12. Mount the chain and sprocket assembly to both output shafts.

NOTE: When installing chain, the copper colored ring of the chain (indicated by the arrow) to be installed in direction of rear.

13. Install the front torn wheel to the front output shaft.
14. Install the spacer to the drive sprocket assembly.

4D2-24 TRANSFER CASE (TOD)

Transfer Case Assembly

265RY00001

Legend

- | | |
|--------------------------------------|--|
| (1) Transfer Case (with Oil Seal) | (8) Snap Ring |
| (2) Ball Bearing | (9) Circular Hub |
| (3) Ring Gear | (10) Carrier Assembly |
| (4) Snap Ring | (11) Snap Ring |
| (5) Input Shaft and Carrier Assembly | (12) Thrust Plate |
| (6) Snap Ring | (13) Sun Gear |
| (7) Ball Bearing | (14) Input Shaft Assembly (with Bearing and Bushing) |

Disassembly

1. Using snap ring pliers, open the snap ring from the gap on the carrier assembly. While opening the snap ring, remove the input shaft assembly, carrier assembly and thrust plate together from the transfer case.

265RY00002

TRANSFER CASE (TOD) 4D2-25

2. Remove the snap ring from the transfer case.

265RY00003

3. Using snap ring pliers, remove the snap ring.

265RW009

4. Using the bearing remover J-22912-01, remove the ball bearing from the input shaft.

265R200001

5. Remove the circular hub.

6. Remove the snap ring from the carrier assembly.

265RW006

7. Remove the thrust plate from the carrier assembly.

4D2-26 TRANSFER CASE (TOD)

8. Remove the snap ring before the ring gear.

261RW025

9. Using the ring gear remover J-42806 and a bench press, remove the ring gear from the transfer case.

261R200005

NOTE: Removing ring gear needs a high-load press. This means the transfer case may be damaged. To remove and replace the ring gear, it is recommended that the transfer case assembly should be replaced.

10. Remove the ball bearing of the front output shaft from the transfer case.

261RY00021

Reassembly

Oil Seal Replacement

1. Remove the oil seal of the front output shaft and input shaft from the transfer case.
2. Apply the circumference of the new oil seal and fill the lip with grease (BESCO L2 or its equivalent).
3. Using the oil seal installer J-42807, install the front output shaft oil seal to the transfer case.

266RY00013

4. Using the oil seal installer J-42808, install the input shaft oil seal to the transfer case.

261RY00031

5. Using the ring gear installer J-42809 and a bench press, install the ring gear to the transfer case.

NOTE: Pay attention to the following points.

- Identify the correct direction of gear.
- Do not damage the gear.
- Do not press-fit the ring gear slantingly.
- Press-fit the ring gear to the innermost.
- Remove burrs generated by press-fitting.
- If the transfer case has serrations, match them with those of the gear and press-fit the gear.

261R20007

6. Install the snap ring.

7. Install the thrust plate to the carrier assembly.
Attach the snap ring to the carrier assembly.

8. Install the carrier assembly to the input shaft.

9. With care the direction of circular hub, mount it to the input shaft.

265RW008

10. Press the ball bearing to the input shaft so that the snap ring will be attached to the input shaft.

265RY00004

11. Install the snap ring to the input shaft.

12. Install the ball bearing of the front output shaft to the transfer case.

4D2-28 TRANSFER CASE (TOD)

13. Install the snap ring of the input shaft bearing to the transfer case.

265RY0003

14. Using snap ring pliers, open the snap ring from the gap on the carrier assembly. While opening the snap ring, securely attach the input shaft and carrier assembly to the transfer case.

265RY0002

Inspection and Repair (Transfer Case Assembly)

When wear, damage, or any other defects are observed during the inspection, the part or parts must be repaired or replaced. Wash all the parts with clean detergent, and check that old oil, metallic particles, dirt, or foreign materials are completely removed. Blow the air into oil holes and grooves to remove foreign materials or residual detergent.

Chain

- Check whether the face that contacts the sprocket is free from excessive wear or damage. If defects are observed, replace the part.
- If the chain interference mark is found on the inside wall of the transfer cover or the chain is so slack that a skipped engagement occurs between the chain and sprocket, replace the chain.

Sprocket

- Check whether the sprocket tooth surface is excessively worn or damaged, and there is evidence of burrs, chipping, wear, or damage on the gear spline. Remove minor flaws or scratches with oil stone. If excessive wear or damage is observed, replace the part.
- If excessive wear or damage is observed on the sprocket inside sliding surface, replace the part.

Gear

- Check whether the gear tooth surface is excessively worn or damaged, and there is evidence of burrs, chipping, wear, or damage on the gear spline. Remove minor flaws or scratches with oil stone. If excessive wear or damage is observed, replace the part.

Thickness of Reduction Hub

- Measure the thickness with a micrometer.
- If the measurement exceeds the limit, replace the reduction hub.

Standard : 3.05–3.30 mm (0.120–0.130 in)

Allowable limit : 2.5 mm (0.098 in)

265RW005

Lockup Collar Assembly

- Install the lockup hub, drive sprocket assembly, and lockup collar assembly to the output shaft.
- If the lockup collar assembly does not move smoothly, replace the lockup collar assembly.

NOTE: Apply ATF to the rear engaging the gear.

Width of Lockup Collar

- Using calipers, measure the lockup collar groove for width of wear.
- If the measurement exceeds the limit, replace the lockup collar assembly.

Standard : 7.16–7.32 mm (0.282–0.288 in)

Allowable limit : 7.9 mm (0.311 in)

Lockup Fork and Rail

- Check the lockup fork and rail for wear, distortion, and scratches. If defects are observed, replace the parts.

Thickness Lockup Fork

If the measurement exceeds the limit, replace the lockup fork.

Standard : 6.99–7.09 mm (0.275–0.279 in)

Allowable limit : 6.3 mm (0.248 in)

Shift Fork and Rail Assembly

Check the shift fork and rail for wear, distortion, and scratches. If defects are observed, replace the parts.

Thickness of Shift Fork

- If the measurement exceeds the limit, replace the shift fork.

Standard : 3.41–3.79 mm (0.134–0.149 in)

Allowable limit : 4.4 mm (0.173 in)

4D2-30 TRANSFER CASE (TOD)

Bearing

Check the profile of the needle, roller, ball, and thrust bearings. Wash the bearings with clean detergent completely, and dry with air.

NOTE: If the bearing is rotated excessively, the rollers may be damaged. So, rotate the bearing slowly with your hand. Apply grease to the bearing, and check the smoothness of the bearing while slowly rotating the race with your hand.

Allowable limit : 0.23 mm (0.009 in)

226RW143

Lockup Fork Spring

Check the lockup fork spring for distortion, cracking, and wear. If defects are observed, replace the part.

Multi Plate Disk Clutch

- If the burned, mirror-surfaced clutch facing, or scraping is observed on the clutch plates, clutch housing, armature plate, and insulator washer, replace the parts.

266R20003

Legend

- (1) Clutch Housing
- (2) Clutch Plate
- (3) Insulator Washer
- (4) Armature Plate

Coil Assembly

- Check the resistance of the coil with a tester. If defects are observed, replace the coil assembly.

Standard : $1.7 \pm 0.3 \Omega$ (at ordinary temperature)

Allowable limit : 1.0~5.0 Ω

261RY00022

Cam Pulley, Cam Ball, and Cam & Coil Housing

- Check the cam balls and cam for excessive wear or damage. If defective, replace the parts.

266RW016

4H and 4L Switch

- Check the continuity of 4H and 4L switch.
If defects are observed, replace the 4H and 4L switch.

261R20006

261RW049

Switch Stroke	4H Switch Signal	4L Switch Signal	The corresponding position of TOD switch
	Terminal 2 to Switch Body	Terminal 1 to 3	
1	Open	Open	2H, TOD
2	Open	Close	4L
3	Close	Close	Neutral

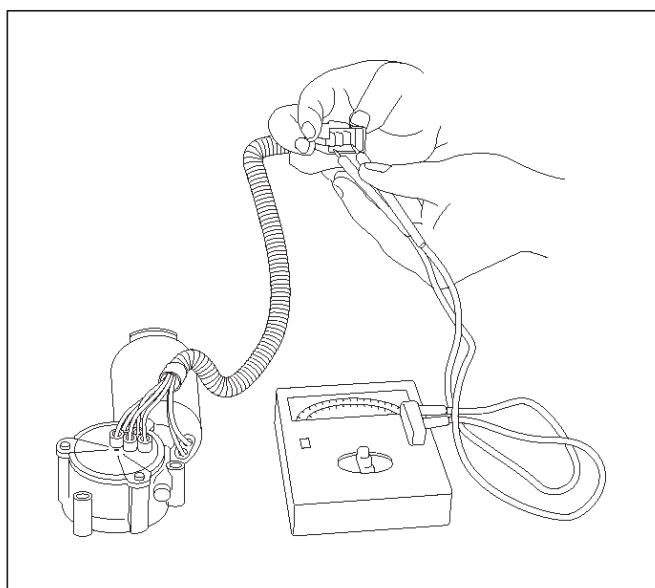

Shift Motor Assembly

- Check the resistance of the shift motor assembly (between terminal 4 to 7) with a tester.
If defects are observed, replace the shift motor assembly.

Standard : $0.63 \pm 0.2 \Omega$ (at ordinary temperature)

8-6

261RY00023

Oil Pump

- Remove foreign materials from the strainer. If the strainer is damaged, replace it.
- If the area into which the shaft is inserted is excessively worn or damaged, replace the oil pump assembly.

Main Data and Specification

General Specification

Type	Electronically controlled torque split four wheel drive with two wheel drive.
	2WD: Rear two wheel drive
	TOD: Electronically controlled torque split four wheel drive.
	4L: Low speed mechanical lockup four wheel drive.
	Rear drive: Direct drive
	Front drive: Chain drive
	Low range deceleration: Planetary gear drive
Control system	Switch control
Gear ratio	High: 1.000
	Low: 2.480
Lubrication system	Built-in oil pump
	Forced lubrication
Type of lubricant	ATF DEXRON®-II or III
Oil capacity	1.35 liters. (1.43 US.quart)
Clutch discs number	13
Planetary gear teeth number	Sun gear: 58
	Pinion gear: 15
	Ring gear: 86

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO *THE SRS COMPONENT AND WIRING LOCATION VIEW* IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO *THE SRS SERVICE INFORMATION*. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

The Anti-lock Brake System (ABS) works on all four wheels. A combination of wheel speed sensor and Electronic Hydraulic Control Unit (EHCUC) can determine when a wheel is about to stop turning and adjust brake pressure to maintain best braking.

This system helps the driver maintain greater control of the vehicle under heavy braking conditions.

NOTE: The Electronic Hydraulic Control Unit (EHCUC) comprises the Hydraulic Unit (H/U) and the coil Integrated Module.

5A-4 BRAKE CONTROL SYSTEM

Functional Description

Hydraulic Unit (H/U)

Solenoid Valve

Legend

(1) Isolation Valve

(2) Dump valve

Normal Braking

During normal (non anti-lock) braking, the solenoid valves are without current and closed due to spring force.

Brake fluid travels through the centre of the normally open isolation valve around the normally closed dump valve and on to the brake pistons.

Legend

(1) Brake

(2) Master Cylinder

5A-6 BRAKE CONTROL SYSTEM

Pressure Isolation (Pressure Maintain)

The electro-hydraulic control unit is activated when the brakes are applied which sends a signal to the coil integrated module to prepare for a possible anti-lock stop.

If the information from the wheel speed sensors indicates excessive wheel deceleration (imminent lockup), the first step in the anti-lock sequence is to isolate the brake pressure being applied by the brake

pedal.

The microprocessor in the coil integrated module sends a voltage to the coil to energize and close the isolation valve. This prevents any additional fluid pressure applied by the brake pedal from reaching the wheel. With the isolation valves closed, further unnecessary increase in the brake pressure is therefore prevented.

Legend

(1) Brake

(2) Master Cylinder

Pressure Reduction

Once the brake pressure is isolated, it must be reduced to allow the wheels to unlock. This is accomplished by dumping a portion of the brake fluid pressure into a low pressure accumulator.

The microprocessor activates the normally closed dump valve to open, allowing fluid from the wheels to be dumped into the accumulator. This is done with very short activation pulses opening and closing the dump valve passageway. Brake pressure is reduced at the

wheel and allows the wheel to begin rotating again. The fluid from the brake piston is stored in the accumulator against spring pressure and a portion of this fluid also primes the pump.

The dump valves are operated independently to control the deceleration of the wheel. At this point, the brake pedal is isolated from the base brake system, the hydraulic control unit pumps are primed and the attenuators are ready to pump fluid.

Legend

(1) Brake

(2) Master Cylinder

5A-8 BRAKE CONTROL SYSTEM

Pressure Increase (Re-apply)

The re-apply sequence is initiated to achieve optimum braking. The isolation valve is momentarily opened to allow master cylinder and pump pressure to reach the brakes. This controlled pressure rise continues until the wheel is at optimum brake output or until the brake pressure is brought up to the master cylinder output pressure.

If more pressure is required, more fluid is drawn from the master cylinder and applied to the brakes. The

driver may feel slight pedal pulsations, or pedal drop, this is normal and expected.

As fluid is re-applied to the brakes, the wheel speed will reduce. If the wheels approach imminent lockup again, the module will isolate, dump and re-apply again. This cycle occurs in millisecond intervals, allowing several cycles to occur each second. It is a much faster and more controlled way of "pumping the pedal".

Legend

(1) Brake

(2) Master Cylinder

Brake Release

At the end of the anti-lock stop, when the brake pedal is released, the pump will remain running for a short time to help drain any fluid from the accumulators. As this fluid returns into the system, the spring forces the piston

back to its original position.

The isolation valve opens and fluid may return to the master cylinder. Conventional braking is then resumed.

Legend

(1) Brake

(2) Master Cylinder

System Components

Electronic Hydraulic Control Unit (EHCU), three Wheel Speed Sensors, Warning Light, and G-sensor.

Electronic Hydraulic Control Unit (EHCU)

The EHCU consists of ABS control circuits, fault detector, and a fail-safe. It drives the hydraulic unit according to the signal from each sensor, cancelling ABS to return to normal braking when a malfunction has occurred in the ABS.

The EHCU has a self-diagnosing function which can indicate faulty circuits during diagnosis.

The EHCU is mounted on the engine compartment rear right side. It consists of a Motor, Plunger Pump, Solenoid Valves.

Solenoid Valves: Reduces or holds the caliper fluid pressure for each front disc brake or both rear disc brakes according to the signal sent from the EHCU.

Reservoir: Temporarily holds the brake fluid that returns from the front and rear disc brake caliper so that pressure of front disc brake caliper can be reduced smoothly.

Plunger Pump: Feeds the brake fluid held in the reservoir to the master cylinder.

Motor: Drives the pump according to the signal from EHCU.

Check Valve: Controls the brake fluid flow.

ABS Warning Light

Vehicles equipped with the Anti-lock Brake System have an amber "ABS" warning light in the instrument panel. The "ABS" warning light will illuminate if a malfunction in the Anti-lock Brake System is detected by the Electronic Hydraulic Control Unit (EHCU). In case of an electronic malfunction, the EHCU will turn "ON" the "ABS" warning light and disable the Anti-lock braking function.

The "ABS" light will turn "ON" for approximately three

seconds after the ignition switch is to the "ON" position. If the "ABS" light stays "ON" after the ignition switch is the "ON" position, or comes "ON" and stays "ON" while driving, the Anti-lock Brake System should be inspected for a malfunction according to the diagnosis procedure.

Wheel Speed Sensor

It consists of a sensor and a rotor. The sensor is attached to the knuckle on the front wheels and to the rear axle case on the rear differential.

The rotor is press-fit in the axle shaft.

The flux generated from electrodes magnetized by a magnet in the sensor varies due to rotation of the rotor, and the electromagnetic induction generates alternating voltage in the coil. This voltage draws a "sine curve" with the frequency proportional to rotor speed and it allows detection of wheel speed.

G-Sensor

The G-sensor installed inside the EHCU detects the vehicle deceleration speed and sends a signal to the EHCU. In 4WD operation, all four wheels may be decelerated in almost the same phase, since all wheels are connected mechanically.

This tendency is noticeable particularly on roads with low friction coefficient, and the ABS control is adversely affected.

The G-sensor judges whether the friction coefficient of road surface is low or high, and changes the EHCU's operating system to ensure ABS control.

Normal and Anti-lock Braking

Under normal driving conditions, the Anti-lock Brake System functions the same as a standard power assisted brake system. However, with the detection of wheel lock-up, a slight bump or kick-back will be felt in the brake pedal. This pedal "bump" will be followed by a series of short pedal pulsations which occurs in rapid succession. The brake pedal pulsation will continue until there is no longer a need for the anti-lock function or until the vehicle is stopped. A slight ticking or popping noise may be heard during brake applications when the Anti-lock features is being used.

When the Anti-lock feature is being used, the brake pedal may rise even as the brakes are being applied. This is also normal. Maintaining a constant force on the pedal will provide the shortest stopping distance.

Brake Pedal Travel

Vehicles equipped with the Anti-lock Brake System may be stopped by applying normal force to the brake pedal. Although there is no need to push the pedal beyond the point where it stops or holds the vehicle, by applying more force the pedal will continue to travel toward the floor.

This extra brake pedal travel is normal.

General Diagnosis

General Information

ABS troubles can be classified into two types, those which can be detected by the ABS warning light and those which can be detected as a vehicle abnormality by the driver.

In either case, locate the fault in accordance with the "Basic Diagnostic Flowchart" and repair.

Please refer to *Section 5C* for the diagnosis of mechanical troubles such as brake noise, brake judder (brake pedal or vehicle vibration felt when braking), uneven braking, and parking brake trouble.

ABS Service Precautions

Required Tools and Items:

- Box Wrench
- Brake Fluid
- Special Tool

Some diagnosis procedures in this section require the installation of a special tool.

5-8840-0366-0 High Impedance Multimeter

When circuit measurements are requested, use a circuit tester with high impedance.

Computer System Service Precautions

The Anti-lock Brake System interfaces directly with the Electronic Hydraulic Control Unit (EHCU) which is a control computer that is similar in some regards to the Powertrain Control Module. These modules are designed to withstand normal current draws associated with vehicle operation. However, care must be taken to avoid overloading any of the EHCU circuits. In testing for opens or shorts, do not ground or apply voltage to any of the circuits unless instructed to do so by the appropriate diagnostic procedure. These circuits should only be tested with a high impedance multimeter 5-8840-0366-0 or special tools as described in this section. Power should never be removed or applied to any control module with the ignition in the "ON" position. Before removing or connecting battery cables, fuses or connectors, always turn the ignition switch to the "OFF" position.

General Service Precautions

The following are general precautions which should be observed when servicing and diagnosing the Anti-lock Brake System and/or other vehicle systems. Failure to observe these precautions may result in Anti-lock Brake System damage.

- If welding work is to be performed on the vehicle using an electric arc welder, the EHCU and valve block connectors should be disconnected before the welding operation begins.
- The EHCU and valve block connectors should never be connected or disconnected with the ignition "ON".
- If only rear wheels are rotated using jacks or drum tester, the system will diagnose a speed sensor malfunction and the "ABS" warning light will illuminate. But actually no trouble exists. After inspection stop the engine once and re-start it, then make sure that the "ABS" warning light does not illuminate.

If the battery has been discharged

The engine may stall if the battery has been completely discharged and the engine is started via jumper cables. This is because the Anti-lock Brake System (ABS) requires a large quantity of electricity. In this case, wait until the battery is recharged, or set the ABS to a

non-operative state by removing the fuse for the ABS (60A). After the battery has been recharged, stop the engine and install the ABS fuse. Start the engine again, and confirm that the ABS warning light does not light.

Note on Intermittents

As with virtually any electronic system, it is difficult to identify an intermittent failure. In such a case duplicating the system malfunction during a test drive or a good description of vehicle behavior from the customer may be helpful in locating a "most likely" failed component or circuit. The symptom diagnosis chart may also be useful in isolating the failure. Most intermittent problems are caused by faulty electrical connections or wiring. When an intermittent failure is encountered, check suspect circuits for:

- Suspected harness damage.
- Poor mating of connector halves or terminals not fully seated in the connector body (backed out).
- Improperly formed or damaged terminals.

Test Driving ABS Complaint Vehicles

In case that there has been an abnormality in the lighting pattern of "ABS" warning light, the fault can be located in accordance with the "Diagnosis By "ABS" Warning Light Illumination Pattern". In case of such trouble as can be detected by the driver as a vehicle symptom, however, it is necessary to give a test drive following the test procedure mentioned below, thereby reproducing the symptom for trouble diagnosis on a symptom basis:

1. Start the engine and make sure that the "ABS" W/L goes OFF. If the W/L remains ON, it means that the Diagnostic Trouble Code (DTC) is stored. Therefore, read the code and locate the fault.

NOTE: The DTC cannot be cleared if the vehicle speed does not exceed 12 km/h (8 mph) at DTC, even though the repair operation is completed.

2. Start the vehicle and accelerate to about 30 km/h (19 mph) or more.
3. Slowly brake and stop the vehicle completely.
4. Then restart the vehicle and accelerate to about 40 km/h (25 mph) or more.
5. Brake at a time so as to actuate the ABS and stop the vehicle.
6. Be cautious of abnormality during the test. If the W/L is actuated while driving, read the DTC and locate the fault.
7. If the abnormality is not reproduced by the test, make best efforts to reproduce the situation reported by the customer.
8. If the abnormality has been detected, repair in accordance with the "Symptom Diagnosis".

NOTE:

- Be sure to give a test drive on a wide, even road with

a small traffic.

- If an abnormality is detected, be sure to suspend the test and start trouble diagnosis at once.

"ABS" Warning Light

When ABS trouble occurs to actuate "ABS" warning light, the trouble code corresponding to the trouble is stored in the EHCUC. Only ordinary brake is available with ABS being unactuated. Even when "ABS" warning light is actuated, if the starter switch is set ON after setting it OFF once, the EHCUC checks up on the entire system and, if there is no abnormality, judges ABS to work currently and the warning light is lit normally even though the trouble code is stored.

NOTE: Illumination of the "ABS" warning light indicates that anti-lock braking is no longer available. Power assisted braking without anti-lock control is still available.

Normal Operation

"ABS" Warning Light

When the ignition is first moved from "OFF" to "RUN", the amber "ABS" warning light will turn "ON". The "ABS" warning light will turn "ON" during engine starting and will usually stay "ON" for approximately three seconds after the ignition switch is returned to the "ON" position. The warning light should remain "OFF" at all other times.

Tech 2 Scan Tool

scan tool user guide.

From 98 MY, Isuzu dealer service departments are recommended to use Tech 2. Please refer to Tech 2

**Legend**

- (3) DLC Cable

- (4) Tech-2

5A-14 BRAKE CONTROL SYSTEM

Getting Started

- Before operating the Isuzu PCMCIA card with the Tech 2, the following steps must be performed:
 1. The Isuzu 98 System PCMCIA card inserts into the Tech 2.
 2. Connect the SAE 16/19 adapter to the DLC cable.
 3. Connect the DLC cable to the Tech 2.
 4. Make sure the vehicle ignition is off.
 5. Connect the Tech 2 SAE 16/19 adapter to the vehicle DLC (1).

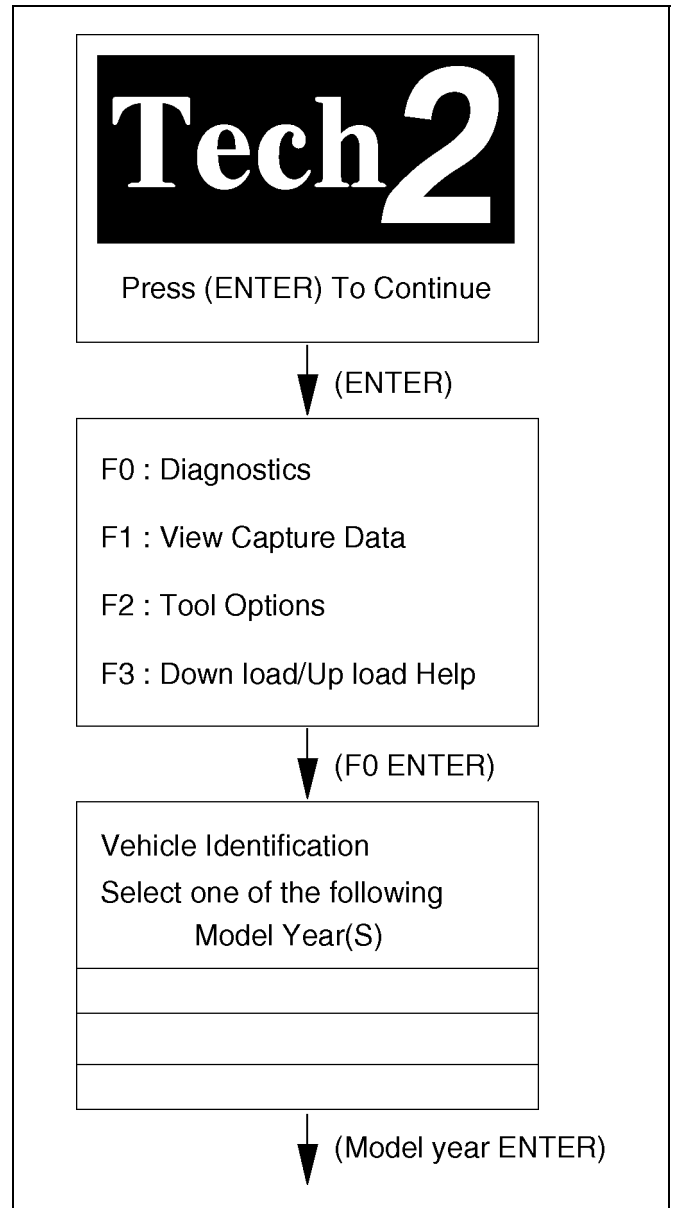

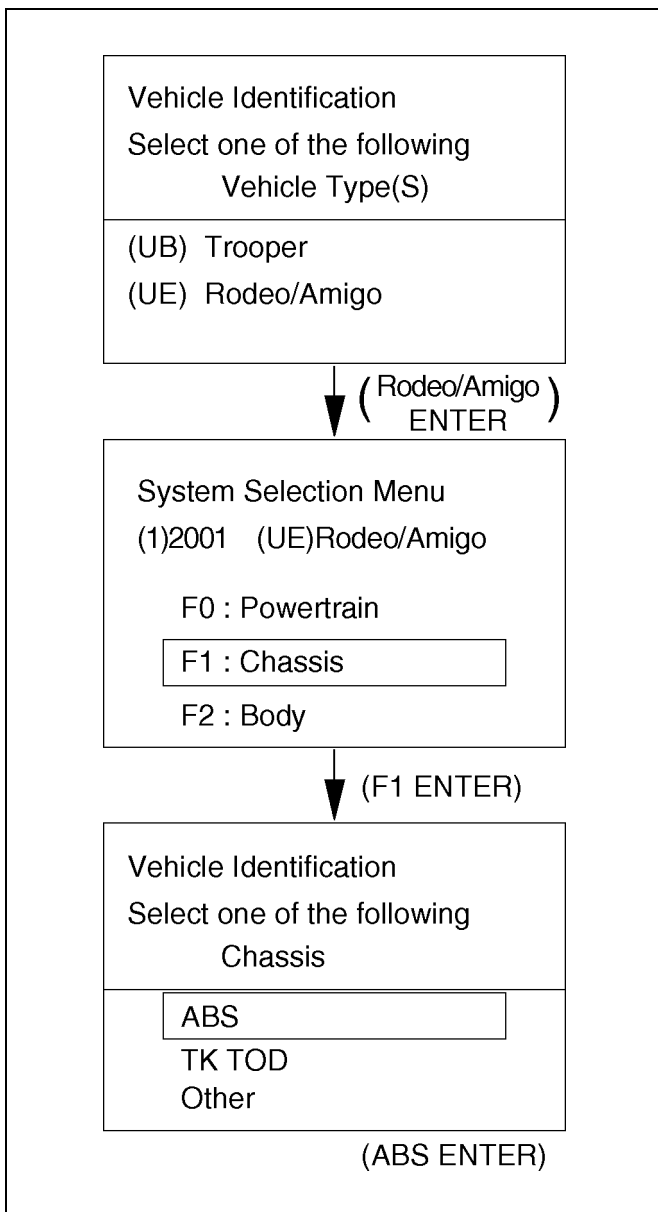

6. The vehicle ignition turns on.
7. Power up the Tech 2.
8. Verify the Tech 2 power up display.

Operating Procedure

The power up screen is displayed when you power up the tester with the Isuzu systems PCMCIA card. Follow the operating procedure below.

5A-16 BRAKE CONTROL SYSTEM

DATA LIST

The data displayed by DATA LIST are as follows:

Display	Content	OK/NG Criteria for Data
Front Left Wheel Speed Front Right Wheel Speed Rear Wheel Speeds	km/h (MPH)	<ul style="list-style-type: none"> Start the vehicle and make sure of linear change in each wheel speed. Turn each wheel by hand and make sure that each speed data change.

ACTUATOR TEST

This mode is used to exercise the ABS actuators and make sure they operate normally. Prior to the test, pay attention to the cautions below. (When checking the solenoid valve system, be sure to jack up the vehicle.)

CAUTION:

- Before testing, be sure that the brakes work normally.
- Make sure that the battery is fully charged.

Conduct the test by two persons (A TECH 2 operator and a vehicle checker).

- Be sure to start ACTUATOR TEST with the engine stopped.
- Before testing, make sure that electrical trouble, if any, has been completely repaired. Conducting tests of ABS solenoid with electrical circuit problem remaining uncorrected could damage the control unit.

Symptom Diagnosis

The symptoms that cannot be indicated by warning light can be divided in the following five categories:

1. ABS works frequently but vehicle does not decelerate.
2. Uneven braking occurs while ABS works.
3. The wheels lock during braking.

4. Brake pedal feel is abnormal.

5. Braking sound (from EHCU) is heard while not braking.

These are all attributable to problems which cannot be detected by EHCU self-diagnosis. Use the customer complaint and a test to determine which symptom is present. Then follow the appropriate flow chart listed below.

No.	Symptom	Diagnostic Flow Charts	
		Without TECH 2	With TECH 2
1	ABS works frequently but vehicle does not decelerate.	Chart A-1	Chart TA-1
2	Uneven braking occurs while ABS works.	Chart A-2	Chart TA-2
3	The wheels are locked.	Chart A-3	Chart TA-3
4	Brake pedal feel is abnormal.	Chart A-4	—
5	Braking sound (from EHCU) is heard while not braking.	Chart A-5	Chart TA-5

Chart A-1 ABS Works Frequently But Vehicle Does Not Decelerate

Step	Action	Yes	No
1	Is braking force distribution normal between front and rear of vehicle?	Go to Step 2	Repair brake parts. Go to Step 7
2	Are axle parts installed normally?	Go to Step 3	Repair axle parts. Go to Step 7
3	Is there play in each or any wheel speed sensor?	Repair wheel speed sensor. Go to Step 7	Go to Step 4
4	Is there damage, or powered iron sticking to each or any wheel speed sensor/sensor ring?	Replace sensor or sensor ring. Go to Step 7	Go to Step 5
5	Is the output of each wheel speed sensor normal? (Refer to <i>chart C-1 or TC-1</i>)	Go to Step 6	Replace wheel speed sensor or repair harness. Go to Step 7
6	Is the input of 4WD controller or TOD controll unit normal?	Go to Step 7	Replace 4WD controller or TOD controll unit or repair harness. Go to Step 7
7	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 7

Chart TA-1 ABS Works Frequently But Vehicle Does Not Decelerate (Use TECH 2)

Step	Action	Yes	No
1	1. Connect TECH 2. 2. Make sure of the output conditions of each sensor. Is the output of each sensor normal?	Go to Step 2	Replace wheel speed sensor. Go to Step 3
2	Return to Chart A-1. Was the Chart A-1 finished?	Go to Step 3	Go to Step 2
3	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

Chart A-2 Uneven Braking Occurs While ABS Works

Step	Action	Yes	No
1	Is there play in each or any sensor?	Repair. Go to Step 5	Go to Step 2
2	Damage or powdered iron sticking to each or any sensor/sensor ring?	Repair. Go to Step 5	Go to Step 3
3	Is the output of each sensor normal? (Refer to <i>chart C-1 or TC-1</i>)	Go to Step 4	Replace sensor or repair harness. Go to Step 5
4	Is brake pipe connecting order correct?	Replace H/U. Go to Step 5	Reconnect brake pipe correctly. Go to Step 5
5	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 5

Chart TA-2 Uneven Braking Occurs While ABS Works (Use TECH 2)

Step	Action	Yes	No
1	1. Connect TECH 2. 2. Make sure of the output conditions of each sensor. Is the output of each sensor normal?	Go to Step 2	Go to Step 3
2	Check piping by TECH 2 ACTUATOR TEST Is the piping normal?	Replace EHCJ. Go to Step 4	Repair the pipe. Go to Step 4
3	Repair and check the wheel speed sensor (Refer to <i>chart B-20 to B-23 , C-1 or TC-1</i>). Was the each chart finished?	Go to Step 4	Go to Step 3
4	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 4

Chart A-3, TA-3 The Wheels Are Locked

Step	Action	Yes	No
1	Is ABS working?	Go to Step 2	Go to Step 4
2	Is vehicle speed under 10 km/h (6mph)?	Go to Step 3	Normal.
3	Is sensor output normal? (Chart C-1 or TC-1)	Go to Step 4	Replace sensor or repair harness. Go to Step 6
4	Is front 4WD controller or TOD controll unit normal?	Go to Step 5	Replace 4WD controller or TOD controll unit or repair harness. Go to Step 6
5	Is hydraulic unit grounded properly?	Replace EHCU. Go to Step 6	Repair. Go to Step 6
6	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 6

Chart A-4 Brake Pedal Feed Is Abnormal

Step	Action	Yes	No
1	Is the stop light actuated when the brake pedal is depressed?	Go to Step 2	Go to Step 3
2	1. Turn the ignition switch off. 2. Disconnected EHCU connector. Is the check voltage EHCU connector terminals 13 to 7 when brake pedal is depressed than battery voltage?	Go to Step 4	Harness NG between brake SW and EHCU. Go to Step 6
3	Is stop light fuse normal?	Go to Step 5	Replace stop light fuse. Go to Step 6
4	Is the check continuity between EHCU connector terminals, 7 to body grounded?	Go to Step 6	Repair body grounded harness. Go to Step 6
5	Is brake SW normal?	Repair stop light harness. Go to Step 6	Replace brake SW. Go to Step 6
6	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 6

Chart A-5, TA-5 Braking Sound (From EHCU) Is Heard While Not Braking

Step	Action	Yes	No
1	Is this the first vehicle start after engine start?	It is self checking sound Normal.	Go to Step 2
2	Is vehicle speed under 10 km/h (6 mph)?	It is self checking sound Normal.	Go to Step 3
3	Check for the following condition: <ul style="list-style-type: none"> • At the time of shift down or clutch operation. • At the time of low road friction drive (ice or snow road) or rough road drive. • At the time of high-speed turn. • At the time of passing curb. • At the time of operating electrical equipment switches. • At the time of racing the engine (over 5000 rpm). Did it occur under any one condition above?	ABS may sometime be actuated even when brake pedal is not applied.	Go to Step 4
4	Is there play in each or any sensor/wheel speed sensor rings?	Repair. Go to Step 7	Go to Step 5
5	Damage or powdered iron sticking to each or any sensor/wheel speed sensor ring?	Repair. Go to Step 7	Go to Step 6
6	Is each sensor output normal? (Refer to <i>chart C-1 or TC-1</i>).	Check harness/connector for suspected disconnection If no disconnection is found, replace Coil integrated module. Go to Step 7	Repair. Go to Step 7
7	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 7

Diagnostic Trouble Codes

Choose and trace an appropriate flowchart by the numbers listed below to find fault and repair.

Code		Diagnosis	Item	Chart No.

Diagnosis By "ABS" Warning Light Illumination Pattern

In the event that there is abnormality in the "ABS"

warning light illumination pattern while the key is in the ON position or if the warning light is actuated during driving, trouble should be diagnosed on a illumination pattern basis as follows:

No.	Condition	"ABS" Warning Light Illumination Pattern	Diagnostic
1	Warning light is actuated normally	<p>Warning light ON OFF Starter SW ON OFF Still not lit during driving</p>	Normal
2	Warning light is not lit	<p>Warning light ON OFF Starter SW ON OFF</p>	Warning light lighting circuit trouble→Go to Chart B-1
3	Warning light remains ON	<p>Warning light ON OFF Starter SW ON OFF</p>	Diagnostic trouble codes are stored. Display diagnostic trouble codes and diagnose on a code basis according to the flow charts.
4	Warning light is actuated while driving	<p>Warning light ON OFF Starter SW ON OFF During driving</p>	Diagnostic trouble codes are stored. Display diagnostic trouble codes and diagnose on a code basis according to the flow charts.
5	Warning light goes at 12 km/h (8 mph) or higher (After repairing the faulty part)	<p>Warning light ON OFF Starter SW ON OFF Speed 0 kph 12 km/h (8 mph)</p>	Even after repairing the faulty part the warning light (W/L) dose not go out it vehicle is at a stop. Turn the ignition switch to the ON position and drive the vehicle at 12 km/h (8 mph) or higher to make sure that the warning light goes out.

Diagnostic Trouble Codes (DTCs)

When the warning light in the meter remains ON, the EHCU stores the fault identification and disables the ABS.

How to display and erase DTCs:

NOTE:

- DTCs can be displayed also by TECH 2. Use "Diagnostic Trouble Codes" mode.

The DLC is located behind the driver side kick panel

350RX008

- Keep #12 terminal connected with #4 terminal or #5 terminal (GND) during DTC display. (If #12 terminal is separated from #4 terminal or #5 terminal (GND) during display, display will stop.)

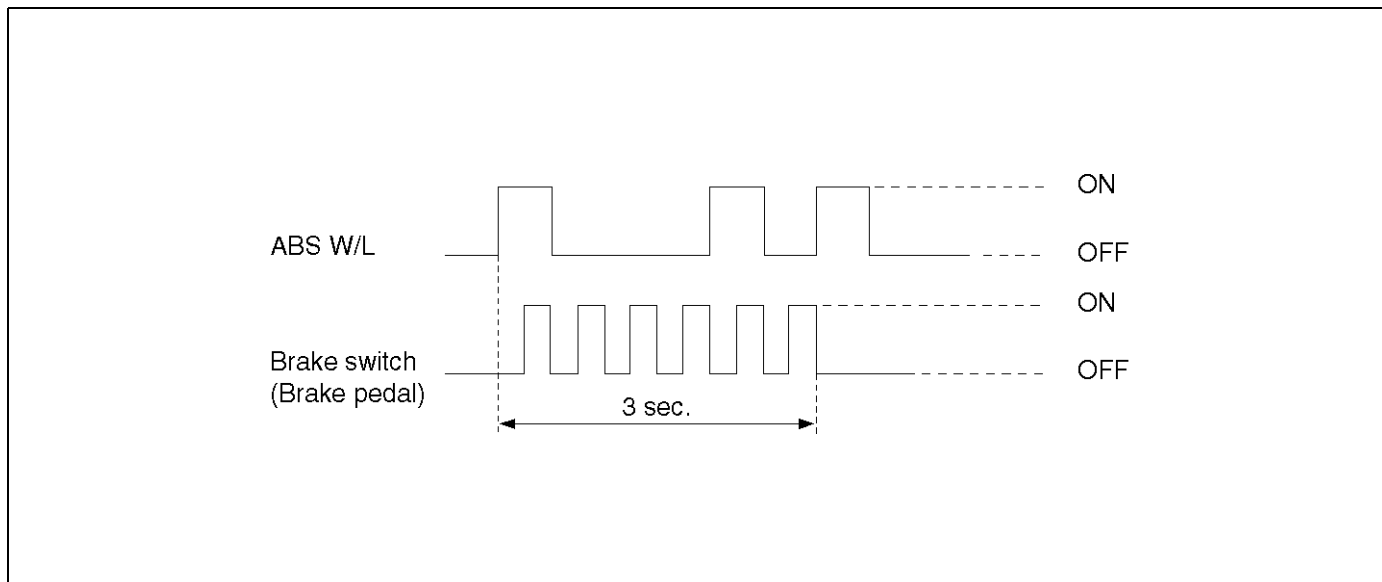

2. DTC display:

- DTC is displayed by blinking warning light.
- Double-digit display.
- First, normal DTC 12 is displayed three times and then any other DTCs are displayed three times. (If no other DTCs have been stored, the display of

DTC 12 will be repeated.)

3. How to erase code:

- Conduct brake switch ON/OFF operation 6 or more times within 3 seconds of self-diagnosis startup.
- The code cannot be erased if more than 3 seconds have passed since self-diagnosis startup, or if self-diagnosis has started with brake switched on (brake pedaled).

B05RW005

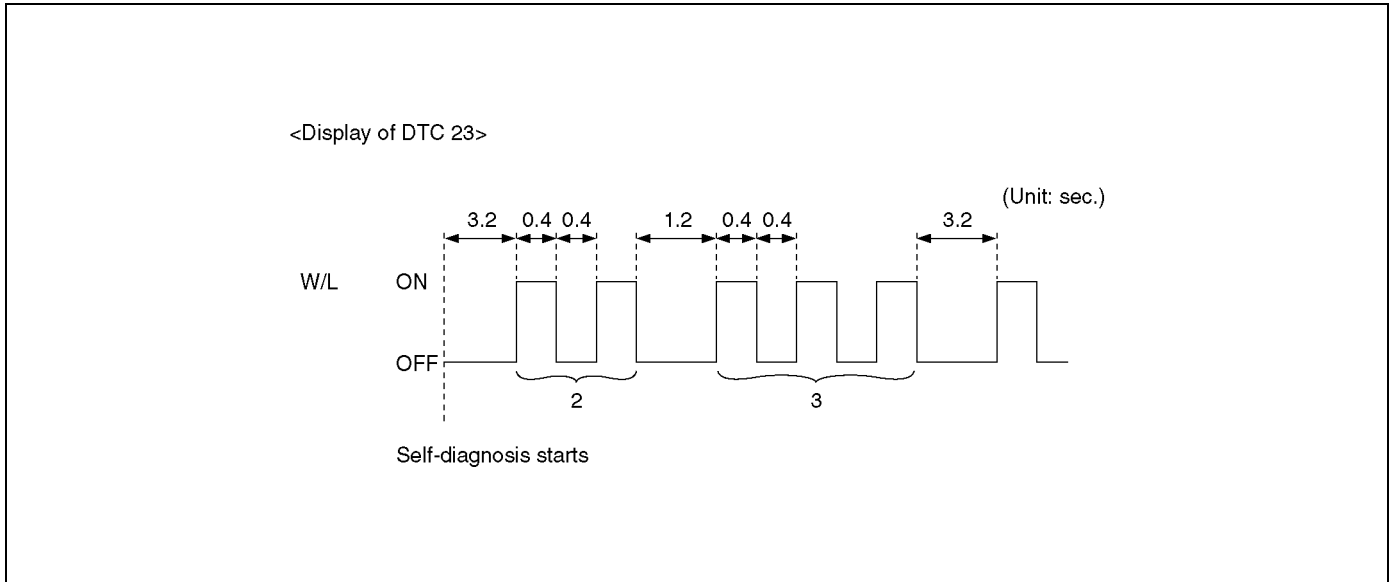

5A-38 BRAKE CONTROL SYSTEM

4. Notes

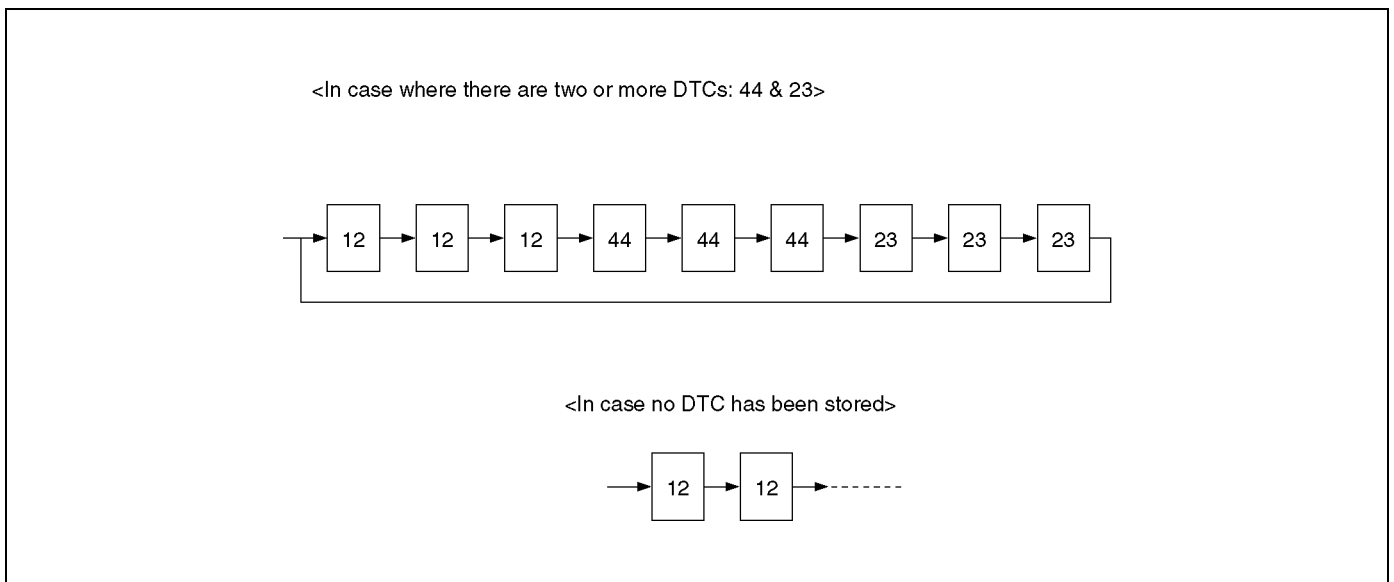

- If the following should occur during Diagnostic Trouble Code (DTC) display the display will be discontinued. After initial check, the status that is under the control of ABS will be returned :
 - The vehicle starts (The wheels turn) or the brake pedal is depressed.

- Up to 3 different codes can be stored.
- If the ABS should turn OFF due to an intermittent defect, the system will be restored at the next key cycle, if the initial check finds no abnormality (when IGN is switched from OFF to ON).

5. An example of DTC display Display of DTC 23

After displaying DTC 12 three times, one DTC after another is displayed, starting with the most recent one. (However, display is discontinued after about 5 minutes.)

The DTC 12 is displayed repeatedly. (display is discontinued after about 5 minutes after)

Chart B-1 With the key in the ON position (Before starting the engine). Warning light (W/L) is not activated.

Step	Action	Yes	No
1	Is W/L fuse disconnected?	Replace fuse. Go to Step 5	Go to Step 2
2	Is W/L burnt out?	Replace W/L bulb. Go to Step 5	Go to Step 3
3	1. Turn the key off. 2. Disconnect coil integrated module connector (C-4). 3. Turn the key ON. Is the check voltage between coil integrated module connector (C-4) terminals 6 and 7 than battery voltage?	Go to Step 4	Repair harness and connector. Go to Step 5
4	Is the check continuity coil integrated module connector (C-4) terminals, 1 and 7 and body ground.	Check harness for suspected disconnection No fault found: Replace EHCU. Go to Step 5	Repair harness and connector. Go to Step 5
5	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 5

Chart B-2 CPU Error (DTC 14 (Flash out) / C0271, C0272, C0273, C0284 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnected coil integrated module connector. 3. Inspect coil integrated module ground. Is the check resistance between the coil integrated module connector terminals, 2 (C-5) and 7 (C-4) and body ground?	Go to Step 2	Repair the body ground harness. Go to Step 3
2	1. Turn the key off, connect the coil integrated module connector. 2. Erase the trouble code. 3. Turn Ignition off, then on, to perform system self-check. 4. If warning light remains on, display trouble codes once again. Is the check trouble code 14 (Flash out) / C0271, C0272, C0273, C0284 (Serial communications)?	Replace EHCU. Go to Step 3	Inspect in accordance with the DTC displayed.
3	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

5A-40 BRAKE CONTROL SYSTEM

Chart B-3 Low or High Ignition Voltage (DTC 15 (Flash out) / C0277, 0278 (Serial communications))

Step	Action	Yes	No
1	Is the check battery voltage normal? (Battery capacity check)	Go to Step 2	Charge or replace battery. Go to Step 2
2	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Turn the key on. Is the check voltage between coil integrated module connector (C-4) terminals 1 and 7, higher than 10V?	Check harness connector for suspected disconnection Fault found: Repair, and perform system self-check No fault found: replace EHCU. Go to Step 3	Repair harness or connector. Go to Step 3
3	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

Chart B-4 Excessive Dump Time (DTC 17 (Flash out) / C0269 (Serial communications))

Step	Action	Yes	No
1	Check for anything causing extended ABS activation, such as locked brakes or an erratic speed sensor signal. Was a problem found?	Repair or Replace	Go to Step 2
2	1. The key turned off. 2. Replace EHCU. 3. Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 2

Chart B-5 Excessive Isolation Time (DTC 18 (Flash out) / C0274 (Serial communications))

Step	Action	Yes	No
1	Check for anything causing extended ABS activation, such as locked brakes or an erratic speed sensor signal. Was a problem found?	Repair or Replace	Go to Step 2
2	1. The key turned off. 2. Replace EHCU. 3. Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 2

Chart B-6 G-Sensor Output Failure (DTC 21 (Flash out) / C0276 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Replace EHCUC. 3. Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 1

Chart B-7 Brake Switch Failure (DTC 22 (Flash out) / C0281 (Serial communications))

Step	Action	Yes	No
1	Is the stop light actuated when the brake pedal is depressed?	Go to Step 2	Go to Step 4
2	1. Turn the key off. 2. Disconnected coil integrated module connector. Is the check voltage coil integrated module connector (C-4) terminals 13 to 7 when brake pedal is depressed than battery voltage?	Go to Step 3	Harness between brake SW and coil integrated module is faulty. Go to Step 6
3	Is the check that pins C-5 connector 2, and C-4 connector 7 have good ground?	Check harness / connector for disconnection Fault found: Repair, and perform system self-check. No fault found: replace EHCUC. Go to Step 6	Repair. Go to Step 6
4	Is stop light fuse normal?	Go to Step 5	Replace. Go to Step 6
5	Is brake SW normal?	Abnormal harness in stop light circuit. Repair the harness. Go to Step 6	Replace. Go to Step 6
6	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 6

5A-42 BRAKE CONTROL SYSTEM

Chart B-8 2WD Controller in 4WD Vehicle Controller (DTC 13 (Flash out) / C0285 (Serial communications)), 4WD State Input Signal Failure (DTC 24 (Flash out) / C0282 (Serial communications))

Step	Action	Yes	No
1	Remove coil integrated module connector. Is the coil integrated module connector (C-4) terminal 8 line normally?	Go to Step 2	Repair. Go to Step 3
2	Is the 4WD controller or TOD controll unit normally?	Replace EHCU. Go to Step 3	Replace 4WD controller or TOD controll unit. Go to Step 3
3	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

Chart B-9 Pump Motor Failure (DTC 32 (Flash out) / C0267, C0268 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Measure the voltage between terminal 1 of the coil integrated module connector (C-5) and body ground. Is the voltage equal to the battery voltage?	Go to Step 2	Repair fuse/harness between battery and coil integrated module connector (C-5) terminal 1. Go to Step 5
2	Is the harness from the hydraulic unit connected to the coil integrated module connector?	Go to Step 3	Connect to the connector. Go to Step 3
3	Is the harness from the hydraulic unit normally?	Go to Step 4	Replace EHCU. Go to Step 5
4	Is the check resistance of hydraulic unit connector terminals 1 and 2 between 0.2 and 1.0 ohms?	Replace EHCU. Go to Step 5	Replace EHCU. Go to Step 5
5	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 5

Chart B-10 EHCUC Valve Relay Failure (DTC 35 (Flash out) / C0265, C0266 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Measure the voltage between terminal 1 of the coil integrated module connector (C-5) and body ground. Is the voltage equal to the battery voltage?	Replace EHCUC. Go to Step 2	Repair fuse and harness coil integrated module connector (C-5) terminal 1 and battery. Go to Step 2
2	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 2

Chart B-11 FL Isolation Solenoid Coil Failure (DTC 41 (Flash out) / C0245, C0247 (Serial communications))

Step	Action	Yes	No
1	Was the "EHCUC Connector Pin-out Checks" performed?	Go to Step 2	Go to "EHCUC Connector Pin-out Checks."
2	1. Turn the key switch to off. 2. Disconnect the 2-way EHCUC connector (C-5) from the EHCUC. 3. Inspect the connector for damage or corrosion. Is the connector free from damage or corrosion?	Go to Step 3	Repair the connector. Repeat the "Basic Diagnostic Flow Chart."
3	1. Replace the Coil Integrated Module. 2. Reconnect all component, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

Chart B-12 FL Dump Solenoid Coil Failure (DTC 42 (Flash out) / C0246, C0248 (Serial communications))

Step	Action	Yes	No
1	Was the "EHCUC Connector Pin-out Checks" performed?	Go to Step 2	Go to "EHCUC Connector Pin-out Checks."
2	1. Turn the key switch to off. 2. Disconnect the 2-way EHCUC connector (C-5) from the EHCUC. 3. Inspect the connector for damage or corrosion. Is the connector free from damage or corrosion?	Go to Step 3	Repair the connector. Repeat the "Basic Diagnostic Flow Chart."
3	1. Replace the Coil Integrated Module. 2. Reconnect all component, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

5A-44 BRAKE CONTROL SYSTEM

Chart B-13 FR Isolation Solenoid Coil Failure (DTC 43 (Flash out) / C0241, C0243 (Serial communications))

Step	Action	Yes	No
1	Was the "EHCUC Connector Pin-out Checks" performed?	Go to Step 2	Go to "EHCUC Connector Pin-out Checks."
2	1. Turn the key switch to off. 2. Disconnect the 2-way EHCUC connector (C-5) from the EHCUC. 3. Inspect the connector for damage or corrosion. Is the connector free from damage or corrosion?	Go to Step 3	Repair the connector. Repeat the "Basic Diagnostic Flow Chart."
3	1. Replace the Coil Integrated Module. 2. Reconnect all component, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

Chart B-14 FR Dump Solenoid Coil Failure (DTC 44(Flash out) / C0242, C0244 (Serial communications))

Step	Action	Yes	No
1	Was the "EHCUC Connector Pin-out Checks" performed?	Go to Step 2	Go to "EHCUC Connector Pin-out Checks."
2	1. Turn the key switch to off. 2. Disconnect the 2-way EHCUC connector (C-5) from the EHCUC. 3. Inspect the connector for damage or corrosion. Is the connector free from damage or corrosion?	Go to Step 3	Repair the connector. Repeat the "Basic Diagnostic Flow Chart."
3	1. Replace the Coil Integrated Module. 2. Reconnect all component, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

Chart B-15 Rear Isolation Solenoid Coil Failure (DTC 45 (Flash out) / C0251, C0253 (Serial communications))

Step	Action	Yes	No
1	Was the "EHCUC Connector Pin-out Checks" performed?	Go to Step 2	Go to "EHCUC Connector Pin-out Checks."
2	1. Turn the key switch to off. 2. Disconnect the 2-way EHCUC connector (C-5) from the EHCUC. 3. Inspect the connector for damage or corrosion. Is the connector free from damage or corrosion?	Go to Step 3	Repair the connector. Repeat the "Basic Diagnostic Flow Chart."
3	1. Replace the Coil Integrated Module. 2. Reconnect all component, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

Chart B-16 Rear Dump Solenoid Coil Failure (DTC 46 (Flash out) / C0252, C0254 (Serial communications))

Step	Action	Yes	No
1	Was the "EHCU Connector Pin-out Checks" performed?	Go to Step 2	Go to "EHCU Connector Pin-out Checks."
2	1. Turn the key switch to off. 2. Disconnect the 2-way EHCU connector (C-5) from the EHCU. 3. Inspect the connector for damage or corrosion. Is the connector free from damage or corrosion?	Go to Step 3	Repair the connector. Repeat the "Basic Diagnostic Flow Chart."
3	1. Replace the Coil Integrated Module. 2. Reconnect all component, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

Chart B-17 FL Speed Sensor Open or Shorted (DTC 51 (Flash out) / C0225 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Measure the resistance between coil integrated module connector (C-4) terminals 2 and 10. Is the resistance between 2.0k and 2.8k ohms?	Check for faults in harness between speed sensor and coil integrated module. Fault found: Repair, and perform system self-check. No fault found: Replace coil integrated module. Go to Step 3	Go to Step 2
2	Measure the FL speed sensor resistance at the sensor connector. Is the resistance between 2.0k and 2.8k ohms?	Repair harness abnormality between sensors and coil integrated module. Go to Step 3	Replace sensor. Go to Step 3
3	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

5A-46 BRAKE CONTROL SYSTEM

Chart B-18 FR Speed Sensor Open or Shorted (DTC 52 (Flash out) / C0221 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Measure the resistance between coil integrated module connector (C-4) terminals 3 and 11. Is the resistance between 2.0k and 2.8k ohms?	Check for faults in harness between speed sensor and coil integrated module. Fault found: Repair, and perform system self-check. No fault found: Replace coil integrated module. Go to Step 3	Go to Step 2
2	Measure the FR speed sensor resistance at the sensor connector. Is the resistance between 2.0k and 2.8k ohms?	Repair harness abnormality between sensors and coil integrated module. Go to Step 3	Replace sensor. Go to Step 3
3	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

Chart B-19 Rear Speed Sensor Open or Shorted (DTC 53 (Flash out) / C0235 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Measure the resistance between coil integrated module connector (C-4) terminals 4 and 12. Is the resistance between 1.0k and 1.7k ohms?	Check for faults in harness between speed sensor and coil integrated module. Fault found: Repair, and perform system self-check. No fault found: Replace EHCU. Go to Step 3	Go to Step 2
2	Measure the Rear speed sensor resistance at the sensor connector. Is the resistance between 1.0k and 1.7k ohms?	Repair harness abnormality between sensors and coil integrated module. Go to Step 3	Replace sensor. Go to Step 3
3	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

5A-48 BRAKE CONTROL SYSTEM

Chart B-20 FL Speed Sensor Missing (DTC 61 (Flash out) / C0226, C0227 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Measure the FL speed sensor resistance between coil integrated module connector (C-4) terminals 2 and 10. Is the resistance between 2.0k and 2.8k ohms?	Go to Step 2	Go to Step 3
2	Is there play sensor/sensor rotor?	Repair. Go to Step 6	Go to Step 4
3	Measure the FL speed sensor resistance at the sensor connector. Is the resistance between 2.0k and 2.8k ohms?	Repair harness abnormality between sensors and coil integrated module. Go to Step 6	Replace sensor. Go to Step 6
4	Damage and powdered iron sticking to sensor/sensor ring?	Repair. Go to Step 6	Go to Step 5
5	Is sensor output normal? (Chart C-1-1 or TC-1)	Check for faults in harness between speed sensor and coil integrated module. Fault found: repair, and perform system self-check. No fault found: replace EHCU. Go to Step 6	Replace sensor. Go to Step 6
6	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 6

NOTE: Even after repairing the faulty part the warning light (W/L) does not go out if the vehicle is at a stop. Turn the ignition switch to the ON position and drive the vehicle at 12 km/h (8 mph) or higher to make sure that the warning light goes out.

Chart B-21 FR Speed Sensor Missing (DTC 62 (Flash out) / C0222, C0223 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Measure the FR speed sensor resistance between coil integrated module connector (C-4) terminals 3 and 11. Is the resistance between 2.0k and 2.8k ohms?	Go to Step 2	Go to Step 3
2	Is there play sensor/sensor rotor?	Repair. Go to Step 6	Go to Step 4
3	Measure the FR speed sensor resistance at the sensor connector. Is the resistance between 2.0k and 2.8k ohms?	Repair harness abnormality between sensors and coil integrated module. Go to Step 6	Replace sensor. Go to Step 6
4	Damage and powered iron sticking to sensor/sensor ring?	Repair. Go to Step 6	Go to Step 5
5	Is sensor output normal? (Chart C-1-2 or TC-1)	Check for faults in harness between speed sensor and coil integrated module. Fault found: repair, and perform system self-check. No fault found: replace EHCU. Go to Step 6	Replace sensor. Go to Step 6
6	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 6

NOTE: Even after repairing the faulty part the warning light (W/L) does not go out if the vehicle is at a stop. Turn the ignition switch to the ON position and drive the vehicle at 12 km/h (8 mph) or higher to make sure that the warning light goes out.

5A-50 BRAKE CONTROL SYSTEM

Chart B-22 Rear Speed Sensor Missing (DTC 63 (Flash out) / C0236, C0237 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Measure the Rear speed sensor resistance between coil integrated module connector (C-4) terminals 4 and 12. Is the resistance between 1.0k and 1.7k ohms?	Go to Step 2	Go to Step 3
2	Is there play sensor/sensor rotor?	Repair. Go to Step 6	Go to Step 4
3	Measure the rear speed sensor resistance at the sensor connector. Is the resistance between 1.0k and 1.7k ohms?	Repair harness abnormality between sensors and coil integrated module. Go to Step 6	Replace sensor. Go to Step 6
4	Damage and powered iron sticking to sensor/sensor ring?	Repair. Go to Step 6	Go to Step 5
5	Is sensor output normal? (Chart C-1-3 or TC-1)	Check for faults in harness between speed sensor and coil integrated module. Fault found: repair, and perform system self-check. No fault found: replace EHCU. Go to Step 6	Replace sensor. Go to Step 6
6	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 6

NOTE: Even after repairing the faulty part the warning light (W/L) does not go out if the vehicle is at a stop. Turn the ignition switch to the ON position and drive the vehicle at 12 km/h (8 mph) or higher to make sure that the warning light goes out.

Chart B-23 Simultaneous Drop-out of Front Speed Sensor Signal (DTC 64 (Flash out) / C0229 (Serial communications))

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Measure the FL speed sensor resistance between coil integrated module connector (C-4) terminals 2 and 10. Is the resistance between 2.0k and 2.8k ohms?	Go to Step 2	Go to Step 3
2	Measure the FR speed sensor resistance between coil integrated module connector (C-4) terminals 3 and 11. Is the resistance between 2.0k and 2.8 k ohms?	Go to Step 5	Go to Step 4
3	Measure the FL speed sensor resistance at the sensor connector. Is the resistance between 2.0k and 2.8k ohms?	Repair harness abnormality between sensors and coil integrated module. Go to Step 2	Replace sensor. Go to Step 2
4	Measure the FR speed sensor resistance at the sensor connector. Is the resistance between 2.0k and 2.8k ohms?	Repair harness abnormality between sensors and coil integrated module. Go to Step 5	Replace sensor. Go to Step 5
5	Damage and powered iron sticking to sensor/sensor ring?	Repair. Go to Step 6	Go to Step 6
6	Is there play sensor/sensor rotor?	Repair. Go to Step 7	Go to Step 7
7	Is sensor output normal? (Chart C-1-1&C-1-2 or TC-1)	Check for faults in harness between speed sensor and coil integrated module. Fault found: repair, and perform system self-check. No fault found: replace EHCU. Go to Step 8	Replace sensor. Go to Step 8
8	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat "Basic diagnostic flow chart"	Go to Step 8

NOTE: Even after repairing the faulty part the warning light (W/L) does not go out if the vehicle is at a stop. Turn the ignition switch to the ON position and drive the vehicle at 12 km/h (8 mph) or higher to make sure that the warning light goes out.

5A-52 BRAKE CONTROL SYSTEM

Chart B-24 Wheel Speed Input Abnormality (DTC 65 (Flash out) / C0238 (Serial communications))

Step	Action	Yes	No
1	Using TECH 2?	Go to Step 2	Go to Step 3
2	1. Connect TECH 2. 2. Select Snap shot manual trigger. 3. With wheel speed data displayed, run the vehicle when speed has arrived at 30 km/h (18 mph). 4. Check speed data on each wheel (refer to <i>the criterion given below</i>). * 1 Is the abnormal sensor condition found?	Replace. Go to Step 8	Go to Step 3 All the sensors should follow the following flowchart (without using TECH 2).
3	Is there play in sensor/sensor ring?	Repair. Go to Step 8	Go to Step 4
4	Is there powdered iron sticking to sensor/sensor ring?	Repair. Go to Step 8	Go to Step 5
5	Is there a broken tooth or indentation in sensor ring?	Replace sensor ring. Go to Step 8	Go to Step 6
6	Is there play in wheel bearing?	Adjust or repair. Go to Step 8	Go to Step 7
7	Is the check wiring between sensor and coil integrated module normal?	Replace EHCU. Go to Step 8	Repair, and perform system self-check. Go to Step 8
8	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	Repeat <FmSdata>[rsquor]Basic diagnostic flow chart"	Go to Step 8

Sensor Signal Abnormality Criteria using TECH 2

1. While driving, the speed of one or two wheels is 25% or more higher or lower than that of the other wheels.
2. The speed of one or two wheels is 10 km/h (6 mph) or more higher or lower than that of the other wheels.
3. During steady driving, wheel speed changes abruptly.

*1 The vehicle must run on a level paved road.

NOTE: Even after repairing the faulty part the warning light (W/L) does not go out if the vehicle is at a stop. Turn the ignition switch to the ON position and drive the vehicle at 12 km/h (8 mph) or higher to make sure that the warning light goes out. It is important to verify that the correct tires are installed on vehicle.

Unit Inspection Procedure

This section describes the following inspection procedures referred to during "Symptom Diagnosis" and "Diagnosis By 'ABS' Warning Light Illumination Pattern"

:

	without TECH 2	with TECH 2
Sensor Output Inspection	Chart C-1-1 to C-1-3	Chart TC-1

Chart C-1-1 FL Sensor Output Inspection Procedure

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Jack up the vehicle with all four wheels off the ground. Measure the AC voltage between coil integrated module connector terminals while turning FL wheel at a speed of 1 RPS: Is the check between coil integrated module connector (C-4) terminals 2 and 10 than under 200 mV?	Go to Step 2	OK. Go to Step 3
2	1. Disconnect the wheel speed sensor. 2. Measure resistance between the wheel speed sensor connector terminals 1 and 2. Is the check between connector (C-13) terminals 1 and 2 within 2.0k - 2.8k ohms?	Connector is faulty, or open or short circuit of harness between wheel speed sensor connector and coil integrated module. Inspect and correct the connector or harness. Go to Step 3	Wheel speed sensor is faulty. Replace the wheel speed sensor. Go to Step 3
3	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

5A-54 BRAKE CONTROL SYSTEM

Chart C-1-2 FR Sensor Output Inspection Procedure

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Jack up the vehicle with all four wheels off the ground. Measure the AC voltage between coil integrated module connector terminals while turning FR wheel at a speed of 1 RPS: Is the check between coil integrated module connector (C-4) terminals 3 and 11 than under 200 mV?	Go to Step 2	OK. Go to Step 3
2	1. Disconnect the wheel speed sensor. 2. Measure resistance between the wheel speed sensor connector terminals 1 and 2. Is the check between connector (C-33) terminals 1 and 2 within 2.0k - 2.8k ohms?	Connector is faulty, or open or short circuit of harness between wheel speed sensor connector and coil integrated module. Inspect and correct the connector or harness. Go to Step 3	Wheel speed sensor is faulty. Replace the wheel speed sensor. Go to Step 3
3	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

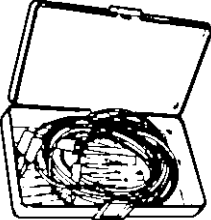

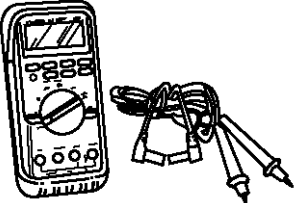

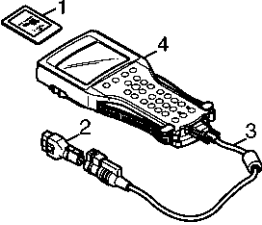

Chart C-1-3 Rear Sensor Output Inspection Procedure

Step	Action	Yes	No
1	1. Turn the key off. 2. Disconnect coil integrated module connector. 3. Jack up the vehicle with all four wheels off the ground measure the AC voltage between coil integrated module connector terminals while turning Rear wheel at a speed of 1 RPS: Is the check between coil integrated module connector (C-4) terminals 4 and 12 than under 200 mV?	Go to Step 2	OK. Go to Step 3
2	1. Disconnect the wheel speed sensor. 2. Measure resistance between the wheel speed sensor connector terminals 1 and 2. Is the check between connector (F-4) terminals 1 and 2 within 1.0k - 1.7k ohms?	Connector is faulty, or open or short circuit of harness between wheel speed sensor connector and coil integrated module. Inspect and correct the connector or harness. Go to Step 3	Wheel speed sensor is faulty. Replace the wheel speed sensor. Go to Step 3
3	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 3

Chart TC-1 Sensor Output Inspection Procedure

Step	Action	Yes	No
1	1. Connect TECH 2. 2. Check the wheel speed of each sensor by Data List. Is the vehicle speed normal?	Go to Step 6	Go to Step 2
2	Check the sensor harness for suspected disconnection (check while shaking harness/connector). Is the sensor harness connection normal?	Replace speed sensor. Go to Step 4	Repair. Go to Step 3
3	Check the wheel speed of each sensor by Data List. Is the vehicle speed normal?	Go to Step 6	Go to Step 4
4	Check the sensor rotor. Is the sensor rotor normal?	Replace speed sensor. Go to Step 5	Replace sensor rotor. Go to Step 5
5	Check the harness between coil integrated module and speed sensor. Is the harness connection normal?	Go to Step 6	Repair harness or connector between coil integrated module and speed sensor. Go to Step 6
6	Reconnect all components, ensure all components are properly mounted. Was this step finished?	Repeat the "Basic diagnostic flow chart"	Go to Step 6

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO *THE SRS COMPONENT AND WIRING LOCATION VIEW* IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO *THE SRS SERVICE INFORMATION*. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

- | | |
|----------|------------------|
| (1) EHC | (3) Bracket |
| (2) Bolt | (4) Bolt and Nut |

Removal

1. Remove brake pipes.
 - After disconnecting brake pipe, cap or tape the openings of the brake pipe to prevent the entry of foreign matter.
2. Remove three bracket fixing bolts.
3. Disconnect red clip from harness connector.

350RW018

4. Remove harness connector.
5. Remove EHCU ASM.
6. Remove EHCU.

Disassembled View

Legend

- (1) Fixing Bolts
- (2) Coil Integrated Module
- (3) Hydraulic Unit (H/U)

Disassembly

1. Remove fixing bolts from EHCU.
2. Remove coil integrated module from hydraulic unit.

Reassembly

To reassembly, follow the disassembly steps in the reverse order, noting the following points:

Torque:

Fixing bolts: 4.4 N·m (4.5 kg·cm/39 lb in)

Installation

To install, follow the removal steps in the reverse order, noting the following points:

Torque:

Hydraulic unit fixing nuts : 22 N·m (2.2 kg·m/16 lbft)

Ground cable : 14 N·m (1.4 kg·m/10 lbft)

Brake pipe (joint bolts) : 16 N·m (1.6 kg·m/12 lbft)

- After installing the hydraulic unit, bleed brakes completely. See *Hydraulic Brakes* in Power-assisted brake system section.

Front Wheel Speed Sensor

Front Wheel Speed Sensor and Associated Parts

350R9033

Legend

- | | |
|---|------------------------------|
| (1) Speed Sensor Connector | (4) Speed Sensor Fixing Bolt |
| (2) Sensor Cable Fixing Bolt (Upper side) | (5) Speed Sensor |
| (3) Sensor Cable Fixing Bolt (Lower side) | |

Removal

1. Remove speed sensor connector.
2. Remove sensor cable fixing bolt (Upper side).
3. Remove sensor cable fixing bolt (Lower side).
4. Remove the speed sensor cable fixing bolt.
5. Remove speed sensor.

Inspection and Repair

1. Check the speed sensor pole piece for presence of foreign materials; remove any dirt, etc.
2. Check the pole piece for damage; replace speed sensor if necessary.
3. Check the speed sensor cable for short or open circuit, and replace with a new one if necessary. To check for cable short or open, bend or stretch the cable while checking for continuity.
4. Check the sensor ring for damage including tooth chipping, and if damaged, replace the sensor ring

assembly. Refer to *removal of the sensor ring* in Section 4C "Front hub and disc".

Installation

1. Install speed sensor and take care not to hit the speed sensor pole piece during installation.
2. Install speed sensor fixing bolt and tighten the fixing bolt to the specified torque.

Torque: 8 N·m (0.8 kg-m/69 lb-in)

3. Install speed sensor cable fixing bolt (Lower side) and tighten the fixing bolt to the specified torque.

Torque : 24 N·m (2.4 kg-m/17 lb-ft)

4. Install speed sensor cable fixing bolt (Upper side) and tighten the fixing bolt to the specified torque.

Torque : 6 N·m (0.6 kg-m/52 lb-ft)

NOTE: Confirm that a white line marked on the cable is not twisted when connecting the speed sensor cable.

5. Install speed sensor connector.

Rear Wheel Speed Sensor

Removal

1. Disconnect harness connector (1).
2. Remove sensor fixing bolt (2) .
3. Remove speed sensor (3).

350RX003

Installation

1. Install speed sensor (3).
2. Tighten the sensor fixing bolt (2) to the specified torque.

Torque : 24 N·m (2.4 kg·m/17 lbft)

3. Connect harness connector (1).

350RX003

Inspection and Repair

1. Check speed sensor pole piece for presence of foreign materials; remove any dirt, etc.
2. Check the pole piece for damage, and replace speed sensor if necessary.
3. Check speed sensor cable for short or open, and replace with a new one if necessary. To check for cable short or open, bend or stretch the cable while checking for continuity.
4. Check the sensor ring for damage including tooth chipping, and if damaged, replace the axle shaft assembly. Refer to *removal of the sensor ring* in Section 4A2 "Differential (Rear)".

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO *THE SRS COMPONENT AND WIRING LOCATION VIEW* IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO *THE SRS SERVICE INFORMATION*. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

Master Cylinder Assembly

330RS001

The master cylinder contains two pistons that supply the hydraulic pressure for a dual-circuit braking system. The primary piston provides the fluid pressure to the front brakes, while the secondary piston provides the fluid pressure to the rear brakes. If the pressure is lost from either system, the remaining system will function to stop the vehicle.

CAUTION:

1. The master cylinder is not repairable. If found defective, it must be replaced as a complete assembly.
2. If any hydraulic component is removed or disconnected, it may be necessary to bleed all or part of the brake system. (Refer to "*Bleeding Brake Hydraulic System*" in this section.)
3. The torque values specified are for dry, unlubricated fasteners.
4. Perform service operations on a clean bench free from all mineral oil materials.

Brake Booster

This booster is a tandem vacuum unit with a diaphragm effective diameter 205mm + 230mm (8.07in + 9.06in). In normal operating mode, with the service brakes in the released position, the tandem vacuum booster operates with vacuum on both sides of its diaphragms. When the brakes are applied, air at atmospheric pressure is admitted to one side of each diaphragm to provide the power assist. When the service brake is released, the atmospheric air is shut off from the one side of each diaphragm. The air is then drawn from the booster through the vacuum check valve to the vacuum source.

CAUTION:

1. If any hydraulic component is removed or disconnected, it may be necessary to bleed all or part of the brake system.
2. The torque values specified are for dry, unlubricated fasteners.
3. The vacuum booster is not repairable and must be replaced as complete assembly.

Disc Brake

Front Disc Brake

A05RW001

Rear Disc Brake

A05RW002

The disc brake assembly consists of a caliper, piston, rotor, pad assembly and support bracket. The caliper assembly has a single bore and is mounted to the support bracket with two mounting bolts. The support bracket allows the caliper to move laterally against the rotor. The caliper is a one-piece casting with the inboard side containing the piston bore. A square cut rubber seal is located in a groove in the piston bore which provides the hydraulic seal between the piston and the cylinder wall.

NOTE:

1. Replace all components included in repair kits used to service this caliper.
2. Lubricate rubber parts with clean brake fluid to ease assembly.
3. If any hydraulic component is removed or disconnected, it may be necessary to bleed all or

part of the brake system.

4. Replace pads in axle sets only.
5. The torque values specified are for dry, unlubricated fasteners.
6. Perform the service operation on a clean bench free from all mineral oil materials.

Operation

Hydraulic pressure, created by applying the brake pedal, is converted by the caliper to a stopping force. This force acts equally against the piston and the bottom of the caliper bore to move the piston outward and to move (slide) the caliper inward resulting in a clamping action on the rotor. This clamping action forces the linings against the rotor, creating friction to stop the vehicle.

Diagnosis

Road Testing The Brakes

Brake Test

Brakes should be tested on a dry, clean, reasonably smooth and level roadway. A true test of brake performance cannot be made if the roadway is wet, greasy or covered with loose dirt so that all tires do not grip the road equally. Testing will also be adversely affected if the roadway is crowned so as to throw the weight of the vehicle toward wheels on one side or if the roadway is so rough that wheels tend to bounce. Test the brakes at different vehicle speeds with both light and heavy pedal pressure; however, avoid locking the wheels and sliding the tires. Locked wheels and sliding tires do not indicate brake efficiency, since heavily braked but turning wheels will stop the vehicle in less distance than locked wheels. More tire-to-road friction is present with a heavily braked turning tire than with a sliding tire.

The standard brake system is designed and balanced to avoid locking the wheels except at very high deceleration levels.

It is designed this way because the shortest stopping distance and best control is achieved without brake lock-up.

Because of high deceleration capability, a firmer pedal may be felt at higher deceleration levels.

External Conditions That Affect Brake Performance

1. Tires: Tires having unequal contact and grip on the road will cause unequal braking. Tires must be equally inflated, identical in size, and the thread pattern of right and left tires must be approximately equal.
2. Vehicle Loading: A heavily loaded vehicle requires more braking effort.
3. Wheel Alignment: Misalignment of the wheels, particularly in regard to excessive camber and caster, will cause the brakes to pull to one side.

Brake Fluid Leaks

With engine running at idle and the transmission in "Neutral", depress the brake pedal and hold a constant foot pressure on the pedal. If pedal gradually falls away with the constant pressure, the hydraulic system may be leaking.

Check the master cylinder fluid level. While a slight drop in the reservoir level will result from normal lining wear, an abnormally low level in reservoir indicates a leak in the system. The hydraulic system may be leaking internally as well as externally. Refer to "*Master Cylinder Inspection*". Also, the system may appear to pass this test but still have slight leakage. If fluid level is normal, check the vacuum booster push rod length. If an incorrect length push rod is found, adjust or replace the push rod. Check the brake pedal travel and the parking brake adjustment.

When checking the fluid level, the master cylinder fluid level may be low from the "MAX" mark if the front and rear linings are worn. This is not abnormal.

Warning Light Operation

When the ignition switch is in the START position, the "BRAKE" warning light should turn on and go off when the ignition switch returns to the ON position.

The following conditions will activate the "BRAKE" light:

1. Parking brake applied. The light should be on whenever the parking brake is applied and the ignition switch is on.
2. Low fluid level. A low fluid level in the master cylinder will turn the "BRAKE" light on.
3. During engine cranking the "BRAKE" light should remain on. This notifies the driver that the warning circuit is operating properly.

General Diagnosis

Condition	Possible cause	Correction
Brake Pull	Tire inflation pressure is unequal.	Adjust
	Front wheel alignment is incorrect.	Adjust
	Unmatched tires on same axle.	Tires with approx. the same amount of tread should be used on the same axle.
	Restricted brake pipes or hoses.	Check for soft hoses and damaged lines. Replace with new hoses and new double-walled steel brake piping.
	Water or oil on the brake pads.	Clean or replace.
	Brake pads hardened.	Replace
	Brake pads worn excessively.	Replace
	Brake rotor worn or scored.	Grind or replace.
	Disc brake caliper malfunctioning.	Clean or replace.
	Front hub bearing preload incorrect.	Adjust or replace.
	Loose suspension parts.	Check all suspension mountings.
	Loose calipers.	Check and tighten the bolts to specifications.
Brake Roughness or Chatter (Pulsates)	Excessive lateral runout.	Check per instructions. If not within specifications, replace or machine the rotor.
	Parallelism not within specifications.	Check per instructions. If not within specifications, replace or machine the rotor.
	Wheel bearings not adjusted.	Adjust wheel bearings to correct specifications
	Pad reversed (steel against iron).	Replace the brake pad and machine rotor to within specifications.
Excessive Pedal Effort	Malfunctioning vacuum booster.	Check the vacuum booster operation and repair, if necessary.
	Partial system failure.	Check the front and rear brake system for failure and repair. Also, check the brake warning light. If a failed system is found, the light should indicate failure.
	Excessively worn pad.	Check and replace pads in sets.
	Piston in caliper stuck or sluggish.	Remove caliper and rebuild.
	Fading brakes due to incorrect pad.	Remove and replace with original equipment pad or equivalent.
	Vacuum leak to vacuum booster.	Check for ruptured or loose hose.
	Check the direction of check valve within vacuum hose.	Correct vacuum hose direction.
	Grease on the brake pads.	Replace or clean.

Condition	Possible cause	Correction
Excessive Brake Pedal Travel	Air in hydraulic circuit.	Bleed the hydraulic circuit.
	Level of brake fluid in the reservoir too low.	Replenish brake fluid reservoir to specified level and bleed hydraulic circuit as necessary.
	Master cylinder push rod clearance excessive.	Adjust
	Leakage in hydraulic system.	Correct or replace defective parts.
Brake Drag	Master cylinder pistons not returning correctly.	Adjust the stop light switch and vacuum booster push rod. If necessary, rebuild.
	Restricted brake pipes or hoses.	Check for soft hoses or damaged pipes, and replace with new hoses and new double-walled steel brake piping.
	Parking brake maladjusted.	Adjust
	Parking brake lining clearance insufficient.	Adjust
	Brake pedal free play insufficient.	Adjust the brake pedal height or power cylinder operating rod.
	Piston in the master cylinder sticking.	Replace
	Piston in the disc brake caliper sticking.	Replace piston seals.
	Brake pads sticking in caliper.	Clean
	Return spring weakened.	Replace
	Parking brake binding.	Overhaul the parking brakes and correct.
	Front hub bearing preload incorrect.	Adjust or replace.
	Parking brake shoes not returning.	Correct or replace the brake back plate and brake shoe as necessary.
	Obstructions in hydraulic circuit.	Clean
	Rotor warped excessively.	Grind or replace.
Grabbing or Uneven Braking Action (All conditions listed under "Pulls")	Malfunctioning vacuum booster.	Check operation and correct as necessary.
	Binding brake pedal mechanism.	Check and lubricate, if necessary.
	Corroded caliper assembly.	Clean and lubricate.

5C-8 POWER-ASSISTED BRAKE SYSTEM

Condition	Possible cause	Correction
Brake Noisy	Brake pads are worn.	Replace
	Brake pads are hardened.	Replace
	Brake pads are in poor contact with rotor.	Correct
	Brake disc(s) warped, worn or damaged.	Grind or replace.
	Disc brake anti-squeak shims fatigued.	Replace
	Front hub bearings are loose or preload is incorrect.	Adjust or replace.
	Brake disc is rusted.	Grind or replace.
Poor Brake Action	Master cylinder faulty.	Correct or replace.
	Vacuum booster faulty.	Correct or replace.
	Level of brake fluid in reservoir too low.	Replenish and bleed.
	Air in hydraulic circuit.	Bleed
	Disc brake caliper faulty.	Clean or replace.
	Water or oil on brake pads.	Clean or replace.
	Brake pads in poor contact with the rotor.	Correct
	Brake pads worn.	Replace
	Brake disc rusted.	Grind or replace.
	Check valve in vacuum hose faulty.	Correct or replace.

Hydraulic Brakes

Filling Master Cylinder Reservoir

CAUTION: Use only specified brake fluid. Do not use any fluid which contains a petroleum base. Do not use a container which has been used for petroleum based fluids or a container which is wet with water. Petroleum based fluid will cause swelling and distortion of rubber parts in the hydraulic brake system. Water mixed with brake fluid lowers the fluid boiling point. Keep all fluid containers capped to prevent contamination. Always fill the master cylinder reservoir when the engine is cold.

Never allow the brake fluid to come in contact with the painted surfaces.

The master cylinder reservoir must be kept properly filled to ensure adequate reserve and to prevent air and moisture from entering the hydraulic system.

However, because of expansion due to heat absorbed from the brakes and the engine, the reservoir must not be overfilled. The brake fluid reservoir is on the master cylinder, which is located under the hood on the left side of the cowl.

Thoroughly clean reservoir cap before removal to avoid getting dirt into reservoir. Remove the diaphragm. Add fluid as required to bring level to the "MAX" mark on the reservoir tank. Use "DOT 3" Hydraulic Brake Fluid. If the fluid cap diaphragm is stretched, return it to the original position before installing.

Deterioration of Brake Fluid

Using any other brake fluid than specified or brake fluid with mineral oil or water mixed in will drop the boiling point of brake fluid. It may, in turn, result in vapor lock or deteriorated rubber parts of the hydraulic system. Be sure to change the brake fluid at specified intervals. If the rubber parts are deteriorated, remove all the system parts and clean them with alcohol. Prior to reassembly, dry the cleaned parts with air to remove the alcohol. Replace all the hoses and rubber parts of the system.

Leakage of Brake Fluid

With engine idling, set shift lever in the neutral position and continue to depress brake pedal at a constant pedal application force.

Should the pedal stroke become deeper gradually, leakage from the hydraulic pressure system is possible. Make sure by visual check that there is no leak.

Bleeding Brake Hydraulic System

A bleeding operation is necessary to remove air from the hydraulic brake system whenever air is introduced into the hydraulic system. It may be necessary to bleed the hydraulic system at all four brakes if air has been

introduced through a low fluid level or by disconnecting brake pipes at the master cylinder. If a brake pipe is disconnected at one wheel, only that wheel cylinder/caliper needs to be bled. If the pipes are disconnected at any fitting located between the master cylinder and brakes, then the brake system served by the disconnected pipe must be bled.

1. For 4-Wheel Antilock Brake System (ABS) equipped vehicle, be sure to remove the ABS main fuse 60A located at the relay and fuse box before bleeding air. If you attempt to bleed air without removing the main fuse, air cannot be let out thoroughly, and this may cause damage to the hydraulic unit. After bleeding air, be sure to replace the ABS main fuse back to its original position.
2. Set the parking brake completely, then start the engine.

NOTE: The vacuum booster will be damaged if the bleeding operation is performed with the engine off.

3. Remove the master cylinder reservoir cap.
4. Fill the master cylinder reservoir with brake fluid. Keep the reservoir at least half full during the air bleeding operation
5. Always use new brake fluid for replenishment.
6. In replenishing brake fluid, take care that air bubbles do not enter the brake fluid. When the master cylinder is replaced or overhauled, first bleed the air from the master cylinder, then from each wheel cylinder and caliper following the procedures described below.

Bleeding the Master Cylinder

7. Disconnect the rear wheel brake pipe (1) from the master cylinder. Check the fluid level and replenish as necessary. If replenished, leave the system for at least one minute.
8. Depress the brake pedal slowly once and hold it depressed.
9. Completely seal the delivery port of the master cylinder with your finger, where the pipe was disconnected then release the brake pedal slowly.
10. Release your finger from the delivery port when the brake pedal returns completely.
11. Repeat steps 8 through 10 until the brake fluid comes out of the delivery port during step 8.

NOTE: Do not allow the fluid level in the reservoir to go below the half-way mark.

12. Reconnect the brake pipe (1) to the master cylinder and tighten the pipe.
13. Depress the brake pedal slowly once and hold it depressed.
14. Loosen the rear wheel brake pipe (1) at the master cylinder.

5C-10 POWER-ASSISTED BRAKE SYSTEM

- Retighten the brake pipe, then release the brake pedal slowly.
- Repeat steps 13 through 15 until no air comes out of the port when the brake pipe is loosened

NOTE: Be very careful not to allow the brake fluid to come in contact with painted surfaces.

- Bleed the air from the front wheel brake pipe connection (2) by repeating steps 7 through 16.

Bleeding the Caliper

- Bleed the air from each wheel in the order listed below:
 - Right rear caliper or wheel cylinder
 - Left rear caliper or wheel cylinder
 - Right front caliper
 - Left front caliperConduct air bleeding from the wheels in the above order. If no brake fluid comes out, it suggests that air is mixed in the master cylinder. In this case, bleed air from the master cylinder. In this case, bleed air from the master cylinder in accordance with steps 7 through 17, and then bleed air from the caliper or wheel cylinder.
- Place the proper size box end wrench over the bleeder screw.
- Cover the bleeder screw with a transparent tube, and submerge the free end of the transparent tube in a transparent container containing brake fluid.
- Pump the brake pedal slowly three (3) times (once/sec), then hold it depressed.
- Loosen the bleeder screw until fluid flows through the tube.
- Retighten the bleeder screw.
- Release the brake pedal slowly.
- Repeat steps 21 through 24 until the air is completely removed.
It may be necessary to repeat the bleeding

procedure 10 or more times for front wheels and 15 or more times for rear wheels.

- Go to the next wheel in the sequence after each wheel is bled.
Be sure to monitor reservoir fluid level.
- Depress the brake pedal to check if you feel "sponginess" after the air has been removed from all wheel cylinders and calipers.
If the pedal feels "spongy", the entire bleeding procedure must be repeated.
- After the bleeding operation is completed on the each individual wheel, check the level of the brake fluid in the reservoir and replenish up to the "MAX" level as necessary.
- Attach the reservoir cap.
If the diaphragm inside the cap is deformed, reform it and install.
- Stop the engine.

Flushing Brake Hydraulic System

It is recommended that the entire hydraulic system be thoroughly flushed with clean brake fluid whenever new parts are installed in the hydraulic system.

Approximately one quart of fluid is required to flush the hydraulic system.

The system must be flushed if there is any doubt as to the grade of fluid in the system or if fluid has been used which contains the slightest trace of mineral oil. All rubber parts that have been subjected to a contaminated fluid must be replaced.

Brake Pipes and Hoses

The hydraulic brake system components are interconnected by special steel piping and flexible hoses. Flexible hoses are used between the frame and the front calipers, the frame and rear axle case and the rear axle and the rear calipers.

When the hydraulic pipes have been disconnected for any reason, the brake system must be bled after reconnecting the pipe. Refer to "*Bleeding the Brake Hydraulic System*" in this section.

Brake Hose Inspection

The brake hose should be inspected at least twice a year. The brake hose assembly should be checked for road hazard, cracks and chafing of the outer cover, and for leaks and blisters. Inspect for proper routing and mounting of the hose. A brake hose that rubs on suspension components will wear and eventually fail. A light and mirror may be needed for an adequate inspection. If any of the above conditions are observed on the brake hose, adjust or replace the hose as necessary.

CAUTION: Never allow brake components such as calipers to hang from the brake hoses, as damage to the hoses may occur.

Front Caliper Brake Hose

Front Caliper Brake Hose and Associated Parts

Legend

- (1) Bolt and Gasket
- (2) Clip
- (3) Hose
- (4) Brake Pipe

Removal

1. Raise the vehicle and support it with suitable safety stands.
2. Remove the wheel and tire assembly.
3. Clean dirt, grease, and other foreign material off the hose fittings at both ends.
4. Disconnect brake pipe.
5. Remove clip.
6. Remove bolt and gasket.
7. Remove hose.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Tighten the brake pipes to the specified torque

Torque: 19 N·m (1.9 kg·m/14 lbft)

2. Tighten the bolt to the specified torque.

Torque: 34 N·m (3.5 kg·m/25 lbft)

NOTE: Always use new gaskets and be sure to put the hooked edge of the flexible hose end into the anti-rotation cavity.

After installing the brake hoses, bleed the brakes as described in this section.

Rear Axle Brake Hose

Rear Axle Brake Hose and Associated Parts

352RW002

Legend

- (1) Brake Pipe

Removal

1. Raise the vehicle and support it with suitable safety stands.
2. Remove wheel and tire assembly.
3. Clean dirt, grease, and other foreign material off the hose fittings at both ends.
4. Disconnect brake pipe.
5. Remove clip.
6. Remove brake pipe.
7. Remove bolt.
8. Remove hose.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Tighten the brake pipes to the specified torque

Torque: 19 N·m (1.9 kg·m/14 lbft)

2. Tighten the bolt to the specified torque.

Torque: 15 N·m (1.5 kg·m/11 lbft)

After installing the brake hoses, bleed the brakes as described in this section.

Brake Pipe

Removal

1. Raise the vehicle and support it with suitable safety stands.
2. Remove wheel and tire assembly as necessary.
3. Clean dirt, grease, and other foreign material off the pipe fittings at both ends.
4. Remove brake pipe (1).

330RW011

5. Remove plastic clip (2).

330RW002

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Tighten the brake pipes to the specified torque.

Master cylinder and P&B valve sides

Torque: 15 N·m (1.5 kg·m/11 lbft)

Others

Torque: 16 N·m (1.6 kg·m/12 lbft)

After installing the brake pipes, bleed the brakes as described in this section.

P & B (Proportioning and Bypass) Valve

P & B (Proportioning and Bypass) Valve Sectional View

350RW014

Legend

- (1) Master Cylinder (Secondary)
- (2) Master Cylinder (Primary)
- (3) Rear Brake
- (4) Front Brake

The P&B valve contains two sections, each serving a different function.

The proportioning section of the P&B valve proportions outlet pressure to the rear brakes after a predetermined rear input pressure has been reached. This is done to prevent rear wheel lock up on the vehicles with light rear wheel loads. The valve has a by-pass feature which assures full system pressure to the rear brakes in the event of front brake system malfunction. Also full front pressure is retained in the event of rear brake malfunction.

The P&B valve is not repairable and must be replaced as complete assembly.

Removal

1. The P&B valve is not repairable and must be replaced as a complete assembly. Care must be taken to prevent brake fluid from contacting any painted surface.
2. Remove hydraulic pipes (1) and plug the pipes (1) to prevent the loss of fluid or the entrance of dirt.
3. Remove bolt (3).
4. Remove P&B valve (2).

350RW026

Installation

1. Install P&B valve (2).
2. Install bolt (3) and tighten the bolt to the specified torque.
Torque: 22 N·m (2.2 kg·m/16 lbft)
3. Install hydraulic pipes (1) and tighten the bolt to the specified torque.
Torque: 15 N·m (1.5 kg·m/11 lbft)
4. After installing the brake pipes, bleed the brakes as refer to *Bleeding Brake Hydraulic System* in this section.

Main Data and Specifications

Torque Specifications

Brake Pedal

Checking Pedal Height

The push rod serves as the brake pedal stopper when the pedal is fully released. Brake pedal height adjustment should be performed as follows:

Adjust Brake Pedal

310RW021

1. Measure the brake pedal height after making sure the pedal is fully returned by the pedal return spring. Pedal height must be measured after starting the engine and receiving it several times.

Pedal Free Play: 8-11 mm (0.31-0.43 in)

Pedal Height: 193-203 mm (7.60-7.99 in)

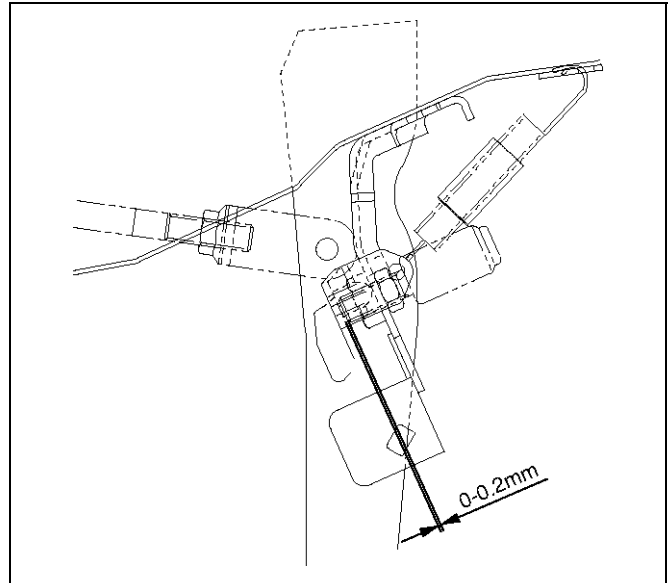

NOTE: Pedal free play must be measured after turning off the engine and stepping on the brake pedal firmly five times or more.

2. If the measured value is not within the above range, adjust the brake pedal as follows:
 - a Disconnect the stoplight switch connector.
 - b Loosen the stoplight switch lock nut.
 - c Rotate the stoplight switch so that it moves away from the brake pedal.
 - d Loosen the lock nut (1) on the push rod.
 - e Adjust the brake pedal to the specified height by rotating the push rod in the appropriate direction.
 - f Tighten the lock nut to the specified torque.

Torque: 20 N·m (2.0 kg·m/15 lbft)

- g Adjust the stoplight switch (2) to the specified clearance (between the switch housing and the brake pedal) by rotating the switch housing.

Clearance: 0-0.2 mm (0-0.008 in)

310RW022

NOTE: While adjusting the stoplight switch, make sure that the threaded part of the stoplight switch does not push the brake pedal.

- h Tighten the stoplight switch lock nut.
- i Connect the stoplight switch connector.

Checking Pedal Travel

310RW021

1. Pedal height must be measured after starting the engine and revving it several times to apply vacuum to the vacuum booster fully.

NOTE: Pedal height must be 50 mm (1.97 in) or more when about 490N (50kg/110lb) of stepping force is applied.

2. If the measured value is lower than the above range, air existing in the hydraulic system is suspected. Perform the bleeding procedure.

Brake Pedal and Associated Parts

310RY0008

Legend

- | | |
|----------------------------------|--------------------------|
| (1) Brake Pedal Bracket Assembly | (7) Push Rod Pin |

| (4) Snap Pin | (10) Driver Knee Bolster |
| (5) Return Spring | |
| (6) Pedal Assembly | |

Removal

1. Disconnect the battery “-” terminal cable, and wait at least 5 minutes.
2. Disconnect the yellow 3 way SRS connector located under the steering column.
3. Remove the engine hood opening lever.
4. Remove lower cover (8).
5. Remove driver knee bolster (10).
6. Disconnect the stop light switch connector (3). Disconnect the anti-theft control module connector. Refer to *Body and Accessories* section.
7. Remove snap pin (4) and push rod pin (7).
8. Remove the steering column shaft fixing bolt and nut (9) on the steering wheel side, and lower the steering column shaft.
9. Remove the brake pedal bracket assembly (1).

10. Remove return spring (5).

11. Remove fulcrum pin and nut (2).
12. Remove pedal assembly (6).

Installation

1. Apply grease to the entire circumference of the fulcrum pin.
2. Install pedal assembly (6) and fulcrum pin and nut (2). Tighten the nut (2) to the specified torque.
Torque: 35 N·m (3.6 kg-m/26 lbft)
3. Install the brake pedal bracket assembly (1). Tighten the bolts and nuts soecified torque.
Torque: 15 N·m (1.5 kg-m/11 lbft)
4. Install return spring (5).

5C-18 POWER-ASSISTED BRAKE SYSTEM

5. Adjust pedal free travel.
Refer to *Brake Pedal Adjustment* in this section.
6. Tighten the steering column fixing bolt (9) (dash panel) to the specified torque.
Torque: 20 N·m (2.0 kg·m/14 lbft)
7. Tighten the steering column fixing nut (9) (Cross Beam) to the specified torque.
Torque: 17 N·m (1.7 kg·m/12 lbft)
8. Apply grease to the entire circumference of the Push rod pin (7).

9. Install push rod pin (7).
10. Install snap pin (4).
11. Connect the anti-theft control module connector.
Refer to *Body and Accessories* section.
12. Connect the stop light switch connector (3).
13. Install driver knee bolster (10) and lower cover (8).
14. Install the engine hood opening lever.
15. Connect the yellow 3 way SRS connector located under the steering column.
16. Connect the battery “-” terminal cable.

Stoplight Switch

Parts Location

310RW024

Legend

- (1) Connector
- (2) Switch
- (3) Lock Nut

Removal

1. Disconnect connector (1)
2. Remove lock nut (3).
3. Remove switch (2).

Installation

1. Adjust the stop light switch to the specified clearance (between switch housing and brake pedal) by rotating the switch housing.

Clearance : 0-0.2 mm (0-0.008 in)

NOTE: Do not attempt to force the push rod into position during the stop light switch installation and adjustment procedure.

310RW022

2. Connect connector (1).
3. Install lock nut (3).

Main Data and Specifications

General Specifications

- (3) O-ring
- (4) Retainer

330RW003

Removal

NOTE: Before removing the fluid reservoir, remove the brake fluid from the fluid reservoir.

1. Disconnect electrical connector.
2. Remove retainer (1).

330RW004

3. Remove fluid reservoir and the fluid level sensor built into the fluid reservoir. The fluid level sensor cannot be removed for servicing.

4. Remove O-ring.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. O-ring (1) must be set onto the fluid reservoir (2), before installing fluid reservoir.

330RW005

Master Cylinder Assembly

Master Cylinder Assembly and Associated Parts

Legend

- | | |
|--------------------------|---------------------------|
| (1) Electrical Connector | (4) P&B Valve and Bracket |
| (2) Master Cylinder | (5) Brake Pipes |
| (3) 2 attaching Nuts | (6) Spacer and 2 gaskets |

Removal

CAUTION: When removing the master cylinder from the vacuum booster, be sure to get rid of the internal negative pressure of the vacuum booster (by, for instance, disconnecting the vacuum hose) in advance.

If any negative pressure remains in the vacuum booster, the piston may possibly come out when the master cylinder is being removed, letting the brake fluid run out.

While removing the master cylinder, further, do not hold the piston as it can be easily pulled out.

Outside surface of the piston is the surface on which seals are to slide. Care should be taken to keep the surface free of cuts and dents.

1. Disconnect electrical connector.
2. Remove brake pipes and after disconnecting the

brake pipe, cap or tape the openings of the brake pipe to prevent the entry of foreign matter.

3. Remove 2 attaching nuts.
4. Remove P&B valve and bracket.
5. Remove master cylinder.
6. Remove spacer and the 2 gaskets.

Inspection and Repair

Master Cylinder

The master cylinder is not repairable and must be replaced as a complete assembly if found defective.

Inspection

Excessive brake pedal travel, malfunction or dragging brake suggests that the master cylinder is defective. In

5C-22 POWER-ASSISTED BRAKE SYSTEM

such cases perform the following visual check:

Visual Check

Make parts replacement as required if wear, distortion, nicks, cuts, corrosion, or other abnormal conditions are found through the following parts inspection:

- Master cylinder body
- Fluid reservoir
- O-ring

Functional Inspection of Master Cylinder Piston

Push the primary piston (1) with your fingers to check that it travels smoothly. If the motion is questionable, replace the master cylinder as a complete assembly.

Functional Inspection of Master Cylinder

Inspect the master cylinder for function as follows. If any abnormal function is found, replace with a new one. Install the primary piston holder (3) 5-8840-2306-0 (including the master cylinder attachment (5) and master cylinder plug (7)) onto the master cylinder (4). Make sure the spacer (2) (2 bolts) with its adjusting bolt is screwed in up to the "0" line

Connect the master cylinder attachment (5) 5-8840-2306-0 with the end of the radiator cap tester (6) 5-8840-0277-0, and apply air pressure with the cap tester. Make sure there is no rise in pressure and that with the adjusting bolt further screwed in 5mm (align the adjusting bolt to the "5" line). There should be a pressure increase of 0.5 kg/cm² or more.

NOTE: When checking the front (or primary) side, be sure to mount the master cylinder plug in the rear (or secondary) port.

	"0" Line	"5" Line
Apply air pressure to the front and rear ports	No pressure rise.	Pressure increase of 0.5 kg/cm ² or more
Remarks	Checks port into the atmospheric pressure chamber	Checks air tightness of the pressure chamber

NOTE:

1. Do not use an air compressor, as the air from the compressor is mixed with compressor oil.
2. When installing the master cylinder onto the vacuum booster, always adjust the vacuum booster push rod. (Refer to "Vacuum Booster" in this section).
3. After the master cylinder is installed onto the vehicle, check for leakage, pedal travel and pedal free play.

Installation

1. Install spacer and the 2 gaskets.
2. Install master cylinder.
When replacing the master cylinder or vacuum booster or both, always measure the vacuum booster push rod protrusion and adjust it as necessary (Refer to "Vacuum Booster" in section).
3. Install P&B valve and bracket.
4. Install 2 attaching nuts and tighten the attaching nuts to the specified torque.

Torque: 13 N·m (1.3 kg·m/113 lbin)

5. Install brake pipes and tighten the brake pipe to the specified torque.

Master cylinder and P&B valve sides

Torque: 12 N·m (1.2 kg·m/104 lbin)

Others

Torque: 16 N·m (1.6 kg·m/12 lbin)

6. Connect electrical connector.

|-------------------------------|--------------------|
| (1) Pin | (5) Vacuum Booster |
| (2) Vacuum Booster Fixing Nut | (6) Snap Pin |
| (3) Vacuum Hose | |
| (4) Master Cylinder | |

Removal

1. Before removing the vacuum booster assembly, disconnect and remove the brake pipes.
2. Remove master cylinder, refer to "*Master Cylinder Removal*" in this section.

CAUTION: When removing the master cylinder from the vacuum booster, be sure to get rid of the internal negative pressure of the vacuum booster (by, for instance, disconnecting the vacuum hose) in advance.

If any negative pressure remains in the vacuum booster, the piston may possibly come out when the master cylinder is being removed, letting the brake fluid run out.

While removing the master cylinder, further, do not hold the piston as it can be easily pulled out.

Outside surface of the piston is the surface on which seals are to slide. Care should be taken to keep the surface free of cuts and dents.

3. Remove vacuum hose.
4. Disconnect the yoke clevis from the brake pedal.
5. Remove vacuum booster fixing nut.
6. Remove vacuum booster.

Inspection and Repair

Vacuum Hose

1. Inspect the check valve (2), which is installed inside the vacuum hose.
2. Air should pass freely from the vacuum booster (3) to the engine (1).

3. Air should not pass from the engine (1) to the vacuum booster (3). If it does, the check valve is inoperative and must be replaced.

360RY0004

Installation

1. Perform vacuum booster and vacuum booster push rod adjustment.

NOTE: When replacing either the master cylinder or vacuum booster, be sure to measure push rod, and adjust if required.

2. Remove retainer from vacuum booster front shell using a small screwdriver. Then gently draw plate and seal assembly out of the shell inside.

331RS003

3. Set push rod gauge 5-8840-2300-0 on vacuum booster, and apply negative pressure by means of vacuum pump 5-8840-0279-0 so that the pressure in the vacuum booster becomes 500 mm Hg.

NOTE: Be sure to apply NEGATIVE pressure after

installing a push rod gauge on the vacuum booster.

331RW012

4. Measure dimension (4).

Dimension (4) (Standard): -0.1-0.1 mm (-0.0039-0.0039 in)

331RW013

5C-26 POWER-ASSISTED BRAKE SYSTEM

5. If dimension (4) is out of the standard range, adjust push rod using the Push Rod Support 5-8840-2305-0.

331RW014

6. Mount plate and seal assembly in vacuum booster front shell. Then install the retainer.
7. Install vacuum booster fixing nut and tighten the specified torque.
Torque: 15 N-m (1.5 kg-m/11 lbft)
8. Install yoke clevis.
9. Connect vacuum hose and make sure that the arrow on the hose points in the direction of the engine.
10. Install master cylinder, refer to "*Master Cylinder Installation*" in this section.

331RW006

Removal

1. Remove master cylinder. Refer to "Master Cylinder" in this section.
2. Remove vacuum booster. Refer to "Vacuum Booster" in this section.
3. Remove yoke clevis.
4. Remove lock nut.
5. Remove retaining clip.
6. Remove valve body guard.
7. Remove silencer.
8. Remove filter.
9. Remove 2 gaskets and spacer.

5C-28 POWER-ASSISTED BRAKE SYSTEM

10. Remove retainer, using a small screwdriver to pry out the retainer. Gently pull out the plate and seal assembly from the shell.

331RS003

Inspection and Repair

Visual Check

Make necessary parts replacement if cuts, nicks, excessive wear, or other abnormal conditions are found

through inspection. Check the following parts:

- Yoke clevis
- Valve body guard
- Silencer
- Filter plate and seal assembly

Installation

1. Install plate and seal assembly.
2. Install retainer.
3. Install 2 gaskets and spacer.
4. Install filter.
5. Install silencer.
6. Install valve body guard.
7. Install retainer.
8. Install lock nut and yoke clevis and tighten to the specified torque.

Torque: 20 N·m (2.0 kg·m/15 lbft)

9. Install vacuum booster, refer to "Vacuum Booster" in this section.
10. Install master cylinder, refer to "Master Cylinder" in this section and after installation, perform brake pedal check and adjustment. Refer to "Brake Pedal" in this section.

Vacuum Booster Overhaul

Vacuum Booster

The vacuum booster cannot be disassembled for repair. Replace a defective vacuum booster with a new one.

Main Data and Specifications

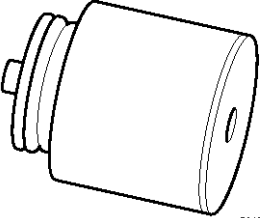

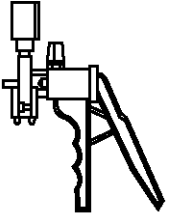

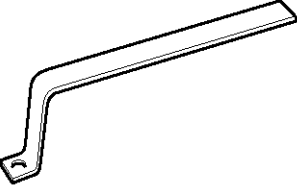

General Specifications

Vacuum booster diaphragm diameter (Front)	205 mm (8.07 in)
Vacuum booster diaphragm diameter (Rear)	230 mm (9.06 in)
Push rod stroke	More than 32.0 mm (1.26 in)
Plunger diameter	10.25 mm (0.40 in)
Push rod diameter	27.4 mm (1.08 in)

Torque Specifications

Front Disc Brake Pads

Front Disc Brake Pads Inspection

Check the outer pad by looking at each caliper from above. Check the thickness on the inner pad by looking down through the inspection hole in the top of the caliper. Whenever the pad is worn to about the thickness of the pad base, the pad should be removed for further measurements. The pad should be replaced anytime the pad thickness (1) is worn to within 1.00 mm (0.039 in) of the pad itself.

The disc pads have a wear indicator that makes a noise when the pad wears to where the replacement is required.

Minimum limit (1): 1.0 mm (0.039 in)

302RS002

Front Disc Brake Pads and Associated Parts

302RW003

Legend

- | | |
|----------------------|----------------|
| (1) Lock Bolt | (4) Clip |
| (2) Caliper Assembly | (5) Outer Side |
| (3) Pad Assembly | |

Removal

NOTE: If a squealing noise occurs from the front brake while driving, check the pad wear indicator plate. If the indicator plate contacts the rotor, the disc pad assembly should be replaced.

- Draw out two-thirds of the brake fluid from the reservoir.
 - Raise the vehicle and support it with suitable safety stands.
1. Remove wheel and tire assembly, refer to "Wheels and Tires System" in Section 3E.
 2. Remove lock bolt (1).

302RW004

3. Rotate caliper assembly and support the caliper assembly so that the brake hose is not stretched or damaged.
4. Remove pad assembly with shim.
5. Remove Clip.

Installation

1. Install clip.

302RS005

2. Apply special grease (approximately 0.2g) to both contacting surfaces of the inner shims (2). Wipe off extruded grease after installing. Install pad assembly with shim.

302RW005

Legend

- (2) Inner Shim
- (3) Wear Indicator
- (4) Inner Side

302RW006

3. Use adjustable pliers to bottom the piston into the caliper bore. Be careful do not damage the piston boot and do not damage the flexible hose by twisting or pulling it.
Install caliper assembly.
Set caliper assembly in place.

302RW018

5. Install wheel and tire assembly, refer to "*Wheels and Tires System*" in Section 3E.
6. Pump the brake pedal several times to make sure that the pedal is firm. Check the brake fluid level in the reservoir after pumping the brakes.

302RS008

4. Install lock bolt (5) and tighten the bolt to the specified torque.

Torque: 74 N-m (7.5 kg-m/54 lbft)

Front Disc Brake Rotor

Inspection

In the manufacturing of the brake rotor, all the tolerances regarding surface finish, parallelism and lateral runout are held very closely. Maintaining these tolerances provides the surface necessary to assure smooth brake operation.

Lateral Runout

Lateral runout is the movement of the rotor from side to side as it rotates on the spindle. This could also be referred to as "rotor wobble". This movement causes the piston to be knocked back into its bore. This results in additional pedal travel and a vibration during braking.

Checking Lateral Runout

1. Adjust the wheel bearing correctly, refer to "*Differential*" in Section 4A.
2. Attach a dial indicator to some portion of the suspension so that the stem contacts the rotor face about 29 mm (1.14 in) from the rotor edge.
3. Move the rotor one complete rotation and the lateral runout should not exceed 0.13 mm (0.005 in).

Maximum runout: 0.13 mm (0.005 in)

411RS019

Parallelism

Parallelism is the measurement of thickness of the rotor at four or more points around the circumference of the rotor. All measurement must be made at 29 mm (1.14 in) from the edge of the rotor. The rotor thickness must not vary more than 0.010 mm (0.0004 in) from point to point.

Maximum runout: 0.010 mm (0.0004 in)

411RS018

Replacing Brake Rotors

When installing new brake rotors, do not refinish the surfaces. These parts are at the correct level of surface finish.

Refinishing Brake Rotors

Accurate control of the rotor tolerances is necessary for proper performance of the disc brakes. Machining of the rotor should be done only with precision equipment. All brake rotors have a minimum thickness dimension cast into them. This dimension is the minimum wear dimension and not a refinish dimension. The minimum wear dimension is 24.60 mm (0.969 in). The minimum refinish dimension is 24.97 mm (0.983 in).

When refinishing rotors, always use sharp cutting tools or bits. Dull or worn tools leave a poor surface finish which will affect initial braking performance. Vibration dampening attachments should always be used when refinishing braking surfaces. These attachments eliminate tool chatter and will result in better surface finish.

After refinishing, replace any rotor that does not meet the minimum thickness of 24.97 mm (0.983 in). Do not use a brake rotor that will not meet the specification.

Minimum wear dimension: 24.60 mm (0.969 in)

Refinish dimension: 24.97 mm (0.983 in)

411RW003

| (4) Caliper Assembly | |

Removal

1. Raise the vehicle and support with suitable safety stands.
2. Concerning wheel and tire assembly, refer to "*Wheels and Tires System*" in Section 3E.
3. Remove the bolt and gaskets, then disconnect the flexible hose from the caliper and after disconnecting the flexible hose (1), cap or tape the openings to prevent entry of foreign material.

302RW009

4. Since the brake fluid flows out from the connecting coupler, place a drain pan under the vehicle.
5. Remove guide bolt (2).
6. Remove lock bolt (3).

302RW010

7. Remove caliper assembly.
8. Remove support bracket with pad assembly and take care not to damage the flexible brake hose when removing the support bracket.
9. Remove pad assembly with shim and mark the lining locations if they are to be reinstalled.
10. Remove clip.

Installation

1. Install clip.

302RS005

2. Apply special grease (approximately 0.2 g) to both contacting surfaces of the inner shims (4). Wipe off extruded grease after installing. Install pad assembly with shim.

302RW011

Legend

- (4) Inner Shim
- (5) Wear Indicator
- (6) Inner Side

3. Install support bracket and tighten the bolt (7) to the specified torque.

Torque: 155 N·m (15.8 kg·m/115 lbft)

302RW012

4. Install caliper assembly.
5. Install lock bolt (9) and guide bolt (8) and tighten the bolt to the specified torque.

Torque: 74 N·m (7.5 kg·m/54 lbft)

302RW013

6. Install brake flexible hose, always use new gaskets and be sure to put the hooked edge of the flexible hose end into the anti-rotation cavity then tighten the I-bolt (10) to the specified torque.

Torque: 34 N·m (3.5 kg·m/25 lb ft)

302RW014

7. Install wheel and tire assembly, referring to "*Wheels and Tires System*" in Section 3E.
8. Bleed brakes. Refer to "*Hydraulic Brakes*" in this section.

| (3) Bleeder with Cap | (8) Dust Boot: Piston |
| (4) Caliper Body | (9) Dust Boot Ring |
| (5) Dust Boot: Guide Bolt and Lock Bolt | |

Disassembly

1. Remove guide bolt.
2. Remove lock bolt.
3. Remove dust boot: guide bolt and lock bolt.

4. Remove dust boot ring, using a small screwdriver.

302RS016

5. Insert a block of wood into the caliper and force out the piston by blowing compressed air into the caliper at the flexible hose attachment. This procedure must be done prior to removal of the dust boot. Remove piston.

WARNING: Do not place your fingers in front of the piston in an attempt to catch or protect it when applying compressed air. This could result in personal injury.

CAUTION: Use just enough air to ease the piston out of the bore. If the piston is blown out, it may be damaged.

302RS017

6. Remove dust boot: piston.
7. Remove piston seal.
8. Remove bleeder with cap.
9. Remove caliper body.

Inspection and Repair

Make necessary parts replacement, if wear, damage, corrosion or any other abnormal conditions are found through inspection.

Check the following parts:

- Rotor
- Cylinder body
- Cylinder bore
- Piston
- Guide bolt, lock bolt
- Support bracket

NOTE: The piston seal, boot ring and dust boot are to be replaced each time the caliper is overhauled. Discard these used rubber parts and replace them with new ones.

Reassembly

1. Install caliper body.
2. Install bleeder with cap and tighten the cap to the specified torque.

Torque: 8 N-m (0.8 kg-m/69 lbin)

3. Apply special rubber grease to the piston seal and cylinder wall, then insert the piston seal into the cylinder. The special rubber grease is included in the repair kit.

302RS018

4. When inserting the piston into the cylinder, use finger pressure only and do not use a mallet or other impact tool, since damage to the cylinder wall or piston seal can result. Install piston.

5. Apply special grease (approximately 1 g) to the piston and attach the dust boot to the piston and caliper. Insert the dust boot ring into the dust boot.

8. Install lock bolt and guide bolt and tighten the bolt to the specified torque.

Torque: 74 N·m (7.5 kg·m/54 lbft)

6. Install guide bolt and lock bolt dust boot.
7. Install the dust boot on the support bracket after applying special grease (approximately 1 g) onto the dust boot inner surface. Apply special grease onto the lock bolt and guide bolt setting hole of the support bracket.

Rear Disc Brake Pads

Brake Pads Inspection

Check the outer pads by looking at each caliper from above. Check the thickness on the inner pad by looking down through the inspection hole in the top of the caliper. Whenever the pad is worn to about the thickness of the pad base, the pad should be removed for further measurements. The pad should be replaced anytime the pad thickness (1) is worn to within 1.0 mm (0.039 in) of the pad itself.

The disc pads have a wear indicator that makes a noise when the pad wears to where replacement is required.

Minimum limit (1): 1.0 mm (0.039 in)

302RW016

Brake Pads and Associated Parts

306RW001

Legend

- (1) Caliper Assembly
- (2) Clip

- (3) Lock Bolt
- (4) Pad Assembly

Removal

NOTE: If a squealing noise occurs from the rear brake while driving, check the pad wear indicator plate. If the indicator plate contacts the rotor, the disc pad assembly should be replaced.

- Draw out two-thirds of the brake fluid from the reservoir.
 - Raise the vehicle and support it with suitable safety stands.
1. Remove wheel and tire assembly, referring to "Wheels and Tires System" in Section 3E.
 2. Remove lock bolt (1)

3. Rotate caliper assembly and support the caliper assembly so that the brake hose is not stretched or damaged.
4. Remove pad assembly with shim.
5. Remove clip.

Installation

1. Install clip (2).

2. Apply special grease (approximately 0.2g) to both contacting surfaces of the inner shims. Wipe off extruded grease after installing. Install pad assembly with shim.

Legend

- (3) Inner Shim
- (4) Wear Indicator

- Use adjustable pliers to bottom the piston into the caliper bore. Be careful not to damage the piston dust boot and do not damage the flexible hose by twisting or pulling it. Install caliper assembly. Set caliper assembly in place.

- Install lock bolt (5) and tighten the bolt to the specified torque.

Torque: 43 N·m (4.4 kg·m/32 lbft)

- Install wheel and tire assembly, referring to "Wheels and Tires System" in Section 3E.
- Pump the brake pedal several times to make sure that the pedal is firm. Check the brake fluid level in the reservoir after pumping the brakes.

Rear Disc Brake Rotor

Inspection

In the manufacturing of the brake rotor, all the tolerances regarding surface finish, parallelism and lateral runout are held very closely. Maintaining these tolerances provides the surface necessary to assure smooth brake operation.

Lateral Runout

Lateral runout is the movement of the rotor from side to side as it rotates on the spindle. This could also be referred to as "rotor wobble". This movement causes the piston to be knocked back into its bore. This results in additional pedal travel and a vibration during braking.

Checking Lateral Runout

1. Adjust the wheel bearing correctly. Refer to *Drive Shaft System* section.
2. Attach a dial indicator to some portion of the suspension so that the stem contacts the rotor face about 29 mm (1.14 in) from the rotor edge.
3. Move the rotor one complete rotation. The lateral runout should not exceed 0.13 mm (0.005 in)

Maximum runout: 0.13 mm (0.005 in)

306RY00013

Parallelism

Parallelism is the measurement of thickness of the rotor at four or more points around the circumference of the rotor. All measurement must be made at 22 mm (0.87 in) from the edge of the rotor.

The rotor thickness must not vary more than 0.010 mm (0.0004 in) from point to point.

Maximum parallelism: 0.010 mm (0.0004 in)

420RS013

Replacing Brake Rotors

When installing new brake rotors, do not refinish the surfaces. These parts are at the correct level of surface finish.

Refinishing Brake Rotors

Accurate control of the rotor tolerances is necessary for proper performance of the disc brakes. Machining of the rotor should be done only with precision equipment. All brake rotors have a minimum thickness dimension cast into them. This dimension is the minimum wear dimension and not a refinish dimension. The minimum wear dimension is 16.6 mm (0.654 in). The minimum refinish dimension is 16.97 mm (0.668 in).

When refinishing rotors, always use sharp cutting tools or bits. Dull or worn tools leave a poor surface finish which will affect initial braking performance. Vibration dampening attachments should always be used when refinishing braking surfaces. These attachments eliminate tool chatter and will result in better surface finish.

After refinishing, replace any rotor that does not meet the minimum thickness of 16.97 mm (0.668 in). Do not use a brake rotor that will not meet the specification.

Minimum wear dimension: 16.6 mm (0.654 in)

Refinish dimension: 16.97 mm (0.668 in)

420RW002

Rear Drum (In Disc) Inside Diameter Check

Check the rear drum inside diameter by measuring at more than two portions as shown in the illustration. If the inside diameter is greater than the limit, replace the rear rotor.

Standard: 210.0 mm (8.27 in)

Limit: 211.4 mm (8.32 in)

420RS035

Rear Disc Brake Caliper Assembly

Rear Disc Brake Caliper Assembly and Associated Parts

| (2) Clip | (6) Pad Assembly with Shim |
| (3) Lock Bolt | (7) Caliper Assembly |
| (4) Support Bracket | |

306RW007

Removal

1. Raise the vehicle and support with suitable safety stands.
2. Remove wheel and tire assembly, referring to "Wheels and Tires System" in Section 3E.
3. Remove the bolt and gaskets, then disconnect the flexible hose from the caliper and after disconnecting the flexible hose (1), cap or tape the openings to prevent entry of foreign material.

306RW008

4. Since the brake fluid flows out from the connecting coupler, place a drain pan under the vehicle.
5. Remove lock bolt (3).

6. Remove guide bolt (2).

306RW009

7. Remove caliper assembly.

8. Remove support bracket with pad assembly and take care not to damage the flexible brake hose when removing the support bracket.

9. Remove pad assembly with shim and mark the lining locations if they are to be reinstalled.

10. Remove clip.

306RW011

Legend

- (5) Inner Shim
- (6) Wear indicator

3. Install support bracket and tighten the bolt (7) to the specified torque.

Torque: 103 N·m (10.5 kg·m/76 lbft)

Installation

1. Install clip (4).

306RW010

2. Apply special grease (approximately 0.2g) to both contacting surfaces of the inner shims (5). Wipe off extruded grease after installing. Install pad assembly with shim.

306RW012

4. Install caliper assembly.

5. Install lock bolt and guide bolt (8) and tighten the bolt to the specified torque.

Torque: 43 N·m (4.4 kg·m/33 lbft)

306RW013

6. Install brake flexible hose, always use new gaskets and be sure to put the hooked edge of the flexible hose end into the anti-rotation cavity then tighten the eye-bolt (9) to the specified torque.

Torque: 34 N·m (3.5 kg·m/25 lb ft)

302RW017

7. Install the wheel and tire assembly, referring to "*Wheels and Tires System*" in Section 3E.
8. Bleed brakes. Refer to "*Hydraulic Brakes*" in this section.

Rear Disc Brake Caliper

| (3) Bleeder with Cap | (8) Dust Boot Ring |
| (4) Caliper Body | (9) Dust Boot: Guide Bolt and Lock Bolt |
| (5) Piston Seal | |

Disassembly

1. Remove guide bolt.
2. Remove lock bolt.
3. Remove dust boot; guide bolt and lock bolt.
4. Remove dust boot ring, using a small screwdriver.

302RS016

5. Insert a block of wood into the caliper and force out the piston by blowing compressed air into the caliper at the flexible hose attachment. This procedure must be done prior to removal of the dust boot. Remove piston.

WARNING: Do not place your fingers in front of the piston in an attempt to catch or protect it when applying compressed air. This could result in personal injury.

CAUTION: Use just enough air to ease the piston out of the bore. If the piston is blown out, it may be damaged.

302RS017

6. Remove dust boot: piston.
7. Remove piston seal.
8. Remove bleeder with cap.
9. Remove caliper body.

Inspection and Repair

Make necessary parts replacement, if wear, damage, corrosion or any other abnormal conditions are found through inspection.

Check the following parts:

- Rotor
- Cylinder body
- Cylinder bore
- Piston
- Guide bolt, lock bolt
- Support bracket

NOTE: The piston dust seal and dust boot are to be replaced each time the caliper is overhauled. Discard these used rubber parts and replace with new ones.

Reassembly

1. Install caliper body.
2. Install bleeder with cap and tighten the cap to the specified torque.

Torque: 8 N-m (0.8 kg-m/69 lbft)

3. Install piston seal and apply special rubber grease to the piston seal and cylinder wall, then insert the piston seal into the cylinder. The special rubber grease is included in the repair kit.

302RS018

4. When inserting the piston into the cylinder, use finger pressure only and do not use a mallet or other impact tool, since damage to the cylinder wall or piston seal can result. Install piston.

302RS019

5. Apply special grease (approximately 1g) to the piston and attach the dust boot to the piston and caliper. Insert the dust boot ring into the dust boot.

302RS021

8. Install lock bolt and guide bolt and tighten the bolt to the specified torque.

Torque: 43 N·m (4.4 kg·m/32 lbft)

302RS020

6. Install guide bolt and lock bolt dust boot.
7. Install the dust boot on the support bracket after applying special grease (Approx. 1g) onto the dust boot inner surface. Also apply special grease onto the lock bolt and guide bolt setting hole of the support bracket.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fasteners joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fasteners. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

Pulling up the parking brake lever by hand will set the parking brake. By means of a ratchet type lock, the lever can be held in that position until it is released. The position of the lever is transmitted through cable/lever systems to the rear wheels. These parts are designed to obtain sufficient braking force even when parking on slopes. When the parking brake is set, or when the ignition SW is in the "ON" position, the brake warning light illuminates. The rear wheel parking brake is a duo-servo brake (mechanical inside expansion type) built in the rear disc brake. Parking brake adjustment is made through the adjusting hole (bored through back plate). Parking brake lever stroke should be adjusted to 6-8 notches. Refer to "Parking Brake Adjustment" in this section.

5D-2 PARKING BRAKE SYSTEM

Operation

When pulled in the direction "A", the parking lever presses the secondary shoe against the brake drum using the lever/shoe joint "B" as a fulcrum and pushes the strut in the direction "C". The strut, in turn, presses the primary shoe against the brake drum. Counter force "D" to the primary shoe is transmitted again to the secondary shoe

through the fulcrum "B". The secondary shoe contacts the drum thereby producing braking effect. Clearance which may result from worn parking brake shoe lining can be adjusted by turning the adjusting screw. Refer to "Parking Brake Adjustment" in this Section.

| (4) Adjust Nut and Lock Nut | (8) Parking Brake Lever |

Removal

1. Remove rear console (1).
 - Refer to *Body and Accessories* section.
2. Disconnect switch connector (2).
3. Remove bolt (3).
4. Remove adjust nut and lock nut (4).
5. Pull out equalizer (6) from trunnion pin (5).
6. Disconnect trunnion pin (5) from Parking brake lever (8).
7. Disconnect parking brake rear cable (7).

Installation

1. Apply grease (BESCO L-2 or equivalent) to the connecting portion of the rear cable (7) and equalizer (6).
2. Connect parking brake rear cable (7) to equalizer (6).
3. Install trunnion pin (5) to parking brake lever (8).
4. Insert equalizer (6) into trunnion pin (5) and tighten adjust nut and lock nut (4).
 - To adjust the parking brake lever, see "*Parking Brake Adjustment*" in this section.
5. Tighten the parking brake lever fixing bolt (3) to the specified torque.

Lock Nut Torque: 13 N·m (1.3 kg·m/113 lb in)
6. Connect switch connector (2).

Torque: 15 N·m (1.5 kg·m/11 lb ft)
7. Install rear console (1).
 - Refer to *Body and Accessories* section.

Parking Brake Rear Cable

Parking Brake Rear Cable and Associated Parts

| (5) Upper Return Spring | (12) Nut |
| (6) Lower Return Spring | (13) Nut |
| (7) Shoe Assembly | (14) Retainer |
| | (15) Rear Cable |

Removal

1. Remove rear wheels (1).
2. Remove 2 bolts to remove the caliper assembly (2) from the support bracket. Refer to "Rear Disc Brakes" in Power Assisted Brake System section. Temporarily hang the caliper with wire etc.
3. Remove rotor (drum) (3).
4. Remove holding spring (4), upper return spring (5) and lower return spring (6).
5. Previously remove the rear cable from the parking brake lever, then remove the brake shoe assembly (7).

308RW004

Legend

- (1) Parking Brake Lever

6. Remove cable fixing bolt (8) and bolt (9) (10) (11).
7. Remove nut (12).
8. Remove nut (13) and retainer (14).
9. Remove rear cable (15).

Installation

1. Apply grease (BESCO L-2 or equivalent) to the connecting portion of the rear cable and equalizer. Install rear cable (15).
2. Install retainer (14).
 - Tighten nut (13) to the specified torque.

Torque: 41N·m (4.2 kg·m/30lb ft)
3. Tighten nut (12) to the specified torque.

Torque: 15N·m (1.5 kg·m/11lb ft)
4. Tighten bolt (11) (10) (9) to the specified torque.

Torque: 6.5N·m (0.66 kg·m/57lb in)

 - To adjust the parking brake, refer to "Parking Brake Adjustment" in this section.
5. Tighten the cable fixing bolt (8) to the specified

Torque: 6.5N·m (0.66 kg·m/57lb in)

6. Install shoe assembly (7).

After installation of the shoe and cable assembly, apply special grease (included in the repair kit) to the following portions indicated in the figure.

308RS005

7. Install lower return spring (6) and upper return spring (5).

The parking brake lever side (secondary side) return spring must be installed on the outer side of the primary side return spring.

308RS003

Legend

- (1) Outer Side
(2) Parking Lever

8. Install holding spring (4).
9. Install rotor (drum) (3).
10. Install caliper assembly (2).
11. Install rear wheels (1).

5D-6 PARKING BRAKE SYSTEM

Inspection and Repair

Parking Brake Lining Inspection

Check the shoe assemblies for wear by removing the brake drum.

Replace the shoe assemblies if the lining thickness is less than 1.0 mm (0.039 in).

Minimum limit: 1.0 mm (0.039 in)

308RS004

Parking Brake Rotor (Drum) Inspection

Refer to "Rear Disc Brakes" in Power-Assisted Brake System section for inspection procedure of the rotor (drum).

Parking Brake Adjustment

1. Prior to lever stroke adjustment, adjust rear brake shoe/rotor (drum) gap. Perform this procedure with loosening the adjust nut of the hand brake lever.
2. Remove the adjusting hole plug (rubber) and turn the shoe adjusting screw downward with a small screwdriver so that shoes will expand until they get into close touch with the rotor. (Turn down the adjusting screw notch by notch until the rotor does not turn.)
3. Turn the adjusting screw in the opposite direction (upward) until the rotor can be turned lightly. Standard number of notches to turn upward: 7 or 8
Turn the rotor and make sure that there is no brake dragging.
4. After the rear brake shoe/rotor (drum) gap has been adjusted, perform parking brake cable adjustment.
5. Turn the adjusting nut so that the parking brake lever travels 6–8 notches when pulled up with a force of 30 kg (66 lb).
6. Make sure there is no brake dragging. Then tighten the cable lock nut

Torque : 13 N·m (113 lb in)

7. When poor braking effect possibly resulting from insufficient break-in is felt, or just after replacement of parking brake shoe, be sure to conduct break-in as follows:

8. Forward 50 km/h (30 mph) × 400 m (About 30 seconds) with a lever pull force of 15 kg (33 lb).
9. Backward 10 km/h (6 mph) × 50 m (About 18 seconds) with a lever pull force of 15 kg (33 lb).

NOTE: Break-in procedures must be performed under safe conditions and traffic rules.

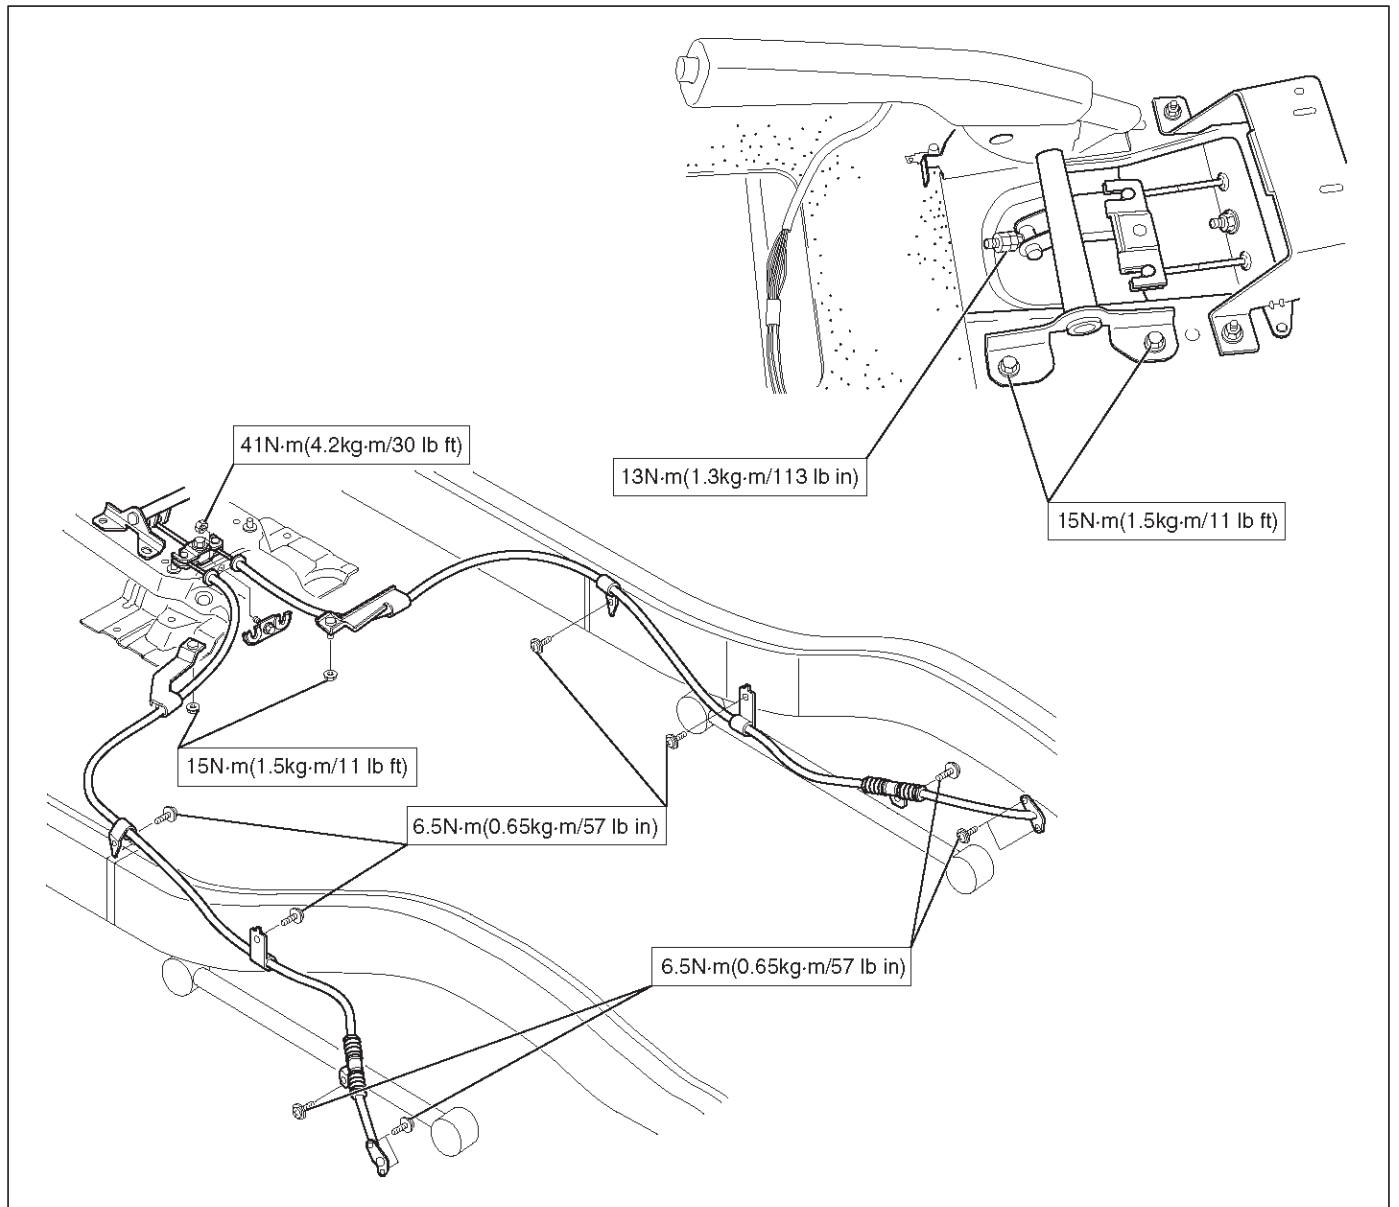

- If braking effect still remains poor after the above break-in, wait for some time until parking brake shoe cools down and repeat the procedures 8. and 9. noted above.
- On completion of break-in, inspect parking brake lever stroke, and if the lever does not come within the specified number of notches when pulled up, readjust.
- Excessive break-in may cause premature wear of the parking brake lining.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS), REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

Engine Cleanliness And Care

An automobile engine is a combination of many machined, honed, polished and lapped surfaces with tolerances that are measured in the thousandths of a millimeter (ten thousandths of an inch). Accordingly, when any internal engine parts are serviced, care and cleanliness are important. Throughout this section, it should be understood that proper cleaning and protection of machined surfaces and friction areas is part of the repair procedure. This is considered standard shop practice even if not specifically stated.

- A liberal coating of engine oil should be applied to all friction areas during assembly to protect and lubricate the surfaces on initial operation.
- Whenever valve train components, pistons, piston rings, connecting rods, rod bearings, and crankshaft journal bearings are removed for service, they should be retained in order.
- At the time of installation, they should be installed in the same locations and with the same mating surfaces as when removed.
- Battery cables should be disconnected before any major work is performed on the engine. Failure to disconnect cables may result in damage to wire harness or other electrical parts.
- The six cylinders of this engine are identified by numbers; Right side cylinders 1, 3 and 5, Left side cylinders 2, 4 and 6, as counted from crankshaft pulley side to flywheel side.

General Information on Engine Service

The following information on engine service should be noted carefully, as it is important in preventing damage and contributing to reliable engine performance:

- When raising or supporting the engine for any reason, do not use a jack under the oil pan. Due to the small clearance between the oil pan and the oil pump strainer, jacking against the oil pan may cause damage to the oil pick-up unit.
- The 12-volt electrical system is capable of damaging circuits. When performing any work where electrical terminals could possibly be grounded, the ground cable of the battery should be disconnected at the battery.
- Any time the intake air duct or air cleaner is removed, the intake opening should be covered. This will protect against accidental entrance of foreign material into the cylinder which could cause extensive damage when the engine is started.

Cylinder Block

The cylinder block is made of aluminum die-cast casting for 75° V-type six cylinders. It has a rear plate integrated structure and employs a deep skirt. The cylinder liner is cast and the liner inner diameter and crankshaft journal diameter are classified into grades. The crankshaft is supported by four bearings of which width of No.3 bearing on the body side is different in order to support the thrust bearing. The bearing cap is made of nodular cast iron and each bearing cap uses four bolts and two side bolts.

Cylinder Head

The cylinder head, made of aluminum alloy casting employs a pent-roof type combustion chamber with a spark plug in the center. The intake and exhaust valves are placed in V-type design. The ports are cross-flow type.

Valve Train

Intake and exhaust camshaft on the both side of banks are driven through an camshaft drive gear by timing belt. The valves are operated by the camshaft and the valve clearance is adjusted to select suitable thickness shim.

Intake Manifold

The intake manifold system is composed of the aluminum cast common chamber and intake manifold attached with six fuel injectors.

Exhaust Manifold

The exhaust manifold is made of nodular cast iron.

Pistons and Connecting Rods

Aluminum pistons are used after selecting the grade that meets the cylinder bore diameter. Each piston has two compression rings and one oil ring. The piston pin is made of chromium steel is offset 1mm toward the thrust side, and the thrust pressure of piston to the cylinder wall varies gradually as the piston travels. The connecting rods are made of forged steel. The connecting rod bearings are graded for correct size selection.

Crankshaft and Bearings

The crankshaft is made of Ductile cast-iron. Pins and journals are graded for correct size selection for their bearing.

Engine Lubrication

The oil discharged by a trochoid-type oil pump driven by the crankshaft is fed through full-flow oil filter and to the oil gallery provided under the crankshaft bearing cap. The oil is then led to the crankshaft journals and cylinder head. The crank pins are lubricated with oil from crankshaft journals through oil holes. Also, an oil jet is fed to each cylinder from crankshaft journals on the connecting rod for piston cleaning. The oil pan flange is dealt with liquid packing only; do not deform or damage the flange surface during removal or installation.

Engine Diagnosis

Hard Starting

1. Starting Motor Does Not Turn Over

Troubleshooting Procedure

Turn on headlights and starter switch.

Condition	Possible cause	Correction
Headlights go out or dim considerably	Battery run down or under charged	Recharge or replace battery
	Terminals poorly connected	Clean battery posts and terminals and connect properly
	Starting motor coil circuit shorted	Overhaul or replace
	Starting motor defective	Overhaul or replace

2. Ignition Trouble — Starting Motor Turns Over But Engine Does Not Start

Spark Test

Disconnect an ignition coil from any spark plug. Connect the spark plug tester J-26792 (ST-125), start the engine, and check if a spark is generated in the spark plug tester. Before starting the engine, make sure that the spark plug tester is properly grounded. To avoid electrical shock, do not touch the part where insulation of the ignition coil is broken while the engine is running.

Condition	Possible cause	Correction
Spark jumps across gap	Spark plug defective	Clean, adjust spark gap or replace
	Ignition timing incorrect	Refer to Ignition System
	Fuel not reaching fuel injector(s) or engine	Refer to item 3 (Trouble in fuel system)
	Valve timing incorrect	Adjust
	Engine lacks compression	Refer to item 4 (Engine lacks compression)
No sparking takes place	Ignition coil disconnected or broken	Connect properly or replace
	Electronic Ignition System with module	Replace
	Poor connections in engine harness	Correct
	Powertrain Control Module cable disconnected or defective	Correct or replace

3. Trouble In Fuel System

Condition	Possible cause	Correction
Starting motor turns over and spark occurs but engine does not start.	Fuel tank empty	Fill
	Water in fuel system	Clean
	Fuel filter clogged	Replace filter
	Fuel pipe clogged	Clean or replace
	Fuel pump defective	Replace
	Fuel pump circuit open	Correct or replace
	Evaporative Emission Control System circuit clogged	Correct or replace
	Multipoint Fuel Injection System faulty	Refer to "Electronic Fuel Injection" section

4. Engine Lacks Compression

Condition	Possible cause	Correction
Engine lacks compression	Spark plug loosely fitted or spark plug gasket defective	Tighten to specified torque or replace gasket
	Valve timing incorrect	Adjust
	Cylinder head gasket defective	Replace gasket
	Valve incorrectly seated	Lap valve
	Valve stem seized	Replace valve and valve guide
	Valve spring weakened or broken	Replace
	Cylinder or piston rings worn	Overhaul engine
	Piston ring seized	Overhaul engine.

Engine Compression Test Procedure

1. Start and run the engine until the engine reaches normal operating temperature.
2. Turn the engine off.
3. Remove all the spark plugs.
4. Remove ignition coil fuse (15A) and disable the ignition system.
5. Remove the fuel pump relay from the relay and fuse box.
6. Engage the starter and check that the cranking speed is approximately 300 rpm.
7. Install cylinder compression gauge into spark plug hole.
8. With the throttle valve opened fully, keep the starter engaged until the compression gage needle reaches the maximum level. Note the reading.
9. Repeat the test with each cylinder.
If the compression pressure obtained falls below the limit, engine overhaul is necessary.

Limit; 1000 kPa (145 psi)

Rough Engine Idling or Engine Stalling

Condition	Possible cause	Correction
Trouble in fuel injection system	Throttle shutting off incomplete	Correct or replace
	Throttle position sensor circuit open or shorted	Correct or replace
	Fuel injector circuits open or shorted	Correct or replace
	Fuel injectors damaged	Replace
	Fuel pump relay defective	Replace
	Mass Air Flow (MAF) Sensor circuit open or poor connections	Correct or replace
	Mass Air Flow (MAF) Sensor defective	Replace
	Manifold Absolute Pressure Sensor circuit open or poor connections	Correct or replace
	Manifold Absolute Pressure Sensor defective	Replace
	Engine Coolant Temperature Sensor circuit open or poor connections	Correct or replace
	Engine Coolant Temperature Sensor defective	Replace
	Intake Air Temperature sensor circuit open or poor connections	Correct or replace
	Intake Air Temperature sensor defective	Replace
	ION Sensing Module cable broken or poor connections	Correct or replace
	ION Sensing Module defective	Replace
Vehicle Speed Sensor circuit open or shorted	Correct or replace	
Vehicle Speed Sensor defective	Replace	
Trouble in emission control system	Powertrain Control Module defective	Replace
	Exhaust Gas Recirculation Valve circuit open or poor connections	Correct or replace
	Exhaust Gas Recirculation Valve faulty	Replace
	Canister purge valve circuit open or poor connections	Correct or replace
	Canister purge valve defective	Replace
	Evaporative Emission Canister Purge control valve defective	Replace
	Trouble in ignition system	Refer to "Hard Start"
Others	Engine lacks compression	Refer to "Hard Start"
	Valve incorrectly seated	Lap valve
	Air Cleaner Filter clogged	Replace filter element
	Valve timing incorrect	Readjust
	Idle air control valve broken	Replace
	Fast idle solenoid defective	Replace
	Positive Crankcase Ventilation valve defective or clogged	Replace

Rough Engine Running

Condition	Possible cause	Correction
Engine misfires periodically	Ignition coil layer shorted	Replace
	Spark plugs fouling	Clean or install hotter type plug
	Spark plug(s) insulator nose leaking	Replace
	Fuel injector(s) defective	Replace
	Powertrain control module faulty	Replace
Engine knocks periodically	Spark plugs running too hot	Install colder type spark plugs
	Powertrain control module faulty	Replace
	ION Sensing module faulty	Refer or replace
Engine lacks power	Spark plugs fouled	Clean
	Fuel injectors defective	Replace
	Mass Air Flow (MAF) Sensor or Intake Airflow Sensor circuit defective	Correct or replace
	Manifold Absolute Pressure (MAP) Sensor or Manifold Absolute Pressure Sensor circuit defective	Correct or replace
	Engine Coolant Temperature Sensor or Engine Coolant Temperature Sensor circuit defective	Correct or replace
	Powertrain Control Module faulty	Replace
	Intake Air Temperature Sensor or Intake Air Temperature Sensor circuit defective	Correct or replace
	Throttle Position Sensor or Throttle Position Sensor circuit defective	Correct or replace
	ION Sensing Module or ION Sensing Module circuits defective	Correct or replace

Hesitation

Condition	Possible cause	Correction
Hesitation on acceleration	Throttle Position Sensor adjustment incorrect	Replace throttle valve assembly
	Throttle Position Sensor circuit open or shorted	Correct or replace
	Mass Air Flow (MAF) Sensor circuit open or poor connections	Correct or replace
	Mass Air Flow (MAF) Sensor defective	Replace
	Manifold Absolute Pressure (MAP) Sensor circuit open or shorted	Correct or replace
	MAP Sensor defective	Replace
	Intake Air Temperature (IAT) Sensor circuit open or poor connections	Correct or replace
	ION Sensing Module circuit open or poor connections	Correct or replace
	ION Sensing Module defective	Replace
	IAT Sensor defective	Replace
Hesitation at high speeds (Fuel pressure too low)	Fuel tank strainer clogged	Clean or replace
	Fuel pipe clogged	Clean or replace
	Fuel filter clogged	Replace
	Defective fuel pump system	Check and replace
	Fuel Pressure Control Valve leaking	Replace
Hesitation at high speeds (Fuel injector not working normally)	Power supply or ground circuit for Multiport Fuel Injection System shorted or open	Check and correct or replace
	Fuel Injector defective	Replace
	Cable of Multiport Fuel Injection System circuit open or poor connections	Correct or replace

Condition	Possible cause	Correction
Hesitation at high speeds	Powertrain Control Module defective	Replace
	Throttle Position Sensor cable broken or poor connections	Correct or replace
	Throttle Position Sensor defective	Replace
	Engine Coolant Temperature Sensor circuit open or shorted	Correct or replace
	Engine Coolant Temperature Sensor defective	Replace
	Mass Air Flow (MAF) Sensor circuit open or poor connections	Correct or replace
	Mass Air Flow (MAF) Sensor defective	Replace
	MAP Sensor cable broken or poor connections	Correct or replace
	MAP Sensor defective	Replace
	IAT Sensor circuit open or poor connections	Correct or replace
	IAT Sensor defective	Replace
	ION Sensing Module circuit open or poor connections	Correct or replace
	ION Sensing Module defective	Replace
	Throttle valve not fully opened	Check and correct or replace
	Air Cleaner Filter clogged	Replace filter element
Power supply voltage too low	Check and correct or replace	

6A-10 ENGINE MECHANICAL (6VD1 3.2L)

Engine Lacks Power

Condition	Possible cause	Correction
Trouble in fuel system	Fuel Pressure Control Valve not working normally	Replace
	Fuel injector clogged	Clean or replace
	Fuel pipe clogged	Clean
	Fuel filter clogged or fouled	Replace
	Fuel pump drive circuit not working normally	Correct or replace
	Fuel tank not sufficiently breathing due to clogged Evaporative Emission Control System circuit	Clean or replace
	Water in fuel system	Clean
	Inferior quality fuel in fuel system	Use fuel of specified octane rating
	Powertrain Control Module supplied poor voltage	Correct circuit
	Throttle Position Sensor cable broken or poor connections	Correct or replace
	Throttle Position Sensor defective	Replace
	Mass Air Flow (MAF) Sensor not working normally	Replace
	Manifold Absolute Pressure Sensor not working normally	Replace
	Intake Air Temperature Sensor not working normally	Replace
	Engine Coolant Temperature Sensor circuit open or shorted	Correct or replace
	Engine Coolant Temperature Sensor defective	Replace
Powertrain Control Module defective	Replace	
Trouble in intake or exhaust system	Air Cleaner Filter clogged	Replace filter element
	Air duct kinked or flattened	Correct or replace
	TWC defective	Repair
Ignition failure	—————	Refer to Hard Start Troubleshooting Guide
	Heat range of spark plug inadequate	Install spark plugs of adequate heat range
	Ignition coil defective	Replace

Condition	Possible cause	Correction
Engine overheating	Level of Engine Coolant too low	Replenish
	Fan clutch defective	Replace
	Incorrect fan installed	Replace
	Thermostat defective	Replace
	Engine Coolant pump defective	Correct or replace
	Radiator clogged	Clean or replace
	Radiator filler cap defective	Replace
	Level of oil in engine crankcase too low or wrong engine oil	Change or replenish
	Resistance in exhaust system increased	Clean exhaust system or replace defective parts
	Throttle Position Sensor adjustment incorrect	Replace with Throttle Valve ASM
	Throttle Position Sensor circuit open or shorted	Correct or replace
Cylinder head gasket damaged	Replace	
Engine overcooling	Thermostat defective	Replace (Use a thermostat set to open at 82° C (180° F))
Engine lacks compression	—————	Refer to Hard Start
Others	Tire inflation pressure abnormal	Adjust to recommended pressures
	Brake drag	Adjust
	Clutch slipping	Adjust or replace
	Level of oil in engine crankcase too high	Correct level of engine oil
	Exhaust Gas Recirculation Valve defective	Replace

Engine Noisy

Abnormal engine noise often consists of various noises originating in rotating parts, sliding parts and other moving parts of the engine. It is, therefore, advisable to locate the source of noise systematically.

Condition	Possible cause	Correction
Noise from crank journals or from crank bearings (Faulty crank journals and crank bearings usually make dull noise that becomes more evident when accelerating)	Oil clearance increased due to worn crank journals or crank bearings	Replace crank bearings and crankshaft or regrind crankshaft and install the undersize bearing
	Crankshaft out of round	Replace crank bearings and crankshaft or regrind crankshaft and install the undersize bearing
	Crank bearing seized	Crank bearing seized Replace crank bearings and crankshaft or regrind crankshaft and install the undersize bearing

6A-12 ENGINE MECHANICAL (6VD1 3.2L)

Troubleshooting Procedure

Short out each spark plug in sequence using insulated spark plug wire removers. Locate cylinder with defective bearing by listening for abnormal noise that stops when spark plug is shorted out.

Condition	Possible cause	Correction
Noise from connecting rods or from connecting rod bearings (Faulty connecting rods or connecting rod bearings usually make an abnormal noise slightly higher than the crank bearing noise, which becomes more evident when engine is accelerated)	Bearing or crankshaft pin worn	Replace connecting rod bearings and crankshaft or regrind crankshaft pin and install the undersize bearing
	Crankpin out of round	Replace connecting rod bearings and crankshaft or regrind crankshaft pin and install the undersize bearing
	Connecting rod bent	Correct or replace
	Connecting rod bearing seized	Replace connecting rod bearings and crankshaft or regrind crankshaft pin and install the undersize bearing

Troubleshooting Procedure

Abnormal noise stops when the spark plug on the cylinder with defective part is shorted out.

Condition	Possible cause	Correction
Piston and cylinder noise (Faulty piston or cylinder usually makes a combined mechanical thumping noise which increases when engine is suddenly accelerated but diminishes gradually as the engine warms up)	Piston clearance increased due to cylinder wear	Replace piston and cylinder body
	Piston seized	Replace piston and cylinder body
	Piston ring broken	Replace piston and cylinder body
	Piston defective	Replace pistons and others

Troubleshooting Procedure

Short out each spark plug and listen for change in engine noise.

Condition	Possible cause	Correction
Piston pin noise (Piston makes noise each time it goes up and down)	Piston pin or piston pin hole worn	Replace piston, piston pin and connecting rod assy

Troubleshooting Procedure

The slapping sound stops when spark plug on bad cylinder is shorted out.

Condition	Possible cause	Correction
Timing belt noise	Timing belt tension is incorrect	Replace pusher or adjust the tension pulley or replace timing belt
	Tensioner bearing defective	Replace
	Timing belt defective	Replace
	Timing pulley defective	Replace
	Timing belt comes in contact with timing cover	Replace timing belt and timing cover
Valve noise	Valve clearance incorrect	Replace adjusting shim
	Valve and valve guide seized	Replace valve and valve guide
	Valve spring broken or weakened	Replace
	Valve seat off-positioned	Correct
	Camshaft worn out	Replace
Crankshaft noise	Crankshaft end play excessive (noise occurs when clutch is engaged)	Replace thrust bearing
Engine knocking	Preignition due to use of spark plugs of inadequate heat range	Install Spark Plugs of adequate heat range
	Carbon deposits in combustion chambers	Clean
	Fuel too low in octane rating	Replace fuel
	Wide Open Throttle enrichment system failure	Refer to Section 6E
	Selection of transmission gear incorrect	Caution operator of incorrect gear selection
	Engine overheating	Refer to "Engine Lacks Power"
Others	Water pump defective	Replace
	Drive belt slipping	Replace auto tensioner or drive belt

6A-14 ENGINE MECHANICAL (6VD1 3.2L)

Abnormal Combustion

Condition	Possible cause	Correction
Trouble in fuel system	Fuel pressure control valve defective	Replace
	Fuel filter clogged	Replace
	Fuel pump clogged	Clean or replace
	Fuel tank or fuel pipe clogged	Clean or replace
	Fuel injector clogged	Clean or replace
	Fuel pump relay defective	Replace
	Power supply cable for fuel pump broken or poor connections	Reconnect, correct or replace
	Mass Air Flow (MAF) Sensor circuit open or defective	Correct or replace
	MAF Sensor defective	Replace
	Manifold Absolute Pressure Sensor circuit open or shorted	Correct or replace
	Manifold Absolute Pressure Sensor defective	Replace
	Engine Coolant Temperature (ECT) Sensor circuit open or shorted	Correct or replace
	ECT Sensor defective	Replace
	Throttle Position Sensor adjustment incorrect	Readjust
	Throttle Position Sensor defective	Replace
	Throttle Position Sensor connector poor connections	Reconnect
	Vehicle Speed Sensor cable poor connections or defective	Correct or replace
	Vehicle Speed Sensor loosely fixed	Fix tightly
	Vehicle Speed Sensor in wrong contact or defective	Replace
	Powertrain Control Module cable poor connections or defective	Correct or replace
Trouble in emission control system	Heated Oxygen Sensor circuit open	Correct or replace
	Heated Oxygen Sensor defective	Replace
	Signal vacuum hose loosely fitted or defective	Correct or replace
	EGR Valve circuit open or shorted	Correct or replace
	Exhaust Gas Recirculation Valve defective	Replace
	ECT Sensor circuit open or shorted	Correct or replace
	Canister Purge Valve circuit open or shorted	Correct or replace
	Canister Purge Valve defective	Replace
	ECT Sensor defective	Replace
	Positive Crankcase Ventilation (PCV) valve and hose clogged	Correct or replace
	Evaporator system	Refer to Section 6E
Trouble in ignition system	—————	Refer to "Engine Lacks Power"

Condition	Possible cause	Correction
Trouble in cylinder head parts	Carbon deposits in combustion chamber	Remove carbon
	Carbon deposit on valve, valve seat and valve guide	Remove carbon

6A-16 ENGINE MECHANICAL (6VD1 3.2L)

Engine Oil Consumption Excessive

Condition	Possible cause	Correction
Oil leaking	Oil pan drain plug loose	Retighten or replace gasket
	Crankcase fixing bolts loosened	Retighten
	Oil pan setting bolts loosened	Retighten
	Oil pan gasket broken	Replace gasket
	Front cover retaining bolts loose or gasket broken	Retighten or replace gasket
	Head cover fixing bolts loose or gasket broken	Retighten or replace gasket
	Oil filter adapter cracked	Replace
	Oil filter attachings bolt loose or rubber gasket broken	Retighten or replace oil filter
	Crankshaft front or rear oil seal defective	Replace oil seal
	Oil pressure unit loose or broken	Retighten or replace
	Blow-by gas hose broken	Replace hose
	Positive Crankcase Ventilation Valve clogged	Clean
	Engine/Transmission coupling failed	Replace oil seal
Oil leaking into combustion chambers due to poor seal in valve system	Valve stem oil seal defective	Replace
	Valve stem or valve guide worn	Replace valve and valve guide
Oil leaking into combustion chambers due to poor seal in cylinder parts	Cylinders and pistons worn excessively	Replace cylinder body assembly and pistons
	Piston ring gaps incorrectly positioned	Correct
	Piston rings set with wrong side up	Correct
	Piston ring sticking	Replace cylinder body assembly and pistons
	Piston ring and ring groove worn	Replace pistons and others
	Return ports in oil rings clogged	Clean piston and replace rings
Positive Crankcase Ventilation System malfunctioning	Positive Crankcase Ventilation Valve clogged	Clean
Others	Improper oil viscosity	Use oil of recommended S.A.E. viscosity
	Continuous high speed driving and/or severe usage such as trailer towing	Continuous high speed operation and/or severe usage will normally cause increased oil consumption

Fuel Consumption Excessive

Condition	Possible cause	Correction
Trouble in fuel system	Mixture too rich or too lean due to trouble in fuel injection system	Refer to "Abnormal Combustion"
	Fuel cut function does not work	Refer to "Abnormal Combustion"
Trouble in ignition system	Misfiring or abnormal combustion due to trouble in ignition system	Refer to "Hard Start" or "Abnormal Combustion"
Others	Engine idle speed too high	Reset Idle Air Control Valve
	Fuel system leakage	Correct or replace
	Clutch slipping	Correct
	Brake drag	Correct
	Selection of transmission gear incorrect	Caution operator of incorrect gear selection
	Excessive Exhaust Gas Recirculation flow due to trouble in Exhaust Gas Recirculation system	Refer to "Abnormal Combustion"

Lubrication Problems

Condition	Possible cause	Correction
Oil pressure too low	Wrong oil in use	Replace with correct engine oil
	Relief valve sticking	Replace
	Oil pump not operating properly	Correct or replace
	Oil pump strainer clogged	Clean or replace strainer
	Oil pump worn	Replace
	Oil pressure gauge defective	Correct or replace
	Crankshaft bearing or connecting rod bearing worn	Replace
Oil contamination	Wrong oil in use	Replace with correct engine oil
	Oil filter clogged	Replace oil filter
	Cylinder head gasket damage	Replace gasket
	Burned gases leaking	Replace piston and piston rings or cylinder body assembly
Oil not reaching valve system	Oil passage in cylinder head or cylinder body clogged	Clean or correct

Engine Oil Pressure Check

1. Check for dirt, gasoline or water in the engine oil.
 - a. Check the viscosity of the oil.
 - b. Check the viscosity of the oil.
 - c. Change the oil if the viscosity is outside the specified standard.
 - d. Refer to the "Maintenance and Lubrication" section of this manual.
2. Check the engine oil level.
The level should fall somewhere between the "ADD" and the "FULL" marks on the oil level dipstick.
If the oil level does not reach the "ADD" mark on the oil level dipstick, engine oil must be added.
3. Remove the oil pressure unit.

4. Install an oil pressure gauge.
5. Start the engine and allow the engine to reach normal operating temperature (About 80°C).
6. Measure the oil pressure.
**Oil pressure should be:
392–550 kPa (56.9–80.4 psi) at 3000 rpm.**
7. Stop the engine.
8. Remove the oil pressure gauge.
9. Install the oil pressure unit.
10. Start the engine and check for leaks.

6A-18 ENGINE MECHANICAL (6VD1 3.2L)

Malfunction Indicator Lamp

The instrument panel "CHECK ENGINE" Malfunction Indicator Lamp (MIL) illuminates by self diagnostic system when the system checks the starting of engine, or senses malfunctions.

Condition	Possible cause	Correction
"CHECK ENGINE" MIL does not illuminate at the starting of engine	Bulb defective	Replace
	MIL circuit open	Correct or replace
	Command signal circuit to operate self diagnostic system shorted	Correct or replace
	Powertrain Control Module (PCM) cable loosely connected, disconnected or defective	Correct or replace
	PCM defective	Replace
"CHECK ENGINE" MIL illuminates, and stays on	Deterioration of heated oxygen sensor internal element	Replace
	Heated oxygen sensor connector terminal improper contact	Reconnect properly
	Heated oxygen sensor lead wire shorted	Correct
	Heated oxygen sensor circuit open	Correct or replace
	Deterioration of engine coolant temperature sensor internal element	Replace
	Engine coolant temperature sensor connector terminal improper contact	Reconnect properly
	Engine coolant temperature sensor lead wire shorted	Correct
	Engine coolant temperature sensor circuit open	Correct or replace
	Throttle position sensor open or shorted circuits	Correct or replace
	Deterioration of crankshaft position sensor	Replace
	Crankshaft position sensor circuit open or shorted	Correct or replace
	Vehicle speed sensor circuit open	Correct or replace
	Manifold absolute pressure sensor circuit open or shorted	Correct or replace
	Intake air temperature sensor circuit open or shorted	Correct or replace
	Fuel injector circuit open or shorted	Correct or replace
	PCM driver transistor defective	Replace PCM
	Malfunctioning of PCM RAM (Random Access Memory) or ROM (Read Only Memory)	Replace PCM

Drive Belt (Serpentine Belt)

033R100002

Legend

- | | |
|--------------------------------|----------------------------------|
| (1) Upper Fan Guide | (3) Nut |
| (2) Cooling Fan and Fan Clutch | (4) Clamp |
| | (5) Drive Belt (Serpentine belt) |

Removal

1. Disconnect the battery negative cable.
2. Remove the two bolts from upper side fan guide and four clamps (4) from side of the fan guide for remove the upper fan guide (1).
3. Remove the four nuts (3) from the fan pulley and remove the cooling fan with the fan clutch (2).
4. Move the drive belt tensioner to loose side using wrench then remove drive belt (5).

850RW001

Legend

- (1) Crankshaft Pulley
- (2) Cooling Fan Pulley
- (3) Tensioner

- (4) Generator
- (5) Air Conditioner Compressor
- (6) Power Steering Oil Pump
- (7) Drive (serpentine) Belt

CAUTION:

1. Do not bend or twist the belt, otherwise its core could be damaged. The belt should not be bent at a radius less than 30 mm.
2. Do not allow oil or other chemical substances to come in contact with the belt. They will shorten the life.
3. Do not attempt to pry or stretch the belt with a screw driver or any other tool during installation.
4. Store the belt in a cool and dark place. Never expose the belt direct sunlight or heat.

Inspection and Repair

1. Replace the drive belt, if found the worn or damaged on the belt during inspection.
2. Inspect the belt life indicator, replace the drive belt if the belt life indicator indicate with out limited.

850R100002

Legend

- | | |
|------------------------------------|--|
| (1) Automatic Drive Belt Tensioner | (3) Tension Pulley; Drive Belt Tensioner |
| (2) Drive Belt Tension Lower Limit | (4) Drive Belt Life Indicator |
| | (5) Drive Belt Tensioner Higher Limit |

Installation

1. Move the drive belt tensioner to loose side using wrench, then install the drive belt to normal position.

850RW001

Legend

- | | |
|------------------------|--------------------------------|
| (1) Crankshaft Pulley | (4) Generator |
| (2) Cooling Fan Pulley | (5) Air Conditioner Compressor |
| (3) Tensioner | (6) Power Steering Oil Pump |
| | (7) Drive (serpentine) Belt |

2. Install the cooling fan with the fan clutch and tighten the four nuts.

Torque : 10 N·m (1.0 kg-m/87 lb in) for fan and fan clutch.

Torque : 22 N·m (2.2 kg-m/16 lb ft) for fan pulley and fan bracket.

3. Install the upper fan guide.
Tighten the two bolts to specified torque.

Torque : 4 N·m (0.4 kg-m/35 lb in)

4. Connect the battery negative cable.

Cylinder Head Cover LH

Removal

1. Disconnect battery ground cable.
2. Remove engine cover from the dowels on the common chamber.

F06RY001

3. Disconnect positive crankcase ventilation hose.
4. Remove ground cable fixing bolt on cylinder head cover.
5. Ignition coil connector and ignition coil.
 - Disconnect the three connectors from the ignition coils.
 - Remove harness bracket bolt on cylinder head cover.
 - Remove fixing bolts on ignition coils.

060RY022

Legend

- (1) Ignition Coil Connector
- (2) Bolt
- (3) Ignition Coil Assemblies

6. Disconnect fuel injector harness connector then remove fuel injector harness bracket bolt.
7. Remove eight fixing bolts, then the cylinder head cover.

010RW001

NOTE: As the inmost left side bolt in the cylinder head cover is not easy to remove, follow the undermentioned procedure for removing the bolt.

Installation

1. Install cylinder head cover.

- Clean the sealing surface of cylinder head and cylinder head cover to remove oil and sealing materials completely.
- Apply sealant (TB-1207B or equivalent) of bead diameter 2-3 mm at eight place of arched area of camshaft bearing cap on front and rear sides.
- The cylinder head cover must be installed within 5 minutes after sealant application to prevent hardening of sealant.
- Tighten bolts to the specified torque.

Torque : 9 N·m (0.9 kg·m/80 lb in)

2. Install fuel injection harness bracket and tighten bolt to the specified torque.

Torque : 9 N·m (0.9 kg·m/80 lb in)

3. Connect ignition coil connector and ignition coil, then tighten bolt to the specified torque.

Torque : 4 N·m (0.4 kg·m/35 lb in)

Legend

- (1) Ignition Coil Connector
- (2) Bolt
- (3) Ignition Coil Assembly

CAUTION: Ignition coil assembly #6 is different from ignition coil assembly from #1 to #5. Ignition coil assembly #6 is short type. So, note it when installing ignition coil assembly of #6.

Legend

- (1) Long Type Ignition Coil Assemblies (# 1 ~ # 5)
- (2) Short Type Ignition Coil Assembly (# 6)

4. Connect ground cable and tighten bolts to the specified torque.

Torque : 9 N·m (0.9 kg·m/80 lb in)

5. Install positive crankcase ventilation hose.

6. Install engine cover mating with the dowels.

Cylinder Head Cover RH

Removal

1. Disconnect battery ground cable.
2. Remove engine cover from the dowels on the common chamber.

F06RY001

3. Disconnect ventilation hose from cylinder head cover.
4. Disconnect three ignition coil connectors from ignition coils and remove harness bracket bolts on cylinder head cover then remove ignition coil fixing bolts on ignition coils and remove ignition coils.
5. Disconnect fuel injector harness connector then remove fuel injector harness bracket bolt.
6. Remove eight fixing bolts then the cylinder head cover.

010RW002

Installation

1. Install cylinder head cover.

- Clean the sealing surface of cylinder head and cylinder head cover to remove oil and sealing materials completely.

Apply sealant (TB-1207B or equivalent) bead (diameter 2-3 mm) at eight places of arched areas of camshaft bracket on front and rear sides.

- The cylinder head cover must be installed within 5 minutes after sealant application to prevent premature hardening of sealant.

- Tighten bolts to the specified torque.

Torque : 9 N·m (0.9 kg·m/78 lb in)

014RW019

2. Tighten fuel injector harness bracket bolts to specified torque then reconnect fuel injector harness connector.

Torque : 7.8 N·m (0.8 kg·m/5.7 lb ft)

3. Connect ignition coil connector and tighten ignition coil fixing bolts to specified torque.

Torque : 4 N·m (0.4 kg·m/35 lb in)

4. Connect ventilation hose to cylinder head.
5. Install engine cover mating with the dowels.

Common Chamber

Removal

1. Disconnect battery ground cable.
2. Remove air cleaner duct assembly.

Legend

- (1) Positive Crankcase Ventilation Hose Connector
 - (2) Intake Air Temperature Sensor
 - (3) Air Cleaner Duct Assembly
 - (4) Air Flow Sensor
3. Disconnect vacuum booster hose from common chamber.
 4. Disconnect connector from manifold absolute pressure sensor, Ion sensing module, throttle position sensor, solenoid valve, electric vacuum sensing valve, and EGR valve.
 5. Disconnect vacuum hose on canister VSV and positive crankcase ventilation hose, fuel rail assembly with pressure control valve bracket.
 6. Remove ventilation hose from throttle valve and intake duct and remove water hose.
 7. Remove the four throttle body fixing bolts.
 8. Remove exhaust gas recirculation valve assembly fixing bolt and nut on common chamber and remove EGR valve assembly.
 9. Remove two bolts from common chamber rear side for remove fuel hose bracket.
 10. Remove common chamber four bolts and four nuts then remove the common chamber.

Legend

- (1) Common Chamber
- (2) Throttle Valve Assembly
- (3) Bolt

Installation

1. Install common chamber and tighten bolts and nuts to the specified torque.
 - Torque :**
 - Bolt : 25 N·m (2.5 kg·m/18 lb ft)**
 - Nut : 25 N·m (2.5 kg·m/18 lb ft)**
2. Install fuel hose bracket and tighten bolts to specified torque.
 - Torque : 10 N·m (1.0 kg·m/89 lb in)**
3. Install exhaust gas recirculation valve assembly and tighten bolt and nut to the specified torque.
 - Torque : 25 N·m (2.5 kg·m/18 lb ft)**
4. Install throttle body and tighten bolts to the specified torque.
 - Torque : 10 N·m (1.0 kg·m/89 lb in)**
5. Install ventilating hose to throttle valve and intake duct.
6. Connect vacuum hoses on canister VSV and positive crankcase ventilation hose. Tighten bolts for fuel rail assembly with pressure control valve bracket.
 - Torque : 25 N·m (2.5 kg·m/18 lb ft)**
7. Connect each connector without fail.

8. Connect vacuum booster hose.
9. Connect the Ion sensing module connectors as shown in the illustration.

060RY00003

Legend

- (1) Green Connector
- (2) Blue Connector

10. Install air cleaner duct assembly.

013RY00001

Legend

- (1) Positive Crankcase Ventilation Hose Connector
- (2) Intake Air Temperature Sensor
- (3) Air Cleaner Duct Assembly
- (4) Mass Air Flow Sensor

Exhaust Manifold LH

Removal

1. Disconnect the battery ground cable.
2. Raise the vehicle and support it with chassis stands.
3. Remove the left side wheel and tire assembly.
4. Remove the mud fender skirt.
5. Disconnect the O2 sensor connector.
6. Remove the 3 stud nuts from the exhaust pipe flange.
7. Remove the 2 bolts from the rear end of the front exhaust pipe with catalytic converter.
8. Remove the front exhaust pipe with catalytic converter rubber support.
9. Move the front exhaust pipe with catalytic converter to the rear.

Legend

- (1) Exhaust Front Pipe LH
- (2) Bolt
- (3) Rubber Support
- (4) Stud Nut
- (5) O2 Sensor

10. Remove the exhaust manifold heat protector.

11. Remove the 8 exhaust manifold fixing nuts and the exhaust manifold from the engine.

Legend

- (1) Exhaust Manifold Heat Protector
- (2) Exhaust Manifold

Installation

1. Install the exhaust manifold and exhaust manifold gasket.
 - Do not reuse the old exhaust manifold nuts. Use new nuts and tighten to the specified torque.**Torque: 57 N·m (5.8 kg·m/42 lb ft)**
2. Install the exhaust manifold heat protector.
3. Fix the front exhaust pipe with catalytic converter to the exhaust manifold flange stud bolts and hand-tighten the nuts.
4. Hang the front exhaust pipe with catalytic converter on the chassis (pipe to rubber support/rubber support to chassis).
5. Hand-tighten the 2 bolts at the rear end of the front exhaust pipe.
6. Tighten the exhaust pipe flange stud nuts.
 Torque : 67 N·m (6.8 kg·m/49 lb ft)
7. Tighten the 2 bolts at the rear end of the front exhaust pipe.
 Torque : 43 N·m (4.4 kg·m/32 lb ft)
8. Connect the O2 sensor connector.
9. Install the mud fender skirt.
10. Install the left side wheel and tire assembly.

Exhaust Manifold RH

Removal

1. Disconnect the battery ground cable.
2. Raise the vehicle and support it with chassis stands.
3. Remove the right side wheel and tire assembly.
4. Remove the mud fender skirt.
5. Disconnect the O₂ sensor connector (5).
6. Remove the 3 stud nuts (6) from the exhaust pipe flange.
7. Remove the 2 bolts (4) from the rear end of the left side front exhaust pipe with catalytic converter.
8. Remove the 4 nuts (1) from the front end of the silencer.
9. Remove the 2 nuts (3) from the rear end of the silencer.
10. Remove the rubber support (8) from the right-front exhaust pipe.
11. Move the front exhaust pipe (7), the center exhaust pipe (9) and the silencer assembly (2) to the rear.

6A-30 ENGINE MECHANICAL (6VD1 3.2L)

12. Remove the exhaust gas recirculation (EGR) pipe fixing bolts from the exhaust manifold.
13. Remove the EGR pipe bracket and bolt from the rear side of the cylinder head.
14. Loosen the nut between the EGR pipe and the EGR valve.

Legend

- (1) Pipe Fixing Nut
- (2) Bracket and Bolt
- (3) Pipe Fixing Bolt

15. Remove the exhaust manifold heat protector.
16. Remove the 8 exhaust manifold fixing nuts and the exhaust manifold from the engine.

Installation

1. Install the exhaust manifold and exhaust manifold gasket.

- Do not reuse the old exhaust manifold nuts.
Use new nuts and tighten to the specified torque.

Torque: 57 N·m (5.8 kg·m/42 lb ft)

2. Install the exhaust manifold heat protector.
3. Install the EGR pipe between the exhaust manifold and the EGR valve.
Tighten the fixing nuts and bolts to the specified torque.

- Exhaust manifold (2)

Torque: 28 N·m (2.9 kg·m/21 lb ft)

- Rear cylinder head (1)

Torque: 44 N·m (4.5 kg·m/33 lb ft)

- EGR pipe and EGR valve.

Torque: 25 N·m (2.5 kg·m/18 lb ft)

4. Fix the front exhaust pipe with catalytic converter to the exhaust manifold flange stud bolts and hand-tighten the nuts.
5. Hang the front exhaust pipe with catalytic converter from the chassis (pipe to rubber support/rubber support to chassis).
6. Fix the front end of silencer and hand-tighten the 4 nuts.
7. Fix the end of the left side front exhaust pipe and hand-tighten the bolts.
8. Fix the rear end of the silencer to the rear exhaust pipe bolts and hand-tighten the nuts.
9. Tighten the exhaust pipe flange stud nuts.

Torque: 67 N·m (6.8 kg·m/49 lb ft)

10. Tighten the front end silencer nuts.

Torque: 15 N·m (1.5 kg·m/11 lb ft)

11. Tighten the fixing bolts at the end of the left-side front exhaust pipe.

Torque: 43 N·m (4.4 kg·m/32 lb ft)

12. Tighten the nuts at the rear of the silencer.

Torque: 43 N·m (4.4 kg·m/32 lb ft)

Crankshaft Pulley

Removal

1. Disconnect the battery ground cable.
2. Remove the upper fan guide.
3. Remove the serpentine belt.
 - Refer to the removal procedure for Drive Belt (Serpentine Belt) in this manual.
4. Remove the 4 cooling fan fixing nuts and the cooling fan with clutch assembly.
5. Remove the fan pulley bracket (2 nuts and 1 bolt) and the fan pulley bracket.
6. Use the crankshaft holder (J-8614-01), to hold the crankshaft pulley.
7. Remove the crankshaft center bolt and the pulley.

Installation

1. Use the crankshaft holder (J-8614-01), to hold the crankshaft pulley.
2. Tighten center bolt to the specified torque.
Torque : 167 N·m (17.0 kg·m/123 lb ft)
3. Install the fan pulley bracket and tighten the nuts and bolt to the specified torque.
Torque : 22 N·m (2.2 kg·m/16 lb ft)
4. Install the fan with clutch assembly to the fan pulley bracket.
Torque : 22 N·m (2.2 kg·m/16 lb ft)
5. Use a wrench to force the auto-tensioner pulley toward the bottom of the engine.
Place the serpentine belt over the pulley.
6. Install the upper fan guide.

Timing Belt

Removal

1. Disconnect battery ground cable.
2. Remove air cleaner assembly.
3. Remove radiator upper fan shroud from radiator.
4. Move drive belt tensioner to loose side using wrench then remove drive belt.

Legend

- (1) Crankshaft Pulley
- (2) Cooling Fan Pulley
- (3) Tensioner
- (4) Generator
- (5) Air Conditioner Compressor
- (6) Power Steering Oil Pump
- (7) Drive Belt

5. Remove cooling fan assembly four nuts, then the cooling fan assembly.
6. Remove cooling fan drive pulley assembly.
7. Remove idle pulley assembly.
8. Remove serpentine belt tensioner assembly.
9. Remove power steering pump assembly.
10. Remove crankshaft pulley assembly using 5-8840-0133-0 crankshaft holder, hold crankshaft pulley remove center bolt, then the pulley.

11. Remove right side timing belt cover then left side timing belt cover.
12. Remove lower timing belt cover
13. Remove pusher.

CAUTION: The pusher prevents air from entering the oil chamber. The rod must always be facing upward.

Legend

- (1) Up Side
- (2) Down Side
- (3) Direction For Installation
- (4) Locking Pin
- (5) Apply a force of 980 N (220 lb) when compressing the pusher rod.

14. Remove timing belt.

CAUTION:

1. Do not bend or twist the belt, otherwise its core could be damaged. The belt should not be bent at a radius less than 30 mm.
2. Do not allow oil or other chemical substances to come in contact with the belt. They will shorten the life.
3. Do not attempt to pry or stretch the belt with a screw driver or any other tool during installation.
4. Store timing belt in a cool and dark place. Never expose the belt to direct sunlight or heat.

Installation

014R100015

NOTE: For correct belt installation, the letter on the belt must be able to be read as viewed from the front of the vehicle.

014RW006

Legend

- (1) Timing Belt
- (2) Engine Rotation Direction
- (3) Cylinder Head Side

6A-34 ENGINE MECHANICAL (6VD1 3.2L)

1. Install timing belt.

- a. Align the mark (notch) of crankshaft timing pulley (2) with mark on oil pump (1).

Align the mark (groove) on the crankshaft timing pulley (3) with alignment mark (white dots line) on the timing belt (4).

NOTE: When timing marks are aligned, No.2 piston will be on Top Dead Center.

Legend

- (1) Alignment Mark on Oil Pump
- (2) Groove on Crankshaft Timing Pulley
- (3) Alignment Mark on Crankshaft Timing Pulley
- (4) Alignment Mark on Timing Belt

- b. Align the alignment mark on the RH bank camshaft drive gear pulley (2) to the alignment mark of the cylinder head cover RH (3).

The camshaft pulley is not 1:1 with the camshafts. It is necessary to rotate the camshaft pulley until the camshaft lobes are in the position as shown in the diagram on page 6A-34.

The camshaft pulley alignment mark should also align with alignment mark on the cylinder head cover.

It may require up to four revolutions of the camshaft pulley to achieve alignment of all marks.

- c. Align the alignment mark (white line) on the timing belt (1) with alignment mark on the RH bank camshaft drive gear pulley (2) (on the left side as viewed from the front of the vehicle) and put the timing belt on the camshaft drive gear pulley.

Secure the belt with a double clip or equivalent clip.

Legend

- (1) Alignment Mark on Timing Belt (White line).
- (2) Alignment Mark on Camshaft Drive Gear Pulley.
- (3) Alignment Mark on Cylinder Head Cover RH.

- d. Align the alignment mark on the LH bank camshaft drive gear pulley (2) to the alignment mark of the cylinder head cover LH (3).

The camshaft pulley is not 1:1 with the camshafts. It is necessary to rotate the camshaft pulley until the camshaft lobes are in the position as shown in the diagram on page 6A-34.

The camshaft pulley alignment mark should also align with alignment mark on the cylinder head cover.

It may require up to four revolutions of the camshaft pulley to achieve alignment of all marks.

- e. Align the alignment mark (white line) on the timing belt (1) with the alignment mark on the LH bank camshaft drive gear pulley (2).

When aligning the timing marks, use a wrench to turn the camshaft drive gear pulley, then set the timing mark between timing belt and camshaft drive gear pulley and put the timing belt on the camshaft drive gear pulley.

Secure the belt with a double clip or equivalent clip.

NOTE: It is recommended for easy installation that the belt be secured with a double clip or equivalent clip after it is installed the timing belt to each pulley.

014RW0005

Legend

- (1) Alignment Mark on Timing Belt (White line).
- (2) Alignment Mark on Camshaft Drive Gear Pulley.
- (3) Alignment Mark on Cylinder Head Cover LH.

f. Install crankshaft pulley temporarily and tighten center bolt by hand (do not use a wrench). Turn the crankshaft pulley clockwise to give some belt slack between the crankshaft timing pulley and the RH bank camshaft drive gear pulley.

2. Install pusher and tighten bolt to the specified torque.

Torque : 25 N·m (2.5 kg·m/18 lb ft)

- a. Install the pusher while pushing the tension pulley to the belt.
- b. Pull out pin from the pusher.

NOTE: When reusing the pusher, compress the pusher rod with approximately 980 N (220 lb/100 kg), and insert a pin (1.4 mm piano wire).

014R100020

Legend

- (1) Up Side
- (2) Down Side
- (3) Direction for Installation
- (4) Locking Pin
- (5) Apply a force of 980 N (220 lb) when compressing the pusher rod.

After release the push rod from the locking pin, the rod projection is approximate 5 mm.

014R100032

Legend

- (1) Tensioner Pulley
- (2) Crankshaft Pulley Rotation Direction
- (3) Crankshaft Pulley
- (4) Pusher Assembly

c. Remove double clips or equivalent clips, from timing belt pulleys. Turn the crankshaft pulley by six turns and check for timing mark alignment.

6A-36 ENGINE MECHANICAL (6VD1 3.2L)

3. Install timing belt cover.

Remove crankshaft pulley that was installed in step 1 item 5.

Tighten bolts to the specified torque.

Torque: 19 N·m (1.9 kg·m/14 lb ft)

020RW004

Legend

- (1) Timing Belt Cover RH
- (2) Timing Belt Cover LH
- (3) Timing Belt Cover Lower

020RW003

Legend

- (2) Rubber Bushing
- (3) Sealing Rubber
- (4) Cylinder Body

4. Install crankshaft pulley using 5-8840-0133-0, hold the crankshaft pulley and tighten center bolt to the specified torque.

Torque : 167 N·m (17.0 kg·m/123 lb ft)

5. Install fan pulley bracket and tighten fixing bolts to the specified torque.

Torque : 22 N·m (2.2 kg·m/16 lb ft)

6. Install power steering pump assembly and tighten to the specified torque.

Torque :

M8 bolt : 22 N·m (2.2 kg·m/16 lb ft)

M10 bolt : 46 N·m (4.7 kg·m/34 lb ft)

7. Install cooling fan assembly and tighten bolts/nuts to the specified torque.

Torque : 22 N·m (2.2 kg·m/16 lb ft) for fan pulley and fan bracket.

Torque : 10 N·m (1.0 kg·m/87 lb in) for fan and clutch assembly.

8. Move drive belt tensioner to loose side using wrench, then install drive belt to normal position.

850RW001

Legend

- (2) Cooling Fan Pulley
- (3) Auto Tensioner
- (4) Generator
- (5) Air Conditioner Compressor
- (6) Power Steering Oil Pump
- (7) Idle Pulley
- (8) Drive Belt

9. Install radiator upper fan shroud.

10. Install air cleaner assembly.

Camshaft

Removal

1. Disconnect battery ground cable.
2. Remove crankshaft pulley.
 - Refer to removal procedure for Crankshaft Pulley in this manual.
3. Remove timing belt.
 - Refer to removal procedure for Timing Belt in this manual.
4. Remove cylinder head cover LH.
 - Refer to removal procedure for Cylinder Head Cover LH in this manual.
5. Remove cylinder head cover RH.
 - Refer to removal procedure for Cylinder Head Cover RH in this manual.
6. Remove twenty fixing bolts from inlet and exhaust camshaft bracket on one side bank, then camshaft brackets.

7. Remove camshaft assembly.
8. Remove fixing bolt for camshaft drive gear pulley.
9. Remove three fixing bolts from camshaft drive gear retainer, then camshaft drive gear assembly.

Legend

- (1) Right Bank
- (2) Left Bank
- (3) Timing Mark on Retainer

Installation

1. Install camshaft drive gear assembly and tighten three bolts to the specified torque.

Torque : 10 N·m (1.0 kg·m/87 lb in)

2. Tighten sub gear setting bolt.
 - a. Use the 5-8840-2443-0 gear spring lever to turn sub gear to right direction until it aligns with the M5 bolt hole between camshaft driven gear and sub gear.
 - b. Tighten the M5 bolt to a suitable torque to prevent the sub gear from moving.

6A-38 ENGINE MECHANICAL (6VD1 3.2L)

3. Align the timing mark on the retainer and dowel pin of the camshaft drive gear.
4. Install camshaft assembly and camshaft brackets, tighten twenty bolts on one side bank to the specified torque.
 - a. Apply engine oil to camshaft journal and bearing surface of camshaft bracket.
 - b. Align timing mark on intake camshaft (one dot for right bank, two dot for left bank) and exhaust camshaft (one dot for right bank, two dots for left bank) to timing mark on camshaft drive gear (one dot).

Legend

014RW031

6A-40 ENGINE MECHANICAL (6VD1 3.2L)

5. Tighten the bolt for camshaft drive gear assembly pulley fixing to the specified torque.

Torque : 98 N·m (10.0 kg·m/72 lb ft)

6. Install cylinder head cover RH.

- Refer to installation procedure for CYLINDER HEAD COVER RH in this manual.

7. Install cylinder head cover LH.

- Refer to installation procedure for CYLINDER HEAD COVER LH in this manual.

8. Install timing belt.

- Refer to installation procedure for TIMING BELT in this manual.

9. Install crankshaft pulley.

- Refer to installation procedure for CRANKSHAFT PULLEY in this manual.

10. Install accelerator pedal cable.

Cylinder Head

Removal

1. Remove engine hood.
2. Disconnect battery ground cable.
3. Drain radiator coolant.
4. Drain engine oil.
5. Remove crankshaft pulley.
 - Refer to removal procedure for Crankshaft Pulley in this manual.
6. Remove timing belt.
 - Refer to removal procedure for Timing Belt in this manual.
7. Remove cylinder head cover LH.
 - Refer to removal procedure for Cylinder Head Cover LH in this manual.
8. Remove cylinder head cover RH.
 - Refer to removal procedure for Cylinder Head Cover RH in this manual.
9. Remove common chamber.
 - Refer to removal procedure for Common Chamber in this manual.
10. Remove cylinder head assembly.
 1. Loosen eight bolts for tight cylinder head.
 2. Remove cylinder head assembly.

014RW028

Legend

- (1) Cylinder Head
- (2) Cylinder Head Bolt
- (3) Camshaft

Installation

1. Install cylinder head assembly to cylinder block.
 - a. Put cylinder head gasket on the cylinder block.

NOTE: There is discrimination mark "R" for right bank and "L" for left bank on the cylinder head gasket as shown in the illustration.

Do not reuse cylinder head gasket.

011RW005

- b. Align dowel pin hole to dowel pin on the cylinder block.
- c. Tighten two bolts temporarily by hand to prevent the cylinder head assembly from moving.
- d. Using 9-8511-4209-0 cylinder head bolt wrench, tighten bolts in numerical order as shown in the illustration to the specified torque.

NOTE: Do not reuse cylinder head bolts.

Do not apply any lubricant to the cylinder head bolts.

Torque :

Temporary : 29 N-m (3.0 kg-m/22 lb ft)

Final : 64 N-m (6.5 kg-m/47 lb ft)

014RW029

6A-42 ENGINE MECHANICAL (6VD1 3.2L)

2. Install common chamber.
 - Refer to installation procedure for Common Chamber in this manual.
3. Install cylinder head cover RH.
 - Refer to installation procedure for Cylinder Head Cover RH in this manual.
4. Install cylinder head cover LH.
 - Refer to installation procedure for Cylinder Head Cover LH in this manual.
5. Install timing belt.
 - Refer to installation procedure for Timing Belt in this manual.
6. Install crankshaft pulley.
 - Refer to installation procedure for Crankshaft Pulley in this manual.
7. Install accelerator pedal cable.

Valve Stem Oil Controller , Valve Spring and Valve Guide

Removal

1. Disconnect battery ground cable.
2. Drain engine oil.
 - Drain engine coolant.
3. Remove cylinder head assembly.
 - Refer to removal procedure for Cylinder Head in this manual.
4. Remove camshaft.
 - Refer to removal procedure for Camshaft in this manual.
5. Remove tappets with shim.

NOTE: Do not damage shim surface.

6. Remove valve springs using 5-8840-2446-0 valve spring compressor and 5-8840-2547-0 valve spring compressor adapter then remove upper valve spring seat and lower seat.

014RW042

7. Remove oil controller using 5-8840-0623-0 oil controller remover, remove each valve stem oil controller.
8. Remove valve guide using 5-8840-2549-0 valve guide replacer.

Installation

1. Install valve guide using 5-8840-2442-0 valve guide installer.
2. Install oil controller using 5-8840-0624-0 oil controller installer.
3. Install lower valve spring seat, valve spring and upper valve spring seat then put split collars on the upper spring seat, using 5-8840-2446-0 valve spring compressor and 5-8840-2547-0 valve spring compressor adapter to install the split collars.
4. Install tappet with shim.
5. Install camshaft assembly.
 - Refer to installation procedure for Camshaft in this manual.
6. Install cylinder head assembly.
 - Refer to installation procedure for Cylinder Head in this manual.
7. Fill engine oil until full level.
8. Fill engine coolant.

Piston, Piston Ring and Connecting Rod

Removal

F06RW011

Legend

- | | |
|----------------------------|---|
| (1) Cylinder Head | (4) Oil Strainer |
| (2) Crankcase with Oil Pan | (5) Oil Gallery |
| (3) Oil Pipe | (6) Piston with Connecting Rod Assembly |

1. Remove cylinder head assembly.
 - Refer to removal procedure for Cylinder Head in this manual.
2. Remove crankcase with Oil Pan.
 - Refer to removal procedure for Oil Pan and Crankcase in this manual.

3. Remove oil strainer fixing bolts, remove oil strainer assembly with O-ring.

050RW002

Legend

- (1) Oil Pump
- (2) Oil Strainer
- (3) Oil Gallery
- (4) From Oil Filter
- (5) To Oil Filter

- 4. Remove three fixing bolts, oil pipe with O-ring.
- 5. Remove eight fixing bolts, oil gallery.
- 6. Remove piston with connecting rod assembly, before removing the bearing cap, remove carbon on the top of cylinder bore and push piston with connecting rod out from the top of cylinder bore.

Installation

- 1. Install piston with connecting rod assembly.
 - Apply engine oil to cylinder bore, connecting rod bearing and crank pin.
When installing the piston, its front mark must face the engine front side.
 - The bearing cap number must be the same as connecting rod number.
 - Apply engine oil to the thread and seating surface of each nut.
 - Tighten nuts to the specified torque.

Torque : 54 N-m (5.5 kg-m/40 lb ft)

- After tightening the nuts, make sure that the crankshaft rotates smoothly.

NOTE: Do not apply engine oil to the bearing back faces and connecting rod bearing fitting surfaces.

015RW003

Legend

- (1) Piston Front Mark
- (2) Piston Grade
- (3) Connecting Rod Front Mark

2. Install oil gallery and tighten the bolts in two steps, in the order shown in illustration.

Torque :

- 1st step : 29 N-m (3.0 kg-m/22 lb ft)**
- 2nd step : 55°-65°**

051RS009

3. Install oil pipe with O-ring.

Torque : 10 N-m (1.0 kg-m/87 lb in)

4. Install oil strainer assembly with O-ring.

Torque : 25 N-m (2.5 kg-m/18 lb ft)

5. Install crankcase with Oil Pan.

- Refer to installation procedure for Oil Pan and Crankcase in this manual.

6. Install cylinder head assembly.

- Refer to installation procedure for Cylinder Head in this manual.

Crankshaft and Main Bearings

Removal

F06RY00023

Legend

- | | |

1. Remove engine assembly.

- Refer to removal procedure for Engine Assembly in this manual.

2. Remove timing belt.

- Refer to removal procedure for Timing Belt in this manual.

3. Remove oil pan and crankcase.

- Refer to removal procedure for Oil Pan and Crankcase in this manual.

4. Remove oil pipe with O-ring.

5. Remove oil strainer assembly with O-ring.

6. Remove oil pump assembly.
 - Refer to removal procedure for Oil Pump in this manual.
7. Remove cylinder body side bolts.
8. Remove oil gallery.
9. Remove flywheel.
10. Remove rear oil seal retainer.
 - Refer to removal procedure for Rear Oil Seal in this manual.
11. Remove connecting rod caps.
12. Remove crankshaft main bearing caps.
13. Remove crankshaft and main bearings.

Installation

1. Install crankshaft and main bearings.
 - Install main bearing in the cylinder block and main bearing cap respectively.
 - Apply new engine oil to upper and lower main bearings.

NOTE:

- Do not apply engine oil to the bearing back faces.
- Make sure that main bearings are in correct position.
- Install crankshaft with care.
- Apply engine oil to the thrust washer.
- Install thrust washer on No.3 journal.
- Oil grooves in thrust washer must face the crankshaft.

015RS012

015R10035

2. Install crankshaft main bearing caps.
 - Apply engine oil to the thread and seating surface of each bearing cap fixing bolt.

NOTE:

- Do not apply engine oil to the bearing back faces.
- Install bearing caps in the order of numbers, starting with cylinder block front side.
- Tighten main bearing fixing bolts to the specified torque.

Torque : 39 N·m (4.0 kg·m/29 lb ft)

- After tightening the bolts, make sure that the crankshaft rotates smoothly.

3. Install connecting rod caps.

- The cap number must be same as connecting rod number.
- Apply engine oil to the thread and seating surface of each nut.
- Tighten nuts to the specified torque.

Torque : 54 N·m (5.5 kg·m/40 lb ft)

- After tightening the nuts, make sure that the crankshaft rotates smoothly.

4. Install rear oil seal retainer.

- Remove oil on cylinder block and retainer fitting surface.
- Apply sealant (TB1207B or equivalent) to retainer fitting surface as shown in illustration.

6A-48 ENGINE MECHANICAL (6VD1 3.2L)

- The oil seal retainer must be installed within 5 minutes after sealant application before the sealant hardens.

015RW002

Legend

- (1) Around Bolt Holes
- (2) Around Dowel Pin

- Apply engine oil to oil seal lip and align a dowel pin hole in the cylinder block with that in the retainer.
- Tighten retainer fixing bolts to the specified torque.

Torque : 18 N·m (1.8 kg·m/13 lb ft)

015RW001

5. Install flywheel.

- Clean tapped holes in the crankshaft.
- Remove oil on crankshaft and flywheel fitting surface.

NOTE:

- Do not reuse the bolts.
- Do not apply oil or thread lock to the bolts.

- Tighten fixing bolts to the specified torque.

Torque : 54 N·m (5.5 kg·m/40 lb ft)

015RS018

For manual transmission.

015RV015

For automatic transmission.

6. Install oil gallery.

- Clean contact surface of oil gallery and main bearing cap.
Apply engine oil to oil gallery fixing bolts and tighten the bolts in two steps, in the order shown in illustration.

Torque :

1st step : 29 N·m (3.0 kg·m/22 lb ft)

2nd step : 55°-65°

- 7. Install cylinder body side bolts and tighten bolts in order to the specified torque.

Torque : 39 N·m (4.0 kg·m/29 lb ft)

NOTE: Do not apply the oil to the bolts.

012RS007

8. Install oil pump assembly.

- Remove oil on cylinder block and oil pump mounting surface.
- Apply sealant (TB1207B or equivalent) to the oil pump mounting surface.
- The oil pump assembly must be installed within 5 minutes after sealant application before the sealant hardens.
- Apply engine oil to oil seal lip.
- Install oil pump in the cylinder block and tighten fixing bolts to the specified torque.

Torque : 25 N-m (2.5 kg-m/18 lb ft)

051RW002

Legend

- (1) Around Bolt Holes
- (2) Around Dowel Pin

051RW001

9. Install oil strainer with O-ring, tighten to the specified torque.

Torque : 25 N-m (2.5 kg-m/18 lb ft)

10. Install oil pipe with O-ring, tighten fixing bolts to the specified torque.

Torque : 25 N-m (2.5 kg-m/18 lb ft)

11. Install crankcase.

- Remove oil on crankcase mounting surface and dry the surface.
- Properly apply a 4.5 mm (0.7 in) wide bead of sealant (TB1207C or equivalent) to the crankcase mounting surface. The bead must be continuous.
- The crankcase must be installed within 5 minutes after sealant application before the sealant hardens.
- Tighten fixing bolts to the specified torque.

Torque : 10 N-m (1.0 kg-m/87 lb in)

013RW010

6A-50 ENGINE MECHANICAL (6VD1 3.2L)

12. Install oil pan

- Remove oil on oil pan mounting surface and dry the surface.
- Properly apply a 4.5 mm (0.7 in) wide bead of sealant (TB1207C or equivalent) to the oil pan mounting surface. The bead must be continuous.
- The oil pan must be installed within 5 minutes after sealant application to prevent premature hardening of sealant.
- Tighten fixing bolts to the specified torque.

Torque : 25 N-m (2.5 kg-m/18 lb ft)

13. Install timing belt.

- Refer to installation procedure for Timing Belt in this manual.

14. Install engine assembly.

- Refer to installation procedure for Engine in this manual.

Rear Oil Seal

Removal

1. Remove transmission assembly.
 - Refer to removal procedure for Transmission section in this manual.
2. Remove flywheel.
3. Remove rear oil seal using a seal remover.

NOTE: Take care not to damage the crankshaft or oil seal retainer when removing oil seal.

Installation

1. Apply engine oil to oil seal lip and install oil seal using 5-8840-2286-0.

2. Install flywheel.
 - Clean tapped holes in the crankshaft.
 - Remove oil on the crankshaft and flywheel mounting surface.
 - Tighten fixing bolts to the specified torque.

NOTE: Do not reuse the bolts and do not apply oil or thread lock to the bolts.

Torque : 54 N·m (5.5 kg·m/40 lb ft)

For manual transmission.

For automatic transmission.

6A-52 ENGINE MECHANICAL (6VD1 3.2L)

3. Install transmission.

- See Transmission section in this manual.

CAUTION: When assembling the engine and transmission, confirm that dowels have been mounted in the specified positions at the engine side. Take care that dowel positions are different between the manual transmission and the automatic transmission.

Otherwise, the transmission may be damaged.

Engine Assembly

Removal

F06RY00016

1. Disconnect battery ground and positive cable.
 2. Remove battery.
 3. Make alignment mark on the engine hood and hinges before removal in order to return the hood to original position exactly.
 4. Remove engine hood.
 5. Drain radiator coolant.
 6. Disconnect Ion sensing module harness connectors, and manifold absolute pressure sensor harness connectors from sensor on common chamber.
 7. Disconnect throttle position sensor harness connectors from throttle body.
 8. Disconnect air duct with air cleaner cover.
 9. Remove air cleaner assembly.
 10. Disconnect canister vacuum hose.
 11. Disconnect vacuum booster hose.
 12. Disconnect three engine harness connectors.
 13. Disconnect harness connector to transmission (left front side of engine compartment), disconnect shift on the fly harness connector from front side of front axle and remove transmission harness bracket from engine left side.
 14. Disconnect ground cable between engine and frame.
 15. Disconnect bonding cable connector on the back of right dash panel.
 16. Disconnect bonding cable terminal on the left bank.
 17. Disconnect starter harness connector from starter.
 18. Disconnect generator harness connector from generator.
 19. Disconnect coolant reserve tank hose from radiator.
 20. Remove radiator upper and lower hoses.
 21. Remove upper fan shroud.
 22. Remove cooling fan assembly four fixing nuts, then the cooling fan assembly.
 23. Move drive belt tensioner to loose side using wrench then remove drive belt.
 24. Remove power steering pump fixing bolts, then power steering pump. Place the power steering pump along with piping on the body side.
 25. Remove air conditioning compressor fixing bolts from bracket and place the compressor along with piping on the body side.
 26. Remove four O₂ sensor harness connectors (two each bank) from exhaust front pipe.
 27. Remove three exhaust pipe fixing nuts from each bank.
 28. Remove two exhaust pipe fixing nuts from each exhaust pipe, then move exhaust pipe to rear side of vehicle.
 29. Remove flywheel dust covers.
 30. Disconnect two heater hoses from engine.
 31. Disconnect fuel hoses from right side of transmission.
- CAUTION: Plug fuel pipes on engine side and fuel hoses from fuel tank.**
32. Remove transmission assembly. Refer to Transmission section in this manual.
 33. Support the engine by engine hoist.
 34. Remove two left side engine mount fixing bolts from engine mount on chassis side.
 35. Remove two right side engine mount fixing bolts from engine mount on chassis side.
 36. Remove engine assembly.

Installation

CAUTION: When assembling the engine and transmission, confirm that dowels have been mounted in the specified positions at the engine side. Take care that dowel positions are different between the manual transmission and the automatic transmission.

If the engine is assembled in the condition that the dowels have not been mounted in the specified positions, the transmission may be damaged the transmission.

1. Install engine assembly. Tighten engine mount fixing bolts to frame to the specified torque.

Torque: 41 N·m (4.2 kg·m/30 lb ft)

2. Reconnect fuel hose to fuel pipe on engine.
3. Install transmission assembly. Refer to Transmission section in this manual.
4. Reconnect two heater hoses to engine.
5. Install flywheel dust covers.
6. Install exhaust pipe and temporarily tighten two (each bank) rear exhaust flange nuts then tighten three stud nuts (each bank) between exhaust manifold and exhaust pipe, finally tighten rear side nuts to the specified torque.

Torque:

Nuts: 43 N·m (4.4 kg·m/32 lb ft)

Stud nuts: 67 N·m (6.8 kg·m/49 lb ft)

Legend

- (1) Exhaust Front Pipe RH
- (2) O2 Sensor

Legend

- (1) O2 Sensor
- (2) Exhaust Front Pipe LH

7. Reconnect O2 sensor connector.
8. Install cooling fan assembly and tighten bolts/nuts to the specified torque.

Torque : 22 N·m (2.2 kg·m/16 lb ft) for fan pulley and fan bracket.

Torque : 10 N·m (1.0 kg·m/87 lb in) for fan and clutch assembly.

9. Install air conditioner compressor to engine and tighten to the specified torque.

Torque :

M8 bolts : 22 N-m (2.2 kg-m/16 lb ft)

M10 bolts : 43 N-m (4.4 kg-m/32 lb ft)

10. Install power steering pump, tighten fixing bolt to the specified torque.

Torque :

M8 bolts : 22N-m (2.2 kg-m/16 lb ft)

M10 bolts : 46 N-m (4.7 kg-m/34 lb ft)

11. Move drive belt tensioner to loose side using wrench, then install drive belt to normal position.

Legend

- (1) Crankshaft Pulley
- (2) Cooling Fan Pulley
- (3) Tensioner
- (4) Generator
- (5) Air Conditioner Compressor
- (6) Power Steering Oil Pump
- (7) Idle Pulley
- (8) Drive Belt

12. Install upper fan shroud.

13. Reconnect radiator upper and lower hoses.

14. Reconnect coolant reserve tank hose to radiator.

15. Reconnect generator harness connector.

16. Reconnect starter harness connector.

17. Reconnect bonding cable terminal on left bank

18. Reconnect bonding cable terminal on the back of right dash panel.

19. Reconnect ground cable between engine and chassis.

20. Reconnect harness connector to transmission and install transmission harness bracket on engine left side.

21. Reconnect three engine harness connectors.

22. Reconnect vacuum booster hose.

23. Reconnect canister vacuum hose.

24. Install air cleaner assembly.

25. Reconnect air duct.

26. Reconnect throttle position sensor harness connector.

Legend

- (1) Throttle Position Sensor Connector
- (2) Throttle Valve Assembly

27. Reconnect manifold absolute pressure sensor harness connectors.

28. Reconnect ion sensing module connectors as shown in the illustration.

Legend

- (1) Green Connector
- (2) Blue Connector

29. Install engine hood to the original position.

- Refer to installation procedure for Body section in this manual.

Cylinder Head

Cylinder Head and Associated Parts

011RW008

Legend

- | | |
|--|---|
| (1) Spark Plug | (8) Camshaft Intake |
| (2) Cylinder Head Bolt | (9) Retainer Fixing Bolt |
| (3) Camshaft Drive Gear Pulley Fixing Bolt | (10) Retainer Assembly |
| (4) Camshaft Drive Gear Pulley | (11) Tappet with Shim |
| (5) Camshaft Bracket Fixing Bolt | (12) Split Collar |
| (6) Camshaft Bracket | (13) Valve Spring and Spring Upper Seat |
| (7) Camshaft Exhaust | (14) Valve |

Disassembly

NOTE:

- During disassembly, be sure that the valve train components are kept together and identified so that they can be reinstalled in their original locations.

- Before removing the cylinder head from the engine and before disassembling the valve mechanism, perform a compression test and note the results.

1. Remove camshaft drive gear pulley fixing bolt (3), then pulley (4).

2. Remove camshaft bracket fixing bolt (5), camshaft bracket (6), then camshaft exhaust (7), and intake side (8).
3. Remove the cylinder head assembly.
4. Remove tappet with shim (11).
5. Use the 5-8840-2446-0 valve spring compressor and 5-8840-2547-0 valve spring compressor adapter to remove the split collar (12), valve spring with upper seat (13) and valve (14).

6. Remove spark plug (1).

CAUTION: Do not remove the spark plugs when the head and plugs are hot. Clean dirt and debris from spark plug recess areas before removal.

Clean

Cylinder head

Carefully remove all varnish, soot and carbon from the bare metal. Do not use a motorized wire brush on any gasket sealing surface.

Inspection and Repair

1. Cylinder head gasket and mating surfaces for leaks, corrosion and blow-by. If the gasket has failed, determine the cause.
 - Insufficient torque on head bolts.
 - Improper installation
 - Loose or warped cylinder head
 - Missing dowel pins
 - Warped case surface
2. Cylinder head for cracks, especially between valve seats and in the exhaust ports.
3. Cylinder head deck for corrosion, sand particles in head and porosity.

CAUTION:

- Do not attempt to weld the cylinder head. Replace it.
 - Do not reuse cylinder head bolts.
4. Cylinder head deck, common chamber and exhaust manifold mating surfaces for flatness. These surfaces may be reconditioned by milling. If the surfaces are "out of flat" by more than specification, the surface should be ground to within specifications. Replace the head if it requires machining beyond the repairable limit.

Head surface and manifold surface

Standard: 0.05 mm (0.002 in) or less

Warpage limit: 0.2 mm (0.0079 in)

Maximum Repairable limit: 0.2 mm (0.0079 in)

Head height

Standard height : 133.2 mm (5.2441 in)

Warpage limit : 0.2 mm (0.0079 in)

Maximum Repairable limit : 133.0 mm (5.2362 in)

5. Water jacket sealing plugs seating surfaces.

Reassembly

1. Reassemble the valve, valve seat, valve spring and split collars.
Refer to the reassembly procedure for valve spring, oil controller, valve, valve guide in this manual.
2. Install the cylinder head assembly to cylinder block.
Refer to the installation procedure for cylinder head in this manual.
3. Install the camshaft assembly.
Refer to the installation procedure for camshaft in this manual.
4. Install the spark plug and tighten all the spark plugs to specified torque.

Torque: 18 N·m (1.8 kg·m/13 lb ft)

Valve Spring, Oil Controller, Valve, Valve Guide

Valve Spring, Oil Controller, Valve, Valve Guide and Associated Parts

014RW039

Legend

- | | |
|-----------------------------------|------------------------|
| (1) Camshaft Bracket Fixing Bolts | (7) Spring Upper Seat |
| (2) Camshaft Assembly Inlet | (8) Valve Spring |
| (3) Camshaft Assembly Exhaust | (9) Oil Controller |
| (4) Shim | (10) Spring Lower Seat |
| (5) Tappet | (11) Valve Guide |
| (6) Split Collar | (12) Valve |

Disassembly

1. Remove camshaft bracket fixing bolts (1).
2. Remove camshaft assembly (intake).
3. Remove camshaft assembly (Exhaust side).
4. Remove shim (4) and tappet (5).

- Use 5-8840-2446-0 valve spring compressor and 5-8840-2547-0 valve spring compressor adapter to remove split collar.

014RW042

- Remove valve spring.
- Remove valve.
- Remove oil controller and spring lower seat.
- Remove the valve guide using the 5-8840-2442-0 valve guide replacer.

Inspection and Repair

Valve Spring

CAUTION: Visually inspect the valve springs and replace them if damage or abnormal wear is evident.

- Measure the free height of the springs. The springs must be replaced if the free height is below the specified limit.

Standard : 44.6 mm (1.7559 in)

Limit : 43.6 mm (1.7165 in)

014RS004

- Measure the valve spring squareness with a steel square and replace the valve springs if the measured value exceeds the specified limit.

Limit : 2 mm (0.0787 in)

014RS005

- Using a spring tester to compress the springs to the installed height, measure the compressed spring tension, and replace the springs if the measured tension is below the specified limit.

At installed height: 35.0 mm (1.38 in)

Standard: 196 N (44 lb)

Limit: Less than 181 N (41 lb)

014RS006

Valve Guide

CAUTION: Take care not to damage the valve seat contact surface, when removing carbon adhering to the valve head. Carefully inspect the valve stem for scratches or abnormal wear. If these conditions are present, the valve and the valve guide must be replaced as a set.

6A-60 ENGINE MECHANICAL (6VD1 3.2L)

1. Measure the valve stem diameter with a micrometer. If the valve stem diameter is less than the specified limit, the valve and the valve guide must be replaced as a set.

Diameter of Valve Stem

Intake

Standard : 5.977 mm–5.959 mm
(0.2353 in–0.2346 in)

Limit : 5.90 mm (0.2323 in)

Exhaust

Standard : 5.952 mm–5.970 mm
(0.2343 in–0.2350 in)

Limit : 5.90 mm (0.2323 in)

014RS007

2. Measure the inside diameter of the valve guide with a micrometer. Subtract the measured outer diameter of the valve stem from the measured inner diameter of the valve guide. If the value exceeds the specified limit, the valve and the valve guide must be replaced as a set.

Inside Diameter of the Valve Guide

Inlet clearance

Standard : 0.023 mm–0.056 mm
(0.0009 in–0.0002 in)

Limit : 0.20 mm (0.00787 in)

Exhaust clearance

Standard : 0.030 mm–0.063 mm
(0.0012 in–0.0025 in)

Limit : 0.20 mm (0.00787 in)

Valve Guide Replacement

1. Using Valve guide replacer: 5-8840-2442-0, drive out the valve guide from the combustion chamber side.

014RS006

2. Apply engine oil to the outside of the valve guide. Using valve guide replacer 5-8840-2442-0, drive in a new valve guide from the camshaft side, and check the valve guide height.

Valve guide upper end height: 13.0 mm (0.5118 in)

(Measured from the cylinder head upper face)

014RW046

3. Check the clearance. If the clearance is less than the specified value, ream the inside diameter of valve guide. Using a sharp 6 mm reamer, ream the valve guide to obtain the specified clearance.

Valve Seat

1. Measure the protrusion of the valve stem when a new valve is installed in the cylinder head. If the protrusion of the valve stem exceeds the limit, replace the valve seat insert or the cylinder head assembly.

Protrusion of valve stem

Intake

Standard: 39.32 mm (1.5480 in)

Limit: 39.47 mm (1.5539 in)

Exhaust

Standard: 39.30 mm (1.5472 in)

Limit: 39.45 mm (1.5531 in)

014RW047

2. Measure the valve seat contact width. Make the necessary corrections if the seat contact surface is damaged or rough or if the contact width wear exceeds the limit.

Valve seat contact width

Standard: 1.1 mm (0.0433 in)

Limit: 1.7 mm (0.0669 in)

014RS011

Contact Surface Angle on Valve Seat on Valve

1. Measure contact surface angle on valve seat.

2. If the measured value exceeds the limit, replace valve, valve guide and valve seat as a set.

Valve contact surface angle: 45°

014RS012

Valve Seat Insert Correction

1. Remove the carbon from the valve seat insert surface.
2. Use a valve cutter to minimize scratches and other rough areas. This will bring the contact width back to the standard value. Remove only the scratches and rough areas. Do not cut away too much. Take care not to cut away unblemished areas of the valve seat surface.

Valve seat angle degree: 90°

014R100036

3. Apply abrasive compound to the valve seat insert surface.
4. Insert the valve into the valve guide.
5. Turn the valve while lapping it to fit the valve seat insert.

6A-62 ENGINE MECHANICAL (6VD1 3.2L)

6. Check that the valve contact width is correct.
7. Check that the valve seat insert surface is in contact with the entire circumference of the valve.

Valve Seat Insert Replacement

1. Arc weld the rod at several points. Be careful not to damage the aluminum section.
2. Allow the rod to cool for a few minutes. This will cause the valve seat to shrink.
3. Strike the rod and pull it out.

4. Carefully clean the valve seat press-fit section on the cylinder head side.
5. Heat the press-fit section with steam or some other means to cause expansion. Cool the valve seat with dry ice or some other means.
6. Insert the press-fit section into the valve seat horizontally.

Standard fitting interference: 0.14 mm–0.09 mm (0.0055 in–0.0035 in)

7. After insertion, use a seat grinder to grind finish the seating face. Carefully note the seating angle, the contact width, and the depression.
8. Lap the valve and the seat.

Reassembly

1. Install valve guide (1) to cylinder head. Apply engine oil to the outside of the valve guide. Using valve guide replacer 5-8840-2442-0, drive in a new valve guide from the camshaft side.
2. Install oil controller (3) and spring lower seat (2). Using oil controller replacer 5-8840-0623-0, drive in a new oil controller.

3. Install valve to valve guide. Before install valve guide apply engine oil to the outside of the valve stem.
4. Install valve spring to cylinder head. Attach the valve spring to the lower spring seat. The painted area of the valve spring should be facing downward.

5. Install lower valve spring seat, valve spring and upper valve spring seat then put split collars on the upper spring seat, using the 5-8840-2446-0 valve spring compressor and 5-8840-2547-0 valve spring compressor adapter to install the split collars.

6. Install tappet with shim.

7. Install camshaft assembly.

- Refer to installation procedure for Camshaft in this manual.

Valve Clearance Adjustments

NOTE: To adjust valve clearance, apply engine oil to the cam as well as to the adjusting shim (2) with the cylinder head built on the cylinder block, give a few turns to the camshaft by means of timing pulley tightening bolt, and measure valve clearance when the nose of cam is just opposite to maximum cam lift (1) as shown in illustration below.

Legend

- (1) Cam
- (2) Shim
- (3) Tappet

Valve Clearance Standard Value (cold)

Intake: 0.28 mm (0.0110 in)

Exhaust: 0.3 mm (0.0118 in)

Selection of Adjusting Shim

Thickness of removed shim.

+ Valve clearance measurement.

- Standard valve clearance.

Thickness of shim to be selected.

Based on the above formula, the best suited shim should be selected from 41 sorts of shim (differently thick at 0.02mm (0.0008 in) intervals from 2.40mm (0.0945 in) through 3.2mm (0.1260 in) thick). Install the shim and check valve clearance.

6A-64 ENGINE MECHANICAL (6VD1 3.2L)

Replacement of Shim

Let the cam push down the edge of tappet by using 5-8840-2444-0 valve clearance adjusting tool and push out the shim with a flat blade screw driver as shown in illustrations below.

Camshaft

Camshaft and Associated Parts

014R100028

Legend

- (1) Camshaft Bracket Fixing Bolt
- (2) Camshaft Bracket

- (6) Camshaft Drive Gear Pulley
- (7) Retainer Fixing Bolt
- (8) Retainer
- (9) Camshaft Drive Gear
- (10) Oil Seal
- (11) O-ring

Disassembly

1. Remove fixing bolt (5) for camshaft drive gear pulley using the 5-8840-2447-0 universal holder.

014RW060

6A-66 ENGINE MECHANICAL (6VD1 3.2L)

2. Remove twenty fixing bolts from inlet and exhaust camshaft bracket on one side bank, then camshaft brackets (2).

014RW027

3. Remove camshaft assembly (3), (4).
4. Remove three fixing bolts (7) from camshaft drive gear retainer (8), then camshaft drive gear assembly.
5. Use the snap ring pliers to remove the snap ring(1).
6. Remove the wave washer(2), sub gear(3) and spring camshaft gear(4) from the camshaft assembly(5).

014R100018

Legend

- (1) Snap Ring
- (2) Wave Washer
- (3) Sub Gear
- (4) Spring; Camshaft Gear
- (5) Camshaft Assembly

Inspection and Repair

1. Use a micrometer to measure the cam lobe height and uneven wear. Replace the camshaft if either the lobe height or the uneven wear exceeds the specified limit.

Lobe height : 44.709 mm (1.7602 in)

Uneven wear : 0.05 mm (0.0020 in)

014RW043

2. Use a micrometer to measure the diameter and the uneven wear of the camshaft journals.

Replace the camshaft if the diameter or the uneven wear exceeds the specified limit.

Journal Diameter

Standard : 25.972 mm–25.993 mm

(1.0225 in–1.0233 in)

Limit : 25.8 mm (1.0157 in)

Uneven wear : 0.05 mm (0.0020 in)

014RS023

- Place the camshaft on V-blocks.
Slowly rotate the camshaft and measure the runout with a dial indicator.
Replace the camshaft if the runout exceeds the specified limit.

Runout

Limit : 0.1 mm (0.0039 in)

- Measure the camshaft journal oil clearance.
 - Measure the camshaft bracket housing inside diameter.

NOTE: Tighten camshaft bracket (2) to specified torque before measuring the camshaft bracket inside diameter.

Torque : 10 N·m (1.0 kg·m/87 lb in)

- Subtract the camshaft outside diameter from the camshaft bracket housing inside diameter.

Oil Clearance

**Standard : 0.027 mm–0.078 mm
(0.0011 in–0.0031 in)**

Limit : 0.11 mm (0.0043 in)

- Replace the cylinder head and/or camshaft if the measured oil clearance exceeds the specified limit.
 - Carefully clean the camshaft journal, the camshaft bracket, and the cylinder head.
 - Install camshaft assembly and camshaft brackets (2), tighten twenty bolts (1) on one side bank to the specified torque.

Torque: 10 N·m (1.0 kg·m/87 lb in)

6A-68 ENGINE MECHANICAL (6VD1 3.2L)

3. Measure the camshaft thrust clearance with a dial indicator. Replace the camshaft and/or the cylinder head if the camshaft thrust clearance exceeds the specified limit.

Camshaft thrust Clearance

**Standard : 0.03 mm–0.08 mm
(0.0012 in.–0.0031 in.)**

Limit : 0.12 mm (0.0047 mm)

Reassembly

1. Install camshaft drive gear assembly and tighten three bolts to specified torque.

Torque: 10 N·m (1.0 kg·m/87 lb in)

2. Install the spring ; camshaft gear(1) into the camshaft assembly.

Ensure the clearance is between the right side of the spring; camshaft gear (1) and the dowel pin (2).

3. Align the dowel pin on the sub gear to the clearance of the spring ; camshaft gear made in step 2 and install the sub gear (3).
4. Install the wave washer (2). Use snap ring pliers to install the snap ring (1).

5. Tighten sub gear setting bolt.
 - a. Use 5-8840-2443-0 gear spring lever to pre-load the sub gear. Turn the sub gear in a clockwise direction until the M5 bolt hole aligns with the hole in the camshaft driven gear.
 - b. Install the M5 bolt and tighten to a suitable torque to prevent the sub gear from moving.

6. Align the timing mark on the retainer and dowel pin of the camshaft drive gear.
7. Install camshaft assembly and camshaft brackets, tighten twenty bolts on one side bank to the specified torque.
 - a. Apply engine oil to camshaft journal and bearing surface of camshaft bracket.

b. Align timing mark on intake camshaft (one dot for right bank, two dots for left bank) and exhaust camshaft (one dot for right bank, two dots for left bank) to timing mark on camshaft drive gear (one dot).

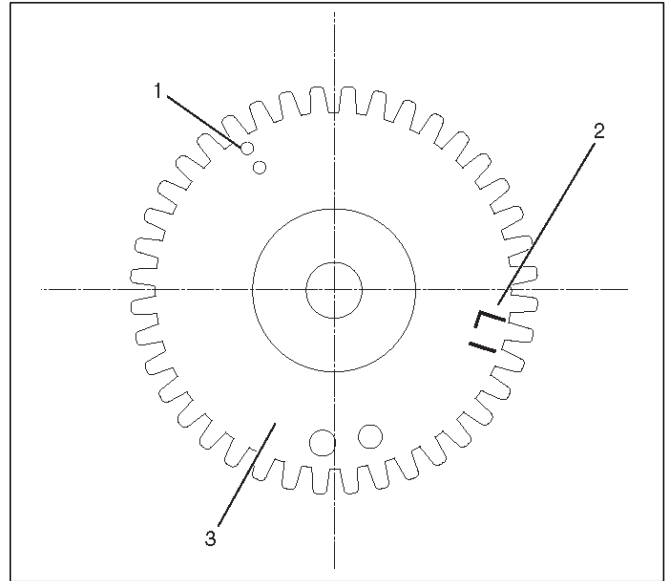

Legend

- (1) Alignment Mark on the Camshaft Gear
- (2) Alignment Mark on the Camshaft Drive Gear

Legend

- (1) Discrimination Mark for Right Bank Intake Camshaft Gear
- (2) Alignment Mark for Right Bank (One Dot)

c. Tighten twenty bolts in numerical order on one side bank as shown in the illustration.

Torque: 10 N-m (1.0 kg-m/87 lb in)

014RW031

8. If the oil seal requires replacement, use the 5-8840-2445-0 to install the oil seal.

014RW034

9. If the camshaft end plug requires replacement, use the 5-8840-2445-0 to install the camshaft end plug.

014R100031

10. Tighten bolt for camshaft drive gear pulley to the specified torque using the 5-8840-2447-0 universal holder.

Torque: 98 N-m (10.0 kg-m/72 lb ft)

014RW060

Crankshaft

Crankshaft and Associated Parts

013RW009

Legend

- | | |
|-------------------------------|--|
| (1) Cylinder Head Assembly | (8) Piston and Connecting Rod Assembly |
| (2) Crankcase with Oil Pan | (9) Flywheel |
| (3) Oil Pipe and O-Ring | (10) Rear Oil Seal Retainer and Oil Seal |
| (4) Oil Strainer and O-Ring | (11) Main Bearing Cap |
| (5) Oil Pump Assembly | (12) Crankshaft |
| (6) Cylinder Block Side Bolts | (13) Main Bearing Cap Fixing Bolts |
| (7) Oil Gallery | (14) Oil Gallery Fixing Bolts |

Disassembly

1. Remove cylinder head assembly (1). Refer to "Cylinder Head" in this manual.
2. Remove crankcase with oil pan (2). Refer to "Oil Pan and Crankcase" in this manual.

CAUTION: Take care not to damage or deform the sealing flange surface of crankcase.

3. Remove oil pipe and O-ring (3).
4. Remove oil strainer and O-ring (4).
5. Remove oil pump assembly (5).
6. Remove crankcase side bolts (6).

7. Remove oil gallery (7).
8. Remove piston and connecting rod assembly (8). Refer to "Piston, Piston Ring and Connecting Rod" in this manual.
9. Remove flywheel (9).
10. Remove rear oil seal retainer (10).
11. Remove main bearing cap (11).
12. Remove crankshaft (12).

Inspection and Repair

1. Crankshaft

Set the dial indicator as shown in the illustration and measure the crankshaft thrust clearance. If the thrust clearance exceeds the specified limit, replace the thrust bearings as a set.

Thrust Clearance

**Standard : 0.06 mm–0.24 mm
(0.0024 in–0.0094 in)**

Limit : 0.30 mm (0.0118 in)

015RS003

Main Bearing Clearance

1. Remove the bearing caps and measure the oil clearance.
2. Remove the main bearing cap fixing bolts in the sequence shown in the illustration. Arrange the removed main bearing caps in the cylinder number order. Remove the main bearings.

015RS004

3. Remove the crankshaft. Remove the main bearings.
4. Clean the upper and lower bearings as well as the crankshaft main journal.
5. Check the bearings for damage or excessive wear. The bearings must be replaced as a set if damage or excessive wear is discovered during inspection.
6. Set the upper bearings and the thrust washers to their original positions. Carefully install the crankshaft.
7. Set the lower bearings to the bearing cap original position.
8. Apply plastigage to the crankshaft journal unit as shown in the illustration.

NOTE: Do not set the plastigage on the oil hole.

015RS005

9. Install main bearing caps, oil gallery and crank case bolts in the order shown, and tighten each bolt to the specified torque.

6A-74 ENGINE MECHANICAL (6VD1 3.2L)

NOTE: Do not apply engine oil to the crank case side bolts.

Main bearing cap bolts.

Torque: 39 N·m (4.0 kg·m/29 lb ft)

Oil gallery fixing bolts.

Torque:

1st step: 29 N·m (3.0 kg·m/22 lb ft)

2nd step 55° ~ 65°

Crank case side bolts

Torque : 39 N·m (4.0 kg·m/29 lb ft)

NOTE: Do not allow the crankshaft to rotate.

015RS006

10. Remove the main bearing caps in the sequence shown in the illustration.

015RS004

11. Measure the plastigage width and determine the oil clearance. If the oil clearance exceeds the specified limit, replace the main bearings as a set and/or replace the crankshaft.

**Standard : 0.019 mm–0.043 mm
(0.0007 in–0.0017 in)**

Limit : 0.08 mm (0.0031 in)

015RS008

12. Clean the plastigage from the bearings and the crankshaft.

Remove the crankshaft and the bearings.

Crankshaft Inspection

Inspect the surface of the crankshaft journal and crank pins for excessive wear and damage. Inspect the oil seal fitting surfaces for excessive wear and damage. Inspect the oil ports for obstructions.

Inspection and Repair

1. Carefully set the crankshaft on the V-blocks. Slowly rotate the crankshaft and measure the runout. If the crankshaft runout exceeds the specified limit, the crankshaft must be replaced.

Runout : 0.04 mm (0.0016 in)

015RS007

2. Measure the diameter and the uneven wear of main journal and crank pin. If the crankshaft wear exceeds the specified limit, crankshaft must be replaced.

**Main journal diameter : 63.918 mm–63.933 mm
(2.5165 in–2.5170 in)**

**Crank pin diameter : 53.922 mm–53.937 mm
(2.1229 in.–2.1235 in.)**

Uneven wear limit : 0.005 mm (0.0002 in)

015RS009

Crankshaft Bearing Selection

When installing new crankshaft bearings or replacing bearings, refer to the selection table below. Select and install the new crankshaft bearings, paying close attention to the cylinder block journal hole.

1. Diameter size mark for the cylinder block.

001R10001

2. Diameter size mark for the crankshaft.

The diameter size marks are stamped on the No.1 crankshaft balancer as shown in the illustration.

015R100034

Legend

- (1) Crankshaft No.1 Balancer
- (2) Crankshaft Journal Grade
The grade number stamped 1,2,3,4 journal from left to right

NOTE: Take care to ensure the bearings are positioned correctly.

015RS012

Legend

- (1) Number 1 and 4 main bearing upper and lower
- (2) Number 2 and 3 main bearing upper
- (3) Number 2 and 3 main bearing lower

6A-76 ENGINE MECHANICAL (6VD1 3.2L)

Main Bearing Grade Mark On Cylinder Block	Main Bearing Bore Diameter mm (in)	Crank Shaft Main Journal Diameter mm (in)	Crankshaft Bearing Grade Mark On Crankshaft	Crankshaft Bearing Size Mark (collor indicator)	Oil Clearance (Reference) mm (in)
1	68.994-69.000 (2.7163-2.7165)	63.918-63.925 (2.5165-2.5167)	2	Blue	0.019-0.043 (0.0007-0.0017)
		63.926-63.933 (2.5168-2.5170)	1	Brown	
2	68.987-68.993 (2.7160-2.7163)	63.918-63.925 (2.5165-2.5167)	2	Green	
		63.926-63.933 (2.5168-2.5170)	1		
3	68.980-68.986 (2.7157-2.7160)	63.918-63.925 (2.5165-2.5167)	2	Yellow	
		63.926-63.933 (2.5168-2.5170)	1		

Reassembly

1. Crankshaft

- Install the main bearings to the cylinder block and the main bearing caps.
- Be sure that they are positioned correctly.
- Apply new engine oil to the upper and lower main bearing faces.

NOTE: Do not apply engine oil to the main bearing back faces.

015RS012

- Carefully mount the crankshaft.
- Apply engine oil to the thrust washer.
- Assemble the thrust washer to the No.3 bearing journal. The oil grooves must face the crankshaft.

015R100033

2. Rear oil seal

- Remove the oil from the cylinder block and the retainer mounting surface.
- Apply sealant (TB-1207B or equivalent) to the retainer mounting surface, following the pattern shown in the illustration.

The retainer must be installed within 5 minutes after sealant application before the sealant hardens.

015RW002

Legend

- (1) Around Bolt Holes
- (2) Around Dowel Pin

- Apply engine oil to the oil seal lip.
- Align the cylinder block dowel pin holes with the rear retainer dowel pins.
- Tighten the rear retainer fixing bolts. New bolts should be used when installing rear retainer.

Torque: 18 N-m (1.8 kg-m/13 lb ft)

NOTE: Be very careful not to disengage the oil seal garter spring during installation of the rear retainer.

If the seal was removed from retainer for replacement, apply engine oil to the oil seal lip and install the oil seal using 5-8840-2286-0 oil seal installer.

015RW001

015RS017

3. Flywheel

1. Thoroughly clean and remove the oil from the threads of crankshaft.
2. Remove the oil from the crankshaft and flywheel mounting faces.
3. Mount the flywheel on the crankshaft and then install the washer.
4. Hold the crankshaft to prevent from rotating then install the bolts in the order shown to the specified torque.

Torque: 54 N-m (5.5 kg-m/40 lb ft)

NOTE: Do not reuse the bolt and do not apply oil or thread lock to the bolt.

015RS018

For manual transmission

6A-78 ENGINE MECHANICAL (6VD1 3.2L)

015RV015

For automatic transmission

4. Piston and connecting rod assembly (8)

- Apply engine oil to the cylinder bores, the connecting rod bearings and the crankshaft pins. Check to see that the piston ring end gaps are correctly positioned.

015RX003

Legend

- (1) No.1 Compression Ring
- (2) No.2 Compression Ring
- (3) Oil Ring Side Rail Upper
- (4) Oil Ring Side Rail Lower
- (5) Piston Front Mark

- Insert the piston/connecting rod assemblies into each cylinder with the piston ring compressor. The front marks must be facing the front of the engine.
- Match the numbered caps with the numbers on the connecting rods. Align the punched marks on the connecting rods and caps.

- Apply engine oil to the threads and seating faces of the nuts.
- Tighten the nuts.

Torque: 54 N·m (5.5 kg·m/40 lb ft)

After tightening the cap nuts, check to see that the crankshaft rotates smoothly.

NOTE: Do not apply engine oil to the bearing back faces.

015RS020

5. Install oil gallery (7) and tighten the bolts in 2 steps, in the order shown.

1st step: 29 N·m (3.0 kg·m/22 lb ft)

2nd step: 55° ~ 65°

051RS009

6. Cylinder block side bolts

- Tighten all the bolts to the specified torque in the order shown.

NOTE: Do not apply engine oil to the crank case side bolts.

Torque: 39 N·m (4.0 kg·m/29 lb ft)

012RS001

7. Install oil pump assembly (5), refer to "Oil pump" in this manual.
8. Install oil strainer and O-ring (4).
9. Install oil pipe and O-ring (3) and tighten the bolts.

Torque: 25 N·m (2.5 kg·m/18 lb ft)

10. Install crankcase with oil pan.
 1. Completely remove all residual sealant, lubricant and moisture from the sealing surfaces. The surfaces must be perfectly dry.
 2. Apply a correct width bead of sealant (TB—1207C or its equivalent) to the contact surfaces of the oil pan. There must be no gaps in the bead.
 3. The crankcase assembly must be installed within 5 minutes after sealant application to prevent premature hardening of the sealant.

4. Tighten the bolts and nuts to the specified torque.

Torque : 10 N·m (1.0 kg·m/87 lb in)

013RW010

Legend

- (1) Portion Between Bolt Holes
- (2) Bolt Hole Portion

11. Install cylinder head assembly, refer to "Cylinder head" in this manual.

Piston and Connecting Rod

Piston, Connecting Rod and Associate Parts

015RW019

Legend

- | | |
|-----------------------------|--|
| (1) Cylinder Head Assembly | (7) Piston and Connecting Rod Assembly |
| (2) Cylinder Head Gasket | (8) Piston Ring |

| (4) Oil Pipe and O-Ring | (10) Piston |
| (5) Oil Strainer and O-Ring | (11) Connecting Rod |
| (6) Oil Gallery | (12) Connecting Rod Cap |

Disassembly

1. Remove cylinder head assembly (1). Refer to "Cylinder Head Removal" in this manual.
2. Remove cylinder head gasket (2).
3. Remove crankcase with oil pan (3). Refer to "Oil Pan and Crankcase" in this manual.
4. Remove oil pipe and O-ring (4).
5. Remove oil strainer and O-ring (5).
6. Remove oil gallery (6).
7. Remove connecting rod cap with connecting rod lower bearing (12).
8. Remove piston and connecting rod assembly (7).

NOTE: Before removing piston and connecting rod assembly, measure thrust clearance.

015RS031

- Remove any ridge or carbon build up from the top end of the cylinder.

9. Remove the piston rings (8) with a piston ring expander. Arrange the removed piston rings in the cylinder number order.

015RS022

10. Remove the piston pin (9) using 5-8840-0551-0 piston pin service set and piston support with a press.

NOTE: Keep the parts removed from each cylinder separate. All parts must be reinstalled in their original positions. Heating the connecting rod will permit easy removal of the piston pin.

015RX001

Legend

- (1) Press Ram
- (2) Piston
- (3) Connecting Rod
- (4) Piston Pin

- 11. Piston (10)
- 12. Connecting rod (11)

Inspection and Repair

Pistons

Carefully clean away all the carbon adhering to the piston head and the piston ring grooves.

NOTE: Never use a wire brush to clean the pistons. Damage will result. Visually check each piston for cracking, scoring, and other signs of excessive wear. If any of the above conditions are found, the piston must be replaced.

Piston Diameter

1. Measure the piston outside diameter with micrometer at the piston grading position and a right angle to the piston pin.

Piston grading position (from piston head)

Piston grading position : 43.0 mm (1.6929 in)

015RV014

The size mark (1) for piston outside diameter is represented as shown in illustration below.

Outside Diameter

**Size Mark A : 93.360 mm–93.370 mm
(3.6756 in–3.6760 in)**

**Size Mark B : 93.371 mm–93.380 mm
(3.6760 in–3.6764 in)**

**Size Mark C : 93.381 mm–93.390 mm
(3.6764 in–3.6768 in)**

015RX002

Measure the cylinder bore inside diameter (refer to “Cylinder Block” in this manual).

012RS002

Piston Rings

Any worn or damaged part discovered during engine overhaul must be replaced with a new one.

1. Ring end gap measurement

- Insert the piston ring into the bore.
- Push the ring by the piston, at a right angle to the wall, into the point at which the cylinder bore diameter is the smallest.
- Measure the ring end gap.

Compression Ring

1st ring

**Standard: 0.300 mm–0.400 mm
(0.0118 in–0.0157 in)**

Limit: 1.0 mm (0.0394 in)

2nd ring

**Standard: 0.450 mm–0.600 mm
(0.0177 in–0.0236 in)**

Limit: 1.2 mm (0.0472 in)

Oil ring

**Standard: 0.150 mm–0.450 mm
(0.0059 in–0.0177 in)**

Limit: 1.05 mm (0.0413 in)

015RS026

- Positioning mark (1) is painted as shown in the illustration.

Marked T : No.1 Compression ring

Marked T2 : No.2 Compression ring

015RS027

2. Measure the clearance between the piston ring groove and the piston ring with a feeler gauge. If the piston ring groove / piston ring clearance exceeds the specified limit, the piston must be replaced.

Compression Ring Clearance

**Standard : 0.016 mm–0.038 mm
(0.0006 in.–0.0015 in)**

Limit : 0.15mm (0.0059 in)

015RS028

Piston Pin

NOTE: Do not reuse the old piston pin.

1. Use a micrometer to measure the new piston pin outside diameter in both directions at three different positions.
2. Measure the inside diameter of the connecting rod small end. If the fitting interference between the small end and pin does not conform to the specified value, the connecting rod must be replaced.

Standard : 0.023 mm–0.038 mm (0.0009 in–0.0015 in)

015RS029

3. Insert the new pin into the piston and rotate it. If the pin rotates smoothly with no backlash, the clearance is normal. If there is backlash or roughness, measure the clearance. If the clearance exceeds the specified limit, the piston must be replaced.

Clearance

**Standard : 0.010 mm–0.017 mm
(0.0004 in.–0.0007 in)**

Limit : 0.040 mm (0.0016 in)

Connecting Rods

1. Check the connecting rod alignment. If either the bend or the twist exceeds the specified limit, the connecting rod must be replaced.

Bend per 100 mm (3.937 in)

Limit: 0.15 (0.0059)

Twist per 100 mm (3.937 in)

Limit: 0.20 (0.0078)

2. Measure the connecting rod thrust clearance. Use a feeler gauge to measure the thrust clearance at the large end of the connecting rod. If the clearance exceeds the specified limit, the connecting rod must be replaced.

Standard : 0.16 mm–0.35 mm

(0.0063 in.–0.0138 in)

Limit : 0.40 mm (0.0157 in)

3. Measure the oil clearance between the connecting rod and the crankshaft.

1. Remove the connecting rod cap nuts and the rod caps (12).
Arrange the removed rod caps in the cylinder number order.

2. Clean the rod bearings and the crankshaft pins.

3. Carefully check the rod bearings. If even one bearing is found to be damaged or badly worn, the entire bearing assembly must be replaced as a set. Reinstall the bearings in their original positions. Apply plastigage to the crank pin.

- Reinstall the rod caps (12) to their original positions.
Tighten the rod cap nuts.

Torque: 54 N·m (5.5 kg·m/40 lb ft)

NOTE: Do not allow the crankshaft to rotate.

- Remove the rod caps.
- Measure the width of the plastigage and determine the oil clearance. If the oil clearance exceeds the limit, replace the rod bearing as a set.

**Standard : 0.019 mm–0.043 mm
(0.0007 in–0.0017 in)**

Limit : 0.08 mm (0.003 in)

- Clean the plastigage from the bearings and the crankshaft pins.

Con-rod Bearing Selection

Select and install the new connecting rod bearings, paying close attention to the connecting rod big end diameter size mark (1).

NOTE: Take care not to confuse the alignment mark (2) and the size mark (1) during the installation procedure.

Connecting Rod Bearing Grade Mark On Connecting Rod	Big end Bore Diameter	Crankshaft Pin Diameter	Connecting Rod Bearing Thickness (Reference)	Color of Size Mark	Oil Clearance (Reference)
A	56.994-57.000 (2.2439-2.2441)	53.922-53.937 (2.1229-2.1235)	1.512-1.516 (0.0595-0.0597)	Yellow	0.025-0.054 (0.0010-0.0021)
B	56.988-56.994 (2.2436-2.2439)		1.508-1.512 (0.0594-0.0595)	Green	0.027-0.056 (0.0011-0.0022)
C	56.982-56.988 (2.2434-2.2436)		1.504-1.508 (0.0592-0.0594)	Pink	0.029-0.058 (0.0011-0.0023)

Reassembly

- Install connecting rod
- Install piston

- Install piston pin

- Apply a thin coat of engine oil to the piston pin. Try to insert the piston pin into the piston pin hole with normal finger pressure.

NOTE: When changing piston / connecting rod combinations, do not change the piston / piston pin combination and do not reuse the old piston pin.

6A-86 ENGINE MECHANICAL (6VD1 3.2L)

- Attach the piston to the connecting rod with the piston front mark and the connecting rod front mark on the same side.

015RS036

- With 5-8840-0551-0 Piston pin service set and a press, press fit the piston pin.

NOTE: Heat the connecting rod small end to a suitable temperature to ensure smooth installation.

015RX001

Legend

- (1) Press Ram
- (2) Piston
- (3) Connecting Rod
- (4) Piston Pin

4. Install piston ring with the piston ring expander. The compression ring must be set with the T mark (1) facing up.

Marked T : No.1 Compression ring

Marked T2 : No.2 Compression ring

015RS027

- Install piston rings in the following sequence.

1. Oil ring
 1. Expander ring
 2. Upper side rail
 3. Lower side rail
2. 2nd compression ring
3. 1st compression ring

- The compression rings must be set with the T or T2 mark facing up.

Marked T : No.1 Compression ring

Marked T2 : No.2 Compression ring

- After installation, apply engine oil to the entire circumference of the piston rings. Check to see that all the rings rotate smoothly.

015RS038

5. Install piston and connecting rod assembly.
 - Insert the bearings into the connecting rods and caps. Apply new engine oil to the bearing faces and nuts.
 - Tighten the connecting rod cap nuts

Torque : 54 N·m (5.5 kg·m/40 lb ft)

NOTE: Do not apply engine oil to the bearing back faces.

6. Oil gallery, refer to "Crankshaft and main bearing" in this manual.
7. Oil strainer and O-ring.
8. Oil pipe and O-ring.
9. Install crankcase with oil pan, refer to "Oil pan and Crankcase" in this manual.
10. Install cylinder head gasket.
11. Install Cylinder head assembly.
 - Refer to "Cylinder head" in this manual.

Cylinder Block

Cylinder Block and Associated Parts

012RW010

Legend

- | | |
|-------------------------------|--|
| (1) Cylinder Head Assembly | (8) Oil Gallery |
| (2) Cylinder Head Gasket | (9) Piston and Connecting Rod Assembly |
| (3) Crankcase with Oil Pan | (10) Flywheel |
| (4) Oil Pipe and O-Ring | (11) Rear Oil Seal Retainer Assembly |
| (5) Oil Strainer and O-Ring | (12) Main Bearing Cap |
| (6) Oil Pump Assembly | (13) Crankshaft |
| (7) Cylinder Block Side Bolts | (14) Cylinder Block |

Disassembly

1. Remove cylinder head assembly.
2. Remove cylinder head gasket.
3. Remove crankcase with oil pan.
4. Remove oil pipe and O-ring.
5. Remove oil strainer and O-ring.
6. Remove oil pump assembly.
7. Remove crankcase side bolts.
8. Remove oil gallery.
9. Remove piston and connecting rod assembly.
10. Remove flywheel.

11. Remove rear oil seal retainer assembly.
12. Remove main bearing cap.
13. Remove crankshaft.
14. Remove cylinder block.

Inspection and Repair

1. Remove the cylinder head gasket and any other material adhering to the upper surface of the cylinder block. Be very careful not to allow any material to accidentally drop into the cylinder block. Be very careful not to scratch the cylinder block.
2. Carefully remove the oil pump, rear oil seal retainer, and crankcase assembly installation surface seal.
3. Wipe the cylinder block clean.
4. Visually inspect the cylinder block. If necessary, use a flaw detector to perform a dye penetrate and hydraulic (or air pressure) test. If cracking or other damage is discovered, the cylinder block must either be repaired or replaced.

Flatness

1. Using a straight-edge and feeler gauge, check that the upper surface of the cylinder block is not warped.

CAUTION: Be very careful not to allow any material to accidentally drop into the upper surface of the cylinder block. Be very careful not to scratch the upper surface of the cylinder block.

2. The cylinder block must be reground or replaced if the warpage exceeds the limit.

Warpage

Limit : 0.15 mm (0.0059 in)

Maximum repairable limit: 0.15 mm (0.0059 in)

012RS004

Cylinder Bore

Use a cylinder gauge to measure the cylinder bore diameter in both the axial and thrust directions. Each measurement should be made at six points.

CAUTION: Be very careful not to allow any material to accidentally drop into the upper surface of the cylinder block. Be very careful not to scratch the upper surface of the cylinder block.

Cylinder Bore Inside Diameter

Limit : 93.530 (3.6823)

If the measurement exceed the specified limit, the cylinder block must be replaced.

Diameter

**Grade A : 93.400 mm–93.410 mm
(3.6772 in–3.6776 in)**

**Grade B : 93.411 mm–93.420 mm
(3.6776 in–3.6779 in)**

**Grade C : 93.421 mm–93.430 mm
(3.6780 in–3.6783 in)**

012RS005

NOTE: For information on piston diameter, please refer to the section "Inspection of the Piston and Connecting Rod Assembly" in this manual.

- The cylinder bore "Grade" mark (1) is stamped at the position illustrated.

012RS006

Reassembly

1. Install cylinder block.
2. Install crankshaft.
 - Install the main bearings to the cylinder block and the main bearing caps.
 - Be sure that they are positioned correctly.
 - Apply new engine oil to the upper and lower main bearing faces.

NOTE: Do not apply engine oil to the bearing back faces.

015RS012

Legend

- (1) Number 1 and 4 main bearing upper and lower.
- (2) Number 2 and 3 main bearing upper.
- (3) Number 2 and 3 main bearing lower.

- Carefully mount the crankshaft.
- Apply engine oil to the thrust washer.

- Assemble the thrust washer to the No. 3 bearing journal. The oil grooves must face the crankshaft.

015R100033

3. Install rear oil seal retainer.

- Remove oil on cylinder block and retainer fitting surface.
- Apply sealant (TB1207B or equivalent) to retainer fitting surface as shown in illustration.
- The oil seal retainer must be installed within 5 minutes after sealant application before the sealant hardens.

015RW002

Legend

- (1) Around Bolt Holes
- (2) Around Dowel Pin

- Apply engine oil to oil seal lip and align a dowel pin hole in the cylinder block with that in the retainer.
- Tighten retainer fixing bolts to the specified torque.

Torque: 25 N·m (2.5 kg·m/18 lb ft)

015RW001

4. Install flywheel

1. Thoroughly clean and remove the oil from the threads of crankshaft.
2. Remove the oil from the crankshaft and flywheel mounting faces.
3. Mount the flywheel on the crankshaft and then install the washer.
4. Holding the crankshaft stationary, tighten the flywheel bolts in the order shown.

Torque: 54 N·m (5.5 kg·m/40 lb ft)

NOTE: Do not reuse the bolts and do not apply oil or thread lock to the bolts.

015RS018

5. Install piston and connecting rod assembly.

- Apply engine oil to the cylinder bores, the connecting rod bearings and the crankshaft pins.

NOTE: Do not apply engine oil to the bearing back faces.

- Check to see that the piston ring end gaps are correctly positioned.

015RX003

Legend

- (1) No.1 Compression Ring
- (2) No.2 Compression Ring
- (3) Oil Ring Side Rail Upper
- (4) Oil Ring Side Rail Lower
- (5) Piston Front Mark

- Insert the piston/connecting rod assemblies into each cylinder with the piston ring compressor.
- The front marks (1) must be facing the front of the engine.

015RS020

6. Install oil gallery and tighten the bolts in 2 steps in the order shown.

1st step : 29 N·m (3.0 kg·m/22 lb ft)

2nd step : 55° ~ 65°

7. Install cylinder block side bolts (1) and tighten crankcase bolts in sequence shown in the illustration.

Torque : 39 N·m (4.0 kg·m/29 lb ft)

8. Install oil pump assembly. Refer to "Oil Pump" in this manual.

9. Install oil strainer and O-ring.

10. Install oil pipe and O-ring.

11. Install crankcase with oil pan.

1. Completely remove all residual sealant, lubricant and moisture from the sealing surfaces. The surfaces must be perfectly dry.
2. Apply a correct width bead of sealant (TB- 1207C or its equivalent) to the contact surfaces of the crankcase. There must be no gaps in the bead.
3. The oil pan must be installed within 5 minutes after sealant application to prevent premature hardening of sealant.
4. Tighten the bolts and nuts to the specified torque.

Torque : 10 N·m (1.0 kg·m/87 lb in)

Legend

- (1) Portion Between Both Holes
- (2) Bolt Hole Portions

12. Install cylinder head gasket.

13. Install cylinder head assembly. Refer to "Cylinder Head" in this manual.

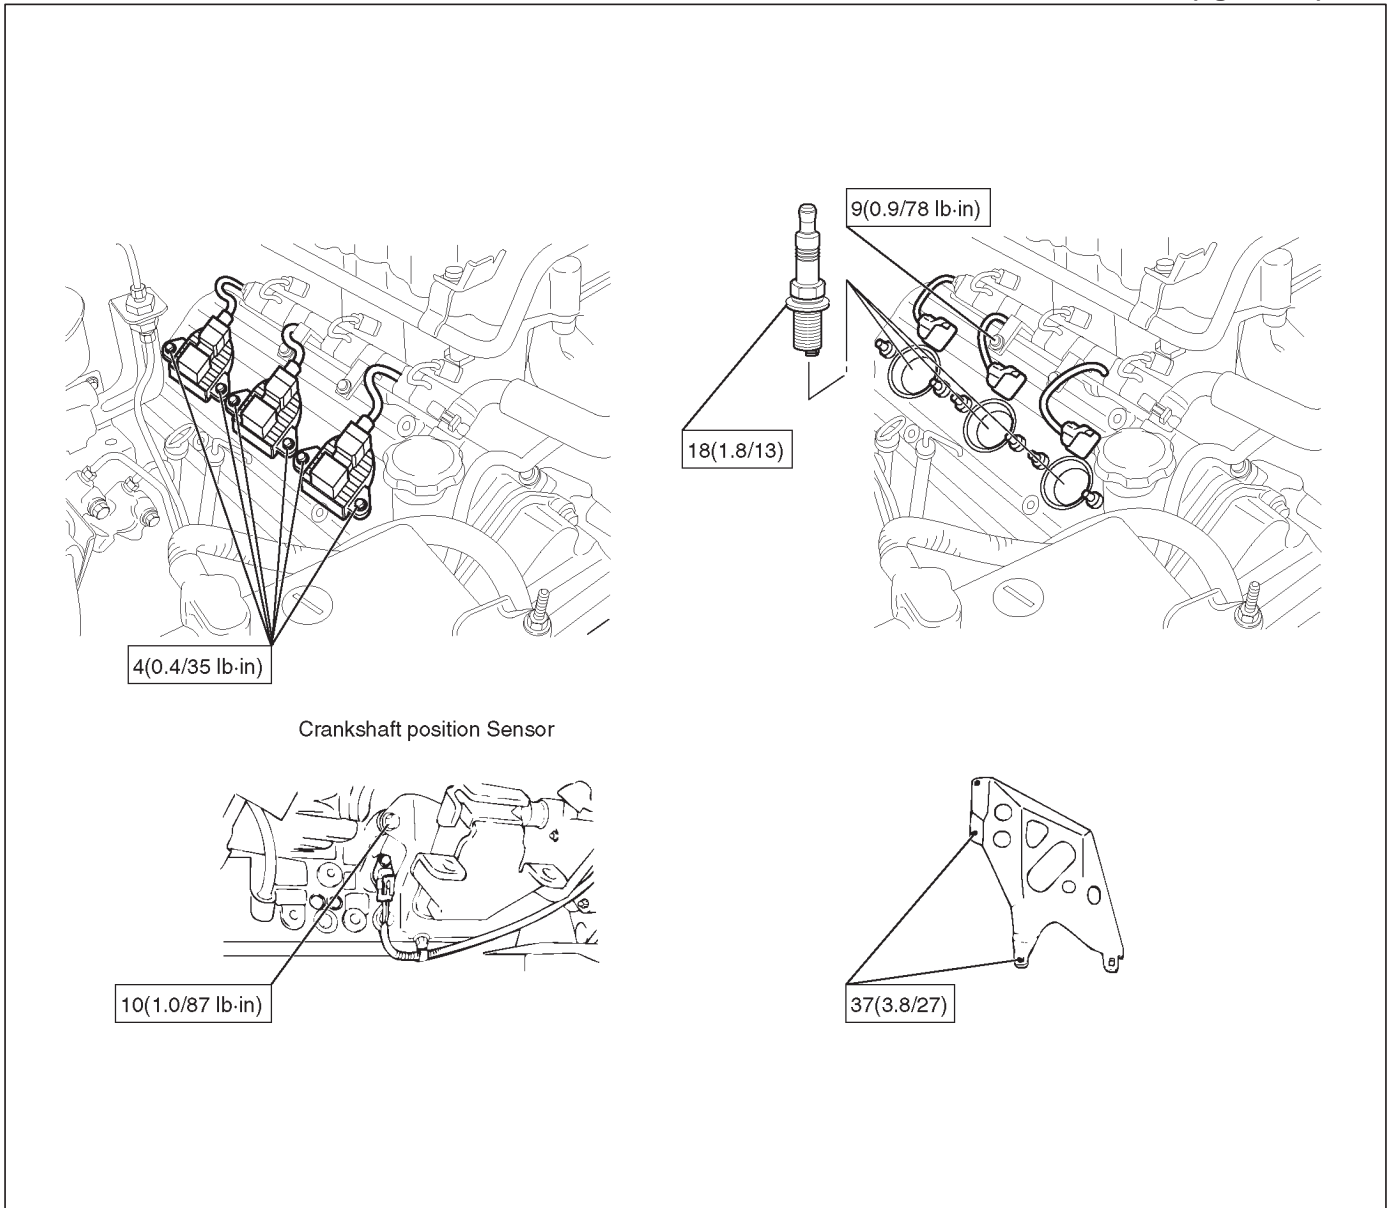

Main Data and Specification**General Specification**

Item	Specifications
	6VD1
Engine type, number of cylinders and arrangement	Water cooled, four cycle V6
Form of combustion chamber	Pent roof type
Valve mechanism	4-Cams, 4-Valves, DOHC Gear & Belt Drive
Cylinder liner type	Casted in cylinder drive
Total piston displacement	3165 cc
Cylinder bore x stroke	93.4mm x 77.0mm (3.6772 in x 3.0315 in)
Compression ratio	9.1 : 1
Compression pressure at 300rpm	1373 kpa (14.0 kg/cm ² /199 psi)
Engine idling speed rpm	Non adjustable (750)
Valve clearance	Intake: 0.28 mm (0.11 in)
	Exhaust: 0.30mm (0.12in)
Oil capacity	5.3 liters
Ignition timing	Non adjustable 16° BTDC at idle rpm
Spark plug	K16PR-P11, PK16PR11, RC10PYP4
Plug gap	1.0 mm-1.1 mm(0.0394 in – 0.0433 in)

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS), REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

030RW001

Legend

- | | |
|--------------------|---------------------|
| (1) Water Pump | (7) Cylinder Head |
| (2) Thermostat | (8) Right Bank |
| (3) Radiator | (9) Throttle Body |
| (4) Reserve Tank | (10) Cylinder Block |
| (5) Cooling Fan | (11) Cylinder Head |
| (6) Cylinder Block | (12) Left Bank |
| | (13) Heater |

The cooling system is a pressurized Engine Coolant (EC) forced circulation type which consists of a water pump, thermostat cooling fan, radiator and other components. The automatic transmission fluid is cooled by the EC in radiator.

Water Pump

The EC pump is a centrifugal impeller type and is driven by a timing belt.

030RS001

Thermostat

The thermostat is a wax pellet type with a air hole(1) and is installed in the thermostat housing.

