20. This test determines if the high fuel pressure is due to a restricted fuel return line or if the high fuel pressure is due to a faulty fuel pressure regulator.
21. A lean condition may result from fuel pressure below 333 kPa (48 psi). A lean condition may cause a DTC P0131 or a DTC P0171 to set. Driveability conditions associated with lean conditions can include hard starting (when the engine is cold), hesitation, poor driveability, lack of power, surging, and misfiring.
22. Restricting the fuel return line causes the fuel pressure to rise above the regulated fuel pressure. Command the fuel pump "ON" with the Tech 2. The fuel pressure should rise above 376 kPa (55 psi) as the fuel return line becomes partially closed.

NOTE: Do not allow the fuel pressure to exceed 414 kPa (60 psi). Fuel pressure in excess of 414 kPa (60 psi) may damage the fuel pressure regulator.

CAUTION: To reduce the risk of fire and personal injury:

- **It is necessary to relieve fuel system pressure before connecting a fuel pressure gauge. Refer to Fuel Pressure Relief Procedure, below.**
- **A small amount of fuel may be released when disconnecting the fuel lines. Cover fuel line fittings with a shop towel before disconnecting, to catch any fuel that may leak out. Place the towel in an approved container when the procedure is completed.**

Fuel Pressure Relief Procedure

1. Remove the fuel cap.
2. Remove the fuel pump relay from the underhood relay center.
3. Start the engine and allow it to stall.
4. Crank the engine for an additional 3 seconds.

Fuel Gauge Installation

1. Remove the shoulder fitting cap.
2. Install fuel gauge 5-8840-0378-0 to the fuel supply line located in front of and above the right side valve cover.
3. Reinstall the fuel pump relay.

Fuel System Diagnosis

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Turn the ignition "OFF." 2. Turn the air conditioning system "OFF." 3. Relieve fuel system pressure and install the fuel pressure gauge. 4. Turn the ignition "ON." NOTE: The fuel pump will run for approximately 2 seconds. Use the Tech 2 to command the fuel pump "ON". (Refer to Miscellaneous Test) 5. Observe the fuel pressure indicated by the fuel pressure gauge with the fuel pump running. Is the fuel pressure within the specified limits?	290-376 kPa (42-55 psi)	Go to Step 3	Go to Step 17
3	NOTE: The fuel pressure will drop when the fuel pump stops running, then it should stabilize and remain constant. Does the fuel pressure indicated by the fuel pressure gauge remain constant?	—	Go to Step 4	Go to Step 12
4	1. When the vehicle is at normal operation temperature, turn the ignition "ON" to build fuel pressure and observe the measurement on the gauge. 2. Start the engine and observe the fuel pressure gauge. Did the reading drop by the amount specified after the engine was started?	21-105 kPa (3-15 psi)	Go to Step 5	Go to Step 9
5	Is fuel pressure dropping off during acceleration, cruise, or hard cornering?	—	Go to Step 6	Check for improper fuel
6	Visually and physically inspect the following items for a restriction: <ul style="list-style-type: none"> ● The in-pipe fuel filter. ● The fuel feed line. Was a restriction found?	—	Verify repair	Go to Step 7
7	Remove the fuel tank and visually and physically inspect the following items: <ul style="list-style-type: none"> ● The fuel pump strainer for a restriction. ● The fuel line for a leak. ● Verify that the correct fuel pump is in the vehicle. Was a problem found in any of these areas?	—	Verify repair	Go to Step 8
8	Replace the fuel pump. Is the action complete?	—	Verify repair	—
9	1. Disconnect the vacuum hose from the fuel pressure regulator. 2. With the engine idling, apply 12-14 inches of vacuum to the fuel pressure regulator. Does the fuel pressure indicated by the fuel pressure gauge drop by the amount specified?	21-105 kPa (3-15 psi)	Go to Step 10	Go to Step 11

Fuel System Diagnosis (Cont'd)

Step	Action	Value(s)	Yes	No
10	Locate and repair the loss of vacuum to the fuel pressure regulator. Is the action complete?	—	Verify repair	—
11	Replace the fuel pressure regulator. Is the action complete?	—	Verify repair	—
12	1. Run the fuel pump with the Tech 2. 2. After pressure has built up, turn off the pump and clamp the supply hose shut with suitable locking pliers which will not damage the hose. Does the fuel pressure indicated by the fuel pressure gauge remain constant?	—	Go to <i>Step 13</i>	Go to <i>Step 15</i>
13	Visually inspect the fuel supply line and repair any leaks. Was a problem found?	—	Verify repair	Go to <i>Step 14</i>
14	Remove the fuel tank and inspect for leaky hose or in-tank fuel line. Was a problem found?	—	Verify repair	Go to <i>Step 8</i>
15	1. If the pliers are still clamped to the fuel supply hose, remove the locking pliers. 2. With suitable locking pliers which will not damage the hose, clamp the fuel return line to prevent fuel from returning to the fuel tank. 3. Run the fuel pump with the Tech 2. 4. After pressure has built up, remove power to the pump. Does the fuel pressure indicated by the fuel pressure gauge remain constant?	—	Go to <i>Step 11</i>	Go to <i>Step 16</i>
16	Locate and replace any leaking fuel injector(s). Is the action complete?	—	Verify repair	—
17	Is the fuel pressure indicated by the fuel pressure gauge above the specified limit?	376 kPa (55 psi)	Go to <i>Step 18</i>	Go to <i>Step 21</i>
18	1. Relieve the fuel pressure. Refer to the <i>Fuel Pressure Relief</i> . 2. Disconnect the fuel return line from the fuel rail. 3. Attach a length of flexible hose to the fuel rail return outlet passage. 4. Place the open end of the flexible hose into an approved gasoline container. 5. Run the fuel pump with the Tech 2. 6. Observe the fuel pressure indicated by the fuel pressure gauge with the fuel pump running. Is the fuel pressure within the specified limits?	290-376 kPa (42-55 psi)	Go to <i>Step 19</i>	Go to <i>Step 20</i>
19	Locate and correct the restriction in the fuel return line. Is the action complete?	—	Verify repair	—
20	Visually and physically inspect the fuel rail outlet passages for a restriction. Was a restriction found?	—	Verify repair	Go to <i>Step 11</i>

Fuel System Diagnosis (Cont'd)

Step	Action	Value(s)	Yes	No
21	Is the fuel pressure indicated by the fuel pressure gauge above the specified value?	0 kPa (0 psi)	Go to <i>Step 22</i>	Go to <i>Step 23</i>
22	1. Command the fuel pump "ON" with the Tech 2. 2. Using suitable pliers which will not damage the fuel hose, gradually apply pressure with the pliers to pinch the flexible fuel return hose closed. CAUTION: Do not let the fuel pressure exceed the second specified value. Does the fuel pressure indicated by the fuel pressure gauge rise above the first specified value?	376 kPa (55 psi). 414 kPa (60 psi).	Go to <i>Step 11</i>	Go to <i>Step 7</i>
23	1. Command the fuel pump "ON" with the Tech 2. 2. Remove the fuel filler cap and listen for the sound of the fuel pump running. 3. Turn the pump off. Was the fuel pump running?	—	Go to <i>Step 7</i>	Go to <i>Fuel System Electrical Test Chart</i>

Idle Air Control (IAC) System Check

Circuit Description

The powertrain control module (PCM) controls engine idle speed with the idle air control (IAC) valve. To increase idle speed, the PCM retracts the IAC valve pintle away from its seat, allowing more air to bypass the throttle bore. To decrease idle speed, it extends the IAC valve pintle towards its seat, reducing bypass air flow. A Tech 2 will read the PCM commands to the IAC valve in counts. Higher counts indicate more air bypass (higher idle). Lower counts indicate less air is allowed to bypass (lower idle).

Diagnostic Aids

A slow, unstable, or fast idle may be caused by a non-IAC system problem that cannot be overcome by the IAC valve. Out of control range IAC Tech 2 counts will be above 60 if idle is too low, and zero counts if idle is too high. The following checks should be made to repair a non-IAC system problem:

- Vacuum leak (high idle) – If idle is too high, stop the engine. Fully extend (low) IAC with the Tech-2. Start the engine. If idle speed is above 800 RPM, locate and correct the vacuum leak, including the PCV system. Check for binding of the throttle blade or linkage.
- Lean heated oxygen sensor signal (high air/fuel ratio) – The idle speed may be too high or too low. Engine speed may vary up and down, and disconnecting the IAC valve does not help. Diagnostic trouble codes P0131, P0151, P0171, or P0174 may be set. Tech 2 oxygen (O₂) voltage will be less than 100 mV (0.1 V). Check for low regulated fuel pressure, water in fuel, or a restricted injector.
- Rich heated oxygen sensor signal (low air/fuel ratio) – The idle speed will be too low. Tech 2 IAC counts will usually be above 80. The system is obviously rich and may exhibit black smoke in the exhaust. Tech 2 O₂ voltage will be fixed at about 750 mV (0.75 V). Check for high fuel pressure, or a leaking or sticking injector. A silicon-contaminated heated oxygen sensor will show an O₂ voltage slow to respond on the Tech 2.

- Throttle body – Remove the IAC valve and inspect the bore for foreign material.
- IAC valve electrical connections – IAC valve connections should be carefully checked for proper contact.
- PCV valve – An incorrect or faulty PCV valve may result in an incorrect idle speed. Refer to *Diagnosis, Rough Idle, Stalling*. If intermittent poor driveability or idle symptoms are resolved by disconnecting the IAC, carefully recheck the connections and valve terminal resistance, or replace the IAC.

Test Description

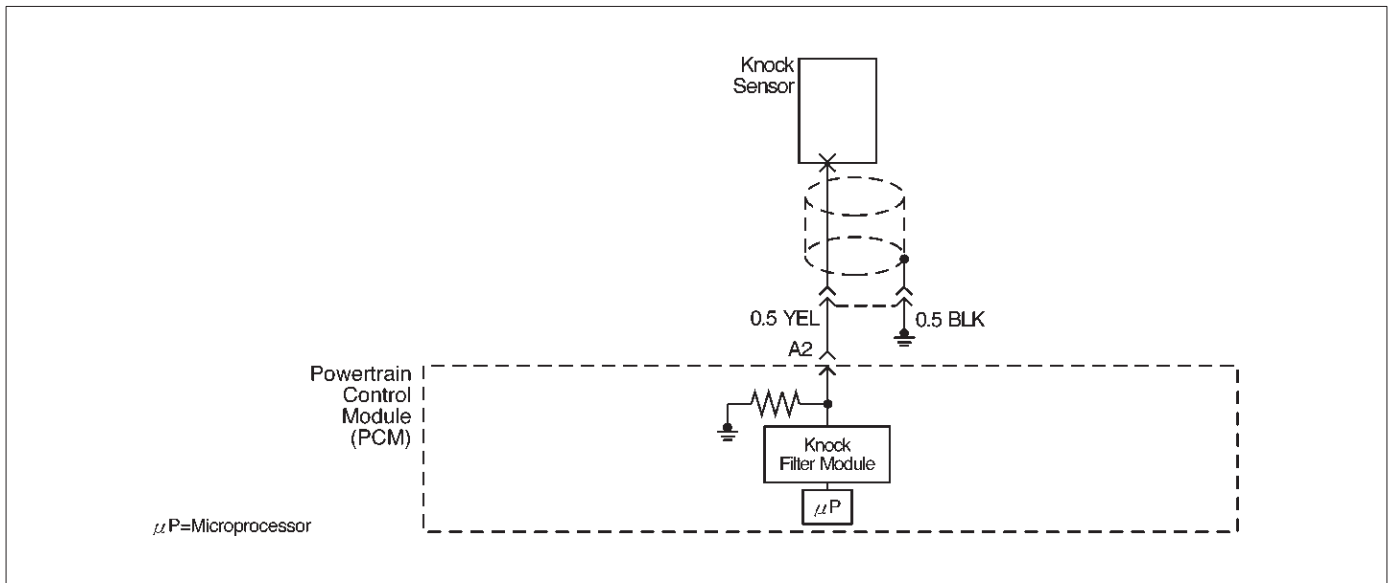

Number(s) below refer to the step number(s) on the Diagnostic Chart.

1. The Tech-2 is used to extend and retract the IAC valve. Valve movement is verified by an engine speed change. If no change in engine speed occurs, the valve can be resettled when removed from the throttle body.
2. This step checks the quality of the IAC movement in step 1. Between 700 revolutions per minute (RPM) and about 1500 RPM, the engine speed should change smoothly with each flash of the tester light in both extend and retract. If the IAC valve is retracted beyond the control range (about 1500 RPM), it may take many flashes to extend the IAC valve before engine speed will begin to drop. This is normal on certain engines. Fully extending the IAC may cause engine stall. This may be normal.
6. Steps 1 and 2 verified the proper IAC valve operation. This step checks the IAC circuits. Each lamp on the noid light should flash red and green while the IAC valve is cycled. While the sequence of color is not important, if either light is "OFF" or does not flash red and green, check the circuits for faults, beginning with poor terminal contacts.

Idle Air Control (IAC) System Check

Step	Action	Value(s)	Yes	No
1	1. Ignition "OFF." 2. Connect the Tech-2. 3. Set the parking brake. 4. Block the wheels. 5. Turn the air conditioning "OFF." 6. Idle the engine in Park (A/T) or Neutral (M/T). 7. Operate the IAC test. 8. The engine speed should decrease and increase as the IAC is cycled. Does the RPM change?	—	Go to <i>Step 2</i>	Go to <i>Step 3</i>
2	RPM should change smoothly. Does the RPM change within the range specified?	700-1500 RPM	—	Go to <i>Step 3</i>
3	Check the IAC passages. Are the IAC passages OK?	—	Go to <i>Step 4</i>	Go to <i>Step 5</i>
4	Clear any obstruction from the IAC passages. Is the action complete?	—	Verify repair	—
5	Replace the IAC. Refer to <i>On-Vehicle Service, Idle Air Control Valve</i> . Is the action complete?	—	Verify repair	—

Knock Sensor (KS) System Check (Engine Knock, Poor Performance, or Poor Economy)

D06RW035-1

Circuit Description

The knock sensor (KS) sends an AC voltage signal to the powertrain control module (PCM). As the KS detects engine knock, the signal to the PCM changes in amplitude and frequency. The PCM retards timing if the engine speed is over 900 RPM.

Diagnostic Aids

If the KS system checks OK, but detonation is the complaint, refer to *Diagnosis, Detonation/Spark Knock*.

Test Description

The numbers below refer to the step numbers on the Diagnostic Chart.

- The change in signal speed depends on how hard the tapping is done. Normally there is about 1.5 to 10 mV at PCM pin A2 with the engine off. Loud tapping should be able to make the reading jump to 20-25 mV AC.

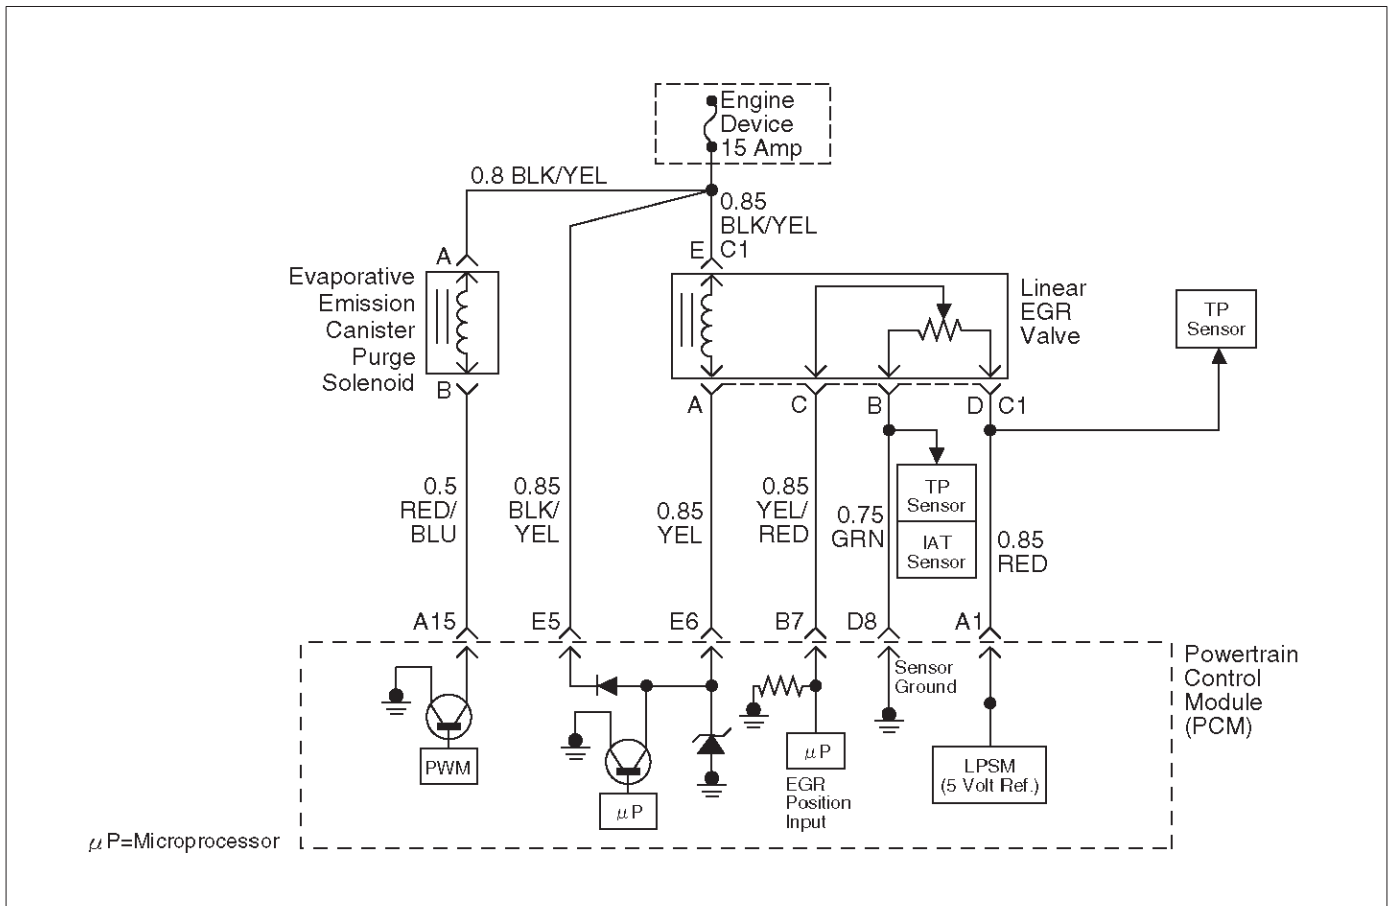

Knock Sensor (KS) System Check (Engine Knock, Poor Performance, or Poor Economy)

Step	Action	Value(s)	Yes	No
1	Is DTC P0325 or P0327 set?	—	Go to <i>DTC P0325 or DTC P0327</i>	Go to <i>Step 2</i>
2	Run the engine at 1500 RPM. Is there an internal engine knock?	—	Go to <i>Step 3</i>	Go to <i>Step 4</i>
3	Repair the mechanical problem. Is the action complete?	—	Verify repair	—
4	1. Install the Tech 2. 2. Turn the ignition "ON." 3. On the Tech 2 select F0: Data List. 4. Cycle through the list until "Knock Noise Channel" is displayed. Is knock retard at the specified value?	more than 0.1V	Go to <i>Step 5</i>	Go to <i>Step 6</i>
5	Replace the PCM. Is the action complete?	—	Verify repair	—

Knock Sensor (KS) System Check (Engine Knock, Poor Performance, or Poor Economy) (Cont'd)

Step	Action	Value(s)	Yes	No
6	1. Start the engine. 2. Monitor the knock retard display on the Tech 2 while changing the throttle setting to place different loads on the engine. Is knock retard at the specified value? (Turn the ignition "OFF.")	0°	Go to <i>Step 9</i>	Go to <i>Step 7</i>
7	1. At the rear of the engine, behind the rear fuel injector on the side, disconnect the 2-wire knock sensor harness connector. NOTE: The connector for the knock sensor cannot easily be removal unless common chamber is removed. (Knock Sensor is on Right side of block). Also, there are two (2) shield grounded wires. The connector only has one wire (Yellow). Please use another method. 2. Attach the positive lead of DVM to B+. 3. On the main harness side of the connector, use the negative lead of the DVM to probe the connector pin that is connected to black wire. Dose the DVM indicate the specified value? (Reconnect the knock sensor harness.)	B+	Go to <i>Step 9</i>	Go to <i>Step 8</i>
8	Repair the open black wire ground for the shield which prevents stray electromagnetic pulses from affecting the knock signal. Is the action complete?	—	Verify repair	—
9	1. Reconnect the wire harness if it was previously disconnected in Step 7. 2. Set a DVM to AC voltage. 3. With the DVM, backprobe the PCM connector at A2. 4. Tap the engine lift bracket with a socket extension. Did the DVM show an increase in AC voltage while tapping on the lift bracket?	—	System OK	Go to <i>Step 10</i>
10	Replace the knock sensor. Is the action complete?	—	Verify repair	—

Exhaust Gas Recirculation (EGR) System Check

D06RW055

Circuit Description

A properly operation exhaust gas recirculation (EGR) system will directly affect the air/fuel requirements of the engine. Since the exhaust gas introduced into the air/fuel mixture is an inert gas (contains very little or no oxygen), less fuel is required to maintain a correct air/fuel ratio. Introducing exhaust gas into the combustion chamber lowers combustion temperatures and reduces the formation of oxides of nitrogen (NO_x) in the exhaust gas. Lower combustion temperatures also prevent detonation. If the EGR pintle were to stay closed, the inert exhaust gas would be replaced with air and the air/fuel mixture would be leaner. The powertrain control module (PCM) would compensate for the lean condition by adding fuel, resulting in higher long term fuel trim values.

Diagnostic Aids

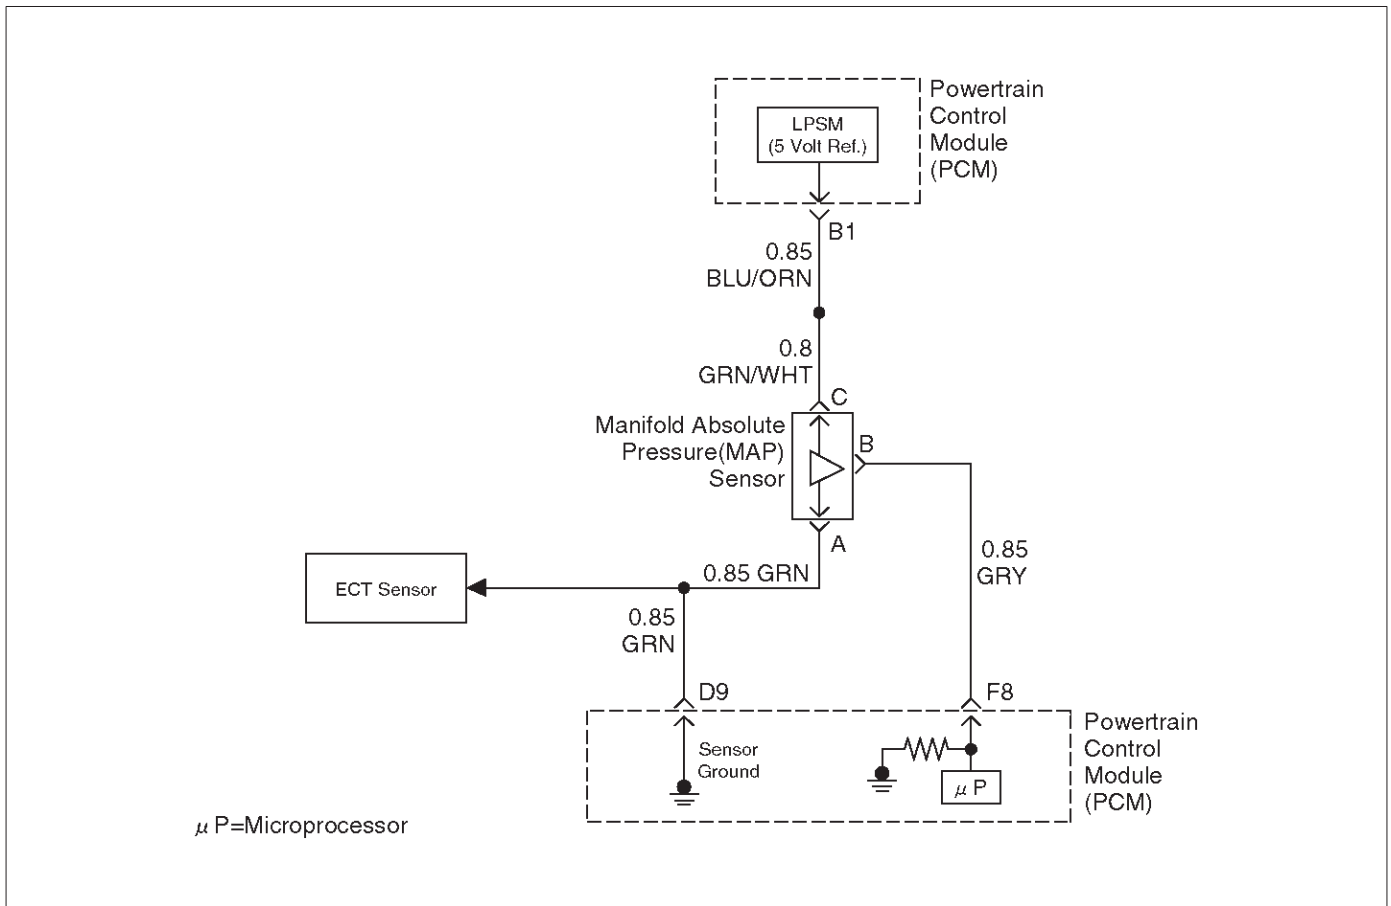

The EGR valve chart is a check of the EGR system. An EGR pintle constantly in the closed position could cause detonation and high emissions of NO_x. It could also result in high long term fuel trim values in the open throttle cell, but not in the closed throttle cell. An EGR pintle constantly in the open position would cause a rough idle. Also, an EGR mounted incorrectly (rotated 180°) could cause rough idle. Check for the following items:

- EGR passages – Check for restricted or blocked EGR passages.
- Manifold absolute pressure sensor – A manifold absolute pressure sensor may shift in calibration enough to affect fuel delivery. Refer to *Manifold Absolute Pressure Output Check*.

Exhaust Gas Recirculation (EGR) System Check

Step	Action	Value(s)	Yes	No
1	Check the EGR valve for looseness. Is the EGR valve Loose?	—	Go to <i>Step 2</i>	Go to <i>Step 3</i>
2	Tighten the EGR valve. Is the action complete?	—	Verify repair	—
3	1. Place the transmission selector in Park or Neutral. 2. Start the engine and idle until warm. 3. Using a Tech 2, command EGR "50% ON." (Refer to Miscellaneous Test) Does the engine idle rough and lose RPMs?	—	EGR system working properly. No problem found.	Go to <i>Step 4</i>
4	1. Engine "OFF." 2. Ignition "ON." 3. Using a test light to ground, check the EGR harness between the EGR valve and the ignition feed. Does the test light illuminate?	—	Go to <i>Step 6</i>	Go to <i>Step 5</i>
5	Repair the EGR harness ignition feed. Was the problem corrected?	—	Verify repair	Go to <i>Step 6</i>
6	1. Remove the EGR valve. 2. Visually and physically inspect the EGR valve pintle, valve passages and adapter for excessive deposits, obstructions or any restrictions. Does the EGR valve have excessive deposits, obstructions or any restrictions?	—	Go to <i>Step 7</i>	Go to <i>Step 8</i>
7	Clean or replace EGR system components as necessary. Was the problem corrected?	—	Verify repair	Go to <i>Step 8</i>
8	1. Ground the EGR valve metal case to battery (-). 2. Using a Tech 2, command EGR "ON" and observe the EGR valve pintle for movement. Does the EGR valve pintle move according to command?	—	Go to <i>Step 9</i>	Go to <i>DTC P1404 chart</i>
9	1. Remove the EGR inlet and outlet pipes from the intake and exhaust manifolds. 2. Visually and physically inspect manifold EGR ports and EGR inlet and outlet pipes for blockage or restriction caused by excessive deposits or other damage. Do the manifold EGR ports or inlet and outlet pipes have excessive deposits, obstructions, or any restrictions?	—	Go to <i>Step 10</i>	EGR system working properly. No problem found.
10	Clean or replace EGR system components as necessary. Is the action complete?	—	Verify repair	—

Manifold Absolute Pressure (MAP) Output Check

D06RX135

Circuit Description

The manifold absolute pressure (MAP) sensor measures the changes in the intake MAP which result from engine load (intake manifold vacuum) and engine speed changes; and converts these into a voltage output. The powertrain control module (PCM) sends a 5-volt reference voltage to the MAP sensor. As the MAP changes, the output voltage of the sensor also changes. By monitoring the the sensor output voltage, the PCM knows the MAP. A lower pressure (low voltage) output voltage will be about 1-2 volts at idle. Higher pressure (high voltage) output voltage will be about 4-4.8 volts at wide open throttle. The MAP sensor is also used, under certain conditions, to measure barometric pressure, allowing the PCM to make adjustments for different altitudes. The PCM uses the MAP sensor to diagnose proper operation of the EGR system, in addition to other functions.

Test Description

IMPORTANT: Be sure to used the same diagnostic test equipment for all measurements.

The number(s) below refer to the step number(s) on the Diagnostic Chart.

1. Applying 34 kPa (10 Hg) vacuum to the MAP sensor should cause the voltage to be 1.5-2.1 volts less than the voltage at step 1. Upon applying vacuum to the sensor, the change in voltage should be instantaneous. A slow voltage change indicates a faulty sensor.

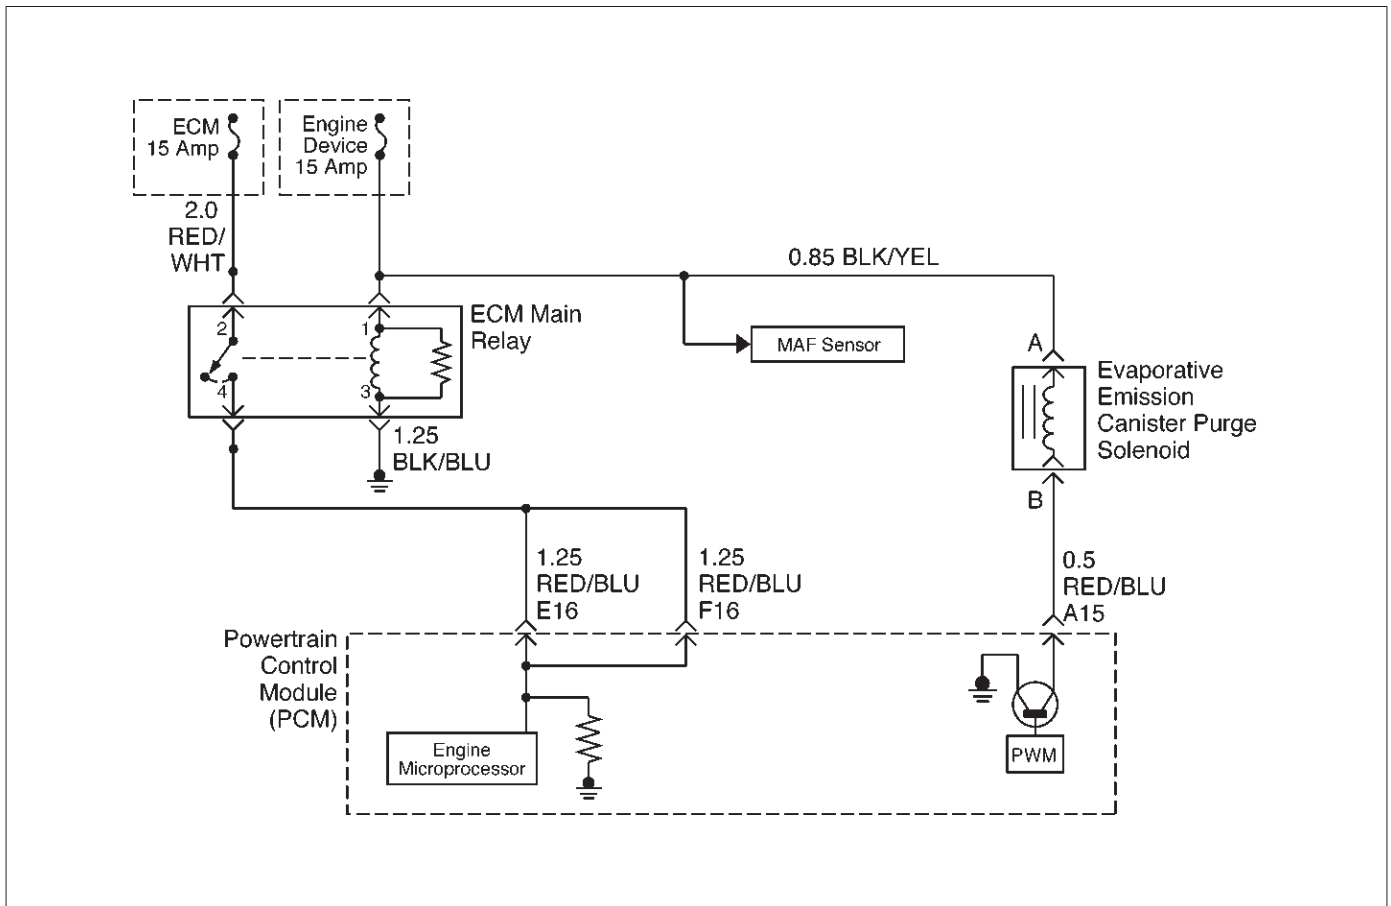

IMPORTANT: Make sure the electrical connector remains securely fastened.

2. Disconnect the sensor from the bracket. Twist the sensor with your hand to check for an intermittent connection. Output changes greater than 0.10 volt indicate a bad sensor.

Manifold Absolute Pressure (MAP) Output Check

Step	Action	Value(s)	Yes	No
1	1. Turn the ignition "OFF" and leave it "OFF" for 15 seconds. 2. Ignition "ON." Don't crank engine. 3. The Tech 2 should indicate a manifold absolute pressure (MAP) sensor voltage. 4. Compare this scan reading to scan reading of a known good vehicle obtained using the exact same procedure as in Steps 1-4. Is the voltage reading the same +/-0.40 volt?	—	Go to Step 2	Go to Step 5
2	1. Disconnect the MAP sensor and plug inlet manifold. 2. Connect a hand vacuum pump to the MAP sensor. 3. Start the engine. 4. Apply 34 kPa (10 Hg) of vacuum and note the voltage change. Is the voltage change 1.5-2.1 volts less than step 1?	—	Go to Step 3	Go to Step 4
3	Check the sensor cover for leakage or restriction. Does the cover supply vacuum to the MAP sensor only?	—	Go to Step 5	Go to Step 4
4	Repair the material to block. Is the action complete?	—	Verify repair	—
5	Check the sensor connection. Is the sensor connection good?	—	Go to Step 5	Go to Step 6
6	Refer to <i>On-Vehicle Service, MAP Sensor</i> . Is the action complete?	—	Verify repair	—
7	Repair the poor connection. Is the action complete?	—	Verify repair	—

Evaporative (EVAP) Emissions Canister Purge Valve Check

D06RX016

Circuit Description

The evaporative emissions canister purge is controlled by a solenoid that allows manifold and/or vacuum to purge the canister when it is energized. The powertrain control module (PCM) supplies a ground to energize the solenoid valve (purge "ON"). The EVAP purge solenoid control is turned "ON" and "OFF" several times a second. The duty cycle (pulse width or "ON" time) is determined by engine operating conditions including load, throttle position, coolant temperature and ambient temperature. The duty cycle is calculated by the PCM and the purge solenoid is enabled when the appropriate conditions have been met:

- The engine run time after start is more than 60 seconds.
- The engine coolant temperature is above 30°C (86°F).
- The fuel control system is operating in the closed-loop mode.

Diagnostic Aids

- Make a visual check of vacuum hoses.
- Check the throttle body for possible cracked.
- Check the malfunction indicator lamp for a possible mechanical problem.

Test Description

The number(s) below refer to the step number(s) on the Diagnostic Chart.

1. Check to see if the solenoid is open or closed. The solenoid is normally de-energized in this step, so it should be closed.
2. This step checks to determine if the solenoid was open due to an electrical circuit problem or a defective solenoid.
3. This should normally energize the solenoid, opening the valve and allowing the vacuum to drop (purge "ON").

Evaporative (EVAP) Emissions Canister Purge Valve Check

Step	Action	Value(s)	Yes	No
1	1. Ignition "OFF." 2. Ignition "ON," engine "OFF." 3. At the throttle body, disconnect the hose that goes to the pump solenoid. 4. Using a hand vacuum pump with an attached vacuum gauge 5-8840-0279-0, apply vacuum (10" Hg or 34 kPa) to the solenoid. Does the solenoid hold the vacuum?	—	Go to <i>Step 3</i>	Go to <i>Step 2</i>
2	1. Disconnect the solenoid electrical connector. 2. As in Step 1, apply vacuum (10" Hg or 34 kPa) to the solenoid. Does the solenoid hold the vacuum?	—	Go to <i>Step 4</i>	Go to <i>Step 7</i>
3	1. At the throttle body, put a cap over the vacuum port where the hose was disconnected for testing. This is to prevent a vacuum leak when the engine is started. 2. Ignition "OFF." 3. Install the Tech 2. 4. Apply vacuum to the purge solenoid with the hand vacuum pump. 5. Start the engine, run at 2500 RPM. 6. Using the Tech 2, select F0: Engine, F3: Misc. Tests, F0: EVAP Purge. 7. Turn the purge solenoid "ON." Did the vacuum drop when the purge was turned on?	—	Go to <i>Step 8</i>	Go to <i>Step 9</i>
4	Check for a short to ground in the RED/BLU wire. Is there a short?	—	Go to <i>Step 5</i>	Go to <i>Step 6</i>
5	Repair the short to ground. Is the action complete?	—	Verify repair	—
6	Replace the PCM. Is the action complete?	—	Verify repair	—
7	Replace the faulty purge solenoid. Refer to <i>On-Vehicle Service, EVAP Canister Purge Solenoid</i> . Is the action complete?	—	Verify repair	—
8	1. Turn the ignition "OFF." 2. At the throttle body, install a vacuum gauge where the hose from the purge solenoid was disconnected for testing. 3. Start the engine. 4. Stabilize the engine speed at about 2500 RPM. 5. Momentarily snap the throttle open and let it return to idle. Is there approximately 10" Hg (34 kPa) of vacuum available at the EVAP emission canister purge solenoid?	—	No problem found in the EVAP emission canister purge valve check	Refer to <i>Diagnostic Aids</i>

Evaporative (EVAP) Emissions Canister Purge Valve Check (Cont'd)

Step	Action	Value(s)	Yes	No
9	1. Disconnect the solenoid electrical connector. 2. Connect a test lamp between the harness terminals. Does the test lamp light?	—	Go to <i>Step 7</i>	Go to <i>Step 10</i>
10	Probe terminal A and terminal B with a test lamp to ground. Does the test lamp light on both terminals?	—	Go to <i>Step 11</i>	Go to <i>Step 12</i>
11	Repair the short to voltage in the RED/BLUE wire. Is the action complete?	—	Verify repair	—
12	Does on of the terminals light the test lamp?	—	Go to <i>Step 13</i>	Go to <i>Step 14</i>
13	Check for an open in the RED/BLU wire between the purge solenoid and the PCM. Was there an open circuit?	—	Go to <i>Step 15</i>	Go to <i>Step 6</i>
14	Repair the open in the BLK/YEL wire. Is the action complete?	—	Verify repair	—
15	Repair the open in the RED/BLU wire. Is the action complete?	—	Verify repair	—

PCM Diagnostic Trouble Codes

The following table lists the diagnostic trouble codes supported by this vehicle application. If any DTCs not listed here are displayed by a Tech 2, the Tech 2 data may

be faulty; notify the Tech 2 manufacturer of any DTCs displayed that are not included in the following table.

PCM Diagnostic Trouble Codes

DTC	Description	Type	Illuminate MIL
P0101	MAF System Performance	B	Yes
P0102	MAF Sensor Circuit Low Frequency	A	Yes
P0103	MAF Sensor Circuit High Frequency	A	Yes
P0107	MAP Sensor Circuit Low Voltage	A	Yes
P0108	MAP Sensor Circuit High Voltage	A	Yes
P0112	IAT Sensor Circuit Low Voltage	A	Yes
P0113	IAT Sensor Circuit High Voltage	A	Yes
P0117	ECT Sensor Circuit Low Voltage	A	Yes
P0118	ECT Sensor Circuit High Voltage	A	Yes
P0121	TP System Performance	A	Yes
P0122	TP Sensor Circuit Low Voltage	A	Yes
P0123	TP Sensor Circuit High Voltage	A	Yes
P0131	HO2S Circuit Low Voltage Bank 1 Sensor 1	A	Yes
P0132	HO2S Circuit High Voltage Bank 1 Sensor 1	A	Yes

Diagnostic Trouble Code (DTC) P0101 MAF System Performance

D06RW057

Circuit Description

The mass air flow (MAF) sensor measures the amount of air which passes through it into the engine during a given time. The powertrain control module (PCM) uses the mass air flow information to monitor engine operating conditions for fuel delivery calculations. A large quantity of air entering the engine indicates an acceleration or high load situation, while a small quantity of air indicates deceleration or idle.

The MAF sensor produces a frequency signal which can be monitored using a Tech 2. The frequency will vary within a range of around 4 to 7 g/s at idle to around 25 to 40 g/s at maximum engine load. DTC P0101 will be set if the signal from the MAF sensor does not match a predicted value based on throttle position and engine RPM.

Conditions for Setting the DTC

- The engine is running.
- No TP sensor or MAP sensor DTCs are set.
- The throttle is steady, TP angle doesn't change by more than 1%.
- System voltage is between 11.5 volts and 16 volts.
- Calculated air flow is between 25 g/second and 40 g/second.
- Above conditions present for at least 1 second.
- MAF signal frequency indicates an airflow significantly higher or lower than a predicted value based on throttle position and engine RPM for a total of 12.5 seconds over a 25-second period of time.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The PCM calculates an airflow value based on idle air control valve position, throttle position, RPM and barometric pressure.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0101 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0101 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Mis-routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Refer to Intermittents under service category Symptoms. Any un-metered air may cause this DTC to set. Check for the following:

- The duct work at the MAF sensor for leaks.
- An engine vacuum leak.
- The PCV system for vacuum leaks.
- An incorrect PCV valve.
- The engine oil dip stick not fully seated.
- The engine oil fill cap loose or missing.

2. The MAF system performance or “rationality” diagnostic uses the MAP sensor signal along with other input to calculate an expected airflow rate that is then compared to the actual measured airflow from the MAF sensor. The first few steps of this table verify that the MAP sensor is working properly.

6. Verifies the signal circuit from the MAF sensor electrical connector to the PCM.

Verifies whether a ground and B+ circuit is available.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

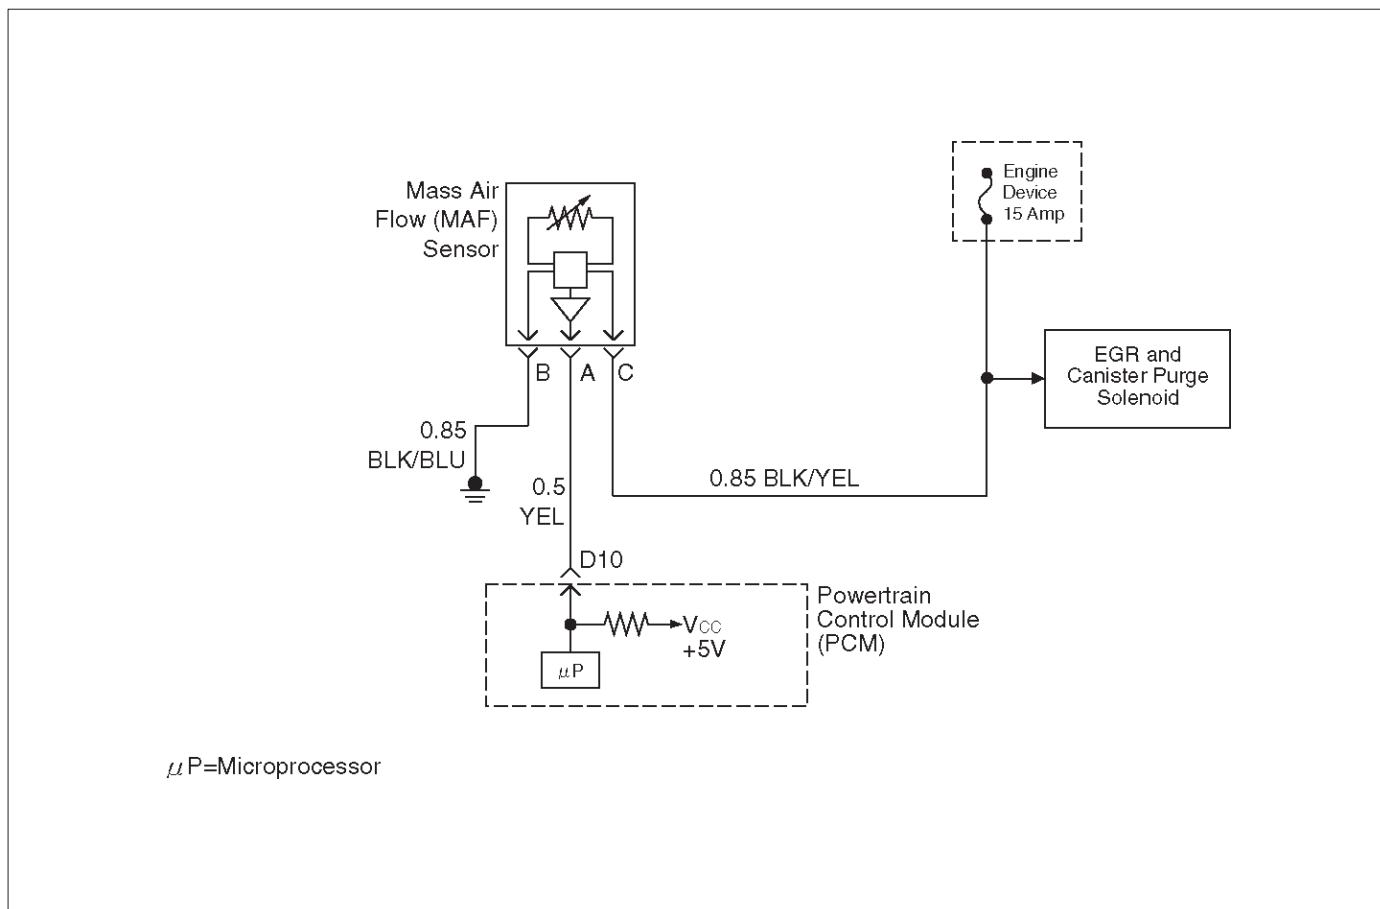

DTC P0101 – MAF System Performance

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to Step 2	Go to OBD System Check
2	1. Ignition “OFF.” 2. Disconnect the Mass Air Flow (MAF) Sensor harness connector from the MAF Sensor. 3. Place an unpowered test lamp between the 12 volt signal circuit and the ground circuit, both at the MAF Sensor connector. 4. Ignition “ON,” Engine “OFF.” Did the test lamp illuminate?	—	Go to Step 6	Go to Step 3
3	1. Ignition “ON,” Engine “OFF.” 2. Using a Digital Voltmeter (DVM), check the 12 volt signal circuit for the correct voltage. Did the DVM indicate a value within the following range?	11.5 to 12.5 Volt	Go to Step 5	Go to Step 4
4	1. Ignition “OFF.” 2. Check the 12 volt signal circuit for the following conditions: ● An open circuit ● A short to ground Was the problem found?	—	Verify repair	—
5	Check the MAF ground circuit for the following conditions: ● An open circuit ● A short to voltage Was a problem found?	—	Verify repair	—
6	1. Ignition “OFF.” 2. Check the MAF Sensor signal circuit between the PCM and the MAF Sensor for the following conditions: ● An open circuit ● A short to ground ● A short to battery voltage Was a problem found?	—	Verify repair	Go to Step 7

DTC P0101 – MAF System Performance (Cont'd)

Step	Action	Value(s)	Yes	No
7	1. Connect the MAF Sensor wiring harness connector to the MAF Sensor. 2. Connect the Tech 2 to the vehicle. 3. Place the Transmission in Park/Neutral, and fully apply the Parking Brake. 4. Start the engine. 5. Select the Mass Air Flow (MAF) parameter on the Tech 2. With the engine idling, does the Tech 2 display the following value(s)?	4 to 7 g/s	Go to <i>Step 8</i>	Go to <i>Step 9</i>
8	Observe the Tech 2 value while increasing the engine RPM to its upper limit. Does the Tech 2 display the following value(s)?	25 to 40 g/s	Go to <i>Step 10</i>	Go to <i>Step 9</i>
9	Replace the MAF Sensor. Is the action complete?	—	Verify repair	—
10	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0102 MAF Sensor Circuit Low Frequency

D06RW057

Circuit Description

The mass air flow (MAF) sensor measures the amount of air which passes through it into the engine during a given time. The powertrain control module (PCM) uses the mass air flow information to monitor engine operating conditions for fuel delivery calculations. A large quantity of air entering the engine indicates an acceleration or high load situation, while a small quantity of air indicates deceleration or idle.

The MAF sensor produces a frequency signal which can be monitored using a Tech 2. The frequency will vary within a range of around 4 to 7 g/s at idle to around 1900 Hz at maximum engine load. DTC P0102 will be set if the signal from the MAF sensor is below the possible range of a normally operating MAF sensor.

Conditions for Setting the DTC

- The engine is running above 500 RPM for greater than 10 seconds.
- System voltage is above 11.5 volts.
- MAF signal frequency is below 1.6 g/s for a total of 50-percent of the last 1000 samples monitored. A sample is taken every cylinder event.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM calculates an air flow value based on idle air control valve position, throttle position, RPM and barometric pressure.

- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0102 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0102 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Misrouted harness – Inspect the MAF sensor harness to ensure that it is not routed too close to high voltage wires.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the Tech 2 while moving connectors and wiring harnesses related to the MAF sensor. A change in the display will indicate the location of the fault.
- Plugged intake air duct or filter element – A wide-open throttle acceleration from a stop should cause the mass air flow displayed on a Tech 2 to increase from

6E2-102 6VD1 3.2L ENGINE DRIVEABILITY AND EMISSIONS

about 3-6 g/second at idle to 100 g/second or greater at the time of the 1-2 shift. If not, check for a restriction. If DTC P0102 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the DTC was last set.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. This step verifies that the problem is present at idle.
4. A voltage reading of less than 4 or over 5 volts at the MAF sensor signal circuit indicates a fault in the wiring or a poor connection.
5. This verifies that ignition feed voltage and a good ground are available at the MAF sensor.

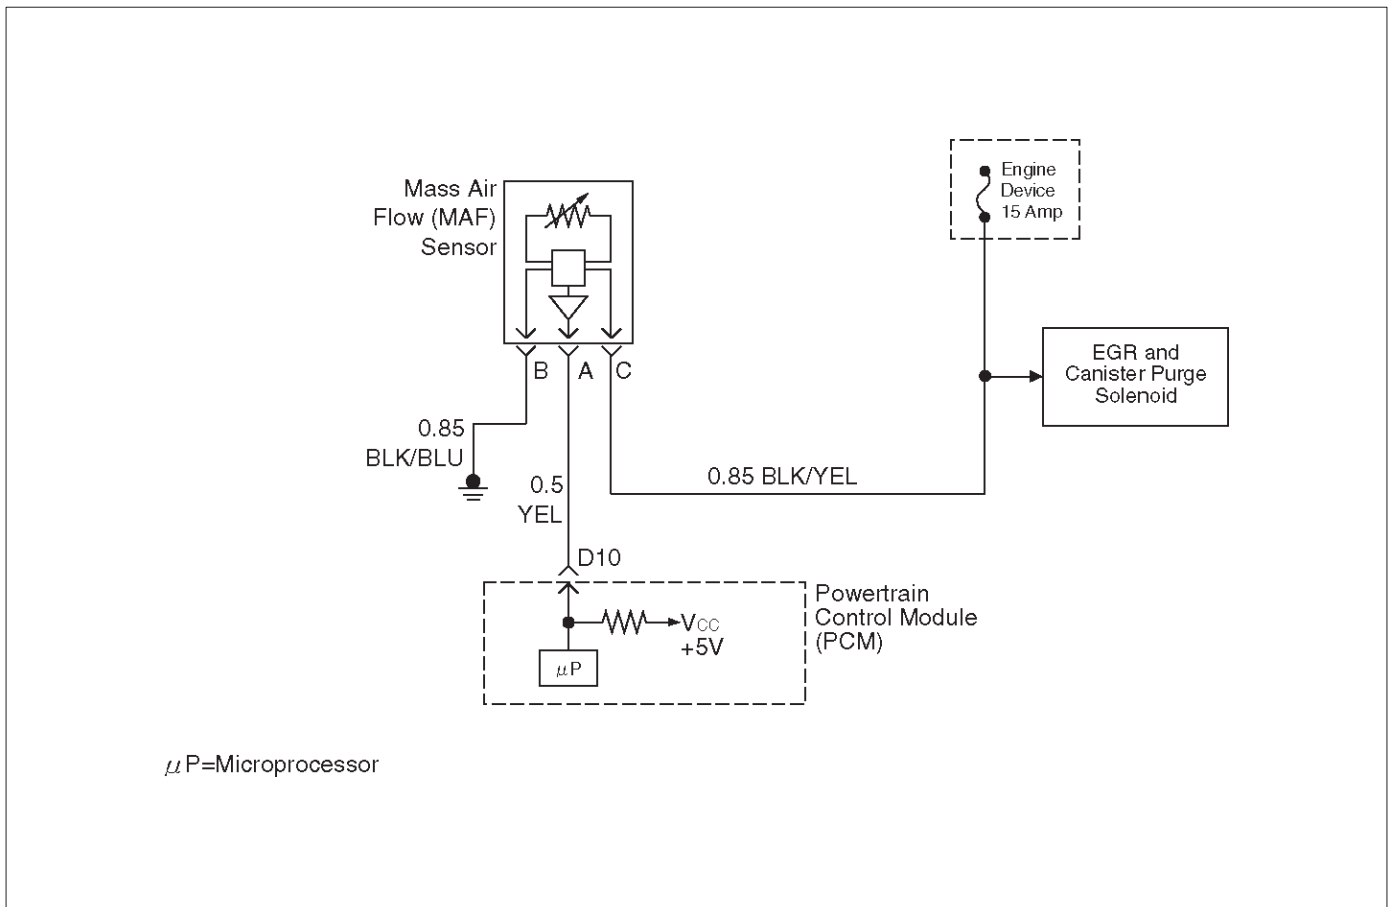

DTC P0102 – MAF Sensor Circuit Low Frequency

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Start the engine. 2. With the engine idling, monitor "MAF Frequency" display on the Tech 2. Is the "MAF Frequency" below the specified value?	2.85 – 6.65 g/s	Go to Step 4	Go to Step 5
3	1. Ignition "ON," engine "OFF." 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor "DTC" info for DTC P0102. Does the Tech 2 indicate DTC P0102 failed this ignition?	—	Go to Step 4	Refer to <i>Diagnostic Aids</i>
4	1. Ignition "OFF." 2. Disconnect the MAF sensor connector. 3. Ignition "ON," engine "OFF." 4. Using a DVM, measure voltage between the MAF sensor signal circuit and battery ground. Is the voltage near the specified value?	5 V	Go to Step 5	Go to Step 8
5	Connect a test light between the MAF sensor ignition feed and ground circuits at the MAF sensor harness connector. Is the test light "ON?"	—	Go to Step 13	Go to Step 6
6	Connect a test light between the MAF sensor ignition feed circuit and battery ground. Is the test light "ON?"	—	Go to Step 12	Go to Step 7
7	1. Check for a poor connection at the MAF sensor. 2. If a poor connection is found, replace the faulty terminal(s). Was a poor connection found?	—	Verify repair	Go to Step 11
8	1. Ignition "OFF." 2. Disconnect the MAF sensor. 3. Disconnect the PCM connector for the MAF signal circuit. 4. Ignition "ON," engine "OFF." 5. With the DVM, measure the voltage between the MAF signal terminal at the PCM and battery ground. Is the voltage under the specified value?	4 V	Go to Step 9	Go to Step 10

DTC P0102 – MAF Sensor Circuit Low Frequency (Cont'd)

Step	Action	Value(s)	Yes	No
9	1. Ignition "OFF." 2. Disconnect the PCM white connector. 3. Ignition "ON." 4. Check the MAF sensor signal circuit for a short to 5 volts. Is the action complete?	—	Verify repair	—
10	1. Ignition "OFF." 2. Disconnect the PCM white connector. 3. Ignition "ON." 4. Check the MAF sensor signal circuit between the PCM and the MAF sensor for an open, short to ground, or short to the MAF ground circuit. Is the action complete?	—	Verify repair	Go to <i>Step 13</i>
11	Locate and repair the open in the ground circuit to the MAF sensor. Is the action complete?	—	Verify repair	—
12	Locate and repair the open in the ignition feed circuit to the MAF sensor. Is the action complete?	—	Verify repair	—
13	Replace the MAF sensor. Is the action complete?	—	Verify repair	Go to <i>Step 14</i>
14	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0103 MAF Sensor Circuit High Frequency

D06RW057

Circuit Description

The mass air flow (MAF) sensor measures the amount of air which passes through it into the engine during a given time. The powertrain control module (PCM) uses the mass air flow information to monitor engine operating conditions for fuel delivery calculations. A large quantity of air entering the engine indicates an acceleration or high load situation, while a small quantity of air indicates deceleration or idle.

The MAF sensor produces a frequency signal which can be monitored using a Tech 2. The frequency will vary within a range of around 4 to 7 g/s at idle to around 9000 Hz at maximum engine load. DTC P0103 will be set if the signal from the MAF sensor is above the possible range of a normally operating MAF sensor.

Conditions for Setting the DTC

- The engine is running above 500 RPM for more than 10 seconds.
- System voltage is above 11.5 volts.
- MAF signal frequency is above 40 g/s for a total of 50 percent of the last 200 samples monitored. A sample is taken every cylinder event.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM calculates an airflow value based on idle air control valve position, throttle position, RPM and barometric pressure.

- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0103 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0103 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

If DTC P0103 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the DTC was last set.

Test Description

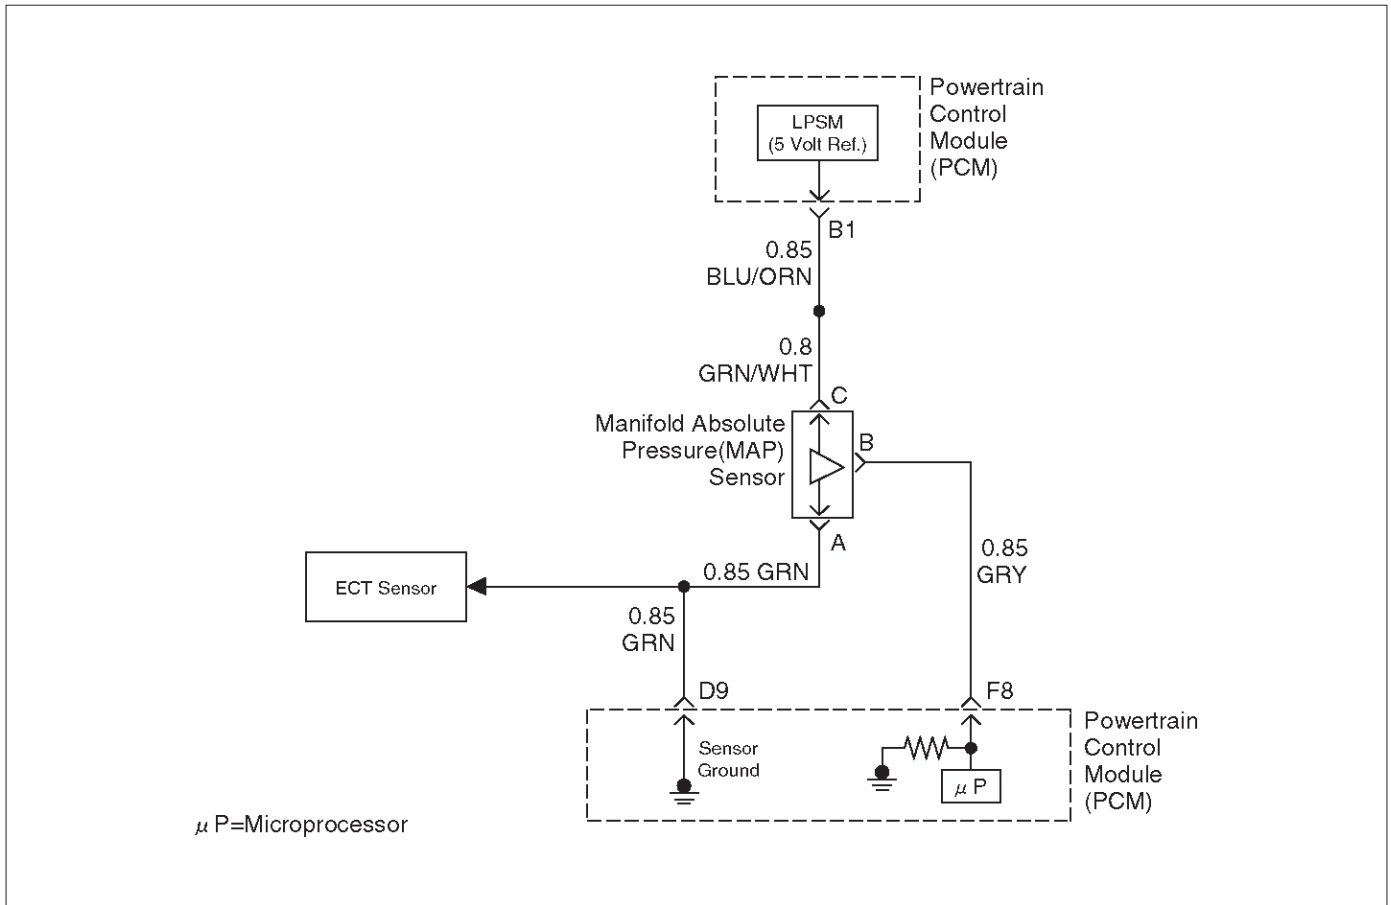

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. This step verifies that the problem is present at idle.
4. A frequency reading with the MAF sensor connector disconnected indicates an electromagnetic interference (EMI) related fault.

DTC P0103 – MAF Sensor Circuit High Frequency

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "ON," engine "OFF." 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor "DTC" info for DTC P0103. Does the Tech 2 indicate DTC P0103 failed this ignition?	—	Go to Step 3	Refer to <i>Diagnostic Aids</i>
3	1. Start the engine. 2. With the engine idling, monitor "MAF Frequency" display on the Tech 2. Is "MAF Frequency" above the specified value?	40 g/s	Go to Step 4	Go to Step 7
4	1. Ignition "OFF." 2. Disconnect the MAF sensor connector. 3. Ignition "ON," engine idling. 4. Using a Tech 2, monitor "MAF Frequency." Does the Tech 2 indicate a "MAF Frequency" at the specified value?	0 g/s	Go to Step 5	Go to Step 6
5	Replace the MAF sensor. Is the action complete?	—	Verify repair	Go to Step 8
6	1. Check the MAF harness for incorrect routing near high voltage components (solenoids, relays, motors). 2. If incorrect routing is found, correct the harness routing. Was a problem found?	—	Verify repair	Go to Step 6
7	1. With the engine idling, monitor "MAF Frequency" display on the Tech 2. 2. Quickly snap open throttle to wide open throttle while under a road load and record value. Does the Tech 2 indicate "MAF Frequency" above the specified value?	40 g/s	Go to Step 5	Go to Step 8
8	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0107 MAP Sensor Circuit Low Voltage

Circuit Description

The manifold absolute pressure (MAP) sensor responds to changes in intake manifold pressure (vacuum). The MAP sensor signal voltage to the powertrain control module (PCM) varies from below 2 volts at idle (high vacuum) to above 4 volts with the ignition "ON," engine not running or at wide-open throttle (low vacuum).

The MAP sensor is used to determine manifold pressure. The PCM monitors the MAP signals for voltages outside the normal range of the MAP sensor. If the PCM detects a MAP signal voltage that is excessively low, DTC P0107 will be set.

Conditions for Setting the DTC

- No TP sensor DTCs present.
- Engine is running.
- Throttle angle is above 1% if engine speed is less than 1000 RPM.
- Throttle angle is above 2% if engine speed is above 1000 RPM.
- The MAP sensor indicates manifold absolute pressure at or below 11 kPa for a total of approximately 10 seconds over a 16-second period.
- Ignition voltage more than 11 volts.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will default to a BARO value of 79.3 kPa.

- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0107 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0107 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Check for intermittent codes.
- The MAP sensor shares a ground with the Fuel Tank Pressure Sensor, the ECT sensor, and the Transmission Fluid Temperature sensor.
- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the MAP display on the Tech 2 while moving connectors and wiring harnesses related to the sensor. A change in the display will indicate the location of the fault.

If DTC P0107 cannot be duplicated, the information included in the Failure Records data can be useful in

determining vehicle mileage since the DTC was last set. If it is determined that the DTC occurs intermittently, performing the DTC P0107 Diagnostic Chart may isolate the cause of the fault.

- The MAP sensor shares a 5 Volt Reference with the Fuel pressure sensor. If these codes are also set, it

could indicate a problem with the 5 Volt reference circuit.

- The MAP sensor shares a ground with the Fuel pressure Sensor, the ECT sensor, and the Transmission Fluid Temperature sensor.

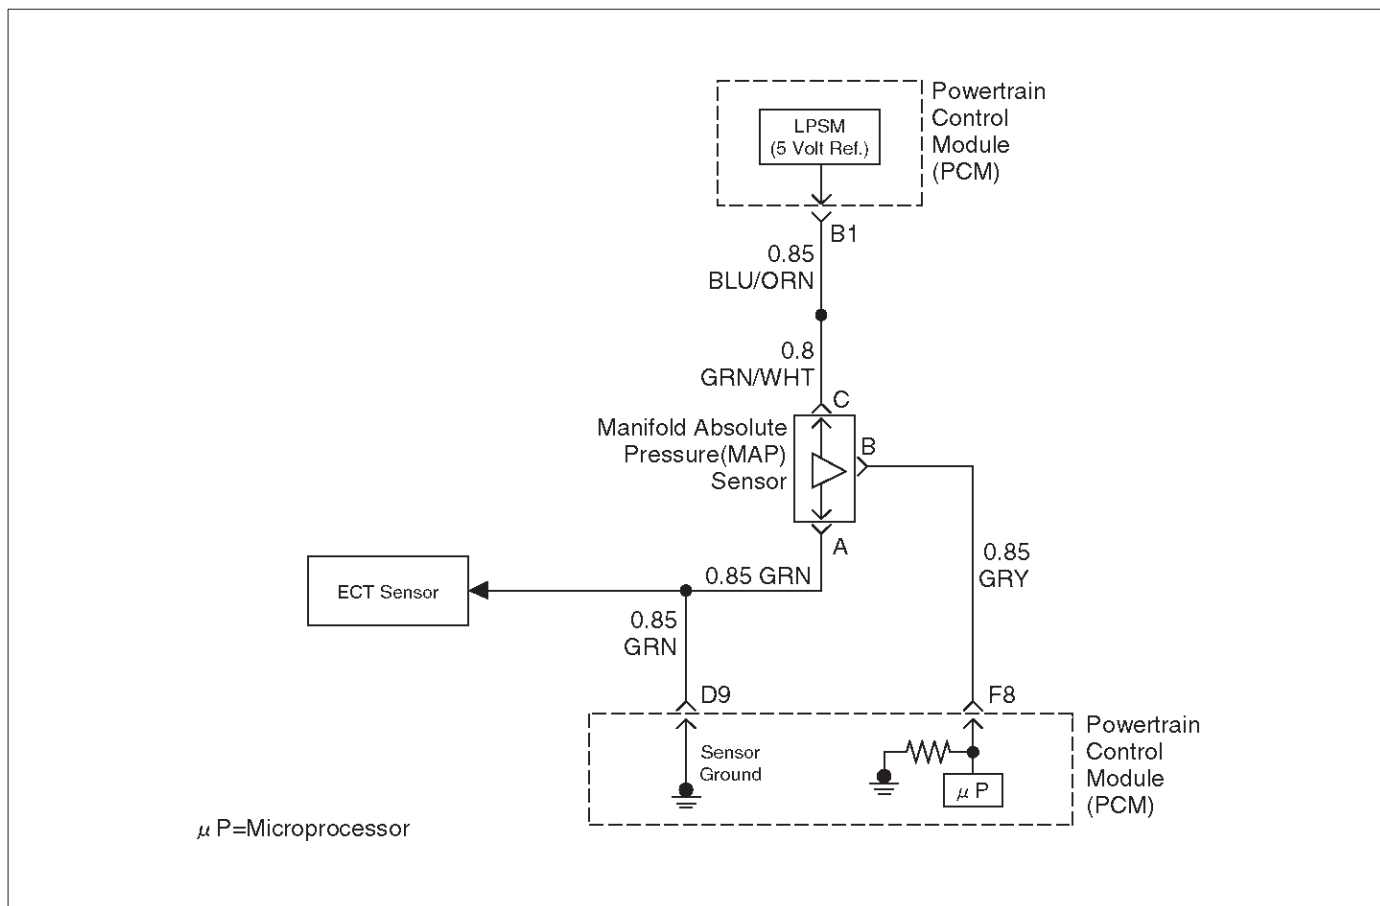

DTC P0107 – MAP Sensor Circuit Low Voltage

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "ON," engine "OFF." 2. With the throttle closed, observe the MAP value displayed on the Tech 2. Is the MAP value near the specified value?	11 kPa at sea level	Go to Step 4	Go to Step 3
3	1. Ignition "ON," engine "OFF." 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor "DTC" info for DTC P0107. Does the Tech 2 indicate DTC P0107 failed?	—	Go to Step 4	Refer to <i>Diagnostic Aids</i>
4	1. Ignition "OFF." 2. Disconnect the MAP sensor electrical connector. 3. Jumper the 5 volt reference "A" circuit and the MAP signal together at the MAP sensor harness connector. 4. Ignition "ON." 5. Observe the MAP value displayed on the Tech 2. Is the MAP value near the specified value? (if no, start with the diagnosis chart for other sensors in the circuit and see if 5V returns.)	5 V 104 kPa	Go to Step 10	Go to Step 5
5	1. Disconnect the jumper. 2. Connect a test light between B+ and the MAP sensor signal circuit at the MAP sensor harness connector. 3. Observe the MAP value displayed on the Tech 2. Is the MAP value near the specified value.	5 V 104 kPa	Go to Step 6	Go to Step 8
6	1. Ignition "OFF." 2. Disconnect the PCM and check the 5 volt reference "A" circuit for an open or short to ground. 3. If the 5 volt reference "A" circuit is open or shorted to ground, repair it as necessary. Was the 5 volt reference "A" circuit open or shorted to ground?	—	Verify repair	Go to Step 7
7	Check the 5 volt reference "A" circuit for a poor connection at the PCM and replace the terminal if necessary. Did the terminal require replacement?	—	Verify repair	Go to Step 11

DTC P0107 – MAP Sensor Circuit Low Voltage (Cont'd)

Step	Action	Value(s)	Yes	No
8	1. Ignition "OFF." 2. Disconnect the PCM, and check the MAP signal circuit for an open, short to ground, or short to the sensor ground circuit. 3. If the MAP sensor signal circuit is open or shorted to ground, repair it as necessary. Was the MAP signal circuit open or shorted to ground?	—	Verify repair	Go to <i>Step 9</i>
9	Check the MAP sensor signal circuit for a poor connection at the PCM and the MAP sensor; replace the terminal if necessary. Did the terminal require replacement?	—	Verify repair	Go to <i>Step 11</i>
10	Replace the MAP sensor. Is the action complete?	—	Verify repair	—
11	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0108 MAP Sensor Circuit High Voltage

D06RX135

Circuit Description

The manifold absolute pressure (MAP) sensor responds to changes in intake manifold pressure (vacuum). The MAP sensor signal voltage to the powertrain control module (PCM) varies from below 2 volts at idle (high vacuum) to above 4 volts with the key "ON," engine not running or at wide- open throttle (low vacuum).

The PCM monitors the MAP signals for voltages outside the normal range of the MAP sensor. If the PCM detects a MAP signal voltage that is excessively high, DTC P0108 will be set.

Conditions for Setting the DTC

- No TP sensor DTCs present.
- Engine is running for more than 10 seconds.
- Throttle position is below 3% if engine speed is below 1000 RPM.
- Throttle position is below 10% if engine speed is above 1000 RPM.
- The MAP sensor indicates an intermittent manifold absolute pressure above 80 kPa for a total of approximately 10 seconds over a 16-second period.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will default to a BARO value of 79.3 kPa.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0108 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0108 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the MAP display on the Tech 2 while moving connectors and wiring harnesses related to the sensor. A change in the display will indicate the location of the fault.

If DTC P0108 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the DTC was last set. If it is determined that the DTC occurs intermittently, performing the DTC P1108 Diagnostic Chart may isolate the cause of the fault.

- The MAP sensor shares a 5 Volt Reference with the Fuel pressure sensor. If these codes are also set, it could indicate a problem with the 5 Volt reference circuit.

6E2-110 6VD1 3.2L ENGINE DRIVEABILITY AND EMISSIONS

- The MAP sensor shares a ground with the Fuel pressure Sensor, the ECT sensor, and the Transmission Fluid Temperature sensor.

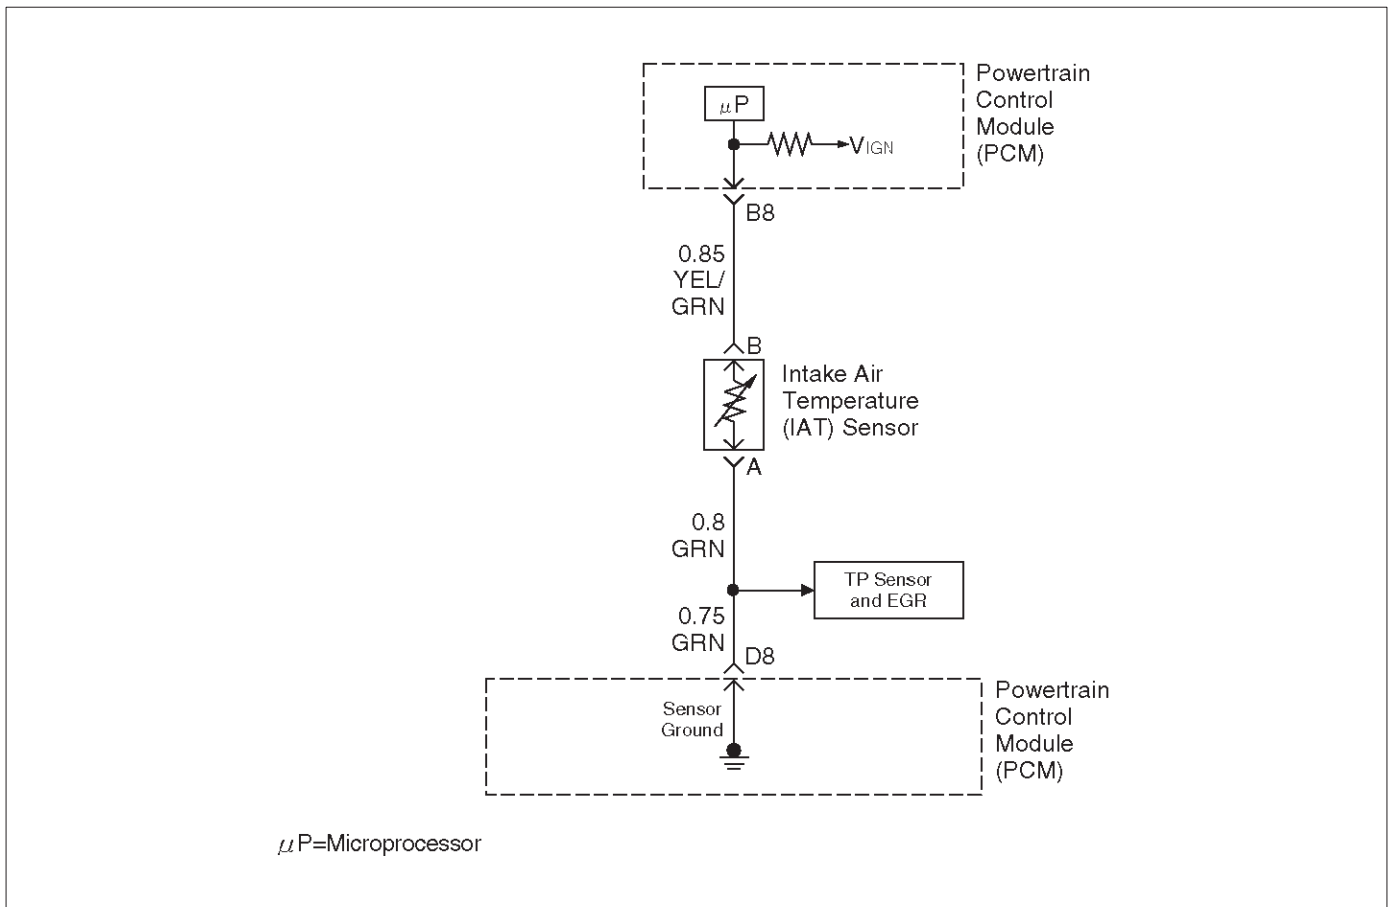

DTC P0108 – MAP Sensor Circuit High Voltage

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. If the engine idle is rough, unstable or incorrect, repair the idle problem before using this chart. Refer to <i>Symptoms</i> section. 2. With the engine idling, note the MAP value on the Tech 2. Is the MAP reading above the specified value?	90 kPa	Go to Step 4	Go to Step 3
3	1. Ignition "ON," engine "OFF." 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor "DTC" info for DTC P0108. Does the Tech 2 indicate DTC P0108 failed this ignition?	—	Go to Step 4	Refer to <i>Diagnostic Aids</i>
4	1. Ignition "OFF." 2. Disconnect the MAP sensor electrical connector. 3. Ignition "ON." 4. Note the MAP sensor voltage displayed on the Tech 2. Is the MAP sensor voltage at the specified value? (If no, start with diagnostic chart for other sensors in the circuit and see if 5 V returns)	0.0 V 11 kPa	Go to Step 5	Go to Step 6
5	Probe the sensor ground circuit with a test light to B+. Is the test light "ON?"	—	Go to Step 7	Go to Step 9
6	1. Check the MAP signal circuit for a short to voltage or a short to the 5 volt reference "A" circuit. 2. If the MAP sensor signal circuit is shorted, repair circuit as necessary. Was the MAP sensor signal circuit shorted?	—	Verify repair	Go to Step 11
7	1. Check for a poor sensor ground terminal connection at the MAP sensor electrical connector. 2. If a problem is found, replace the faulty terminal. Did the terminal require replacement?	—	Verify repair	Go to Step 8
8	Check for a plugged or leaking vacuum supply to the MAP sensor. Is the vacuum supply plugged or leaking?	—	Verify repair	Go to Step 12
9	1. Check for a poor sensor ground terminal connection at the PCM. 2. If a problem is found, replace the faulty terminal. Did the terminal require replacement?	—	Verify repair	Go to Step 10

DTC P0108 – MAP Sensor Circuit High Voltage (Cont'd)

Step	Action	Value(s)	Yes	No
10	1. Check the continuity of the MAP sensor ground circuit. 2. If the MAP sensor ground circuit measures over 5 ohms, repair open or poor connection. Was a condition found and corrected?	—	Verify repair	Go to <i>Step 11</i>
11	Replace the PCM. Is the action complete?	—	Verify Repair	—
12	Replace the MAP sensor. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0112 IAT Sensor Circuit Low Voltage

D06RW078

Circuit Description

The intake air temperature (IAT) sensor is a thermistor which measures the temperature of the air entering the engine. The powertrain control module (PCM) applies 5 volts through a pull-up resistor to the IAT sensor. When the intake air is cold, the sensor resistance is high and the PCM will monitor a high signal voltage on the IAT signal circuit. If the intake air is warm, the sensor resistance is lower, causing the PCM to monitor a lower voltage. DTC P0112 will set when the PCM detects an excessively low signal voltage on the intake air temperature sensor signal circuit.

Conditions for Setting the DTC

- The engine has been running for over 2 minutes.
- Vehicle speed is greater than 30 mph (48 km/h) .
- IAT signal voltage indicates an intake air temperature greater than 148°C (298°F) (about 5 volts) for a total of 12.5 seconds over a 25-second period of time.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0112 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0112 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
 - Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the IAT display on the Tech 2 while moving connectors and wiring harnesses related to the IAT sensor. A change in the IAT display will indicate the location of the fault.
- If DTC P0112 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the DTC was last set.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

2. Verifies that the fault is present.

3. If DTC P0112 can be repeated only by duplicating the Failure Records condition, refer to the *Temperature vs. Resistance Value* table. The table may be used to test the IAT sensor at various temperatures to evaluate the possibility of a “shifted” sensor that may be stored above or below a certain temperature. If this is the case, replace the IAT sensor. If the IAT sensor appears to be OK, the fault is intermittent; refer to *Diagnostic Aids*.

Diagnostic Trouble Code (DTC) P0113 IAT Sensor Circuit High Voltage

D06RW078

Circuit Description

The intake air temperature (IAT) sensor is a thermistor which measures the temperature of the air entering the engine. The powertrain control module (PCM) applies 5 volts through a pull-up resistor to the IAT sensor. When the intake air is cold, the sensor resistance is high and the PCM will monitor a high signal voltage on the IAT signal circuit. If the intake air is warm, the sensor resistance is lower causing the PCM to monitor a lower voltage. DTC P0113 will set when the PCM detects an excessively high signal voltage on the intake air temperature sensor signal circuit.

Conditions for Setting the DTC

- The engine has been running for over 4 minutes.
- Vehicle speed is less than 20 mph (32 km/h).
- ECT signal temperature is above 60°C (140°F).
- Mass air flow is less than 20 g/second.
- IAT signal voltage indicates an intake air temperature less than -39°C (-38°F) for total of 12.5 seconds over a 25-second period.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0113 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0113 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the IAT display on the Tech 2 while moving connectors and wiring harnesses related to the IAT sensor. A change in the IAT display will indicate the location of the fault.

If DTC P0113 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the DTC was last set.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

2. Verifies that the fault is present.

6E2-116 6VD1 3.2L ENGINE DRIVEABILITY AND EMISSIONS

3. If DTC P0113 can be repeated only by duplicating the Failure Records conditions, refer to the "Temperature vs. Resistance Values" table. The table may be used to test the IAT sensor at various temperatures to evaluate the possibility of a "shifted" sensor that may be open above or below a certain temperature. If this is the case, replace the IAT sensor. If the IAT sensor appears to be OK, the fault is intermittent; refer to *Diagnostic Aids*.

Diagnostic Trouble Code (DTC) P0117 ECT Sensor Circuit Low Voltage

D06RX136

Circuit Description

The engine coolant temperature (ECT) sensor is a thermistor mounted on a coolant crossover pipe at the front of the engine. The powertrain control module (PCM) applies a voltage (about 5 volts) through a pull-up resistor to the ECT signal circuit. When the engine coolant is cold, the sensor (thermistor) resistance is high, therefore the PCM will measure a high signal voltage. As the engine coolant warms, the sensor resistance becomes lower, and the ECT signal voltage measured at the PCM drops. With a fully warmed-up engine, the ECT signal voltage should measure about 1.5 to 2.0 volts.

Conditions for Setting the DTC

- Engine running time is longer than one minute.
- The ECT sensor signal indicates an engine coolant temperature greater than 150°C (302°F) (about 0.10 V) for a total of 50 seconds over a 100-second period.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will substitute the ECT reading with a default engine coolant temperature value. The default value is based on start-up intake air temperature and running time.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0117 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0117 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the ECT display on the Tech 2 while moving connectors and wiring harnesses related to the ECT sensor. A change in the ECT display will indicate the location of the fault.

If DTC P0117 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the DTC was last set.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. Verifies that the fault is present.

6E2-120 6VD1 3.2L ENGINE DRIVEABILITY AND EMISSIONS

3. If DTC P0117 can be repeated only by duplicating the Failure Records conditions, refer to the "Temperature vs. Resistance Values" table. The table may be used to test the ECT sensor at various temperatures to evaluate the possibility of a "shifted" sensor that may be shorted above or below a certain temperature. If this is the case, replace the ECT sensor. If the ECT sensor appears to be OK, the fault is intermittent; refer to *Diagnostic Aids*.

6	Replace the ECT sensor. Is the action complete?	—	Verify repair	—
7	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0118 ECT Sensor Circuit High Voltage

D06RX136

Circuit Description

The engine coolant temperature (ECT) sensor is a thermistor mounted in on a coolant crossover pipe at the front of the engine. The powertrain control module (PCM) applies a voltage (about 5 volts) through a pull-up resistor to the ECT signal circuit. When the engine coolant is cold, the sensor (thermistor) resistance is high, therefore the PCM will measure a high signal voltage. As the engine coolant warms, the sensor resistance becomes less, and the ECT signal voltage measured at the PCM drops. With a fully warmed-up engine, the ECT signal voltage should measure about 1.5 to 2.0 volts.

Conditions for Setting the DTC

- Engine running time is longer than 1.5 minutes.
- The ECT sensor signal indicates an engine coolant temperature of -39°C (-38°F) or less (about 5 volts) for a total of 50 seconds over a 100-second period.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will substitute the ECT reading with a default engine coolant temperature value. The default value is based on start-up intake air temperature and running time.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0118 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0118 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the ECT display on the Tech 2 while moving connectors and wiring harnesses related to the ECT sensor. A change in the ECT display will indicate the location of the fault.

If DTC P0118 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the DTC was last set.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. Verifies that the fault is present.

6E2-122 6VD1 3.2L ENGINE DRIVEABILITY AND EMISSIONS

3. If DTC P0118 can be repeated only by duplicating the Failure Records conditions, refer to the "Temperature vs. Resistance Value" table. The table may be used to test the ECT sensor at various temperatures to evaluate the possibility of a "shifted" sensor that may be shorted above or below a certain temperature. If this is the case, replace the ECT sensor. If the ECT sensor appears to be OK, the fault is intermittent; refer to *Diagnostic Aids*.

Diagnostic Trouble Code (DTC) P0121 TP System Performance

D06RW059

Circuit Description

The throttle position (TP) sensor circuit provides a voltage signal that changes relative to throttle blade angle. The signal voltage will vary from about 0.6 volts at closed throttle to about 4.5 volts at wide open throttle (WOT). The TP signal is one of the most important inputs used by the powertrain control module (PCM) for fuel control and many of the PCM-controlled outputs. The PCM monitors throttle position and compares actual throttle position from the TP sensor to a predicted TP value calculated from engine speed. If the PCM detects an out-of-range condition, DTC P0121 will set.

Conditions for Setting the DTC

- The engine is running.
- No MAP DTCs, or P0121, P0123 DTCs are set.
- MAP reading is below 55 kPa.
- Throttle is steady, throttle angle is changing less than 1%.
- Predicted throttle angle is not close to actual throttle angle.
- Above conditions are present for a total of 12.5 seconds over a 25-second period of time.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.

- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.
- The PCM will use a default throttle position based on mass air flow and RPM.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0121 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0121 can be cleared by using the Tech 2 "Clear info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Skewed MAP signal or faulty MAP sensor – An incorrect MAP signal may cause the PCM to incorrectly calculate the predicted TP sensor value during high engine load situations. Check for an unusually low MAP reading. This condition can cause DTC P0121 to be set.
- The TP Sensor shares a 5 Volt reference with the EGR Valve.
If these codes are also set, it could indicate a problem with the 5 Volt reference circuit or components itself.
- The TP Sensor share a ground with the EGR Valve and the IAT Sensor.

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the

ECT display on the Tech 2 while moving connectors and wiring harnesses related to the sensor. A change in the display will indicate the location of the fault. If DTC P0121 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the DTC was last set.

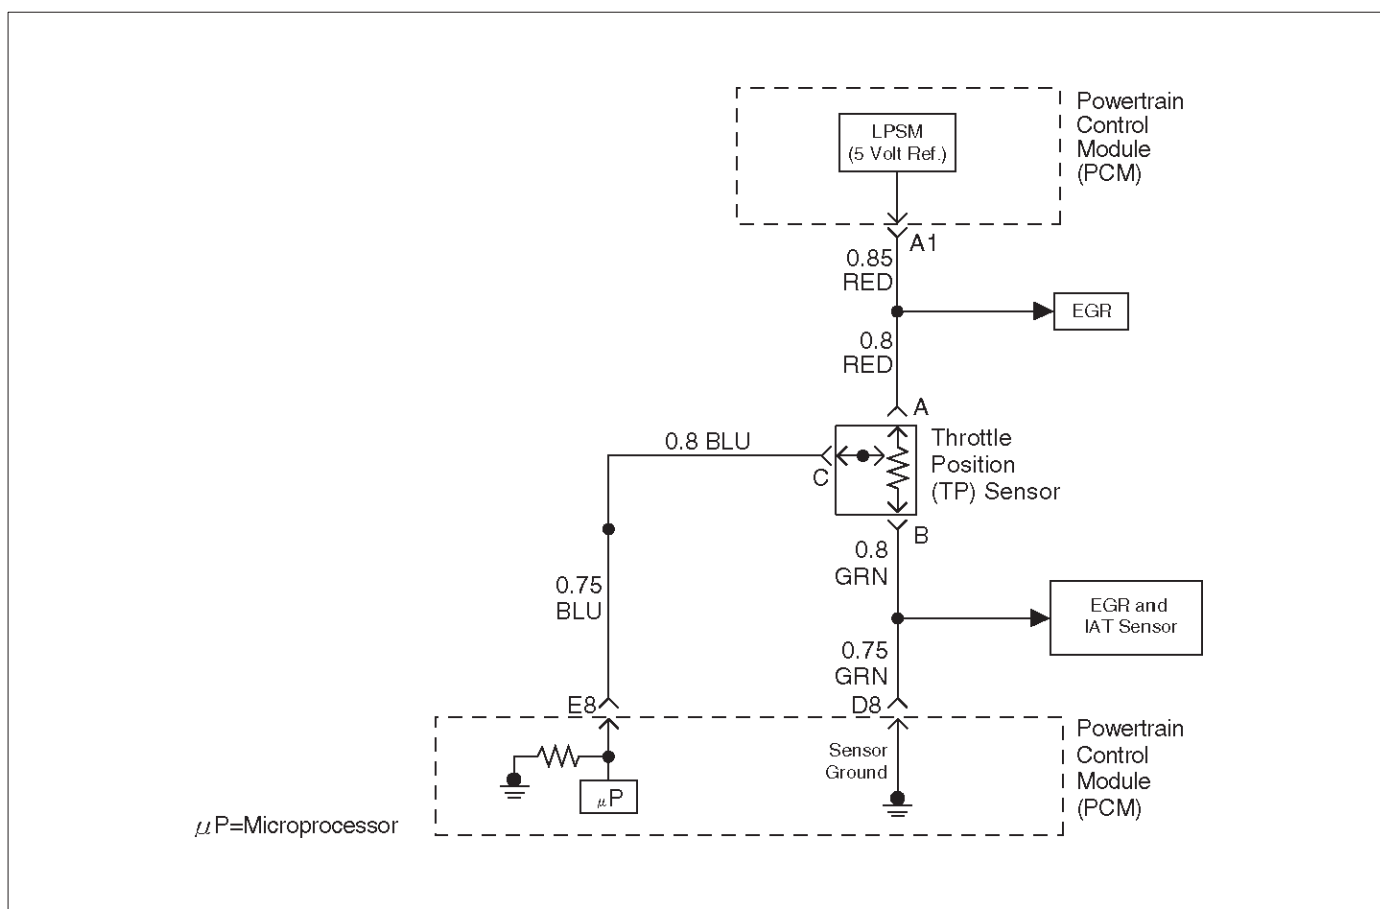

DTC P0121 –TP System Performance

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition “ON,” engine not running. 2. Observe the MAP reading on the Tech 2. Is the MAP reading less than the specified value?	65 kPa	Go to Step 3	Go to Step 6
3	1. Disconnected the MAP sensor. 2. Connect a test light between the 5 volt reference “A” circuit and the MAP signal circuit at the MAP sensor harness connector. 3. Observe the MAP reading on the Tech 2. Is the MAP reading less than the specified value? (If no, start with diagnosis chart for other sensors in the circuit and see if 5V returns.)	65 kPa	Go to Step 5	Go to Step 4
4	1. Check the MAP signal circuit between the PCM and the MAP sensor for an open, short to ground, or short to the MAP ground circuit. 2. If the MAP signal circuit is open or shorted, repair it as necessary. Was the MAP signal circuit open or shorted?	—	Verify repair	Go to Step 12
5	Replace the MAP sensor. Is the action complete?	—	Verify repair	—
6	Observe the TP angle reading on the Tech 2 while slowly opening the throttle. Does the TP angle increase steadily and evenly from the closed throttle value to the wide open throttle value?	Closed throttle = 0% Wide open throttle = 100%	Refer to <i>Diagnostic Aids</i>	Go to Step 7
7	1. Disconnect the TP sensor. 2. Observe the TP sensor reading on the Tech 2. Is the TP sensor reading near the specified value?	0 V	Go to Step 8	Go to Step 9
8	1. Connect a test light between the 5 volt reference “A” circuit and the TP sensor signal circuit at the TP sensor harness connector. 2. Observe the TP sensor reading on the Tech 2. Is the TP sensor reading at the specified value?	5 V	Go to Step 11	Go to Step 10
9	Check the following items: 1. TP signal circuit for a short to voltage. 2. TP sensor ground circuit for high resistance between the PCM and the TP sensor. 3. TP sensor ground circuit for a poor connection. 4. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to Step 12

DTC P0121 –TP System Performance (Cont'd)

Step	Action	Value(s)	Yes	No
10	Check the following items: 1. TP signal circuit or 5 volt reference "A" circuit for a poor connection. 2. TP signal circuit or 5 volt reference "A" circuit for high resistance between the PCM and the TP sensor. 3. If a problem is found, repair wiring harness as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 12</i>
11	Replace the TP sensor. Is the action complete?	—	Verify repair	—
12	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0122 TP Sensor Circuit Low Voltage

D06RW059

Circuit Description

The throttle position (TP) sensor circuit provides a voltage signal that changes relative to throttle blade angle. The signal voltage will vary from below 0.6 volts at closed throttle to about 4.5 volts at wide open throttle (WOT). The TP signal is used by the powertrain control module (PCM) for fuel control and many of the PCM-controlled outputs.

Conditions for Setting the DTC

- The ignition is "ON."
- TP sensor signal voltage is less than 0.22 volt for a total of 0.78 second over a 1.5-second period.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.
- The PCM will use a default throttle position based on mass air flow and RPM.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.

- A history DTC P0122 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0122 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- The TP Sensor shares a 5 Volt reference with the EGR Valve.

If these codes are also set, it could indicate a problem with the 5 Volt reference circuit or components itself.

- The TP Sensor share a ground with the EGR Valve and the IAT Sensor.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the throttle position display on the Tech 2 while moving connectors and wiring harnesses related to the TP sensor. A change in the display will indicate the location of the fault.

If DTC P0122 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the DTC was last set.

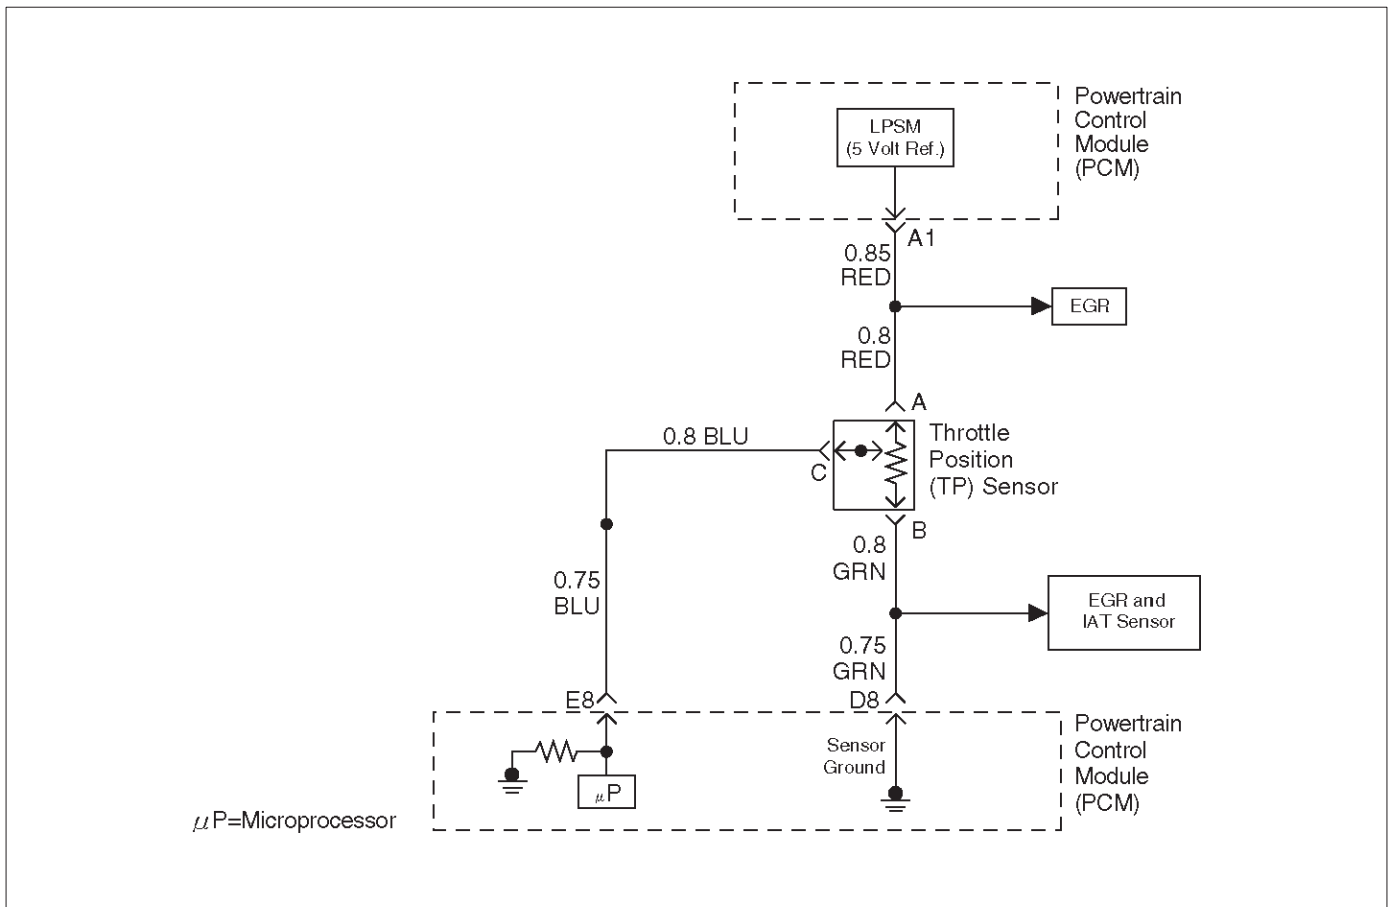

DTC P0122 –TP Sensor Circuit Low Voltage

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "ON," engine "OFF." 2. With the throttle closed, observe the "TP Sensor" display on the Tech 2. Is the "TP Sensor" below the specified value?	0.22 V	Go to Step 4	Go to Step 3
3	1. Ignition "ON," engine "OFF." 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor the "DTC" info for DTC P0122. Does the Tech 2 indicate DTC P0122 failed?	—	Go to Step 4	Refer to <i>Diagnostic Aids</i>
4	1. Ignition "OFF." 2. Disconnect the TP sensor electrical connector. 3. Jumper the 5 volt reference "A" circuit and the TP signal together at the TP sensor harness connector. 4. Ignition "ON." Observe the "TP Sensor" display on the Tech 2. Is the "TP Sensor" at the specified value?	5 V	Go to Step 10	Go to Step 5
5	1. Disconnect jumper. 2. Connect a test light between B+ and the TP sensor signal circuit at the TP sensor harness connector. Observe the "TP Sensor" display on the Tech 2. Is the "TP Sensor" at the specified value? (If no, start with diagnosis chart for other sensors in the circuit and see if 5V returns.)	5 V	Go to Step 6	Go to Step 8
6	1. Ignition "OFF." 2. Disconnect the PCM and check the 5 volt reference "A" circuit for an open or short to ground. 3. If the 5 volt reference "A" circuit is open or shorted to ground, repair it as necessary. Was the 5 volt reference "A" circuit open or shorted to ground?	—	Verify repair	Go to Step 7
7	Check the 5 volt reference "A" circuit for a poor connection at the PCM and replace the terminal if necessary. Did the terminal require replacement?	—	Verify repair	Go to Step 12
8	1. Ignition "OFF." 2. Disconnect the PCM, and check the TP signal circuit for an open, short to ground, or short to the sensor ground circuit. 3. If the TP sensor signal circuit is open or shorted to ground, repair it as necessary. Was the TP signal circuit open or shorted to ground?	—	Verify repair	Go to Step 9

DTC P0122 –TP Sensor Circuit Low Voltage (Cont'd)

Step	Action	Value(s)	Yes	No
9	Check the TP sensor signal circuit for a poor connection at the PCM and replace the terminal if necessary. Did the terminal require replacement?	—	Verify repair	Go to <i>Step 12</i>
10	Check the TP sensor signal circuit for a poor connection at the TP sensor and replace the terminal if necessary. Did the terminal require replacement?	—	Verify repair	Go to <i>Step 11</i>
11	Replace the TP sensor. Is the action complete?	—	Verify repair	—
12	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0123 TP Sensor Circuit High Voltage

Circuit Description

The throttle position (TP) sensor circuit provides a voltage signal that changes relative to throttle blade angle. The signal voltage will vary from about 0.6 volts at closed throttle to about 4.5 volts at wide open throttle (WOT). The TP signal is one of the most important inputs used by the powertrain control module (PCM) for fuel control and many of the PCM-controlled outputs.

Conditions for Setting the DTC

- The ignition is "ON."
- TP sensor signal voltage is greater than 4.88 volts for a total of 0.78 second over a 1.5-second period.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.
- The PCM will use a default throttle position based on mass air flow and RPM.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0123 will clear after 40 consecutive warm-up cycles have occurred without a fault.

- DTC P0123 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- The TP sensor shares a 5 Volt Reference with the EGR Position sensor. Check the 5 Volt reference if these DTCs are also set.
- The TP sensor shares a ground with the IAT sensor and the EGR position Sensor. Check the ground if these other DTCs are also set.
- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the TP sensor display on the Tech 2 while moving connectors and wiring harnesses related to the TP sensor. A change in the display will indicate the location of the fault.
- Faulty TP sensor – With the ignition key "ON," engine "OFF," observe the TP sensor display on the Tech 2 while slowly depressing the accelerator to wide open throttle. If a voltage over 4.88 volts is seen at any point in normal accelerator travel, replace the TP sensor.

If DTC P0123 cannot be duplicated, the information included in the Failure Records data can be useful in determining vehicle mileage since the DTC was last set.

Test Description

Number (s) below refer to the step number(s) on the Diagnostic Chart.

7. Components that share the TP sensor 5 volt reference "A" circuit include the following device:

- EGR valve

Disconnect the component while observing the TP sensor display on the Tech 2. If the reading changes drastically when this component is disconnected, replace the component that affected the reading.

