC POSITION — Tech 2 Range 0-255 Counts —

Displays the commanded position of the idle air control pintle in counts. A larger number of counts means that more air is being commanded through the idle air passage. Idle air control should respond fairly quickly to changes in engine load to maintain desired idle RPM.

IAT (INTAKE AIR TEMPERATURE)— Tech 2 Range –40°C to 151°C (–40°F to 304°F) —

The PCM converts the resistance of the intake air temperature sensor to degrees. Intake air temperature (IAT) is used by the PCM to adjust fuel delivery and spark timing according to incoming air density.

IGNITION 1 — Tech 2 Range 0-25.5 Volts —

This represents the system voltage measured by the PCM at its ignition feed.

INJ. PULSE BANK 1/INJ. PULSE BANK 2— Tech 2 Range 0-1000 msec. —

Indicates the amount of time the PCM is commanding each injector "ON" during each engine cycle. A longer injector pulse width will cause more fuel to be delivered. Injector pulse width should increase with increased engine load.

KS NOISE CHANNEL (Knock Sensor)—

Indicates the output from the KS noise channel. There is always some electrical noise in an engine compartment and to avoid mistaking this as engine knock, the output from the knock sensor is compared to the output from the noise channel. A knock condition is not set unless the knock sensor output is greater than the noise channel output.

LONG TERM FUEL TRIM BANK 1/BANK 2 –

The long term fuel trim is derived from the short term fuel trim values and represents a long term correction of fuel delivery for the bank in question. A value of 0% indicates that fuel delivery requires no compensation to maintain the PCM commanded air/fuel ratio. A negative value significantly below 0% indicates that the fuel system is rich and fuel delivery is being reduced (decreased injector pulse width). A positive value significantly greater than 0% indicates that a lean condition exists and the PCM is compensating by adding fuel (increased injector pulse width). Because long term fuel trim tends to follow short term fuel trim, a value in the negative range due to canister purge at idle should not be considered unusual. Fuel trim values at maximum authority may indicate an excessively rich or lean system.

LOOP STATUS — Tech 2 Displays OPEN or CLOSED —

"CLOSED" indicates that the PCM is controlling fuel delivery according to oxygen sensor voltage. In "OPEN" the PCM ignores the oxygen sensor voltage and bases the amount of fuel to be delivered on TP sensor, engine coolant, and MAF sensor inputs only.

MAF — Tech 2 Range 0.0-512 gm/s —

MAF (mass air flow) is the MAF input frequency converted to grams of air per second. This indicates the amount of air entering the engine.

MAP — Tech 2 Range 10-105 kPa (0.00-4.97 Volts)—

The manifold absolute pressure (MAP) sensor measures the change in the intake manifold pressure from engine load, EGR flow, and speed changes. As intake manifold pressure increases, intake vacuum decreases, resulting in a higher MAP sensor voltage and kPa reading. The MAP sensor signal is used to monitor intake manifold pressure changes during the EGR flow test, to update the BARO reading, and as an enabling factor for several of the diagnostics.

MIL — Tech 2 Displays ON or OFF —

Indicates the PCM commanded state of the malfunction indicator lamp.

POWER ENRICHMENT — Tech 2 Displays ACTIVE or INACTIVE —

"ACTIVE" displayed indicates that the PCM has detected conditions appropriate to operate in power enrichment mode. The PCM will command power enrichment mode when a large increase in throttle position and load is detected. While in power enrichment mode, the PCM will increase the amount of fuel delivered by entering open loop and increasing the injector pulse width. This is done to prevent a possible sag or hesitation from occurring during acceleration.

RICH/LEAN BANK 1/ BANK 2 — Tech 2 Displays RICH or LEAN —

Indicates whether oxygen sensor voltage is above a 600 mV threshold voltage ("RICH") or below a 3000 mV threshold voltage ("LEAN"). Should change constantly while in closed loop, indicating that the PCM is controlling the air/fuel mixture properly.

SHORT TERM FT BANK1/BANK2-

Short term fuel trim to a bank represents a short term correction to bank fuel delivery by the PCM in response to the amount of time the bank fuel control oxygen sensor voltage spends above or below the 450 mV threshold. If the oxygen sensor voltage has mainly remained less than 450 mV, indicating a lean air/fuel mixture, short term fuel trim will increase into the positive range above 0% and the PCM will pass fuel. If the oxygen sensor voltage stays mainly above the threshold, short term fuel trim will decrease below 0% into the negative range while the PCM reduces fuel delivery to compensate for the indicated rich condition. Under certain conditions such as extended idle and high ambient temperatures, canister purge may cause short term fuel trim to read in the negative range during normal operation. Fuel trim values at maximum authority may indicate an excessively rich or lean system.