031RW002

Radiator

The radiator is a tube type with corrugated fins. In order to raise the boiling point of the coolant, the radiator is fitted with a cap in which the valve is operated at 88.2 ~ 117.6 kPa (12.8 ~ 17.0 psi) pressure. (No oil cooler provided for M/T)

110RW023

Anti Freeze Solution

- Relation between the mixing ratio and freezing temperature of the Engine Coolant varies with the ratio of anti-freeze solution in water. Proper mixing ratio can be determined by referring to the chart. Supplemental inhibitors or additives claiming to increase cooling capability that have not been specifically approved by Isuzu are not recommended for addition to the cooling system.
- Calculating mixing ratio

$$\text{Mixing ratio} = \frac{\text{Anti freeze solution (Lit/gal.)}}{\text{Anti freeze solution (Lit/gal.)} + \text{Water (Lit/gal.)}}$$

F06RW005

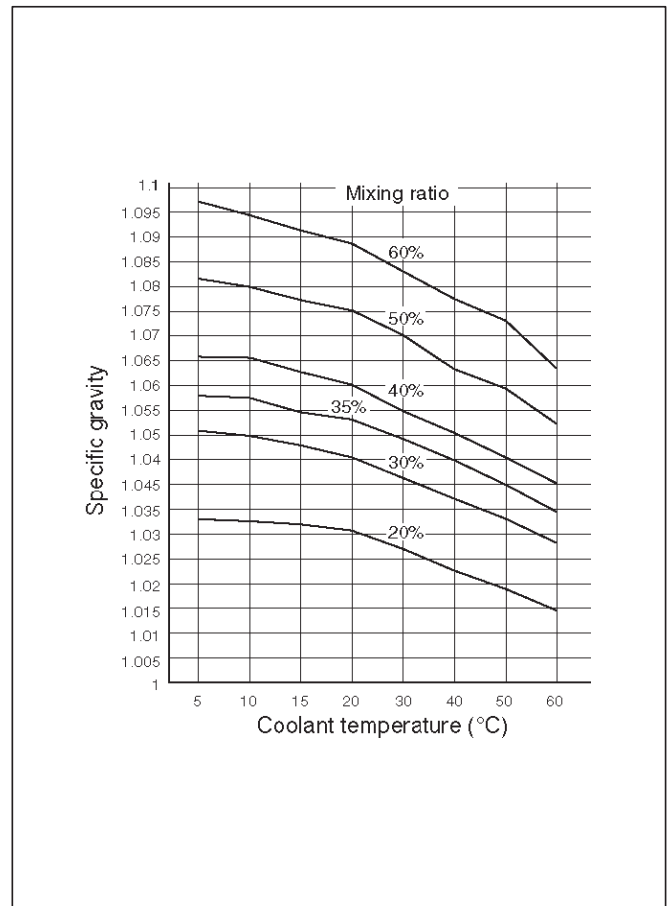

NOTE: Antifreeze solution + Water = Total cooling system capacity.

- **Total Cooling System Capacity**
- **M/T 8.8Lit (2.32Us gal)**
- **A/T 8.4Lit (2.22Us gal)**

6B-4 ENGINE COOLING (6VD1 3.2L)

B06RW002

B06RW003

● Mixing ratio

Check the specific gravity of engine coolant in the cooling system temperature ranges from 0°C to 50°C using a suction type hydrometer, then determine the density of the engine coolant by referring to the table.

NOTE:

1. Even in the areas where the atmospheric temperature is higher than 0°C, be sure not to use antifreeze solution at a mixing ratio lower than 20% so that the inside of the engine may not be corroded.
2. If antifreeze solution is used at a mixing ratio higher than 60%, the specific heat of the coolant falls and the engine may be overheated. Moreover, antifreeze performance drop and the coolant may be frozen. The density of the solution must be adjusted as occasion calls.

Antifreeze solution lower than 20% may not have sufficient anticorrosive performance, and therefore, please never fail to adjust as occasion demands within the range of 20% to 60%.

Diagnosis

Engine Cooling Trouble

Condition	Possible cause	Correction
Engine overheating	Low Engine Coolant level	Replenish
	Incorrect fan installed	Replace
	Thermo meter unit faulty	Replace
	Faulty thermostat	Replace
	Faulty Engine Coolant temperature sensor	Repair or replace
	Clogged radiator	Clean or replace
	Faulty radiator cap	Replace
	Low engine oil level or use of improper engine oil	Replenish or change oil
	Clogged exhaust system	Clean exhaust system or replace faulty parts
	Faulty Throttle Position sensor	Replace throttle valve assembly
	Open or shorted Throttle Position sensor circuit	Repair or replace
Damaged cylinder head gasket	Replace	
Engine overcooling	Faulty thermostat	Replace
Engine slow to warm-up	Faulty thermostat	Replace
	Thermo unit faulty	Replace

Draining and Refilling Cooling System

Before draining the cooling system, inspect the system and perform any necessary service to ensure that it is clean, does not leak and is in proper working order. The engine coolant (EC) level should be between the "MIN" and "MAX" lines of reserve tank when the engine is cold. If low, check for leakage and add EC up to the "MAX" line. There should not be any excessive deposit of rust or scales around the radiator cap or radiator filler hole, and the EC should also be free from oil. Replace the EC if excessively dirty.

Engine coolant change

1. To change engine coolant, make sure that the engine is cool.

WARNING: WHEN THE COOLANT IS HEATED TO A HIGH TEMPERATURE, BE SURE NOT TO LOOSEN OR REMOVE THE RADIATOR CAP. OTHERWISE YOU MIGHT GET SCALDED BY HOT VAPOR OR BOILING WATER. TO OPEN THE RADIATOR CAP, PUT A PIECE OF THICK CLOTH ON THE CAP AND LOOSEN THE CAP SLOWLY TO REDUCE THE PRESSURE WHEN THE COOLANT HAS BECOME COOLER.

2. Open radiator cap and drain the cooling system by loosening the drain valve on the radiator and on the cylinder body.

NOTE: For best result it is suggested that the engine cooling system be flushed at least once a year. It is advisable to flash the interior of the cooling system including the radiator before using anti-freeze (ethylene-glycol based).

Replace damaged rubber hoses as the engine anti-freeze coolant is liable to leak out even minor cracks.

Isuzu recommends to use Isuzu genuine anti-freeze (ethylene-glycol based) or equivalent, for the cooling system and not add any inhibitors or additives.

CAUTION: A failure to correctly fill the engine cooling system in changing or topping up coolant may sometimes cause the coolant to overflow from the filler neck even before the engine and radiator are completely full.

If the engine runs under this condition, shortage of coolant may possibly result in engine overheating. To avoid such trouble, the following precautions should be taken in filling the system.

3. To refill engine coolant, pour coolant up to filler neck using a filling hose which is smaller in outside diameter of the filler neck. Otherwise air between the filler neck and the filling hose will block entry, preventing the system from completely filling up.
4. Keep a filling rate of 9 liter/min. or less. Filling over this maximum rate may force air inside the engine and radiator.

And also, the coolant overflow will increase, making it difficult to determine whether or not the system is completely full.

5. After filling the system to the full, pull out the filling hose and check to see if air trapped in the system is dislodged and the coolant level goes down. Should the coolant level go down, repeat topping-up until there is no more drop in the coolant level.
6. After directly filling the radiator, fill the reservoir to the maximum level.
7. Install and tighten radiator cap and start the engine. After idling for 2 to 3 minutes, stop the engine and reopen radiator cap. If the water level is lower, replenish.

WARNING: WHEN THE COOLANT IS HEATED TO A HIGH TEMPERATURE, BE SURE NOT TO LOOSEN OR REMOVE THE RADIATOR CAP. OTHERWISE YOU MIGHT GET SCALDED BY HOT VAPOR OR BOILING WATER. TO OPEN THE RADIATOR CAP, PUT A PIECE OF THICK CLOTH ON THE CAP AND LOOSEN THE CAP SLOWLY TO REDUCE THE PRESSURE WHEN THE COOLANT HAS BECOME COOLER.

8. After tightening radiator cap, warm up the engine at about 2,000 rpm.
Set heater adjustment to the highest temperature position, and let the coolant circulate also into heater water system.
9. Check to see the thermostat has opened through the needle position of water thermometer, conduct a 5-minute idling again and stop the engine.
10. When the engine has been cooled, check filler neck for water level and replenish if required. Should extreme shortage of coolant is found, check the coolant system and reservoir tank hose for leakage.
11. Fill the coolant into the reservoir tank up to "MAX" line.

Water Pump

Water Pump and Associated Parts

030R100004

Legend

- (1) Timing Belt
- (2) Idle Pulley

- (3) Water Pump Assembly
- (4) Gasket

Removal

1. Disconnect battery ground cable.
2. Drain coolant.
3. Radiator hose (on inlet pipe side).
4. Remove timing belt. Refer to "Timing Belt" in this manual.
5. Remove Idle pulley.
6. Remove water pump assembly.
7. Remove gasket.

2. Install water pump assembly and tighten bolts to the specified torque.

Torque: 25 N·m (2.5 kg·m/18 lb ft)

- Tightening order

The tightening order are in the illustrate.

NOTE: To prevent the oil leakage, apply the LOCTITE 262 or an equivalent, to the arrow marked fixing bolt thread.

Inspection

Make necessary repair and parts replacement if extreme wear or damage is found during inspection. Should any of the following problems occur, the entire water pump assembly must be replaced:

- Crack in the water pump body
- EC leakage from the seal unit
- Play or abnormal noise in the bearing
- Cracks or corrosion in the impeller.

Installation

1. Install gasket, clean the mating surface of gasket before installation.

030RW006

6B-8 ENGINE COOLING (6VD1 3.2L)

3. Idle pulley

- Install idle pulley and tighten bolt to the specified torque.

Torque: 52 N-m (5.3 kg-m/38 lb ft)

4. Timing belt

- Install timing belt. Refer to timing belt installation step in "Timing Belt" in this manual.

5. Connect radiator inlet hose and replenish EC.

6. Connect battery ground cable.

Thermostat

Thermostat and Associated Parts

Legend

- (1) Thermostat Housing
- (2) Thermostat
- (3) Outlet Pipe

Removal

1. Disconnect battery ground cable.
2. Drain engine coolant from the radiator and engine.
3. Disconnect radiator hose from the inlet pipe.
4. Remove thermostat housing.
5. Remove thermostat(2).

Inspection

Suspend the thermostat in a water-filled container using thin wire. Place a thermometer next to the thermostat. Do not directly heat the thermostat. Gradually increase the water temperature. Stir the water so that the entire water is same temperature.

Confirm the temperature when the valve first begins to open.

**Valve opening temperature 74.5C ~ 78.5°C
(166.1°F ~ 173.3°F)**

Confirm the temperature when the valve is fully opened.

**Valve full open temperature and lift More than
8.5mm (0.33 in) at 90°C (194°F)**

Make necessary repair and parts replacement if extreme wear or damage is found during inspection.

Installation

1. Install thermostat into the outlet pipe(4) making sure that the air hole is in the up position.
2. Install thermostat housing and tighten bolts to the specified torque.
Torque: 25 N-m (2.5 kg-m/18 lb ft)
3. Install rubber hose.
4. Replenish engine coolant (EC).
5. Start engine and check for EC leakage.

Radiator

Radiator and Associated Parts

110RW010

Legend

- | | |
|--|-----------------------|
| (1) Oil Cooler Hose For Automatic Transmission | (4) Reserve Tank Hose |
| (2) Radiator Hose | (5) Radiator Assembly |
| (3) Fan Guide, Lower | (6) Reserve Tank |

Removal

1. Disconnect battery ground cable.
2. Loosen a drain plug (2) to drain Engine Coolant.
3. Disconnect oil cooler hose(1) on automatic transmission (A/T).
4. Disconnect radiator inlet hose and outlet hose from the engine.

110RW002

5. Remove fan guide(1), clips (2) on both sides and the bottom lock, then remove lower fan guide(3) with fan shroud(4).

110RW001

6B-10 ENGINE COOLING (6VD1 3.2L)

6. Disconnect the reserve tank hose(4) from radiator.
7. Remove bracket.

8. Lift up and remove the radiator assembly with hose, taking care not to damage the radiator core with a fan blade.
9. Remove rubber cushions on both sides at the bottom.

Inspection

Radiator Cap

Measure the valve opening pressure of the pressurizing valve with a radiator filler cap tester. Replace the cap if the valve opening pressure is outside the standard range.

Valve opening pressure kPa (psi) 88.3 ~ 117.7 (12.8 ~17.1)

Check the condition of the vacuum valve in the center of the valve seat side of the cap. If considerable rust or dirt is found, or if the valve seat cannot be moved by hand, clean or replace the cap.

Valve opening vacuum kPa (psi) 1.96 ~ 4.91 (0.28 ~ 0.71)

Radiator Core

1. A bent fin may result in reduced ventilation and overheating may occur. All bent fins must be straightened. Pay close attention to the base of the fin when it is being straightened.
2. Remove all dust, bugs and other foreign material.

Flushing the Radiator

Thoroughly wash the inside of the radiator and the engine coolant passages with cold water and mild detergent. Remove all signs of scale and rust.

Cooling System Leakage Check

Use a radiator cap tester to force air into the radiator through the filler neck at the specified pressure of 150 kPa (22 psi) with a cap tester:

- Leakage from the radiator
- Leakage from the coolant pump
- Leakage from the water hoses
- Check the rubber hoses for swelling.

Installation

1. Install rubber cushions on both sides of radiator bottom.
2. Install radiator assembly with hose, taking care not to damage the radiator core with a fan blade.
3. Install bracket and support the radiator upper tank with the bracket and secure the radiator.
4. Connect reserve tank hose (4).
5. Install lower fan guide (3).
6. Connect radiator inlet hose and outlet hose to the engine.
7. Connect oil cooler hose (1) to automatic transmission.

8. Connect battery ground cable.
9. Pour engine coolant up to filler neck of radiator, and up to MAX mark of reserve tank.

Important operation (in case of 100% engine coolant change) procedure for filling with engine coolant.

1. Make sure that the engine is cool.
2. Open radiator cap pour coolant up to filler neck.
3. Pour coolant into reservoir tank up to "MAX" line.
4. Tighten radiator cap and start the engine. After idling for 2 to 3 minutes, stop the engine and reopen radiator cap. If the water level is lower, replenish.

WARNING: WHEN THE COOLANT IS HEATED TO A HIGH TEMPERATURE, BE SURE NOT TO LOOSEN OR REMOVE THE RADIATOR CAP. OTHERWISE YOU MIGHT GET SCALDED BY HOT VAPOR OR BOILING WATER. TO OPEN THE RADIATOR CAP, PUT A PIECE OF THICK CLOTH ON THE CAP AND LOOSEN THE CAP SLOWLY TO REDUCE THE PRESSURE WHEN THE COOLANT HAS BECOME COOLER.

5. After tightening radiator cap, warm up the engine at about 2000 rpm. Set heater adjustment to the highest temperature position, and let the coolant circulate also into heater water system.
6. Check to see the thermostat has opened through the needle position of water thermometer, conduct a 5-minute idling again and stop the engine.
7. When the engine has been cooled, check filler neck for water level and replenish if required. Should extreme shortage of coolant is found, check the cooling system and reservoir tank hose for leakage.
8. Pour coolant into reservoir tank up to "MAX" line.

Drive Belt and Cooling Fan

Drive Belt and Associated Parts

015RW005

Legend

- | | |
|-------------------------|---------------------------------------|
| (1) Crankshaft Pulley | (4) Water Pump and Cooling Fan Pulley |
| (2) Generator | (5) Idle Pulley |
| (3) Power Steering Pump | (6) Tension Pulley |
| | (7) Drive Belt |

The drive belt adjustment is not required as automatic drive belt tensioner is equipped.

Inspection

Check drive belt for wear or damage, and replace with a new one as necessary.

Installation

Install cooling fan assembly and tighten bolts/nuts to the specified torque.

Torque : 22 N·m (2.2 kg·m/16 lb ft) for fan pulley and fan bracket.

Torque : 10 N·m (1.0 kg·m/87 lb in) for fan and clutch assembly.

Main Data and Specifications

General Specifications

	M/T	A/T
Cooling system	Engine coolant forced circulation	
Radiator	Tube type corrugated (2 tube in row)	
Heat radiation capacity	70,000 kcal/h	77,800 kcal/h
Heat radiation area	9.74 m ² (104.8 ft ²)	11.74 m ² (126.4 ft ²)
Radiator front area	0.263 m ² (2.83 ft ²)	
Radiator dry weight	42 N (9.4 lb)	45 N (10.1 lb)
Radiator cap valve opening pressure	93.3 ~ 122.7 kpa (13.5 ~ 17.8 psi)	
Engine coolant capacity	2.5 lit (2.6U.S q.t.)	2.4 lit (2.5U.S q.t.)
Engine coolant pump	Centrifugal impeller type	
Delivery	300 (317) or more	
Pump speed	5000 ± 50 rpm	
Thermostat	Wax pellet type with air hole	
Valve opening temperature	74.5 ~ 78.5 °C (166.1 ~ 173.3 °F)	
Engine coolant total capacity	10.5 lit (11.10U.S qt)	10.4 lit (10.99U.S qt)

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

- Adhere to all Notices and Cautions.

All gasoline engines are designed to use only unleaded gasoline. Unleaded gasoline must be used for proper emission control system operation.

Its use will also minimize spark plug fouling and extend engine oil life. Using leaded gasoline can damage the emission control system and could result in loss of emission warranty coverage.

All cars are equipped with an Evaporative Emission Control System. The purpose of the system is to minimize the escape of fuel vapors to the atmosphere.

Fuel Metering

The Powertrain Control Module (PCM) is in complete control of this fuel delivery system during normal driving conditions.

The intake manifold function, like that of a diesel, is used only to let air into the engine. The fuel is injected by separate injectors that are mounted over the intake manifold.

The Manifold Absolute Pressure (MAP) sensor measures the changes in the intake manifold pressure which result from engine load and speed changes, which the MAP sensor converts to a voltage output.

This sensor generates the voltage to change corresponding to the flow of the air drawn into the engine. The changing voltage is transformed into an electric signal and provided to the PCM.

With receipt of the signals sent from the MAP sensor, Intake Air Temperature sensor and others, the PCM determines an appropriate fuel injection pulse width feeding such information to the fuel injector valves to effect an appropriate air/fuel ratio.

The Multiport Fuel Injection system utilizes an injection system where the injectors turn on at every crankshaft revolution. The PCM controls the injector on time so that the correct amount of fuel is metered depending on driving conditions.

Two interchangeable "O" rings are used on the injector that must be replaced when the injectors are removed.

The fuel rail is attached to the top of the intake manifold and supplies fuel to all the injectors.

Fuel is recirculated through the rail continually while the engine is running. This removes air and vapors from the fuel as well as keeping the fuel cool during hot weather operation.

The fuel pressure control valve that is mounted on the fuel rail maintains a pressure differential across the injectors under all operating conditions. It is accomplished by controlling the amount of fuel that is recirculated back to the fuel tank based on engine demand.

See Section "Driveability and Emission" for more information and diagnosis.

Fuel Filter

Removal

CAUTION: When repair to the fuel system has been completed, start engine and check the fuel system for loose connection or leakage. For the fuel system diagnosis, see Section "Driveability and Emission".

140R100050

Legend

- (1) Fuel Filler Cap
- (2) Receiver Rubber Drain

1. Disconnect battery ground cable.
2. Remove Fuel filler cap(1).

041RW003

Legend

- (1) Fuel Hose
- (2) Fuel Filter Fixing Bolt
- (3) Fuel Filter

3. Disconnect fuel hoses(1) from fuel filter on both engine side and fuel tank side.
4. Fuel filter fixing bolt(2).
 - Remove the fuel filter fixing bolt(2) on fuel filter holder.
5. Remove fuel filter(3).

Inspection

1. Replace the fuel filter if the fuel leaks from fuel filter body or if the fuel filter body itself is damaged.
2. Replace the filter if it is clogged with dirt or sediment.
3. Check the drain of receive rubber and if it is clogged with dust, clean it up with air.

Installation

1. Install the fuel filter in the proper direction.
2. Install fuel filter holder fixing bolt.
3. Connect fuel hoses on engine side(1) and fuel tank side(2).

041RW001

4. Install fuel filler cap
5. Connect the battery ground cable.

Inspection

After installation, start engine and check for fuel leakage.

In-Tank Fuel Filter

The filter is located on the lower end of fuel pickup tube in the fuel tank. It prevents dirt from entering the fuel pipe and also stops water unless the filter is completely submerged in the water. It is a selfcleaning type, not requiring scheduled maintenance. Excess water and sediment in the tank restricts fuel supply to the engine, resulting in engine stoppage. In such a case, the tank must be cleaned thoroughly.

Fuel Pump Flow Test

If reduction of fuel supply is suspected, perform the following checks.

1. Make sure that there is fuel in the tank.
2. With the engine running, check the fuel feed pipe and hose from fuel tank to injector for evidence of leakage. Retighten, if pipe or hose connection is loose. Also, check pipes and hoses for squashing or clogging.
3. Insert the hose from fuel feed pipe into a clean container, and check for fuel pump flow rate.
4. Connect the pump relay terminals with a jumper wire(1) as shown and start the fuel pump to measure delivery.

140RX020

CAUTION: Never generate sparks when connecting a jumper wire.

Delivery	Delivery
15 seconds	0.38 liters minimum

If the measure value is out of standard, conduct the pressure test.

Pressure test

For the pressure test to the fuel system, see Section 6E "Fuel Control System".

Fuel Pump

Fuel Pump and Associated Parts

140RX004

| (4) Fuel Pump and Sender Assembly | (9) Hose; Air Breather |
| (5) Connector; Fuel Feed Pump | (10) Hose; Fuel Filler |
| | (11) Fuel Tank Assembly |

Removal

CAUTION: When repair to the fuel system has been completed, start engine and check the fuel system for loose connection or leakage. For the fuel system diagnosis, see Section "Driveability and Emission".

1. Disconnect battery ground cable.
2. Loosen fuel filler cap.
3. Support underneath of the fuel tank assembly (11) with a lifter.
4. Remove fuel tank assembly(11). Refer to "Fuel Tank Removal" in this section.
5. Remove Fuel Tube/Quick Connector (2).

NOTE: Handling of the fuel tube sure to refer "Fuel Tube/Quick Connector Fittings" in this section.

6. Remove fuel pump and sender (FPAS) assembly (4) fixing snap ring and remove the FPAS assembly.

NOTE: After removing pump assembly (4), cover fuel tank to prevent any dust entering.

Installation

1. Install FPAS assembly(4).
2. Install Fuel Tube/Quick Connector (2).

NOTE: Handling of the fuel tube sure to refer "Fuel Tube/Quick Connector Fittings" in this section.

3. Install fuel tank assembly(11). Refer to "Fuel Tank Installation".
4. Fill the tank with fuel and tighten fuel filler cap.
5. Connect battery ground cable.

Fuel Tube / Quick – Connector Fittings

Precautions

- Lighting of Fires Prohibited.
- Keep flames away from your work area to prevent the inflammable from catching fire.
- Disconnect the battery negative cable to prevent shorting during work.
- When welding or conducting other heat-generating work on other parts, be sure to provide pretreatment to protect the piping system from thermal damage or spattering.

Cautions During Work

Do not expose the assembly to battery electrolyte or do not wipe the assembly with a cloth used to wipe off spilt battery electrolyte.

The piping wet with battery electrolyte cannot be used. Be careful not to give a bending or twisting force to the piping during the work. If deformed, replace with a new piping.

Removal

1. Open the fuel cap to relieve the fuel pressure in the tank.

If the fuel quick-connect fittings are dusty, clean with an air blower, etc. and then remove it.

As some pressure may remain in the piping, cover the connector with a cloth, etc. to prevent the splashing of fuel in the first disconnection of the piping.

2. For removal of the delivery pipe (feeding fuel to the engine), and return pipe (returning fuel to the tank) hold the connector in one hand, and hold the retainer tab with the other hand and pull out the connector, as illustrated. The pipe can be removed with the retainer attached.

NOTE: This work should be done by hands. Do not use any tools. Should the pipe can hardly be removed from the connector, use a lubricant (light oil) and/or push and pull the connector longitudinally until the pipe is removed.

6C-8 ENGINE FUEL (6VD1 3.2L)

When reusing the delivery and return pipe retainer, reuse without removing the retainer from the pipe. If the retainer is damaged or deformed, however, replace with a new retainer.

Cover the connectors removed with a plastic bag, etc. to prevent the entry of dust or rain water.

Reuse of Quick-Connector

(Delivery Pipe and Return Pipe)

- Replace the pipe and connector if scratch, dent or crack is found.
- Remove mud and dust from the pipe and make sure that the end including spool is free of defects, such as scratch, rust, and dent, which may cause poor sealability. If defective, replace with a new pipe.
- If the retainer removed according to the removal step above is attached to the pipe, clean and insert it straight into the quick-connector till it clicks. After it clicks, try pulling it out to make sure that it is not drawn and is securely locked.

NOTE: The retainer, once removed from the pipe, cannot be reused. Just replace with a new retainer. Insert the new retainer into the connector side until it clicks, and connect the pipe as inserting it into the retainer until it clicks.

Assembling Advice

Application of engine oil or light oil to the pipe facilitates connecting work. The work should be started immediately after lubrication, since dust may stick to the pipe surface to cause poor sealability if a long time passes after lubrication.

Test/Inspection After Assembling

1. Reconnect the battery negative cable.
2. Turn the ignition key to the "ON" position and check pump startup sound. As the pump is actuated to raise fuel pressure, check and see fuel leak from the piping system.
3. Make sure of no fuel leakage by conducting the above fuel leak check a few times.
4. Start the engine and make sure of stable idling speed and normal vehicle run. The entry of dust during the work may sometimes affect the fuel injection system.

Fuel Pump Relay

General Description

In order to control the FPAS operation, the FPAS relay is provided. When the starter switch is turned to "ON" position, the FPAS relay operates the FPAS for 2 seconds.

When it is turned to "START" position, the Engine Control Module receives the reference pulse from the Ignition Control Module and it operates the relay, again causing the FPAS to feed fuel.

Fuel Tank

Fuel Tank and Associated Parts

140RX005

Legend

| | (19) Protector; Heat |

Removal

CAUTION: When repair to the fuel system has been completed, start engine and check the fuel system for loose connection or leakage. For the fuel system diagnosis, see Section "Driveability and Emission".

1. Disconnect battery ground cable.
2. Loosen fuel filler cap.
3. Support underneath of the fuel tank protector (15) with a lifter.
4. Disconnect evaporative fuel hose (3) at the canister.
5. Disconnect fuel feed hose (17) and fuel return hose (18) near the fuel filter.

NOTE: Plug both ends of the fuel hoses to prevent fuel leakage.

6. Disconnect air breather hose (4) and fuel filler hose (5) at the fuel filler neck.

NOTE: Cover fuel hose to prevent any dust entering.

7. Remove the four fuel tank assembly fixing bolts (14) at four corners of the tank.
8. Let down the tank and disconnect the wiring connectors (8,9).
9. Remove fuel tank assembly along with protectors (15,19) .
10. Remove retaining cover (2) and roll over & float valve (1) along with the evaporative fuel hose and pipe (3).

6C-10 ENGINE FUEL (6VD1 3.2L)

11. Remove Fuel Tube/Quick Connector (12).

NOTE: Handling of the fuel tube sure to refer "Fuel Tube/Quick Connector Fittings" in this section.

12. Remove fuel pump and sender assembly (10) by removing the snap ring (7) along with the fuel hoses (17,18).

13. Remove protectors (15,19) by removing the six fixing bolts (6).

Installation

1. Install protectors (15,19) and tighten the six fixing bolts to the specified torque.

Torque: 69 N-m (7.0 kg-m/51 lb ft)

2. Install fuel pump and sender assembly by fitting in of the snap ring (7).

3. Install Fuel Tube/Quick connector (12).

NOTE: Handling of the fuel tube sure to refer "Fuel Tube/Quick Connector Fittings" in this section.

4. Install roll over & float valve (1) by fitting in of the retaining cover (2).

5. Lift up fuel tank assembly and connect the wiring connectors (8,9).

6. Install fuel tank assembly along with protectors and tighten the four fixing bolts to the specified torque.

Torque: 69 N-m (7.0 kg-m/51 lb ft)

7. Connect fuel filler hose (5) and air breather hose (4), and clip them firmly.

8. Connect fuel feed hose (17) and fuel return hose (18), and clip them firmly.

9. Connect evaporative fuel hose (3).

10. Tighten fuel filler cap.

11. Connect battery ground cable.

Fuel Gauge Unit

Removal and Installation

As for removal and installation of the Fuel Gauge Unit, refer to "Fuel Tank" of this section 6C as the fuel gauge unit is combined with the fuel pump and sender assembly.

Fuel Filler Cap

General Description

Fuel filler cap includes vacuum valve and pressure valve. In case any high vacuum and any high pressure happen in tank, each valve works to adjust the pressure to prevent the tank from being damaged.

Legend

- (1) Vacuum Valve
- (2) Pressure Valve
- (3) Seal Ring

Inspection

Check the seal ring in the filler cap for presence of any abnormality and for seal condition. Replace the filler cap, if abnormal.

CAUTION:

The fuel filler cap valve has characteristics.

A defective valve, no valve at all or a valve with the wrong characteristics will do a lot of harm to engine operating characteristics; be sure to use the same fuel filler cap as installed in this vehicle.

General Description	6D1-2	Battery Installation	6D1-4
Diagnosis	6D1-2	Main Data and Specifications	6D1-5
Battery Charging	6D1-3		

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS), REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Battery

General Description

There are six battery fluid caps on top of the battery. These are covered by a paper label.

The battery is completely sealed except for the six small vent holes on the side. These vent holes permit the escape of small amounts of gas generated by the battery. This type of battery has the following advantages over conventional batteries:

1. There is no need to add water during the entire service life of the battery.
2. The battery protects itself against overcharging. The battery will refuse to accept an extensive charge. (A conventional battery will accept an excessive charge, resulting in gassing and loss of battery fluid.)
3. The battery is much less vulnerable to self discharge than a conventional type battery.

Diagnosis

1. Visual Inspection

Inspect the battery for obvious physical damage, such as a cracked or broken case, which would permit electrolyte loss.

Replace the battery if obvious physical damage is discovered during inspection.

Check for any other physical damage and correct it as necessary.

2. Hydrometer Check

There is a built-in hydrometer (Charge test indicator(1)) at the top of the battery. It is designed to be used during diagnostic procedures.

Before trying to read the hydrometer, carefully clean the upper battery surface.

If your work area is poorly lit, additional light may be necessary to read the hydrometer.

- a. BLUE RING OR DOT VISIBLE(5) – Go to Step 4.
- b. BLUE RING OR DOT NOT VISIBLE(4) – Go to Step 3.

061RW001

3. Fluid Level Check

The fluid level should be between the upper level line(2) and lower level line(3) on side of battery.

- a. CORRECT FLUID LEVEL – Charge the battery.
- b. BELOW LOWER LEVEL – Replace battery.

061RW001

4. Voltage Check

1. Put voltmeter test leads to battery terminals.
 - a. VOLTAGE IS 12.4V OR ABOVE – Go to Step 5.
 - b. VOLTAGE IS UNDER 12.4V – Go to procedure (2) below.
2. Determine fast charge amperage from specification. (See Main Data and Specifications in this section). Fast charge battery for 30 minutes at amperage rate no higher than specified value. Take voltage and amperage readings after charge.
 - a. VOLTAGE IS ABOVE 16V AT BELOW 1/3 OF AMPERAGE RATE – Replace battery.
 - b. VOLTAGE IS ABOVE 16V AT ABOVE 1/3 OF AMPERAGE RATE – Drop charging voltage to 15V and charge for 10–15 hours. Then go to Step 5.
 - c. VOLTAGE IS BETWEEN 12V AND 16V – Continue charging at the same rate for an additional 3–1/2 hours. Then go to Step 5.
 - d. VOLTAGE BELOW 12V – Replace Battery.

5. Load Test

1. Connect a voltmeter and a battery load tester across the battery terminals.
2. Apply 300 ampere load for 15 seconds to remove surface charge from the battery. Remove load.
3. Wait 15 seconds to let battery recover. Then apply specified load from specifications (See Main Data and Specifications in this section). Read voltage after 15 seconds, then remove load.

- a. VOLTAGE DOES NOT DROP BELOW THE MINIMUM LISTED IN THE TABLE – The battery is good and should be returned to service.
- b. VOLTAGE IS LESS THAN MINIMUM LISTED – Replace battery.

ESTIMATED TEMPERATURE		MINIMUM VOLTAGE
°F	°C	V
70	21	9.6
60	16	9.5
50	10	9.4
40	4	9.3
30	-1	9.1
20	-7	8.9
10	-12	8.7
0	-18	8.5
The battery temperature must be estimated by feel and by the temperature the battery has been exposed to for the preceding few hours.		

Battery Charging

Observe the following safety precautions when charging the battery:

1. Never attempt to charge the battery when the fluid level is below the lower level line on the side of the battery. In this case, the battery must be replaced.
2. Pay close attention to the battery during charging procedure.
Battery charging should be discontinued or the rate of charge reduced if the battery feels hot to the touch.
Battery charging should be discontinued or the rate of charge reduced if the battery begins to gas or spew electrolyte from the vent holes.
3. In order to more easily view the hydrometer blue dot or ring, it may be necessary to jiggle or tilt the battery.
4. Battery temperature can have a great effect on battery charging capacity.
5. The sealed battery used on this vehicle may be either quick charged or slow charged in the same manner as other batteries.
Whichever method you decide to use, be sure that you completely charge the battery. Never partially charge the battery.

Jump Starting

Jump Starting with an Auxiliary (Booster) Battery

CAUTION: Never push or tow the vehicle in an attempt to start it. Serious damage to the emission system as well as other vehicle parts will result.

Treat both the discharged battery and the booster battery with great care when using jumper cables. Carefully follow the jump starting procedure, being careful at all times to avoid sparking.

WARNING: FAILURE TO CAREFULLY FOLLOW THE JUMP STARTING PROCEDURE COULD RESULT IN THE FOLLOWING:

1. Serious personal injury, particularly to your eyes.
2. Property damage from a battery explosion, battery acid, or an electrical fire.
3. Damage to the electronic components of one or both vehicles particularly.

Never expose the battery to an open flame or electrical spark. Gas generated by the battery may catch fire or explode.

Remove any rings, watches, or other jewelry before working around the battery. Protect your eyes by wearing an approved set of goggles.

Never allow battery fluid to come in contact with your eyes or skin.

Never allow battery fluid to come in contact with fabrics or painted surfaces.

Battery fluid is a highly corrosive acid.

Should battery fluid come in contact with your eyes, skin, fabric, or a painted surface, immediately and thoroughly rinse the affected area with clean tap water.

Never allow metal tools or jumper cables to come in contact with the positive battery terminal, or any other metal surface of the vehicle. This will protect against a short circuit.

Always keep batteries out of reach of young children.

Jump Starting Procedure

1. Set the vehicle parking brake.
If the vehicle is equipped with an automatic transmission, place the selector level in the "PARK" position.
If the vehicle is equipped with a manual transmission, place the shift lever in the "NEUTRAL" position.
Turn "OFF" the ignition.
Turn "OFF" all lights and any other accessory requiring electrical power.
2. Look at the built-in hydrometer.
If the indication area of the built-in hydrometer is completely clear, do not try to jump start.
3. Attach the end of one jumper cable to the positive terminal of the booster battery.
Attach the other end of the same cable to the positive terminal of the discharged battery.
Do not allow the vehicles to touch each other. This will cause a ground connection, effectively neutralizing the charging procedure.
Be sure that the booster battery has a 12 volt rating.

6D1-4 ENGINE ELECTRICAL (6VD1 3.2L)

4. Attach one end of the remaining cable to the negative terminal of the booster battery.

Attach the other end of the same cable to a solid engine ground (such as the air conditioning compressor bracket or the generator mounting bracket) of the vehicle with the discharged battery.

The ground connection must be at least 450 mm (18 in.) from the battery of the vehicle whose battery is being charged.

WARNING: NEVER ATTACH THE END OF THE JUMPER CABLE DIRECTLY TO THE NEGATIVE TERMINAL OF THE DEAD BATTERY.

5. Start the engine of the vehicle with the good battery.
Make sure that all unnecessary electrical accessories have been turned "OFF".
6. Start the engine of the vehicle with the dead battery.
7. To remove the jumper cables, follow the above directions in reverse order.
Be sure to first disconnect the negative cable from the vehicle with the discharged battery.

Battery Removal

061RX002

1. Remove negative cable (1).
2. Remove positive cable (2).
3. Remove retainer screw and rods (3).
4. Remove retainer (4).
5. Remove battery (5).

Battery Installation

1. Install battery (5).
2. Install retainer (4).
3. Install retainer screw and rods (3).

NOTE: Make sure that the rod is hooked on the body side.

4. Install positive cable (2).
5. Install negative cable (1).

WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

6D2-2 IGNITION SYSTEM (6VD1 3.2L)

General Description

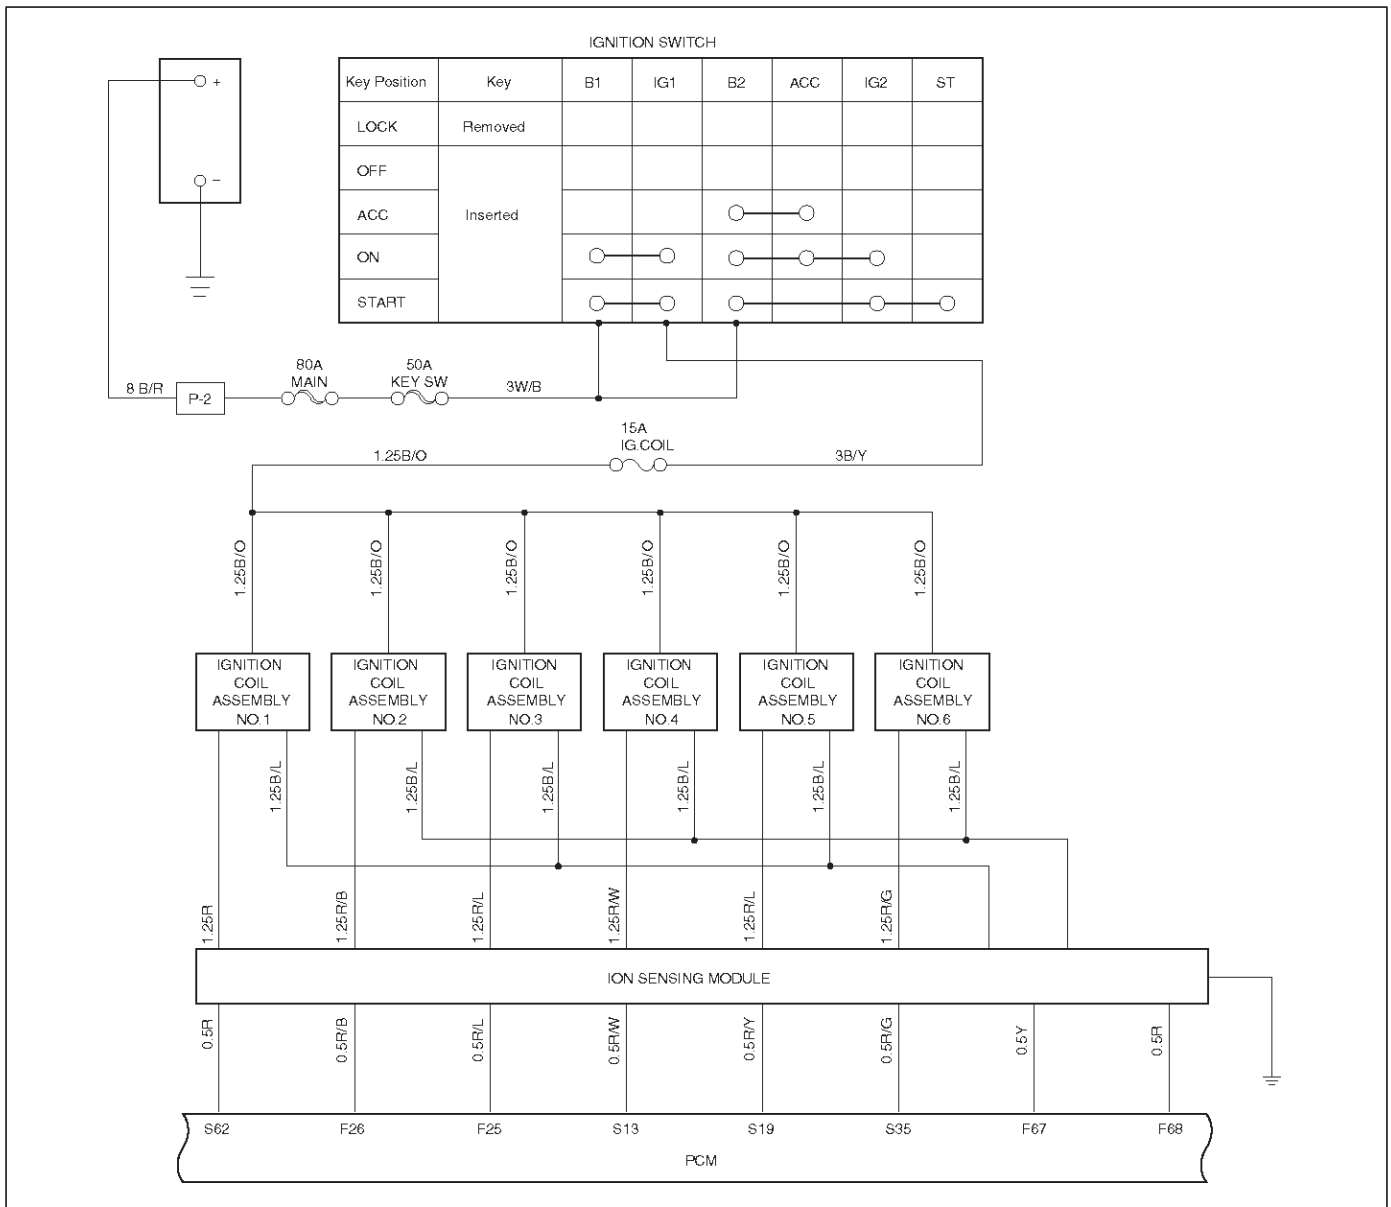

Ignition is done by the Electronic Ignition (EI) system that directly fire the spark plugs from ignition coils through spark plug wires without using a distributor. This firing order are selected No.1, No.2, No.3 No.4, No.5 and No.6. Since the cylinder on exhaust stroke requires less energy to fire its ignition plug, energy from the ignition coils can be utilized to fire the mating cylinder on compression stroke. After additional 360 degrees rotation, respective cylinder strokes are reversed.

The EI consists of six ignition coils, ION sensing module, crankshaft position sensor, power train control module (PCM) and other components.

The ignition coils are connected with the PCM through the ION sensing module.

The ION sensing module has the function to energize and de-energize the primary ignition coil in response to signals from the PCM. The PCM controls ignition timing and dwell time.

Further, the ION sensing module to monitoring Electronic Spark Timing (EST) signals.

D06RY00037

Diagnosis

Refer to Section Drivability and Emissions for the diagnosis to electronic ignition system (EI system).

Ignition Coil

Removal

1. Disconnect battery ground cable.
2. Ignition coil connector and ignition coil.
 - Disconnect three connector from ignition coil.
 - Remove harness bracket bolt on cylinder head cover.
 - Remove fixing bolts on ignition coil.

060R100116

Legend

- (1) Ignition Coil Connector
- (2) Bolt
- (3) Ignition Coil Assembly

Inspection and Repair

Check the ignition coil assembly for insulation. Check terminals for corrosion or damage, and replace as necessary.

Measuring resistance of ignition coil assembly.

Terminal No.	Limit
1 to 2	Without 0 ohm or infinity maximum ohm.
1 to 3	Same as above
2 to 3	Same as above

Measure resistance of ignition coil assembly, and replace the ignition coil assembly if its value exceeds the standard.

060RW006

Installation

1. Install the ignition coil assembly (3).
Connect ignition coil connector (1) and ignition coil (3), then tighten bolt (2) to the specified torque.

Torque: 4 N·m (0.4 kg·m/35 lb in)

060R100116

6D2-4 IGNITION SYSTEM (6VD1 3.2L)

CAUTION: Ignition coil assembly #6 is different from ignition coil assembly from #1 to #5. Ignition coil assembly #6 is short type. So, note it when installing ignition coil assembly of #6.

060R100117

Legend

- (1) Long type Ignition Coil Assemblies (#1 ~ #5)
- (2) Short type Ignition Coil Assembly (#6)

2. Connect battery ground cable.

Spark Plug

Inspection

Poor spark plug condition adversely affects engine performance. Carefully inspect each spark plug following the procedure outlined below.

1. Remove the spark plug.
2. Check the plug for dirt and other foreign material.
If the plug is extremely dirty, the fuel and electrical systems must be checked.
3. If necessary, clean the spark plugs by placing them in a spark plug cleaning machine for no more than 20 seconds.
4. Check the electrode and insulator for wear and/or cracking. If there is significant wear or cracking, the plug must be replaced.
5. Check the gasket for damage. Replace the gasket if necessary.
6. Measure the insulation resistance with a 500-volt megohm meter. Replace the plug if the resistance is less than the specified value.

Insulation resistance: 50 M Ω or more

011RS010

7. Check the spark plug gap. Replace the spark plug the if gap is not as specified.

Standard: 1.0–1.1 mm (0.04–0.043 in)

Limit: 1.3 mm (0.05 in)

011RS011

- Do not attempt to adjust the gap of an old spark plug. Replace the plug and adjust the gap of the new plug if required.
- Take care not to damage the spark plug tip during handling.

8. Tighten the spark plugs to the specified torque.

Torque: 18 N·m (13 lb ft)

Replacement spark plugs

- Under normal conditions (no problem with the fuel and/or electrical systems), use replacement spark plugs with a low heat value (hot-type plug).
- If insulator and electrode scorching is significant, use replacement spark plugs with a high heat value (cold-type plug).

Crankshaft Position Sensor

Removal

1. Disconnect battery ground cable
2. Wiring connector from crankshaft angle sensor.
3. Remove crankshaft angle sensor from cylinder block.

Installation

1. Install crankshaft angle sensor into the cylinder block.
Before installation, apply small amount of engine oil to the O-ring.

Torque: 10 N·m (1.0 kg·m/87 lb in)

2. Reconnect wiring connector to crankshaft position sensor.

WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Starting System

General Description

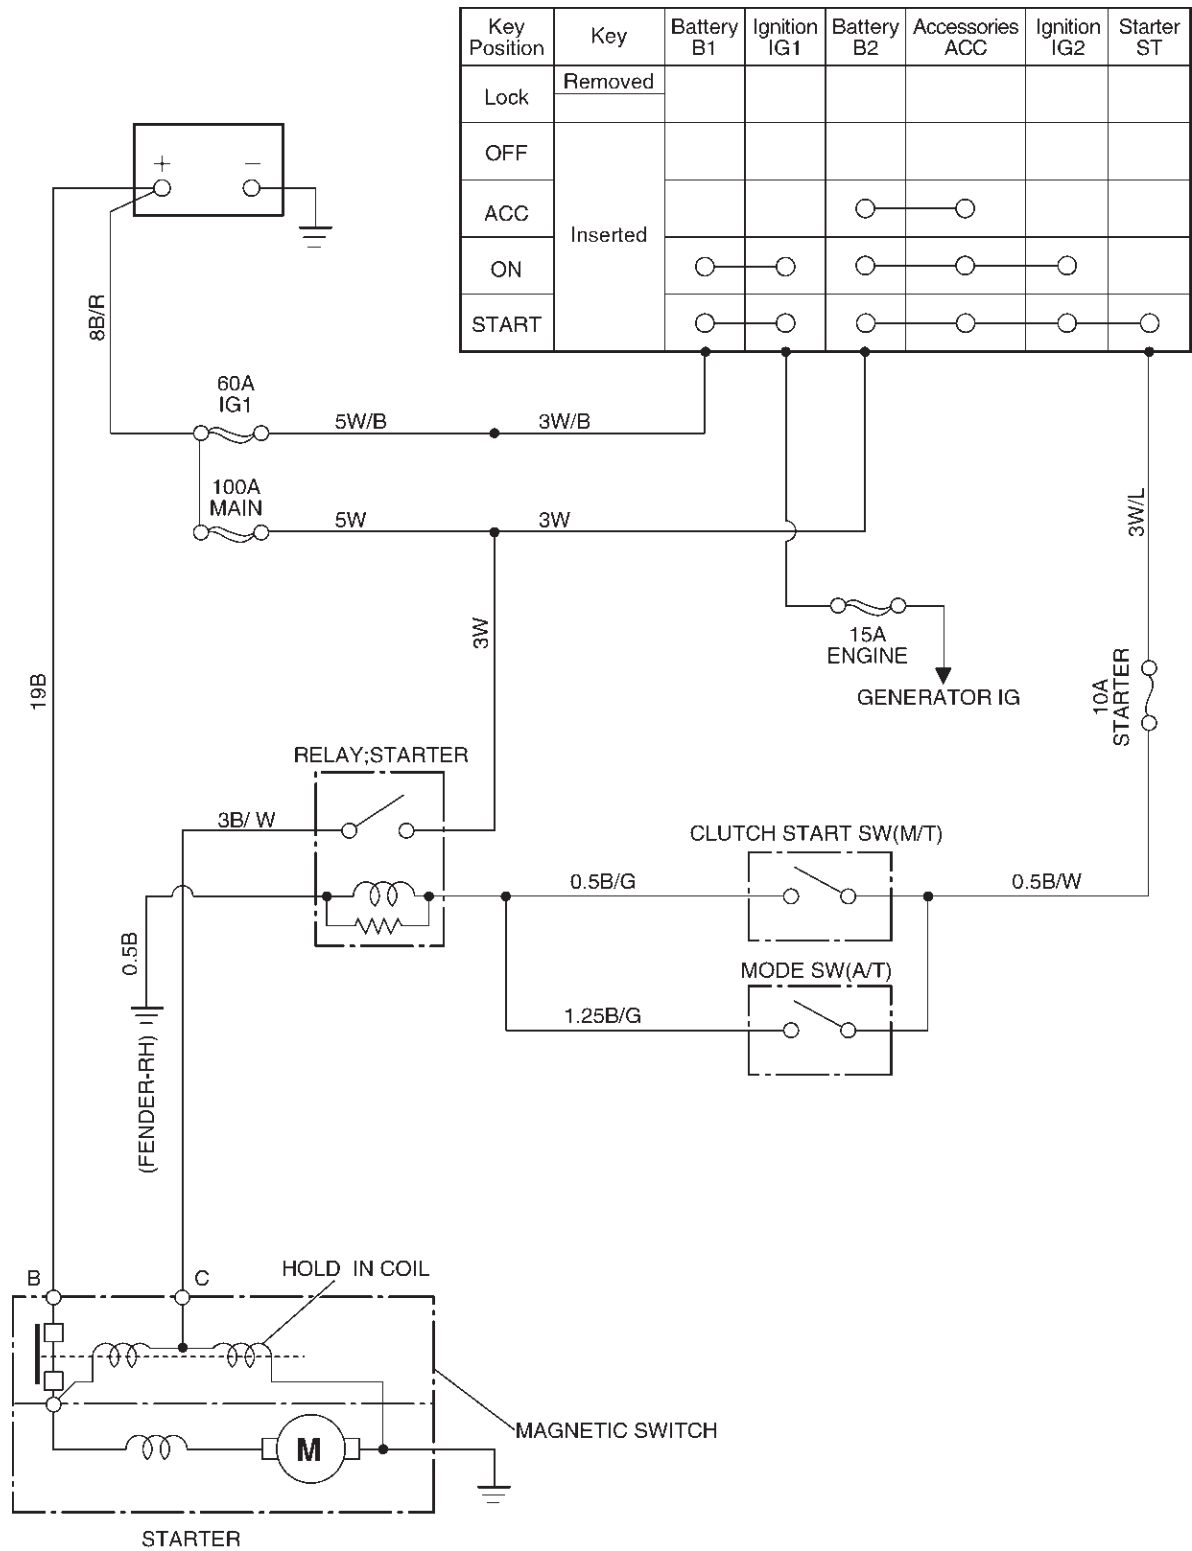

Cranking Circuit

The cranking system consists of a battery, starter, starter switch, starter relay, etc. These main components are connected.

Starter

The cranking system employs a magnetic type reduction starter in which the motor shaft is also used as a pinion shaft. When the starter switch is turned on, the contacts of magnetic switch are closed, and the armature rotates. At the same time, the plunger is attracted, and the pinion is pushed forward by the shift lever to mesh with the ring gear.

Then, the ring gear runs to start the engine. When the engine starts and the starter switch is turned off, the plunger returns, the pinion is disengaged from the ring gear, and the armature stops rotation. When the engine speed is higher than the pinion, the pinion idles, so that the armature is not driven.

Diagnosis

Condition	Possible cause	Correction
Starter does not run	Charging failure	Repair charging system
	Battery Failure	Replace Battery
	Terminal connection failure	Repair or replace terminal connector and/or wiring harness
	Starter switch failure	Repair or replace starter switch
	Starter failure	Repair or replace starter

Starter

Removal

1. Battery ground cable.
2. Disconnect heated oxygen (O₂) sensor connector (1).
3. Remove exhaust front left pipe(2).

4. Remove heat protector(3).
5. Disconnect starter wiring connector from terminals "B" and "S"(4).
6. Remove starter assembly mounting bolts on inside and outside(5).
7. Remove starter assembly toward the bottom of engine(6).

Installation

1. Install starter assembly(6).

2. Install mounting bolts and tighten bolts to specified torque(5).

Torque: 40 N-m (4.1 kg-m/30 lb ft)

3. Reconnect the connectors to terminals "B" and "S" and tighten Terminals "B" to specified torque.

Torque: 9 N-m (0.9 kg-m/78 lb in)

4. Install heat protector(3).

5. Install exhaust front left pipe and tighten bolts and nuts to specified torque(2).

Stud Nuts

Torque: 67 N-m (6.8 kg-m/49 lb ft)

Nuts

Torque: 43 N-m (4.4 kg-m/32 lb ft)

6. Connect O₂ sensor connector (2).

7. Reconnect the battery ground cable.

| (12) E-Ring | (25) Screw (2 pcs) |
| (13) Thrust Washer (2) | (26) Through Bolt (2 pcs) |

Disassembly

1. Loosen the nut(1) on terminal "M" of magnetic switch and disconnect the connector cable.
2. Remove bolt (2 pcs) (2).

3. Remove magnetic switch(5).
4. Remove dust cover(4).
5. Remove torsion spring bolts, then the magnetic switch assembly.
6. Remove torsion spring(3) from magnetic switch assembly(5).

7. Remove screw (2 pcs) (8).
8. Remove through bolt (2 pcs) (7).

9. Remove screws and through bolts, then the rear cover(9) then remove thrust washer(10).
10. Remove brush holder(6).

11. Raise a brush spring to detach brushes (4 pcs) from the commutator face and pull off the brush holder(12) and brush(11).

12. Remove yoke assembly(14).
13. Remove armature(15).
14. Pull off the yoke assembly, then remove armature, washer and center bracket.(A) (13).

6D3-8 STARTING AND CHARGING SYSTEM (6VD1 3.2L)

NOTE: In disassembling the yoke assembly, hold the armature and pull off slowly the yoke assembly. Because of strong magnetic force, avoid placing a metallic part near armature.

15. Remove dust cover(17).

16. Remove a dust cover and shift lever(16) from the gear case.

17. Remove ball bearing(19).

18. Remove bearing cover(20).

19. Remove a ball bearing and bearing cover from the gear case(18).

20. Internal gear(21).

21. Remove internal gear and planet gear(3) (22).

22. Remove an E-ring(23) from the pinion shaft using a flat blade screwdriver.

23. Holding the pinion shaft, push pinion toward the center bracket, and turn the pinion clockwise or counterclockwise by one tooth of spline, then pull off the pinion.

24. Remove thrust washer(24).

25. Remove center bracket

26. Remove pinion shaft.

Inspection and Repair

Repair or replace necessary parts if extreme wear or damage is found during inspection.

Armature

Measure the outer diameter of commutator, and replace with a new one if it is out of the limit.

Standard: 33.0 mm (1.30 in)

Limit: 32.0 mm (1.26 in)

Check for continuity between commutator and segment. Replace commutator if there is no continuity (i.e., disconnected).

6D3-10 STARTING AND CHARGING SYSTEM (6VD1 3.2L)

Check for continuity between commutator and shaft. Also, check for continuity between commutator and armature core, armature core and shaft. Replace commutator if there is continuity (i.e., internally grounded).

065RS016

Measure runout of armature core and commutator with a dial gauge. Repair or replace, if it exceeds the limit.

Armature

Standard: 0.05 mm (0.002 in) Max.

Limit: 0.10 mm (0.004 in)

Commutator

Standard: 0.05 mm (0.002 in) Max.

Limit: 0.10 mm (0.004 in)

065RS017

Polish the commutator surface with sandpaper #500 to #600 if it is rough.

065RW012

Measure the depth of insulator in commutator. Repair, if it is below the limit.

Standard: 0.05 mm to 0.8 mm (0.02 in to 0.03 in)

Limit: 0.2 mm (0.008 in)

065RW013

Legend

- (1) Steel Saw
- (2) Insulator
- (3) Commutator Segments

Brush

Measure the length of brush.
 Replace with a new one, if it is below the limit.

Standard: 16 mm (0.63 in)

Limit: 11 mm (0.43 in)

065RW014

Brush Holder

Check for continuity between brush holder (+) (4) and base (-). Replace, if there is continuity (i.e., insulation is broken).

065RW015

Magnetic Switch

Check for continuity of shunt coil between terminals S and M.

Replace, if there is no continuity (i.e., coil is disconnected).

065RW016

Continuity of Series Coil

Check for continuity between terminals S and M.

Replace, if there is no continuity (i.e., coil is disconnected).

065RW017

6D3-12 STARTING AND CHARGING SYSTEM (6VD1 3.2L)

Continuity of Contacts

With the plunger faced downward, push down the magnetic switch. In this state, check for continuity between terminals B and M. Replace, if there is no continuity (i.e., contacts are faulty).

Pinion

Check if the pinion rotates smoothly in drive direction by hand, or if it is locked when it is rotated in reverse. If not, replace the pinion.

Yoke Assembly

Check a magnet inside the yoke. Replace the yoke assembly if it is broken.

Ball Bearing

Clamp the inner race of the ball bearing with your finger, and check for sticking or play when rotating the outer race.

Replace, if abnormality is found.

Measure inner diameter of bushing in the rear cover, and replace if it exceeds the limit.

Standard: 12.50 mm to 12.527 mm (0.492 in to 0.4932 in)

Limit: 12.60 mm (0.4961 in)

065RS028

Measure inner diameter of bushing in the center bracket (P), and replace if it exceeds the limit.

Standard: 18.01 mm to 18.127 mm (0.7091 in to 0.7137 in)

Limit: 18.15 mm (0.7146 in)

065RS029

Reassembly

To install, follow the removal steps in the reverse order, noting the following points:

Grease application places

- Bushing in rear cover and center bracket
- Gears in reduction gear
- Shift lever operating portion
- Sliding portion of pinion
- Plunger sliding portion of magnetic switch

Reassembling Yoke Assembly

Before reassembly, make sure that no metallic parts attach to the yoke assembly. Because of strong magnetic force, hold the yoke assembly and insert it slowly into the armature.

Torque

Torque for each part (See Torque Specifications in this section)

Pinion Jump-out Dimension

Connect the “+” cable of battery to terminal S and the “-” cable to terminal M. Turn the switch on, and measure pinion travel dimension in thrust direction from the jump-out position.

In measuring the dimension, pull the pinion out a little in the arrow direction.

Dimension(L): 0.05 mm to 1.5 mm (0.002 in to 0.06 in)

065RS030

6D3-14 STARTING AND CHARGING SYSTEM (6VD1 3.2L)

If the measured value is out of standard, insert dust cover, or disassemble and adjust.

065RW019

Characteristic Test

For easily confirming the characteristics, conduct the no load test as follows:

Rating as short as 30 seconds requires rapid testing.

Fix the starter on the test bench, and wire as shown in illustration. When the switch is closed, the current flows and the starter runs under no load. At this time, measure current, voltage and speed to check if they satisfy the standard.

065RW020

Charging System

General Description

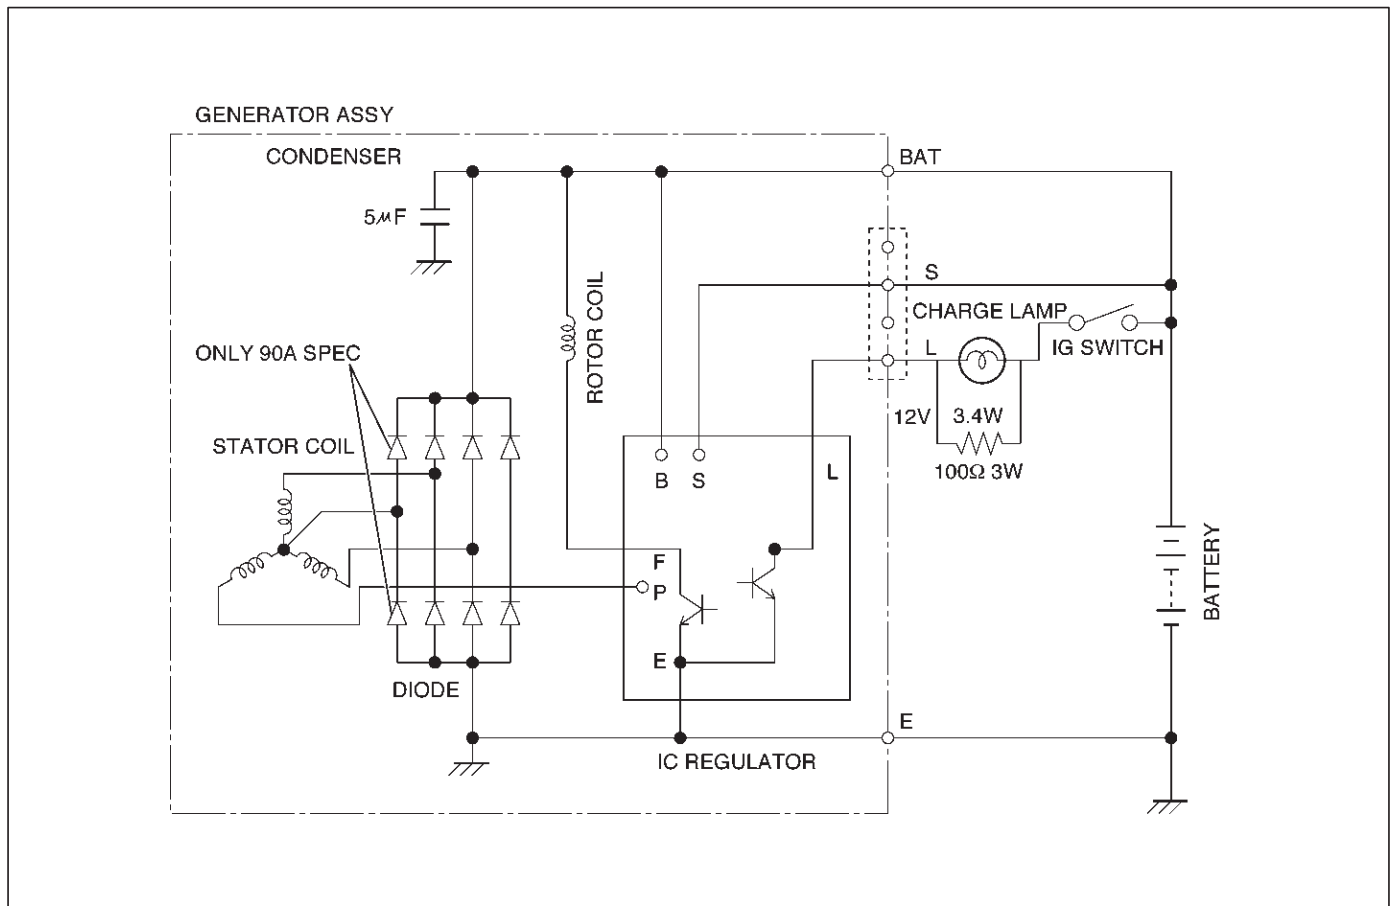

The IC integral regulator charging system and its main components are connected as shown in illustration.

The regulator is a solid state type and it is mounted along with the brush holder assembly inside the generator installed on the rear end cover.

The generator does not require particular maintenance such as voltage adjustment.

The rectifier connected to the stator coil has diodes to transform AC voltage into DC voltage.

This DC voltage is connected to the output terminal of generator.

General On-Vehicle Inspection

A basic wiring diagram is shown in the illustration. When operating normally, the indicator bulb will come on when the switch is turned on, and will then go out when the engine starts. If the indicator operates abnormally, or if an undercharged or overcharged battery condition occurs, the following procedure may be used to diagnose the charging system. Remember that an undercharged battery is often caused by accessories being left on overnight, or by a defective switch which allows a bulb, such as a trunk or glove box light, to stay on.

OBSERVE THE FOLLOWING PROCEDURE:

1. Visually check belt and wiring.
2. Go to step 5. for vehicles without charge indicator light.
3. Switch on, engine stopped, light should be on. If not, detach harness at generator, ground "L" terminal lead.
 - a. Lamp lights, replace or repair generator.
 - b. Lamp dose not light, locate open circuit between grounding lead and ignition switch. Bulb may be open.
4. Switch on, engine running at moderate speed. Light should be off. If not, detach wiring harness at generator.
 - a. If light goes off, replace or repair generator.
 - b. If light stays on, check for grounded "L" terminal wire in harness.
5. Battery undercharged or overcharged.
 - a. Detach wiring harness connector from generator.
 - b. With switch on, engine not running connect voltmeter from ground to "L" terminal in wiring harness, and to "IG" terminal. If used. Wiring harness may connect to either "L" or "IG" or both.
 - c. Zero reading indicates open circuit between terminal and battery. Connect as required.

- d. Re-connect harness connector to generator, run engine at moderate speed, with electrical accessories turned off.
 - e. Measure voltage across battery. If above 16.0V, replace or repair generator.
 - f. Connect ammeter at generator output terminal. Turn on accessories, load battery with carbon pile to obtain maximum amperes output. Maintain voltage at 13.0V or above.
1. If within 15 amperes of rated output, generator is OK.
 2. If not within 15 amperes of rated output, replace or repair generator.

Generator

Removal

1. Disconnect battery ground cable.
2. Move drive belt tensioner to loose side using wrench then remove drive belt (1).
3. Disconnect the wire from terminal "B" and disconnect the connector (4).
4. Remove generator fixing bolt (3).
5. Remove generator assembly (2).

Inspection

1. Disconnect the wiring connector from generator.
2. With the engine stopped, turn starter switch to "on" and connect a voltmeter between connector terminal L (1) and ground or between terminal IG (2) and ground.

If voltage is not present, the line between battery and connector is disconnected and so requires repair.

3. Reconnect the wiring connector to the generator, run the engine at middle speed, and turn off all electrical devices other than engine.
4. Measure battery voltage. If it exceeds 16V, repair or replace the generator.
5. Connect an ammeter to output terminal of generator, and measure output current under load by turning on the other electrical devices (eg., headlights). At this time the amperes must not be less than 15A and the voltage must not be less than 13V.

6D3-20 STARTING AND CHARGING SYSTEM (6VD1 3.2L)

Installation

1. Install generator assembly to the position.
2. Install generator assembly and tighten the fixing bolts to the specified torque.

Torque:

M10 bolt: 41 N·m (4.2 kg·m/30 lb ft)

M8 bolt: 21 N·m (2.1 kg·m/15 lb ft)

3. Connect wiring harness connector and direct terminal "B".
4. Move drive belt tensioner to loose side using wrench, then install drive belt to normal position.
5. Reconnect battery ground cable.

Disassembled View

Legend

| (3) Front Cover Assembly | (9) Rear Cover Assembly |
| (4) Rotor Assembly | (10) Rectifier |
| (5) Stator Assembly | (11) Brush Holder Assembly |
| (6) Through Bolt | (12) Regulator Assembly |

Disassembly

1. Remove the through bolt.

Insert the tip of a pry bar into the gaps between the front cover and the stator core.

Pry apart and separate the front cover, rotor, the rear cover and stator.

NOTE: Take care not to scratch or otherwise damage the stator coil with pry bar.

F06RT021

2. Clamp the rotor in a vise and then remove the nut and pulley.

3. Remove the rotor assembly from front cover.

F06RT022

4. Remove screws with bearing retainer from front cover and remove bearing.

F06RT023

5. Remove the mounting nuts holding the "B" terminal, the diode, and the brush holder.

6. Separate the rear cover from the stator.

F06RT024

6D3-22 STARTING AND CHARGING SYSTEM (6VD1 3.2L)

7. Remove bolts which secure stator terminal to rectifier terminal, and remove stator.

066RS030

8. Remove Bolts which secure regulator, rectifier and brush-holder, and separate these parts.

NOTE: Do not apply a shock or load to regulator, rectifier and brush holder.

066RW025

Inspection and Repair

Repair or replace necessary parts if extreme wear or damage is found during inspection.

Rotor Assembly

1. Check the face of the slip rings for contamination and roughness. If found to be scored, dress with a fine sandpaper (#500 –600). If found to be contaminated, clean with a cloth saturated with alcohol.
2. Measure the outside diameter of the slip rings.

Standard: 27mm (1.06in)

Limit: 26mm (1.02in)

066RS032

3. Check resistance between slip rings, and replace if there is no continuity.

Standard: 3.75Ω or less

066RS033

4. Check for continuity between slip ring and rotor core. In case of continuity, replace the rotor assembly.

066RS017

2. Check for continuity across one of the stator coils and stator core. If a continuity exists, replace the coil.

Standard: More than 1MΩ

066RS035

Stator Coil

1. Check for continuity across the stator coils. If no continuity exists, replace the coils.

Resistance value at 20°C.

Standard: Approx. 0.07Ω

066RS034

Brush

Measure the brush length.

If more than limit, replace the brush.

Standard: 18.0mm (0.709in)

Limit: 5.5mm (0.217in)

066RW024

Rectifier Assembly

1. Measure the resistance between each diode terminal and aluminum diode fin in forward and reverse directions with the connection of the tester leads switched. The diodes are normal if resistance is nearly zero ohms in one direction and is infinitely high in the other direction.
2. If a diode has no resistance or equal resistance in both directions, it is defective and should be replaced together with the holder.

066RS036

066RX005

IC Regulator Assembly

Connect a variable resistor, two 12V batteries, a fixed resistor, and a voltmeter to the IC regulator as shown in illustration.

- a. Measuring equipment specifications
 1. Fixed resistor (R1) : 10 Ohms /3W
 2. Variable resistor (Rv) : 0-300 Ohms/12W
 3. Batteries (BAT1, BAT2) : 12V (2 Batteries)
 4. DC voltmeter : 0-50V/0.5 steps (4 Check points)
- b. Measuring procedure
 1. Measure the voltage "V1" across the first battery (BAT1). If the reading is between 10 and 13 volts, the battery is normal.
 2. Measure the voltage "V3" across both the batteries (BAT1, BAT2). If the reading is between 20 and 26 volts, the batteries are normal.
 3. Gradually increase the resistance of the variable resistor from zero. Measure the voltage "V2" (the voltage across the F and E terminals).

Check to see that the voltage across "V1" changes at this time. If there is no change, the voltage regulator is faulty and must be replaced.

4. Measure the voltage at "V4" (the voltage across the variable resistor center tap and terminal E with the variable resistor resistance held constant). The measure voltage should be within the specified (14.4±0.3 volts) limits. If it is not, the regulator must be replaced.

Reassembly

To reassemble, follow the disassembly steps in the reverse order, noting the following points:

NOTE:

- Never make battery connections with polarities reversed, or battery will be shorted via the diodes. This will cause damage to the diodes.
- Do not connect generator B terminal to ground; it is connected directly to the battery. This cable will burn if it is connected to ground.
- Make sure to disconnect the positive (+) terminal of the battery when quick-charging battery. Diodes may be damaged due to abnormal pulse voltage generated by the quick charger.
- When reassembling the front section to rear section, insert a stiff wire into hole in the rear face of the rear cover from the outboard side to support the brush in raised position, then insert the front section to which rotor is assembled.
- Reassemble parts carefully to be sure they fit into their original position, paying attention to the insulated portions.
- Wipe insulating tubes, washers and plates clean and install them in position carefully to avoid getting oil or grease on them.

- Using a press with a socket wrench attached, reassemble rotor and rear end cover assembly in the front cover.

066RS022

- Install pulley on the rotor.

Secure the pulley directly in the vise between two copper plates, and tighten nut to the specified torque.

Torque: 111 N·m (11.3 kg·m/82 lb ft)

066RS010

Bench Test

Conduct a bench test of the generator.

066RS023

Preparation

Remove generator from the vehicle (see "Generator removal").

- Secure generator to the bench test equipment and connect wires.
Terminal "IG" for energization
Terminal "L" for neutral (warning lamp)
Terminal "B" for output
- Conduct the generator characteristic test.
Characteristics of generator are shown in illustration.
Repair or replace the generator if its outputs are abnormal.

066RX001

Diagnosis

Strategy-Based Diagnostics

Strategy-Based Diagnostics

The strategy-based diagnostic is a uniform approach to repair all Electrical/Electronic (E/E) systems. The diagnostic flow can always be used to resolve an E/E system problem and is a starting point when repairs are necessary. The following steps will instruct the technician how to proceed with a diagnosis:

1. Verify the customer complaint.
 - To verify the customer complaint, the technician should know the normal operation of the system.
2. Perform preliminary checks.
 - Conduct a thorough visual inspection.
 - Review the service history.
 - Detect unusual sounds or odors.
 - Gather diagnostic trouble code information to achieve an effective repair.
3. Check bulletins and other service information.
 - This includes videos, newsletters, etc.
4. Refer to service information (manual) system check(s).
 - "System checks" contain information on a system that may not be supported by one or more DTCs. System checks verify proper operation of the system. This will lead the technician in an organized approach to diagnostics.
5. Refer to service diagnostics.

DTC Stored

Follow the designated DTC chart exactly to make an effective repair.

No DTC

Select the symptom from the symptom tables. Follow the diagnostic paths or suggestions to complete the repair. You may refer to the applicable component/system check in the system checks.

No Matching Symptom

1. Analyze the complaint.
2. Develop a plan for diagnostics.
3. Utilize the wiring diagrams and the theory of operation.

Combine technician knowledge with efficient use of the available service information.

Intermittents

Conditions that are not always present are called intermittents. To resolve intermittents, perform the following steps:

1. Observe history DTCs, DTC modes, and freeze frame data.
2. Evaluate the symptoms and the conditions described by the customer.

3. Use a check sheet or other method to identify the circuit or electrical system component.
4. Follow the suggestions for intermittent diagnosis found in the service documentation.

Most Scan Tools, such as the Tech 2, have data-capturing capabilities that can assist in detecting intermittents.

No Trouble Found

This condition exists when the vehicle is found to operate normally. The condition described by the customer may be normal. Verify the customer complaint against another vehicle that is operating normally. The condition may be intermittent. Verify the complaint under the conditions described by the customer before releasing the vehicle.

1. Re-examine the complaint.

When the complaint cannot be successfully found or isolated, a re-evaluation is necessary. The complaint should be re-verified and could be intermittent as defined in *Intermittents* section, or could be normal.
2. Repair and verify.

After isolating the cause, the repairs should be made. Validate for proper operation and verify that the symptom has been corrected. This may involve road testing or other methods to verify that the complaint has been resolved under the following conditions:

 - Conditions noted by the customer.
 - If a DTC was diagnosed, verify a repair by duplicating conditions present when the DTC was set as noted in the Failure Records or Freeze Frame data.

Verifying Vehicle Repair

Verification of the vehicle repair will be more comprehensive for vehicles with OBD system diagnostics. Following a repair, the technician should perform the following steps:

IMPORTANT: Follow the steps below when you verify repairs on OBD systems. Failure to follow these steps could result in unnecessary repairs.

1. Review and record the Failure Records and the Freeze Frame data for the DTC which has been diagnosed (Freeze Frame data will only be stored for an A or B type diagnostic and only if the MIL ("Check Engine" lamp) has been requested).
2. Clear the DTC(S).
3. Operate the vehicle within conditions noted in the Failure Records and Freeze Frame data.
4. Monitor the DTC status information for the DTC which has been diagnosed until the diagnostic test associated with that DTC runs.

General Service Information

OBD Serviceability Issues

With the introduction of OBD diagnostics across the entire passenger car and light-duty truck market in 1996, illumination of the MIL ("Check Engine" lamp) due to a non-vehicle fault could lead to misdiagnosis of the vehicle, increased warranty expense and customer

dissatisfaction. The following list of non-vehicle faults does not include every possible fault and may not apply equally to all product lines.

Fuel Quality

Fuel quality is not a new issue for the automotive industry, but its potential for turning on the MIL (“Check Engine” lamp) with OBD systems is new.

Fuel additives such as “dry gas” and “octane enhancers” may affect the performance of the fuel. If this results in an incomplete combustion or a partial burn, it will show up as a Misfire DTC P0300. The Reid Vapor Pressure of the fuel can also create problems in the fuel system, especially during the spring and fall months when severe ambient temperature swings occur. A high Reid Vapor Pressure could show up as a Fuel Trim DTC due to excessive canister loading. High vapor pressures generated in the fuel tank can also affect the Evaporative Emission diagnostic as well.

Using fuel with the wrong octane rating for the vehicle may cause drivability problems. Many of the major fuel companies advertise that using “premium” gasoline will improve the performance of the vehicle. Most premium fuels use alcohol to increase the octane rating of the fuel. Although alcohol-enhanced fuels may raise the octane rating, the fuel’s ability to turn into vapor in cold temperatures deteriorates. This may affect the starting ability and cold drivability of the engine.

Low fuel levels can lead to fuel starvation, lean engine operation, and eventually engine misfire.

Non-OEM Parts

All of the OBD diagnostics have been calibrated to run with OEM parts. Something as simple as a high-performance exhaust system that affects exhaust system back pressure could potentially interfere with the operation of the EGR valve and thereby turn on the MIL (“Check Engine” lamp). Small leaks in the exhaust system near the post catalyst oxygen sensor can also cause the MIL (“Check Engine” lamp) to turn on.

Aftermarket electronics, such as transceivers, stereos, and anti-theft devices, may radiate EMI into the control system if they are improperly installed. This may cause a false sensor reading and turn on the MIL (“Check Engine” lamp).

Environment

Temporary environmental conditions, such as localized flooding, will have an effect on the vehicle ignition system. If the ignition system is rain-soaked, it can temporarily cause engine misfire and turn on the MIL (“Check Engine” lamp).

Vehicle Marshaling

The transportation of new vehicles from the assembly plant to the dealership can involve as many as 60 key cycles within 2 to 3 miles of driving. This type of operation contributes to the fuel fouling of the spark plugs and will turn on the MIL (“Check Engine” lamp) with a P0300 Misfire DTC.

Poor Vehicle Maintenance

The sensitivity of OBD diagnostics will cause the MIL (“Check Engine” lamp) to turn on if the vehicle is not maintained properly. Restricted air filters, fuel filters, and crankcase deposits due to lack of oil changes or improper oil viscosity can trigger actual vehicle faults that were not previously monitored prior to OBD. Poor vehicle maintenance can’t be classified as a “non-vehicle fault”, but with the sensitivity of OBD diagnostics, vehicle maintenance schedules must be more closely followed.

Related System Faults

Many of the OBD system diagnostics will not run if the PCM detects a fault on a related system or component. One example would be that if the PCM detected a Misfire fault, the diagnostics on the catalytic converter would be suspended until Misfire fault was repaired. If the Misfire fault was severe enough, the catalytic converter could be damaged due to overheating and would never set a Catalyst DTC until the Misfire fault was repaired and the Catalyst diagnostic was allowed to run to completion. If this happens, the customer may have to make two trips to the dealership in order to repair the vehicle.

Visual / Physical Engine Compartment Inspection

Perform a careful visual and physical engine compartment inspection when performing any diagnostic procedure or diagnosing the cause of an emission test failure. This can often lead to repairing a problem without further steps. Use the following guidelines when performing a visual/physical inspection:

- Inspect all vacuum hoses for pinches, cuts, disconnections, and proper routing.
- Inspect hoses that are difficult to see behind other components.
- Inspect all wires in the engine compartment for proper connections, burned or chafed spots, pinched wires, contact with sharp edges or contact with hot exhaust manifolds or pipes.

Basic Knowledge of Tools Required

NOTE: Lack of basic knowledge of this powertrain when performing diagnostic procedures could result in an incorrect diagnosis or damage to powertrain components. Do not attempt to diagnose a powertrain problem without this basic knowledge.

A basic understanding of hand tools is necessary to effectively use this section of the Service Manual.

Serial Data Communications

Class 2 Serial Data Communications

Government regulations require that all vehicle manufacturers establish a common communication system. This vehicle utilizes the “Class 2” communication system. Each bit of information can have one of two lengths: long or short. This allows vehicle wiring to be reduced by transmitting and receiving multiple signals over a single wire. The messages carried on Class 2 data

streams are also prioritized. If two messages attempt to establish communications on the data line at the same time, only the message with higher priority will continue. The device with the lower priority message must wait. The most significant result of this regulation is that it provides Scan tool manufacturers with the capability to access data from any make or model vehicle that is sold. The data displayed on other Scan tools will appear the same, with some exceptions. Some Scan tools will only be able to display certain vehicle parameters as values that are a coded representation of the true or actual value. On this vehicle the Scan tool displays the actual values for vehicle parameters. It will not be necessary to perform any conversions from coded values to actual values.

On-Board Diagnostic (OBD)

On-Board Diagnostic Tests

A diagnostic test is a series of steps, the result of which is a pass or fail reported to the diagnostic executive. When a diagnostic test reports a pass result, the diagnostic executive records the following data:

- The diagnostic test has been completed since the last ignition cycle.
- The diagnostic test has passed during the current ignition cycle.
- The fault identified by the diagnostic test is not currently active.

When a diagnostic test reports a fail result, the diagnostic executive records the following data:

- The diagnostic test has been completed since the last ignition cycle.
- The fault identified by the diagnostic test is currently active.
- The fault has been active during this ignition cycle.
- The operating conditions at the time of the failure.

Remember, a fuel trim DTC may be triggered by a list of vehicle faults. Make use of all information available (other DTCs stored, rich or lean condition, etc.) when diagnosing a fuel trim fault.

Comprehensive Component Monitor Diagnostic Operation

Comprehensive component monitoring diagnostics are required to monitor emissions-related input and output powertrain components. The *OBD Comprehensive Component Monitoring List Of Components Intended To illuminate MIL* is a list of components, features or functions that could fall under this requirement.

Input Components:

Input components are monitored for circuit continuity and out-of-range values. This includes rationality checking. Rationality checking refers to indicating a fault when the signal from a sensor does not seem reasonable, i.e. Throttle Position (TP) sensor that indicates high throttle position at low engine loads or MAP voltage. Input components may include, but are not limited to the following sensors:

- Vehicle Speed Sensor (VSS)
- Crankshaft Position (CKP) sensor
- Throttle Position (TP) sensor
- Engine Coolant Temperature (ECT) sensor
- Manifold Absolute Pressure (MAP) sensor
- Mass Air Flow (MAF) sensor

In addition to the circuit continuity and rationality check, the ECT sensor is monitored for its ability to achieve a steady state temperature to enable closed loop fuel control.

Output Components:

Output components are diagnosed for proper response to control module commands. Components where functional monitoring is not feasible will be monitored for circuit continuity and out-of-range values if applicable.

Output components to be monitored include, but are not limited to, the following circuits:

- Control module controlled EVAP Canister Purge Valve
- Electronic Transmission controls
- A/C relays
- VSS output
- MIL control

Refer to PCM and Sensors in General Descriptions.

Passive and Active Diagnostic Tests

A passive test is a diagnostic test which simply monitors a vehicle system or component. Conversely, an active test, actually takes some sort of action when performing diagnostic functions, often in response to a failed passive test. For example, the EGR diagnostic active test will force the EGR valve open during closed throttle decel. Either action should result in a change in manifold pressure.

Intrusive Diagnostic Tests

This is any on-board test run by the Diagnostic Management System which may have an effect on vehicle performance or emission levels.

Warm-Up Cycle

A warm-up cycle means that engine at temperature must reach a minimum of 70°C (160°F) and rise at least 22°C (40°F) over the course of a trip.

Freeze Frame

Freeze Frame is an element of the Diagnostic Management System which stores various vehicle information at the moment an emissions-related fault is stored in memory and when the MIL is commanded on. These data can help to identify the cause of a fault. Refer to *Storing And Erasing Freeze Frame Data* in this section for more detailed information.

Failure Records

Failure Records data is an enhancement of the OBD II Freeze Frame feature. Failure Records store the same vehicle information as does Freeze Frame, but it will store that information for any fault which is stored in on-board memory, while Freeze Frame stores information only for emission-related faults that command the MIL on.

Enable Criteria

The term “enable criteria” is engineering language for the conditions necessary for a given diagnostic test to run. Each diagnostic has a specific list of conditions which must be met before the diagnostic will run. “Enable criteria” is another way of saying “conditions required”.

The enable criteria for each diagnostic is listed on the first page of the DTC description in Section 6E under the heading “Conditions for Setting the DTC”. Enable criteria varies with each diagnostic, and typically includes, but is not limited to the following items:

- engine speed
- vehicle speed
- ECT
- MAF/MAP
- barometric pressure
- IAT
- TP
- high canister purge
- fuel trim
- TCC enabled
- A/C on

Trip

Technically, a trip is a key on-run-key off cycle in which all the enable criteria for a given diagnostic are met, allowing the diagnostic to run. Unfortunately, this concept is not quite that simple. A trip is official when all the enable criteria for a given diagnostic are met. But because the enable criteria vary from one diagnostic to another, the definition of trip varies as well. Some diagnostics are run when the vehicle is at operating temperature, some when the vehicle first starts up; some require that the vehicle be cruising at a steady highway speed, some run only when the vehicle is idle; some diagnostics function with the TCC disabled. Some run only immediately following a cold engine start-up.

A trip then, is defined as a key on-run-key off cycle in which the vehicle was operated in such a way as to satisfy the enabling criteria for a given diagnostic, and this diagnostic will consider this cycle to be one trip. However, another diagnostic with a different set of enable criteria (which were not met) during this driving event, would not consider it a trip. No trip will occur for that particular diagnostic until the vehicle is driven in such a way as to meet all the enable criteria.

The Diagnostic Executive

The Diagnostic Executive is a unique segment of software which is designed to coordinate and prioritize the diagnostic procedures as well as define the protocol for recording and displaying their results. The main responsibilities of the Diagnostic Executive are listed as the following:

- Commanding the MIL (“Check Engine” lamp) on and off
- DTC logging and clearing
- Freeze Frame data for the first emission related DTC recorded
- Non-emission related Service Lamp

- Operating conditions Failure Records buffer, (the number of records will vary)
- Current status information on each diagnostic
- System Status (I/M ready)

The Diagnostic Executive records DTCs and turns on the MIL when emission-related faults occur. It can also turn off the MIL if the conditions cease which caused the DTC to set.

Diagnostic Information

The diagnostic charts and functional checks are designed to locate a faulty circuit or component through a process of logical decisions. The charts are prepared with the requirement that the vehicle functioned correctly at the time of assembly and that there are no multiple faults present.

There is a continuous self-diagnosis on certain control functions. This diagnostic capability is complemented by the diagnostic procedures contained in this manual. The language of communicating the source of the malfunction is a system of diagnostic trouble codes. When a malfunction is detected by the control module, a diagnostic trouble code is set and the Malfunction Indicator Lamp (MIL) (“Check Engine” lamp) is illuminated.

Malfunction Indicator Lamp (MIL)

The Malfunction Indicator Lamp (MIL) looks the same as the MIL you are already familiar with (“Check Engine” lamp). However, OBD requires that it illuminate under a strict set of guide lines.

Basically, the MIL is turned on when the PCM detects a DTC that will impact vehicle emissions.

The MIL is under the control of the Diagnostic Executive. The MIL will be turned on if an emissions-related diagnostic test indicates a malfunction has occurred. It will stay on until the system or component passes the same test, for three consecutive trips, with no emissions related faults.

Extinguishing the MIL

When the MIL is on, the Diagnostic Executive will turn off the MIL after *three(3) consecutive* trips that a “test passed” has been reported for the diagnostic test that originally caused the MIL to illuminate.

Although the MIL has been turned off, the DTC will remain in the PCM memory (both Freeze Frame and Failure Records) until *forty(40) warm-up cycles after no faults* have been completed.

If the MIL was set by either a fuel trim or misfire-related DTC, additional requirements must be met. In addition to the requirements stated in the previous paragraph, these requirements are as follows:

- The diagnostic tests that are passed must occur within 375 RPM of the RPM data stored at the time the last test failed.
- Plus or minus ten (10) percent of the engine load that was stored at the time the last failed.
- Similar engine temperature conditions (warmed up or warming up) as those stored at the time the last test failed.

Meeting these requirements ensures that the fault which turned on the MIL has been corrected.

The MIL (“Check Engine” lamp) is on the instrument panel and has the following function:

- It informs the driver that a fault affects vehicle emission levels has occurred and that the vehicle should be taken for service as soon as possible.
- As a bulb and system check, the MIL will come “ON” with the key “ON” and the engine not running. When the engine is started, the MIL will turn “OFF.”
- When the MIL remains “ON” while the engine is running, or when a malfunction is suspected due to a derivability or emissions problem, a Powertrain On-Board Diagnostic System Check must be performed. The procedures for these checks are given in On-Board Diagnostic (OBD) System Check. These checks will expose faults which may not be detected if other diagnostics are performed first.

DTC Types

Each DTC is directly related to a diagnostic test. The Diagnostic Management System sets DTC based on the failure of the tests during a trip or trips. Certain tests must fail two (2) consecutive trips before the DTC is set. The following are the four (4) types of DTCs and the characteristics of those codes:

- Type A
 - Emissions related
 - Requests illumination of the MIL of the first trip with a fail
 - Stores a History DTC on the first trip with a fail
 - Stores a Freeze Frame (if empty)
 - Stores a Fail Record
 - Updates the Fail Record each time the diagnostic test fails
- Type B
 - Emissions related
 - “Armed” after one (1) trip with a fail
 - “Disarmed” after one (1) trip with a pass
 - Requests illumination of the MIL on the *second consecutive trip* with a fail
 - Stores a History DTC on the second consecutive trip with a fail (The DTC will be armed after the first fail)
 - Stores a Freeze Frame on the second consecutive trip with a fail (if empty)
 - Stores a Fail Record when the first test fails (not dependent on *consecutive trip* fails)
 - Updates the Fail Record each time the diagnostic test fails

(Some special conditions apply to misfire and fuel trim DTCs)

- Type C (if the vehicle is so equipped)
 - Non-Emissions related
 - Requests illumination of the Service Lamp
 - Stores a History DTC on the *first trip* with a fail
 - *Does not* store a Freeze Frame
 - Stores Fail Record when test fails
 - Updates the Fail Record each time the diagnostic test fails
- Type D

- Non-Emissions related
- Not request illumination of any lamp
- Stores a History DTC on the *first trip* with a fail
- *Does not* store a Freeze Frame
- Stores Fail Record when test fails
- Updates the Fail Record each time the diagnostic test fails

IMPORTANT: Only four Fail Records can be stored. Each Fail Record is for a different DTC. It is possible that there will not be Fail Records for every DTC if multiple DTCs are set.

Special Cases of Type B Diagnostic Tests

Unique to the misfire diagnostic, the Diagnostic Executive has the capability of alerting the vehicle operator to potentially damaging levels of misfire. If a misfire condition exists that could potentially damage the catalytic converter as a result of high misfire levels, the Diagnostic Executive will command the MIL to “flash” at a rate of once per second during those the time that the catalyst damaging misfire condition is present.

Fuel trim and misfire are special cases of *Type B* diagnostics. Each time a fuel trim or misfire malfunction is detected, engine load, engine speed, and engine coolant temperature are recorded.

When the ignition is turned off, the last reported set of conditions remain stored. During subsequent ignition cycles, the stored conditions are used as reference for similar conditions. If a malfunction occurs during two consecutive trips, the Diagnostic Executive treats the failure as a normal *Type B* diagnostic, and does not use the stored conditions. However, if a malfunction occurs on two non-consecutive trips, the stored conditions are compared with the current conditions. The MIL will then illuminate under the following conditions:

- When the engine load conditions are within 10% of the previous test that failed.
- Engine speed is within 375 rpm, of the previous test that failed.
- Engine coolant temperature is in the same range as the previous test that failed.

Storing and Erasing Freeze Frame Data and Failure Records

Government regulations require that engine operating conditions be captured whenever the MIL is illuminated. The data captured is called Freeze Frame data. The Freeze Frame data is very similar to a single record of operating conditions. Whenever the MIL is illuminated, the corresponding record of operating conditions is recorded to the Freeze Frame buffer.

Freeze Frame data can only be overwritten with data associated with a misfire or fuel trim malfunction. Data from these faults take precedence over data associated with any other fault. The Freeze Frame data will not be erased unless the associated history DTC is cleared.

Each time a diagnostic test reports a failure, the current engine operating conditions are recorded in the *Failure Records* buffer. A subsequent failure will update the recorded operating conditions. The following operating conditions for the diagnostic test which failed *typically* include the following parameters:

- Air Fuel Ratio
- Air Flow Rate
- Fuel Trim
- Engine Speed
- Engine Load
- Engine Coolant Temperature
- Vehicle Speed
- TP Angle
- MAP/BARO
- Injector Base Pulse Width
- Loop Status

Intermittent Malfunction Indicator Lamp

In the case of an “intermittent” fault, the MIL (“Check Engine” lamp) may illuminate and then (after three trips) go “OFF”. However, the corresponding diagnostic trouble code will be stored in memory. When unexpected diagnostic trouble codes appear, check for an intermittent malfunction.

A diagnostic trouble code may reset. Consult the “Diagnostic Aids” associated with the diagnostic trouble code. A physical inspection of the applicable sub-system most often will resolve the problem.

Data Link Connector (DLC)

The provision for communication with the control module is the Data Link Connector (DLC). It is located at the lower left of the instrument panel behind a small square cover. The DLC is used to connect to the Tech 2 Scan Tool. Some common uses of the Tech 2 are listed below:

- Identifying stored Diagnostic Trouble Codes (DTCs).
- Clearing DTCs.
- Performing output control tests.
- Reading serial data.

TS24064

Decimal/Binary/Hexadecimal Conversions

Beginning in 1996, Federal Regulations require that all auto manufacturers selling vehicles in the United States provide Scan Tool manufacturers with software information to display vehicle operating parameters. All

Scan Tool manufacturers will display a variety of vehicle information which will aid in repairing the vehicle. Some Scan Tools will display encoded messages which will aid in determining the nature of the concern. The method of encoding involves the use of a two additional numbering systems: Binary and Hexadecimal.

The binary number system has a base of two numbers. Each digit is either a 0 or a 1. A binary number is an eight digit number and is read from right to left. Each digit has a position number with the farthest right being the 0 position and the farthest left being the 7 position. The 0 position, when displayed by a 1, indicates 1 in decimal. Each position to the left is double the previous position and added to any other position values marked as a 1.

A hexadecimal system is composed of 16 different alpha numeric characters. The alpha numeric characters used are numbers 0 through 9 and letters A through F. The hexadecimal system is the most natural and common approach for Scan Tool manufacturers to display data represented by binary numbers and digital code.

Verifying Vehicle Repair

Verification of vehicle repair will be more comprehensive for vehicles with OBD II system diagnostic. Following a repair, the technician should perform the following steps:

1. Review and record the Fail Records and/or Freeze Frame data for the DTC which has been diagnosed (Freeze Frame data will only be stored for an A or B type diagnostic and only if the MIL has been requested).
2. Clear DTC(s).
3. Operate the vehicle within conditions noted in the Fail Records and/or Freeze Frame data.
4. Monitor the DTC status information for the DTC which has been diagnosed until the diagnostic test associated with that DTC runs.

Following these steps are very important in verifying repairs on OBD II systems. Failure to follow these steps could result in unnecessary repairs.

Reading Diagnostic Trouble Codes Using The Tech 2 Scan Tool

The procedure for reading diagnostic trouble code(s) is to use a diagnostic Scan Tool. When reading DTC(s), follow instructions supplied by tool manufacturer.

Clearing Diagnostic Trouble Codes

IMPORTANT: Do not clear DTCs unless directed to do so by the service information provided for each diagnostic procedure. When DTCs are cleared, the Freeze Frame and Failure Record data which may help diagnose an intermittent fault will also be erased from memory.

If the fault that caused the DTC to be stored into memory has been corrected, the Diagnostic Executive will begin to count the “warm-up” cycles with no further faults detected, the DTC will automatically be cleared from the PCM memory.

To clear Diagnostic Trouble Codes (DTCs), use the diagnostic Scan Tool “clear DTCs” or “clear information” function. When clearing DTCs follow instructions supplied by the tool manufacturer.

When a Scan Tool is not available, DTCs can also be cleared by disconnecting *one* of the following sources for at least thirty (30) seconds.

NOTE: To prevent system damage, the ignition key must be "OFF" when disconnecting or reconnecting battery power.

- The power source to the control module. Examples: fuse, pigtail at battery PCM connectors, etc.
- The negative battery cable. (Disconnecting the negative battery cable will result in the loss of other on-board memory data, such as preset radio tuning).

Tech 2

From 98 MY, Isuzu dealer service departments are recommended to use the Tech 2 Scan Tool. Please refer to the Tech 2 user guide.

Legend

- | | |
|--------------------------------|-----------------------|
| (1) PCMCIA Card | (3) SAE 16/19 Adapter |
| (2) RS 232 Loop Back Connector | (4) DLC Cable |
| | (5) Tech-2 |

Tech 2 Features

1. Tech 2 is a 12 volt system. Do not apply 24 volts.
2. After connecting and/or installing the Vehicle Communications Interface (VCI) module, PCMCIA card and DLC connector to the Tech 2, connect the tool to the vehicle DLC.
3. Make sure the Tech 2 is OFF when removing or installing the PCMCIA card.
4. The PCMCIA card has a capacity of 10 Megabytes which is 10 times greater than the memory of the Tech 1 Mass Storage Cartridge.
5. The Tech 2 has the capability of two snapshots.
6. The PCMCIA card is sensitive to magnetism and static electricity, so care should be taken in the handling of the card.
7. The Tech 2 can plot a graph when replaying a snapshot.
8. Always return to the Main Menu by pressing the EXIT key several times before shutting down.
9. To clear Diagnostic Trouble Codes (DTCs), open Application Menu and press "F1: Clear DTC Info".

Getting Started

- Before operating the Isuzu PCMCIA card with the Tech 2, the following steps must be performed:
 1. Insert the Isuzu system PCMCIA card (1) into the Tech 2 (5).
 2. Connect the SAE 16/19 adapter (3) to the DLC cable (4).
 3. Connect the DLC cable to the Tech 2 (5)
 4. Make sure the vehicle ignition is off.
 5. Connect the Tech 2 SAE 16/19 adapter to the vehicle DLC.

810RW317

6. Turn on the vehicle ignition.

7. Power the Tech 2 ON and verify the Tech 2 power up display.

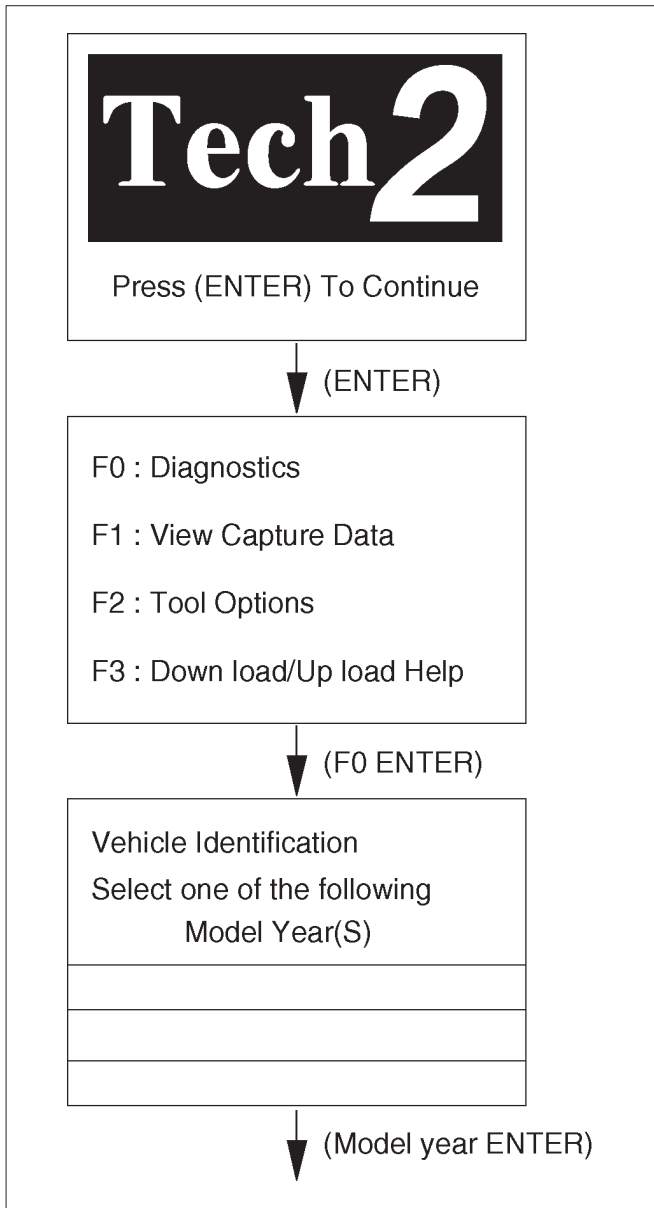

060RW009

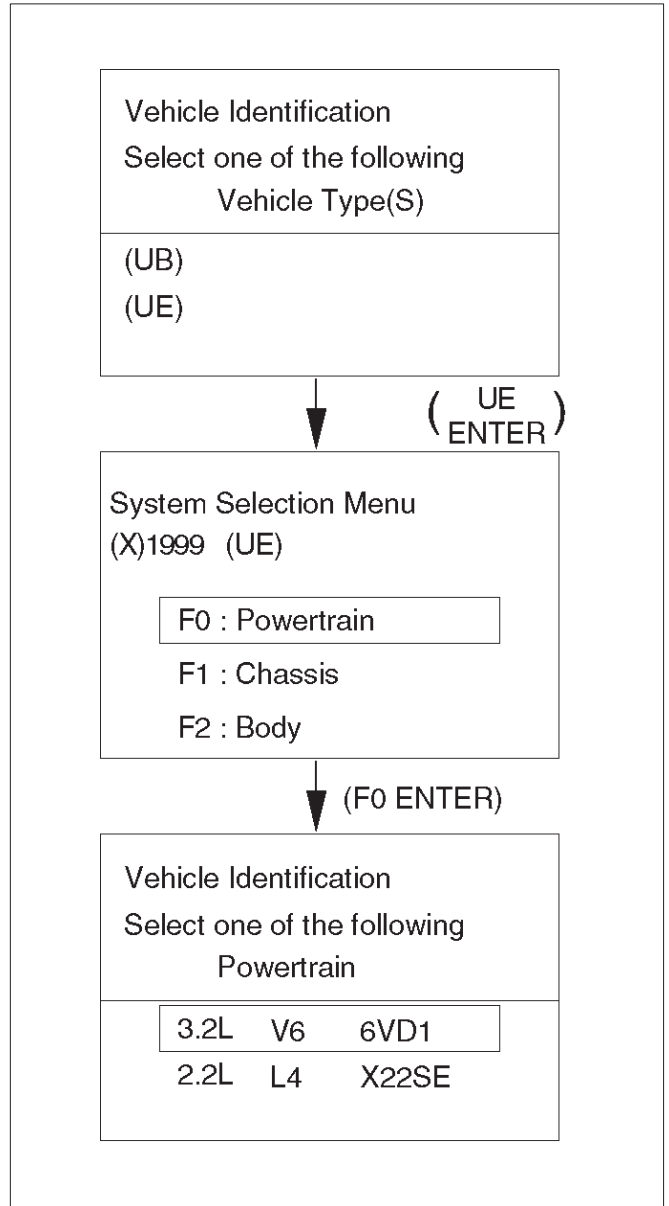

NOTE: The RS232 Loop back connector is only to use for diagnosis of Tech 2. Refer to user guide of the Tech 2.

Operating Procedure (For Example)

The power up screen is displayed when you power up the tester with the Isuzu systems PCMCIA card. Follow the operating procedure below.

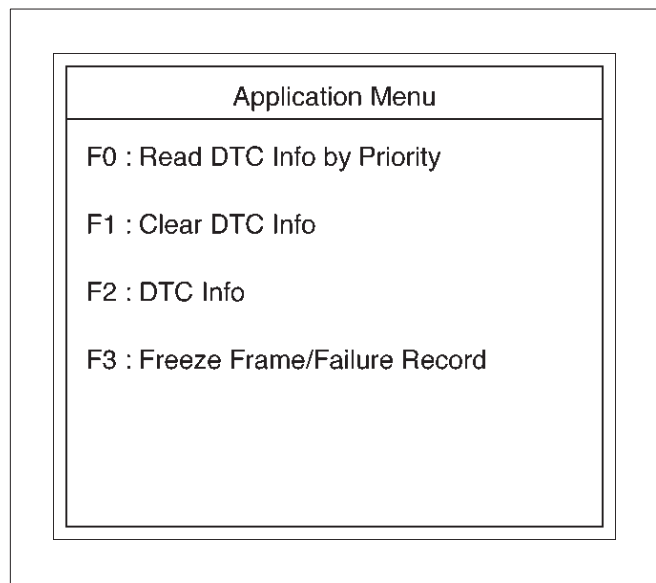

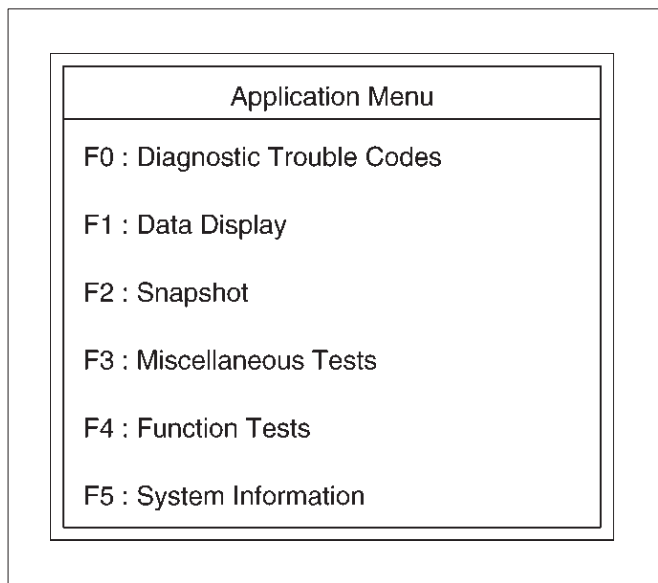

060R100102

060RX086

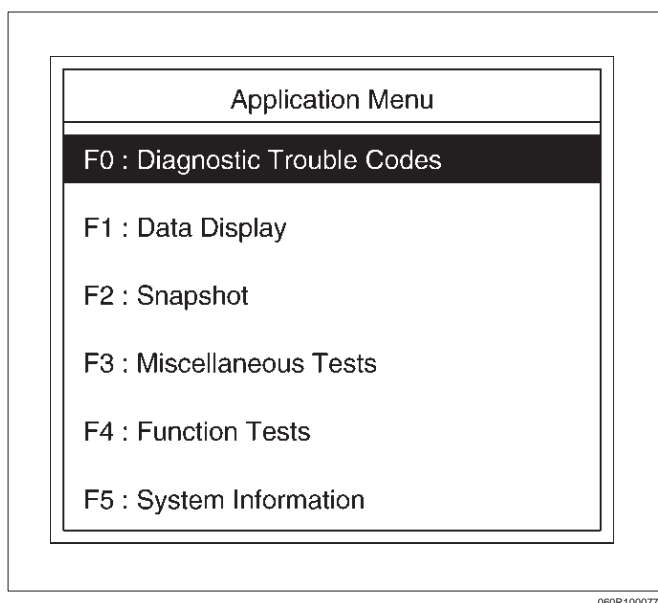

Menu

- The following table shows which functions are used for the available equipment versions.

The following is a brief description of each of the sub menus in DTC Info and DTC. The order in which they appear here is alphabetical and not necessarily the way they will appear on the Tech 2.

DTC Modes

On OBD vehicles there are options available in Tech 2 DTC mode to display the enhanced information available. After selecting DTC, the following menu appears:

1. Read DTC Info by Priority
2. Freeze Frame
3. Fail Records (not all applications)
4. DTC Info
5. Clear Info

DTC Information Mode

Use the DTC info mode to search for a specific type of stored DTC information.

DTC Status

This selection will display any DTCs that have not run during the current ignition cycle or have reported a test failure during this ignition up to DTCs. DTC tests which run and pass will cause that DTC number to be removed from Tech 2 screen.

Fail This Ignition

This selection will display all DTCs that have failed during the present ignition cycle.

History

This selection will display only DTCs that are stored in the PCM's history memory. It will display all type A and B DTCs that have requested the MIL and have failed within the last 40 warm-up cycles. In addition, it will display all type C and type D DTCs that have failed within the last 40 warm-up cycles.

Last Test Failed

This selection will display only DTCs that have failed the last time the test run. The last test may have run during a previous ignition cycle if a type A or type B DTC is displayed. For type C and type D DTCs, the last failure must have occurred during the current ignition cycle to appear as Last Test Fail.

MILSVC or Message Request

This selection will display only DTCs that are requesting the MIL. Type C and type D DTCs cannot be displayed using this option. This selection will report type B DTCs only after the MIL has been requested.

Not Run Since Code Cleared

This option will display up to DTCs that have not run since the DTCs were last cleared. Since any displayed DTCs have not run, their condition (passing or failing) is unknown.

Test Failed Since Code Cleared

This selection will display all active and history DTCs that have reported a test failure since the last time DTCs were cleared. DTCs that last failed more than 40 warm-up cycles before this option is selected will not be displayed.

Miscellaneous Test

This test consists of eight menus-Lights, Relays, EVAP, Fuel System, Instruments, EGR Control, Variable Intake Manifold Solenoid, and Injector Balance Tests.

In these tests, Tech 2 sends operating signals to the systems to confirm their operations thereby to judge the normality of electric circuits.

To judge intermittent trouble,

1. Confirm DTC freeze frame data, and match the freeze frame data as test conditions with the data list displayed by Miscellaneous Test.
2. Confirm DTC setting conditions, and match the setting conditions as test conditions with the data list displayed by Miscellaneous Test.
3. Refer to the latest Service Bulletin.
Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM.

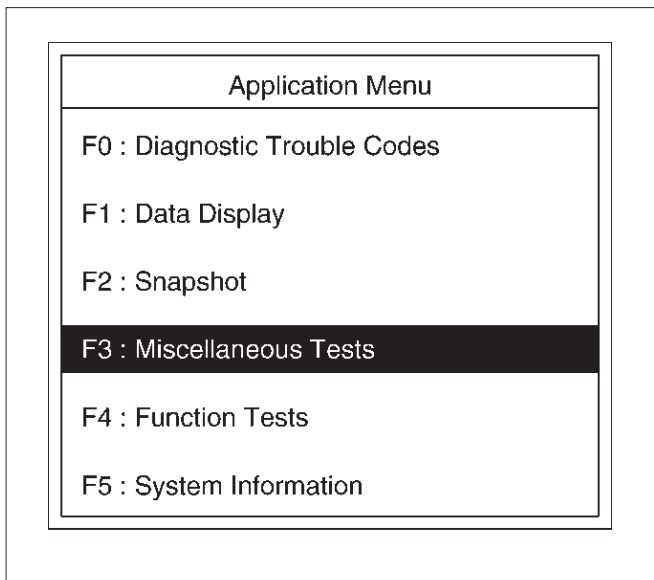

Lamps Test

This test is conducted check MIL, Up Shift Lamp, Low Fuel Lamp, Reduced Power Lamp and Cruise Control Lamp for its working.

Tech2 must be used for this test.

Test Procedure:

1. Connect Tech 2 to the vehicle DLC.
2. Run the Engine at idle.
3. Select F3: Miscellaneous Test in the Application Menu.

060R100078

4. Select F0:Lamps Test in the Miscellaneous Test.

060RY00080

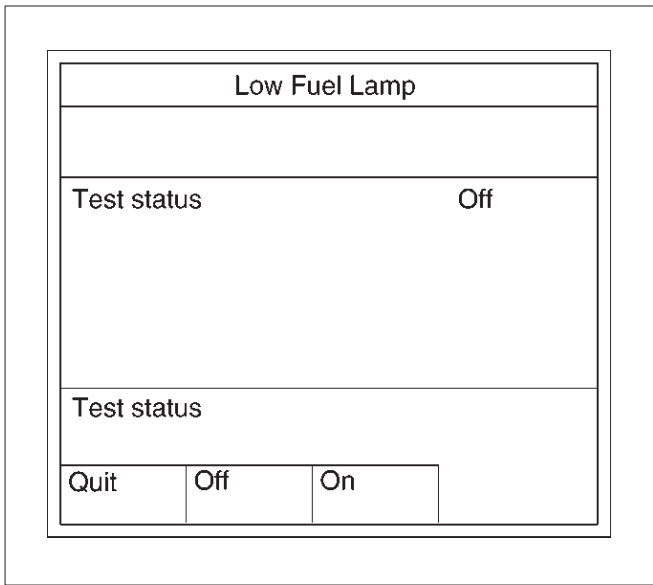

5. Select F0:Malfunction Indicator Lamp.

060RY00091

6. Push "On" soft key.
7. Make sure Lamp illuminates.
8. If lamp illuminates, the Lamp is operating correctly.

9. Select F2:Low Fuel Lamp

- 10. Push "On" soft key.
- 11. Make sure Lamp illuminates.
- 12. If Lamp illuminates, the Lamp is operating correctly.
- 13. Select F3:Reduced Power Lamp

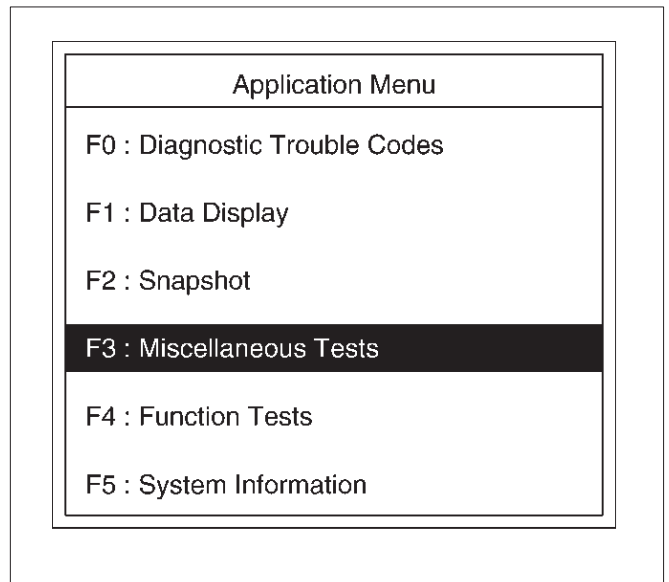

- 14. Push "On" soft key.
- 15. Make sure Lamp illuminates.
- 16. If Lamp illuminates, the Lamp is operating correctly.

Relays Test

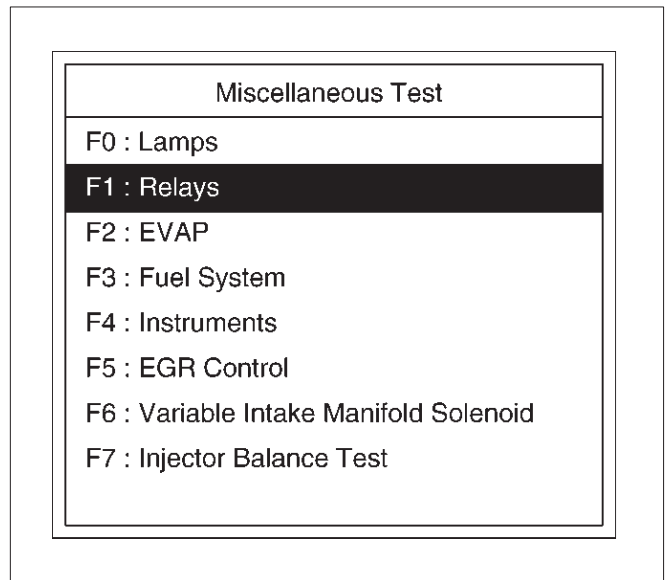

This test is conducted to check Fuel Pump Relay and A/C Clutch for proper operation. Tech 2 must be used for this test.

Test Procedure:

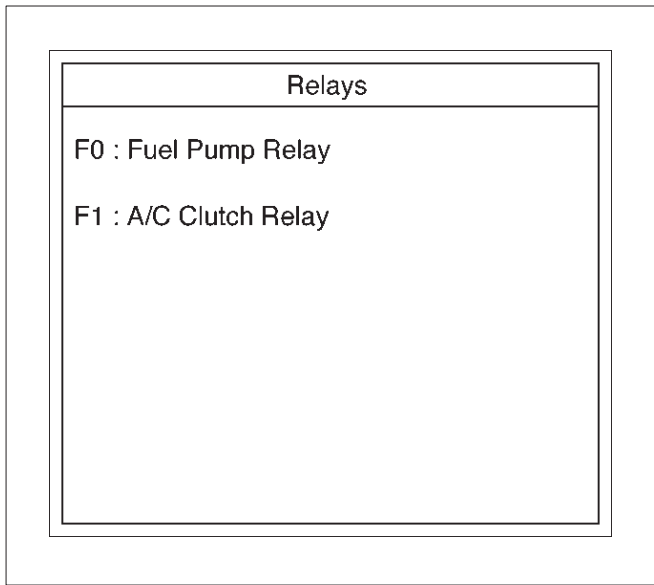

1. Connect Tech 2 to the vehicle DLC.
2. Ignition SW is "On".
3. Select F3: Miscellaneous Test in the Application Menu.

4. Select F1:Relay Test in the Miscellaneous Test.

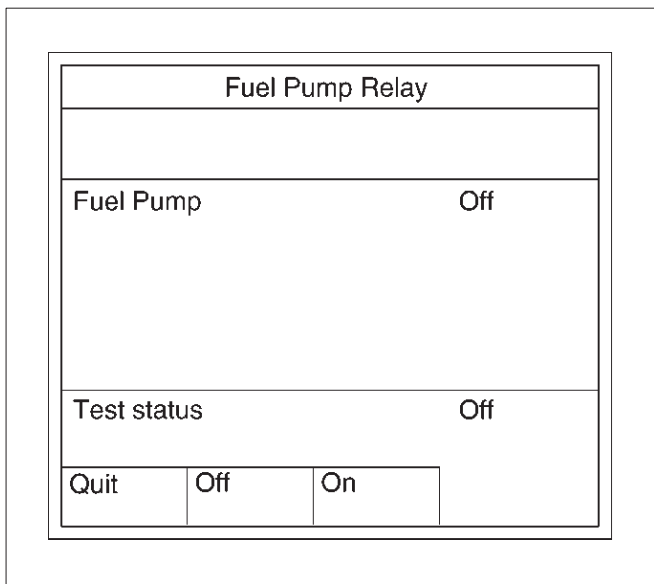

5. Select F0:Fuel Pump Relay.

060RX021

6. Push "On" soft key.

060RY0093

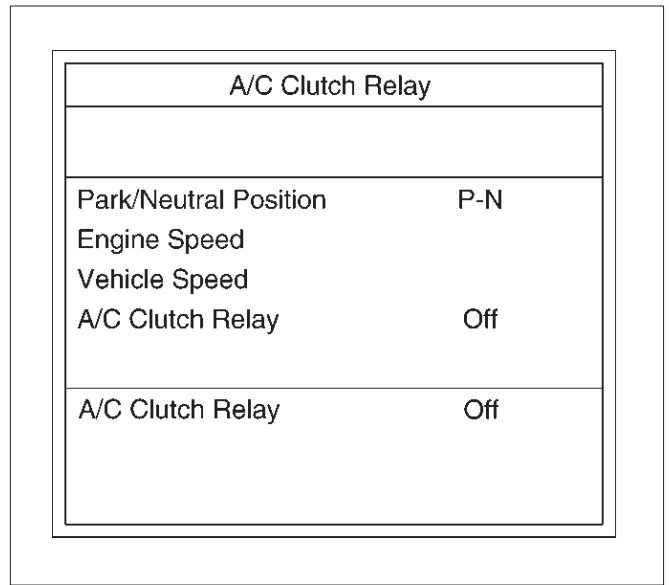

7. Control Fuel Pump Relay and check data list.

8. If the data list changes, the Fuel Pump Relay is normal.

9. Select F1:A/C Clutch Relay.

10. Run the Engine at idle.

11. Turn on Air Conditioning.

060RY00094

12. Turn "On" and "Off" A/C Switch.

13. Control A/C Clutch Relay and check data list.

14. If the data list changes, the Fuel Pump Relay is normal.

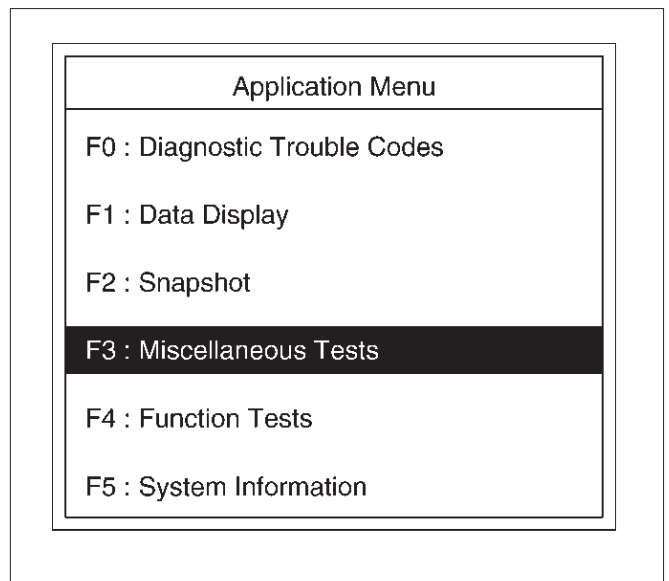

EVAP Test

This test is conducted to check EVAP system for its power operation.

Tech 2 must be used for this test.

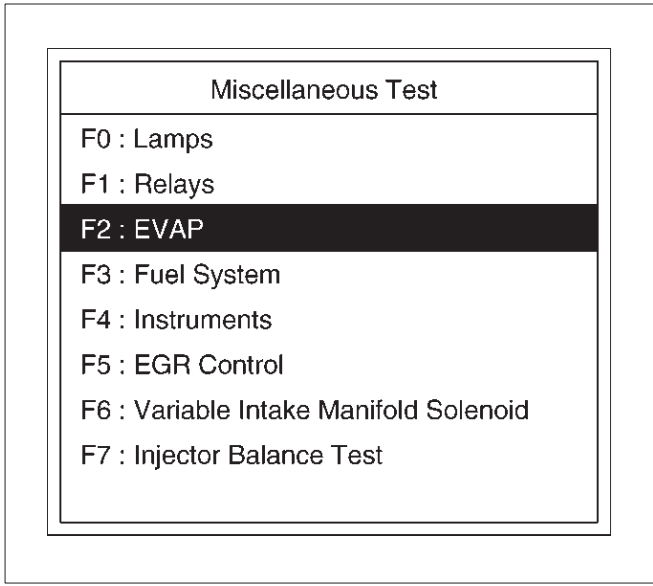

Test Procedure:

1. Connect Tech 2 to the vehicle DLC.
2. Run the Engine at idle.
3. Select F3: Miscellaneous Test in the Application Menu.

060R100078

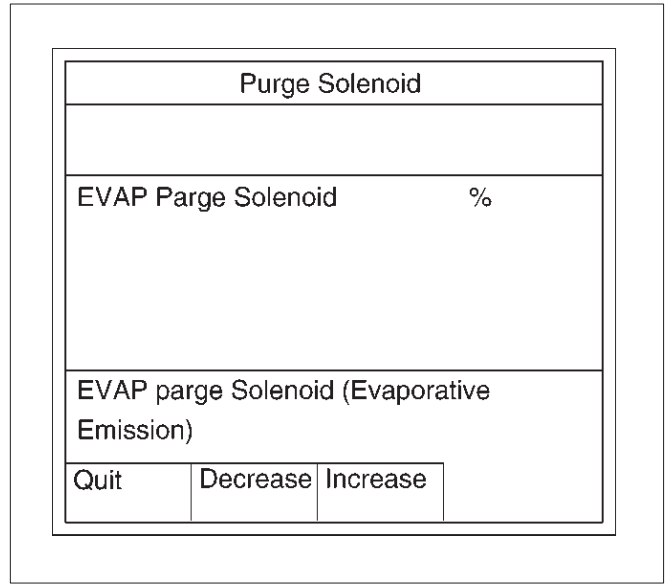

4. Select F2: EVAP Test in the Miscellaneous Test.

5. Select F0: Purge Solenoid.

6. Push "Decrease" or "Increase" soft key.

- 7. Control EVAP Purge Solenoid and check a data list.
- 8. If the data list changes, the Purge Solenoid is normal.
- 9. Turn engine off, turn ignition SW "On".

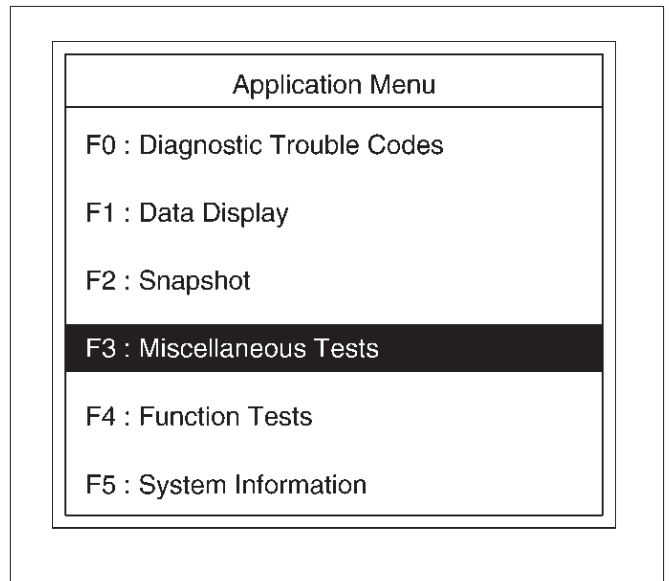

Fuel System Test

This test is conducted check Fuel system for proper operation.

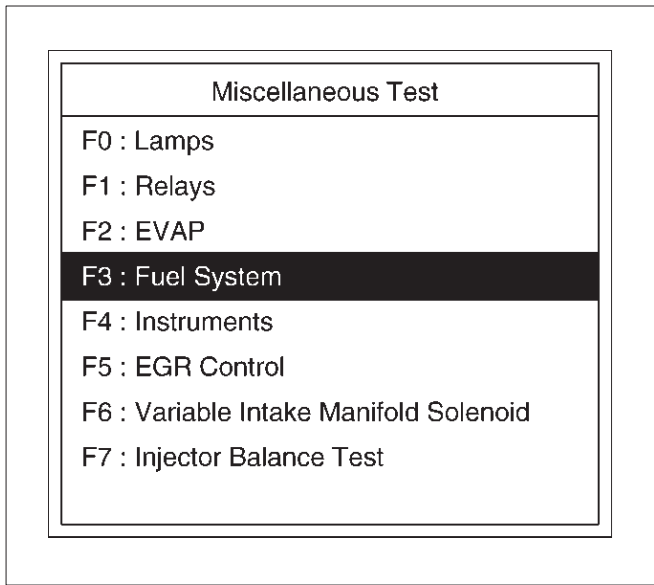

Tech 2 must be used for this test.

Test Procedure:

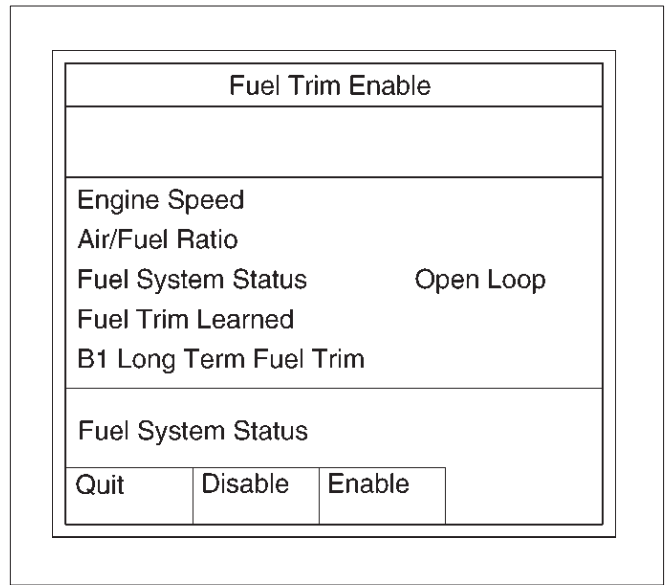

- 1. Connect Tech 2 to the vehicle DLC.
- 2. Ignition SW is "On".
- 3. Select F3: Miscellaneous Test in the Application Menu.

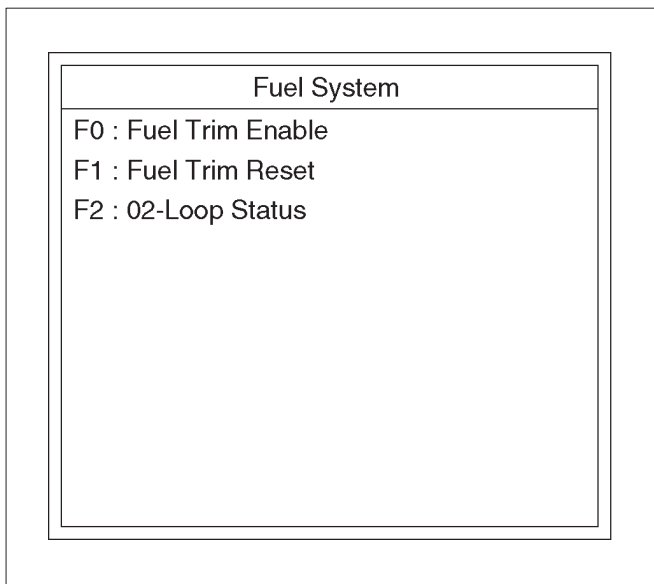

4. Select F3: Fuel System in the Miscellaneous Menu.

6. Push "Disable" or "Enable" soft key.

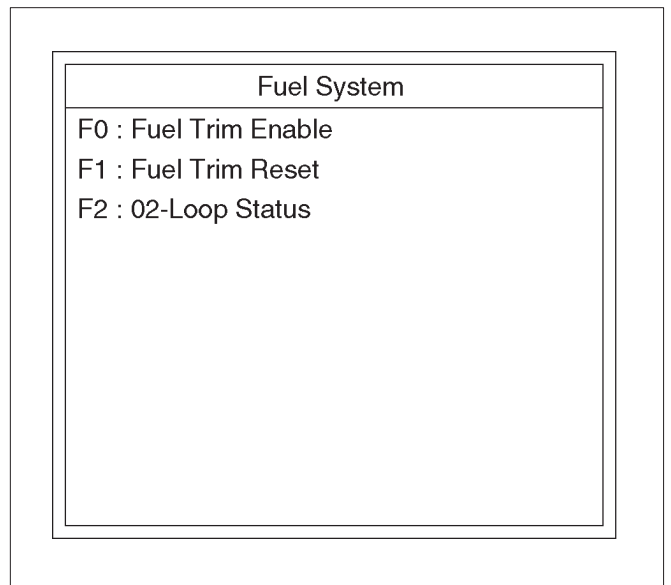

5. Select F0: Fuel Trim Enable.

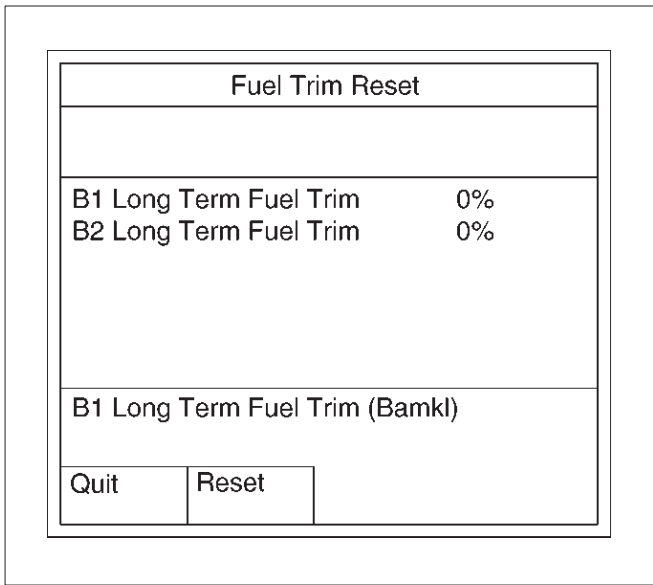

7. Control Fuel Trim and check data list.

8. If data list changes, the Fuel Trim is normal.

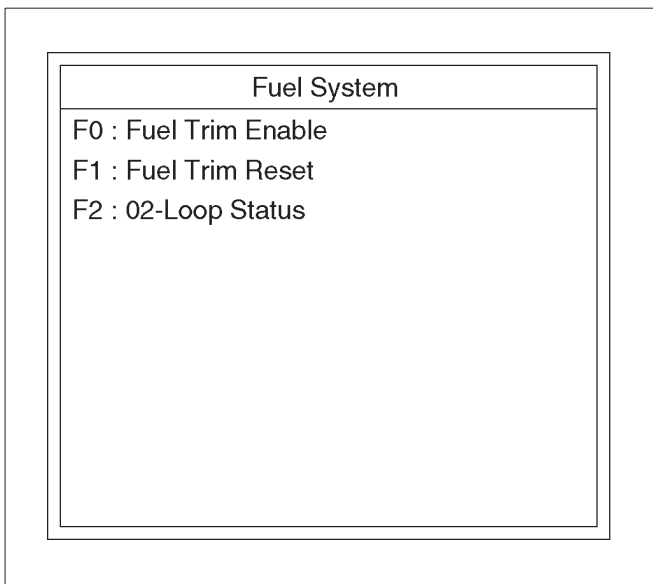

9. Select F1: Fuel Trim Reset.

10. Push "Reset" soft key.

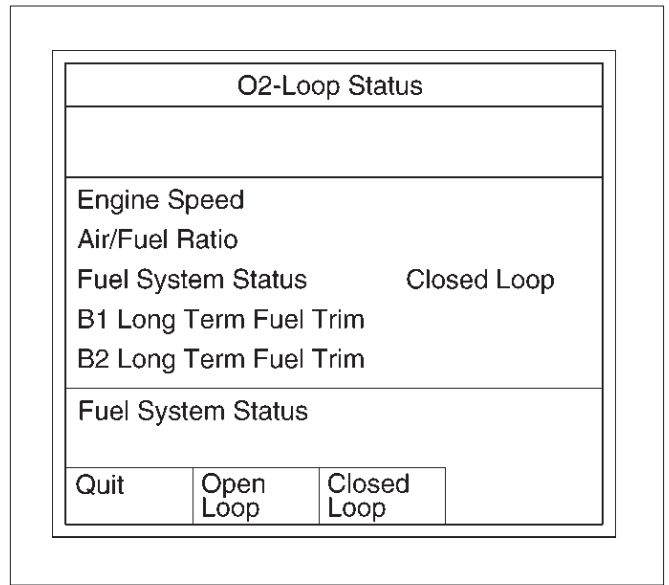

11. Select F2: O2-Loop status.

12. This test is check the "Closed Loop Status" performance.

13. Push "Open Loop" or "Closed Loop" soft key.

14. Control O2-Loop and check data list.

15. If data list changes, the O2-Loop is normal.

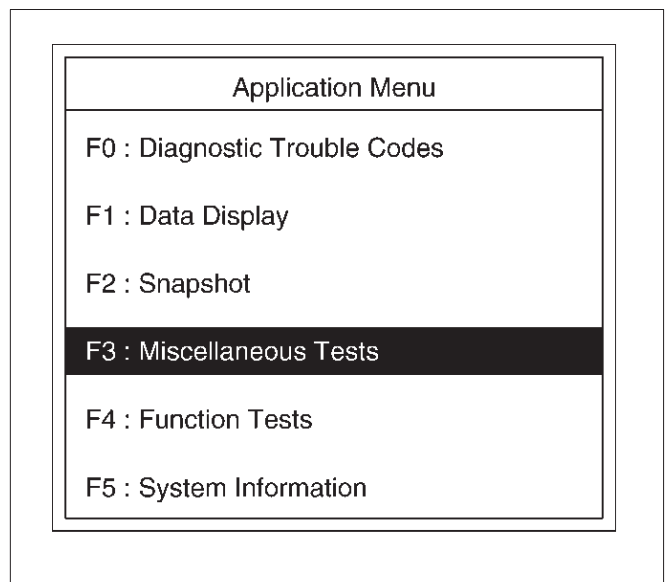

Instruments Test

This test is conducted check Instruments for proper operation.

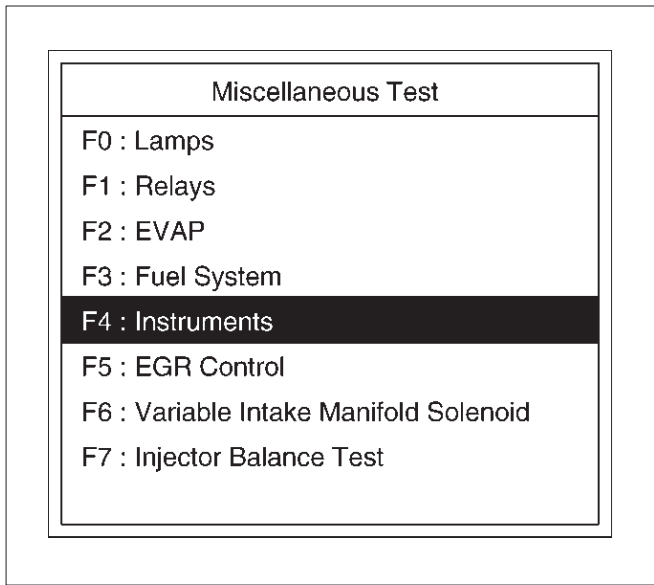

Tech 2 must be used for this test.

Test Procedure:

1. Connect Tech 2 to the vehicle DLC.
2. Ignition SW is "On".
3. Select F3: Miscellaneous Test in the Application Menu.

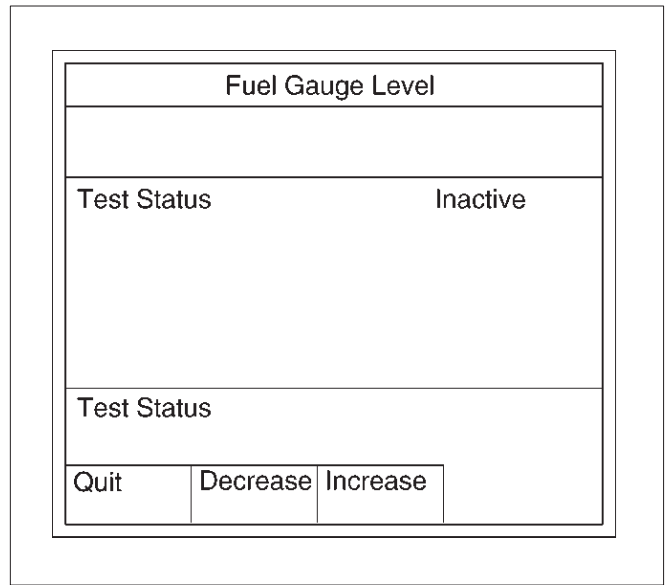

4. Select F4: Instruments in the Miscellaneous Menu.

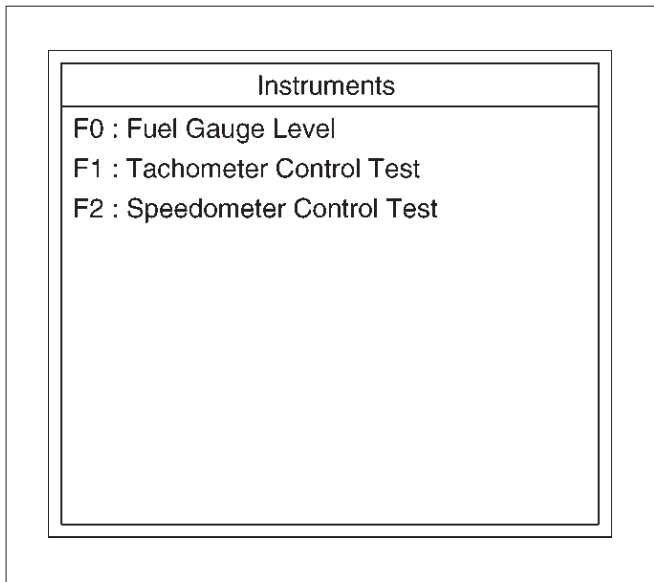

060RY00106

6. Push "Decrease" or "Increase" soft key.

060RY00100

5. Select F0: Fuel Gauge level.

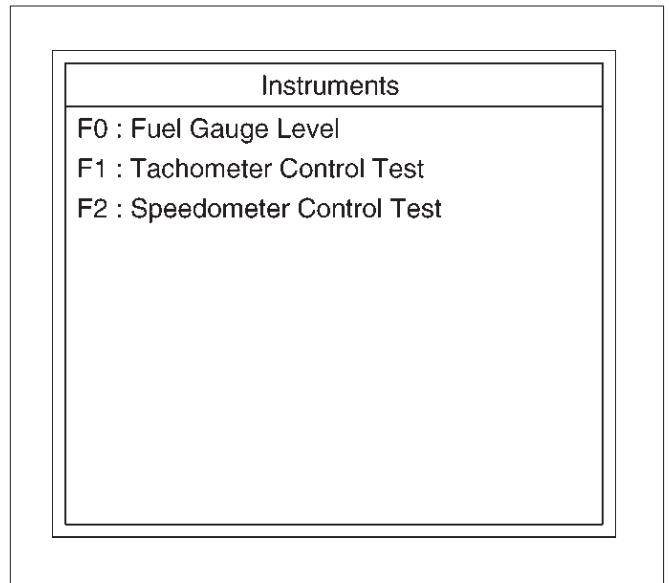

060RY00107

7. Control Fuel Level and check data list.

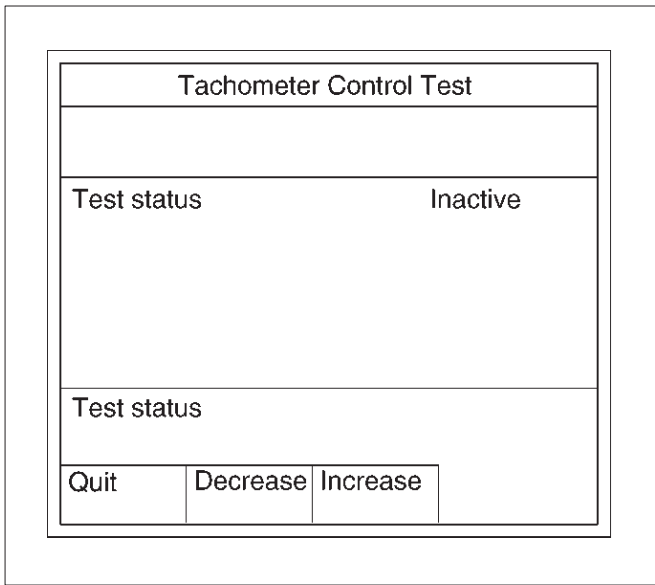

8. If data list and Fuel gauge meter changes, Fuel Gauge level is normal.

9. Select F1: Tachometer Control Test.

060RY00107

10. Push "Inactive" or "active" soft key.

060RY00101

- 11. Control tachometer and data list.
- 12. If data list and meter changes, the tachometer control is normal.

EGR Control Test

This test is conducted check EGR valve for proper operation.

Tech 2 must be used for this test.

Test Procedure:

- 1. Connect Tech 2 to the vehicle DLC.
- 2. Run the Engine at idle.
- 3. Select F3: Miscellaneous Test in the Application Menu.

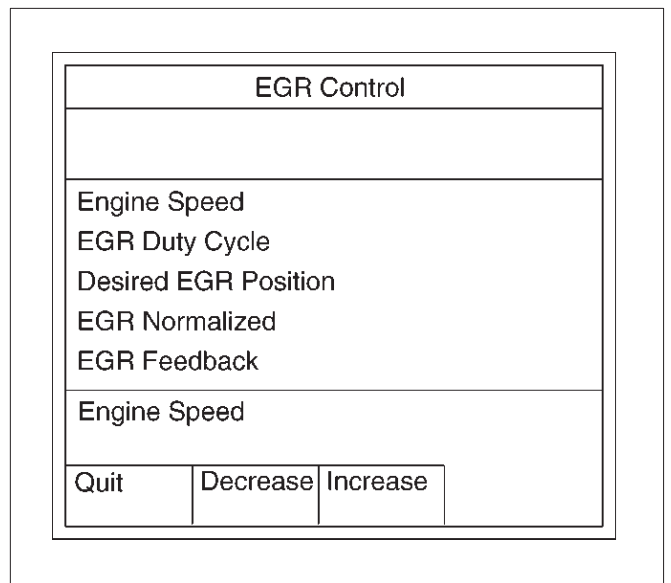

060R100078

4. Select F5: EGR Control Test in the Miscellaneous Test.

060RY00084

5. Control EGR Valve and check data list.

060RY00103

6. If data list changes, the EGR Control is normal.

Variable Intake Manifold Solenoid Test

This test is conducted check VIM Solenoid for proper operation.

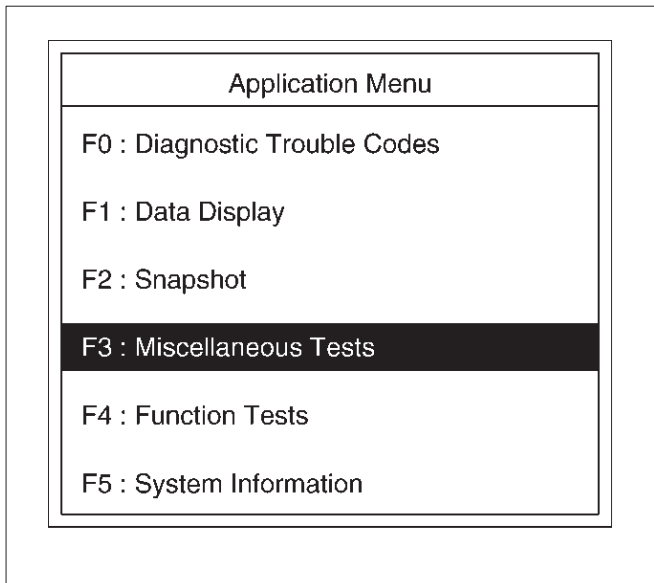

Tech 2 must be used for this test.

Test Procedure:

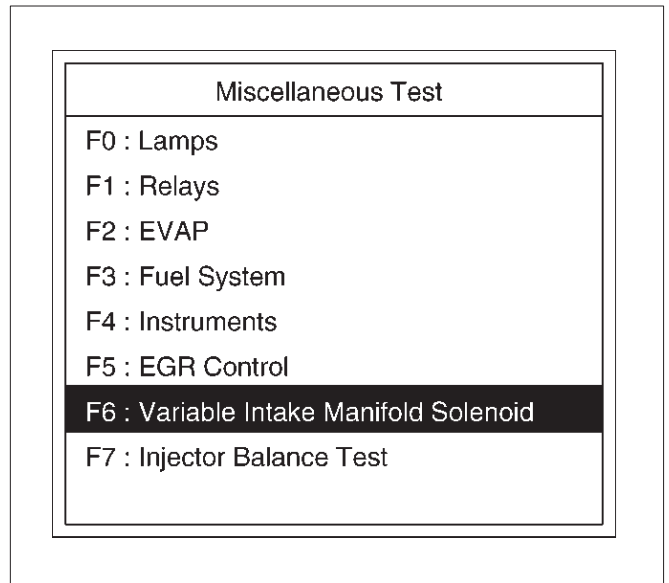

1. Connect Tech 2 to the vehicle DLC.
2. Ignition SW is "On".

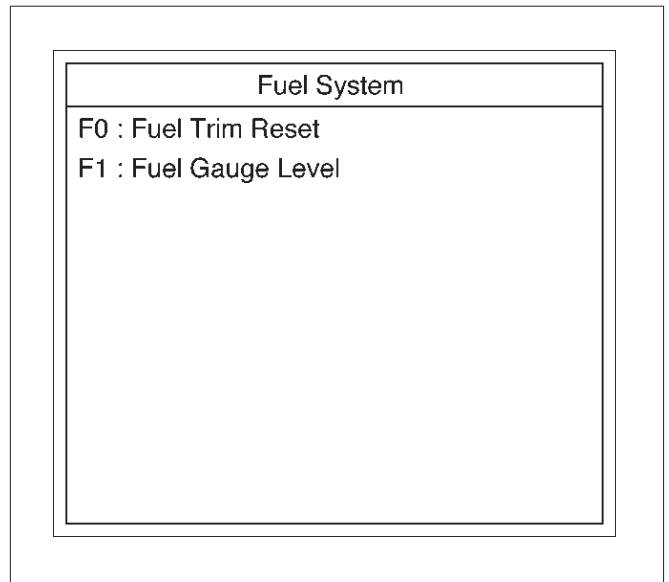

3. Select F3: Miscellaneous Test in the Application Menu.

4. Select F6: Variable Intake Manifold Solenoid Test.

5. Push "On" or "Off" soft key.

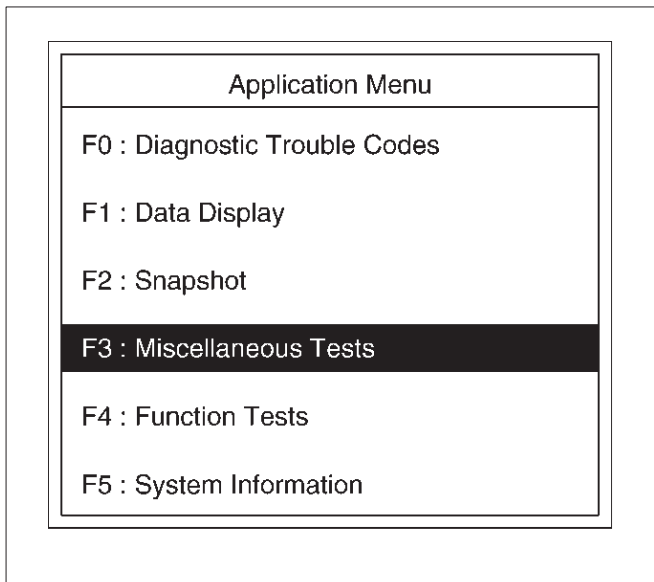

6. Control VIM Solenoid check data list.
7. If data list changes, the VIM Solenoid is normal.

Injector Balance Test

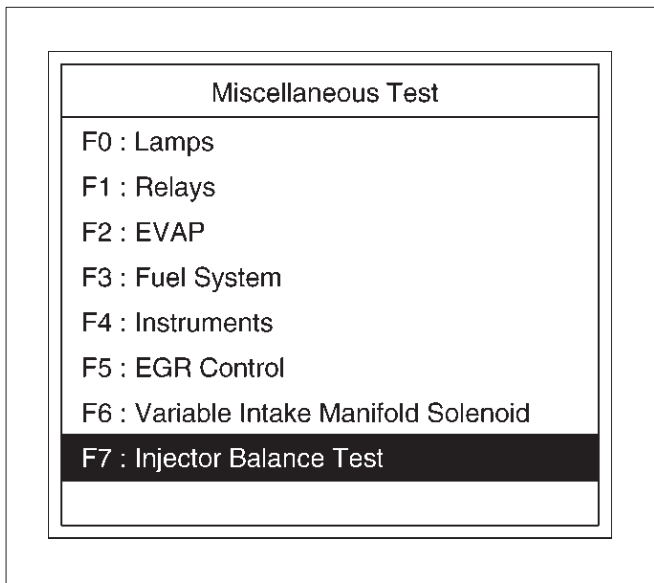

This test is conducted to make sure the appropriate electric signals are being sent to injectors Nos. 1-6. Tech 2 must be used for this test.

Test Procedure:

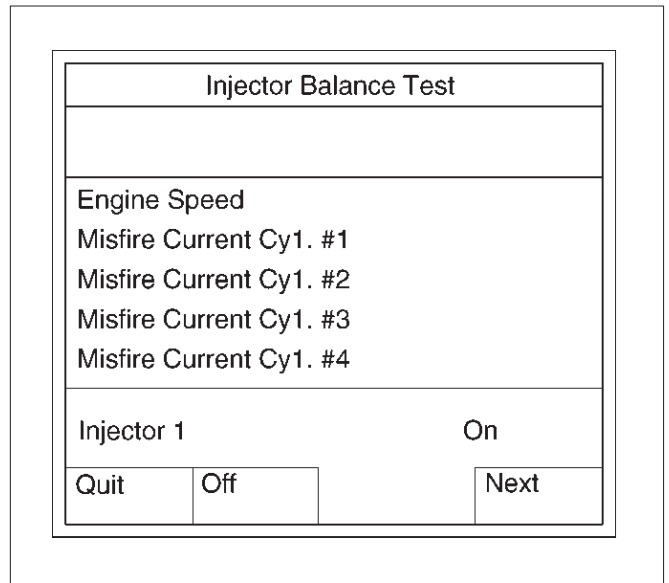

1. Connect Tech 2 to the vehicle DLC.
2. Run the Engine at idle.
3. Select F3: Miscellaneous Test in the Application Menu.

4. Select F7: Injector Balance Test in the Miscellaneous Test.

5. Select injector number and push "injector off" soft key.

6. Make sure of engine speed change.
7. If engine speed changes, the injector electric circuit is normal. If engine speed does not change, the injector electric circuit or the injector itself is not normal.

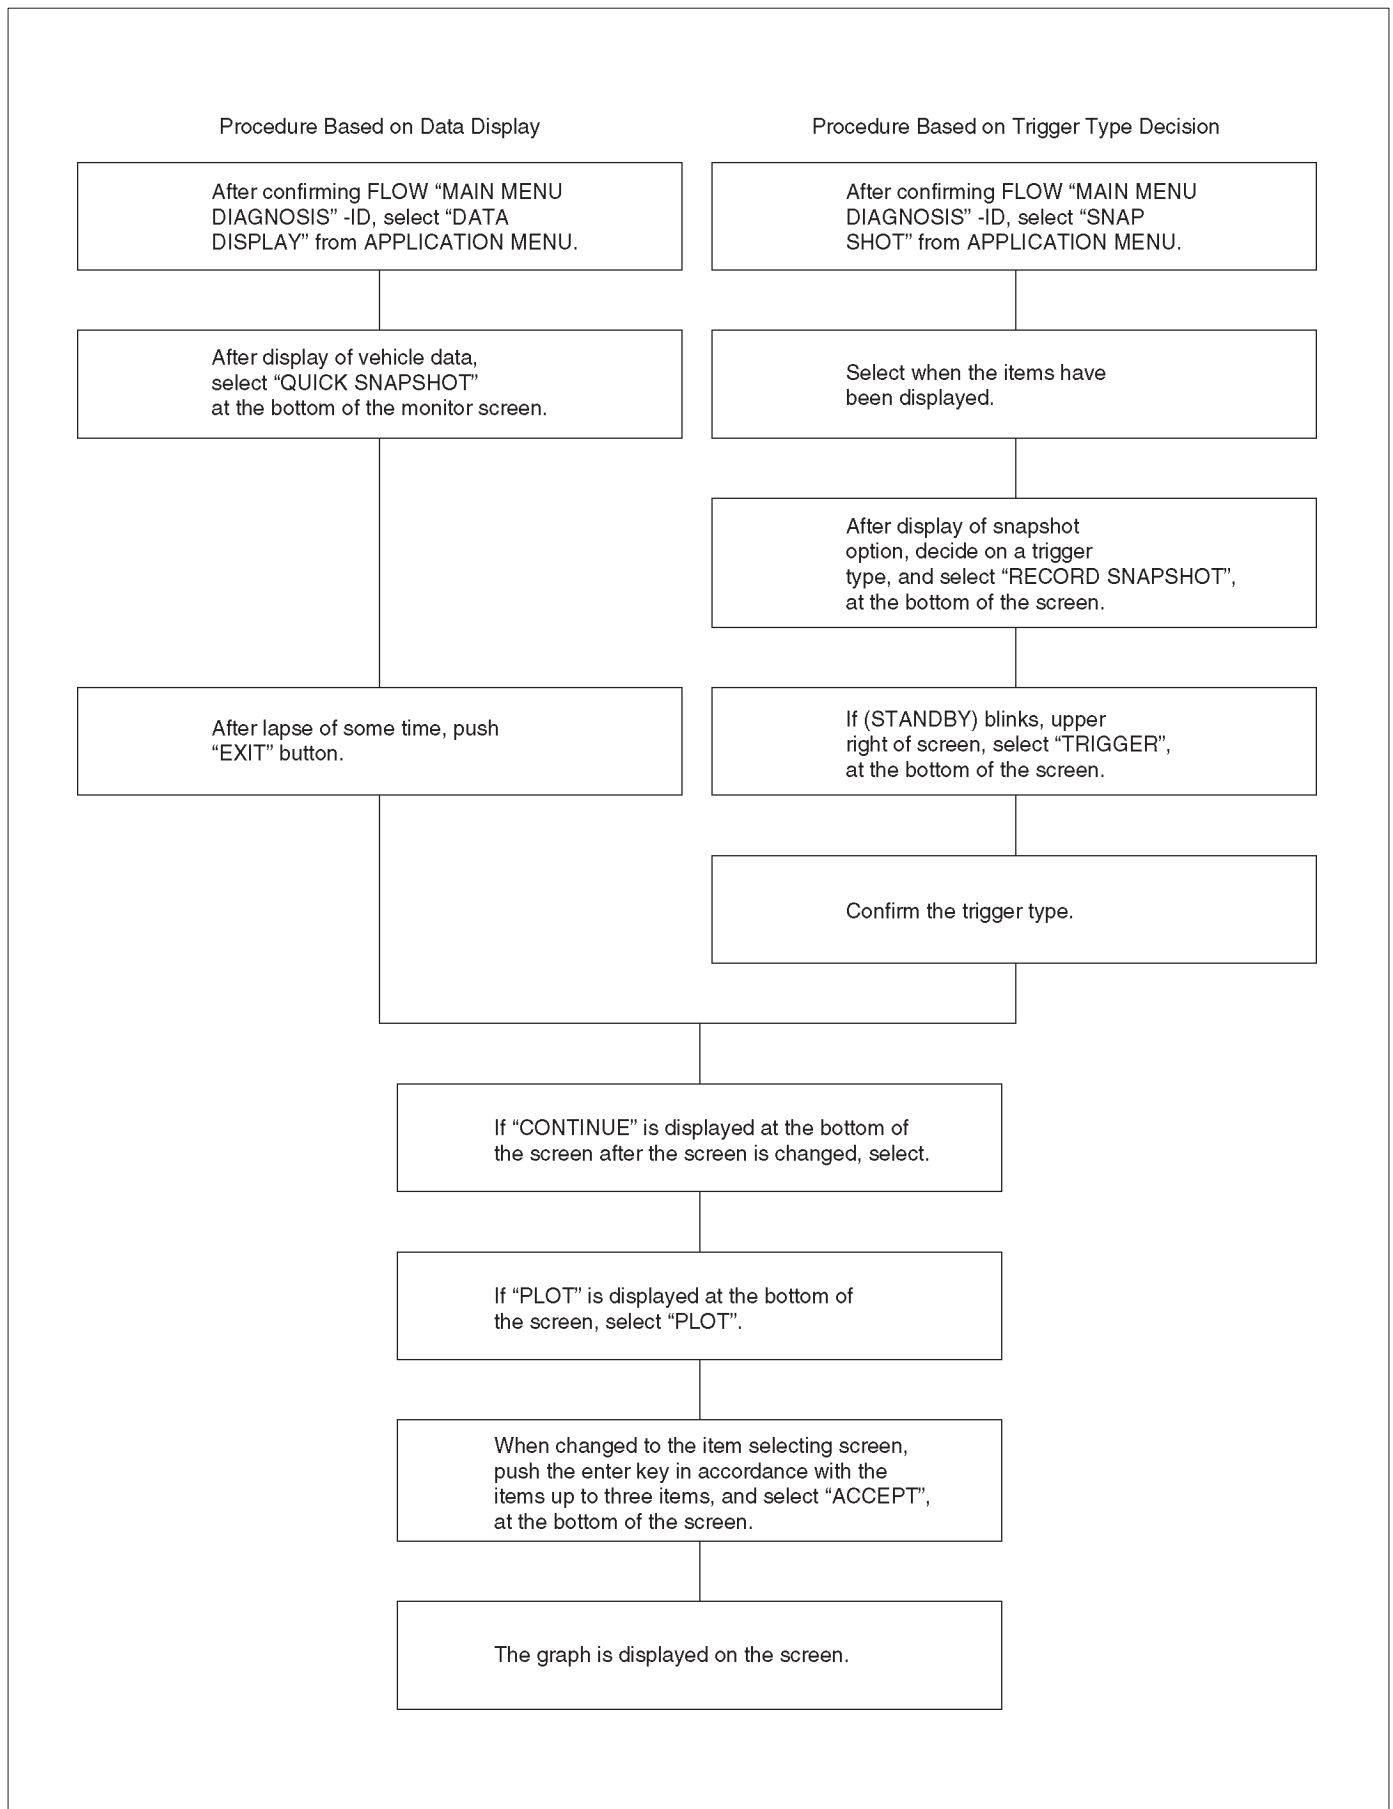

Plotting Snapshot Graph

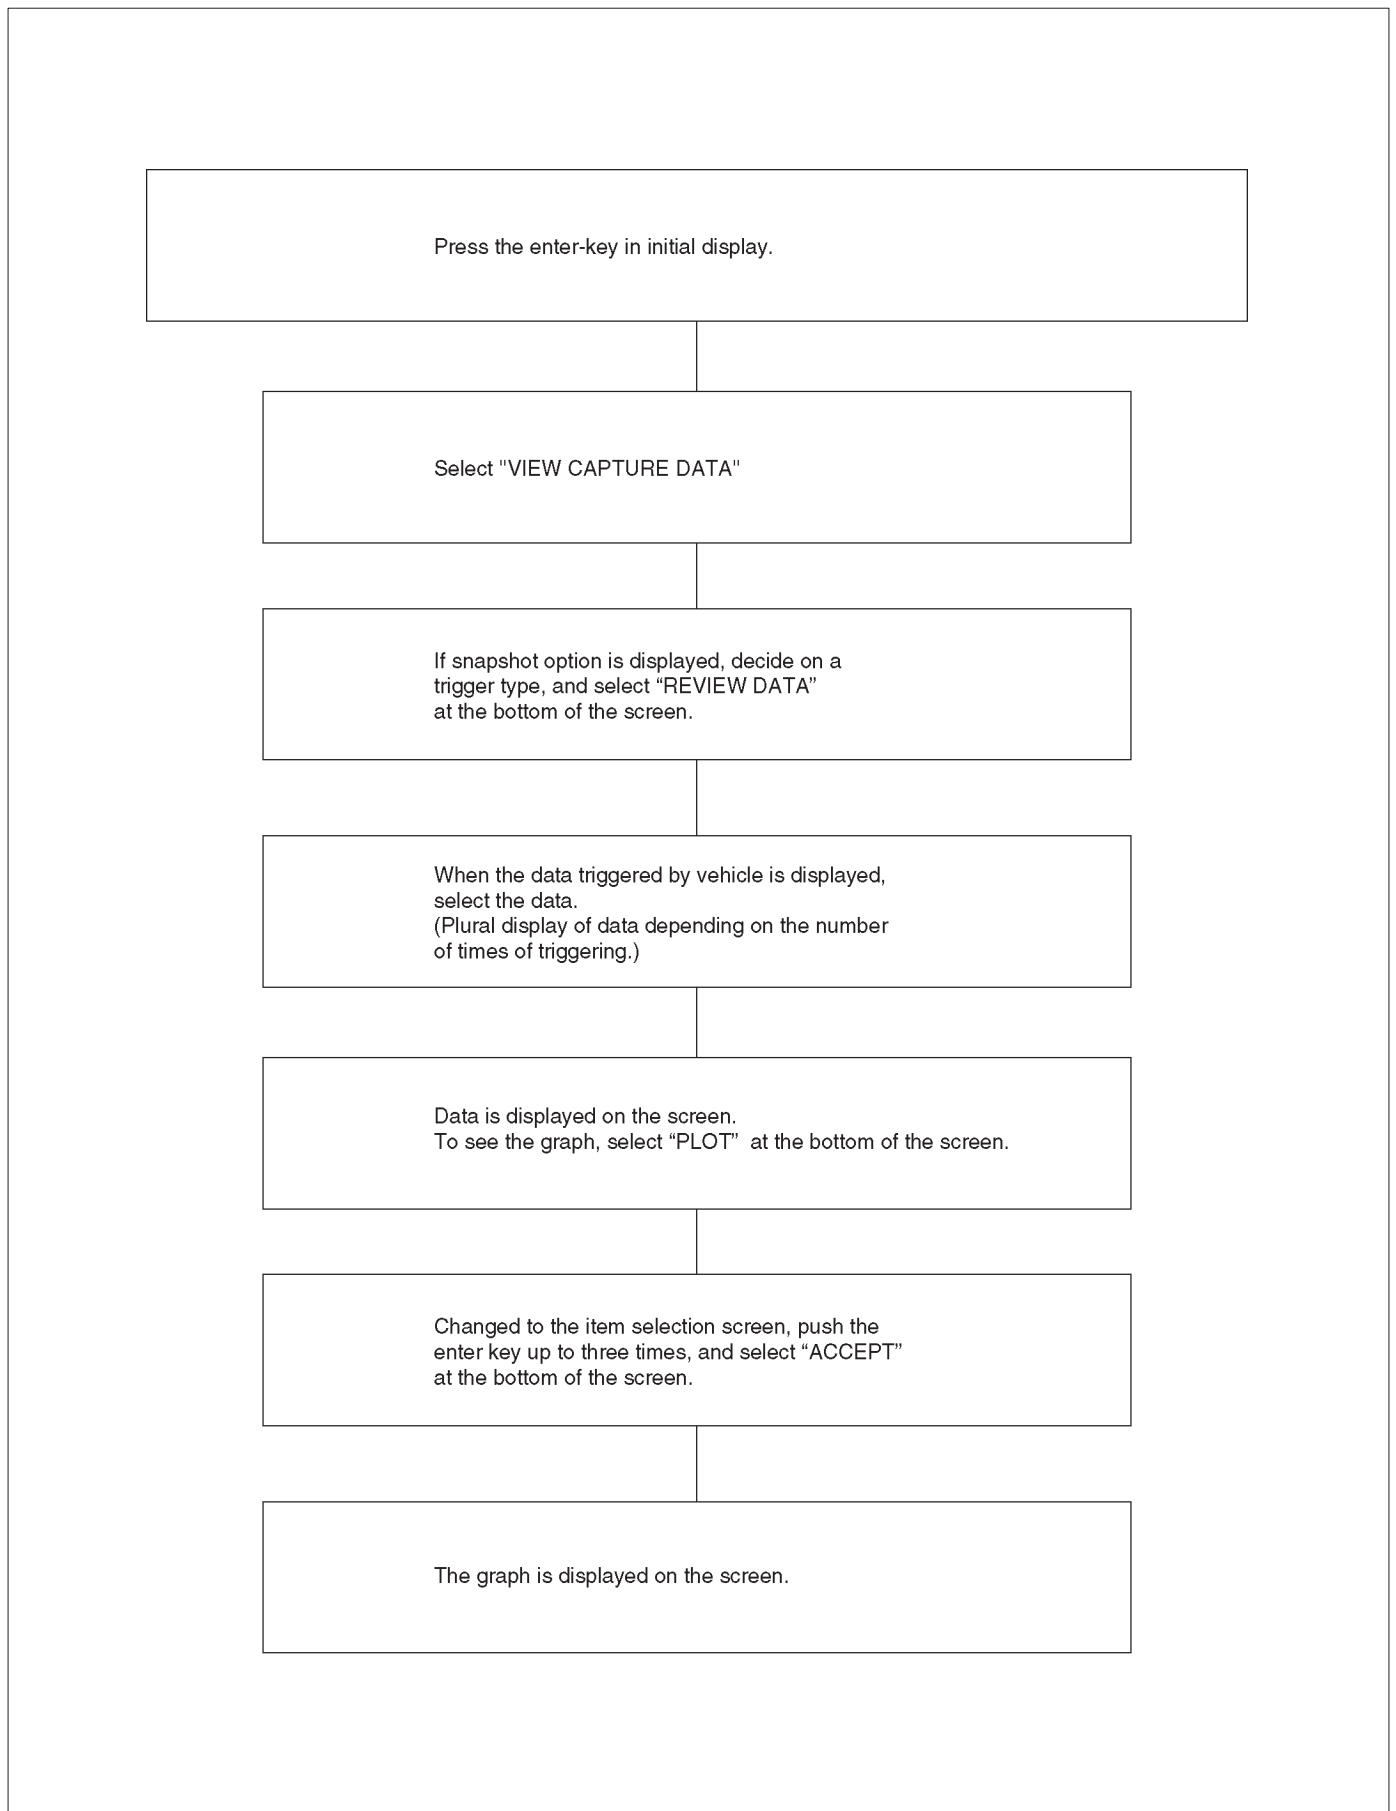

This test selects several necessary items from the data list to plot graphs and makes data comparison on a long term basis. It is an effective test particularly in emission related evaluations.

For trouble diagnosis, you can collect graphic data (snapshot) directly from the vehicle. You can replay the snapshot data as needed. Therefore, accurate diagnosis is possible, even though the vehicle is not available.

Plotting Graph Flow Chart (Plotting graph after obtaining vehicle information)

Flow Chart for Snapshot Replay (Plotting Graph)

Primary System-Based Diagnostic

Primary System-Based Diagnostic

There are primary system-based diagnostics which evaluate system operation and its effect on vehicle emissions. The primary system-based diagnostics are listed below with a brief description of the diagnostic function:

Oxygen Sensor Diagnosis

The fuel control heated oxygen sensors are diagnosed for the following conditions:

- Heater performance (time to activity on cold start)
- Slow response
- Response time (time to switch R/L or L/R)
- Inactive signal (output steady at bias voltage – approx. 450 mV)
- Signal fixed high
- Signal fixed low

If the oxygen sensor pigtail wiring, connector or terminal are damaged, the entire oxygen sensor assembly must be replaced. DO NOT attempt to repair the wiring, connector or terminals. In order for the sensor to function properly, it must have clean reference air provided to it. This clean air reference is obtained by way of the oxygen sensor wire(s). Any attempt to repair the wires, connector or terminals could result in the obstruction of the reference air and degrade oxygen sensor performance. Refer to *On-Vehicle Service, Heated Oxygen Sensors* in this section.

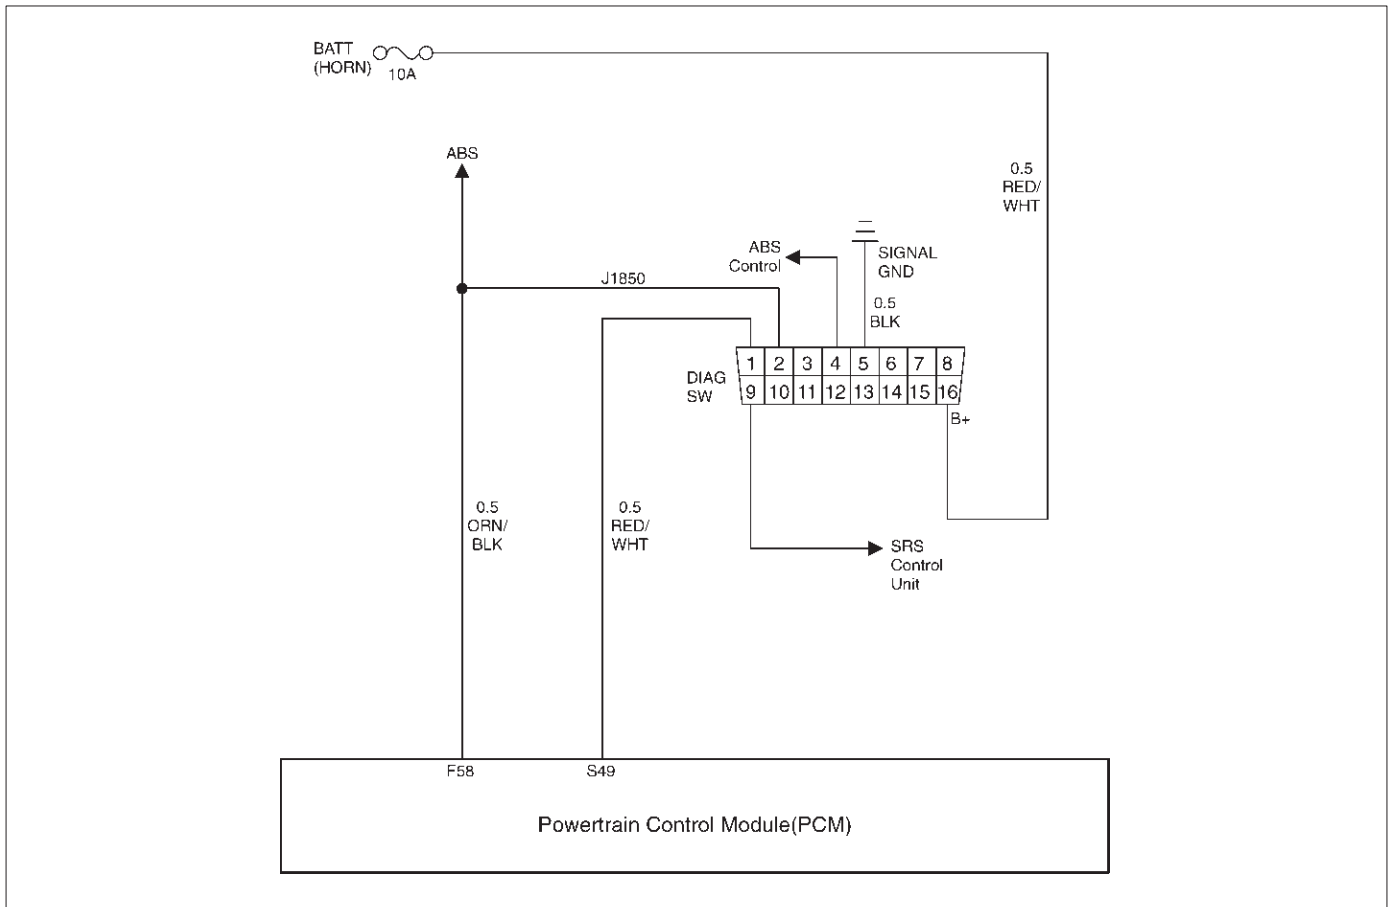

Fuel Control Heated Oxygen Sensor

The main function of the fuel control heated oxygen sensors is to provide the control module with exhaust stream oxygen content information to allow proper fueling and maintain emissions within mandated levels. After it reaches operating temperature, the sensor will generate a voltage, inversely proportional to the amount of oxygen present in the exhaust gases. The control module uses the signal voltage from the fuel control heated oxygen sensors while in closed loop to adjust fuel injector pulse width. While in closed loop, the PCM can adjust fuel delivery to maintain an air/fuel ratio which allows the best combination of emission control and drivability. The fuel control heated oxygen sensors are also used to determine catalyst efficiency.

HO2S Heater

Heated oxygen sensors are used to minimize the amount of time required for closed loop fuel control to begin operation and to allow accurate catalyst monitoring. The oxygen sensor heater greatly decreases the amount of time required for fuel control sensors (Bank 1 HO2S 1 and Bank2 HO2S 1) to become active.

On-Board Diagnostic (OBD) System Check

060R100062

Circuit Description

The on-board diagnostic system check is the starting point for any drivability complaint diagnosis. Before using this procedure, perform a careful visual/physical check of the PCM and engine grounds for cleanliness and tightness.

The on-board diagnostic system check is an organized approach to identifying a problem created by an electronic engine control system malfunction.

Diagnostic Aids

An intermittent may be caused by a poor connection, rubbed-through wire insulation or a wire broken inside the insulation. Check for poor connections or a damaged harness. Inspect the PCM harness and connector for improper mating, broken locks, improperly formed or damaged terminals, poor terminal-to-wire connection, and damaged harness.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

1. The MIL ("Check Engine lamp") should be "ON" steady with the ignition "ON" and the engine "OFF". If not, the "No MIL" chart should be used to isolate the malfunction.

3. Checks the Class 2 data circuit and ensures that the PCM is able to transmit serial data.
4. This test ensures that the PCM is capable of controlling the MIL ("Check Engine lamp") and the MIL ("Check Engine lamp") driver circuit is not shorted to ground.
5. This test ensures that the PCM is capable of controlling the RPL ("Reduced Power lamp") and the RPL ("Reduced Power lamp") driver circuit is not shorted to ground.
7. Check the DTCs (System, Volts Supply circuit).
8. Check the DTCs (PCM {Software} detect Errors).
10. If the engine will not start, the Cranks But Will Not Run chart should be used to diagnose the condition.
13. A Tech 2 parameter which is not within the typical range may help to isolate the area which is causing the problem.
14. This vehicle is equipped with a PCM which utilizes an electrically erasable programmable read only memory (EEPROM). When the PCM is replaced, the new PCM must be programmed. Refer to *PCM Replacement and Programming Procedures in Powertrain Control Module (PCM) and Sensors* of this section.

On-Board Diagnostic (OBD) System Check

Step	Action	Value(s)	Yes	No
1	1. Ignition "ON", engine "OFF". 2. Observe the malfunction indicator lamp (MIL or "Check Engine lamp"). Is the MIL ("Check Engine lamp") "ON"?	—	Go to Step 2	Go to No MIL ("Check Engine lamp")
2	1. Ignition "ON", engine "OFF". 2. Observe the "Reduced Power lamp". Is the RPL ("Reduced Power lamp") "ON" during 3 seconds?	—	Go to Step 3	Go to No RPL ("Reduced Power lamp")
3	1. Ignition "OFF". 2. Install Tech 2. 3. Ignition "ON". 4. Attempt to display PCM engine data with the Tech 2. Does the Tech 2 display PCM data?	—	Go to Step 4	Go to Step 12
4	1. Using the Tech 2 output tests function, select MIL ("Check Engine lamp") control and command the MIL ("Check Engine lamp") "OFF". 2. Observe the MIL ("Check Engine lamp"). Did the MIL ("Check Engine lamp") turn "OFF"?	—	Go to Step 5	Go to MIL ("Check Engine lamp") On Steady
5	1. Using the Tech 2 output tests function, select MIL ("Check Engine lamp") control and command the RPL ("Reduced Power lamp") "OFF". 2. Observe the RPL ("Reduced Power lamp"). Did the MIL ("Reduced Power lamp") turn "OFF"?	—	Go to Step 6	Go to RPL ("Reduced Power lamp") On Steady
6	Select "Display DTCs" with the Tech 2. Are any DTCs stored?	—	Go to Step 7	Go to Step 11
7	Stored DTCs; P0562, P0563, P0601, P0602, P0604, P0606, P1625, P1635, P1639, P1640, P1650 Are the applicable DTCs stored?	—	Go to applicable DTC table	Go to Step 8
8	Stored DTCs; P1514, P1515, P1516, P1523, P1125, P1290, P1295, P1299 Are the applicable DTCs stored?	—	Go to applicable DTC table	Go to Step 9
9	Stored DTCs; 1. P0106, P0107, P1107, P0401, P1404, P0405, P1120, P1221, P1515, P1516, P1275, P1635, P1271, P1273, P1285, P1272 2. P0336, P0337, P1220, P1515, P1221, P1516, P1280, P1639, P1271, P1272 Are the applicable DTCs stored?	—	Go to "Multiple PCM Information sensor DTCs Set"	Go to Step 10
10	Attempt to start the engine. Did the engine start and continue to run?	—	Go to Step 6	Go to Cranks But Will Not Run

On-Board Diagnostic (OBD) System Check (Cont'd)

Step	Action	Value(s)	Yes	No
11	<p>Compare PCM data values displayed on the Tech 2 to the typical engine scan data values.</p> <p>Are the displayed values normal or close to the typical values?</p>	—	Go to <i>Symptom</i>	Refer to <i>indicated Component System Checks</i>
12	<ol style="list-style-type: none"> 1. Ignition "OFF", disconnect the PCM. 2. Ignition "ON", engine "OFF". 3. Check the Class 2 data circuit for an open, short to ground, or short to voltage. Also, check the DLC ignition feed circuit for an open or short to ground and the DLC ground circuit for an open. 4. If a problem is found, repair as necessary. <p>Was a problem found?</p>	—	Go to <i>Step 2</i>	Go to <i>Step 13</i>
13	<ol style="list-style-type: none"> 1. Attempt to reprogram the PCM. Refer to <i>Powertrain Control Module (PCM) in On-Vehicle Service</i>. 2. Attempt to display PCM data with the Tech 2. <p>Does the Tech 2 display PCM engine data?</p>	—	Go to <i>Step 2</i>	Go to <i>Step 14</i>
14	<p>Replace the PCM.</p> <p>IMPORTANT: The replacement PCM must be programmed. Refer to <i>ON-Vehicle Service in Power Control Module and Sensors for procedures</i>.</p> <p>And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM.</p> <p>Is the action complete?</p>	—	Go to <i>Step 2</i>	—

A/C Clutch Diagnosis

This chart should be used for diagnosing the electrical portion of the A/C compressor clutch circuit. A Tech 2 will be used in diagnosing the system. The Tech 2 has the ability to read the A/C request input to the PCM. The Tech 2 can display when the PCM has commanded the A/C clutch "ON". The Tech 2 should have the ability to override the A/C request signal and energize the A/C compressor relay.

Test Description

IMPORTANT: Do not engage the A/C compressor clutch with the engine running if an A/C mode is not selected at the A/C control switch.

The numbers below refer to the step numbers on the Diagnostic Chart:

3. This a test determine is the problem is with the refrigerant system. If the switch is open, A/C pressure gauges will be used to determine if the pressure switch is faulty or if the system is partially discharged or empty.
4. Although the normal complaint will be the A/C clutch failing to engage, it is possible for a short circuit to cause the clutch to run when A/C has not been selected. This step is a test for that condition.
7. There is an extremely low probability that both relays will fail at the same time, so the substitution process is one way to check the A/C Thermostat relay. Use a known good relay to do a substitution check.

A/C Clutch Control Circuit Diagnosis

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Are any other DTCs stored?	—	Go to the other DTC chart(s) first	Go to Step 3
3	1. Disconnect the electrical connector at the pressure switch located on the receiver/drier. 2. Use an ohmmeter to check continuity across the pressure switch. Is the pressure switch open?	—	Go to Air Conditioning to diagnose the cause of the open pressure switch	Go to Step 4
4	IMPORTANT: Before continuing with the diagnosis, the following conditions must be met: <ul style="list-style-type: none"> ● The intake air temperature must be greater than 15°C. (60°F). ● The engine coolant temperature must be less than 119°C (246°F). 1. A/C "OFF". 2. Start the engine and idle for 1 minute. 3. Observe the A/C compressor. Is the A/C compressor clutch engaged even though A/C has not been requested?	—	Go to Step 37	Go to Step 5
5	1. Idle the engine. 2. A/C "ON". 3. Blower "ON". 4. Observe the A/C compressor. Is the A/C compressor magnetic clutch engaged?	—	Refer to <i>Diagnostic Aids</i>	Go to Step 6
6	1. Engine idling. 2. A/C "ON". 3. Blower "ON". 4. Observe the "A/C Request" display on the Tech 2. (Refer to the Miscellaneous test) Does the tool "A/C Request" display indicate "Yes"?	—	Go to Step 26	Go to Step 7

A/C Clutch Control Circuit Diagnosis (Cont'd)

Step	Action	Value(s)	Yes	No
7	Temporarily substitute the A/C compressor relay in place of the A/C thermostat relay, then repeat Step 5. Did the "A/C Request" display indicate "Yes"?	—	Go to Step 8	Go to Step 9
8	Replace the original A/C thermostat relay. Is the action complete?	—	Verify repair	—
9	Does the blower operate?	—	Go to Step 10	Go to Step 11
10	Repair the blower. Is the action complete?	—	Verify repair	—
11	Check for a faulty 10A A/C fuse in the underdash fuse panel. Was the 10A fuse OK?	—	Go to Step 13	Go to Step 12
12	Check for short circuit and make repairs if necessary. Replace the 10A A/C fuse. Is the action complete?	—	Verify repair	—
13	1. Remove the glove box to gain access to the A/C thermostat. 2. Disconnect the thermostat connector. 3. Attach a fused jumper between ground and the thermostat wire. 4. A/C "ON". 5. Blower "ON". Dose A/C request indicate "YES" on the Tech 2?	—	Go to Step 14	Go to Step 17
14	1. Ignition "ON". 2. Use a DVM to check voltage at the electronic A/C thermostat. Was voltage equal to the specified value?	B+	Go to Step 17	Go to Step 15
15	Check for open wire between the thermostat and the A/C switch. Was the wire open?	—	Go to Step 16	Go to Step 17
16	Repair the open wire between the thermostat and the A/C switch. Is the action complete?	—	Verify repair	—
17	Check for an open circuit between A/C thermostat relay and PCM A/C request terminal (F45). Was there an open circuit?	—	Go to Step 18	Go to Step 19
18	Repair the open circuit between the PCM and A/C thermostat relay. Is the action complete?	—	Verify repair	—
19	1. Ignition "ON". 2. Use a DVM to check voltage at the A/C pressure switch (BRN). Was voltage equal to the specified value?	B+	Go to Step 21	Go to Step 20
20	Repair the open circuit between the 10A A/C fuse and the pressure switch. Is the action complete?	—	Verify repair	—

A/C Clutch Control Circuit Diagnosis (Cont'd)

Step	Action	Value(s)	Yes	No
21	Use an ohmmeter to check continuity between the pressure switch and the A/C thermostat relay. Was the circuit open?	—	Go to <i>Step 22</i>	Go to <i>Step 23</i>
22	Repair the open circuit between the pressure switch and the A/C thermostat relay. Is the action complete?	—	Verify repair	—
23	Check for damaged pin or terminal at F45 of the PCM. Was a damaged pin or terminal found?	—	Go to <i>Step 24</i>	Go to <i>Step 25</i>
24	Repair the damaged pin or terminal. Is the action complete?	—	Verify repair	—
25	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service</i> in <i>Powertrain Control Module Sensors for procedures</i> . And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—
26	1. Remove the A/C compressor relay. 2. Ignition "ON". 3. Use a DVM to check voltage at both of the wires at the A/C compressor relay socket. Is the voltage equal to the specified value?	B+	Go to <i>Step 28</i>	Go to <i>Step 27</i>
27	Repair the faulty wire between the A/C fuse and the A/C compressor relay . Is the action complete?	—	Verify repair	—
28	1. A/C compressor relay removed. 2. Engine idling. 3. A/C "ON". 4. Blower "ON". 5. Use a DVM to measure voltage between the wire at the A/C compressor relay socket and battery±. Did the DVM indicate the specified value?	B+	Go to <i>Step 32</i>	Go to <i>Step 29</i>
29	Check for an open wire between PCM terminal F4 and the A/C compressor relay. Was the wire open?	—	Go to <i>Step 30</i>	Go to <i>Step 31</i>
30	Repair the open wire between the PCM and the A/C compressor relay. Is the action complete?	—	Verify repair	—
31	Check for a damaged pin or terminal at F4 of the PCM. Was a damaged pin or a terminal found?	—	Go to <i>Step 24</i>	Go to <i>Step 25</i>

A/C Clutch Control Circuit Diagnosis (Cont'd)

Step	Action	Value(s)	Yes	No
32	1. A/C compressor relay removed. 2. Connect a fused jumper at the A/C compressor relay socket with either wire. 3. Engine idling. 4. A/C "ON". 5. Blower "ON". Did the compressor magnetic clutch engage?	—	Go to <i>Step 33</i>	Go to <i>Step 34</i>
33	Repair the A/C compressor relay. Is the action complete?	—	Verify repair	—
34	Check for an open circuit between the A/C compressor relay and the A/C clutch. Was an open circuit found?	—	Go to <i>Step 35</i>	Go to <i>Step 36</i>
35	Repair the open circuit between the compressor Clutch and the A/C compressor relay. Is the action complete?	—	Verify repair	—
36	Service the compressor clutch or replace the compressor due to a faulty internal overheat switch. Is the action complete?	—	Verify repair	—
37	1. Remove the A/C compressor relay. 2. Idle the engine. Is the compressor clutch still engaged when A/C is not selected?	—	Go to <i>Step 38</i>	Go to <i>Step 39</i>
38	Repair the short to voltage between the A/C clutch and A/C compressor relay. Is the action complete?	—	Verify repair	—
39	1. Reinstall the A/C compressor relay. 2. Remove the A/C thermostat relay. 3. Engine idling. Is the compressor clutch still engaged when A/C is not selected?	—	Go to <i>Step 40</i>	Go to <i>Step 42</i>
40	Use a DVM to check for a short to ground between the A/C compressor relay and F4 of the PCM. Was a short detected?	—	Go to <i>Step 41</i>	Go to <i>Step 25</i>
41	Repair the short to ground between the PCM and A/C compressor relay. Is the action complete?	—	Verify repair	—
42	Repair the short to ground between the A/C thermostat relay and the electronic thermostat. Is the action complete?	—	Verify repair	—

Electronic Ignition System Diagnosis

If the engine cranks but will not run or immediately stalls, the Engine Cranks But Will Not Start chart must be used to determine if the failure is in the ignition system or the fuel system. If DTC P0300 through P0306, P0341, or P0336 is set, the appropriate diagnostic trouble code chart must be used for diagnosis.

If a misfire is being experienced with no DTC set, refer to the *Symptoms* section for diagnosis.

Visual Check of The Evaporative Emission Canister

- If the canister is cracked or damaged, replace the canister.
- If fuel is leaking from the canister, replace the canister and check hoses and hose routing.

Fuel Metering System Check

Some failures of the fuel metering system will result in an "Engine Cranks But Will Not Run" symptom. If this condition exists, refer to the *Cranks But Will Not Run* chart. This chart will determine if the problem is caused by the ignition system, the PCM, or the fuel pump electrical circuit.

Refer to *Fuel System Electrical Test* for the fuel system wiring schematic.

If there is a fuel delivery problem, refer to *Fuel System Diagnosis*, which diagnoses the fuel injectors, the fuel pressure regulator, and the fuel pump. If a malfunction occurs in the fuel metering system, it usually results in either a rich HO₂S signal or a lean HO₂S signal. This condition is indicated by the HO₂S voltage, which causes the PCM to change the fuel calculation (fuel injector pulse width) based on the HO₂S reading. Changes made to the fuel calculation will be indicated by a change in the long term fuel trim values which can be monitored with a Tech 2. Ideal long term fuel trim values are around 0%; for a lean HO₂S signal, the PCM will add fuel, resulting in a fuel trim value above 0%. Some variations in fuel trim values are normal because all engines are not exactly the same. If the evaporative emission canister purge is "ON", the fuel trim may be as low as -38%. If the fuel trim values are greater than +23%, refer to *DTC P0131*, *DTC P0151*, *DTC P0171*, and *DTC 1171* for items which can cause a lean HO₂S signal.

Powertrain Control Module (PCM) Diagnosis

To read and clear diagnostic trouble codes, use a Tech 2.

IMPORTANT: Use of a Tech 2 is recommended to clear diagnostic trouble codes from the PCM memory. Diagnostic trouble codes can also be cleared by turning the ignition "OFF" and disconnecting the battery power from the PCM for over 3 hours. Turning off the ignition and disconnecting the battery power from the PCM will cause all diagnostic information in the PCM memory to be cleared. Therefore, all the diagnostic tests will have to be re-run.

Since the PCM can have a failure which may affect only one circuit, following the diagnostic procedures in this

section will determine which circuit has a problem and where it is.

If a diagnostic chart indicates that the PCM connections or the PCM is the cause of a problem, and the PCM is replaced, but this does not correct the problem, one of the following may be the reason:

- There is a problem with the PCM terminal connections. The terminals may have to be removed from the connector in order to check them properly.
- EEPROM program is not correct for the application. Incorrect components or reprogramming the PCM with the wrong EEPROM program may cause a malfunction and may or may not set a DTC.
- The problem is intermittent. This means that the problem is not present at the time the system is being checked. In this case, refer to the *Symptoms* portion of the manual and make a careful physical inspection of all component and wiring associated with the affected system.
- There is a shorted solenoid, relay coil, or harness. Solenoids and relays are turned "ON" and "OFF" by the PCM using internal electronic switches called drivers. A shorted solenoid, relay coil, or harness will not damage the PCM but will cause the solenoid or relay to be inoperative.

Multiple PCM Information Sensor DTCs Set

Circuit Description

The powertrain control module (PCM) monitors various sensors to determine the engine operating conditions. The PCM controls fuel delivery, spark advance, transmission operation, and emission control device operation based on the sensor inputs.

The PCM provides a sensor ground to all of the sensors. The PCM applies 5 volts through a pull-up resistor, and determines the status of the following sensors by monitoring the voltage present between the 5-volt supply and the resistor:

- The engine coolant temperature (ECT) sensor
- The intake air temperature (IAT) sensor
- The transmission fluid temperature (TFT) sensor

The PCM provides the following sensors with a 5-volt reference and a sensor ground signal:

1

- The exhaust gas recirculating (EGR) pintle position sensor
- The manifold absolute pressure (MAP) sensor
- The throttle position (TP) sensor 1
- The accelerator position (AP) sensor 1
- The accelerator position (AP) sensor 3

2

- The Crank position (CKP) sensor
- The throttle position (TP) sensor 2
- The accelerator position (AP) sensor 2

The PCM monitors the separate feedback signals from these sensors in order to determine their operating status.

- TPS1/TPS2
- APS1/APS2/APS3
- CKP

Diagnostic Aids

IMPORTANT: Be sure to inspect PCM and engine grounds for being secure and clean.

A short to voltage in one of the sensor input circuits may cause one or more of the following DTCs to be set:

- P0108, P1106
- P0406
- P1120, P1515, P1221, P1516, P1635
- P1275, P1639, P1271, P1273
- P1285, P1272, P1273
- P0336, P0337
- P1220, P1515, P1221, P1515, P1516
- P1280, P1271, P1272

IMPORTANT: If a sensor input circuit has been shorted to voltage, ensure that the sensor is not damaged. A damaged sensor will continue to indicate a high or low voltage after the affected circuit has been repaired. If the sensor has been damaged, replace it.

An open in the sensor ground circuit between the PCM and the splice will cause one or more of the following DTCs to be set:

- P0108, P1106
- P0406
- P1120, P1515, P1221, P1516, P1635
- P1275, P1639, P1271, P1273
- P1285, P1272, P1273
- P0336, P0337
- P1220, P1515, P1221, P1515, P1516
- P1280, P1271, P1272

A short to ground in the 5-volt reference A or B circuit will cause one or more of the following DTCs to be set:

- P0106, P0107, P1107
- P0401, P1404, P0405
- P1120, P1515, P1221, P1516, P1635
- P1275, P1639, P1271, P1273
- P1285, P1272, P1273
- P0336, P0337
- P1220, P1515, P1221, P1515, P1516
- P1280, P1271, P1272

Check for the following conditions:

- **Poor connection at PCM.** Inspect the harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and a poor terminal-to-wire connection.
- **Damaged harness.** Inspect the wiring harness for damage. If the harness is not damaged, observe an affected sensor's displayed value on the Tech 2 with the ignition "ON" and the engine "OFF" while you move the connectors and the wiring harnesses related to the following sensors:
 - MAP Sensor
 - EGR

Multiple PCM Information Sensor DTCs Set

Step	Action	Value(s)	Yes	No
1	Was the "On-Board (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Turn the ignition "OFF", disconnect the PCM. 2. Turn the ignition "ON", check the 5 volt reference 1 and 2 circuit for the following conditions: <ul style="list-style-type: none"> ● A poor connection at the PCM. ● An open between the PCM connector and the splice. ● A short to ground. ● A short to voltage. Is there an open or short?	—	Go to Step 3	Go to Step 4
3	Repair the open or short. Is the action complete?	—	Verify repair	—
4	Check the sensor ground circuit for the following conditions: <ul style="list-style-type: none"> ● A poor connection at the PCM or the affected sensors. ● An open between the PCM connector and the affected sensors. Is there an open or a poor connection?	—	Go to Step 5	Go to Step 6
5	Repair the open or the poor connection. Is the action complete?	—	Verify repair	—
6	Following below the DTCs stored: P1635, P1639	—	Go to <i>applicable DTC table</i>	Go to Step 7
7	Measure the resistance below the items: <ul style="list-style-type: none"> ● EGR sensor supply circuit and ground circuit. ● Between MAP sensor supply circuit and EGR Sensor supply circuit. ● Between MAP Sensor supply circuit and PCM harness connector. (5Volt supply circuit) Is the resistance near the specified value?	0 Ω	Go to Step 9	Go to Step 8
8	Locate and repair the open circuit in the MAP or EGR sensor supply circuit. Is the action complete?	—	Verify repair	—
9	1. Disconnect the MAP, and EGR connector. 2. Ignition "ON". 3. Measure the resistance below the items: <ul style="list-style-type: none"> ● MAP sensor GND circuit. ● EGR GND circuit. Does the voltage resistance near the specified value?	0 Ω	Go to Step 11	Go to Step 10
10	Locate and repair the short circuit in the MAP or EGR sensor signal or GND circuit. Is the action complete?	—	Verify repair	—

Multiple PCM Information Sensor DTCs Set (Cont'd)

Step	Action	Value(s)	Yes	No
11	Measure the resistance below the items: <ul style="list-style-type: none"> ● CKP sensor supply circuit. ● Between CKP Sensor supply circuit and PCM harness connector. (5Volt supply circuit) Does the voltage resistance near the specified value?	—	Go to <i>Step 13</i>	Go to <i>Step 12</i>
12	Locate and repair the open circuit in the CKP sensor supply circuit. Is the action complete?	—	Verify repair	—
13	1. Disconnect the CKP sensor connector. 2. Ignition "ON". 3. Measure the voltage below the items: <ul style="list-style-type: none"> ● CKP sensor GND circuit and shield circuit. Does the voltage resistance near the specified value?	0 Ω	Go to <i>Step 15</i>	Go to <i>Step 14</i>
14	Locate and repair the short circuit in the CKP sensor signal or GND circuit. Is the action complete?	—	Verify repair	—
15	Are more of the following items for DTCs stored? EGR, MAP, CKP, TPS, APS	—	Go to <i>applicable DTC table</i>	Go to <i>Step 16</i>
16	Replace the PCM. The replacement PCM must be programmed. Refer to <i>ON-Vehicle Service in Power Control Module and Sensors for procedures</i> . And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Go to <i>OBD System Check</i>	—

Exhaust Gas Recirculation (EGR) Diagnosis

An EGR flow check diagnosis of the linear EGR system is covered by DTC P0401. Pintle position error diagnosis is covered by DTC P0402, P0404, P1404, P0405, P0406. If EGR diagnostic trouble codes P0401 and/or P0402, P0404, P1404, P0405, P0406 are encountered, refer to the DTC charts.

Engine Tech 2 Data Definitions and Ranges

A/C CLUTCH – Tech 2 Displays ON or OFF –

Indicates whether the PCM has commanded the A/C clutch ON. Used in A/C system diagnostic.

A/C REQUEST — Tech 2 Displays YES or NO —

Indicates the state of the A/C request input circuit from the HVAC controls. The PCM uses the A/C request signal to determine whether A/C compressor operation is being requested.

AIR/FUEL RATIO — Tech 2 Range 0.0-25.5 —

Air/fuel ratio indicates the PCM commanded value. In closed loop, the air/fuel ratio should normally be displayed around “14.2-14.7”. A lower air/fuel ratio indicates a richer commanded mixture, which may be seen during power enrichment or TWC protection modes. A higher air/fuel ratio indicates a leaner commanded mixture. This can be seen during deceleration fuel mode.

AP1 —Tech 2 Range 0%-100% —

AP (accelerator pedal) angle is computed by the PCM from the AP sensor voltage. AP angle should display “13%” at idle and “85-89%” at wide open throttle.

AP2 —Tech 2 Range 0%-100% —

AP (accelerator pedal) angle is computed by the PCM from the AP sensor voltage. AP angle should display “85-89%” at idle and “11-15%” at wide open throttle.

AP3 —Tech 2 Range 0%-100% —

AP (accelerator pedal) angle is computed by the PCM from the AP sensor voltage. AP angle should display “85-89%” at idle and “32-36%” at wide open throttle.

BAROMETRIC PRESSURE — Tech 2 Range 10-105 kPa/0.00-5.00 Volts —

The barometric pressure reading is determined from the MAP sensor signal monitored during key up and wide open throttle (WOT) conditions. The barometric pressure is used to compensate for altitude differences and is normally displayed around “61-104” depending on altitude and barometric pressure.

CHECK TRANS LAMP — AUTO TRANSMISSION —

Indicates the need to check for a DTC with the Tech 2 when the lamp is flashing 0.2 seconds ON and 0.2 seconds OFF.

DESIRED EGR POS. — Tech 2 Range 0%-100% —

Represents the EGR pintle position that the PCM is commanding.

DESIRED IDLE — Tech 2 Range 0-3187 RPM —

The idle speed that the PCM is commanding. The PCM will compensate for various engine loads based on engine coolant temperature, to keep the engine at the desired speed.

ECT — (Engine Coolant Temperature) Tech 2 Range –40°C to 151°C (–40°F to 304°F) —

The engine coolant temperature (ECT) is mounted in the coolant stream and sends engine temperature information to the PCM. The PCM applies 5 volts to the ECT sensor circuit. The sensor is a thermistor which changes internal resistance as temperature changes. When the sensor is cold (high resistance), the PCM monitors a high signal voltage and interprets that as a cold engine. As the sensor warms (decreasing resistance), the voltage signal will decrease and the PCM will interpret the lower voltage as a warm engine.

EGR DUTY CYCLE — Tech 2 Range 0%-100% —

Represents the EGR valve driver PWM signal from the PCM. A duty cycle of 0% indicates that no EGR flow is being commanded; a 100% duty cycle indicates maximum EGR flow commanded.

EGR FEEDBACK — Tech 2 Range 0.00-5.00 Volts —

Indicates the EGR pintle position sensor signal voltage being monitored by the PCM. A low voltage indicates a fully extended pintle (closed valve); a voltage near 5 volts indicates a retracted pintle (open valve).

ENGINE LOAD — Tech 2 Range 0%-100% —

Engine load is calculated by the PCM from engine speed and MAF sensor readings. Engine load should increase with an increase in RPM or air flow.

ENGINE RUN TIME — Tech 2 Range 00:00:00-99:99:99 Hrs:Min:Sec —

Indicates the time elapsed since the engine was started. If the engine is stopped, engine run time will be reset to 00:00:00.

ENGINE SPEED — Range 0-9999 RPM —

Engine speed is computed by the PCM from the 58X reference input. It should remain close to desired idle under various engine loads with engine idling.

EVAP PURGE PWM — Tech 2 Range 0%-100% —

Represents the PCM commanded PWM duty cycle of the EVAP purge solenoid valve. “0%” displayed indicates no purge; “100%” displayed indicates full purge.

FUEL PUMP — Tech 2 Displays ON or OFF —

Indicates the PCM commanded state of the fuel pump relay driver circuit.

HO2S BANK 1, SEN. 1

— Tech 2 Range 0-1132 mV —

Represents the fuel control exhaust oxygen sensor output voltage. Should fluctuate constantly within a range between 10 mV (lean exhaust) and 1000 mV (rich exhaust) while operating in closed loop.

HO2S BANK2, SEN. 1 —Tech 2 Range 0-1132 mV—
Represents the fuel control exhaust oxygen sensor output voltage. Should fluctuate constantly within a range between 10mV (lean exhaust) and 1000 mV (rich exhaust) while operating in closed loop.

HO2S BANK 1, SEN. 1—Tech 2 Displays NOT READY or READY—

Indicates the status of the exhaust oxygen sensor. The Tech 2 will indicate that the exhaust oxygen sensor is ready when the PCM detects a fluctuating HO2S voltage sufficient to allow closed loop operation. This will not occur unless the exhaust oxygen sensor is warmed up.

HO2S BANK 2, SEN. 1 — Tech 2 Displays NOT READY or READY —

Indicates the status of the exhaust oxygen sensor. The Tech 2 will indicate that the exhaust oxygen sensor is ready when the PCM detects a fluctuating HO2S voltage sufficient to allow closed loop operation. This will not occur unless the exhaust oxygen sensor is warmed up.

IAT (INTAKE AIR TEMPERATURE) — Tech 2 Range -40°C to 151°C (-40°F to 304°F) —

The PCM converts the resistance of the intake air temperature sensor to degrees. Intake air temperature (IAT) is used by the PCM to adjust fuel delivery and spark timing according to incoming air density.

IGNITION 1 — Tech 2 Range 0-25.5 Volts —

This represents the system voltage measured by the PCM at its ignition feed.

INJ. PULSE BANK 1/INJ. PULSE BANK 2 — Tech 2 Range 0-1000 msec. —

Indicates the amount of time the PCM is commanding each injector "ON" during each engine cycle. A longer injector pulse width will cause more fuel to be delivered. Injector pulse width should increase with increased engine load.

LONG TERM FUEL TRIM BANK 1/BANK 2 —

The long term fuel trim is derived from the short term fuel trim values and represents a long term correction of fuel delivery for the bank in question. A value of 0% indicates that fuel delivery requires no compensation to maintain the PCM commanded air/fuel ratio. A negative value significantly below 0% indicates that the fuel system is rich and fuel delivery is being reduced (decreased injector pulse width). A positive value significantly greater than 0% indicates that a lean condition exists and the PCM is compensating by adding fuel (increased injector pulse width). Because long term fuel trim tends to follow short term fuel trim, a value in the negative range due to canister purge at idle should not be considered unusual. Fuel trim values at maximum authority may indicate an excessively rich or lean system.

Fuel System STATUS — Tech 2 Displays OPEN or CLOSED —

"CLOSED" indicates that the PCM is controlling fuel delivery according to oxygen sensor voltage. In "OPEN" the PCM ignores the oxygen sensor voltage and bases the amount of fuel to be delivered on TP sensor, engine coolant, and MAF sensor inputs only.

MAF — Tech 2 Range 0.0-512 gm/s —

MAF (mass air flow) is the MAF input frequency converted to grams of air per second. This indicates the amount of air entering the engine.

MAP

— Tech 2 Range 10-105 kPa (0.00-4.97 Volts) —

The manifold absolute pressure (MAP) sensor measures the change in the intake manifold pressure from engine load, EGR flow, and speed changes. As intake manifold pressure increases, intake vacuum decreases, resulting in a higher MAP sensor voltage and kPa reading. The MAP sensor signal is used to monitor intake manifold pressure changes during the EGR flow test, to update the BARO reading, and as an enabling factor for several of the diagnostics.

MIL — Tech 2 Displays ON or OFF —

Indicates the PCM commanded state of the malfunction indicator lamp.

MISFIRE CUR. CYL. #1 /#2 /#3 /#4 / #5 / #6 — Tech 2 Range 0-255 Counts —

The misfire current counters increase at a rate according to the number of the possible misfires being detected on each cylinder. The counters may normally display some activity, but the activity should be nearly equal for all the cylinders.

MISFIRE CUR. CYL. #1 /#2 /#3 /#4 / #5 / #6 — Tech 2 Range 0-65535 Counts —

The misfire history counters display the relative level of misfire that has been detected on each cylinder. The misfire history counters will not update or show any activity until a misfire DTC (P0300) has become active.

MISFIRE FAILURES SINCE FIRST FAIL — Tech 2 Range 0-65535 Counts —

Indicates the number of 200 crankshaft revolution sample periods during which the level of misfire was sufficiently high to report a fail.

MISFIRE PASSES SINCE FIRST FAIL — Tech 2 Range 0-65535 Counts —

Indicates the number of 200 crankshaft revolution sample periods during which the level of misfire was sufficiently low to report a pass.

POWER ENRICHMENT — Tech 2 Displays ACTIVE or INACTIVE —

"ACTIVE" displayed indicates that the PCM has detected conditions appropriate to operate in power enrichment mode. The PCM will command power enrichment mode when a large increase in throttle position and load is detected. While in power enrichment mode, the PCM will increase the amount of fuel delivered by entering open loop and increasing the injector pulse width. This is done to prevent a possible sag or hesitation from occurring during accelerator.

SPARK — Tech 2 Range -64° to 64° —

Displays the amount of spark advance being commanded by the PCM on the IC circuit.

**START-UP ECT — Tech 2 Range -40°C to 151°C
(-40°F to 304°F) —**

Indicates the engine coolant temperature at the time that the vehicle was started. Used by the HO2S diagnostic to determine if the last start-up was a cold start.

**START-UP IAT — Tech 2 Range -40°C to 151°C
(-40°F to 304°F) —**

Indicates the intake air temperature at the time that the vehicle was started. Used by the HO2S diagnostic to determine if the last start-up was a cold start.

**TOTAL MISFIRE CURRENT COUNT — Tech 2
Range 0-255 —**

Indicates the total number of cylinder firing events that were detected as being misfires during the last 200 crankshaft revolution sample period.

TP — Tech 2 Range 0%-100% —

TP (throttle position) angle is computed by the PCM from the TP sensor voltage. TP angle should display “3-5%” at idle and “100%” at wide open throttle.

**CATALYST PROTECTION MODE — Tech 2 Displays
YES or NO —**

“YES” displayed indicates that the PCM has detected conditions appropriate to operate in TWC protection mode. The PCM will decrease the air/fuel ratio to a value that depends on mass air flow (higher mass air flow = lower air/fuel ratio).

**WEAK CYLINDER — Tech 2 Displays Cylinder
Number —**

This indicates that the PCM has detected crankshaft speed variations that indicate 2% or more cylinder firing events are misfires.

Typical Scan Data Values

Use the Typical Scan Data Values Table only after the On-Board Diagnostic System Check has been completed, no DTC(s) were noted, and you have determined that the on-board diagnostics are functioning properly. Tech 2 values from a properly-running engine may be used for comparison with the engine you are diagnosing. The typical scan data values represent values that would be seen on a normally-running engine.

NOTE: A Tech 2 that displays faulty data should not be used, and the problem should be reported to the Tech 2 manufacturer. Use of a faulty Tech 2 can result in misdiagnosis and unnecessary replacement of parts.

Only the parameters listed below are referred to in this service manual for use in diagnosis. For further information on using the Tech 2 to diagnose the PCM and related sensors, refer to the applicable reference section listed below. If all values are within the typical range described below, refer to the *Symptoms* section for diagnosis.

Test Conditions

Engine running, lower radiator hose hot, transmission in park or neutral, closed loop, accessories off, brake not applied and air conditioning off.

3.2L V-6 Engine (Automatic and Manual Transmission)

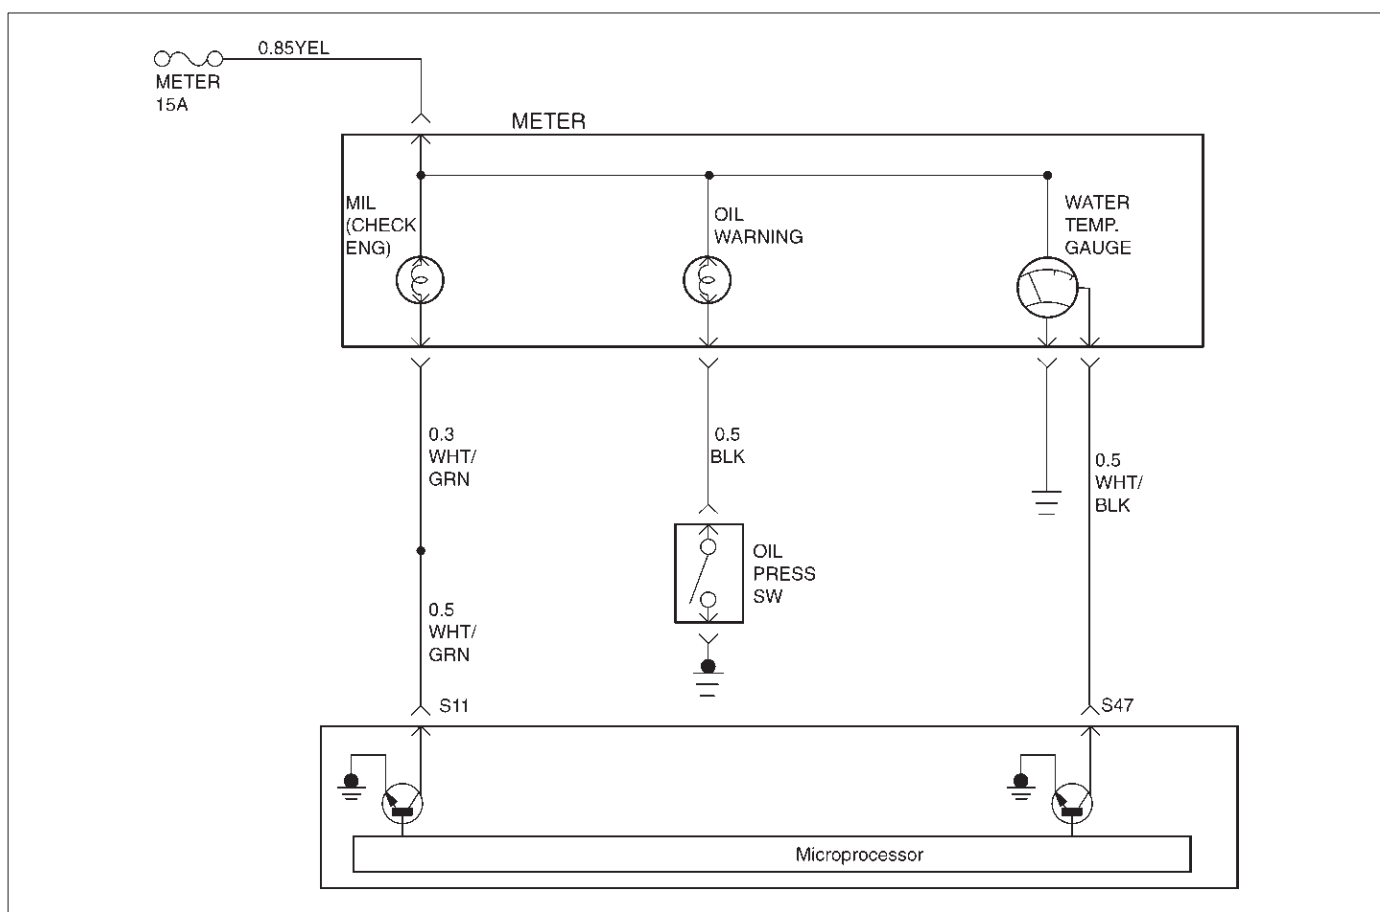

Tech 2 Parameter	Data List	Units Displayed	Typical Data Values (IDLE)	Typical Data Values (2500 RPM)	Refer To

No Malfunction Indicator Lamp (MIL)

060R100064

Circuit Description

The “Check Engine” lamp (MIL) should always be illuminated and steady with the ignition “ON” and the engine stopped. Ignition feed voltage is supplied to the MIL bulb through the meter fuse. The powertrain control module (PCM) turns the MIL “ON” by grounding the MIL driver circuit.

Diagnostic Aids

An intermittent MIL may be caused by a poor connection, rubbed-through wire insulation, or a wire broken inside the insulation. Check for the following items:

- Inspect the PCM harness and connections for improper mating, broken locks, improperly formed or damaged terminals, poor terminal-to-wire connection, and damaged harness.
- If the engine runs OK, check for a faulty light bulb, an open in the MIL driver circuit, or an open in the instrument cluster ignition feed.
- If the engine cranks but will not run, check for an open PCM ignition or battery feed, or a poor PCM to engine ground.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

- A “No MIL” condition accompanied by a no-start condition suggests a faulty PCM ignition feed or battery feed circuit.
- Using a test light connected to B+, probe each of the PCM ground terminals to ensure that a good ground is present. Refer to *PCM Terminal End View* for terminal locations of the PCM ground circuits.
- In this step, temporarily substitute a known good relay for the PCM relay. The horn relay is nearby, and it can be verified as “good” simply by honking the horn. Replace the horn relay after completing this step.
- This vehicle is equipped with a PCM which utilizes an electrically erasable programmable read only memory (EEPROM). When the PCM is replaced, the new PCM must be programmed. Refer to *PCM Replacement and Programming Procedures* and *Powertrain Control Module (PCM) and Sensors*.

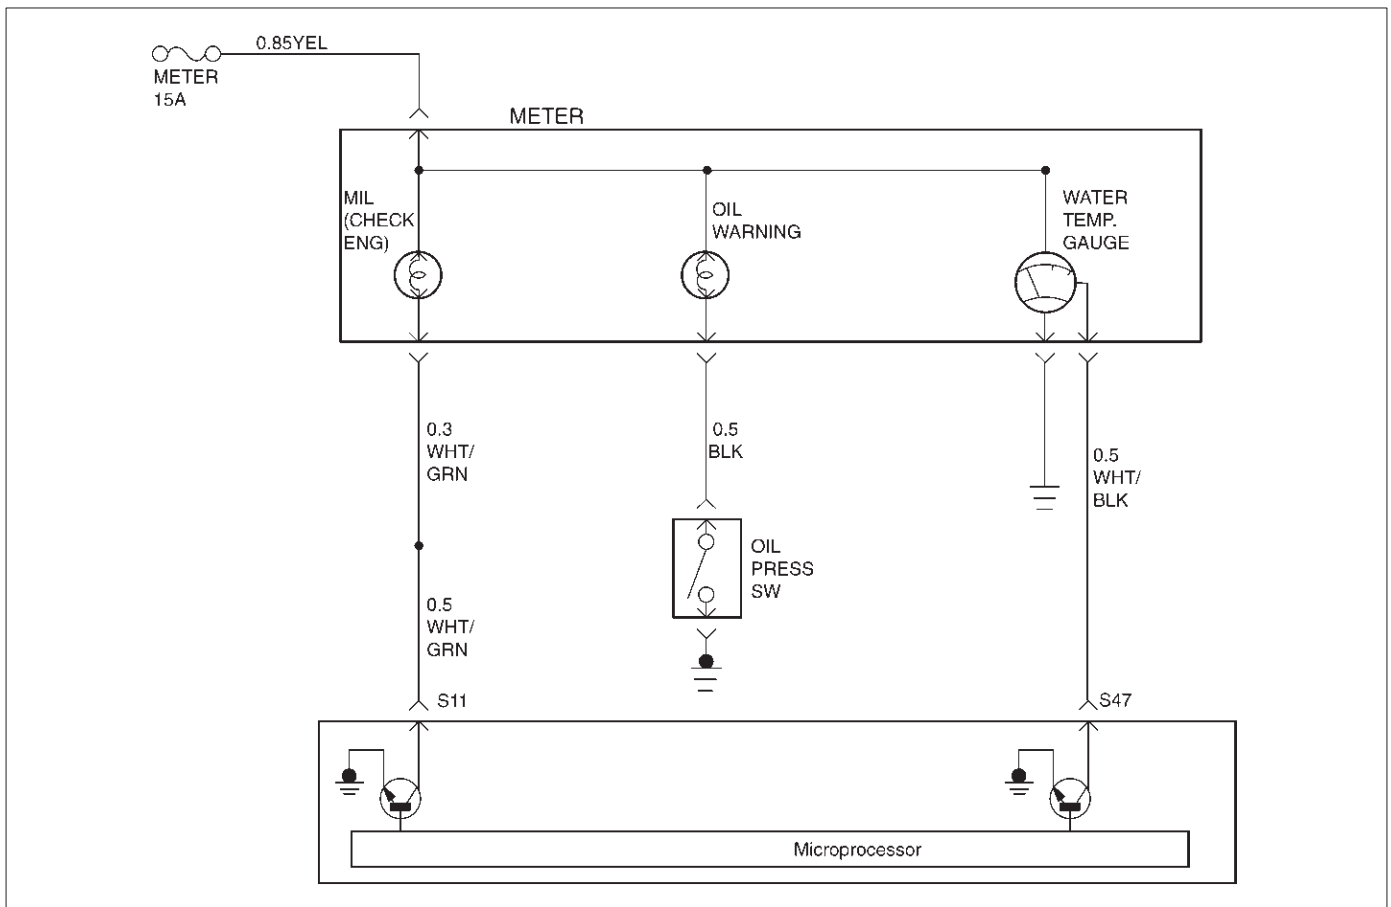

No Malfunction Indicator Lamp (MIL)

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Attempt to start the engine. Does the engine start?	—	Go to Step 3	Go to Step 6
3	Check the meter fuse for the instrument cluster ignition feed circuit. Is the fuse OK?	—	Go to Step 4	Go to Step 16
4	Ignition "ON", probe the ignition feed circuit at the cluster connector with a test light to ground. Is the test light "ON"?	—	Go to Step 5	Go to Step 13
5	1. Ignition "OFF". 2. Disconnect the PCM. 3. Jumper the MIL driver circuit at the PCM connector to ground. 4. Ignition "ON". Is the MIL "ON"?	—	Go to Step 10	Go to Step 11
6	Check the PCM ignition feed and battery feed fuses (15 A engine fuse and 15 A PCM fuse). Are both fuses OK?	—	Go to Step 7	Go to Step 15
7	1. Ignition "OFF". 2. Disconnect the PCM. 3. Ignition "ON". 4. Probe the ignition feed circuit at the PCM harness connector with a test light to ground. Is the test light "ON"?	—	Go to Step 8	Go to Step 12
8	Probe the battery feed circuit at the PCM harness connector with a test light to ground. Is the test light "ON"?	—	Go to Step 9	Go to Step 14
9	Check for a faulty PCM ground connection. Was a problem found?	—	Verify repair	Go to Step 10
10	Check for damaged terminals at the PCM. Was a problem found?	—	Verify repair	Go to Step 17
11	Check for an open MIL driver circuit between the PCM and the MIL. Was a problem found?	—	Verify repair	Go to Step 18
12	Substitute a known "good" relay for the PCM main relay. Was the malfunction fixed?	—	Verify repair	Go to Step 13
13	Repair the open in the ignition feed circuit. Is the action complete?	—	Verify repair	—
14	Locate and repair the open PCM battery feed circuit. Is the action complete?	—	Verify repair	—

No Malfunction Indicator Lamp (MIL) (Cont'd)

Step	Action	Value(s)	Yes	No
15	Locate and repair the short to ground in the PCM ignition feed circuit or PCM battery feed circuit. Is the action complete?	—	Verify repair	—
16	Locate and repair the short to ground in the ignition feed circuit to the instrument cluster, and replace the fuse. Is the action complete?	—	Verify repair	—
17	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>PCM in ON-Vehicle Service</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—
18	Check the MIL driver circuit for a poor connection at the instrument panel connector. Was a problem found?	—	Verify repair	Go to <i>Instrument Panel in Electrical Diagnosis</i>

Malfunction Indicator Lamp (MIL) "ON" Steady

060R100064

Circuit description

The malfunction indicator lamp (MIL) should always be illuminated and steady with ignition "ON" and the engine stopped. Ignition feed voltage is supplied directly to the MIL indicator. The powertrain control module (PCM) turns the MIL "ON" by grounding the MIL driver circuit. The MIL should not remain "ON" with the engine running and no DTC(s) set. A steady MIL with the engine running and no DTC(s) suggests a short to ground in the MIL driver circuit.

Diagnostic Aids

An intermittent may be caused by a poor connection, rubbed-through wire insulation, or a wire broken inside the insulation. Check for the following items:

- Poor connection or damaged harness – Inspect the PCM harness and connectors for improper mating, broken locks, improperly formed or damaged terminals, poor terminal-to-wire connection, and damaged harness.

Test Description

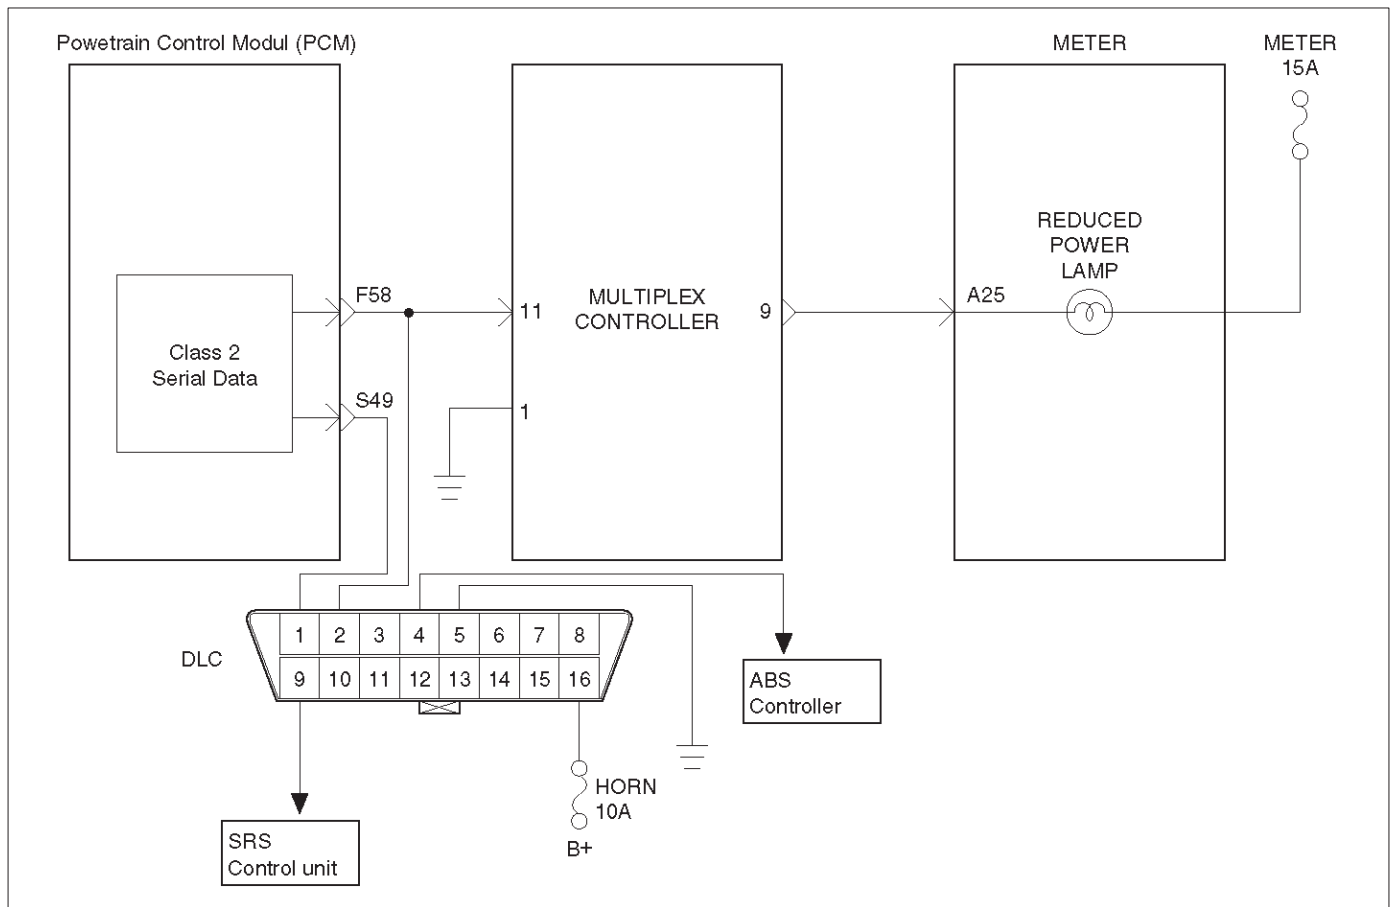

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. If the MIL does not remain "ON" when the PCM is disconnected, the MIL driver wiring is not faulty.
3. If the MIL driver circuit is OK, the instrument panel cluster is faulty.
6. This vehicle is equipped with a PCM which utilizes an electrically erasable programmable read only memory (EEPROM). When the PCM is replaced, the new PCM must be programmed. Refer to *PCM Replacement and Programming Procedures in Powertrain Control Module (PCM) and Sensors*.

Malfunction Indicator Lamp (MIL) "ON" Steady

Step	Action	Value(s)	Yes	No
1	Was the "On-Board diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "OFF", disconnect PCM. 2. Ignition "ON", observe the MIL (Service Engine Soon lamp). Is the MIL "ON"?	—	Go to Step 3	Go to Step 5
3	1. Ignition "OFF", disconnect the instrument panel cluster. 2. Check the MIL driver circuit between the PCM and the instrument panel cluster for a short to ground. 3. If a problem is found, repair as necessary. Was the MIL driver circuit shorted to ground?	—	Go to <i>OBD System Check</i>	Go to Step 4
4	Replace the instrument panel cluster. Is the action complete?	—	Go to <i>OBD System Check</i>	—
5	1. Ignition "OFF", reconnect the PCM. 2. Ignition "ON", reprogram the EEPROM. Refer to <i>On-Vehicle Service</i> in <i>Powertrain Control Module and Sensors</i> for procedures. 3. Using the Tech 2 output controls function, select MIL dash lamp control and command the MIL "OFF". (Refer to the Miscellaneous test) Did the MIL turn "OFF"?	—	Go to <i>OBD System Check</i>	Go to Step 6
6	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service</i> in <i>Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Go to <i>OBD System Check</i>	—

No Reduced Power Lamp (RPL)

060R100065

Circuit Description

The Reduced Power lamp (RPL) should be illuminated during 3 seconds with the ignition "ON" and the engine stopped. Ignition feed voltage is supplied to the RPL bulb through the meter fuse. The powertrain control module (PCM) orders the RPL "ON" signal for Multiplex Control Unit. When Multiplex Control Unit is received RPL "ON" signal that turn RPL "ON" by grounding the RPL driver circuit.

Diagnostic Aids

An intermittent RPL may be caused by a poor connection, rubbed-through wire insulation, or a wire broken inside the insulation. Check for the following items:

- Inspect the PCM and Multiplex Control Unit harness and connections for improper mating, broken locks, improperly formed or damaged terminals, poor terminal to wire connection, and damaged harness.
- If the engine runs OK, check for a faulty light bulb, an open in the MIL driver circuit, or an open in the instrument cluster ignition feed.
- If the engine cranks but will not run, check for an open PCM ignition or battery feed, or a poor PCM to engine ground.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. A "No RPL" condition accompanied by a no-start condition suggests a faulty PCM ignition feed or battery feed circuit.
9. Using a test light connected to B+, probe each of the Multiplex Control Unit ground terminals to ensure that a good ground is present. Refer to Multiplex Control Unit Terminal End View for terminal locations of the Unit Terminal End View for terminal locations of the Multiplex Control Unit ground circuits.
12. Using a test light connected to B+, probe each of the PCM ground terminals to ensure that a good ground is present. Refer to PCM Terminal End View for terminal locations of the PCM ground circuits.
21. In this step, temporarily substitute a known good relay for the PCM relay. The horn relay is nearby, and it can be verified as "good" simply by honking the horn. Replace the horn relay after completing this step.
24. This vehicle is equipped with a PCM which utilizes an electrically erasable programmable read only memory (EEPROM). When the PCM is replaced, the new PCM must be programmed. Refer to PCM Replacement and Programming Procedures in Powertrain Control Module (PCM) and Sensors.

No Reduced Power Lamp (RPL)

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" Performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Attempt to start the engine. Does the engine start?	—	Go to Step 3	Go to Step 11
3	Check the following fuses: MAIN(100A), B+1(60A), B+2(50A), METER(15A), ECM(15A), ENGINE(15A) Was a problem found?	—	Go to Step 14	Go to Step 4
4	1. Ignition "OFF". 2. Disconnect the cluster meter connector. 3. Ignition "ON", Probe the ignition feed circuit at the cluster connector with a test light to ground. Is the test light "ON"?	—	Go to Step 5	Go to Step 15
5	1. Ignition "OFF". 2. Disconnect the Multiplex Control Unit. 3. Check the circuit (Lamp driver Circuit) between PCM and Multiplex Control Unit. Was a problem found?	—	Go to Step 16	Go to Step 6
6	1. Reconnect the cluster meter connector. 2. Disconnect the Multiplex Control Unit. 3. Jumper the RPL driver circuit at the Multiplex Control Unit connector to ground. 4. Ignition "ON". Is the RPL "ON"?	—	Go to Step 7	Go to <i>Instrument Panel in Electrical Diagnosis</i>
7	1. Ignition "OFF". 2. Probe the ignition feed circuit at the Multiplex Control Unit connector with a test light to ground. 3. Ignition "ON". Is the test light "ON"?	—	Go to Step 8	Go to Step 17
8	1. Ignition "OFF". 2. Disconnect the PCM. 3. Check the circuit (Lamp driver Circuit) between PCM and Multiplex Control Unit. Was a problem found?	—	Go to Step 18	Go to Step 9
9	Check the Multiplex Control Unit ground connection and circuit. Was a problem found?	—	Go to Step 19	Go to Step 10
10	Check for damaged terminals at the Multiplex Control Unit. Was a problem found?	—	Go to Step 20	Go to Step 11
11	1. Ignition "ON". 2. Probe the ignition feed circuit at the PCM harness connector with a test light to ground. Is the test light "ON"?	—	Go to Step 12	Go to Step 21

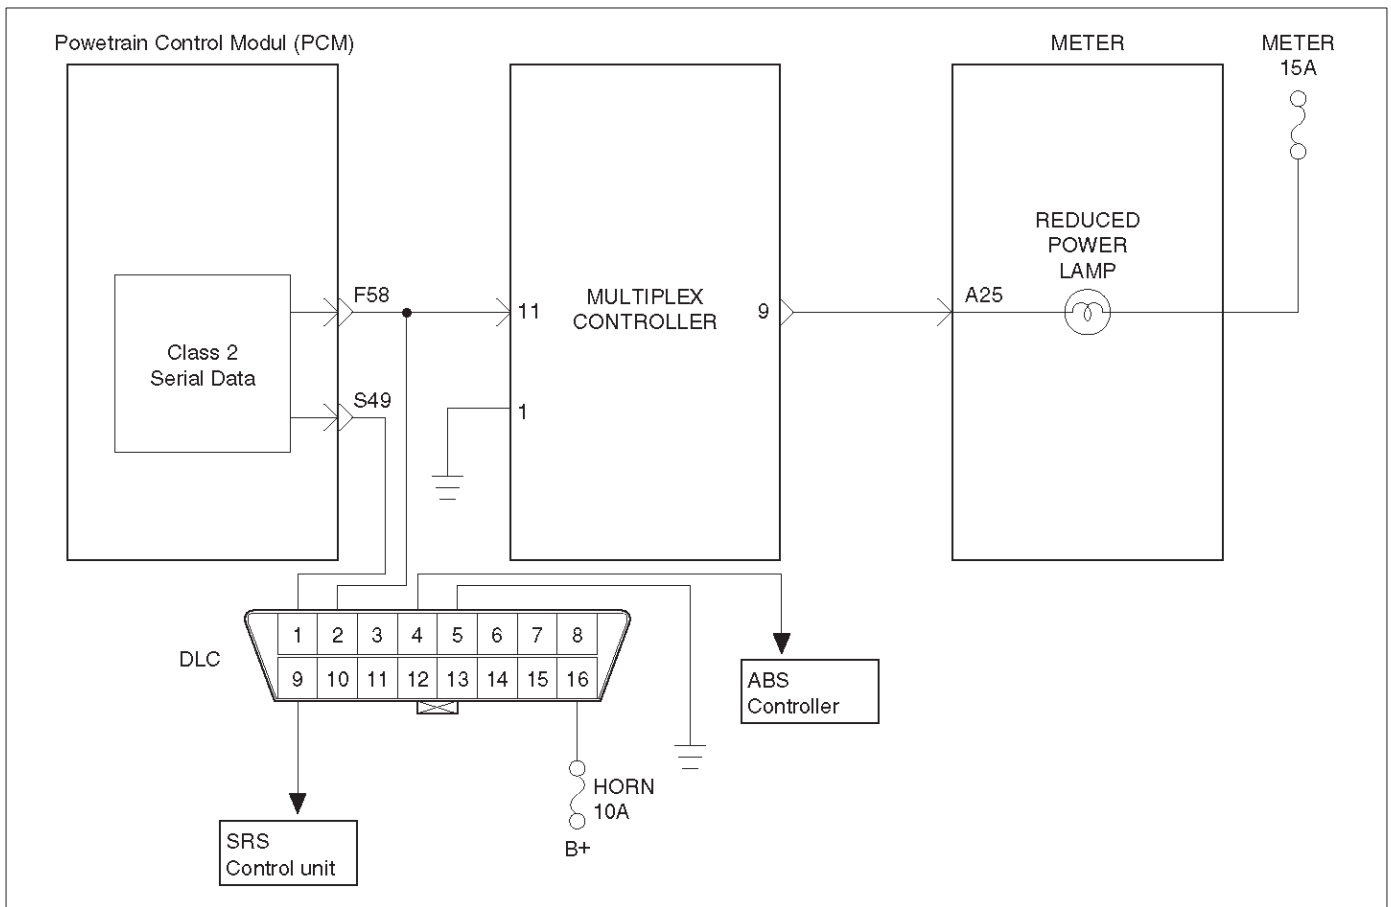

No Reduced Power Lamp (RPL) (Cont'd)

Step	Action	Value(s)	Yes	No
12	1. Ignition "OFF". 2. Check for a faulty PCM ground connection and Circuit. Was a problem found?	—	Go to <i>Step 23</i>	Go to <i>Step 13</i>
13	Check for damaged terminals at the PCM. Was a problem found?	—	Go to <i>Step 24</i>	Go to <i>Step 25</i>
14	Replace the fuse. Is the action complete?	—	Verify repair	—
15	Locate and repair the cluster meter battery feed open circuit. Is the action complete?	—	Verify repair	—
16	Locate and repair the circuit between cluster meter and Multiplex Control Unit open circuit. Is the action complete?	—	Verify repair	—
17	Locate and repair the circuit Multiplex Control Unit battery feed open circuit. Is the action complete?	—	Verify repair	—
18	Locate and repair the between Multiplex Control Unit and PCM open circuit. Is the action complete?	—	Verify repair	—
19	Locate and repair the ground connection for Multiplex Control Unit circuit. Is the action complete?	—	Verify repair	—
20	Replace the Multiplex Control Unit. circuit. Is the action complete?	—	Verify repair	—
21	Substitute a known "good" relay for the PCM main relay. Was the malfunction fixed?	—	Verify repair	Go to <i>Step 22</i>
22	Repair the open in the ignition feed circuit. Is the action complete?	—	Verify repair	—
23	Locate and repair the ground connection for PCM circuit. Is the action complete?	—	Verify repair	—
24	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to ON-Vehicle Service in Power Control Module and Sensors for procedures. And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

No Reduced Power Lamp (RPL) (Cont'd)

Step	Action	Value(s)	Yes	No
25	1. Ignition "OFF". 2. Reconnect all connectors. 3. Install the Tech 2. 4. Ignition "ON". 5. Using the Tech 2 output controls function, select RPL dash lamp control and command the RPL "ON". (Refer to the Miscellaneous test) Did the RPL turn "ON"?	—	Verify repair	Go to <i>Step 26</i>
26	1. Ignition "OFF". 2. Disconnect the PCM. 3. Check the circuit (DLC line) between PCM and DLC. Was a problem found?	—	Go to <i>Step 27</i>	Go to <i>Step 24</i>
27	Locate and repair the circuit between PCM and DLC. Is the action complete?	—	Go to <i>Step 25</i>	—

Reduced Power Lamp (RPL) "ON" Steady

060R100065

Circuit Description

The Reduced Power lamp (RPL) should be illuminated during 3 seconds with the ignition "ON" and the engine stopped. Ignition feed voltage is supplied to the RPL bulb through the meter fuse. The powertrain control module (PCM) orders the RPL "ON" signal for Multiplex Control Unit. When Multiplex Control Unit is received RPL "ON" signal that turn RPL "ON" by grounding the RPL driver circuit.

The RPL should not remain "ON" with the engine running and no DTC(s) set. A steady RPL with the engine running and no DTC(s) suggests a short to ground in the RPL driver circuit.

Diagnostic Aids

An intermittent RPL may be caused by a poor connection, rubbed through wire insulation, or a wire broken inside the insulation. Check for the following items:

- Poor connection or damaged harness – Inspect the PCM harness and connectors for improper mating, broken locks, improperly formed or damaged terminals, poor terminal to wire connection, and damaged harness.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

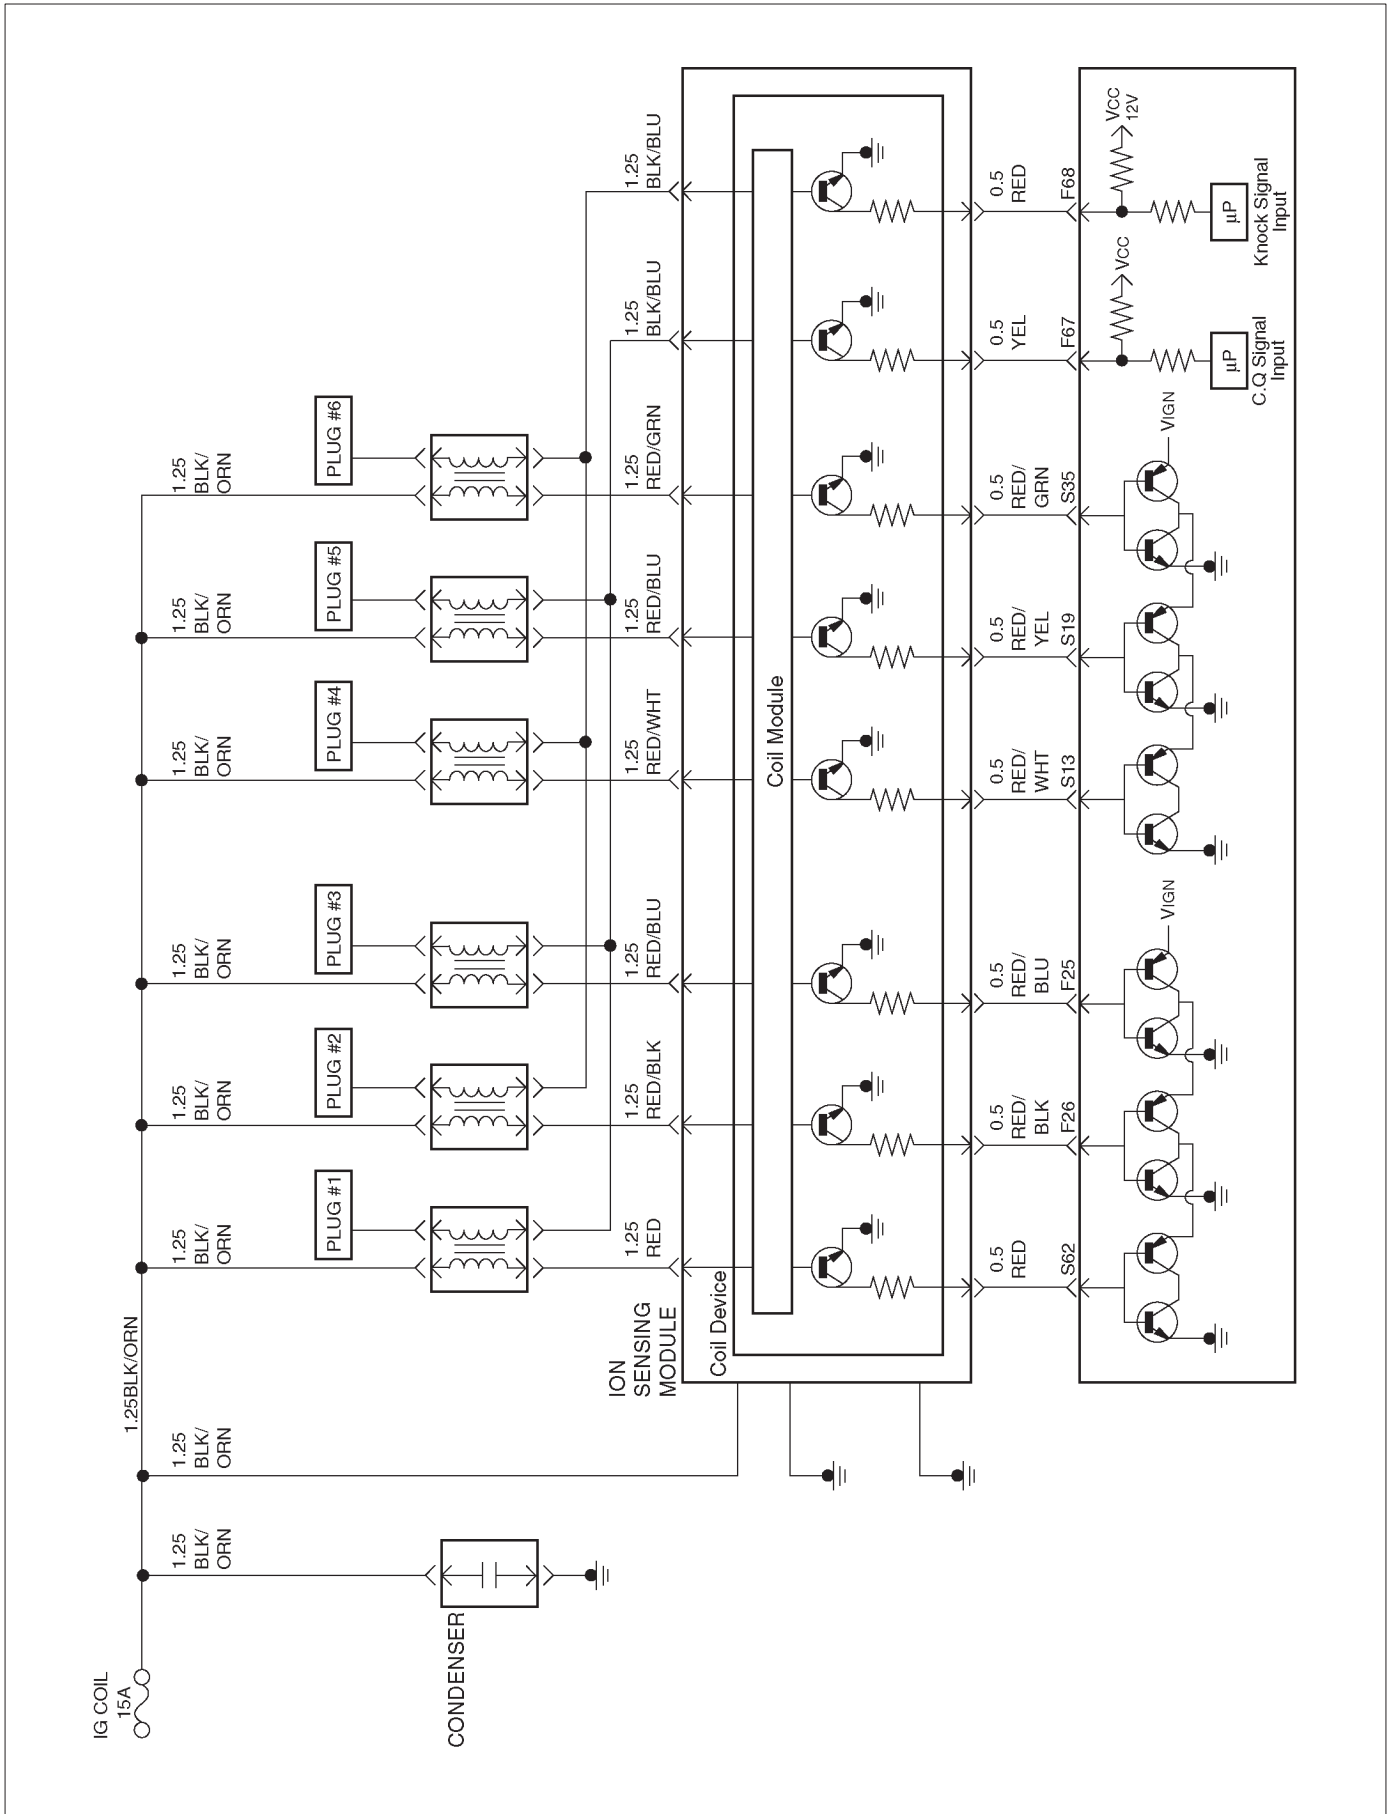

2. If the RPL does not remain "ON" when the Multiplex Control Unit is disconnected, the RPL driver wiring is not faulty.
3. If the RPL driver circuit is OK, the instrument panel cluster is faulty.
10. This vehicle is equipped with a PCM which utilizes an electrically erasable programmable read only memory (EEPROM). When the PCM is replaced, the new PCM must be programmed. Refer to PCM Replacement and Programming Procedures in Powertrain Control Module (PCM) and Sensors.

Reduced Power Lamp (RPL) "ON" Steady

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	1. Ignition "OFF", disconnect Multiplex Control Unit. 2. Ignition "ON", observe the RPL (Reduced Power Lamp). Is the RPL "ON"?	—	Go to <i>Step 3</i>	Go to <i>Step 4</i>
3	1. Ignition "OFF", disconnect the instrument panel cluster. 2. Check the RPL driver circuit between the Multiplex Control Unit and the instrument panel cluster for a short to ground. 3. If a problem is found, repair as necessary. Was the RPL driver circuit shorted to ground?	—	Verify repair	Go to <i>Step 4</i>
4	1. Replace the Multiplex Control Unit. 2. Install the Tech 2 3. Ignition "ON". 4. Using the Tech 2 output controls function, select RPL dash lamp control and command the RPL "OFF". (Refer to the Miscellaneous test) Did the MIL turn "OFF"?	—	Verify repair	Go to <i>Step 5</i>

10	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to ON-Vehicle Service in Power Control Module and Sensors for procedures. And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Go to <i>OBD System Check</i>	—

Circuit Description

The electronic Ignition system uses a coil -at-plug method of spark distribution. In this type of ignition system, the powertrain control module (PCM) triggers the correct driver outside the Ignition Current Sense System (ICSS), which then triggers the correct ignition coil based on the 58X signal received from the crankshaft position sensor (CKP). The spark plug connected to the coil fires when the ICSS opens the ground circuit for the coil’s primary circuit.

During crank, the PCM monitors the CKP 58X signal. The CKP signal is used to determine which cylinder will fire first. After the CKP 58X signal has been processed by the PCM, it will command all six injectors to allow a priming shot of fuel for all the cylinders. After the priming, the injectors are left “OFF” during the next six 58X reference pulses from the CKP. This allows each cylinder a chance to use the fuel from the priming shot. During this waiting been received by the PCM. The ION sensor signal allows the PCM to operate the injectors sequentially based on camshaft position. If the camshaft position signal is not present at start - up, the PCM will begin sequential fuel delivery with a 1 -in-6 chance that fuel delivery is correct. The engine will run without a ION sensor signal, but will set a DTC code.

Diagnostic Aids

An intermittent problem may be caused by a poor connection, rubbed - through wire insulation or a wire broken inside the insulation. Check for the following items:

- Poor connection or damaged harness-Inspect the PCM harness and connectors for improper mating, broken locks, improperly formed or damaged terminals, poor terminal-to-wire connection, and damaged harness.

- Faulty engine coolant temperature sensor-Using a Tech 2, compare engine coolant temperature with intake air temperature on a completely cool engine. Engine coolant temperature should be within 10 ° C of intake air temperature. If not, replace the ECT sensor.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

5. An obvious cause of low fuel pressure would be an empty fuel tank.
6. A blinking test light verifies that the PCM is monitoring the 58X crankshaft reference signal and is capable of activating the injectors. If there is an open or shorted driver circuit, DTCs 201 – 206 and a misfire DTC 300 – 306 should be set.
18. By using a spark tester, each ignition coil’s ability to produce 25,000 volts is verified.
24. If there is an open or shorted driver circuit, DTCs 201 – 206 and a misfire DTC 301 – 306 should be set. All six injector driver circuits can be checked at one time without removing the intake manifold if a J 39021 – 95 test light is available. This is the alternative procedure:
 - With the ignition “OFF”, disconnect the gray connector located at the rear of the air filter, attached to a bracket on the purge canister.
 - Connect test light 5-8840-2636-0 to the connector. Do any of the light constantly illuminate or fail to blink when the engine is cranked? If so, repair the short or open circuit, or replace the PCM if indicated.

This procedure only tests the driver circuit as far as the test connection, so step 31 is added to test the circuit all the way to the injector.