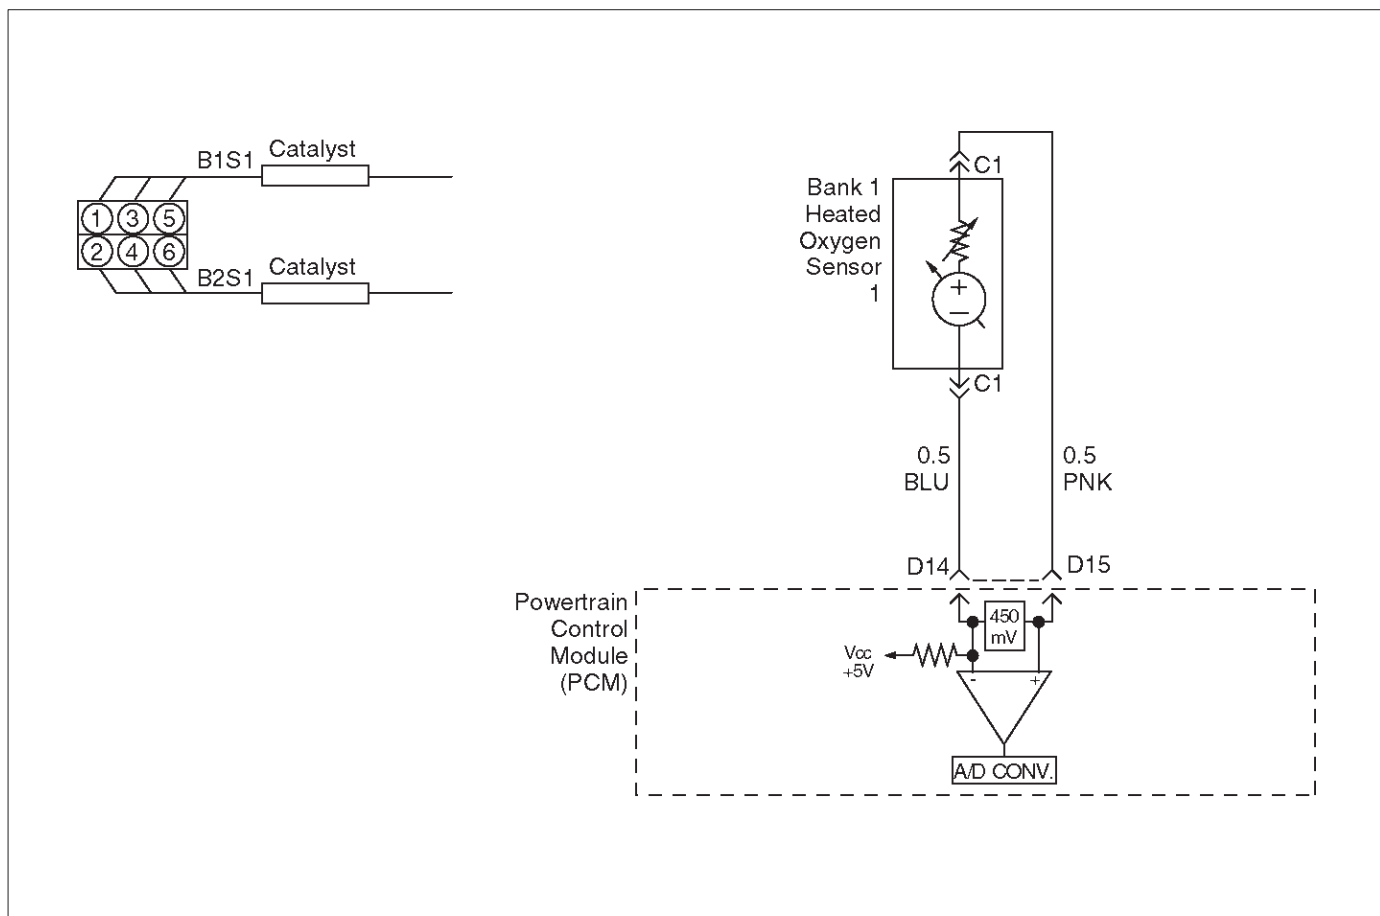

DTC P0123 – TP Sensor Circuit High Voltage

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "ON," engine "OFF." 2. With the throttle closed, observe the "TP Sensor" display on the Tech 2. Is the "TP Sensor" above the specified value?	4.88 V	Go to Step 4	Go to Step 3
3	1. Ignition "ON," engine "OFF." 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor "DTC" info for DTC P0123. Does the Tech 2 indicate DTC P0123 failed.	—	Go to Step 4	Refer to <i>Diagnostic Aids</i>
4	1. Disconnect the TP sensor electrical connector. 2. Observe the "TP Sensor" display on the Tech 2.(If no, start with diagnostic chart other sensors in the circuit and see if 5 V returns) Is the "TP Sensor" near the specified value?	0 V	Go to Step 5	Go to Step 6
5	Probe the sensor ground circuit at the TP sensor harness connector with a test light connected to B+. Is the test light "ON?"	—	Go to Step 7	Go to Step 10
6	1. Ignition "OFF," disconnect the PCM. 2. Ignition "ON," engine "OFF." 3. Check for a short to voltage on the TP sensor signal circuit. 4. If the TP sensor signal circuit is shorted, repair it as necessary. Was the TP sensor signal circuit shorted?	—	Verify repair	Go to Step 12
7	1. Ignition "ON." 2. Monitor the "TP Sensor" Tech 2 display while disconnecting each of the components that share the 5 volt reference "A" circuit (one at a time). 3. If the "TP Sensor" Tech 2 display changes, replace the component that caused the display to change when disconnected. Does disconnecting any of these components cause the "TP Sensor" display to change?	—	Verify repair	Go to Step 8

DTC P0123 – TP Sensor Circuit High Voltage (Cont'd)

Step	Action	Value(s)	Yes	No
8	1. Ignition "OFF," disconnect the PCM. 2. Ignition "ON," engine "OFF." 3. Check for a short to B+ on the 5 volt reference "A" circuit. 4. If the 5 volt reference "A" circuit is shorted, repair it as necessary. Was the 5 volt reference "A" circuit shorted?	—	Verify repair	Go to <i>Step 9</i>
9	Check for poor electrical connections at the TP sensor and replace terminals if necessary. Did any terminals require replacement?	—	Verify repair	Go to <i>Step 11</i>
10	1. Ignition "OFF." 2. Disconnect the PCM, and check for an open sensor ground circuit to the TP sensor. 3. If a problem is found, repair it as necessary. Was the sensor ground circuit to the TP sensor open?	—	Verify repair	Go to <i>Step 12</i>
11	Replace the TP sensor. Is the action complete?	—	Verify repair	—
12	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0131 HO2S Circuit Low Voltage Bank 1 Sensor 1

D06RX137

Circuit Description

The powertrain control module (PCM) supplies a bias voltage of about 450 mV between the heated oxygen sensor (HO2S) signal high and signal low circuits. When measured with a 10 megaohm digital voltmeter, this may display as low as 350 mV. The oxygen sensor varies the voltage within a range of about 1000 mV when the exhaust is rich, down through about 10 mV when exhaust is lean. The PCM constantly monitors the HO2S signal during “closed loop” operation and compensates for a rich or lean condition by decreasing or increasing injector pulse width as necessary. If the Bank 1 HO2S 1 voltage remains excessively low for an extended period of time, DTC P0131 will be set.

Conditions for Setting the DTC

- No related DTCs.
- Vehicle is operating in “closed loop.”
- Engine coolant temperature is above 60°C (140°F)
- “Closed loop” commanded air/fuel ratio is between 14.5 and 14.8.
- Throttle angle is between 3% and 19%.
- Bank 1 HO2S 1 signal voltage remains below 22 mV during normal “closed loop” operation for a total of 77 seconds over a 90-second period of time.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.
- “Open loop” fuel control will be in effect.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0131 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0131 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Heated oxygen sensor wiring – The sensor pigtail may be routed incorrectly and contacting the exhaust system.
- Poor PCM to engine block grounds.
- Fuel pressure – The system will go lean if pressure is too low. The PCM can compensate for some

decrease. However, If fuel pressure is too low, a DTC P0131 may be set. Refer to *Fuel System Diagnosis*.

- Lean injector(s) – Perform “Injector Balance Test.”
- Vacuum leaks – Check for disconnected or damaged vacuum hoses and for vacuum leaks at the intake manifold, throttle body, EGR system, and PCV system.
- Exhaust leaks – An exhaust leak may cause outside air to be pulled into the exhaust gas stream past the HO2S, causing the system to appear lean. Check for exhaust leaks that may cause a false lean condition to be indicated.
- MAF sensor – The system can go lean if the MAF sensor signal indicates an engine airflow measurement that is not correct. Disconnect the MAF sensor to see if the lean condition is corrected. If so, replace the MAF sensor.
- Fuel contamination – Water, even in small amounts, can be delivered to the fuel injectors. The water can cause a lean exhaust to be indicated. Excessive alcohol in the fuel can also cause this condition. Refer to *Fuel System Diagnosis* for the procedure to check for fuel contamination.
- If none of the above conditions are present, replace the affected HO2S.

Test Description

Number(s) below refer to step numbers on the diagnostic chart.

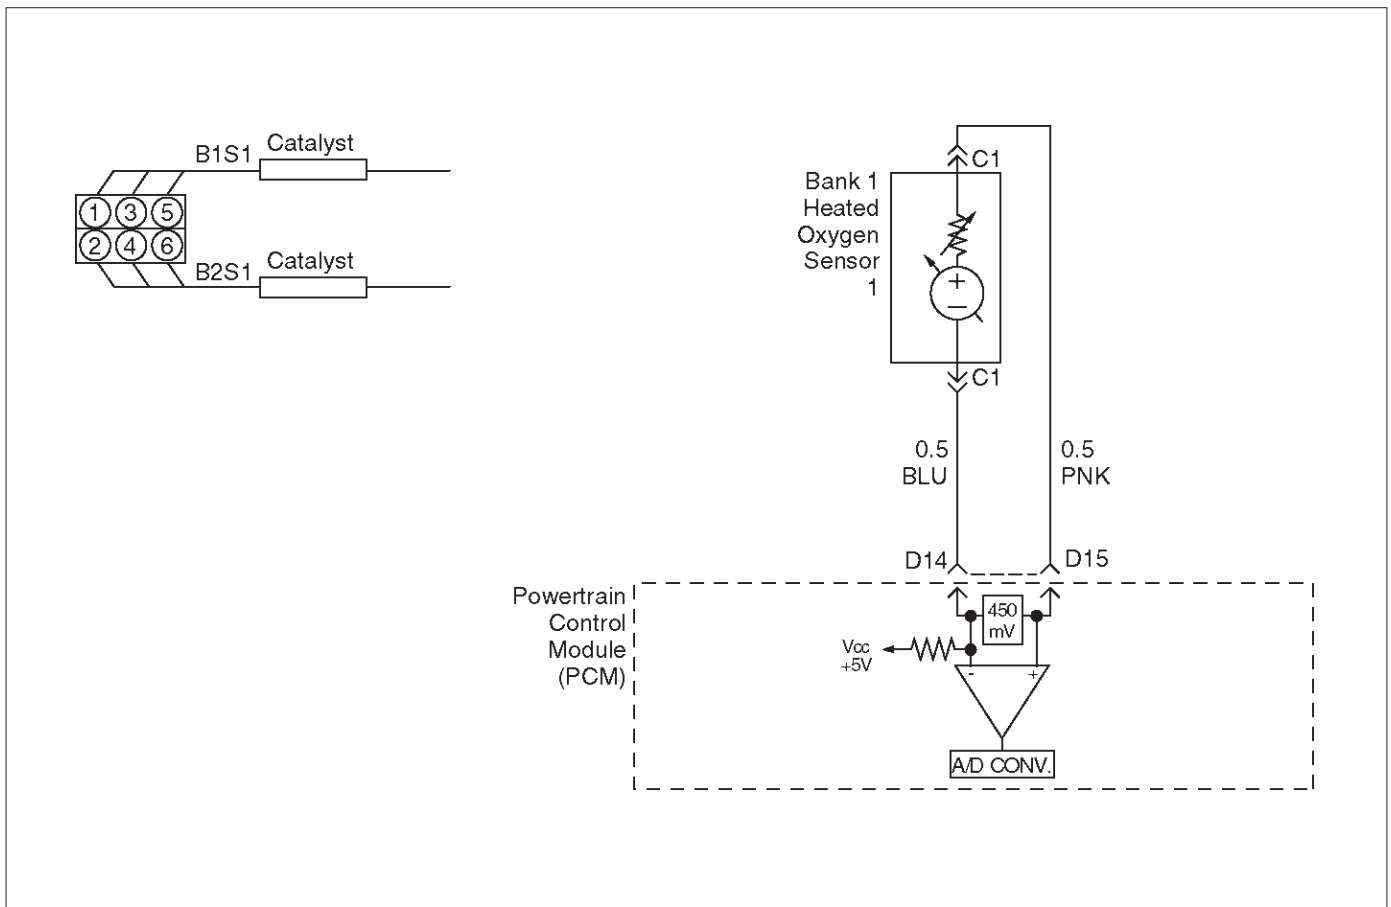

3. DTC P0131 failing during operation may indicate a condition described in the “Diagnostic Aids” above. If the DTC P0131 test passes while the Failure Records conditions are being duplicated, an intermittent condition is indicated.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P0131 –HO2S Circuit Low Voltage Bank 1 Sensor 1

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Install the Tech 2. 2. Run the engine at operating temperature. 3. Operate the vehicle within the parameters specified under "Conditions for Setting the DTC" criteria included in Diagnostic Support. 4. Using a Tech 2, monitor Bank 1 HO2S 1 voltage. Does the Bank 1 HO2S 1 voltage remain below the specified value?	22 mV	Go to Step 4	Go to Step 3
3	1. Ignition "ON," engine "OFF," review and record Tech 2 Failure Records data and note parameters. 2. Operate the vehicle within Failure Records conditions as noted. 3. Using a Tech 2, monitor "DTC" info for DTC P0131 until the DTC P0131 test runs. Note test result. Does Tech 2 indicate DTC P0131 failed this ignition?	—	Go to Step 4	Refer to <i>Diagnostic Aids</i>
4	1. Turn the ignition "OFF." 2. Disconnect the PCM. 3. Check the Bank 1 HO2S 1 high and low circuits for a short to ground or a short to the heater ground circuit. Are the Bank 1 HO2S 1 signal circuits shorted to ground?	—	Go to Step 5	Go to Step 6
5	Repair the Bank 1 HO2S 1 signal circuit. Is the action complete?	—	Verify repair	—
6	1. Turn the ignition "OFF," HO2S 1 and PCM disconnected. 2. Check for continuity between the high and low signal circuits. Was there continuity between the high and low circuits?	—	Go to Step 7	Go to Step 8
7	Repair the short between the high and low circuits. Is the action complete?	—	Verify repair	—
8	1. Ignition "OFF." 2. Reconnect the PCM, leave the sensor disconnected. 3. Ignition "ON." Does the Tech 2 indicate Bank 1 HO2S 1 voltage between the specified values?	425–475 mV	Refer to <i>Diagnostic Aids</i>	Go to Step 9
9	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0132 HO2S Circuit High Voltage Bank 1 Sensor 1

D06RX137

Circuit Description

The powertrain control module (PCM) supplies a bias voltage of about 450 mV between the heated oxygen sensor (HO2S) signal high and signal low circuits. When measured with a 10 megaohm digital voltmeter, this may display as low as 320 mV. The oxygen sensor varies the voltage within a range of about 1000 mV when the exhaust is rich, down through about 10 mV when exhaust is lean. The PCM constantly monitors the HO2S signal during “closed loop” operation and compensates for a rich or lean condition by decreasing or increasing injector pulse width as necessary. If the Bank 1 HO2S 1 voltage remains excessively high for an extended period of time, DTC P0132 will be set.

Conditions for Setting the DTC

- No related DTCs.
- Engine coolant temperature is above 60°C (140°F)
- “Closed loop” commanded air/fuel ratio is between 14.5 and 14.8.
- Throttle angle is between 3% and 19%.
- Bank 1 HO2S 1 signal voltage remains above 952 mV during normal “closed loop” operation for a total of 77 seconds over a 90-second period.

OR

- Bank 1 HO2S 1 signal voltage remains above 500 mV during “deceleration fuel cutoff mode” operation for 3 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.
- “Open loop” fuel control will be in effect.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0132 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0132 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check the following items:

- Fuel pressure – The system will go rich if pressure is too high. The PCM can compensate for some increase. However, if fuel pressure is too high, a DTC P0132 may be set. Refer to *Fuel System Diagnosis*.
- Perform “Injector Balance Test” – Refer to *Fuel System Diagnosis*.
- Check the EVAP canister for fuel saturation – If full of fuel, check canister control and hoses. Refer to *Evaporative (EVAP) Emission Control System*.

- MAF sensor –The system can go rich if MAF sensor signal indicates an engine airflow measurement that is not correct. Disconnect the MAF sensor to see if the rich condition is corrected. If so, replace the MAF sensor.
- Check for a leak in the fuel pressure regulator diaphragm by checking the vacuum line to the regulator for the presence of fuel. There should be no fuel in the vacuum line.
- An intermittent TP sensor output will cause the system to go rich due to a false indication of the engine accelerating.
- Shorted Heated Oxygen Sensor (HO2S) –If the HO2S is internally shorted, the HO2S voltage displayed on the Tech 2 will be over 1 volt. Try disconnecting the affected HO2S with the key “ON,” engine “OFF.” If the displayed HO2S voltage changes from over 1000 mV to around 450 mV, replace the HO2S. Silicon contamination of the HO2S can also cause a high HO2S voltage to be indicated. This condition is indicated by a powdery white deposit on the portion of the HO2S exposed to the exhaust stream. If contamination is noticed, replace the affected HO2S.
- Open HO2S Signal Circuit or Faulty HO2S–A poor connection or open in the HO2S signal circuit can cause the DTC to set during deceleration fuel mode. An HO2S which is faulty and not allowing a full voltage swing between the rich and lean thresholds can also cause this condition. Operate the vehicle by monitoring the HO2S voltage with a Tech 2. If the HO2S voltage is limited within a range between 300 mV to 600 mV, check the HO2S signal circuit wiring and associated terminal conditions.
- If none of the above conditions are present, replace the affected HO2S.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

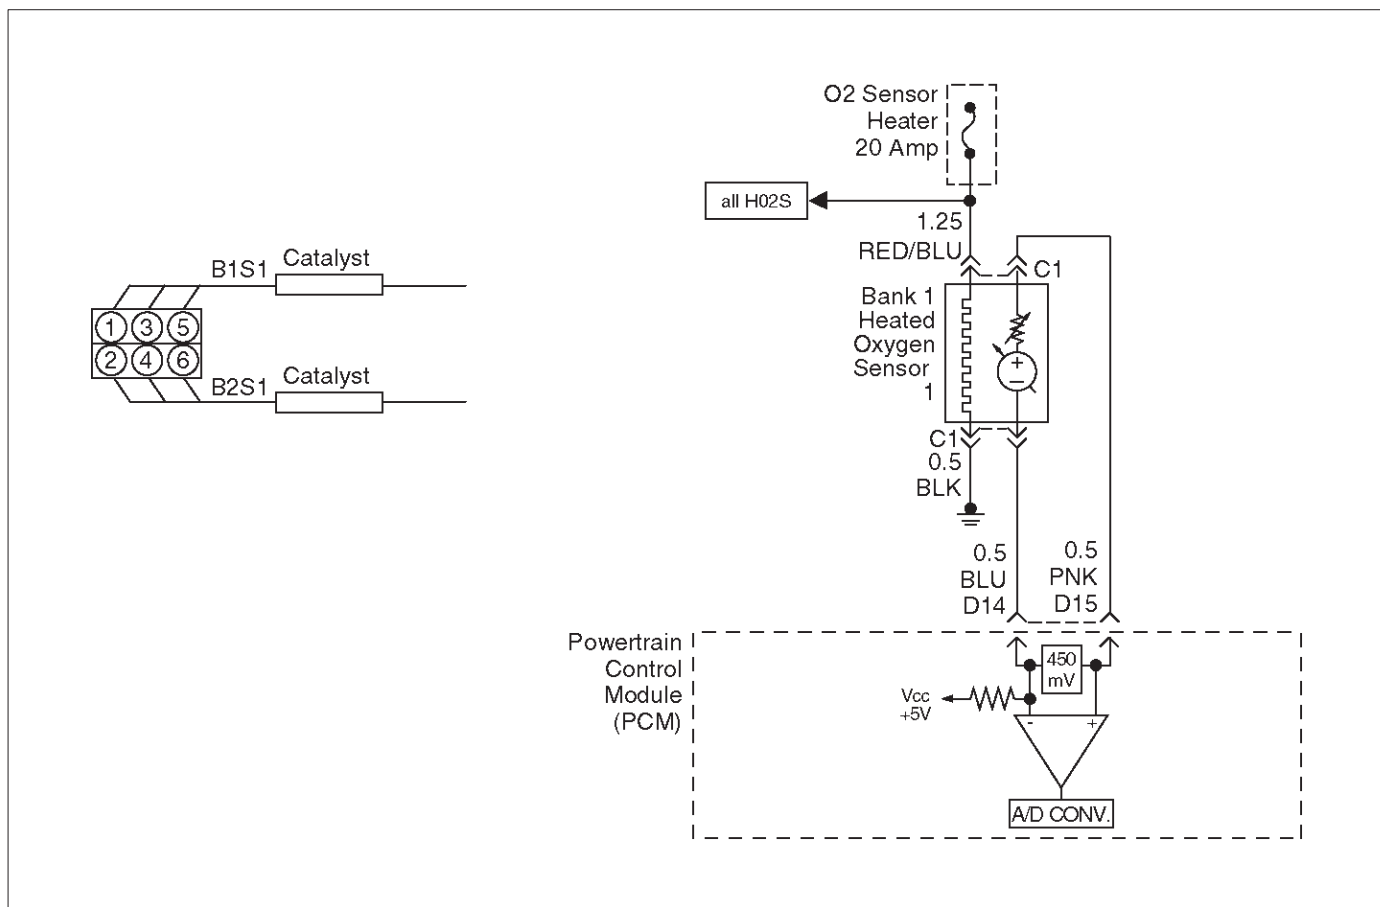

3. DTC P0132 failing during “deceleration fuel cutoff mode” operation may indicate a condition described in the “Diagnostic Aids” above. If the DTC P0132 test passes while the Failure Records conditions are being duplicated, an intermittent condition is indicated.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

8	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0134 HO2S Circuit Insufficient Activity Bank 1 Sensor 1

D06RX138

Circuit Description

- The powertrain control module (PCM) supplies a bias voltage of about 450 mV between the heated oxygen sensor (HO2S) high and low circuits. When measured with a 10 megaohm digital voltmeter, this may display as low as 320 mV. The oxygen sensor varies the voltage within a range of about 1000 mV when the exhaust is rich, down through about 10 mV when exhaust is lean. The PCM constantly monitors the HO2S signal during “closed loop” operation and compensates for a rich or lean condition by decreasing or increasing injector pulse width as necessary. If the Bank 1 HO2S 1 voltage remains at or near the 450 mV bias for an extended period of time, DTC P0134 will be set, indicating an open sensor signal or sensor low circuit.
- Heated oxygen sensors are used to minimize the amount of time required for “closed loop” fuel control operation and to allow accurate catalyst monitoring. The oxygen sensor heater greatly decreases the amount of time required for fuel control sensors Bank 1 HO2S 1 and Bank 2 HO2S 1 to become active. Oxygen sensor heaters are required by post-catalyst monitor sensors to maintain a sufficiently high temperature for accurate exhaust oxygen content readings further from the engine.

Conditions for Setting the DTC

- No related DTCs.
- Battery voltage is above 10 volts.
- Engine run time is longer than 40 seconds.

- Oxygen sensor heater has been determined to be functioning properly.
- Bank 1 HO2S 1 signal voltage remains between 400 mV and 500 mV for a total of 77 seconds over a 90-second period of time.

Action Take When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.
- “Open loop” fuel control will be in effect.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0134 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0134 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection or damaged harness – Inspect the harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, poor terminal-to-wire connection, and damaged harness.
- Faulty HO2S heater or heater circuit – With the ignition “ON,” engine “OFF,” after a cool down period, the HO2S 1 voltage displayed on the Tech 2 is normally 455-460 mV. A reading over 1000 mV indicates a signal line shorted to voltage. A reading under 5 mV indicates a signal line shorted to ground or signal lines shorted together. Disconnect the HO2S and connect a test light between the HO2S ignition feed and heater ground circuits. If the test light does not light for 2 seconds when the ignition is turned on, repair the open ignition feed or sensor ground circuit as necessary. If the test light lights and the HO2S signal and low circuits are OK, replace the HO2S.

- Intermittent test – With the Ignition “ON,” monitor the HO2S signal voltage while moving the wiring harness and related connectors. If the fault is induced, the HO2S signal voltage will change. This may help isolate the location of the malfunction.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

3. If the DTC P0134 test passes while the Failure Records conditions are being duplicated, an intermittent condition is indicated.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

10	Replace Bank 1 HO2S 1. Is the action complete?	—	Verify repair	—
11	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0151 HO2S Circuit Low Voltage Bank 2 Sensor 1

D06RX139

Circuit Description

The powertrain control module (PCM) supplies a bias voltage of about 450 mV between the heated oxygen sensor (HO2S) signal high and signal low circuits. When measured with a 10 megaohm digital voltmeter, this may display as low as 320 mV. The oxygen sensor varies the voltage within a range of about 1000 mV when the exhaust is rich, down through about 10 mV when exhaust is lean. The PCM constantly monitors the HO2S signal during "closed loop" operation and compensates for a rich or lean condition by decreasing or increasing injector pulse width as necessary. If the Bank 2 HO2S 1 voltage remains excessively low for an extended period of time, DTC P0151 will be set.

Conditions for Setting the DTC

- No related DTCs.
- The engine is operating in "closed loop."
- Engine coolant temperature is above 60°C (140°F).
- "Closed loop" commanded air/fuel ratio is between 14.5 and 14.8.
- Throttle angle is between 3% and 19%.
- Bank 2 HO2S 1 signal voltage remains below 22 mV during normal "closed loop" operation for a total of 77 seconds over a 90-second period of time.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.
- "Open loop" fuel control will be in effect.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0151 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0151 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Heated oxygen sensor wiring – The sensor pigtail may be mispositioned and contacting the exhaust system.
- Poor PCM to engine block grounds.
- Fuel pressure – The system will go lean if pressure is too low. The PCM can compensate for some decrease. However, if fuel pressure is too low, a DTC P0151 may be set. Refer to *Fuel System Diagnosis*.
- Lean injector(s) – Perform "Injector Balance Test."

- Vacuum leaks – Check for disconnected or damaged vacuum hoses and for vacuum leaks at the intake manifold, throttle body, EGR system, and PCV system.
- Exhaust leaks – An exhaust leak may cause outside air to be pulled into the exhaust gas stream past the HO2S, causing the system to appear lean. Check for exhaust leaks that may cause a false lean condition to be indicated.
- MAF sensor –The system can go lean if the MAF sensor signal indicates an engine airflow measurement that is not correct. Disconnect the MAF sensor to see if the lean condition is corrected. If so, replace the MAF sensor.
- Fuel contamination – Water, even in small amounts, can be delivered to the fuel injectors. The water can cause a lean exhaust to be indicated. Excessive alcohol in the fuel can also cause this condition. Refer to *Fuel System Diagnosis* for the procedure to check for fuel contamination.

- If none of the above conditions are present, replace the affected HO2S.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

3. DTC P0151 failing during operation may indicate a condition described in the “Diagnostic Aids” above. If the DTC P0151 test passes while the Failure Records conditions are being duplicated, an intermittent condition is indicate.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

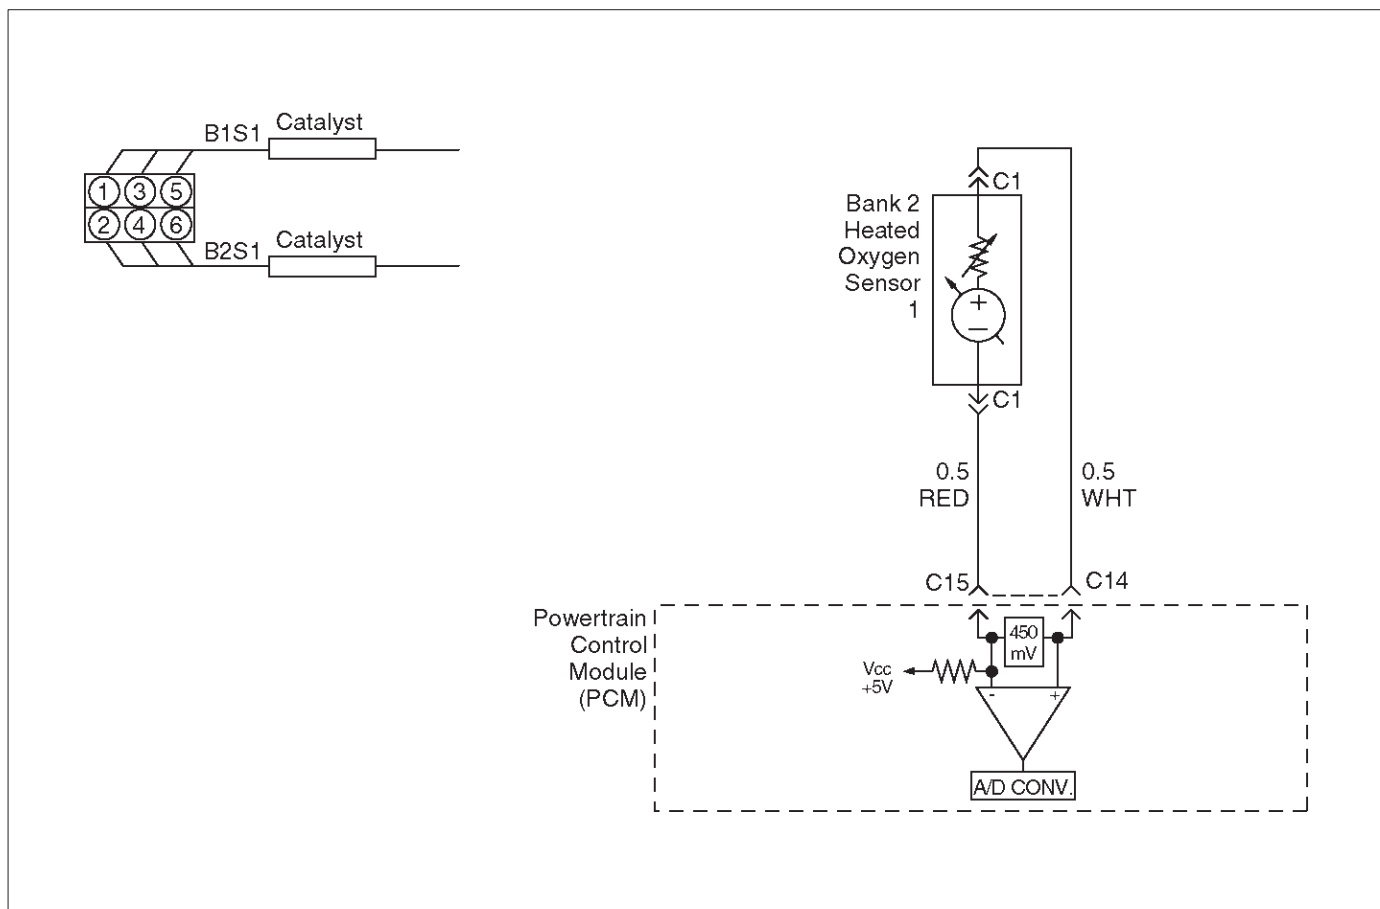

DTC P0151 — HO2S Circuit Low Voltage Bank 2 Sensor 1

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Install the Tech 2. 2. Run the engine at operating temperature. 3. Operate the vehicle within the parameters specified under “Conditions for Setting the DTC” criteria included in Diagnostic Support. 4. Using a Tech 2, monitor Bank 2 HO2S 1 voltage. Does the Bank 2 HO2S 1 voltage remain below the specified value?	22 mV	Go to Step 4	Go to Step 3
3	1. Ignition “ON,” engine “OFF,” review and record Tech 2 Failure Records data and note parameters. 2. Operate the vehicle within Failure Records conditions as noted. 3. Using a Tech 2, monitor “DTC” info for DTC P0151 until the DTC P0151 test runs. 4. Note test result. Does the Tech 2 indicate DTC P0151 failed this ignition?	—	Go to Step 4	Refer to <i>Diagnostic Aids</i>
4	1. Turn ignition “OFF.” 2. Disconnect the PCM. 3. Check the Bank 2 HO2S 1 high and low signal circuits for a short to ground or a short to the heater ground circuit. Were Bank 2 HO2S 1 signal circuits shorted?	—	Go to Step 5	Go to Step 6
5	Repair the Bank 2 HO2S 1 signal circuit. Is the action complete?	—	Verify repair	—
6	1. Ignition “OFF.” 2. Leave the PCM and HO2S 1 disconnected. 3. Check for continuity between the high and low signal circuits. Was there continuity between the high and low circuits?	—	Go to Step 7	Go to Step 8

DTC P0151 — HO2S Circuit Low Voltage Bank 2 Sensor 1 (Cont'd)

Step	Action	Value(s)	Yes	No
7	Repair the short between the high and low circuits. Is the action complete?	—	Verify repair	—
8	1. Ignition "OFF." 2. Reconnect the PCM, leave HO2S 1 disconnected. 3. Ignition "ON." Does the Tech 2 indicate Bank 2 HO2S 1 voltage near the specified value?	425-475 mV	Refer to <i>Diagnostic Aids</i>	Go to <i>Step 9</i>
9	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0152 HO2S Circuit High Voltage Bank 2 Sensor 1

D06RX139

Circuit Description

The powertrain control module (PCM) supplies a bias voltage of about 450 mV between the heated oxygen sensor (HO2S) signal high and signal low circuits. When measured with a 10 megaohm digital voltmeter, this may display as low as 320 mV. The oxygen sensor varies the voltage within a range of about 1000 mV when the exhaust is rich, down through about 10 mV when exhaust is lean. The PCM constantly monitors the HO2S signal during "closed loop" operation and compensates for a rich or lean condition by decreasing or increasing the injector pulse width as necessary. If the Bank 2 HO2S 1 voltage remains excessively high for an extended period of time, DTC P0152 will be set.

Conditions for Setting the DTC

- No related DTCs.
- The engine is operating in "closed loop."
- The engine coolant temperature is above 60°C (140°F).
- "Closed loop" commanded air/fuel ratio between 14.5 and 14.8.
- Throttle angle between 3% and 19%.
- Bank 2 HO2S 1 signal voltage remains above 952 mV during normal "closed loop" operation for a total of 77 seconds over a 90-second period.

OR

- Bank 2 HO2S 1 signal voltage remains above 500 mV during deceleration fuel cutoff mode operation for up to 3 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.
- "Open loop" fuel control will be in effect.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0152 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0152 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Fuel pressure – The system will go rich if pressure is too high. The PCM can compensate for some increase. However, if fuel pressure is too high, a DTC P0152 may be set. Refer to *Fuel System Diagnosis*.
- Rich injector(s) – Perform "Injector Balance Test."

- Leaking injector – Refer to *Fuel System Diagnosis*.
- Evaporative emissions (EVAP) system – Check the canister for fuel saturation. If the canister is full of fuel, check EVAP control system components and hoses. Refer to *Evaporative Emission (EVAP) Control System*.
- MAF sensor – The system can go rich if the MAF sensor signal indicates an engine airflow measurement that is not correct. Disconnect the MAF sensor to see if rich condition is corrected. If so, replace MAF sensor.
- Check for leaking fuel pressure regulator diaphragm by checking vacuum line to regulator for the presence of fuel. There should be no fuel in the vacuum line.
- TP sensor – An intermittent TP sensor output will cause the system to go rich, due to a false indication of the engine accelerating.
- Shorted Heated Oxygen Sensor (HO2S)– If the HO2S is internally shorted, the HO2S voltage displayed on the Tech 2 will be over 1 volt. Try disconnecting the affected HO2S with the key “ON,” engine “OFF.” If the displayed HO2S voltage changes from over 1000 mV to around 450 mV, replace the HO2S. Silicon contamination of the HO2S can cause a high HO2S voltage to be indicated. This condition is indicated by powdery white deposit on the portion of the HO2S exposed to the exhaust stream. If contamination is noticed, replace the affected HO2S.
- Open HO2S Signal Circuit of Faulty HO2S– A poor connection or open in the HO2S signal circuit can cause the DTC to set during deceleration fuel mode. An HO2S which is faulty and not allowing a full voltage switch between the rich and lean thresholds can also cause the condition. Operate the vehicle while monitoring the HO2S voltage with a Tech 2. If the HO2S is voltage limited within a range between 300 mV to 600 mV, check the HO2S signal circuit wiring and associated terminal connections.
- If none of the above conditions are present, replace the affected HO2S.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

3. DTC P0152 failing during deceleration fuel cutoff mode operation may indicate a condition described in the “Diagnostic Aids” above. If the DTC P0152 test passes while the Failure Records conditions are being duplicated, an intermittent condition is indicated.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P0152 – HO2S Circuit High Voltage Bank 2 Sensor 1

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	<ol style="list-style-type: none"> 1. Install the Tech 2. 2. Engine is at operating temperature. 3. Operate the vehicle within the parameters specified under "Conditions for Setting the DTC" criteria included in Diagnostic Support. 4. Using a Tech 2, monitor Bank 2 HO2S 1 voltage. Does the Bank 2 HO2S 1 voltage remain above the specified value?	952 mV (500 mV in deceleration fuel cut-off mode)	Go to Step 4	Go to Step 3
3	<ol style="list-style-type: none"> 1. Ignition "ON." 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor "DTC" info for DTC P0152 until the DTC P0152 test runs. 5. Note the test result. Does the Tech 2 indicate DTC P0152 failed this ignition?	—	Go to Step 4	Refer to <i>Diagnostic Aids</i>
4	<ol style="list-style-type: none"> 1. Ignition "OFF." 2. Disconnect Bank 2 HO2S 1. 3. Ignition "ON." 4. At HO2S Bank 2 Sensor 1 connector (PCM side) use a DVM to measure voltages at the high and low signal terminals. Are the voltages in the specified range?	3-4 V	Go to Step 5	Go to Step 6
5	Repair short to voltage in signal circuit. Is the action complete?	—	Verify repair	—
6	<ol style="list-style-type: none"> 1. Ignition "ON," engine "OFF." 2. At Bank 2 HO2S 1 connector (PCM side) jumper both the HO2S high and low signal circuits (PCM side) to ground. 3. Using a Tech 2, monitor Bank 2 HO2S 1 voltage. Is Bank 2 HO2S 1 voltage below the specified value?	10 mV	Go to Step 7	Go to Step 8
7	<ol style="list-style-type: none"> 1. Disconnect the jumpers to ground from Bank 2 HO2S 1 PCM-side connector. 2. With the HO2S 1 connector disconnected, monitor Bank 2 HO2S 1 voltage. Is the Bank 2 HO2S 1 voltage between the specified values?	425-475 mV	Refer to <i>Diagnostic Aids</i>	Go to Step 8
8	Replace the PCM. Is the action complete?	—	Verify repair	—

improper mating, broken locks, improperly formed or damaged terminals, poor terminal-to-wire-connection, and damaged harness.

- Faulty HO2S heater or heater circuit – With the ignition “ON,” engine “OFF,” the HO2S 1 voltage displayed on the Tech 2 is normally 455-460 mV. A reading over 1000 mV indicates a signal line shorted to voltage. A reading under 5 mV indicates a signal line shorted to ground or signal lines shorted together. If not, disconnect the HO2S and connect a test light between the HO2S ignition feed and heater ground circuits. If the test light does not light for 2 seconds when the ignition is turned on, repair the open ignition feed or sensor ground circuit as necessary. If the test light lights and the HO2S signal and low circuits are OK, replace the HO2S.
- Intermittent test – With the ignition “ON,” monitor the HO2S signal voltage while moving the wiring harness

and related connectors. If the fault is induced, the HO2S signal voltage will change. This may help isolate the location of the malfunction.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

3. If the DTC P0154 test passes while the Failure Records conditions are being duplicated, an intermittent condition is indicated.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P0154 – HO2S Circuit Insufficient Activity Bank 2 Sensor 1

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Install the Tech 2. 2. Run the engine at operating temperature. 3. Operate the engine above 1200 RPM for two minutes. Does the Tech 2 indicate Bank 2 HO2S 1 voltage varying outside the specified values?	400-500 mV	Go to Step 3	Go to Step 4
3	1. Ignition “ON,” engine “OFF.” 2. Review and record Tech 2 Failure Records data and note parameters. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor “DTC” info for DTC P0154 until the DTC P0154 test runs. 5. Note the test result. Does the Tech 2 indicate DTC P0154 failed this ignition?	—	Go to Step 4	Refer to <i>Diagnostic Aids</i>
4	Check for a damaged harness. Was a problem found?	—	Verify repair	Go to Step 5
5	Check for a poor Bank 2 HO2S 1 high and low circuit terminal connections at the Bank 2 HO2S 1 harness connector and replace terminal(s) if necessary. Did any terminals require replacement?	—	Verify repair	Go to Step 6
6	Check for a poor Bank 2 HO2S 1 high and low circuit terminal connections at the PCM and replace terminal(s) if necessary. Did the terminal require replacement?	—	Verify repair	Go to Step 7

8	1. Ignition "OFF." 2. With the PCM disconnected check continuity of the Bank 2 HO2S 1 low circuit. 3. If the Bank 2 HO2S 1 low circuit measures over 5 ohms, repair open or poor connection as necessary. Was a Bank 2 HO2S 1 low circuit problem found and corrected?	—	Verify repair	Go to <i>Step 9</i>
9	1. Ignition "ON," engine "OFF." 2. Disconnect Bank 2 HO2S 1 and jumper the HO2S high and low circuits (PCM side) to ground. 3. Using a Tech 2, monitor Bank 2 HO2S 1 voltage. Is the Bank 2 HO2S 1 voltage in the specified range?	0-10 mV	Go to <i>Step 10</i>	Go to <i>Step 11</i>
10	Replace Bank 2 HO2S 1. Is the action complete?	—	Verify repair	—
11	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0171 Fuel Trim System Too Lean Bank 1

Circuit Description

To provide the best possible combination of driveability, fuel economy, and emission control, a “closed loop” air/fuel metering system is used. While in “closed loop,” the powertrain control module (PCM) monitors the Bank 1 HO₂S 1 and Bank 2 HO₂S 1 signals and adjusts fuel delivery based upon the HO₂S signal voltages. A change made to fuel delivery will be indicated by the long and short term fuel trim values which can be monitored with a Tech 2. Ideal fuel trim values are around 0%; if the HO₂S signals are indicating a lean condition the PCM will add fuel, resulting in fuel trim values above 0%. If a rich condition is detected, the fuel trim values will be below 0%, indicating that the PCM is reducing the amount of fuel delivered. If an excessively lean condition is detected on Bank 1, the PCM will set DTC P0171.

The PCM’s maximum authority to control long term fuel trim allows a range between –15% (automatic transmission) or –12% (manual transmission) and +20%. The PCM monitors fuel trim under various engine speed/load fuel trim cells before determining the status the fuel trim diagnostic.

Conditions for Setting the DTC

- No Tech 2 test is being run.
- None of the following: EGR DTCs, HO₂S DTCs, (response, transition, open, low volts, no activity), MAF DTCs, TP sensor DTCs, MAP DTCs, IAT DTCs, canister purge DTCs, EVAP DTCs, injector circuit DTCs, or misfire DTCs.

- Engine coolant temperature is between 25°C (77°F) and 100°C (212°F).
- Intake air temperature is between –40°C (–40°F) and 120°C (248°F).
- Manifold absolute pressure is between 24 kPa and 99 kPa.
- Throttle angle is steady below 95%.
- Vehicle speed is below 136 km/h (85 mph).
- Engine speed is between 400 and 6000 RPM.
- Barometric pressure is greater than 72.5 kPa.
- Mass air flow (MAF) is between 2 g/second and 200 g/second.
- Ignition voltage is above 9.5 volts.
- Fuel system is in “closed loop.”
- Canister purge duty cycle is greater than 0% if on.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.

- A history DTC P0171 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0171 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the Bank 1 HO2S 1 display on the Tech 2 while moving connectors and wiring harnesses related to the engine harness. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. DTCs other than P0171 and P0174 may indicate a condition present which may cause a lean condition. If this is the case, repairing the condition which caused the other DTC will most likely correct the DTC P0171/P0174.
4. If the DTC P0171 test passes while the Failure Records conditions are being duplicated, the lean condition is intermittent. Refer to *Diagnostic Aids* or *Symptoms* for additional information on diagnosing intermittent problems.

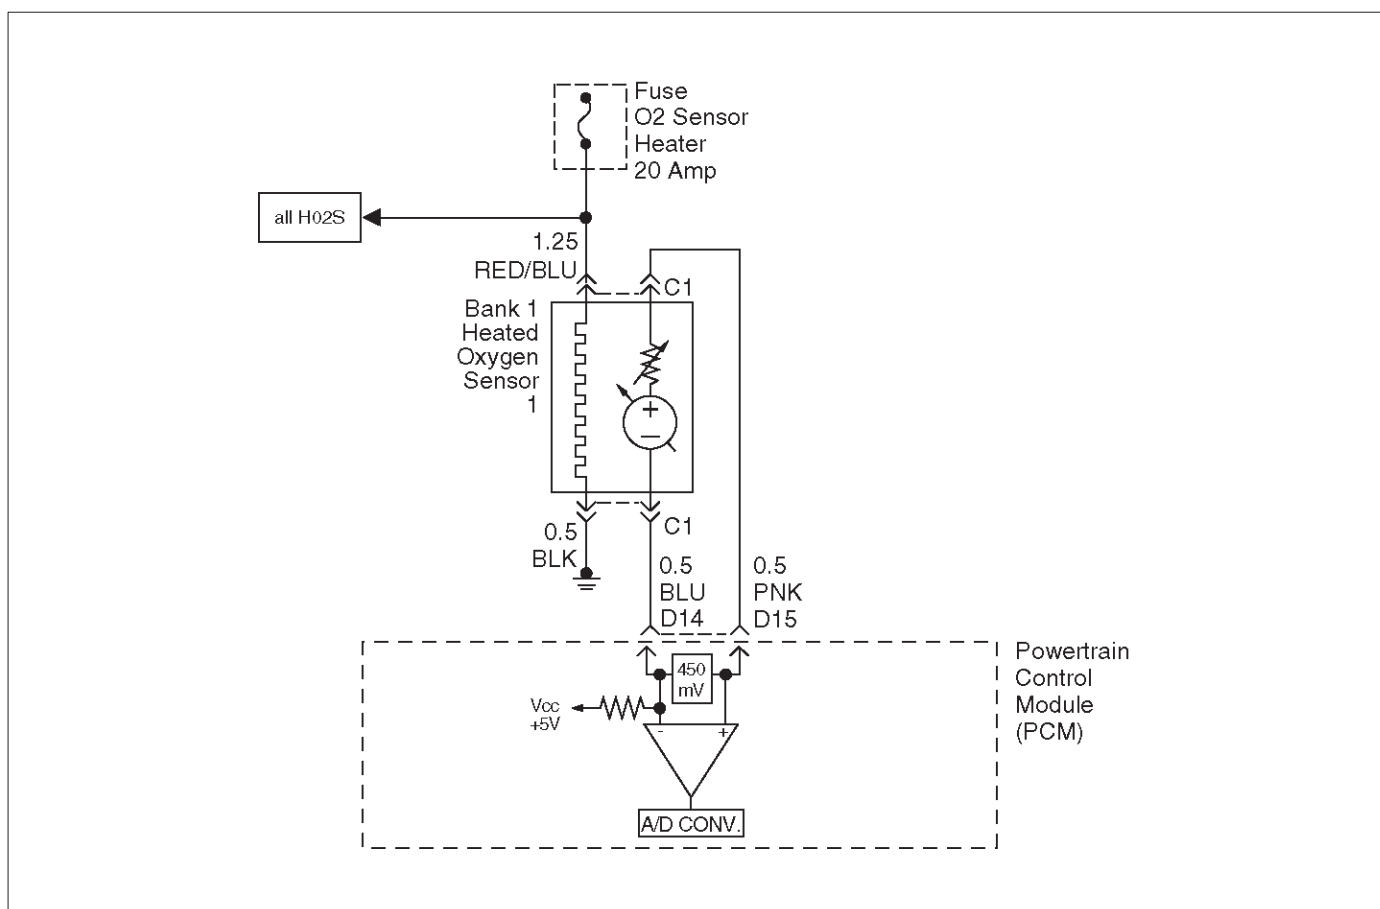

DTC P0171 –Fuel Trim System Lean Bank 1

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	Are any DTCs set other than P0171 and P0174?	—	Go to the applicable DTC charts and repair the other DTCs before proceeding with this chart	Go to <i>Step 3</i>
3	1. Start the engine and operate the vehicle in “closed loop.” 2. Observe the “B1 Long Term Fuel Trim” display on the Tech 2. Is the displayed value greater than the specified value?	L.T. Fuel Trim: +20%	Go to <i>Step 5</i>	Go to <i>Step 4</i>
4	1. Review and record the Tech 2 Failure Records data. 2. Clear the DTC P0171/P0174 and operate the vehicle to duplicate the Failure Records conditions. 3. Monitor the Tech 2 “DTC” info for DTC P0171 while operating the vehicle to duplicate the Failure Records conditions. 4. Continue operating the vehicle until the DTC P0171 test runs and note the test result. Does the Tech 2 indicate DTC P0171 failed this ignition?	—	Go to <i>Step 5</i>	The lean condition is not present. If a driveability symptom still exists, refer to <i>Symptoms</i> section.
5	Was DTC P0174 also set?	—	Go to <i>Step 6</i>	Go to <i>Step 15</i>
6	Visually and physically inspect the vacuum hoses for disconnections, splits, kinks, improper routing and improper connections and repair any problem found. Did your inspection reveal a problem requiring repair?	—	Verify repair	Go to <i>Step 7</i>
7	Visually and physically inspect the crankcase ventilation valve for proper installation and repair any problem found (refer to <i>Crankcase Ventilation System</i>). Did your inspection reveal a problem requiring repair?	—	Verify repair	Go to <i>Step 8</i>
8	1. Inspect the MAF sensor inlet screen for damage or for the presence of foreign objects which may partially block the air flow sample through the MAF sensor. 2. Correct any problem that is found as necessary. Did your inspection of the MAF sensor reveal a condition requiring repair?	—	Verify repair	Go to <i>Step 9</i>
9	Start the engine and note the idle quality. Is a high or unsteady idle being experienced?	—	Go to <i>Step 10</i>	Go to <i>Step 11</i>
10	1. Visually and physically inspect the throttle body, intake manifold, EGR valve and the EGR feed pipe for vacuum leaks. 2. Repair any vacuum leaks as necessary. Did your inspection reveal a vacuum leak?	—	Verify repair	Go to <i>Step 11</i>

DTC P0171 –Fuel Trim System Lean Bank 1 (Cont'd)

Step	Action	Value(s)	Yes	No
11	Check the fuel for excessive water, alcohol, or other contaminants (see <i>Diagnosis in Engine Fuel</i> for the procedure) and correct the contaminated fuel condition if present (see <i>Engine Fuel</i>). Was the fuel contaminated?	—	Verify repair	Go to <i>Step 12</i>
12	1. Visually and physically inspect the PCM injector grounds, power grounds and sensor grounds to ensure that they are clean, tight, and in their proper locations. 2. If a faulty ground condition is present, correct it as necessary. Did your inspection reveal a condition requiring repair?	—	Verify repair	Go to <i>Step 13</i>
13	1. Disconnect the MAF sensor electrical connector. 2. Operate the vehicle in “closed loop” while monitoring the “B1 Long Term Fuel Trim” displayed on the Tech 2. Does “BANK 1 S.T. FUEL TRIM” value decrease to near the specified value?	0%	Go to <i>Step 19</i>	Go to <i>Step 14</i>
14	Perform the procedure in the “Fuel System Pressure Test” and repair fuel system problem if necessary. Did Fuel System Pressure Test isolate a condition requiring repair?	—	Verify repair	Go to <i>Step 15</i>
15	1. Visually and physically inspect the intake manifold, injector O-rings, EGR adapter, EGR valve and the EGR feed pipes for vacuum leaks. 2. Repair any problem that is found. Did your inspection reveal a problem?	—	Verify repair	Go to <i>Step 16</i>
16	Visually and physically inspect the Bank 1 exhaust manifold for leaks and loose or missing hardware and correct any problem found. Did your inspection reveal a problem?	—	Verify repair	Go to <i>Step 17</i>
17	Perform the “Injector Balance Test,” and correct any problem found (refer to <i>Fuel Metering System</i>). Did Injector Balance Test isolate a problem?	—	Verify repair	Go to <i>Step 18</i>
18	1. Visually and physically inspect the Bank 1 HO2S 1 to ensure that it is installed securely and that the Bank 1 HO2S 1 pigtail and wiring harness are not contacting the exhaust or otherwise damaged. 2. If a problem is found, correct it as necessary. Did your inspection reveal a problem?	—	Verify repair	Refer to <i>Diagnostic Aids</i>
19	Replace the MAF sensor. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0172 Fuel Trim System Rich Bank 1

D06RW068

Circuit Description

To provide the best possible combination of driveability, fuel economy, and emission control, a “closed loop” air/fuel metering system is used. While in “closed loop,” the powertrain control module (PCM) monitors the Bank 1 heated oxygen sensors (HO2S) 1 and Bank 2 HO2S 1 signals and adjusts fuel delivery based upon the HO2S signal voltages. A change made to fuel delivery will be indicated by the long and short term fuel trim values which can be monitored with a Tech 2. Ideal fuel trim values are around 0%; if the HO2S signals are indicating a lean condition the PCM will add fuel, resulting in fuel trim values above 0%. If a rich condition is detected, the fuel trim values will be below 0%, indicating that the PCM is reducing the amount of fuel delivered. If an excessively rich condition is detected on Bank 1, the PCM will set DTC P0172.

The PCM's maximum authority to control long term fuel trim allows a range between -15% (automatic transmission) or -12 (manual transmission) and +20%. The PCM's maximum authority to control short term fuel trim allows a range between -11% and +20%. The PCM monitors fuel trim under various engine speed/load fuel trim cells before determining the status of the fuel trim diagnostic.

Conditions for Setting the DTC

- No Tech 2 test is being run.

- None of the following was set: EGR DTCs, HO2S DTCs, (response, transition, open, low volts, no activity), MAF DTCs, TPS DTCs, MAP DTCs, IAT DTCs, canister purge DTCs, EVAP DTCs, injector circuit DTCs, or misfire DTCs.
- Engine coolant temperature is between 25°C (77°F) and 100°C (212°F).
- Intake air temperature is between -40°C (-40°F) and 120°C (248°F).
- Manifold absolute pressure is between 24 kPa and 99 kPa.
- Throttle angle is steady below 95%.
- Vehicle speed is below 136 km/h (85 mph).
- Engine speed is between 400 and 6000 RPM.
- Barometric pressure is greater than 72.5 kPa.
- Mass air flow (MAF) is between 2 g/second and 200 g/second.
- Ignition voltage is above 9.5 volts.
- Fuel system is in “closed loop.”
- Canister purge duty cycle is greater than 0%, if “ON.”

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0172 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0172 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the Bank 1 HO2S 1 display on the Tech 2 while moving connectors and wiring harnesses related to the engine harness. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. DTCs other than P0172 and P0175 may indicate a condition present which may cause a lean condition. If this is the case, repairing the condition which caused the other DTC will most likely correct the DTC P0172/P0175.
4. If the DTC P0172 test passes while the Failure Records conditions are being duplicated, the rich condition is intermittent. Refer to *Diagnostic Aids* or *Symptoms* for additional information on diagnosing intermittent problems.

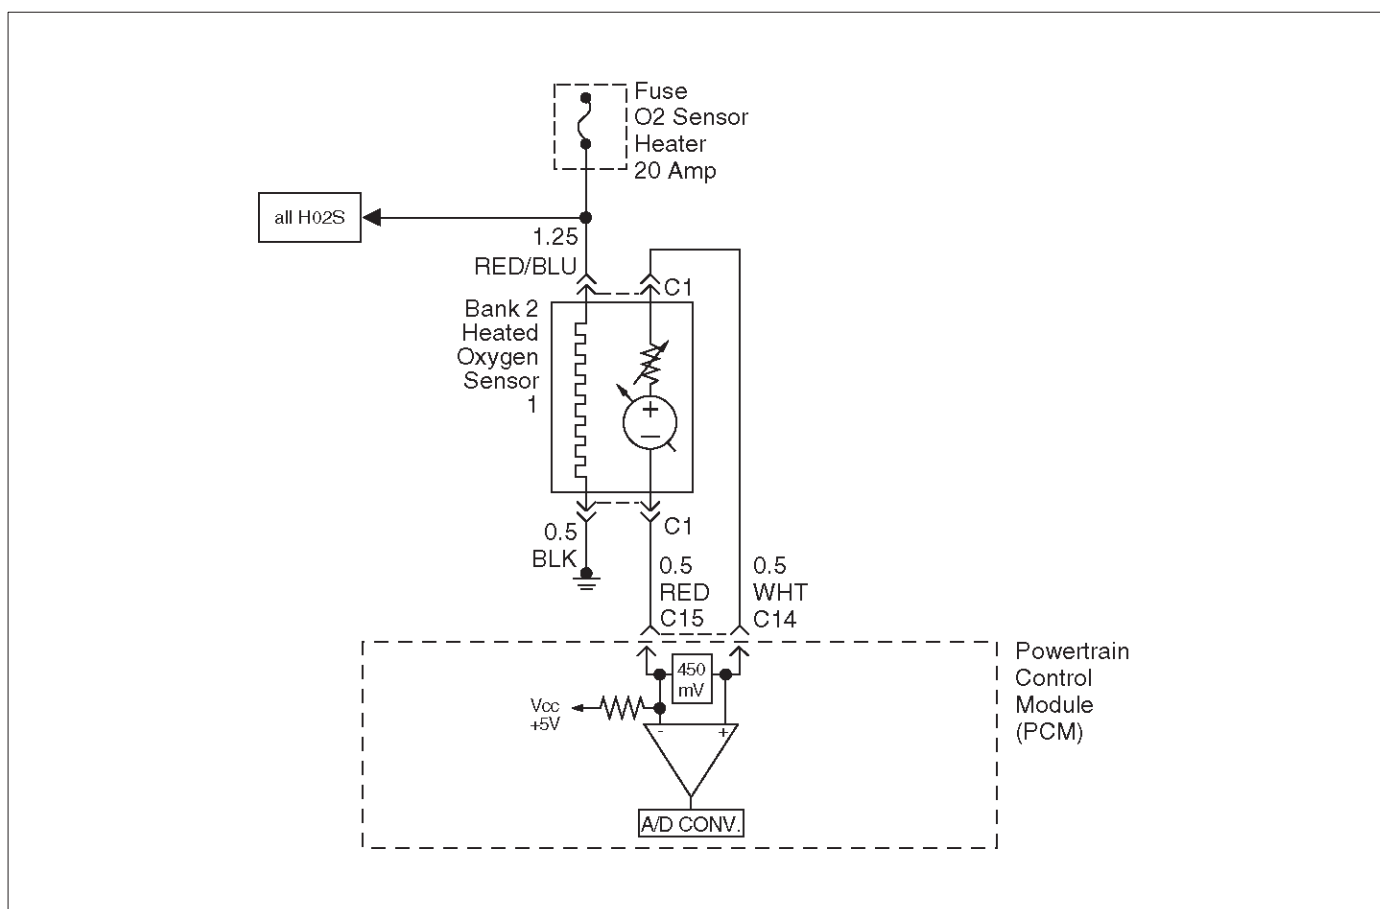

DTC P0172 – Fuel Trim System Rich Bank 1

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	Are any DTCs set other than P0172 and P0175?	—	Go to the applicable DTC charts and repair the other DTCs before proceeding with this chart	Go to <i>Step 3</i>
3	1. Start the engine and operate the vehicle in “closed loop.” 2. Observe “B1 Long Term Fuel Trim” display on the Tech 2. Is the displayed value more negative than the specified value?	L.T. Fuel Trim: –15% (auto. trans.) OR –12% (man. trans.)	Go to <i>Step 5</i>	Go to <i>Step 4</i>
4	1. Review and record the Tech 2 Failure Records data. 2. Clear the DTC P0172/P0175 and operate the vehicle to duplicate the Failure Records conditions. 3. Monitor the Tech 2 “DTC” info for DTC P0172 while operating the vehicle to duplicate the Failure Records conditions. 4. Continue operating the vehicle until the DTC P0172 test runs and note test result. Does the Tech 2 indicate DTC P0172 failed this ignition?	—	Go to <i>Step 5</i>	The rich condition is not present. If a driveability symptom still exists, refer to <i>Symptoms</i> .
5	Is DTC P0175 also set?	—	Go to <i>Step 6</i>	Go to <i>Step 15</i>
6	Visually and physically inspect the air filter element and replace it if necessary. Did the air filter require replacement?	—	Verify repair	Go to <i>Step 7</i>
7	Visually and physically inspect the air intake duct for collapse or restriction and repair if necessary. Did your inspection reveal a condition requiring repair?	—	Verify repair	Go to <i>Step 8</i>
8	Inspect the MAF sensor inlet screen for damage or for the presence of foreign objects which may partially block air flow through the screen and correct any problem found. Did your inspection of the MAF sensor reveal a condition requiring repair or replacement?	—	Verify repair	Go to <i>Step 9</i>
9	Start the engine and note the idle quality. Is a low or unsteady idle being experienced?	—	Go to <i>Step 10</i>	Go to <i>Step 11</i>
10	1. Ignition “OFF.” 2. Physically inspect the throttle body bore, throttle plate, and IAC passages for coking and foreign objects. 3. If a problem was found, repair as necessary. Did your inspection reveal a condition requiring repair?	—	Verify repair	Go to <i>Step 11</i>

DTC P0172 – Fuel Trim System Rich Bank 1 (Cont'd)

Step	Action	Value(s)	Yes	No
11	1. Disconnect the vacuum hose from the fuel pressure regulator and inspect the hose for the presence of fuel. 2. If fuel is present in the vacuum hose, replace the fuel pressure regulator (refer to <i>Fuel Metering System</i>). Did the fuel pressure regulator require replacement?	—	Verify repair	Go to <i>Step 12</i>
12	Ignition "ON," engine "OFF," monitor the TP display on the Tech 2 while slowly depressing the accelerator pedal. Does the TP Angle display increase steadily and evenly from minimum value at closed throttle to maximum value at wide-open throttle?	Minimum 0% Maximum 100%	Go to <i>Step 13</i>	Go to <i>Step 20</i>
13	1. Disconnect the MAF sensor electrical connector. 2. Operate the vehicle in "closed loop" while monitoring the "B1 Long Term Fuel Trim" and "B1 Short Term Fuel Trim" display on the Tech 2. Did both values change to near the specified value?	0%	Go to <i>Step 21</i>	Go to <i>Step 14</i>
14	1. Ignition "ON," engine "OFF." 2. Connect a test light between the harness connector terminals of canister purge solenoid. Is the test light on?	—	Go to <i>Step 15</i>	Go to <i>Step 18</i>
15	Check for short to ground in the wire (red/blue) between the canister purge solenoid and PCM terminal A-15. Was there a short to ground?	—	Go to <i>Step 16</i>	Go to <i>Step 17</i>
16	Repair the short to ground. Is the action complete?	—	Verify repair	—
17	Replace the PCM. Is the action complete?	—	Verify repair	—
18	1. Perform the "Injector Balance Test." 2. If Injector Balance Test isolates a problem, repair as necessary (refer to <i>Fuel Metering System</i>). Did the Injector Balance Test isolate a problem requiring repair?	—	Verify repair	Go to <i>Step 19</i>
19	1. Remove and visually/physically inspect the Bank 1 HO2S 1 for silicon contamination. This will be indicated by a powdery white deposit on the portion of the HO2S that is exposed to the exhaust stream. 2. If contamination is evident on the Bank 1 HO2S 1, replace the contaminated sensors. Did the sensor require replacement?	—	Verify repair	Refer to <i>Diagnostic Aids</i>
20	1. Check the TP sensor mounting screws and tighten or replace them as necessary if they are loose or missing. 2. If the screws are OK, replace the TP sensor. Is the action complete?	—	Verify repair	—
21	Replace the MAF sensor. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0174 Fuel Trim System Lean Bank 2

Circuit Description

To provide the best possible combination of driveability, fuel economy, and emission control, a “closed loop” air/fuel metering system is used. While in “closed loop,” the powertrain control module (PCM) monitors the Bank 1 HO₂S 1 and Bank 2 HO₂S 1 signals and adjusts fuel delivery based upon the HO₂S signal voltages. A change made to fuel delivery will be indicated by the long and short term fuel trim values which can be monitored with a Tech 2. Ideal fuel trim values are around 0%; if the HO₂S signals are indicating a lean condition the PCM will add fuel, resulting in fuel trim values above 0%. If a rich condition is detected, the fuel trim values will be below 0%, indicating that the PCM is reducing the amount of fuel delivered. If an excessively lean condition is detected on Bank 2, the PCM will set DTC P0174.

The PCM's maximum authority to control long term fuel trim allows a range between -15% (automatic transmission) or -12% (manual transmission) and +20%. The PCM monitors fuel trim under various engine speed/load fuel trim cells before determining the status of the fuel trim diagnostic.

Conditions for Setting the DTC

- No Tech 2 test is being run.
- None of the following DTCs are set: idle system, EGR, HO₂S, (response, transition, open, low volts, no activity), MAF, TP sensor, MAP, IAT, canister purge, EVAP, injector circuit, or misfire.

- Engine coolant temperature is between 25°C (77°F) and 100°C (212°F).
- Intake air temperature is between -40°C (-40°F) and 120°C (248°F).
- Manifold absolute pressure is between 24 kPa and 99 kPa.
- Throttle angle is steady below 95%.
- Vehicle speed is below 136 km/h (85 mph).
- Engine speed is between 400 and 6000 RPM.
- Barometric pressure is greater than 72.5 kPa.
- Mass air flow is between 2 g/second and 200 g/second.
- Ignition voltage is above 9.5 volts.
- Fuel system is in “closed loop.”
- Canister purge duty cycle is greater than 15%, if “ON.”

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the failure is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0174 will clear after 40 consecutive warm-up cycles have occurred without a fault.

- DTC P0174 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the Bank 2 HO2S 1 display on the Tech 2 while moving connectors and wiring harnesses related to the engine harness. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. DTCs other than P0171 and P0174 may indicate a condition present which may cause a lean condition. If this is the case, repairing the condition which caused the other DTC will most likely correct the DTC P0171/P0174.
4. If the DTC P0174 test passes while the Failure Records conditions are being duplicated, the lean condition is intermittent. Refer to *Diagnostic Aids* or *Symptoms* for additional information on diagnosing intermittent problems.

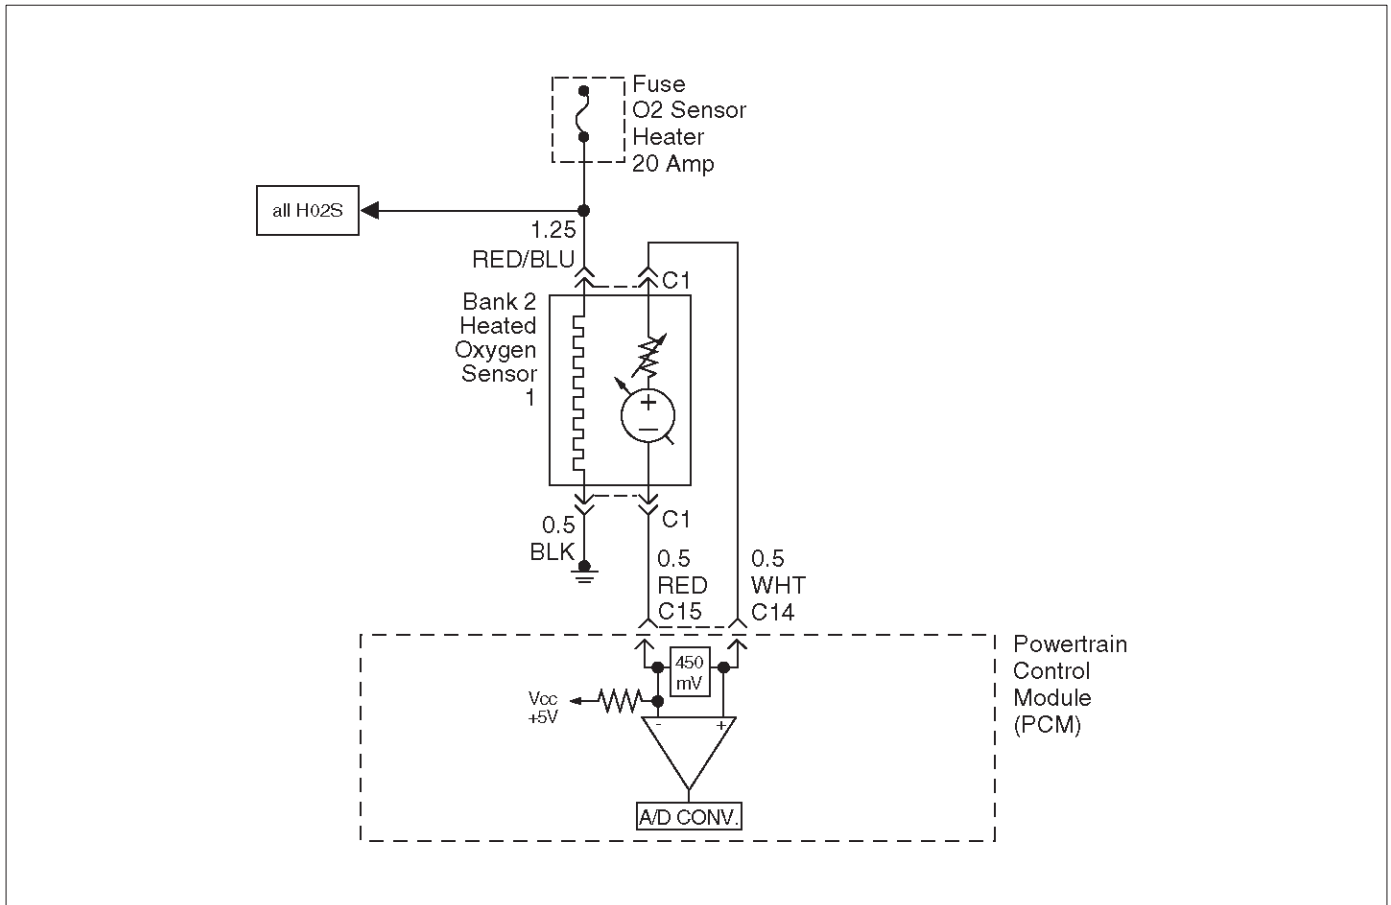

DTC P0174 – Fuel Trim System Lean Bank 2

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	Are any DTCs set other than P0174 and P0171?	—	Go to the applicable DTC charts and repair the other DTCs before proceeding with this chart.	Go to <i>Step 3</i>
3	1. Start the engine and operate the vehicle in “closed loop.” 2. Observe the “B2 Long Term Fuel Trim” display on the Tech 2. Is the displayed values greater than the specified values?	L.T. Fuel Trim: +20%	Go to <i>Step 5</i>	Go to <i>Step 4</i>
4	1. Review and record Tech 2 Failure Records data. 2. Clear the DTC P0171/P0174 and operate the vehicle to duplicate the Failure Records conditions. 3. Monitor the Tech 2 “DTC” info for DTC P0174 while operating the vehicle to duplicate the Failure Records conditions. 4. Continue operating the vehicle until the DTC P0174 test runs. 5. Note the test result. Does the Tech 2 indicate DTC P0174 failed this ignition?	—	Go to <i>Step 5</i>	The lean condition is not present. If a driveability symptom still exists, refer to <i>Symptoms</i> section.
5	Was DTC P0171 also set?	—	Go to <i>Step 6</i>	Go to <i>Step 15</i>
6	Visually and physically inspect the vacuum hoses for disconnects, splits, kinks, improper routing and improper disconnections and repair any problem found. Did your inspection reveal a problem requiring repair?	—	Verify repair	Go to <i>Step 7</i>
7	Visually and physically inspect the crankcase ventilation valve for proper installation and repair any problem found (refer to <i>Crankcase Ventilation System</i>). Did your inspection reveal a problem requiring repair?	—	Verify repair	Go to <i>Step 8</i>
8	1. Inspect the MAF sensor inlet screen for damage or for the presence of foreign objects which may partially block the air flow sample through the MAF sensor. 2. Correct any problem that is found as necessary. Did your inspection of the MAF sensor reveal a condition requiring repair?	—	Verify repair	Go to <i>Step 9</i>
9	Start the engine and note the idle quality. Is a high or unsteady idle being experienced?	—	Go to <i>Step 10</i>	Go to <i>Step 11</i>

DTC P0174 – Fuel Trim System Lean Bank 2 (Cont'd)

Step	Action	Value(s)	Yes	No
10	1. Visually and physically inspect the throttle body, intake manifold, EGR valve and the EGR feed pipe for vacuum leaks. 2. Repair any vacuum leaks as necessary. Did your inspection reveal a vacuum leak?	—	Verify repair	Go to Step 11
11	Check the fuel for excessive water, alcohol, or other contaminants (see <i>Diagnosis in Engine Fuel</i> for procedure) and correct the contaminated fuel condition if present (see <i>Engine Fuel</i>). Was the fuel contaminated?	—	Verify repair	Go to Step 12
12	1. Visually and physically inspect the PCM injector grounds, power grounds and sensor grounds to ensure that they are clean, tight, and in their proper locations. 2. If a faulty ground condition is present, correct it as necessary. Did your inspection reveal a condition requiring repair?	—	Verify repair	Go to Step 13
13	1. Disconnect the MAF sensor electrical connector. 2. Operate the vehicle in “closed loop” while monitoring the “B2 Short Term Fuel Trim” displayed on the Tech 2. Does the “B2 Short Term Fuel Trim” value decrease to near the specified value?	0%	Go to Step 19	Go to Step 14
14	Perform the procedure in the “Fuel System Pressure Test” and repair fuel system problem if necessary. Did the Fuel System Pressure Test isolate a condition requiring repair?	—	Verify repair	Go to Step 15
15	1. Visually and physically inspect the intake manifold, injector O-rings, EGR adapter, EGR valve and the EGR feed pipes for vacuum leaks. 2. Repair any problem that is found. Did your inspection reveal a problem?	—	Verify repair	Go to Step 16
16	Visually and physically inspect the Bank 2 exhaust manifold for leaks and loose or missing hardware and correct any problem found. Did your inspection reveal a problem?	—	Verify repair	Go to Step 17
17	Perform the “Injector Balance Test,” and correct any problem found (refer to <i>Fuel Metering System</i>). Did the Injector Balance Test isolate a problem?	—	Verify repair	Go to Step 18
18	1. Visually and physically inspect the Bank 2 HO2S 1 to ensure that it is installed securely and that the Bank 2 HO2S 1 pigtail and wiring harness are not contacting the exhaust or otherwise damaged. 2. If a problem is found, correct it as necessary. Did your inspection reveal a problem?	—	Verify repair	Refer to Diagnostic Aids
19	Replace the MAF sensor. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0175 Fuel Trim System Rich Bank 2

Circuit Description

To provide the best possible combination of driveability, fuel economy, and emission control, a “closed loop” air/fuel metering system is used. While in “closed loop,” the powertrain control module (PCM) monitors the Bank 1 HO₂S 1 and Bank 2 HO₂S 1 signals and adjusts fuel delivery based upon the HO₂S signal voltages. A change made to fuel delivery will be indicated by the long and short term fuel trim values which can be monitored with a Tech 2. Ideal fuel trim values are around 0%; if the HO₂S signals are indicating a lean condition the PCM will add fuel, resulting in fuel trim values above 0%. If a rich condition is detected, the fuel trim values will be below 0%, indicating that the PCM is reducing the amount of fuel delivered. If an excessively rich condition is detected on Bank 2, the PCM will set DTC P0175.

The PCM's maximum authority to control long term fuel trim allows a range between -15% (automatic transmission) or -12% (manual transmission) and +20%. The PCM's maximum authority to control short term fuel trim allows a range between -11% and +20%. The PCM monitors fuel trim under various engine speed/load fuel trim cells before determining the status of the fuel trim diagnostic.

Conditions for Setting the DTC

- No Tech 2 test is being run.
- None of the following DTCs are set: idle system, EGR, HO₂S, (response, transition, open, low volts, no

activity), MAF, TPS, MAP, IAT, canister purge, EVAP, injector circuit, or misfire.

- Engine coolant temperature is between 25 °C (77 °F) and 100 °C (212 °F).
- Intake air temperature is between -40 °C (-40 °F) and 120 °C (248 °F).
- Manifold absolute pressure is between 24 kPa and 99 kPa.
- Throttle angle is steady below 95%.
- Vehicle speed is below 136 km/h (85 mph).
- Engine speed is between 400 and 6000 RPM.
- Barometric pressure is greater than 72.5 kPa.
- Mass air flow (MAF) is between 2 g/second and 200 g/second.
- Ignition voltage is above 9.5 volts.
- Fuel system is in “closed loop.”
- Canister purge duty cycle is greater than 15%, if “ON.”

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the failure is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.

6E2-164 6VD1 3.2L ENGINE DRIVEABILITY AND EMISSIONS

- A history DTC P0175 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0175 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the Bank 2 HO2S 1 display on the Tech 2 while moving connectors and wiring harnesses related to the engine harness. A change in the display will indicate the location of the fault.

Reviewing the Failure Records Vehicle mileage since the diagnostic test last failed may help determine how often

the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. DTCs other than P0172 and P0175 may indicate a condition present which may cause a lean condition. If this is the case, repairing the condition which caused the other DTC will most likely correct the DTC P0172/P0175.
4. If the DTC P0175 test passes while the Failure Records conditions are being duplicated, the rich condition is intermittent. Refer to *Diagnostic Aids* or *Symptoms* for additional information on diagnosing intermittent problems.

DTC P0175 – Fuel Trim System Rich Bank 2

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Are any DTCs set other than P0172 and P0175?	—	Go to the applicable DTC charts and repair the other DTCs before proceeding with this chart.	Go to <i>Step 3</i>
3	1. Start the engine and operate the vehicle in "closed loop." 2. Observe the "BANK 2 L.T. FUEL TRIM" display on the Tech 2. Is the displayed value more negative than the specified value?	L.T. Fuel Trim: -15% (auto. trans.) OR -12% (man. trans.)	Go to <i>Step 5</i>	Go to <i>Step 4</i>
4	1. Review and record the Tech 2 Failure Records data. 2. Clear the DTC P0172/P0175 and operate the vehicle to duplicate the Failure Records conditions. 3. Monitor the Tech 2 "DTC" info for DTC P0175 while operating the vehicle to duplicate the Failure Records conditions. 4. Continue operating the vehicle until the DTC P0175 test runs. 5. Note the test result. Does the Tech 2 indicate DTC P0175 failed this ignition?	—	Go to <i>Step 5</i>	The rich condition is not present. If a driveability symptom still exists, refer to <i>Symptoms</i>
5	Was DTC P0172 also set?	—	Go to <i>Step 6</i>	Go to <i>Step 15</i>
6	Visually and physically inspect the air filter element and replace it if necessary. Did the air filter require replacement?	—	Verify repair	Go to <i>Step 7</i>

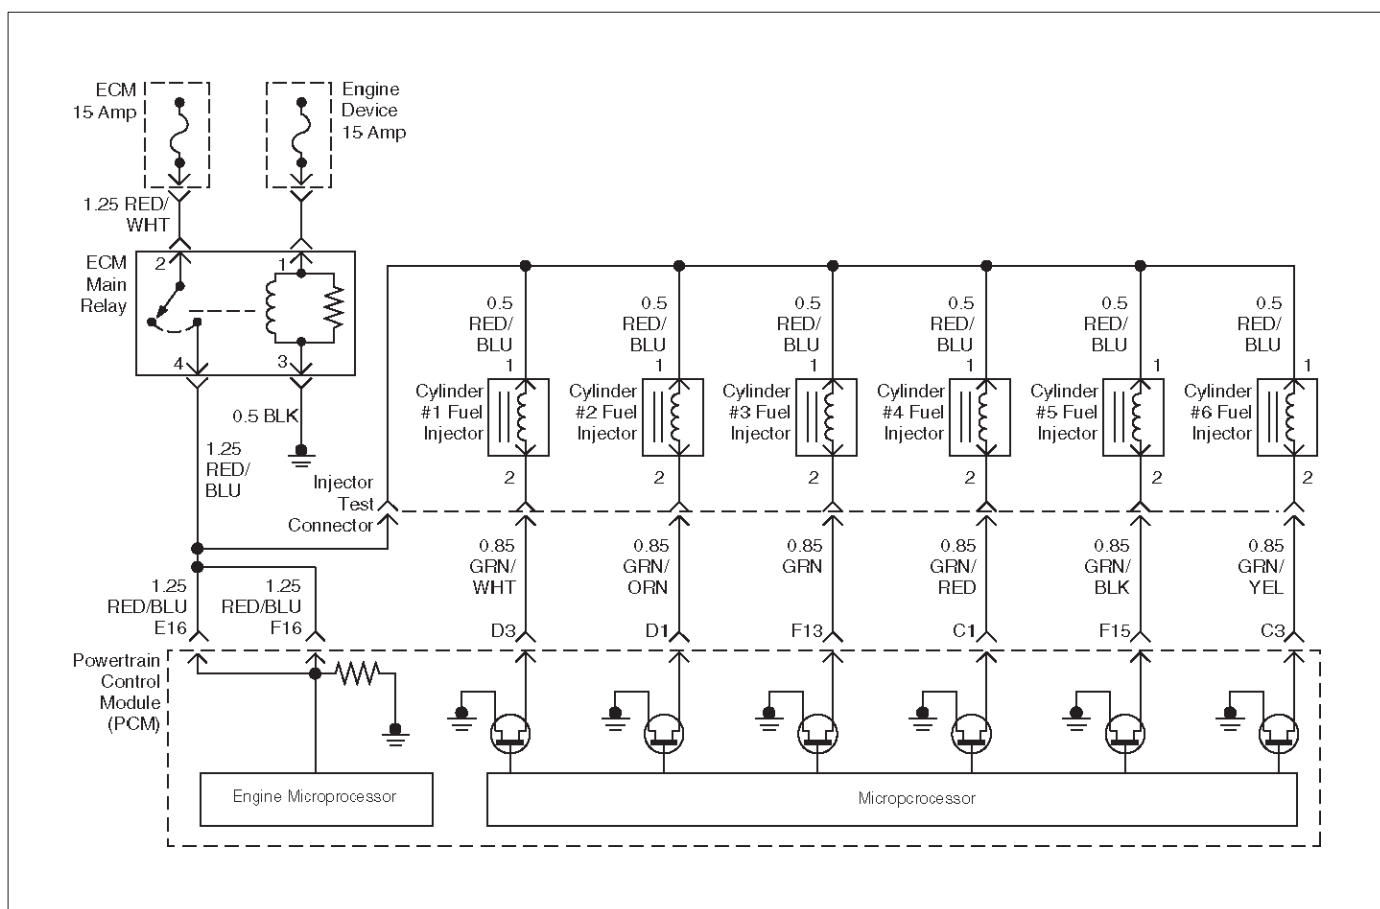

DTC P0175 – Fuel Trim System Rich Bank 2 (Cont'd)

Step	Action	Value(s)	Yes	No
7	Visually and physically inspect the air intake duct for collapse or restriction and repair if necessary. Did your inspection reveal a problem requiring repair?	—	Verify repair	Go to <i>Step 8</i>
8	Inspect the MAF sensor inlet screen for damage or for the presence of foreign objects which may partially block air flow through the screen and correct any problem found. Did your inspection of the MAF sensor reveal a condition requiring repair or replacement?	—	Verify repair	Go to <i>Step 9</i>
9	Start the engine and note the idle quality. Is a low or unsteady idle being experienced?	—	Go to <i>Step 10</i>	Go to <i>Step 11</i>
10	1. Turn the ignition off and physically inspect the throttle body bore, throttle plate, and IAC passages for coking and foreign objects. 2. If a problem was found, repair as necessary. Did your inspection reveal a condition requiring repair?	—	Verify repair	Go to <i>Step 11</i>
11	1. Disconnect the vacuum hose from the fuel pressure regulator and inspect the hose for the presence of fuel. 2. If fuel is present in the vacuum hose, replace the fuel pressure regulator (refer to <i>Fuel Metering System</i>). Did the fuel pressure regulator require replacement?	—	Verify repair	Go to <i>Step 12</i>
12	1. Ignition "ON," engine "OFF." 2. Monitor the TP Angle display on the Tech 2 while slowly depressing the accelerator pedal. Does the TP Angle display increase steadily and evenly from minimum value at closed throttle to maximum value at wide-open throttle?	Minimum 0% Maximum 100%	Go to <i>Step 13</i>	Go to <i>Step 21</i>
13	1. Disconnect the MAF sensor electrical connector. 2. Operate the vehicle in "closed loop" while monitoring the "B1 Long Term Fuel Trim" and "BANK 2 S.T. FUEL TRIM" display on the Tech 2. Did both values change to near the specified value?	0%	Go to <i>Step 22</i>	Go to <i>Step 14</i>
14	1. Ignition "ON," engine "OFF." 2. Connect a test light between the harness connector terminals of canister purge solenoid. Is the test light on?	—	Go to <i>Step 15</i>	Go to <i>Step 18</i>
15	Check for short to ground in the wire (red/blue) between the canister purge solenoid and PCM terminal A-15. Was there a short to ground?	—	Go to <i>Step 16</i>	Go to <i>Step 17</i>
16	Repair the short to ground. Is the action complete?	—	Verify repair	—
17	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0201 Injector 1 Control Circuit

D06RW070

Circuit Description

The powertrain control module (PCM) has six individual injector driver circuits. Each controls an injector. When a driver circuit is grounded by the PCM, the injector is activated. The PCM monitors the current in each driver circuit. The voltage on each driver is monitored to detect a fault. If the voltage is not what the PCM expects to monitor on the circuit, a DTC is set. This DTC is also set if an injector driver is shorted to voltage or if there is an open circuit.

Conditions for Setting the DTC

- The battery voltage is more than 9 volts.
- The engine is turning, determined by 58X crankshaft position input signal.
- The injector voltage does not equal the ignition voltage when the injector is commanded "OFF" or the injector voltage does not equal 0 volts when the injector is commanded "ON."
- The above conditions are met for 5 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn "OFF" the MIL on the third consecutive trip cycle in which the diagnostic has been run and the fault is no longer present.
- A history DTC P0201 will clear after 40 consecutive warm-up cycles occur without a fault.
- DTC P0201 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

An injector driver circuit that is open or shorted to voltage will cause a DTC P0201 to set. It will also cause a misfire due to an inoperative injector. A misfire DTC will also be set indicating which cylinder is inoperative. Long term and short term fuel trims that are excessively high or low are a good indication that an injector is faulty. Use Fuel Injector Coil Test Procedure to check for faulty injectors.

Test Description

The number(s) below refer to the step number(s) on the Diagnostic Chart.

3. This step determines if DTC P0201 is the result of a hard failure or an intermittent condition.

6E2-168 6VD1 3.2L ENGINE DRIVEABILITY AND EMISSIONS

5. A special injector test connector is provided so that the injectors can be electrically tested without removal of the manifold. The test connector can be identified by the blue connector lock which is tethered to the wiring harness. If the light for cylinder 1 is "ON" steady before cranking the engine as well as while cranking the engine, then the injector driver circuit is shorted to ground.

If the test light blinks while cranking, the PCM and the wiring to the injectors are OK. The Fuel Injector Coil Test Procedure will check if the injectors are faulty.

7. Because the test light was "ON" steady, voltage to the injector is OK, but the driver circuit is grounded at all times. This step determines if the circuit is shorted to ground or the PCM is faulty.

9. The reading should be about 12-14Ω.

10. Locating the open in the harness or in the injector will require removal of the manifold to provide access.

R321054

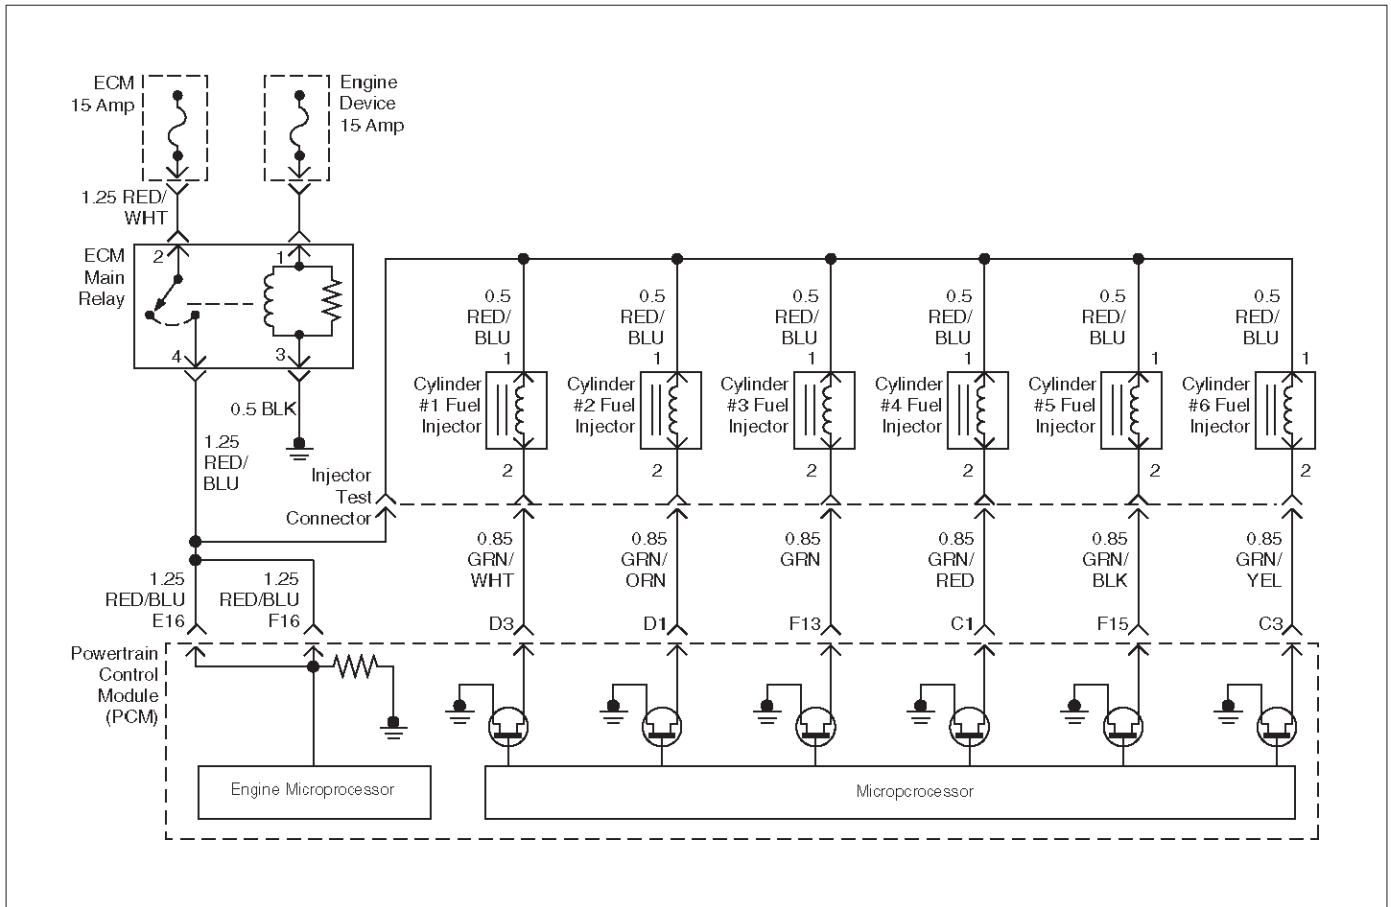

DTC P0201 – Injector 1 Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Will the engine start?	—	Go to Step 3	Go to <i>Engine Cranks But Will Not Run</i> chart
3	1. Install the Tech 2. Clear the DTC. 2. Idle the engine for one minute. Does DTC P0201 reset?	—	Go to Step 5	Go to Step 4
4	1. Review the Freeze Frame data with the ignition "ON" and the engine "OFF" and note the parameters. 2. Operate the vehicle within the Freeze Frame conditions as noted. Does P0201 reset?	—	Go to Step 5	Go to <i>Diagnostic Aids</i>

DTC P0201 – Injector 1 Control Circuit (Cont'd)

Step	Action	Value(s)	Yes	No
5	1. Engine "OFF." 2. Disconnect the injector connector. 3. Install an injector test light 5-8840-2636-0 on the injector test connector. 4. Crank the engine and note the light. Does the injector test light blink?	—	Go to <i>Fuel Injector Coil Test Procedure</i>	Go to <i>Step 6</i>

9	1. Disconnect the injector test connector. 2. At the injector side of the harness, connect an ohmmeter between the positive wire (red with blue tracer) and the wire for cylinder 1 (green with white tracer). Does the ohmmeter indicate continuity?	—	Go to <i>Step 11</i>	Go to <i>Step 10</i>
10	Repair the open injector harness wire or open injector. Is the action complete?	—	Verify repair	—
11	At the PCM side of the injector test connector, check the green/white wire for a short to voltage. Was there a short to voltage?	—	Go to <i>Step 12</i>	Go to <i>Step 13</i>
12	Repair the short to voltage. Is the action complete?	—	Verify repair	—
13	Check for an open circuit between the injector test connector and the PCM. Was there an open circuit?	—	Go to <i>Step 14</i>	Go to <i>Step 15</i>
14	Repair the open circuit. Is the action complete?	—	Verify repair	—
15	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0202 Injector 2 Control Circuit

D06RW070

Circuit Description

The powertrain control module (PCM) has six individual injector driver circuits. Each controls an injector. When a driver circuit is grounded by the PCM, the injector is activated. The PCM monitors the current in each driver circuit. The voltage on each driver is monitored to detect a fault. If the voltage is not what the PCM expects to monitor on the circuit, a DTC is set. This DTC is also set if an injector driver is shorted to voltage or if there is an open circuit.

Conditions for Setting the DTC

- The battery voltage is more than 9 volts.
- The engine is turning, determined by 58X crankshaft position input signal.
- The injector voltage does not equal the ignition voltage when the injector is commanded "OFF" or the injector voltage does not equal 0 volts when the injector is commanded "ON."
- The above conditions are met for 5 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn "OFF" the MIL on the third consecutive trip cycle in which the diagnostic has been run and the fault is no longer present.
- A history DTC P0202 will clear after 40 consecutive warm-up cycles occur without a fault.
- DTC P0202 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

An injector driver circuit that is open or shorted to voltage will cause a DTC P0202 to set. It will also cause a misfire due to an inoperative injector. A misfire DTC will also be set indicating which cylinder is inoperative. Long term and short term fuel trims that are excessively high or low are a good indication that an injector is faulty. Use Fuel Injector Coil Test Procedure to check for faulty injectors.

Test Description

The number(s) below refer to the step number(s) on the Diagnostic Chart.

3. This step determines if DTC P0202 is the result of a hard failure or an intermittent condition.

5. A special injector test connector is provided so that the injectors can be electrically tested without removal of the manifold. The test connector can be identified by the blue connector lock which is tethered to the wiring harness. If the light for cylinder 2 is "ON" steady before cranking the engine as well as while cranking the engine, then the injector driver circuit is shorted to ground.

If the test light blinks while cranking, the PCM and the wiring to the injectors are OK. Fuel Injector Coil Test Procedure will check if the injectors are faulty.

7. Because the test light was "ON" steady, voltage to the injector is OK, but the driver circuit is grounded at all times. This step determines if the circuit is shorted to ground or the PCM is faulty.

9. The reading should be about 12-14Ω.

10. Locating the open in the harness or in the injector will require removal of the manifold to provide access.

R321055

DTC P0202 – Injector 2 Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Will the engine start?	—	Go to Step 3	Go to <i>Engine Cranks But Will Not Run</i> chart
3	1. Install the Tech 2. Clear the DTC. 2. Idle the engine for one minute. Does DTC P0202 reset?	—	Go to Step 5	Go to Step 4
4	1. Review the Freeze Frame data with the ignition "ON" and the engine "OFF" and note the parameters. 2. Operate the vehicle within the Freeze Frame conditions as noted. Does P0202 reset?	—	Go to Step 5	Go to <i>Diagnostic Aids</i>

DTC P0202 – Injector 2 Control Circuit (Cont'd)

Step	Action	Value(s)	Yes	No
5	1. Engine "OFF." 2. Disconnect the injector test connector. 3. Install an injector test light 5-8840-2636-0 on injector test connector 4. Crank the engine and note the light. Does the cylinder 2 test light blink?	—	Go to <i>Fuel Injector Coil Test Procedure</i>	Go to <i>Step 6</i>
6	Note whether the injector test light for cylinder 2 was "OFF" or "ON" steady in step 5. Was the test light "ON" steady while cranking the engine?	—	Go to <i>Step 7</i>	Go to <i>Step 9</i>
7	1. Disconnect the PCM connector for the affected injectors. 2. With a test light connected to B+, probe the affected injector driver circuit. Does the test light illuminate?	—	Go to <i>Step 8</i>	Go to <i>Step 15</i>
8	Repair short to ground in the injector driver circuit. Is the action complete?	—	Go to <i>OBD System Check</i>	—
9	1. Disconnect the injector test connector. 2. At the injector side of the harness, connect an ohmmeter between the positive wire (red with blue tracer) and the wire for cylinder 2 (green with orange tracer). Does the ohmmeter indicate continuity?	—	Go to <i>Step 11</i>	Go to <i>Step 10</i>
10	Repair the open injector harness wire or open injector. Is the action complete?	—	Verify repair	—
11	At the PCM side of the injector test connector, check the green/orange wire for a short to voltage. Was there a short to voltage?	—	Go to <i>Step 12</i>	Go to <i>Step 13</i>
12	Repair the short to voltage. Is the action complete?	—	Verify repair	—
13	Check for an open circuit between the injector test connector and the PCM. Was there an open circuit?	—	Go to <i>Step 14</i>	Go to <i>Step 15</i>
14	Repair the open circuit. Is the action complete?	—	Verify repair	—
15	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0203 Injector 3 Control Circuit

D06RW070

Circuit Description

The powertrain control module (PCM) has six individual injector driver circuits. Each controls an injector. When the driver circuit is grounded by the PCM, the injector is activated. The PCM monitors the current in each driver circuit. The voltage on each driver is monitored to detect a fault. If the voltage is not what the PCM expects to monitor on the circuit, a DTC is set. This DTC is also set if an injector driver is shorted to voltage or if there is an open circuit.

Conditions for Setting the DTC

- The battery voltage is more than 9 volts.
- The engine is turning, determined by the 58X crankshaft position input signal.
- The injector voltage does not equal the ignition voltage when the injector is commanded "OFF" or the injector voltage does not equal 0 volts when the injector is commanded "ON."
- The above conditions are met for 5 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn "OFF" the MIL on the third consecutive trip cycle in which the diagnostic has been run and the fault is no longer present.
- A history DTC P0203 will clear after 40 consecutive warm-up cycles occur without a fault.
- DTC P0203 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

An injector driver circuit that is open or shorted to voltage will cause a DTC P0203 to set. It will also cause a misfire due to an inoperative injector. A misfire DTC will also be set indicating which cylinder is inoperative. Long term and short term fuel trims that are excessively high or low are a good indication that an injector is faulty. Use Fuel Injector Coil Test Procedure to check for faulty injectors.

Test Description

The number(s) below refer to the step number(s) on the Diagnostic Chart.

3. This step determines if DTC P0203 is the result of a hard failure or an intermittent condition.

6E2-174 6VD1 3.2L ENGINE DRIVEABILITY AND EMISSIONS

5. A special injector test connector is provided so that the injectors can be electrically tested without removal of the manifold. The test connector can be identified by the blue connector lock which is tethered to the wiring harness. If the light for cylinder 3 is "ON" steady before cranking the engine as well as while cranking the engine, then the injector driver circuit is shorted to ground.

If the test light blinks while cranking, the PCM and the wiring to the injectors are OK. The Fuel Injector Coil Test Procedure will check if the injectors are faulty.

7. Because the test light was "ON" steady, voltage to the injector is OK, but the driver circuit is grounded at all times. This step determines if the circuit is shorted to ground or the PCM is faulty.

9. The reading should be about 12-14Ω.

10. Locating the open in the harness or in the injector will require removal of the manifold to provide access.

DTC P0203 – Injector 3 Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Will the engine start?	—	Go to Step 3	Go to <i>Engine Cranks But Will Not Run</i> chart
3	1. Install the Tech 2. Clear the DTC. 2. Idle the engine for one minute. Does DTC P0203 reset?	—	Go to Step 5	Go to Step 4
4	1. Review the Freeze Frame data with the ignition "ON" and the engine "OFF" and note the parameters. 2. Operate the vehicle within the Freeze Frame conditions as noted. Does P0203 reset?	—	Go to Step 5	Go to <i>Diagnostic Aids</i>

DTC P0203 – Injector 3 Control Circuit (Cont'd)

Step	Action	Value(s)	Yes	No
5	1. Engine "OFF." 2. Disconnect the injector test connector . 3. Install an injector test light 5-8840-2636-0 on injector connector 4. Crank the engine and note the light. Does the cylinder 3 test light blink?	—	Go to <i>Fuel Injector Coil Test Procedure</i>	Go to <i>Step 6</i>
6	Note whether the injector test light for cylinder 3 was "OFF" or "ON" steady in step 5. Was the test light "ON" steady while cranking the engine?	—	Go to <i>Step 7</i>	Go to <i>Step 9</i>
7	1. Disconnect the PCM connector for the affected injectors. 2. With a test light connected to B+, probe the affected injector driver circuit. Does the test light illuminate?	—	Go to <i>Step 8</i>	Go to <i>Step 15</i>
8	Repair short to ground in the injector driver circuit. Is the action complete?	—	Go to <i>OBD System Check</i>	—
9	1. Disconnect the injector test connector. 2. At the injector side of the harness, connect an ohmmeter between the positive wire (red with blue tracer) and the wire for cylinder 3 (green). Does the ohmmeter indicate continuity?	—	Go to <i>Step 11</i>	Go to <i>Step 10</i>
10	Repair the open injector harness wire or open injector. Is the action complete?	—	Verify repair	—
11	At the PCM side of the injector test connector, check the green wire for a short to voltage. Was there a short to voltage?	—	Go to <i>Step 12</i>	Go to <i>Step 13</i>
12	Repair the short to voltage. Is the action complete?	—	Verify repair	—
13	Check for an open circuit between the injector test connector and the PCM. Was there an open circuit?	—	Go to <i>Step 14</i>	Go to <i>Step 15</i>
14	Repair the open circuit. Is the action complete?	—	Verify repair	—
15	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0204 Injector 4 Control Circuit

D06RW070

Circuit Description

The powertrain control module (PCM) has six individual injector driver circuits. Each controls an injector. When the driver circuit is grounded by the PCM, the injector is activated. The PCM monitors the current in each driver circuit. The voltage on each driver is monitored to detect a fault. If the voltage is not what the PCM expects to monitor on the circuit, a DTC is set. This DTC is also set if an injector driver is shorted to voltage or if there is an open circuit.

Conditions for Setting the DTC

- The battery voltage is more than 9 volts.
- The engine is turning, determined by the 58X crankshaft position input signal.
- The injector voltage does not equal the ignition voltage when the injector is commanded "OFF" or the injector voltage does not equal 0 volts when the injector is commanded "ON."
- The above conditions are met for 5 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn "OFF" the MIL on the third consecutive trip cycle in which the diagnostic has been run and the fault is no longer present.
- A history DTC P0204 will clear after 40 consecutive warm-up cycles occur without a fault.
- DTC P0204 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

An injector driver circuit that is open or shorted to voltage will cause a DTC P0204 to set. It will also cause a misfire due to an inoperative injector. A misfire DTC will also be set indicating which cylinder is inoperative. Long term and short term fuel trims that are excessively high or low are a good indication that an injector is faulty. Use Fuel Injector Coil Test Procedure to check for faulty injectors.

Test Description

The number(s) below refer to the step number(s) on the Diagnostic Chart.

3. This step determines if DTC P0204 is the result of a hard failure or an intermittent condition.

5. A special injector test connector is provided so that the injectors can be electrically tested without removal of the manifold. The test connector can be identified by the blue connector lock which is tethered to the wiring harness. If the light for cylinder 4 is "ON" steady before cranking the engine as well as while cranking the engine, then the injector driver circuit is shorted to ground.

If the test light blinks while cranking, the PCM and the wiring to the injectors are OK. The Fuel Injector Coil Test Procedure will check if the injectors are faulty.

7. Because the test light was "ON" steady, voltage to the injector is OK, but the driver circuit is grounded at all times. This step determines if the circuit is shorted to ground or the PCM is faulty.

9. The reading should be about 12-14Ω.

10. Locating the open in the harness or in the injector will require removal of the manifold to provide access.

15	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0205 Injector 5 Control Circuit

D06RW070

Circuit Description

The powertrain control module (PCM) has six individual injector driver circuits. Each controls an injector. When the driver circuit is grounded by the PCM, the injector is activated. The PCM monitors the current in each driver circuit. The voltage on each driver is monitored to detect a fault. If the voltage is not what the PCM expects to monitor on the circuit, a DTC is set. This DTC is also set if an injector driver is shorted to voltage or if there is an open circuit.

Conditions for Setting the DTC

- The battery voltage is more than 9 volts.
- The engine is turning, determined by the 58X crankshaft position input signal.
- The injector voltage does not equal the ignition voltage when the injector is commanded "OFF" or the injector voltage does not equal 0 volts when the injector is commanded "ON."
- The above conditions are met for 5 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn "OFF" the MIL on the third consecutive trip cycle in which the diagnostic has been run and the fault is no longer present.
- A history DTC P0205 will clear after 40 consecutive warm-up cycles occur without a fault.
- DTC P0205 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

An injector driver circuit that is open or shorted to voltage will cause a DTC P0205 to set. It will also cause a misfire due to an inoperative injector. A misfire DTC will also be set indicating which cylinder is inoperative. Long term and short term fuel trims that are excessively high or low are a good indication that an injector is faulty. Use Fuel Injector Coil Test Procedure to check for faulty injectors.

Test Description

The number(s) below refer to the step number(s) on the Diagnostic Chart.

3. This step determines if DTC P0205 is the result of a hard failure or an intermittent condition.

6E2-180 6VD1 3.2L ENGINE DRIVEABILITY AND EMISSIONS

5. A special injector test connector is provided so that the injectors can be electrically tested without removal of the manifold. The test connector can be identified by the blue connector lock which is tethered to the wiring harness. If the light for cylinder 5 is "ON" steady before cranking the engine as well as while cranking the engine, then the injector driver circuit is shorted to ground.

If the test light blinks while cranking, the PCM and the wiring to the injectors are OK. Fuel Injector Coil Test Procedure will check if the injectors are faulty.

7. Because the test light was "ON" steady, voltage to the injector is OK, but the driver circuit is grounded at all times. This step determines if the circuit is shorted to ground or the PCM is faulty.

9. The reading should be about 12-14Ω.

10. Locating the open in the harness or in the injector will require removal of the manifold to provide access.

Diagnostic Trouble Code (DTC) P0206 Injector 6 Control Circuit

D06RW070

Circuit Description

The powertrain control module (PCM) has six individual injector driver circuits. Each controls an injector. When the driver circuit is grounded by the PCM, the injector is activated. The PCM monitors the current in each driver circuit. The voltage on each driver is monitored to detect a fault. If the voltage is not what the PCM expects to monitor on the circuit, a DTC is set. This DTC is also set if an injector driver is shorted to voltage or if there is an open circuit.