SPARK — Tech 2 Range -64° to 64° —

Displays the amount of spark advance being commanded by the PCM on the IC circuit.

START-UP ECT — Tech 2 Range -40° C to 151° C (-40° F to 304° F) —

Indicates the engine coolant temperature at the time that the vehicle was started. Used by the HO2S diagnostic to determine if the last start-up was a cold start.

START-UP IAT — Tech 2 Range -40° C to 151° C (-40° F to 304° F) —

Indicates the intake air temperature at the time that the vehicle was started. Used by the HO2S diagnostic to determine if the last start-up was a cold start.

TP — Tech 2 Range 0%-100% —

TP (throttle position) angle is computed by the PCM from the TP sensor voltage. TP angle should display "0%" at idle and "100%" at wide open throttle.

TP SENSOR — Tech 2 Range 0.00-5.00 Volts —

The voltage being monitored by the PCM on the TP sensor signal circuit.

WEAK CYLINDER -Tech 2 Displays Cylinder Number—

This indicates that the PCM has detected crankshaft speed variations that indicate 2% or more cylinder firing events are misfires.

diagnosing. The typical scan data values represent values that would be seen on a normally-running engine.

NOTE: A Tech 2 that displays faulty data should not be used, and the problem should be reported to the Tech 2 manufacturer. Use of a faulty Tech 2 can result in misdiagnosis and unnecessary replacement of parts.

Only the parameters listed below are referred to in this service manual for use in diagnosis. For further information on using the Tech 2 to diagnose the PCM and related sensors, refer to the applicable reference section listed below. If all values are within the typical range described below, refer to the *Symptoms* section for diagnosis.

Test Conditions

Engine running, lower radiator hose hot, transmission in park or neutral, closed loop, accessories off, brake not applied and air conditioning off.

Typical Scan Data Values

Use the Typical Scan Data Values Table only after the On-Board Diagnostic System Check has been completed, no DTC(s) were noted, and you have determined that the on-board diagnostics are functioning properly. Tech 2 values from a properly-running engine may be used for comparison with the engine you are

3.5L V-6 Engine

Tech 2 Parameter	Data List	Units Displayed	Typical Data Values (IDLE)	Typical Data Values (2500 RPM)
Engine Speed	Engine	RPM	Within -50 to +100 of "Desired Idle"	Actual engine speed

No Malfunction Indicator Lamp (MIL)

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	Attempt to start the engine. Does the engine start?	—	Go to <i>Step 3</i>	Go to <i>Step 6</i>
3	Check the meter fuse for the instrument cluster ignition feed circuit. Is the fuse OK?	—	Go to <i>Step 4</i>	Go to <i>Step 16</i>
4	Ignition "ON," probe the ignition feed circuit at the cluster connector with a test light to ground. Is the test light "ON?"	—	Go to <i>Step 5</i>	Go to <i>Step 13</i>
5	1. Ignition "OFF." 2. Disconnect the PCM. 3. Jumper the MIL driver circuit at the PCM connector to ground. 4. Ignition "ON." Is the MIL "ON?"	—	Go to <i>Step 10</i>	Go to <i>Step 11</i>
6	Check the PCM ignition feed and battery feed fuses (15 A engine fuse and 15 A PCM fuse). Are both fuses OK?	—	Go to <i>Step 7</i>	Go to <i>Step 15</i>
7	1. Ignition "OFF." 2. Disconnect the PCM. 3. Ignition "ON." 4. Probe the ignition feed circuit at the PCM harness connector with a test light to ground. Is the test light "ON?"	—	Go to <i>Step 8</i>	Go to <i>Step 12</i>
8	Probe the battery feed circuit at the PCM harness connector with a test light to ground. Is the test light "ON?"	—	Go to <i>Step 9</i>	Go to <i>Step 14</i>
9	Check for a faulty PCM ground connection. Was a problem found?	—	Verify repair	Go to <i>Step 10</i>
10	Check for damaged terminals at the PCM. Was a problem found?	—	Verify repair	Go to <i>Step 17</i>
11	Check for an open MIL driver circuit between the PCM and the MIL. Was a problem found?	—	Verify repair	Go to <i>Step 18</i>
12	Substitute a known "good" relay for the PCM main relay. Was the malfunction fixed?	—	Verify repair	Go to <i>Step 13</i>
13	Repair the open in the ignition feed circuit. Is the action complete?	—	Verify repair	—
14	Locate and repair the open PCM battery feed circuit. Is the action complete?	—	Verify repair	—

No Malfunction Indicator Lamp (MIL) (Cont'd)