Engine Cranks But Will Not Run

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Check the ignition coil fuse (15A), the engine fuse (15A), and the PCM fuse (30A). Was a fuse blown?	—	Go to Step 3	Go to Step 4
3	Check for a short to ground and replace the fuse. Is the action complete?	—	Verify repair	—
4	1. Ignition “OFF”, install a fuel pressure gauge at the test fitting on the fuel supply line in the engine compartment. (Use a shop cloth to absorb any fuel leakage while making the connection.) 2. Ignition “ON”, observe the fuel pressure. Is the fuel pressure within the specified values, and does it hold steady?	285 - 375 kPa (43 – 55 psi)	Go to Step 6	Go to Step 5
5	Is any fuel pressure indicated?	—	Go to <i>Fuel System Electrical Test</i>	Go to <i>Fuel System Diagnosis</i>

Engine Cranks But Will Not Run (Cont'd)

Step	Action	Value(s)	Yes	No
6	Install an injector test light at the #2 cylinder injector harness connector (or install 5-8840-2636-0 test light to the injector test connector). Does the light blink when the engine is cranked?	—	Go to <i>Step 8</i>	Go to <i>Step 24</i>
7	1. Ignition "OFF". 2. Disconnect the 11-pin connector at the ION sensing module. 3. With a test light to B + , probe each of the 6 exposed ION sensing module pins, one at a time, while the engine is cranked. (Use the gray narrow Metri - Pak © flexible female connector from the J - 35616 kit to make the pin accessible.) Does the light flash at each pin when the engine is cranked?	—	Go to <i>Step 11</i>	Go to <i>Step 8</i>
8	1. Remove the 4-pin connector at the ION sensing module. 2. Ignition "ON". 3. Use a test light at the harness connector to verify that the module is being supplied with B + and ground. Was a problem found?	—	Go to <i>Step 9</i>	Go to <i>Step 10</i>
9	Repair the open ignition feed circuit or ground circuit to the ION sensing module. Is the action complete?	—	Verify repair	—
10	Repair the ION sensing module. Is the action complete?	—	Verify repair	—
11	1. Reconnect the ION sensing module 11-pin connector. 2. Remove the electrical connector from each coil. 3. With a test light to B+, probe each of the coil connectors at the wire which runs to the ION sensing module. Does the light flash at each coil connector when the engine is cranked?	—	Go to <i>Step 13</i>	Go to <i>Step 12</i>
12	Check for an open circuit between the coil and ION sensing module. Is the action complete?	—	Verify repair	—
13	1. Ignition "ON". 2. While the coil connectors are disconnected, touch each coil connector's ignition feed terminal with a grounded test light (the ignition feed wire is YEL tracer). Did the test light illuminate?	—	Go to <i>Step 15</i>	Go to <i>Step 14</i>
14	Repair the open ignition feed circuit. Is the action complete?	—	Verify repair	—
15	While the coil connectors are disconnected, touch each connector's secondary ground terminal with a test light to B +. (The ground wires are black.) Did the test light illuminate at each coil connector?	—	Go to <i>Step 17</i>	Go to <i>Step 16</i>

Engine Cranks But Will Not Run (Cont'd)

Step	Action	Value(s)	Yes	No
16	Repair the open secondary ground circuit. Is the action complete?	—	Verify repair	—
17	1. Test the fuel for contamination. 2. If a problem is found, clean the fuel system and correct the contaminated fuel condition as necessary. Replace the fuel filter and replace any injectors that are not delivering fuel (see Injector Balance Test). Was a problem found?	—	Verify repair	Go to <i>Step 18</i>
18	1. Remove any ignition coil and install a spark tester at the spark plug end of the coil. 2. Observe the tester while the engine is cranking. Was a crisp, blue spark observed? Only one or two sparks followed by no result is considered the same as "No Spark".	—	Go to <i>Step 20</i>	Go to <i>Step 19</i>
19	Replace the ignition coil, and return to Step 19 to test the remaining coils. Is the action complete?	—	Verify repair	—
20	Repeat Step 19 for each coil. Remove only one coil at a time, and reinstall each coil on its spark plug after testing, but do not refasten coils with screws at this time. After all coils have passed the spark test, does the engine start?	—	Refasten all coils with their screws	Go to <i>Step 21</i>
21	1. Remove the spark plugs from all cylinders. 2. Visually inspect the spark plug electrodes. 3. Replace any spark plugs with loose or missing electrodes or cracked insulators. Did your inspection reveal any spark plugs exhibiting excessive fouling?	—	Correct the fouling condition	Go to <i>Step 22</i>
22	Refer to <i>Engine Mechanical Diagnosis</i> to diagnose the following conditions: <ul style="list-style-type: none"> ● Faulty or incorrect camshaft drive belts ● Leaking or sticky valves or rings ● Excessive valve deposits ● Weak valve springs ● Incorrect valve timing ● Leaking head gasket Is the action complete?	—	Verify repair	Go to <i>Step 24</i>
23	Observe the "Engine Speed" data display on the Tech 2 while cranking the engine. Is the engine RPM indicated?	—	Go to <i>Step 24</i>	Go to <i>Step 33</i>

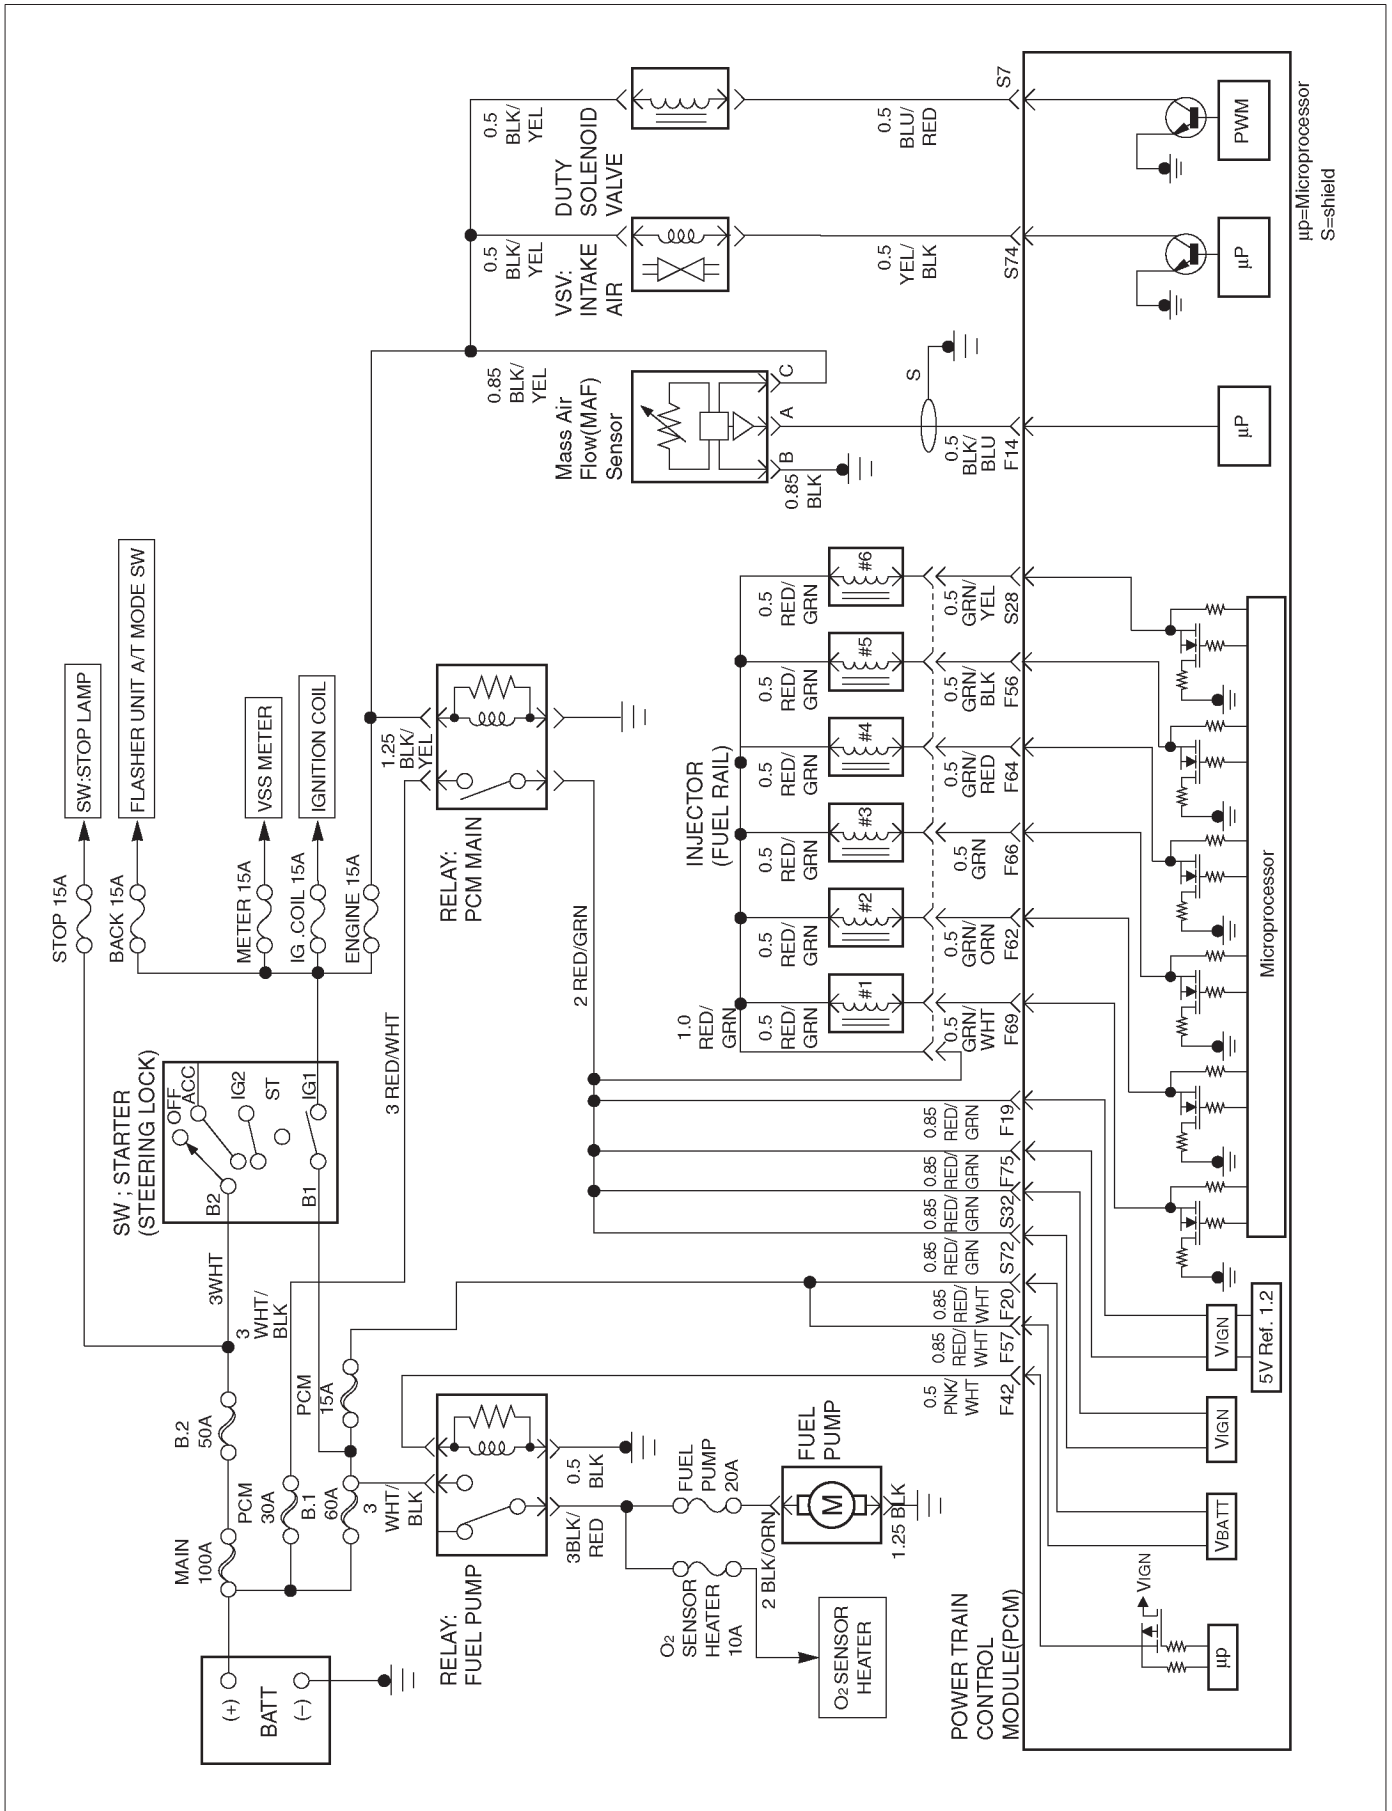

Engine Cranks But Will Not Run (Cont'd)

Step	Action	Value(s)	Yes	No
24	<ol style="list-style-type: none"> 1. Disconnect the 7-pin gray connector at the rear of the air filter beneath the point where the air duct attaches to the MAF sensor. 2. Ignition "ON". 3. Using a test light connected to ground, probe the ignition terminal at the PCM (female) side of the 7-pin connector. <p>Is the test light "ON"?</p>	—	Go to <i>Step 25</i>	Go to <i>Step 31</i>
25	<ol style="list-style-type: none"> 1. At the PCM (female) side of the connector, connect a test light between the ignition + terminal and one of the injector driver circuits at the same connector. 2. Ignition "ON". 3. Observe the test light, and repeat the test for each injector driver circuit. <p>Did the test light stay on when checking any of the 6 injector driver circuits?</p>	—	Go to <i>Step 26</i>	Go to <i>Step 28</i>
26	<ol style="list-style-type: none"> 1. Ignition "OFF", disconnect the PCM. 2. Ignition "ON", observe the test light. <p>Is the test light "ON"?</p>	—	Go to <i>Step 27</i>	Go to <i>Step 32</i>
27	<p>Locate and repair the short to ground in the injector driver circuit.</p> <p>Is the action complete?</p>	—	Verify repair	—
28	<ol style="list-style-type: none"> 1. Using the same test location as in step 26, connect a test light between the ignition terminal and one of the driver circuits. 2. Crank the engine and observe the test light. 3. Repeat for each injector driver circuit. <p>Did the light blink during the test for each circuit?</p>	—	Go to <i>Step 30</i>	Go to <i>Step 29</i>
29	<p>Check for an open injector driver circuit.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 32</i>
30	<ol style="list-style-type: none"> 1. At the injector (male) side of the gray connector mentioned in step 25, connect an ohmmeter between the ignition pin and one of the driver circuit pins. 2. Check for continuity in the circuit. 3. Repeat for each injector circuit. The readings should be approximately equal to the specified value for injector resistance. <p>Was a problem found?</p>	12.5 Ω	Verify repair	Go to <i>Step 7</i>
31	<p>Repair the ignition feed circuit.</p> <p>Is the action complete?</p>	—	Verify repair	—

Engine Cranks But Will Not Run (Cont'd)

Step	Action	Value(s)	Yes	No
32	<p>Replace the PCM.</p> <p>IMPORTANT: The replacement PCM must be programmed.</p> <p>Refer to <i>ON-Vehicle Service in Power Control Module and Sensors for procedures</i>.</p> <p>And also refer to latest Service Bulletin.</p> <p>Check to see if the latest software is released or not.</p> <p>And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM.</p> <p>Is the action complete?</p>	—	Verify repair	—
33	<ol style="list-style-type: none"> 1. Raise the vehicle and disconnect the CKP sensor harness. 2. Ignition "ON". 3. With a test light to ground, probe the harness ignition feed terminal. <p>Did the light illuminate?</p>	—	Go to <i>Step 35</i>	Go to <i>Step 34</i>
34	<p>Check the ignition feed wire between the sensor and the PCM for a short to ground or open circuit.</p> <p>Is the action complete?</p>	—	Verify repair	—
35	<ol style="list-style-type: none"> 1. Ignition "ON". 2. At the CKP harness connector, connect a test light between the ignition and ground terminals. <p>Did the light illuminate?</p>	—	Go to <i>Step 37</i>	Go to <i>Step 36</i>
36	<p>Check the sensor ground circuit for an open or short to voltage.</p> <p>Is the action complete?</p>	—	Verify repair	—
37	<p>Check the signal circuit between the sensor and the PCM for a short to ground, short to voltage, or an open.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 38</i>
38	<p>Replace the CKP position sensor.</p> <p>Is the action complete?</p>	—	Verify repair	Go to <i>Step 32</i>

Fuel System Electrical Test

Circuit Description

When the ignition switch is first turned "ON", the powertrain control module (PCM) energizes the fuel pump relay which applies power to the in-tank fuel pump. The fuel pump relay will remain "ON" as long as the engine is running or cranking and the PCM is receiving 58X crankshaft position pulses. If no 58X crankshaft position pulses are present, the PCM de-energizes the fuel pump relay within 2 seconds after the ignition is turned "ON" or the engine is stopped.

The fuel pump delivers fuel to the fuel rail and injectors, then to the fuel pressure regulator. The fuel pressure regulator controls fuel pressure by allowing excess fuel to be returned to the fuel tank. With the engine stopped and ignition "ON", the fuel pump can be turned "ON" by using a command by the Tech 2.

Diagnostic Aids

An intermittent may be caused by a poor connection, rubbed-through wire insulation, or a wire broken inside the insulation. Check for the following items:

- Poor connection or damaged harness – Inspect the PCM harness and connectors for improper mating, broken locks, improperly formed or damaged terminals, poor terminal-to-wire connection, and damaged harness.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. If the fuel pump is operating but incorrect pressure is noted, the fuel pump wiring is OK and the "Fuel System Pressure Test" chart should be used for diagnosis.

CAUTION: To reduce the risk of fire and personal injury:

- It is necessary to relieve fuel system pressure before connecting a fuel pressure gauge. Refer to Fuel Pressure Relief Procedure, below.
- A small amount of fuel may be released when disconnecting the fuel lines. Cover fuel line fittings with a shop towel before disconnecting, to catch any fuel that may leak out. Place the towel in an approved container when the procedure is completed.

Fuel Pressure Relief Procedure

1. Remove the fuel cap.
2. Remove the fuel pump relay from the underhood relay center.
3. Start the engine and allow it to stall.
4. Crank the engine for an additional 3 seconds.

Fuel Gauge Installation

1. Remove the shoulder fitting cap.
2. Install fuel gauge 5-8840-0378-0 to the fuel feed line located in front of and above the right side valve train cover.
3. Reinstall the fuel pump relay.

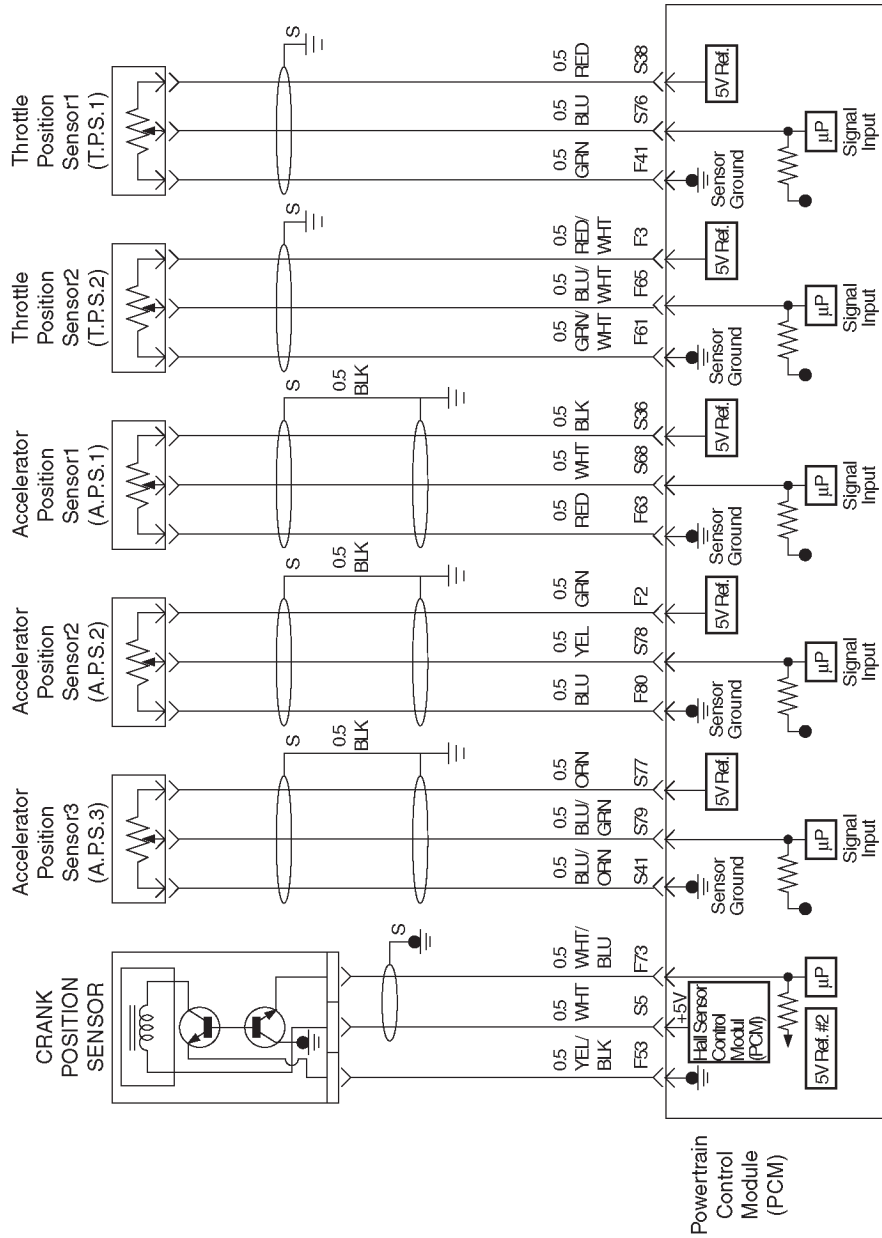

Fuel System Electrical Test

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Read the "Caution" above. 2. Relieve the fuel system pressure and install the fuel pump pressure gauge to the test fitting. 3. Ignition ON, Engine is Off. 4. Use a Tech 2 to command the fuel pump "ON". (Refer to the Miscellaneous Test.) Is there an immediate pressure build-up which indicates the pump is running?	—	Go to Step 3	Go to Step 4
3	1. Verify that the pump is not running by removing the fuel filler cap and listening. 2. Command the pump "ON" with the Tech 2. Did the pump turn "OFF" after 2 seconds?	—	Test completed	Go to Step 12
4	1. Ignition "OFF". 2. Remove the fuel pump relay. 3. Using a test light connected to ground, probe the battery feed to the relay. Did the light illuminate?	—	Go to Step 6	Go to Step 5
5	Repair short or open battery feed to fuel pump relay. Is the action complete?	—	Verify repair	—
6	1. Connect a test light between the two wires that connect to the fuel pump relay pull-in coil. 2. Ignition "ON". Did the test light illuminate for 2 seconds and then turn off?	—	Go to Step 12	Go to Step 7
7	1. With a test light connected to battery (-), probe the fuel pump relay connector at the wire which runs from the relay pull-in coil to the PCM. 2. Ignition "ON". Did the test light illuminate for 2 seconds and then turn off?	—	Go to Step 8	Go to Step 9
8	Locate and repair open in the fuel pump relay ground circuit. Is the action complete?	—	Verify repair	—
9	Check for short or open between the PCM and the fuel pump relay. Was a problem found?	—	Verify repair	Go to Step 10
10	1. Check the fuel pump relay circuit for a poor terminal connection at the PCM. 2. If a problem is found, replace terminal as necessary. Was a problem found?	—	Verify repair	Go to Step 11

Fuel System Electrical Test (Cont'd)

Step	Action	Value(s)	Yes	No
11	<p>Replace the PCM.</p> <p>IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors for procedures</i>.</p> <p>And also refer to latest Service Bulletin.</p> <p>Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM.</p> <p>Is the action complete?</p>	—	Verify repair	—
12	<ol style="list-style-type: none"> 1. Reconnect the fuel pump relay. 2. Disconnect the fuel pump electrical connector at the fuel tank. 3. Using a test light connected to ground, probe the fuel pump feed wire (harness side). 4. Command the fuel pump "ON" with a Tech 2. <p>Did the light illuminate for 2 seconds?</p>	—	Go to Step 15	Go to Step 13
13	<ol style="list-style-type: none"> 1. Honk the horn to verify that the horn relay is functioning. 2. Substitute the horn relay for the fuel pump relay. 3. Leave the test light connected as in step 12. 4. Command the fuel pump "ON" with the Tech 2. <p>Did the test light illuminate for 2 seconds when the fuel pump was commanded "ON"?</p>	—	Go to Step 17	Go to Step 14
14	<ol style="list-style-type: none"> 1. Re-connect the horn relay in its proper location. 2. Check for a short circuit, blown fuse or open circuit between the relay and the fuel tank. <p>Is the action complete?</p>	—	Verify repair	—
15	<ol style="list-style-type: none"> 1. With the fuel pump electrical connector at the fuel tank disconnected, connect a test light between the feed wire and the ground wire (harness side). 2. Command the fuel pump "ON" with a Tech 2. <p>Did the test light illuminate for 2 seconds?</p>	—	Go to Step 18	Go to Step 16
16	<p>Repair the open circuit in the fuel pump ground wire.</p> <p>Is the action complete?</p>	—	Verify repair	—
17	<ol style="list-style-type: none"> 1. Re-connect the horn relay in its proper location. 2. Replace the fuel pump relay. <p>Is the action complete?</p>	—	Verify repair	—
18	<p>Replace the fuel pump.</p> <p>Is the action complete?</p>	—	Verify repair	—

Electric Throttle Control (ETC) System Check

µP = Microprocessor
S = Shield

Circuit Description

- The powertrain control module (PCM) controls engine speed by adjusting the position of the throttle control valve (DC motor). The throttle motor is a DC motor driven by one coil. The PCM applies current to the DC motor coil in PWM (%) to adjust the throttle valve into a passage in the throttle body to allow air flow. This method allows highly accurate control of engine speed and quick response to changes in engine load.
- The accelerator position (AP1) sensor circuit provides a voltage signal relative to accelerator pedal angle.

The accelerator pedal angle will vary about 13% at idle position to about 87% at wide open throttle(WOT).

APS signal is used to determine which DC motor will adjust throttle position.

After the APS signal has been processed by the PCM, it will command DC motor to allow movement of throttle position.

Diagnostic Aids

- An intermittent may be caused by a poor connection, rubbed-through wire insulation or a wire broken inside the insulation. Check for poor connections or a damaged harness. Inspect the PCM harness and connector for improper mating, broken locks, improperly formed or damaged terminals, poor terminal-to-wire connection, and damaged harness.
- Throttle body – Check for objects blocking the DC motor or throttle bore, excessive deposits in the ETC passage and on the valve spring, and excessive deposits in the throttle bore and on the throttle valve plate.
- Accelerator pedal – Check for objects blocking the AP sensor or pedal arm with spring, and excessive deposits in the accelerator pedal arm and on the accelerator pedal.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

2. Visually/physically inspect for the following throttle valve conditions.
3. Visually/physically inspect for the following accelerator pedal conditions.
5. Check the following circuits for throttle valve and DC motor. Check the following TP sensor resistance and DC motor.
7. Check the following circuits for accelerator pedal. Check the following AP sensor resistance.
10. Following DTC: Software detect Error for ETC system.
11. Following DTC: Software detect Error for ETC system.

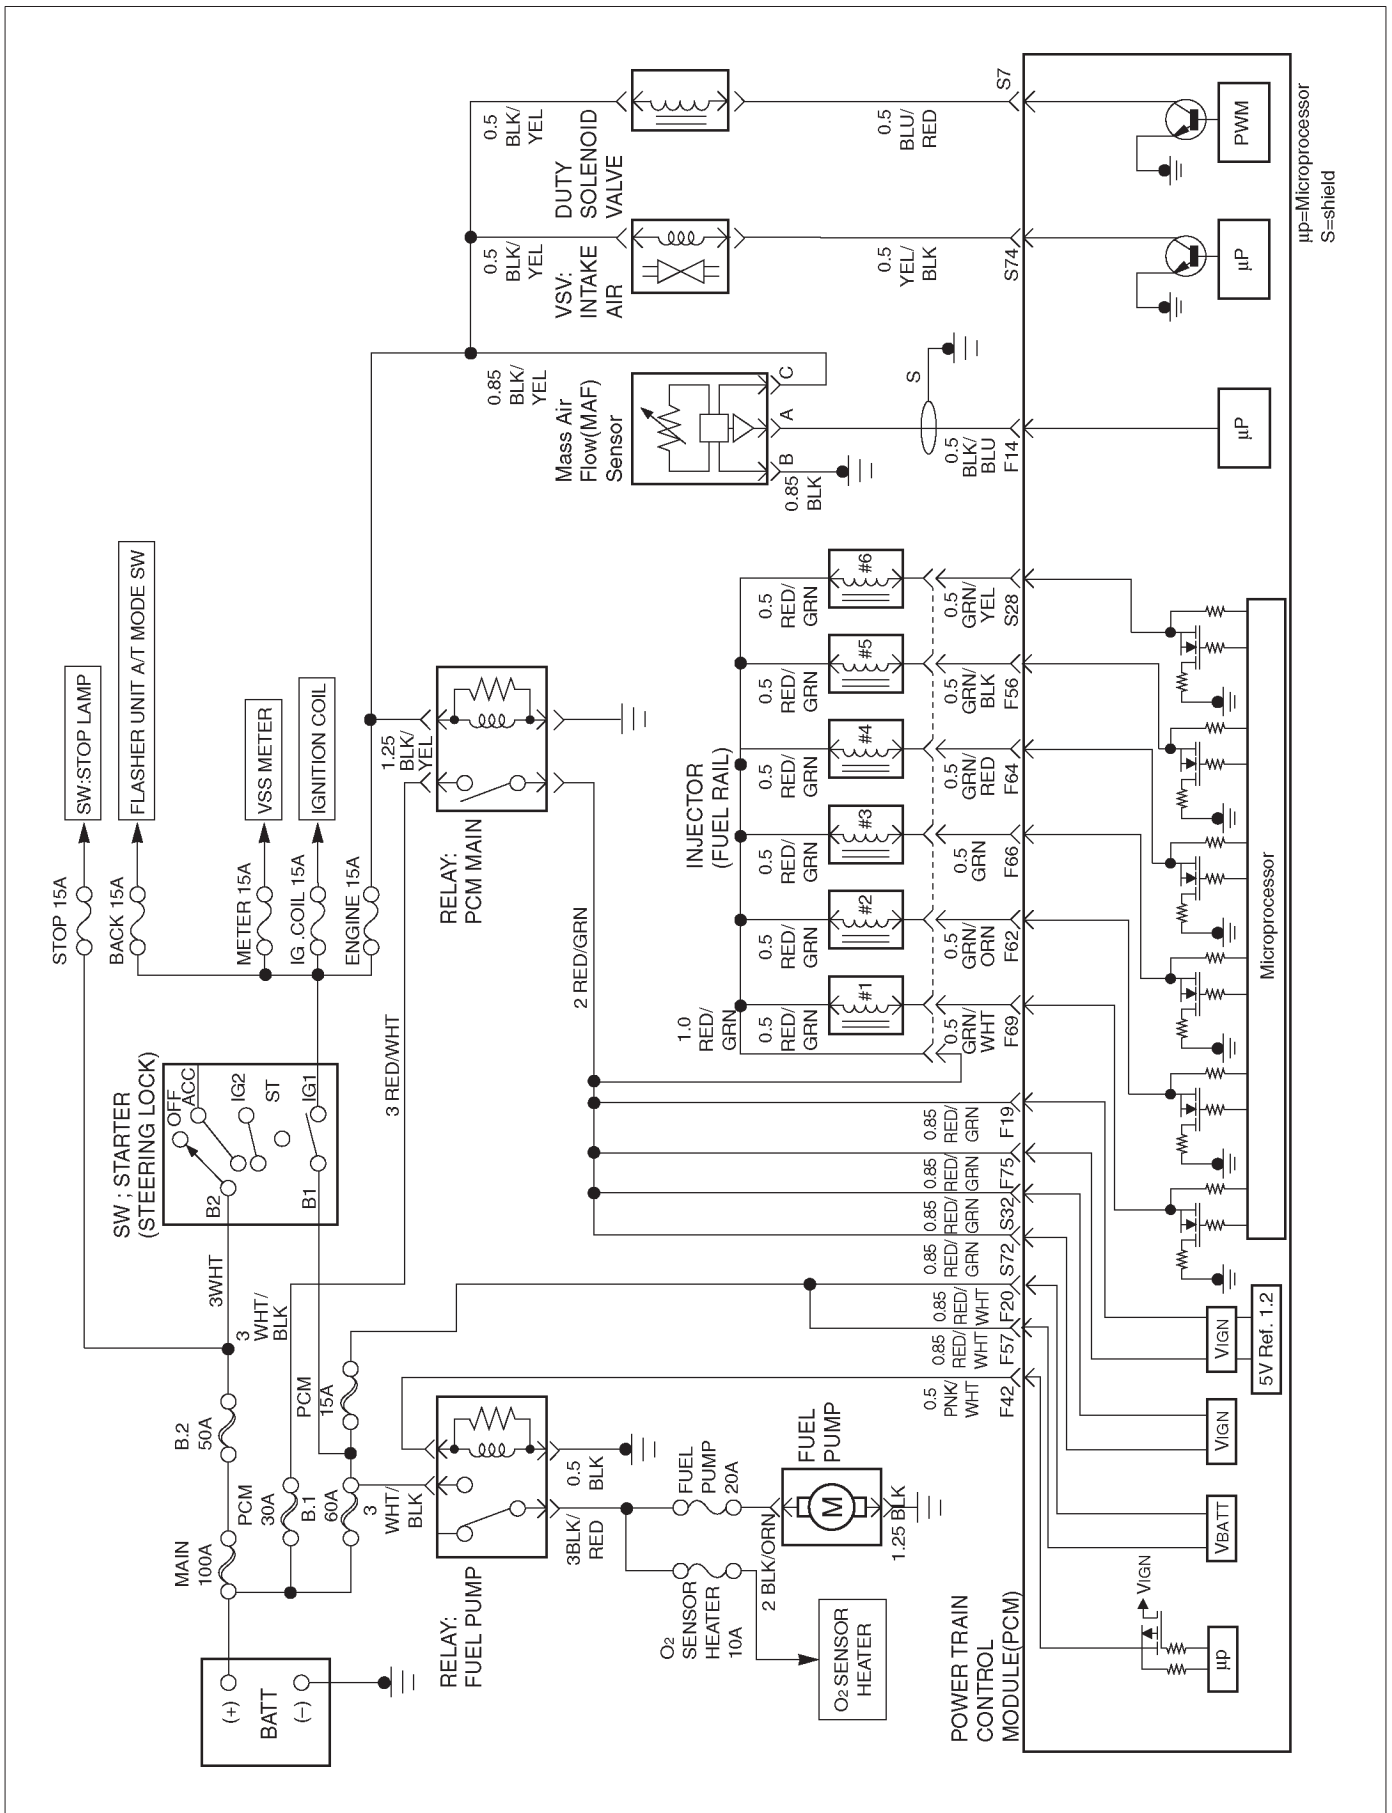

Electric Throttle Control (ETC) System Check

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Visually/physically inspect for the following conditions: <ul style="list-style-type: none"> ● Throttle body tampering. ● Restricted intake throttle system. Check for a possible collapsed air intake duct, restricted air filter element, or foreign objects blocking the air intake system. ● Throttle body: Check for objects blocking the throttle passage or throttle bore, excessive deposits in the throttle passage and on the throttle valve, and excessive deposits in the throttle bore and on the throttle plate. ● Throttle body with lever: When check for objects to send round the throttle spring lever that lever is smooth movement by less than 9 l·bm{1.0 N·m}, and spring lever has not excessive play. ● Throttle function: Check for the throttle function. When ignition switch "ON" that throttle lever is smooth operated by step on the accelerator pedal. Did any of the above require a repair?	—	Refer to <i>appropriate section for on-vehicle service</i>	Go to Step 3
3	Visually/physically inspect for the following conditions: <ul style="list-style-type: none"> ● Accelerator pedal tampering. ● Accelerator pedal : Check for objects blocking the spring or pedal arm. ● Accelerator pedal : For check for objects to move the accelerator pedal that pedal is smooth movement, and accelerator pedal arm has not excessive play. Did any of the above require a repair?	—	Refer to <i>appropriate section for on-vehicle service</i>	Go to Step 4
4	1. Check for a poor connection at the throttle body harness connector. 2. Check for a poor connection at the accelerator position sensor harness connector. 3. If a problem is found, replace faulty terminals as necessary. Was a problem found?	—	Verify repair	Go to Step 5
5	Check the following circuits for an open, short to voltage, short to ground, or poor connection at the PCM: <ul style="list-style-type: none"> ● Throttle position sensor 1 circuit. ● Throttle position sensor 2 circuit. ● Throttle DC motor circuit. ● Throttle position sensor resistance. ● Throttle DC motor resistance. If a problem is found, repair as necessary. Was a problem found?	Vcc-GND 1-7kΩ SIG-GND change resistance 0.3-100Ω	Verify repair	Go to Step 6

Electric Throttle Control (ETC) System Check (Cont'd)

Step	Action	Value(s)	Yes	No
6	1. Install the Tech 2 2. Ignition "ON" but not engine run. 3. Check the valve for APS and TPS. Was the problem found?	Idle AP1 = 11–13% AP2 = 87–88% AP3 = 87–88% TP1 = 1–6% TP2 = 1–6% WOT AP1 = 85–89% AP2 = 11–15% AP3 = 32–36% TP1 = 98–100% TP2 = 98–100%	Go to <i>Step 10</i>	Go to <i>Step 7</i>
7	Replace the throttle valve. Is the action complete?	—	Go to <i>Step 8</i>	—
8	Check the following circuits for an open, short to voltage, short to ground, or poor connection at the PCM: <ul style="list-style-type: none"> ● Accelerator position sensor 1 circuit. ● Accelerator position sensor 2 circuit. ● Accelerator position sensor 3 circuit. ● Accelerator position sensor resistance. If a problem is found, repair as necessary. Was a problem found?	Vcc–GND 4–6kΩ SIG–GND change resistance	Verify repair	Go to <i>Step 9</i>
9	Replace the accelerator position sensor. Is the action complete?	—	Go to <i>Step 10</i>	—
10	Following below the DTCs stored: P1125, P1290, P1295, P1299	—	Go to <i>applicable DTC chart</i>	Go to <i>Step 11</i>
11	Following below the DTCs stored: P1514, P1515, P1516, P1523, P1271, P1272, P1273	—	Go to <i>applicable DTC chart</i>	Go to <i>Step 12</i>
12	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors for procedures.</i> And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Fuel System Diagnosis

Circuit Description

When the ignition switch is turned "ON", the powertrain control module (PCM) will turn "ON" the in-tank fuel pump. The in-tank fuel pump will remain "ON" as long as the engine is cranking or running and the PCM is receiving 58X crankshaft position pulses. If there are no 58X crankshaft position pulses, the PCM will turn the in-tank fuel pump "OFF" 2 seconds after the ignition switch is turned "ON" or 2 seconds after the engine stops running. The in-tank fuel pump is an electric pump within an integral reservoir. The in-tank fuel pump supplies fuel through an in-line fuel filter to the fuel rail assembly. The fuel pump is designed to provide fuel at a pressure above the pressure needed by the fuel injectors. A fuel pressure regulator, attached to the fuel rail, keeps the fuel available to the fuel injectors at a regulated pressure. Unused fuel is returned to the fuel tank by a separate fuel return line.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. Connect the fuel pressure gauge to the fuel feed line as shown in the fuel system illustration. Wrap a shop towel around the fuel pressure connection in order to absorb any fuel leakage that may occur when installing the fuel pressure gauge. With the ignition switch "ON" and the fuel pump running, the fuel pressure indicated by the fuel pressure gauge should be 333-376 kPa (48-55 psi). This pressure is controlled by the amount of pressure the spring inside the fuel pressure regulator can provide.
3. A fuel system that cannot maintain a constant fuel pressure has a leak in one or more of the following areas:
 - The fuel pump check valve.
 - The fuel pump flex line.
 - The valve or valve seat within the fuel pressure regulator.
 - The fuel injector(s).
4. Fuel pressure that drops off during accelerator, cruise, or hard cornering may cause a lean condition. A lean condition can cause a loss of power, surging, or misfire. A lean condition can be diagnosed using a Tech 2. If an extremely lean condition occurs, the oxygen sensor(s) will stop toggling. The oxygen sensor output voltage(s) will drop below 500 mV. Also, the fuel injector pulse width will increase.

IMPORTANT: Make sure the fuel system is not operating in the "Fuel Cut-Off Mode".

When the engine is at idle, the manifold pressure is low (high vacuum). This low pressure (high vacuum) is applied to the fuel pressure regulator diaphragm. The low pressure (high vacuum) will offset the pressure being applied to the fuel pressure regulator diaphragm by the spring inside the fuel pressure regulator. When this happens, the result is lower fuel pressure. The fuel pressure at idle will vary slightly as the barometric pressure changes, but the fuel pressure at idle should always be less than the fuel pressure noted in step 2 with the engine "OFF".

16. Check the spark plug associated with a particular fuel injector for fouling or saturation in order to determine if that particular fuel injector is leaking. If checking the spark plug associated with a particular fuel injector for fouling or saturation does not determine that a particular fuel injector is leaking, use the following procedure:

- Remove the fuel rail, but leave the fuel lines and injectors connected to the fuel rail. Refer to *Fuel Rail Assembly* in *On-Vehicle Service*.
- Lift the fuel rail just enough to leave the fuel injector nozzles in the fuel injector ports.

CAUTION: In order to reduce the risk of fire and personal injury that may result from fuel spraying on the engine, verify that the fuel rail is positioned over the fuel injector ports and verify that the fuel injector retaining clips are intact.

- Pressurize the fuel system by connecting a 10 amp fused jumper between B+ and the fuel pump relay connector.
 - Visually and physically inspect the fuel injector nozzles for leaks.
17. A rich condition may result from the fuel pressure being above 376 kPa (55 psi). A rich condition may cause a DTC P0132 or a DTC P0172 to set. Derivability conditions associated with rich conditions can include hard starting (followed by black smoke) and a strong sulfur smell in the exhaust.
 20. This test determines if the high fuel pressure is due to a restricted fuel return line or if the high fuel pressure is due to a faulty fuel pressure regulator.
 21. A lean condition may result from fuel pressure below 333 kPa (48 psi). A lean condition may cause a DTC P0131 or a DTC P0171 to set. Derivability conditions associated with lean conditions can include hard starting (when the engine is cold), hesitation, poor derivability, lack of power, surging, and misfiring.
 22. Restricting the fuel return line causes the fuel pressure to rise above the regulated fuel pressure. Command the fuel pump "ON" with the Tech 2. The fuel pressure should rise above 376 kPa (55 psi) as the fuel return line becomes partially closed.

NOTE: Do not allow the fuel pressure to exceed 414 kPa (60 psi). Fuel pressure in excess of 414 kPa (60 psi) may damage the fuel pressure regulator.

CAUTION: To reduce the risk of fire and personal injury:

- It is necessary to relieve fuel system pressure before connecting a fuel pressure gauge. Refer to **Fuel Pressure Relief Procedure**, below.
- A small amount of fuel may be released when disconnecting the fuel lines. Cover fuel line fittings with a shop towel before disconnecting, to catch any fuel that may leak out. Place the towel in an approved container when the procedure is completed.

Fuel Pressure Relief Procedure

1. Remove the fuel cap.
2. Remove the fuel pump relay from the underhood relay center.
3. Start the engine and allow it to stall.
4. Crank the engine for an additional 3 seconds.

Fuel Gauge Installation

1. Remove the shoulder fitting cap.
2. Install fuel gauge 5-8840-0378-0 to the fuel feed line located in front of and above the right side valve train cover.
3. Reinstall the fuel pump relay.

Fuel System Diagnosis

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	<ol style="list-style-type: none"> 1. Turn the ignition "OFF". 2. Turn the air conditioning system "OFF". 3. Relieve fuel system pressure and install the fuel pressure gauge. 4. Turn the ignition "ON". <p>NOTE: The fuel pump will run for approximately 2 seconds. Use the Tech 2 to command the fuel pump "ON".</p> <p>(Refer to the Miscellaneous Test.)</p> <ol style="list-style-type: none"> 5. Observe the fuel pressure indicated by the fuel pressure gauge with the fuel pump running. Is the fuel pressure within the specified limits?	290-376 kPa (42-55 psi)	Go to Step 3	Go to Step 17
3	<p>NOTE: The fuel pressure will drop when the fuel pump stops running, then it should stabilize and remain constant.</p> Does the fuel pressure indicated by the fuel pressure gauge remain constant?	—	Go to Step 4	Go to Step 12
4	<ol style="list-style-type: none"> 1. When the vehicle is at normal operation temperature, turn the ignition "ON" to build fuel pressure and observe the measurement on the gauge. 2. Start the engine and observe the fuel pressure gauge. Did the reading drop by the amount specified after the engine was started?	21-105 kPa (3-15 psi)	Go to Step 5	Go to Step 9
5	Is fuel pressure dropping off during accelerator, cruise, or hard cornering?	—	Go to Step 6	Check for improper fuel
6	Visually and physically inspect the following items for a restriction: <ul style="list-style-type: none"> ● The in-pipe fuel filter. ● The fuel feed line. Was a restriction found?	—	Verify repair	Go to Step 7
7	Remove the fuel tank and visually and physically inspect the following items: <ul style="list-style-type: none"> ● The fuel pump strainer for a restriction. ● The fuel line for a leak. ● Verify that the correct fuel pump is in the vehicle. Was a problem found in any of these areas?	—	Verify repair	Go to Step 8

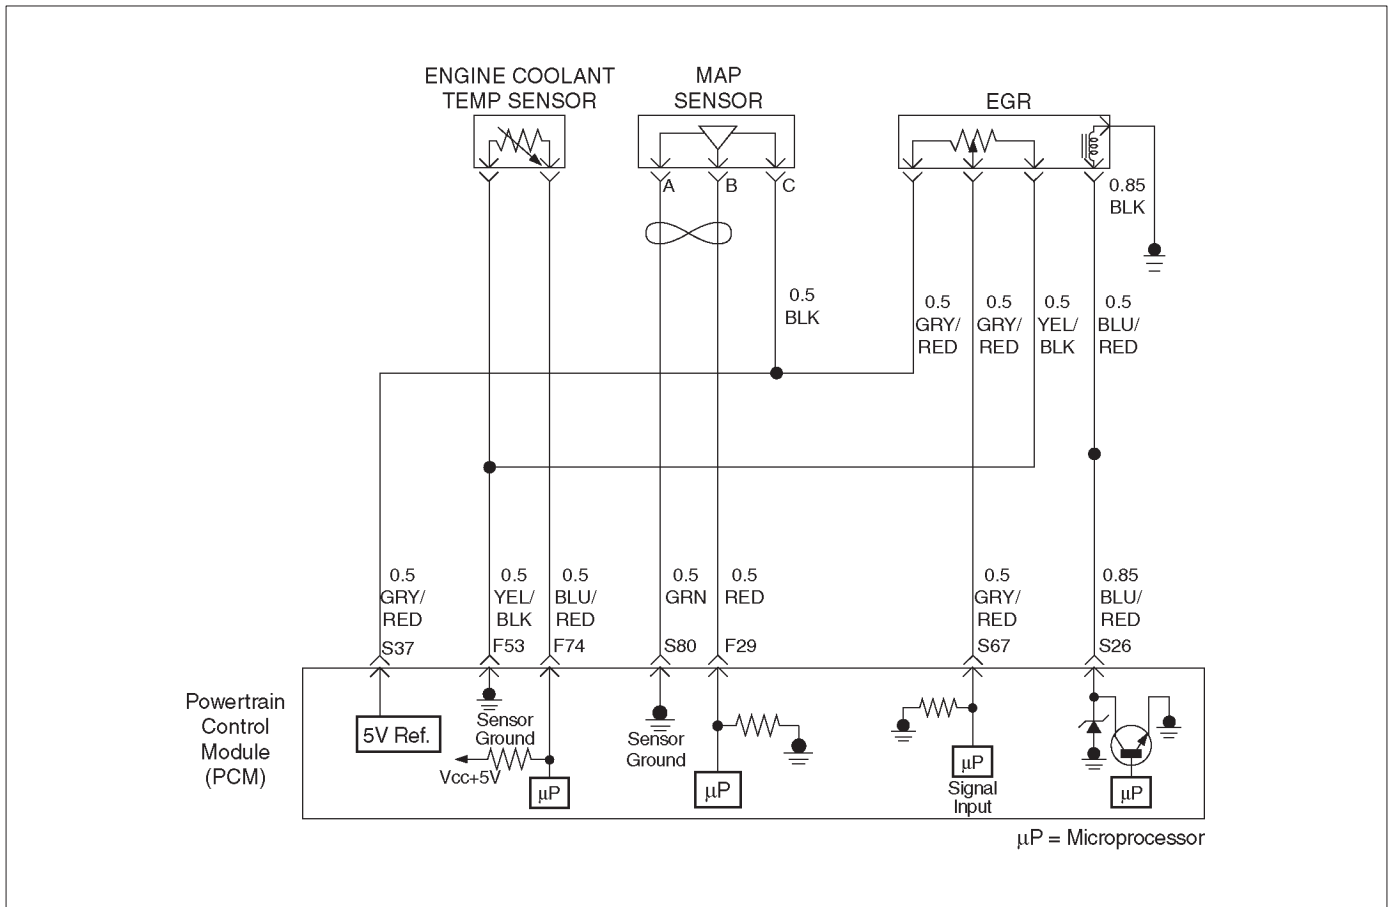

Fuel System Diagnosis (Cont'd)

Step	Action	Value(s)	Yes	No
8	Replace the fuel pump. Is the action complete?	—	Verify repair	—
9	1. Disconnect the vacuum hose from the fuel pressure regulator. 2. With the engine idling, apply 12-14 inches of vacuum to the fuel pressure regulator. Does the fuel pressure indicated by the fuel pressure gauge drop by the amount specified?	21-105 kPa (3-15 psi)	Go to <i>Step 10</i>	Go to <i>Step 11</i>
10	Locate and repair the loss of vacuum to the fuel pressure regulator. Is the action complete?	—	Verify repair	—
11	Replace the fuel pressure regulator. Is the action complete?	—	Verify repair	—
12	1. Run the fuel pump with the Tech 2. 2. After pressure has built up, turn off the pump and clamp the supply hose shut with suitable locking pliers which will not damage the hose. Does the fuel pressure indicated by the fuel pressure gauge remain constant?	—	Go to <i>Step 13</i>	Go to <i>Step 15</i>
13	Visually inspect the fuel supply line and repair any leaks. Was a problem found?	—	Verify repair	Go to <i>Step 14</i>
14	Remove the fuel tank and inspect for leaky hose or in-tank fuel line. Was a problem found?	—	Verify repair	Go to <i>Step 8</i>
15	1. If the pliers are still clamped to the fuel supply hose, remove the locking pliers. 2. With suitable locking pliers, which will not damage the hose, clamp the fuel return line to prevent fuel from returning to the fuel tank. 3. Run the fuel pump with the Tech 2. 4. After pressure has built up, remove power to the pump. Does the fuel pressure indicated by the fuel pressure gauge remain constant?	—	Go to <i>Step 11</i>	Go to <i>Step 16</i>
16	Locate and replace any leaking fuel injector(s). Is the action complete?	—	Verify repair	—
17	Is the fuel pressure indicated by the fuel pressure gauge above the specified limit?	376 kPa (55 psi)	Go to <i>Step 18</i>	Go to <i>Step 21</i>

Fuel System Diagnosis (Cont'd)

Step	Action	Value(s)	Yes	No
18	1. Relieve the fuel pressure. Refer to the <i>Fuel Pressure Relief</i> . 2. Disconnect the fuel return line from the fuel rail. 3. Attach a length of flexible hose to the fuel rail return outlet passage. 4. Place the open end of the flexible hose into an approved gasoline container. 5. Run the fuel pump with the Tech 2. 6. Observe the fuel pressure indicated by the fuel pressure gauge with the fuel pump running. Is the fuel pressure within the specified limits?	290-376 kPa (42-55 psi)	Go to <i>Step 19</i>	Go to <i>Step 20</i>
19	Locate and correct the restriction in the fuel return line. Is the action complete?	—	Verify repair	—
20	Visually and physically inspect the fuel rail outlet passages for a restriction. Was a restriction found?	—	Verify repair	Go to <i>Step 11</i>
21	Is the fuel pressure indicated by the fuel pressure gauge above the specified value?	0 kPa (0 psi)	Go to <i>Step 22</i>	Go to <i>Step 23</i>
22	1. Command the fuel pump "ON" with the Tech 2. 2. Using suitable pliers which will not damage the fuel hose, gradually apply pressure with the pliers to pinch the flexible fuel return hose closed. CAUTION: Do not let the fuel pressure exceed the second specified value. Does the fuel pressure indicated by the fuel pressure gauge rise above the first specified value?	376 kPa (55 psi) 414 kPa (60 psi)	Go to <i>Step 11</i>	Go to <i>Step 7</i>
23	1. Command the fuel pump "ON" with the Tech 2. 2. Remove the fuel filler cap and listen for the sound of the fuel pump running. 3. Turn the pump off. Was the fuel pump running?	—	Go to <i>Step 7</i>	Go to <i>Fuel System Electrical Test Chart</i>

Exhaust Gas Recirculation (EGR) System Check

060R100131

Circuit Description

A properly operation exhaust gas recirculation (EGR) system will directly affect the air/fuel requirements of the engine. Since the exhaust gas introduced into the air/fuel mixture is an inert gas (contains very little or no oxygen), less fuel is required to maintain a correct air/fuel ratio. Introducing exhaust gas into the combustion chamber lowers combustion temperatures and reduces the formation of oxides of nitrogen (NO_x) in the exhaust gas. Lower combustion temperatures also prevent detonation. If the EGR pintle were to stay closed, the inert exhaust gas would be replaced with air and the air/fuel mixture would be leaner. The powertrain control module (PCM) would compensate for the lean condition by adding fuel, resulting in higher long term fuel trim values.

Diagnostic Aids

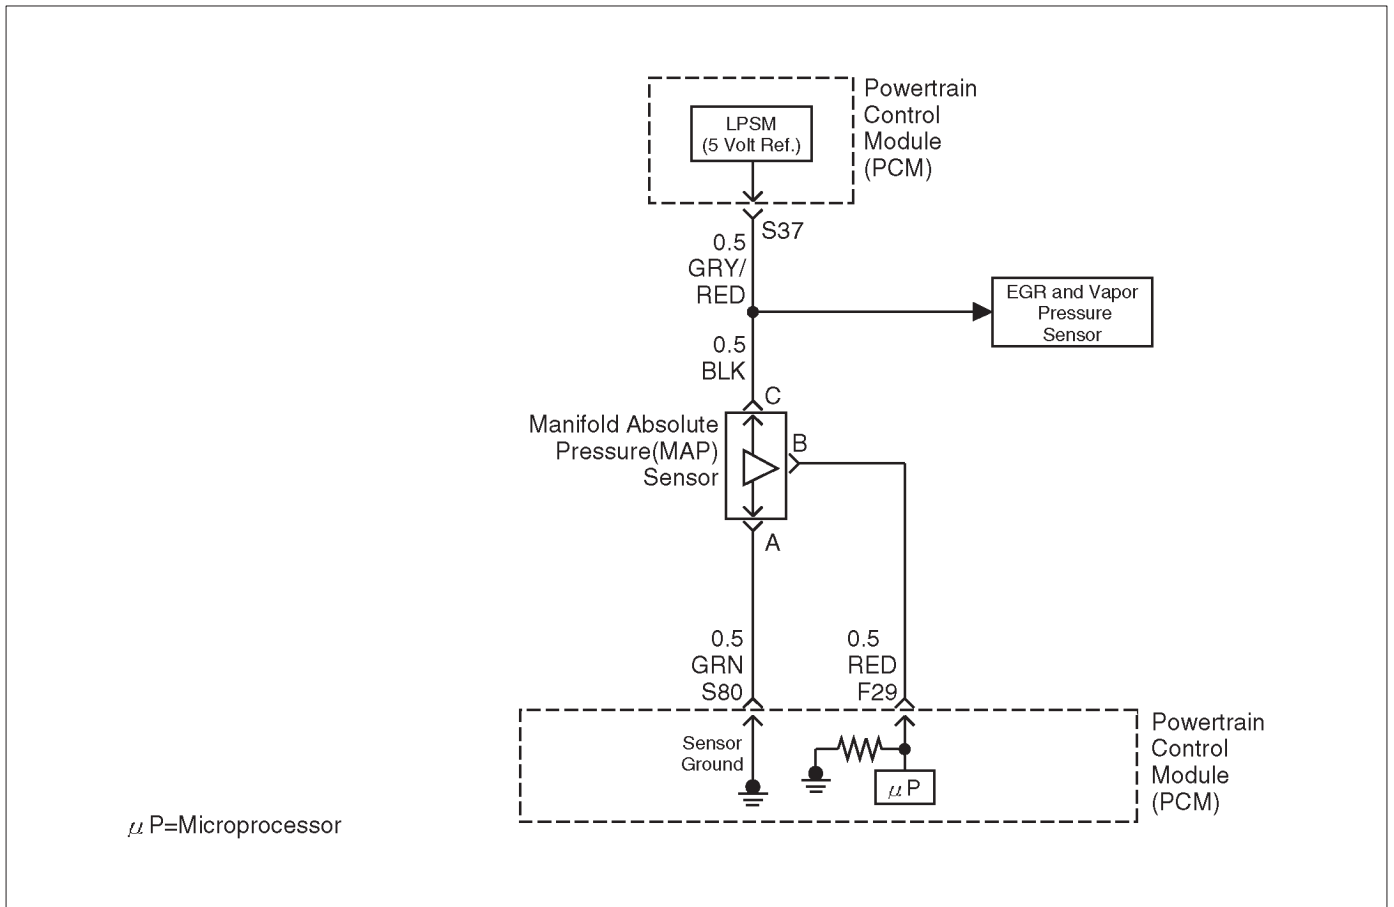

The EGR valve chart is a check of the EGR system. An EGR pintle constantly in the closed position could cause detonation and high emissions of NO_x. It could also result in high long term fuel trim values in the open throttle cell, but not in the closed throttle cell. An EGR pintle constantly in the open position would cause a rough idle. Also, an EGR mounted incorrectly (rotated 180°) could cause rough idle. Check for the following items:

- EGR passages – Check for restricted or blocked EGR passages.
- Manifold absolute pressure sensor – A manifold absolute pressure sensor may shift in calibration enough to affect fuel delivery. Refer to *Manifold Absolute Pressure Output Check*.

Exhaust Gas Recirculation (EGR) System Check

Step	Action	Value(s)	Yes	No
1	Check the EGR valve for looseness. Is the EGR valve Loose?	—	Go to <i>Step 2</i>	Go to <i>Step 3</i>
2	Tighten the EGR valve. Is the action complete?	—	Verify repair	—
3	1. Place the transmission selector in Park or Neutral. 2. Start the engine and idle until warm. 3. Using a Tech 2, command EGR "50% ON". (Refer to the Miscellaneous Test.) Does the engine idle rough and lose RPMs?	—	EGR system working properly. No problem found.	Go to <i>Step 4</i>
4	1. Engine "OFF". 2. Ignition "ON". 3. Using a test light to ground, check the EGR harness between the EGR valve and the ignition feed. Does the test light illuminate?	—	Go to <i>Step 6</i>	Go to <i>Step 5</i>
5	Repair the EGR harness ignition feed. Was the problem corrected?	—	Verify repair	Go to <i>Step 6</i>
6	1. Remove the EGR valve. 2. Visually and physically inspect the EGR valve pintle, valve passages and adapter for excessive deposits, obstructions or any restrictions. Does the EGR valve have excessive deposits, obstructions or any restrictions?	—	Go to <i>Step 7</i>	Go to <i>Step 8</i>
7	Clean or replace EGR system components as necessary. Was the problem corrected?	—	Verify repair	Go to <i>Step 8</i>
8	1. Ground the EGR valve metal case to battery (-). 2. Using a Tech 2, command EGR "ON" and observe the EGR valve pintle for movement. Does the EGR valve pintle move according to command?	—	Go to <i>Step 9</i>	Go to <i>DTC P1406 chart</i>
9	1. Remove the EGR inlet and outlet pipes from the intake and exhaust manifolds. 2. Visually and physically inspect manifold EGR ports and EGR inlet and outlet pipes for blockage or restriction caused by excessive deposits or other damage. Do the manifold EGR ports or inlet and outlet pipes have excessive deposits, obstructions, or any restrictions?	—	Go to <i>Step 10</i>	EGR system working properly. No problem found.
10	Clean or replace EGR system components as necessary. Is the action complete?	—	Verify repair	—

Manifold Absolute Pressure (MAP) Output Check

060R100132

Circuit Description

The manifold absolute pressure (MAP) sensor measures the changes in the intake MAP which result from engine load (intake manifold vacuum) and engine speed changes; and converts these into a voltage output. The powertrain control module (PCM) sends a 5-volt reference voltage to the MAP sensor. As the MAP changes, the output voltage of the sensor also changes. By monitoring the sensor output voltage, the PCM knows the MAP. A lower pressure (low voltage) output voltage will be about 1-2 volts at idle. Higher pressure (high voltage) output voltage will be about 4-4.8 volts at wide open throttle. The MAP sensor is also used, under certain conditions, to measure barometric pressure, allowing the PCM to make adjustments for different altitudes. The PCM uses the MAP sensor to diagnose proper operation of the EGR system, in addition to other functions.

Test Description

IMPORTANT: Be sure to use the same diagnostic test equipment for all measurements.

The number(s) below refer to the step number(s) on the Diagnostic Chart.

- Applying 34 kPa (10 inch Hg) vacuum to the MAP sensor should cause the voltage to be 1.5-2.1 volts less than the voltage at step 1. Upon applying vacuum to the sensor, the change in voltage should be instantaneous. A slow voltage change indicates a faulty sensor.
- Check the vacuum hose to the sensor for leaking or restriction. Be sure that no other vacuum devices are connected to the MAP hose.

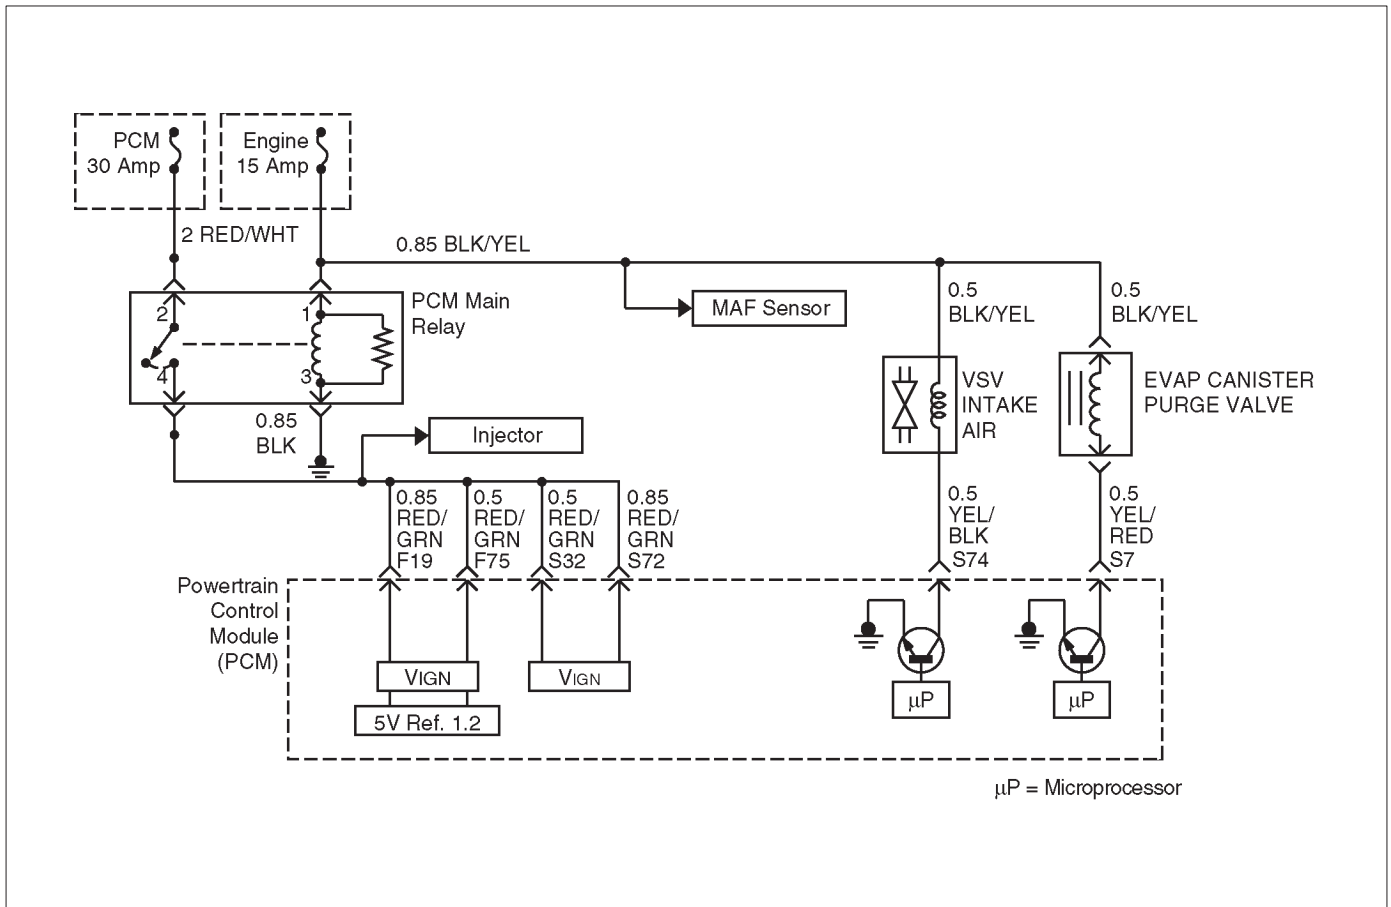

IMPORTANT: Make sure the electrical connector remains securely fastened.

- Disconnect the sensor from the bracket. Twist the sensor with your hand to check for an intermittent connection. Output changes greater than 0.10 volt indicate a bad sensor.

Manifold Absolute Pressure (MAP) Output Check

Step	Action	Value(s)	Yes	No
1	1. Turn the ignition "OFF" and leave it "OFF" for 15 seconds. 2. Ignition "ON". Don't crank engine. 3. The Tech 2 should indicate a manifold absolute pressure (MAP) sensor voltage. 4. Compare this scan reading to scan reading of a known good vehicle obtained using the exact same procedure as in Steps 1-4. Is the voltage reading the same +/-0.40 volt?	—	Go to <i>Step 2</i>	Go to <i>Step 5</i>
2	1. Disconnect the vacuum hose at the MAP sensor and plug the hose. 2. Connect a hand vacuum pump to the MAP sensor. 3. Start the engine. 4. Apply 34 kPa (10 in.Hg) of vacuum and note the voltage change. Is the voltage change 1.5-2.1 volts less than Step 1?	—	Go to <i>Step 3</i>	Go to <i>Step 4</i>
3	Check the sensor cover for leakage or restriction. Does the hose supply vacuum to the MAP sensor only?	—	Go to <i>Step 5</i>	Go to <i>Step 4</i>
4	Repair the hose blockage. Is the action complete?	—	Verify repair	—
5	Check the sensor connection. Is the sensor connection good?	—	Go to <i>Step 6</i>	Go to <i>Step 7</i>
6	Refer to <i>On-Vehicle Service, MAP Sensor</i> . Is the action complete?	—	Verify repair	—
7	Repair the poor connection. Is the action complete?	—	Verify repair	—

Evaporative (EVAP) Emissions Canister Purge Valve Check

060R100111

Circuit Description

Canister purge is controlled by a solenoid valve that allows manifold vacuum to purge the canister. The powertrain control module (PCM) supplies a ground to energize the solenoid valve (purge "ON"). The EVAP purge solenoid control is turned "ON" and "OFF" several times a second. The duty cycle (pulse width or "ON" time) is determined by engine operating conditions including load, throttle position, coolant temperature and ambient temperature. The duty cycle is calculated by the PCM and the purge solenoid is enabled when the appropriate conditions have been met:

- The fuel control system is operating in the closed-loop mode.
- The engine coolant temperature (ECT) is more than 10°C at start up, and then the ECT is more than 40°C.
- The ECT is less than 10°C at start up, and then it is more than 60°C.
- The ECT is more than 40°C at start up, and the engine run time after start is more than 30 seconds.
- The ECT is less than 40°C at start up, and the engine run time after start is more than 90 seconds.

Diagnostic Aids

- Make a visual check of vacuum hoses.
- Check the throttle body for cracks.
- Check the malfunction indicator lamp for a possible mechanical problem.

Test Description

The number(s) below refer to the step number(s) on the Diagnostic Chart.

1. Check to see if the solenoid is open or closed. The solenoid is normally de-energized in this step, so it should be closed.
2. This step checks to determine if the solenoid was open due to an electrical circuit problem or a defective solenoid.
3. This should normally energize the solenoid, opening the valve and allowing the vacuum to drop (purge "ON").

Evaporative (EVAP) Emissions Canister Purge Valve Check

Step	Action	Value(s)	Yes	No
1	1. Ignition "OFF". 2. Ignition "ON", engine "OFF". 3. At the throttle body, disconnect the hose that goes to the purge solenoid. 4. Using a hand vacuum pump with an attached vacuum gauge 5-8840-0279-0, apply vacuum (10 in. Hg or 34 kPa) to the solenoid. Does the solenoid hold the vacuum?	—	Go to <i>Step 3</i>	Go to <i>Step 2</i>
2	1. Disconnect the solenoid electrical connector. 2. As in Step 1, apply vacuum (10 in. Hg or 34 kPa) to the solenoid. Does the solenoid hold the vacuum?	—	Go to <i>Step 4</i>	Go to <i>Step 7</i>
3	1. At the throttle body, put a cap over the vacuum port where the hose was disconnected for testing. This is to prevent a vacuum leak when the engine is started. 2. Ignition "OFF". 3. Install the Tech 2. 4. Apply vacuum to the purge solenoid with the hand vacuum pump. 5. Start the engine, run at 2500 RPM. 6. Using the Tech 2, select Powertrain, 3.2-V6 6VD1, F3: Misc. Tests, F2: EVAP Purge, F0: EVAP Purge. (Refer to the Miscellaneous Test.) 7. Turn the purge solenoid "ON". Did the vacuum drop when the purge was turned on?	—	Go to <i>Step 8</i>	Go to <i>Step 9</i>
4	Check for a short to ground in the YEL/RED wire. Is there a short?	—	Go to <i>Step 5</i>	Go to <i>Step 6</i>
5	Repair the short to ground. Is the action complete?	—	Verify repair	—
6	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors for procedures</i> . And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—
7	Replace the faulty purge solenoid. Refer to <i>On-Vehicle Service, EVAP Canister Purge Solenoid</i> . Is the action complete?	—	Verify repair	—

Evaporative (EVAP) Emissions Canister Purge Valve Check (Cont'd)

Step	Action	Value(s)	Yes	No
8	1. Turn the ignition "OFF". 2. At the throttle body, install a vacuum gauge where the hose from the purge solenoid was disconnected for testing. 3. Start the engine. 4. Stabilize the engine speed at about 2500 RPM. 5. Momentarily snap the throttle open and let it return to idle. Is there approximately 10 in. Hg (34 kPa) of vacuum available at the EVAP emission canister purge solenoid?	—	No problem found in the EVAP emission canister purge valve check	Refer to <i>Diagnostic Aids</i>
9	1. Disconnect the solenoid electrical connector. 2. Connect a test lamp between the harness terminals. Does the test lamp light?	—	Go to <i>Step 7</i>	Go to <i>Step 10</i>
10	Probe terminal A and terminal B with a test lamp to ground. Does the test lamp light on both terminals?	—	Go to <i>Step 11</i>	Go to <i>Step 12</i>
11	Repair the short to voltage in the YEL/RED wire. Is the action complete?	—	Verify repair	—
12	Does one of the terminals light the test lamp?	—	Go to <i>Step 13</i>	Go to <i>Step 14</i>
13	Check for an open in the YEL/RED wire between the purge solenoid and the PCM. Was there an open circuit?	—	Go to <i>Step 15</i>	Go to <i>Step 6</i>
14	Repair the open in the BLK/YEL wire. Is the action complete?	—	Verify repair	—
15	Repair the open in the YEL/RED wire. Is the action complete?	—	Verify repair	—

PCM Diagnostic Trouble Codes

The following table lists the diagnostic trouble codes supported by this vehicle application. If any DTCs not listed here are displayed by a Tech 2, the Tech 2 data may be faulty; notify the Tech 2 manufacturer of any DTCs displayed that are not included in the following table.

PCM Diagnostic Trouble Codes

DTC	Description	Type	Illuminate MIL (Check Engine Lamp)	Illuminate RPL (Reduced Power Lamp)
P0101	MAF System Performance	B	Yes	No
P0102	MAF Sensor Circuit Low Frequency	B	Yes	No
P0103	MAF Sensor Circuit High Frequency	B	Yes	No
P0106	MAP Rationality/Performance	B	Yes	No
P0107	MAP Circuit Low Input Voltage	B	Yes	No
P0108	MAP Circuit High Input Voltage	B	Yes	No
P0112	IAT Circuit Low Input Voltage	B	Yes	No
P0113	IAT Circuit High Input Voltage	B	Yes	No
P0117	ECT Circuit Low Input Voltage	B	Yes	No
P0118	ECT Circuit High Input Voltage	B	Yes	No

Diagnostic Trouble Code (DTC) P0101 MAF System Performance

060R100112

Circuit Description

The mass air flow (MAF) sensor measures the amount of air which passes through it into the engine during a given time. The powertrain control module (PCM) uses the mass air flow information to monitor engine operating conditions for fuel delivery calculations. A large quantity of air entering the engine indicates an accelerator or high load situation, while a small quantity of air indicates deceleration or idle.

The MAF sensor produces a frequency signal which can be monitored using a Tech 2. The frequency will vary within a range of around 4 to 7g/s at idle to around 25 to 40g/s at maximum engine load. DTC P0101 will be set if the signal from the MAF sensor does not match a predicted value based on throttle position and engine RPM.

Conditions for setting the DTC

- The engine is running.
- No TP sensor and MAP sensor DTCs are set.
- No MAF frequency DTCs are set.
- System voltage is between 11.5 volts and 16 volts.
- TP angle is more than 37.5%.
- Difference BARO pressure between current and calculated value based on MAF sensor signal becomes more than 20 kPa and more than 5 seconds in a trip.

Action Taken When the DTC Sets

- The PCM will ON the MIL after second trip with detected fault.
- The PCM calculates an air flow value based on idle air control valve position, throttle position, RPM and barometric pressure.
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0101 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P0101 can be cleared using the Tech 2 "Clear Info" function.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Misrouted harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.
- he duct work at the MAF sensor for leaks.
- An engine vacuum leak.
- The PCV system for vacuum leaks.

6E-118 6VD1 3.2L ENGINE DRIVEABILITY AND EMISSIONS

- An incorrect PCV valve.
- The engine oil dip stick not fully seated.
- The engine oil fill cap loose or missing.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness- Inspect the wiring harness for damage. If the harness appears to be OK, observe the Mass Air Flow (MAF) display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.
- Plugged intake air duct or filter element

- A wide-open throttle accelerator from a stop should cause the mass air flow displayed on a Tech 2 to increase from about 3–6 g/s at idle to 100 g/s or greater at the time of the 1–2 shift. If not, check for a restriction.

A change in the display will indicate the location of the fault.

If DTC P0101 cannot be duplicated, the information included in the Failure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently, performing the DTC P001 Diagnostic Chart may isolate the cause of the fault.

DTC P0101 – MAF System Performance

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "OFF". 2. Disconnect the Mass Air Flow (MAF) Sensor harness connector from the MAF Sensor. 3. Place an unpowered test lamp between the 12 volt signal circuit and the ground circuit, both at the MAF Sensor connector. 4. Ignition "ON", Engine "OFF". Did the test lamp illuminate?	—	Go to Step 6	Go to Step 3
3	1. Ignition "ON", Engine "OFF". 2. Using a Digital Voltmeter (DVM), check the 12 volt signal circuit for the correct voltage. Did the DVM indicate a value within the following range?	11.5 to 12.5 Volt	Go to Step 5	Go to Step 4
4	1. Ignition "OFF". 2. Check the 12 volt signal circuit for the following conditions: <ul style="list-style-type: none"> • An open circuit • A short to ground Was the problem found?	—	Verify repair	—
5	Check the MAF ground circuit for the following conditions: <ul style="list-style-type: none"> • An open circuit • A short to voltage Was a problem found?	—	Verify repair	—
6	1. Ignition "OFF". 2. Check the MAF Sensor signal circuit between the PCM and the MAF Sensor for the following conditions: <ul style="list-style-type: none"> • An open circuit • A short to ground • A short to battery voltage Was a problem found?	—	Verify repair	Go to Step 7

DTC P0101 – MAF System Performance (Cont'd)

Step	Action	Value(s)	Yes	No
7	1. Connect the MAF Sensor wiring harness connector to the MAF Sensor. 2. Connect the Tech 2 to the vehicle. 3. Place the Transmission in Park/Neutral, and fully apply the Parking Brake. 4. Start the engine. 5. Select the Mass Air Flow (MAF) parameter on the Tech 2. With the engine idling, does the Tech 2 display the following value(s)?	4 to 7 g/s	Go to <i>Step 8</i>	Go to <i>Step 9</i>
8	Observe the Tech 2 value while increasing the engine RPM to its upper limit. Does the Tech 2 display the following value(s)?	25 to 40 g/s	Go to <i>Step 10</i>	Go to <i>Step 9</i>
9	Replace the MAF Sensor. Is the action complete?	—	Verify repair	—
10	Replace the PCM. IMPORTANT: The PCM must be reprogrammed. Refer to PCM reprogramming. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0102 MAF Sensor Circuit Low Frequency

060R100112

Circuit Description

The mass air flow (MAF) sensor measures the amount of air which passes through it into the engine during a given time. The powertrain control module (PCM) uses the mass air flow information to monitor engine operating conditions for fuel delivery calculations. A large quantity of air entering the engine indicates an accelerator or high load situation, while a small quantity of air indicates deceleration or idle.

The MAF sensor produces a frequency signal which can be monitored using a Tech 2. The frequency will vary within a range of around 4 to 7g/s at idle to around 25 to 40 g/s at maximum engine load. DTC P0102 will be set if the signal from the MAF sensor is below the possible range of a normally operating MAF sensor.

Conditions for Setting the DTC

- The engine is running above 500 RPM for more than 10 seconds.
- System voltage is above 11.5 volts.
- MAF signal frequency is below 1 kHz for a total of 50-percent of the last 1000 samples monitored. A sample is taken every cylinder event.

Action Taken When the DTC Sets

- The PCM will ON the MIL after second trip with detected fault.
- The PCM calculates an air flow value based on throttle position, RPM and barometric pressure.

- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0102 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0102 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Misrouted harness – Inspect the MAF sensor harness to ensure that it is not routed too close to high voltage wires.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the Tech 2 while moving connectors and wiring harnesses related to the MAF sensor. A change in the display will indicate the location of the fault.
- Plugged intake air duct or filter element – A wide-open throttle accelerator from a stop should cause the mass air flow displayed on a Tech 2 to increase from about

3-6 g/second at idle to 100 g/second or greater at the time of the 1-2 shift. If not, check for a restriction. If DTC P0102 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the DTC was last set.

- 2. This step verifies that the problem is present at idle.
- 4. A voltage reading of less than 4 or over 5 volts at the MAF sensor signal circuit indicates a fault in the wiring or a poor connection.
- 5. This verifies that ignition feed voltage and a good ground are available at the MAF sensor.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

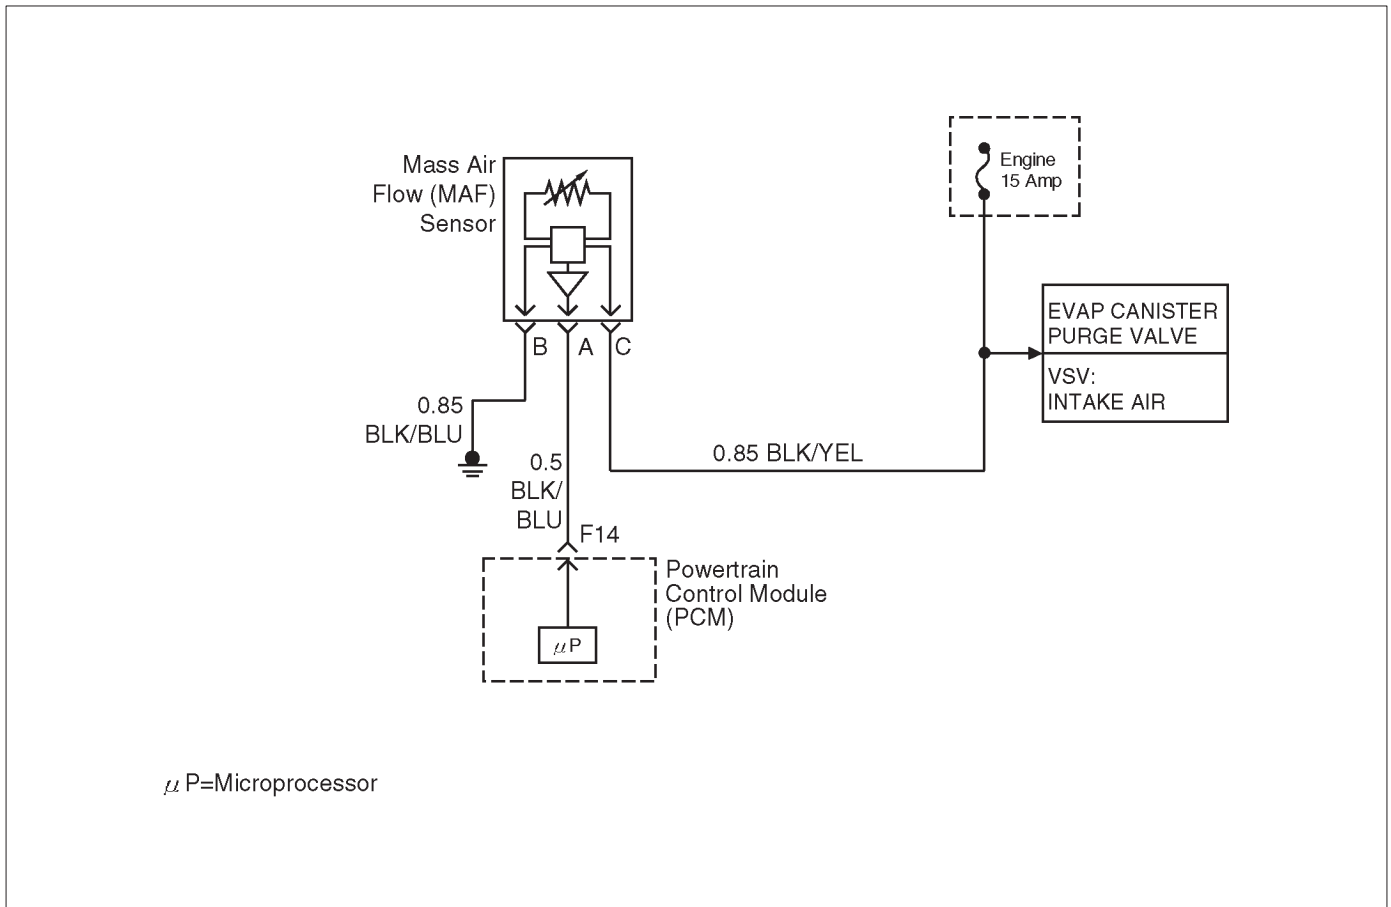

DTC P0102 – MAF Sensor Circuit Low Frequency

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Start the engine. 2. With the engine idling, monitor "MAF Frequency" display on the Tech 2. Is the "MAF Frequency" below the specified value?	1.6 g/s	Go to Step 4	Go to Step 5
3	1. Ignition "ON", engine "OFF". 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor "DTC" info for DTC P0102. Does the Tech 2 indicate DTC P0102 failed this ignition?	—	Go to Step 4	Refer to <i>Diagnostic Aids</i>
4	1. Ignition "OFF". 2. Disconnect the MAF sensor connector. 3. Ignition "ON", engine "OFF". 4. Using a DVM, measure voltage between the MAF sensor signal circuit and battery ground. Is the voltage near the specified value?	11.5–12 V	Go to Step 5	Go to Step 8
5	Connect a test light between the MAF sensor ignition feed and ground circuits at the MAF sensor harness connector. Is the test light "ON"?	—	Go to Step 13	Go to Step 6
6	Connect a test light between the MAF sensor ignition feed circuit and battery ground. Is the test light "ON"?	—	Go to Step 12	Go to Step 7
7	1. Check for a poor connection at the MAF sensor. 2. If a poor connection is found, replace the faulty terminal(s). Was a poor connection found?	—	Verify repair	Go to Step 11
8	1. Ignition "OFF". 2. Disconnect the MAF sensor. 3. Disconnect the PCM connector for the MAF signal circuit. 4. Ignition "ON", engine "OFF". 5. With the DVM, measure the voltage between the MAF signal terminal at the PCM and battery ground. Is the voltage under the specified value?	11.5–12 V	Go to Step 9	Go to Step 10

DTC P0102 – MAF Sensor Circuit Low Frequency (Cont'd)

Step	Action	Value(s)	Yes	No
9	1. Ignition "OFF". 2. Disconnect the PCM connector. 3. Ignition "ON". 4. Check the MAF sensor signal circuit for a short to 5 volts. Is the action complete?	—	Verify repair	—
10	1. Ignition "OFF". 2. Disconnect the PCM connector. 3. Ignition "ON". 4. Check the MAF sensor signal circuit between the PCM and the MAF sensor for an open, short to ground, or short to the MAF ground circuit. Is the action complete?	—	Verify repair	Go to <i>Step 13</i>
11	Locate and repair the open in the ground circuit to the MAF sensor. Is the action complete?	—	Verify repair	—
12	Locate and repair the open in the ignition feed circuit to the MAF sensor. Is the action complete?	—	Verify repair	—
13	Replace the MAF sensor. Is the action complete?	—	Verify repair	Go to <i>Step 14</i>
14	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0103 MAF Sensor Circuit High Frequency

060R100112

Circuit Description

The mass air flow (MAF) sensor measures the amount of air which passes through it into the engine during a given time. The powertrain control module (PCM) uses the mass air flow information to monitor engine operating conditions for fuel delivery calculations. A large quantity of air entering the engine indicates an accelerator or high load situation, while a small quantity of air indicates deceleration or idle.

The MAF sensor produces a frequency signal which can be monitored using a Tech 2. The frequency will vary within a range of around 4 to 7g/s at idle to around 25 to 40 g/s at maximum engine load. DTC P0103 will be set if the signal from the MAF sensor is above the possible range of a normally operating MAF sensor.

Conditions for Setting the DTC

- The engine is running above 500 RPM for more than 10 seconds.
- System voltage is above 11.5 volts.
- MAF signal frequency is above 10 kHz for a total of 50 percent of the last 1000 samples monitored. A sample is taken every cylinder event.

Action Taken When the DTC Sets

- The PCM will ON the MIL after second trip with detected the fault.

- The PCM calculates an airflow value based on idle air control valve position, throttle position, RPM and barometric pressure.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0103 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0103 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

If DTC P0103 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the DTC was last set.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

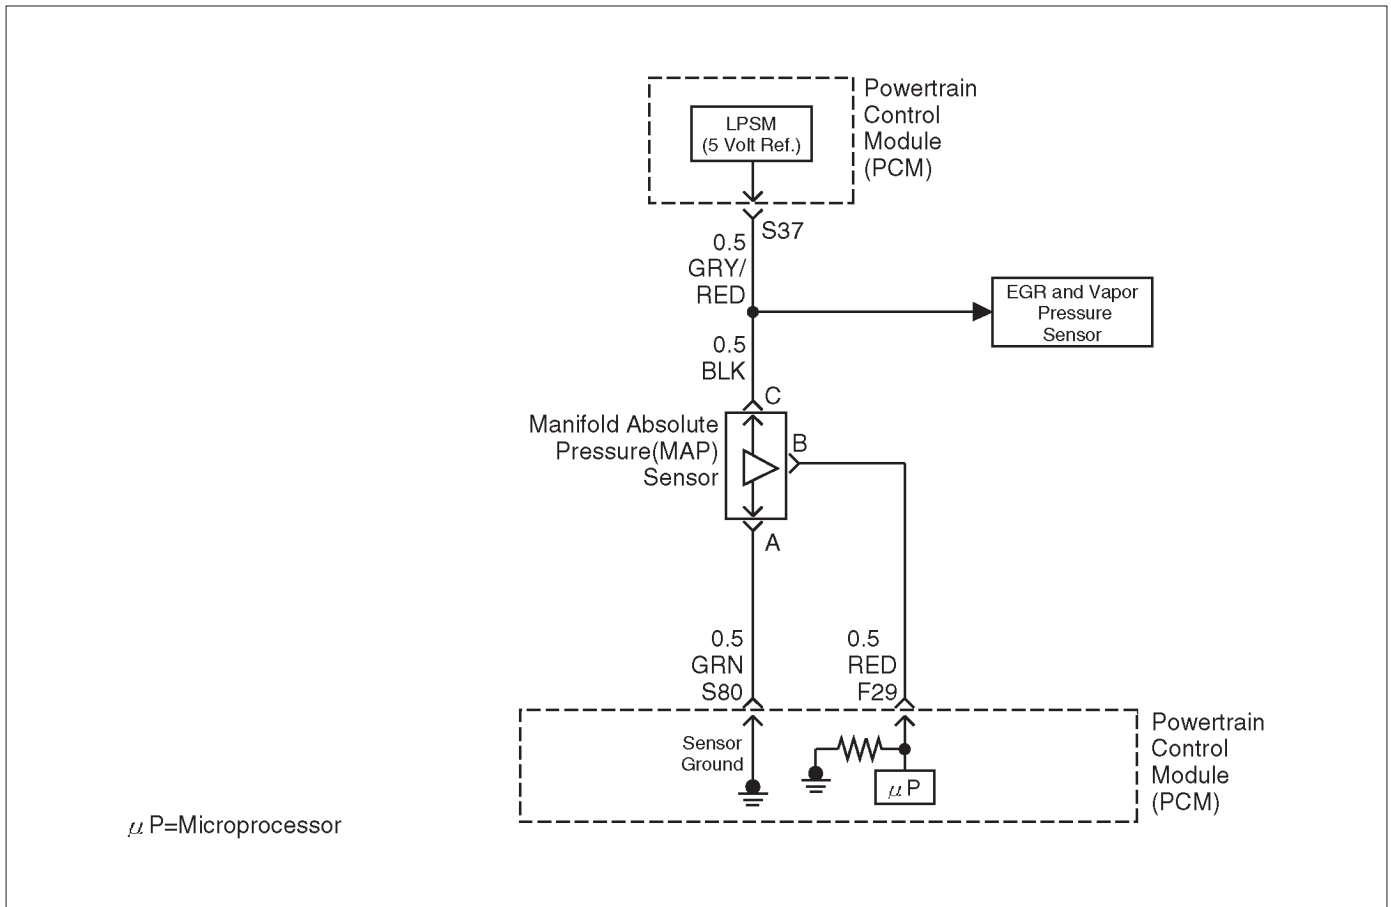

2. This step verifies that the problem is present at idle.

4. A frequency reading with the MAF sensor connector disconnected indicates an electromagnetic interference (EMI) related fault.
8. This vehicle is equipped with a PCM which utilizes an electrically erasable programmable read only memory (EEPROM). When the PCM is being replaced, the new PCM must be programmed. Refer to *PCM Replacement and Programming Procedures in Powertrain Control Module (PCM) and Sensors*.

DTC P0103 – MAF Sensor Circuit High Frequency

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "ON", engine "OFF". 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor "DTC" info for DTC P0103. Does the Tech 2 indicate DTC P0103 failed this ignition?	—	Go to Step 3	Refer to <i>Diagnostic Aids</i>
3	1. Start the engine. 2. With the engine idling, monitor "MAF Frequency" display on the Tech 2. Is "MAF Frequency" above the specified value?	40g/s	Go to Step 4	Go to Step 7
4	1. Ignition "OFF". 2. Disconnect the MAF sensor connector. 3. Ignition "ON", engine idling. 4. Using a Tech 2, monitor "MAF Frequency". Does the Tech 2 indicate a "MAF Frequency" at the specified value?	0g/s	Go to Step 5	Go to Step 6
5	Replace the MAF sensor. Is the action complete?	—	Verify repair	Go to Step 8
6	1. Check the MAF harness for incorrect routing near high voltage components (solenoids, relays, motors). 2. If incorrect routing is found, correct the harness routing. Was a problem found?	—	Verify repair	Go to Step 6
7	1. With the engine idling, monitor "MAF Frequency" display on the Tech 2. 2. Quickly snap open throttle to wide open throttle while under a road load and record value. Does the Tech 2 indicate "MAF Frequency" above the specified value?	40g/s	Go to Step 5	Go to Step 8
8	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0106 MAP System Performance

060R100132

Circuit Description

The manifold absolute pressure (MAP) sensor responds to changes in intake manifold pressure (vacuum). The MAP sensor signal voltage to the powertrain control module (PCM) varies from below 2 volts at idle (high vacuum) to above 4 volts at wide-open throttle (low vacuum) at sea level.

The MAP sensor is used to determine manifold pressure changes while the linear exhaust gas recirculation (EGR) flow test diagnostic is being run (refer to DTC P0401), engine vacuum level for some other diagnostics, and barometric pressure (BARO). The PCM compares the MAP sensor signal to a calculated MAP based on throttle position and various engine load factors. If the PCM detects a MAP signal that varies excessively above or below the calculated value, DTC P0106 will set.

Conditions for Setting the DTC

- No TP sensor DTCs are present.
- Engine speed is steady, changing less than 100 RPM.
- Engine speed is between 1000 rpm and 4000 rpm.
- Throttle position is steady, throttle angle changes less than 1%.
- EGR flow rate is steady, changing less than 4%.
- No change in brake switch, A/C clutch, TCC or power steering pressure switch status.
- Above conditions are met for longer than 1 second.
- Calculated MAP signal indicates an value significantly higher or lower than a predicated value based on

throttle position and engine RPM for a total of 12.5 seconds over 25 second period of time.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The PCM will default to a BARO value of 79.3 kPa.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0106 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0106 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the MAP display on the Tech 2 while moving connectors

and wiring harnesses related to the sensor. A change in the display will indicate the location of the fault. If DTC P0106 cannot be duplicated, the information included in the Failure Records data can be useful in

determining vehicle mileage since the DTC was last set. If it is determined that the DTC occurs intermittently, performing the DTC P1107 Diagnostic Chart may isolate the cause of the fault.

DTC P0106 – MAP System Performance

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "ON", engine "OFF". 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor "DTC" info for DTC P0106. Does the Tech 2 indicate DTC P0106 failed?	—	Go to Step 4	Go to Step 3
3	1. Check for the following conditions: <ul style="list-style-type: none"> ● Vacuum hoses disconnected, damaged, or incorrectly routed ● Intake manifold vacuum leaks ● Vacuum leaks at throttle body ● Vacuum leaks at EGR valve flange and pipes; ● Crankcase ventilation valve faulty, missing or incorrectly installed. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Refer to <i>Diagnostic Aids</i>
4	1. Disconnect the MAP sensor electrical connector. 2. Observe the MAP value displayed on the Tech 2. Is the MAP value near the specified value?	11 kPa	Go to Step 5	Go to Step 13
5	1. Connect a test light between B+ and the MAP sensor signal circuit at the MAP sensor harness connector. 2. Observe the MAP value displayed on the Tech 2. Is the MAP value near the specified value?	105 kPa	Go to Step 6	Go to Step 9
6	1. Jumper the 5 volt reference circuit and the MAP signal circuit together at the MAP sensor harness connector. 2. Observe the MAP value displayed on the Tech 2. Is the MAP value near the specified value?	104 kPa	Go to Step 7	Go to Step 8
7	1. Ignition "OFF". 2. Disconnect the PCM and check the sensor ground circuit for high resistance, an open between the PCM and the MAP sensor, or for a poor connection at the PCM. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 11
8	1. Check the 5 volt reference circuit for high resistance, an open between the PCM and the MAP sensor, or a poor connection at the PCM. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 10

DTC P0106 – MAP System Performance (Cont'd)

Step	Action	Value(s)	Yes	No
9	1. Ignition "OFF". 2. Disconnect the PCM, and check the MAP sensor signal circuit for high resistance, an open, a short to ground, or a short to the sensor ground circuit. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 10</i>
10	1. Check the MAP sensor signal circuit for a poor connection at the PCM. 2. If a problem is found, repair as necessary. Did the terminal require replacement?	—	Verify repair	Go to <i>Step 14</i>
11	1. Check for a poor connection at the MAP sensor. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 12</i>
12	Replace the MAP sensor. Is the action complete?	—	Verify repair	—
13	1. Ignition "OFF", disconnected the PCM. 2. Ignition "ON", check the MAP signal circuit for a short to voltage or a short to the 5 volt reference circuit. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 14</i>
14	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service</i> in <i>Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0107 MAP Sensor Circuit Low Voltage

060R100132

Circuit Description

The manifold absolute pressure (MAP) sensor responds to changes in intake manifold pressure (vacuum). The MAP sensor signal voltage to the powertrain control module (PCM) varies from below 2 volts at idle (high vacuum) to above 4 volts with the ignition "ON", engine not running or at wide-open throttle (low vacuum).

The MAP sensor is used to determine manifold pressure changes while the exhaust gas recirculation (EGR) flow test diagnostic is being run (refer to *DTC P0401*), to determine engine vacuum level for some other diagnostics and to determine barometric pressure (BARO). The PCM monitors the MAP signals for voltages outside the normal range of the MAP sensor. If the PCM detects a MAP signal voltage that is excessively low, DTC P0107 will be set.

Conditions for Setting the DTC

- No TP sensor DTCs present.
- Engine is running.
- Throttle angle is above 1% if engine speed is less than 1000 RPM.
- Throttle angle is above 2% if engine speed is above 1000 RPM.
- The MAP sensor indicates manifold absolute pressure at or below 11 kPa for a total of approximately 10 seconds over a 16-second period.
- Ignition voltage more than 11 volts.

Action Taken When the DTC Sets

- The PCM will ON the MIL after second trip with detected fault.
- The PCM will default to a BARO value of 79.3 kPa.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0107 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0107 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Check for intermittent codes.
- The MAP sensor shares a 5 Volt reference with the Fuel Tank Pressure Sensor. If these codes are also set, it could indicate a problem with the 5 Volt reference circuit.
- The MAP sensor shares a ground with the Fuel Tank Pressure Sensor, the ECT sensor, and the Transmission Fluid Temperature sensor.
- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken

locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.

- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the MAP display on the Tech 2 while moving connectors and wiring harnesses related to the sensor. A change in the display will indicate the location of the fault.

If DTC P0107 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the DTC was last set. If it is determined that the DTC occurs intermittently, performing the DTC P0107 Diagnostic Chart may isolate the cause of the fault.

DTC P0107 – MAP Sensor Circuit Low Voltage

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "ON", engine "OFF". 2. With the throttle closed, observe the MAP value displayed on the Tech 2. Is the MAP value near the specified value?	0 V 11 kPa at sea level	Go to Step 4	Go to Step 3
3	1. Ignition "ON", engine "OFF". 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor "DTC" info for DTC P0107. Does the Tech 2 indicate DTC P0107 failed?	—	Go to Step 4	Refer to <i>Diagnostic Aids</i>
4	1. Ignition "OFF". 2. Disconnect the MAP sensor electrical connector. 3. Jumper the 5 volt reference circuit and the MAP signal together at the MAP sensor harness connector. 4. Ignition "ON". 5. Observe the MAP value displayed on the Tech 2. Is the MAP value near the specified value? (If no, start with diagnosis chart for other sensors in the circuit and see if 5V returns.)	5 V 104 kPa	Go to Step 10	Go to Step 5
5	1. Disconnect the jumper. 2. Connect a test light between B+ and the MAP sensor signal circuit at the MAP sensor harness connector. 3. Observe the MAP value displayed on the Tech 2. Is the MAP value near the specified value.	5 V 104 kPa	Go to Step 6	Go to Step 8
6	1. Ignition "OFF". 2. Disconnect the PCM and check the 5 volt reference circuit for an open or short to ground. 3. If the 5 volt reference circuit is open or shorted to ground, repair it as necessary. Was the 5 volt reference circuit open or shorted to ground?	—	Verify repair	Go to Step 7
7	Check the 5 volt reference circuit for a poor connection at the PCM and replace the terminal if necessary. Did the terminal require replacement?	—	Verify repair	Go to Step 11

DTC P0107 – MAP Sensor Circuit Low Voltage (Cont'd)

Step	Action	Value(s)	Yes	No
8	1. Ignition "OFF". 2. Disconnect the PCM, and check the MAP signal circuit for an open, short to ground, or short to the sensor ground circuit. 3. If the MAP sensor signal circuit is open or shorted to ground, repair it as necessary. Was the MAP signal circuit open or shorted to ground?	—	Verify repair	Go to <i>Step 9</i>
9	Check the MAP sensor signal circuit for a poor connection at the PCM and the MAP sensor; replace the terminal if necessary. Did the terminal require replacement?	—	Verify repair	Go to <i>Step 11</i>
10	Replace the MAP sensor. Is the action complete?	—	Verify repair	—
11	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0108 MAP Sensor Circuit High Voltage

060R100132

Circuit Description

The manifold absolute pressure (MAP) sensor responds to changes in intake manifold pressure (vacuum). The MAP sensor signal voltage to the powertrain control module (PCM) varies from below 2 volts at idle (high vacuum) to above 4 volts with the key "ON", engine not running or at wide-open throttle (low vacuum).

The MAP sensor is used to determine manifold pressure changes while the linear EGR flow test diagnostic is being run (refer to *DTC P0401*), to determine engine vacuum level for some other diagnostics and to determine barometric pressure (BARO). The PCM monitors the MAP signals for voltages outside the normal range of the MAP sensor. If the PCM detects a MAP signal voltage that is excessively high, DTC P0108 will be set.

Conditions for Setting the DTC

- No TP sensor DTCs present.
- Engine is running for more than 10 seconds.
- Throttle position is below 3% if engine speed is below 1000 RPM.
- Throttle position is below 10% if engine speed is above 1000 RPM.
- The MAP sensor indicates an intermittent manifold absolute pressure above 80 kPa for a total of approximately 10 seconds over a 16-second period.

Action Taken When the DTC Sets

- The PCM will ON the MIL after second trip with detected fault.

- The PCM will default to a BARO value of 79.3 kPa.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0108 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0108 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- The MAP sensor shares a 5 Volt reference with the Fuel Tank Pressure Sensor (Vapor Pressure Sensor). If these codes are also set, it could indicate a problem with the 5 Volt reference circuit.
- The MAP sensor shares a ground with the Fuel Tank Pressure Sensor, the ECT sensor, and the Transmission Fluid Temperature sensor.
- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the MAP display on the Tech 2 while moving connectors and wiring harnesses related to the sensor. A change in the display will indicate the location of the fault.

If DTC P0108 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the DTC was last set. If

it is determined that the DTC occurs intermittently, performing the DTC P1108 Diagnostic Chart may isolate the cause of the fault.

DTC P0108 – MAP Sensor Circuit High Voltage

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. If the engine idle is rough, unstable or incorrect, repair the idle problem before using this chart. Refer to <i>Symptoms</i> section. 2. With the engine idling, note the MAP value on the Tech 2. Is the MAP reading above the specified value?	90 kPa	Go to Step 4	Go to Step 3
3	1. Ignition "ON", engine "OFF". 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor "DTC" info for DTC P0108. Does the Tech 2 indicate DTC P0108 failed this ignition?	—	Go to Step 4	Refer to <i>Diagnostic Aids</i>
4	1. Ignition "OFF". 2. Disconnect the MAP sensor electrical connector. 3. Ignition "ON". 4. Note the MAP sensor voltage displayed on the Tech 2. (If no, start with diagnostic chart for other sensors in the circuit and see if 5V returns.) Is the MAP sensor voltage at the specified value?	11 kPa 0.0 V	Go to Step 5	Go to Step 6
5	Probe the sensor ground circuit with a test light to B+. Is the test light "ON"?	—	Go to Step 7	Go to Step 9
6	1. Check the MAP signal circuit for a short to voltage or a short to the 5 volt reference circuit. 2. If the MAP sensor signal circuit is shorted, repair circuit as necessary. Was the MAP sensor signal circuit shorted?	—	Verify repair	Go to Step 11
7	1. Check for a poor sensor ground terminal connection at the MAP sensor electrical connector. 2. If a problem is found, replace the faulty terminal. Did the terminal require replacement?	—	Verify repair	Go to Step 8
8	Check for a plugged or leaking vacuum supply to the MAP sensor. Is the vacuum supply plugged or leaking?	—	Verify repair	Go to Step 12
9	1. Check for a poor sensor ground terminal connection at the PCM. 2. If a problem is found, replace the faulty terminal. Did the terminal require replacement?	—	Verify repair	Go to Step 10

DTC P0108 – MAP Sensor Circuit High Voltage (Cont'd)

Step	Action	Value(s)	Yes	No
10	<p>1. Check the continuity of the MAP sensor ground circuit.</p> <p>2. If the MAP sensor ground circuit measures over 5 ohms, repair open or poor connection.</p> <p>Was a condition found and corrected?</p>	—	Verify repair	Go to <i>Step 11</i>
11	<p>Replace the PCM.</p> <p>IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service</i> in <i>Powertrain Control Module and Sensors</i> for procedures.</p> <p>And also refer to latest Service Bulletin.</p> <p>Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM.</p> <p>Is the action complete?</p>	—	Verify Repair	—
12	<p>Replace the MAP sensor.</p> <p>Is the action complete?</p>	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0112 IAT Sensor Circuit Low Voltage

D06RY00147

Circuit Description

The intake air temperature (IAT) sensor is a thermistor which measures the temperature of the air entering the engine. The powertrain control module (PCM) applies 5 volts through a pull-up resistor to the IAT sensor. When the intake air is cold, the sensor resistance is high and the PCM will monitor a high signal voltage on the IAT signal circuit. If the intake air is warm, the sensor resistance is lower, causing the PCM to monitor a lower voltage. DTC P0112 will set when the PCM detects an excessively low signal voltage on the intake air temperature sensor signal circuit.

Conditions for Setting the DTC

- The engine has been running for over 15 seconds.
- Vehicle speed is greater than 30 mph (48 km/h) .
- IAT signal voltage indicates and intake air temperature greater than 148°C (298°F) (about 5 volts) for a total of 12.5 seconds over a 25-second period of time.

Action Taken When the DTC Sets

- The PCM will ON the MIL after second trip with detected fault.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0112 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0112 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-bout terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the IAT display on the Tech 2 while moving connectors and wiring harnesses related to the IAT sensor. A change in the IAT display will indicate the location of the fault.

If DTC P0112 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the DTC was last set.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

2. Verifies that the fault is present.
3. If DTC P0112 can be repeated only by duplicating the Failure Records condition, refer to the *Temperature vs. Resistance Value* table. The table may be used to test the IAT sensor at various temperatures to evaluate the possibility of a "shifted" sensor that may be stored above or below a certain temperature. If this is the case, replace the IAT sensor. If the IAT sensor appears to be OK, the fault is intermittent; refer to *Diagnostic Aids*.

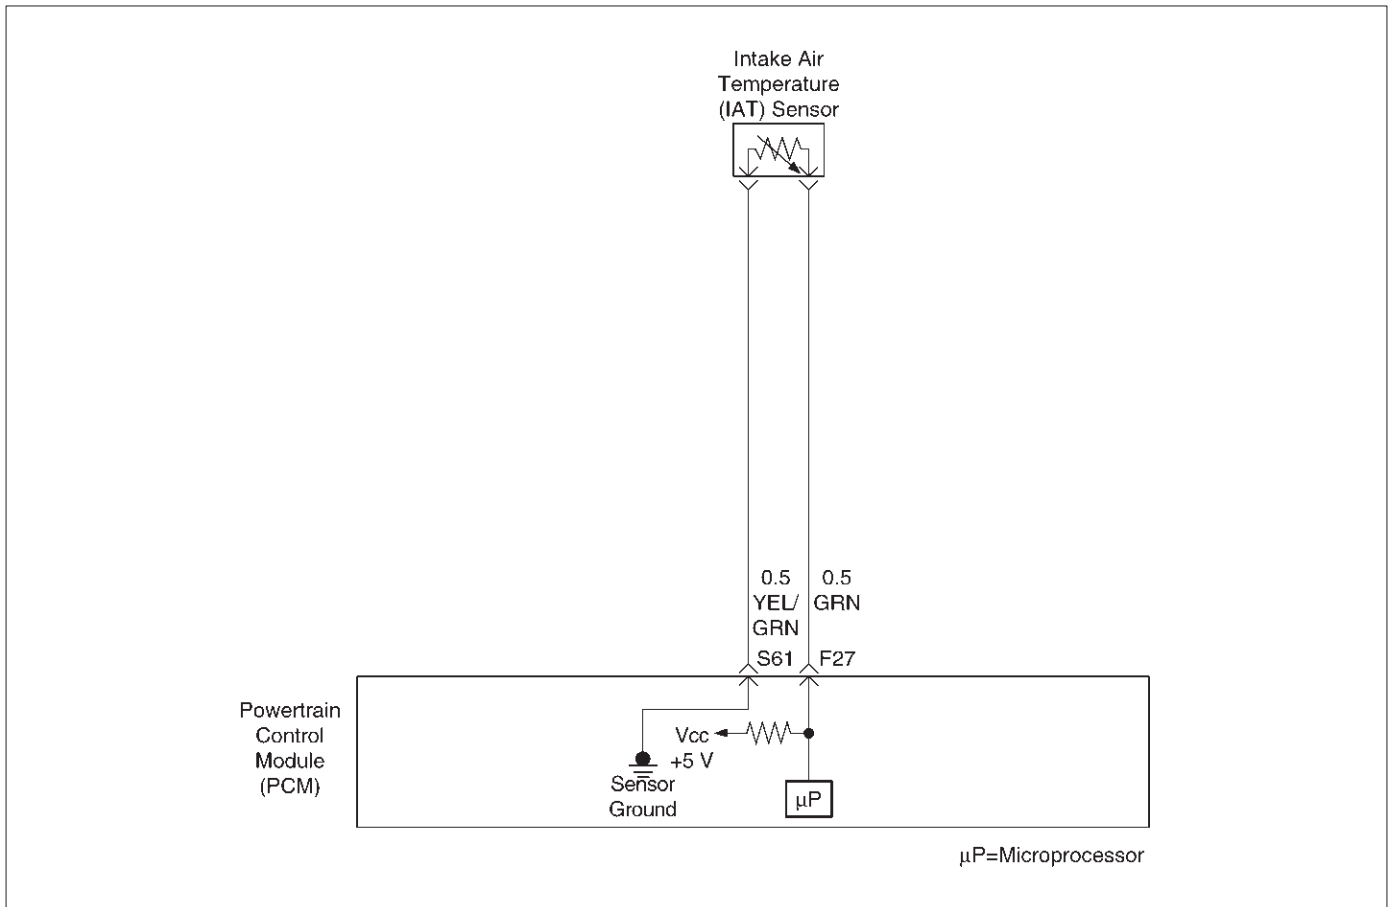

Intake Air Temperature Sensor

°C	°F	OHMS
Temperature vs. Resistance Values (approximate)		
100	212	177
80	176	332
60	140	667
45	113	1188

-40	-40	100700

DTC P0112–IAT Sensor Circuit Low Voltage

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	1. Ignition “ON”, engine “OFF”. 2. Using a Tech 2, monitor the intake air temperature (IAT). Is the intake air temperature greater than the specified value?	148°C (283°F)	Go to <i>Step 4</i>	Go to <i>Step 3</i>
3	1. Ignition “ON”, engine “OFF”. Review and record Tech 2 Failure Records data. 2. Operate the vehicle within Failure Records conditions as noted. 3. Using a Tech 2, monitor the “DTC” info for DTC P0112. Does the Tech 2 indicate DTC P0112 failed this ignition?	—	Refer to <i>Test Description</i>	Refer to <i>Diagnostic Aids</i>
4	1. Ignition “OFF”. 2. Disconnect the IAT sensor electrical connector. 3. Ignition “ON”. 4. Observe the intake air temperature on the Tech 2. Is the intake air temperature below the specified value?	–38°C (–36°F)	Go to <i>Step 6</i>	Go to <i>Step 5</i>
5	1. Ignition “OFF”. 2. Disconnect the PCM electrical connectors. 3. Check the IAT sensor signal circuit for a short to ground. Is the IAT sensor signal circuit shorted to ground?	—	Verify repair	Go to <i>Step 7</i>
6	Replace the IAT sensor. Is the action complete?	—	Verify repair	—
7	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0113 IAT Sensor Circuit High Voltage

D06RY00147

Circuit Description

The intake air temperature (IAT) sensor is a thermistor which measures the temperature of the air entering the engine. The powertrain control module (PCM) applies 5 volts through a pull-up resistor to the IAT sensor. When the intake air is cold, the sensor resistance is high and the PCM will monitor a high signal voltage on the IAT signal circuit. If the intake air is warm, the sensor resistance is lower causing the PCM to monitor a lower voltage. DTC P0113 will set when the PCM detects an excessively high signal voltage on the intake air temperature sensor signal circuit.

Conditions for Setting the DTC

- The engine has been running for over 30 seconds.
- Vehicle speed is less than 20 mph (32 km/h).
- ECT signal temperature is above 60°C (140°F).
- Mass air flow is less than 20 g/second.
- IAT signal voltage indicates an intake air temperature less than -39°C (-38°F) for total of 12.5 seconds over a 25-second period.

Action Taken When the DTC Sets

- The PCM will ON the MIL after second trip with detected fault.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0113 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0113 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the IAT display on the Tech 2 while moving connectors and wiring harnesses related to the IAT sensor. A change in the IAT display will indicate the location of the fault.

If DTC P0113 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the DTC was last set.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

2. Verifies that the fault is present.

3. If DTC P0113 can be repeated only by duplicating the Failure Records conditions, refer to the "Temperature vs. Resistance Values" table. The table may be used to test the IAT sensor at various temperatures to evaluate the possibility of a "shifted" sensor that may be open above or below a certain temperature. If this is the case, replace the IAT sensor. If the IAT sensor appears to be OK, the fault is intermittent; refer to *Diagnostic Aids*.

7	1. Ignition "OFF". 2. Disconnect the PCM, and check the IAT sensor ground circuit for an open. 3. If the IAT sensor ground circuit is open, repair it as necessary. Was the IAT sensor ground circuit open?	—	Verify repair	Go to <i>Step 9</i>
8	1. Ignition "OFF". 2. Disconnect the PCM, and check the IAT signal circuit for an open. 3. If the IAT sensor signal circuit is open, repair it as necessary. Was the IAT signal circuit open?	—	Verify repair	Go to <i>Step 9</i>
9	Check for a poor sensor ground or IAT signal circuit terminal connection at the PCM and replace terminal(s) if necessary. Did any of the terminals need to be replaced?	—	Verify repair	Go to <i>Step 11</i>
10	Replace the IAT sensor. Is the action complete?	—	Verify repair	—
11	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0117 ECT Sensor Circuit Low Voltage

D06RY00148

Circuit Description

The engine coolant temperature (ECT) sensor is a thermistor mounted on a coolant crossover pipe at the front of the engine. The powertrain control module (PCM) applies a voltage (about 5 volts) through a pull-up resistor to the ECT signal circuit. When the engine coolant is cold, the sensor (thermistor) resistance is high, therefore the PCM will measure a high signal voltage. As the engine coolant warms, the sensor resistance becomes lower, and the ECT signal voltage measured at the PCM drops. With a fully warmed-up engine, the ECT signal voltage should measure about 1.5 to 2.0 volts.

Conditions for Setting the DTC

- Engine running time is longer than 120 seconds.
- The ECT sensor signal indicates an engine coolant temperature greater than 150°C (302°F) (about 0.10 V) for a total of 50 seconds over a 100-second period.

Action Taken When the DTC Sets

- The PCM will ON the MIL after second trip with detected fault.
- The PCM will substitute the ECT reading with a default engine coolant temperature value. The default value is based on start-up intake air temperature and running time.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0117 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0117 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the ECT display on the Tech 2 while moving connectors and wiring harnesses related to the ECT sensor. A change in the ECT display will indicate the location of the fault.

If DTC P0117 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the DTC was last set. If it is determined that the DTC occurs intermittently, performing the DTC P1114 Diagnostic Chart may isolate the cause of the fault.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

- 2. Verifies that the fault is present.
- 3. If DTC P0117 can be repeated only by duplicating the Failure Records conditions, refer to the "Temperature vs. Resistance Values" table. The table may be used to test the ECT sensor at various temperatures to evaluate the possibility of a "shifted" sensor that may be shorted above or below a certain temperature. If this is the case, replace the ECT sensor. If the ECT sensor appears to be OK, the fault is intermittent; refer to *Diagnostic Aids*.

5	1. Ignition "OFF". 2. Disconnect the PCM and check the ECT signal circuit for a short to ground or a short to the sensor ground circuit. 3. If the ECT signal circuit is shorted, repair it as necessary. Was the ECT signal circuit shorted to ground?	—	Verify repair	Go to Step 7
6	Replace the ECT sensor. Is the action complete?	—	Verify repair	—
7	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0118 ECT Sensor Circuit High Voltage

Circuit Description

The engine coolant temperature (ECT) sensor is a thermistor mounted in on a coolant crossover pipe at the front of the engine. The powertrain control module (PCM) applies a voltage (about 5 volts) through a pull-up resistor to the ECT signal circuit. When the engine coolant is cold, the sensor (thermistor) resistance is high, therefore the PCM will measure a high signal voltage. As the engine coolant warms, the sensor resistance becomes less, and the ECT signal voltage measured at the PCM drops. With a fully warmed-up engine, the ECT signal voltage should measure about 1.5 to 2.0 volts.

Conditions for Setting the DTC

- Engine running time is longer than 90 seconds.
- The ECT sensor signal indicates an engine coolant temperature of -39°C (-38°F) or less (about 5 volts) for a total of 50 seconds over a 100-second period.

Action Taken When the DTC Sets

- The PCM will ON the MIL after second trip with detected fault.
- The PCM will substitute the ECT reading with a default engine coolant temperature value. The default value is based on start-up intake air temperature and running time.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0118 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0118 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

The ECT shares a ground with the Transmission Fluid Temperature sensor, the Fuel Tank Pressure sensor, and the MAP sensor.

Check the ground if these DTCs are also set.

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the ECT display on the Tech 2 while moving connectors and wiring harnesses related to the ECT sensor. A change in the ECT display will indicate the location of the fault.

If DTC P0118 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the DTC was last set. If it is determined that the DTC occurs intermittently, performing the DTC P1115 Diagnostic Chart may isolate the cause of the fault.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. Verifies that the fault is present.
3. If DTC P0118 can be repeated only by duplicating the Failure Records conditions, refer to the "Temperature vs. Resistance Value" table. The table may be used to test the ECT sensor at various temperatures to evaluate the possibility of a "shifted" sensor that may be shorted above or below a certain temperature. If this is the case, replace the ECT sensor. If the ECT sensor appears to be OK, the fault is intermittent; refer to *Diagnostic Aids*.

DTC P0118 – ECT Sensor Circuit High Voltage

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	1. Ignition "ON", engine "OFF". 2. Observe the "Eng Cool Temp" display on the Tech 2. Is the "Eng Cool Temp" below the specified value?	-39°C (-38°F)	Go to Step 4	Go to Step 3
3	1. Ignition "ON", engine "OFF". 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor the "DTC" info for DTC P0118. Does the Tech 2 indicate DTC P0118 failed?	—	Refer to Test Description	Refer to Diagnostic Aids
4	1. Disconnect the ECT sensor electrical connector. 2. Jumper the ECT signal circuit and the sensor ground circuit together at the ECT sensor harness connector. 3. Observe the "Eng Cool Temp" display on the Tech 2. Is the "Eng Cool Temp" at the specified value?	140°C (284°F)	Go to Step 6	Go to Step 5
5	1. Jumper the ECT signal circuit at the ECT sensor harness connector to chassis ground. 2. Observe the "Eng Cool Temp" display on the Tech 2. Is the "Eng Cool Temp" at the specified value?	140°C (284°F)	Go to Step 7	Go to Step 8
6	Check for poor connections at the ECT sensor and replace terminals if necessary. Did any terminals require replacement?	—	Verify repair	Go to Step 10

DTC P0118 – ECT Sensor Circuit High Voltage (Cont'd)

Step	Action	Value(s)	Yes	No
7	1. Ignition "OFF". 2. Disconnect the PCM, and check the ECT sensor ground circuit for an open. 3. If the ECT sensor ground circuit is open, repair it as necessary. Was the ECT sensor ground circuit open?	—	Verify repair	Go to <i>Step 9</i>
8	1. Ignition "OFF". 2. Disconnect the PCM, and check the ECT signal circuit for an open. 3. If the ECT sensor signal circuit is open, repair it as necessary. Was the ECT signal circuit open?	—	Verify repair	Go to <i>Step 9</i>
9	Check for a poor sensor ground or ECT signal circuit terminal connection at the PCM and replace terminal(s) if necessary. Did any of the terminals need to be replaced?	—	Verify repair	Go to <i>Step 11</i>
10	Replace the ECT sensor. Is the action complete?	—	Verify repair	—
11	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service</i> in <i>Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0131 HO2S Circuit Low Voltage Bank 1 Sensor 1

060R100133

Circuit Description

The powertrain control module (PCM) supplies a bias voltage of about 450 mV between the heated oxygen sensor (HO2S) signal high and signal low circuits. When measured with a 10 megaohm digital voltmeter, this may display as low as 350 mV. The oxygen sensor varies the voltage within a range of about 1000 mV when the exhaust is rich, down through about 10 mV when exhaust is lean. The PCM constantly monitors the HO2S signal during "closed loop" operation and compensates for a rich or lean condition by decreasing or increasing injector pulse width as necessary. If the Bank 1 HO2S 1 voltage remains excessively low for an extended period of time, DTC P0131 will be set.

Conditions for Setting the DTC

- No related DTCs.
- Vehicle is operating in "closed loop".
- Engine coolant temperature is above 60°C (140°F).
- Bank 1 HO2S 1 signal voltage remains below 30 mV during normal "closed loop" operation for a total of 77 seconds over a 90-second period of time.

Action Taken When the DTC Sets

- The PCM will ON the MIL after second trip with detected fault.

- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.
- "Open loop" fuel control will be in effect.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0131 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0131 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Heated oxygen sensor wiring – The sensor pigtail may be routed incorrectly and contacting the exhaust system.
- Poor PCM to engine block grounds.
- Fuel pressure – The system will go lean if pressure is too low. The PCM can compensate for some decrease. However, if fuel pressure is too low, a DTC P0131 may be set. Refer to *Fuel System Diagnosis*.
- Lean injector(s) – Perform "Injector Balance Test".
- Vacuum leaks – Check for disconnected or damaged vacuum hoses and for vacuum leaks at the intake manifold, throttle body, EGR system, and PCV system.

- Exhaust leaks – An exhaust leak may cause outside air to be pulled into the exhaust gas stream past the HO2S, causing the system to appear lean. Check for exhaust leaks that may cause a false lean condition to be indicated.
- MAF sensor – The system can go lean if the MAF sensor signal indicates an engine airflow measurement that is not correct. Disconnect the MAF sensor to see if the lean condition is corrected. If so, replace the MAF sensor.
- Fuel contamination – Water, even in small amounts, can be delivered to the fuel injectors. The water can cause a lean exhaust to be indicated. Excessive alcohol in the fuel can also cause this condition. Refer to *Fuel System Diagnosis* for the procedure to check for fuel contamination.

- If none of the above conditions are present, replace the affected HO2S.

Test Description

Number(s) below refer to step numbers on the diagnostic chart.

3. DTC P0131 failing during operation may indicate a condition described in the “Diagnostic Aids” above. If the DTC P0131 test passes while the Failure Records conditions are being duplicated, an intermittent condition is indicated.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P0131 –HO2S Circuit Low Voltage Bank 1 Sensor 1

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Install the Tech 2. 2. Run the engine at normal operating temperature. 3. Operate the vehicle within the parameters specified under “Conditions for Setting the DTC” criteria included in Diagnostic Support. 4. Using a Tech 2, monitor Bank 1 HO2S 1 voltage. Does the Bank 1 HO2S 1 voltage remain below the specified value?	22 mV	Go to Step 4	Go to Step 3
3	1. Ignition “ON”, engine “OFF”, review and record Tech 2 Failure Records data and note parameters. 2. Operate the vehicle within Failure Records conditions as noted. 3. Using a Tech 2, monitor “DTC” info for DTC P0131 until the DTC P0131 test runs. Note test result. Does Tech 2 indicate DTC P0131 failed this ignition?	—	Go to Step 4	Refer to <i>Diagnostic Aids</i>
4	1. Turn the ignition “OFF”. 2. Disconnect the PCM. 3. Check the Bank 1 HO2S 1 high and low circuits for a short to ground or a short to the heater ground circuit. Are the Bank 1 HO2S 1 signal circuits shorted to ground?	—	Go to Step 5	Go to Step 6
5	Repair the Bank 1 HO2S 1 signal circuit. Is the action complete?	—	Verify repair	—
6	1. Turn the ignition “OFF”, HO2S 1 and PCM disconnected. 2. Check for continuity between the high and low signal circuits. Was there continuity between the high and low circuits?	—	Go to Step 7	Go to Step 8
7	Repair the short between the high and low circuits. Is the action complete?	—	Verify repair	—

DTC P0131 –HO2S Circuit Low Voltage Bank 1 Sensor 1 (Cont'd)

Step	Action	Value(s)	Yes	No
8	1. Ignition "OFF". 2. Reconnect the PCM, leave the sensor disconnected. 3. Ignition "ON". Does the Tech 2 indicate Bank 1 HO2S 1 voltage between the specified values?	425-475 mV	Refer to <i>Diagnostic Aids</i>	Go to <i>Step 9</i>
9	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service</i> in <i>Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0132 HO2S Circuit High Voltage Bank 1 Sensor 1

060R100133

Circuit Description

The powertrain control module (PCM) supplies a bias voltage of about 450 mV between the heated oxygen sensor (HO2S) signal and low circuits. When measured with a 10 megaohm digital voltmeter, this may display as low as 320 mV. The oxygen sensor varies the voltage within a range of about 1000 mV when exhaust is rich, down through about 10 mV when exhaust is lean. The PCM constantly monitors the HO2S signal during “closed loop” operation and compensates for a rich or lean condition by decreasing or increasing injector pulse width as necessary. If the Bank 1 HO2S 1 voltage remains excessively high for an extended period of time, DTC P0132 will be set.

Conditions for Setting the DTC

- No related DTCs.
- Engine coolant temperature is above 60°C (140°F)
- Bank 1 HO2S 1 signal voltage remains above 952 mV during normal “closed loop” operation for a total of 77 seconds over a 90-second period.
- The fuel control system is operating in the closed loop mode.

Action Taken When the DTC Sets

- The PCM will ON the MIL after second trip with detected fault.

- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.
- “Open loop” fuel control will be in effect.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0132 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0132 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check the following items:

- Fuel pressure – The system will go rich if pressure is too high. The PCM can compensate for some increase. However, if fuel pressure is too high, a DTC P0132 may be set. Refer to *Fuel System Diagnosis*.
- Perform “Injector Balance Test” – Refer to *Fuel System Diagnosis*.
- Check the EVAP canister for fuel saturation – If full of fuel, check canister control and hoses. Refer to *Evaporative (EVAP) Emission Control System*.
- MAF sensor –The system can go rich if MAF sensor signal indicates an engine airflow measurement that is not correct. Disconnect the MAF sensor to see if the

rich condition is corrected. If so, replace the MAF sensor.

- Check for a leak in the fuel pressure regulator diaphragm by checking the vacuum line to the regulator for the presence of fuel. There should be no fuel in the vacuum line.
- An intermittent TP sensor output will cause the system to go rich due to a false indication of the engine accelerator.
- Shorted Heated Oxygen Sensor (HO2S) –If the HO2S is internally shorted, the HO2S voltage displayed on the Tech 2 will be over 1 volt. Try disconnecting the affected HO2S with the key “ON”, engine “OFF”. If the displayed HO2S voltage changes from over 1000 mV to around 450 mV, replace the HO2S. Silicon contamination of the HO2S can also cause a high HO2S voltage to be indicated. This condition is indicated by a powdery deposit on the portion of the HO2S exposed to the exhaust stream. If contamination is noticed, replace the affected HO2S.
- Open HO2S Signal Circuit or Faulty HO2S—A poor connection or open in the HO2S signal circuit can cause the DTC to set during deceleration fuel mode. An HO2S which is faulty and not allowing a full voltage

swing between the rich and lean thresholds can also cause this condition. Operate the vehicle by monitoring the HO2S voltage with a Tech 2. If the HO2S voltage is limited within a range between 300 mV to 600 mV, check the HO2S signal circuit wiring and associated terminal conditions.

- If none of the above conditions are present, replace the affected HO2S.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

3. DTC P0132 failing during “deceleration fuel cutoff mode” operation may indicate a condition described in the “Diagnostic Aids” above. If the DTC P0132 test passes while the Failure Records conditions are being duplicated, an intermittent condition is indicated.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P0132 – HO2S Circuit High Voltage Bank 1 Sensor 1

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Install the Tech 2. 2. Run the engine at operating temperature. 3. Operate the vehicle within parameters specified under “Conditions for Setting the DTC” included in Diagnostic Support. 4. Using a Tech 2, monitor Bank 1 HO2S 1 voltage. Does the Bank 1 HO2S 1 voltage remain above the specified value?	952 mV (500 mV in deceleration fuel cutoff mode)	Go to Step 4	Go to Step 3
3	1. Ignition “ON”, review and record Tech 2 Failure Records data. 2. Operate the vehicle within Failure Records conditions as noted. 3. Using a Tech 2, monitor “DTC” info for DTC P0132 until the DTC P0132 test runs. 4. Note the test result. Does the Tech 2 indicate DTC P0132 failed this ignition?	—	Go to Step 4	Refer to <i>Diagnostic Aids</i>
4	1. Ignition “OFF”. 2. Disconnect Bank 1 HO2S 1. 3. Ignition “ON”. 4. At HO2S Bank 1 Sensor 1 connector (PCM side) use a DVM to measure voltages at the high and low signal terminals. Are the voltages in the specified range?	3-4 V	Go to Step 5	Go to Step 6
5	Repair short to voltage in signal circuit. Is the action complete?	—	Verify repair	—

DTC P0132 – HO2S Circuit High Voltage Bank 1 Sensor 1 (Cont'd)

Step	Action	Value(s)	Yes	No
6	1. Ignition "ON", engine"OFF". 2. At Bank 1 HO2S 1 connector (PCM side) jumper both the HO2S high and low signal circuits (PCM side) to ground. 3. Using a Tech 2, monitor Bank 1 HO2S 1 voltage. Is Bank 1 HO2S 1 voltage below the specified value?	10 mV	Go to <i>Step 7</i>	Go to <i>Step 8</i>
7	1. Disconnect the jumpers to ground from Bank 1 HO2S 1 PCM-side connector. 2. With the HO2S 1 connector disconnected, monitor Bank 1 HO2S 1 voltage. Is Bank 1 HO2S 1 voltage between the specified values?	425-475 mV	Refer to <i>Diagnostic Aids</i>	Go to <i>Step 8</i>
8	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service</i> in <i>Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC)

P0134 HO2S Circuit Insufficient Activity Bank 1 Sensor 1

Circuit Description

- The powertrain control module (PCM) supplies a bias voltage of about 450 mV between the heated oxygen sensor (HO2S) high and low circuits. When measured with a 10 megohm digital voltmeter, this may display as low as 320 mV. The oxygen sensor varies the voltage within a range of about 1000 mV when the exhaust is rich, down through about 10 mV when exhaust is lean. The PCM constantly monitors the HO2S signal during “closed loop” operation and compensates for a rich or lean condition by decreasing or increasing injector pulse width as necessary. If the Bank 1 HO2S 1 voltage remains at or near the 450 mV bias for an extended period of time, DTC P0134 will be set, indicating an open sensor signal or sensor low circuit.
- Heated oxygen sensors are used to minimize the amount of time required for “closed loop” fuel control operation and to allow accurate catalyst monitoring. The oxygen sensor heater greatly decreases the amount of time required for fuel control sensors Bank 1 HO2S 1 and Bank 2 HO2S 1 to become active.
- Oxygen sensor heaters are required by post-catalyst monitor sensors to maintain a sufficiently high temperature for accurate exhaust oxygen content readings further from the engine.

Conditions for Setting the DTC

- No related DTCs.
- Battery voltage is above 10 volts.
- The engine has been running for over 5 seconds.
- Engine coolant temperature (ETC) is above 60°C (140°F).
- Oxygen sensor heater has been determined to be functioning properly.
- Bank 1 HO2S 1 signal voltage remains between 400 mV and 500 mV for a total of 77 seconds over a 90-second period of time.

Action Take When the DTC Sets

- The PCM will ON the MIL after second trip with detected fault.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.
- “Open loop” fuel control will be in effect.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0134 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0134 can be cleared by using the Tech 2 “Clear Info” function.

Diagnostic Aids

Check for the following conditions:

- Poor connection or damaged harness – Inspect the harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, poor terminal-to-wire connection, and damaged harness.
- Faulty HO2S heater or heater circuit – With the ignition “ON”, engine “OFF”, after a cool down period, the HO2S 1 voltage displayed on the Tech 2 is normally 455-460 mV. A reading over 1000 mV indicates a signal line shorted to voltage. A reading under 5 mV indicates a signal line shorted to ground or signal lines shorted together. Disconnect the HO2S and connect a test light between the HO2S ignition feed and heater ground circuits. If the test light does not light for 2 seconds when the ignition is turned on, repair the open ignition feed or sensor ground circuit as necessary. If the test light lights and the HO2S signal and low circuits are OK, replace the HO2S.

- Intermittent test – With the Ignition “ON”, monitor the HO2S signal voltage while moving the wiring harness and related connectors. If the fault is induced, the HO2S signal voltage will change. This may help isolate the location of the malfunction.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

3. If the DTC P0134 test passes while the Failure Records conditions are being duplicated, an intermittent conditions is indicated.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P0134 –HO2S Circuit Insufficient Activity Bank 1 Sensor 1

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Install the Tech 2. 2. Run the engine at operating temperature. 3. Operate the engine above 1200 RPM for two minutes. Does the Tech 2 indicate Bank 1 HO2S 1 voltage varying outside the specified values?	400-500 mV	Go to Step 3	Go to Step 4
3	1. Ignition “ON”, engine “OFF”, review and record Tech 2 Failure Records data and note parameters. 2. Operate the vehicle within Failure Records conditions as noted. 3. Using a Tech 2, monitor “DTC” info for DTC P0134 until the DTC P0134 test runs. 4. Note the test result. Does the Tech 2 indicate DTC P0134 failed this ignition?	—	Go to Step 4	Refer to <i>Diagnostic Aids</i>
4	Check for a damaged harness. Was a problem found?	—	Verify repair	Go to Step 5
5	Check for poor Bank 1 HO2S 1 high and low circuit terminal connections at the Bank 1 HO2S 1 harness connector and replace terminal(s) if necessary. Did any terminals require replacement?	—	Verify repair	Go to Step 6
6	Check for poor Bank 1 HO2S 1 high and low circuit terminal connections at the PCM and replace terminals if necessary. Did any terminals require replacement?	—	Verify repair	Go to Step 7

DTC P0134 –HO2S Circuit Insufficient Activity Bank 1 Sensor 1 (Cont'd)

Step	Action	Value(s)	Yes	No
7	1. Ignition "OFF". 2. With the PCM disconnected, check continuity of the Bank 1 HO2S 1 high circuit. 3. If the Bank 1 HO2S 1 high circuit measures over 5.0 ohms, repair open or poor connection as necessary. Was a Bank 1 HO2S 1 high circuit problem found and corrected?	—	Verify repair	Go to <i>Step 8</i>
8	1. Ignition "OFF". 2. With the PCM disconnected, check continuity of the Bank 1 HO2S 1 low circuit. 3. If the Bank 1 HO2S 1 low circuit measures over 5 ohms, repair open or poor connection as necessary. Was a Bank 1 HO2S 1 low circuit problem found and corrected?	—	Verify repair	Go to <i>Step 9</i>
9	1. Ignition "ON", engine "OFF". 2. Disconnect Bank 1 HO2S 1 and jumper the HO2S high and low circuits (PCM side) to ground. 3. Using a Tech 2, monitor Bank 1 HO2S 1 voltage. Is Bank 1 HO2S 1 voltage in the specified range?	0-10 mV	Go to <i>Step 10</i>	Go to <i>Step 11</i>
10	Replace Bank 1 HO2S 1. Is the action complete?	—	Verify repair	—
11	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. The HO2S should be allowed to cool before performing this test. If the HO2S heater is functioning, the signal voltage will gradually increase or decrease as the sensor element warms. If the heater is not functioning, the HO2S signal will remain near the 450 mV bias voltage.

- 4. Ensures that the ignition feed circuit to the HO2S is not open or shorted. The test light should be connected to a good chassis ground, in case the HO2S low or HO2S heater ground circuit is faulty.
- 5. Checks the HO2S heater ground circuit.
- 6. Checks or an open or shorted HO2S heater element.
- 10. An open HO2S signal or low circuit can cause the HO2S heater to appear faulty. Check these circuits before replacing the sensor.

DTC P0135 – HO2S Heater Circuit Bank 1 Sensor 1

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	NOTE: If the engine has just been operating, allow the engine to cool for at least 15 minutes before proceeding. 1. Remove the fuel pump relay. 2. Connect a fused jumper at the fuel pump relay socket, between the battery positive at the relay and the relay wire that leads to the fuel pump and HO2S fuses. 3. Ignition "OFF". 4. Install a Tech 2. 5. Ignition "ON", engine "OFF". 6. Monitor the Bank 1 HO2S 1 voltage for several minutes. Did the HO2S voltage go from bias voltage to above or below the specified values?	Above 650 mV or below 250 mV	Refer to <i>Diagnostic Aids</i>	Go to Step 3
3	Inspect the fuse for the Bank 1 HO2S 1 ignition feed. Is the fuse open?	—	Go to Step 15	Go to Step 4
4	1. Ignition "OFF". 2. Raise the vehicle. 3. Disconnect the Bank 1 HO2S 1 electrical connector. 4. Using a test light connected to a good ground (do not use Bank 1 HO2S 1 heater ground or Bank 1 HO2S 1 low), probe the ignition feed circuit at the Bank 1 HO2S 1 electrical connector (PCM harness side). Does the test light illuminate?	—	Go to Step 5	Go to Step 7
5	Connect the test light between the Bank 1 HO2S 1 ignition feed and the Bank 1 HO2S 1 heater ground. Does the test light illuminate?	—	Go to Step 6	Go to Step 8

DTC P0135 – HO2S Heater Circuit Bank 1 Sensor 1 (Cont'd)

Step	Action	Value(s)	Yes	No
6	1. Allow the HO2S to cool for at least 15 minutes. 2. Using a DVM, measure the resistance between the Bank 1 HO2S 1 ignition feed and the Bank 1 HO2S 1 heater ground at the Bank 1 HO2S 1 pigtail. Is the HO2S heater resistance within the specified values?	3-6 ohms	Go to <i>Step 9</i>	Go to <i>Step 10</i>
7	Repair the open Bank 1 HO2S 1 ignition feed circuit to Bank 1 HO2S 1. Is the action complete?	—	Verify repair	—
8	Repair the open Bank 1 HO2S 1 heater ground circuit to Bank 1 HO2S 1. Is the action complete?	—	Verify repair	—
9	1. Check for a poor connection at the Bank 1 HO2S 1 harness terminals. 2. If a poor connection is found, replace terminals. Was a poor connection found?	—	Verify repair	Go to <i>Step 10</i>
10	Check for a poor Bank 1 HO2S 1 high or low circuit terminal connection at the Bank 1 HO2S 1 harness connector and replace terminal(s) if necessary. Did any terminals require replacement?	—	Verify repair	Go to <i>Step 11</i>
11	1. Ignition "OFF". 2. Disconnect the PCM and check the continuity of the Bank 1 HO2S 1 signal circuit and the Bank 1 HO2S 1 low circuit. 3. If the Bank 1 HO2S 1 high circuit or HO2S low circuit measures over 5 ohms, repair open or poor connection as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 12</i>
12	Check for a poor Bank 1 HO2S 1 low circuit terminal connection at the PCM and replace the terminal if necessary. Did the terminal require replacement?	—	Verify repair	Go to <i>Step 13</i>
13	Check for a poor Bank 1 HO2S 1 high circuit terminal connection at the PCM and replace the terminal if necessary. Did the terminal require replacement?	—	Verify repair	Go to <i>Step 14</i>
14	Replace the Bank 1 HO2S 1. Is the action complete?	—	Verify repair	—
15	Locate and repair the short to ground in Bank 1 HO2S 1 ignition feed circuit and replace the fault fuse. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0151 HO2S Circuit Low Voltage Bank 2 Sensor 1

Circuit Description

The powertrain control module (PCM) supplies a bias voltage of about 450 mV between the heated oxygen sensor (HO2S) signal high and signal low circuits. When measured with a 10 megaohm digital voltmeter, this may display as low as 320 mV. The oxygen sensor varies the voltage within a range of about 1000 mV when the exhaust is rich, down through about 10 mV when exhaust is lean. The PCM constantly monitors the HO2S signal during “closed loop” operation and compensates for a rich or lean condition by decreasing or increasing injector pulse width as necessary. If the Bank 2 HO2S 1 voltage remains excessively low for an extended period of time, DTC P0151 will be set.

Conditions for Setting the DTC

- No related DTCs.
- The engine is operating in “closed loop”.
- Engine coolant temperature is above 60°C (140°F).
- Bank 2 HO2S 1 signal voltage remains below 30 mV during normal “closed loop” operation for a total of 77 seconds over a 90-second period of time.

Action Taken When the DTC Sets

- The PCM will ON the MIL after second trip with detected fault.

- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.
- “Open loop” fuel control will be in effect.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0151 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0151 can be cleared by using the Tech 2 “Clear Info” function.

Diagnostic Aids

Check for the following conditions:

- Heated oxygen sensor wiring – The sensor pigtail may be mispositioned and contacting the exhaust system.
- Poor PCM to engine block grounds.
- Fuel pressure – The system will go lean if pressure is too low. The PCM can compensate for some decrease. However, if fuel pressure is too low, a DTC P0151 may be set. Refer to *Fuel System Diagnosis*.
- Lean injector(s) – Perform “Injector Balance Test”.
- Vacuum leaks – Check for disconnected or damaged vacuum hoses and for vacuum leaks at the intake manifold, throttle body, EGR system, and PCV system.
- Exhaust leaks – An exhaust leak may cause outside air to be pulled into the exhaust gas stream past the

HO2S, causing the system to appear lean. Check for exhaust leaks that may cause a false lean condition to be indicated.

- MAF sensor –The system can go lean if the MAF sensor signal indicates an engine airflow measurement that is not correct. Disconnect the MAF sensor to see if the lean condition is corrected. If so, replace the MAF sensor.
- Fuel contamination – Water, even in small amounts, can be delivered to the fuel injectors. The water can cause a lean exhaust to be indicated. Excessive alcohol in the fuel can also cause this condition. Refer to *Fuel System Diagnosis* for the procedure to check for fuel contamination.
- If none of the above conditions are present, replace the affected HO2S.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

3. DTC P0151 failing during operation may indicate a condition described in the “Diagnostic Aids” above. If the DTC P0151 test passes while the Failure Records conditions are being duplicated, an intermittent condition is indicate.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P0151 – HO2S Circuit Low Voltage Bank 2 Sensor 1

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Install the Tech 2. 2. Run the engine at operating temperature. 3. Operate the vehicle within the parameters specified under “Conditions for Setting the DTC” criteria included in Diagnostic Support. 4. Using a Tech 2, monitor Bank 2 HO2S 1 voltage. Does the Bank 2 HO2S 1 voltage remain below the specified value?	22 mV	Go to Step 4	Go to Step 3
3	1. Ignition “ON”, engine “OFF”, review and record Tech 2 Failure Records data and note parameters. 2. Operate the vehicle within Failure Records conditions as noted. 3. Using a Tech 2, monitor “DTC” info for DTC P0151 until the DTC P0151 test runs. 4. Note test result. Does the Tech 2 indicate DTC P0151 failed this ignition?	—	Go to Step 4	Refer to <i>Diagnostic Aids</i>
4	1. Turn ignition “OFF”. 2. Disconnect the PCM. 3. Check the Bank 2 HO2S 1 high and low signal circuits for a short to ground or a short to the heater ground circuit. Were Bank 2 HO2S 1 signal circuits shorted?	—	Go to Step 5	Go to Step 6
5	Repair the Bank 2 HO2S 1 signal circuit. Is the action complete?	—	Verify repair	—
6	1. Ignition “OFF”. 2. Leave the PCM and HO2S 1 disconnected. 3. Check for continuity between the high and low signal circuits. Was there continuity between the high and low circuits?	—	Go to Step 7	Go to Step 8
7	Repair the short between the high and low circuits. Is the action complete?	—	Verify repair	—

DTC P0151 – HO2S Circuit Low Voltage Bank 2 Sensor 1 (Cont'd)

Step	Action	Value(s)	Yes	No
8	1. Ignition "OFF". 2. Reconnect the PCM, leave HO2S disconnected. 3. Ignition "ON". Does the Tech 2 indicate Bank 2 HO2S 1 voltage near the specified value?	425-475 mV	Refer to <i>Diagnostic Aids</i>	Go to <i>Step 9</i>
9	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service</i> in <i>Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0152 HO2S Circuit High Voltage Bank 2 Sensor 1

060R100133

Circuit Description

The powertrain control module (PCM) supplies a bias voltage of about 450 mV between the heated oxygen sensor (HO2S) signal high and signal low circuits. When measured with a 10 megaohm digital voltmeter, this may display as low as 320 mV. The oxygen sensor varies the voltage within a range of about 1000 mV when the exhaust is rich, down through about 10 mV when exhaust is lean. The PCM constantly monitors the HO2S signal during "closed loop" operation and compensates for a rich or lean condition by decreasing or increasing the injector pulse width as necessary. If the Bank 2 HO2S 1 voltage remains excessively high for an extended period of time, DTC P0152 will be set.

Conditions for Setting the DTC

- No related DTCs.
- The engine is operating in "closed loop".
- The engine coolant temperature is above 60°C (140°F).
- Bank 2 HO2S 1 signal voltage remains above 952 mV during normal "closed loop" operation for a total of 77 seconds over a 90-second period.

Action Taken When the DTC Sets

- The PCM will "ON" the MIL after second trip with detected fault

- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.
- "Open loop" fuel control will be in effect.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0152 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0152 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Fuel pressure – The system will go rich if pressure is too high. The PCM can compensate for some increase. However, if fuel pressure is too high, a DTC P0152 may be set. Refer to *Fuel System Diagnosis*.
- Rich injector(s) – Perform "Injector Balance Test".
- Leaking injector – Refer to *Fuel System Diagnosis*.
- Evaporative emissions (EVAP) system – Check the canister for fuel saturation. If the canister is full of fuel, check EVAP control system components and hoses. Refer to *Evaporative Emission (EVAP) Control System*.
- MAF sensor – The system can go rich if the MAF sensor signal indicates an engine airflow

measurement that is not correct. Disconnect the MAF sensor to see if rich condition is corrected. If so, replace MAF sensor.

- Check for leaking fuel pressure regulator diaphragm by checking vacuum line to regulator for the presence of fuel. There should be no fuel in the vacuum line.
- TP sensor – An intermittent TP sensor output will cause the system to go rich, due to a false indication of the engine accelerating.
- Shorted Heated Oxygen Sensor (HO2S)– If the HO2S is internally shorted, the HO2S voltage displayed on the Tech 2 will be over 1 volt. Try disconnecting the affected HO2S with the key “ON”, engine “OFF”. If the displayed HO2S voltage changes from over 1000 mV to around 450 mV, replace the HO2S. Silicon contamination of the HO2S can cause a high HO2S voltage to be indicated. This condition is indicated by powdery deposit on the portion of the HO2S exposed to the exhaust stream. If contamination is noticed, replace the affected HO2S.
- Open HO2S Signal Circuit of Faulty HO2S– A poor connection or open in the HO2S signal circuit can cause the DTC to set during deceleration fuel mode. An HO2S which is faulty and not allowing a full voltage

switch between the rich and lean thresholds can also cause the condition. Operate the vehicle while monitoring the HO2S voltage with a Tech 2. If the HO2S is limited within a range between 300 mV to 600 mV, check the HO2S signal circuit wiring and associated terminal connections.

- If none of the above conditions are present, replace the affected HO2S.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

3. DTC P0152 failing during deceleration fuel cutoff mode operation may indicate a condition described in the “Diagnostic Aids” above. If the DTC P0152 test passes while the Failure Records conditions are being duplicated, an intermittent condition is indicated.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P0152 – HO2S Circuit High Voltage Bank 2 Sensor 1

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Install the Tech 2. 2. Engine is at operating temperature. 3. Operate the vehicle within the parameters specified under “Conditions for Setting the DTC” criteria included in Diagnostic Support. 4. Using a Tech 2, monitor Bank 2 HO2S 1 voltage. Does the Bank 2 HO2S 1 voltage remain above the specified value?	952 mV (500 mV in deceleration fuel cut-off mode)	Go to Step 4	Go to Step 3
3	1. Ignition “ON”. 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor “DTC” info for DTC P0152 until the DTC P0152 test runs. 5. Note the test result. Does the Tech 2 indicate DTC P0152 failed this ignition?	—	Go to Step 4	Refer to <i>Diagnostic Aids</i>
4	1. Ignition “OFF”. 2. Disconnect Bank 2 HO2S 1. 3. Ignition “ON”. 4. At HO2S Bank 2 Sensor 1 connector (PCM side) use a DVM to measure voltages at the high and low signal terminals. Are the voltages in the specified range?	3-4 V	Go to Step 5	Go to Step 6
5	Repair short to voltage in signal circuit. Is the action complete?	—	Verify repair	—

DTC P0152 – HO2S Circuit High Voltage Bank 2 Sensor 1 (Cont'd)

Step	Action	Value(s)	Yes	No
6	1. Ignition "ON", engine "OFF". 2. At Bank 2 HO2S 1 connector (PCM side) jumper both the HO2S high and low signal circuits (PCM side) to ground. 3. Using a Tech 2, monitor Bank 2 HO2S 1 voltage. Is Bank 2 HO2S 1 voltage below the specified value?	10 mV	Go to <i>Step 7</i>	Go to <i>Step 8</i>
7	1. Disconnect the jumpers to ground from Bank 2 HO2S 1 PCM-side connector. 2. With the HO2S 1 connector disconnected, monitor Bank 2 HO2S 1 voltage. Is the Bank 2 HO2S 1 voltage between the specified values?	425-475 mV	Refer to <i>Diagnostic Aids</i>	Go to <i>Step 8</i>
8	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service</i> in <i>Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC)

P0154 HO2S Circuit Insufficient Activity Bank 2 Sensor 1

060R100133

Circuit Description

The powertrain control module (PCM) supplies a bias voltage of about 450 mV between the heated oxygen sensor (HO2S) high and low circuits. When measured with a 10 megaohm digital voltmeter, this may display as low as 320 mV. The oxygen sensor varies the voltage within a range of about 1000 mV when the exhaust is rich, down through about 10 mV when exhaust is lean. The PCM constantly monitors the HO2S signal during “closed loop” operation and compensates for a rich or lean condition by decreasing or increasing injector pulse width as necessary. If the Bank 2 HO2S 1 voltage remains at or near the 450 mV bias for an extended period of time, DTC P0154 will be set, indicating an open sensor signal or sensor low circuit.

Heated oxygen sensors are used to minimize the amount of time required for “closed loop” fuel control operation and to allow accurate catalyst monitoring. The oxygen sensor heater greatly decreases the amount of time required for fuel control sensors Bank 1 HO2S 1 and Bank 2 HO2S 1 to become active. Oxygen sensor heaters are required by post-catalyst monitor sensors to maintain a sufficiently high temperature for accurate exhaust oxygen content readings further from the engine.

Conditions for Setting the DTC

- No related DTCs.
- Engine coolant temperature is above 60°C (140°F).

- The engine has been running for over 5 seconds.
- Oxygen sensor heater is functioning properly.
- Bank 2 HO2S 1 signal voltage remains between 400 mV and 500 mV for a total of 77 seconds over a 90-second period of time.

Action Taken When the DTC Sets

- The PCM will ON the MIL after second trip with detected fault.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.
- “Open loop” fuel control will be in effect.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0154 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0154 can be cleared by using the Tech 2 “Clear Info” function.

Diagnostic Aids

Check for the following conditions:

- Poor connection or damaged harness – Inspect the harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or

damaged terminals, poor terminal-to-wire-connection, and damaged harness.

- Faulty HO2S heater or heater circuit – With the ignition “ON”, engine “OFF”, the HO2S 1 voltage displayed on the Tech 2 is normally 455-460 mV. A reading over 1000 mV indicates a signal line shorted to voltage. A reading under 5 mV indicates a signal line shorted to ground or signal lines shorted together. If not, disconnect the HO2S and connect a test light between the HO2S ignition feed and heater ground circuits. If the test light does not light for 2 seconds when the ignition is turned on, repair the open ignition feed or sensor ground circuit as necessary. If the test light lights and the HO2S signal and low circuits are OK, replace the HO2S.
- Intermittent test – With the ignition “ON”, monitor the HO2S signal voltage while moving the wiring harness

and related connectors. If the fault is induced, the HO2S signal voltage will change. This may help isolate the location of the malfunction.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

3. If the DTC P0154 test passes while the Failure Records conditions are being duplicated, an intermittent condition is indicated.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P0154 –HO2S Circuit Insufficient Activity Bank 2 Sensor 1

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Install the Tech 2. 2. Run the engine at operating temperature. 3. Operate the engine above 1200 RPM for two minutes. Does the Tech 2 indicate Bank 2 HO2S 1 voltage varying outside the specified values?	400-500 mV	Go to Step 3	Go to Step 4
3	1. Ignition “ON”, engine “OFF”. 2. Review and record Tech 2 Failure Records data and note parameters. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor “DTC” info for DTC P0154 until the DTC P0154 test runs. 5. Note the test result. Does the Tech 2 indicate DTC P0154 failed this ignition?	—	Go to Step 4	Refer to <i>Diagnostic Aids</i>
4	Check for a damaged harness. Was a problem found?	—	Verify repair	Go to Step 5
5	Check for a poor Bank 2 HO2S 1 high and low circuit terminal connections at the Bank 2 HO2S 1 harness connector and replace terminal(s) if necessary. Did any terminals require replacement?	—	Verify repair	Go to Step 6
6	Check for a poor Bank 2 HO2S 1 high and low circuit terminal connections at the PCM and replace terminal(s) if necessary. Did the terminal require replacement?	—	Verify repair	Go to Step 7
7	1. Ignition “OFF”. 2. With the PCM disconnected, check continuity of the Bank 2 HO2S 1 high circuit. 3. If the Bank 2 HO2S 1 high circuit measures over 5.0 ohms, repair open or poor connection as necessary. Was a Bank 2 HO2S 1 high circuit problem found and corrected?	—	Verify repair	Go to Step 8

DTC P0154 –HO2S Circuit Insufficient Activity Bank 2 Sensor 1 (Cont'd)

Step	Action	Value(s)	Yes	No
8	1. Ignition "OFF". 2. With the PCM disconnected, check continuity of the Bank 2 HO2S 1 low circuit. 3. If the Bank 2 HO2S 1 low circuit measures over 5.0 ohms, repair open or poor connection as necessary. Was a Bank 2 HO2S 1 low circuit problem found and corrected?	—	Verify repair	Go to <i>Step 9</i>
9	1. Ignition "ON", engine "OFF". 2. Disconnect Bank 2 HO2S 1 and jumper the HO2S high and low circuits (PCM side) to ground. 3. Using a Tech 2, monitor Bank 2 HO2S 1 voltage. Is the Bank 2 HO2S 1 voltage in the specified range?	0-10 mV	Go to <i>Step 10</i>	Go to <i>Step 11</i>
10	Replace Bank 2 HO2S 1. Is the action complete?	—	Verify repair	—
11	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0155 HO2S Heater Circuit Open Bank 2 Sensor 1

060R100133

Circuit Description

Heated oxygen sensors are used to minimize the amount of time required for closed loop fuel control operation and to allow accurate catalyst monitoring. The oxygen sensor heater greatly decreases the amount of time required for fuel control sensors Bank 1 HO₂S 1 and Bank 2 HO₂S 1 to become active. Oxygen sensor heaters are required by post-catalyst monitor sensors to maintain a sufficiently high temperature which allows accurate exhaust oxygen content readings further from the engine.

The powertrain control module (PCM) will run the heater test only after a cold start (determined by engine coolant and intake air temperature at the time of start-up) and only once during an ignition cycle. When the engine is started the PCM will monitor the HO₂S voltage. When the Bank HO₂S voltage indicates a sufficiently active sensor, the PCM looks at how much time has elapsed since start-up. If the PCM determines that too much time was required for the Bank 2 HO₂S 1 to become active, a DTC P0155 will set. The time it should take the HO₂S to reach operating temperature is based on the total amount of air that has passed through the mass air flow (MAF) sensor and into the engine (more total air flow = shorter time to HO₂S activity).

Conditions for Setting the DTC

- No related DTCs.
- The engine has been running for over 120 seconds.

- Heater signal is below 0.1A.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0155 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0155 can be cleared by using the Tech 2 "Clear info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the display on the Tech 2 while moving connectors and wiring harnesses related to the sensor. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. The HO2S should be allowed to cool before performing this test. If the HO2S heater is functioning, the signal voltage will gradually increase or decrease as the sensor element warms. If the heater is not functioning, the HO2S signal will remain near the 450 mV bias voltage.

- 4. Ensures that the ignition feed circuit to the HO2S is not open or shorted. The test light should be connected to a good chassis ground, in case the HO2S low or HO2S heater ground circuit is faulty.
- 5. Checks the HO2S heater ground circuit.
- 6. Checks for an open or shorted HO2S heater element.
- 10. An open HO2S signal or low circuit can cause the HO2S heater to appear faulty. Check these circuits before replacing the sensor.

DTC P0155 – HO2S Heater Circuit Open Bank 2 Sensor 1

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	NOTE: If the engine has just been operating, allow the engine to cool for at least 15 minutes before proceeding. 1. Remove the fuel pump relay. 2. Connect a fused jumper at the fuel pump relay socket, between the battery positive at the relay and the relay wire that leads to the fuel pump and HO2S fuses. 3. Ignition "OFF". 4. Install a Tech 2. 5. Ignition "ON", engine "OFF". 6. Monitor the Bank 1 HO2S 1 voltage for several minutes. Did the HO2S voltage go from bias voltage to above or below the specified value?	Above 650 mV or below 250 mV	Refer to <i>Diagnostic Aids</i>	Go to Step 3
3	Inspect the fuse for the Bank 2 HO2S 1 ignition feed. Is the fuse open?	—	Go to Step 15	Go to Step 4
4	1. Ignition "OFF". 2. Raise the vehicle. 3. Disconnect the Bank 2 HO2S 1 electrical connector. 4. Using a test light connected to a known good ground (do not use Bank 2 HO2S 1 heater ground or Bank 2 HO2S 1 low), probe the ignition feed circuit at the Bank 2 HO2S 1 electrical connector (PCM harness side). Does the test light illuminate?	—	Go to Step 5	Go to Step 7
5	Connect the test light between Bank 2 HO2S 1 ignition feed and Bank 2 HO2S 1 heater ground. Does the test light illuminate?	—	Go to Step 6	Go to Step 8
6	1. Allow the HO2S to cool for at least 15 minutes. 2. Using a DVM, measure resistance between the Bank 2 HO2S 1 ignition feed and the Bank 2 HO2S 1 heater ground at the Bank 2 HO2S 1 pigtail. Is the HO2S resistance within the specified values?	3-6 ohms	Go to Step 9	Go to Step 10

DTC P0155 – HO2S Heater Circuit Open Bank 2 Sensor 1 (Cont'd)

Step	Action	Value(s)	Yes	No
7	Repair the open Bank 2 HO2S 1 ignition feed circuit to Bank 2 HO2S 1. Is the action complete?	—	Verify repair	—
8	Repair the open Bank 2 HO2S 1 heater ground circuit. Is the action complete?	—	Verify repair	—
9	1. Check for a poor connection at the Bank 2 HO2S 1 harness terminals. 2. If a poor connection is found, replace terminals. Was a poor connection found?	—	Verify repair	Go to <i>Step 10</i>
10	Check for a poor Bank 2 HO2S 1 signal or low circuit terminal connection at the Bank 2 HO2S 1 harness connector and replace terminal(s) if necessary. Did any terminals require replacement?	—	Verify repair	Go to <i>Step 11</i>
11	1. Ignition "OFF". 2. Disconnect the PCM and check the continuity of the Bank 2 HO2S 1 signal circuit and the Bank 2 HO2S 1 low circuit. 3. If the Bank 2 HO2S 1 signal circuit or HO2S low circuit measures over 5 ohms, repair open or poor connection as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 12</i>
12	Check for a poor Bank 2 HO2S 1 low circuit terminal connection at the PCM and replace the terminal if necessary. Did the terminal require replacement?	—	Verify repair	Go to <i>Step 13</i>
13	Check for a poor Bank 2 HO2S 1 signal circuit terminal connection at the PCM and replace the terminal if necessary. Did the terminal require replacement?	—	Verify repair	Go to <i>Step 14</i>
14	Replace Bank 2 HO2S 1. Is the action complete?	—	Verify repair	—
15	Locate and repair short to ground in Bank 2 HO2S 1 ignition feed circuit and replace the faulty fuse. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0171 Fuel Trim System Lean Bank 1

060R100133

Circuit Description

To provide the best possible combination of drivability, fuel economy, and emission control, a “closed loop” air/fuel metering system is used. While in “closed loop”, the powertrain control module (PCM) monitors the Bank 1 HO₂S 1 and Bank 2 HO₂S 1 signals and adjusts fuel delivery based upon the HO₂S signal voltages. A change made to fuel delivery will be indicated by the long and short term fuel trim values which can be monitored with a Tech 2. Ideal fuel trim values are around 0%; if the HO₂S signals are indicating a lean condition the PCM will add fuel, resulting in fuel trim values above 0%. If a rich condition is detected, the fuel trim values will be below 0%, indicating that the PCM is reducing the amount of fuel delivered. If an excessively lean condition is detected on Bank 1, the PCM will set DTC P0171.

The PCM's maximum authority to control long term fuel trim allows a range between -15% and +15%. The PCM monitors fuel trim under various engine speed/load fuel trim cells before determining the status of the fuel trim diagnostic.

Conditions for Setting the DTC

- None of the following: EGR DTCs, HO₂S DTCs, (response, transition, open, low volts, no activity), MAF DTCs, TP sensor DTCs, MAP DTCs, IAT DTCs, injector circuit DTCs, or misfire DTCs.
- Engine coolant temperature is between 6°C (42.8°F) and 105°C (221°F).

- Intake air temperature is between -40°C (-40°F) and 120°C (248°F).
- Manifold absolute pressure is between 24 kPa and 99 kPa.
- Throttle angle is steady below 95%.
- Vehicle speed is below 136 km/h (85 mph).
- Engine speed is between 400 and 6,000 RPM.
- Barometric pressure is greater than 72.5 kPa.
- Mass air flow is between 2 g/second and 200 g/second.
- Ignition voltage is above 9.5 volts.
- Fuel system is in “closed loop”.
- The short term fuel trim is more than 2%, and the long term fuel trim is more than 15%.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0171 will clear after 40 consecutive warm-up cycles have occurred without a fault.

- DTC P0171 can be cleared by using the Tech 2 “Clear Info” function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the Bank 1 HO2S 1 display on the Tech 2 while moving connectors and wiring harnesses related to the engine harness. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. DTCs other than P0171 and P0174 may indicate a condition present which may cause a lean condition. If this is the case, repairing the condition which caused the other DTC will most likely correct the DTC P0171/P0174.
4. If the DTC P0171 test passes while the Failure Records conditions are being duplicated, the lean condition is intermittent. Refer to *Diagnostic Aids* or *Symptoms* for additional information on diagnosing intermittent problems.

DTC P0171 – Fuel Trim System Lean Bank 1

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	Are any DTCs set other than P0171 and P0174?	—	Go to the applicable DTC charts and repair the other DTCs before proceeding with this chart	Go to <i>Step 3</i>
3	1. Start the engine and operate the vehicle in “closed loop”. 2. Observe the “BANK 1 L.T. FUEL TRIM” display on the Tech 2. Is the displayed value greater than the specified value?	L.T. Fuel Trim: +20%	Go to <i>Step 5</i>	Go to <i>Step 4</i>
4	1. Review and record the Tech 2 Failure Records data. 2. Clear the DTC P0171/P0174 and operate the vehicle to duplicate the Failure Records conditions. 3. Monitor the Tech 2 “DTC” info for DTC P0171 while operating the vehicle to duplicate the Failure Records conditions. 4. Continue operating the vehicle until the DTC P0171 test runs and note the test result. Does the Tech 2 indicate DTC P0171 failed this ignition?	—	Go to <i>Step 5</i>	The lean condition is not present. If a derivability symptom still exists, refer to <i>Symptoms</i> section.
5	Was DTC P0174 also set?	—	Go to <i>Step 6</i>	Go to <i>Step 15</i>
6	Visually and physically inspect the vacuum hoses for disconnections, splits, kinks, improper routing and improper connections and repair any problem found. Did your inspection reveal a problem requiring repair?	—	Verify repair	Go to <i>Step 7</i>
7	Visually and physically inspect the crankcase ventilation valve for proper installation and repair any problem found (refer to <i>Crankcase Ventilation System</i>). Did your inspection reveal a problem requiring repair?	—	Verify repair	Go to <i>Step 8</i>
8	1. Inspect the MAF sensor inlet screen for damage or for the presence of foreign objects which may partially block the air flow sample through the MAF sensor. 2. Correct any problem that is found as necessary. Did your inspection of the MAF sensor reveal a condition requiring repair?	—	Verify repair	Go to <i>Step 9</i>
9	Start the engine and note the idle quality. Is a high or unsteady idle being experienced?	—	Go to <i>Step 10</i>	Go to <i>Step 11</i>
10	1. Visually and physically inspect the throttle body, intake manifold, EGR valve and the EGR feed pipe for vacuum leaks. 2. Repair any vacuum leaks as necessary. Did your inspection reveal a vacuum leak?	—	Verify repair	Go to <i>Step 11</i>

DTC P0171 – Fuel Trim System Lean Bank 1 (Cont'd)

Step	Action	Value(s)	Yes	No
11	Check the fuel for excessive water, alcohol, or other contaminants (see <i>Diagnosis in Engine Fuel</i> for the procedure) and correct the contaminated fuel condition if present (see <i>Engine Fuel</i>). Was the fuel contaminated?	—	Verify repair	Go to Step 12
12	1. Visually and physically inspect the PCM injector grounds, power grounds and sensor grounds to ensure that they are clean, tight, and in their proper locations. 2. If a faulty ground condition is present, correct it as necessary. Did your inspection reveal a condition requiring repair?	—	Verify repair	Go to Step 13
13	1. Disconnect the MAF sensor electrical connector. 2. Operate the vehicle in “closed loop” while monitoring the “BANK 1 S.T. FUEL TRIM” displayed on the Tech 2. Does “BANK 1 S.T. FUEL TRIM” value decrease to near the specified value?	0%	Go to Step 19	Go to Step 14
14	Perform the procedure in the “Fuel System Pressure Test” and repair fuel system problem if necessary. Did Fuel System Pressure Test isolate a condition requiring repair?	—	Verify repair	Go to Step 15
15	1. Visually and physically inspect the intake manifold, injector O-rings, EGR adapter, EGR valve and the EGR feed pipes for vacuum leaks. 2. Repair any problem that is found. Did your inspection reveal a problem?	—	Verify repair	Go to Step 16
16	Visually and physically inspect the Bank 1 exhaust manifold for leaks and loose or missing hardware and correct any problem found. Did your inspection reveal a problem?	—	Verify repair	Go to Step 17
17	Perform the “Injector Balance Test”, and correct any problem found (refer to <i>Fuel Metering System</i>). Did Injector Balance Test isolate a problem?	—	Verify repair	Go to Step 18
18	1. Visually and physically inspect the Bank 1 HO2S 1 to ensure that it is installed securely and that the Bank 1 HO2S 1 pigtail and wiring harness are not contacting the exhaust or otherwise damaged. 2. If a problem is found, correct it as necessary. Did your inspection reveal a problem?	—	Verify repair	Refer to Diagnostic Aids
19	Replace the MAF sensor. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0172 Fuel Trim System Rich Bank 1

060R100109

Circuit Description

To provide the best possible combination of drivability, fuel economy, and emission control, a “closed loop” air/fuel metering system is used. While in “closed loop”, the powertrain control module (PCM) monitors the Bank 1 heated oxygen sensors (HO2S) 1 and Bank 2 HO2S 1 signals and adjusts fuel delivery based upon the HO2S signal voltages. A change made to fuel delivery will be indicated by the long and short term fuel trim values which can be monitored with a Tech 2. Ideal fuel trim values are around 0%; if the HO2S signals are indicating a lean condition the PCM will add fuel, resulting in fuel trim values above 0%. If a rich condition is detected, the fuel trim values will be below 0%, indicating that the PCM is reducing the amount of fuel delivered. If an excessively rich condition is detected on Bank 1, the PCM will set DTC P0172.

The PCM's maximum authority to control long term fuel trim allows a range between -15% and +15%. The PCM monitors fuel trim under various engine speed/load fuel trim cells before determining the status of the fuel trim diagnostic.

Conditions for Setting the DTC

- None of the following was set: EGR DTCs, HO2S DTCs, (response, transition, open, low volts, no activity), MAF DTCs, TPS DTCs, MAP DTCs, IAT DTCs, injector circuit DTCs, or misfire DTCs.
- Engine coolant temperature is between 6°C (42.8°F) and 105°C (221°F).

- Intake air temperature is between -40°C (-40°F) and 120°C (248°F).
- Manifold absolute pressure is between 24 kPa and 99 kPa.
- Throttle angle is steady below 95%.
- Vehicle speed is below 136 km/h (85 mph).
- Engine speed is between 400 and 6,000 RPM.
- Barometric pressure is greater than 72.5 kPa.
- Mass air flow is between 2 g/second and 200 g/second.
- Ignition voltage is above 9.5 volts.
- Fuel system is in “closed loop”.
- The short term fuel trim is less than -2%, and the long term fuel trim is more than -15%.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0172 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0172 can be cleared by using the Tech 2 “Clear Info” function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the Bank 1 HO2S 1 display on the Tech 2 while moving connectors and wiring harnesses related to the engine harness. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. DTCs other than P0172 and P0175 may indicate a condition present which may cause a lean condition. If this is the case, repairing the condition which caused the other DTC will most likely correct the DTC P0172/P0175.
4. If the DTC P0172 test passes while the Failure Records conditions are being duplicated, the rich condition is intermittent. Refer to *Diagnostic Aids* or *Symptoms* for additional information on diagnosing intermittent problems.

DTC P0172 – Fuel Trim System Rich Bank 1

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Are any DTCs set other than P0172 and P0175?	—	Go to the applicable DTC charts and repair the other DTCs before proceeding with this chart	Go to Step 3
3	1. Start the engine and operate the vehicle in “closed loop”. 2. Observe “B1 Long Term Fuel Trim” display on the Tech 2. Is the displayed value more negative than the specified value?	L.T. Fuel Trim: –15% (auto. trans.) OR –12% (man. trans.)	Go to Step 5	Go to Step 4
4	1. Review and record the Tech 2 Failure Records data. 2. Clear the DTC P0172/P0175 and operate the vehicle to duplicate the Failure Records conditions. 3. Monitor the Tech 2 “DTC” info for DTC P0172 while operating the vehicle to duplicate the Failure Records conditions. 4. Continue operating the vehicle until the DTC P0172 test runs and note test result. Does the Tech 2 indicate DTC P0172 failed this ignition?	—	Go to Step 5	The rich condition is not present. If a derivability symptom still exists, refer to <i>Symptoms</i> .
5	Is DTC P0175 also set?	—	Go to Step 6	Go to Step 15
6	Visually and physically inspect the air filter element and replace it if necessary. Did the air filter require replacement?	—	Verify repair	Go to Step 7
7	Visually and physically inspect the air intake duct for collapse or restriction and repair if necessary. Did your inspection reveal a condition requiring repair?	—	Verify repair	Go to Step 8

DTC P0172 – Fuel Trim System Rich Bank 1 (Cont'd)

Step	Action	Value(s)	Yes	No
8	Inspect the MAF sensor inlet screen for damage or for the presence of foreign objects which may partially block air flow through the screen and correct any problem found. Did your inspection of the MAF sensor reveal a condition requiring repair or replacement?	—	Verify repair	Go to Step 9
9	Start the engine and note the idle quality. Is a low or unsteady idle being experienced?	—	Go to Step 10	Go to Step 11
10	1. Ignition "OFF". 2. Physically inspect the throttle body bore and throttle plate for coking and foreign objects. 3. If a problem was found, repair as necessary. Did your inspection reveal a condition requiring repair?	—	Verify repair	Go to Step 11
11	1. Disconnect the vacuum hose from the fuel pressure regulator and inspect the hose for the presence of fuel. 2. If fuel is present in the vacuum hose, replace the fuel pressure regulator (refer to <i>Fuel Metering System</i>). Did the fuel pressure regulator require replacement?	—	Verify repair	Go to Step 12
12	Ignition "ON", engine "OFF", monitor the TP1 Angle display on the Tech 2 while slowly depressing the accelerator pedal. Does the TP Angle display increase steadily and evenly from minimum value at closed throttle to maximum value at wide-open throttle?	Minimum 8% Maximum 92%	Go to Step 13	Go to Step 21
13	1. Disconnect the MAF sensor electrical connector. 2. Operate the vehicle in "closed loop" while monitoring the "BANK 1 L.T. FUEL TRIM" and "BANK 1 S. T. FUEL TRIM" display on the Tech 2. Did both values change to near the specified value?	0%	Go to Step 22	Go to Step 14
14	1. Perform "Fuel System Pressure Test". 2. If Fuel System Pressure Test isolates a problem, repair as necessary (refer to <i>Engine Fuel</i> or <i>Fuel Metering System</i>). Did the Fuel System Pressure Test isolate a problem requiring repair?	—	Verify repair	Go to Step 15
15	1. Ignition "ON", engine "OFF". 2. Connect a test light between the harness connector terminals of canister purge solenoid. Is the test light on?	—	Go to Step 16	Go to Step 19
16	Check for short to ground in the wire (YEL/RED) between the canister purge solenoid and PCM terminal S-48. Was there a short to ground?	—	Go to Step 17	Go to Step 18
17	Repair the short to ground. Is the action complete?	—	Verify repair	—

DTC P0172 – Fuel Trim System Rich Bank 1 (Cont'd)

Step	Action	Value(s)	Yes	No
18	<p>Replace the PCM.</p> <p>IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors</i> for procedures.</p> <p>And also refer to the latest Service Bulletin.</p> <p>Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM.</p> <p>Is the action complete?</p>	—	Verify repair	—
19	<p>1. Perform the “Injector Balance Test”.</p> <p>2. If Injector Balance Test isolates a problem, repair as necessary (refer to <i>Fuel Metering System</i>).</p> <p>Did the Injector Balance Test isolate a problem requiring repair?</p>	—	Verify repair	Go to <i>Step 20</i>
20	<p>1. Remove and visually/physically inspect the Bank 1 HO2S 1 for silicon contamination. This will be indicated by a powdery deposit on the portion of the HO2S that is exposed to the exhaust stream.</p> <p>2. If contamination is evident on the Bank 1 HO2S 1, replace the contaminated sensors.</p> <p>Did the sensor require replacement?</p>	—	Verify repair	Refer to <i>Diagnostic Aids</i>
21	<p>1. Check the TP sensor mounting screws and tighten or replace them as necessary if they are loose or missing.</p> <p>2. If the screws are OK, replace the TP sensor.</p> <p>Is the action complete?</p>	—	Verify repair	—
22	<p>Replace the MAF sensor.</p> <p>Is the action complete?</p>	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0174 Fuel Trim System Lean Bank 2

060R100133

Circuit Description

To provide the best possible combination of drivability, fuel economy, and emission control, a “closed loop” air/fuel metering system is used. While in “closed loop”, the powertrain control module (PCM) monitors the Bank 1 HO₂S 1 and Bank 2 HO₂S 1 signals and adjusts fuel delivery based upon the HO₂S signal voltages. A change made to fuel delivery will be indicated by the long and short term fuel trim values which can be monitored with a Tech 2. Ideal fuel trim values are around 0%; if the HO₂S signals are indicating a lean condition the PCM will add fuel, resulting in fuel trim values above 0%. If a rich condition is detected, the fuel trim values will be below 0%, indicating that the PCM is reducing the amount of fuel delivered. If an excessively lean condition is detected on Bank 2, the PCM will set DTC P0174.

The PCM's maximum authority to control long term fuel trim allows a range between -15% and +15%. The PCM monitors fuel trim under various engine speed/load fuel trim cells before determining the status of the fuel trim diagnostic.

Conditions for Setting the DTC

- None of the following DTCs are set: idle system, EGR, HO₂S, (response, transition, open, low volts, no activity), MAF, TP sensor, MAP, IAT, injector circuit, or misfire.
- Engine coolant temperature is between 6°C (42.8°F) and 105°C (221°F).

- Intake air temperature is between -40°C (-40°F) and 120°C (248°F).
- Manifold absolute pressure is between 24 kPa and 99 kPa.
- Throttle angle is steady between 3 and 95%.
- Vehicle speed is below 136 km/h (85 mph).
- Engine speed is between 400 and 6,000 RPM.
- Barometric pressure is greater than 72.5 kPa.
- Mass air flow is between 2 g/second and 200 g/second.
- Ignition voltage is above 9.5 volts.
- Fuel system is in “closed loop”.
- The short term fuel trim is more than 2%, and the long term fuel trim is more than 15%.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the failure is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0174 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0174 can be cleared by using the Tech 2 “Clear Info” function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the Bank 2 HO2S 1 display on the Tech 2 while moving connectors and wiring harnesses related to the engine harness. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. DTCs other than P0171 and P0174 may indicate a condition present which may cause a lean condition. If this is the case, repairing the condition which caused the other DTC will most likely correct the DTC P0171/P0174.
4. If the DTC P0174 test passes while the Failure Records conditions are being duplicated, the lean condition is intermittent. Refer to *Diagnostic Aids* or *Symptoms* for additional information on diagnosing intermittent problems.

DTC P0174 – Fuel Trim System Lean Bank 2

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	Are any DTCs set other than P0174 and P0171?	—	Go to the applicable DTC charts and repair the other DTCs before proceeding with this chart.	Go to <i>Step 3</i>
3	1. Start the engine and operate the vehicle in “closed loop”. 2. Observe the “BANK 2 L.T. FUEL TRIM” display on the Tech 2. Is the displayed values greater than the specified values?	L.T. Fuel Trim: +20%	Go to <i>Step 5</i>	Go to <i>Step 4</i>
4	1. Review and record Tech 2 Failure Records data. 2. Clear the DTC P0171/P0174 and operate the vehicle to duplicate the Failure Records conditions. 3. Monitor the Tech 2 “DTC” info for DTC P0174 while operating the vehicle to duplicate the Failure Records conditions. 4. Continue operating the vehicle until the DTC P0174 test runs. 5. Note the test result. Does the Tech 2 indicate DTC P0174 failed this ignition?	—	Go to <i>Step 5</i>	The lean condition is not present. If a derivability symptom still exists, refer to <i>Symptoms</i> section.
5	Was DTC P0171 also set?	—	Go to <i>Step 6</i>	Go to <i>Step 15</i>
6	Visually and physically inspect the vacuum hoses for disconnections, splits, kinks, improper routing and improper connections and repair any problem found. Did your inspection reveal a problem requiring repair?	—	Verify repair	Go to <i>Step 7</i>
7	Visually and physically inspect the crankcase ventilation valve for proper installation and repair any problem found (refer to <i>Crankcase Ventilation System</i>). Did your inspection reveal a problem requiring repair?	—	Verify repair	Go to <i>Step 8</i>
8	1. Inspect the MAF sensor inlet screen for damage or for the presence of foreign objects which may partially block the air flow sample through the MAF sensor. 2. Correct any problem that is found as necessary. Did your inspection of the MAF sensor reveal a condition requiring repair?	—	Verify repair	Go to <i>Step 9</i>
9	Start the engine and note the idle quality. Is a high or unsteady idle being experienced?	—	Go to <i>Step 10</i>	Go to <i>Step 11</i>

DTC P0174 – Fuel Trim System Lean Bank 2 (Cont'd)

Step	Action	Value(s)	Yes	No
10	1. Visually and physically inspect the throttle body, intake manifold, EGR valve and the EGR feed pipe for vacuum leaks. 2. Repair any vacuum leaks as necessary. Did your inspection reveal a vacuum leak?	—	Verify repair	Go to Step 11
11	Check the fuel for excessive water, alcohol, or other contaminants (see <i>Diagnosis in Engine Fuel</i> for procedure) and correct the contaminated fuel condition if present (see <i>Engine Fuel</i>). Was the fuel contaminated?	—	Verify repair	Go to Step 12
12	1. Visually and physically inspect the PCM injector grounds, power grounds and sensor grounds to ensure that they are clean, tight, and in their proper locations. 2. If a faulty ground condition is present, correct it as necessary. Did your inspection reveal a condition requiring repair?	—	Verify repair	Go to Step 13
13	1. Disconnect the MAF sensor electrical connector. 2. Operate the vehicle in “closed loop” while monitoring the “BANK 2 S.T. FUEL TRIM” displayed on the Tech 2. Does the “BANK 2 S.T. FUEL TRIM” value decrease to near the specified value?	0%	Go to Step 19	Go to Step 14
14	Perform the procedure in the “Fuel System Pressure Test” and repair fuel system problem if necessary. Did the Fuel System Pressure Test isolate a condition requiring repair?	—	Verify repair	Go to Step 15
15	1. Visually and physically inspect the intake manifold, injector O-rings, EGR adapter, EGR valve and the EGR feed pipes for vacuum leaks. 2. Repair any problem that is found. Did your inspection reveal a problem?	—	Verify repair	Go to Step 16
16	Visually and physically inspect the Bank 2 exhaust manifold for leaks and loose or missing hardware and correct any problem found. Did your inspection reveal a problem?	—	Verify repair	Go to Step 17
17	Perform the “Injector Balance Test” and correct any problem found (refer to <i>Fuel Metering System</i>). Did the Injector Balance Test isolate a problem?	—	Verify repair	Go to Step 18
18	1. Visually and physically inspect the Bank 2 HO2S 1 to ensure that it is installed securely and that the Bank 2 HO2S 1 pigtail and wiring harness are not contacting the exhaust or otherwise damaged. 2. If a problem is found, correct it as necessary. Did your inspection reveal a problem?	—	Verify repair	Refer to Diagnostic Aids
19	Replace the MAF sensor. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0175 Fuel Trim System Rich Bank 2

060R100133

Circuit Description

To provide the best possible combination of drivability, fuel economy, and emission control, a “closed loop” air/fuel metering system is used. While in “closed loop”, the powertrain control module (PCM) monitors the Bank 1 HO₂S 1 and Bank 2 HO₂S 1 signals and adjusts fuel delivery based upon the HO₂S signal voltages. A change made to fuel delivery will be indicated by the long and short term fuel trim values which can be monitored with a Tech 2. Ideal fuel trim values are around 0%; if the HO₂S signals are indicating a lean condition the PCM will add fuel, resulting in fuel trim values above 0%. If a rich condition is detected, the fuel trim values will be below 0%, indicating that the PCM is reducing the amount of fuel delivered. If an excessively rich condition is detected on Bank 2, the PCM will set DTC P0175.

The PCM's maximum authority to control long term fuel trim allows a range between -15% (automatic transmission) or -12% (manual transmission) and +15%. The PCM monitors fuel trim under various engine speed/load fuel trim cells before determining the status of the fuel trim diagnostic.

Conditions for Setting the DTC

- None of the following DTCs are set: idle system, EGR, HO₂S, (response, transition, open, low volts, no activity), MAF, TPS, MAP, IAT, canister purge, EVAP, injector circuit, or misfire.
- Engine coolant temperature is between 6 °C (42.8 °F) and 105 °C (221 °F).

- Intake air temperature is between -40 °C (-40 °F) and 120 °C (248 °F).
- Manifold absolute pressure is between 24 kPa and 99 kPa.
- Throttle angle is steady between 3 and 95%.
- Vehicle speed is below 136 km/h (85 mph).
- Engine speed is between 400 and 6,000 RPM.
- Barometric pressure is greater than 72.5 kPa.
- Mass air flow is between 2 g/second and 200 g/second.
- Ignition voltage is above 9.5 volts.
- Fuel system is in “closed loop”.
- The short term fuel trim is less than -2%, and the long term fuel trim is more than -15%.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the failure is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0175 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0175 can be cleared by using the Tech 2 “Clear Info” function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed -out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the Bank 2 HO2S 1 display on the Tech 2 while moving connectors and wiring harnesses related to the engine harness. A change in the display will indicate the location of the fault.

Reviewing the Failure Records Vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. DTCs other than P0172 and P0175 may indicate a condition present which may cause a lean condition. If this is the case, repairing the condition which caused the other DTC will most likely correct the DTC P0172/P0175.
4. If the DTC P0175 test passes while the Failure Records conditions are being duplicated, the rich condition is intermittent. Refer to *Diagnostic Aids* or *Symptoms* for additional information on diagnosing intermittent problems.

DTC P0175 – Fuel Trim System Rich Bank 2

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Are any DTCs set other than P0172 and P0175?	—	Go to the applicable DTC charts and repair the other DTCs before proceeding with this chart.	Go to <i>Step 3</i>
3	1. Start the engine and operate the vehicle in "closed loop". 2. Observe the "BANK 2 L.T. FUEL TRIM" display on the Tech 2. Is the displayed value more negative than the specified value?	L.T. Fuel Trim: -15% (auto. trans.) OR -12% (man. trans.)	Go to <i>Step 5</i>	Go to <i>Step 4</i>
4	1. Review and record the Tech 2 Failure Records data. 2. Clear the DTC P0172/P0175 and operate the vehicle to duplicate the Failure Records conditions. 3. Monitor the Tech 2 "DTC" info for DTC P0175 while operating the vehicle to duplicate the Failure Records conditions. 4. Continue operating the vehicle until the DTC P0175 test runs. 5. Note the test result. Does the Tech 2 indicate DTC P0175 failed this ignition?	—	Go to <i>Step 5</i>	The rich condition is not present. If a derivability symptom still exists, refer to <i>Symptoms</i> .
5	Was DTC P0172 also set?	—	Go to <i>Step 6</i>	Go to <i>Step 15</i>
6	Visually and physically inspect the air filter element and replace it if necessary. Did the air filter require replacement?	—	Verify repair	Go to <i>Step 7</i>
7	Visually and physically inspect the air intake duct for collapse or restriction and repair if necessary. Did your inspection reveal a problem requiring repair?	—	Verify repair	Go to <i>Step 8</i>

DTC P0175 – Fuel Trim System Rich Bank 2 (Cont'd)

Step	Action	Value(s)	Yes	No
8	Inspect the MAF sensor inlet screen for damage or for the presence of foreign objects which may partially block air flow through the screen and correct any problem found. Did your inspection of the MAF sensor reveal a condition requiring repair or replacement?	—	Verify repair	Go to Step 9
9	Start the engine and note the idle quality. Is a low or unsteady idle being experienced?	—	Go to Step 10	Go to Step 11
10	1. Turn the ignition off and physically inspect the throttle body bore, throttle plate, and IAC passages for coking and foreign objects. 2. If a problem was found, repair as necessary. Did your inspection reveal a condition requiring repair?	—	Verify repair	Go to Step 11
11	1. Disconnect the vacuum hose from the fuel pressure regulator and inspect the hose for the presence of fuel. 2. If fuel is present in the vacuum hose, replace the fuel pressure regulator (refer to <i>Fuel Metering System</i>). Did the fuel pressure regulator require replacement?	—	Verify repair	Go to Step 12
12	1. Ignition "ON", engine "OFF". 2. Monitor the TP Angle display on the Tech 2 while slowly depressing the accelerator pedal. Does the TP Angle display increase steadily and evenly from minimum value at closed throttle to maximum value at wide-open throttle?	Minimum 8% Maximum 92%	Go to Step 13	Go to Step 21
13	1. Disconnect the MAF sensor electrical connector. 2. Operate the vehicle in "closed loop" while monitoring the "BANK 2 L.T. FUEL TRIM" and "BANK 2 S.T. FUEL TRIM" display on the Tech 2. Did both values change to near the specified value?	0%	Go to Step 22	Go to Step 14
14	1. Perform the "Fuel System Pressure Test". 2. If Fuel System Pressure Test isolates a problem, repair as necessary (refer to <i>Engine Fuel</i> or <i>Fuel Metering System</i>). Did the Fuel System Pressure Test isolate a condition requiring repair?	—	Verify repair	Go to Step 15
15	1. Ignition "ON", engine "OFF". 2. Connect a test light between the harness connector terminals of canister purge solenoid. Is the test light on?	—	Go to Step 16	Go to Step 19
16	Check for short to ground in the wire (YEL/RED) between the canister purge solenoid and PCM terminal S-48. Was there a short to ground?	—	Go to Step 17	Go to Step 18
17	Repair the short to ground. Is the action complete?	—	Verify repair	—

DTC P0175 – Fuel Trim System Rich Bank 2 (Cont'd)

Step	Action	Value(s)	Yes	No
18	<p>Replace the PCM.</p> <p>IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service</i> in <i>Powertrain Control Module and Sensors</i> for procedures.</p> <p>And also refer to the latest Service Bulletin.</p> <p>Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM.</p> <p>Is the action complete?</p>	—	Verify repair	—
19	<p>1. Perform the "Injector Balance Test".</p> <p>2. If the Injector Balance Test isolates a problem, repair as necessary (refer to <i>Fuel Metering System</i>).</p> <p>Did the Injector Balance Test isolate a problem requiring repair?</p>	—	Verify repair	Go to Step 20
20	<p>1. Remove and visually/physically inspect the Bank 2 HO2S 1 for silicon contamination. This will be indicated by a powdery deposit on the portion of the HO2S that is exposed to the exhaust stream.</p> <p>2. If contamination is evident on the Bank 2 HO2S 1, replace the contaminated sensor.</p> <p>Did the sensor require replacement?</p>	—	Verify repair	Refer to Diagnostic Aids
21	<p>1. Check the TP sensor mounting screws and tighten or replace them as necessary if they are loose or missing.</p> <p>2. If the screws are OK, replace the TP sensor.</p> <p>Is the action complete?</p>	—	Verify repair	—
22	<p>Replace the MAF sensor.</p> <p>Is the action complete?</p>	—	Verify repair	—

Test Description

The number(s) below refer to the step number(s) on the Diagnostic Chart.

- 3. This step determines if DTC P0201 is the result of a hard failure or an intermittent condition.
- 5. A special injector test connector is provided so that the injectors can be electrically tested without removal of the manifold. The test connector can be identified by the blue connector lock which is tethered to the wiring harness. If the light for cylinder 1 is "ON" steady before cranking the engine as well as while cranking the engine, then the injector driver circuit is shorted to ground.

If the test light blinks while cranking, the PCM and the wiring to the injectors are OK. The Fuel Injector Coil Test Procedure will check if the injectors are faulty.

R321054

- 7. Because the test light was "ON" steady, voltage to the injector is OK, but the driver circuit is grounded at all times. This step determines if the circuit is shorted to ground or the PCM is faulty.
- 9. The reading should be about 12-14Ω.
- 10. Locating the open in the harness or in the injector will require removal of the manifold to provide access.

DTC P0201 – Injector 1 Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Will the engine start?	—	Go to Step 3	Go to <i>Engine Cranks But Will Not Run</i> chart
3	1. Install the Tech 2. Clear the DTC. 2. Idle the engine for one minute. Does DTC P0201 reset?	—	Go to Step 5	Go to Step 4
4	1. Review the Freeze Frame data with the ignition "ON" and the engine "OFF" and note the parameters. 2. Operate the vehicle within the Freeze Frame conditions as noted. Does P0201 reset?	—	Go to Step 5	Go to <i>Diagnostic Aids</i>
5	1. Engine "OFF". 2. Disconnect the injector connector. 3. Install an injector test light 5-8840-2636-0 on the injector test connector. 4. Crank the engine and note the light. Does the injector test light blink?	—	Go to <i>Fuel Injector Coil Test Procedure</i>	Go to Step 6

DTC P0201 – Injector 1 Control Circuit (Cont'd)

Step	Action	Value(s)	Yes	No
6	Note whether the injector test light for cylinder 1 was "OFF" or "ON" steady in step 5. Was the test light "ON" steady while cranking the engine?	—	Go to <i>Step 7</i>	Go to <i>Step 9</i>
7	1. Disconnect the PCM connector for the affected injectors. 2. With a test light connected to B+, probe the affected injector driver circuit. Does the test light illuminate?	—	Go to <i>Step 8</i>	Go to <i>Step 15</i>
8	Repair short to ground in the injector driver circuit. Is the action complete?	—	Go to <i>OBD System Check</i>	—
9	1. Disconnect the injector test connector. 2. At the injector side of the harness, connect an ohmmeter between the positive wire (red with blue tracer) and the wire for cylinder 1 (green with white tracer). Does the ohmmeter indicate continuity?	—	Go to <i>Step 11</i>	Go to <i>Step 10</i>
10	Repair the open injector harness wire or open injector. Is the action complete?	—	Verify repair	—
11	At the PCM side of the injector test connector, check the green/white wire for a short to voltage. Was there a short to voltage?	—	Go to <i>Step 12</i>	Go to <i>Step 13</i>
12	Repair the short to voltage. Is the action complete?	—	Verify repair	—
13	Check for an open circuit between the injector test connector and the PCM. Was there an open circuit?	—	Go to <i>Step 14</i>	Go to <i>Step 15</i>
14	Repair the open circuit. Is the action complete?	—	Verify repair	—
15	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors</i> for procedures. And also refer to the latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Test Description

The number(s) below refer to the step number(s) on the Diagnostic Chart.

- 3. This step determines if DTC P0202 is the result of a hard failure or an intermittent condition.
- 5. A special injector test connector is provided so that the injectors can be electrically tested without removal of the manifold. The test connector can be identified by the blue connector lock which is tethered to the wiring harness. If the light for cylinder 2 is "ON" steady before cranking the engine as well as while cranking the engine, then the injector driver circuit is shorted to ground.

If the test light blinks while cranking, the PCM and the wiring to the injectors are OK. The Fuel Injector Coil Test Procedure will check if the injectors are faulty.

- 7. Because the test light was "ON" steady, voltage to the injector is OK, but the driver circuit is grounded at all times. This step determines if the circuit is shorted to ground or the PCM is faulty.
- 9. The reading should be about 12-14Ω.
- 10. Locating the open in the harness or in the injector will require removal of the manifold to provide access.

DTC P0202 – Injector 2 Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Will the engine start?	—	Go to Step 3	Go to <i>Engine Cranks But Will Not Run</i> chart
3	1. Install the Tech 2. Clear the DTC. 2. Idle the engine for one minute. Does DTC P0202 reset?	—	Go to Step 5	Go to Step 4
4	1. Review the Freeze Frame data with the ignition "ON" and the engine "OFF" and note the parameters. 2. Operate the vehicle within the Freeze Frame conditions as noted. Does P0202 reset?	—	Go to Step 5	Go to <i>Diagnostic Aids</i>
5	1. Engine "OFF". 2. Disconnect the injector test connector. 3. Install an injector test light 5-8840-2636-0 on injector connector. 4. Crank the engine and note the light. Does the cylinder 2 test light blink?	—	Go to <i>Fuel Injector Coil Test Procedure</i>	Go to Step 6

DTC P0202 – Injector 2 Control Circuit (Cont'd)

Step	Action	Value(s)	Yes	No
6	Note whether the injector test light for cylinder 2 was "OFF" or "ON" steady in step 5. Was the test light "ON" steady while cranking the engine?	—	Go to Step 7	Go to Step 9
7	1. Disconnect the PCM connector for the affected injectors. 2. With a test light connected to B+, probe the affected injector driver circuit. Does the test light illuminate?	—	Go to Step 8	Go to Step 15
8	Repair short to ground in the injector driver circuit. Is the action complete?	—	Go to OBD System Check	—
9	1. Disconnect the injector test connector. 2. At the injector side of the harness, connect an ohmmeter between the positive wire (red with blue tracer) and the wire for cylinder 2 (green with orange tracer). Does the ohmmeter indicate continuity?	—	Go to Step 11	Go to Step 10
10	Repair the open injector harness wire or open injector. Is the action complete?	—	Verify repair	—
11	At the PCM side of the injector test connector, check the green/orange wire for a short to voltage. Was there a short to voltage?	—	Go to Step 12	Go to Step 13
12	Repair the short to voltage. Is the action complete?	—	Verify repair	—
13	Check for an open circuit between the injector test connector and the PCM. Was there an open circuit?	—	Go to Step 14	Go to Step 15
14	Repair the open circuit. Is the action complete?	—	Verify repair	—
15	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors</i> for procedures. And also refer to the latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Test Description

The number(s) below refer to the step number(s) on the Diagnostic Chart.

- 3. This step determines if DTC P0203 is the result of a hard failure or an intermittent condition.
- 5. A special injector test connector is provided so that the injectors can be electrically tested without removal of the manifold. The test connector can be identified by the blue connector lock which is tethered to the wiring harness. If the light for cylinder 3 is "ON" steady before cranking the engine as well as while cranking the engine, then the injector driver circuit is shorted to ground.

If the test light blinks while cranking, the PCM and the wiring to the injectors are OK. The Fuel Injector Coil Test Procedure will check if the injectors are faulty.

- 7. Because the test light was "ON" steady, voltage to the injector is OK, but the driver circuit is grounded at all times. This step determines if the circuit is shorted to ground or the PCM is faulty.
- 9. The reading should be about 12-14Ω.
- 10. Locating the open in the harness or in the injector will require removal of the manifold to provide access.

DTC P0203 – Injector 3 Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Will the engine start?	—	Go to Step 3	Go to <i>Engine Cranks But Will Not Run</i> chart
3	1. Install the Tech 2. Clear the DTC. 2. Idle the engine for one minute. Does DTC P0203 reset?	—	Go to Step 5	Go to Step 4
4	1. Review the Freeze Frame data with the ignition "ON" and the engine "OFF" and note the parameters. 2. Operate the vehicle within the Freeze Frame conditions as noted. Does P0203 reset?	—	Go to Step 5	Go to <i>Diagnostic Aids</i>
5	1. Engine "OFF". 2. Disconnect the injector test connector . 3. Install an injector test light 5-8840-2636-0 on injector connector. 4. Crank the engine and note the light. Does the cylinder 3 test light blink?	—	Go to <i>Fuel Injector Coil Test Procedure</i>	Go to Step 6

DTC P0203 – Injector 3 Control Circuit (Cont'd)

Step	Action	Value(s)	Yes	No
6	Note whether the injector test light for cylinder 3 was "OFF" or "ON" steady in step 5. Was the test light "ON" steady while cranking the engine?	—	Go to Step 7	Go to Step 9
7	1. Disconnect the PCM connector for the affected injectors. 2. With a test light connected to B+, probe the affected injector driver circuit. Does the test light illuminate?	—	Go to Step 8	Go to Step 15
8	Repair short to ground in the injector driver circuit. Is the action complete?	—	Go to OBD System Check	—
9	1. Disconnect the injector test connector. 2. At the injector side of the harness, connect an ohmmeter between the positive wire (red with blue tracer) and the wire for cylinder 3 (green). Does the ohmmeter indicate continuity?	—	Go to Step 11	Go to Step 10
10	Repair the open injector harness wire or open injector. Is the action complete?	—	Verify repair	—
11	At the PCM side of the injector test connector, check the green wire for a short to voltage. Was there a short to voltage?	—	Go to Step 12	Go to Step 13
12	Repair the short to voltage. Is the action complete?	—	Verify repair	—
13	Check for an open circuit between the injector test connector and the PCM. Was there an open circuit?	—	Go to Step 14	Go to Step 15
14	Repair the open circuit. Is the action complete?	—	Verify repair	—
15	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors</i> for procedures. And also refer to the latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Test Description

The number(s) below refer to the step number(s) on the Diagnostic Chart.

- 3. This step determines if DTC P0204 is the result of a hard failure or an intermittent condition.
- 5. A special injector test connector is provided so that the injectors can be electrically tested without removal of the manifold. The test connector can be identified by the blue connector lock which is tethered to the wiring harness. If the light for cylinder 4 is "ON" steady before cranking the engine as well as while cranking the engine, then the injector driver circuit is shorted to ground.

If the test light blinks while cranking, the PCM and the wiring to the injectors are OK. The Fuel Injector Coil Test Procedure will check if the injectors are faulty.

R321057

- 7. Because the test light was "ON" steady, voltage to the injector is OK, but the driver circuit is grounded at all times. This step determines if the circuit is shorted to ground or the PCM is faulty.
- 9. The reading should be about 12-14Ω.
- 10. Locating the open in the harness or in the injector will require removal of the manifold to provide access.

DTC P0204 – Injector 4 Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Will the engine start?	—	Go to Step 3	Go to <i>Engine Cranks But Will Not Run</i> chart
3	1. Install the Tech 2. Clear the DTC. 2. Idle the engine for one minute. Does DTC P0204 reset?	—	Go to Step 5	Go to Step 4
4	1. Review the Freeze Frame data with the ignition "ON" and the engine "OFF" and note the parameters. 2. Operate the vehicle within the Freeze Frame conditions as noted. Does P0204 reset?	—	Go to Step 5	Go to <i>Diagnostic Aids</i>
5	1. Engine "OFF". 2. Disconnect the injector test connector. 3. Install an injector test light 5-8840-2636-0 on injector connector. 4. Crank the engine and note the light. Does the cylinder 4 test light blink?	—	Go to <i>Fuel Injector Coil Test Procedure</i>	Go to Step 6

DTC P0204 – Injector 4 Control Circuit (Cont'd)

Step	Action	Value(s)	Yes	No
6	Note whether the injector test light for cylinder 4 was "OFF" or "ON" steady in step 5. Was the test light "ON" steady while cranking the engine?	—	Go to Step 7	Go to Step 9
7	1. Disconnect the PCM connector for the affected injectors. 2. With a test light connected to B+, probe the affected injector driver circuit. Does the test light illuminate?	—	Go to Step 8	Go to Step 15
8	Repair short to ground in the injector driver circuit. Is the action complete?	—	Go to OBD System Check	—
9	1. Disconnect the injector test connector. 2. At the injector side of the harness, connect an ohmmeter between the positive wire (red with blue tracer) and the wire for cylinder 4 (green/red). Does the ohmmeter indicate continuity?	—	Go to Step 11	Go to Step 10
10	Repair the open injector harness wire or open injector. Is the action complete?	—	Verify repair	—
11	At the PCM side of the injector test connector, check the green/red wire for a short to voltage. Was there a short to voltage?	—	Go to Step 12	Go to Step 13
12	Repair the short to voltage. Is the action complete?	—	Verify repair	—
13	Check for an open circuit between the injector test connector and the PCM. Was there an open circuit?	—	Go to Step 14	Go to Step 15
14	Repair the open circuit. Is the action complete?	—	Verify repair	—
15	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors</i> for procedures. And also refer to the latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Test Description

The number(s) below refer to the step number(s) on the Diagnostic Chart.

- 3. This step determines if DTC P0205 is the result of a hard failure or an intermittent condition.
- 5. A special injector test connector is provided so that the injectors can be electrically tested without removal of the manifold. The test connector can be identified by the blue connector lock which is tethered to the wiring harness. If the light for cylinder 5 is "ON" steady before cranking the engine as well as while cranking the engine, then the injector driver circuit is shorted to ground.

If the test light blinks while cranking, the PCM and the wiring to the injectors are OK. The Fuel Injector Coil Test Procedure will check if the injectors are faulty.

R321058

- 7. Because the test light was "ON" steady, voltage to the injector is OK, but the driver circuit is grounded at all times. This step determines if the circuit is shorted to ground or the PCM is faulty.
- 9. The reading should be about 12-14Ω.
- 10. Locating the open in the harness or in the injector will require removal of the manifold to provide access.

DTC P0205 – Injector 5 Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Will the engine start?	—	Go to Step 3	Go to <i>Engine Cranks But Will Not Run</i> chart
3	1. Install the Tech 2. Clear the DTC. 2. Idle the engine for one minute. Does DTC P0205 reset?	—	Go to Step 5	Go to Step 4
4	1. Review the Freeze Frame data with the ignition "ON" and the engine "OFF" and note the parameters. 2. Operate the vehicle within the Freeze Frame conditions as noted. Does P0205 reset?	—	Go to Step 5	Go to <i>Diagnostic Aids</i>
5	1. Engine "OFF". 2. Disconnect the injector test connector. 3. Install an injector test light 5-8840-2636-0 on injector connector. 4. Crank the engine and note the light. Does the cylinder 5 test light blink?	—	Go to <i>Fuel Injector Coil Test Procedure</i>	Go to Step 6

DTC P0205 – Injector 5 Control Circuit (Cont'd)

Step	Action	Value(s)	Yes	No
6	Note whether the injector test light for cylinder 5 was "OFF" or "ON" steady in step 5. Was the test light "ON" steady while cranking the engine?	—	Go to <i>Step 7</i>	Go to <i>Step 9</i>
7	1. Disconnect the PCM connector for the affected injectors. 2. With a test light connected to B+, probe the affected injector driver circuit. Does the test light illuminate?	—	Go to <i>Step 8</i>	Go to <i>Step 15</i>
8	Repair short to ground in the injector driver circuit. Is the action complete?	—	Go to <i>OBD System Check</i>	—
9	1. Disconnect the injector test connector. 2. At the injector side of the harness, connect an ohmmeter between the positive wire (red with blue tracer) and the wire for cylinder 5 (green with black tracer). Does the ohmmeter indicate continuity?	—	Go to <i>Step 11</i>	Go to <i>Step 10</i>
10	Repair the open injector harness wire or open injector. Is the action complete?	—	Verify repair	—
11	At the PCM side of the injector test connector, check the green/black wire for a short to voltage. Was there a short to voltage?	—	Go to <i>Step 12</i>	Go to <i>Step 13</i>
12	Repair the short to voltage. Is the action complete?	—	Verify repair	—
13	Check for an open circuit between the injector test connector and the PCM. Was there an open circuit?	—	Go to <i>Step 14</i>	Go to <i>Step 15</i>
14	Repair the open circuit. Is the action complete?	—	Verify repair	—
15	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors</i> for procedures. And also refer to the latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Test Description

The number(s) below refer to the step number(s) on the Diagnostic Chart.

- 3. This step determines if DTC P0206 is the result of a hard failure or an intermittent condition.
- 5. A special injector test connector is provided so that the injectors can be electrically tested without removal of the manifold. The test connector can be identified by the blue connector lock which is tethered to the wiring harness. If the light for cylinder 6 is "ON" steady before cranking the engine as well as while cranking the engine, then the injector driver circuit is shorted to ground.

If the test light blinks while cranking, the PCM and the wiring to the injectors are OK. The Fuel Injector Coil Test Procedure will check if the injectors are faulty.

R321059

- 7. Because the test light was "ON" steady, voltage to the injector is OK, but the driver circuit is grounded at all times. This step determines if the circuit is shorted to ground or the PCM is faulty.
- 9. The reading should be about 12-14Ω.
- 10. Locating the open in the harness or in the injector will require removal of the manifold to provide access.

DTC P0206 – Injector 6 Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Will the engine start?	—	Go to Step 3	Go to <i>Engine Cranks But Will Not Run</i> chart
3	1. Install the Tech 2. Clear the DTC. 2. Idle the engine for one minute. Does DTC P0206 reset?	—	Go to Step 5	Go to Step 4
4	1. Review the Freeze Frame data with the ignition "ON" and the engine "OFF" and note the parameters. 2. Operate the vehicle within the Freeze Frame conditions as noted. Does P0206 reset?	—	Go to Step 5	Go to <i>Diagnostic Aids</i>
5	1. Engine "OFF". 2. Disconnect the injector test connector. 3. Install an injector test light 5-8840-2636-0 on injector connector. 4. Crank the engine and note the light. Does the cylinder 6 test light blink?	—	Go to <i>Fuel Injector Coil Test Procedure</i>	Go to Step 6

DTC P0206 – Injector 6 Control Circuit (Cont'd)

Step	Action	Value(s)	Yes	No
6	Note whether the injector test light for cylinder 6 was "OFF" or "ON" steady in step 5. Was the test light "ON" steady while cranking the engine?	—	Go to Step 7	Go to Step 9
7	1. Disconnect the PCM connector for the affected injectors. 2. With a test light connected to B+, probe the affected injector driver circuit. Does the test light illuminate?	—	Go to Step 8	Go to Step 15
8	Repair short to ground in the injector driver circuit. Is the action complete?	—	Go to OBD System Check	—
9	1. Disconnect the injector test connector. 2. At the injector side of the harness, connect an ohmmeter between the positive wire (red with blue tracer) and the wire for cylinder 6 (green with yellow tracer). Does the ohmmeter indicate continuity?	—	Go to Step 11	Go to Step 10
10	Repair the open injector harness wire or open injector Is the action complete?	—	Verify repair	—
11	At the PCM side of the injector test connector, check the green/yellow wire for a short to voltage. Was there a short to voltage?	—	Go to Step 12	Go to Step 13
12	Repair the short to voltage. Is the action complete?	—	Verify repair	—
13	Check for an open circuit between the injector test connector and the PCM. Was there an open circuit?	—	Go to Step 14	Go to Step 15
14	Repair the open circuit. Is the action complete?	—	Verify repair	—
15	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors</i> for procedures. And also refer to the latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0300 Engine Misfire Detected

Circuit Description

Misfire is monitored as a function of the combustion quality (CQ) signals generated from the ION Sensing Module. Combustion signals represent the degree of combustion in each cylinder. Misfire is detected when the combustion signal is below a predetermined value. This DTC P0300 will determine if a multiple cylinder misfire is occurring by monitoring the Combustion Quality.

Conditions for Setting the DTC

- None of the following DTCs occur: TP sensor, MAF sensor, VSS, ECT sensor.
- The engine speed is between 600 and 6250 RPM.
- The system voltage is between 11 and 16 volts.
- The engine temperature sensor (ECT) indicates an engine temperature between -7°C (20°F) and 110°C (230°F).
- Throttle angle is steady and throttle changes less than 0.4% per 125 milliseconds.

Action Taken When the DTC Sets

- The PCM will ON the MIL after second trip with detected the fault.
- If the misfire is severe enough to cause possible catalyst damage, the PCM will flash the MIL for as long as the misfire remains at catalyst damaging levels.
- The PCM will disable the TCC operation.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle in which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0300 will clear after 40 consecutive warm-up cycles occur without a fault.
- DTC P0300 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

The Tech 2 display "Misfire Cur. #1 through #6" can be useful to determine whether the misfire is isolated to a single cylinder.

- Damaged or faulty ignition coil – Check for cracks or other damage.
- Substitute a known good coil – Swap the ignition coils and retest. If the misfire follows the coil, replace the ignition coil.

If the misfire is random, check for the following conditions:

- System grounds – Ensure all connections are clean and properly tightened.
- MAF – A mass air flow (MAF) sensor output that causes the PCM to sense a lower than normal air flow will cause a lean condition.
- Air induction system – Air leaks into the induction system which bypass the MAF sensor will cause a lean condition. Check for disconnected or damaged vacuum hoses, incorrectly installed or faulty PCV valve, or for vacuum leaks at the throttle body, EGR valve, and intake manifold mounting surfaces.
- Fuel pressure – Perform a fuel system pressure test. A faulty fuel pump, plugged filter, or faulty fuel system pressure regulator will contribute to a lean condition.
- Injector(s) – Perform an injector coil/balance test to locate faulty injector(s) contributing to a lean or flooding condition. In addition to the above test, check the condition of the injector O-rings.
- EGR – Check for a leaking valve, adapter, or feed pipes which will contribute to a lean condition or excessive EGR flow.
- Fuel quality – Using fuel with the wrong octane rating for the vehicle may cause drivability problems. Although alcohol-enhanced fuels may raise the octane rating, the fuel's ability to turn into vapor in cold temperatures deteriorates. This may affect the cold drivability of the engine. The Reid Vapor Pressure of the fuel can also create problems in the fuel system, especially during the spring and fall when changes by the refineries may not coincide with changes in the weather.
- Vehicle marshalling – The transportation of new vehicles from the assembly plant to the dealership can involve as many as 60 key cycles within 2 to 3 miles of driving. This type of operation contributes to the fuel fouling of the spark plugs and will turn on the MIL with a P0300 Misfire DTC.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P0300 – Engine Misfire Detected

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	1. Start the engine. Run the engine at idle. 2. Review and record the Tech 2 Freeze Frame data. 3. Operate the vehicle to duplicate the conditions present when the DTC was set (as defined by the Freeze Frame data). 4. Monitor the Tech 2 “Misfire Cur. #” display for each cylinder. Is “Misfire Cur. #” display increasing for any cylinder (indicating a misfire currently occurring)?	—	Go to <i>Step 3</i>	Refer to <i>Diagnostic Aids</i>
3	1. Visually and physically inspect the vacuum hoses for splits, kinks, and improper connections. 2. If a problem is found, repair or replace the vacuum hoses as necessary. Did your inspection reveal a problem?	—	Verify repair	Go to <i>Step 4</i>
4	1. Visually and physically inspect the following areas for vacuum leaks: <ul style="list-style-type: none"> ● The intake manifold ● The injector O-rings ● The EGR adapter ● The EGR feed pipes ● ION Sensing Module 2. If a problem is found, repair the vacuum leak as necessary. Did your inspection reveal a vacuum leak?	—	Verify repair	Go to <i>Step 5</i>
5	1. Visually and physically inspect the crankcase ventilation valve for improper installation or damaged grommet. 2. If a problem is found, repair as necessary (refer to <i>Crankcase Ventilation System</i>). Did your inspection reveal a problem?	—	Verify repair	Go to <i>Step 6</i>
6	1. Inspect the MAF sensor inlet screen for damage or for the presence of foreign objects that may partially block the air flow sample through the MAF sensor. 2. If a problem is found, repair or replace the MAF sensor as necessary. Did your inspection of the MAF sensor reveal a condition requiring repair or replacement?	—	Verify repair	Go to <i>Step 7</i>
7	1. Remove the EGR valve and visually/physically inspect the valve to ensure that the pintle is not sticking partially open. Also, inspect the EGR valve pintle and seat for carbon deposits or burrs that may interfere with the pintle closing completely. 2. If a problem is found, clean the EGR valve pintle and seat or replace the EGR valve as necessary. Did your inspection reveal a problem?	—	Verify repair	Go to <i>Step 8</i>

DTC P0300 – Engine Misfire Detected (Cont'd)

Step	Action	Value(s)	Yes	No
8	1. Install a spark tester at the spark plug end of the ignition coil for a cylinder that indicated a misfire. 2. Crank the engine while observing the spark tester. A crisp, blue spark should be observed. Is adequate spark present?	—	Go to <i>Step 14</i>	Go to <i>Step 9</i>
9	1. Remove and visually/physically inspect the ignition coil(s) associated with the cylinders that were indicated as misfiring. Ensure that the coil(s) are free of cracks. 2. If a problem is found, replace the damaged ignition coil(s) as necessary. Did any ignition coils require replacement?	—	Verify repair	Go to <i>Step 10</i>
10	1. Remove the spark plugs from the cylinders that were indicated as misfiring. 2. Visually inspect the spark plug electrodes. Does your inspection reveal any spark plugs exhibiting excessive fouling?	—	Go to <i>Engine Mechanical Diagnosis</i>	Go to <i>Step 11</i>
11	1. Visually inspect the spark plug insulators for cracks, carbon tracking, or other damage. 2. If a problem is found, replace the faulty spark plug(s) as necessary. Did your inspection reveal a problem?	—	Verify repair	Go to <i>Step 12</i>
12	1. Disconnect the MAF sensor electrical connector. 2. Operate the vehicle in "closed loop" while monitoring the "BANK 1 L.T. FUEL TRIM" and "BANK 1 S.T. FUEL TRIM" display on the Tech 2. Do both values decrease below the specified values?	"BANK 1 L.T. FUEL TRIM" below +20%; "BANK 1 S.T. FUEL TRIM" below +50%	Go to <i>Step 13</i>	Replace the ignition coil of the affected cylinder
13	Replace the ignition coil control module. Is the action complete?	—	Verify repair	—
14	1. Visually and physically inspect the PCM injector grounds, power grounds and sensor grounds to ensure that they are clean, tight and in their proper locations. 2. If a problem is found, correct the faulty ground condition as necessary. Did your inspection reveal a poor ground?	—	Verify repair	Go to <i>Step 15</i>
15	1. Perform the "Fuel System Pressure Test" procedure. 2. If a problem is found, repair as necessary (refer to <i>Engine Fuel or Fuel Metering System</i>). Was a fuel system problem found?	—	Verify repair	Go to <i>Step 16</i>
16	1. Check the fuel for excessive water, alcohol, or other contaminants (refer to <i>Diagnosis in Engine Fuel</i> for procedure). 2. If a problem is found, correct the contaminated fuel condition as necessary. Was the fuel contaminated?	—	Verify repair	Go to <i>Step 17</i>

DTC P0300 – Engine Misfire Detected (Cont'd)

Step	Action	Value(s)	Yes	No
17	1. Perform the "Injector Coil/Balance Test". 2. If a problem is found, replace faulty injector(s) as necessary. Did any of the injectors require replacement?	—	Verify repair	Go to <i>Step 18</i>
18	1. Check for an engine mechanical problem. Refer to <i>Engine Mechanical Diagnosis</i> to diagnose the following conditions: <ul style="list-style-type: none"> ● A faulty or incorrect camshaft ● Leaking or sticky valves or rings ● Excessive valve deposits ● Weak valve springs ● Incorrect valve timing ● A leaking head gasket ● A loose or broken motor mount 2. If a problem is found, repair as necessary. Was a basic engine mechanical problem found and repaired?	—	Verify repair	Go to <i>Step 19</i>
19	1. Check for a transmission TCC problem. Refer to <i>4L30-E Automatic Transmission Diagnosis</i> . 2. If a problem is found, repair the transmission as necessary. Refer to <i>4L30-E Automatic Transmission Unit Repair</i> . Was a transmission problem found and repaired?	—	Verify repair	Go to <i>Step 20</i>
20	Replace the MAF sensor. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0301 Cylinder Misfire Detected

Circuit Description

Misfire is monitored as a function of the combustion quality (CQ) signals generated from the ignition current sense system. Combustion signals represent the degree of combustion in each cylinder. Misfire is detected when the combustion signal is below a predetermined value. This DTC P0301 will determine if the No.1 cylinder misfire is occurring by monitoring the Combustion Quality.

Conditions for Setting the DTC

- None of the following DTCs occur: TP sensor, MAF sensor, vehicle speed sensor, ECT sensor.
- The engine speed is between 600 and 6250 RPM.
- The system voltage is between 11 and 16 volts.
- The ECT indicates an engine temperature between -7°C (28°F) and 110°C (230°F).
- The throttle angle is steady and throttle change less than 0.4% per 125 milliseconds.

Action Taken When the DTC Sets

- The PCM will ON the MIL after second trip with detected the fault.
- If the misfire is severe enough to cause possible catalyst damage, the PCM will flash the MIL for as long as the misfire remains at catalyst damaging levels.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive ignition cycle in which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0301 will clear after 40 consecutive ignition cycles occur without a fault.
- DTC P0301 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- System grounds – Ensure all connections are clean and properly tightened.
- Injector – Perform the injector coil/balance test to locate a faulty injector that contributes to a lean condition on the affected cylinder. In addition to the above test, check the condition of the injector O-ring.
- Faulty spark plug – Check for a cracked insulator, carbon tracking, incorrect gap, and worn electrodes.
- Damaged or faulty ignition coil – Check for cracks or other damage.
- Substitute a known good coil – Swap the ignition coils and retest. If the misfire follows the coil, replace the ignition coil.

DTC P0301 – Cylinder Misfire Detected

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Start the engine. Run the engine at idle. 2. Review and record Tech 2 Freeze Frame data. 3. Monitor "Misfire Cur. #1" on the Tech 2. Is "Misfire Cur. #1" increasing (indicating a misfire currently occurring)?	—	Go to Step 4	Go to Step 3
3	Monitor "Misfire Hist. #1" while operating the vehicle to duplicate the conditions present when the DTC was set (as defined by the Freeze Frame data recorded in Step 2). Is "Misfire Hist. #1" increasing (indicating a misfire currently occurring)?	—	Go to Step 4	Refer to <i>Diagnostic Aids</i>
4	1. Visually and physically inspect the vacuum hoses for splits, kinks, and improper connections. Also, inspect the intake manifold for a vacuum leak. 2. If a problem is found, repair it as necessary. Did the inspection reveal a problem?	—	Verify repair	Go to Step 5
5	1. Install a spark tester at the spark plug end of the cylinder #1 ignition coil. 2. Crank the engine while observing the spark tester. A crisp, blue spark should be observed. Is adequate spark present?	—	Go to Step 8	Go to Step 6

DTC P0301 – Cylinder Misfire Detected (Cont'd)

Step	Action	Value(s)	Yes	No
6	1. Remove and visually/physically inspect the ignition coil associated with cylinder #1. Ensure that the coil is free of cracks and carbon tracking. 2. If a problem is found, replace the damaged ignition coil as necessary. Did the visual inspection reveal a problem?	—	Verify repair	Go to <i>Step 7</i>
7	1. Measure the ignition coil primary resistance. 2. If resistance is not within the specified value, replace the faulty ignition coil. Did the ignition coil require replacement?	2.6-2.7 K μ	Verify repair	Go to <i>Step 12</i>
8	Remove the cylinder #1 spark plug and visually inspect the spark plug electrode. Does the inspection reveal excessive fouling?	—	Go to <i>Contamination Diagnosis</i> chart in <i>Engine Mechanical Diagnosis</i>	Go to <i>Step 9</i>
9	1. Visually inspect the spark plug insulator for cracks, carbon tracking, or other damage. 2. If the spark plug is damaged, replace the spark plug. Did the inspection reveal a problem?	—	Verify repair	Go to <i>Step 10</i>
10	1. Perform the "Injector Coil/Balance Test". 2. If any faulty injectors are found, replace them as necessary. Did any of the injectors require replacement?	—	Verify repair	Go to <i>Step 11</i>
11	1. Inspect the injector O-rings for a vacuum leak. 2. If a problem is found, repair it as necessary. Did the inspection reveal a problem?	—	Verify repair	Go to <i>Step 12</i>
12	Check for an engine mechanical problem. Refer to <i>Engine Mechanical Diagnosis</i> to diagnose and repair the following conditions: <ul style="list-style-type: none"> ● A faulty or incorrect camshaft ● Leaking or sticky valves or rings ● Excessive valve deposits ● Weak valve springs ● A leaking head gasket Was a basic engine mechanical problem found?	—	Verify repair	Refer to <i>Diagnostic Aids</i>

Diagnostic Trouble Code (DTC) P0302 Cylinder Misfire Detected

Circuit Description

Misfire is monitored as a function of the combustion quality (CQ) signals generated from the ignition current sense system. Combustion signals represent the degree of combustion in each cylinder. Misfire is detected when the combustion signal is below a predetermined value. This DTC P0302 will determine if the No.2 cylinder misfire is occurring by monitoring the Combustion Quality.

Conditions for Setting the DTC

- None of the following DTCs occur: TP sensor, MAF sensor, vehicle speed sensor, ECT sensor.
- The engine speed is between 600 and 6250 RPM.
- The system voltage is between 11 and 16 volts.
- The ECT indicates an engine temperature between -7°C (28°F) and 110°C (230°F).
- The throttle angle is steady and throttle change less than 0.4% per 125 milliseconds.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- If the misfire is severe enough to cause possible catalyst damage, the PCM will flash the MIL for as long as the misfire remains at catalyst damaging levels.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive ignition cycle in which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0302 will clear after 40 consecutive ignition cycles occur without a fault.
- DTC P0302 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- System grounds – Ensure all connections are clean and properly tightened.
- Injector – Perform the injector coil/balance test to locate a faulty injector that contributes to a lean condition on the affected cylinder. In addition to the above test, check the condition of the injector O-ring.
- Faulty spark plug – Check for a cracked insulator, carbon tracking, incorrect gap, and worn electrodes.
- Damaged or faulty ignition coil – Check for cracks, carbon tracking or other damage.
- Substitute a known good coil – Swap the ignition coils and retest. If the misfire follows the coil, replace the ignition coil.

DTC P0302 – Cylinder Misfire Detected

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Start the engine. Run the engine at idle. 2. Review and record Tech 2 Freeze Frame data. 3. Monitor "Misfire Cur. #2" on the Tech 2. Is "Misfire Cur. #2" increasing (indicating a misfire currently occurring)?	—	Go to Step 4	Go to Step 3
3	Monitor "Misfire Hist. #2" while operating the vehicle to duplicate the conditions present when the DTC was set (as defined by the Freeze Frame data recorded in Step 2). Is "Misfire Hist. #2" increasing (indicating a misfire currently occurring)?	—	Go to Step 4	Refer to <i>Diagnostic Aids</i>
4	1. Visually and physically inspect the vacuum hoses for splits, kinks, and improper connections. Also, inspect the intake manifold for a vacuum leak. 2. If a problem is found, repair it as necessary. Did the inspection reveal a problem?	—	Verify repair	Go to Step 5
5	1. Install a spark tester at the spark plug end of the cylinder #2 ignition coil. 2. Crank the engine while observing the spark tester. A crisp, blue spark should be observed. Is adequate spark present?	—	Go to Step 8	Go to Step 6

DTC P0302 – Cylinder Misfire Detected (Cont'd)

Step	Action	Value(s)	Yes	No
6	1. Remove and visually/physically inspect the ignition coil associated with cylinder #2. Ensure that the coil is free of cracks and carbon tracking. 2. If a problem is found, replace the damaged ignition coil as necessary. Did the visual inspection reveal a problem?	—	Verify repair	Go to <i>Step 7</i>
7	1. Measure the ignition coil primary resistance. 2. If resistance is not within the specified value, replace the faulty ignition coil. Did the ignition coil require replacement?	2.6-2.7 K μ	Verify repair	Go to <i>Step 12</i>
8	Remove the cylinder #2 spark plug and visually inspect the spark plug electrode. Does the inspection reveal excessive fouling?	—	Go to <i>Contamination Diagnosis</i> chart in <i>Engine Mechanical Diagnosis</i>	Go to <i>Step 9</i>
9	1. Visually inspect the spark plug insulator for cracks, carbon tracking, or other damage. 2. If the spark plug is damaged, replace the spark plug. Did the inspection reveal a problem?	—	Verify repair	Go to <i>Step 10</i>
10	1. Perform the "Injector Coil/Balance Test". 2. If any faulty injectors are found, replace them as necessary. Did any of the injectors require replacement?	—	Verify repair	Go to <i>Step 11</i>
11	1. Inspect the injector O-rings for a vacuum leak. 2. If a problem is found, repair it as necessary. Did the inspection reveal a problem?	—	Verify repair	Go to <i>Step 12</i>
12	Check for an engine mechanical problem. Refer to <i>Engine Mechanical Diagnosis</i> to diagnose and repair the following conditions: <ul style="list-style-type: none"> ● A faulty or incorrect camshaft ● Leaking or sticky valves or rings ● Excessive valve deposits ● Weak valve springs ● A leaking head gasket Was a basic engine mechanical problem found?	—	Verify repair	Refer to <i>Diagnostic Aids</i>

Diagnostic Trouble Code (DTC) P0303 Cylinder Misfire Detected

Circuit Description

Misfire is monitored as a function of the combustion quality (CQ) signals generated from the ignition current sense system. Combustion signals represent the degree of combustion in each cylinder. Misfire is detected when the combustion signal is below a predetermined value. This DTC P0303 will determine if the No.3 cylinder misfire is occurring by monitoring the Combustion Quality.

Conditions for Setting the DTC

- None of the following DTCs occur: TP sensor, MAF sensor, vehicle speed sensor, ECT sensor.
- The engine speed is between 600 and 6250 RPM.
- The system voltage is between 11 and 16 volts.
- The ECT indicates an engine temperature between -7°C (28°F) and 110°C (230°F).
- The throttle angle is steady and throttle change less than 0.4% per 125 milliseconds.

Action Taken When the DTC Sets

- The PCM will ON the MIL after second trip with detected the fault.
- If the misfire is severe enough to cause possible catalyst damage, the PCM will flash the MIL for as long as the misfire remains at catalyst damaging levels.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive ignition cycle in which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0303 will clear after 40 consecutive ignition cycles occur without a fault.
- DTC P0303 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- System grounds – Ensure all connections are clean and properly tightened.
- Injector — Perform the injector coil/balance test to locate a faulty injector that contributes to a lean condition on the affected cylinder. In addition to the above test, check the condition of the injector O-ring.
- Faulty spark plug – Check for a cracked insulator, carbon tracking, incorrect gap, and worn electrodes.
- Damaged or faulty ignition coil – Check for cracks, carbon tracking or other damage.
- Substitute a known good coil – Swap the ignition coils and retest. If the misfire follows the coil, replace the ignition coil.

DTC P0303 – Cylinder Misfire Detected

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Start the engine. Run the engine at idle. 2. Review and record Tech 2 Freeze Frame data. 3. Monitor "Misfire Cur. #3" on the Tech 2. Is "Misfire Cur. #3" increasing (indicating a misfire currently occurring)?	—	Go to Step 4	Go to Step 3
3	Monitor "Misfire Hist. #3" while operating the vehicle to duplicate the conditions present when the DTC was set (as defined by the Freeze Frame data recorded in Step 2). Is "Misfire Hist. #3" increasing (indicating a misfire currently occurring)?	—	Go to Step 4	Refer to <i>Diagnostic Aids</i>
4	1. Visually and physically inspect the vacuum hoses for splits, kinks, and improper connections. Also, inspect the intake manifold for a vacuum leak. 2. If a problem is found, repair it as necessary. Did the inspection reveal a problem?	—	Verify repair	Go to Step 5
5	1. Install a spark tester at the spark plug end of the cylinder #3 ignition coil. 2. Crank the engine while observing the spark tester. A crisp, blue spark should be observed. Is adequate spark present?	—	Go to Step 8	Go to Step 6

DTC P0303 – Cylinder Misfire Detected (Cont'd)

Step	Action	Value(s)	Yes	No
6	1. Remove and visually/physically inspect the ignition coil associated with cylinder #3. Ensure that the coil is free of cracks and carbon tracking. 2. If a problem is found, replace the damaged ignition coil as necessary. Did the visual inspection reveal a problem?	—	Verify repair	Go to <i>Step 7</i>
7	1. Measure the ignition coil primary resistance. 2. If resistance is not within the specified value, replace the faulty ignition coil. Did the ignition coil require replacement?	2.6-2.7 K μ	Verify repair	Go to <i>Step 12</i>

9	1. Visually inspect the spark plug insulator for cracks, carbon tracking, or other damage. 2. If the spark plug is damaged, replace the spark plug. Did the inspection reveal a problem?	—	Verify repair	Go to <i>Step 10</i>
10	1. Perform the "Injector Coil/Balance Test". 2. If any faulty injectors are found, replace them as necessary. Did any of the injectors require replacement?	—	Verify repair	Go to <i>Step 11</i>
11	1. Inspect the injector O-rings for a vacuum leak. 2. If a problem is found, repair it as necessary. Did the inspection reveal a problem?	—	Verify repair	Go to <i>Step 12</i>
12	Check for an engine mechanical problem. Refer to <i>Engine Mechanical Diagnosis</i> to diagnose and repair the following conditions: <ul style="list-style-type: none"> ● A faulty or incorrect camshaft ● Leaking or sticky valves or rings ● Excessive valve deposits ● Weak valve springs ● A leaking head gasket Was a basic engine mechanical problem found?	—	Verify repair	Refer to <i>Diagnostic Aids</i>

Diagnostic Trouble Code (DTC) P0304 Cylinder Misfire Detected

Circuit Description

Misfire is monitored as a function of the combustion quality (CQ) signals generated from the ignition current sense system. Combustion signals represent the degree of combustion in each cylinder. Misfire is detected when the combustion signal is below a predetermined value. This DTC P0304 will determine if the No.4 cylinder misfire is occurring by monitoring the Combustion Quality.

Conditions for Setting the DTC

- None of the following DTCs occur: TP sensor, MAF sensor, vehicle speed sensor, ECT sensor.
- The engine speed is between 600 and 6250 RPM.
- The system voltage is between 11 and 16 volts.
- The ECT indicates an engine temperature between -7°C (28°F) and 110°C (230°F).
- The throttle angle is steady and throttle change less than 0.4% per 125 milliseconds.

Action Taken When the DTC Sets

- The PCM will ON the MIL after second trip with detected the fault.
- If the misfire is severe enough to cause possible catalyst damage, the PCM will flash the MIL for as long as the misfire remains at catalyst damaging levels.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive ignition cycle in which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0304 will clear after 40 consecutive ignition cycles occur without a fault.
- DTC P0304 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- System grounds – Ensure all connections are clean and properly tightened.
- Injector – Perform the injector coil/balance test to locate a faulty injector that contributes to a lean condition on the affected cylinder. In addition to the above test, check the condition of the injector O-ring.
- Faulty spark plug – Check for a cracked insulator, carbon tracking, incorrect gap, and worn electrodes.
- Damaged or faulty ignition coil – Check for cracks, carbon tracking or other damage.
- Substitute a known good coil – Swap the ignition coils and retest. If the misfire follows the coil, replace the ignition coil.

DTC P0304 – Cylinder Misfire Detected

Diagnostic Trouble Code (DTC) P0305 Cylinder Misfire Detected

Circuit Description

Misfire is monitored as a function of the combustion quality (CQ) signals generated from the ignition current sense system. Combustion signals represent the degree of combustion in each cylinder. Misfire is detected when the combustion signal is below a predetermined value. This DTC P0305 will determine if the No.5 cylinder misfire is occurring by monitoring the Combustion Quality.

Conditions for Setting the DTC

- None of the following DTCs occur: TP sensor, MAF sensor, vehicle speed sensor, ECT sensor.
- The engine speed is between 600 and 6250 RPM.
- The system voltage is between 11 and 16 volts.
- The ECT indicates an engine temperature between -7°C (28°F) and 110°C (230°F).
- The throttle angle is steady and throttle change less than 0.4% per 125 milliseconds.

Action Taken When the DTC Sets

- The PCM will ON the MIL after second trip with detected the fault.
- If the misfire is severe enough to cause possible catalyst damage, the PCM will flash the MIL for as long as the misfire remains at catalyst damaging levels.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive ignition cycle in which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0305 will clear after 40 consecutive ignition cycles occur without a fault.
- DTC P0305 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- System grounds – Ensure all connections are clean and properly tightened.
- Injector – Perform the injector coil/balance test to locate a faulty injector that contributes to a lean condition on the affected cylinder. In addition to the above test, check the condition of the injector O-ring.
- Faulty spark plug – Check for a cracked insulator, carbon tracking, incorrect gap, and worn electrodes.
- Damaged or faulty ignition coil – Check for cracks, carbon tracking or other damage.
- Substitute a known good coil – Swap the ignition coils and retest. If the misfire follows the coil, replace the ignition coil.

DTC P0305 – Cylinder Misfire Detected

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Start the engine. Run the engine at idle. 2. Review and record Tech 2 Freeze Frame data. 3. Monitor "Misfire Cur. #5" on the Tech 2. Is "Misfire Cur. #5" increasing (indicating a misfire currently occurring)?	—	Go to Step 4	Go to Step 3
3	Monitor "Misfire Hist. #5" while operating the vehicle to duplicate the conditions present when the DTC was set (as defined by the Freeze Frame data recorded in Step 2). Is "Misfire Hist. #5" increasing (indicating a misfire currently occurring)?	—	Go to Step 4	Refer to <i>Diagnostic Aids</i>
4	1. Visually and physically inspect the vacuum hoses for splits, kinks, and improper connections. Also, inspect the intake manifold for a vacuum leak. 2. If a problem is found, repair it as necessary. Did the inspection reveal a problem?	—	Verify repair	Go to Step 5
5	1. Install a spark tester at the spark plug end of the cylinder #5 ignition wire. 2. Crank the engine while observing the spark tester. A crisp, blue spark should be observed. Is adequate spark present?	—	Go to Step 8	Go to Step 6

DTC P0305 – Cylinder Misfire Detected (Cont'd)

Step	Action	Value(s)	Yes	No
6	1. Remove and visually/physically inspect the ignition coil associated with cylinder #5. Ensure that the coil is free of cracks and carbon tracking. 2. If a problem is found, replace the damaged ignition coil as necessary. Did the visual inspection reveal a problem?	—	Verify repair	Go to <i>Step 7</i>
7	1. Measure the ignition coil primary resistance. 2. If resistance is not within the specified value, replace the faulty ignition coil. Did the ignition coil require replacement?	2.6-2.7 K μ	Verify repair	Go to <i>Step 12</i>

Refer to <i>Engine Mechanical Diagnosis</i> to diagnose and repair the following conditions: <ul style="list-style-type: none"> ● A faulty or incorrect camshaft ● Leaking or sticky valves or rings ● Excessive valve deposits ● Weak valve springs ● A leaking head gasket Was a basic engine mechanical problem found?	—	Verify repair	Refer to <i>Diagnostic Aids</i>

Diagnostic Trouble Code (DTC) P0306 Cylinder Misfire Detected

Circuit Description

Misfire is monitored as a function of the combustion quality (CQ) signals generated from the ignition current sense system. Combustion signals represent the degree of combustion in each cylinder. Misfire is detected when the combustion signal is below a predetermined value. This DTC P0306 will determine if the No.6 cylinder misfire is occurring by monitoring the Combustion Quality.

Conditions for Setting the DTC

- None of the following occur: TP sensor, MAF sensor, vehicle speed sensor, ECT sensor.
- The engine speed is between 600 and 6250 RPM.
- The system voltage is between 11 and 16 volts.
- The ECT indicates an engine temperature between -7°C (28°F) and 110°C (230°F).
- The throttle angle is steady and throttle change less than 0.4% per 125 milliseconds.

Action Taken When the DTC Sets

- The PCM will ON the MIL after second trip with detected the fault.
- If the misfire is severe enough to cause possible catalyst damage, the PCM will flash the MIL for as long as the misfire remains at catalyst damaging levels.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive ignition cycle in which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0306 will clear after 40 consecutive ignition cycles occur without a fault.
- DTC P0306 can be cleared by using the Tech 2 “Clear Info” function.

Diagnostic Aids

Check for the following conditions:

- System grounds – Ensure all connections are clean and properly tightened.
- Injector – Perform the injector coil/balance test to locate a faulty injector that contributes to a lean condition on the affected cylinder. In addition to the above test, check the condition of the injector O-ring.
- Faulty spark plug – Check for a cracked insulator, carbon tracking, incorrect gap, and worn electrodes.
- Damaged or faulty ignition coil – Check for cracks or other damage.
- Substitute a known good coil – Swap the ignition coils and retest. If the misfire follows the coil, replace the ignition coil.

DTC P0306 – Cylinder Misfire Detected

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Start the engine. Run the engine at idle. 2. Review and record Tech 2 Freeze Frame data. 3. Monitor “Misfire Cur. #6” on the Tech 2. Is “Misfire Cur. #6” increasing (indicating a misfire currently occurring)?	—	Go to Step 4	Go to Step 3
3	Monitor “Misfire Hist. #6” while operating the vehicle to duplicate the conditions present when the DTC was set (as defined by the Freeze Frame data recorded in Step 2). Is “Misfire Hist. #6” increasing (indicating a misfire currently occurring)?	—	Go to Step 4	Refer to <i>Diagnostic Aids</i>
4	1. Visually and physically inspect the vacuum hoses for splits, kinks, and improper connections. Also, inspect the intake manifold for a vacuum leak. 2. If a problem is found, repair it as necessary. Did the inspection reveal a problem?	—	Verify repair	Go to Step 5
5	1. Install a spark tester at the spark plug end of the cylinder #6 ignition wire. 2. Crank the engine while observing the spark tester. A crisp, blue spark should be observed. Is adequate spark present?	—	Go to Step 8	Go to Step 6

DTC P0306 – Cylinder Misfire Detected (Cont'd)

Step	Action	Value(s)	Yes	No
6	1. Remove and visually/physically inspect the ignition coil associated with cylinder #6. Ensure that the coil is free of cracks and carbon tracking. 2. If a problem is found, replace the damaged ignition coil as necessary. Did the visual inspection reveal a problem?	—	Verify repair	Go to <i>Step 7</i>
7	1. Measure the ignition coil primary resistance. 2. If resistance is not within the specified value, replace the faulty ignition coil. Did the ignition coil require replacement?	2.6-2.7 K μ	Verify repair	Go to <i>Step 12</i>
8	Remove the cylinder #6 spark plug and visually inspect the spark plug electrode. Does the inspection reveal excessive fouling?	—	Go to <i>Contamination Diagnosis</i> chart in <i>Engine Mechanical Diagnosis</i>	Go to <i>Step 9</i>
9	1. Visually inspect the spark plug insulator for cracks, carbon tracking, or other damage. 2. If the spark plug is damaged, replace the spark plug. Did the inspection reveal a problem?	—	Verify repair	Go to <i>Step 10</i>
10	1. Perform the "Injector Coil/Balance Test". 2. If any faulty injectors are found, replace them as necessary. Did any of the injectors require replacement?	—	Verify repair	Go to <i>Step 11</i>
11	1. Inspect the intake manifold and the injector O-rings for a vacuum leak. 2. If a problem is found, repair it as necessary. Did the inspection reveal a problem?	—	Verify repair	Go to <i>Step 12</i>
12	Check for an engine mechanical problem. Refer to <i>Engine Mechanical Diagnosis</i> to diagnose and repair the following conditions: <ul style="list-style-type: none"> ● A faulty or incorrect camshaft ● Leaking or sticky valves or rings ● Excessive valve deposits ● Weak valve springs ● A leaking head gasket Was a basic engine mechanical problem found?	—	Verify repair	Refer to <i>Diagnostic Aids</i>

Diagnostic Trouble Code (DTC)

P0325 ION Sensing Module/ION Sensing Knock Intensity Circuit Fault

060R100135

Circuit Description

The Power Control Module (PCM) checks the validity of the signals used in the ION Sensing module at the following engine operating conditions.

- The test is performed to evacuate the Knock Intensity (KI) signal pulse width if it is within a predetermined range. If the KI signal pulse width is out of the predetermined range, the fail counter will be incremented. If the failure counter exceeds the calibration, then test is complete and a failure will be reported. If the sample counter threshold is reached before the failure threshold, then the test is complete and a pass will be reported. This test will detect an open/short in the KI line circuit, ION module faults and analog input faults in the PCM.

Conditions for setting the DTC

- Ignition voltage is between 10volt and 16 volts.
- No Crank DTCs set.
- No EST DTCs set.
- No Misfire DTCs set.

Action Taken When the DTC Sets

- The PCM will ON the MIL after second trip with detected the fault.
- The PCM calculates an air flow value based on idle air control valve position, throttle position, RPM and barometric pressure.

- The KI signal pulse width are less than 30μ seconds or more than 1070μ seconds.
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0325 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P0325 can be cleared using the Tech2 "Clear Info" function.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Misrouted harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM- Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage.

6E-222 6VD1 3.2L ENGINE DRIVEABILITY AND EMISSIONS

If the harness appears to be OK, observe the Knock Present, Knock Sensor Noise Channel display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

A change in the display will indicate the location of the fault.

If DTC P0325 cannot be duplicated, the information included in the Failure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently, performing the DTC P0325 Diagnostic Chart may isolate the cause of the fault.

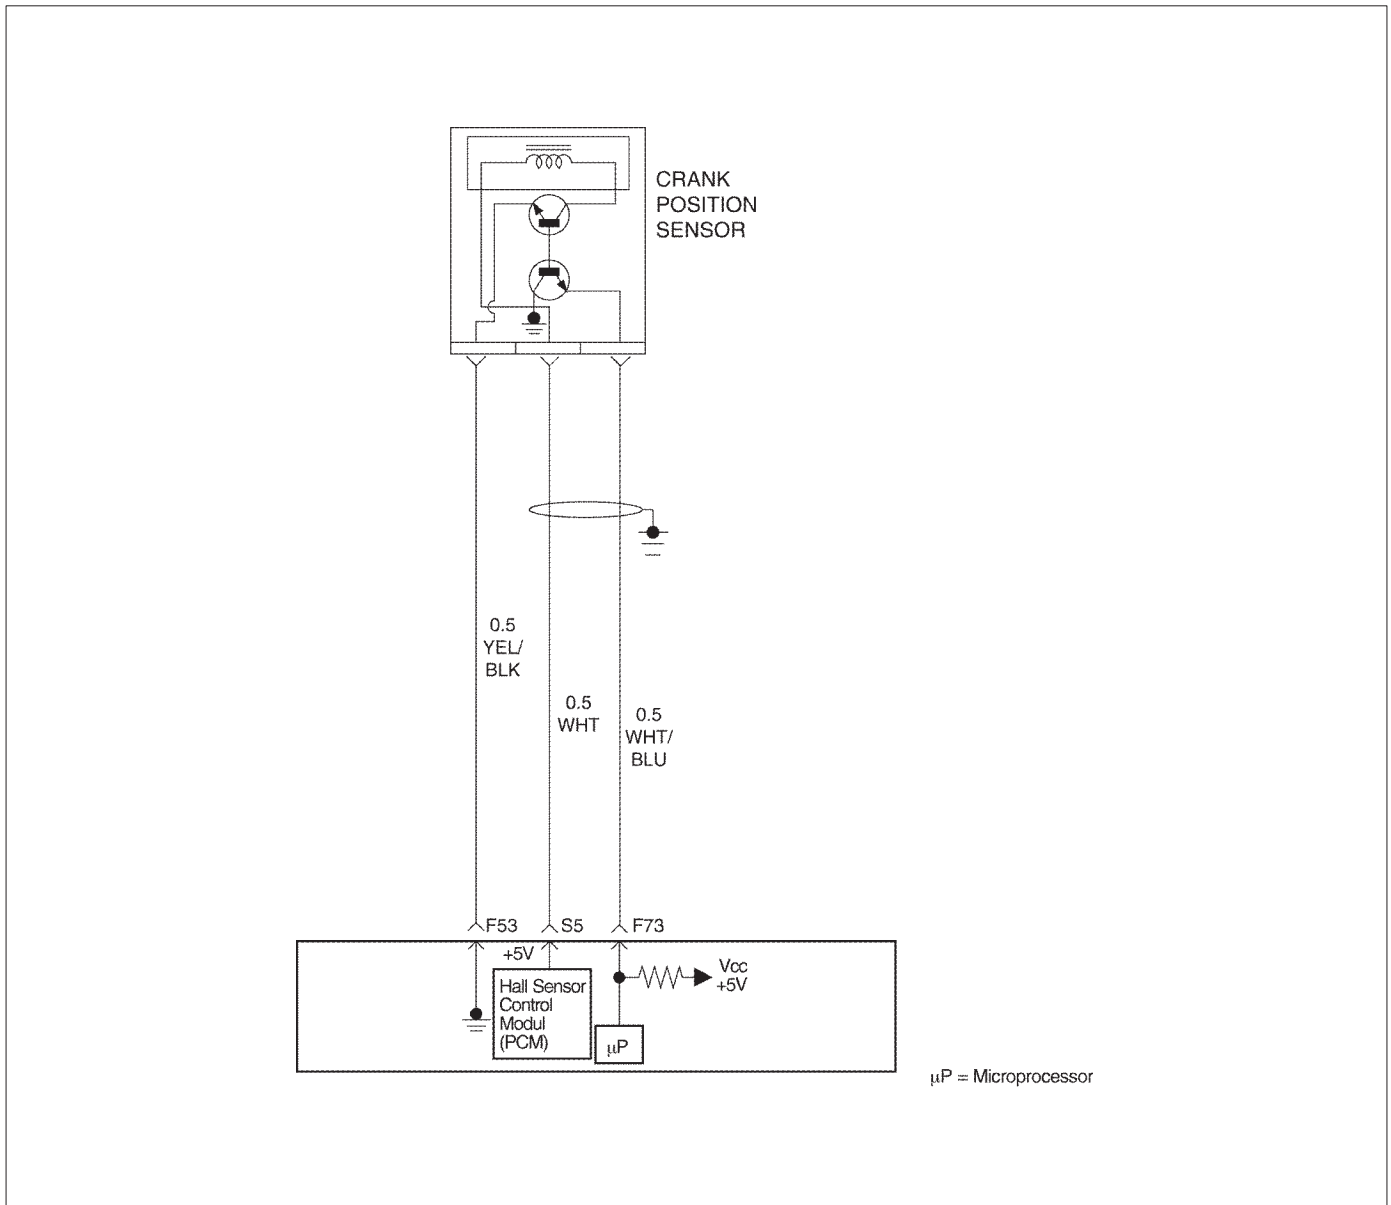

DTC P0325 - ION Sensing Module Knock Intensity Circuit Fault

Step	Action	Value(s)	Yes	No
1	Was the "On-Board (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "ON", engine "OFF". 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor "DTC" info for DTC P0325. Does the Tech 2 indicate DTC P0325 failed this ignition?	—	Go to Step 3	Refer to <i>Diagnostic Aids</i>
3	1. Ignition "OFF". 2. Disconnect the ION sensing module. 3. Disconnect the PCM. Is the action complete?	—	Go to Step 4	—
4	Check the ION sensing harness between the PCM (F68) and ION sensing module circuit (RED Wire) at the KI line harness connector. Was a problem found?	—	Verify repair	Go to Step 5
5	1. Disconnect the ignition coil. Is the action complete?	—	Go to Step 6	—
6	Check the ION sensing harness between the ignition coil and ION sensing module circuit at the DC motor harness connector. Was a problem found?	—	Verify repair	Go to Step 7
7	Check the following items; 1. Ignition coil and ignition coil circuit. 2. Ignition coil ground circuit for a poor connection. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to Step 8
8	Replace the Ignition coil. Is the action complete?	—	Verify repair	Go to Step 9
9	Check the following items; 1. ION sensing module ground circuit for a poor connection. 2. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Go to Step 10	Go to Step 11

DTC P0325 - ION Sensing Module Knock Intensity Circuit Fault (Cont'd)

Step	Action	Value(s)	Yes	No
10	Replace the ION Sensing module. Is the action complete?	—	Verify repair	Go to <i>Step 10</i>
11	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>ON-Vehicle Service in Power Control Module and Sensors for procedures</i> . And also refer to latest Service Bulletin. Check to see if the latest software is released or not .And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0336 58X Reference Signal Circuit

060R100101

Circuit Description

The 58X reference signal is produced by the crankshaft position (CKP) sensor. During one crankshaft revolution, 58 crankshaft pulses will be produced. The powertrain control module (PCM) uses the 58X reference signal to calculate engine RPM and crankshaft position. The PCM constantly monitors the number of pulses on the 58X reference circuit. If the PCM receives an incorrect number of pulses on the 58X reference circuit, DTC P0336 will set.

Conditions for Setting the DTC

- Engine is running.
- Extra or missing pulse is detected between consecutive 58X reference pulses.
- Above condition is detected in 10 of 100 crankshaft rotations.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0336 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0336 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

An intermittent may be caused by a poor connection, rubbed-through wire insulation or a wire broken inside the insulation. Check for:

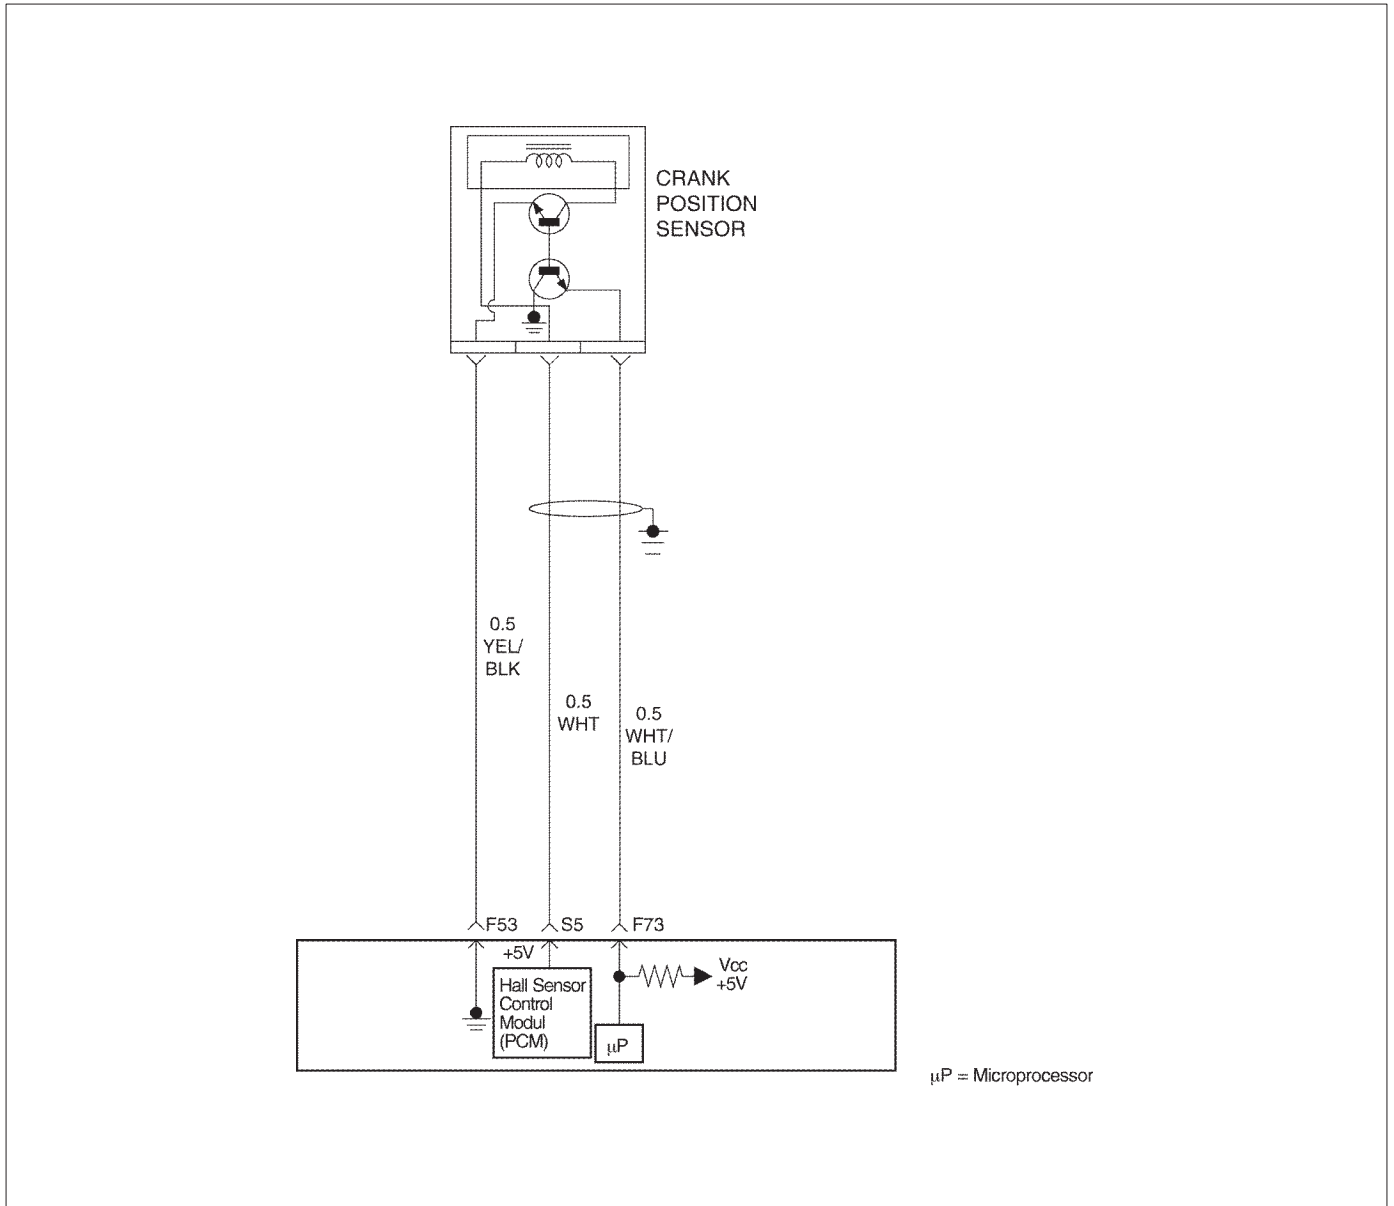

- Poor connection - Inspect the PCM harness and connectors for improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, disconnect the PCM, turn the ignition on and observe a voltmeter connected to the 58X reference circuit at the PCM harness connector while moving connectors and wiring harnesses related to the PCM. A change in voltage will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P0336 – 58X Reference Signal Circuit

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Attempt to start the engine. Does the engine start?	—	Go to Step 3	Go to " <i>Engine Cranks But Will Not Run</i> " chart
3	1. Review and record Failure Records information. 2. Clear DTC P0336. 3. Start the engine and idle for 1 minute. 4. Observe DTCs. Is DTC P0336 set?	—	Go to Step 4	Refer to Diagnostic Aids
4	1. Disconnect the PCM and CKP sensor. 2. Check for an open or a short to ground in the 58X reference circuit between the CKP sensor connector and the PCM harness connector. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 5
5	1. Reconnect the PCM and CKP sensor. 2. Connect a DVM to measure voltage on the 58X reference circuit at the PCM connector. 3. Observe the voltage while cranking the engine. Is the voltage near the specified value?	2.5 V	Go to Step 8	Go to Step 6
6	Check the connections at the CKP sensor and replace the terminals if necessary. Did any terminals require replacement?	—	Verify repair	Go to Step 7
7	Replace the CKP sensor. Use caution to avoid any hot oil that may drip out. Is the action complete?	—	Verify repair	—
8	Check connections at the PCM and replace the terminals if necessary. Did any terminals require replacement?	—	Verify repair	Go to Step 9
9	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0337 CKP Sensor Circuit Low Frequency

Circuit Description

The 58X reference signal is produced by the crankshaft position (CKP) sensor. During one crankshaft revolution, 58 crankshaft reference pulses will be produced. The powertrain control module (PCM) uses the 58X reference signal to calculate engine RPM and crankshaft position. The PCM constantly monitors the number of pulses on the 58X reference circuit. If the PCM does not receive pulses on the 58X reference circuit, DTC P0337 will set.

Conditions for Setting the DTC

- Engine cranking.
- Crankshaft position (CKP) sensor signal is not present between two cam pulses.
- CKP reference pulse is not detected within 8 CMP pulses.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0337 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0337 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

An intermittent may be caused by a poor connection, rubbed-through wire insulation or a wire broken inside the insulation. Check for:

- Poor connection – Inspect the PCM harness and connectors for improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, disconnect

the PCM, turn the ignition on and observe a voltmeter connected to the 58X reference circuit at the PCM harness connector while moving connectors and wiring harnesses related to the PCM. A change in voltage will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P0337 – CKP Sensor Circuit Low Frequency

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Attempt to start the engine. Does the engine start?	—	Go to Step 3	Go to <i>Chart 3</i>
3	1. Review and record Failure Records information. 2. Clear DTC P0337. 3. Start the engine and idle for 1 minute. 4. Observe DTCs. Is DTC P0337 set?	—	Go to Step 4	Refer to <i>Diagnostic Aid</i>
4	1. Disconnect the CKP sensor. 2. Ignition “ON”. 3. Using a DVM, verify that 5 V reference and ground are being supplied at the sensor connector (PCM side). Are 4-6 volts and ground available at the sensor?	—	Go to Step 7	Go to Step 5
5	1. Ignition “ON”. 2. With a DVM, backprobe the PCM connector 5 V reference and ground connections. Are 5 V reference and ground available at the PCM?	—	Go to Step 6	Go to Step 11
6	Check 5 V reference or ground between the CKP sensor and PCM and repair the open circuit, short to ground or short to voltage. Is the action complete?	—	Verify repair	—
7	1. Ignition “OFF”. 2. Disconnect the PCM and CKP sensor. 3. Check for an open or a short to ground in the 58X reference circuit between the CKP sensor connector and the PCM harness connector. 4. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 8
8	1. Reconnect the PCM and CKP sensor. 2. Connect a DVM to measure voltage on the 58X reference circuit at the PCM connector. 3. Observe the voltage while cranking the engine. Is the voltage near the specified value?	2.5 V	Go to Step 11	Go to Step 9
9	Check the connections at the CKP sensor and replace the terminals if necessary. Did any terminals require replacement?	—	Verify repair	Go to Step 10

DTC P0337 – CKP Sensor Circuit Low Frequency (Cont'd)

Step	Action	Value(s)	Yes	No
10	Replace the CKP sensor. Use caution and avoid hot oil that may drip out. Is the action complete?	—	Verify repair	—
11	Check the connections at the PCM and replace the terminals if necessary. Did any terminals require replacement?	—	Verify repair	Go to <i>Step 12</i>
12	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect the harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connections.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the

Tech 2 display related to DTC P0351 while moving the connector and wiring related to the ignition system. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

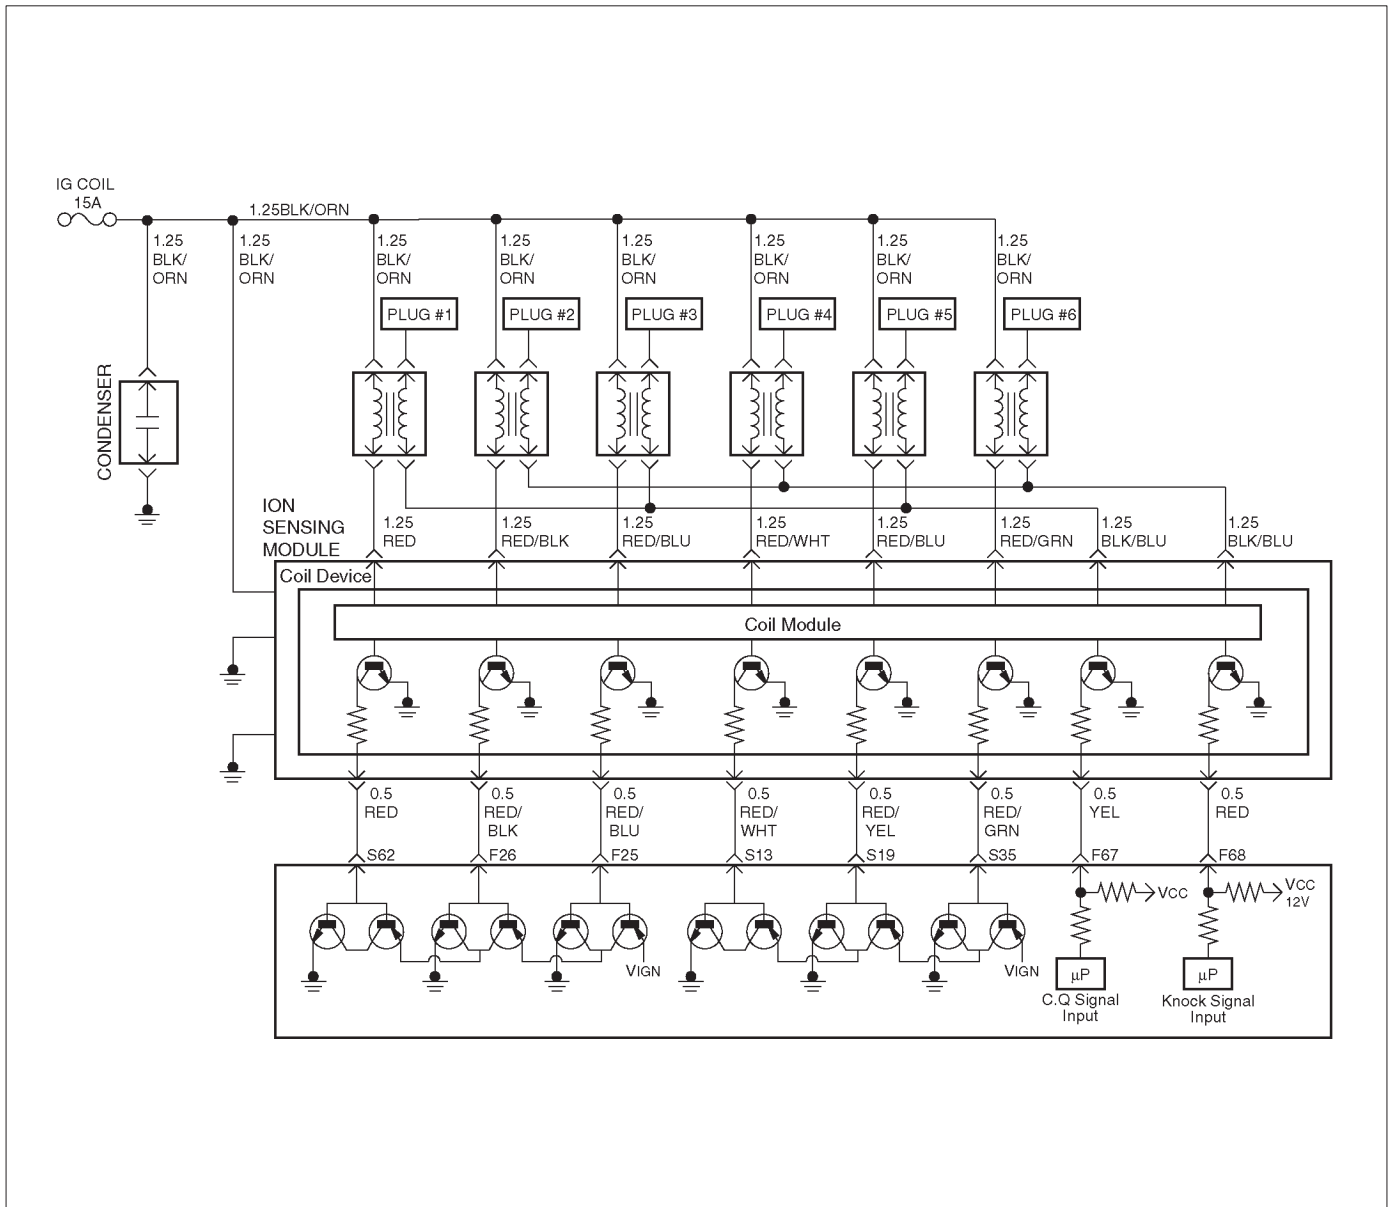

DTC P0351 – Ignition 1 Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "ON", engine "OFF". 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Record conditions as noted. 4. Use a Tech 2 to monitor the "DTC" information for DTC P0351 until the DTC P0351 test runs. 5. Note the test result. Does the Tech 2 indicate DTC P0351 failed this ignition cycle?	—	Go to Step 3	Go to <i>Diagnostic Aids</i>
3	Check for faulty connection at ignition coil. Was a problem found?	—	Verify repair	Go to Step 4
4	Check for faulty connection at PCM connector. Was a problem found?	—	Verify repair	Go to Step 5
5	1. Ignition "ON", engine "OFF". 2. Back probe the ignition control circuit 1 at the ION Sensing Module with a DVM. Is the voltage near the specified value?	25-55 mV	Go to Step 6	Go to Step 9
6	1. Ignition "ON", engine running. 2. Back probe the ignition control circuit at the ION Sensing Module for the cylinder being tested. Is the voltage in the specified range, rapidly toggling back and forth to a reading 20-50 mV higher?	100-180 mV	Go to Step 7	Go to Step 13
7	1. Ignition "OFF". 2. Disconnect the 3-pin and connector at the ignition coil. 3. Check ignition control circuit 1 voltage at the ignition coil connector while cranking the engine. Does the voltage measure between the specified values?	200-1200 mV	Go to Step 8	Go to Step 11
8	Replace the ignition coil. Is the action complete?	—	Verify repair	—
9	1. Ignition "OFF". 2. Disconnect the PCM and the ignition coil. 3. Check ignition control circuit 1 for short to ground. Was a problem found?	—	Verify repair	Go to Step 10
10	Check ignition control circuit 1 for short to voltage. Was a problem found?	—	Verify repair	Go to Step 13

DTC P0351 – Ignition 1 Control Circuit (Cont'd)

Step	Action	Value(s)	Yes	No
11	Check for an open ignition control circuit 1. Was the ignition control circuit open?	—	Go to <i>Step 12</i>	Go to <i>Step 13</i>
12	Repair the open ignition control circuit. Is the action complete?	—	Verify repair	—
13	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service</i> in <i>Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0352 Ignition 2 Control Circuit

Circuit Description

ION Sensing Module has the function to energize and de-energize the primary ignition coil in response to signals from the PCM. The PCM controls ignition timing and dwell time.