Conditions for Setting the DTC

- The battery voltage is more than 9 volts.
- The engine is turning, determined by 58X crankshaft position input signal.
- The injector voltage does not equal the ignition voltage when the injector is commanded "OFF" or the injector voltage does not equal 0 volts when the injector is commanded "ON."
- The above conditions are met for 5 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn "OFF" the MIL on the third consecutive trip cycle in which the diagnostic has been run and the fault is no longer present.
- A history DTC P0206 will clear after 40 consecutive warm-up cycles occur without a fault.
- DTC P0206 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

An injector driver circuit that is open or shorted to voltage will cause a DTC P0206 to set. It will also cause a misfire due to an inoperative injector. A misfire DTC will also be set indicating which cylinder is inoperative. Long term and short term fuel trims that are excessively high or low are a good indication that an injector is faulty. Use Fuel Injector Coil Test Procedure to check for faulty injectors.

Test Description

The number(s) below refer to the step number(s) on the Diagnostic Chart.

3. This step determines if DTC P0206 is the result of a hard failure or an intermittent condition.

5. A special injector test connector is provided so that the injectors can be electrically tested without removal of the manifold. The test connector can be identified by the blue connector lock which is tethered to the wiring harness. If the light for cylinder 6 is "ON" steady before cranking the engine as well as while cranking the engine, then the injector driver circuit is shorted to ground.

If the test light blinks while cranking, the PCM and the wiring to the injectors are OK. The Fuel Injector Coil Test Procedure will check if the injectors are faulty.

7. Because the test light was "ON" steady, voltage to the injector is OK, but the driver circuit is grounded at all times. This step determines if the circuit is shorted to ground or the PCM is faulty.

9. The reading should be about 12-14Ω.

10. Locating the open in the harness or in the injector will require removal of the manifold to provide access.

14	Repair the open circuit. Is the action complete?	—	Verify repair	—
15	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0325 KS Module Circuit

D06RW035-1

Circuit Description

The knock sensor is used to detect engine detonation, allowing the powertrain control module (PCM) to retard ignition control (IC) spark timing based on the knock sensor (KS) signal being received. The knock sensor produces an AC signal so that under a no knock condition the signal on the KS circuit measures about 0.007 V AC. The KS signal's amplitude and frequency depend upon the amount of knock being experienced. The PCM contains a non-replaceable knock filter module called a signal-to-noise enhancement filter (SNEF) module. This filter module in the PCM determines whether knock is occurring by comparing the signal level on the KS circuit with the voltage level on the noise channel. The noise channel allows the PCM to reject any false knock signal by knowing the amount of normal engine mechanical noise present. Normal engine noise varies depending on engine speed and load. When the PCM determines that an abnormally low noise channel voltage level is being experienced, a DTC P0325 will set.

Conditions for Setting the DTC

- Engine has been running for at least 30 seconds.
- The PCM determines that its internal signal from its knock filter module indicates a continuous knocking condition for more than 10 seconds.

Action Taken When the DTC Sets

- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

- The PCM will use a "substitute" default spark retard value of 6 degrees to minimize knock during conditions when knock is likely to occur.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0325 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0325 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect the knock sensor and PCM connectors for backed-out terminals, broken locks, and improperly formed or damaged terminals.
- Misrouted harness – Inspect the knock sensor harness to ensure that it is not routed too close to high voltage circuits such as spark plug coils.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Test Description

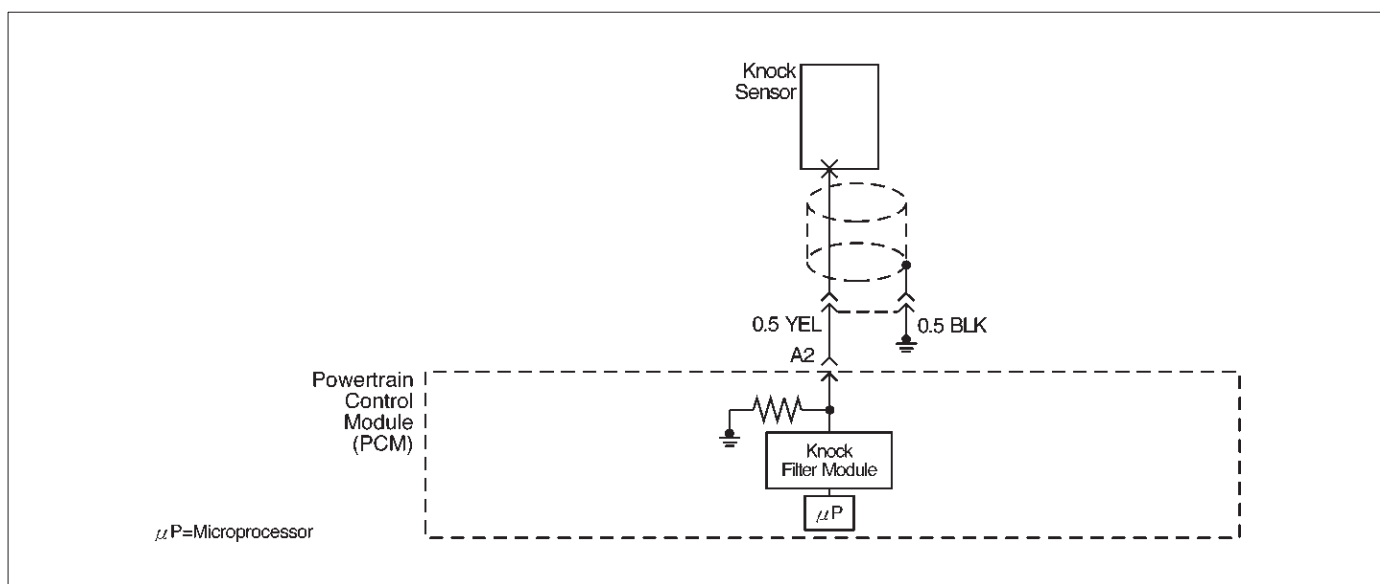

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. Ensures that the fault is present.

DTC P0325 – KS Module Circuit

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	<p>IMPORTANT: If an engine knock can be heard, repair the engine mechanical problem before proceeding with this diagnostic.</p> <p>1. Operate the vehicle within parameters specified under criteria included in "Conditions for Setting the DTC."</p> <p>2. Using a Tech 2, monitor "DTC" info for DTC P0325 until the DTC P0325 test runs.</p> <p>3. Note the test result.</p> <p>Does the Tech 2 indicate DTC P0325 failed this ignition?</p>	—	Go to Step 4	Go to Step 3
3	<p>1. Ignition "ON," engine "OFF."</p> <p>2. Review and record Tech 2 Failure Records data for DTC P0325.</p> <p>3. Operate the vehicle within Failure Records conditions.</p> <p>4. Using a Tech 2, monitor "DTC" info for DTC P0325 until the DTC P0325 test runs.</p> <p>Does the Tech 2 indicate DTC P0325 test failed this ignition?</p>	—	Go to Step 4	Refer to <i>Diagnostic Aids</i>
4	<p>Replace the PCM.</p> <p>Is the action complete?</p>	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0327 KS Sensor Circuit

D06RW035-1

Circuit Description

The powertrain control module (PCM) uses the knock sensor to detect engine detonation, allowing the PCM to retard ignition control (IC) spark timing based on the knock sensor (KS) signal being received. The knock sensor produces an AC signal so that under a no knock condition the signal on the KS circuit measures about 0.007 V AC. The signal amplitude and frequency are dependent upon the amount of knock being experienced. The PCM monitors the KS signal and can diagnose the KS sensor and circuitry.

Conditions for Setting the DTC

- Engine running time is at least 10 seconds.
- The TP sensor is greater than 5%.
- The ECT sensor is greater than 60°C (140°F).
- Engine speed is between 2000 and 4000 RPM.
- The knock sensor signal voltage is less than 0.20 volts, or greater than 4.8 volts.
- All conditions are present for more than 15 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

- The PCM will use a calculated spark retard value to minimize knock during conditions when knock is likely to occur. The calculated value will vary based on engine speed and load.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0327 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0327 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. Ensures that the fault is present.

DTC P0327 – KS Sensor Circuit

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	IMPORTANT: If an engine knock can be heard, repair the engine mechanical problem before proceeding with this diagnostic. 1. Operate the engine within the conditions specified in diagnostic support "Conditions for Setting the DTC." 2. Using a Tech 2, monitor "DTC" info for DTC P0327 until the DTC P0327 test runs. 3. Note the test result. Does the Tech 2 indicate DTC P0327 failed this ignition?	—	Go to Step 4	Go to Step 3
3	1. Ignition "ON," engine "OFF." 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions. 4. Using a Tech 2, monitor "DTC" info for DTC P0327 until the DTC P0327 test runs. 5. Note the test result. Does the Tech 2 indicate DTC P0327 failed this ignition?	—	Go to Step 4	Refer to <i>Diagnostic Aids</i>
4	Using a test light to battery +, check the black/blue wire (PCM side) to verify that the shield connection is good. Did the test light illuminate?	—	Go to Step 6	Go to Step 5
5	Repair the open shield ground. Is the action complete?	—	Verify repair	—
6	1. Ignition "OFF," disconnect the PCM. 2. Check the KS signal circuit for a poor terminal connection at the PCM. 3. If a problem is found, replace the faulty terminal. Was a problem found?	—	Verify repair	Go to Step 7
7	1. Ignition "OFF," PCM disconnected. 2. Check the KS signal circuit between the PCM and the knock sensor connector for an open, a short to voltage, or a short to ground. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 8
8	1. Ignition "OFF," PCM disconnected. 2. Knock sensor connected. 3. Measure the resistance of the knock sensor by connecting the DVM between the PCM connector and the engine block. Is the resistance of the knock sensor near the specified value?	100K ohms	Go to Step 9	Go to Step 10

DTC P0327 – KS Sensor Circuit (Cont'd)

Step	Action	Value(s)	Yes	No
9	1. Ignition "OFF," PCM disconnected. 2. Connect the DVM to monitor AC voltage between the PCM connector and engine ground. 3. Tap on the engine lift bracket with a socket extension while observing the signal indicated on the DVM. Is any signal indicated on the DVM while tapping on the engine lift bracket?	—	Go to <i>Step 11</i>	Go to <i>Step 10</i>
10	Replace the knock sensor. Is the action complete?	—	Verify repair	—
11	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Aids

An intermittent may be caused by a poor connection, rubbed-through wire insulation or a wire broken inside the insulation. Check for:

- Poor connection – Inspect the PCM harness and connectors for improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, disconnect

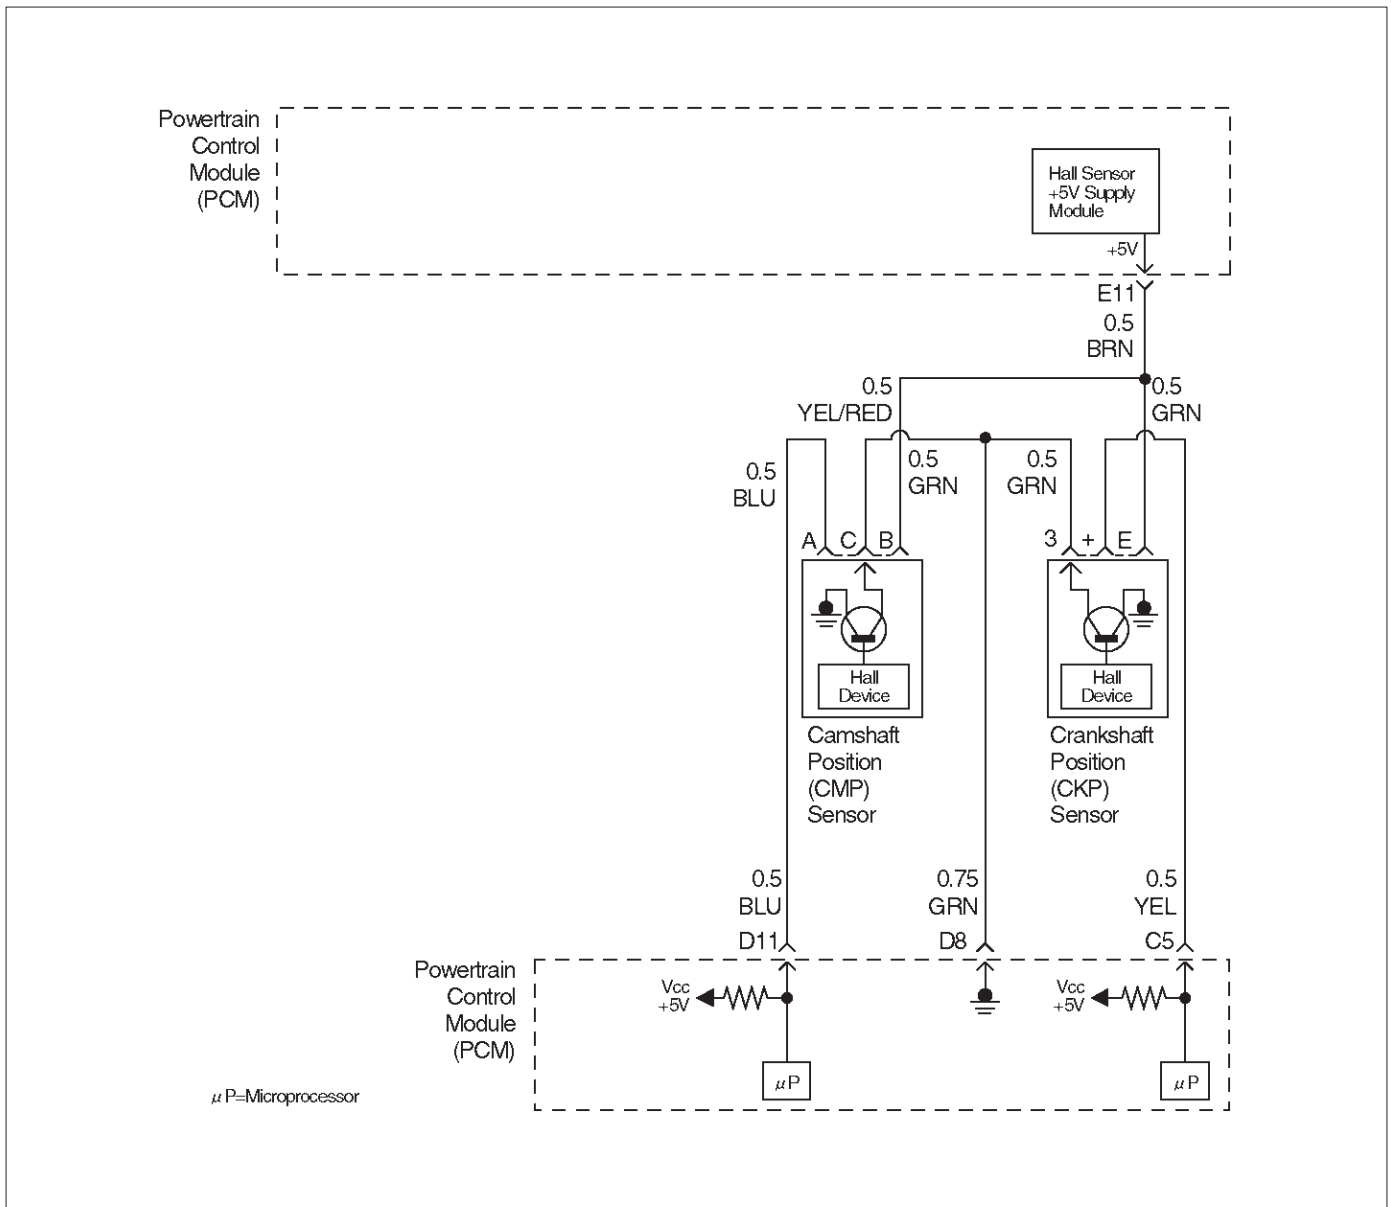

the PCM, turn the ignition on and observe a voltmeter connected to the 58X reference circuit at the PCM harness connector while moving connectors and wiring harnesses related to the ICM. A change in voltage will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P0336 – 58X Reference Signal Circuit

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Attempt to start the engine. Does the engine start?	—	Go to Step 3	Go to “ <i>Engine Cranks But Will Not Run</i> ” chart
3	1. Review and record Failure Records information. 2. Clear DTC P0336. 3. Start the engine and idle for 1 minute. 4. Observe DTCs. Is DTC P0336 set?	—	Go to Step 4	Refer to Diagnostic Aids
4	1. Disconnect the PCM and CKP sensor. 2. Check for an open or a short to ground in the 58X reference circuit between the CKP sensor connector and the PCM harness connector. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 5
5	1. Reconnect the PCM and CKP sensor. 2. Connect a DVM to measure voltage on the 58X reference circuit at the PCM connector. 3. Observe the voltage while cranking the engine. Is the voltage near the specified value?	2.5 V	Go to Step 8	Go to Step 6
6	Check the connections at the CKP sensor and replace the terminals if necessary. Did any terminals require replacement?	—	Verify repair	Go to Step 7
7	Replace the CKP sensor. Use caution to avoid any hot oil that may drip out. Is the action complete?	—	Verify repair	—
8	Check connections at the PCM and replace the terminals if necessary. Did any terminals require replacement?	—	Verify repair	Go to Step 10
9	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0337 CKP Sensor Circuit Low Frequency

Circuit Description

The 58X reference signal is produced by the crankshaft position (CKP) sensor. During one crankshaft revolution, 58 crankshaft reference pulses will be produced. The powertrain control module (PCM) uses the 58X reference signal to calculate engine RPM and crankshaft position. The PCM constantly monitors the number of pulses on the 58X reference circuit and compares them to the number of camshaft position (CMP) signal pulses being received. If the PCM does not receive pulses on the 58X reference circuit, DTC P0337 will set.

Conditions for Setting the DTC

- No camshaft position (CMP) sensor DTCs are set.
- Engine cranking.
- Crankshaft position (CKP) sensor signal is not present between two cam pulses.

- CKP reference pulse is not detected within 8 CMP pulses.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0337 will clear after 40 consecutive warm-up cycles have occurred without a fault.

- DTC P0337 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by a poor connection, rubbed-through wire insulation or a wire broken inside the insulation. Check for:

- Poor connection – Inspect the PCM harness and connectors for improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.

- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, disconnect the PCM, turn the ignition on and observe a voltmeter connected to the 58X reference circuit at the PCM harness connector while moving connectors and wiring harnesses related to the ICM. A change in voltage will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

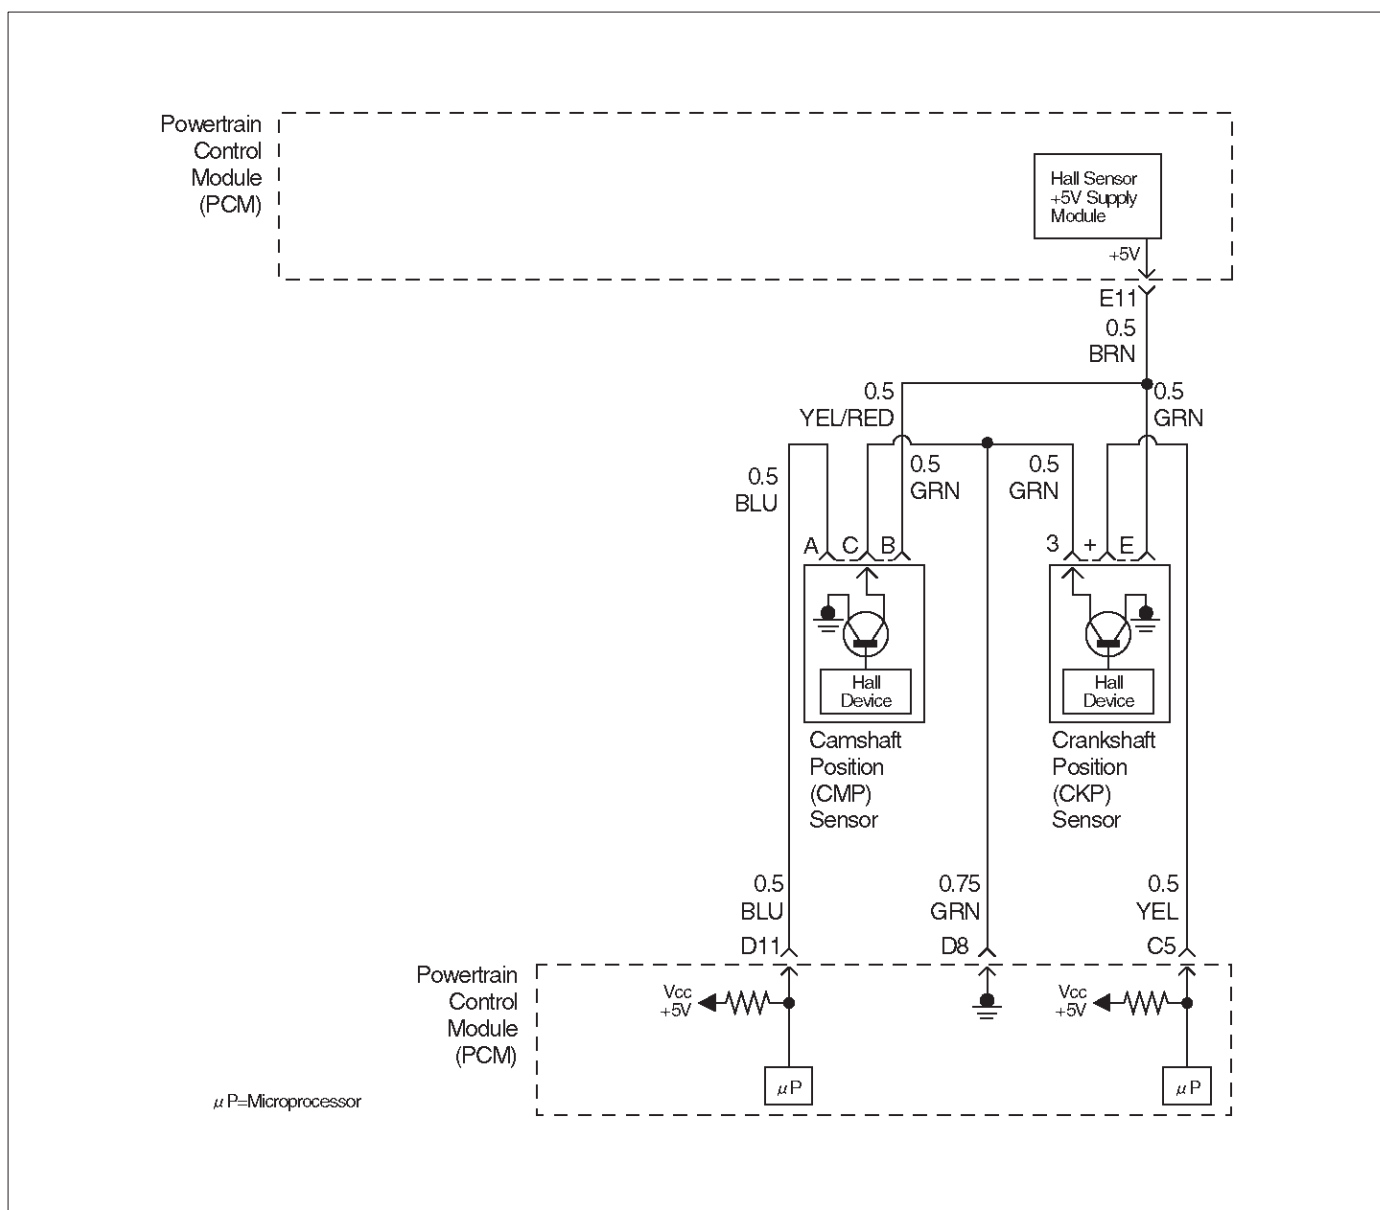

DTC P0337 – CKP Sensor Circuit Low Frequency

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Attempt to start the engine. Does the engine start?	—	Go to Step 3	Go to <i>Chart 3</i>
3	1. Review and record Failure Records information. 2. Clear DTC P0337. 3. Start the engine and idle for 1 minute. 4. Observe DTCs. Is DTC P0337 set?	—	Go to Step 4	Refer to <i>Diagnostic Aid</i>
4	1. Disconnect the CKP sensor. 2. Ignition “ON.” 3. Using a DVM, verify that 5 V reference and ground are being supplied at the sensor connector (PCM side). Are 4-6 volts and ground available at the sensor?	—	Go to Step 7	Go to Step 5
5	1. Ignition “ON.” 2. With a DVM, backprobe the PCM connector 5 V reference and ground connections. Are 5 V reference and ground available at the PCM?	—	Go to Step 6	Go to Step 11
6	Check 5 V reference or ground between the CKP sensor and PCM and repair the open circuit, short to ground or short to voltage. Is the action complete?	—	Verify repair	—
7	1. Ignition “OFF.” 2. Disconnect the PCM and CKP sensor. 3. Check for an open or a short to ground in the 58X reference circuit between the CKP sensor connector and the PCM harness connector. 4. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 8
8	1. Reconnect the PCM and CKP sensor. 2. Connect a DVM to measure voltage on the 58X reference circuit at the PCM connector. 3. Observe the voltage while cranking the engine. Is the voltage near the specified value?	2.5 V	Go to Step 11	Go to Step 9

DTC P0337 – CKP Sensor Circuit Low Frequency (Cont'd)

Step	Action	Value(s)	Yes	No
9	Check the connections at the CKP sensor and replace the terminals if necessary. Did any terminals require replacement?	—	Verify repair	Go to <i>Step 10</i>
10	Replace the CKP sensor. Use caution and avoid hot oil that may drip out. Is the action complete?	—	Verify repair	—
11	Check the connections at the PCM and replace the terminals if necessary. Did any terminals require replacement?	—	Verify repair	Go to <i>Step 12</i>
12	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0341 CMP Sensor Circuit Performance

D06RX145

Circuit Description

The CMP signal is produced by the camshaft position (CMP) sensor pulses when the engine is running and crankshaft position (CKP) sync pulses are also being received. The powertrain control module (PCM) uses the CMP signal pulses to initiate sequential fuel injection. The PCM constantly monitors the number of pulses on the CMP signal circuit and compares the number of CMP pulses to the number of 58X reference pulses received. If the PCM receives an incorrect number of pulses on the CMP reference circuit, DTC P0341 will set and the PCM will initiate injector sequence without the CMP signal with a one in six chance that injector sequence is correct. The engine will continue to start and run normally, although the misfire diagnostic will be affected if a misfiring condition occurs.

Conditions for Setting the DTC

- The engine is running (1X CMP reference pulses are being received).
- The CMP sensor signal is not detected at the correct interval every 6 cylinders.
- Above condition fails for 100 occurrences within 200 test samples.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The PCM will initiate the injector sequence without the CMP signal with a one in six chance that the injector sequence is correct.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0341 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0341 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by a poor connection, rubbed-through wire insulation or a wire broken inside the insulation. Check for:

- Poor connection — Inspect the PCM harness and connectors for improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness — Inspect the wiring harness for damage. If the harness appears to be OK, disconnect the PCM, turn the ignition on and observe a voltmeter connected to the CMP signal circuit at the PCM harness connector while moving connectors and wiring harnesses related to the ICM and the CMP

sensor. A change in voltage will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

NOTE: On early-built Troopers, the Tech 2 indication for “CMP ACT. COUNTER” (Cam Position Sensor activity) will continue to count up, even if no cam position signal is being received by the PCM. This problem can be corrected by reprogramming the PCM with the latest EEPROM program.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. Ensures that the fault is present.
10. Determines whether the fault is being caused by a missing camshaft magnet or a faulty sensor. The voltage measured in this step should read around 4 volts, toggling to near 0 volts when the CMP sensor interfaces with the camshaft magnet.

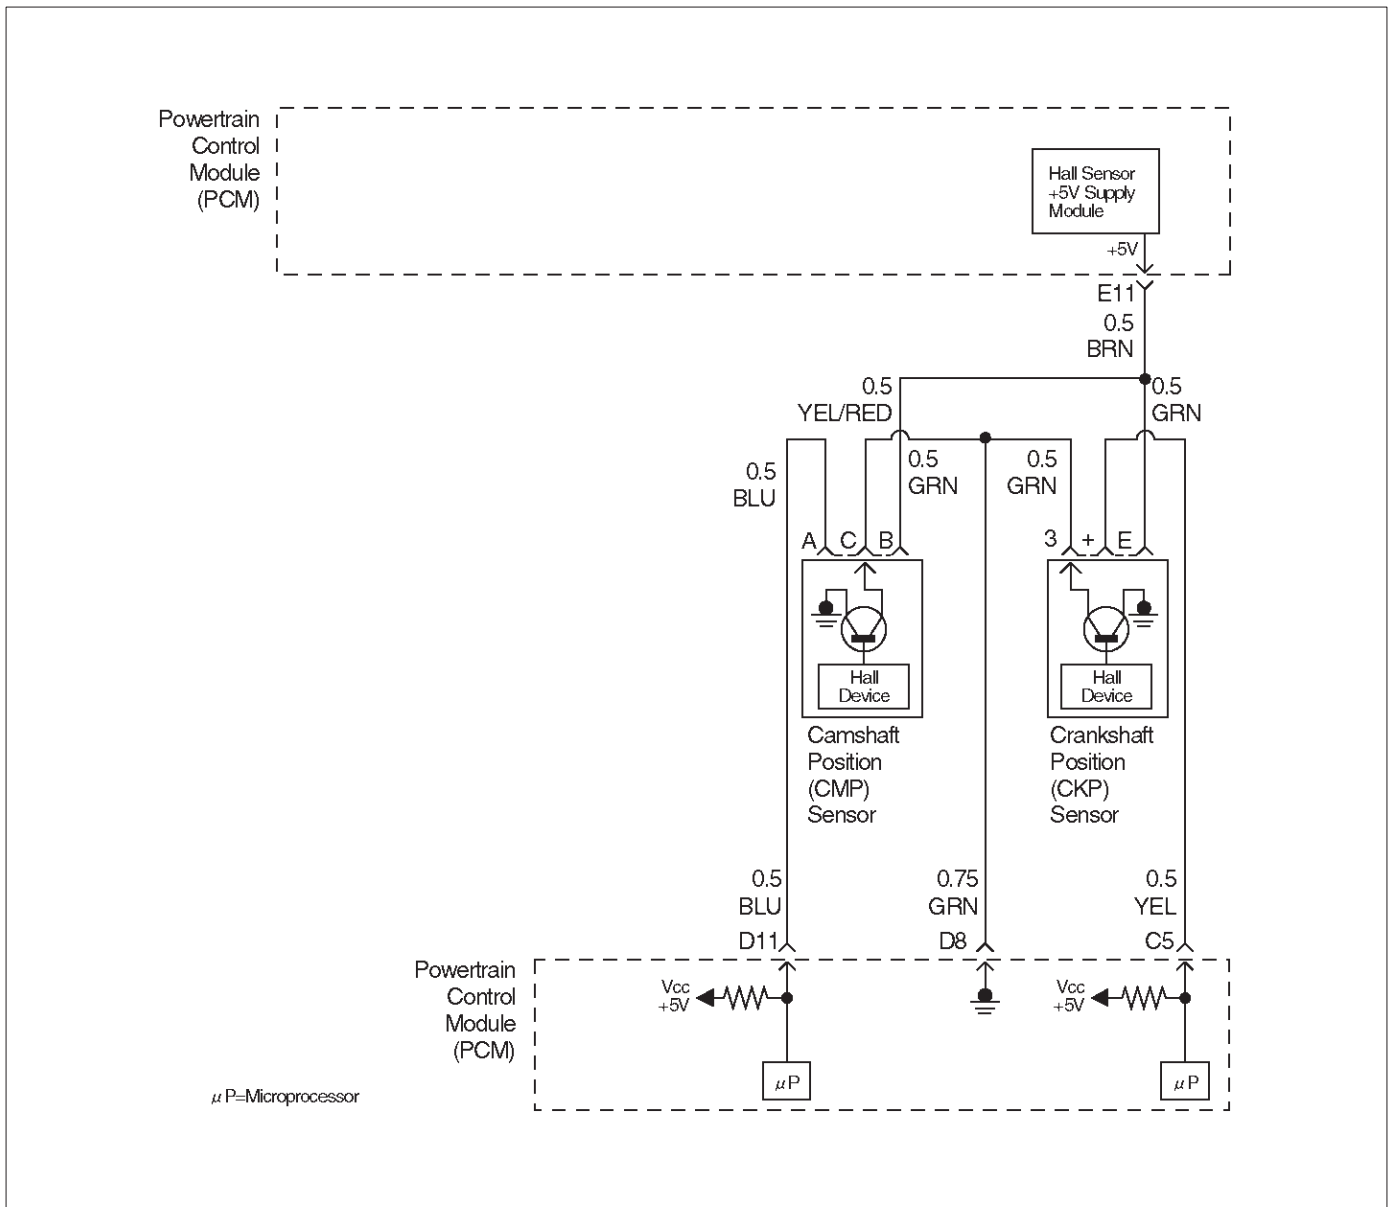

DTC P0341 —CMP Sensor Circuit Performance

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition “ON.” 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor “DTC” info for DTC P0341 until the DTC P0341 test runs. 5. Note the test result. Does the Tech 2 indicate DTC P0341 failed this ignition?	—	Go to Step 3	Refer to <i>Diagnostic Aids</i>
3	Measure the voltage between the CMP sensor signal circuit and the sensor ground circuit at the CMP sensor harness connector. Does the voltage measure near the specified value?	4-6 V	Go to Step 10	Go to Step 7
4	If the voltage measured in step 3 was less than 4-6 volts, proceed directly to step 6 without completing this step. If the voltage in step 3 was greater than 4-6 V, repair the short to voltage in the CMP feed circuit. Is the action complete?	—	Verify repair	—
5	1. Check for poor connections at the camshaft position sensor. 2. If a problem is found, repair it as necessary. Was a problem found?	—	Verify repair	Go to Step 6

DTC P0341 —CMP Sensor Circuit Performance (Cont'd)

Step	Action	Value(s)	Yes	No
6	1. Ignition "OFF," disconnect the PCM and the CMP sensor. 2. Check the following circuits for an open between the ignition control module and the CMP sensor: <ul style="list-style-type: none"> • The sensor feed circuit. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 8</i>
7	1. Ignition "OFF," disconnect the PCM (leave the CMP sensor disconnected). 2. Ignition "ON," check the following circuits: <ul style="list-style-type: none"> • The CMP sensor signal circuit for an open or a short to voltage. • The CMP sensor input signal circuit for a short to ground. 3. If a problem is found, repair it as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 8</i>
8	Check for a short or open in the sensor ground circuit. Was a problem found?	—	Verify repair	Go to <i>Step 9</i>
9	1. Check for poor connections at the PCM. 2. If a problem is found, repair it as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 10</i>
10	Backprobe the PCM connector with a DVM to monitor voltage on the camshaft position input signal circuit while cranking the engine with the sensor connected. (Use rubber band, tape, or an assistant to keep the DVM lead in contact with the sensor terminal during this test.) Does the voltage toggle between the specified values?	4-0 V	Go to <i>Step 10</i>	Go to <i>Step 11</i>
11	1. Remove the CMP sensor. Does the DVM display a voltage near the specified value?	—	Go to <i>Step 12</i>	Go to <i>Step 13</i>
12	Replace the faulty or missing camshaft position sensor. Is the action complete?	—	Verify repair	—
13	Replace the camshaft position sensor. Is the action complete?	—	Verify repair	—
14	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0342 CMP Sensor Circuit Low

Circuit Description

The CMP signal produced by the camshaft position (CMP) sensor pulses when the engine is running and crankshaft position (CKP) sync pulses are also being received. The hall type CMP sensor and the CKP sensor share 5 V and ground connections at the powertrain control module (PCM). The third wire at the sensor is a signal circuit to the PCM. The PCM uses the CMP signal pulses to initiate sequential fuel injection. The PCM constantly monitors the number of pulses on the CMP signal circuit and compares the number of CMP pulses to the number of 58X reference pulses received. If the PCM does not receive pulses on the CMP reference circuit, DTC P0342 will set and the PCM will initiate injector sequence without the CMP signal with a one in six chance that injector sequence is correct. The engine will continue to start and run normally, although the misfire diagnostic will be affected if a misfiring condition occurs.

Conditions for Setting the DTC

- The engine is running.
- The CMP sensor signal is not received by the PCM once every 6 cylinders.
- The above condition occurs for 10 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The PCM will initiate injector sequence without the CMP signal with a one in six chance that the injector sequence is correct.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0342 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0342 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

An intermittent may be caused by a poor connection, rubbed-through wire insulation or a wire broken inside the insulation. Check for:

- Poor connection – Inspect the PCM harness and connectors for improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, disconnect the PCM, turn the ignition on and observe a voltmeter connected to the CMP signal circuit at the PCM harness connector while moving connectors and wiring harnesses related to the ICM and the CMP sensor. A change in voltage will indicate the location of the fault.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. Ensures that the fault is present.
12. Determines whether the fault is being caused by a damaged camshaft or a faulty PCM. The voltage measured in this step should read around 4 volts, toggling to near 0 volts when the CMP sensor interfaces with the camshaft magnet.

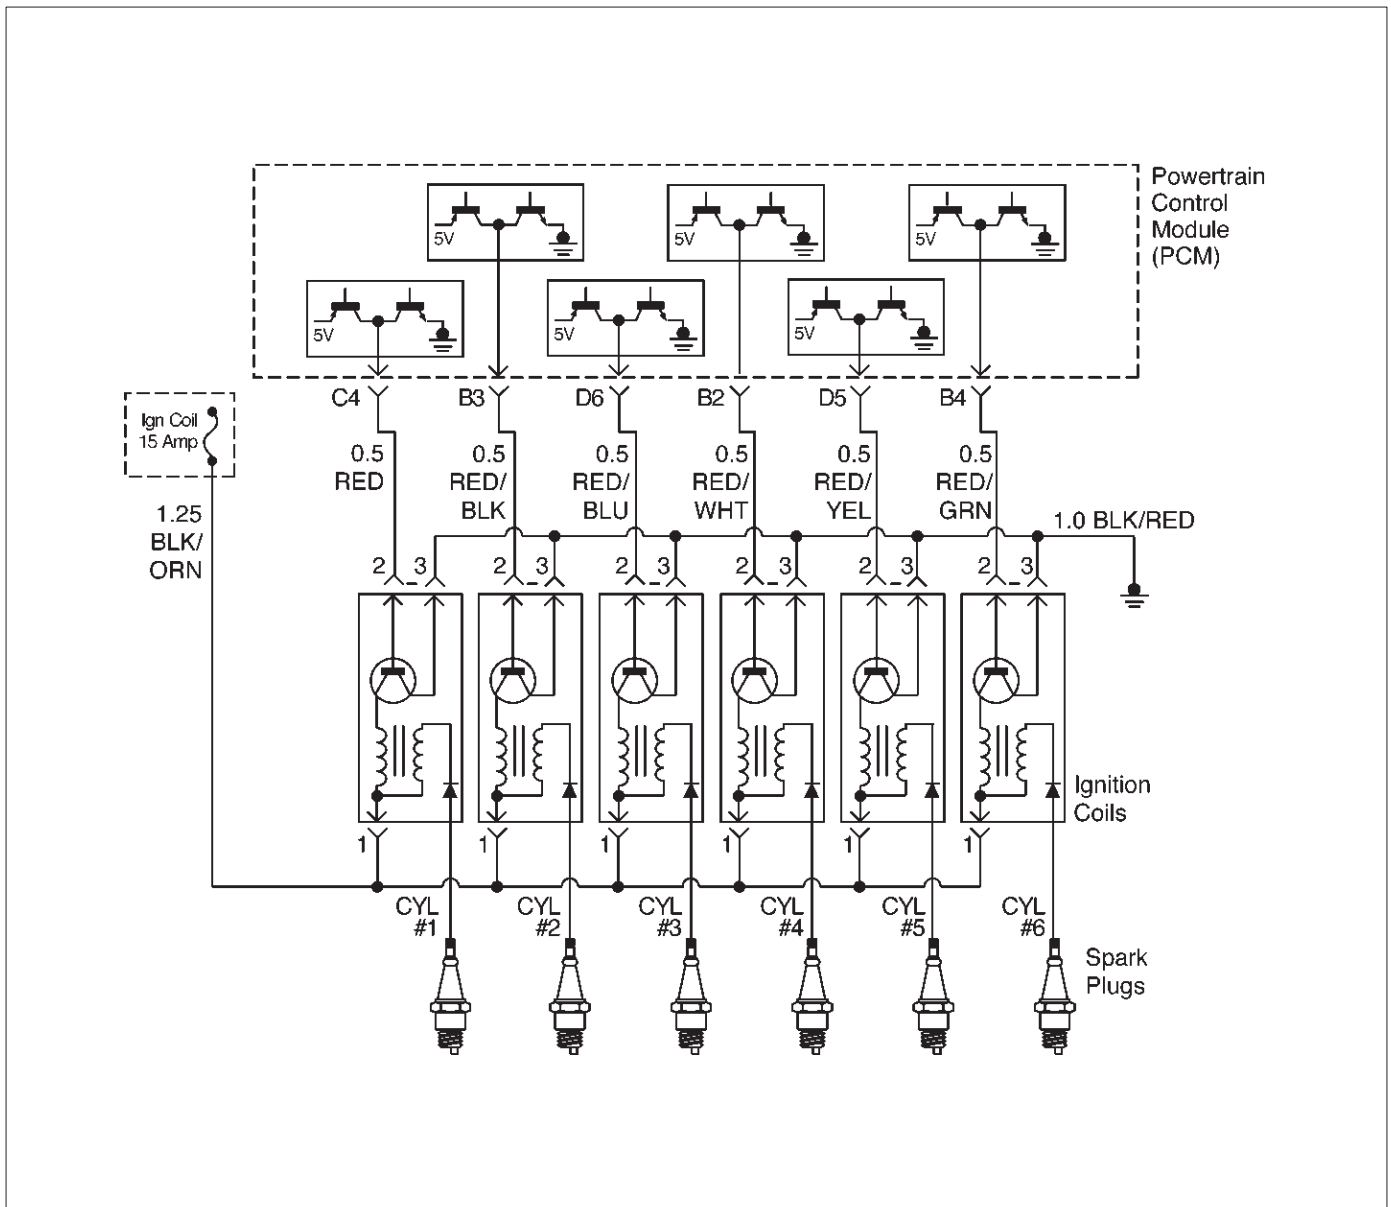

DTC P0342 —CMP Sensor Circuit Low

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "ON." 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Records conditions as noted. 4. Using a Tech 2, monitor "DTC" information for DTC P0342 until the DTC P0342 test runs. 5. Note test result. Does the Tech 2 indicate DTC P0342 failed this ignition?	—	Go to Step 3	Refer to <i>Diagnostic Aids</i>
3	1. Ignition "ON." 2. Disconnect the CMP sensor. 3. Measure the voltage between the sensor feed circuit and the sensor ground circuit at the CMP sensor harness connector. Does the voltage measure near the specified value?	4-6 V	Go to Step 7	Go to Step 4
4	1. Ignition "OFF," disconnect the PCM and the CMP sensor. 2. Check for poor connections at the camshaft position sensor. 3. If a problem is found, repair it as necessary. Was a problem found?	—	Verify repair	Go to Step 5

13	<p>Replace the camshaft position sensor.</p> <p>Is the action complete?</p>	—	Verify repair	—
14	<p>Replace the PCM.</p> <p>Is the action complete?</p>	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0351 Ignition 1 Control Circuit

Circuit Description

The powertrain control module's (PCM) control circuit 1 provides a zero-volt or a 5-volt output signal to the ignition coil. The normal voltage on the circuit is zero volts. When the ignition coil receives the 5-volt signal from the PCM, it provides a ground path for the B+ supply to the primary side of the number 1 ignition coil. When the PCM shuts off the 5 volts to the ignition coil, the ignition coil turns "OFF." This causes the ignition coil primary magnetic field to collapse, producing a voltage in the secondary coil which fires the spark plug.

The circuit between the PCM and ignition coil is monitored for an open circuit, short to voltage, and short to ground. When the PCM detects a problem on ignition control circuit 1, it will set a DTC P0351.

Conditions for Setting the DTC

- The ignition is "ON."
- The engine is turning, determined by the 58X crankshaft position input signal.

- The output voltage is not equal to 5 volts when output is "ON."
- The output voltage is not equal to 0 volts when output is "OFF."
- Twenty test failures occur within 40 samples of continuous spark events.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle in which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0351 will clear after 40 consecutive warm-up cycles occur without a fault.

- DTC P0351 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

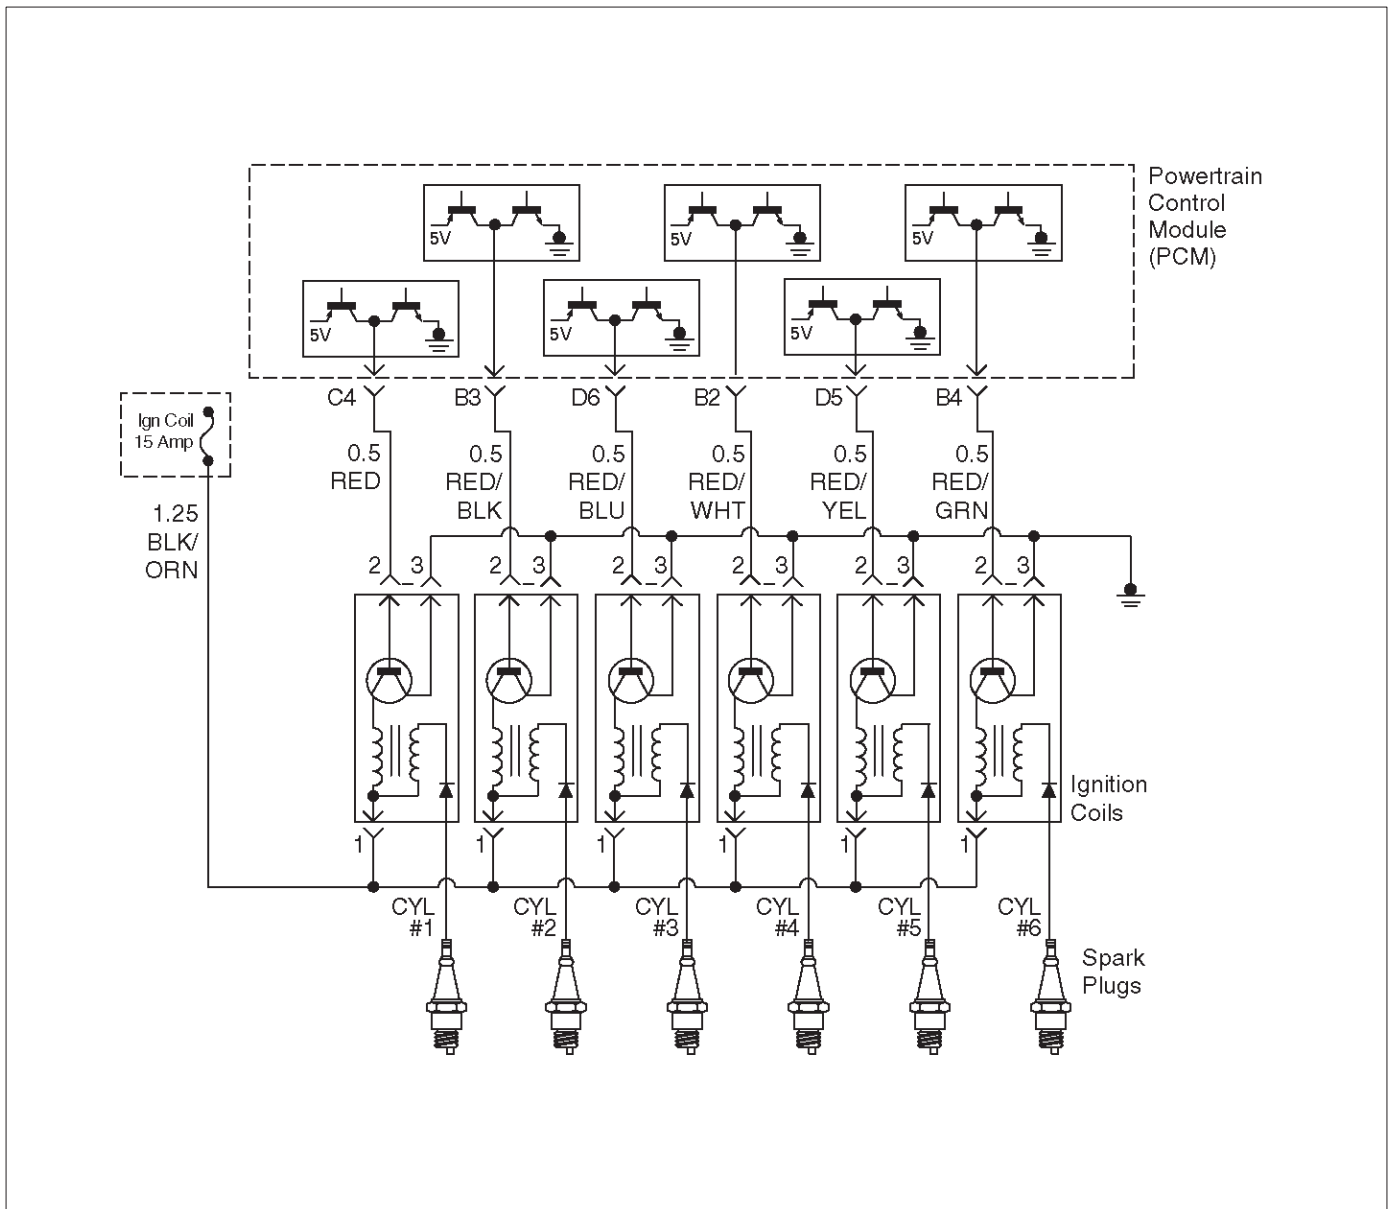

- Poor connection at PCM – Inspect the harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connections.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the Tech 2 display related to DTC P0351 while moving the connector and wiring related to the ignition system. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P0351 – Ignition 1 Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "ON," engine "OFF." 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Record conditions as noted. 4. Use a Tech 2 to monitor the "DTC" information for DTC P0351 until the DTC P0351 test runs. 5. Note the test result. Does the Tech 2 indicate DTC P0351 failed this ignition cycle?	—	Go to Step 3	Go to <i>Diagnostic Aids</i>
3	Check for faulty connection at ignition coil. Was a problem found?	—	Verify repair	Go to Step 4
4	Check for faulty connection at PCM connector. Was a problem found?	—	Verify repair	Go to Step 5
5	1. Ignition "ON," engine "OFF." 2. Back probe the ignition control circuit 1 at the PCM with a DVM. Is the voltage near the specified value?	25-55 mV	Go to Step 6	Go to Step 9
6	1. Ignition "ON," engine running. 2. Back probe the ignition control circuit at the PCM for the cylinder being tested. Is the voltage in the specified range, rapidly toggling back and forth to a reading 20-50 mV higher?	100-180 mV	Go to Step 7	Go to Step 13
7	1. Ignition "OFF." 2. Disconnect the 3-pin connector at the ignition coil. 3. Check ignition control circuit 1 voltage at the ignition coil connector while cranking the engine. Does the voltage measure between the specified values?	200-1200 mV	Go to Step 8	Go to Step 11
8	Replace the ignition coil. Is the action complete?	—	Verify repair	—
9	1. Ignition "OFF." 2. Disconnect the PCM and the ignition coil. 3. Check ignition control circuit 1 for short to ground. Was a problem found?	—	Verify repair	Go to Step 10
10	Check ignition control circuit 1 for short to voltage. Was a problem found?	—	Verify repair	Go to Step 13
11	Check for an open ignition control circuit 1. Was the ignition control circuit open?	—	Go to Step 12	Go to Step 13
12	Repair the open ignition control circuit. Is the action complete?	—	Verify repair	—
13	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0352 Ignition 2 Control Circuit

Circuit Description

The powertrain control module's (PCM) control circuit 2 provides a zero-volt or a 5-volt output signal to the ignition coil. The normal voltage on the circuit is zero volts. When the ignition coil receives the 5-volt signal from the PCM, it provides a ground path for the B+ supply to the primary side of the number 2 ignition coil. When the PCM shuts off the 5 volts to the ignition coil, the ignition coil turns "OFF." This causes the ignition coil primary magnetic field to collapse, producing a voltage in the secondary coil which fires the spark plug.

The circuit between the PCM and ignition coil is monitored for an open circuit, short to voltage, and short to ground. When the PCM detects a problem on ignition control circuit 2, it will set a DTC P0352.

Conditions for Setting the DTC

- The ignition is "ON."
- The engine is turning, determined by the 58 X crankshaft position input signal.

- The output voltage is not equal to 5 volts when output is "ON."
- The output voltage is not equal to 0 volts when output is "OFF."
- Twenty test failures occur within 40 samples of continuous spark events.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle in which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0352 will clear after 40 consecutive warm-up cycles occur without a fault.

- DTC P0352 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect the harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connections.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the Tech 2 display related to DTC P0352 while moving the connector and wiring related to the ignition system. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P0352 – Ignition 2 Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition “ON,” engine “OFF.” 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Record conditions as noted. 4. Use a Tech 2 to monitor the “DTC” information for DTC P0352 until the DTC P0352 test runs. 5. Note the test result. Does the Tech 2 indicate DTC P0352 failed this ignition cycle?	—	Go to Step 3	Go to <i>Diagnostic Aids</i>
3	Check for faulty connection at ignition coil. Was a problem found?	—	Verify repair	Go to Step 4
4	Check for faulty connection at PCM connector. Was a problem found?	—	Verify repair	Go to Step 5
5	1. Ignition “ON,” engine “OFF.” 2. Back probe the ignition control circuit 2 at the PCM with a DVM . Is the voltage near the specified value?	25-55 mV	Go to Step 6	Go to Step 9
6	1. Ignition “ON,” engine running. 2. Back probe the ignition control circuit at the PCM for the cylinder being tested. Is the voltage in the specified range, rapidly toggling back and forth to a reading 20-50 mV higher?	100-180 mV	Go to Step 7	Go to Step 13
7	1. Ignition “OFF.” 2. Disconnect the 3-pin connector at the ignition coil. 3. Check ignition control circuit 2 voltage at the ignition coil connector while cranking the engine connector. Does the voltage measure between the specified values?	200-1200 mV	Go to Step 8	Go to Step 11
8	Replace the ignition coil. Is the action complete?	—	Verify repair	—
9	1. Ignition “OFF.” 2. Disconnect the PCM and the ignition coil. 3. Check ignition control circuit 2 for short to ground. Was a problem found?	—	Verify repair	Go to Step 10
10	Check ignition control circuit 2 for short to voltage. Was a problem found?	—	Verify repair	Go to Step 13
11	Check for an open ignition control circuit 2. Was the ignition control circuit open?	—	Go to Step 12	Go to Step 13

13	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0353 Ignition 3 Control Circuit

Circuit Description

The powertrain control module's (PCM) control circuit 3 provides a zero-volt or a 5-volt output signal to the ignition coil. The normal voltage on the circuit is zero volts. When the ignition coil receives the 5-volt signal from the PCM, it provides a ground path for the B+ supply to the primary side of the number 3 ignition coil. When the PCM shuts off the 5 volts to the ignition coil, the ignition coil turns "OFF." This causes the ignition coil primary magnetic field to collapse, producing a voltage in the secondary coil which fires the spark plug.

The circuit between the PCM and ignition coil is monitored for an open circuit, short to voltage, and short to ground. When the PCM detects a problem on ignition control circuit 3, it will set a DTC P0353.

Conditions for Setting the DTC

- The ignition is "ON."
- The engine is turning, determined by the 58X crankshaft position input signal.

- The output voltage is not equal to 5 volts when output is "ON."
- The output voltage is not equal to 0 volts when output is "OFF."
- Twenty test failures occur within 40 samples of continuous spark events.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle in which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0353 will clear after 40 consecutive warm-up cycles occur without a fault.

- DTC P0353 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

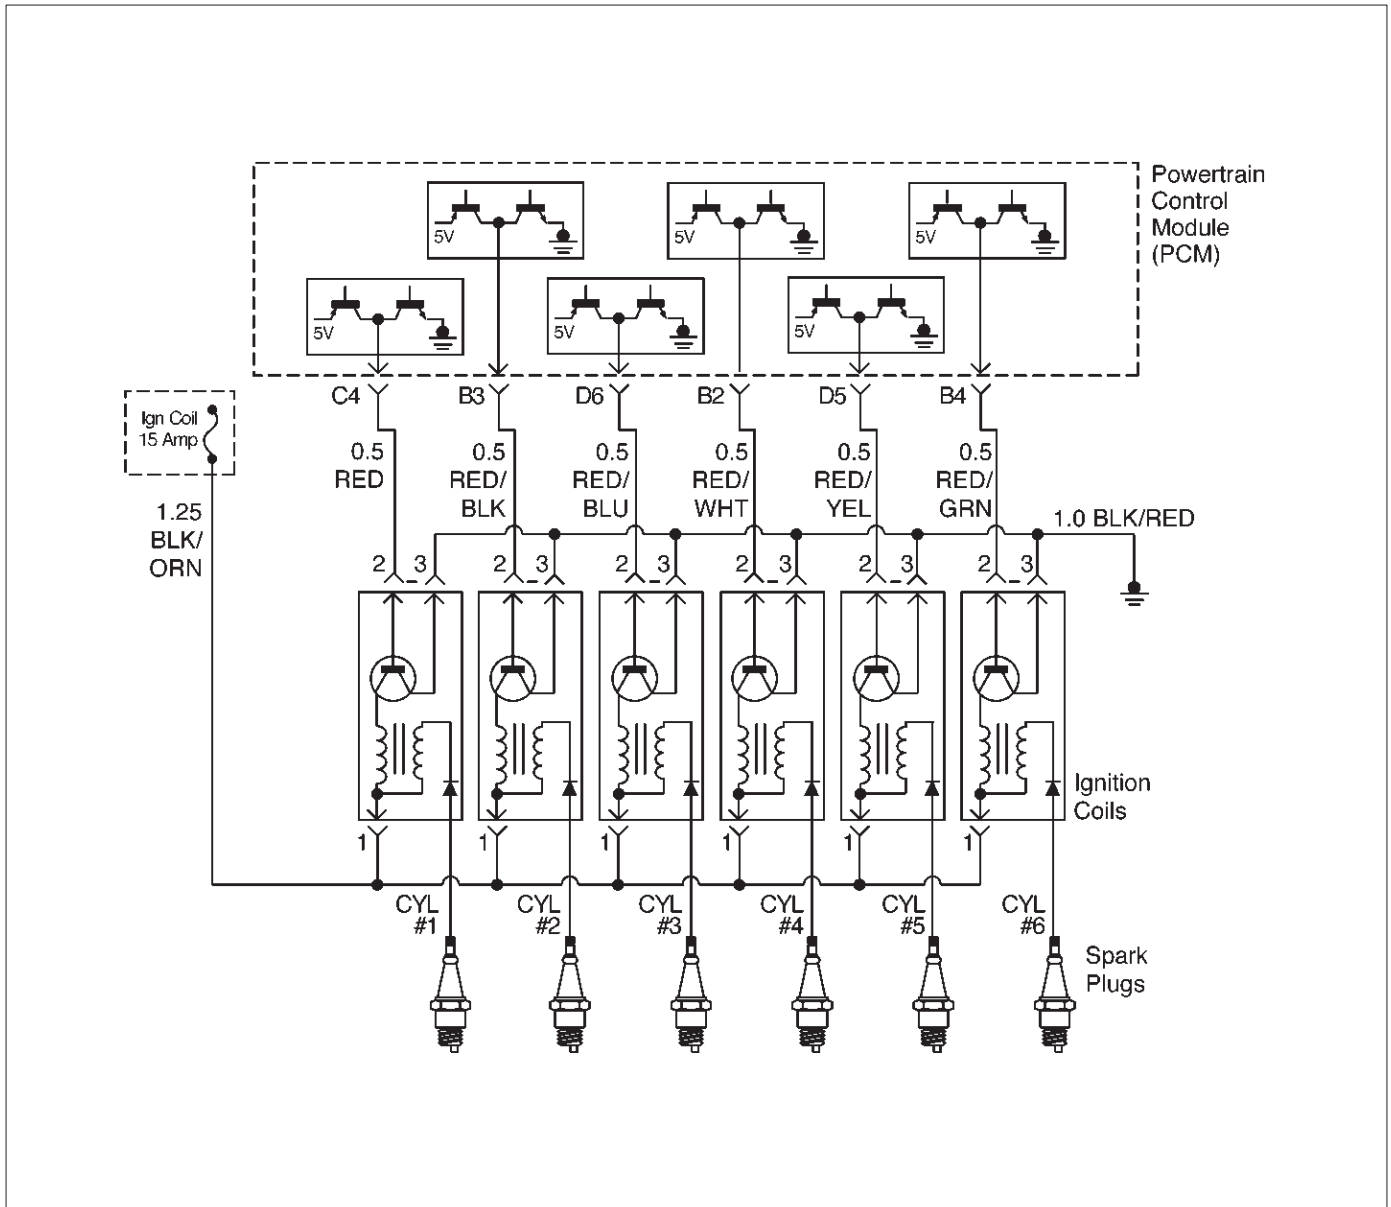

- Poor connection at PCM – Inspect the harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connections.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the Tech 2 display related to DTC P0353 while moving the connector and wiring related to the ignition system. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P0353 – Ignition 3 Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "ON," engine "OFF." 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Record conditions as noted. 4. Use a Tech 2 to monitor the "DTC" information for DTC P0353 until the DTC P0353 test runs. 5. Note the test result. Does the Tech 2 indicate DTC P0353 failed this ignition cycle?	—	Go to Step 3	Go to <i>Diagnostic Aids</i>
3	Check for faulty connection at ignition coil. Was a problem found?	—	Verify repair	Go to Step 4
4	Check for faulty connection at PCM connector. Was a problem found?	—	Verify repair	Go to Step 5
5	1. Ignition "ON," engine "OFF." 2. Back probe the ignition control circuit 3 at the PCM with a DVM. Is the voltage near the specified value?	25-55 mV	Go to Step 6	Go to Step 9
6	1. Ignition "ON," engine running. 2. Back probe the ignition control circuit at the PCM for the cylinder being tested. Is the voltage in the specified range, rapidly toggling back and forth to a reading 20-50 mV higher?	100-180 mV	Go to Step 7	Go to Step 13
7	1. Ignition "OFF." 2. Disconnect the 3-pin connector at the ignition coil. 3. Check ignition control circuit 3 voltage at the ignition coil connector while cranking the engine. Does the voltage measure between the specified values?	200-1200 mV	Go to Step 8	Go to Step 11
8	Replace the ignition coil. Is the action complete?	—	Verify repair	—
9	1. Ignition "OFF." 2. Disconnect the PCM and the ignition coil. 3. Check ignition control circuit 3 for short to ground. Was a problem found?	—	Verify repair	Go to Step 10
10	Check ignition control circuit 3 for short to voltage. Was a problem found?	—	Verify repair	Go to Step 13
11	Check for an open ignition control circuit 3. Was the ignition control circuit open?	—	Go to Step 12	Go to Step 13
12	Repair the open ignition control circuit. Is the action complete?	—	Verify repair	—
13	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0354 Ignition 4 Control Circuit

D06RX018

Circuit Description

The powertrain control module's (PCM) control circuit 4 provides a zero-volt or a 5-volt output signal to the ignition coil. The normal voltage on the circuit is zero volts. When the ignition coil receives the 5-volt signal from the PCM, it provides a ground path for the B+ supply to the primary side of the number 4 ignition coil. When the PCM shuts off the 5 volts to the ignition coil, the ignition coil turns "OFF." This causes the ignition coil primary magnetic field to collapse, producing a voltage in the secondary coil which fires the spark plug.

The circuit between the PCM and ignition coil is monitored for an open circuit, short to voltage, and short to ground. When the PCM detects a problem on ignition control circuit 4, it will set a DTC P0354.

Conditions for Setting the DTC

- The ignition is "ON."
- The engine is turning, determined by the 58X crankshaft position input signal.

- The output voltage is not equal to 5 volts when output is "ON."
- The output voltage is not equal to 0 volts when output is "OFF."
- Twenty test failures occur within 40 samples of continuous spark events.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle in which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0354 will clear after 40 consecutive warm-up cycles occur without a fault.

6E2-212 6VD1 3.2L ENGINE DRIVEABILITY AND EMISSIONS

- DTC P0354 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect the harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connections.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the Tech 2 display related to DTC P0354 while moving the connector and wiring related to the ignition system. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P0354 – Ignition 4 Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition “ON,” engine “OFF.” 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Record conditions as noted. 4. Use a Tech 2 to monitor the “DTC” information for DTC P0354 until the DTC P0354 test runs. 5. Note the test result. Does the Tech 2 indicate DTC P0354 failed this ignition cycle?	—	Go to Step 3	Go to <i>Diagnostic Aids</i>
3	Check for faulty connection at ignition coil. Was a problem found?	—	Verify repair	Go to Step 4
4	Check for faulty connection at PCM connector. Was a problem found?	—	Verify repair	Go to Step 5
5	1. Ignition “ON,” engine “OFF.” 2. Back probe the ignition control circuit 4 at the PCM with a DVM. Is the voltage near the specified value?	25-55 mV	Go to Step 6	Go to Step 9
6	1. Ignition “ON,” engine running. 2. Back probe the ignition control circuit at the PCM for the cylinder being tested. Is the voltage in the specified range, rapidly toggling back and forth to a reading 20-50 mV higher?	100-180 mV	Go to Step 7	Go to Step 13
7	1. Ignition “OFF.” 2. Disconnect the 3-pin connector at the ignition coil. 3. Check ignition control circuit 4 voltage at the ignition coil connector while cranking the engine. Does the voltage measure between the specified values?	200-1200 mV	Go to Step 8	Go to Step 11
8	Replace the ignition coil. Is the action complete?	—	Verify repair	—
9	1. Ignition “OFF.” 2. Disconnect the PCM and the ignition coil. 3. Check ignition control circuit 4 for short to ground. Was a problem found?	—	Verify repair	Go to Step 10
10	Check ignition control circuit 4 for short to voltage. Was a problem found?	—	Verify repair	Go to Step 13
11	Check for an open ignition control circuit 4. Was the ignition control circuit open?	—	Go to Step 12	Go to Step 13
12	Repair the open in ignition control circuit. Is the action complete?	—	Verify repair	—
13	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0355 Ignition 5 Control Circuit

Circuit Description

The powertrain control module's (PCM) control circuit 5 provides a zero-volt or a 5-volt output signal to the ignition coil. The normal voltage on the circuit is zero volts. When the ignition coil receives the 5-volt signal from the PCM, it provides a ground path for the B+ supply to the primary side of the number 5 ignition coil. When the PCM shuts off the 5 volts to the ignition coil, the ignition coil turns "OFF." This causes the ignition coil primary magnetic field to collapse, producing a voltage in the secondary coil which fires the spark plug.

The circuit between the PCM and ignition coil is monitored for an open circuit, short to voltage, and short to ground. When the PCM detects a problem on ignition control circuit 5, it will set a DTC P0355.

Conditions for Setting the DTC

- The ignition is "ON."
- The engine is turning, determined by the 58X crankshaft position input signal.

- The output voltage is not equal to 5 volts when output is "ON."
- The output voltage is not equal to 0 volts when output is "OFF."
- Twenty test failures occur within 40 samples of continuous spark events.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle in which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0355 will clear after 40 consecutive warm-up cycles occur without a fault.

- DTC P0355 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect the harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connections.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the Tech 2 display related to DTC P0355 while moving the connector and wiring related to the ignition system. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P0355 – Ignition 5 Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "ON," engine "OFF." 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Record conditions as noted. 4. Use a Tech 2 to monitor the "DTC" information for DTC P0355 until the DTC P0355 test runs. 5. Note the test result. Does the Tech 2 indicate DTC P0355 failed this ignition cycle?	—	Go to Step 3	Go to <i>Diagnostic Aids</i>
3	Check for faulty connection at ignition coil. Was a problem found?	—	Verify repair	Go to Step 4
4	Check for faulty connection at PCM connector. Was a problem found?	—	Verify repair	Go to Step 5
5	1. Ignition "ON," engine "OFF." 2. Back probe the ignition control circuit 5 at the PCM with a DVM. Is the voltage near the specified value?	25-55 mV	Go to Step 6	Go to Step 9
6	1. Ignition "ON," engine running. 2. Back probe the ignition control circuit at the PCM for the cylinder being tested. Is the voltage in the specified range, rapidly toggling back and forth to a reading 20-50 mV higher?	100-180 mV	Go to Step 7	Go to Step 13
7	1. Ignition "OFF." 2. Disconnect the 3-pin connector at the ignition coil. 3. Check ignition control circuit 5 voltage at the ignition coil connector while cranking the engine. Does the voltage measure between the specified values?	200-1200 mV	Go to Step 8	Go to Step 11
8	Replace the ignition coil. Is the action complete?	—	Verify repair	—
9	1. Ignition "OFF." 2. Disconnect the PCM and the ignition coil. 3. Check ignition control circuit 5 for short to ground. Was a problem found?	—	Verify repair	Go to Step 10
10	Check ignition control circuit 5 for short to voltage. Was a problem found?	—	Verify repair	Go to Step 13
11	Check for an open ignition control circuit 5. Was the ignition control circuit open?	—	Go to Step 12	Go to Step 13
12	Repair the open ignition control circuit. Is the action complete?	—	Verify repair	—
13	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0356 Ignition 6 Control Circuit

Circuit Description

The powertrain control module's (PCM) control circuit 6 provides a zero-volt or a 5-volt output signal to the ignition coil. The normal voltage on the circuit is zero volts. When the ignition coil receives the 5-volt signal from the PCM, it provides a ground path for the B+ supply to the primary side of the number 6 ignition coil. When the PCM shuts off the 5 volts to the ignition coil, the ignition coil turns "OFF." This causes the ignition coil primary magnetic field to collapse, producing a voltage in the secondary coil which fires the spark plug.

The circuit between the PCM and ignition coil is monitored for an open circuit, short to voltage, and short to ground. When the PCM detects a problem on ignition control circuit 6, it will set a DTC P0356.

Conditions for Setting the DTC

- The ignition is "ON."
- The engine is turning, determined by the 58X crankshaft position input signal.

- The output voltage is not equal to 5 volts when output is "ON."
- The output voltage is not equal to 0 volts when output is "OFF."
- Twenty test failures occur within 40 samples of continuous spark events.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle in which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0356 will clear after 40 consecutive warm-up cycles occur without a fault.

- DTC P0356 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect the harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connections.
- Damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the Tech 2 display related to DTC P0356 while moving the connector and wiring related to the ignition system. A change in the display will indicate the location of the fault.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P0356 – Ignition 6 Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition “ON,” engine “OFF.” 2. Review and record Tech 2 Failure Records data. 3. Operate the vehicle within Failure Record conditions as noted. 4. Use a Tech 2 to monitor the “DTC” information for DTC P0356 until the DTC P0356 test runs. 5. Note the test result. Does the Tech 2 indicate DTC P0356 failed this ignition cycle?	—	Go to Step 3	Go to <i>Diagnostic Aids</i>
3	Check for faulty connection at ignition coil. Was a problem found?	—	Verify repair	Go to Step 4
4	Check for faulty connection at PCM connector. Was a problem found?	—	Verify repair	Go to Step 5
5	1. Ignition “ON,” engine “OFF.” 2. Back probe the ignition control circuit 6 at the PCM with a DVM. Is the voltage near the specified value?	25-55 mV	Go to Step 6	Go to Step 9
6	1. Ignition “ON,” engine running. 2. Back probe the ignition control circuit at the PCM for the cylinder being tested. Is the voltage in the specified range, rapidly toggling back and forth to a reading 20-50 mV higher?	100-180 mV	Go to Step 7	Go to Step 13
7	1. Ignition “OFF.” 2. Disconnect the 3-pin connector at the ignition coil. 3. Check ignition control circuit 6 voltage at the ignition coil connector while cranking the engine. Does the voltage measure between the specified values?	200-1200 mV	Go to Step 8	Go to Step 11
8	Replace the ignition coil. Is the action complete?	—	Verify repair	—
9	1. Ignition “OFF.” 2. Disconnect the PCM and the ignition coil. 3. Check ignition control circuit 6 for short to ground. Was a problem found?	—	Verify repair	Go to Step 10
10	Check ignition control circuit 6 for short to voltage. Was a problem found?	—	Verify repair	Go to Step 13
11	Check for an open ignition control circuit 6. Was the ignition control circuit open?	—	Go to Step 12	Go to Step 13
12	Repair the open ignition control circuit. Is the action complete?	—	Verify repair	—
13	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0404 EGR Open Stuck

Circuit Description

The powertrain control module (PCM) monitors the EGR valve pintle position input to ensure that the valve responds properly to commands from the PCM, and to detect a fault if pintle position is different from commanded position. If the PCM detects a pintle position signal indicates more than 15 points different between current and commanded and more than 15 seconds, the PCM will set DTC P0404.

Conditions for Setting the DTC

- Ignition voltage is between 11 and 16 volts.
- Intake Air temp is more than 3°C.
- Desire EGR position is more than 0.
- The difference between desired EGR and current EGR is less than 3%.
- Difference EGR pintle position between current and commanded position becomes more than 15% and last more than 15 seconds, and this condition meets three times in a trip. Then it trigger, the PCM lights on.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) as soon as failure detected after consecutive 2nd trip in which the fault is detected.

- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0404 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0404 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Excessive carbon deposit on EGR valve shaft may cause EGR stuck open or unsmooth operation. Those carbon deposit may occur by unusual port operation. Clean up carbon may make smooth function of EGR valve.
- Poor connection or damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the EGR actual position display on the Tech 2 while moving connectors and wiring harnesses related to EGR valve. A change in the display will indicate the location of the fault.

DTC P0404 – EGR Open Stuck

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "ON," engine "OFF", review and record Tech 2 Failure Records Data. 2. Operate the vehicle within Failure Records conditions as noted. 3. Using a Tech 2, monitor "DTC" info for DTC P0404 until the DTC P0404 test runs. Note the result. Does the Tech 2 indicates DTC P0404 failed this ignition?	—	Go to Step 3	Refer to <i>Diagnostic Aids</i>
3	1. Disconnect the EGR valve harness connector. 2. Inspect the EGR valve and connectors for damaged pin or terminals. Were there any damaged pins or terminals?	—	Go to Step 4	Go to Step 5
4	Repair the damaged pin or terminal.	—	Verify repair	Is the action complete?
5	1. Remove EGR valve from Engine. 2. Inspect EGR valve whether there is any excessive carbon deposit on EGR shaft. Was excessive carbon deposit on EGR valve shaft?	—	Go to Step 6	Go to Step 7
6	1. Clean up EGR valve shaft and inside of EGR valve. 2. Visually inspect damage of pintle and seat if is bent, leakage may occur. Was there any severe damage which affects function?	—	Go to Step 8	Verify repair Go to Step 7
7	1. Reconnect. 2. Ignition "OFF". 3. Install the Tech 2. 4. Run the engine at idle. 5. On the Tech 2, select EGR control test. 6. Use the "UP" arrow to increase the EGR from 0% to 40%. Did EGR work properly?	—	—	Go to Step 8
8	Replace the EGR valve. Does DTC P0404 still fail "DTC" test on the Tech 2?	—	Go to Step 9	Verify repair
9	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0405 EGR Low Voltage

D06RW055

Circuit Description

The powertrain control module (PCM) monitors the EGR valve pintle position input to ensure that the valve responds properly to command from the PCM. If current pintle position voltage indicates less than 0.1 V and last more than 10 seconds, then the PCM will set DTC P0405.

Conditions for Setting the DTC

- Ignition voltage is between 11 and 16 volts.
- EGR pintle position output voltage is less than 0.1 volt and last more than 10 sec. Action taken when the DTC sets.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) as soon as failure detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0405 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0405 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection or damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the EGR actual position display on the Tech 2 while moving connectors and wiring harnesses related to EGR valve. A change in the display will indicate the location of the fault.

DTC P0405 – EGR Low Voltage

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "ON," engine "OFF", review and record Tech 2 Failure Records Data. 2. Operate the vehicle within Failure Records conditions as noted. 3. Using a Tech 2, monitor "DTC" info for DTC P0405 until the DTC P0405 test runs. Note the result. Does the Tech 2 indicates DTC P0405 failed this ignition?	—	Go to Step 3	Refer to <i>Diagnostic Aids</i>
3	1. Disconnect the EGR valve harness connector. 2. Inspect the EGR valve and connectors for damaged pin or terminals. Were there any damaged pins or terminals?	—	Go to Step 4	Go to Step 5
4	Repair the damaged pin or terminal. Is the action complete?	—	Verify repair	—
5	1. Disconnect the EGR harness connector. 2. Ignition "ON". 3. At the EGR valve, use a DVM to check the voltage at the 5 volt reference wire (RED) and ground (B). Did the DVM indicate the specified value?	4–6 V	Go to Step 6	Go to Step 7
6	1. Disconnect the EGR harness connector. 2. Measure resistance between terminal B and D. Was resistance in range?	5–5.5 K Ω	Go to Step 10	Go to Step 17
7	1. Ignition "ON". 2. At the PCM connector, backprobe with a DVM at the 5 volt reference for the EGR valve. Did the DVM indicate the specified value?	4–6 V	Go to Step 8	Go to Step 18
8	Repair the open 5 volt reference circuit. Is the action complete?	—	Verify repair	—
9	Repair the damaged sensor ground wire. Is the action complete?	—	Verify repair	—
10	1. Disconnect the EGR harness 2. Use an ohmmeter to measure between the pintle position pin and the sensor ground pin on the EGR valve. NOTE: J-35616 Connector Test Adapter Kit may be useful for gaining access to the recessed pins on the valve. Was the ohmmeter reading approximately equal to the specified value?	1 to 1.25 K Ω	Go to Step 13	Go to Step 17
11	1. Ignition "ON". 2. Backprobe with a DVM to measure voltage at EGR valve pintle position pin and sensor ground pin. Was voltage in range?	Less than 0.1 V	Go to Step 17	Go to Step 12

DTC P0405 – EGR Low Voltage (Cont'd)

Step	Action	Value(s)	Yes	No
12	1. Ignition "ON". 2. Backprobe with a DVM to measure voltage at PCM sensor ground pin and pintle position pin. Was voltage in range?	Less than 0.1 V	Go to <i>Step 13</i>	Go to <i>Step 18</i>
13	1. Ignition "OFF". 2. Disconnect the EGR harness. 3. Check short circuit between EGR pintle position circuit and EGR ground circuit. Was any short circuit?	—	Go to <i>Step 14</i>	Go to <i>Step 18</i>
14	Locate and repair the short to ground in the pintle position circuit Is the action complete?	—	Verify repair	—
15	1. Ignition "OFF". 2. Disconnect the PCM. 3. Ignition "ON". 4. Measure the voltage between the EGR pintle position circuit and ground. Is the measured voltage near the specified value?	Less than 0.1 V	Go to <i>Step 17</i>	Go to <i>Step 16</i>
16	Check for a short circuit between other wires and the pintle position circuit Is there any short circuit?	—	Repair short circuit Verify repair	Go to <i>Step 17</i>
17	Replace the EGR valve. Does DTC P1404 still fail "DTC test on the Tech 2"?	—	Go to <i>Step 18</i>	Verify repair
18	Examine the PCM pin and terminal connection. Was there a damaged terminal?	—	Go to <i>Step 4</i>	Go to <i>Step 19</i>
19	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0406 EGR High Voltage

D06RW055

Circuit Description

The powertrain control module (PCM) monitors the EGR valve pintle position input to ensure that the valve responds properly to command from the PCM. If current pintle position voltage indicates more than 4.8 V and last more than 10 seconds, then the PCM will set DTC P0406.

Conditions for Setting the DTC

- Ignition voltage is between 11 and 16 volts.
- EGR pintle position output voltage is more than 4.8 volt and last more than 10 sec.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) as soon as failure detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0406 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0406 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection or damaged harness – Inspect the wiring harness for damage. If the harness appears to be OK, observe the EGR actual position display on the Tech 2 while moving connectors and wiring harnesses related to EGR valve. A change in the display will indicate the location of the fault.

DTC P0406 – EGR High Voltage

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "ON," engine "OFF", review and record Tech 2 Failure Records Data. 2. Operate the vehicle within Failure Records conditions as noted. 3. Using a Tech 2, monitor "DTC" info for DTC P0406 until the DTC P0406 test runs. Note the result. Does the Tech 2 indicates DTC P0406 failed this ignition?	—	Go to Step 3	Refer to <i>Diagnostic Aids</i>
3	1. Disconnect the EGR valve harness connector. 2. Inspect the EGR valve and connectors for damaged pin or terminals. Were there any damaged pins or terminals?	—	Go to Step 4	Go to Step 5
4	Repair the damaged pin or terminal. Is the action complete?	—	Verify repair	Is the action complete?
5	1. Disconnect the EGR harness connector. 2. Ignition "ON". 3. At the EGR valve, use a DVM to check the voltage at the 5 volt reference wire (RED). Did the DVM indicate the specified value?	4–6 V	Go to Step 8	Go to Step 6
6	1. Ignition "ON". 2. At the PCM connector, backprobe with a DVM at the 5 volt reference for the EGR valve. Did the DVM indicate the specified value?	4–6 V	Go to Step 7	Go to Step 16
7	Repair the open 5 volt reference circuit Is the action complete?	—	Verify repair	—
8	1. Ignition "OFF" 2. Disconnect the EGR harness. 3. Use a DVM to check for an resistance between D (5 V reference) and B (Sensor Ground) at EGR sensor terminals. NOTE: J-35616 Connector Test Adapter Kit may be useful for gaining access to the recessed pins on the valve. Was the measured resistance in range?	5 to 5 K Ω	Go to Step 9	Go to Step 15
9	1. Ignition "OFF". 2. Disconnect the EGR harness. 3. Use a DVM to check for an resistance between B and C at EGR sensor terminal. Is there an open circuit?	—	Go to Step 15	Go to Step 10
10	1. Ignition "OFF". 2. Disconnect the EGR harness at PCM connector. 3. Use a DVM to check for shorted wire between A1 and B7. Is there a shorted wire?	—	Go to Step 14	Go to Step 11

DTC P0406 – EGR High Voltage (Cont'd)

Step	Action	Value(s)	Yes	No
11	1. Ignition "ON". 2. Use a DVM to backprobe at terminal C of EGR valve for voltage. Was measured voltage more than 4.8 V?	more than 4.8 V	Go to <i>Step 12</i>	Go to <i>Step 12</i>
12	1. Ignition "ON". 2. Stay the EGR harness connected. 3. Check voltage by backproving at PCM B7 terminal. Was voltage more than 4.8 V?	4.8 V	Go to <i>Step 16</i>	Go to <i>Step 13</i>
13	1. Locate short circuit at EGR harness between RED to RED or GREEN, RED to YEL. 2. Replace EGR harness. Is the action complete?	—	Verify repair	—
14	Replace EGR harness. Is the action complete?	—	Verify repair	—
15	Replace the EGR valve. Does DTC P1404 still fail "DTC test on the Tech 2?"	—	Go to <i>Step 16</i>	Verify repair
16	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0502 VSS Circuit Low Input

D06RX021

Circuit Description

The vehicle speed sensor has a magnet rotated by the transmission output shaft. Attached to the sensor is a hall effect circuit that interacts with the magnetic field created by the rotating magnet. A 12-volt operating supply for the speed sensor hall circuit is supplied from the meter fuse. The VSS pulses to ground the 9-volt signal sent from the powertrain control module (PCM) on the reference circuit. The PCM interprets vehicle speed by the number of pulses to ground per second on the reference circuit.

Conditions for Setting the DTC

- Engine is running.
- Engine coolant temperature is above 60°C (140°F).
- Engine speed is between 1800 RPM and 2500 RPM.
- Throttle angle is between 10% and 40%.
- Engine load is greater than 50 kPa.
- MAP sensor indicates greater than 50 kPa manifold pressure.

- PCM detects no VSS signal for 12.5 seconds over a period of 25 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first time the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0502 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0502 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

9. To avoid backprobing the VSS and possibly damaging a seal or terminal, the VSS output can be tested at the point where the transmission harness connected to the engine harness. The green 16-way connector is adjacent to a blue 16-way connector, and it can be easily accessed by removing the air cleaner assembly. The green 16-way connector is separated, and battery voltage is applied to the VSS through the yellow wire at one corner of the connector. The VSS output can be monitored with a DVM connected to the blue wire with a black tracer. The two wires are next to each other in the 16-way connector. The test connections are made on the transmission side of the connector, the side that is not clipped to the body sheetmetal.

14. The speedometer-to-PCM VSS signal wire is spliced to a wire leading to the cruise control module. If a short to ground or voltage is found between the PCM and speedometer, it could be located between the splice and the cruise control module.

DTC P0502 –VSS Circuit Low Input

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Does the speedometer work?	—	Go to Step 10	Go to Step 3
3	1. Disconnect the VSS connector. 2. Ignition "ON." 3. Using a test light to battery +, probe the connector ground wire. Did the light illuminate?	—	Go to Step 5	Go to Step 4
4	Repair the sensor ground. Is the action complete?	—	Verify repair	—
5	1. Ignition "ON," sensor disconnected. 2. Using a DVM, measure at the VSS connector between ground and voltage supply. Was the measurement near the specified value?	Battery voltage	Go to Step 7	Go to Step 6
6	Repair the open or short to ground which may have blown the meter fuse. Is the action complete?	—	Verify repair	—
7	1. Ignition "ON," VSS disconnected. 2. Using a DVM, measure at the VSS connector between ground and the blue/black wire from the speedometer. Was the measurement near the specified value?	7.5-8 V	Go to Step 9	Go to Step 8
8	Check for an open or short circuit between the speedometer and the VSS. Was an open or short circuit located?	—	Verify repair	Go to Step 9
9	Replace the speedometer. Is the action complete?	—	Verify repair	—

DTC P0502 –VSS Circuit Low Input (Cont'd)

Step	Action	Value(s)	Yes	No
10	1. Ignition "OFF." 2. Disconnect the MAF sensor. The connector attaches the VSS wires from the transmission harness to the left-side engine harness. 3. Disconnect the green 16-way connector. 4. Select a terminal adapter from kit 5-8840-0385-0 that can be used with a jumper to supply B+ to the yellow (transmission side of the connector). There are 2 yellow wires at that connector, but the correct one is in the corner position. 5. Use another terminal adapter to attach a voltmeter to the blue wire with a black tracer (next to the wire in the previous step.) 6. At the transmission side of the green 16-way connector, locate the black wire next to the VSS yellow ign+ wire. The black wire is the VSS ground wire. Use a terminal adapter to attach a jumper to ground to the black VSS ground wire at the transmission side of the connector. 7. Raise the rear wheels off the ground with transmission in neutral. Does the DVM toggle back and forth between 0.6 V and 10 V as the wheels (and driveshaft) are rotated?	—	Go to Step 12	Go to Step 11
11	Replace the VSS. Is the action complete?	—	Verify repair	—
12	Check for an open or short between the PCM and the speedometer. Was a problem found?	—	Verify repair	Go to Step 13
13	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0562 System Voltage Low

D06RX022

Circuit Description

The powertrain control module (PCM) monitors the system voltage on the ignition feed terminal to the PCM. A system voltage DTC will set whenever the voltage is below a calibrated value.

Conditions for Setting the DTC

- Ignition "ON."
- System voltage is below 11.5 volts for 15 minutes.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store as Failure Records conditions which were present when the DTC was set. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- A history DTC P0562 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0562 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

If the DTC sets when an accessory is operated, check for a poor connection or excessive current draw.

DTC P0562 – System Voltage Low

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	Using a DVM, measure the battery voltage at the battery. Is the battery voltage greater than the specified value?	11.5 V	Go to <i>Step 3</i>	Charge battery, then go to <i>Step 3</i>
3	1. Install a Tech 2. 2. Select "Ignition Volts" on the Tech 2. 3. Start the engine and raise the engine speed to the specified value. 4. Load the electrical system by turning on the headlights, high blower, etc. Is the ignition voltage approximately equal to the specified value?	2000 RPM 12.8-14.1 V	Go to <i>Step 4</i>	Go to <i>Starting/Charging</i>
4	1. Ignition "OFF." 2. Disconnect the PCM connector at the PCM. 3. Using a DVM, measure the battery voltage at the PCM connector A-4. Is it approximately equal to battery voltage?	—	Check for excessive current draw with ignition "OFF," engine "OFF."	Go to <i>Step 5</i>
5	1. Check for faulty connections at the PCM harness terminals. 2. Repair as necessary. Was a repair necessary?	—	Verify repair	Go to <i>Step 6</i>
6	Check for an open battery feed circuit to the PCM. Is the action complete?	—	Verify repair	Go to <i>Step 7</i>
7	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0563 System Voltage High

Circuit Description

The powertrain control module (PCM) monitors the system voltage on the ignition feed terminals to the PCM. A system voltage DTC will set whenever the voltage is above a calibrated value.

Conditions for Setting the DTC

- Ignition "ON."
- System voltage is above 16 volts for 15 minutes.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).

- The PCM will store as Failure Records only conditions which were present when the DTC was set. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- A history DTC P0563 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0563 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

If the DTC sets when an accessory is operated, check for a poor connection or defective accessory.

DTC P0563 – System Voltage High

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Using a DVM, measure the battery voltage at the battery. Is the battery voltage less than the specified value?	11.5 V	Go to Step 3	Go to Step 4
3	1. Charge the battery and clean the battery terminals. 2. Clean the battery ground cable connection if corrosion is indicated. Is the battery voltage less than the specified value?	11.5 V	Replace battery	Go to Step 4
4	1. Turn "OFF" all the accessories. 2. Install a Tech 2. 3. Select the ignition voltage parameter on the Tech 2. 4. Start the engine and raise the engine RPM to the specified value. Is the voltage more than 2.5 volts greater than the measurement taken in step 2 or 3?	2000 RPM	Go to <i>Starting/Charging</i>	Go to Step 5
5	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P0601 PCM Memory

Circuit Description

The powertrain control module (PCM) used in this vehicle utilizes an electrically erasable programmable read-only memory (EEPROM). The EEPROM contains program information and the calibrations required for engine, transmission, and powertrain diagnostics operation. Unlike the PROM used in past applications, the EEPROM is not replaceable.

Conditions for Setting the DTC

- The PCM detects an internal program fault (check sum error).

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).

- The PCM will store conditions which were present when the DTC was set in the Failure Records data only.

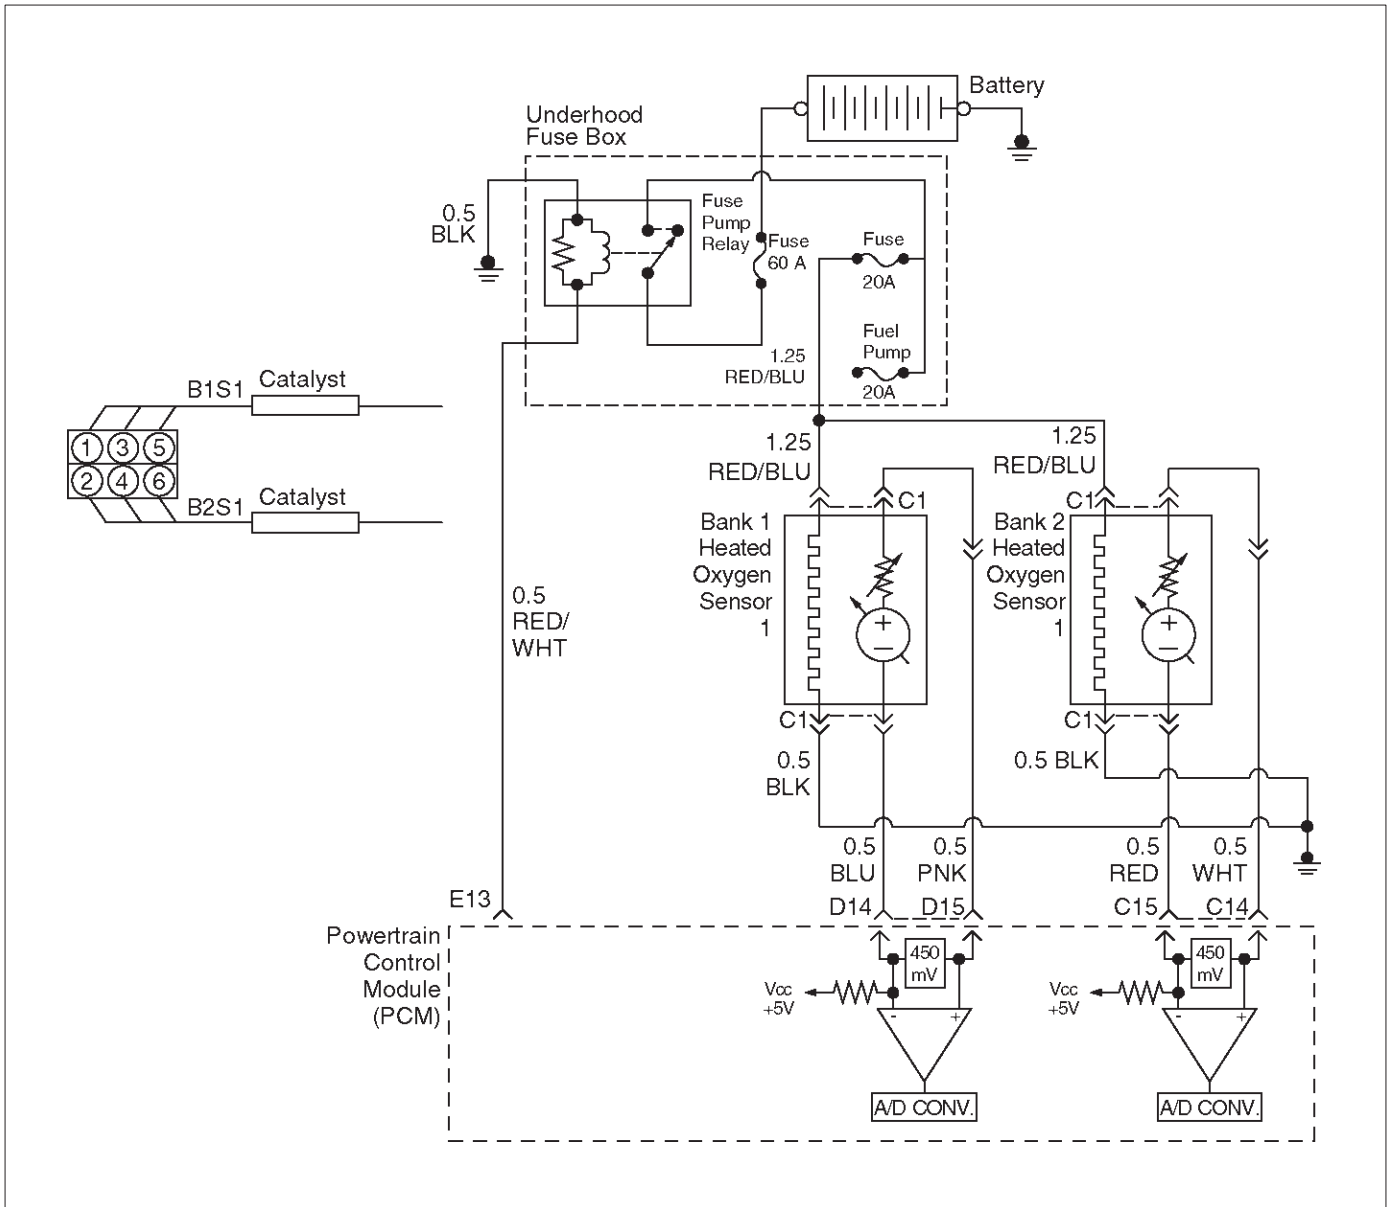

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P0601 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P0601 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

DTC P0601 – PCM Memory

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1171 Fuel System Lean During Acceleration

Circuit Description

The powertrain control module (PCM) internal circuitry can identify if the vehicle fuel system is capable of supplying adequate amounts of fuel during heavy acceleration (power enrichment). The PCM monitors the voltage of the oxygen sensor during power enrichment. When a power enrichment mode of operation is requested during “closed loop” operation (by heavy acceleration), the PCM will provide more fuel to the engine. Under these conditions the PCM should detect a “rich” condition (high oxygen sensor voltage). If this “rich” exhaust is not detected at this time, a DTC P1171 will set. A plugged fuel filter, restricted fuel line, restricted in-tank filter or defective fuel pump can prevent adequate amounts of fuel from being supplied during power enrichment mode.

Conditions for Setting the DTC

- No related DTCs.

- Engine is operating in “closed loop power enrichment” mode for 3 seconds.
- Engine coolant temperature is above 60°C (140°F).
- While in “power enrichment” mode the oxygen sensor voltage remains below 400 mV for 3 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) the first the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL “OFF” on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1171 will clear after 40 consecutive warm-up cycles have occurred without a fault.

- DTC P1171 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

- A restricted fuel filter or fuel line, restricted in-tank filter, or a defective fuel pump may supply adequate amounts of fuel at idle, but may not be able to supply enough fuel during heavy acceleration.
- Water or alcohol in the fuel may cause low HO2S voltage during acceleration.
- Check for faulty or plugged fuel injector(s).
- Check for low fuel.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

4. When the engine is idling or at steady cruise, the HO2S voltage should vary from between approximately 100 mV to 900 mV. It is possible to measure a satisfactory fuel pressure at idle even though the pressure may drop at high flow requirements. It may be necessary to watch fuel pressure at high engine load.
5. Wrap a shop towel around the fuel pressure connector to absorb any small amount of fuel leakage that may occur when installing gauge. Ignition “ON,” pump pressure should be 280-320kPa.
7. Add Caution: Use correct pliers so damage to fuel lines will not occur.

DTC P1171 – Fuel System Lean During Acceleration

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Are any component-related DTCs set?	—	Go to component DTC charts	Go to Step 3
3	1. Check the vehicle's fuel tank for an adequate amount of fuel. 2. Add fuel to the vehicle's fuel tank if the tank is almost empty. Was fuel added to the vehicle's fuel tank?	—	Go to Step 4	Go to Step 5
4	1. Place the transmission in park. 2. Using a Tech 2, observe HO2S 1 voltage while running warm engine 75°C-95°C (167°F-203°F) at 1200 RPM. 3. HO2S 1 voltage should vary within the specified range. 4. Quickly open the throttle halfway for a few seconds. Did the voltage suddenly rise toward the high end of the specified range?	100-900 mV	Go to <i>Fuel System Diagnosis</i>	Go to Step 5
5	1. Disconnect the fuel pump relay and crank the engine to relieve the fuel pressure. 2. Install the fuel pressure gauge. 3. Start the engine and idle at normal operating temperature. 4. Disconnect the vacuum line going to the fuel pressure regulator. With the engine running, is the fuel pressure within the specified range?	280-325 kPa (41-46 psi)	Go to <i>OBD System Check</i>	Go to Step 6
6	Check for restricted fuel lines or restricted in-line filter. Was a problem found?	—	Verify repair	Go to Step 7
7	1. Ignition "OFF." 2. Remove the fuel pump relay and replace it with a fused jumper which will connect the relay's battery terminal to the terminal leading to the fuel pump fuse. 3. While the fuel pump is operating, use pliers to slowly close the return line (do not exceed the first specified value). Using the pliers to restrict the return line, can the fuel pressure be manipulated to exceed the second specified value?	414 kPa (60 psi) 325 kPa (46 psi)	Go to <i>Diagnostic Aids</i>	Go to Step 8
8	Check for: <ul style="list-style-type: none"> ● Faulty fuel pump ● Restricted fuel pump strainer (sock) ● Incorrect fuel pump ● Incorrect fuel being used ● Hot fuel Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1380 ABS Rough Road ABS System Fault

Circuit Description

The powertrain control module (PCM) monitors ABS fault signal. When PCM receives fault signal, PCM will set DTC P1380.

Conditions for Setting the DTC

- Vehicle speed is more than 5 mph.
- Load is less than 99%.
- Engine revolution is less than 6250 rpm.
- PCM receives ABS fault signals from ABS unit.
- Ignition on.
- Misfire DTCs exist.
- 100 test failures within 120 test samples.

Action Taken When the DTC Sets

- The PCM will store DTC 1380 only, no MIL turn on.

Conditions for Clearing the MIL/DTC

- A history DTC P1380 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC 1380 can be cleared by using Tech-II or disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- PCM and ABS communication line short circuit to other line may cause faulty signal. Inspect communication line.
- Follow ABS ECU diagnosis procedure, refer to ABS procedure page.

DTC P1380 – ABS Rough Road ABS System Fault

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	1. Ignition "ON," engine "OFF", review and record Tech 2 Failure Records Data. 2. Operate the vehicle within Failure Records conditions as noted. 3. Using a Tech 2, monitor "DTC" info for DTC P1380. Note the result. Does the Tech 2 indicates DTC P1380 DTCs failed this ignition?	—	Refer to ABS diagnosis After inspecting ABS, repeat <i>Step 2</i> If problem still exists, go to <i>Step 3</i>	Clear DTC by Tech 2
3	Check short circuit among communication line of PCM/ABS and others. Does short circuit exist?	—	Repair wiring Verify repair	Go to <i>Step 4</i>
4	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1381 ABS Rough Road Class 2 Serial Link Error

Circuit Description

The powertrain control module (PCM) monitors no ABS signal. When PCM does not receive ABS signal, PCM will set DTC P1381.

Conditions for Setting the DTC

- PCM does not receive ABS signals from ABS ECU.
- Vehicle speed is more than 0 mph.
- Load is less than 99%.
- Engine revolution is less than 6250rpm.
- 2.5 second after key on.
- Misfire DTCs exist.
- 100 test failures within 120 test samples.

Action Taken When the DTC Sets

- The PCM will store DTC 1381 only, MIL on.

Conditions for Clearing the MIL/DTC

- A history code DTC P1381 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1381 can be cleared by Tech-II or by disconnecting the PCM battery feed.

Diagnostic Aids

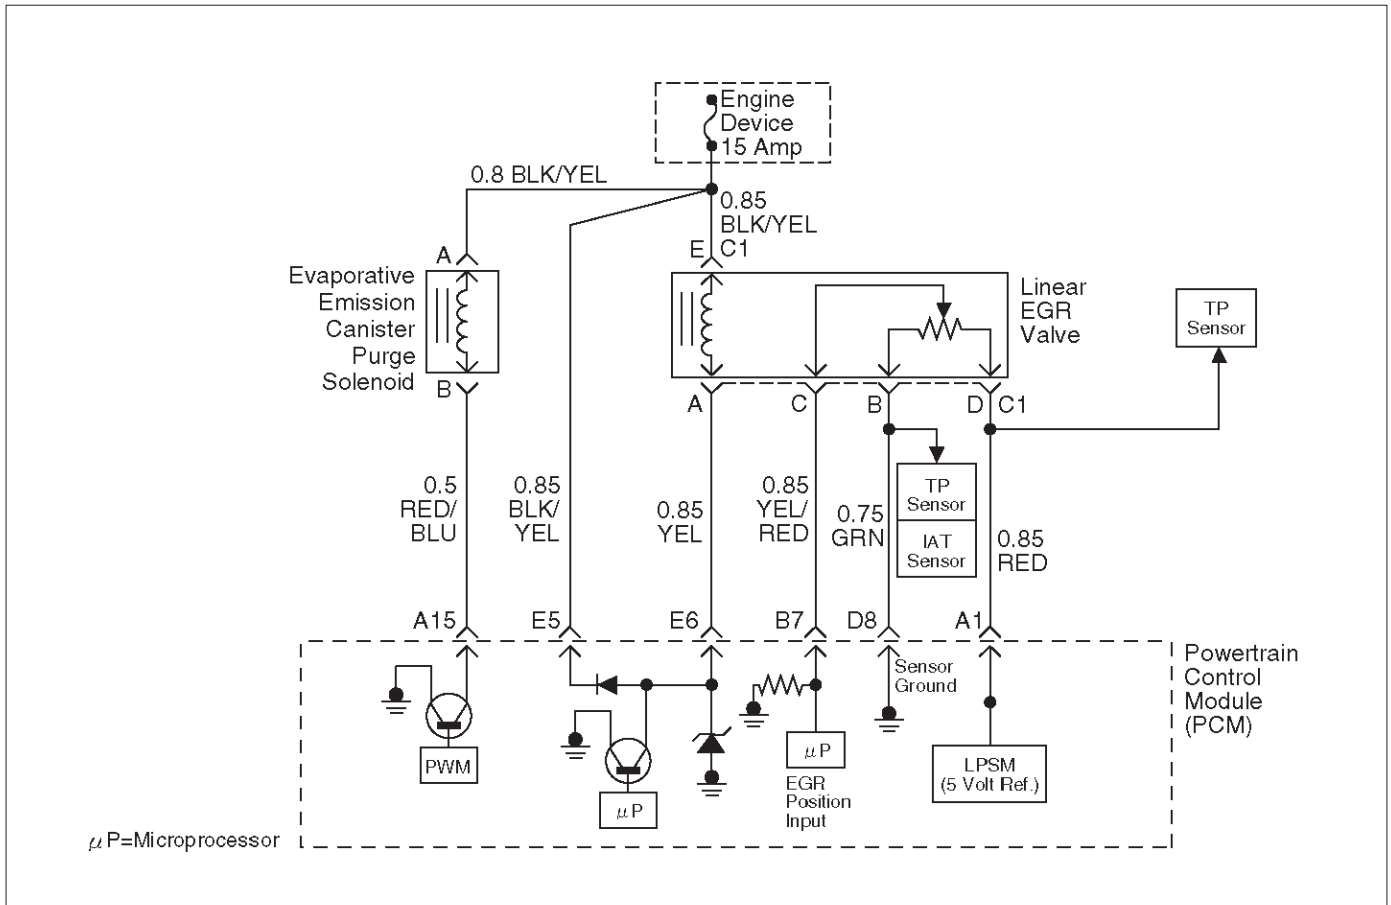

Check for the following conditions:

- Inspect open circuit of communication wire between ABS ECU and PCM.
 - Follow ABS ECU diagnosis procedure.
- Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P1381 – ABS Rough Road Class 2 Serial Link Error

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	1. Ignition "ON," engine "OFF", review and record Tech 2 Failure Records Data. 2. Operate the vehicle within Failure Records conditions as noted. 3. Using a Tech 2, monitor "DTC inf. for DTC P1381. Note the result. Does the Tech 2 indicates DTC P1381 DTCs failed this ignition?	—	Refer to ABS diagnosis After inspecting ABS, repeat <i>Step 2</i> If problem still exists, go to <i>Step 3</i>	Clear DTC by Tech 2
3	Check open circuit among communication line of PCM/ABS and others. Does short circuit exist?	—	Repair wiring Verify repair	Go to <i>Step 4</i>
4	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1404 EGR Stuck Closed

D06RW055

Circuit Description

The powertrain control module (PCM) monitors the EGR valve pintle position input to ensure that the valve responds properly to commands from the PCM, and to detect a fault if current pintle zero position is different from the learned zero position. If the PCM detects a pintle position signal indicates more than 30 % different between current zero position and the learned zero position for more than 5 seconds, and this condition exists 3 times during trip, then the PCM will set DTC P1404.