Step	Action	Value(s)	Yes	No
15	Locate and repair the short to ground in the PCM ignition feed circuit or PCM battery feed circuit. Is the action complete?	—	Verify repair	—
16	Locate and repair the short to ground in the ignition feed circuit to the instrument cluster, and replace the fuse. Is the action complete?	—	Verify repair	—
17	Replace the PCM. Is the action complete?	—	Verify repair	—
18	Check the MIL driver circuit for a poor connection at the instrument panel connector. Was a problem found?	—	Verify repair	Go to <i>Instrument Panel in Electrical Diagnosis</i>

Malfunction Indicator Lamp (MIL) "ON" Steady

Circuit description

The "Check Engine" lamp (MIL) should always be illuminated and steady with ignition "ON" and the engine stopped. Ignition feed voltage is supplied directly to the MIL indicator. The powertrain control module (PCM) turns the MIL "ON" by grounding the MIL driver circuit. The MIL should not remain "ON" with the engine running and no DTC(s) set. A steady MIL with the engine running and no DTC(s) suggests a short to ground in the MIL driver circuit.

Diagnostic Aids

An intermittent may be caused by a poor connection, rubbed-through wire insulation, or a wire broken inside the insulation. Check for the following items:

- Poor connection or damaged harness – Inspect the PCM harness and connectors for improper mating, broken locks, improperly formed or damaged terminals, poor terminal-to-wire connection, and damaged harness.