This diagnosis detects open circuit or short-circuiting in the Ignition Electronic Spark Timing (EST) line by monitoring EST signals. A failure determination is made when the signal voltage remains higher or lower than the threshold for corresponding fault code beyond a predetermined time period.

When the PCM detects a problem on EST control circuit 2, it will set a DTC P0352.

Conditions for Setting the DTC

- The ignition is "ON".
- The engine is running, determined by the 58 X crankshaft position input signal.
- The output voltage is not equal to 5 volts when output is "ON".

- The output voltage is not equal to 0 volts when output is "OFF".
- 20 test failures occur within 40 samples of continuous spark events.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle in which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0352 will clear after 40 consecutive warm-up cycles occur without a fault.
- DTC P0352 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect the harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connections.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the

Tech 2 display related to DTC P0352 while moving the connector and wiring related to the ignition system. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

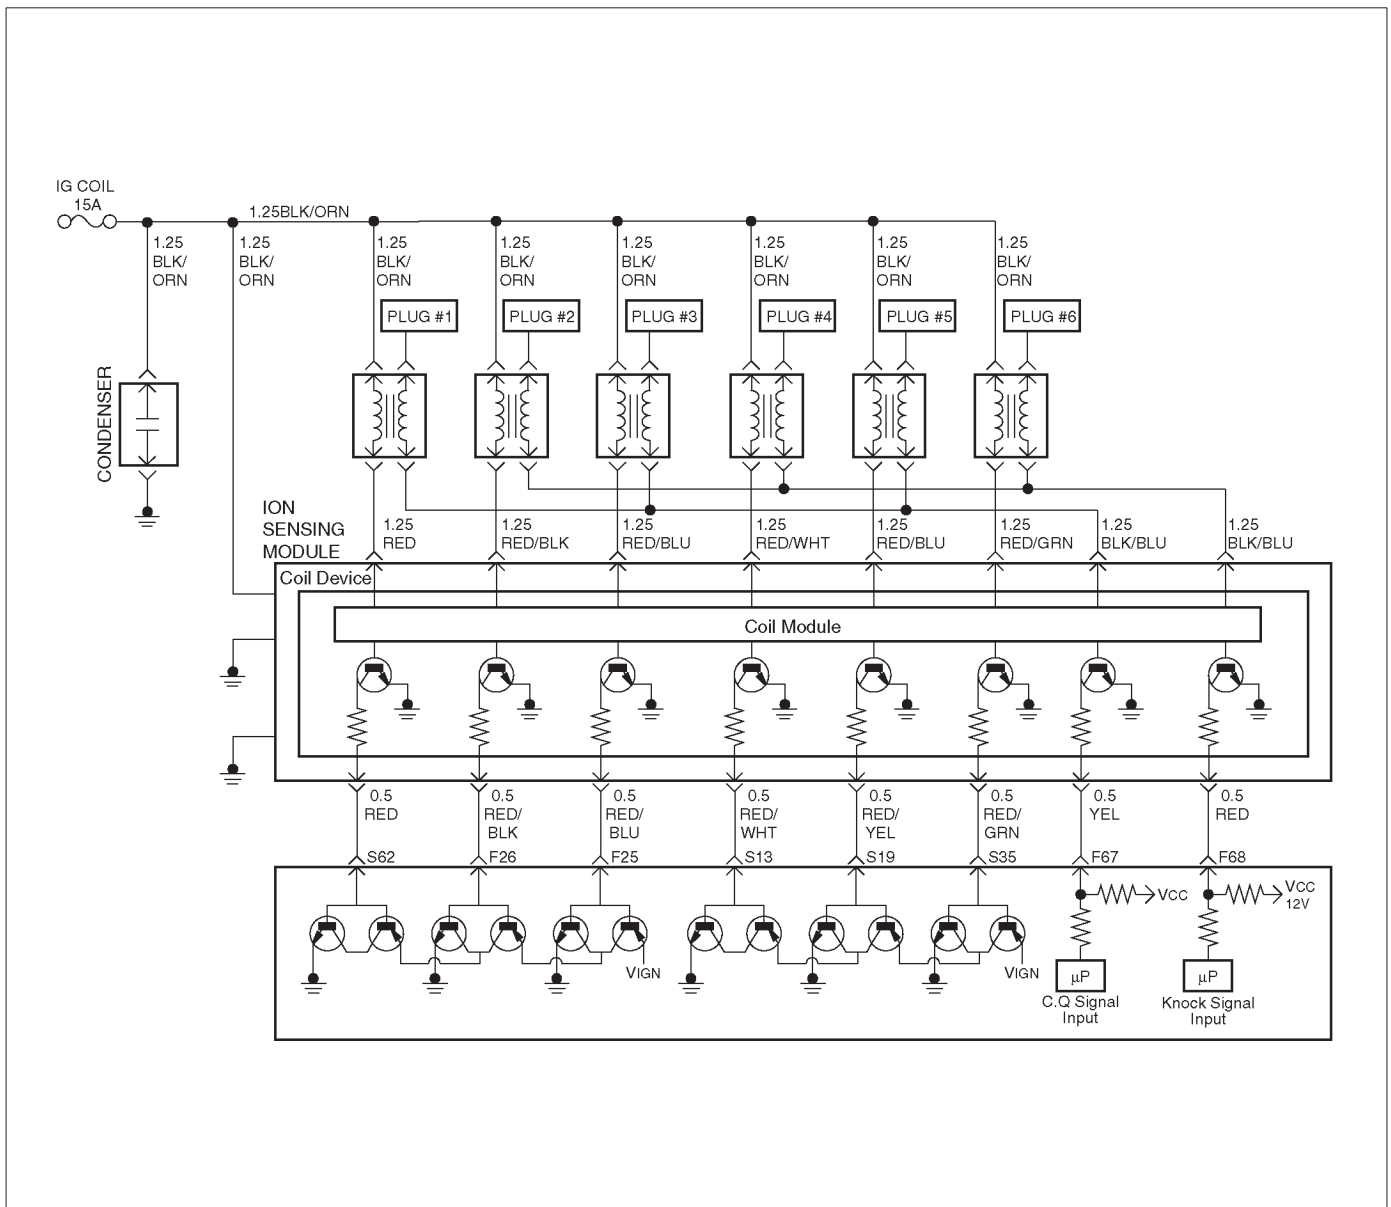

DTC P0352 – Ignition 2 Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "ON", engine "OFF". 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Record conditions as noted. 4. Use a Tech 2 to monitor the "DTC" information for DTC P0352 until the DTC P0352 test runs. 5. Note the test result. Does the Tech 2 indicate DTC P0352 failed this ignition cycle?	—	Go to Step 3	Go to <i>Diagnostic Aids</i>
3	Check for faulty connection at ignition coil. Was a problem found?	—	Verify repair	Go to Step 4
4	Check for faulty connection at PCM connector. Was a problem found?	—	Verify repair	Go to Step 5
5	1. Ignition "ON", engine "OFF". 2. Back probe the ignition control circuit 2 at the ION Sensing Module with a DVM . Is the voltage near the specified value?	25-55 mV	Go to Step 6	Go to Step 9
6	1. Ignition "ON", engine running. 2. Back probe the ignition control circuit at the ION Sensing Module for the cylinder being tested. Is the voltage in the specified range, rapidly toggling back and forth to a reading 20-50 mV higher?	100-180 mV	Go to Step 7	Go to Step 13
7	1. Ignition "OFF". 2. Disconnect the 3-pin connector at the ignition coil. 3. Check ignition control circuit 2 voltage at the ignition coil connector while cranking the engine connector. Does the voltage measure between the specified values?	200-1200 mV	Go to Step 8	Go to Step 11
8	Replace the ignition coil. Is the action complete?	—	Verify repair	—
9	1. Ignition "OFF". 2. Disconnect the PCM and the ignition coil. 3. Check ignition control circuit 2 for short to ground. Was a problem found?	—	Verify repair	Go to Step 10
10	Check ignition control circuit 2 for short to voltage. Was a problem found?	—	Verify repair	Go to Step 13

DTC P0352 – Ignition 2 Control Circuit (Cont'd)

Step	Action	Value(s)	Yes	No
11	Check for an open ignition control circuit 2. Was the ignition control circuit open?	—	Go to <i>Step 12</i>	Go to <i>Step 13</i>
12	Repair the open ignition control circuit. Is the action complete?	—	Verify repair	—
13	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service</i> in <i>Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0353 Ignition 3 Control Circuit

Circuit Description

ION Sensing Module has the function to energize and de-energize the primary ignition coil in response to signals from the PCM. The PCM controls ignition timing and dwell time.

This diagnosis detects open circuit or short-circuiting in the Ignition Electronic Spark Timing (EST) line by monitoring EST signals. A failure determination is made when the signal voltage remains higher or lower than the threshold for corresponding fault code beyond a predetermined time period.

When the PCM detects a problem on EST control circuit 3, it will set a DTC P0353.

Conditions for Setting the DTC

- The ignition is "ON".
- The engine is running, determined by the 58X crankshaft position input signal.
- The output voltage is not equal to 5 volts when output is "ON".

- The output voltage is not equal to 0 volts when output is "OFF".
- 20 test failures occur within 40 samples of continuous spark events.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle in which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0353 will clear after 40 consecutive warm-up cycles occur without a fault.
- DTC P0353 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect the harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connections.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the

Tech 2 display related to DTC P0353 while moving the connector and wiring related to the ignition system. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P0353 – Ignition 3 Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "ON", engine "OFF". 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Record conditions as noted. 4. Use a Tech 2 to monitor the "DTC" information for DTC P0353 until the DTC P0353 test runs. 5. Note the test result. Does the Tech 2 indicate DTC P0353 failed this ignition cycle?	—	Go to Step 3	Go to <i>Diagnostic Aids</i>
3	Check for faulty connection at ignition coil. Was a problem found?	—	Verify repair	Go to Step 4
4	Check for faulty connection at PCM connector. Was a problem found?	—	Verify repair	Go to Step 5
5	1. Ignition "ON", engine "OFF". 2. Back probe the ignition control circuit 3 at the ION Sensing Module with a DVM positive lead with the negative lead to ground. Is the voltage near the specified value?	25-55 mV	Go to Step 6	Go to Step 9
6	1. Ignition "ON", engine running. 2. Back probe the ignition control circuit at the ION Sensing Module for the cylinder being tested. Is the voltage in the specified range, rapidly toggling back and forth to a reading 20-50 mV higher?	100-180 mV	Go to Step 7	Go to Step 13
7	1. Ignition "OFF". 2. Disconnect the 3-pin connector at the ignition coil. 3. Check ignition control circuit 3 voltage at the ignition coil connector while cranking the engine. Does the voltage measure between the specified values?	200-1200 mV	Go to Step 8	Go to Step 11
8	Replace the ignition coil. Is the action complete?	—	Verify repair	—
9	1. Ignition "OFF". 2. Disconnect the PCM and the ignition coil. 3. Check ignition control circuit 3 for short to ground. Was a problem found?	—	Verify repair	Go to Step 10
10	Check ignition control circuit 3 for short to voltage. Was a problem found?	—	Verify repair	Go to Step 13

DTC P0353 – Ignition 3 Control Circuit (Cont'd)

Step	Action	Value(s)	Yes	No
11	Check for an open ignition control circuit 3. Was the ignition control circuit open?	—	Go to <i>Step 12</i>	Go to <i>Step 13</i>
12	Repair the open ignition control circuit. Is the action complete?	—	Verify repair	—
13	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service</i> in <i>Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect the harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connections.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the

Tech 2 display related to DTC P0354 while moving the connector and wiring related to the ignition system. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P0354 – Ignition 4 Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "ON", engine "OFF". 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Record conditions as noted. 4. Use a Tech 2 to monitor the "DTC" information for DTC P0354 until the DTC P0354 test runs. 5. Note the test result. Does the Tech 2 indicate DTC P0354 failed this ignition cycle?	—	Go to Step 3	Go to <i>Diagnostic Aids</i>
3	Check for faulty connection at ignition coil. Was a problem found?	—	Verify repair	Go to Step 4
4	Check for faulty connection at PCM connector. Was a problem found?	—	Verify repair	Go to Step 5
5	1. Ignition "ON", engine "OFF". 2. Back probe the ignition control circuit 4 at the ION Sensing with a DVM positive lead with the negative lead to ground. Is the voltage near the specified value?	25-55 mV	Go to Step 6	Go to Step 9
6	1. Ignition "ON", engine running. 2. Back probe the ignition control circuit at the ION Sensing Module for the cylinder being tested. Is the voltage in the specified range, rapidly toggling back and forth to a reading 20-50 mV higher?	100-180 mV	Go to Step 7	Go to Step 13
7	1. Ignition "OFF". 2. Disconnect the 3-pin connector at the ignition coil. 3. Check ignition control circuit 4 voltage at the ignition coil connector while cranking the engine. Does the voltage measure between the specified values?	200-1200 mV	Go to Step 8	Go to Step 11
8	Replace the ignition coil. Is the action complete?	—	Verify repair	—
9	1. Ignition "OFF". 2. Disconnect the PCM and the ignition coil. 3. Check ignition control circuit 4 for short to ground. Was a problem found?	—	Verify repair	Go to Step 10
10	Check ignition control circuit 4 for short to voltage. Was a problem found?	—	Verify repair	Go to Step 13

DTC P0354 – Ignition 4 Control Circuit (Cont'd)

Step	Action	Value(s)	Yes	No
11	Check for an open ignition control circuit 4. Was the ignition control circuit open?	—	Go to <i>Step 12</i>	Go to <i>Step 13</i>
12	Repair the open in ignition control circuit. Is the action complete?	—	Verify repair	—
13	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service</i> in <i>Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0355 Ignition 5 Control Circuit

Circuit Description

ION Sensing Module has the function to energize and de-energize the primary ignition coil in response to signals from the PCM. The PCM controls ignition timing and dwell time.

This diagnosis detects open circuit or short-circuiting in the Ignition Electronic Spark Timing (EST) line by monitoring EST signals. A failure determination is made when the signal voltage remains higher or lower than the threshold for corresponding fault code beyond a predetermined time period.

When the PCM detects a problem on EST in control circuit 5, it will set a DTC P0355.

Conditions for Setting the DTC

- The ignition is "ON".
- The engine is running, determined by the 58X crankshaft position input signal.
- The output voltage is not equal to 5 volts when output is "ON".

- The output voltage is not equal to 0 volts when output is "OFF".
- 20 test failures occur within 40 samples of continuous spark events.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle in which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0355 will clear after 40 consecutive warm-up cycles occur without a fault.
- DTC P0355 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect the harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connections.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the

Tech 2 display related to DTC P0355 while moving the connector and wiring related to the ignition system. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P0355 – Ignition 5 Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition “ON”, engine “OFF”. 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Record conditions as noted. 4. Use a Tech 2 to monitor the “DTC” information for DTC P0355 until the DTC P0355 test runs. 5. Note the test result. Does the Tech 2 indicate DTC P0355 failed this ignition cycle?	—	Go to Step 3	Go to <i>Diagnostic Aids</i>
3	Check for faulty connection at ignition coil. Was a problem found?	—	Verify repair	Go to Step 4
4	Check for faulty connection at PCM connector. Was a problem found?	—	Verify repair	Go to Step 5
5	1. Ignition “ON”, engine “OFF”. 2. Back probe the ignition control circuit 5 at the ION Sensing Module with a DVM positive lead with the negative lead to ground. Is the voltage near the specified value?	25-55 mV	Go to Step 6	Go to Step 9
6	1. Ignition “ON”, engine running. 2. Back probe the ignition control circuit at the ION Sensing Module for the cylinder being tested. Is the voltage in the specified range, rapidly toggling back and forth to a reading 20-50 mV higher?	100-180 mV	Go to Step 7	Go to Step 13
7	1. Ignition “OFF”. 2. Disconnect the 3-pin connector at the ignition coil. 3. Check ignition control circuit 5 voltage at the ignition coil connector while cranking the engine. Does the voltage measure between the specified values?	200-1200 mV	Go to Step 8	Go to Step 11
8	Replace the ignition coil. Is the action complete?	—	Verify repair	—
9	1. Ignition “OFF”. 2. Disconnect the PCM and the ignition coil. 3. Check ignition control circuit 5 for short to ground. Was a problem found?	—	Verify repair	Go to Step 10
10	Check ignition control circuit 5 for short to voltage. Was a problem found?	—	Verify repair	Go to Step 13

DTC P0355 – Ignition 5 Control Circuit (Cont'd)

Step	Action	Value(s)	Yes	No
11	Check for an open ignition control circuit 5. Was the ignition control circuit open?	—	Go to <i>Step 12</i>	Go to <i>Step 13</i>
12	Repair the open ignition control circuit. Is the action complete?	—	Verify repair	—
13	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service</i> in <i>Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0356 Ignition 6 Control Circuit

060R100135

Circuit Description

ION Sensing Module has the function to energize and de-energize the primary ignition coil in response to signals from the PCM. The PCM controls ignition timing and dwell time.

This diagnosis detects open circuit or short-circuiting in the Ignition Electronic Spark Timing (EST) line by monitoring EST signals. A failure determination is made when the signal voltage remains higher or lower than the threshold for corresponding fault code beyond a predetermined time period.

When the PCM detects a problem on EST control circuit 6, it will set a DTC P0356.

Conditions for Setting the DTC

- The ignition is "ON".
- The engine is running, determined by the 58X crankshaft position input signal.
- The output voltage is not equal to 5 volts when output is "ON".

- The output voltage is not equal to 0 volts when output is "OFF".
- 20 test failures occur within 40 samples of continuous circuit monitoring.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle in which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0356 will clear after 40 consecutive warm-up cycles occur without a fault.
- DTC P0356 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect the harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connections.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the

Tech 2 display related to DTC P0356 while moving the connector and wiring related to the ignition system. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P0356 – Ignition 6 Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "ON", engine "OFF". 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Record conditions as noted. 4. Use a Tech 2 to monitor the "DTC" information for DTC P0356 until the DTC P0356 test runs. 5. Note the test result. Does the Tech 2 indicate DTC P0356 failed this ignition cycle?	—	Go to Step 3	Go to <i>Diagnostic Aids</i>
3	Check for faulty connection at ignition coil. Was a problem found?	—	Verify repair	Go to Step 4
4	Check for faulty connection at PCM connector. Was a problem found?	—	Verify repair	Go to Step 5
5	1. Ignition "ON", engine "OFF". 2. Back probe the ignition control circuit 6 at the ION Sensing Module with a DVM positive lead with the negative lead to ground. Is the voltage near the specified value?	25-55 mV	Go to Step 6	Go to Step 9
6	1. Ignition "ON", engine running. 2. Back probe the ignition control circuit at the ION Sensing Module for the cylinder being tested. Is the voltage in the specified range, rapidly toggling back and forth to a reading 20-50 mV higher?	100-180 mV	Go to Step 7	Go to Step 13
7	1. Ignition "OFF". 2. Disconnect the 3-pin connector at the ignition coil. 3. Check ignition control circuit 6 voltage at the ignition coil connector while cranking the engine. Does the voltage measure between the specified values?	200-1200 mV	Go to Step 8	Go to Step 11
8	Replace the ignition coil. Is the action complete?	—	Verify repair	—
9	1. Ignition "OFF". 2. Disconnect the PCM and the ignition coil. 3. Check ignition control circuit 6 for short to ground. Was a problem found?	—	Verify repair	Go to Step 10
10	Check ignition control circuit 6 for short to voltage. Was a problem found?	—	Verify repair	Go to Step 13

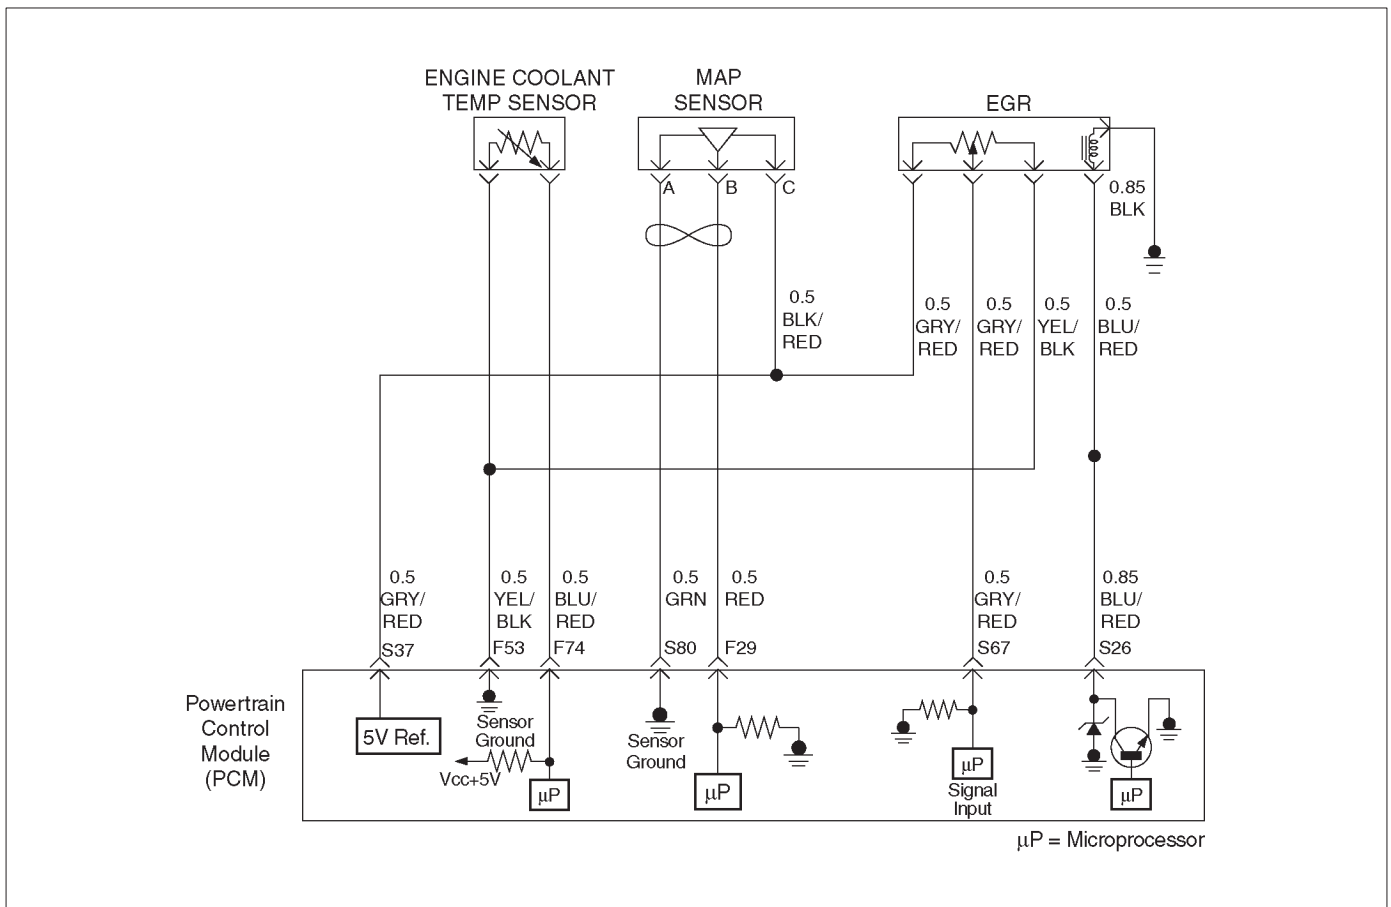

DTC P0356 – Ignition 6 Control Circuit (Cont'd)

Step	Action	Value(s)	Yes	No
11	Check for an open ignition control circuit 6. Was the ignition control circuit open?	—	Go to <i>Step 12</i>	Go to <i>Step 13</i>
12	Repair the open ignition control circuit. Is the action complete?	—	Verify repair	—
13	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service</i> in <i>Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

DTC P0402 – EGR Pintle Crank Open Error

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "ON", engine "OFF", review and record Tech 2 Failure Records data. 2. Operate the vehicle within Failure Records conditions as noted. 3. Using a Tech 2, monitor "DTC" info for DTC P0402 until the DTC P0402 test runs. Note the result. Does the Tech 2 indicates DTC P0402 failed this ignition?	—	Go to Step 3	Refer to <i>Diagnostic Aids</i>
3	1. Disconnect the EGR valve harness connector. 2. Inspect the EGR valve and connectors for damaged pin or terminals. Were there any damaged pins or terminals?	—	Go to Step 4	Go to Step 5
4	Repair the damaged pin or terminal. Is the action complete?	—	Verify repair	—
5	1. Remove EGR valve from Engine. 2. Inspect EGR valve whether there is any foreign material between seat and pintle. Was any foreign material in EGR valve?	—	Go to Step 6	Go to Step 7
6	1. Remove EGR valve foreign material from EGR valve and clean up inside. 2. Visually inspect for damage of pintle and seat, which leakage may occur. Was there any severe damage which affects function?	—	Go to Step 7	Verify repair Go to Step 8
7	1. Reconnect. 2. Ignition "OFF". 3. Install the Tech 2. 4. Run the engine at idle. 5. On Tech-II, select special function for EGR. 6. Use the "UP" arrow to increase the EGR from 0% to 40%. Did EGR work properly?	—	—	Go to Step 8
8	Replace the EGR valve. Does DTC P0402 still fail "DTC" test on the Tech 2?	—	Go to Step 9	Verify repair
9	Replace the EGR valve. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0404 EGR Open Stuck

060R100136

Circuit Description

The powertrain control module (PCM) monitors the EGR valve pintle position input to ensure that the valve responds properly to commands from the PCM, and to detect a fault if pintle position is different from commanded position. If the PCM detects a pintle position signal indicates more than 15 points different between current and commanded and more than 15 seconds, the PCM will set DTC P0404.

Conditions for Setting the DTC

- The engine is running.
- Ignition voltage is between 11 and 16 volts.
- Intake Air Temp is more than 3°C (37.4°F).
- Difference EGR pintle position between current and commanded position becomes more than 3% and last more than 15 seconds, and this condition meets greater than 0.4 seconds in a trip. Then it trigger, the PCM lights on.

Action Taken When the DTC Sets

- The PCM will ON the MIL after second trip with detected the fault.

- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0404 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0404 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Excessive carbon deposit on EGR valve shaft may cause EGR stuck open or unsmooth operation. Those carbon deposit may occur by unusual port operation. Clean up carbon may make smooth function of EGR valve.
- Poor connection or damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the EGR actual position display on the Tech 2 while moving connectors and wiring harnesses related to EGR valve. A change in the display will indicate the location of the fault.

DTC P0404 – EGR Open Stuck

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "ON", engine "OFF", review and record Tech 2 Failure Records Data. 2. Operate the vehicle within Failure Records conditions as noted. 3. Using a Tech 2, monitor "DTC" info for DTC P0404 until the DTC P0404 test runs. Note the result. Does the Tech 2 indicates DTC P0404 failed this ignition?	—	Go to Step 3	Refer to <i>Diagnostic Aids</i>
3	1. Disconnect the EGR valve harness connector. 2. Inspect the EGR valve and connectors for damaged pin or terminals. Were there any damaged pins or terminals?	—	Go to Step 4	Go to Step 5
4	Repair the damaged pin or terminal.	—	Verify repair	Is the action complete?
5	1. Remove EGR valve from Engine. 2. Inspect EGR valve whether there is any excessive carbon deposit on EGR shaft. Was excessive carbon deposit on EGR valve shaft?	—	Go to Step 6	Go to Step 7
6	1. Clean up EGR valve shaft and inside of EGR valve. 2. Visually inspect damage of pintle and seat if is bent, leakage may occur. Was there any severe damage which affects function?	—	Go to Step 8	Verify repair Go to Step 7
7	1. Reconnect. 2. Ignition "OFF". 3. Install the Tech 2. 4. Run the engine at idle. 5. On the Tech 2, select EGR Control Test. 6. Use the "UP" arrow to increase the EGR from 0% to 40%. Did EGR work properly?	—	—	Go to Step 8
8	Replace the EGR valve. Does DTC P0404 still fail "DTC" test on the Tech 2?	—	Go to Step 9	Verify repair
9	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0405 EGR Low Voltage

060R100136

Circuit Description

The powertrain control module (PCM) monitors the EGR valve pintle position input to ensure that the valve responds properly to command from the PCM. If current pintle position voltage indicates less than 0.1 V and last more than 10 seconds, then the PCM will set DTC P0405.

Conditions for Setting the DTC

- Ignition voltage is between 11 and 16 volts.
- Intake Air Temp is more than 3°C (37.4°F).
- EGR pintle position is less than 2% and last more than 10 sec. Action taken when the DTC sets.

Action Taken When the DTC Sets

- The PCM will ON the MIL after second trip with detected the fault.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0402 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0405 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection or damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the EGR actual position display on the Tech 2 while moving connectors and wiring harnesses related to EGR valve. A change in the display will indicate the location of the fault.

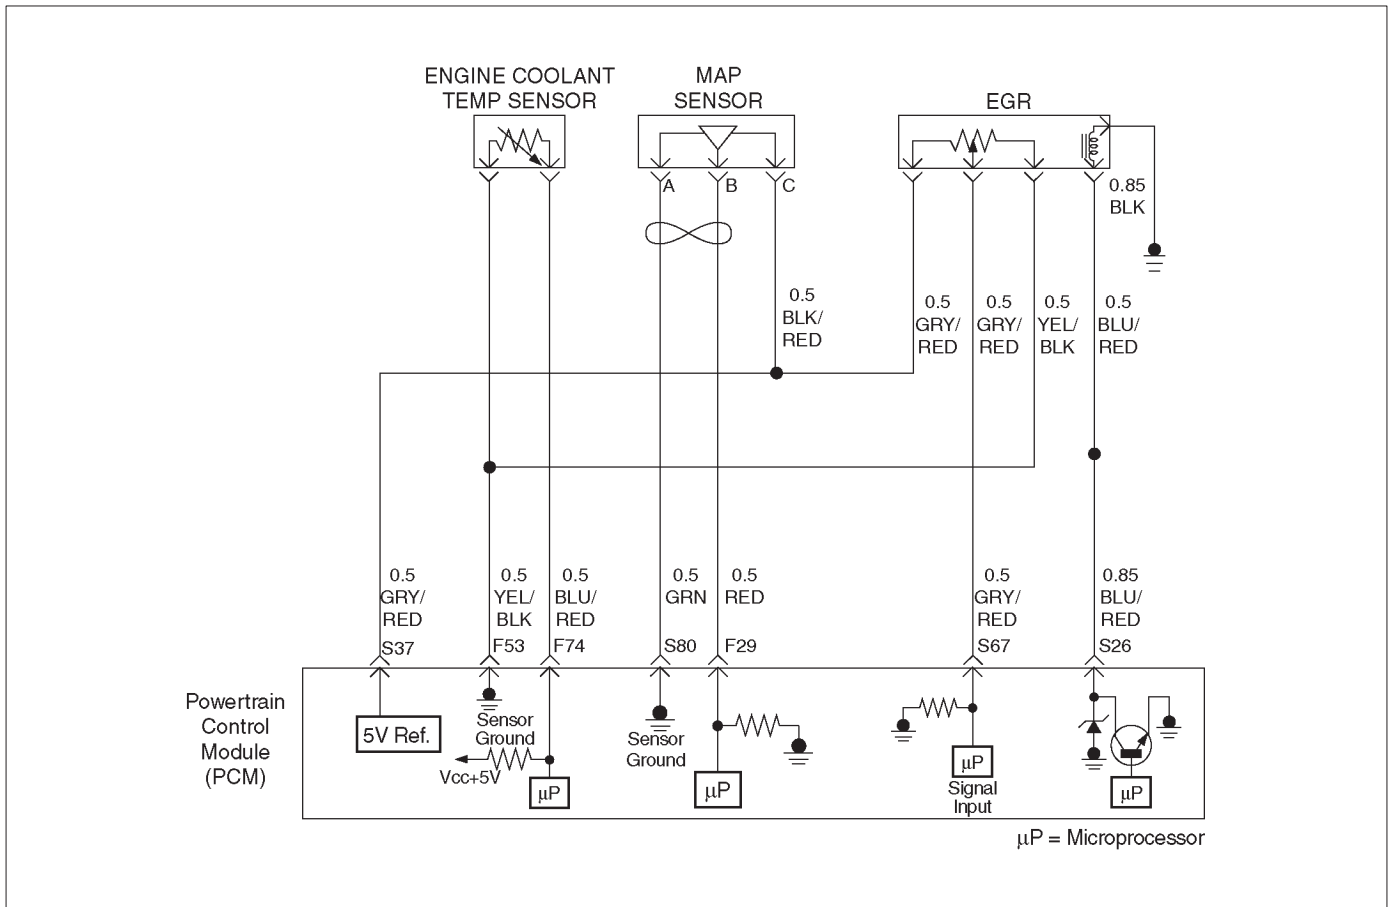

DTC P0405 – EGR Low Voltage

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "ON", engine "OFF", review and record Tech 2 Failure Records Data. 2. Operate the vehicle within Failure Records conditions as noted. 3. Using a Tech 2, monitor "DTC" info for DTC P0405 until the DTC P0405 test runs. Note the result. Does the Tech 2 indicates DTC P0405 failed this ignition?	—	Go to Step 3	Refer to <i>Diagnostic Aids</i>
3	1. Disconnect the EGR valve harness connector. 2. Inspect the EGR valve and connectors for damaged pin or terminals. Were there any damaged pins or terminals?	—	Go to Step 4	Go to Step 5
4	Repair the damaged pin or terminal. Is the action complete?	—	Verify repair	—
5	1. Disconnect the EGR harness connector. 2. Ignition "ON". 3. At the EGR valve, use a DVM to check the voltage at the 5 volt reference wire (BLU/RED) and ground. Did the DVM indicate the specified value?	4–6 V	Go to Step 6	Go to Step 7
6	1. Disconnect the EGR harness connector. 2. Measure resistance between terminal 5 volt reference wire and ground. Was resistance in range?	5–5.5 K Ω	Go to Step 10	Go to Step 17
7	1. Ignition "ON". 2. At the PCM connector, backprobe with a DVM at the 5 volt reference for the EGR valve. Did the DVM indicate the specified value?	4–6 V	Go to Step 8	Go to Step 18
8	Repair the open 5 volt reference circuit. Is the action complete?	—	Verify repair	—
9	Repair the damaged sensor ground wire. Is the action complete?	—	Verify repair	—
10	1. Disconnect the EGR harness 2. Use an ohmmeter to measure between the pintle position pin and the sensor ground pin on the EGR valve. NOTE: J-35616 Connector Test Adapter Kit may be useful for gaining access to the recessed pins on the valve. Was the ohmmeter reading approximately equal to the specified value?	1 to 1.25 K Ω	Go to Step 13	Go to Step 17
11	1. Ignition "ON". 2. Backprobe with a DVM to measure voltage at EGR valve pintle position pin and sensor ground pin. Was voltage in range?	Less than 0.1 V	Go to Step 17	Go to Step 12

DTC P0405 – EGR Low Voltage (Cont'd)

Step	Action	Value(s)	Yes	No
12	1. Ignition "ON". 2. Backprobe with a DVM to measure voltage at PCM sensor ground pin and pintle position pin. Was voltage in range?	Less than 0.1 V	Go to <i>Step 13</i>	Go to <i>Step 18</i>
13	1. Ignition "OFF". 2. Disconnect the EGR harness. 3. Check short circuit between EGR pintle position circuit and EGR ground circuit. Was any short circuit?	—	Go to <i>Step 14</i>	Go to <i>Step 18</i>
14	Locate and repair the short to ground in the pintle position circuit Is the action complete?	—	Verify repair	—
15	1. Ignition "OFF". 2. Disconnect the PCM. 3. Ignition "ON". 4. Measure the voltage between the EGR pintle position circuit and ground. Is the measured voltage near the specified value?	Less than 0.1 V	Go to <i>Step 17</i>	Go to <i>Step 16</i>
16	Check for a short circuit between other wires and the pintle position circuit Is there any short circuit?	—	Repair short circuit and then Verify repair	Go to <i>Step 17</i>
17	Replace the EGR valve. Does DTC P1404 still fail "DTC test on the Tech 2"?	—	Go to <i>Step 18</i>	Verify repair
18	Examine the PCM pin and terminal connection. Was there a damaged terminal?	—	Go to <i>Step 4</i>	Go to <i>Step 19</i>
19	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0406 EGR High Voltage

Circuit Description

The powertrain control module (PCM) monitors the EGR valve pintle position input to ensure that the valve responds properly to command from the PCM. If current pintle position voltage indicates more than 4.8 V and last more than 10 seconds, then the PCM will set DTC P0406.

Conditions for Setting the DTC

- Ignition voltage is between 11 and 16 volts.
- Intake Air temp is more than 3°C (37.4°F).
- EGR pintle position is more than 99% and last more than 10 sec.

Action Taken When the DTC Sets

- The PCM will ON the MIL after second trip with detected the fault.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0402 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0404 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection or damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the EGR actual position display on the Tech 2 while moving connectors and wiring harnesses related to EGR valve. A change in the display will indicate the location of the fault.

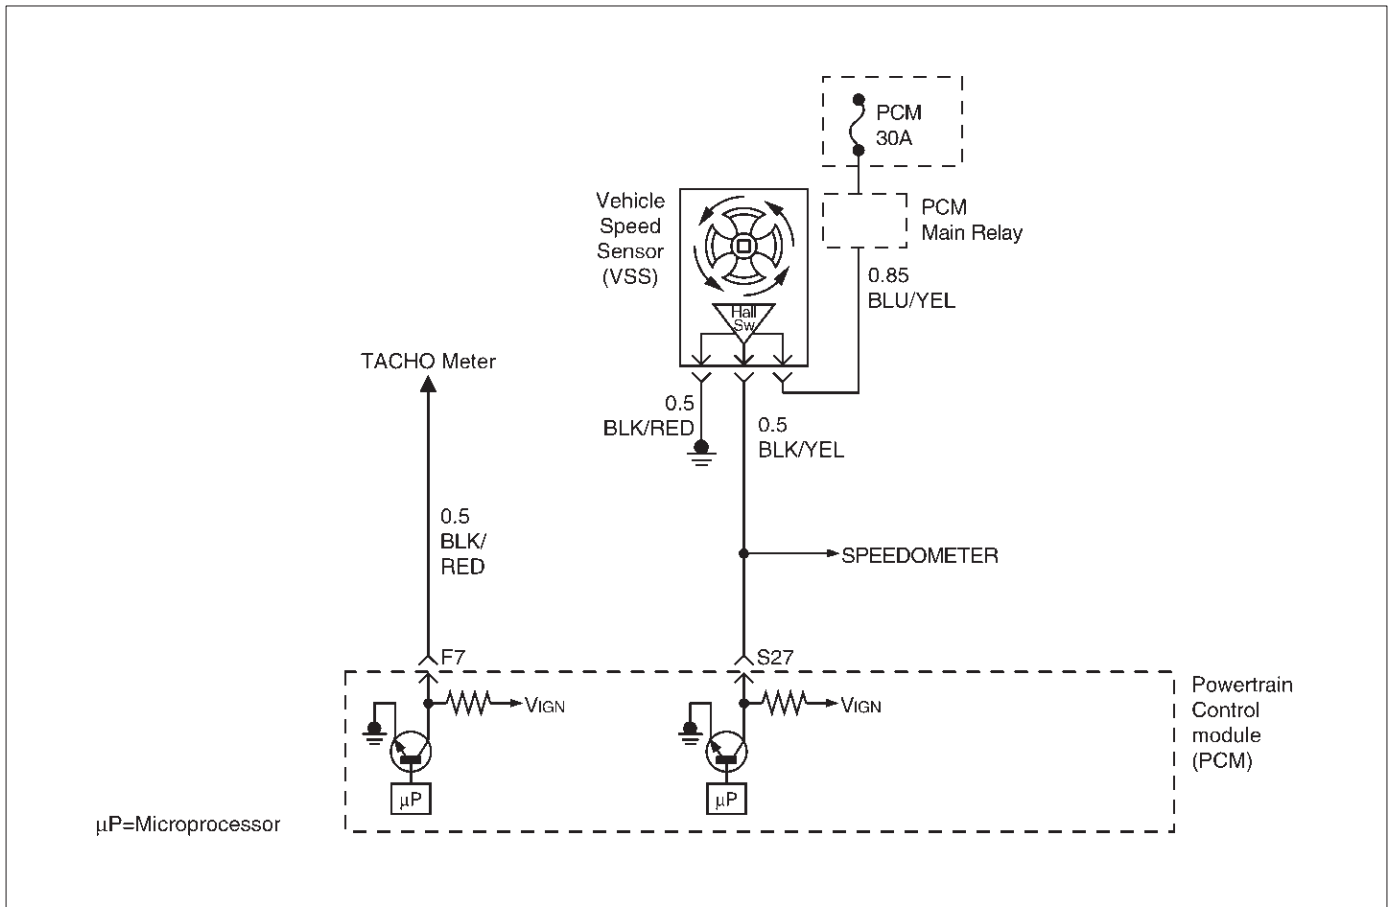

DTC P0406 – EGR High Voltage

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "ON", engine "OFF", review and record Tech 2 Failure Records Data. 2. Operate the vehicle within Failure Records conditions as noted. 3. Using a Tech 2, monitor "DTC" info for DTC P0406 until the DTC P0406 test runs. Note the result. Does the Tech 2 indicates DTC P0406 failed this ignition?	—	Go to Step 3	Refer to <i>Diagnostic Aids</i>
3	1. Disconnect the EGR valve harness connector. 2. Inspect the EGR valve and connectors for damaged pin or terminals. Were there any damaged pins or terminals?	—	Go to Step 4	Go to Step 5
4	Repair the damaged pin or terminal. Is the action complete?	—	Verify repair	Is the action complete?
5	1. Disconnect the EGR harness connector. 2. Ignition "ON". 3. At the EGR valve, use a DVM to check the voltage at the 5 volt reference wire (BLU/RED). Did the DVM indicate the specified value?	4–6 V	Go to Step 8	Go to Step 6
6	1. Ignition "ON". 2. At the PCM connector, backprobe with a DVM at the 5 volt reference for the EGR valve. Did the DVM indicate the specified value?	4–6 V	Go to Step 7	Go to Step 16
7	Repair the open 5 volt reference circuit Is the action complete?	—	Verify repair	—
8	1. Ignition "OFF" 2. Disconnect the EGR harness. 3. Use a DVM to check for an resistance between 5 V reference and Sensor Ground at EGR sensor terminals. NOTE: J-35616 Connector Test Adapter Kit may be useful for gaining access to the recessed pins on the valve. Was the measured resistance in range?	5 to 5 K Ω	Go to Step 9	Go to Step 15
9	1. Ignition "OFF". 2. Disconnect the EGR harness. 3. Use a DVM to check for an resistance between Sensor Ground and Signal Wire at EGR sensor terminal. Is there an open circuit?	—	Go to Step 15	Go to Step 10
10	1. Ignition "OFF". 2. Disconnect the EGR harness at PCM connector. 3. Use a DVM to check for shorted wire between S37 and F53. Is there a shorted wire?	—	Go to Step 14	Go to Step 11

DTC P0406 – EGR High Voltage (Cont'd)

Step	Action	Value(s)	Yes	No
11	1. Ignition "ON". 2. Use a DVM to backprobe at terminal Connector of EGR valve for voltage. Was measured voltage more than 4.8 V?	more than 4.8 V	Go to <i>Step 12</i>	Go to <i>Step 12</i>
12	1. Ignition "ON". 2. Stay the EGR harness connected. 3. Check voltage by backprobing at PCM S37 terminal. Was voltage more than 4.8 V?	4.8 V	Go to <i>Step 16</i>	Go to <i>Step 13</i>
13	1. Locate short circuit at EGR harness between BLU/RED to GRY/RED or GRY/RED to YEL, BLU/RED. 2. Replace EGR harness. Is the action complete?	—	Verify repair	—
14	Replace EGR harness. Is the action complete?	—	Verify repair	—
15	Replace the EGR valve. Does DTC P1404 still fail "DTC test on the Tech 2"?	—	Go to <i>Step 16</i>	Verify repair
16	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0502 VSS Circuit Low Input

Circuit Description

The vehicle speed sensor has a magnet rotated by the transmission output shaft. Attached to the sensor is a hall effect circuit that interacts with the magnetic field created by the rotating magnet. A 12-volt operating supply for the speed sensor hall circuit is supplied from the meter fuse. The VSS pulses to ground the 9-volt signal sent from the powertrain control module (PCM) on the reference circuit. The PCM interprets vehicle speed by the number of pulses to ground per second on the reference circuit.

Conditions for Setting the DTC

- Engine is running.
- Engine speed is between 1800 RPM and 2500 RPM.
- Throttle angle is between 10% and 40%.
- Engine load is greater than 50 kPa.
- PCM detects no VSS signal for 12.5 seconds over a period of 15 seconds.

Action Taken When the DTC Sets

- The PCM will ON the MIL after second trip with detected the fault.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0502 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0502 can be cleared by using the Tech 2 "Clear Info" function.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

- To avoid backprobing the VSS and possibly damaging a seal or terminal, the VSS output can be tested at the point where the transmission harness connects to the engine harness. Power and ground are applied by jumpers to the VSS through the connectors which are located to the rear of the air cleaner assembly. The VSS signal is monitored with a DVM as the rear driveshaft turns. The wheels can be turned to rotate the driveshaft, or in 2-wheels-drive vehicles the driveshaft can be turned directly.

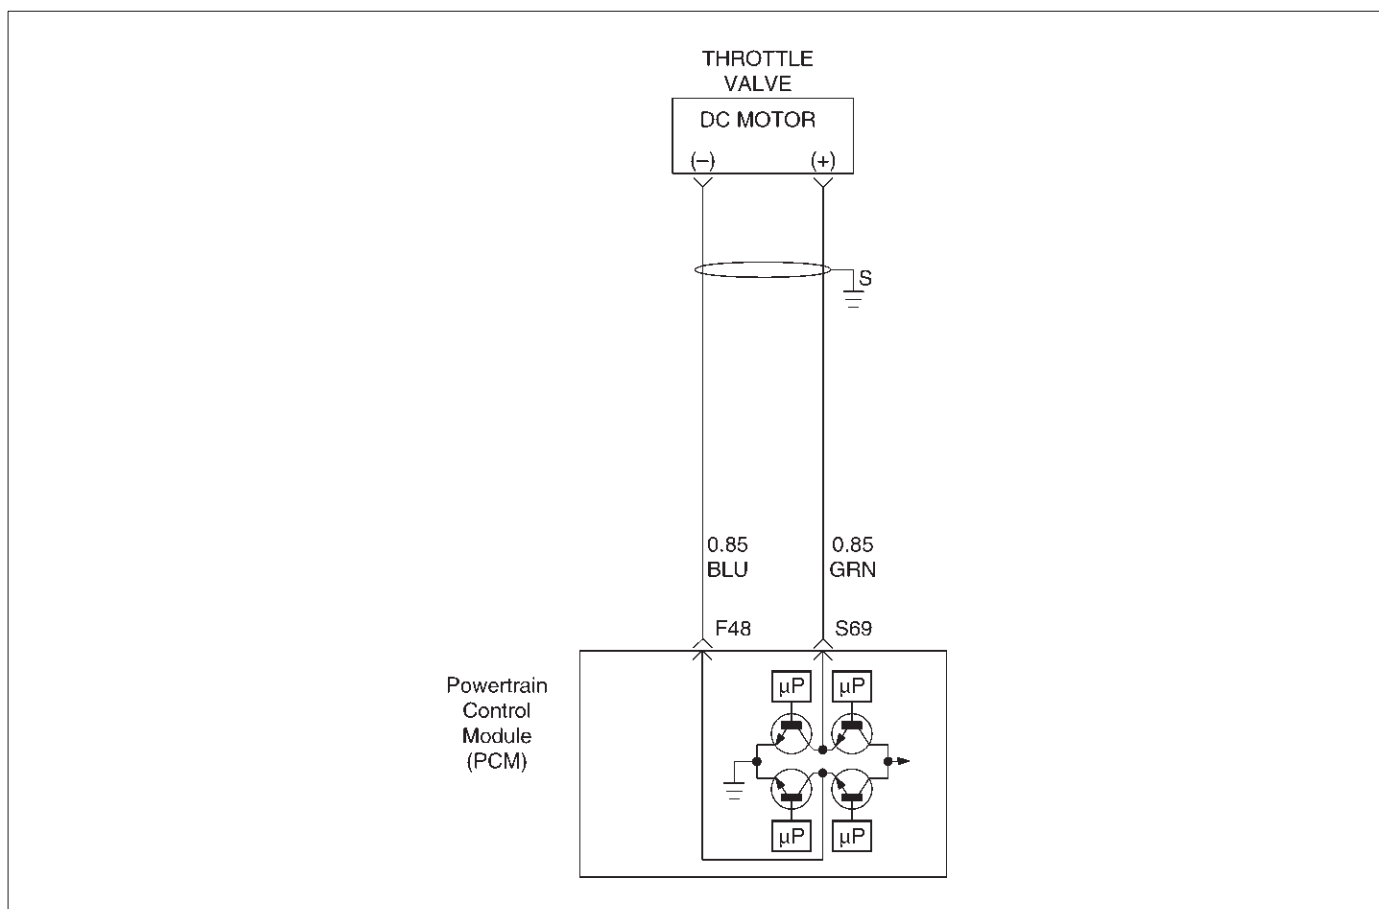

DTC P0502 – VSS Circuit Low Input

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	Does the speedometer work?	—	Go to <i>Step 10</i>	Go to <i>Step 3</i>
3	1. Disconnect the VSS connector. 2. Ignition "ON". 3. Using a test light to battery +, probe the connector ground wire. Did the light illuminate?	—	Go to <i>Step 5</i>	Go to <i>Step 4</i>
4	Repair the sensor ground. Is the action complete?	—	Verify repair	—
5	1. Ignition "ON", sensor disconnected. 2. Using a DVM, measure at the VSS connector between ground and voltage supply. Was the measurement near the specified value?	Battery voltage	Go to <i>Step 7</i>	Go to <i>Step 6</i>
6	Repair the open or short to ground which may have blown the meter fuse. Is the action complete?	—	Verify repair	—
7	1. Ignition "ON", VSS disconnected. 2. Using a DVM, measure at the VSS connector between ground and the wire from the speedometer. Was the measurement near the specified value?	7.5-8 V	Go to <i>Step 9</i>	Go to <i>Step 8</i>
8	Check for an open or short circuit between the speedometer and the VSS. Was an open or short circuit located?	—	Verify repair	Go to <i>Step 9</i>
9	Replace the speedometer. Is the action complete?	—	Verify repair	—

DTC P0502 – VSS Circuit Low Input (Cont'd)

Step	Action	Value(s)	Yes	No
10	<p>1. Ignition "OFF".</p> <p>2. Disconnect the MAF sensor. The connector attaches the VSS wires from the transmission harness to the left-side engine harness.</p> <p>3. Disconnect the black 16-way connector.</p> <p>4. Select a terminal adapter from kit 5-8840-0385-0 that can be used with a jumper to supply B+ to the blue wire with a yellow tracer (transmission side of the connector).</p> <p>5. Use another terminal adapter to attach a voltmeter to the light-green wire with a white tracer (next to the wire in the previous step.)</p> <p>6. Disconnect the blue connector next to the black 16-way connector, and locate the black/red tracer wire at one corner of the blue connector. The black/red wire is the VSS ground. Use a terminal adapter to attach a jumper to ground to the black/red VSS ground wire at the transmission side of the blue connector.</p> <p>7. Raise the rear wheels off the ground with transmission in neutral.</p> <p>Does the DVM toggle back and forth between 0.6 V and 10 V as the wheels (and driveshaft) are rotated?</p>	—	Go to Step 11	Go to Step 10

12	<p>Check for an open or short between the PCM and the speedometer.</p> <p>Was a problem found?</p>	—	Verify repair	Go to Step 13
13	<p>Replace the PCM.</p> <p>IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors</i> for procedures.</p> <p>AND also refer to latest Service Bulletin.</p> <p>Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM.</p> <p>Is the action complete?</p>	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0506 Idle Air Control System Low RPM

D06RV00161

Circuit Description

The powertrain control module (PCM) controls engine speed by adjusting the position of the throttle control valve (DC motor). The throttle motor is a DC motor driven by one coil. The PCM applies current to the DC motor coil in position (%) to adjustment the throttle valve into a passage in the throttle body to air flow. This method allows highly accurate control of engine speed and quick response to changes in engine load.

If the PCM detects a condition where too low of an idle speed is present and the PCM is unable to adjust idle speed by increasing the throttle position, DTC P0506 will set, indicating a problem with the idle control system.

Conditions for Setting the DTC

- No TPS, VSS, ECT, EGR, MAF, MAP, IAT, low voltage, fuel system, canister purge, injector control, or ignition control DTCs are set.
- MAP is less than 60 kPa.
- Engine running time is more than 125 seconds.
- Engine coolant temperature (ECT) is above 50°C (122°F).
- Ignition voltage is between 9.5 volts and 16.7 volts.
- The throttle is closed.
- EVAP purge duty cycle more than 10%.
- All conditions are met for 10 seconds.

- Engine speed is more than 100 RPM lower than desired idle based upon coolant temperature.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- DTC P0506 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM or throttle DC motor – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage.
- Restricted air intake system – Check for a possible collapsed air intake duct, restricted air filter element, or foreign objects blocking the air intake system.
- Throttle body – Check for objects blocking the ETC passage or throttle bore, excessive deposits in the

ETC passage and on the ETC position, and excessive deposits in the throttle bore and on the throttle plate.

- Large vacuum leak – Check for a condition that causes a large vacuum leak, such as an incorrectly installed or faulty PCV valve or brake booster hose disconnected.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

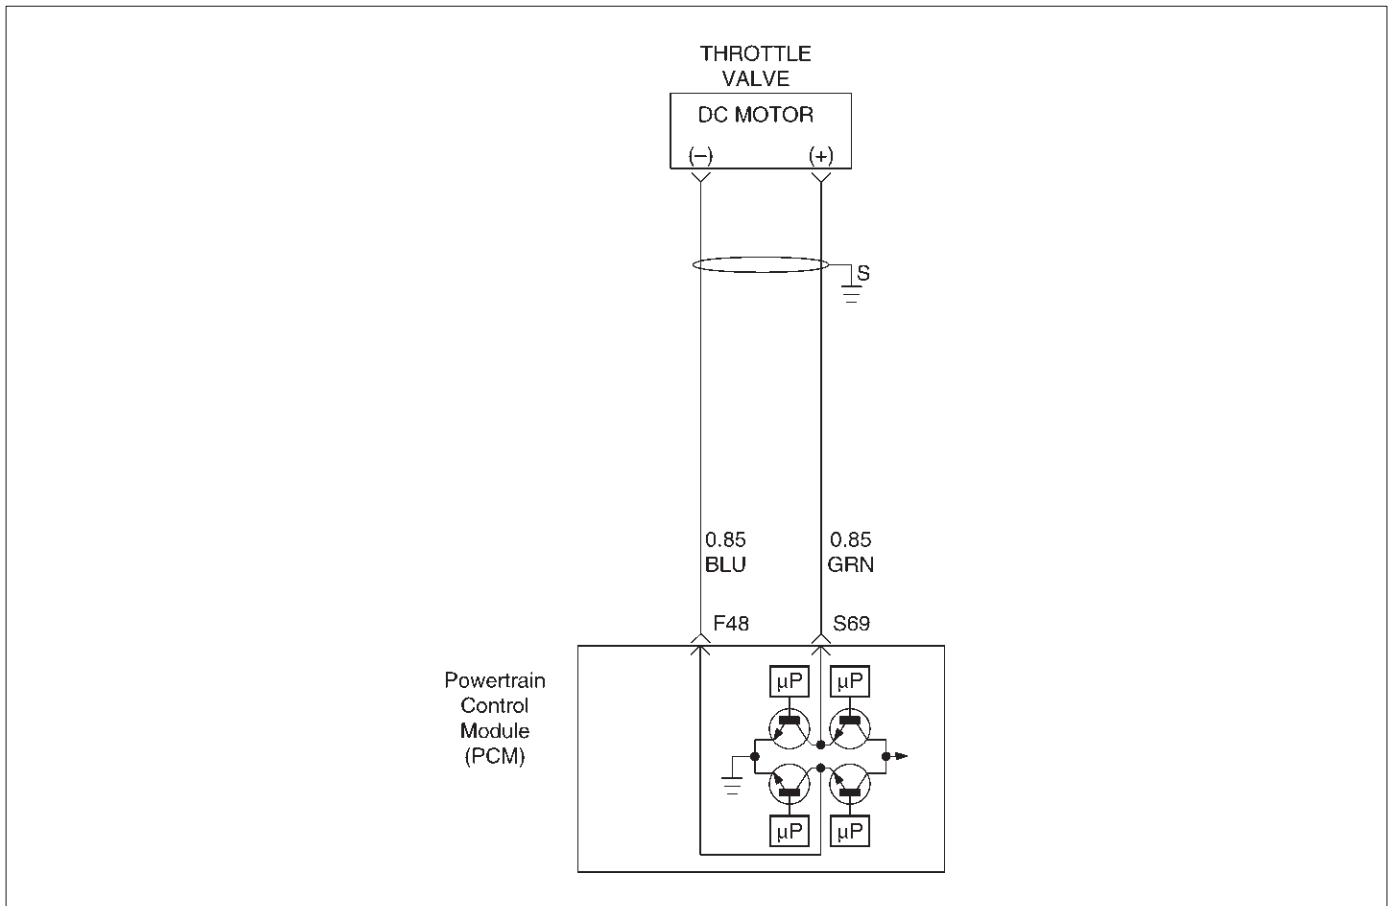

DTC P0506 – Idle Air Control System Low RPM

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	<p>Visually/physically inspect for the following conditions:</p> <ul style="list-style-type: none"> ● Throttle body tampering. ● Restricted intake throttle system. Check for a possible collapsed air intake duct, restricted air filter element, or foreign objects blocking the air intake system. ● Throttle body: Check for objects blocking the throttle passage or throttle bore, excessive deposits in the throttle passage and on the throttle valve, and excessive deposits in the throttle bore and on the throttle plate. ● Throttle body with lever: Check for objects send round the throttle spring lever that lever is smooth movement, and spring lever has not excessive play <p>Do any of the above require a repair?</p>	—	Refer to <i>appropriate section for on-vehicle service</i>	Go to Step 4
3	<p>Visually/physically inspect for the following conditions:</p> <ul style="list-style-type: none"> ● Accelerator pedal tampering. ● Accelerator pedal : Check for objects blocking the spring or pedal arm. ● Accelerator pedal : Check for objects move the accelerator pedal that pedal is smooth movement, and accelerator pedal arm has not excessive play. <p>Do any of the above require a repair?</p>	—	Refer to <i>appropriate section for on-vehicle service</i>	Go to Step 4

11	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service</i> in <i>Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0507 Idle Air Control System High RPM

D06RV00161

Circuit Description

The powertrain control module (PCM) controls engine speed by adjusting the position of the throttle control valve (DC motor). The throttle motor is a DC motor driven by one coil. The PCM applies current to the DC motor coil in position (%) to adjustment the throttle valve into a passage in the throttle body to air flow. This method allows highly accurate control of engine speed and quick response to changes in engine load.

If the PCM detects a condition where too high of an idle speed is present and the PCM is unable to adjust idle speed by increasing the throttle position, DTC P0507 will set, indicating a problem with the idle control system.

Conditions for Setting the DTC

- No TPS, VSS, ECT, EGR, MAF, MAP, IAT, low voltage, fuel system, canister purge, injector control or ignition control DTCs are set.
- MAP is less than 60 kPa.
- Engine running time is more than 125 seconds.
- Engine coolant temperature (ECT) is above 50°C (122°F).
- Ignition voltage is between 9.5 volts and 16.7 volts.
- The throttle is closed.
- EVAP purge duty cycle is more than 10%.
- All conditions are met for 10 seconds.
- Engine speed is more than 100 RPM higher than desired idle based upon coolant temperature.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0507 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0507 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM or throttle DC motor – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage.
- Vacuum leak – Check for a condition that causes a vacuum leak, such as disconnected or damaged hoses, leaks at EGR valve and EGR pipe to intake

manifold, leak at the throttle body, a faulty or incorrectly installed PCV valve, leaks at the intake manifold, etc.

- Throttle body – Check for sticking throttle plate. Also inspect the air passage for deposits or objects which will not allow the ETC position to fully extend or properly seat.

If DTC P0507 cannot be duplicated, reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

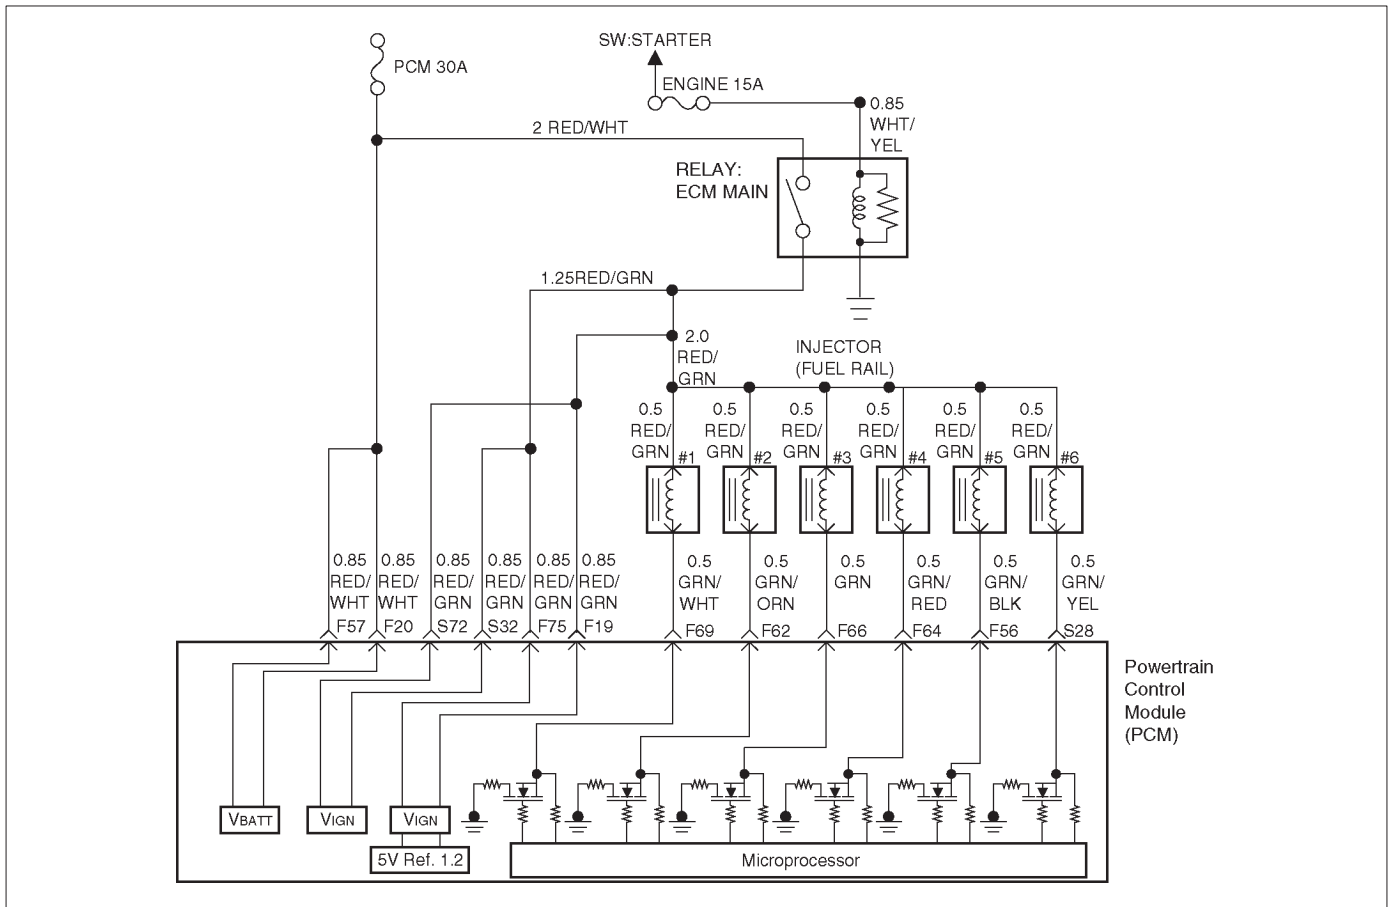

DTC P0507 – Idle Air Control System High RPM

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Visually/physically inspect for the following conditions: <ul style="list-style-type: none"> • Throttle body tampering. • Restricted intake throttle system. Check for a possible collapsed air intake duct, restricted air filter element, or foreign objects blocking the air intake system. • Throttle body: Check for objects blocking the throttle passage or throttle bore, excessive deposits in the throttle passage and on the throttle valve, and excessive deposits in the throttle bore and on the throttle plate. • Throttle body with lever: Check for objects send round the throttle spring lever that lever is smooth movement, and spring lever has not excessive play Do any of the above require a repair?	—	Refer to <i>appropriate section for on-vehicle service</i>	Go to Step 3
3	Visually/physically inspect for the following conditions: <ul style="list-style-type: none"> • Accelerator pedal tampering. • Accelerator pedal : Check for objects blocking the spring or pedal arm. • Accelerator pedal : Check for objects move the accelerator pedal that pedal is smooth movement, and accelerator pedal arm has not excessive play. AND also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0562 System Voltage Low

060R100139

Circuit Description

The powertrain control module (PCM) monitors the system voltage on the ignition feed terminal to the PCM. A system voltage DTC will set whenever the voltage is below a calibrated value.

Conditions for Setting the DTC

- Ignition "ON".
- System voltage is below 11.5 volts for 40 seconds.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store as Failure Records conditions which were present when the DTC was set. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- A history DTC P0562 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0562 can be cleared by using the Tech 2 "Clear Info" function.

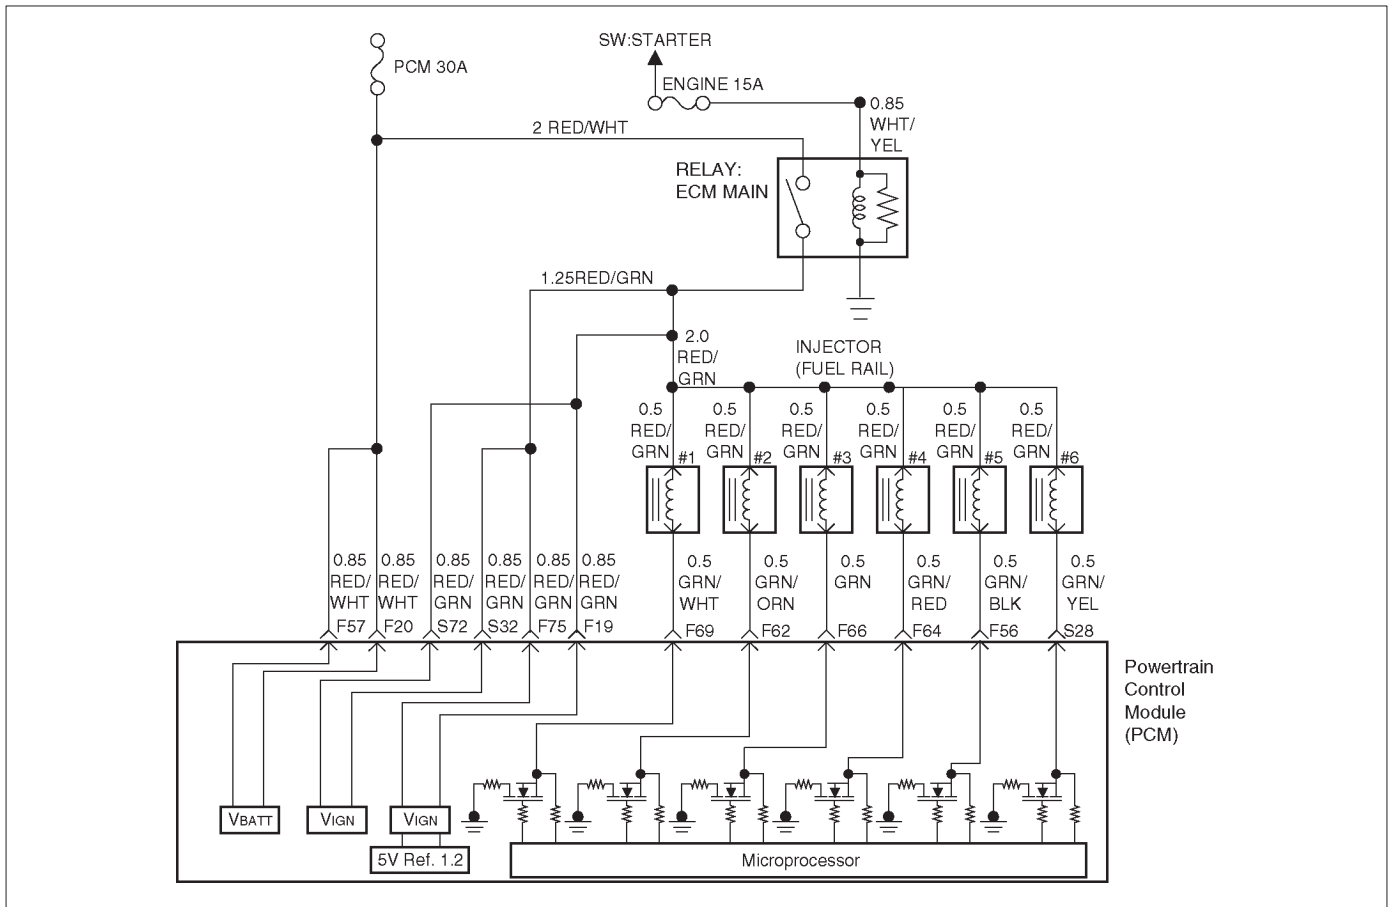

Diagnostic Aids

If the DTC sets when an accessory is operated, check for a poor connection or excessive current draw.

DTC P0562 – System Voltage Low

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	Using a DVM, measure the battery voltage at the battery. Is the battery voltage greater than the specified value?	11.5 V	Go to <i>Step 3</i>	Charge battery, then go to <i>Step 3</i>
3	1. Install a Tech 2. 2. Select "Ignition Volts" on the Tech 2. 3. Start the engine and raise the engine speed to the specified value. 4. Load the electrical system by turning on the headlights, high blower, etc. Is the ignition voltage approximately equal to the specified value?	2000 RPM 12.8-14.1 V	Go to <i>Step 4</i>	Go to <i>Starting/Charging</i>
4	1. Ignition "OFF". 2. Disconnect the PCM connector at the PCM. 3. Using a DVM, measure the battery voltage at the PCM connector F-20 and F-57. Is it approximately equal to battery voltage?	—	Check for excessive current draw with ignition "OFF", engine "OFF".	Go to <i>Step 5</i>
5	1. Check for faulty connections at the PCM harness terminals. 2. Repair as necessary. Was a repair necessary?	—	Verify repair	Go to <i>Step 6</i>
6	Check for an open battery feed circuit to the PCM. Is the action complete?	—	Verify repair	Go to <i>Step 7</i>
7	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors</i> for procedures. AND also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0563 System Voltage High

060R100139

Circuit Description

The powertrain control module (PCM) monitors the system voltage on the ignition feed terminals to the PCM. A system voltage DTC will set whenever the voltage is above a calibrated value.

Conditions for Setting the DTC

- Ignition "ON".
- System voltage is above 16 volts for 40 seconds.

Action Taken When the DTC Sets

- The PCM will ON the MIL after second trip with detected the fault.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- A history DTC P0563 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0563 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

If the DTC sets when an accessory is operated, check for a poor connection or excessive current draw.

DTC P0563 – System Voltage High

Step	Action	Value(s)	Yes	No
1	Was the "ON-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Using a DVM, measure the battery voltage at the battery. Is the battery voltage less than the specified value?	11.5 V	Go to Step 3	Go to Step 4
3	1. Charge the battery and clean the battery terminals. 2. Clean the battery ground cable connection if corrosion is indicated. Is the battery voltage less than the specified value?	11.5 V	Replace battery	Go to Step 4
4	1. Turn "OFF" all the accessories. 2. Install a Tech 2. 3. Select the ignition voltage parameter on the Tech 2. 4. Start the engine and raise the engine RPM to the specified value. Is the voltage more than 2.5 volts greater than the measurement taken in step 2 or 3?	2000 RPM	Go to <i>Starting/Charging</i>	Go to Step 5
5	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors</i> for procedures. AND also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0565 Cruise Main Switch Circuit Error

060R100137

Circuit Description

The cruise control keeps the vehicle running at a fixed speed until a signal canceling this fixed speed is received. When the main switch is turned on with the vehicle in the running mode, the battery voltage is applied to power train control module(PCM). When a signal from the control switch is input to PCM while the vehicle is in this state, the cruise control system is activated. Also, while the PCM is operating, the "CRUISE MAIN" indicator light in the meter assembly lights up.

Conditions for setting the DTC

- The Ignition is "ON".
- Engine is running.
- System voltage is between 11.5 volts and 16 volts.
- The switch contact remains on for 15 seconds or more.
- Noises are generated by poor switch contact 60 times within 1 second.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store conditions which were present when the DTC was set in the Failure Records data only.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0565 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P0565 can be cleared using the Tech 2 "Clear Info" function.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Misrouted harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the

cruise main switch display on the Tech 2 while moving connectors and wiring harnesses related to the sensor. A change in the display will indicate the location of the fault.

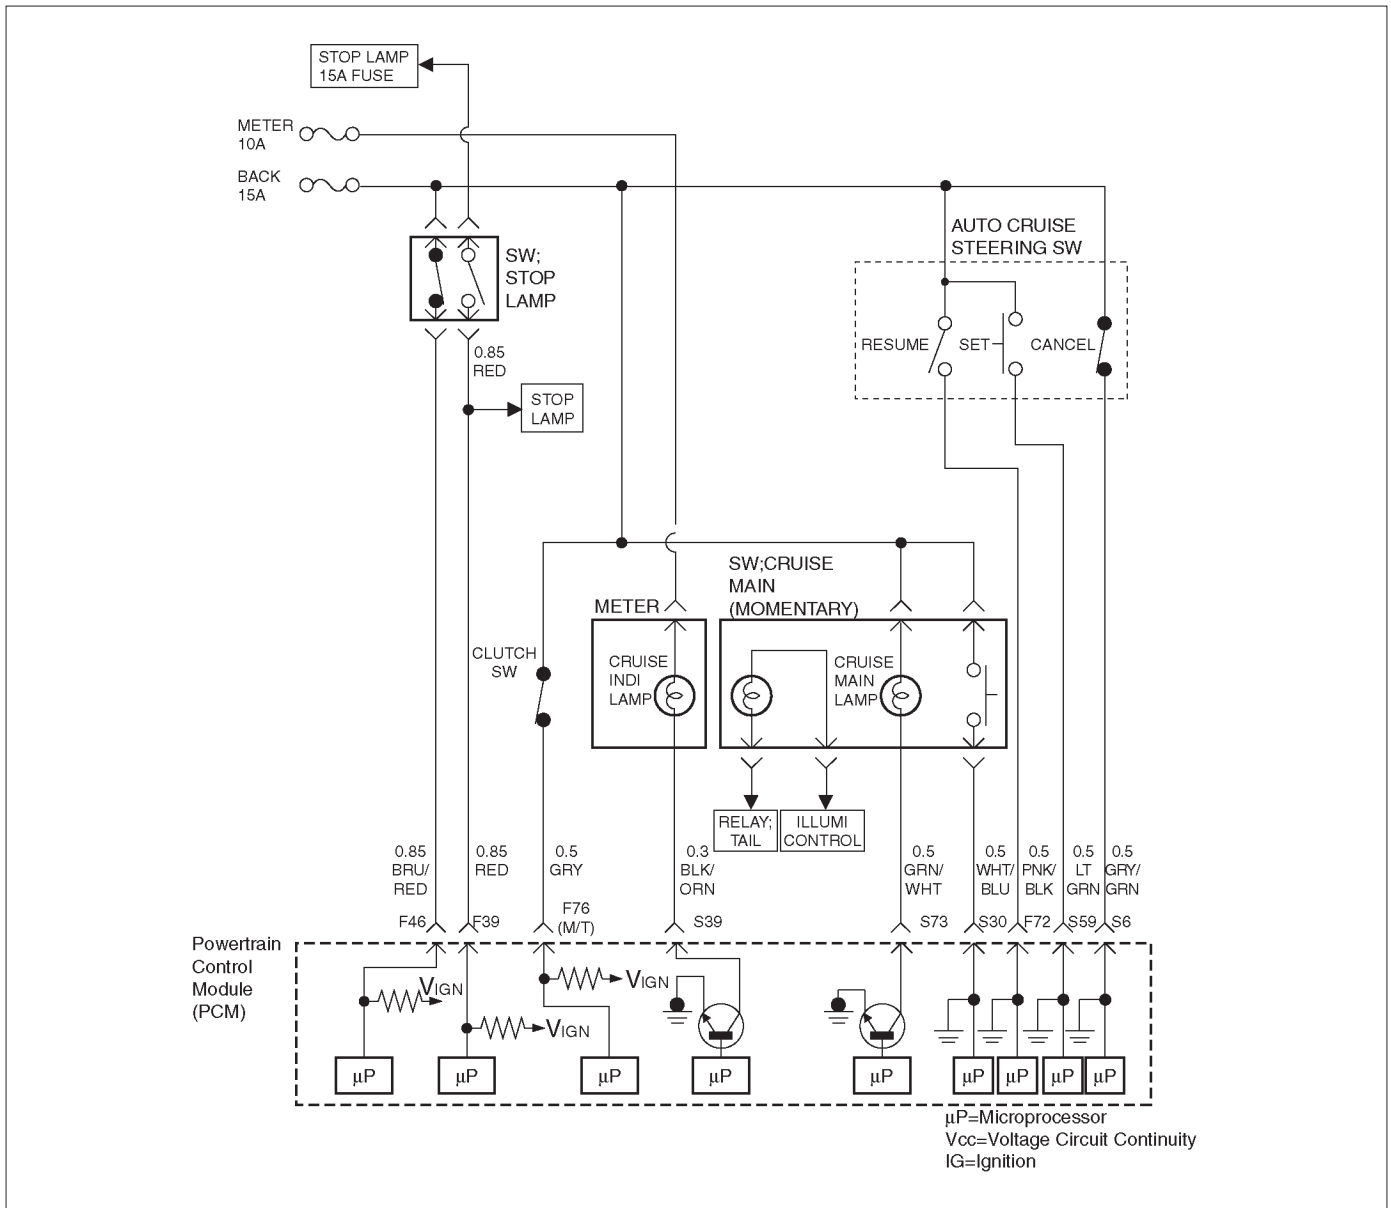

If DTC P0565 cannot be duplicated, the information included in the Failure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently, performing the DTC P0565 Diagnostic Chart may isolate the cause of the fault.

DTC P0565 Cruise Main Switch Circuit Error

Step	Action	Value(s)	Yes	No
1	Was the "On-Board (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "ON," engine "ON." 2. Observe the cruise main lamp in the switch. Is the cruise main lamp "ON?"	—	Go to Step 3	Go to Step 4
3	1. Push the auto cruise main switch. 2. Observe the cruise main lamp in the switch. Is the cruise main lamp "OFF?"	—	Go to <i>Diagnostic Aids</i>	Go to Step 4
4	Check the signal circuit for auto cruise main switch. 1. Ignition is "OFF". 2. Disconnect the powertrain control module(PCM). 3. Disconnect the cruise main switch. Check for an open cruise main switch signal circuit between the PCM and the cruise main switch. Is a problem found?	—	Go to Step 5	Go to Step 6
5	Repair the auto cruise main switch signal circuit. Is the action complete?	—	Verify repair	—
6	Check the auto cruise main switch and lamp circuit. Is a problem found?	—	Go to Step 7	Go to Step 8
7	Repair or replace the auto cruise main switch and lamp circuit. Is the action complete?	—	Verify repair	—
8	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>ON-Vehicle Service in Power Control Module and Sensors for procedures.</i> And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0566 Cruise Cancel Switch Circuit Error

060R100137

Circuit Description

The cruise control keeps the vehicle running at a fixed speed until a signal canceling this fixed speed is received. When the main switch is turned on with the vehicle in the running mode, the battery voltage is applied to powertrain control module (PCM). When a signal from the control switch is input to PCM while the vehicle is in this state, the cruise control system is activated. Also, while the PCM is operating, the "CRUISE MAIN" indicator light in the meter assembly lights up.

When the cancel switch is "ON", cruise system is "OFF".

Conditions for setting the DTC

- The Ignition is "ON".
- Engine is running.
- System voltage is between 11.5 volts and 16 volts.
- The switch contact remains on for 40 seconds or more.

- Noises are generated by poor switch contact 100 times within 1.6 seconds.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store conditions which were present when the DTC was set in the Failure Records data only.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0566 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P0566 can be cleared using the Tech 2 "Clear Info" function.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Misrouted harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the

cruise cancel switch display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

A change in the display will indicate the location of the fault. If DTC P0566 cannot be duplicated, the information included in the Failure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently, performing the DTCP0566 Diagnostic Chart may isolate the cause of the fault.

DTC P0566 Cruise Cancel Switch Circuit Error

Step	Action	Value(s)	Yes	No
1	Was the "On-Board (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Check the signal circuit for auto cruise cancel switch. 1. Ignition is "OFF". 2. Disconnect the powertrain control module(PCM). 3. Disconnect the cruise cancel switch. Check for cruise cancel switch signal circuit between the PCM and the cruise cancel switch. Is a problem found?	—	Go to Step 3	Go to Step 4
3	Repair the main cruise cancel switch signal circuit. Is the action complete?	—	Verify repair	—
4	Check the auto cruise main switch. Is a problem found?	—	Go to Step 5	Go to Step 6
5	Repair or replace the main cruise main switch. Is the action complete?	—	Verify repair	—
6	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>ON-Vehicle Service in Power Control Module and Sensors for procedures</i> . And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0567 Cruise Resume Switch Circuit Error

060R100137

Circuit Description

The cruise control keeps the vehicle running at a fixed speed until a signal canceling this fixed speed is received. When the main switch is turned on with the vehicle in the running mode, the battery voltage is applied to powertrain control module (PCM). When a signal from the control switch is input to PCM while the vehicle is in this state, the cruise control system is activated. Also, while the PCM is operating, the "CRUISE MAIN" indicator light in the meter assembly lights up.

When the resume switch is "ON", vehicle speed is resealed to the previous set speed.

Conditions for setting the DTC

- The Ignition is "ON".
- Engine is running.
- System voltage is between 11.5 volts and 16 volts.

- The switch contact remain on for 50 seconds or more.
- Noises are generated by poor switch contact 100 times within 1.6 seconds.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store conditions which were present when the DTC was set in the Failure Records data only.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0567 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.

- DTC P0567 can be cleared using the Tech 2 “Clear Info” function.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Misrouted harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage.

If the harness appears to be OK, observe the Cruise resume switch display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

A change in the display will indicate the location of the fault.

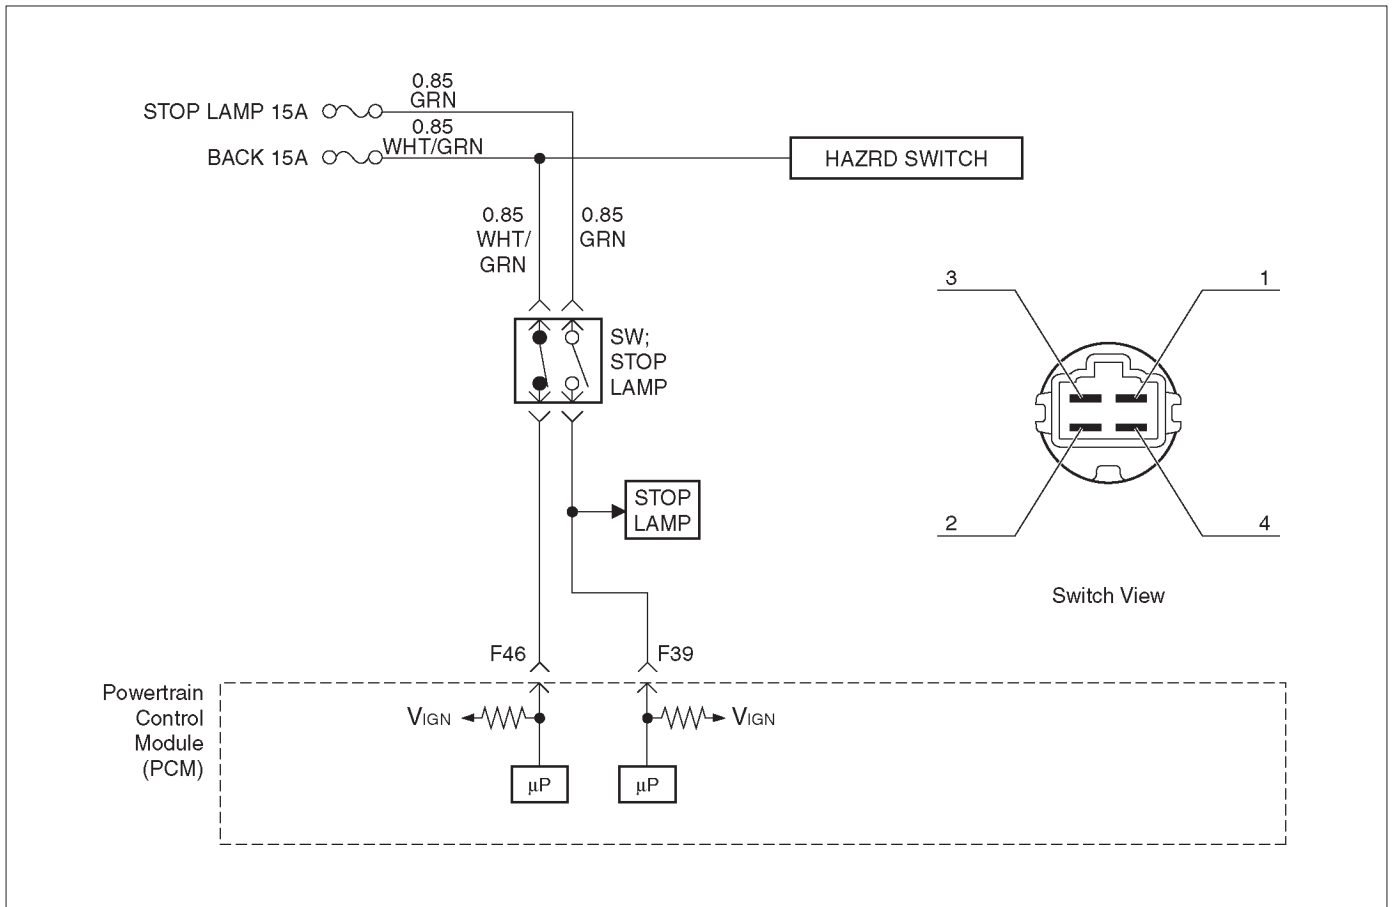

If DTC P0567 cannot be duplicated, the information included in the Failure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently, performing the DTCP0567 Diagnostic Chart may isolate the cause of the fault.

DTC P0567 Cruise Resume Switch Circuit Error

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Check the signal circuit for auto cruise resume switch. 1. Ignition is “OFF”. 2. Disconnect the powertrain control module (PCM). 3. Disconnect the cruise resume switch. Check for cruise resume switch signal circuit between the PCM and the cruise resume switch. Is a problem found?		Go to Step 3	Go to Step 4
3	Repair the main cruise resume switch signal circuit. Is the action complete?	—	Verify repair	—
4	Check the auto cruise resume switch. Is a problem found?	—	Go to Step 5	Go to Step 6
5	Repair or replace the main cruise resume switch. Is the action complete?	—	Verify repair	—
6	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. <i>Refer to ON-Vehicle Service in Power Control Module and Sensors for procedures.</i> And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0571 No Brake Switch Signal

060R100138

Circuit Description

The brake switch has 3 functions.

- Brake pedal operation check
- Brake light operation (On and off)
- Cruise control (Cancel)

The PCM receives vehicle speed and switch position signals from the brake switch. The PCM sets brake operating conditions in response to these signals.

If the brake switch is on, the brake system is in normal operation (cruise control cancelled).

Conditions for Setting the DTC

- Two brake switch signals not acknowledged after signal changed.
- VSS not defective.
- Engine is running.
- Vehicle speed above 20km/h.

Action Taken When the DTC Sets

- The PCM will not turn the malfunction indicator lamp (MIL) "ON".
- The PCM will store conditions which were present when the DTC was set as Failure Records only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the DTC

- DTC P0571 can be cleared by using the scan tool "Clear Info" function.

Diagnostic Aids

- Damaged harness—Inspect the wiring harness for damage. If the harness appears to be OK, observe the fuel level display on the scan tool while moving connectors and wiring harnesses related to the sensor. A change in the display will indicate the location of the fault.

DTC P0571 No Brake Switch Signal

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "Off". Engine "Off". 2. Check following fuses. <ul style="list-style-type: none"> ● BACK 15A ● STOP LAMP 15A Was a problem found?	—	Verify repair	Go to Step 3
3	1. Make adjustment to the brake switch. The brake switch is installed to the brake pedal assembly. (Refer to "Brake switch" in "10A CRUISE CONTROL SYSTEM".) Was the problem found?	—	Verify repair	Go to Step 4
4	1. Push the shaft at brake switch. 2. Check shaft operation for smooth movements. Was the problem found?	—	Verify repair	Go to Step 5
5	1. Disconnect the connector at brake switch. 2. Check following terminal pin at ohmmeter. (Leave the shaft position at brake switch. Don't push it.) <ul style="list-style-type: none"> ● Between pin 1 and pin 2 ● Between pin 3 and pin 4 Was it specified value?	Between pin1 and pin2 is 0Ω, Between pin3 and pin4 is ∞Ω	Go to Step 6	Go to Step 9
6	1. Disconnect the connector at brake switch. 2. Check following terminal pin at ohmmeter. (Push the shaft position at brake switch and hold it) <ul style="list-style-type: none"> ● Between pin 1 and pin 2 ● Between pin 3 and pin 4 Was it specified value?	Between pin1 and pin2 is ∞Ω, Between pin3 and pin4 is 0Ω	Go to Step 7	Go to Step 9
7	1. Probe related circuits for open or short to ground. 2. If a problem was found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 8
8	1. Replace the ECM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service</i> in <i>Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Was the action completed?	—	Verify repair	—
9	1. Replace the brake switch. Was the action completed?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0601 PCM Memory

060RY014

Circuit Description

The powertrain control module (PCM) used in this vehicle utilizes an electrically erasable programmable read-only memory (EEPROM). The EEPROM contains program information and the calibrations required for engine, transmission, and powertrain diagnostics operation.

Unlike the PROM used in past applications, the EEPROM is not replaceable. When the PCM is replaced or a calibration update is required, the PCM must be programmed using a Tech 2. Refer to *On-Vehicle Service in Powertrain Control Module and Sensors* for the EEPROM programming procedure.

Conditions for Setting the DTC

- The PCM detects an internal program fault (check sum error).

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.

- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0601 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0601 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

- DTC P0601 indicates that the contents of the EEPROM have changed since the PCM was programmed. The only possible repair is PCM replacement. Remember to program the replacement PCM with the correct software and calibration for the vehicle.

DTC P0601 – PCM Memory

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	<p>Replace the PCM.</p> <p>IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors</i> for procedures.</p> <p>ANd also refer to latest Service Bulletin.</p> <p>Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM.</p> <p>Is the action complete?</p>	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0602 PCM Programming Error

060RY014

Circuit Description

The powertrain control module (PCM) uses Main CPU and Watchdog CPU software/calibration.

Conditions for Setting the DTC

- This code detects inconsistencies between Main CPU and Watchdog CPU software/calibration.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).

- The PCM will store conditions which were present when the DTC was set in the Failure Records data only.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0602 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0602 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

DTC P0602 – PCM Programming Error

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	<p>Replace the PCM.</p> <p>IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service</i> in <i>Powertrain Control Module and Sensors</i> for procedures.</p> <p>ANd also refer to latest Service Bulletin.</p> <p>Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM.</p> <p>Is the action complete?</p>	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0604 PCM RAM Error

060RY014

Circuit Description

The powertrain control module (PCM) uses Main CPU RAM and Watchdog CPU RAM.

Conditions for Setting the DTC

- This code detects inconsistencies between Main CPU RAM and Watchdog CPU RAM.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).

- The PCM will store conditions which were present when the DTC was set in the Failure Records data only.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0604 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0604 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

DTC P0604 – PCM RAM Error

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors</i> for procedures. ANd also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0606 PCM Internal Performance

060RY014

Circuit Description

The input/output devices in the PCM include analog-to-digital converters, signal buffers, counters, and special drivers. The PCM controls most components with electronic switches which complete a ground circuit when turned "ON". These switches are arranged in groups of 4 and 7, called either a surface-mounted quad driver module (QDM), which can independently control up to 4 output terminals, or QDMs which can independently control up to 7 outputs.

Conditions for Setting the DTC

- This code detects inconsistencies between Main CPU A/D converters and Watchdog CPU A/D converters.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store conditions which were present when the DTC was set in the Failure Records data only.

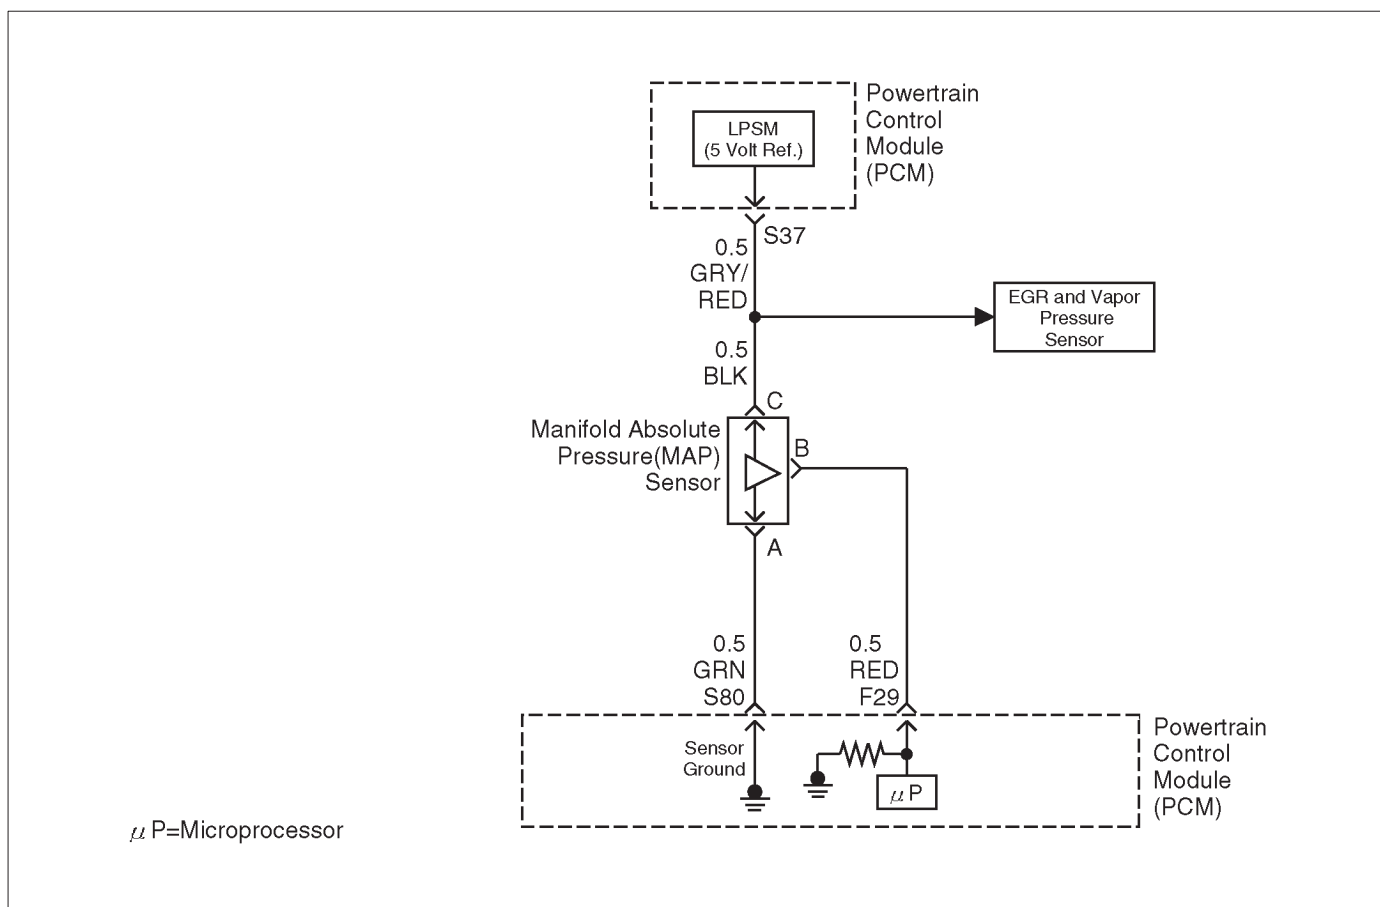

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0606 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0606 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

DTC P0606 – PCM Internal Performance

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors</i> for procedures. ANd also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1106 MAP Sensor Circuit Intermittent High Voltage

060R100132

Circuit Description

The manifold absolute pressure (MAP) sensor responds to changes in intake manifold pressure (vacuum). The MAP sensor signal voltage to the PCM varies from below 2 volts at idle (high vacuum) to above 4 volts with the ignition "ON", engine not running or at wide-open throttle (low vacuum).

The MAP sensor is used to determine manifold pressure changes while the liner EGR flow test diagnostic is being run (refer to *DTC P0401*), to determine engine vacuum level for some other diagnostics and to determine barometric pressure (BARO). The PCM compares the MAP sensor signal to a calculated MAP based on throttle position and various engine load factors. If the PCM detects a MAP signal that is intermittently above the calculated value, DTC P1106 will set.

Conditions for Setting the DTC

- No TP sensor DTCs are present.
- Engine is running for at least 10 seconds.
- Throttle angle is below 3% if engine speed is below 1000 RPM.
- Throttle angle is below 10% if engine speed is above 1000 RPM.
- The MAP sensor indicates an intermittent manifold absolute pressure above 80 kPa for a total of approximately 5 seconds over a 16-second period of time.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store conditions which were present when the DTC was set as Failure Records data only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- A history DTC P1106 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1106 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Leaking or plugged vacuum supply line to the MAP sensor.
- Inspect PCM harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Inspect the wiring harness for damage. If the harness appears to be OK, observe the MAP display on the Tech 2 while moving connectors and wiring harnesses related to the sensor. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often

the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

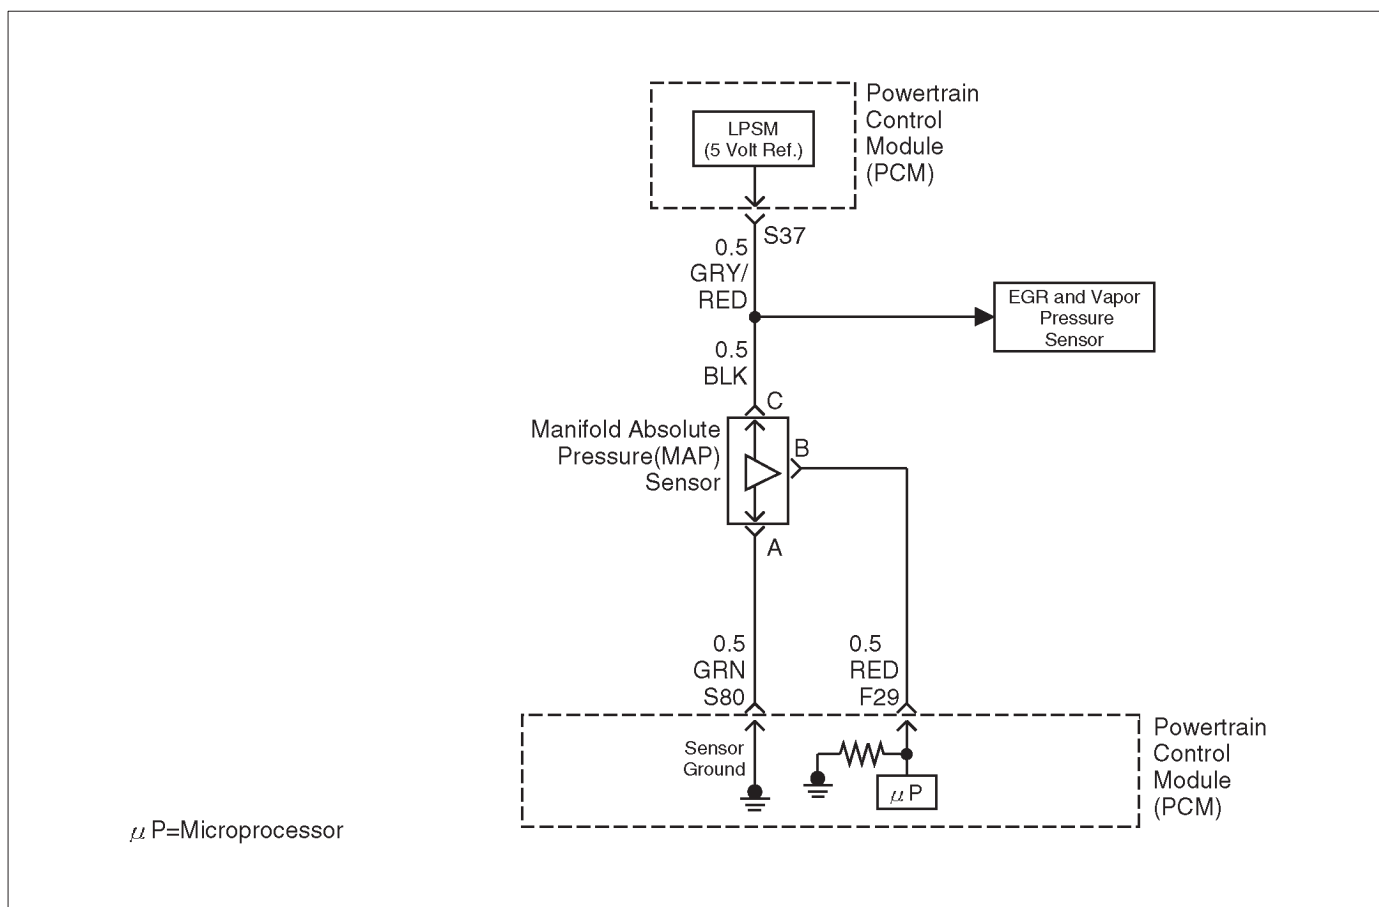

- The MAP sensor shares a 5 Volt Reference with the Fuel Tank Pressure sensor. Check the 5 Volt reference if this DTC is also set.

- The MAP sensor shares a ground with the Fuel Tank Pressure sensor and the ECT Sensor. Check the ground if these other DTCs are also set.

DTC P1106 – MAP Sensor Circuit Intermittent High Voltage

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Is DTC P0108 also set?	—	Go to <i>DTC P0108</i> chart first	Go to Step 3
3	Are DTC P1111, P1115, and/or P1120 also set?	—	Go to Step 6	Go to Step 4
4	Check for a poor sensor ground circuit terminal connection at the MAP sensor. Was a problem found?	—	Go to Step 9	Go to Step 5
5	Check the MAP signal circuit between the MAP sensor connector and the PCM for an intermittent short to voltage. Was a problem found?	—	Go to Step 10	Go to Step 8
6	Check for an intermittent short to voltage on the 5 volt reference circuit between the PCM and the following components: <ul style="list-style-type: none"> • MAP sensor • EGR valve • TP sensor Was a problem found?	—	Go to Step 10	Go to Step 7
7	Check for a poor sensor ground circuit terminal connection at the PCM. Was a problem found?	—	Go to Step 9	Go to Step 8
8	Check for an intermittent open or a faulty splice in the sensor ground circuit. Was a problem found?	—	Go to Step 10	Refer to <i>Diagnostic Aids</i>
9	Replace the faulty harness connector terminal for the sensor ground circuit. Is the action complete?	—	Verify repair	—
10	Locate and repair the intermittent open/short circuit in the wiring harness as necessary. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1107 MAP Circuit Intermittent Low Voltage

060R100132

approximately 5 seconds over a 16-second period of time.

Circuit Description

The manifold absolute pressure (MAP) sensor responds to changes in intake manifold pressure (vacuum). The MAP sensor signal voltage to the powertrain control module (PCM) varies from below 2 volts at idle (high vacuum) to above 4 volts with the ignition "ON", engine not running or at wide-open throttle (low vacuum).

The MAP sensor is used to determine manifold pressure changes while the linear EGR flow test diagnostic is being run (refer to *DTC P0401*), to determine engine vacuum level for some other diagnostics and to determine barometric pressure (BARO). The PCM compares the MAP sensor signal to a calculated MAP based on throttle position and various engine load factors. If the PCM detects a MAP signal that is intermittently below the calculated value, DTC P1107 will be set.

Conditions for Setting the DTC

- No TP sensor DTCs are present.
- Engine is running.
- Ignition voltage is more than 11 volts.
- Throttle angle is above 1% if engine speed is less than 1000 RPM.
- Throttle angle is above 3% if engine speed is above 1000 RPM.
- The MAP sensor indicates an intermittent manifold absolute pressure below 80 kPa for a total of

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store conditions which were present when the DTC was set as Failure Records data only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- A history DTC P1107 will Clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1107 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- The MAP Sensor shares a 5 Volt reference with the EGR Valve. If these codes are also set, it could indicate a problem with the 5 Volt reference circuit or components itself.
- The MAP Sensor share a ground with the EGR Valve and the IAT Sensor.

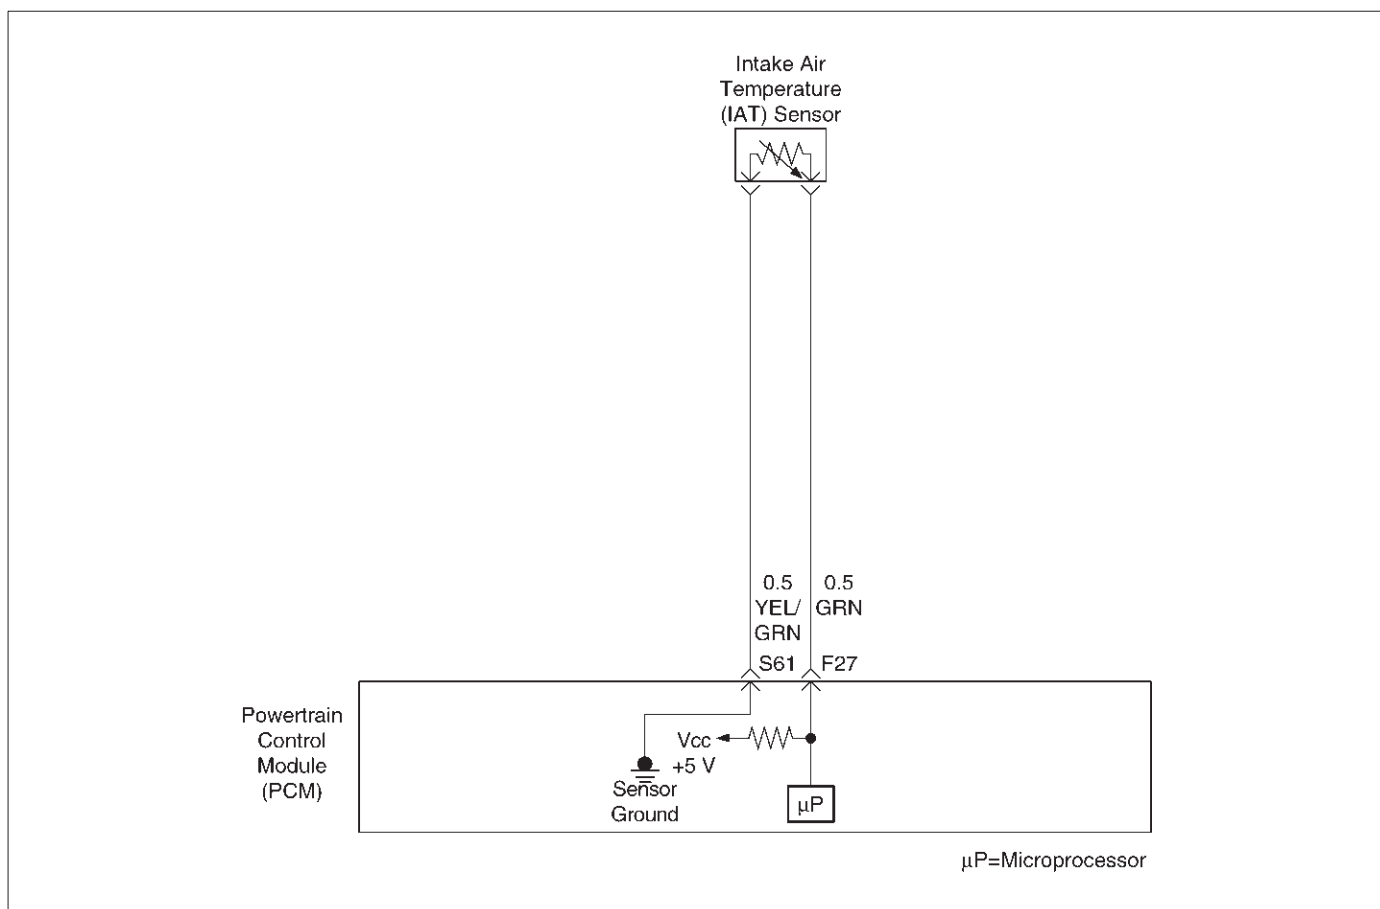

- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the MAP display on the Tech 2 while moving connectors and wiring harnesses related to the sensor. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P1107 – MAP Sensor Circuit Intermittent Low Voltage

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	Is DTC P0107 also set?	—	Go to <i>DTC P0107</i> chart first	Go to <i>Step 3</i>
3	Check for a poor 5 volt reference circuit or MAP signal circuit terminal connection at the MAP sensor. Was a problem found?	—	Go to <i>Step 8</i>	Go to <i>Step 4</i>
4	Check the MAP signal circuit between the MAP sensor connector and the PCM for an intermittent open or short to ground. Was a problem found?	—	Go to <i>Step 9</i>	Go to <i>Step 7</i>
5	Check for an intermittent short to ground on the 5 volt reference circuit between the PCM and the following components: <ul style="list-style-type: none"> • MAP sensor • EGR valve • TP sensor Was a problem found?	—	Go to <i>Step 9</i>	Go to <i>Step 6</i>
6	Check for a poor 5 volt reference terminal connection at the PCM. Was a problem found?	—	Go to <i>Step 8</i>	Go to <i>Step 7</i>
7	Check for an intermittent open or a faulty splice in the 5 volt reference circuit. Was a problem found? (If no, start with the diagnosis chart for other sensors in the circuit and see if 5V returns.)	—	Go to <i>Step 9</i>	Refer to <i>Diagnostic Aids</i>
8	Replace the faulty harness connector terminal(s) for the 5 volt reference circuit and/or the MAP signal circuit as necessary. Is the action complete?	—	Verify repair	—
9	Repair intermittent open/short circuit in the wiring harness as necessary. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1111 IAT Sensor Circuit Intermittent High Voltage

D06RV00147

Circuit Description

The intake air temperature (IAT) sensor is a thermistor which measures the temperature of the air entering the engine. The powertrain control module (PCM) applies 5 volts through a pull-up resistor to the IAT sensor. When the intake air is cold, the sensor resistance is high and the PCM will monitor a high signal voltage on the IAT signal circuit. If the intake air is warm, the sensor resistance is lower causing the PCM to monitor a lower voltage. DTC P1111 will set when the PCM intermittently detects an excessively high signal voltage on the intake air temperature sensor signal circuit.

Conditions for Setting the DTC

- The engine has been running for over 30 seconds.
- Vehicle speed is less than 32 km/h (20 mph).
- Engine coolant temperature is above 60°C (140°F).
- Mass air flow is less than 20g/second.
- IAT signal voltage indicates and intake air temperature intermittently less than -39°C (-38°F) (about 5 volts) for approximately 2.5 seconds over a 25-second period of time.

Action Taken When the DTC Sets

- The PCM will substitute a default value for intake air temperature.
- The PCM will store conditions which were present when the DTC set as Failure Records data only. This information will not be stored as Freeze Frame data.
- DTC P1111 does not illuminate the MIL.

Conditions for Clearing the MIL/DTC

- A history DTC P1111 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1111 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the IAT display on the Tech 2 while moving connectors and wiring harnesses related to the IAT sensor. A change in the IAT display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

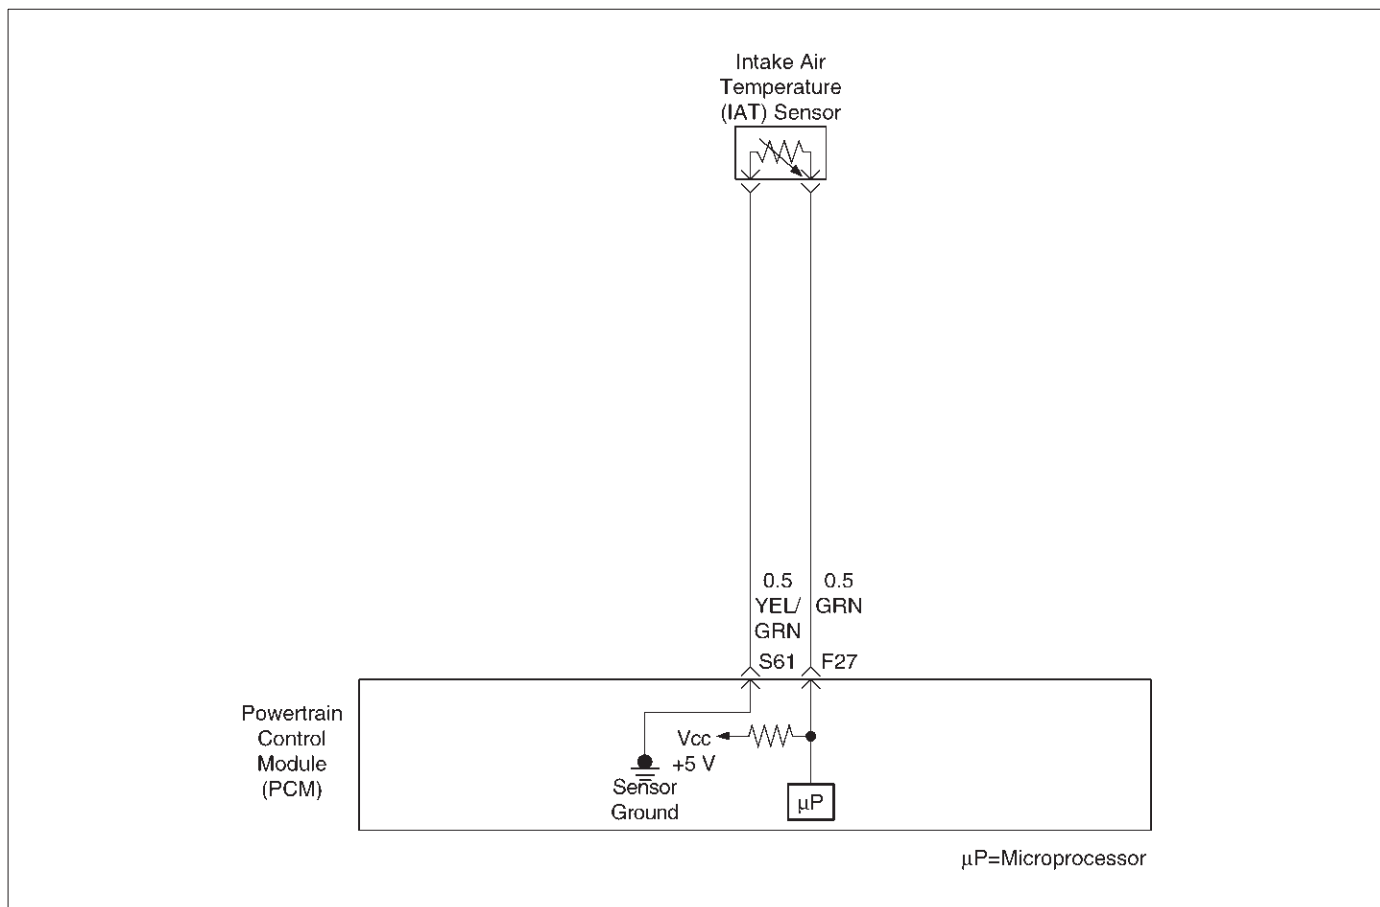

Intake Air Temperature Sensor

°C	°F	OHMS
Temperature vs. Resistance Values (approximate)		
100	212	177
80	176	332
60	140	667
45	113	1188
35	95	1802
25	77	2796

9	1. Check for an intermittent open or a faulty splice in the sensor ground circuit. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Refer to <i>Diagnostic Aids</i>

Diagnostic Trouble Code (DTC) P1112 IAT Sensor Circuit Intermittent Low Voltage

Circuit Description

The intake air temperature (IAT) sensor is a thermistor which measures the temperature of the air entering the engine. The powertrain control module (PCM) applies 5 volts through a pull-up resistor to the IAT sensor. When the intake air is cold, the sensor resistance is high and the PCM will monitor a high signal voltage on the IAT signal circuit. If the intake air is warm, the sensor resistance becomes lower, causing the PCM to monitor a lower voltage. DTC P1112 will set when the PCM intermittently detects an excessively low signal voltage on the intake air temperature sensor signal circuit.

Conditions for Setting the DTC

- The engine has been running for over 15 seconds.
- Vehicle speed is greater than 48 km/h (30 mph).
- IAT signal voltage is greater than 148°C (298°F) (about 0.10 volt) for a total of 2.5 seconds over a 25-second period of time.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store conditions which were present when the DTC was set as Failure Records data only. This information will not be stored as Freeze Frame data.
- The PCM will substitute a default value for intake air temperature.

Conditions for Clearing the MIL/DTC

- A history DTC P1112 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1112 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
 - Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the IAT display on the Tech 2 while moving connectors and wiring harnesses related to the IAT sensor. A change in the IAT display will indicate the location of the fault.
- Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. Verifies that the fault is present.
3. If DTC P1112 can be repeated only by duplicating the Failure Records conditions, refer to the "Temperature vs. Resistance Value Chart". The chart may be used to test the IAT sensor at various temperatures to evaluate the possibility of a "shifted" sensor that may be shorted above or below a certain temperature. If this is the case, replace the IAT sensor.

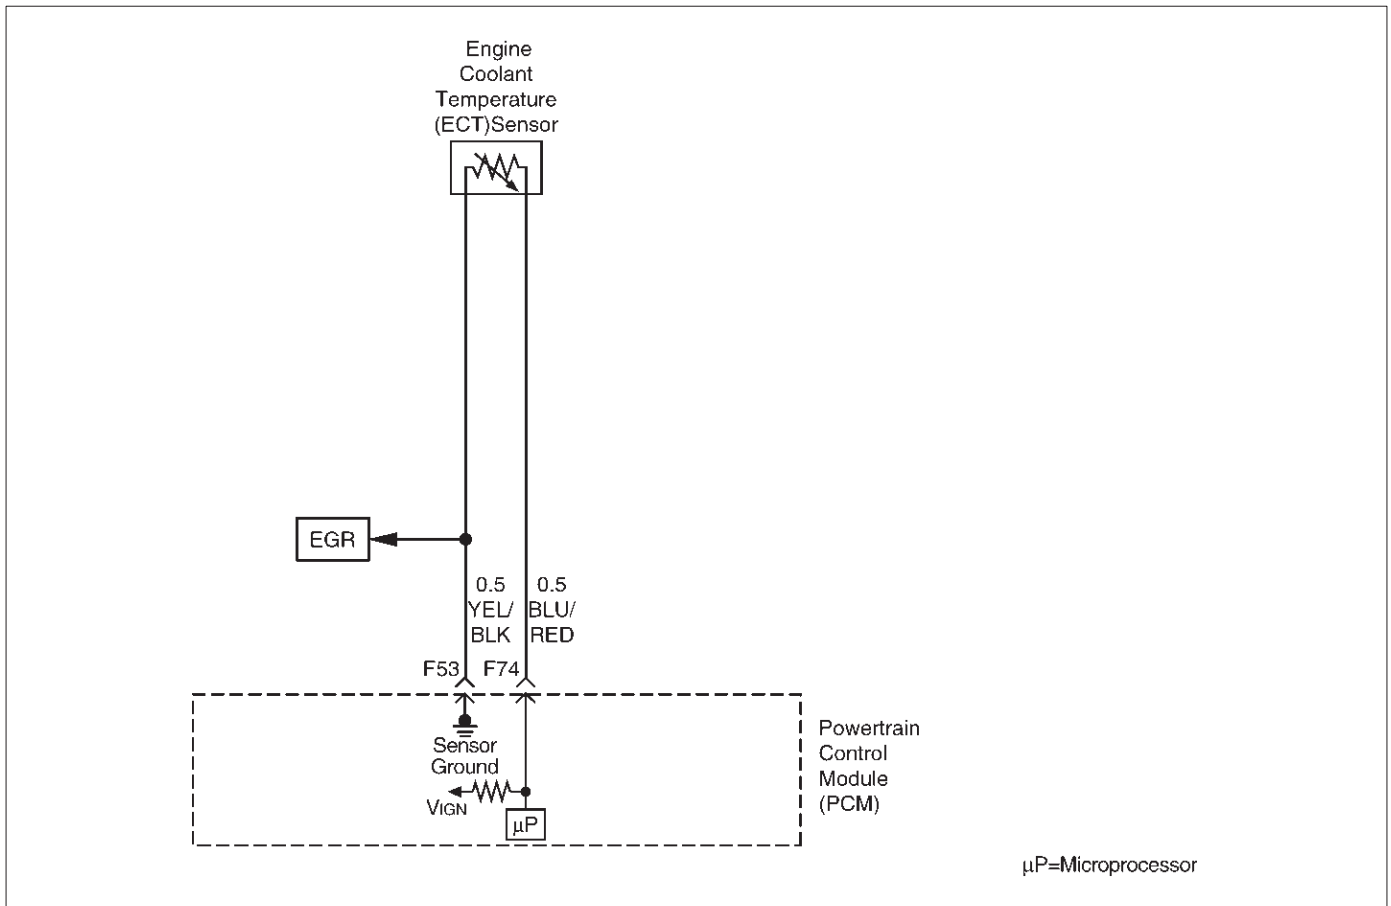

Intake Air Temperature Sensor

1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	Is DTC P0112 also set?	—	Go to <i>DTC P0112</i> first	Go to <i>Step 3</i>
3	1. Check the IAT signal circuit between the IAT sensor connector and the PCM for an intermittent short to ground. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Refer to <i>Diagnostic Aids</i>

Diagnostic Trouble Code (DTC) P1114 ECT Sensor Circuit Intermittent Low Voltage

D06RV00148

Circuit Description

The engine coolant temperature (ECT) sensor is a thermistor mounted in the engine coolant stream. The powertrain control module (PCM) applies a voltage (about 5.0 volts) through a pull-up resistor to the ECT signal circuit. When the engine coolant is cold, the sensor (thermistor) resistance is high, therefore the PCM will measure a high signal voltage. As the engine coolant warms, the sensor resistance becomes less, and the ECT signal voltage measured at the PCM drops. With a fully warmed up engine, the ECT signal voltage should measure about 1.5 to 2.0 volts. If the PCM detects an ECT signal that is intermittently below the range of the ECT sensor, DTC P1114 will set.

Conditions for Setting the DTC

- Engine run time longer than 120 seconds.
- The ECT sensor signal is intermittently greater than 150°C (302°F) (about 0.10 volt) for a total of 2.5 seconds over a 25-second period.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).

- The PCM will store conditions which were present when the DTC set as Failure Records data only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- A history DTC P1114 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1114 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the ECT display on the Tech 2 while moving connectors and wiring harnesses related to the ECT sensor. A change in the ECT display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Diagnostic Trouble Code (DTC) P1115 ECT Sensor Circuit Intermittent High Voltage

D06RV00148

Circuit Description

The engine coolant temperature (ECT) sensor is a thermistor mounted in the engine coolant stream. The powertrain control module (PCM) applies a voltage (about 5.0 volts) through a pull-up resistor to the ECT signal circuit. When the engine coolant is cold, the sensor (thermistor) resistance is high, therefore the PCM will measure a high signal voltage. As the engine coolant warms, the sensor resistance becomes less, and the ECT signal voltage measured at the PCM drops. With a fully warmed up engine, the ECT signal voltage should measure about 1.5 to 2.0 volts. If the PCM detects an ECT signal that is intermittently above the range of the ECT sensor, DTC P1115 will set.

Conditions for Setting the DTC

- Engine running time longer than 90 seconds.
- The ECT sensor signal is intermittently less than -39°C (-38°F) (about 5 volts) for a total of 2.5 seconds over a 25-second period.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).

- The PCM will store conditions which were present when the DTC was set as Failure Records data only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- A history DTC P1115 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1115 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the ECT display on the Tech 2 while moving connectors and wiring harnesses related to the ECT sensor. A change in the ECT display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often

the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Diagnostic Trouble Code(DTC)

P1120-TPS 1 Throttle Position Sensor (TPS1) Output Abnormal

D06RY00111

Circuit Description

- The throttle position (TP) sensor circuit provides a voltage signal relative to throttle blade angle. The TPS1 voltage will vary about 8% (0.4V) to about 92% (4.6V) at Wide Open Throttle (WOT) in the specified voltage (about 5V). This code detects a continuous short to ground or high in either the circuit or the sensor.

Conditions for setting the DTC

- The Ignition is "ON".
- The TPS1 output is more than 93.6 milliseconds, less than 2.5% or more than 97.5% in the specified voltage (5V).

Action Taken When the DTC Sets

- The PCM will ON the MIL after second trip with detected fault.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.

- A history DTC P1120 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1120 can be cleared using the Tech 2 "Clear Info" function.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Misrouted harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the TPS 1 display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

A change in the display will indicate the location of the fault.

If DTC P1120 cannot be duplicated, the information included in the Failure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently, performing the DTC P1120 Diagnostic Chart may isolate the cause of the fault.

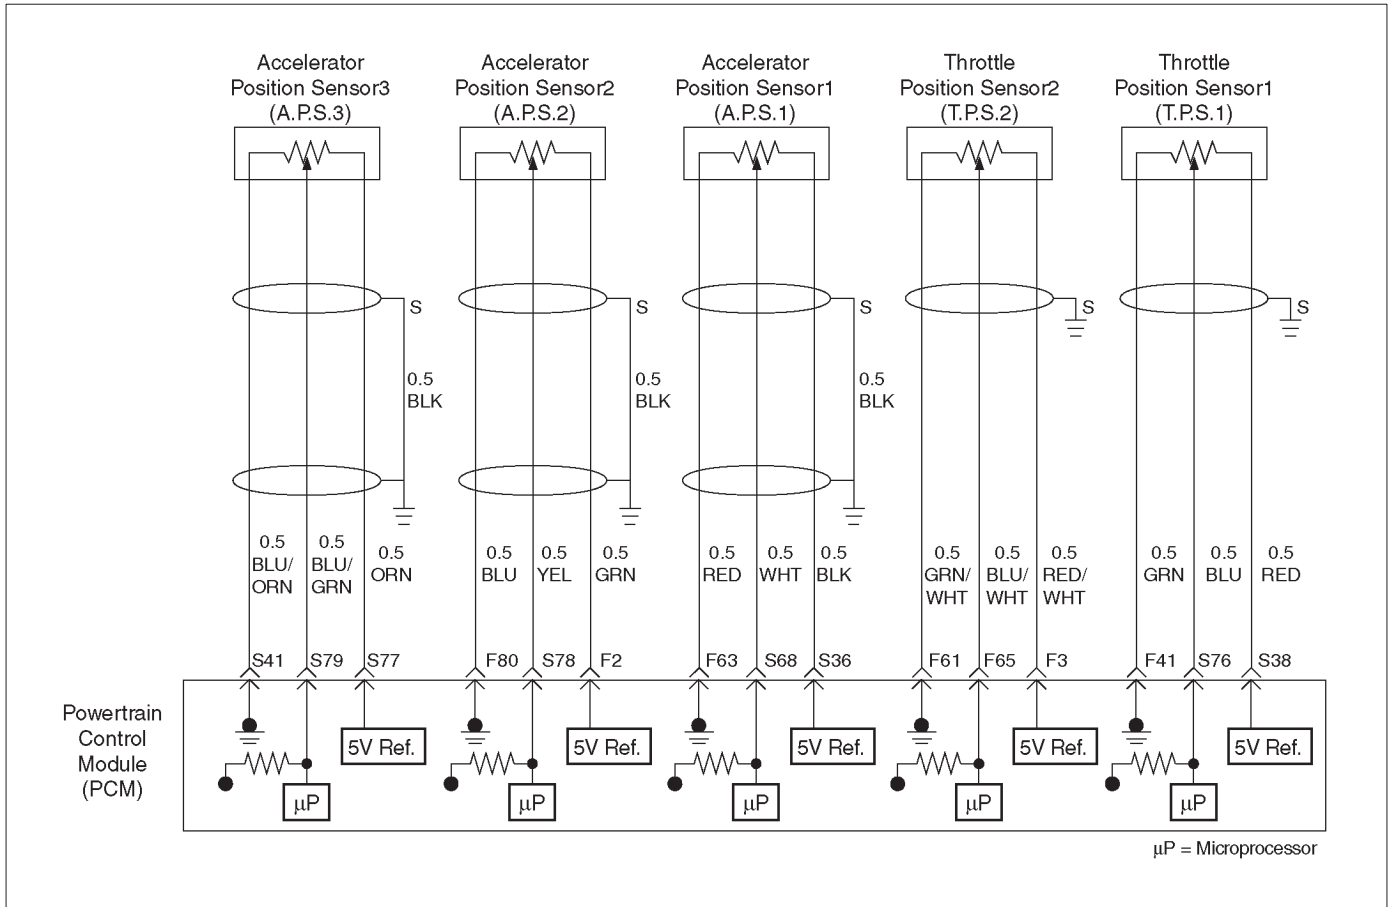

Diagnostic Trouble Code(DTC)P1120-TPS 1 Output Abnormal

Step	Action	Value(s)	Yes	No
1	Was the "On-Board(OBD)System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "ON", engine not running. 2. Observe the MAP reading on the Tech 2. Is the MAP reading less than the specified value?	65kPa	Go to Step 3	Go to Step 6
3	1. Disconnect the MAP sensor. 2. Connect a test 5 volt reference circuit and the MAP signal at the MAP sensor harness connector. 3. Observe the MAP reading on the Tech 2. Is the MAP reading less than the specified value? (If no, start with diagnosis chart for other sensors in the circuit and see if 5V returns.)	—	Go to Step 5	Go to Step 4
4	1. Check the MAP signal circuit between the PCM and MAP shorted circuit. 2. If the MAP signal circuit is open or shorted, repair it as necessary. Was the MAP signal circuit open or shorted?	—	Verify repair	Go to Step 12
5	Replace the MAP sensor. Is the action complete?	—	Verify repair	—
6	Observe the TP angle reading on the Tech 2 while slowly opening the throttle. Does the TP angle increase steadily and evenly from the closed throttle value to the wide open throttle value? Diagnostic Trouble Code (DTC) P1125 ETC (Electric Throttle Control) Limit Performance Mode

Circuit Description

- The accelerator position (AP1) sensor circuit provides a voltage signal relative to accelerator pedal angle. The accelerator pedal angle will vary about 13 % at idle position to about 87 % at wide open throttle (WOT).

This code detects if the system is in Limit Performance Mode (Fail safe Mode) and Multiple DTCs performance Mode.

Conditions for setting the DTC

- The Ignition is "ON".
- Limit Performance Mode is active. (Fail safe Mode)

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) and reduced power lamp (RPL) the first time the fault is detected.
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.

- A history DTC P1125 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1125 can be cleared using the Tech 2 "Clear Info" function.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Misrouted harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the AP sensor 1, AP sensor 2, AP sensor 3 display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

A change in the display will indicate the location of the fault.

If DTC P1125 cannot be duplicated, the information included in the Failure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently, performing the DTC P1125 Diagnostic Chart may isolate the cause of the fault.

DTC P1125 – ETC Limit Performance Model

Step	Action	Value(s)	Yes	No
1	Was the "On-Board (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Was the "Electric Throttle Control (ETC) System Check" performed?	—	Go to Step 3	Go to <i>ETC System Check</i>
3	Observe the AP angle reading on the Tech 2 while slowly opening the throttle. Does the AP angle increase steadily and evenly from the closed throttle value to the wide open throttle value?	Idle position AP sensor 1 =13 % AP sensor 2, 3 =85 ~ 89 % open throttle AP sensor 1 =85 ~ 89 % AP sensor 2 =11 ~ 15 %	Refer to <i>Diagnostic Aids</i>	Go to Step 4
4	1. Disconnect the AP sensor. 2. Observe the AP sensor reading on the Tech 2. Is the AP sensor reading near the specified value?	0V	Go to Step 5	Go to Step 6
5	1. Connect a test light between the 5 Voltage supply circuit and the AP1, AP2 AND AP3 sensor signal circuit at the AP sensor harness connector. 2. Observe the AP sensor reading on the Tech 2. Is the AP sensor reading near the specified value?	5V	Go to Step 7	Go to Step 8
6	Check the following items; 1. AP1, AP2 or AP3 signal circuit for a short to voltage. 2. AP1, AP2 or AP3 sensor ground circuit for high resistance between the PCM and the AP sensor. 3. AP1, AP2 or AP3 sensor ground circuit for a poor connection. 4. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to Step 9
7	Check the following items; 1. AP1, AP2 or AP3 signal circuit or 5 voltage supply circuit for a poor connection. 2. AP1, AP2 or AP3 signal circuit or 5 voltage supply circuit for high resistance between the PCM and the AP1, AP2 or AP3 sensor. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to Step 9

DTC P1125 – ETC Limit Performance Model (Cont'd)

Step	Action	Value(s)	Yes	No
8	Replace the AP sensor. Is the action complete?	—	Verify repair	—
9	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>ON-Vehicle Service in Power Control Module and Sensors for procedures</i> . And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1167 Fuel System Rich During Decel Fuel Cut Off (Bank 1)

060R100133

Circuit Description

The powertrain control module (PCM) continuously monitors the heated oxygen sensor (HO2S) activity for 90 seconds after “closed loop” has been enabled. During the monitoring period the powertrain control module (PCM) counts the number of times a rich to lean response is indicated and adds the amount of time it took to complete all rich to lean transitions and lean to rich transitions. This code detects if Bank1 O2 sensor indicated rich exhaust while in Decel Fuel Cut Off (DFCO) for fuel control sensors.

Conditions for setting the DTC

- No related DTCs.
- The engine coolant temperature is more than 60 °C (140 °F).
- Engine is operating in “closed loop” power enrichment mode for 0.4 seconds.

- While in “decel fuel cut off (DFCO)” mode the oxygen sensor voltage remains more than 600mV.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction malfunction indicator lamp (MIL).
- The PCM will store conditions which were present when the DTC was set as Failure Records only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- A history DTC P1167 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1167 can be cleared using the Tech 2 “Clear Info” function.

Diagnostic Aids

- Check for faulty fuel injectors and fuel pump.

Diagnostic Trouble Code (DTC) P1167 Fuel System Rich During Decel Fuel Cut Off (Bank1)

Step	Action	Value(s)	Yes	No
1	Was the "On-Board (OBD) System Check" performed?	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	Are any component related DTCs set?		Go to <i>component DTC charts</i>	Go to <i>Step 3</i>
3	<ol style="list-style-type: none"> 1. Place the transmission in Park. 2. Using a Tech 2, HO2S 1 voltage while running warm engine 75 °C – 95 °C (167 °F – 203 °F) at 1200 RPM. 3. HO2S 1 voltages should vary within the specified range. (100 – 900mV) 4. Quickly open the wide open the throttle for a few seconds. Did the voltage suddenly rise toward the low end of the specified range?	100 – 600 mV	Go to <i>OBD System Check</i>	Go to <i>Step 4</i>
4	<ol style="list-style-type: none"> 1. Disconnect the fuel pump relay and crank the engine to relieve the fuel pressure. 2. Install the fuel pressure gauge. 3. Start the engine and idle at normal operating temperature. 4. Disconnect the vacuum line going to the fuel pressure regulator. With the engine running, is the fuel pressure within the specified range?	280 – 325Kpa (41 – 46psi)	Go to <i>OBD System Check</i>	Go to <i>Step 5</i>
5	<ol style="list-style-type: none"> 1. Ignition "OFF". 2. Remove the fuel pump relay and replace it with a fused jumper which will connect the relay's battery terminal to the terminal leading to the fuel pump fuse. 3. While the fuel pump is operating, use pliers to slowly close the return line (do not exceed the first specified value). Using the pliers to restrict the return line, can the fuel pressure be manipulated to exceed the second value? Is the TP sensor reading near the specified value?	414KPa (60psi) 325KPa (46psi)	Refer to <i>Diagnostic Aids</i>	Go to <i>Step 6</i>
6	Check the following items; <ul style="list-style-type: none"> ● Faulty fuel pump ● Incorrect fuel pump ● Incorrect fuel being used ● Cold fuel If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1169 Fuel System Rich During Decel Fuel Cut Off (Bank 2)

060R100133

Circuit Description

The powertrain control module (PCM) continuously monitors the heated oxygen sensor (HO₂S) activity for 90 seconds after “closed loop” has been enabled. During the monitoring period the powertrain control module (PCM) counts the number of times a rich to lean response is indicated and adds the amount of time it look to complete all rich to lean transitions and lean to rich transitions.

This code detects if Bank2 sensor indicated rich exhaust while in Decel Fuel Cut Off (DFCO) for fuel control sensors.

Conditions for setting the DTC

- No related DTCs.
- The engine coolant temperature is more than 60 °C (140 °F).
- Engine is operating in “closed loop” power enrichment mode for 0.4 seconds.

- While in “closed fuel cut off (DFCO)” mode the oxygen sensor voltage remains more than 600mV in DFCO.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction malfunction indicator lamp (MIL).
- The PCM will store conditions which were present when the DTC was set as Failure Records only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- A history DTC P1169 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1169 can be cleared using the Tech 2 “Clear Info” function.

Diagnostic Aids

- Check for faulty fuel injectors and fuel pump.

Diagnostic Trouble Code (DTC) P1171 Fuel System Lean During Accelerator

060R100133

Circuit Description

The powertrain control module (PCM) internal circuitry can identify if the vehicle fuel system is capable of supplying adequate amounts of fuel during heavy accelerator (power enrichment). The PCM monitors the voltage of the oxygen sensor during power enrichment. When a power enrichment mode of operation is requested during "closed loop" operation (by heavy accelerator), the PCM will provide more fuel to the engine. Under these conditions the PCM should detect a "rich" condition (high oxygen sensor voltage). If this "rich" exhaust is not detected at this time, a DTC P1171 will set. A plugged fuel filter, restricted fuel line, restricted in-tank filter or defective fuel pump can prevent adequate amounts of fuel from being supplied during power enrichment mode.

Conditions for Setting the DTC

- No related DTCs.
- Engine is operating in "closed loop power enrichment" mode for 3 seconds.
- Engine coolant temperature is above 60°C (140°F).
- While in "power enrichment" mode the oxygen sensor voltage remains below 400 mV for 3 seconds.

Action Taken When the DTC Sets

- The PCM will not turn the malfunction indicator lamp (MIL) "ON".
- The PCM will store conditions which were present when the DTC was set as Failure Records only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1171 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1171 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

- A restricted fuel filter or fuel line, restricted in-tank filter, or a defective fuel pump may supply adequate amounts of fuel at idle, but may not be able to supply enough fuel during heavy accelerator.
- Water or alcohol in the fuel may cause low HO₂S voltage during accelerator.
- Check for faulty or plugged fuel injector(s).
- Check for low fuel.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

4. When the engine is idling or at steady cruise, the HO₂S voltage should vary from between approximately 100 mV to 900 mV. It is possible to measure a satisfactory fuel pressure at idle even though the pressure may drop at high flow requirements. It may be necessary to watch fuel pressure at high engine load.
5. Wrap a shop towel around the fuel pressure connector to absorb any small amount of fuel leakage that may occur when installing gauge. Ignition "ON", pump pressure should be 280-320 kPa.
7. Add Caution, Use correct pliers so damage to fuel lines will not occur.

DTC P1171 – Fuel System Lean During Accelerator

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	Are any component-related DTCs set?	—	Go to component DTC charts	Go to <i>Step 3</i>
3	1. Check the vehicle's fuel tank for an adequate amount of fuel. 2. Add fuel to the vehicle's fuel tank if the tank is almost empty. Was fuel added to the vehicle's fuel tank?	—	Go to <i>Step 4</i>	Go to <i>Step 5</i>
4	1. Place the transmission in park. 2. Using a Tech 2, observe HO2S 1 voltage while running warm engine 75°C-95°C (167°F-203°F) at 1200 RPM. 3. HO2S 1 voltage should vary within the specified range. 4. Quickly open the throttle halfway for a few seconds. Did the voltage suddenly rise toward the high end of the specified range?	100-900 mV	Go to <i>Fuel System Electrical Test</i>	Go to <i>Step 5</i>
5	1. Disconnect the fuel pump relay and crank the engine to relieve the fuel pressure. 2. Install the fuel pressure gauge. 3. Start the engine and idle at normal operating temperature. 4. Disconnect the vacuum line going to the fuel pressure regulator. With the engine running, is the fuel pressure within the specified range?	280-325 kPa (41-46 psi)	Go to <i>OBD System Check</i>	Go to <i>Step 6</i>
6	Check for restricted fuel lines or restricted in-line filter. Was a problem found?	—	Verify repair	Go to <i>Step 7</i>
7	1. Ignition "OFF". 2. Remove the fuel pump relay and replace it with a fused jumper which will connect the relay's battery terminal to the terminal leading to the fuel pump fuse. 3. While the fuel pump is operating, use pliers to slowly close the return line (do not exceed the first specified value). Using the pliers to restrict the return line, can the fuel pressure be manipulated to exceed the second specified value?	414 kPa (60 psi) 325 kPa (46 psi)	Go to <i>Diagnostic Aids</i>	Go to <i>Step 8</i>
8	Check for: <ul style="list-style-type: none"> ● Faulty fuel pump ● Restricted fuel pump strainer (sock) ● Incorrect fuel pump ● Incorrect fuel being used ● Hot fuel Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1120 Throttle Position Sensor2 (TPS2) Circuit Fault

D06RY00111

Circuit Description

- The throttle position (TP2) sensor circuit provides a voltage signal relative to throttle blade angle. The TPS2 voltage will vary about 8% (0.4V) to about 92% (4.6V) at Wide Open Throttle (WOT) in the specified voltage (about 5V). This code detects a continuous short to ground or high in either the circuit or the sensor.

Conditions for setting the DTC

- The Ignition is "ON".
- The TPS2 output is more than 93.6 milliseconds, less than 2.5% or more than 97.5% in the specified voltage (5V).

Action Taken When the DTC Sets

- The PCM will ON the MIL after second trip with detected fault.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.

- A history DTC P1120 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1120 can be cleared using the Tech2 "Clear Info" function.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Misrouted harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- The MAP sensor shares a 5 Volt reference with the Fuel Tank Pressure. If these codes are also set, it could indicate a problem with the 5 Volt reference circuit.
- The MAP sensor shares a ground with the Fuel Tank Pressure, the ECT sensor, and the Transmission Fluid
- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, poor terminal to wire connection.
- Damaged harness—Inspect the wiring harness for damage. If the harness appears to be OK, observe the TP sensor display on the Tech 2 while moving connectors and wiring harnesses related to the sensor. A change in the display will indicate the location of the fault. If DTC P1120 cannot be duplicated, the

information included in the Failure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently, performing the DTC

P1120 Diagnostic Chart may isolate the cause of the fault.

DTC P1220-TPS 2 Circuit Fault

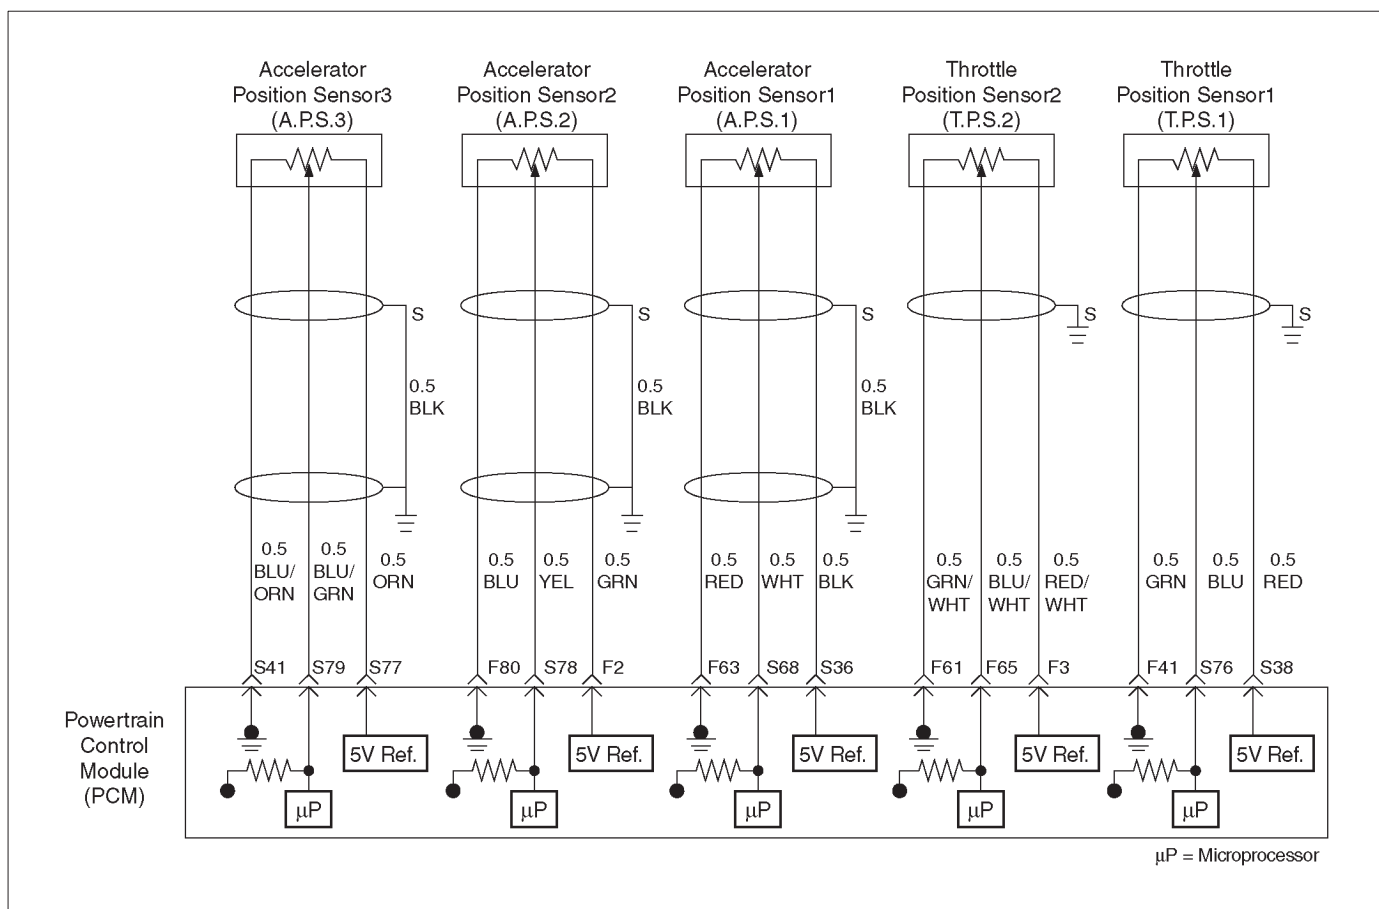

Step	Action	Value(s)	Yes	No
1	Was the "On-Board (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Was the "Electric Throttle Control (ETC) System Check" performed?	—	Go to Step 3	Go to <i>ETC System Check</i>
3	1. Ignition "ON", engine not running. 2. Observe the MAP reading on the Tech 2. Is the MAP reading less than the specified value?	65 kPa	Go to Step 4	Go to Step 7
4	1. Disconnect the MAP sensor. 2. Connect a test 5 volt reference circuit and the MAP signal at the MAP sensor harness connector. 3. Observe the MAP reading on the Tech 2. Is the MAP reading less than the specified value? (If no, start with diagnosis chart for other sensors in the circuit and see if 5V returns.)	—	Go to Step 6	Go to Step 5
5	1. Check the MAP signal circuit between the PCM and MAP ground circuit. 2. If the MAP signal circuit is open or shorted, repair as necessary. Was the MAP signal circuit open or shorted?	—	Verify repair	Go to Step 13
6	Replace the MAP sensor. Is the action complete?	—	Verify repair	—
7	Observe the TP angle reading on the Tech-2 while slowly opening the throttle. Does the TP angle increase steadily and evenly from the closed throttle value to the wide open throttle value?	Closed TPS1 8–10 % TPS2 8–10 % WTO TPS1 90–92 % TPS2 90–92 %	Refer to <i>Diagnostic Aids</i>	Go to Step 8
8	1. Disconnect the TP sensor. 2. Observe the TP sensor reading on the Tech2. Is the TP sensor reading near the specified value?	0V	Go to Step 9	Go to Step 10
9	1. Connect a test light between the 5Volt reference circuit and the TP2 sensor signal circuit at the TP sensor harness connector. 2. Observe the TP sensor reading on the Tech 2. Is the TP sensor reading near the specified value?	5V	Go to Step 12	Go to Step 11

Diagnosis Trouble Code(DTC)

P1221 TPS1 – TPS2 Correlation(Circuit Performance)

060R100140

Circuit Description

- The powertrain control module (PCM) controls engine speed by adjusting the position of the throttle control valve (DC motor). The throttle motor is a DC motor driven by one coil. The PCM applies current to DC motor coil in duty (%) to adjustment the valve into a passage in the throttle body to air flow.

This method allows highly accurate control of engine speed and quick response to changes in engine load.

- The accelerator position (AP) sensor circuit provides a voltage signal relative to accelerator pedal angle. The accelerator pedal angle (AP1) will vary about 13% at idle position to about 87% at open throttle(WOT).

APS signal is used to determine which DC will adjust throttle position.

After the APS signal has been processed by the PCM, it will command DC motor to allow a move of throttle position.

- Accelerator pedal – Check for objects blocking the AP sensor or pedal arm with spring, and excessive deposits in the accelerator pedal arm and on the accelerator pedal.

Conditions for Setting the DTC

- The ignition is "ON".

- Difference of between TPS1 and TPS2 correlation is over 6.5% with over 125 milliseconds.

Action Taken When the DTC Sets

- The PCM will not turn the malfunction indicator lamp (MIL) "ON".
- The PCM will store conditions which were present when the DTC was set as Failure Records only. This information will not be stored as Freeze Frame data.

Condition for Clearing the MIL/DTC

- A history DTC 1221 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC 1221 can be cleared using the Tech 2 "Clear Info" function.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

2. Visually/physically inspect for the following throttle valve conditions.
3. Visually/physically inspect for the following accelerator pedal conditions.
5. Check the following circuits for throttle valve and DC motor. Check the following TP sensor resistance and DC motor.

- 7. Check the following circuits for accelerator pedal problems. Check the following AP sensor resistance.
- 9. Following DTC: Software detect Error for ETC system.
- 10. Following DTC: Software detect Error for ETC system.

the insulation. Check for poor connections or a damaged harness. Inspect the PCM harness and connector for improper mating, broken locks, improperly formed or damaged terminals, poor terminal-to-wire connection, and damaged harness.

- Throttle body – Check for objects blocking the DC motor or throttle bore, excessive deposits in the ETC passage and on the valve spring, and excessive deposits in the throttle bore and on the throttle valve plate.

Diagnostic Aids

- An intermittent may be caused by a poor connection, rubbed-through wire insulation or a wire broken inside

Diagnostic Trouble Code (DTC) P1271 APS 1-2 Correlation Error

Circuit Description

- The accelerator position (AP) sensor circuit provides a voltage signal relative to accelerator pedal angle.

The accelerator pedal sensor (AP1) will vary about 13 % at idle position to about 87 % at wide open throttle (WOT) to specified voltage (about 5V).

This code detects a correlation error between APS1 and APS2.

Conditions for setting the DTC

- The Ignition is "ON".
- The accelerator pedal angle difference is more than 4.5 % between ASP1 and APS2 for over than 265 milliseconds.

Action Taken When the DTC Sets

- The PCM will not turn the malfunction indicator lamp (MIL) "ON".
- The PCM will store conditions which were present when the DTC was set as Failure Records only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1271 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.

- DTC P1271 can be cleared using the Tech 2 "Clear Info" function.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Misrouted harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the AP sensor 1, AP sensor 2 display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

A change in the display will indicate the location of the fault. If DTC P1271 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently, performing the DTC P1271 Diagnostic Chart may isolate the cause of the fault.

Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1272 APS 2 – 3 Correlation Error

060R100141

Circuit Description

- The accelerator position (AP) sensor circuit provides a voltage signal relative to accelerator pedal angle.

The accelerator pedal sensor (AP2) will vary about 87 % at idle position to about 13 % at wide open throttle (WOT) to specified voltage (about 5V).

This code detects a correlation error between APS2 and APS3.

Conditions for setting the DTC

- The Ignition is "ON".
- The accelerator pedal angle difference is more than 4.5 % between ASP2 and APS3 for more than 265 millisecond.

Action Taken When the DTC Sets

- The PCM will not turn the malfunction indicator lamp (MIL) "ON".
- The PCM will store conditions which were present when the DTC was set as Failure Records only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1272 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.

- DTC P1272 can be cleared using the Tech 2 "Clear Info" function.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Misrouted harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the AP sensor 2, AP sensor 3 display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

A change in the display will indicate the location of the fault. If DTC P1272 cannot be duplicated, the information included in the Failure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently, performing the DTC

P1272 Diagnostic Chart may isolate the cause of the fault.

Diagnostic Trouble Code (DTC) P1275 APS 1 Output Fault

060R100141

Circuit Description

- The accelerator position (AP) sensor circuit provides a voltage signal relative to accelerator pedal angle. The accelerator pedal sensor (AP1) will vary about 13 % at idle position to about 87 % at wide open throttle (WOT) to specified voltage (about 5V). This code detects a continuous short to ground or high in either the circuit or the sensor.

Conditions for setting the DTC

- The Ignition is "ON".
- The accelerator pedal sensor 1 is less than 2.5 % or more than 97 % in the specified voltage (5V) with more than 62.4 milliseconds.

Action Taken When the DTC Sets

- The PCM will ON the MIL after second trip with detected fault.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1275 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.

- DTC P1275 can be cleared using the Tech 2 "Clear Info" function.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Misrouted harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the AP sensor 1 display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

A change in the display will indicate the location of the fault. If DTC P1275 cannot be duplicated, the information included in the Failure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently, performing the DTC

P1275 Diagnostic Chart may isolate the cause of the fault.

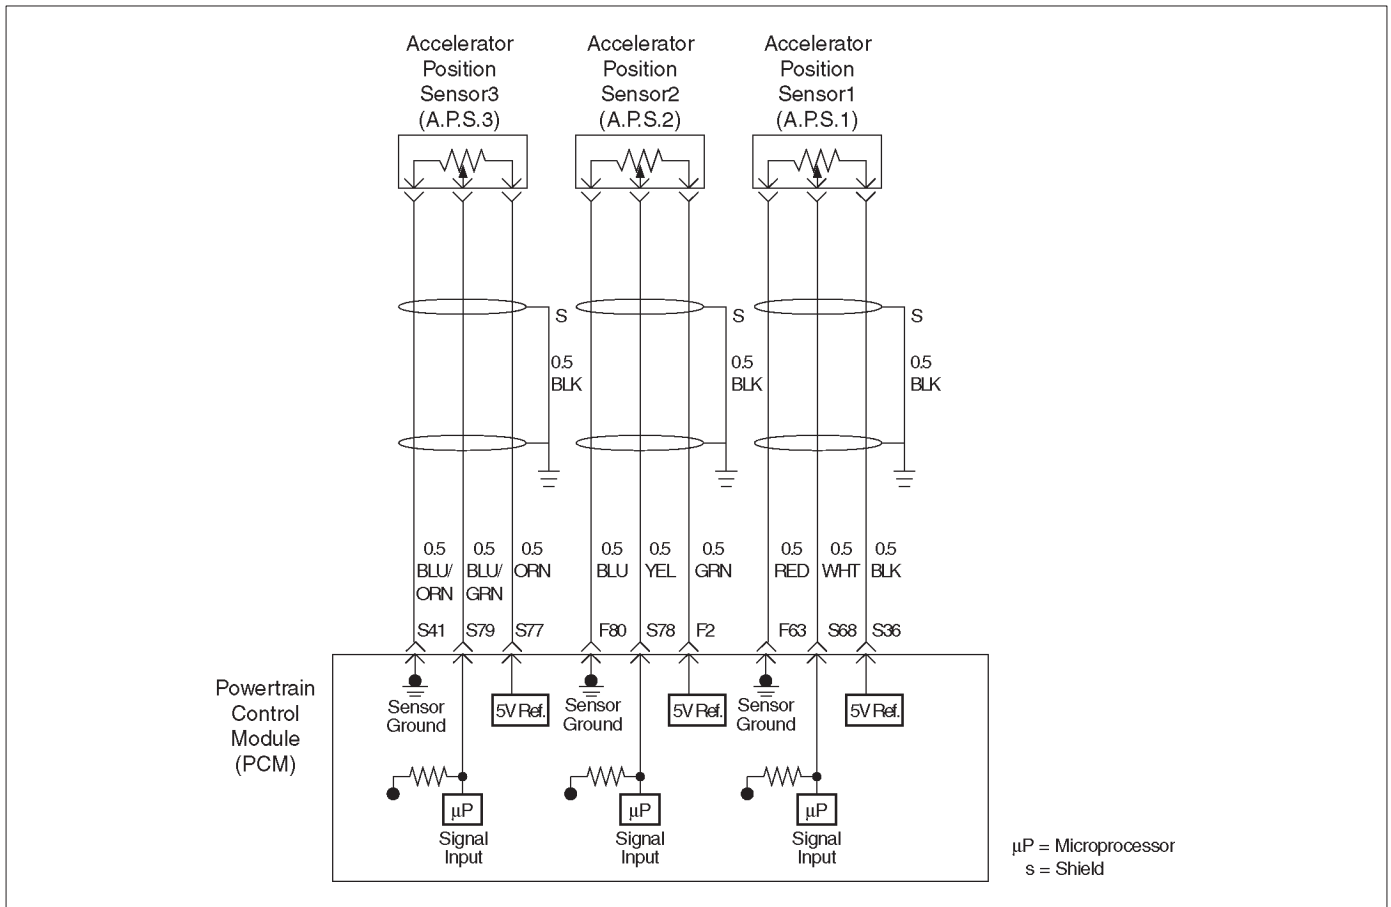

DTC P1275 – APS 1 Circuit Fault

6	Check the following items; 1. AP1 signal circuit for a short to voltage. 2. AP1 sensor ground circuit for high resistance between the PCM and the AP sensor. 3. AP1 sensor ground circuit for a poor connection. 4. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to Step 9
7	Check the following items; 1. AP1 signal circuit or 5 volt supply circuit for a poor connection. 2. AP1 signal circuit or 5 volt supply circuit for high resistance between the PCM and the AP1 sensor. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to Step 9
8	Replace the AP sensor. Is the action complete?	—	Verify repair	—
9	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>ON-Vehicle Service in Power Control Module and Sensors for procedures</i> . And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

DTC P1280 - APS 2 Circuit Fault

Step	Action	Value(s)	Yes	No
1	Was the "On-Board (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Was the "Electric Throttle Control (ETC) System Check" performed?	—	Go to Step 3	Go to <i>ETC System Check</i>
3	Observe the AP angle reading on the Tech 2 while slowly opening the throttle. Does the AP angle increase steadily and evenly from the closed throttle value to the wide open throttle value?	Idle position =86 ~ 88 % Wide open throttle =12 ~ 14 %	Refer to <i>Diagnostic Aids</i>	Go to Step 4
4	1. Disconnect the AP sensor. 2. Observe the AP sensor reading on the Tech 2. Is the AP sensor reading near the specified value?	0V	Go to Step 5	Go to Step 6
5	1. Connect a test light between the 5 voltage supply circuit and the AP2 sensor signal circuit at the AP sensor harness connector. 2. Observe the AP sensor reading on the Tech 2. Is the AP sensor reading near the specified value?	5V	Go to Step 7	Go to Step 8
6	Check the following items; 1. AP2 signal circuit for a short to volt. 2. AP2 sensor ground circuit for high resistance between the PCM and the AP sensor. 3. AP2 sensor ground circuit for a poor connection. 4. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to Step 9
7	Check the following items; 1. AP2 signal circuit or 5 volt supply circuit for a poor connection. 2. AP2 signal circuit or 5 volt supply circuit for high resistance between the PCM and the AP2 sensor. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to Step 9
8	Replace the AP sensor. Is the action complete?	—	Verify repair	—
9	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>ON-Vehicle Service in Power Control Module and Sensors for procedures</i> . And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1285 APS 3 Output Fault

Circuit Description

- The accelerator position (AP) sensor circuit provides a voltage signal relative to accelerator pedal angle.

The accelerator pedal sensor (AP3) will vary about 87 % at idle position to about 34 % at wide open throttle (WOT) to specified voltage (about 5V).

This code detects a continuous short to ground or high in either the circuit or the sensor.

Conditions for setting the DTC

- The Ignition is "ON".
- The accelerator pedal sensor 3 is less than 2.5 % or more than 97 % in the specified voltage (5V) with more than 62.4 milliseconds.

Action Taken When the DTC Sets

- The PCM will ON the MIL after second trip with detected the fault.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1285 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.

- DTC P1285 can be cleared using the Tech 2 "Clear Info" function.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Misrouted harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the AP sensor 3 display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

A change in the display will indicate the location of the fault. If DTC P1285 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the DTC was last set.

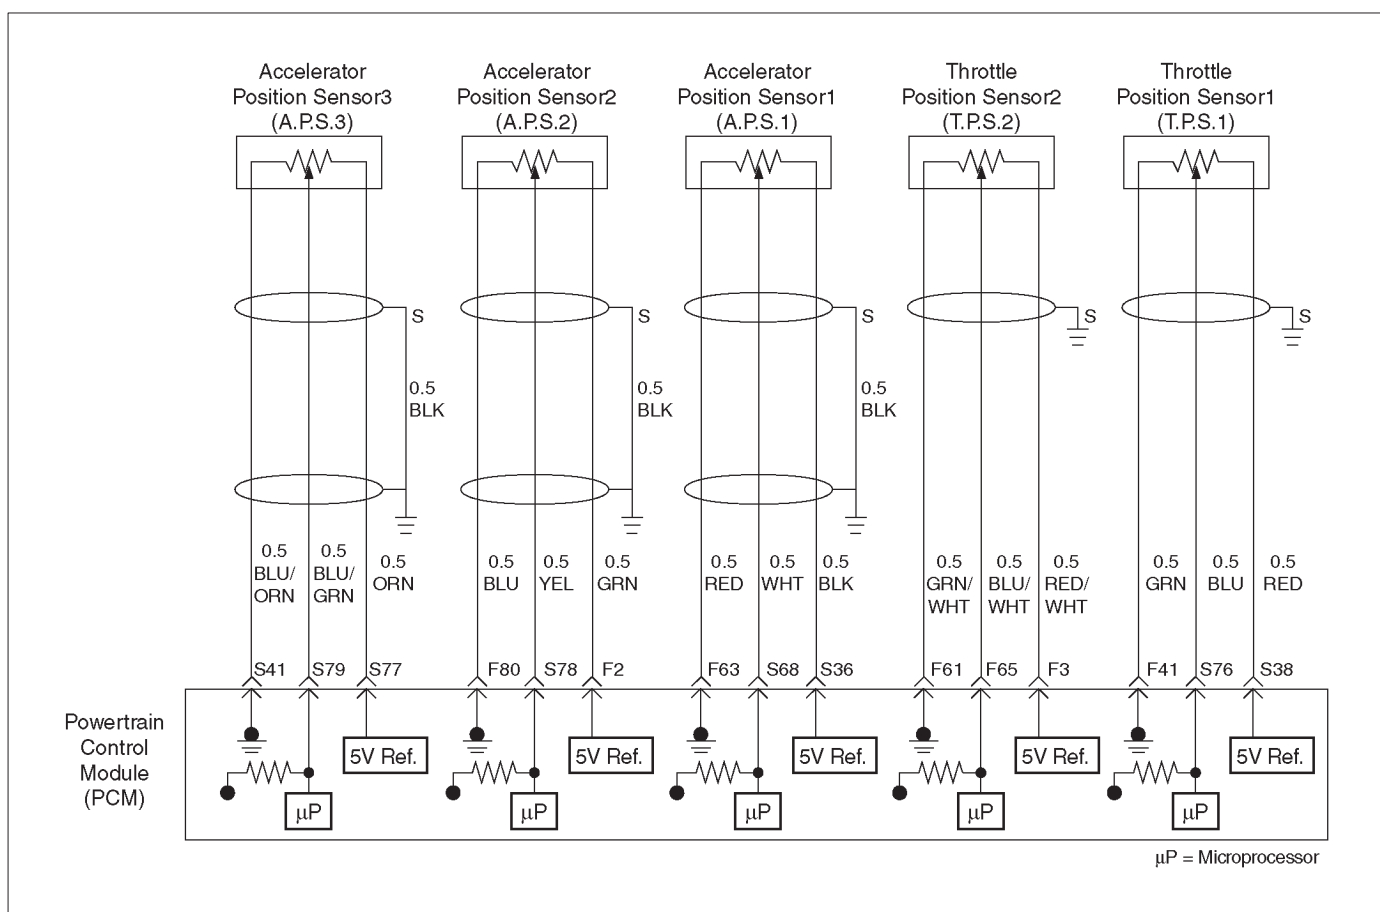

If it is determined that the DTC occurs intermittently, performing the DTC

P1285 Diagnostic Chart may isolate the cause of the fault.

DTC P1285 – APS 3 Circuit Fault

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Was the “Electric Throttle Control (ETC) System Check” performed?	—	Go to Step 3	Go to <i>ETC System Check</i>
3	Observe the AP angle reading on the Tech 2 while slowly opening the throttle. Does the AP angle increase steadily and evenly from the closed throttle value to the wide open throttle value?	Idle position =86 ~ 88 % Wide open throttle =32 ~ 36 %	Refer to <i>Diagnostic Aids</i>	Go to Step 4
4	1. Disconnect the AP sensor. 2. Observe the AP sensor reading on the Tech 2. Is the AP sensor reading near the specified value?	0V	Go to Step 5	Go to Step 6
5	1. Connect a test light between the 5 volt supply circuit and the AP3 sensor signal circuit at the AP sensor harness connector. 2. Observe the AP sensor reading on the Tech 2. Is the AP sensor reading near the specified value?	5V	Go to Step 7	Go to Step 8
6	Check the following items; 1. AP3 signal circuit for a short to voltage. 2. AP3 sensor ground circuit for high resistance between the PCM and the AP sensor. 3. AP3 sensor ground circuit for a poor connection. 4. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to Step 9
7	Check the following items; 1. AP3 signal circuit or 5 volt supply circuit for a poor connection. 2. AP3 signal circuit or 5 volt supply circuit for high resistance between the PCM and the AP3 sensor. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to Step 9
8	Replace the AP sensor. Is the action complete?	—	Verify repair	—
9	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>ON-Vehicle Service in Power Control Module and Sensors for procedures</i> . And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1290 ETC Forced Idle Mode

060R100140

Circuit Description

- The accelerator position (AP) sensor circuit provides a voltage signal relative to accelerator pedal angle.

This code detects that if the system is in Forced Idle Mode. (Fail safe Mode)

DTC P1290 is recorded by the PCM when all AP sensors are failed.

Conditions for setting the DTC

- The Ignition is "ON".
- Forced Idle Mode is active. (Fail safe Mode)

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) and reduced powered lamp (RPL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1290 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.

- DTC P1290 can be cleared using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Misrouted harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the AP sensor 1, AP sensor 2, AP sensor 3 display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

A change in the display will indicate the location of the fault. If DTC P1290 cannot be duplicated, the information included in the Failure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determining that the DTC occurs intermittently, performing the DTC

P1290 Diagnostic Chart may isolate the cause of the fault.

DTC P1290 - ETC Forced Idle Mode

Step	Action	Value(s)	Yes	No
1	Was the "On - Board (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Was the "Electric Throttle Control (ETC) System Check" performed?	—	Go to Step 3	Go to <i>ETC System Check</i>
3	Observe the AP angle reading on the Tech2 while slowly opening the throttle. Does the AP angle increase steadily and evenly from the closed throttle value to the wide open throttle value?	Idle position AP sensor 1 =12 ~ 14 % AP sensor 2, 3 =86 ~ 88 % Wide open throttle AP sensor 1 =86 ~ 88 % AP sensor 2 =12 ~ 14 % AP sensor 3 =32 ~ 36 %	Refer to <i>Diagnostic Aids</i>	Go to Step 4
4	1. Disconnect the AP sensor. 2. Observe the AP sensor reading on the Tech 2. Is the AP sensor reading near the specified value?	0V	Go to Step 5	Go to Step 6
5	1. Connect a test light between the 5 volt supply circuit and the AP1, AP2 and AP3 sensor signal circuit at the AP sensor harness connector. 2. Observe the AP sensor reading on the Tech2. Is the AP sensor reading near the specified value?	5V	Go to Step 7	Go to Step 8
6	Check the following items; 1. AP1,AP2 and AP3 signal circuit for a short to voltage. 2. AP1, AP2 and AP3 sensor ground circuit for high resistance between the PCM and the AP sensor. 3. AP1, AP2 and AP3 sensor ground circuit for a poor connection. 4. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to Step 9
7	Check the following items; 1. AP1, AP2 and AP3 signal circuit or 5 volt supply circuit for a poor connection. 2. AP1, AP2 and AP3 signal circuit or 5 volt supply circuit for high resistance between the PCM and the AP1, AP2 and AP3 sensor. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to Step 9

DTC P1290 - ETC Forced Idle Mode (Cont'd)

Step	Action	Value(s)	Yes	No
8	Replace the AP sensor. Is the action complete?	—	Verify repair	—
9	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>ON-Vehicle Service in Power Control Module and Sensors for procedures</i> . And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1295 ETC Power Management Mode

D06RY00111

Circuit Description

- The throttle position (TP) sensor circuit provides a voltage signal relative to throttle position (blade angle).
- The DC motor circuit provides a voltage signal relative to command throttle position (blade angle).
- This DTC detects that if the system is in Power Management Mode.(Fail safe Mode)
- DTC P1295 recorded by the PCM when all TP sensors are failed.

Conditions for setting the DTC

- The ignition is "ON".
- Power Management Mode is active. (Fail safe Mode)

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) and the reduced power lamp (RPL) the first time the fault is detected.
- The PCM calculates an air flow value based on idle air control valve position, throttle position, RPM and barometric pressure.
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.

- A history DTC P1295 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1295 can be cleared using the Tech 2 "Clear Info" function.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Misrouted harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the TP sensor 1, TP sensor 2 display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

A change in the display will indicate the location of the fault. If DTC P1295 cannot be duplicated, the information included in the Failure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determining that the DTC occurs intermittently, performing the DTC

P1295 Diagnostic Chart may isolate the cause of the fault.

DTC P1295 - ETC Power Management Mode

Step	Action	Value(s)	Yes	No
1	Was the "On-Board (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Was the "Electric Throttle Control (ETC) System Check" performed?	—	Go to Step 3	Go to <i>ETC System Check</i>
3	1. Ignition "ON", engine "OFF". 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor "DTC" info for DTC P1295. Does the Tech 2 indicate DTC P1295 failed this ignition?	—	Go to Step 4	Refer to <i>Diagnostic Aids</i>
4	Observe the TP angle reading on the Tech 2 while slowly opening the throttle. Does the TP angle increase steadily and evenly from the closed throttle value to the wide open throttle value?	Closed throttle TP sensor 1 =8 ~ 10 % TP sensor 2 =90 ~ 92 % Wide open throttle TP sensor 1 =90 ~ 92 % TP sensor 2 =8 ~ 10 %	Go to Step 9	Go to Step 5
5	1. Ignition "OFF". 2. Disconnect the DC motor. Is the DC motor reading near the specified value?	0.3 ~ 100 μ	Go to Step 6	Go to Step 8
6	Check the DC motor harness between the PCM and DC Motor circuit at the DC motor harness connector. Was a problem found?	—	Verify repair	Go to Step 7
7	Check the throttle valve assembly. Was a problem found?		Verify repair	Go to Step 8
8	Replace the DC motor. (Replace the Throttle valve assembly) Is the action complete?	—	Verify repair	Go to Step 7
9	1. Disconnect the TP sensor. 2. Observe the TP sensor reading on the Tech 2. Is the TP sensor reading near the specified value?	0V	Go to Step 10	Go to Step 11
10	1. Connect a test light between the 5Volt reference "A" circuit and the TP1 and TP2 sensor signal circuit at the TP sensor harness connector. 2. Observe the TP sensor reading on the Tech 2. Is the TP sensor reading near the specified value?	5V	Go to Step 13	Go to Step 12

Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1299 ETC Forced Engine Shutdown Mode

Circuit Description

- The throttle position sensor circuit provides a voltage signal relative to throttle position (blade angle).
- The DC motor circuit provides a voltage signal relative to command throttle position (blade angle).
- This DTC detects if the system is in ETC Forced Engine Shutdown Mode.(Fail safe Mode)

Conditions for setting the DTC

- The ignition is "ON".
- ETC Forced Engine Shutdown Mode is active. (Fail safe Mode)

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) and the reduced power lamp (RPL) the first time the fault is detected.
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1299 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.

- DTC P1299 can be cleared using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Misrouted harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the TP sensor 1, TP sensor 2 display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

A change in the display will indicate the location of the fault. If DTC P1299 cannot be duplicated, the information included in the Failure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determining that the DTC occurs intermittently, performing the DTC P1299 Diagnostic Chart may isolate the cause of the fault.

DTC P1299 - ETC Forced Engine Shutdown Mode

Step	Action	Value(s)	Yes	No
1	Was the "On-Board (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Was the "Electric Throttle Control (ETC) System Check" performed?	—	Go to Step 3	Go to <i>ETC System Check</i>
3	Observe the TP angle reading on the Tech 2 while slowly opening the throttle. Does the TP angle increase steadily and evenly from the closed throttle value to the wide open throttle value?	Closed throttle TP sensor 1 =8 ~ 10 % TP sensor 2 =90 ~ 92 % Wide open throttle TP sensor 1 =90 ~ 92 % TP sensor 2 =8 ~ 10 %	Go to Step 8	Go to Step 4
4	1. Ignition "OFF". 2. Disconnect the DC motor. Is the DC motor reading near the specified value?	0.3 ~ 100 μ	Go to Step 5	Go to Step 7
5	Check the DC motor harness between the PCM and DC Motor circuit at the DC motor harness connector. Was a problem found?	—	Verify repair	Go to Step 6
6	Check the throttle valve assembly. Was a problem found?		Verify repair	Go to Step 7
7	Replace the DC motor. (Replace the Throttle valve assembly) Is the action complete?	—	Verify repair	Go to Step 8
8	1. Disconnect the TP sensor. 2. Observe the TP sensor reading on the Tech 2. Is the TP sensor reading near the specified value?	0V	Go to Step 9	Go to Step 10
9	1. Connect a test light between the 5 Volt reference circuit and the TP1 and TP2 sensor signal circuit at the TP sensor harness connector. 2. Observe the TP sensor reading on the Tech 2. Is the TP sensor reading near the specified value?	5V	Go to Step 12	Go to Step 11
10	Check the following items; 1. TP1 and TP2 signal circuit for a short to voltage. 2. TP1 and TP2 sensor ground circuit for high resistance between the PCM and the TP sensor. 3. TP1 and TP2 sensor ground circuit for a poor connection. 4. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to Step 13

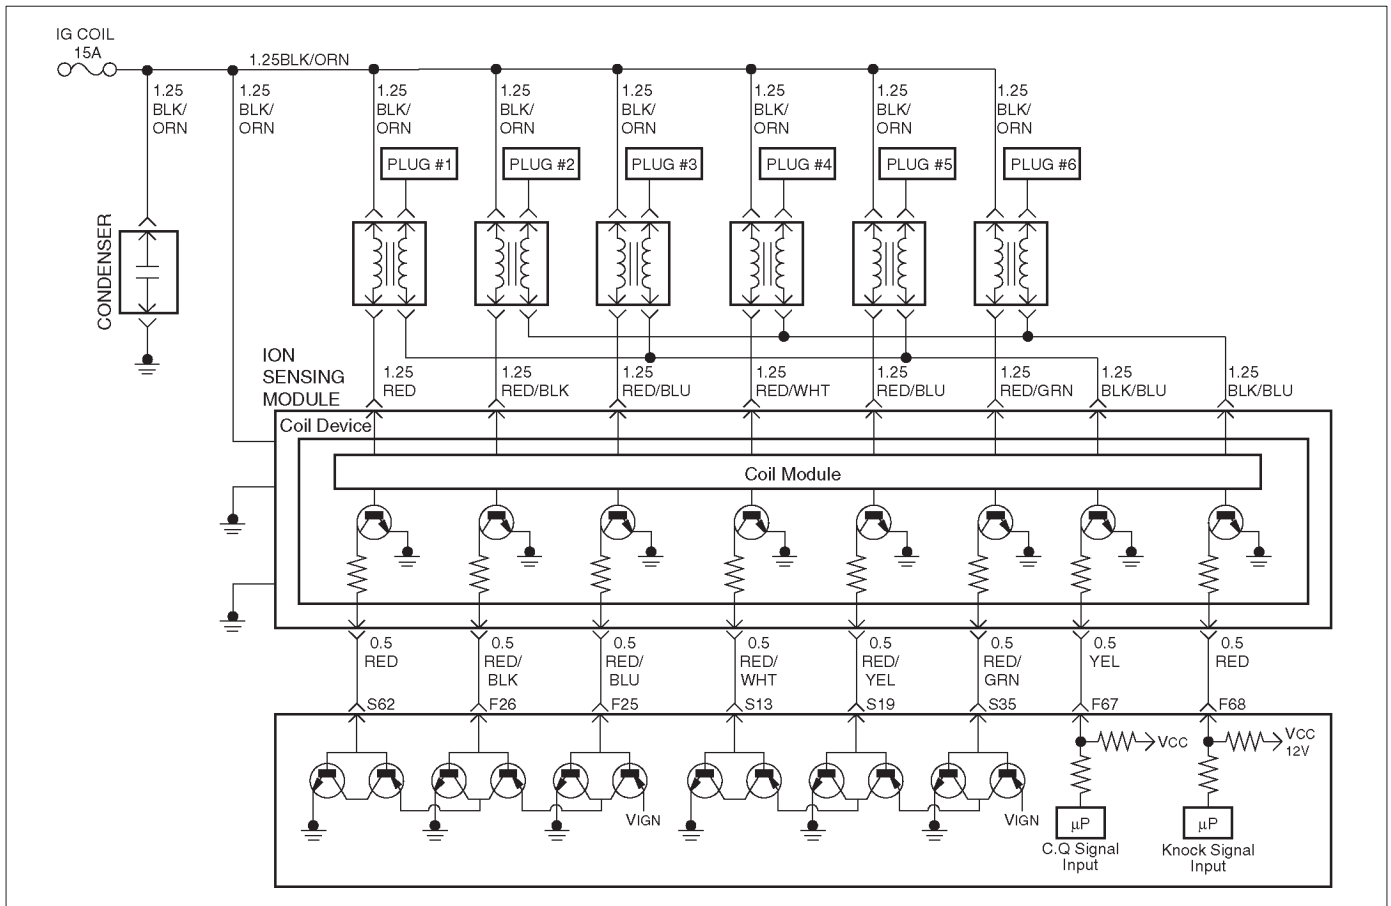

DTC P1299 - ETC Forced Engine Shutdown Mode (Cont'd)

Step	Action	Value(s)	Yes	No
11	Check the following items; 1. TP1 and TP2 signal circuit or 5 volt reference circuit for a poor connection. 2. Diagnostic Trouble Code (DTC) P1310 ION Sensing Module Diagnosis

060R100135

Circuit Description

The Power Control Module (PCM) checks the validity of the signals used in the ION Sensing module at the following engine operating conditions.

- The Deceleration Fuel Cut Off (DFCO) test is performed to evaluate the Combustion Quality (CQ) signal pulse width. If it is below a predetermined value, the value it is expected to be during DFCO conditions. If the CQ signal pulse width is above the predetermined threshold, the fail counter will be incremented. If the failure counter exceeds the calibration, then the test is complete and a failure will be reported.
- The Power Enrichment (PE) test is performed to evaluate the Combustion Quality (CQ) signal pulse width. If it is below a predetermined value, the value it is expected to be during PE conditions. If the CQ signal pulse width is above the predetermined threshold, the fail counter will be incremented. If the failure counter exceeds the calibration, then the test is complete and a failure will be reported.
- The Combustion Quality (CQ) test is performed to check if inappropriate (CQ) signal status were detected. If missing CQ pulses or multiple CQ pulses or CQ pulse width calculation errors were detected, the fail counter will be incremented. If the failure counter exceeds the calibration, then the test is complete and a failure will be reported.

Conditions for setting the DTC

- Ignition voltage is between 10volt and 16 volts.
- MAP sensor signal is between 26kPa and 100 kPa.
- Fuel level is more than 19%.
- Engine speed is between 650rpm and 6250rpm.
- No Crank DTCs set.
- No System voltage DTCs set.
- CQ pulse width is less than 30μs or more than 1070μs.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM calculates an air flow value based on idle air control valve position, throttle position, RPM and barometric pressure.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1310 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.

- DTC P1310 can be cleared using the Tech 2 “Clear Info” function.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Misrouted harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.

- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the moving connectors and wiring harnesses related to the sensor.

A change in the display will indicate the location of the fault. If DTC P1310 cannot be duplicated, the information included in the Failure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently, performing the DTC P1310 Diagnostic Chart may isolate the cause of the fault.

DTC P1310 - ION Sensing Module Diagnostic

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition “ON”, engine “OFF”. 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor “DTC” info for DTC P1310. Does the Tech 2 indicate DTC P1310 failed this ignition?	—	Go to Step 3	Refer to <i>Diagnostic Aids</i>
3	1. Ignition “OFF”. 2. Disconnect the ION Sensing module. 3. Disconnect the PCM. Is the action complete?	—	Go to Step 4	Go to Step 3
4	Check the ION Sensing harness between the PCM and ION Sensing module circuit harness connector. Was a problem found?	—	Verify repair	Go to Step 6
5	1. Disconnect the ignition coil. Is the action complete?	—	Go to Step 6	Go to Step 5
6	Check the ION Sensing harness between the ignition coil and ION Sensing module circuit at the ION Sensing Module harness connector. Was a problem found?	—	Verify repair	Go to Step 7
7	Check the following items; 1. Ignition coil and ignition coil circuit. 2. Ignition coil ground circuit for a poor connection. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to Step 8
8	Replace the Ignition coil. Is the action complete?	—	Verify repair	Go to Step 9

DTC P1310 - ION Sensing Module Diagnostic (Cont'd)

Step	Action	Value(s)	Yes	No
9	<p>Check the following items;</p> <p>1. ION Sensing module ground circuit for a poor connection.</p> <p>2. If a problem is found, repair wiring harness as necessary.</p> <p>Was a problem found?</p>	—	Go to <i>Step 10</i>	Go to <i>Step 11</i>
10	<p>Replace the ION Sensing module.</p> <p>Is the action complete?</p>	—	Verify repair	Go to <i>Step 10</i>
11	<p>Replace the PCM.</p> <p>IMPORTANT: The replacement PCM must be programmed.</p> <p>Refer to <i>ON-Vehicle Service in Power Control Module and Sensors for procedures</i>.</p> <p>And also refer to latest Service Bulletin.</p> <p>Check to see if the latest software is released or not.</p> <p>And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM.</p> <p>Is the action complete?</p>	—	Verify repair	—

- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1311 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1311 can be cleared using the Tech 2 “Clear Info” function.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Misrouted harness.

- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the moving connectors and wiring harnesses related to the sensor.
- A change in the display will indicate the location of the fault. If DTC P1311 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the DTC was last set.
- If it is determined that the DTC occurs intermittently, performing the DTC P1311 Diagnostic Chart may isolate the cause of the fault.

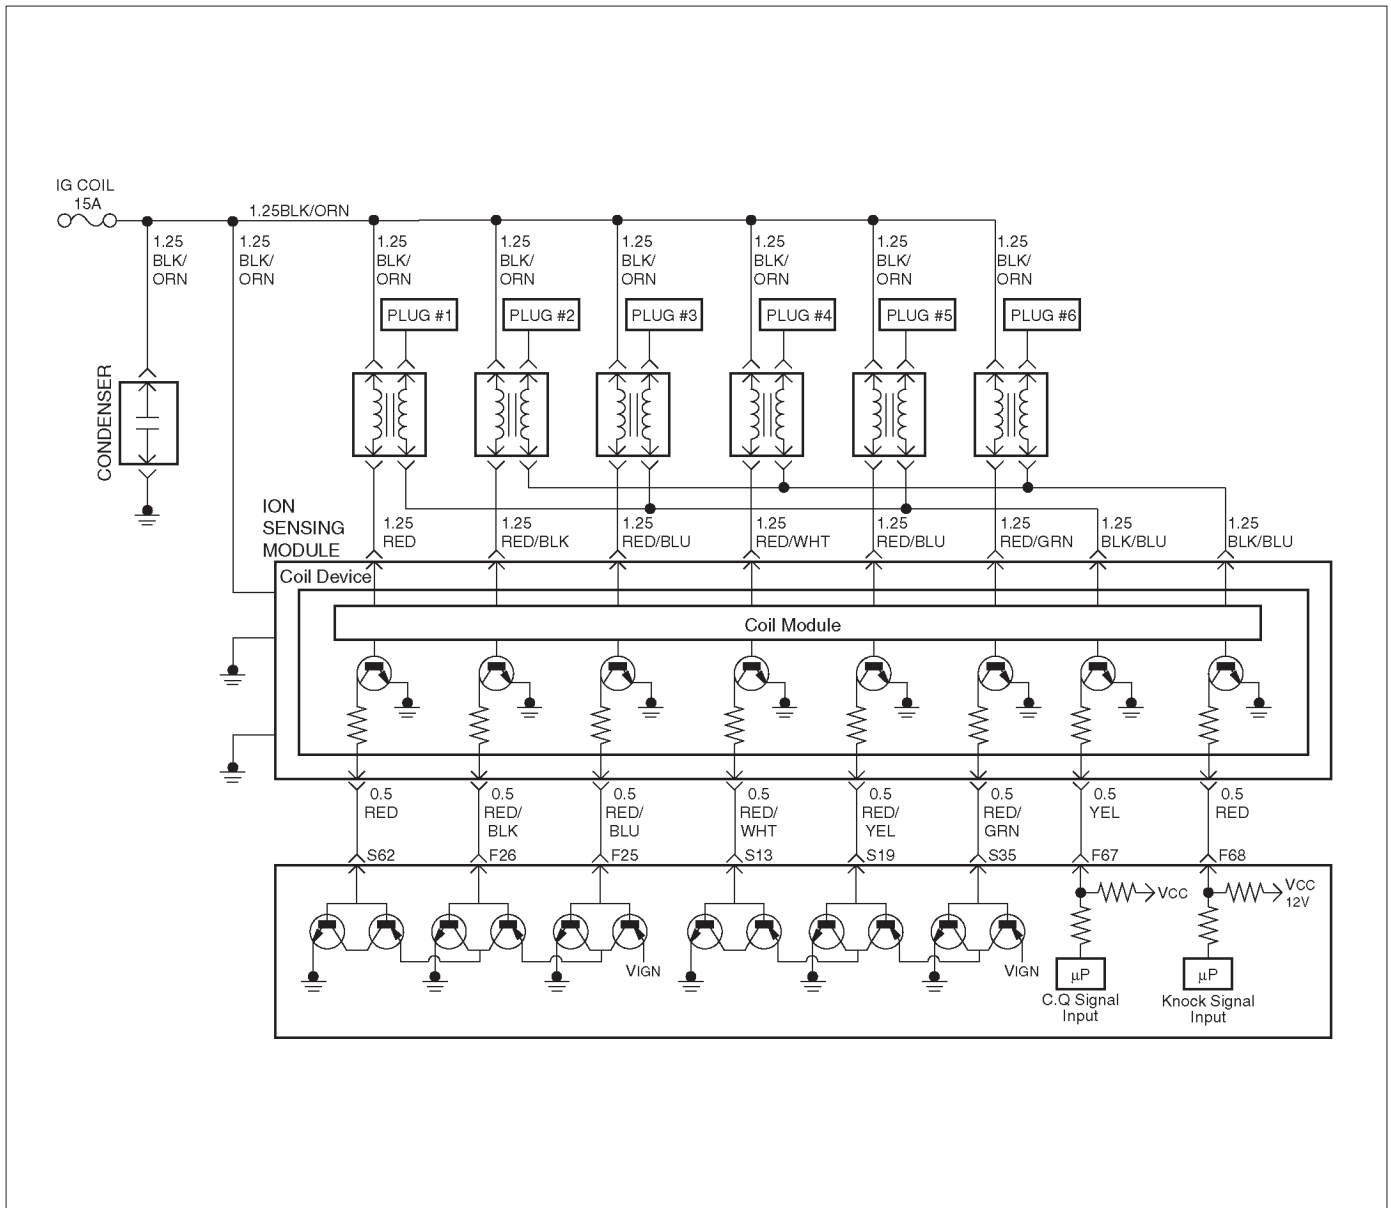

DTC P1311 - ION Sensing Module SEC Line 1 Circuit Fault

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition “ON”, engine “OFF”. 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor “DTC” info for DTC P1311. Does the Tech 2 indicate DTC P1311 failed this ignition?	—	Go to Step 3	Refer to <i>Diagnostic Aids</i>
3	1. Ignition “OFF”. 2. Disconnect the ION Sensing module. 3. Disconnect the PCM. Is the action complete?	—	Go to Step 4	Go to Step 3
4	Check the ION Sensing module harness between the PCM and ION Sensing module circuit at the ION Sensing module harness connector. Was a problem found?	—	Verify repair	Go to Step 6
5	1. Disconnect the ignition coil. Is the action complete?	—	Go to Step 6	Go to Step 5
6	Check the ION Sensing module harness between the ignition coil and ION Sensing module circuit at the SEC line 1 harness connector. Was a problem found?	—	Verify repair	Go to Step 7
7	Check the following items; 1. Ignition coil and ignition coil circuit. 2. Ignition coil ground circuit for a poor connection. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to Step 8
8	Replace the Ignition coil. Is the action complete?	—	Verify repair	Go to Step 9

DTC P1311 - ION Sensing Module SEC Line 1 Circuit Fault (Cont'd)

Step	Action	Value(s)	Yes	No
9	<p>Check the following items;</p> <p>1. ION Sensing module ground circuit for a poor connection.</p> <p>2. If a problem is found, repair wiring harness as necessary.</p> <p>Was a problem found?</p>	—	Go to <i>Step 10</i>	Go to <i>Step 11</i>
10	<p>Replace the ION Sensing module.</p> <p>Is the action complete?</p>	—	Verify repair	Go to <i>Step 10</i>
11	<p>Replace the PCM.</p> <p>IMPORTANT: The replacement PCM must be programmed.</p> <p>Refer to <i>ON-Vehicle Service in Power Control Module and Sensors for procedures</i>.</p> <p>And also refer to latest Service Bulletin. Check to see if the latest software is released or not.</p> <p>And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM.</p> <p>Is the action complete?</p>	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1312 ION Sensing Module SEC Line 2 Circuit Fault

060R100135

Circuit Description

- The Power Control Module (PCM) will compare the secondary current reading to predetermined maximum and minimum thresholds.

If the secondary current signal pulse width is out of the predetermined range, the fail counter will be incremented. If the fail counter exceeds the calibration, then the PCM is complete and a failure will be reported. If the sample counter threshold is reached before the failure threshold, then the PCM is complete and pass will be reported.

This PCM will detect an open/short circuit in the secondary current sense input circuit, misfire on the entire bank for the secondary current sense input circuit, coil failure, and same internal Ignition Current Sense System (ICSS) module faults.

Conditions for setting the DTC

- Ignition voltage is between 10volt and 16 volts.
- MAP sensor signal is between 26kPa and 100 kPa.
- Fuel level is more than 19%.
- Engine speed is between 650rpm and 6250rpm.
- ION Sensing Module circuit is open or shorted signals on the SEC 2 line.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM calculates an air flow value based on idle air control valve position, throttle position, RPM and barometric pressure.

- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1312 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1312 can be cleared using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Misrouted harness.

- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the moving connectors and wiring harnesses related to the sensor.

A change in the display will indicate the location of the fault. If DTC P1312 cannot be duplicated, the information included in the Failure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determining that the DTC occurs intermittently, performing the DTC P1312 Diagnostic Chart may isolate the cause of the fault.

DTC P1312 - ION Sensing Module SEC Line 2 Circuit Fault

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition “ON”, engine “OFF”. 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor “DTC” info for DTC P1312. Does the Tech 2 indicate DTC P1312 failed this ignition?	—	Go to Step 3	Refer to <i>Diagnostic Aids</i>
3	1. Ignition “OFF”. 2. Disconnect the ION Sensing module. 3. Disconnect the PCM. Is the action complete?	—	Go to Step 4	Go to Step 3
4	Check the ION Sensing module harness between the PCM and ICSS module circuit at the ION Sensing Module harness connector. Was a problem found?	—	Verify repair	Go to Step 6
5	1. Disconnect the ignition coil. Is the action complete?	—	Go to Step 6	Go to Step 5
6	Check the ION Sensing module harness between the ignition coil and ION Sensing module circuit at the SEC line 2 harness connector. Was a problem found?	—	Verify repair	Go to Step 7
7	Check the following items; 1. Ignition coil and ignition coil circuit. 2. Ignition coil ground circuit for a poor connection. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to Step 8

DTC P1312 - ION Sensing Module SEC Line 2 Circuit Fault (Cont'd)

Step	Action	Value(s)	Yes	No
8	Replace the Ignition coil. Is the action complete?	—	Verify repair	Go to <i>Step 9</i>
9	Check the following items; 1. ION Sensing module ground circuit for a poor connection. 2. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Go to <i>Step 10</i>	Go to <i>Step 11</i>
10	Replace the ION Sensing module. Is the action complete?	—	Verify repair	Go to <i>Step 10</i>
11	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>ON-Vehicle Service in Power Control Module and Sensors for procedures</i> . And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

- A history DTC P1326 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1326 can be cleared using the Tech 2 “Clear Info” function.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Misrouted harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken

locks, improperly formed or damaged terminals, and poor terminal to wire connection.

- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the moving connectors and wiring harnesses related to the sensor.

A change in the display will indicate the location of the fault. If DTC P1326 cannot be duplicated, the information included in the Failure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determining that the DTC occurs intermittently, performing the DTC P1326 Diagnostic Chart may isolate the cause of the fault.

DTC P1326 - ION Sensing Module Combustion

Step	Action	Value(s)	Yes	No
1	Was the “On-Board (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition “ON”, engine “OFF”. 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor “DTC”info for DTC P1326. Does the Tech 2 indicate DTC P1326 failed this ignition?	—	Go to Step 3	Refer to <i>Diagnostic Aids</i>
3	1. Ignition “OFF”. 2. Disconnect the ION Sensing module. 3. Disconnect the PCM. Is the action complete?	—	Go to Step 4	Go to Step 3
4	Check the ION Sensing module harness between the PCM and ION Sensing module circuit at the QC line harness connector. Was a problem found?	—	Verify repair	Go to Step 6
5	1. Disconnect the ignition coil. Is the action complete?	—	Go to Step 6	Go to Step 5
6	Check the ION Sensing module harness between the ignition coil and ICSS module circuit at the ION Sensing Module harness connector. Was a problem found?	—	Verify repair	Go to Step 7
7	Check the following items; 1. Ignition coil and ignition coil circuit. 2. Ignition coil ground circuit for a poor connection. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to Step 8
8	Replace the Ignition coil. Is the action complete?	—	Verify repair	Go to Step 9

DTC P1326 - ION Sensing Module Combustion (Cont'd)

Step	Action	Value(s)	Yes	No
9	Check the following items; 1. ION Sensing module ground circuit for a poor connection. 2. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Go to <i>Step 10</i>	Go to <i>Step 11</i>
10	Replace the ION Sensing module. Is the action complete?	—	Verify repair	Go to <i>Step 10</i>
11	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>ON-Vehicle Service in Power Control Module and Sensors for procedures</i> . And also refer to latest Service Bulletin .Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

- Damaged harness—Inspect the wiring harness for damage. If the harness appears to be OK, observe the moving connectors and wiring harnesses related to the sensor.

A change in the display will indicate the location of the fault. If DTC P1340 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently, performing the DTC P1340 Diagnostic Chart may isolate the cause of the fault.

DTC P1340 - ION Sensing Module Cylinder ID Fault (Cylinder Synchronization Fail)

Step	Action	Value(s)	Yes	No
1	Was the "On-Board (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "ON", engine "OFF". 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor "DTC" info for DTC P1340. Does the Tech 2 indicate DTC P1340 failed this ignition?	—	Go to Step 3	Refer to <i>Diagnostic Aids</i>
3	1. Ignition "OFF". 2. Disconnect the ION Sensing module. 3. Disconnect the PCM. Is the action complete?	—	Go to Step 4	Go to Step 3
4	Check the ION Sensing module harness between the PCM and ICSS module circuit at the QC line harness connector. Was a problem found?	—	Verify repair	Go to Step 6
5	1. Disconnect the ignition coil. Is the action complete?	—	Go to Step 6	Go to Step 5
6	Check the ION Sensing module harness between the ignition coil and ION Sensing module circuit at the ION Sensing Module harness connector. Was a problem found?	—	Verify repair	Go to Step 7
7	Check the following items; 1. Ignition coil and ignition coil circuit. 2. Ignition coil ground circuit for a poor connection. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to Step 8
8	Replace the Ignition coil. Is the action complete?	—	Verify repair	Go to Step 9

DTC P1340 - ION Sensing Module Cylinder ID Fault (Cylinder Synchronization Fail) (Cont'd)

Step	Action	Value(s)	Yes	No
9	Check the following items; 1. ION Sensing module ground circuit for a poor connection. 2. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Go to <i>Step 10</i>	Go to <i>Step 11</i>
10	Replace the ION Sensing module. Is the action complete?	—	Verify repair	Go to <i>Step 10</i>
11	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>ON-Vehicle Service in Power Control Module and Sensors for procedures</i> . And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1404 EGR Stuck Closed

060R100136

Circuit Description

The powertrain control module (PCM) monitors the EGR valve pintle position input to ensure that the valve responds properly to commands from the PCM, and to detect a fault if current pintle zero position is different from the learned zero position. If the PCM detects a pintle position signal indicates more than 30 % different between current zero position and the learned zero position for more than 5 seconds, and this condition exists 3 times during trip, then the PCM will set DTC P1404.

Conditions for Setting the DTC

- Ignition voltage is between 11 and 16 volts.
- Intake Air temp is more than 3°C.
- Desired EGR position is more than 3%.
- Difference of EGR pintle position between current and the learned zero is more than 15%.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after consecutive 2nd trip in which the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1404 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1404 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Excessive carbon deposit on EGR valve shaft and/or foreign material may cause the EGR valve not to fully seat. The carbon deposit may occur by unusual port operation. Remove foreign material and/or excessive carbon deposit on EGR valve shaft and to allow the EGR valve to be fully seated.
- Poor connection or damaged harness – Inspect the wiring harness for damage.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

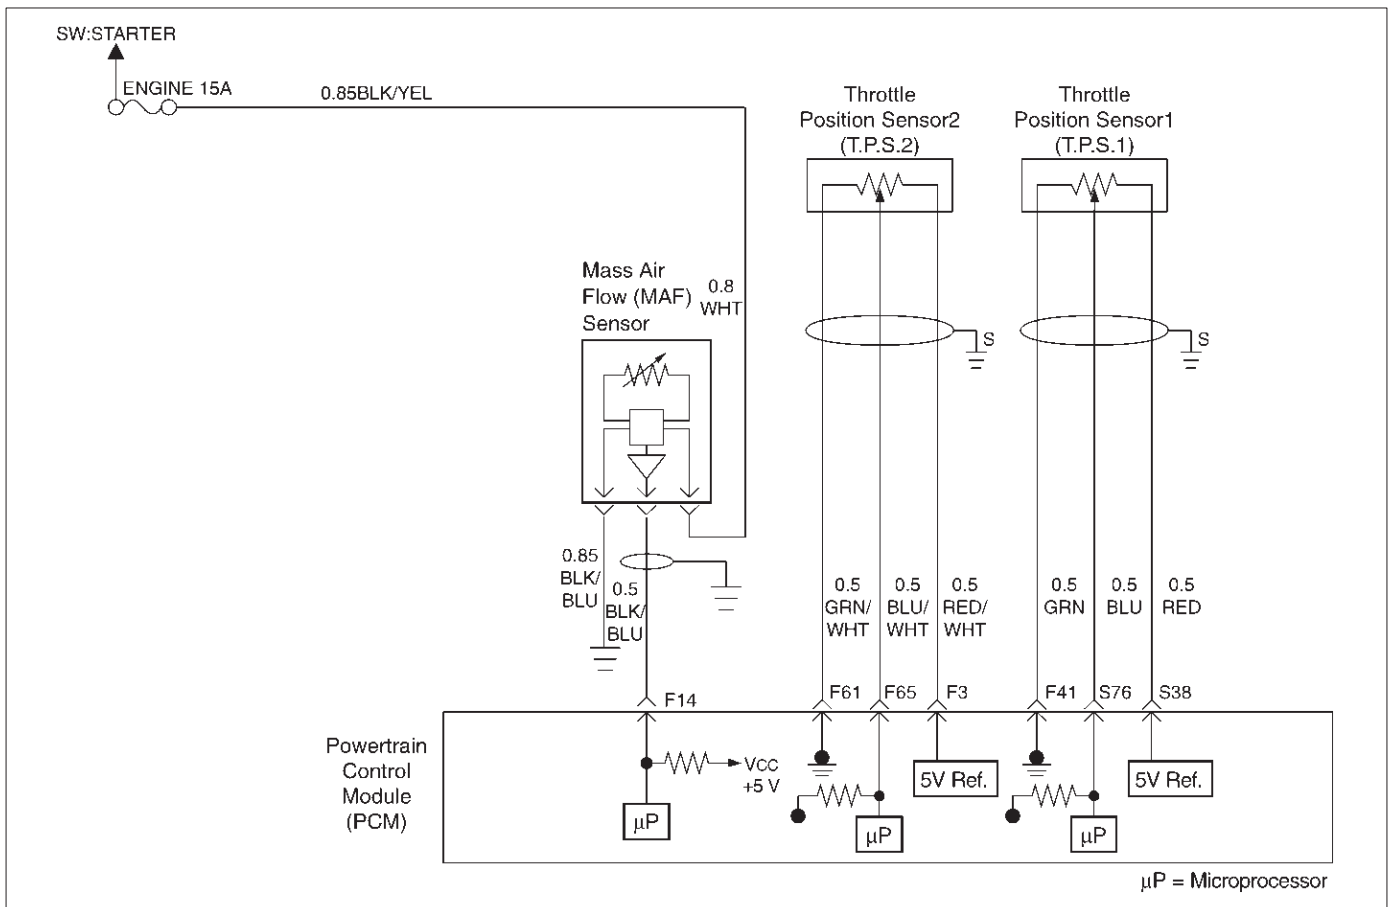

DTC P1404 – EGR Stuck Closed

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition “ON”, engine “OFF”, review and record Tech 2 Failure Records Data. 2. Operate the vehicle within Failure Records conditions as noted. 3. Using a Tech 2, monitor “DTC inf.” for DTC P1404 until the DTC P1404 test runs. Note the result. Does the Tech 2 indicates DTC P1404 failed this ignition?	—	Go to Step 3	Refer to <i>Diagnostic Aids</i>
3	1. Disconnect the EGR valve harness connector. 2. Inspect the EGR valve and connectors for damaged pin or terminals. Were there any damaged pins or terminals?	—	Go to Step 4	Go to Step 5
4	Repair the damaged pin or terminal. Is the action complete?	—	Verify repair	—
5	1. Remove EGR valve from Engine. 2. Inspect EGR valve for any excessive carbon deposit on EGR shaft. 3. Inspect for any foreign material inside of EGR valve. Was excessive carbon deposit on EGR valve shaft and/or foreign material in EGR valve ?	—	Go to Step 6	Go to Step 7
6	1. Clean up EGR valve shaft and inside of EGR valve. 2. Remove foreign material from EGR valve. 3. Visually inspect damage of pintle and seat to see if it is bent. If damaged, leakage may occur. Was there any severe damage which affects function?	—	Go to Step 8	Verify repair Go to Step 7
7	1. Install the EGR valve. 2. Ignition “OFF”. 3. Install the Tech 2. 4. Run the engine at idle. 5. On the Tech 2, select EGR Control Test. 6. Use the “UP” arrow to increase the EGR from 0% to 40%. Did EGR work properly?	—	—	Go to Step 8
8	1. Reset the learned zero EGR valve position. 2. Repeat step 7. Did EGR work properly?	—	Verify repair	Go to Step 9

DTC P1404 – EGR Stuck Closed (Cont'd)

Step	Action	Value(s)	Yes	No
9	Replace the EGR valve. Does DTC P1404 still fail "DTC" test on the Tech 2?	—	Go to <i>Step 10</i>	Verify repair
10	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service</i> in <i>Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1514 TPS - MAF Correlation Error

060R100073

Circuit Description

- The throttle position (TP) sensor circuit provides a voltage signal relative to throttle blade angle. The throttle blade angle will vary about 8 % at closed throttle to about 92 % at wide open throttle (WOT).
- The mass air flow (MAF) sensor measures the amount of air which passes through it into the engine during a given time. The powertrain Control Module (PCM) uses the mass air flow information to monitor engine operating conditions for fuel delivery calculations. A large quantity of air entering the engine indicates an accelerator or high load situation, while a small quantity of air indicates deceleration or idle. The MAF sensor produces a frequency signal which can be monitored using a Tech 2. The frequency will vary within a range of around 4 to 7g/s at idle to around 25 to 40g/s at maximum engine load.

Conditions for setting the DTC

- The engine is running.
- No MAF sensor DTCs are set.
- Throttle actuation mode is not off.
- MAF reading-ETC estimated air flow is less than 40g/s for 250 failures within test 1000 test samples (15.6 m sec).

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.

- The PCM calculates an air flow value based on idle air control valve position, throttle position, RPM and barometric pressure.
- The PCM will store condition which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault conditions is no longer present.
- A history DTC P1514 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1514 can be cleared using the Tech 2 "Clear Info" function.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Misrouted harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM - Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness - Inspect the wiring harness for damage. If the harness appears to be OK, observe the Mass Air Flow, TP sensor 1, TP sensor 2 display on the

Tech 2 while moving connectors and wiring harnesses related to the sensor.

- Plugged intake air duct or filter element
- A wide - open throttle accelerator from a stop should cause the mass air flow displayed on a Tech 2 to increase from about 3 – 6 g/s at idle to 100 g/s or greater at the time of the 1 – 2 shift. If not, check for a restriction.

A change in the display will indicate the location of the fault. If DTC P1514 cannot be duplicated, the information included in the Failure Records data can be useful in vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently, performing the DTC P1514 Diagnostic Chart may isolate the cause of the fault.

DTC P1514 - TPS-MAF Correlation Error

Step	Action	Value(s)	Yes	No
1	Was the "On-Board (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Was the "Electric Throttle Control (ETC) System Check" performed?	—	Go to Step 3	Go to <i>ETC System Check</i>
3	1. Ignition "ON", engine "OFF". 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor "DTC" info for DTC P1514. Does the Tech 2 indicate DTC P1514 failed this ignition?	—	Go to Step 4	Refer to <i>Diagnostic Aids</i>
4	1. Start the engine. 2. With the engine idling, monitor "MAF Frequency" display on the Tech 2. Is the "MAF Frequency" below the specified value?	6 ~ 10 g/s	Go to Step 5	Go to Step 8
5	1. Ignition "OFF". 2. Disconnect the MAF sensor connector. 3. Ignition "ON", engine idling. 4. Using a Tech 2, monitor "MAF Frequency". Does the Tech 2 indicate a "MAF Frequency" at the specified value?	0g/s	Go to Step 6	Go to Step 7
6	Replace the MAF sensor. Is the action complete?	—	Verify repair	Go to Step 9
7	1. Check the MAF harness for incorrect routing near high voltage components (solenoids, relays, motors). 2. If incorrect routing is found, correct the harness routing. Was a problem found?	—	Verify repair	Go to Step 7
8	1. With the engine idling, monitor "MAF Frequency" display on the Tech 2. 2. Quickly snap open throttle to wide open throttle while under a road load and record value. Does the Tech 2 indicate a "MAF Frequency" at the specified value?	6 ~ 10 g/s	Go to Step 6	Go to Step 9
9	1. Ignition "ON", engine not running. 2. Observe the MAP reading on the Tech 2. Is the MAP reading less than the specified value?	65kPa	Go to Step 10	Go to Step 13

DTC P1514 - TPS-MAF Correlation Error (Cont'd)

Step	Action	Value(s)	Yes	No
10	1. Disconnect the MAP sensor. 2. Connect a test 5 volt reference circuit and the MAP signal at the MAP sensor harness connector. 3. Observe the MAP reading on the Tech 2. Is the MAP reading less than the specified value? (If no, start with diagnosis chart for other sensors in the circuit and see if 5V returns.)	—	Go to Step 12	Go to Step 11
11	1. Check the MAP signal circuit between the PCM and MAP ground circuit. 2. If the MAP signal circuit is open or shorted, repair it as necessary. Was the MAP signal circuit open or shorted?	—	Verify repair	Go to Step 13
12	Replace the MAP sensor. Is the action complete?	—	Verify repair	—
13	Observe the TP angle reading on the Tech 2 while slowly opening the throttle. Does the TP angle increase steadily and evenly from the closed throttle value to the wide open throttle value?	Closed throttle TP sensor 1 =8 ~ 10 % TP sensor 2 =90 ~ 92 % Wide open throttle TP sensor 1 =90 ~ 92 % TP sensor 2 =8 ~ 10 %	Refer to Diagnostic Aids	Go to Step 14
14	1. Disconnect the TP sensor. 2. Observe the TP sensor reading on the Tech2. Is the TP sensor reading near the specified value?	0V	Go to Step 15	Go to Step 16
15	1. Connect a test light between the 5Volt reference circuit and the TP1 and TP2 sensor signal circuit at the TP sensor harness connector. 2. Observe the TP sensor reading on the Tech2. Is the TP sensor reading near the specified value?	5V	Go to Step 18	Go to Step 17
16	Check the following items; 1. TP1 and TP2 signal circuit for a short to voltage. 2. TP1 and TP2 sensor ground circuit for high resistance between the PCM and the TP sensor. 3. TP1 and TP2 sensor ground circuit for a poor connection. 4. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to Step 19

DTC P1514 - TPS-MAF Correlation Error (Cont'd)

Step	Action	Value(s)	Yes	No
17	Check the following items; 1. TP1and TP2 signal circuit or 5 volt reference circuit for a poor connection. 2. TP1 and TP2 signal circuit or 5 volt reference circuit for high resistance between the PCM and the TP1and TP2 sensor. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 18</i>
18	Replace the TP sensor. Is the action complete?	—	Verify repair	—
19	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>ON-Vehicle Service in Power Control Module and Sensors for procedures</i> . And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1515 Command - Actual TPS Correlation Error

D06RY00111

Circuit Description

- The throttle position (TP) sensor circuit provides a voltage signal relative to throttle position (blade angle). The throttle blade angle will vary about 8 % at closed throttle to about 92 % at wide open throttle(WOT).
- The DC motor circuit provides a voltage signal relative to command throttle position (blade angle).
- This DTC detects the difference between actual throttle position and command throttle position.

Conditions for setting the DTC

- The ignition is "ON".
- Throttle actuation mode is normal.
- Command Throttle position - Actual Throttle position is more than + 5 % for 100 counts within test 1000 test samples (15.6 m sec) else Actual Throttle position is less than + 40 % and Command Throttle position - Actual Throttle position is more than - 5 % or Command Throttle position - Actual Throttle position is more than - 20 % for 150 failures within test 1000 test samples (15.6 m sec).

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM calculates an air flow value based on idle air control valve position, throttle position, RPM and barometric pressure.

- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1515 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1515 can be cleared using the Tech 2 "Clear Info" function.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Misrouted harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the TP sensor 1, TP sensor 2 display on the Tech2 while

moving connectors and wiring harnesses related to the sensor.

A change in the display will indicate the location of the fault. If DTC P1515 cannot be duplicated, the information included in the Failure Records data can

be useful in determining vehicle mileage since the DTC was last set.

If it is determined that the DTC occurs intermittently, performing the DTC P1515 Diagnostic Chart may isolate the cause of the fault.

DTC P1515 - Command - Actual TPS Correlation Error

Step	Action	Value(s)	Yes	No
1	Was the "On-Board (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Was the "Electric Throttle Control (ETC) System Check" performed?	—	Go to Step 3	Go to <i>ETC System Check</i>
3	1. Ignition "ON", engine "OFF". 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor "DTC" info for DTC P1515. Does the Tech 2 indicate DTC P1515 failed this ignition?	—	Go to Step 4	Refer to <i>Diagnostic Aids</i>
4	Observe the TP angle reading on the Tech 2 while slowly opening the throttle. Does the TP angle increase steadily and evenly from the closed throttle value to the wide open throttle value?	Closed throttle TP sensor 1 =8 ~ 10 % TP sensor 2 =90 ~ 92 % Wide open throttle TP sensor 1 =90 ~ 92 % TP sensor 2 =8 ~ 10 %	Go to Step 8	Go to Step 5
5	1. Ignition "OFF". 2. Disconnect the DC motor. Is the DC motor reading near the specified value?	0.3 ~ 100 Ω	Go to Step 6	Go to Step 7
6	Check the DC motor harness between the PCM and DC Motor circuit at the DC motor harness connector. Was a problem found?	—	Verify repair	Go to Step 8
7	Replace the DC motor. Is the action complete?	—	Verify repair	Go to Step 6
8	1. Disconnect the TP sensor. 2. Observe the TP sensor reading on the Tech 2. Is the TP sensor reading near the specified value?	0V	Go to Step 9	Go to Step 10
9	1. Connect a test light between the 5Volt reference circuit and the TP1 and TP2 sensor signal circuit at the TP sensor harness connector. 2. Observe the TP sensor reading on the Tech2. Is the TP sensor reading near the specified value?	5V	Go to Step 12	Go to Step 11

DTC P1515 - Command - Actual TPS Correlation Error (Cont'd)

Step	Action	Value(s)	Yes	No
10	Check the following items; <ol style="list-style-type: none"> 1. TP1 and TP2 signal circuit for a short to voltage. 2. TP1 and TP2 sensor ground circuit for high resistance between the PCM and the TP sensor. 3. TP1 and TP2 sensor ground circuit for a poor connection. 4. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 13</i>
11	Check the following items; <ol style="list-style-type: none"> 1. TP1 and TP2 signal circuit or 5 volt reference circuit for a poor connection. 2. TP1 and TP2 signal circuit or 5 volt reference circuit for high resistance between the PCM and the TP1 and TP2 sensor. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 13</i>
12	Replace the TP sensor. Is the action complete?	—	Verify repair	—
13	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>ON-Vehicle Service in Power Control Module and Sensors for procedures</i> . And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1516 Command - Actual TPS Correlation Error

D06RY00111

Circuit Description

- The throttle position (TP) sensor circuit provides a voltage signal relative to throttle position (blade angle). The throttle blade angle will vary about 8% at closed throttle to about 92% at wide open throttle (WOT).
- The DC motor circuit provides a voltage signal relative to command throttle position (blade angle).
- This DTC detects the difference between actual throttle position and command throttle position in steady state.

Conditions for setting the DTC

- The ignition is "ON".
- Throttle Actuation mode is normal.
- Command Throttle position-Actual Throttle position is more than 2% when desired TPS is steady within 0.5% for 30 second within test samples (30 second)

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM calculates an air flow value based on idle air control valve position, throttle position, RPM and barometric pressure.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1516 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1516 can be cleared using the Tech 2 "Clear Info" function.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Misrouted harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness - Inspect the wiring harness for damage. If the harness appears to be OK, observe the TP sensor 1, TP sensor 2 display on the Tech2 while moving connectors and wiring harnesses related to the sensor.

A change in the display will indicate the location of the fault. If DTC P1516 cannot be duplicated, the

information included in the Failure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determining that the DTC occurs intermittently, performing the DTC P1516 Diagnostic Chart may isolate the cause of the fault.

DTC P1516 - Command - Actual TPS Correlation Error

Step	Action	Value(s)	Yes	No
1	Was the "On-Board (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Was the "Electric Throttle Control (ETC) System Check" performed?	—	Go to Step 3	Go to <i>ETC System Check</i>
3	1. Ignition "ON", engine "OFF". 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor "DTC" info for DTC P1516. Does the Tech 2 indicate DTC P1516 failed this ignition?	—	Go to Step 4	Refer to <i>Diagnostic Aids</i>
4	Observe the TP angle reading on the Tech 2 while slowly opening the throttle. Does the TP angle increase steadily and evenly from the closed throttle value to the wide open throttle value?	Closed throttle TP sensor 1 =8 ~ 10 % TP sensor 2 =90 ~ 92 % Wide open throttle TP sensor 1 =90 ~ 92 % TP sensor 2 =8 ~ 10 %	Go to Step 8	Go to Step 5
5	1. Ignition "OFF". 2. Disconnect the DC motor. Is the DC motor reading near the specified value?	0.3 ~ 100 Ω	Go to Step 6	Go to Step 7
6	Check the DC motor harness between the PCM and DC Motor circuit at the DC motor harness connector. Was a problem found?	—	Verify repair	Go to Step 8
7	Replace the DC motor. Is the action complete?	—	Verify repair	Go to Step 6
8	1. Disconnect the TP sensor. 2. Observe the TP sensor reading on the Tech2. Is the TP sensor reading near the specified value?	0V	Go to Step 9	Go to Step 10
9	1. Connect a test light between the 5 Volt reference circuit and the TP1 and TP2 sensor signal circuit at the TP sensor harness connector. 2. Observe the TP sensor reading on the Tech 2. Is the TP sensor reading near the specified value?	5V	Go to Step 12	Go to Step 11

DTC P1516 - Command - Actual TPS Correlation Error (Cont'd)

Step	Action	Value(s)	Yes	No
10	Check the following items; 1. TP1 and TP2 signal circuit for a short to voltage. 2. TP1 and TP2 sensor ground circuit for high resistance between the PCM and the TP sensor. 3. 11	Check the following items; 1. TP1 and TP2 signal circuit or 5 volt reference circuit for a poor connection. 2. TP1 and TP2 signal circuit or 5 volt reference circuit for high resistance between the PCM and the TP1 and TP2 sensor. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 13</i>
12	Replace the TP sensor. Is the action complete?	—	Verify repair	—
13	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>ON-Vehicle Service in Power Control Module and Sensors for procedures</i> . And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1523 Actuator Control Return Performance

D06RY00111

Circuit Description

- The throttle position (TP) sensor circuit provides a voltage signal relative to throttle position (blade angle). The throttle blade angle will vary about 8 % at closed throttle to about 92 % at wide open throttle (WOT).
- The DC motor circuit provides a voltage signal relative to command throttle position (blade angle).
- This DTC detects if the throttle return to the default position at key on is steady.

Conditions for setting the DTC

- The ignition is "ON".
- Normalized TPS is less than 7 % but Normalized TPS is more than 25 %.

Action Taken When the DTC Sets

- The PCM will not turn the malfunction indicator lamp (MIL) "ON".
- The PCM will store conditions which were present when the DTC was set as Failure Records only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.

- A history DTC P1523 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1523 can be cleared using the Tech 2 "Clear Info" function.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Misrouted harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at PCM-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage. If the harness appears to be OK, observe the TP sensor 1, TP sensor 2 display on the Tech 2 while moving connectors and wiring harnesses related to the sensor.

A change in the display will indicate the location of the fault. If DTC P1523 cannot be duplicated, the information included in the Failure Records data can be useful in determined vehicle mileage since the DTC was last set.

If it is determining that the DTC occurs intermittently, performing the DTC P1523 Diagnostic Chart may isolate the cause of the fault.

Was the action completed?	—	Verify repair	—
9	1. Replace the brake switch. Was the action completed?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1635 Reference Voltage # 1 Circuit Fault

Circuit Description

The TP sensor # 1 shares a 5 Volt reference with the PCM.

If the PCM detects the 5 Volt reference for the TP sensor # 1 is failure, DTC P1635 will be set.

Conditions for setting the DTC

- The ignition is "ON".
- The 5 Volt reference voltage for the TP sensor # 1 is less than 4 volts.
- The 5 Volt reference voltage for the TP sensor # 1 is more than 5 volts.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL) .

- The PCM will store conditions which were present when the DTC was set as Failure Records only. This information will not be stored as Freeze Frame data.

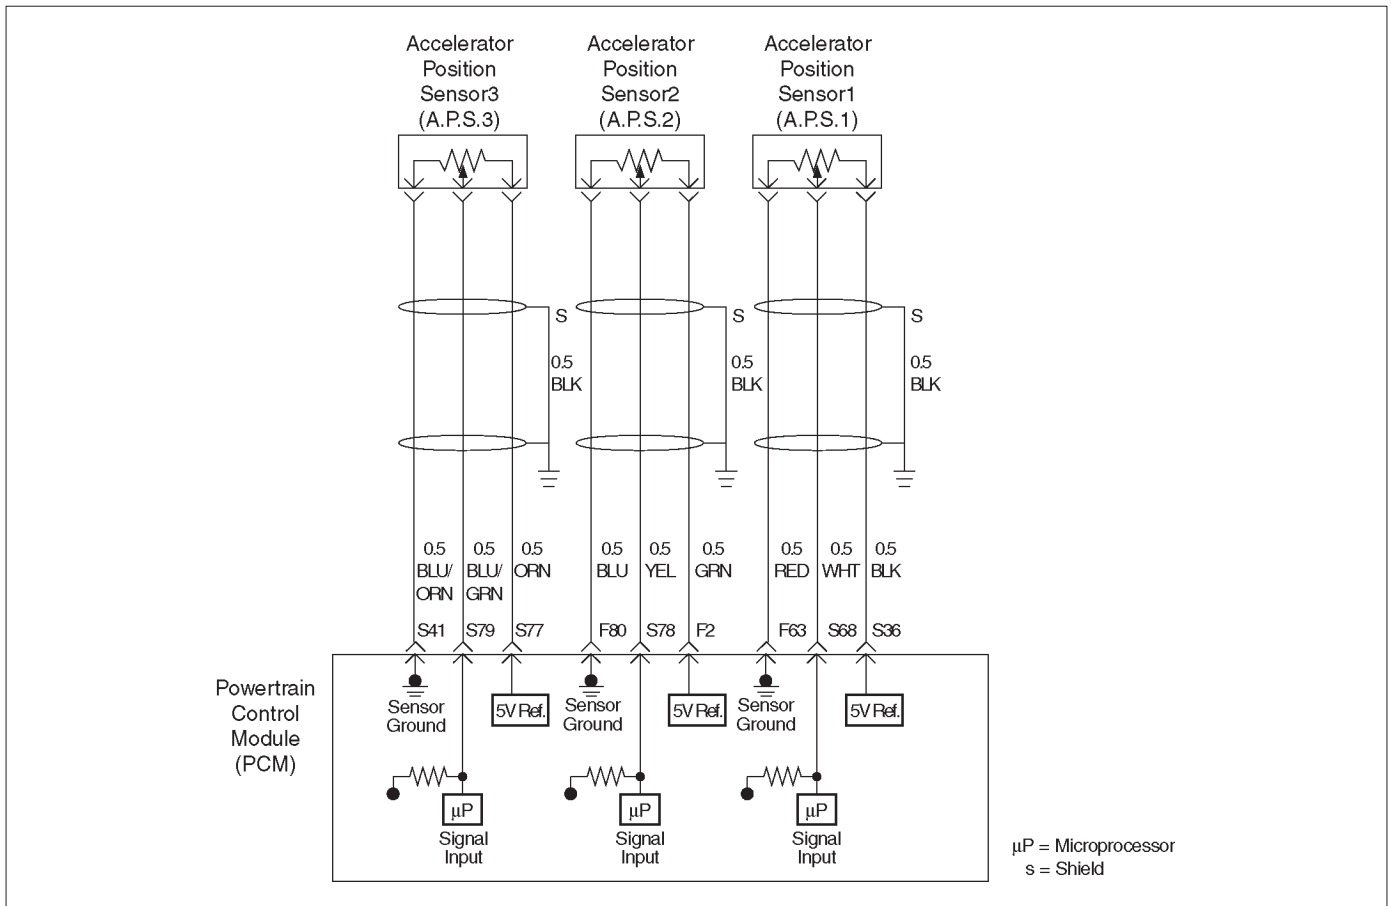

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1635 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1635 can be cleared using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed. Tech2 "Clear Info" function.

Diagnostic Trouble Code (DTC) P1635 Reference Voltage # 1 Circuit Fault

Step	Action	Value(s)	Yes	No
1	Was the "On-Board(OBD)System Check" performed?	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	1. Ignition "ON", engine not running. 2. Using a DVM at the PCM side of the connector, check the voltage at terminal S38 (RED) pin. Is the voltage in specified range?	4.95 – 5.0V	Go to <i>ETC System Check</i>	Go to <i>Step 3</i>
3	1. Ignition "ON", engine not running. 2. Using a DVM at the PCM side of the connector, check the voltage at terminal F20 (RED/WHT) pin. Is the voltage in specified range?	11.6 – 12.7V	Go to <i>Step 4</i>	Go to <i>Step 5</i>
4	1. Ignition "ON", engine not running. 2. Using a DVM at the PCM side of the connector, check the voltage at terminal F57 (RED/WHT) pin. Is the voltage in specified range?	11.6 – 12.7V	Go to <i>Step 6</i>	Go to <i>Step 5</i>
5	Observe the battery voltage and circuit. If a problems, repair it as necessary. Was the problem found?	—	Verify repair	Go to <i>Step 6</i>
6	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>ON-Vehicle Service in Power Control Module and Sensors for procedures</i> . And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1639 Reference Voltage # 2 Circuit Fault

060R100141

Circuit Description

The AP sensor # 1 shares a 5 Volt reference with the PCM. If the PCM detects the 5 Volt reference for the AP sensor # 1 is failure, DTC P1635 will be set.

Conditions for setting the DTC

- The ignition is "ON".
- The 5 Volt reference voltage for the AP sensor # 1 is less than 4 volts.
- The 5 Volt reference voltage for the AP sensor # 1 is more than 5 volts.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).

- The PCM will store conditions which were present when the DTC was set as Failure Records only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1639 will clear after 40 consecutive trip cycle during which the warm up cycles have occurred without a fault.
- DTC P1639 can be cleared using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed. Tech 2 "Clear Info" function.

Diagnostic Trouble Code (DTC) P1639 Reference Voltage # 2 Circuit Fault

Step	Action	Value(s)	Yes	No
1	Was the "On-Board (OBD) System Check" performed?	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	1. Ignition "ON", engine not running. 2. Using a DVM at the PCM side of the connector, check the voltage at terminal S36 (BLK) pin. Is the voltage in specified range?	4.95 – 5.0V	Go to <i>ETC System Check</i>	Go to <i>Step 3</i>
3	1. Ignition "ON", engine not running. 2. Using a DVM at the PCM side of the connector, check the voltage at terminal F20(RED/WHT) pin. Is the voltage in specified range?	11.6 – 12.7V	Go to <i>Step 4</i>	Go to <i>Step 5</i>
4	1. Ignition "ON", engine not running. 2. Using a DVM at the PCM side of the connector, check the voltage at terminal F57 (RED/WHT) pin. Is the voltage in specified range?	11.6 – 12.7V	Go to <i>Step 6</i>	Go to <i>Step 5</i>
5	Observe the battery voltage and circuit. If a problem is found, repair as necessary. Was the problem found?	—	Verify repair	Go to <i>Step 6</i>
6	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>ON-Vehicle Service in Power Control Module and Sensors for procedures</i> . And also refer to latest Service Bulletin. Check to see if the latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1640 Driver-1-Output Circuit Fault (ODM)

Circuit Description

Output driver modules (ODMs) are used by the powertrain control module (PCM) to turn "ON" many of the current-driven devices that are needed to control various engine and transmission functions. Each ODM is capable of controlling up to 7 separate outputs by applying ground to the device which the PCM is commanding "ON".

Unlike the Quad Driver Modules (QDMs) used in prior model years, ODMs have the capability of diagnosing each output circuit individually. DTC P1640 set indicates an improper voltage level has been detected on an ODM output.

Since A/C is an option, No A/C will cause the air conditioning clutch relay output to always fail. If a fault is seen on the air conditioning clutch relay output, it will not be logged as a fault until the A/C request input interrupts a high voltage, indicating that A/C has been installed.

Conditions for Setting the DTC

- Ignition "ON".
- Engine running.
- Ignition voltage is above 11 volts for 4 seconds.
- Output voltage does not equal ignition voltage when output is "OFF" or output voltage is zero volt when output is "ON".
- Above conditions occur for at least 1 second.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store conditions which were present when the DTC was set as Failure Records only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- A history DTC P1640 will clear after 40 consecutive warm-up cycles occur without a fault.
- DTC P1640 can be cleared by using the Tech 2 "Clear Info" function.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, disconnect the PCM, turn the ignition "ON" and observe a voltmeter connected to the suspect driver circuit at the PCM harness connector while moving connectors and wiring harnesses related to the MIL. A change in voltage will indicate the location of the fault.
- Poor connection at component – Examine for damaged connectors, unplugged connector, or damaged terminals at the following locations: Instrument cluster harness, canister purge solenoid, A/C clutch relay. An open ignition feed circuit at any of these components will cause DTC P1640 to be set.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

4. The Tech 2 Driver Module Status indicates the PCM pin that is affected.
9. The Tech 2 may indicate "short circuit" even when the problem is an open circuit. The cause of an open circuit may be in the component itself-lamp, purge, solenoid, or A/C compressor relay.
11. A short to ground on the ignition side of the component will blow the fuse. Since the fuse was checked in Step 2, a short to ground would be between the affected component and the PCM.

DTC P1640 – Driver-1-Output Circuit Fault (ODM)

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Check the fuse for the driver circuit that was shown as faulty. Was the fuse blown?	—	Go to Step 3	Go to Step 4
3	1. Check for a short to ground between the fuse and the affected component. 2. Replace the fuse after making any necessary repairs. Is the action complete?	—	Verify repair	—
4	Disconnect the PCM connector for the affected driver circuit. Is there any damage to the PCM pin or connector?	—	Go to Step 5	Go to Step 6
5	Repair the damaged pin or terminal. Is the action complete?	—	Verify repair	—
6	Were either of the lamp circuits for "Check Engine" or "Check Trans" indicated as faulty by the Tech 2?	—	Go to Step 7	Go to Step 13
7	1. Leave the PCM connector for the lamp driver circuit disconnected. 2. Ignition "ON". 3. Using a DVM, check the voltage at the PCM connector for the affected lamp driver circuit. Was the voltage equal to the specified value?	B+	Go to Step 15	Go to Step 8
8	1. Ignition "ON". 2. Check for battery voltage at the fuse for the affected lamp circuit. Was battery voltage available at the fuse?	—	Go to Step 10	Go to Step 9
9	Repair the open circuit between the ignition switch and the fuse. Is the action complete?	—	Verify repair	—
10	1. Ignition "OFF". 2. Disconnect the PCM connector for the affected driver terminal. 3. Connect an ohmmeter between a good ground and the PCM connector for the affected driver. Did the ohmmeter indicate continuity?	—	Go to Step 11	Go to Step 12
11	Repair the short to ground between the affected component and its PCM driver terminal. Is the action complete?	—	Verify repair	—
12	Repair the open circuit between the fuse and the PCM driver terminal for the affected circuit. Is the action complete?	—	Verify repair	—

DTC P1640 – Driver-1-Output Circuit Fault (ODM) (Cont'd)

Step	Action	Value(s)	Yes	No
13	1. Connect the PCM. 2. Start the engine and let it idle. 3. Backprobe the affected terminal at the PCM with a DVM. Was the voltage equal to the specified value?	+B	Go to <i>Step 15</i>	Go to <i>Step 14</i>
14	1. Run the engine at idle. 2. Check for battery voltage at the fuse for the affected circuit. Was battery voltage available at the fuse?	—	Go to <i>Step 10</i>	Go to <i>Step 9</i>
15	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service in Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1650 Quad Driver Module “A” Fault

Circuit Description

The Quad Driver Module (QDMs) are used by the powertrain control module (PCM) to turn “ON” current-driven devices that are needed to control two engine functions. The PCM monitors open or short circuit of either of Canister Control Purge (CCP) Vent solenoid or Variable Intake Manifold (VIM).

Conditions for Setting the DTC

- Ignition “ON”.
- Engine running.
- Ignition voltage is above 11 volts for 4 seconds.
- Output voltage does not equal voltage is zero volt when output is “ON”.
- Above conditions occur for at least 0.5 second.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store conditions which were present when the DTC was set as Failure Records only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1650 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1650 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, disconnect the PCM, turn the ignition “ON” and observe a voltmeter connected to the suspect driver circuit at the PCM harness connector while moving connectors and wiring harnesses relates to the MIL. A change in voltage will indicate the location of the fault.
- Poor connection at component – Examine for damaged connectors, unplugged connector, or damaged terminals at the following locations: canister purge solenoid, fuel level sensor. An open ignition feed circuit at any of these components will cause DTC P1650 to be set.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

The following PCM pins are controlled by Quad driver modules (QDMs):

- S74 – VIM
- S48 – Canister control purge

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

4. The Tech 2 Driver Module Status indicates the PCM pin that is affected.
9. The Tech 2 may indicate “short circuit” even when the problem is an open circuit. The cause of an open circuit may be in the component itself.
11. A short to ground on the ignition side of the component will blow the fuse. Since the fuse was checked in Step 2, a short to ground would be between the affected component and the PCM.

DTC P1650 – Quad Driver Module (QDM) Fault

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Check the fuse for the driver circuit that was shown as faulty. Was the fuse blown?	—	Go to Step 5	Go to Step 6
3	1. Check for a short to ground between the fuse and the affected component. 2. Replace the fuse after making any necessary repairs. Is the action complete?	—	Verify repair	—
4	Disconnect the PCM connector for the affected driver circuit. Is there any damage to the PCM pin or connector?	—	Go to Step 5	Go to Step 6
5	Repair the damaged pin or terminal. Is the action complete?	—	Verify repair	—
6	Were either of the lamp circuits for "Check Engine" or "Check Trans". indicated as faulty by the Tech 2?	—	Go to Step 7	Go to Step 13
7	1. Leave the PCM connector for the lamp driver circuit disconnected. 2. Ignition "ON". 3. Using a DVM, check the voltage at the PCM connector for the affected lamp driver circuit. Was the voltage equal to the specified value?	B+	Go to Step 15	Go to Step 8
8	1. Ignition "ON". 2. Check for battery voltage at the fuse for the affected lamp circuit. Was battery voltage available at the fuse?	—	Go to Step 10	Go to Step 9
9	Repair the open circuit between the ignition switch and the fuse. Is the action complete?	—	Verify repair	—
10	1. Ignition "OFF". 2. Disconnect the PCM connector for the affected driver terminal. 3. Connect an ohmmeter between a good ground and the PCM connector for the affected driver. Did the ohmmeter indicate continuity?	—	Go to Step 11	Go to Step 12
11	Repair the short to ground between the affected component and its PCM driver terminal. Is the action complete?	—	Verify repair	—
12	Repair the open circuit between the fuse and the PCM driver terminal for the affected circuit. Is the action complete?	—	Verify repair	—

DTC P1650 – Quad Driver Module (QDM) Fault (Cont'd)

Step	Action	Value(s)	Yes	No
13	1. Connect the PCM. 2. Start the engine and let it idle. 3. Backprobe the affected terminal at the PCM with a DVM. Was the voltage equal to the specified value?	+B	Go to <i>Step 15</i>	Go to <i>Step 14</i>
14	1. Run the engine at idle. 2. Check for battery voltage at the fuse for the affected circuit. Was battery voltage available at the fuse?	—	Go to <i>Step 10</i>	Go to <i>Step 9</i>
15	Replace the PCM. IMPORTANT: The replacement PCM must be programmed. Refer to <i>On-Vehicle Service</i> in <i>Powertrain Control Module and Sensors</i> for procedures. And also refer to latest Service Bulletin. Check to see if the Latest software is released or not. And then Down Load the LATEST PROGRAMMED SOFTWARE to the replacement PCM. Is the action complete?	—	Verify repair	—

Symptom Diagnosis

Preliminary Checks

Before using this section, perform the “On-Board Diagnostic (OBD) System Check” and verify all of the following items:

- The powertrain control module (PCM), and malfunction indicator lamp (MIL) (Check Engine lamp) and Reduced Power Lamp (RPL) are operating correctly.
- There are no DTC(s) stored.
- Tech 2 data is within normal operating range. Refer to *Typical Scan Data Values*.
- Verify the customer complaint and locate the correct symptom in the table of contents. Perform the procedure included in the symptom chart.

Visual/Physical Check

Several of the symptom procedures call for a careful visual/physical check. This can lead to correcting a problem without further checks and can save valuable time.

This check should include the following items:

- PCM grounds for cleanliness, tightness and proper location.
- Vacuum hoses for splits, kinks, and proper connections, as shown on the “Vehicle Emission Control Information” label. Check thoroughly for any type of leak or restriction.
- Air intake ducts for collapsed or damaged areas.
- Air leaks at throttle body mounting area, mass air flow (MAF) sensor and intake manifold sealing surfaces.
- Ignition components for cracking, hardness, and carbon tracking.
- Wiring for proper connections, pinches and cuts.

Intermittents

IMPORTANT: An intermittent problem may or may not turn on the malfunction indicator lamp (MIL) or store a DTC. DO NOT use the Diagnostic Trouble Code (DTC) charts for intermittent problems. The fault must be present to locate the problem.

Most intermittent problems are caused by faulty electrical connections or wiring. Perform a careful visual/physical check for the following conditions:

- Poor mating of the connector halves or a terminal not fully seated in the connector (backed out).
- Improperly formed or damaged terminal.
- All connector terminals in the problem circuit should be carefully checked for proper contact tension.
- Poor terminal-to-wire connection. This requires removing the terminal from the connector body to check.

Road test the vehicle with a J 39200 Digital Multimeter connected to a suspected circuit. An abnormal voltage when the malfunction occurs is a good indication that there is a fault in the circuit being monitored.

Use a Tech 2 to help detect intermittent conditions. The scan tool has several features that can be used to locate

an intermittent condition. Use the following feature to find intermittent faults:

- Using a Tech 2’s “Freeze Frame” buffer or “Failure Records” buffer can aid in locating an intermittent condition. Review and record the information in the freeze frame or failure record associated with the intermittent DTC being diagnosed. The vehicle can be driven within the conditions that were present when the DTC originally set.

To check for loss of diagnostic code memory, disconnect the MAP sensor and idle the engine until the MIL (Check Engine lamp) comes on. DTC P0107 should be stored and kept in memory when the ignition is turned “OFF”. If not, the PCM is faulty. When this test is completed, make sure that you clear the DTC P0107 from memory.

An intermittent MIL (Check Engine lamp) with no stored DTC may be caused by the following:

- Ignition coil shorted to ground and arcing.
- MIL (Check Engine lamp) wire to PCM shorted to ground.
- Poor PCM grounds. Refer to the PCM wiring diagrams.

Check for improper installation of electrical options such as lights, cellular phones, etc. Check all wires from the PCM to the ignition coils for poor connections.

Check for an open diode across the A/C compressor clutch and check for other open diodes (refer to wiring diagrams in *Electrical Diagnosis*).

If problem has not been found, refer to *PCM Connector Symptom* tables.

- Check the “Calibration ID” of the PCM, and compare it with the latest Isuzu service bulletins and/or Isuzu EEPROM reprogramming equipment to determine if an update to the PCM’s reprogrammable memory has been released. To check the “Calibration ID”, connect the Tech 2, then look for “Powertrain”, then select “Calibration ID”. This identifies the contents of the reprogrammable software and calibration contained in the PCM. If the “Calibration ID” is not the most current available, it is advisable to reprogram the PCM’s EEPROM memory, which may either help identify a hard-to-find problem or may fix the problem.