Conditions for Setting the DTC

- Ignition voltage is between 11 and 16 volts.
- Intake Air temp is more than 3°C.
- Desired EGR position is 0.
- Difference of EGR pintle position between current and the learned zero is more than 30 % for more than 5 seconds, and exists three time to the above condition during a trip the PCM will set DTC 1404. Then it trigger the PCM lights on.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after consecutive 2nd trip in which the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1404 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1404 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Excessive carbon deposit on EGR valve shaft and/or foreign material may cause the EGR valve not to fully seated. The carbon deposit may occur by unusual port operation. Remove foreign material and/or excessive carbon deposit on EGR valve shaft may allow the EGR valve to be fully seated.
- Poor connection or damaged harness – Inspect the wiring harness for damage.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P1404 – EGR Stuck Closed

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition "ON," engine "OFF", review and record Tech 2 Failure Records Data. 2. Operate the vehicle within Failure Records conditions as noted. 3. Using a Tech 2, monitor "DTC inf. for DTC P1404 until the DTC P1404 test runs. Note the result. Does the Tech 2 indicates DTC P1404 failed this ignition?	—	Go to Step 3	Refer to <i>Diagnostic Aids</i>
3	1. Disconnect the EGR valve harness connector. 2. Inspect the EGR valve and connectors for damaged pin or terminals. Were there any damaged pins or terminals?	—	Go to Step 4	Go to Step 5
4	Repair the damaged pin or terminal. Is the action complete?	—	Verify repair	—
5	1. Remove EGR valve from Engine. 2. Inspect EGR valve for is any excessive carbon deposit on EGR shaft. 3. Inspect for any foreign material inside of EGR valve. Was excessive carbon deposit on EGR valve shaft and/or foreign material in EGR valve ?	—	Go to Step 6	Go to Step 7
6	1. Clean up EGR valve shaft and inside of EGR valve. 2. Remove foreign material from EGR valve. 3. Visually inspect damage of pintle and seat to see if it is bent If damaged leakage may occur. Was there any severe damage which affects function?	—	Go to Step 8	Verify repair Go to Step 7
7	1. Install the EGR valve. 2. Ignition "OFF". 3. Install the Tech 2. 4. Run the engine at idle. 5. On the Tech 2, select EGR control test. 6. Use the "UP" arrow to increase the EGR from 0% to 40%. Did EGR work properly?	—	—	Go to Step 8
8	1. Reset the learned zero EGR valve position. 2. Repeat step 7. Did EGR work properly?	—	Verify repair	Go to Step 9
9	Replace the EGR valve. Does DTC P1404 still fail "DTC" test on the Tech 2?	—	Go to Step 10	Verify repair
10	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1508 IAC System Low RPM

T321115

Circuit Description

The powertrain control module (PCM) controls engine idle speed by adjusting the position of the idle air control (IAC) motor pintle. The IAC is a bi-directional stepper motor driven by two coils. The PCM applies current to the IAC coils in steps (counts) to extend the IAC pintle into a passage in the throttle body to decrease air flow. The PCM reverses the current to retract the pintle, increasing air flow. This method allows highly accurate control of idle speed and quick response to changes in engine load. If the PCM detects a condition where too low of an idle speed is present and the PCM is unable to adjust idle speed by increasing the IAC counts, DTC P1508 will set, indicating a problem with the idle control system.

Conditions for Setting the DTC

- No Tech 2 test is being run.
- None of these DTCs are set: TP sensor, VSS, ECT, EGR, fuel system, MAF, MAP, IAT, canister purge, injector control or ignition control.
- Barometric pressure is above 75 kPa.
- Engine coolant temperature (ECT) is above 50°C (120°F).
- Vehicle speed is less than 1 mph.
- The engine has been running for at least 125 seconds.
- Canister purge duty cycle is above 10%.
- Ignition voltage is between 9.5 volts and 16.7 volts.
- The throttle is closed.
- Engine speed is lower than desired idle.

- Engine speed is more than 100-200 RPM lower than desired idle, based upon coolant temperature.
- All of the above conditions are met for 5 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1508 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1508 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM or IAC motor – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring for damage.

- Restricted air intake system – Check for a possible collapsed air intake duct, restricted air filter element, or foreign objects blocking the air intake system.
- Throttle body – Check for objects blocking the IAC passage or throttle bore, excessive deposits in the IAC passage and on the IAC pintle, and excessive deposits in the throttle bore and on the throttle plate.
- Large vacuum leak – Check for a condition that causes a large vacuum leak, such as an incorrectly installed or

faulty PCV valve or a disconnected brake booster hose.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

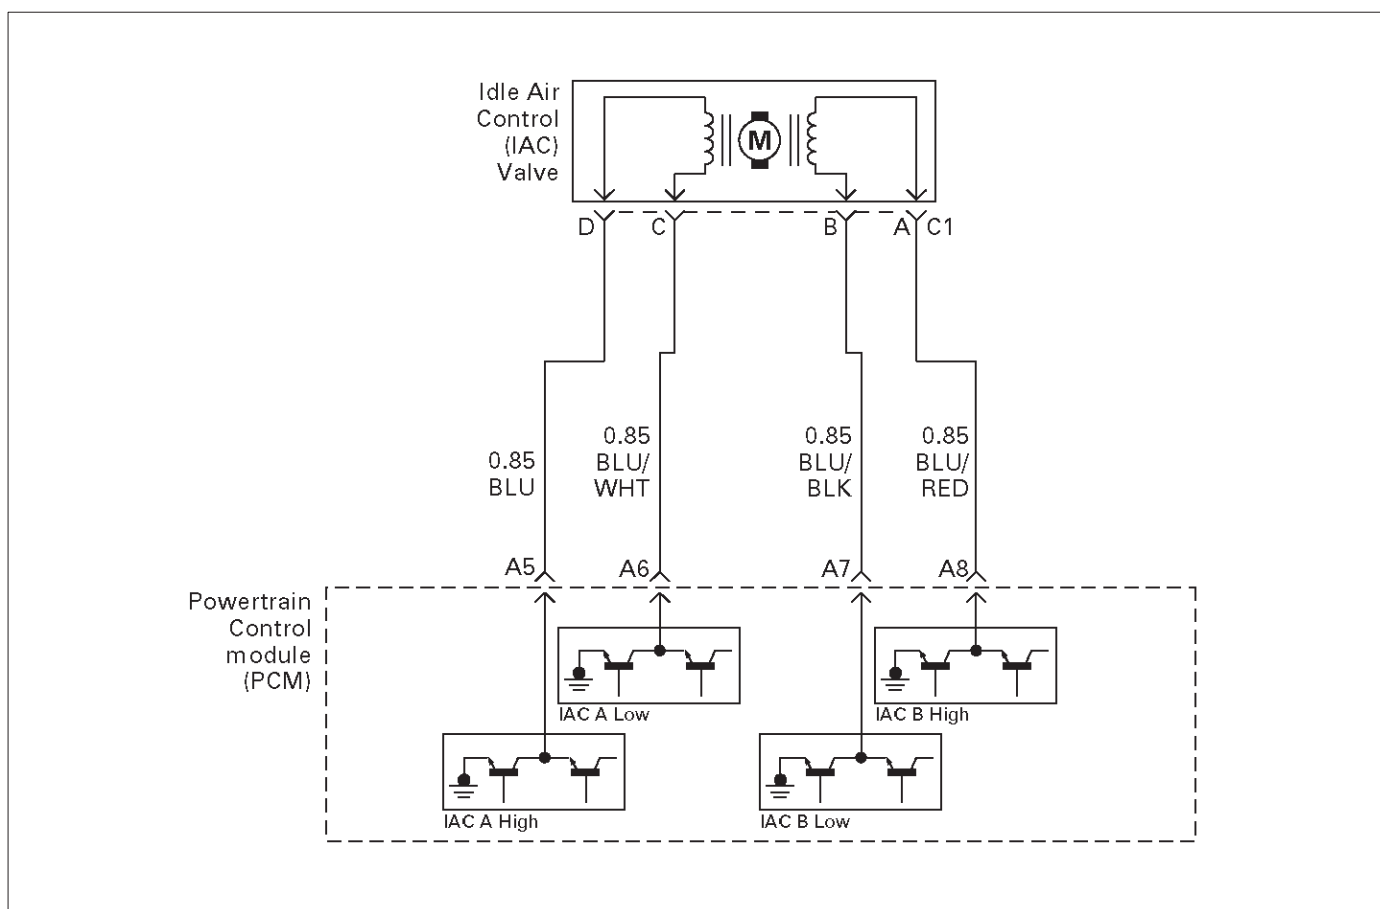

DTC P1508 –IAC System Low RPM

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	<p>1. Start the engine.</p> <p>2. Turn all accessories “OFF”(A/C, rear defroster, etc).</p> <p>3. Using a Tech 2, command RPM up to 1500, down to 500, and then up to 1500 while monitoring the “Engine Speed” on the Tech 2.</p> <p>NOTE: This Tech 2 command may cause the engine to “cut out” when RPM goes above 1500. If this occurs, the “cutting out” will stop when the Tech 2 command for the test is discontinued, or if the Tech 2 command is changed to less than 1500 RPM.</p> <p>Does the “Engine Speed” remain within the specified value of the “Desired Idle” for each RPM command?</p>	± 50 RPM	No trouble found. 3	<p>1. Disconnect the IAC.</p> <p>2. Install IAC Noid Light 5-8840-2312-0 or equivalent.</p> <p>3. With the engine running, command RPM up to 1500, down to 500, and then up to 1500 while observing the noid light.</p> <p>NOTE: This Tech 2 command may cause the engine to “cut out” when RPM goes above 1500. If this occurs, the “cutting out” will stop when the Tech 2 command for the test is discontinued, or if the Tech 2 command is changed to less than 1500 RPM.</p> <p>Does each noid light cycle red and green (never “OFF”)?</p>	—	Go to <i>Step 5</i>	Go to <i>Step 4</i>
4	<p>1. Check the following circuits for an open, short to voltage, short ground, or poor connections at the PCM:</p> <ul style="list-style-type: none"> ● IAC “A” Low. ● IAC “A” High. ● IAC “B” Low. ● IAC “B” High. <p>2. If a problem is found, repair as necessary,</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 8</i>

DTC P1508 –IAC System Low RPM (Cont'd)

Step	Action	Value(s)	Yes	No
5	Visually/physically inspect for following conditions: <ul style="list-style-type: none"> ● Restricted air intake system. Check for a possible collapsed air intake duct, restricted air filter element, or foreign objects blocking the air intake system. ● Throttle body. Check for objects blocking the IAC passage or throttle bore, excessive deposits in the IAC passage and on the IAC pintle, and excessive deposits in the throttle bore and on the throttle plate. Do any of the above require a repair?	—	Refer to appropriate section for on-vehicle service	Go to <i>Step 6</i>
6	1. Check for a poor connection at the IAC harness connector. 2. If a problem is found, replace faulty terminals as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 7</i>
7	Replace the IAC valve. Is the action complete?	—	Verify repair	—
8	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1509 IAC System High RPM

T321115

Circuit Description

The powertrain control module (PCM) controls engine idle speed by adjusting the position of the idle air control (IAC) motor pintle. The IAC is a bi-directional stepper motor driven by two coils. The PCM applies current to the IAC coils in steps (counts) to extend the IAC pintle into a passage in the throttle body to decrease air flow. The PCM reverses the current to retract the pintle, increasing air flow. This method allows highly accurate control of idle speed and quick response to changes in engine load. If the PCM detect a condition where too high of an idle speed is present and the PCM is unable to adjust idle speed by increasing the IAC counts, DTC P1509 will set, indicating a problem with the idle control system.

Conditions for Setting the DTC

- No Tech 2 test is being run.
- None of these DTCs are set: TP sensor, VSS, ECT, EGR, fuel system, MAF, MAP, IAT, canister purge, injector control or ignition control.
- Barometric pressure is above 75 kPa.
- Engine coolant temperature is above 50°C (120°F).
- Engine speed is more than 100-200 RPM higher than desired idle, based upon coolant temperature.
- The engine has been running for at least 125 seconds.
- Vehicle speed is less than 1 mph.
- Canister purge duty cycle is above 10%.
- Ignition voltage is between 9.5 volts and 16.7 volts.
- Engine speed is higher than desired idle.

- All of the above conditions are met for 5 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the malfunction indicator lamp (MIL) after the second consecutive trip in which the fault is detected.
- The PCM will store conditions which were present when the DTC was set as Freeze Frame and in the Failure Records data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1509 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1509 can be cleared by using the Tech 2 "Clear Info" function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM or IAC motor – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring for damage.
- Vacuum leak – Check for a condition that causes a vacuum leak, such as disconnected or damaged hoses, leaks at the EGR valve and the EGR pipe to the

6E2-246 6VD1 3.2L ENGINE DRIVEABILITY AND EMISSIONS

intake manifold, leaks at the throttle body, faulty or incorrectly installed PCV valve, leaks at the intake manifold, etc.

- Throttle body – Check for sticking throttle plate. Also inspect the IAC passage for deposits or objects which keep the IAC pintle from fully extending.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

DTC P1509 –IAC System High RPM

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	<p>1. Start the engine.</p> <p>2. Turn all accessories “OFF” (A/C, rear defroster, etc.).</p> <p>3. Using a Tech 2, command RPM up to 1500, down to 500, and then up to 1500 while monitoring “Engine Speed” on the Tech 2.</p> <p>NOTE: This Tech 2 command may cause the engine to “cut out” when RPM goes above 1500. If this occurs, the “cutting out” will stop when the Tech 2 command for the test is discontinued, or if the Tech 2 command is changed to less than 1500 RPM.</p> <p>Does the “Engine Speed” remain within the specified value of “Desired Idle” for each RPM command?</p>	± 50 RPM	No trouble found. Go to <i>Diagnostic Aids</i>	Go to <i>Step 3</i>
3	<p>1. Disconnect the IAC.</p> <p>2. Install IAC Noid Light 5-8840-2312-0 or equivalent.</p> <p>3. With the engine running, command RPM up to 1500, down to 500, and then up to 1500 while observing the noid light.</p> <p>NOTE: This Tech 2 command may cause the engine to “cut out” when RPM goes above 1500. If this occurs, the “cutting out” will stop when the Tech 2 command for the test is discontinued, or if the Tech 2 command is changed to less than 1500 RPM.</p> <p>Does each noid light cycle red and green (never “OFF”)?</p>	—	Go to <i>Step 5</i>	Go to <i>Step 4</i>
4	<p>1. Check the following circuits for an open, short to voltage, short ground, or poor connections at the PCM:</p> <ul style="list-style-type: none"> ● IAC “A” Low. ● IAC “A” High. ● IAC “B” Low. ● IAC “B” High. <p>2. If a problem its found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 8</i>

DTC P1509 –IAC System High RPM (Cont'd)

Step	Action	Value(s)	Yes	No
5	Visually/physically inspect for the following conditions: <ul style="list-style-type: none"> ● Vacuum leaks. ● Throttle plate or throttle shaft for binding. ● Accelerator and cruise control cables for being misadjusted or for binding. ● Faulty, missing, or incorrectly installed PCV valve. Do any of the above require a repair?	—	Refer to appropriate section for on-vehicle service	Go to <i>Step 6</i>
6	1. Check for a poor connection at the IAC harness connector. 2. If a problem is found, replace faulty terminals as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 7</i>
7	Replace the IAC valve. Is the action complete?	—	Verify repair	—
8	Replace the PCM. Is the action complete?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1625 PCM Unexpected Reset

Circuit Description

The powertrain control module (PCM) monitors unexpected PCM reset. This will not turn on MIL light on, only records code DTC P1625.

Conditions for Setting the DTC

- Clock or COP (Computer Operating Properly) reset.

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store conditions which were present when the DTC was set as Failure Records only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL "OFF" on the third consecutive trip cycle during which the diagnostic has been run and the fault condition is no longer present.
- A history DTC P1625 will clear after 40 consecutive warm-up cycles have occurred without a fault.
- DTC P1625 can be cleared by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- P1625 alone stored does not need diagnosis. Clear DTC code.

DTC P1625 – PCM Unexpected Reset

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	1. Ignition is "ON". 2. Install the Tech 2. 3. Start the engine at let it Idle. 4. On the Tech 2, select "DTC info". Does the Tech 2 indicate DTC P1625 failed?	—	Go to Step 3	Go to <i>Diagnostic Aids</i>
3	1. Ignition is "ON". 2. Clear DTC P1625 by using the Tech 2 "Clear Info". 3. Start the engine at let it Idle. 4. On the Tech 2, select "DTC info". Does the Tech 2 indicate DTC P1625 failed?	—	Go to Step 4	Go to <i>Diagnostic Aids</i>
4	1. Check for aftermarket electronics, such as transceiver, stereos, and anti theft devices. May radiate EMI into the control system if they are improperly installed. (This may cause a false sensor reading and turn on the MIL.) 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	—

Diagnostic Trouble Code (DTC) P1640 Output Driver Module (ODM) “A” Fault

Action Taken When the DTC Sets

- The PCM will not illuminate the malfunction indicator lamp (MIL).
- The PCM will store conditions which were present when the DTC was set as Failure Records only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the MIL/DTC

- A history DTC P1640 will clear after 40 consecutive warm-up cycles occur without a fault.
- DTC P1650 can be cleared by using the Tech 2 “Clear Info” function or by disconnecting the PCM battery feed.

Diagnostic Aids

Check for the following conditions:

- Poor connection at PCM – Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness – Inspect the wiring harness for damage, If the harness appears to be OK, disconnect the PCM, turn the ignition “ON” and observe a voltmeter connected to the suspect driver circuit at the PCM harness connector while moving connectors and wiring harnesses relates to the MIL. A change in voltage will indicate the location of the fault.
- Poor connection at component – Examine for damaged connectors, unplugged connector, or

damaged terminals at the following locations: canister purge solenoid, Fuel level check.

Reviewing the Failure Records vehicle mileage since the diagnostic test last failed may help determine how often the condition that caused the DTC to be set occurs. This may assist in diagnosing the condition.

The following PCM pins are controlled by output driver modules (ODMs):

- A13 – MIL (Check Engine)
- A14 – Check T/M or Up-Shift
- A15 – EVAP Canister Purge
- A16 – Band Apply (4L30E)
- B14 – A/C Clutch

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

- The Tech 2 Driver Module Status indicates the PCM pin that is affected.
- The Tech 2 may indicate “short circuit” even when the problem is an open circuit. The cause of an open circuit may be in the component itself.
- A short to ground on the ignition side of the component will blow the fuse. Since the fuse was checked in Step 2, a short to ground would be between the affected component and the PCM.

DTC P1640 –Output Driver Module (ODM) “A” Fault

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to Step 2	Go to <i>OBD System Check</i>
2	Check the fuse for the driver circuit that was shown as faulty. Was the fuse blown?	—	Go to Step 3	Go to Step 4
3	1. Check for a short to ground between the fuse and the affected component. 2. Replace the fuse after making any necessary repairs. Is the action complete?	—	Verify repair	—
4	1. Disconnect the PCM connector for the affected driver circuit. Is there any damage to the PCM pin or connector?	—	Go to Step 5	Go to Step 6
5	Repair the damaged pin or terminal. Is the action complete?	—	Verify repair	—
6	Were either of the lamp circuits for “Check Engine” or “Check Trans.” indicated as faulty by the Tech 2?	—	Go to Step 7	Go to Step 13

DTC P1640 –Output Driver Module (ODM) “A” Fault (Cont’d)

Step	Action	Value(s)	Yes	No
7	1. Leave the PCM connector for the lamp driver circuit disconnected. 2. Ignition “ON.” 3. Using a DVM, check the voltage at the PCM connector for the affected lamp driver circuit. Was the voltage equal to the specified value?	B+	Go to <i>Step 15</i>	Go to <i>Step 8</i>
8	1. Ignition “ON.” 2. Check for battery voltage at the fuse for the affected lamp circuit. Was battery voltage available at the fuse?	—	Go to <i>Step 10</i>	Go to <i>Step 9</i>
9	Repair the open circuit between the ignition switch and the fuse. Is the action complete?	—	Verify repair	—
10	1. Ignition “OFF.” 2. Disconnect the PCM connector for the affected driver terminal. 3. Connect an ohmmeter between a good ground and the PCM connector for the affected driver. Did the ohmmeter indicate continuity?	—	Go to <i>Step 11</i>	Go to <i>Step 12</i>
11	Repair the short to ground between the affected component and its PCM driver terminal. Is the action complete?	—	Verify repair	—
12	Repair the open circuit between the fuse and the PCM driver terminal for the affected circuit. Is the action complete?	—	Verify repair	—
13	1. Connect the PCM. 2. Start the engine and let it idle. 3. Backprobe the affected terminal at the PCM with a DVM. Was the voltage equal to the specified value?	B+	Go to <i>Step 15</i>	Go to <i>Step 14</i>
14	1. Run the engine at idle. 2. Check for battery voltage at the fuse for the affected circuit. Was battery voltage available at the fuse?	—	Go to <i>Step 10</i>	Go to <i>Step 9</i>
15	Replace the PCM. Is the action complete?	—	Verify repair	—

Symptom Diagnosis

Preliminary Checks

Before using this section, perform the “On-Board Diagnostic (OBD) System Check” and verify all of the following items:

- The powertrain control module (PCM) and malfunction indicator lamp (MIL) (Check Engine lamp) are operating correctly.
- There are no DTC(s) stored.
- Tech 2 data is within normal operating range. Refer to *Typical Scan Data Values*.
- Verify the customer complaint and locate the correct symptom in the table of contents. Perform the procedure included in the symptom chart.

Visual/Physical Check

Several of the symptom procedures call for a careful visual/physical check. This can lead to correcting a problem without further checks and can save valuable time.

This check should include the following items:

- PCM grounds for cleanliness, tightness and proper location.
- Vacuum hoses for splits, kinks, and proper connections, as shown on the “Vehicle Emission Control Information” label. Check thoroughly for any type of leak or restriction.
- Air intake ducts for collapsed or damaged areas.
- Air leaks at throttle body mounting area, mass air flow (MAF) sensor and intake manifold sealing surfaces.
- Ignition components for cracking, hardness, and carbon tracking.
- Wiring for proper connections, pinches and cuts.

Intermittents

IMPORTANT: An intermittent problem may or may not turn on the malfunction indicator lamp (MIL) or store a DTC. DO NOT use the Diagnostic Trouble Code (DTC) charts for intermittent problems. The fault must be present to locate the problem.

Most intermittent problems are caused by faulty electrical connections or wiring. Perform a careful visual/physical check for the following conditions:

- Poor mating of the connector halves or a terminal not fully seated in the connector (backed out).
- Improperly formed or damaged terminal.
- All connector terminals in the problem circuit should be carefully checked for proper contact tension.
- Poor terminal-to-wire connection. This requires removing the terminal from the connector body to check.

Road test the vehicle with a 5-8840-0285-0 Digital Multimeter connected to a suspected circuit. An abnormal voltage when the malfunction occurs is a good indication that there is a fault in the circuit being monitored.

Use a Tech 2 to help detect intermittent conditions. The scan tool has several features that can be used to locate

an intermittent condition. Use the following feature to find intermittent faults:

- Using a Tech 2’s “Freeze Frame” buffer or “Failure Records” buffer can aid in locating an intermittent condition. Review and record the information in the freeze frame or failure record associated with the intermittent DTC being diagnosed. The vehicle can be driven within the conditions that were present when the DTC originally set.

To check for loss of diagnostic code memory, disconnect the MAP sensor and idle the engine until the MIL (Service Engine Soon lamp) comes on. DTC P0107 should be stored and kept in memory when the ignition is turned “OFF.” If not, the PCM is faulty. When this test is completed, make sure that you clear the DTC P0107 from memory.

An intermittent MIL (Check Engine lamp) with no stored DTC may be caused by the following:

- Ignition coil shorted to ground and arcing at ignition wires or plugs.
- MIL (Check Engine lamp) wire to PCM shorted to ground.
- Poor PCM grounds. Refer to the PCM wiring diagrams.

Check for improper installation of electrical options such as lights, cellular phones, etc. Check all wires from the PCM to the ignition coils for poor connections.

Check for an open diode across the A/C compressor clutch and check for other open diodes (refer to wiring diagrams in *Electrical Diagnosis*).

If problem has not been found, refer to *PCM Connector Symptom* tables.

Hard Start Symptom

Step	Action	Value(s)	Yes	No
1	<p>DEFINITION: Engine cranks, but does not start for a long time. Does eventually run, or may start but immediately stalls.</p> <p>Was the "On-Board Diagnostic (OBD) System Check" performed?</p>	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	<p>1. Perform a bulletin search.</p> <p>2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin.</p> <p>Was a bulletin found that addresses the symptom?</p>	—	Verify repair	Go to <i>Step 3</i>
3	<p>Was a visual/physical check performed?</p>	—	Go to <i>Step 4</i>	Go to <i>Visual/Physical Check</i>
4	<p>Check engine coolant temperature (ECT) sensor for shift in value. After 8 hours with the hood up and the engine not running, connect the Tech 2. With the ignition "ON" and the engine not running, compare engine coolant temperature to intake air temperature.</p> <p>Are ECT and IAT within the specified value of each other?</p>	$\pm 5^{\circ}\text{C}$ ($\pm 9^{\circ}\text{F}$)	Go to <i>Step 9</i>	Go to <i>Step 5</i>
5	<p>1. Using a Tech 2, display the engine coolant temperature and note the value.</p> <p>2. Check the resistance of the engine coolant temperature sensor.</p> <p>3. Refer to <i>Engine Coolant Temperature Sensor Temperature vs. Resistance</i> chart on <i>DTC P0118 Diagnostic Support</i> for resistance specifications.</p> <p>Is the resistance value near the resistance for the temperature noted?</p>	—	Go to <i>Step 7</i>	Go to <i>Step 6</i>

16	<p>1. Check for the following engine mechanical problems (refer to <i>Engine Mechanical</i>):</p> <ul style="list-style-type: none"> ● Low compression ● Leaking cylinder head gaskets ● Worn or incorrect camshaft ● Camshaft drive belt slipped or stripped <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 17</i>
17	<p>1. Review all diagnostic procedures within this table.</p> <p>2. If all procedures have been completed and no malfunctions have been found, review/inspect the following:</p> <ul style="list-style-type: none"> ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records buffer ● All electrical connections within a suspected circuit and/or system. <p>3. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Contact Technical Assistance

Surges and/or Chuggles Symptom

Step	Action	Value(s)	Yes	No
1	<p>DEFINITION: Engine power variation under steady throttle or cruise. Feels like the vehicle speeds up and slows down with no change in the accelerator pedal.</p> <p>Was the "On-Board Diagnostic (OBD) System Check" performed?</p>	—	Go to Step 2	Go to <i>OBD System Check</i>
2	<p>1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin.</p> <p>Was a bulletin found that addresses the symptom?</p>	—	Verify repair	Go to Step 3
3	<p>Was a visual/physical check performed?</p>	—	Go to Step 4	Go to <i>Visual/Physical Check</i>
4	<p>Be sure that the driver understands transmission torque converter clutch and A/C compressor operation as explained in the owner's manual. Inform the customer how the TCC and the A/C clutch operate.</p> <p>Is the customer experiencing a normal condition?</p>	—	System OK	Go to Step 5
5	<p>1. Check the the fuel control heated oxygen sensors (HO2S, B1S1 and B2S1). The fuel control heated oxygen sensors (HO2S) should respond quickly to different throttle positions. If they don't, check them for silicone or other contaminants from fuel or use of improper RTV sealant. The sensors may have a white powdery coating. Silicone contamination causes a high but false HO2S signal voltage (rich exhaust indication). The PCM will then reduce the amount of fuel delivered to the engine, causing a severe driveability problem. For more information, refer to <i>Powertrain Control Module (PCM) and Sensors</i>.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to Step 6
6	<p>1. Check the fuel pressure. Refer to <i>Fuel System Pressure Test</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to Step 7
7	<p>Monitor the long term fuel trim on the Tech 2.</p> <p>Is the long term fuel trim significantly in the negative range (rich condition)?</p>	—	Go to Step 8	Go to Step 9
8	<p>1. Check items that can cause the engine to run rich. Refer to <i>Diagnostic Aids in DTC P0172 Diagnostic Support</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Go to Step 10	Verify repair
9	<p>1. Check items that can cause the engine to run lean. Refer to <i>Diagnostic Aids in DTC P0171</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Go to Step 10	Verify repair

Surges and/or Chuggles Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
10	<p>1. Check for proper ignition voltage output with spark tester 5-8840-0383-0. Refer to <i>Electric Ignition System</i> for procedure.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 11</i>
11	<p>1. Check for a loose ignition coil ground. Refer to <i>Electric Ignition System</i>.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 12</i>
12	<p>1. Check the ignition coils for cracks or carbon tracking.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 14</i>
13	<p>1. Remove the spark plugs and check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to <i>Electronic Ignition System</i>.</p> <p>NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 14</i>
14	<p>1. Check the injector connections.</p> <p>2. If any of the injector connectors are connected to an incorrect cylinder, correct as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 15</i>
15	<p>1. Check PCM grounds for the cleanliness, tightness and proper locations. Refer to the PCM wiring diagrams in <i>Electrical Diagnosis</i>.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 16</i>
16	<p>1. Check MAF sensor connections.</p> <p>2. If a problem is found, replace the faulty terminals as necessary. Refer to <i>Electrical Diagnosis</i> for wiring repair procedures.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 17</i>
17	<p>1. Visually/physically check vacuum hoses for splits, kinks, and proper connections and routing as shown on the "Vehicle Emission Control Information" label.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 18</i>

Surges and/or Chuggles Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
18	1. Check the exhaust system for possible restriction: <ul style="list-style-type: none"> ● Inspect the exhaust system for damaged or collapsed pipes. ● Inspect the muffler for heat distress or possible internal failure. ● Check for a possible plugged three-way catalytic converter by checking the exhaust system back pressure. Refer to <i>Restricted Exhaust System Check</i>. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 19</i>
19	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: <ul style="list-style-type: none"> ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records buffer ● All electrical connections within a suspected circuit and/or system. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Lack of Power, Sluggish or Spongy Symptom

Step	Action	Value(s)	Yes	No
1	<p>DEFINITION: Engine delivers less than expected power. Little or no increase in speed when accelerator pedal is pushed down part-way.</p> <p>Was the "On-Board Diagnostic (OBD) System Check" performed?</p>	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	<p>1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin.</p> <p>Was a bulletin found that addresses the symptom?</p>	—	Verify repair	Go to <i>Step 3</i>
3	<p>Was a visual/physical check performed?</p>	—	Go to <i>Step 4</i>	Go to <i>Visual/Physical Check</i>
4	<p>1. Remove and check the air filter element for dirt or restrictions. Refer to <i>Air Intake System</i> in <i>On-Vehicle Service</i>. 2. Replace the air filter element if necessary.</p> <p>Was a repair required?</p>	—	Verify repair	Go to <i>Step 5</i>
5	<p>1. Check for water-or alcohol-contaminated fuel. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 6</i>
6	<p>1. Using a Tech 2, monitor the knock sensor (KS) system for excessive spark retard activity. Refer to <i>Knock Sensor (KS) System</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 7</i>
7	<p>1. Install the Tech 2. 2. Run the engine at idle. 3. On the Tech 2, select F3: Miscellaneous Test, F6: Variable Intake Manifold. 4. Repeat Switch ON or OFF of VIM solenoid valve by using the Tech 2. 5. Check the working solenoid sound if the actuator works normally. 6. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 8</i>
8	<p>1. Check for proper ignition voltage output with spark tester 5-8840-0383-0. Refer to <i>Electronic Ignition System</i> for procedure. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 9</i>

Lack of Power, Sluggish or Spongy Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
9	<p>1. Remove the spark plugs and check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to <i>Electronic Ignition System</i>.</p> <p>NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 10</i>
10	<p>1. Check the ignition coils for cracks or carbon tracking.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 11</i>
11	<p>1. Check the PCM grounds for the cleanliness, tightness and proper locations. Refer to the PCM wiring diagrams in <i>Electrical Diagnosis</i>.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 12</i>
12	<p>1. Check the exhaust system for possible restriction:</p> <ul style="list-style-type: none"> ● Inspect the exhaust system for damaged or collapsed pipes. ● Inspect the muffler for heat distress or possible internal failure. ● Check for a possible plugged three-way catalytic converter by checking the exhaust system back pressure. Refer to <i>Restricted Exhaust System Check</i>. <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 13</i>
13	<p>1. Check the torque converter clutch (TCC) for proper operation. Refer to <i>4L30-E Transmission Diagnosis</i>.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 14</i>
14	<p>1. Check for an engine mechanical problem. Check for low compression, incorrect or worn camshaft, loose timing belt, etc. Refer to <i>Engine Mechanical</i>.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 15</i>
15	<p>1. Review all diagnostic procedures within this table.</p> <p>2. If all procedures have been completed and no malfunctions have been found, review/inspect the following:</p> <ul style="list-style-type: none"> ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records buffer ● All electrical connections within a suspected circuit and/or system. <p>3. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Contact Technical Assistance

Detonation/Spark Knock Symptom

Step	Action	Value(s)	Yes	No
1	<p>DEFINITION: A mild to severe ping, usually worse under acceleration. The engine makes sharp metallic knocks that change with throttle opening.</p> <p>Was the "On-Board Diagnostic (OBD) System Check" performed?</p>	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	<p>1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin.</p> <p>Was a bulletin found that addresses the symptom?</p>	—	Verify repair	Go to <i>Step 3</i>
3	<p>Was a visual/physical check performed?</p>	—	Go to <i>Step 4</i>	Go to <i>Visual/Physical Check</i>
4	<p>If Tech 2 readings are normal (refer to <i>Typical Scan Values</i>) and there are no engine mechanical faults, fill the fuel tank with a known quality gasoline that has a minimum octane rating of 87 and re-evaluate the vehicle performance.</p> <p>Is detonation present?</p>	—	Go to <i>Step 5</i>	Verify repair
5	<p>1. Check the transmission range switch circuit. Use a Tech 2 and be sure the Tech 2 indicates that the vehicle is in drive with the gear selector in drive or overdrive. 2. If a problem is found, diagnose and repair the transmission range switch as necessary (refer to <i>4L30-E Automatic Transmission Diagnosis</i>).</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 6</i>
6	<p>1. Check TCC operation. Refer to <i>4L30-E Transmission Diagnosis</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 7</i>
7	<p>1. Check for obvious overheating problems:</p> <ul style="list-style-type: none"> ● Low engine coolant. ● Restricted air flow to radiator, or restricted water flow through radiator. ● Correct coolant solution should be a 50/50 mix of approved antifreeze/coolant and water. Refer to <i>Engine Cooling</i>. <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 8</i>
8	<p>1. Check fuel a leak. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 9</i>
9	<p>1. Check items that can cause an engine to run lean (long term fuel trim significantly in the positive range). For a lean condition, refer to <i>Diagnostic Aids</i> in <i>DTC P0171 Diagnostic Support</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 10</i>

Detonation/Spark Knock Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
10	1. Spark plugs for proper heat range. Refer to <i>General Information</i> . 2. If incorrect spark plugs are installed, replace spark plugs as necessary. Did any spark plugs require replacement?	—	Verify repair	Go to <i>Step 11</i>
11	1. Remove excessive carbon buildup with a top engine cleaner. Refer to instructions on the top engine cleaner can. 2. Re-evaluate vehicle performance. Is detonation still present?	—	Go to <i>Step 12</i>	Verify repair
12	1. Check for an engine mechanical problem. Perform a cylinder compression check. Refer to <i>Engine Mechanical</i> . 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 13</i>
13	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: <ul style="list-style-type: none"> ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records buffer ● All electrical connections within a suspected circuit and/or system. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Rough, Unstable, or Incorrect Idle, Stalling Symptom

Step	Action	Value(s)	Yes	No
1	<p>DEFINITION: Engine runs unevenly at idle. If severe, the engine or vehicle may shake. Engine idle speed may vary in RPM. Either condition may be severe enough to stall the engine.</p> <p>Was the "On-Board Diagnostic (OBD) System Check" performed?</p>	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	<p>1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin.</p> <p>Was a bulletin found that addresses the symptom?</p>	—	Go to <i>Step 13</i>	Go to <i>Step 3</i>
3	<p>Was a visual/physical check performed?</p>	—	Go to <i>Step 4</i>	Go to <i>Visual/Physical Check</i>
4	<p>1. Check the PCM grounds for cleanliness, tightness and proper routing. Refer to the PCM wiring diagrams in <i>Electrical Diagnosis</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 5</i>
5	<p>Observe the long term fuel trim on the Tech 2. Is the long term fuel trim significantly in the negative range (rich condition)?</p>	—	Go to <i>Step 6</i>	Go to <i>Step 7</i>
6	<p>1. Check items that can cause the engine to run rich. Refer to <i>Diagnostic Aids in DTC P0172 Diagnostic Support</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 9</i>
7	<p>Is the long term fuel trim significantly in the positive range (lean condition)?</p>	—	Go to <i>Step 8</i>	Go to <i>Step 9</i>
8	<p>1. Check items that can cause the engine to run lean. Refer to <i>Diagnostic Aids in DTC P0171 Diagnostic Support</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 9</i>
9	<p>1. Check for incorrect idle speed. Ensure that the following conditions are present:</p> <ul style="list-style-type: none"> ● The engine is fully warm. ● The accessories are "OFF." <p>2. Using a Tech 2, monitor the IAC position. Is the IAC position within the specified values?</p>	Between 10 and 50 counts	Go to <i>Step 11</i>	Go to <i>Step 10</i>

Rough, Unstable, or Incorrect Idle, Stalling Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
10	<p>1. Visually/physically inspect for the following conditions:</p> <ul style="list-style-type: none"> ● Restricted air intake system. Check for a possible collapsed air intake duct, restricted air filter element, or foreign objects blocking the air intake system. ● Throttle body. Check for objects blocking the IAC passage or throttle bore, excessive deposits in the IAC passage and on the IAC pintle, and excessive deposits in the throttle bore and on the throttle plate. ● Large vacuum leak. Check for a condition that causes a large vacuum leak, such as an incorrectly installed or faulty crankcase ventilation valve or a disconnected brake booster hose. <p>2. If a problem is found, repair as necessary. Was a problem found?</p>	—	Verify repair	Go to <i>Step 8</i>
11	<p>Check the injector connections. If any of the injectors are connected to an incorrect cylinder, correct as necessary. Was a problem found?</p>	—	Verify repair	Go to <i>Step 12</i>
12	<p>1. Perform the "Injector Coil/Balance Test" in <i>Fuel Metering System</i>. 2. If a problem is found, repair as necessary. Was a problem found?</p>	—	Verify repair	Go to <i>Step 13</i>
13	<p>1. Check for fuel in the pressure regulator vacuum hose. 2. If fuel is present, replace the fuel pressure regulator assembly. Refer to <i>Fuel Metering System</i>. 3. If a problem is found, repair as necessary. Was a problem found?</p>	—	Verify repair	Go to <i>Step 14</i>
14	<p>1. Check for proper ignition voltage output with spark tester 5-8840-0383-0. Refer to <i>Electronic Ignition System</i> for the procedure. 2. If a problem is found, repair as necessary. Was a problem found?</p>	—	Verify repair	Go to <i>Step 15</i>
15	<p>1. Remove spark plugs. Check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to <i>Electronic Ignition System</i>. NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. 2. If a problem is found, repair as necessary. Was a problem found?</p>	—	Verify repair	Go to <i>Step 16</i>
16	<p>1. Check for a loose ignition coil ground. Refer to <i>Electrical Ignition System</i>. 2. If a problem is found, repair as necessary. Was a problem found?</p>	—	Verify repair	Go to <i>Step 17</i>

Rough, Unstable, or Incorrect Idle, Stalling Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
17	1. Check ignition coils for cracks or carbon tracking. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 18</i>
18	Using a Tech 2, monitor the throttle position (TP) angle with the engine idling. Is the TP angle at the specified value and steady?	0%	Go to <i>Step 19</i>	Refer to <i>DTC P0123</i> for further diagnosis
19	1. Check the positive crankcase ventilation (PCV) valve for proper operation. Refer to <i>Crankcase Ventilation System</i> . 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 20</i>
20	1. Check the transmission range switch circuit. Use a Tech 2 and be sure the Tech 2 indicates that the vehicle is in drive with the gear selector in drive or overdrive. 2. If a problem is found, diagnose and repair the transmission range switch as necessary (refer to <i>4L30-E Automatic Transmission Diagnosis</i>). Was a problem found?	—	Verify repair	Go to <i>Step 21</i>
21	1. Check for the following engine mechanical items. Refer to <i>Engine Mechanical</i> for diagnosis procedures: <ul style="list-style-type: none"> ● Low compression ● Sticking or leaking valves ● Worn camshaft lobe(s) ● Camshaft drive belt slipped or stripped ● Incorrect valve timing ● Worn rocker arms ● Broken valve springs 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 22</i>
22	1. Check for faulty motor mounts. Refer to <i>Engine Mechanical</i> for inspection of mounts. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 23</i>
23	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: <ul style="list-style-type: none"> ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records buffer ● All electrical connections within a suspected circuit and/or system. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Poor Fuel Economy Symptom

Step	Action	Value(s)	Yes	No
1	<p>DEFINITION: Fuel economy, as measured by an actual road test, is noticeably lower than expected. Also, economy is noticeably lower than it was on this vehicle at one time, as previously shown by an actual road test. (Larger than standard tires will cause odometer readings to be incorrect, and that may cause fuel economy to appear poor when it is actually normal.)</p> <p>Was the "On-Board Diagnostic (OBD) System Check" performed?</p>	—	Go to Step 2	Go to <i>OBD System Check</i>
2	<p>1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin.</p> <p>Was a bulletin found that addresses the symptom?</p>	—	Verify repair	Go to Step 3
3	<p>Was a visual/physical check performed?</p>	—	Go to Step 4	Go to <i>Visual/Physical Check</i>
4	<p>Check owner's driving habits.</p> <ul style="list-style-type: none"> ● Is the A/C "ON" full time (defroster mode "ON")? ● Are tires at the correct pressure? ● Are excessively heavy loads being carried? ● Is acceleration too much, too often? <p>Was a problem found?</p>	—	Go to Step 5	Go to Step 6
5	<p>Review the items in Step 4 with the customer and advise as necessary.</p> <p>Is the action complete?</p>	—	System OK	—
6	<p>1. Visually/physically check: Vacuum hoses for splits, kinks, and improper connections and routing as shown on the "Vehicle Emission Control Information" label. 2. If a problem is found, repair as necessary.</p> <p>Was a repair required?</p>	—	Verify repair	Go to Step 7
7	<p>1. Remove and check the air filter element for dirt or for restrictions. Refer to <i>Air Intake System</i>. 2. Replace the air filter element if necessary.</p> <p>Was a repair required?</p>	—	Verify repair	Go to Step 8
8	<p>1. Remove spark plugs and check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to <i>Spark Plug Replacement</i>.</p> <p>NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to Step 9
9	<p>1. Check for low engine coolant level. Refer to <i>Engine Cooling</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to Step 10

Poor Fuel Economy Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
10	1. Check for an incorrect or faulty engine thermostat. Refer to <i>Engine Cooling</i> . 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 11
11	1. Check for low engine compression. Refer to <i>Engine Mechanical</i> . 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 12
12	1. Check the TCC operation. Refer to <i>4L30-E Transmission Diagnosis</i> . 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 13
13	1. Check the exhaust system for possible restriction: <ul style="list-style-type: none"> ● Inspect the exhaust system for damaged or collapsed pipes. ● Inspect the muffler for heat distress or possible internal failure. ● Check for a possible plugged three-way catalytic converter by checking the exhaust system back pressure. Refer to <i>Restricted Exhaust System Check</i>. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 14
14	Check for proper calibration of the speedometer. Does the speed indicated on the speedometer closely match the vehicle speed displayed on the Tech 2?	—	Go to Step 16	Go to Step 15
15	Diagnose and repair an inaccurate speedometer condition as necessary. Refer to <i>Vehicle Speed Sensor</i> in <i>Electrical Diagnosis</i> . Was a problem found?	—	Verify repair	—
16	1. Check the air intake system and the crankcase for air leaks. Refer to <i>Air Intake System</i> and <i>Crankcase Ventilation System</i> . 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 17
17	1. Review all diagnostic procedures within this table. 2. When all procedures have been completed and no malfunctions have been found, review/inspect the following: <ul style="list-style-type: none"> ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records buffer ● All connections within a suspected circuit and/or system. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to Step 18
18	Perform the procedure in <i>Fuel System Pressure Test</i> . Was the fuel pressure normal?	—	Contact Technical Assistance	Verify repair

Excessive Exhaust Emissions or Odors Symptom

Step	Action	Value(s)	Yes	No
1	<p>DEFINITION: Vehicle fails an emission test. Vehicle has excessive "rotten egg" smell. (Excessive odors do not necessarily indicate excessive emissions.)</p> <p>Was the "On-Board Diagnostic (OBD) System Check" performed?</p>	—	Go to Step 2	Go to <i>OBD System Check</i>
2	<p>1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin.</p> <p>Was a bulletin found that addresses the symptom?</p>	—	Go to Step 13	Go to Step 3
3	<p>Was a thorough visual/physical check performed?</p>	—	Go to Step 4	Go to <i>Visual/Physical Check</i>
4	<p>1. Check for vacuum leaks. Check vacuum lines, intake manifold, throttle body, etc. 2. If a problem is found, repair as necessary.</p> <p>Were any vacuum leaks located?</p>	—	Go to Step 13	Go to Step 5
5	<p>1. Check the fuel cap for proper installation. 2. Secure the fuel cap if necessary.</p> <p>Was the fuel cap installed properly?</p>	—	Go to Step 6	Go to Step 13
6	<p>1. Check the fuel pressure. Perform the procedure in <i>Fuel System Pressure Test</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Go to Step 13	Go to Step 7
7	<p>1. Check for a faulty, plugged, or incorrectly installed crankcase ventilation valve; also check the crankcase ventilation system for plugging. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Go to Step 13	Go to Step 8
8	<p>1. Check the injector connections. 2. If any of the injectors are connected to an incorrect cylinder, correct as necessary.</p> <p>Was a problem found?</p>	—	Go to Step 13	Go to Step 9
9	<p>1. Perform the "Injector Coil/Balance Test" in <i>Fuel Metering System</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Go to Step 13	Go to Step 10
10	<p>1. Refer to <i>Engine Cooling</i> for cooling system diagnosis. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Go to Step 13	Go to Step 11
11	<p>1. Check EVAP canister for fuel loading. Refer to <i>Evaporative Emission Control System</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Go to Step 13	Go to Step 12

Excessive Exhaust Emissions or Odors Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
12	1. Remove excessive carbon buildup with a top engine cleaner. Refer to the instructions on the top engine cleaner can. 2. Perform the exhaust emission test. Does the vehicle pass the test?	—	System OK	Go to <i>Step 14</i>
13	Perform the exhaust emission test. Does the vehicle pass the test?	—	System OK	Go to <i>Step 14</i>
14	Does the exhaust emission test indicate excessive CO and HC levels or is long term fuel trim significantly in the negative range (rich condition)?	—	Go to <i>Step 15</i>	Go to <i>Step 16</i>
15	1. Check items that can cause the engine to run rich. Refer to <i>Diagnostic Aids in DTC P0172 Diagnostic Support</i> . Make any necessary repairs. 2. Perform the exhaust emission test. Does the vehicle pass the test?	—	System OK	Go to <i>Step 17</i>
16	1. Check items that can cause the engine to run lean. Refer to <i>Diagnostic Aids in DTC P0171 Diagnostic Support</i> . Make any necessary repairs. 2. Perform the exhaust emission test. Does the vehicle pass the test?	—	System OK	Go to <i>Step 17</i>
17	1. Check the EGR system. 2. If a problem is found, repair as necessary. Was a problem found?	—	Go to <i>Step 13</i>	Go to <i>Step 18</i>
18	1. Check for an engine mechanical problem. Perform a cylinder compression check (refer to <i>Engine Mechanical</i>). 2. If a problem is found, repair as necessary. Was a problem found?	—	Go to <i>Step 13</i>	Go to <i>Step 19</i>
19	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: <ul style="list-style-type: none"> ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records butter ● All electrical connections within a suspected circuit and/or system. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Dieseling, Run-On Symptom

Step	Action	Value(s)	Yes	No
1	<p>DEFINITION: Engine continues to run after key is turned "OFF," but runs very rough. If engine runs smooth, check ignition switch and adjustment.</p> <p>Was the "On-Board Diagnostic (OBD) System Check" performed?</p>	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	<p>1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin.</p> <p>Was a bulletin found that addresses the symptom?</p>	—	Verify repair	Go to <i>Step 3</i>
3	<p>Was a visual/physical check performed?</p>	—	Go to <i>Step 4</i>	Go to <i>Visual/Physical Check</i>
4	<p>1. Check for a short between B+ and any of the ignition feed circuits. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 5</i>
5	<p>1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following:</p> <ul style="list-style-type: none"> ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records butter ● All electrical connections within a suspected circuit and/or system <p>3. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Contact Technical Assistance

Backfire Symptom

Step	Action	Value(s)	Yes	No
1	<p>DEFINITION: Fuel ignites in the intake manifold, or in the exhaust system, making a loud popping noise.</p> <p>Was the "On-Board Diagnostic (OBD) System Check" performed?</p>	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	<p>1. Perform a bulletin search.</p> <p>2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin.</p> <p>Was a bulletin found that addresses the symptom?</p>	—	Verify repair	Go to <i>Step 3</i>
3	<p>Was a visual/physical check performed?</p>	—	Go to <i>Step 4</i>	Go to <i>Visual/Physical Check</i>
4	<p>1. Check for proper ignition voltage coil output with spark tester 5-8840-0383-0. Refer to <i>Electronic Ignition System</i> for procedure.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 5</i>
5	<p>1. Remove spark plugs and check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to <i>Electronic Ignition System</i>.</p> <p>NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. Refer to <i>DTC P0172</i> to determine the cause of a rich condition or <i>Engine Mechanical</i> for an oil fouling condition.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 6</i>
6	<p>1. Visually/physically inspect the ignition coils for cracks.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 7</i>
7	<p>1. Check for an intermittent ignition system malfunction:</p> <ul style="list-style-type: none"> ● Intermittent CKP 58X signal. ● Intermittent ignition feed circuit or sensor ground circuit to the crankshaft position sensor. <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 8</i>
8	<p>1. Check the fuel pressure. Refer to <i>Fuel System Pressure Test</i>.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 9</i>

Backfire Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
9	1. Check for the following engine mechanical conditions. Refer to <i>Engine Mechanical</i> for diagnosis procedures: <ul style="list-style-type: none"> ● Low compression ● Sticking or leaking valves ● Worn camshaft lobe(s) ● Camshaft drive belt slipped or stripped ● Incorrect valve timing 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 10</i>
10	1. Check the intake and exhaust manifold(s) for casting flash. Refer to <i>Engine Mechanical</i> . 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 11</i>
11	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: <ul style="list-style-type: none"> ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records buffer ● All electrical connections within a suspected circuit and/or system. 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Cuts Out, Misses Symptom

Step	Action	Value(s)	Yes	No
1	<p>DEFINITION: Steady pulsation or jerking that follows engine speed; usually more pronounced as engine load increases.</p> <p>Was the "On-Board Diagnostic (OBD) System Check" performed?</p>	—	Go to <i>Step 2</i>	Go to <i>OBD System Check</i>
2	<p>1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin.</p> <p>Was a bulletin found that addresses the symptom?</p>	—	Go to <i>Step 13</i>	Go to <i>Step 3</i>
3	<p>Was a visual/physical check performed?</p>	—	Go to <i>Step 4</i>	Go to <i>Visual/Physical Check</i>
4	<p>1. Check the PCM grounds for clearness, tightness and proper routing. Refer to the PCM wiring diagrams in <i>Electrical Diagnosis</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 5</i>
5	<p>Observe the long term fuel trim on the Tech 2.</p> <p>Is the long term fuel trim significantly in the negative range (rich condition)?</p>	—	Go to <i>Step 6</i>	Go to <i>Step 7</i>
6	<p>1. Check items that can cause the engine to run rich. Refer to <i>Diagnostic Aids in DTC P0172 Diagnostic Support</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 9</i>
7	<p>Is the long term fuel trim significantly in the positive range (lean condition)?</p>	—	Go to <i>Step 8</i>	Go to <i>Step 9</i>
8	<p>1. Check items that can cause the engine to run lean. Refer to <i>Diagnostic Aids in DTC P0171 Diagnostic Support</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 9</i>
9	<p>1. Check for incorrect idle speed. Ensure that the following conditions are present:</p> <ul style="list-style-type: none"> ● The engine is fully warm. ● The accessories are "off." <p>2. Using a Tech 2, monitor the IAC position.</p> <p>Is the IAC position within the specified values?</p>	Between 5 and 50 counts	Go to <i>Step 11</i>	Go to <i>Step 10</i>

Cuts Out, Misses Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
10	<p>1. Visually/physically inspect for the following conditions:</p> <ul style="list-style-type: none"> ● Restricted air intake system. Check for a possible collapsed air intake duct, restricted air filter element, or foreign objects blocking the air intake system. ● Throttle body. Check for objects blocking the IAC passage or throttle bore, excessive deposits in the IAC passage and on the IAC pintle, and excessive deposits in the throttle bore and on the throttle plate. ● Large vacuum leak. Check for a condition that causes a large vacuum leak, such as an incorrectly installed or faulty PCV valve or brake booster hose disconnected . <p>2. If a problem is found, repair as necessary. Was a problem found?</p>	—	Verify repair	Go to <i>Step 8</i>
11	<p>Check the injector connections. If any of the injectors are connected to an incorrect cylinder, correct as necessary. Was a problem found?</p>	—	Verify repair	Go to <i>Step 12</i>
12	<p>1. Perform the "Injector Coil/Balance Test" in <i>Fuel Metering System</i>. 2. If a problem is found, repair as necessary. Was a problem found?</p>	—	Verify repair	Go to <i>Step 13</i>
13	<p>1. Check for fuel in the pressure regulator vacuum hose. 2. If fuel is present, replace the fuel pressure regulator assembly. Refer to <i>Fuel Metering System</i>. 3. If a problem is found, repair as necessary. Was a problem found?</p>	—	Verify repair	Go to <i>Step 14</i>
14	<p>1. Check for proper ignition voltage output with spark tester 5-8840-0383-0. Refer to <i>Electronic Ignition System</i> for the procedure. 2. If a problem is found, repair as necessary. Was a problem found?</p>	—	Verify repair	Go to <i>Step 15</i>
15	<p>1. Remove spark plugs. Check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to <i>Electronic Ignition System</i>. NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. 2. If a problem is found, repair as necessary. Was a problem found?</p>	—	Verify repair	Go to <i>Step 16</i>
16	<p>1. Check for a loose ignition coil ground. Refer to <i>Electronic Ignition System</i>. 2. If a problem is found, repair as necessary. Was a problem found?</p>	—	Verify repair	Go to <i>Step 17</i>

Cuts Out, Misses Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
17	1. Check ignition coils for cracks or carbon tracking. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 18</i>
18	Using a Tech 2, monitor the TP angle with the engine idling. Is the TP angle at the specified value and steady?	0%	Go to <i>Step 19</i>	Refer to <i>DTC P0123</i> for further diagnosis
19	1. Check the PCV valve for proper operation. Refer to <i>Crankcase Ventilation System</i> . 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 20</i>
20	1. Check the transmission range switch circuit. Use a Tech 2 and be sure the Tech 2 indicates that the vehicle is in drive with the gear selector in drive or overdrive. 2. If a problem is found, diagnose and repair the transmission range switch as necessary (refer to <i>4L30-E Automatic Transmission Diagnosis</i>). Was a problem found?	—	Verify repair	Go to <i>Step 21</i>
21	1. Check the following engine mechanical items. Refer to <i>Engine Mechanical</i> for diagnosis procedures: <ul style="list-style-type: none"> ● Low compression ● Sticking or leaking valves ● Worn camshaft lobe(s) ● Camshaft drive belt slipped or stripped ● Incorrect valve timing ● Worn rocker arms ● Broken valve springs 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 22</i>
22	1. Check for faulty motor mounts. Refer to <i>Engine Mechanical</i> for inspection of mounts. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to <i>Step 23</i>
23	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: <ul style="list-style-type: none"> ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records buffer ● All electrical connections within a suspected circuit and/or system 3. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Contact Technical Assistance

Hesitation, Sag, Stumble Symptom

Step	Action	Value(s)	Yes	No
1	<p>DEFINITION: Momentary lack of response as the accelerator is pushed down. Can occur at any vehicle speed. Usually most pronounced when first trying to make the vehicle move, as from a stop sign. May cause the engine to stall if severe enough.</p> <p>Was the "On-Board Diagnostic (OBD) System Check" performed?</p>	—	Go to Step 2	Go to <i>OBD System Check</i>
2	<p>1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin.</p> <p>Was a bulletin found that addresses the symptom?</p>	—	Verify repair	Go to Step 3
3	<p>Was a visual/physical check performed?</p>	—	Go to Step 4	Go to <i>Visual/Physical Check</i>
4	<p>1. Check the fuel control heated oxygen sensors (HO2S, B1S1 and B2S1). The fuel control heated oxygen sensors (HO2S) should respond quickly to different throttle positions. If they don't, check them for silicon or other contaminants from fuel or use of improper RTV sealant. The sensors may have a white powdery coating. Silicon contamination causes a high but false HO2S signal voltage (rich exhaust indication). The PCM will then reduce the amount of fuel delivered to the engine, causing a severe driveability problem. For more information, refer to <i>Powertrain Control Module (PCM) and Sensors</i>.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to Step 5
5	<p>1. Check the fuel pressure. Refer to <i>Fuel System Pressure Test</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to Step 6
6	<p>Observe the TP angle display on the Tech 2 while slowly increasing throttle pedal.</p> <p>Does the TP angle display steadily increase from 0% at closed throttle to 100% at WOT?</p>	—	Go to Step 7	Go to Step 18
7	<p>Monitor the long term fuel trim on the Tech 2.</p> <p>Is the long term fuel trim significantly in the negative range (rich condition)?</p>	—	Go to Step 8	Go to Step 9
8	<p>1. Check items that can cause the engine to run rich. Refer to <i>Diagnostic Aids in DTC P0172 Diagnostic Support</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to Step 10
9	<p>1. Check items that can cause the engine to run lean. Refer to <i>Diagnostic Aids in DTC P0171 Diagnostic Support</i>. 2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to Step 10

Hesitation, Sag, Stumble Symptom (Cont'd)

Step	Action	Value(s)	Yes	No
10	<p>1. Check for proper ignition voltage output with spark tester 5-8840-0383-0. Refer to <i>Electronic Ignition System</i> for the procedure.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 11</i>
11	<p>1. Check for a loose ignition coil ground. Refer to <i>Electronic Ignition System</i>.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 12</i>
12	<p>1. Check the ignition coils for cracks or carbon tracking.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 13</i>
13	<p>1. Remove spark plugs and check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Refer to <i>Electronic Ignition System</i>.</p> <p>NOTE: If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 14</i>
14	<p>1. Check the PCM grounds for clearness, tightness and proper routing. Refer to the PCM wiring diagrams in <i>Electrical Diagnosis</i>.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 15</i>
15	<p>1. Check the MAF sensor connections.</p> <p>2. If a problem is found, replace the faulty terminals as necessary. Refer to <i>Electrical Diagnosis</i> for wiring repair procedures.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 16</i>
16	<p>1. Visually/physically check vacuum hoses for splits, kinks, and proper connections and routing as shown on the "Vehicle Emission Control Information" label.</p> <p>2. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Go to <i>Step 17</i>
17	<p>1. Review all diagnostic procedures within this table.</p> <p>2. If all procedures have been completed and no malfunctions have been found, review/inspect the following:</p> <ul style="list-style-type: none"> ● Visual/physical inspection ● Tech 2 data ● Freeze Frame data/Failure Records butter ● All electrical connections within a suspected circuit and/or system <p>3. If a problem is found, repair as necessary.</p> <p>Was a problem found?</p>	—	Verify repair	Contact Technical Assistance

Default Matrix Table

Service Procedure Default Strategy

A referral strategy has been established to assist the technician with additional information when the cause of the failure cannot be determined. If no problem is found after performing diagnostics, then refer to the default matrix table for further diagnostic information.

Default Matrix Table

Strategy Based Diagnostic Charts	Initial Diagnosis	Default Section(s)
On-Board Diagnostic (OBD) System Check	Vehicle does not enter diagnostics.	Chassis Electrical
On-Board Diagnostic (OBD) System Check	Vehicle enters diagnostics and communicates with the Tech 2. MIL is "ON" in diagnostics. Engine does not start and run.	Ignition System Check
On-Board Diagnostic (OBD) System Check	Engine starts and runs, no PCM codes set. Customer complains of vibration.	—
On-Board Diagnostic (OBD) System Check	Engine starts and runs, no PCM codes set. Customer complains of harsh or soft shift, poor performance, delayed or no engagement into drive or reverse, transmission fluid leak, transmission noise or vibration, or improper TCC operation.	Automatic Transmission
PCM Power and Ground Check	On-Board Diagnostic (OBD) System Check.	Chassis Electrical
PCM Power and Ground Check	On-Board Diagnostic (OBD) System Check. PCM power and ground circuits OK. Data link voltage incorrect.	Chassis Electrical
On-Board Diagnostic (OBD) System Check	Engine starts and runs, no PCM codes set. Customer complains of harsh or soft shift, poor performance, delayed or no engagement into drive or reverse, transmission fluid leak, transmission noise or vibration, or improper TCC operation.	Automatic Transmission

Symptoms	Initial Diagnosis	Default Section(s)
Intermittents	<ol style="list-style-type: none"> 1. On-board diagnostic (OBD) system check. 2. Careful visual/physical inspections. 	Chassis Electrical

On-Vehicle Service Camshaft Position (CMP) Sensor

Removal Procedure

1. Disconnect the negative battery cable.
2. Remove the engine cover.
3. Remove the common chamber assembly.
Refer to Common Chamber in Engine Mechanical.

014RW120

4. Disconnect the electrical connector to the CMP sensor.

014RV053

5. Remove the CMP retaining bolt from the side of left cylinder head.
6. Remove the CMP sensor from the cylinder head.

Inspection Procedure

1. Inspect the sensor O-ring for cracks or leaks.
2. Replace the O-ring if it is worn or damaged.
3. Lubricate the new O-ring with engine oil.

4. Install the lubricated O-ring.

Installation Procedure

1. Install the CMP sensor in the cylinder head.
2. Install the CMP sensor retaining bolt.

Tighten

- Tighten the retaining screw to 9 N·m (0.9kg·m/78 lb in.).

3. Connect the electrical connector to the CMP sensor.

014RV053

4. Install the common chamber assembly.
Refer to Common Chamber in Engine Mechanical.

014RW106

5. Install the engine cover.
6. Connect the negative battery cable.

Crankshaft Position (CKP) Sensor

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the electrical connector to the CKP sensor.
3. Remove one bolt and the CKP sensor from the right side of the engine block, just behind the mount.

NOTE: Use caution to avoid any hot oil that might drip out.

TS22909

Inspection Procedure

1. Inspect the sensor O-ring for cracks or leaks.
2. Replace the O-ring if it is worn or damaged.
3. Lubricate the new O-ring with engine oil.
4. Install the lubricated O-ring.

Installation Procedure

1. Install the CKP sensor in the engine block.
2. Install the CKP sensor mounting bolt.

Tighten

- Tighten the mounting bolt to 9 N-m (0.9kg-m/78 lb in.).

TS22909

3. Connect the electrical connector to the CKP sensor.
4. Connect the negative battery cable.

Engine Coolant Temperature (ECT) Sensor

Removal Procedure

NOTE: Care must be taken when handling the engine coolant temperature (ECT) sensor. Damage to the ECT sensor will affect proper operation of the fuel injection system.

1. Disconnect the negative battery cable.
2. Drain the radiator coolant. Refer to *Draining and Refilling Cooling System in Engine Cooling*.
3. Disconnect the electrical connector.

014RW127

4. Remove the ECT sensor from the coolant crossover.

014RW086

3. Connect the electrical connector.

014RW085

Installation Procedure

1. Apply sealer or the equivalent to the threads of the ECT sensor.
2. Install the ECT sensor in the coolant crossover.

Tighten

- Tighten the ECT sensor to 30 N·m (3.1kg·m/22 lb ft.).

014RW086

4. Fill the radiator with coolant. Refer to *Draining and Refilling Cooling System in Engine Cooling.*

5. Connect the negative battery cable.

Heated Oxygen Sensor (HO2S)

Removal Procedure

1. Disconnect the negative battery cable.
2. Locate the four oxygen sensors.

060RX087

6E2-282 6VD1 3.2L ENGINE DRIVEABILITY AND EMISSIONS

- Bank 1 sensor 1 is mounted on the exhaust pipe ahead of the right-hand catalytic converter.

- Bank 2 sensor 1 is mounted on the exhaust pipe ahead of the left-hand catalytic converter.

3. Disconnect the pigtail from the wiring harness.

IMPORTANT: The pigtail is permanently attached to the sensor. Be careful not to pull the wires out.

NOTE: Do not use a torch to remove an HO2S unless the sensor is being replaced. Using a torch could damage the sensor.

4. Remove the sensor from the exhaust pipe.

- Because of the expansion and contraction of the metal in the exhaust system over time, this may be difficult if the engine temperature is below 48°C (120°F).

Inspection Procedure

All four sensors are identical. Inspect each in the same way.

1. Inspect the pigtail and the electrical connector for grease, dirt, corrosion, and bare wires or worn insulation.
2. Inspect the louvered end of the sensor for grease, dirt, or other contaminations.

Installation Procedure

IMPORTANT:

- New or service sensors will already have the compound applied to the threads. If a sensor is removed and is to be reinstalled for any reason, the threads must have anti-seize compound applied.
1. Apply anti-seize compound or the equivalent to the threads of the oxygen sensor, if necessary.
 2. Install the oxygen sensor on the exhaust pipe in its original position.

Tighten

- Tighten the oxygen sensor to 55 N·m (5.6kg·m/40 lb in.).

3. Connect the pigtail to the wiring harness.
4. Connect the negative battery cable.

Intake Air Temperature (IAT) Sensor

Removal Procedure

1. Disconnect the negative battery cable.
2. Remove the engine cover
3. The IAT sensor is located in the intake air duct, behind the throttle body.

4. Disconnect the electrical connector from the IAT sensor.

5. Remove the IAT sensor from the intake air duct by using a rocking motion while pulling the sensor.

Installation Procedure

1. Install the IAT sensor into the grommet in the intake air duct.
2. Correct the IAT electrical connector.

3. Install the engine cover.
4. Connect the negative battery cable.

Knock Sensor (KS)

Removal Procedure

1. Disconnect the negative battery cable.
2. Drain the cooling system. Refer to *Draining and Filling the Cooling System* in *Engine Cooling*.
3. Remove the engine cover.
4. Remove the common chamber assembly. Refer to *Common Chamber* in *Engine Mechanical*.

5. Disconnect the electrical connector from the knock sensor.

6. Unscrew the knock sensor from the engine block.

Installation Procedure

NOTE: Do not apply thread sealant to the sensor threads. The sensor is coated at the factory and applying additional sealant will affect the sensor's ability to detect detonation.

1. Screw the knock sensor into the engine block.

Tighten

- Tighten the knock sensor to 20 N·m (2.0kg·m/177 lb in.).

2. Connect the electrical connector to the knock sensor.
3. Install the common chamber assembly. Refer to *Common Chamber* in *Engine Mechanical*.

4. Install the engine cover.
5. Fill the cooling system. Refer to *Draining and Filling the Cooling System* in *Engine Cooling*.
6. Connect the negative battery cable.

Mass Air Flow (MAF) Sensor

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the electrical connector from the MAF sensor.

3. Loosen the clamps which secure the intake air duct and the air cleaner to the MAF sensor.
4. Remove the intake air duct from the MAF sensor.
5. Remove the MAF sensor from the air cleaner.

Installation Procedure

1. Install the MAF sensor on the air cleaner with the clamp.

2. Install the intake air duct and the clamp on the MAF sensor.

3. Tighten the clamps to secure the MAF sensor to the intake air duct and the air cleaner.
4. Connect the MAF electrical connector.
5. Connect the negative battery cable.

Manifold Absolute Pressure (MAP) Sensor

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the electrical connector from the MAP sensor.

3. Remove the bolt securing the MAP sensor to the mounting bracket on the common chamber.

4. Remove the MAP sensor from the mounting bracket.

055RW002

Installation Procedure

1. Install the MAP sensor in the mounting bracket.
2. Install the mounting bracket retaining bolt on the common chamber.
3. Connect the MAP electrical connector.

055RW005

4. Connect the negative battery cable.

Malfunction Indicator Lamp (MIL)

Removal and Installation Procedure

Refer to Warning light bulb, indicator light valve, illumination light bulb, A/T indicator light bulb in Meter and Gauge.

Powertrain Control Module (PCM)

Service Precaution

NOTE: To prevent possible electrostatic discharge damage to the PCM, do not touch the connector pins or soldered components on the circuit board.

Electrostatic Discharge (ESD) Damage

Electronic components used in the control systems are often designed to carry very low voltage. Electronic components are susceptible to damage caused by electrostatic discharge. Less than 100 volts of static electricity can cause damage to some electronic components. By comparison, it takes as much as 4,000 volts for a person to even feel the zap of a static discharge.

There are several ways for a person to become statically charged. The most common methods of charging are by friction and by induction. An example of charging by friction is a person sliding across a car seat.

Charging by induction occurs when a person with well insulated shoes stands near a highly charged object and momentarily touches ground. Charges of the same polarity are drained off leaving the person highly charged with the opposite polarity. Static charges can cause damage, therefore, it is important to use care when handling and testing electronic components.

NOTE: To prevent possible Electrostatic Discharge damage, follow these guidelines:

- Do not touch the control module connector pins or soldered components on the control module circuit board.
- Do not open the replacement part package until the part is ready to be installed.
- Before removing the part from the package, ground the package to a known good ground on the vehicle.
- If the part has been handled while sliding across the seat, or while sitting down from a standing position, or while walking a distance, touch a known good ground before installing the part.

NOTE: To prevent internal PCM damage, the ignition must be in the "OFF" position in order to disconnect or reconnect power to the PCM (for example: battery cable, PCM pigtail, PCM fuse, jumper cables, etc.).

IMPORTANT: When replacing the production PCM with a service PCM, it is important to transfer the broadcast code and production PCM number to the service PCM label. This will allow positive identification of PCM parts throughout the service life of the vehicle. Do not record this information on the metal PCM cover.

IMPORTANT: The ignition should always be in the "OFF" position in order to install or remove the PCM connectors.

Removal Procedure

1. Disconnect the negative battery cable.
2. Block the wheels.
3. Remove the two screws attaching the rear console and lift the upward rear console, then disconnect the switch connector.
4. Remove the lower cluster assembly by pulling the cover toward the rear.
5. Remove the transfer knob.
6. Remove the six screws attaching the upper console and front console.

7. Disconnect the red, white, and blue electrical connectors at the PCM.
8. Remove the two screws in the front of the PCM.
9. Remove the one screws at the left rear of the PCM.
10. Pull the PCM straight out from the dashboard.

Installation Procedure

1. Insert the PCM into the dashboard.
 - Line up the holes in front for the mounting screws.
2. Install the PCM with two screws in the front and one screw at the left rear.
3. Plug the red, white, and blue connectors into the appropriate sockets.

4. Install the front console and lower console.
5. Install the transfer knob.
6. Connect the switch connector and install the rear console.

If the PCM is replaced, the new PCM will need to be programmed.

EEPROM

General Description

The Electronically Erasable Programmable Read Only Memory (EEPROM) is a permanent memory that is physically soldered within the PCM. The EEPROM contains program and calibration information that the PCM needs to control powertrain operation.

Functional Check

1. Perform the On-Board Diagnostic System Check.
2. Start the engine and run for one minute.
3. Scan for DTCs using the Tech 2.

Throttle Position (TP) Sensor

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the TPS electrical connector.
3. Remove the bolts and the TP sensor from the throttle body.

NOTE: Do not clean the TP sensor by soaking it in solvent. The sensor will be damaged as a result.

Function Check

Use a Tech 2 to check the TP sensor output voltage at closed throttle.

- The voltage should be under 0.85 volt.
- If the reading is greater than 0.85 volt, check the throttle shaft to see if it is binding. Check that the throttle cable is properly adjusted, also. Refer to *Throttle Cable Adjustment*.
- If the throttle shaft is not binding and the throttle cable is properly adjusted, install a new TP sensor.

Installation Procedure

1. Install the TP sensor on the throttle body with the bolts.

2. Connect the TP electrical connector.
3. Install the negative battery cable.

Vehicle Speed Sensor (VSS)

Removal Procedure

CAUTION: The VSS is located on the right side of the transfer case just ahead of the rear propeller shaft and very close to the exhaust pipes. Be sure that the exhaust pipes are cool enough to touch before trying to remove the VSS. If the pipes are hot, you could be burned.

1. Disconnect the negative battery cable.
2. Disconnect the VSS electrical connector.

3. Remove the bolt and the clamp securing the VSS in place.

IMPORTANT: Have a container ready to catch any fluid that leaks out when the VSS is removed from the transfer case.

4. Remove the VSS from the transfer case by wiggling it slightly and pulling it straight out.

Inspection Procedure

1. Inspect the electrical connector for signs of corrosion or warping. Replace the VSS if the electrical connector is corroded or warped.
2. Inspect the VSS driven gear for chips, breaks, or worn condition. Replace the VSS if the driven gear is chipped, broken or worn.
3. Inspect the O-ring for wear, nicks, tears, or looseness. Replace the O-ring if necessary.

Installation Procedure

1. Install the VSS in the transfer case with the notch for the connector facing the rear.

2. Secure the VSS in place with the clamp and the bolt.

Tighten

- Tighten the bolt to 16 N·m (1.6 kg·m/12 lb ft.).

3. Connect the VSS electrical connector.

4. Check the transfer case oil level. Add fluid if necessary.

5. Connect the negative battery cable.

Air Cleaner/Air Filter

Removal Procedure

1. Loosen the clamp between the air cleaner lid and the mass air flow sensor.
2. Release the four latches securing the lid to the air cleaner housing.
3. Remove the air cleaner lid.

TS23973

4. Remove the air filter element.

TS23794

5. Remove the retaining bolts and the air cleaner housing from the vehicle.

130RT002

Installation Procedure

1. Install the air cleaner housing in the vehicle with the retaining bolts.

130RT002

2. Install the air filter element in the air cleaner housing.

TS23794

3. Install the air cleaner lid on the MAF sensor and the air cleaner housing.

TS23973

4. Tighten the clamp and secure the four latches between the lid and the air cleaner housing.

Idle Air Control (IAC) Valve

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the IAC electrical connector.
3. Remove the bolts and the IAC valve from the throttle body.

NOTE: Do not clean the IAC valve by soaking it in solvent. The valve will be damaged as a result.

TS23745

Cleaning, Inspection, and Measurement Procedure

- Clean the IAC valve O-ring sealing surface, pintle valve seat and air passage.
 - Use carburetor cleaner and a parts cleaning brush to remove carbon deposits. Do not use a cleaner that contains methyl ethyl ketone. This is an extremely strong solvent and not necessary for this type of deposit.
 - Shiny spots on the pintle are normal and do not indicate misalignment or a bent pintle shaft.
 - If the air passage has heavy deposits, remove the throttle body for complete cleaning.

TS23746

- Inspect the IAC valve O-ring for cuts, cracks, or distortion. Replace the O-ring if damaged.
- In order to install a new IAC valve, measure the distance between the tip of the pintle and the mounting flange. If that measurement is 28 mm (1.1 in.) or less, the valve needs no adjustment. If the measurement is greater than 28 mm (1.1 in.), apply finger pressure and retract the valve. The force required to retract the pintle on a new valve will not damage the valve, shaft, or pintle.

NOTE: Do not push or pull on the IAC valve pintle on IAC valves that have been in service. The force required to move the pintle may damage it.

IMPORTANT: Use an identical replacement part in order to replace a valve. IAC valve pintle shape and diameter are designed for the specific application.

Installation Procedure

1. Install the IAC valve on the throttle body with the bolts.

2. Connect the IAC valve electrical connector.
3. Install the negative battery cable.

Common Chamber

Removal and Installation Procedure

Refer to Common Chamber in Engine Mechanical.

Accelerator Cable Assembly

Removal Procedure

1. Remove the engine cover.
2. Loosen the adjusting nut on the cable bracket mounting on the common chamber.

3. Remove the accelerator control cable (on the throttle valve end).

4. Remove the accelerator control cable (on the accelerator pedal end).

TS23982

5. Remove the grommet.

6. Remove the accelerator control cable.

TS23983

Installation Procedure

1. Install the accelerator control cable.

TS23983

2. Install the grommet.

3. Install the accelerator control cable (on the accelerator pedal end).

TS23982

Inspection Procedure

Check the following items, and replace the control cable if any abnormality is found:

- The control cable should move smoothly.
- The control cable should not be bent or kinked.
- The control cable should be free of damage and corrosion.

4. Install the accelerator control cable (on the throttle valve end).

101RW006

5. Install the adjusting nut.

101RW007

6. Adjust the accelerator cable at the throttle body. Refer to *Accelerator Cable Adjustment*.

7. Install the engine cover.

Adjustment Procedure

1. Loosen the adjusting nut and lock nut.
2. Pull outer cable closing fully the throttle valve.

3. Tighten adjusting nut and lock nut temporarily.

035RW004

4. Loosen adjusting nut by three turns and tighten lock nut. Then, manually operating the throttle valve, make sure that the valve lever returns up to the stopper screw.

IMPORTANT: The valve lever must return up to the stopper screw. If the valve lever does not reach the stopper screw, repeat the procedure again from step 1.

5. It does not reach the stopper screw, repeat from step 1.

TS23782

Accelerator Pedal Replacement

Removal Procedure

1. Disconnect the cruise control cable from the accelerator pedal assembly.

TS24053

2. Disconnect the accelerator pedal control cable from the accelerator pedal assembly.

TS24054

3. Disconnect the wiring harness from the kick-down switch.

TS24038

4. Remove the two screws from the accelerator pedal assembly.

TS24055

5. Remove the accelerator pedal assembly from the bulkhead.

Installation Procedure

1. Install the accelerator pedal assembly on the bulkhead.

6E2-296 6VD1 3.2L ENGINE DRIVEABILITY AND EMISSIONS

2. Install the two screws to the accelerator pedal assembly.

3. Connect the wiring harness to the kick-down switch.

4. Connect the accelerator pedal control cable to the accelerator pedal assembly.

5. Connect the cruise control cable to the accelerator pedal assembly.

Pedal Stroke Adjustment Procedure

1. Loosen the jam nut and rotate the kick-down switch counterclockwise.

TS24039

2. Fully depress the pedal and hold it by hand. Rotate the switch clockwise until the switch clicks.
3. Rotate the switch 1/2 turn further and lock it in this position by tightening the jam nut.

TS24040

4. Step on the accelerator pedal and make sure there is a clicking sound at the full-stroke position.

Fuel Filter Cap

General Description

The fuel filter cap includes a vacuum valve and a pressure valve.

If high vacuum or high pressure occurs in the fuel tank, each valve works to adjust the pressure in order to prevent damage to the tank at the EGR valve.

TS23767

Inspection Procedure

NOTE: Replace the fuel filler cap with the same type of filler cap that was originally installed on the vehicle.

- Check the seal ring in the filler cap for any abnormality and for seal condition.
- Replace the filler cap if any abnormality is found.

Fuel Filter

Removal Procedure

1. Disconnect the negative battery cable.
2. Remove the fuel filler cap.

041RW005

6E2-298 6VD1 3.2L ENGINE DRIVEABILITY AND EMISSIONS

3. Disconnect the fuel line from the fuel filter on the engine side.
4. Disconnect the fuel line from the fuel filter on the fuel tank side.

041RW006

5. Remove the bolt on the fuel filter holder.

041RW007

6. Remove the fuel filter.

041RW008

Inspection Procedure

1. Replace the fuel filter when the following occur:
 - Fuel leaks from the fuel filter body.
 - The fuel filter body is damaged.
 - The fuel filter is clogged with dirt or sediment.
2. If the drain hole is clogged, clean the drain.

041RW009

Installation Procedure

1. Install the fuel filter in the correct direction.

041RW006

2. Install the bolt on the fuel filter holder.

041RW007

3. Connect the fuel line on the engine side.

4. Connect the fuel line on the fuel tank side.

041RW006

5. Install the fuel filler cap.

041RW005

6. Connect the negative battery cable.

Fuel Gauge Unit

Removal Procedure

Refer to *Fuel Gauge Unit In Engine Fuel*.

014RW133

Fuel Injectors

Removal Procedure

NOTE: If the fuel injectors are leaking, the engine oil may be contaminated with fuel. Check the oil for signs of contamination and change the oil and the filter if necessary.

NOTE: Use care in removing the fuel injectors in order to prevent damage to the fuel injector electrical connector pins or the fuel injector nozzles. The fuel injector is an electrical component and should not be immersed in any type of cleaner as this may damage the fuel injector.

IMPORTANT: Fuel injectors are serviced as a complete assembly only.

1. Disconnect the negative battery cable.
2. Remove the upper intake manifold. Refer to *Common Chamber in Engine Mechanical*.
3. Remove the fuel rail. Refer to *Fuel Rail*.

014RW106

4. Remove the injector retainer clip.

F06RW017

5. Remove the fuel injector assembly.
6. Remove the O-ring from the fuel injector.
7. Remove the O-ring backup from the fuel injector .

Inspection Procedure

1. Inspect the O-rings for cracks or leaks.
2. Replace worn or damaged O-rings.
3. Lubricate the new O-rings with engine oil before installation.

Installation Procedure

1. Install the O-ring backup on the fuel injector.
2. Install the new O-ring on the fuel injector.
3. Install the fuel injector on the fuel rail.

F06RW017

4. Use new fuel injector retainer clips to retain the fuel injector to the fuel rail.
5. Coat the end of the fuel injector with engine oil.
6. Install the fuel rail. Refer to *Fuel Rail*.

014RW106

7. Install the upper intake manifold. Refer to *Common Chamber in Engine Mechanical*.
8. Install the engine cover.

9. Connect the negative battery cable.

Fuel Pressure Regulator

Removal Procedure

CAUTION: To reduce the risk of fire and personal injury, it is necessary to relieve the fuel system pressure before servicing the fuel system components.

CAUTION: After relieving the system pressure, a small amount of fuel may be released when servicing fuel lines or connections. Reduce the chance of personal injury by covering the fuel line fittings with a shop towel before disconnecting the fittings. The towels will absorb any fuel that may leak out. When the disconnect is completed, place the towel in an approved container.

NOTE: Compressed air must never be used to test or clean a fuel pressure regulator, as damage to the fuel pressure regulator may result.

NOTE: To prevent damage to the fuel pressure regulator, do not immerse the pressure regulator in solvent.

1. Depressurize the fuel system. Refer to *Fuel Pressure Relief Procedure*.
2. Disconnect the negative battery cable.
3. Remove the fuel pump relay. Refer to *Fuel Pump Relay*.
4. Remove the pressure regulator hose from the fuel pressure regulator.

014RW110

5. Remove the two bolts from the protector that secures the common chamber.

014RW109

6. Remove the fuel pressure regulator attaching screw.

F06RW016

7. Remove the fuel pressure regulator from the fuel rail.

Disassembly Procedure

1. Remove the O-ring from the fuel pressure regulator.
2. Loosen the swivel nut.
3. Remove the fuel return line from the fuel pressure regulator.
4. Remove the O-ring from the fuel return line.
 - The O-ring may be left inside the fuel pressure regulator instead of on the fuel return line.

F06RW016

Assembly Procedure

1. Install a new O-ring on the fuel return line.
2. Install the fuel return line on the fuel pressure regulator.

NOTE: Do not over-tighten the swivel nut on the fuel pressure regulator. The fuel pressure regulator can be damaged and fuel may leak if the swivel nut is over-tightened.

3. Tighten the swivel nut.
4. Install a new O-ring on the fuel pressure regulator.

Installation Procedure

1. Install the fuel pressure regulator attaching screw.

Tighten

- Tighten the fuel pressure regulator attaching screw to 3 N·m (0.3kg-m/26 lb in.).

F06RW016

2. Install the fuel pressure regulator on the fuel rail.
3. Install the two bolts to the protector that secures the common chamber.

014RW109

4. Install the pressure regulator hose to the fuel pressure regulator.

014RW110

5. Install the fuel pump relay. Refer to *Fuel Pump Relay*.
6. Connect the negative battery cable.
7. Crank the engine until it starts. Cranking the engine may take longer than usual due to trapped air in the fuel lines.

Fuel Metering System

Fuel Pressure Relief Procedure

CAUTION: To reduce the risk of fire and personal injury, it is necessary to relieve the fuel system pressure before servicing the fuel system components.

CAUTION: After relieving the system pressure, a small amount of fuel may be released when servicing fuel lines or connections. Reduce the chance of personal injury by covering the fuel line fittings with a shop towel before you disconnect the fittings. The towels will absorb any fuel that may leak out. When the disconnect is completed, place the towel in an approved container.

1. Remove the fuel cap.
2. Remove the fuel pump relay from the underhood relay box. Refer to *Fuel Pump Relay*.

014RW089

3. Start the engine and allow it to stall.
4. Crank the engine for 30 seconds.
5. Disconnect the negative battery cable.

Fuel Pump Assembly

Removal Procedure

Refer to *Fuel Tank In Fuel Pump Relay*.

014RW133

Fuel Pump Relay

Removal Procedure

1. Remove the fuse and relay box cover from under the hood.
2. Consult the diagram on the cover to determine which is the correct relay.
3. Pull the relay straight up and out of the fuse and relay box.

014RW089

Installation Procedure

1. Insert the relay into the correct place in the fuse and relay box with the catch slot facing forward.

014RW089

2. Press down until the catch engages.
 - An audible “click” will be heard.
3. Install the fuse and relay box cover.

Fuel Rail Assembly

Removal Procedure

NOTE:

- Do not attempt to remove the fuel inlet fitting on the fuel rail. It is staked in place. Removing the fuel inlet fitting will result in damage to the fuel rail or the internal O-ring seal.
- Use care when removing the fuel rail assembly in order to prevent damage to the injector electrical connector terminals and the injector spray tips.
- Fittings should be capped and holes plugged during servicing to prevent dirt and other contaminants from entering open lines and passages.

IMPORTANT: An eight-digit identification number is stamped on the side of the fuel rail. Refer to this number when you service the fuel rail or when a replacement part is required.

TS24022

Before removal, the fuel rail assembly may be cleaned with a spray type engine cleaner. Follow the spray package instructions. Do not immerse the fuel rails in liquid cleaning solvent.

1. Depressurize the fuel system. Refer to Fuel Pressure Relief Procedure in this Section.
2. Disconnect the negative battery cable.
3. Remove the engine cover.
4. Disconnect the accelerator pedal cable from throttle body and cable bracket.
5. Disconnect the connectors from manifold absolute pressure sensor, solenoid valve, electric vacuum sensing valve.
6. Disconnect the vacuum hose on canister VSV and positive crankcase ventilation hose.
7. Remove the common chamber Refer to the common chamber in Engine Mechanical.
 1. Lift up carefully on the fuel injectors. Do not separate the fuel injectors from the fuel rail.

2. If an injector becomes separated from the fuel rail, the injector O-ring seals and the retainer clip must be replaced.
3. Drain residual fuel into an approved container.

014RW106

8. If removal of the fuel pressure regulator is necessary, refer to *Fuel Pressure Regulator*.
9. If removal of the fuel injectors is necessary, refer to *Fuel Injectors*.

Installation Procedure

1. If the fuel injectors were removed, install them. Refer to *Fuel Injectors*.
2. If the fuel pressure regulator was removed, install it. Refer to *Fuel Pressure Regulator*.
3. Install the common chamber. Refer to common chamber in engine Mechanical.

014RW106

4. Connect the vacuum hose on Canister VSV and positive crankcase ventilation hose.
5. Connect the connectors to manifold absolute pressure sensor, solenoid valve, electric vacuum sensing valve.
6. Connect the accelerator pedal cable to throttle body and cable bracket.
7. Install the engine cover.
8. Connect the negative battery cable.
9. Crank the engine until it starts. Cranking the engine may take longer than usual due to trapped air in the fuel rail and in the injectors.

Fuel Tank

Removal Procedure

Refer to *Fuel Tank In Fuel Pump Relay*.

014RW134

Throttle Body (TB)

Removal Procedure

1. Disconnect the negative battery cable.
2. Drain the cooling system. Refer to *Cooling System*.
3. Remove the accelerator cable assembly. Refer to *Accelerator Cable in Engine Speed Control System*.
4. Disconnect the electrical connectors:
 - Throttle position (TP) sensor.
 - Idle air control (IAC) solenoid.

- Intake air temperature (IAT) sensor. Refer to *Intake Air Temperature Sensor*.

035RW023

5. Disconnect the vacuum hose below the air horn.
6. Remove the intake air duct clamp.
7. Disconnect the intake air duct.
8. Disconnect the coolant lines from the throttle body.
9. Remove the bolts from the common chamber.
10. Remove the throttle body from the common chamber.
11. Remove the gasket from the upper intake manifold.

035RW024

12. Remove the IAC. Refer to *Idle Air Control (IAC) Solenoid*.
13. Remove the TP sensor. Refer to *Throttle Position (TP) Sensor*.

Inspection Procedure

NOTE: Do not use solvent of any type when you clean the gasket surfaces on the intake manifold and the throttle body assembly. The gasket surfaces and the throttle body assembly may be damaged as a result.

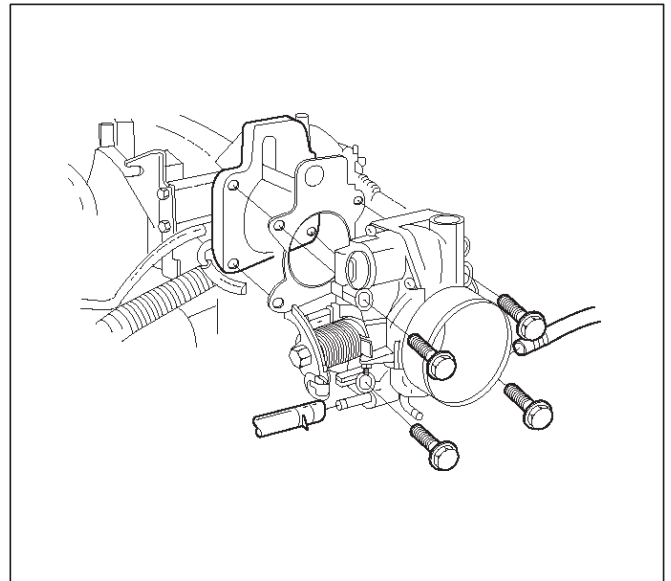

- If the throttle body gasket needs to be replaced, remove any gasket material that may be stuck to the mating surfaces of the manifold.
- Do not leave any scratches in the aluminum casting.

Installation Procedure

1. Install the TP sensor. Refer to *Throttle Position (TP) Sensor*.
2. Install the IAC. Refer to *Idle Air Control (IAC) Solenoid*.
3. Install the gasket on the common chamber.
4. Install the throttle body on the common chamber.
5. Secure the gasket and the throttle body with the four bolts.
 - The vacuum lines must be properly routed under the throttle body before tightening the mounting bolts.

Tighten

- Tighten the throttle body mounting bolts to 24 N·m (2.4kg·m/17 lb ft.).

035RW024

6. Install the coolant lines.
7. Connect all the vacuum lines.
8. Install the intake air duct.
9. Tighten the intake air duct clamp.
10. Connect all the electrical connectors:
 - Throttle position (TP) sensor.
 - Idle air control (IAC) solenoid.

- Intake air temperature (IAT) sensor. Refer to *Intake Air Temperature Sensor*.

035RW023

11. Install the accelerator cable assembly. Refer to *Accelerator Cable in Engine Speed Control System*.
12. Fill the cooling system. Refer to *Cooling System*.
13. Install the negative battery cable.

Electronic Ignition System

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the electrical connector at the coil module.
3. Remove the two screws that secure the coil module to the rocker cover.

014RW108

4. Remove the coil module and the spark plug boot from the spark plug.
 - Twist the coil module while pulling it straight up.

014RW091

5. Use the spark plug socket in order to remove the spark plug from the engine.

Spark Plug Gap Check

- Check the gap of all spark plugs before installation.
- Use a round wire feeler gauge to ensure an accurate check.
- Plugs installed with the wrong gap can cause poor engine performance and excessive emissions.

Installation Procedure

NOTE: The plug must thread smoothly into the cylinder head and be fully seated. Use a thread chaser if necessary to clean the threads in the cylinder head. Cross-threading or failure to fully seat the spark plug can cause plug overheating, exhaust blow-by gases, or thread damage. Do not overtighten the spark plugs. Over tightening can cause aluminum threads to strip.

1. Install the spark plug in the engine. Use the appropriate spark plug socket.

Tighten

- Tighten the spark plug to 18 N·m (1.8kg·m/13 lb ft.).

2. Install the coil module and spark plug boot over the spark plug.

014RW108

3. Secure the coil module to the rocker cover with two screws.

014RW091

4. Connect the electrical connector at the coil module.
5. Connect the negative battery cable.

Catalytic Converter

Removal and Installation Procedure

Refer to *Engine Exhaust in Engine*.

Air Conditioning Relay

Removal Procedure

1. Remove the fuse and relay box cover from under the hood.
2. Consult the diagram on the cover to determine which is the correct relay.
3. Pull the relay straight up and out of the fuse and relay box.

014RW090

Installation Procedure

1. Insert the relay into the correct place in the fuse and relay box with the catch slot facing forward.
2. Press down until the catch engages.
 - An audible "click" will be heard.
3. Install the fuse and relay box cover.

EVAP Canister Hoses

Service Information

To view the routing of the EVAP canister hoses, refer to *Vehicle Emission Control Information in Diagnosis*. Use 6148M or equivalent when you replace the EVAP canister hoses.

EVAP Canister

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the two hoses from the EVAP canister.

3. Disconnect the fuel vapor connector and the purge hose from the EVAP canister vent solenoid.

014RW130

4. Remove the two retaining bolts the EVAP canister to the mounting bracket on the cross member.

014RW131

5. Remove the retaining bolt on the mounting bracket the slide the canister out of mounting bracket.

014RW129

Inspection Procedure

1. Inspect the hoses for cracks and leaks.
2. Inspect the canister for a damaged case.

Installation Procedure

1. Slide the canister into mounting bracket the install the mounting bracket bolt.

014RW129

2. Install the retaining bolts the EVAP canister to the mounting bracket on the cross member.

014RW131

3. Connect the fuel vapor connector to the EVAP canister vent solenoid.
4. Connect the two hoses to the EVAP canister.

014RW130

5. Disconnect the negative battery cable.

EVAP Canister Purge Solenoid

Removal Procedure

1. Disconnect the electrical connector from the EVAP canister purge solenoid.

2. Disconnect the vacuum hoses from the EVAP canister purge solenoid.

014RW136

3. Remove the EVAP canister purge solenoid retaining bolt from the upper intake manifold.
4. Remove the EVAP canister purge solenoid.

014RW137

Installation Procedure

1. Install the EVAP canister purge solenoid on the upper intake manifold.
2. Install the EVAP canister purge solenoid retaining bolt.

3. Connect the vacuum hoses to the EVAP canister purge solenoid.

014RW137

4. Connect the electrical connector to the EVAP canister purge solenoid.

014RW138

Fuel Tank Vent Valve

Removal and Installation Procedure

Refer to *Fuel Pump*

Linear Exhaust Gas Recirculation (EGR) Valve

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the electrical connector at the EGR valve.

014RW139

3. Remove the bolt and the nut from the upper intake manifold.

014RW098

4. Remove the EGR valve from the upper intake manifold.
5. Remove the gasket from the upper intake manifold.

Installation Procedure

1. Install the gasket on the upper intake manifold.
2. Install the EGR valve on the upper intake manifold.
3. Secure the EGR valve and the gasket with the bolt and the nut.

NOTE: It is possible to install the EGR valve rotated 180° from the correct position. Make sure that the base of the valve is placed so that it aligns with the mounting flange.

014RW096

4. Connect the electrical connector at the EGR valve.

014RW139

5. Connect the negative battery cable.

Positive Crankcase Ventilation (PCV) Valve

Removal Procedure

1. Remove the vacuum hose at the PCV valve.
 - Slide the clamp back to release the hose.

2. Pull the PCV valve from the rubber grommet in the right valve cover.

014RW097

Inspection Procedure

1. Shake the valve and listen for the rattle of the needle inside the valve.
2. If the valve does not rattle, replace the valve.

Installation Procedure

1. Push the PCV valve into the rubber grommet in the left valve cover.
2. Install the vacuum hose on the PCV valve and secure the vacuum hose with the clamp.

014RW097

Wiring and Connectors

Wiring Harness Service

The control module harness electrically connects the control module to the various solenoids, switches and sensors in the vehicle engine compartment and passenger compartment.

Replace wire harnesses with the proper part number replacement.

Because of the low amperage and voltage levels utilized in powertrain control systems, it is essential that all wiring in environmentally exposed areas be repaired with crimp and seal splice sleeves.

The following wire harness repair information is intended as a general guideline only. Refer to *Chassis Electrical* for all wire harness repair procedures.

Connectors and Terminals

Use care when probing a connector and when replacing terminals. It is possible to short between opposite terminals. Damage to components could result. Always use jumper wires between connectors for circuit checking. NEVER probe through Weather-Pack seals. Use an appropriate connector test adapter kit which contains an assortment of flexible connectors used to probe terminals during diagnosis. Use an appropriate fuse remover and test tool for removing a fuse and to adapt the fuse holder to a meter for diagnosis.

Open circuits are often difficult to locate by sight because oxidation or terminal misalignment are hidden by the connectors. Merely wiggling a connector on a sensor, or in the wiring harness, may temporarily correct the open circuit. Intermittent problems may also be caused by oxidized or loose connections.

Be certain of the type of connector/terminal before making any connector or terminal repair. Weather-Pack and Com-Pack III terminals look similar, but are serviced differently.

PCM Connectors and Terminals

Removal Procedure

1. Remove the connector terminal retainer.
2. Push the wire connected to the affected terminal through the connector face so that the terminal is exposed.
3. Service the terminal as necessary.

Installation Procedure

1. Bend the tab on the connector to allow the terminal to be pulled into position within the connector.
2. Pull carefully on the wire to install the connector terminal retainer.

Wire Harness Repair: Twisted Shielded Cable

Removal Procedure

1. Remove the outer jacket.
2. Unwrap the aluminum/mylar tape. Do not remove the mylar.

3. Untwist the conductors.
4. Strip the insulation as necessary.

Installation Procedure

1. Splice the wires using splice clips and rosin core solder.
2. Wrap each splice to insulate.

3. Wrap the splice with mylar and with the drain (uninsulated) wire.

049

4. Tape over the whole bundle to secure.

050

Twisted Leads

Removal Procedure

1. Locate the damaged wire.

2. Remove the insulation as required.

051

Installation Procedure

1. Use splice clips and rosin core solder in order to splice the two wires together.

052

2. Cover the splice with tape in order to insulate it from the other wires.

3. Twist the wires as they were before starting this procedure.

4. Tape the wires with electrical tape. Hold in place.

Weather-Pack Connector

Tools Required

5-8840-6632-0 Weather-Pack II Terminal Remover

Removal Procedure

A Weather-Pack connector can be identified by a rubber seal at the rear of the connector. This engine room connector protects against moisture and dirt, which could lead to oxidation and deposits on the terminals. This protection is important, because of the low voltage and the low amperage found in the electronic systems.

1. Open the secondary lock hinge on the connector.

6E2-316 6VD1 3.2L ENGINE DRIVEABILITY AND EMISSIONS

2. Use tool 5-8840-6632-0 or the equivalent to remove the pin and the sleeve terminals. Push on 5-8840-6632-0 to release.

NOTE: Do not use an ordinary pick or the terminal may be bent or deformed. Unlike standard blade terminals, these terminals cannot be straightened after they have been improperly bent.

3. Cut the wire immediately behind the cable seal.

Installation Procedure

Make certain the connectors are properly seated and all of the sealing rings are in place when you reconnect the leads. The secondary lock hinge provides a backup locking feature for the connector. The secondary lock hinge is used for added reliability. This flap should retain the terminals even if the small terminal lock tangs are not positioned properly.

Do not replace the Weather-Pack connections with standard connections. Read the instructions provided with the Weather-Pack connector and terminal packages.

1. Replace the terminal.
2. Slip the new seal onto the wire.
3. Strip 5 mm (0.2") of insulation from the wire.
4. Crimp the terminal over the wire and the seal.

5. Push the terminal and the connector to engage the locking tangs.

6. Close the secondary locking hinge.

Com-Pack III

General Information

The Com-Pack III terminal looks similar to some Weather-Pack terminals. This terminal is not sealed and is used where resistance to the environment is not required. Use the standard method when repairing a terminal. Do not use the Weather-Pack terminal tool 5-8840-6632-0 or equivalent. These will damage the terminals.

Metri-Pack

Tools Required

5-8840-0632-0 Terminal Remover

Removal Procedure

Some connectors use terminals called Metri-Pack Series 150. These may be used at the engine coolant temperature (ECT) sensor.

1. Slide the seal (1) back on the wire.
2. Insert the 5-8840-0632-0 tool or equivalent (3) in order to release the terminal locking tang (2).

3. Push the wire and the terminal out through the connector. If you reuse the terminal, reshape the locking tang.

Installation Procedure

Metri-Pack terminals are also referred to as "pull-to-seat" terminals.

1. In order to install a terminal on a wire, the wire must be inserted through the seal (2) and through the connector (3).

2. The terminal (1) is then crimped onto the wire.

3. Then the terminal is pulled back into the connector to seat it in place.

General Description (PCM and Sensors)

58X Reference PCM Input

The powertrain control module (PCM) uses this signal from the crankshaft position (CKP) sensor to calculate engine RPM and crankshaft position at all engine speeds. The PCM also uses the pulses on this circuit to initiate injector pulses. If the PCM receives no pulses on this circuit, DTC P0337 will set. The engine will not start and run without using the 58X reference signal.

A/C Request Signal

This signal tells the PCM when the A/C mode is selected at the A/C control head. The PCM uses this to adjust the idle speed before turning "ON" the A/C clutch. The A/C compressor will be inoperative if this signal is not available to the PCM.

Refer to *A/C Clutch Circuit Diagnosis* for A/C wiring diagrams and diagnosis for the A/C electrical system.

Crankshaft Position (CKP) Sensor

The crankshaft position (CKP) sensor provides a signal used by the powertrain control module (PCM) to calculate the ignition sequence. The CKP sensor initiates the 58X reference pulses which the PCM uses to calculate RPM and crankshaft position.

Refer to *Electronic Ignition System* for additional information.

0013

Camshaft Position (CMP) Sensor and Signal

The camshaft position (CMP) sensor sends a CMP signal to the PCM. The PCM uses this signal as a "syncpulse" to trigger the injectors in the proper sequence. The PCM uses the CMP signal to indicate the position of the #1 piston during its power stroke. This allows the PCM to calculate true sequential fuel injection (SFI) mode of operation. If the PCM detects an incorrect CMP signal while the engine is running, DTC P0341 will set. If the CMP signal is lost while the engine is running, the fuel

injection system will shift to a calculated sequential fuel injection mode based on the last fuel injection pulse, and the engine will continue to run. As long as the fault is present, the engine can be restarted. It will run in the calculated sequential mode with a 1-in-6 chance of the injector sequence being correct.

Refer to *DTC P0341* for further information.

Engine Coolant Temperature (ECT) Sensor

The engine coolant temperature (ECT) sensor is a thermistor (a resistor which changes value based on temperature) mounted in the engine coolant stream. Low coolant temperature produces a high resistance of 100,000 ohms at -40°C (-40°F). High temperature causes a low resistance of 70 ohms at 130°C (266°F). The PCM supplies a 5-volt signal to the ECT sensor through resistors in the PCM and measures the voltage. The signal voltage will be high when the engine is cold and low when the engine is hot. By measuring the voltage, the PCM calculates the engine coolant temperature. Engine coolant temperature affects most of the systems that the PCM controls.

The Tech 2 displays engine coolant temperature in degrees. After engine start-up, the temperature should rise steadily to about 85°C (185°F). It then stabilizes when the thermostat opens. If the engine has not been run for several hours (overnight), the engine coolant temperature and intake air temperature displays should be close to each other. A hard fault in the engine coolant sensor circuit will set DTC P0117 or DTC P0118.

0016

Electrically Erasable Programmable Read Only Memory (EEPROM)

The electrically erasable programmable read only memory (EEPROM) is a permanent memory chip that is physically soldered within the PCM. The EEPROM contains the program and the calibration information that the PCM needs to control powertrain operation.

Fuel Control Heated Oxygen Sensors

The fuel control heated oxygen sensors (Bank 1 HO2S 1 and Bank 2 HO2S 1) are mounted in the exhaust stream

where they can monitor the oxygen content of the exhaust gas. The oxygen present in the exhaust gas reacts with the sensor to produce a voltage output. This voltage should constantly fluctuate from approximately 100 mV to 900 mV. The heated oxygen sensor voltage can be monitored with a Tech 2. By monitoring the voltage output of the oxygen sensor, the PCM calculates the pulse width command for the injectors to produce the proper combustion chamber mixture.