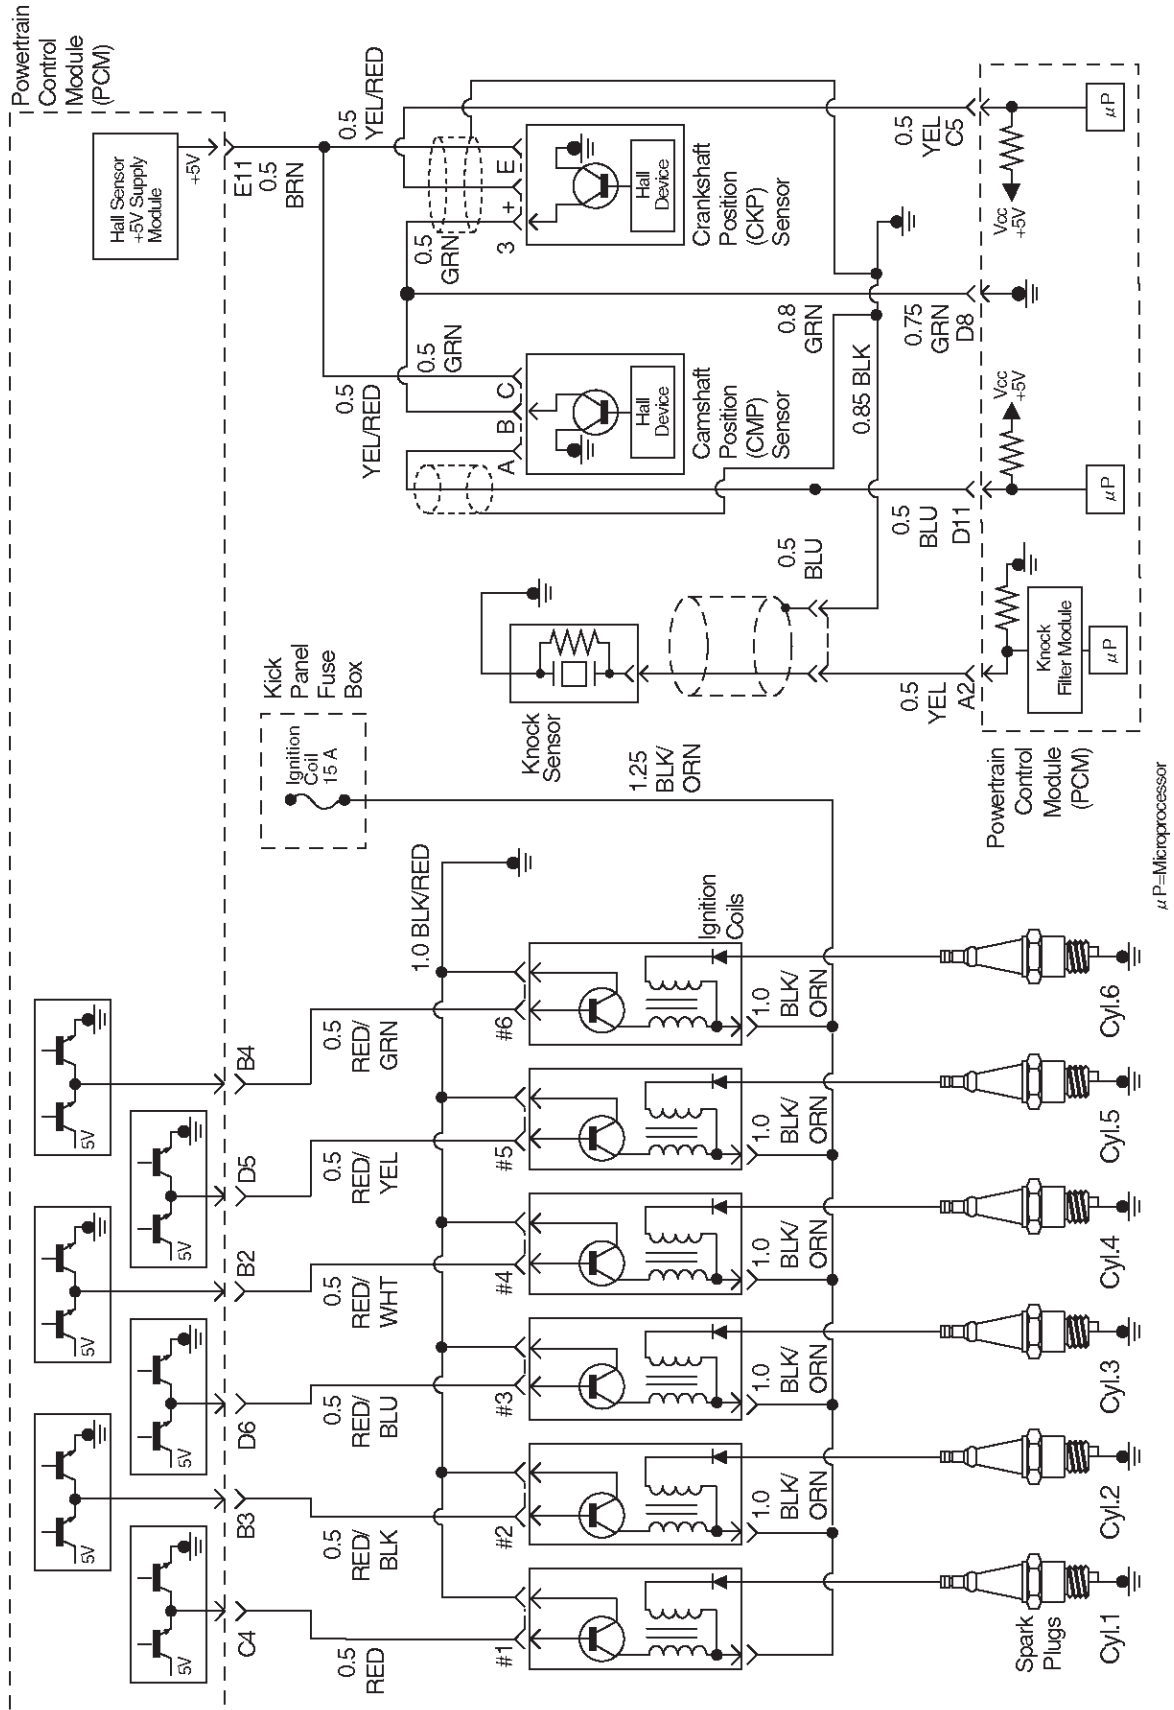

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. If the MIL does not remain "ON" when the PCM is disconnected, the MIL driver wiring is not faulty.
3. If the MIL driver circuit is OK, the instrument panel cluster is faulty.

Malfunction Indicator Lamp (MIL) "ON" Steady

Step	Action	Value(s)	Yes	No
1	Was the "On-Board diagnostic (OBD) System Check" performed?	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	1. Ignition "OFF," disconnect PCM. 2. Ignition "ON," observe the MIL (Service Engine Soon lamp). Is the MIL "ON?"	—	Go to <i>Step 3</i>	Go to <i>Step 5</i>
3	1. Ignition "OFF," disconnect the instrument panel cluster. 2. Check the MIL driver circuit between the PCM and the instrument panel cluster for a short to ground. 3. If a problem is found, repair as necessary. Was the MIL driver circuit shorted to ground?	—	Go to <i>OBD System Check</i>	Go to <i>Step 4</i>
4	Replace the instrument panel cluster. Is the action complete?	—	Go to <i>OBD System Check</i>	—
5	1. Ignition "OFF," reconnect the PCM. 2. Using the Tech 2 output controls function, select MIL dash lamp control and command the MIL "OFF." (Refer to the miscellaneous test) Did the MIL turn "OFF?"	—	Go to <i>OBD System Check</i>	Go to <i>Step 6</i>
6	Replace the PCM. Is the action complete?	—	Go to <i>OBD System Check</i>	—

Engine Cranks But Will Not Run

Circuit Description

The electronic Ignition system uses a coil-at-plug method of spark distribution. In this type of ignition system, the powertrain control module (PCM) triggers the correct driver inside the ignition coil, which then triggers the correct ignition coil based on the 58X signal received from the crankshaft position sensor (CKP). The spark plug connected to the coil fires when the ignition coil opens the ground circuit for the coil's primary circuit.