Hard Start Symptom

Step	Action	Value(s)	Yes	No
1	DEFINITION: Engine cranks, but does not start for a long time. Does eventually run, or may start but immediately stall. Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Was the "Electric Throttle Control (ETC) System Check" performed?	—	Go to Step 3	Go to <i>ETC System Check</i>
3	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to Step 4
4	Was a visual/physical check performed?	—	Go to Step 5	Go to <i>Visual/Physical Check</i>
5	Check engine coolant temperature (ECT) sensor for shift in value. After 8 hours with the hood up and the engine not running, connect the Tech 2. With the ignition "ON" and the engine not running, compare engine coolant temperature to intake air temperature. Are ECT and IAT within the specified value of each other?	$\pm 5^{\circ}\text{C}$ ($\pm 9^{\circ}\text{F}$)	Go to Step 10	Go to Step 6
6	1. Using a Tech 2, display the engine coolant temperature and note the value. 2. Check the resistance of the engine coolant temperature sensor. 3. Refer to <i>Engine Coolant Temperature Sensor Temperature vs. Resistance</i> chart on <i>DTC P0118 Diagnostic Support</i> for resistance specifications. Is the resistance value near the resistance for the temperature noted?	—	Go to Step 8	Go to Step 7
7	Replace the ECT sensor. Is the action complete?	—	Verify repair	—
8	Locate and repair high resistance or poor connection in the ECT signal circuit or the ECT sensor ground. Is the action complete?	—	Verify repair	—
9	1. Check for a faulty, plugged, or incorrectly installed PCV valve. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 10
10	1. Check for water- or alcohol-contaminated fuel. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 11
11	1. Perform the procedure in <i>Fuel System Pressure Test</i> . 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 12

Hard Start Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
12	<p>1. Check for proper ignition voltage output with spark tester 5-8840-0383-0. Refer to <i>Electric Ignition System</i> for procedure.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 13</i>
13	<p>1. Remove spark plugs. Check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to <i>Electronic Ignition System</i>.</p> <p>NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 14</i>
14	<p>1. Check for a loose ignition coil ground and ION Sensing module circuit.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 15</i>
15	<p>1. Remove the ignition coils and check the ignition coils for cracks or carbon tracking.</p> <p>2. If a problem is found, replace affected coil(s) as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 16</i>
16	<p>1. Check for the following engine mechanical problems (refer to <i>Engine Mechanical</i>):</p> <ul style="list-style-type: none"> ● Low compression ● Leaking cylinder head gaskets ● Worn or incorrect camshaft ● Camshaft drive belt slipped or stripped <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 17</i>
17	<p>1. Review all diagnostic procedures within this table.</p> <p>2. If all procedures have been completed and no malfunctions have been found, review/inspect the following:</p> <ul style="list-style-type: none"> ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records buffer ● All electrical connections within a suspected circuit and/or system. <p>3. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Contact Technical Assistance

Surges and/or Chuggles Symptom

Step	Action	Value(s)	Yes	No
1	<p>DEFINITION: Engine power variation under steady throttle or cruise. Feels like the vehicle speeds up and slows down with no change in the accelerator pedal.</p> <p>Was the "On-Board Diagnostic (OBD) System Check" performed?</p>	—	Go to Step 2	Go to <i>OBD System Check</i>
2	<p>Was the "Electric Throttle Control (ETC) System Check" performed?</p>	—	Go to Step 3	Go to <i>ETC System Check</i>
3	<p>1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin.</p> <p>Was a bulletin found that addresses the symptom?</p>	—	Verify repair	Go to Step 4
4	<p>Was a visual/physical check performed?</p>	—	Go to Step 5	Go to <i>Visual/Physical Check</i>
5	<p>Be sure that the driver understands transmission torque converter clutch and A/C compressor operation as explained in the owner's manual. Inform the customer how the TCC and the A/C clutch operate.</p> <p>Is the customer experiencing a normal condition?</p>	—	System OK	Go to Step 6
6	<p>1. Check the fuel control heated oxygen sensors (HO2S, B1S1 and B2S1). The fuel control heated oxygen sensors (HO2S) should respond quickly to different throttle positions. If they don't, check them for silicone or other contaminants from fuel or use of improper RTV sealant. The sensors may have a white powdery coating. Silicon contamination causes a high but false HO2S signal voltage (rich exhaust indication). The PCM will then reduce the amount of fuel delivered to the engine, causing a severe drivability problem. For more information, refer to <i>Powertrain Control Module (PCM) and Sensors</i>.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to Step 7
7	<p>1. Check the fuel pressure. Refer to <i>Fuel System Pressure Test</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to Step 8
8	<p>Monitor the long term fuel trim on the Tech 2.</p> <p>Is the long term fuel trim significantly in the negative range (rich condition)?</p>	—	Go to Step 9	Go to Step 10
9	<p>1. Check items that can cause the engine to run rich. Refer to <i>Diagnostic Aids in DTC P0172 Diagnostic Support</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Go to Step 11	Verify repair

Surges and/or Chuggles Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
10	1. Check items that can cause the engine to run lean. Refer to <i>Diagnostic Aids</i> in <i>DTC P0171</i> . 2. If a problem is found, repair as necessary. Was a problem found?	—	Go to <i>Step 11</i>	Verify repair
11	1. Check for proper ignition voltage output with spark tester 5-8840-0383-0. Refer to <i>Electric Ignition System</i> for procedure. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 12</i>
12	1. Check for a loose ignition coil ground and ION Sensing module circuit. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 13</i>
13	1. Check the ignition coils for cracks or carbon tracking. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 15</i>
14	1. Remove the spark plugs and check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to <i>Electronic Ignition System</i> . NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 15</i>
15	1. Check the injector connections. 2. If any of the injector connectors are connected to an incorrect cylinder, correct as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 16</i>
16	1. Check PCM grounds for the cleanliness, tightness and proper locations. Refer to the PCM wiring diagrams in <i>Electrical Diagnosis</i> . 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 17</i>
17	1. Check MAF sensor connections. 2. If a problem is found, replace the faulty terminals as necessary. Refer to <i>Electrical Diagnosis</i> for wiring repair procedures. Was a problem found?	—	Verify repair	Go to <i>Step 18</i>
18	1. Visually/physically check vacuum hoses for splits, kinks, and proper connections and routing as shown on the "Vehicle Emission Control Information" label. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 19</i>

Surges and/or Chuggles Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
19	1. Check the exhaust system for possible restriction: <ul style="list-style-type: none"> ● Inspect the exhaust system for damaged or collapsed pipes. ● Inspect the muffler for heat distress or possible internal failure. ● Check for a possible plugged three-way catalytic converter by checking the exhaust system back pressure. Refer to <i>Restricted Exhaust System Check</i>. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 20</i>
20	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: <ul style="list-style-type: none"> ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records buffer ● All electrical connections within a suspected circuit and/or system. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Lack of Power, Sluggish, or Spongy Symptom

Step	Action	Value(s)	Yes	No
1	<p>DEFINITION: Engine delivers less than expected power. Little or no increase in speed when accelerator pedal is pushed down part-way.</p> <p>Was the "On-Board Diagnostic (OBD) System Check" performed?</p>	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	<p>Was the "Electric Throttle Control (ETC) System Check" performed?</p>	—	Go to <i>Step 3</i>	Go to <i>ETC System Check</i>
3	<p>1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin.</p> <p>Was a bulletin found that addresses the symptom?</p>	—	Verify repair	Go to <i>Step 4</i>
4	<p>Was a visual/physical check performed?</p>	—	Go to <i>Step 5</i>	Go to <i>Visual/Physical Check</i>
5	<p>1. Remove and check the air filter element for dirt or restrictions. Refer to <i>Air Intake System</i> in <i>ON-Vehicle Service</i>. 2. Replace the air filter element if necessary.</p> <p>Was a repair required?</p>	—	Verify repair	Go to <i>Step 6</i>
6	<p>1. Check for low fuel pressure. Refer to <i>Fuel System Pressure Test</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 7</i>
7	<p>1. Check for water- or alcohol-contaminated fuel. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 8</i>
8	<p>1. Install the Tech 2. 2. Run the engine at idle. 3. On the Tech 2, select F3: Miscellaneous Test, F6: Variable Intake Manifold. 4. Repeat Switch ON or OFF of VIM solenoid valve by using the Tech 2. 5. Check to see if the actuator works normally. 6. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 9</i>
9	<p>1. Check for proper ignition voltage output with spark tester J 26792 (ST-125). Refer to <i>Electronic Ignition System</i> for procedure. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 10</i>

Lack of Power, Sluggish, or Spongy Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
10	<p>1. Remove the spark plugs and check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to <i>Electronic Ignition System</i>.</p> <p>NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 11</i>
11	<p>1. Check the ignition coils for cracks or carbon tracking.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 12</i>
12	<p>1. Check the PCM grounds for cleanliness, tightness and proper locations. Refer to the PCM wiring diagrams in <i>Electrical Diagnosis</i>.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 13</i>
13	<p>1. Check the exhaust system for possible restriction:</p> <ul style="list-style-type: none"> ● Inspect the exhaust system for damaged or collapsed pipes. ● Inspect the muffler for heat distress or possible internal failure. ● Check for a possible plugged three-way catalytic converter by checking the exhaust system back pressure. Refer to <i>Restricted Exhaust System Check</i>. <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 14</i>
14	<p>1. Check the torque converter clutch (TCC) for proper operation. Refer to <i>4L30-E Transmission Diagnosis</i>.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 15</i>
15	<p>1. Check for an engine mechanical problem. Check for low compression, incorrect or worn camshaft, loose timing belt, etc. Refer to <i>Engine Mechanical</i>.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 16</i>
16	<p>1. Review all diagnostic procedures within this table.</p> <p>2. If all procedures have been completed and no malfunctions have been found, review/inspect the following:</p> <ul style="list-style-type: none"> ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records buffer ● All electrical connections within a suspected circuit and/or system. <p>3. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Contact Technical Assistance

Detonation/Spark Knock Symptom

Step	Action	Value(s)	Yes	No
1	<p>DEFINITION: A mild to severe ping, usually worse under accelerator. The engine makes sharp metallic knocks that change with throttle opening.</p> <p>Was the "On-Board Diagnostic (OBD) System Check" performed?</p>	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	<p>1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin.</p> <p>Was a bulletin found that addresses the symptom?</p>	—	Verify repair	Go to <i>Step 3</i>
3	<p>Was a visual/physical check performed?</p>	—	Go to <i>Step 4</i>	Go to <i>Visual/Physical Check</i>
4	<p>If Tech 2 readings are normal (refer to <i>Typical Scan Values</i>) and there are no engine mechanical faults, fill the fuel tank with a known quality gasoline that has a minimum octane rating of 87 and re-evaluate the vehicle performance.</p> <p>Is detonation present?</p>	—	Go to <i>Step 5</i>	Verify repair
5	<p>1. Check the transmission range switch circuit. Use a Tech 2 and be sure the Tech 2 indicates that the vehicle is in drive with the gear selector in drive or overdrive.</p> <p>2. If a problem is found, diagnose and repair the transmission range switch as necessary (refer to <i>4L30-E Automatic Transmission Diagnosis</i>).</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 6</i>
6	<p>1. Check TCC operation. Refer to <i>4L30-E Transmission Diagnosis</i>.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 7</i>
7	<p>1. Check for obvious overheating problems:</p> <ul style="list-style-type: none"> ● Low engine coolant. ● Restricted air flow to radiator, or restricted water flow through radiator. ● Correct coolant solution should be a 50/50 mix of approved antifreeze/coolant and water. Refer to <i>Engine Cooling</i>. ● EGR operation. Refer to <i>DTC P0401</i>. ● ION sensing module fault. <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 8</i>
8	<p>1. Ignition "OFF". 2. Disconnect the ION sensing module. 3. Disconnect the PCM.</p> <p>Is the action complete?</p>	—	Go to <i>Step 9</i>	—
9	<p>Check the ION sensing harness between the PCM (F68) and ION sensing module circuit (RED Wire) at the KI line harness connector.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 10</i>

Detonation/Spark Knock Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
10	1. Disconnect the ignition coil. Is the action complete?	—	Go to <i>Step 11</i>	—
11	Check the ION sensing harness between the ignition coil and ION sensing module circuit at the DC motor harness connector. Was a problem found?	—	Verify repair	Go to <i>Step 12</i>
12	Check the following items; 1. Ignition coil and ignition coil circuit. 2. Ignition coil ground circuit for a poor connection. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 13</i>
13	Replace the Ignition coil. Is the action complete?	—	Verify repair	Go to <i>Step 14</i>
14	Check the following items; 1. ION sensing module ground circuit for a poor connection. 2. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Go to <i>Step 10</i>	Go to <i>Step 16</i>
15	Replace the ION sensing module. Is the action complete?	—	Verify repair	Go to <i>Step 16</i>
16	1. Check fuel pressure. Refer to Chart Fuel System Pressure Test. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 17</i>
17	1. Check items that can cause an engine to run lean (long term fuel trim significantly in the positive range). For a lean condition, refer to <i>Diagnostic Aids</i> in <i>DTC P0171 Diagnostic Support</i> . 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 18</i>
18	1. Spark plugs for proper heat range. Refer to <i>General Information</i> . 2. If incorrect spark plugs are installed, replace spark plugs as necessary. Did any spark plugs require replacement?	—	Verify repair	Go to <i>Step 19</i>
19	1. Remove excessive carbon buildup with a top engine cleaner. Refer to instructions on the top engine cleaner can. 2. Re-evaluate vehicle performance. Is detonation still present?	—	Go to <i>Step 20</i>	Verify repair

Detonation/Spark Knock Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
20	1. Check for an engine mechanical problem. Perform a cylinder compression check. Refer to <i>Engine Mechanical</i> . 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 21</i>
21	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: <ul style="list-style-type: none"> ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records buffer ● All electrical connections within a suspected circuit and/or system. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Rough, Unstable, or Incorrect Idle, Stalling Symptom

Step	Action	Value(s)	Yes	No
1	<p>DEFINITION: Engine runs unevenly at idle. If severe, the engine or vehicle may shake. Engine idle speed may vary in RPM. Either condition may be severe enough to stall the engine.</p> <p>Was the "On-Board Diagnostic (OBD) System Check" performed?</p>	—	Go to Step 2	Go to <i>OBD System Check</i>
2	<p>Was the "Electric Throttle Control (ETC) System Check" performed?</p>	—	Go to Step 3	Go to <i>ETC System Check</i>
3	<p>1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin.</p> <p>Was a bulletin found that addresses the symptom?</p>	—	Go to Step 14	Go to Step 4
4	<p>Was a visual/physical check performed?</p>	—	Go to Step 5	Go to <i>Visual/Physical Check</i>
5	<p>1. Check the PCM grounds for cleanliness, tightness and proper routing. Refer to the PCM wiring diagrams in <i>Electrical Diagnosis</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to Step 6
6	<p>Observe the long term fuel trim on the Tech 2.</p> <p>Is the long term fuel trim significantly in the negative range (rich condition)?</p>	—	Go to Step 7	Go to Step 8
7	<p>1. Check items that can cause the engine to run rich. Refer to <i>Diagnostic Aids</i> in <i>DTC P0172 Diagnostic Support</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to Step 10
8	<p>Is the long term fuel trim significantly in the positive range (lean condition)?</p>	—	Go to Step 9	Go to Step 10
9	<p>1. Check items that can cause the engine to run lean. Refer to <i>Diagnostic Aids</i> in <i>DTC P0171 Diagnostic Support</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to Step 10
10	<p>1. Check for incorrect idle speed. Ensure that the following conditions are present:</p> <ul style="list-style-type: none"> ● The engine is fully warm. ● The accessories are "OFF". <p>2. Using a Tech 2, monitor the Engine Speed.</p> <p>Is the Engine Speed within the specified values?</p>	Desired Idle Speed	Go to Step 12	Go to Step 11

Rough, Unstable, or Incorrect Idle, Stalling Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
11	1. Visually/physically inspect for the following conditions: <ul style="list-style-type: none"> ● Restricted air intake system. Check for a possible collapsed air intake duct, restricted air filter element, or foreign objects blocking the air intake system. ● Large vacuum leak. Check for a condition that causes a large vacuum leak, such as an incorrectly installed or faulty crankcase ventilation valve or a disconnected brake booster hose. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 9</i>
12	Check the injector connections. If any of the injectors are connected to an incorrect cylinder, correct as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 13</i>
13	1. Perform the "Injector Coil/Balance Test" in <i>Fuel Metering System</i> . 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 14</i>
14	1. Check for fuel in the pressure regulator vacuum hose. 2. If fuel is present, replace the fuel pressure regulator assembly. Refer to <i>Fuel Metering System</i> . 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 15</i>
15	1. Check for proper ignition voltage output with spark tester J 26792 (ST-125). Refer to <i>Electronic Ignition System</i> for the procedure. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 16</i>
16	1. Remove spark plugs. Check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to <i>Electronic Ignition System</i> . NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 17</i>
17	1. Check for a loose ignition coil ground and ION Sensing Module circuit. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 18</i>
18	1. Check ignition coils for cracks or carbon tracking. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 19</i>

Rough, Unstable, or Incorrect Idle, Stalling Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
19	Using a Tech 2, monitor the throttle position 1 and 2 angle with the engine idling. Is the TP angle at the specified value and steady?	8 ~ 10%	Go to <i>Step 20</i>	Refer to <i>DTC</i> for further diagnosis
20	1. Check the positive crankcase ventilation (PCV) valve for proper operation. Refer to <i>Crankcase Ventilation System</i> . 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 21</i>
21	1. Check the transmission range switch circuit. Use a Tech 2 and be sure the Tech 2 indicates that the vehicle is in drive with the gear selector in drive or overdrive. 2. If a problem is found, diagnose and repair the transmission range switch as necessary (refer to <i>4L30-E Automatic Transmission Diagnosis</i>). Was a problem found?	—	Verify repair	Go to <i>Step 22</i>
22	1. Check for the following engine mechanical items. Refer to <i>Engine Mechanical</i> for diagnosis procedures: <ul style="list-style-type: none"> ● Low compression ● Sticking or leaking valves ● Worn camshaft lobe(s) ● Camshaft drive belt slipped or stripped ● Incorrect valve timing ● Worn rocker arms ● Broken valve springs 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 23</i>
23	1. Check for faulty motor mounts. Refer to <i>Engine Mechanical</i> for inspection of mounts. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 24</i>
24	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: <ul style="list-style-type: none"> ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records buffer ● All electrical connections within a suspected circuit and/or system. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Poor Fuel Economy Symptom

Step	Action	Value(s)	Yes	No
1	<p>DEFINITION: Fuel economy, as measured by an actual road test, is noticeably lower than expected. Also, economy is noticeably lower than it was on this vehicle at one time, as previously shown by an actual road test. (Non-standard tires will cause odometer readings to be incorrect, and that may cause fuel economy to appear poor when it is actually normal.)</p> <p>Was the "On-Board Diagnostic (OBD) System Check" performed?</p>	—	Go to Step 2	Go to <i>OBD System Check</i>
2	<p>1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin.</p> <p>Was a bulletin found that addresses the symptom?</p>	—	Verify repair	Go to Step 3
3	<p>Was a visual/physical check performed?</p>	—	Go to Step 4	Go to <i>Visual/Physical Check</i>
4	<p>Check owner's driving habits.</p> <ul style="list-style-type: none"> ● Is the A/C "ON" full time (defroster mode "ON")? ● Are tires at the correct pressure? ● Are excessively heavy loads being carried? ● Is accelerator too much, too often? <p>Was a problem found?</p>	—	Go to Step 5	Go to Step 6
5	<p>Review the items in Step 4 with the customer and advise as necessary.</p> <p>Is the action complete?</p>	—	System OK	—
6	<p>1. Visually/physically check: Vacuum hoses for splits, kinks, and improper connections and routing as shown on the "Vehicle Emission Control Information" label. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to Step 7
7	<p>1. Remove and check the air filter element for dirt or for restrictions. Refer to <i>Air Intake System</i>. 2. Replace the air filter element if necessary.</p> <p>Was a repair required?</p>	—	Verify repair	Go to Step 8
8	<p>1. Remove spark plugs and check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to <i>Spark Plug Replacement</i>.</p> <p>NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to Step 9
9	<p>1. Check for low engine coolant level. Refer to <i>Engine Cooling</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to Step 10

Poor Fuel Economy Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
10	1. Check for an incorrect or faulty engine thermostat. Refer to <i>Engine Cooling</i> . 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 11
11	1. Check for low engine compression. Refer to <i>Engine Mechanical</i> . 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 12
12	1. Check the TCC operation. Refer to <i>4L30-E Transmission Diagnosis</i> . 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 13
13	1. Check the exhaust system for possible restriction: <ul style="list-style-type: none"> ● Inspect the exhaust system for damaged or collapsed pipes. ● Inspect the muffler for heat distress or possible internal failure. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 14
14	Check for proper calibration of the speedometer. Does the speed indicated on the speedometer closely match the vehicle speed displayed on the Tech 2?	—	Go to Step 16	Go to Step 15
15	Diagnose and repair an inaccurate speedometer condition as necessary. Refer to <i>Vehicle Speed Sensor</i> in <i>Electrical Diagnosis</i> . Was a problem found?	—	Verify repair	—
16	1. Check the air intake system and the crankcase for air leaks. Refer to <i>Air Intake System</i> and <i>Crankcase Ventilation System</i> . 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 17
17	1. Review all diagnostic procedures within this table. 2. When all procedures have been completed and no malfunctions have been found, review/inspect the following: <ul style="list-style-type: none"> ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records buffer ● All connections within a suspected circuit and/or system. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 18
18	Perform the procedure in <i>Fuel System Pressure Test</i> . Was the fuel pressure normal?	—	Contact Technical Assistance	Verify repair

Excessive Exhaust Emissions or Odors Symptom

Step	Action	Value(s)	Yes	No
1	<p>DEFINITION: Vehicle fails an emission test. Vehicle has excessive "rotten egg" smell. (Excessive odors do not necessarily indicate excessive emissions.)</p> <p>Was the "On-Board Diagnostic (OBD) System Check" performed?</p>	—	Go to Step 2	Go to <i>OBD System Check</i>
2	<p>1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin.</p> <p>Was a bulletin found that addresses the symptom?</p>	—	Go to Step 13	Go to Step 3
3	<p>Was a thorough visual/physical check performed?</p>	—	Go to Step 4	Go to <i>Visual/Physical Check</i>
4	<p>1. Check for vacuum leaks. Check vacuum lines, intake manifold, throttle body, etc. 2. If a problem is found, repair as necessary.</p> <p>Were any vacuum leaks located?</p>	—	Go to Step 13	Go to Step 5
5	<p>1. Check the fuel cap for proper installation. 2. Secure the fuel cap if necessary.</p> <p>Was the fuel cap installed properly?</p>	—	Go to Step 6	Go to Step 13
6	<p>1. Check the fuel pressure. Perform the procedure in <i>Fuel System Pressure Test</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Go to Step 13	Go to Step 7
7	<p>1. Check for a faulty, plugged, or incorrectly installed crankcase ventilation valve; also check the crankcase ventilation system for plugging. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Go to Step 13	Go to Step 8
8	<p>1. Check the injector connections. 2. If any of the injectors are connected to an incorrect cylinder, correct as necessary.</p> <p>Was a problem found?</p>	—	Go to Step 13	Go to Step 9
9	<p>1. Perform the "Injector Coil/Balance Test" in <i>Fuel Metering System</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Go to Step 13	Go to Step 10
10	<p>1. Refer to <i>Engine Cooling</i> for cooling system diagnosis. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Go to Step 13	Go to Step 11
11	<p>1. Check EVAP canister for fuel loading. Refer to <i>Evaporative Emission Control System</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Go to Step 13	Go to Step 12

Excessive Exhaust Emissions or Odors Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
12	1. Remove excessive carbon buildup with a top engine cleaner. Refer to the instructions on the top engine cleaner can. 2. Perform the exhaust emission test. Does the vehicle pass the test?	—	System OK	Go to <i>Step 14</i>
13	Perform the exhaust emission test. Does the vehicle pass the test?	—	System OK	Go to <i>Step 14</i>
14	Does the exhaust emission test indicate excessive CO and HC levels or is long term fuel trim significantly in the negative range (rich condition)?	—	Go to <i>Step 15</i>	Go to <i>Step 16</i>
15	1. Check items that can cause the engine to run rich. Refer to <i>Diagnostic Aids in DTC P0172 Diagnostic Support</i> . Make any necessary repairs. 2. Perform the exhaust emission test. Does the vehicle pass the test?	—	System OK	Go to <i>Step 17</i>
16	1. Check items that can cause the engine to run lean. Refer to <i>Diagnostic Aids in DTC P0171 Diagnostic Support</i> . Make any necessary repairs. 2. Perform the exhaust emission test. Does the vehicle pass the test?	—	System OK	Go to <i>Step 17</i>
17	1. Check the EGR system (refer to <i>DTC P0401</i>). 2. If a problem is found, repair as necessary. Was a problem found?	—	Go to <i>Step 13</i>	Go to <i>Step 18</i>
18	1. Check for an engine mechanical problem. Perform a cylinder compression check (refer to <i>Engine Mechanical</i>). 2. If a problem is found, repair as necessary. Was a problem found?	—	Go to <i>Step 13</i>	Go to <i>Step 19</i>
19	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: <ul style="list-style-type: none"> ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records buffer ● All electrical connections within a suspected circuit and/or system. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Dieseling, Run-On Symptom

Step	Action	Value(s)	Yes	No
1	<p>DEFINITION: Engine continues to run after key is turned "OFF," but runs very rough. If engine runs smooth, check ignition switch and adjustment.</p> <p>Was the "On-Board Diagnostic (OBD) System Check" performed?</p>	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	<p>1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin.</p> <p>Was a bulletin found that addresses the symptom?</p>	—	Verify repair	Go to <i>Step 3</i>
3	<p>Was a visual/physical check performed?</p>	—	Go to <i>Step 4</i>	Go to <i>Visual/Physical Check</i>
4	<p>1. Check for a short between B+ and any of the ignition feed circuits. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 5</i>
5	<p>1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following:</p> <ul style="list-style-type: none"> ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records buffer ● All electrical connections within a suspected circuit and/or system <p>3. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Contact Technical Assistance

Backfire Symptom

Step	Action	Value(s)	Yes	No
1	<p>DEFINITION: Fuel ignites in the intake manifold, or in the exhaust system, making a loud popping noise.</p> <p>Was the "On-Board Diagnostic (OBD) System Check" performed?</p>	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	<p>1. Perform a bulletin search.</p> <p>2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin.</p> <p>Was a bulletin found that addresses the symptom?</p>	—	Verify repair	Go to <i>Step 3</i>
3	<p>Was a visual/physical check performed?</p>	—	Go to <i>Step 4</i>	Go to <i>Visual/Physical Check</i>
4	<p>1. Check for proper ignition voltage coil output with spark tester J 26792 (ST-125). Refer to <i>Electric Ignition System</i> for procedure.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 5</i>
5	<p>1. Remove spark plugs and check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to <i>Electronic Ignition System</i>.</p> <p>NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. Refer to <i>DTC P0172</i> to determine the cause of a rich condition or <i>Engine Mechanical</i> for an oil fouling condition.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 6</i>
6	<p>1. Visually/physically inspect the ignition coils for cracks.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 7</i>
7	<p>1. Check for an intermittent ignition system malfunction:</p> <ul style="list-style-type: none"> ● Intermittent CKP 58X signal. ● Intermittent ignition feed circuit or sensor ground circuit to the crankshaft position sensor. <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 8</i>
8	<p>1. Check the fuel pressure. Refer to <i>Fuel System Pressure Test</i>.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 9</i>

Backfire Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
9	<p>1. Check for the following engine mechanical conditions. Refer to <i>Engine Mechanical</i> for diagnosis procedures:</p> <ul style="list-style-type: none"> ● Low compression ● Sticking or leaking valves ● Worn camshaft lobe(s) ● Camshaft drive belt slipped or stripped ● Incorrect valve timing <p>2. If a problem is found, repair as necessary. Was a problem found?</p>	—	Verify repair	Go to <i>Step 10</i>
10	<p>1. Check the intake and exhaust manifold(s) for casting flash. Refer to <i>Engine Mechanical</i>.</p> <p>2. If a problem is found, repair as necessary. Was a problem found?</p>	—	Verify repair	Go to <i>Step 11</i>
11	<p>1. Review all diagnostic procedures within this table.</p> <p>2. If all procedures have been completed and no malfunctions have been found, review/inspect the following:</p> <ul style="list-style-type: none"> ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records buffer ● All electrical connections within a suspected circuit and/or system. <p>3. If a problem is found, repair as necessary. Was a problem found?</p>	—	Verify repair	Contact Technical Assistance

Cuts Out, Misses Symptom

Step	Action	Value(s)	Yes	No
1	DEFINITION: Steady pulsation or jerking that follows engine speed; usually more pronounced as engine load increases. Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to OBD System Check
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Go to Step 14	Go to Step 3
3	Was a visual/physical check performed?	—	Go to Step 4	Go to Visual/Physical Check
4	Was the "Electric Throttle Control (ETC) System Check" performed?	—	Go to Step 5	Go to ETC System Check
5	1. Check the PCM grounds for clearness, tightness and proper routing. Refer to the PCM wiring diagrams in <i>Electrical Diagnosis</i> . 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 6
6	Observe the long term fuel trim on the Tech 2. Is the long term fuel trim significantly in the negative range (rich condition)?	—	Go to Step 7	Go to Step 8
7	1. Check items that can cause the engine to run rich. Refer to <i>Diagnostic Aids in DTC P0172 Diagnostic Support</i> . 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 10
8	Is the long term fuel trim significantly in the positive range (lean condition)?	—	Go to Step 9	Go to Step 10
9	1. Check items that can cause the engine to run lean. Refer to <i>Diagnostic Aids in DTC P0171 Diagnostic Support</i> . 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 10
10	1. Check for incorrect idle speed. Ensure that the following conditions are present: <ul style="list-style-type: none"> • The engine is fully warm. • The accessories are "off". 2. Using a Tech 2, monitor the Engine Speed. Is the Engine Speed within the specified values?	Desired Idle Speed	Go to Step 12	Go to Step 11

Cuts Out, Misses Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
11	1. Visually/physically inspect for the following conditions: <ul style="list-style-type: none"> ● Restricted air intake system. Check for a possible collapsed air intake duct, restricted air filter element, or foreign objects blocking the air intake system. ● Large vacuum leak. Check for a condition that causes a large vacuum leak, such as an incorrectly installed or faulty PCV valve or brake booster hose disconnected. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 9</i>
12	Check the injector connections. If any of the injectors are connected to an incorrect cylinder, correct as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 13</i>
13	1. Perform the "Injector Coil/Balance Test" in <i>Fuel Metering System</i> . 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 14</i>
14	1. Check for fuel in the pressure regulator vacuum hose. 2. If fuel is present, replace the fuel pressure regulator assembly. Refer to <i>Fuel Metering System</i> . 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 15</i>
15	1. Check for proper ignition voltage output with spark tester J 26792 (ST-125). Refer to <i>Electronic Ignition System</i> for the procedure. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 16</i>
16	1. Remove spark plugs. Check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to <i>Electronic Ignition System</i> . NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 17</i>
17	1. Check for a loose ignition coil ground and ION Sensing module circuit. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 18</i>
18	1. Check ignition coils for cracks or carbon tracking. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 19</i>
19	Using a Tech 2, monitor the TP 1, 2 angle with the engine idling. Is the TP angle at the specified value and steady?	8 ~ 10%	Go to <i>Step 20</i>	Refer to <i>DTC P0123</i> for further diagnosis

Cuts Out, Misses Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
20	<p>1. Check the PCV valve for proper operation. Refer to <i>Crankcase Ventilation System</i>.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 21</i>
21	<p>1. Check the transmission range switch circuit. Use a Tech 2 and be sure the Tech 2 indicates that the vehicle is in drive with the gear selector in drive or overdrive.</p> <p>2. If a problem is found, diagnose and repair the transmission range switch as necessary (refer to <i>4L30-E Automatic Transmission Diagnosis</i>).</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 22</i>
22	<p>1. Check the following engine mechanical items. Refer to <i>Engine Mechanical</i> for diagnosis procedures:</p> <ul style="list-style-type: none"> ● Low compression ● Sticking or leaking valves ● Worn camshaft lobe(s) ● Camshaft drive belt slipped or stripped ● Incorrect valve timing ● Worn rocker arms ● Broken valve springs <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 23</i>
23	<p>1. Check for faulty motor mounts. Refer to <i>Engine Mechanical</i> for inspection of mounts.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 24</i>
24	<p>1. Review all diagnostic procedures within this table.</p> <p>2. If all procedures have been completed and no malfunctions have been found, review/inspect the following:</p> <ul style="list-style-type: none"> ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records buffer ● All electrical connections within a suspected circuit and/or system <p>3. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Contact Technical Assistance

Hesitation, Sag, Stumble Symptom

Step	Action	Value(s)	Yes	No
1	<p>DEFINITION: Momentary lack of response as the accelerator is pushed down. Can occur at any vehicle speed. Usually most pronounced when first trying to make the vehicle move, as from a stop sign. May cause the engine to stall if severe enough.</p> <p>Was the "On-Board Diagnostic (OBD) System Check" performed?</p>	—	Go to Step 2	Go to <i>OBD System Check</i>
2	<p>Was the "Electric Throttle Control (ETC) System Check" performed?</p>	—	Go to Step 3	Go to <i>ETC System Check</i>
3	<p>1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin.</p> <p>Was a bulletin found that addresses the symptom?</p>	—	Verify repair	Go to Step 4
4	<p>Was a visual/physical check performed?</p>	—	Go to Step 5	Go to <i>Visual/Physical Check</i>
5	<p>1. Check the fuel control heated oxygen sensors (HO2S, B1S1 and B2S1). The fuel control heated oxygen sensors (HO2S) should respond quickly to different throttle positions. If they don't, check them for silicon or other contaminants from fuel or use of improper RTV sealant. The sensors may have a white powdery coating. Silicon contamination causes a high but false HO2S signal voltage (rich exhaust indication). The PCM will then reduce the amount of fuel delivered to the engine, causing a severe drivability problem. For more information, refer to <i>Powertrain Control Module (PCM) and Sensors</i>.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to Step 6
6	<p>1. Check the fuel pressure. Refer to <i>Fuel System Pressure Test</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to Step 7
7	<p>Observe the TP 1, 2 angle display on the Tech 2 while slowly increasing throttle pedal.</p> <p>Does the TP angle display steadily increase from 8 ~ 10% at closed throttle to 90 ~ 92% at WOT?</p>	—	Go to Step 8	Go to Step 9
8	<p>Monitor the long term fuel trim on the Tech 2.</p> <p>Is the long term fuel trim significantly in the negative range (rich condition)?</p>	—	Go to Step 9	Go to Step 10
9	<p>1. Check items that can cause the engine to run rich. Refer to <i>Diagnostic Aids in DTC P0172 Diagnostic Support</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to Step 11

Hesitation, Sag, Stumble Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
10	1. Check items that can cause the engine to run lean. Refer to <i>Diagnostic Aids</i> in <i>DTC P0171 Diagnostic Support</i> . 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 11</i>
11	1. Check for proper ignition voltage output with spark tester J 26792 (ST-125). Refer to <i>Electronic Ignition System</i> for the procedure. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 12</i>
12	1. Check for a loose ignition coil ground and ION Sensing module circuit. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 13</i>
13	1. Check the ignition coils for cracks or carbon tracking. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 14</i>
14	1. Remove spark plugs and check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to <i>Electronic Ignition System</i> . NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 15</i>
15	1. Check the PCM grounds for clearness, tightness and proper routing. Refer to the PCM wiring diagrams in <i>Electrical Diagnosis</i> . 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 16</i>
16	1. Check the MAF sensor connections. 2. If a problem is found, replace the faulty terminals as necessary. Refer to <i>Electrical Diagnosis</i> for wiring repair procedures. Was a problem found?	—	Verify repair	Go to <i>Step 17</i>

Hesitation, Sag, Stumble Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
17	1. Visually/physically check vacuum hoses for splits, kinks, and proper connections and routing as shown on the "Vehicle Emission Control Information" label. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 18</i>
18	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: <ul style="list-style-type: none"> ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records butter ● All electrical connections within a suspected circuit and/or system 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Default Matrix Table

Service Procedure Default Strategy

A referral strategy has been established to assist the technician with additional information when the cause of the failure cannot be determined. If no problem is found after performing diagnostics, then refer to the default matrix table for further diagnostic information.

Default Matrix Table

Strategy Based Diagnostic Charts	Initial Diagnosis	Default Section(s)
On-Board Diagnostic (OBD) System Check	Vehicle does not enter diagnostics.	Chassis Electrical
On-Board Diagnostic (OBD) System Check	Vehicle enters diagnostics and communicates with the Tech 2. MIL is "ON" in diagnostics. Engine does not start and run.	Ignition System Check
On-Board Diagnostic (OBD) System Check	Engine starts and runs, no PCM codes set. Customer complains of vibration.	—
On-Board Diagnostic (OBD) System Check	Engine starts and runs, no PCM codes set. Customer complains of harsh or soft shift, poor performance, delayed or no engagement into drive or reverse, transmission fluid leak, transmission noise or vibration, or improper TCC operation.	Automatic Transmission
PCM Power and Ground Check	On-Board Diagnostic (OBD) System Check.	Chassis Electrical
PCM Power and Ground Check	On-Board Diagnostic (OBD) System Check. PCM power and ground circuits OK. Data link voltage incorrect.	Chassis Electrical
On-Board Diagnostic (OBD) System Check	Engine starts and runs, no PCM codes set. Customer complains of harsh or soft shift, poor performance, delayed or no engagement into drive or reverse, transmission fluid leak, transmission noise or vibration, or improper TCC operation.	Automatic Transmission

On Vehicle Service Crankshaft Position (CKP) Sensor

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the electrical connector to the CKP sensor.
3. Remove one bolt and the CKP sensor from the right side of the engine block, just behind the mount.

NOTE: Use caution to avoid any hot oil that might drip out.

TS22909

Inspection Procedure

1. Inspect the sensor O-ring for cracks or leaks.
2. Replace the O-ring if it is worn or damaged.
3. Lubricate the new O-ring with engine oil.
4. Install the lubricated O-ring.

Installation Procedure

1. Install the CKP sensor in the engine block.
2. Install the CKP sensor mounting bolt.
 - Tighten**
 - Tighten the mounting bolt to 9 N-m (78 lb in.).

TS22909

3. Connect the electrical connector to the CKP sensor.
4. Connect the negative battery cable.

Engine Coolant Temperature (ECT) Sensor

Removal Procedure

NOTE: Care must be taken when handling the engine coolant temperature (ECT) sensor. Damage to the ECT sensor will affect proper operation of the fuel injection system.

1. Disconnect the negative battery cable.
2. Drain the radiator coolant. Refer to *Draining and Refilling Cooling System in Engine Cooling* section.
3. Disconnect the electrical connector.

014RY0001

4. Remove the ECT sensor from the coolant crossover.

014RY0002

3. Connect the electrical connector.

014RY0003

Installation Procedure

1. Apply sealer or the equivalent to the threads of the ECT sensor.
2. Install the ECT sensor in the coolant crossover.

Tighten

- Tighten the ECT sensor to 30 N·m (22 lb ft.).

014RY0002

4. Fill the radiator with coolant. Refer to *Draining and Refilling Cooling System* in *Engine Cooling* section.
5. Connect the negative battery cable.

Heated Oxygen Sensor (HO2S)

Removal Procedure

1. Disconnect the negative battery cable.
2. Locate the two oxygen sensors.

060R100113

- Bank 1 sensor 1 is mounted on the exhaust pipe ahead of the right-hand catalytic converter.

TS22912

- Bank 2 sensor 1 is mounted on the exhaust pipe ahead of the left-hand catalytic converter.

TS22914

3. Disconnect the pigtail from the wiring harness.

060RY00128

IMPORTANT: The pigtail is permanently attached to the sensor. Be careful not to pull the wires out.

NOTE: Do not use a torch to remove an HO2S unless the sensor is being replaced. Using a torch could damage the sensor.

4. Remove the sensor from the exhaust pipe.

- Because of the expansion and contraction of the metal in the exhaust system over time, this may be difficult if the engine temperature is below 48°C (120°F).

060RY00128

Inspection Procedure

All four sensors are identical. Inspect each in the same way.

1. Inspect the pigtail and the electrical connector for grease, dirt, corrosion, and bare wires or worn insulation.
2. Inspect the louvered end of the sensor for grease, dirt, or other contaminations.

060RY00128

Installation Procedure

IMPORTANT:

- There is a special anti-seize compound on the HO2S threads. This compound consists of glass beads suspended in a liquid graphite solution. The graphite burns away with engine heat, but the glass beads will remain, making the sensor easier to remove.
 - New or service sensors will already have the compound applied to the threads. If a sensor is removed and is to be reinstalled for any reason, the threads must have anti-seize compound applied.
1. Apply anti-seize compound or the equivalent to the threads of the oxygen sensor, if necessary.

2. Install the oxygen sensor on the exhaust pipe in its original position.

Tighten

- Tighten the oxygen sensor to 55 N·m (40 lb ft.).

060RY00128

3. Connect the pigtail to the wiring harness.
4. Connect the negative battery cable.

Intake Air Temperature (IAT) Sensor

Removal Procedure

1. Disconnect the negative battery cable.
2. Remove the engine cover
3. The IAT sensor is located in the intake air duct, behind the throttle body.
4. Disconnect the electrical connector from the IAT sensor.

TS23741

5. Remove the IAT sensor from the intake air duct by using a rocking motion while pulling the sensor.

Installation Procedure

1. Install the IAT sensor into the grommet in the intake air duct.
2. Correct the IAT electrical connector.

TS23741

3. Install the engine cover.
4. Connect the negative battery cable.

ION Sensing Module

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the ION sensing module connector.
3. Remove the bolts and the ION sensing module from the common chamber.

060R100143

Installation Procedure

1. Install the ION sensing module on the common chamber with the bolts.

Tighten

- Tighten the ION sensing module to 4 N-m (35 lb in.).
2. Connect the ION sensing module connectors as shown in the illustration.

060RY00003

Legend

- (1) Green (Light Blue) Color Connector
- (2) Blue Color Connector

3. Connect the negative battery cable.

Mass Air Flow (MAF) Sensor

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the electrical connector from the MAF sensor.

3. Loosen the clamps which secure the intake air duct and the air cleaner to the MAF sensor.
4. Remove the intake air duct from the MAF sensor.
5. Remove the MAF sensor from the air cleaner.

Installation Procedure

1. Install the MAF sensor on the air cleaner with the clamp.
2. Install the intake air duct and the clamp on the MAF sensor.

3. Tighten the clamps to secure the MAF sensor to the intake air duct and the air cleaner.
4. Connect the MAF electrical connector.
5. Connect the negative battery cable.

Manifold Absolute Pressure (MAP) Sensor

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the electrical connector from the MAP sensor.

3. Remove the bolt securing the MAP sensor to the mounting bracket on the common chamber.
4. Remove the MAP sensor from the mounting bracket.

Installation Procedure

1. Install the MAP sensor in the mounting bracket.

2. Install the mounting bracket retaining bolt on the common chamber.

Tighten

- Tighten the bolt to 20 N·m (12 lb ft.).
3. Connect the MAP electrical connector.

4. Connect the negative battery cable.

Malfunction Indicator Lamp (MIL)

Removal and Installation Procedure

Refer to Warning light bulb, indicator light valve, illumination light bulb, A/T indicator light bulb in Meter and Gauge.

Reduced Power Lamp

The reduced power lamp (RPL) turns on when the ignition key is moved to the ON position. It should turn off in approximately 3 seconds or immediately after the engine starts.

If the RPL turns on during vehicle operation, a vehicle system failure resulting in reduced engine output is indicated.

If both the reduced RPL and the check engine light turn on, a serious problem affecting vehicle performance is indicated.

Refer to the *OBD system check NO and RPL "ON" steady* in this manual.

Powertrain Control Module (PCM)

Service Precaution

NOTE: To prevent possible electrostatic discharge damage to the PCM, do not touch the connector pins or soldered components on the circuit board.

Electrostatic Discharge (ESD) Damage

Electronic components used in the control systems are often designed to carry very low voltage. Electronic components are susceptible to damage caused by electrostatic discharge. Less than 100 volts of static electricity can cause damage to some electronic components. By comparison, it takes as much as 4,000 volts for a person to even feel the zap of a static discharge.

There are several ways for a person to become statically charged. The most common methods of charging are by friction and by induction. An example of charging by friction is a person sliding across a car seat.

Charging by induction occurs when a person with well insulated shoes stands near a highly charged object and momentarily touches ground. Charges of the same polarity are drained off leaving the person highly charged with the opposite polarity. Static charges can cause damage, therefore, it is important to use care when handling and testing electronic components.

NOTE: To prevent possible Electrostatic Discharge damage, follow these guidelines:

- Do not touch the control module connector pins or soldered components on the control module circuit board.
- Do not open the replacement part package until the part is ready to be installed.
- Before removing the part from the package, ground the package to a known good ground on the vehicle.
- If the part has been handled while sliding across the seat, or while sitting down from a standing position, or while walking a distance, touch a known good ground before installing the part.

NOTE: To prevent internal PCM damage, the ignition must be in the "OFF" position in order to disconnect or reconnect power to the PCM (for example: battery cable, PCM pigtail, PCM fuse, jumper cables, etc.).

IMPORTANT: When replacing the production PCM with a service PCM, it is important to transfer the broadcast code and production PCM number to the service PCM label. This will allow positive identification of PCM parts throughout the service life of the vehicle. Do not record this information on the metal PCM cover.

IMPORTANT: The ignition should always be in the "OFF" position in order to install or remove the PCM connectors.

Service of the PCM should normally consist of either replacement of the PCM or EEPROM programming. If the diagnostic procedures call for the PCM to be replaced, the PCM should be checked first to ensure it is the correct part. If it is, remove the faulty PCM and install the new service PCM.

The service PCM EEPROM will not be programmed. DTC P0601 indicates the check sum error.

Removal Procedure

1. Disconnect the negative battery cable.
2. Block the wheels.
3. Remove the two screws from the PCM electrical connectors.
4. Disconnect the PCM electrical connectors.

5. After removing the clip which fixes the PCM to the bracket, remove PCM.

060RY00067

Installation Procedure

1. Install the PCM to bracket and fix with the clip.

060RY00066

2. Connect the PCM electrical connectors.

3. Install the two screws to PCM electrical connectors.

060RY00065

Throttle Position (TP) Sensor

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the TPS electrical connector.
3. Remove the bolts and the TP sensor from the throttle body.

060RY00159

NOTE: Do not clean the TP sensor by soaking it in solvent. The sensor will be damaged as a result.

Function Check

Use a Tech 2 to check the TP sensor output voltage at closed throttle.

- The voltage should be TP1 about 0.4V, TP2 about 4.6V and TP3 about 4.6V.
- If the reading is abnormal value, check the throttle shaft to see if it is binding.

Installation Procedure

1. Install the TP sensor on the throttle body with the bolts.

2. Connect the TP electrical connector.
3. Install the negative battery cable.

Vehicle Speed Sensor (VSS)

Removal Procedure

CAUTION: The VSS is located on the right side of the transfer case just ahead of the rear propeller shaft and very close to the exhaust pipes for 4WD and on the extension cover for 2WD. Be sure that the exhaust pipes are cool enough to touch before trying to remove the VSS. If the pipes are hot, you could be burned.

1. Disconnect the negative battery cable.

2. Disconnect the VSS electrical connector.

3. Remove the bolt and the clamp securing the VSS in place.

IMPORTANT: Have a container ready to catch any fluid that leaks out when the VSS is removed from the transfer case for 4WD and on the extension cover for 2WD.

4. Remove the VSS from the transfer case by wiggling it slightly and pulling it straight out.

Inspection Procedure

1. Inspect the electrical connector for signs of corrosion or warping. Replace the VSS if the electrical connector is corroded or warped.
2. Inspect the VSS driven gear for chips, breaks, or worn condition. Replace the VSS if the driven gear is chipped, broken or worn.
3. Inspect the O-ring for wear, nicks, tears, or looseness. Replace the O-ring if necessary.

Installation Procedure

1. Install the VSS in the transfer case with the notch for the connector facing the rear.
2. Secure the VSS in place with the clamp and the bolt.

Tighten

- Tighten the bolt to 16 N-m (12 lb ft.).

TS23780

3. Connect the VSS electrical connector.

TS23748

4. Check the transfer case oil level. Add fluid if necessary.
5. Connect the negative battery cable.

Air Cleaner/Air Filter

Removal Procedure

1. Loosen the clamp between the air cleaner lid and the mass air flow sensor.

025RY0001

2. Release the four latches securing the lid to the air cleaner housing.
3. Remove the air cleaner lid.
4. Remove the air filter element.
5. Remove the retaining bolts and the air cleaner housing from the vehicle.

025RY0002

Legend

- (1) Air Cleaner Housing
- (2) Air Filter Element
- (3) Air Cleaner Lid

Installation Procedure

1. Install the air cleaner housing in the vehicle with the retaining bolts.
2. Install the air filter element in the air cleaner housing.
3. Install the air cleaner lid on the MAF sensor and the air cleaner housing.

Legend

- (1) Air Cleaner Housing
- (2) Air Filter Element
- (3) Air Cleaner Lid
- (4) Mass Air Flow Sensor

4. Tighten the clamp and secure the four latches between the lid and the air cleaner housing.

Common Chamber

Removal and Installation Procedure

Refer to Common Chamber in Engine Mechanical section.

Accelerator Pedal Replacement

Removal Procedure

1. Disconnect the negative battery cable.

2. Disconnect the electrical harness from the accelerator position sensor.

Legend

- (1) Accelerator Position Sensor
- (2) Accelerator Pedal Assembly

3. Remove the two screws from the accelerator pedal assembly.

4. Remove the accelerator pedal assembly from the bulkhead.

Installation Procedure

1. Install the accelerator pedal assembly on the bulkhead.
2. Install the two screws to the accelerator pedal assembly.

Tighten

- Tighten the screws to 22 N·m (16 lb ft.).

3. Connect the electrical harness to the accelerator position sensor.

Legend

- (1) Accelerator Position Sensor
- (2) Accelerator Pedal Assembly

Accelerator Position Sensor Replacement

CAUTION: Remove the Accelerator (A) pedal assembly as a unit to have it serviced. Do not remove the Accelerator Position (AP) sensor on the A pedal. If the AP sensor is removed for emergency cause, refer to following items as necessary.

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the electrical harness from the AP sensor.

Legend

- (1) AP Sensor
- (2) A Pedal Assembly

4. Install the negative battery cable.

3. Remove the AP sensor.

101RY00009

Legend

- (1) AP Sensor
- (2) AP Screw

Installation Procedure

1. Install the accelerator position (AP) sensor to bolts with accelerator (A) pedal.
2. Connect the connector to AP sensor.
3. Install the negative battery cable.

Accelerator Position Sensor Adjustment

AP sensor is controlled three multiple control system, and adjust the idle position and WOT position are between A and B for AP sensor 1, AP sensor 2, and AP sensor 3. Refer to "How to adjust for AP sensor".

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the electrical harness from the AP sensor.

How To Adjust For AP Sensor

1. Connect the Tech 2 to DLC on vehicle.
2. Ignition "ON," engine "OFF."

3. Display the APS date list. Check the following item for AP position (%).

	AP position (%)	
	Idle position A	WOT position B
APS1	13%	87 ± 2%
APS2	87 ± 2%	13 ± 2%
APS3	87 ± 1%	34 ± 2%

060RY00305

4. If the problem was found, adjust as necessary.

101RY00011

Fuel Filler Cap

General Description

The fuel filler cap includes a vacuum valve and a pressure valve.

If high vacuum or high pressure occurs in the fuel tank, each valve works to adjust the pressure in order to prevent damage to the tank.

TS23767

Inspection Procedure

NOTE: Replace the fuel filler cap with the same type of filler cap that was originally installed on the vehicle.

- Check the seal ring in the filler cap for any abnormality and for seal condition.
- Replace the filler cap if any abnormality is found.

Fuel Filter

Removal Procedure

1. Disconnect the negative battery cable.

2. Remove the fuel filler cap.

041RY0001

3. Disconnect the fuel hose from the fuel filter on the engine side.
4. Disconnect the fuel hose from the fuel filter on the fuel tank side.
5. Remove the bolt on the fuel filter holder.

041RW003

Legend

- (1) Fuel Hose
- (2) Fuel Filter Fixing Bolt
- (3) Fuel Filter

6. Remove the fuel filter.

Inspection Procedure

1. Replace the fuel filter when the following occur:
 - Fuel leaks from the fuel filter body.
 - The fuel filter body is damaged.
 - The fuel filter is clogged with dirt or sediment.
2. If the drain hole is clogged, clean the drain.

Legend

- (1) Fuel Hose
- (2) Fuel Filter Fixing Bolt
- (3) Fuel Filter

5. Install the fuel filler cap.

6. Connect the negative battery cable.

Installation Procedure

1. Install the fuel filter in the correct direction.
2. Install the bolt on the fuel filter holder.
 - Tighten**
 - **Tighten the screws to 20 N·m (14 lb ft.).**
3. Connect the fuel hose on the engine side.
4. Connect the fuel hose on the fuel tank side.

Fuel Gauge Unit

Removal Procedure

Refer to *Fuel Gauge Unit Engine Fuel* section.

Fuel Injectors

Removal Procedure

NOTE: If the fuel injectors are leaking, the engine oil may be contaminated with fuel. Check the oil for signs of contamination and change the oil and the filter if necessary.

NOTE: Use care in removing the fuel injectors in order to prevent damage to the fuel injector electrical connector pins or the fuel injector nozzles. The fuel injector is an electrical component and should not be immersed in any type of cleaner as this may damage the fuel injector.

IMPORTANT: Fuel injectors are serviced as a complete assembly only.

1. Disconnect the negative battery cable.
2. Remove the common chamber. Refer to *Common Chamber in Engine Mechanical* section.
3. Remove the fuel rail. Refer to *Fuel Rail* section.

4. Remove the injector retainer clip.

5. Remove the fuel injector assembly.
6. Remove the O-ring from the fuel injector.
7. Remove the O-ring backup from the fuel injector .

Inspection Procedure

1. Inspect the O-rings for cracks or leaks.
2. Replace worn or damaged O-rings.
3. Lubricate the new O-rings with engine oil before installation.

Installation Procedure

1. Install the O-ring backup on the fuel injector.
2. Install the new O-ring on the fuel injector.
3. Install the fuel injector on the fuel rail.

4. Use new fuel injector retainer clips to retain the fuel injector to the fuel rail.
5. Coat the end of the fuel injector with gasoline.
6. Install the fuel rail. Refer to *Fuel Rail* section.

7. Install the common chamber. Refer to *Common Chamber in Engine Mechanical* section.
8. Install the engine cover.
9. Connect the negative battery cable.

Fuel Metering System

Fuel Pressure Relief Procedure

CAUTION: To reduce the risk of fire and personal injury, there are necessary to relieve the fuel system pressure before filler and gauge unit servicing the fuel system components.

CAUTION: After relieving the system pressure, a small amount of fuel may be released when servicing fuel lines or connections. Reduce the chance of personal injury by covering the fuel line fittings with a shop towel before you disconnect the fittings. The towels will absorb any fuel that may leak out. When the disconnect is completed, place the towel in an approved container.

1. Remove the fuel cap.
2. Remove the fuel pump relay from the underhood relay box. Refer to *Fuel Pump Relay* section.

014RY0004

3. Start the engine and allow it to stall.
4. Crank the engine for 30 seconds.
5. Disconnect the negative battery cable.

Fuel Pump Assembly

Removal Procedure

Refer to *Fuel Tank In Fuel Pump Relay* section.

014RW133

Fuel Pump Relay

Removal Procedure

1. Remove the fuse and relay box cover from under the hood.
2. Consult the diagram on the cover to determine which is the correct relay.
3. Insert a small screwdriver into the catch slot on the forward side of the fuel pump relay.
 - The screwdriver blade will release the catch inside.

D08RY00291

4. Pull the relay straight up and out of the fuse and relay box.

014RY00004

Fuel Rail Assembly

Removal Procedure

NOTE:

- Do not attempt to remove the fuel inlet fitting on the fuel rail. It is staked in place. Removing the fuel inlet fitting will result in damage to the fuel rail or the internal O-ring seal.
- Use care when removing the fuel rail assembly in order to prevent damage to the injector electrical connector terminals and the injector spray tips.
- Fittings should be capped and holes plugged during servicing to prevent dirt and other contaminants from entering open lines and passages.

IMPORTANT: An eight-digit identification number is stamped on the side of the fuel rail. Refer to this number when you service the fuel rail or when a replacement part is required.

014RY00008

Installation Procedure

1. Insert the relay into the correct place in the fuse and relay box with the catch slot facing forward.
2. Press down until the catch engages.
 - An audible "click" will be heard.

014RY00004

3. Install the fuse and relay box cover.

Before removal, the fuel rail assembly may be cleaned with a spray type engine cleaner. Follow the spray package instructions. Do not immerse the fuel rails in liquid cleaning solvent.

1. Depressurize the fuel system. Refer to Fuel Pressure Relief Procedure in this Section.
2. Disconnect the negative battery cable.
3. Remove the engine cover.
4. Disconnect the throttle position sensor electrical connector from throttle body.
5. Disconnect the connectors from manifold absolute pressure sensor, solenoid valve, electric vacuum sensing valve.
6. Disconnect the vacuum hose on canister VSV and positive crankcase ventilation hose.

7. Remove the common chamber. Refer to the common chamber in Engine Mechanical section.
 1. Lift up carefully on the fuel injectors. Do not separate the fuel injectors from the fuel rail.
 2. If an injector becomes separated from the fuel rail, the injector O-ring seals and the retainer clip must be replaced.
 3. Drain residual fuel into an approved container.

014RW164

8. If removal of the fuel pressure regulator is necessary, refer to *Fuel Pressure Regulator* section.
9. If removal of the fuel injectors is necessary, refer to *Fuel Injectors* section.

Installation Procedure

1. If the fuel injectors were removed, install them. Refer to *Fuel Injectors* section.
2. If the fuel pressure regulator was removed, install it. Refer to *Fuel Pressure Regulator* section.
3. Install the common chamber. Refer to common chamber in engine Mechanical section.

014RW164

4. Connect the vacuum hose on Canister VSV and positive crankcase ventilation hose.
5. Connect the connectors to manifold absolute pressure sensor, solenoid valve, electric vacuum sensing valve.
6. Connect the throttle position sensor electrical connector to throttle body.
7. Install the engine cover.
8. Connect the negative battery cable.
9. Crank the engine until it starts. Cranking the engine may take longer than usual due to trapped air in the fuel rail and in the injectors.

Fuel Tank

Removal Procedure

Refer to *Fuel Tank In Fuel Pump Relay*

014RW134

Throttle Body (TB)

Removal Procedure

1. Disconnect the negative battery cable.
2. Drain the cooling system. Refer to *Cooling System* section.

3. Disconnect the electrical connectors:

- Throttle position (TP) sensor.
- Intake air temperature (IAT) sensor. Refer to *Intake Air Temperature Sensor* section.

066RY00014

4. Disconnect the vacuum hose below the air horn.
5. Remove the intake air duct clamp.
6. Disconnect the intake air duct.
7. Disconnect the coolant lines from the throttle body.
8. Remove the bolts from the common chamber.
9. Remove the throttle body from the common chamber.
10. Remove the gasket from the common chamber.

025RY00004

11. Remove the TP sensor. Refer to *Throttle Position (TP) Sensor* section.

Inspection Procedure

NOTE: Do not use solvent of any type when you clean the gasket surfaces on the intake manifold and the throttle body assembly. The gasket surfaces and the throttle body assembly may be damaged as a result.

- If the throttle body gasket needs to be replaced, remove any gasket material that may be stuck to the mating surfaces of the manifold.
- Do not leave any scratches in the aluminum casting.

Installation Procedure

1. Install the TP sensor. Refer to *Throttle Position (TP) Sensor* section.
2. Install the gasket on the common chamber.
3. Install the throttle body on the common chamber.
4. Secure the gasket and the throttle body with the four bolts.
 - The vacuum lines must be properly routed under the throttle body before tightening the mounting bolts.

Tighten

- Tighten the throttle body mounting bolts to 10 N·m (87 lb in).

025RY00004

5. Install the coolant lines.
6. Connect all the vacuum lines.
7. Install the intake air duct.
8. Tighten the intake air duct clamp.

9. Connect all the electrical connectors:
 - Throttle position (TP) sensor.
 - Intake air temperature (IAT) sensor. Refer to *Intake Air Temperature Sensor* section.

060RY00020

10. Install the accelerator cable assembly. Refer to *Accelerator Cable in Engine Speed Control System* section.
11. Fill the cooling system. Refer to *Cooling System* section.
12. Install the negative battery cable.

Electronic Ignition System

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the ignition coil connector at the ignition coil assemblies.
3. Remove the two screws that secure the ignition coil assemblies to the rocker cover.

060RY022

Legend

- (1) Ignition Coil Connectors
- (2) Bolts
- (3) Ignition Coil Assemblies

4. Remove the ignition coil assemblies and the spark plug boot from the spark plug.
 - Twist the ignition coil assemblies while pulling it straight up.
5. Use the appropriate spark plug socket in order to remove the spark plug from the engine.

Installation Procedure

NOTE: The plug must thread smoothly into the cylinder head and be fully seated. Use a thread chaser if necessary to clean the threads in the cylinder head. Cross-threading or failure to fully seat the spark plug can cause plug overheating, exhaust blow-by gases, or thread damage. Do not overtighten the spark plugs. Over tightening can cause aluminum threads to strip.

1. Install the spark plug in the engine. Use the appropriate spark plug socket.

Tighten

- **Tighten the spark plug to 18 N·m (13 lb ft.).**
2. Install the ignition coil assemblies and spark plug boot over the spark plug.

CAUTION: Ignition coil assembly #6 is different from ignition coil assembly #1 to #5. Ignition coil assemblies #6 is short type. Be careful it when installing ignition coil assembly of #6.

060RY00002

Legend

- (1) Long Type Ignition Coil Assemblies (#1 ~ #5)
- (2) Short Type Ignition Coil Assembly (#6)

3. Install ignition coil assemblies and tighten the fixing bolts to the specified torque.

Torque: 4 N·m (35.4 lb in)

060RY022

Legend

- (1) Ignition Coil Connectors
- (2) Bolts
- (3) Ignition Coil Assemblies

4. Connect the ignition coil connector at the ignition coil assemblies.

5. Connect the negative battery cable.

Catalytic Converter

Removal and Installation Procedure

Refer to *Engine Exhaust in Engine* section.

Air Conditioning Thermo Relay

Removal Procedure

1. Remove the fuse and relay box cover from under the hood.
2. Consult the diagram on the cover to determine which is the correct relay.

3. Insert a small screwdriver into the catch slot on the forward side of the fuel pump relay.

- The screwdriver blade will release the catch inside.

D08RW131

4. Pull the relay straight up and out of the fuse and relay box.

014RY0007

Installation Procedure

1. Insert the relay into the correct place in the fuse and relay box with the catch slot facing forward.
2. Press down until the catch engages.
 - An audible “click” will be heard.
3. Install the fuse and relay box cover.

EVAP Canister

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the two hoses from the EVAP canister.

3. Disconnect the fuel vapor connector and the purge hose from the EVAP canister vent solenoid.

4. Remove the two retaining bolts the EVAP canister to the mounting bracket on the cross member.

5. Remove the retaining bolt on the mounting bracket the slide the canister out of mounting bracket.

014RW129

Inspection Procedure

1. Inspect the hoses for cracks and leaks.
2. Inspect the canister for a damaged case.

Installation Procedure

1. Slide the canister into mounting bracket and install the mounting bracket bolt.

014RW129

2. Install the retaining bolts the EVAP canister to the mounting bracket on the cross member.

014RW131

3. Connect the fuel vapor connector to the EVAP canister vent solenoid.
4. Connect the two hoses to the EVAP canister.

014RW130

5. Disconnect the negative battery cable.

EVAP Canister Purge Solenoid

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the electrical connector from the EVAP canister purge solenoid.
3. Disconnect the vacuum hoses from the EVAP canister purge solenoid.

014RW136

4. Remove the EVAP canister purge solenoid retaining bolt from the common chamber.
5. Remove the EVAP canister purge solenoid.

014RW137

Installation Procedure

1. Install the EVAP canister purge solenoid on the upper intake manifold.
2. Install the EVAP canister purge solenoid retaining bolt.

Tighten

- **Tighten the bolts to 20 N·m (16 lb ft.).**
3. Connect the vacuum hoses to the EVAP canister purge solenoid.

014RW137

4. Connect the electrical connector to the EVAP canister purge solenoid.

014RW138

Linear Exhaust Gas Recirculation (EGR) Valve

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the electrical connector at the EGR valve.

014RW139

3. Remove the bolts from the common chamber.

014RW098

4. Remove the EGR valve from the common chamber manifold.
5. Remove the gasket from the common chamber manifold.

Installation Procedure

1. Install the gasket on the common chamber.
2. Install the EGR valve on the common chamber.
3. Secure the EGR valve and the gasket with the bolts.

Torque: 25 N-m (18 lb ft)

NOTE: It is possible to install the EGR valve rotated 180° from the correct position. Make sure that the base of the valve is placed so that it aligns with the mounting flange.

014RW098

4. Connect the electrical connector at the EGR valve.

014RW139

5. Connect the negative battery cable.

Positive Crankcase Ventilation (PCV) Valve

Removal Procedure

1. Remove the vacuum hose at the PCV valve.
 - Slide the clamp back to release the hose.
2. Pull the PCV valve from the rubber grommet in the right valve cover.

014RW097

Inspection Procedure

Before inspecting the PCV valve, make sure that the hoses are connected properly and are in good condition. Also check that the oil pan and rocker cover gaskets are sealing properly.

PCV Valve

1. Run the engine at normal operating temperature.
2. Disconnect the valve from the rocker cover.

RESULT: A hissing noise should be heard from the valve. If no noise is heard, the PCV valve or hose is plugged.
3. Remove the PCV valve from the engine.
 - a. Blow air into the rocker cover side of the valve.

RESULT: Air should pass freely.
 - b. Blow air into the air cleaner side of the valve.

RESULT: Air should not pass through the valve.
4. Re-install the PCV valve and remove the oil filler cap.

RESULT: A small vacuum should be felt at the oil filler hole.

Installation Procedure

1. Push the PCV valve into the rubber grommet in the left valve cover.
2. Install the vacuum hose on the PCV valve and secure the vacuum hose with the clamp.

014RW097

Wiring and Connectors

Wiring Harness Service

The control module harness electrically connects the control module to the various solenoids, switches and sensors in the vehicle engine compartment and passenger compartment.

Replace wire harnesses with the proper part number replacement.

Because of the low amperage and voltage levels utilized in powertrain control systems, it is essential that all wiring in environmentally exposed areas be repaired with crimp and seal splice sleeves.

The following wire harness repair information is intended as a general guideline only. Refer to *Chassis Electrical* section for all wire harness repair procedures.

Connectors and Terminals

Use care when probing a connector and when replacing terminals. It is possible to short between opposite terminals. Damage to components could result. Always use jumper wires between connectors for circuit checking. NEVER probe through Weather-Pack seals. Use an appropriate connector test adapter kit which contains an assortment of flexible connectors used to probe terminals during diagnosis. Use an appropriate fuse remover and test tool for removing a fuse and to adapt the fuse holder to a meter for diagnosis.

Open circuits are often difficult to locate by sight because oxidation or terminal misalignment are hidden by the connectors. Merely wiggling a connector on a sensor, or in the wiring harness, may temporarily correct the open circuit. Intermittent problems may also be caused by oxidized or loose connections.

Be certain of the type of connector/terminal before making any connector or terminal repair. Weather-Pack and Com-Pack III terminals look similar, but are serviced differently.

PCM Connectors and Terminals

Removal Procedure

1. Remove the connector terminal retainer.
2. Push the wire connected to the affected terminal through the connector face so that the terminal is exposed.
3. Service the terminal as necessary.

Installation Procedure

1. Bend the tab on the connector to allow the terminal to be pulled into position within the connector.
2. Pull carefully on the wire to install the connector terminal retainer.

3. Untwist the conductors.
4. Strip the insulation as necessary.

048

Wire Harness Repair: Twisted Shielded Cable

Removal Procedure

1. Remove the outer jacket.
2. Unwrap the aluminum/mylar tape. Do not remove the mylar.

047

Installation Procedure

1. Splice the wires using splice clips and rosin core solder.
2. Wrap each splice to insulate.
3. Wrap the splice with mylar and with the drain (uninsulated) wire.

049

4. Tape over the whole bundle to secure.

050

Twisted Leads

Removal Procedure

1. Locate the damaged wire.
2. Remove the insulation as required.

051

Installation Procedure

1. Use splice clips and rosin core solder in order to splice the two wires together.

052

2. Cover the splice with tape in order to insulate it from the other wires.

053

3. Twist the wires as they were before starting this procedure.

4. Tape the wires with electrical tape. Hold in place.

Weather-Pack Connector

Tools Required

5-8840-6632-0 Weather-Pack II Terminal Remover

Removal Procedure

A Weather-Pack connector can be identified by a rubber seal at the rear of the connector. This engine room connector protects against moisture and dirt, which could result from oxidation and deposits on the terminals. This protection is important, because of the low voltage and the low amperage found in the electronic systems.

1. Open the secondary lock hinge on the connector.

2. Use tool 5-8840-6632-0 or the equivalent to remove the pin and the sleeve terminals. Push on 5-8840-6632-0 to release.

NOTE: Do not use an ordinary pick or the terminal may be bent or deformed. Unlike standard blade terminals, these terminals cannot be straightened after they have been improperly bent.

3. Cut the wire immediately behind the cable seal.

072

5. Push the terminal and the connector to engage the locking tangs.

070

6. Close the secondary locking hinge.

Installation Procedure

Make certain the connectors are properly seated and all of the sealing rings are in place when you reconnect the leads. The secondary lock hinge provides a backup locking feature for the connector. The secondary lock hinge is used for added reliability. This flap should retain the terminals even if the small terminal lock tangs are not positioned properly.

Do not replace the Weather-Pack connections with standard connections. Read the instructions provided with the Weather-Pack connector and terminal packages.

1. Replace the terminal.
2. Slip the new seal onto the wire.
3. Strip 5 mm (0.2") of insulation from the wire.
4. Crimp the terminal over the wire and the seal.

073

Com-Pack III

General Information

The Com-Pack III terminal looks similar to some Weather-Pack terminals. This terminal is not sealed and is used where resistance to the environment is not required. Use the standard method when repairing a terminal. Do not use the Weather-Pack terminal tool J 28742-A or equivalent. These will damage the terminals.

Metri-Pack

Tools Required

J 35689 Terminal Remover

Removal Procedure

Some connectors use terminals called Metri-Pack Series 150. These may be used at the engine coolant temperature (ECT) sensor.

1. Slide the seal (1) back on the wire.
2. Insert the J 35689 tool or equivalent (3) in order to release the terminal locking tang (2).

3. Push the wire and the terminal out through the connector. If you reuse the terminal, reshape the locking tang.

Installation Procedure

Metri-Pack terminals are also referred to as "pull-to-seat" terminals.

1. In order to install a terminal on a wire, the wire must be inserted through the seal (2) and through the connector (3).
2. The terminal (1) is then crimped onto the wire.

3. Then the terminal is pulled back into the connector to seat it in place.

General Description (PCM and Sensors)

58X Reference PCM Input

The powertrain control module (PCM) uses this signal from the crankshaft position (CKP) sensor to calculate engine RPM and crankshaft position at all engine speeds. The PCM also uses the pulses on this circuit to initiate injector pulses. If the PCM receives no pulses on this circuit, DTC P0337 will set. The engine will not start and run without using the 58X reference signal.

A/C Request Signal

This signal tells the PCM when the A/C mode is selected at the A/C control head. The PCM uses this to adjust the idle speed before turning "ON" the A/C clutch. The A/C compressor will be inoperative if this signal is not available to the PCM.

Refer to *A/C Clutch Circuit Diagnosis* section for A/C wiring diagrams and diagnosis for the A/C electrical system.

Crankshaft Position (CKP) Sensor

The crankshaft position (CKP) sensor provides a signal used by the powertrain control module (PCM) to calculate the ignition sequence. The CKP sensor initiates the 58X reference pulses which the PCM uses to calculate RPM and crankshaft position.

Refer to *Electronic Ignition System* section for additional information.

Engine Coolant Temperature (ECT) Sensor

The engine coolant temperature (ECT) sensor is a thermistor (a resistor which changes value based on temperature) mounted in the engine coolant stream. Low coolant temperature produces a high resistance of 100,000 ohms at -40°C (-40°F). High temperature causes a low resistance of 70 ohms at 130°C (266°F). The PCM supplies a 5-volt signal to the ECT sensor through resistors in the PCM and measures the voltage. The signal voltage will be high when the engine is cold and low when the engine is hot. By measuring the voltage, the

PCM calculates the engine coolant temperature. Engine coolant temperature affects most of the systems that the PCM controls.

The Tech 2 displays engine coolant temperature in degrees. After engine start-up, the temperature should rise steadily to about 85°C (185°F). It then stabilizes when the thermostat opens. If the engine has not been run for several hours (overnight), the engine coolant temperature and intake air temperature displays should be close to each other. A hard fault in the engine coolant sensor circuit will set DTC P0177 or DTC P0118. An intermittent fault will set a DTC P1114 or P1115.

0016

Electrically Erasable Programmable Read Only Memory (EEPROM)

The electrically erasable programmable read only memory (EEPROM) is a permanent memory chip that is physically soldered within the PCM. The EEPROM contains the program and the calibration information that the PCM needs to control powertrain operation.

Unlike the PROM used in past applications, the EEPROM is not replaceable. If the PCM is replaced, the new PCM will need to be programmed. Equipment containing the correct program and calibration for the vehicle is required to program the PCM.

Fuel Control Heated Oxygen Sensors

The fuel control heated oxygen sensors (Bank 1 HO2S 1 and Bank 2 HO2S 1) are mounted in the exhaust stream where they can monitor the oxygen content of the exhaust gas. The oxygen present in the exhaust gas reacts with the sensor to produce a voltage output. This voltage should constantly fluctuate from approximately 100 mV to 900 mV. The heated oxygen sensor voltage can be monitored with a Tech 2. By monitoring the voltage output of the oxygen sensor, the PCM calculates the pulse width command for the injectors to produce the proper combustion chamber mixture.

- Low HO2S voltage is a lean mixture which will result in a rich command to compensate.
- High HO2S voltage is a rich mixture which will result in a lean command to compensate.

An open Bank 1 HO2S 1 signal circuit will set a DTC P0134 and the Tech 2 will display a constant voltage between 400-500 mV. A constant voltage below 300 mV in the sensor circuit (circuit grounded) will set DTC P0131. A constant voltage above 800 mV in the circuit will set DTC P0132. Faults in the Bank 2 HO2S 1 signal circuit will cause DTC 0154 (open circuit), DTC P0151 (grounded circuit), or DTC P0152 (signal voltage high) to set. A fault in the Bank 1 HO2S 1 heater circuit will cause DTC P0135 to set. A fault in the Bank 2 HO2S 1 heater circuit will cause DTC P0155 to set. The PCM can also detect HO2S response problems. If the response time of an HO2S is determined to be too slow, the PCM will store a DTC that indicates degraded HO2S performance.

060RY00127

Intake Air Temperature (IAT) Sensor

The intake air temperature (IAT) sensor is a thermistor which changes its resistance based on the temperature of air entering the engine. Low temperature produces a high resistance of 100,000 ohms at -40°C (-40°F). High temperature causes low resistance of 70 ohms at 130°C (266°F). The PCM supplies a 5-volt signal to the sensor through a resistor in the PCM and monitors the signal voltage. The voltage will be high when the incoming air is cold. The voltage will be low when the incoming air is hot. By measuring the voltage, the PCM calculates the incoming air temperature. The IAT sensor signal is used to adjust spark timing according to the incoming air density.

The Tech 2 displays the temperature of the air entering the engine. The temperature should read close to the ambient air temperature when the engine is cold and rise as underhood temperature increases. If the engine has not been run for several hours (overnight), the IAT sensor temperature and engine coolant temperature should read close to each other. A fault in the IAT sensor circuit will set DTC P0112 or DTC P0113.

Linear Exhaust Gas Recirculation (EGR) Control

The PCM monitors the exhaust gas recirculation (EGR) actual position and adjusts the pintle position accordingly.

The PCM uses information from the following sensors to control the pintle position:

- Engine coolant temperature (ECT) sensor.
- Throttle position (TP) sensor.
- Mass air flow (MAF) sensor.

Mass Air Flow (MAF) Sensor

The mass air flow (MAF) sensor measures the difference between the volume and the quantity of air that enters the engine. "Volume" means the size of the space to be filled. "Quantity" means the number of air molecules that will fit into the space. This information is important to the PCM because heavier, denser air will hold more fuel than lighter, thinner air. The PCM adjusts the air/fuel ratio as needed depending on the MAF value. The Tech 2 reads the MAF value and displays it in terms of grams per second (gm/s). At idle, the Tech 2 should read between 4-7 gm/s on a fully warmed up engine. Values should change quickly on accelerator. Values should remain stable at any given RPM. A failure in the MAF sensor or circuit will set DTC P0101, DTC P0102, or DTC P0103.

0007

Manifold Absolute Pressure (MAP) Sensor

The manifold absolute pressure (MAP) sensor responds to changes in intake manifold pressure (vacuum). The MAP sensor signal voltage to the PCM varies from below 2 volts at idle (high vacuum) to above 4 volts with the ignition ON, engine not running or at wide-open throttle (low vacuum).

The MAP sensor is used to determine the following:

- Manifold pressure changes while the linear EGR flow test diagnostic is being run. Refer to *DTC P0401*.
- Barometric pressure (BARO).

If the PCM detects a voltage that is lower than the possible range of the MAP sensor, DTC P0107 will be set. A signal voltage higher than the possible range of the sensor will set DTC P0108. An intermittent low or high voltage will set DTC P1107, respectively. The PCM can detect a shifted MAP sensor. The PCM compares the MAP sensor signal to a calculated MAP based on throttle position and various engine load factors. If the PCM

detects a MAP signal that varies excessively above or below the calculated value, DTC P0106 will set.

Powertrain Control Module (PCM)

The powertrain control module (PCM) is located in the passenger compartment below the center console. The PCM controls the following:

- Fuel metering system.
- Transmission shifting (automatic transmission only).
- Ignition timing.
- On-board diagnostics for powertrain functions.

The PCM constantly observes the information from various sensors. The PCM controls the systems that affect vehicle performance. The PCM performs the diagnostic function of the system. It can recognize operational problems, alert the driver through the MIL (Check Engine lamp), and store diagnostic trouble codes (DTCs). DTCs identify the problem areas to aid the technician in making repairs.

PCM Function

The PCM supplies either 5 or 12 volts to power various sensors or switches. The power is supplied through resistances in the PCM which are so high in value that a test light will not light when connected to the circuit. In some cases, even an ordinary shop voltmeter will not give an accurate reading because its resistance is too low. Therefore, a digital voltmeter with at least 10 megohms input impedance is required to ensure accurate voltage readings. Tool J 39200 meets this requirement. The PCM controls output circuits such as the injectors, fan relays, etc., by controlling the ground or the power feed circuit through transistors or through either of the following two devices:

- Output Driver Module (ODM)
- Quad Driver Module (QDM)

PCM Components

The PCM is designed to maintain exhaust emission levels to government mandated standards while providing excellent drivability and fuel efficiency. The PCM monitors numerous engine and vehicle functions via electronic sensors such as the throttle position (TP) sensor, heated oxygen sensor (HO2S), and vehicle speed sensor (VSS). The PCM also controls certain engine operations through the following:

- Fuel injector control
- Ignition control module
- ION sensing module
- Automatic transmission shift functions
- Cruise control
- Evaporative emission (EVAP) purge
- A/C clutch control

PCM Voltage Description

The PCM supplies a buffered voltage to various switches and sensors. It can do this because resistance in the PCM is so high in value that a test light may not illuminate when connected to the circuit. An ordinary shop voltmeter may not give an accurate reading because the voltmeter input impedance is too low. Use a 10-megohm input impedance digital voltmeter (such as J 39200) to assure accurate voltage readings.

The input/output devices in the PCM include analog-to-digital converters, signal buffers, counters, and special drivers. The PCM controls most components with electronic switches which complete a ground circuit when turned "ON." These switches are arranged in groups of 4 and 7, called either a surface-mounted quad driver module (QDM), which can independently control up to 4 output terminals, or QDMs which can independently control up to 7 outputs. Not all outputs are always used.

PCM Input/Outputs

Inputs – Operating Conditions Read

- Air Conditioning “ON” or “OFF”
- Engine Coolant Temperature
- Crankshaft Position
- Exhaust Oxygen Content
- Electronic Ignition
- Manifold Absolute Pressure
- Battery Voltage
- Throttle Position
- Vehicle Speed
- Fuel Pump Voltage
- Power Steering Pressure
- Intake Air Temperature
- Mass Air Flow
- Engine Knock

Outputs – Systems Controlled

- EVAP Canister Purge
- Exhaust Gas Recirculation (EGR)
- Ignition Control
- Fuel Control
- ION Sensing Module
- Electric Fuel Pump
- Air Conditioning
- Diagnostics
 - Malfunction Indicator Lamp
 - Data Link Connector (DLC)
 - Data Output
- Transmission Control Module

PCM Service Precautions

The PCM is designed to withstand normal current draws associated with vehicle operation. Avoid overloading any circuit. When testing for opens and shorts, do not ground or apply voltage to any of the PCM's circuits unless instructed to do so. These circuits should only be tested using digital voltmeter J 39200. The PCM should remain connected to the PCM or to a recommended breakout box.

Reprogramming The PCM

Reprogramming of the PCM is done without removing it from the vehicle. This provides a flexible and cost-effective method of making changes in software calibrations.

Refer to the latest Techline information on reprogramming or flashing procedures.

Throttle Position (TP) Sensor

The throttle position (TP) sensor is a potentiometer connected to the throttle shaft on the throttle body. The PCM monitors the voltage on the signal line and calculates throttle position. As the throttle valve angle is changed (accelerator pedal moved), the TP sensor signal also changes. At a closed throttle position, the output of

the TP1 sensor is low. As the throttle valve opens, the output increases so that at wide open throttle (WOT), the output voltage should be above 92% (Tech 2 Display). The PCM calculates fuel delivery based on throttle valve angle (driver demand). A broken or loose TP sensor may cause intermittent bursts of fuel from an injector and unstable idle because the PCM thinks the throttle is moving.

060RY00027

Transmission Fluid Temperature (TFT) Sensor

The transmission fluid temperature sensor is a thermistor which changes its resistance based on the temperature of the transmission fluid. For a complete description of the TFT sensor, refer to *4L30-E Automatic Transmission Diagnosis* section.

A failure in the TFT sensor or associated wiring will cause DTC P0712 or DTC P0713 to set. In this case, engine coolant temperature will be substituted for the TFT sensor value and the transmission will operate normally.

Transmission Range Switch

IMPORTANT: The vehicle should not be driven with the transmission range switch disconnected; idle quality will be affected.

The four inputs from the transmission range switch indicate to the PCM which position is selected by the transmission selector lever. This information is used for ignition timing, EVAP canister purge, EGR operation.

For more information on the transmission on the transmission range switch, refer to *4L30-E Automatic Transmission* section.

Vehicle Speed Sensor (VSS)

The PCM determines the speed of the vehicle by converting a pulsing voltage signal from the vehicle speed sensor (VSS) into miles per hour. The PCM uses this signal to operate the cruise control, speedometer, and the TCC and shift solenoids in the transmission. For more information on the TCC and shift solenoids, refer to *4L30-E Automatic Transmission* section.

0008

Use of Circuit Testing Tools

Do not use a test light to diagnose the powertrain electrical systems unless specifically instructed by the diagnostic procedures. Use Connector Test Adapter Kit J 35616 whenever diagnostic procedures call for probing connectors.

Aftermarket Electrical and Vacuum Equipment

Aftermarket (add-on) electrical and vacuum equipment is defined as any equipment which connects to the vehicle's electrical or vacuum systems that is installed on a vehicle after it leaves the factory. No allowances have been made in the vehicle design for this type of equipment.

NOTE: No add-on vacuum equipment should be added to this vehicle.

NOTE: Add-on electrical equipment must only be connected to the vehicle's electrical system at the battery (power and ground).

Add-on electrical equipment, even when installed to these guidelines, may still cause the powertrain system to malfunction. This may also include equipment not connected to the vehicle electrical system such as portable telephones and radios. Therefore, the first step in diagnosing any powertrain problem is to eliminate all aftermarket electrical equipment from the vehicle. After this is done, if the problem still exists, it may be diagnosed in the normal manner.

Electrostatic Discharge Damage

Electronic components used in the PCM are often designed to carry very low voltage. Electronic components are susceptible to damage caused by electrostatic discharge. Less than 100 volts of static electricity can cause damage to some electronic components. By comparison, it takes as much as 4000 volts for a person to feel even the zap of a static discharge.

TS23795

There are several ways for a person to become statically charged. The most common methods of charging are by friction and induction.

- An example of charging by friction is a person sliding across a vehicle seat.
- Charge by induction occurs when a person with well insulated shoes stands near a highly charged object and momentarily touches ground. Charges of the same polarity are drained off leaving the person highly charged with the opposite polarity. Static charges can cause damage, therefore it is important to use care when handling and testing electronic components.

NOTE: To prevent possible electrostatic discharge damage, follow these guidelines:

- Do not touch the PCM connector pins or soldered components on the PCM circuit board.
- Do not open the replacement part package until the part is ready to be installed.
- Before removing the part from the package, ground the package to a known good ground on the vehicle.
- If the part has been handled while sliding across the seat, while sitting down from a standing position, or while walking a distance, touch a known good ground before installing the part.

General Description (Air Induction)

Air Induction System

The air induction system filters contaminants from the outside air, and directs the progress of the air as it is drawn into the engine. A remote-mounted air cleaner prevents dirt and debris in the air from entering the engine. The air duct assembly routes filtered air to the throttle body. Air enters the engine by the following steps:

1. Through the throttle body.
2. Into the common chamber.
3. Through the cylinder head intake ports.

4. Into the cylinders.

055RV010

General Description (Fuel Metering)

Accelerator Mode

The PCM provides extra fuel when it detects a rapid increase in the throttle position and the air flow.

Battery Voltage Correction Mode

When battery voltage is low, the PCM will compensate for the weak spark by increasing the following:

- The amount of fuel delivered.
- The idle RPM.
- Ignition dwell time.

Clear Flood Mode

Clear a flooded engine by pushing the accelerator pedal down all the way. The PCM then de-energizes the fuel injectors. The PCM holds the fuel injectors de-energized as long as the throttle remains above 80% and the engine speed is below 800 RPM. If the throttle position becomes less than 80%, the PCM again begins to pulse the injectors "ON" and "OFF," allowing fuel into the cylinders.

Deceleration Mode

The PCM reduces the amount of fuel injected when it detects a decrease in the throttle position and the air flow. When deceleration is very fast, the PCM may cut off fuel completely for short periods.

Engine Speed/Vehicle Speed/Fuel Disable Mode

The PCM monitors engine speed. It turns off the fuel injectors when the engine speed increases above 6400 RPM. The fuel injectors are turned back on when engine speed decreases below 6150 RPM.

Fuel Cutoff Mode

No fuel is delivered by the fuel injectors when the ignition is "OFF." This prevents engine run-on. In addition, the PCM suspends fuel delivery if no reference pulses are detected (engine not running) to prevent engine flooding.

Fuel Injector

The sequential multiport fuel injection (SFI) fuel injector is a solenoid-operated device controlled by the PCM. The PCM energizes the solenoid, which opens a valve to allow fuel delivery.

The fuel is injected under pressure in a conical spray pattern at the opening of the intake valve. Excess fuel not used by the injectors passes through the fuel pressure regulator before being returned to the fuel tank.

A fuel injector which is stuck partly open will cause a loss of fuel pressure after engine shut down, causing long crank times.

014RY00009

Fuel Metering System Components

The fuel metering system is made up of the following parts:

- The fuel injectors.
- The throttle body.
- The fuel rail.
- The fuel pressure regulator.
- The PCM.
- The crankshaft position (CKP) sensor.
- The ION sensing module.
- The fuel pump.
- The fuel pump relay.

Basic System Operation

The fuel metering system starts with the fuel in the fuel tank. An electric fuel pump, located in the fuel tank, pumps fuel to the fuel rail through an in-line fuel filter. The pump is designed to provide fuel at a pressure above the pressure needed by the injectors. A fuel pressure regulator in the fuel rail keeps fuel available to the fuel injectors at a constant pressure. A return line delivers unused fuel back to the fuel tank. Refer to *Section 6C* for further information on the fuel tank, line filter, and fuel pipes.

Fuel Metering System Purpose

The basic function of the air/fuel metering system is to control the air/fuel delivery to the engine. Fuel is delivered to the engine by individual fuel injectors mounted in the intake manifold near each intake valve.

The main control sensor is the heated oxygen sensor (HO2S) located in the exhaust system. The HO2S tells the PCM how much oxygen is in the exhaust gas. The PCM changes the air/fuel ratio to the engine by controlling the amount of time that fuel injector is "ON." The best mixture to minimize exhaust emissions is 14.7 parts of air to 1 part of gasoline by weight, which allows the catalytic converter to operate most efficiently. Because of the constant measuring and adjusting of the air/fuel ratio, the fuel injection system is called a "closed loop" system.

The PCM monitors signals from several sensors in order to determine the fuel needs of the engine. Fuel is delivered under one of several conditions called "modes." All modes are controlled by the PCM.

Fuel Pressure Regulator

The fuel pressure regulator is a diaphragm-operated relief valve mounted on the fuel rail with fuel pump pressure on one side and manifold pressure on the other side. The fuel pressure regulator maintains the fuel pressure available to the injector at three times barometric pressure adjusted for engine load. It may be serviced separate.

If the pressure is too low, poor performance and a DTC P0131, DTC P0151, DTC P0171 or DTC P1171 will be the result. If the pressure is too high, excessive odor and/or a DTC P0132, DTC P0152, DTC P0172 will be the result. Refer to *Fuel System Diagnosis* for information on diagnosing fuel pressure conditions.

014RY00010

Fuel Pump Electrical Circuit

When the key is first turned "ON," the PCM energizes the fuel pump relay for two seconds to build up the fuel pressure quickly. If the engine is not started within two seconds, the PCM shuts the fuel pump off and waits until the engine is cranked. When the engine is cranked and the 58 X crankshaft position signal has been detected by the PCM, the PCM supplies 12 volts to the fuel pump relay to energize the electric in-tank fuel pump.

An inoperative fuel pump will cause a "no-start" condition. A fuel pump which does not provide enough pressure will result in poor performance.

Fuel Rail

The fuel rail is mounted to the top of the engine and distributes fuel to the individual injectors. Fuel is delivered to the fuel inlet tube of the fuel rail by the fuel lines. The fuel goes through the fuel rail to the fuel pressure regulator. The fuel pressure regulator maintains a constant fuel pressure at the injectors. Remaining fuel is then returned to the fuel tank.

055RW009

Run Mode

The run mode has the following two conditions:

- Open loop
- Closed loop

When the engine is first started the system is in “open loop” operation. In “open loop,” the PCM ignores the signal from the heated oxygen sensor (HO2S). It calculates the air/fuel ratio based on inputs from the TP, ECT, and MAF sensors.

The system remains in “open loop” until the following conditions are met:

- The HO2S has a varying voltage output showing that it is hot enough to operate properly (this depends on temperature).
- The ECT has reached a specified temperature.
- A specific amount of time has elapsed since starting the engine.
- Engine speed has been greater than a specified RPM since start-up.

The specific values for the above conditions vary with different engines and are stored in the programmable read only memory (PROM). When these conditions are met, the system enters “closed loop” operation. In “closed loop,” the PCM calculates the air/fuel ratio (injector on-time) based on the signal from the HO2S. This allows the air/fuel ratio to stay very close to 14.7:1.

Starting Mode

When the ignition is first turned “ON,” the PCM energizes the fuel pump relay for two seconds to allow the fuel pump to build up pressure. The PCM then checks the engine coolant temperature (ECT) sensor and the throttle position (TP) sensor to determine the proper air/fuel ratio for starting.

The PCM controls the amount of fuel delivered in the starting mode by adjusting how long the fuel injectors are energized by pulsing the injectors for very short times.

Throttle Body Unit

The throttle body has a throttle plate to control the amount of air delivered to the engine. The TP sensor are also mounted on the throttle body. Vacuum ports located behind the throttle plate provide the vacuum signals needed by various components.

Engine coolant is directed through a coolant cavity in the throttle body to warm the throttle valve and to prevent icing.

General Description (Electronic Ignition System)

Crankshaft Position (CKP) Sensor

The crankshaft position (CKP) sensor provides a signal used by the powertrain control module (PCM) to calculate the ignition sequence. The sensor initiates the 58X reference pulses which the PCM uses to calculate RPM and crankshaft position. Refer to *Electronic Ignition System* section for additional information.

Electronic Ignition

The electronic ignition system controls fuel combustion by providing a spark to ignite the compressed air/fuel mixture at the correct time. To provide optimum engine performance, fuel economy, and control of exhaust emissions, the PCM controls the spark advance of the ignition system. Electronic ignition has the following advantages over a mechanical distributor system:

- No moving parts.
- Less maintenance.
- Remote mounting capability.
- No mechanical load on the engine.
- More coil cooldown time between firing events.
- Elimination of mechanical timing adjustments.
- Increased available ignition coil saturation time.

0013

Ignition Coils

A separate coil-at-plug module is located at each spark plug. The coil-at-plug module is attached to the engine with two screws. It is installed directly to the spark plug by an electrical contact inside a rubber boot. A three-way connector provides 12-volt primary supply from the 15-amp ignition fuse, a ground-switching trigger line from the PCM, and a ground.

060RY00022

Ignition Control

The ignition control (IC) spark timing is the PCM's method of controlling the spark advance and the ignition dwell. The IC spark advance and the ignition dwell are calculated by the PCM using the following inputs:

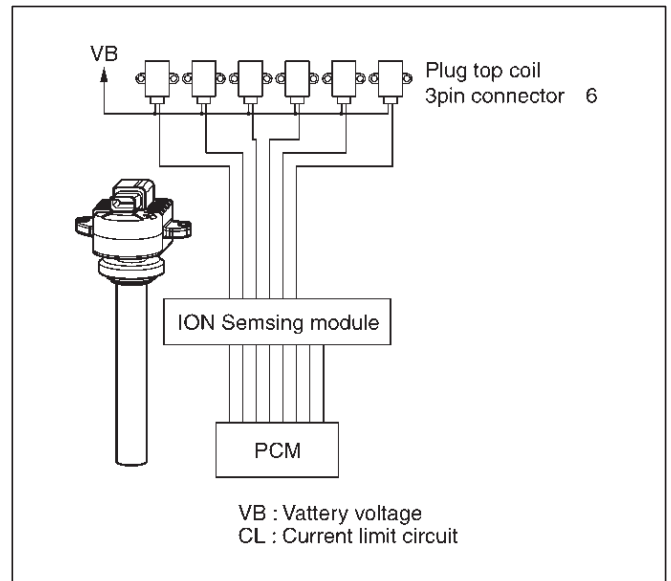

- Engine speed.
- Crankshaft position (58X reference).
- Engine coolant temperature (ECT) sensor.
- Throttle position (TP) sensor.
- ION sensing module.
- Park/Neutral position (PRNDL input).

- Vehicle speed (vehicle speed sensor).
- PCM and ignition system supply voltage.
- The crankshaft position (CKP) sensor sends the PCM a 58X signal related to the exact position of the crankshaft.

TS22909

Based on these sensor signals and engine load information, the PCM sends 5V to each ignition coil.

060RY00116

This module has the function to energize and de-energize the primary ignition coil in response to signals from the PCM. The Throttle PCM controls ignition timing and dwell time.

Continuity and out-of-range value check:

This diagnosis detects open circuit or short-circuiting in the Electronic Spark Timing (EST) line by monitoring EST signals. A failure determination is made when the signal voltage remains higher or lower than the threshold for corresponding fault code beyond a predetermined time period.

Diagnosis enabling conditions are as follows:

- RPM is higher than the specified threshold.
- EST line is enabled.

060RY00029

- Throttle position (TP) sensor.
- Vehicle speed sensor (VSS) .
- Crankshaft position (CKP) sensor.

Spark Plug

Although worn or dirty spark plugs may give satisfactory operation at idling speed, they frequently fail at higher engine speeds. Faulty spark plugs may cause poor fuel economy, power loss, loss of speed, hard starting and generally poor engine performance. Follow the scheduled maintenance service recommendations to ensure satisfactory spark plug performance. Refer to *Maintenance and Lubrication* section.

Normal spark plug operation will result in brown to grayish-tan deposits appearing on the insulator portion of the spark plug. A small amount of red-brown, yellow, and white powdery material may also be present on the insulator tip around the center electrode. These deposits are normal combustion by-products of fuels and lubricating oils with additives. Some electrode wear will also occur. Engines which are not running properly are often referred to as "misfiring." This means the ignition spark is not igniting the air/fuel mixture at the proper time. While other ignition and fuel system causes must also be considered, possible causes include ignition system conditions which allow the spark voltage to reach ground in some other manner than by jumping across the air gap at the tip of the spark plug, leaving the air/fuel mixture unburned. Refer to *DTC P0300*. Misfiring may also occur when the tip of the spark plug becomes overheated and ignites the mixture before the spark jumps. This is referred to as "pre-ignition."

Spark plugs may also misfire due to fouling, excessive gap, or a cracked or broken insulator. If misfiring occurs before the recommended replacement interval, locate and correct the cause.

Carbon fouling of the spark plug is indicated by dry, black carbon (soot) deposits on the portion of the spark plug in the cylinder. Excessive idling and slow speeds under light engine loads can keep the spark plug temperatures so low that these deposits are not burned off. Very rich fuel mixtures or poor ignition system output may also be the cause. Refer to DTC P0172.

Oil fouling of the spark plug is indicated by wet oily deposits on the portion of the spark plug in the cylinder, usually with little electrode wear. This may be caused by oil during break-in of new or newly overhauled engines. Deposit fouling of the spark plug occurs when the normal red-brown, yellow or white deposits of combustion by products become sufficient to cause misfiring. In some cases, these deposits may melt and form a shiny glaze on the insulator around the center electrode. If the fouling is found in only one or two cylinders, valve stem clearances or intake valve seals may be allowing excess lubricating oil to enter the cylinder, particularly if the deposits are heavier on the side of the spark plug facing the intake valve.

Ignition Control PCM Output

The PCM provides a zero volt (actually about 100 mV to 200 mV) or a 5-volt output signal to the ignition control (IC) module. Each spark plug has its own primary and secondary ignition coil assembly ("coil-at-plug") located at the spark plug itself. When the ignition coil receives the 5-volt signal from the PCM, it provides a ground path for the B+ supply to the primary side of the coil-at -plug module. When the PCM shuts off the 5-volt signal to the ION sensing module, the ground path for the primary coil is broken. The magnetic field collapses and induces a high voltage secondary impulse which fires the spark plug and ignites the air/fuel mixture.

The circuit between the PCM and the ignition coil is monitored for open circuits, shorts to voltage, and shorts to ground. If the PCM detects one of these events, it will set one of the following DTCs:

- P0351: Ignition coil Fault on Cylinder #1
- P0352: Ignition coil Fault on Cylinder #2
- P0353: Ignition coil Fault on Cylinder #3
- P0354: Ignition coil Fault on Cylinder #4
- P0355: Ignition coil Fault on Cylinder #5
- P0356: Ignition coil Fault on Cylinder #6

Powertrain Control Module (PCM)

The PCM is responsible for maintaining proper spark and fuel injection timing for all driving conditions. To provide optimum drivability and emissions, the PCM monitors the input signals from the following components in order to calculate spark timing:

- Engine coolant temperature (ECT) sensor.
- Intake air temperature (IAT) sensor.
- Mass air flow (MAF) sensor.
- PRNDL input from transmission range switch.

TS23995

Excessive gap means that the air space between the center and the side electrodes at the bottom of the spark plug is too wide for consistent firing. This may be due to improper gap adjustment or to excessive wear of the electrode during use. A spark plug gap that is too small may cause an unstable idle condition. Excessive gap wear can be an indication of continuous operation at high speeds or with engine loads, causing the spark to run too hot. Another possible cause is an excessively lean fuel mixture.

TS23992

Low or high spark plug installation torque or improper seating can result in the spark plug running too hot and can cause excessive center electrode wear. The plug and the cylinder head seats must be in good contact for proper heat transfer and spark plug cooling. Dirty or damaged threads in the head or on the spark plug can keep it from seating even though the proper torque is applied. Once spark plugs are properly seated, tighten them to the torque shown in the Specifications Table. Low torque may result in poor contact of the seats due to a loose spark plug. Overtightening may cause the spark plug shell to be stretched and will result in poor contact

between the seats. In extreme cases, exhaust blow-by and damage beyond simple gap wear may occur. Cracked or broken insulators may be the result of improper installation, damage during spark plug re-gapping, or heat shock to the insulator material. Upper insulators can be broken when a poorly fitting tool is used during installation or removal, when the spark plug is hit from the outside, or is dropped on a hard surface. Cracks in the upper insulator may be inside the shell and not visible. Also, the breakage may not cause problems until oil or moisture penetrates the crack later.

TS23994

A/C Clutch Diagnosis

A/C Clutch Circuit Operation

A 12-volt signal is supplied to the A/C request input of the PCM when the A/C is selected through the A/C control switch.

The A/C compressor clutch relay is controlled through the PCM. This allows the PCM to modify the idle air control position prior to the A/C clutch engagement for better idle quality. If the engine operating conditions are within their specified calibrated acceptable ranges, the PCM will enable the A/C compressor relay. This is done by providing a ground path for the A/C relay coil within the PCM. When the A/C compressor relay is enabled, battery voltage is supplied to the compressor clutch coil. The PCM will enable the A/C compressor clutch whenever the engine is running and the A/C has been requested. The PCM will not enable the A/C compressor clutch if any of the following conditions are met:

- The throttle is greater than 90%.
- The engine speed is greater than 6315 RPM.
- The ECT is greater than 119°C (246°F).
- The IAT is less than 5°C (41°F).
- The throttle is more than 80% open.

A/C Clutch Circuit Purpose

The A/C compressor operation is controlled by the powertrain control module (PCM) for the following reasons:

- It improves idle quality during compressor clutch engagement.
- It improves wide open throttle (WOT) performance.
- It provides A/C compressor protection from operation with incorrect refrigerant pressures.

The A/C electrical system consists of the following components:

- The A/C control head.
- The A/C refrigerant pressure switches.
- The A/C compressor clutch.
- The A/C compressor clutch relay.
- The PCM.

A/C Request Signal

This signal tells the PCM when the A/C mode is selected at the A/C control head. The PCM uses this to adjust the idle speed before turning on the A/C clutch. The A/C compressor will be inoperative if this signal is not available to the PCM.

Refer to *A/C Clutch Circuit Diagnosis* section for A/C wiring diagrams and diagnosis for A/C electrical system.

General Description (Evaporative (EVAP) Emission System)

EVAP Emission Control System Purpose

The basic evaporative emission (EVAP) control system used on all vehicles is the charcoal canister storage method. Gasoline vapors from the fuel tank flow into the canister through the inlet labeled "TANK." These vapors are absorbed into the activated carbon (charcoal) storage device (canister) in order to hold the vapors when the vehicle is not operating. The canister is purged by PCM control when the engine coolant temperature is over 60°C (140°F), the IAT reading is over 10°C (50°F), and the engine has been running. Air is drawn into the canister through the air inlet grid. The air mixes with the vapor and the mixture is drawn into the intake manifold.

EVAP Emission Control System Operation

The EVAP canister purge is controlled by a solenoid valve that allows the manifold vacuum to purge the canister. The powertrain control module (PCM) supplies a ground to energize the solenoid valve (purge on). The EVAP purge solenoid control is pulse-width modulated (PWM) (turned on and off several times a second). The duty cycle (pulse width) is determined by engine operating conditions including load, throttle position, coolant temperature and ambient temperature. The duty cycle is calculated by the PCM. The output is commanded when the appropriate conditions have been met. These conditions are:

- The engine is fully warmed up.
- The engine has been running for a specified time.
- The IAT reading is above 10°C (50°F).

Poor idle, stalling and poor drivability can be caused by:

- A malfunctioning purge solenoid.
- A damaged canister.

- Hoses that are split, cracked, or not connected properly.

General Description (Exhaust Gas Recirculation (EGR) System)

EGR Purpose

The exhaust gas recirculation (EGR) system is used to reduce emission levels of oxides of nitrogen (NOx). NOx emission levels are caused by a high combustion temperature. The EGR system lowers the NOx emission levels by decreasing the combustion temperature.

Linear EGR Valve

The main element of the system is the linear EGR valve. The EGR valve feeds small amounts of exhaust gas back into the combustion chamber. The fuel/air mixture will be diluted and combustion temperatures reduced.

Linear EGR Control

The PCM monitors the EGR actual position and adjusts the pintle position accordingly. The PCM uses information from the following sensors to control the pintle position:

- Engine coolant temperature (ECT) sensor.
- Throttle position (TP) sensor.
- Mass air flow (MAF) sensor.

Linear EGR Valve Operation and Results of Incorrect Operation

The linear EGR valve is designed to accurately supply EGR to the engine independent of intake manifold vacuum. The valve controls EGR flow from the exhaust to the intake manifold through an orifice with a PCM controlled pintle. During operation, the PCM controls pintle position by monitoring the pintle position feedback signal. The feedback signal can be monitored with a Tech 2 as "Actual EGR Pos." "Actual EGR Pos." should always be near the commanded EGR position ("Desired EGR Pos."). If a problem with the EGR system will not allow the PCM to control the pintle position properly, DTC P1406

will set. The PCM also tests for EGR flow. If incorrect flow is detected, DTC P0401 will set. If DTCs P0401 and/or P1406 are set, refer to the DTC charts.

The linear EGR valve is usually activated under the following conditions:

- Warm engine operation.
- Above-idle speed.

Too much EGR flow at idle, cruise or cold operation may cause any of the following conditions to occur:

- Engine stalls after a cold start.
- Engine stalls at idle after deceleration.
- Vehicle surges during cruise.
- Rough idle.
- DTC P0300 (misfire detected).

Too little or no EGR flow may allow combustion temperatures to get too high. This could cause:

- Spark knock (detonation).
- Engine overheating.
- Emission test failure.
- DTC P0401 (EGR flow test).
- Poor fuel economy.

EGR Pintle Position Sensor

The PCM monitors the EGR valve pintle position input to ensure that the valve responds properly to commands from the PCM and to detect a fault if the pintle position sensor and control circuits are open or shorted. If the PCM detects a pintle position signal voltage outside the normal range of the pintle position sensor, or a signal voltage that is not within a tolerance considered acceptable for proper EGR system operation, the PCM will set DTC P1406.

General Description (Positive Crankcase Ventilation (PCV) System)

Crankcase Ventilation System Purpose

The crankcase ventilation system is used to consume crankcase vapors in the combustion process instead of venting them to the atmosphere. Fresh air from the throttle body is supplied to the crankcase and mixed with blow-by gases. This mixture is then passed through the positive crankcase ventilation (PCV) valve into the common chamber.

Crankcase Ventilation System Operation

The primary control is through the positive crankcase ventilation (PCV) valve. The PCV valve meters the flow at a rate that depends on the intake vacuum. The PCV valve restricts the flow when the inlet vacuum is highest. In addition, the PCV valve can seal the common chamber off in case of sudden high pressure in the crankcase.

028RV002

While the engine is running, exhaust fumes and small amounts of the fuel/air mixture escape past the piston rings and enter the crankcase. These gases are mixed with clean air entering through a tube from the air intake duct.

During normal, part-throttle operation, the system is designed to allow crankcase gases to flow through the PCV valve into the throttle body to be consumed by normal combustion.

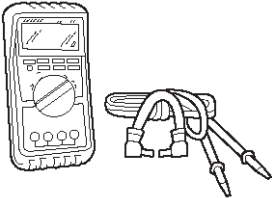

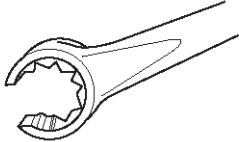

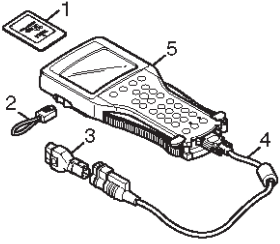

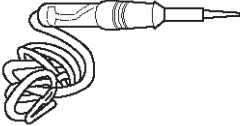

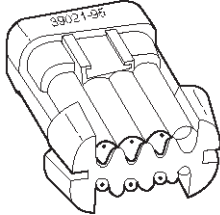

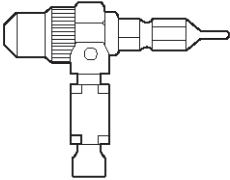

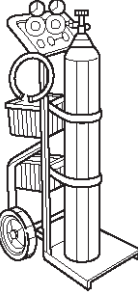

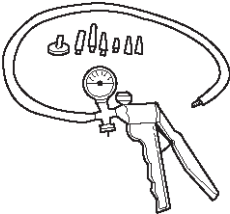

A plugged valve or PCV hose may cause the following conditions:

- Rough idle.
- Stalling of slow idle speed.
- Oil leaks.
- Sludge in the engine.

A leaking PCV hose would cause:

- Rough idle.
- Stalling.
- High idle speed.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

150RX019

When inspecting or replacing exhaust system components, make sure there is adequate clearance from all points on the underbody to prevent overheating the floor pan and possible damage to the passenger compartment insulation and trim materials.

Check complete exhaust system and nearby body areas and rear compartment lid for broken, damaged, missing or mispositioned parts, open seams, holes, loose connections or other deterioration which could permit exhaust fumes to seep into the rear compartment or passenger compartment. Dust or water in the rear compartment may be an indication of a problem in one of these areas. Any faulty areas should be corrected immediately.

Hangers

Various types of hangers are used to support exhaust system(s). These include conventional rubber straps, rubber rings, and rubber blocks.

The installation of exhaust system supports is very important, as improperly installed supports can cause annoying vibrations which can be difficult to diagnose.

Three Way Catalytic Converter

The three way catalytic converter is an emission control device added to the exhaust system to reduce pollutants from the exhaust gas stream.

CAUTION: The catalytic converter requires the use of unleaded fuel only.

Periodic maintenance of the exhaust system is not required. If the vehicle is raised for other service, it is advisable to check the condition of the complete exhaust system.

A dual bed monolith catalytic converter is used in combination with three way catalytic converter.

Catalytic Converter Types:

Three way (Reduction/Oxidation) catalyst

The catalyst coating on the three way (reduction) converter contains platinum and rhodium which lowers the levels of nitrous oxide (NOx) as well as hydrocarbons (HC) and carbon monoxide (Co).

Gasket

The gasket must be replaced whenever a new exhaust pipe, muffler or catalytic converter is installed.

2. Lift up the vehicle and support with suitable safety stands.
3. Disconnect O₂ sensor harness connectors (9).
4. Remove the forked exhaust pipe fixing bolts and nuts (1) (4) (6) and the exhaust silencer fixing nuts (5), then remove the forked exhaust pipe (3) and the mass damper (2).
5. Remove the three way catalytic converter fixing nuts (11) and the mounting rubber (7), then remove the three way catalytic converter (8).

Installation

1. Install the three way catalytic converter (8) and the mounting rubber (7), and tighten the fixing nuts (11) to the specific torque.

Torque

Nuts: 67 N·m (6.8kg·m/49 lb ft)

2. Install the forked exhaust pipe (3) and the mass damper (2), and tighten the fixing bolts (1) (6) and nuts (4) (5) to the specified torque.

Torque

Bolts&Nuts: 43 N·m (4.4kg·m/32 lb ft)

Nuts: 43 N·m (4.4kg·m/32 lb ft)

3. Connect the O₂ sensor connectors (9).

Forked Exhaust Pipe

Forked Exhaust Pipe and Associated Parts

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS), REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

| (5) Oil Pump Assembly | (12) Oil Seal |
| (6) Plug | (13) O-ring |
| (7) Spring | (14) Oil Pump Body |

Oil Pump and Associated Parts

1. Remove crankshaft timing pulley.
2. Remove crankcase with oil pan.
3. Remove oil pipe.
4. Remove oil strainer.
5. Remove oil pump assembly.
6. Remove plug.
7. Remove spring.
8. Remove relief valve.
9. Remove oil pump cover.
10. Remove driven gear.
11. Remove drive gear.
12. Remove oil seal.
13. Remove O-ring.

Inspection and Repair

CAUTION: Make necessary correction or parts replacement if wear, damage or any other abnormal conditions are found during inspection.

Relief Valve (8)

- Check to see that the relief valve slides freely.
- The oil pump must be replaced if the relief valve does not slide freely.
- Replace the spring and/or the oil pump assembly (5) if the spring is damaged or badly worn.

Body (14) and Gears (10, 11)

The pump assembly must be replaced if one or more of the conditions below is discovered during inspection.

- Badly worn or damaged driven gear (10).
- Badly worn drive gear (11) driving face.
- Badly scratched or scored body sliding face (14) or driven gear (10).

- Badly worn or damaged gear teeth.
Measure the clearance between the body and the driven gear with a feeler gauge.

**Standard : 0.10 mm–0.18 mm
(0.0039 in.–0.0070 in)**

Limit : 0.20mm (0.0079 in)

- Measure the clearance between the drive gear and driven gear with a feeler gauge.

**Standard : 0.11 mm–0.24 mm
(0.0043 in–0.0094 in)**

Limit : 0.35mm (0.0138 in)

- Measure the side clearance with a precision straight edge and a feeler gauge.

Clearance

**Standard : 0.03 mm–0.09 mm
(0.0011 in–0.0035 in)**

Limit : 0.15mm (0.0059 in)

051RS005

Oil Strainer

Check the oil strainer for cracking and scoring. If cracking and scoring are found, the oil strainer must be replaced.

051RS006

Reassembly

1. Install drive gear (11).
2. Install driven gear (10).
3. Install oil pump cover (9) and first, loosely tighten all of the attaching screws. Next, tighten the attaching screws to the specified torque.

Torque : 10 N·m (1.0 kg·m/87 lb in)

After installation, check that the gear rotates smoothly.

4. Install relief valve (8) and apply engine oil to the relief valve and spring (7).
5. Install spring (7).

6. Install the plug (6).

Torque : 8 N·m (0.8 kg·m/69 lb in)

051RS007

7. Install oil pump assembly (5).

- Carefully remove any oil from the cylinder body and the pump. Apply sealant (TB-1207B or equivalent) to the pump fitting face as shown in illustration. Take care that sealant is not applied to oil port surfaces. The oil pump assembly must be installed within 5 minutes after sealant application before the sealant hardens.

CAUTION: Do not apply an excessive amount of sealant to the contact surface. Applying too much sealant will overflow the contact surfaces. This could cause serious damage to the engine.

- Attach oil pump assembly to cylinder body.
- Tighten the oil pump fixing bolts.

Torque : 25 N·m (2.5 kg·m/18 lb-ft)

051RW002

6G-6 ENGINE LUBRICATION (6VD1 3.2L)

Legend

- (1) Around Bolt Holes
- (2) Around Dowel Pin

8. Install the new oil seal (12). Apply engine oil to the oil seal lip before installation then use 5-8840-2287-0 oil seal Installer, install oil seal.

9. Install oil strainer (4) with O-ring (13).

Torque: 25 N-m (2.5 kg-m/18 lb ft)

10. Install oil pipe (3) with O-ring (13).

Torque: 25 N-m (2.5 kg-m/18 lb ft)

11. Install crankcase with oil pan (2).

- Remove oil on crankcase mounting surface and dry the surface.
- Apply a proper 4.5 mm (0.7 in) wide bead of sealant (TB1207C or equivalent) to the crankcase mounting surface. The bead must be continuous.
- The crankcase must be installed within 5 minutes after sealant application before the sealant hardens.

- Tighten fixing bolts to the specified torque.

Torque : 10 N-m (1.0 kg-m/87 lb in)

12. Install crankshaft timing pulley.

Oil Pan and Crankcase

Removal

1. Disconnect battery ground cable.
2. Drain engine oil.
3. Lift vehicle by supporting the frame.
4. Remove front wheels.
5. Remove oil level dipstick from level gauge tube.
6. Remove stone guard.
7. Remove radiator under fan shroud.
8. Remove suspension cross member fixing bolts, 2 pcs each per side and remove suspension cross member.
9. Remove pitman arm and relay lever assembly, using the 5-8840-2005-0 remover, remove pitman arm from the steering unit and remove four fixing bolts for relay lever assembly.
10. Remove axle housing assembly four fixing bolts from housing isolator side and mounting bolts from wheel side. At this time support the axle with a garage jack and remove axle housing assembly.
11. Remove oil pan fixing bolts.
12. Remove oil pan, using 5-8840-2153-0 sealer cutter, remove oil pan.

013RS003

Installation

1. Install crankcase.
 1. Remove residual sealant, lubricant and moisture from mounting surface, then dry thoroughly.
 2. Properly apply a 4.5 mm (0.7 in) wide bead of sealant (TB-1207C or equivalent) to mounting surface of crankcase.

Sealant bead must be continuous.

 - The crankcase must be installed within 5 minutes after sealant application before the sealant hardens.

013RS003

13. Remove crankcase fixing bolts.
14. Remove crankcase, using 5-8840-2153-0 sealer cutter, remove crankcase.

NOTE: Do not deform or damage the flange of oil pan and crankcase.

Replace the oil pan and/or crankcase if deformed or damaged.

013RW010

6G-8 ENGINE LUBRICATION (6VD1 3.2L)

3. Install crankcase, tighten crankcase fixing bolts to the specified torque.

Torque : 10 N·m (1.0 kg·m/87 lb in)

013RW004

2. Install oil pan

1. Remove residual sealant, lubricant and moisture from mounting surface, then dry thoroughly.
2. Properly apply a 4.5 mm (0.7 in) wide bead of sealant (TB-1207C or equivalent) to mounting surface of oil pan.

Sealant bead must be continuous.

- The crankcase must be installed within 5 minutes after sealant application before the sealant hardens.

013RW003

3. Install oil pan, tighten oil pan fixing bolts to the specified torque.

Torque : 25 N·m (2.5 kg·m/18 lb ft)

3. Install axle housing assembly and tighten fixing bolts to the specified torque.

Axle case bolts

Torque : 82 N·m (8.4 kg·m/61 lb ft)

Mounting bolts

Torque : 152 N·m (15.5 kg·m/112 lb ft)

013RW005

4. Install relay lever assembly and tighten fixing bolts.

Torque: 44 N·m (4.5 kg·m/33 lb ft)

5. Engage teeth of pitman arm and steering unit, and tighten nut to the specified torque.

Torque : 216 N·m (22.0 kg·m/159 lb ft)

013RW006

Legend

- (1) Pitman Arm
- (2) Relay Lever

6. Install suspension cross member and tighten fixing bolts to the specified torque.

Torque : 78 N·m (8.0 kg·m/58 lb ft)

013RW007

7. Install radiator under fan shroud.
8. Install stone guard.
9. Install engine oil level dipstick.
10. Fill engine oil until full level on engine oil gauge dipstick.

Oil Pump

Removal

1. Disconnect battery ground cable.
2. Drain engine oil.
3. Remove crankcase assembly.
 - Refer to removal procedure for Oil Pan and Crankcase in this manual.
4. Remove crankshaft pulley.
 - Refer to removal procedure for Crankshaft Pulley in this manual.
5. Remove timing belt.
 - Refer to removal procedure for Timing Belt in this manual.
6. Remove timing pulley from crankshaft.
7. Remove four fixing bolts from oil filter assembly.
8. Remove oil strainer fixing bolts, remove oil strainer assembly with O-ring.
9. Remove three bolts from oil pipe and O-ring.
10. Remove eight oil pump fixing bolts, then oil pump assembly.
11. Remove sealant from mounting surface of oil pump assembly, cylinder block and take care not to damage mounting surfaces of oil pump and cylinder block.

Installation

1. Install oil pump assembly
 - Apply sealant (TB-1207B or equivalent) to the oil pump mounting surfaces as shown in the illustration.
 - The oil pump assembly must be installed within 5 minutes after sealant application before the sealant hardens.

NOTE: Do not apply sealant to the oil ports.

051RW002

- Use 5-8840-2287-0 installer when installing new oil seal.
- Apply engine oil to oil seal lip.
- Install oil pump assembly to the cylinder block.

NOTE: Do not damage oil seal during installation of oil pump assembly.

015RS001

- Tighten fixing bolts to the specified torque.

Torque : 25 N-m (2.5 kg-m/18 lb ft)

051RW001

2. Install oil pipe with O-ring, tighten fixing bolt to the specified torque.

Torque : 10 N-m (1.0 kg-m/87 lb in)

3. Install oil strainer with O-ring, tighten fixing bolt to the specified torque.

Torque : 25 N-m (2.5 kg-m/18 lb ft)

Oil Pump Oil Seal

Removal

1. Disconnect battery ground cable.
2. Drain engine oil.
3. Remove crankshaft pulley.
 - Refer to removal procedure for Crankshaft Pulley in this manual.
4. Remove timing belt.
 - Refer to removal procedure for Timing Belt in this manual.
5. Remove timing pulley from crankshaft.
6. Remove oil pump oil seal using a sealer puller.

NOTE: Take care not to damage sealing surfaces of oil pump and crankshaft when removing oil seal.

Installation

1. Install oil pump oil seal, apply engine oil to oil seal lip, then install oil seal using 5-8840-2287-0 installer.

2. Install timing pulley to crankshaft.
3. Install timing belt.
 - Refer to installation procedure for Timing Belt in this manual.
4. Install crankshaft pulley.
 - Refer to installation procedure for Crankshaft Pulley in this manual.
5. Refill engine oil until full level.

Oil Filter

Removal

1. Disconnect battery ground cable.
2. Drain engine oil.
3. Remove oil filter using 5-8840-0203-0 filter wrench.

Installation

1. Clean filter fitting surface and apply small amount of engine oil to sealing surface.
2. Install oil filter cartridge by hand until it comes in contact with sealing surface then rotate additional 7/8 turn to tighten using 5-8840-0203-0 filter wrench.

Legend

- (1) Oil Pump
- (2) Oil Filter
- (3) Oil Gallery
- (4) From Filter
- (5) To Filter

3. Fill engine oil until full level on dipstick.
4. Reconnect battery ground cable.

WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Air Cleaner Element

Removal

1. Remove positive ventilation hose connector(1).
2. Remove intake air temperature sensor(2).
3. Remove air flow sensor(3).
4. Remove air cleaner duct assembly(4).
5. Remove air cleaner element(5).

Installation

1. Install air cleaner element(5).
2. Attach the mass air cleaner duct cover to the body completely, then clamp it with the clip(4).
3. Install air flow sensor(3).
4. Install air temperature sensor(2).
5. Install positive crankcase ventilation hose connector(1).

Inspection

Check the air cleaner filter for damage or dust clogging. Replace if it is damaged, or clean if it is clogged.

Cleaning Method

Tap the air cleaner filter gently so as not to damage the paper filter, or clean the element by blowing with compressed air of about 490 kPa (71 psi) from the clean side if it is extremely dirty.

LD : LOCKED IN DRIVE

FW : FREEWHEELING

NE : NOT EFFECTIVE

Normal Operation of 2001 4L30-E Transmission

Torque Converter Clutch (TCC)

Application Conditions:

The TCC is normally applied in 2nd, 3rd and 4th gears only when all of the following conditions exist:

- The engine coolant temperature is above 70°C (158°F).
- The brake pedal is released.
- The shift pattern requests TCC apply.

Moreover, TCC is always applied in 2nd, 3rd and 4th gears when the transmission oil temperature is above 135°C (275°F).

This mode should be canceled at 125°C (257°F).

ATF Warning Lamp

The ATF warning lamp will be constantly on (not flashing) if the transmission oil temperature is above 145°C (293°F).

The ATF warning lamp goes off again when the transmission oil temperature is below 125°C (257°F).

Reverse Lock Out

With the selector lever in reverse position, the PCM will not close the PWM solenoid until the vehicle is below 15 km/h (9.3 mph), thus preventing reverse engagement above this speed.

Diagnosis

Introduction

The systematic troubleshooting information covered by this Section offers a practical and systematic approach to diagnosing 4L30-E transmission, using information that can be obtained from road tests, electrical diagnosis, oil pressure checks or noise evaluation.

The key to correcting a complaint is to make use of all of the available symptoms and logically letting them direct you to the cause.

When dealing with automatic transmission complaints, it is best to gather as many symptoms as possible before making the decision to remove the transmission from the vehicle.

Frequently, the correction of the complaint does not require removal of the transmission from the vehicle.

Driver Information

To analyze the problem fill out a complete description of the owner's complaint.

Please draw a circle around the right information and complete the following form. (The next page is an example of a completed form.) You can draw a circle around many numbers if you are not sure.

General Diagnosis Procedure

Preliminary Inspection Chart

Checking Transmission Fluid Level and Condition

Checking fluid level and condition (color and odor) at regular intervals will provide early diagnosis information about the transmission. This information may be used to correct a condition that, if not detected early, could result in major transmission repairs.

IMPORTANT: When new, automatic transmission fluid is red in color. As the vehicle is driven, the transmission fluid will begin to look darker in color. The color may eventually appear light brown.

A dark brown color with burnt odor may indicate excessive fluid deterioration and signal a need for fluid change.

Fluid Level

When adding or changing fluid, use only DEXRON®-III. Refer to *Maintenance and Lubrication in General Information* section for maintenance information and servicing interval.

CAUTION: DO NOT OVERFILL.

Overfilling will cause foaming, loss of fluid, abnormal shifting and possible damage to the transmission.

1. Park the vehicle on level ground and apply the parking brake firmly.
2. Check fluid level with engine running at idle.

NOTE: Be sure that transmission fluid temperature is below 30°C (86°F).

3. Move the selector lever through all gear ranges.
4. Move the selector lever to "Park".
5. Let engine idle for 3 minutes and open the overfill screw (1).
6. Add released transmission fluid until it flows out over the overfill screw opening.
7. Let engine idle until a fluid temperature between 32°C (90°F) and 57°C (135°F) is reached, then close the overfill screw (1).

Torque: 38 N•m (28 lb ft)

NOTE: To prevent fluid leaks, the overfill screw and oil drain screws gasket must be replaced each time these screws are removed.

NOTE: Check transmission fluid temperature with scan tool.

Minimum fluid level → 57°C (135°F)

Maximum fluid level → 32°C (90°F)

242R200001

CAUTION: Do not open overfill screw with engine stopped.

CAUTION: DO NOT CHECK FLUID LEVEL UNDER THESE CONDITIONS:

- Immediately after driving at sustained highway speeds.
- In heavy city traffic during hot weather.
- If vehicle is towing a trailer.

If the vehicle has been operated under these conditions, shut the engine off and allow the vehicle to "cool" for thirty (30) minutes. After the cool down period, restart the vehicle and continue from step 2 above.

Fluid Condition

FLUID CONDITION				
	NORMAL*		CONTAMINATED	
COLOR	RED OR LIGHT BROWN	BROWN	NON-TRANSPARENT / PINK	BROWN
DRAIN REQUIRED?	NO	YES	YES	YES
CONTAMINATION	NONE	Very small amount of foreign material in bottom of pan	Contamination by coolant or other source	Large pieces of metal or other foreign material in bottom of pan
CORRECT LEVEL AND CONDITION	1. LOW LEVEL: A. Add fluid to obtain proper level & check for external leaks. B. Correct cause of leak. 2. HIGH LEVEL: - Remove excess fluid	- Remove both pans - Change filter - Flush cooler - Add new fluid - Check level	- Repair/replace radiator cooler - Transmission overhaul required - Check for: ● Damaged plates and seals ● Contaminated solenoids - Flush cooler - Add new fluid - Check level	- Transmission overhaul required - Flush cooler and cooler lines - Add new fluid - Check level

*Fluid should be changed according to maintenance schedule.

Test Driving

Some 4L30-E automatic transmission complaints will require a test drive as a part of the diagnostic procedure. Some codes will not set unless the vehicle is moving. The purpose of the test drive is to duplicate the customer's complaint condition and set a current Powertrain Control Module (PCM) trouble code. Perform this procedure before each 4L30-E automatic transmission repair, and again after repairs are made.

IMPORTANT:

- Duplicate the condition under which the customer's complaint was observed.
- Depending on the complaint, the line pressure gauge and the scan tool may be required during the test drive.
- During the test drive, it is important to record all necessary data from the areas being monitored, for use in diagnosis. Also listen for and note any unusual noises.

The following procedure should be used to test drive 4L30-E automatic transmission complaint vehicles:

1. Turn the ignition ON without starting the engine. Check that the "CHECK TRANS" lamp comes on for approximately 2 seconds and then goes out and remains out.
 - If the lamp is flashing, GO TO *Check Trans Indicator in Transmission Control System (4L30-E) section.*

- If no serial data is present, GO TO *OBD System Check. Refer to Driveability and Emissions in Engine section.*
 - If the lamp stays ON or stays OFF, GO TO "*Check Trans*" Check in *Transmission Control System (4L30-E) section.*
2. Drive the vehicle. During the test drive, be sure that the transmission achieves normal operating temperature (approx. 20 minutes). Allow the transmission to go through all of its gear ranges, checking shift timing and firmness. Duplicate the owner's complaint condition as closely as possible during the test drive.
 3. If, during the test drive, the "CHECK TRANS" lamp comes on, use the scan tool to check for trouble codes.
 4. If, during the test drive, a problem is felt, but the "CHECK TRANS" lamp does not come on and no trouble codes are present, drive the vehicle with the PCM disconnected (manually shifting the vehicle).
 - In Manual L, the vehicle operates in first gear.
 - In Manual 2, the vehicle operates in third gear.
 - In Manual 3 or "D", the vehicle operates in fourth gear.
 If the problem still exists with the PCM disconnected, refer to *Mechanical/Hydraulic Diagnosis in this section.*
 5. If no problem has been found at this point, check all underhood connections that supply power to the PCM and ignition fuses. Physically and visually inspect all the PCM harness connectors for loose or corroded terminals. Inspect the PCM ground points.

Mechanical / Hydraulic Diagnosis Check Trans Indicator Chart

Perform Preliminary Inspection First!

When the "CHECK TRANS" indicator is flashing, it indicates that a problem related to the transmission, the Powertrain Control Module (PCM), or the vehicle harness has occurred.

The system is now operating in a "BACKUP MODE" where the risk of further damaging the transmission has been reduced. The vehicle may be shifted manually. If the initial problem is intermittent or seldom, switching the engine OFF/ON might allow normal operation again until the problem reoccurs.

Mechanical / Hydraulic Diagnosis Symptoms Index

Perform Preliminary Inspection First!

CHART	SYMPTOMS
1	NO ENGINE START IN NEUTRAL OR PARK
2	NO FORWARD GEARS IN ANY RANGE/NO REVERSE
3	NO ENGINE BRAKE IN ANY RANGE
4	POOR SHIFTING IN ALL GEARS (ALL HARSH OR ALL SOFT)
5a	DELAYS IN DRIVE AND REVERSE
5b	DELAYS IN REVERSE ONLY
6	DIAGNOSTIC TROUBLE CODE (DTC) P0730
7	HARSH 1-2 SHIFT
8	HARSH 3-4 SHIFT
9a	3-2 DOWNSHIFT COMPLAINT
9b	HARSH SHIFT WHEN SHIFTING INTO "D" OR ACCELERATING FROM STOP
9c	COASTDOWN HARSH SHIFT OR CLUNK AT 3-2 DOWNSHIFT
10	INTERMITTENT 4TH TO 2ND GEAR DOWNSHIFT AT STEADY SPEED
11	ENGINE FLARE AT SHIFTING DURING TURNING ONLY (USUALLY WITH WARM ENGINE)
12	ENGINE FLARE DURING 1-2 OR 2-3 SHIFT
13	SHUDDER ONLY DURING TORQUE CONVERTER CLUTCH (TCC) APPLYING
14	POSSIBLE CAUSES OF TRANSMISSION NOISE
15a	POSSIBLE CAUSES OF LOW LINE PRESSURE
15b	POSSIBLE CAUSES OF HIGH LINE PRESSURE
16	POSSIBLE CAUSES OF TRANSMISSION FLUID LEAKS

NOTE: Numbers with parenthesis on the following charts refer to *Parts List at end of this section*.

Chart 1: No Engine Start In Neutral Or Park

Step	Action	Yes	No
1	Does engine start when shift lever moved from drive to neutral mostly in hot condition?	Go to Step 2	Go to Step 3
2	Does engine start in park at any condition?	Re-test vehicle	Go to Step 4
3	Does engine also not start in neutral when shift lever moved from park to neutral?	Go to Step 4	Go to Step 5
4	Check mode switch (63) setting. Readjust if necessary. Problems fixed?	Re-test vehicle	Go to Step 5
5	Check start circuit of mode switch (63) open in neutral. Was open found?	Locate and repair open(s).	Replace mode switch (63).

7A-14 AUTOMATIC TRANSMISSION (4L30-E)

Chart 2: No Forward Gears In Any Range/No Reverse

Step	Action	Yes	No
1	Check line pressure. Refer to <i>Line Pressure Test in this section</i> . Was line pressure normal?	Go to <i>Step 2</i>	Use Chart 15a: Possible Causes of Low Line Pressure in this section.
2	1. Check internal linkage: – Manual linkage (58) not moving manual valve (326). 2. Check for internal mechanical damage: – Turbine shaft (506) broken loose. – Overrun roller clutch (516) broken loose. Was the problem found?	Repair or replace	—

Chart 3: No Engine Brake In Any Range

Step	Action	Yes	No
1	Check line pressure. Refer to <i>Line Pressure Test in this section</i> . Was line pressure normal?	Go to <i>Step 2</i>	Use Chart 15a: Possible Causes of Low Line Pressure in this section.
2	1. Check for overrun clutch leaks caused by: – Damaged piston lip (513) – Check ball defective (504) 2. Check for overrun lockout valve (705) stuck by foreign material. 3. Check for leaks at turbine shaft (506) caused by: – Teflon seal rings damaged (508) – Excessive wear of turbine shaft bearing surfaces. Was the problem found?	Repair or replace	—

Chart 4: Poor Shifting In All Gears (All Harsh Or All Soft)

Step	Action	Yes	No
1	Check line pressure. Refer to <i>Line Pressure Test in this section</i> . Was line pressure normal?	Go to <i>Step 2</i>	Go to <i>Step 3</i>
2	1. Check for these conditions which could affect clutch apply time: <ul style="list-style-type: none"> - Defective band apply solenoid (323). - Defective servo or/and accumulator piston. - Excessive clutch piston travel. 2. Check of possible causes of internal leaks: <ul style="list-style-type: none"> - Cut or damaged sealing ring(s) - Damaged sealing gasket(s) - Check ball missing or out of location in 2nd and 3rd clutch pistons. 3. Check for causes of burned clutch plates or band. Was the problem found?	Repair or replace	—
3	Was the line pressure high?	Go to <i>Step 4</i>	Use Chart 15a: Possible Causes of Low Line Pressure in this section.
4	Were DTC P0705 set?	Diagnose those DTC(s) first.	Use Chart 15b: Possible Causes of High Line Pressure in this section.

Chart 5a: Delays In Drive and Reverse

NOTE: A short delay (less than 3 seconds) when first engaging drive or reverse after allowing vehicle to sit overnight is normal.

Step	Action	Yes	No
1	Check line pressure. Refer to <i>Line Pressure Test in this section</i> . Was line pressure normal?	More than 3 second delay in drive and reverse with engine off 1 hour or less. Teflon seals (508) on turbine shaft damaged. Repair	Use Chart 15a: Possible Causes of Low Line Pressure in this section.

Chart 5b: Delays In Reverse Only

Step	Action	Yes	No
1	Check line pressure. Refer to <i>Line Pressure Test in this section</i> . Was line pressure normal?	Go to <i>Step 2</i>	Use Chart 15a: Possible Causes of Low Line Pressure in this section.
2	Main case valve body gasket (88) damaged. <ul style="list-style-type: none"> - Reverse check ball (85) in valve body (84) missing or out of location. - Check for restrictions at valve body transfer plate orifice. Was the problem found?	Repair	—

7A-16 AUTOMATIC TRANSMISSION (4L30-E)

Chart 6: Diagnostic Trouble Code (DTC) P0730

Step	Action	Yes	No
1	Check line pressure. Refer to <i>Line Pressure Test in this section</i> . Was line pressure normal?	Go to <i>Step 2</i>	Use Chart 15b: Possible Causes of High Line Pressure in this section.
2	<ol style="list-style-type: none"> 1. 1st and 2nd gear missing or 3rd and 4th gear missing. Check appropriate shift valve. If OK replace solenoid. 2. No engine brake in any range (All ranges in Drive and Reverse are OK) Check for suspected conditions modifying delays to clutch apply: <ul style="list-style-type: none"> – Overrun clutch seal damaged. – Excessive overrun clutch piston travel. – Defective 3–4 accumulator piston. – Causes of internal leaks. – Causes of burned clutch plates. 3. 1st and 4th gear missing or 2nd and 3rd gear missing. Shift solenoid A stuck. Replace shift solenoid A. 4. DTC P0730 is set in D range 1st gear above 3500 rpm. Go to <i>Step 3</i>. 5. DTC P0730 is set in D range 3rd gear between 55-80 mph. <p>NOTE: Perform this test within safe and legal limits. Check for suspected conditions modifying delays to clutch apply:</p> <ul style="list-style-type: none"> – 4th clutch seal damaged. – Excessive 4th clutch piston travel. – Defective 3–4 accumulator piston. – Causes of internal leaks. – Causes of burned clutch plates. <p>Was the problem found?</p>	Repair or replace	—
3	Check 3rd gear in “D” in winter mode. Does vehicle move?	Shift solenoid A stuck. Replace shift solenoid A.	Go to <i>Step 4</i>
4	Check for suspected conditions modifying delays to clutch apply: <ul style="list-style-type: none"> – 2nd clutch seal damaged. – Excessive 2nd clutch piston travel. – Defective accumulator piston. – Causes of internal leaks. – Check ball missing or out of location in 2nd clutch. – Seals cut, damaged or missing. – Gaskets defective. – Causes of burned clutch plates. <p>Was the problem found?</p>	Repair or replace	—

Chart 7: Harsh 1–2 Shift

Step	Action	Yes	No
1	Check line pressure. Refer to <i>Line Pressure Test in this section</i> . Was line pressure normal?	Check for 1–2 accumulator valve (320) stuck by foreign material in main case valve body.	Use Chart 15b: Possible Causes of High Line Pressure in this section.

Chart 8: Harsh 3–4 Shift

Step	Action	Yes	No
1	Check line pressure. Refer to <i>Line Pressure Test in this section</i> . Was line pressure normal?	Go to <i>Step 2</i>	Use Chart 15b: Possible Causes of High Line Pressure in this section.
2	1. Check for 3–4 accumulator valve (407) stuck in adapter case valve body (401). 2. Check for 3–4 accumulator piston (18) stuck in adapter case (20). Was the problem found?	Repair or replace	—

Chart 9a: 3–2 Downshift Complaint

Step	Action	Yes	No
1	Check line pressure. Refer to <i>Line Pressure Test in this section</i> . Was line pressure normal?	Go to <i>Step 2</i>	Use Chart 15a: Possible Causes of Low Line Pressure in this section.
2	Does DTC P1850 set?	Diagnose P1850 first.	Replace band apply solenoid (PWM) (323).

Chart 9b: Harsh Shift When Shifting Into “D” Or Accelerating From Stop

Step	Action	Yes	No
1	Check line pressure. Refer to <i>Line Pressure Test in this section</i> . Was line pressure normal?	Go to <i>Step 2</i>	Use Chart 15b: Possible Causes of High Line Pressure in this section.
2	Does DTC P1850 set?	Diagnose P1850 first.	Replace band apply solenoid (PWM) (323).

7A-18 AUTOMATIC TRANSMISSION (4L30-E)

Chart 9c: Coastdown Harsh Shift Or Clunk At 3-2 Downshift

Step	Action	Yes	No
1	Check line pressure. Refer to <i>Line Pressure Test in this section</i> . Was line pressure normal?	Go to <i>Step 2</i>	Use Chart 15b: Possible Causes of High Line Pressure in this section.
2	Does DTC P1850 set?	Diagnose P1850 first.	Replace band apply solenoid (PWM) (323).

Chart 10: Intermittent 4TH TO 2ND Gear Downshift At Steady Speed

Step	Action	Yes	No
1	Check for consistent speed sensor reading with scan tool. Was the reading correct?	Replace mode switch for intermittent contact.	Go to <i>Step 2</i>
2	1. Check for wiring harness damage or short to ground. If OK, go to (2). 2. Check transmission speed sensor connections. If OK, go to (3). 3. Replace transmission speed sensor. Was the replacement complete?	—	Replace speed sensor.

Chart 11: Engine Flare At Shifting During Turning Only (Usually With Warm Engine)

Step	Action	Yes	No
1	Check for oil leaks at transmission. Was the problem found?	Replace transmission oil filter and gasket.	—

Chart 12: Engine Flare During 1-2 Or 2-3 Shift

Step	Action	Yes	No
1	Check line pressure. Refer to <i>Line Pressure Test in this section</i> . Was line pressure normal?	Go to <i>Step 2</i>	Use Chart 15a: Possible Causes of Low Line Pressure in this section.
2	1. Check for a stuck 1-2 accumulator valve (320). 2. Check for servo piston (106) leaks. 3. Check for a stuck band apply solenoid (323). Was line pressure normal?	Repair or replace	—

Chart 13: Shudder Only During Torque Converter Clutch (TCC) Applying

Step	Action	Yes	No
1	<p>1. TCC shudder is one of the most commonly misdiagnosed conditions in an automatic transmission. The key to diagnosing TCC shudder is to note when it happens and under what conditions. Once the TCC has been fully applied, it is nearly impossible to make it shudder. TCC shudder (short burst of noise normally less than 1 second) will only occur during clutch applying. It is not a steady state condition.</p> <p>2. Drive until whole drivetrain is at normal operating temperature.</p> <ul style="list-style-type: none"> – On 4WD vehicles, the test must be performed with transfer case selector lever in “2H” position. – Shudder is a short burst of noise normally less than 1 second in duration, and can be induced by the following maneuver: <p>3. From coast condition at 50 mph in “D” range (Normal mode), depress the throttle to 1/4-1/3 throttle. If present, shudder will occur within 5 seconds together with TCC application. (The scan tool may be used to determine the exact time of TCC application).</p> <p>Was the problem found?</p>	<p>Replace transmission fluid and filter (remove both pans) and flush cooler lines. Replace converter assembly and O-ring on turbine shaft</p>	<p>Perform mechanical inspection of other drivetrain components.</p>

Chart 14: Possible Causes of Transmission Noise

CAUTION: Before checking transmission for what is believed to be transmission noise, ensure presence and positioning of insulating plugs, pads etc. Also make sure that noise does not come from other drivetrain components.

Condition	Possible cause	Correction
Whine or Buzz	Oil level low	Fill with ATF, check for external leaks.
	Plugged or restricted oil filter	Inspect oil filter. Replace oil filter or ATF as necessary.
	Damaged oil filter gasket	Replace oil filter gasket.
Knocking noise from front of transmission.	Loose bolts (Converter to flex plate)	Tighten to specifications.
	Cracked or broken flex plate	Replace flex plate.
	Converter damaged	Replace converter.
Knocking noise while driving, mostly on acceleration.	Transmission mount loose or broken	Tighten mount bolts or replace transmission mount.
	Cooler line mounts loose or broken	Tighten or replace cooler line mounts.
	Cooler lines touching body or frame	Repair or replace as necessary.
Knocking noise when vehicle is stationary.	Loose flex plate mounting bolts	Tighten to specifications.
	Cracked or broken flex plate	Replace flex plate.
	Damaged converter	Replace converter.

7A-20 AUTOMATIC TRANSMISSION (4L30-E)

Chart 15a: Possible Causes of Low Line Pressure

Step	Action	Yes	No
1	Check oil level. Was the problem found?	Fill with ATF.	Go to <i>Step 2</i>
2	Check for defective throttle position sensor. Was the problem found?	Replace throttle position sensor.	Go to <i>Step 3</i>
3	Check for plugged, loose, or damaged oil filter (79). Was the problem found?	Inspect oil filter, tighten bolts or replace oil filter (79).	Go to <i>Step 4</i>
4	Check for a stuck force motor plunger (404). (Adapter case valve body) Was the problem found?	Replace force motor plunger (404).	Go to <i>Step 5</i>
5	Check for a stuck feed limit valve (412). (Adapter case valve body) Was the problem found?	Replace feed limit valve (412).	Go to <i>Step 6</i>
6	Check for loose converter bolts (4 & 5). Was the problem found?	Tighten converter bolts (4 & 5).	Go to <i>Step 7</i>
7	Check for a stuck pressure regulator valve (208). (Oil pump) Was the problem found?	Replace pressure regulator valve (208).	Go to <i>Step 8</i>
8	Check for a stuck boost valve (205). (Oil pump) Was the problem found?	Replace boost valve (205).	Go to <i>Step 9</i>
9	Check for blocked intermediate oil passages to pressure regulator valve. (Oil pump) Was the problem found?	Replace oil pump.	Go to <i>Step 10</i>
10	Check for defective oil pump (9, 201, 202 & 209). Was the problem found?	Replace oil pump.	Go to <i>Step 11</i>
11	Check for internal leaks. – Check balls missing or out of location in valve bodies – Seals cut or damaged – Gaskets defective, etc. Was the problem found?	Install balls, or correct ball location. Replace seals. Replace gaskets.	—

Chart 15b: Possible Causes of High Line Pressure

NOTE: If transmission is operating in backup mode, high line pressure will be present.

Step	Action	Yes	No
1	Check for defective throttle position sensor. Was the problem found?	Replace throttle position sensor.	Go to <i>Step 2</i>
2	Check for a stuck force motor plunger (404). (Open circuit/intermittent) (Adapter case valve body) Was the problem found?	Replace force motor plunger (404).	Go to <i>Step 3</i>
3	Check for a stuck feed limit valve (412). (Adapter case valve body) Was the problem found?	Replace feed limit valve (412).	Go to <i>Step 4</i>
4	Check converter bolts (4 & 5). Was the problem found?	Tighten converter bolts (4 & 5).	Go to <i>Step 5</i>
5	Check for a stuck pressure regulator valve (208). (Oil pump) Was the problem found?	Replace pressure regulator valve (208).	Go to <i>Step 6</i>
6	Check for a stuck boost valve (205). (Oil pump) Was the problem found?	Replace boost valve (205).	Go to <i>Step 7</i>
7	Check for internal leaks. – Check balls missing or out of location in valve bodies – Seals cut or missing – Gaskets defective, etc. Was the problem found?	Install balls, or correct ball location. Replace seals. Replace gaskets.	—

Chart 16: Possible Causes of Transmission Fluid Leaks

Before attempting to correct an oil leak, the actual source of the leak must be determined. In many cases, the source of the leak may be difficult to determine due to “wind flow” around the engine and transmission. The suspected area should be wiped clean before inspecting for the source of the leak.

Oil leaks around the engine and transmission are generally carried toward the rear of the vehicle by the air stream. In determining the source of an oil leak, the following two checks should be made:

1. With the engine running, check for external line pressure leaks.
2. With the engine off, check for oil leaks due to the raised oil level caused by drainback of converter oil into the transmission.

Possible Causes of Fluid Leaks Due To Sealing Malfunction

240RX008

Stall Test

The stall test allows you to check the transmission for internal abrasion and the one way clutch for slippage. Torque converter performance can also be evaluated. The stall test results together with the road test results will identify transmission components requiring servicing or adjustment.

Stall Test Procedure:

1. Check the level of the engine coolant, the engine oil, and the automatic transmission fluid. Replenish if necessary.
2. Block the wheels and set the parking brake.
3. Connect a tachometer to the engine.
4. Start the engine and allow it to idle until the engine coolant temperature reaches 70 – 80°C (158 – 176°F).

5. Hold the brake pedal down as far as it will go.

6. Place the selector in the “D” range.

7. Gradually push the accelerator pedal to the floor. The throttle valve will be fully open.

Note the engine speed at which the tachometer needle stabilizes.

Stall Speed : 2,100 ±150 rpm

NOTE: Do not continuously run this test longer than 5 seconds.

8. Release the accelerator pedal.

9. Place the selector in the “N” range.

10. Run the engine at 1,200 rpm for one minute. This will cool the transmission fluid.

11. Repeat Steps 7 – 10 for the “3”, “2”, “L” and “R” ranges.

Line Pressure Test

The line pressure test checks oil pump and control valve pressure regulator valve function. It will also detect oil leakage.

Line Pressure Test Procedure:

1. Check the level of the engine coolant, the engine oil, and the automatic transmission fluid.
Replenish if required.
2. Block the wheels and set the parking brake.
3. Remove the pressure detection plug at the left side of the transmission case.
Set J-29770-A pressure gauge and adapter to the pressure detection plug hole.

4. Start the engine and allow it to idle until the engine coolant temperature reaches 70 – 80°C (158 – 176°F).
5. Hold the brake pedal down as far as it will go.
6. Place the selector in the “D” range.
7. Note the pressure gauge reading with the engine idling.
8. Gradually push the accelerator pedal to the floor. The throttle valve will be fully open.
Note the pressure gauge reading with the accelerator pedal fully depressed.

NOTE: Do not continuously run this test longer than 5 seconds.

9. Release the accelerator pedal.
10. Place the selector in the “N” range.
11. Run the engine at 1,200 rpm for one minute.
This will cool the transmission fluid.
12. Repeat Steps 7 – 11 for the “3”, “2”, “L”, and “R” ranges.
13. Install a pressure detection plug to the transmission case, applying recommended thread locking agent (LOCTITE 242) or its equivalent to thread of plug. Make sure that thread is cleaned before applying locking agents.
14. Tighten the pressure detection plug to the specified torque.

Torque: 9 – 14N·m (7 – 10lb ft)

MODE	LEVER POSITION	ENGINE SPEED	LINE PRESSURE		FORCE MOTOR CURRENT (mA)
			kPa	PSI

Changing Transmission Fluid

There is no need to change the transmission fluid unless the transmission is used under one or more of the following heavy duty conditions.

- A. Repeated short trips
- B. Driving on rough roads
- C. Driving on dusty roads
- D. Towing a trailer

If the vehicle is used under these conditions, change the fluid every 20,000 miles (32,000 km.)

More over, the remaining life percentage of ATF can be estimated by using Tech 2 as an auxiliary tool to judge the right time for ATF replacement.

The remaining life percentage is calculated from ATF'S heat history. When it is close to 0%, ATF replacement is recommended.

1. Place a large drain pan under the oil pan.
2. Remove the transmission oil drain screw (2) and drain fluid.
3. Tighten drain screw (2).

Torque: 38 N•m (28 lb ft)

4. Remove the transmission overfill screw (1) and fill transmission through overfill screw opening, using DEXRON®-III ATF.

NOTE: Add transmission fluid until it flows out over the overfill screw opening.

5. Let engine idle until a fluid temperature between 32° C (90° F) and 57° C (135° F) is reached.
6. Add transmission fluid until it flows out over the overfill screw opening, then close the overfill screw (1).

Torque: 38 N•m (28 lb ft)

NOTE: To prevent fluid leaks, the overfill screw and oil drain screws gasket must be replaced each time these screws are removed.

NOTE: Check transmission fluid temperature with scan tool.

7. Reset "Oil Life Monitor" data by using Tech 2.

Refer to *Tech 2 OBD II Connection in Transmission Control System (4L30-E) section.*

242R20001

Selector Lever

Inspection

1. Make sure that when the selector lever is shifted from "P" to "L", a "clicking" can be felt at each shift position. Make sure that the gear corresponds to that of the position plate indicator.
2. Check to see if the selector lever can be shifted as shown in illustration.

C07RW009

Removal

1. Disconnect battery ground cable.
2. Set ignition Key in "LOCK" position and selector lever in "P" position.
3. Remove transfer control lever knob.
4. Remove lower cluster assembly.

740RW021

5. Remove rear console.

745RW011

6. Remove center console.

256RW006

7. Remove selector lever knob and cover.

256RW043

8. Disconnect select cable.
 - Refer to *Select Cable* in this section.
9. Disconnect shift lock cable.
 - Refer to *Shift Lock Cable* in this section.
10. Disconnect harness connector.

7A-28 AUTOMATIC TRANSMISSION (4L30-E)

11. Remove selector lever subassembly.

256RW044

5. Install selector lever knob and cover.

256RW043

Installation

1. Install selector lever subassembly.
2. Connect harness connector.
3. Connect shift lock cable.
 - Refer to *Shift Lock Cable* in this section.
4. Connect select cable.
 - Refer to *Select Cable* in this section.

6. Install center console.
7. Install rear console.
8. Install lower cluster assembly.
9. Install transfer control lever knob.
10. Connect negative (-) battery cable.
11. After installation, make sure that the selector lever operates normally, and that each selector position is properly indicated. (The red mark shows through the window.)

Select Cable

Removal

1. Set selector lever in "P" position.
2. Remove transfer control lever knob, lower cluster assembly, rear console, center console, selector lever knob and cover.
 - Refer to *Selector Lever* in this section.
3. Disconnect inner cable by pulling projection on pin.

256RW022

4. Press down claws and disconnect cable assembly.

A07RW017

5. Disconnect PCM harness connectors and remove nuts that fasten grommet in select cable assembly.

6. Disconnect inner cable.

210RW013

7A-30 AUTOMATIC TRANSMISSION (4L30-E)

7. Slide sleeve and disconnect cable assembly.

A07RW082

8. Pull lock.

A07RW015

9. Draw select cable assembly into the interior side.

Installation

1. Set selector lever in "P" position.
2. Let out select cable transmission side end from floor hole.
3. Fit outer cable into bracket in selector lever assembly.

A07RW016

4. Set inner cable end in selector lever and push pin into selector lever hole and inner cable end.

256RW023

7A-32 AUTOMATIC TRANSMISSION (4L30-E)

5. Check that lock projects.

A07RW015

6. Connect adjust end fitting attachment to the bracket on transmission.

7. Set selector lever "P" position and connect inner cable to selector lever.

210RW013

8. Push lock into adjust end fitting attachment.

A07RW014

9. Install grommet.

10. About following installation steps, refer to *Selector Lever in this section*.

Shift Lock Cable

Removal

1. Set ignition key in "LOCK" position and selector lever in "P" position.
2. Remove transfer control lever knob, lower cluster assembly, rear console, center console, selector lever knob and cover.
 - Refer to *Selector Lever* in this section.
3. Disconnect inner cable from selector lever assembly then push claw and disconnect cable assembly.

256RW016

4. Disconnect lock adjust.

256RW017

5. Remove instrument panel lower cover and steering column cover.

6. Remove spring pin and disconnect inner cable.
 - Disconnect outer cable from bracket.

256RW006

Installation

1. Set ignition key in "LOCK" position and selector lever in "P" position.
2. Connect outer cable to bracket near steering lock.
 - Connect inner cable to steering lock and install spring pin.
3. Install steering column cover and instrument lower cover.
4. Install adjust body of cable assembly to bracket in selector lever assembly.
 - Install inner cable to lever, pulling inner cable with outer cable.

256RW018

7A-34 AUTOMATIC TRANSMISSION (4L30-E)

5. Check that cable moves smoothly, lightly pulling outer cable rearward.

256RW019

6. Connect lock adjust, aligning "T" mark in the "Up" position.

256RW017

7. About following installation steps, refer to *Selector Lever in this section*.

8. Check the shift lock operation:
- Selector lever should not be moved out of "P" position with ignition key in "Lock" position.
 - Selector lever can be moved out of "P" position with ignition key in "ON" position only when brake pedal is depressed.
 - ignition key can be turned to "LOCK" position only when selector lever is in "P" position (key can be pulled out).
9. If a. and c. fail, readjust cable. If b. fails, readjust connector wiring and brake pedal switch.

Mode Switch

Removal

1. Place selector lever in neutral.
2. Disconnect battery ground cable.
3. Remove mode switch cover (1).
4. Disconnect selector lever (2) from the mode switch.
5. Remove bracket with cable (3).
6. Disconnect transmission harness from the mode switch connector (4).
7. Remove bracket with mode switch connector from the transmission case.
8. Remove mode switch connector (4) from the bracket (5).
9. Remove two mode switch bolts and nut then remove mode switch (6).

210RW014

- c. Remove the mode switch cover.
- d. Loosen the two 10 mm screws.
- e. Rotate the mode switch until the slot in the mode switch housing aligns with the selector shaft bushing, and insert a 3/32 in. (2.4 mm) drill bit or punch (1) into the slot.
- f. Tighten the screws to 13 N·m (113 lb in).
- g. After completing adjustment, snap the mode switch cover into place.
- h. Reinstall the selector lever.

249RW001

Installation

To install, follow the removal steps in the reverse order, noting the following points;

1. Torque

Mode switch bolt: 13 N·m (113 lb in)

Selector lever nut: 23 N·m (17 lb ft)

2. Mode switch setting procedure

Perform either of the following adjustment procedures:

Procedure 1

- a. Place selector lever in neutral.
- b. Remove selector lever from the mode switch.

Procedure 2

- a. Place selector lever in neutral.
- b. Disconnect transmission harness connector from mode switch connector.
- c. Remove mode switch connector with bracket from the transmission case.
- d. Connect multimeter (resistance mode) to terminals 1(E) and 4(H) on mode switch connector.
- e. Loosen two mounting screws.
- f. Rotate mode switch slightly in both directions to determine the range (approx. 5 degrees) of electrical contact.
- g. Position mode switch in middle of contact range.
- h. Tighten two mounting screws.
- i. Remove multimeter and install mode switch harness connector with bracket to the transmission case.

7A-36 AUTOMATIC TRANSMISSION (4L30-E)

- j. Connect transmission harness connector to mode switch connector.

| (4) Front Propeller Shaft | (12) Transfer Control Lever |
| (5) Center Exhaust Pipe | (13) Select Cable |
| (6) Harness Heat Protector | (14) Torque Converter Bolt (Non – reusable part) |
| (7) Rear Mount Nut | (15) Engine-Transmission Bolt |
| (8) Third Crossmember | (16) Transmission Assembly (With Transfer Case) |

7A-38 AUTOMATIC TRANSMISSION (4L30-E)

Removal

NOTE: Before remove transmission and transfer assembly from vehicle, change the transfer mode to 2WD using push button on dash panel.

1. Disconnect battery ground cable.
2. Remove rear propeller shaft and front propeller shaft.

NOTE: Apply alignment marks on the flange at both front and rear sides.

3. Remove transfer protector.
4. Remove center exhaust pipe.

5. Remove fuel pipe bracket from the third crossmember.

141RY0007

240RW014

Fuel hose connector removal procedure

If removal of the fuel hose connector is required for transmission servicing and/or replacement, follow the steps below.

NOTE:

- An O-ring is used as a seal between the fuel pipe and the connector. Take care not to damage the contact surfaces during the removal procedure. Do not allow the surfaces to become contaminated with dirt or other foreign material.
- Perform the entire removal procedure with your hands. Do not use tools.

1. Separating the connector and fuel pipe

1. Clean the fuel pipe and connector to remove mud and other dirt.
2. Pull the black plastic piece toward the connector. Hold the piece near the connector. Pull the connector from the fuel pipe.

If the connector and fuel pipe are stuck together, jiggle the connector back and forth to loosen the connector. Do not yank the connector from the fuel pipe.

141RY0002

141RY0003

7A-40 AUTOMATIC TRANSMISSION (4L30-E)

3. Tie a vinyl bag around the connector and fuel pipe to protect them from dirt.

141RY00004

2. Joining the connector and fuel hose

1. Remove the vinyl bags from the connector and fuel hose. Check that the contact surfaces are undamaged and free of dirt and other foreign material. Clean if necessary.
2. Align the axis of the fuel pipe and connector. Push the connector into the fuel pipe until a distinct click is heard.

141RY00005

3. Gently pull on the connector to check that it is securely latched.

141RY00006

6. Disconnect transmission harness connector and clip.
Connector : Adapter case, mode switch, main case, magnetic sensor, transfer switch, 2-4 actuator and car speed sensor.

7. Remove harness heat protector.

815RW002

8. Support transmission with a jack.
Remove rear mount nuts from the third crossmember.

9. Remove third crossmember.
10. Disconnect transmission oil cooler pipes from A/T side.
11. Remove oil pipe clamp and bracket from the converter housing.

12. Remove skid plate and loosen oil cooler pipe clamp bolt at the engine mount side.

13. Remove select cable by disconnecting inner cable from select lever and removing outer cable with bracket.

14. Remove starter.
15. Remove under covers from the transmission and engine.
16. Remove transfer control lever fixing bolts and push up transfer control lever.

7A-42 AUTOMATIC TRANSMISSION (4L30-E)

17. Remove flex plate torque converter fixing bolts (6 pieces) by turning crankshaft.

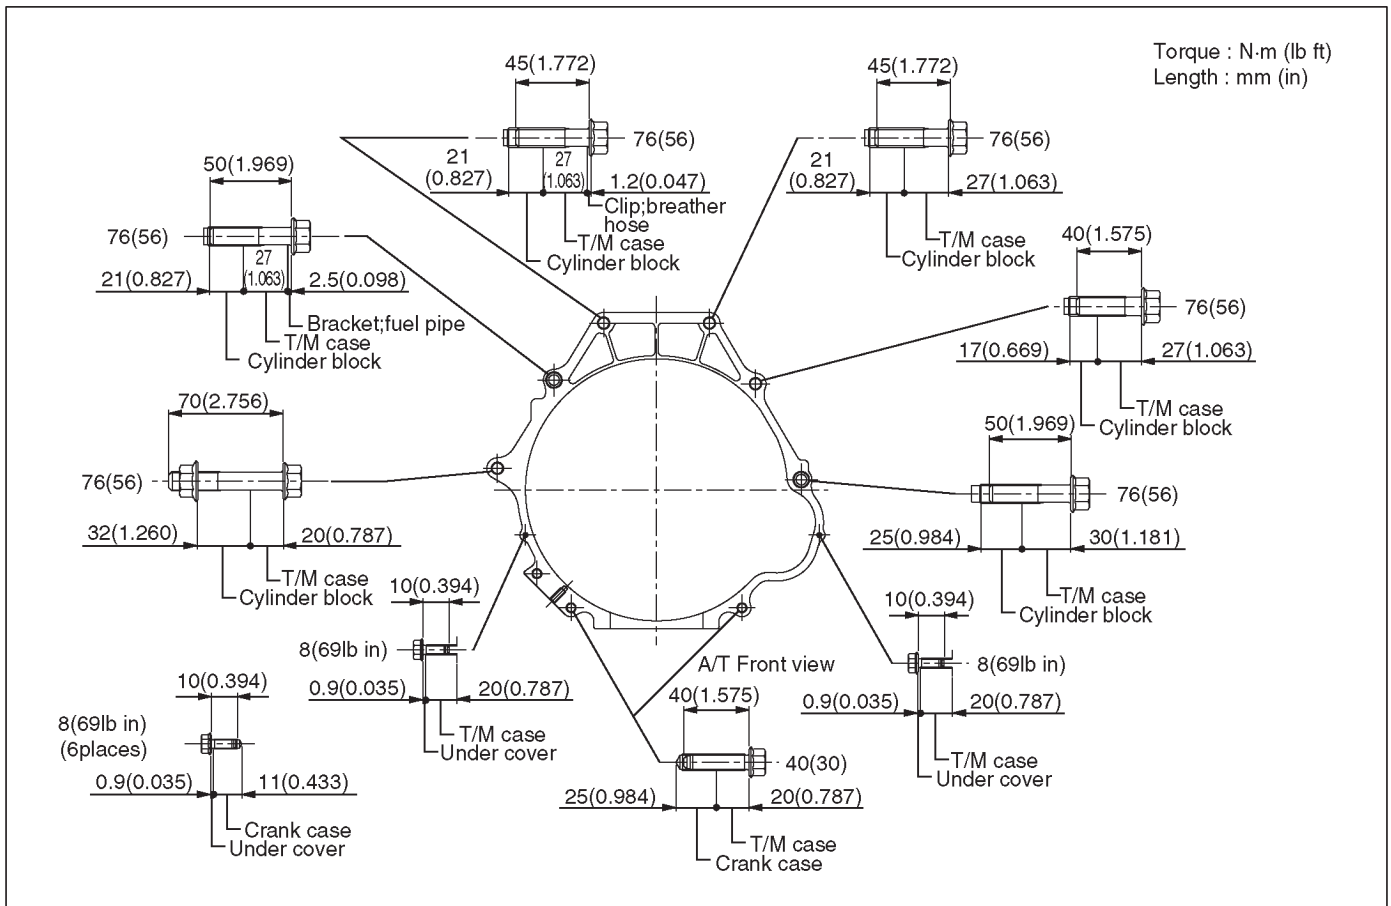

240RX010

18. Remove engine-transmission fixing bolts.

19. Pull out transmission from the engine.

Installation

1. Slowly raise transmission jack until front of the transmission is aligned with rear of the engine. Join the transmission to the engine.
2. Tighten engine-transmission bolts as shown in the figure.

F07R200004

3. Align the flex plate torque converter bolt boss with flex plate hole by turning the torque converter. Install flex plate torque converter bolts (6 pieces) by turning the crankshaft.

Torque: 54 N•m (40 lb ft)

NOTE: Do not reuse the flex plate torque converter bolt.

240RX010

4. Install transfer control lever on the transfer case.

262RW015

5. Install under covers to the transmission and engine.

Torque: 8 N•m (69 lb in)

6. Install starter.

Torque: 40 N•m (30 lb ft)

7. Install select cable by connecting inner cable to select lever and installing outer cable with bracket.

256RW025

8. Connect transmission oil cooler pipes to A/T.

Torque: 44 N•m (33 lb ft)

9. Install oil cooler pipe clamp and bracket to the converter housing.

253RX002

7A-44 AUTOMATIC TRANSMISSION (4L30-E)

10. Tighten oil cooler pipe clamp bolt at the engine mount side and install skid plate.
11. Install third crossmember.

Torque: 116 N•m (85 lb ft)

12. Install rear mount nuts.

Torque: 50 N•m (37 lb ft)

13. Install harness heat protector.

Torque: 6 N•m (52 lb in)

14. Connect transmission harness connector and clip.
Connector : Adapter case, mode switch, main case, magnetic sensor, transfer switch, 2-4 actuator and car speed sensor.

15. Connect fuel pipe to transmission side.

NOTE: See "NOTE" of removal steps.

16. Install fuel pipe bracket to the third crossmember.

17. Install center exhaust pipe.

Torque: 43 N•m (32 lb ft)

18. Install transfer protector.

19. Install front propeller shaft and rear propeller shaft.

Torque: 63 N•m (46 lb ft)

20. Connect battery ground cable.

Solenoid (Main Case Valve Body)

Removal

1. Raise the vehicle and support it on jack stands.
2. Disconnect battery ground cable.
3. Drain fluid.
4. Remove sixteen 10 mm screws, main case oil pan, magnet, and gasket.
5. Remove three 13 mm screws, oil filter.
6. Disconnect wiring harness from band control solenoid and shift solenoids. Pull only on connectors, not on wiring harness.
7. Remove spring pin for shift solenoid A, shift solenoid B, and band control solenoid respectively, using suitable pliers taking care not to damage solenoids.

210RW010

244RW003

8. Remove shift solenoid A, shift solenoid B, band control solenoid, and gaskets from main case valve body. Do not pull on wiring harness. Remove solenoids by grasping the metal tip.

Installation

1. Install shift solenoid A, shift solenoid B, band control solenoid with new gaskets to main case valve body respectively.
2. Carefully install spring pin with hammer to avoid damage to valve body, etc.

243RW004

3. Connect wiring harness to solenoids.
4. Install oil filter with a new gasket and the three 13 mm screws, tighten to the specified torque.
Torque: 20 N•m (15 lb ft)
5. Install magnet, main case oil pan with new gasket, and sixteen 10 mm screws. Tighten the screws to the specified torque.
Torque: 11 N•m (96 lb in)
6. Fill transmission through the overfill screw hole of oil pan, using ATF DEXRON®-III. Refer to *Changing Transmission Fluid* in this section.
7. Connect battery ground cable.

Solenoid (Adapter Case Valve Body)

Removal

1. Raise the vehicle and support it on jack stands.
2. Disconnect battery ground cable.
3. Drain fluid.
4. Remove adapter case oil pan twelve fixing 10 mm screws, adapter case oil pan, and gasket.

NOTE: Oil pan still contains transmission fluid. Place a large drain container under the oil pan and drain the fluid carefully.

5. Disconnect wiring harness from force motor solenoid and converter clutch solenoid. Pull only on connectors, not on wiring harness.
6. Remove 11 mm bolt and converter clutch solenoid with two O-rings.

210RW011

7. Remove 11 mm bolt, retainer, and force motor solenoid.

210R10002

Installation

1. Install force motor solenoid, retainer, and 11 mm bolt to adapter case valve body. Tighten the bolt to the specified torque.

Torque: 10 N•m (87 lb in)

2. Install converter clutch solenoid with two O-rings, and 11 mm bolt to adapter case valve body. Tighten the bolt to the specified torque.

Torque : 10 N•m (87 lb in)

3. Connect wiring harness assembly to solenoids.
4. Install adapter case oil pan, new gasket, and twelve 10 mm screws. Tighten the screws to the specified torque.

Torque : 11 N•m (96 lb in)

5. Fill transmission through overfill screw hole oil pan, using ATF DEXRON®-III. Refer to *Changing Transmission Fluid* in this section.
6. Connect battery ground cable.

Valve Body Assembly (Main Case)

Removal

1. Raise the vehicle and support it on jack stands.
2. Disconnect battery ground cable.
3. Drain fluid.
4. Remove sixteen 10 mm screws, main case oil pan, magnet and gasket.
5. Remove three 13 mm oil filter fixing screws, then remove oil filter.
6. Remove two 13 mm manual detent fixing screws, then remove roller and spring assembly.
7. Disconnect wiring harness from band control solenoid and shift solenoids. Pull only on connectors, not on wiring harness.
8. Remove four 13 mm servo cover fixing screws, then remove servo cover and gasket.
9. Remove seven 13 mm valve body fixing screws.
10. Remove main case valve body with manual valve link and transfer plate. Note the position of the link (long end into valve, short end into range selector lever).
11. Remove transfer plate gasket from main case.
12. Remove two check balls from main case.

Installation

1. Install two check balls to main case.

2. Inspect electrical 7 way connector and seal of main case. Replace if necessary.
3. Use two J-25025-B guide pin to install main case.
 - Install valve body complete assembly and manual valve link.

NOTE: Valve must be extended as the short end of manual valve link is connected to the range selector lever. Long end of link goes into valve.

4. Install seven 13 mm screws, and tighten them to the specified torque.

Torque: 20 N•m (15 lb ft)

243RS008

5. Remove two guide pins from main case.
6. Install servo cover gasket, cover, and four 13 mm screws. Tighten the screws to the specified torque.

Torque: 25 N•m (18 lb ft)

7. Connect wiring harness to band control and shift solenoids.
8. Install roller and spring assembly to manual detent.
 - Install two 13 mm screws, and tighten them to the specified torque.

Torque: 20 N•m (15 lb ft)

9. Install oil filter and three 13 mm screws. Tighten to the specified torque.

Torque : 20 N•m (15 lb ft)

10. Install oil pan gasket, magnet, oil pan and sixteen 10 mm screws. Tighten the screws to the specified torque.

Torque: 11 N•m (96 lb in)

11. Fill transmission through overfill screw hole of oil pan, using ATF DEXRON®-III. Refer to *Changing Transmission Fluid in this section*.

12. Connect battery ground cable.

Valve Body Assembly (Adapter Case)

Removal

1. Raise the vehicle and support it on jack stands.
2. Disconnect battery ground cable.
3. Drain fluid.
4. Remove twelve 10 mm adapter case oil pan fixing screws, adapter case oil pan, and gasket.

NOTE: Oil pan still contains transmission fluid. Place a large drain container under the oil pan.

Drain the fluid carefully.

5. Disconnect wiring harness from force motor solenoid and converter clutch solenoid. Pull only on connectors, not on wiring harness.
6. Remove seven 13 mm screws from adapter case valve body assembly, then remove transfer plate, two gaskets, and adapter case valve body.

Installation

1. Inspect electrical 4 way connector and seal of adapter case. Replace if necessary.
2. Install gasket, transfer plate, and gasket.
3. Install adapter case valve body and seven 13 mm screws. Tighten the screws to the specified torque.

Torque: 20 N•m (15 lb ft)

4. Connect wiring harness assembly to converter clutch solenoid and force motor.
5. Install oil pan gasket, oil pan, and twelve 10 mm screws. Tighten the screws to the specified torque.

Torque: 11 N•m (96 lb in)

6. Fill transmission through the overfill screw hole of oil pan, using ATF DEXRON®-III, Refer to *Changing Transmission Fluid in this section*.
7. Connect battery ground cable.

Powertrain Control Module (PCM)

Removal

1. Disconnect battery ground cable.
2. Disconnect PCM wiring harness connectors from PCM.
3. Remove PCM from bracket.

Installation

1. Install PCM to bracket.
2. Connect PCM wiring harness connectors to PCM.
3. Connect battery ground cable.

825R100016

Speed Sensor (Extension Housing)

Removal

1. Disconnect battery ground cable.
2. Remove front console.
3. Remove selector lever assembly.

4. Disconnect speed sensor harness connector from speed sensor.
5. Remove one 10 mm screw and speed sensor with O-ring.

Installation

1. Inspect the speed sensor O-ring, and replace it if necessary.
2. Install speed sensor assembly and 10 mm screw.

Torque: 9 N•m (78 lb in)

3. Connect speed sensor harness connector to speed sensor.
4. Install selector lever assembly.
 - Adjust shift lock cable.
Refer to *Shift Lock Cable* in this section.
5. Install front console.
6. Connect battery ground cable.

Transmission Oil Temperature Sensor (Main Case)

Removal

1. Raise the vehicle and support it on jack stands.
2. Disconnect battery ground cable.
3. Drain fluid.
4. Remove sixteen 10 mm main case oil pan fixing screws, main case oil pan, and gasket.
5. Disconnect wiring harness from shift solenoids, band apply solenoid, and 7 way connector of main case. Pull only on connectors, not on wiring harness.
6. Remove wiring harness assembly with transmission oil temperature sensor.

244RY001

Installation

1. Install wiring harness assembly with transmission oil temperature sensor to band apply solenoid, shift solenoids, and 7 way connector of main case.
2. Install oil pan gasket, oil pan and sixteen 10 mm fixing screws. Tighten the screws to the specified torque.

Torque: 11 N•m (96 lb in)

3. Fill transmission through the overfill screw hole of oil pan, using ATF DEXRON®-III. Refer to *Changing Transmission Fluid* in this section.
4. Connect battery ground cable.

Front Oil Seal (Converter Housing)

Removal

1. Remove transmission assembly from the vehicle, refer to *Transmission (With Transfer Case) in this section*.
2. Remove torque converter from converter housing.
3. Remove three screws and oil seal ring from converter housing.

241RW008

Installation

1. Apply clean ATF to the new oil seal ring lip.
 - Install oil seal ring to converter housing, tighten to the specified torque.

Torque: 3 N•m (26 lb in)

2. Install torque converter to converter housing.
3. Install transmission assembly to the vehicle, refer to *Transmission (With Transfer Case) in this section*.

Rear Oil Seal (Extension Housing)

Removal

1. Remove transfer case assembly from the vehicle. Refer to *Transfer Case in Drive Line/Axle section*.
2. Remove rear oil seal from transmission extension housing.

241RW005

Installation

1. Use J-36797 extension housing oil seal installer, and install the rear oil seal to the transmission extension housing.
2. Install the transfer case assembly to the vehicle. Refer to *Transfer Case in Drive Line/Axle section*.

Transmission (4L30-E)

Disassembly

NOTE: During the disassembly and reassembly, perform the following:

- Wash each part thoroughly, and blow air through each oil passage and groove to eliminate blockage.
- Seal rings, roll pins, and gaskets should be replaced.
- When assembling the components, apply DEXRON®-III Automatic Transmission Fluid (ATF) to each seal, rotating part, and sliding part.
- Do not dip part facings, such as clutch or brake drive plates, in cleaner when washing it.
Also, always coat parts with new ATF two or three times after cleaning with solvent.

1. Remove torque converter (1).

- Drain fluid from torque converter.
- Attach J-8763-02 holding fixture to the transmission and set it on J-3289-20 holding fixture base.

NOTE: Do not overtighten the tool, as case damage may result.

420RW021

2. Remove O-ring (2) from turbine shaft.
3. Remove two 10mm mode switch screws, selector lever nut, cover, and mode switch (3).
4. Remove twelve 10mm adapter case oil pan (4) fixing screws, adapter oil pan, and gasket.
5. Disconnect electrical wiring connections (5) from solenoids and 4 way connector of adapter case. Pull on connectors only, not on wiring harness.
6. Remove seven 13mm adapter case valve body (6) fixing screws, adapter case valve body assembly, transfer plate, and two gaskets.
 - Remove wiring harness and 4 way connector.
7. Remove sixteen 10mm main case oil pan (7) fixing screws, main oil pan, magnet, and gasket.
8. Remove three 13mm oil filter (8) fixing screws and oil filter.
9. Remove two 13mm manual detent (9) fixing screws, roller and spring, and manual detent.
10. Disconnect wiring harness assembly (10) from band apply solenoid, shift solenoids, and main case 7 way connector.
Pull on connectors only, not on wiring harness.
11. Remove four 13mm servo cover (11) fixing screws, servo cover, and gasket.
12. Remove seven 13mm valve body screws from main case.
 - Remove wiring harness assembly (5) from the adapter case side.
 - Remove main valve body assembly (12) with manual valve link and transfer plate. Note the position of the link (long end into valve, short end into range selector lever).
 - Remove 7 way connector.
 - Remove gasket transfer plate from main case.
13. Remove two check balls (13) from main case.

240RY001

14. Turn transmission to vertical position to drain fluid.
Return back to horizontal position when drained.
- Install J-23075 servo piston spring compressor with offset to the rear of case.
 - Compress servo piston assembly.
 - Remove servo piston retaining ring (14).
 - Slowly release servo piston assembly (15).
 - Remove tool.
15. Remove servo piston assembly (15), return spring (16), and servo apply rod (17).

16. Rotate transmission to horizontal position, pan side down.

- Remove one 10mm screw, and speed sensor (18) with "O" ring.

17. Remove seven 8mm extension housing hexagon socket head screws, extension housing assembly (19), and gasket.

18. Remove retaining ring (20).

NOTE: Use extra long, needle nose pliers.

19. Remove speed wheel (21).

20. Remove wheel parking lock (with seal ring) (22).

21. Rotate transmission to vertical position, converter housing up.

- Loosen the converter housing and oil pump assembly fixing screws, but do not remove, the five 13 mm inner screws unless oil pump disassembly is required.

- Remove seven outer screws.

- Remove converter housing and oil pump assembly (23).

22. Remove gasket (24).

23. Remove selective thrust washer (25).

24. Remove fourth clutch retainer (26).
 25. Grasp turbine shaft and lift out the overrun clutch housing assembly (27) and fourth clutch plates (28).
 26. Remove thrust bearing assembly (29).
 27. Remove overdrive internal gear (30).
 28. Remove thrust washer (31).

241RW004

29. Remove adapter case and center support assembly (with fourth clutch piston) (32).
 30. Remove seal ring (33).
 31. Remove selective thrust washer (34) and two O-ring seals (35) from main case.
 32. Use J-23327 and J-23327-90 compressor to compress the fourth clutch spring retainer and springs (37).
 • Release snap ring (36) from groove.
 • Remove clutch compressor and snap ring (36).
 33. Remove retainer and spring assembly (37).
 34. Insert two converter housing/main case screws to hold adapter case while pulling out fourth clutch piston (38).
 • Remove fourth clutch piston assembly (38) from the adapter case.
 • Remove converter housing/main case screws.
 35. Grasp intermediate shaft, twist and pull out the second and third clutch drum assemblies with reverse clutch plates while holding onto output shaft (39).

252RS001

7A-58 AUTOMATIC TRANSMISSION (4L30-E)

36. Separate second (40) and third clutch (41) assemblies.
37. Remove thrust washer (42).
38. Remove reverse clutch plates (43 and 44) and reverse clutch pressure plate (45).
39. Remove bearing (46) and washer (47).
40. Remove planetary carrier assembly (48).
41. Remove thrust bearing (49).
42. Remove reaction sun gear (50)
43. Remove needle bearing (51).
44. Remove brake drum (52).
45. Remove brake band (53).
46. Remove thrust bearing (54).

47. Rotate case to horizontal position, valve body side facing up.

- Remove spring pin (55), using cutting pliers, then remove parking lock and selector lever assembly (56).

NOTE: Insert wire in the center of the spring pin to prevent it from collapsing during removal. Be aware of pin height. Protect machined face of main case.

48. Remove parking lock and range selector lever 17 mm nut (57).
49. Remove parking lock and range selector lever (56), and actuator assembly.
50. Remove selector shaft (58).

NOTE: Inspect the shaft for burrs before removing to prevent damaging seal. If necessary, remove burrs by lightly sanding with an oilstone.

Reassembly

1. Inspect selector shaft seal and replace it if necessary.

NOTE: Use a seal installer when replacing the seal.

- Install selector shaft.

NOTE: Spring pin groove must be positioned inside the case.

2. Install spring pin. Be sure the selector shaft can move freely. Do not push the pin flush with the case surface. Leave enough height for removal.
3. Install actuator assembly (1).
4. Install parking lock and range selector lever (2) and new 17 mm nut. Tighten the nut to the specified torque.

Torque: 22 N•m (16 lb ft)

5. Rotate main case to vertical position, extension end facing down.

- Install brake band assembly (3).

NOTE: Be sure to align servo pin area with the servo hole.

6. Install thrust bearing (4).

NOTE: The case bushing acts as a guide for the thrust bearing.

7. Install brake drum (5).

8. Install reaction sun gear (6).

9. Install needle bearing (7).

10. Inspect planetary carrier assembly (8) for wear and damage. If necessary replace it.

- Measure pinion end play clearance with a feeler gauge.

Clearance: 0.13mm–0.89mm (0.005 in–0.035 in)

If clearance is outside specified value, replace the planetary carrier assembly.

11. Install the thrust bearing (9) on the output shaft.

NOTE: Use petroleum jelly to hold the thrust bearing in place.

12. Align planetary pinions. Each pinion is marked with double points to indicate the master tooth space and exactly opposite with a single point to indicate the master tooth. The markings on the planetary carrier consist of double lines which are to be lined up with the double points on two opposite pinions; the single lines are to be lined up with the single points on the other two pinions.

- After all four pinions are lined up, slide on the third clutch assembly. Rotate third clutch and check mark alignment. Considering that the ring gear tooth between the double points of one planetary pinion is tooth number 1, count the teeth to check that the single points on the two adjacent pinions are between teeth 23 and 24 of the ring gear, and that the ring gear tooth between the double points of the opposite pinion is tooth number 46. If the ring gear and pinions are not lined up, remove and realign them.

13. Install planetary carrier (8) with third clutch (12).

NOTE: Do not force. When properly aligned, the parts will fit together easily.

14. Remove the third clutch (12).

15. Install bearing (11) and washer (10).

7A-60 AUTOMATIC TRANSMISSION (4L30-E)

NOTE: Use petroleum jelly to hold the washer and bearing in place.

16. Carefully align the second clutch plate inner tangs.

- Install thrust washer, tangs pointing downward, and locating tang positioned in slot on second clutch hub.

NOTE: Use petroleum jelly to hold thrust washer in place.

17. Install third clutch and intermediate shaft assembly (13) into the second clutch drum (14).

18. Install second and third clutch assemblies into the main case. Twist output shaft and clutch assemblies to ensure proper fit.

19. Install pressure plate (15) with lip side up, tang facing valve body face.

20. Install reverse clutch plates. Start with a steel plate (17) and alternate with a lined plate (16).

21. Install waved clutch plate (18) with center tang facing valve body side.

22. Second clutch end play measurement

1. Install the J-23085-A selective washer gauging tool (with spacer ring) on the case flange and against the intermediate shaft.
2. Position the inner shaft of the gauging tool against the thrust surface of the second clutch hub.
3. Tighten thumb screw. Remove the tool.
4. Fit the spacer ring on the inner shaft of the tool.
5. Measure the gap and select appropriate washer as shown in the chart.

Selective Thrust Washer	
Gap: mm(in)	Color
1.53 – 1.63 (0.060 – 0.064)	Yellow
1.72 – 1.82 (0.068 – 0.072)	Red
1.91 – 2.01 (0.075 – 0.079)	Black
2.10 – 2.20 (0.083 – 0.087)	Natural
2.29 – 2.39 (0.090 – 0.094)	Green
2.48 – 2.58 (0.098 – 0.102)	Blue
FOLLOWING THE PROCEDURE SHOULD RESULT IN FINAL END-PLAY FROM 0.36 mm TO 0.79 mm (0.014 in TO 0.031 in)	

23. Inspect fourth clutch piston seals and replace if necessary.

- Lubricate J-38554 fourth clutch piston fitter and install it on fourth clutch piston (19).
- Install fourth clutch piston (19) in adapter case (20).
- Remove fitter.

24. Install retainer and spring assembly (22) into fourth clutch piston (21).

25. Install snap ring (23) in adapter case.

- Install J-23327 and J-23327-90 fourth clutch spring compressor.
- Seat snap ring in groove.
- Remove compressor.

7A-62 AUTOMATIC TRANSMISSION (4L30-E)

252RW002

252RS004

26. Install selective washer using petroleum jelly.
27. Install two O-ring seals (24) in main case and adapter case/main case seal ring (25).
28. Install J-38588 guide pins.
 - Install adapter case and center support assembly to main case.

242RS004

29. Install thrust washer (26) into adapter case, with tangs pointing downwards.
 30. Preassemble overdrive internal gear (27) and thrust bearing assembly (28) onto the turbine shaft and overrun clutch assembly.
- NOTE: Install bearing assembly, black side up. Use petroleum jelly to keep assembly in place.
31. Install overdrive carrier (30) and internal gear assembly into adapter case.
 32. Install fourth clutch plates (29) in the following order: Steel, Lined, Steel, Steel, Lined, Steel. Steel plates go in with short tang facing towards valve body surface.
 33. Install fourth clutch retainer (31) with the notch facing up and positioned towards valve body surface.

34. Overdrive clutch end play measurement

1. Install the J-23085-A selective washer gauging tool on the adapter case flange and against the input shaft.
2. Position the inner shaft of the tool against the thrust surface of the overrun clutch housing.
3. Tighten thumb screw. Remove the tool.
4. Measure gap. Select appropriate size washer as shown in the chart.
5. Set selective thrust washer aside.

Selective Thrust Washer	
Gap: mm(in)	Color
1.53 – 1.63 (0.060 – 0.064)	Yellow
1.72 – 1.82 (0.068 – 0.072)	Red
1.91 – 2.01 (0.075 – 0.079)	Black
2.10 – 2.20 (0.083 – 0.087)	Natural
2.29 – 2.39 (0.090 – 0.094)	Green
2.48 – 2.58 (0.098 – 0.102)	Blue
FOLLOWING THE PROCEDURE SHOULD RESULT IN FINAL END-PLAY FROM 0.1 mm TO 0.8 mm (0.004 in TO 0.03 in)	

35. Install selective washer (32).

NOTE: Use petroleum jelly to hold selective washer in place.

36. Install gasket (33).

37. Install converter housing and oil pump assembly (34) to adapter case.

- Fit and tighten seven outer 13 mm screws.

Torque: 39 N•m (29 lb ft)

7A-64 AUTOMATIC TRANSMISSION (4L30-E)

- Ensure free rotation of pump using J-23082-01 pump rotation tool.

38. Overdrive clutch end play measurement

1. Fit J-25022 and J-24773-1 turbine shaft puller on turbine shaft.
2. Position axial play checking tool on converter housing mating face.
3. Pull turbine shaft upwards with puller until first resistance is met. (due to weight of overdrive assembly)
4. Maintain shaft in this position and set indicator to zero.
5. Pull turbine shaft further upwards with puller. Read end play shown on indicator.

End play: 0.1mm – 0.8mm (0.004 in – 0.031in)

6. Remove axial play checking tool and puller.

NOTE: If end play is not correct, repeat selective washer selection.

39. Inspect extension housing oil seal and replace if necessary, using J-36797 extension housing oil seal installer.

- Rotate transmission to horizontal position, with valve body side down.
- Inspect parking wheel seal ring. Replace if necessary.
- Install wheel parking lock assembly (35).

40. Install speed wheel (36) and snap ring (37).

NOTE: Use extra long, needle nose pliers.

41. Install gasket onto extension assembly with a thin coating of oil.

- Install extension housing assembly (38), and align parking pawl shaft.
- Install actuator assembly into extension assembly.
- Install seven 8 mm hexagon socket head screws.

Torque: 32 N•m (24 lb ft)

42. Inspect speed sensor O-ring. Replace if necessary.

- Install speed sensor assembly (39) and 10 mm screw.

Torque: 9 N•m (78 lb in)

241RW009

241RS004

43. Main case end play measurement

1. Attach axial play checking tool on the extension housing and set indicator to zero on output shaft.
2. Manually push output shaft upwards.

End play: 0.36mm – 0.80mm (0.014 in – 0.031in)

3. Remove axial play checking tool.
4. If end play is not correct, repeat selective washer selection.

241RS005

44. Inspect servo piston seal ring. Replace if necessary.

- Ensure brake band is correctly positioned. Rotate output shaft if necessary.
- Install J-38428 servo piston fitter in servo bore.
- Install apply rod (40), round end toward band, return spring (41) and piston assembly (42).

45. Install the J-23075 servo spring compressor with offset to rear of case.

- Compress servo piston seal ring, using fitter while tightening the tool screw.
- Install servo piston retaining ring (43).
- Remove tool.
- Adjust the brake band by tightening the servo adjusting screw to 4.5 N·m (39.8 lb in) torque. Be certain the lock nut is loose, then back-off the screw five turns exactly. Hold piston sleeve with wrench and tighten lock nut to 18.5 N·m (13.6 lb ft) torque. Be certain the adjusting screw does not turn.

46. Install two check balls (44).

47. Inspect main case electrical connector and seal, replace if necessary.

- Install electrical 7 way connector/main case and wiring harness.

48. Install two J-25025-B guide pins into main case.
- Install main case valve body complete assembly (45) and manual valve link.

NOTE: Valve must be extended as the short end of manual valve link is connected to the range selector lever. Long end of link goes into valve.

- Install seven 13 mm screws, tighten the specified torque.

Torque: 20 N•m (15 lb ft)

- Remove two guide pins.

49. Install servo cover gasket, cover (46) and four 13 mm screws.

Torque: 25 N•m (18 lb ft)

50. Connect wiring harness (47) to band control, shift solenoids, and main case 7 way connector.

51. Install manual detent roller and spring assembly (48) with clip.

- Install two 13 mm screws.

Torque: 20 N•m (15 lb ft)

52. Install oil filter (49) and three 13 mm screws.

Torque: 20 N•m (15 lb ft)

53. Install oil pan gasket, magnet, main oil pan (50), sixteen 10 mm screws.

Torque: 11 N•m (96 lb in)

54. Inspect adapter case electrical connector and seal. Replace if necessary.

- Install electrical 4 way connector and harness assembly (52) in bottom of adapter case.

55. Install gasket, transfer plate, and gasket.

- Install adapter case valve body (51) complete and seven 13 mm screws.

Torque: 20 N•m (15 lb ft)

56. Connect wiring harness assembly (52) to converter clutch solenoid, force motor, and 4 way connector.

57. Install oil pan gasket, adapter case oil pan (53), and twelve 10 mm screws.

Torque: 11 N•m (96 lb in)

- Rotate transmission, with bottom pan facing down.

58. Install mode switch (54), two 10 mm screws, selector lever nut, and cover.

10 mm screw

Torque: 13 N•m (113 lb in)

Nut

Torque: 23 N•m (17 lb ft)

- Adjust using setting tool, refer to *Mode Switch in this section*.

59. Install O-ring (55) on turbine shaft.

60. Install torque converter (56).

The converter assembly must be replaced under any of the following conditions:

- a. Evidence of damage to the pump assembly.
- b. Metal particles are found after flushing the cooler lines.
- c. External leaks in hub weld area.
- d. Converter pilot broken, damaged, or poor fit into crankshaft.

e. Converter hub scored or damaged.

f. Internal failure in stator.

g. Contamination from engine coolant.

h. Excess end play.

- Rotate transmission, bell housing up. Spin converter to insure proper fit.

61. Fill transmission through the overfill screw hole of oil pan, using ATF DEXRON®-III. Refer to *Changing Transmission Fluid* in this section.

Converter Housing and Oil Pump Assembly

Disassembled View

241RW003

Legend

- | | |
|-----------------------|-----------------------|
| (1) Converter Housing | (4) Wear Plate |
| (2) Outer Seal Ring | (5) Oil Pump Assembly |
| (3) Gasket | (6) Oil Seal Ring |

Disassembly

1. Remove oil pump assembly from converter housing.
2. Remove outer seal ring.
3. Remove gasket.
4. Remove wear plate.
5. Remove oil seal ring.

Inspection and Repair

Visual Check:

If any damage, deformation, or local wear is found in a converter housing, outer seal ring, wear plate, or oil seal ring, replace it.

Reassembly

1. Install wear plate onto oil pump assembly.
2. Install converter housing onto complete oil pump assembly. Align with two short J-38588 guide pins on outer bolt holes.
 - Loosely install five 13mm bolts.
 - Center converter housing using J-38557 centering tool.
 - Tighten five inner 13mm bolts in an alternating pattern.

Torque: 20 N•m (15 lb ft)

241RW002

3. Install oil seal ring (3 screws).
Torque: 3 N•m (26 lb in)
4. Install gasket.
5. Install outer seal ring.

Oil Pump

Disassembled View

241RS014

Legend

- | | |
|------------------------------------|---|
| (1) Oil Pump Drive Gear | (10) Throttle Signal Accumulator Piston |
| (2) Oil Pump Driven Gear | (11) Sleeve Pin |
| (3) Pin | (12) Sleeve |
| (4) Plug | (13) Boost Valve |
| (5) Spring | (14) Spring Seat |
| (6) Converter Clutch Control Valve | (15) Valve Spring |
| (7) Snap Ring | (16) Spring Seat |
| (8) Spring Seat | (17) Pressure Regulator valve |
| (9) Spring | (18) Oil Pump Assembly |

Disassembly

1. Remove oil pump drive gear (1) and driven gear (2).
2. Remove pin (3) from oil pump assembly (18).
3. Remove plug (4), spring (5), and converter clutch control valve (6).
4. Remove snap ring (7) from oil pump assembly (18).
5. Remove spring seat (8), spring (9), and throttle signal accumulator piston (10).
6. Remove sleeve pin (11) from oil pump assembly (18).
7. Remove sleeve (12), boost valve (13), spring seat (14), valve spring (15), spring seat (16), and pressure regulator valve (17).

Inspection and Repair

Visual Check:

If any damage, deformation or wear is found, replace the damaged part.

Reassembly

1. Lubricate and preinstall pressure regulator spring seat (16) on valve (17), with the flat side against shoulder.
2. Install pressure regulator valve (17) and spring seat (16) assembly, valve spring (15), and spring seat (14) with the flat side away from spring to oil pump assembly (18).
3. Assemble boost valve (13) into sleeve (12).
4. Install boost valve and sleeve assembly, and sleeve pin (11) to oil pump assembly (18).
5. Install throttle signal accumulator piston (10), spring (9), and spring seat (8), with the flat side away from the spring, and snap ring (7) to oil pump assembly (18).
6. Install converter clutch control valve (6), spring (5), plug (4), and pin (3) to oil pump assembly (18).
7. Install oil pump driven gear (2) and drive gear (1).

Main Case Valve Body

Disassembled View

244RS010

Legend

| (12) Solenoid B | (26) 1-2 Accumulator Control Valve |
| (13) Retainer | (27) Check ball |
| (14) 2-3 Shift Valve | (28) Main Case Valve Body |

Disassembly

1. Remove two 11mm bolts from valve body (28), then remove gaskets and transfer plate (1).
2. Remove manual valve (2).
3. Push in band control solenoid (3) to compress waved washer (5), and remove pin (4).
4. Remove band control solenoid (3) and waved washer (5).
5. Remove spring pin (6) with a 3 mm diameter punch.
6. Remove solenoid A (7) by grasping the metal tip. Do not grasp the connector housing.
7. Remove retainer (8), 1-2/3-4 shift valve (9) and spring (10).
8. Remove spring pin (11) with a 3 mm diameter punch.
9. Remove solenoid B (12) by grasping the metal tip. Do not grasp the connector housing.
10. Remove retainer (13), 2-3 shift valve (14), and spring (15).
11. Remove spring pin (16), plug (17), spring (18) and low pressure control valve (19).
12. Remove spring pin (20), plug (21), and band control screen assembly (22).
13. Remove spring pin (23), plug (24), 1-2 accumulator valve (25), and 1-2 accumulator control valve (26).
14. Remove 1 check ball (27) from valve body (28).

Inspection and Repair

Inspect for the following, and replace any damaged or worn parts:

1. Damage or wear to each valve.
2. Damage in oil passages.
3. Cracks or damage to valve body.
4. Valve operations.
5. Spring fatigue.

Reassembly

1. Install 1-2 accumulator control valve (26), 1-2 accumulator valve (25), plug (24), and spring pin (23).
2. Install band control screen assembly (22), plug (21), and spring pin (20).
3. Install low pressure control valve (19), spring (18), plug (17), and spring pin (16).
4. Install spring (15), 2-3 shift valve (14), retainer (13), solenoid B (12), and spring pin (11).
5. Install spring (10), 1-2/3-4 shift valve (9), retainer (8), solenoid A (7), and spring pin (6).
6. Install waved washer (5), band control solenoid (3), and pin (4).
7. Install manual valve (2).
8. Install check ball (27) to valve body (28).
9. Install gasket (valve body/transfer plate) and transfer plate using two J-3387-2 guide pins.

- Install two 11mm bolts.

Torque: 13 N•m (113 lb in)

- Install gasket (transfer plate/main case).

Adapter Case Valve Body

Disassembled View

243R100001

Legend

- | | |
|--|----------------------------------|
| (1) Converter Clutch Solenoid Assembly | (8) Spring |
| (2) Retainer | (9) Retaining Ring |
| (3) Force Motor Solenoid | (10) Feed limit Valve |
| (4) Retainer | (11) Plug Retainer |
| (5) Plug | (12) O-ring |
| (6) 3/4 Accumulator Valve | (13) Plug |
| (7) 3/4 Accumulator Control Valve | (14) Force Motor Screen Assembly |
| | (15) Adapter Case Valve Body |

Disassembly

- Remove 11mm bolt from valve body.
 - Remove converter control solenoid assembly (1).
- Remove 11mm bolt and retainer (2) from valve body.
 - Remove force motor solenoid (3).
- Remove retainer (4), plug (5), 3/4 accumulator valve (6), and 3/4 accumulator control valve (7)
- Remove spring (8), retaining ring (9), and feed limit valve (10).
- Remove plug retainer (11), O-ring (12), plug (13), and force motor screen assembly (14).
 - Use 5 mm bolt to pull plug.

Inspection and Repair

Inspect for the following, and replace any damaged or worn parts:

- Damage or wear to each valve.
- Damage in oil passages.
- Cracks or damage to valve body.
- Valve operations.
- Spring fatigue.

Reassembly

- Install force motor screen assembly (14), plug (13), O-ring (12), and plug retainer (11).
- Install feed limit valve (10), retaining ring (9), and spring (8).

3. Install 3/4 accumulator control valve (7), 3/4 accumulator valve (6), plug (5), and retainer (4).

4. Install force motor solenoid (3).

- Place solenoid terminals pointing towards mating face.
- Install retainer (2) and bolt.

Torque: 10 N•m (87 lb in)

5. Install converter clutch solenoid assembly with two O-rings (1) to valve body.

- Install bolt.

Torque: 10 N•m (87 lb in)

Third Clutch and Sprag Unit

Disassembled View

248RW001

Legend

- | | |
|--|---------------------------------------|
| (1) Retaining Ring | (5) Thrust Washer |
| (2) Input Sun Gear and Sprag Unit Assembly | (6) Clutch Plates |
| (3) Retaining Washer | (7) Third Clutch Spring Cushion Plate |
| (4) Bearing | (8) Third Clutch Drum Assembly |

Disassembly

1. Place the third clutch drum and intermediate shaft assembly upright, using the overdrive internal gear as a support.
2. Locate the ends of the retaining ring. Depress one end of the ring using a small screwdriver instead of the depressor handle provided with the tool J-38450-A. Slide one blade down between the third clutch drum and the retaining ring.
3. Remove a screwdriver and repeat this step for the other end of retaining ring.
4. Install the remaining four blades approximately (five) notches apart using a screwdriver to depress the retaining ring.
5. Pull up on input sun gear and sprag unit assembly (1 and 2) to release the retaining ring from third clutch drum assembly (8).
6. Remove the tool blades.

248RX001

7A-74 AUTOMATIC TRANSMISSION (4L30-E)

7. Remove retaining washer (3), bearing (4), thrust washer (5), and clutch plates (6 and 7) from the third clutch drum assembly (8).

Inspection and Repair

Visual Check:

If any damage, deformation or wear is found, replace the damaged part.

Reassembly

1. Place third clutch drum and intermediate shaft assembly upright, using the overdrive internal gear as a support.
2. Install third clutch spring cushion plate (7), bevel face down.
3. Install third clutch plates (6) into third clutch drum assembly (8). Start with the steel clutch plate and alternate with lined plates.
4. Install thrust washer (5), bearing (4) and retaining washer (3).
5. Fully engage the hub spline of the input sun gear and sprag unit assembly (2) into the third clutch inner tangs.
 - Simultaneously rotate the outer sprag race to engage into the third clutch drum assembly (8).

6. Place J-38450-A blades between the retaining ring and the third clutch drum approximately (five) notches apart, and one blade at each end of the retaining ring (1). Push down on sprag assembly until the assembly is seated into the third clutch drum assembly (8).

7. Remove the tool blades and engage retaining ring into groove of third clutch drum.

Third Clutch

Disassembled View

Legend

- (1) Retaining Ring
(2) Spring Seat

- (3) Springs
(4) Piston Assembly
(5) Third Clutch Drum

Disassemble

1. Compress spring seat using the J-23075 spring compressor and J-23075-12 adapter tool.

NOTE: Do not overstress the springs and seat. This will cause damage to the spring seat.

- Remove the tool.
- Remove retaining ring (1).

2. Release the spring seat (2).

NOTE: Do not let the spring seat catch in the ring groove.

- Remove spring seat (2) and springs (3).
3. Remove piston assembly (4) from third clutch drum (5).

Inspection and Repair

Visual check:

If any damage, deformation or wear is found, replace the damaged part.

Operation check:

Shake the piston and listen for check ball movement. Movement indicates proper check ball operation. Replace the piston if the check ball is missing or falls out.

Reassembly

1. The lip of the piston seal must point toward the front of the transmission. Lubricate the seal lip with transmission fluid.

- Install piston assembly (4) into the third clutch drum (5). Use the J-23084 third clutch piston installer to protect the outer seal during installation.
- Remove the seal installer.

2. Install twelve springs (3) and spring seat (2).

3. Place retaining ring (1) onto spring seat.

- Compress the piston springs, using the J-23075 piston spring compressor and J-23075-12 adapter.

CAUTION: Do not overstress the springs and seat. Do not let the spring seat catch in the ring groove. This may cause damage to the spring seat.

- Install spring seat retaining ring (1).
- Remove the piston spring compressor and adapter.

Sprag Unit

Disassembled View

248RS009

Legend

- | | |
|----------------------|--|
| (1) Retaining Ring | (4) Sprag Assembly |
| (2) Sprag Outer Race | (5) Ring |
| (3) Ring | (6) Third Clutch Hub and Sun Gear Assembly |

Disassembly

1. Remove the sprag outer race, retaining ring, and sprag assembly from the third clutch hub and sun gear assembly.
2. Remove the rings and sprag assembly from the sprag outer race.

Inspection and Repair

Visual Check:

If any damage, deformation or local wear is found, replace the damaged part.

Reassembly

NOTE: Flared shoulder of the sprag cage faces the sun gear. This procedure must be followed exactly to be sure that the sprag assembly is installed properly.

1. Install rings and sprag assembly onto the third clutch hub and sun gear.
2. Install sprag outer race and retaining ring assembly over the sprag cage assembly.
 - Place third clutch hub and sun gear assembly on a flat surface, sun gear facing up. Place sprag outer race and sprag assembly over the sun gear assembly, push down and turn the input sun counterclockwise at the same time.

NOTE: Check correct rotation by holding the sun gear in your left hand and turning the outer race. The outer sprag race should turn freely towards you and should lock turning away from you.

| (3) Retaining Ring | (8) Spring Seat |
| (4) Spacer | (9) Springs |
| (5) Clutch Plates | (10) Piston Assembly |
| | (11) Second Clutch Drum |

Disassembly

1. Remove retaining ring (1) from second clutch drum (11).
2. Remove ring gear (2), retaining ring (3), and spacer (4).
3. Remove clutch plates (5) and waved washer (6).
4. Remove retaining ring (7) using J-23327 compressor to compress the spring seat (8).
5. Remove spring seat (8), springs (9) and piston assembly (10) from second clutch drum (11).

247RS006

Inspection and Repair

Visual Check:

If any damage, deformation or wear is found, replace the damaged part.

Operation Check:

Shake the piston and listen for check ball movement. Movement indicates proper check ball operation. Replace the piston if the check ball is missing or falls out.

Reassembly

1. Install piston assembly (10) into the second clutch drum (11).
 - Lubricate the lip seal with transmission fluid. Use the J-23080-A second clutch piston installer to protect the outer piston lip seal.

NOTE: Lip of the seal should point toward front of transmission.

- Remove the installer.

2. Install twenty-two piston springs (9) and spring seat (8) on the second clutch piston (10). Place retaining ring (7) onto spring seat.

- Use the J-23327 compressor to compress the piston springs.

NOTE: Do not let spring seat catch in ring groove.

- Remove the compressor.

3. Install waved plate (6) and clutch plates (5). Start with a steel plate and alternate with lined plates.

- Align second clutch inner tangs.

4. Install spacer (4), with the fluted end toward clutch plates.

5. Install retaining ring (3), ring gear (2) and retaining ring (1).

247RS007

3-4 Accumulator Piston

Disassembled View

244RS005

Legend

- (1) Snap Ring
- (2) Cover

- (3) Spring
- (4) Piston Assembly

Disassembly

1. Install the J-38559-A cover compressor on adapter case.
 - Compress piston cover then remove snap ring.

242RS007

2. Install the J-41096 cover remover and J-38584 adapter to center hole of cover.
 - Use the J-23907 slide hammer to remove cover.
3. Remove spring and piston assembly.

242RW001

Inspection and Repair

Visual Check:

If any damage, deformation or wear is found, replace the damaged part.

Reassembly

1. Place the J-38553 piston fitter into adaptor case and push the piston into position, using suitable diameter tube.
 - Remove the piston fitter.

244RS006

2. Install spring and cover.
3. Install snap ring, using the J-38559-A compressor tool.
 - Install snap ring in groove.
 - Remove the compressor tool.

242RS007

Reverse Clutch Piston and Center Support

Disassembled View

242RY001

Legend

- | | |
|---------------------|-------------------------------------|
| (1) Retaining Ring | (9) Restrictor |
| (2) Spring Seat | (10) Retainer Plate |
| (3) Springs | (11) Plug |
| (4) Piston Assembly | (12) Spring |
| (5) Center Support | (13) Overrun Lock Out Valve |
| (6) Gasket | (14) Retainer Plate |
| (7) Transfer Plate | (15) Plug |
| (8) Gasket | (16) Spring |
| | (17) Reverse Lock Out Control Valve |

Disassembly

1. Install the J-23327 compressor tool on spring seat, then compress the spring seat.

- Remove retaining ring (1).

NOTE: Do not over-stress the springs and seat, as this will cause damage to the spring seat.

- Remove the compressor tool.

247RS008

2. Remove spring seat (2) and springs (3).
3. Remove piston assembly (4).
4. Remove 8 bolts from center support (5), then remove center support (5) from adapter case.
5. Remove gasket transfer plate/outer support (6), center support transfer plate (7), and gasket transfer plate/adapter case (8).
6. Remove restrictor (9) from adapter case housing.
7. Remove retainer plate (10), plug (11), spring (12), and overrun lock out valve (13) from center support (5).

Inspection and Repair

Visual Check:

If any damage, deformation or wear is found, replace the damaged part.

Reassembly

1. Install overrun lock out valve (13) and spring (12) to center support.

NOTE: Ensure correct assembly of valve. The spring should be located over the long small diameter end.

2. Install plug (11) and retainer plate (10).
3. Place restrictor (9) in the lube overdrive channel in the adapter case housing.

242RS005

4. Install gasket transfer plate/adapter case (8), center support transfer plate (7), and gasket transfer plate/center support (6).
5. Install center support (5) with 8 bolts.

Torque : 25 N•m (18 lb ft)

6. Install piston assembly (4) into center support (5).
 7. Install twenty four springs (3), spring seat (2), and retaining ring (1).
- Install the J-23327 compressor and compress spring seat (2) and springs (3), then seat snap ring (1) in groove.
 - Remove the tool.

Overrun Clutch and Turbine Shaft

Disassembled View

252RW005

Legend

- | | |
|--------------------------------|---|
| (1) Snap Ring | (8) Snap Ring |
| (2) Overdrive Carrier Assembly | (9) Overrun Roller Clutch Cam |
| (3) Sun Gear | (10) Roller Clutch Assembly |
| (4) Turbine Shaft | (11) Overrun Clutch Release Spring Retainer |
| (5) Snap Ring | (12) Diaphragm Spring |
| (6) Backing Plate | (13) Piston Assembly |
| (7) Clutch Plates | (14) Overrun Clutch Drum |
| | (15) Turbine Shaft Seal Rings |

Disassembly

1. Position overrun clutch assembly upright, using the overdrive internal gear as a support.
 - Remove snap ring (1).

252RS009

2. Remove overdrive carrier assembly (2), sun gear (3) and turbine shaft (4).
3. Remove snap ring (5), backing plate (6), and clutch plates (7).
4. Compress diaphragm spring with the J-23327-91 compressor then remove snap ring (8).

252RS010

5. Remove overrun roller clutch cam (9) and roller clutch assembly (10).
6. Remove overrun clutch release spring retainer (11) and diaphragm spring (12).
7. Remove piston assembly (13) from overrun clutch drum (14).
8. Remove turbine shaft seal rings (15).

Inspection and Repair

Overdrive Carrier Check

- Check pinion end play with a feeler gauge.

Clearance: 0.24mm–0.64mm (0.0094in–0.025in)

If clearance is outside specified value, replace overdrive carrier assembly.

252RS011

Visual Check:

If any damage, deformation or wear is found, replace the damaged part.

Reassembly

1. Install turbine shaft seal rings (15) with grease (petroleum jelly).

241RS008

2. Install the J-38555 inner installer on the drum (14).
 - Pre-install piston assembly into J-38555 outer installer.
 - Install overrun clutch piston assembly (13). Use the outer installer while pushing piston into drum (14).

- Remove the installer.

252RS012

252RS013

NOTE: Turn the assembly in a counter-clockwise direction only until roller clutch enters the outer race. After Installation, rotate the assembly and listen for loose rollers.

11. Install turbine shaft (4) and snap ring (1).

3. Install diaphragm spring (12).
4. Install overrun clutch release spring retainer (11) (lip faces upwards), overrun roller clutch assembly (10) and cam (9).
5. Place snap ring loosely on spring retainer.
 - Hold the J-23327-91 compressor in a vise and compress piston return spring with compressor.
 - Set snap ring (8) in ring groove.
 - Remove the compressor.
6. Install clutch plates (7), start with steel plate and alternate with lined plates.
7. Install backing plate (6).
8. Install snap ring (5).
9. Install overdrive sun gear with countersink pointing downwards.
10. Install the overdrive carrier assembly (2).

7A-86 AUTOMATIC TRANSMISSION (4L30-E)

Main Data and Specification

General Specifications

				Remarks
Model		THM 4L30-E		
Engine		V6 3.2L 6VD1		
Type		Automatic four speed overdrive in 4th gear lockup clutch torque converter		
Control systems	Shift control		Hydraulic	
	Shift pattern		Electronic	
	Shift quality		Electronic	
	Lockup clutch		Electronic	
Gear ratio	1st		2.856	
	2nd		1.618	
	3rd		1.000	
	4th (O/D)		0.723	
	Reverse		2.000	
Gear set		Noiseless, high torque capability		
Oil used	Name		ATF DEXRON®-III	
	Q'ty liter (qt)		8.6 (9.1)	
Torque converter		2,100 ± 150		Stall speed (rpm)
	Reverse clutch		RC	Number of discs
	Second clutch		C2	
	Third clutch		C3	
	Brake band		Double wrap	
	Fourth clutch		C4	Number of discs
	Overrun clutch		OC	
Overdrive roller clutch		OFW	10	Number of rollers
Principle sprag assembly		PFW	26	Number of sprags
Ravigneaux type gear train (planetary gear set)	Input sun gear		30	Number of teeth
	Pinion gear		19

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS), REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

The 4L30-E is a 4-speed fully automatic transmission. It uses a microcomputer as a control unit to judge running conditions including throttle opening rate and vehicle speed, then it sets the shifting point in the optimum timing so that best driving performance can be achieved.

In addition, the built-in shift mode select function can select three shift modes according to the driver's preference:

- Normal mode –Normal shift pattern.
- Winter mode –Starts in 3rd gear to reduce slippage on ice or snow.
- Power mode has a delayed upshift for when more powerful acceleration is required.

Also, the built-in fail safe function ("backup mode") assures driving performance even if the vehicle speed sensor, throttle signal or any solenoid fails.

Further, the self-diagnostic function conducts diagnosis in a short time when the control system fails, thus improving serviceability.

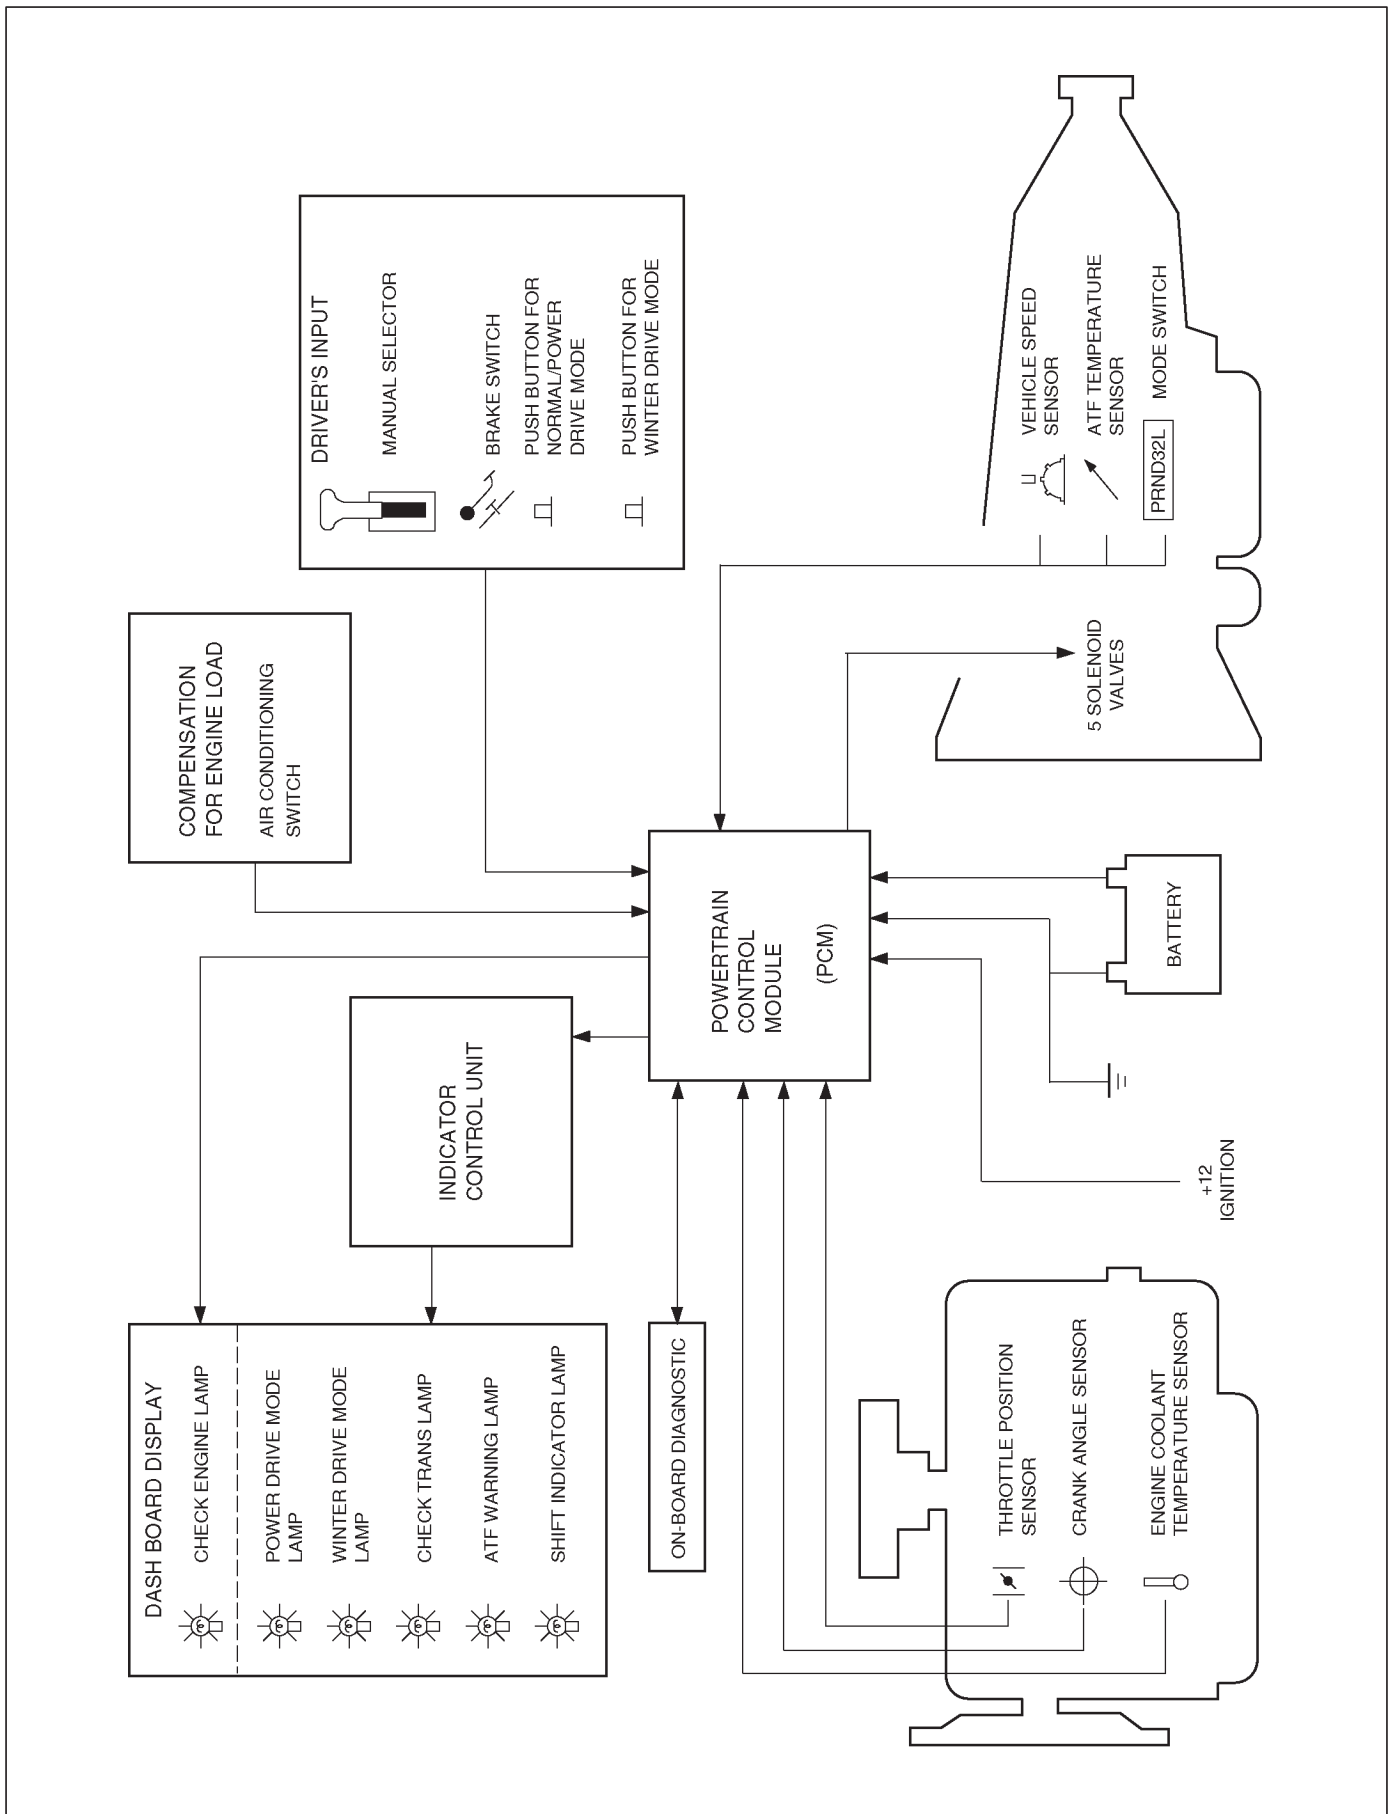

The major features of 4L30-E are as follows:

- A compact structure consisting of 2 sets of planetary gears and flat torque converter.
- Electronic control selects the optimum shift mode according to the driving conditions.
- Electronic control maintains the optimum hydraulic pressure for clutch, band brake as well as transmission so that shift feeling is improved.
- Two sets of planetary gears reduce friction of power train.

Also, a lockup mechanism in the torque converter reduces fuel consumption.

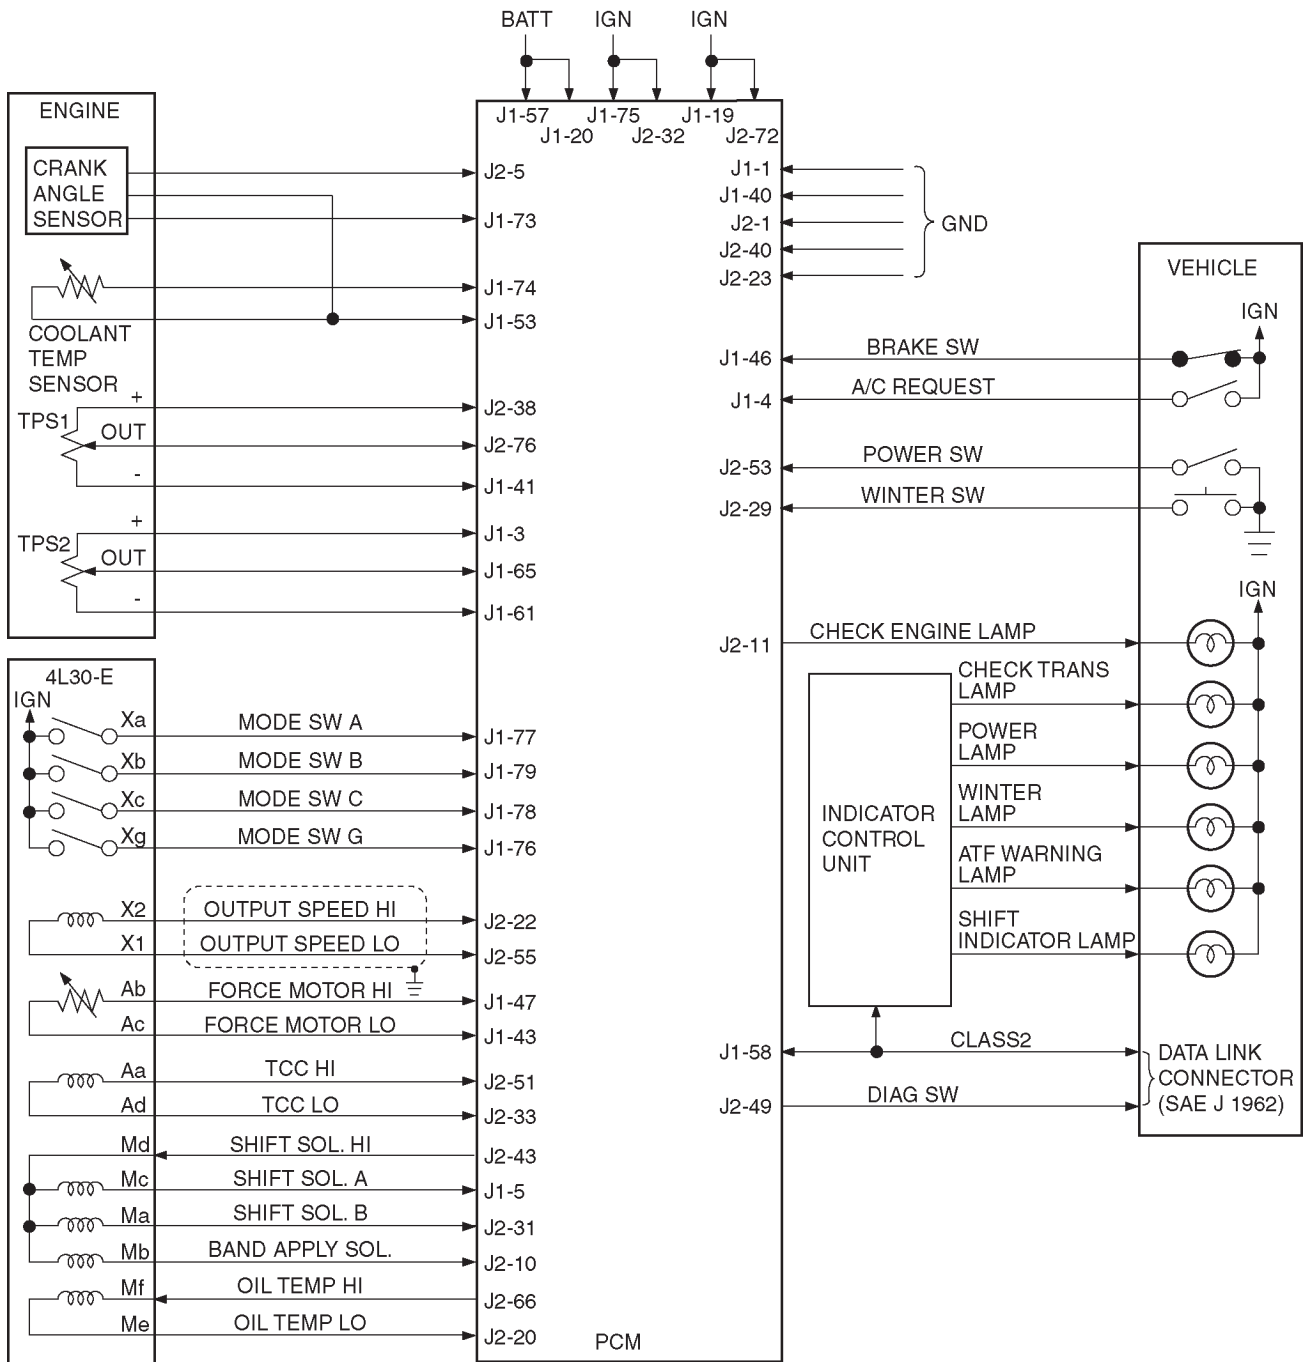

- Wide gear ratio and high torque rate of torque converter provide excellent starting performance.

Electronic Control Diagram

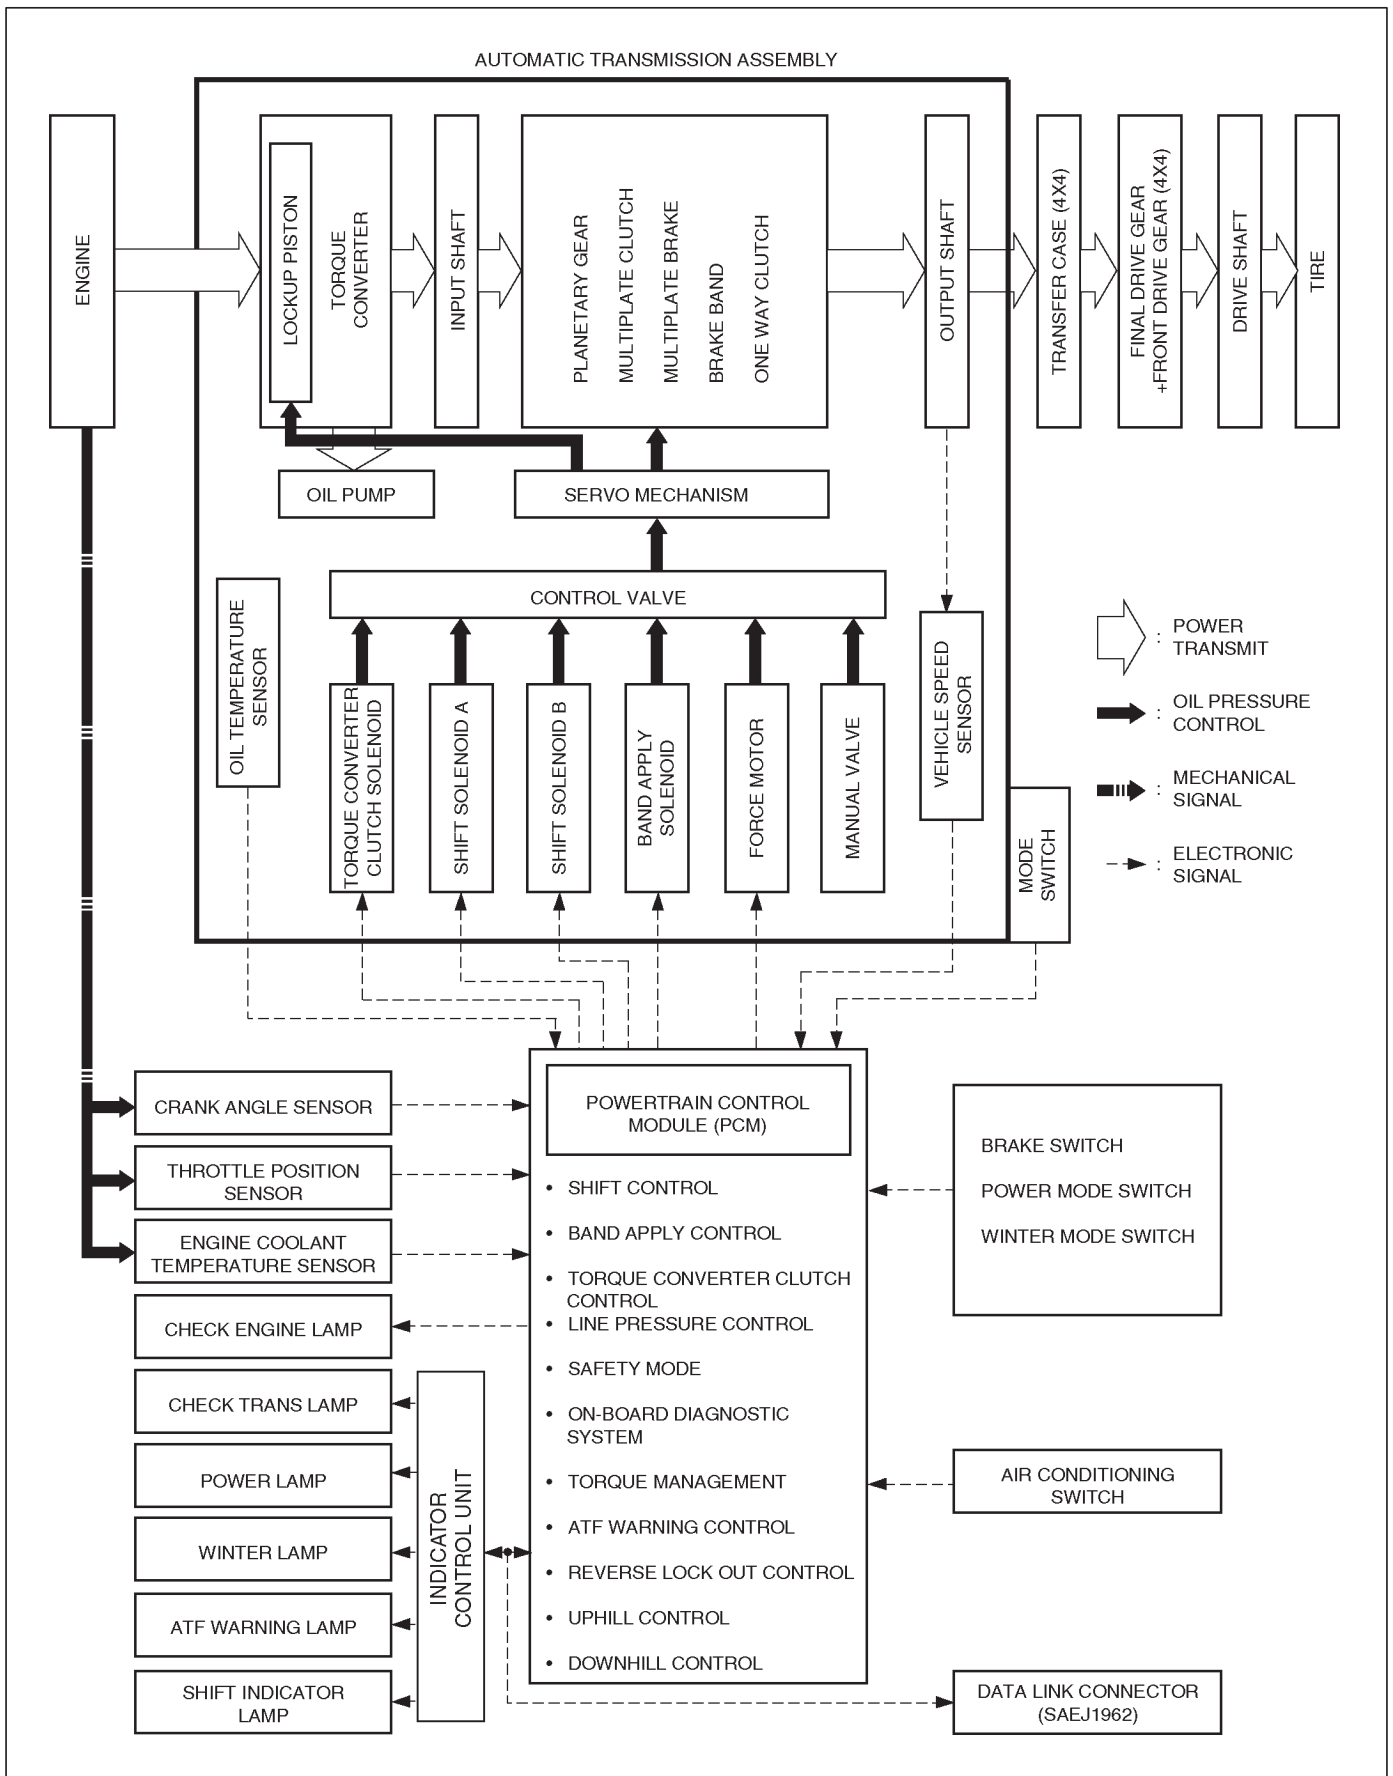

7A1-4 TRANSMISSION CONTROL SYSTEM (4L30-E)

Powertrain Control Module (PCM)

TPS : Throttle Position Sensor
TCC : Torque Converter Clutch

Control System Diagram

7A1-6 TRANSMISSION CONTROL SYSTEM (4L30-E)

Shift Control

The transmission gear is shifted according to the shift pattern selected by the driver. In shifting gears, the gear ratio is controlled by the ON/ OFF signal using the shift solenoid A and the shift solenoid B.

Band Apply Control

The band apply is controlled when in the 3-2 downshift (engine overrun prevention) and the garage shift (shock control).

The band apply solenoid is controlled by the signal from the Pulse Width Modulation (PWM) to regulate the flow of the oil.

Torque Converter Clutch Control

The clutch ON/OFF is controlled by moving the converter clutch valve through shifting Torque Converter Clutch (TCC) solenoid using the ON/OFF signal.

Line Pressure Control

The throttle signal allows the current signal to be sent to the force motor. After receiving the current signal, the force motor activates the pressure regulator valve to regulate the line pressure.

On-Board Diagnostic System

Several malfunction displays can be stored in the Powertrain Control Module (PCM) memory, and read out of it afterward.

The serial data lines, which are required for the testing of the final assembly and the coupling to other electronic modules, can be regulated by this function.

Fail Safe Mechanism

If there is a problem in the transmission system, the PCM will go into a "backup" mode.

The vehicle can still be driven, but the driver must use the select lever to shift gears.

Torque Management Control

The transmission control side sends the absolute spark advance signal to the engine control side while the transmission is being shifted. This controls the engine spark timing in compliance with the vehicle running condition to reduce the shocks caused by the change of speed.

ATF Warning Control

The oil temperature sensor detects the ATF oil temperature to control the oil temperature warning, TCC, and the winter mode.

Reverse Lock Out Control

With the selector lever in reverse position, the PCM will not close the PWM solenoid until the vehicle is below 11 km/h (6.8 mph), thus preventing reverse engagement above this speed.

Downhill Control

This mode is automatically activated from NORMAL mode only when downhill conditions are recognized.

The shift pattern is identical to NORMAL mode except 3-4 and 4-3 shift lines at low throttle modified to get engine braking on a larger speed range.

Uphill Control

When uphill condition are recognized the 2-3 and 3-4 shift and TCC apply take place only when the engine torque is sufficient in order to avoid shift hunting.

Shift Mode Control

① Mode Type

Mode Type	Select lever position
Normal drive mode (NOR)	Entire range (excluding "R")
Power drive mode (PWR)	Entire range (excluding "R")
Winter drive mode	"D" range only

② Mode selection

Mode Type	SWITCH (SW)		LAMP	
	POW/NOR. SW	WINTER SW	POWER DRIVE LAMP	WINTER DRIVE LAMP
Normal drive mode (NOR)	OFF	OFF	OFF	OFF
Power drive mode (PWR)	ON	OFF	ON	OFF
Winter drive mode	ON/OFF	ON	OFF	ON

However, the winter switch prevails over the PWR/NOR switch.
The mode becomes normal drive mode when the winter switch is operated from ON to OFF.

③ Comparison of mode

- (1) The normal drive mode is set at the normal shift points.
- (2) The shift points of the power drive mode are shifted to the higher speed side, compared to the normal drive mode.
- (3) The winter drive mode is a special mode used exclusively for starting in third gear.

Shift diagram

7A1-8 TRANSMISSION CONTROL SYSTEM (4L30-E)

Gear Shift Control

① Shift pattern

SELECT LEVER RANGE	SHIFT PATTERN
D (Drive)	1 ⇄ 2TCC ⇄ 3TCC ⇄ 4TCC
3 (Third)	1 ⇄ 2TCC ⇄ 3TCC ← 4TCC
2 (Second)	1 ⇄ 2TCC ← 3TCC
L (First)	1 ← 2

TCC = Torque Converter Clutch

② Gear position

The gear is selected by ON/OFF of two solenoids.

Gear \ SOL	A	B
4 (Fourth)	×	×
3 (Third)	○	×
2 (Second)	○	○
1 (First)	×	○
P (park)		
R (Reverse)	×	○
N (Neutral)		

○ = ON

× = OFF

Shift solenoid A
(Normally closed)

ON → PRESSURE TO
SHIFT VALVE

Shift solenoid B
(Normally open)

OFF → PRESSURE TO
SHIFT VALVE

③ Selecting gear position

Seven types of positions can be selected according to 5 signals from the mode switch as below.

SELECT LEVER RANGE	MODE SW TERMINALS				
	5(D)	8(A)	7(B)	6(C)	3(G)
P (park)	•	•			•
R (Reverse)	•	•	•		
N (Neutral)	•		•		•
D (Drive)	•		•	•	
3 (Third)	•	•	•	•	•
2 (Second)	•	•		•	
L (First)	•			•	•

• = Continuity

Winter Drive Mode

1. The winter switch will operate when switched on after all of the following conditions are present:
 - a. The gear select position is "D" range only.
 - b. Vehicle speed is 7 mph (11 km/h) or less.
 - c. Transmission oil temperature is 130°C (260°F) or less.
 - d. Accelerator opening is at 8% or less.

NOTE: Though the winter indicator lamp lights even on P, R or N range except D range, the winter mode is not activated until the winter mode activate conditions are satisfied.

2. Cancel Release

1. Cancellation by driver
 - a. Turning off the winter drive mode switch
 - b. Shifting select position to "3", "2", or "L" (Winter drive mode is not canceled by selecting "N", "R", or "P" from "D")
 - c. Ignition key is turned off.
2. Automatic cancellation
 - a. When vehicle runs at 21mph (34 km/h) or more for 1 second or more
 - b. When transmission oil temperature reaches 130°C (266°F) or above

NOTE: The mode returns to normal drive mode or power drive mode after the winter drive mode is canceled.

Backup Mode

If a major system failure occurs which could affect safety or damage the transmission under normal vehicle operation, the diagnostic system detects the fault and overrides the Powertrain Control Module (PCM).

The "CHECK TRANS" light flashes to alert the driver, and the transmission must be manually shifted as follows:

Select lever position	Gear Ratio Selected
D	4 (Fourth)
Manual 3	4 (Fourth)
Manual 2	3 (Third)
Manual L	1 (First)
R	Reverse

Shifts are firmer to prevent clutch slip and consequent wear. The fault should be corrected as soon as possible.

7A1-10 TRANSMISSION CONTROL SYSTEM (4L30-E)

Functions of Input / Output Components

Components		Function	
I N P U T S I G N A L	Speed sensor (fixed to transmission (T/M))	Senses rotation of output shaft and feeds the data to Powertrain Control Module (PCM).	
	Throttle position sensor (TPS) (fixed to engine)	Senses the extent of throttle valve opening and the speed of the throttle valve lever motion to open the valve. Feeds the data to PCM.	
	Brake Switch (SW) (fixed to brake pedal)	Senses whether the driver has pressed the brake pedal or not and feeds the information to PCM.	
	Mode SW (fixed to T/M)	Senses the select lever position, and feeds the information to PCM.	
	Power drive SW (fixed to front console)	Senses whether the driver has selected the power mode, and feeds the information to PCM.	
	T/M oil temp. sensor	Senses the T/M oil temperature and feeds the data to PCM	
	Engine coolant temperature sensor	Senses the engine coolant temperature, and feeds the data to PCM.	
	Engine speed signal	Feeds the signals monitoring engine speed to PCM from crank angle sensor.	
	Air conditioning information	Senses whether the air conditioner has been switched on or not, and feeds the information to PCM.	
	Winter switch (fixed to front console)	Senses whether the driver has selected the winter mode, and feeds the information to PCM.	
Cruise controller (Overdrive OFF signal)	Downshift takes place when Overdrive OFF signal is received from auto cruise control unit.		
O U T P U T S I G N A L	S O L E N O I D	Shift solenoid A, B	Selects shift point and gear position suited to the vehicle running condition on the basis of PCM output.
		Band apply solenoid	Controls oil flow suited to the vehicle running condition on the basis of PCM output.
		Torque Converter Clutch solenoid	Controls clutch engagement/disengagement suited to the vehicle running condition on the basis of PCM output.
		Force motor (Pressure regulator valve)	Adjusts the oil pump delivery pressure to line pressure suited to the vehicle running condition on the basis of PCM output.
	Power drive mode lamp	Informs the driver whether the vehicle is in power mode or not.	
	Winter drive mode lamp	Informs the driver whether the vehicle is in winter mode or not.	
	"CHECK TRANS" lamp	Informs the driver of failure in the system.	
	ATF warning lamp	Lights when ATF oil temperature rises.	

Diagnosis

Electronic Diagnosis

How To Diagnose The Problem

1. To avoid incorrect diagnostics, this book needs to be followed accurately. Unless stated, **do not jump directly to a section that could contain the solution. Some important information may be missed.**
2. The sections in CAPITALS and bold are the main sections that can be found in the contents.
3. The GO TO "**SECTION**" means to continue to check going to the "section".
4. The GO THROUGH "**SECTION**" means to go through the "section" and then to go back to the place the GO THROUGH was written.
5. BASIC ELECTRIC CIRCUITS:
You should understand the basic theory of electricity. This includes the meaning of voltage, amps, ohms, and what happens in a circuit with an open or shorted wire. You should also be able to read and understand wiring diagrams.

Check Trans Indicator

Find CHECK TRANS indicator and verify if it is

- A. Flashing: GO TO **DIAGNOSTIC CHECK.**
- B. Staying on: GO THROUGH **CHECK TRANS CHECK.**
- C. Is never ON when the ignition key is turned on: GO THROUGH **CHECK TRANS CHECK**
- D. Is ON during 2 seconds at ignition but OFF after: Normal operation. No DTC or malfunction.

821RY00064

Diagnostic Check

This test determines if the transmission or its input, or output, connections, or sensors are failing.

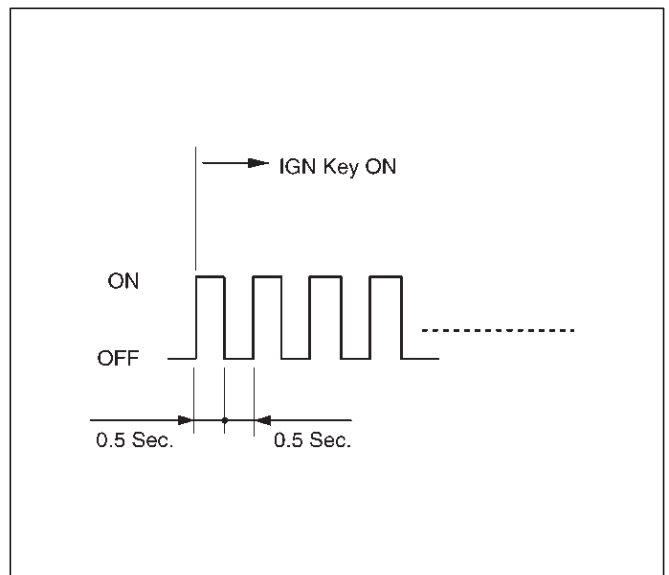

1. Connect the Tech 2: GO THROUGH **Tech 2 OBD II CONNECTION.**
2. Turn on the ignition but not the engine.
3. Push "F0" on Tech 2 to see the Diagnostic Trouble Code (DTC):
4. Do you have a DTC?
YES: write down all code numbers and do the **DTC CHECK**
NO: the DTC can not help you find the problem.
 1. GO THROUGH "**CHECK TRANS**" CHECK
 2. IF it is flashing and the flash is 0.5 seconds ON and 0.5 seconds OFF, this means that you should have a DTC stored. Please recheck GO TO **DIAGNOSTIC CHECK** and if you find the same problem, replace the Powertrain Control Module (PCM).

Normal

C07R200006

Abnormal

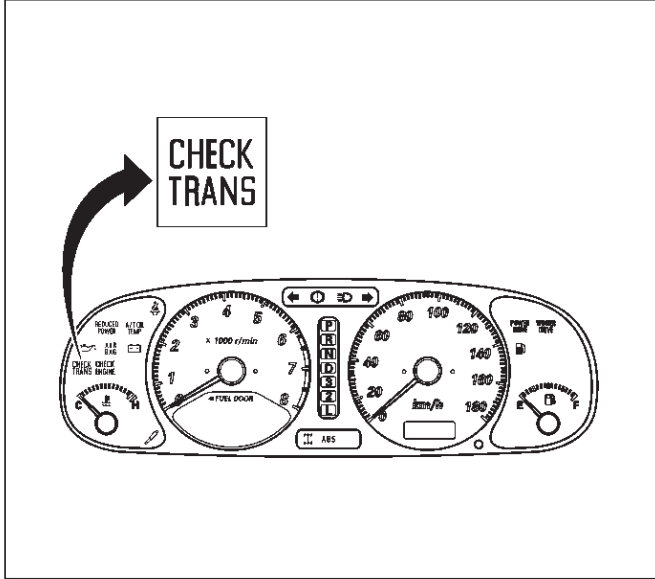

C07RY00058

7A1-12 TRANSMISSION CONTROL SYSTEM (4L30-E)

“Check Trans” Check

- Indicator is ON during 2 ~ 3 seconds at ignition (or when the engine is cranked) but it is OFF after the engine starts. The indicator is working normally GO TO **DIAGNOSTIC CHECK**.

821RY00064

Normal

C07R200006

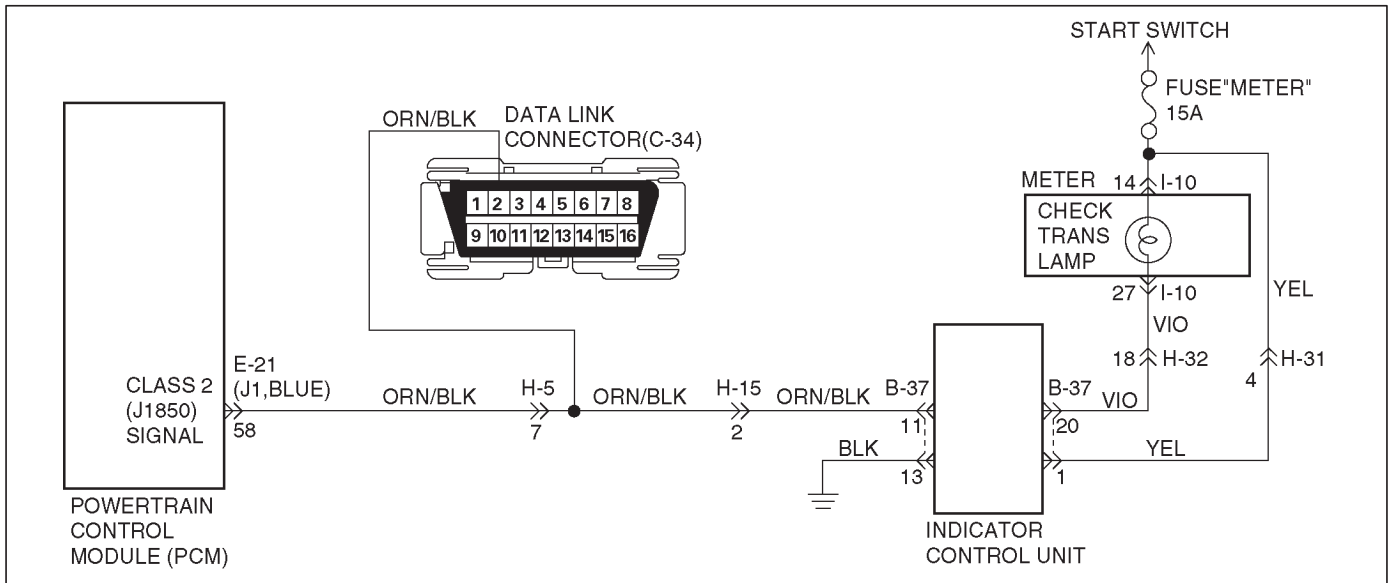

- Indicator is flashing and the flash is 0.5 seconds ON and 0.5 seconds OFF always when ignition is on (engine cranked or not). This means that there is a malfunction. GO TO **DIAGNOSTIC CHECK**.

Abnormal

C07RY00056

- Indicator is staying ON always when Ignition is ON.
 - This means that connection between the lamp and the PCM is shorted to ground.
 - Verify if instrument panel terminal 27 of connector I-10 is shorted to ground.
 - Verify if the indicator control unit connector B-37 terminal 20 is shorted to ground.
 - Verify that the instrument panel terminal 14 of connector I-10 is connected to battery.
 - IF problem solved: GO TO **CHECK TRANS INDICATOR**.
NO: Replace Powertrain Control Module (PCM).
- Indicator is staying OFF with the ignition ON (engine OFF).
 - This means that connection between the lamp and the indicator control unit is shorted to battery or opened.
 - Verify if instrument panel terminal 27 of connector I-10 is shorted to battery or open.
 - Verify if the indicator control unit connector B-37 terminal 20 is shorted to battery or open.
 - Verify that the instrument panel terminal 14 of connector I-10 is connected to battery. If not, check the fuses and the connections (terminal 18 of connector H-32) voltage.
 - IF problem solved: GO TO **CHECK TRANS INDICATOR**.
NO: Replace Powertrain Control Module (PCM).

D07R100031

Tech 2 OBD II Connection

In order to access OBD II Powertrain Control Module (PCM) data, use of the Tech 2 scan tool kit (7000086) is required.

1. The electronic diagnosis equipment is composed of:
 1. Tech 2 hand-held scan tool unit (7000057) and DLC cable (3000095).

901RW176

2. SAE 16/19 Pin Adapter (3000098)(1), RS232 Loop Back Connector (3000112)(2), and PCMCIA Card (3000117)(3).

F07RW033

7A1-14 TRANSMISSION CONTROL SYSTEM (4L30-E)

2. Connecting the Tech 2

901RW180

Legend

- | | |
|--------------------------------|-----------------------|
| (1) PCMCIA Card | (3) SAE 16/19 Adapter |
| (2) RS 232 Loop Back Connector | (4) DLC Cable |
| | (5) Tech 2 |

- Before operating the Isuzu PCMCIA card with the Tech 2, the following steps must be performed:
 1. The Isuzu 2001 System PCMCIA card (1) inserts into the Tech 2 (5).
 2. Connect the SAE 16/19 adapter (3) to the DLC cable (4).
 3. Connect the DLC cable to the Tech 2 (5)
 4. Make sure the vehicle ignition is off.
 5. Connect the Tech 2 SAE 16/19 adapter to the vehicle DLC.

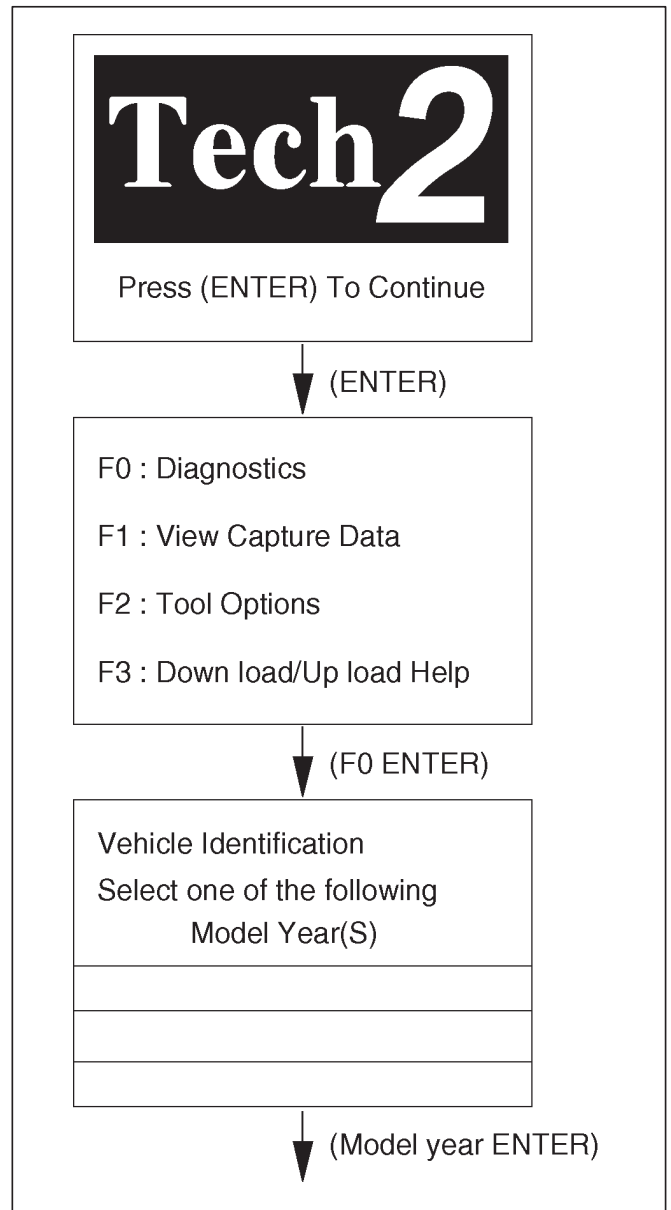

810RW317

6. The vehicle ignition turns on.
7. Verify the Tech 2 power up display.

060RW009

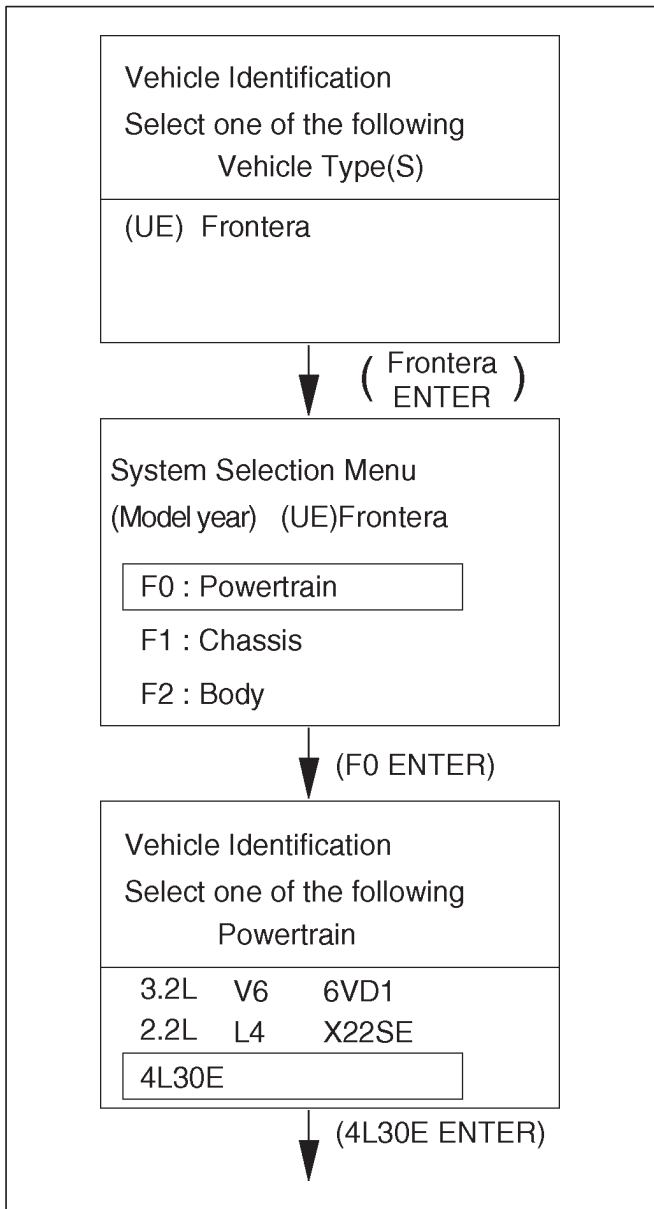

8. The power up screen is displayed when you power up the tester with the Isuzu systems PCMCIA card. Follow the operating procedure below.

060R100102

NOTE: The RS232 Loop back connector is only use for diagnosis of Tech 2 and refer to user guide of the Tech 2.

7A1-16 TRANSMISSION CONTROL SYSTEM (4L30-E)

Once the test vehicle has been identified an "Application (Powertrain) Menu" screen appears. Please select the appropriate application.

The following table shows, which functions are used for the available equipment versions.

F0: Diagnostic Trouble Codes
F0: Read DTC Info Ordered By Priority
F1: Clear DTC Information
F2: DTC Information
F1: Data Display
F0: Transmission Data
F2: Snap Shot
F3: Actuator Tests
F0: Lamps
F0: Check Light
F1: Winter Drive Lamp
F2: Power Drive Lamp
F3: AT Oil Temperature Lamp
F1: Solenoids
F0: Solenoid 1-2/3-4 Test
F1: Solenoid 2-3 Test
F2: TCC Solenoid
F3: Band Apply Solenoid
F4: Pressure Control Solenoid (PCS)
F4: Function Tests
F0: Reset Oil Life Monitor

Diagnostic Trouble Codes

The purpose of the "Diagnostic Trouble Codes" mode is to display stored PCM trouble codes.

When "Diagnostic Trouble Codes" is selected an "Application Menu" screen appears.

Clear DTC Information

The purpose of the "Clear DTC Information" mode is to command the clearing of stored PCM trouble codes.

When "Clear DTC Information" is selected, a "Clear DTC Information", warning screen appears. This screen informs you that by cleaning DTC's, "all stored DTC information in controller will be erased".

Do you want to clear DTC's (Yes/No).

Press either the Yes or No key when answering.

After clearing codes, confirm system operation by test driving the vehicle.

Allow the vehicle to shift through all four forward gears in a manner which attempts to repeat the failure condition.

NOTE: When the trouble has not been repaired and the trouble code cannot be erased, check the vehicle again.

DTC Information

When "DTC Information" is selected, an "Application Menu" appears with a list of DTC information function keys addressing DTC specifics and their origins.

Function key selections may vary for particular vehicle and/or system.

Data Display

The purpose of the "Data Display" mode is to continuously monitor data parameters.

The current actual values of all important sensors and signals in the system are display through F1 mode.

When "Data Display" is selected an "Application Menu" appears. Please select either "Engine" or "Transmission Data Display".

See "Transmission Data" on next page.

Snapshot

When "Snapshot" is selected an "Application Menu" appears.

When "Transmission Snapshot" application is selected from the "Application Menu", a "Snapshot Menu" appears, displaying several options. "Snapshot" options may vary from one system to another.

"Snapshot" allows a recording of all vehicle parameters. These parameters may then be replayed at a future point in time.

This action allows you to focus on making the condition occur, rather than trying to view all of the data in anticipation of the fault. The snapshot will collect parameter information around a trigger point that you select.

When a snapshot is taken. It is recorded onto the PCMCIA memory card. When the Tech 2 is powered down. Snapshots are not lost.

Actuator Tests

The purpose of "Actuator Tests" mode is to check for correct operation of electronic system actuators.

Lamps

You can operate the lamps by pressing the "ON" and "OFF" buttons.

Preconditions: none

Solenoid**Solenoid 1-2/3-4, Solenoid 2-3, TCC Solenoid**

You can operate the solenoids by pressing the "ON" and "OFF" buttons.

Preconditions: P-N position, no vehicle speed, no engine speed

Band Apply Solenoid

You can operate the solenoid by pressing the "ON" and "OFF" buttons.

Preconditions: P-N position, idle engine speed, no vehicle speed.

Pressure Control Solenoid (PCS)

You can set desired PCS Current using the "Increment" (+20) and "Decrement" (-20) button. The PC Solenoid Data informs about PCS Current, Pressure and Duty Cycle.

Preconditions: P-N position, no engine speed, no vehicle speed

Reset Oil Life Monitor

Displays parameter "Oil Life Monitor" and resets to 100% if Yes-button is pressed on Reset-question. "No" leaves test.

NOTE:

Freeze Frame (Powertrain DTC A/B Type)

Freeze Frame is an element of the Diagnostic Management System which stores various vehicle information at the moment an emission-related fault is stored in memory and when the MIL is commanded on. These data can help to identify the cause of a fault. Refer to *Storing And Erasing Freeze Frame Data for more detailed information.*

Failure Records (Powertrain DTC C/D Type)

Failure Records data is an enhancement of the OBD II Freeze Frame feature. Failure Records store the same vehicle information as does Freeze Frame, but it will store that information for any fault which is stored in on-board memory, while Freeze Frame stores information only for emission-related faults that commands the MIL on.

7A1-18 TRANSMISSION CONTROL SYSTEM (4L30-E)

Transmission Data

Item	Unit	Engine running at idle
Ignition Voltage	V	12.8 ~ 14.1 V
Engine Speed	RPM	750 ~ 900 RPM
Vehicle Speed	km/h, MPH	0 MPH
AT Output Speed (Automatic Transmission)	RPM	0 RPM
AT Input Speed Ratio (Automatic Transmission)		0
Throttle Position	%	0 %
AT Oil Temperature (Automatic Transmission)	°C, °F	70 ~ 80°C (158 ~ 176°F)
Transmission Temperature	°C, °F	75 ~ 110°C (167 ~ 230°F)
AT Oil Temperature Lamp (Automatic Transmission)	On/Off	Off
AT Oil Life Monitor (Automatic Transmission)	%	100 %
AT Oil Life Lamp (Automatic Transmission)	On/Off	Not used
Commanded Gear		1
Current Gear		1
Mode Switch A	Inactive/Active	Active
Mode Switch B	Inactive/Active	Inactive
Mode Switch C	Inactive/Active	Inactive
Mode Switch G	Inactive/Active	Active
Selector Position		Park
1-2 Shift Solenoid A	On/Off	Off
2-3 Shift Solenoid B	On/Off	On
Solenoid Brake Band	On/Off	Off
TCC Slip Speed	RPM	750 ~ 900 RPM
TCC Solenoid	On/Off	Off
TCC Duty Cycle	%	0 %
PCS Current (Pressure Control Solenoid)	A	approx. 1.0 A
PCS Duty Cycle (Pressure Control Solenoid)	%	approx. 45 ~ 60 %
Desired PCS Pressure (Pressure Control Solenoid)	kPa	43 ~ 52 kPa
Shift Pressure	kPa	43 ~ 52 kPa
Brake Switch	On/Off	On
Winter Switch	On/Off	Off
Winter Drive Lamp	On/Off	Off
Power Switch	Normal	Normal
Power Drive Lamp	On/Off	Off
Emergency Mode	Inactive, Active	Inactive
ABS Status	On/Off	(Not used)

Flashing Code

1. A DTC (Flashing Code) can be displayed by the Powertrain Control Module (PCM) by shorting together terminals 6 and 4 or 5 (GND) of the Data Link Connector (DLC) located right side of the drivers side instrument panel.

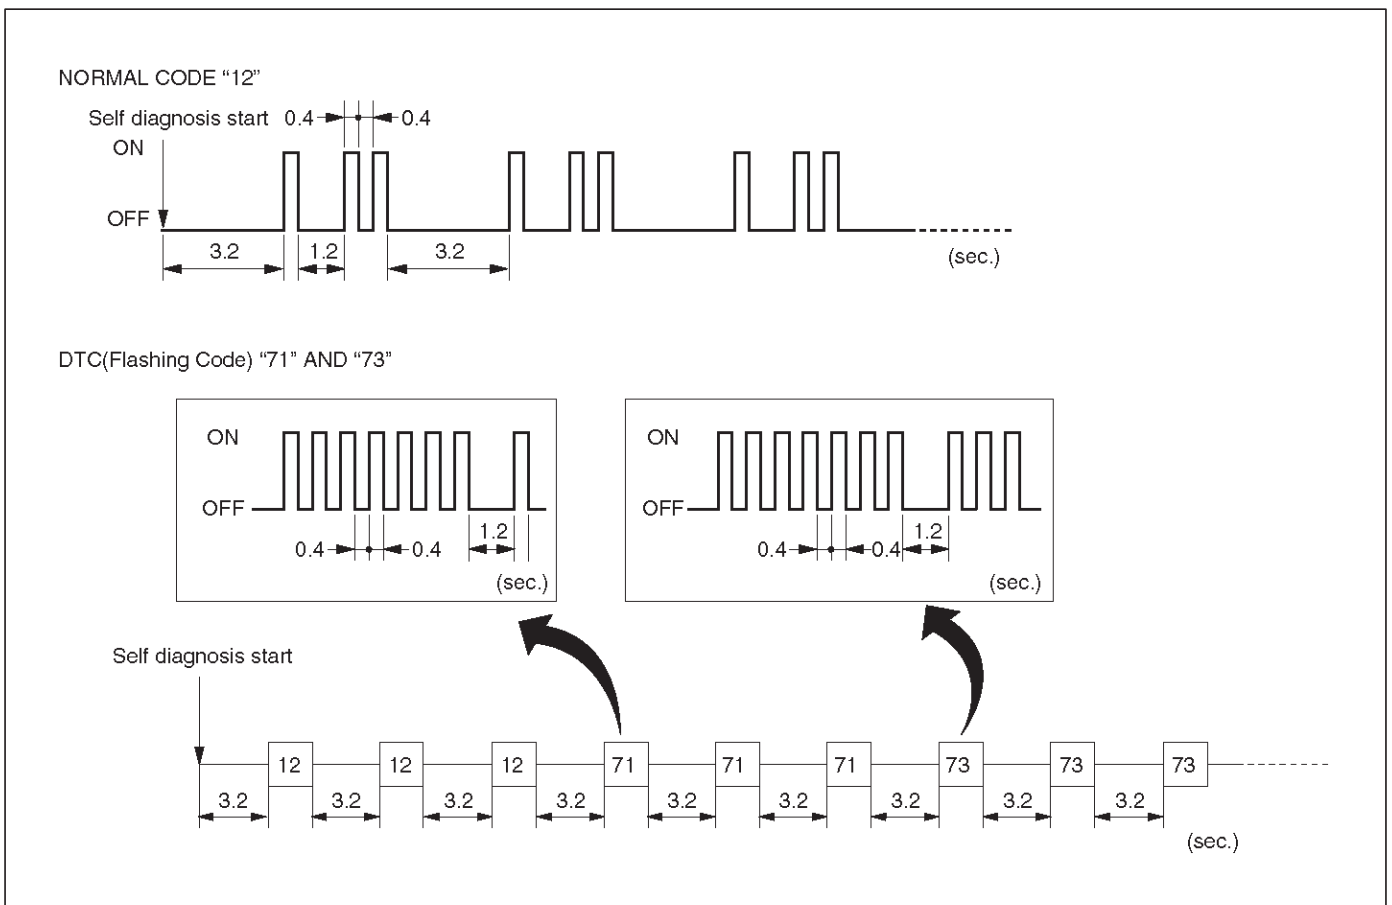

810RW317

821RY0065

2.
 1. In case there is no DTC stored in memory. The CHECK ENGINE indicator flashes Normal Code "12" repeatedly.
 2. In case there is DTC stored in memory. First, Normal Code "12" is displayed three times and then any other DTC's are displayed three times. When all DTC's have been displayed they are displayed again beginning from the first one.
 3. Write down all codes numbers and GO TO DTC CHECK.

C07RX006

7A1-20 TRANSMISSION CONTROL SYSTEM (4L30-E)

OBD II Diagnostic Management System Powertrain Control Module (PCM) Location

825R100018

Class 2 Serial Data Bus

OBD II technology requires a much more sophisticated PCM than does OBD I technology. The OBD II PCM diagnostic management system not only monitors systems and components that can impact emissions, but they also run active tests on these systems and components. The decision making functions of OBD II PCM have also greatly increased. To accommodate this expansion in diagnostic complexity, Isuzu engineers have designed the Class 2 serial data bus, which meets SAE J1850 recommended practice for serial data.

“Serial Data” refers to information which is transferred in a linear fashion – over a single line, one bit at a time. A “Data Bus” is an electronic pathway through which serial data travels.

826R10002

FRONTERA previously used a 5 volt data bus called UART, which is an acronym for “Universal Asynchronous Receive and Transmit”. When neither the vehicle’s control module nor the diagnostic tool, such as a Tech 2, are “talking,” the voltage level of the bus at rest is 5 volts. The two computers talk to each other at a rate of 8,192 bits per second, by toggling or switching the voltage on the data bus from 5 volts to ground.

Class 2 data, which is used on OBD II vehicles, is quite different. Data is transferred at a rate of 10.4 kilobits per second, and the voltage is toggled between zero and 7 volts.

UART

CLASS 2

Class 2 data is also pulse width modulated. Each bit of information can have one of two lengths: long or short. On the other hand, UART data bits come in only one length (short). The pulse width modulation of Class 2 data allows better utilization of the data line.

The message carried on Class 2 data streams are also prioritized. This means that if two devices try to communication on the data line at the same time, only the higher priority message will continue. The device with the lower priority message must wait.

NOTE: The Class 2 data wire is always terminal 2 of the new 16-terminal Data Link Connector (DLC).

16 – Terminal Data Link Connector (DLC)

OB2 II standardizes Data Link Connector (DLC) configurations. The DLC, formerly referred to as the ALDL, will be a 16-terminal connector found on the lower right side of the driver's side instrument panel. All manufacturers must conform to this 16-terminal standard.

C07RT006

810RW317

7A1-22 TRANSMISSION CONTROL SYSTEM (4L30-E)

PIN 1 –	(Not used)
PIN 2 –	J1850 Bus + L line on 2-wire systems, or single wire (Class 2)
PIN 3 –	(Not used)
PIN 4 –	Chassis ground pin
PIN 5 –	Signal ground pin
PIN 6 –	PCM diagnostic enable
PIN 7 –	(Not used)
PIN 8 –	(Not used)
PIN 9 –	Primary UART
PIN 10 –	(Not used)
PIN 11 –	(Not used)
PIN 12 –	ABS diagnostic or CCM diagnostic enable
PIN 13 –	SIR diagnostic enable
PIN 14 –	(Not used)
PIN 15 –	(Not used)
PIN 16 –	Battery power from vehicle unswitched (4 AMP MAX.)

Malfunction Indicator Lamp (MIL)

The Malfunction Indicator Lamp (MIL) looks the same as the MIL you are already familiar with (“CHECK ENGINE” lamp). However, OBD II requires that it illuminate under a strict set of guidelines. Basically, the MIL is turned on when the PCM detects a DTC that will impact the vehicle’s emissions.

The MIL is under the control of the Diagnostic Executive. The MIL will be turned on if a component or system which has an impact on vehicle emissions indicates a malfunction or fails to pass an emissions-related diagnostic test. It will stay on until the system or component passes the same test, for three consecutive trips, with no emissions-related faults.

DTC Types

Each DTC is directly related to a diagnostic test. The Diagnostic Management System sets DTC based on the failure of the tests during a trip or trips. Certain tests must fail two (2) consecutive trips before the DTC is set. The

following are the four (4) types of DTCs and the characteristics of those codes:

- Type A
 - Emissions related
 - Requests illumination of the MIL of the first trip with a fail
 - Stores a History DTC on the first trip with a fail
 - Stores a Freeze Frame (if empty) (DTC Information for 6VD1 engine)
 - Stores a Fail Record
 - Updates the Fail Record each time the diagnostic test fails
- Type B
 - Emissions related
 - “Armed” after one (1) trip with a fail
 - “Disarmed” after one (1) trip with a pass
 - Requests illumination of the MIL on the *second consecutive trip* with a fail
 - Stores a History DTC on the second consecutive trip with a fail (The DTC will be armed after the first fail)
 - Stores a Freeze Frame on the second consecutive trip with a fail (if empty) (DTC Information for 6VD1 engine)
 - Stores a Fail Record when the first test fails (not dependent on *consecutive trip* fails)
 - Updates the Fail Record each time the diagnostic test fails

(Some special conditions apply to misfire and fuel trim DTCs)

- Type C (if the vehicle is so equipped)
 - Non-Emissions related
 - Requests illumination of the Service Lamp or the service message on the Drive Information Center (DIC) on the *first trip* with a fail
 - Stores a History DTC on the *first trip* with a fail
 - *Does not* store a Freeze Frame
 - Stores Fail Record when test fails
 - Updates the Fail Record each time the diagnostic test fails
- Type D
 - Non-Emissions related
 - Not request illumination of any lamp
 - Stores a History DTC on the *first trip* with a fail
 - *Does not* store a Freeze Frame
 - Stores Fail Record when test fails
 - Updates the Fail Record each time the diagnostic test fails

IMPORTANT: Only four Fail Records can be stored. Each Fail Record is for a different DTC. It is possible that there will not be Fail Records for every DTC if multiple DTCs are set.

Clear DTC

NOTE: If you clear the DTC (Diagnostic Trouble Codes) you will not be able to read any codes recorded during the last occurrence.

NOTE: To use the DTC again to identify a problem, you will need to reproduce the fault or the problem. This may require a new test drive or just turning the ignition on (this depends on the nature of the fault).

1. IF you have a Tech 2:
 1. Connect the Tech 2 if it is still not connected go through **Tech 2 OBD II CONNECTION**.
 2. Push "F1: Clear DTC Information" in the Application Menu and answer "Yes" to the question "Do you want to clear DTC's?"
 - a. When a malfunction still exists and the Tech 2 displays "4L30E CODES NOT CLEARED". This means that the problem is still there or that the recovery was not done. Please go to **DTC CHECK**.
 - b. When a malfunction has been repaired and the recovery is done the Tech 2 displays "4L30E CODES CLEARED".
2. IF you have no Tech 2, disconnect the PCM battery feed as necessary.