- Low HO₂S voltage is a lean mixture which will result in a rich command to compensate.
- High HO₂S voltage is a rich mixture which will result in a lean command to compensate.

An open Bank 1 HO₂S 1 signal circuit will set a DTC P0134 and the Tech 2 will display a constant voltage between 400-500 mV. A constant voltage below 300 mV in the sensor circuit (circuit grounded) will set DTC P0131. A constant voltage above 800 mV in the circuit will set DTC P0132. Faults in the Bank 2 HO₂S 1 signal circuit will cause DTC 0154 (open circuit), DTC P0151 (grounded circuit), or DTC P0152 (signal voltage high) to set. The PCM can also detect HO₂S response problems. If the response time of an HO₂S is determined to be too slow, the PCM will store a DTC that indicates degraded HO₂S performance.

0012

Intake Air Temperature (IAT) Sensor

The intake air temperature (IAT) sensor is a thermistor which changes its resistance based on the temperature of air entering the engine. Low temperature produces a high resistance of 100,000 ohms at -40°C (-40°F). High temperature causes low resistance of 70 ohms at 130°C (266°F). The PCM supplies a 5-volt signal to the sensor through a resistor in the PCM and monitors the signal voltage. The voltage will be high when the incoming air is cold. The voltage will be low when the incoming air is hot. By measuring the voltage, the PCM calculates the incoming air temperature. The IAT sensor signal is used

to adjust spark timing according to the incoming air density.

The Tech 2 displays the temperature of the air entering the engine. The temperature should read close to the ambient air temperature when the engine is cold and rise as underhood temperature increases. If the engine has not been run for several hours (overnight), the IAT sensor temperature and engine coolant temperature should read close to each other. A fault in the IAT sensor circuit will set DTC P0112 or DTC P0113.

Knock Sensor

Insufficient gasoline octane levels may cause detonation in some engines. Detonation is an uncontrolled explosion (burn) in the combustion chamber. This uncontrolled explosion results from a flame front opposite that of the normal flame front produced by the spark plug. The rattling sound normally associated with detonation is the result of two or more opposing pressures (flame fronts) colliding within the combustion chamber. Light detonation is sometimes considered normal, but heavy detonation could result in engine damage.

A knock sensor system is used to control detonation. This system is designed to retard spark timing up to 20 degrees to reduce detonation in the engine. This allows the engine to use maximum spark advance to improve driveability and fuel economy.

The knock sensor system has two major components:

- The knock sensor (KS) module.
- The knock sensor.

The knock sensor, mounted in the engine block near the cylinders, detects abnormal vibration in the engine. The sensor produces an AC output signal of about 10 millivolts. The signal amplitude and frequency are dependent on the amount of knock being experienced. The signal voltage increases with the severity of the knock. This signal voltage is input to the PCM. The PCM then retards the ignition control (IC) spark timing based on the KS signal being received.

The PCM determines whether knock is occurring by comparing the signal level on the KS circuit with the voltage level on the noise channel. The noise channel allows the PCM to reject any false knock signal by indicating the amount of normal engine mechanical noise present. Normal engine noise varies depending on the engine speed and load. If the voltage level on the KS noise channel circuit is below the range considered normal, DTC P0327 will set, indicating a fault in the KS circuit or the knock sensor. If the PCM determines that an abnormal minimum or maximum noise level is being experienced, DTC P0325 will set.

The PCM contains a knock sensor (KS) module. The KS module contains the circuitry which allows the PCM to utilize the KS signal and diagnose the KS sensor and the KS circuitry. If the KS module is missing or faulty, a continuous knock condition will be indicated, and the PCM will set DTC P0325.

Although it is a plug-in device, the KS module is not replaceable. If the KS module is faulty, the entire PCM must be replaced.

Linear Exhaust Gas Recirculation (EGR) Control

The PCM monitors the exhaust gas recirculation (EGR) actual position and adjusts the pintle position accordingly. The PCM uses information from the following sensors to control the pintle position:

- Engine coolant temperature (ECT) sensor.
- Throttle position (TP) sensor.
- Mass air flow (MAF) sensor.

Mass Air Flow (MAF) Sensor

The mass air flow (MAF) sensor measures the difference between the volume and the quantity of air that enters the engine. "Volume" means the size of the space to be filled. "Quantity" means the number of air molecules that will fit into the space. This information is important to the PCM because heavier, denser air will hold more fuel than lighter, thinner air. The PCM adjusts the air/fuel ratio as needed depending on the MAF value. The Tech 2 reads the MAF value and displays it in terms of grams per second (gm/s). At idle, the Tech 2 should read between 4-7 gm/s on a fully warmed up engine. Values should change quickly on acceleration. Values should remain stable at any given RPM. A failure in the MAF sensor or circuit will set DTC P0101, DTC P0102, or DTC P0103.

Manifold Absolute Pressure (MAP) Sensor

The manifold absolute pressure (MAP) sensor responds to changes in intake manifold pressure (vacuum). The MAP sensor signal voltage to the PCM varies from below 2 volts at idle (high vacuum) to above 4 volts with the ignition ON, engine not running or at wide-open throttle (low vacuum).

The MAP sensor is used to determine the following:

- Engine vacuum level for other diagnostics.
- Barometric pressure (BARO).

If the PCM detects a voltage that is lower than the possible range of the MAP sensor, DTC P0107 will be set. A signal voltage higher than the possible range of the sensor will set DTC P0108. The PCM can detect a shifted MAP sensor. The PCM compares the MAP sensor signal to a calculated MAP based on throttle position and various engine load factors.

Powertrain Control Module (PCM)

The powertrain control module (PCM) is located in the passenger compartment below the center console. The PCM controls the following:

- Fuel metering system.
- Transmission shifting (automatic transmission only).
- Ignition timing.
- On-board diagnostics for powertrain functions.

The PCM constantly observes the information from various sensors. The PCM controls the systems that affect vehicle performance. The PCM performs the diagnostic function of the system. It can recognize operational problems, alert the driver through the MIL (Service Engine Soon lamp), and store diagnostic trouble codes (DTCs). DTCs identify the problem areas to aid the technician in making repairs.

- IPCM-6KT for automatic transmission-equipped vehicles.

PCM Function

The PCM supplies either 5 or 12 volts to power various sensors or switches. The power is supplied through resistances in the PCM which are so high in value that a test light will not light when connected to the circuit. In some cases, even an ordinary shop voltmeter will not give an accurate reading because its resistance is too low. Therefore, a digital voltmeter with at least 10 megohms input impedance is required to ensure accurate voltage readings. Tool 5-8840-0285-0 meets this requirement. The PCM controls output circuits such as the injectors, IAC, cooling fan relays, etc., by controlling the ground or the power feed circuit through transistors or through either of the following two devices:

- Output Driver Module (ODM)
- Quad Driver Module (QDM)

PCM Components

The PCM is designed to maintain exhaust emission levels to government mandated standards while providing excellent driveability and fuel efficiency. The PCM

monitors numerous engine and vehicle functions via electronic sensors such as the throttle position (TP) sensor, heated oxygen sensor (HO2S), and vehicle speed sensor (VSS). The PCM also controls certain engine operations through the following:

- Fuel injector control
- Ignition control module
- Knock sensor
- Automatic transmission shift functions
- Evaporative emission (EVAP) purge

PCM Voltage Description

The PCM supplies a buffered voltage to various switches and sensors. It can do this because resistance in the PCM is so high in value that a test light may not illuminate when connected to the circuit. An ordinary shop voltmeter may not give an accurate reading because the voltmeter input impedance is too low. Use a 10-megohm input impedance digital voltmeter (such as 5-8840-0285-0) to assure accurate voltage readings. The input/output devices in the PCM include analog-to-digital converters, signal buffers, counters, and special drivers. The PCM controls most components with electronic switches which complete a ground circuit when turned "ON." These switches are arranged in groups of 4 and 7, called either a surface-mounted quad driver module (QDM), which can independently control up to 4 output terminals, or QDMs which can independently control up to 7 outputs. Not all outputs are always used.

PCM Input/Outputs

Inputs – Operating Conditions Read

- Air Conditioning "ON" or "OFF"
- Engine Coolant Temperature
- Crankshaft Position
- Exhaust Oxygen Content
- Electronic Ignition
- Manifold Absolute Pressure
- Battery Voltage
- Throttle Position
- Vehicle Speed
- Fuel Pump Voltage
- Power Steering Pressure
- Intake Air Temperature
- Mass Air Flow
- Engine Knock
- Camshaft Position

Outputs – Systems Controlled

- EVAP Canister Purge
- Exhaust Gas Recirculation (EGR)
- Ignition Control
- Fuel Control
- Idle Air Control
- Electric Fuel Pump
- Air Conditioning

- Diagnostics
 - Malfunction Indicator Lamp
 - Data Link Connector (DLC)
 - Data Output
- Transmission Control Module
- Alternator Gain Control

PCM Service Precautions

The PCM is designed to withstand normal current draws associated with vehicle operation. Avoid overloading any circuit. When testing for opens and shorts, do not ground or apply voltage to any of the PCM's circuits unless instructed to do so. These circuits should only be tested using digital voltmeter (5-8840-0285-0). The PCM should remain connected to the PCM or to a recommended breakout box.

Throttle Position (TP) Sensor

The throttle position (TP) sensor is a potentiometer connected to the throttle shaft on the throttle body. The PCM monitors the voltage on the signal line and calculates throttle position. As the throttle valve angle is changed (accelerator pedal moved), the TP sensor signal also changes. At a closed throttle position, the output of the TP sensor is low. As the throttle valve opens, the output increases so that at wide open throttle (WOT), the output voltage should be above 4 volts.

The PCM calculates fuel delivery based on throttle valve angle (driver demand). A broken or loose TP sensor may cause intermittent bursts of fuel from an injector and unstable idle because the PCM thinks the throttle is moving. A hard failure in the TP sensor 5-volt reference or signal circuits will set either a DTC P0122 or DTC P0123. A hard failure with the TP sensor ground circuit may set DTC P0123 and DTC P0112. Once a DTC is set, the PCM will use an artificial default value based on engine RPM and mass air flow for the throttle position, and some vehicle performance will return. A high idle may result when either DTC P0122 or DTC P0123 is set. The PCM can also detect a shifted TP sensor. The PCM monitors throttle position and compares the actual TP sensor reading to a predicted TP value calculated from engine speed. If the PCM detects an out-of-range condition, DTC P0121 will be set.

Transmission Fluid Temperature (TFT) Sensor

The transmission fluid temperature sensor is a thermistor which changes its resistance based on the temperature of the transmission fluid. For a complete description of the TFT sensor, refer to *4L30-E Automatic Transmission Diagnosis*.

A failure in the TFT sensor or associated wiring will cause DTC P0712 or DTC P0713 to set. In this case, engine coolant temperature will be substituted for the TFT sensor value and the transmission will operate normally.

Transmission Range Switch

IMPORTANT: The vehicle should not be driven with the transmission range switch disconnected; idle quality will be affected.

The four inputs from the transmission range switch indicate to the PCM which position is selected by the transmission selector lever. This information is used for ignition timing, EVAP canister purge, EGR and IAC valve operation.

For more information on the transmission on the transmission range switch, refer to *4L30-E Automatic Transmission*.

Vehicle Speed Sensor (VSS)

The PCM determines the speed of the vehicle by converting a pulsing voltage signal from the vehicle speed sensor (VSS) into miles per hour. The PCM uses this signal to operate the cruise control, speedometer, and the TCC and shift solenoids in the transmission. For more information on the TCC and shift solenoids, refer to *4L30-E Automatic Transmission*.

0008

TS23795

Use of Circuit Testing Tools

Do not use a test light to diagnose the powertrain electrical systems unless specifically instructed by the diagnostic procedures. Use Connector Test Adapter Kit J 35616 whenever diagnostic procedures call for probing connectors.

Aftermarket Electrical and Vacuum Equipment

Aftermarket (add-on) electrical and vacuum equipment is defined as any equipment which connects to the vehicle's electrical or vacuum systems that is installed on a vehicle after it leaves the factory. No allowances have been made in the vehicle design for this type of equipment.

NOTE: No add-on vacuum equipment should be added to this vehicle.

NOTE: Add-on electrical equipment must only be connected to the vehicle's electrical system at the battery (power and ground).

Add-on electrical equipment, even when installed to these guidelines, may still cause the powertrain system to malfunction. This may also include equipment not connected to the vehicle electrical system such as portable telephones and radios. Therefore, the first step in diagnosing any powertrain problem is to eliminate all aftermarket electrical equipment from the vehicle. After this is done, if the problem still exists, it may be diagnosed in the normal manner.

Electrostatic Discharge Damage

Electronic components used in the PCM are often designed to carry very low voltage. Electronic components are susceptible to damage caused by electrostatic discharge. Less than 100 volts of static electricity can cause damage to some electronic components. By comparison, it takes as much as 4000 volts for a person to feel even the zap of a static discharge.

There are several ways for a person to become statically charged. The most common methods of charging are by friction and induction.

- An example of charging by friction is a person sliding across a vehicle seat.
- Charge by induction occurs when a person with well insulated shoes stands near a highly charged object and momentarily touches ground. Charges of the same polarity are drained off leaving the person highly charged with the opposite polarity. Static charges can cause damage, therefore it is important to use care when handling and testing electronic components.

NOTE: To prevent possible electrostatic discharge damage, follow these guidelines:

- Do not touch the PCM connector pins or soldered components on the PCM circuit board.
- Do not touch the knock sensor module component leads.
- Do not open the replacement part package until the part is ready to be installed.
- Before removing the part from the package, ground the package to a known good ground on the vehicle.
- If the part has been handled while sliding across the seat, while sitting down from a standing position, or while walking a distance, touch a known good ground before installing the part.

Upshift Lamp

Refer to *Manual Transmission*.

General Description (Air Induction)

Air Induction System

The air induction system filters contaminants from the outside air, and directs the progress of the air as it is drawn into the engine. A remote-mounted air cleaner prevents dirt and debris in the air from entering the engine. The air duct assembly routes filtered air to the throttle body. Air enters the engine by the following steps:

1. Through the throttle body.

2. Into the common chamber.
3. Through the cylinder head intake ports.
4. Into the cylinders.

General Description (Fuel Metering)

Acceleration Mode

The PCM provides extra fuel when it detects a rapid increase in the throttle position and the air flow.

Accelerator Controls

The accelerator control system is a cable-type system with specific linkage adjustments. Refer to *Cable Adjustment*.

Battery Voltage Correction Mode

When battery voltage is low, the PCM will compensate for the weak spark by increasing the following:

- The amount of fuel delivered.
- The idle RPM.
- Ignition dwell time.

CMP Signal

The PCM uses this signal to determine the position of the number 1 piston during its power stroke, allowing the PCM to calculate true sequential multiport fuel injection (SFI). Loss of this signal will set a DTC P0341. If the CMP signal is lost while the engine is running, the fuel injection system will shift to a calculated sequential fuel injection based on the last fuel injection pulse, and the engine will continue to run. The engine can be restarted and will run in the calculated sequential mode as long as the fault is present, with a 1-in-6 chance of being correct.

Clear Flood Mode

Clear a flooded engine by pushing the accelerator pedal down all the way. The PCM then de-energizes the fuel injectors. The PCM holds the fuel injectors de-energized as long as the throttle remains above 80% and the engine speed is below 800 RPM. If the throttle position becomes

less than 80%, the PCM again begins to pulse the injectors "ON" and "OFF," allowing fuel into the cylinders.

Deceleration Mode

The PCM reduces the amount of fuel injected when it detects a decrease in the throttle position and the air flow. When deceleration is very fast, the PCM may cut off fuel completely for short periods.

Engine Speed/Vehicle Speed/Fuel Disable Mode

The PCM monitors engine speed. It turns off the fuel injectors when the engine speed increase above 6400 RPM. The fuel injectors are turned back on when engine speed decreases below 6150 RPM.

Fuel Cutoff Mode

No fuel is delivered by the fuel injectors when the ignition is "OFF." This prevents engine run-on. In addition, the PCM suspends fuel delivery if no reference pulses are detected (engine not running) to prevent engine flooding.

Fuel Injector

The sequential multiport fuel injection (SFI) fuel injector is a solenoid-operated device controlled by the PCM. The PCM energizes the solenoid, which opens a valve to allow fuel delivery.

The fuel is injected under pressure in a conical spray pattern at the opening of the intake valve. Excess fuel not used by the injectors passes through the fuel pressure regulator before being returned to the fuel tank.

A fuel injector which is stuck partly open will cause a loss of fuel pressure after engine shut down, causing long crank times.

Fuel Metering System Components

The fuel metering system is made up of the following parts:

- The fuel injectors.
- The throttle body.
- The fuel rail.

- The fuel pressure regulator.
- The PCM.
- The crankshaft position (CKP) sensor.
- The camshaft position (CMP) sensor.
- The idle air control (IAC) valve.
- The fuel pump.
- The fuel pump relay.

Basic System Operation

The fuel metering system starts with the fuel in the fuel tank. An electric fuel pump, located in the fuel tank, pumps fuel to the fuel rail through an in-line fuel filter. The pump is designed to provide fuel at a pressure above the pressure needed by the injectors. A fuel pressure regulator in the fuel rail keeps fuel available to the fuel injectors at a constant pressure. A return line delivers unused fuel back to the fuel tank. Refer to *Section 6C* for further information on the fuel tank, line filter, and fuel pipes.

Fuel Metering System Purpose

The basic function of the air/fuel metering system is to control the air/fuel delivery to the engine. Fuel is delivered to the engine by individual fuel injectors mounted in the intake manifold near each intake valve.

The main control sensor is the heated oxygen sensor (HO2S) located in the exhaust system. The HO2S tells the PCM how much oxygen is in the exhaust gas. The PCM changes the air/fuel ratio to the engine by controlling the amount of time that fuel injector is "ON." The best mixture to minimize exhaust emissions is 14.7 parts of air to 1 part of gasoline by weight, which allows the catalytic converter to operate most efficiently. Because of the constant measuring and adjusting of the air/fuel ratio, the fuel injection system is called a "closed loop" system.

The PCM monitors signals from several sensors in order to determine the fuel needs of the engine. Fuel is delivered under one of several conditions called "modes." All modes are controlled by the PCM.

Fuel Pressure Regulator

The fuel pressure regulator is a diaphragm-operated relief valve mounted on the fuel rail with fuel pump pressure on one side and manifold pressure on the other side. The fuel pressure regulator maintains the fuel pressure available to the injector at three times barometric pressure adjusted for engine load. It may be serviced separate.

If the pressure is too low, poor performance and a DTC P0131, DTC P0151, DTC P0171 will be the result. If the pressure is too high, excessive odor and/or a DTC P0132, DTC P0152, DTC P0172 or DTC P0175 will be the result. Refer to *Fuel System Diagnosis* for information on diagnosing fuel pressure conditions.

0011

Fuel Pump Electrical Circuit

When the key is first turned "ON," the PCM energizes the fuel pump relay for two seconds to build up the fuel pressure quickly. If the engine is not started within two seconds, the PCM shuts the fuel pump off and waits until the engine is cranked. When the engine is cranked and the 58 X crankshaft position signal has been detected by the PCM, the PCM supplies 12 volts to the fuel pump relay to energize the electric in-tank fuel pump.

An inoperative fuel pump will cause a "no-start" condition. A fuel pump which does not provide enough pressure will result in poor performance.

Fuel Rail

The fuel rail is mounted to the top of the engine and distributes fuel to the individual injectors. Fuel is delivered to the fuel inlet tube of the fuel rail by the fuel lines. The fuel goes through the fuel rail to the fuel pressure regulator. The fuel pressure regulator maintains a constant fuel pressure at the injectors. Remaining fuel is then returned to the fuel tank.

055RV009

Idle Air Control (IAC) Valve

The purpose of the idle air control (IAC) valve is to control engine idle speed, while preventing stalls due to changes in engine load. The IAC valve, mounted in the throttle body, controls bypass air around the throttle plate. By moving the conical valve (pintle) in (to decrease air flow) or out (to increase air flow), a controlled amount of air can move around the throttle plate. If the RPM is too low, the PCM will retract the IAC pintle, resulting in more air moving past the throttle plate to increase the RPM. If the RPM is too high, the PCM will extend the IAC pintle, allowing less air to move past the throttle plate, decreasing the RPM.

The IAC pintle valve moves in small steps called counts. During idle, the proper position of the IAC pintle is calculated by the PCM based on battery voltage, coolant temperature, engine load, and engine RPM. If the RPM drops below a specified value, and the throttle plate is closed, the PCM senses a near-stall condition. The PCM will then calculate a new IAC pintle valve position to prevent stalls.

If the IAC valve is disconnected and reconnected with the engine running, the idle RPM will be wrong. In this case, the IAC must be reset. The IAC resets when the key is cycled "ON" then "OFF." When servicing the IAC, it should only be disconnected or connected with the ignition "OFF."

The position of the IAC pintle valve affects engine start-up and the idle characteristics of the vehicle. If the IAC pintle is fully open, too much air will be allowed into the manifold. This results in high idle speed, along with possible hard starting and a lean air/fuel ratio.

Run Mode

The run mode has the following two conditions:

- Open loop
- Closed loop

When the engine is first started the system is in "open loop" operation. In "open loop," the PCM ignores the signal from the heated oxygen sensor (HO2S). It

calculates the air/fuel ratio based on inputs from the TP, ECT, and MAF sensors.

The system remains in "open loop" until the following conditions are met:

- The HO2S has a varying voltage output showing that it is hot enough to operate properly (this depends on temperature).
- The ECT has reached a specified temperature.
- A specific amount of time has elapsed since starting the engine.
- Engine speed has been greater than a specified RPM since start-up.

The specific values for the above conditions vary with different engines and are stored in the programmable read only memory (PROM). When these conditions are met, the system enters "closed loop" operation. In "closed loop," the PCM calculates the air/fuel ratio (injector on-time) based on the signal from the HO2S. This allows the air/fuel ratio to stay very close to 14.7:1.

Starting Mode

When the ignition is first turned "ON," the PCM energizes the fuel pump relay for two seconds to allow the fuel pump to build up pressure. The PCM then checks the engine coolant temperature (ECT) sensor and the throttle position (TP) sensor to determine the proper air/fuel ratio for starting.

The PCM controls the amount of fuel delivered in the starting mode by adjusting how long the fuel injectors are energized by pulsing the injectors for very short times.

Throttle Body Unit

The throttle body has a throttle plate to control the amount of air delivered to the engine. The TP sensor and IAC valve are also mounted on the throttle body. Vacuum ports located behind the throttle plate provide the vacuum signals needed by various components.

Engine coolant is directed through a coolant cavity in the throttle body to warm the throttle valve and to prevent icing.

General Description (Electronic Ignition System)

Camshaft Position (CMP) Sensor

The camshaft position (CMP) sensor is located on the rear left side. As the camshaft sprocket turns, a magnet in the sprocket activates the Hall-effect switch in the CMP sensor. When the Hall-effect switch is activated, it grounds the signal line to the PCM, pulling the camshaft position sensor signal circuit's applied voltage low. This is a CMP signal. The CMP signal is created as piston #1 is approximately 25° after top dead center on the power stroke. If the correct CMP signal is not received by the PCM, DTC P0341 will be set.

Crankshaft Position (CKP) Sensor

The crankshaft position (CKP) sensor provides a signal used by the powertrain control module (PCM) to calculate the ignition sequence. The sensor initiates the 58X reference pulses which the PCM uses to calculate RPM and crankshaft position. Refer to *Electronic Ignition System* for additional information.

Electronic Ignition

The electronic ignition system controls fuel combustion by providing a spark to ignite the compressed air/fuel mixture at the correct time. To provide optimum engine performance, fuel economy, and control of exhaust emissions, the PCM controls the spark advance of the ignition system. Electronic ignition has the following advantages over a mechanical distributor system:

- No moving parts.
- Less maintenance.
- Remote mounting capability.
- No mechanical load on the engine.
- More coil cooldown time between firing events.
- Elimination of mechanical timing adjustments.
- Increased available ignition coil saturation time.

Ignition Coils

A separate coil-at-plug module is located at each spark plug. The coil-at-plug module is attached to the engine with two screws. It is installed directly to the spark plug by an electrical contact inside a rubber boot. A three-way connector provides 12-volt primary supply from the 15-amp ignition fuse, a ground-switching trigger line from the PCM, and a ground.

Ignition Control

The ignition control (IC) spark timing is the PCM's method of controlling the spark advance and the ignition dwell. The IC spark advance and the ignition dwell are calculated by the PCM using the following inputs:

- Engine speed.
- Crankshaft position (58X reference).
- Camshaft position (CMP) sensor.
- Engine coolant temperature (ECT) sensor.
- Throttle position (TP) sensor.
- Knock signal (knock sensor).

6E2-328 6VD1 3.2L ENGINE DRIVEABILITY AND EMISSIONS

- Park/Neutral position (PRNDL input).
- Vehicle speed (vehicle speed sensor).
- PCM and ignition system supply voltage.
- The crankshaft position (CKP) sensor sends the PCM a 58X signal related to the exact position of the crankshaft.

- The camshaft position (CMP) sensor sends a signal related to the position of the camshaft.
- The knock sensor tells the PCM if there is any problem with pre-ignition or detonation. This information allows the PCM to retard timing, if necessary.

Based on these sensor signals and engine load information, the PCM sends 5V to each ignition coil.

The PCM applies 5V signal voltage to the ignition coil requiring ignition. This signal sets on the power transistor of the ignition coil to establish a grounding circuit for the primary coil, applying battery voltage to the primary coil. At the ignition timing, the PCM stops sending the 5V signal voltage. Under this condition the power transistor of the ignition coil is set off to cut the battery voltage to the primary coil, thereby causing a magnetic field generated in the primary coil to collapse. On this moment a line of magnetic force flows to the secondary coil, and when this magnetic line crosses the coil, high voltage induced by the secondary ignition circuit to flow through the spark plug to the ground.

Ignition Control PCM Output

The PCM provides a zero volt (actually about 100 mV to 200 mV) or a 5-volt output signal to the ignition control (IC) module. Each spark plug has its own primary and secondary coil module ("coil-at-plug") located at the spark plug itself. When the ignition coil receives the 5-volt signal from the PCM, it provides a ground path for the B+ supply to the primary side of the coil-at-plug module. This

energizes the primary coil and creates a magnetic field in the coil-at-plug module. When the PCM shuts off the 5-volt signal to the ignition control module, the ground path for the primary coil is broken. The magnetic field collapses and induces a high voltage secondary impulse which fires the spark plug and ignites the air/fuel mixture. The circuit between the PCM and the ignition coil is monitored for open circuits, shorts to voltage, and shorts to ground. If the PCM detects one of these events, it will set one of the following DTCs:

- P0351: Ignition coil Fault on Cylinder #1
- P0352: Ignition coil Fault on Cylinder #2
- P0353: Ignition coil Fault on Cylinder #3
- P0354: Ignition coil Fault on Cylinder #4
- P0355: Ignition coil Fault on Cylinder #5
- P0356: Ignition coil Fault on Cylinder #6

Knock Sensor (KS) PCM Input

The knock sensor (KS) system is comprised of a knock sensor and the PCM. The PCM monitors the KS signals to determine when engine detonation occurs. When a knock sensor detects detonation, the PCM retards the spark timing to reduce detonation. Timing may also be retarded because of excessive mechanical engine or transmission noise.

Powertrain Control Module (PCM)

The PCM is responsible for maintaining proper spark and fuel injection timing for all driving conditions. To provide optimum driveability and emissions, the PCM monitors the input signals from the following components in order to calculate spark timing:

- Engine coolant temperature (ECT) sensor.
- Intake air temperature (IAT) sensor.
- Mass air flow (MAF) sensor.
- PRNDL input from transmission range switch.
- Throttle position (TP) sensor.
- Vehicle speed sensor (VSS) .
- Crankshaft position (CKP) sensor.

Spark Plug

Although worn or dirty spark plugs may give satisfactory operation at idling speed, they frequently fail at higher engine speeds. Faulty spark plugs may cause poor fuel economy, power loss, loss of speed, hard starting and generally poor engine performance. Follow the scheduled maintenance service recommendations to ensure satisfactory spark plug performance. Refer to *Maintenance and Lubrication*.

Normal spark plug operation will result in brown to grayish-tan deposits appearing on the insulator portion of the spark plug. A small amount of red-brown, yellow, and white powdery material may also be present on the

insulator tip around the center electrode. These deposits are normal combustion by-products of fuels and lubricating oils with additives. Some electrode wear will also occur.

Carbon fouling of the spark plug is indicated by dry, black carbon (soot) deposits on the portion of the spark plug in the cylinder. Excessive idling and slow speeds under light engine loads can keep the spark plug temperatures so low that these deposits are not burned off. Very rich fuel mixtures or poor ignition system output may also be the cause. Refer to DTC P0172.

Oil fouling of the spark plug is indicated by wet oily deposits on the portion of the spark plug in the cylinder, usually with little electrode wear. This may be caused by oil during break-in of new or newly overhauled engines. Deposit fouling of the spark plug occurs when the normal red-brown, yellow or white deposits of combustion by products become sufficient to cause misfiring. In some cases, these deposits may melt and form a shiny glaze on the insulator around the center electrode. If the fouling is found in only one or two cylinders, valve stem clearances or intake valve seals may be allowing excess lubricating oil to enter the cylinder, particularly if the deposits are heavier on the side of the spark plug facing the intake valve.

Excessive gap means that the air space between the center and the side electrodes at the bottom of the spark plug is too wide for consistent firing. This may be due to improper gap adjustment or to excessive wear of the electrode during use. A check of the gap size and comparison to the gap specified for the vehicle in *Maintenance and Lubrication* will tell if the gap is too wide. A spark plug gap that is too small may cause an unstable idle condition. Excessive gap wear can be an indication of continuous operation at high speeds or with engine

6E2-330 6VD1 3.2L ENGINE DRIVEABILITY AND EMISSIONS

loads, causing the spark to run too hot. Another possible cause is an excessively lean fuel mixture.

TS23992

Low or high spark plug installation torque or improper seating can result in the spark plug running too hot and can cause excessive center electrode wear. The plug and the cylinder head seats must be in good contact for proper heat transfer and spark plug cooling. Dirty or damaged threads in the head or on the spark plug can keep it from seating even though the proper torque is applied. Once spark plugs are properly seated, tighten them to the torque shown in the Specifications Table. Low torque may result in poor contact of the seats due to a loose spark plug. Overtightening may cause the spark plug shell to be stretched and will result in poor contact between the seats. In extreme cases, exhaust blow-by and damage beyond simple gap wear may occur. Cracked or broken insulators may be the result of improper installation, damage during spark plug re-gapping, or heat shock to the insulator material. Upper insulators can be broken when a poorly fitting tool is used during installation or removal, when the spark plug is hit from the outside, or is dropped on a hard surface. Cracks in the upper insulator may be inside the shell and not visible. Also, the breakage may not cause problems until oil or moisture penetrates the crack later.

TS23994

A broken or cracked lower insulator tip (around the center electrode) may result from damage during re-gapping or from "heat shock" (spark plug suddenly operating too hot).

TS23993

- Damage during re-gapping can happen if the gapping tool is pushed against the center electrode or the insulator around it, causing the insulator to crack. When re-gapping a spark plug, make the adjustment by bending only the ground side terminal, keeping the tool clear of other parts.
- "Heat shock" breakage in the lower insulator tip generally occurs during several engine operating conditions (high speeds or heavy loading) and may be caused by over-advanced timing or low grade fuels. Heat shock refers to a rapid increase in the tip temperature that causes the insulator material to crack.

Spark plugs with less than the recommended amount of service can sometimes be cleaned and re-gapped, then returned to service. However, if there is any doubt about the serviceability of a spark plug, replace it. Spark plugs with cracked or broken insulators should always be replaced.

A/C Clutch Diagnosis

A/C Clutch Circuit Operation

A 12-volt signal is supplied to the A/C request input of the PCM when the A/C is selected through the A/C control switch.

The A/C compressor clutch relay is controlled through the PCM. This allows the PCM to modify the idle air control position prior to the A/C clutch engagement for better idle quality. If the engine operating conditions are within their specified calibrated acceptable ranges, the PCM will enable the A/C compressor relay. This is done by providing a ground path for the A/C relay coil within the PCM. When the A/C compressor relay is enabled, battery voltage is supplied to the compressor clutch coil. The PCM will enable the A/C compressor clutch whenever the engine is running and the A/C has been requested. The PCM will not enable the A/C compressor clutch if any of the following conditions are met:

- The throttle is greater than 90%.
- The engine speed is greater than 6315 RPM.
- The ECT is greater than 119°C (246°F).
- The IAT is less than 5°C (41°F).
- The throttle is more than 80% open.

A/C Clutch Circuit Purpose

The A/C compressor operation is controlled by the powertrain control module (PCM) for the following reasons:

- It improves idle quality during compressor clutch engagement.
- It improves wide open throttle (WOT) performance.
- It provides A/C compressor protection from operation with incorrect refrigerant pressures.

The A/C electrical system consists of the following components:

- The A/C control head.
- The A/C refrigerant pressure switches.
- The A/C compressor clutch.
- The A/C compressor clutch relay.
- The PCM.

A/C Request Signal

This signal tells the PCM when the A/C mode is selected at the A/C control head. The PCM uses this to adjust the idle speed before turning on the A/C clutch. The A/C compressor will be inoperative if this signal is not available to the PCM.

Refer to *A/C Clutch Circuit Diagnosis* for A/C wiring diagrams and diagnosis for A/C electrical system.

General Description (Evaporative (EVAP) Emission System)

EVAP Emission Control System Purpose

The basic evaporative emission (EVAP) control system used on all vehicles is the charcoal canister storage method. Gasoline vapors from the fuel tank flow into the canister through the inlet labeled "TANK." These vapors are absorbed into the activated carbon (charcoal) storage device (canister) in order to hold the vapors when the vehicle is not operating. The canister is purged by PCM control when the engine coolant temperature is over 60°C (140°F), the IAT reading is over 10°C (50°F), and the engine has been running. Air is drawn into the canister through the air inlet grid. The air mixes with the vapor and the mixture is drawn into the intake manifold.

EVAP Emission Control System Operation

The EVAP canister purge is controlled by a solenoid valve that allows the manifold vacuum to purge the canister. The powertrain control module (PCM) supplies a ground to energize the solenoid valve (purge on). The EVAP purge solenoid control is pulse-width modulated (PWM) (turned on and off several times a second). The duty cycle (pulse width) is determined by engine operating conditions including load, throttle position, coolant temperature and ambient temperature. The duty cycle is calculated by the PCM. The output is commanded when the appropriate conditions have been met. These conditions are:

- The engine is fully warmed up.
- The engine has been running for a specified time.
- The IAT reading is above 10°C (50°F).

Poor idle, stalling and poor driveability can be caused by:

- A malfunctioning purge solenoid.
- A damaged canister.
- Hoses that are split, cracked, or not connected properly.

General Description (Exhaust Gas Recirculation (EGR) System)

EGR Purpose

The exhaust gas recirculation (EGR) system is used to reduce emission levels of oxides of nitrogen (NOx). NOx emission levels are caused by a high combustion

temperature. The EGR system lowers the NOx emission levels by decreasing the combustion temperature.

057/RW002

Linear EGR Valve

The main element of the system is the linear EGR valve. The EGR valve feeds small amounts of exhaust gas back into the combustion chamber. The fuel/air mixture will be diluted and combustion temperatures reduced.

Linear EGR Control

The PCM monitors the EGR actual position and adjusts the pintle position accordingly. The uses information from the following sensors to control the pintle position:

- Engine coolant temperature (ECT) sensor.
- Throttle position (TP) sensor.
- Mass air flow (MAF) sensor.

Linear EGR Valve Operation and Results of Incorrect Operation

The linear EGR valve is designed to accurately supply EGR to the engine independent of intake manifold vacuum. The valve controls EGR flow from the exhaust to the intake manifold through an orifice with a PCM controlled pintle. During operation, the PCM controls pintle position by monitoring the pintle position feedback signal. The feedback signal can be monitored with a Tech 2 as "Actual EGR Pos." "Actual EGR Pos." should always be near the commanded EGR position ("Desired EGR Pos."). If a problem with the EGR system will not allow the

PCM to control the pintle position properly, DTC P1404 will set. The PCM also tests for EGR flow. The linear EGR valve is usually activated under the following conditions:

- Warm engine operation.
- Above-idle speed.

Too much EGR flow at idle, cruise or cold operation may cause any of the following conditions to occur:

- Engine stalls after a cold start.
- Engine stalls at idle after deceleration.
- Vehicle surges during cruise.
- Rough idle.

Too little or no EGR flow may allow combustion temperatures to get too high. This could cause:

- Spark knock (detonation).
- Engine overheating.
- Emission test failure.
- Poor fuel economy.

0017

EGR Pintle Position Sensor

The PCM monitors the EGR valve pintle position input to ensure that the valve responds properly to commands from the PCM and to detect a fault if the pintle position sensor and control circuits are open or shorted. If the PCM detects a pintle position signal voltage outside the normal range of the pintle position sensor, or a signal voltage that is not within a tolerance considered acceptable for proper EGR system operation, the PCM will set DTC P1404.

General Description (Positive Crankcase Ventilation (PCV) System)

Crankcase Ventilation System Purpose

The crankcase ventilation system is used to consume crankcase vapors in the combustion process instead of venting them to the atmosphere. Fresh air from the throttle body is supplied to the crankcase and mixed with blow-by gases. This mixture is then passed through the

positive crankcase ventilation (PCV) valve into the common chamber.

Crankcase Ventilation System Operation

The primary control is through the positive crankcase ventilation (PCV) valve. The PCV valve meters the flow at a rate that depends on the intake vacuum. The PCV valve restricts the flow when the inlet vacuum is highest. In addition, the PCV valve can seal the common chamber off in case of sudden high pressure in the crankcase.

While the engine is running, exhaust fuses and small amounts of the fuel/air mixture escape past the piston rings and enter the crankcase. These gases are mixed with clean air entering through a tube from the air intake duct.

During normal, part-throttle operation, the system is designed to allow crankcase gases to flow through the PCV valve into the throttle body to be consumed by normal combustion.

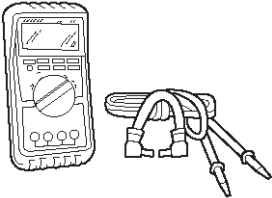

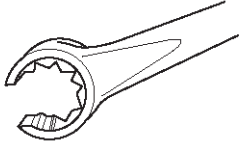

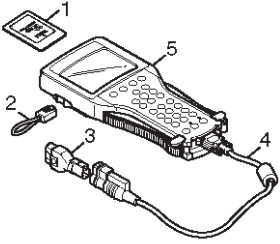

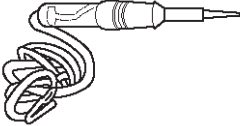

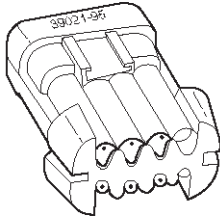

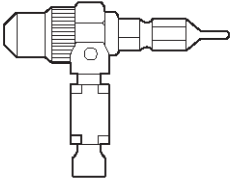

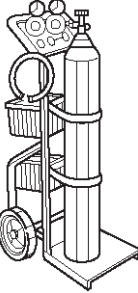

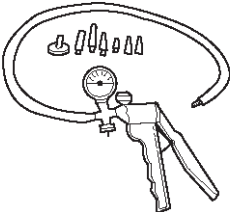

A plugged valve or PCV hose may cause the following conditions:

- Rough idle.
- Stalling of slow idle speed.
- Oil leaks.
- Sludge in the engine.

A leaking PCV hose would cause:

- Rough idle.
- Stalling.
- High idle speed.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

150RX019

When inspecting or replacing exhaust system components, make sure there is adequate clearance from all points on the underbody to prevent overheating the floor pan and possible damage to the passenger compartment insulation and trim materials.

Check complete exhaust system and nearby body areas and rear compartment lid for broken, damaged, missing or mispositioned parts, open seams, holes, loose connections or other deterioration which could permit exhaust fumes to seep into the rear compartment or passenger compartment. Dust or water in the rear compartment may be an indication of a problem in one of these areas. Any faulty areas should be corrected immediately.

Hangers

Various types of hangers are used to support exhaust system(s). These include conventional rubber straps, rubber rings, and rubber blocks.

The installation of exhaust system supports is very important, as improperly installed supports can cause annoying vibrations which can be difficult to diagnose.

Three Way Catalytic Converter

The three way catalytic converter is an emission control device added to the exhaust system to reduce pollutants from the exhaust gas stream.

CAUTION: The catalytic converter requires the use of unleaded fuel only.

Periodic maintenance of the exhaust system is not required. If the vehicle is raised for other service, it is advisable to check the condition of the complete exhaust system.

A dual bed monolith catalytic converter is used in combination with three way catalytic converter.

Catalytic Converter Types:

Three way (Reduction/Oxidation) catalyst

The catalyst coating on the three way (reduction) converter contains platinum and rhodium which lowers the levels of nitrous oxide (NOx) as well as hydrocarbons (HC) and carbon monoxide (Co).

Gasket

The gasket must be replaced whenever a new exhaust pipe, muffler or catalytic converter is installed.

5. Remove oil pump assembly.
6. Remove plug.
7. Remove spring.
8. Remove relief valve.
9. Remove oil pump cover.
10. Remove driven gear.
11. Remove drive gear.
12. Remove oil seal.
13. Remove O-ring.

Inspection and Repair

CAUTION: Make necessary correction or parts replacement if wear, damage or any other abnormal conditions are found during inspection.

Relief Valve (8)

- Check to see that the relief valve slides freely.
- The oil pump must be replaced if the relief valve does not slide freely.
- Replace the spring and/or the oil pump assembly (5) if the spring is damaged or badly worn.

Body (14) and Gears (10, 11)

The pump assembly must be replaced if one or more of the conditions below is discovered during inspection.

- Badly worn or damaged driven gear (10).
- Badly worn drive gear (11) driving face.
- Badly scratched or scored body sliding face (14) or driven gear (10).

- Badly worn or damaged gear teeth.
Measure the clearance between the body and the driven gear with a feeler gauge.

**Standard : 0.10 mm–0.18 mm
(0.0039 in.–0.0070 in)**

Limit : 0.20mm (0.0079 in)

- Measure the clearance between the drive gear and driven gear with a feeler gauge.

**Standard : 0.11 mm–0.24 mm
(0.0043 in–0.0094 in)**

Limit : 0.35mm (0.0138 in)

- Measure the side clearance with a precision straight edge and a feeler gauge.

Clearance

**Standard : 0.03 mm–0.09 mm
(0.0011 in–0.0035 in)**

Limit : 0.15mm (0.0059 in)

051RS005

Oil Strainer

Check the oil strainer for cracking and scoring. If cracking and scoring are found, the oil strainer must be replaced.

051RS006

Reassembly

1. Install drive gear (11).
2. Install driven gear (10).
3. Install oil pump cover (9) and first, loosely tighten all of the attaching screws. Next, tighten the attaching screws to the specified torque.

Torque : 10 N·m (1.0 Kg·m/89 lb in)

After installation, check that the gear rotates smoothly.

4. Install relief valve (8) and apply engine oil to the relief valve and spring (7).
5. Install spring (7).

6. Install the plug (6).

Torque : 8 N·m (0.8 Kg·m/69 lb in)

051RS007

7. Install oil pump assembly (5).

- Carefully remove any oil from the cylinder body and the pump. Apply sealant (TB-1207B or equivalent) to the pump fitting face as shown in illustration. Take care that sealant is not applied to oil port surfaces. The oil pump assembly must be installed within 5 minutes after sealant application before the sealant hardens.

CAUTION: Do not apply an excessive amount of sealant to the contact surface. Applying too much sealant will overflow the contact surfaces. This could cause serious damage to the engine.

- Attach oil pump assembly to cylinder body.
- Tighten the oil pump fixing bolts.

Torque : 25 N·m (2.5 Kg·m/18 lb-ft)

051RW002

6G-6 ENGINE LUBRICATION

051RW001

Legend

- (1) Around Bolt Holes
- (2) Around Dowel Pin

8. Install the new oil seal (12). Apply engine oil to the oil seal lip before installation then use 5-8840-2287-0 oil seal Installer, install oil seal.

015RS001

9. Install oil strainer (4) with O-ring (13).

Torque: 25 N-m (2.5 Kg-m/18 lb ft)

10. Install oil pipe (3) with O-ring (13).

Torque: 25 N-m (2.5 Kg-m/18 lb ft)

11. Install crankcase with oil pan (2).

- Remove oil on crankcase mounting surface and dry the surface.
- Apply a proper 4.5 mm (0.7 in) wide bead of sealant (TB1207C or equivalent) to the crankcase mounting surface. The bead must be continuous.
- The crankcase must be installed within 5 minutes after sealant application before the sealant hardens.

- Tighten fixing bolts to the specified torque.

Torque : 10 N-m (1.0 Kg-m/89 lb in)

013RW010

12. Install crankshaft timing pulley.

Oil Pan and Crankcase

Removal

1. Disconnect battery ground cable.
2. Drain engine oil.
3. Lift vehicle by supporting the frame.
4. Remove front wheels.
5. Remove oil level dipstick from level gauge tube.
6. Remove stone guard.
7. Remove radiator under fan shroud.
8. Remove suspension cross member fixing bolts, 2 pcs each per side and remove suspension cross member.
9. Remove pitman arm and relay lever assembly, using the 5-8840-2005-0 remover, remove pitman arm from the steering unit and remove four fixing bolts for relay lever assembly.
10. Remove axle housing assembly four fixing bolts from housing isolator side and mounting bolts from wheel side. At this time support the axle with a garage jack and remove axle housing assembly.
11. Remove oil pan fixing bolts.
12. Remove oil pan, using 5-8840-2153-0 sealer cutter, remove oil pan.

013RS003

13. Remove crankcase fixing bolts.
14. Remove crankcase, using 5-8840-2153-0 sealer cutter, remove crankcase.

NOTE: Do not deform or damage the flange of oil pan and crankcase.

Replace the oil pan and/or crankcase if deformed or damaged.

013RS003

Installation

1. Install crankcase.
 1. Remove residual sealant, lubricant and moisture from mounting surface, then dry thoroughly.
 2. Properly apply a 4.5 mm (0.7 in) wide bead of sealant (TB-1207C or equivalent) to mounting surface of crankcase.

Sealant beat must be continuous.

 - The crankcase must be installed within 5 minutes after sealant application before the sealant hardens.

013RW010

6G-8 ENGINE LUBRICATION

3. Install crankcase, tighten crankcase fixing bolts to the specified torque.

Torque : 10 N-m (1.0 Kg-m/89 lb in)

013RW004

2. Install oil pan

1. Remove residual sealant, lubricant and moisture from mounting surface, then dry thoroughly.
2. Properly apply a 4.5 mm (07 in) wide bead of sealant (TB-1207C or equivalent) to mounting surface of oil pan.

Sealant beat must be continuous.

- The crankcase must be installed within 5 minutes after sealant application before the sealant hardens.

013RW003

3. Install oil pan, tighten oil pan fixing bolts to the specified torque.

Torque : 25 N-m (2.5 Kg-m/18 lb ft)

3. Install axle housing assembly and tighten fixing bolts to the specified torque.

Axle case bolts

Torque : 82 N-m (8.4 Kg-m/60 lb ft)

Mounting bolts

Torque : 152 N-m (15.5 Kg-m/112 lb ft)

013RW005

4. Install relay lever assembly and tighten fixing bolts.

Torque: 44 N-m (4.5 Kg-m/32 lb ft)

5. Engage teeth of pitman arm and steering unit, and tighten nut to the specified torque.

Torque : 216 N-m (22.0 Kg-m/159 lb ft)

013RW006

Legend

- (1) Pitman Arm
- (2) Relay Lever

6. Install suspension cross member and tighten fixing bolts to the specified torque.

Torque : 78 N·m (8.0 Kg·m/58 lb ft)

013RW007

7. Install radiator under fan shroud.
8. Install stone guard.
9. Install engine oil level dipstick.
10. Fill engine oil until full level on engine oil gauge dipstick.

Oil Pump

Removal

1. Disconnect battery ground cable.
2. Drain engine oil.
3. Remove crankcase assembly.
 - Refer to removal procedure for Oil Pan and Crankcase in this manual.
4. Remove crankshaft pulley.
 - Refer to removal procedure for Crankshaft Pulley in this manual.
5. Remove timing belt.
 - Refer to removal procedure for Timing Belt in this manual.
6. Remove timing pulley from crankshaft.
7. Remove four fixing bolts from oil filter assembly.
8. Remove oil strainer fixing bolts, remove oil strainer assembly with O-ring.
9. Remove three bolts from oil pipe and O-ring.
10. Remove eight oil pump fixing bolts, then oil pump assembly.
11. Remove sealant from mounting surface of oil pump assembly, cylinder block and take care not to damage mounting surfaces of oil pump and cylinder block.

Installation

1. Install oil pump assembly
 - Apply sealant (TB-1207B or equivalent) to the oil pump mounting surfaces as shown in the illustration.
 - The oil pump assembly must be installed within 5 minutes after sealant application before the sealant hardens.

NOTE: Do not apply sealant to the oil ports.

051RW002

- Use 5-8840-2287-0 installer when installing new oil seal.
- Apply engine oil to oil seal lip.
- Install oil pump assembly to the cylinder block.

NOTE: Do not damage oil seal during installation of oil pump assembly.

015RS001

- Tighten fixing bolts to the specified torque.

Torque : 25 N-m (2.5 Kg-m/18 lb ft)

051RW001

2. Install oil pipe with O-ring, tighten fixing bolt to the specified torque.

Torque : 10 N-m (1.0 Kg-m/89 lb in)

3. Install oil strainer with O-ring, tighten fixing bolt to the specified torque.

Torque : 25 N-m (2.5 Kg-m/18 lb ft)

4. Install oil filter assembly and tighten bolts to the specified torque.

Torque : 25 N·m (2.5 Kg·m/18 lb ft)

Legend

- (1) Oil Pump
- (2) Oil Filter
- (3) Oil Gallery
- (4) From Oil Filter
- (5) To Oil Filter

5. Install timing pulley on crankshaft.

Install timing belt.

- Refer to installation procedure for Timing Belt in this manual.

6. Install crankshaft pulley.

- Refer to install procedure for Crankshaft Pulley in this manual.

7. Install crankcase assembly.

- Refer to installation procedure for Oil Pan and Crankcase in this manual.

8. Refill engine oil until full level on engine oil dipstick.

Oil Pump Oil Seal

Removal

1. Disconnect battery ground cable.
2. Drain engine oil.
3. Remove crankshaft pulley.
 - Refer to removal procedure for Crankshaft Pulley in this manual.
4. Remove timing belt.
 - Refer to removal procedure for Timing Belt in this manual.
5. Remove timing pulley from crankshaft.
6. Remove oil pump oil seal using a sealer puller.

NOTE: Take care not to damage sealing surfaces of oil pump and crankshaft when removing oil seal.

Installation

1. Install oil pump oil seal, apply engine oil to oil seal lip, then install oil seal using 5-8840-2287-0 installer.

2. Install timing pulley to crankshaft.
3. Install timing belt.
 - Refer to installation procedure for Timing Belt in this manual.
4. Install crankshaft pulley.
 - Refer to installation procedure for Crankshaft Pulley in this manual.
5. Refill engine oil until full level.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Accelerator Pedal Control Cable

101RX001

Removal

1. Loosen the nut(5) on the cable bracket mounted on the common chamber.
2. Remove cable clip(3).
3. Disconnect accelerator pedal (AP) control cable(6). (on throttle valve side)
4. Disconnect AP control cable(1). (on AP pedal(7) side)
5. Remove molding cap(2).
6. Remove AP control cable(4).

Installation

1. Install AP control cable(4).
2. Install molding cap(2).
3. Connect AP control cable(1). (on AP side)
4. Connect AP control cable(6). (on throttle valve side)
5. Install cable clip(3).
6. Install nut(5).

Inspection

Check the following items, and replace the control cable if any abnormality is found:

- The control cable should move smoothly.
- The control cable should not be bent or kinked.
- The control cable should be free of damage and corrosion.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Air Cleaner Element

Removal

1. Remove positive ventilation hose connector(1).
2. Remove intake air temperature sensor(2).
3. Remove air flow sensor(3).
4. Remove air cleaner duct assembly(4).
5. Remove air cleaner element(5).

Installation

1. Install air cleaner element(5).
2. Attach the mass air cleaner duct cover to the body completely, then clamp it with the clip(4).
3. Install air flow sensor(3).
4. Install air temperature sensor(2).
5. Install positive crankcase ventilation hose connector(1).

Inspection

Check the air cleaner filter for damage or dust clogging. Replace if it is damaged, or clean if it is clogged.

Cleaning Method

Tap the air cleaner filter gently so as not to damage the paper filter, or clean the element by blowing with compressed air of about 490 kPa (71 psi) from the clean side if it is extremely dirty.

NE : NOT EFFECTIVE

Normal Operation of 1999 4L30-E Transmission

Torque Converter Clutch (TCC)

Application Conditions:

The TCC is normally applied in 2nd, 3rd and 4th gears only when all of the following conditions exist:

- The engine coolant temperature is above 70°C (158°F).
- The brake pedal is released.
- The shift pattern requests TCC apply.

Moreover, TCC is always applied in 2nd, 3rd and 4th gears when the transmission oil temperature is above 135°C (275°F).

This mode should be canceled at 125°C (257°F).

ATF Warning Lamp

The ATF warning lamp will be constantly on (not flashing) if the transmission oil temperature is above 145°C (293°F).

The ATF warning lamp goes off again when the transmission oil temperature is below 125°C (257°F).

Special Shift Pattern When The Engine Is Cold:

A special shift pattern is activated when the engine coolant temperature is below 70°C (158°F). (3-4 shifts, for example, are delayed for small throttle openings and will occur a few MPH higher.)

Diagnosis

Introduction

The systematic troubleshooting information covered by this Section offers a practical and systematic approach to diagnosing 4L30-E transmission, using information that can be obtained from road tests, electrical diagnosis, oil pressure checks or noise evaluation.

The key to correcting a complaint is to make use of all of the available symptoms and logically letting them direct you to the cause.

When dealing with automatic transmission complaints, it is best to gather as many symptoms as possible before making the decision to remove the transmission from the vehicle.

Frequently, the correction of the complaint does not require removal of the transmission from the vehicle.

Driver Information

To analyze the problem fill out a complete description of the owner's complaint.

Please draw a circle around the right information and complete the following form. (The next page is an example of a completed form.) You can draw a circle around many numbers if you are not sure.

General Diagnosis Procedure

Preliminary Inspection Chart

Checking Transmission Fluid Level and Condition

Checking fluid level and condition (color and odor) at regular intervals will provide early diagnosis information about the transmission. This information may be used to correct a condition that, if not detected early, could result in major transmission repairs.

IMPORTANT: When new, automatic transmission fluid is red in color. As the vehicle is driven, the transmission fluid will begin to look darker in color. The color may eventually appear light brown.

A dark brown color with burnt odor may indicate excessive fluid deterioration and signal a need for fluid change.

Fluid Level

When adding or changing fluid, use only DEXRON®-III. Refer to Maintenance and Lubrication in General Information section for maintenance information and servicing interval.

CAUTION: DO NOT OVERFILL.

Overfilling will cause foaming, loss of fluid, abnormal shifting and possible damage to the transmission.

1. Park the vehicle on level ground and apply the parking brake firmly.
2. Check fluid level with engine running at idle.

NOTE: Be sure that transmission fluid temperature is below 30°C (86°F).

3. Move the selector lever through all gear ranges.
4. Move the selector lever to "Park".
5. Let engine idle for 3 minutes and open the overfill screw (1).
6. Add released transmission fluid until it flows out over the overfill screw opening.
7. Let engine idle until a fluid temperature between 32°C (90°F) and 57°C (135°F) is reached, then close the overfill screw (1).

Torque: 38 N•m (28 lb ft)

NOTE: To prevent fluid leaks, the overfill screw and oil drain screws gasket must be replaced each time these screws are removed.

NOTE: Check transmission fluid temperature with scan tool.

Minimum fluid level → 57°C (135°F)

Maximum fluid level → 32°C (90°F)

CAUTION: Do not open overfill screw with engine stopped.

CAUTION: DO NOT CHECK FLUID LEVEL UNDER THESE CONDITIONS:

- Immediately after driving at sustained highway speeds.
- In heavy city traffic during hot weather.
- If vehicle is towing a trailer.

If the vehicle has been operated under these conditions, shut the engine off and allow the vehicle to "cool" for thirty (30) minutes. After the cool down period, restart the vehicle and continue from step 2 above.

Fluid Condition

FLUID CONDITION				
	NORMAL*		CONTAMINATED	
COLOR	RED OR LIGHT BROWN	BROWN	NON-TRANSPARENT / PINK	BROWN
DRAIN REQUIRED?	NO	YES	YES	YES
CONTAMINATION	NONE	Very small amount of foreign material in bottom of pan	Contamination by coolant or other source	Large pieces of metal or other foreign material in bottom of pan
CORRECT LEVEL AND CONDITION	1. LOW LEVEL: A. Add fluid to obtain proper level & check for external leaks. B. Correct cause of leak. 2. HIGH LEVEL: - Remove excess fluid	- Remove both pans - Change filter - Flush cooler - Add new fluid - Check level	- Repair/replace radiator cooler - Transmission overhaul required - Check for: ● Damaged plates and seals ● Contaminated solenoids - Flush cooler - Add new fluid - Check level	- Transmission overhaul required - Flush cooler and cooler lines - Add new fluid - Check level

*Fluid should be changed according to maintenance schedule.

Test Driving

Some 4L30-E automatic transmission complaints will require a test drive as a part of the diagnostic procedure. Some codes will not set unless the vehicle is moving. The purpose of the test drive is to duplicate the customer's complaint condition and set a current Powertrain Control Module (PCM) trouble code. Perform this procedure before each 4L30-E automatic transmission repair, and again after repairs are made.

IMPORTANT:

- Duplicate the condition under which the customer's complaint was observed.
- Depending on the complaint, the line pressure gauge and the scan tool scan tool may be required during the test drive.
- During the test drive, it is important to record all necessary data from the areas being monitored, for use in diagnosis. Also listen for and note any unusual noises.

The following procedure should be used to test drive 4L30-E automatic transmission complaint vehicles:

1. Turn the ignition ON without starting the engine. Check that the "CHECK TRANS" lamp comes on for approximately 2 to 3 seconds and then goes out and remains out.
 - If the lamp is flashing, GOTO Check Trans Indicator in Transmission Control System (4L30-E) section.
 - If no serial data is present, GOTO OBD System Check. Refer to Driveability and Emissions in Engine section.

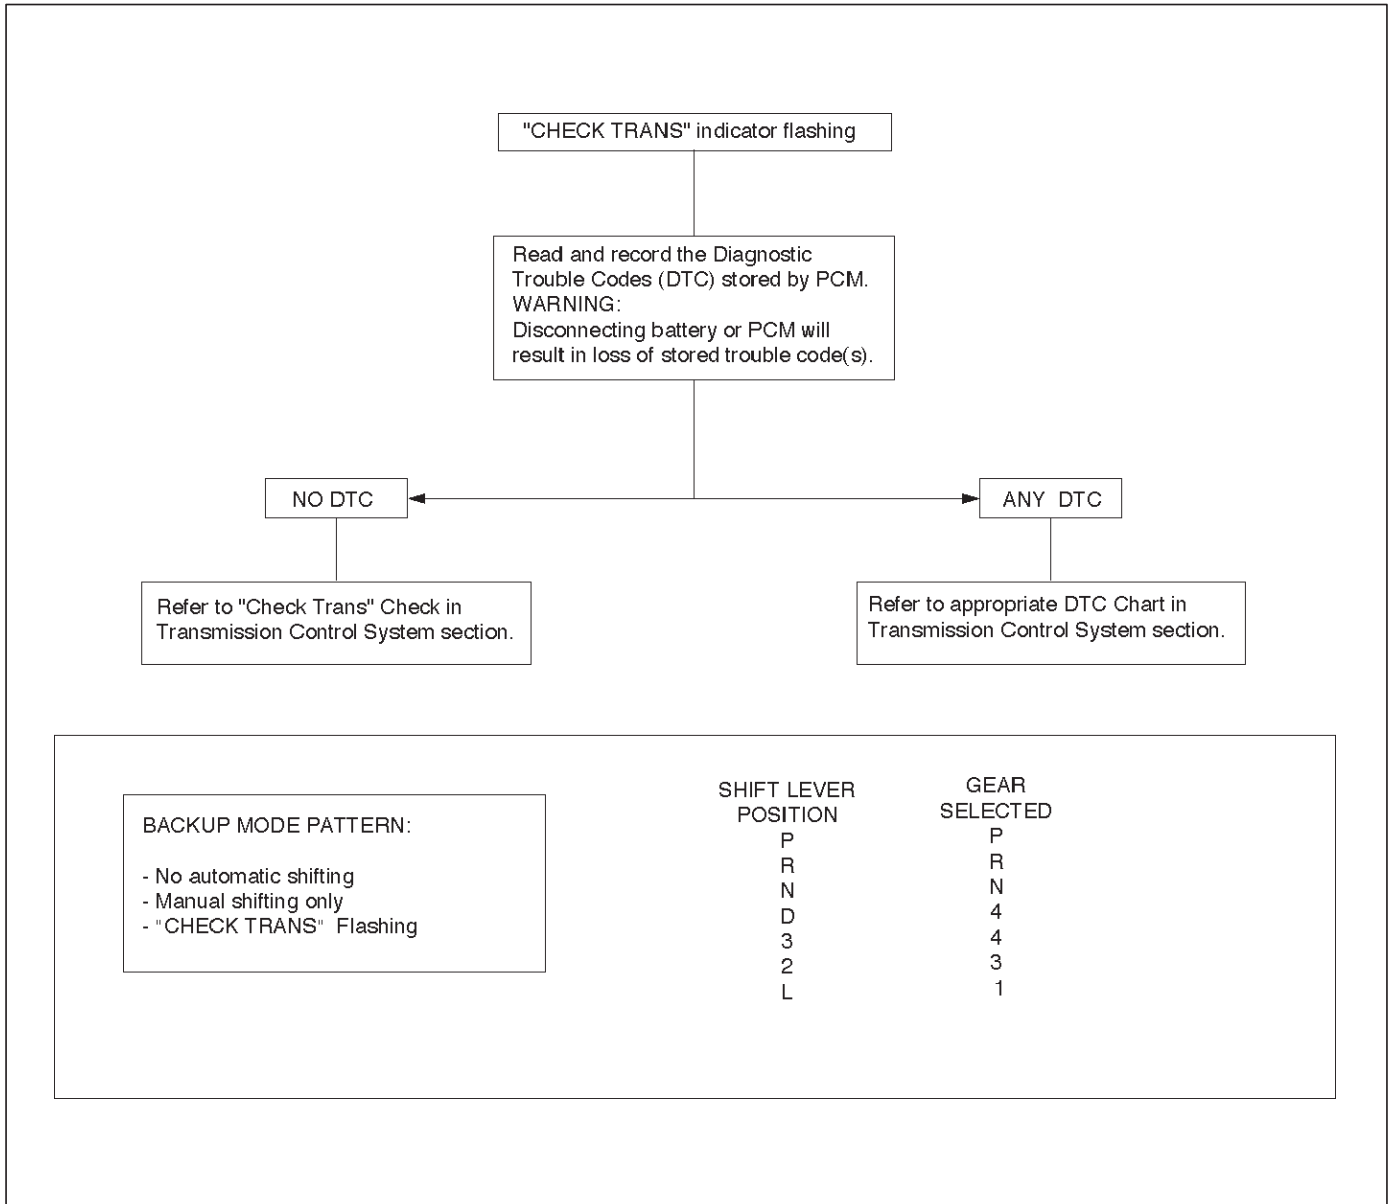

- If the lamp stays ON or stays OFF, GOTO "Check Trans" Check in Transmission Control System (4L30-E) section.
2. Drive the vehicle. During the test drive, be sure that the transmission achieves normal operating temperature (approx. 20 minutes). Allow the transmission to go through all of its gear ranges, checking shift timing and firmness. Duplicate the owner's complaint condition as closely as possible during the test drive.
 3. If, during the test drive, the "CHECK TRANS" lamp comes on, use the scan tool to check for trouble codes.
 4. If, during the test drive, a problem is felt, but the "CHECK TRANS" lamp does not come on and no trouble codes are present, drive the vehicle with the PCM disconnected (manually shifting the vehicle).
 - In Manual L, the vehicle operates in first gear.
 - In Manual 2, the vehicle operates in third gear.
 - In Manual 3 or "D", the vehicle operates in fourth gear.
 If the problem still exists with the PCM disconnected, refer to Mechanical/Hydraulic Diagnosis in this section.
 5. If no problem has been found at this point, check all underhood connections that supply power to the PCM and ignition fuses. Physically and visually inspect all the PCM harness connectors for loose or corroded terminals. Inspect the PCM ground points.

Mechanical / Hydraulic Diagnosis Check Trans Indicator Chart

Perform Preliminary Inspection First!

When the "CHECK TRANS" indicator is flashing, it indicates that a problem related to the transmission, the Powertrain Control Module (PCM), or the vehicle harness has occurred.

The system is now operating in a "BACKUP MODE" where the risk of further damaging the transmission has been reduced. The vehicle may be shifted manually. If the initial problem is intermittent or seldom, switching the engine OFF/ON might allow normal operation again until the problem reoccurs.

Mechanical / Hydraulic Diagnosis Symptoms Index

Perform Preliminary Inspection First!

CHART	SYMPTOMS
1	NO ENGINE START IN NEUTRAL OR PARK
2	NO FORWARD GEARS IN ANY RANGE/NO REVERSE
3	NO ENGINE BRAKE IN ANY RANGE
4	POOR SHIFTING IN ALL GEARS (ALL HARSH OR ALL SOFT)
5a	DELAYS IN DRIVE AND REVERSE
5b	DELAYS IN REVERSE ONLY
6	DIAGNOSTIC TROUBLE CODE (DTC) P0730
7	HARSH 1-2 SHIFT
8	HARSH 3-4 SHIFT
9a	3-2 DOWNSHIFT COMPLAINT
9b	HARSH SHIFT WHEN SHIFTING INTO "D" OR ACCELERATING FROM STOP
9c	COASTDOWN HARSH SHIFT OR CLUNK AT 3-2 DOWNSHIFT
10	INTERMITTENT 4TH TO 2ND GEAR DOWNSHIFT AT STEADY SPEED
11	ENGINE FLARE AT SHIFTING DURING TURNING ONLY (USUALLY WITH WARM ENGINE)
12	ENGINE FLARE DURING 1-2 OR 2-3 SHIFT
13	SHUDDER ONLY DURING TORQUE CONVERTER CLUTCH (TCC) APPLYING
14	POSSIBLE CAUSES OF TRANSMISSION NOISE
15a	POSSIBLE CAUSES OF LOW LINE PRESSURE
15b	POSSIBLE CAUSES OF HIGH LINE PRESSURE
16	POSSIBLE CAUSES OF TRANSMISSION FLUID LEAKS

NOTE: Numbers with parenthesis on the following charts refer to Parts List at end of this section.

Chart 1: No Engine Start In Neutral Or Park

Step	Action	Yes	No
1	Does engine start when shift lever moved from drive to neutral mostly in hot condition?	Go to Step 2	Go to Step 3
2	Does engine start in park at any condition?	Re-test vehicle	Go to Step 4
3	Does engine also not start in neutral when shift lever moved from park to neutral?	Go to Step 4	Go to Step 5
4	Check mode switch (63) setting. Readjust if necessary. Problems fixed?	Re-test vehicle	Go to Step 5
5	Check start circuit of mode switch (63) open in neutral. Was open found?	Locate and repair open(s).	Replace mode switch (63).

7A-14 AUTOMATIC TRANSMISSION (4L30-E)

Chart 2: No Forward Gears In Any Range/No Reverse

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Use Chart 15a: Possible Causes of Low Line Pressure in this section.
2	1. Check internal linkage: – Manual linkage (58) not moving manual valve (326). 2. Check for internal mechanical damage: – Turbine shaft (506) broken loose. – Overrun roller clutch (516) broken loose. Was the problem found?	Repair or replace	—

Chart 3: No Engine Brake In Any Range

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Use Chart 15a: Possible Causes of Low Line Pressure in this section.
2	1. Check for overrun clutch leaks caused by: – Damaged piston lip (513) – Check ball defective (504) 2. Check for overrun lockout valve (705) stuck by foreign material. 3. Check for leaks at turbine shaft (506) caused by: – Teflon seal rings damaged (508) – Excessive wear of turbine shaft bearing surfaces. Was the problem found?	Repair or replace	—

Chart 4: Poor Shifting In All Gears (All Harsh Or All Soft)

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Go to Step 3
2	1. Check for these conditions which could affect clutch apply time: <ul style="list-style-type: none"> - Defective band apply solenoid (323). - Defective servo or/and accumulator piston. - Excessive clutch piston travel. 2. Check of possible causes of internal leaks: <ul style="list-style-type: none"> - Cut or damaged sealing ring(s) - Damaged sealing gasket(s) - Check ball missing or out of location in 2nd and 3rd clutch pistons. 3. Check for causes of burned clutch plates or band. Was the problem found?	Repair or replace	—
3	Was the line pressure high?	Go to Step 4	Use Chart 15a: Possible Causes of Low Line Pressure in this section.
4	Were DTCs P0560 and P0705 set?	Diagnose those DTC(s) first.	Use Chart 15b: Possible Causes of High Line Pressure in this section.

Chart 5a: Delays In Drive and Reverse

NOTE: A short delay (less than 3 seconds) when first engaging drive or reverse after allowing vehicle to sit overnight is normal.

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	More than 3 second delay in drive and reverse with engine off 1 hour or less. Teflon seals (508) on turbine shaft damaged. Repair	Use Chart 15a: Possible Causes of Low Line Pressure in this section.

Chart 5b: Delays In Reverse Only

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Use Chart 15a: Possible Causes of Low Line Pressure in this section.
2	Main case valve body gasket (88) damaged. <ul style="list-style-type: none"> - Reverse check ball (85) in valve body (84) missing or out of location. - Check for restrictions at valve body transfer plate orifice. Was the problem found?	Repair	—

7A-16 AUTOMATIC TRANSMISSION (4L30-E)

Chart 6: Diagnostic Trouble Code (DTC) P0730

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Use Chart 15b: Possible Causes of High Line Pressure in this section.
2	1. 1st and 2nd gear missing or 3rd and 4th gear missing. Check appropriate shift valve. If OK replace solenoid. 2. No engine brake in any range (All ranges in Drive and Reverse are OK) Check for suspected conditions modifying delays to clutch apply: – Overrun clutch seal damaged. – Excessive overrun clutch piston travel. – Defective 3-4 accumulator piston. – Causes of internal leaks. – Causes of burned clutch plates. 3. 1st and 4th gear missing or 2nd and 3rd gear missing. Shift solenoid A stuck. Replace shift solenoid A. 4. DTC P0730 is set in D range 1st gear above 3500 rpm. Go to Step 3. 5. DTC P0730 is set in D range 3rd gear between 55-80 mph. NOTE: Perform this test within safe and legal limits. Check for suspected conditions modifying delays to clutch apply: – 4th clutch seal damaged. – Excessive 4th clutch piston travel. – Defective 3-4 accumulator piston. – Causes of internal leaks. – Causes of burned clutch plates. Was the problem found?	Repair or replace	—
3	Check 3rd gear in “D” in winter mode. Does vehicle move?	Shift solenoid A stuck. Replace shift solenoid A.	
4	Check for suspected conditions modifying delays to clutch apply: – 2nd clutch seal damaged. – Excessive 2nd clutch piston travel. – Defective accumulator piston. – Causes of internal leaks. – Check ball missing or out of location in 2nd clutch. – Seals cut, damaged or missing. – Gaskets defective. – Causes of burned clutch plates. Was the problem found?	Repair or replace	—

Chart 7: Harsh 1–2 Shift

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Check for 1–2 accumulator valve (320) stuck by foreign material in main case valve body.	Use Chart 15b: Possible Causes of High Line Pressure in this section.

Chart 8: Harsh 3–4 Shift

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Use Chart 15b: Possible Causes of High Line Pressure in this section.
2	1. Check for 3–4 accumulator valve (407) stuck in adapter case valve body (401). 2. Check for 3–4 accumulator piston (18) stuck in adapter case (20). Was the problem found?	Repair or replace	—

Chart 9a: 3–2 Downshift Complaint

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Use Chart 15a: Possible Causes of Low Line Pressure in this section.
2	Does DTC P1850 set?	Diagnose P1850 first.	Replace band apply solenoid (PWM) (323).

Chart 9b: Harsh Shift When Shifting Into “D” Or Accelerating From Stop

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Use Chart 15b: Possible Causes of High Line Pressure in this section.
2	Does DTC P1850 set?	Diagnose P1850 first.	Replace band apply solenoid (PWM) (323).

7A-18 AUTOMATIC TRANSMISSION (4L30-E)

Chart 9c: Coastdown Harsh Shift Or Clunk At 3-2 Downshift

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Use Chart 15b: Possible Causes of High Line Pressure in this section.
2	Does DTC P1850 set?	Diagnose P1850 first.	Replace band apply solenoid (PWM) (323).

Chart 10: Intermittent 4TH TO 2ND Gear Downshift At Steady Speed

Step	Action	Yes	No
1	Check for consistent speed sensor reading with scan tool. Was the reading correct?	Replace mode switch for intermittent contact.	Go to Step 2
2	1. Check for wiring harness damage or short to ground. If OK, go to (2). 2. Check transmission speed sensor connections. If OK, go to (3). 3. Replace transmission speed sensor. Was the replacement complete?	—	Replace speed sensor.

Chart 11: Engine Flare At Shifting During Turning Only (Usually With Warm Engine)

Step	Action	Yes	No
1	Check for oil leaks at transmission. Was the problem found?	Replace transmission oil filter and gasket.	—

Chart 12: Engine Flare During 1-2 Or 2-3 Shift

Step	Action	Yes	No
1	Check line pressure. Refer to Line Pressure Test in this section. Was line pressure normal?	Go to Step 2	Use Chart 15a: Possible Causes of Low Line Pressure in this section.
2	1. Check for a stuck 1-2 accumulator valve (320). 2. Check for servo piston (106) leaks. 3. Check for a stuck band apply solenoid (323). Was line pressure normal?	Repair or replace	—

Chart 13: Shudder Only During Torque Converter Clutch (TCC) Applying

Step	Action	Yes	No
1	<p>1. TCC shudder is one of the most commonly misdiagnosed conditions in an automatic transmission. The key to diagnosing TCC shudder is to note when it happens and under what conditions. Once the TCC has been fully applied, it is nearly impossible to make it shudder. TCC shudder (short burst of noise normally less than 1 second) will only occur during clutch applying. It is not a steady state condition.</p> <p>2. Drive until whole drivetrain is at normal operating temperature.</p> <ul style="list-style-type: none"> – On 4WD vehicles, the test must be performed with transfer case selector lever in “2H” position. – Shudder is a short burst of noise normally less than 1 second in duration, and can be induced by the following maneuver: <p>3. From coast condition at 50 mph in “D” range (Normal mode), depress the throttle to 1/4-1/3 throttle. If present, shudder will occur within 5 seconds together with TCC application. (The scan tool may be used to determine the exact time of TCC).</p> <p>Was the problem found?</p>	<p>Replace transmission fluid and filter (remove both pans) and flush cooler lines. Replace converter assembly and O-ring on turbine shaft</p>	<p>Perform mechanical inspection of other drivetrain components.</p>

Chart 14: Possible Causes of Transmission Noise

CAUTION: Before checking transmission for what is believed to be transmission noise, ensure presence and positioning of insulating plugs, pads etc. Also make sure that noise does not come from other drivetrain components.

Condition	Possible cause	Correction
Whine or Buzz	Oil level low	Fill with ATF, check for external leaks.
	Plugged or restricted oil filter	Inspect oil filter. Replace oil filter or ATF as necessary.
	Damaged oil filter gasket	Replace oil filter gasket.
Knocking noise from front of transmission.	Loose bolts (Converter to flex plate)	Tighten to specifications.
	Cracked or broken flex plate	Replace flex plate.
	Converter damaged	Replace converter.
Knocking noise while driving, mostly on acceleration.	Transmission mount loose or broken	Tighten mount bolts or replace transmission mount.
	Cooler line mounts loose or broken	Tighten or replace cooler line mounts.
	Cooler lines touching body or frame	Repair or replace as necessary.
Knocking noise when vehicle is stationary.	Loose flex plate mounting bolts	Tighten to specifications.
	Cracked or broken flex plate	Replace flex plate.
	Damaged converter	Replace converter.

7A-20 AUTOMATIC TRANSMISSION (4L30-E)

Chart 15a: Possible Causes of Low Line Pressure

Step	Action	Yes	No
1	Check oil level. Was the problem found?	Fill with ATF.	Go to Step 2
2	Check for defective throttle position sensor. Was the problem found?	Replace throttle position sensor.	Go to Step 3
3	Check for plugged, loose, or damaged oil filter (79). Was the problem found?	Inspect oil filter, tighten bolts or replace oil filter (79).	Go to Step 4
4	Check for a stuck force motor plunger (404). (Adapter case valve body) Was the problem found?	Replace force motor plunger (404).	Go to Step 5
5	Check for a stuck feed limit valve (412). (Adapter case valve body) Was the problem found?	Replace feed limit valve (412).	Go to Step 6
6	Check for loose converter bolts (4 & 5). Was the problem found?	Tighten converter bolts (4 & 5).	Go to Step 7
7	Check for a stuck pressure regulator valve (208). (Oil pump) Was the problem found?	Replace pressure regulator valve (208).	Go to Step 8
8	Check for a stuck boost valve (205). (Oil pump) Was the problem found?	Replace boost valve (205).	Go to Step 9
9	Check for blocked intermediate oil passages to pressure regulator valve. (Oil pump) Was the problem found?	Replace oil pump.	Go to Step 10
10	Check for defective oil pump (9, 201, 202 & 209). Was the problem found?	Replace oil pump.	Go to Step 11
11	Check for internal leaks. – Check balls missing or out of location in valve bodies – Seals cut or damaged – Gaskets defective, etc. Was the problem found?	Install balls, or correct ball location. Replace seals. Replace gaskets.	—

Chart 15b: Possible Causes of High Line Pressure

NOTE: If transmission is operating in backup mode, high line pressure will be present.

Step	Action	Yes	No
1	Check for defective throttle position sensor. Was the problem found?	Replace throttle position sensor.	Go to Step 2
2	Check for a stuck force motor plunger (404). (Open circuit/intermittent) (Adapter case valve body) Was the problem found?	Replace force motor plunger (404).	Go to Step 3
3	Check for a stuck feed limit valve (412). (Adapter case valve body) Was the problem found?	Replace feed limit valve (412).	Go to Step 4
4	Check converter bolts (4 & 5). Was the problem found?	Tighten converter bolts (4 & 5).	Go to Step 5
5	Check for a stuck pressure regulator valve (208). (Oil pump) Was the problem found?	Replace pressure regulator valve (208).	Go to Step 6
6	Check for a stuck boost valve (205). (Oil pump) Was the problem found?	Replace boost valve (205).	Go to Step 7
7	Check for internal leaks. – Check balls missing or out of location in valve bodies – Seals cut or missing – Gaskets defective, etc. Was the problem found?	Install balls, or correct ball location. Replace seals. Replace gaskets.	—

Chart 16: Possible Causes of Transmission Fluid Leaks

Before attempting to correct an oil leak, the actual source of the leak must be determined. In many cases, the source of the leak may be difficult to determine due to “wind flow” around the engine and transmission. The suspected area should be wiped clean before inspecting for the source of the leak.

Oil leaks around the engine and transmission are generally carried toward the rear of the vehicle by the air stream. In determining the source of an oil leak, the following two checks should be made:

1. With the engine running, check for external line pressure leaks.
2. With the engine off, check for oil leaks due to the raised oil level caused by drainback of converter oil into the transmission.

Possible Causes of Fluid Leaks Due To Sealing Malfunction

Stall Test

The stall test allows you to check the transmission for internal abrasion and the one way clutch for slippage. Torque converter performance can also be evaluated. The stall test results together with the road test results will identify transmission components requiring servicing or adjustment.

Stall Test Procedure:

1. Check the level of the engine coolant, the engine oil, and the automatic transmission fluid. Replenish if necessary.
2. Block the wheels and set the parking brake.
3. Connect a tachometer to the engine.
4. Start the engine and allow it to idle until the engine coolant temperature reaches 70 – 80°C (158 – 176°F).

5. Hold the brake pedal down as far as it will go.

6. Place the selector in the “D” range.

7. Gradually push the accelerator pedal to the floor. The throttle valve will be fully open.

Note the engine speed at which the tachometer needle stabilizes.

Stall Speed : 2,200 ±150 rpm

NOTE: Do not continuously run this test longer than 5 seconds.

8. Release the accelerator pedal.

9. Place the selector in the “N” range.

10. Run the engine at 1,200 rpm for one minute. This will cool the transmission fluid.

11. Repeat Steps 7 – 10 for the “3”, “2”, “L” and “R” ranges.

Line Pressure Test

The line pressure test checks oil pump and control valve pressure regulator valve function. It will also detect oil leakage.

Line Pressure Test Procedure:

1. Check the level of the engine coolant, the engine oil, and the automatic transmission fluid.
Replenish if required.
2. Block the wheels and set the parking brake.
3. Remove the pressure detection plug at the left side of the transmission case.
Set J-29770-A pressure gauge and adapter to the pressure detection plug hole.

4. Start the engine and allow it to idle until the engine coolant temperature reaches 70 – 80°C (158 – 176°F).
5. Hold the brake pedal down as far as it will go.
6. Place the selector in the “D” range.
7. Note the pressure gauge reading with the engine idling.
8. Gradually push the accelerator pedal to the floor. The throttle valve will be fully open.
Note the pressure gauge reading with the accelerator pedal fully depressed.

NOTE: Do not continuously run this test longer than 5 seconds.

9. Release the accelerator pedal.
10. Place the selector in the “N” range.
11. Run the engine at 1,200 rpm for one minute.
This will cool the transmission fluid.
12. Repeat Steps 7 – 11 for the “3”, “2”, “L”, and “R” ranges.
13. Install a pressure detection plug to the transmission case, applying recommended thread locking agent (LOCTITE 242) or its equivalent to thread of plug. Make sure that thread is cleaned before applying locking agents.
14. Tighten the pressure detection plug to the specified torque.

Torque: 9 – 14N·m (7 – 10lb ft)

MODE	LEVER POSITION	ENGINE SPEED	LINE PRESSURE		FORCE MOTOR CURRENT
			kPa	PSI

	Power	79 ~ 85 (49 ~ 53)	84 ~ 90 (52 ~ 56)	84 ~ 90 (52 ~ 56)	74 ~ 80 (46 ~ 50)	76 ~ 82 (47 ~ 51)	81 ~ 87 (50 ~ 54)

Changing Transmission Fluid

There is no need to change the transmission fluid unless the transmission is used under one or more of the following heavy duty conditions.

- A. Repeated short trips
- B. Driving on rough roads
- C. Driving on dusty roads
- D. Towing a trailer

If the vehicle is used under these conditions, change the fluid every 20,000 miles (32,000 km.)

More over, the remaining life percentage of ATF can be estimated by using Tech 2 as an auxiliary tool to judge the right time for ATF replacement.

The remaining life percentage is calculated from ATF'S heat history. When it is close to 0%, ATF replacement is recommended.

1. Place a large drain pan under the oil pan.
2. Remove the transmission oil drain screw (2) and drain fluid.
3. Tighten drain screw (2).

Torque: 38 N•m (28 lb ft)

4. Remove the transmission overfill screw (1) and fill transmission through overfill screw opening, using DEXRON®-III ATF.

NOTE: Add transmission fluid until it flows out over the overfill screw opening.

5. Let engine idle until a fluid temperature between 32° C (90° F) and 57° C (135° F) is reached.
6. Add transmission fluid until it flows out over the overfill screw opening, then close the overfill screw (1).

Torque: 38 N•m (28 lb ft)

NOTE: To prevent fluid leaks, the overfill screw and oil drain screws gasket must be replaced each time these screws are removed.

NOTE: Check transmission fluid temperature with scan tool.

7. Reset "Oil Life Monitor" data by using Tech 2.

Refer to Tech 2 OBD II Connection in Transmission Control System (4L30-E) section.

242RW003

Selector Lever

Inspection

1. Make sure that when the selector lever is shifted from "P" to "L", a "clicking" can be felt at each shift position. Make sure that the gear corresponds to that of the position plate indicator.
2. Check to see if the selector lever can be shifted as shown in illustration.

C07RW009

Removal

1. Disconnect battery ground cable.
2. Set ignition Key in "LOCK" position and selector lever in "P" position.
3. Remove transfer control lever knob.
4. Remove lower cluster assembly.

740RW021

5. Remove rear console.

745RW011

6. Remove center console.

256RW006

7. Remove selector lever knob and cover.

256RW043

8. Disconnect select cable.
 - Refer to Select Cable in this section.
9. Disconnect shift lock cable.
 - Refer to Shift Lock Cable in this section.
10. Disconnect harness connector.

7A-28 AUTOMATIC TRANSMISSION (4L30-E)

11. Remove selector lever subassembly.

5. Install selector lever knob and cover.

Installation

1. Install selector lever subassembly.
2. Connect harness connector.
3. Connect shift lock cable.
 - Refer to Shift Lock Cable in this section.
4. Connect select cable.
 - Refer to Select Cable in this section.

6. Install center console.
7. Install rear console.
8. Install lower cluster assembly.
9. Install transfer control lever knob.
10. Connect negative (-) battery cable.
11. After installation, make sure that the selector lever operates normally, and that each selector position is properly indicated. (The red mark shows through the window.)

Select Cable

Removal

1. Set selector lever in "P" position.
2. Remove transfer control lever knob, lower cluster assembly, rear console, center console, selector lever knob and cover.
 - Refer to Selector Lever in this section.
3. Disconnect inner cable by pulling projection on pin.

4. Press down claws and disconnect cable assembly.

A07RW017

5. Disconnect PCM harness connectors and remove nuts that fasten grommet in select cable assembly.

6. Disconnect inner cable.

210RW013

7. Pull lock.

A07RW015

7A-30 AUTOMATIC TRANSMISSION (4L30-E)

8. Slide sleeve and disconnect cable assembly.

A07RW082

9. Draw select cable assembly into the interior side.

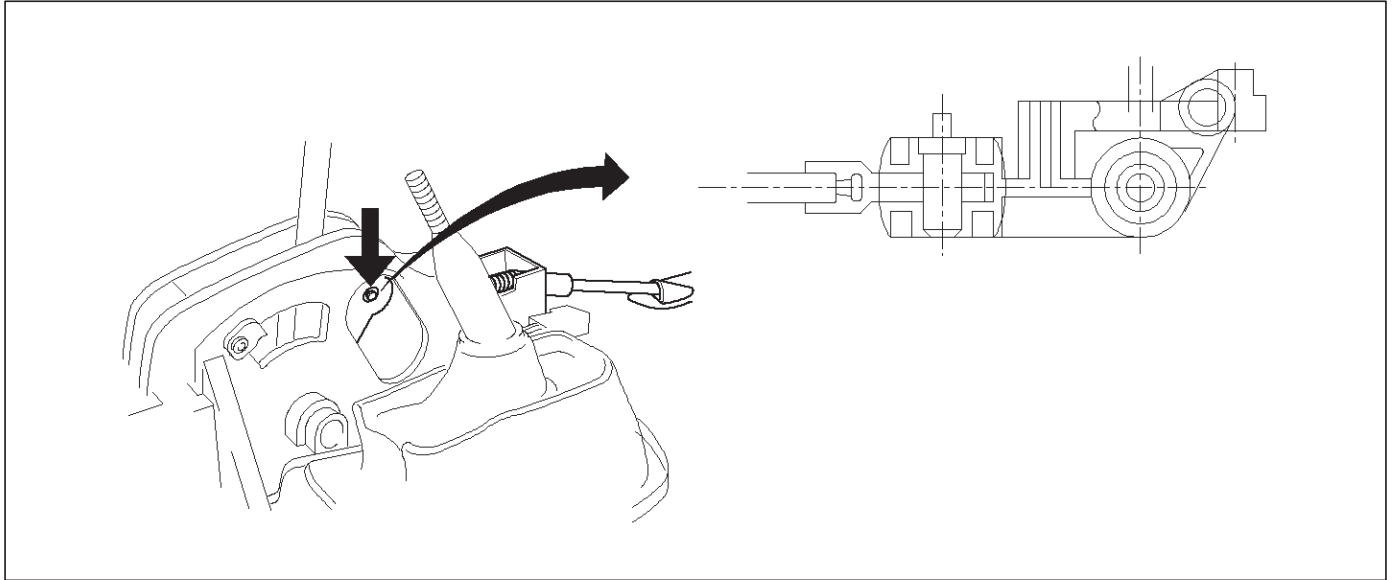

Installation

1. Set selector lever in "P" position.
2. Let out select cable transmission side end from floor hole.
3. Fit outer cable into bracket in selector lever assembly.

A07RW016

4. Set inner cable end in selector lever and push pin into selector lever hole and inner cable end.

256RW023

5. Check that lock projects.

A07RW015

6. Connect adjust end fitting attachment to the bracket on transmission.

7. Set select lever "P" position and connect inner cable to select lever.

210RW013

7A-32 AUTOMATIC TRANSMISSION (4L30-E)

8. Push lock into adjust end fitting attachment.

A07RW014

9. Install grommet.

10. About following installation steps, refer to Selector Lever in this section.

Shift Lock Cable

Removal

1. Set ignition key in "LOCK" position and selector lever in "P" position.
2. Remove transfer control lever knob, lower cluster assembly, rear console, center console, selector lever knob and cover.
 - Refer to Selector Lever in this section.
3. Disconnect inner cable from selector lever assembly then push claw and disconnect cable assembly.

256RW016

4. Disconnect lock adjust.

256RW017

5. Remove instrument panel lower cover and steering column cover.

6. Remove spring pin and disconnect inner cable.
- Disconnect outer cable from bracket.

256RW008

5. Check that cable moves smoothly, lightly pulling outer cable rearward.

256RW019

6. Connect lock adjust, aligning "T" mark in the "Up" position.

Installation

1. Set ignition key in "LOCK" position and selector lever in "P" position.
2. Connect outer cable to bracket near steering lock.
 - Connect inner cable to steering lock and install spring pin.
3. Install steering column cover and instrument lower cover.
4. Install adjust body of cable assembly to bracket in selector lever assembly.
 - Install inner cable to lever, pulling inner cable with outer cable.

256RW016

256RW017

7. About following installation steps, refer to Select Lever in this section.
8. Check the shift lock operation:
 - a. Selector lever should not be moved out of "P" position with ignition key in "Lock" position.
 - b. Selector lever can be moved out of "P" position with ignition key in "ON" position only when brake pedal is depressed.
 - c. Ignition key can be turned to "LOCK" position only when selector lever is in "P" position (key can be pulled out).
9. If a. and c. fail, readjust cable. If b. fails, readjust connector wiring and brake pedal switch.

Mode Switch

Removal

1. Place selector lever in neutral.
2. Disconnect battery ground cable.
3. Remove mode switch cover (1).
4. Disconnect selector lever (2) from the mode switch.
5. Remove bracket with cable (3).
6. Disconnect transmission harness from the mode switch connector (4).
7. Remove bracket with mode switch connector from the transmission case.
8. Remove mode switch connector (4) from the bracket (5).
9. Remove two mode switch bolts and nut then remove mode switch (6).

210RW014

- c. Remove the mode switch cover.
- d. Loosen the two 10 mm screws.
- e. Rotate the mode switch until the slot in the mode switch housing aligns with the selector shaft bushing, and insert a 3/32 in. (2.4 mm) drill bit or punch (1) into the slot.
- f. Tighten the screws to 13 N·m (113 lb in).
- g. After completing adjustment, snap the mode switch cover into place.
- h. Reinstall the selector lever.

249RW001

Installation

To install, follow the removal steps in the reverse order, noting the following points;

1. Torque

Mode switch bolt: 13 N·m (113 lb in)

Selector lever nut: 23 N·m (17 lb ft)

2. Mode switch setting procedure

Perform either of the following adjustment procedures:

Procedure 1

- a. Place selector lever in neutral.
- b. Remove selector lever from the mode switch.

Procedure 2

- a. Place selector lever in neutral.
- b. Disconnect transmission harness connector from mode switch connector.
- c. Remove mode switch connector with bracket from the transmission case.
- d. Connect multimeter (resistance mode) to terminals 1(E) and 4(H) on mode switch connector.
- e. Loosen two mounting screws.
- f. Rotate mode switch slightly in both directions to determine the range (approx. 5 degrees) of electrical contact.
- g. Position mode switch in middle of contact range.
- h. Tighten two mounting screws.
- i. Remove multimeter and install mode switch harness connector with bracket to the transmission case.
- j. Connect transmission harness connector to mode switch connector.

Transmission

Transmission and Associated Parts

240RX012

Legend

- | | |
|----------------------------|--|
| (1) Skid Plate | (9) Transmission Oil Cooler Pipe |
| (2) Transfer Protector | (10) Starter |
| (3) Rear Propeller Shaft | (11) Under Cover |
| (4) Front Propeller Shaft | (12) Transfer Control Lever |
| (5) Center Exhaust Pipe | (13) Select Cable |
| (6) Harness Heat Protector | (14) Torque Converter Bolt (Non – reusable part) |
| (7) Rear Mount Nut | (15) Engine-Transmission Bolt |
| (8) Third Crossmember | (16) Transmission Assembly |

Removal

NOTE: Before remove transmission and transfer assembly from vehicle, change the transfer mode to 2WD using push button on dash panel.

1. Disconnect battery ground cable.
2. Remove rear propeller shaft and front propeller shaft.

NOTE: Apply alignment marks on the flange at both front and rear sides.

3. Remove transfer protector.
4. Remove center exhaust pipe.

5. Remove fuel pipe bracket from the third crossmember.

6. Disconnect transmission harness connector and clip. Connector : Adapter case, mode switch, main case, magnetic sensor, transfer switch, 2-4 actuator and car speed sensor.

7A-38 AUTOMATIC TRANSMISSION (4L30-E)

7. Remove harness heat protector.

8. Support transmission with a jack.
Remove rear mount nuts from the third crossmember.

9. Remove third crossmember.
10. Disconnect transmission oil cooler pipes from A/T side.

11. Remove oil pipe clamp and bracket from the converter housing.

12. Remove skid plate and loosen oil cooler pipe clamp bolt at the engine mount side.

13. Remove select cable by disconnecting inner cable from select lever and removing outer cable with bracket.

14. Remove starter.

15. Remove under covers from the transmission and engine.

16. Remove transfer control lever fixing bolts and push up transfer control lever.

262RW015

17. Remove flex plate torque converter fixing bolts (6 pieces) by turning crankshaft.

240RX010

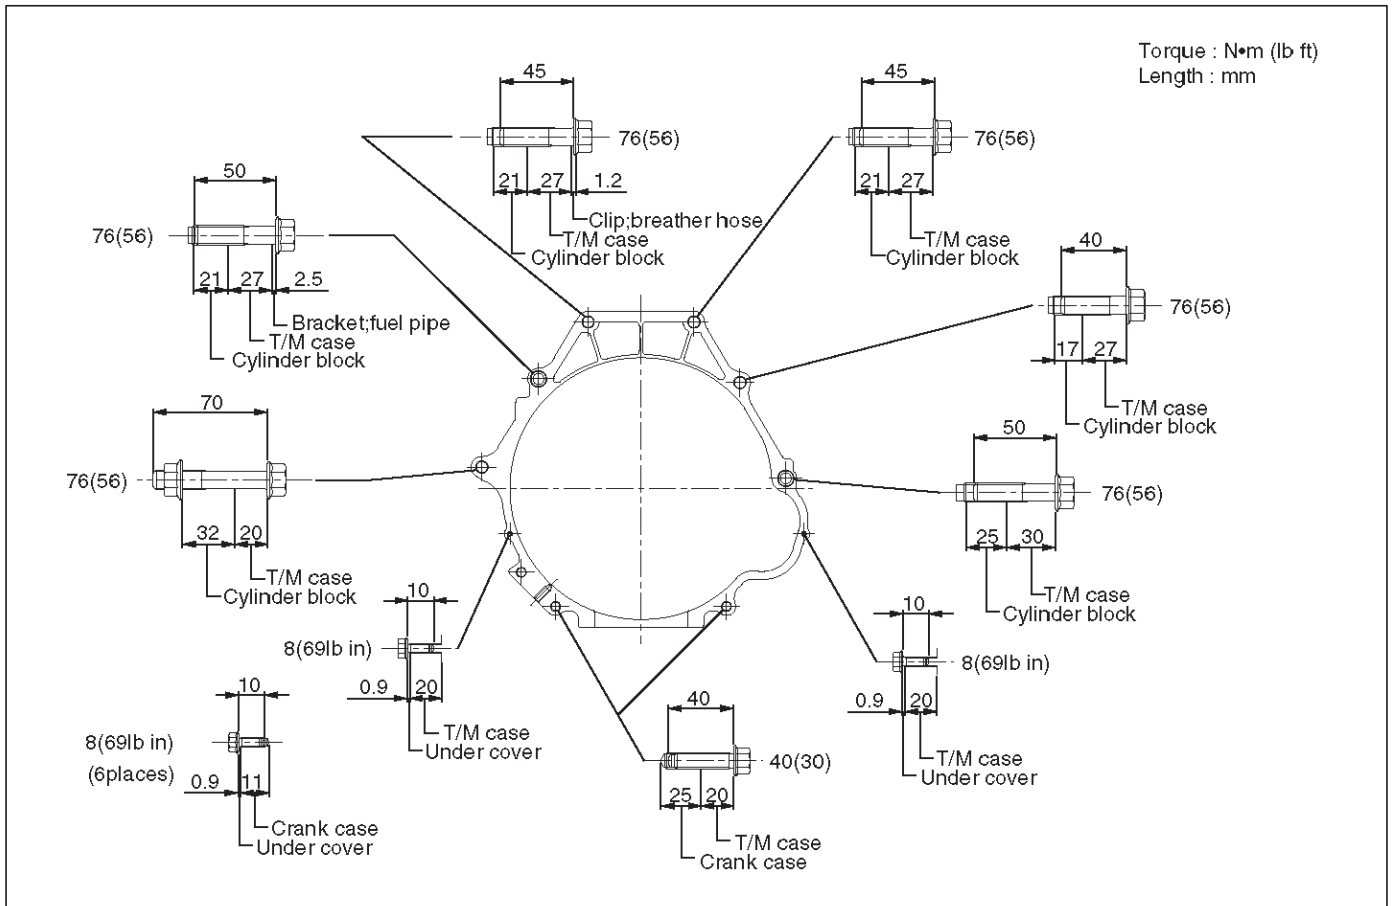

18. Remove engine-transmission fixing bolts.

19. Pull out transmission from the engine.

Installation

1. Slowly raise transmission jack until front of the transmission is aligned with rear of the engine. Join the transmission to the engine.
2. Tighten engine-transmission bolts as shown in the figure.

7A-40 AUTOMATIC TRANSMISSION (4L30-E)

3. Align the flex plate torque converter bolt boss with flex plate hole by turning the torque converter. Install flex plate torque converter bolts (6 pieces) by turning the crankshaft.

Torque: 54 N•m (40 lb ft)

NOTE: Do not reuse the flex plate torque converter bolt.

4. Install transfer control lever on the transfer case.

5. Install under covers to the transmission and engine.

Torque: 8 N•m (69 lb in)

6. Install starter.

Torque: 40 N•m (30 lb ft)

7. Install select cable by connecting inner cable to select lever and installing outer cable with bracket.

256RW025

8. Connect transmission oil cooler pipes to A/T.

Torque: 44 N•m (33 lb ft)

9. Install oil cooler pipe clamp and bracket to the converter housing.

253RX002

10. Tighten oil cooler pipe clamp bolt at the engine mount side and install skid plate.

11. Install third crossmember.

Torque: 50 N•m (37 lb ft)

12. Install rear mount nuts.

Torque: 50 N•m (37 lb ft)

F07RW008

13. Install harness heat protector.

Torque: 6 N•m (52 lb in)

815RW002

14. Connect transmission harness connector and clip.

Connector : Adapter case, mode switch, main case, magnetic sensor, transfer switch, 2-4 actuator and car speed sensor.

15. Connect fuel pipe to transmission side.

141RW035

16. Install fuel pipe bracket to the third crossmember.

18. Install transfer protector.

141RX004

17. Install center exhaust pipe.
Torque: 43 N•m (32 lb ft)

150RX008

19. Install front propeller shaft and rear propeller shaft.
Torque: 63 N•m (46 lb ft)
20. Connect battery ground cable.

Solenoid (Main Case Valve Body)

Removal

1. Raise the vehicle and support it on jack stands.
2. Disconnect battery ground cable.
3. Drain fluid.
4. Remove sixteen 10 mm screws, main case oil pan, magnet, and gasket.
5. Remove three 13 mm screws, oil filter.
6. Disconnect wiring harness from band control solenoid and shift solenoids. Pull only on connectors, not on wiring harness.
7. Remove spring pin for shift solenoid A, shift solenoid B, and band control solenoid respectively, using suitable pliers taking care not to damage solenoids.

210RW010

244RW003

8. Remove shift solenoid A, shift solenoid B, band control solenoid, and gaskets from main case valve body. Do not pull on wiring harness. Remove solenoids by grasping the metal tip.

Installation

1. Install shift solenoid A, shift solenoid B, band control solenoid with new gaskets to main case valve body respectively.
2. Carefully install spring pin with hammer to avoid damage to valve body, etc.

243RW004

3. Connect wiring harness to solenoids.
4. Install oil filter with a new gasket and the three 13 mm screws, tighten to the specified torque.

Torque: 20 N•m (15 lb ft)

5. Install magnet, main case oil pan with new gasket, and sixteen 10 mm screws. Tighten the screws to the specified torque.

Torque: 11 N•m (96 lb in)

6. Fill transmission through the overfill screw hole of oil pan, using ATF DEXRON®-III. Refer to Changing Transmission Fluid in this section.
7. Connect battery ground cable.

Solenoid (Adapter Case Valve Body)

Removal

1. Raise the vehicle and support it on jack stands.
2. Disconnect battery ground cable.
3. Drain fluid.
4. Remove adapter case oil pan twelve fixing 10 mm screws, adapter case oil pan, and gasket.

NOTE: Oil pan still contains transmission fluid. Place a large drain container under the oil pan and drain the fluid carefully.

5. Disconnect wiring harness from force motor solenoid and converter clutch solenoid. Pull only on connectors, not on wiring harness.
6. Remove 11 mm bolt and converter clutch solenoid with two O-rings.

210RW011

7. Remove 11 mm bolt, retainer, and force motor solenoid.

210RW009

Installation

1. Install force motor solenoid, retainer, and 11 mm bolt to adapter case valve body. Tighten the bolt to the specified torque.

Torque: 10 N•m (87 lb in)

2. Install converter clutch solenoid with two O-rings, and 11 mm bolt to adapter case valve body. Tighten the bolt to the specified torque.

Torque : 10 N•m (87 lb in)

3. Connect wiring harness assembly to solenoids.
4. Install adapter case oil pan, new gasket, and twelve 10 mm screws. Tighten the screws to the specified torque.

Torque : 11 N•m (96 lb in)

5. Fill transmission through overfill screw hole oil pan, using ATF DEXRON®-III. Refer to Changing Transmission Fluid in this section.
6. Connect battery ground cable.

Valve Body Assembly (Main Case)

Removal

1. Raise the vehicle and support it on jack stands.
2. Disconnect battery ground cable.
3. Drain fluid.
4. Remove sixteen 10 mm screws, main case oil pan, magnet and gasket.
5. Remove three 13 mm oil filter fixing screws, then remove oil filter.
6. Remove two 13 mm manual detent fixing screws, then remove roller and spring assembly.
7. Disconnect wiring harness from band control solenoid and shift solenoids. Pull only on connectors, not on wiring harness.
8. Remove four 13 mm servo cover fixing screws, then remove servo cover and gasket.
9. Remove seven 13 mm valve body fixing screws.
 - Disconnect ground wire from the main case valve body.
10. Remove main case valve body with manual valve link and transfer plate. Note the position of the link (long end into valve, short end into range selector lever).
11. Remove transfer plate gasket from main case.
12. Remove two check balls from main case.

Installation

1. Install two check balls to main case.

2. Inspect electrical 4 pin connector and seal of main case. Replace if necessary.
3. Use two J-25025-B guide pin to install main case.
 - Install valve body complete assembly and manual valve link.

NOTE: Valve must be extended as the short end of manual valve link is connected to the range selector lever. Long end of link goes into valve.

4. Install seven 13 mm screws, and tighten them to the specified torque.

Torque: 20 N•m (15 lb ft)

5. Install 8.5 mm connector of ground wire under the head of this valve body bolt and reinstall it. Tighten the bolt to the specified torque.

Torque: 20 N•m (15 lb ft)

6. Remove two guide pins from main case.
7. Install servo cover gasket, cover, and four 13 mm screws. Tighten the screws to the specified torque.

Torque: 25 N•m (18 lb ft)

8. Connect wiring harness to band control and shift solenoids.
9. Install roller and spring assembly to manual detent.
 - Install two 13 mm screws, and tighten them to the specified torque.

Torque: 20 N•m (15 lb ft)

7A-46 AUTOMATIC TRANSMISSION (4L30-E)

10. Install oil filter and three 13 mm screws. Tighten to the specified torque.

Torque : 20 N•m (15 lb ft)

11. Install oil pan gasket, magnet, oil pan and sixteen 10 mm screws. Tighten the screws to the specified torque.

Torque: 11 N•m (96 lb in)

12. Fill transmission through overfill screw hole of oil pan, using ATF DEXRON®-III. Refer to Changing Transmission Fluid in this section.