During crank, the PCM monitors the CKP 58X signal. The CKP signal is used to determine which cylinder will fire first. After the CKP 58X signal has been processed by the PCM, it will command all six injectors to allow a priming shot of fuel for all the cylinders. After the priming, the injectors are left "OFF" during the next six 58X reference pulses from the CKP. This allows each cylinder a chance to use the fuel from the priming shot. During this waiting period, a camshaft position (CMP) signal pulse will have been received by the PCM. The CMP signal allows the PCM to operate the injectors sequentially based on camshaft position. If the camshaft position signal is not present at start-up, the PCM will begin sequential fuel delivery with a 1-in-6 chance that fuel delivery is correct. The engine will run without a CMP signal, but will set a DTC code.

Diagnostic Aids

An intermittent problem may be caused by a poor connection, rubbed-through wire insulation or a wire broken inside the insulation. Check for the following items:

- Poor connection or damaged harness – Inspect the PCM harness and connectors for improper mating, broken locks, improperly formed or damaged terminals, poor terminal-to-wire connection, and damaged harness.
- Faulty engine coolant temperature sensor – Using a Tech 2, compare engine coolant temperature with intake air temperature on a completely cool engine. Engine coolant temperature should be within 10°C of intake air temperature. If not, replace the ECT sensor.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

5. An obvious cause of low fuel pressure would be an empty fuel tank.
6. The engine will easily start and run if a few injectors are disabled. It is not necessary to test all injectors at this time since this step is only a test to verify that all of the injectors have not been disabled by fuel contamination.
7. A blinking test light verifies that the PCM is monitoring the 58X crankshaft reference signal and is capable of activating the injectors. If there is an open or shorted driver circuit, DTCs 201–206 should be set.

19. By using a spark tester, each ignition coil's ability to produce 25,000 volts is verified.

25. If there is an open or shorted driver circuit, DTCs 201-206 should be set. All six injector driver circuits can be checked at one time without removing the intake manifold if a 5-8840-2636-0 test light is available. This is the alternative procedure:

- With the ignition "OFF," disconnect the gray connector located at the rear of the air filter, attached to a bracket on the purge canister.
- Connect test light 5-8840-2636-0 to the connector. Do any of the light constantly illuminate or fail to blink when the engine is cranked? If so, repair the short or open circuit, or replace the PCM if indicated.

This procedure only tests the driver circuit as far as the test connection, so step 31 is added to test the circuit all the way to the injector.

Engine Cranks But Will Not Run

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Check the 15 A ignition coil fuse, the 15 A engine device fuse, and the 15A PCM fuse. Was a fuse blown?	—	Go to Step 3	Go to Step 4
3	Check for a short to ground and replace the fuse. Is the action complete?	—	Verify repair	—
4	1. Ignition "OFF," install a fuel pressure gauge at the test fitting on the fuel supply line in the engine compartment. (Use a shop cloth to absorb any fuel leakage while making the connection.) 2. Ignition "ON," observe the fuel pressure. Is the fuel pressure within the specified values, and does it hold steady?	285-375 kPa (43-55 psi)	Go to Step 6	Go to Step 5
5	Is any fuel pressure indicated?	—	Go to <i>Fuel System Electrical Test</i>	Go to <i>Fuel System Diagnosis</i>
6	Install an injector test light at the #2 cylinder injector harness connector (or install 5-8840-2636-0 test light to the the injector test connector). Does the light blink when the engine is cranked?	—	Go to Step 7	Go to Step 23
7	1. Ignition "OFF." 2. Disconnect the 6-pin connector at the ignition coil. 3. With a test light to B+, probe each of the 6 exposed ignition module pins, one at a time, while the engine is cranked. Does the light flash at each pin when the engine is cranked?	—	Go to Step 11	Go to Step 8
8	1. Remove the 5-pin connector at the ignition coil. 2. Ignition "ON." 3. Use a test light at the harness connector to verify that the module is being supplied with B+ and ground. Was a problem found?	—	Go to Step 9	Go to Step 10
9	Repair the open ignition feed circuit or ground circuit to the ignition coil. Is the action complete?	—	Verify repair	—
10	Repair the ignition module. Is the action complete?	—	Verify repair	—
11	1. Reconnect the ignition coil connector. 2. Remove the electrical connector from each coil. 3. With a test light to B+, probe each of the coil connectors at the wire which runs to the ignition module. (Wire color will match the wire color at the ignition module 6-pin connector – green, or green with a tracer.) Does the light flash at each coil connector when the engine is cranked?	—	Go to Step 13	Go to Step 12