DTC Check

1. Diagnostic Trouble Codes (DTC) have been identified by Tech 2.
2. You have written the list of the DTCs. The order of the malfunctions has no meanings for this PCM. Usually only one or two malfunctions should be set for a given problem.
3. Check directly the DTCs you identified. The DTCs are sorted by number. Refer to *Diagnostic Trouble Code (DTC) Identification in this section*.

PCM Precaution

The PCM can be damaged by:

1. The electrostatic discharge
2. The short circuit of some terminals to voltage or to ground.

Electrostatic Discharge Damage Description:

1. Electronic components used to control systems are often designed to carry very low voltage, and are very susceptible to damage caused by electrostatic discharge. It is possible for less than 100 volts of static electricity to cause damage to some electronic components. By comparison, it takes as much as 4,000 volts for a person to even feel the zap of a static discharge.

2. There are several ways for a person to become statically charged. The most common methods of charging are by friction and induction. An example of charging by friction is a person sliding across a car seat, in which a charge of as much as 25,000 volts can build up. Charging by induction occurs when a person with well insulated shoes stands near a highly charged object and momentarily touches ground. Charges for the same polarity are drained off, leaving the person highly charged with the opposite polarity. Static charges of either type can cause damage, therefore, it is important to use care when handling and testing electronic components.

NOTICE: To prevent possible electrostatic discharge damage:

1. Do not touch the PCM connector pins or soldered components on the PCM circuit board.
2. Be sure to follow the guidelines listed below if servicing any of these electronic components:
3. Do not open the replacement part package until it is time to install the part.
4. Avoid touching electrical terminals of the part.
5. Before removing the part from its package, ground the package to a known good ground on the vehicle.
6. Always touch a known good ground before handling the part. This step should be repeated before installing the part if the part has been handled while sliding across the seat, while sitting down from a standing position or while walking some distance.

Information On PCM

1. The Powertrain Control Module (PCM) is located in the center console and is the control center of the electronic transmission control system.
2. The PCM must be maintained at a temperature below 85°C (185°F) at all times. This is most essential if the vehicle is put through a paint baking process. The PCM will become inoperative if its temperature exceeds 85°C (185°F). Therefore, it is recommended that the PCM be removed or that temporary insulation be placed around the PCM during the time the vehicle is in a paint oven or other high temperature process.
3. The PCM is designed to process the various inputs and then respond by sending the appropriate electrical signals to control transmission upshift, downshift, shift feel and torque converter clutch engagement.
4. The PCM constantly interprets information from the various sensors, and controls the systems that affect transmission and vehicle performance. By analyzing operational problems, the PCM is able to perform a diagnostic function by displaying DTC(s) and aid the technician in making repairs.

7A1-24 TRANSMISSION CONTROL SYSTEM (4L30-E)

Intermittent Conditions

If the Tech 2 displays a diagnostic trouble code as intermittent, or if after a test drive a DTC does not reappear though the detection conditions for this DTC are present, the problem is most likely a faulty electrical connection or loose wiring. Terminals and grounds should always be the prime suspect. Intermittents rarely occur inside sophisticated electronic components such as the PCM.

Use the DTC information to understand which wires and sensors are involved.

When an intermittent problem is encountered, check suspect circuits for:

1. Poor terminal to wire connection.
2. Terminals not fully seated in the connector body (backed out).
3. Improperly formed or damaged terminals.
4. Loose, dirty, or corroded ground connections:
HINT: Any time you have an intermittent in more than one circuit, check whether the circuits share a common ground connection.
5. Pinched or damaged wires.
6. Electromagnetic Interference (EMI):
HINT: Check that all wires are properly routed away from spark plug wires, distributor wires, coil, and generator. Also check for improperly installed electrical options, such as lights, 2-way radios, etc.

Use the F2: SNAPSHOT mode of the Tech 2 to help isolate the cause of an intermittent fault. The snapshot mode will record information before and after the problem occurs. Set the snapshot to "trigger" on the suspect DTC or, if you notice the reported symptom during the test drive, trigger the snapshot manually.

After the snapshot has been triggered, command the Tech 2 to play back the flow of data recorded from each of the various sensors. Sign of an intermittent fault in a sensor circuit is a sudden unexplainable jump in data values out of the normal range.

Transmission and PCM Identification

The chart below contains a list of all important information concerning rear axle ratio, Powertrain Control Module (PCM), and transmission identification.

VEHICLE		Rr axle Ratio	PCM	TRANSMISSION		
Type	Engine		ISUZU Parts No.	Calibration Code	Isuzu Part No.	Model Code
Isuzu/Frontera	3.2L V6	4.100	8-12207-159-0	I36	8-96018-555-0	FT (4x4)

The identification plate is located on the left-hand side of the transmission above the mode switch.

AT Transmission identification on vehicle identification plate :

1. Model code
2. Calibration code
3. Production serial number
4. Production part number

PCM IDENTIFICATION:

1. ISUZU part number
2. Broadcast code
3. Service number
4. Engine size

DTC P0218/Flashing Code 71 Transmission Fluid Over Temperature

D07R100026

Circuit Description

The Transmission Fluid Temperature (TFT) sensor is a thermister that controls the signal voltage to the PCM. The PCM supplies a 5-volt reference to the sensor on circuit RED/BLK. When the transmission fluid is cold, the sensor resistance is high and the PCM will sense high signal voltage. As the fluid temperature warms to a normal transmission operating temperature of 100°C (212°F), the sensor resistance becomes less and the voltage decreases to 1.5 to 2.0 volts.

This DTC detects a high transmission temperature for a long period of time. This is a type "D" DTC.

Conditions For Setting The DTC

- No TFT DTCs P0712 (Flashing Code 75) or P0713 (Flashing Code 76).
- TFT is greater than 135°C (275°F).
- All conditions met for 21 seconds.

Action Taken When The DTC Sets

- Hot mode TCC Shift Pattern.
- The PCM will not illuminate the CHECK TRANS Lamp.
- ATF Lamp ON. (greater than 145°C (293°F))
- Disable E-side TCC OFF request.

Conditions For Clearing The DTC

- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warm-up cycles without a failure reported.

- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connections at the PCM and at the transmission 7-way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well.

Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.

- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Check harness routing for a potential short to ground in circuit RED/BLK.
- Scan tool TFT sensor temperature should rise steadily to about 100°C (212°F), then stabilize.
- Check for a "skewed" (mis-scaled) sensor by comparing the TFT sensor temperature to the ambient temperature after a vehicle cold soak. A "skewed" sensor can cause delayed garage shifts or TCC complaints.
- Check for a possible torque converter stator problem.
- Verify customer driving habits, trailer towing, etc.

Test Description

The numbers below refer to the step numbers on the diagnostic chart.

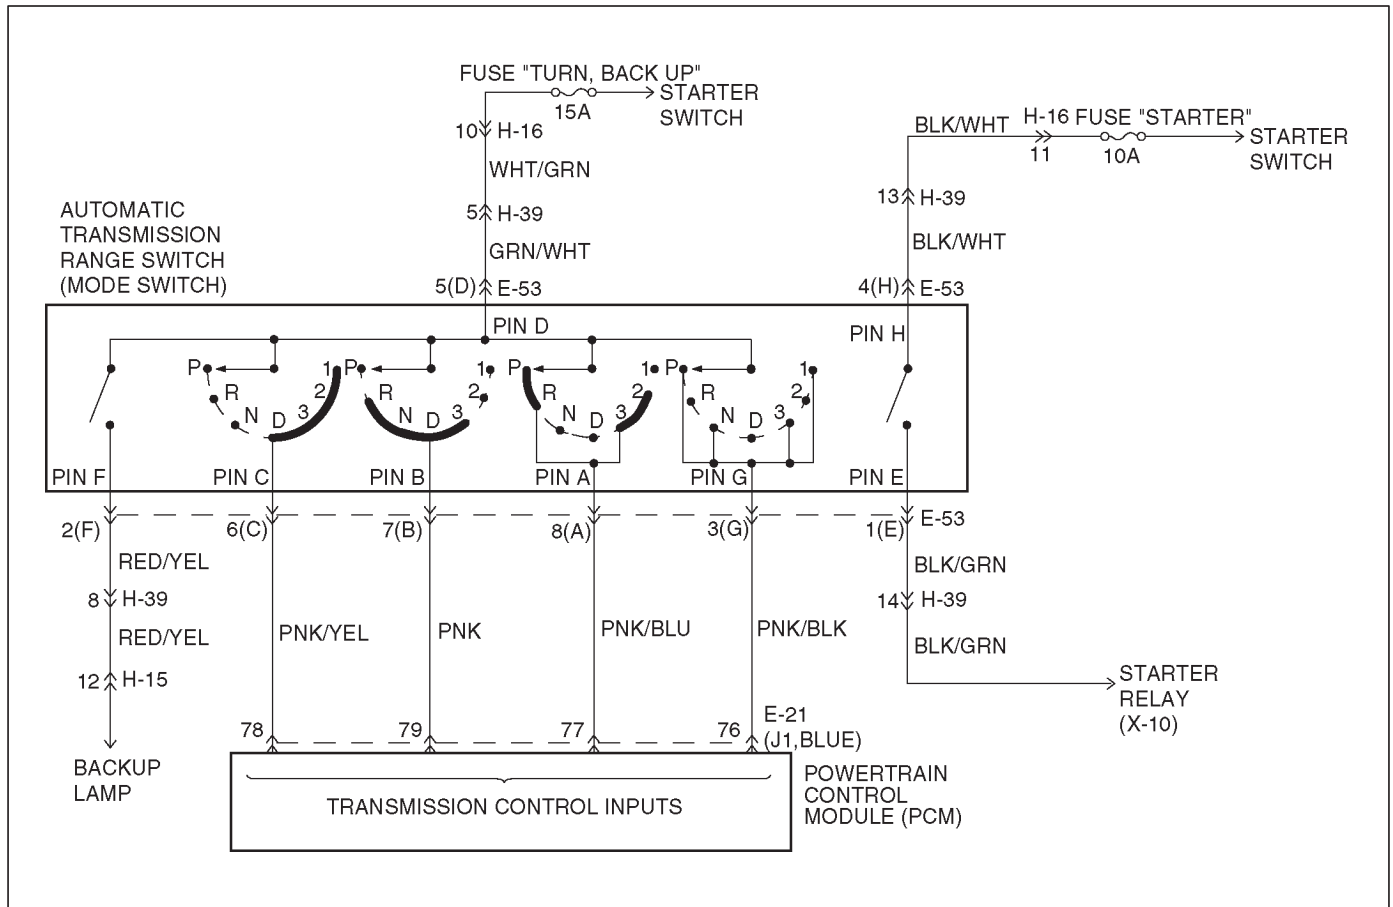

2. This test checks for a "skewed" sensor or shorted circuit.
3. This test simulates a TFT DTC P0713.

7A1-28 TRANSMISSION CONTROL SYSTEM (4L30-E)

DTC P0218/Flashing Code 71 Transmission Fluid Over Temperature

Step	Action	Yes	No
1	Perform the following checks: <ul style="list-style-type: none"> ● Check for possible engine system problems. ● Transmission fluid checking procedure. Refer to <i>Checking Transmission Fluid Level and Condition in Automatic Transmission (4L30-E) Section</i>. Were the checks performed?	Go to <i>Step 2</i>	Refer to <i>"Engine Manual"</i>
2	1. Install the scan tool. 2. With the engine "off", turn the ignition switch "on". NOTE: Before clearing DTC(s), use the scan tool to record "Failure Records" for reference, as data will be lost when "Clear Info" function is used. 3. Record the DTC "Failure Records". Is the TFT sensor signal voltage less than 1.54 volts?	Go to <i>Step 3</i>	Go to <i>Diagnostic Aids</i>
3	1. Turn the ignition "off". 2. Disconnect the transmission 7-way connector E-54 (additional DTCs may set). 3. With the engine "off", turn the ignition switch "on". Is the TFT sensor signal voltage greater than 4.92 volts?	Go to <i>Internal Wiring Harness Check</i>	Go to <i>Step 4</i>
4	Inspect/repair circuit RED/BLK for a short to ground. Was a problem found?	Go to <i>Step 6</i>	Go to <i>Step 5</i>
5	1. Inspect the PCM for poor connections. 2. Replace the PCM if no poor connections were found. Is the replacement complete?	Go to <i>Step 6</i>	—
6	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and ensure the following conditions are met: TFT is less than 125°C (257°F) for at least 10 seconds. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to <i>Step 1</i>	Repair verified Exit DTC table

DTC P0705/Flashing Code 73 Transmission Range Switch (Mode Switch) Illegal Position

D07R100027

Circuit Description

- The range switch supplies the Powertrain Control Module (PCM) with information regarding the selector lever position: P, R, N, D 3, 2 or L. The selector lever position is indicated by the state of four ON/OFF contracts. The range switch is located on one side of the transmission. It is on the transmission manual shaft and is fixed to the main case.
- The range switch is also used to provide the information P or N to the engine crank wiring. The engine can be cranked only if connector E-53 terminal 4(H) is connected to terminal 1(E) which is connected to ground.
- The range switch is also used to provide the backup lamp power in reverse. This is the reason why the range switch is supplied through a 15A fuse (TURN, BACK UP). This fuse can burn due to a short circuit in the back up lamp.

This DTC detects when a fuse is open or the range switch circuit does not work. This is a type "D" DTC.

Conditions For Setting The DTC

- Range switch illegal positions met for 5 seconds.

Action Taken When The DTC Sets

- Default to D position.
- Inhibit torque management.
- Turn Force Motor off.
- Maximum line pressure.
- The PCM will not illuminate the CHECK TRANS Lamp.

Conditions For Clearing The DTC

- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

7A1-30 TRANSMISSION CONTROL SYSTEM (4L30-E)

Diagnostic Aids

- Refer to accompanying chart for the normal range signals and the illegal combinations.
- Inspect the wiring for poor electrical connections at the PCM and at the transmission 8-way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Refer to the *“Range Switch Logic Table”* for further information.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

2. This test checks the indicated range signal to the manual valve actually selected.
5. This test checks for continuity between each selected range switch connector terminals.

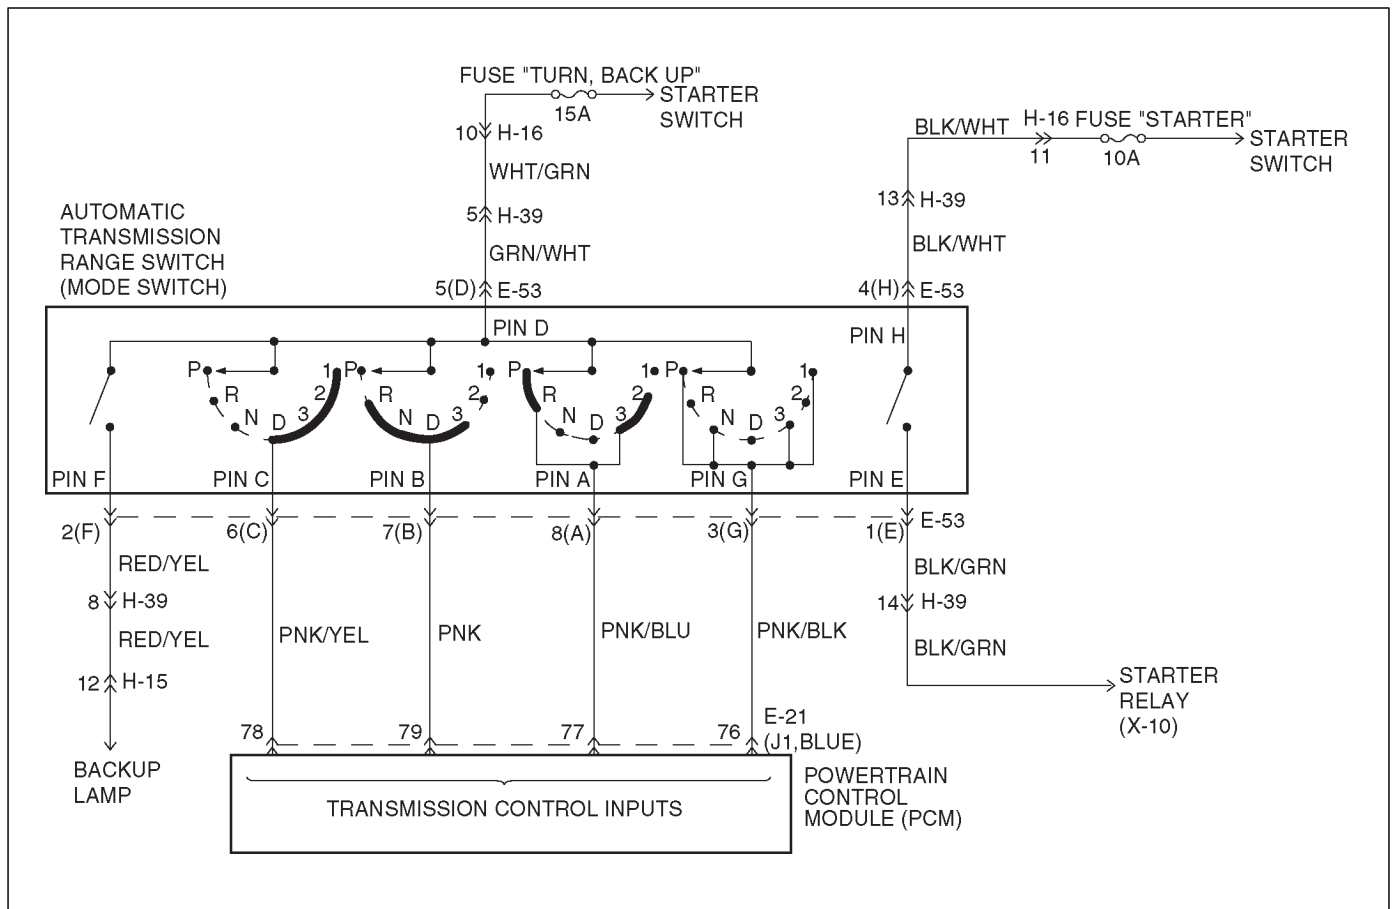

Range Switch Logic Table

Range Position	Range Switch Pin			
	A	B	C	P(G)
Park	ON	OFF	OFF	ON
Reverse	ON	ON	OFF	OFF
Neutral	OFF	ON	OFF	ON
D4	OFF	ON	ON	OFF
D3	ON	ON	ON	ON
2	ON	OFF	ON	OFF
L	OFF	OFF	ON	ON
Illegal	OFF	OFF	OFF	OFF
Illegal	OFF	OFF	OFF	ON

DTC P0705/Flashing Code 73 Transmission Range Switch (Mode Switch) Illegal Position

Step	Action	Yes	No
1	Perform the following checks: <ul style="list-style-type: none"> • The transmission linkage from the select lever to the manual valve is adjusted properly. • Diagnostic circuit check. Were the checks performed?	Go to <i>Step 2</i>	Refer to <i>Select Lever, and Mode Switch in Automatic Transmission (4L30-E) section</i>
2	1. Install the scan tool. 2. With the engine "off", turn the ignition switch "on". NOTE: Before clearing DTC(s), use the scan tool to record "Failure Records" for reference, as data will be lost when the "Clear Info" function is used. 3. Record the DTC "Failure Records". 4. Select each transmission range: DL, D2, D3, D4, N, R, and P. Does each selected transmission range match the scan tool "Range Switch" display?	Go to <i>Diagnostic Aids</i>	Go to <i>Step 3</i>
3	Are all range switch pin displays incorrect?	Go to <i>Step 4</i>	Go to <i>Step 5</i>
4	Check fuse and wiring to the 8-way connector terminal 5(D) for opens. Refer to <i>ode Switch in Automatic Transmission (4L30-E) section</i> . If no problem was found, replace the range switch. Is the replacement complete?	Go to <i>Step 8</i>	—
5	1. Disconnect the 8-way range switch connector. 2. Using ohmmeter, check continuity between terminal 5(D) and respectively terminals 3(G), 6(C), 7(B) and 8(A) of the 8-way range switch connector. 3. Move shift selector lever through all positions and compare results with "Range Switch Logic Table". Is one range switch pin display incorrect?	Go to <i>Step 6</i>	Go to <i>Step 7</i>
6	Check the affected wiring and connector, and repair. Is the repair complete?	Go to <i>Step 8</i>	—
7	Check the Powertrain Control Module (PCM) connectors for poor connection. If no problem was found, replace the PCM. Is the replacement complete?	Go to <i>Step 8</i>	—
8	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and road test the vehicle. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to <i>Step 1</i>	Repair verified Exit DTC table

DTC P0706/Flashing Code 74 Transmission Range Switch (Mode Switch) Performance

D07R100027

Circuit Description

- The range switch supplies the Powertrain Control Module (PCM) with information regarding the selector lever position: P, R, N, D, 3, 2 or L. The selector lever position is indicated by the state of four ON/OFF contracts. The range switch is located on one side of the transmission. It is on the transmission manual shaft and is fixed to the main case.
- The range switch is also used to provide the information P or N to the engine crank wiring. The engine can be cranked only if connector E-53 terminal 4(H) is connected to terminal 1(E) which is connected to ground.
- The range switch is also used to provide the back up lamp power in reverse. This is the reason why the mode switch is supplied through a 15A fuse (TURN, BACK UP). This fuse can burn due to a short circuit in the back up lamp.
- This DTC detects an invalid state of the range switch or the range switch circuit by deciphering the range switch inputs. This is a type "D" DTC.

Conditions For Setting The DTC

This DTC will set if any of the following conditions occurs:

Condition 1 ("R" bad position):

- Engine is running.
- No output speed DTC P0722 (Flashing Code 78), P0723 (Flashing Code 79).
- Output speed greater than 3,200 RPM.
- Range switch indicates "R".
- All conditions met for 4 seconds.

Condition 2 ("P" or "N" bad position):

- Engine is running.
- No TPS codes.
- Engine speed is less than 3,000 RPM.
- TP angle is greater than 20%.
- Range switch indicates "P" or "N".
- All conditions met for 4 seconds.

Action Taken When The DTC Sets

- Default to "D" position.
- The PCM will not illuminate the CHECK TRANS Lamp.

Conditions For Clearing The DTC

- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- Refer to the accompanying chart for the normal range signals and the illegal combinations.
- Inspect the wiring for poor electrical connections at the PCM and at the transmission 8-way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Refer to the “Range Switch Logic Table” for further information.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

2. This test checks the indicated range signal to the manual valve actually selected.
5. This test checks for continuity between each selected range switch connector terminals.

DTC P0712/Flashing Code 75 Transmission Fluid Temperature (TFT) Sensor Circuit Low Input

D07R100026

Circuit Description

The TFT sensor is a thermister that controls the signal voltage to the PCM. The PCM supplies a 5-volt reference signal to the sensor on circuit RED/BLK. When the transmission fluid is cold, the sensor resistance is high. The PCM detects high signal voltage. As the transmission fluid temperature increases to the normal operating temperature of 100°C (212°F), the sensor resistance becomes less and the voltage decreases to 1.5 to 2 volts. With transmission fluid over temperature and DTC P0218 (Flashing Code 71) also set, check the transmission cooling system.

This DTC detects a continuous short to ground in the TFT signal circuit or the TFT sensor. This is a type "D" DTC.

Conditions For Setting The DTC

- Battery voltage is between 10 and 16 volts.
- Ignition is "on".
- TFT sensor indicating a voltage less than 0.4 volts.
- All conditions met for 20 seconds.

Action Taken When The DTC Sets

- Transmission default temperature will be:
 - 80°C (176°F) if engine temperature code is set.
 - 100°C (212°F) if engine temperature is warm.
 - 80°C (176°F) if engine run time is greater than 5 minutes.
 - 21°C (69.8°F) if engine run time is less than 5 minutes.
- The PCM will not illuminate the CHECK TRANS Lamp.

Conditions For Clearing The DTC

- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

Diagnostic Aids

- Check harness routing for a potential short to ground in circuit RED/BLK. Scan tool TFT display should rise steadily to about 100°C (212°F), then stabilize.
- Inspect the wiring for poor electrical connection at the PCM and at the transmission 7-way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- The temperature to resistance value scale may be used to test the TFT sensor at the various temperature levels to evaluate the possibility of a "skewed" (mis-scaled) sensor.
 - A "skewed" sensor could result in delayed garage shifts or TCC complaints.
- Verify customer driving habits, trailer towing, etc.

7A1-36 TRANSMISSION CONTROL SYSTEM (4L30-E)

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

2. This test checks for a short to ground or a "skewed" sensor.
3. This test checks for an internal fault within the transmission by creating an open.

DTC P0712/Flashing Code 75 Transmission Fluid Temperature (TFT) Sensor Circuit Low Input

Step	Action	Yes	No
1	Perform the transmission fluid checking procedure. Refer to <i>Checking Transmission Fluid Level and Condition in Automatic Transmission (4L30-E)</i> section. Was the fluid checking procedure performed?	Go to Step 2	Refer to <i>Checking Transmission Fluid Level and Condition in Automatic Transmission (4L30-E)</i> section
2	1. Install the scan tool. 2. With the engine "off", turn the ignition switch "on". NOTE: Before clearing DTC(s), use the scan tool to record "Failure Records" for reference, as data will be lost when the "Clear Info" function is used. 3. Record the DTC "Failure Records". Does the scan tool display a TFT sensor signal voltage less than 0.4 volts?	Go to Step 3	Go to <i>Diagnostic Aids</i>
3	1. Turn the ignition "off". 2. Disconnect the transmission 7-way connector E-54. 3. Turn the ignition "on". Does the TFT signal voltage change to match the voltage 4.92 volts?	Go to Step 4	Go to Step 9
4	Using the J39200 DVOM, measure the resistance between terminals 3(C) and 5 (D). Is the resistance within specifications? (See Transmission Fluid Temperature (TFT) Sensor Specifications.)	Go to <i>Diagnostic Aids</i>	Go to Step 5
5	1. Disconnect the transmission 7-way connector E-54. 2. Using the J39200 DVOM, measure the resistance between terminals E54-4(F) and E54-1(E). Is the resistance within specifications? (See Transmission Fluid Temperature (TFT) Sensor Specifications.)	Go to <i>Diagnostic Aids</i>	Go to Step 6
6	1. Remove the transmission oil pan. Refer to <i>Transmission Oil Temperature Sensor (Adapter Case) in Automatic Transmission (4L30-E)</i> section. 2. Check the internal wiring harness for a short to ground. Was a problem found?	Go to Step 8	Go to Step 7
7	1. Disconnect the internal wiring harness at the TFT sensor. 2. Measure the resistance of the TFT sensor. Is the resistance within specifications? (See Transmission Fluid Temperature (TFT) Sensor Specifications.)	Go to <i>Diagnostic Aids</i>	Go to Step 8
8	Replace the TFT Sensor. Is the replacement complete?	Go to Step 12	—

DTC P0712/Flashing Code 75 Transmission Fluid Temperature (TFT) Sensor Circuit Low Input (Cont'd)

Step	Action	Yes	No
9	Check circuit RED/BLK for a short to ground. Was a problem found?	Go to <i>Step 12</i>	Go to <i>Step 10</i>
10	Check the PCM for faulty connections. Was a problem found?	Go to <i>Step 12</i>	Go to <i>Step 11</i>
11	Replace the PCM. Refer to <i>Powertrain Control Module (PCM) in Automatic Transmission (4L30-E) section</i> . Is the replacement complete?	Go to <i>Step 12</i>	—
12	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and ensure the following conditions are met: TFT sensor indicates a voltage greater than 0.33 volts for 2 seconds. 2. Review the scan tool "DTC info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to <i>Step 1</i>	Repair verified Exit DTC table

DTC P0713/Flashing Code 76 Transmission Fluid Temperature (TFT) Sensor Circuit High Input

D07R100026

Circuit Description

The TFT sensor is a thermistor that controls the signal voltage to the PCM. The PCM supplies a 5-volt reference signal to the sensor on circuit RED/BLK. When the transmission fluid is cold, the sensor resistance is high and the PCM will sense high signal voltage. As the transmission fluid temperature warms to the normal operating temperature of 100°C (212°F), the sensor resistance becomes less and the voltage decreases to about 1.5 to 2 volts.

This DTC detects a continuous open or short to power in the TFT signal circuit or the TFT sensor. This is a type "D" DTC.

Conditions For Setting The DTC

- Battery voltage is between 10 and 16 volts.
- Ignition is "on".
- TFT sensor indicating a voltage greater than 4.86 volts.
- All conditions met for 20 seconds.

Action Taken When The DTC Sets

- Transmission default temperature will be:
 - 80°C (176°F) if engine temperature code is set.
 - 100°C (212°F) if engine temperature is warm.
 - 80°C (176°F) if engine run time is greater than 5 minutes.
 - 21°C (69.8°F) if engine run time is less than 5 minutes.
- The PCM will not illuminate the CHECK TRANS Lamp.

Conditions For Clearing The DTC

- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the PCM and at the transmission 7-way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Scan tool displays transmission fluid temperature in degrees. After transmission is operating, the temperature should rise steadily to about 100°C (212°F), then stabilize.
- The temperature to resistance value scale may be used to check the TFT sensor at the various temperature levels to evaluate the possibility of a "skewed" (mis-scaled) sensor.

A "skewed" sensor could result in hard shifts or TCC complaints.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

2. This check verifies problem in the TFT sensor circuit.
3. This test simulates a TFT sensor DTC P0712. If the PCM recognizes the low signal voltage (high temperature), and the scan tool displays 146°C (295°F) or greater, the PCM and wiring are OK.
4. This test checks the TFT sensor and internal wiring harness.

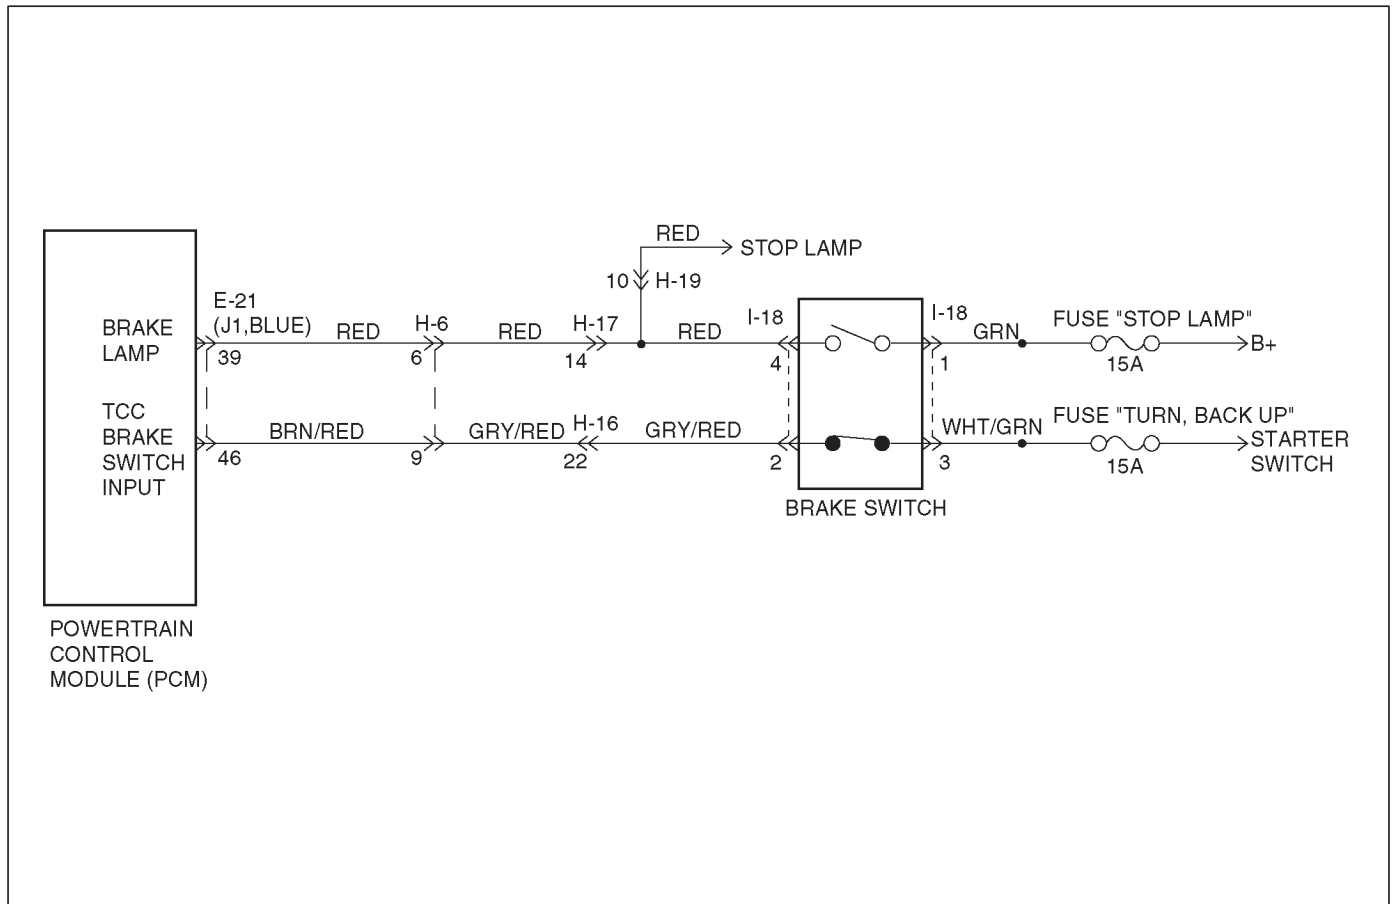

DTC P0713/Flashing Code 76 Transmission Fluid Temperature (TFT) Sensor Circuit High Input

Step	Action	Yes	No
1	Perform the transmission fluid checking procedure. Refer to <i>Checking Transmission Fluid Level and Condition in Automatic Transmission (4L30-E)</i> section. Was the fluid checking procedure performed?	Go to Step 2	Refer to <i>Checking Transmission Fluid Level and Condition in Automatic Transmission (4L30-E)</i> section
2	1. Install the scan tool. 2. With the engine "off", turn the ignition switch "on". NOTE: Before clearing DTC(s), use the scan tool to record "Failure Records" for reference, as data will be lost when the "Clear Info" function is used. 3. Record the DTC "Failure Records". Does the scan tool display a TFT sensor signal voltage greater than 4.86 volts?	Go to Step 3	Go to <i>Diagnostic Aids</i>
3	1. Turn the ignition "off". 2. Disconnect the transmission 7-way connector E-54. 3. Install a fused jumper wire from terminal E54-4(F) to E54-1(E) on the engine harness. 4. Turn the ignition "on". Does the TFT signal voltage drop to less than 0.4 volts?	Go to Step 4	Go to Step 9
4	1. Turn the ignition "off". 2. Using the J39200 DVOM, measure the resistance between terminals E54-4(F) and E54-1(E). Is the resistance within specifications? (See Transmission Fluid Temperature (TFT) Sensor Specifications.)	Go to <i>Diagnostic Aids</i>	Go to Step 5
5	1. Disconnect the transmission 7-way connector E-54. 2. Using the J39200 DVOM, measure the resistance between terminals E54-4(F) and E54-1(E). Is the resistance within specifications? (See Transmission Fluid Temperature (TFT) Sensor Specifications.)	Go to <i>Diagnostic Aids</i>	Go to Step 6
6	1. Remove the transmission oil pan. 2. Check the internal wiring harness for an open. Refer to <i>Transmission Oil Temperature Sensor (Adapter Case) in Automatic Transmission (4L30-E)</i> section. Was a problem found and corrected?	Go to Step 13	Go to Step 7
7	1. Disconnect the internal wiring harness at the TFT sensor. 2. Measure the resistance of the TFT sensor. Is the resistance within specifications? (See Transmission Fluid Temperature (TFT) Sensor Specifications.)	Go to <i>Diagnostic Aids</i>	Go to Step 8

7A1-40 TRANSMISSION CONTROL SYSTEM (4L30-E)

DTC P0713/Flashing Code 76 Transmission Fluid Temperature (TFT) Sensor Circuit High Input (Cont'd)

Step	Action	Yes	No
8	Replace TFT sensor. Refer to <i>Transmission Oil Temperature Sensor (Adapter Case) in Automatic Transmission (4L30-E) section</i> . Is the replacement complete?	Go to <i>Step 13</i>	—
9	Check circuit RED/BLK for an open or short to B+. Was a problem found?	Go to <i>Step 13</i>	Go to <i>Step 10</i>
10	Check circuit RED/WHT for an open. Was a problem found?	Go to <i>Step 13</i>	Go to <i>Step 11</i>
11	Check the PCM for faulty or intermittent connections. Was a problem found?	Go to <i>Step 13</i>	Go to <i>Step 12</i>
12	Replace the PCM. Refer to <i>Powertrain Control Module (PCM) in Automatic Transmission (4L30-E) section</i> . Is the replacement complete?	Go to <i>Step 13</i>	—
13	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and ensure the following conditions are met: TFT sensor indicates a voltage less than 4.92 volts for 2 seconds. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to <i>Step 1</i>	Repair verified Exit DTC table

DTC P0719/Flashing Code 77 TCC Brake Switch Circuit High (Stuck On)**Circuit Description:**

The brake switch indicates brake pedal status to the Powertrain Control Module (PCM). The brake switch is a normally-closed switch that supplies battery voltage on circuit GRY/RED-BRN/RED to the PCM. Applying the brake pedal opens the switch, interrupting voltage to the PCM. When the brake pedal is released, the PCM receives a constant voltage signal. If the PCM receives a zero voltage signal at the brake switch input, and the Torque Converter Clutch (TCC) is engaged, the PCM de-energizes the Torque Converter Clutch Solenoid Valve (TCC Sol. Valve). The PCM disregards the brake switch input for TCC scheduling if there is a brake switch circuit fault (Refer to *Diagnostic Aids*).

When the PCM detects an open brake switch circuit (0 volts, low input) during accelerations, then DTC P0719 sets. DTC P0719 is a type D DTC.

Conditions For Setting The DTC

- No OSS Assy. DTCs P0722 (Flashing Code 78) or P0723 (Flashing Code 79).

- The PCM detects an open brake switch or circuit (0 volts) for 15 minutes without changing for 2 seconds, and the following events occur seven consecutive times.
 - The vehicle speed is less than 8 km/h (5 mph).
 - then the vehicle speed is 8–32 km/h (5–20 mph) for 4 seconds.
 - then the vehicle speed is greater than 32 km/h (20 mph) for 4 seconds.

Action Taken When The DTC Sets

- The PCM does not illuminate the Malfunction Indicator Lamp (MIL).
- DTC P0719 stores in PCM history.

Conditions For Clearing The DTC

- A scan tool can clear the DTC from the PCM history.
- The PCM clears the DTC from the PCM history if the vehicle completes 40 warm-up cycles without a failure reported.
- The PCM cancels the DTC default actions when the fault no longer exists and the ignition is OFF long enough in order to power down the PCM.

7A1-42 TRANSMISSION CONTROL SYSTEM (4L30-E)

Diagnostic Aids

- Inspect the wiring for poor electrical connections at the PCM and brake switch. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Check customer driving habits and/or unusual driving conditions (i.e. stop and go, highway).
- Check brake switch for proper mounting and adjustment.

Test Description

The numbers below refer to the step numbers on the diagnostic chart.

2. This step isolates the brake switch as a source for setting the DTC.

DTC P0719/Flashing Code 77 TCC Brake Switch Circuit High (Stuck On)

Step	Action	Yes	No
1	1. Install the scan tool. 2. With the engine "off," turn the ignition switch to the "on" position. NOTE: Before clearing the DTC(s), use the scan tool in order to record the "Failure Records" for reference. Using the "Clear Info" function will erase the stored "Failure Records" from the PCM. 3. Record the "Failure Records", then clear the DTC(s). 4. Select "Brake Switch" on the scan tool. 5. Disconnect the brake switch connector from the brake switch. 6. Connect a test lamp from cavity I18-3 of the brake switch connector to a known good ground. Is the test lamp ON?	Go to <i>Step 2</i>	Go to <i>Step 3</i>
2	Install a J 36169-A Fused Jumper Wire from terminal I18-2 to terminal I18-3 of the brake switch connector. Did the TCC Brake Switch status change from Open to Closed?	Go to <i>Step 6</i>	Go to <i>Step 8</i>
3	1. Remove the fuse "TURN, BACK UP" (15A). 2. Inspect the fuse for an open. Is the fuse open?	Go to <i>Step 4</i>	Go to <i>Step 7</i>
4	Inspect circuit WHT/GRN for a short to ground condition. Repair the circuit if necessary. Did you find a short to ground condition?	Go to <i>Step 10</i>	Go to <i>Step 5</i>
5	Inspect circuit GRY/RED-BRN/RED for a short to ground condition. Repair the circuit if necessary. Did you find a short to ground condition?	Go to <i>Step 10</i>	Go to <i>Step 9</i>
6	Replace the brake switch. Is the replacement complete?	Go to <i>Step 10</i>	—
7	Inspect circuit WHT/GRN for an open condition. Repair the circuit if necessary. Did you find and correct an open condition?	Go to <i>Step 10</i>	—
8	Inspect circuit GRY/RED-BRN/RED for an open. Did you find an open condition?	Go to <i>Step 10</i>	Go to <i>Step 9</i>
9	Replace the PCM. Is the replacement complete?	Go to <i>Step 10</i>	—
10	In order to verify your repair, perform the following procedure: 1. Select DTC. 2. Select Clear Info. 3. With the engine "off," turn the ignition switch to the "on" position. 4. Do not depress the brake pedal. 5. Verify that the TCC Brake Switch status indicates "Closed" (12 volts) for 2 seconds. 6. Select Specific DTC. Enter DTC P0719. Has the test run and passed?	System OK	Begin the diagnosis again. Go to <i>Step 1</i>

DTC P0722/Flashing Code 78 Transmission Output Speed Sensor (OSS) Low Input

D07RY00032

Circuit Description

Output speed information is provided to the PCM by the OSS, which is a permanent magnet (PM) generator. The PM generator produces a pulsing AC voltage. The AC voltage level and number of pulses increases as the speed of the vehicle increases. The PCM then converts the pulsing voltage to output speed, which is used for calculations. The vehicle speed can be displayed with a scan tool.

This DTC detects a low output speed when there is a high engine speed in a drive gear range. This is a type "C" DTC.

Conditions For Setting The DTC

- No MAP DTCs P0107 or P0108, P0106, P1106, P1107.
- No TPS DTCs P0122 or P0123.
- Not in Park or Neutral.
- TPS angle is greater than 10%.
- Engine vacuum is between 0 and 70kPa.
- Engine speed is between 3000 and 7000 rpm.
- Transmission output speed is less than 0 rpm.
- All conditions met for 5 seconds.

Action Taken When The DTC Sets

- Fixed to 4th gear.
- Maximum line pressure.
- Inhibit TCC engagement.
- The PCM will illuminate the CHECK TRANS Lamp.

Conditions For Clearing The DTC/CHECK TRANS Lamp

- The PCM will turn off the CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool. The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

Diagnostic Aids

- An OSS DTC P0722 will set when no output speed is detected at start off.
- Inspect the wiring for poor electrical connection at the PCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move or massage the wiring harness while observing test equipment for a change.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

3. This test checks the OSS circuit.
4. This test checks the integrity of the OSS.
6. This test checks the 5-volt and ground circuit of the PCM.

DTC P0722/Flashing Code 78 Transmission Output Speed Sensor (OSS) Low Input

Step	Action	Yes	No
1	<ol style="list-style-type: none"> 1. Install the scan tool. 2. With the engine "off", turn the ignition switch "on". <p>NOTE: Before clearing DTC(s), use the scan tool to record "Failure Records" for reference, as data will be lost when the "Clear Info" function is used.</p> <ol style="list-style-type: none"> 3. Record the DTC "Failure Records". 4. Raise the drive wheels. 5. Start the engine. 6. 7A1-46 TRANSMISSION CONTROL SYSTEM (4L30-E)

DTC P0722/Flashing Code 78 Transmission Output Speed Sensor (OSS) Low Input (Cont'd)

Step	Action	Yes	No
14	Repair the short to B+ in circuit BLU/YEL. Is the repair complete?	Go to <i>Step 16</i>	—
15	Replace the PCM. Refer to <i>Powertrain Control Module (PCM) in automatic Transmission (4L30-E) section</i> . Is the replacement complete?	Go to <i>Step 16</i>	—
16	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and operate the vehicle under the following conditions: <ul style="list-style-type: none">• Transmission output speed is greater than 101 rpm for 3 seconds. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to <i>Step 1</i>	Repair verified Exit DTC table

DTC P0723/Flashing Code 79 Transmission Output Speed Sensor (OSS) Intermittent

D07RY00032

Circuit Description

Output speed information is provided to the PCM by the OSS, which is a permanent magnet (PM) generator. The PM generator produces a pulsing AC voltage. The AC voltage level and number of pulses increases as the speed of the vehicle increases. The PCM then converts the pulsing voltage to output speed, which is used for calculations. The vehicle speed can be displayed with a scan tool.

This DTC detects a low output speed when there is a high engine speed in a drive gear range. This is a type "C" DTC.

Conditions For Setting The DTC

Drive range

- Transmission output speed is greater than 1300 rpm for 2 seconds.
- Engine running time is greater than 5 seconds.
- NORAW-NOLAST < 200 rpm for 2 seconds.
 - NORAW: Latest raw data of output shaft speed.
 - NOLAST: Filtered previous data of output speed.
- Transmission negative output speed change is greater than 1300 rpm.
- Conditions met for 3 seconds.

Action Taken When The DTC Sets

- Fixed to 4th gear.
- Maximum line pressure.
- Inhibit TCC engagement.
- The PCM will illuminate the CHECK TRANS Lamp.

Conditions For Clearing The DTC/CHECK TRANS Lamp

- The PCM will turn off the CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

Diagnostic Aids

- A OSS DTC P0723 will set when output speed has been detected and is lost.
- Inspect the wiring for poor electrical connection at the PCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

3. This test checks the OSS circuit.
4. This test checks the integrity of the OSS.
6. This test checks the 5-volt and ground circuit of the PCM.

7A1-48 TRANSMISSION CONTROL SYSTEM (4L30-E)

DTC P0723/Flashing Code 79 Transmission Output Speed Sensor (OSS) Intermittent

Step	Action	Yes	No
1	<ol style="list-style-type: none"> 1. Install the scan tool. 2. LD : LOCKED IN DRIVE

FW : FREEWHEELING

NE : NOT EFFECTIVE

D07RT015

Circuit Description

- The Powertrain Control Module (PCM) calculates the slippage of the converter and transmission based upon the engine speed, the output speed, and the current gear ratio.
- The slippage of the converter at a high enough engine speed is low. The transmission should not slip more than a given value when there is no shift.
- This DTC detects a slip at each gear. This is a type "C" DTC.

Conditions For Setting The DTC

- No Output Speed Sensor DTC(s) P0722 (Flashing Code 78), P0723 (Flashing Code 79).
- Not in Park, Neutral or Reverse.
- Engine speed is greater than 3500 rpm.

- 3 seconds since upshift.
- 3 seconds since downshift.
- 3 seconds since garage shift (N→D).
- And one of the following conditions occur:
 - Slip is greater than 720 rpm in 1st gear.
 - Slip is greater than 680 rpm in 2nd gear.
 - Slip is greater than 660 rpm on 3rd gear.
 - Slip is greater than 650 rpm on 4th gear.
- All conditions met for 5.5 seconds.

Action Taken When The DTC Sets

- Maximum line pressure.
- The PCM will illuminate the CHECK TRANS Lamp.
- Turn Force Motor off.

Conditions For Clearing The DTC/CHECK TRANS Lamp

- The PCM will turn “off” the CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from PCM memory by using a scan tool. The DTC can also be cleared from memory when the vehicle has made 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC Actions Taken items when the fault conditions no longer exist and the ignition is cycles “off” long enough to power down the PCM.

Diagnostic Aids

- Check for intermittent output speed sensor circuit problems.
- Check for possible incorrect calibration. (PCM part No., tire specifications, and rear axle ratio)

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

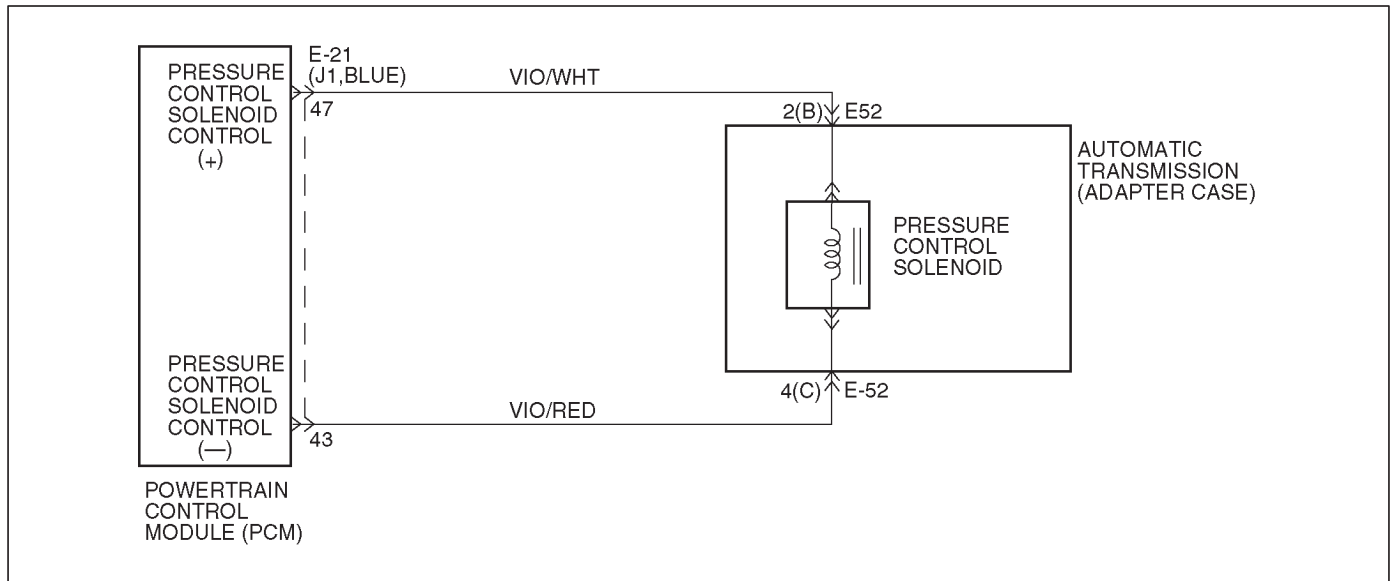

2. This step checks for possible low fluid level causing slipping resulting in an undefined gear ratio.
3. This step checks for correct gear ratios for commanded gears.
4. This step checks for low line pressure.

7A1-52 TRANSMISSION CONTROL SYSTEM (4L30-E)

DTC P0730/Flashing Code 81 Transmission Incorrect Gear Ratio

Step	Action	Yes	No
1	<p>Visually inspect the transmission cooling system for fluid leaks.</p> <ul style="list-style-type: none"> Refer to <i>Chart 16: Possible Causes of Transmission Fluid Leaks of Mechanical/Hydraulic Diagnosis Symptoms Index in Automatic Transmission (4L30-E) section.</i> <p>Was condition found and corrected?</p>	Go to <i>Step 6</i>	Go to <i>Step 2</i>

DTC P0748/Flashing Code 82 Pressure Control Solenoid (PCS) (Force Motor) Circuit Electrical

Circuit Description

The PCS is a PCM-controlled device used to regulate transmission line pressure. The PCM compares TPS voltage, engine rpm, and other inputs to determine the line pressure appropriate for a given load. The PCM will regulate the pressure by applying a varying amperage to the PCS. The applied amperage can vary from 0.1 to 1 amp, and is monitored by the PCM.

This DTC detects a continuous open or short to ground in the PCS circuit or the PCS. This is a type "C" DTC.

Conditions For Setting The DTC

- Battery voltage is between 10 and 16 volts.
- The PCM detects that the difference between commanded and actual current is 200 milliamperes (mA) for over 1 second.
- Engine speed is greater than 300 rpm.

Action Taken When the DTC Sets

- Maximum line pressure.
- The PCM will illuminate the CHECK TRANS Lamp.
- Turn Force Motor off.

Conditions For Clearing The DTC/CHECK TRANS Lamp

- The PCM will turn "off" the CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.

- The DTC can be cleared from PCM history by using a scan tool.
- The DTC will be cleared from memory when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the PCM and at the transmission 4-way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

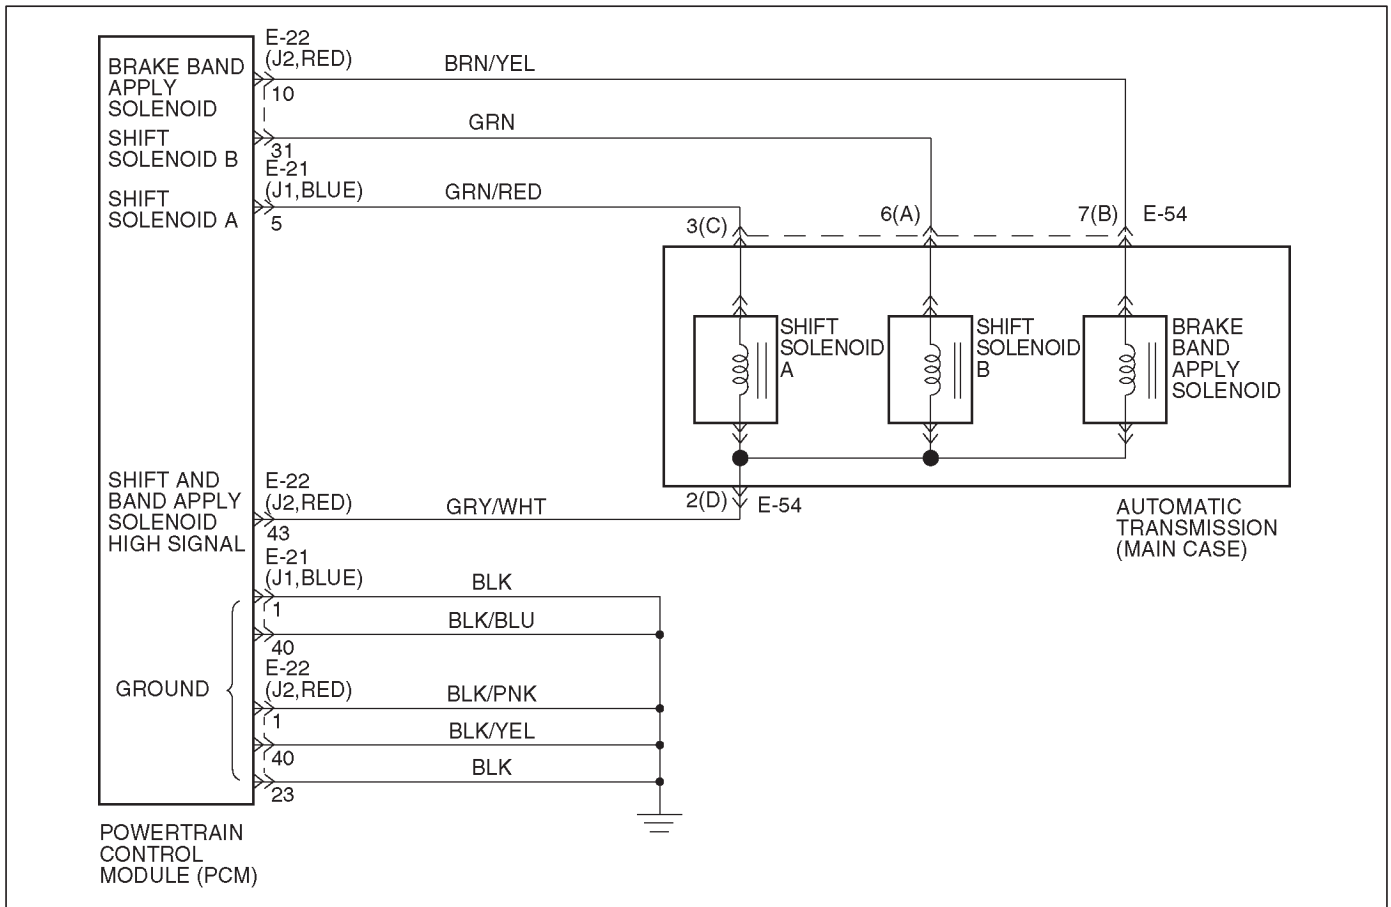

1. This test checks the ability of the PCM to command the PCS.
2. This test checks the PCS and internal wiring harness for incorrect resistance.

7A1-54 TRANSMISSION CONTROL SYSTEM (4L30-E)

DTC P0748/Flashing Code 82 Pressure Control Solenoid (PCS) (Force Motor) Circuit Electrical

Step	Action	Yes	No
1	<p>1. Install the scan tool. 2. With the engine "off", turn the ignition switch "on".</p> <p>NOTE: Before clearing DTC(s), use the scan tool to record "Failure Records" for reference, as data will be lost when the "Clear Info" function is used.</p> <p>3. Record the DTC "Failure Records". 4. While the engine is operating, put the transmission in Park. 5. Using the scan tool, apply 0.1 amp through 1.0 amp while observing "PC Ref. Current" and "PC Act. Current".</p> <p>Is the "PC Act. Current" reading always within 0.16 amp?</p>	Go to <i>Diagnostic Aids</i>	Go to <i>Step 2</i>
2	<p>1. Turn the ignition "off". 2. Disconnect the transmission 4-way connector E-52. 3. Using the J39200 DVOM, measure the resistance between terminals E52-2(B) and E52-4(C).</p> <p>Is the resistance within 3-7 ohms?</p>	Go to <i>Step 6</i>	Go to <i>Step 3</i>
3	<p>1. Remove the transmission oil pan. Refer to <i>Solenoid (Adapter Case Valve Body) in Automatic Transmission (4L30-E) section</i>. 2. Disconnect the internal wiring harness at the PCS. 3. Measure the resistance of the PCS.</p> <p>Is the resistance within 3-7 ohms?</p>	Go to <i>Step 5</i>	Go to <i>Step 4</i>
4	<p>Replace the PCS.</p> <p>Is the replacement complete?</p>	Go to <i>Step 9</i>	—

DTC P0753/Flashing Code 83 Shift Solenoid A Electrical

Circuit Description

- The shift solenoid A is a simple on/off solenoid located in the main case valve body. The solenoid is the normally closed type. In second or third gear the Powertrain Control Module (PCM) energizes the solenoid to open a fluid inlet port. When the port is open, fluid pressure actuates the shift valve.
- The solenoid is activated by a current. This current is produced by applying a voltage to one side (the High side) and a ground to the other side (Low side).
- The High Side Driver (HSD) is a circuit of the PCM that acts as a switch between the solenoids and the supply voltage. The High side of the solenoid is permanently supplied with voltage, except in BACKUP MODE or when ignition is off the HSD is turned off.

This DTC detects a continuous open or short to ground in the shift solenoid A circuit or the shift solenoid A. This is a type "C" DTC.

Conditions For Setting The DTC

- Ignition is "on", Engine "run".
- Battery voltage is between 10 and 16 volts.
- The PCM commands the solenoid "on" and the voltage remains high (B+), or the PCM commands the solenoid "off" and the voltage remains low (zero volts).
- All conditions met for 0.84-1.0 seconds.

Action Taken When The DTC Sets

- Maximum line pressure.
- Immediate landing to 4th gear.
- Inhibit TCC engagement.
- The PCM will illuminate the CHECK TRANS Lamp.

Conditions For Clearing The DTC/CHECK TRANS Lamp

- The PCM will turn off the CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the PCM and at the transmission 7-way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.

7A1-56 TRANSMISSION CONTROL SYSTEM (4L30-E)

- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- An open ignition feed circuit can cause multiple DTCs to set.
- A shift solenoid B DTC P0758 (Flashing Code 84) could also set with a shift solenoid A electrical failure.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

2. This test checks for power to the shift solenoid A from the ignition through the PCM.

4. This test measures the resistance of the component.
7. This test checks the function of the shift solenoid A and the transmission internal wiring harness.

DTC P0758/Flashing Code 84 Shift Solenoid B Electrical

Circuit Description

- The shift solenoid B is a simple on/off solenoid located in the main case valve body. It is normally open. When the port is open, fluid pressure actuates the shift valve. In first or second gear, the Powertrain Control Module (PCM) energizes the solenoid to close a fluid inlet port.
- The solenoid is activated by current. This current is produced by applying a voltage to one side (the High side) and a ground to the other side (Low side).
- The High Side Driver (HSD) is a circuit of the PCM that acts as a switch between the solenoids and the supply voltage. The High side of the solenoid is permanently supplied with voltage. In BACKUP MODE or when the ignition is off, the HSD is turned off.

This DTC detects a continuous open or short to ground in the shift solenoid B circuit or shift solenoid B. This is a type “C” DTC.

Conditions For Setting The DTC

- Ignition is “on”, Engine “run”.
- Battery voltage is between 10 and 16 volts.
- The PCM commands the solenoid “on” and the voltage remains high (B+), or the PCM commands the solenoid “off” and the voltage remains low (zero volts).
- All conditions met for 0.84–1.0 seconds.

Action Taken When The DTC Sets

- Fixed to 4th gear.
- Maximum line pressure.
- Inhibit TCC engagement.
- The PCM will illuminate the CHECK TRANS Lamp.

Conditions For Clearing The DTC/CHECK TRANS Lamp

- The PCM will turn off the CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connections at the PCM and at the transmission 7–way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.

- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

4. This test measures the resistance of the component.
5. This test checks the function of the shift solenoid B and the transmission internal wiring harness.
8. This test checks for power to the shift solenoid B from the ignition through the PCM.

DTC P1850/Flashing Code 88 Brake Band Apply Solenoid Malfunction

D07RY00035

Circuit Description

- The brake band apply solenoid is a normally open solenoid which controls the flow of fluid for brake band application. The Powertrain Control Module (PCM) uses Pulse Width Modulation (PWM) and changes the duty cycle to control the solenoid. The PCM turns the solenoid on (energized) and off (deenergized) at a constant frequency. The length of time the solenoid is energized during each on/off cycle is called the pulse width. By varying or "modulating" the pulse width, the solenoid output pressure is changed. Since the solenoid is normally open, increasing the pulse width increases the duty cycle and decreases the output pressure. PWM control provides smooth band application without an accumulator. The band is only applied in first and second gears.
- In the event of an electrical failure (open), the solenoid regulates at the maximum oil flow (0% duty cycle).
- The solenoid is activated by a current. This current is produced by applying a voltage to one side (the High side) and a ground to the other side (Low side).
- The High Side Driver (HSD) is a circuit of the PCM that acts as a switch between the solenoids and the supply voltage. The High side of the solenoid is permanently supplied with voltage. When the ignition is off, the HSD is turned off.

This DTC detects a continuous open or short to ground in the brake band apply solenoid circuit or the brake band apply solenoid. This is a type "D" DTC.

Conditions For Setting The DTC

- Battery voltage is between 10 and 16 volts.
- Ignition is "on", Engine "run".
- The PCM commands the solenoid "on" and the voltage remains high (B+), or the PCM commands the solenoid "off" and the voltage remains low (zero volts).
- All conditions met in 1.34~1.56 seconds.

Action Taken When The DTC Sets

- Inhibit brake band apply solenoid.
- The PCM will not illuminate the CHECK TRANS Lamp.

Conditions For Clearing The DTC

- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the PCM and at the transmission 7-way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

2. This test checks for power to the brake band apply solenoid from the ignition through the PCM.
3. This test checks the resistance of the transmission internal wiring harness and brake band apply solenoid.
4. This test checks the ability of the PCM and wiring to control the ground circuit.

DTC P1860/Flashing Code 89 TCC Solenoid Electrical

D07RY00036

Circuit Description

The PCM allows current to flow through the solenoid (0 or 12 volts). This current flow through the solenoid coil creates a magnetic field that magnetizes the solid core. The magnetized core attracts the check ball to seat against spring pressure. This blocks the exhaust for the TCC signal fluid and allows solenoid feed drive fluid to feed to TCC signal circuit. The TCC signal fluid pressure acts on the torque converter clutch control valve. When the TCC control valve is in the apply position, line pressure is directed through the TCC valve to apply the torque converter clutch. The TCC solenoid is attached to the valve body within the transmission.

This DTC detects a continuous open or short to ground or ignition in the TCC circuit or the TCC solenoid. This is a type "C" DTC.

Conditions For Setting The DTC

- Battery voltage is between 10 and 16 volts.
- No shift solenoid A DTCs P0753 (Flashing Code 83).
- No shift solenoid B DTCs P0758 (Flashing Code 84).
- Ignition "on". Engine "run".
- The PCM commands the solenoid "on" and the voltage remains low (zero volts).
- The PCM commands the solenoid "off" and the voltage remains high (B+).
- All conditions met for 0.875 ~ 1.25 seconds.

Action Taken When The DTC Sets

- Inhibit TCC engagement.
- The PCM will illuminate the CHECK TRANS Lamp.

Conditions For Clearing The DTC

- The PCM will turn off the CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connections at the PCM and at the transmission 4-way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

2. This test checks for voltage to the solenoid.
3. This test checks the ability of the PCM and wiring to control the ignition circuit.
7. This test checks the resistance of the TCC solenoid and the internal wiring harness.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

MUA5C Transmission

A07RX005

The MUA5C is a constant mesh transmission, synchronized in all speeds. The transmission is designed for a great reduction of the shift effort and the quietest possible operation.

Principle parts of the transmission are the integral clutch housing, intermediate plate, the transfer case, the rear cover, and the gears.

The transmission control box and transfer control box are built into the transmission and transfer case.

Diagnosis (MUA)

Condition	Possible cause	Correction
Abnormal noise	Flywheel pilot bearing worn	Replace
	Bearings worn or broken (Mainshaft, counter shaft, and transfer shaft)	Replace
	Gear tooth contact surfaces worn or scuffed (Mainshaft, counter shaft, reverse idler gear and transfer gears)	Replace
	Splines worn (Mainshaft, synchronizer clutch hub)	Replace
	Gear or bearing thrust face seized	Replace
	Lack of backlash between meshing gears	Replace
Hard Shifting	Improper clutch pedal free play	Readjust
	Change lever sliding portions worn	Repair or replace Regrease
	Shift block, shift rod and/or control box sliding faces worn	Replace
	Shift arm and synchronizer sleeve groove worn	Replace worn parts
	Thrust washer, collar, and/or gear thrust faces worn (Mainshaft and counter shaft thrust play)	Replace worn parts
	Synchronizer parts worn	Replace
Walking or Jumping out of gear	Detent ball worn	Replace
	Detent spring weakened or broken	Replace
	Shift rod and/or control box sliding faces worn	Replace
	Shift arm and synchronizer sleeve groove worn	Replace worn parts
	Thrust washer, collar, and/or gear thrust faces worn (Mainshaft and counter shaft thrust play)	Replace worn parts
	Bearings worn or broken	Replace
	Splines worn (Mainshaft, synchronizer hub)	Replace
	Synchronizer spring weakened or broken	Replace
Oil leakage	Loose drain plug(s) and/or filler plug(s)	Tighten Replenish oil
	Defective or improperly installed gasket(s)	Replace
	Oil seal worn or scratched	Replace

Transmission (MUA)

Removal

NOTE: Before removing transmission assembly from vehicle, change the transfer mode to 2WD using the 4WD push button on dash panel.

1. Disconnect battery ground cable.
2. Remove gear control lever knob(1).
3. Remove transfer control lever knob(2).

4. Remove lower cluster assembly.

740RW021

6. Remove center console(3).

F07RW018

5. Remove rear console.

256RW045

7. Remove grommet assembly(4).

F07RW016

7B-6 MANUAL TRANSMISSION

8. Remove gear control lever(5) and transfer control lever(5).
9. Raise and support vehicle with suitable stands. Remove transfer protector(6).

150RX010

10. Remove rear propeller shaft(7).

NOTE: Apply alignment marks on the flange at both front and rear sides.

401RW008

11. Remove front propeller shaft(8).

NOTE: Apply alignment marks on the flange at both front and rear sides.

401RW007

12. Remove center exhaust pipe(9).

150RX009

13. Disconnect transmission harness connectors and clip.
 Connector: Transfer switch, 2-4 actuator, speed sensor, back up switch.

14. Remove transmission harness clamps(10) from the transmission case and bracket.

15. Remove harness heat protector(11).
 16. Remove dust covers(12).
 17. Support transmission with a transmission jack.

18. Remove engine rear mount nuts(13) from third crossmember.

19. Remove third crossmember(14) by removing six fixing bolts.
 20. Remove starter(15).
 21. Remove flywheel under cover(16).
 22. Use clutch release bearing remover 5-8840-2291-0 to disconnect the clutch release bearing from the clutch pressure plate.

23. Pull the shift fork toward the transmission to press the clutch release bearing against the clutch pressure plate.

7B-8 MANUAL TRANSMISSION

24. Insert the clutch release bearing remover 5-8840-2291-0 between the wedge collar and the release bearing.

NOTE: Be sure not to insert the remover between the wedge collar and the clutch.

25. Turn the remover to separate the release bearing.

26. Remove transmission retaining nut and bolts (17). Remove transmission (18) from the vehicle.

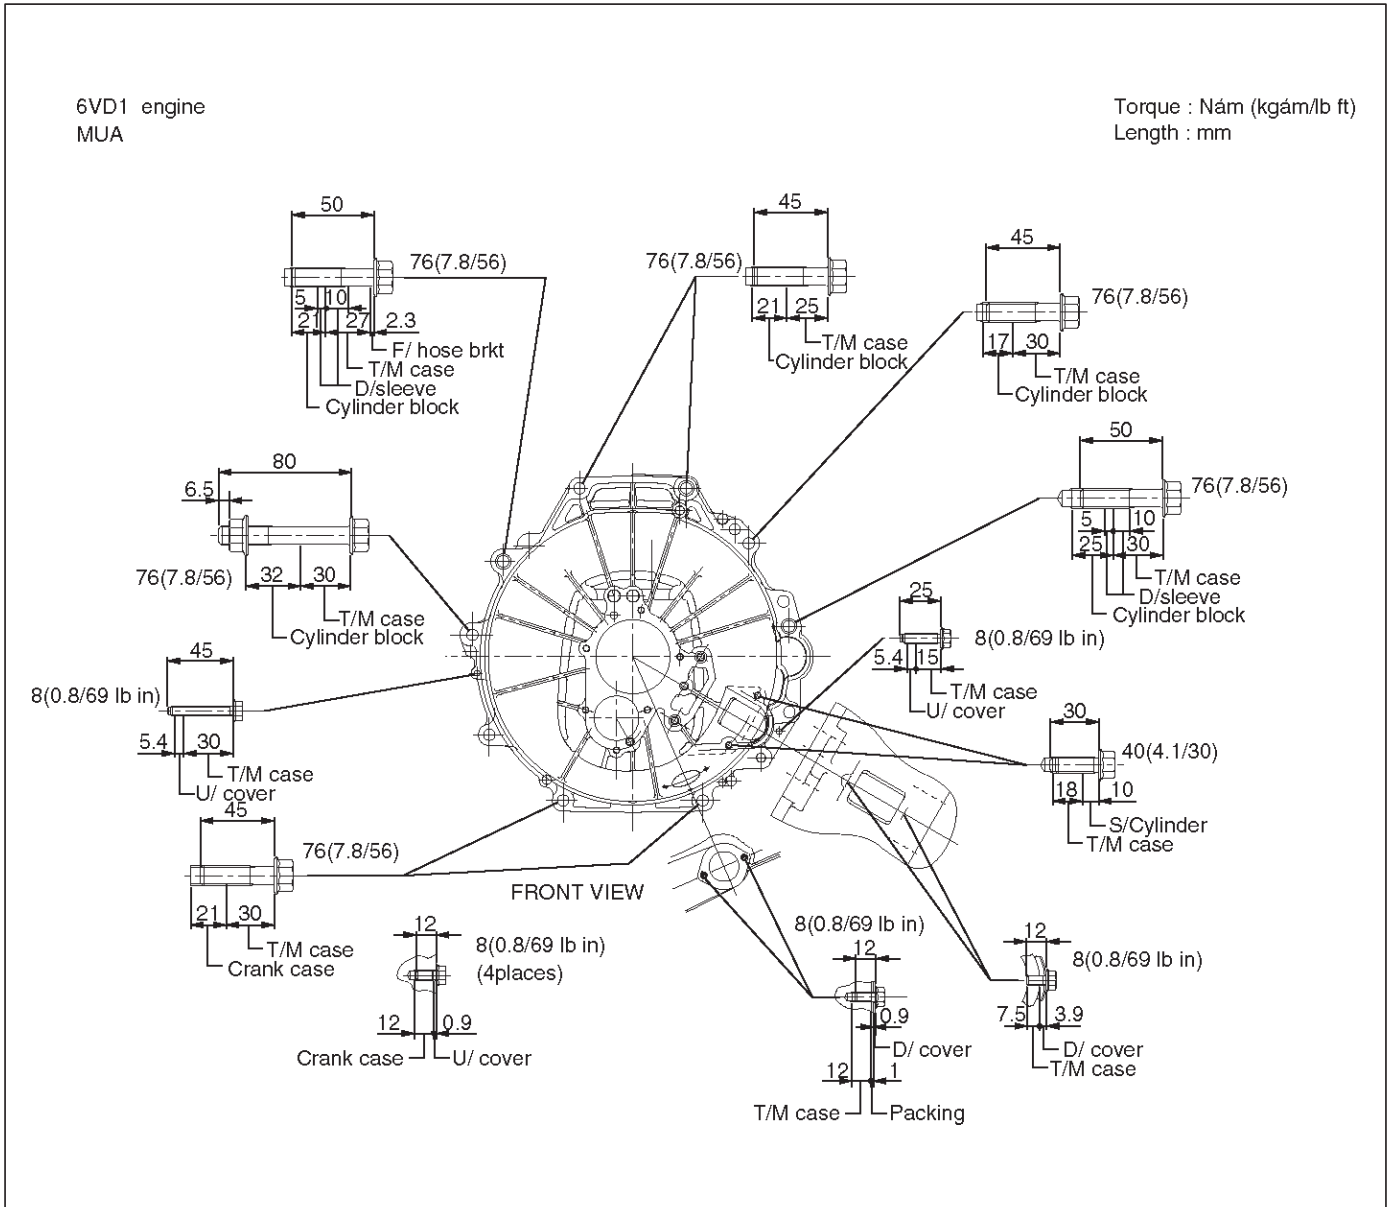

Installation

1. Apply a thin coat of molybdenum disulfide grease to the top gear shaft spline.
2. Slowly operate the transmission jack until the front of transmission is aligned with the rear of the engine. The slope of the engine and the transmission must be the same.
3. Align the top gear shaft spline with the clutch driven plate spline.

4. Install the transmission to the engine.

5. Tighten the transmission nut and bolts as shown in the figure.

6. Apply a force of 59 – 78 N (6.0 – 8.0 kg/ 13.2 – 17.6 lb) to the tip of the shift fork in the direction of the transmission to engage the clutch pressure plate and release bearing.

NOTE: A click sound is heard when the release bearing and the tip of the diaphragm spring engage each other. Check to see if they are securely engaged by pushing the tip of the shift fork toward the engine side while applying a force of about 25 N (2.5 kg/5.5 lb). If the shift fork will not move, then they are securely engaged.

7B-10 MANUAL TRANSMISSION

7. Install flywheel under cover(16).

Torque: 8 N-m (0.8 kg-m/69 lb in)

8. Install starter(15).

Torque: 40 N-m (4.1 kg-m/30 lb ft)

9. Install third crossmember(14).

Torque: 50 N-m (5.1 kg-m/37 lb ft)

10. Install engine rear mount nuts(13).

Torque: 40 N-m (4.1 kg-m/30 lb ft)

Remove the transmission jack from transmission side.

11. Install clutch dust covers(12) to clutch housing.

Torque: 6 N-m (0.6 kg-m/52 lb in)

12. Connect transmission harness connectors and clip.

Connector: transfer switch, 2-4 actuator, car speed sensor.

13. Install bracket and transmission harness clamps(10) to the transmission case.

14. Install harness heat protector(11).

15. Connect fuel pipe to transmission side.

16. Install center exhaust pipe(9).

Torque: 43 N-m (4.4 kg-m/32 lb ft)

17. Install front(8) and rear propeller shaft(7).

Torque: 63 N-m (6.4 kg-m/46 lb ft)

18. Install transfer protector(6).

Lower the vehicle.

19. Install gear control lever(5) and transfer control lever(5).

20. Install grommet assembly(4).

21. Install center console(3), rear console and lower cluster assembly.

22. Install transfer control lever knob(2) and gear control lever knob(1).

23. Connect battery ground cable.

7B-12 MANUAL TRANSMISSION

Disassembly

1. Clean the exterior of the unit with solvent.
2. Remove the drain plug from the transmission case and transfer case and drain the lubricant.
3. Remove the clutch release bearing(1) from the transmission case.

4. Remove the snap pin.
Remove the shift fork pin and shift fork(2) from the fulcrum bridge(3).

5. Remove the fulcrum bridge bolts.
 - Remove the fulcrum bridge(3) from the transmission case.Remove the front cover(4) and gasket from the transmission case.

6. Remove counter front bearing snap ring(5) and top gear bearing snap ring(6).
Use a pair of snap ring pliers to remove the snap ring.

7. Remove the speedometer sensor(7).
Remove the plate(7).
Remove the driven gear bushing and driven gear(7).

NOTE: Apply a reference mark to the driven gear bushing before removal.

8. Remove front companion flange(8) and rear companion flange(9) using the flange holder 5-8840-0133-0 to remove the end nut.

9. Disconnect breather hose from transmission and remove gear control box assembly(10).

10. Remove 2WD-4WD actuator assembly(11) by performing the following steps:

1. Disconnect the actuator breather hose from 2WD-4WD actuator assembly(11).

2. Remove the 2WD-4WD actuator assembly bolts.
3. Pull the 2WD-4WD actuator assembly with 2WD-4WD shift rod.

Legend

- (1) Shift Rod: 2WD-4WD (Position: 2WD)
- (2) 2WD-4WD Actuator Assembly
- (3) Pull
- (4) Rear Case Assembly
- (5) Position: 4WD
- (6) Position: 2WD

4. Offset the actuator assembly.

7B-14 MANUAL TRANSMISSION

5. Remove the actuator assembly.

Legend

- (7) Position: 4WD
- (8) Mode: 2WD

NOTE: Before removing the transmission and transfer assembly from vehicle, change the transfer mode to 2WD using the 4WD push button switch on dash panel.

11. Remove the transfer rear cover assembly(12) from the transfer case(28).
12. Regarding detent, shift arm, and interlock pin(13) disassembly, refer to *Detent, Shift Arm, and Interlock Pin* in Drive Line/Axle section.
13. Use a pair of snap ring pliers to remove the bearing snap ring(14).
14. Use a bearing remover 5-8840-2155-0 and puller 5-8840-2027-0 to remove the ball bearing(15).

15. Install the front companion flange temporarily. Use the flange holder 5-8840-0133-0 and lock nut wrench 5-8840-2156-0 to remove the lock nut(16). Remove the front companion flange.

16. Remove high-low clutch sleeve(17). Use the universal puller to remove the high-low clutch hub(17) and transfer input gear(18).

17. Remove needle bearing(19), bearing collar(20), ball(21), and plate(22).

226RS071

18. Use a pair of snap ring pliers to remove the bearing snap ring(23).
19. Use a plastic hammer to tap the front output gear assembly(24) free.

262RS009

20. Remove bearing snap ring(25) by using a pair of snap ring pliers.
21. Remove the counter gear assembly(26) from the transfer case(28).
22. Remove the transfer case assembly(28) from the transmission case.
- Refer to *Transfer Case Assembly* in Drive Line/Axle section for repair of transfer case assembly.
23. Pull out intermediate plate with gear assembly(29) from transmission case.

Reassembly

1. Apply recommended liquid gasket (LOCTITE 17430) or its equivalent to the transmission case(30), intermediate plate(29) and transfer case(28) fitting surfaces.
2. Install the intermediate plate with gear assembly(29) to the transmission case(30).
Pull out the top gear shaft until the ball bearing snap ring groove protrudes from the transmission case front cover fitting face.
Avoid subjecting the mainshaft to sudden shock or stress.
3. Install the transfer case assembly(28) to the intermediate plate with gear assembly.
Tighten the eight transmission-transfer case bolts to the specified torque.

Torque: 37 N·m (3.8 kg·m/27 lb ft)

Refer to *Transfer Rear Case Assembly* in Drive Line/Axle section for oil seal replacement.

4. Install the counter gear assembly(26) to the transfer case(28).
5. Use a pair of snap ring pliers to install the snap ring(25) to the transfer case(28).

NOTE: The snap ring must be fully inserted into the transfer case snap ring groove.

6. Install front output gear assembly(24).
7. Use a pair of snap ring pliers to install the snap ring (23) to the transfer case(28).

NOTE: The snap ring must be fully inserted into the transfer case snap ring groove.

8. Install plate(22), ball(21), bearing collar(20), needle bearing(19), and transfer input gear(18).
9. Install High-low clutch hub and sleeve(17).
The clutch hub face (with the heavy boss) must be facing the transfer input gear side.

226RW152

7B-16 MANUAL TRANSMISSION

10. Install the front companion flange temporarily.

- Use the flange holder 5-8840-0133-0 and lock nut wrench 5-8840-2156-0 to install the lock nut(16).

Torque: 137 N·m (14.0 kg·m/101 lb ft)

11. Use the punch to stake the lock nut at one spot.

12. Use a suitable drift and hammer to install the ball bearing(15).

13. Use a pair of snap ring pliers to install the bearing snap ring(14).

14. Regarding detent, shift arm, and interlock pin(13) assembly, refer to *Detent, Shift Arm, and Interlock Pin* in Drive Line/Axle section.

15. Apply recommended liquid gasket (LOCTITE 17430) or its equivalent to the transfer rear case fitting faces.

16. Perform the following steps before fitting the transfer rear cover(11):

1. Shift the High-Low shift rod to the 4H side.
2. The cut-away portion of select rod head should align with the rear case hole's stopper.

17. Tighten the eleven transfer rear case bolts to the specified torque.

Torque: 37 N·m (3.8 kg·m/27 lb ft)

18. Install 2WD-4WD actuator assembly(11) by performing the following steps.

1. Shift the 2WD-4WD shift rod to the 4WD side.
2. Join the rod grooves of 2WD-4WD actuator assembly and shift rod.

220RW030

Legend

- (11) Shift Rod: 2WD-4WD (Position: 4WD)
- (12) 2WD-4WD Actuator Assembly (Mode: 2WD)
- (13) Rear Case Assembly

3. Push the 2WD-4WD actuator assembly with 2WD-4WD shift rod till the shift rod reaches the 2WD position.

220RW031

Legend

- (14) Position: 2WD
- (15) Mode: 2WD

4. Tighten the 2WD-4WD actuator bolts to the specified torque.

Torque: 19 N·m (1.9 kg·m/14 lb ft)

5. Connect the actuator breather hose to actuator.

19. Install a new packing and gear control box assembly(10).

Install the harness clips and brackets and then tighten four new gear control box bolts to the specified torque.

Torque: 20 N·m (2.0 kg·m/14 lb ft)

261RW043

20. Install the rear and front companion flange(9) (8).

Install the O-ring(9).

Use the flange holder J-8614-11 to tighten the flange nuts(9) (8) to the transfer case.

Tighten new transfer flange nuts(9) (8) to the specified torque.

Rear Companion Flange

Torque: 167 N·m (17.0 kg·m/123 lb ft)

Front Companion Flange

Torque: 137 N·m (14.0 kg·m/101 lb ft)

266RW026

7B-18 MANUAL TRANSMISSION

21. Use the punch 5-8840-2293-0 to stake the rear companion flange nut at two spots.

- Stake the front companion flange nut at one spot.

NOTE: Be sure to confirm that there is no crack at the staked portion of the flange nut after staking.

266RW027

266RS003

22. Install the O-ring (4) to the speedometer driven gear bushing(3).

Install the driven gear to the speedometer driven gear bushing(3).

Install the speedometer driven gear assembly(7) to the transfer rear cover.

225RW008

23. Install the plate to the transfer rear cover.

Torque: 15 N-m (1.5 kg-m/11 lb ft)

24. Install the speedometer sensor.

Torque: 27 N-m (2.8 kg-m/20 lb ft)

25. Install top gear bearing snap ring(6) and counter front bearing snap ring(5).

Use a pair of snap ring pliers to install the snap rings to the mainshaft and countershaft.

The snap rings must be fully inserted into the bearing snap ring groove.

26. Install a new packing and front cover (with oil seal) (4) to the transmission case.

NOTE: Take care not to damage the oil seal.

Notes When Tightening the Bolt:

- After cleaning the bolt hole, dry it thoroughly with air.
 - After cleaning the screw face of a removed bolt or new one, dry it thoroughly. Apply recommended liquid gasket (LOCTITE 242) or its equivalent before tightening it.
- Tighten six new front cover bolts to the specified torque.

Torque: 25 N-m (2.5 kg-m/18 lb ft)

27. Install the fulcrum bridge(3) to the transmission case. Tighten three fulcrum bridge bolts to the specified torque.

Torque: 38 N-m (3.9 kg-m/28 lb ft)

28. Apply grease to the pin hole inner circumferences and thrust surfaces.

Attach the shift fork(2) to the fulcrum bridge(3) by inserting the shift fork pin from the bottom side of the fulcrum bridge.

Install the washer and snap pin.

29. Apply grease to the areas shown in the figure.

Install the release bearing(1) to the shift fork(2) in the proper direction.

NOTE: Ensure release bearing is properly positioned during installation, as shown in the figure.

Intermediate Plate with Gear Assembly, Detent, Shift Arm, and Interlock Pin (MUA)

Disassembled View

220RS010

Legend

- | | |
|---|---|
| (1) Detent Spring Plate and Gasket | (7) 1st-2nd Shift Rod |
| (2) Detent Spring | (8) 3rd-4th Shift Rod |
| (3) Detent Ball | (9) 3rd-4th Shift Arm |
| (4) Spring | (10) 1st-2nd Shift Arm |
| (5) Rev-5th Shift Rod | (11) Interlock Pin |
| (6) Rev-5th Shift Arm and Reverse Inhibitor | (12) Intermediate Plate and Gear Assembly |

Disassembly

1. Remove detent spring plate and gasket(1), detent spring(2) and detent ball(3).

Use a magnetic hand to remove the detent balls from the intermediate plate.

220RS011

2. Remove spring(4).
3. Remove rev-5th shift rod(5), and rev-5th shift arm and reverse inhibitor(6).
Remove 1st-2nd shift rod(7), 3rd-4th shift rod(8), 3rd-4th shift arm(9), and 1st-2nd shift arm (10).

- Hold a round bar against the shift rod end.

230RS003

- Use a spring pin remover to remove the shift arm spring pins from the shift arms and the shift rods.

230RS004

- Move the 3rd-4th shift rod forward.

230RS005

- Remove the rev-5th, 1st-2nd and 3rd-4th shifter rods carefully. Interlock pins are located between the shifter rods in the intermediate plate.

4. Remove interlock pin(11) from intermediate plate and gear assembly(12).

Inspection and Repair

Make the necessary adjustments, and part replacements if excessive wear or damage is discovered during inspection.

Shift Arm Thickness

- Use a micrometer to measure the shift arm thickness. If the measured value is less than the specified limit, the shift arm must be replaced.

Shift Arm Thickness

	Standard	Limit
1st-2nd	9.60-9.85 mm (0.378-0.388 in)	9.0 mm (0.354 in)
3rd-4th	9.60-9.80 mm (0.378-0.386 in)	
Rev.5th	9.60-9.80 mm (0.378-0.386 in)	

230RS006

Detent Spring Free Length

- Use a vernier caliper to measure the detent spring free length. If the measured value is less than the specified limit, the detent spring must be replaced.

Detent Spring Free Length

Standard	Limit
26.8 mm (1.06 in)	26.2 mm (1.03 in)

220RS012

Detent Spring Tension

- Use a spring tester to measure the valve spring tension. If the measured value is less than the specified limit, the detent spring must be replaced.

Detent Spring Tension

Compressed height	Standard
20 mm (0.787 in)	87.2 - 97.1 N (8.9 - 9.9 kg/ 19.6 - 21.8 lb)

220RS013

Reassembly

1. Install 1st-2nd shift arm(10) and 3rd-4th shift arm(9) to intermediate plate and gear assembly(12).
2. Install 3rd-4th shift rod(8) and 1st-2nd shift rod(7).
 - Install the interlock pin(11) to the shift rod.
 - Install the shift rod together with the interlock pin to the intermediate plate.
Do not allow the interlock pin to fall from the shift rod.
 - Hold a round bar against the shift rod end lower face to protect it against damage.
 - Install a new spring pin.
Never reinstall the used spring pin.

230RS007

3. Install rev-5th shift arm and reverse inhibitor(6) and rev-5th shift rod(5).
 - Apply oil to the reverse inhibitor inner surface.
 - Install the interlock pin(11) to the shift rod.
 - Install the shift rod together with the interlock pin to the intermediate plate.
Do not allow the interlock pin to fall from the shift rod.
 - Hold a round bar against the shift rod end lower face to protect it against damage.
 - Install a new spring pin.
Never reinstall the used spring pin.
4. Install spring(4).
5. Put detent balls(3) in the intermediate plate holes.
 - Apply oil to the detent balls.

6. Install detent springs(2) and detent spring plate and gasket(1).
 - Install a new gasket and the detent spring plate.
 - Tighten the detent spring plate bolts to the specified torque.

Torque: 20 N·m (2.0 kg·m/ 14 lb ft)

220RS030

| (11) Reverse Idler Shaft | (24) Bearing Plate and Screw |
| (12) Bearing Snap Ring | (25) Bearing Snap Ring |
| (13) Ball Bearing | (26) Intermediate Plate |

Disassembly

1. Set the retaining ring remover 5-8840-2158-0 and puller 5-8840-2027-0 to the retainer(3) and the mainshaft end.

2. Remove the retainer(3) together with the bearing(2) and the oil seal collar(1).
The universal puller may be used in place of the retaining ring remover.
3. Remove thrust plate(4) and thrust washer and lock ball(5).
4. Use a pair of snap ring pliers to remove reverse idler gear snap ring(6).

5. Remove the reverse idler gear assembly(7) from the intermediate plate(26).

6. Remove idle shaft pin(8), thrust washer(9), reverse idler gear(10), and reverse idler shaft(11).
7. Use a pair of snap ring pliers to remove the snap ring(12).
8. Attach the bearing remover to the counter gear shaft. Use the bearing remover to remove the ball bearing(13) and the counter 5th gear(14).

9. Remove counter reverse gear(15).

7B-26 MANUAL TRANSMISSION

10. Remove 5th gear(16), 5th block ring(17), and needle bearing (2 piece type) (18).

226RS007

11. Attach the holding fixture 5-8840-2160-0 and base 5-8840-0003-0 to the mainshaft and the counter gear.

226RW212

12. Engage the 3rd-4th synchronizer with the 3rd gear. Engage the 1st-2nd synchronizer with the 1st gear.

226RW210

Use the mainshaft nut wrench 5-8840-2156-0 to remove the mainshaft nut(19).

226RW211

13. Use pry bars between the reverse gear(22) and bearing plate(24) to remove the Rev-5th synchronizer assembly(20) together with reverse block ring(21) and reverse gear(22).

226RS010

14. Remove needle bearing(23).

15. Use the torx bit wrench 5-8840-0047-0(T45) to remove the bearing plate and screw(24) from the intermediate plate.

220RW137

16. Use the snap ring pliers(1) to remove the mainshaft bearing snap ring(29).

226RS011

17. Hold the snap ring open with the pliers.

Push the intermediate plate(26) toward the rear of the transmission to remove it.

The bearing snap ring(25) will come free.

Inspection and Repair

Refer to Top Gear Shaft, Main Gear Shaft, and Counter Gear in this section for inspection and repair.

Reassembly

1. Mesh the counter gear with the mainshaft assembly. Install the holding fixture 5-8840-2160-0 and base 5-8840-0003-0 to the mainshaft and the counter gear.

226RW212

7B-28 MANUAL TRANSMISSION

2. Place the holding fixture (with the mainshaft and the counter shaft) in a vise.

Install the intermediate plate(26).

3. Install bearing snap ring(25).

4. Apply recommended thread locking agents (LOCTITE 242) or its equivalent to each of the bearing plate screw threads.

Install bearing plate and screw(24).

Tighten the screws to the specified torque by using torx bit wrench 5-8840-0047-0.

Torque: 15 N-m (1.5 kg-m/11 lb ft)

5. Install needle bearing(23), reverse gear(22), and reverse block ring(21).

6. Assemble rev-5th synchronizer assembly(20) by performing the following steps.

1. Turn the clutch hub face(1) toward the sleeve groove(2) (rear side) on the outer circumference.

2. Check that the inserts(3) fit snugly into the block ring insert grooves.

3. Check that the inserts springs(4) are fitted to the inserts as shown in the illustration.

4. Check that the clutch hub(5) and the sleeve(6) slide smoothly.

5. Install the synchronizer assembly(20) to the mainshaft.

The clutch hub face (with the heavy boss) must be facing the reverse gear(22) side.

7. Mesh the 1st-2nd and 3rd-4th synchronizers with both the 1st and 3rd gears (double engagement).

226RS015

This will prevent the mainshaft from turning.

8. Install the new mainshaft hub nut(19).
Use the mainshaft nut wrench 5-8840-2156-0 to tighten the mainshaft nut(19) to the specified torque.

Torque: 137 N-m (14.0 kg-m/101 lb ft)

226RW214

9. Use a punch to stake the mainshaft nut at one spot.

226RW153

10. Install needle bearing(18), 5th block ring(17), and 5th gear(16).

11. Apply engine oil to the counter reverse gear(15) and the reverse gear(22).

Install the counter reverse gear(15) to the counter shaft.

The reverse gear projection must be facing the intermediate plate.

226RW151

7B-30 MANUAL TRANSMISSION

12. Install the counter 5th gear(14) to the transmission.

226RS019

13. Install ball bearing(13) and bearing snap ring by performing the following steps:

- Select the snap ring(12) which will provide the minimum clearance between the ball bearing and the snap ring.

226RS020

- There are six snap ring sizes available. The snap rings are color-coded to indicate their thickness.

226RS021

Ball Bearing and Snap Ring Clearance

Standard: 0–0.15 mm (0–0.0059 in)

Snap Ring Availability

Thickness	Color Coding
1.1 mm (0.043 in)	White
1.2 mm (0.047 in)	Yellow
1.3 mm (0.051 in)	Blue
1.4 mm (0.055 in)	Pink
1.5 mm (0.059 in)	Green
1.6 mm (0.063 in)	Brown

- Use a pair of snap ring pliers to install the snap ring(12) to the counter gear shaft. The snap ring must be fully inserted into the counter gear shaft snap ring groove.
14. Assemble reverse idler shaft(11), reverse idler gear(10), thrust washer(9), and idle shaft pin(8) into reverse idler gear assembly(7).
15. Select reverse idler gear snap ring(6) which will provide the minimum clearance between the intermediate plate(26) and the snap ring(6).

- There are three snap ring sizes available. The snap rings are color-coded to indicate their thickness.

Intermediate Plate and Snap Ring Clearance

Standard: 0 – 0.15 mm (0 – 0.0059 in)

Snap Ring Availability

Thickness	Color Coding
1.2 mm (0.047 in)	White
1.3 mm (0.051 in)	Yellow
1.4 mm (0.055 in)	Blue

- Use a pair of snap ring pliers to install the snap ring to the reverse idler shaft. The snap ring must be fully inserted into the reverse idler shaft snap ring groove.

16. Install thrust washer and lock ball(5) by performing the following steps:

- Use a thickness gauge to measure the clearance between the 5th gear and the thrust washer.

5th Gear and Thrust Washer Clearance

Standard: 0.10 – 0.25 mm (0.004 – 0.010 in)

- Measure clearance “A” as shown in the figure.

- Select appropriate thrust washer from chart.
- There are four thrust washer sizes available.
- The thrust washers are color coded to indicate their thickness.

7B-32 MANUAL TRANSMISSION

Thrust Washer Availability

Thickness mm (in)	Color Coding	A mm (in)	Clearance mm (in)
7.9 (0.311)	White	8.05-8.1 (0.317-0.319)	0.15-0.25 (0.006-0.010)
8.0 (0.315)	Yellow	8.1-8.2 (0.319-0.323)	0.1-0.25 (0.004-0.010)
8.1 (0.319)	Green	8.2-8.3 (0.323-0.327)	0.1-0.25 (0.004-0.010)
8.2 (0.323)	Bluen	8.3-8.36 (0.327-0.329)	0.1-0.21 (0.004-0.008)

226RS024

- Apply grease to the thrust washer and the lock ball.
- Install the thrust washer and the lock ball.

17. Install thrust plate(4) and retainer(3).

18. Apply engine oil to the bearing inner and outer circumference.

Use the installer 5-8840-2159-0 to install the ball bearing(2) to the mainshaft in proper direction.

226RW215

19. Install oil seal collar(1).

Disassembly

1. Use a pair of snap ring pliers to remove the top gear shaft snap ring(1).
2. Remove top gear shaft(2) with ball bearing(3).
3. Use a bench press and the bearing remover 5-8840-0015-0 to remove the ball bearing(3).

4. Remove needle bearing(4) and top block ring(5), mainshaft snap ring.
5. Use a pair of snap ring pliers to remove the mainshaft snap ring(6).

6. Use a bench press and the bearing remover 5-8840-0015-0 to remove the 3rd-4th synchronizer assembly(7) as a set.
Disassemble the synchronizer assembly.

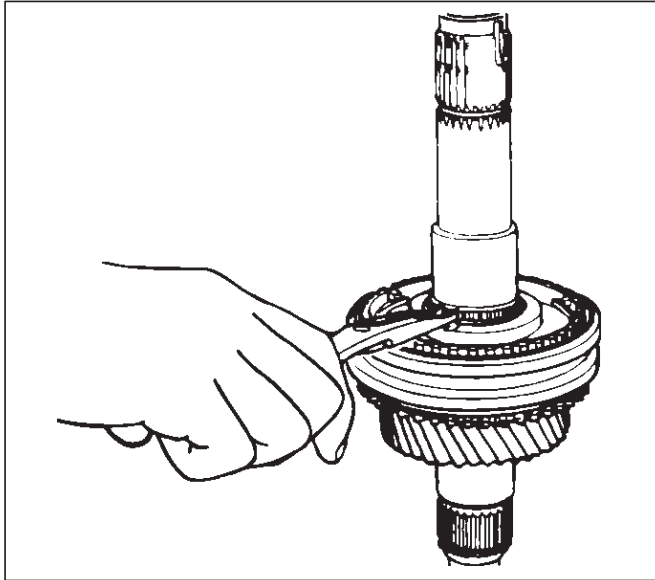

Legend

- (1) Springs
- (2) Sleeve
- (3) Clutch Hub
- (4) Inserts

7. Remove 3rd block ring(8), 3rd gear(9), and needle bearing(10).
8. Remove needle bearing collar(11).
9. Use a bench press and the bearing remover 5-8840-0015-0 to remove the 1st gear(14) together with the mainshaft ball bearing(12) and 1st gear thrust bearing(13).

10. Disassemble 1st inside ring(15), 1st outside ring(16), and 1st block ring(17).
11. Remove needle bearing(18).
12. Use a pair of snap ring pliers to remove the clutch hub snap ring(19).

13. Use a bench press and the bearing remover 5-8840-0015-0 to remove the 2nd gear(24) together with 1st-2nd synchronizer assembly(20), 2nd block ring(21), 2nd outside ring(22), and 2nd inside ring(23).
Disassemble the synchronizer assembly.

Legend

- (1) Springs
- (2) Sleeve
- (3) Clutch Hub

14. Remove needle bearing(25) from mainshaft(26).
15. Remove bearing snap ring(27)

16. Use a bench press and the bearing remover 5-8840-0015-0 to remove the front roller bearing(28).

17. Remove center roller bearing(29) from counter gear shaft(30).

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Block Ring and Dog Teeth Clearance

- Use a thickness gauge to measure the clearance between the block ring and the dog teeth.

If the measured value exceeds the specified limit, the block ring must be replaced.

7B-36 MANUAL TRANSMISSION

Block Ring and Dog Teeth Clearance

Standard	Limit
1.5 mm (0.059 in)	0.8 mm (0.032 in)

1st-2nd Synchronizer (3-CONE)

- Use a thickness gauge to measure the clearance between the block ring and the dog teeth.

226RS036

If the measured value exceeds the specified limit, the 1st-2nd synchronizer assembly must be replaced.

Block Ring and Dog Teeth Clearance

Standard	Limit
1.5 mm (0.059 in)	0.8 mm (0.032 in)

Block Ring and Insert Clearance

- Use a vernier caliper or thickness gauge to measure the clearance between the block ring and the insert.

226RS037

If the measured value exceeds the specified limit, the block ring and the insert must be replaced.

Block and Insert Clearance

	Standard	Limit
3rd-4th	3.46 – 3.74 mm (0.136 – 0.147 in)	4.0 mm (0.158 in)
1st-2nd	4.34 – 4.66 mm (0.171 – 0.183 in)	4.9 mm (0.193 in)
Rev-5th	3.59 – 3.91 mm (0.141 – 0.154 in)	4.1 mm (0.161 in)

Clutch Hub and Insert Clearance

- Use a thickness gauge to measure the clearance between the clutch hub and the insert.

226RS038

If the measured value exceeds the specified limit, the clutch hub and the insert must be replaced.

Clutch Hub and Insert Clearance

	Standard	Limit
3rd-4th	0.01 – 0.19 mm (0.0004 – 0.0075 in)	0.3 mm (0.012 in)
1st-2nd	0.09 – 0.31 mm (0.0035 – 0.0122 in)	0.4 mm (0.016 in)
Rev-5th		

Mainshaft Run-out

- Install the mainshaft to V-blocks.
- Use a dial indicator to measure the mainshaft central portion run-out.

226RS039

If the measured mainshaft run-out exceeds the specified limit, the mainshaft must be replaced.

Mainshaft Run-out

Limit: 0.05 mm (0.0020 in)

Gear Inside Diameter

- Use an inside dial indicator to measure the gear inside diameter.

226RS040

If the measured value is less than the specified limit, the gear must be replaced.

Gear Inside Diameter

	Standard	Limit
1st 3rd	45.000 – 45.013 mm (1.771 – 1.772 in)	45.100 mm (1.776 in)
2nd	52.000 – 52.013 mm (2.047 – 2.048 in)	52.100 mm (2.051 in)
Rev.	48.000 – 48.013 mm (1.889 – 1.890 in)	48.100 mm (1.894 in)
5th	32.000 – 32.013 mm (1.259 – 1.260 in)	32.100 mm (1.246 in)

Reverse Idler Gear and Idler Gear Shaft Clearance

- Use a micrometer to measure the idler gear shaft diameter.
- Use an inside dial indicator to measure the idler gear inside diameter.

226RS041

- Calculate the idler gear and idler gear shaft clearance.

Idler gear inside diameter-idler gear shaft diameter = idler gear and idler gear shaft clearance.

If the measured value exceeds the specified limit, the idler gear and/or the idler gear shaft must be replaced.

Idler Gear and Idler Gear Shaft Clearance

Standard: 0.041–0.074 mm (0.016–0.0029 in)

Limit: 0.150 mm (0.0059 in)

Clutch Hub Spline Play

- Set a dial indicator to the clutch hub to be measured.

226RS042

- Move the clutch hub as far as possible to both the right and the left.
Note the dial indicator reading.
If the measured value exceeds the specified limit, the clutch hub must be replaced.

Clutch Hub Spline Play

	Standard	Limit
1st-2nd	0 – 0.1 mm (0 – 0.004 in)	0.2 mm (0.008 in)
3rd-4th		
Rev. 5th	0 – 0.2 mm (0 – 0.008 in)	0.3 mm (0.012 in)

Ball Bearing Play

- Use a dial indicator to measure the ball bearing play.

Ball Bearing Play

Limit: 0.2 mm (0.008 in)

226RS043

Reassembly

1. Install center roller bearing(29) to counter gear shaft(30).
 - Apply engine oil to the bearing inner and outer circumferences.
 - Install the roller bearing in the proper direction.

NOTE: Check that outer race moves only in the direction of arrow.

226RS044

2. Install front roller bearing(28) by performing the following steps.
 - Use bearing installer to install the front roller bearing inner race to the counter gear shaft.
 - Install the outer race and roller assembly.
The snap ring groove must be facing the transmission front side.
 - Use bearing installer J-35283 to install the ring.

226RS045

Legend

- (1) Ring
- (2) Outer Race and Roller Assembly
- (3) Inner Race

3. Install bearing snap ring(27) to mainshaft(26).
4. Apply engine oil to the needle bearing(25) and the 2nd gear thrust surfaces.
Install the needle bearing(25) and the 2nd gear(24) to the mainshaft.
The 2nd gear dog teeth must be facing the transmission rear side.

226RS046

5. Assemble 2nd inside ring(23), 2nd outside ring(22), and 2nd block ring(21).

- Apply engine oil to the synchronizer ring friction surfaces.

226RS047

Legend

- (1) Block Ring
- (2) Outside Ring
- (3) Inside Ring
- (4) 2nd Gear
- (5) Needle Bearing

6. Assemble 1st-2nd synchronizer assembly by performing the following steps:

1. Check that the inserts(3) fit snugly into the block ring insert grooves.
2. Check that the inserts springs(4) are fitted to the inserts as shown in the illustration.
3. Check that the clutch hub(5) and the sleeve(6) slide smoothly.
4. Install the synchronizer assembly to the mainshaft.

The clutch hub face (with the heavy boss) must be facing the 2nd gear side.

226RS048

226RS049

7. Install clutch hub snap ring(19) by performing the following steps:

- Select the snap ring which will provide the minimum clearance between the 1st-2nd clutch hub and the snap ring.

226RS050

There are three snap ring sizes available.

The snap rings are color coded to indicate their thickness.

226RS021

Clutch Hub and Snap Ring Clearance

Standard: 0 – 0.1 mm (0 – 0.004 in)

Snap Ring Availability

Thickness	Color Coding
1.80 mm (0.071 in)	White
1.85 mm (0.073 in)	Yellow
1.90 mm (0.075 in)	Blue

- Use a pair of snap ring pliers to install the snap ring to the mainshaft.

The snap ring must be fully inserted into the mainshaft snap ring groove.

226RS031

8. Install needle bearing(18), 1st block ring(17), 1st outside ring(16), 1st inside ring(15), and 1st gear(14).

- Apply engine oil to the needle bearing, 1st gear thrust surfaces and synchronizer ring friction surfaces.
- Install the needle bearing and the 1st gear to the mainshaft.

The 1st gear dog teeth must be facing the transmission front side.

226RS053

Legend

- (1) 1st Gear
- (2) Needle Bearing
- (3) Inside Ring
- (4) Outside Ring
- (5) Block Ring

9. Install the 1st gear thrust bearing and the race(13) to the main shaft.

The thrust bearing side must be facing the transmission front side.

226RS054

10. Apply engine oil to the mainshaft ball bearing(12) and the mainshaft(26).

Install the ball bearing(12) and needle bearing collar(11) to the mainshaft(26).

The ball bearing snap ring groove must be facing the transmission rear side.

Use a bench press and installer J-6133-01 to slowly force the collar into place.

226RS055

7B-42 MANUAL TRANSMISSION

11. Apply engine oil to the needle bearing and the 3rd gear thrust surfaces.
Install the needle bearing(10) and the 3rd gear(9) to the mainshaft.

The 3rd gear dog teeth must be facing the transmission front side.

12. Install 3rd block ring(8).

13. Check and install 3rd-4th synchronizer assembly(7) by the following steps:

1. Check that the inserts(3) fit snugly into the block ring insert grooves.
2. Check that the insert springs(4) are fitted to the inserts as shown in the illustration.
3. Check that the clutch hub(5) and the sleeve(6) slide smoothly.
4. Install the synchronizer assembly to the mainshaft.

The clutch hub face (with the heavy boss) must be facing the 3rd gear side.

14. Select and install mainshaft snap ring(6) in the following way:

- Select the snap ring which will provide the minimum clearance between the 3rd-4th clutch hub and the snap ring.

There are three snap ring sizes available.

The snap rings are color coded to indicate their thickness.

Clutch Hub and Snap Ring Clearance
Standard: 0 – 0.1 mm (0 – 0.004 in)

Snap Ring Availability

Thickness	Color Coding
1.80 mm (0.071 in)	White
1.85 mm (0.073 in)	Yellow
1.90 mm (0.075 in)	Blue

- Use a pair of snap ring pliers to install the snap ring to the mainshaft.
 The snap ring must be fully inserted into the mainshaft snap ring groove.

15. Install top block ring(5).
16. Apply grease to the bearing inner and outer circumferences and install needle bearing(4).
17. Use a bench press to install the top gear shaft ball bearing(3) to the top gear shaft(2).

The snap ring groove must be facing the transmission front side.

18. Use a pair of snap ring pliers to install the top gear shaft snap ring(1) to the bearing.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO *THE SRS COMPONENT AND WIRING LOCATION VIEW* IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO *THE SRS SERVICE INFORMATION*. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

Clutch

The clutch assembly consists of the pressure plate assembly and the driven plate assembly.

The clutch pedal is connected to the release bearing through the shift fork.

The driven plate assembly is installed between the flywheel and the pressure plate. Diaphragm spring pressure holds the driven plate against the flywheel and the pressure plate to provide the friction necessary to engage the clutch.

Depressing the clutch pedal moves the shift fork against the release bearing. The release bearing force overcomes the force of the diaphragm spring and separates the driven plate from the flywheel and pressure plate to disengage the clutch.

For 6VD1 (3.2L) engine model, the pull-type clutch is employed.

Master Cylinder

A07RW071

The master cylinder converts mechanical energy into hydraulic energy.

Depressing the clutch pedal causes the push rod to move against the piston to close the return port.

Clutch fluid is forced out of the master cylinder.

Releasing the clutch pedal causes the return spring to force the piston back to its original position.

Damper Cylinder

A07RS004

In order to reduce the occurrence of noises at the clutch hydraulic system, the damper cylinder is used in the clutch hydraulic line between the master cylinder and slave cylinder.

Slave Cylinder

A07RW037

The slave cylinder converts hydraulic energy into mechanical energy. Hydraulic fluid supplied by the master cylinder moves the slave cylinder piston to actuate the shift fork. The mechanical energy produced by the slave cylinder is directly proportional to the diameters of the master cylinder and the slave cylinder.

Pressure Plate Assembly

A07RW025

The pressure plate assembly consists of the clutch cover, the pressure plate with diaphragm spring. Operating the clutch pedal causes the pressure plate to move in an axial direction to engage and disengage the clutch.

Driven Plate Assembly

A07RW027

The driven plate assembly consists of the plate and the facing.

The plate consists of the clutch center, the cushioning plate, and the torsion springs.

The facing is riveted to both sides of the cushioning plate.

The cushioning plate provides a longer service life by minimizing wear and vibration at the clutch contact surfaces.

Diagnosis

Condition	Possible cause	Correction
Dragging	Air in circuit.	Bleed and check for damage.
	Driven plate worn or warped.	Replace.
	Clutch fork off the ball stud.	Install correctly and lubricate.
	Diaphragm spring weak or tip of fingers worn.	Replace.
	Driven plate sticking on splines.	Clean and free splines and lubricate with grease.
	Pilot bearing worn or damaged.	Replace.
	Master cylinder and slave cylinder seals worn.	Replace.
Slipping	Clutch facing worn.	Replace.
	Driven plate friction pads worn or oilsoaked.	Replace and check for leaks as needed.
	Diaphragm spring weak.	Replace pressure plate.
	Pressure plate or flywheel warped.	Replace.
	Master cylinder and slave cylinder seals worn.	Replace as needed.
Chattering	Clutch facing in poor contact or facing warped.	Replace.
	Surface of facing hardened.	Replace.
	Driven plate friction pads oil soaked.	Replace and check for leaks.
	Damper springs weakened or broken.	Replace.
	Rivets on clutch plate loosened.	Replace.
	Pressure plate or flywheel warped.	Replace as needed.
Rattling	Diaphragm spring weak.	Replace the pressure plate.
	Clutch fork loose or off the ball stud.	Replace the retaining spring or install the fork correctly.
	Driven plate springs weak or oil in the damper.	Replace and check for leaks as needed.
Release bearing noisy with the clutch engaged	Release bearing binding.	Clean, or replace if damaged, and lubricate.
	Clutch fork off the ball stud or loose spring tension.	Install correctly, and lubricate.
	Linkage return springs weak.	Replace.
Noisy	Release bearing worn or damaged.	Replace.
	Clutch fork off the ball stud.	Install correctly and lubricate.
	Pilot bearing loose.	Replace.
Pedal stays on the floor when disengaged	Release bearing binding.	Free up, or replace, and lubricate.
	Diaphragm spring weak.	Replace the pressure plate.
Pedal is hard to push	Hydraulic line blocked or crimped.	Clean out or replace.
	Master or slave cylinders binding.	Repair or replace as needed.
	Driven plate worn.	Replace.
Squeaking	Ball stud not lubricated or incorrectly lubricated.	Lubricate with high temperature grease.

Clutch Assembly

Clutch Assembly and Associated Parts

201RS023

Legend

- | | |
|-----------------------------|--|
| (1) Transmission Assembly | (4) Release Bearing |
| (2) Pressure Plate Assembly | (5) Shift Fork |
| (3) Driven Plate Assembly | (6) Fulcrum Bridge |
| | (7) Flywheel Assembly and Crankshaft Bearing |

Removal

1. Refer to "Manual Transmission" of Section 7B for "Removal and Installation" procedure of transmission assembly (1).

2. Use the pilot aligner J24547 to prevent the driven plate assembly (3) from falling free.

201RS001

Legend

- (2) Pressure Plate Assembly
- (3) Driven Plate Assembly
- (8) Pilot Aligner

3. Mark the flywheel, clutch cover and pressure plate lug for alignment when installing.

4. Remove the release bearing (4) from the transmission case.

201RS024

5. Remove the snap pin. Remove the shift fork pin and shift fork from the fulcrum bridge.

201RS025

6. Remove the fulcrum bridge bolts. Remove the fulcrum bridge (6) from the transmission case.

201RS026

- Do not remove crankshaft bearing (7) except for replacement.

7C-10 CLUTCH

- Use the remover 5-8840-2000-0 and sliding hammer 5-8840-0019-0 to remove the crankshaft bearing.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, or any other abnormal condition are found through inspection.

Pressure Plate Assembly

- Visually check the pressure plate friction surface for excessive wear and heat cracks. If excessive wear or deep heat cracks are present, the pressure plate must be replaced.

Pressure Plate Warpage

- Use a straight edge and a feeler gauge to measure the pressure plate friction surface flatness in four directions. If any of the measured values exceed the specified limit, the pressure plate must be replaced.

Pressure Plate Warpage

Limit: 0.3 mm (0.012 in)

Clutch Cover

- Visually check the entire clutch cover for excessive wear, cracking, and other damage. The clutch cover must be replaced if any of these conditions are present.

Clutch Set Force

1. Invert the pressure plate assembly.
2. Place a new driven plate over the pressure plate. A metal sheet with thickness of 8.0mm (0.315in) may be used in place of the driven plate.
3. Compress the pressure plate assembly until the distance becomes 12mm (0.472in).
4. Note the pressure gauge reading. If the measured value is less than the specified limit, the pressure plate assembly must be replaced.

Clutch Set Force

Standard: 7208N (735 kg/1621lb)

Limit: 6669N (980 kg/1499lb)

Driven Plate Assembly

- Visually check the torsion spring for looseness, breakage, and weakening. If any of these conditions are discovered, the driven plate assembly must be replaced.
- Visually check the facing surfaces for cracking and excessive scorching. Visually inspect the facing surfaces for the presence of oil or grease. If any of these conditions are discovered, the facing must be cleaned or replaced.
- Check that the driven plate moves smoothly on the transmission top gear shaft spline. Minor ridges on the top gear shaft spline may be removed with an oil stone.

Diaphragm Spring Finger Height

1. Place a new driven plate or a 8.0mm (0.315in) spacer beneath the pressure plate.
2. Fully compress the pressure plate and diaphragm spring.

There are two ways to do this:

 - a. Use a bench press to press down on the assembly from the top.
 - b. Tighten the fixing bolts.

NOTE: Preload on diaphragm spring finger must be 4998N (510 kg/1122lb) in direction of release, when clutch cover assembly is bolted to the flywheel.

3. Measure the spring height from base to spring tip. If the measured value exceeds the specified limit, the pressure plate assembly must be replaced.

Spring Finger Height

Standard: 49.9 – 51.9 mm (1.965– 2.043 in)

Driven Plate Warpage

1. Insert the clutch pilot aligner J-24547 into the driven plate splined hub. The clutch pilot aligner must be held perfectly horizontal.
2. Set a dial indicator to the driven plate outside circumference.
3. Slowly turn the driven plate. Read the dial indicator as you turn the driven plate. If the measured value exceeds the specified limit, the driven plate assembly must be replaced.

Driven Plate Warpage

Standard: 0.7mm (0.028in)

Limit: 1.0mm (0.039in)

Driven Plate Splined Hub Spline Wear

1. Clean the driven plate splined hub.
2. Install the driven plate to the transmission top gear shaft spline.
3. Set a surface gauge to the driven plate outside circumference.
4. Slowly turn the driven plate counterclockwise. Measure the spline rotation play as you turn the driven plate. If the measured value exceeds the specified limit, the driven plate assembly must be replaced.

Driven Plate Warpage

Standard: 0.5mm (0.020in)

Limit: 1.0mm (0.039in)

Rivet Head Depression

- Use a depth gauge or a straight edge with steel rule to measure the rivet head depression (1) from the facing surface (2).
- Be sure to measure the rivet head depression on both sides of the driven plate. If the measured value is less than the specified limit, the driven plate assembly must be replaced.

Rivet Head Depression

	Standard	Limit
Fly wheel side	1.2–1.8mm (0.047–0.071in)	0.2mm (0.008in)
Pressure plate side	1.6–2.2mm (0.062–0.087in)	

Release Bearing

- Visually check the release bearing for excessive play, noise and breakage. If any of these conditions are discovered, the release bearing must be replaced.

201RS011

- When replacing the release bearing (4), replace both the wedge collar (10) and wire ring (11) at the same time.

201RS012

Legend

- (2) Pressure Plate Assembly
- (4) Release Bearing
- (10) Wedge collar
- (11) Wire Ring

Wedge Collar (10)

- Visually check the surfaces of the wedge collar making contact with the release bearing for excessive wear and damage.
- Replace exhibiting excessive wear or damage.

201RS013

Shift Fork

- Visually check the surfaces of the shift fork making contact with the release bearing for excessive wear and damage.
- Remove any minor stepping or abrasion from shift fork with an oil stone. Replace exhibiting excessive wear or damage.

201RS014

7C-14 CLUTCH

Installation

1. Clean and lubricate with grease.
2. Use the installer 5-8840-0125-0 and driver handle 5-8840-0007-0 to install the crankshaft bearing (7).

3. Install the fulcrum bridge (6) to the transmission case. Tighten three fulcrum bridge bolts to the specified torque.

Torque: 38 N-m (28 lb ft)

4. Apply molybdenum disulfide type grease to the pin hole inner circumferences and thrust surfaces. Attach the shift fork (5) to the fulcrum bridge (6) and insert the pin from below of the fulcrum bridge. Install the washer and snap pin.

5. Apply molybdenum disulfide type grease to the areas shown in the figure.

Install the release bearing (4) in the proper direction.

NOTE: Ensure release bearing is properly positioned during installation, as shown in the figure.

201RS019

6. Use the pilot aligner 5-85253-001-0 to install the driven plate assembly (3).

201RX004

7. Tighten the bolts holding the pressure plate assembly (2) in the order shown in the figure.

201RS017

Torque: 18 N·m (1.8 kg·m/13 lb ft)

8. Remove the aligner.

NOTE: Do not strike the aligner with a hammer to remove it.

9. Install transmission assembly to the engine.

Clutch Control

| (3) Pin and Jaw Joint Pin | (6) Damper Cylinder Assembly |

Removal

1. Disconnect the ground battery cable.
2. Remove the instrument panel lower cover (7) and driver knee bolster panel assembly (8).

740RW162

Legend

- (7) Driver Lower Cover
- (8) Driver Knee Bolster Panel

3. Remove pin and jaw joint pin (3).
4. Remove pedal assembly (2).
5. Remove oil line pipe (4).
6. Remove slave cylinder assembly (5).
7. Remove master cylinder assembly (1).
8. Remove damper cylinder assembly (6).
9. Remove oil line hose (5).

Inspection and Repair

Make necessary adjustments, repairs, and part replacements if wear, damage or other problems are discovered during inspection.

Installation

Clutch Pedal Adjustment

1. With clutch switch.
 1. Disconnect clutch switch connector.

2. Loosen lock nut, then turn switch out until there is a gap between the switch plunger and clutch pedal.

208RX004

Legend

- (7) Push Rod
- (8) Clutch Switch

2. Loosen clutch master cylinder push rod lock nut. Turn push rod by hand to set clutch pedal height to within specification. Tighten push rod lock nut.

Clutch Pedal Height

178 – 188 mm (7.01 – 7.40 in)

F07RW026

7C-18 CLUTCH

3. With clutch switch.

1. Turn the clutch switch until the switch bolt just touches the clutch pedal arm.
2. Adjust clutch switch by backing it out half a turn, and measure the clearance between the clutch pedal arm and the clutch switch bolt end.

F07RW027

Legend

- (8) Clutch Switch
- (10) Clutch Pedal Arm
- (11) Lock Nut
- (12) Bracket
- (13) Back Out Switch 1/2 Turn

3. Lock the lock nut.

4. Connect clutch switch connector.

Clutch Switch and Clutch Pedal Clearance

0.5 – 1.5 mm (0.020 – 0.059 in)

4. After adjusting the clutch pedal height, push the clutch pedal by hand to ensure the clutch pedal free play is within specification.

Pedal Free Play

5 – 15 mm (0.20 – 0.59 in)

5. Perform clutch pedal engagement height inspection:

1. Operate the parking brake lever and block the wheels.
2. Start the engine, fully step on the clutch pedal slowly and move the shift lever 1st position.
3. With the engine idling, release the clutch pedal slowly and measure its stroke – just prior to its clutching position.

Clutch Pedal Engagement Height (H3)

MIN. 30 mm (1.18 in)

F07RW028

6. If the measured value exceeds the specified limit, check the following points and repair if necessary:

- Hydraulic circuit for fluid leakage or air in circuit.
- Clutch disc warped.
- Diaphragm spring weakened or tip of fingers worn.
- Driven plate sticking on sprines.
- Release bearing worn or damaged.
- Master cylinder and slave cylinder worn.

Torque

- Master cylinder to dash panel
16 N·m (1.6 kg·m/12 lb ft)
- Clutch pedal to dash panel
15 N·m (1.5 kg·m/11 lb ft)
- Master cylinder push rod to yoke
17 N·m (1.7 kg·m/12 lb ft)
- Clutch pipe to master cylinder
20 N·m (2.0 kg·m/14 lb ft)
- Clutch pipe to damper cylinder
12 N·m (1.2 kg·m/104 lb in)
- Clutch pipe to flex, hose
20 N·m (2.0 kg·m/14 lb ft)
- Flexible hose to slave cylinder
20 N·m (2.0 kg·m/14 lb ft)
- Slave cylinder to case
40 N·m (4.1 kg·m/30 lb ft)
- Slave cylinder bleeder screw
8 N·m (0.8 kg·m/69 lb in)

Bleeding

1. Check the level of clutch fluid in the reservoir and replenish if necessary.
2. Bleeding the slave cylinder.
 1. Remove the rubber cap from the bleeder screw and wipe clean the bleeder screw. Connect a vinyl tube to the bleeder screw and insert the other end of the vinyl tube into a transparent container.
 2. Pump the clutch pedal repeatedly and hold it depressed.

3. Loosen the bleeder screw to release clutch fluid with air bubbles into the container, then tighten the bleeder screw immediately.
4. Release the clutch pedal carefully. Repeat the above operation until air bubbles disappear from the clutch fluid being pumped out into the container. During the bleeding operation, keep the clutch fluid reservoir filled to the specified level. Reinstall the rubber cap.

Master Cylinder

Disassembly

1. Disassemble boot (1), push rod (2), piston and piston cup (3), and spring (4) from cylinder body (5).

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Cylinder Body

1. Clean the cylinder body.
2. Check the fluid return port for restrictions and clean it if necessary.

206RS003

Piston and Piston Cup

1. Visually inspect the disassembled piston and piston cup for excessive wear and damage.

206RS004

Replace the inner parts with new parts if necessary.

2. Measure the clearance between slave cylinder wall and piston.

206RS005

If the measured value exceeds the specified limit, the slave cylinder assembly must be replaced.

Standard: 0.07 mm (0.0028 in)

Limit: 0.15 mm (0.0059 in)

Reassembly

To reassemble, follow the disassembly steps in the reverse order, noting the following points:

Piston Assembly

1. Before installing the parts, apply a thin coat of rubber grease.
2. Install cup in groove in piston with the lip turned to the front of cylinder. Use care so as not to scratch the cylinder.

206RS006

Damper Cylinder

Disassembled View

Disassembly

1. Disassembly cover and gasket (6).
2. Disassembly damper rubber (5).
3. Disassembly spacer (4).
4. Disassembly piston assembly (3).
5. Disassembly spring (2).
6. Disassembly cylinder body (1).

Reassembly

To assemble, follow the disassembly steps in the reverse order.

Inspection and Repair

Check damper rubber and piston cup for cracks, deformation or damage.
Replace the damper cylinder assembly if necessary.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Headlight Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the headlight bulb.
 - Disconnect the connector (2).
 - Remove the rubber cap (1).
 - Remove the spring.

CAUTION: The halogen light bulb produces heat and temperature rises high, therefore, if the glass surface is contaminated it will be burnt by heat leaving stains which will not come out. This may reduce the illuminating power or damage the bulb due to thermal deformation during evaporation. In order to prevent this problem, do not touch the glass surface with your fingers.

801RY00010

Installation

To install, follow the removal steps in the reverse order.

Headlight Assembly

Removal

1. Disconnect the battery ground cable.
2. Remove the radiator grille (1).
 - Remove eight clips and a screw.
3. Remove the side marker light (3).
 - Remove three screws.
 - Disconnect the connector.
4. Remove the headlight assembly (2).
 - Disconnect the connector.
 - Remove four screws.

801RY00017

Installation

To install, follow the removal steps in the reverse order.

CAUTION: After installing the headlight, be sure to adjust the headlight aim.

Headlight Adjustment

Preparation

Place the vehicle with 1 – person in driver seat, on a level surface and check to see if the inflation pressure of the tires is correct, the linses are clean, the battery is sufficiently charged, and adjust to place vehicle by using the screen.

1. Set up the screen (1) on a level surface.
2. Put on the screen at right angles to the center line (3).
3. Adjust the center of the vehicle (2) to the center line on floor.

4. Keep the vehicle (2) 3m (9.8 ft) apart from the screen (1).
5. Toward the screen from the bulb center mark of headlight, extend a parallel line (A) to the floor and draw a vertical line (V) at an intersection point of screen and a parallel line (A).

6. Measure a height (H) from the bulb mark of headlight to the floor and draw a horizontal line on the screen.
7. Turn on the low beam of headlight.
8. Adjust the bending point to the vertical line (V) by horizontal adjustment and adjust cut line 30mm (1.18in) below from horizontal line (H) by vertical adjustment.

NOTE: While adjusting the headlight, cover the other one not to light the screen.

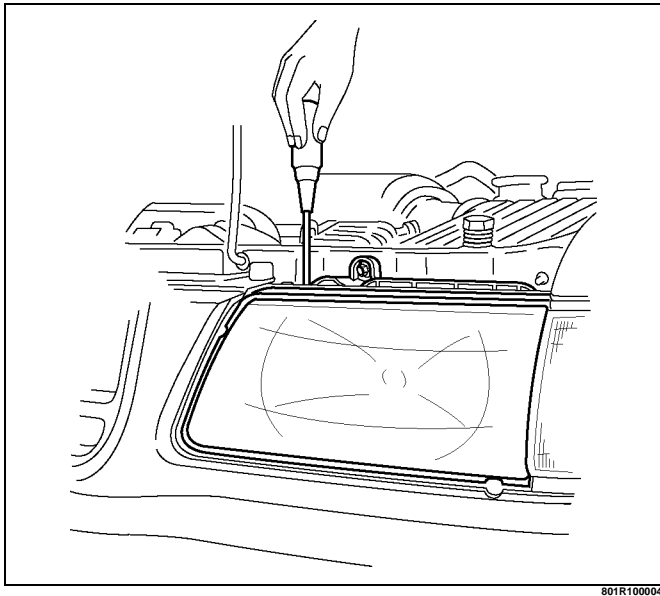

Vertical Adjustment

Use a screwdriver for vertical adjustment.

Horizontal Adjustment

Use a screwdriver for horizontal adjustment.

Fog Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the fog light bulb (2).
 - Open the rear cover (1).
 - Remove the dust cover.
 - Disconnect the bulb connector.
 - Remove the clip (3).

Installation

To install, follow the removal steps in the reverse order.

Fog Light Assembly

Removal

1. Disconnect the battery ground cable.
2. Remove the fog light assembly (1).
 - Disconnect the connector.
 - Remove two nuts from the bracket.

3. Adjust the center of the vehicle (2) to the center line on floor.

4. Keep the vehicle (2) 3m (9.8 ft) apart from the screen (1).
5. Toward the screen from the bulb center mark of fog light, extend a parallel line (A) to the floor and draw a vertical line (V) at an intersection point of screen and a parallel line (A).

Installation

To install, follow the removal steps in the reverse order.

CAUTION: After installing the fog light, be sure to adjust the fog light aim.

Fog Light Adjustment

Preparation

Place the vehicle with 1 – person in driver seat, on a level surface and check to see if the inflation pressure of the tires is correct, the lenses are clean, the battery is sufficiently charged, and adjust to place vehicle by using the screen.

1. Set up the screen (1) on a level surface.
2. Put on the screen at right angles to the center line (3).

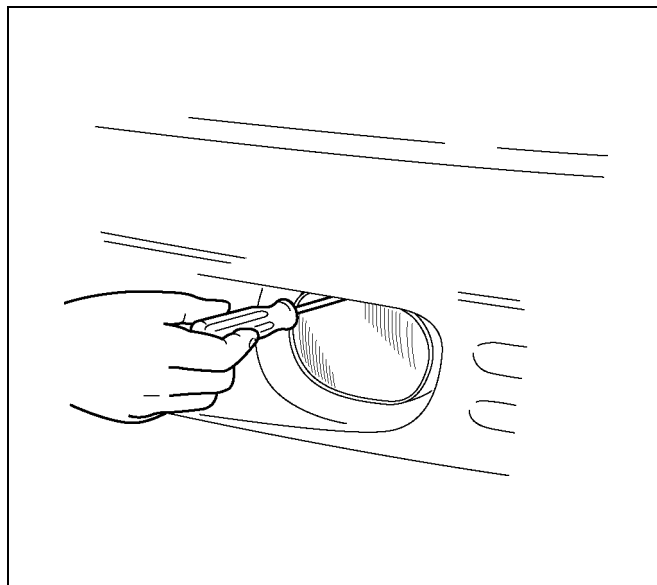

6. Measure a height (H) from the bulb mark of fog light to the floor and draw a horizontal line on the screen.
7. Turn on the fog light.

8. Adjust cut line 60mm (2.36in) below from horizontal line (H) by vertical adjustment.

NOTE: While adjusting the fog light, cover the other one not to light the screen.

Vertical Adjustment

Turn the adjusting screw with a screwdriver to adjust the aim of the fog light vertically.

Clearance Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Disconnect the connector.
3. Remove the socket retaining ring by turning it counterclockwise.
4. Remove the clearance light bulb (2).
 - Remove the rubber cap.
 - Pull out the bulb socket (1).

Installation

To install, follow the removal steps in the reverse order.

Front Combination Light Assembly

Removal

1. Disconnect the battery ground cable.
2. Remove the side combination light.
 - Refer to Side Marker Light Bulb in this section.
3. Disconnect the connector.

Installation

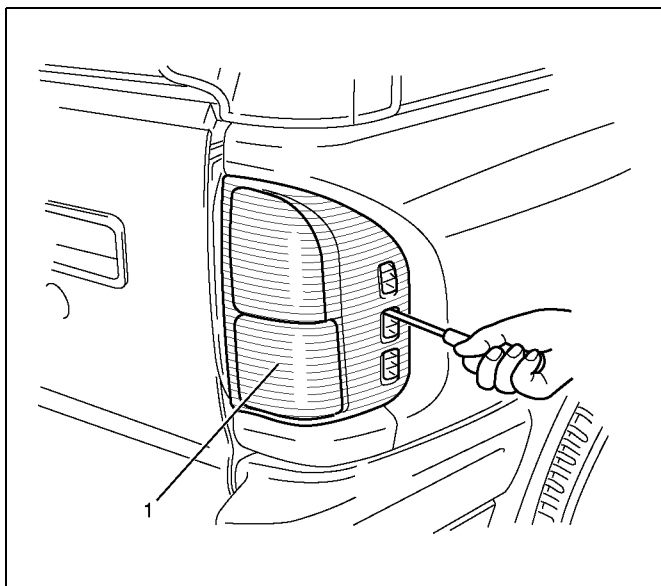

To install, follow the removal steps in the reverse order.

Taillight Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the rear combination light assembly (1).
 - Remove three screws.
3. Pull out the rear combination light assembly to ward you.

- Remove the bulb (1) by turning it counterclockwise while pushing it at the same time.

803RY00005

825RW069

Installation

To install, follow the removal steps in the reverse order.

License Plate Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the lens cover (3).
 - Remove two screws.
3. Remove the lens (2).
4. Remove the bulb (1).
 - Pull out the bulb from the socket.

825RW070

Installation

To install, follow the removal steps in the reverse order.

Stoplight Bulb

Removal and Installation

Refer to Taillight Bulb in this section.

High Mounted Stoplight Assembly

Removal

1. Disconnect the battery ground cable.
2. Remove the high mount stoplight assembly (2).
 - Remove the cover (3).
 - Disconnect the connectors (1).
 - Remove two screws.

803RX001

Installation

To install, follow the removal steps in the reverse order.

High Mounted Stoplight Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the cover.
3. Remove the bulb (1).
 - Remove the socket by turning it counterclockwise.

825RW071-1

Installation

To install, follow the removal steps in the reverse order.

Backup Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the rear combination light assembly.
 - Refer to the Taillight Bulb removal step 2 in this section.
 - Remove the bulb (1) by turning it counterclockwise while pushing it at the same time.

825RW073

Installation

To install, follow the removal steps in the reverse order.

Front Turn Signal Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the radiator grille.
 - Refer to Engine Hood and Fender in section.
3. Remove the front turn signal light (2).
 - Remove three screws.
4. Remove the bulb (1).
 - Remove the front turn signal light socket by turning it counterclockwise.
 - Remove the bulb by turning it counterclockwise while pushing it at the same time.

825RW067

Installation

To install, follow the removal steps in the reverse order.

Side Turn Signal Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the side turnsignal light assembly.
 - Pushing in the rear direction of vehicle, pull out it toward you.
3. Remove the bulb (1) by turning it counterclockwise.

801RW024

Installation

To install, follow the removal steps in the reverse order.

Rear Turn Signal Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the rear combination light assembly.
 - Refer to the Taillight Bulb in this section.
 - Remove the bulb (1) by turning it counterclockwise while pushing it at the same time.

825RW074

Installation

To install, follow the removal steps in the reverse order.

Dome Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the lens (2).
3. Remove the bulb (1).
 - Pull out the bulb.

Installation

To install, follow the removal steps in the reverse order.

Courtesy Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the lens (2).
3. Remove the bulb (1).
 - Pull out the bulb.

Installation

To install, follow the removal steps in the reverse order.

Map Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the lens (2).
3. Remove the bulb (1).
 - Pull out the bulb.

805R100001

Installation

To install, follow the removal steps in the reverse order.

Map Light Bulb (with Overhead Console)

Removal

1. Disconnect the battery ground cable.
2. Remove the lens (1).
3. Remove the bulb (2).

825RX059

Installation

To install, follow the removal steps in the reverse order.

Luggage Room Light Bulb (4Door Model)

Removal

1. Disconnect the battery ground cable.
2. Remove the lens (2).
3. Remove the bulb (1).
 - Pull out the bulb.

Installation

To install, follow the removal steps in the reverse order.

HVAC Bezel Illumination Light Bulb

Removal and Installation

Refer to Control Panel Illumination bulb in Heating, Ventilation and Air Conditioning (HVAC) section.

Shift Lever Illumination Light Bulb (A/T)

Removal

1. Disconnect the battery ground cable.
2. Remove the console assembly.
 - Remove four screws.
3. Remove the bulb (1).
 - Turn the bulb socket counterclockwise.
 - Pull out the bulb from the socket.

825RW287

Ashtray Illumination Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the lower cluster panel(1).
 - Refer to Instrument Panel Assembly in Body Structure section.
3. Disconnect the connector (2).
4. Turn the socket counterclockwise to remove it then pull out the bulb(3).

45RW013

Installation

To install, follow the removal steps in the reverse order.

Starter Switch

Removal and Installation

Refer to Lock cylinder in steering section.

Lighting Switch (Combination Switch)

Removal and Installation

Refer to Combination Switch in Steering section.

Dimmer-Passing Switch (Combination Switch)

Removal and Installation

Refer to Combination Switch in Steering section.

Door Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the door switch (2).
 - Remove the screw (1).
 - Disconnect the connector (3).

Installation

To install, follow the removal steps in the reverse order.

825RW289

Rear Defogger Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the meter cluster assembly (1).
 - Refer to Instrument Panel Assembly in Body Structure section.
3. Remove the rear defogger switch (2).
 - Disconnect the switch connector.
 - Push the lock from the back side of the meter cluster assembly.

825RW280

Installation

To install, follow the removal steps in the reverse order.

Key Remind Switch (Starter Switch)

Removal and Installation

Refer to Lock Cylinder in Steering section.

Hazard Warning Light Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the meter cluster assembly (1).
 - Refer to Instrument Panel Assembly in Body Structure section.
3. Remove the hazard warning switch (2).
 - Disconnect the switch connector.
 - Push the lock from the back side of the meter cluster assembly.

825RW279

Installation

To install, follow the removal steps in the reverse order.

Stoplight Switch

Removal and Installation

Refer to Stoplight Switch in Brake section.

4WD Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the meter cluster assembly (1).
 - Refer to Instrument Panel Assembly in Body Structure section.
3. Remove the 4WD switch (2).
 - Disconnect the switch connector.
 - Push the lock from the back side of the meter cluster assembly.

Installation

To install, follow the removal steps in the reverse order.

Fog Light Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the meter cluster assembly (1).
 - Refer to Instrument Panel Assembly in Body Structure section.
3. Remove the fog light switch (2).
 - Disconnect the switch connector.
 - Push the lock from the back side of the meter cluster assembly.

Installation

To install, follow the removal steps in the reverse order.

TOD Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the meter cluster Assembly (1).
 - Refer to Instrument Panel Assembly in Body Structure section.
3. Remove the TOD switch (2).
 - Disconnect the switches (2) (3) (4) connectors.
 - Push the lock from the back side of the meter cluster assembly.

825R100031

Installation

To install, follow the removal steps in the reverse order.

Cruise Main Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the meter cluster assembly (1).
 - Refer to Instrument Panel Assembly in Body Structure section.
3. Remove the cruise main switch (2).
 - Disconnect the switch connector.
 - Push the lock from the back side of the meter cluster assembly.

825R100032

Installation

To install, follow the removal steps in the reverse order.

Power/Winter Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the power/winter switch (1).
 - Pull out the power/winter switch.
 - Disconnect the switch connector.

Installation

To install, follow the removal steps in the reverse order.

Intelligent Suspension Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the intelligent suspension switch (1).
 - Pull out the intelligent suspension switch.
 - Disconnect the switch connector.

Installation

To install, follow the removal steps in the reverse order.

Illumination Controller

Removal

1. Disconnect the battery ground cable.
2. Remove the meter cluster assembly (1).
 - Refer to Instrument Panel Assembly in Body Structure section.
3. Remove the illumination controller (2).
 - Disconnect the controller connector.
 - Remove the controller knob (4).
 - Remove the nut (3).
 - Remove the controller from the back side of the meter cluster assembly.

825R100033

Installation

To install, follow the removal steps in the reverse order.

Backup Light Switch (M/T)

Removal

1. Disconnect the battery ground cable.
2. Remove the backup light switch (1).
 - Disconnect the connector (2).

230RW010

Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Apply liquid gasket to the screw portion of the switch to prevent oil leak.

Turn Signal Light Switch (Combination Switch)

Removal and Installation

Refer to Combination Switch in Steering section.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Windshield Wiper/Washer System

General Description

The circuit consists of the starter switch, windshield wiper & washer switch, windshield wiper motor, windshield washer motor and alarm & relay control unit. When the windshield wiper & washer switch is turned on

with the starter switch on, the battery voltage is applied to the wiper motor to activate the wiper.

The washer motor squirts glass cleaning fluid while the washer switch is being pushed. The alarm & relay control unit relay is used to control motion of the wiper.

Windshield Wiper And Washer Switch

Removal and Installation

Refer to Combination Switch in Steering section.

Windshield Wiper Motor

Removal

1. Disconnect the battery ground cable.
2. Disconnect the connector (2).
3. Remove 4 mounting bolts (3).
4. Remove the windshield wiper motor(1).

880RW002-1

5. Remove the crank arm fixing ball (4).

880RX011

Installation

To install, follow the removal steps in the reverse order.

Windshield Washer Motor

Removal

1. Disconnect the battery ground cable.
2. Remove the fender inner liner (right side).
3. Disconnect the windshield washer motor connector and the rear washer motor connector.
4. Disconnect the windshield washer hose connector and the rear washer hose connector.
5. Remove the filler neck (2).
 - Remove the bolt.
6. Remove the washer tank (1).
 - Remove the three nuts.
7. Pull out the windshield washer motor (4) from the washer tank.

Installation

To install, follow the removal steps in the reverse order.

880RW028

Windshield Washer Spray Pattern

880RW024

Legend

- (1) Spray Target
- (2) Washer Nozzle

Windshield Wiper Linkage

Windshield Wiper Linkage and Associated Parts

880RW026-1

Legend

|---------------------------------------|------------------------------|
| (1) Windshield Wiper Arm/Blade | (4) Windshield Wiper Motor |
| (2) Vent Cowl Cover | (5) Windshield Wiper Arm Nut |
| (3) Windshield Wiper Linkage Assembly | |

Removal

1. Disconnect the battery ground cable.
2. Remove the windshield wiper arm/blade.
3. Remove the vent cowl cover.
4. Remove the windshield wiper motor.
5. Remove the pivot assembly mounting nuts, fixing screws.
6. Take out the windshield wiper linkage assembly from the opening of the cowl.

Installation

To install, follow the removal steps in the reverse order.

Windshield Wiper Arm/Blade

Removal

1. Dry the cap(2) off with the tip of a screwdriver.
2. Remove the nut.
3. Remove the wiper arm/blade(1).

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Before installing the wiper arm/blade to the shaft, confirm that the motor stops at the autostop position.
2. Set the wiper arm/blade so that the tips of both blades are positioned about 40mm (1.57 in) from the upper edge of the cowl cover as shown in the figure.
3. Tighten the nuts to the specified torque.

Torque: 23N·m (2.3kg·m/17lbf)

Windshield Wiper Blade Rubber

Removal

1. Push the wiper blade lock(1) while pulling the wiper blade in the arrow direction as shown in the figure.

CAUTION: When the wiper blade has been removed, wrap the tip of the wiper arm with cloth, to avoid damaging the glass.

880RS011

2. Pull the end of rubber and remove the projection(3) from the click of the blade stay (2).

880RS010

3. Pull the rubber out in the same direction.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Install the click of the blade stay in the groove of the new rubber and slide it in. Complete wiper blade installation by pushing the click.

885RS002

2. Finally, check that the click of the stay has caught in the hole of the rubber.

885RS001

Rear Wiper/Washer System

General Description

The circuit consists of the starter switch, rear wiper & washer switch, rear wiper motor, rear washer motor and Alarm & relay control unit.

When the rear wiper & washer switch is turned on with the starter switch on, the battery voltage is applied to the wiper motor to activate the wiper.

The washer motor squirts glass cleaning fluid while the washer switch is being pushed. The alarm & relay control unit is used to control motion of the wiper.

Rear Wiper and Washer Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the dash side trim panel(1).
3. Remove the lower cover assembly(2).
 - Refer to Instrument panel Assembly in Body Structure section.

821RW293-1

4. Remove the meter cluster assembly(3).

5. Remove the rear wiper & washer switch (4).

- Disconnect the connector.
- Push the lock from the back side of the meter cluster assembly.

825RW285

Installation

To install, follow the removal steps in the reverse order, noting the following point:

1. Push the switch with your fingers until it locks securely.

Rear Wiper Motor

Removal

1. Disconnect the battery ground cable.
2. Remove the tailgate trim pad.
3. Remove the wiper arm/blade. Refer to Rear Wiper Arm/Blade in section.
4. Remove the rear wiper motor (1).
 - Disconnect the connector.
 - Remove the motor shaft nut (2).
 - Remove the rear wiper motor fixing screws.

885RW001-1

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Before installing the wiper arm/blade to the motor shaft, confirm that the motor stops at the autostop position.
2. Install the wiper arm/blade so that the wiper arm (5) contact with the stopper portion (6) on the hatch gate cover (3) as shown in the figure.

885RW005-1

3. Tighten the motor shaft nut (2) to the specified torque.

Torque: 10N·m (1.0kg·m/87lbin)

4. Tighten the wiper arm nut (4) to the specified torque.

Torque: 14N·m (1.4kg·m/122lbin)

Rear Washer Motor

Removal

1. Disconnect the battery ground cable.
2. Remove the fender inner liner (right side).
3. Disconnect the windshield washer motor connector and the rear washer motor connector.
4. Disconnect the windshield washer hose connector and the rear washer hose connector.
5. Remove the filler neck (2).
 - Remove the bolt.
6. Remove the washer tank (1).
 - Remove the three nuts.
7. Pull out the rear washer motor (3) from the washer tank.

880RW028

Installation

To install, follow the removal steps in the reverse order.

Alarm and Relay Control Unit

Removal

1. Disconnect the battery ground cable.
2. Remove the glove box.
3. Remove the alarm and relay control unit (1).
 - Remove the fixing screw and disconnect the connector.

826R100030

Installation

To install, follow the removal steps in the reverse order.

Rear Wiper Arm/Blade

Removal

1. Remove the arm nut(2).
2. Remove the wiper arm/blade(1).

885RW007

Rear Washer Nozzle

Removal

1. Remove the rear roof trim cover.
 - Refer to Interior Trim Panel in Interior and Exterior Panel section.
2. Remove the washer nozzle(1).
 - Pull out the washer nozzle from the washer hose (2).

885R10003

Rear Washer Spray Pattern

885R10002

Legend

- (1) Washer Nozzle
- (2) Spray Target

Installation

To install, follow the removal steps in the reverse order.

Rear Wiper Blade Rubber

Removal

1. Remove the wiper blade from the wiper arm.
2. Push out the wiper rubber from the wiper blade by sliding it horizontally while holding down the rubber on the wiper blade convex (1) side.

CAUTION: When the wiper blade has been removed, wrap the tip of the wiper arm with cloth, to avoid damaging the glass.

Installation

1. Install the wiper blade rubber.
 - Insert the tip of wiper rubber (2) from the opposite side of removal in the arrow direction.

- Check if the convex part (3) of wiper blade is installed in the groove of the wiper rubber.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Cigarette Lighter

General Description

When the cigarette lighter is pushed in with the starter switch at either "ACC" or "ON" position, a circuit is formed in the cigarette lighter case to heat the lighter coil.

The cigarette lighter springs back to its original position after the lighter coil is heated.

Removal

1. Disconnect the battery ground cable.
2. Remove the lower cluster assembly (1).
 - Refer to the Instrument Panel Assembly in Body Structure section.
3. Remove the cigarette lighter assembly (2).
 - Disconnect the connectors.
 - Remove the socket (3).

826RW004-1

Installation

To install, follow the removal steps in the reverse order, noting the following point:

1. When installing the bezel, align the projected portion of the socket with the notch of the bezel.

Digital Clock

Removal

1. Disconnect the battery ground cable.
2. Remove the dash side trim panel-LH (1).
 - Refer to Instrument Panel Assembly in Body Structure section.
3. Remove the lower cover assembly (2).
 - Refer to instrument Panel Assembly in Body Structure section.

821RW293-1

4. Remove the meter cluster assembly (3). Refer to instrument Panel Assembly in Body Structure section.
5. Remove the digital clock (4).
 - Remove the fixing screw.

- Disconnect the connector.

821RW291

Installation

To install, follow the removal steps in the reverse order.

Rod Type Antenna

Removal

1. Disconnect the battery ground cable.
2. Turn the antenna rod (3) counterclockwise to remove it.
3. Remove three screws and nine clips to remove the fender inner liner (6).
4. Disconnect the feeder cable connector (7) at the inside of the vehicle.
5. Turn the lock nut (2) counterclockwise and remove it together with the base mold (1).
6. Pull down and remove the housing (4) from the panel.
7. Pull and remove the cable with the grommet (5).

890R100019

Installation

To install, follow the removal steps in the reverse order.

Radio

Removal

1. Disconnect the battery ground cable.
2. Remove the lower cluster assembly (1).
 - Refer to Instrument Panel Assembly in Body Structure section.

89RW086

3. Remove the radio (2).
 - Remove the two fixing screws.
 - Disconnect the connector (4) and the antenna cable (3).

89RW085

Installation

To install, follow the removal steps in the reverse order.

Speaker

Front Speaker

Removal

1. Disconnect the battery ground cable.
2. Pull the grille (1) to release the locks and then remove it.
3. Remove four screws and disconnect the connector (3) to remove the speaker (2).

Installation

To install, follow the removal steps in the reverse order.

Tweeter Assembly

Removal

1. Disconnect the battery ground cable.
2. Remove the front door trim pad (2).
 - Refer to Front Window Regulator, Glass And Glass Run in Body Structure section:
3. Remove the tweeter (1).
 - Disconnect the connector.

Installation

To install, follow the removal steps in the reverse order.

Rear Speaker

Removal

1. Disconnect the battery ground cable.
2. Remove the roof rear lining (1).
 - Release the locks and clips.
3. Remove the speaker (2).
 - Remove the four screws.
 - Disconnect the connector (3).

Installation

To install, follow the removal steps in the reverse order.

Rear Door Speaker

Removal

1. Disconnect the battery ground cable.
2. Remove the rear door speaker.
 - Refer to Rear Window Regulator, Glass and Glass Run in Body Structure section.

890R100020

Installation

To install, follow the removal steps in the reverse order.

Accessory Socket

Front Accessory Socket

Removal

1. Disconnect the battery ground cable.
2. Remove the lower cluster assembly (1).
3. Remove the front accessory socket (4).
 - Disconnect the connectors (2).
 - Pull out the front accessory socket from the socket cover (3).

810RW326

Installation

To install, follow the removal steps in the reverse order, noting the following point:

Rear Accessory Socket

Removal

1. Disconnect the battery ground cable.
2. Remove the rear accessory socket (2).
 - Disconnect the connectors (1).
 - Pull out the front accessory socket from the socket cover (3).

810RW004

Installation

To install, follow the removal steps in the reverse order.

Horn

Removal

1. Disconnect the battery ground cable.
2. Remove the radiator grille.
 - Refer to Engine Hood and Fender in Body Structure section.
3. Remove the horn (1).
 - Disconnect the connector.
 - Remove the horn mounting bolt.

82BRX001

Installation

To install, follow the removal steps in the reverse order.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fasteners joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fasteners. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

The chassis electrical system is a 12-volt system with a negative ground polarity.

Wire size are appropriate to respective circuits, and classified by color. (The classification of harnesses by color is shown on the circuit diagram for ease of harness identification.)

The wire size is determined by load capacity and the length of wire required.

The vehicle harness are: body harness, chassis harness, engine room harness, instrument harness, transmission harness, engine ECGI harness, dome light harness, door harness, rear body harness, tailgate harness, SRS harness and battery cables.

The harnesses are protected either by tape or corrugated tube, depending on harness location.

The circuit for each system consists of the power source, wire, fuse, relay, switch, load parts and ground, all of which are shown on the circuit diagram.

In this section, each electrical device is classified by system.

For major parts shown on the circuit based on the circuit diagram for each system, a summary, diagnosis of troubles and inspection procedures are detailed.

Notes for Working on Electrical Items

Disconnecting the Battery Cable

1. All switches should be in the "OFF" position.
2. Disconnect the battery ground cable (2).
3. Disconnect the battery positive cable (1).

CAUTION: It is important that the battery ground cable be disconnected first. Disconnecting the battery positive cable first can result in a short circuit.

061RW002

Connecting the Battery Cable

Follow the disconnecting procedure in the reverse order.

CAUTION: Clean the battery terminal and apply a light coat of grease to prevent terminal corrosion.

Disconnecting the Connector

Some connectors have a tang lock to hold the connectors together during vehicle operation.

Some tang locks are released by pulling them towards you (1).

Other tang locks are released by pressing them forward (2).

Determine which type of tang lock is on the connector being handled.

Firmly grasp both sides (male and female) of the connector.

Release the tang lock and carefully pull the two halves of the connector apart.

D08RW128

Never pull on the wires to separate the connectors. This will result in wire breakage as shown in the figure.

D08RW129

8D-4 WIRING SYSTEM

When removing the connector for relay (MR5B type) (3), unfasten the tang lock of the connector by using a screwdriver, then pull the relay out as shown in the figure.

D08RW131

Connecting the Connector

Firmly grasp both sides (male and female) of the connector. Be sure that the connector pins and pin holes match, Be sure that both sides of the connector are aligned with each other.

Firmly but carefully push the two sides of the connector together until a distinct click is heard.

D08RW130

Connector Inspection

Use a circuit tester to check the connector for continuity. Insert the test probes (1) from the connector wire side.

D08RW132

Never insert the circuit tester test probes (2) into the connector open end to test the continuity. Broken or open connector terminals will result.

D08RW133

Waterproof Connector Inspection

It is not possible to insert the test probes (2) into the connector wire side of a waterproof connector. Use one side of a connector (1) with its wires cut to make the test. Connect the test connector (3) to the connector to be tested. Connect the test probes to the cut wires to check the connector continuity.

D08RW134

Connector Pin Removal – Pin Tang Lock Type

1. Insert a slender shaft (1) into the connector housing open end (5).
2. Push the tang lock (2) flat (toward the wire (3) side of the connector).
Pull the wire with pin (4) free from the wire side of the connector.

D08RW136

Connector Pin Removal – Connector Housing Tang Lock Type

1. Insert a slender shaft (1) into the connector housing open end (5).
2. Push the tang lock (2) up (in the direction of the arrow in the illustration).
Pull the wire (3) with pin (4) free from the wire side of the connector.

D08RW135

Connector Pin Insertion

1. Check that the tang lock (1) is fully up.
2. Insert the pin (3) from the connector wire (2) side. Push the pin in until the tang lock closes firmly.
3. Gently pull on the wires to make sure that the connector pin is firmly set in place.

D08RW137

8D-6 WIRING SYSTEM

Parts Handling

Be careful when handling electrical parts. They should not be dropped or thrown, because short circuiting or other damage may result.

D08RW138

Cable Harness

1. When installing the parts, be careful not to pinch or wedge the wiring harness.
2. All electrical connections must be kept clean and tight.

D08RW139

3. Use a grommet or guard tube to protect the wiring harness from contacting a sharp edge or surface.

D08RW139

4. Position the wiring harness with enough clearance from the other parts and guard the wiring harness with a vinyl tube (2) and clips (1) to avoid direct contact.

D08RW141

5. The wiring harness between engine and chassis should be long enough to prevent chafing or damage due to various vibrations.

D08RW142

Splicing Wire

1. If the harness is taped, remove the tape. To avoid wire insulation damage, use a sewing "seam ripper" (available from sewing supply stores) to cut open the harness.

If the harness has a black plastic conduit, simply pull out the desired wire.

2. Begin by cutting as little wire off the harness as possible. You may need the extra length of wire later if you decide to cut more wire off to change the location of a splice. You may have to adjust splice locations to make certain that each splice is at least 1-1/2" (40 mm) away from other splices, harness branches, or connectors.

3. When replacing a wire, use a wire of the same size as the original wire.

Check the stripped wire for nicks or cut stands. If the wire is damaged, repeat the procedure on a new section of wire. The two stripped wire ends should be equal in length.

4. Select the proper clip to secure the splice.

To determine the proper clip size for the wire being spliced, follow the directions included with your clips. Select the correct anvil on the crimper. (On most crimpers your choice is limited to either a small or large anvil.)

Overlap the two stripped wire ends and hold them between your thumb and forefinger as shown in the figure.

The center the spline clip (1) under the stripped wires and hold it in place.

D08RW143

- Open the crimping tool to its full width and rest one handle on a firm flat surface.
- Center the back of the splice clip on the proper anvil and close the crimping tool to the point where the back of the splice clip touches the wings of the clip.
- Make sure that the clip and wires are still in the correct position. Then, apply steady pressure until the crimping tool closes as shown in the figure.

D08RW144

8D-8 WIRING SYSTEM

Before crimping the ends of the clip (1), be sure that:

- The wires extend beyond the clip in each direction.
- No strands of wire are cut loose, and
- No insulation is caught under the clip.

Crimp the splice again, once on each end.

Does not let the crimping tool (2) extend beyond the edge of the clip or you may damage or nick the wires as shown in the figure.

D08RW145

5. Apply 60/40 resin core solder to the opening in the back of the clip as shown in the figure.

Follow the manufacturer's instructions for the solder equipment you are using.

D08RW146

6. Center and roll the splicing tape.

The tape should cover the entire splice.

Roll on enough tape to duplicate the thickness of the insulation on the existing wires.

Does not flag the tape. Flagged tape may not provide enough insulation, and the flagged ends will tangle with the other wires in the harness as shown in the figure.

D08RW147

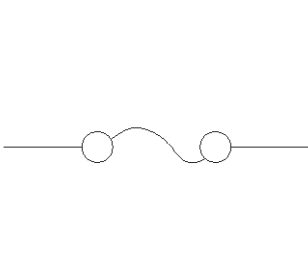

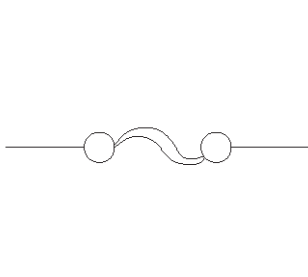

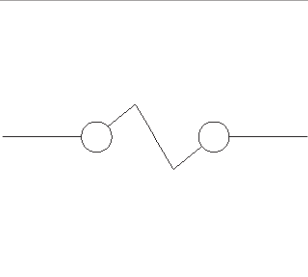

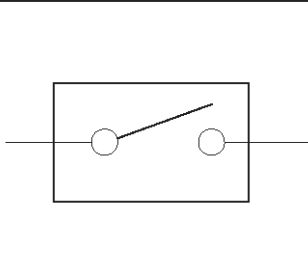

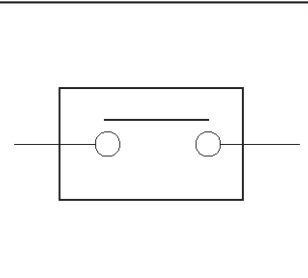

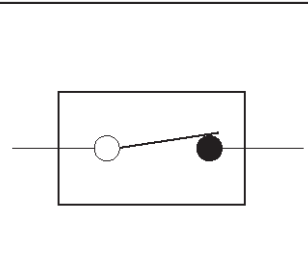

If the wire does not belong in a conduit or other harness covering, tape the wire again. Use a winding motion to cover the first piece of tape as shown in the figure.

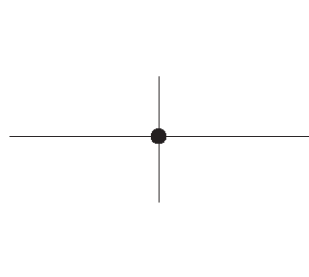

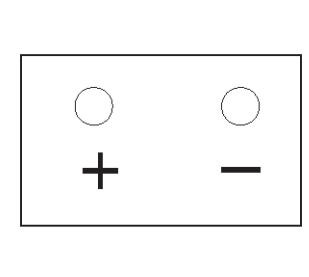

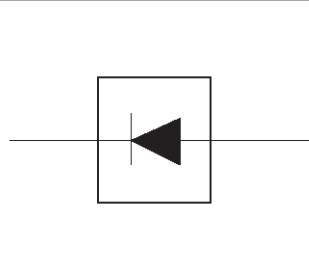

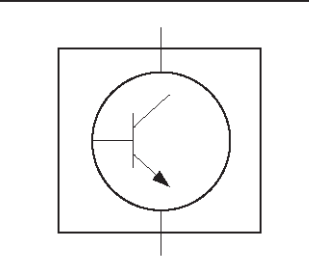

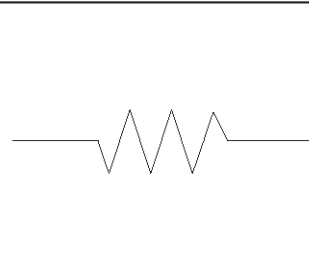

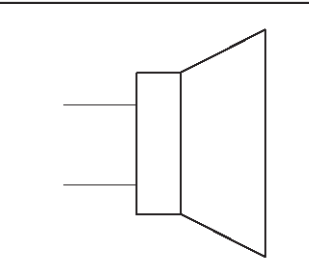

D08RW148

Parts for Electrical Circuit

Wiring – Wire color

All wires have color-coded insulation.

Wires belonging to a system's main harness will have a single color (1). Wires belonging to a system's subcircuits will have a colored stripe (2). Striped wires use the following code to show wire size and colors.

Wiring – Wire Color Coding

Abbreviations are used to indicate wire color within a circuit diagram.

Refer to the following table.

Color-coding	Meaning
B	Black
W	White
R	Red
G	Green
Y	Yellow
L	Blue
O	Orange
BR	Brown
LG	Light green
GR	Grey
P	Pink
LB	Light blue
V	Violet

8D-14 WIRING SYSTEM

Wiring – Wire Size

The size of wire used in a circuit is determined by the amount of current (amperage), the length of the circuit, and the voltage drop allowed. The following wire size and load capacity, shown below, are specified by AWG (American Wire Gauge) (Nominal size means approximate cross sectional area (1).)

D08RW151

Wiring – Wire Size Table

Nominal size	Cross sectional area (mm ²)	Outside diameter (mm)	Allowable current (A)	AWG size (cross reference)
0.3	0.372	1.5	9	22
0.5	0.563	1.7	12	20
0.85	0.885	1.9	16	18
1.25	1.287	2.2	21	16
2	2.091	2.7	28	14
3	3.296	3.6	37.5	12
5	5.227	4.4	53	10
8	7.952	5.5	67	8
15	13.36	7.0	75	6
20	20.61	8.2	97	4

Fuse

Fuses are the most common form of circuit protection used in vehicle wiring. A fuse is a thin piece of wire or strip of metal encased in a glass or plastic housing. It is wired in series with the circuit it protects. When there is an overload of current in a circuit, such as a short to ground, the metal strip is designed to burn out and interrupt the flow of current. This prevents a surge of high current from reaching and damaging other components in the circuit.

Determine the cause of the overloaded before replacing the fuse.

The replacement fuse must have the same amperage specification as the original fuse.

Never replace a blown fuse with a fuse of a different amperage specification.

Doing so can result in an electrical fire or other serious circuit damage. A blown fuse is easily identified as shown in the figure.

810RX001

Fusible Link

The fusible link is primarily used to protect circuits where high amounts of current flow and where it would not be practical to use a fuse. For example, the starter circuit. When a current overload occurs, the fusible link melts open and interrupts the flow of current so as to prevent the rest of the wiring harness from burning.

Determine the cause of the overload before replacing the fusible link. The replacement fusible link must have the same amperage specification as the original fusible link. Never replace a blown fusible link with fusible link of a different amperage specification. Doing so can result in an electrical fire or other serious circuit damage.

A blown fusible link is easily identified as shown in the figure.

D08RW154

Fusible Link Specifications

Type	Rating	Case Color	Maximum Circuit Current (A)
Connector	30A	Pink	15
Connector	40A	Green	20
Bolted	50A	Red	25
Bolted/Connector	60A	Yellow	30
Bolted	80A	Black	40
Bolted	100A	Blue	50

Circuit Breaker

The circuit breaker is a protective device designed to open the circuit when a current load is in excess of rated breaker capacity. If there is a short or other type of overload condition in the circuit, the excessive current will open the circuit between the circuit breaker terminals. The reset knob (1) pops out when the circuit is open. Push the reset knob in place to restore the circuit after repairing it.

D08RW155

Relay

Battery and load location may require that a switch be placed some distance from either component. This means a longer wire and a higher voltage drop (1).

The installation of a relay between the battery and the load reduces the voltage drop (2).

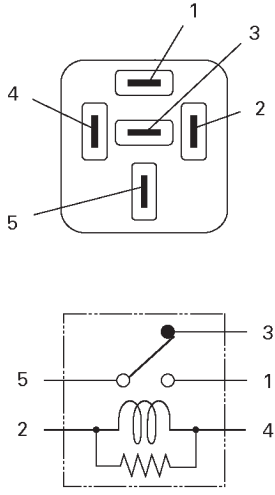

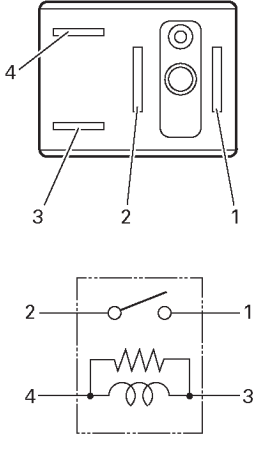

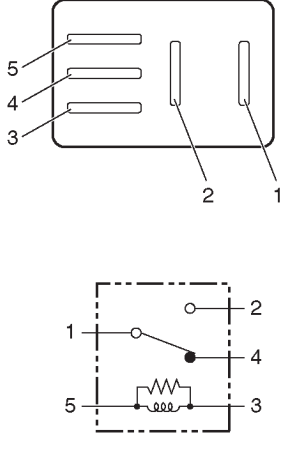

Because the switch controls the relay, amperage through the switch can be reduced.

D08RW156

8D-18 WIRING SYSTEM

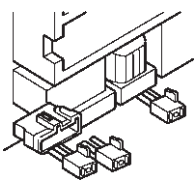

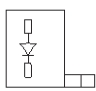

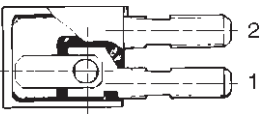

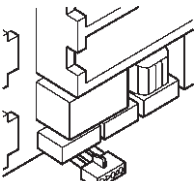

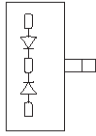

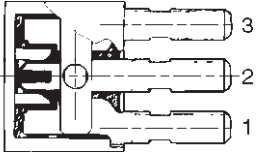

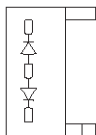

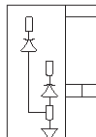

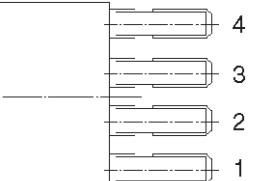

Relay Specifications and Configurations

Name/ Color	Rated voltage/Coil resistance	Internal circuit	Name/ Color	Rated voltage/Coil resistance	Internal circuit

Diode – Maximum Rating (Temp. = 77°F (25°C))

Items	Rating	Remarks
Peak reverse voltage	400V	
Transient peak reverse voltage	500V	
Average output current	1.5A	Temp. = 104°F (40°C)
Working ambient temperature	-22°F~176°F (-30°C~80°C)	
Storage temperature	-40°F~212°F (-40°C~100°C)	

8D-20 WIRING SYSTEM

Connector

- The connector pin shape (2) determines whether the connector is male (3) or female (1).

D08RW159

- The symbol illustrated in the figure is used as connector, in the circuit of this section.

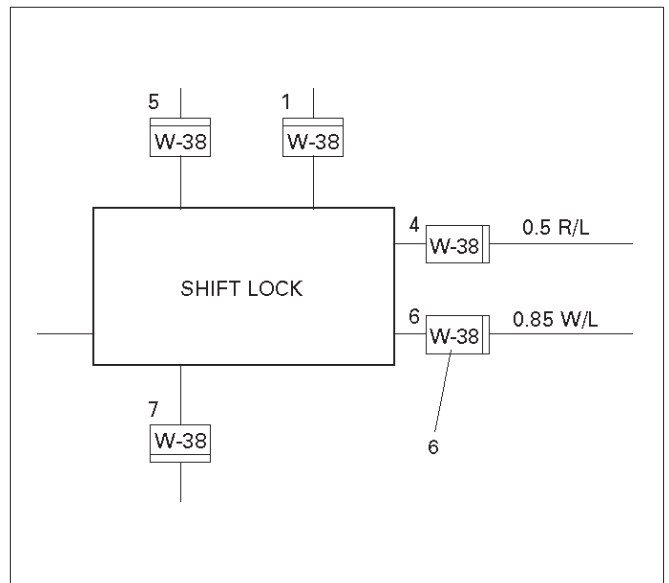

D08RW160

Legend

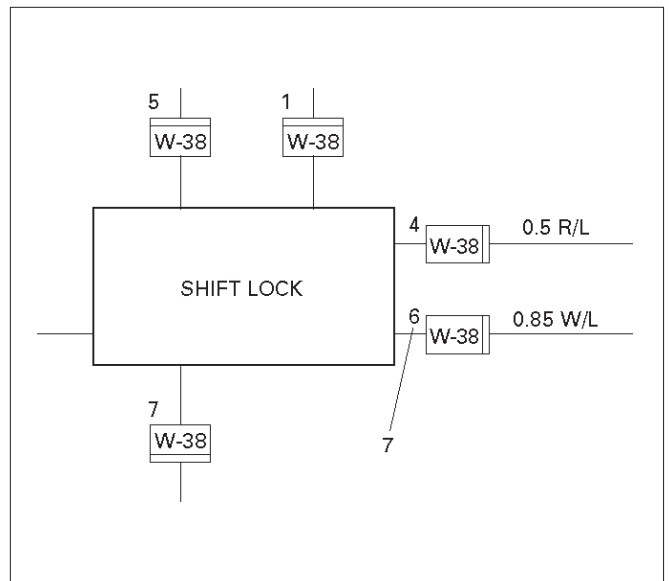

- (4) Female Side Connector
- (5) Male Side Connector

- Connector is identified with a connector number (6)

D08RW161

- The applicable terminal number (7) is shown for each connector.

D08RW162

- Connector terminal numbers (10) are clearly shown. Make side connector (9) terminal numbers are in sequence from upper right to lower left. Female side connector (8) terminal numbers are in sequence from upper left to lower right.

D08RW163

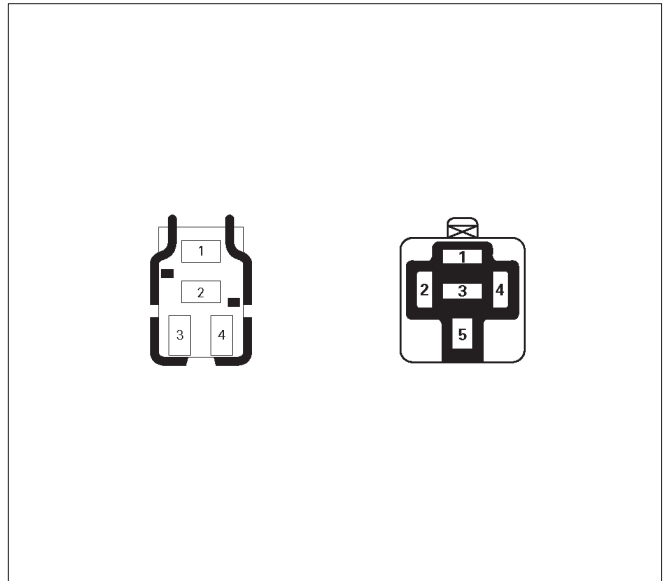

NOTE:

1. For those connectors on which specific terminal numbers or symbols are shown (such as PCM), the terminal numbers or symbols are used in the circuit diagram, irrespective of the above rule. Refer to the following figure.

D08RW164

2. The connectors used for relays have their own terminal number assignment, irrespective of the above rule. Refer to the following figure.

Double Lock Type Connector

Doublelock type yellow color connectors are used for supplemental restraint system–air bag circuit. When removing the cable harness, disconnect the connector by unlocking at two places, outside (1) and inside (2). In such a case, do not pull the cables. Otherwise, cable disconnection may occur.

When connecting the connector, insert the connector completely and lock at outside. Imperfect locking may cause malfunction of SRS system circuit.

F00RX010

Reading the Circuit Diagram

In this section, each system has its own parts location illustration and circuit diagram. And harness connector faces used in the circuit diagram are shown at the end of this section.

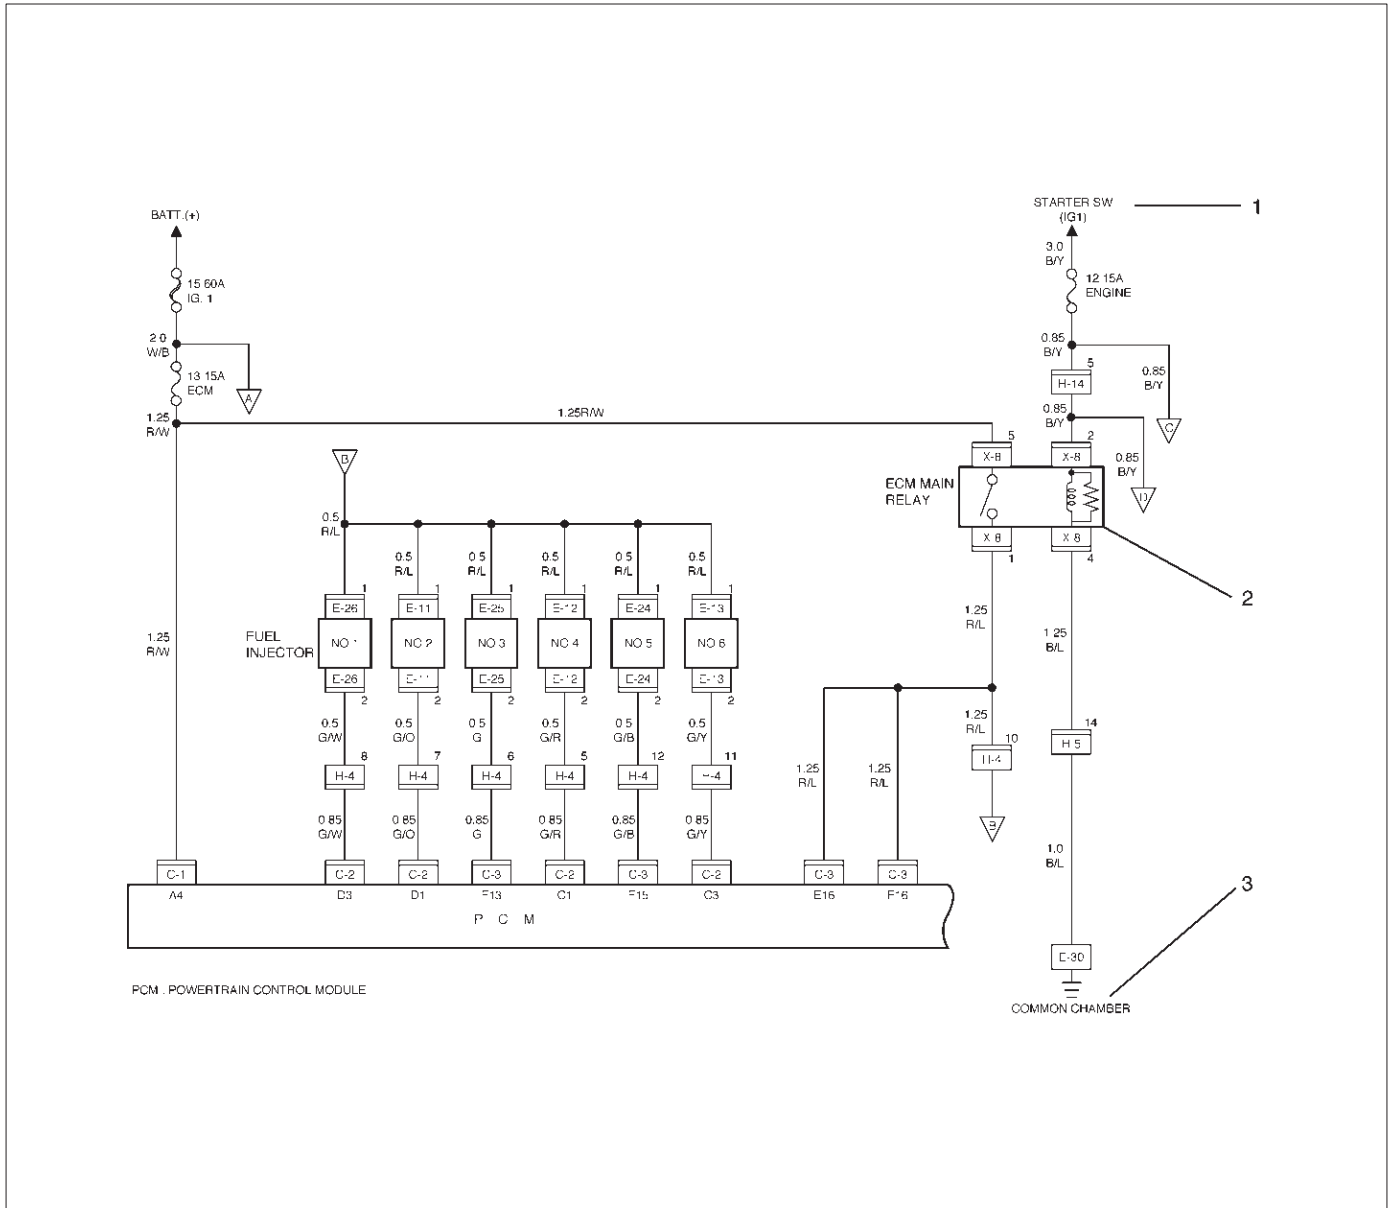

Parts Location

The parts location shows the location of the connectors (1) and the harness (2) used in each harness routing.

Circuit Diagram

The circuit diagram shows the power supply (1) the load or loads (2) and the grounding point(s) (3).

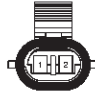

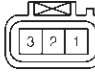

8D-24 WIRING SYSTEM

Harness Connector Faces

The harness connector faces show each connector's number (1), configuration (2) and the pin number (3).

Start and Charging

General Description

This system consists of starter, AC generator, starter relay, clutch start SW (M/T), mode SW (A/T) and heater & A/C relay.

When starter SW is set to "ST" position with A/T select lever at "P" (Parking) or "N" (Neutral) position (Mode SW "ON"), or clutch pedal depressed (Clutch start SW "ON"), battery positive voltage is applied to starter solenoid coil through starter relay to start starter. At the same time, starter relay cuts off blower motor and A/C circuit.

Powertrain Control Module (PCM)

General Description

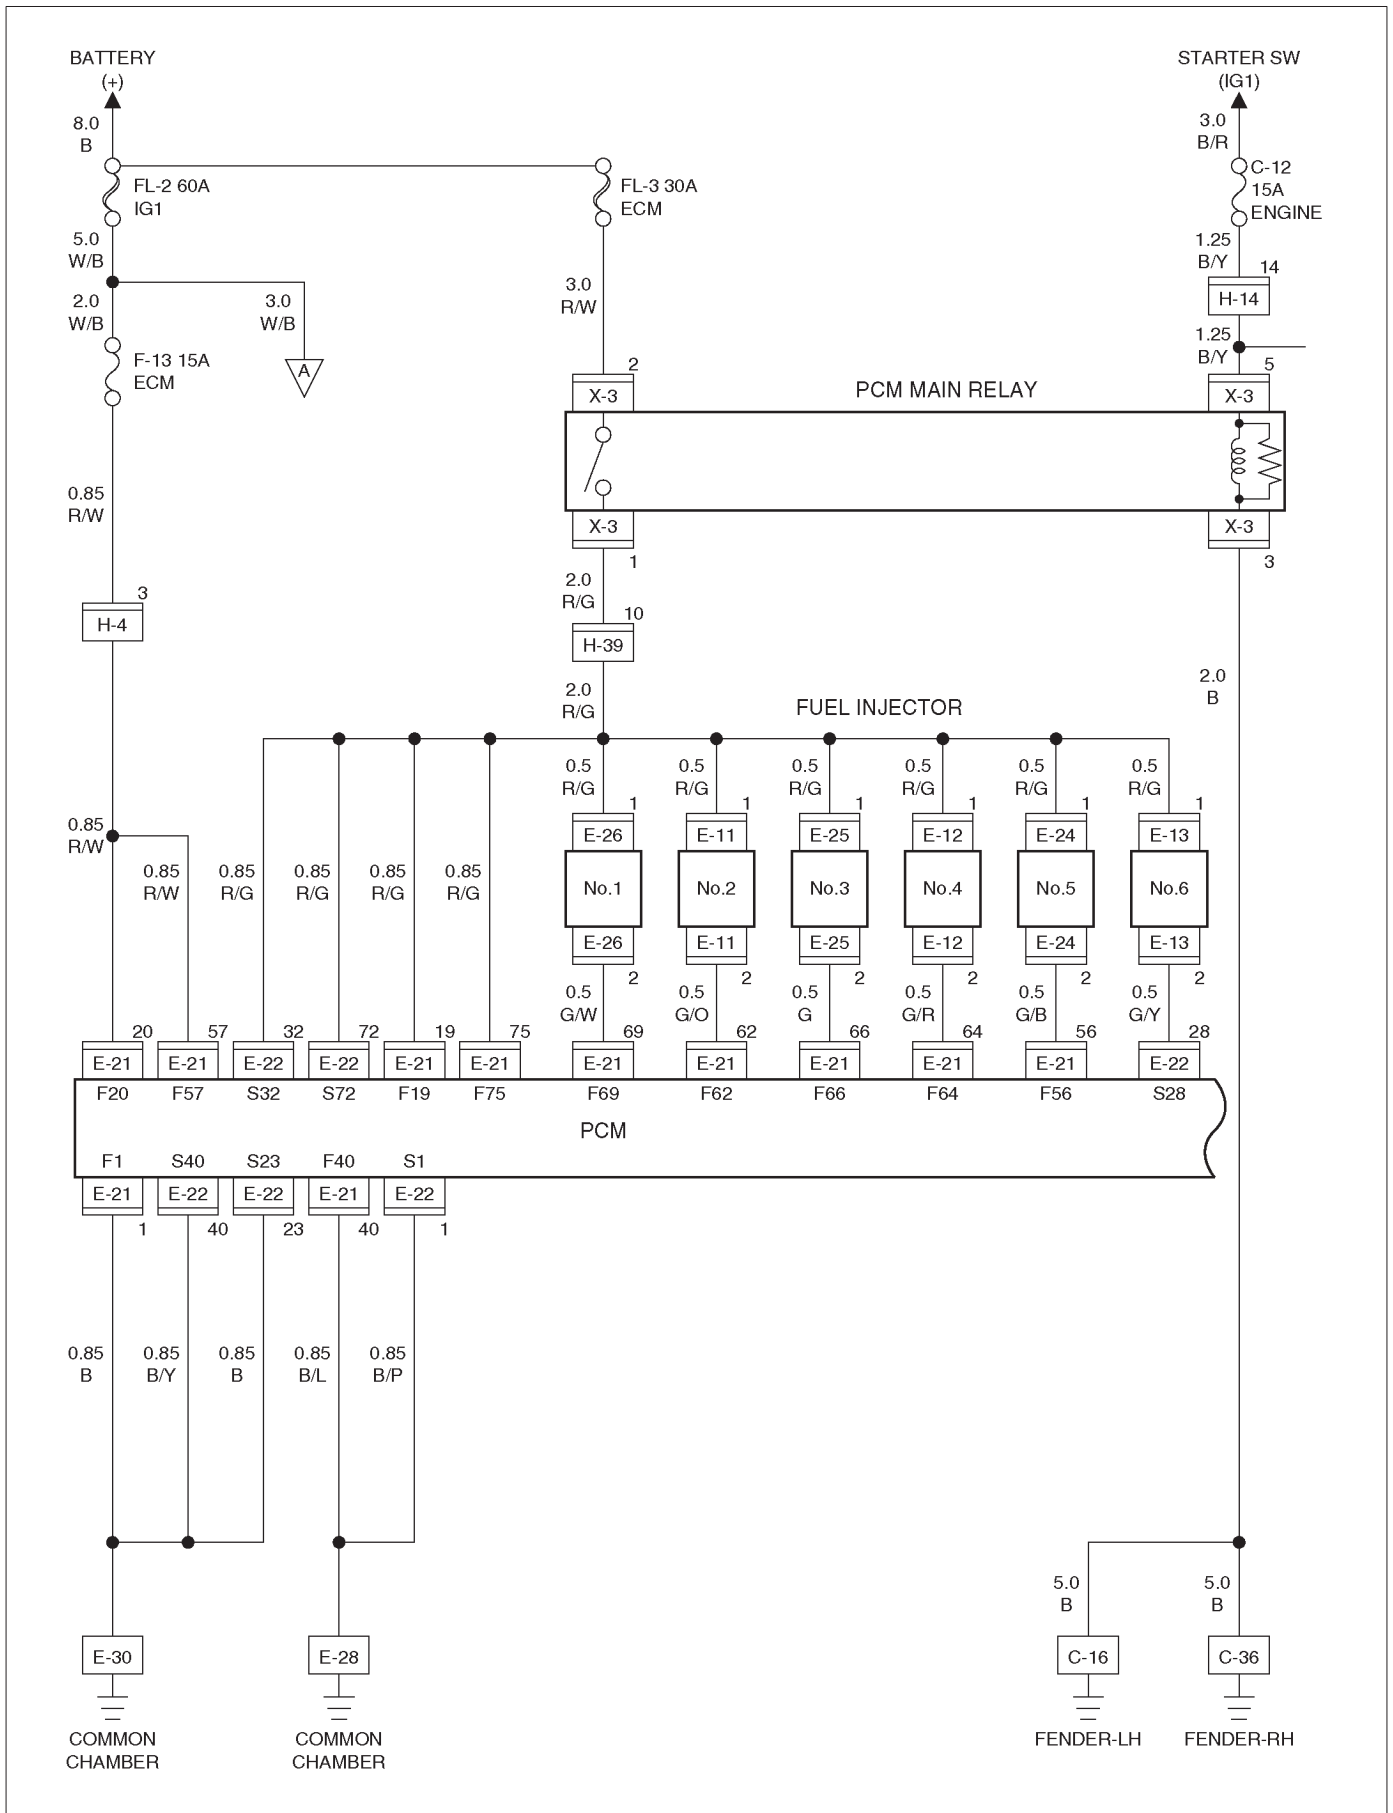

The Powertrain Control Module (PCM) is located in the passenger compartment.

The PCM constantly monitors the information from various sensors, and controls the systems that affect vehicle performance.

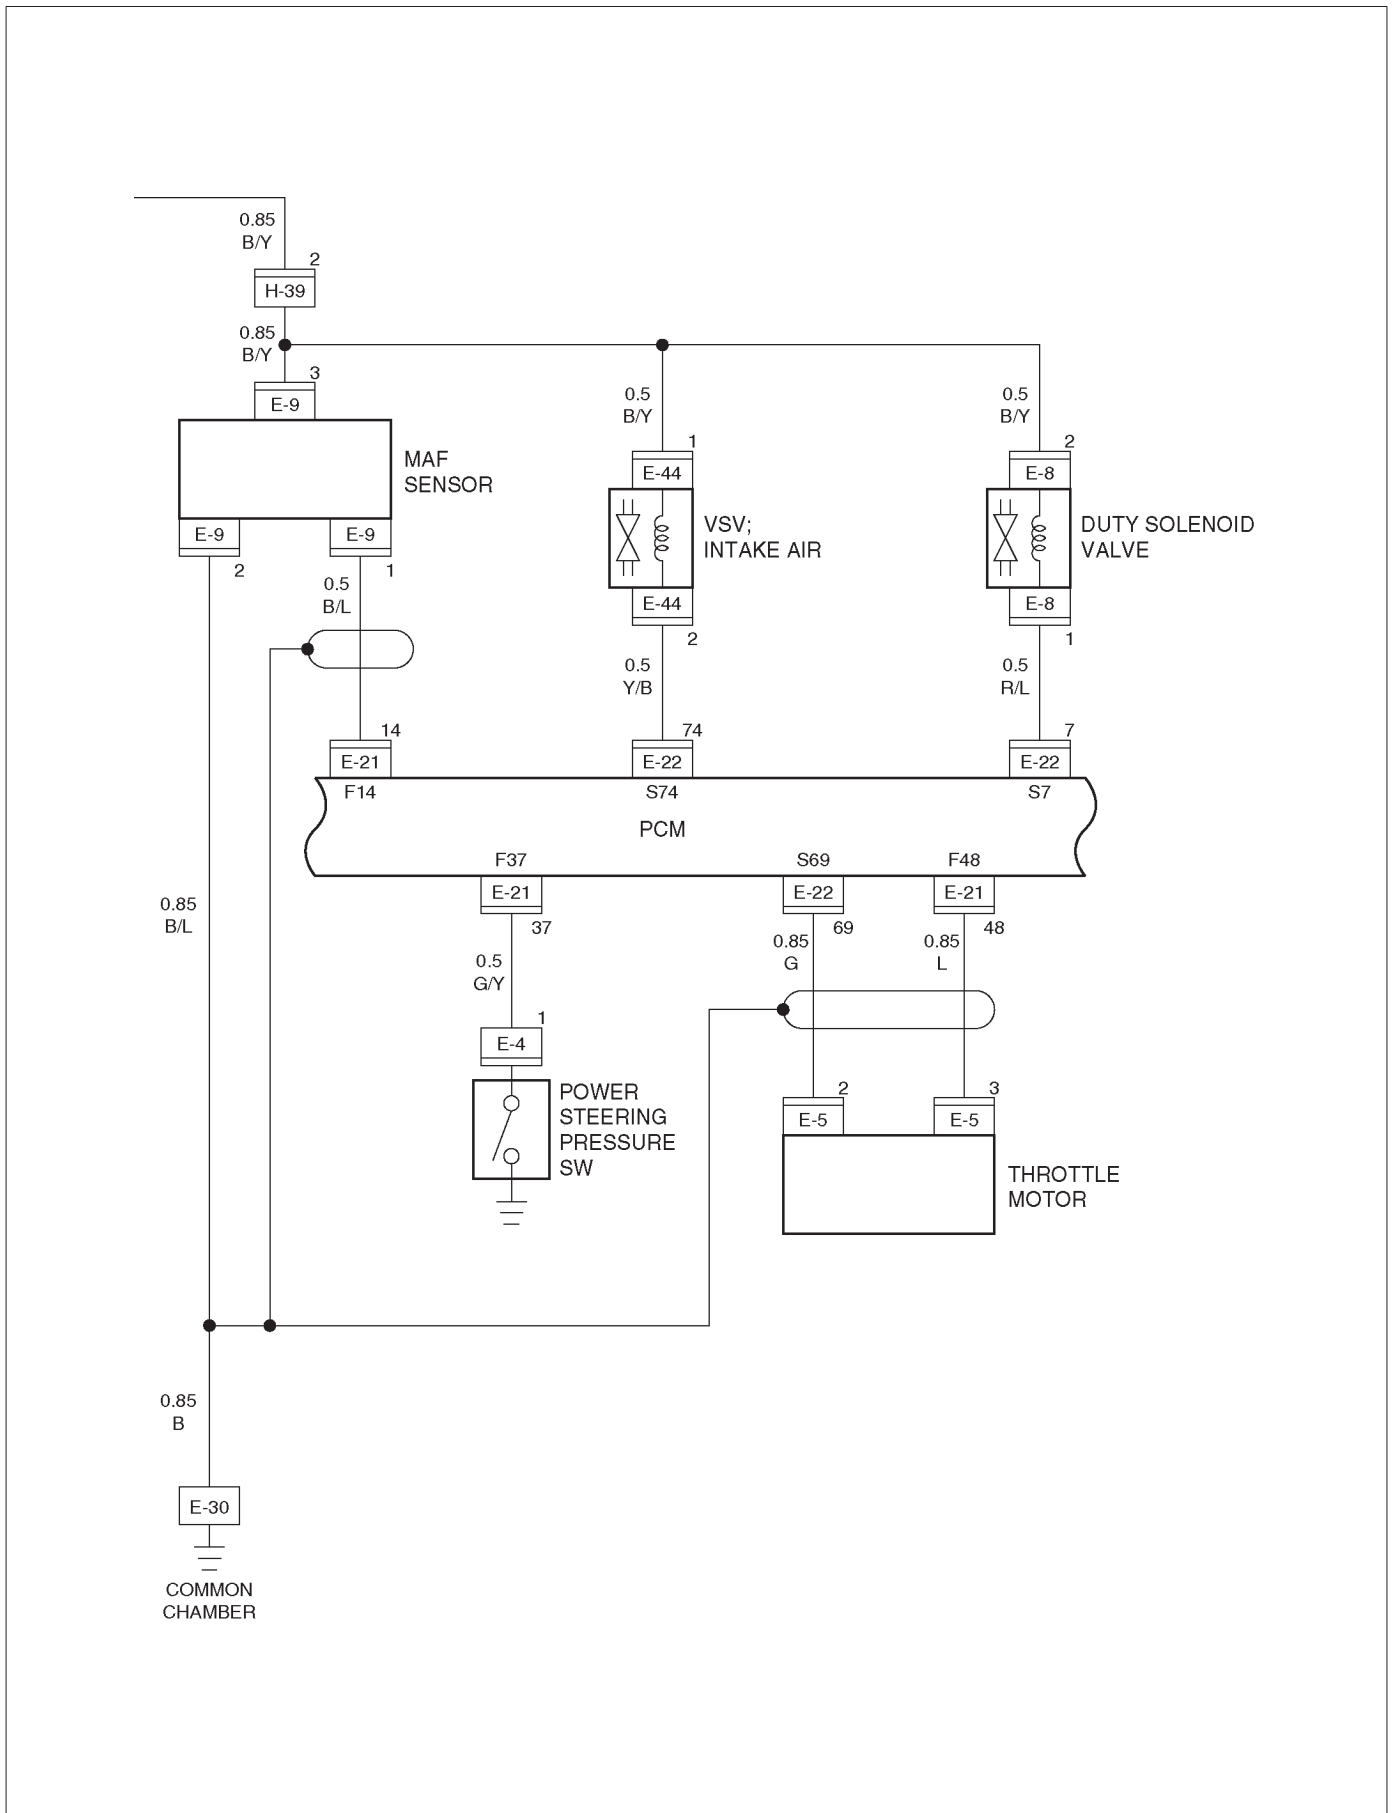

The PCM performs the diagnostic function of the system. It can recognize operational problems, alert the driver through the Malfunction Indicator Light (MIL) and store a Diagnostic Trouble Code (DTC) or DTC(s) which identify the problem areas to aid the technician in making repairs. The PCM is designed to process the various input informations and then send the necessary electrical responses to control fuel delivery, spark timing and other emission control systems. The input information has an interrelation to more than one output therefore, if the one input failed, it could affect more than one system operation.

Refer to Driveability and Emission in Engine Section and Automatic Transmission in Transmission section.

Headlight and Fog Light

General Description

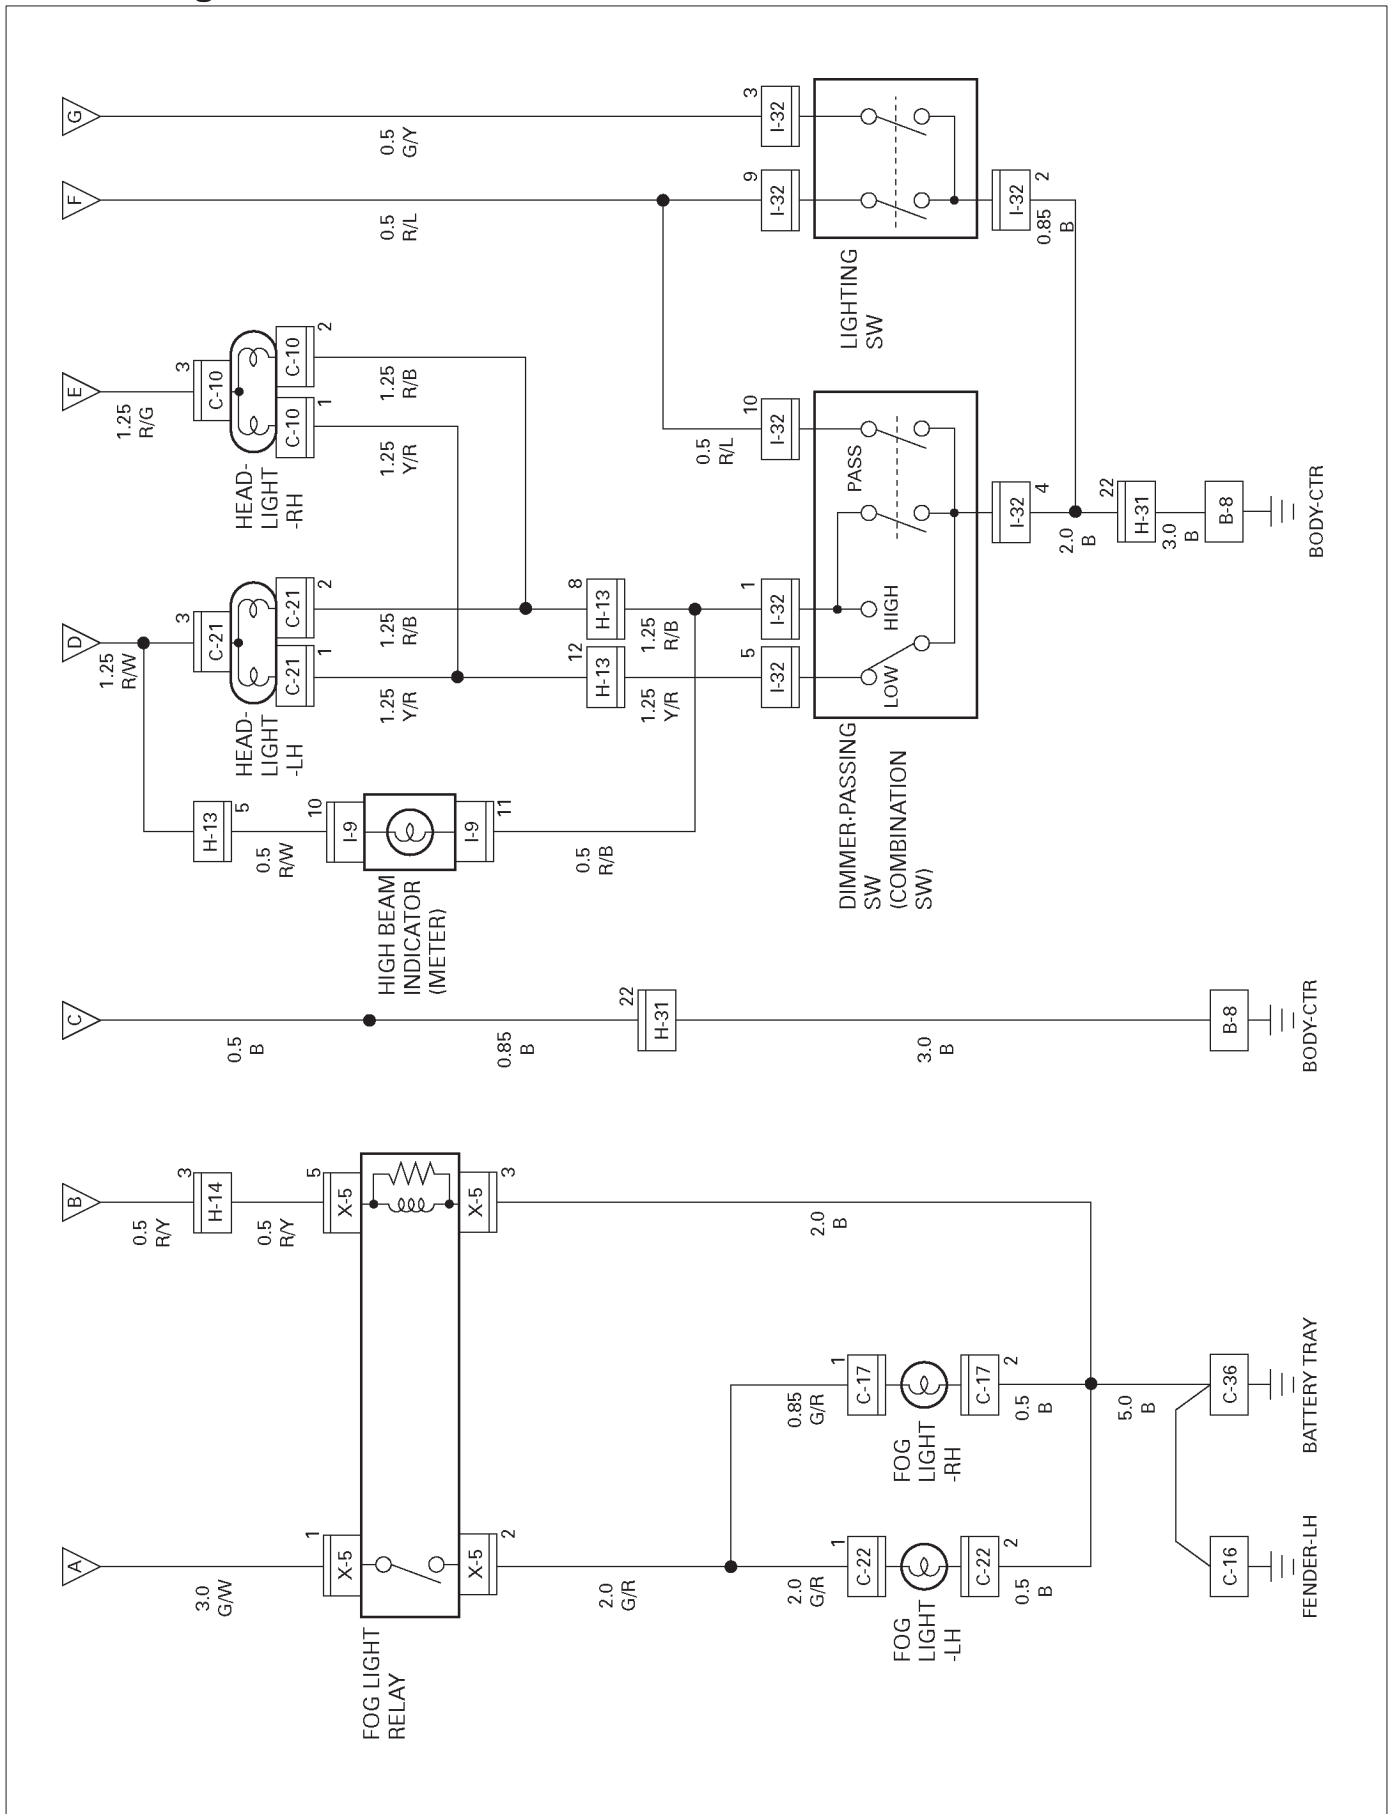

The circuit consists of headlight, fog light, lighting switch, dimmer-passing switch, fog light switch, high beam indicator, lighting relay and fog light relay. When starter switch is turned on by setting it at headlight position, lighting relay is activated to turn on headlight. Optical axis of headlight can be turned up or down by operating dimmer switch while headlight is on. Passing switch is independent of lighting switch, and optical axis of passing light can be turned up only while switch lever is pulled up and held in this state.

When fog light switch is turned on while headlight on at low-beam, fog light relay is activated to turn on fog light.

Diagnosis

Both Headlights Inoperative

Step	Action	Value(s)	Yes	No
1	Check the ground terminal B-8. Is B-8 grounded securely?	—	Go to Step 2	Ground it securely
2	Disconnect the combination switch connector I-32. Is there continuity between switch side connector I-32 terminals 9 and 2 with the switch turned to headlight position?	—	Go to Step 2	Replace the switch
3	Check continuity of dimmer-passing switch. Is there continuity between switch side connector I-32 terminal 5 and 4 with the switch turned to low position, and terminal 1 and 4 with the switch turned to high position?	—	Go to Step 3	Replace the switch
4	Check continuity between the lighting switch and the ground B-8. Is there continuity between harness side connector I-32 terminal 2 and the ground?	—	Go to Step 5	Repair an open circuit
5	Remove the lighting relay from the relay and fuse box. Is the battery voltage applied between harness side connector X-9 terminal 1 and the ground, X-9 terminal 3 and the ground?	Approx. 12V	Go to Step 6	Repair an open circuit between battery and the lighting relay
6	Check continuity between the lighting relay and the lighting switch. Is there continuity between harness side connector X-9 terminal 5 and I-32 terminal 9?	—	Go to Step 7	Repair an open circuit
7	Check continuity between the lighting relay and fuse F-8 or F-9. Is there continuity between harness side connector X-9 terminal 2 and fuse F-8 or F-9?	—	Go to Step 8	Repair an open circuit
8	Check continuity between the dimmer-passing switch and the ground. Is there continuity between switch side connector I-32 terminal 4 and the ground B-8?	—	Replace the lighting relay	Repair an open circuit

Headlight On The Left (or Right) Side Inoperative

Step	Action	Value(s)	Yes	No
1	Is the fuse F-8 or F-9 normal?	—	Go to Step 2	Replace the fuse
2	Remove the headlight bulb on the left or right side. Is the bulb normal?	—	Go to Step 3	Replace the bulb
3	1. Reinstall the bulb. 2. Turn the lighting switch to headlight position. Is the battery voltage applied between harness side connector C-21 terminal 3 and the ground or C-10 terminal 3 and the ground?	Approx. 12V	Reconnect the headlight connector securely	Repair an open circuit between the fuse and headlight

Headlights In Low-Beam Inoperative

Step	Action	Value(s)	Yes	No
1	Disconnect the combination switch connector I-32. Is there continuity between switch side connector I-32 terminal 5 and 4 with the switch at low-beam position?	—	Go to Step 2	Repair or replace the switch
2	Repair an open circuit between connector H-13 terminal 12 and connector I-32 terminal 5. Is the action complete?	—	Verify repair	—

Headlight In High-Beam Inoperative

Step	Action	Value(s)	Yes	No
1	Disconnect the combination switch connector I-32. Is there continuity between switch side connector I-32 terminal 1 and 4 with the switch at high-beam position?	—	Go to Step 2	Repair or replace the switch
2	Repair an open circuit between connector H-13 terminal 8 and connector I-32 terminal 1. Is the action complete?	—	Verify repair	—

Headlights Remain On When Lighting Switch Turned Off

Step	Action	Value(s)	Yes	No
1	1. Turn the lighting switch to off position. 2. Disconnect the combination switch connector I-32. Do the headlights still remain on?	—	Go to Step 3	Go to Step 2
2	Repair or replace the lighting switch. NOTE: There should be no continuity between switch side connector I-32 terminal 9 and 2. Is the action complete?	—	Go to Step 1	—
3	Remove the lighting relay. Is there continuity between the relay side connector X-9 terminal 1 and 2?	—	Replace the relay	Go to Step 4
4	Repair short circuit between the lighting relay and the lighting switch. Is the action complete?	—	Verify repair	—

Headlight Comes On With Lighting Switch At Parking Light Position

Step	Action	Value(s)	Yes	No
1	Repair or replace the lighting switch. NOTE: There should be no continuity between switch side connector I-32 terminal 9 and 2 when the switch is turned to parking light position. Is the action complete?	—	Verify repair	—

(While Headlight Is On In Low-Beam) Both Fog Lights Inoperative

Step	Action	Value(s)	Yes	No
1	Are the fuse F-10 and C-4 normal?	—	Go to Step 2	Replace the fuse(s)
2	Is C-36 grounded securely?	—	Go to Step 3	Ground it securely
3	Remove the foglight relay. Is the battery voltage applied between harness side connector X-5 terminal 1 and the ground?	Approx. 12V	Go to Step 5	Go to Step 4
4	Repair an open circuit between Fuse F-10 and connector X-5 terminal 1. Is the action complete?	—	Go to Step 3	—
5	Is there continuity between harness side connector X-5 terminal 3 and the ground?	—	Go to Step 7	Go to Step 6
6	Repair an open circuit between connector X-5 terminal 3 and the ground C-36. Is the action complete?	—	Go to Step 5	—
7	1. Turn the lighting switch to clearance light position. 2. Turn the fog light switch on. Is the battery voltage applied between harness side connector X-5 terminal 5 and the ground?	Approx. 12V	Replace the fog light relay	Go to Step 8
8	Disconnect the lighting switch connector I-32. Is there continuity between the switch side connector terminal 2 and 3?	—	Go to Step 9	Repair or replace the switch.
9	Disconnect the tail relay. Is there continuity between harness side connector I-21 terminal 3 and X-32 terminal 3?	—	Go to Step 10	Repair an open circuit
10	Is the battery voltage applied between harness side connector X-21 terminal 2, 4 and the ground?	Approx. 12V	Go to Step 12	Go to Step 11
11	Repair an open circuit between the fuse C-4 and connector X-21 terminal 2 or 4. Is the action complete?	—	Go to Step 10	—
12	1. Disconnect the fog light switch. 2. Turn the switch on. Is there continuity between the switch terminal 3 and 4?	—	Go to Step 13	Repair or replace the switch
13	Is there continuity between harness side connector I-5 terminal 4 and connector X-21 terminal 1?	—	Go to Step 14	Repair an open circuit
14	Is there continuity between harness side connector I-5 terminal 3 and connector X-5 terminal 5?	—	Replace the tail relay	Repair an open circuit

(While Headlight Is On In Low-Beam) Fog Light On the Left (or Right) Side Inoperative

Step	Action	Value(s)	Yes	No
1	Is the fog light bulb on the left or right side normal?	—	Go to Step 2	Replace the bulb
2	Disconnect the fog light connector C-22 or C-17. Is there continuity between the fog light harness side connector terminal 2 and the ground?	—	Go to Step 3	Repair an open circuit
3	Repair an open circuit between fog light relay connector X-5 terminal 2 and fog light connector terminal 1. Is the action complete?	—	Verify repair	—

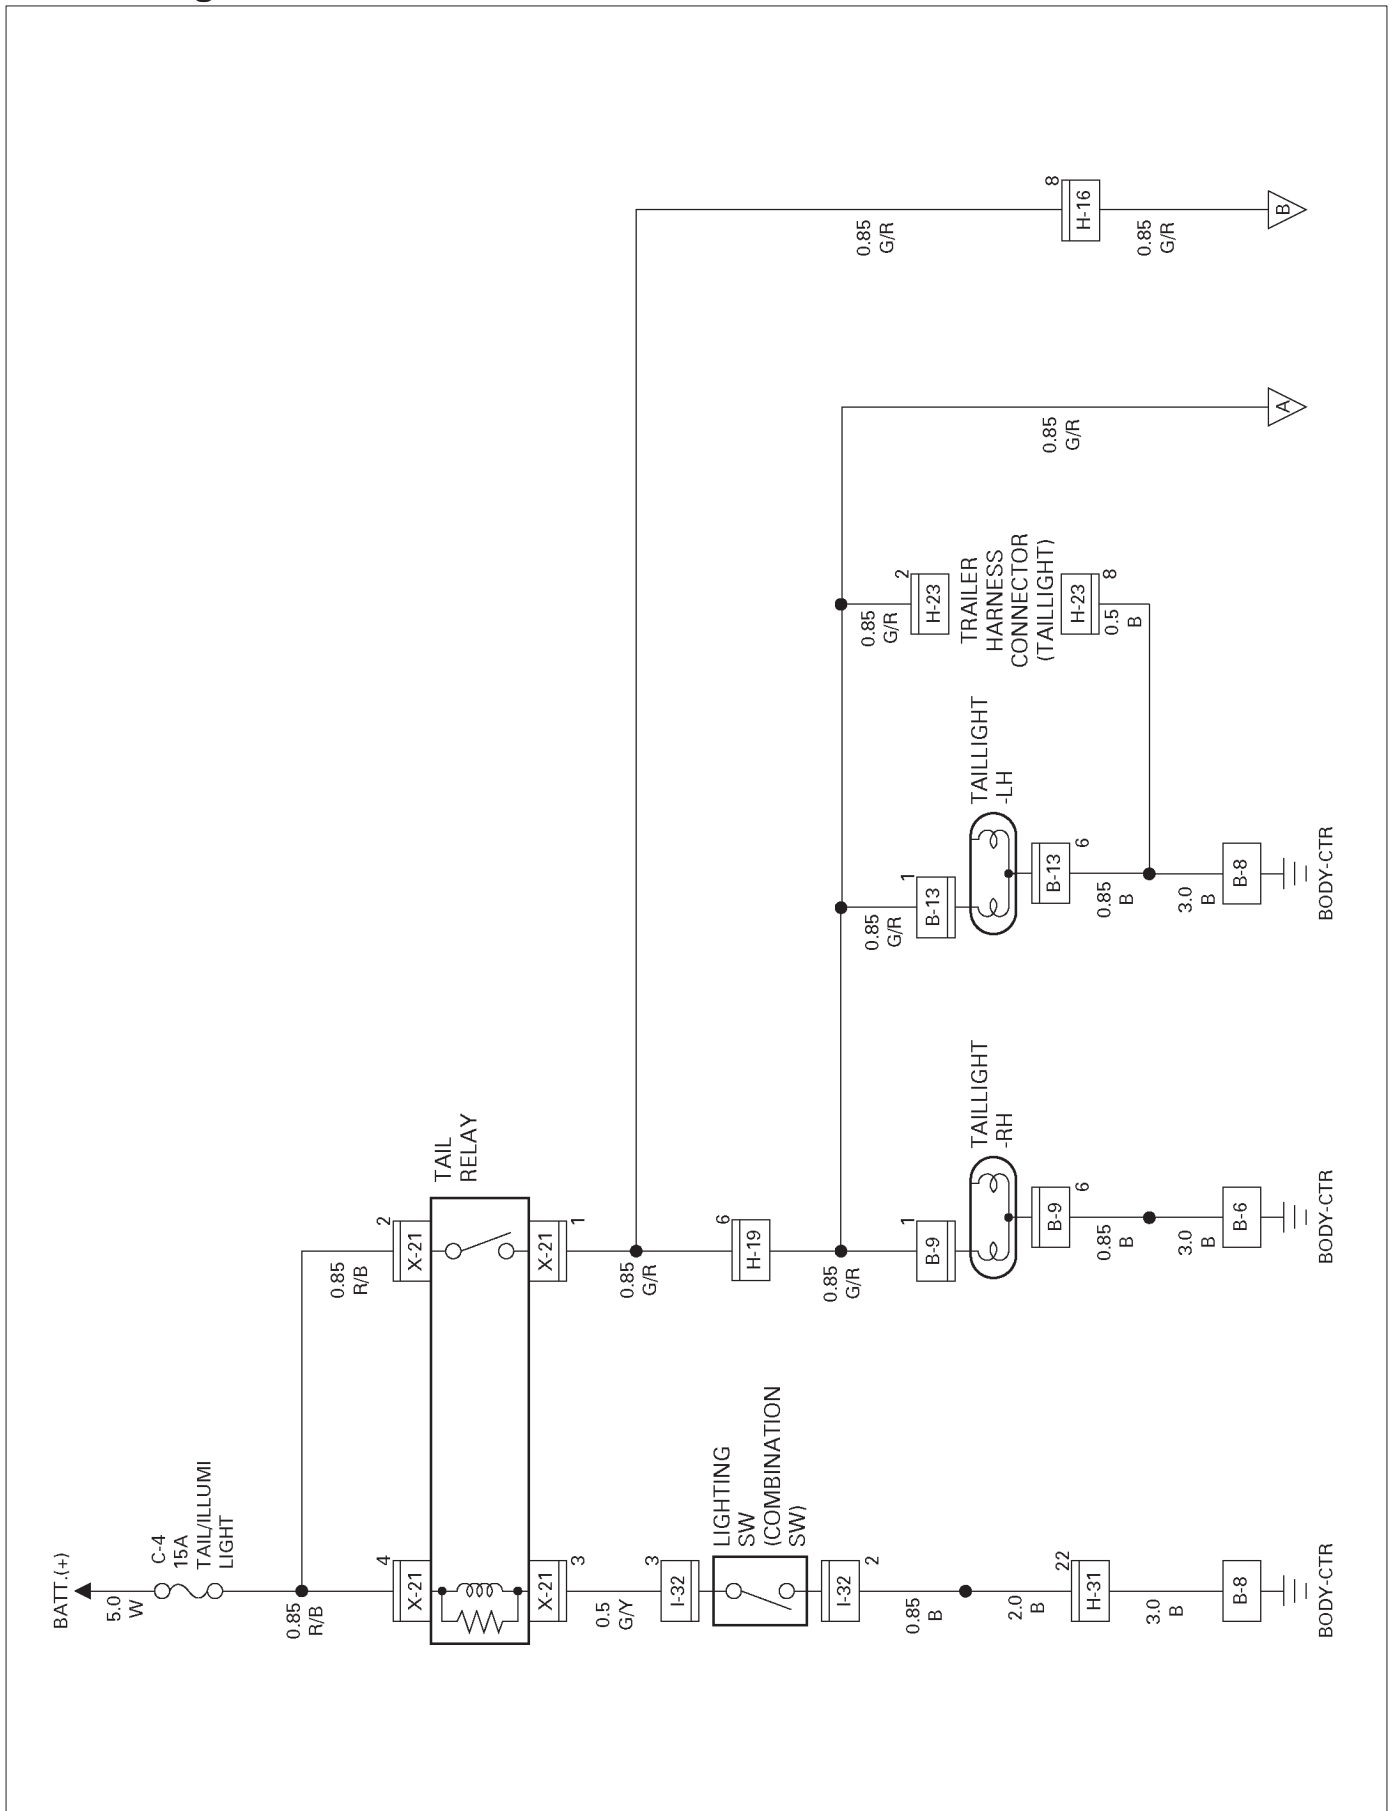

Clearance Light, Tail Light and License Plate Light

General Description

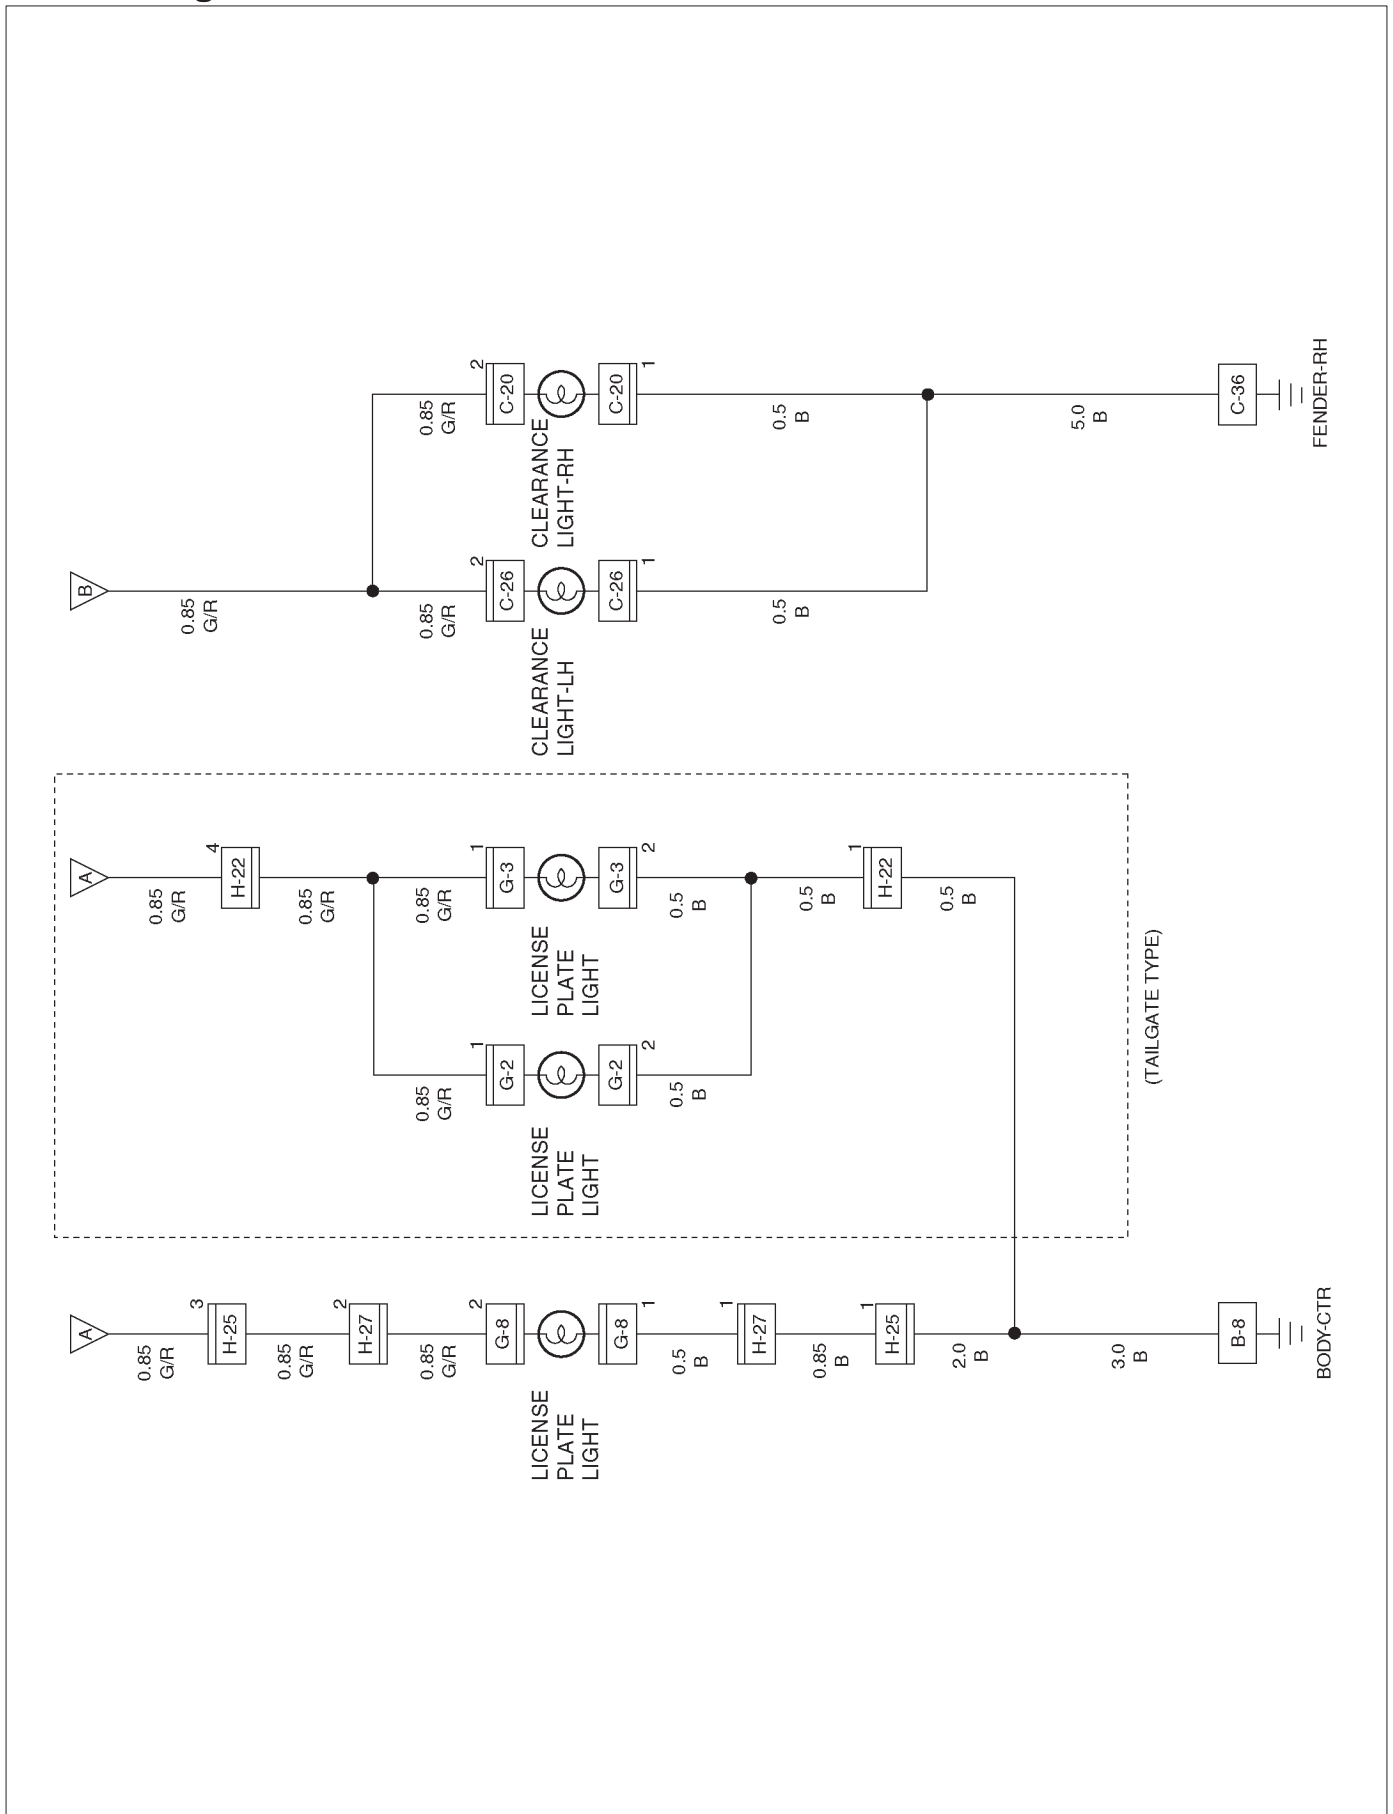

The circuit consists of lighting switch, clearance light, tail light and license plate light.

All these lights come on when lighting switch is turned on with the switch to either parking or headlight position.

Diagnosis

Both Tail Lights Inoperative

Step	Action	Value(s)	Yes	No
1	Repair an open circuit between the tail relay and the taillights. Is the action complete?	—	Verify repair	—

Tail Light On The Left (or Right) Side Inoperative

Step	Action	Value(s)	Yes	No
1	Remove the taillight bulb on the left or right side. Is the bulb normal?	—	Go to Step 2	Replace the bulb
2	Is B-6 or B-8 grounded securely?	—	Go to Step 3	Ground it securely
3	Disconnect the taillight connector B-9 or B-13. Is the battery voltage applied between harness side connector B-9 or B-13 terminal 1 and the ground?	Approx. 12V	Go to Step 5	Go to Step 4
4	Repair an open circuit between the tail relay and the taillight on the left or right side. Is the action complete?	—	Verify repair	—
5	Repair an open circuit between the taillight on the left or right side and the ground. Is the action complete?	—	Verify repair	—

Clearance Light Inoperative

Step	Action	Value(s)	Yes	No
1	Repair an open circuit between the tail relay and the taillights. Is the action complete?	—	Verify repair	—

Clearance Light On The Left (or Right) Side Inoperative

Step	Action	Value(s)	Yes	No
1	Remove the clearance light bulb on the left or right side. Is the bulb normal?	—	Go to Step 2	Replace the bulb
2	Disconnect the clearance light connector C-20 or C-26. Is the battery voltage applied between harness side connector C-20, or C-26 terminal 2 and the ground?	Approx. 12V	Go to Step 4	Go to Step 3
3	Repair an open circuit between the tail relay and the clearance light on the left or right side. Is the action complete?	—	Verify repair	—
4	Repair an open circuit between the clearance light and the ground? Is the action complete?	—	Verify repair	—

License Plate Light Inoperative

Step	Action	Value(s)	Yes	No
1	Do the taillights come on?	—	Go to Step 2	Go to Step 6
2	Remove the license plate light bulb. Is the bulb normal?	—	Go to Step 3	Replace bulb
3	1. Disconnect the license plate light connector G-8. 2. Turn the lighting switch on. Is the battery voltage applied between the license plate light harness side connector terminal and the ground?	Approx. 12V	Go to Step 5	Go to Step 4
4	Repair an open circuit between connector H-19 terminal 6 and the license plate light. Is the action complete?	—	Verify repair	—
5	Repair an open circuit between the license plate light and the ground. Is the action complete?	—	Verify repair	—
6	Refer to the diagnosis procedure for "Both Taillight Inoperative" in this section. Is the action complete?	—	Verify repair	—

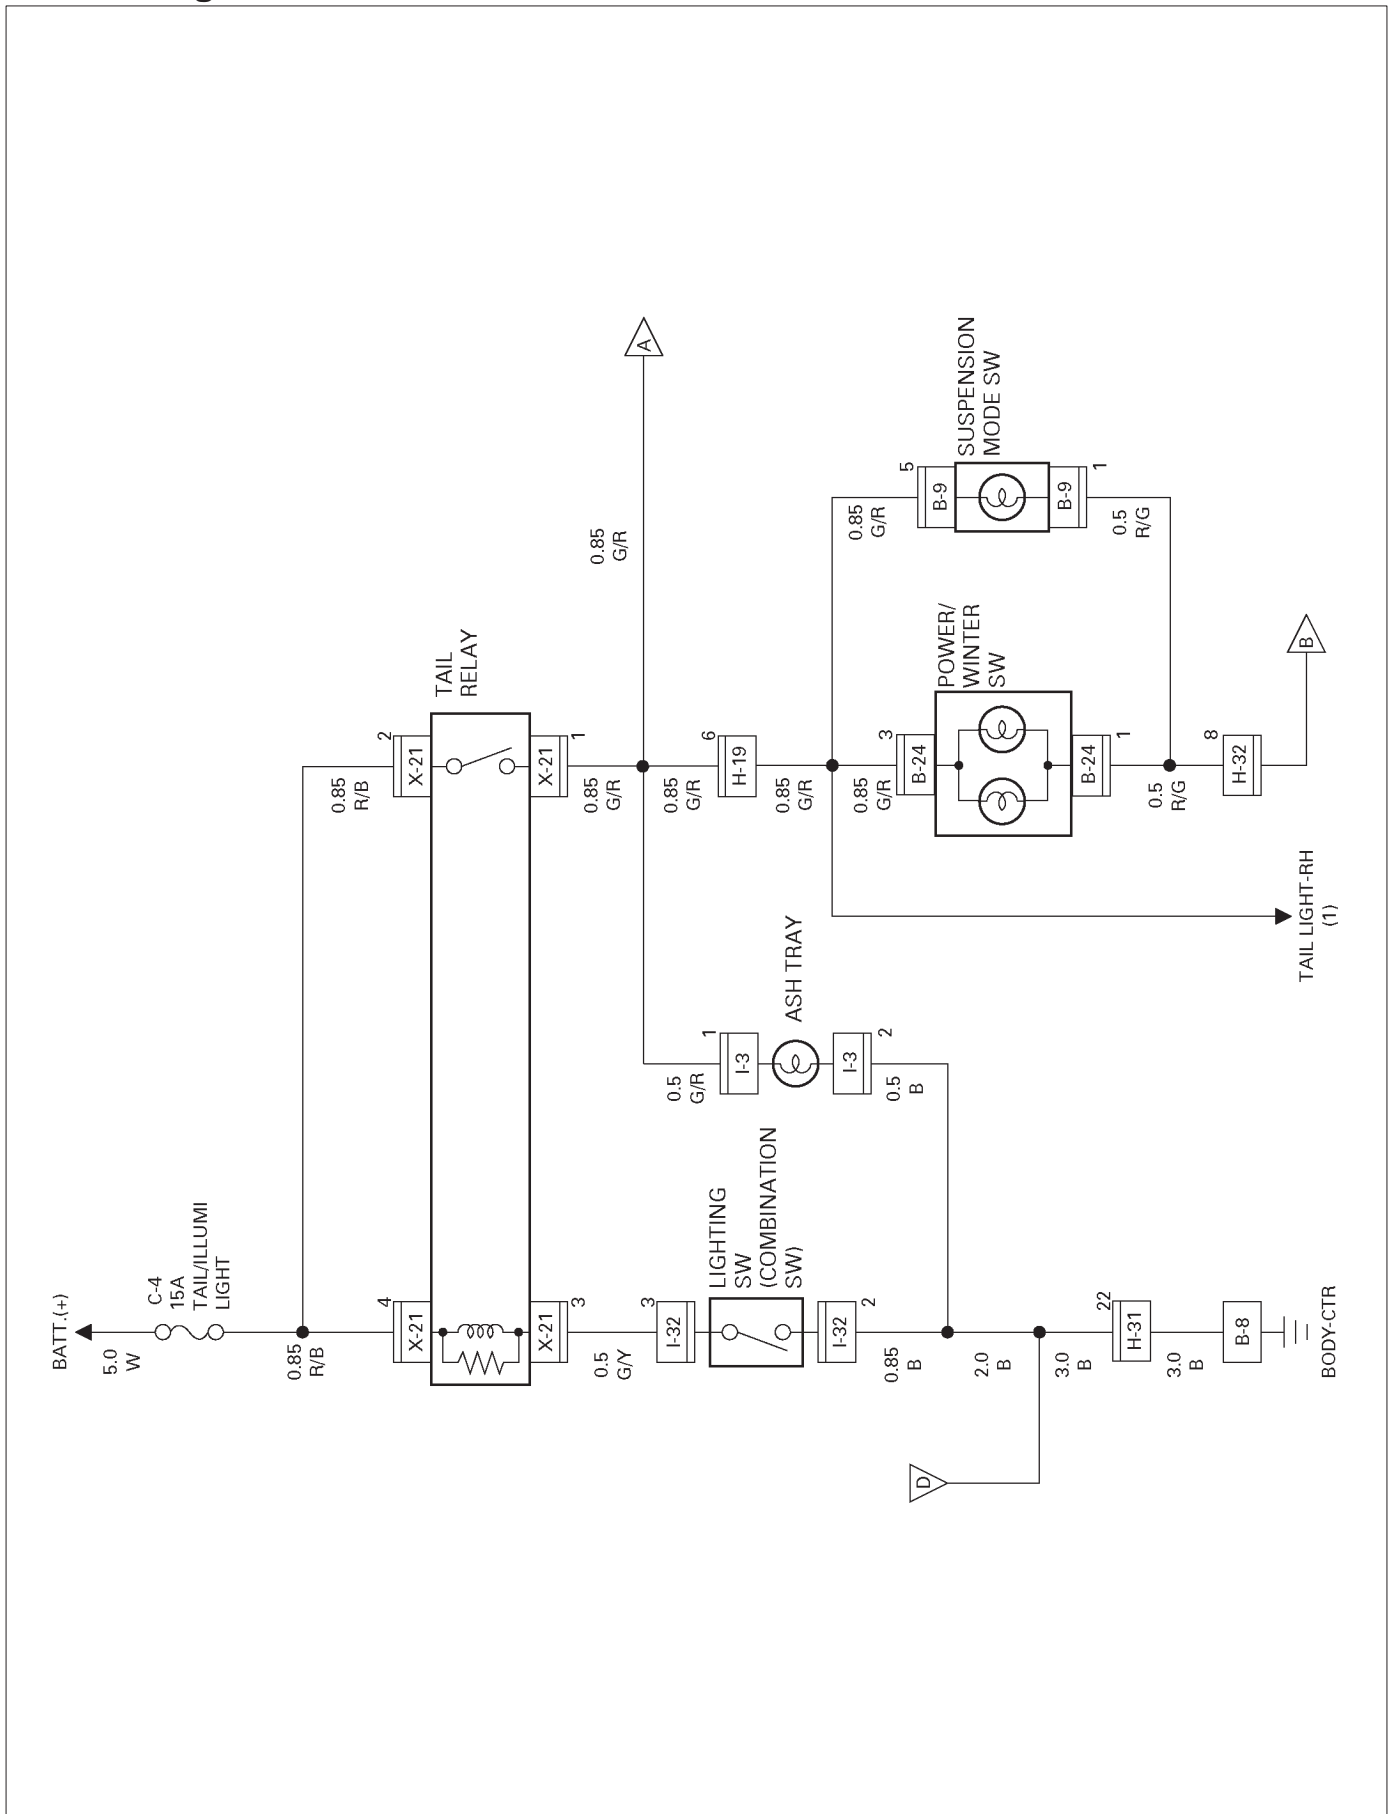

Interior Illumination Light

General Description

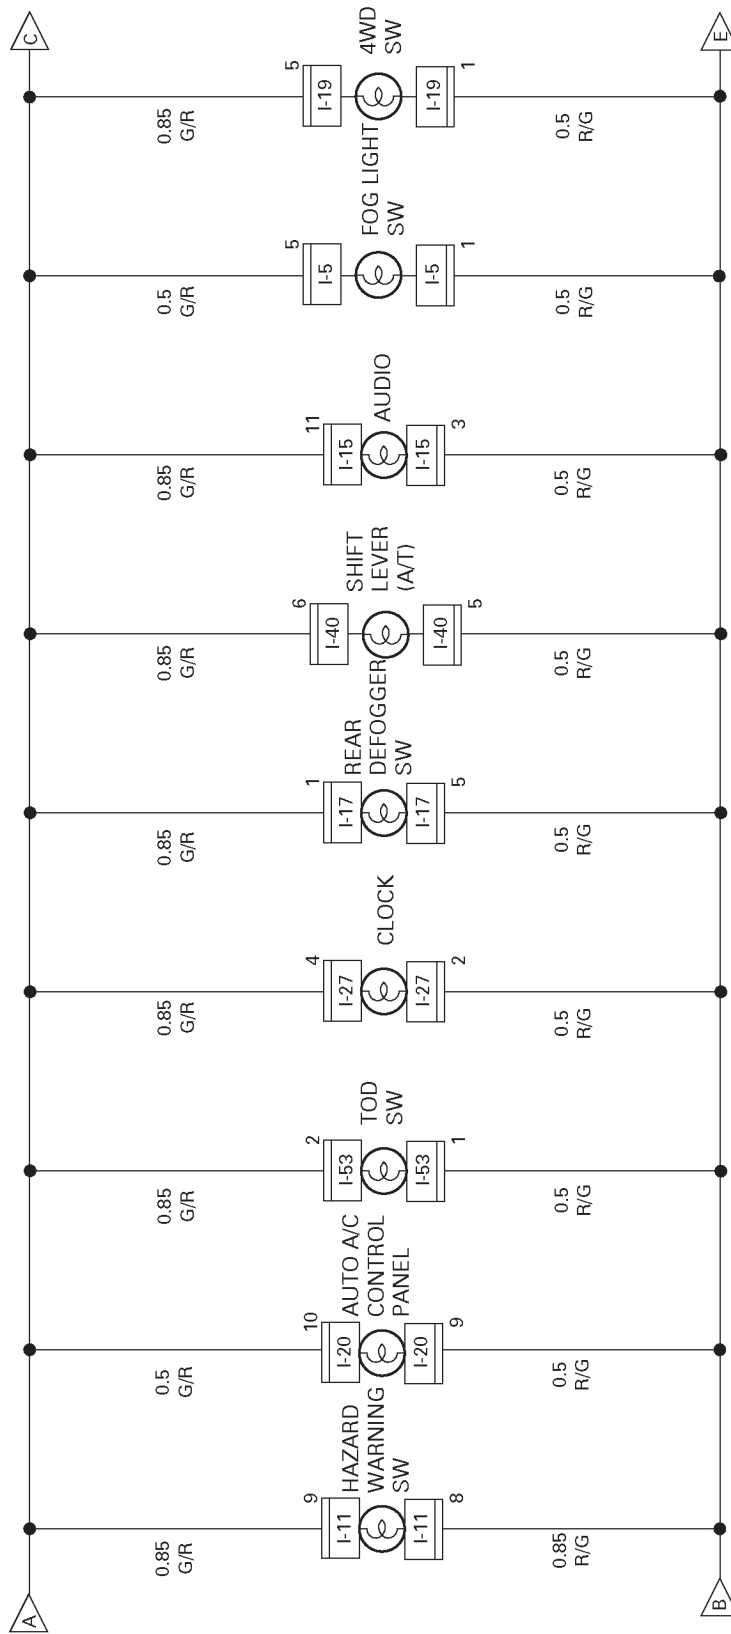

The circuit consists of lighting switch, tail relay, and illumination lights.

All these lights come on when lighting switch is turned on with the switch to either parking or headlight position.

Diagnosis

Interior Illumination Lights Inoperative

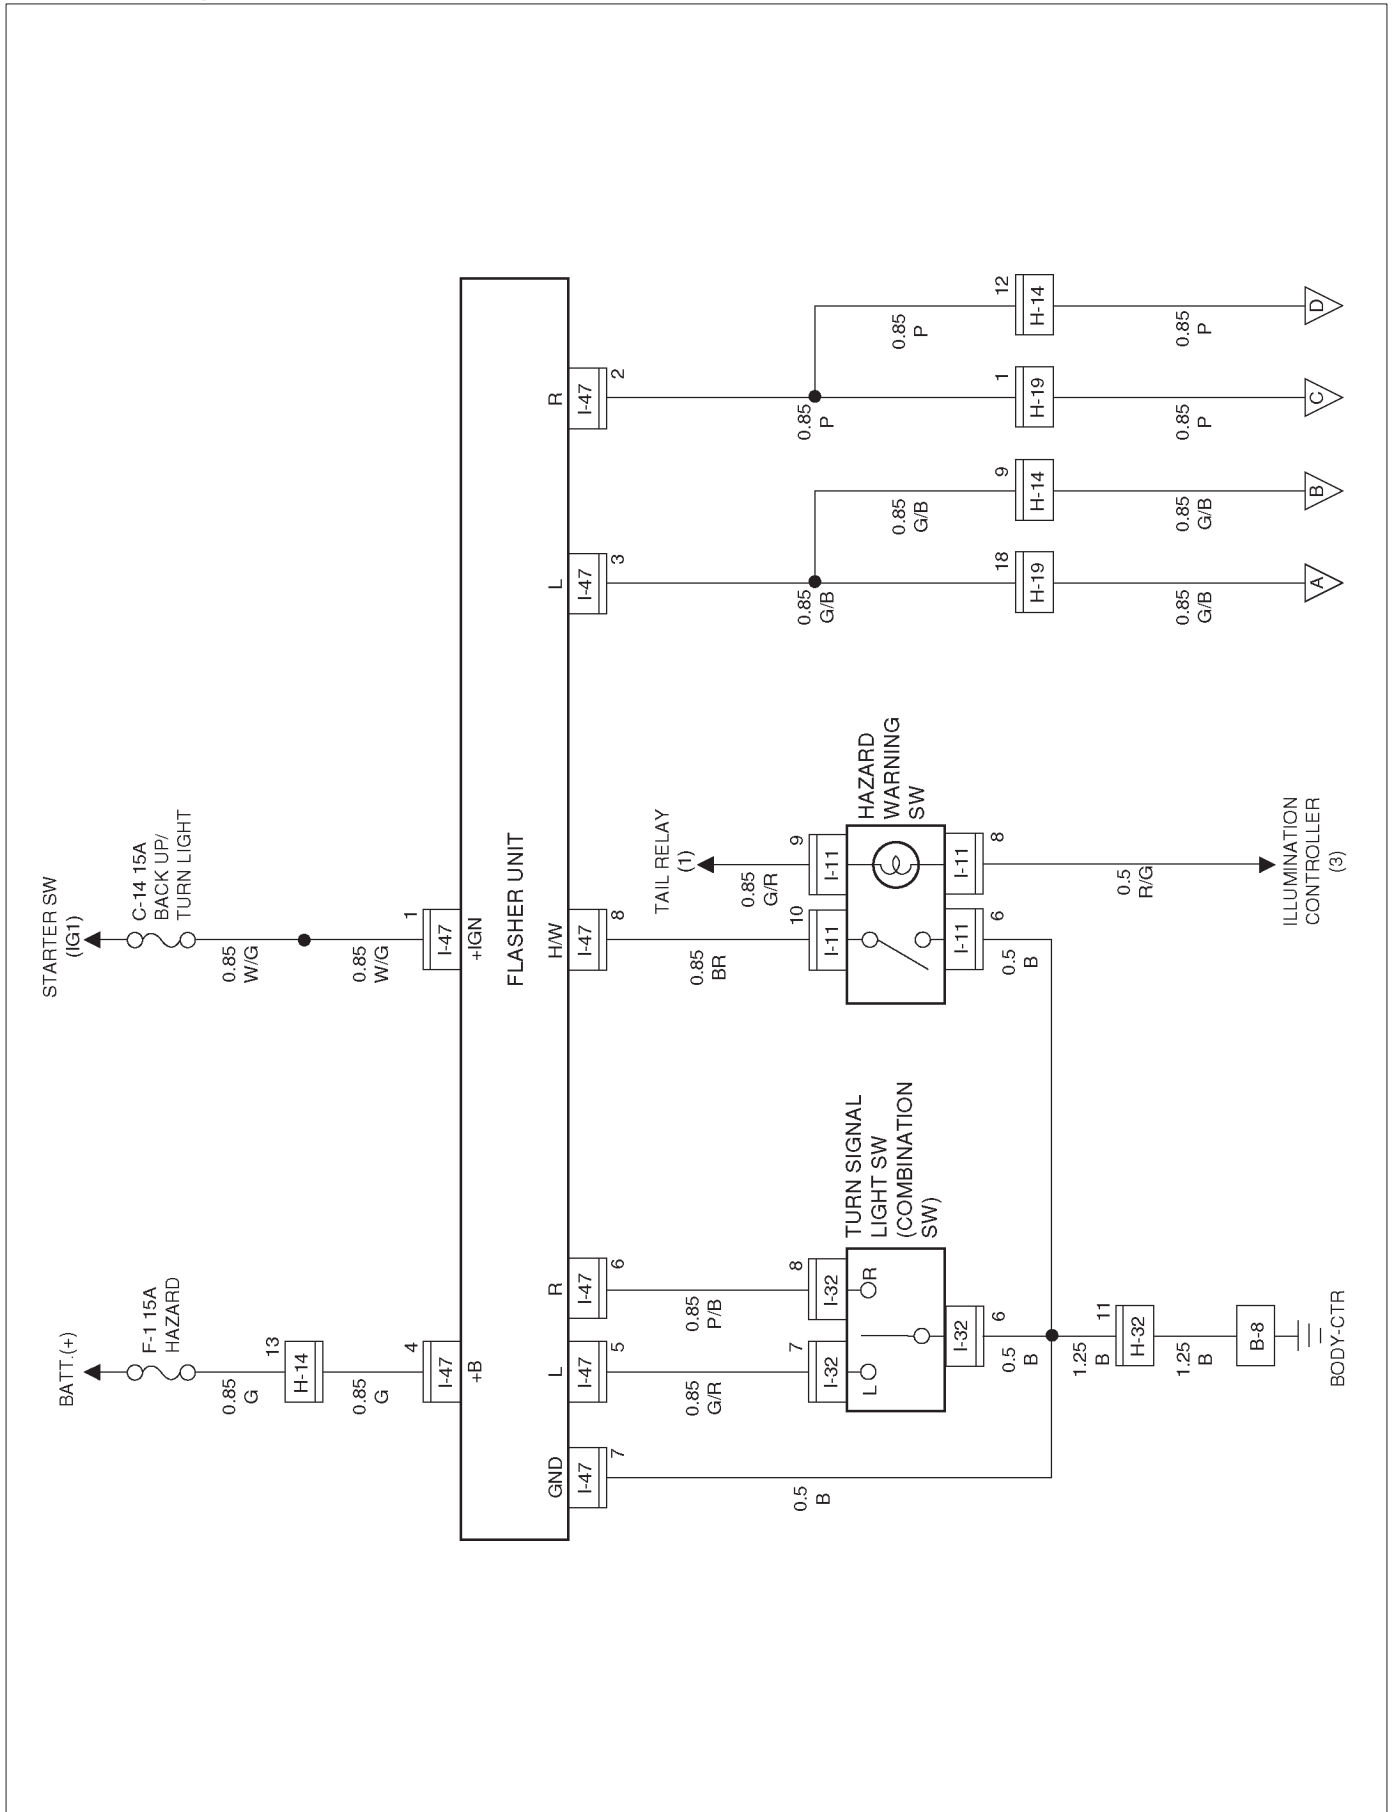

Step	Action	Value(s)	Yes	No
1	Turn the lighting switch to clearance light position. Do the exterior lights come on?	—	Go to Step 3	Go to Step 2
2	Refer to the diagnosis procedure in Clearance Light, Taillight and License Plate Light section. Is the action complete?	—	Verify repair	—
3	Repair an open circuit between tail relay harness side connector X-21 terminal 1 and interior lights. Is the action complete?	—	Verify repair	—

Turn Signal Light, Hazard Warning Light

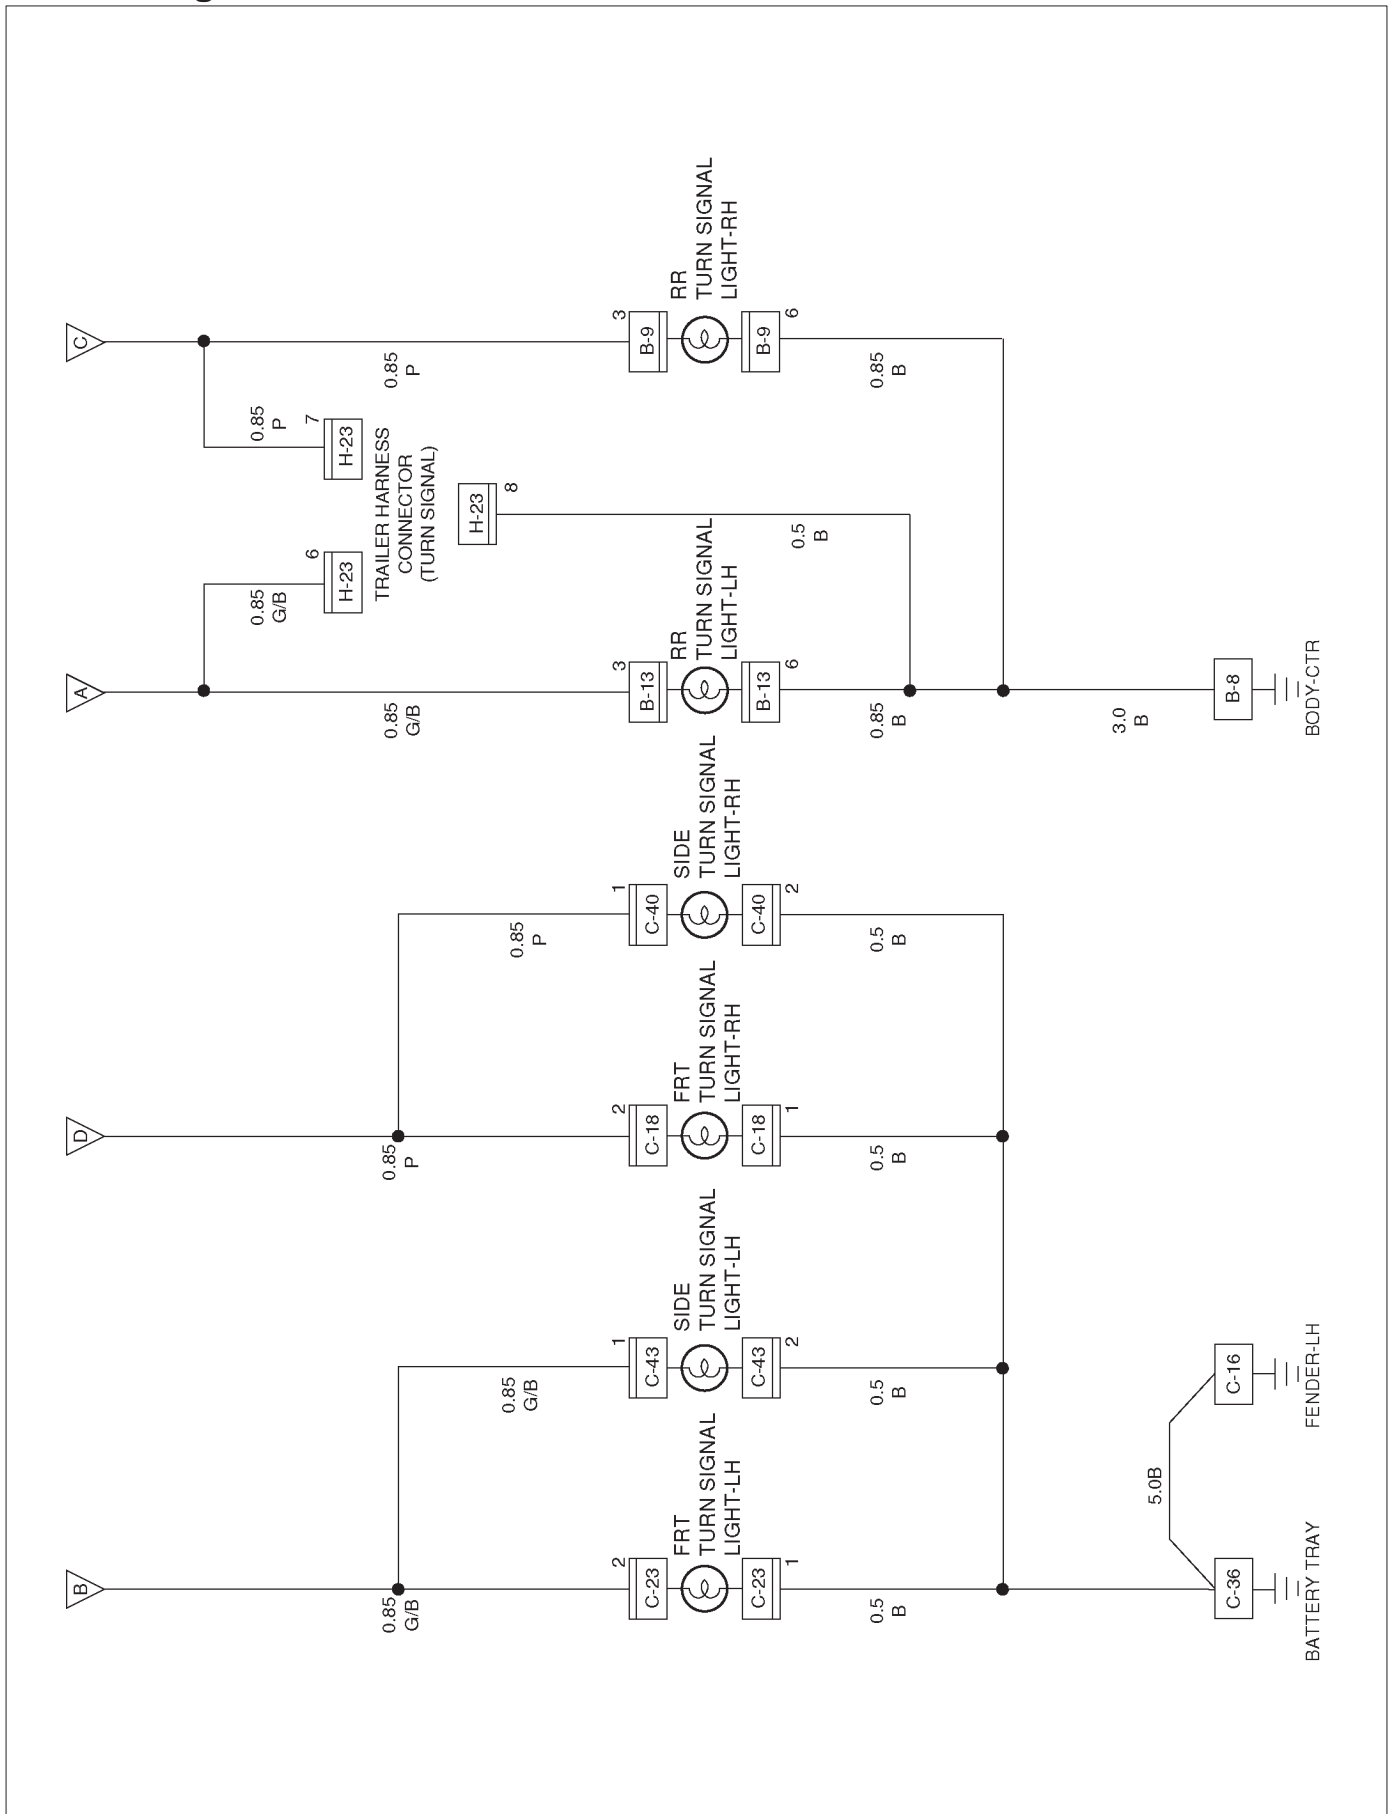

General Description

The circuit consists of turn signal light switch (combination switch) turn signal light, hazard warning switch and flasher unit. When turn signal light switch is turned on with starter switch on, turn signal light will operate. When turn signal light is flashing, indicator light in meter also starts flashing. When hazard warning switch is turned on, current flows to flasher unit through hazard warning switch to cause hazard warning light to flash independent of position of starter switch. At the same time, indicator lights in meter also start flashing.