13. Connect battery ground cable.

Valve Body Assembly (Adapter Case)

Removal

1. Raise the vehicle and support it on jack stands.
2. Disconnect battery ground cable.
3. Drain fluid.
4. Remove twelve 10 mm adapter case oil pan fixing screws, adapter case oil pan, and gasket.

NOTE: Oil pan still contains transmission fluid. Place a large drain container under the oil pan.

Drain the fluid carefully.

5. Disconnect wiring harness from force motor solenoid and converter clutch solenoid. Pull only on connectors, not on wiring harness.
6. Remove seven 13 mm screws from adapter case valve body assembly, then remove transfer plate, two gaskets, and adapter case valve body.

Installation

1. Inspect electrical 5 pin connector and seal of adapter case. Replace if necessary.
2. Install gasket, transfer plate, and gasket.
3. Install adapter case valve body and seven 13 mm screws. Tighten the screws to the specified torque.

Torque: 20 N•m (15 lb ft)

4. Connect wiring harness assembly to converter clutch solenoid and force motor.
5. Install oil pan gasket, oil pan, and twelve 10 mm screws. Tighten the screws to the specified torque.

Torque: 11 N•m (96 lb in)

6. Fill transmission through the overfill screw hole of oil pan, using ATF DEXRON®-III, refer to Changing Transmission Fluid in this section.
7. Connect battery ground cable.

Powertrain Control Module (PCM)

Removal

1. Disconnect battery ground cable.
2. Remove transfer control lever knob, lower cluster assembly, center console and rear console.
3. Disconnect PCM wiring harness connectors from PCM.
4. Remove four PCM retaining screws.
5. Remove two brackets from PCM.

014RW221

Installation

1. Install two brackets to PCM.
2. Install four PCM retaining screws.
3. Connect PCM wiring harness connectors to PCM.
4. Install center console, rear console, lower cluster assembly and transfer control lever knob.
5. Connect battery ground cable.

Speed Sensor (Extension Housing)

Removal

1. Disconnect battery ground cable.
2. Raise the vehicle and support it on jack stands.
3. Disconnect speed sensor harness connector from speed sensor.
4. Remove one 10 mm screw and speed sensor with O-ring.

Installation

1. Inspect the speed sensor O-ring, and replace it if necessary.
2. Install speed sensor assembly and 10 mm screw.
Torque: 9 N•m (78 lb in)
3. Connect speed sensor harness connector to speed sensor.
4. Connect battery ground cable.

Transmission Oil Temperature Sensor (Adapter Case)

Removal

1. Raise the vehicle and support it on jack stands.
2. Disconnect battery ground cable.
3. Drain fluid.
4. Remove twelve 10 mm adapter case oil pan fixing screws, adapter case oil pan, and gasket.

NOTE: Oil pan still contains transmission fluid. Place a large drain container under the oil pan and drain the fluid carefully.

5. Disconnect wiring harness from force motor solenoid, converter clutch solenoid, and 5 pin connector of adapter case. Pull only on connectors, not on wiring harness.
6. Disconnect ground wire from converter clutch solenoid wiring harness connector.
7. Remove wiring harness assembly (transmission oil temperature sensor).

Installation

1. Connect ground wire to converter clutch solenoid wiring harness connector of the wiring harness assembly.
2. Install wiring harness assembly to converter clutch solenoid, force motor, and 5 pin connector of adapter case.
3. Install oil pan gasket, oil pan and twelve 10 mm fixing screws. Tighten the screws to the specified torque.
Torque: 11 N•m (96 lb in)
4. Fill transmission through the overfill screw hole of oil pan, using ATF DEXRON®-III. Refer to Changing Transmission Fluid in this section.
5. Connect battery ground cable.

243RW002

Front Oil Seal (Converter Housing)

Removal

1. Remove transmission assembly from the vehicle, refer to Transmission in this section.
2. Remove torque converter from converter housing.
3. Remove three screws and oil seal ring from converter housing.

241RW008

Installation

1. Apply clean ATF to the new oil seal ring lip.
 - Install oil seal ring to converter housing, tighten to the specified torque.

Torque: 3 N•m (26 lb in)

2. Install torque converter to converter housing.
3. Install transmission assembly case to the vehicle, refer to Transmission in this section.

Rear Oil Seal (Extension Housing)

Removal

1. Remove transfer case assembly from the vehicle. Refer to Transfer Case in Drive Line/Axle section.
2. Remove rear oil seal from transmission extension housing.

241RW005

Installation

1. Use J-36797 extension housing oil seal installer, and install the rear oil seal to the transmission extension housing.
2. Install the transfer case assembly to the vehicle. Refer to Transfer Case in Drive Line/Axle section.

Transmission (4L30-E)

Disassembly

NOTE: During the disassembly and reassembly, perform the following:

- Wash each part thoroughly, and blow air through each oil passage and groove to eliminate blockage.
- Seal rings, roll pins, and gaskets should be replaced.
- When assembling the components, apply DEXRON®-III Automatic Transmission Fluid (ATF) to each seal, rotating part, and sliding part.
- Do not dip part facings, such as clutch or brake drive plates, in cleaner when washing it.
Also, always coat parts with new ATF two or three times after cleaning with solvent.

1. Remove torque converter (1).

- Drain fluid from torque converter.
- Attach J-8763-02 holding fixture to the transmission and set it on J-3289-20 holding fixture base.

NOTE: Do not overtighten the tool, as case damage may result.

420RW021

2. Remove O-ring (2) from turbine shaft.
3. Remove two 10mm mode switch screws, selector lever nut, cover, and mode switch (3).
4. Remove twelve 10mm adapter case oil pan (4) fixing screws, adapter oil pan, and gasket.
5. Disconnect electrical wiring connections (5) from solenoids and 5 pin connector of adapter case. Pull on connectors only, not on wiring harness.
6. Remove seven 13mm adapter case valve body (6) fixing screws, adapter case valve body assembly, transfer plate, and two gaskets.
 - Remove wiring harness and 5 pin connector.
7. Remove sixteen 10mm main case oil pan (7) fixing screws, main oil pan, magnet, and gasket.
8. Remove three 13mm oil filter (8) fixing screws and oil filter.
9. Remove two 13mm manual detent (9) fixing screws, roller and spring, and manual detent.
10. Disconnect wiring harness assembly (10) from band apply solenoid, shift solenoids, and main case 4 pin connector.
Pull on connectors only, not on wiring harness.
11. Remove four 13mm servo cover (11) fixing screws, servo cover, and gasket.
12. Remove seven 13mm valve body screws and ground wire from main case.
 - Remove wiring harness assembly (5) from the adapter case side.
 - Remove main valve body assembly (12) with manual valve link and transfer plate. Note the position of the link (long end into valve, short end into range selector lever).
 - Remove 4 pin connector.
 - Remove gasket transfer plate from main case.
13. Remove two check balls (13) from main case.

240RW022

14. Turn transmission to vertical position to drain fluid.
Return back to horizontal position when drained.
- Install J-23075 servo piston spring compressor with offset to the rear of case.
 - Compress servo piston assembly.
 - Remove servo piston retaining ring (14).
 - Slowly release servo piston assembly (15).
 - Remove tool.
15. Remove servo piston assembly (15), return spring (16), and servo apply rod (17).

7A-52 AUTOMATIC TRANSMISSION (4L30-E)

16. Rotate transmission to horizontal position, pan side down.

- Remove one 10mm screw, and speed sensor (18) with "O" ring.

17. Remove seven 8mm extension housing hexagon socket head screws, extension housing assembly (19), and gasket.

18. Remove retaining ring (20).

NOTE: Use extra long, needle nose pliers.

19. Remove speed wheel (21).

20. Remove wheel parking lock (with seal ring) (22).

21. Rotate transmission to vertical position, converter housing up.

- Loosen the converter housing and oil pump assembly fixing screws, but do not remove, the five 13 mm inner screws unless oil pump disassembly is required.

- Remove seven outer screws.

- Remove converter housing and oil pump assembly (23).

22. Remove gasket (24).

23. Remove selective thrust washer (25).

24. Remove fourth clutch retainer (26).
 25. Grasp turbine shaft and lift out the overrun clutch housing assembly (27) and fourth clutch plates (28).
 26. Remove thrust bearing assembly (29).
 27. Remove overdrive internal gear (30).
 28. Remove thrust washer (31).

241RW004

29. Remove adapter case and center support assembly (with fourth clutch piston) (32).
 30. Remove seal ring (33).
 31. Remove selective thrust washer (34) and two O-ring seals (35) from main case.
 32. Use J-23327 and J-23327-90 compressor to compress the fourth clutch spring retainer and springs (37).
 • Release snap ring (36) from groove.
 • Remove clutch compressor and snap ring (36).
 33. Remove retainer and spring assembly (37).
 34. Insert two converter housing/main case screws to hold adapter case while pulling out fourth clutch piston (38).
 • Remove fourth clutch piston assembly (38) from the adapter case.
 • Remove converter housing/main case screws.
 35. Grasp intermediate shaft, twist and pull out the second and third clutch drum assemblies with reverse clutch plates while holding onto output shaft (39).

252RS001

7A-54 AUTOMATIC TRANSMISSION (4L30-E)

36. Separate second (40) and third clutch (41) assemblies.
37. Remove thrust washer (42).
38. Remove reverse clutch plates (43 and 44) and reverse clutch pressure plate (45).
39. Remove bearing (46) and washer (47).
40. Remove planetary carrier assembly (48).
41. Remove thrust bearing (49).
42. Remove reaction sun gear (50)
43. Remove needle bearing (51).
44. Remove brake drum (52).
45. Remove brake band (53).
46. Remove thrust bearing (54).

47. Rotate case to horizontal position, valve body side facing up.

- Remove spring pin (55), using cutting pliers, then remove parking lock and selector lever assembly (56).

NOTE: Insert wire in the center of the spring pin to prevent it from collapsing during removal. Be aware of pin height. Protect machined face of main case.

48. Remove parking lock and range selector lever 17 mm nut (57).
49. Remove parking lock and range selector lever (56), and actuator assembly.
50. Remove selector shaft (58).

NOTE: Inspect the shaft for burrs before removing to prevent damaging seal. If necessary, remove burrs by lightly sanding with an oilstone.

Reassembly

1. Inspect selector shaft seal and replace it if necessary.

NOTE: Use a seal installer when replacing the seal.

- Install selector shaft.

NOTE: Spring pin groove must be positioned inside the case.

2. Install spring pin. Be sure the selector shaft can move freely. Do not push the pin flush with the case surface. Leave enough height for removal.
3. Install actuator assembly (1).
4. Install parking lock and range selector lever (2) and new 17 mm nut. Tighten the nut to the specified torque.

Torque: 22 N•m (16 lb ft)

5. Rotate main case to vertical position, extension end facing down.

- Install brake band assembly (3).

NOTE: Be sure to align servo pin area with the servo hole.

6. Install thrust bearing (4).

NOTE: The case bushing acts as a guide for the thrust bearing.

7. Install brake drum (5).

8. Install reaction sun gear (6).

9. Install needle bearing (7).

10. Inspect planetary carrier assembly (8) for wear and damage. If necessary replace it.

- Measure pinion end play clearance with a feeler gauge.

Clearance: 0.13mm–0.89mm (0.005 in–0.035 in)

If clearance is outside specified value, replace the planetary carrier assembly.

11. Install the thrust bearing (9) on the output shaft.

NOTE: Use petroleum jelly to hold the thrust bearing in place.

12. Align planetary pinions. Each pinion is marked with double points to indicate the master tooth space and exactly opposite with a single point to indicate the master tooth. The markings on the planetary carrier consist of double lines which are to be lined up with the double points on two opposite pinions; the single lines are to be lined up with the single points on the other two pinions.

- After all four pinions are lined up, slide on the third clutch assembly. Rotate third clutch and check mark alignment. Considering that the ring gear tooth between the double points of one planetary pinion is tooth number 1, count the teeth to check that the single points on the two adjacent pinions are between teeth 23 and 24 of the ring gear, and that the ring gear tooth between the double points of the opposite pinion is tooth number 46. If the ring gear and pinions are not lined up, remove and realign them.

13. Install planetary carrier (8) with third clutch (12).

NOTE: Do not force. When properly aligned, the parts will fit together easily.

14. Remove the third clutch (12).

15. Install bearing (11) and washer (10).

7A-56 AUTOMATIC TRANSMISSION (4L30-E)

NOTE: Use petroleum jelly to hold the washer and bearing in place.

16. Carefully align the second clutch plate inner tangs.
- Install thrust washer, tangs pointing downward, and locating tang positioned in slot on second clutch hub.

NOTE: Use petroleum jelly to hold thrust washer in place.

17. Install third clutch and intermediate shaft assembly (13) into the second clutch drum (14).
18. Install second and third clutch assemblies into the main case. Twist output shaft and clutch assemblies to ensure proper fit.

19. Install pressure plate (15) with lip side up, tang facing valve body face.
20. Install reverse clutch plates. Start with a steel plate (17) and alternate with a lined plate (16).
21. Install waved clutch plate (18) with center tang facing valve body side.

22. Second clutch end play measurement

1. Install the J-23085-A Selective washer gauging tool (with spacer ring) on the case flange and against the intermediate shaft.
2. Position the inner shaft of the gauging tool against the thrust surface of the second clutch hub.
3. Tighten thumb screw. Remove the tool.
4. Fit the spacer ring on the inner shaft of the tool.
5. Measure the gap and select appropriate washer as shown in the chart.

Selective Thrust Washer	
Gap: mm(in)	Color
1.53 – 1.63 (0.060 – 0.064)	Yellow
1.72 – 1.82 (0.068 – 0.072)	Red
1.91 – 2.01 (0.075 – 0.079)	Black
2.10 – 2.20 (0.083 – 0.087)	Natural
2.29 – 2.39 (0.090 – 0.094)	Green
2.48 – 2.58 (0.098 – 0.102)	Blue

FOLLOWING THE PROCEDURE SHOULD RESULT IN FINAL END-PLAY FROM 0.36 mm TO 0.79 mm (0.014 in TO 0.031 in)

23. Inspect fourth clutch piston seals and replace if necessary.

- Lubricate J-38554 fourth clutch piston fitter and install it on fourth clutch piston (19).
- Install fourth clutch piston (19) in adapter case (20).
- Remove fitter.

24. Install retainer and spring assembly (22) into fourth clutch piston (21).

25. Install snap ring (23) in adapter case.

- Install J-23327 and J-23327-90 fourth clutch spring compressor.
- Seat snap ring in groove.
- Remove compressor.

7A-58 AUTOMATIC TRANSMISSION (4L30-E)

252RW002

252RS004

26. Install selective washer using petroleum jelly.
27. Install two O-ring seals (24) in main case and adapter case/main case seal ring (25).
28. Install J-38588 guide pins.
 - Install adapter case and center support assembly to main case.

242RS004

29. Install thrust washer (26) into adapter case, with tangs pointing downwards.
 30. Preassemble overdrive internal gear (27) and thrust bearing assembly (28) onto the turbine shaft and overrun clutch assembly.
- NOTE: Install bearing assembly, black side up. Use petroleum jelly to keep assembly in place.
31. Install overdrive carrier (30) and internal gear assembly into adapter case.
 32. Install fourth clutch plates (29) in the following order: Steel, Lined, Steel, Steel, Lined, Steel. Steel plates go in with short tang facing towards valve body surface.
 33. Install fourth clutch retainer (31) with the notch facing up and positioned towards valve body surface.

34. Overdrive clutch end play measurement

1. Install the J-23085-A selective washer gauging tool on the adapter case flange and against the input shaft.
2. Position the inner shaft of the tool against the thrust surface of the overrun clutch housing.
3. Tighten thumb screw. Remove the tool.
4. Measure gap. Select appropriate size washer as shown in the chart.
5. Set selective thrust washer aside.

Selective Thrust Washer	
Gap: mm(in)	Color
1.53 – 1.63 (0.060 – 0.064)	Yellow
1.72 – 1.82 (0.068 – 0.072)	Red
1.91 – 2.01 (0.075 – 0.079)	Black
2.10 – 2.20 (0.083 – 0.087)	Natural
2.29 – 2.39 (0.090 – 0.094)	Green
2.48 – 2.58 (0.098 – 0.102)	Blue
FOLLOWING THE PROCEDURE SHOULD RESULT IN FINAL END-PLAY FROM 0.1 mm TO 0.8 mm (0.004 in TO 0.03 in)	

35. Install selective washer (32).

NOTE: Use petroleum jelly to hold selective washer in place.

36. Install gasket (33).

37. Install converter housing and oil pump assembly (34) to adapter case.

- Fit and tighten seven outer 13 mm screws.

Torque: 39 N•m (29 lb ft)

7A-60 AUTOMATIC TRANSMISSION (4L30-E)

- Ensure free rotation of pump using J-23082-01 pump rotation tool.

38. Overdrive clutch end play measurement.

1. Fit J-25022 and J-24773-1 turbine shaft puller on turbine shaft.
2. Position axial play checking tool on converter housing mating face.
3. Pull turbine shaft upwards with puller until first resistance is met. (due to weight of overdrive assembly)
4. Maintain shaft in this position and set indicator to zero.
5. Pull turbine shaft further upwards with puller. Read end play shown on indicator.

End play: 0.1mm – 0.8mm (0.004 in – 0.031in)

6. Remove axial play checking tool and puller.

NOTE: If end play is not correct, repeat selective washer selection.

39. Inspect extension housing oil seal and replace if necessary, using J-36797 extension housing oil seal installer.

- Rotate transmission to horizontal position, with valve body side down.
- Inspect parking wheel seal ring. Replace if necessary.
- Install wheel parking lock assembly (35).

40. Install speed wheel (36) and snap ring (37).

NOTE: Use extra long, needle nose pliers.

41. Install gasket onto extension assembly with a thin coating of oil.

- Install extension housing assembly (38), and align parking pawl shaft.
- Install actuator assembly into extension assembly.
- Install seven 8 mm hexagon socket head screws.

Torque: 32 N•m (24 lb ft)

42. Inspect speed sensor O-ring. Replace if necessary.

- Install speed sensor assembly (39) and 10 mm screw.

Torque: 9 N•m (78 lb in)

241RW009

241RS004

43. Main case end play measurement.

1. Attach axial play checking tool on the extension housing and set indicator to zero on output shaft.
2. Manually push output shaft upwards.

End play: 0.36mm – 0.80mm (0.014 in – 0.031in)

3. Remove axial play checking tool.
4. If end play is not correct, repeat selective washer selection.

241RS005

44. Inspect servo piston seal ring. Replace if necessary.

- Ensure brake band is correctly positioned. Rotate output shaft if necessary.
- Install J-38428 servo piston fitter in servo bore.
- Install apply rod (40), round end toward band, return spring (41) and piston assembly (42).

45. Install the J-23075 servo spring compressor with offset to rear of case.

- Compress servo piston seal ring, using fitter while tightening the tool screw.
- Install servo piston retaining ring (43).
- Remove tool.
- Adjust the brake band by tightening the servo adjusting screw to 4.5 N-m torque. Be certain the lock nut is loose, then back-off the screw five turns exactly. Hold piston sleeve with wrench and tighten lock nut to 18.5 N-m torque. Be certain the adjusting screw does not turn.

7A-62 AUTOMATIC TRANSMISSION (4L30-E)

46. Install two check balls (44).

242RW004

47. Inspect main case electrical connector and seal, replace if necessary.

- Install electrical 4 pin connector/main case and wiring harness.

48. Install two J-25025-B guide pins into main case.

- Install main case valve body complete assembly (45) and manual valve link.

244RW002

NOTE: Valve must be extended as the short end of manual valve link is connected to the range selector lever. Long end of link goes into valve.

- Install seven 13 mm screws, tighten the specified torque.

Torque: 20 N•m (15 lb ft)

- Pass ground wire of adapter case wiring harness assembly through the hole joining adapter fluid area and main case fluid area.

- Assemble 8.5 mm connector of ground wire under the head of this valve body bolt and reinstall it.

- Remove two guide pins.

49. Install servo cover gasket, cover (46) and four 13 mm screws.

Torque: 25 N•m (18 lb ft)

50. Connect wiring harness (47) to band control, shift solenoids, and main case 4 pin connector.

51. Install manual detent roller and spring assembly (48) with clip.

- Install two 13 mm screws.

Torque: 20 N•m (15 lb ft)

52. Install oil filter (49) and three 13 mm screws.

Torque: 20 N•m (15 lb ft)

53. Install oil pan gasket, magnet, main oil pan (50), sixteen 10 mm screws.

Torque: 11 N•m (96 lb in)

54. Inspect adapter case electrical connector and seal. Replace if necessary.

- Install electrical five pin connector and harness assembly (52) in bottom of adapter case.

55. Install gasket, transfer plate, and gasket.

- Install adapter case valve body (51) complete and seven 13 mm screws.

Torque: 20 N•m (15 lb ft)

244RW001

56. Connect wiring harness assembly (52) to converter clutch solenoid, force motor, and 5 pin connector.

57. Install oil pan gasket, adapter case oil pan (53), and twelve 10 mm screws.

Torque: 11 N•m (96 lb in)

- Rotate transmission, with bottom pan facing down.

58. Install mode switch (54), two 10 mm screws, selector lever nut, and cover.

10 mm screw

Torque: 13 N•m (113 lb in)

Nut

Torque: 23 N•m (17 lb ft)

- Adjust using setting tool, refer to Mode Switch in this section.

59. Install O-ring (55) on turbine shaft.

60. Install torque converter (56)

The converter assembly must be replaced under any of the following conditions:

- Evidence of damage to the pump assembly.
- Metal particles are found after flushing the cooler lines.
- External leaks in hub weld area.
- Converter pilot broken, damaged, or poor fit into crankshaft.
- Converter hub scored or damaged.
- Internal failure in stator.
- Contamination from engine coolant.
- Excess end play.

- Rotate transmission, bell housing up. Spin converter to insure proper fit.

61. Fill transmission through the overfill screw hole of oil pan, using ATF DEXRON®-III. Refer to Changing Transmission Fluid in this section.

Converter Housing and Oil Pump Assembly

Disassembled View

241RW003

Legend

- (1) Converter Housing
- (2) Outer Seal Ring
- (3) Gasket

- (4) Wear Plate
- (5) Oil Pump Assembly
- (6) Oil Seal Ring

Disassembly

1. Remove oil pump assembly from converter housing.
2. Remove outer seal ring.
3. Remove gasket.
4. Remove wear plate.
5. Remove oil seal ring.

Inspection and Repair

Visual Check:

If any damage, deformation, or local wear is found in a converter housing, outer seal ring, wear plate, or oil seal ring, replace it.

Reassembly

1. Install wear plate onto oil pump assembly.
2. Install converter housing onto complete oil pump assembly. Align with two short J-38588 guide pins on outer bolt holes.
 - Loosely install five 13mm bolts.
 - Center converter housing using J-38557 centering tool.
 - Tighten five inner 13mm bolts in an alternating pattern.

Torque: 20 N•m (15 lb ft)

241RW002

3. Install oil seal ring (3 screws).

Torque: 3 N•m (26 lb in)

4. Install gasket.
5. Install outer seal ring.

Oil Pump

Disassembled View

241RS014

Legend

- | | |
|------------------------------------|---|
| (1) Oil Pump Drive Gear | (10) Throttle Signal Accumulator Piston |
| (2) Oil Pump Driven Gear | (11) Sleeve Pin |
| (3) Pin | (12) Sleeve |
| (4) Plug | (13) Boost Valve |
| (5) Spring | (14) Spring Seat |

| (7) Snap Ring | (16) Spring Seat |
| (8) Spring Seat | (17) Pressure Regulator valve |
| (9) Spring | (18) Oil Pump Assembly |

Disassembly

1. Remove oil pump drive gear (1) and driven gear (2).
2. Remove pin (3) from oil pump assembly (18).
3. Remove plug (4), spring (5), and converter clutch control valve (6).
4. Remove snap ring (7) from oil pump assembly (18).
5. Remove spring seat (8), spring (9), and throttle signal accumulator piston (10).
6. Remove sleeve pin (11) from oil pump assembly (18).
7. Remove sleeve (12), boost valve (13), spring seat (14), valve spring (15), spring seat (16), and pressure regulator valve (17).

Inspection and Repair

Visual Check:

If any damage, deformation or wear is found, replace the damaged part.

Reassembly

1. Lubricate and preinstall pressure regulator spring seat (16) on valve (17), with the flat side against shoulder.
2. Install pressure regulator valve (17) and spring seat (16) assembly, valve spring (15), and spring seat (14) with the flat side away from spring to oil pump assembly (18).
3. Assemble boost valve (13) into sleeve (12).
4. Install boost valve and sleeve assembly, and sleeve pin (11) to oil pump assembly (18).
5. Install throttle signal accumulator piston (10), spring (9), and spring seat (8), with the flat side away from the spring, and snap ring (7) to oil pump assembly (18).
6. Install converter clutch control valve (6), spring (5), plug (4), and pin (3) to oil pump assembly (18).
7. Install oil pump driven gear (2) and drive gear (1).

Main Case Valve Body

| (12) Solenoid B | (26) 1-2 Accumulator Control Valve |
| (13) Retainer | (27) Check ball |
| (14) 2-3 Shift Valve | (28) Main Case Valve Body |

Disassembly

1. Remove two 11mm bolts from valve body (28), then remove gaskets and transfer plate (1).
2. Remove manual valve (2).
3. Push in band control solenoid (3) to compress waved washer (5), and remove pin (4).
4. Remove band control solenoid (3) and waved washer (5).
5. Remove spring pin (6) with a 3 mm dia. punch.
6. Remove solenoid A (7) by grasping the metal tip. Do not grasp the connector housing.
7. Remove retainer (8), 1-2/3-4 shift valve (9) and spring (10).
8. Remove spring pin (11) with a 3 mm dia. punch.
9. Remove solenoid B (12) by grasping the metal tip. Do not grasp the connector housing.
10. Remove retainer (13), 2-3 shift valve (14), and spring (15).
11. Remove spring pin (16), plug (17), spring (18) and low pressure control valve (19).
12. Remove spring pin (20), plug (21), and band control screen assembly (22).
13. Remove spring pin (23), plug (24), 1-2 accumulator valve (25), and 1-2 accumulator control valve (26).
14. Remove 1 check ball (27) from valve body (28).

Inspection and Repair

Inspect for the following, and replace any damaged or worn parts:

1. Damage or wear to each valve.
2. Damage in oil passages.
3. Cracks or damage to valve body.
4. Valve operations.
5. Spring fatigue.

Reassembly

1. Install 1-2 accumulator control valve (26), 1-2 accumulator valve (25), plug (24), and spring pin (23).
2. Install band control screen assembly (22), plug (21), and spring pin (20).
3. Install low pressure control valve (19), spring (18), plug (17), and spring pin (16).
4. Install spring (15), 2-3 shift valve (14), retainer (13), solenoid B (12), and spring pin (11).
5. Install spring (10), 1-2/3-4 shift valve (9), retainer (8), solenoid A (7), and spring pin (6).
6. Install waved washer (5), band control solenoid (3), and pin (4).
7. Install manual valve (2).
8. Install check ball (27) to valve body (28).
9. Install gasket (valve body/transfer plate) and transfer plate using two J-3387-2 guide pins.

- Install two 11mm bolts.

Torque: 13 N•m (113 lb in)

- Install gasket (transfer plate/main case).

Adapter Case Valve Body

| (6) 3/4 Accumulator Valve | (13) Plug |
| (7) 3/4 Accumulator Control Valve | (14) Force Motor Screen Assembly |
| | (15) Adapter Case Valve Body |

Disassembly

- Remove 11mm bolt from valve body.
 - Remove converter control solenoid assembly (1).
- Remove 11mm bolt and retainer (2) from valve body.
 - Remove force motor solenoid (3).
- Remove retainer (4), plug (5), 3/4 accumulator valve (6), and 3/4 accumulator control valve (7)
- Remove spring (8), retaining ring (9), and feed limit valve (10).
- Remove plug retainer (11), O-ring (12), plug (13), and force motor screen assembly (14).
 - Use 5 mm bolt to pull plug.

Inspection and Repair

Inspect for the following, and replace any damaged or worn parts:

- Damage or wear to each valve.
- Damage in oil passages.
- Cracks or damage to valve body.
- Valve operations.
- Spring fatigue.

Reassembly

- Install force motor screen assembly (14), plug (13), O-ring (12), and plug retainer (11).
- Install feed limit valve (10), retaining ring (9), and spring (8).

3. Install 3/4 accumulator control valve (7), 3/4 accumulator valve (6), plug (5), and retainer (4).

4. Install force motor solenoid (3).

- Place solenoid terminals pointing towards mating face.

- Install retainer (2) and bolt.

Torque: 10 N•m (87 lb in)

5. Install converter clutch solenoid assembly with two O-rings (1) to valve body.

- Install bolt.

Torque: 10 N•m (87 lb in)

Third Clutch and Sprag Unit

Disassembled View

248RW001

Legend

- (1) Retaining Ring
- (2) Input Sun Gear and Sprag Unit Assembly
- (3) Retaining Washer
- (4) Bearing

- (5) Thrust Washer
- (6) Clutch Plates
- (7) Third Clutch Spring Cushion Plate
- (8) Third Clutch Drum Assembly

Disassembly

- Place the third clutch drum and intermediate shaft assembly upright, using the overdrive internal gear as a support.
- Locate the ends of the retaining ring. Depress one end of the ring using a small screwdriver instead of the depressor handle provided with the tool J-38450-A. Slide one blade down between the third clutch drum and the retaining ring.
- Remove a screwdriver and repeat this step for the other end of retaining ring.
- Install the remaining four blades approximately (five) notches apart using a screwdriver to depress the retaining ring.
- Pull up on input sun gear and sprag unit assembly (1 and 2) to release the retaining ring from third clutch drum assembly (8).
- Remove the tool blades.

248RX001

7A-70 AUTOMATIC TRANSMISSION (4L30-E)

7. Remove retaining washer (3), bearing (4), thrust washer (5), and clutch plates (6 and 7) from the third clutch drum assembly (8).

Inspection and Repair

Visual Check:

If any damage, deformation or wear is found, replace the damaged part.

Reassembly

1. Place third clutch drum and intermediate shaft assembly upright, using the overdrive internal gear as a support.
2. Install third clutch spring cushion plate (7), bevel face down.
3. Install third clutch plates (6) into third clutch drum assembly (8). Start with the steel clutch plate and alternate with lined plates.
4. Install thrust washer (5), bearing (4) and retaining washer (3).
5. Fully engage the hub spline of the input sun gear and sprag unit assembly (2) into the third clutch inner tangs.
 - Simultaneously rotate the outer sprag race to engage into the third clutch drum assembly (8).

6. Place J-38450-A blades between the retaining ring and the third clutch drum approximately (five) notches apart, and one blade at each end of the retaining ring (1). Push down on sprag assembly until the assembly is seated into the third clutch drum assembly (8).

7. Remove the tool blades and engage retaining ring into groove of third clutch drum.

Third Clutch

Disassembled View

Legend

- (1) Retaining Ring
(2) Spring Seat

- (3) Springs
(4) Piston Assembly
(5) Third Clutch Drum

Disassemble

1. Compress spring seat using the J-23075 spring compressor and J-23075-12 adapter tool.

NOTE: Do not overstress the springs and seat. This will cause damage to the spring seat.

- Remove the tool.
- Remove retaining ring (1).

2. Release the spring seat (2).

NOTE: Do not let the spring seat catch in the ring groove.

- Remove spring seat (2) and springs (3).
3. Remove piston assembly (4) from third clutch drum (5).

Inspection and Repair

Visual check:

If any damage, deformation or wear is found, replace the damaged part.

Operation check:

Shake the piston and listen for check ball movement. Movement indicates proper check ball operation. Replace the piston if the check ball is missing or falls out.

Reassembly

1. The lip of the piston seal must point toward the front of the transmission. Lubricate the seal lip with transmission fluid.

- Install piston assembly (4) into the third clutch drum (5). Use the J-23084 third clutch piston installer to protect the outer seal during installation.
- Remove the seal installer.

2. Install twelve springs (3) and spring seat (2).

3. Place retaining ring (1) onto spring seat.

- Compress the piston springs, using the J-23075 piston spring compressor and J-23075-12 adapter.

CAUTION: Do not overstress the springs and seat. Do not let the spring seat catch in the ring groove. This may cause damage to the spring seat.

- Install spring seat retaining ring (1).
- Remove the piston spring compressor and adapter.

Sprag Unit

Disassembled View

248RS009

Legend

- | | |
|----------------------|--|
| (1) Retaining Ring | (4) Sprag Assembly |
| (2) Sprag Outer Race | (5) Ring |
| (3) Ring | (6) Third Clutch Hub and Sun Gear Assembly |

Disassembly

1. Remove the sprag outer race, retaining ring, and sprag assembly from the third clutch hub and sun gear assembly.
2. Remove the rings and sprag assembly from the sprag outer race.

Inspection and Repair

Visual Check:

If any damage, deformation or local wear is found, replace the damaged part.

Reassembly

NOTE: Flared shoulder of the sprag cage faces the sun gear. This procedure must be followed exactly to be sure that the sprag assembly is installed properly.

1. Install rings and sprag assembly onto the third clutch hub and sun gear.
2. Install sprag outer race and retaining ring assembly over the sprag cage assembly.
 - Place third clutch hub and sun gear assembly on a flat surface, sun gear facing up. Place sprag outer race and sprag assembly over the sun gear assembly, push down and turn the input sun counterclockwise at the same time.

NOTE: Check correct rotation by holding the sun gear in your left hand and turning the outer race. The outer sprag race should turn freely towards you and should lock turning away from you.

| (3) Retaining Ring | (8) Spring Seat |
| (4) Spacer | (9) Springs |
| (5) Clutch Plates | (10) Piston Assembly |
| | (11) Second Clutch Drum |

Disassembly

1. Remove retaining ring (1) from second clutch drum (11).
2. Remove ring gear (2), retaining ring (3), and spacer (4).
3. Remove clutch plates (5) and waved washer (6).
4. Remove retaining ring (7) using J-23327 compressor to compress the spring seat (8).
5. Remove spring seat (8), springs (9) and piston assembly (10) from second clutch drum (11).

247RS006

Inspection and Repair

Visual Check:

If any damage, deformation or wear is found, replace the damaged part.

Operation Check:

Shake the piston and listen for check ball movement. Movement indicates proper check ball operation. Replace the piston if the check ball is missing or falls out.

Reassembly

1. Install piston assembly (10) into the second clutch drum (11).
 - Lubricate the lip seal with transmission fluid. Use the J-23080-A second clutch piston installer to protect the outer piston lip seal.

NOTE: Lip of the seal should point toward front of transmission.

- Remove the installer.

247RS007

2. Install twenty-two piston springs (9) and spring seat (8) on the second clutch piston (10). Place retaining ring (7) onto spring seat.
 - Use the J-23327 compressor to compress the piston springs.

NOTE: Do not let spring seat catch in ring groove.

- Remove the compressor.

3. Install waved plate (6) and clutch plates (5). Start with a steel plate and alternate with lined plates.
 - Align second clutch inner tangs.
4. Install spacer (4), with the fluted end toward clutch plates.
5. Install retaining ring (3), ring gear (2) and retaining ring (1).

3-4 Accumulator Piston

Disassembled View

244RS005

Legend

- (1) Snap Ring
- (2) Cover

- (3) Spring
- (4) Piston Assembly

Disassembly

1. Install the J-38559-A cover compressor on adapter case.
 - Compress piston cover then remove snap ring.

242RS007

2. Install the J-41096 cover remover and J-38584 adapter to center hole of cover.
 - Use the J-23907 slide hammer to remove cover.

- Use the J-23907 slide hammer to remove cover.

3. Remove spring and piston assembly.

242RW001

Inspection and Repair

Visual Check:

If any damage, deformation or wear is found, replace the damaged part.

Reassembly

1. Place the J-38553 piston fitter into adaptor case and push the piston into position, using suitable diameter tube.

- Remove the piston fitter.

244RS006

2. Install spring and cover.
3. Install snap ring, using the J-38559-A compressor tool.

- Install snap ring in groove.
- Remove the compressor tool.

242RS007

Reverse Clutch Piston and Center Support

Disassembled View

242RS006

Legend

- | | |
|---------------------|-----------------------------|
| (1) Retaining Ring | (7) Transfer Plate |
| (2) Spring Seat | (8) Gasket |
| (3) Springs | (9) Restrictor |
| (4) Piston Assembly | (10) Retainer Plate |
| (5) Center Support | (11) Plug |
| (6) Gasket | (12) Spring |
| | (13) Overrun Lock Out Valve |

Disassembly

1. Install the J-23327 compressor tool on spring seat, then compress the spring seat.

- Remove retaining ring (1).

NOTE: Do not over-stress the springs and seat, as this will cause damage to the spring seat.

- Remove the compressor tool.

247RS008

2. Remove spring seat (2) and springs (3).
3. Remove piston assembly (4).
4. Remove 8 bolts from center support (5), then remove center support (5) from adapter case.
5. Remove gasket transfer plate/outer support (6), center support transfer plate (7), and gasket transfer plate/adapter case (8).
6. Remove restrictor (9) from adapter case housing.
7. Remove retainer plate (10), plug (11), spring (12), and overrun lock out valve (13) from center support (5).

Inspection and Repair

Visual Check:

If any damage, deformation or wear is found, replace the damaged part.

Reassembly

1. Install overrun lock out valve (13) and spring (12) to center support.

NOTE: Ensure correct assembly of valve. The spring should be located over the long small diameter end.

2. Install plug (11) and retainer plate (10).
3. Place restrictor (9) in the lube overdrive channel in the adapter case housing.

242RS005

4. Install gasket transfer plate/adapter case (8), center support transfer plate (7), and gasket transfer plate/center support (6).
5. Install center support (5) with 8 bolts.

Torque : 25 N•m (18 lb ft)

6. Install piston assembly (4) into center support (5).
 7. Install twenty four springs (3), spring seat (2), and retaining ring (1).
- Install the J-23327 compressor and compress spring seat (2) and springs (3), then seat snap ring (1) in groove.
 - Remove the tool.

Overrun Clutch and Turbine Shaft

Disassembled View

252RW005

Legend

- | | |
|--------------------------------|---|
| (1) Snap Ring | (8) Snap Ring |
| (2) Overdrive Carrier Assembly | (9) Overrun Roller Clutch Cam |
| (3) Sun Gear | (10) Roller Clutch Assembly |
| (4) Turbine Shaft | (11) Overrun Clutch Release Spring Retainer |
| (5) Snap Ring | (12) Diaphragm Spring |
| (6) Backing Plate | (13) Piston Assembly |
| (7) Clutch Plates | (14) Overrun Clutch Drum |
| | (15) Turbine Shaft Seal Rings |

Disassembly

1. Position overrun clutch assembly upright, using the overdrive internal gear as a support.
 - Remove snap ring (1).

252RS009

2. Remove overdrive carrier assembly (2), sun gear (3) and turbine shaft (4).
3. Remove snap ring (5), backing plate (6), and clutch plates (7).
4. Compress diaphragm spring with the J-23327-91 compressor then remove snap ring (8).

252RS010

5. Remove overrun roller clutch cam (9) and roller clutch assembly (10).
6. Remove overrun clutch release spring retainer (11) and diaphragm spring (12).
7. Remove piston assembly (13) from overrun clutch drum (14).
8. Remove turbine shaft seal rings (15).

Inspection and Repair

Overdrive Carrier Check

- Check pinion end play with a feeler gauge.

Clearance: 0.24mm–0.64mm (0.0094in–0.025in)

If clearance is outside specified value, replace overdrive carrier assembly.

252RS011

Visual Check:

If any damage, deformation or wear is found, replace the damaged part.

Reassembly

1. Install turbine shaft seal rings (15) with grease (petroleum jelly).

241RS008

2. Install the J-38555 inner installer on the drum (14).
 - Pre-install piston assembly into J-38555 outer installer.
 - Install overrun clutch piston assembly (13). Use the outer installer while pushing piston into drum (14).

- Remove the installer.

252RS012

252RS013

NOTE: Turn the assembly in a counter-clockwise direction only until roller clutch enters the outer race. After Installation, rotate the assembly and listen for loose rollers.

11. Install turbine shaft (4) and snap ring (1).

3. Install diaphragm spring (12).
4. Install overrun clutch release spring retainer (11) (lip faces upwards), overrun roller clutch assembly (10) and cam (9).
5. Place snap ring loosely on spring retainer.
 - Hold the J-23327-91 compressor in a vise and compress piston return spring with compressor.
 - Set snap ring (8) in ring groove.
 - Remove the compressor.
6. Install clutch plates (7), start with steel plate and alternate with lined plates.
7. Install backing plate (6).
8. Install snap ring (5).
9. Install overdrive sun gear with countersink pointing downwards.
10. Install the overdrive carrier assembly (2).

Service Precaution

WARNING: IF SO EQUIPPED WITH A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

The 4L30-E is a 4-speed fully automatic transmission. It uses a microcomputer as a control unit to judge running conditions including throttle opening rate and vehicle speed, then it sets the shifting point in the optimum timing so that best driving performance can be achieved. In addition, the built-in shift mode select function can select three shift modes according to the driver's preference:

- Normal mode –Normal shift pattern.
- Winter mode –Starts in 3rd gear to reduce slippage on ice or snow.
- Power mode has a delayed upshift for when more powerful acceleration is required.

Also, the built-in fail safe function ("backup mode") assures driving performance even if the vehicle speed sensor, throttle signal or any solenoid fails.

Further, the self-diagnostic function conducts diagnosis in a short time when the control system fails, thus improving serviceability.

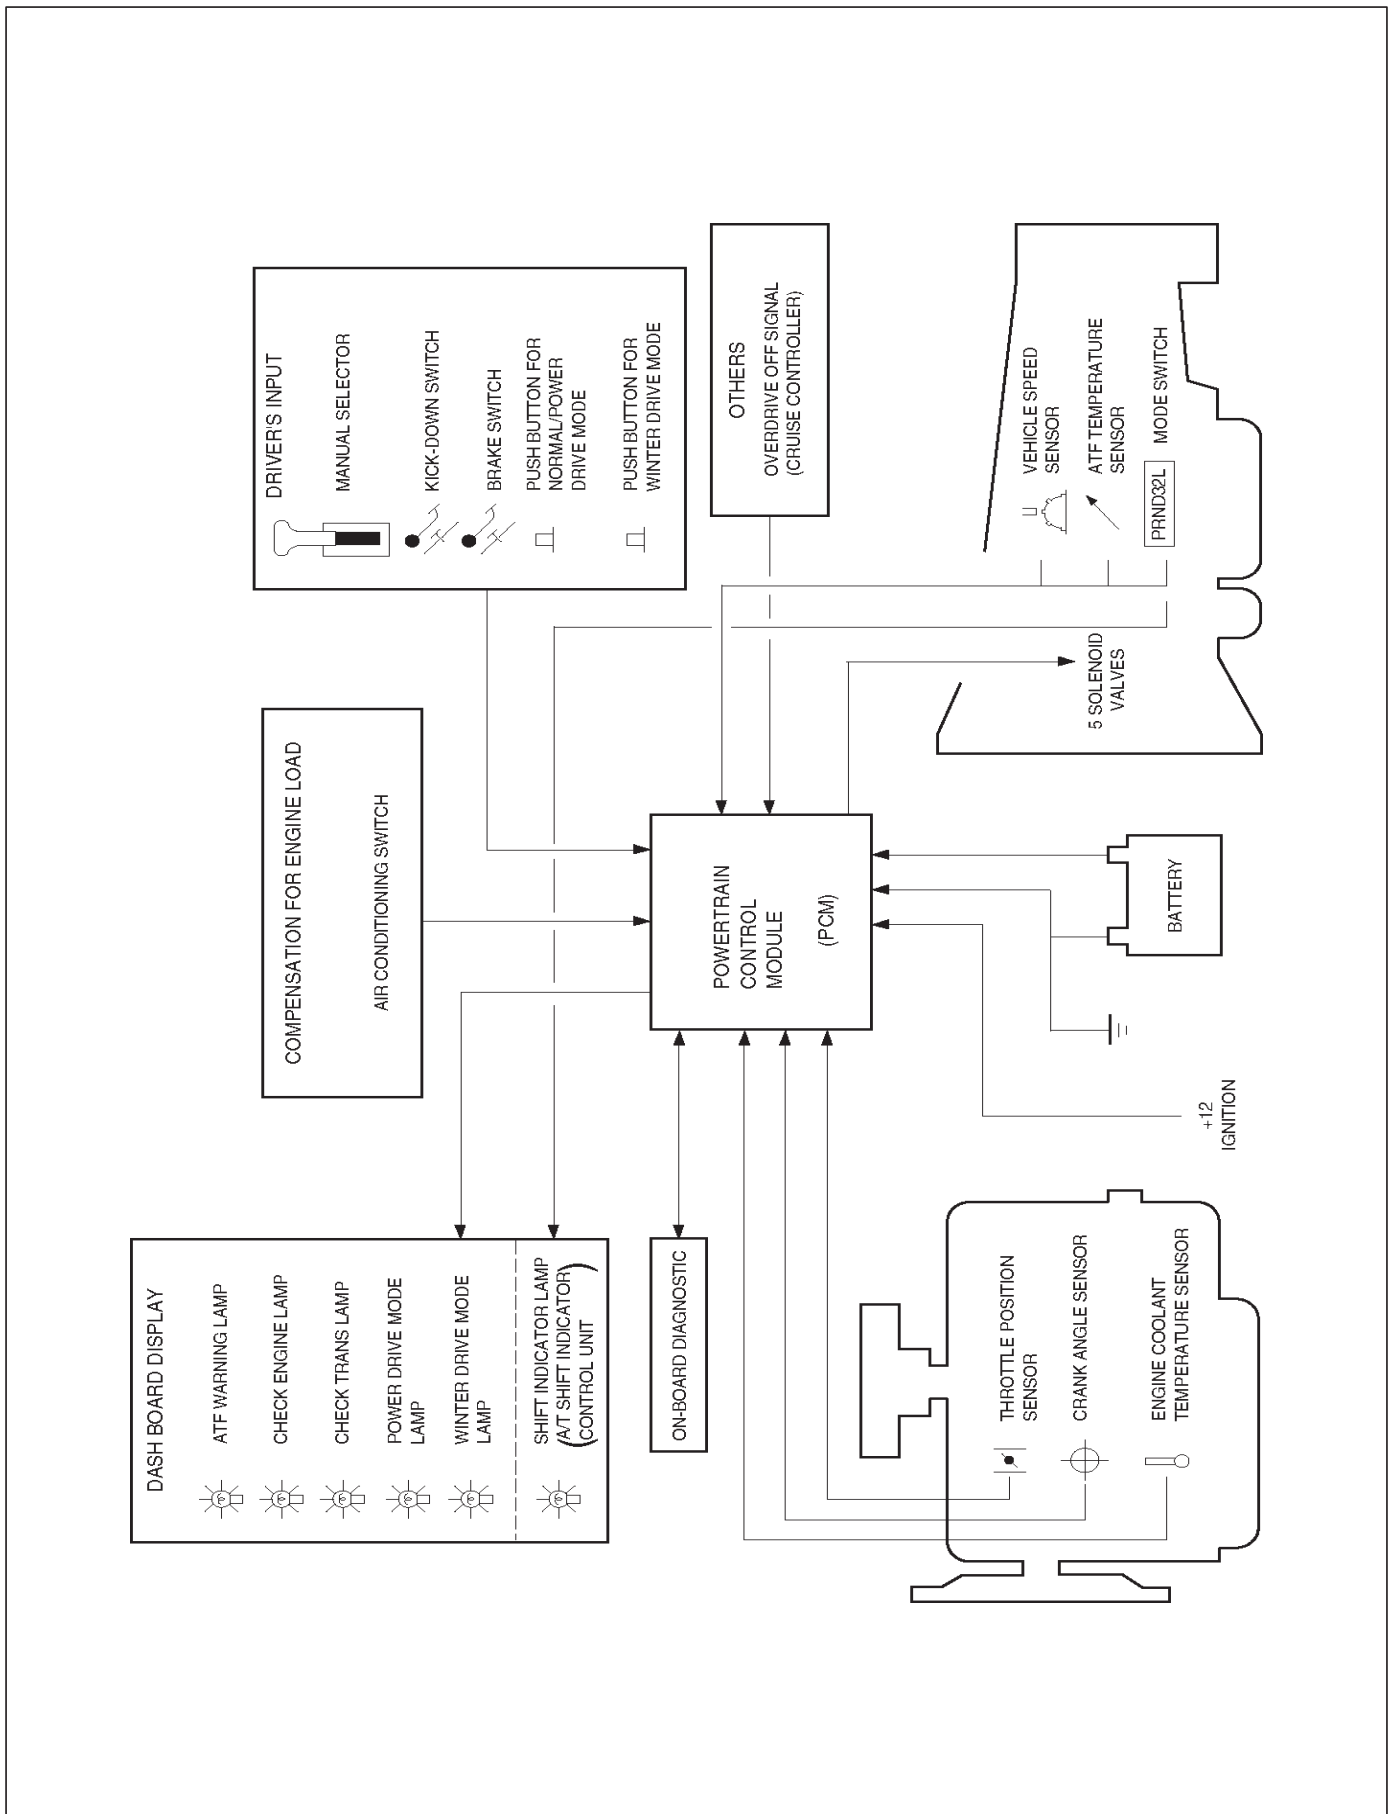

The major features of 4L30-E are as follows:

- A compact structure consisting of 2 sets of planetary gears and flat torque converter.
- Electronic control selects the optimum shift mode according to the driving conditions.
- Electronic control maintains the optimum hydraulic pressure for clutch, band brake as well as transmission so that shift feeling is improved.
- Two sets of planetary gears reduce friction of power train.

Also, a lockup mechanism in the torque converter reduces fuel consumption.

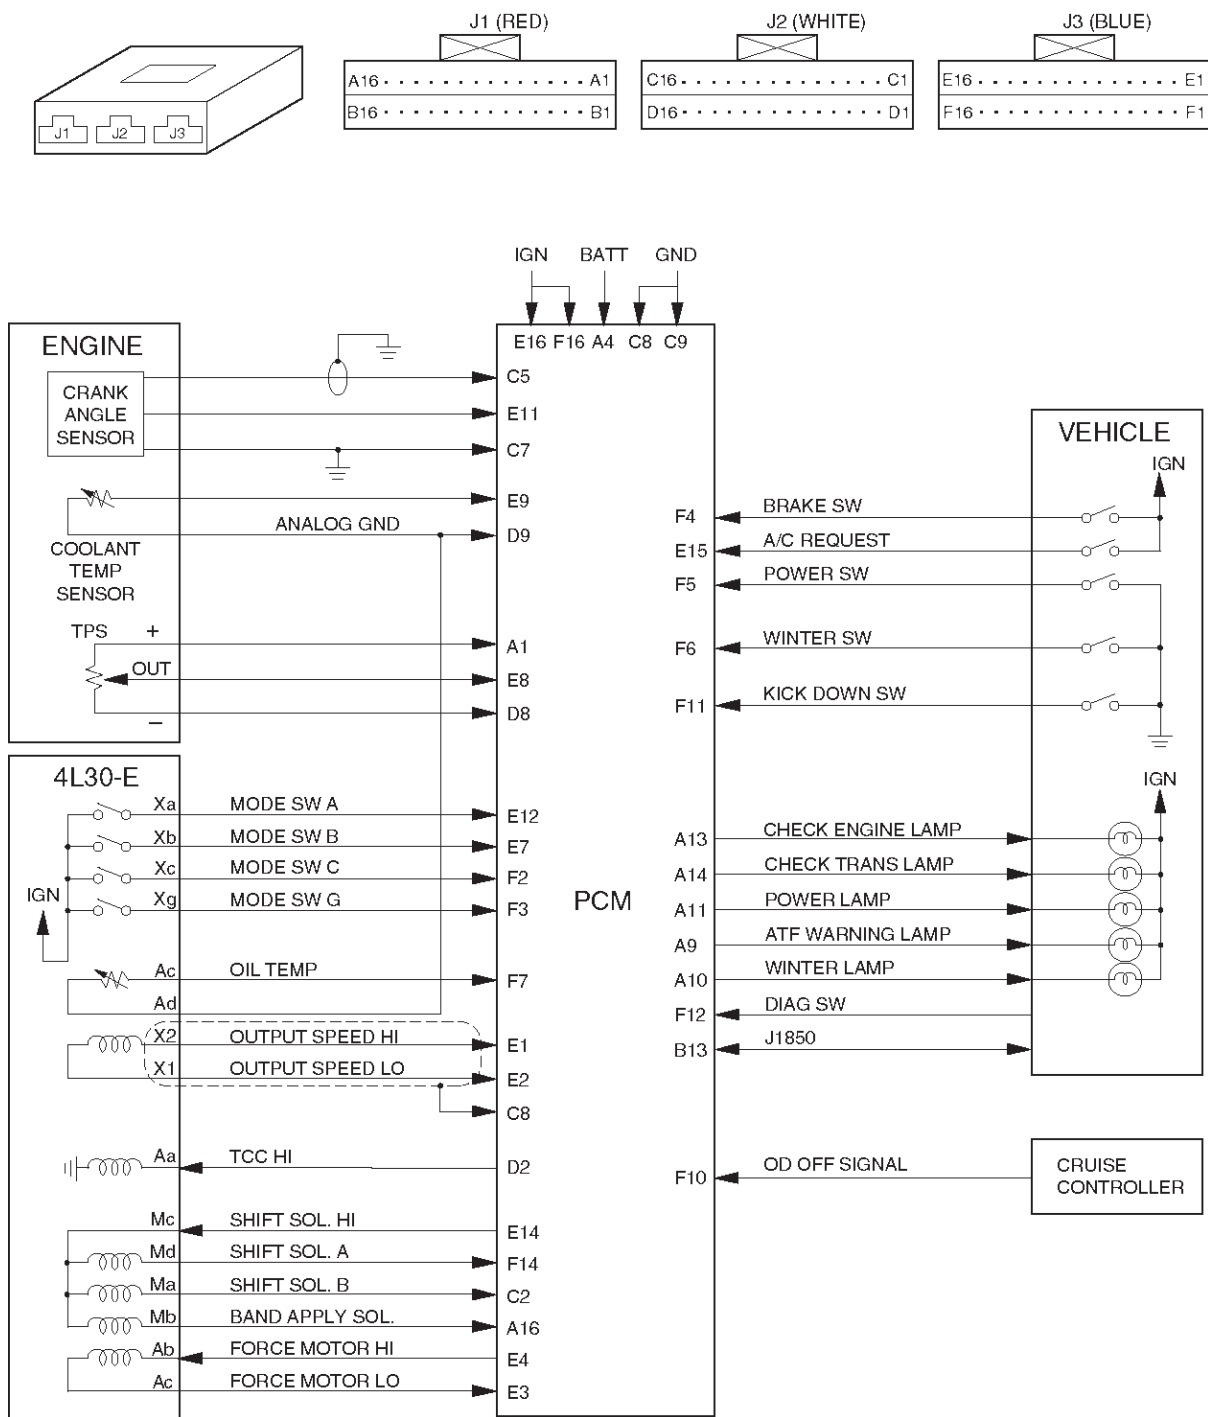

- Wide gear ratio and high torque rate of torque converter provide excellent starting performance.

Electronic Control Diagram

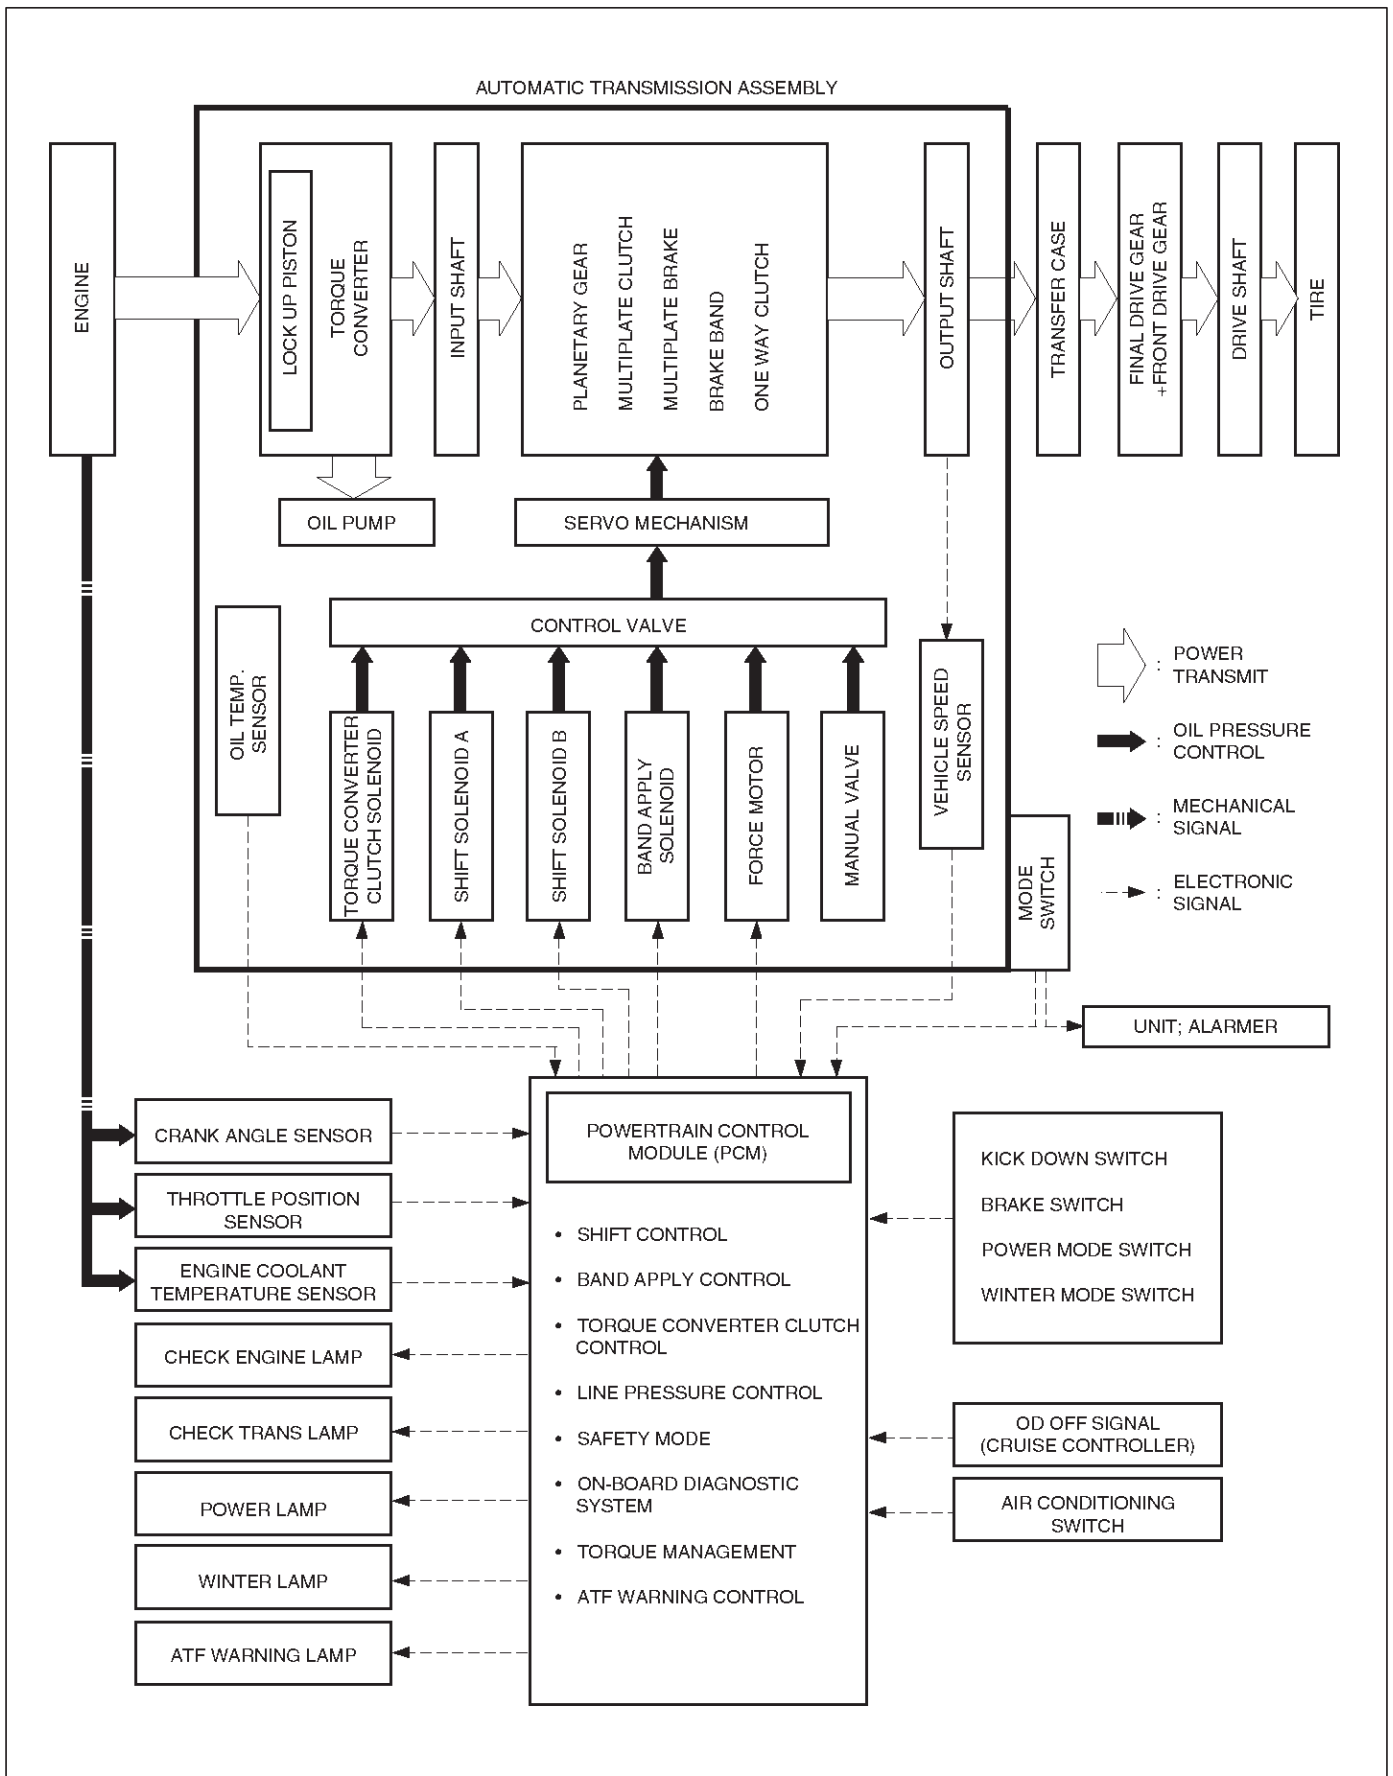

7A1-4 TRANSMISSION CONTROL SYSTEM (4L30-E)

Powertrain Control Module (PCM)

TPS: Throttle Position Sensor
 TCC: Torque Converter Clutch

Control System Diagram

Shift Control

The transmission gear is shifted according to the shift pattern selected by the driver. In shifting gears, the gear ratio is controlled by the ON/ OFF signal using the shift solenoid A and the shift solenoid B.

Band Apply Control

The band apply is controlled when in the 3-2 downshift (engine overrun prevention) and the garage shift (shock control).

The band apply solenoid is controlled by the signal from the Pulse Width Modulation (PWM) to regulate the flow of the oil.

Torque Converter Clutch Control

The clutch ON/OFF is controlled by moving the converter clutch valve through shifting Torque Converter Clutch (TCC) solenoid using the ON/OFF signal.

Line Pressure Control

The throttle signal allows the current signal to be sent to the force motor. After receiving the current signal, the force motor activates the pressure regulator valve to regulate the line pressure.

On-Board Diagnostic System

Several malfunction displays can be stored in the Powertrain Control Module (PCM) memory, and read out of it afterward.

The serial data lines, which are required for the testing of the final assembly and the coupling to other electronic modules, can be regulated by this function.

Fail Safe Mechanism

If there is a problem in the transmission system, the PCM will go into a "backup" mode.

The vehicle can still be driven, but the driver must use the select lever to shift gears.

Torque Management Control

The transmission control side sends the absolute spark advance signal to the engine control side while the transmission is being shifted. This controls the engine spark timing in compliance with the vehicle running condition to reduce the shocks caused by the change of speed.

ATF Warning Control

The oil temperature sensor detects the ATF oil temperature to control the oil temperature warning, TCC, and the winter mode.

Shift Mode Control

① Mode Type

Mode Type	Select lever position
Normal drive mode (NOR)	Entire range (excluding "R")
Power drive mode (PWR)	Entire range (excluding "R")
Winter drive mode	"D", "N", "R" and "P" range

② Mode selection

Mode Type	SWITCH (SW)		LAMP	
	POW/NOR. SW	WINTER SW	POWER DRIVE LAMP	WINTER DRIVE LAMP
Normal drive mode (NOR)	OFF	OFF	OFF	OFF
Power drive mode (PWR)	ON	OFF	ON	OFF
Winter drive mode	ON/OFF	ON	OFF	ON

However, the winter switch prevails over the PWR/NOR switch.
The mode becomes normal drive mode when the winter switch is operated from ON to OFF.

③ Comparison of mode

- (1) The normal drive mode is set at the normal shift points.
- (2) The shift points of the power drive mode are shifted to the higher speed side, compared to the normal drive mode.
- (3) The winter drive mode is a special mode used exclusively for starting in third gear.

Shift diagram

7A1-8 TRANSMISSION CONTROL SYSTEM (4L30-E)

Gear Shift Control

① Shift pattern

SELECT LEVER RANGE	SHIFT PATTERN
D (Drive)	1 ⇄ 2TCC ⇄ 3TCC ⇄ 4TCC
3 (Third)	1 ⇄ 2TCC ⇄ 3TCC ← 4TCC
2 (Second)	1 ⇄ 2TCC ← 3TCC
L (First)	1 ← 2

TCC = Torque Converter Clutch

② Gear position

The gear is selected by ON/OFF of two solenoids.

Gear \ SOL	A	B
4 (Fourth)	×	×
3 (Third)	○	×
2 (Second)	○	○
1 (First)	×	○
P (park)		
R (Reverse)	×	○
N (Neutral)		

○ = ON

× = OFF

Shift solenoid A
(Normally closed)

ON → PRESSURE TO
SHIFT VALVE

Shift solenoid B
(Normally open)

OFF → PRESSURE TO
SHIFT VALVE

③ Selecting gear position

Seven types of positions can be selected according to 5 signals from the mode switch as below.

SELECT LEVER RANGE	MODE SW TERMINALS				
	5(D)	8(A)	7(B)	6(C)	3(G)
P (park)	•	•			•
R (Reverse)	•	•	•		
N (Neutral)	•		•		•
D (Drive)	•		•	•	
3 (Third)	•	•	•	•	•
2 (Second)	•	•		•	
L (First)	•			•	•

• = Continuity

Winter Drive Mode

1. The winter switch will operate when switched on after all of the following conditions are present:
 - a. The gear select position is "D", "N", "R" and "P" range.
 - b. Vehicle speed is 7 mph (11 km/h) or less.
 - c. Transmission oil temperature is 120°C (248°F) or less.
 - d. Kickdown switch is off.
 - e. Accelerator opening is at 8% or less.

2. Cancel Release

1. Cancellation by driver
 - a. Turning off the winter drive mode switch
 - b. Shifting select position to "3", "2", or "L" (Winter drive mode is not canceled by selecting "N", "R", or "P" from "D")
 - c. Ignition key is turned off.
2. Automatic cancellation
 - a. When vehicle runs at 21mph (34 km/h) or more for 1 second or more
 - b. When transmission oil temperature reaches 140°C (284°F) or above

NOTE: The mode returns to normal drive mode or power drive mode after the winter drive mode is canceled.

Backup Mode

If a major system failure occurs which could affect safety or damage the transmission under normal vehicle operation, the diagnostic system detects the fault and overrides the Powertrain Control Module (PCM).

The "CHECK TRANS" light flashes to alert the driver, and the transmission must be manually shifted as follows:

Select lever position	Gear Ratio Selected
D	4 (Fourth)
Manual 3	4 (Fourth)
Manual 2	3 (Third)
Manual L	1 (First)
R	Reverse

Shifts are firmer to prevent clutch slip and consequent wear. The fault should be corrected as soon as possible.

7A1-10 TRANSMISSION CONTROL SYSTEM (4L30-E)

Functions of Input / Output Components

Components		Function
I N P U T S I G N A L	Speed sensor (fixed to transmission (T/M))	Senses rotation of output shaft and feeds the data to Powertrain Control Module (PCM).
	Throttle position sensor (TPS) (fixed to engine)	Senses the extent of throttle valve opening and the speed of the throttle valve lever motion to open the valve. Feeds the data to PCM.
	Brake Switch (SW) (fixed to brake pedal)	Senses whether the driver has pressed the brake pedal or not and feeds the information to PCM.
	Kickdown SW (fixed to accelerator pedal)	Senses whether the driver has pushed the accelerator pedal fully or not, and feeds the information to PCM.
	Mode SW (fixed to T/M)	Senses the select lever position, and feeds the information to PCM.
	Power drive SW (fixed to front console)	Senses whether the driver has selected the power mode, and feeds the information to PCM.
	T/M oil temp. sensor	Senses the T/M oil temperature and feeds the data to PCM
	Engine coolant temperature sensor	Senses the engine coolant temperature, and feeds the data to PCM.
	Engine speed signal	Feeds the signals monitoring engine speed to PCM from crank angle sensor.
	Air conditioning information	Senses whether the air conditioner has been switched on or not, and feeds the information to PCM.
	Winter switch (fixed to front console)	Senses whether the driver has selected the winter mode, and feeds the information to PCM.
	Cruise controller (Overdrive OFF signal)	Downshift takes place when Overdrive OFF signal is received from auto cruise control unit.
O U T P U T S I G N A L	Shift solenoid A, B	Selects shift point and gear position suited to the vehicle running condition on the basis of PCM output.
	Band apply solenoid	Controls oil flow suited to the vehicle running condition on the basis of PCM output.
	Torque Converter Clutch solenoid	Controls clutch engagement/disengagement suited to the vehicle running condition on the basis of PCM output.
	Force motor (Pressure regulator valve)	Adjusts the oil pump delivery pressure to line pressure suited to the vehicle running condition on the basis of PCM output.
	Power drive mode lamp	Informs the driver whether the vehicle is in power mode or not.
	Winter drive mode lamp	Informs the driver whether the vehicle is in winter mode or not.
	T/M monitor lamp ("CHECK TRANS")	Informs the driver of failure in the system.
	ATF warning lamp	Lights when ATF oil temperature rises.

Diagnosis

Electronic Diagnosis

How To Diagnose The Problem

1. To avoid incorrect diagnostics, this book needs to be followed accurately. Unless stated, **do not jump directly to a section that could contain the solution. Some important information may be missed.**
2. The sections in CAPITALS and bold are the main sections that can be found in the contents.
3. The GOTO "**SECTION**" means to continue to check going to the "section".
4. The GOTHROUGH "**SECTION**" means to go through the "section" and then to go back to the place the GOTHROUGH was written.
5. BASIC ELECTRIC CIRCUITS:
You should understand the basic theory of electricity. This includes the meaning of voltage, amps, ohms, and what happens in a circuit with an open or shorted wire. You should also be able to read and understand wiring diagrams.

Check Trans Indicator

Find CHECK TRANS indicator and verify if it is

- A. Flashing: GOTO **DIAGNOSTIC CHECK**.
- B. Staying on: GOTHROUGH **CHECK TRANS CHECK**.
- C. Is never ON when the ignition key is turned on: GOTHROUGH **CHECK TRANS CHECK**
- D. Is ON during 2 seconds at ignition but OFF after: Normal operation. No DTC or malfunction.

821RW105

Diagnostic Check

This test determines if the transmission or its input, or output, connections, or sensors are failing.

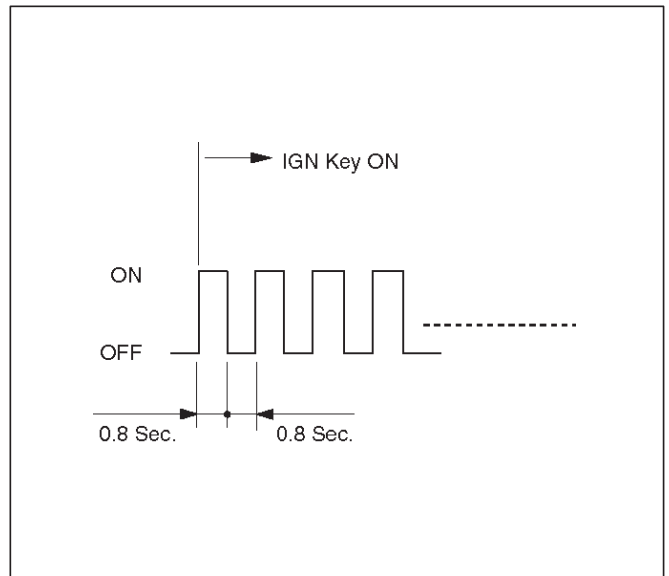

1. Connect the Tech 2: GOTHROUGH **Tech 2 OBD II CONNECTION**.
2. Turn on the ignition but not the engine.
3. Push "F0" on Tech 2 to see the Diagnostic Trouble Code (DTC):
4. Do you have a DTC?
YES: write down all code numbers and do the **DTC CHECK**
NO: the DTC can not help you find the problem.
1. GOTHROUGH "**CHECK TRANS**" CHECK
2. IF it is flashing and the flash is 0.8 seconds ON and 0.8 seconds OFF, this means that you should have a DTC stored. Please recheck GOTO **DIAGNOSTIC CHECK** and if you find the same problem, replace the Powertrain Control Module (PCM).

Normal

C07RW047

Abnormal

C07RX009

7A1-12 TRANSMISSION CONTROL SYSTEM (4L30-E)

“Check Trans” Check

1. Indicator is ON during 2 seconds at ignition (or when the engine is cranked) but it is OFF after the engine starts. The indicator is working normally GOTO **DIAGNOSTIC CHECK**.

Normal

2. Indicator is flashing and the flash is 0.8 seconds ON and 0.8 seconds OFF always when ignition is on (engine cranked or not). This means that there is a malfunction. GOTO **DIAGNOSTIC CHECK**.

Abnormal

3. Indicator is staying ON always when Ignition is ON.
 1. This means that connection between the lamp and the PCM is shorted to ground.
 2. Verify if instrument panel terminal 6 of connector I-1 is shorted to ground.
 3. Verify if the PCM connector C1 (RED) terminal A14 is shorted to ground.
 4. Verify that the instrument panel terminal 12 of connector I-1 is connected to battery.
 5. IF problem solved: GOTO **CHECK TRANS INDICATOR**.
NO: Replace Powertrain Control Module (PCM).
4. Indicator is staying OFF with the ignition ON (engine OFF).
 1. This means that connection between the lamp and the PCM is shorted to battery or opened.
 2. Verify if instrument panel terminal 6 of connector I-1 is shorted to battery or open.
 3. Verify if the PCM connector C1 (RED) terminal A14 is shorted to battery or open.
 4. Verify that the instrument panel terminal 12 of connector I-1 is connected to battery. If not, check the fuses and the connections voltage.
 5. IF problem solved: GOTO **CHECK TRANS INDICATOR**.
NO: Replace Powertrain Control Module (PCM).

Tech 2 OBD II Connection

In order to access OBD II Powertrain Control Module (PCM) data, use of the Tech 2 scan tool kit (7000086) is required.

1. The electronic diagnosis equipment is composed of:
 1. Tech 2 hand-held scan tool unit (7000057) and DLC cable (3000095).

2. SAE 16/19 Pin Adapter (3000098)(1), RS232 Loop Back Connector (3000112)(2), and PCMCIA Card (3000117)(3).

7A1-14 TRANSMISSION CONTROL SYSTEM (4L30-E)

2. Connecting the Tech 2

901RW180

Legend

(1) PCMCIA Card

(2) RS 232 Loop Back Connector

(3) SAE 16/19 Adapter

(4) DLC Cable

(5) Tech 2

- Before operating the Isuzu PCMCIA card with the Tech 2, the following steps must be performed:
 1. The Isuzu 99 System PCMCIA card (1) inserts into the Tech 2 (5).
 2. Connect the SAE 16/19 adapter (3) to the DLC cable (4).
 3. Connect the DLC cable to the Tech 2 (5)
 4. Make sure the vehicle ignition is off.
 5. Connect the Tech 2 SAE 16/19 adapter to the vehicle DLC.

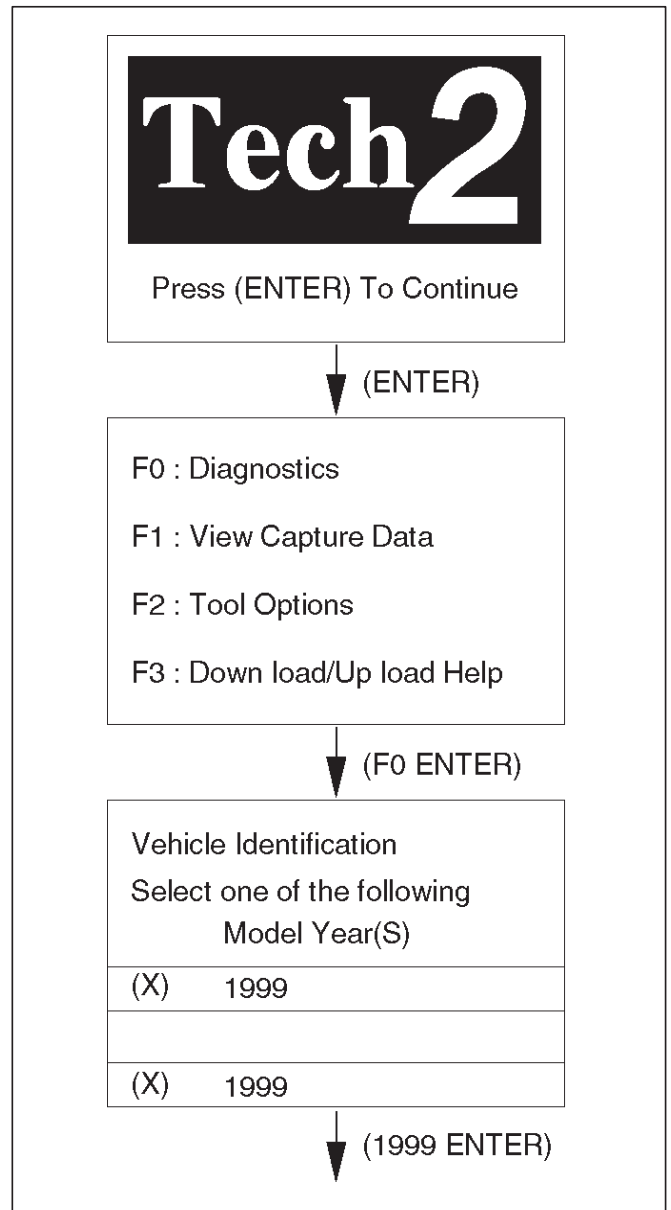

810RW317

6. The vehicle ignition turns on.
7. Verify the Tech 2 power up display.

060RW009

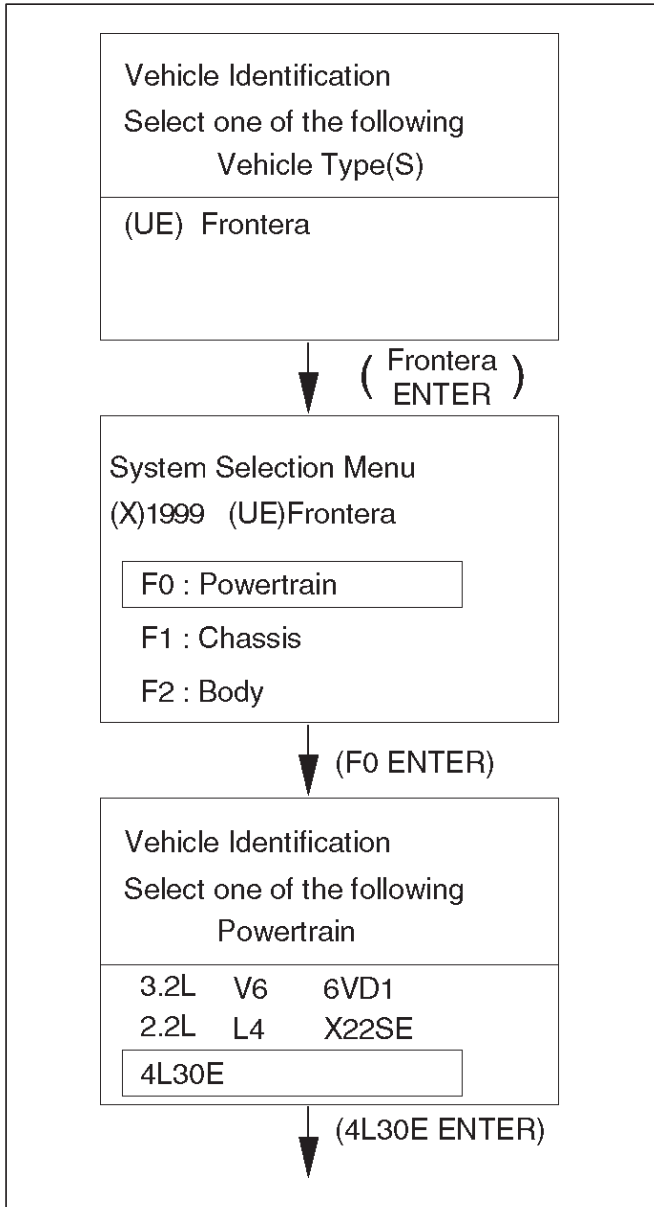

8. The power up screen is displayed when you power up the tester with the Isuzu systems PCMCIA card. Follow the operating procedure below.

060RX004

NOTE: The RS232 Loop back connector is only use for diagnosis of Tech 2 and refer to user guide of the Tech 2.

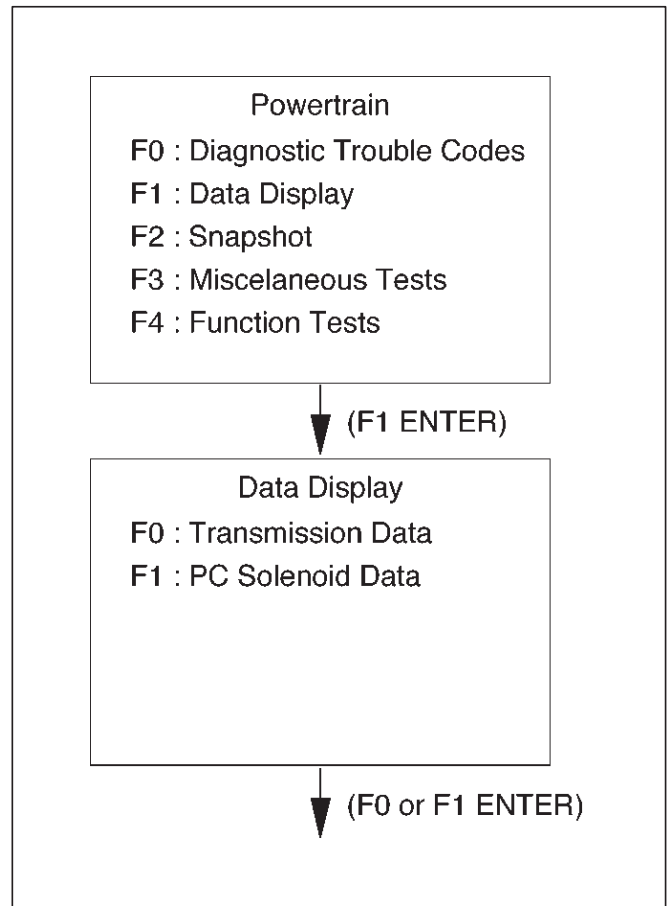

7A1-16 TRANSMISSION CONTROL SYSTEM (4L30-E)

Once the test vehicle has been identified an "Application (Powertrain) Menu" screen appears. Please select the appropriate application.

Data Display

When F1: Data Display is selected, a "Data Display Menu" screen appears. Please select either "Transmission Data" or "PC Solenoid Data".

Function Tests (Reset Oil Life Monitor)

When F4: Function Tests is selected from the "Powertrain Menu", a "Reset Oil Life Monitor Menu" screen appears. When the ATF has been replaced, select "F0" and reset "Oil Life Monitor" data.

F0: Transmission Data

Item	Unit	Engine running at idle
Engine Speed	RPM	750 ~ 900 RPM
Vehicle Speed	km/h, MPH	0 MPH
Throttle Position	%	0 %
Throttle Position Sensor	V	0.5 ~ 1.0 V
Manifold Absolute Pressure	kPa	approx. 40 kPa
Barometric Pressure	kPa	approx. 102 kPa
AT Output Speed (Automatic Transmission)	RPM	0 RPM
AT Input Speed Ratio (Automatic Transmission)		0.0
Ignition Voltage	V	12.8 ~ 14.1 V
AT Oil Temperature (Automatic Transmission)	°C, °F	70 ~ 80°C (158 ~ 176°F)
AT Oil Life Monitor (Automatic Transmission)	%	100 %
Commanded Gear		1
Current Gear		1
Mode Switch C	Inactive, Active	Inactive
Mode Switch B	Inactive, Active	Inactive
Mode Switch A	Inactive, Active	Active
Mode Switch G	Inactive, Active	Active
Actual Gear		Park
1-2 Shift Solenoid A	Off, On	Off
2-3 Shift Solenoid B	Off, On	On
Brake Switch	Off, On	Off
Solenoid Brake Band	Off, On	Off
TCC Slip Speed	RPM	750 ~ 900 RPM
TCC Status	Disabled, Enabled	Enabled
TCC Solenoid	Off, On	Off
TCC Duty Cycle	%	0 %
TCC Apply Mode	No Apply, In Apply	No Apply
TCC Release Mode	No, Yes	No
TCC On Mode	No, Yes	No
TCC Off Mode	No, Yes	Yes
Default Gear	No, Yes	No
Engine Warm	No, Yes	Yes
A/C Request	Yes, No	Yes
A/C Clutch Relay	Off, On	On
Winter Switch	Off, On	Off
Winter Drive Lamp	Off, On	Off
Kickdown Switch	Off, On	Off
ATF Lamp (Automatic Transmission)	Off, On	Off
Power Switch	Normal, Power	Normal
Power Drive Lamp	Off, On	Off
ABS Status	On, Off	(Not used)

7A1-18 TRANSMISSION CONTROL SYSTEM (4L30-E)

F1: PC Solenoid Data

Item	Unit	Engine running at idle
Engine Speed	RPM	750 ~ 900 RPM
Vehicle Speed	km/h, MPH	0 MPH
Throttle Position	%	0 %
Throttle Position Sensor	V	0.5 ~ 1.0 V
Manifold Absolute Pressure	kPa	approx. 40 kPa
Barometric Pressure	kPa	approx. 102 kPa
PCS Current (Pressure Control Solenoid)	A	approx. 1.0 A
PCS Actual Current (Pressure Control Solenoid)	A	approx. 1.0 A
PCS Duty Cycle (Pressure Control Solenoid)	%	approx. 45 %
Desired PCS Pressure (Pressure Control Solenoid)	kPa	43 ~ 52 kPa
Shift Pressure (Line Pressure)	kPa	43 ~ 52 kPa
Transmission Temperature	°C, °F	75 ~ 110 °C (167 ~ 230 °F)

Flashing Code

1. A DTC (Flashing Code) can be displayed by the Powertrain Control Module (PCM) by shorting together terminals 6 and 4 or 5 (GND) of the Data Link Connector (DLC) located right side of the drivers side instrument panel.

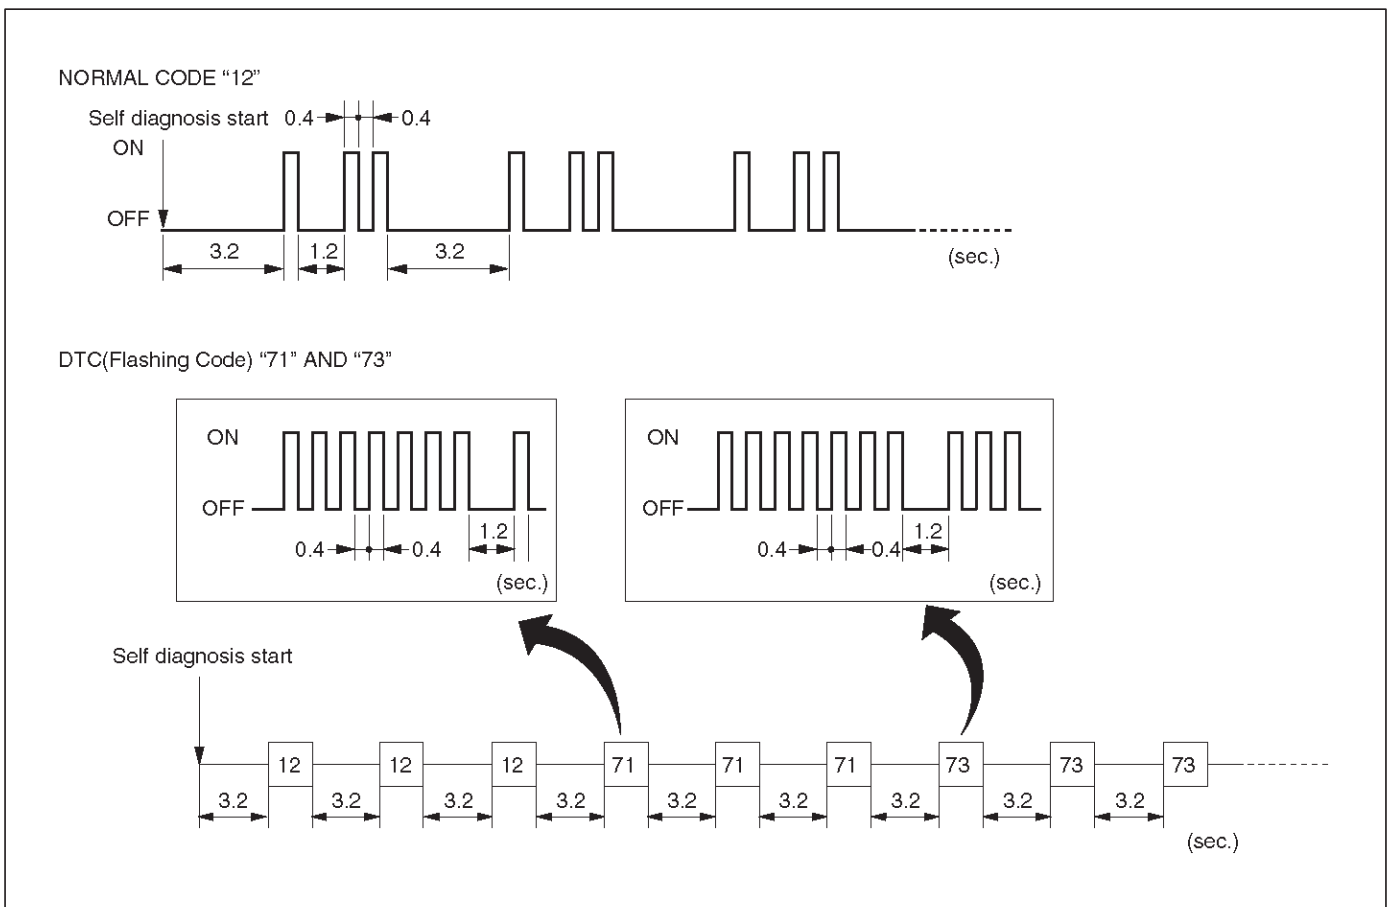

810RW317

821RW286

2.
 1. In case there is no DTC stored in memory. The CHECK ENGINE indicator flashes Normal Code "12" repeatedly.
 2. In case there is DTC stored in memory. First, Normal Code "12" is displayed three times and then any other DTC's are displayed three times. When all DTC's have been displayed they are displayed again beginning from the first one.
 3. Write down all codes numbers and GOTO DTC CHECK.

C07RX006

7A1-20 TRANSMISSION CONTROL SYSTEM (4L30-E)

OBD II Diagnostic Management System

Powertrain Control Module (PCM) Location

828RX004

Class 2 Serial Data Bus

OBD II technology requires a much more sophisticated PCM than does OBD I technology. The OBD II PCM diagnostic management system not only monitors systems and components that can impact emissions, but they also run active tests on these systems and components. The decision making functions of OBD II PCM have also greatly increased. To accommodate this expansion in diagnostic complexity, Isuzu engineers have designed the Class 2 serial data bus, which meets SAE J1850 recommended practice for serial data.

“Serial Data” refers to information which is transferred in a linear fashion – over a single line, one bit at a time. A “Data Bus” is an electronic pathway through which serial data travels.

FRONTERA previously used a 5 volt data bus called UART, which is an acronym for “Universal Asynchronous Receive and Transmit”. When neither the vehicle’s control module nor the diagnostic tool, such as a Tech 2, are “talking,” the voltage level of the bus at rest is 5 volts. The two computers talk to each other at a rate of 8,192 bits per second, by toggling or switching the voltage on the data bus from 5 volts to ground.

Class 2 data, which is used on OBD II vehicles, is quite different. Data is transferred at a rate of 10.4 kilobits per second, and the voltage is toggled between zero and 7 volts.

UART

CLASS 2

Class 2 data is also pulse width modulated. Each bit of information can have one of two lengths: long or short. On the other hand, UART data bits come in only one length (short). The pulse width modulation of Class 2 data allows better utilization of the data line.

The message carried on Class 2 data streams are also prioritized. This means that if two devices try to communication on the data line at the same time, only the higher priority message will continue. The device with the lower priority message must wait.

NOTE: The Class 2 data wire is always terminal 2 of the new 16-terminal Data Link Connector (DLC).

16 – Terminal Data Link Connector (DLC)

OB2 II standardizes Data Link Connector (DLC) configurations. The DLC, formerly referred to as the ALDL, will be a 16-terminal connector found on the lower right side of the driver's side instrument panel. All manufacturers must conform to this 16-terminal standard.

7A1-22 TRANSMISSION CONTROL SYSTEM (4L30-E)

- PIN 1 – (Not used)
- PIN 2 – J1850 Bus + L line on 2-wire systems, or single wire (Class 2)
- PIN 3 – (Not used)
- PIN 4 – Chassis ground pin
- PIN 5 – Signal ground pin
- PIN 6 – PCM diagnostic enable
- PIN 7 – (Not used)
- PIN 8 – (Not used)
- PIN 9 – Primary UART
- PIN 10 – (Not used)
- PIN 11 – (Not used)
- PIN 12 – ABS diagnostic or CCM diagnostic enable
- PIN 13 – SIR diagnostic enable
- PIN 14 – (Not used)
- PIN 15 – (Not used)
- PIN 16 – Battery power from vehicle unswitched (4 AMP MAX.)

Malfunction Indicator Lamp (MIL)

The Malfunction Indicator Lamp (MIL) looks the same as the MIL you are already familiar with (“CHECK ENGINE” lamp). However, OBD II requires that it illuminate under a strict set of guidelines. Basically, the MIL is turned on when the PCM detects a DTC that will impact the vehicle’s emissions.

The MIL is under the control of the Diagnostic Executive. The MIL will be turned on if a component or system which has an impact on vehicle emissions indicates a malfunction or fails to pass an emissions-related diagnostic test. It will stay on until the system or component passes the same test, for three consecutive trips, with no emissions-related faults.

Types Of Diagnostic Trouble Codes (DTCs)

The Diagnostic Executive classifies Diagnostic Trouble Codes (DTCs) into certain categories. Each type has different requirements to set the code, and the Diagnostic Executive will only illuminate the Malfunction Indicator Lamp (MIL) for emissions-related DTCs. DTCs fall into

four categories: A, B, C, and D; only types A and B are emission related. The following descriptions define these categories:

TYPE A

Will store the DTC and turn on the MIL (“Check Engine” lamp) on the first trip in which an emission-related diagnostic test has run and reported a “test failed” to the Diagnostic Executive.

TYPE B

Will store the DTC and turn on the MIL on the second consecutive trip in which an emission-related diagnostic test has run and reported a “test failed” to the Diagnostic Executive. After one failure, the type B DTC is “armed,” or prepared to store a history code and turn on the MIL if a second failure occurs. One passed test will disarm a type B DTC. Some special conditions apply to misfire and fuel trim DTCs. For a type B DTC to store and turn on the MIL, two ignition cycles are required.

TYPE C

Will store the DTC and turn on a “SERVICE” lamp (“Check Trans” lamp) on the first trip that a non-emission-related diagnostic test has run and reported a “test failed” to the Diagnostic Executive. This type of DTC will be used in future applications.

TYPE D

Will store a DTC but will not turn on the MIL on the first trip that a non-emission-related diagnostic test has run and reported a “test failed” to the Diagnostic Executive. These codes can be very helpful for vehicle service when the driver may comment about a condition, but the MIL did not turn on.

Clear DTC

NOTE: If you clear the DTC (Diagnostic Trouble Codes) you will not be able to read any codes recorded during the last occurrence.

NOTE: To use the DTC again to identify a problem, you will need to reproduce the fault or the problem. This may require a new test drive or just turning the ignition on (this depends on the nature of the fault).

1. IF you have a Tech 2:

1. Connect the Tech 2 if it is still not connected **GOTHRUGH Tech 2 OBD II CONNECTION.**
2. Push “F1: Clear DTC Info” in the Application Menu and answer “Yes” to the question “Do you want to clear DTC’s?”
 - a. When a malfunction remains as it is the Tech 2 displays “4L30E CODES NOT CLEARED”. This means that the problem is still there or that the recovery was not done. Please **GOTO DTC CHECK.**
 - b. When a malfunction has been repaired and the recovery is done the Tech 2 displays “4L30E CODES CLEARED”.

2. IF you have no Tech 2:
To clear the DTC, remove Fuse "ECM" (F-13, 15A) for at least 10 seconds.

DTC Check

1. Diagnostic Trouble Codes (DTC) have been identified by Tech 2.
2. You have written the list of the DTCs. The order of the malfunctions has no meanings for this PCM. Usually only one or two malfunctions should be set for a given problem.
3. Check directly the DTCs you identified. The DTCs are sorted by number. Refer to Diagnostic Trouble Code (DTC) Identification in this section.

PCM Precaution

The PCM can be damaged by:

1. The electrostatic discharge
2. The short circuit of some terminals to voltage or to ground.

Electrostatic Discharge Damage Description:

1. Electronic components used to control systems are often designed to carry very low voltage, and are very susceptible to damage caused by electrostatic discharge. It is possible for less than 100 volts of static electricity to cause damage to some electronic components. By comparison, it takes as much as 4,000 volts for a person to even feel the zap of a static discharge.

2. There are several ways for a person to become statically charged. The most common methods of charging are by friction and induction. An example of charging by friction is a person sliding across a car seat, in which a charge of as much as 25,000 volts can build up. Charging by induction occurs when a person with well insulated shoes stands near a highly charged object and momentarily touches ground. Charges for the same polarity are drained off, leaving the person highly charged with the opposite polarity. Static charges of either type can cause damage, therefore, it is important to use care when handling and testing electronic components.

NOTICE: To prevent possible electrostatic discharge damage:

1. Do not touch the PCM connector pins or soldered components on the PCM circuit board.
2. Be sure to follow the guidelines listed below if servicing any of these electronic components:
3. Do not open the replacement part package until it is time to install the part.
4. Avoid touching electrical terminals of the part.
5. Before removing the part from its package, ground the package to a known good ground on the vehicle.
6. Always touch a known good ground before handling the part. This step should be repeated before installing the part if the part has been handled while sliding across the seat, while sitting down from a standing position or while walking some distance.

Information On PCM

1. The Powertrain Control Module (PCM) is located in the center console and is the control center of the electronic transmission control system.
2. The PCM must be maintained at a temperature below 85°F (185°C) at all times. This is most essential if the vehicle is put through a paint baking process. The PCM will become inoperative if its temperature exceeds 85°C (185°F). Therefore, it is recommended that the PCM be removed or that temporary insulation be placed around the PCM during the time the vehicle is in a paint oven or other high temperature process.
3. The PCM is designed to process the various inputs and then respond by sending the appropriate electrical signals to control transmission upshift, downshift, shift feel and torque converter clutch engagement.
4. The PCM constantly interprets information from the various sensors, and controls the systems that affect transmission and vehicle performance. By analyzing operational problems, the PCM is able to perform a diagnostic function by displaying DTC(s) and aid the technician in making repairs.

7A1-24 TRANSMISSION CONTROL SYSTEM (4L30-E)

Intermittent Conditions

If the Tech 2 displays a diagnostic trouble code as intermittent, or if after a test drive a DTC does not reappear though the detection conditions for this DTC are present, the problem is most likely a faulty electrical connection or loose wiring. Terminals and grounds should always be the prime suspect. Intermittents rarely occur inside sophisticated electronic components such as the PCM.

Use the DTC information to understand which wires and sensors are involved.

When an intermittent problem is encountered, check suspect circuits for:

1. Poor terminal to wire connection.
2. Terminals not fully seated in the connector body (backed out).
3. Improperly formed or damaged terminals.
4. Loose, dirty, or corroded ground connections:
HINT: Any time you have an intermittent in more than one circuit, check whether the circuits share a common ground connection.
5. Pinched or damaged wires.
6. Electromagnetic Interference (EMI):
HINT: Check that all wires are properly routed away from spark plug wires, distributor wires, coil, and generator. Also check for improperly installed electrical options, such as lights, 2-way radios, etc.

Use the F2: SNAPSHOT mode of the Tech 2 to help isolate the cause of an intermittent fault. The snapshot mode will record information before and after the problem occurs. Set the snapshot to "trigger" on the suspect DTC or, if you notice the reported symptom during the test drive, trigger the snapshot manually.

After the snapshot has been triggered, command the Tech 2 to play back the flow of data recorded from each of the various sensors. Sign of an intermittent fault in a sensor circuit is a sudden unexplainable jump in data values out of the normal range.

Transmission and PCM Identification

The chart below contains a list of all important information concerning rear axle ratio, Powertrain Control Module (PCM), and transmission identification.

VEHICLE		Rr axle Ratio	PCM	TRANSMISSION		
Type	Engine		ISUZU Parts No.	Calibration Code	Isuzu Part No.	Model Code

D	No lamps

NOTE: On the following charts, refer to Powertrain Control Module (PCM) section for Wiring System and the Body and Accessories section for circuit diagram details, parts location, and connector configuration.

DTC P0218/Flashing Code 71 Transmission Fluid Over Temperature

D07RX016

Circuit Description

The Transmission Fluid Temperature (TFT) sensor is a thermister that controls the signal voltage to the PCM. The PCM supplies a 5-volt reference to the sensor on circuit GRN/RED. When the transmission fluid is cold, the sensor resistance is high and the PCM will sense high signal voltage. As the fluid temperature warms to a normal transmission operating temperature of 100°C (212°F), the sensor resistance becomes less and the voltage decreases to 1.5 to 2.0 volts.

This DTC detects a high transmission temperature for a long period of time. This is a type "D" DTC.

Conditions For Setting The DTC

- No TFT DTCs P0712 or P0713.
- TFT is greater than 135°C (275°F).
- All conditions met for 21 seconds.

Action Taken When The DTC Sets

- Hot mode TCC Shift Pattern.
- The PCM will not illuminate the CHECK TRANS Lamp.
- ATF Lamp ON. (greater than 145°C (293°F))
- Disable E-side TCC OFF request.

Conditions For Clearing The DTC

- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warm-up cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connections at the PCM and at the transmission 16-way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well.

Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.

- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Check harness routing for a potential short to ground in circuit GRN/RED.
- Scan tool TFT sensor temperature should rise steadily to about 100°C (212°F), then stabilize.
- Check for a "skewed" (mis-scaled) sensor by comparing the TFT sensor temperature to the ambient temperature after a vehicle cold soak. A "skewed" sensor can cause delayed garage shifts or TCC complaints.
- Check for a possible torque converter stator problem.
- Verify customer driving habits, trailer towing, etc.

Test Description

The numbers below refer to the step numbers on the diagnostic chart.