Engine Cranks But Will Not Run (Cont'd)

Step	Action	Value(s)	Yes	No
12	Check for an open circuit between the ignition coil. Is the action complete?	—	Verify repair	—
13	1. Ignition "ON." 2. While the coil connectors are disconnected, touch each coil connector's ignition feed terminal with a grounded test light (the ignition feed wire is black with orange tracer). Did the test light illuminate?	—	Go to Step 15	Go to Step 14
14	Repair the open ignition feed circuit. Is the action complete?	—	Verify repair	—
15	While the coil connectors are disconnected, touch each connector's secondary ground terminal with a test light to B+. (The ground wires are black.) Did the test light illuminate at each coil connector?	—	Go to Step 17	Go to Step 16
16	Repair the open secondary ground circuit. Is the action complete?	—	Verify repair	—
17	1. Test the fuel for contamination. 2. If a problem is found, clean the fuel system and correct the contaminated fuel condition as necessary. Replace the fuel filter and replace any injectors that are not delivering fuel (see Injector Balance Test). Was a problem found?	—	Verify repair	Go to Step 18
18	1. Remove any ignition coil and install a spark tester at the spark plug end of the coil. 2. Observe the tester while the engine is cranking. Was a crisp, blue spark observed? Only one or two sparks followed by no result is considered the same as "No Spark."	—	Go to Step 20	Go to Step 19
19	Replace the ignition coil, and return to Step 19 to test the remaining coils. Is the action complete?	—	Verify repair	—
20	Repeat Step 19 for each coil. Remove only one coil at a time, and reinstall each coil on its spark plug after testing, but do not refasten coils with screws at this time. After all coils have passed the spark test, does the engine start?	—	Refasten all coils with their screws	Go to Step 21
21	1. Remove the spark plugs from all cylinders. 2. Visually inspect the spark plug electrodes. 3. Replace any spark plugs with loose or missing electrodes or cracked insulators. Did your inspection reveal any spark plugs exhibiting excessive fouling?	—	Correct the fouling condition	Go to Step 22

Engine Cranks But Will Not Run (Cont'd)

Step	Action	Value(s)	Yes	No
22	Refer to <i>Engine Mechanical Diagnosis</i> to diagnose the following conditions: <ul style="list-style-type: none"> ● Faulty or incorrect camshaft drive belts ● Leaking or sticky valves or rings ● Excessive valve deposits ● Loose or worn rocker arms ● Weak valve springs ● Incorrect valve timing ● Leaking head gasket <p>Is the action complete?</p>	—	Verify repair	Go to <i>Step 24</i>
23	Observe the "Engine Speed" data display on the Tech 2 while cranking the engine. <p>Is the engine RPM indicated?</p>	—	Go to <i>Step 24</i>	Go to <i>Step 33</i>
24	1. Disconnect the 7-pin gray connector at the rear of the air filter beneath the point where the air duct attaches to the MAF sensor. 2. Ignition "ON." 3. Using a test light connected to ground, probe the ignition terminal at the PCM (female) side of the 7-pin connector. <p>Is the test light "ON?"</p>	—	Go to <i>Step 25</i>	Go to <i>Step 31</i>
25	1. At the PCM (female) side of the connector mentioned in step 25, connect a test light between the ignition + terminal and one of the injector driver circuits at the same connector. 2. Ignition "ON." 3. Observe the test light, and repeat the test for each injector driver circuit. <p>Did the test light stay on when checking any of the 6 injector driver circuits?</p>	—	Go to <i>Step 26</i>	Go to <i>Step 28</i>
26	1. Ignition "OFF," disconnect the PCM. 2. Ignition "ON," observe the test light. <p>Is the test light "ON?"</p>	—	Go to <i>Step 27</i>	Go to <i>Step 32</i>
27	Locate and repair the short to ground in the injector driver circuit. <p>Is the action complete?</p>	—	Verify repair	—
28	1. Using the same test location as in step 26, connect a test light between the ignition terminal and one of the driver circuits. 2. Crank the engine and observe the test light. 3. Repeat for each injector driver circuit. <p>Did the light blink during the test for each circuit?</p>	—	Go to <i>Step 30</i>	Go to <i>Step 29</i>
29	Check for an open injector driver circuit. <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 32</i>

Engine Cranks But Will Not Run (Cont'd)