Diagnosis

Turn Signal Light Does Not Flash

Step	Action	Value(s)	Yes	No
1	Is fuse C-14 normal?	—	Go to Step 2	Replace the fuse
2	1. Disconnect the flasher unit connector I-47. 2. Turn the starter switch on. Is the battery voltage applied between harness side connector I-47 terminal 1 and the ground?	Approx. 12V	Go to Step 4	Go to Step 3
3	Repair an open circuit between fuse C-14 and connector I-47 terminal 1. Is the action complete?	—	Go to Step 2	—
4	Is there continuity between harness side connector I-47 terminal 7 and the ground?	—	Go to Step 6	Go to Step 5
5	Repair an open circuit between harness side connector I-47 terminal 7 and the ground B-8. Is the action complete?	—	Go to Step 4	—
6	Turn the turn signal light SW to the left position. Is there continuity between harness side connector I-47 terminal 5 and the ground?	—	Go to Step 12	Go to Step 7
7	Disconnect the turn signal light switch connector I-32. Is there continuity between harness side connector I-32 terminal 7 and I-47 terminal 5?	—	Go to Step 9	Go to Step 8
8	Repair an open circuit between connector I-32 terminal 7 and I-47 terminal 5. Is the action complete?	—	Go to Step 7	—
9	Is there continuity between harness side connector I-32 terminal 6 and the ground?	—	Go to Step 11	Go to Step 10
10	Repair an open circuit between connector I-32 terminal 6 and the ground B-8. Is the action complete?	—	Go to Step 9	—
11	Repair or replace the combination switch. Is the action complete?	—	Go to Step 5	—
12	Turn the turn signal light to the right position. Is there continuity between harness side connector I-47 terminal 6 and ground?	—	Go to Step 18	Go to Step 13
13	Disconnect the turn signal light switch connector I-32. Is there continuity between the harness side connector terminal I-32 terminal 8 and I-47 terminal 6?	—	Go to Step 15	Go to Step 14
14	Repair an open circuit between connector I-32 terminal 8 and I-47 terminal 6. Is the action complete?	—	Go to Step 13	—
15	Is there continuity between harness side connector I-32 terminal 6 and the ground?	—	Go to Step 17	Go to Step 16
16	Repair an open circuit between connector I-36 terminal 6 and the ground B-8. Is the action complete?	—	Go to Step 15	—

Step	Action	Value(s)	Yes	No
17	Repair or replace the combination switch. Is the action complete?	—	Verify repair	—
18	Replace the flusher unit. Is the action complete?	—	Verify repair	—

Hazard Warning Light Does Not Flash

Step	Action	Value(s)	Yes	No
1	Is fuse F-1 normal?	—	Go to Step 2	Replace the fuse
2	Disconnect the flasher unit connector I-47. Is the battery voltage applied between harness side connector I-47 terminal 4 and the ground?	Approx. 12V	Go to Step 4	Go to Step 3
3	Repair an open circuit between the fuse F-1 and connector I-47 terminal 4. Is the action complete?	—	Go to Step 2	—
4	Is there continuity between harness side connector I-47 terminal 7 and the ground?	—	Go to Step 6	Go to Step 5
5	Repair an open circuit between connector I-47 terminal 7 and the ground B-8. Is the action complete?	—	Go to Step 4	—
6	Is B-8 grounded securely?	—	Go to Step 7	Ground it securely
7	1. Disconnect the hazard warning switch connector I-11. 2. Turn the hazard warning switch on. Is there continuity between the switch side connector I-11 terminal 6 and 10?	—	Go to Step 8	Repair or replace the switch
8	Is there continuity between the harness side connector I-11 terminal 6 and the ground B-8 or I-11 terminal 10 and I-47 terminal 8?	—	Go to Step 10	Go to Step 9
9	Repair an open circuit between connector I-11 terminal 6 and the ground B-8 or I-11 terminal 10 and I-47 terminal 8. Is the action complete?	—	Verify repair	—
10	Replace the flasher unit. Is the action complete?	—	Verify repair	—

Turn Signal Light Flashes Too Quickly

Step	Action	Value(s)	Yes	No
1	Do all of turn signal lights flash?	—	Go to Step 2	Go to Step 3
2	Replace the flasher unit. Is the action complete?	—	Verify repair	—
3	Is the bulb of turn signal light that does not work normal?	—	Go to Step 4	Replace the bulb
4	Repair an open circuit between the turn signal light and the turn signal light. Is the action complete?	—	Verify repair	—

Stoplight

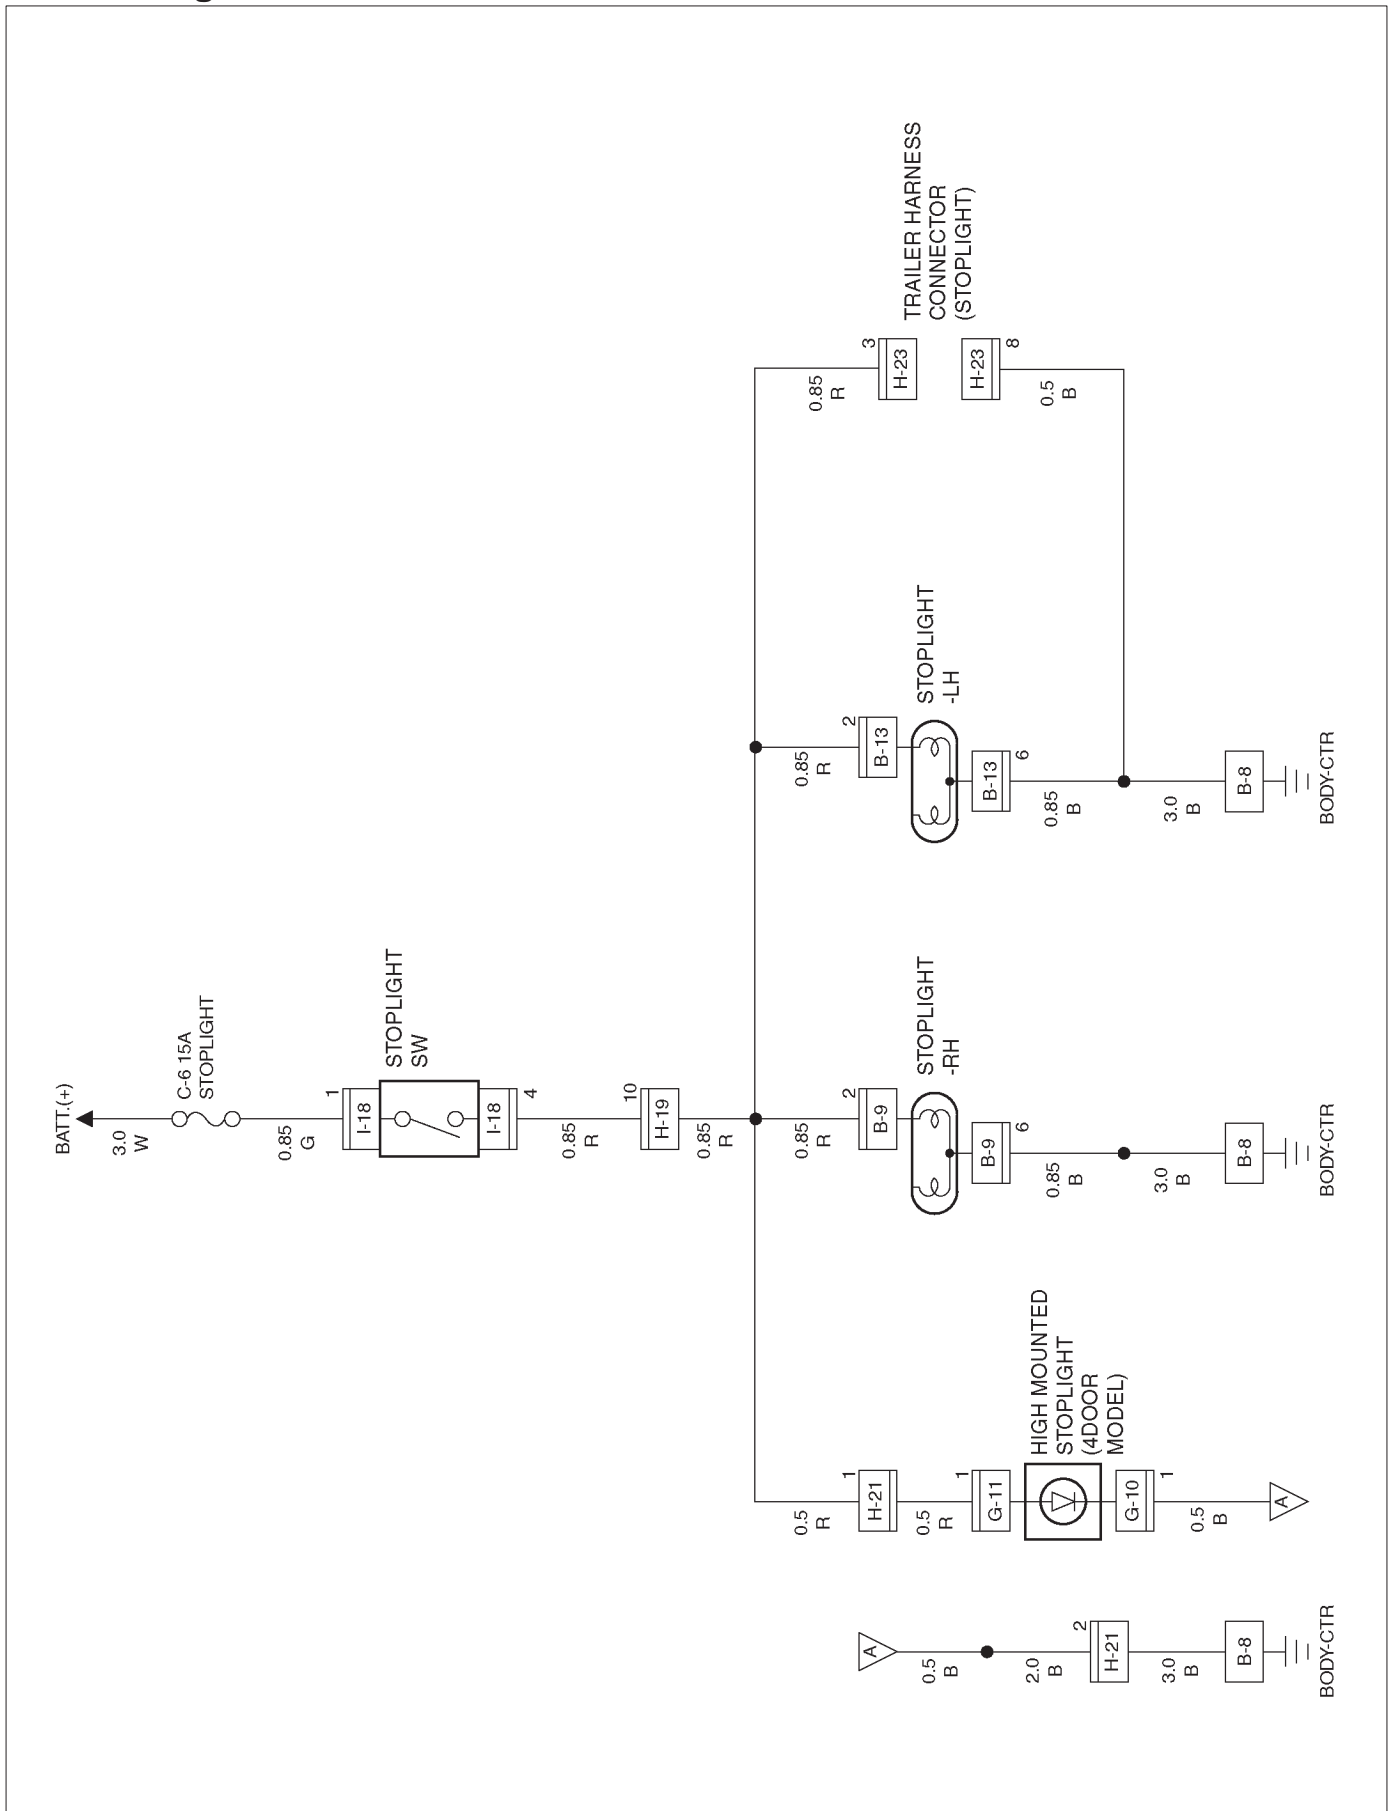

General Description

The circuit consists of stoplight, high mounted stoplight and stoplight switch.

With brake pedal depressed, stoplight switch is turned on to illuminate stoplight.

Stoplight switch controls not only the operation of stoplight but also the input of cruise cancel signals to cruise control unit.

Circuit Diagram

| (5) Stoplight - RH | (11) B-8 |
| (6) G-10, G-11 | (12) B-6 |

Diagnosis

Both Stoplights Inoperative

Step	Action	Value(s)	Yes	No
1	Is the fuse C-6 normal?	—	Go to Step 2	Replace the fuse
2	Dieconnect the stoplight switch connector I-18. Is there continuity between switch side connector I-18 terminal 1 and 4 with the brake pedal depressed?	—	Go to Step 3	Repair or replace the switch
3	Is the battery voltage applied between harness side connector I-18 terminal 1 and the ground?	Approx. 12V	Go to Step 5	Go to Step 4
4	Repair an open circuit between the fuse C-6 and connector I-18 terminal 1. Is the action complete?	—	Verify repair	—
5	Repair an open circuit between stoplight switch and the stoplight. Is the action complete?	—	Verify repair	—

Stoplight On The Left (or Right) Side Inoperative

Step	Action	Value(s)	Yes	No
1	1. Disconnect the stoplight connector B-9 or B-13. 2. Depress the brake pedal. Is the battery voltage applied between stoplight harness side connector terminal 2 and the ground?	Approx. 12V	Go to Step 2	Go to Step 3
2	Repair an open circuit between the stoplight and the ground. Is the action complete?	—	Verify repair	—
3	Repair an open circuit between the stoplight switch and the stoplight. Is the action complete?	—	Verify repair	—

High Mounted Stoplight Inoperative

Step	Action	Value(s)	Yes	No
1	Depress the brake pedal. Does the stoplight come on?	—	Go to Step 3	Go to Step 2
2	Refer to the diagnosis procedure for “Both Stoplights inoperative” in this section. Is the action complete?	—	Verify repair	—
3	Is B-8 grounded securely?	—	Go to Step 4	Ground it securely
4	1. Disconnect the high mounted stoplight connector. 2. Depress the brake pedal. Is the battery voltage applied between harness side connector G-11 terminal 1 and the ground?	Approx. 12V	Go to Step 6	Go to Step 5
5	Repair an open circuit between connector H-19 terminal 10 and the high mounted stoplight. Is the action complete?	—	Go to Step 4	—
6	Is there continuity between high mounted stoplight side connector terminals?	—	Go to Step 7	Repair or replace the light
7	Repair an open circuit between the high mounted stoplight and the ground B-8. Is the action complete?	—	Verify repair	—

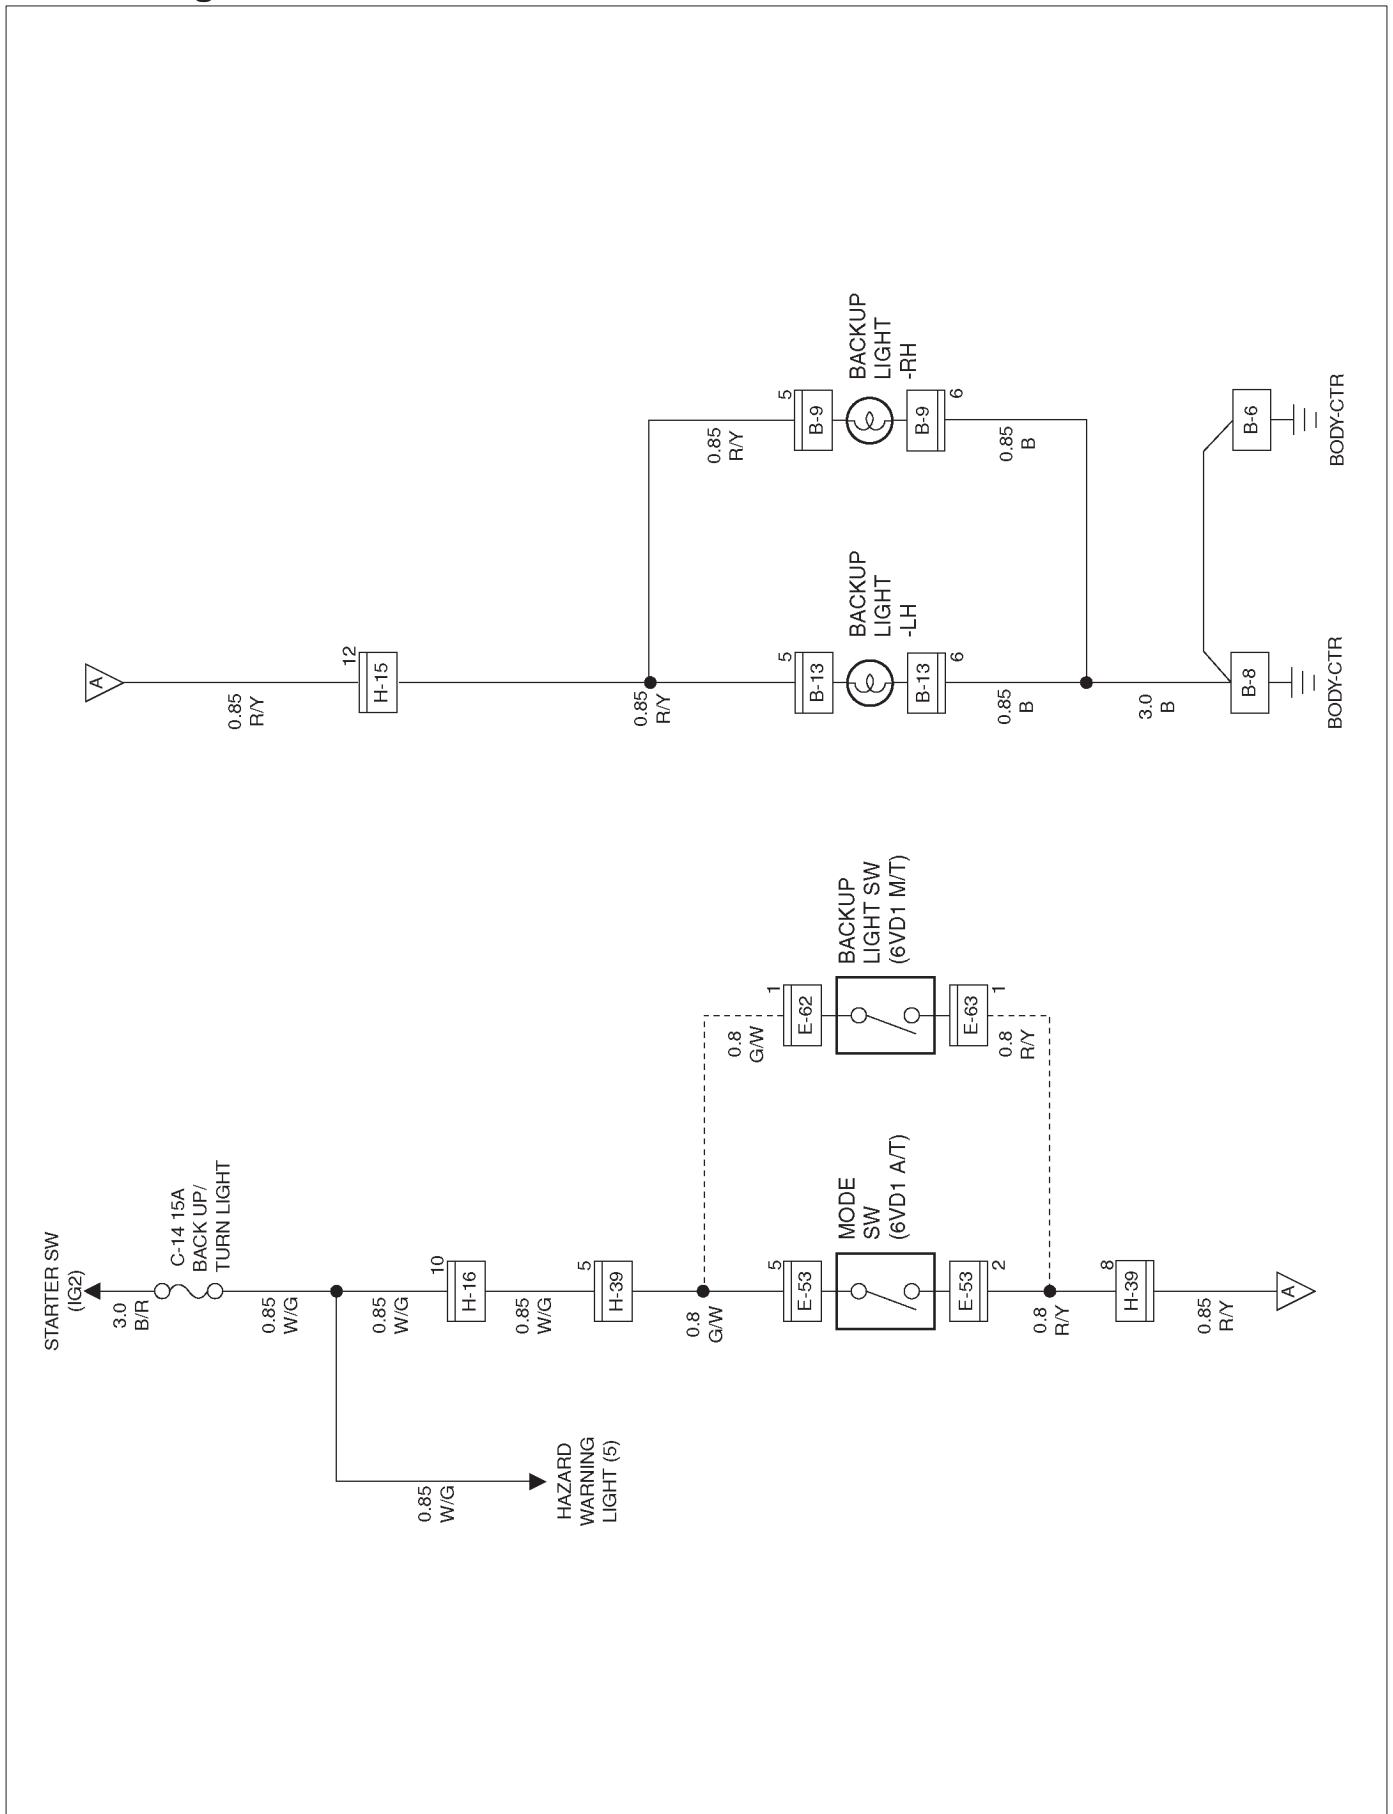

Backup Light

General Description

The circuit consists of backup light switch (M/T), mode switch (A/T) and backup light.

When shift lever is set to "R" position, backup light switch (M/T) or mode switch (A/T) is activated to illuminate backup light.

Circuit Diagram

| (4) B-13 | (9) E-62 |
| (5) H-15, H-16 | (10) E-53 |
| | (11) Relay & Fuse Box |

Diagnosis

Both Backup Lights Inoperative

Step	Action	Value(s)	Yes	No
1	Is the fuse C-14 normal?	—	Go to Step 2	Replace the fuse
2	Are B-6 and B-8 ground securely?	—	Go to Step 3	Ground them securely
3	1. Disconnect the mode switch connector E-53 or backup light switch connector E-62 and E-63. 2. Turn the starter switch on. Is the battery voltage applied between harness side connector E-53 terminal 5 and the ground, or harness side connector E-62 terminal 1 and the ground?	Approx. 12V	Go to Step 5	Go to Step 4
4	Repair an open circuit between the fuse C-14 and connector E-53 terminal 5 or connector E-62 terminal 1. Is the action complete?	—	Go to Step 3	—
5	Set the transmission gear to the reverse position. Is there continuity between mode switch side connector terminal 2 and 5, or backup light switch side connector terminals?	—	Go to Step 6	Repair or replace the switch
6	1. Reconnect the mode switch connector E-53 or backup light switch connector E-62 and E-63. 2. Disconnect the backup light connector B-9 or B-13. Is the battery voltage applied between the backup light harness side connector terminal 5 and the ground?	Approx. 12V	Go to Step 8	Go to Step 7
7	Repair an open circuit between the mode switch or backup light switch and the backup lights. Is the action complete?	—	Verify repair	—
8	Repair an open circuit between backup lights and the ground. Is the action complete?	—	Verify repair	—

Backup Light On The Left (or Right) Side Inoperative

Step	Action	Value(s)	Yes	No
1	Remove the backup light bulb on the left or right side. Is the bulb normal?	—	Go to Step 2	Replace the bulb
2	1. Set the transmission gear to the reverse position. 2. Turn the starter switch on. Is the battery voltage applied between backup light harness side connector B-9 or B-13 terminal 5 and the ground?	Approx. 12V	Go to Step 4	Go to Step 3
3	Repair an open circuit between connector H-15 terminal 12 and the backup light on the left or right side. Is the action complete?	—	Verify repair	—
4	Repair an open circuit between the backup light on the left or right side and the ground. Is the action complete?	—	Verify repair	—

8D-104 WIRING SYSTEM

Backup Lights Remain On

Step	Action	Value(s)	Yes	No
1	Repair or replace the mode switch or the backup light switch. Is the action complete?	—	Verify repair	—

Horn

General Description

The circuit consists of horn (high note and low note), horn relay (alarm & relay control unit) and horn switch. When horn switch is pressed, (independent of position of starter switch) horn relay is activated to sound horns.

Circuit Diagram

Parts Location

D08RWD18

Legend

- | | |
|------------------|----------------------|
| (1) H-14 | (5) I-32 |
| (2) SRS Coil ASM | (6) Horn (Low note) |
| (3) Horn Switch | (7) C-14 |
| (4) I-42 | (8) C-12 |
| | (9) Horn (High note) |

Diagnosis

Horn Does Not Sound

Step	Action	Value(s)	Yes	No
1	Is the fuse F-2 normal?	—	Go to Step 2	Replace the fuse
2	Disconnect the alarm & relay control unit connector I-42. Is the battery voltage applied between harness side connector I-42 terminal 12 and the ground?	Approx. 12V	Go to Step 4	Go to Step 3
3	Repair an open circuit between the fuse F-2 and the alarm & relay control unit. Is the action complete?	—	Verify repair	—
4	Disconnect the horn switch connector I-32. Is there continuity between switch side connector I-32 terminal 12 and the ground with the horn switch pressed?	—	Go to Step 5	Repair or replace the switch
5	Is there continuity between harness side connector I-32 terminal 12 and connector I-42 terminal 14?	—	Go to Step 7	Go to Step 6
6	Repair an open circuit between the alarm & relay control unit and the horn switch. Is the action complete?	—	Verify repair	—
7	1. Disconnect the horn connector. 2. Connect the battery positive terminal to the horn side connector terminal 1. Does the horn work?	—	Go to Step 8	Replace the horn
8	Is there continuity between harness side connector terminal between the horn and the alarm & relay control unit?	—	Go to Step 9	Go to Step 10
9	Replace the alarm & relay control unit. Is the action complete?	—	Verify repair	—
10	Repair an open circuit between the horn and the alarm & relay control unit. Is the action complete?	—	Verify repair	—

Horn Does Not Stop Sounding

Step	Action	Value(s)	Yes	No
1	Disconnect the horn switch connector I-32. Do the horn stop sounding?	—	Repair or replace the horn switch	Go to Step 2
2	Disconnect the alarm & relay control unit connector I-42. Is there continuity between harness side connector terminal 14 and the ground?	—	Repair short circuit	Replace the alarm & relay control unit

Dome Light, Luggage Room Light, Courtesy Light, Map Light, Seat Belt Switch and Warning Buzzer

General Description

The circuit consists of door switch, dome light, luggage room light, courtesy light, map light, tail relay, key cylinder switch and alarm & relay control unit.

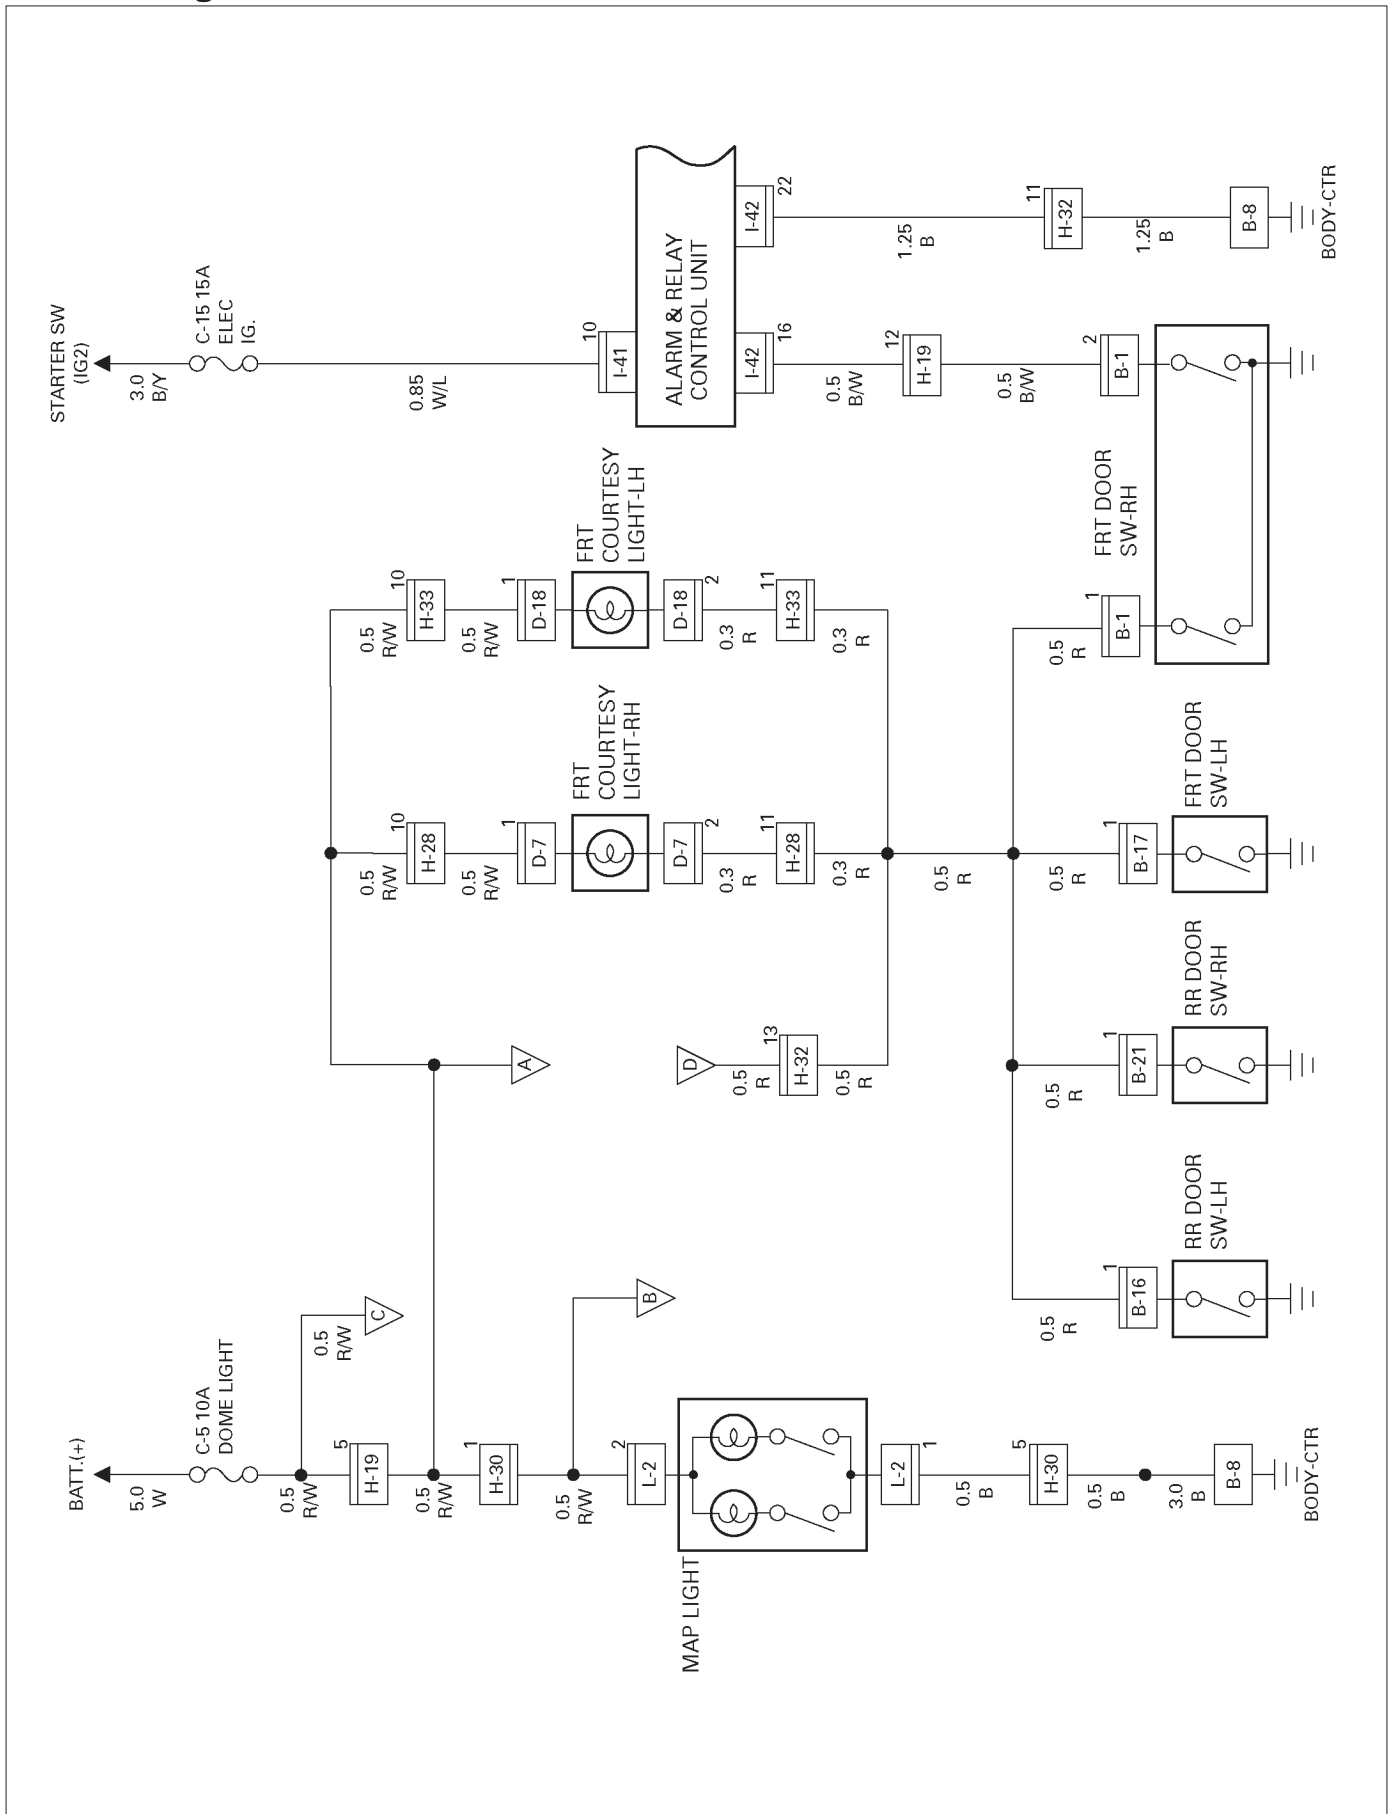

Dome light comes on with dome light switch turned to door position and any door open.

The buzzer sounds when starter switch is turned to either "ACC" or "OFF" position and FRT door-RH, is opened with lighting switch on.

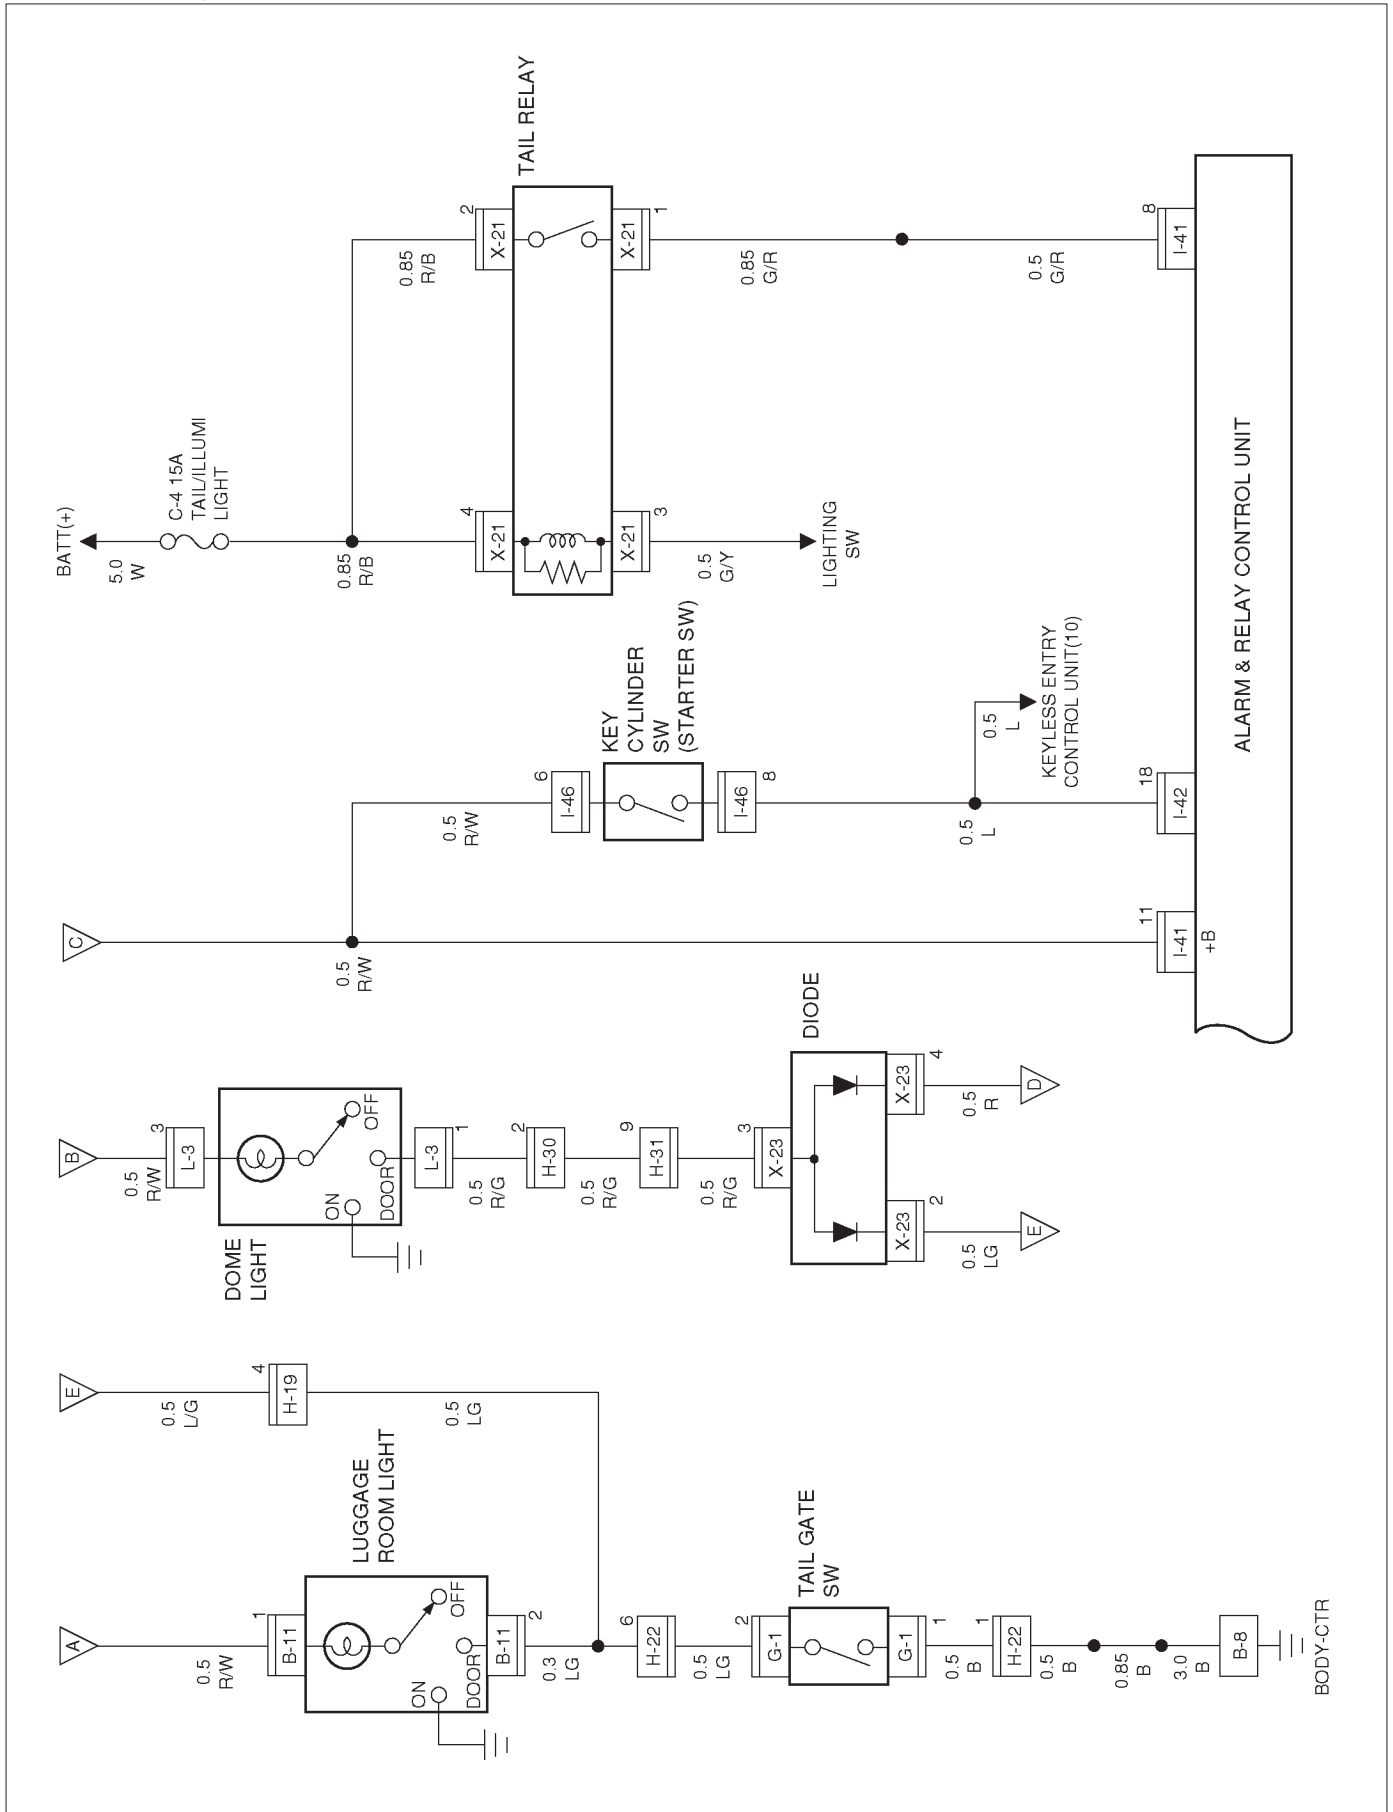

The buzzer also sounds when FRT door-RH is opened with starter key left in starter switch key cylinder.

These functions are controlled by the alarm & relay control unit.

Diagnosis

Dome Light Inoperative

Step	Action	Value(s)	Yes	No
1	Remove the dome light bulb. Is the bulb normal?	—	Go to Step 2	Replace the bulb
2	1. Reinstall the bulb. 2. Disconnect the dome light connector L-3. 3. Set the dome light switch to door position. Is there continuity between the dome light side connector terminal 1 and 3?	—	Go to Step 3	Repair or replace the dome light
3	Is the battery voltage applied between harness side connector L-3 terminal 3 and the ground?	Approx. 12V	Go to Step 5	Go to Step 4
4	Repair an open circuit between the fuse C-5 and the dome light. Is the action complete?	—	Verify repair	—
5	Repair an open circuit between the dome light and the door switch or the tail gate switch. Is the action complete?	—	Verify repair	—

Power Door Lock

General Description

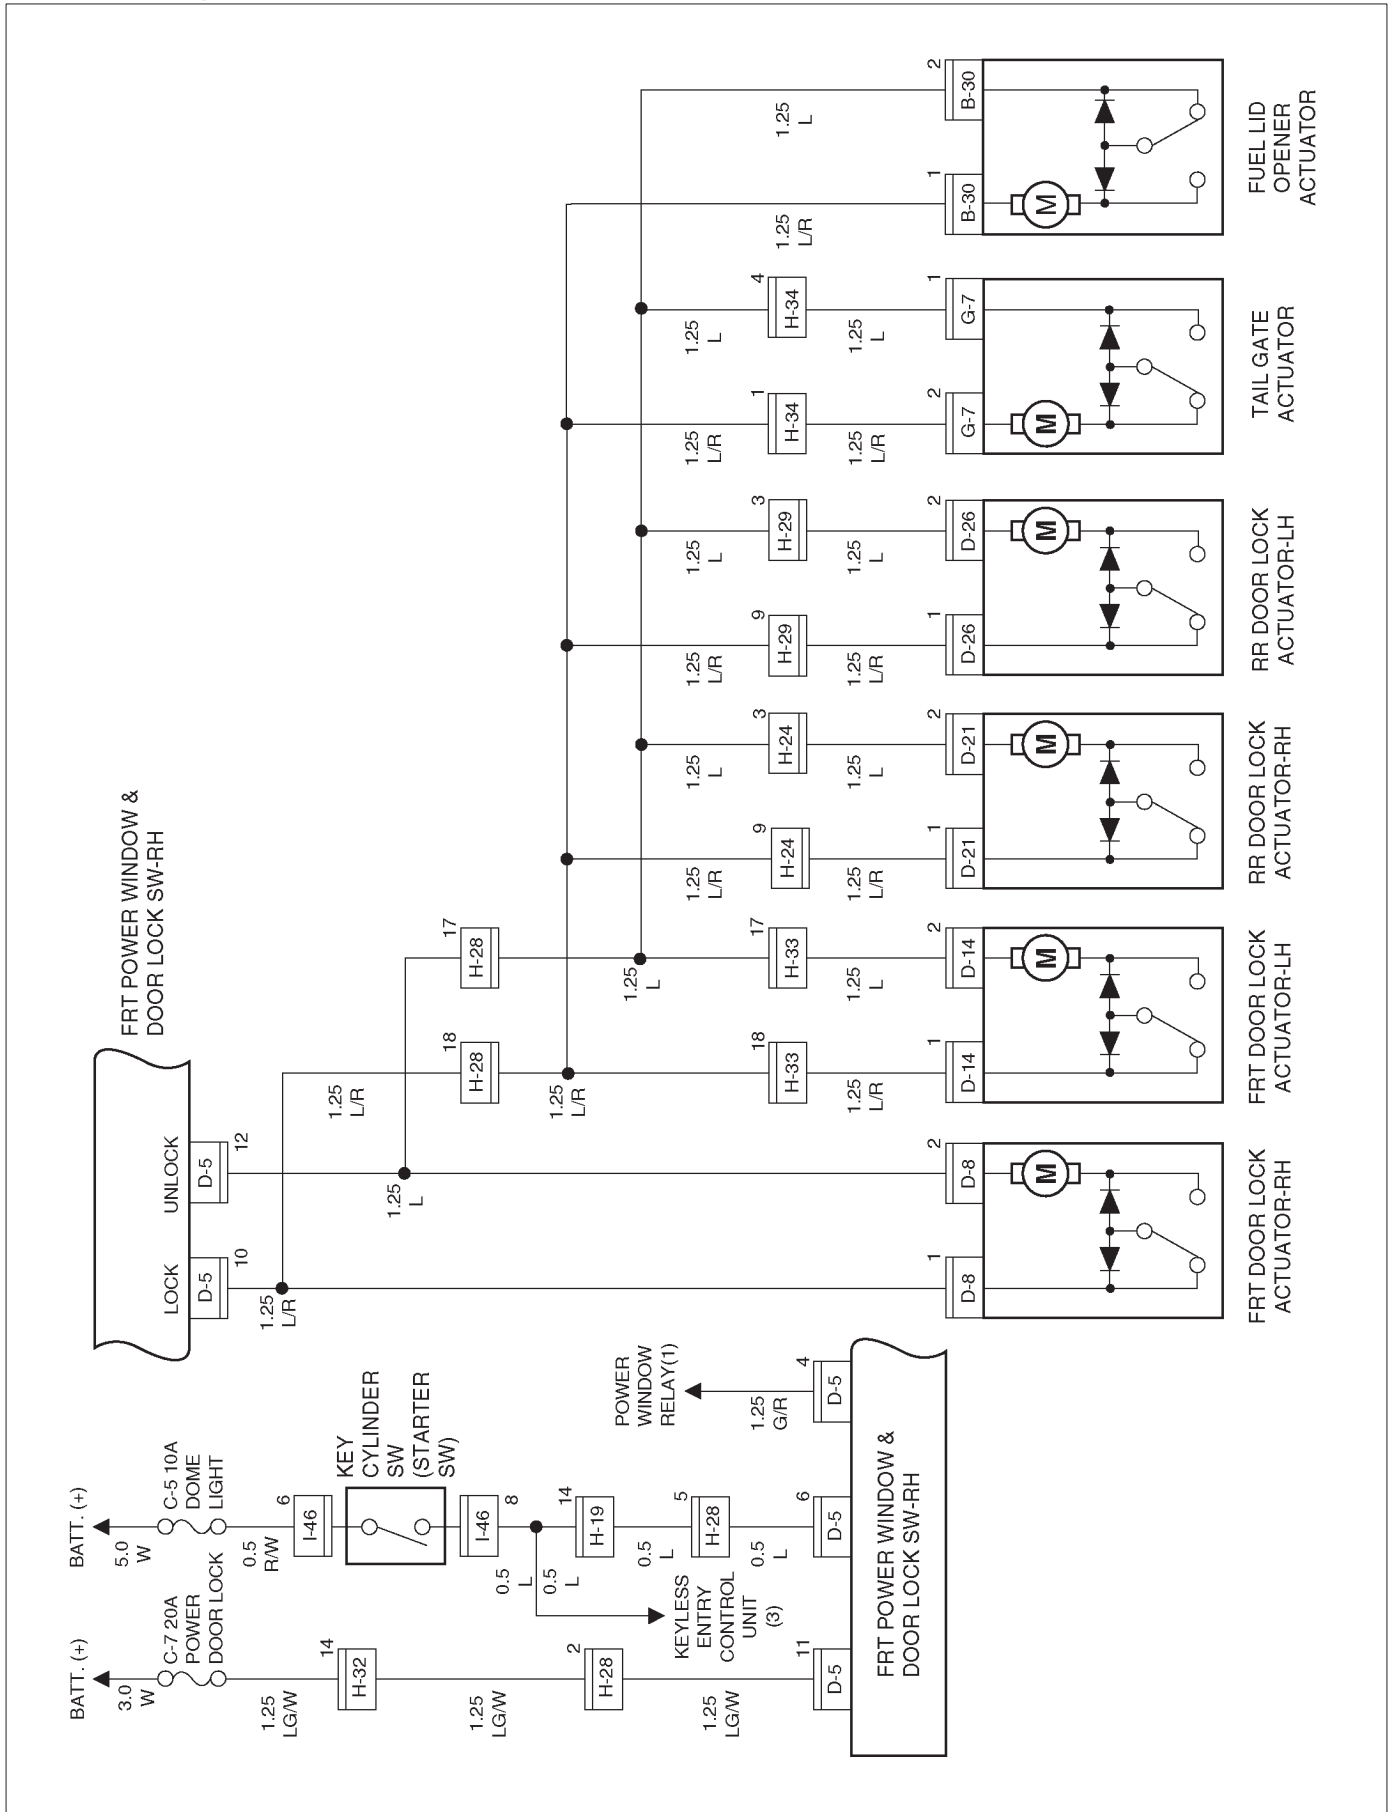

The door lock system consists of door lock & power window switch, key cylinder switch and door lock actuator. Door lock switch on driver's side can actuate the door lock mechanism.

Locking or unlocking the lock switch on the driver side causes the door lock mechanism to be locked or unlocked.

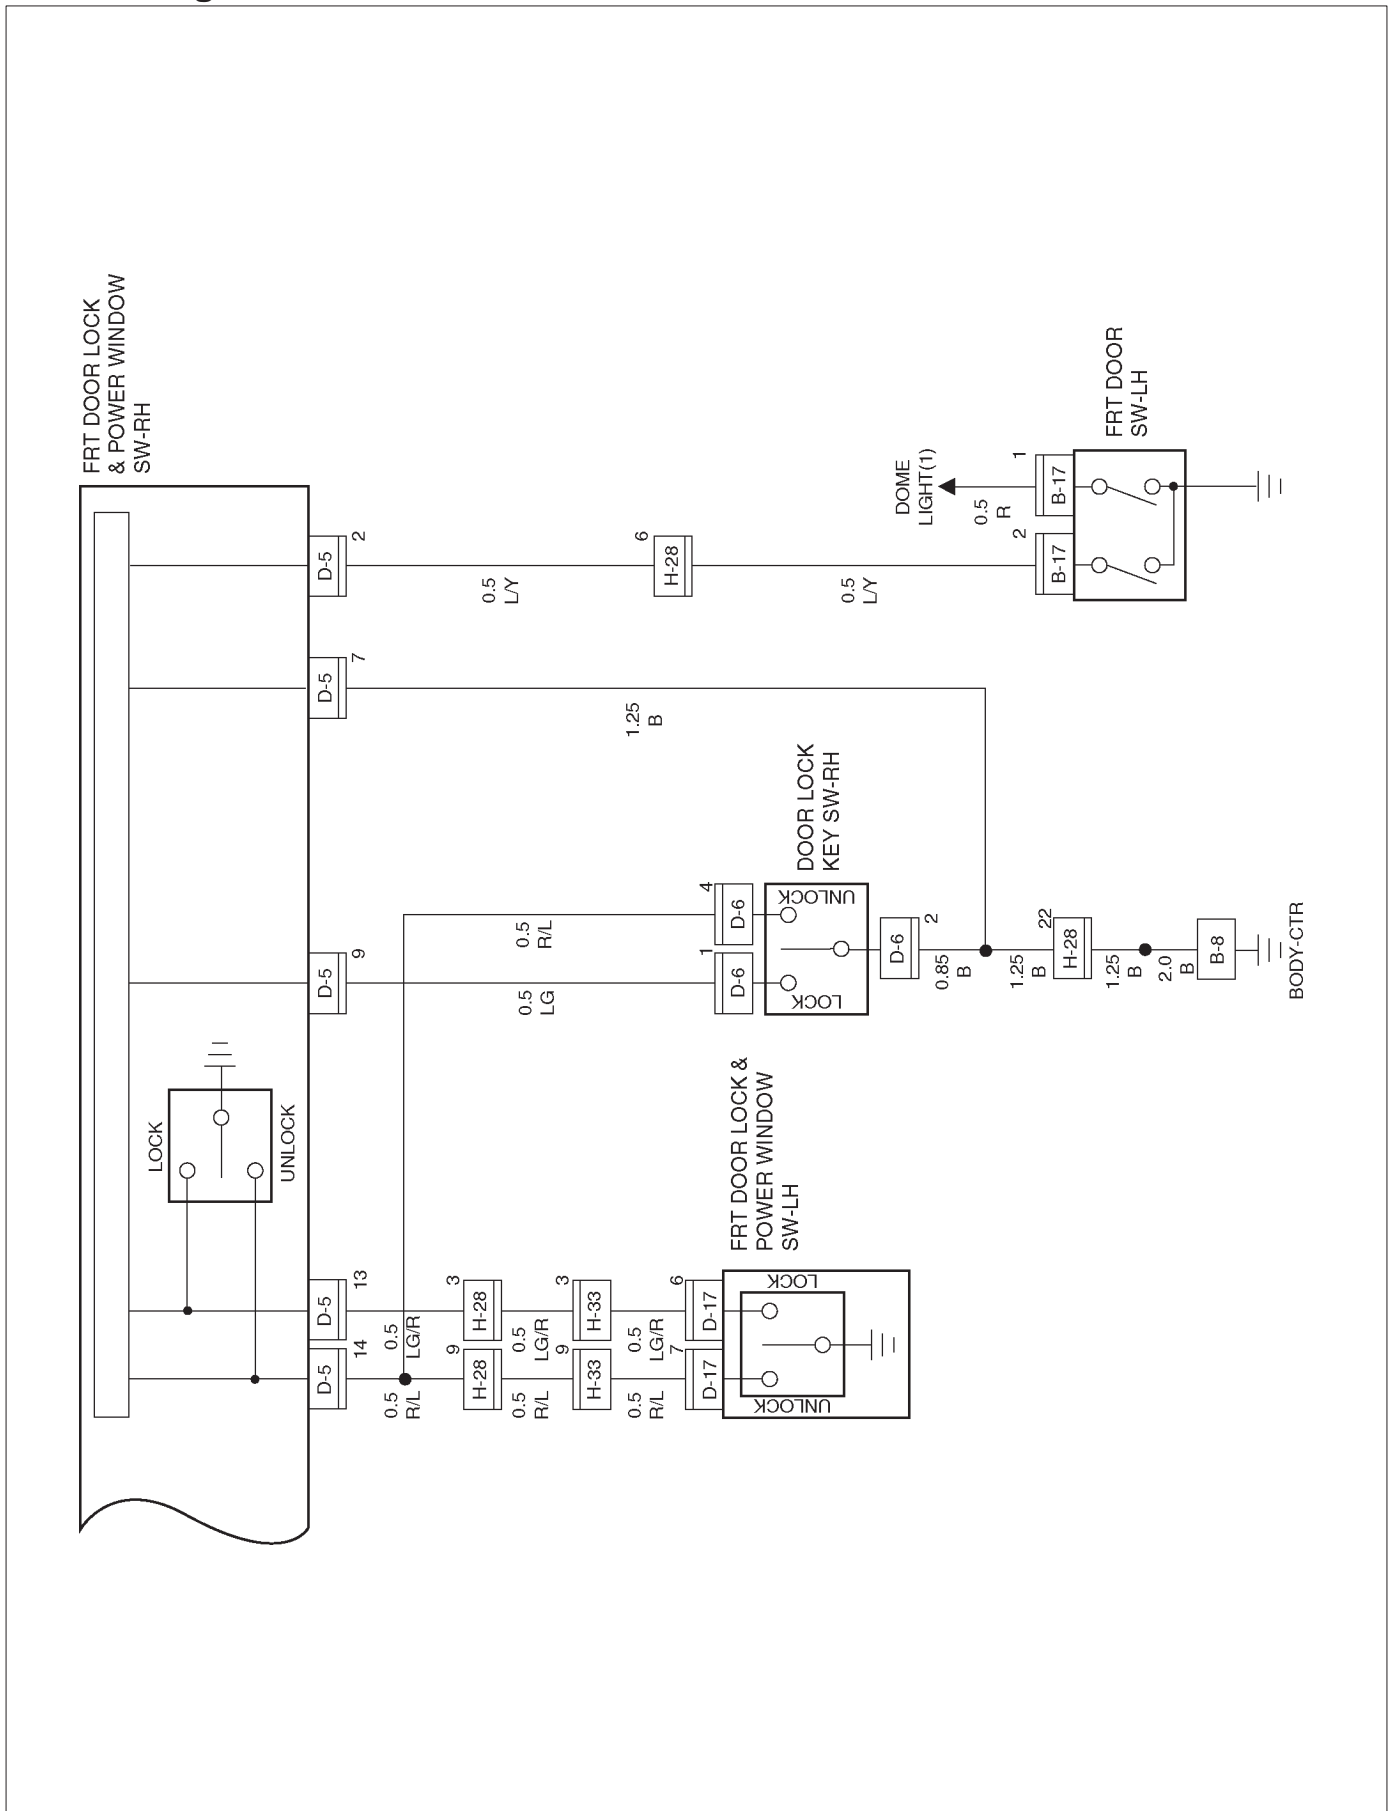

At this time, the current flows for approx. 1 second from door lock switch on driver's side to door lock actuator to run the motor.

When the key is in the key cylinder, Door Lock can not be done.

Diagnosis

All The Doors Do Not Lock And Unlock By Door Lock SW-RH

Step	Action	Value(s)	Yes	No
1	Is the fuse C-7 normal?	—	Go to Step 2	Replace the fuse
2	Disconnect the front power window & door lock SW-RH connector D-5. Is the battery voltage applied between harness side connector D-5 terminal 11 and the ground?	Approx. 12V	Go to Step 4	Go to Step 3
3	Repair an open circuit between the fuse C-7 and the switch. Is the action complete?	—	Verify repair	—
4	Disconnect the FRT door lock actuator-RH connector D-8. Is there continuity between harness side connector D-5 terminal 10 and connector D-8 terminal 1 (or connector D-5 terminal 12 and connector D-8 terminal 2)?	—	Go to Step 5	Go to Step 6
5	Replace the FRT power window & door lock SW-RH. Is the action complete?	—	Verify repair	—
6	Repair an open circuit between the FRT power window & door lock SW-RH and door lock actuator. Is the action complete?	—	Verify repair	—

All The Doors Do Not Lock and Unlock by FRT Door Lock SW-LH

Step	Action	Value(s)	Yes	No
1	Disconnect the FRT power window & door lock SW-RH and -LH connector D-5 and D-17. Is there continuity between harness side connector D-5 terminal 13 and connector D-17 terminal 6 (or connector D-5 terminal 14 and connector D-17 terminal 7)?	—	Go to Step 2	Go to Step 3
2	Replace the FRT power window & door lock SW-LH. Is the action complete?	—	Verify repair	—
3	Repair an open circuit between the FRT power window & door lock SW-RH and -LH. Is the action complete?	—	Verify repair	—

All the Doors Do Not Lock and Unlock by Door Lock Key SW

Step	Action	Value(s)	Yes	No
1	Is B-8 grounded securely?	—	Go to Step 2	Ground it securely
2	Disconnect the door lock key SW connector D-6. Is there continuity between harness side connector D-6 terminal 2 and the ground?	—	Go to Step 4	Go to Step 3
3	Repair an open circuit between connector D-6 terminal 2 and the ground B-8. Is the action complete?	—	Verify repair	—
4	Is there continuity between the switch side connector terminal 1 and 2 when the switch is turned to lock position, and terminal 2 and 4 when the switch is turned to unlock position?	—	Go to Step 5	Repair or replace the switch
5	Repair an open circuit between the door lock key SW and FRT power window & door lock SW-RH. Is the action complete?	—	Verify repair	—

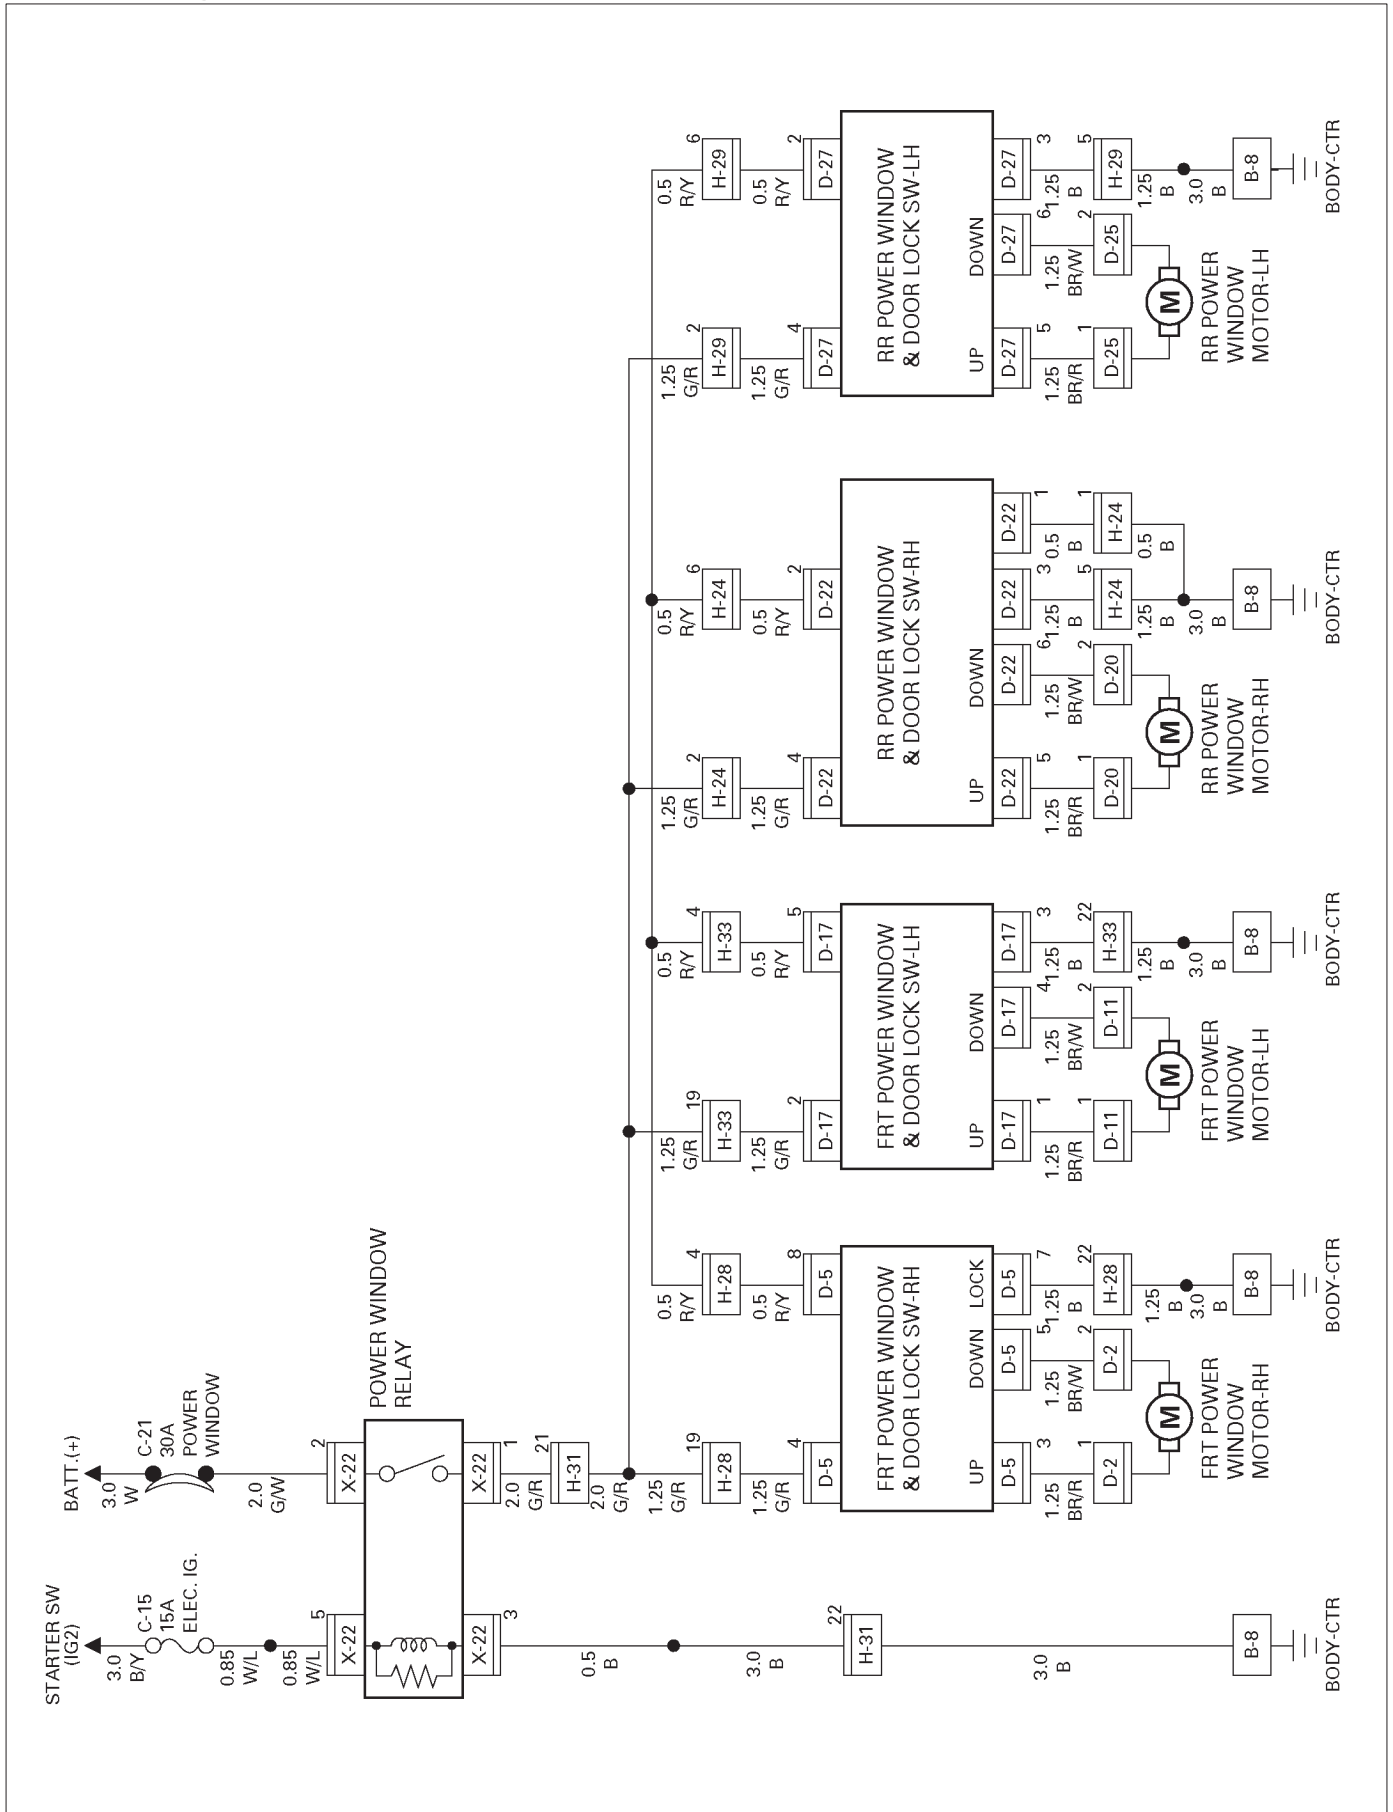

Power Window

General Description

The power window system consists of power window switches, power window motors and power window relay. With the starter switch in "ON" position, the battery voltage is supplied through power window relay to the power window switches. Selection of up or down switch changes over the motor rotating direction to open or close the window.

When the lock switch on the switch panel on the driver side is pressed, the power window switch is in open state. As a result, the power source to the other switches are cut off, and the power window motors do not run.

Diagnosis

All Window Do Not Operate

Step	Action	Value(s)	Yes	No
1	Is the fuse C-15 normal?	—	Go to Step 2	Replace the fuse
2	Is the circuit breaker C-21 normal?	—	Go to Step 3	Replace the circuit breaker
3	Is B-8 grounded securely?	—	Go to Step 4	Ground it securely
4	Disconnect the power window relay connector X-22. Is the battery voltage applied between harness side connector X-22 terminal 2 and the ground?	Approx. 12V	Go to Step 6	Go to Step 5
5	Repair an open circuit between the circuit breaker C-21 and connector X-22 terminal 2. Is the action complete?	—	Go to Step 4	—
6	Turn the starter switch on. Is the battery voltage applied between harness side connector X-22 terminal 5 and the ground?	Approx. 12V	Go to Step 8	Go to Step 7
7	Repair an open circuit between the fuse C-15 and connector X-22 terminal 5. Is the action complete?	—	Go to Step 6	—
8	Is there continuity between harness side connector X-22 terminal 3 and the ground B-8?	—	Go to Step 10	Go to Step 9
9	Repair an open circuit between connector harness side X-22 terminal 3 and the ground B-8. Is the action complete?	—	Go to step 8	—
10	Is there continuity between harness side connector X-22 terminal 1 and connector D-5 terminal 4?	—	Replace the power window relay	Go to Step 11
11	Repair an open circuit between power window relay and FRT power window & door lock switch-RH. Is the action complete?	—	Verify repair	—

8D-124 WIRING SYSTEM

Window On The Driver's Side Does Not Operate

Step	Action	Value(s)	Yes	No
1	Turn the starter switch on. Is the battery voltage applied between harness side connector D-5 terminal 4 and the ground?	Approx. 12V	Go to Step 3	Go to Step 2
2	Repair an open circuit between connector X-22 terminal 1 and connector D-5 terminal 4. Is the action complete?	—	Go to Step 1	—
3	Disconnect the front power window & door lock switch-RH connector D-5. Is there continuity between the front power window & door lock switch-RH harness side connector D-5 terminal 7 and ground B-8?	—	Go to Step 5	Go to Step 4
4	Repair an open circuit between connector D-5 terminal 7 and ground B-8. Is the action complete?	—	Go to Step 3	—
5	Connect the battery positive terminal with harness side connector D-5 terminal 3 or 5, and the negative terminal with harness side connector D-5 terminal 5 or 3. Does the motor operate?	—	Replace the front power window & door lock switch-RH	Go to Step 6
6	1. Disconnect the front power window motor-RH connector D-2. 2. Connect the battery positive terminal with the motor side connector D-2 terminal 1 or 2, and connect the battery negative terminal with the motor side connector D-2 terminal 2 or 1. Does the motor operate?	—	Go to Step 7	Replace the motor
7	Repair an open circuit between the front power window and door lock switch-RH and the front power window motor-RH. Is the action complete?	—	Verify repair	—

Window On The Front Passenger's Side Does Not Operate

Step	Action	Value(s)	Yes	No
1	Turn the starter switch on. Is the battery voltage applied between harness side connector D-17 terminal 2 and the ground?	Approx. 12V	Go to Step 3	Go to Step 2
2	Repair an open circuit between connector X-22 terminal 1 and connector D-17 terminal 2. Is the action complete?	—	Go to Step 1	—
3	Disconnect the front power window & door lock switch-RH connector D-17. Is there continuity between the front power window & door lock switch-RH harness side connector D-17 terminal 3 and ground B-8?	—	Go to Step 5	Go to Step 4
4	Repair an open circuit between connector D-17 terminal 3 and ground B-8. Is the action complete?	—	Go to Step 3	—
5	Connect the battery positive terminal with harness side connector D-17 terminal 1 or 4, and the negative terminal with harness side connector D-17 terminal 4 or 1. Does the motor operate?	—	Replace the front power window & door lock switch-RH	Go to Step 6
6	1. Disconnect the front power window motor-LH connector D-11. 2. Connect the battery positive terminal with the motor side connector D-11 terminal 1 or 2, and connect the battery negative terminal with the motor side connector D-11 terminal 2 or 1. Does the motor operate?	—	Go to Step 7	Replace the motor
7	Repair an open circuit between the front power window and door lock switch-LH and the front power window motor-LH. Is the action complete?	—	Verify repair	—

Rear Window On The Left (or Right) Side Does Not Operate

Step	Action	Value(s)	Yes	No
1	1. Disconnect the rear power window switch–RH connector D–22 or the rear power window and door lock switch–LH connector D–27. 2. Turn the starter switch on. Is the battery voltage applied between harness side connector D–22 terminal 4 and the ground, or harness side connector D–27 terminal 4 and the ground?	Approx. 12V	Go to Step 3	Go to Step 2
2	Repair an open circuit between connector X–22 terminal 1 and connector D–22 terminal 4 or connector D–27 terminal 4. Is the action complete?	—	Go to Step 1	—
3	Is there continuity between harness side connector D–22 terminal 3 and the ground B–8, or harness side connector D–27 terminal 3 and the ground B–6 or 8?	—	Go to Step 5	Go to Step 4
4	Repair an open circuit between connector D–22 terminal 3 or connector D–27 terminal 3 and the ground B–6 or 8. Is the action complete?	—	Go to Step 3	—
5	Connect the battery positive terminal with harness side connector D–22 terminals 5 or harness side connector D–27 terminal 5, and connect the battery negative terminal with harness side connector D–22 terminal 6 or harness side connector D–27 terminal 6. Does the motor operate?	—	Replace the rear power window switch–LH or –RH	Go to Step 6
6	1. Disconnect the rear power window motor connector D–20 or D–25. 2. Connect the battery positive terminal with motor side connector D–20 or D–25 terminal 1 or 2, and connect the battery negative terminal with the motor side connector D–20 or D–25 terminal 2 or 1. Does the motor operate?	—	Go to Step 7	Replace the motor
7	Repair an open circuit between the rear power window switch and the rear power window motor. Is the action complete?	—	Verify repair	—

Window On The Front Passenger’s Side Does Not Operate by the Front Power Window and Door Lock Switch–RH

Step	Action	Value(s)	Yes	No
1	Disconnect the front power window and door lock switch–RH connector D–5 and the front power window and door lock switch–LH connector D–17. Is there continuity between harness side connector D–5 terminal 8 and harness side connector D–17 terminal 5?	—	Replace the front power window and door lock switch–LH	Go to Step 2
2	Repair an open circuit between connector D–5 terminal 8 and connector D–17 terminal 5. Is the action complete?	—	Verify repair	—

Lock SW Does Not Function

Step	Action	Value(s)	Yes	No
1	Repair or replace the front power window and door lock switch–RH. Is the action complete?	—	Verify repair	—

Anti-Lock Brake System (ABS)

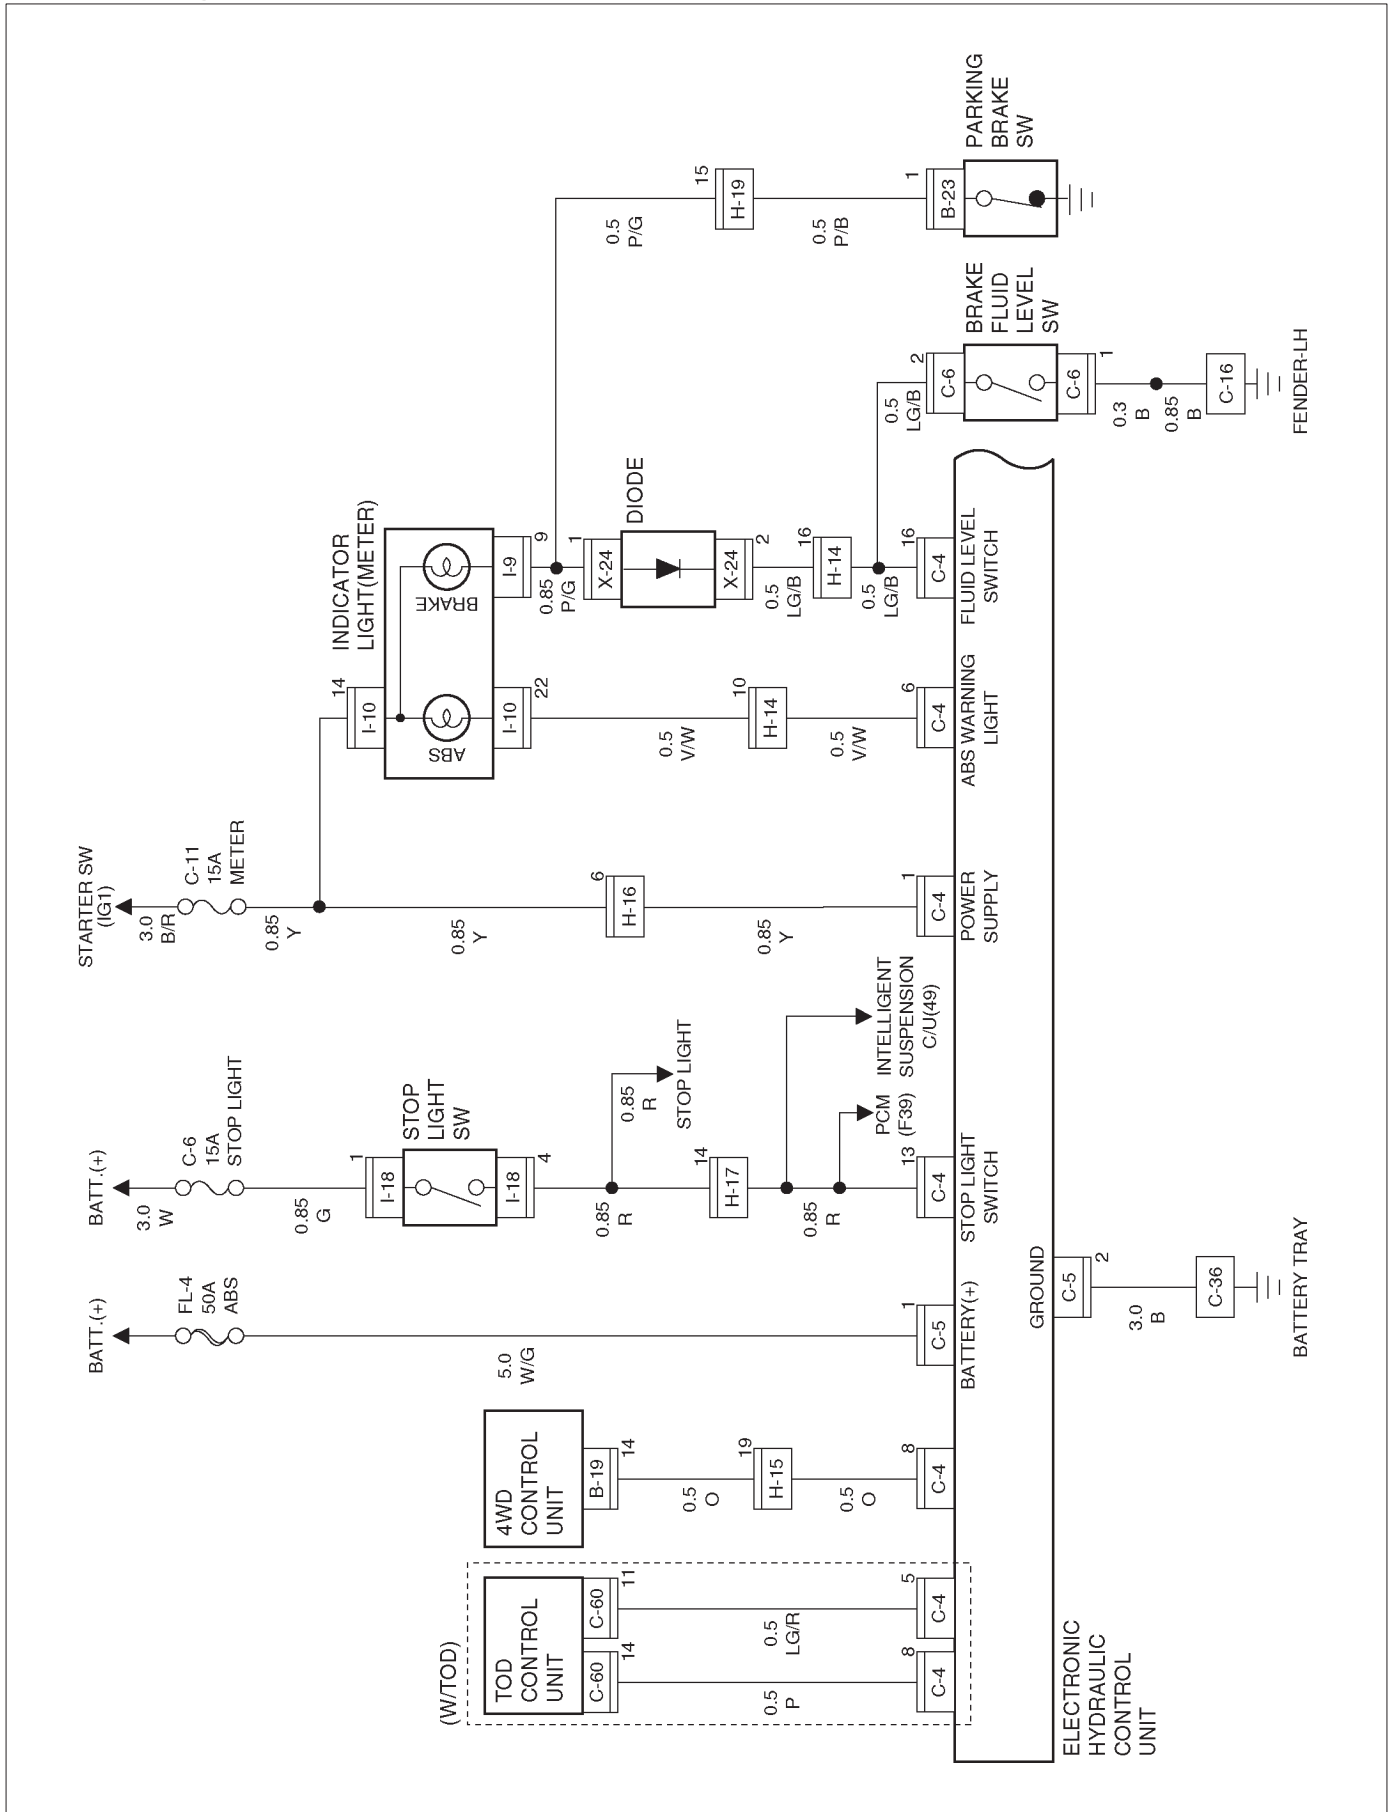

General Description

The circuit consists of the Electronic Hydraulic Control Unit (EHCU), the starter switch, stoplight switch, wheel speed sensor, ABS warning light, BRAKE warning light, and data link connector.

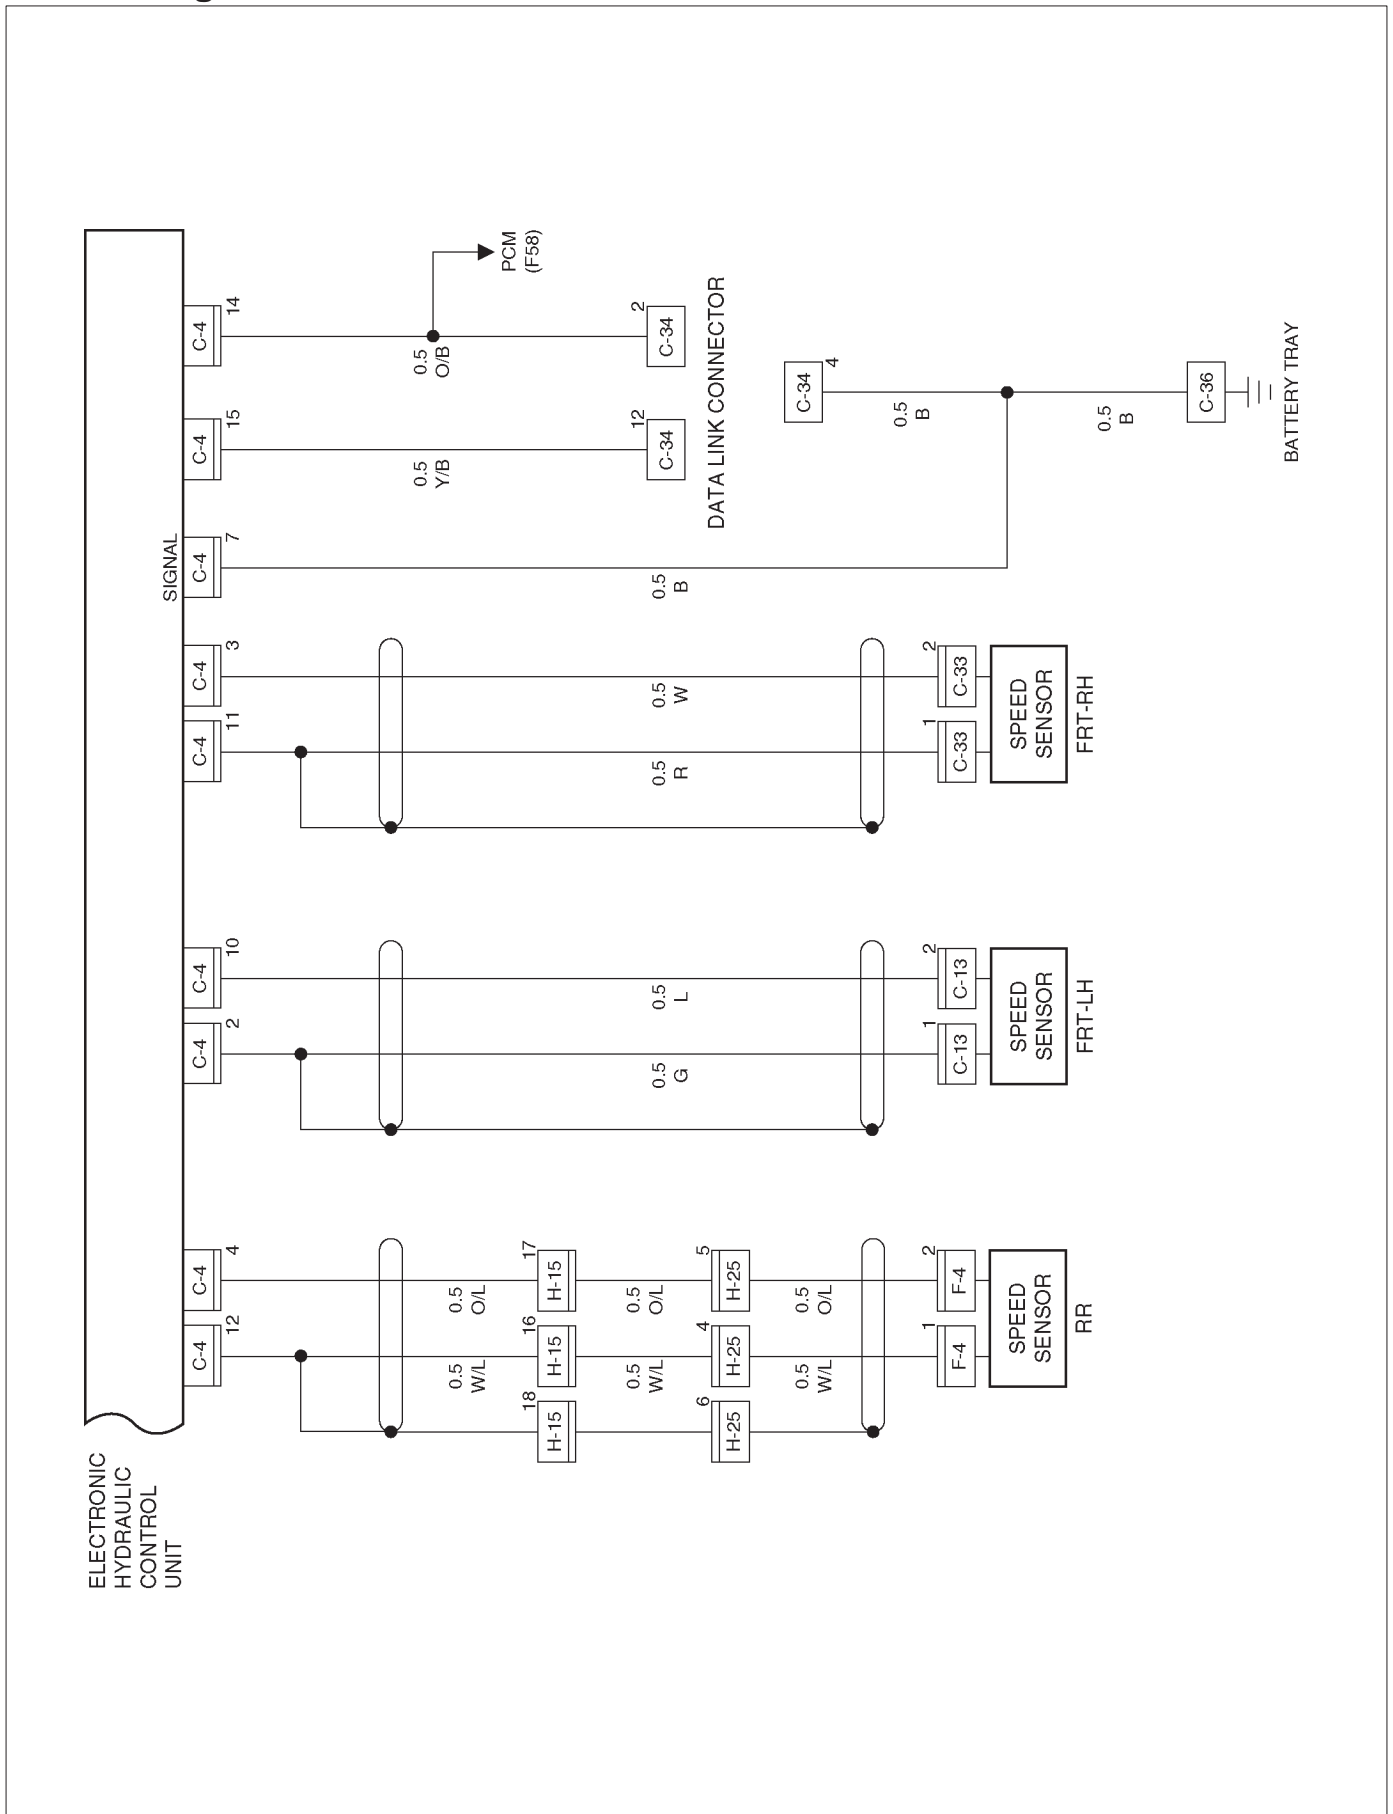

When the service brake is applied while in the running mode, the EHCU judges which wheel is about to lock by using the wheel rotation speed signals sent from the three wheel speed sensors at the front wheels and rear differential. And the brake fluid pressure applied to the four wheels is controlled by the EHCU to prevent the wheels from locking.

Refer to Brake Control System in Brakes section in detail.

A/T Shift Lock

General Description

With the starter switch in the "ON" position and the shift lever in "P" position, the shift lever cannot be shifted from "P" to another position unless the brake pedal is depressed. This is because, unless the brake pedal is depressed, the solenoid pin underneath the shift lever retracts and the link lever then locks the shift lever cam.

Windshield Wiper and Washer

General Description

The system consists of a windshield wiper and washer switch, alarm & relay control unit, windshield wiper motor and windshield washer motor. With the starter switch in the "ON" position, when the windshield wiper switch is turned on ("LOW" or "HI") the battery voltage is applied to the windshield wiper motor to operate the wipers.

When the "INT" switch is turned on, the operation of the wipers is controlled by the alarm & relay control unit. When the "WASHER" switch is turned on, the operation of the wipers is also controlled by the alarm & relay control unit and the windshield washer motor operates to squirt the washing solution when the washer switch is pressed.

Diagnosis

Windshield Wiper Does Not Operate At Any Switch Position

Step	Action	Value(s)	Yes	No
1	Is the fuse C-17 normal?	—	Go to Step 2	Replace the fuse
2	Is C-36 grounded securely?	—	Go to Step 3	Ground it securely
3	Disconnect the windshield wiper motor connector C-27. Is there continuity between harness side connector C-27 terminal 3 and the ground?	—	Go to Step 5	Go to Step 4
4	Repair an open circuit between connector C-27 terminal 3 and the ground C-36. Is the action complete?	—	Go to Step 3	—
5	1. Disconnect the windshield wiper & washer switch connector I-31. 2. Turn the starter switch on. Is the battery voltage applied between harness side connector I-31 terminal 3 and the ground?	Approx. 12V	Go to Step 7	Go to Step 6
6	Repair an open circuit between the fuse C-17 and connector I-31 terminal 3. Is the action complete?	—	Go to Step 5	—
7	Is the continuity between the windshield wiper and washer switch terminal normal?	—	Repair or replace the windshield wiper motor	Repair or replace the switch

Windshield Wiper Does Not Operate At “INT” Position

Step	Action	Value(s)	Yes	No
1	1. Disconnect the windshield wiper and washer switch connector I-31. 2. Turn the windshield wiper and washer switch to INT position. Is there continuity between switch side connector I-31 terminal 2 and 3, 5 and 6?	—	Go to Step 2	Repair or replace the switch
2	Is B-8 grounded securely?	—	Go to Step 3	Ground it securely
3	1. Reconnect the windshield wiper and washer switch connector I-31. 2. Disconnect the alarm and relay control unit connector I-41 and I-42. 3. Turn the starter switch on. Is the battery voltage applied between harness side connector I-42 terminal 7 and the ground?	Approx. 12V	Go to Step 5	Go to Step 4
4	Repair an open circuit between connector I-31 terminal 2 and the alarm & relay control unit. Is the action complete?	—	Verify repair	—
5	Is the battery voltage applied between harness side connector I-41 terminal 3 and the ground?	Approx. 12V	Replace the alarm and relay control unit	Go to Step 6
6	Repair an open circuit between the fuse C-17 and the alarm & relay control unit. Is the action complete?	—	Verify repair	—

Windshield Wiper Does Not Operate At “LO” Position

Step	Action	Value(s)	Yes	No
1	Repair or replace the windshield wiper and washer switch. NOTE: There should be continuity between switch side connector I-31 terminal 3 and 5 with the switch turned to the LOW position. Is the action complete?	—	Verify repair	—

8D-140 WIRING SYSTEM

Windshield Wiper Does Not Operate At “HI” Position

Step	Action	Value(s)	Yes	No
1	1. Disconnect the windshield wiper and washer switch connector I-31. 2. Turn the windshield wiper and washer switch to the HIGH position. Is there continuity between switch side connector I-31 terminal 3 and 4?	—	Go to Step 2	Repair or replace the switch
2	1. Reconnect the windshield wiper and washer switch connector I-31. 2. Disconnect the windshield wiper motor connector C-27. 3. Turn the starter switch on. Is the battery voltage applied between harness side connector C-27 terminal 1 and the ground?	Approx. 12V	Repair or replace the windshield wiper motor	Go to Step 3
3	Repair an open circuit between connector I-31 terminal 4 and connector C-27 terminal 1. Is the action complete?	—	Verify repair	—

Auto-Stop Function Of The Windshield Wiper Motor Does Not Operate

Step	Action	Value(s)	Yes	No
1	Disconnect the windshield wiper and washer switch connector I-31. Turn the windshield wiper and washer switch off. Is there continuity between switch side connector I-31 terminal 5 and 6?	—	Go to Step 2	Repair or replace the switch
2	Disconnect the windshield wiper motor connector C-27. Turn the starter switch on. Is the battery voltage applied between harness side connector C-27 terminal 6 and the ground?	Approx. 12V	Go to Step 4	Go to Step 3
3	Repair an open circuit between the fuse C-17 and connector C-27 terminal 6. Is the action complete?	—	Go to Step 2	—
4	1. Connect the battery positive terminal with motor side connector C-27 terminal 2 and the battery negative terminal with terminal 3. 2. While the motor is operating at low speed, disconnect the battery positive terminal from terminal 2 and then connect it with terminal 6 again. 3. Under this condition, connect motor side connector terminal 5 with terminal 2. Does the motor stop at the correct position?	—	Go to Step 5	Repair or replace the motor
5	Disconnect the alarm and relay control unit connector I-41 and I-42. Is the battery voltage applied between harness side connector I-41 terminal 3 and the ground?	Approx. 12V	Go to Step 7	Go to Step 6
6	Repair an open circuit between the fuse C-17 and connector I-41 terminal 3. Is the action complete?	—	Go to Step 5	—
7	1. Reconnect the windshield wiper and washer switch connector I-31 and windshield wiper motor connector C-27. 2. Turn the windshield wiper and washer switch to the low position. Is the battery voltage applied between harness side connector I-41 terminal 4 and the ground?	Approx. 12V intermittently	Go to Step 9	Go to Step 8
8	Repair an open circuit between connector C-27 terminal 5 and connector I-41 terminal 4. Is the action complete?	—	Go to Step 7	—
9	1. Connect the alarm and relay control unit harness side connector I-41 terminal 4 and connector I-41 terminal 1. 2. Turn the windshield wiper and washer switch to the off position. Does the motor stop at the correct position?	—	Replace the alarm and relay control unit	Go to Step 10
10	Repair an open circuit between connector I-31 terminal 6 and the alarm & relay control unit. Is the action complete?	—	Verify repair	—

8D-142 WIRING SYSTEM

Windshield Wiper Motor Does Not Stop

Step	Action	Value(s)	Yes	No
1	1. Disconnect the windshield wiper and washer switch connector I-31. 2. Turn the switch off. NOTE: When the switch is turned of OFF position, there is no continuity between the switch terminals except terminal 5 and 6. Is the continuity between the switch terminal normal?	—	Go to Step 2	Repair or replace the switch
2	Repair or replace the windshield motor. Is the action complete?	—	Verify repair	—

Windshield Washer Motor Does Not Operate

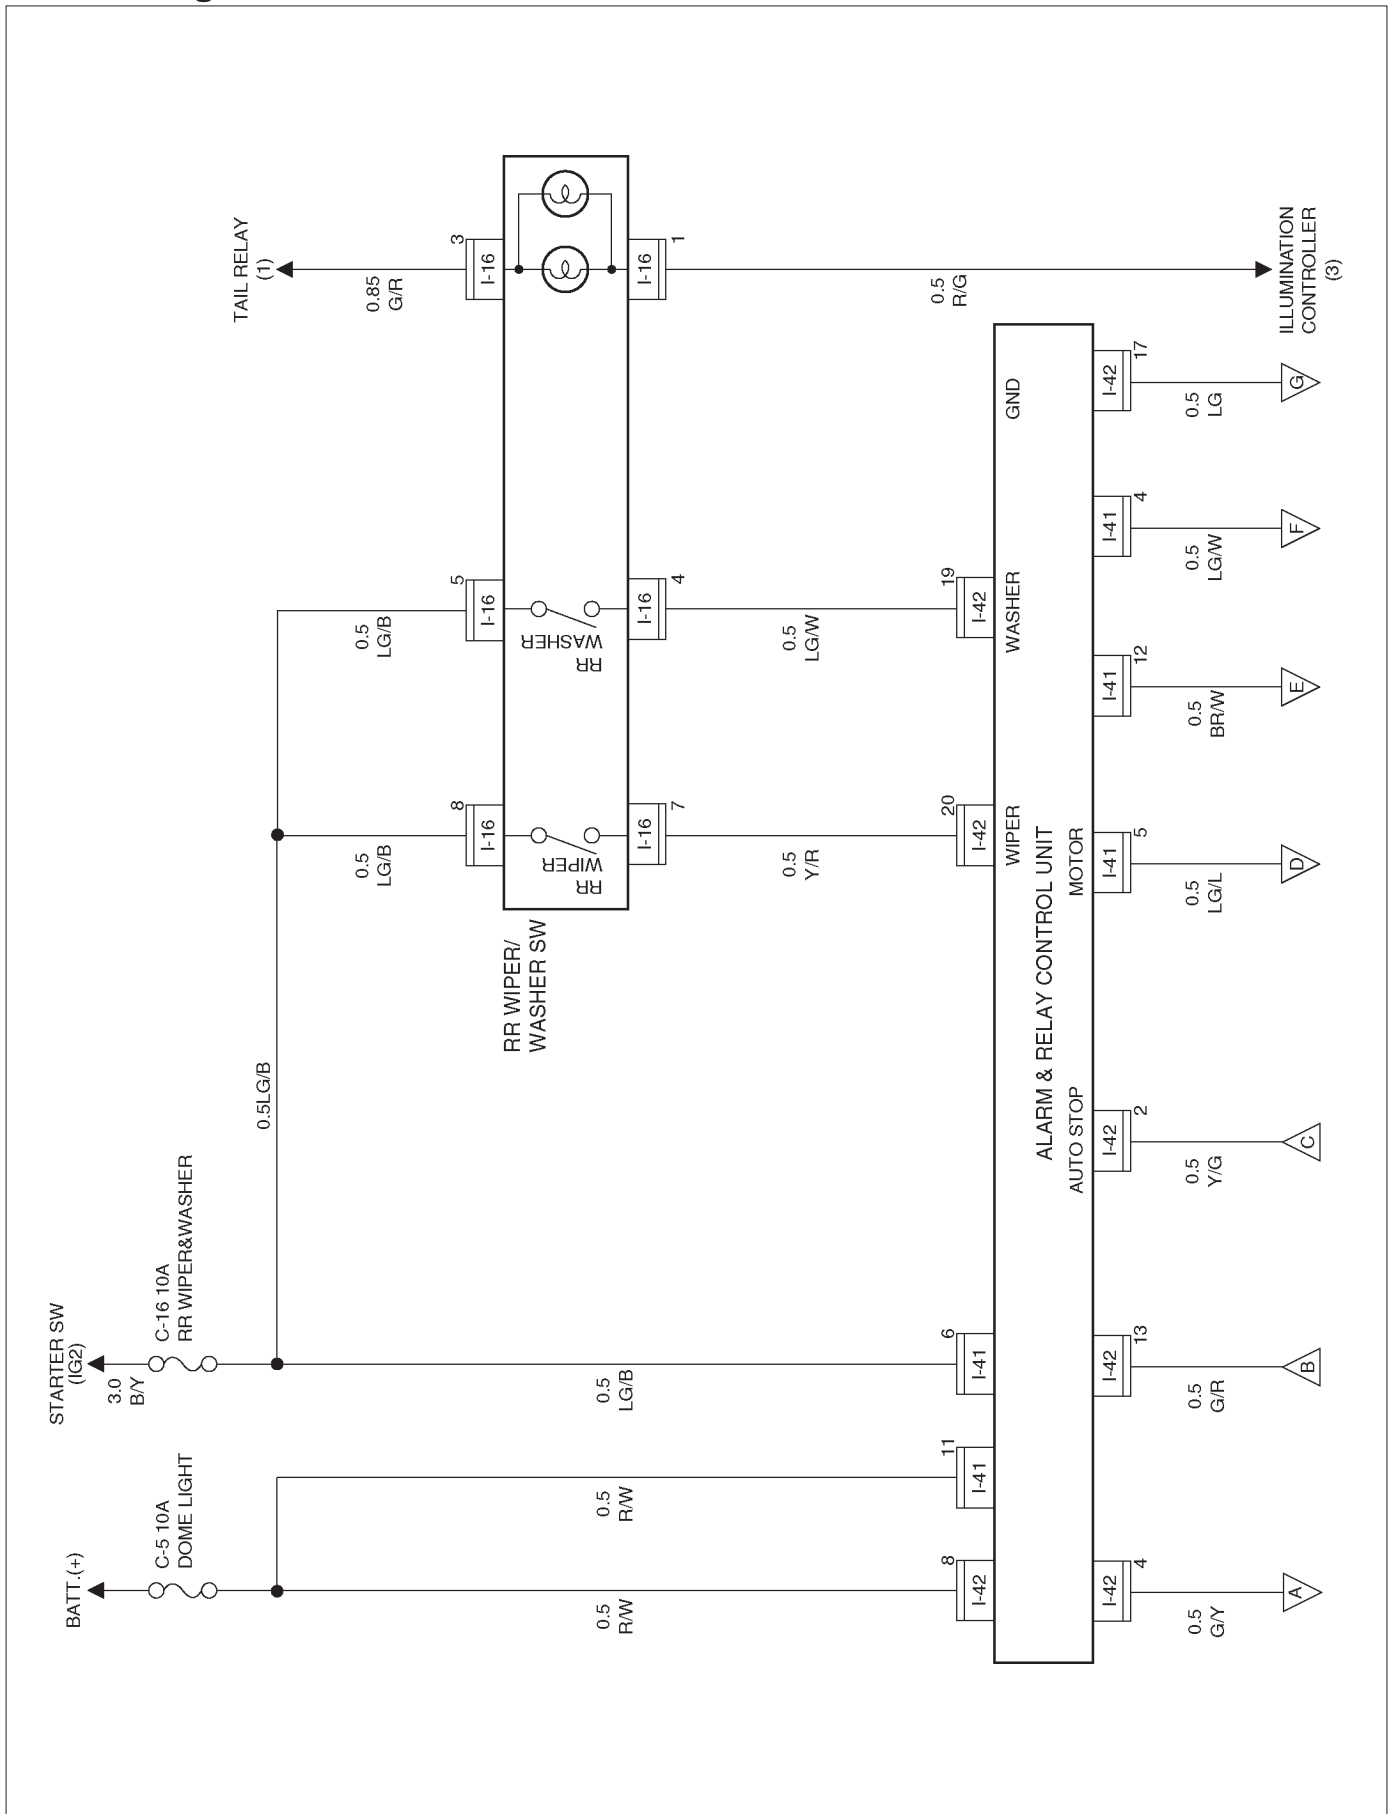

Step	Action	Value(s)	Yes	No
1	Does the windshield wiper motor operate?	—	Go to Step 6	Go to Step 2
2	Is the fuse C-17 normal?	—	Go to Step 3	Replace the fuse
3	1. Disconnect the windshield wiper and washer switch connector I-31. 2. Turn the starter switch on. Is the battery voltage applied between harness side connector I-31 terminal 1 and the ground?	Approx. 12V	Go to Step 5	Go to Step 4
4	Repair an open circuit between the fuse C-17 and connector I-31 terminal 1. Is the action complete?	—	Go to Step 3	—
5	Is C-16 grounded securely?	—	Go to Step 6	Ground it securely
6	Turn the windshield wiper and washer switch to the washer position. Is there continuity between switch side connector I-31 terminal 1 and 7?	—	Go to Step 7	Repair or replace the switch
7	1. Disconnect the windshield washer motor connector C-28. 2. Connect the battery positive terminal with the motor side connector C-28 terminal 1 and connect the battery negative terminal with terminal 2. Does the motor operate?	—	Go to Step 8	Repair or replace the motor
8	1. Reconnect the windshield wiper and washer switch connector I-31. 2. Turn the starter switch on. Is the battery voltage applied between harness side connector C-28 terminal 1 and the ground?	Approx. 12V	Go to Step 10	Go to Step 9
9	Repair an open circuit between connector I-31 terminal 7 and connector C-28 terminal 1. Is the action complete?	—	Verify repair	—
10	Repair an open circuit between connector C-28 terminal 2 and the ground C-16. Is the action complete?	—	Verify repair	—

Rear Wiper/Washer

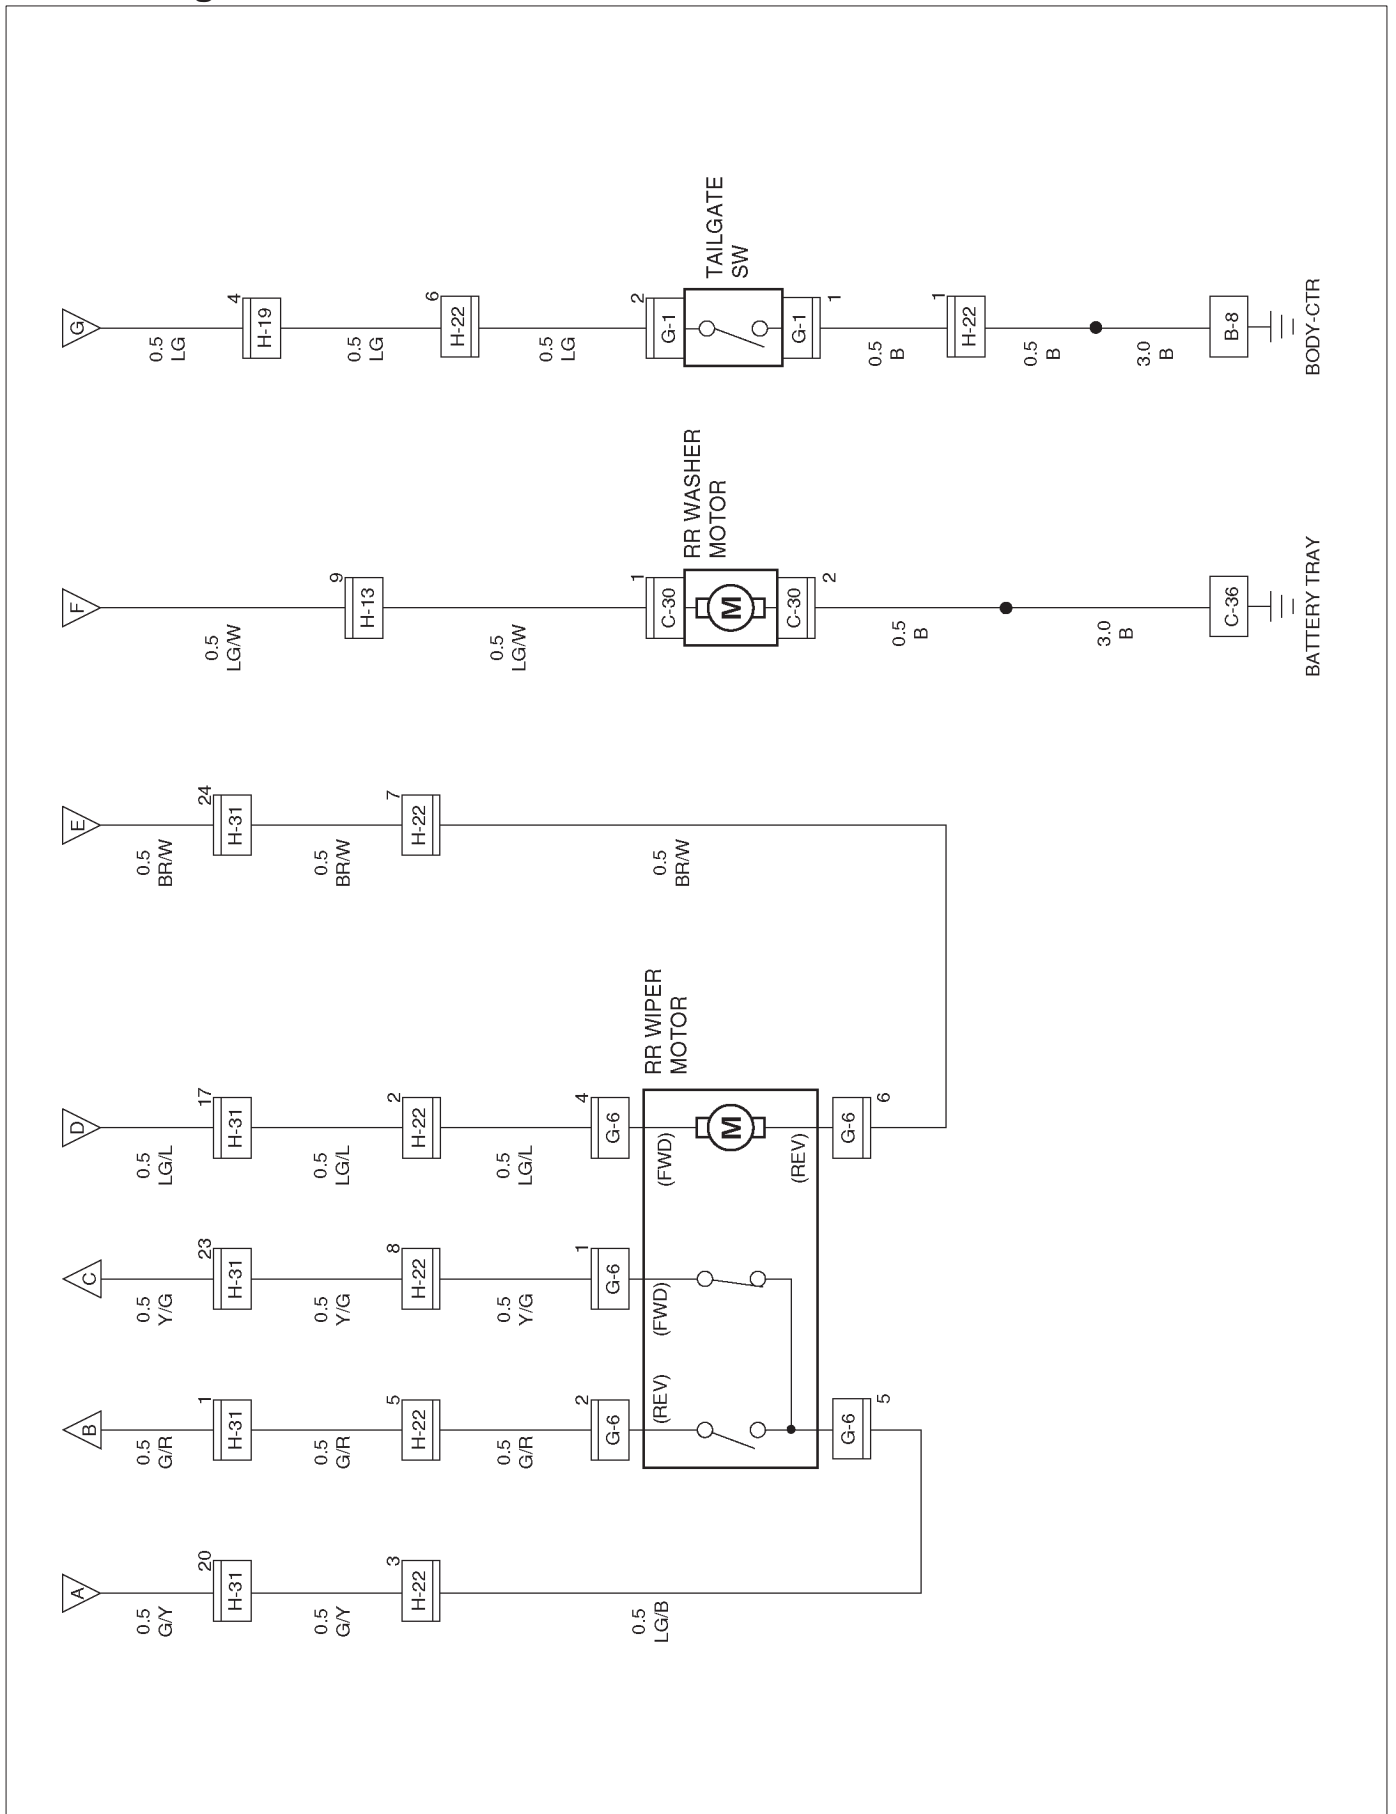

General Description

The system consists of the rear wiper and washer switch, the rear wiper motor, the rear washer motor and the alarm & relay control unit. The rear wiper provides intermittent and riseup functions and is controlled by the alarm & relay control unit. When the hatch gate is open, the rear wiper does not operate. The hatch gate actuator does not operate while the rear wiper is operating.

Diagnosis

Rear Wiper Motor Does Not Operate

Step	Action	Value(s)	Yes	No
1	Is the fuse C-16 normal?	—	Go to Step 2	Replace the fuse
2	1. Disconnect the rear wiper/washer switch connector I-16. 2. Turn the rear wiper switch on. Is there continuity between switch side connector I-16 terminal 8 and 7?	—	Go to Step 3	Repair or replace the switch
3	Turn the starter switch on Is the battery voltage applied between harness side connector I-16 terminal 8 and the ground?	Approx. 12V	Go to Step 5	Go to Step 4
4	Repair an open circuit between the fuse C-16 and connector I-16 terminal 8. Is the action complete?	—	Go to Step 3	—
5	Disconnect the alarm & relay control unit connector I-41 and I-42. Is the battery voltage applied between harness side connector I-41 terminal 6 and the ground?	Approx. 12V	Go to Step 7	Go to Step 6
6	Repair an open circuit between the fuse C-16 and connector I-41 terminal 6. Is the action complete?	—	Go to Step 5	—
7	Is there continuity between harness side connector I-16 terminal 7 and harness side connector I-42 terminal 20?	—	Go to Step 9	Go to Step 8
8	Repair an open circuit between connector I-16 terminal 7 and connector I-42 terminal 20. Is the action complete?	—	Go to Step 7	—
9	1. Disconnect the rear wiper motor connector G-6. 2. Connect the battery positive terminal with the motor side connector G-6 terminal 4 and the battery negative terminal with the motor side connector G-6 terminal 6. Does the motor operate?	—	Go to Step 10	Repair or replace the motor
10	Is there continuity between harness side connector I-41 terminal 5 and harness side connector G-6 terminal 4?	—	Go to Step 12	Go to Step 11
11	Repair an open circuit between connector I-41 terminal 5 and connector G-6 terminal 4. Is the action complete?	—	Go to Step 10	—
12	Is there continuity between harness side connector I-41 terminal 12 and harness side connector G-6 terminal 6?	—	Replace the alarm & relay control unit	Go to Step 13
13	Repair an open circuit between connector G-6 terminal 6 and connector I-41 terminal 12. Is the action complete?	—	Verify repair	—

Auto-Stop Function Of The Rear Wiper Motor Does Not Operate

Step	Action	Value(s)	Yes	No
1	1. Disconnect the rear wiper motor connector G-6 2. Connect the battery positive terminal with the motor side connector G-6 terminal 4 and the battery negative terminal with terminal 6. 3. While the motor is operating, disconnect the battery positive terminal from terminal 4 and then connect it with terminal 5 again. 4. Under this condition, connect the motor side connector terminal 1 with terminal 4. Does the motor stop operating?	—	Go to Step 2	Repair or replace the motor
2	1. Connect the battery positive terminal with the motor side connector G-6 terminal 5 and the battery negative terminal with terminal 4. 2. Under this condition, connect the motor side connector terminal 2 with 6. Does the motor stop at the correct position?	—	Go to Step 2	Repair or replace the motor
3	Turn the start switch on Is the battery voltage applied between harness side connector G-6 terminal 5 and the ground?	Adpprox. 12V	Go to Step 5	Go to Step 4
4	Repair an open circuit between connector I-42 terminal 4 and connector G-6 terminal 5. Is the action complete?	—	Go to Step 3	—
5	Disconnect the alarm & relay control unit connector I-41 and I-42. Is there continuity between harness side connector G-6 terminal 1 and harness side connector I-42 terminal 2, harness side connector G-6 terminal 2 and harness side connector I-42 terminal 13?	—	Replace the alarm & relay control unit	Go to Step 4
6	Repair an open circuit between connector G-6 terminal 1 and connector I-42 terminal 2. Is the action complete?	—	Verify repair	—

Rear Wiper Motor Does Not Operate With Rear Wiper/Washer Switch At Wiper Position

Step	Action	Value(s)	Yes	No
1	1. Disconnect the rear wiper/washer switch connector I-16. 2. Turn the switch to rear wiper position. Is there continuity between the switch side connector I-16 terminal 8 and 7?	—	Go to Step 2	Repair or replace the switch
2	1. Reconnect the rear wiper/washer switch connector I-16. 2. Disconnect the alarm & relay control unit connector I-41 and I-42. 3. Turn the starter switch on. Is the battery voltage applied between harness side connector I-42 terminal 20 and the ground?	Approx. 12V	Replace the alarm & relay control unit	Go to Step 3
3	Repair an open circuit between connector I-16 terminal 7 and connector I-42 terminal 20. Is the action complete?	—	Verify repair	—

Rear Wiper Motor Does Not Operate With Rear Wiper/Washer Switch At Washer Position

Step	Action	Value(s)	Yes	No
1	1. Disconnect the rear wiper/washer switch connector I-16. 2. Turn the switch to the washer position. Is there continuity between the switch side connector I-16 terminal 5 and 4?	—	Go to Step 2	Repair or replace the switch
2	1. Reconnect the rear wiper/washer switch connector I-16. 2. Disconnect the alarm & relay control unit connector I-41 and I-42. 3. Turn the starter switch on. Is the battery voltage applied between harness side connector I-42 terminal 19 and the ground?	Approx. 12V	Replace the alarm & relay control unit	Go to Step 3
3	Repair an open circuit between connector I-16 terminal 4 and connector I-42 terminal 19. Is the action complete?	—	Verify repair	—

Rear Wiper Motor Does Not Stop Operating

Step	Action	Value(s)	Yes	No
1	1. Disconnect the rear wiper/washer switch connector I-16. 2. Turn the switch to the off position. NOTE: There should be no continuity. Is there continuity between the switch side connector I-16 terminal 8 and 7?	—	Repair or replace the switch	Replace the alarm & relay control unit

8D-150 WIRING SYSTEM

Rear Washer Motor Does Not Operate

Step	Action	Value(s)	Yes	No
1	Does the rear wiper motor operate?	—	Go to Step 6	Go to Step 2
2	Is the fuse C-16 normal?	—	Go to Step 3	Replace the fuse
3	1. Disconnect the rear wiper/washer switch connector I-16. 2. Turn the switch to the rear washer position. Is there continuity between the switch side connector I-16 terminal 5 and 4?	—	Go to Step 4	Replace the switch
4	Turn the starter switch on. Is the battery voltage applied between harness side connector I-16 terminal 5 and the ground?	Approx. 12V	Go to Step 6	Go to Step 5
5	Repair an open circuit between the fuse C-16 and connector I-16 terminal 5. Is the action complete?	—	Go to Step 4	—
6	Is C-36 grounded securely?	—	Go to Step 7	Ground it securely
7	1. Disconnect the rear washer motor connector C-30. 2. Connect the battery positive terminal with the motor side connector C-30 terminal 1 and the battery negative terminal with terminal 2. Does the motor operate?	—	Go to Step 8	Repair or replace the motor
8	Reconnect the rear wiper/washer switch connector I-16. Is the battery voltage applied between harness side connector C-30 terminal 1 and the ground?	Approx. 12V	Go to Step 10	Go to Step 9
9	Is there continuity between harness side connector I-41 terminal 4 and harness side connector C-30 terminal 1?	—	Go to Step 10	Repair an open circuit
10	Is there continuity between harness side connector C-30 terminal 2 and the ground?	—	Go to Step 11	Repair an open circuit
11	Replace the alarm & relay control unit. Is the action complete?	—	Verify repair	—

Rear Defogger/Mirror Defogger

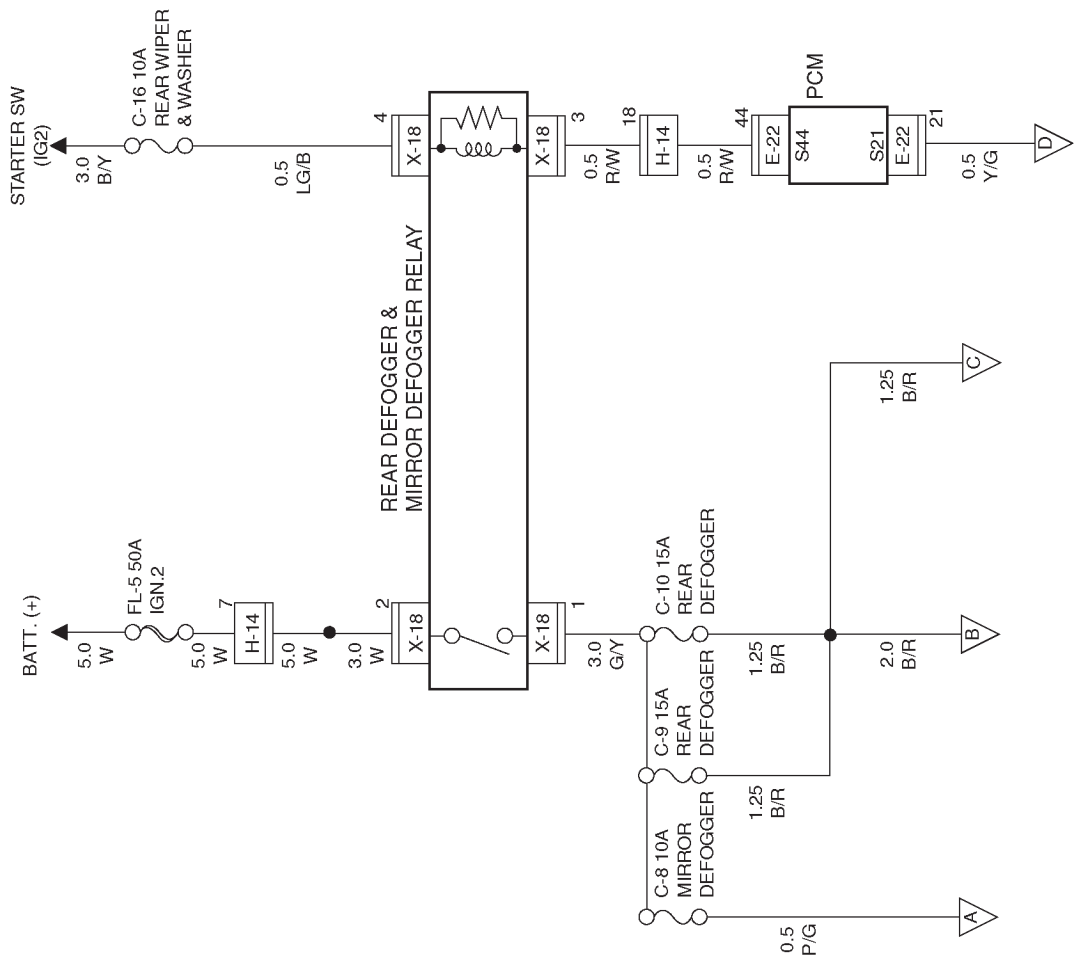

General Description

The system consists of the rear defogger and mirror defogger switch, the rear defogger & mirror defogger relay, the rear defogger & mirror defogger and the Powertrain Control Module (PCM).

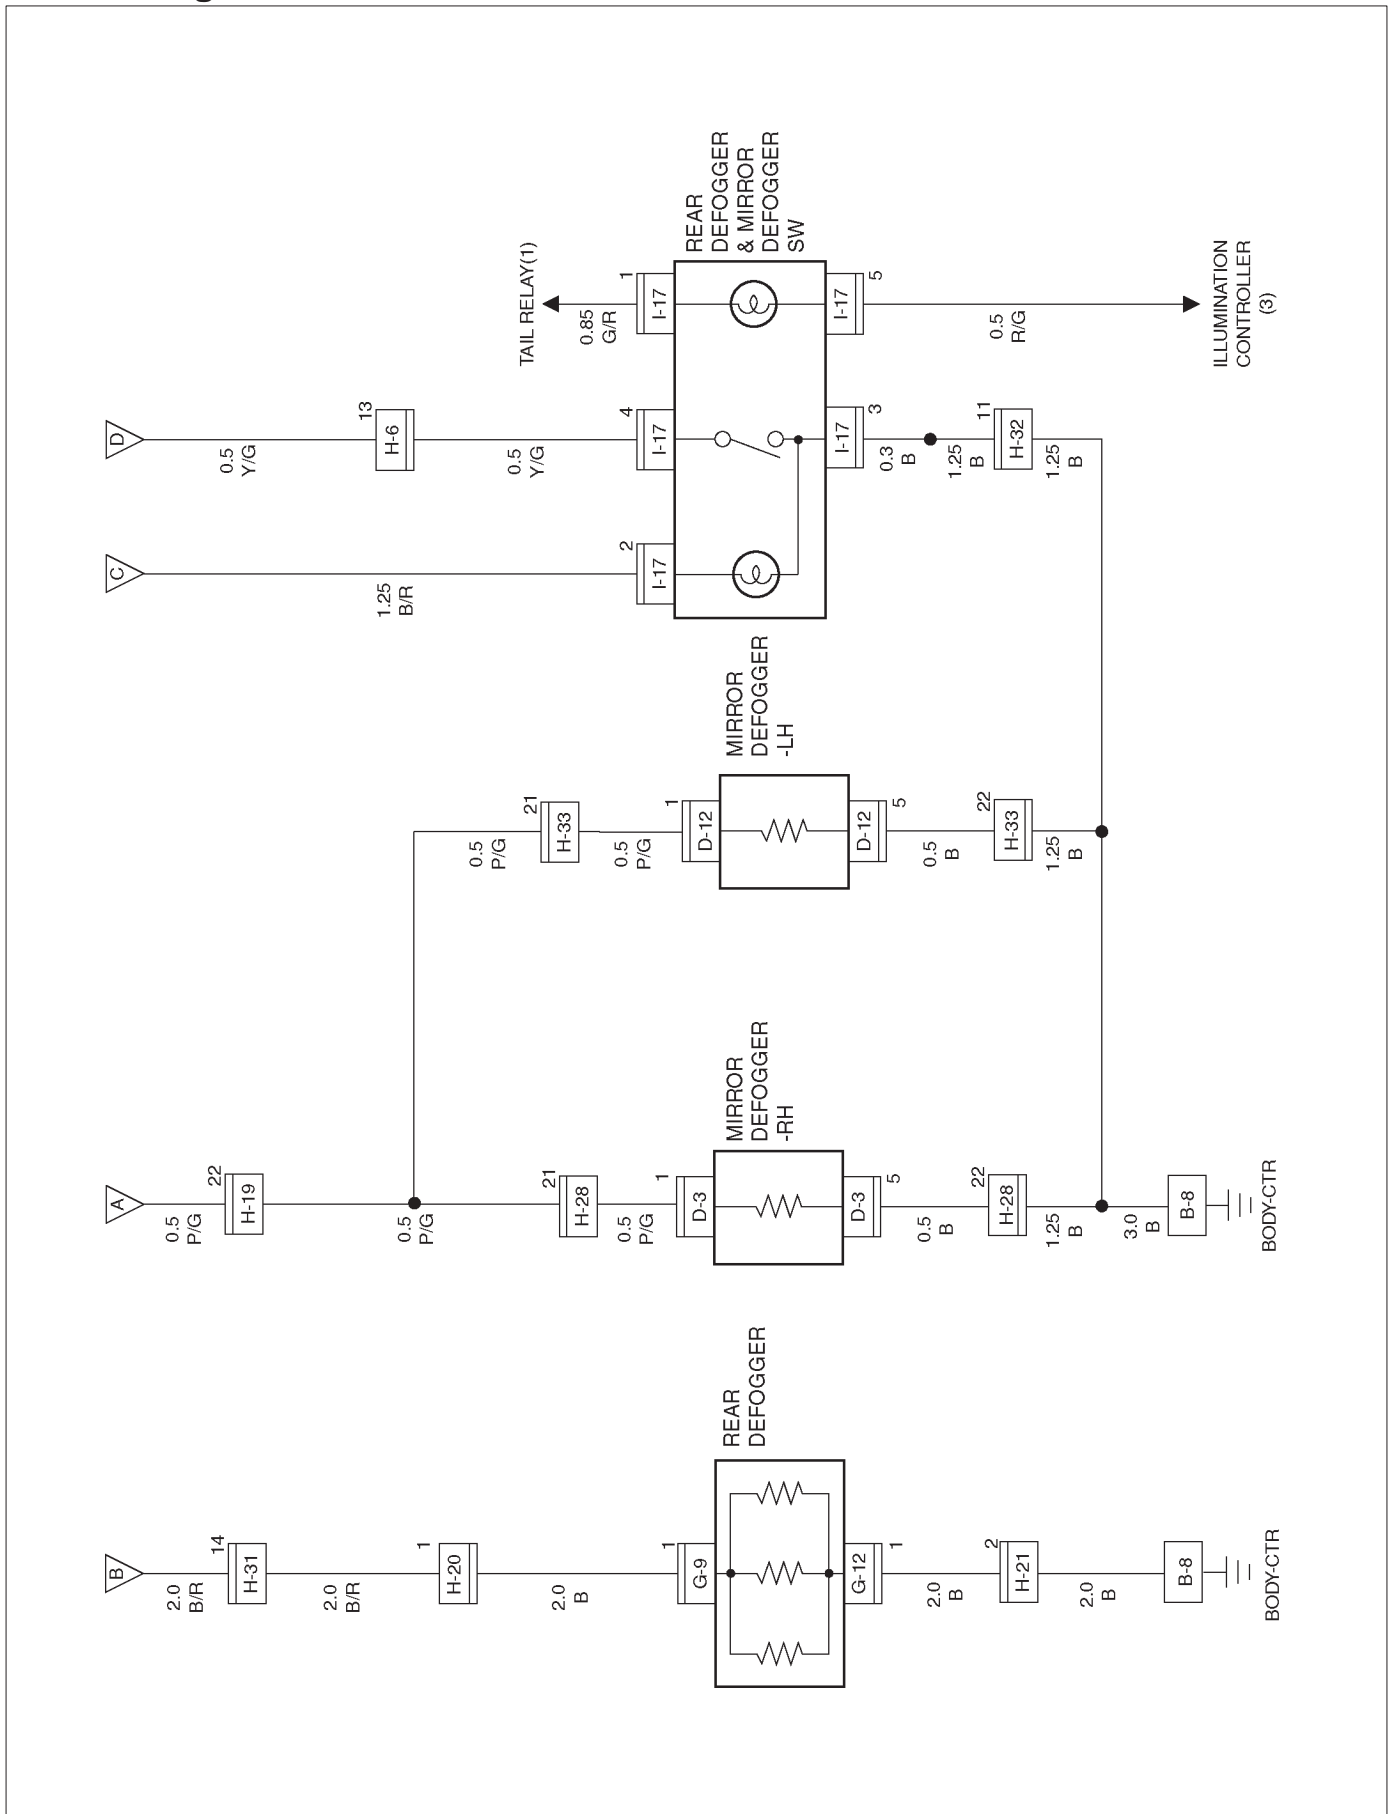

When the rear defogger and mirror defogger switch is turned on with the starter switch on, the rear defogger and mirror defogger relay is activated and the battery voltage is applied to the rear defogger and mirror defogger.

The PCM is provided with the timer. When the operation time of the timer elapses which has been set in advance, the rear defogger and mirror defogger relay is automatically deactivated and the rear defogger and mirror defogger is turned off.

Diagnosis

Rear Defogger Does Not Operate

Step	Action	Value(s)	Yes	No
1	Are the fuse C-9, C-10 and C-16 normal?	—	Go to Step 2	Replace the fuse(s)
2	Is B-8 grounded securely?	—	Go to Step 3	Ground it securely
3	Remove the rear defogger relay. Is the battery voltage applied between the rear defogger relay harness side connector X-18 terminal 2 and the ground?	Approx. 12V	Go to Step 5	Go to Step 4
4	Repair an open circuit between the battery and connector X-18 terminal 2. Is the action complete?	—	Go to Step 3	—
5	Turn the starter switch on. Is the battery voltage applied between harness side connector X-18 terminal 4 and the ground?	Approx. 12V	Go to Step 7	Go to Step 6
6	Repair an open circuit between the fuse C-16 and connector X-18 terminal 4. Is the action complete?	—	Go to Step 5	—
7	Disconnect the PCM connector E-21, E-22. Is there continuity between harness side connector X-18 terminal 3 and harness side connector E-22 terminal 44 (S44)?	—	Go to Step 9	Go to Step 8
8	Repair an open circuit between connector X-18 terminal 3 and connector E-22 terminal 44 (S-44). Is the action complete?	—	Go to Step 7	—
9	Is there continuity between harness side connector I-17 terminal 4 and connector E-22 terminal 21 (S21)?	—	Go to Step 11	Go to Step 10
10	Repair an open circuit between connector I-17 terminal 4 and connector E-22 terminal 21 (S21). Is the action complete?	—	Go to Step 9	—
11	Is there continuity between harness side connector I-17 terminal 3 and the ground?	—	Go to Step 13	Go to Step 12
12	Repair an open circuit between connector I-17 terminal 3 and the ground B-8. Is the action complete?	—	Go to Step 11	—
13	1. Reconnect the rear defogger relay. 2. Ground the PCM harness side connector E-22 terminal 44 (S44). Is the battery voltage applied between the rear defogger harness side connector G-9 terminal 1 and the ground?	Approx. 12V	Go to Step 14	Repair an open circuit between the fuse C-9 or C-10 and the rear defogger
14	Is there continuity between the rear defogger harness side connector G-12 terminal 1 and the ground?	—	Go to Step 16	Go to Step 15
15	Repair an open circuit between connector G-12 terminal 1 and the ground B-8. Is the action complete?	—	Go to Step 14	—

8D-156 WIRING SYSTEM

Step	Action	Value(s)	Yes	No
16	1. Reconnect the PCM connector E-21 and E-22. 2. Turn the rear defogger switch on. Is the battery voltage applied between the rear defogger harness side connector G-9 terminal 1 and the ground?	Approx. 12V	Go to Step 18	Go to Step 17
17	Replace the PCM. Is the action complete?	—	Verify repair	—
18	Repair broken heat wire or connector poor contact of the rear defogger. Is the action complete?	—	Verify repair	—

Rear Defogger Timer Does Not Function

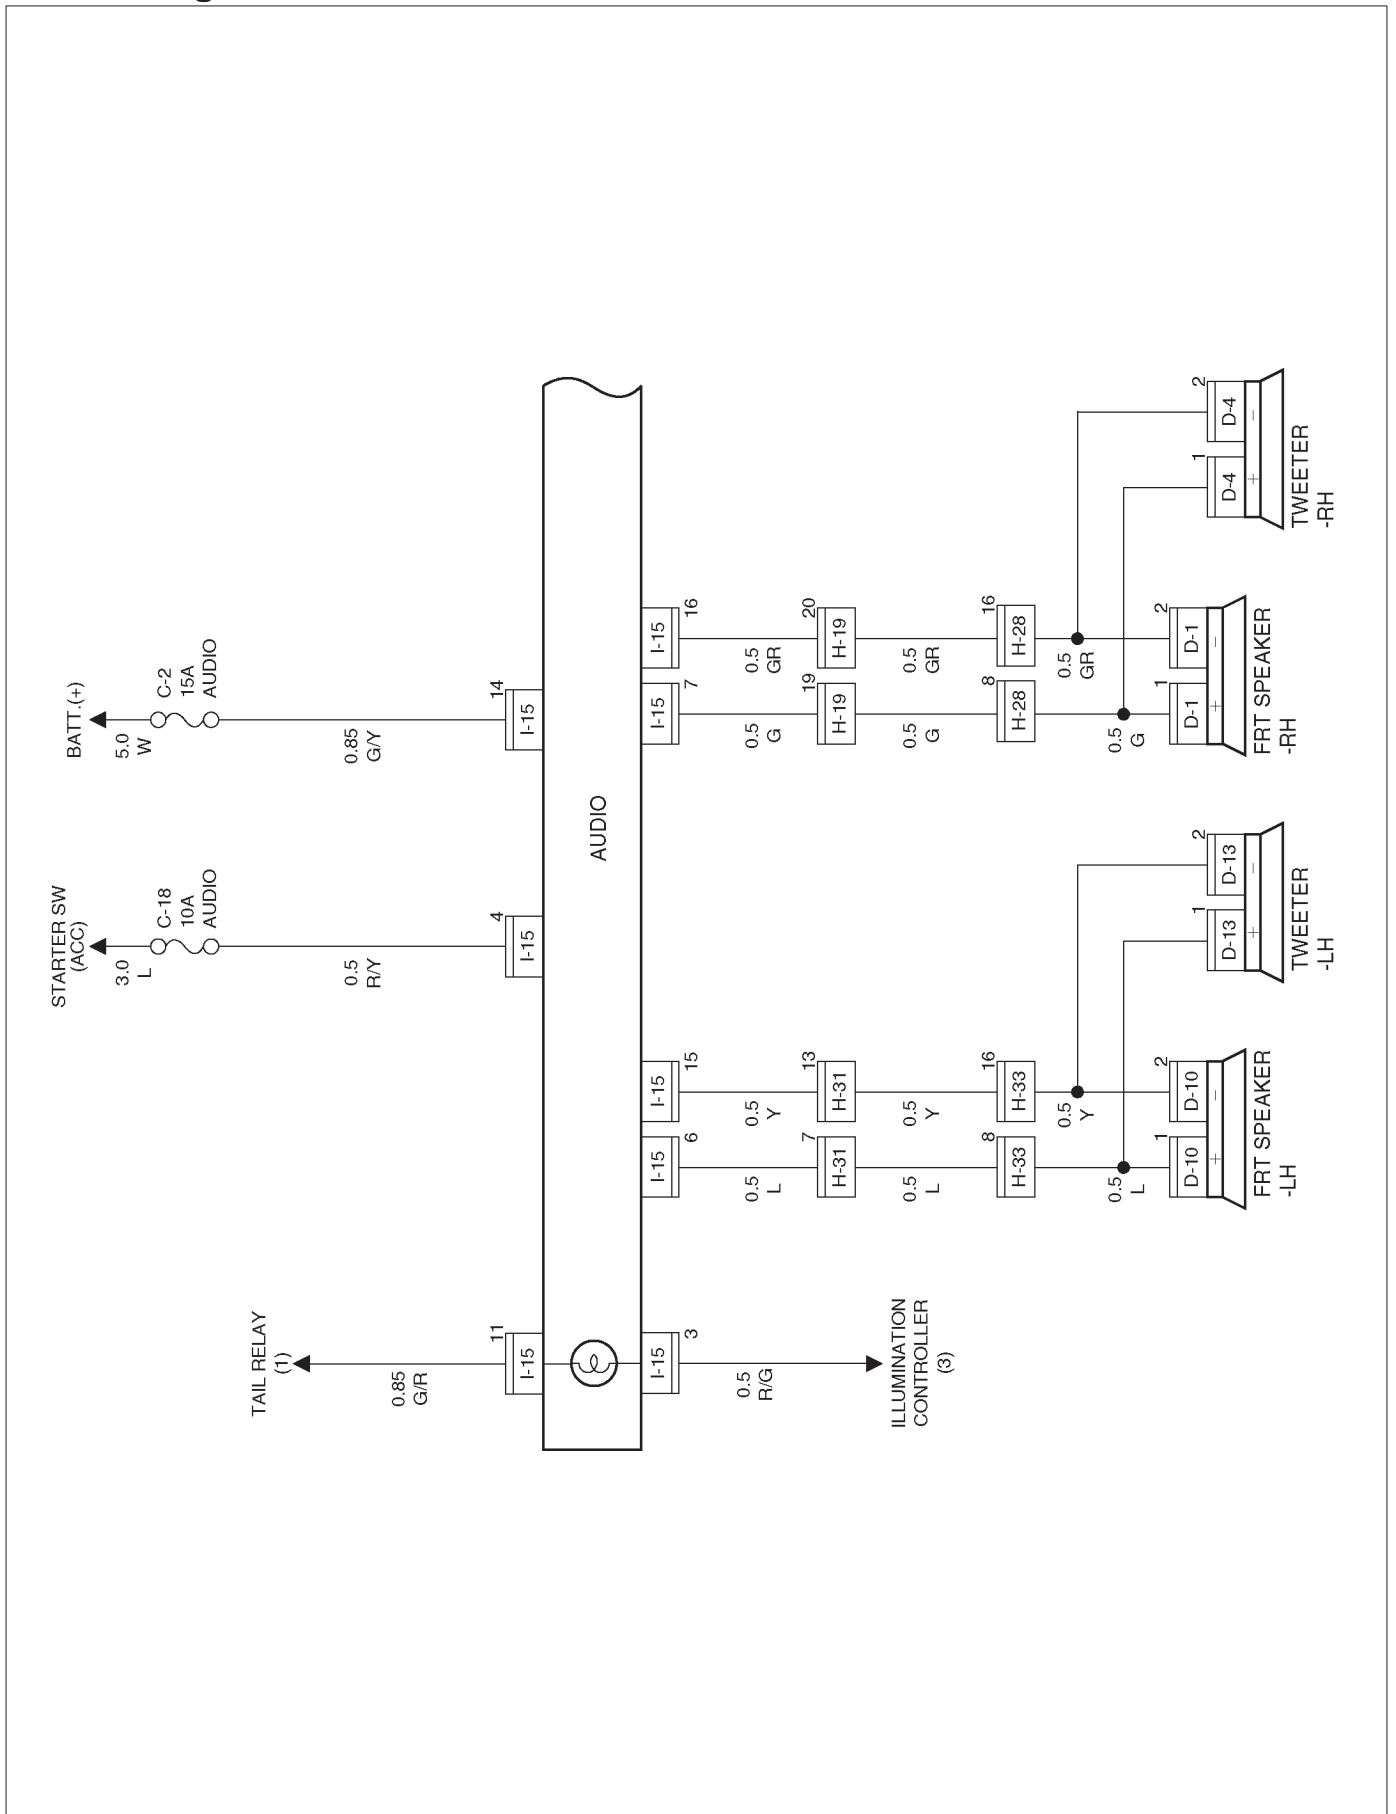

Step	Action	Value(s)	Yes	No
1	Replace the PCM. Is the action complete?	—	Verify repair	—

Audio

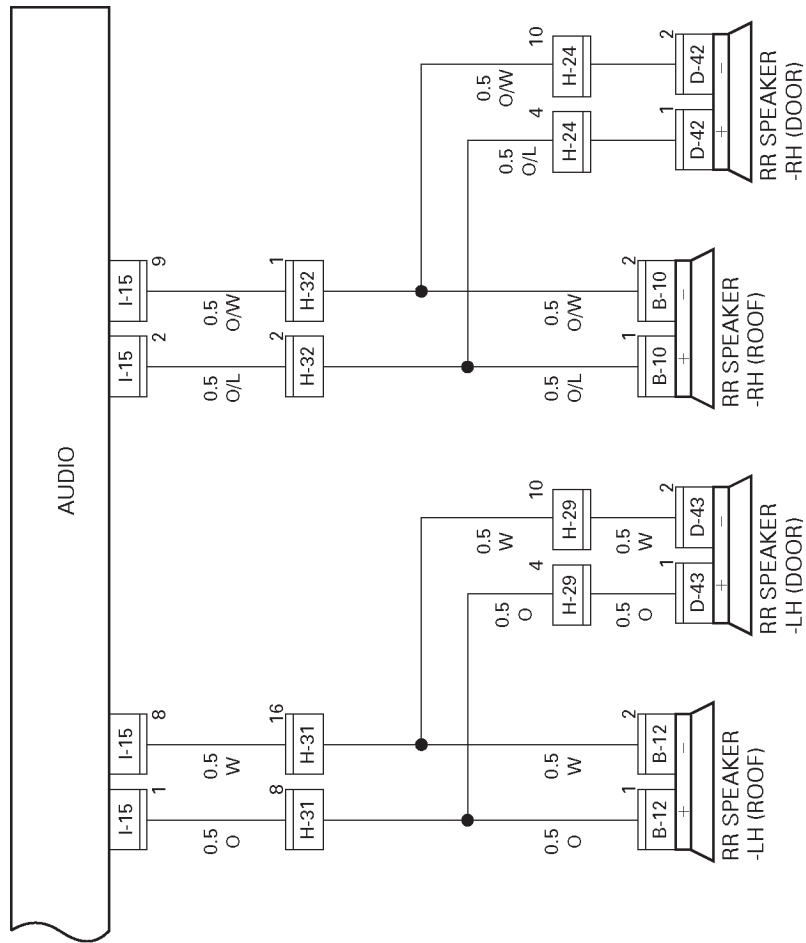

General Description

The audio circuit is designed for the current to flow through the receiver circuit when the radio switch is turned on with the starter switch in "ACC" or "ON". Current runs through the memory circuit of the audio regardless of the position of the starter switch.

Cigarette Lighter, Digital Clock and Accessory Socket

General Description

When the cigarette lighter is pushed in with the starter switch at either "ACC" or "ON" position, a circuit is formed in the cigarette lighter case to heat the lighter coil.

The cigarette lighter is sprung back to its original position after the lighter coil is heated.

Circuit Diagram

Diagnosis

Cigarette Lighter Does Not Work

Step	Action	Value(s)	Yes	No
1	Is the fuse C-19 normal?	—	Go to Step 2	Replace the fuse
2	Is B-8 grounded securely?	—	Go to Step 3	Ground it securely
3	1. Disconnect the cigarette lighter connector I-22. 2. Turn the starter switch to the ACC or ON position. Is the battery voltage applied between harness side connector I-22 terminal 1 and the ground?	Approx. 12V	Go to Step 5	Go to Step 4
4	Repair an open circuit between the fuse C-19 and connector I-22 terminal 1. Is the action complete?	—	Go to Step 3	—
5	Disconnect the cigarette lighter connector I-21. Is there continuity between harness side connector I-21 terminal 1 and the ground B-8?	—	Repair or replace the cigarette lighter assembly	Go to Step 6
6	Repair an open circuit between connector I-21 terminal 1 and the ground B-8. Is the action complete?	—	Verify repair	—

Cigarette Lighter Does Not Spring Out After Being Heated

Step	Action	Value(s)	Yes	No
1	Repair or replace the cigarette lighter. Is the action complete?	—	Verify repair	—

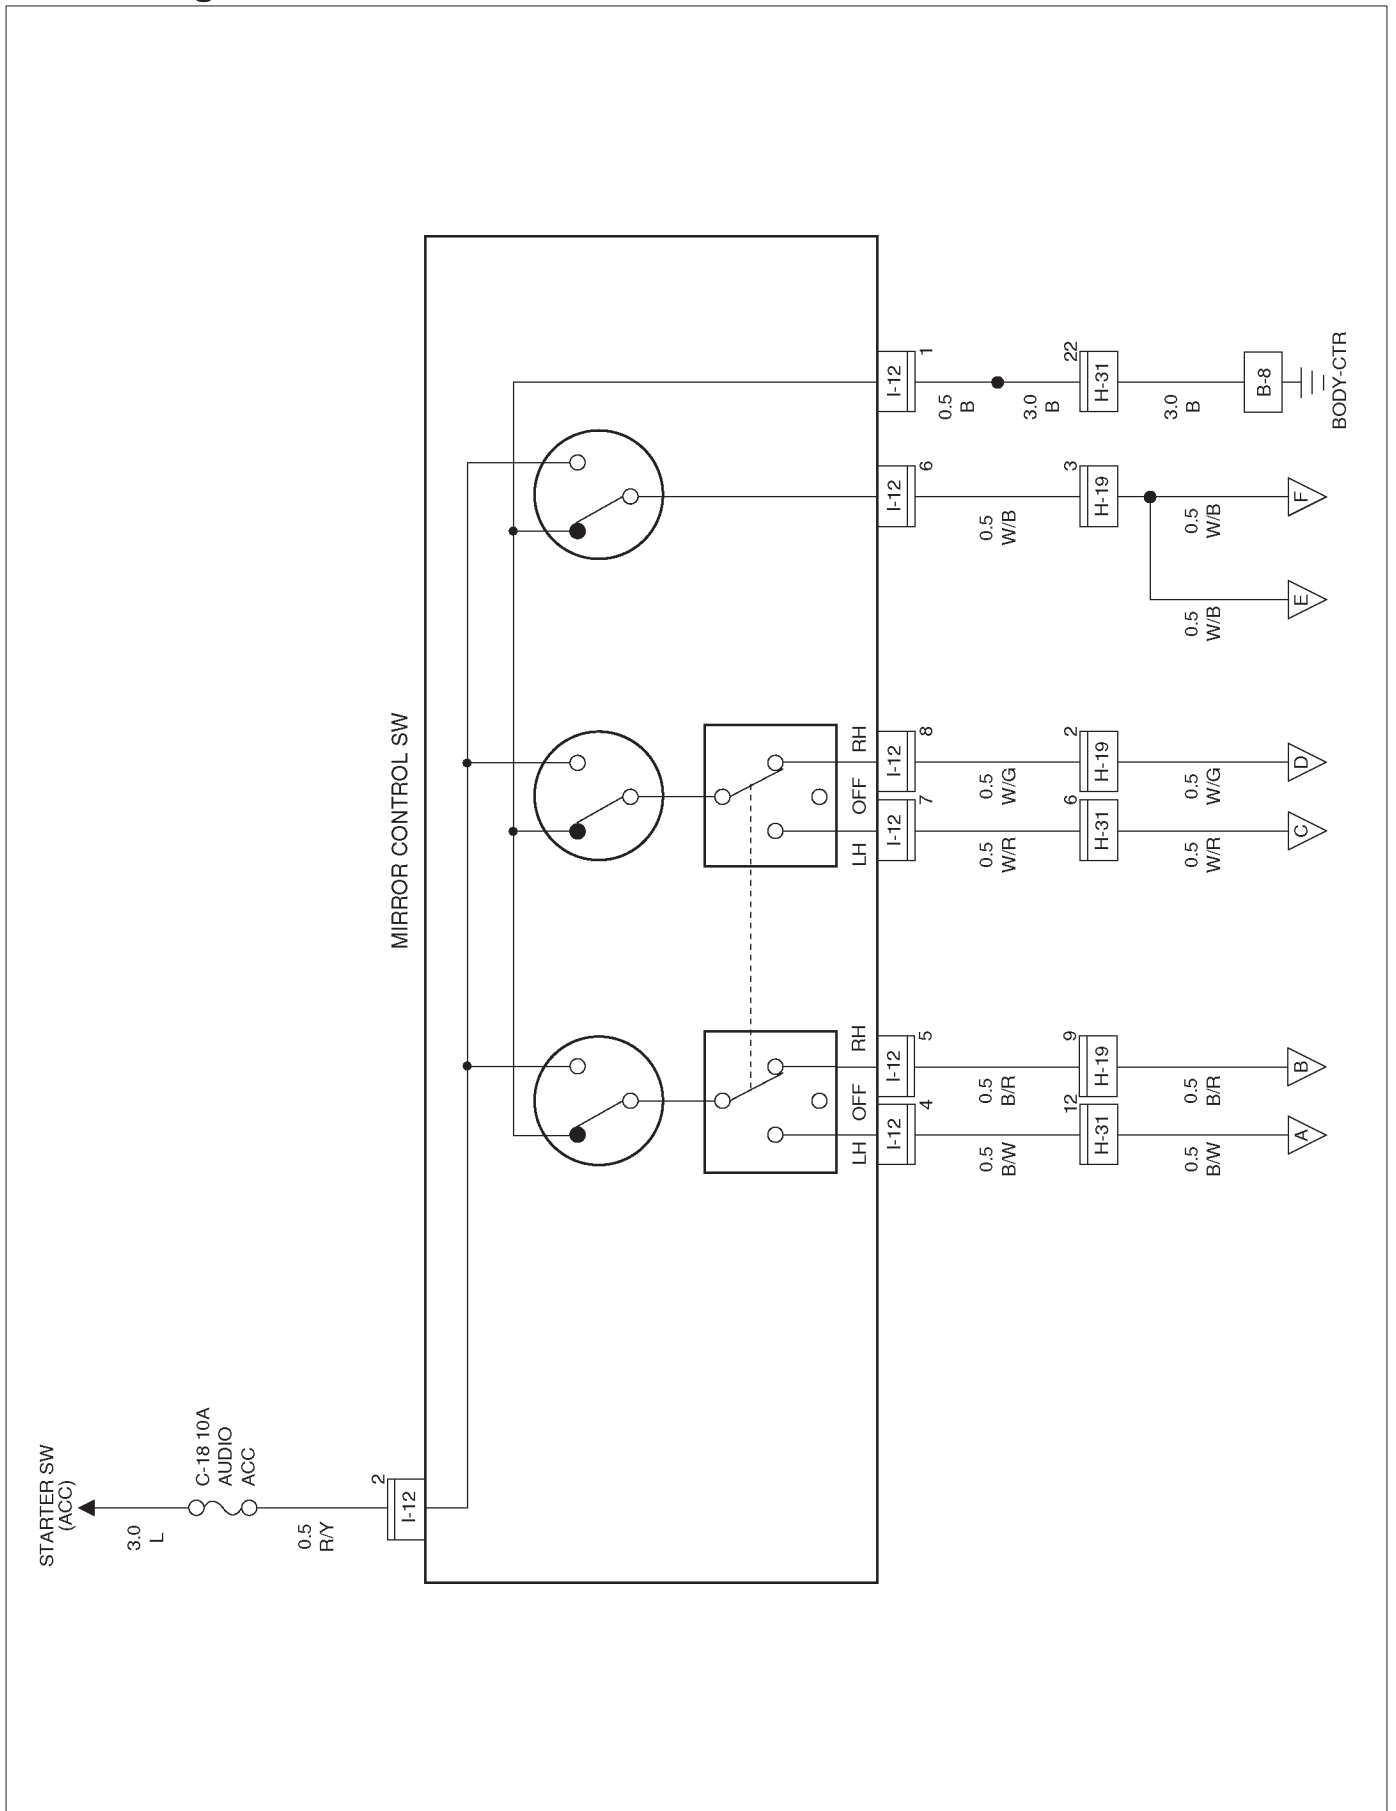

Power Door Mirror

General Description

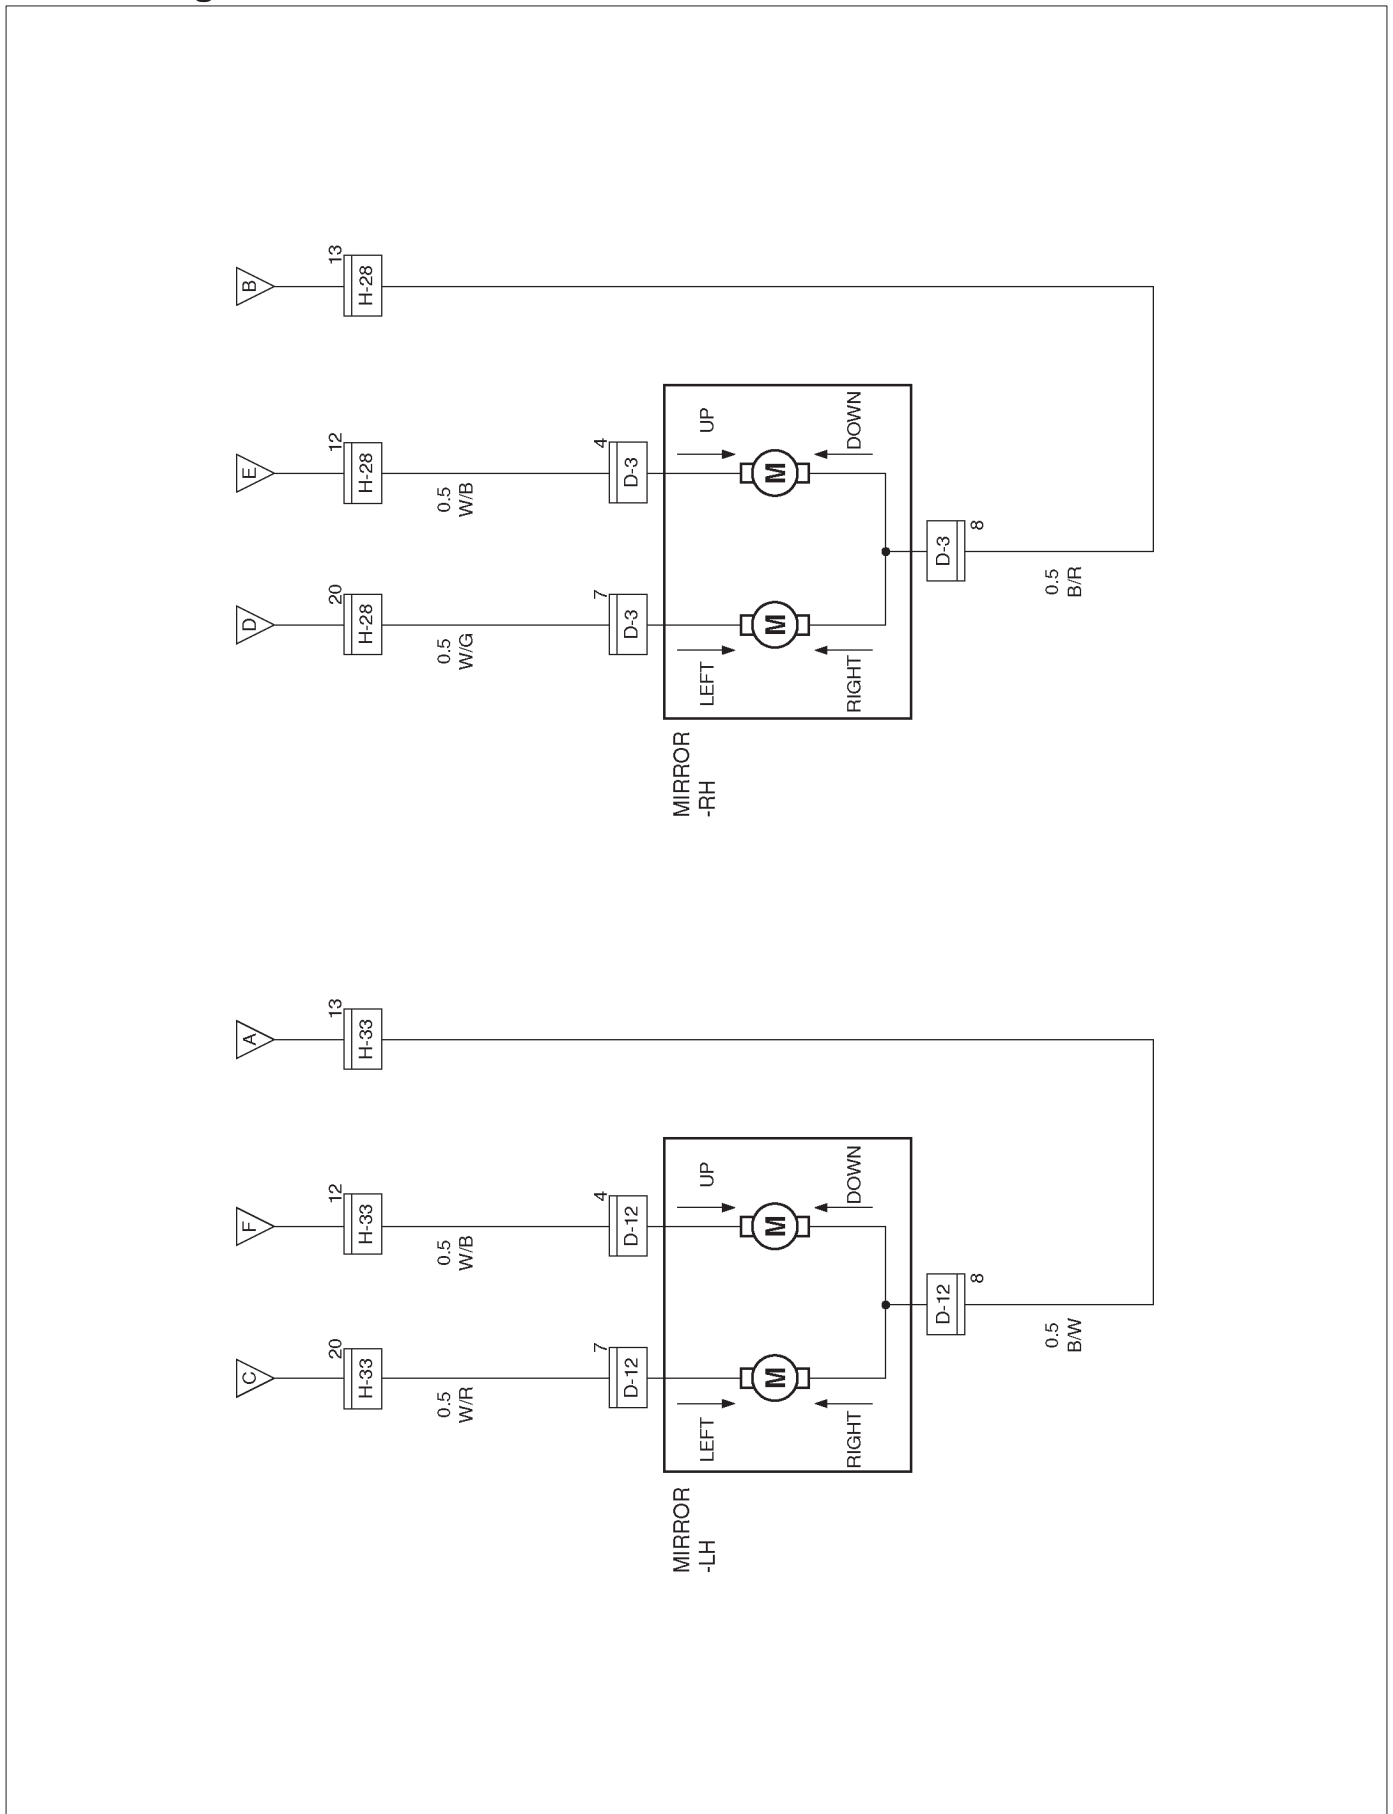

The system consists of the starter switch, the mirror control switch, and door mirrors on both sides.

When the mirror control switch is operated with the starter switch at either "ACC" or "ON" position, the motor in the door mirror (on either side) rotates to allow the horizontal and vertical adjustment of mirror angles.

Diagnosis

Mirrors On Both Sides Do Not Operate

Step	Action	Value(s)	Yes	No
1	Is the fuse C-18 normal?	—	Go to Step 2	Replace the fuse
2	Is B-8 grounded securely?	—	Go to Step 3	Ground it securely
3	Disconnect the mirror control switch connector I-12. Is the battery voltage applied between the harness side connector I-12 terminal 2 and the ground?	Approx. 12V	Go to Step 5	Go to Step 4
4	Repair an open circuit between the fuse C-18 and connector I-12 terminal 2. Is the action complete?	—	Go to Step 3	—
5	Is there continuity between the harness side connector I-12 terminal 1 and the ground?	—	Go to Step 7	Go to Step 6
6	Repair an open circuit between connector I-12 terminal 1 and the ground. Is the action complete?	—	Verify repair	—
7	Repair or replace the mirror control switch. Is the action complete?	—	Verify repair	—

Mirrors On the Left (or Right) Side Does Not Operate

Step	Action	Value(s)	Yes	No
1	1. Remove the mirror control switch. 2. Move the mirror select switch to the left side mirror (or right side mirror). Is there continuity between the switch side connector terminal 1, 4 and 7 (or 1, 5 and 8)?	—	Go to Step 2	Replace the mirror control switch
2	Repair an open circuit between connector I-12 terminal 4 and connector D-12 terminal 8 (or connector I-12 terminal 5 and connector D-3 terminal 8)? Is the action complete?	—	Verify repair	—

Mirrors On Both Sides Operate Only In The Vertical (Or Horizontal) Direction

Step	Action	Value(s)	Yes	No
1	Repair or replace the mirror control switch. Is the action complete?	—	Verify repair	—

Mirror On the Left (or Right) Side Operates Only In The Vertical (Or Horizontal) Direction

Step	Action	Value(s)	Yes	No
1	Does the mirror operate vertically?	—	Go to Step 2	Go to Step 3
2	1. Remove the mirror—LH (or ? RH). 2. Connect the battery positive terminal to the mirror side connector terminal 7, and battery negative terminal to mirror side terminal 8. Then connect the battery positive terminal to mirror side terminal 8, and negative terminal to mirror side terminal 7. Does the mirror operate horizontally?	—	Go to Step 4	Replace the mirror
3	1. Remove the mirror—LH (or ? RH). 2. Connect the battery positive terminal to the mirror side connector terminal 4, and battery negative terminal to mirror side terminal 8. Then connect the battery positive terminal to mirror side terminal 8, and negative terminal to mirror side terminal 4. Does the mirror operate vertically?	—	Go to Step 4	Replace the mirror
4	Repair an open circuit between connector I-12 terminal 7 or 8 and mirror connector terminal 7, or connector I-12 terminal 6 and mirror connector terminal 4. Is the action complete?	—	Verify repair	—

Keyless Entry

General Description

This circuit consists of the keyless entry control unit, the front door lock, & power window switch (RH), the starter switch, the dome light, the door switch and the tail gate switch and possible to lock/unlock each door by operation of transmitter. Basic function of system is as follows.

1. Lock/unlock function

When the Keyless entry control unit receives the signal from the transmitter, the control unit sends the locker unlock signal to the front door lock and power window switch (RH).

Function code (lock or unlock) and proper ID code for each vehicle are added to the signal. But, when starter switch is on or any of the doors opens, lock/unlock function is not unable to work.

2. Answer back function

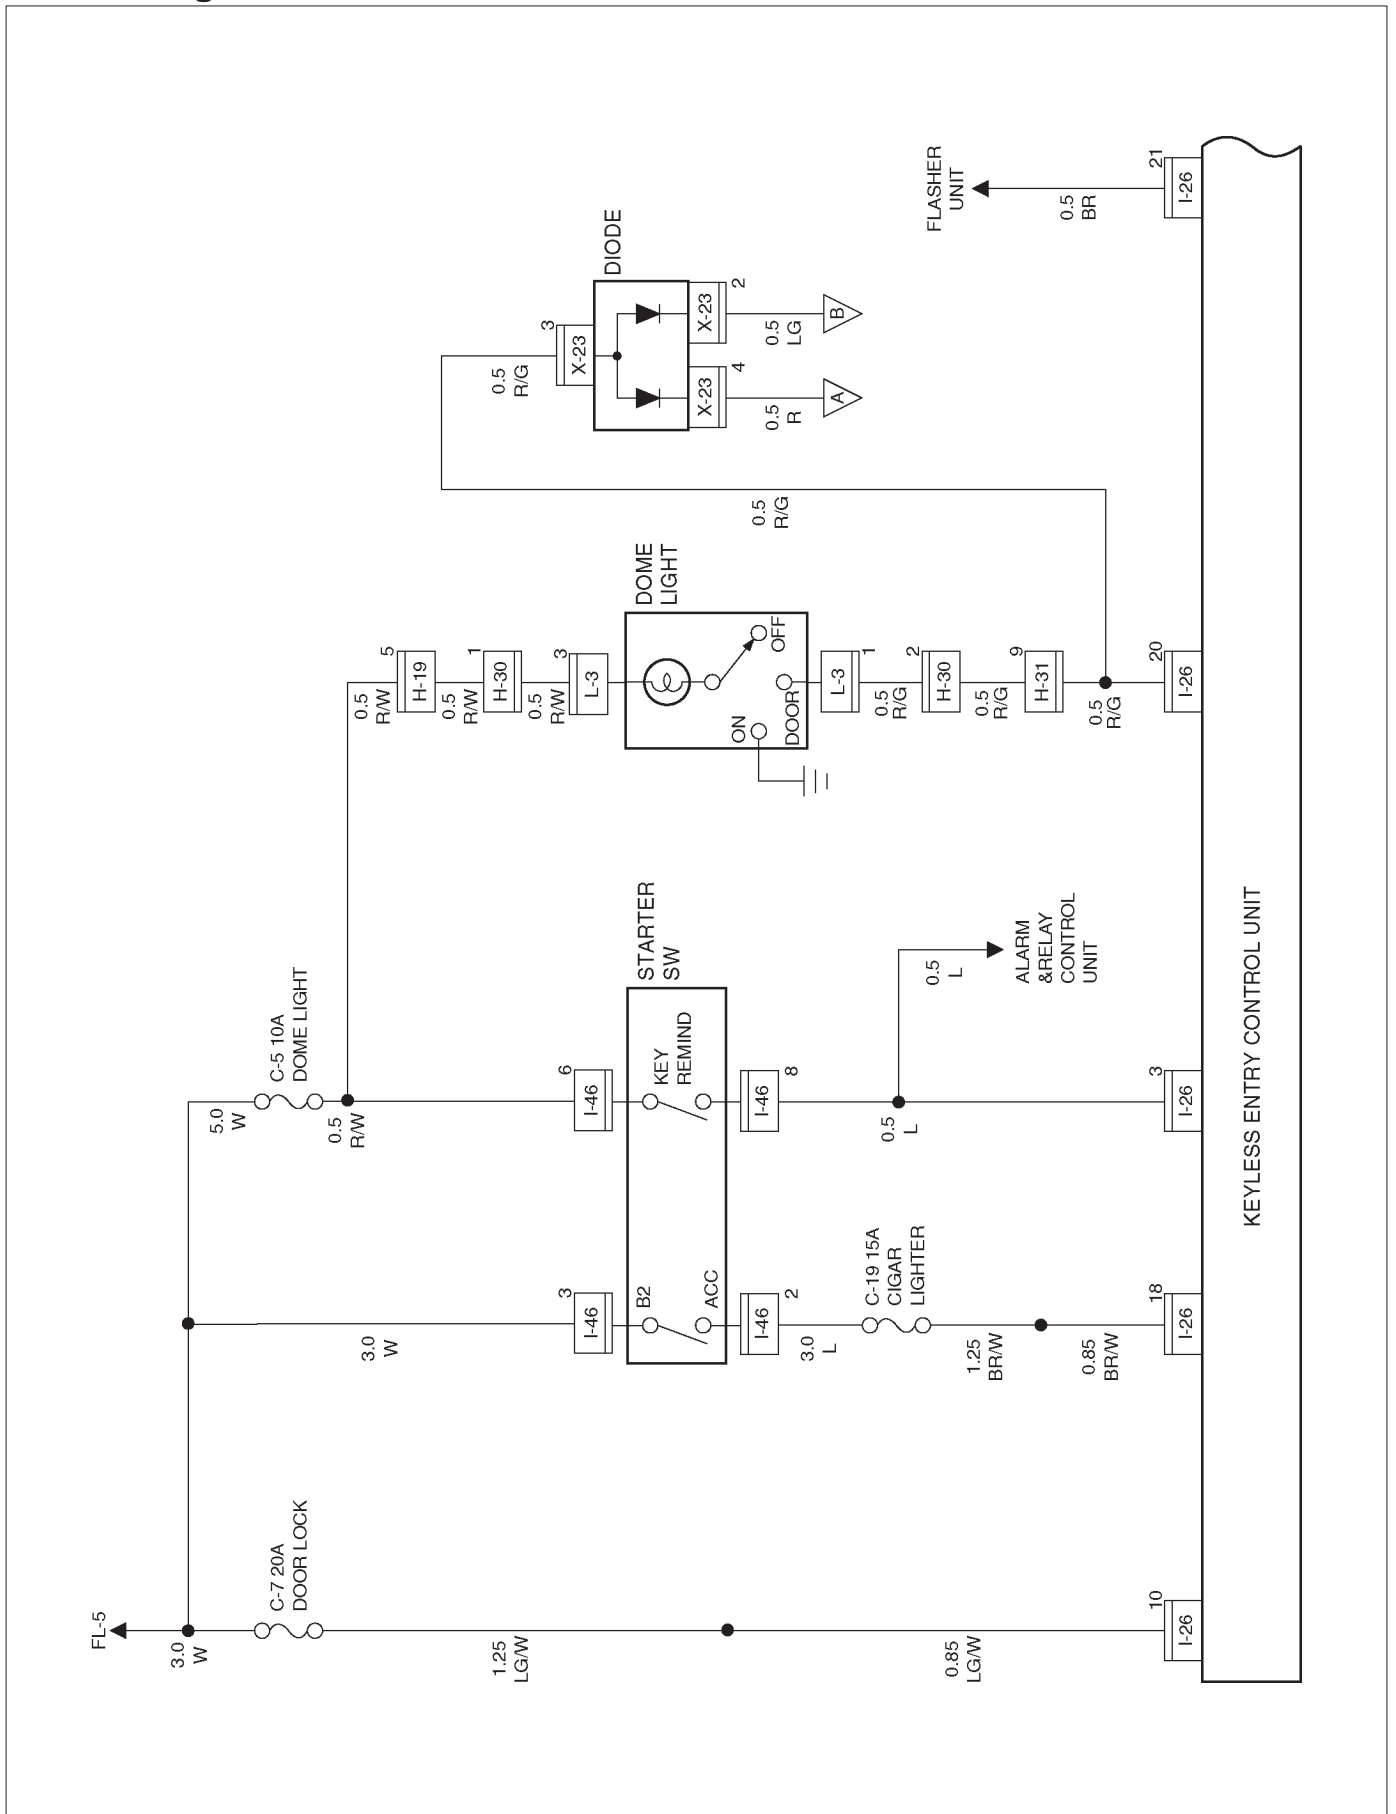

When receiving the signal from the transmitter, the keyless entry control unit responds by using the dome light. In case of being locked, the keyless entry control unit turns on the dome light at two times (about 0.5 second at each time). In case of being unlocked, it turns on the dome light at one time (about 3 seconds).

3. Autolock function

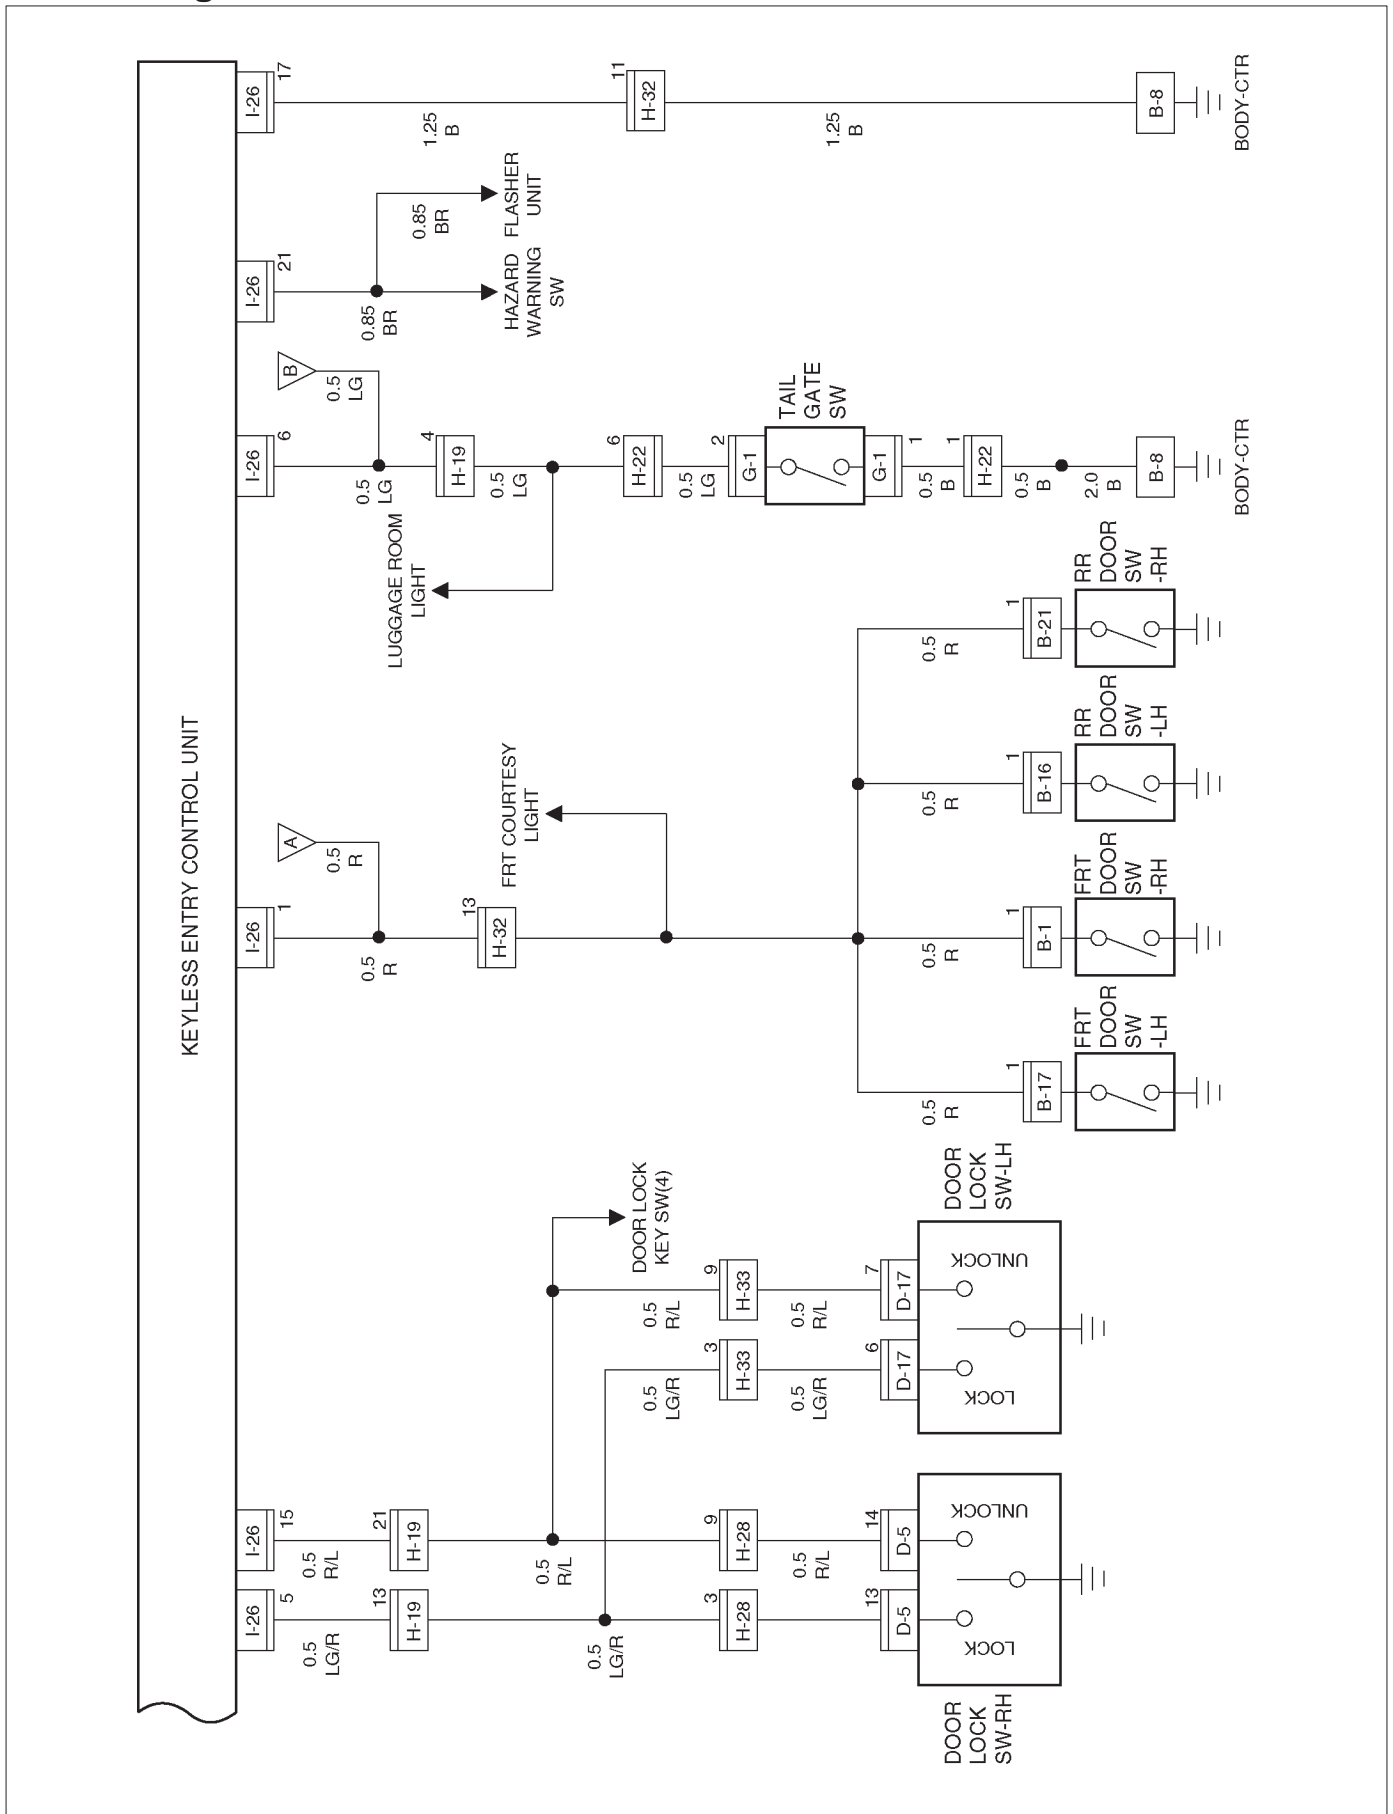

After unlock function is done, in case of effecting one of following conditions within about 30 seconds, the keyless entry control unit automatically sends the lock signal to lock each door.

- (1) The doors are closed.
- (2) Starter key is not inserted
- (3) The lock operation is not done by transmitter.

Keyless Entry System

ID Code Registration

This procedure registers a new ID code. When total number of registered ID codes and newly registered ID code exceed four, they are erased in order of older one.

Step	Action	Value(s)	Yes	No
1	1. Confirm that all the doors are closed and unlocked. 2. Open the driver's side door. 3. Insert the key into the starter switch. Is the action complete?	—	Go to Step 2	Go to Step 1
2	Turn the starter switch to ACC position and then to OFF position three times. NOTE: This step must be carried out within five seconds after step 1. Is the action complete?	—	Go to Step 3	Go to Step 1
3	Close the driver's side door and then open it two times. NOTE: This step must be carried out within ten seconds after step 2. Is the action complete?	—	Go to Step 4	Go to Step 1
4	1. Turn the starter switch to ACC position and then to OFF position three times. 2. Close the driver's side door and then open it. NOTE: This step must be carried out within ten seconds after step 3. Is the action complete?	—	Go to Step 5	Go to Step 1
5	The control unit lock and unlocks the doors two times. Does the control unit work normally?	—	Go to Step 6	Go to Step 1
6	Operate the lock or unlock button of the transmitter. NOTE: This step must be carried out within twenty seconds after step 5. Is the action complete?	—	Go to Step 7	Go to Step 1
7	The control unit locks and unlock the doors two times. Does the control unit work normally?	—	Go to Step 8	Go to Step 1
8	Operate the lock or unlock button of the transmitter. NOTE: This step must be carried out within twenty seconds after step 7. Is the action complete?	—	Go to Step 9	Go to Step 1
9	The control unit compares the two codes sent from the transmitter. If the code succeeds in registration, the control unit locks and unlocks the doors one time. If the two codes are different from each other or fails in registration, the control unit locks and unlocks the doors three times. NOTE: In any case, this procedure is finished.	—	Go to Step 1	Go to Step 1

Meter and Warning/Indicator Light

General Description

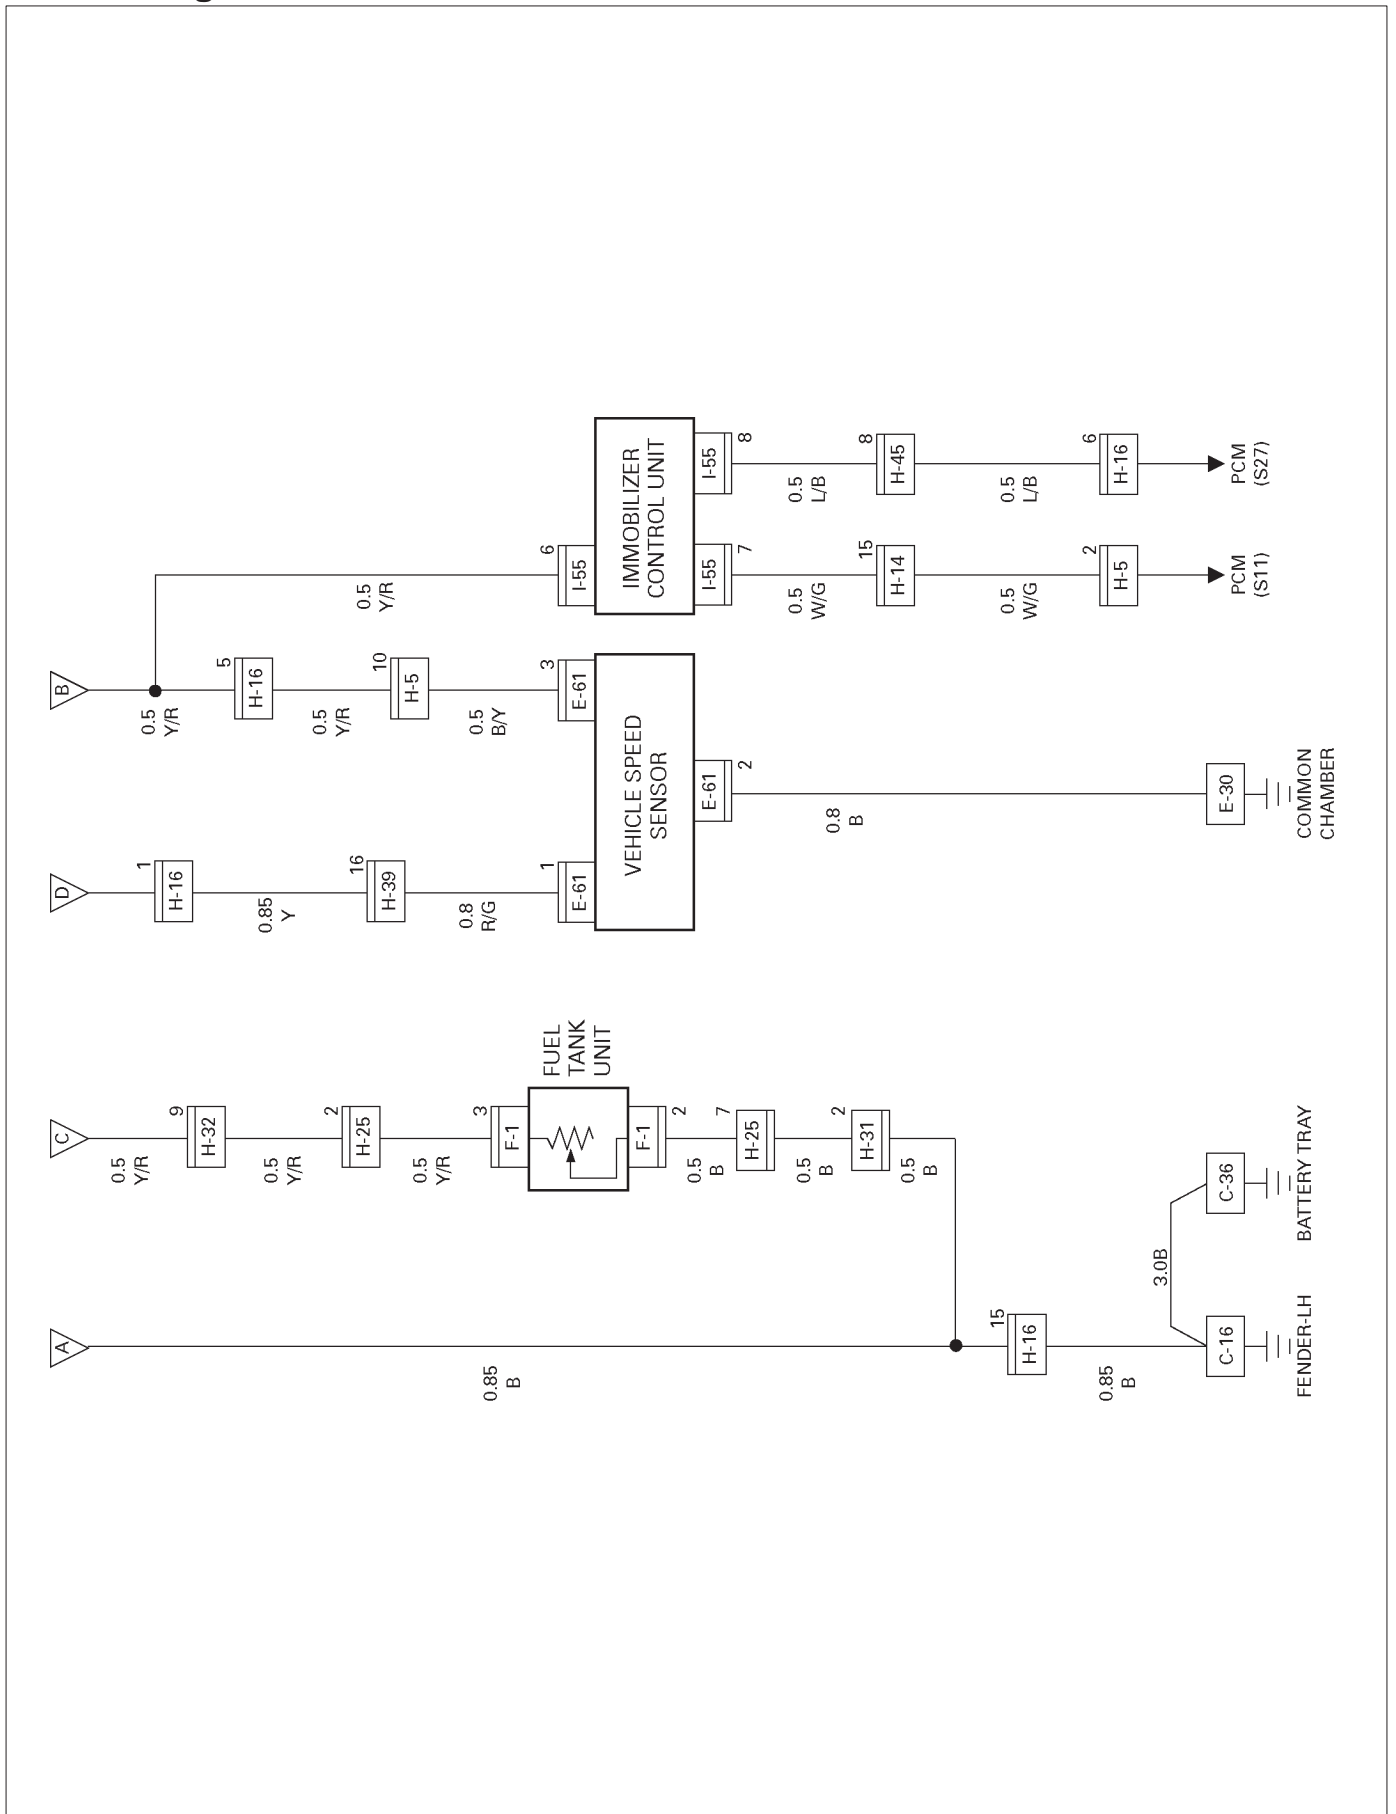

The circuit consists of the starter switch, meter assembly, vehicle speed sensor, alarm & relay control unit, lighting switch, turn signal switch, engine coolant temperature unit, oil pressure unit, Powertrain Control Module, fuel tank unit, 4WD control unit, oil pressure switch, parking brake switch, brake fluid switch, seat belt switch, illumination controller.

The meter ASM contains the speedometer, tachometer, voltmeter, engine coolant temperature gauge, oil pressure gauge, fuel gauge and warning/indicator lights. The meter warning/indicator lights and their bulb sockets are a unit, they are installed from the back of the speedometer assembly.

Diagnosis

Speedometer and Odometer Do Not Function

Step	Action	Value(s)	Yes	No
1	Is C-16 grounded securely?	—	Go to Step 2	Ground it securely
2	Disconnect the vehicle speed sensor connector E-61. Is there continuity between harness side connector E-61 terminal 2 and the ground?	—	Go to Step 4	Go to Step 3
3	Repair an open circuit between connector E-61 terminal 2 and the ground C-16. Is the action complete?	—	Go to Step 2	—
4	1. Disconnect the meter connector I-10. 2. Turn the starter switch on. Is the battery voltage applied between harness side connector E-61 terminal 1 and the ground?	Approx. 12V	Go to Step 6	Go to Step 5
5	Repair an open circuit between fuse C-11 and connector E-61 terminal 1. Is the action complete?	—	Go to Step 4	—
6	Disconnect the meter connector I-9. Is there continuity between harness side connector I-9 terminal 7 and harness side connector E-61 terminal 3?	—	Go to Step 8	Go to Step 7
7	Repair an open circuit between connector I-9 terminal 7 and connector E-61 terminal 3. Is the action complete?	—	Verify repair	—
8	1. Connector a resistance of 1.3 to 5K ohm (1.4W or more) between harness side connector I-10 terminal 14 and harness side connector I-9 terminal 7. 2. Install a speedometer tester. 3. Check the waveform at the time when the vehicle speed is 60 Km/h with a oscilloscope. NOTE: Normal waveform appears between approx. 12V and 2V with cycles of 23.6 m sec.. Is the waveform normal?	—	Replace the meter assembly	Replace the vehicle speed sensor

Speedometer Does Not Function (Odometer is Normal)

Step	Action	Value(s)	Yes	No
1	Replace the meter assembly. Is the action complete?	—	Verify repair	—

Odometer Does Not Function (Speedometer is Normal)

Step	Action	Value(s)	Yes	No
1	Replace the meter assembly. Is the action complete?	—	Verify repair	—

Speedometer Pointer Fluctuates (May be Wide Fluctuation)

Step	Action	Value(s)	Yes	No
1	NOTE: Refer to the step 8 of diagnosis procedure for Speedometer and Odometer Does Not Function in this section. Is the vehicle speed sensor signal normal?	—	Replace the meter assembly	Go to step 2
2	Repair a poor connections of the connectors or a failure in the circuit between connector I-9 terminal 7 and connector E-61 terminal 3. Is the action complete?	—	Verify repair	—

Speedometer Pointer Jumps Erratically

Step	Action	Value(s)	Yes	No
1	NOTE: Refer to the step 8 of diagnosis procedure for Speedometer and Odometer Does Not Function in this section. Is the vehicle speed sensor signal normal?	—	Replace the meter assembly	Go to step 2
2	Repair a poor connections of the connectors or a failure in the circuit between connector 1-9 terminal 7 and connector E-61 terminal 3. Is the action complete?	—	Verify repair	—

Tachometer Does Not Function

Step	Action	Value(s)	Yes	No
1	1. Disconnect the meter connector I-9. 2. Check the waveform of terminal 6 when the engine revolution is 3000 rpm with a oscilloscope. NOTE: Normal waveform appears between 4.3V and 0.4V with cycles of 6.7 m sec.. Is the waveform normal?	—	Replace the meter assembly	Go to step 2
2	Is the circuit between connector I-9 terminal 6 and the PCM connector E-21 terminal 7(F7) normal?	—	Replace the PCM	Repair the circuit

Tachometer Pointer Fluctuates (May Be Wide Fluctuation)

Step	Action	Value(s)	Yes	No
1	NOTE: Refer to the step 1 of diagnosis procedure for Tachometer Does Not Function in this section. Is the waveform normal?	—	Replace the meter assembly	Go to step 2
2	Is the circuit between connector I-9 terminal 6 and the PCM connector E-21 terminal 7(F7) normal?	—	Replace the PCM	Repair the circuit

Tachometer Pointer Jumps Erratically

Step	Action	Value(s)	Yes	No
1	NOTE: Refer to the step 1 of diagnosis procedure for Tachometer Does Not Function in this section. Is the waveform normal?	—	Replace the meter assembly	Go to step 2
2	Is the circuit between connector I-9 terminal 6 and the PCM connector E-21 terminal 7(F7) normal?	—	Replace the PCM	Repair the circuit

Engine Coolant Temperature (ECT) Gauge Pointer Does Not Move

Step	Action	Value(s)	Yes	No
1	Repair or replace the PCM, the ECT sensor, or the circuits between the PCM and the ECT sensor, if necessary. NOTE: Refer to PCM Diagnostic Trouble Codes in Driveability and Emission section. Is the action complete?	—	Go to step 2	—
2	Does the ECT gauge work normally?	—	—	Go to step 3
3	Disconnect the meter and the PCM connector. Is there continuity between harness side connector I-10 terminal 30 and connector E-22 terminal 47 (S47)?	—	Replace the meter assembly	Repair an open circuit

Engine Coolant Temperature (ECT) Gauge Reading is Too Low

Step	Action	Value(s)	Yes	No
1	Repair or replace the PCM, the ECT sensor, or the circuits between the PCM and the ECT sensor, if necessary. NOTE: Refer to PCM Diagnostic Trouble Codes in Driveability and Emission section. Is the action complete?	—	Go to Step 2	—
2	Does the ECT gauge work normally?	—	—	Go to Step 3
3	Replace the meter assembly. Is the action complete?	—	Verify repair	—

Engine Coolant Temperature (ECT) Gauge Pointer Overshoots (or Goes Up To the "H" Range)

Step	Action	Value(s)	Yes	No
1	Repair or replace the PCM, the ECT sensor, or the circuits between the PCM and the ECT sensor, if necessary. NOTE: Refer to PCM Diagnostic Trouble Codes in Driveability and Emission section. Is the action complete?	—	Go to Step 2	—
2	Does the ECT gauge work normally?	—	—	Go to Step 3
3	Is there a short circuit between connector I-10 terminal 30 and connector E-22 terminal 47 (S47)?	—	Repair a short circuit	Replace the meter assembly

Fuel Gauge Needle Does Not Move

Step	Action	Value(s)	Yes	No
1	Is C-16 grounded securely?	—	Go to step 2	Ground it securely
2	Disconnect the fuel tank unit connector F-1. Is there continuity between the harness side connector F-1 terminal 2 and the ground?	—	Go to step 4	Go to step 3
3	Repair an open circuit between connector F-1 terminal 2 and the ground C-16. Is the action complete?	—	Verify repair	—
4	1. Connect a 3.4W bulb between the harness side connector F-1 terminal 3 and the ground. 2. Turn the starter switch on. Does the fuel gauge needle fluctuate after about 90 seconds?	—	Replace the fuel tank unit	Go to step 5
5	Disconnect the meter connector I-2. Is there continuity between the harness side connector I-2 terminal 3 and connector F-1 terminal 3?	—	Replace the meter assembly	Go to step 6
6	Repair an open circuit between the meter assembly and the fuel tank unit. Is the action complete?	—	Verify repair	—

Even the Tank is Filled Up With Fuel, The Needle Does Not Reach "F"

Step	Action	Value(s)	Yes	No
1	Disconnect and connect the fuel tank unit connector F-1 several times. Does the indication of the fuel gauge vary?	—	Go to step 2	Go to step 3
2	Repair a poor connection of the fuel tank unit connector F-1. Is the action complete?	—	Verify repair	—
3	1. Disconnect the fuel tank unit connector F-1. 2. Connect the harness side connector F-1 terminal 2 and 3 with a lead wire. 3. Turn the starter switch on. Does the fuel gauge needle overshoot to "F" after about 5 minutes?	—	Repair or replace the fuel tank unit	Replace the meter assembly

Even When The Tank Is Not Filled With Fuel, The Needle Overshoots To "F"

Step	Action	Value(s)	Yes	No
1	1. Disconnect the fuel tank unit connector F-1. 2. Turn the starter switch on. Does the needle point to "E"?	—	Replace the fuel tank unit	Go to step 2
2	Is there a short circuit between the meter connector I-2 terminal 3 and the fuel tank unit connector F-1 terminal 3?	—	Repair a short circuit	Replace the meter assembly

Heater and Air Conditioning (Manual)

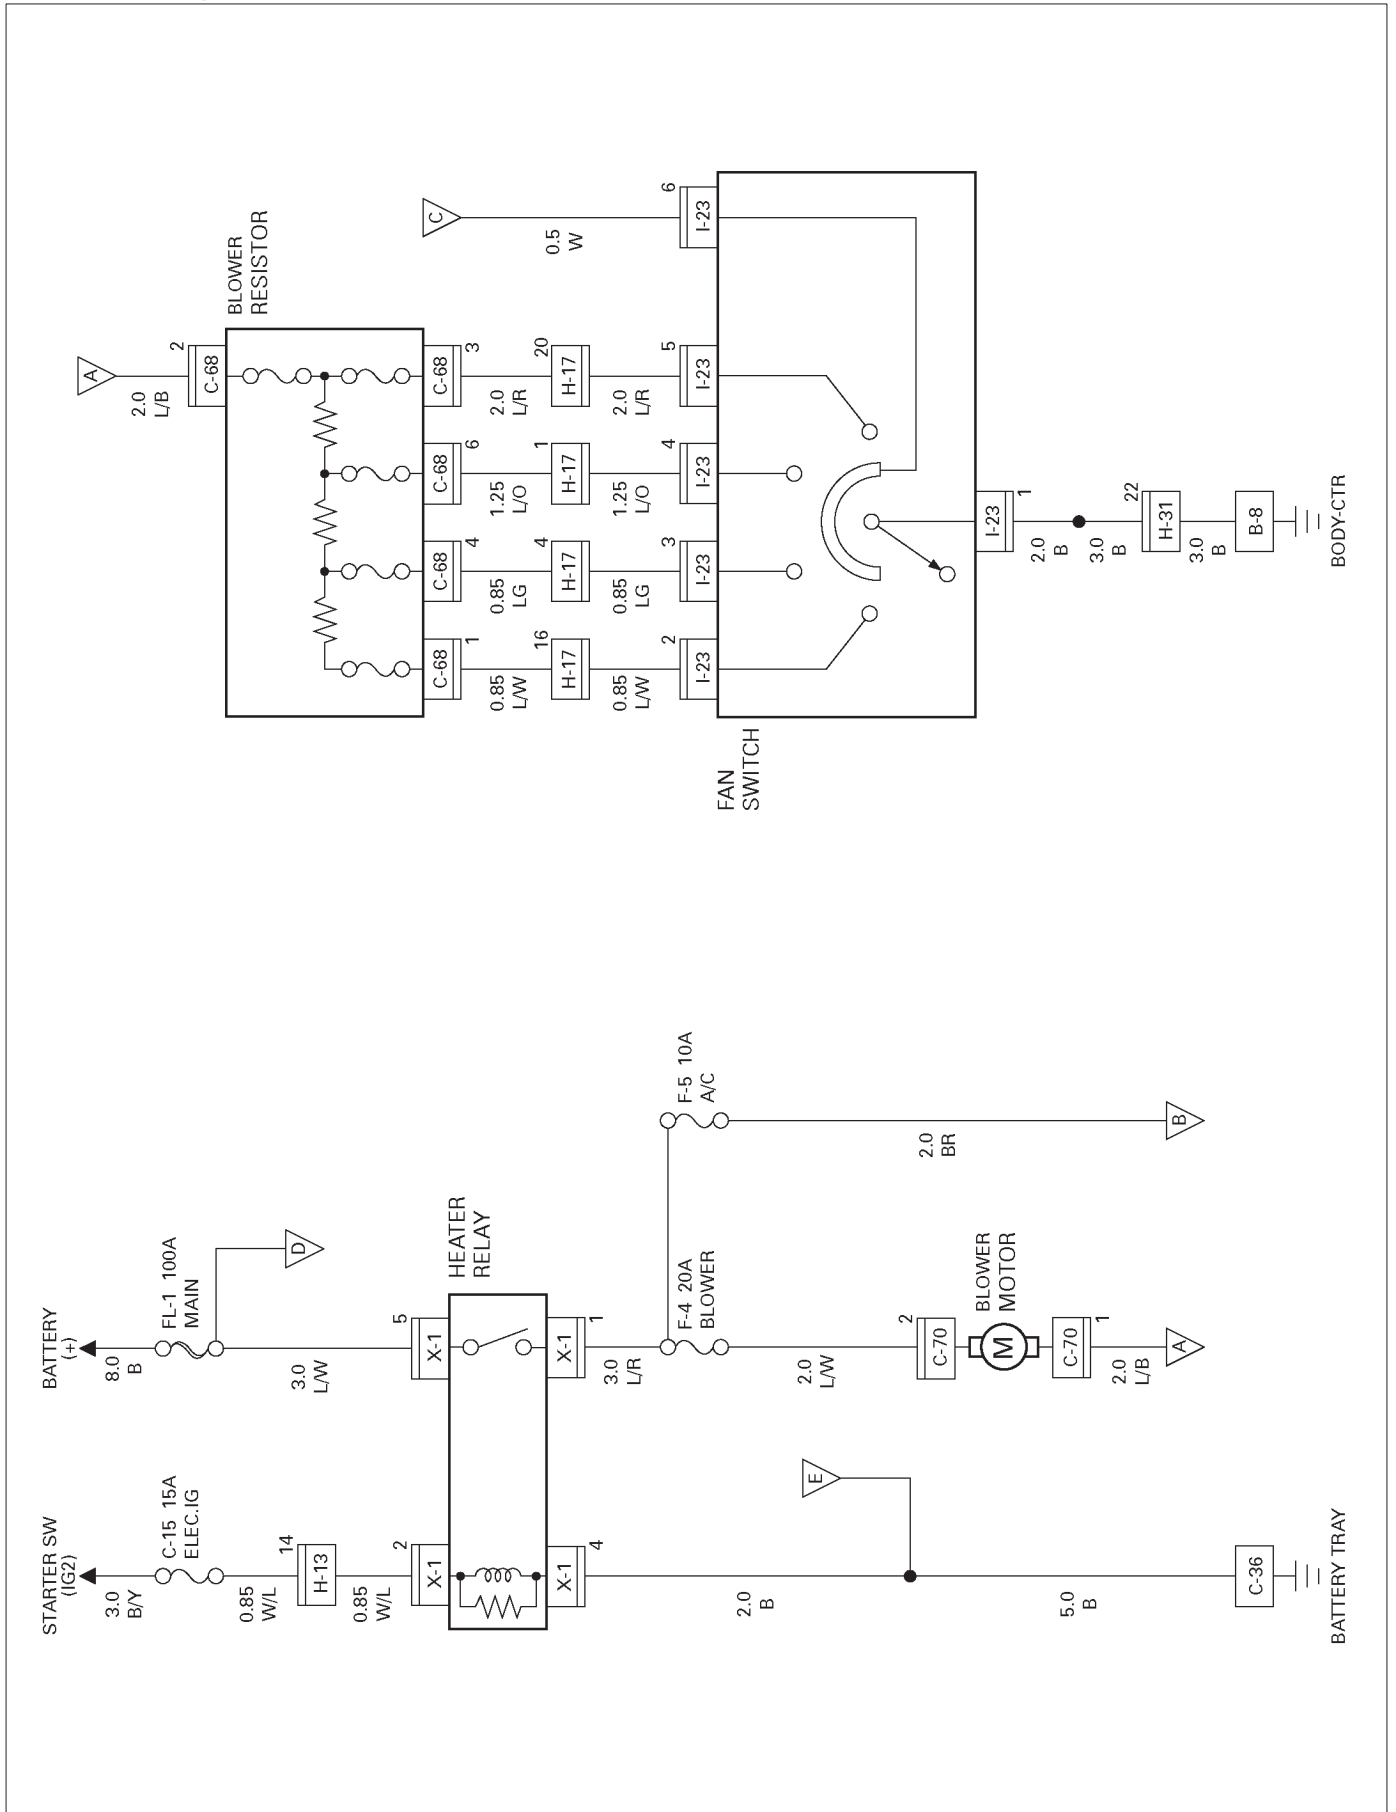

General Description

The heater and air conditioning system consists of pressure switch, A/C switch, electronic thermostat, blower motor, fan switch, magnetic clutch for A/C compressor, blower resistor, relays and PCM. Basically the air conditioning system works while the A/C switch and the fan switch are turned on, and stops working when the pressure switch turns off or the electronic thermostat cuts off the circuit.

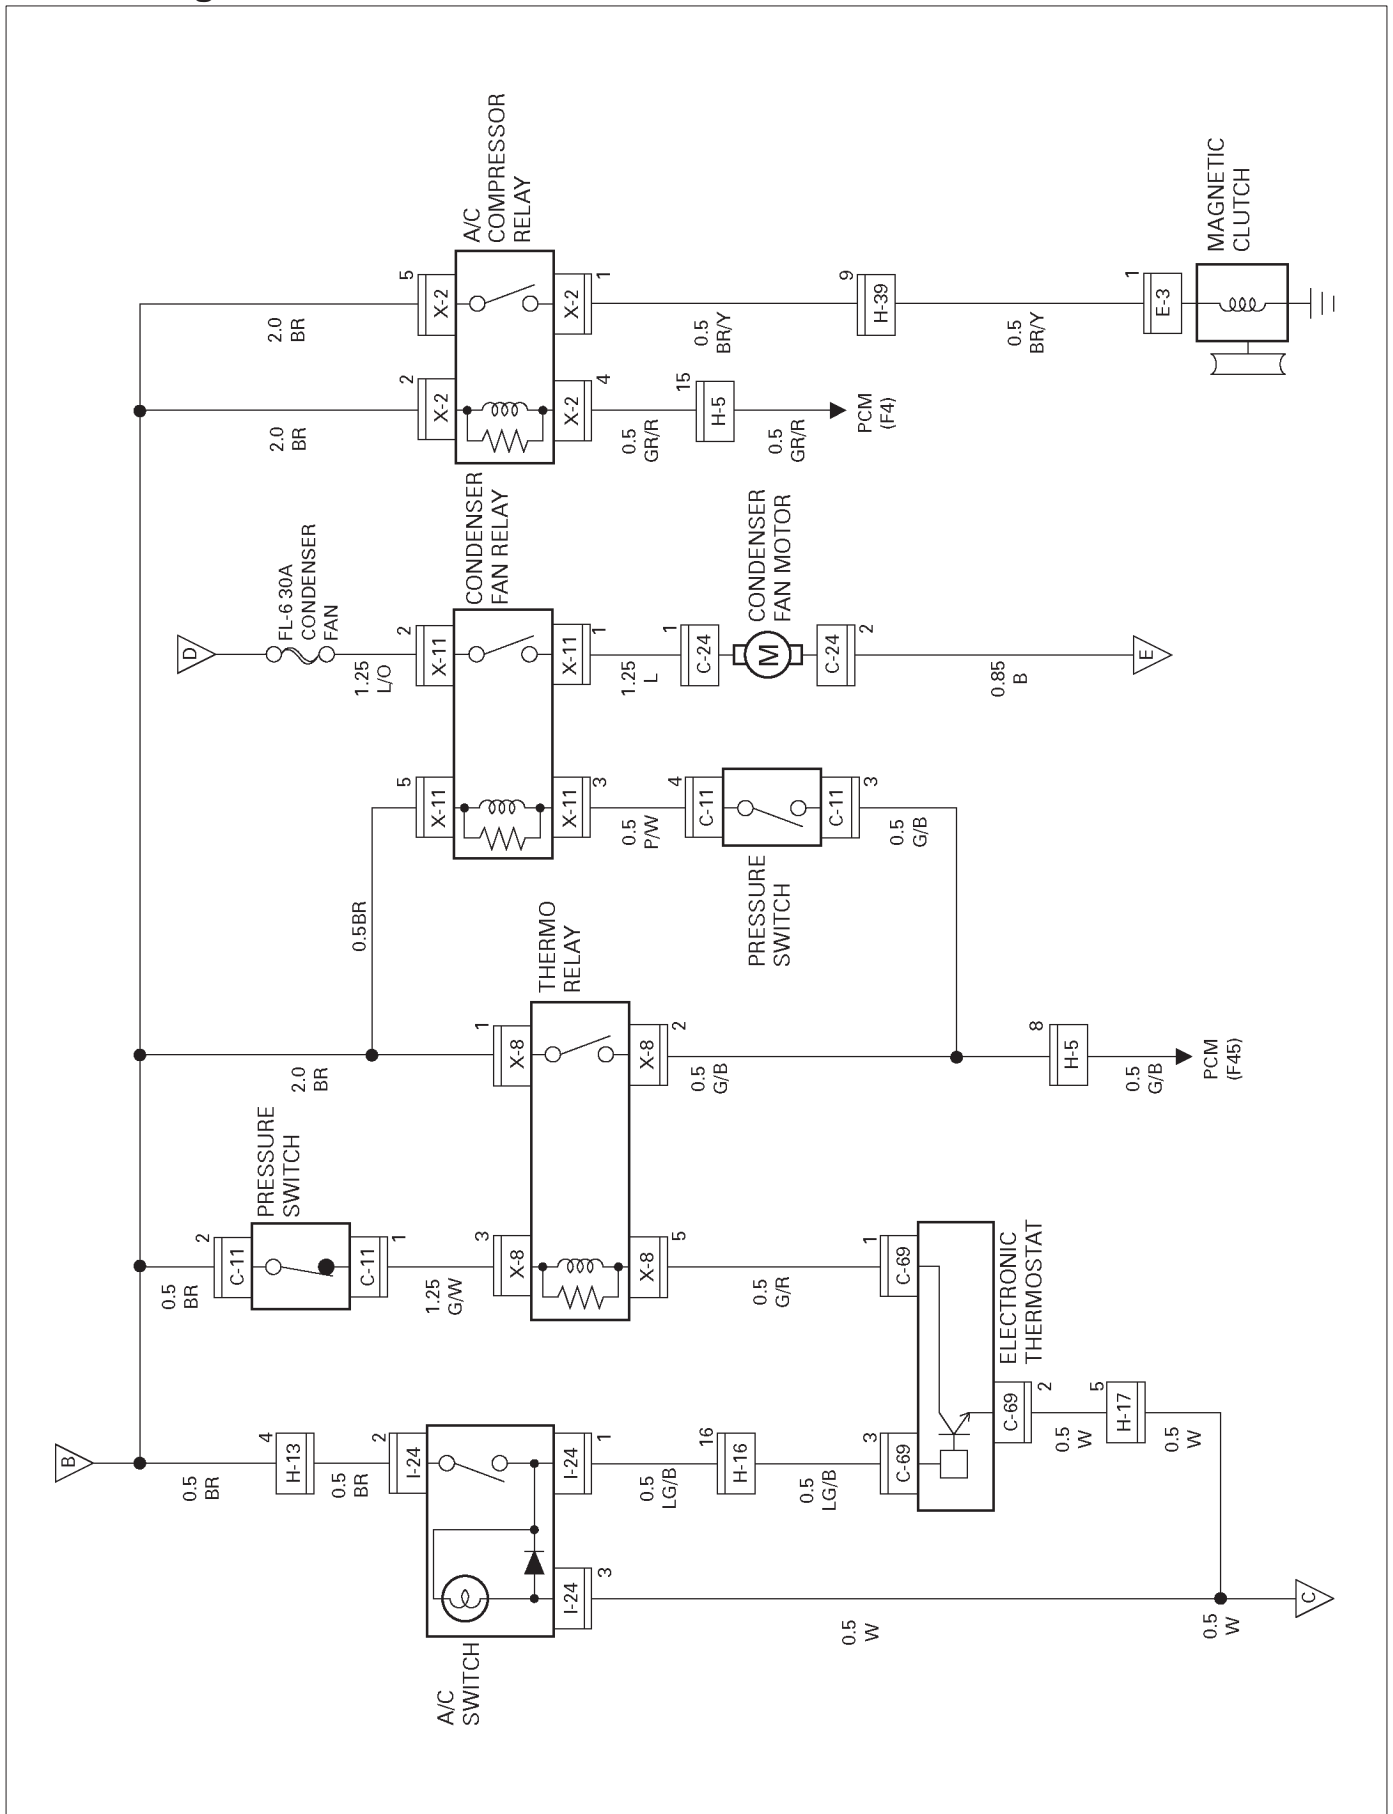

The PCM also stops working of the air conditioning system to reduce the engine load.

Refer to Heating and Ventilation System, and Air Conditioning System in HVAC System.

Heater and Air Conditioning (Automatic)

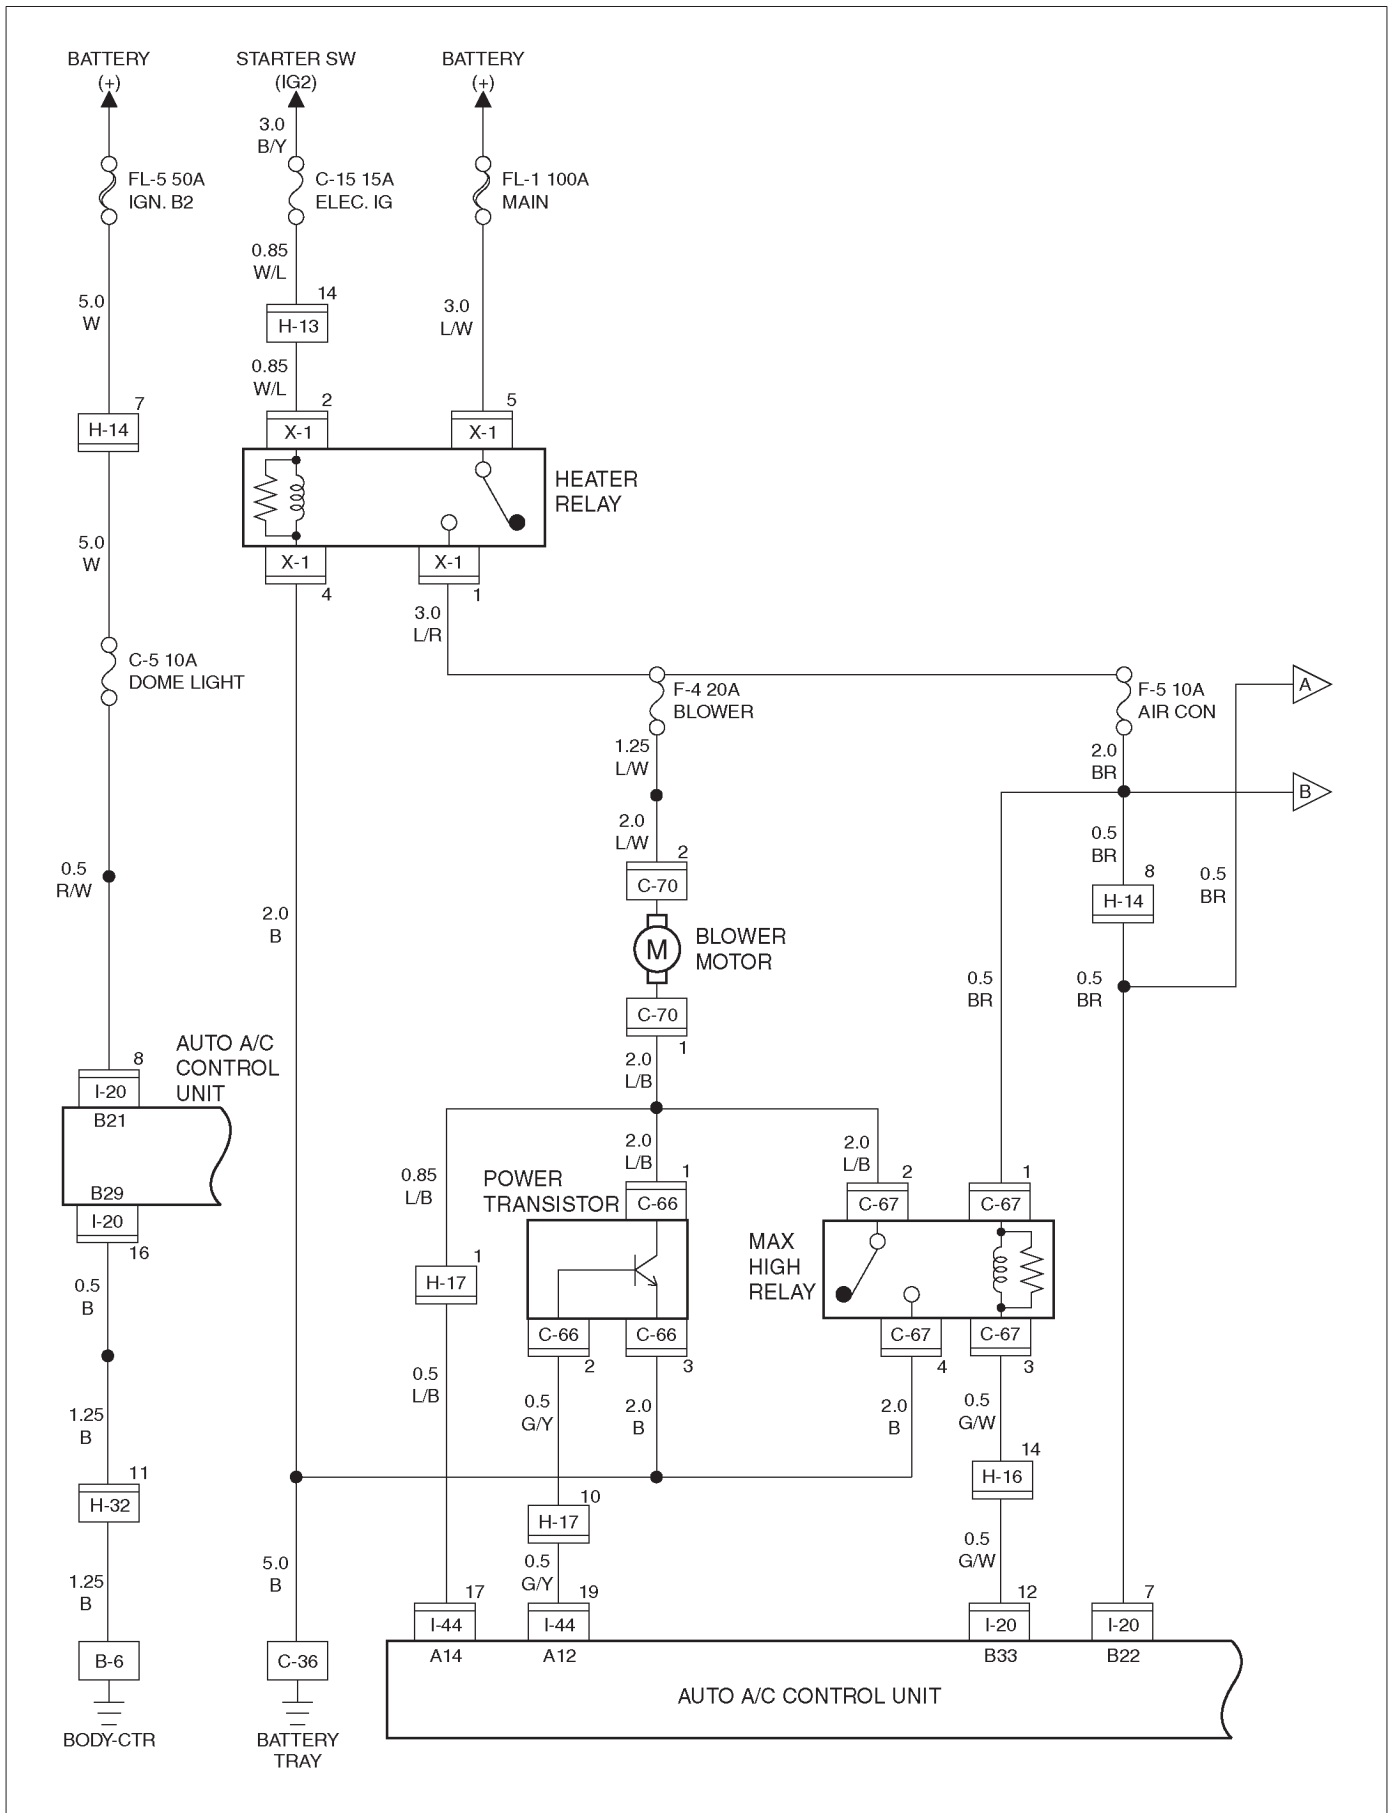

General Description

Using the signals from a variety of sensors, the full automatic heater and air conditioning system accurately senses outside air temperature, solar radiation quantity, evaporator's blowing temperature, heater core water temperature and interior temperature. These signals enable the control unit to automatically control blow temperature and air blow quantity, turn on or off the compressor and switch the blow port as well as switching between the fresh air intake and interior air circulation. Resetting the automatic function allows the system to switch to the manual control mode.

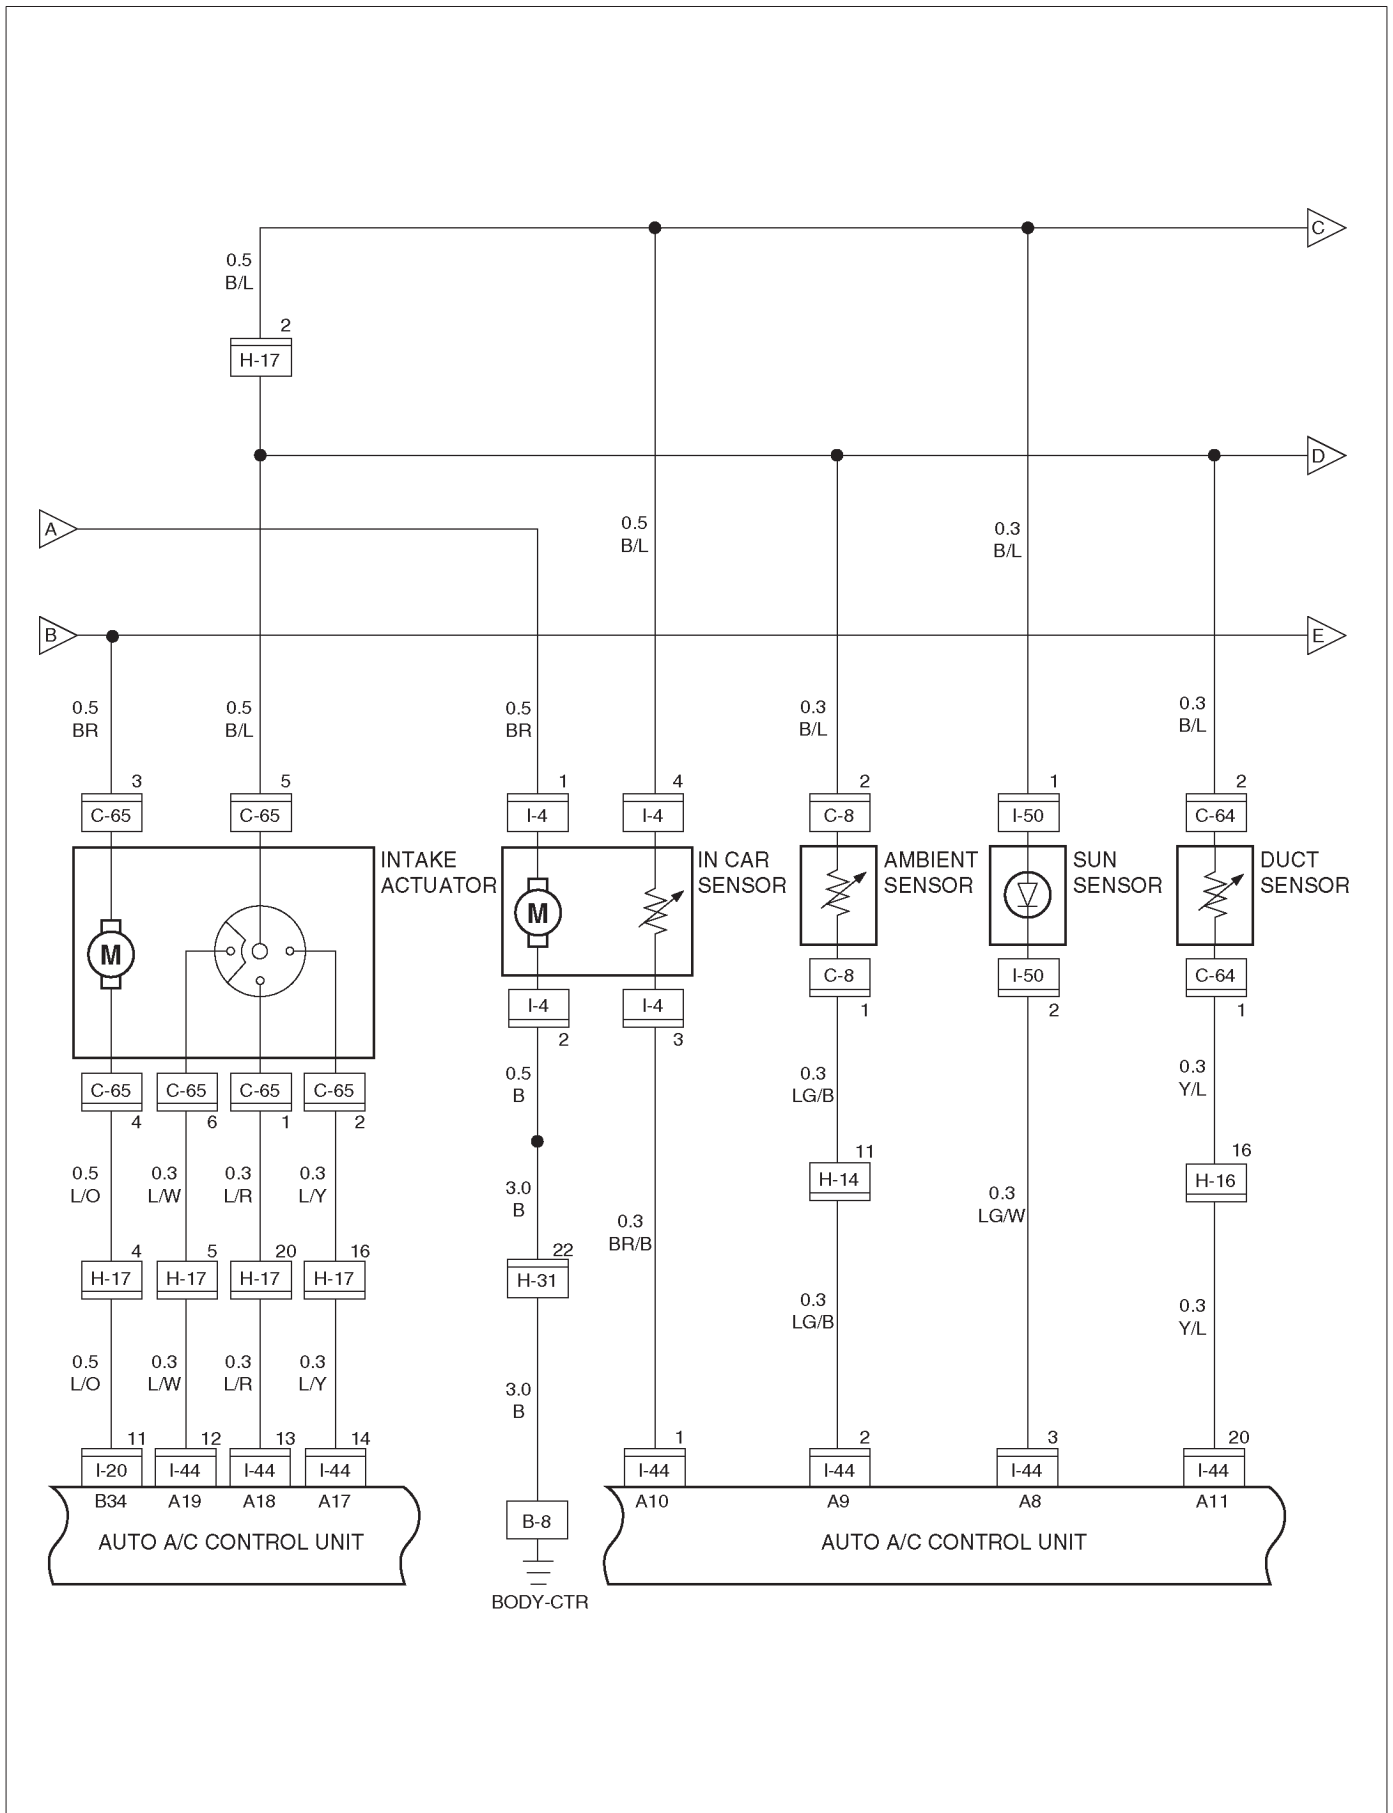

The self-diagnosis function of the control unit allows the unit to access and diagnose failed parts easier and quicker.

Refer to Air Conditioning System in HVAC System.

Sunroof

General Description

The circuit consists of the starter switch, sunroof switch, sunroof control unit, limit switch, and sunroof motor.

When the sunroof switch is turned on, the battery voltage is applied to the sunroof control unit through the circuit breaker and the power window relay on the circuit. Accordingly, when the sunroof switch is set to "Open" or "Close" position, the open or close relay incorporated into the control unit is activated to change the rotational direction of the sunroof motor to open or close the sunroof.

Also, the operational process (full close → limit stop → full open → safety stop → full close) of the sunroof is controlled by the control unit in accordance with signals sent from the sunroof switch and limit switch.

Diagnosis

Sunroof Inoperative

Step	Action	Value(s)	Yes	No
1	1. Disconnect the sunroof connector L-1. 2. Turn the starter switch on. Is the battery voltage applied between the harness side connector L-1 terminal 1 and the ground?	Approx. 12V	Go to Step 3	Go to Step 2
2	Repair an open circuit between the power window relay and the sunroof control unit. Is the action complete?	—	Verify repair	—
3	Replace the sunroof control unit. Is the action complete?	—	Verify repair	—

Safety Stop Mechanism Inoperative

Step	Action	Value(s)	Yes	No
1	Replace the sunroof control unit. Is the action complete?	—	Verify repair	—

Supplemental Restraint System (SRS) – Air Bag

General Description

The circuit consists of Sensing and Diagnostic Module (SDM), driver's air bag assembly, SRS coil assembly, passenger's air bag assembly, and "AIR BAG" warning light. SDM, SRS coil assembly (driver side only), driver air bag assembly, passenger air bag assembly and connector wire make up the deployment loops. The function of the deployment loops is to supply current through air bag assembly, which will cause deployment of the air bags in the event of a frontal crash of sufficient force, up to 30 degrees off the center line of the vehicle. The air bag assemblies are only supplied enough current to deploy when the SDM detects vehicle velocity changes severe enough to warrant deployment.

The SDM contains a sensing device which converts vehicle velocity changes to an electrical signal.

The electrical signal generated is processed by the SDM and then compared to a value stored in memory. When the generated signal exceeds the stored value, the SDM will cause current to flow through the air bag assembly deploying the air bags.

Refer to Supplemental Restraint System (SRS) and Restraint Control System in Restraints.

Shift on the Fly System

General Description

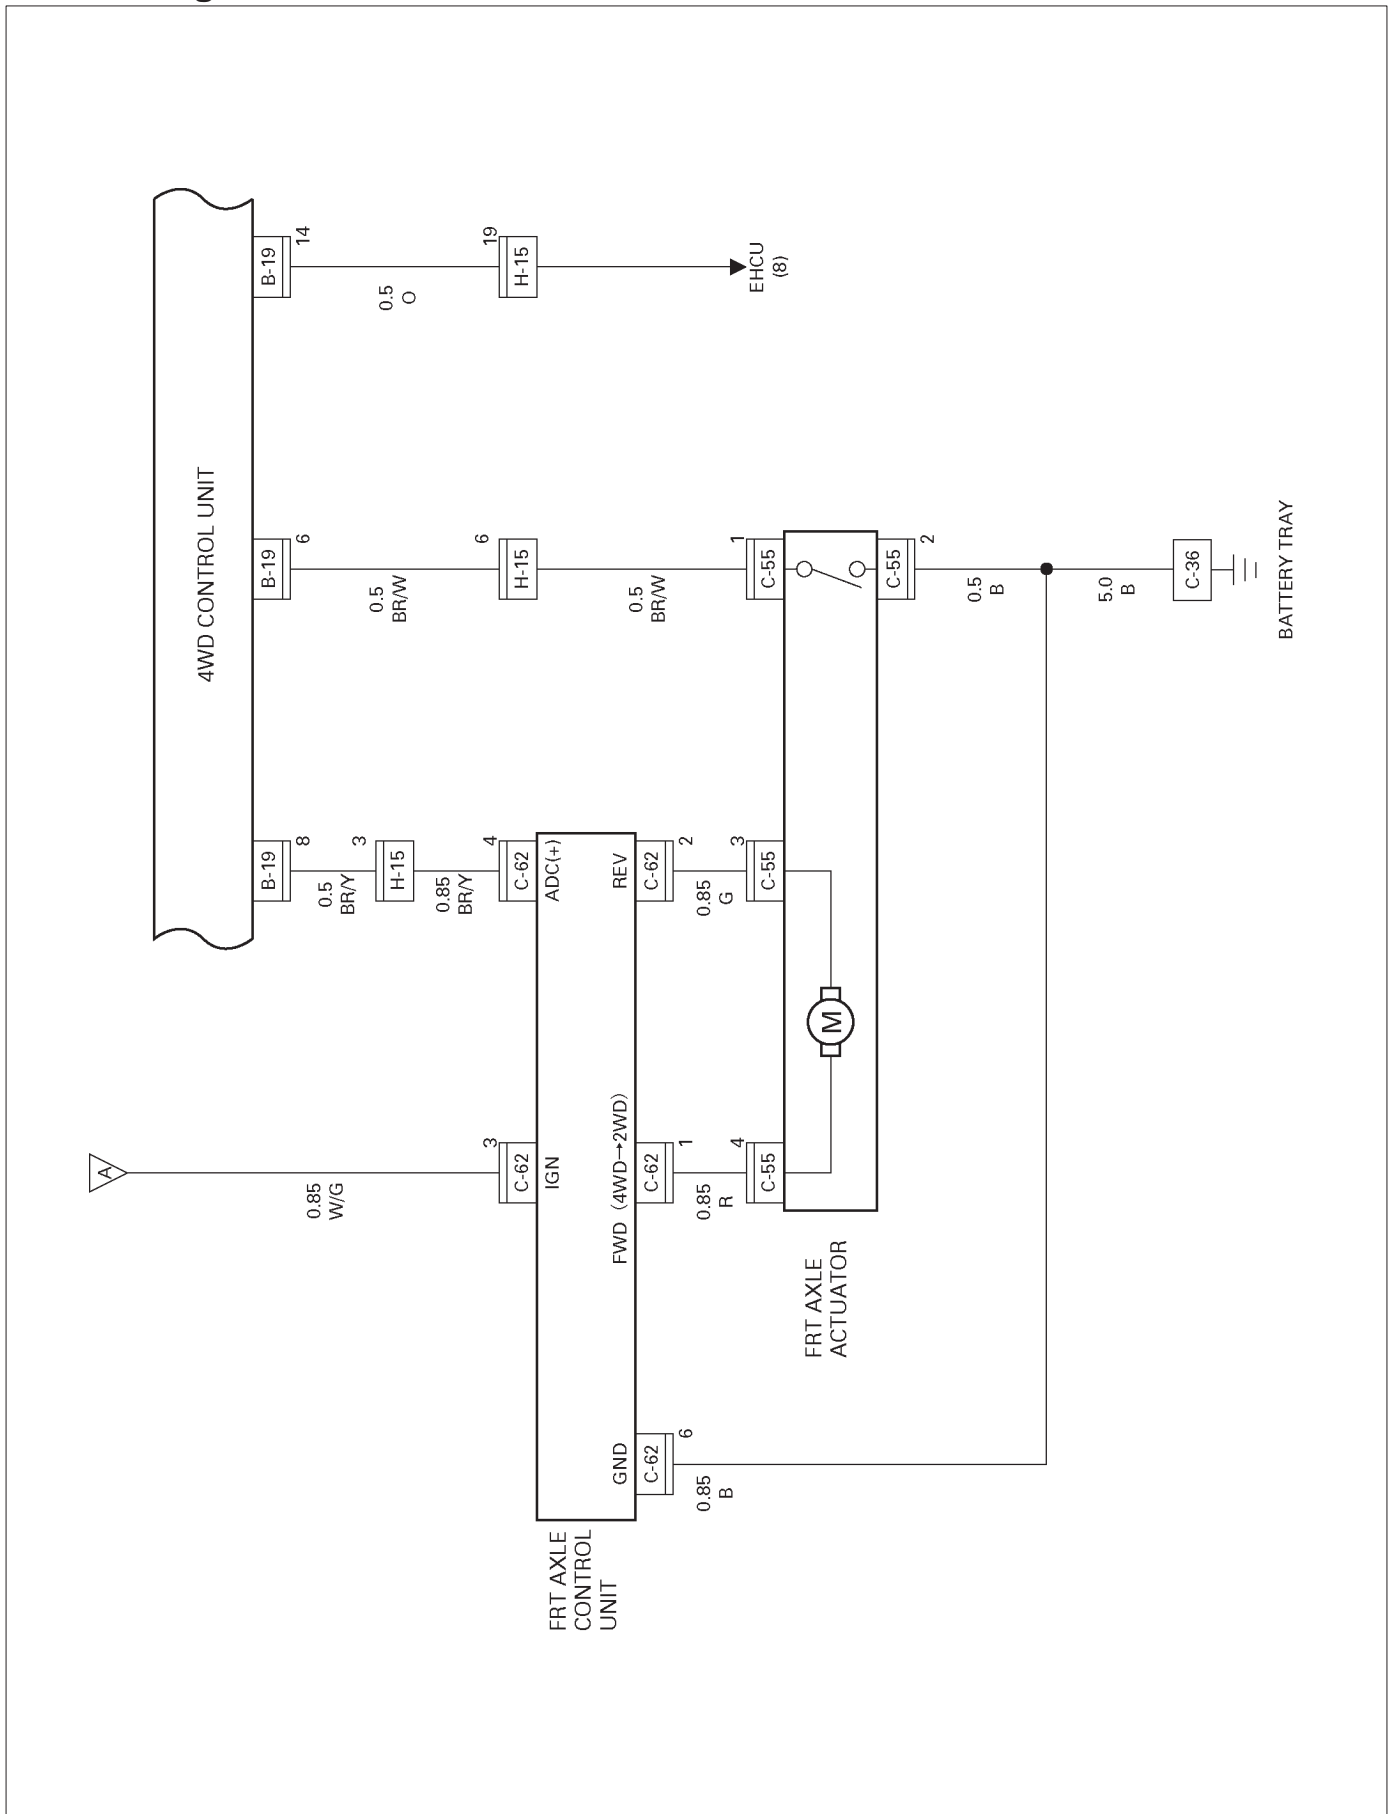

The circuit consists of the starter switch, 4WD control unit, actuator (transfer), 4WD switch, front axle control unit, front axle actuator and 4WD indicator (meter).

Refer to Driveline Control System (Shift on the Fly) in Driveline/Axle.

T.O.D.

General Description

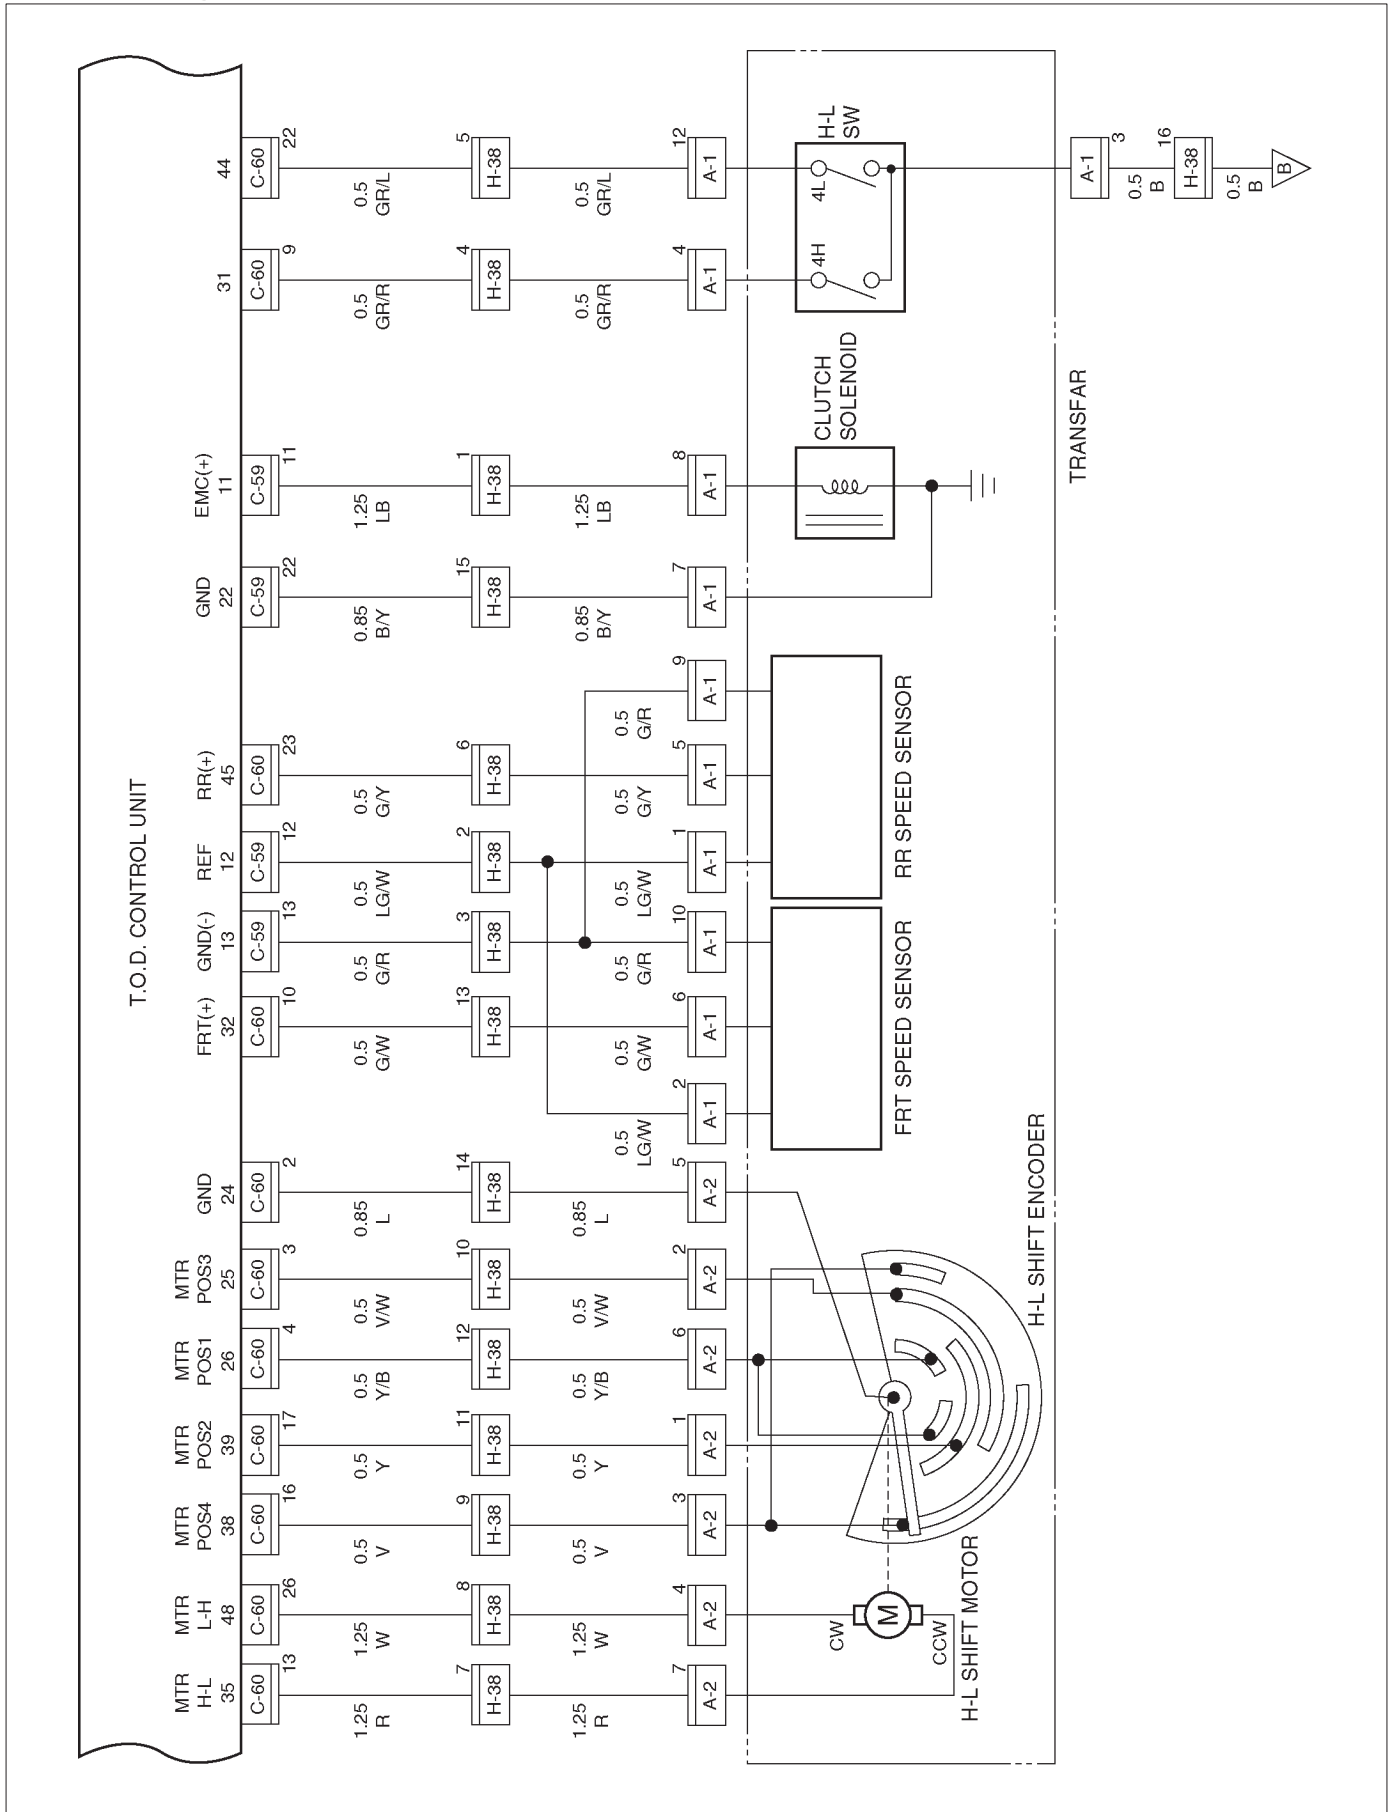

The system consists of the T.O.D. control unit, the FRT axle control unit, the FRT axle actuator, T.O.D. switch and indicator light and ETC. The T.O.D. control unit always monitors road conditions that the vehicle runs on, and varies the torque applied to the front and rear axle to keep vehicle stability, if necessary.

Refer to Driveline Control System (T.O.D.) in Driveline/Axle section.

Intelligent Suspension

General Description

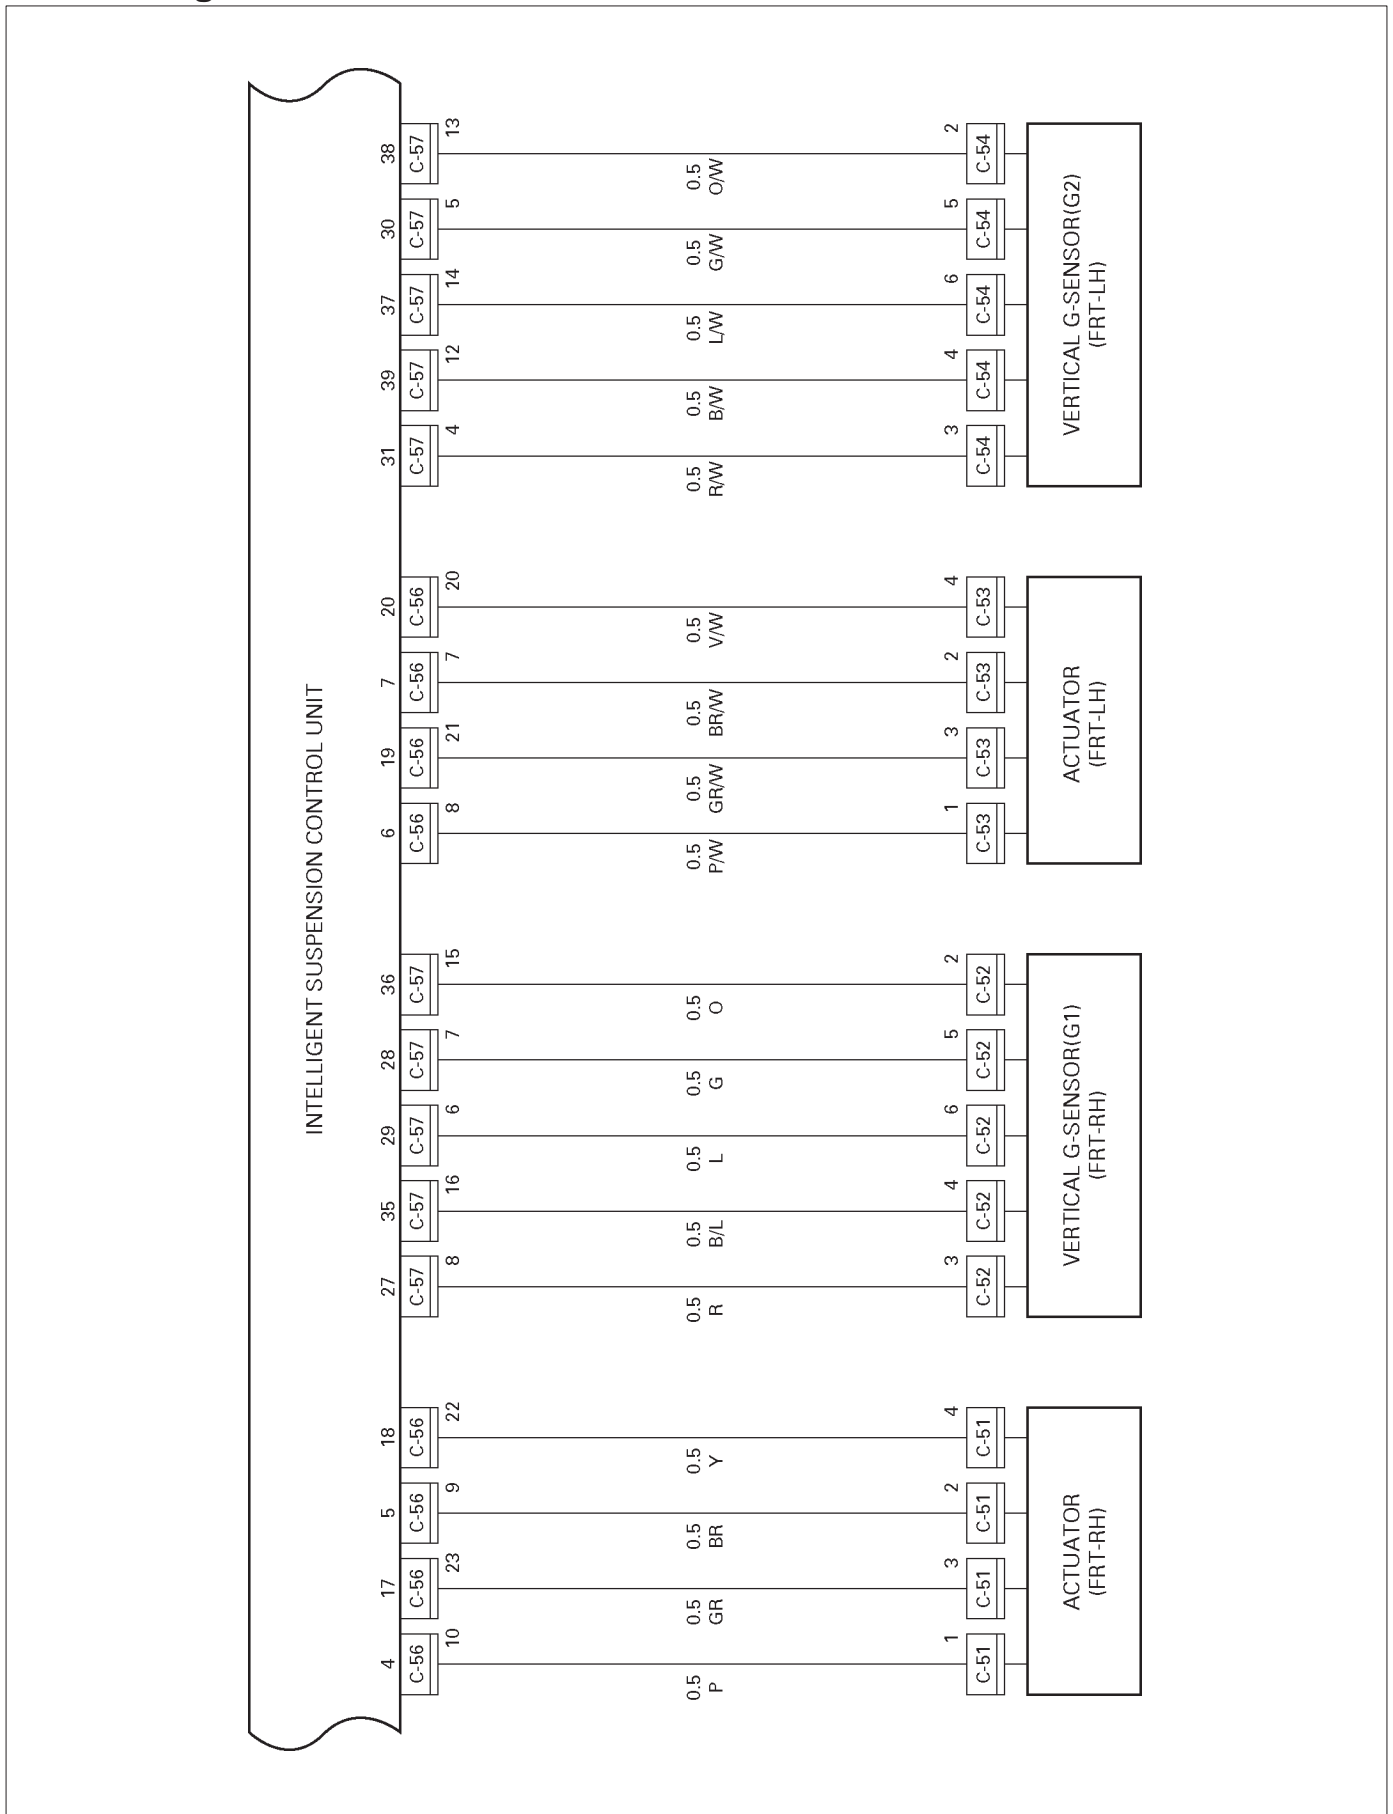

The system consists of the intelligent suspension control unit, the vehicle speed sensor, the G-sensors, the actuators, the stoplight switch, the suspension mode switch and the indicator lights. While the vehicle is running, the intelligent suspension control unit always controls the shock absorber damping force so that the best vehicle stability can be achieved.