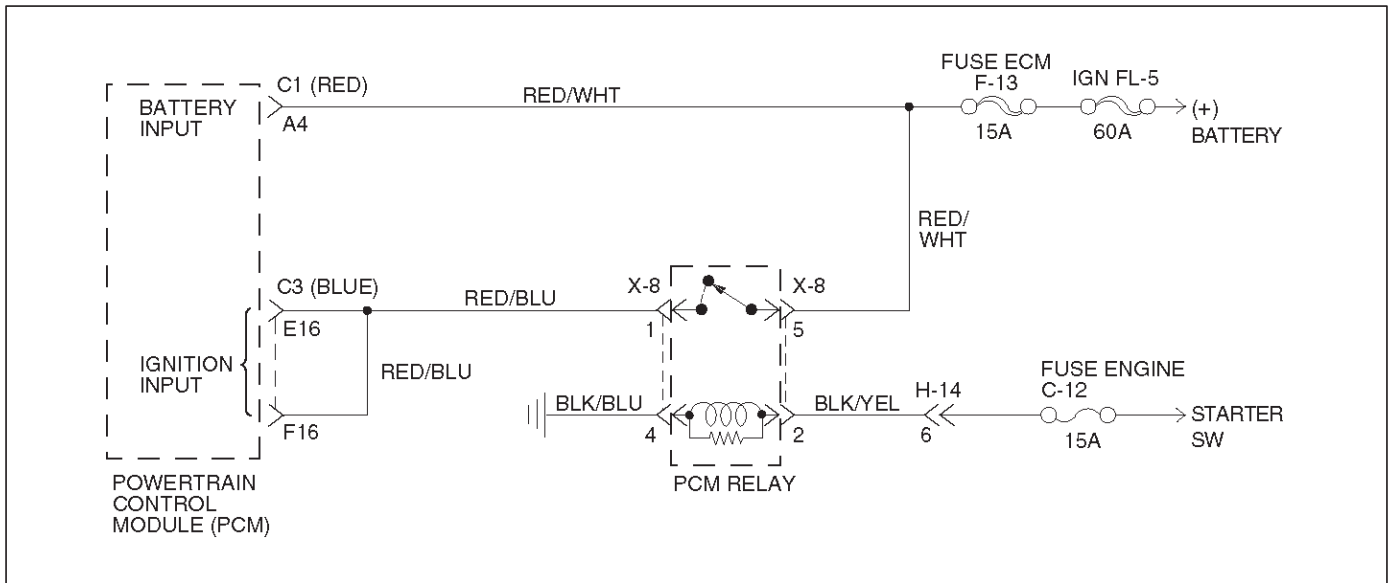

2. This test checks for a "skewed" sensor or shorted circuit.
3. This test simulates a TFT DTC P0713.

7A1-28 TRANSMISSION CONTROL SYSTEM (4L30-E)

DTC P0218/Flashing Code 71 Transmission Fluid Over Temperature

Step	Action	Yes	No
1	Perform the following checks: <ul style="list-style-type: none"> ● Check for possible engine system problems. ● Transmission fluid checking procedure. Refer to Checking Transmission Fluid Level and Condition in Automatic Transmission (4L30-E) Section. Were the checks performed?	Go to Step 2	—
2	1. Install the scan tool. 2. With the engine "off", turn the ignition switch "on". NOTE: Before clearing DTC(s), use the scan tool to record "Failure Records" for reference, as data will be lost when "Clear Info" function is used. 3. Record the DTC "Failure Records". Is the TFT sensor signal voltage less than 0.33 volts?	Go to Step 3	Go to Diagnostic Aids
3	1. Turn the ignition "off". 2. Disconnect the transmission 16-way connector H-10 (additional DTCs may set). Is the TFT sensor signal voltage greater than 4.92 volts?	Go to Internal Wiring Harness Check	Go to Step 4
4	Inspect/repair circuit GRN/RED for a short to ground. Was a problem found?	Go to Step 6	Go to Step 5
5	1. Inspect the PCM for poor connections. 2. Replace the PCM if no poor connections were found. Is the replacement complete?	Go to Step 6	—
6	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and ensure the following conditions are met: TFT is less than 125°C (257°F) for at least 10 seconds. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0560/Flashing Code 72 System Voltage Malfunction

D07RX017

Circuit Description

Circuit RED/WHT is the battery voltage feed for the PCM. Circuit RED/BLU is the ignition voltage feed for the PCM. This DTC detects a low voltage or a high voltage. This is a type "C" DTC.

Conditions For Clearing The DTC

System Voltage Low:

- Engine speed is greater than 1,000 rpm.
- System voltage is less than 10 volts at a maximum transmission temperature of 150°C (302°F).
- System voltage is less than 7.3 volts at a minimum transmission temperature of -40°C (-40°F).
- All conditions met for 4 seconds.

System Voltage High:

- System voltage is greater than 16 volts for 2 seconds.

Action Taken When The DTC Sets

- Fixed to 4th gear.
- Maximum line pressure.
- Inhibit TCC engagement.
- The PCM will illuminate the CHECK TRANS Lamp.

Conditions For Clearing The DTC/CHECK TRANS Lamp

- The PCM will turn off the CHECK TRANS lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

Diagnostic Aids

- Charging the battery with a battery charger and jump starting an engine may set DTC(s). If DTC(s) set when an accessory is operated, check for faulty connections or excessive current draw.
- Check for faulty connections at the starter solenoid or fusible link.
- Check for loose/damaged terminals at generator.
- Check belt wear/tension.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

3. This test checks charging system voltage.
4. This test checks battery voltage input at the PCM.
6. This test checks ignition voltage input at the PCM.

7A1-30 TRANSMISSION CONTROL SYSTEM (4L30-E)

DTC P0560/Flashing Code 72 System Voltage Malfunction

Step	Action	Yes	No
1	<p>1. Install the scan tool.</p> <p>2. With the engine "off", turn the ignition switch "on".</p> <p>NOTE: Before clearing DTC(s), use the scan tool to record "Failure Records" for reference, as data will be lost when the "Clear Info" function is used.</p> <p>3. Record the DTC "Failure Records". Note: If any other DTCs are present, refer to their applicable diagnostic charts before continuing.</p> <p>4. Using the J-39200 DVOM, measure the battery voltage across the battery terminals. Record the measurement for future reference.</p> <p>Is the voltage higher than 10.5 volts?</p>	Go to Step 2	Go to Engine Electrical in Engine section
2	<p>Start the engine and warm to normal operating temperature.</p> <p>Is the generator/check engine light "on"?</p>	Go to Starting and Charging System in Engine section	Go to Step 3
3	<p>1. Increase the engine speed to 1,000–1,500 rpm.</p> <p>2. Observe scan tool system voltage.</p> <p>Is the system voltage within 13–15 volts.</p>	Go to Step 4	Go to Starting and Charging System in Engine section
4	<p>1. Turn the ignition switch "off".</p> <p>2. Disconnect the C1(RED) and C3 (BLUE) PCM connector (additional DTCs will set).</p> <p>3. With the engine "off", turn the ignition switch "on".</p> <p>4. Using the J39200 DVOM, measure the battery voltage input at PCM connector terminals C1–A4 and C3–E16.</p> <p>Is there a voltage variance between the voltage measured at the battery (taken in Step 1) and at terminals C1–A4 and C3–E16 that is greater than 0.5 volts?</p>	Go to Step 5	Go to Step 6
5	<p>Repair the high resistance condition in circuit RED/WHT.</p> <p>Was the circuit repaired?</p>	Go to Step 10	—
6	<p>1. Disconnect the C3 (BLUE) PCM connector.</p> <p>2. Measure the ignition voltage input at PCM connector terminals C3–E16 and C3–F16.</p> <p>Is there a voltage variance between the voltage measured at the battery (taken in Step 1) and at terminals C3–E16 and C3–F16 that is greater than 0.5 volts?</p>	Go to Step 7	Go to Step 8
7	<p>Repair the high resistance condition is circuit RED/BLU.</p> <p>Was the circuit repaired?</p>	Go to Step 10	—
8	<p>Check PCM connector terminals C1–A4, C3–E16 and C3–F16 for bent, damaged, or backed out connector pins. Also check for weak terminal tension.</p> <p>Was a problem found?</p>	Go to Step 10	Go to Step 9

DTC P0560/Flashing Code 72 System Voltage Malfunction (Cont'd)

Step	Action	Yes	No
9	Replace the PCM. Is the replacement complete?	Go to Step 10	—
10	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and operate the vehicle under the following conditions: Start the vehicle and warm to normal operating temperature. The PCM must see a system voltage between 10 and 16 volts. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0705/Flashing Code 73 Transmission Range Switch (Mode Switch) Illegal Position

D07RX018

Circuit Description

- The range switch supplies the Powertrain Control Module (PCM) with information regarding the selector lever position: P, R, N, D 3, 2 or L. The selector lever position is indicated by the state of four ON/OFF contracts. The range switch is located on one side of the transmission. It is on the transmission manual shaft and is fixed to the main case.
- The range switch is also used to provide the information P or N to the engine crank wiring. The engine can be cranked only if connector M-16 terminal 4(H) is connected to terminal 1(E) which is connected to ground.
- The range switch is also used to provide the backup lamp power in reverse. This is the reason why the range switch is supplied through a 15A fuse (C-14). This fuse can burn due to a short circuit in the back up lamp.

This DTC detects when a fuse is open or the range switch circuit does not work. This is a type "D" DTC.

Conditions For Setting The DTC

- Range switch illegal positions met for 5 seconds.

Action Taken When The DTC Sets

- Default to D position.
- Inhibit torque management.

- Maximum line pressure.
- The PCM will not illuminate the CHECK TRANS Lamp.

Conditions For Clearing The DTC

- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

Diagnostic Aids

- Refer to accompanying chart for the normal range signals and the illegal combinations.
- Inspect the wiring for poor electrical connections at the PCM and at the transmission 8-way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

- Refer to the “Range Switch Logic Table” or “Functional Test Procedure” for further information.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

2. This test checks the indicated range signal to the manual valve actually selected.
5. This test checks for continuity between each selected range switch connector terminals.

Range Switch Logic Table

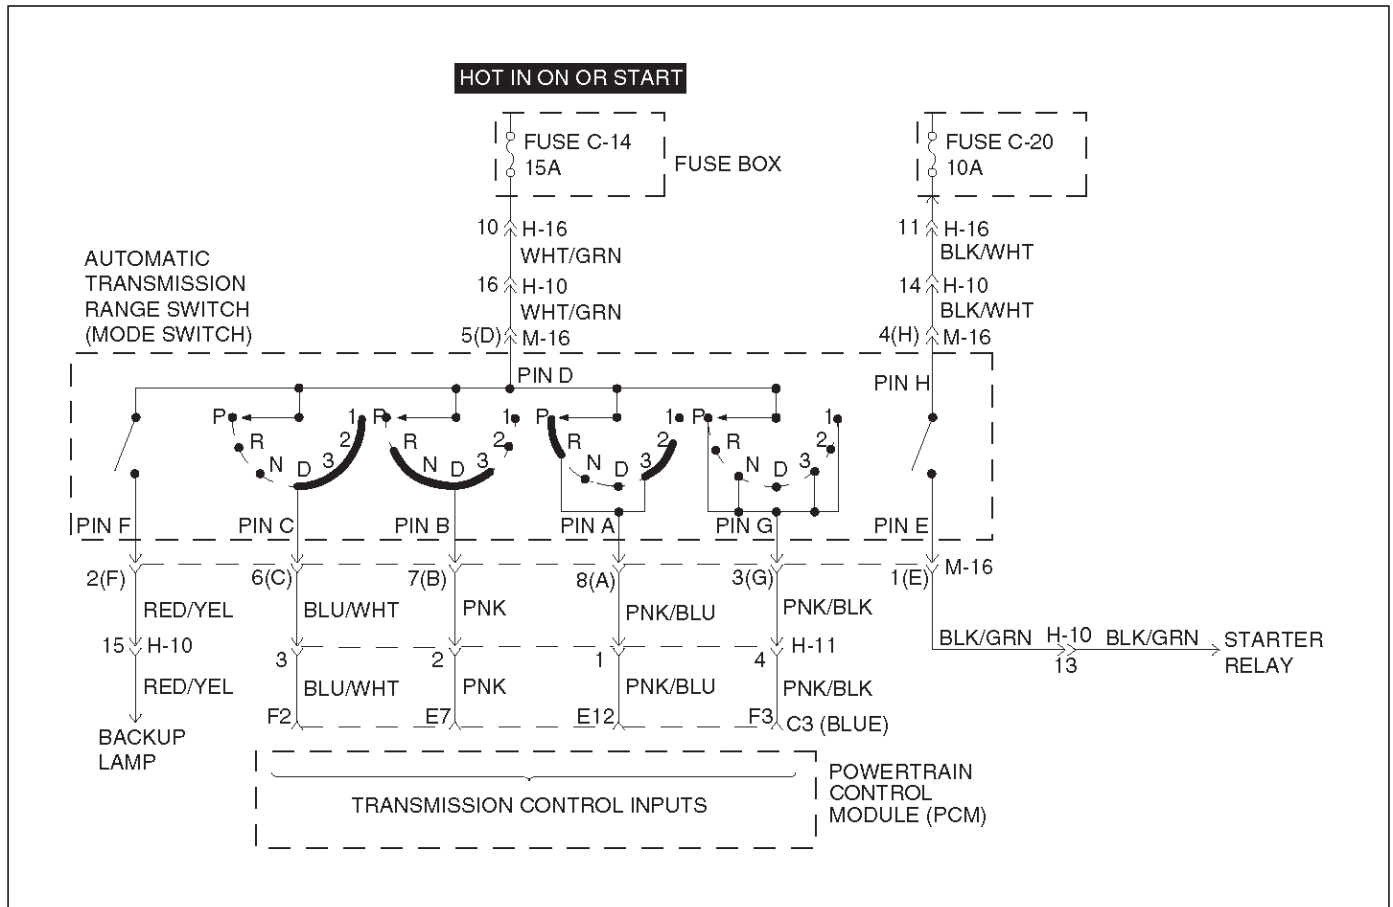

Range Position	Range Switch Pin			
	A	B	C	P(G)
Park	ON	OFF	OFF	ON
Reverse	ON	ON	OFF	OFF
Neutral	OFF	ON	OFF	ON
D4	OFF	ON	ON	OFF
D3	ON	ON	ON	ON
2	ON	OFF	ON	OFF
L	OFF	OFF	ON	ON
Illegal	OFF	OFF	OFF	OFF
Illegal	OFF	OFF	OFF	ON

7A1-34 TRANSMISSION CONTROL SYSTEM (4L30-E)

DTC P0705/Flashing Code 73 Transmission Range Switch (Mode Switch) Illegal Position

Step	Action	Yes	No
1	<p>Perform the following checks:</p> <ul style="list-style-type: none"> ● The transmission linkage from the select lever to the manual valve is adjusted properly. ● Diagnostic circuit check. <p>Were the checks performed?</p>	Go to Step 2	—
2	<p>1. Install the scan tool. 2. With the engine "off", turn the ignition switch "on".</p> <p>NOTE: Before clearing DTC(s), use the scan tool to record "Failure Records" for reference, as data will be lost when the "Clear Info" function is used.</p> <p>3. Record the DTC "Failure Records". 4. DTC P0706/Flashing Code 74 Transmission Range Switch (Mode Switch) Performance

Circuit Description

- The range switch supplies the Powertrain Control Module (PCM) with information regarding the selector lever position: P, R, N, D, 3, 2 or L. The selector lever position is indicated by the state of four ON/OFF contracts. The range switch is located on one side of the transmission. It is on the transmission manual shaft and is fixed to the main case.
- The range switch is also used to provide the information P or N to the engine crank wiring. The engine can be cranked only if connector M-16 terminal 4(H) is connected to terminal 1(E) which is connected to ground.
- The range switch is also used to provide the back up lamp power in reverse. This is the reason why the mode switch is supplied through a 15A fuse (C-14). This fuse can burn due to a short circuit in the back up lamp.
- This DTC detects an invalid state of the range switch or the range switch circuit by deciphering the range switch inputs. This is a type "D" DTC.

Conditions For Setting The DTC

This DTC will set if any of the following conditions occurs:

Condition 1 ("R" bad position):

- Engine is running.
- No output speed greater than 3,200 RPM.

- Output speed greater than 3,200 RPM.
- Range switch indicates "R".
- All conditions met for 4 seconds.

Condition 2 ("P" or "N" bad position):

- Engine is running.
- No TPS codes.
- Engine speed is less than 3,000 RPM.
- TP angle is greater than 20%.
- Range switch indicates "P" or "N".
- All conditions met for 4 seconds.

Action Taken When The DTC Sets

- Default to "D" position.
- The PCM will not illuminate the CHECK TRANS Lamp.

Conditions For Clearing The DTC

- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

7A1-36 TRANSMISSION CONTROL SYSTEM (4L30-E)

Diagnostic Aids

- Refer to the accompanying chart for the normal range signals and the illegal combinations.
- Inspect the wiring for poor electrical connections at the PCM and at the transmission 8-way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Refer to the “Range Switch Logic Table” or “Functional Test Procedure” for further information.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

2. This test checks the indicated range signal to the manual valve actually selected.
5. This test checks for continuity between each selected range switch connector terminals.

Range Switch Logic Table

Range Position	Range Switch Pin			
	A	B	C	P(G)
Park	ON	OFF	OFF	ON
Reverse	ON	ON	OFF	OFF
Neutral	OFF	ON	OFF	ON
D4	OFF	ON	ON	OFF
D3	ON	ON	ON	ON
2	ON	OFF	ON	OFF
L	OFF	OFF	ON	ON
Illegal	OFF	OFF	OFF	OFF
Illegal	OFF	OFF	OFF	ON

DTC P0706/Flashing Code 74 Transmission Range Switch (Mode Switch) Performance

Step	Action	Yes	No
1	Perform the following checks: <ul style="list-style-type: none"> • The transmission linkage from the select lever to the manual valve is adjusted properly. • Diagnostic circuit check. Were the checks performed?	Go to Step 2	—
2	1. Install the scan tool. 2. With the engine "off", turn the ignition switch "on". NOTE: Before clearing DTC(s), use the scan tool to record "Failure Records" for reference, as data will be lost when the "Clear Info" function is used. 3. Record the DTC "Failure Records". 4. Select each transmission range: D1, D2, D3, D4, N, R, and P. Does each selected transmission range match the scan tool "Range Switch" display?	Go to Diagnostic Aids	Go to Step 3
3	Are all range switch pin displays incorrect?	Go to Step 4	Go to Step 5
4	Check fuse and wiring to the 8-way connector terminal 5(D) for opens. Refer to Mode Switch in Automatic Transmission (4L30-E) section. If no problem was found, replace the range switch. Is the replacement complete?	Go to Step 8	—
5	1. Disconnect the 8-way range switch connector. 2. Using ohmmeter, check continuity between terminal 5(D) and respectively terminals 3(G), 6(C), 7(B) and 8(A) of the 8-way range switch connector. 3. Move shift selector lever through all positions and compare results with "Range Switch Logic Table". Is one range switch pin display incorrect?	Go to Step 6	Go to Step 7
6	Check the affected wiring and connector, and repair. Is the repair complete?	Go to Step 8	—
7	Check the Powertrain Control Module (PCM) connectors for poor connection. If no problem was found, replace the PCM. Is the replacement complete?	Go to Step 8	—
8	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and road test the vehicle. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0712/Flashing Code 75 Transmission Fluid Temperature (TFT) Sensor Circuit Low Input

D07RX016

Circuit Description

The TFT sensor is a thermister that controls the signal voltage to the PCM. The PCM supplies a 5-volt reference signal to the sensor on circuit GRN/RED. When the transmission fluid is cold, the sensor resistance is high. The PCM detects high signal voltage. As the transmission fluid temperature increases to the normal operating temperature of 100°C (212°F), the sensor resistance becomes less and the voltage decreases to 1.5 to 2 volts. With transmission fluid over temperature and DTC P0218 also set, check the transmission cooling system.

This DTC detects a continuous short to ground in the TFT signal circuit or the TFT sensor. This is a type "D" DTC.

Conditions For Setting The DTC

- Battery voltage is between 10 and 16 volts.
- Ignition is "on".
- TFT sensor indicating a voltage less than 0.4 volts.
- All conditions met for 20 seconds.

Action Taken When The DTC Sets

- Transmission default temperature will be:
 - 80°C (176°F) if engine temperature code is set.
 - 100°C (212°F) if engine temperature is warm.
 - 80°C (176°F) if engine run time is greater than 5 minutes.
 - 21°C (69.8°F) if engine run time is less than 5 minutes.
- The PCM will not illuminate the CHECK TRANS Lamp.

Conditions For Clearing The DTC

- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

Diagnostic Aids

- Check harness routing for a potential short to ground in circuit GRN/RED. Scan tool TFT display should rise steadily to about 100°C (212°F), then stabilize.
- Inspect the wiring for poor electrical connection at the PCM and at the transmission 16-way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- The temperature to resistance value scale may be used to test the TFT sensor at the various temperature levels to evaluate the possibility of a "skewed" (mis-scaled) sensor.
 - A "skewed" sensor could result in delayed garage shifts or TCC complaints.
- Verify customer driving habits, trailer towing, etc.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

- 2. This test checks for a short to ground or a "skewed" sensor.
- 3. This test checks for an internal fault within the transmission by creating an open.

Resistance Chart

°C	°F	Resistance (kΩ)
-40	-40	672
0	32	65
20	68	25
80	176	2.5
120	248	0.78
150	304	0.37

DTC P0712/Flashing Code 75 Transmission Fluid Temperature (TFT) Sensor Circuit Low Input

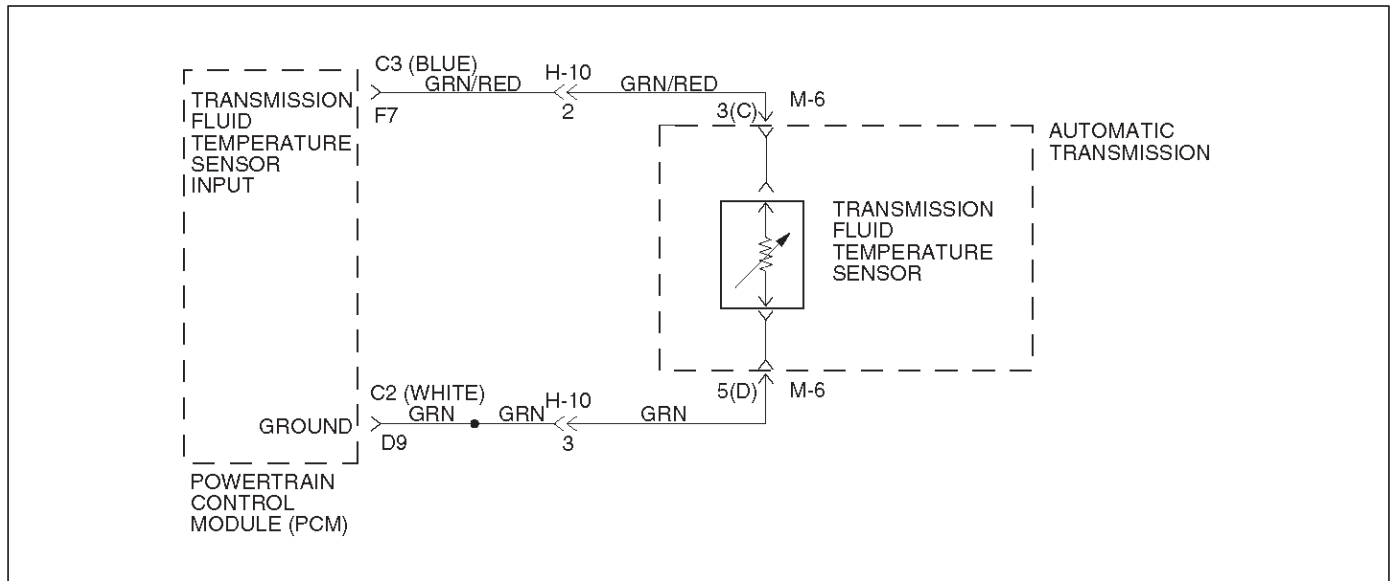

Step	Action	Yes	No
1	Perform the transmission fluid checking procedure. Refer to Checking Transmission Fluid Level and Condition in Automatic Transmission (4L30-E) section. Was the fluid checking procedure performed?	Go to Step 2	Refer to Checking Transmission Fluid Level and Condition in Automatic Transmission (4L30-E) section
2	1. Install the scan tool. 2. With the engine "off", turn the ignition switch "on". NOTE: Before clearing DTC(s), use the scan tool to record "Failure Records" for reference, as data will be lost when the "Clear Info" function is used. 3. Record the DTC "Failure Records". Does the scan tool display a TFT sensor signal voltage less than 0.4 volts?	Go to Step 3	Go to Diagnostic Aids
3	1. Turn the ignition "off". 2. Disconnect the transmission 16-way connector H-10. 3. Turn the ignition "on". Does the TFT signal voltage change to match the voltage 4.92 volts?	Go to Step 4	Go to Step 9
4	Using the J39200 DVOM, measure the resistance between terminals 3(C) and 5 (D). Is the resistance within specifications? (See Resistance Chart.)	Go to Diagnostic Aids	Go to Step 5
5	1. Disconnect the transmission 5-way connector M-6. 2. Using the J39200 DVOM, measure the resistance between terminals 3(C) and 5(D). Is the resistance within specifications? (See Resistance Chart.)	Go to Diagnostic Aids	Go to Step 6
6	1. Remove the transmission oil pan. Refer to Transmission Oil Temperature Sensor (Adapter Case) in Automatic Transmission (4L30-E) section. 2. Check the internal wiring harness for a short to ground. Was a problem found?	Go to Step 8	Go to Step 7
7	1. Disconnect the internal wiring harness at the TFT sensor. 2. Measure the resistance of the TFT sensor. Is the resistance within specifications? (See Resistance Chart.)	Go to Diagnostic Aids	Go to Step 8
8	Replace the TFT Sensor. Is the replacement complete?	Go to Step 12	—

7A1-40 TRANSMISSION CONTROL SYSTEM (4L30-E)

DTC P0712/Flashing Code 75 Transmission Fluid Temperature (TFT) Sensor Circuit Low Input (Cont'd)

Step	Action	Yes	No
9	Check circuit GRN/RED for a short to ground. Was a problem found?	Go to Step 12	Go to Step 10
10	Check the PCM for faulty connections. Was a problem found?	Go to Step 12	Go to Step 11
11	Replace the PCM. Refer to Powertrain Control Module (PCM) in Automatic Transmission (4L30-E) section. Is the replacement complete?	Go to Step 12	—
12	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and ensure the following conditions are met: TFT sensor indicates a voltage greater than 0.33 volts for 2 seconds. 2. Review the scan tool "DTC info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0713/Flashing Code 76 Transmission Fluid Temperature (TFT) Sensor Circuit High Input

D07RX016

Circuit Description

The TFT sensor is a thermistor that controls the signal voltage to the PCM. The PCM supplies a 5-volt reference signal to the sensor on circuit GRN/RED. When the transmission fluid is cold, the sensor resistance is high and the PCM will sense high signal voltage. As the transmission fluid temperature warms to the normal operating temperature of 100°C (212°F), the sensor resistance becomes less and the voltage decreases to about 1.5 to 2 volts.

This DTC detects a continuous open or short to power in the TFT signal circuit or the TFT sensor. This is a type "D" DTC.

Conditions For Setting The DTC

- Battery voltage is between 10 and 16 volts.
- Ignition is "on".
- TFT sensor indicating a voltage greater than 4.86 volts.
- All conditions met for 20 seconds.

Action Taken When The DTC Sets

- Transmission default temperature will be:
 - 80°C (176°F) if engine temperature code is set.
 - 100°C (212°F) if engine temperature is warm.
 - 80°C (176°F) if engine run time is greater than 5 minutes.
 - 21°C (69.8°F) if engine run time is less than 5 minutes.
- The PCM will not illuminate the CHECK TRANS Lamp.

Conditions For Clearing The DTC

- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the PCM and at the transmission 16-way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Scan tool displays transmission fluid temperature in degrees. After transmission is operating, the temperature should rise steadily to about 100°C (212°F), then stabilize.
- The temperature to resistance value scale may be used to check the TFT sensor at the various temperature levels to evaluate the possibility of a "skewed" (mis-scaled) sensor.

A "skewed" sensor could result in hard shifts or TCC complaints.

7A1-42 TRANSMISSION CONTROL SYSTEM (4L30-E)

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

2. This check verifies problem in the TFT sensor circuit.
3. This test simulates a TFT sensor DTC P0712. If the PCM recognizes the low signal voltage (high temperature), and the scan tool displays 146°C (295°F) or greater, the PCM and wiring are OK.
4. This test checks the TFT sensor and internal wiring harness.

Resistance Chart

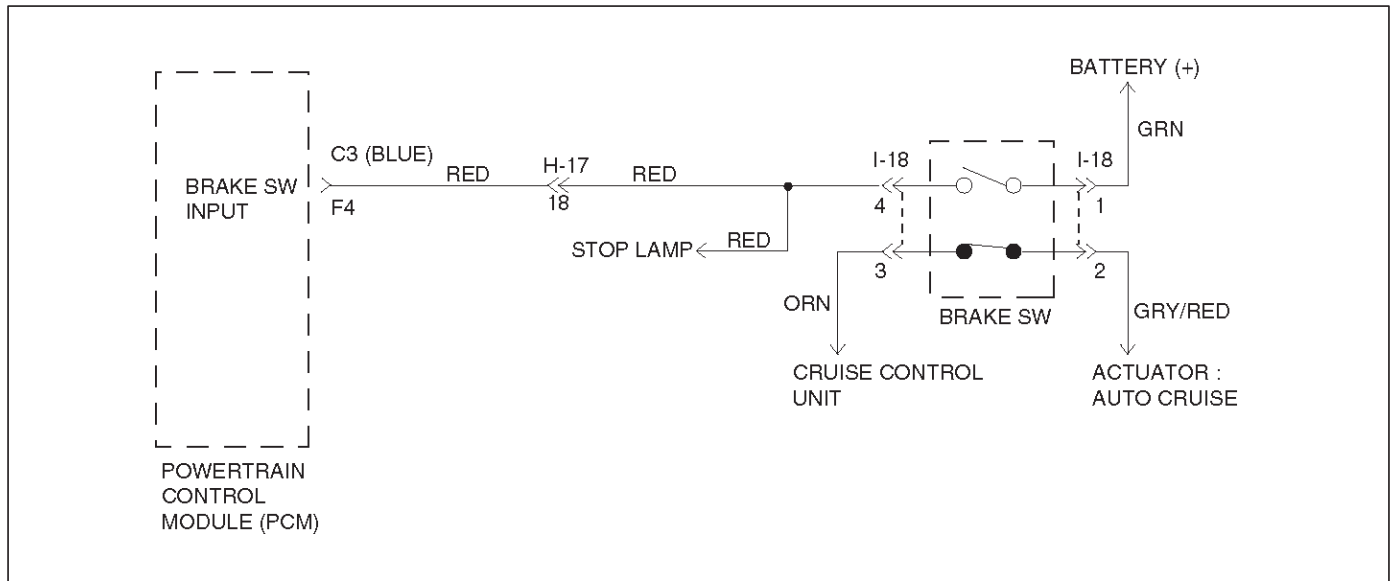

°C	°F	Resistance (kΩ)
-40	-40	672
0	32	65
20	68	25
80	176	2.5
120	248	0.78
150	304	0.37

DTC P0713/Flashing Code 76 Transmission Fluid Temperature (TFT) Sensor Circuit High Input

Step	Action	Yes	No
1	Perform the transmission fluid checking procedure. Refer to Checking Transmission Fluid Level and Condition in Automatic Transmission (4L30-E) section. Was the fluid checking procedure performed?	Go to Step 2	Refer to Checking Transmission Fluid Level and Condition in Automatic Transmission (4L30-E) section
2	1. Install the scan tool. 2. With the engine "off", turn the ignition switch "on". NOTE: Before clearing DTC(s), use the scan tool to record "Failure Records" for reference, as data will be lost when the "Clear Info" function is used. 3. Record the DTC "Failure Records". Does the scan tool display a TFT sensor signal voltage greater than 4.86 volts?	Go to Step 3	Go to Diagnostic Aids
3	1. Turn the ignition "off". 2. Disconnect the transmission 16-way connector H-10. 3. Install a fused jumper wire from terminal 3(C) to 5(D) on the engine harness. 4. Turn the ignition "on". Does the TFT signal voltage drop to less than 0.4 volts?	Go to Step 4	Go to Step 9
4	1. Turn the ignition "off". 2. Using the J39200 DVOM, measure the resistance between terminals 3(C) and 5(D). Is the resistance within specifications? (See Resistance Chart.)	Go to Diagnostic Aids	Go to Step 5
5	1. Disconnect the transmission 5-way connector M-6. 2. Using the J39200 DVOM, measure the resistance between terminals 3(C) and 5(D). Is the resistance within specifications? (See Resistance Chart.)	Go to Diagnostic Aids	Go to Step 6
6	1. Remove the transmission oil pan. 2. Check the internal wiring harness for an open. Refer to Transmission Oil Temperature Sensor (Adapter Case) in Automatic Transmission (4L30-E) section. Was a problem found and corrected?	Go to Step 13	Go to Step 7
7	1. Disconnect the internal wiring harness at the TFT sensor. 2. Measure the resistance of the TFT sensor. Is the resistance within specifications? (See Resistance Chart.)	Go to Diagnostic Aids	Go to Step 8

DTC P0713/Flashing Code 76 Transmission Fluid Temperature (TFT) Sensor Circuit High Input (Cont'd)

Step	Action	Yes	No
8	Replace TFT sensor. Refer to Transmission Oil Temperature Sensor (Adapter Case) in Automatic Transmission (4L30-E) section. Is the replacement complete?	Go to Step 13	—
9	Check circuit GRN/RED for an open or short to B+. Was a problem found?	Go to Step 13	Go to Step 10
10	Check circuit GRN for an open. Was a problem found?	Go to Step 13	Go to Step 11
11	Check the PCM for faulty or intermittent connections. Was a problem found?	Go to Step 13	Go to Step 12
12	Replace the PCM. Refer to Powertrain Control Module (PCM) in Automatic Transmission (4L30-E) section. Is the replacement complete?	Go to Step 13	—
13	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and ensure the following conditions are met: TFT sensor indicates a voltage less than 4.92 volts for 2 seconds. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0719/Flashing Code 77 TCC Brake Switch Circuit High (Stuck On)

D07RX019

Circuit Description

The brake switch is used to indicate brake pedal status. The normally opened brake switch signal voltage circuit is opened.

Brake switch supplies a B+ signal on circuit RED to the PCM, when the brakes are applied. The PCM uses this signal to deenergize the TCC solenoid when the brakes are applied.

This DTC detects a closed brake switch during accelerations. This is a type "D" DTC.

Conditions For Setting The DTC

- No OSS DTCs P0722 or P0723.
- The PCM detects a closed brake switch/circuit (12 volts) for 2 seconds, and the following events occur seven consecutive times: vehicle speed is less than 8 km/h (5 mph); then vehicle speed is between 8 and 32 km/h (5 and 20 mph) for 4 seconds; then vehicle speed is greater than 32 km/h (20 mph) for 4 seconds.

Action Taken When The DTC Sets

- If throttle opening is greater than 10% and vehicle speed is greater than 45 km/h (28 mph), then disregard brake switch contingency for TCC off mode.
- The PCM will not illuminate CHECK TRANS Lamp.

Conditions For Clearing The DTC

- The DTC can be cleared from the PCM history by using a scan tool.

- The DTC will be cleared from history when the vehicle has achieved 40 warm-up cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connections at the PCM and brake switch. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move or massage the wiring harness while observing test equipment for a change.
- Check customer driving habits and/or unusual driving conditions (i.e. stop and go, highway).
- Check brake switch for proper mounting and adjustment.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

2. This test checks for voltage at the brake switch.
5. This test checks the brake switch.
8. This test checks circuit RED at the PCM.

DTC P0719/Flashing Code 77 TCC Brake Switch Circuit High (Stuck On)

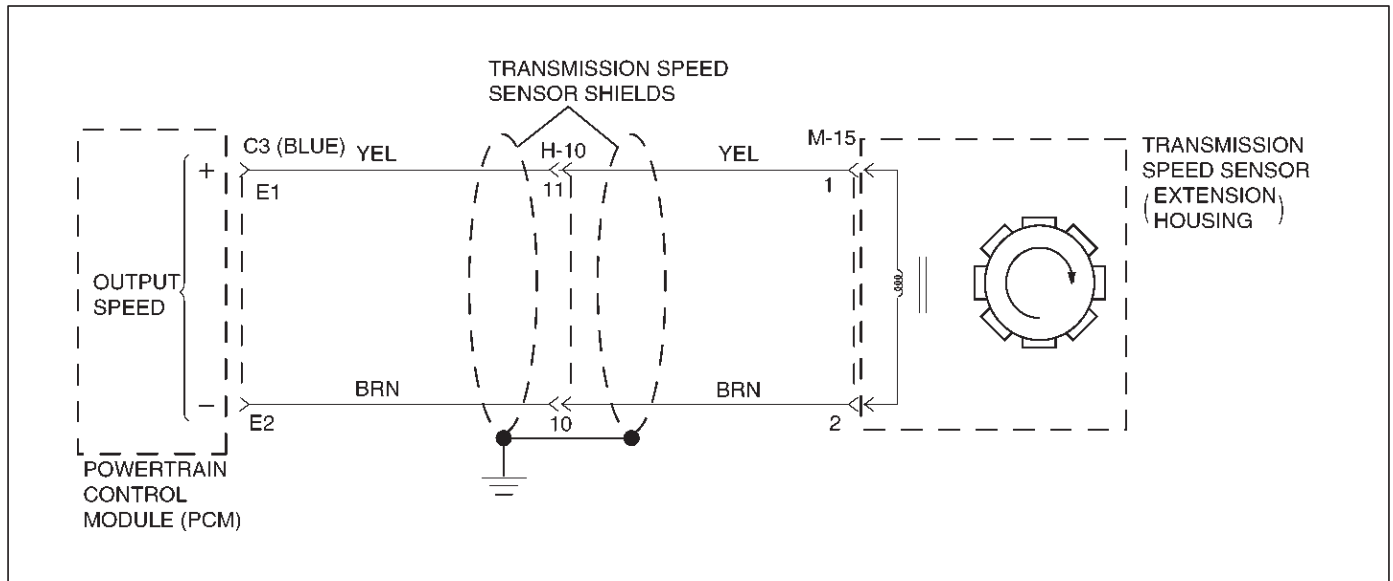

Step	Action	Yes	No
1	1. Install the scan tool. 2. With the engine "off", turn the ignition switch "on". If ABS code is set, check applicable fuse. NOTE: Before clearing DTC(s), use the scan tool to record "Failure Records" for reference, as data will be lost when the "Clear Info" function is used. 3. Record the DTC "Failure Records". 4. Apply then release the brake pedal. Does the scan tool display "Brake Switch" as "closed" with the brake pedal applied, and then display "open" when the brake pedal is released?	Go to Diagnostic Aids	Go to Step 2
2	1. Connect the test light to ground. 2. Back probe ignition feed circuit terminal I18-1 at the brake switch. Is the test light "on"?	Go to Step 3	Go to Step 4
3	1. Connect the test light to ground. 2. Back probe circuit terminal I18-4 at the brake switch. Is the test light "off"?	Go to Step 7	Go to Step 5
4	Repair the open in battery feed circuit terminal I18-1 to the brake switch. If fuse is open, check circuit terminal I18-4 for a short to ground. Is the repair complete?	Go to Step 13	—
5	Disconnect brake switch connector I-18 and ignition switch "on". Is the test light "on"?	Go to Step 8	Go to Step 6
6	Check the brake switch short (I18-1 and I18-4). Was a problem found?	Go to Step 9	Go to Step 10
7	Check circuit terminal I18-4 for a short to voltage. Ignition switch "on". Is the test light "on"?	Go to Step 8	Go to Step 10
8	1. Disconnect the C3 (BLUE) PCM connector. 2. Check circuit terminal I18-4 for a short to voltage. Was a problem found?	Go to Step 13	Go to Step 10
9	Replace the brake switch. Is the replacement complete?	Go to Step 13	—
10	1. Turn the ignition "off". 2. Reconnect the C3 (BLUE) PCM connector. 3. Turn the ignition "on". Does the scan tool display "Brake Switch" as "open" with the brake applied, then display "closed" with the brake pedal released?	Go to Diagnostic Aids	Go to Step 11
11	Check the PCM for faulty or intermittent connections. Was a problem found and corrected?	Go to Step 13	Go to Step 12

7A1-46 TRANSMISSION CONTROL SYSTEM (4L30-E)

DTC P0719/Flashing Code 77 TCC Brake Switch Circuit High (Stuck On) (Cont'd)

Step	Action	Yes	No
12	Replace the PCM. Refer to Powertrain Control Module (PCM) in Automatic Transmission (4L30-E) section. Is the replacement complete?	Go to Step 13	—
13	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and ensure the following conditions are met: The PCM brake switch signal must indicate 0 volts for 1 seconds with the brake pedal applied. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0722/Flashing Code 78 Transmission Output Speed Sensor (OSS) Low Input

D07RW022

Circuit Description

Output speed information is provided to the PCM by the OSS, which is a permanent magnet (PM) generator. The PM generator produces a pulsing AC voltage. The AC voltage level and number of pulses increases as the speed of the vehicle increases. The PCM then converts the pulsing voltage to output speed, which is used for calculations. The vehicle speed can be displayed with a scan tool.

This DTC detects a low output speed when there is a high engine speed in a drive gear range. This is a type "C" DTC.

Conditions For Setting The DTC

- No MAP DTCs P0107 or P0108, P0106, P1106, P1107.
- No TP DTCs P0122 or P0123.
- Not in Park or Neutral.
- TP angle is greater than 10%.
- Engine vacuum is between 0 and 70kPa.
- Engine speed is between 3000 and 7000 rpm.
- Transmission output speed is less than 0 rpm.
- All conditions met for 5 seconds.

Action Taken When The DTC Sets

- Fixed to 4th gear.
- Maximum line pressure.
- Inhibit TCC engagement.
- The PCM will illuminate the CHECK TRANS Lamp.

Conditions For Clearing The DTC/CHECK TRANS Lamp

- The PCM will turn off the CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool. The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

Diagnostic Aids

- An OSS DTC P0722 will set when no output speed is detected at start off.
- Inspect the wiring for poor electrical connection at the PCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move or massage the wiring harness while observing test equipment for a change.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

4. This test checks the OSS circuit.
5. This test checks the integrity of the OSS.
7. This test checks the 5-volt and ground circuit of the PCM.

7A1-48 TRANSMISSION CONTROL SYSTEM (4L30-E)

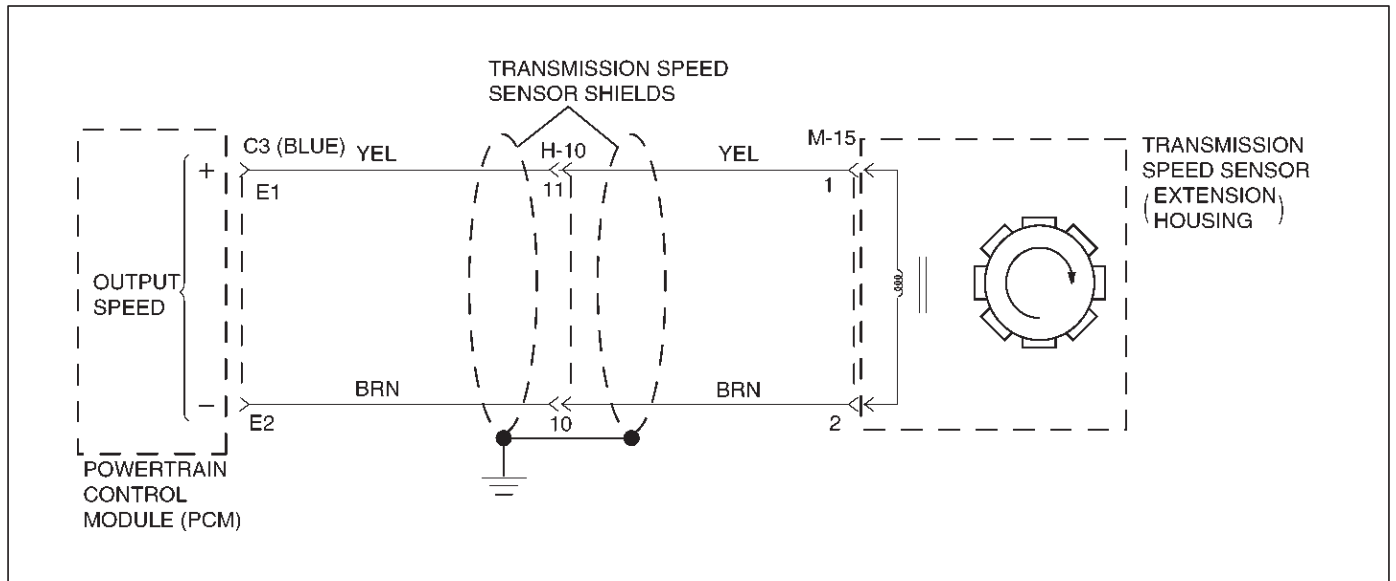

DTC P0722/Flashing Code 78 Transmission Output Speed Sensor (OSS) Low Input

Step	Action	Yes	No
1	<ol style="list-style-type: none"> 1. Install the scan tool. 2. With the engine "off", turn the ignition switch "on". <p>NOTE: Before clearing DTC(s), use the scan tool to record "Failure Records" for reference, as data will be lost when the "Clear Info" function is used.</p> <ol style="list-style-type: none"> 3. Record the DTC "Failure Records". 4. Raise the drive wheels. 5. Start the engine. 6. Place the transmission in any drive range. <p>With the drive wheels rotating, does the "Trans Output Speed" increase with the drive wheel speed?</p>	Go to Diagnostic Aids	Go to Step 2

DTC P0722/Flashing Code 78 Transmission Output Speed Sensor (OSS) Low Input (Cont'd)

Step	Action	Yes	No
15	Repair the short to B+ in circuit YEL. Is the repair complete?	Go to Step 17	—
16	Replace the PCM. Refer to Powertrain Control Module (PCM) in automatic Transmission (4L30-E) section. Is the replacement complete?	Go to Step 17	—
17	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and operate the vehicle under the following conditions: Transmission output speed is greater than 101 rpm for 3 seconds. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0723/Flashing Code 79 Transmission Output Speed Sensor (OSS) Intermittent

D07RW022

Circuit Description

Output speed information is provided to the PCM by the OSS, which is a permanent magnet (PM) generator. The PM generator produces a pulsing AC voltage. The AC voltage level and number of pulses increases as the speed of the vehicle increases. The PCM then converts the pulsing voltage to output speed, which is used for calculations. The vehicle speed can be displayed with a scan tool.

This DTC detects a low output speed when there is a high engine speed in a drive gear range. This is a type "C" DTC.

Conditions For Setting The DTC

In Park or Neutral:

- Transmission output speed change is greater than 10000 rpm.
- Conditions met for 6 seconds.
- Engine running time is greater than 2 seconds.

Not in Park or Neutral:

- Transmission output speed change is greater than 512 rpm.
- Conditions met for 0.075 seconds
- Engine running time is greater than 2 seconds.
- Engine vacuum is less than 70 kPa.
- Output speed is greater than 1380 rpm for 1 second.
- NORAW-NOLAST < 60 rpm for 6 seconds.
 - NORAW: Latest raw data of output shaft speed.
 - NOLAST: Filtered previous data of output speed.

Action Taken When The DTC Sets

- Fixed to 4th gear.
- Maximum line pressure.
- Inhibit TCC engagement.

- The PCM will illuminate the CHECK TRANS Lamp.

Conditions For Clearing The DTC/CHECK TRANS Lamp

- The PCM will turn off the CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

Diagnostic Aids

- A OSS DTC P0723 will set when output speed has been detected and is lost.
- Inspect the wiring for poor electrical connection at the PCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

4. This test checks the OSS circuit.
5. This test checks the integrity of the OSS.
7. This test checks the 5-volt and ground circuit of the PCM.

D07RT05

Circuit Description

- The Powertrain Control Module (PCM) calculates the slippage of the converter and transmission based upon the engine speed, the output speed, and the current gear ratio.
- The slippage of the converter at a high enough engine speed is low. The transmission should not slip more than a given value when there is no shift.
- This DTC detects a slip at each gear. This is a type "C" DTC.

Conditions For Setting The DTC

- No Output Speed Sensor DTC(s) P0722, P0723.
- Not in Park, Neutral or Reverse.
- Engine speed is greater than 3500 rpm.

- 3 seconds since upshift.
- 3 seconds since downshift.
- 3 seconds since garage shift (N→D).
- And one of the following conditions occur:
 - Slip is greater than 753 rpm in 1st gear.
 - Slip is greater than 713 rpm in 2nd gear.
 - Slip is greater than 694 rpm on 3rd gear.
 - Slip is greater than 685 rpm on 4th gear.
- All conditions met for 5.5 seconds.

Action Taken When The DTC Sets

- Maximum line pressure.
- The PCM will illuminate the CHECK TRANS Lamp.

Conditions For Clearing The DTC/CHECK TRANS Lamp

- The PCM will turn “off” the CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from PCM memory by using a scan tool. The DTC can also be cleared from memory when the vehicle has made 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC Actions Taken items when the fault conditions no longer exist and the ignition is cycles “off” long enough to power down the PCM.

Diagnostic Aids

- Check for intermittent output speed sensor circuit problems.
- Check for possible incorrect calibration. (PCM part No., tire specifications, and rear axle ratio)

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

2. This step checks for possible low fluid level causing slipping resulting in an undefined gear ratio.
3. This step checks for correct gear ratios for commanded gears.
4. This step checks for low line pressure.

DTC P0730/Flashing Code 81 Transmission Incorrect Gear Ratio

DTC P0748/Flashing Code 82 Pressure Control Solenoid (PCS) (Force Motor) Circuit Electrical

Circuit Description

The PCS is a PCM-controlled device used to regulate transmission line pressure. The PCM compares TPS voltage, engine rpm, and other inputs to determine the line pressure appropriate for a given load. The PCM will regulate the pressure by applying a varying amperage to the PCS. The applied amperage can vary from 0.1 to 1 amp, and is monitored by the PCM.

This DTC detects a continuous open or short to ground in the PCS circuit or the PCS. This is a type "C" DTC.

Conditions For Setting The DTC

- Battery voltage is between 10 and 16 volts.
- The PCM detects that the difference between commanded and actual current is 200 milliamperes (mA) for over 1 second.

Action Taken When the DTC Sets

- Maximum line pressure.
- The PCM will illuminate the CHECK TRANS Lamp.

Conditions For Clearing The DTC/CHECK TRANS Lamp

- The PCM will turn "off" the CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from PCM history by using a scan tool.

- The DTC will be cleared from memory when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the PCM and at the transmission 5-way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Test Description

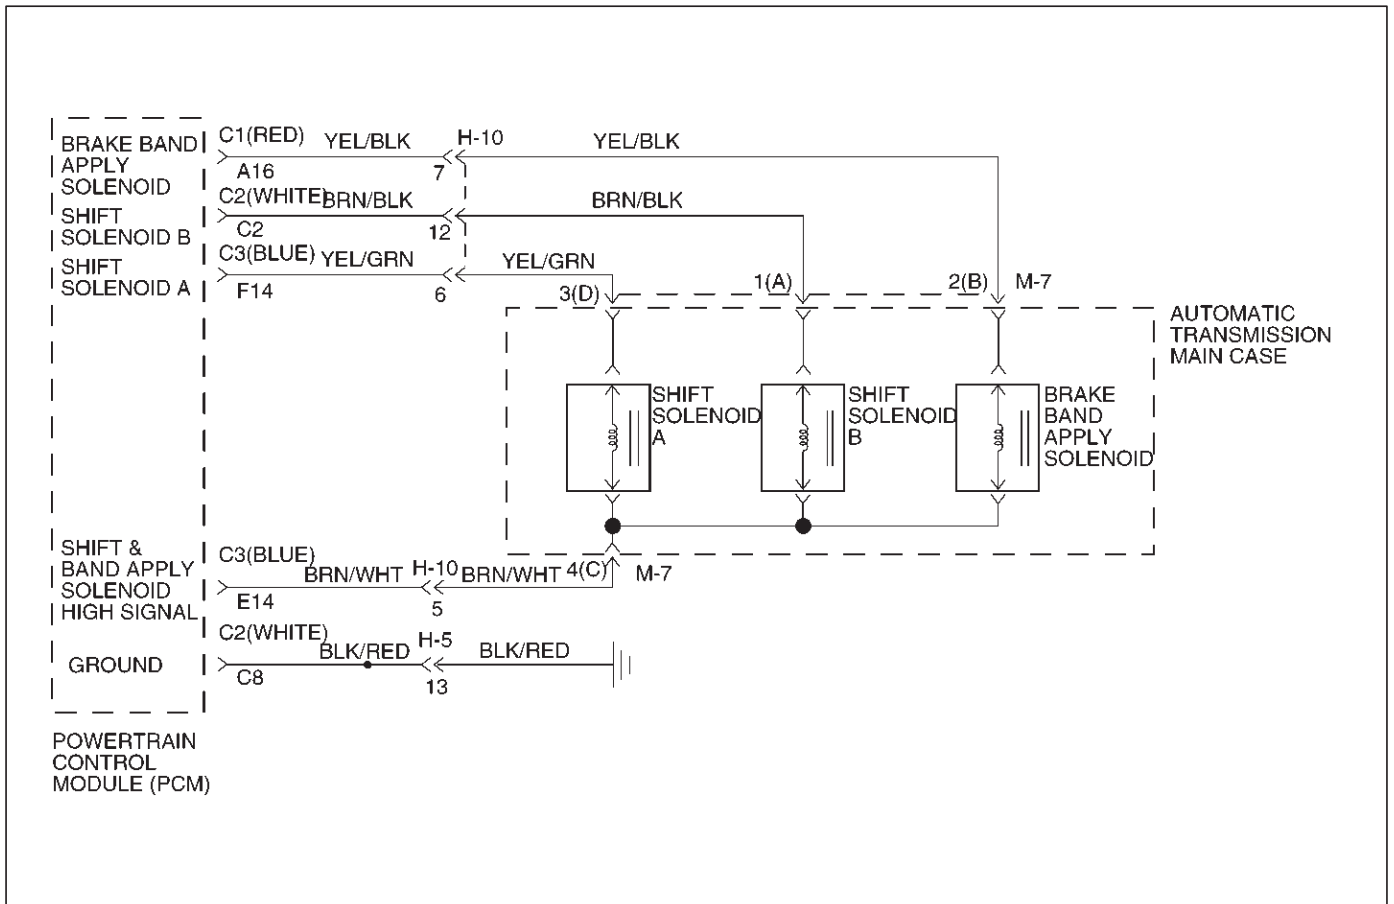

The numbers below refer to the step numbers on the diagnostic chart:

1. This test checks the ability of the PCM to command the PCS.
2. This test checks the PCS and internal wiring harness for incorrect resistance.

DTC P0748/Flashing Code 82 Pressure Control Solenoid (PCS) (Force Motor) Circuit Electrical

Step	Action	Yes	No
1	1. Install the scan tool. 2. With the engine "off", turn the ignition switch "on". NOTE: Before clearing DTC(s), use the scan tool to record "Failure Records" for reference, as data will be lost when the "Clear Info" function is used. 3. Record the DTC "Failure Records". 4. While the engine is operating, put the transmission in Park. 5. Using the scan tool, apply 0.1 amp through 1.0 amp while observing "PC Ref. Current" and "PC Act. Current". Is the "PC Act. Current" reading always within 0.16 amp?	Go to Diagnostic Aids	Go to Step 2
2	1. Turn the ignition "off". 2. Disconnect the transmission 5-way connector M-6. 3. Using the J39200 DVOM, measure the resistance between terminals M6-2(B) and M6-1(E). Is the resistance within 3-7 ohms?	Go to Step 6	Go to Step 3
3	1. Remove the transmission oil pan. Refer to Solenoid (Adapter Case Valve Body) in Automatic Transmission (4L30-E) section. 2. Disconnect the internal wiring harness at the PCS. 3. Measure the resistance of the PCS. Is the resistance within 3-7 ohms?	Go to Step 5	Go to Step 4
4	Replace the PCS. Is the replacement complete?	Go to Step 9	—
5	Repair the internal wiring harness for an open. Is the repair complete?	Go to Step 9	—
6	Inspect/repair circuits C3-E4, M6-2(B), C3-E3, M6-1(E). Was a problem found?	Go to Step 9	Go to Step 7
7	Inspect/repair circuits C3-E4, M6-2(B), C3-E3, M6-1(E) for a short to ground or poor connections. Was a problem found?	Go to Step 9	Go to Step 8
8	Replace the PCM. Refer to Powertrain Control Module (PCM) in Automatic Transmission (4L30-E) section. Is the replacement complete?	Go to Step 9	—
9	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and ensure the following conditions are met: The PCS duty cycle is not at its electrical high or low limit. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0753/Flashing Code 83 Shift Solenoid A Electrical

D07RW014

Circuit Description

- The shift solenoid A is a simple on/off solenoid located in the main case valve body. The solenoid is the normally closed type. In second or third gear the Powertrain Control Module (PCM) energizes the solenoid to open a fluid inlet port. When the port is open, fluid pressure actuates the shift valve.
- The solenoid is activated by a current. This current is produced by applying a voltage to one side (the High side) and a ground to the other side (Low side).
- The High Side Driver (HSD) is a circuit of the PCM that acts as a switch between the solenoids and the supply voltage. The High side of the solenoid is permanently supplied with voltage, except in BACKUP MODE or when ignition is off the HSD is turned off.

This DTC detects a continuous open or short to ground in the shift solenoid A circuit or the shift solenoid A. This is a type "C" DTC.

Conditions For Setting The DTC

- Ignition is "on", Engine "run".
- Battery voltage is between 10 and 16 volts.
- The PCM commands the solenoid "on" and the voltage remains high (B+), or the PCM commands the solenoid "off" and the voltage remains low (zero volts).
- All conditions met for 0.33 seconds.

Action Taken When The DTC Sets

- Maximum line pressure.
- Immediate landing to 4th gear.
- Inhibit TCC engagement.
- The PCM will illuminate the CHECK TRANS Lamp.

Conditions For Clearing The DTC/CHECK TRANS Lamp

- The PCM will turn off the CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the PCM and at the transmission 16-way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.

- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- An open ignition feed circuit can cause multiple DTCs to set.
- A shift solenoid B DTC P0756 could also set with a shift solenoid A electrical failure.

- 4. This test measures the resistance of the component.
- 8. This test checks the function of the shift solenoid A and the transmission internal wiring harness.

Shift Solenoid Status Chart

Gear	Shift solenoid A	Shift solenoid B
1st	OFF	ON
2nd	ON	ON
3rd	ON	OFF
4th	OFF	OFF

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

- 2. This test checks for power to the shift solenoid A from the ignition through the PCM.

DTC P0753/Flashing Code 83 Shift Solenoid A Electrical

Step	Action	Yes	No
1	1. Install the scan tool. 2. With the engine "on", turn the ignition switch "on". NOTE: Before clearing DTC(s), use the scan tool to record "Failure Records" for reference, as data will be lost when the "Clear Info" function is used. 3. Record the DTC "Failure Records". Were DTCs P0753, P0758, P1860 set?	Go to Step 2	Go to Diagnostic Aids
2	1. Turn the ignition "on". 2. Using the J39200 DVOM, measure the voltage between PCM connector terminals C3-E14 and C2-C8 (GND). Is the voltage within 10-12 volts?	Go to Step 3	Go to Step 4
3	1. Turn the ignition "off". 2. Disconnect the C3 (BLUE) PCM connector. 3. Turn the ignition "on". 4. Using the J39200 DVOM, measure the voltage between PCM connector terminals C3-F14 and ground. Is the voltage within 10 - 12 volts?	Go to Step 10	Go to Step 4
4	1. Turn the ignition "off". 2. Disconnect the C3 (BLUE) PCM connector. 3. Using the J39200 DVOM, measure the resistance between PCM connector terminals C3-E14 and C3-F14. Is the resistance within 18 - 20 ohms?	Go to Step 5	Go to Step 6
5	1. Disconnect the C1 (RED) and C2 (WHITE) PCM connectors. 2. Using the J39200 DVOM, check a continuity between PCM terminals C3-F14 and ground. Is there a continuity?	Go to Step 11	Go to Step 7
6	1. Disconnect the 16-way harness connector H-10. 2. Using the J39200 DVOM, measure the resistance between terminals H10-6 and H10-5. Is the resistance within 18-20 ohms?	Go to Step 13	Go to Step 8
7	Using the J39200 DVOM, check a continuity between C3 (BLUE) PCM terminal E14 and ground. Is there a continuity?	Go to Step 12	Go to Step 9
8	1. Disconnect the transmission main case 4 pin connector M-7. 2. Using the J39200 DVOM, measure the resistance between terminals M7-3(D) and M7-4(C). Is the resistance within 18-20 ohms?	Go to Step 14	Go to Step 15

7A1-60 TRANSMISSION CONTROL SYSTEM (4L30-E)

18	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and operate the vehicle under the following conditions: <ul style="list-style-type: none"> • The shift solenoid A is commanded "on" and the voltage drops to zero. • The shift solenoid A is commanded "off" and the voltage increases to B+. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P0758/Flashing Code 84 Shift Solenoid B Electrical

D07RW014

Circuit Description

- The shift solenoid B is a simple on/off solenoid located in the main case valve body. It is normally open. When the port is open, fluid pressure actuates the shift valve. In first or second gear, the Powertrain Control Module (PCM) energizes the solenoid to close a fluid inlet port.
- The solenoid is activated by current. This current is produced by applying a voltage to one side (the High side) and a ground to the other side (Low side).
- The High Side Driver (HSD) is a circuit of the PCM that acts as a switch between the solenoids and the supply voltage. The High side of the solenoid is permanently supplied with voltage. In BACKUP MODE or when the ignition is off, the HSD is turned off.

This DTC detects a continuous open or short to ground in the shift solenoid B circuit or shift solenoid B. This is a type "C" DTC.

Conditions For Setting The DTC

- Ignition is "on", Engine "run".
- Battery voltage is between 10 and 16 volts.
- The PCM commands the solenoid "on" and the voltage remains high (B+), or the PCM commands the solenoid "off" and the voltage remains low (zero volts).
- All conditions met for 0.33 seconds.

Action Taken When The DTC Sets

- Fixed to 4th gear.
- Maximum line pressure.
- Inhibit TCC engagement.
- The PCM will illuminate the CHECK TRANS Lamp.

Conditions For Clearing The DTC/CHECK TRANS Lamp

- The PCM will turn off the CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connections at the PCM and at the transmission 16-way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.

7A1-62 TRANSMISSION CONTROL SYSTEM (4L30-E)

- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Shift Solenoid Status Chart

Gear	Shift solenoid A	Shift solenoid B
1st	OFF	ON
2nd	ON	ON
3rd	ON	OFF
4th	OFF	OFF

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

- This test measures the resistance of the component.
- This test checks the function of the shift solenoid B and the transmission internal wiring harness.
- This test checks for power to the shift solenoid B from the ignition through the PCM.

DTC P0758/Flashing Code 84 Shift Solenoid B Electrical

Step	Action	Yes	No
1	<ol style="list-style-type: none"> Install the scan tool. DTC P0758/Flashing Code 84 Shift Solenoid B Electrical (Cont'd)

Step	Action	Yes	No
9	1. Disconnect the transmission 16-way connector H-10. 2. Using the J39200 DVOM, measure the resistance between terminals H10-12 and H10-5. Is the resistance within 18-20 ohms?	Go to Step 20	Go to Step 11
10	Using the J39200 DVOM, check a continuity between PCM connector terminal C3-E14 and ground. Is there a continuity?	Go to Step 21	Go to Step 12
11	1. Disconnect the transmission main case connector M-7. 2. Using the J39200 DVOM, measure the resistance between terminals M7-1(A) and M7-4(C). Is the resistance within 18 - 20 ohms?	Go to Step 22	Go to Step 23
12	Check every connection of the PCM and transmission 16-way connector H-10. Was a problem found and corrected?	Go to Step 25	Go to Step 13
13	1. Connect the C2 (WHITE) and C3 (BLUE) PCM connectors to the PCM. 2. Turn the ignition "on", the engine "on". 3. Repeat Step 2. Does the scan tool display DTC P0758 at 3rd gear?	Go to Step 24	Go to Diagnostic Aids
14	The wiring harness between PCM connector terminal C2-C2 and transmission main case terminal M7-1(A) is shorted to voltage. Was a problem found and corrected?	Go to Step 25	—
15	The PCM internal terminal C2-C2 is shorted to voltage. Replace the PCM. Refer to Powertrain Control Module (PCM) in Automatic Transmission (4L30-E) section. Is the replacement complete?	Go to Step 25	—
16	The wiring harness between PCM connector and transmission 16-way connector is shorted. Was a problem found and corrected?	Go to Step 25	—
17	The wiring harness between transmission 16-way connector and transmission main case connector is shorted. Was a problem found and corrected?	Go to Step 25	—
18	The shift solenoid B is faulty, or the internal wiring harness from the shift solenoid B is shorted. Was a problem found and corrected?	Go to Step 25	—
19	The wiring harness between PCM connector terminal C2-C2 and transmission main case connector terminal M7-1(A) is shorted to ground. Was a problem found and corrected?	Go to Step 25	—
20	The wiring harness between PCM connector terminal C2-C2 and transmission 16-way connector terminal H10-12, or between PCM connector terminal C3-E14 and 16-way connector terminal H10-5 is open. Was a problem found and corrected?	Go to Step 25	—

7A1-64 TRANSMISSION CONTROL SYSTEM (4L30-E)

DTC P0758/Flashing Code 84 Shift Solenoid B Electrical (Cont'd)

Step	Action	Yes	No
21	The wiring harness between PCM connector terminal C3-E14 and transmission main case connector terminal M7-4(C) is shorted to ground. Was a problem found and corrected?	Go to Step 25	—
22	The wiring harness between transmission 16-way connector terminal H10-12 and transmission main case connector terminal M7-1(A), or between H10-5 and M7-4(C) is open. Was a problem found and corrected?	Go to Step 25	—
23	The internal wiring harness from the shift solenoid B is open, or the shift solenoid B is faulty. Was a problem found and corrected?	Go to Step 25	—
24	Replace the PCM. Is the replacement complete?	Go to Step 25	—
25	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and operate the vehicle under the following conditions: <ul style="list-style-type: none"> ● The shift solenoid B is commanded "on" and voltage drops to zero. ● The shift solenoid B is commanded "off" and voltage increases to B+. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P1790/Flashing Code 85 ROM Transmission Side Bad Check Sum

Circuit Description

Transmission Side Read Only Memory (ROM) and Electronically Erasable Programmable Read Only Memory (EEPROM) is an electronic circuit that controls the transmission controls in the Powertrain Control Module (PCM).

This DTC detects a check sum error. This is a type "C" DTC.

Conditions For Setting The DTC

- Detects check sum error for 1 second.

Action Taken When The DTC Sets

- Maximum line pressure.
- Immediate landing to 4th gear.
- Inhibit TCC engagement.

- The PCM will illuminate the CHECK TRANS Lamp.

Conditions For Clearing The DTC/CHECK TRANS Lamp

- The PCM will turn off the CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

DTC P1790/Flashing Code 85 ROM Transmission Side Bad Check Sum

Step	Action	Yes	No
1	1. Install the scan tool. 2. With the engine "off", turn the ignition switch "on". NOTE: Before clearing DTC(s), use the scan tool to record "Failure Records" for reference, as data will be lost when the "Clear Info" function is used. 3. Record the DTC "Failure Records". Was DTC P1790 set?	Go to Step 4	Go to Step 2
2	Was DTC P1792 set?	Go to Step 3	—
3	1. Remove the PCM. Refer to Powertrain Control Module (PCM) in Automatic Transmission (4L30-E) section. 2. Using the ITCS reprogram the transmission EEPROM. Was the reprogramming complete?	Go to Step 5	—
4	Replace the PCM. Is the replacement complete?	Go to Step 5	—
5	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and operate the vehicle. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

7A1-66 TRANSMISSION CONTROL SYSTEM (4L30-E)

DTC P1792/Flashing Code 86 EEPROM Transmission Side Bad Check Sum

Circuit Description

Transmission Side Read Only Memory (ROM) and Electronically Erasable Programmable Read Only Memory (EEPROM) is an electronic circuit that controls the transmission controls in the Powertrain Control Module (PCM).

This DTC detects a check sum error. This is a type "C" DTC.

Conditions For Setting The DTC

- Detects check sum error for 1 second.

Action Taken When The DTC Sets

- Maximum line pressure.
- Immediate landing to 4th gear.
- Inhibit TCC engagement.

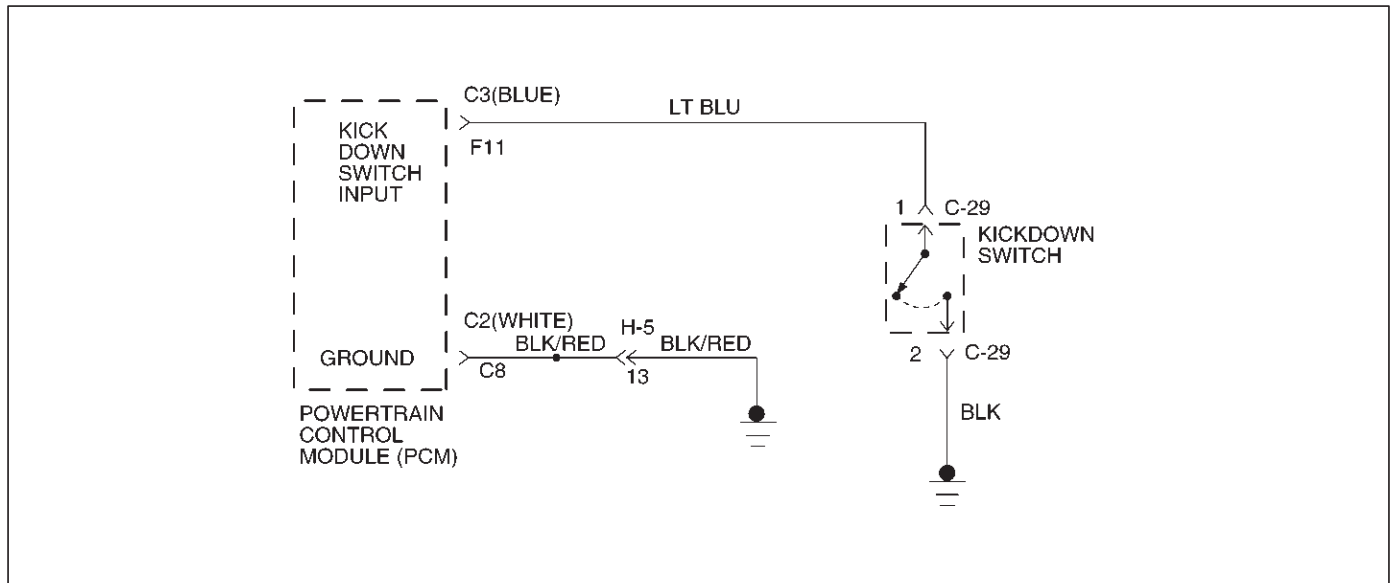

- The PCM will illuminate the CHECK TRANS Lamp.

Conditions For Clearing The DTC/CHECK TRANS Lamp

- The PCM will turn off the CHECK TRANS Lamp after three consecutive ignition cycles without a failure reported.
- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

DTC P1792/Flashing Code 86 EEPROM Transmission Side Bad Sum

Step	Action	Yes	No
1	1. Install the scan tool. 2. With the engine "off", turn the ignition switch "on". NOTE: Before clearing DTC(s), use the scan tool to record "Failure Records" for reference, as data will be lost when the "Clear Info" function is used. 3. Record the DTC "Failure Records". Was DTC P1790 set?	Go to Step 4	Go to Step 2
2	Was DTC P1792 set?	Go to Step 3	—
3	1. Remove the PCM. Refer to Powertrain Control Module (PCM) in Automatic Transmission (4L30-E) section. 2. Using the ITCS reprogram the transmission EEPROM. Was the reprogramming complete?	Go to Step 5	—
4	Replace the PCM. Is the replacement complete?	Go to Step 5	—
5	1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and operate the vehicle. 2. Review the scan tool "DTC Info". Has the last test failed or is the current DTC displayed?	Begin diagnosis again Go to Step 1	Repair verified Exit DTC table

DTC P1835/Flashing Code 87 Kickdown Switch Always On

D07RW015

Circuit Description

- When the driver presses the accelerator pedal down fully, the kickdown switch closes, sending a ground signal to the Powertrain Control Module (PCM).
- This information is used to perform shifts at high engine speed.
- When the kickdown switch is closed, the Throttle Position Sensor (TPS) is already at 100%.
- This DTC detects a closed kickdown switch when TP angle is less than 70%.
- This is a type "D" DTC.

Conditions For Setting The DTC

- No TP DTCs P0122 or P0123.
- TP angle is less than 70%.
- Kickdown switch is "on".
- All conditions met for 1 second.

Action Taken When The DTC Sets.

- Kickdown mode control is off.
- The PCM will not illuminate the CHECK TRANS Lamp.

Conditions For Clearing The DTC

- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

Diagnostic Aids

- Check the wiring harness for a short to ground between the PCM and kickdown switch.
- Check the kickdown switch for failure.
- Check kickdown adjustment.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

1. This test checks for short to ground or kickdown switch failure.
3. This test checks for regulation kickdown switch.

7A1-68 TRANSMISSION CONTROL SYSTEM (4L30-E)

Record the DTC "Failure Records".</p> <p>Does the scan tool display "Kickdown switch" "low" (closed switch)?</p>	Go to Step 2	Go to Step 3
2	<p>1. Turn the ignition "off". 2. Disconnect the C3 (BLUE) PCM connector. 3. Using the J39200 DVOM, check a continuity between PCM connector terminal C3-F11 and ground.</p> <p>Is there a continuity?</p>	Go to Step 4	Go to Step 7
3	<p>The TP angle goes from 0% to 100% with the accelerator pedal depressed.</p> <p>Does the kickdown switch "on" when TP angle is below 70%?</p>	Go to Step 5	Go to Diagnostic Aids
4	<p>1. Disconnect the kickdown switch connector C-29. 2. Using the J39200 DVOM, check a continuity between terminals C29-1 and C29-2.</p> <p>Is there a continuity?</p>	Go to Step 6	Go to Step 8
5	<p>Adjust the kickdown switch.</p> <p>Does the kickdown switch "on" when TP angle is above 95%?</p>	Go to Step 9	—
6	<p>Replace the kickdown switch.</p> <p>Is the replacement complete?</p>	Go to Step 9	—
7	<p>Replace the PCM. Refer to Powertrain Control Module (PCM) in Automatic Transmission (4L30-E) section.</p> <p>Is the replacement complete?</p>	Go to Step 9	—
8	<p>Repair the short to ground in circuit LT BLUE.</p> <p>Is the repair complete?</p>	Go to Step 9	—
9	<p>1. After the repair is complete, use the scan tool to select "DTC", then "Clear Info" function and ensure the following condition is met: The torque converter stator temperature switch circuit does not indicate a hot mode when the transmission fluid temperature is less than 60°C (140°F) for at least 5 seconds.</p> <p>2. Review the scan tool "DTC Info".</p> <p>Has the last test failed or is the current DTC displayed?</p>	<p>Begin diagnosis again Go to Step 1</p>	<p>Repair verified Exit DTC table</p>

DTC P1850/Flashing Code 88 Brake Band Apply Solenoid Malfunction

D07RW014

Circuit Description

- The brake band apply solenoid is a normally open solenoid which controls the flow of fluid for brake band application. The Powertrain Control Module (PCM) uses Pulse Width Modulation (PWM) and changes the duty cycle to control the solenoid. The PCM turns the solenoid on (energized) and off (deenergized) at a constant frequency. The length of time the solenoid is energized during each on/off cycle is called the pulse width. By varying or "modulating" the pulse width, the solenoid output pressure is changed. Since the solenoid is normally open, increasing the pulse width increases the duty cycle and decreases the output pressure. PWM control provides smooth band application without an accumulator. The band is only applied in first and second gears.
- In the event of an electrical failure (open), the solenoid regulates at the maximum oil flow (0% duty cycle).
- The solenoid is activated by a current. This current is produced by applying a voltage to one side (the High side) and a ground to the other side (Low side).
- The High Side Driver (HSD) is a circuit of the PCM that acts as a switch between the solenoids and the supply voltage. The High side of the solenoid is permanently supplied with voltage. When the ignition is off, the HSD is turned off.

This DTC detects a continuous open or short to ground in the brake band apply solenoid circuit or the brake band apply solenoid. This is a type "D" DTC.

Conditions For Setting The DTC

- Battery voltage is between 10 and 16 volts.
- Ignition is "on", Engine "run".
- The PCM commands the solenoid "on" and the voltage remains high (B+), or the PCM commands the solenoid "off" and the voltage remains low (zero volts).
- All conditions met in 1.3 seconds.

Action Taken When The DTC Sets

- Inhibit brake band apply solenoid.
- The PCM will not illuminate the CHECK TRANS Lamp.

Conditions For Clearing The DTC

- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled "off" long enough to power down the PCM.

7A1-70 TRANSMISSION CONTROL SYSTEM (4L30-E)

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the PCM and at the transmission 16-way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

2. This test checks for power to the brake band apply solenoid from the ignition through the PCM.
3. This test checks the resistance of the transmission internal wiring harness and brake band apply solenoid.
4. This test checks the ability of the PCM and wiring to control the ground circuit.

DTC P1860/Flashing Code 89 TCC Solenoid Electrical

D07RW016

Circuit Description

The PCM allows current to flow through the solenoid coil. This current flow through the solenoid coil creates a magnetic field that magnetizes the solid core. The magnetized core attracts the check ball to seat against spring pressure. This blocks the exhaust for the TCC signal fluid and allows 2–3 drive fluid to feed to TCC signal circuit. The TCC signal fluid pressure acts on the TCC regulator valve to regulate line pressure and to apply fluid pressure to the torque converter clutch shift valve. When the TCC shift valve is in the apply position, regulated apply fluid pressure is directed through the TCC valve to apply the torque converter clutch. The TCC solenoid is used in conjunction with the TCC solenoid to regulate fluid to the torque converter. The TCC solenoid is attached to the valve body within the transmission. This DTC detects a continuous open or short to ground or ignition in the TCC circuit or the TCC solenoid. This is a type “D” DTC.

Conditions For Setting The DTC

- Battery voltage is between 10 and 16 volts.
- No shift solenoid A DTCs P0753.
- No shift solenoid B DTCs P0758.
- Ignition “on”. Engine “run”.
- The PCM commands the solenoid “on” and the voltage remains low (zero volts).
- The PCM commands the solenoid “off” and the voltage remains high (B+).
- All conditions met for 0.25 seconds.

Action Taken When The DTC Sets

- Inhibit TCC engagement.

- The PCM will not illuminate the CHECK TRANS Lamp.

Conditions For Clearing The DTC

- The DTC can be cleared from the PCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warmup cycles without a failure reported.
- The PCM will cancel the DTC default actions when the fault no longer exists and the ignition is cycled “off” long enough to power down the PCM.

Diagnostic Aids

- Inspect the wiring for poor electrical connections at the PCM and at the transmission 16-way connector. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Test Description

The numbers below refer to the step numbers on the diagnostic chart:

2. This test checks for voltage to the solenoid.
3. This test checks the ability of the PCM and wiring to control the ignition circuit.
8. This test checks the resistance of the TCC solenoid and the internal wiring harness.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

MUA5C Transmission

For 6VD1

For X22SE

A07RX006

The MUA5C is a constant mesh transmission, synchronized in all speeds. The transmission is designed for a great reduction of the shift effort and the quietest possible operation.

Principle parts of the transmission are the integral clutch housing, intermediate plate, the transfer case, the rear cover, and the gears.

The transmission control box and transfer control box are built into the transmission and transfer case.

Diagnosis (MUA)

Condition	Possible cause	Correction
Abnormal noise	Flywheel pilot bearing worn	Replace
	Bearings worn or broken (Mainshaft, counter shaft, and transfer shaft)	Replace
	Gear tooth contact surfaces worn or scuffed (Mainshaft, counter shaft, reverse idler gear and transfer gears)	Replace
	Splines worn (Mainshaft, synchronizer clutch hub)	Replace
	Gear or bearing thrust face seized	Replace
	Lack of backlash between meshing gears	Replace
Hard Shifting	Improper clutch pedal free play	Readjust
	Change lever sliding portions worn	Repair or replace Regrease
	Shift block, shift rod and/or control box sliding faces worn	Replace
	Shift arm and synchronizer sleeve groove worn	Replace worn parts
	Thrust washer, collar, and/or gear thrust faces worn (Mainshaft and counter shaft thrust play)	Replace worn parts
	Synchronizer parts worn	Replace
Walking or Jumping out of gear	Detent ball worn	Replace
	Detent spring weakened or broken	Replace
	Shift rod and/or control box sliding faces worn	Replace
	Shift arm and synchronizer sleeve groove worn	Replace worn parts
	Thrust washer, collar, and/or gear thrust faces worn (Mainshaft and counter shaft thrust play)	Replace worn parts
	Bearings worn or broken	Replace
	Splines worn (Mainshaft, synchronizer hub)	Replace
	Synchronizer spring weakened or broken	Replace
Oil leakage	Loose drain plug(s) and/or filler plug(s)	Tighten Replenish oil
	Defective or improperly installed gasket(s)	Replace
	Oil seal worn or scratched	Replace

Transmission (MUA)

Removal

NOTE: Before removing transmission assembly from vehicle, change the transfer mode to 2WD using the 4WD push button on dash panel.

1. Disconnect battery ground cable.
2. Remove gear control lever knob(1).
3. Remove transfer control lever knob(2).

7B-6 MANUAL TRANSMISSION

4. Remove lower cluster assembly.

740RW021

6. Remove center console(3).

F07RW018

5. Remove rear console.

256RW045

7. Remove grommet assembly(4).

F07RW016

- 8. Remove gear control lever(5) and transfer control lever(5).
- 9. Raise and support vehicle with suitable stands. Remove transfer protector(6).

150RX010

- 10. Remove rear propeller shaft(7).

NOTE: Apply alignment marks on the flange at both front and rear sides.

401RW008

- 11. Remove front propeller shaft(8).

NOTE: Apply alignment marks on the flange at both front and rear sides.

401RW007

- 12. Remove center exhaust pipe(9) (6VD1).

150RX009

7B-8 MANUAL TRANSMISSION

13. Loosen the exhaust pipe nuts at the exhaust manifold side (X22SE).

14. Disconnect transmission harness connectors and clip.

Connector: Transfer switch, 2-4 actuator, speed sensor, back up switch 1-2 indicator switch (6VD1) and 3-4 indicator switch (6VD1).

15. Remove transmission harness clamps(10) from the transmission case and bracket.

16. Remove harness heat protector(11) (6VD1).

17. Remove slave cylinder(12) and flexible hose fixing bracket (X22SE).

18. Remove dust covers(13) (6VD1).

19. Support transmission with a transmission jack.

20. Remove engine rear mount nuts(14) from third crossmember.

21. Remove third crossmember(15) by removing six fixing bolts.

22. Remove starter(16) (6VD1).

23. Remove flywheel under cover(17). 6VD1:3 pieces, X22SE:1 piece.

24. Use clutch release bearing remover 5-8840-2291-0 to disconnect the clutch release bearing from the clutch pressure plate (6VD1).

220RW109

25. Pull the shift fork toward the transmission to press the clutch release bearing against the clutch pressure plate (6VD1).

26. Insert the clutch release bearing remover 5-8840-2291-0 between the wedge collar and the release bearing (6VD1).

NOTE: Be sure not to insert the remover between the wedge collar and the clutch.

220RS003

7B-10 MANUAL TRANSMISSION

27. Turn the remover to separate the release bearing (6VD1).

28. Remove the front skid plate and then remove one right side bolt from the front (X22SE).
29. Remove transmission retaining nut and bolts(18). Remove transmission(19) from the vehicle.

6. Align the top gear shaft spline with the clutch driven plate spline.

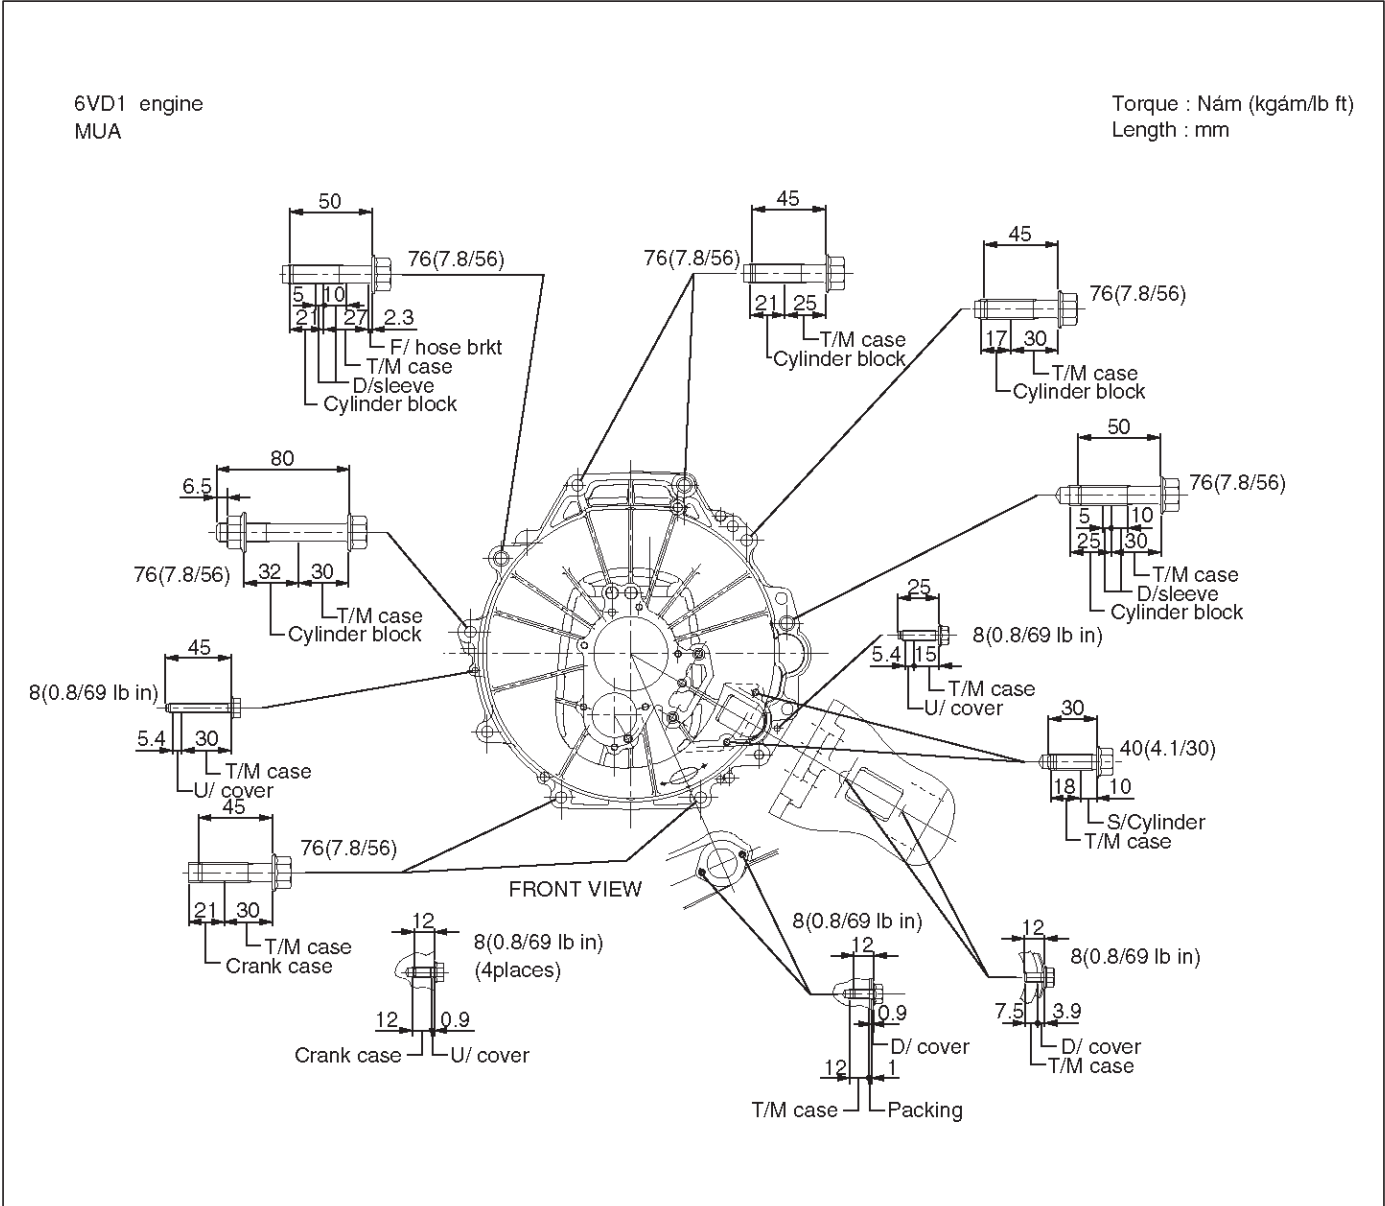

7. Install the transmission to the engine.
8. Connect the heater pipe with the hose (X22SE).

Installation

1. Apply a thin coat of molybdenum disulfide grease to the top gear shaft spline.
2. Drain coolant and disconnect the lower heater pipe from the hose on the back of the engine at right side (X22SE).
3. Turn the heater pipe assembly backward not to interfere with the transmission (X22SE).
4. Disconnect fuel pipes from hoses at the front side of the transmission (X22SE).
5. Slowly operate the transmission jack until the front of transmission is aligned with the rear of the engine. The slope of the engine and the transmission must be the same.

9. Tighten the transmission nut and bolts as shown in the figure.

7B-12 MANUAL TRANSMISSION

10. Connect the fuel pipes with the hoses (X22SE).

11. Apply a force of 59 – 78 N (6.0 – 8.0 kg/ 13.2 – 17.6 lb) to the tip of the shift fork in the direction of the transmission to engage the clutch pressure plate and release bearing (6VD1).

NOTE: A click sound is heard when the release bearing and the tip of the diaphragm spring engage each other.

Check to see if they are securely engaged by pushing the tip of the shift fork toward the engine side while applying a force of about 25 N (2.5 kg/5.5 lb). If the shift fork will not move, then they are securely engaged (6VD1).

12. Install flywheel under cover(17). 6VD1: 3 pieces, X22SE: 1 piece.

Torque: 8 N·m (0.8 kg·m/69 lb in)

13. Install starter(16) (6VD1).

Torque: 40 N·m (4.1 kg·m/30 lb ft)

14. Install third crossmember(15).

Torque: 50 N·m (5.1 kg·m/37 lb ft)

15. Install engine rear mount nuts(14).

Torque: 40 N·m (4.1 kg·m/30 lb ft)

Remove the transmission jack from transmission side.

16. Apply grease to top hole portion of the shift fork. Install slave cylinder(12) and flexible hose fixing bracket (X22SE).

Torque: 43 N·m (4.4 kg·m/32 lb ft)

220RS007

Legend

(1) Apply Grease

17. Install clutch dust covers(13) to clutch housing (6VD1).

Torque: 6 N·m (0.6 kg·m/52 lb in)

18. Connect transmission harness connectors and clip. Connector: transfer switch, 2-4 actuator, car speed sensor, 1-2 indicator switch (6VD1) and 3-4 indicator switch (6VD1).

19. Install bracket and transmission harness clamps(10) to the transmission case.

20. Install harness heat protector(11) (6VD1).

21. Connect fuel pipe to transmission side.

220RW046

220RW047

7B-14 MANUAL TRANSMISSION

22. Install center exhaust pipe(9) (6VD1).

Torque: 43 N·m (4.4 kg·m/32 lb ft)

23. Tighten the exhaust pipe nuts at the manifold (X22SE).

Torque: 43 N·m (4.4 kg·m/32 lb ft)

24. Install front(8) and rear propeller shaft(7).

Torque: 63 N·m (6.4 kg·m/46 lb ft)

25. Install transfer protector(6).

Lower the vehicle.

26. Install gear control lever(5) and transfer control lever(5).

27. Install grommet assembly(4).

28. Install center console(3), rear console and lower cluster assembly.

29. Install transfer control lever knob(2) and gear control lever knob(1).

30. Connect battery ground cable.

31. Replenish engine coolant (X22SE).

| | (29) Intermediate Plate with Gear Assembly |
| | (30) Transmission Case |

Disassembly

1. Clean the exterior of the unit with solvent.
2. Remove the drain plug from the transmission case and transfer case and drain the lubricant.
3. Remove the clutch release bearing(1) from the transmission case.

4. Remove the snap pin (6VD1).
Remove the shift fork pin (6VD1) and shift fork(2) from the fulcrum bridge(3) (6VD1).

5. Remove the fulcrum bridge bolts (6VD1).
 - Remove the fulcrum bridge(3) (6VD1) from the transmission case.Remove the front cover(4) and gasket from the transmission case.

6. Remove counter front bearing snap ring(5) and top gear bearing snap ring(6).
Use a pair of snap ring pliers to remove the snap ring.

7. Remove the speedometer sensor(7).
Remove the plate(7).
Remove the driven gear bushing and driven gear(7).

NOTE: Apply a reference mark to the driven gear bushing before removal.

8. Remove front companion flange(8) and rear companion flange(9) using the flange holder 5-8840-0133-0 to remove the end nut.

9. Disconnect breather hose from transmission and remove gear control box assembly(10).

10. Remove 2WD-4WD actuator assembly(11) by performing the following steps:

1. Disconnect the actuator breather hose from 2WD-4WD actuator assembly(11).

2. Remove the 2WD-4WD actuator assembly bolts.
3. Pull the 2WD-4WD actuator assembly with 2WD-4WD shift rod.

Legend

- (1) Shift Rod: 2WD-4WD (Position: 2WD)
- (2) 2WD-4WD Actuator Assembly
- (3) Pull
- (4) Rear Case Assembly
- (5) Position: 4WD
- (6) Position: 2WD

4. Offset the actuator assembly.

7B-18 MANUAL TRANSMISSION

5. Remove the actuator assembly.

Legend

- (7) Position: 4WD
- (8) Mode: 2WD

NOTE: Before removing the transmission and transfer assembly from vehicle, change the transfer mode to 2WD using the 4WD push button switch on dash panel.

11. Remove the transfer rear cover assembly(12) from the transfer case(28).
12. Regarding detent, shift arm, and interlock pin(13) disassembly, refer to Detent, Shift Arm, and Interlock Pin in Drive Line/Axle section.
13. Use a pair of snap ring pliers to remove the bearing snap ring(14).

14. Use a bearing remover 5-8840-2155-0 and puller 5-8840-2027-0 to remove the ball bearing(15).

15. Install the front companion flange temporarily. Use the flange holder 5-8840-0133-0 and lock nut wrench 5-8840-2156-0 to remove the lock nut(16). Remove the front companion flange.

16. Remove high-low clutch sleeve(17).
Use the universal puller to remove the high-low clutch hub(17) and transfer input gear(18).

17. Remove needle bearing(19), bearing collar(20), ball(21), and plate(22).

18. Use a pair of snap ring pliers to remove the bearing snap ring(23).
19. Use a plastic hammer to tap the front output gear assembly(24) free.

20. Remove bearing snap ring(25) by using a pair of snap ring pliers.
21. Remove the counter gear assembly(26) from the transfer case(28).
22. Remove 1-2 and 3-4 indicator switch, pin and ball(27).
23. Remove the transfer case assembly(28) from the transmission case.
• Refer to Transfer Case Assembly in Drive Line/Axle section for repair of transfer case assembly.
24. Pull out intermediate plate with gear assembly(29) from transmission case.

Reassembly

1. Apply recommended liquid gasket (LOCTITE 17430) or its equivalent to the transmission case(30), intermediate plate(29) and transfer case(28) fitting surfaces.
2. Install the intermediate plate with gear assembly(29) to the transmission case(30).
Pull out the top gear shaft until the ball bearing snap ring groove protrudes from the transmission case front cover fitting face.
Avoid subjecting the mainshaft to sudden shock or stress.
3. Install the transfer case assembly(28) to the intermediate plate with gear assembly.
Tighten the eight transmission-transfer case bolts to the specified torque.
Torque: 37 N·m (3.8 kg·m/27 lb ft)
Refer to Transfer Rear Case Assembly in Drive Line/Axle section for oil seal replacement.
4. Install 1-2 and 3-4 indicator switch, pin and ball(27) (6VD1).
5. Install the counter gear assembly(26) to the transfer case(28).
6. Use a pair of snap ring pliers to install the snap ring(25) to the transfer case(28).

7B-20 MANUAL TRANSMISSION

NOTE: The snap ring must be fully inserted into the transfer case snap ring groove.

7. Install front output gear assembly(24).
8. Use a pair of snap ring pliers to install the snap ring (23) to the transfer case(28).

NOTE: The snap ring must be fully inserted into the transfer case snap ring groove.

9. Install plate(22), ball(21), bearing collar(20), needle bearing(19), and transfer input gear(18).
10. Install High-low clutch hub and sleeve(17).
The clutch hub face (with the heavy boss) must be facing the transfer input gear side.

11. Install the front companion flange temporarily.
 - Use the flange holder 5-8840-0133-0 and lock nut wrench 5-8840-2156-0 to install the lock nut(16).**Torque: 137 N-m (14.0 kg-m/101 lb ft)**

12. Use the punch to stake the lock nut at one spot.
13. Use a suitable drift and hammer to install the ball bearing(15).

14. Use a pair of snap ring pliers to install the bearing snap ring(14).
15. Regarding detent, shift arm, and interlock pin(13) assembly, refer to Detent, Shift Arm, and Interlock Pin in Drive Line/Axle section.
16. Apply recommended liquid gasket (LOCTITE 17430) or its equivalent to the transfer rear case fitting faces.

220RS017

17. Perform the following steps before fitting the transfer rear cover(11):

1. Shift the High-Low shift rod to the 4H side.
2. The cut-away portion of select rod head should align with the rear case hole's stopper.

230RS002

18. Tighten the eleven transfer rear case bolts to the specified torque.

Torque: 37 N·m (3.8 kg·m/27 lb ft)

19. Install 2WD-4WD actuator assembly(11) by performing the following steps.

1. Shift the 2WD-4WD shift rod to the 4WD side.
2. Join the rod grooves of 2WD-4WD actuator assembly and shift rod.

220RW030

Legend

- (11) Shift Rod: 2WD-4WD (Position: 4WD)
- (12) 2WD-4WD Actuator Assembly (Mode: 2WD)
- (13) Rear Case Assembly

3. Push the 2WD-4WD actuator assembly with 2WD-4WD shift rod till the shift rod reaches the 2WD position.

220RW031

Legend

- (14) Position: 2WD
- (15) Mode: 2WD

4. Tighten the 2WD-4WD actuator bolts to the specified torque.

Torque: 19 N·m (1.9 kg·m/14 lb ft)

5. Connect the actuator breather hose to actuator.

7B-22 MANUAL TRANSMISSION

20. Install a new packing and gear control box assembly(10).

Install the harness clips and brackets and then tighten four new gear control box bolts to the specified torque.

Torque: 20 N-m (2.0 kg-m/14 lb ft)

21. Install the rear and front companion flange(9) (8).

Install the O-ring(9).

Use the flange holder J-8614-11 to tighten the flange nuts(9) (8) to the transfer case.

Tighten new transfer flange nuts(9) (8) to the specified torque.

Rear Companion Flange

Torque: 167 N-m (17.0 kg-m/123 lb ft)

Front Companion Flange

Torque: 137 N-m (14.0 kg-m/101 lb ft)

22. Use the punch 5-8840-2293-0 to stake the rear companion flange nut at two spots.

- Stake the front companion flange nut at one spot.

NOTE: Be sure to confirm that there is no crack at the staked portion of the flange nut after staking.

23. Install the O-ring (4) to the speedometer driven gear bushing(3).
 Install the driven gear to the speedometer driven gear bushing(3).
 Install the speedometer driven gear assembly(7) to the transfer rear cover.

Type	Drive gear teeth × Driven gear teeth
A	6 × 17 6 × 18
B	6 × 20

24. Install the plate to the transfer rear cover.

Torque: 15 N-m (1.5 kg-m/11 lb ft)

25. Install the speedometer sensor.

Torque: 27 N-m (2.8 kg-m/20 lb ft)

26. Install top gear bearing snap ring(6) and counter front bearing snap ring(5).

Use a pair of snap ring pliers to install the snap rings to the mainshaft and countershaft.

The snap rings must be fully inserted into the bearing snap ring groove.

27. Install a new packing and front cover (with oil seal) (4) to the transmission case.

NOTE: Take care not to damage the oil seal.

Notes When Tightening the Bolt:

- After cleaning the bolt hole, dry it thoroughly with air.
 - After cleaning the screw face of a removed bolt or new one, dry it thoroughly. Apply recommended liquid gasket (LOCTITE 242) or its equivalent before tightening it.
- Tighten six new front cover bolts to the specified torque.

Torque: 25 N-m (2.5 kg-m/18 lb ft)

28. Install the fulcrum bridge(3) to the transmission case.

Tighten three fulcrum bridge bolts to the specified torque (6VD1).

Torque: 38 N-m (3.9 kg-m/28 lb ft)

7B-24 MANUAL TRANSMISSION

29. Apply grease to the pin hole inner circumferences and thrust surfaces (6VD1).

Attach the shift fork(2) to the fulcrum bridge(3) by inserting the shift fork pin from the bottom side of the fulcrum bridge (6VD1).

Install the washer and snap pin (6VD1).

201RS018

30. Apply grease to the areas shown in the figure (6VD1).

201RW017

Install the release bearing(1) to the shift fork(2) in the proper direction.

NOTE: Ensure release bearing is properly positioned during installation, as shown in the figure (6VD1).

201RS019

Intermediate Plate with Gear Assembly, Detent, Shift Arm, and Interlock Pin (MUA)

Disassembled View

220RS010

Legend

- | | |
|---|---|
| (1) Detent Spring Plate and Gasket | (7) 1st-2nd Shift Rod |
| (2) Detent Spring | (8) 3rd-4th Shift Rod |
| (3) Detent Ball | (9) 3rd-4th Shift Arm |

| (5) Rev-5th Shift Rod | (11) Interlock Pin |
| (6) Rev-5th Shift Arm and Reverse Inhibitor | (12) Intermediate Plate and Gear Assembly |

Disassembly

1. Remove detent spring plate and gasket(1), detent spring(2) and detent ball(3).

Use a magnetic hand to remove the detent balls from the intermediate plate.

220RS011

2. Remove spring(4).
3. Remove rev-5th shift rod(5), and rev-5th shift arm and reverse inhibitor(6).
Remove 1st-2nd shift rod(7), 3rd-4th shift rod(8), 3rd-4th shift arm(9), and 1st-2nd shift arm (10).

- Hold a round bar against the shift rod end.

230RS003

- Use a spring pin remover to remove the shift arm spring pins from the shift arms and the shift rods.

230RS004

- Move the 3rd-4th shift rod forward.

230RS005

- Remove the rev-5th, 1st-2nd and 3rd-4th shifter rods carefully. Interlock pins are located between the shifter rods in the intermediate plate.

4. Remove interlock pin(11) from intermediate plate and gear assembly(12).

Inspection and Repair

Make the necessary adjustments, and part replacements if excessive wear or damage is discovered during inspection.

Shift Arm Thickness

- Use a micrometer to measure the shift arm thickness. If the measured value is less than the specified limit, the shift arm must be replaced.

Shift Arm Thickness

	Standard	Limit
1st-2nd	9.60-9.85 mm (0.378-0.388 in)	9.0 mm (0.354 in)
3rd-4th	9.60-9.80 mm (0.378-0.386 in)	
Rev.5th	9.60-9.80 mm (0.378-0.386 in)	

230RS006

Detent Spring Free Length

- Use a vernier caliper to measure the detent spring free length. If the measured value is less than the specified limit, the detent spring must be replaced.

Detent Spring Free Length

Standard	Limit
26.8 mm (1.06 in)	26.2 mm (1.03 in)

220RS012

Detent Spring Tension

- Use a spring tester to measure the valve spring tension. If the measured value is less than the specified limit, the detent spring must be replaced.

Detent Spring Tension

Compressed height	Standard
20 mm (0.787 in)	87.2 - 97.1 N (8.9 - 9.9 kg/ 19.6 - 21.8 lb)

220RS013

Reassembly

1. Install 1st-2nd shift arm(10) and 3rd-4th shift arm(9) to intermediate plate and gear assembly(12).
2. Install 3rd-4th shift rod(8) and 1st-2nd shift rod(7).
 - Install the interlock pin(11) to the shift rod.
 - Install the shift rod together with the interlock pin to the intermediate plate.
Do not allow the interlock pin to fall from the shift rod.
 - Hold a round bar against the shift rod end lower face to protect it against damage.
 - Install a new spring pin.
Never reinstall the used spring pin.

230RS007

3. Install rev-5th shift arm and reverse inhibitor(6) and rev-5th shift rod(5).
 - Apply oil to the reverse inhibitor inner surface.
 - Install the interlock pin(11) to the shift rod.
 - Install the shift rod together with the interlock pin to the intermediate plate.
Do not allow the interlock pin to fall from the shift rod.
 - Hold a round bar against the shift rod end lower face to protect it against damage.
 - Install a new spring pin.
Never reinstall the used spring pin.
4. Install spring(4).
5. Put detent balls(3) in the intermediate plate holes.
 - Apply oil to the detent balls.
6. Install detent springs(2) and detent spring plate and gasket(1).
 - Install a new gasket and the detent spring plate.
 - Tighten the detent spring plate bolts to the specified torque.

Torque: 20 N·m (2.0 kg·m/ 14 lb ft)

220RS030

Disassembly

1. Set the retaining ring remover 5-8840-2158-0 and puller 5-8840-2027-0 to the retainer(3) and the mainshaft end.

2. Remove the retainer(3) together with the bearing(2) and the oil seal collar(1).
The universal puller may be used in place of the retaining ring remover.
3. Remove thrust plate(4) and thrust washer and lock ball(5).
4. Use a pair of snap ring pliers to remove reverse idler gear snap ring(6).

5. Remove the reverse idler gear assembly(7) from the intermediate plate(26).

6. Remove idle shaft pin(8), thrust washer(9), reverse idler gear(10), and reverse idler shaft(11).
7. Use a pair of snap ring pliers to remove the snap ring(12).
8. Attach the bearing remover to the counter gear shaft. Use the bearing remover to remove the ball bearing(13) and the counter 5th gear(14).

9. Remove counter reverse gear(15).

10. Remove 5th gear(16), 5th block ring(17), and needle bearing (2 piece type) (18).

226RS007

11. Attach the holding fixture 5-8840-2160-0 and base 5-8840-0003-0 to the mainshaft and the counter gear.

226RW212

12. Engage the 3rd-4th synchronizer with the 3rd gear. Engage the 1st-2nd synchronizer with the 1st gear.

5-8840-2160-0

226RW210

Use the mainshaft nut wrench 5-8840-2156-0 to remove the mainshaft nut(19).

5-8840-2156-0

226RW211

7B-32 MANUAL TRANSMISSION

13. Use pry bars between the reverse gear(22) and bearing plate(24) to remove the Rev-5th synchronizer assembly(20) together with reverse block ring(21) and reverse gear(22).