Step	Action	Value(s)	Yes	No
30	1. At the injector (male) side of the gray connector mentioned in step 25, connect an ohmmeter between the ignition pin and one of the driver circuit pins. 2. Check for continuity in the circuit. 3. Repeat for each injector circuit. The readings should be approximately equal to the specified value for injector resistance. Was a problem found?	12.5 ohms	Verify repair	Go to Step 7
31	Repair the ignition feed circuit. Is the action complete?	—	Verify repair	—
32	Replace the PCM. Is the action complete?	—	Verify repair	—
33	1. Raise the vehicle and disconnect the CKP sensor harness. 2. Ignition "ON." 3. With a test light to ground, probe the harness ignition feed terminal. Did the light illuminate?	—	Go to Step 35	Go to Step 34
34	Check the ignition feed wire between the sensor and the PCM for a short to ground or open circuit. Is the action complete?	—	Verify repair	—
35	1. Ignition "ON." 2. At the CKP harness connector, connect a test light between the ignition and ground terminals. Did the light illuminate?	—	Go to Step 37	Go to Step 36
36	Check the sensor ground circuit for an open or short to voltage. Is the action complete?	—	Verify repair	—
37	Check the signal circuit between the sensor and the PCM for a short to ground, short to voltage, or an open. Was a problem found?	—	Verify repair	Go to Step 38
38	Replace the CKP position sensor. Is the action complete?	—	Verify repair	Go to Step 32

CAUTION: To reduce the risk of fire and personal injury:

- It is necessary to relieve fuel system pressure before connecting a fuel pressure gauge. Refer to Fuel Pressure Relief Procedure, below.
- A small amount of fuel may be released when disconnecting the fuel lines. Cover fuel line fittings with a shop towel before disconnecting, to catch any fuel that may leak out. Place the towel in an approved container when the procedure is completed.

2. Remove the fuel pump relay from the underhood relay center.
3. Start the engine and allow it to stall.
4. Crank the engine for an additional 3 seconds.

Fuel Gauge Installation

1. Remove the shoulder fitting cap.
2. Install fuel gauge 5-8840-0378-0 to the fuel feed line located in front of and above the right side valve cover.
3. Reinstall the fuel pump relay.

Fuel Pressure Relief Procedure

1. Remove the fuel cap.

Fuel System Electrical Test

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Read the "Caution" above. 2. Relieve the fuel system pressure and install the fuel pump pressure gauge to the test fitting. 3. Ignition SW is "ON". 4. Use a Tech 2 to command the fuel pump "ON." (Refer to Miscellaneous Test) Is there an immediate pressure build-up which indicates the pump is running?	—	Go to Step 3	Go to Step 4
3	1. Verify that the pump is not running by removing the fuel filler cap and listening. 2. Command the pump "ON" with the Tech 2. Did the pump turn "OFF" after 2 seconds?	—	Test completed	Go to Step 12
4	1. Ignition "OFF." 2. Remove the fuel pump relay. 3. Using a test light connected to ground, probe the battery feed to the relay. Did the light illuminate?	—	Go to Step 6	Go to Step 5
5	Repair short or open battery feed to fuel pump relay. Is the action complete?	—	Verify repair	—
6	1. Connect a test light between the two wires that connect to the fuel pump relay pull-in coil. 2. Ignition "ON." Did the test light illuminate for 2 seconds and then turn off?	—	Go to Step 12	Go to Step 7
7	1. With a test light connected to battery (-), probe the fuel pump relay connector at the wire which runs from the relay pull-in coil to the PCM. 2. Ignition "ON." Did the test light illuminate for 2 seconds and then turn off?	—	Go to Step 8	Go to Step 9
8	Locate and repair open in the fuel pump relay ground circuit. Is the action complete?	—	Verify repair	—

Fuel System Electrical Test (Cont'd)