Refer to Intelligent Suspension in 3F section.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Meter Assembly

General Description

The meter assembly has the speedometer, tachometer, engine coolant temperature gauge, fuel gauge and warning/indicator lights. These gauges and warning/indicator lights can be removed and installed from the back side of meter assembly.

Removal

1. Disconnect the battery ground cable.
2. Remove the Dash Side Trim Panel –RH (3).
3. Remove the lower cover Assembly(2).
 - Refer to the Instrument Panel Assembly in Body Structure section.
4. Remove the meter cluster Assembly(1).
 - Refer to the Instrument Panel Assembly in Body Structure section.

821RW292-1

5. Remove four fixing screws and disconnect the meter connectors to remove the meter assembly(4).

825RW284

CAUTION: The removed meter assembly should be placed upright or with its face side up.

Installation

To install, follow the removal steps in the reverse order.

Warning Light Bulb, Indicator Light Bulb, Illumination Light Bulb, A/T Shift Indicator Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the meter assembly(1).
 - Refer to the Meter Assembly removal steps in Meter and Gauge section.
3. Hold the bulb socket by hand and rotate it counterclockwise to remove the socket & bulb(2) from the meter body.

825RW059

Installation

To install, follow the removal steps in the reverse order.

Vehicle Speed Sensor

Removal

1. Disconnect the battery ground cable.
2. Remove the vehicle speed sensor(1).
 - Disconnect the connector.
 - Rotate the sensor counterclockwise.

225R200001

Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Tighten the vehicle speed sensor to the specified torque.

Torque: 25 N·m (18 lbft)

Fuel Tank Unit

Removal and Installation

Refer to Engine Fuel section.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Frame

General Description

Proper frame alignment is important to assure normal vehicle life and performance of many other parts of the vehicle. If the vehicle has been involved in a fire, collision or has been overloaded, it is necessary to check the frame alignment.

Frame Dimensions

General Description (Bumper)

Front and rear bumpers consist of bumper fascia, support, and reinforcement.

The absorbing capability for both front and rear bumper systems are achieved through reinforcements in each bumper.

Front Bumper

Parts Location

Legend

- (1) Inner Liner
- (2) Backbar
- (3) Support Assembly
- (4) Front Bumper Reinforcement Assembly
- (5) Front Bumper Slider
- (6) Front Bumper Fascia
- (7) Front Bumper Assembly

Removal

1. Disconnect the battery ground cable.
2. Disconnect front fog light connector (With fog light).
3. Remove the inner liner fixing clip on the back side of the front bumper.

647RY0002

4. Remove the front bumper fixing bolts.
 - Remove the two bolts from both sides of the front bumper.

601RW004

5. Remove the front bumper assembly.
6. Remove the support assembly.
 - Remove the three fixing bolts.
7. Remove the front bumper reinforcement assembly.
 - Remove the eleven fixing bolts.
8. Remove the three bolts at each backbar and remove backbars.
9. Remove the front fog light assembly (With fog light).
10. Remove the front bumper slider(1).

- Remove the two screws(4) and the two nuts(3), and release the claw from the washer(2).

601RY0004

Installation

To install, follow the removal steps in reverse order noting the following points:

1. Tighten the front bumper assembly fixing bolts to the specified torque.

Torque : 147 N·m (15 kg·m/108 lb ft)

2. Front bumper adjustment

- When the bolts fixing front bumper assembly are tightened, adjustment should be made between the back bar and front side bumper so that a clearance of 11.5 mm is provided between the lower side of the fender and the upper side of the front bumper.

601RY00013

Front Bumper Slider Bracket

Removal

1. Disconnect the battery ground cable.
2. Remove the front bumper.
 - Refer to Front Bumper in this section.
3. Remove the three nuts(1) and draw out the slider bracket(2).

Installation

To install, follow the removal steps in reverse order.

601RW017

Rear Bumper

Parts Location

690RY00012

Legend

- | | |
|--|-----------------------------------|
| (1) Protector | (10) License Plate Light Assembly |
| (2) Rear Mud Flap | (11) Rear License Plate Extension |
| (3) Bumper Bracket | (12) Reflector Assembly |
| (4) Rear Bumper Support | (13) Rear Bumper Assembly |
| (5) Rear Bumper Slider Bracket | (14) Rear Center Bumper |
| (6) Rear Corner Bumper | (15) Rear Bumper Fixing Bolt |
| (7) Backbar | (16) License Plate Light Harness |
| (8) Rear Bumper Reinforcement Assembly | |
| (9) Rear License Plate Bracket | |

Removal

1. Disconnect the battery ground cable.
2. Remove the rear mud flaps.
 - Remove the four bolts.
3. Remove the protectors.
 - Remove the three clips on the right side and five clips on the left side.
4. Remove the bumper brackets.
 - Remove the two nuts.
5. Remove the rear bumper supports.
 - Remove the nut and bolt.
6. Remove the rear bumper assembly(1).
 - Remove the two bolts(2) from each side.
 - Disconnect the license plate light harness connector.
 - Open the tailgate in an angle of 60° to avoid the interference with the spare tire.

7. Remove the license plate light assembly and license plate harness.
8. Remove the rear license plate extension and bracket.
9. Remove the rear center bumper.
 - Remove the ten clips from the step part and three bolts from each upper and lower sides.
10. Remove the reflector assemblies.
11. Remove the rear corner bumpers.
 - Remove the three bolts from each rear corner bumper.
12. Remove the rear bumper slider brackets(1).
 - Remove the two screws(4) and two nuts(3), and then remove claw caught in the washer(2).

13. Remove the backbars from the rear bumper reinforcement assembly.
 - Remove the three bolts at each backbar.

Installation

To install, follow the removal steps in reverse order, noting the following points:

1. Partially tighten the rear bumper bolts(2) (3) and adjust the clearance between the body (tailgate) and the rear bumper(1). Then fully tighten the rear bumper bolts(2) (3).

Torque : 147 N·m (15.0 kg·m/108 lb ft)

2. Rear bumper adjustment.

- When the bolts fixing rear bumper assembly are tightened, adjustment should be made with shims so that clearances shown in the figure below are provided between the body (tailgate) (4) and the rear bumper(5).

690RY00015

3. Tighten the spare tire fixing bolts to the specified torque.

Torque : 118 N·m (12.0 kg·m/87 lb ft)

Rear Bumper Slider

Removal

1. Remove the Rear bumper.
 - Refer to Rear bumper removal (in this section).
2. Remove the rear bumper slider(1).
 - Remove the three bolts(2).

690RW016

Installation

To install, follow the removal steps in reverse order, noting the following point:

1. Apply chassis grease to the slider and the slider bracket moving surface.

General Description (Sheet Metal)

This section includes items of front end sheet metal that are attached by bolts, screws or clips and related accessory components.

Anticorrosion materials have been applied to the interior surfaces of some metal panels to provide rust

resistance.

When servicing these panels, areas on which this material has been disturbed, should be properly recoated with service-type anticorrosion material.

Engine Hood

Parts Location

610RY00017

Legend

- | | |
|-----------------------------------|---------------------|
| (1) Engine Hood Assembly | (3) Hood Hinge Bolt |
| (2) Windshield Washer Nozzle Tube | |

Removal

1. Open the hood.
2. Support the hood.
3. Remove the windshield washer nozzle tube.

880RS001

4. Remove the hood hinge bolts.
 - Before removing the hinges from the engine hood, scribe a mark showing location of the hinges to facilitate installation in the original position.

610RS006

5. Remove the engine hood.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Tighten the engine hood hinge fixing bolts to the specified torque.

Torque : 10 N·m (1.0 kg·m/87 lb in)

2. Check the engine hood and fender(1).

Clearance: 4.5 mm (0.18 in)

Height (step): 0.5 mm (0.02 in)

- Adjust clearance with the hinges on the engine hood.
- Adjust height (step) with the hood buffers(2).

610RY00010

610RX001

8F-12 BODY STRUCTURE

610RY00008

Engine Hood Lock

Parts Location

610RY00024

Legend

- | | |
|-------------------------------|---------------------|
| (1) Hood Lock Control Lever | (4) Radiator Grille |
| (2) Control Cable | (5) Inner Liner |
| (3) Engine Hood Lock Assembly | |

Removal

1. Remove the hood lock control lever.
2. Remove the inner liner.
3. Remove the radiator grille.
 - Refer to Radiator Grille in this section.
4. Remove the engine hood lock assembly.
 - Apply setting marks(1) to the hood lock assembly and the body prior to removal.

610RY00020

8F-14 BODY STRUCTURE

5. Remove the control cable.
 - Remove the cable fixing clips from the engine hood lock.

Installation

To install, follow the removal steps in the reverse order noting the following points.

1. Set the position of installing the engine hood lock assembly (4).
 - Install the buffers (3) to the body.
 - Adjust the buffers as the position of the engine hood (1) is 2mm to the fender panel (2).
2. Fix the engine hood lock assembly.
 - Tighten the hood lock assembly fixing bolts under condition 1 to the specified torque.

Torque : 10 N·m (1.0 kg·m/87 lb in)

3. Adjust the appearance quality. (Engine hood and fender panel)
 - By buffers, adjust the difference of the height of engine hood is $0\pm 0.5\text{mm}$ to the fender. (Turn the buffers approx. one revolution and move the position of buffers upward.)

4. Reroute the control cable to its original position, and check and see if the lock assembly and control lever work normally.

Radiator Grille

Parts Location

603RY00010

Legend

- | | |
|----------------------------|------------------------------|
| (1) Radiator Grille Rubber | (3) Radiator Grille Assembly |
| (2) Screw | (4) Clip |

Removal

1. Open the hood.
2. Support the hood.
3. Remove radiator grille.
 - Raise the clips on the radiator grille and remove screw.

603RY00011

4. Pull out the radiator grille rubber from fender panel front lower side.

Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Install the radiator grille clips remaining on the body side in the radiator grille, and then install the radiator grille on the body.

Front Fender Panel

Parts Location

605RY00004

Legend

- | | |

| (2) Side Turn Signal Light | (7) Front Turn Signal Light Assembly |
| (3) Front Fender Panel | (8) Radiator Grille |
| (4) Front Wheel Arch Moulding (If so equipped) | |
| (5) Front Mud Flap | |

Removal

1. Disconnect the battery ground cable.
2. Remove the radiator grille assembly.
 - Refer to Radiator Grille in this section.

8F-18 BODY STRUCTURE

3. Remove the front turn signal light assembly.
 - Remove the fixing screws and disconnect the connector.

601RY0005

4. Remove the front mud flap.
5. Remove the inner liner.

647RY0003

6. Remove the antenna assembly.
 - Refer to Rod Type Antenna in Entertainment section.
7. Remove the side turn signal light.
 - Refer to Side Turn Signal Light Bulb in Lighting System section.

8. Remove the front fender panel.
 - Remove the eight fixing bolts.

614RX006

9. Remove the front wheel arch moulding (If so equipped).
 - Refer to Wheel Arch Moulding in Exterior/Interior Trim section.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Tighten the front fender panel fixing bolts to the specified torque.

Torque : 7 N·m (0.7 kg·m/61 lb in)

2. Check the fender and front door(1).

Clearance: 5.0 mm (0.196 in)

Height (step): Flush

Instrument Panel Assembly

Parts Location

Legend

- | | |
|--|-------------------------------------|
| (1) Cross Beam | (12) Audio Sub Box |
| (2) Instrument Harness Assembly | (13) Radio Assembly |
| (3) Instrument Panel Assembly | (14) Glove Box |
| (4) Meter Assembly | (15) Passenger Lower Bracket |
| (5) Instrument Panel Center Reinforcement | (16) Glove Box Side Reinforcement |
| (6) Meter Cluster Assembly | (17) Instrument Upper Reinforcement |
| (7) Driver knee Bolster Assembly | (18) Dash Side Trim Panel |
| (8) Instrument Panel Driver Lower Cover Assembly | (19) Passenger Air Bag Cover |
| (9) Lower Cluster Assembly | (20) Passenger Air Bag |
| (10) Front Console Assembly | (21) Instrument Panel Stay |
| (11) Control Lever Assembly | (22) Vent Duct Assembly |

Removal

CAUTION: For precautions on installation or removal of SRS – air bag system, refer to Supplemental Restraint System (SRS) – AIR BAG in Restraint section.

1. Disconnect the battery ground cable.
2. Remove the lower cluster assembly.
 - Remove screw (3) and pull out the cluster at the clip positions (1).
 - Disconnect the cigarette lighter connectors (2).

3. Remove the radio assembly and audio sub box.
 - Refer to Radio in Entertainment section.
4. Remove the front and rear consoles.
 - Refer to Consoles in Exterior/Interior Trim section.
5. Remove the dash side trim panels.
 - Remove the sill plates, then remove the trim panels.
6. Remove the glove box.
 - Remove the two fixing screws.

7. Remove the instrument panel driver lower cover assembly.
 - Remove the engine hood opener two fixing screws and another one fixing screw. After four clips are pried, disconnect switch connector and duct.

8. Remove the meter cluster assembly.
 - Remove the five fixing screws, two clips and switch connectors.
9. Remove the meter assembly.
 - Remove the four fixing screws and disconnect the connectors.
10. Remove the driver knee bolster assembly.
 - Remove the six fixing bolts and screw.
11. Remove the control lever assembly.
 - Refer to Control Lever Assembly and/or Control Cable in Heating, Ventilation and Air Conditioning (HVAC) section.

8F-36 BODY STRUCTURE

12. Remove the Instrument panel assembly.

CAUTION: For precautions on installation or removal of SRS – air bag system, refer to Supplemental Restraint System (SRS) – AIR BAG in Restraint section.

- Disconnect the instrument harness connectors (six connectors on the driver's side, three connectors on the passenger side and two connectors on the center side).
- Disconnect radio antenna cable plug and the ground cable fixing bolts from dash side panel.
- Remove the two fixing bolts of passenger air bag assembly and disconnect the connector.
- Remove the two fixing screws from fuse box.
- After pry the three hole cover from the surface of instrument panel, remove the three nuts.
- Remove the six bolts and one screw.

13. Remove the passenger air bag.

- Remove the four fixing nuts.

CAUTION: For precautions on installation or removal of SRS – air bag system, refer to Supplemental Restraint System in Restraint section.

14. Remove the vent duct assembly.

- Remove the five fixing screws.

15. Remove the passenger lower bracket.

- Remove the three screws.

16. Remove the glove box side reinforcement.

17. Remove the instrument upper reinforcement.

- Remove the nine screws.

18. Remove the instrument panel center reinforcement.

- Remove the six screws.

19. Remove the instrument panel harness assembly (1).

- Remove the clips.

20. Remove the instrument panel stays.

- Remove the two fixing nuts and two fixing bolts for each bracket.

21. Remove the cross beam.

- Remove the five fixing nuts, two fixing bolts (upper) and six fixing bolts (lower).

840R1W025

Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Adjust the control cable.
 - Refer to Control Lever Assembly in Heating, Ventilation and Air Conditioning (HVAC) section.

Front Door Assembly

Parts Location

630RW044

Legend

- | | |
|-----------------------------|------------------------|
| (1) Front Door Assembly | (4) Door Check Arm Pin |
| (2) Lower Hinge Bolt | (5) Upper Hinge Bolt |
| (3) Door Harness Connection | |

Removal

1. Disconnect the battery ground cable.
2. Apply a setting mark on the body side hinge.
3. Remove the door check arm pin.

630RW001

4. Remove the upper and lower hinge bolts.
- Position a wood block under the door for protection and support the door assembly with hands during removal or installation.

63SRW003

5. Remove the door harness connection.
- Pull the door harness grommet out in order to disconnect the harness connection.

63ORW004

6. Remove the front door assembly.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Align the door fitting to the body.
 - Check the fender and front door (1).

Clearance: 5.0 mm (0.196 in)

Height (step): Flush

- Check the front door and rear door (2).

Clearance: 6.0 mm (0.23 in)

Height (step): Flush

- Check the rear door and body (3).

Clearance: 5.0 mm (0.196 in)

Height (step): Flush

Adjust clearance with door hinges.

Adjust height (step) by tapping on the fender lightly with a rubber hammer.

61OR100002

2. Tighten the door hinge bolts to the specified torque.

Torque : 34 N·m (3.5 kg·m/25 lb ft)

Rear Door Assembly

Parts Location

650R100001

Legend

- | | |
|-----------------------------|------------------------|
| (1) Rear Door Assembly | (4) Door Check Arm Pin |
| (2) Lower Hinge Bolt | (5) Upper Hinge Bolt |
| (3) Door Harness Connection | |

Removal

1. Disconnect the battery ground cable.
2. Apply a setting mark on the body side hinge.
3. Remove the door check arm pin.

4. Remove the upper and lower hinge bolts.
 - Position a wood block under the door for protection and support the door assembly with hands during removal or installation.

630RW003

650R100002

5. Remove the door harness connection.

- Pull the door harness grommet out in order to disconnect the door harness connection.

630R1W004

6. Remove the rear door assembly.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Align the door fitting to the body by referring to Front Door Assembly in this section.
2. Tighten the door hinge bolts to the specified torque.

Torque : 34 N·m (3.5 kg·m/25 lb ft)

Front Window Regulator, Glass and Glass Run

Parts Location

635RY00011

Legend

- | | |
|--------------------------|---------------------------|
| (1) Glass Run | (11) Speaker Grille |
| (2) Glass | (12) Grip Cover |
| (3) Window Regulator | (13) Inside Handle |
| (4) Waist Seal | (14) Power Window Switch |
| (5) Outside Handle | (15) Speaker Assembly |
| (6) Locking Link | (16) Tweeter |
| (7) Door Lock Assembly | (17) Door Mirror Cover |
| (8) Waterproof Sheet | (18) Door Mirror Assembly |
| (9) Door Trim Panel | |
| (10) Courtesy Light Lens | |

Removal

1. Disconnect the battery ground cable.
2. Remove the power window switch.
 - Pry out the power window switch and remove the connectors.

635RW016

3. Remove the screw while pulling the inside lever toward you and then remove the inside handle.

632RW003

4. Remove the speaker grille (1).
 - Pull out the front side of the grille.
5. Remove the speaker assembly (2).
 - Remove the four screws and disconnect the speaker harness connector (3).

890RX012

6. Remove the door mirror cover.
7. Remove the grip cover.
8. Remove the five screws (1), (3) and pull out the trim panel at the six clip positions (2).

635RW007

8F-44 BODY STRUCTURE

9. Remove the waterproof sheet.
10. Remove the two bolts through the access hole and pull out the glass upward.

11. Turn the glass inside out and pull it up from its rear side.

12. Remove the window regulator.
 - Remove the seven fixing bolts.
 - Disconnect the window regulator motor harness connector.
13. Remove the glass run.
 - Pull the glass run (6) out from the door frame groove.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Check to see that the window regulator operates smoothly and the glass opens and closes properly.
2. Install the waterproof sheet with no clearance between the door panel and the waterproof sheet.

Rear Window Regulator, Glass and Glass Run

Parts Location

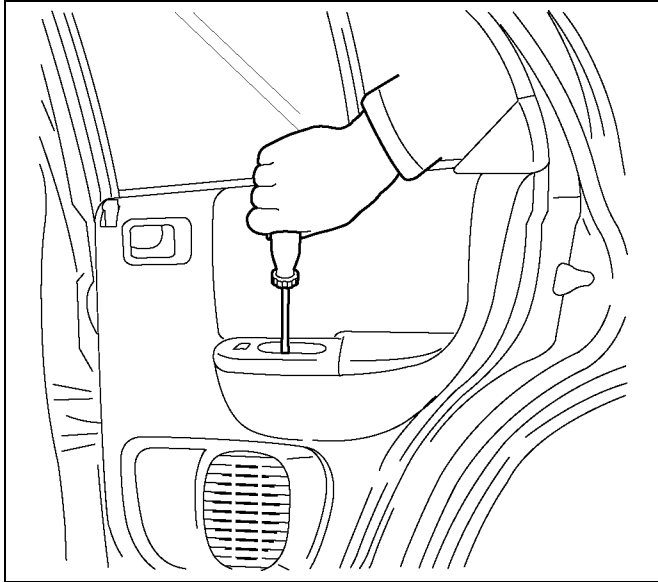

655R100005

Legend

- | | |
|------------------------|--|
| (1) Glass Run | (9) Bracket |
| (2) Glass | (10) Rear Corner Garnish |
| (3) Fixed Glass | (11) Door Trim Panel |
| (4) Window Regulator | (12) Power Window Switch and Pull Case |
| (5) Outside Handle | (13) Inside Handle |
| (6) Door Lock Assembly | (14) Waterproof Sheet |
| (7) Speaker Bracket | (15) Waist Seal |
| (8) Speaker | |

Removal

1. Disconnect the battery ground cable.
2. Remove the screw while pulling the inside lever toward you and then remove the inside handle.
3. Remove the one screw at the pull case.

655R10002

4. Remove the rear corner garnish.
5. Pull out the trim panel at the eight clip positions.
 - Disconnect the power window switch connector.

655R10003

6. Remove the power window switch and pull case.
 - Remove the fixing screws from back side of the rear door trim panel.
7. Remove the bracket.
8. Disconnect the speaker harness connector.
9. Remove the speaker with the speaker harness connector from the door inner panel.
10. Remove the waterproof sheet (1).
 - Taking notice of the door harness, peel the waterproof sheet off the door panel carefully.

651RS002

11. Remove the speaker bracket.
 - Remove the six fixing screws.
12. Remove the fixed glass.
 - Remove one bolt and screw as shown in the figure, then pull it upward.

651RW002

13. Remove the glass.

- First, align the height of regulator to the access hole. Remove two screws attaching bottom channel and regulator, then remove the glass.

651RW006

- Remove the window glass by tilting it as necessary.

651RW007

14. Remove the window regulator.

- Remove the six fixing bolts and pull the regulator out from the lower hole of the door panel.
- Disconnect the connector.

651RW005

15. Remove the glass run.

- Pull the glass run out from the door frame.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Check to see that the window regulator operates smoothly and the glass opens and closes properly.
2. Install the waterproof sheet with no clearance between the door panel and the waterproof sheet.

Tailgate

Parts Location

681RW010

Legend

- | | |
|-----------------------------|---------------------------------------|
| (1) Hatchgate Lock Assembly | (9) Rear Wiper Motor |
| (2) Tailgate Assembly | (10) Dove Tail |
| (3) Tailgate Bell Crank | (11) Key Cylinder |
| (4) Hinges | (12) Tailgate Lock Assembly |
| (5) Plug | (13) Hatchgate Lock Actuator Assembly |
| (6) Tailgate Stopper Link | (14) Outside Handle |
| (7) Waterproof Sheet | (15) Tailgate Waist Seal |
| (8) Trim Cover Assembly | |

Removal

1. Disconnect the battery ground cable.
2. Remove the tailgate trim cover assembly (3).
 - Remove the two screws (2) holding the hatchgate lock assembly (1) first and the two screws fixing the trim cover assembly. Pull up the trim cover while detaching the clips from tailgate panel.

3. Remove the tailgate trim brackets (2).
 - Remove the three fixing screws (3) and screw grommets (1).
4. Remove the waterproof sheet (4).
 - Remove the waterproof sheet, taking special care so as not to break it.

5. Remove the hatchgate lock.
 - Disconnect the lock link and connector and remove the three fixing bolts.

6. Remove the key cylinder.
 - Disconnect the locking links.
 - Remove the key cylinder retaining clip with screwdriver to remove the key cylinder.

7. Remove the hatchgate lock actuator assembly.
 - Disconnect the actuator harness connector.
 - Remove the two nuts holding hatchgate lock actuator assembly from inside.
8. Remove the outside handle.
 - Remove the two bolts holding the outside handle from inside.
9. Remove the tailgate lock assembly.
 - Remove the three screws holding the lock assembly.
10. Remove the dove tail.
11. Remove the tailgate locking links.
12. Remove the rear wiper arm.
 - Refer to Rear Wiper Arm/Blade in Wiper/Washer System section.
13. Remove the rear wiper motor.
14. Remove the tailgate harness cable.
15. Remove the spare tire carrier.
 - Refer to Spare Tire Carrier in this section.
16. Remove the tailgate stopper link.
17. Remove the tailgate assembly.
 - Remove the tailgate assembly, taking care so as not to damage the hinge. Tailgate assembly is heavy and removal operation require two people.
18. Remove the tailgate waist seal.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. When setting up links, pay attention to the position and direction of the links.

683RW003

Legend

- (1) Tailgate Lock Link
- (2) Outside Handle
- (3) Key Cylinder Lock Link
- (4) Cancel Mechanism

-
2. Tighten the tailgate hinge fixing bolts to the specified torque.

Torque: 34 N·m (3.5 kg-m/25 lb ft)

3. Tighten the tailgate stopper link fixing bolts to the specified torque.

Torque: 34 N·m (3.5 kg-m/25 lb ft)

4. Tighten the dove tail fixing bolts to the specified torque.

Torque: 25 N·m (2.6 kg-m/19 lb ft)

Rear Hatchgate

Parts Location

682RY0002

Legend

- (1) High Mount Stoplight
- (2) Hatchgate Hinge
- (3) Hinge Collar
- (4) Hatchgate Glass Seal
- (5) Hatchgate Gas Stay
- (6) Hatchgate Ball Stud
- (7) Ball Stud Spacer
- (8) Ball Stud Fastener
- (9) Hatchgate Glass
- (10) Hatchgate Striker
- (11) Striker Fastener
- (12) High Mount Stoplight Fastener
- (13) Outside Handle Collar
- (14) Outside Handle
- (15) High Mount Stoplight Spacer

Removal

1. Disconnect the battery ground cable.
2. Disconnect the high mount stoplight and rear defogger harness connectors.
3. Remove the hatchgate ball stud (LH and RH).
 - Remove gas stay fixing screw and pull up the gas stay assembly (3) from the ball stud by spreading the retainer (2) holding the ball stud at the end of the gas stay with screwdriver (1), etc.

4. Remove the hatchgate hinge nuts from body side.
5. Remove the hatchgate glass.
 - When pulling down the hatchgate glass, exercise special care so as not to damage it. Hatchgate glass assembly is heavy and removal operation requires the two people.
6. Remove the two screws to remove hatchgate striker and fastener.
7. Remove the outside handle.
8. Remove the hinges.
9. Remove the high mount stoplight.
10. Remove the hatchgate finisher.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Attach the upper seal (1) to the hatchgate glass (2) indicated portion (3) so that the end of the glass contacts the bottom of the upper seal.

2. When installing the hatchgate glass, first attach the hinge to the hatchgate glass. Align the stud of the hinge to the hole at body while supporting the hatchgate glass with two people at indicated positions (1), and then partially tighten the hinge to body nut (2). After adjustment (refer to Adjustment in this section) is completed, fully tighten the nut, hinge to body nut.
 - Hatchgate hinge assembly for left and right sides from each other.

3. When installing gas stay assembly (1), first install the gas stay onto the rear quarter panel with fixing screw (2) and fastener (3) and then attach the gas stay upper end to the ball stud by spreading the retainer with screwdriver, etc. Gas stay assemblies for left and right sides differ from each other (The letter (4) L(LH) or R(RH) is embossed on the gas stay assembly.)

683RW005

4. When installing hatchgate striker assembly, first partially tighten the fixing screw and close the hatchgate and tailgate. Then fully tighten the fixing screw with the condition that the striker fits the hatchgate lock assembly at the tailgate. Make sure that clearance exists between hatchgate striker and lock assembly. After installation, again make sure that the striker fits the lock assembly properly.
 5. Tighten the nuts; hinge to body (LH and RH)
Torque : 6 N-m (0.6 kg-m/52 lb in)
 6. Tighten the screws; glass and hinge fix (LH and RH)
Torque : 6 N-m (0.6 kg-m/52 lb in)
- NOTE: When installing the hinge to the body, exercise special care not to damage the body paint surface.
7. Tighten the hatchgate striker fixing screws.
Torque : 6 N-m (0.6 kg-m/52 lb in)

Adjustment

- Hatchgate alignment is obtained by moving hatchgate hinges.

682RY00003

Legend

- | | |

Spare Tire Carrier

Parts Location

530RX005

Legend

- (1) Spare Tire
- (2) Spare Tire Carrier

Removal

1. Remove the spare tire (1).
2. Remove the spare tire carrier (2) by using spare tire carrier nut wrench 5-8840-2095-0 (J-34355).

Installation

1. Spare tire carrier.
 - Tighten the carrier fixing bolts to the specified torque.

Torque : 31 N·m (3.2 kg·m/23 lb ft)
2. Spare tire
 - Tighten the spare tire fixing bolts to the specified torque.

Torque : 118 N·m (12.0 kg·m/87 lb ft)

Windshield

Parts Location

607RY0005

Legend

- | | |
|-------------------------------|------------------------------|
| (1) Windshield Wiper Arm | (4) Windshield Side Moulding |
| (2) Windshield Upper Moulding | (5) Windshield Support |
| (3) Windshield | (6) Front Cowl Cover |

Removal

1. Disconnect the battery ground cable.
2. Remove the front pillar trim cover.
 - Turn up the finisher and pry the trim cover clips free from the body panel.
3. Remove the sunvisors and sunvisor holders.
 - Refer to Headlining in Exterior/Interior Trim section.
4. Remove the interior mirror.
 - Refer to Interior Mirror Assembly in Exterior/Interior Trim section.
5. Remove the windshield wiper arm.
 - Refer to Windshield Wiper Arm/Blade in Wiper/Washer System section.
6. Remove the windshield side moulding.

- Pull the moulding out from drip rail.
7. Remove the front cowl cover.
 8. Remove the windshield support.
 9. Remove the upper moulding.
 10. Remove the windshield.
 - Use a knife to cut through part of the adhesive caulking material.
 - Secure one end of a piece of steel piano wire (0.02 inches in diameter) to a piece of wood that can serve as a handle.
 - Use a pair of needle nose pliers to insert the other end of the piano wire through the adhesive caulking material at the edge of the windshield glass.
 - Secure the other end of the piano wire to another piece of wood.
 - With the aid of an assistant, carefully move the piano wire with a sawing motion to cut through the adhesive caulking material around the entire circumference of the windshield glass.
 - Attach some cloth tape (1) on the body for protecting the painting surface.

- Clean the remaining adhesive caulking material from the area of the body which holds the windshield.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Clean the bonding surfaces of both the windshield and body panel with a soft rag and white gasoline.
2. Install the spacer.
 - Attach spacers in ten locations as shown in the figure.
 - Always use new spacer.

3. Install the windshield upper moulding.
 - Peel off the tear-away paper from the windshield upper moulding, and start applying it with one end of the glass and cut away the surplus at the other end of the glass for length adjustment.
 - Always use new upper moulding.
4. Temporary install the windshield support.
5. Apply the primer to the windshield and body panel.
 - Apply the primer (3) (Sun star # 435-40 or equivalent) to the windshield side bonding surface as shown in the figure.

- Apply the primer (Sun star # 435-95 or equivalent) to the body side bonding surface.

NOTE: Apply an adhesive 3 minutes or more but within 24 hours after the application of primer. If more than 24 hours have passed, reapply primer.

Primer should be handled as following:

1. Use the primer manufactured 3 months or less ago and having been kept in a refrigerator.
2. Wipe off primer-stains on positions other than requires application.
3. Stir the primer for a minute or more before use.

Legend

- | | |
|-------------------------|--------------------|
| (1) Adhesive | (4) Windshield |
| (2) Sealing Dam | (5) Upper Moulding |
| (3) Primer Coating Area | |

6. Apply the adhesive (1) to the windshield.
 - After drying primer completely, apply a sealing adhesive (Sun star # 555 or equivalent) along the edge of the glass so that the sealing adhesive has a 20 mm (0.79 in) junction at middle of the base of the glass.

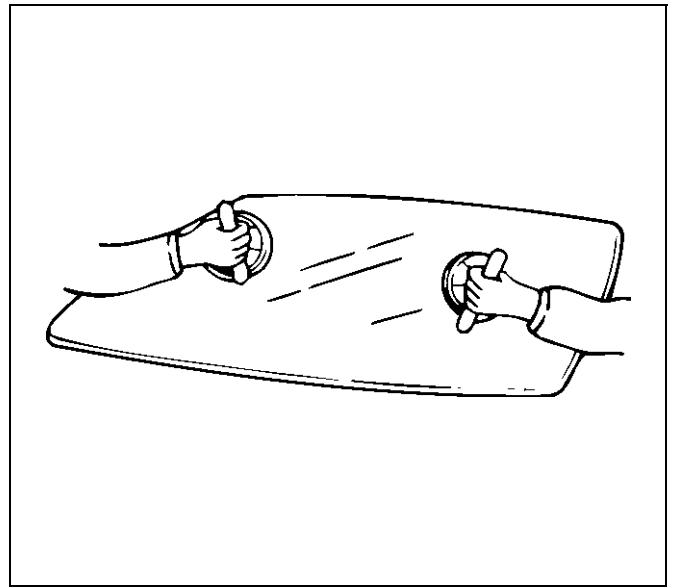

607RW015

NOTE: Apply an adhesive 3 minutes or more but within 24 hours after the application of primer. If more than 24 hours have passed, reapply primer.

Adhesive should be handled as follows:

1. Use the adhesive manufactured 3 months or less ago.
 2. Wipe off adhesive-stains on positions other than requires application.
7. Install the windshield.
 - Set the windshield with sealing adhesive applied to entire circumference in the body panel. Specifically, adjust windshield support with the upper moulding making contact with the body panel, press the glass, and tighten the windshield support.

NOTE: Affix the glass within 5 minutes of application.

607RS017

8. Install the front cowl cover.
9. Install side moulding.
 - Use white gasoline and a soft cloth to wipe away any excess adhesive.
 - Cure the bonding at a temperature of 20°C – 30°C (68°F – 86°F) for 24 hours.
 - Check that the windshield does not leak water.

607RX010

10. Install windshield wiper arm.

Rear Quarter Glass

Parts Location

Legend

- | | |
|---------------------------------|--|
| (1) Quarter Trim Panel | (6) Clip |
| (2) Rear Quarter Glass Moulding | (7) Fastener Tape |
| (3) Rear Quarter Glass | (8) Primer Coating Area (Glass side & Body side) |
| (4) Clip | (9) Sealant |
| (5) Body Panel | |

Removal

1. Disconnect the battery ground cable.
2. Remove the rear quarter trim panel.
 - Refer to Interior Trim Panels (LWB) in Exterior/Interior Trim section.
3. Remove the rear quarter glass.
 - Refer to Windshield in this section.

Installation

1. Rear quarter glass.

- Clean the bonding surfaces of both the glass and the body panel.
- Be absolutely sure to apply glass primer to the side glass.
- Be absolutely sure to apply body primer fully to the body.

NOTE: Immediately wipe off the primer left on the body or extruded sealant.

- Attach the fastener tape to the indicated position of body with sealant as shown in the figure.
- Apply the sealant to the circumference of glass as shown in the figure.
- Insert the location pins on glass into the panel, push the glass against the panel, and bond them.
- Attach the moulding to the body with sealant.
- Cure the bonding at a temperature of 20°C – 30°C (68°F – 86°F) for 24 hours.
- Check that the rear quarter glass does not leak water.

2. Install the rear quarter trim panel.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Front Seat Assembly

Front Seat Assembly and Associated Parts

750R100011

Legend

- | | |
|------------------------|--------------------------------------|

| (4) Reclining Device | (11) Hinge Cover |
| (5) Side Cover | (12) Front Seat Assembly |
| (6) Reclining Knob | |
| (7) Rear Leg Cover | |

Removal

1. Disconnect the battery ground cable.
2. Remove the front and rear leg covers.
3. Remove the front seat assembly.
 - Remove the four fixing bolts.
 - Disconnect the seat belt warning connector (Driver's side only).

4. Pull out the reclining knob.
5. Remove the side cover.
 - Remove the two screws.
6. Remove the headrest.
7. Remove the reclining device.
 - Turn up the seat back trim cover in order to remove the reclining device fixing bolts.

8. Remove the seat back assembly.
 - Remove the seat back assembly fixing nut on the opposite side of the reclining device.

9. Remove the trim cover (Seat back side).
10. Remove the guide holder.
 - Pull the guide holder out by holding the bottom end of it from the seat back assembly.

11. Remove the seat adjuster.
 - Disconnect the release wire (4) and remove the fixing bolts.

12. Remove the seat belt buckle assembly.
13. Remove the trim cover (Seat cushion side).

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Tighten the reclining device fixing bolts to the specified torque.

Torque: 46 N-m (4.7 kg-m/34 lbft)

2. Tighten the front seat assembly fixing bolts to the specified torque.

Torque: 39 N-m (4.0 kg-m/29 lbft)

Rear Seat Assembly

| (2) Rear Seat Lock Assembly | (6) Seat Cushion Fixing Bolt |
| (3) Rear Seat Belt Buckle Assembly | (7) Rear Seat Cushion Assembly |
| (4) Seat Cushion Hinge | |

Removal

1. Remove the hinge covers.
2. Remove the seat cushion fixing bolts.

3. Remove the seat cushion assembly (2).

- Pull on the strap (1) of the rear seat lock assembly to release the seat lock.

755R10006

4. Remove the seat cushion hinges.

5. Remove the rear cushion trim cover (1) and rear seat cushion pad (2).

- Remove cushion trim cover from rear cushion frame (3) with prying the plastic retainers (4).

755RX028

6. Remove the rear seat lock assembly and rear seat belt buckle assembly.

7. Remove the rear seat lock strikers.

- Remove the four bolts at each striker.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Tighten the rear seat lock assembly and rear seat belt buckle assembly fixing bolts to the specified torque.

Torque: 39 N·m (4.0 kg·m/29 lbft)

2. Tighten the rear seat lock striker fixing bolts to the specified torque.

Torque: 39 N·m (4.0 kg·m/29 lbft)

3. Tighten the seat cushion hinge fixing bolts to the specified torque.

Torque: 39 N·m (4.0 kg·m/29 lbft)

| (2) Seat Back Assembly | (7) Side Hinge |
| (3) Guide Holder | (8) Body Floor Panel |
| (4) Release Knob | (9) Center Hinge |
| (5) Seat Lock Cover | |

Removal

1. Pull on the release knob and fold the seat back assembly forward.
2. Remove the luggage floor carpets.
 - Remove the carpet fixing nine clips at each from the backside of the seat back assembly.
3. Remove the seat back assembly.
4. Remove the seat lock covers.
5. Remove the headrests.
6. Remove the release knobs.
 - Turn the knob counterclockwise to remove it.
7. Remove the trim covers.
8. Remove the guide holders.

9. Remove the side hinges.
 - Remove the one fixing nut at each side hinge.
10. Remove the center hinge.
 - Remove the two fixing bolts.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Tighten the center hinge fixing bolts to the specified torque.

Torque: 39 N·m (4.0 kg·m/29 lb ft)

2. Tighten the side hinge fixing nuts to the specified torque.

Torque: 29 N·m (3.0 kg·m/22 lb ft)

3. Tighten the side lock striker fixing bolts to the specified torque.

Torque: 19 N·m (1.9 kg·m/14 lb ft)

| (3) Door Lock Assembly | (9) Inside Handle |
| (4) Waterproof Sheet | (10) Power Window Switch |
| (5) Door Trim Panel | (11) Speaker Assembly |
| (6) Courtesy Light Lens | |

Removal

1. Disconnect the battery ground cable.
2. Remove the power window switch (1).
 - Pry out the power window switch and remove the connectors.

3. Remove the screw while pulling the inside lever toward you and then remove the inside handle.

4. Remove the speaker grille (1).
 - Pull out the front side of the grille.

5. Remove the speaker assembly (2).
 - Remove four screws and disconnect the speaker harness connector (3).

6. Remove the courtesy light lens.
7. Remove the five screws (1), (3) and pull out the door trim panel at the six clip positions (2).
 - Disconnect the tweeter connector and courtesy light connector.

8. Remove the waterproof sheet.
 - Taking notice of the door harness, peel the waterproof sheet off the door panel carefully.
9. Raise the glass up to the uppermost position, and then remove the rear guide rail.

8H-4 SECURITY AND LOCKS

10. Disconnect the locking links then remove the door lock assembly fixing screws and door lock assembly.

632RY00005

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Apply chassis grease to the lock assembly and striker moving surface.
2. Tighten the door lock assembly fixing screws to the specified torque.

Torque 7 N·m (0.7kg·m/61 lbin)

3. Check that the door lock operates smoothly.

Front Outside Handle

Front Outside Handle and Associated Parts

635RY0005

Legend

- | | |
|-------------------------|--------------------------|
| (1) Outside Handle | (7) Speaker Grille |

| (5) Door Trim Panel | (11) Speaker Assembly |
| (6) Courtesy Light Lens | |

Removal

1. Disconnect the battery ground cable.
2. Remove the door trim panel.
 - Refer to Front Door Lock Assembly in this section.
3. Remove the waterproof sheet.
 - Taking notice of the door harness, peel the waterproof sheet off the door panel carefully.
4. Disconnect the locking links and remove the outside handle.
5. Remove the fixing clip to remove the door lock cylinder.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Be sure to install the door lock cylinder at a right angle to the outside handle.
2. Check for smooth outside handle and lock cylinder operation.
3. Tighten the outside handle fixing bolts to the specified torque.

Torque 9N·m (0.9kg·m/78lbin)

| (2) Door Lock Assembly | (6) Power Window Switch and Pull Case |
| (3) Bracket | (7) Inside Handle |
| (4) Rear Corner Garnish | (8) Waterproof Sheet |

Removal

1. Disconnect the battery ground cable.
2. Remove rear corner garnish.
3. Remove the screw while pulling the inside lever toward you and then remove the inside handle.
4. Remove the screw at the pull case.

655R100002

5. Pull out the trim panel at the eight clip positions.
 - Disconnect the power window switch connector.

655R100003

6. Remove the bracket.
7. Peel the upper half of the waterproof sheet.
 - Taking notice of the door harness, peel the waterproof sheet off the door panel carefully.
8. Disconnect the locking links and remove the door lock assembly fixing screws to remove the door lock assembly.

652RW002

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Apply chassis grease to the lock assembly and striker moving surface.
2. Tighten the door lock assembly fixing screws to the specified torque.

Torque 7 N·m (0.7 kg·m/61 lb in)

3. Check that the door lock operates smoothly.

Rear Outside Handle

Rear Outside Handle and Associated Parts

655R100006

Legend

- | | |

| (2) Door Lock Assembly | (6) Power Window Switch and Pull Case |
| (3) Bracket | (7) Inside Handle |
| (4) Rear Corner Garnish | (8) Waterproof Sheet |

Removal

1. Disconnect the battery ground cable.
2. Remove the door trim panel.
 - Refer to Rear Door Lock Assembly in this section.
3. Peel the upper half of the waterproof sheet.
 - Taking notice of the door harness, peel the waterproof sheet off the door panel carefully.
4. Disconnect the locking link and remove fixing bolts to remove the outside handle.

Installation

To install, follow the removal steps in the reverse order, noting the following point:

1. Check that the outside handle operates smoothly.
2. Tighten the outside handle fixing bolts to the specified torque.

Torque 9N·m (0.9kg·m/78lbin)

Tailgate Lock and Hatchgate Lock

Tailgate Lock, Hatchgate Lock and Associated Parts

681RW015

Legend

- | | |
|-------------------------------|--------------------------------------|
| (1) Hatchgate Lock Assembly | (6) Key Cylinder |

| (4) Waterproof Sheet | (9) Hatchgate Lock Actuator Assembly |
| (5) Trim Cover Assembly | |

Removal

1. Disconnect the battery ground cable.
2. Remove the tailgate trim cover assembly (3).
 - Remove the two screws (2) holding the hatchgate lock assembly (1) first and the two screws fixing the trim cover assembly. Pull up the trim cover while detaching the clips from tailgate panel.

683RW001

3. Remove the tailgate trim brackets (2).
 - Remove the three screws (3) and screw grommets (1).
4. Remove the waterproof sheet (4).
 - Remove the waterproof sheet, taking special care so as not to break it.

681RW014

5. Remove the hatchgate lock.
 - Disconnect the lock link and connector and remove the three fixing bolts.
6. Remove the key cylinder.
 - Disconnect the lock links.
 - Remove the key cylinder retaining clip with screw driver to remove the key cylinder.

683RW025

7. Remove the hatchgate lock actuator assembly.
 - Disconnect the actuator harness connector.
 - Remove the two nuts holding hatchgate lock actuator assembly from inside.
8. Remove the outside handle.
 - Disconnect the lock links.
 - Remove the two bolts holding the outside handle from inside.
9. Remove tailgate lock assembly.
 - Remove the three screws holding the lock assembly.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. When setting up links, pay attention to the position and direction of the links.

683RW003

Legend

- (1) Tailgate Lock Link
- (2) Outside Handle
- (3) Key Cylinder Link
- (4) Cancel Mechanism

2. Apply chassis grease to the lock assembly and striker moving surface.
3. Check that the tailgate lock operates correctly after installing it.
4. Tighten the hatchgate lock assembly fixing bolts to the specified torque.

Torque 9N·m (0.9kg·m/78lbin)

5. Tighten the tailgate lock assembly fixing screws to the specified torque.

Torque 7N·m (0.7kg·m/61lbin)

Fuel Filler Door Lock

Fuel Filler Door Lock and Associated Parts

686R10004

Legend

- | | |
|---|-----------------------------------|
| (1) Fuel Filler Door Lock Actuator Assembly | (3) Body Harness Connector |
| (2) Rod | (4) Rear Quarter Trim Covers (LH) |

Removal

1. Unlock the fuel filler door.
2. Disconnect the battery ground cable.
3. Remove the lower quarter trim cover (Left side).
 - Refer to Interior Trim Panels in Exterior/Interior Trim section.
4. Remove the fuel filler door lock actuator assembly.
 - Remove the one fixing bolt and two fixing nuts.
 - Disconnect the body harness connector.
5. Remove the fuel filler door lock cap (2).
 - While pressing the two lock portions of the cap from inside of the vehicle, push the cap into the hole. Open the fuel filler door (3) and remove the cap out of the installation hole (1).

686RW013

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Install the cap by using the actuator assembly rod as a guide.
2. Take care not to pinch the drain hose and the harness while tightening the actuator fixing bolt and nuts.

Key

Key Coding

730R100001

Legend

- (1) Key (Actual size)
- (2) Key Code Tag
- (3) Position
- (4) Level

One key is used for the ignition, door, and tailgate lock cylinders. The keys are cut on both edges to make them reversible.

Key identification is obtained from the five character key code stamped on the key code tag. From this key code, the key code cutting combination can be determined from a code list (available to owners of key cutting equipment from suppliers).

If key codes are not available from records or tags, the key code can be obtained from the right hand door lock cylinder (if lock has not been replaced). Lock cylinders supplied by the factory as service parts are unmarked. If the original key is available, the key code cutting combination can be determined by laying the key on the diagram shown in the figure.

Key Styles

730R100002

Legend

- (1) Blank Key Style "A"
- (2) Blank Key Style "B"

The keys come in styles A or B depending on the key code cutting combination. When the first position in the combination is a 1, 2 or 3, Style A is used. When the first position is a 4, Style B (factory pre-cut key) is used.

Power Door Lock System

General Description

The circuit consists of the door lock (& power window) switch, door lock actuator for the front and rear door, tailgate lock actuator, fuel filler door lock actuator and the door lock key switch.

The front door lock switch—LH is always provided with the battery voltage.

The key or the inside lock button on the both driver's and the front passenger's door can activate the lock mechanism of all the doors (including the tailgate).

When the driver's door lock switch or the front passenger's door lock switch is turned on, current flows for about one second to the door lock actuator of each door connected in parallel with the front door lock (& power window) switch—LH to activate the actuator to lock and unlock the doors.

Door Lock Key Switch

Removal and Installation

- Refer to Front Door Lock Assembly in this section.

Front Door Lock Actuator

Removal and Installation

- Refer to Front Door Lock Assembly in this section.

Rear Door Lock Actuator

Removal and Installation

- Refer to Rear Door Lock Assembly in this section.

Tailgate Lock Actuator

Removal and Installation

- Refer to Tailgate Lock Assembly in this section.

Fuel Filler Door Lock Actuator

Removal and Installation

- Refer to Fuel Filler Door Lock in this section.

Keyless Entry System

General Description

This circuit consists of the keyless entry control unit, the front door lock & power window switch (RH), the starter switch, the dome light, the door switch and the tail gate switch and possible to be locked/unlocked each door by operation of transmitter. Basic function of system is as follows.

Keyless Entry Control Unit

Removal

1. Disconnect the battery ground cable.
2. Remove the glove box.
 - Refer to the Instrument Panel Assembly in Body Structure section.
3. Remove the keyless entry control unit (1).
 - Disconnect the connector.
 - Remove two fixing screws.

826R100030

Installation

To install, follow the removal steps in the reverse order.

Keyless Entry Control Unit/ Transmitter Replacement

Keyless Entry Control Unit Replacement

1. Remove and install the control unit.
 - Refer to Keyless Entry Control Unit in this section.
2. Register ID code.
 - Refer to ID Code Registration in Wiring System section.
3. Check that the keyless entry system works normally.

Transmitter Replacement

1. Prepare a new transmitter.
2. Register ID code.
 - Refer to ID Code Registration in Wiring System section.
3. Check that the keyless entry system works normally.

Transmitter Battery Replacement

1. Remove the cover.
 - Remove the fixing screw.
2. Remove the battery.
3. Set the new battery into the transmitter.
4. Install the cover to the transmitter.
5. Check that the keyless entry system works normally.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Sunroof Glass

Sunroof Glass and Associated Parts

665RW04

Legend

- (1) Sunroof Weatherstrip
- (2) Sunroof Glass

Removal

1. Tilt the sunroof and open the sunshade.
2. Disconnect the battery ground cable.
3. Pull out the front of sight shield (2).
4. Remove four sunroof glass fixing Torx screws (3) to remove the sunroof glass (1).

665RW011

Installation

1. Be sure to install the sunroof weatherstrip so that the joint of the weatherstrip is on the rear side of the vehicle.
2. Temporary install the glass to the sunroof frame.
3. Open and shut the sunroof four to five times to position correctly the sunroof weatherstrip and the glass in the longitudinal and latitudinal setting positions.
4. Adjust the setting position to flush the surface between the roof panel and weatherstrip of sunroof glass.
5. Tighten the sunroof glass fixing screws to the specified torque.

Torque: 4 N·m (0.4 kg·m/35 lbin)

6. After the sunroof glass is installed, recheck the roof panel and sunroof glass for vertical install position. If out of standard, adjust with fixing screws.

Sunroof Deflector

Removal

1. Open the sunroof.
 - Let a 5 mm drill go through two blind rivets (2) to disengage riveted portions.
2. Remove the sunroof deflector (1).

Installation

To install, follow the removal steps in the reverse order.

665RW027

Sunshade

Disassembled View

665RW012

Legend

- | | |
|-------------------|----------------------|
| (1) Sunroof Glass | (3) Sunshade Stopper |
| (2) Sight Shield | (4) Sunshade |

Removal

1. Tilt the sunroof.
2. Disconnect the battery ground cable.
3. Remove the sunroof glass.
 - Refer to Sunroof Glass (LWB) in this section.
4. Pull the sight shield upward using screwdriver.

665RW006

8I-6 SUNROOF/CONVERTIBLE TOP

5. Remove 2 sunshade stopper fixing screws and remove sunshade stopper (1).

665RW007

6. Pull out the sunshade (4) up to the guide rail edge. Lift the front of sunshade and clear the projection (3) of sunshade through the notch (2) of guide rail edge, then draw the sunshade out of the roof.

665RW009

Installation

To install, follow the removal steps in the reverse order.

Sunroof Frame Complete Assembly

Sunroof Frame Complete Assembly and Associated Parts

665RW005

Legend

- | | |
|-------------------------------------|----------------|
| (1) Sunroof Drain Hose | (3) Headlining |
| (2) Sunroof Frame Complete Assembly | |

Removal

1. Disconnect the battery ground cable.
2. Remove the headlining.
 - Refer to Headlining in Exterior/Interior Trim section.

8I-8 SUNROOF/CONVERTIBLE TOP

3. Disconnect the sunroof drain hose at the sunroof frame side as shown in the figure.

4. Disconnect the sunroof harness connection.
5. Remove two sunroof frame complete assembly fixing nuts (front side) and six fixing bolts from the frame complete assembly, and then remove the sunroof frame complete assembly.

NOTE: Be sure to remove the frame complete assembly while supporting it.

Installation

1. Install the sunroof frame complete assembly.
2. After installing the frame complete assembly, loosen the sunroof glass fixing nuts and adjust the sunroof glass setting position.
 - Refer to Sunroof Glass in this section.
3. Install the sunroof drain hose.
4. Install the headlining.
 - Refer to Headlining in Exterior/Interior Trim section.

Sunroof Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the sunroof switch (1).
 - Remove the switch by pushing the spring with the tip of a screwdriver.
 - Disconnect the switch connector.

Installation

To install, follow the removal steps in the reverse order.

Sunroof Control Unit

Removal

1. Disconnect the battery ground cable.
2. Remove the headlining.
 - Refer to Headlining in Exterior/Interior Trim section.
3. Remove the sunroof control unit (1).
 - Disconnect two connectors.
 - Slide it to the direction indicated by arrow in the illustration and remove it.

665RW013

Installation

To install, follow the removal steps in the reverse order.

Sunroof Motor

Removal

1. Disconnect the battery ground cable.
2. Remove the headlining.
 - Refer to Headlining in Exterior/Interior Trim section.
3. Remove the sunroof motor (1).
 - Disconnect the connector.
 - Remove the three screws.

665R100001

Installation

To install, follow the removal steps in the reverse order.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Consoles

Consoles and Associated Parts

Legend

- | | |
|----------------------|---------------------------|
| (1) Front Console | (3) Rear Console Assembly |
| (2) Console Brackets | |

Removal

1. Disconnect the battery ground cable.
2. Remove the shift knob (M/T) / transfer knob (W/O TOD).
3. Remove the rear console assembly.
 - Open the rear console lid and remove two screws.
 - Disconnect the switch connector.
4. Remove the front console assembly.
 - Remove six fixing screws and disconnect the accessory socket connector.

Installation

To install, follow the removal steps in the reverse order.

Front Door Trim Panel

Front Door Trim Panel and Associated Parts

635RY00012

Legend

- | | |

| (1) Door Mirror Cover | (6) Inside Handle |
| (2) Door Trim Panel | (7) Power Window Switch |
| (3) Courtesy Light Lens | (8) Speaker Assembly |
| (4) Speaker Grill | (9) Tweeter |
| (5) Grip Cover | |

Removal

1. Disconnect the battery ground cable.
2. Remove the door mirror cover (2).
3. Remove the power window switch (1).
 - Pry the power window switch out and disconnect the switch connector.

635RW016

4. Remove the speaker cover.
5. Remove the front speaker.
 - Remove the front speaker fixing screws in order to disconnect the speaker connector.
6. Remove the inside handle fixing screw.

CAUTION: Take care not to apply excessive force on the inside handle link, lest this link is elongated, which could make it impossible to operate the door with the inside handle.

632RW003

7. Remove the door trim panel.
 - Remove the five fixing screws (1), (3) in order to pull out the six clip positions (2) from the door panel.

635RW007

- Disconnect the tweeter and courtesy light connectors to lift the door trim panel and unlock the engagement of the waist seal section. Then, pass the inside handle through the mounting hole of the trim panel, and detach the trim panel.

8. Remove the inside handle.
9. Remove the tweeter.

Installation

To install, follow the removal steps in the reverse order.

Rear Door Trim Panel

Rear Door Trim Panel and Associated Parts

Legend

- | | |
|---------------------|------------------------------|
| (1) Inside Handle | (3) Rear Door Corner Garnish |
| (2) Door Trim Panel | (4) Power Window Switch |

Removal

1. Disconnect the battery ground cable.
2. Remove the one screw from the pull case.

655R10002

3. Remove the inside handle fixing screw.

CAUTION: Take care not to apply excessive force on the inside handle link, lest this link be elongated, which could make it impossible to operate the door with the inside handle.

4. Remove the rear door corner garnish.
 - Pull the garnish to disconnect the retaining clip.
5. Remove the door trim panel.
 - Pull the trim panel at the eight clip positions from the door panel.

655R10003

- Disconnect the power window switch connector to lift the trim panel and unlock the engagement of the waist seal section, then pass the inside lever through the mounting hole of the trim panel, and

detach the trim panel.

6. Remove the inside handle.
7. Remove the power window switch (1) and pull case.
 - Remove the fixing screws of switch from back side of the rear door trim (2).

825RW079

Installation

To install, follow the removal steps in the reverse order.

Door Mirror Assembly

Removal

1. Disconnect the battery ground cable.
2. Remove the door mirror cover (3).
3. Remove the door mirror assembly (1).
 - Remove the three bolts and disconnect the connector (2).

4. Remove the mirror from the mirror base.
 - Prepare a scraper (1) or metal scale, which thickness is less than 1 mm.
 - Insert the scraper or metal scale from the inside as shown in figure and lift up the back side of the mirror in approx. 10 mm.
 - Peel the periphery part off little by little with fingers.

Installation

To install, follow the removal steps in the reverse order.

Mirror Replacement

1. Disconnect the battery ground cable.
2. Push down the door mirror (2) to ward the front of vehicle.
3. Heat the periphery (3) of the mirror with a dryer (1).
 - As the dryer keeps the specific distance of 50 mm to 60 mm from the mirror, heat uniformly.
 - Touch the heating part by hand to check if the mirror base becomes soft.

CAUTION: As pressing excessively and peeling off may damage it, handle it with care. When replacing the mirror which is broken, take care to avoid the injury.

5. When installing the mirror, heat the periphery (1) of the mirror base in same order to remove it.

720RY00004

6. Peeling off the protection sheet of butyl tape, put it on the mirror base.
- Check the direction of the upper and lower to put it on.
 - Put the mirror on the mirror base little by little

from the outside of the mirror.

- After checking that the lip of periphery of the mirror base covers the mirror uniformly, push the butyl tape to put it on by palm of hand.

CAUTION: When replacing the mirror, check the part number and change the mirror of the same part number.

720RY00005

Interior Mirror Assembly

Removal

1. Disconnect the battery ground cable.
2. Remove the harness clip (1).
3. Remove the interior mirror assembly (4).
 - Pull the interior mirror up with the stay and remove the interior mirror from the base (3).
 - Disconnect the connector (2).

825R100021

Installation

To install, follow the removal steps in the reverse order.

Interior Trim Panels

Interior Trim Panels and Associated Parts

643RY0001

Legend

- | | |

| (4) Rear Roof Trim Cover | (10) Upper Center Pillar Trim Cover |
| (5) Tailgate Weather Strip | (11) Front Pillar Trim Cover |
| (6) Rear End Floor Trim Cover | |

Removal

1. Disconnect the battery ground cable.
2. Remove the sill plates (Front & Rear).
3. Remove the dash side trim cover.
4. Remove the lower center pillar trim cover.
 - Remove the lower anchor bolt cover and lower anchor bolt from the front seat belt.
 - Pry the trim cover clips free from the body panel.
5. Remove the door finishers (Front & Rear).
6. Remove the upper center pillar trim cover.
 - Pry the trim cover clips free from the body panel.
7. Remove the front pillar trim cover.
 - Pry the trim cover clips free from the body panel.
8. Remove the tailgate weather strip.
9. Remove the rear end floor trim cover.
 - Remove the five fixing screws.

10. Remove the luggage room light.

- Remove the luggage room light lens (1) and the fixing screw.
- Disconnect the luggage room light connector.

11. Remove the rear roof trim cover.

- Pry the trim cover clips free from the body panel.

12. Remove the tonneau cover assembly (1).

13. Remove the lower anchor bolt cover (6) and the lower anchor bolt (5) from the rear seat belt.

14. Remove the lower quarter trim cover (1).

- Remove the tool box lid (3) and fixing screw (4). Pry the five (RH) or six (LH) clip positions (2) free from the body panel.
- Disconnect the accessory socket connector (LH side).

15. Remove the upper quarter trim cover (1).

- Pry the twelve clip positions (2) free from the body panel.

8J-12 EXTERIOR/INTERIOR TRIM

16. Remove the front pillar assist grip (1) (Front & Rear).

- Open the both sides of the assist grip cover (2) and remove the fixing screws and the front pillar assist grip.

743RW003

Installation

To install, follow the removal steps in the reverse order, noting the following point:

1. Tighten the seat belt anchor bolt to the specified torque.

Torque: 39N·m (4.0kg·m/29lbft)

Overhead Console

Parts Location

743R10002

Legend

- | | |
|------------------------------|-------------------------------|
| (1) Overhead Console Bracket | (5) Overhead Console Assembly |
| (2) Harness Connector | (6) Front Door Finisher |
| (3) Head Lining | (7) Front Assist Grip |
| (4) Interior Mirror | |

Removal

1. Disconnect the battery ground cable.
2. Remove the overhead console assembly.
 - Open the lid and remove the two screws.
 - Disconnect the harness connector.
3. Remove the sunvisor and sunvisor holder. (right and left)
4. Remove the front assist grip. (right and left)
5. Remove the front pillar trim cover.
6. Remove the front door finisher.
 - Remove the upper side of door finisher.
7. Remove the interior mirror.
8. Remove the overhead console bracket.
 - Remove the two screws.

Installation

To install, follow the removal steps in the reverse order.

Headlining

Parts Location

666RY0003

Legend

- | | |
|----------------------------------|--|
| (1) Interior Trim Panels | (7) Sunroof Finisher (With Sunroof) |
| (2) Clip | (8) Sunroof Switch (With Sunroof) |
| (3) Headlining (Without Sunroof) | (9) Sunvisors |
| (4) Assist Grip | (10) Sunvisor Holder |
| (5) Dome Light | (11) Overhead Consol (Without Sunroof) |
| (6) Headlinng (With Sun Roof) | |

Removal

1. Disconnect the battery ground cable.
2. Remove the interior trim panels.
 - Refer to Interior Trim Panels in this section.
3. Remove the dome light.
 - Remove the dome light lens and the fixing screws.
 - Disconnect the dome light connectors.

4. Remove the sunroof switch (With sunroof).

- Pry the clip positions free from the sunroof switch bracket and disconnect the connector.

665RW002

5. Remove the overhead consol (Without sunroof).

- Refer to Overhead Consol Assembly in Exterior/Interior section.

6. Remove the sunvisors.

- Remove the fixing screws and pull out the sunvisor holder (1) to remove it.

743R200003

7. Remove the sunroof finisher (With sunroof).

8. Remove the headlining.

- Remove the headlining fixing clips.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Install the headlining so that the fixing clips will not come off.
2. To install the sunroof finisher (1), first fit it in at one place with the headlining (3) close to the sunroof frame complete (2), then install the entire finisher tightly by hitting it with a plastic hammer, not allowing it to move up.

665RW003

Wheel Arch Protector

Wheel Arch Protector and Associated Parts

Legend

- | | |
|-------------------------------|--------------------------------|
| (1) Wheel Arch Protector | (6) Double Sided Adhesive Tape |
| (2) Rear Door Panel | (7) Clip |
| (3) Rear Door Wheel Arch Seal | (8) Screw Grommet |
| (4) Wheel Arch Cover | (9) Clip |
| (5) Body Panel | |

Removal

1. Remove the wheel arch cover.
 - Remove the four fixing screws.
2. Remove the wheel arch protector.
 - Remove the two fixing screws from the back side of the rear door panel and pull out the clips at three positions.
3. Remove the rear door wheel arch seal.
 - After disengaging five clips, peel off the double sided adhesive tape.

Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Use a new double sided adhesive tape whenever installing the rear door wheel arch seal. Using a white gasoline, clean the places in advance where a double sided adhesive tape is affixed.

Wheel Arch Moulding

Wheel Arch Moulding and Associated Parts

620RY0007

Legend

| (3) Rocker Wheel Arch Extension | |

Removal

1. Remove the front mud flap (2).
 - Remove the four fixing screws (1).
(Three of four screws are fixed together with moulding.)

647RW002

2. Remove the front wheel arch molding.
 - Remove the three fixing screws and pull out the clips at three positions from the fender panel.
3. Remove the rocker wheel arch extension.
 - Remove the fixing bolt (4) and screw (3). Pull out the extension with the two clips (1) from the rocker outer panel.
4. Remove the quarter panel wheel arch moulding.
 - Remove the three fixing screws (2) and pull out the moulding with the three clips (1) from the quarter outer panel.
5. Remove the rear wheel arch moulding.
 - Remove the three fixing screws (5) of the back of the door panel and pull out the moulding with the three clips (1) from the door outer panel.

620RY0003

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Install the front wheel arch molding (2).
 - Install the six nuts (1) to the body panel (4).
 - Put the four clips (3) of the front wheel arch molding into the body in order of A, B, C and D.
2. Install the six fixing screws (6).
(Three of six screws are fixed together with the front mud flap.)

620RW015

Fuel Filler Door

686RW010

Legend

- (1) Fuel Filler Door Fixing Screw
- (2) Basic Hole
- (3) Fuel Filler Door Buffer
- (4) Fuel Filler Door
- (5) Fuel Filler Door Hinge Buffer

Removal

1. Open the fuel filler door.
2. Remove the fuel filler door.
 - Remove the two fixing screws.
3. Pull out the fuel filler door buffer.
4. Pull out the fuel filler hinge buffer.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Install the fuel filler door to match the basic hole.
2. Adjust the clearance between quarter outer panel (1) and fuel filler door (2).

686RX003

Roof Rail

Parts Location

660RY00016

Legend

- | | |

| (1) Roof Rail Fixing Bolt | (3) Roof Rail Sub Assembly |
| (2) Rear Roof Rail Cover | (4) Front Roof Rail Cover |

Removal

1. Remove the front and rear of roof rail cover.
 - Pry the roof rail covers.
2. Remove the roof rail sub assembly.
 - Remove the four fixing bolts at each roof rail.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Tighten the roof rail sub assembly fixing bolts to the specified torque.

Torque 8N·m (0.8kg·m/69lbin)

Power Door Mirror System

General Description

The system consists of the starter switch, door mirror switch, rear defogger/mirror defogger switch and door mirrors on both sides.

When the door mirror switch is operated with the starter switch at either "ACC" or "ON" position, the motor in the door mirror (on either side) rotates to allow the horizontal and vertical adjustment of mirror angles.

When the rear defogger/mirror defogger switch is turned "ON" (with the starter switch at "ON" position), the heaters in both left and right mirrors and the rear hatchgate glass are activated to defog both mirrors and rear hatchgate glass at the same time.

Door Mirror Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the instrument panel lower cover (1). Refer to the instrument panel assembly in Body Structure section.
3. Remove the door mirror switch (2).

825RW266

Installation

To install, follow the removal steps in the reverse order.

Rear Defogger/Mirror Defogger Switch

Refer to Rear Defogger/Mirror Switch in Lighting System section.

Door Mirrors

Refer to Door Mirror Assembly in this section.

Power Window System

General Description

The power window system consists of power window switches and power window motors on driver and passenger sides and power window relay. With the starter switch in "ON" position, the battery voltage is supplied through power window relay to the power window switches on driver and passenger sides. Selection of up or down switch changes the motor rotating direction to open or close the window. When the lock switch on the switch panel on the driver side is pressed, the power window switch is in open state. As a result, the power source to the other switches are cut off, and the power window motors do not run.

Power Window Switch Driver Seat Side

Removal

1. Disconnect the battery ground cable.
2. Remove the switch (1).
 - Pull out the switch by pushing the spring with the tip of a screwdriver.
 - Disconnect the connector.

825RY00073

Installation

To install, follow the removal steps in the reverse order.

Front Passenger Seat Side

Removal

1. Disconnect the battery ground cable.
2. Remove the switch (1).
 - Pull out the switch by pushing the spring with the tip of a screwdriver.
 - Disconnect the connector.

825RW264

Installation

To install, follow the removal steps in the reverse order.

Rear-Left and Right Sides

Removal

1. Disconnect the battery ground cable.
2. Remove the rear door trim panel (2).
 - Refer to Rear Door Trim Panel in this section.
 - Disconnect the rear power window switch (1) connector.

3. Remove the rear power window switch (1).
 - Remove the switch fixing screw from the back side of the rear door trim (2).

825RW081

825RW079

Installation

To install, follow the removal steps in the reverse order.

Power Window Motor

Driver Seat Side

Removal

1. Disconnect the battery ground cable.
2. Remove the window regulator assembly (2).
 - Refer to Window Regulator and Glass in Body Structure section.
3. Remove the power window motor (1).
 - Remove three screws.

825RW096

Installation

To install, follow the removal steps in the reverse order.

Front Passenger Seat Side

Removal and Installation

Refer to Front Window Motor — Driver Seat Side in this section.

Rear-Left Side

Removal

1. Disconnect the battery ground cable.
2. Remove the rear window regulator assembly (2).
 - Refer to Rear Window Regulator and Glass in Body Structure section.
3. Remove the power window motor (1).
 - Remove three screws.

825RW095

Installation

To install, follow the removal steps in the reverse order.

Rear-Right Side

Removal and Installation

Refer to Rear Power Window Motor — Left Side in this section.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Front Seat Belt

Front Seat Belt and Associated Parts

760R100045

Legend

- | | |
|---|------------------------------------|
| (1) Door Seal Finisher (Front & Rear) | (7) Seat Belt Lower Anchor Bolt |
| (2) Adjustable Shoulder Anchor Assembly | (8) Lower Center Pillar Trim Cover |
| (3) Seat Belt Upper Anchor Bolt | (9) Retractor |
| (4) Upper Center Pillar Trim Cover | (10) Rear Sill Plate |
| (5) Front Seat Belt Assembly | (11) Front Sill Plate |
| (6) Anchor Cover | |

Removal

1. Disconnect the battery ground cable.
2. Remove the sill plate (Front & Rear).
3. Remove the anchor cover and seat belt lower anchor bolt.
4. Remove the lower center pillar trim cover.
5. Remove the door seal finisher (Front & Rear).
6. Remove the upper center pillar trim cover.
7. Remove the seat belt upper anchor bolt.
8. Remove the retractor fixing bolt.
9. Remove the seat belt assembly.
10. Remove the adjustable shoulder anchor assembly.
 - Remove the two fixing bolts.

Inspection

If any of the following abnormalities is found, replace on an assembly basis.

- Deform and malfunction of adjustable shoulder anchor (1).
- No smooth move of upper/lower anchors (2) in the circumferential direction.
- Damaged and/or deformed through ring (3).
- Damaged and/or deformed tongue (4).
- Damaged and/or frayed of webbing (5).
- Deformed retractor bracket (6).
- Seat belt not rewound up (7).
- Resistance or abnormal sound when seat belt is wound out and rewound (7).

- Retractor (7) abnormality.

760R100032

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Tighten the adjustable shoulder anchor assembly fixing bolts to the specified torque.

Torque: 39N·m (4.0kg-m/29lbf·ft)

2. Tighten the seat belt anchor bolts (Upper & Lower) and the retractor fixing bolts to the specified torque.

Torque: 39N·m (4.0kg-m/29lbf·ft)

Inspection of retractor

1. ELR (Emergency Locking Retractor) lock inclining angle check.
 - When the retractor is moved gently from its installing position, make sure it is not locked within 15° in any directions, and it remains locked at 45° or larger.
2. ELR lock check.
 - When the seat belt is drawn slowly with the retractor installed, make sure it is not locked. And when it is drawn quickly, make sure it is locked.

CAUTION: Do not disassemble the retractor.

Front Seat Belt

Front Seat Belt and Associated Parts

| (6) Tailgate Weather Strip | (14) Rear Sill Plate |
| (7) Rear End Floor Trim Cover | (15) Rear Door Seal Finisher |
| (8) Lower Quarter Trim Cover | |

Removal

1. Disconnect the battery ground cable.
2. Remove the tailgate weather strip.
3. Remove the rear end floor trim cover.
4. Remove the luggage room light.
 - Remove the luggage room light lens (1) and the fixing screw.

- Disconnect the luggage room light connector.

825RW100

- Remove the rear roof trim cover.
 - Pry the trim cover clips free from the body panel.
- Remove the rear sill plate.
- Remove the anchor cover and the lower anchor bolt.
- Remove the upper and lower quarter trim cover.
 - Refer to Interior Trim Panel (LWB) in Exterior/Interior Trim section.
- Remove the slider plate trim assembly (2).
 - Remove the two fixing screws from the adjustable shoulder anchor (1).
 - Pull out the seat belt through the hole (3) on the slider plate trim.

755RW069

- Remove the seat belt upper anchor bolt.
- Remove the retractor.
- Remove the rear seat belt assembly.
- Remove the adjustable shoulder anchor assembly.

- Remove the two fixing bolts.

Inspection

If any of the following abnormalities is found, replace on an assembly basis.

- Deform and malfunction of adjustable shoulder anchor (1).
- No smooth move of upper/lower anchors (2) in the circumferential direction.
- Damaged and/or deformed through ring (3).
- Damaged and/or deformed tongue (4).
- Damaged and/or frayed of webbing (5).
- Deformed retractor bracket (6).
- Seat belt not rewound up (7).
- Resistance or abnormal sound when seat belt is wound out and rewound (7).
- Retractor (7) abnormality.

760R1000051

Inspection of retractor

1. ELR (Emergency Locking Retractor) lock inclining angle check.
 - When the retractor is moved gently from its installing position, make sure it is not locked within 15° in any directions, and it remains locked at 45° or larger.
2. ELR lock check.
 - When the seat belt is drawn slowly with the retractor installed, make sure it is not locked. And when it is drawn quickly, make sure it is locked.

CAUTION: Do not disassemble the retractor.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Tighten the adjustable shoulder anchor assembly and retractor fixing bolts to the specified torque.
Torque: 39N·m (4.0kg·m/29lbft)
2. Tighten the seat belt anchor bolts (Upper & Lower) and the retractor fixing bolts to the specified torque.
Torque: 39N·m (4.0kg·m/29lbft)

Front Seat Buckle Assembly

Removal

1. Disconnect the battery ground cable.
2. Disconnect the seat belt warning connector (driver's side) and remove a clip.
3. Remove the front seat buckle assembly (1).

760RY00016

Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Tighten the buckle anchor bolt to the specified torque.

Torque: 39N·m (4.0kg·m/29lbft)

Rear Center Seat Belt / Buckle Assembly

Rear Center Seat Belt / Buckle Assembly and Associated Parts

755R200006

Legend

- | | |
|------------------------------------|---------------------------------|
| (1) Rear Seat Lock Assembly | (3) Rear Cushion Frame Assembly |
| (2) Rear Seat Belt Buckle Assembly | |

Removal

1. Remove the rear cushion frame assembly.
 - Refer to Rear Seat Assembly in Seats section.
2. Remove the rear seat lock assembly and rear seat belt buckle assembly.

Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Tighten the rear seat lock assembly and rear seat belt buckle assembly fixing bolts to the specified torque.

Torque: 39N-m (4.0kg-m/29lbft)

NOTE: Removal and installation procedure of rear center seat belt assembly same as rear seat belt buckle assembly procedures.

Child Seat Tether Anchor Bracket (Child Restraint)

General Description

Plastic plug is provided at two or three places on the luggage floor panel.

Remove the center plug from the floor panel.

Install the bracket to the hole where the plug is

removed.

Alternatively, the bracket may be installed in the right-hand or left-hand plug hole.

Child Seat Tether Anchor Bracket and Associated Parts

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

CAUTION: When fasteners are removed, always reinstall them at the same location from which they were removed. If a fastener needs to be replaced, use the correct part number fastener for that application. If the correct part number fastener is not available, a fastener of equal size and strength (or stronger) may be used. Fasteners that are not reused, and those requiring thread locking compound will be called out. The correct torque value must be used when installing fasteners that require it. If the above conditions are not followed, parts or system damage could result.

Restraint Devices

Legend

- (1) Deployed Air Bag
- (2) Knee Bolster
- (3) Seat Belt

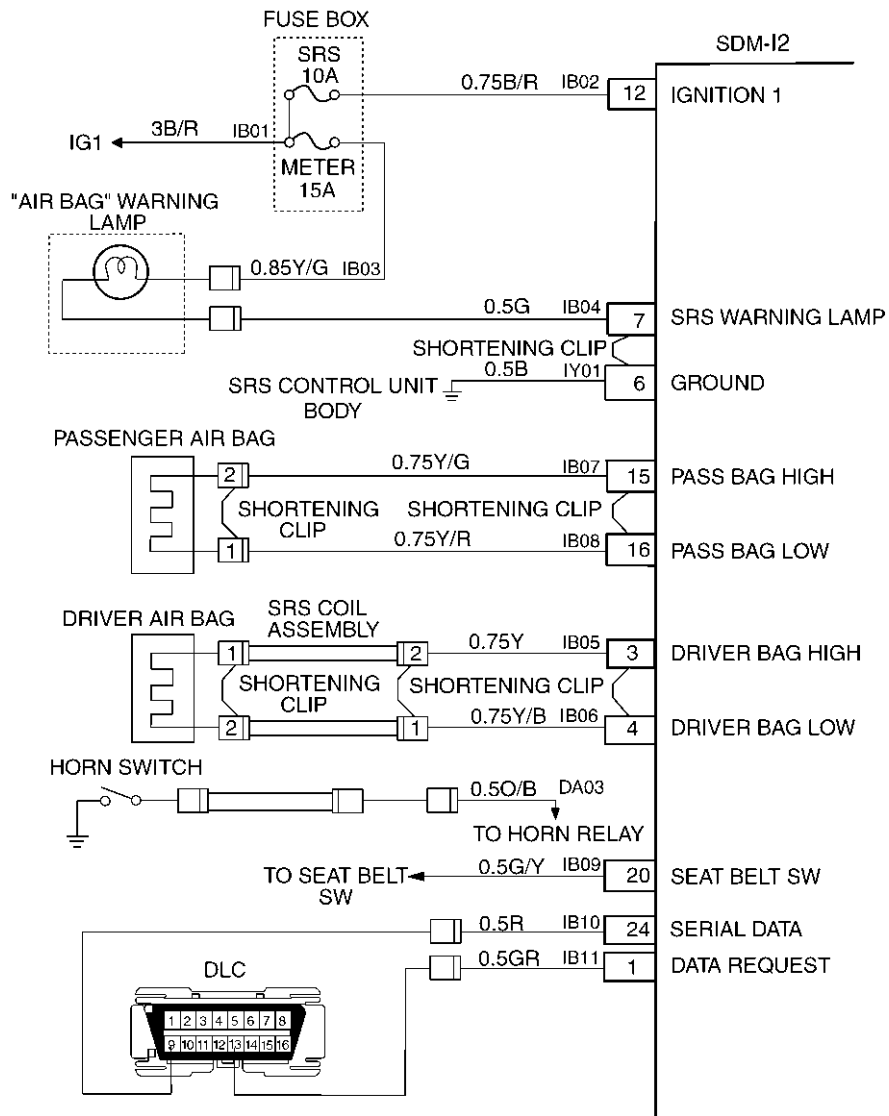

The Supplemental Restraint System (SRS) helps supplement the protection offered by the driver and front passenger seat belts by deploying an air bag from the center of the steering wheel and from the top of the right side of the instrument panel.

The air bag deploys when the vehicle is involved in a frontal crash of sufficient force up to 30 degrees off the centerline of the vehicle. To further absorb the crash energy there is a knee bolster located beneath the instrument panel for both the driver and passenger, and the steering column is collapsible.

System Description

The SRS consists of the Sensing and Diagnostic Module (SDM), the driver air bag assembly, the SRS coil assembly, the passenger air bag assembly, and the "AIR BAG" warning lamp in the instrument cluster. The SDM, SRS coil assembly (driver side only), driver air bag assembly, passenger air bag assembly and connector wire make up the deployment loops. The function of the deployment loops is to supply current through air bag assembly, which will cause deployment of the air bags in the event of a frontal crash of sufficient force, up to 30 degrees off the centerline of the vehicle. The air bag assemblies are only supplied enough current to deploy when the SDM detects vehicle velocity changes severe enough to warrant deployment. The SDM contains a sensing device which converts vehicle velocity change to an electrical signal. The electrical signal generated is processed by the SDM and then compared to a value stored in memory. When the generated signal exceeds the stored value, the SDM will cause current to flow through the air bag assembly deploying the air bags.

WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY.

The SDM is designed to perform the following functions in the Supplemental Restraint System (SRS):

1. Energy Reserve — The SDM maintains 24-Volt Loop Reserve (24VLR) energy supply to provide deployment energy when ignition voltage is lost in a frontal crash.
2. Frontal Crash Detection — The SDM monitors vehicle velocity changes to detect frontal crashes which are severe enough to warrant deployment.
3. Air Bag Deployment — When a frontal crash of sufficient force is detected, the SDM will cause enough current to flow through the air bag assembly to deploy the air bag.
4. Malfunction Detection — The SDM performs diagnostic monitoring of SRS electrical components and sets a diagnostic trouble code when a malfunction is detected.
5. Frontal Crash Recording — The SDM records information regarding SRS status during frontal crash.
6. Malfunction Diagnosis — The SDM displays SRS diagnostic trouble codes and system status information through the use of a scan tool.
7. Driver Notification — The SDM warns the vehicle driver of SRS malfunctions by controlling the "Air Bag" warning lamp.

The SDM is connected to the SRS wiring harness by a 24-pin connector. This harness connector uses a shorting clip across certain terminals in the contact area. This shorting clip connects the "AIR BAG" warning lamp to ground when the SDM harness connector is disconnected or Connector Position Assurance (CPA) is not inserted even if completely connected. This will cause the "AIR BAG" warning lamp to come "ON" steady whenever the ignition switch is at the ON or START positions with the SDM disconnected.

Component Description

SDM (Sensing and Diagnostic Module)

WARNING: DURING SERVICE PROCEDURES, BE VERY CAREFUL WHEN HANDLING A SDM. NEVER STRIKE OR JAR THE SDM. NEVER POWER UP THE SRS WHEN THE SDM IS NOT RIGIDLY ATTACHED TO THE VEHICLE. ALL SDM AND MOUNTING BRACKET FASTENERS MUST BE CAREFULLY TORQUED AND THE ARROW MUST BE POINTED TOWARD THE FRONT OF THE VEHICLE TO ENSURE PROPER OPERATION OF THE SRS. THE SDM COULD BE ACTIVATED WHEN POWERED

827RW067

Legend

- (1) Connector Position Assurance (CPA)
- (2) Supplemental Restraint System (SRS) Harness
- (3) Sensing and Diagnostic Module (SDM)

821RW116

SRS Coil Assembly

The SRS coil assembly consists of two current carrying coils. This is attached to the steering column and allow rotation of the steering wheel while maintaining continuous contact of the driver deployment loop to the driver air bag assembly.

There is a shorting clip on the yellow 2-pin connector near the base of steering column which connects the SRS coil to the SRS wiring harness.

The shorting clip shorts to the SRS coil and driver air bag assembly when the yellow 2-pin connector is disconnected. The circuit to the driver air bag assembly is shorted in this way to help prevent unwanted deployment of the air bag when servicing the steering column or other SRS components.

“Air Bag” Warning Lamp

Ignition voltage is applied to the “AIR BAG” warning lamp when the ignition switch is at the ON or START positions. The SDM controls the lamp by providing ground with a lamp driver. The “AIR BAG” warning lamp is used in the SRS to do the following:

1. Verify lamp and SDM operation by flashing SEVEN (7) times when the ignition switch is first turned “ON”.
2. Warn the vehicle driver of SRS electrical system malfunctions which could potentially affect the operation of the SRS. These malfunctions could result in nondeployment in case of a frontal crash or deployment for conditions less severe than intended.

The “AIR BAG” warning lamp is the key to driver notification of SRS malfunctions. For proper lamp operation, refer to the “SRS Diagnostic System Check” in this section.

825RS071

Air Bag Assemblies

The air bag assembly consist of an inflatable air bag

9J-6 SUPPLEMENTAL RESTRAINT SYSTEM

assembly and an inflator (a canister of gas-generating material and an initiating device). When the vehicle is in a frontal crash of sufficient force.

The SDM causes current flow through the deployment loops. Current passing through the inflator ignites the material in the air bag assembly. The gas produced from this reaction rapidly inflates the air bag assembly. There is a shorting clip on the driver air bag assembly connector which connects the SRS coil assembly. The shorting clip shorts across the driver air bag assembly circuits when driver air bag assembly connector is disconnected.

The circuit to the driver air bag assembly is shorted in this way to help prevent unwanted deployment of the air bag when servicing the driver air bag assembly, the steering column or other Supplemental Restraint System (SRS) components.

There is a shorting clip on the passenger air bag assembly connector which connects to the SRS harness. The shorting clip shorts across the passenger air bag assembly circuit when the passenger air bag assembly connector is disconnected. The circuit to the passenger air bag assembly is shorted in this way to help prevent unwanted deployment of the air bag when servicing the passenger air bag assembly, the instrument panel or other SRS components.

Steering Column

The steering column absorbs energy and is designed to compress in a frontal crash to decrease the chance of injury to the driver.

Knee Bolster

The knee bolsters are used to absorb energy to protect knees and control the forward movement of the vehicle's front seat occupants during a frontal crash, by limiting leg movement.

740RS021

Definition

Air Bag

An inflatable cloth cushion designed to deploy in certain frontal crashes. It supplements the protection offered by the seat belts by distributing the impact load more evenly over the vehicle occupant's head and torso.

(B+)

Battery voltage, (B+) The voltage available at the battery at the time of the indicated measurement. With the key "ON" and the engine not running, the system voltage will likely be between 12 and 12.5 volts. At idle the voltage may be 14 to 16 volts. The voltage could be as low as 10 volts during engine cranking.

Bulb Check

The Sensing and Diagnostic Module (SDM) will cause the "AIR BAG" warning lamp to flash seven times and then go "OFF" whenever the ignition switch transitions to the ON position from any other ignition switch position and no malfunctions are detected.

"CONTINUOUS MONITORING"

Tests performed by the SDM on the SRS every 100 milliseconds while "Ignition 1" voltage is in the normal operating voltage range at the SDM.

Data Link Connector (DLC)

Formerly "DLC" a connector which allows communication with an external computer, such as a scan tool.

Deploy

To inflate the air bag.

Deployment Loops

The circuits which supply current to the air bag assemblies to deploy the air bag.

Diagnostic Trouble Code (DTC)

Formerly "Code", a numerical designator used by the SDM to indicate specific SRS malfunctions.

Driver Current Source

An output of the SDM which applies current into the driver air bag assembly circuit during the "Initiator Assembly Resistance Test".

Driver Air Bag Assembly

An assembly located in the steering wheel hub consisting of an inflatable bag, an inflator and an initiator.

EEPROM

Electrically Erasable Programmable Read Only Memory. Memory which retains its contents when power is removed from the SDM.

Ignition Cycle

The voltage at the SDM "Ignition 1" inputs, with ignition switch "ON", is within the normal operating voltage range for at least ten seconds before turning ignition switch "OFF".

Ignition 1

A battery voltage (B+) circuit which is only powered with the ignition switch in the ON, or START positions.

Initiator

The electrical component inside the air bag assembly which, when sufficient current flows, sets off the chemical reaction that inflates the air bag.

"Initiator Assembly Resistance Test"

Tests performed once each ignition cycle when no malfunctions are detected during "Turn-ON" or "Continuous Monitoring." This test checks for the correct SDM configuration for the vehicle, shorts to "Ignition 1" in the deployment loops, high resistance or opens in the "Driver Side High", "Driver Side Low", "Passenger Side High" and "Passenger Side Low" circuits and measures the resistance of the inflator assembly consisting of: 1) Initiators, 2) SRS coil assembly (driver side only), 3) Connectors and associated wiring.

Normal Operating Voltage Range

The voltage measured between the SDM "Ignition 1" terminals and "Ground" terminals is between 9 and 16 volts.

Passenger Current Source

An output of the SDM which applies current into the passenger air bag assembly circuit during the "Initiator Assembly Resistance Test".

Passenger Air Bag Assembly

An assembly located in the left side of the instrument panel consisting of an inflatable bag, an inflator and an initiator.

Scan Tool

An external computer used to read diagnostic information from onboard computers via the data link connector.

SDM

Sensing and Diagnostic Module which provides reserve energy to the deployment loops, deploys the air bags when required and performs diagnostic monitoring of all SRS components.

Serial Data

Information representing the status of the SRS.

SRS

Supplemental Restraint System.

SRS Coil Assembly

An assembly of two current-carrying coils in the driver deployment loop that allows the rotation of the steering wheel while maintaining the continuous contact of the driver deployment loop to the driver air bag assembly.

SRS Wiring Harness

The wires and connectors that electrically connect the components in the Supplemental Restraint System (SRS).

"Turn-ON"

Test which the Sensing and Diagnostic Module (SDM) performs on the SRS once during each ignition cycle immediately after "Ignition 1" voltage is applied to the SDM and before "Continuous Monitoring".

Diagnosis

WARNING: TO AVOID DEPLOYMENT WHEN TROUBLESHOOTING THE SRS, DO NOT USE ELECTRICAL TEST EQUIPMENT SUCH AS A BATTERY-POWERED OR AC-POWERED VOLTMETER, OHMMETER, ETC., OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN THAT SPECIFIED IN THIS MANUAL. DO NOT USE A NON-POWERED PROBE-TYPE TESTER. INSTRUCTIONS IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT.

Diagnostic Trouble Codes

The "SRS Diagnostic System Check" must always be the starting point of any SRS diagnosis. The "SRS Diagnostic System Check" checks for proper "AIR BAG" warning lamp operation and checks for SRS diagnostic trouble codes using the scan tool.

1. Current diagnostic trouble codes – Malfunctions that are presently being detected. Current diagnostic trouble codes are stored in Random Access Memory (RAM).
2. History diagnostic trouble codes – All malfunctions detected since the last time the history memory was cleared. History diagnostic trouble codes are stored in Electronically Erasable Programmable

Read Only Memory (EEPROM).

Scan Tool Diagnostics

A scan tool is used to read current and history diagnostic trouble codes and to clear all diagnostic trouble codes after a repair is completed. The scan tool must be updated to communicate with the SRS through a replaceable cartridge before it can be used for SRS diagnostics. To use the scan tool, connect it to the data link connector and turn the ignition switch "ON". The scan tool reads serial data from the SDM "Serial Data" line terminal "24" to the data link connector terminal "9".

Use of Special Tools

WARNING: TO AVOID DEPLOYMENT WHEN TROUBLESHOOTING THE SRS, DO NOT USE ELECTRICAL TEST EQUIPMENT SUCH AS A BATTERY-POWERED OR AC-POWERED VOLTMETER, OHMMETER, ETC, OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN THAT SPECIFIED IN THIS MANUAL. DO NOT USE A NON POWERED PROBE-TYPE TESTER. INSTRUCTIONS IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT. YOU SHOULD BE FAMILIAR WITH THE TOOLS LISTED IN THIS SECTION UNDER THE HANDLING SRS SPECIAL TOOLS.

You should be able to measure voltage and resistance. You should be familiar with proper use of a scan tool such as the Tech 2 Diagnostic Computer, SRS Driver/ Passenger Load Tool 5-8840-2421-0, Connector Test Adapter Kit 5-8840-0385-0, and the DVM (Digital Multimeter) 5-8840-0285-0.

Repairs and Inspections Required After an Accident

NOTE: If any SRS components are damaged, they must be replaced. If SRS component mounting points are damaged, they must be replaced.

- Never use SRS parts from another vehicle. This does not include remanufactured parts purchased from an authorized dealer; they may be used for SRS repairs.
- Do not attempt to service the SDM, the SRS coil assembly, or the air bag assembly. Service of these items is by replacement only.
- Verify the part number of replacement air bag assembly.

CAUTION: Never use the air bag assembly from another vehicle.

Use only the air bag assembly for UE models.

CAUTION: Proper operation of the sensors and

Supplemental Restraint System (SRS) requires that any repairs to the vehicle structure return it to the original production configuration. Deployment requires, at a minimum, replacement of the SDM, air bag assembly and dimensional inspection of the steering column. Any visible damage to the SDM mounting bracket (s) requires replacement, and the steering column must be dimensionally inspected, whether deployment occurred or not.

Accident With Deployment – Component Replacement and Inspections

Certain SRS components must be replaced or inspected for damage after a frontal crash involving air bag deployment. Those components are:

- Air bag assembly
- SDM

CAUTION: Refer to "SDM Replacement Guidelines" below for important information on Sensing and

Diagnostic Module (SDM) replacement in both deployment and non deployment crashes.

- Supplemental Restraint System (SRS) coil assembly—Inspect wiring and connector for any signs of scorching, melting, or damage due to excessive heat. Replace if damaged. Refer to SRS coil assembly in this section.

Accident With or Without Deployment—Component Inspection

Certain SRS and restraint system components must be inspected after any crash, whether the air bag deployed or not. Those components are:

- Steering column—Dimensionally inspect per "Checking Steering Column for Accident Damage" in 3 of this workshop manual.
- Knee bolsters and mounting points— Inspect for any distortion, bending, cracking, or other damage.
- Instrument panel steering column reinforcement plate— Inspect for any distortion, bending, cracking, or other damage.
- Instrument panel braces—Inspect for any distortion, bending, cracking, or other damage.
- Seat belts and mounting points—Refer to "Seat Belts" in 10 of this workshop manual.

SDM Replacement Guidelines

SDM replacement policy requires replacement of SDM, after crash involving air bag deployment when "SRS Warning Lamp" turn "ON", "SRS Diagnosis" should be done according to "Section".

Wiring Damage

If any SRS wire harness is damaged, it should be replaced. Don't repair SRS. It is replace only.

SRS Connector (Plastic Body And Terminal Metal Pin) Damage

If any connector or terminal in the SRS wire harness (except pigtails) is damaged, it should be replaced.

SRS Wire Pigtail Damage

If the wiring pigtail (a wire or wires attached directly to the device, not by a connector) is damaged, the entire component (with pigtail) must be replaced. Examples of "pigtail" components are the driver air bag assembly, the passenger air bag assembly, and the SRS coil assembly.

On-Vehicle Service

Service Precautions

WARNING: WHEN PERFORMING SERVICE ON OR AROUND SRS COMPONENTS OR SRS WIRING, FOLLOW THE PROCEDURES LISTED BELOW TO TEMPORARILY DISABLE THE SRS. FAILURE TO FOLLOW PROCEDURES COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY OR OTHERWISE UNNEEDED SRS REPAIRS.

The SDM in Driver—Passenger SRS can maintain sufficient voltage to cause a deployment for up to 15 seconds after the ignition switch is turned "OFF", the battery is disconnected, or the fuse powering the SDM is removed.

Many of the service procedures require removal of the "SRS" fuse, and disconnection of the air bag assembly from the deployment loop to avoid an accidental deployment. If the air bag assembly is disconnected from the deployment loop as noted in the "Disabling the SRS" procedure that follows, service can begin immediately without waiting for the 15 second time period to expire.

Disabling The SRS

Removal

Turn the ignition switch to "lock" and remove key.

1. Remove SRS fuse "METER" and "SRS", from left dash side lower fuse block or disconnect battery.
2. Disconnect yellow 2-pin connector at the base of steering column.
3. Remove glove box assembly, Refer to "Passenger Air Bag Assembly Replacement" in section.
4. Disconnect yellow 2-pin connector behind the glove box assembly.

CAUTION: With the "SRS" fuse removed and ignition switch "ON", "AIR BAG" warning lamp will be "ON". This is normal operation and does not indicate an SRS malfunction.

Enabling The SRS

Installation

CAUTION: Never use the air bag assembly from another vehicle. Use only the air bag assembly for UE models.

Turn ignition switch to "LOCK" and remove key.

1. Connect yellow 2-pin connector passenger air bag assembly.
2. Install glove box assembly, refer to "Passenger Air Bag Assembly Replacement" in section.
3. Connect yellow 2-pin connector at the base of steering column.
4. Install "AIR BAG" fuse "METER" and "SRS" to left dash side lower fuse block or connect battery.

Turn ignition switch to "ON" and verify that the "AIR

BAG" warning lamp flashes seven times and then turns "OFF" If it does not operate as described, perform the "Supplemental Restraint System (SRS) Diagnostic System Check" in section.

Handling / Installation / Diagnosis

1. Air bag assembly should not be subjected to temperatures above 93°C (200°F).
2. Air bag assembly, and Sensing and Diagnostic Module (SDM) should not be used if they have been dropped from a height of 100 centimeters (3.28 feet).
3. When a SDM is replaced, it must be oriented with the arrow on the sensor pointing toward the front of the vehicle. It is very important for the SDM to be located flat on the mounting surface, parallel to the vehicle datum line. It is important that the SDM mounting surface is free of any dirt or other foreign material.
4. Do not apply power to the SRS unless all components are connected or a diagnostic chart requests it, as this will set a diagnostic trouble code.
5. The "SRS Diagnostic System Check" must be the starting point of any SRS diagnostics. The "SRS Diagnostic System Check" will verify proper "AIR BAG" warning lamp operation and will lead you to the correct chart to diagnose any SRS malfunctions. Bypassing these procedures may result in extended diagnostic time, incorrect diagnosis, and incorrect parts replacement.

Air Bag Assembly Handling / Shipping / Scrapping

Live (Undeployed) Air Bag Assembly

Special care is necessary when handling and storing a live (undeployed) air bag assembly. The rapid gas generation produced during deployment of the air bag could cause the air bag assembly, or an object in front of the air bag assembly, to be thrown through the air in the unlikely event of an accidental deployment.

827RX037

WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG OPENING IS POINTED AWAY FROM YOU. IN CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. NEVER CARRY THE AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF THE MODULE.

ALWAYS CARRY INFLATOR MODULE WITH TRIM COVER AWAY FROM BODY.

ALWAYS PLACE INFLATOR MODULE ON WORKBENCH WITH TRIM COVER UP, AWAY FROM LOOSE OBJECTS.

827RS044

Air Bag Assembly Shipping Procedure For Live (Undeployed) Air Bag Assemblies

Service personnel should refer to the latest Service Bulletins for proper Supplemental Restraint System (SRS) air bag assembly shipping procedures.

Deployed Air Bag Assembly

"You should wear gloves and glasses. After the air bag assembly has been deployed, the surface of the air bag may contain solid particulate. This solid particulate consists primarily of by products of the chemical reaction, Potassium Chloride and copper metal dust. Compounds of Potassium Borate, Strontium Chloride, Copper Chloride, and Ammonium Chloride may be found in amounts of about 1% (each) of the total particulate."

Air Bag Assembly Scrapping Procedure

During the course of a vehicle's useful life, certain situations may arise which will necessitate the disposal of a live (undeployed) air bag assembly. This information covers proper procedures for disposing of a live air bag assembly.

Before a live air bag assembly can be disposed of, it must be deployed. A live air bag assembly must not be disposed of through normal refuse channels.

WARNING: FAILURE TO FOLLOW PROPER SRS AIR BAG ASSEMBLY DISPOSAL PROCEDURES CAN RESULT IN AIR BAG DEPLOYMENT WHICH MAY CAUSE PERSONAL INJURY. AN UNDEPLOYED AIR BAG ASSEMBLY MUST NOT BE DISPOSED OF THROUGH NORMAL REFUSE CHANNELS. THE UNDEPLOYED AIR BAG ASSEMBLY CONTAINS SUBSTANCES THAT CAN CAUSE SEVERE ILLNESS OR PERSONAL INJURY IF THE SEALED CONTAINER IS DAMAGED DURING DISPOSAL. DISPOSAL IN ANY MANNER INCONSISTENT WITH PROPER PROCEDURES MAY BE A VIOLATION OF FEDERAL, STATE, AND / OR LOCAL LAW.

In situations which require deployment of a live air bag assembly module, deployment may be accomplished inside or outside the vehicle. The method employed depends upon the final disposition of the particular vehicle, as noted in "Deployment Outside Vehicle" and "Deployment Inside Vehicle" in this section.

Cautions About Air Bag Deployment And Disposal

Failure to follow proper procedures could result in erroneous air bag deployment which may cause personal injury be sure to follow proper procedures.

1. Turn off (Lock) the ignition switch and disconnect the minus terminal of the battery, then start the work 15 or more sec later. (Air bag is designed to work by the back-up power source even if the battery power source is cut off at vehicle collision).
2. Be sure not to disassemble the air bag.

3. Do not give an impact to the air bag and bring the air bag close to magnet. (The air bag could deploy unexpectedly).
4. Place the air bag with its trim cover up.
5. Do not let the air bag deploy directly on the floor. (The air bag may be blown off 20 ~ 30 cm (6.5 or 10 feet)).
6. Be sure to install the air bag firmly to a deployment tool (fixing tool).
7. Set a battery 10 m (33 feet) or more away from the air bag.
8. Before disconnecting air bag harness, ground the worker by touching the vehicle outer panel with bare hand.
9. When connecting or disconnecting the harness, do not work just in front of the air bag.
10. As deployment gives rise to big sound, warn the people around against it. Further, try to reduce the sound by covering the steering wheel or tires, and shut the vehicle windows in case of deployment inside the vehicle.
11. As deployment generates smoke, select a well ventilated place. (In case of deployment indoors, avoid deployment just under a fire alarm, smoke sensor, and fluorescent lamps).
12. Be careful not to inhale the smoke after deployment.
13. If part of the vehicle glass is damaged, cover the vehicle with a car cover to prevent the glass from braking at the time of deployment.
14. Do not touch the air bag immediately after deployment, since it remains hot for 30 minutes.
15. Do not water the air bag immediately after deployment.
16. Wear safety glasses and gloves throughout the work and wash the glasses and gloves after the work.
17. Do not reuse the removed air bag for another vehicle. (Deployment characteristic is different with vehicle types).

Deployment Outside Vehicle (Driver Air Bag Assembly)

Deployment outside the vehicle is proper when the vehicle is to be returned to service. This includes, for example, situations in which the vehicle will be returned to useful service after a functionally or cosmetically deficient air bag assembly is replaced. Deployment and disposal of a malfunctioning air bag assembly is, of course, subject to any required retention period. For deployment of a live (undeployed) air bag assembly outside the vehicle, the deployment procedure must be followed exactly. Always wear safety glasses during this deployment procedure until a deployed air bag assembly is scrapped or until an undeployed air bag assembly is shipped. Before performing the procedures you should be familiar with servicing the SRS and with proper handling of the air bag assembly. Procedures

should be read fully before they are performed. The following procedure requires use of 5-8840-2468-0 Supplemental Restraint System (SRS) Deployment Harness with the appropriate pigtail adapter. The procedure also requires the use of 5-8840-2420-0 Driver Side SRS Deployment Fixture. Do not attempt this procedure without 5-8840-2468-0 and fixture 5-8840-2420-0.

901RX046

901RX062

WARNING: FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED MAY RESULT IN PERSONAL INJURY. NEVER CONNECT DEPLOYMENT HARNESS TO ANY POWER SOURCE BEFORE CONNECTING DEPLOYMENT HARNESS TO THE DRIVER AIR BAG ASSEMBLY. DEPLOYMENT HARNESS SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. WEAR SAFETY GLASSES THROUGHOUT THIS

ENTIRE DEPLOYMENT AND DISPOSAL PROCEDURE.

NOTE: This information applies only to driver air bag assembly. Refer to "Deployment Outside Vehicle (Passenger Air Bag Assembly)" in this section for information on passenger air bag assembly scrapping.

18. Turn ignition switch to "LOCK", remove key and put on safety glasses.
19. Inspect 5-8840-2419-0 SRS Deployment Harness and appropriate pigtail adapter for damage. If harness or pigtail adapter is damaged, discard and obtain a replacement.
20. Short the two SRS deployment harness leads together by fully seating one banana plug into the other. SRS deployment harness shall remain shorted and not be connected to a power source until the air bag is to be deployed.

827RS003

21. Connect the appropriate pigtail adapter to the SRS deployment harness.

827RS004

9J-14 SUPPLEMENTAL RESTRAINT SYSTEM

1. Remove the driver air bag assembly from vehicle.
Refer to driver air bag assembly Removal in this Section.

WARNING: WHEN STORING A LIVE AIR BAG ASSEMBLY OR WHEN LEAVING A LIVE AIR BAG ASSEMBLY UNATTENDED ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE AIR BAG AND TRIM COVER UP AND AWAY FROM THE SURFACE. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. FAILURE TO FOLLOW PROCEDURES MAY RESULT IN PERSONAL INJURY.

22. Clear a space on the ground about 183 cm (6 feet) in clearance where the driver air bag assembly is to be deployed. A paved, outdoor location where there is no activity is preferred. If an outdoor location is not available, a space on the shop floor where there is no activity and sufficient ventilation is recommended. Ensure no loose or flammable objects are within the deployment area.

23. Place the J-41497 on the bench vice. This is necessary to provide sufficient stabilization of the fixture during deployment.
24. Attach the Driver air bag assembly in the J-41497. Air bag assembly must be mounted such that the bag will deploy upward. **SECURELY HAND-TIGHTEN ALL FASTENERS PRIOR TO DEPLOYMENT.**
25. Extend double pole extension cord to a position for away 10 m (33 feet) from the air bag assembly.
26. Place a power source near the shorted end of the SRS deployment harness. Recommended application: 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.

27. Connect the driver air bag assembly to the pigtail adapter on the Supplemental Restraint System (SRS) deployment harness. Deployment harness shall remain shorted and not be connected to a power source until the air bag is to be deployed. The driver air bag assembly will immediately deploy the air bag when a power source is connected to it.

NOTE: Ensure that the pigtail adapter is firmly seated into the driver air bag assembly connector. Failure to fully seat the connectors may leave the shorting bar located in the driver air bag assembly connector functioning (shorted) and may result in non deployment of the driver air bag assembly.

28. Verify that the area around the driver air bag assembly is clear of all people and loose or flammable objects.
29. Verify that the driver air bag assembly is firmly and properly in 5-8840-2420-0.
30. Notify all people in the immediate area that you intend to deploy the driver air bag. The deployment will be accompanied by a substantial noise which may startle the uninformed.
31. Separate the two banana plugs on the SRS deployment harness.

NOTE: When the air bag deploys, the rapid gas expansion will create a substantial noise. Notify all people in the immediate area that you intend to deploy the driver air bag.

WARNING: DEPLOYMENT HARNESS SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. CONNECTING THE DEPLOYMENT HARNESS TO THE POWER SOURCE SHOULD ALWAYS BE THE LAST STEP IN THE AIR BAG ASSEMBLY DEPLOYMENT PROCEDURE. FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED MAY RESULT IN PERSONAL INJURY.

32. Connect the Supplemental Restraint System (SRS) deployment harness wires to the power source to immediately deploy the driver air bag. Recommended application: 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.
33. Disconnect the SRS deployment harness from the power source.
34. Short the two SRS deployment harness leads together by fully seating one banana plug into the other.
35. In the unlikely event that the driver air bag assembly did not deploy after following these procedures, proceed immediately with Steps 24 through 26. If the driver air bag assembly did deploy, proceed with Steps 20 through 23.
36. Put on a pair of shop gloves and safety glasses to protect your hands and eyes from possible irritation and heat when handling the deployed driver air bag assembly. After the air bag assembly has been deployed, the surface of the air bag may contain solid particulate. This solid particulate consists primarily of by products of the chemical reaction, Potassium Chloride and copper metal dust. Compounds of Potassium Borate, Strontium Chloride, Copper Chloride, and Ammonium Chloride may be found in amounts of about 1% (each) of the total particulate.

WARNING: SAFETY PRECAUTIONS MUST BE OBSERVED WHEN HANDING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE METAL SURFACES OF THE AIR BAG ASSEMBLY WILL BE VERY HOT. ALLOW THE INFLATOR MODULE TO COOL BEFORE HANDLING ANY METAL PORTION OF IT. DO NOT PLACE THE DEPLOYED AIR BAG ASSEMBLY NEAR ANY FLAMMABLE OBJECTS. FAILURE TO FOLLOW PROCEDURES MAY RESULT IN FIRE OR PERSONAL INJURY.

AFTER A DRIVER AIR BAG ASSEMBLY HAS BEEN DEPLOYED, THE METAL CANISTER AND SURROUNDING AREAS OF THE DRIVER AIR BAG ASSEMBLY WILL BE VERY HOT. DO NOT TOUCH THE METAL AREAS OF THE DRIVER AIR BAG ASSEMBLY FOR ABOUT TEN MINUTES AFTER DEPLOYMENT. IF THE DEPLOYED DRIVER AIR BAG ASSEMBLY MUST BE MOVED BEFORE IT IS COOL,

WEAR GLOVES AND HANDLE BY THE AIR BAG OR TRIM COVER.

37. Disconnect the pigtail adapter from the driver air bag assembly as soon after deployment as possible. This will prevent damage to the pigtail adapter or SRS deployment harness due to possible contact with the hot driver air bag assembly canister. The pigtail adapter can be reused. They should, however, be inspected for damage after each deployment and replaced if necessary.
38. Dispose of the deployed driver air bag assembly through normal refuse channels after it has cooled for at least 30 minutes.
39. Wash your hands with mild soap and water afterward.

NOTE: The remaining steps are to be followed in the unlikely event that the driver air bag assembly did not deploy after following these procedures.

40. Ensure that the SRS deployment harness has been disconnected from the power source and that its two banana plugs have been shorted together by fully seating one banana plug into the other.

827RW055

41. Disconnect the pigtail adapter from the driver air bag assembly.

WARNING: WHEN STORING A LIVE AIR BAG ASSEMBLY OR WHEN LEAVING A LIVE INFLATOR MODULE UNATTENDED ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE BAG AND TRIM COVER UP AND AWAY FROM THE SURFACE. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. FAILURE TO FOLLOW PROCEDURES MAY RESULT IN PERSONAL INJURY.

42. Temporarily store the driver air bag assembly with its trim cover facing up, away from the surface upon which it rests.

Deployment Outside Vehicle (Passenger Air Bag Assembly)

WARNING: FAILURE TO FOLLOW PROPER SRS AIR BAG ASSEMBLY DISPOSAL PROCEDURES CAN RESULT IN AIR BAG DEPLOYMENT WHICH MAY CAUSE PERSONAL INJURY. UNDEPLOYED AIR BAG ASSEMBLIES MUST NOT BE DISPOSED OF THROUGH NORMAL REFUSE CHANNELS. THE UNDEPLOYED AIR BAG ASSEMBLY CONTAINS SUBSTANCES THAT CAN CAUSE SEVERE ILLNESS OR PERSONAL INJURY IF THE SEALED CONTAINER IS DAMAGED DURING DISPOSAL. DISPOSAL IN ANY MANNER INCONSISTENT WITH PROPER PROCEDURES MAY BE A VIOLATION OF FEDERAL, STATE AND/OR LOCAL LAWS.

Deployment out of the vehicle is proper when the vehicle is to be returned to service. This includes, for example, situations in which a functionally or cosmetically deficient air bag assembly is replaced. Deployment and disposal of an air bag assembly is, of course, subject to any required retention period. For deployment of a live air bag assembly out of the vehicle, the deployment procedure must be followed exactly. Always wear safety glasses during this deployment procedure until the deployed air bag assembly is scrapped. Before performing the procedures, you should be familiar with servicing the SRS system and with proper handling of the air bag assembly. Procedures should be read fully before they are performed.

The following procedure requires use of 5-8840-2468-0 SRS Deployment Harness with the appropriate pigtail adapter. The procedure also requires the use of 5-8840-2420-0 Passenger Side Supplemental Restraint System (SRS) Deployment Fixture. Do not attempt this procedure without 5-8840-2468-0 and fixture 5-8840-2420-0.

901RX046

901RW068

WARNING: FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED MAY RESULT IN PERSONAL INJURY. NEVER CONNECT DEPLOYMENT HARNESS TO ANY POWER SOURCE BEFORE CONNECTING DEPLOYMENT HARNESS TO THE AIR BAG ASSEMBLY. DEPLOYMENT HARNESS SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. WEAR SAFETY GLASSES THROUGHOUT THIS ENTIRE DEPLOYMENT AND DISPOSAL PROCEDURE.

NOTE: This information applies only to passenger air bag assembly. Information for disposing of a live driver air bag assembly can be found in "Deployment Outside Vehicle" (Driver Air Bag Assembly) in this section.

43. Turn ignition switch to "LOCK" remove key, and put on safety glasses.
44. Inspect 5-8840-2419-0 SRS Deployment Harness and appropriate pigtail adapter for damage. If harness or pigtail is damaged, discard and obtain a replacement.
45. Short the two SRS Deployment Harness leads together by fully seating one banana plug into the other. The SRS Deployment Harness shall remain shorted and not be connected to a power source until the air bag is to be deployed.

827RS003

46. Connect the appropriate pigtail adapter to the Supplemental Restraint System (SRS) Deployment Harness

827RS004

47. Remove passenger air bag assembly from vehicle. Refer to "Passenger Air Bag Assembly Removal" in this Section.
48. Clear a space on the ground approximately 183 cm (6 feet) in clearance where the fixture with attached air bag assembly is to be placed for deployment. A paved outdoor location where there is no activity is preferred. If an outdoor location is not available, a space on the shop floor where there is no activity and sufficient ventilation is recommended. Ensure that no loose or flammable objects are within the deployment area.
49. Place the 5-8840-2420-0 on the bench vice. This is necessary to provide sufficient stabilization of the fixture during deployment.
50. Attach the passenger air bag assembly in the 5-

8840-2420-0. Air bag assembly must be mounted such that the bag will deploy upward. SECURELY HAND-TIGHTEN ALL FASTENERS PRIOR TO DEPLOYMENT.

51. Extend double pole extension cord to a position for away 10 m (33 feet) from the air bag assembly.
52. Place a power source near the shorted end of the SRS deployment harness. (Recommended application: 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.)

827RX043

53. Connect the air bag assembly to the pigtail adapter on the SRS deployment harness. The SRS Deployment Harness shall remain shorted and not be connected to a power source until the air bag is to be deployed. The air bag assembly will immediately deploy the air bag when a power source is connected to it.

NOTE: Ensure that the pigtail adapter is firmly seated into the air bag assembly connector. Failure to fully seat the connectors may leave the shorting bar located in the air bag assembly connector functioning (shorting the deployment circuit) and may result in non deployment of the air bag assembly.

54. Verify that the area around the passenger air bag assembly is clear of all people and loose or flammable objects.
55. Verify that the passenger air bag assembly is firmly and properly in 5-8840-2420-0.

56. Notify all people in the immediate area of your intention to deploy the passenger air bag assembly. The deployment will be accompanied by a substantial noise which may startle the uninformed.
57. Separate the two banana plugs on the Supplemental Restraint System (SRS) deployment harness.

NOTE: When air bag deploys, the rapid gas expansion will create a substantial noise. Notify all people in the immediate area that you intend to deploy the air bag assembly.

WARNING: DEPLOYMENT HARNESS SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. CONNECTING THE DEPLOYMENT HARNESS TO THE POWER SOURCE SHOULD ALWAYS BE THE LAST STEP IN THE AIR BAG ASSEMBLY DEPLOYMENT PROCEDURE. FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED MAY RESULT IN PERSONAL INJURY.

58. Connect the SRS deployment harness wires to the power source to immediately deploy the air bag assembly. Recommended application : 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.
59. Disconnect the SRS deployment harness from the power source.
60. Short the two SRS deployment harness leads together by fully seating one banana plug into the other.
61. In the unlikely event that the passenger air bag assembly did not deploy after following these procedures, proceed immediately with Steps 24 through 26. If the passenger air bag assembly deployed as intended, proceed with Steps 20 through 23.
62. Put on a pair of shop gloves and safety glasses to protect your hands and eyes from possible irritation and heat when handling the deployed air bag assembly. After the air bag assembly has been deployed, the surface of the air bag may contain a powdery residue. This powder consists primarily of cornstarch (used to lubricate the bag as it inflates) and by products of the chemical reaction. Sodium hydroxide dust (similar to lye soap) is produced as a by product of the deployment reaction. The sodium hydroxide quickly reacts with the atmospheric moisture and is converted to sodium carbonate and sodium bicarbonate (baking soda). Therefore, it is unlikely that sodium hydroxide will be present for very long after deployment.

WARNING: SAFETY PRECAUTIONS MUST BE OBSERVED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE

METAL SURFACES OF THE AIR BAG ASSEMBLY WILL BE HOT. ALLOW THE AIR BAG ASSEMBLY TO COOL BEFORE HANDLING ANY METAL PORTION OF IT. DO NOT PLACE THE DEPLOYED INFLATOR MODULE NEAR ANY FLAMMABLE OBJECTS. FAILURE TO FOLLOW PROCEDURES MAY RESULT IN FIRE OR PERSONAL INJURY. AFTER AN AIR BAG ASSEMBLY HAS BEEN DEPLOYED, THE METAL CANISTER AND SURROUNDING AREAS OF THE AIR BAG ASSEMBLY WILL BE HOT. DO NOT TOUCH THE METAL AREAS OF THE AIR BAG ASSEMBLY FOR ABOUT THIRTY MINUTES AFTER DEPLOYMENT. IF THE DEPLOYED AIR BAG ASSEMBLY MUST BE MOVED BEFORE IT IS COOL, WEAR GLOVES AND HANDLE BY THE AIR BAG ITSELF.

63. Disconnect the pigtail adapter from the air bag assembly as soon after deployment as possible to avoid damage to the pigtail adapter or SRS deployment harness from contacting the hot air bag assembly canister. The pigtail adapter and SRS deployment harness are designed to be reused. They should, however, be inspected for damage after each deployment and replaced if necessary.
64. Dispose of the deployed air bag assembly through normal refuse channels after it has cooled for at least 30 minutes.
65. Wash your hands with mild soap and water afterward.

NOTE: The remaining steps are to be followed in the unlikely event that the air bag assembly did not deploy after following the above procedures.

66. Ensure that the SRS deployment harness has been disconnected from the the power source and that its two banana plugs have been shorted together by fully seating one banana plug into the other.

67. Disconnect the pigtail adapter from the air bag assembly.

WARNING: WHEN STORING A LIVE AIR BAG ASSEMBLY OR WHEN LEAVING A LIVE AIR BAG ASSEMBLY UNATTENDED ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE BAG UP AND AWAY FROM THE SURFACE. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. FAILURE TO FOLLOW PROCEDURES MAY RESULT IN PERSONAL INJURY.

68. Temporarily store the air bag assembly with the bag facing up, away from the surface upon which it rests.

Deployment Outside Vehicle (Fixing Air Bag on Tire)

Read and understand the items of “CAUTIONS ABOUT AIR BAG DEPLOYMENT AND DISPOSAL PROCEDURES” and “Usage of Deployment Tool” for safe deployment of air bag.

1. Remove air bag assembly from vehicle. Refer to air bag assembly Removal “in this section”.
2. Inspect 5-8840-2419-0 Supplemental Restraint System (SRS) Deployment Harness and appropriate pigtail adapter for damage. If harness or pigtail is damaged, discard and obtain a replacement.
3. Extend double pole extension cord to a position far away 10 m (33 feet) from the air bag assembly.
4. Place a power source near the extended end of SRS air bag deployment harness. (Use of 12V battery is recommended).

827RX040

Legend

(A) 10 m (33 feet) or more

5. Insert one of the banana plugs into the other banana plug to short the two SRS air bag deployment harness. Do not the harness to a power source until deployment.

827RW055

6. Prepare four 15 inch or larger tires without wheel and two same size tires with wheels.

827RX041

7. How to fix Driver air bag.

1. Fix the air bag with its trim cover up on a tire with a wheel using an automobile use wire harness, (core size: 1.3 mm² (0.05 inch)) or a wire trebly at two or more points.
2. Connect SRS air bag assembly to the double pole extension cord of the air bag deployment harness.
Do not connect the deployment harness to a power source until air bag deployment.
(If connected the SRS air bag assembly deploys immediately)

NOTE: Ensure that the pigtail adapter is firmly seated into the air bag assembly connector. Failure to fully seat the connectors may leave the shorting bar located in the air bag assembly connector functioning (shorting the deployment circuit) and may result in non deployment of

9J-20 SUPPLEMENTAL RESTRAINT SYSTEM

the air bag assembly.

3. Place three tires without wheel on the tire on which air bag is fixed and a tire with a wheel on top. Bind the five tires with a rope so that the tires may not collapse.

Legend

(A) 10 m (33 feet) or more

8. How to fix Passenger air bag.

1. Fix the air bag with its trim cover side fixing the center of a tire without a wheel using an automobile use wire harness, (core size: 1.3 mm (0.05 inch)) or a wire treble at two or more points.

2. Connect Supplemental Restraint System (SRS) air bag assembly to the deployment harness double pole extension cord end. Be sure not to connect the deployment harness to a power source. (If connected the SRS air bag assembly deploys immediately).

NOTE: Ensure that the pigtail adapter is firmly seated into the air bag assembly connector. Failure to fully seat the connectors may leave the shorting bar located in the air bag assembly connector functioning (shorting the deployment circuit) and may result in non deployment of the air bag assembly.

3. Put a tire without wheel on another, put the tire on which the air bag is fixing, put a tire without a wheel, and finally put a tire with a wheel on top. Bind the tires with a rope so that the tires pile may not collapse.

827RW050

Legend

(A) 10 m (33 feet) or more

9. Notify all people in the immediate area of your intention to deploy the passenger air bag assembly. The deployment will be accompanied by a substantial noise which may startle the uninformed.

WARNING: DEPLOYED HARNESS SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A CONNECTING THE DEPLOYMENT HARNESS TO THE POWER SOURCE SHOULD ALWAYS BE THE LAST STEP IN THE AIR BAG ASSEMBLY DEPLOYMENT PROCEDURE. FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED MAY RESULT IN PERSONAL INJURY.

10. Connect the Supplemental Restraint System (SRS) deployment harness wires to the power source to immediately deploy the air bag assembly. Recommended application : 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.

827LW011

WARNING: SAFETY PRECAUTIONS MUST BE OBSERVED WHEN HANDING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE METAL SURFACES OF THE AIR BAG ASSEMBLY WILL BE VERY HOT. ALLOW THE AIR BAG ASSEMBLY TO COOL BEFORE HANDLING ANY METAL PORTION OF IT. DO NOT PLACE THE DEPLOYED INFLATOR MODULE NEAR ANY FLAMMABLE OBJECTS. FAILURE TO FOLLOW PROCEDURES MAY RESULT IN FIRE OR PERSONAL INJURY. AFTER AN AIR BAG ASSEMBLY HAS BEEN DEPLOYED, THE METAL CANISTER AND SURROUNDING AREAS OF THE AIR BAG ASSEMBLY WILL BE HOT. DO NOT TOUCH THE METAL AREAS OF THE AIR BAG ASSEMBLY FOR ABOUT THIRTY MINUTES AFTER DEPLOYMENT. IF THE DEPLOYED AIR BAG ASSEMBLY MUST BE MOVED BEFORE IT IS COOL, WEAR GLOVES AND HANDLE BY THE AIR BAG IT SELF.

11. Disconnect the pigtail adapter from the air bag assembly as soon after deployment as possible to avoid damage to the pigtail adapter or SRS deployment harness from contacting the hot air bag assembly canister. The pigtail adapter and SRS deployment harness are designed to be reused. They should, however, be inspected for damage after each deployment and replaced if necessary.
12. Dispose of the deployed air bag assembly through normal refuse channels after it has cooled for at least 30 minutes.
13. Wash your hands with mild soap and water afterward.

NOTE: The remaining steps are to be followed in the unlikely event that the air bag assembly did not deploy after following the above procedures.

14. Ensure that the SRS deployment harness has been disconnected from the power source and that its two banana plugs have been shorted together by fully

seating one banana plug into the other.

827RW055

2. Disconnect the pigtail adapter from the air bag assembly.

WARNING: WHEN STORING A LIVE AIR BAG ASSEMBLY OR WHEN LEAVING A LIVE AIR BAG ASSEMBLY UNATTENDED ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE BAG UP AND AWAY FROM THE SURFACE. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. FAILURE TO FOLLOW PROCEDURES MAY RESULT IN PERSONAL INJURY.

3. Temporarily store the air bag assembly with the bag facing up, away from the surface upon which it rests.

066RW030

Deployment Inside Vehicle (Vehicle Scrapping Procedure)

Deployment inside vehicle is proper when the vehicle is to be destroyed or salvaged for component parts. This includes, but is not limited to, the following situations:

1. The vehicle has completed its useful life.
2. The vehicle has been damaged beyond repair in a non deployment type accident.
3. The vehicle has been stripped or damaged beyond repair in a theft.
4. The vehicle will be salvaged for component parts to be used on a vehicle with a different Vehicle Identification Number (VIN) as opposed to being rebuilt as same VIN. Never use SRS components from another vehicle.

WARNING: FAILURE TO FOLLOW PROPER SRS AIR BAG ASSEMBLY DISPOSAL PROCEDURES CAN RESULT IN AIR BAG DEPLOYMENT WHICH MAY CAUSE PERSONAL INJURY. UNDEPLOYED AIR BAG ASSEMBLIES MUST NOT BE DISPOSED OF THROUGH NORMAL REFUSE CHANNELS. THE UNDEPLOYED AIR BAG ASSEMBLY CONTAINS SUBSTANCES THAT CAN CAUSE SEVERE ILLNESS OR PERSONAL INJURY IF THE SEALED CONTAINER IS DAMAGED DURING DISPOSAL. DISPOSAL IN ANY MANNER INCONSISTENT WITH PROPER PROCEDURES MAY BE A VIOLATION OF FEDERAL, STATE AND/OR LOCAL LAWS.

15. Turn ignition switch to "LOCK", remove key and put on safety glasses.
16. Remove all loose objects from front seats.
17. Disconnect Supplemental Restraint System (SRS) coil assembly, yellow 2-pin connector located at the base of the steering column.
18. Cut the SRS coil assembly yellow 2-pin harness connector from the vehicle leaving at least 16 cm (six inches) of wire at the connector.
19. Strip 13 mm (1/2 inch) of insulation from yellow-green and yellow-black wire lead of the connector.
20. Cut two 900 cm (30 feet) deployment wires from 0.8 mm² (18 gauge) or thicker multi-strand wire. These wires will be used to fabricate the driver deployment harness.
21. Strip 13 mm (1/2 inch) of insulation from both ends of the wires cut in the previous step.

4. Short the wires by twisting together one end from each. Deployment wires shall remain shorted and not be connected to a power source until the air bag is to be deployed.

F09RX001

WARNING: FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED COULD RESULT IN PERSONAL INJURY. NEVER CONNECT DEPLOYMENT WIRES TO ANY POWER SOURCE BEFORE CONNECTING DEPLOYMENT WIRES TO THE AIR BAG ASSEMBLY LEADS. DEPLOYMENT WIRES SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. WEAR SAFETY GLASSES THROUGHOUT THIS ENTIRE DEPLOYMENT AND DISPOSAL PROCEDURE.

22. Twist together one connector wire lead to one deployment wire. The connection should be mechanically secure.

5. Bend twisted connection made in the previous step flat and wrap tightly with electrical tape to insulate and secure.

F09HV009

23. Twist together, bend and tape the remaining connector wire lead to the remaining deployment wire.
24. Connect the deployment harness to the driver air bag assembly, yellow 2-pin connector at the base of the steering column. Route deployment harness out the driver side of the vehicle.

WARNING: DEPLOYMENT WIRES SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT.

Connecting the deployment wires to the power source should always be the final step in the air bag assembly deployment procedure.

Failure to follow procedures in the order listed could result in personal injury.

25. Disconnect passenger air bag assembly, yellow 2-pin connector located behind glove box assembly.
26. Cut the passenger air bag assembly harness connector from the vehicle leaving at least 16 cm (six inches) of wire at the connector.
27. Strip 13 mm (1/2 inch) of insulation from yellow-green and yellow-red wire lead of the connector.
28. Cut two 900 cm (30 feet) deployment wires from 0.8 mm² (18 gauge) or thicker multi-strand wire. These wires will be used to fabricate the passenger deployment harness.
29. Strip 13 mm (1/2 inch) of insulation from both ends of the wires cut in the previous step.

6. Short the wires by twisting together one end from each. Deployment wires shall remain shorted and not be connected to a power source until the air bag is to be deployed.

F09RX001

WARNING: FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED COULD RESULT IN PERSONAL INJURY. NEVER CONNECT DEPLOYMENT WIRES TO ANY POWER SOURCE BEFORE CONNECTING DEPLOYMENT WIRES TO THE AIR BAG ASSEMBLY LEADS. DEPLOYMENT WIRES SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN SAFETY GLASSES THROUGHOUT THIS ENTIRE DEPLOYMENT AND DISPOSAL PROCEDURE.

30. Twist together one connector wire lead to one deployment wire. The connection should be mechanically secure.

7. Bend twisted connection made in the previous step flat and wrap tightly with electrical tape to insulate and secure.

F09HV009

31. Twist together, bend and tape the remaining connector wire lead to the remaining deployment wire.
32. Connect the deployment harness to the passenger air bag assembly, yellow 2-pin connector located behind the glove box assembly. Route deployment harness out the passenger side of the vehicle.

WARNING: DEPLOYMENT WIRES SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. CONNECTING THE DEPLOYMENT WIRES SHOULD ALWAYS BE THE FINAL STEP IN THE AIR BAG ASSEMBLY DEPLOYMENT PROCEDURE. FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED COULD RESULT IN PERSONAL INJURY.

33. Verify that the inside of the vehicle and the area surrounding the vehicle are clear of all people and loose or flammable objects.
34. Stretch the driver and passenger deployment harness to their full length.
35. Completely cover windshield area and front door window openings with a drop cloth, blanket or similar item. This reduces the possibility of injury due to possible fragmentation of the vehicle's glass or interior.
36. Notify all people in the immediate area that you intend to deploy the air bags. The deployment will be accompanied by a substantial noise which may startle the uninformed.
37. Separate the two ends of the driver deployment harness wires.

WARNING: DEPLOYMENT WIRES SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. CONNECTING THE DEPLOYMENT WIRES TO THE POWER SOURCE SHOULD ALWAYS BE THE FINAL STEP IN THE AIR BAG ASSEMBLY DEPLOYMENT PROCEDURE. FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED COULD RESULT IN PERSONAL INJURY.

NOTE: When the air bag deploys, the rapid gas expansion will create a substantial noise. Notify all people in the immediate area that you intend to deploy the air bags.

38. Connect the driver deployment harness wires to a power source to immediately deploy the driver air bag assembly. Recommended application: 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.
39. Separate the two ends of the passenger deployment harness wires.

WARNING: DEPLOYMENT WIRES SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. CONNECTING THE DEPLOYMENT WIRES TO THE POWER SOURCE SHOULD ALWAYS BE THE FINAL STEP IN THE AIR BAG ASSEMBLY DEPLOYMENT PROCEDURE. FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED COULD RESULT IN PERSONAL INJURY.

40. Connect the passenger deployment harness wires to a power source to immediately deploy the passenger air bag assembly. Recommended application: 12 volts minimum, 2 amps minimum. A vehicle battery is suggested. (Driver air bag assembly) Put on a pair of shop gloves and safety glasses to protect your hands and eyes from possible irritation and heat when handling the deployed air bag assembly. After the air bag assembly has been deployed, the surface of the air bag may contain solid particulate. This solid particulate consists primarily of by products of the chemical reaction, Potassium Chloride and copper metal dust. Compounds of Potassium Borate, Strontium Chloride, Copper Chloride, and Ammonium Chloride may be found in amounts of about 1% (each) of the total particulate. (Passenger air bag assembly)
Put on a pair of shop gloves and safety glasses to protect your hands and eyes from possible irritation and heat when handling the deployed air bag

assembly.

After the air bag assembly has been deployed, the surface of the air bag may contain a powdery residue. This powder consists primarily of cornstarch (used to lubricate the bag as it inflates) and by products of the chemical reaction. Sodium hydroxide dust (similar to lye soap) is produced as a by product of the deployment reaction. The sodium hydroxide then quickly reacts with atmospheric moisture and is converted to sodium carbonate and sodium bicarbonate (baking soda). Therefore, it is unlikely that sodium hydroxide will be present after deployment.

WARNING: SAFETY PRECAUTIONS MUST BE OBSERVED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE METAL SURFACES OF THE AIR BAG ASSEMBLY WILL BE VERY HOT. ALLOW THE AIR BAG ASSEMBLY TO COOL BEFORE HANDLING ANY METAL PORTION OF IT. DO NOT PLACE THE HOT DEPLOYED AIR BAG ASSEMBLY NEAR ANY FLAMMABLE OBJECTS. FAILURE TO FOLLOW PROCEDURES COULD RESULT IN FIRE OR PERSONAL INJURY.

After an air bag assembly has been deployed, the metal canister and surrounding areas of the air bag assembly will be very hot. Do not touch the metal areas of the air bag assembly for about 30 minutes after deployment. If the deployed air bag assembly must be moved before it is cool, wear gloves and handle by the air bag or trim cover.

41. Short the driver deployment harness wires by twisting together one end from each. Repeat this procedure for the passenger deployment harness.
42. Carefully remove drop cloth from vehicle and clean off any fragments or discard drop cloth entirely.
43. Disconnect driver deployment harness and passenger deployment harness from vehicle and discard.
44. In the unlikely event that either or both of the air bag assemblies did not deploy after following these procedures, proceed immediately with Steps 36 through 37. If the air bag assembly deployed, proceed to step 35.
45. With both air bags deployed, the vehicle may be scrapped in the same manner as a non-SRS equipped vehicle.

NOTE: The remaining steps are to be followed in the unlikely event that the air bag assembly did not deploy after following these procedures.

46. Remove the undeployed air bag assembly (s) from the vehicle. For driver air bag assembly refer to in the "Passenger Air Bag Assembly Removal" in this section.

WARNING: WHEN STORING A LIVE AIR BAG ASSEMBLY OR WHEN LEAVING A LIVE AIR BAG ASSEMBLY UNATTENDED ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. FAILURE TO FOLLOW PROCEDURES COULD RESULT IN PERSONAL INJURY.

47. Temporarily store the air bag assembly with the air bag opening facing up, away from the surface upon which it rests.

Deployed Air Bag Assembly Handling

Put on a pair of shop gloves and safety glasses to protect your hands and eyes from possible irritation and heat when handling the deployed air bag assembly.

After the air bag assembly has been deployed, the surface of the air bag may contain solid particulate. This solid particulate consists primarily of by products of the chemical reaction, Potassium Chloride and copper metal dust. Compounds of Potassium Borate, Strontium Chloride, Copper Chloride, and Ammonium Chloride may be found in amounts of about 1% (each) of the total particulate.

(Passenger air bag assembly)

Put on a pair of shop gloves and safety glasses to protect your hands and eyes from possible irritation and heat when handling the deployed air bag assembly.

After the air bag assembly has been deployed, the surface of the air bag may contain a powdery residue. This powder consists primarily of cornstarch (used to lubricate the bag as it inflates) and by products of the chemical reaction. Sodium hydroxide dust (similar to lye soap) is produced as a by product of the deployment reaction. The sodium hydroxide then quickly reacts with atmospheric moisture and is converted to sodium carbonate and sodium bicarbonate (baking soda). Therefore, it is unlikely that sodium hydroxide will be present after deployment.

Special Tools

WARNING: TO AVOID DEPLOYMENT WHEN TROUBLESHOOTING THE SRS, DO NOT USE ELECTRICAL TEST EQUIPMENT SUCH AS A BATTERY-POWERED OR AC-POWERED VOLTMETER, OHMMETER, ETC., OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN THAT SPECIFIED IN THIS MANUAL. DO NOT USE A NON POWERED PROBE-TYPE TESTER. INSTRUCTIONS IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT.

5-8840-2421-0 (J-41433) SRS Driver/ Passenger Load Tool

The Supplemental Restraint System (SRS) Driver/ Passenger Load Tool 5-8840-2421-0 is used only when called for in this section. It is used as a diagnostic aid and safety device to prevent inadvertent air bag assembly deployment.

The load tool has four yellow connectors attached to its case.

The three small connectors are electrically functional and serve as resistive load substitutions.

No more than two connectors are used at any time.

One of the small connectors is used to substitute for the load of the driver air bag assembly when it is connected at the top of the column to the SRS coil assembly.

Another small connector is used to substitute for the load of the driver air bag assembly and the SRS coil assembly when it is connected at the base of the column to the SRS wiring harness. The third small connector is used to substitute for the load of the passenger air bag assembly when connected to the passenger air bag assembly harness connector.

By substituting the resistance of the load tool when called for, a determination can be made as to whether an inflator circuit component is causing system malfunction and which component is causing the malfunction. The load tool should be used only when specifically called for in the diagnostic procedures.

901RS146

5-8840-0285-0 (J-39200) DVM

The 5-8840-0285-0 Digital Multimeter (DVM) is the preferred DVM for use in SRS diagnosis and repair. However, 5-8840-0366-0 may be used if 5-8840-0285-0 is not available. No other DVMs are approved for SRS diagnosis and repair.

901RS153

Scan Tool

The Tech 2 is used to read and clear SRS Diagnostic Trouble Codes (DTCs). Refer to the Tech 2 Operator's Manual for specific information on how to use the Tech 2.

901RW176

5-8840-2468-0 (J-42986) SRS Deployment Tool

The 5-8840-2468-0 Supplemental Restraint System (SRS) Deployment Tool must be used for deployment of the undeployed air bag.

901RX046

5-8840-0385-0 (J-35616-A) Connector Test Adapter Kit

The 5-8840-0385-0 Connector Test Adapter Kit must be used whenever a diagnostic procedure requests checking or probing a terminal. Using the appropriate adapter will ensure that no damage to the terminal will occur from the Digital Multimeter (DVM) probe, such as spreading or bending. The adapter will also give an idea of whether contact tension is sufficient, helping to find an open or intermittent open due to poor terminal contact.

901RS151

5-8840-2429-0 (J-42987) SRS Adapter For Load Tool

The J-42987 SRS Adapter be used for connect previous load tool to new SRS system when inspect SRS system harness.

901RW107

5-8840-2420-0 (J-41497) SRS Deployment Fixture

The 5-8840-2420-0 SRS Deployment Fixture must be used for deployment of the undeployed passenger side air bag.

901RW088

Tech 2 Scan Tool

From 1999 Vehi CROSS (VX), dealer service departments are recommended to use Tech 2. Please refer to Tech 2 scan tool user guide.

Legend

- | | |
|--------------------------------|-------------------------------------|
| (1) PCMCIA Card | (4) Data Link Connector (DLC) Cable |
| (2) RS 232 Loop Back Connector | (5) Tech-2 |
| (3) SAE 16/19 Adaptor | |

Getting Started

- Before operating the Isuzu PCMCIA card with the Tech 2, the following steps must be performed:
 1. The Isuzu 98 System PCMCIA card (1) inserts into the Tech 2 (5).
 2. Connect the SAE 16/19 adaptor (3) to the DLC cable (4).

1. Connect the DLC cable to the Tech 2 (5)
3. Mark sure the vehicle ignition is off.

2. Connect the Tech 2 SAE 16/19 adapter to the vehicle Data Link Connector (DLC).

740RX068

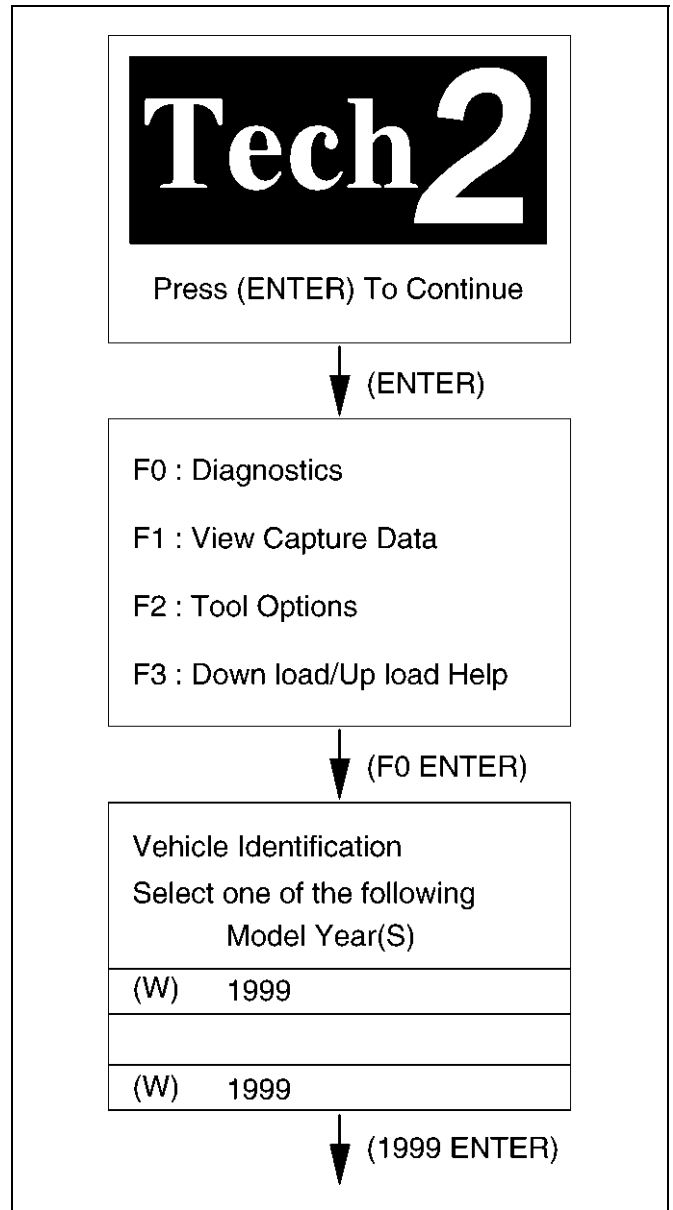

4. The vehicle ignition turns on.
5. Verify the Tech 2 power up display.

060RW009

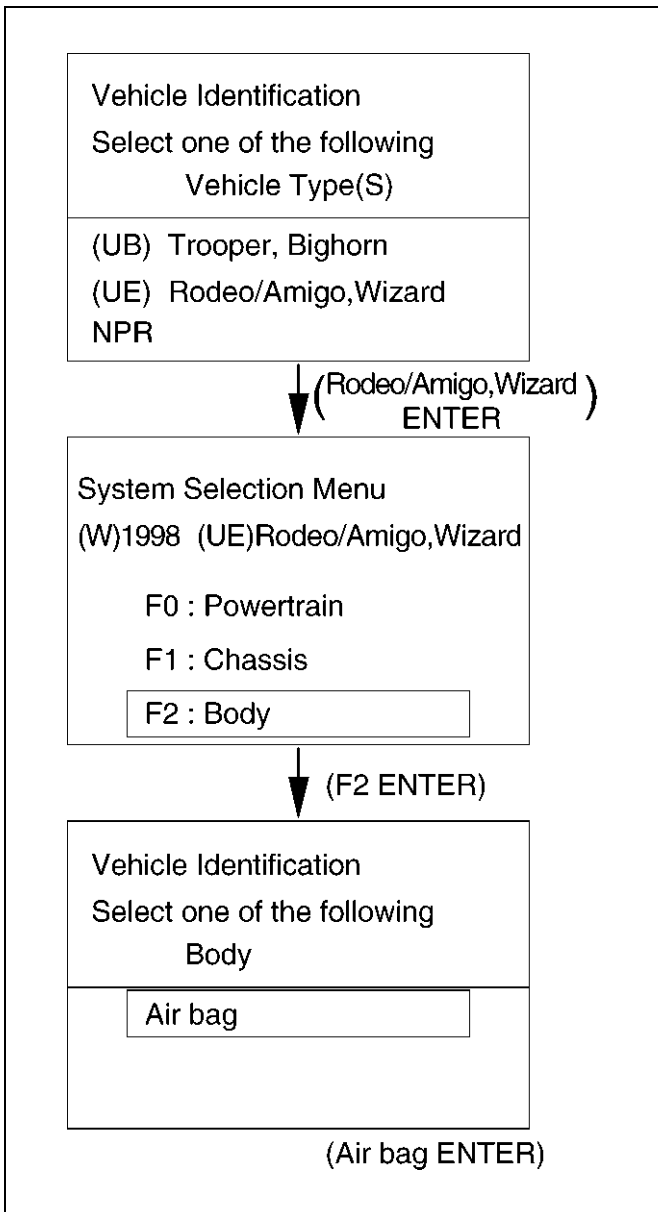

Operating Procedure

The power up screen is displayed when you power up the tester with the Isuzu systems PCMCIA card. Follow the operating procedure below.

060RX001

NOTE: The RS232 loop back connector is only to use for diagnosis of Tech 2 and refer to user guide of the Tech 2.

Service Precaution

CAUTION: When fasteners are removed, always reinstall them at the same location from which they were removed. If a fastener needs to be replaced, use the correct part number fastener for that application. If the correct part number fastener is not available, a fastener of equal size and strength (or stronger) may be used. Fasteners that are not reused, and those requiring thread locking compound will be called out. The correct torque value must be used when installing fasteners that require it. If the above conditions are not followed, parts or system damage could result.

WARNING: WHEN PERFORMING SERVICE ON OR AROUND SUPPLEMENTAL RESTRAINT SYSTEM (SRS) COMPONENTS OR SRS WIRING, FOLLOW THE PROCEDURES LISTED BELOW TO TEMPORARILY DISABLE THE SRS. FAILURE TO FOLLOW PROCEDURES COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY OR OTHERWISE UNNEEDED SRS REPAIRS.

The Sensing and Diagnostic Module (SDM) in Driver–Passenger SRS can maintain sufficient voltage to cause a deployment for up to 15 seconds after the ignition switch is turned “OFF,” the battery is disconnected, or the fuse powering the SDM is removed.

Many of the service procedures require removal of the “SRS-1” fuse, and disconnection of the air bag assembly from the deployment loop to avoid an accidental deployment. If the air bag assembly is disconnected from the deployment loop as noted in the “Disabling the SRS” procedure that follows, service can begin immediately without waiting for the 15 second time period to expire.

Disabling The SRS

Removal

Turn the ignition switch to “OFF” and turn the steering wheel so that the vehicle’s wheels are pointing straight ahead.

6. Remove SRS fuse METER and SRS, from left dash side lower fuse block or disconnect battery.
7. Disconnect yellow 2–pin connector at the base of steering column.
8. Remove glove box assembly; Refer to “Passenger Air Bag Assembly Replacement” in this section.
9. Disconnect passenger air bag assembly yellow 2–pin connector behind the glove box assembly.

CAUTION: With the “SRS” fuse removed and ignition switch “ON,” the “AIR BAG” warning lamp will be “ON.” This is normal operation and does not indicate an SRS malfunction.

Enabling The SRS

Installation

Turn ignition switch to “LOCK” and remove key.

1. Connect yellow 2–pin connector passenger air bag assembly.
 2. Install glove box assembly, Refer to “Passenger Air Bag Assembly Replacement” in this section.
 3. Connect yellow 2–pin connector at the base of the steering column.
 4. Install “AIR BAG” fuse METER and SRS to left dash side lower fuse block or connect battery.
- Turn ignition switch to “ON” and verify that the “AIR BAG” warning lamp flashes seven times and then turns “OFF” If it does not operate as described, perform the “SRS Diagnostic System Check” in section.

Handling / Installation / Diagnosis

5. Air bag assembly should not be subjected to temperatures above 93°C (200°F).
6. Air bag assembly, and SDM should not be used if they have been dropped from a height of 100 cm (3.3 feet) or more.
7. When a SDM is replaced, it must be oriented with the arrow on the SDM pointing toward the front of the vehicle. It is very important for the SDM to be located flat on the mounting surface, parallel to the vehicle datum line. It is important that the SDM mounting surface is free of any dirt or other foreign material.
8. Do not apply power to the SRS unless all components are connected or a diagnostic chart requests it, as this will set a diagnostic trouble code.
9. The “SRS Diagnostic System Check” must be the starting point of any SRS diagnostics. The “SRS Diagnostic System Check” will verify proper “AIR BAG” warning lamp operation and will lead you to the correct chart to diagnose any SRS malfunctions. Bypassing these procedures may result in extended diagnostic time, incorrect diagnosis, and incorrect parts replacements.

Inspections Required After An Accident

CAUTION: Certain SRS components must be replaced after a frontal crash involving air bag deployment.

In all types of accidents regardless of “Air Bag” deployment, visually inspect all of the following components and replace as required:

- Driver air bag assembly
- Passenger air bag assembly
- Steering wheel
- SRS coil assembly
- Steering column
- Knee bolster and instrument panel mounting attachments
- Driver seat and belt
- Passenger seat and belt
- SDM

Be sure to replace Sensing and Diagnostic Module (SDM) in accordance with “SDM Replacement Guidelines”. In cases of collision without causing air bag deployment, SDM could be used unless this manual instructs to replace.

CAUTION: Refer to SDM replacement Guidelines below for important information on SDM replacement in both deployment and non-deployment crashes.

SDM Replacement Guidelines

1. In case that the air bag has been deployed, replace the SDM.
2. When DTC 51, 53 and 71 are set.
3. When SDM fell down from a 100 cm (3.3 feet) height.

All above is SDM replacement Guideline.

Inspection is needed also on the following.

Inspect Supplemental Restraint System (SRS) coil assembly wiring and steering wheel for any signs of scorching melting or damage due to excessive heat. If coil assembly wire or steering wheel is damaged replace them. The steering column and wheel must be dimensionally checked to determine if they are damaged. Refer to in this Section of this manual.

Never use SRS parts from another vehicle. This does not include remanufactured parts purchased from an authorized Retailer they may be used for SRS repairs. Do not attempt to repair the SDM, the SRS harness, the SRS coil assembly, the air bag assembly, the steering wheel, or the steering column. Service of these items is replacement only.

Verify replacement part numbers.

CAUTION: Proper operation of the SDM and Supplemental Restraint System (SRS) requires that any repairs to the vehicle structure return it to its original production configuration.

Sensing and Diagnostic Module (SDM)

Service Precautions

WARNING: DURING SERVICE PROCEDURES, BE VERY CAREFUL WHEN HANDLING SDM. NEVER STRIKE OR JAR SDM. UNDER SOME CIRCUMSTANCES, IT COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY OR IMPROPER OPERATION OF THE SUPPLEMENTAL RESTRAINT SYSTEM (SRS). SDM MOUNTING BRACKET BOLTS MUST BE CAREFULLY TORQUED TO ASSURE PROPER OPERATION. NEVER POWER UP THE SRS WHEN SDM IS NOT RIGIDLY ATTACHED TO THE VEHICLE. THE SDM COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY.

WARNING: PROPER OPERATION OF THE SENSING AND DIAGNOSTIC MODULE (SDM) REQUIRES THE SDM TO BE RIGIDLY ATTACHED TO THE VEHICLE STRUCTURE AND THAT THE ARROW ON THE SENSOR BE POINTING TOWARD THE FRONT OF THE VEHICLE.

SDM is specifically calibrated and is keyed to the SDM location SRS wiring harness. Caution should be used to ensure proper location of the SDM. The keying of the SDM to its location and wiring harness connectors should never be modified in the field.

Removal

1. Disable the SRS. (Refer to "Disable the SRS" in this manual)
2. Remove dressing panel around the radio and disconnect cigar lighter harness.
3. Remove the transfer sift lever knob.
4. Remove the center console.
5. Remove three connector from Powertrain Control Module (PCM).
6. Remove PCM with bracket.(Fixed four bolts)
7. Remove right side stay between instrument panel and floor.
8. Remove driver and passenger seat.
9. Turn over carpet to rear side.

1. Remove air conditioning duct for rear seat. (Transform the duct during removing it)

827RW023

10. Pull CPA (3) (Connector Position Assurance—red color) out and push connector lock down to disconnect the SDM harness connector (2).
11. Remove the three SDM fixing bolts and remove SDM (1).

827RW044

Installation

1. Install the SDM (1) on bracket and fixing bolts and tighten the fixing bolts to the specified torque.
Torque: 10 ± 3 N·m (1.0 ± 0.3 kg·m/87 ± 26 lbin)
1. Connect the SDM harness connector (2) and after that, put CPA into connector (3).

2. Install air conditioning duct for rear seat to normal position.
2. Return carpet normal position.
3. Install right side stay between instrument panel and floor, tighten to the specified torque.

Torque: 10 ± 3 N·m (1.0 ± 0.3 kg·m/87 ± 26 lbin)

4. Install PCM with bracket and tighten to the specified torque.

Torque: 10 ± 3 N·m (1.0 ± 0.3 kg·m/87 ± 26 lbin)

5. Reconnect three connector to Powertrain Control Module (PCM).
6. Install the center console.
7. Install the transfer shift lever knob.
8. Install the dressing panel around the radio and reconnect cigar lighter harness.
9. Enable the SRS. (Refer to "Enabling the SRS" in this manual)

Driver Air Bag Assembly

Service Precautions

WARNING: SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY-PRODUCT OF THE DEPLOYMENT REACTION, THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWDER ON THE AIR BAG ASSEMBLY IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. WHEN PLACING A LIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE. NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

NOTE: In the event deployment has occurred, inspect coil assembly wire for any signs of scorching, melting or any other damage due to excessive heat. If the coil has been damaged, replace it.

Removal

1. Disable the Supplemental Restraint System (SRS). (Refer to "Disabling the SRS" in this section.)
2. Remove air bag assembly from steering wheel by removing two bolts. Lift air bag assembly out of steering wheel.

827RX036

3. Disconnect connector and remove air bag assembly.
4. Disconnect horn lead.

827RX035

Installation

1. Connect air bag to wiring harness connector.

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of air bag to prevent lead wire from being pinched.

2. Connect horn lead.
3. Install air bag into steering wheel and tighten bolts to specified sequence as shown in figure.

Torque: 8.8 N·m (0.9 kg·m/78 lbin)

CAUTION: Never use the air bag assembly from another vehicle.

Use only the air bag assembly for UE.

4. Enable the Supplemental Restraint System (SRS). (Refer to "Enabling the SRS" in this section.)

Steering Wheel

Service Precautions

WARNING: SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY-PRODUCT OF THE DEPLOYMENT REACTION, THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWDER ON THE AIR BAG ASSEMBLY IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. WHEN PLACING A LIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE. NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

NOTE: In the event deployment has occurred, inspect coil assembly wire for any signs of scorching, melting or any other damage due to excessive heat. If the coil has been damaged, replace it.

Removal

1. Disable the SRS. (Refer to "Disabling the SRS" in this section.)

827RX034

2. Remove the air bag assembly (5) from steering wheel (6) by removing two bolts (7). Lift air bag assembly out of steering wheel.

827RX036

3. Disconnect connector (2) and remove air bag assembly.

827RX035

3. Disconnect horn lead (1)
4. Remove steering wheel attachment nut (4).
5. Move the tires to the straight ahead position before removing the steering wheel. Install steering wheel puller onto steering wheel and remove steering wheel with 5-8521-0016-0.
6. Apply a setting mark (3) across the steering wheel and shaft so parts can be reassembled in their original position.

827RW063

7. Feed wiring through the wheel and remove wheel.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

Installation

1. Install the steering wheel and align the setting marks (3).
2. Tighten the steering wheel fixing nut (4) to the specified torque.

Torque: 34 N-m (3.5 kg-m/25 lbft)

3. Connect horn lead (1).
4. Connect air bag to wiring harness connector (2).

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of air bag to prevent lead wire from being pinched.

5. Install air bag into steering wheel and tighten bolts (7) to specified sequence as show in figure.

Torque: 8.8 N-m (0.9 kg-m/78 lb in)

CAUTION: Never use the air bag assembly from another vehicle. Use only the air bag assembly for UE.

827RX034

6. Enable the Supplemental Restraint System (SRS). (Refer to "Enabling The SRS" in this section.)

SRS Coil Assembly

Service Precaution

WARNING: SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY-PRODUCT OF THE DEPLOYMENT REACTION, THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWDER ON THE AIR BAG ASSEMBLY IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. WHEN PLACING A LIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE. NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

NOTE: In the event deployment has occurred, inspect coil assembly wire for any signs of scorching, melting or any other damage due to excessive heat. If the coil has been damaged, replace it.

Removal

1. Disable the SRS. (Refer to "Disabling the SRS" in this section.)

825RX047

2. Remove the air bag assembly (6) from steering wheel (7) by removing two bolts (8). Lift air bag assembly out of steering wheel.

827RX036

4. Disconnect the 2-pin yellow connector (2) and remove air bag assembly.

827RX035

3. Disconnect horn lead connector (1).
4. Remove the steering wheel attachment nut (5).
5. Move the tires to the straight ahead position before removing the steering wheel and remove wheel with 5-8521-0016-0.
6. Apply a setting mark (4) across the steering wheel and shaft so parts can be reassembled in their original position.

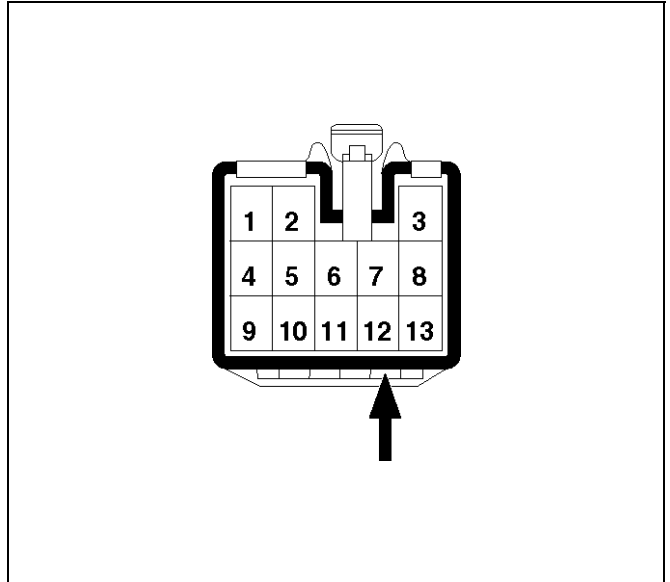

827RW063

7. Feed wiring through the wheel and remove wheel.

CAUTION: Never apply force to the steering wheel in the direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

8. Remove the steering lower cover.
9. Remove the driver knee bolster assembly.

10. Remove the steering column cover (3).
11. Disconnect the wiring harness connectors (10) located at the base of steering column.
12. Disconnect the horn terminal NO.2 from connector and remove the tape binding harness. (Refer to How to Disconnect the horn terminal in this section.)

827RX029

13. Remove four bolts of combination switch assembly (9) attached to steering lock and remove the combination switch assembly (with SRS coil) from steering shaft.

825RX047

9J-42 SUPPLEMENTAL RESTRAINT SYSTEM

5. Remove four bolts of SRS coil assembly and remove the SRS coil assembly from the combination switch.

825RX033

6. Pull out the terminal of lead wire coming to black connector NO.12 while lifting the lock part with a minitenes screw driver (-).

827RX046

How to Disconnect the horn terminal

1. Lift the white part of black connector with a minitenes screw driver (-) and release connector terminal lock.

827RX045

Legend

- (1) Minitenes screw driver (-)
- (2) Connector lock knob

How to Connect Horn Terminal

1. Insert horn terminal from behind black connector NO.12 until connector lock works.

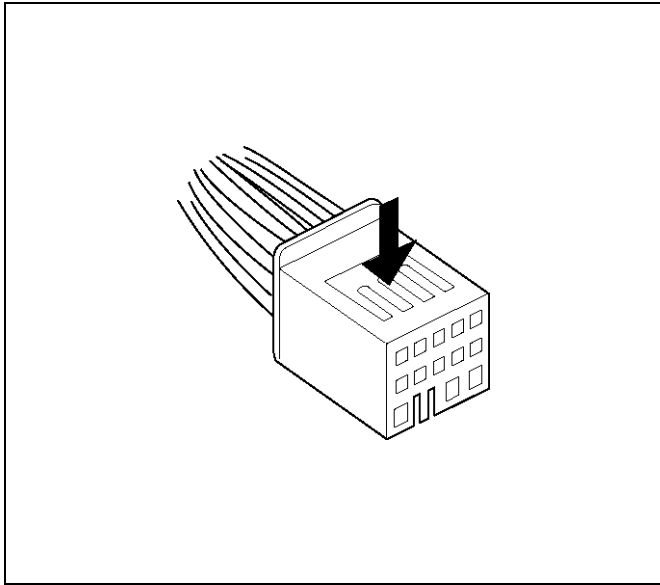

827RX047

Legend

- (1) Terminal
- (2) Connector lock knob

7. Push white connector into the black connector for a double lock.

827RX048

Installation

1. Set cancel cam and SRS coil in position and install the SRS coil to combination switch by tightening the four bolts to a specified tightening torque with four bolts.

Torque: 0.5 N·m (0.05 kg·m/0.4 lb ft)

825RX033

2. Insert the horn terminal into the connector NO.12 and bind the combination switch harness and SRS coil harness with a tape.(Refer to How to Connect the horn terminal in this section.)

8. Install the combination switch assembly (with SRS coil) to steering lock of steering shaft and tighten the four bolts to a specified tightening torque.

825RX047

3. Connect the wiring harness connectors (10) located at the base of steering column.
4. Turn the SRS coil clockwise to full, return about 3 turns and align the neutral mark.

NOTE: Whenever installing the new combination switch with SRS coil, be sure to tear off the lock pin for aligning the neutral position before it is installed to the base of steering column.

825RX032

CAUTION: When turning the SRS coil clockwise to full, stop turning if resistance is felt. Forced further turning may damage the cable in the SRS coil.

9J-44 SUPPLEMENTAL RESTRAINT SYSTEM

9. Install the steering column cover (3).

CAUTION: When installing the steering column cover, be sure to thread each harness as illustrated so that the harnesses starter switch, combination switch and SRS coil may not catch wiring.

5. Install the driver knee blaster assembly.

6. Install the steering lower cover.

7. Install the steering wheel and align the setting marks (4).

8. Tighten the steering wheel fixing nut (5) to the specified torque.

Torque: 34 N-m (3.5 kg-m/25 lb ft)

9. Connect horn lead (1).

10. Connect air bag to wiring harness connector (2).

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of air bag to prevent lead wire from being pinched.

10. Install Air Bag (6) into steering wheel and tighten bolts (8) to specified sequence as figure.

Torque: 8.8 N-m (0.9 kg-m/78 lb in)

CAUTION: Never use the air bag assembly from another vehicle. Use only the air bag assembly for "UE".

11. Enable the SRS. (Refer to "Enabling The SRS" in this section.)

Steering Column

Service Precaution

WARNING: SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY-PRODUCT OF THE DEPLOYMENT REACTION, THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWDER ON THE AIR BAG ASSEMBLY IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. WHEN PLACING A LIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE. NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

NOTE: In the event deployment has occurred, inspect coil assembly wire for any signs of scorching, melting or any other damage due to excessive heat. If the coil has been damaged, replace it.

Removal

1. Disable the Supplemental Restraint System (SRS). (Refer to "Disabling The SRS" in this section.)

2. Remove the air bag assembly (4) from steering wheel (2) by removing two bolts (5). Lift air bag assembly out of steering wheel.

3. Disconnect the 2-pin yellow connector (7) and remove air bag assembly.

827RX035

4. Disconnect horn lead connector (8).
5. Remove the steering wheel attachment nut (3).
6. Move the tires to the straight ahead position before removing the steering wheel and removing wheel with 5-8521-0016-0.
7. Apply a setting mark (6) across the steering wheel and shaft so parts can be reassembled in their original position.

827RW063

8. Feed wiring through the wheel and remove wheel.
9. Remove the steering lower cover.
10. Remove the driver knee bolster assembly.
11. Remove the steering column cover (1).
12. Disconnect the wiring harness connectors (10) located at the base of steering column.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other

impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

13. Remove the combination switch assembly with Supplemental Restraint System (SRS) coil (9).

NOTE: SRS coil is a part of combination switch assembly, which cannot be replaced separately. Therefore, be sure not to remove the SRS coil from the combination switch assembly.

14. Remove the snap ring.
15. Remove the cushion rubber.
16. Disconnect shift lock cable.
17. Disconnect the starter switch harness connector (12) located base of steering column.
18. Remove steering lock cylinder assembly (11).
19. Remove the 2nd shaft (14) from the column shaft assembly (13) by removing bolt (15).
20. Remove steering column assembly (13).

431RX012

Installation

1. Install the 2nd shaft (14) to the column shaft assembly (13).
2. Install the steering column assembly (13).
3. Tighten the steering column fixing bolts (dash panel side) to the specified torque.

Torque: 20 N·m (2.0 kg·m/15 lbft)

4. Tighten the steering column fixing nuts (Cross beam) to the specified torque.

Torque: 17 N·m (1.7 kg·m/13 lbft)

5. Tighten the universal joint to the specified torque.

Torque: 31 N·m (3.2 kg·m/23 lbft)

6. Install steering lock cylinder assembly (11).
7. Connect shift lock cable.
8. Install cushion rubber.
9. Install snap ring.
10. Install the combination switch assembly with Supplemental Restraint System (SRS) coil (9).
11. Connect the wiring harness connector (10) located on the base of steering column.
12. Turn the SRS coil clockwise to full, return about 3 turns and align the neutral mark.

825RX032

CAUTION: When turning the SRS coil clockwise to full, stop turning if resistance is felt. Further forced turning may damage the cable in the SRS coil.

13. Install steering column cover (1).

825RS048

CAUTION: When installing the steering column cover, be sure to wire (through each harness) as illustrated so that the harnesses starter switch, combination switch and SRS coil may not catch wiring.

14. Install the steering wheel (2) and align the setting marks (6).
15. Tighten the steering wheel fixing nut (3) to the specified torque.

Torque: 34 N·m (3.5 kg·m/25 lbft)

16. Connect horn lead (8).
17. Connect air Bag wiring harness connector (7).

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of air bag to prevent lead wire from being pinched.

9J-48 SUPPLEMENTAL RESTRAINT SYSTEM

18. Install air bag into steering wheel and tighten bolts (5) to specified sequence as shown in figure.

Torque: 8.8 N-m (9.0 kg-m/78 lbin)

CAUTION: Never use the air bag assembly from another vehicle.

Use only the air bag assembly for UE.

19. Enable the Supplemental Restraint System (SRS)
(Refer to "Enabling The SRS" in this section.)

Passenger Air Bag Assembly

Service Precaution

WARNING: SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY-PRODUCT OF THE DEPLOYMENT REACTION, THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWDER ON THE AIR BAG ASSEMBLY IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. WHEN PLACING A LIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE. NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

In the event deployment has occurred, inspect coil assembly wire for any signs of scorching, melting or any other damage due to excessive heat. If the coil has been damaged, replace it.

Removal

1. Disable the SRS. (Refer to "Disabling the SRS" in this section.)
2. Remove glove box assembly.
3. Disconnect passenger air bag assembly harness connector.
4. Remove air bag assembly fixing bolts and nuts.
5. Remove reinforcement.
6. Remove passenger air bag assembly from glove box opening of instrument panel.

827RX051

Installation

1. Install passenger air bag assembly from glove box opening of instrument panel.
2. Install reinforcement from glove box opening of instrument panel.
3. Install air bag assembly fixing nuts and bolts, and tighten to specified torque.
Torque: 7.8 N·m (69 lbin)
4. Connect air bag assembly harness connector.
5. Install glove box assembly.
6. Enable the SRS (Refer to "Enabling the SRS" in this section.)

827RW062

SRS Air Bag System Inspection Standards For Repair

Parts Name	Inspection Standard		Part Replacement Standard
	Collision	Trouble	
Driver Air bag Assembly			1. Air bag has deployed due to collision. 2. Pad surface has crack or scratch. 3. Connector has cracks. 4. Harness is disconnected or scratched. 5. Air bag is soaked in water, oil etc. 6. Air bag has fallen from a height of about 10 cm (3.3) feet. 7. Trouble diagnosis in Workshop Manual resulted in part replacement.
Passenger Air bag Assembly			
Sensing and Diagnostic Module (SDM)			1. Air bag has deployed due to collision. 2. SDM is crack or deformed. 3. Connector has cracks. 4. SDM has fallen from a height of about 100 cm (3.3 feet). 5. Trouble diagnosis in Workshop Manual resulted in part replacement.
SRS Coil Assembly			1. Burn or melt due to overheat. 2. Case is cracked or deformed. 3. Trouble diagnosis in Workshop Manual resulted in part replacement.
SRS Harness			1. Air bag circuit wire harness is disconnected or damaged. 2. Connector has cracks. 3. Trouble diagnosis in Workshop Manual resulted in part replacement.
Steering Wheel			1. Bracket is deformed. 2. A new air bag cannot be installed with ease. 3. When a new air bag is installed, pad interferes with the steering wheel, and clearance is uneven.
Steering Column			1. Capsule is broken. 2. The fitting of column collapses. 3. Bellows pipe is deformed.
Instrument Panel & Knee bolster & Cover Glove box. Seat Seat Belt Wood shield Glass			1. Dent, bend, cracks, and deform.
Mounts			1. Repair or replace if dent, bend, cracks, and deform are found. 2. Retighten to specified torque if loose.

Inspection Standards

In cases of collision: When any type of collision has occurred regardless of air bag deployment.

In cases of trouble code: When trouble code has been detected by TECH 2 in case of the AIR BAG WARNING LIGHT failing to work or remaining lighted.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Diagnostic Information

Diagnostic Procedures

WARNING: WHEN FASTENERS ARE REMOVED, ALWAYS REINSTALL THEN AT THE SAME LOCATION FROM WHICH THEY WERE REMOVED. IF A FASTENER NEEDS TO BE ReplacED, USE THE CORRECT PART NUMBER FASTENER FOR THAT APPLICATION. IF THE CORRECT PART NUMBER FASTENER IS NOT AVAILABLE, A FASTENER OF EQUAL SIZE AND STRENGTH (OR STRONGER) MAY BE USED. FASTENERS THAT ARE NOT REUSED, AND THOSE REQUIRING THREAD LOCKING COMPOUND WILL BE CALLED OUT. THE CORRECT TORQUE VALUE MUST BE USED WHEN INSTALLING FASTENERS THAT REQUIRE IT. IF THE ABOVE CONDITIONS ARE NOT FOLLOWED, PARTS OR SYSTEM DAMAGE COULD RESULT.

WARNING: TO AVOID DEPLOYMENT WHEN TROUBLESHOOTING THE SRS, DO NOT USE ELECTRICAL TEST EQUIPMENT SUCH AS A BATTERY-POWERED OR AC-POWERED VOLTMETER, OHMMETER, ETC., OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN THAT SPECIFIED IN THIS MANUAL. DO NOT USE A NONPOWERED, PROBE-TYPE TESTER. INSTRUCTIONS IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT.

The diagnostic procedures used in this section are designed to aid in finding and repairing SRS problems. Outlined below are the steps to find and repair SRS problems quickly and effectively. Failure to carefully follow these procedures may result in extended diagnostic time, incorrect diagnosis and incorrect parts Replacement.

1. Perform The "SRS Diagnostic System Check."

The "Supplemental Restraint System (SRS) Diagnostic System Check" should always be the starting point of any SRS diagnostics. The "SRS Diagnostic System Check" checks for proper "AIR BAG" warning lamp operation and checks for SRS trouble codes using both "Flash Code" and "Scan Tool" Methods.

2. Refer To The Proper Diagnostic Chart As Directed By The "SRS Diagnostic System Check."

The "SRS Diagnostic System Check" will lead you to the correct chart to diagnose any SRS problems. Bypassing these procedures may result in extended diagnostic time, incorrect diagnosis and incorrect parts Replacement.

3. Repeat the "SRS Diagnostic System Check" After Any Repair Or Diagnostic Procedures Have Been Performed.

Performing the "SRS Diagnostic System Check" after all repair or diagnostic procedures will assure that the repair has been made correctly and that no

other conditions exist.

Diagnostic Codes

The Sensing and Diagnostic Module (SDM) maintains a history record of all diagnostic codes that have been detected since the SRS codes were last cleared during service.

1. Active Codes—Faults that are presently detected this ignition cycle. Active codes are stored in Random Access Memory (RAM).
2. History Codes—All faults detected since the last time the history fault memory was cleared. History codes are stored in Electronically Erasable Programmable Read only Memory (EEPROM).

How To Read Trouble Codes

All codes (Active and history) can be read (or cleared) by using a scan tool or equivalent.

If a Diagnostic Trouble Code (DTC) is not available, have the vehicle serviced by dealer.

How To Clear Trouble Codes

Trouble codes can only be cleared by using a scan tool. If a scan tool is not available then inform the owner of the stored codes and suggest that the codes are cleared upon the next visit to a dealership.

Scan Tool Diagnostics

A scan tool can be used to read current and history codes and to clear all history codes after a repair is complete. The scan tool must be updated to communicate with the SRS through a replaceable cartridge for SRS diagnostics. To use the scan tool, connect it to the Data Link Connector (DLC) and turn the ignition switch "ON". Then follow the manufacturer's directions for communication with the SRS. The scan tool reads serial data from the Sensing and Diagnostic Module (SDM) "Serial Data" output (terminal 24) to the DLC.

Basic Knowledge Required

Before using this section of the Service Manual, there is some basic knowledge which will be required. Without this knowledge, you will have trouble using the diagnostic procedures in this section. Use care to prevent harm or unwanted deployment. Read all cautions in the service manual and on warning labels attached to SRS components.

Basic Electrical Circuits

You should understand the basic theory of electricity including series and parallel circuits, and understand the voltage drops across series resistors. You should know the meaning of voltage (volts), current (amps), and resistance (ohms). You should understand what happens in a circuit with an open or a shorted wire. You

should be able to read and understand a wiring diagram.

“Flash Code” Diagnostics

Flash code diagnostics can be used to read current codes and to determine if history codes are present but cannot be used to clear codes or read history codes. Flash code diagnostics is enabled by grounding by terminal 13 shorting to terminal 4 of the DLC with the ignition switch “ON”. Grounding terminal 13 of the DLC pulls the “Diagnostics Request” input (Terminal 1) of the SDM low and signals the SDM to enter the flash code diagnostic display mode.

The SDM displays the trouble codes by flashing the warning lamp. Each code that is displayed will consist of a number of flashes which represents the tens digit, a 1.2 second pause, following by a number of flashes which represents the ones digit of the code. Each code is displayed one time before moving on to the next code. After all of the codes have been displayed, the entire code sequence will continually be repeated until ground is removed from terminal 13 of the DLC.

Two special codes exist when reading in the flash code mode (Flash Code 12 and Flash Code 13). “Flash Code 12” will always be the first code displayed when the flash code mode is enabled. Code 12 is not an indication of a SRS problem but an indication that the flash code mode has been enabled. If there are no current or history codes present, the SDM will display code 12 until ground is removed from the DLC at terminal 13. “Flash Code 13” will be displayed if there are history codes. To read the history codes, a scan tool must be used.

Parts For Electrical Circuit

Wiring

Wire Color

D08RX174

Legend

- (1) Colored Stripe
- (2) Single Color

All wires have color-coded insulation. Wires belonging to a system's main harness will have a single color. Wires belonging to a system's sub-circuits will have a colored stripe. Striped wires use the following code to show wire size and colors.

D08RX175

Abbreviations are used to indicate wire color within a circuit diagram. Refer to the following table.

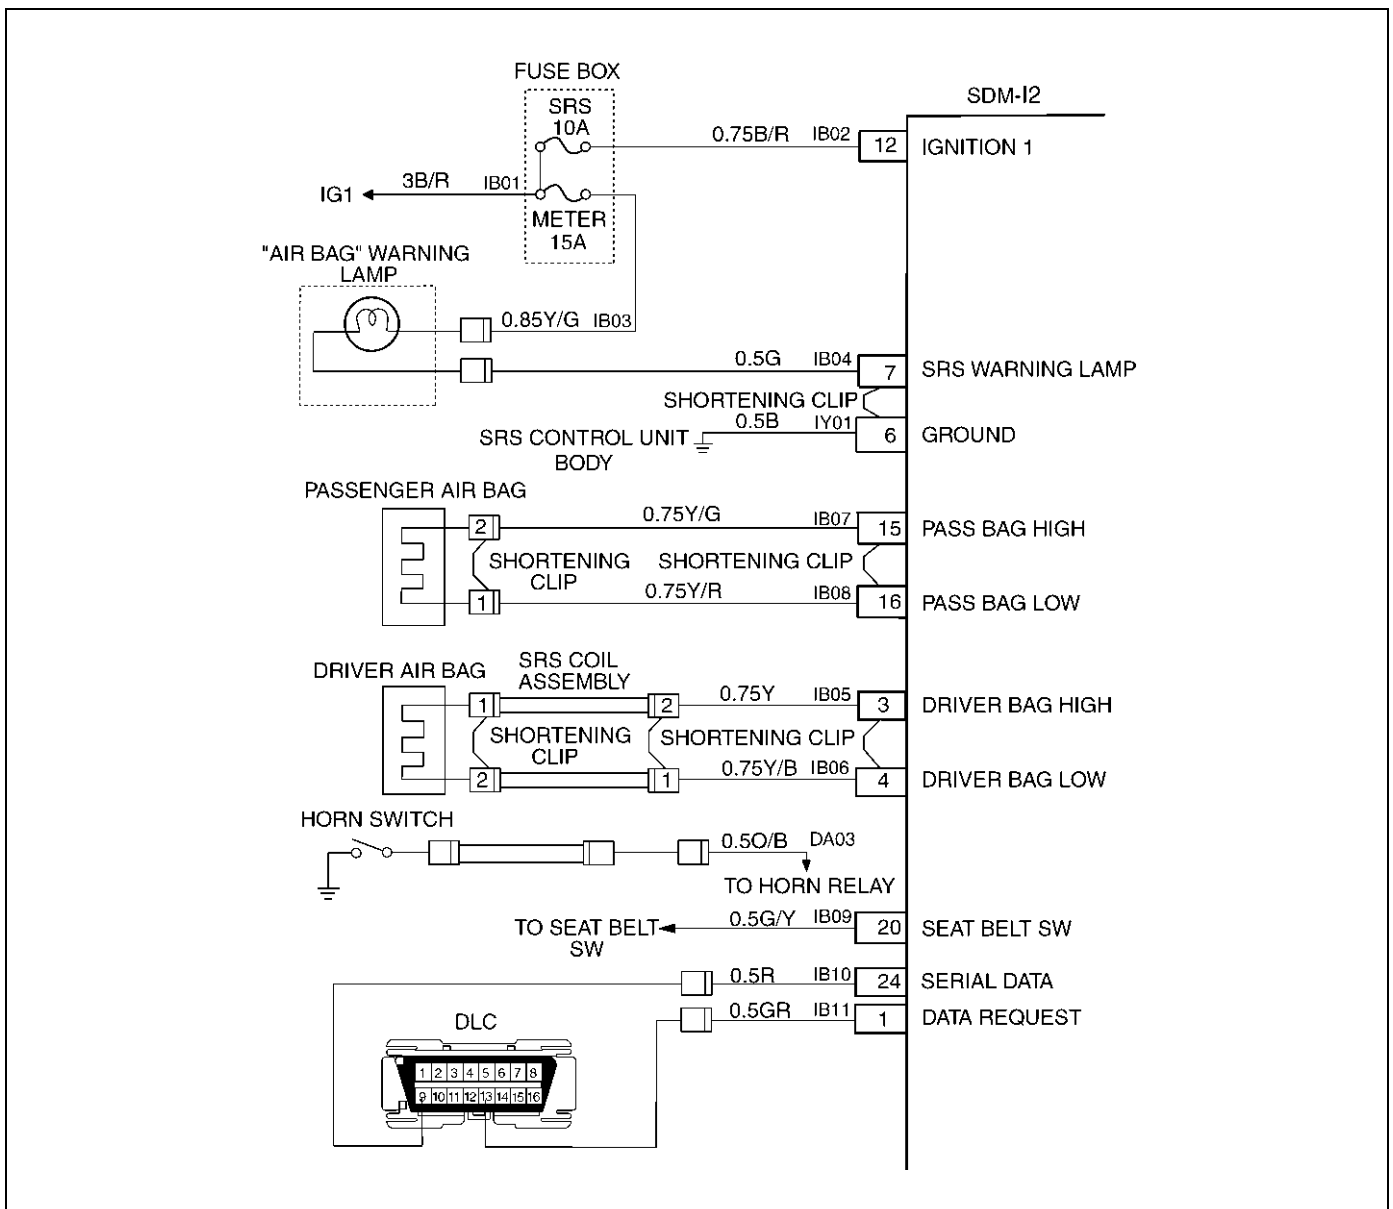

Wire Color Coding

Color-coding	Meaning	Color-coding	Meaning
B	Black	BR	Brown
W	White	LG	Light green
R	Red	GR	Grey
G	Green	P	Pink
Y	Yellow	LB	Light blue
L	Blue	V	Violet
O	Orange		

Distinction of Circuit by Wire Base Color

Base color	Circuits	Base color	Circuits
B	Starter circuit and grounding circuit	Y	Instrument circuit
W	Charging circuit	L, O, BR, LG, GR, P, SB, V	Other circuit
R	Lighting circuit		
G	Signal circuits		

System Schematic

D09RX002

SRS Diagnostic System Check

The diagnostic procedures used in this section are designed to find and repair Supplemental Restraint System (SRS) malfunctions. To get the best results, it is important to use the diagnostic charts and follow the sequence listed below:

- A Perform the "SRS Diagnostic System Check." The "SRS Diagnostic System Check" must be the starting point of any SRS diagnostics. The "SRS Diagnostic System Check" checks for proper "AIR BAG" warning lamp operation, the ability of the Sensing and Diagnostic Module (SDM) to communicate through the "Serial Data" line and whether SRS diagnostic trouble codes exist.
- B Refer to the proper diagnostic chart as directed by the "SRS Diagnostic System Check." The "SRS Diagnostic System Check" will lead you

to the correct chart to diagnose any SRS malfunctions. Bypassing these procedures may result in extended diagnostic time, incorrect diagnosis and incorrect parts replacement.

- C Repeat the "SRS Diagnostic System Check" after any repair or diagnostic procedures have been performed. Performing the "SRS Diagnostic System Check" after all repair or diagnostic procedures will ensure that the repair has been made correctly and that no other malfunctions exist

Circuit Description

When the ignition switch is first turned "ON", "ignition 1" voltage is applied from the "SRS" fuse to the SDM at the "ignition 1" input terminals "12". The SDM responds by flashing the "AIR BAG" warning lamp seven times while performing tests on the SRS.

Notes On System Check Chart:

Number(s) below refer to step number(s) on the "Supplemental Restraint System Diagnostic System Check" chart.

1. The "AIR BAG" warning lamp should flash seven times after ignition is first turned "ON."
2. After the "AIR BAG" warning lamp flashes seven times, it should turn "OFF."
3. Improper operation of the "AIR BAG" warning lamp is indicated. This test differentiates a warning lamp stays "ON" condition from a warning lamp does not come "ON" condition.
4. This test checks for the proper operation of the "Serial Data" line. This test will also determine whether history diagnostic trouble codes are stored and, if so, identify them.
5. This test checks for proper operation of the "Serial Data" line. This test will also identify the stored diagnostic trouble codes and whether they are current or history.

Diagnostic Aids:

The order in which diagnostic trouble codes are diagnosed is very important. Failure to diagnose the diagnostic trouble codes in the order specified may result in extended diagnostic time, incorrect diagnosis and incorrect parts Replacement.

SRS Diagnostic System Check

Step	Action	Yes	No
1	Note the "AIR BAG" warning lamp when ignition switch is turned "ON." Does the "AIR BAG" warning lamp flash seven (7) times?	Go to Step 2	Go to Step 3
2	Note the "AIR BAG" warning lamp after it flashed 7 times. Does the "AIR BAG" warning lamp go "OFF"?	Go to Step 4	Go to Step 5
3	Note the "AIR BAG" warning lamp when ignition switch is turned "ON." Does the "AIR BAG" warning lamp come "ON" steady?	Go to Chart B.	Go to Chart C.
4	1. Ignition switch "OFF." 2. Connect a scan tool to data link connector. 3. Follow direction given in the scan tool instruction manual. 4. Ignition switch "ON." 5. Request the SRS diagnostic trouble code display recode all history diagnostic trouble code(s) specify as such, on repair order. Is diagnostic trouble code(s) displayed?	Ignition switch "OFF." When DTC 71 is set, go to DTC 71 chart. For all other history codes refer to "Diagnostics Aids" for that specific DTC. A history DTC indicates the malfunction has been repaired or is intermittent.	SRS is functional and free of malfunctions, no further diagnosis is required. If scan tool indicates "No Data Received," refer to chassis electrical section.

Step	Action	Yes	No
5	1. Ignition switch "OFF." 2. Connect a scan tool to data link connector. 3. Follow directions as given in the scan tool instruction manual. 4. Ignition switch "ON." 5. Request the SRS diagnostic trouble code display, recode all diagnostic trouble code(s), specifying as current or history on repair order. Is diagnostic trouble code(s) displayed?	Ignition switch "OFF." When DTC 53 is set, go to DTC 53 chart. When DTC 51 is set, go to DTC 51 chart. When DTC 19 is set, go to DTC 19 chart. When DTC 25 is set, go to DTC 25 chart. Diagnose remaining current DTCs from lowest to highest. When only history DTCs exist, Refer to "Diagnostics Aids" for that specific DTC. A history DTC indicates the malfunction has been repaired or is intermittent.	If scan tool indicates "No Data Received," refer to chassis electrical section.

Chart A SDM Integrity Check

D09RX002

Circuit Description:

When the Sensing and Diagnostic Module (SDM) recognizes "ignition 1" voltage, applied to terminals "12", is greater than 9 volts, the "AIR BAG" warning lamp is flashed 7 times to verify operation. At this time the SDM performs "Turn-ON" tests followed by "Continuous Monitoring" tests. When a malfunction is detected, the SDM sets a current diagnostic trouble code and illuminates the "AIR BAG" warning lamp. The SDM will clear current diagnostic trouble codes and move them to a history file when the malfunction is no longer detected and/or the ignition switch is cycled, except for Diagnostic Trouble Codes (DTCs) 51, 53 and 71. DTC 71 can only be cleared using a scan tool "Clear Codes" command in case that the malfunction on DTC 71 has been solved and no DTCs 51 and 53 were remained. DTCs 51, 53 and 71 can not be cleared after a "Clear Codes" command is issued.

Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

1. This test confirms a current malfunction. If no current malfunction is occurring (history DTC set) the "Diagnostic Aids" for the appropriate diagnostic trouble code should be referenced. The SDM should not be replaced for a history diagnostic trouble code.
2. This test checks for a malfunction introduced into the SRS during the diagnostic process. It is extremely unlikely that a malfunctioning SDM would cause a new malfunction to occur during the diagnostic process.
3. When all circuitry outside the SDM has been found to operate properly, as indicated by the appropriate diagnostic chart, then and only then should the SDM be replaced.

Chart A SDM Integrity Check

WARNING: DURING SERVICE PROCEDURES. BE VERY CAREFUL WHEN HANDLING A SENSING AND DIAGNOSTIC MODULE (SDM). NEVER STRIKE OR JAR THE SDM. NEVER POWER UP THE SRS WHEN THE SDM IS NOT RIGIDLY ATTACHED TO THE VEHICLE. ALL SDM AND MOUNTING BRACKET FASTENERS MUST BE CAREFULLY TORQUED AND

THE ARROW MUST BE POINTING TOWARD THE FRONT OF THE VEHICLE TO ENSURE PROPER OPERATION OF THE SRS. THE SDM COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY.

Step	Action	Yes	No
1	<p>1. This chart assumes that the "SRS Diagnostic System Check" and either a symptom chart or a diagnostic trouble code chart diagnosis have been performed. When all circuitry outside the SDM has been found to operate properly, as indicated by the appropriate diagnostic chart, and the symptom or DTC remains current, the following diagnostic procedures must be performed to verify the need for SDM Replacement.</p> <p>2. Ignition switch "OFF."</p> <p>3. Reconnect all SRS components, ensure all components are properly mounted.</p> <p>4. Ensure the ignition switch has been "OFF" for at least 15 seconds.</p> <p>5. Note "AIR BAG" warning lamp as ignition switch is turned "ON."</p> <p>Does warning lamp flash 7 times then go "OFF"?</p>	<p>The symptom or DTC is no longer occurring. Clear SRS diagnostic trouble codes. Repeat the "SRS Diagnostic System Check."</p>	<p>Go to Step 2</p>
2	<p>Using a scan tool, request diagnostic trouble code display. Is the same symptom or DTC occurring as was when the "SRS Diagnostic System Check" was first performed?</p>	<p>Ignition switch "OFF." Go to the appropriate chart for the indicated malfunction.</p>	<p>Go to Step 3</p>
3	<p>1. Clear "SRS Diagnostic Trouble Codes." 2. Ignition switch "OFF" for at least two minutes. 3. Note "AIR BAG" warning lamp as ignition switch is turned "ON." Does warning lamp flash 7 times then go "OFF"?</p>	<p>SRS is functional and free of malfunctions. No further diagnosis is required. Go to Step 4</p>	<p>Ignition switch "OFF." Replace SDM. Go to Step 4</p>
4	<p>Reconnect all SRS components, ensure all components are properly mounted. Was this step finished?</p>	<p>Repeat the "SRS Diagnostic System Check."</p>	<p>Go to Step 4</p>

Chart B "AIR BAG" Warning Lamp Comes "ON" Steady

D09RX002

Circuit Description:

When the ignition switch is first turned "ON", "ignition 1" voltage is applied from the "METER" fuse to "AIR BAG", warning lamp which is connected to "Supplemental Restraint System (SRS) warning lamp", terminal "7". The "SRS" fuses apply system voltage to the "ignition 1" inputs, terminals "12". The Sensing and Diagnostic Module (SDM) responds by flashing the "AIR BAG" warning lamp 7 times. If "ignition 1" voltage is less than 9 volts, the "AIR BAG" warning lamp will come "ON" solid with no DTCs set.

Chart Test Description:

Number (s) below refer to step number (s) on the diagnostic chart.

2. This test checks for an open in the "ignition 1" circuit to the SDM.
3. This test checks for the voltage of "ignition 1."

4. This test determines whether the malfunction is a short to ground in Circuit IB04 – GREEN.

9J1-12 RESTRAINT CONTROL SYSTEM

Chart B "AIR BAG" Warning Lamp Comes "ON" Steady

Step	Action	Yes	No
1	1. When measurements are requested in this chart use 5-8840-0285-0 DVM with correct terminal adapter from 5-8840-0385-0. 2. Ignition switch "OFF." 3. Connect scan tool to data link connector, Follow directions as given in the scan tool instruction manual. 4. Ignition switch "ON." 5. Request SRS diagnostic trouble code display. Does scan tool indicate "No Data Received"?	Go to Step 2	Go to Step 3
2	1. Ignition switch "OFF." 2. Inspect SDM harness connector connection to SDM. Is it securely connected to the SDM?	Ignition switch "OFF." Replace SDM. Go to Step 5	Connect SDM securely to deactivate shorting clip in SDM harness connector. Go to Step 5
3	Using scan tool, request SRS data list. Is "ignition" more than 9 volts?	Go to Step 4	Ignition switch "OFF." Replace SDM. Go to Step 5
4	1. Ignition switch "OFF." 2. Disconnect SRS coil and passenger air bag assemblies. Yellow 2-pin connectors located at base of steering column and behind the glove box assembly. 3. Disconnect SDM. 4. Measure resistance from SDM harness connector terminal "6" to ground. Does DVM display "0L" (infinite)?	Go to Chart A.	Replace SRS harness. Go to Step 5
5	Reconnect all SRS components, ensure all components are properly mounted. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 5

Chart C "AIR BAG" Warning Lamp Does Not Comes "ON" Steady

D09RX002

Circuit Description:

When the ignition switch is first turned "ON", "ignition 1" voltage is applied from the "METER" fuse to the "AIR BAG" warning lamp which is connected to "Supplemental Restraint System (SRS) warning lamp", terminal "7". The "SRS" fuse apply system voltage to the "ignition 1" inputs, terminals "12". The Sensing and Diagnostic Module (SDM) responds by flashing the "AIR BAG" warning lamp seven times. If "ignition 1" voltage is more than 16 volts, the "AIR BAG" warning lamp will be still "OFF" solid with no DTCs set.

Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

1. This test decides whether power is available to SDM warning lamp power feed circuit.
2. This test determines whether the voltage is present in

- the warning lamp circuit.
3. This test determines if the malfunction is in the instrument cluster.
4. This test checks for open in the warning lamp circuitry.
5. This test isolates the IB04-GREEN circuit and checks for a short in the IB04-GREEN circuit to B+.
8. This test checks for a short from the SDM warning lamp power feed circuit to ground.
9. This test determines whether the short to ground is due to a short in the wiring.

Chart C "AIR BAG" Warning Lamp Does Not Comes "ON" Steady

Step	Action	Yes	No
1	1. When measurements are requested in this chart use 5-8840-0285-0 DVM with correct terminal adapter from 5-8840-0385-0. 2. Ignition switch "OFF." 3. Remove and inspect "METER" fuse to the "AIR BAG" warning lamp. Is fuse good?	Go to Step 2	Go to Step 7
2	1. Ignition switch "OFF." 2. Disconnect SRS coil and passenger air bag assemblies. Yellow 2-pin connectors located at base of steering column and behind the glove box assembly. 3. Disconnect SDM. 4. Ignition switch "ON." 5. Measure voltage on SDM harness connector from terminal "7" to terminal "6" (ground). Is system voltage present on terminal "7"?	Go to Step 4	Go to Step 3
3	1. Ignition switch "OFF." 2. Remove instrument meter cluster. 3. Check for proper connection to instrument cluster at IB04-GRN terminal. 4. If OK, then remove and inspect "AIR BAG" bulb. Is bulb good?	Go to Step 5	Replace bulb. Go to Step 6
4	1. Ignition switch "OFF." 2. Disconnect instrument meter cluster harness connector. 3. Ignition switch "ON." 4. Measure voltage on SDM harness connector from terminal "7" to terminal "6" (ground). Is voltage 1 volt or less?	Go to Chart A.	Replace SRS harness. Go to Step 6
5	1. Install bulb. 2. Measure resistance from instrument meter cluster harness connector IB04-GRN terminal to SDM harness connector terminal "7". Is resistance 5.0 ohms or less?	Service instrument meter cluster. Go to Step 6	Replace SRS harness. Go to Step 6
6	Reconnect all SRS components, ensure all components are properly mounted. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 6
7	Were you sent here from chart C?	Go to Step 8	Go to Step 1
8	1. Replace "METER" fuse. 2. Ignition switch "ON" wait 10 seconds then ignition switch "OFF." 3. Remove and inspect "METER" fuse. Is fuse good?	Install "METER" fuse. Go to Step 10	Go to Step 9

Step	Action	Yes	No
9	1. Disconnect SRS coil and passenger air bag assemblies. Yellow 2-pin connectors located at base of steering column and behind the glove box assembly. 2. Disconnect SDM. 3. Replace "METER" fuse. 4. Ignition switch "ON" wait to 10 seconds. 5. Ignition switch "OFF". 6. Remove and inspection "METER" fuse. Is fuse good?	Install "METER" fuse. Go to Chart A.	Replace SRS harness. Replace "METER" fuse. Go to Step 10
10	Reconnect all SRS components, ensure all components are properly mounted. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 10

DTC 15 Passenger Deployment Loop Resistance High

D09RX002

Circuit Description:

When the ignition switch is turned "ON", the Sensing and Diagnostic Module (SDM) will perform tests to diagnose critical malfunctions within itself. Upon passing these tests "ignition 1", and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. The SDM then proceeds with the "Resistance Measurement Test". "Passenger Bag Low" terminal "16" is grounded through a resistor and the passenger current source connected to "Passenger Bag High" terminal "15" allows a known amount of current to flow. By monitoring the voltage difference between "Passenger Bag High" and "Passenger Bag Low" the SDM calculates the combined resistance of the passenger air bag assembly, harness wiring Circuits (CKTs) IB07-YELLOW/GREEN and IB08-YELLOW/RED connector terminal contact.

DTC Will Set When:

The combined resistance of the passenger air bag assembly, harness wiring CKTs IB07-YELLOW/GREEN and IB08-YELLOW/RED, and connector terminal contact is above a specified value. This test is run once each ignition cycle during the "Resistance Measurement Test" when:

1. No "higher priority faults" are detected during "Turn-ON."
2. "Ignition 1" voltage is in the specified value.

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The ignition switch is turned "OFF."

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the Sensing and Diagnostic Module (SDM).
3. This test verifies proper connection of the yellow 2-pin connector.
4. This test checks for proper contact and/or corrosion of the yellow 2-pin connector terminals.
5. The test checks for a malfunctioning passenger air bag assembly.
6. This test determines whether the malfunction is due to high resistance in the wiring.

Diagnostic Aids:

An intermittent condition is likely to be caused by a poor connection at the passenger air bag assembly harness connector terminals "1" and "2", SDM terminal "15" and "16", or a poor wire to terminal connection in Circuits(CKTs) IB07-YELLOW/GREEN and IB08-YELLOW/RED. This test for this diagnostic trouble code is only run while the "AIR BAG" warning lamp is performing the bulb check, unless Diagnostic Trouble Code (DTC) 17 or DTC 26 is detected. When a scan tool "Clear Codes" command is issued and the malfunction is still present, the DTC will not reappear until the next ignition cycle.

DTC 15 Passenger Deployment Loop Resistance High

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	1. When measurements are requested in this chart use 5-8840-0285-0 DVM with correct terminal adapter from 5-8840-0385-0. 2. Use scan tool data list function, read and record the passenger deployment loop resistance. Is passenger resist more than 2.9 ohms?	Go to Step 3	Go to Chart A.
3	1. Ignition switch "OFF." 2. Make sure the passenger air bag assembly yellow 2-pin connector located behind the glove box assembly is seated properly. Is the yellow 2-pin connector connected properly?	Go to Step 4	Seat passenger air bag assembly yellow 2-pin connector properly. Go to Step 7
4	1. Disconnect and inspect the passenger air bag assembly yellow 2-pin connector located behind the glove box assembly. 2. If OK, reconnect the passenger air bag assembly 2-pin connector. 3. Ignition switch "ON." Is DTC 15 current?	Go to Step 5	Ignition switch "OFF." Go to Step 7
5	1. Ignition switch "OFF." 2. Disconnect SRS coil and passenger air bag 2-pin connectors located at the base of the steering column and behind the glove box assembly. 3. Connect 5-8840-2421-0 SRS driver / passenger load tool and appropriate adapters to SRS coil and passenger air bag assembly harness connectors. 4. Ignition switch "ON." Is DTC 15 current?	Go to Step 6	Ignition switch "OFF." Replace the passenger air bag assembly. Go to Step 7
6	1. Ignition switch "OFF." 2. There has been an increase in the total circuit resistance of the passenger inflator deployment loop. 3. Use the high resolution ohmmeter mode of the DVM while checking CKTs IB07-YEL/GRN and IB08-YEL/RED, and SDM connector terminal "15" and "16" to locate the root cause. Was a fault found?	Replace SRS harness. Go to Step 7	Go to Chart A.
7	1. Reconnect all components ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 7

DTC 16 Passenger Deployment Loop Resistance Low

D09RX002

Circuit Description:

When the ignition switch is turned "ON", the Sensing and Diagnostic Module (SDM) will perform tests to diagnose critical malfunctions within itself. Upon passing these tests "ignition 1", and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. The SDM then proceeds with the "Resistance Measurement Test". "Passenger Bag Low" terminal "16" is grounded through a resistor and the passenger current source connected to "Passenger Bag High" terminal "15" allows a known amount of current to flow. By monitoring the voltage difference between "Passenger Bag High" and "Passenger Bag Low", the SDM calculates the combined resistance of the passenger air bag assembly, harness wiring Circuits(CKTs) IB07-YELLOW/GREEN and IB08-YELLOW/RED connector terminal contact.

DTC Will Set When:

The combined resistance of the passenger air bag assembly, harness wiring CKTs IB07-YELLOW/GREEN and IB08-YELLOW/RED, and connector terminal contact is above a specified value. This test is run once each ignition cycle during the "Resistance Measurement Test" when:

1. No "higher priority faults" are detected during "Turn-ON",
2. "Ignition 1" voltage is in the specified value.

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The ignition switch is turned "OFF."

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the Sensing and Diagnostic Module (SDM).
3. This test verifies connection of the yellow 2-pin connector.
4. This test checks for proper operation of the shorting clip in the yellow 2-pin connector.
5. The test checks for a malfunction passenger air bag assembly.
6. This test determines whether the malfunctioning is due to shorting in the wiring.

Diagnostic Aids:

An intermittent condition is likely to be caused by a short between Circuits(CKTs) IB07-YELLOW/GREEN and IB08-YELLOW/RED, or a malfunctioning shorting clip on the passenger air bag assembly which would require replacement of the air bag assembly. The test for this diagnostic trouble code is only run while "AIR BAG" warning lamp is performing the bulb check, unless Diagnostic Trouble Code (DTC) 17 or DTC 26 is detected. When a scan tool "Clear Codes" command is issued and the malfunction is still present, the DTC will not reappear until the next ignition cycle.

DTC 16 Passenger Deployment Loop Resistance Low

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	1. When measurements are requested in this chart use 5-8840-0285-0 DVM with correct terminal adapter from 5-8840-0385-0. 2. Using scan tool data list function, read and record the passenger deployment loop resistance. Is passenger resist. less than 1.4 ohms?	Go to Step 3	Go to Chart A.
3	1. Ignition switch "OFF." 2. Make sure the passenger air bag assembly yellow 2-pin connector located behind the glove box assembly is seated properly. Is the yellow 2-pin connector connected properly?	Go to Step 4	Seat passenger air bag assembly yellow 2-pin connector properly. Go to Step 7
4	1. Disconnect and inspect the passenger air bag assembly yellow 2-pin connector located behind the glove box assembly. 2. If OK, reconnect the passenger air bag assembly 2-pin connector. 3. Ignition switch "ON." Is DTC 16 current?	Go to Step 5	Ignition switch "OFF." Go to Step 7
5	1. Ignition switch "OFF." 2. Disconnect SRS coil and passenger air bag 2-pin connectors located at the base of the steering column and behind the glove box assembly. 3. Connect 5-8840-2421-0 SRS driver / passenger load tool and appropriate adapters to SRS coil and passenger air bag assembly harness connectors. 4. Ignition switch "ON." Is DTC 16 current?	Go to Step 6.	Ignition switch "OFF." Replace the passenger air bag assembly. Go to Step 7
6	1. Ignition switch "OFF." 2. There has been a decrease in the total circuit resistance of the passenger inflator deployment loop. 3. Use the high resolution ohmmeter mode of the DVM while checking CKTs IB07-YEL/GRN and IB08-YEL/RED, and SDM connector terminal "15" and "16" to locate the root cause. Was a fault found?	Replace SRS harness. Go to Step 7	Go to Chart A.
7	1. Reconnect all components, ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 7

DTC 17 Passenger Deployment Loop Open

D09RX002

Circuit Description:

When the ignition switch is turned "ON", the Sensing and Diagnostic Module (SDM) will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, "ignition 1", and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. During "Continuous Monitoring" diagnostics, a fixed amount of current is flowing in the deployment loop. This produces proportional voltage drops in the loop. By monitoring the voltage difference between "Passenger Bag High" and "Passenger Bag Low", the SDM calculates the combined resistance of the passenger air bag assembly, harness wiring Circuits (CKTs) IB07–YELLOW/GREEN and IB08–YELLOW/RED, and connector terminal contact.

DTC Will Set When:

The voltage difference between "Passenger Bag High" terminal "15" and "Passenger Bag Low" terminal "16" is above or equal to a specified value for 500 milliseconds during "Continuous Monitoring".

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The voltage difference between "Passenger Bag High" terminal "15" and "Passenger Bag Low" terminal "16" is below a specified value for 500 milliseconds during "Continuous Monitoring".

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the Sensing and Diagnostic Module (SDM).
3. This test verifies proper connection of the yellow 2-pin connector.
4. This test checks for proper contact and/or corrosion of the shorting clip in the yellow 2-pin connector terminals.
5. The test checks for a malfunctioning passenger air bag assembly.
6. This test determines whether there is an open in the wiring.

Diagnostic Aids:

An intermittent condition is likely to be caused by a poor connection at the passenger air bag assembly harness connector terminals "1" and "2," SDM terminals "15" and "16," or an open in Circuits IB07-YELLOW/GREEN and IB08-YELLOW/RED.

DTC 17 Passenger Deployment Loop Open

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	1. When measurements are requested in this chart use 5-8840-0285-0 DVM with correct terminal adapter from 5-8840-0385-0. 2. Using scan tool data list function, read and record the passenger differential voltage. Is passenger differential voltage. more than 4.25 volts?	Go to Step 3	Go to Chart A.
3	1. Ignition switch "OFF." 2. Make sure the passenger air bag assembly yellow 2-pin connector located behind the glove box assembly is seated properly. Is the yellow 2-pin connector connected properly?	Go to Step 4	Seat passenger air bag assembly yellow 2-pin connector properly. Go to Step 7
4	1. Disconnect and inspect the passenger air bag assembly yellow 2-pin connector located behind the glove box assembly. 2. If OK, reconnected the passenger air bag assembly yellow 2-pin connector. 3. Ignition switch "ON." Is DTC 17 current?	Go to Step 5	Ignition switch "OFF." Go to Step 7
5	1. Ignition switch "OFF." 2. Disconnect SRS coil and passenger air bag assembly yellow 2-pin connectors located at the base of the steering column and behind the glove box assembly. 3. Connect 5-8840-2421-0 SRS driver / passenger load tool and appropriate adapters to SRS coil and passenger air bag assembly harness connectors. 4. Ignition switch "ON." Is DTC 17 current?	Go to Step 6	Ignition switch "OFF." Replace the passenger air bag assembly. Go to Step 7
6	1. Ignition switch "OFF." 2. There has been an open circuit in the passenger inflator deployment loop. 3. Use the high resolution ohmmeter mode of the DVM while checking CKTs IB07-YEL/GRN and IB08-YEL/RED, and SDM connector terminal "15" and "16" to locate the root cause. Was a fault found?	Replace SRS harness. Go to Step 7	Go to Chart A.
7	1. Reconnect all components ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 7

DTC 18 Passenger Deployment Loop Short To Ground

D09RX002

Circuit Description:

When the ignition switch is turned "ON", the Sensing and Diagnostic Module (SDM) will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, "ignition 1", and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. The SDM monitors the voltages at "Driver Bag Low" terminal "4" and "Passenger Bag Low" terminal "16" to detect short to ground in the air bag assembly circuits.

DTC Will Set When:

Neither of the two air bag assemblies is open. "Ignition 1" is within the normal operating voltage range. Once these conditions are met and the voltage at "Passenger Bag Low" is below a specified value, Diagnostic Trouble Code (DTC) 18 will set. This test is run once each ignition cycle and "Continuous

Monitoring".

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

This malfunction is no longer occurring and the ignition switch is turned "OFF".

DTC Chart Test Description:

- Number(s) below refer to circled number(s) on the diagnostic chart:
2. This test determines whether the SDM is malfunctioning.
 3. This test isolates the malfunction to one side of the passenger air bag assembly yellow 2-pin connector

9J1-26 RESTRAINT CONTROL SYSTEM

behind glove box compartment.

4. This test determines whether the malfunction is in Circuit(CKT) IB07-YELLOW/GREEN.
5. This test determines whether the malfunction is in CKT IB08-YELLOW/RED.

Diagnostic Aids:

An intermittent condition is likely to be caused by a short to ground in the passenger air bag assembly circuit. Inspect CKTs IB07-YELLOW/GREEN and IB08-YELLOW/RED carefully for cutting or chafing. If the wiring pigtail of the passenger air bag assembly is damaged, the component must be replaced.

DTC 18 Passenger Deployment Loop Short To Ground

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	1. When measurements are requested in this chart use 5-8840-0285-0 DVM with correct terminal adapter from 5-8840-0385-0. 2. Ignition switch "OFF." 3. Connect scan tool data link connector. Follow directions as given in the scan tool operator's manual. 4. Ignition switch "ON." 5. Read passenger sense LO. Is passenger sense LO less than 1.5 volts?	Go to Step 3	Go to Chart A.
3	1. Ignition switch "OFF." 2. Disconnect passenger air bag assembly yellow 2-pin connector behind the glove box assembly.. 3. Leave driver air bag assembly connected. Connect SRS driver / passenger load tool 5-8840-2421-0 and appropriate adapter to passenger air bag assembly harness connector. 4. Ignition switch "ON." Is DTC 18 current?	Go to Step 4	Ignition switch "OFF." Replace passenger air bag assembly. Go to Step 6
4	1. Ignition switch "OFF." 2. Disconnect SRS driver / passenger load tool. 3. Measure resistance on SDM harness connector from terminal "15" to terminal "6" (ground). Does DVM display "0L" (infinite)?	Go to Step 5	Replace SRS harness. Go to Step 6
5	Measure resistance on SDM harness connector from terminal "6" "16" to terminal (ground). Does DVM display "0L" (infinite)?	Go to Chart A.	Replace SRS harness. Go to Step 6
6	1. Reconnect all components, ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 6

DTC 19 Passenger Deployment Loop Short To Voltage

D09RX002

Circuit Description:

When the ignition switch is turned "ON", the Sensing and Diagnostic Module (SDM) will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, "ignition 1", and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges.

The SDM monitors the voltages at "Driver Bag Low" terminal "4" and "Passenger Bag Low" terminal "16" to detect short to B+ in the air bag assembly circuits.

DTC Will Set When:

"Ignition 1" is within the normal operating voltage range. Once these conditions are met and the voltage at "Passenger Bag Low" is above a specified value, Diagnostic Trouble Code (DTC) 19 will set. This test is run once each ignition cycle and "Continuous Monitoring".

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets DTC 19 and also DTC 71.

DTC Will Clear When:

The SDM is replaced.

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the SDM.
3. This test isolates the malfunction to one side of the passenger air bag assembly yellow 2-pin connector behind glove box compartment.
4. This test determines whether the malfunction is in Circuit(CKT) IB07-YELLOW/GREEN.

-
5. This test determines whether the malfunction is in CKT IB08-YELLOW/RED.

Diagnostic Aids:

An intermittent condition is likely to be caused by a short to B+ in the passenger air bag assembly circuit. Inspect CKTs IB07-YELLOW/GREEN and IB08-YELLOW/RED carefully for cutting or chafing. If the wiring pigtail of the passenger air bag assembly is damaged, the component must be replaced. A careful inspection of CKT IB07-YELLOW/GREEN and IB08-YELLOW/RED, including the passenger air bag assembly pigtail is essential to ensure that the replacement Sensing and Diagnostic Module (SDM) will not be damaged.

DTC 19 Passenger Deployment Loop Short To Voltage

CAUTION: When DTC 19 has been set, it is necessary to replace the Sensing and Diagnostic Module (SDM). Setting Diagnostic Trouble Code (DTC) 19 and 25 or 51 or 53 will also cause DTC 71 to set. When a scan tool "CLEAR CODES" command is issued and the malfunction is no

longer present, DTC 71 will remain current. Ensure that the short to voltage condition is repaired prior to installing a replacement SDM to avoid damaging the SDM.

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	1. When measurements are requested in this chart use 5-8840-0285-0 DVM with correct terminal adapter from 5-8840-0385-0. 2. Ignition switch "OFF." 3. Connect scan tool data link connector. Follow directions as given in the scan tool operator's manual. 4. Ignition switch "ON." 5. Read passenger sense LO. Is passenger sense LO more than 3.5 volts?	Go to Step 3	Go to Chart A.
3	1. Ignition switch "OFF." 2. Disconnect passenger air bag assembly yellow 2-pin connector behind the glove box assembly. 3. Leave driver air bag assembly connected. 4. Connect SRS driver / passenger load tool 5-8840-2421-0 and appropriate adapter to passenger air bag assembly harness connector. 5. Ignition switch "ON." Is passenger sense LO more than 3.5 volts?	Go to Step 4	Ignition switch "OFF." Replace passenger air bag assembly. Go to Step 6
4	1. Ignition switch "OFF." 2. Disconnect SDM. 3. Disconnect SRS driver / passenger load tool. 4. Measure resistance on SDM harness connector from terminal "15" to terminal "12" (IGNITION 1). Does DVM display "0L" (infinite)?	Go to Step 5	Replace SRS harness. Go to Step 6
5	Measure resistance on SDM harness connector from terminal "16" to terminal "12" (IGNITION 1). Does DVM display "0L" (infinite)?	Go to Chart A.	Replace SRS harness. Go to Step 6
6	1. Reconnect all components, ensure all component are properly mounted. 2. Ignition switch "ON." Is passenger sense LO less than 3.5 volts?	Ignition switch "OFF." Replace SDM. Go to Step 7	Go to Chart A.
7	1. Reconnect all components, ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 7

DTC 21 Driver Deployment Loop Resistance High

D09RX002

Circuit Description:

When the ignition switch is turned "ON", the Sensing and Diagnostic Module (SDM) will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, "ignition 1", and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges.

The SDM then proceeds with the "Resistance Measurement Test" "Driver Bag Low" terminal "4" is grounded through a current sink and the driver current source connected to "Driver Bag High" terminal "3" allows a known amount of current to flow. By monitoring the voltage difference between "Driver Bag High" and "Driver Bag Low", the SDM calculates the combined resistance of the driver air bag assembly, SRS coil assembly, harness wiring Circuits(CKTs) IB05-YELLOW and IB06-YELLOW/BLACK, and connector terminal contact.

DTC Will Set When:

The combined resistance of the driver air bag assembly, SRS Coil assembly, harness wiring CKTs IB05-YELLOW and IB06-YELLOW/BLACK, and connector terminal contact is above a specified value. This test run once each ignition cycle during the "Resistance Measurement Test" when:

No "higher priority faults" are detected during "Turn-ON" "Ignition 1" voltage is in the specified value.

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets DTC 21.

DTC Will Clear When:

The ignition switch is turned "OFF".

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the Sensing and Diagnostic Module (SDM).
3. This test verifies proper connection of the yellow 2-pin connector at the base of the steering column.
4. This test checks for proper contact and/or corrosion of the 2-pin connector terminals at the base of steering column.
5. This test isolate the malfunction to one side of the Supplemental Restraint System (SRS) coil assembly yellow 2-pin connector located at the base of the steering column.
6. This test determines whether the malfunction is due to high resistance in the wiring.
7. This test determines whether the malfunction is in the SRS coil assembly or the driver air bag assembly.

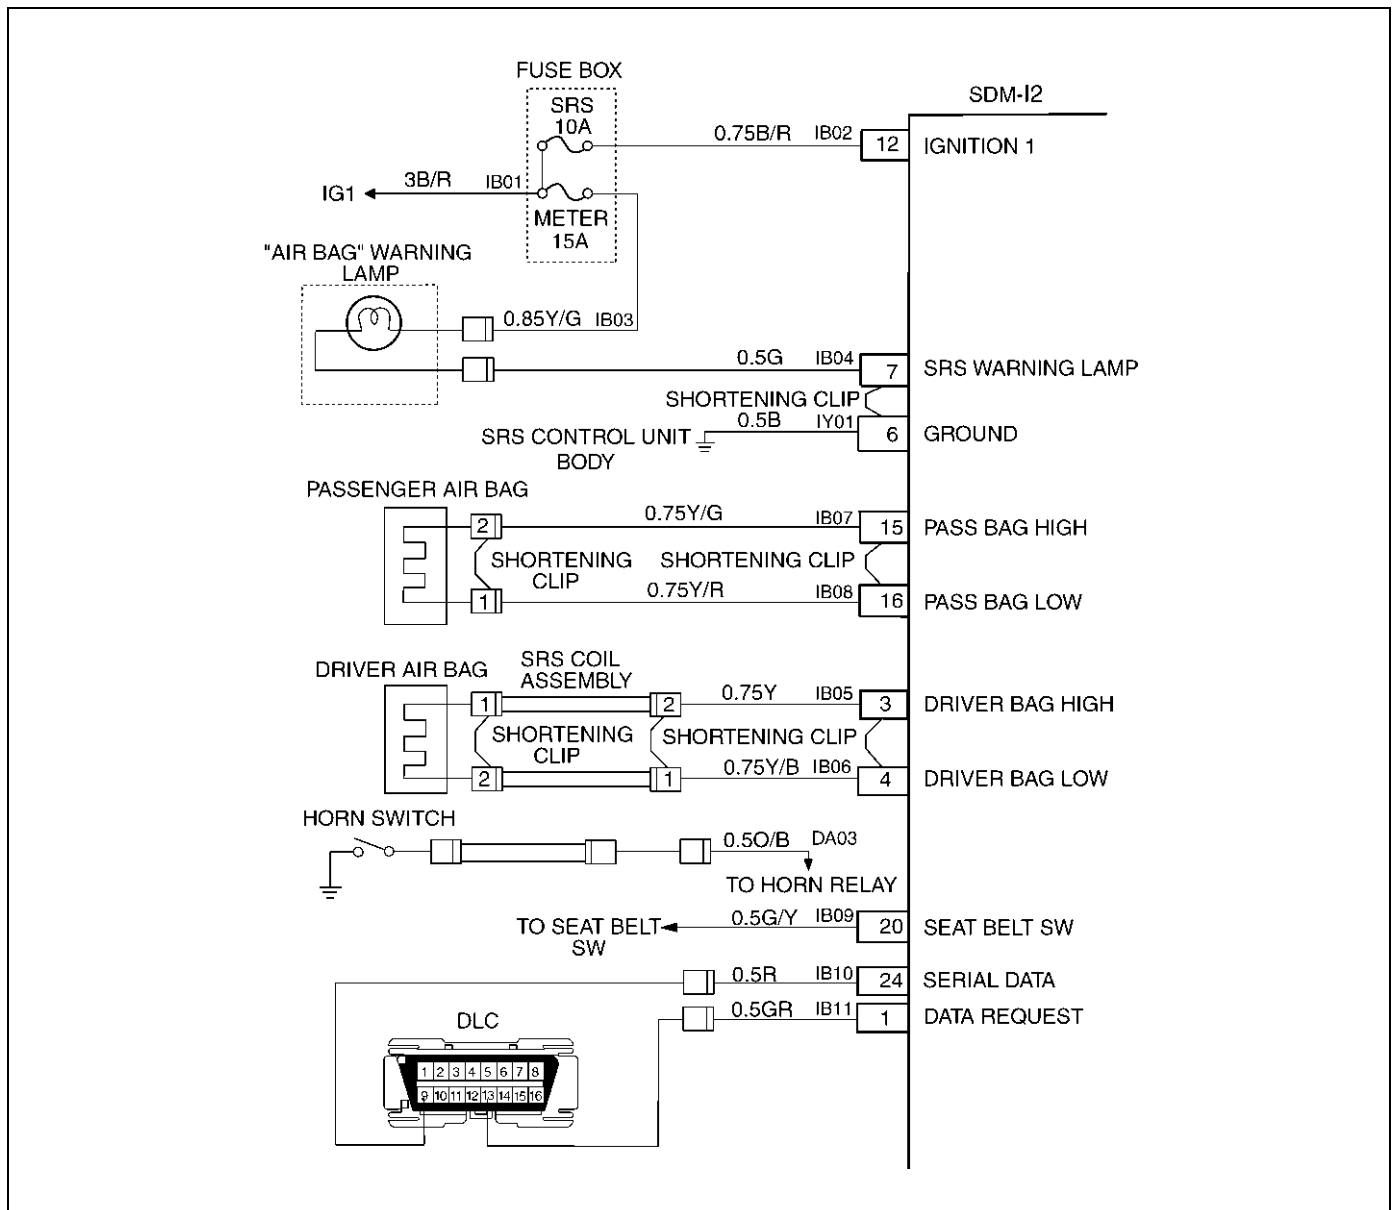

Diagnostic Aids:

An intermittent condition is likely to be caused by a poor connection at terminals "1" and "2" of the SRS coil 2-pin connector at the base of the steering column, terminal "1" and "2" of the driver air bag assembly 2-pin connector at the top of the steering column, SDM terminals "3" and "4" or a poor wire to terminal connection in Circuit IB05-YELLOW or IB06-YELLOW/BLACK. The test for this diagnostic trouble code is only run while the "AIR BAG" warning lamp is performing the bulb check, unless Diagnostic Trouble Code (DTC) 17 or DTC 26 is detected. When a scan tool "Clear Codes" command is issued and the malfunction is still present, the DTC will not reappear until the next ignition cycle.

DTC 21 Driver Deployment Loop Resistance High

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	1. When measurements are requested in this chart use 5-8840-0285-0 DVM with correct terminal adapter from 5-8840-0385-0. 2. Use scan tool data list function, read and record the driver deployment loop resistance. Is driver deployment loop resistance more than 4.4 ohms?	Go to Step 3	Go to Chart A.
3	1. Ignition switch "OFF." 2. Disconnect driver air bag assembly yellow 2-pin connector located at base of steering column is seated properly. Is the 2-pin connector connected properly?	Go to Step 4	Seat SRS coil assembly 2-pin connector properly. Go to Step 8
4	1. Disconnect and inspect the SRS coil assembly yellow 2-pin connector located base of steering column. 2. If OK, reconnect the SRS coil assembly yellow 2-pin connector. 3. Ignition switch "ON." Is DTC 21 current?	Go to Step 5	Ignition switch "OFF." Go to Step 8
5	1. Ignition switch "OFF." 2. Disconnect SRS coil and passenger air bag assembly yellow 2-pin connectors located at the base of steering column and behind the glove box assembly. 3. Connect SRS driver / passenger load tool 5-8840-2421-0 and appropriate adapter to SRS coil and passenger air bag assembly harness connectors. 4. Ignition switch "ON." Is DTC 21 current?	Go to Step 6	Go to Step 7
6	1. Ignition switch "OFF." 2. There has been a increase in the total circuit resistance of the driver deployment loop. 3. Use the high resolution ohmmeter mode of the DVM while checking CKTs IB05-YEL/IB06-YEL/BLK, and SDM connector terminal "3" and "4" to locate the root cause. Was a fault found?	Replace SRS harness. Go to Step 8	Go to Chart A.
7	1. Ignition switch "OFF." Disconnect SRS driver / passenger load tool from SRS coil assembly harness connector. Connect SRS driver / passenger load tool 5-8840-2421-0 on the top of steering column. Reconnect SRS coil assembly harness connector as the base of steering column. Ignition switch "ON." Is DTC 21 current?	Ignition switch "OFF." Replace SRS COIL ASSEMBLY. Refer to in this section. Go to Step 8	Ignition switch "OFF." Replace driver air bag assembly. Go to Step 8
8	Reconnect all components, ensure all component are properly mounted. Clear diagnostic trouble codes. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 8.

DTC 22 Driver Deployment Loop Resistance Low

D09RX002

Circuit Description:

When the ignition switch is turned "ON", the Sensing and Diagnostic Module (SDM) will perform tests to diagnose critical malfunctions within itself. Upon passing these tests "ignition 1", and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. The SDM then proceeds with the "Resistance Measurement Test" "Driver Bag Low" terminal "4" is grounded through a current sink and the driver current source connected to "Driver Bag High" terminal "3" allows a known amount of current to flow. By monitoring the voltage difference between "Driver Bag High" and "Driver Bag Low" the SDM calculates the combined resistance of the driver air bag assembly, Supplemental Restraint System (SRS) coil assembly, harness wiring Circuits(CKTs) IB05-YELLOW and IB06-YELLOW/BLACK and connector terminal contact.

DTC Will Set When:

The combined resistance of the driver air bag assembly, SRS coil assembly, harness wiring CKTs IB05-YELLOW and IB06-YELLOW/BLACK and connector terminal contact is above a specified value. This test is run once each ignition cycle during the "Resistance Measurement Test" when:

1. No "higher priority faults" are detected during "Turn-ON"
2. "Ignition 1" voltage is in the specified value.

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets DTC 22.

DTC Will Clear When:

The ignition switch is turned "OFF."

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the Sensing and Diagnostic Module (SDM).
3. This test verifies proper connection of the yellow 2-pin connector at the base of the steering column.
4. This test checks for proper operation of the shorting clip in the yellow 2-pin connector.
5. This test isolate the malfunction to one side of the Supplemental Restraint System (SRS) coil assembly yellow 2-pin connector located at the base of steering column.
6. This test determines whether the malfunction is due to shorting in the wiring.
7. This test determines whether the malfunction is in the SRS coil assembly or the driver air bag assembly.

Diagnostic Aids:

An intermittent condition is likely to be caused by a short between Circuits IB05-YELLOW or IB06-YELLOW/BLACK or a malfunctioning shorting clip on the driver air bag assembly or SRS coil assembly which would require replacement of the component. The test for this diagnostic trouble code is only run while the "AIR BAG" warning lamp is performing the bulb check, unless Diagnostic Trouble Code (DTC) 17 or DTC 26 is detected. When a scan tool "Clear Codes" command is issued and the malfunction is still present, the DTC will not reappear until the next ignition cycle.

DTC 22 Driver Deployment Loop Resistance Low

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	1. When measurements are requested in this chart use 5-8840-0285-0 DVM with correct terminal adapter from 5-8840-0385-0. 2. Use scan tool data list function, read and record the driver deployment loop resistance. Is driver resist. less than 1.9 ohms?	Go to Step 3	Go to Chart A.
3	1. Ignition switch "OFF." 2. Make sure the SRS coil assembly yellow 2-pin connector located at the base of steering column is seated properly. Is the 2-pin connector connected properly?	Go to Step 4	Seat driver air bag assembly 2-pin connector properly. Go to Step 8
4	1. Disconnect and inspect the SRS coil assembly yellow 2-pin connector located base of steering column. 2. If OK, reconnect the driver air bag assembly yellow 2-pin connector. 3. Ignition switch "ON." Is DTC 22 current?	Go to Step 5	Ignition switch "OFF." Go to Step 8
5	1. Ignition switch "OFF." 2. Disconnect SRS coil and passenger air bag 2-pin connectors located at the base of steering column and behind the glove box assembly. 3. Connect SRS driver / passenger load tool 5-8840-2421-0 and appropriate adapter to SRS coil and passenger air bag assembly harness connectors. 4. Ignition switch "ON." Is DTC 22 current?	Go to Step 6	Go to Step 7
6	1. Ignition switch "OFF." 2. There has been a decrease in the total circuit resistance of the driver deployment loop. 3. Use the high resolution ohmmeter mode of the DVM while checking CKTs IB05-YEL and IB06-YEL/BLK, and SDM connector terminal "3" and "4" to locate the root cause. Was a fault found?	Replace SRS harness. Go to Step 8	Go to Chart A.
7	1. Ignition switch "OFF." 2. Disconnect SRS driver / passenger load tool from SRS coil assembly harness connector. 3. Connect SRS driver / passenger load tool 5-8840-2421-0 to the top of steering column. 4. Reconnect SRS coil assembly harness connector as the base of steering column. 5. Ignition switch "ON." Is DTC 22 current?	Ignition switch "OFF." Replace SRS coil assembly. Refer to in this section. Go to Step 8	Ignition switch "OFF." Replace driver air bag assembly. Go to Step 8
8	1. Reconnect all components, ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 8

DTC 24 Driver Deployment Loop Short To Ground

D09RX002

Circuit Description:

When the ignition switch is turned "ON", the Sensing and Diagnostic Module (SDM) will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, "ignition 1", and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. The SDM monitors the voltage at "Driver Bag Low" terminal "4" and "Passenger Bag Low" terminal "16" to detect shorts to ground in the air bag assembly circuits.

DTC Will Set When:

Neither of the two air bag assemblies is open. "Ignition 1" is within the normal operating voltage range. This test is run once each ignition cycle and "Continuous Monitoring". Once these conditions are met and the voltage at "Driver Bag Low" is below a specified value, DTC 24 will set.

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The malfunction is no longer occurring and the ignition is turned "OFF."

DTC Chart Test Description:

- Number(s) below refer to step number(s) on the diagnostic chart:
2. This test determines whether the SDM is malfunctioning
 3. This test isolates the malfunction to one side of the Supplemental Restraint System (SRS) coil assembly yellow 2-pin connector at the base of the steering column.

9J1-38 RESTRAINT CONTROL SYSTEM

4. This test determines whether the malfunction is in Circuit(CKT) IB05-YELLOW.
5. This test determines whether the malfunction is in CKT IB06-YELLOW/BLACK.
6. This test determines whether the malfunction is in the SRS coil assembly or the driver air bag assembly.

Diagnostic Aids:

An intermittent condition is likely to be caused by a short to ground in the driver air bag assembly circuit. Inspect CKTs IB05-YELLOW and IB06-YELLOW/BLACK carefully for cutting or chafing.

DTC 24 Driver Deployment Loop Short To Ground

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	1. When measurements are requested in this chart use 5-8840-0285-0 DVM with correct terminal adapter from 5-8840-0385-0. 2. Ignition switch "OFF." 3. Connect scan tool data link connector. Follow directions as given in the scan tool operator's manual. Ignition switch "ON." 4. Read driver sense LO. Is driver sense LO less than 1.5 volts?	Go to Step 3	Go to Chart A.
3	1. Ignition switch "OFF." 2. Disconnect SRS coil assembly yellow 2-pin connector located at base of the steering column. Leave passenger air bag assembly connected. 3. Connect SRS driver / passenger load tool 5-8840-2421-0 and appropriate adapter to SRS coil assembly harness connector. 4. Ignition switch "ON." Is DTC 24 current?	Go to Step 4	Go to Step 6
4	1. Ignition switch "OFF." 2. Disconnect SDM. 3. Disconnect SRS driver / passenger load tool. 4. Measure resistance on SDM harness connector "3" to terminal "6" (ground). Does DVM display "0L" (infinite)?	Go to Step 5	Replace SRS harness. Go to Step 7
5	Measure resistance on SDM harness connector from terminal "4" to terminal "6" (ground). Does DVM display "0L" (infinite)?	Go to Chart A.	Replace SRS harness. Go to Step 7
6	1. Ignition switch "OFF." 2. Disconnect SRS driver / passenger load tool 5-8840-2421-0 from SRS coil assembly harness connector. 3. Connect SRS driver / passenger load tool 5-8840-2421-0 and appropriate adapter 5-8840-0385-0 to driver air bag assembly harness connector. Located top of the steering column. 4. Reconnect SRS coil assembly harness connector as the base of steering column. 5. Ignition switch "ON." Is DTC 24 current?	Ignition switch "OFF." Replace SRS coil assembly. Refer to in this section. Go to Step 7	Ignition switch "OFF." Replace driver air bag assembly. Go to Step 7
7	1. Reconnect all components, ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 7

DTC 25 Driver Deployment Loop Short To Voltage

D09RX002

Circuit Description:

When the ignition switch is turned "ON", the Sensing and Diagnostic Module (SDM) will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, "ignition 1", and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges.

The SDM monitors the voltage at "Driver Bag Low" terminal "4" and "Passenger Bag Low" terminal "16" to detect shorts to B+ in the air bag assembly circuits.

DTC Will Set When:

"Ignition 1" is in the normal operating voltage range. This test is run once each ignition cycle and "Continuous Monitoring". Once these conditions are met and the voltage at "Driver Bag Low" is above a specified value, Diagnostic Trouble Code (DTC) 25 will set.

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets DTC 25 and also DTC 71

DTC Will Clear When:

The SDM is replaced.

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the SDM is malfunctioning.
3. This test isolates the malfunction to one side of the Supplemental Restraint System coil assembly yellow 2-pin connector at the base of steering column.
4. This test determines whether the malfunction is in Circuit(CKT) IB05-YELLOW.

5. This test determines whether the malfunction is in CKT IB06-YELLOW/BLACK.
6. This test determines whether the malfunction is in the Supplemental Restraint System (SRS) coil assembly or the driver air bag assembly.

Diagnostic Aids:

An intermittent condition is likely to be caused by a short to B+ in the driver air bag assembly circuit. Inspect CKTs IB05-YELLOW and IB06-YELLOW/BLACK carefully for cutting or chafing. If the wiring pigtail of the driver air bag assembly and SRS coil assembly is damaged, the components must be replaced. A careful inspection of CKT IB05-YELLOW and IB06-YELLOW/BLACK, including the SRS coil assembly and driver air bag assembly is essential to ensure that the replacement Sensing and Diagnostic Module (SDM) will not be damaged.

DTC 25 Driver Deployment Loop Short To Ignition

CAUTION: When Diagnostic Trouble Code (DTC) 25 has been set, it is necessary to replace the Sensing and Diagnostic Module (SDM). Setting DTC 25 will also cause DTC 71 to set. When a scan tool "CLEAR CODES" command is issued and the malfunction is

no longer present, DTC 71 will remain current. Ensure that the short to voltage condition is repaired prior to installing a replacement SDM to avoid damaging the SDM.

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	1. When measurements are requested in this chart use 5-8840-0285-0 DVM with correct terminal adapter from 5-8840-0385-0. 2. Ignition switch "OFF." 3. Connect scan tool data link connector. Follow directions as given in the scan tool operator's manual. 4. Ignition switch "ON." 5. Read driver sense LO. Is driver sense LO more than 3.5 volts?	Go to Step 3	Go to Chart A.
3	1. Ignition switch "OFF." 2. Disconnect SRS coil assembly yellow 2-pin connector at the base of the steering column. Leave passenger air bag assembly connected. Connect SRS driver / passenger load tool 5-8840-2421-0 and appropriate adapter to SRS coil assembly harness connector. 3. Ignition switch "ON." Is driver sense LO more than 3.5 volts?	Go to Step 4	Go to Step 6
4	1. Ignition switch "OFF." 2. Disconnect SDM. 3. Disconnect SRS driver / passenger load tool. 4. Measure resistance on SDM harness connector from terminal "3" to terminal "12" (Ignition 1). Does DVM display "0L" (infinite)?	Go to Step 5	Replace SRS harness. Go to Step 7
5	Measure resistance on SDM harness connector from terminal "4" to terminal "12" (Ignition 1). Does DVM display "0L" (infinite)?	Go to Chart A.	Replace SRS harness. Go to Step 7
6	1. Ignition switch "OFF." 2. Connect SRS driver / passenger load tool 5-8840-2421-0 and appropriate adapter 5-8840-0385-0 to driver air bag assembly harness connector located of top of the steering column. 3. Reconnect SRS coil assembly harness connector as the base of steering column. 4. Ignition switch "ON." Is driver sense LO more than 3.5 volts?	Ignition switch "OFF." Replace SRS coil assembly. Go to Step 7	Ignition switch "OFF." Replace driver air bag assembly. Go to Step 7
7	1. Reconnect all components, ensure all components are properly mounted. 2. Ignition switch "ON." Is passenger sense LO less than 3.5 volts?	Replace SDM. Go to Step 8	Go to Chart A.

Step	Action	Yes	No
8	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 8

DTC 26 Driver Deployment Loop Open

D09RX002

Circuit Description:

When the ignition switch is turned "ON", the Sensing and Diagnostic Module (SDM) will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, "ignition 1", and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges.

During "Continuous Monitoring" diagnostics, a fixed amount of current is following in the deployment loop. This produces proportional voltage drops in the loop. By monitoring the voltage difference between "Driver Bag High" and "Driver Bag Low", the SDM calculates the combined resistance of the driver air bag assembly, SRS coil assembly, harness wiring Circuits (CKTs) IB05-YELLOW and IB06-YELLOW/BLACK, and connector terminal contact.

DTC Will Set When:

The voltage difference between "Driver Bag High" terminal "3" and "Driver Bag Low" terminal "4" is above or equal to a specified value for 500 milliseconds during "Continuous Monitoring."

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The voltage difference between "Driver Bag High" terminal "3" and "Driver Bag Low" terminal "4" is below a specified value for 500 milliseconds during "Continuous Monitoring."

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart:

1. This test determines whether the malfunction is in the Sensing and Diagnostic Module (SDM).
2. This test verifies proper connection of the yellow 2-pin connector at the base of the steering column.
3. This test checks for proper contact and/or corrosion of the yellow 2-pin connector at the base of the steering column.
4. This test isolates the malfunction to one side of the Supplemental Restraint System (SRS) coil assembly yellow 2-pin connector located at the base of steering column.
5. This test determines whether the open is in the wiring.
6. This test determines whether the malfunction is in the SRS coil assembly or the driver air bag assembly.

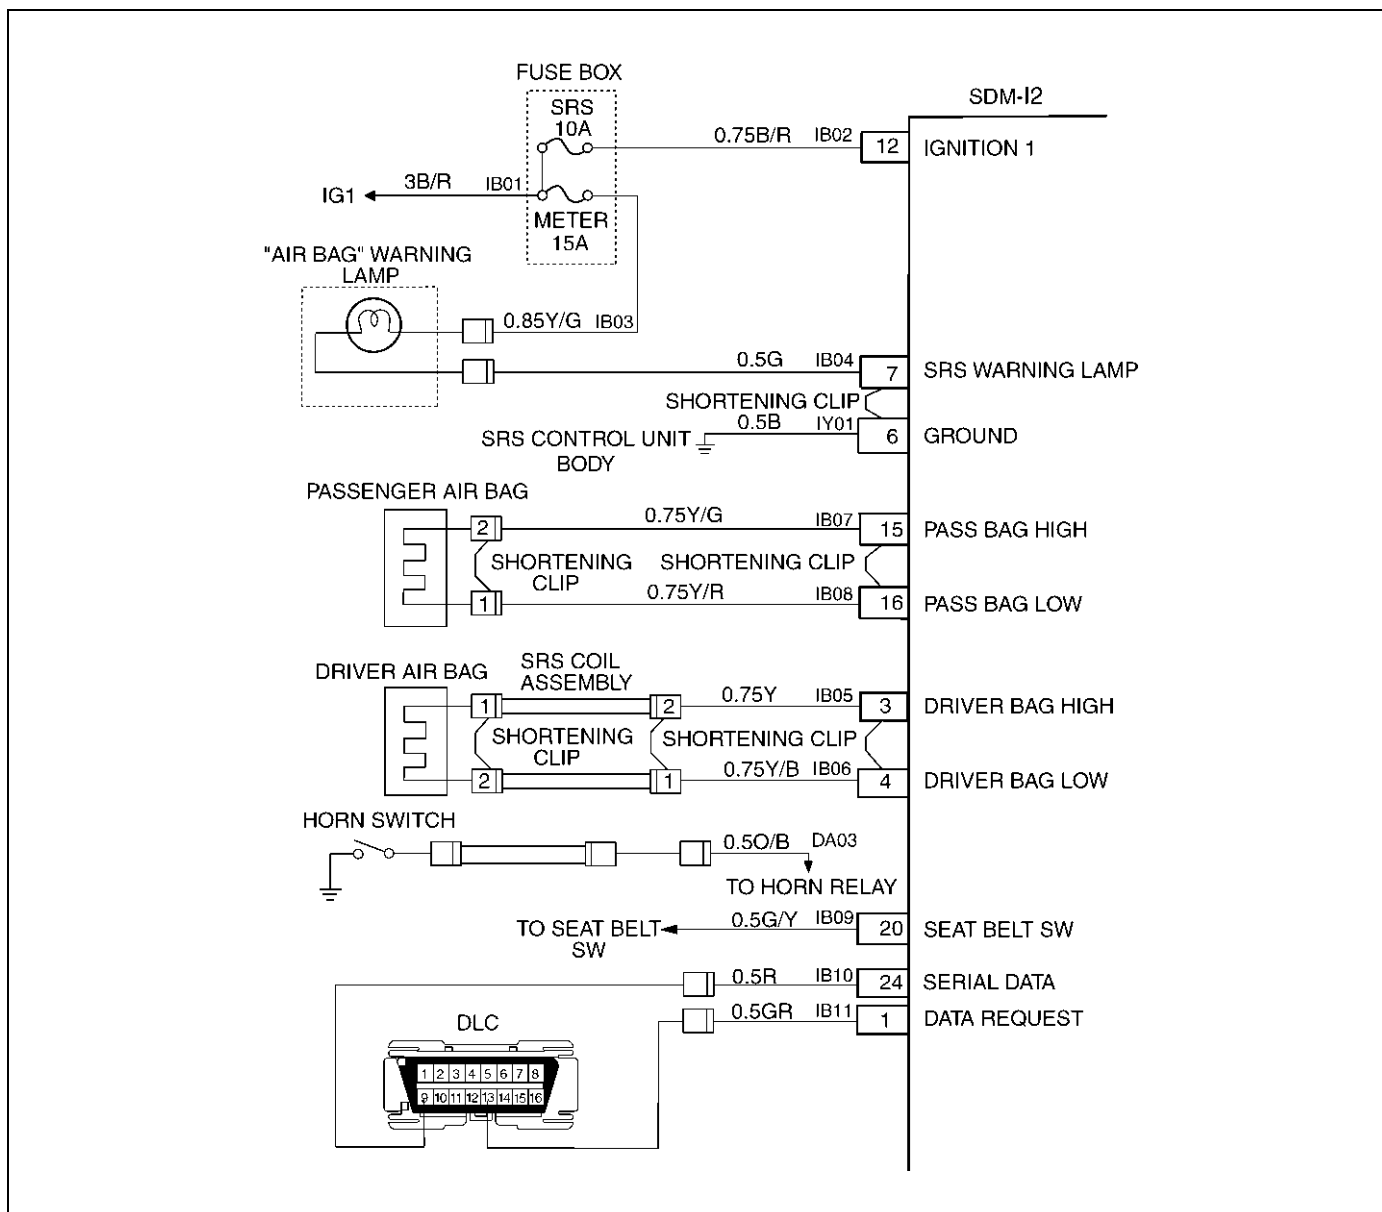

Diagnostic Aids:

An intermittent condition is likely to be caused by a poor connection at the driver air bag assembly harness 2-pin connector terminals "1" and "2" at the top of the steering column, SRS coil assembly harness 2-pin connection terminals "1" and "2", SDM terminals "3" and "4", or an open in Circuits(CKTs) IB05-YELLOW and IB06-YELLOW/BLACK.

DTC 26 Driver Deployment Loop Open

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	1. When measurements are requested in this chart use 5-8840-0285-0 DVM with correct terminal adapter from 5-8840-0385-0. 2. Use scan tool data list function, read and record the driver differential voltage. Is driver differential voltage more than 4.25 volts?	Go to Step 3	Go to Chart A.
3	1. Ignition switch "OFF." 2. Make sure the SRS coil assembly yellow 2-pin connector located at the base of steering column is seated properly. Is the yellow 2-pin connector connected properly?	Go to Step 4	Seat driver air bag assembly 2-pin connector. Go to Step 8
4	1. Disconnect and inspect the SRS coil assembly yellow 2-pin connector located base of steering column. 2. If OK, reconnect the SRS coil assembly yellow 2-pin connector. 3. Ignition switch "ON". Is DTC 26 current?	Go to Step 5	Ignition switch "OFF." Go to Step 8
5	1. Ignition switch "OFF." 2. Disconnect SRS coil and passenger air bag assembly, yellow 2-pin connectors located at the base of steering column and behind the glove box assembly. 3. Connect SRS driver / passenger load tool 5-8840-2421-0 and appropriate adapter to SRS coil and passenger air bag assembly harness connectors. 4. Ignition switch "ON." Is DTC 26 current?	Go to Step 6	Go to Step 7
6	1. Ignition switch "OFF." 2. There has been an open circuit in the driver deployment loop. Use the high resolution ohmmeter mode of the DVM while checking CKTs IB05 YEL and IB06 YEL/BLK, and SDM connector terminal "3" AND "4" to locate the root cause. Was a fault found?	Replace SRS harness. Go to Step 8	Go to Chart A.
7	1. Ignition switch "OFF." 2. Disconnect SRS driver / passenger load tool from SRS coil assembly harness connector. 3. Connect SRS driver / passenger load tool 5-8840-2421-0 on steering column. 4. Reconnect SRS coil assembly harness connector as the base of steering column. 5. Ignition switch "ON." Is DTC 26 current?	Ignition switch "OFF." Replace SRS coil assembly, refer to in this section. Go to Step 8	Ignition switch "OFF." Replace driver air bag assembly. Go to Step 8
8	1. Reconnect all components, ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 8

DTC 51 Deployment Event Commanded

D09RX002

Circuit Description:

The Sensing and Diagnostic Module (SDM) contains a sensing device which converts vehicle velocity changes to an electrical signal. The electrical signal generated is processed by the SDM and then compared to a value stored in memory. When the generated signal exceeds the stored value, the SDM will cause current to flow through the air bag assembly deploying the air bags and causing Diagnostic Trouble Code (DTC) 51 to set.

DTC Will Set When:

The SDM detects a frontal crash, up to 30 degrees off the centerline of the vehicle, of sufficient force to warrant deployment of the air bags.

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp records

"Crash Data", and sets a diagnostic trouble code.

DTC Will Clear When:

The SDM is replaced.

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. If air bag assembly (s) has not deployed, DTC 51 may have falsely set.
3. If DTC 51 has set with no signs of frontal impact, the diagnostic trouble code has falsely set.

DTC 51 Deployment Event Commanded

WARNING: DURING SERVICE PROCEDURES. BE VERY CAREFUL WHEN HANDLING A SENSING AND DIAGNOSTIC MODULE (SDM). NEVER STRIKE OR JAR THE SDM. NEVER POWER UP THE SRS WHEN THE SDM IS NOT RIGIDLY ATTACHED TO THE VEHICLE. ALL SDM AND MOUNTING BRACKET FASTENERS MUST BE CAREFULLY TORQUED AND THE ARROW MUST BE POINTING TOWARD

THE FRONT OF THE VEHICLE TO ENSURE PROPER OPERATION OF THE SUPPLEMENTAL RESTRAINT SYSTEM (SRS). THE SDM COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY.

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	Ignition switch "OFF." Have air bag assemblies deployed?	Replace components and perform inspections as directed in "repairs and inspections required after an accident" in this section. Clear diagnostic trouble codes. Repeat the "SRS Diagnostic System Check."	Go to Step 3
3	Inspect front of vehicle and undercarriage for signs of impact. Were signs of impact found?	Replace components and perform inspections as directed in "repairs and inspections required after an accident" in this section. Clear diagnostic trouble codes. Repeat the "SRS Diagnostic System Check."	Ignition switch "OFF." Replace SDM. Reconnect all SRS system components, ensure all components are properly mounted. Repeat the "SRS Diagnostic System Check."

DTC 53 Deployment Commanded With Deployment Loop Fault Or Energy Reserves Out Of Range

D09RX002

Circuit Description:

The Sensing and Diagnostic Module (SDM) contains a sensing drive which converts vehicle velocity changes to an electrical signal. The electrical signal generated is processed by the SDM and then compared to a value stored in memory. When the generated signal exceeds the stored value, the SDM will cause current to flow through the air bag assembly deploying the air bags. Diagnostic Trouble Code (DTC) 53 is set accompanying with DTC 51 when a deployment occurs while an air bag assembly circuit fault is present that could possibly result in a no deployment situation in one or both air bag assemblies.

DTC Will Set When:

The SDM detects a frontal crash, up to 30 degrees off

the centerline of the vehicle, of sufficient force to warrant deployment of the air bags and an inflator circuit fault is present.

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp records "Crash Data", and sets a diagnostic trouble code.

DTC Will Clear When:

The SDM is replaced. If DTC 53 is set, one or more DTCs will be set in addition to DTC 53. Malfunction(s) setting DTC(s) (other than DTC 71) must be repaired so that DTC(s) will not be set when a new SDM is installed.

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. If air bag assembly has not deployed, Diagnostic Trouble Code (DTC) 53 may have falsely set.
3. If DTC 53 has set with no signs of frontal impact, the diagnostic trouble code has falsely set.

DTC 53 Deployment Commanded With Deployment Loop Fault Or Energy Reserves Out Of Range

WARNING: DURING SERVICE PROCEDURES. BE VERY CAREFUL WHEN HANDLING A SENSING AND DIAGNOSTIC MODULE (SDM). NEVER STRIKE OR JAR THE SDM. NEVER POWER UP THE SRS WHEN THE SDM IS NOT RIGIDLY ATTACHED TO THE VEHICLE. ALL SDM AND MOUNTING BRACKET FASTENERS MUST BE CAREFULLY TORQUED AND THE ARROW MUST BE POINTING TOWARD THE

FRONT OF THE VEHICLE TO ENSURE PROPER OPERATION OF THE SRS. THE SDM COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY.

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	Ignition switch "OFF." Have air bag assemblies deployed?	Replace components and perform inspections as directed in "repairs and inspections required after an accident" in this section. Clear diagnostic trouble codes. Repeat the "SRS Diagnostic System Check."	Go to Step 3
3	Inspect front of vehicle and undercarriage for signs of impact. Were signs of impact found?	Replace components and perform inspections as directed in "repairs and inspections required after an accident" in this section. Clear diagnostic trouble codes. Repeat the "SRS Diagnostic System Check."	Ignition switch "OFF." Replace SDM. Reconnect all SRS system components, ensure all components are properly mounted. Repeat the "SRS Diagnostic System Check."

DTC 61 Warning Lamp Circuit Failure

D09RX002

Circuit Description:

When the ignition switch is turned "ON", battery voltage is applied to the "AIR BAG" warning lamp and to the "ignition 1" input terminal "12". The Sensing and Diagnostic Module (SDM) responds by flashing the "AIR BAG" warning lamp seven times. The SDM monitors the lamp driver output by comparing the output state at "Supplemental Restraint System (SRS) warning lamp" terminal "7" to the microprocessor commanded state. When "ignition 1" is in the specified value, and the output state Does not match the commanded state of the lamp driver for 500 milliseconds, DTC 61 is set.

DTC Will Set When:

"Ignition 1" voltage is in the specified value and the output state at the "SRS warning lamp" terminal does not match the commanded state of the lamp driver for 500 milliseconds. This test is run every 100

milliseconds during "Continuous Monitoring" tests and once per each ignition cycle at the beginning.

Action Taken:

SDM attempts to turn "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The ignition switch is turned "OFF."

Diagnostic Aids:

Refer to Charts B and C to diagnose warning lamp circuit malfunctions.

DTC 61 Warning Lamp Circuit Failure

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	<ol style="list-style-type: none">1. Malfunctions within the "AIR BAG" warning lamp circuitry will set this diagnostic trouble code.2. These malfunctions are addressed in the "SRS Diagnostic System Check" via Chart B and Chart C.3. Failure to properly perform the "SRS Diagnostic System Check" may result in misdiagnosis.4. Ignition switch "ON."5. Clear SRS diagnostic trouble codes. Is DTC 61 SET?	Ignition switch "OFF." Go to Chart A.	Repeat the "SRS Diagnostic System Check."

DTC 71 Internal SDM Fault

D09RX002

Circuit Description:

Diagnostic Trouble Code (DTC) 71 is an indication of a potential internal Sensing and Diagnostic Module (SDM) malfunction and will set if any of the following conditions are detected:

- 1) Deployment or microprocessor energy reserve failure.
- 2) Electronically Erasable Programmable Read Only Memory failure. (EEPROM).
- 3) Random Only Memory failure. (ROM).
- 4) Random Access Memory failure. (RAM).
- 5) Calibration check sum failure.
- 6) Deployment switch faults.
- 7) Accelerometer fault.
- 8) Arming sensor fault.
- 9) Diagnostic current faults.
- 10) DTC 19
- 11) DTC 25
- 12) DTC 51

13) DTC 53

DTC Will Set When:

Any of the above indicated malfunctions are detected by the SDM. The malfunctions described above are tested mainly during "Continuous Monitoring" and some ones run each ignition cycle.

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

A scan tool "Clear Codes" commanded is received by the SDM. Some of the indicated malfunctions will only allow the "AIR BAG" warning lamp to go out. But when DTC 19, 25, 51, 53 are also set, SDM is Replaced.

DTC 71 Internal SDM Fault

WARNING: DURING SERVICE PROCEDURES. BE VERY CAREFUL WHEN HANDLING A SENSING AND DIAGNOSTIC MODULE (SDM). NEVER STRIKE OR JAR THE SDM. NEVER POWER UP THE SRS WHEN THE SDM IS NOT RIGIDLY ATTACHED TO THE VEHICLE. ALL SDM AND MOUNTING BRACKET FASTENERS MUST BE CAREFULLY TORQUED AND THE ARROW MUST BE POINTING TOWARD THE FRONT OF THE VEHICLE TO ENSURE PROPER OPERATION OF THE SRS. THE SDM COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL

INJURY.

CAUTION: When Diagnostic Trouble Code (DTC) 19 or 25 or 51 or 53 has been set it is necessary to Replace the SDM. Setting DTC 19 and 25 or 51 or 53 will also cause DTC 71 to set. When a scan tool "CLEAR CODES" command is issued and the malfunction is no longer present, DTC 51 or 53 and DTC 71 will remain current. Ensure that the short to voltage condition DTC 19, 25 is repaired prior to installing a Replacement SDM to avoid damaging the SDM.

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	Note SRS "Diagnostic System Check." Is DTC 19 or 25 or 51 or 53 also set (current or history)? (Refer to notice above).	Go to DTC 19 if DTC 19 is set. Go to DTC 25 if DTC 25 is set. Go to DTC 51 if DTC 51 is set. Go to DTC 53 if DTC 53 is set.	Ignition switch "OFF." Replace SDM. Repeat the "SRS Diagnostic System Check."

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

The cruise control keeps the vehicle running at a fixed speed until a signal canceling this fixed speed is received. When the main switch "AUTO CRUISE" is turned on with the vehicle in the running mode, the battery voltage is applied to the PCM. When a signal from the control switch is input to the PCM while the vehicle is in this state, the cruise control system is activated. Also, while the system is operating, the "AUTO CRUISE" indicator light in the meter assembly lights up.

1 . SET/COAST Switch Function

1. **Set Function:** When the SET/COAST switch is pressed and released with the main switch on, the speed at which the vehicle is running at that moment is stored in the memory, and the vehicle automatically runs at the speed stored.
2. **Coast-Down Function:** When the SET/COAST switch is kept on while the vehicle is running, the vehicle decelerates during that time. The speed at which vehicle is running when the control switch is turned off is stored in the memory, and the vehicle automatically returns to the stored speed.
3. **Tap-Down Function:** When the SET/COAST switch is turned on and off instantaneously while the vehicle is running, the vehicle decelerates for each on/off operation. The vehicle speed at which the vehicle was running when the SET/COAST was turned off last is stored in the memory, and the vehicle automatically returns to this stored speed.

10A-2 CRUISE CONTROL SYSTEM

2 . RESUME/ACCEL Switch Function

1. **Resume Function:** When the RESUME, ACCEL switch is turned on/off after the system is temporarily deactivated by pressing the brake or clutch pedal while the vehicle is running, the vehicle resumes, the speed stored before the system was released.
2. **Accelerate Function:** When the RESUME/ACCEL switch is kept on after the system is released completely, the vehicle accelerates its speed during that time. The vehicle speed at which the vehicle was running when the switch was turned off is stored in the memory, and the vehicle automatically returns to this speed.
3. **Tap-Up Function:** When the RESUME/ACCEL switch is turned on and off instantaneously while the vehicle is running, the vehicle accelerates a mile for each on/off operation. The vehicle speed at which the vehicle was running when the switch was turned off last is stored in the memory, and the vehicle automatically returns to this stored speed.

3 . CANCEL Function

1. **Temporary Cancellation:**
 - When the cancel switch is turned on.
 - When the brake pedal is pressed.
 - When the clutch pedal is pressed. (M/T)
 - When the select lever is shifted to any position other than "D", "3", "2" or "L". (A/T)
 - When the vehicle speed has decreased about 20 km/h or more than the stored speed.
 - When the vehicle speed gets lower than 32 km/h.
2. **Complete Cancellation:**
 - When the starter switch or the main switch is turned off.
 - When the failsafe function is activated.

Brake Switch

Removal and Installation

Refer to Brake Pedal Replacement in Brake section.

Adjustment

1. Check that the brake pedal (3) is fully returned by pedal return spring.
2. Disconnect the switch connector.
3. Loosen the lock nut (2).
4. Rotate the brake switch (1) by hand until push rod disappears from brake switch tip (4).
5. Return the brake switch by a half turn.
6. Tighten the lock nut.
7. Connect the switch connector.

Clutch Switch

Removal and Installation

Refer to the Clutch Control removal and installation steps in Clutch section.

Adjustment

1. Turn the clutch switch (1) until the switch plunger is fully retracted against the clutch pedal arm.
2. Adjust clutch switch by backing it out half a turn and measure the clearance (4) between the clutch pedal arm (3) and the clutch switch.
3. Lock the lock nut(2).
4. Connect clutch switch connector.

Clutch Switch (bolt) and Clutch Pedal Clearance

0.5 – 1.5 mm (0.020 – 0.059 in)

203RS016-1

Powertrain Control Module (PCM)

Removal and Installation

Refer to Powertrain Control Module (PCM) in Engine section.

Mode Switch

Removal and Installation

Refer to Mode Switch in Automatic Transmission section.

Cruise Control Main Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the meter cluster assembly (1).
 - Refer to Instrument Panel Assembly in Body Structure section.
3. Remove the cruise control main switch (2).
 - Disconnect the switch connector.
 - Push the lock from the back side of the meter cluster assembly.

Installation

To install, follow the removal steps in the reverse order.

Cruise Control Switch (Combination Switch)

Removal and Installation

Refer to Lighting Switch (Combination Switch) in Lighting System section.

Diagnosis

Cruise control system is controlled by the PCM as well as 6VD1 engine and automatic transmission. DTCs are stored in the PCM if troubles occur in the circuit. DTCs categorized "type D" are shown only by using the Tech 2 scan tool. The following chart only shows some typical DTCs for cruise control system. Refer to PCM Diagnostic Trouble Codes in Driveability and Emissions for entire DTC diagnosis.

DTC	TROUBLE PART	DTC TYPE	MAJOR CONDITION OF TROUBLE	DIAGNOSIS PERIOD
P0565	CRUISE MAIN CIRCUIT	D	<ul style="list-style-type: none"> • THE SWITCH CONTACT REMAINS ON FOR 15 SECONDS OR MORE. • NOISES ARE GENERATED BY THE POOR SWITCH CONTACT 60 TIMES WITHIN 1 SECOND. 	DIAGNOSIS IS ENABLED IN 130 SECONDS AFTER THE SWITCH OPERATED.
P0566	CRUISE CANCEL CIRCUIT	D	<ul style="list-style-type: none"> • THE SWITCH CONTACT REMAINS ON FOR 40 SECONDS OR MORE. • NOISES ARE GENERATED BY THE POOR SWITCH CONTACT 100 TIMES WITHIN 1.6 SECONDS. 	DIAGNOSIS IS ENABLED IN 120 SECONDS AFTER THE SWITCH OPERATED.
P0567	CRUISE RE-SUME CIRCUIT	D	<ul style="list-style-type: none"> • THE SWITCH CONTACT REMAINS ON FOR 50 SECONDS OR MORE. • NOISES ARE GENERATED BY THE POOR SWITCH CONTACT 100 TIMES WITHIN 1.6 SECONDS. 	DIAGNOSIS IS ENABLED IN 110 SECONDS AFTER THE SWITCH OPERATED.

DTC: Diagnostic Trouble Code

NOTE: The DTCs are detected while the engine is running