Step	Action	Value(s)	Yes	No
9	Check for short or open between the PCM and the fuel pump relay. Was a problem found?	—	Verify repair	Go to <i>Step 10</i>
10	1. Check the fuel pump relay circuit for a poor terminal connection at the PCM. 2. If a problem is found, replace terminal as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 11</i>
11	Replace the PCM. Is the action complete?	—	Verify repair	—
12	1. Reconnect the fuel pump relay. 2. Disconnect the fuel pump electrical connector at the fuel tank. 3. Using a test light connected to ground, probe the fuel pump feed wire (harness side). 4. Command the fuel pump "ON" with a Tech 2. Did the light illuminate for 2 seconds?	—	Go to <i>Step 15</i>	Go to <i>Step 13</i>
13	1. Substitute a known good relay for the fuel pump relay. 2. Leave the test light connected as in step 12. 3. Command the fuel pump "ON" with the Tech 2. 4. After this test, re-connect the known good relay in its proper location. Did the test light illuminate for 2 seconds when the fuel pump was commanded "ON?"	—	Go to <i>Step 17</i>	Go to <i>Step 14</i>
14	Check for a short circuit, blown fuse or open circuit between the relay and the fuel tank. Is the action complete?	—	Verify repair	—
15	1. With the fuel pump electrical connector at the fuel tank disconnected, connect a test light between the feed wire and the ground wire (harness side). 2. Command the fuel pump "ON" with a Tech 2. Did the test light illuminate for 2 seconds?	—	Go to <i>Step 18</i>	Go to <i>Step 16</i>
16	Repair the open circuit in the fuel pump ground wire. Is the action complete?	—	Verify repair	—
17	Replace the fuel pump relay. Is the action complete?	—	Verify repair	—
18	Replace the fuel pump. Is the action complete?	—	Verify repair	—

Circuit Description

When the ignition switch is turned "ON," the powertrain control module (PCM) will turn "ON" the in-tank fuel pump. The in-tank fuel pump will remain "ON" as long as the engine is cranking or running and the PCM is receiving 58X crankshaft position pulses. If there are no 58X crankshaft position pulses, the PCM will turn the in-tank fuel pump "OFF" 2 seconds after the ignition switch is turned "ON" or 2 seconds after the engine stops running. The in-tank fuel pump is an electric pump within an integral reservoir. The in-tank fuel pump supplies fuel through an in-line fuel filter to the fuel rail assembly. The fuel pump is designed to provide fuel at a pressure above the pressure needed by the fuel injectors. A fuel pressure regulator, attached to the fuel rail, keeps the fuel available to the fuel injectors at a regulated pressure. Unused fuel is returned to the fuel tank by a separate fuel return line.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. Connect the fuel pressure gauge to the fuel feed line as shown in the fuel system illustration. Wrap a shop towel around the fuel pressure connection in order to absorb any fuel leakage that may occur when installing the fuel pressure gauge. With the ignition switch "ON" and the fuel pump running, the fuel pressure indicated by the fuel pressure gauge should be 333-376 kPa (48-55 psi). This pressure is controlled by the amount of pressure the spring inside the fuel pressure regulator can provide.
3. A fuel system that cannot maintain a constant fuel pressure has a leak in one or more of the following areas:
 - The fuel pump check valve.
 - The fuel pump flex line.

- The valve or valve seat within the fuel pressure regulator.
 - The fuel injector(s).
4. Fuel pressure that drops off during acceleration, cruise, or hard cornering may cause a lean condition. A lean condition can cause a loss of power, surging, or misfire. A lean condition can be diagnosed using a Tech 2. If an extremely lean condition occurs, the oxygen sensor(s) will stop toggling. The oxygen sensor output voltage(s) will drop below 500 mV. Also, the fuel injector pulse width will increase.

IMPORTANT: Make sure the fuel system is not operating in the "Fuel Cut-Off Mode."

When the engine is at idle, the manifold pressure is low (high vacuum). This low pressure (high vacuum) is applied to the fuel pressure regulator diaphragm. The low pressure (high vacuum) will offset the pressure being applied to the fuel pressure regulator diaphragm by the spring inside the fuel pressure regulator. When this happens, the result is lower fuel pressure. The fuel pressure at idle will vary slightly as the barometric pressure changes, but the fuel pressure at idle should always be less than the fuel pressure noted in step 2 with the engine "OFF."

16. Check the spark plug associated with a particular fuel injector for fouling or saturation in order to determine if that particular fuel injector is leaking. If checking the spark plug associated with a particular fuel injector for fouling or saturation does not determine that a particular fuel injector is leaking, use the following procedure:
- Remove the fuel rail, but leave the fuel lines and injectors connected to the fuel rail. Refer to *Fuel Rail Assembly* in *On-Vehicle Service*.
 - Lift the fuel rail just enough to leave the fuel injector nozzles in the fuel injector ports.

CAUTION: In order to reduce the risk of fire and personal injury that may result from fuel spraying on the engine, verify that the fuel rail is positioned over the fuel injector ports and verify that the fuel injector retaining clips are intact.

- **Pressurize the fuel system by connecting a 10 amp fused jumper between B+ and the fuel pump relay connector.**
- **Visually and physically inspect the fuel injector nozzles for leaks.**

17. A rich condition may result from the fuel pressure being above 376 kPa (55 psi). A rich condition may cause a DTC P0132 or a DTC P0172 to set. Driveability conditions associated with rich conditions can include hard starting (followed by black smoke) and a strong sulfur smell in the exhaust.