14. Remove needle bearing(23).

15. Use the torx bit wrench 5-8840-0047-0(T45) to remove the bearing plate and screw(24) from the intermediate plate.

16. Use the snap ring pliers(1) to remove the mainshaft bearing snap ring(29).

17. Hold the snap ring open with the pliers.

Push the intermediate plate(26) toward the rear of the transmission to remove it.

The bearing snap ring(25) will come free.

Inspection and Repair

Refer to Top Gear Shaft, Main Gear Shaft, and Counter Gear in this section for inspection and repair.

Reassembly

1. Mesh the counter gear with the mainshaft assembly. Install the holding fixture 5-8840-2160-0 and base 5-8840-0003-0 to the mainshaft and the counter gear.

2. Place the holding fixture (with the mainshaft and the counter shaft) in a vise.
Install the intermediate plate(26).
3. Install bearing snap ring(25).
4. Apply recommended thread locking agents (LOCTITE 242) or its equivalent to each of the bearing plate screw threads.
Install bearing plate and screw(24).
Tighten the screws to the specified torque by using torx bit wrench 5-8840-0047-0.

Torque: 15 N-m (1.5 kg-m/11 lb ft)

5. Install needle bearing(23), reverse gear(22), and reverse block ring(21).
6. Assemble rev-5th synchronizer assembly(20) by performing the following steps.
 1. Turn the clutch hub face(1) toward the sleeve groove(2) (rear side) on the outer circumference.
 2. Check that the inserts(3) fit snugly into the block ring insert grooves.
 3. Check that the inserts springs(4) are fitted to the inserts as shown in the illustration.
 4. Check that the clutch hub(5) and the sleeve(6) slide smoothly.
 5. Install the synchronizer assembly(20) to the mainshaft.

The clutch hub face (with the heavy boss) must be facing the reverse gear(22) side.

7B-34 MANUAL TRANSMISSION

7. Mesh the 1st-2nd and 3rd-4th synchronizers with both the 1st and 3rd gears (double engagement).

226RS015

This will prevent the mainshaft from turning.

8. Install the new mainshaft hub nut(19).
Use the mainshaft nut wrench 5-8840-2156-0 to tighten the mainshaft nut(19) to the specified torque.
Torque: 137 N-m (14.0 kg-m/101 lb ft)

226RW214

9. Use a punch to stake the mainshaft nut at one spot.

226RW153

10. Install needle bearing(18), 5th block ring(17), and 5th gear(16).
11. Apply engine oil to the counter reverse gear(15) and the reverse gear(22).
Install the counter reverse gear(15) to the counter shaft.
The reverse gear projection must be facing the intermediate plate.

226RW151

12. Install the counter 5th gear(14) to the transmission.

226RS019

13. Install ball bearing(13) and bearing snap ring by performing the following steps:

- Select the snap ring(12) which will provide the minimum clearance between the ball bearing and the snap ring.

226RS020

- There are six snap ring sizes available. The snap rings are color-coded to indicate their thickness.

226RS021

Ball Bearing and Snap Ring Clearance
Standard: 0–0.15 mm (0–0.0059 in)

Snap Ring Availability

Thickness	Color Coding
1.1 mm (0.043 in)	White
1.2 mm (0.047 in)	Yellow
1.3 mm (0.051 in)	Blue
1.4 mm (0.055 in)	Pink
1.5 mm (0.059 in)	Green
1.6 mm (0.063 in)	Brown

- Use a pair of snap ring pliers to install the snap ring(12) to the counter gear shaft. The snap ring must be fully inserted into the counter gear shaft snap ring groove.
14. Assemble reverse idler shaft(11), reverse idler gear(10), thrust washer(9), and idle shaft pin(8) into reverse idler gear assembly(7).
15. Select reverse idler gear snap ring(6) which will provide the minimum clearance between the intermediate plate(26) and the snap ring(6).

- There are three snap ring sizes available. The snap rings are color-coded to indicate their thickness.

Intermediate Plate and Snap Ring Clearance

Standard: 0 – 0.15 mm (0 – 0.0059 in)

Snap Ring Availability

Thickness	Color Coding
1.2 mm (0.047 in)	White
1.3 mm (0.051 in)	Yellow
1.4 mm (0.055 in)	Blue

- Use a pair of snap ring pliers to install the snap ring to the reverse idler shaft. The snap ring must be fully inserted into the reverse idler shaft snap ring groove.

16. Install thrust washer and lock ball(5) by performing the following steps:

- Use a thickness gauge to measure the clearance between the 5th gear and the thrust washer.

5th Gear and Thrust Washer Clearance

Standard: 0.10 – 0.25 mm (0.004 – 0.010 in)

- Measure clearance “A” as shown in the figure.

- Select appropriate thrust washer from chart.
- There are four thrust washer sizes available.
- The thrust washers are color coded to indicate their thickness.

Thrust Washer Availability

Thickness mm (in)	Color Coding	A mm (in)	Clearance mm (in)
7.9 (0.311)	White	8.05-8.1 (0.317-0.319)	0.15-0.25 (0.006-0.010)
8.0 (0.315)	Yellow	8.1-8.2 (0.319-0.323)	0.1-0.25 (0.004-0.010)
8.1 (0.319)	Green	8.2-8.3 (0.323-0.327)	0.1-0.25 (0.004-0.010)
8.2 (0.323)	Bluen	8.3-8.36 (0.327-0.329)	0.1-0.21 (0.004-0.008)

226RS024

- Apply grease to the thrust washer and the lock ball.
- Install the thrust washer and the lock ball.

17. Install thrust plate(4) and retainer(3).

18. Apply engine oil to the bearing inner and outer circumference.

Use the installer 5-8840-2159-0 to install the ball bearing(2) to the mainshaft in proper direction.

226RW215

19. Install oil seal collar(1).

Disassembly

1. Use a pair of snap ring pliers to remove the top gear shaft snap ring(1).
2. Remove top gear shaft(2) with ball bearing(3).
3. Use a bench press and the bearing remover 5-8840-0015-0 to remove the ball bearing(3).

4. Remove needle bearing(4) and top block ring(5), mainshaft snap ring.
5. Use a pair of snap ring pliers to remove the mainshaft snap ring(6).

6. Use a bench press and the bearing remover 5-8840-0015-0 to remove the 3rd-4th synchronizer assembly(7) as a set.
Disassemble the synchronizer assembly.

Legend

- (1) Springs
- (2) Sleeve
- (3) Clutch Hub
- (4) Inserts

7. Remove 3rd block ring(8), 3rd gear(9), and needle bearing(10).
8. Remove needle bearing collar(11).
9. Use a bench press and the bearing remover 5-8840-0015-0 to remove the 1st gear(14) together with the mainshaft ball bearing(12) and 1st gear thrust bearing(13).

7B-40 MANUAL TRANSMISSION

10. Disassemble 1st inside ring(15), 1st outside ring(16), and 1st block ring(17).
11. Remove needle bearing(18).
12. Use a pair of snap ring pliers to remove the clutch hub snap ring(19).

13. Use a bench press and the bearing remover 5-8840-0015-0 to remove the 2nd gear(24) together with 1st-2nd synchronizer assembly(20), 2nd block ring(21), 2nd outside ring(22), and 2nd inside ring(23).

Disassemble the synchronizer assembly.

Legend

- (1) Springs
- (2) Sleeve
- (3) Clutch Hub
- (4) Inserts

14. Remove needle bearing(25) from mainshaft(26).
15. Remove bearing snap ring(27)

16. Use a bench press and the bearing remover 5-8840-0015-0 to remove the front roller bearing(28).

17. Remove center roller bearing(29) from counter gear shaft(30).

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Block Ring and Dog Teeth Clearance

- Use a thickness gauge to measure the clearance between the block ring and the dog teeth.

If the measured value exceeds the specified limit, the block ring must be replaced.

Block Ring and Dog Teeth Clearance

Standard	Limit
1.5 mm (0.059 in)	0.8 mm (0.032 in)

1st-2nd Synchronizer (3-CONE)

- Use a thickness gauge to measure the clearance between the block ring and the dog teeth.

226RS036

If the measured value exceeds the specified limit, the 1st-2nd synchronizer assembly must be replaced.

Block Ring and Dog Teeth Clearance

Standard	Limit
1.5 mm (0.059 in)	0.8 mm (0.032 in)

Block Ring and Insert Clearance

- Use a vernier caliper or thickness gauge to measure the clearance between the block ring and the insert.

226RS037

If the measured value exceeds the specified limit, the block ring and the insert must be replaced.

Block and Insert Clearance

	Standard	Limit
3rd-4th	3.46 – 3.74 mm (0.136 – 0.147 in)	4.0 mm (0.158 in)
1st-2nd	4.34 – 4.66 mm (0.171 – 0.183 in)	4.9 mm (0.193 in)
Rev-5th	3.59 – 3.91 mm (0.141 – 0.154 in)	4.1 mm (0.161 in)

Clutch Hub and Insert Clearance

- Use a thickness gauge to measure the clearance between the clutch hub and the insert.

226RS038

If the measured value exceeds the specified limit, the clutch hub and the insert must be replaced.

Clutch Hub and Insert Clearance

	Standard	Limit
3rd-4th	0.01 – 0.19 mm (0.0004 – 0.0075 in)	0.3 mm (0.012 in)
1st-2nd	0.09 – 0.31 mm (0.0035 – 0.0122 in)	0.4 mm (0.016 in)
Rev-5th	0.09 – 0.31 mm (0.0035 – 0.0122 in)	0.4 mm (0.016 in)

Mainshaft Run-out

- Install the mainshaft to V-blocks.
- Use a dial indicator to measure the mainshaft central portion run-out.

226RS039

If the measured mainshaft run-out exceeds the specified limit, the mainshaft must be replaced.

Mainshaft Run-out

Limit: 0.05 mm (0.0020 in)

Gear Inside Diameter

- Use an inside dial indicator to measure the gear inside diameter.

226RS040

If the measured value is less than the specified limit, the gear must be replaced.

Gear Inside Diameter

	Standard	Limit
1st	45.000 – 45.013 mm (1.771 – 1.772 in)	45.100 mm (1.776 in)
3rd		
2nd	52.000 – 52.013 mm (2.047 – 2.048 in)	52.100 mm (2.051 in)
Rev.	48.000 – 48.013 mm (1.889 – 1.890 in)	48.100 mm (1.894 in)
5th	32.000 – 32.013 mm (1.259 – 1.260 in)	32.100 mm (1.246 in)

Reverse Idler Gear and Idler Gear Shaft Clearance

- Use a micrometer to measure the idler gear shaft diameter.
- Use an inside dial indicator to measure the idler gear inside diameter.

226RS041

- Calculate the idler gear and idler gear shaft clearance.

Idler gear inside diameter - idler gear shaft diameter = idler gear and idler gear shaft clearance.

If the measured value exceeds the specified limit, the idler gear and/or the idler gear shaft must be replaced.

Idler Gear and Idler Gear Shaft Clearance

Standard: 0.041–0.074 mm (0.016–0.0029 in)

Limit: 0.150 mm (0.0059 in)

Clutch Hub Spline Play

- Set a dial indicator to the clutch hub to be measured.

- Move the clutch hub as far as possible to both the right and the left. Note the dial indicator reading. If the measured value exceeds the specified limit, the clutch hub must be replaced.

Clutch Hub Spline Play

	Standard	Limit
1st-2nd	0 – 0.1 mm (0 – 0.004 in)	0.2 mm (0.008 in)
3rd-4th		
Rev. 5th	0 – 0.2 mm (0 – 0.008 in)	0.3 mm (0.012 in)

Ball Bearing Play

- Use a dial indicator to measure the ball bearing play.

Ball Bearing Play

Limit: 0.2 mm (0.008 in)

Reassembly

1. Install center roller bearing(29) to counter gear shaft(30).
 - Apply engine oil to the bearing inner and outer circumferences.
 - Install the roller bearing in the proper direction.

NOTE: Check that outer race moves only in the direction of arrow.

2. Install front roller bearing(28) by performing the following steps.
 - Use bearing installer to install the front roller bearing inner race to the counter gear shaft.
 - Install the outer race and roller assembly. The snap ring groove must be facing the transmission front side.
 - Use bearing installer J-35283 to install the ring.

7B-44 MANUAL TRANSMISSION

226RS045

Legend

- (1) Ring
- (2) Outer Race and Roller Assembly
- (3) Inner Race

3. Install bearing snap ring(27) to mainshaft(26).
4. Apply engine oil to the needle bearing(25) and the 2nd gear thrust surfaces.
Install the needle bearing(25) and the 2nd gear(24) to the mainshaft.
The 2nd gear dog teeth must be facing the transmission rear side.

226RS046

5. Assemble 2nd inside ring(23), 2nd outside ring(22), and 2nd block ring(21).

- Apply engine oil to the synchronizer ring friction surfaces.

226RS047

Legend

- (1) Block Ring
- (2) Outside Ring
- (3) Inside Ring
- (4) 2nd Gear
- (5) Needle Bearing

6. Assemble 1st-2nd synchronizer assembly by performing the following steps:

1. Check that the inserts(3) fit snugly into the block ring insert grooves.
2. Check that the inserts springs(4) are fitted to the inserts as shown in the illustration.
3. Check that the clutch hub(5) and the sleeve(6) slide smoothly.
4. Install the synchronizer assembly to the mainshaft.

The clutch hub face (with the heavy boss) must be facing the 2nd gear side.

226RS048

226RS049

7. Install clutch hub snap ring(19) by performing the following steps:

- Select the snap ring which will provide the minimum clearance between the 1st-2nd clutch hub and the snap ring.

226RS050

There are three snap ring sizes available.

The snap rings are color coded to indicate their thickness.

226RS021

Clutch Hub and Snap Ring Clearance

Standard: 0 – 0.1 mm (0 – 0.004 in)

Snap Ring Availability

Thickness	Color Coding
1.80 mm (0.071 in)	White
1.85 mm (0.073 in)	Yellow
1.90 mm (0.075 in)	Blue

- Use a pair of snap ring pliers to install the snap ring to the mainshaft.

The snap ring must be fully inserted into the mainshaft snap ring groove.

226RS031

8. Install needle bearing(18), 1st block ring(17), 1st outside ring(16), 1st inside ring(15), and 1st gear(14).

- Apply engine oil to the needle bearing, 1st gear thrust surfaces and synchronizer ring friction surfaces.
- Install the needle bearing and the 1st gear to the mainshaft.

The 1st gear dog teeth must be facing the transmission front side.

226RS053

Legend

- (1) 1st Gear
- (2) Needle Bearing
- (3) Inside Ring
- (4) Outside Ring
- (5) Block Ring

9. Install the 1st gear thrust bearing and the race(13) to the main shaft.

The thrust bearing side must be facing the transmission front side.

226RS054

10. Apply engine oil to the mainshaft ball bearing(12) and the mainshaft(26).

Install the ball bearing(12) and needle bearing collar(11) to the mainshaft(26).

The ball bearing snap ring groove must be facing the transmission rear side.

Use a bench press and installer J-6133-01 to slowly force the collar into place.

226RS055

11. Apply engine oil to the needle bearing and the 3rd gear thrust surfaces.
Install the needle bearing(10) and the 3rd gear(9) to the mainshaft.

The 3rd gear dog teeth must be facing the transmission front side.

226RS056

12. Install 3rd block ring(8).

13. Check and install 3rd-4th synchronizer assembly(7) by the following steps:

1. Check that the inserts(3) fit snugly into the block ring insert grooves.
2. Check that the insert springs(4) are fitted to the inserts as shown in the illustration.
3. Check that the clutch hub(5) and the sleeve(6) slide smoothly.
4. Install the synchronizer assembly to the mainshaft.

The clutch hub face (with the heavy boss) must be facing the 3rd gear side.

226RW221-1

226RS049

14. Select and install mainshaft snap ring(6) in the following way:

- Select the snap ring which will provide the minimum clearance between the 3rd-4th clutch hub and the snap ring.

226RS058

There are three snap ring sizes available.

The snap rings are color coded to indicate their thickness.

Clutch Hub and Snap Ring Clearance
Standard: 0 – 0.1 mm (0 – 0.004 in)

Snap Ring Availability

Thickness	Color Coding
1.80 mm (0.071 in)	White
1.85 mm (0.073 in)	Yellow
1.90 mm (0.075 in)	Blue

- Use a pair of snap ring pliers to install the snap ring to the mainshaft.
 The snap ring must be fully inserted into the mainshaft snap ring groove.

15. Install top block ring(5).
16. Apply grease to the bearing inner and outer circumferences and install needle bearing(4).
17. Use a bench press to install the top gear shaft ball bearing(3) to the top gear shaft(2).

The snap ring groove must be facing the transmission front side.

18. Use a pair of snap ring pliers to install the top gear shaft snap ring(1) to the bearing.

Main Data and Specifications

General Specifications

MUA 5C Manual Transmission 5 Speed

		4X4
Transmission type		Fully synchronized forward and reverse gears
Transfer case		Synchronized type gears shifting between the 2- and 4-wheel drive mode. Constant mesh type gears between "low" and "high"
Control method		Remote control with the gear shift lever on the floor.
Gear ratio: Transmission	1st	3.767
	2nd	2.248
	3rd	1.404
	4th	1.000
	5th	0.809
	Rev.	3.873
Gear ratio: Transfer	High	1.000
	Low	2.050
Transmission oil capacity		2.95 lit. (3.12 US qt)
Transfer oil capacity		1.45 lit. (1.53 US qt)

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

Clutch

X22SE, MUA

A07RW035

The clutch assembly consists of the pressure plate assembly and the driven plate assembly.

The clutch pedal is connected to the release bearing through the shift fork.

The driven plate assembly is installed between the flywheel and the pressure plate. Diaphragm spring pressure holds the driven plate against the flywheel and the pressure plate to provide the friction necessary to engage the clutch.

Depressing the clutch pedal moves the shift fork against the release bearing. The release bearing force overcomes the force of the diaphragm spring and separates the driven plate from the flywheel and pressure plate to disengage the clutch.

For 6VD1 (3.2L) engine model, the pull-type clutch is employed.

6VD1, MUA

A07RW031

Master Cylinder

A07RW071

The master cylinder converts mechanical energy into hydraulic energy. Depressing the clutch pedal causes the push rod to move against the piston to close the return port.

Clutch fluid is forced out of the master cylinder. Releasing the clutch pedal causes the return spring to force the piston back to its original position.

Damper Cylinder

A07RS004

In order to reduce the occurrence of noises at the clutch hydraulic system, the damper cylinder is used in the

clutch hydraulic line between the master cylinder and slave cylinder.

Slave Cylinder

X22SE, MUA

6VD1, MUA

The slave cylinder converts hydraulic energy into mechanical energy. Hydraulic fluid supplied by the master cylinder moves the slave cylinder piston to

actuate the shift fork. The mechanical energy produced by the slave cylinder is directly proportional to the diameters of the master cylinder and the slave cylinder.

7C-6 CLUTCH

Pressure Plate Assembly

X22SE, MUA

A07RW024

6VD1, MUA

A07RW025

The pressure plate assembly consists of the clutch cover, the pressure plate with diaphragm spring.

Operating the clutch pedal causes the pressure plate to move in an axial direction to engage and disengage the clutch.

Driven Plate Assembly**X22SE, MUA**

A07RW026

6VD1, MUA

A07RW027

The driven plate assembly consists of the plate and the facing.

The plate consists of the clutch center, the cushioning plate, and the torsion springs.

The facing is riveted to both sides of the cushioning plate. The cushioning plate provides a longer service life by minimizing wear and vibration at the clutch contact surfaces.

Diagnosis

Condition	Possible cause	Correction
Dragging	Air in circuit.	Bleed and check for damage.
	Driven plate worn or warped.	Replace.
	Clutch fork off the ball stud.	Install correctly and lubricate.
	Diaphragm spring weak or tip of fingers worn.	Replace.
	Driven plate sticking on splines.	Clean and free splines and lubricate with grease.
	Pilot bearing worn or damaged.	Replace.
	Master cylinder and slave cylinder seals worn.	Replace.
Slipping	Clutch facing worn.	Replace.
	Driven plate friction pads worn or oilsoaked.	Replace and check for leaks as needed.
	Diaphragm spring weak.	Replace pressure plate.
	Pressure plate or flywheel warped.	Replace.
	Master cylinder and slave cylinder seals worn.	Replace as needed.
Chattering	Clutch facing in poor contact or facing warped.	Replace.
	Surface of facing hardened.	Replace.
	Driven plate friction pads oil soaked.	Replace and check for leaks.
	Damper springs weakened or broken.	Replace.
	Rivets on clutch plate loosened.	Replace.
	Pressure plate or flywheel warped.	Replace as needed.
Rattling	Diaphragm spring weak.	Replace the pressure plate.
	Clutch fork loose or off the ball stud.	Replace the retaining spring or install the fork correctly.
	Driven plate springs weak or oil in the damper.	Replace and check for leaks as needed.
Release bearing noisy with the clutch engaged	Release bearing binding.	Clean, or replace if damaged, and lubricate.
	Clutch fork off the ball stud or loose spring tension.	Install correctly, and lubricate.
	Linkage return springs weak.	Replace.
Noisy	Release bearing worn or damaged.	Replace.
	Clutch fork off the ball stud.	Install correctly and lubricate.
	Pilot bearing loose.	Replace.
Pedal stays on the floor when disengaged	Release bearing binding.	Free up, or replace, and lubricate.
	Diaphragm spring weak.	Replace the pressure plate.
Pedal is hard to push	Hydraulic line blocked or crimped.	Clean out or replace.
	Master or slave cylinders binding.	Repair or replace as needed.
	Driven plate worn.	Replace.
Squeaking	Ball stud not lubricated or incorrectly lubricated.	Lubricate with high temperature grease.

Clutch Assembly (X22SE, MUA)

Clutch Assembly (X22SE, MUA) and Associated Parts

201RX003

Legend

- | | |
|-----------------------------|-------------------------|
| (1) Transmission Assembly | (4) Release Bearing |
| (2) Pressure Plate Assembly | (5) Shift Fork |
| (3) Driven Plate Assembly | (6) Crank Shaft Bearing |

Removal

1. Remove transmission assembly, refer to "MANUAL TRANSMISSION" of Section 7B for "REMOVAL AND INSTALLATION" procedure.

7C-10 CLUTCH

2. Use the clutch pilot aligner (7) J-42877 (MUA) to prevent the driven plate assembly from falling free.

201RX002

Legend

- (3) Driven Plate Assembly
- (2) Pressure Plate Assembly
- (7) Pilot Aligner

3. Mark the flywheel, clutch cover and pressure plate (2) lug for alignment when installing.

4. Loosen the clutch cover bolts in the numerical order shown in the illustration.

201RS036

5. Remove pressure plate assembly (2) and driven plate assembly (3).

6. Remove release bearing (4).

NOTE: The release bearing is permanently packed with lubricant and should not be soaked in cleaning solvent, as this will dissolve the lubricant.

7. Remove shift fork.

- Do not remove crank shaft bearing (6) except for replacement.

Remove the crank shaft bearing (6) using remover 5-8840-2000-0 and sliding hammer 5-8840-0019-0.

015RW107

Inspection and Repair

Make necessary adjustments, repairs, and part replacements if wear, damage, or other problems are discovered during inspection.

Pressure Plate Assembly

Visually inspect the pressure plate friction surface for excessive wear and heat cracks. If excessive wear or deep heat cracks are present, the pressure plate must be replaced.

Pressure Plate Warpage

Use a straight edge and a feeler gauge to measure the pressure plate friction surface flatness in four directions.

201RS038

If any of the measured values exceed the specified limit, the pressure plate must be replaced.

Pressure Plate Warpage

Limit: 0.3mm (0.012in)

Clutch Cover

Visually inspect the entire clutch cover for excessive wear, cracking, and other damage. The clutch cover must be replaced if any of these conditions are present.

201RS039

Clutch Set Force

1. Invert the pressure plate assembly.
2. Place a new driven plate over the pressure plate. A metal sheet with thickness of 8.0mm (0.315in) may be used in place of the driven plate.
3. Compress the pressure plate assembly until the distance becomes 4mm (0.157in).

4. Note the pressure gauge reading.

Clutch Set Force

Standard: 5488N (559 kg/1235lb)

201RW015

Diaphragm Spring Finger Height

1. Place a 8.0mm (0.315in) spacer beneath the pressure plate.
2. Fully compress the pressure plate and diaphragm spring.

There are two ways to do this:

- a. Use a bench press to press down on the assembly from the top.
- b. Tighten the fixing bolts.

3. Measure the spring finger height from base to spring tip.

If the measured value exceeds the specified limit, the pressure plate assembly must be replaced.

Spring Finger Height

Standard: 37.5 mm – 39.5 mm (1.48 in – 1.56 in)

A07RX002

7C-12 CLUTCH

Shift Fork

1. Visually inspect the surfaces of the shift fork making contact with the shift block.
2. Remove any minor stepping or abrasion from the shift block with an oil stone.
3. Apply molybdenum disulfide type grease to the areas as shown in the figure.

MUA

Driven Plate Assembly

1. Visually inspect the torsion spring for looseness, breakage, and weakening. If any of these conditions are discovered, the driven plate assembly must be replaced.
2. Visually inspect the facing surfaces for cracking and excessive scorching. Visually inspect the facing surfaces for the presence of oil or grease. If any of these conditions are discovered, the facing must be cleaned or replaced.

3. Check that the driven plate moves smoothly on the transmission top gear shaft spline. Minor ridges on the top gear shaft spline may be removed with an oil stone.

Driven Plate Warpage

1. Insert the clutch pilot aligner J-42877 (MUA) into the driven plate splined hub. The clutch pilot aligner must be held perfectly horizontal.
2. Set a dial indicator to the driven plate outside circumference.

3. Slowly turn the driven plate. Read the dial indicator as you turn the driven plate. If the measured value exceeds the specified limit, the driven plate assembly must be replaced.

Driven Plate Warpage

Standard: 0.7 mm (0.028 in)

Limit: 1.0 mm (0.039 in)

Driven Plate Splined Hub Spline Wear

1. Clean the driven plate splined hub.
2. Install the driven plate to the transmission top gear shaft spline.
3. Set a surface gauge to the driven plate outside circumference.
4. Slowly turn the driven plate counterclockwise. Measure the spline rotation play as you turn the driven plate.

Driven Plate Splined Hub Spline Wear

Standard: 0.5 mm (0.020 in)

Limit: 1.0 mm (0.039 in)

201RS009

Rivet Head Depression

Use a depth gauge or a straight edge with steel rule to measure the rivet head depression (1) from the facing surface (2).

Be sure to measure the rivet head depression on both sides of the driven plate. If the measured value is less than the specified limit, the facing must be replaced.

Rivet Head Depression

Standard: MIN 1.3 mm (0.051 in)

Limit: 0.2 mm (0.008 in)

201RS010

Pressure Plate Assembly

Check the cover for cracks and distortion, and the diaphragm spring for heat distortion, loosened rivets. Check the diaphragm spring for wear.

201RS047

Installation

1. Clean and lubricate with grease.
2. Use installer J-1522 to install crankshaft bearing (6).

X22SE

015RS078

7C-14 CLUTCH

3. Apply molybdenum disulfide type grease to the areas as shown in the figure and install shift fork (5).

MUA

4. Pack the inside recess (A) and coat the rubbing surface (B) of the release bearing with grease as shown in the figure.

5. Install driven plate assembly by using aligner J-42877 (MUA).

6. Tighten the bolts holding the pressure plate assembly (2) in the order shown in the figure.

Torque: 18N·m (1.8 kg·m/13 lb ft)

7. Remove the aligner.

NOTE: Do not strike the aligner with a hammer to remove it.

8. Install transmission assembly (1) to the engine. Refer to Transmission Installation in Manual Transmission section.

Clutch Assembly (6VD1, MUA)

Clutch Assembly (6VD1, MUA) and Associated Parts

201RS023

Legend

| (1) Transmission Assembly | (4) Release Bearing |
| (2) Pressure Plate Assembly | (5) Shift Fork |
| (3) Driven Plate Assembly | (6) Fulcrum Bridge |
| | (7) Flywheel Assembly and Crankshaft Bearing |

Removal

1. Refer to "MANUAL TRANSMISSION" of Section 7B for "REMOVAL AND INSTALLATION" procedure of transmission assembly (1).

7C-16 CLUTCH

2. Use the pilot aligner J24547 to prevent the driven plate assembly (3) from falling free.

201RS001

Legend

- (2) Pressure Plate Assembly
- (3) Driven Plate Assembly
- (8) Pilot Aligner

3. Mark the flywheel, clutch cover and pressure plate lug for alignment when installing.

4. Remove the release bearing (4) from the transmission case.

201RS024

5. Remove the snap pin. Remove the shift fork pin and shift fork from the fulcrum bridge.

201RS025

6. Remove the fulcrum bridge bolts. Remove the fulcrum bridge (6) from the transmission case.

201RS026

- Do not remove crankshaft bearing (7) except for replacement.
- Use the remover 5-8840-2000-0 and sliding hammer 5-8840-0019-0 to remove the crankshaft bearing.

015RW053

Pressure Plate Warpage

- Use a straight edge and a feeler gauge to measure the pressure plate friction surface flatness in four directions. If any of the measured values exceed the specified limit, the pressure plate must be replaced.

Pressure Plate Warpage

Limit: 0.3 mm (0.012 in)

201RS003

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, or any other abnormal condition are found through inspection.

Pressure Plate Assembly

- Visually check the pressure plate friction surface for excessive wear and heat cracks. If excessive wear or deep heat cracks are present, the pressure plate must be replaced.

201RS002

Clutch Cover

- Visually check the entire clutch cover for excessive wear, cracking, and other damage. The clutch cover must be replaced if any of these conditions are present.

201RS004

Clutch Set Force

1. Invert the pressure plate assembly.
2. Place a new driven plate over the pressure plate. A metal sheet with thickness of 8.0mm (0.315in) may be used in place of the driven plate.
3. Compress the pressure plate assembly until the distance becomes 12mm (0.472in).
4. Note the pressure gauge reading. If the measured value is less than the specified limit, the pressure plate assembly must be replaced.

Clutch Set Force

Standard: 7208N (735 kg/1621lb)

Limit: 6669N (980 kg/1499lb)

Driven Plate Assembly

- Visually check the torsion spring for looseness, breakage, and weakening. If any of these conditions are discovered, the driven plate assembly must be replaced.
- Visually check the facing surfaces for cracking and excessive scorching. Visually inspect the facing surfaces for the presence of oil or grease. If any of these conditions are discovered, the facing must be cleaned or replaced.
- Check that the driven plate moves smoothly on the transmission top gear shaft spline. Minor ridges on the top gear shaft spline may be removed with an oil stone.

Diaphragm Spring Finger Height

1. Place a new driven plate or a 8.0mm (0.315in) spacer beneath the pressure plate.
2. Fully compress the pressure plate and diaphragm spring.
 - There are two ways to do this:
 - a. Use a bench press to press down on the assembly from the top.
 - b. Tighten the fixing bolts.

NOTE: Preload on diaphragm spring finger must be 4998N (510 kg/1122lb) in direction of release, when clutch cover assembly is bolted to the flywheel.

3. Measure the spring height from base to spring tip. If the measured value exceeds the specified limit, the pressure plate assembly must be replaced.

Spring Finger Height

Standard: 49.9 – 51.9 mm (1.965– 2.043 in)

Driven Plate Warpage

1. Insert the clutch pilot aligner J-24547 into the driven plate splined hub. The clutch pilot aligner must be held perfectly horizontal.
2. Set a dial indicator to the driven plate outside circumference.
3. Slowly turn the driven plate. Read the dial indicator as you turn the driven plate. If the measured value exceeds the specified limit, the driven plate assembly must be replaced.

Driven Plate Warpage

Standard: 0.7mm (0.028in)

Limit: 1.0mm (0.039in)

201RS008

Driven Plate Splined Hub Spline Wear

1. Clean the driven plate splined hub.
2. Install the driven plate to the transmission top gear shaft spline.
3. Set a surface gauge to the driven plate outside circumference.
4. Slowly turn the driven plate counterclockwise. Measure the spline rotation play as you turn the driven plate. If the measured value exceeds the specified limit, the driven plate assembly must be replaced.

Driven Plate Warpage

Standard: 0.5mm (0.020in)

Limit: 1.0mm (0.039in)

201RS009

Rivet Head Depression

- Use a depth gauge or a straight edge with steel rule to measure the rivet head depression (1) from the facing surface (2).
- Be sure to measure the rivet head depression on both sides of the driven plate. If the measured value is less than the specified limit, the driven plate assembly must be replaced.

Rivet Head Depression

	Standard	Limit
Fly wheel side	1.2–1.8mm (0.047–0.071in)	0.2mm (0.008in)

Release Bearing

- Visually check the release bearing for excessive play, noise and breakage. If any of these conditions are discovered, the release bearing must be replaced.

201RS011

- When replacing the release bearing (4), replace both the wedge collar (10) and wire ring (11) at the same time.

201RS012

Legend

- (2) Pressure Plate Assembly
- (4) Release Bearing
- (10) Wedge collar
- (11) Wire Ring

Wedge Collar (10)

- Visually check the surfaces of the wedge collar making contact with the release bearing for excessive wear and damage.
- Replace exhibiting excessive wear or damage.

201RS013

Shift Fork

- Visually check the surfaces of the shift fork making contact with the release bearing for excessive wear and damage.
- Remove any minor stepping or abrasion from shift fork with an oil stone. Replace exhibiting excessive wear or damage.

201RS014

Installation

1. Clean and lubricate with grease.
2. Use the installer 5-8840-0125-0 and driver handle 5-8840-0007-0 to install the crankshaft bearing (7).

3. Install the fulcrum bridge (6) to the transmission case. Tighten three fulcrum bridge bolts to the specified torque.

Torque: 38 N-m (28 lb ft)

4. Apply molybdenum disulfide type grease to the pin hole inner circumferences and thrust surfaces. Attach the shift fork (5) to the fulcrum bridge (6) and insert the pin from below of the fulcrum bridge. Install the washer and snap pin.

5. Apply molybdenum disulfide type grease to the areas shown in the figure.

7C-22 CLUTCH

Install the release bearing (4) in the proper direction.

NOTE: Ensure release bearing is properly positioned during installation, as shown in the figure.

6. Use the pilot aligner 5-85253-001-0 to install the driven plate assembly (3).

7. Tighten the bolts holding the pressure plate assembly (2) in the order shown in the figure.

Torque: 18 N·m (1.8 kg·m/13 lb ft)

8. Remove the aligner.

NOTE: Do not strike the aligner with a hammer to remove it.

9. Install transmission assembly to the engine.

X22SE MUA

7. Remove master cylinder assembly (1).
8. Remove damper cylinder assembly (6).
9. Remove oil line hose (5).

Inspection and Repair

Make necessary adjustments, repairs, and part replacements if wear, damage or other problems are discovered during inspection.

Installation

Clutch Pedal Adjustment

1. With clutch switch.
 1. Disconnect clutch switch connector.
 2. Loosen lock nut, then turn switch out until there is a gap between the switch plunger and clutch pedal.

Legend

- (7) Push Rod
- (8) Clutch Switch

2. Loosen clutch master cylinder push rod lock nut. Turn push rod by hand to set clutch pedal height to within specification. Tighten push rod lock nut.

Clutch Pedal Height

178 – 188 mm (7.01 – 7.40 in)

3. With clutch switch.

1. Turn the clutch switch until the switch bolt just touches the clutch pedal arm.
2. Adjust clutch switch by backing it out half a turn, and measure the clearance between the clutch pedal arm and the clutch switch bolt end.

Legend

- (8) Clutch Switch
- (10) Clutch Pedal Arm
- (11) Lock Nut
- (12) Bracket
- (13) Back Out Switch 1/2 Turn

3. Lock the lock nut.
4. Connect clutch switch connector.

Clutch Switch and Clutch Pedal Clearance

0.5 – 1.5 mm (0.020 – 0.059 in)

4. After adjusting the clutch pedal height, push the clutch pedal by hand to ensure the clutch pedal free play is within specification.

Pedal Free Play

5 – 15 mm (0.20 – 0.59 in)

5. Perform clutch pedal engagement height inspection:
 1. Operate the parking brake lever and block the wheels.
 2. Start the engine, fully step on the clutch pedal slowly and move the shift lever 1st position.
 3. With the engine idling, release the clutch pedal slowly and measure its stroke – just prior to its clutching position.

Clutch Pedal Engagement Height (H3)

MIN. 30 mm (1.18 in)

F07RW028

6. If the measured value exceeds the specified limit, check the following points and repair if necessary:

- Hydraulic circuit for fluid leakage or air in circuit.
- Clutch disc warped.
- Diaphragm spring weakened or tip of fingers worn.
- Driven plate sticking on sprines.
- Release bearing worn or damaged.
- Master cylinder and slave cylinder worn.

Torque

- **Master cylinder to dash panel**
16 N·m (1.6 kg·m/12 lb ft)
- **Clutch pedal to dash panel**
15 N·m (1.5 kg·m/11 lb ft)
- **Master cylinder push rod to yoke**

40 N·m (4.1 kg·m/30 lb ft)
- **Slave cylinder bleeder screw**
8 N·m (0.8 kg·m/69 lb in)
- **Clutch pipe to slave cylinder (X22SE)**
20 N·m (2.0 kg·m/14 lb ft)

Bleeding

1. Check the level of clutch fluid in the reservoir and replenish if necessary.
2. Bleeding the slave cylinder.
 1. Remove the rubber cap from the bleeder screw and wipe clean the bleeder screw. Connect a

vinyl tube to the bleeder screw and insert the other end of the vinyl tube into a transparent container.

2. Pump the clutch pedal repeatedly and hold it depressed.

203RS005

3. Loosen the bleeder screw to release clutch fluid with air bubbles into the container, then tighten the bleeder screw immediately.
4. Release the clutch pedal carefully. Repeat the above operation until air bubbles disappear from the clutch fluid being pumped out into the container. During the bleeding operation, keep the clutch fluid reservoir filled to the specified level. Reinstall the rubber cap.

Disassembly

1. Disassemble boot (1), push rod (2), piston and piston cup (3), and spring (4) from cylinder body (5).

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Cylinder Body

1. Clean the cylinder body.
2. Check the fluid return port for restrictions and clean it if necessary.

206RS003

Piston and Piston Cup

1. Visually inspect the disassembled piston and piston cup for excessive wear and damage.

206RS004

Replace the inner parts with new parts if necessary.

2. Measure the clearance between slave cylinder wall and piston.

206RS005

If the measured value exceeds the specified limit, the slave cylinder assembly must be replaced.

Standard: 0.07 mm (0.0028 in)

Limit: 0.15 mm (0.0059 in)

Reassembly

To reassemble, follow the disassembly steps in the reverse order, noting the following points:

Piston Assembly

1. Before installing the parts, apply a thin coat of rubber grease.
2. Install cup in groove in piston with the lip turned to the front of cylinder. Use care so as not to scratch the cylinder.

206RS006

Damper Cylinder

Disassembled View

Legend

- | | |
|---------------------|----------------------|
| (1) Cylinder Body | (4) Spacer |
| (2) Spring | (5) Damper Rubber |
| (3) Piston Assembly | (6) Cover and Gasket |

Disassembly

1. Disassembly cover and gasket (6).
2. Disassembly damper rubber (5).
3. Disassembly spacer (4).
4. Disassembly piston assembly (3).
5. Disassembly spring (2).
6. Disassembly cylinder body (1).

Inspection and Repair

Check damper rubber and piston cup for cracks, deformation or damage. Replace the damper cylinder assembly if necessary.

Reassembly

To assemble, follow the disassembly steps in the reverse order.

Main Data and Specifications

General Specifications

Engine	X22SE	6VD1
Type	Dry single plate type with diaphragm spring	
Size	240 mm (9.45 in)	260 mm (10.24 in)
Pressure plate		
Outside diameter	299 mm (11.77 in)	332 mm (13.07 in)
Clamping force	5488 N (1235 lb)	7208 N (1621 lb)
Spring finger height	37.5 – 39.5 mm (1.476 – 1.555 in)	49.9 – 51.9 mm (1.965 – 2.043 in)
Driven plate		
Outside diameter × inside diameter	240 × 160 mm (9.45 × 6.30 in)	260 × 170 mm (10.24 × 6.70 in)
Thickness		
Clutch disengaged	8.3 mm (0.327 in)	8.6 mm (0.339 in)
Clutch engaged	8.0 mm (0.315 in)	8.0 mm (0.315 in)
Total friction area	251 × 2 cm ² (39 × 2 in ²)	304 × 2 cm ² (47 × 2 in ²)
Clutch control type	Hydraulic	
Clutch pedal free play	5 – 15 mm (0.20 – 0.59 in)	
Clutch pedal stroke	165.5 – 175.5 mm (6.52 – 6.91 in)	
Clutch pedal height	178 – 188 mm (7.01 – 7.40 in)

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Headlight Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the headlight bulb.
 - Disconnect the connector (3).
 - Remove the socket retaining ring (1) by turning it counterclockwise.
 - Remove the cup (2).
 - Remove the spring.

CAUTION: The halogen light bulb produces heat and temperature rises high, therefore, if the glass surface is contaminated it will be burnt by heat leaving stains which will not come out. This may reduce the illuminating power or damage the bulb due to thermal deformation during evaporation. In order to prevent this problem, do not touch the glass surface with your fingers.

801RW026

Installation

To install, follow the removal steps in the reverse order.

Headlight Assembly

Removal

1. Disconnect the battery ground cable.
2. Remove the radiator grille (1).
 - Remove eight clips and a screw.
3. Remove the side marker light (3).
 - Remove three screws.
 - Disconnect the connector.
4. Remove the headlight assembly (2).
 - Disconnect the connector.
 - Remove four screws.

825RW283

Installation

To install, follow the removal steps in the reverse order.

CAUTION: After installing the headlight, be sure to adjust the headlight aim.

Headlight Adjustment

Preparation

Place the unloaded vehicle on a level surface and check to see if the inflation pressure of the tires is correct, the lenses are clean, and the battery is sufficiently charged. Adjust the aim with the headlight tester, if necessary. When adjusting, follow the procedure of the tester manufacture's.

Vertical Adjustment

Use a screwdriver for vertical adjustment.

Horizontal Adjustment

Use a screwdriver for horizontal adjustment.

Fog Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the fog light bulb (2).
 - Open the rear cover (1).
 - Remove the dust cover.
 - Disconnect the bulb connector.
 - Remove the clip (3).

Installation

To install, follow the removal steps in the reverse order.

Fog Light Assembly

Removal

1. Disconnect the battery ground cable.
2. Remove the fog light assembly (1).
 - Disconnect the connector.
 - Remove two nuts from the bracket.

801RW021

CAUTION: After installing the fog light, be sure to adjust the fog light aim.

Fog Light Adjustment

Vertical Adjustment

Turn the adjusting screw with a screwdriver to adjust the aim of the fog light vertically.

801RW022

Installation

To install, follow the removal steps in the reverse order.

Clearance Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Disconnect the connector.
3. Remove the socket retaining ring by turning it counterclockwise.
4. Remove the clearance light bulb (2).
 - Remove the rubber cap.
 - Pull out the bulb socket (1).

801RW025

Installation

To install, follow the removal steps in the reverse order.

Front Combination Light Assembly

Removal

1. Disconnect the battery ground cable.
2. Remove the side combination light.
 - Refer to Side Marker Light Bulb in this section.
3. Disconnect the connector.

Installation

To install, follow the removal steps in the reverse order.

Taillight Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the rear combination light assembly (1).
 - Remove three screws.
3. Pull out the rear combination light assembly to ward you.

4. Remove the bulb holder (2).
 - Remove the two wing nuts (1).

- Remove the bulb (3) by turning it counterclockwise while pushing it at the same time.

Installation

To install, follow the removal steps in the reverse order.

License Plate Light Bulb (Bumper Type)

Removal

1. Disconnect the battery ground cable.
2. Remove the lens cover (3).
 - Remove two screws.
3. Remove the lens (2).
4. Remove the bulb (1).
 - Pull out the bulb from the socket.

Installation

To install, follow the removal steps in the reverse order.

License Plate Light Bulb (Tailgate Type)

Removal

1. Disconnect the battery ground cable.
2. Remove the lens cover (3).
 - Remove two screws.
3. Remove the bulb (2).
 - Pull out the bulb from the socket (1).

Installation

To install, follow the removal steps in the reverse order.

Stoplight Bulb

Removal

1. Remove the bulb holder (2).
 - Remove the two wing nuts (1).

- Remove the bulb (3) by turning it counterclockwise while pushing it at the same time.

Installation

To install, follow the removal steps in the reverse order.

High Mounted Stoplight Assembly (4Door Model)

Removal

1. Disconnect the battery ground cable.
2. Remove the high mount stoplight assembly (2).
 - Remove the cover (3).
 - Disconnect the connectors (1).
 - Remove two screws.

Installation

To install, follow the removal steps in the reverse order.

High Mounted Stoplight Bulb (4Door Model)

Removal

1. Disconnect the battery ground cable.
2. Remove the cover.
3. Remove the bulb (1).
 - Remove the socket by turning it counterclockwise.

825RW071-1

Installation

To install, follow the removal steps in the reverse order.

High Mounted Stoplight Assembly (2Door Model)

Removal

1. Disconnect the battery ground cable.
2. Remove the high mounted stoplight assembly (1).
 - Remove the two screws.
 - Pull out the high mounted stoplight assembly (1).
 - Disconnect the connector (2).

803RX009

Installation

To install, follow the removal steps in the reverse order.

High Mounted Stoplight Bulb (2Door Model)

Removal

1. Disconnect the battery ground cable.
2. Remove the cover (2).
3. Remove the bulb (1).

803RX002-1

Installation

To install, follow the removal steps in the reverse order.

Backup Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the rear combination light assembly.
 - Refer to the Taillight Bulb removal step 2 in this section.
3. Remove the bulb holder (2).
 - Remove the two wing nuts (1).

825RX054

- Remove the bulb (3) by turning it counterclockwise while pushing it at the same time.

825RX056

Installation

To install, follow the removal steps in the reverse order.

Front Turn Signal Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the radiator grille.
 - Refer to Engine Hood and Fender in section.
3. Remove the front turn signal light (2).
 - Remove three screws.
4. Remove the bulb (1).
 - Remove the front turn signal light socket by turning it counterclockwise.
 - Remove the bulb by turning it counterclockwise while pushing it at the same time.

825RW067

Installation

To install, follow the removal steps in the reverse order.

Side Turn Signal Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the side turn signal light assembly.
 - Pushing in the rear direction of vehicle, pull out it toward you.
3. Remove the bulb (1) by turning it counterclockwise.

801RW024

Installation

To install, follow the removal steps in the reverse order.

Rear Turn Signal Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the rear combination light assembly.
 - Refer to the Taillight Bulb in this section.
3. Remove the bulb holder (2).
 - Remove the two wing nuts (2).

- Remove the bulb (3) by turning it counterclockwise while pushing it at the same time.

Installation

To install, follow the removal steps in the reverse order.

Dome Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the lens (2).
3. Remove the bulb (1).
 - Pull out the bulb.

Installation

To install, follow the removal steps in the reverse order.

Courtesy Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the lens (2).
3. Remove the bulb (1).
 - Pull out the bulb.

825RW076

Installation

To install, follow the removal steps in the reverse order.

Map Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the lens (2).
3. Remove the bulb (1).
 - Pull out the bulb.

825RW105

Installation

To install, follow the removal steps in the reverse order.

Luggage Room Light Bulb (4Door Model)

Removal

1. Disconnect the battery ground cable.
 2. Remove the lens (2).
 3. Remove the bulb (1).
- Pull out the bulb.

Installation

To install, follow the removal steps in the reverse order.

Luggage Room Light Bulb (2Door Model)

Removal

1. Disconnect the battery ground cable.
 2. Remove the lens (2).
 3. Remove the bulb (1).
- Pull out the bulb.

Installation

To install, follow the removal steps in the reverse order.

HVAC Bezel Illumination Light Bulb

Removal and Installation

Refer to Control Panel Illumination bulb in Heating, Ventilation and Air Conditioning (HVAC) section.

Shift Lever Illumination Light Bulb (A/T)

Removal

1. Disconnect the battery ground cable.
2. Remove the console assembly.
 - Remove four screws.
3. Remove the bulb (1).
 - Turn the bulb socket counterclockwise.
 - Pull out the bulb from the socket.

Installation

To install, follow the removal steps in the reverse order.

825RW287

Ashtray Illumination Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the lower cluster panel(1).
 - Refer to Instrument Panel Assembly in Body Structure section.
3. Disconnect the connector (2).
4. Turn the socket counterclockwise to remove it then pull out the bulb(3).

45RW013

Installation

To install, follow the removal steps in the reverse order.

Starter Switch

Removal and Installation

Refer to Lock cylinder in steering section.

Lighting Switch (Combination Switch)

Removal and Installation

Refer to Combination Switch in Steering section.

Dimmer-Passing Switch (Combination Switch)

Removal and Installation

Refer to Combination Switch in Steering section.

Door Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the door switch (2).
 - Remove the screw (1).
 - Disconnect the connector (3).

Installation

To install, follow the removal steps in the reverse order.

Rear Defogger Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the meter cluster assembly (1).
 - Refer to Instrument Panel Assembly in Body Structure section.
3. Remove the rear defogger switch (2).
 - Disconnect the switch connector.
 - Push the lock from the back side of the meter cluster assembly.

Installation

To install, follow the removal steps in the reverse order.

Key Remind Switch (Starter Switch)

Removal and Installation

Refer to Lock Cylinder in Steering section.

Hazard Warning Light Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the meter cluster assembly (1).
 - Refer to Instrument Panel Assembly in Body Structure section.
3. Remove the hazard warning switch (2).
 - Disconnect the switch connector.
 - Push the lock from the back side of the meter cluster assembly.

Installation

To install, follow the removal steps in the reverse order.

Stoplight Switch

Removal and Installation

Refer to Stoplight Switch in Brake section.

4WD Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the meter cluster assembly (1).
 - Refer to Instrument Panel Assembly in Body Structure section.
3. Remove the 4WD switch (2).
 - Disconnect the switch connector.
 - Push the lock from the back side of the meter cluster assembly.

825RW275-1

Installation

To install, follow the removal steps in the reverse order.

Backup Light Switch (M/T)

Removal

1. Disconnect the battery ground cable.
2. Remove the backup light switch (1).
 - Disconnect the connector (2).

230RW010

Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Apply liquid gasket to the screw portion of the switch to prevent oil leak.

Turn Signal Light Switch (Combination Switch)

Removal and Installation

Refer to Combination Switch in Steering section.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Windshield Wiper/Washer System

General Description

The circuit consists of the starter switch, windshield wiper & washer switch, windshield wiper motor, windshield washer motor and alarm & relay control unit. When the windshield wiper & washer switch is turned on

with the starter switch on, the battery voltage is applied to the wiper motor to activate the wiper.

The washer motor squirts glass cleaning fluid while the washer switch is being pushed. The alarm & relay control unit relay is used to control motion of the wiper.

Windshield Wiper And Washer Switch

Removal and Installation

Refer to Combination Switch in Steering section.

Windshield Wiper Motor

Removal

1. Disconnect the battery ground cable.
2. Disconnect the connector (2).
3. Remove 4 mounting bolts (3).
4. Remove the windshield wiper motor(1).

880RW002

5. Remove the crank arm fixing ball (4).

880RX011

Installation

To install, follow the removal steps in the reverse order.

Windshield Washer Motor

Removal

1. Disconnect the battery ground cable.
2. Remove the fender inner liner (right side).
3. Disconnect the windshield washer motor connector and the rear washer motor connector.
4. Disconnect the windshield washer hose connector and the rear washer hose connector.
5. Remove the filler neck (2).
 - Remove the bolt.
6. Remove the washer tank (1).
 - Remove the three nuts.
7. Pull out the windshield washer motor (4) from the washer tank.

Installation

To install, follow the removal steps in the reverse order.

Windshield Washer Spray Pattern

880RW024

Legend

- (1) Spray Target
- (2) Washer Nozzle

Windshield Wiper Linkage

Windshield Wiper Linkage and Associated Parts

Legend

- | | |
|---------------------------------------|------------------------------|
| (1) Windshield Wiper Arm/Blade | (4) Windshield Wiper Motor |
| (2) Vent Cowl Cover | (5) Windshield Wiper Arm Nut |
| (3) Windshield Wiper Linkage Assembly | |

Removal

1. Disconnect the battery ground cable.
2. Remove the windshield wiper arm/blade.
3. Remove the vent cowl cover.
4. Remove the windshield wiper motor.
5. Remove the pivot assembly mounting nuts, fixing screws.
6. Take out the windshield wiper linkage assembly from the opening of the cowl.

Installation

To install, follow the removal steps in the reverse order.

Windshield Wiper Arm/Blade

Removal

1. Dry the cap(2) off with the tip of a screwdriver.
2. Remove the nut.
3. Remove the wiper arm/blade(1).

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Before installing the wiper arm/blade to the shaft, confirm that the motor stops at the autostop position.
2. Set the wiper arm/blade so that the tips of both blades are positioned about 40mm (1.57 in) from the upper edge of the cowl cover as shown in the figure.
3. Tighten the nuts to the specified torque.

Torque: 23N·m (2.3kg·m/17lbf)

Windshield Wiper Blade Rubber

Removal

1. Push the wiper blade lock(1) while pulling the wiper blade in the arrow direction as shown in the figure.

CAUTION: When the wiper blade has been removed, wrap the tip of the wiper arm with cloth, to avoid damaging the glass.

880RS011

2. Pull the end of rubber and remove the projection(3) from the click of the blade stay (2).

880RS010

3. Pull the rubber out in the same direction.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Install the click of the blade stay in the groove of the new rubber and slide it in. Complete wiper blade installation by pushing the click.

885RS002

2. Finally, check that the click of the stay has caught in the hole of the rubber.

885RS001

Rear Wiper/Washer System

General Description

The circuit consists of the starter switch, rear wiper & washer switch, rear wiper motor, rear washer motor and Alarm & relay control unit.

When the rear wiper & washer switch is turned on with

the starter switch on, the battery voltage is applied to the wiper motor to activate the wiper.

The washer motor squirts glass cleaning fluid while the washer switch is being pushed. The alarm & relay control unit is used to control motion of the wiper.

Rear Wiper and Washer Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the dash side trim panel(1).
3. Remove the lower cover assembly(2).
 - Refer to Instrument panel Assembly in Body Structure section.

821RW293-1

4. Remove the meter cluster assembly(3).
5. Remove the rear wiper & washer switch (4).
 - Disconnect the connector.
 - Push the lock from the back side of the meter cluster assembly.

825RW285

Installation

To install, follow the removal steps in the reverse order, noting the following point:

1. Push the switch with your fingers until it locks securely.

Rear Wiper Motor (4Door Model)

Removal

1. Disconnect the battery ground cable.
2. Remove the tailgate trim pad.
3. Remove the wiper arm/blade. Refer to Rear Wiper Arm/Blade in section.
4. Remove the rear wiper motor (1).
 - Disconnect the connector.
 - Remove the motor shaft nut (2).
 - Remove the rear wiper motor fixing screws.

885RW001-1

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Before installing the wiper arm/blade to the motor shaft, confirm that the motor stops at the autostop position.
2. Install the wiper arm/blade so that the wiper arm (5) contact with the stopper portion (6) on the hatch gate cover (3) as shown in the figure.

885RW005-1

3. Tighten the motor shaft nut (2) to the specified torque.

Torque: 10N·m (1.0kg·m/87lbin)

4. Tighten the wiper arm nut (4) to the specified torque.

Torque: 14N·m (1.4kg·m/122lbin)

Rear Wiper Motor (2Door Model)

Removal

1. Disconnect the battery ground cable.
2. Remove the tailgate trim pad.
3. Remove the wiper arm/blade.
Refer to Rear Wiper Arm/Blade in section.
4. Remove the rear wiper motor (1).
 - Disconnect the connector.
 - Remove the rear wiper shaft nut and the rear wiper motor fixing screws.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Before installing the wiper arm/blade to the motor shaft, confirm that the motor stops at the autostop position.
2. Install the wiper arm/blade (4) on the hatch gate as shown in the figure.
 - Wiper blade is set on defogger line (5).

3. Tighten the motor shaft nut (2) to the specified torque.

Torque: 6N-m (0.6kg-m/52 lbin)

4. Tighten the wiper arm nut (3) to the specified torque.

Torque: 9N-m (0.9kg-m/78 lbin)

Rear Washer Motor

Removal

1. Disconnect the battery ground cable.
2. Remove the fender inner liner (right side).
3. Disconnect the windshield washer motor connector and the rear washer motor connector.
4. Disconnect the windshield washer hose connector and the rear washer hose connector.
5. Remove the filler neck (2).
 - Remove the bolt.
6. Remove the washer tank (1).
 - Remove the three nuts.
7. Pull out the rear washer motor (3) from the washer tank.

880RW028

Installation

To install, follow the removal steps in the reverse order.

Alarm and Relay Control Unit

Removal

1. Disconnect the battery ground cable.
2. Remove the instrument panel (1).
3. Remove the alarm and relay control unit (2).
 - Remove the fixing screw and disconnect the connector.

826RW039

Installation

To install, follow the removal steps in the reverse order.

Rear Wiper Arm/Blade (4Door Model)

Removal

1. Remove the arm nut(2).
2. Remove the wiper arm/blade(1).

Installation

Refer to Rear Wiper Motor (4door Model) in this section.

Rear Wiper Arm/Blade (2Door Model)

Removal

1. Remove the arm nut(2).
2. Remove the wiper arm/blade(1).

Installation

Refer to Rear Wiper Motor (2door Model) in this section.

Rear Washer Nozzle (4Door Model)

Removal

1. Remove the washer nozzle(1).
 - Pull out the washer nozzle from the washer hose (2).

Rear Washer Spray Pattern

Legend

- (1) Washer Nozzle
- (2) Spray Target

Installation

To install, follow the removal steps in the reverse order.

Rear Washer Nozzle (2Door Model)

Removal

1. Remove the washer nozzle(1).
 - Pull out the washer nozzle and disconnect the washer hose.

Installation

To install, follow the removal steps in the reverse order.

Rear Washer Spray Pattern

To install, follow the removal steps in the reverse order.

Legend

- (1) Washer Nozzle
- (2) Spray Target

Rear Wiper Blade Rubber

Removal

1. Remove the wiper blade from the wiper arm.
2. Push out the wiper rubber from the wiper blade by sliding it horizontally while holding down the rubber on the wiper blade convex (1) side.

CAUTION: When the wiper blade has been removed, wrap the tip of the wiper arm with cloth, to avoid damaging the glass.

Installation

1. Install the wiper blade rubber.
 - Insert the tip of wiper rubber (2) from the opposite side of removal in the arrow direction.

- Check if the convex part (3) of wiper blade is installed in the groove of the wiper rubber.

Main Data and Specifications**Torque Specifications**

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Cigarette Lighter

General Description

When the cigarette lighter is pushed in with the starter switch at either "ACC" or "ON" position, a circuit is formed in the cigarette lighter case to heat the lighter coil.

The cigarette lighter springs back to its original position after the lighter coil is heated.

Removal

1. Disconnect the battery ground cable.
2. Remove the lower cluster assembly (1).
 - Refer to the Instrument Panel Assembly in Body Structure section.
3. Remove the cigarette lighter assembly (2).
 - Disconnect the connectors.
 - Remove the socket (3).

826RW004-1

Installation

To install, follow the removal steps in the reverse order, noting the following point:

1. When installing the bezel, align the projected portion of the socket with the notch of the bezel.

Digital Clock

Removal

1. Disconnect the battery ground cable.
2. Remove the dash side trim panel-LH (1).
 - Refer to Instrument Panel Assembly in Body Structure section.
3. Remove the lower cover assembly (2).
 - Refer to instrument Panel Assembly in Body Structure section.

821RW293-1

4. Remove the meter cluster assembly (3). Refer to instrument Panel Assembly in Body Structure section.
5. Remove the digital clock (4).
 - Remove the fixing screw.

- Disconnect the connector.

821RW291

Installation

To install, follow the removal steps in the reverse order.

Rod Type Antenna

Removal

1. Disconnect the battery ground cable.
2. Turn the antenna rod (2) counterclockwise to remove it.
3. Remove three screws and nine clips to remove the fender inner liner (4).
4. Disconnect the feeder cable connector at the inside of the vehicle, remove the housing bracket screw (1), turn the lock nut counterclockwise to remove it together with the base mold and then remove the housing (3).

890RX021

Installation

To install, follow the removal steps in the reverse order.

Radio

Removal

1. Disconnect the battery ground cable.
2. Remove the lower cluster assembly (1).
 - Refer to Instrument Panel Assembly in Body Structure section.

3. Remove the radio (2).

- Remove the two fixing screws.
- Disconnect the connector (4) and the antenna cable (3).

Installation

To install, follow the removal steps in the reverse order.

Speaker

Front Speaker

Removal

1. Disconnect the battery ground cable.
2. Pull the grille (1) to release the locks and then remove it.
3. Remove four screws and disconnect the connector (3) to remove the speaker (2).

Installation

To install, follow the removal steps in the reverse order.

Tweeter Assembly

Removal

1. Disconnect the battery ground cable.
2. Remove the front door trim pad (2).
 - Refer to Front Window Regulator, Glass And Glass Run in Body Structure section:
3. Remove the tweeter (1).
 - Disconnect the connector.

Installation

To install, follow the removal steps in the reverse order.

Rear Speaker (4Door Model)

Removal

1. Disconnect the battery ground cable.
2. Remove the roof rear lining (1).
 - Release the locks and clips.
3. Remove the speaker (2).
 - Remove the four screws.
 - Disconnect the connector (3).

Installation

To install, follow the removal steps in the reverse order.

Rear Speaker (2Door Model)

Removal

1. Disconnect the battery ground cable.
2. Pull the grille (1) to release the locks clips and then remove it.
3. Remove four screws and disconnect the connector (3) to remove the speaker (2).

890RW048-1

Installation

To install, follow the removal steps in the reverse order.

Accessory Socket

Front Accessory Socket

Removal

1. Disconnect the battery ground cable.
2. Remove the lower cluster assembly (1).
3. Remove the front accessory socket (4).
 - Disconnect the connectors (2).
 - Pull out the front accessory socket from the socket cover (3).

810RW326

Installation

To install, follow the removal steps in the reverse order, noting the following point:

Rear Accessory Socket

Removal

1. Disconnect the battery ground cable.
2. Remove the rear accessory socket (2).
 - Disconnect the connectors (1).
 - Pull out the front accessory socket from the socket cover (3).

810RW004

Installation

To install, follow the removal steps in the reverse order.

Horn

Removal

1. Disconnect the battery ground cable.
2. Remove the radiator grille.
 - Refer to Engine Hood and Fender in Body Structure section.
3. Remove the horn (1).
 - Disconnect the connector.
 - Remove the horn mounting bolt.

82BRX001

Installation

To install, follow the removal steps in the reverse order.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fasteners joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fasteners. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

The chassis electrical system is a 12-volt system with a negative ground polarity.

Wire size are appropriate to respective circuits, and classified by color. (The classification of harnesses by color is shown on the circuit diagram for ease of harness identification.)

The wire size is determined by load capacity and the length of wire required.

The vehicle harness are: body harness, chassis harness, engine room harness, instrument harness, transmission harness, engine ECGI harness, dome light harness, door harness, rear body harness, tailgate harness, SRS harness and battery cables.

The harnesses are protected either by tape or corrugated tube, depending on harness location.

The circuit for each system consists of the power source, wire, fuse, relay, switch, load parts and ground, all of which are shown on the circuit diagram.

In this section, each electrical device is classified by system.

For major parts shown on the circuit based on the circuit diagram for each system, a summary, diagnosis of troubles and inspection procedures are detailed.

Notes for Working on Electrical Items

Disconnecting the Battery Cable

1. All switches should be in the "OFF" position.
2. Disconnect the battery ground cable (2).
3. Disconnect the battery positive cable (1).

CAUTION: It is important that the battery ground cable be disconnected first. Disconnecting the battery positive cable first can result in a short circuit.

061RW002

Connecting the Battery Cable

Follow the disconnecting procedure in the reverse order.

CAUTION: Clean the battery terminal and apply a light coat of grease to prevent terminal corrosion.

Disconnecting the Connector

Some connectors have a tang lock to hold the connectors together during vehicle operation.

Some tang locks are released by pulling them towards you (1).

Other tang locks are released by pressing them forward (2).

Determine which type of tang lock is on the connector being handled.

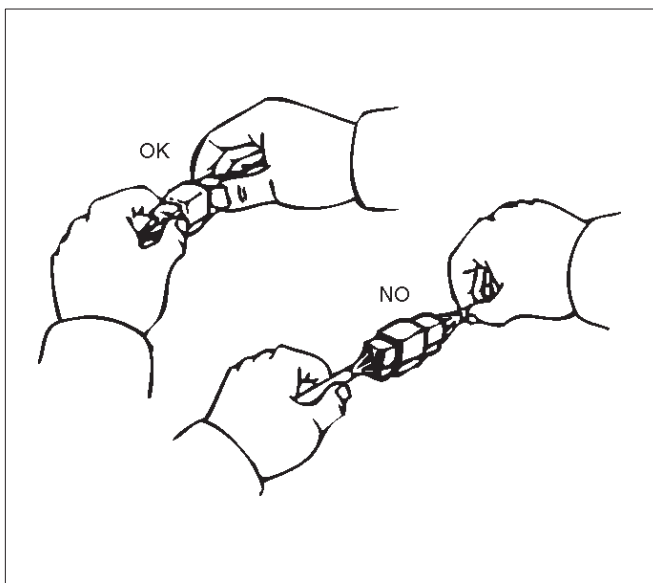

Firmly grasp both sides (male and female) of the connector.

Release the tang lock and carefully pull the two halves of the connector apart.

D08RW128

Never pull on the wires to separate the connectors. This will result in wire breakage as shown in the figure.

D08RW129

8D-4 WIRING SYSTEM

When removing the connector for relay (MR5B type) (3), unfasten the tang lock of the connector by using a screwdriver, then pull the relay out as shown in the figure.

D08RW131

Connecting the Connector

Firmly grasp both sides (male and female) of the connector. Be sure that the connector pins and pin holes match. Be sure that both sides of the connector are aligned with each other.

Firmly but carefully push the two sides of the connector together until a distinct click is heard.

D08RW130

Connector Inspection

Use a circuit tester to check the connector for continuity. Insert the test probes (1) from the connector wire side.

D08RW132

Never insert the circuit tester test probes (2) into the connector open end to test the continuity. Broken or open connector terminals will result.

D08RW133

Waterproof Connector Inspection

It is not possible to insert the test probes (2) into the connector wire side of a waterproof connector. Use one side of a connector (1) with its wires cut to make the test. Connect the test connector (3) to the connector to be tested. Connect the test probes to the cut wires to check the connector continuity.

D08RW134

Connector Pin Removal – Pin Tang Lock Type

1. Insert a slender shaft (1) into the connector housing open end (5).
2. Push the tang lock (2) flat (toward the wire (3) side of the connector).
Pull the wire with pin (4) free from the wire side of the connector.

D08RW136

Connector Pin Removal – Connector Housing Tang Lock Type

1. Insert a slender shaft (1) into the connector housing open end (5).
2. Push the tang lock (2) up (in the direction of the arrow in the illustration).
Pull the wire (3) with pin (4) free from the wire side of the connector.

D08RW135

Connector Pin Insertion

1. Check that the tang lock (1) is fully up.
2. Insert the pin (3) from the connector wire (2) side. Push the pin in until the tang lock closes firmly.
3. Gently pull on the wires to make sure that the connector pin is firmly set in place.

D08RW137

8D-6 WIRING SYSTEM

Parts Handling

Be careful when handling electrical parts. They should not be dropped or thrown, because short circuiting or other damage may result.

D08RW138

Cable Harness

1. When installing the parts, be careful not to pinch or wedge the wiring harness.
2. All electrical connections must be kept clean and tight.

D08RW139

3. Use a grommet or guard tube to protect the wiring harness from contacting a sharp edge or surface.

D08RW139

4. Position the wiring harness with enough clearance from the other parts and guard the wiring harness with a vinyl tube (2) and clips (1) to avoid direct contact.

D08RW141

5. The wiring harness between engine and chassis should be long enough to prevent chafing or damage due to various vibrations.

D08RW142

Splicing Wire

1. If the harness is taped, remove the tape. To avoid wire insulation damage, use a sewing "seam ripper" (available from sewing supply stores) to cut open the harness.

If the harness has a black plastic conduit, simply pull out the desired wire.

2. Begin by cutting as little wire off the harness as possible. You may need the extra length of wire later if you decide to cut more wire off to change the location of a splice. You may have to adjust splice locations to make certain that each splice is at least 1-1/2" (40 mm) away from other splices, harness branches, or connectors.

3. When replacing a wire, use a wire of the same size as the original wire.

Check the stripped wire for nicks or cut stands. If the wire is damaged, repeat the procedure on a new section of wire. The two stripped wire ends should be equal in length.

4. Select the proper clip to secure the splice.

To determine the proper clip size for the wire being spliced, follow the directions included with your clips. Select the correct anvil on the crimper. (On most crimpers your choice is limited to either a small or large anvil.)

Overlap the two stripped wire ends and hold them between your thumb and forefinger as shown in the figure.

The center the spline clip (1) under the stripped wires and hold it in place.

D08RW143

- Open the crimping tool to its full width and rest one handle on a firm flat surface.
- Center the back of the splice clip on the proper anvil and close the crimping tool to the point where the back of the splice clip touches the wings of the clip.
- Make sure that the clip and wires are still in the correct position. Then, apply steady pressure until the crimping tool closes as shown in the figure.

D08RW144

8D-8 WIRING SYSTEM

Before crimping the ends of the clip (1), be sure that:

- The wires extend beyond the clip in each direction.
- No strands of wire are cut loose, and
- No insulation is caught under the clip.

Crimp the splice again, once on each end.

Does not let the crimping tool (2) extend beyond the edge of the clip or you may damage or nick the wires as shown in the figure.

D08RW145

5. Apply 60/40 resin core solder to the opening in the back of the clip as shown in the figure.

Follow the manufacturer's instructions for the solder equipment you are using.

D08RW146

6. Center and roll the splicing tape.

The tape should cover the entire splice.

Roll on enough tape to duplicate the thickness of the insulation on the existing wires.

Does not flag the tape. Flagged tape may not provide enough insulation, and the flagged ends will tangle with the other wires in the harness as shown in the figure.

D08RW147

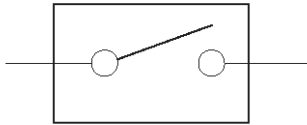

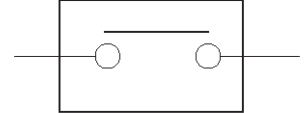

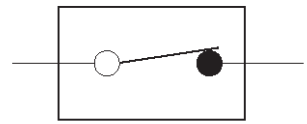

If the wire does not belong in a conduit or other harness covering, tape the wire again. Use a winding motion to cover the first piece of tape as shown in the figure.

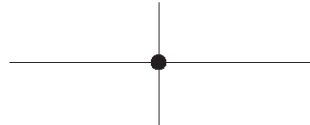

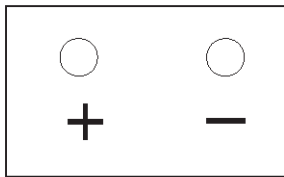

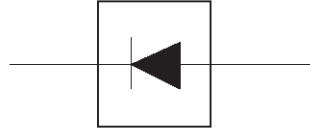

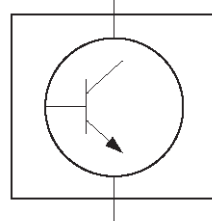

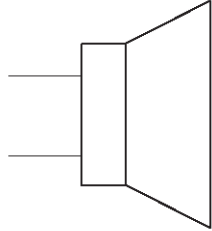

D08RW148

Parts for Electrical Circuit

Wiring – Wire color

All wires have color-coded insulation.

Wires belonging to a system's main harness will have a single color (1). Wires belonging to a system's subcircuits will have a colored stripe (2). Striped wires use the following code to show wire size and colors.

Wiring – Wire Color Coding

Abbreviations are used to indicate wire color within a circuit diagram.

Refer to the following table.

Color-coding	Meaning
B	Black
W	White
R	Red
G	Green
Y	Yellow
L	Blue
O	Orange
BR	Brown
LG	Light green
GR	Grey
P	Pink
LB	Light blue
V	Violet

8D-14 WIRING SYSTEM

Wiring – Wire Size

The size of wire used in a circuit is determined by the amount of current (amperage), the length of the circuit, and the voltage drop allowed. The following wire size and load capacity, shown below, are specified by AWG (American Wire Gauge) (Nominal size means approximate cross sectional area (1).)

D08RW151

Wiring – Wire Size Table

Nominal size	Cross sectional area (mm ²)	Outside diameter (mm)	Allowable current (A)	AWG size (cross reference)
0.3	0.372	1.5	9	22
0.5	0.563	1.7	12	20
0.85	0.885	1.9	16	18
1.25	1.287	2.2	21	16
2	2.091	2.7	28	14
3	3.296	3.6	37.5	12
5	5.227	4.4	53	10
8	7.952	5.5	67	8
15	13.36	7.0	75	6
20	20.61	8.2	97	4

Fuse

Fuses are the most common form of circuit protection used in vehicle wiring. A fuse is a thin piece of wire or strip of metal encased in a glass or plastic housing. It is wired in series with the circuit it protects. When there is an overload of current in a circuit, such as a short to ground, the metal strip is designed to burn out and interrupt the flow of current. This prevents a surge of high current from reaching and damaging other components in the circuit.

Determine the cause of the overloaded before replacing the fuse.

The replacement fuse must have the same amperage specification as the original fuse.

Never replace a blown fuse with a fuse of a different amperage specification.

Doing so can result in an electrical fire or other serious circuit damage. A blown fuse is easily identified as shown in the figure.

810RX001

8D-16 WIRING SYSTEM

Fusible Link

The fusible link is primarily used to protect circuits where high amounts of current flow and where it would not be practical to use a fuse. For example, the starter circuit. When a current overload occurs, the fusible link melts and interrupts the flow of current so as to prevent the rest of the wiring harness from burning.

Determine the cause of the overload before replacing the fusible link. The replacement fusible link must have the same amperage specification as the original fusible link. Never replace a blown fusible link with fusible link of a different amperage specification. Doing so can result in an electrical fire or other serious circuit damage.

A blown fusible link is easily identified as shown in the figure.

D08RW154

Fusible Link Specifications

Type	Rating	Case Color	Maximum Circuit Current (A)
Connector	30A	Pink	15
Connector	40A	Green	20
Bolted	50A	Red	25
Bolted/Connector	60A	Yellow	30
Bolted	80A	Black	40
Bolted	100A	Blue	50

Circuit Breaker

The circuit breaker is a protective device designed to open the circuit when a current load is in excess of rated breaker capacity. If there is a short or other type of overload condition in the circuit, the excessive current will open the circuit between the circuit breaker terminals. The reset knob (1) pops out when the circuit is open. Push the reset knob in place to restore the circuit after repairing it.

D08RW155

Relay

Battery and load location may require that a switch be placed some distance from either component. This means a longer wire and a higher voltage drop (1).

The installation of a relay between the battery and the load reduces the voltage drop (2).

Because the switch controls the relay, amperage through the switch can be reduced.

D08RW156

8D-18 WIRING SYSTEM

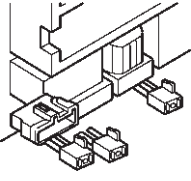

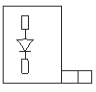

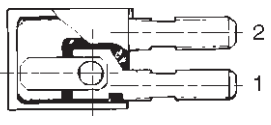

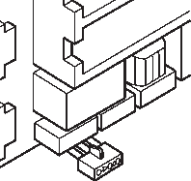

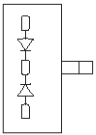

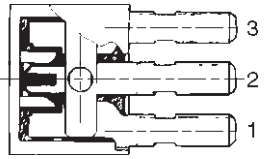

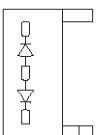

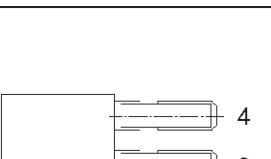

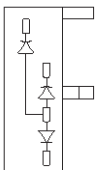

Relay Specifications and Configurations

Color	Rated voltage/Coil resistance		Name/Color	Rated voltage/Coil resistance	Internal circuit
<p>1T (MR5C)/ Black</p>	<p>12V/ Approx. 90Ω Minimum operating voltage: 7V at 77°F (25°C)</p>		<p>1M (M02)/ Black</p>	<p>12V/ Approx. 130Ω Minimum operating voltage: 7V at 77°F (25°C)</p>

8D-20 WIRING SYSTEM

Connector

- The connector pin shape (2) determines whether the connector is male (3) or female (1).

- The symbol illustrated in the figure is used as connector, in the circuit of this section.

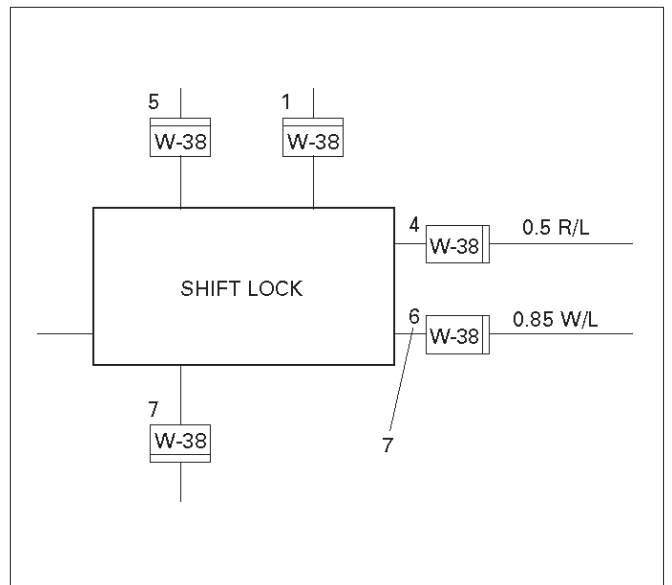

Legend

- (4) Female Side Connector
- (5) Male Side Connector

- Connector is identified with a connector number (6)

- The applicable terminal number (7) is shown for each connector.

- Connector terminal numbers (10) are clearly shown. Make side connector (9) terminal numbers are in sequence from upper right to lower left. Female side connector (8) terminal numbers are in sequence from upper left to lower right.

D08RW163

NOTE:

1. For those connectors on which specific terminal numbers or symbols are shown (such as PCM), the terminal numbers or symbols are used in the circuit diagram, irrespective of the above rule. Refer to the following figure.

D08RW164

2. The connectors used for relays have their own terminal number assignment, irrespective of the above rule. Refer to the following figure.

Double Lock Type Connector

Doublelock type yellow color connectors are used for supplemental restraint system–air bag circuit. When removing the cable harness, disconnect the connector by unlocking at two places, outside (1) and inside (2). In such a case, do not pull the cables. Otherwise, cable disconnection may occur.

When connecting the connector, insert the connector completely and lock at outside. Imperfect locking may cause malfunction of SRS system circuit.

F00RX010

Reading the Circuit Diagram

In this section, each system has its own parts location illustration and circuit diagram. And harness connector faces used in the circuit diagram are shown at the end of this section.

Parts Location

The parts location shows the location of the connectors (1) and the harness (2) used in each harness routing.

Circuit Diagram

The circuit diagram shows the power supply (1) the load or loads (2) and the grounding point(s) (3).

8D-24 WIRING SYSTEM

Harness Connector Faces

The harness connector faces show each connector's number (1), configuration (2) and the pin number (3).

Start and Charging

General Description

This system consists of starter, AC generator, starter relay, clutch start SW (M/T), mode SW (A/T) and heater & A/C relay.

When starter SW is set to "ST" position with A/T select lever at "P" (Parking) or "N" (Neutral) position (Mode SW "ON"), or clutch pedal depressed (Clutch start SW "ON"), battery positive voltage is applied to starter solenoid coil through starter relay to start starter. At the same time, starter relay cuts off blower motor and A/C circuit.

Powertrain Control Module (PCM)

General Description

The Powertrain Control Module (PCM) is located in the passenger compartment.

The PCM constantly monitors the information from various sensors, and controls the systems that affect vehicle performance.

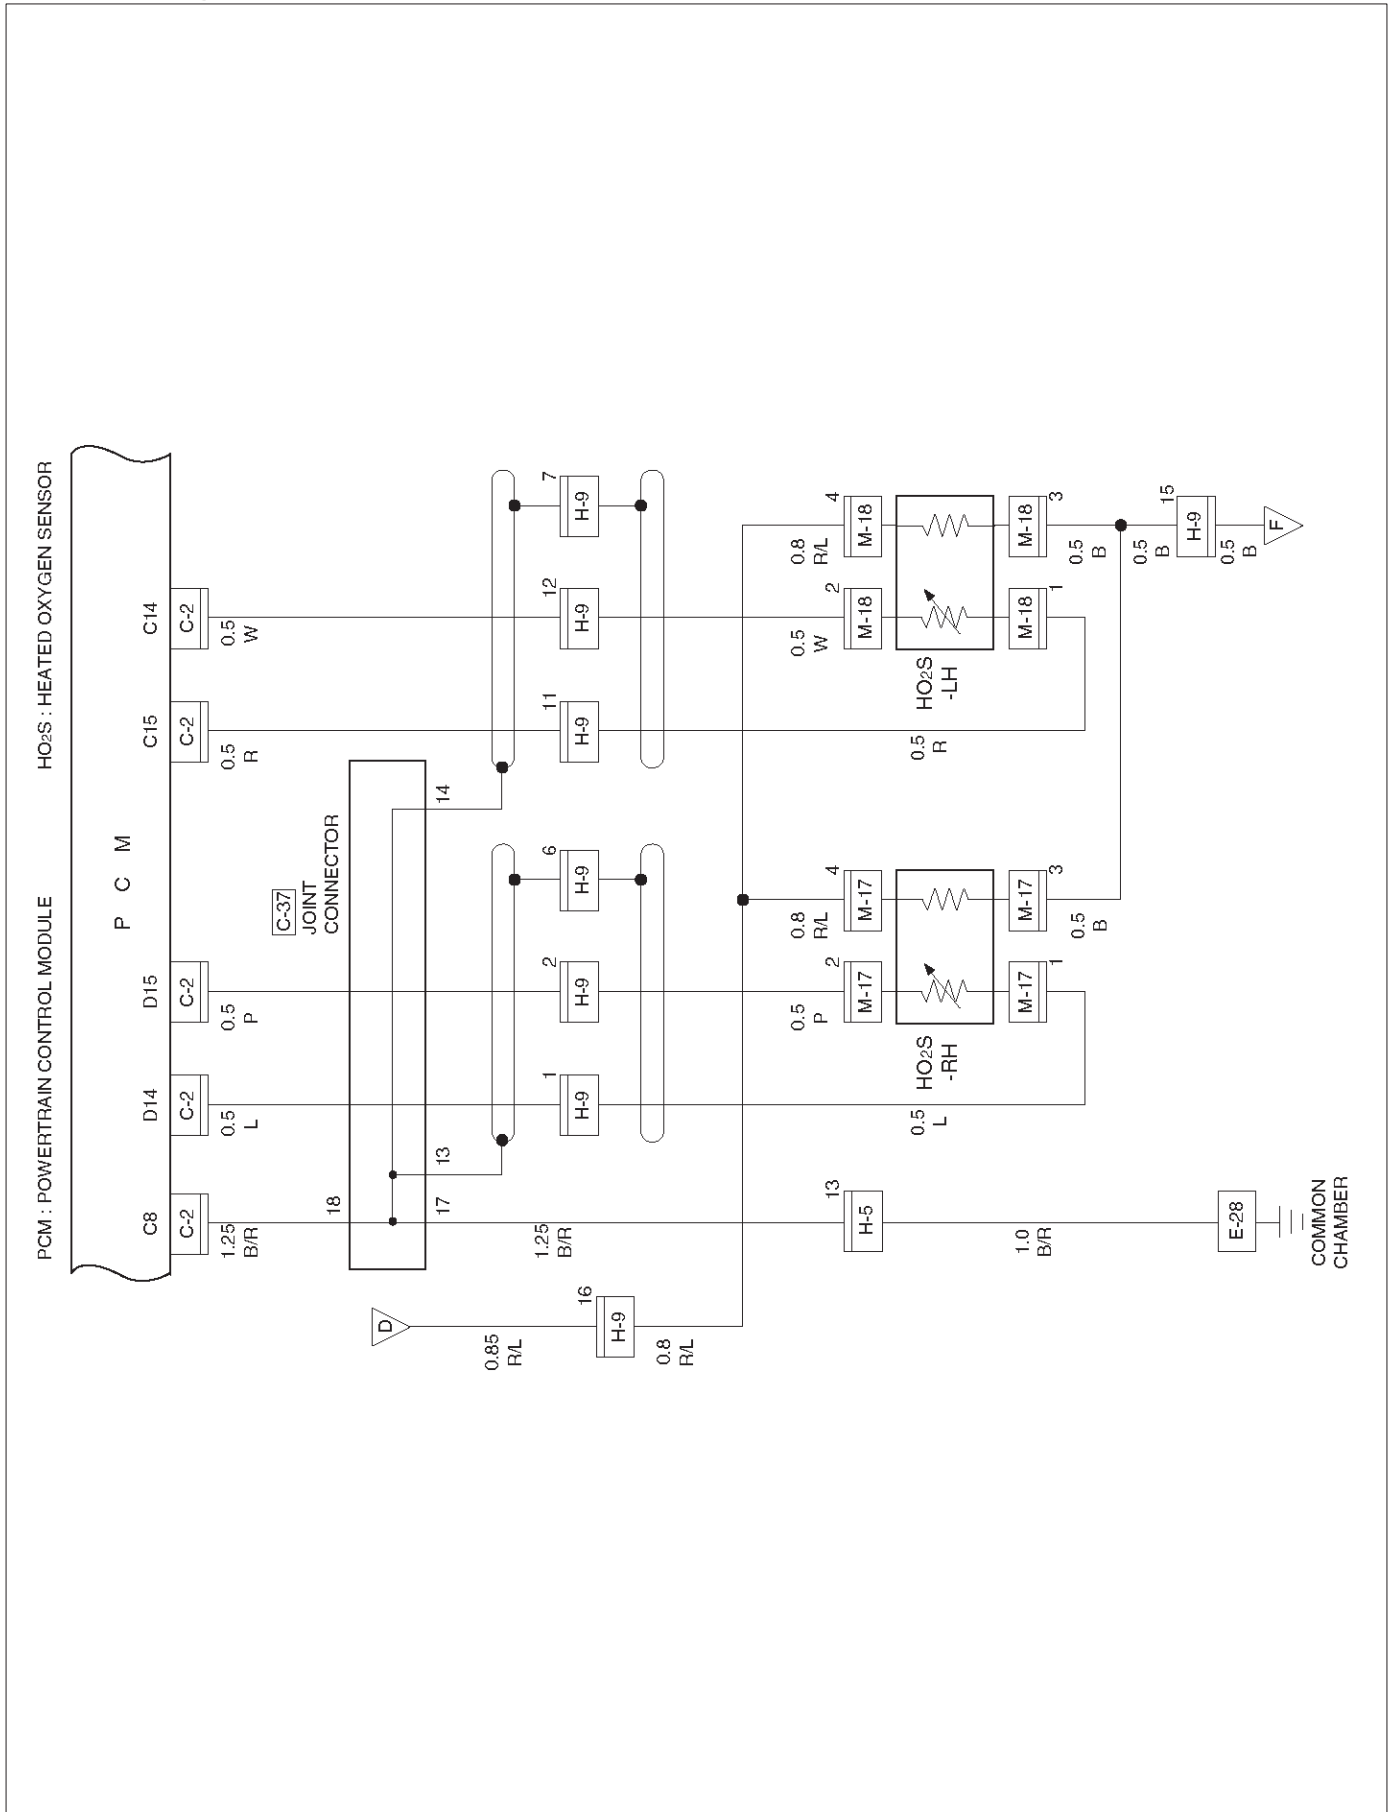

The PCM performs the diagnostic function of the system. It can recognize operational problems, alert the driver through the Malfunction Indicator Light (MIL) and store a Diagnostic Trouble Code (DTC) or DTC(s) which identify the problem areas to aid the technician in making repairs. The PCM is designed to process the various input informations and then send the necessary electrical responses to control fuel delivery, spark timing and other emission control systems. The input information has an interrelation to more than one output therefore, if the one input failed, it could affect more than one system operation.

Refer to Driveability and Emission in Engine Section and Automatic Transmission in Transmission section.

Headlight and Fog Light

General Description

The circuit consists of headlight, fog light, lighting switch, dimmer-passing switch, fog light switch, high beam indicator, lighting relay and fog light relay. When starter switch is turned on by setting it at headlight position, lighting relay is activated to turn on headlight. Optical axis of headlight can be turned up or down by operating dimmer switch while headlight is on. Passing switch is independent of lighting switch, and optical axis of passing light can be turned up only while switch lever is pulled up and held in this state.

When fog light switch is turned on while headlight on at low-beam, fog light relay is activated to turn on fog light.

Diagnosis

Both Headlights Inoperative

Step	Action	Value(s)	Yes	No
1	Check the ground terminal B-8. Is B-8 grounded securely?	—	Go to Step 2	Ground it securely
2	Disconnect the combination switch connector I-32. Is there continuity between switch side connector I-32 terminals 9 and 2 with the switch turned to headlight position?	—	Go to Step 2	Replace the switch
3	Check continuity of dimmer-passing switch. Is there continuity between switch side connector I-32 terminal 5 and 4 with the switch turned to low position, and terminal 1 and 4 with the switch turned to high position?	—	Go to Step 3	Replace the switch
4	Check continuity between the lighting switch and the ground B-8. Is there continuity between harness side connector I-32 terminal 2 and the ground?	—	Go to Step 5	Repair an open circuit
5	Remove the lighting relay from the relay and fuse box. Is the battery voltage applied between harness side connector X-1 terminal 5 and the ground, X-1 terminal 2 and the ground?	Approx. 12V	Go to Step 6	Repair an open circuit between battery and the lighting relay
6	Check continuity between the lighting relay and the lighting switch. Is there continuity between harness side connector X-1 terminal 4 and I-32 terminal 9?	—	Go to Step 7	Go to Step 6
7	Check continuity between the lighting relay and fuse F-8 or F-9. Is there continuity between harness side connector X-1 terminal 3 and fuse F-8 or F-9?	—	Go to Step 8	Repair an open circuit
8	Check continuity between the dimmer-passing switch and the ground. Is there continuity between switch side connector I-32 terminal 4 and the ground B-8?	—	Repair an open circuit	—

Headlight On The Left (or Right) Side Inoperative

Step	Action	Value(s)	Yes	No
1	Is the fuse F-8 or F-9 normal?	—	Go to Step 2	Replace the fuse
2	Remove the headlight bulb on the left or right side. Is the bulb normal?	—	Go to Step 3	Replace the bulb
3	1. Reinstall the bulb. 2. Turn the lighting switch to headlight position. Is the battery voltage applied between harness side connector C-21 terminal 3 and the ground or C-10 terminal 3 and the ground?	Approx. 12V	Reconnect the headlight connector securely	Repair an open circuit between the fuse and headlight

Headlights In Low-Beam Inoperative

Step	Action	Value(s)	Yes	No
1	Disconnect the combination switch connector I-32. Is there continuity between switch side connector I-32 terminal 5 and 4 with the switch at low-beam position?	—	Go to Step 2	Repair or replace the switch
2	Repair an open circuit between connector H-13 terminal 15 and connector I-32 terminal 5. Is the action complete?	—	Verify repair	—

Headlight In High-Beam Inoperative

Step	Action	Value(s)	Yes	No
1	Disconnect the combination switch connector I-32. Is there continuity between switch side connector I-32 terminal 1 and 4 with the switch at high-beam position?	—	Go to Step 2	Repair or replace the switch
2	Repair an open circuit between connector H-13 terminal 14 and connector I-32 terminal 1. Is the action complete?	—	Verify repair	—

Headlights Remain On When Lighting Switch Turned Off

Step	Action	Value(s)	Yes	No
1	1. Turn the lighting switch to off position. 2. Disconnect the combination switch connector I-32. Do the headlights still remain on?	—	Go to Step 3	Go to Step 2
2	Repair or replace the lighting switch. NOTE: There should be no continuity between switch side connector I-32 terminal 9 and 2. Is the action complete?	—	Go to Step 1	—
3	Remove the lighting relay. Is there continuity between the relay side connector X-1 terminal 1 and 5?	—	Replace the relay	Go to Step 4
4	Repair short circuit between the lighting relay and the lighting switch. Is the action complete?	—	Verify repair	—

Headlight Comes On With Lighting Switch At Parking Light Position

Step	Action	Value(s)	Yes	No
1	Repair or replace the lighting switch. NOTE: There should be no continuity between switch side connector I-32 terminal 9 and 2 when the switch is turned to parking light position. Is the action complete?	—	Verify repair	—

(While Headlight Is On In Low-Beam) Both Fog Lights Inoperative

Step	Action	Value(s)	Yes	No
1	Are the fuse F-10 and C-4 normal?	—	Go to Step 2	Replace the fuse(s)
2	Is C-36 grounded securely?	—	Go to Step 3	Ground it securely
3	Remove the foglight relay. Is the battery voltage applied between harness side connector X-2 terminal 5 and the ground?	Approx. 12V	Go to Step 5	Go to Step 4
4	Repair an open circuit between Fuse F-10 connector X-2 terminal 5. Is there action complete?	—	Go to Step 3	—
5	Is there continuity between harness side connector X-2 terminal 4 and the ground?	—	Go to Step 7	Go to Step 6
6	Repair an open circuit between connector X-2 terminal 4 and the ground C-36. Is the action complete?	—	Go to Step 5	—
7	1. Turn the lighting switch to clearance light position. 2. Turn the fog light switch on. Is the battery voltage applied between harness side connector X-2 terminal 2 and the ground?	Approx. 12V	Replace the fog light relay	Go to Step 8
8	Disconnect the lighting switch connector I-32. Is there continuity between the switch side connector terminal 2 and 3?	—	Go to Step 9	Repair or replace the switch.
9	Disconnect the tail relay. Is there continuity between harness side connector I-32 terminal 3 and I-32 terminal 3?	—	Go to Step 10	Repair an open circuit
10	Is the battery voltage applied between harness side connector I-34 terminal 2, 4 and the ground?	Approx. 12V	Go to Step 12	Go to Step 11
11	Repair an open circuit between the fuse C-4 and connector I-34 terminal 2 or 4. Is the action complete?	—	Go to Step 10	—
12	1. Disconnect the fog light switch. 2. Turn the switch on. Is there continuity between the switch terminal 3 and 4?	—	Go to Step 13	Repair or replace the switch
13	Is there continuity between harness side connector I-5 terminal 4 and connector I-34 terminal 1?	—	Go to Step 14	Repair an open circuit
14	Is there continuity between harness side connector I-5 terminal 3 and connector X-2 terminal 2?	—	Replace the tail relay	Repair an open circuit

8D-86 WIRING SYSTEM**(While Headlight Is On In Low-Beam) Fog Light On the Left (or Right) Side Inoperative**

Step	Action	Value(s)	Yes	No
1	Is the fog light bulb on the left or right side normal?	—	Go to Step 2	Replace the bulb
2	Is C-16 or C-36 grounder securely?	—	Go to Step 3	Ground it Securely
3	Disconnect the fog light connector C-22 or C-17. Is there continuity between the fog light harness side connector terminal 2 and the ground?	—	Go to Step 4	Repair an open circuit
4	Repair an open circuit between fog light relay connector X-2 terminal 1 and fog light connector terminal 1. Is the action complete?	—	Verify repair	—

Clearance Light, Tail Light and License Plate Light

General Description

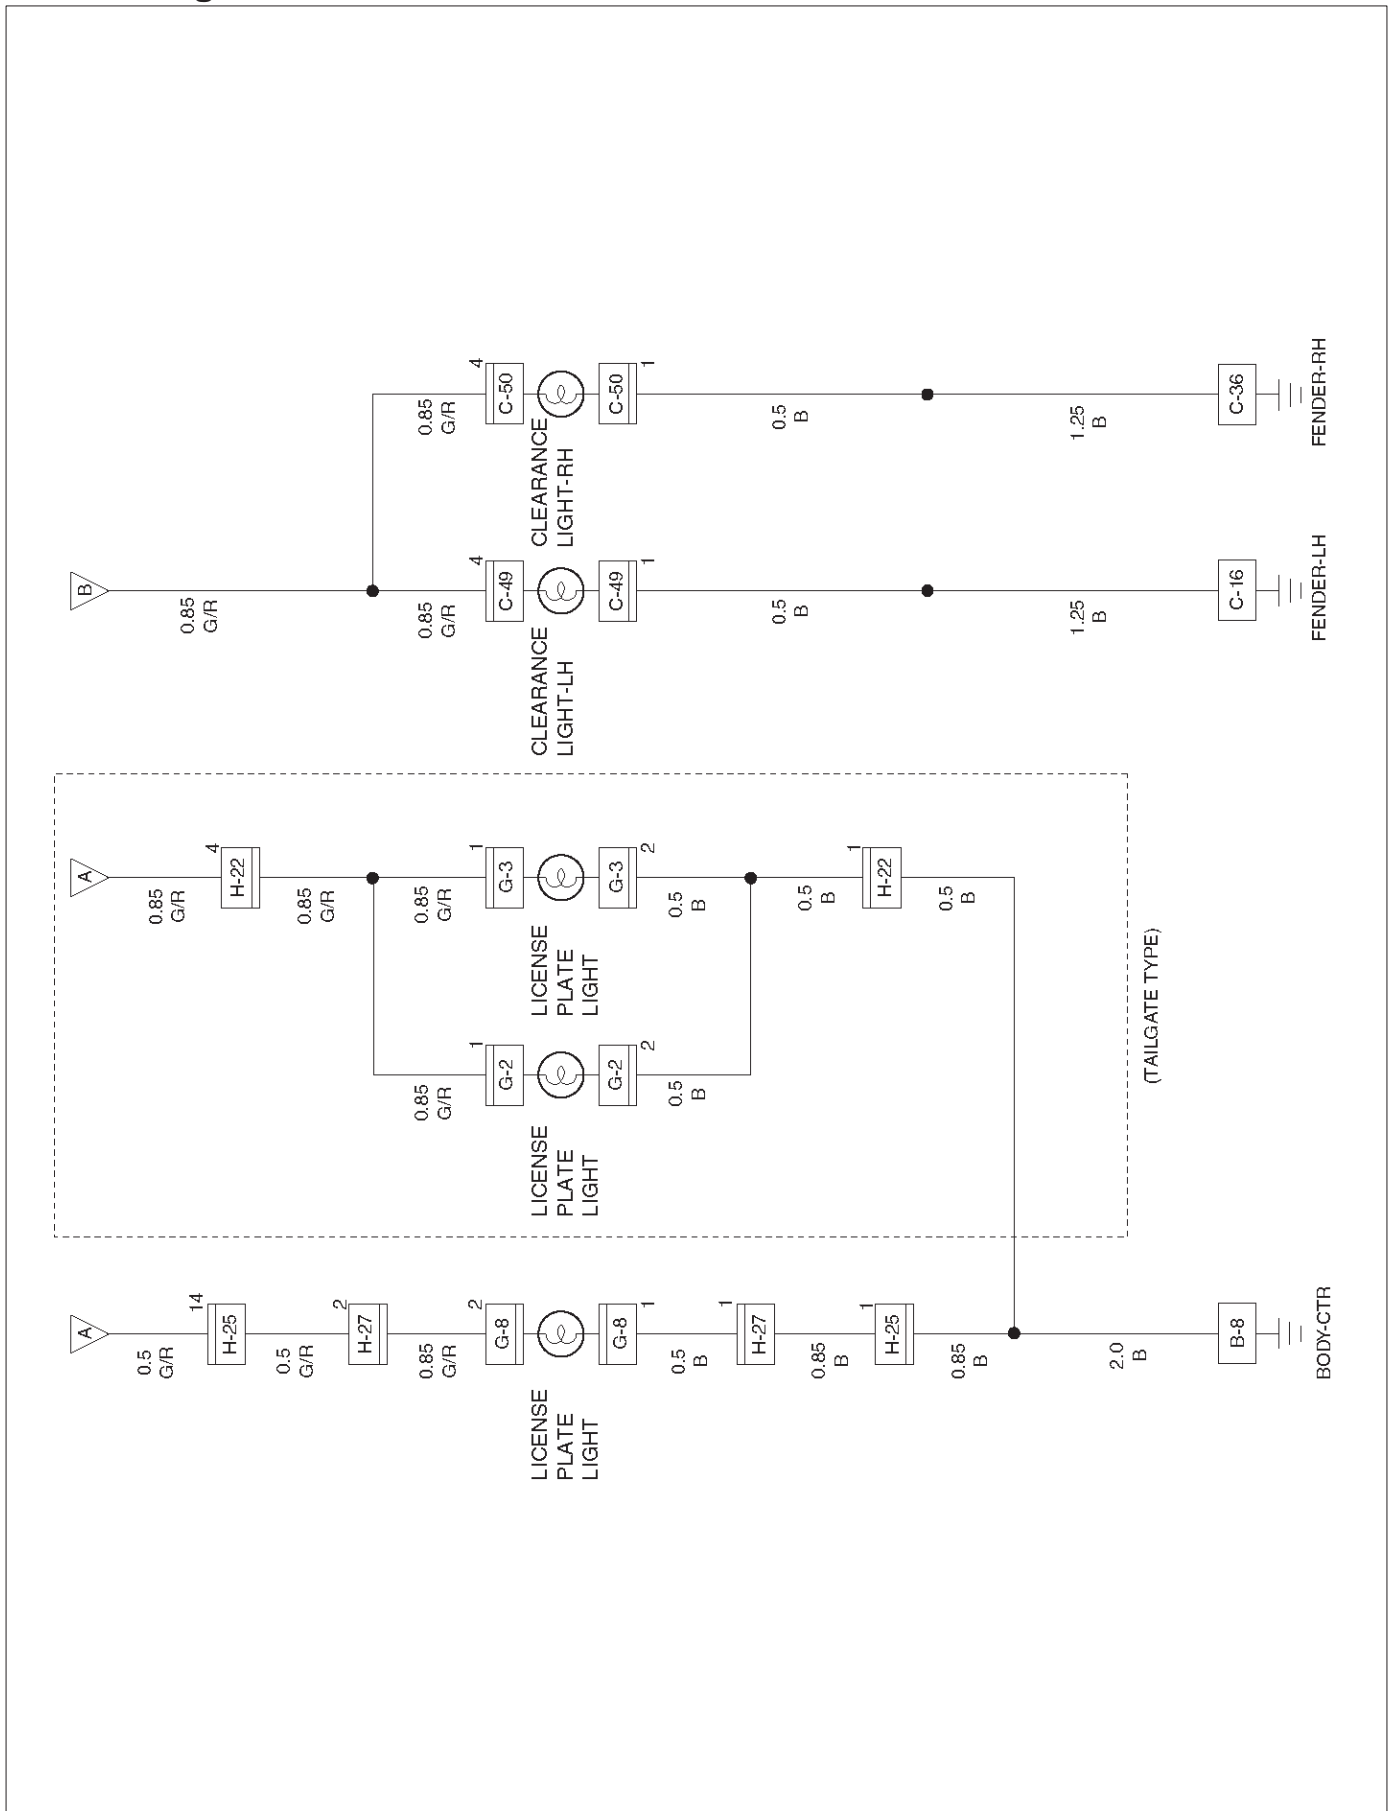

The circuit consists of lighting switch, clearance light, tail light and license plate light.

All these lights come on when lighting switch is turned on with the switch to either parking or headlight position.

Diagnosis

Both Tail Lights Inoperative

Step	Action	Value(s)	Yes	No
1	Repair an open circuit between the tail relay and the taillights. Is the action complete?	—	Verify repair	—

Tail Light On The Left (or Right) Side Inoperative

Step	Action	Value(s)	Yes	No
1	Remove the taillight bulb on the left or right side. Is the bulb normal?	—	Go to Step 2	Replace the bulb
2	Disconnect the taillight connector B-9 or B-13. Is the battery voltage applied between harness side connector B-9 or B-13 terminal 4 or 3 and the ground?	Approx. 12V	Go to Step 4	Go to Step 3
3	Repair an open circuit between the tail relay and the taillight on the left or right side. Is the action complete?	—	Verify repair	—
4	Repair an open circuit between the taillight on the left or right side and the ground. Is the action complete?	—	Verify repair	—

Clearance Light Inoperative

Step	Action	Value(s)	Yes	No
1	Repair an open circuit between the tail relay and the taillights. Is the action complete?	—	Verify repair	—

Clearance Light On The Left (or Right) Side Inoperative

Step	Action	Value(s)	Yes	No
1	Remove the clearance light bulb on the left or right side. Is the bulb normal?	—	Go to Step 2	Replace the bulb
2	Disconnect the clearance light connector C-49 or C-50. Is the battery voltage applied between harness side connector C-49, or C-50 terminal 4 and the ground?	Approx. 12V	Go to Step 4	Go to Step 3
3	Repair an open circuit between the tail relay and the clearance light on the left or right side. Is the action complete?	—	Verify repair	—
4	Repair an open circuit between the clearance light and the ground? Is the action complete?	—	Verify repair	—

8D-92 WIRING SYSTEM**License Plate Light Inoperative**

Step	Action	Value(s)	Yes	No
1	Do the taillights come on?	—	Go to Step 2	Go to Step 6
2	Remove the license plate light bulb. Is the bulb normal?	—	Go to Step 3	Replace bulb
3	1. Disconnect the license plate light connector G-8. 2. Turn the lighting switch on. Is the battery voltage applied between harness side connector G-8 terminal 1 and the ground?	Approx. 12V	Go to Step 5	Go to Step 4
4	Repair an open circuit between connector H-19 terminal 6 and the license plate light. Is the action complete?	—	Verify repair	—
5	Repair an open circuit between the license plate light and the ground B-8. Is the action complete?	—	Verify repair	—
6	Refer to the diagnosis procedure for "Both Taillight Inoperative" in this section. Is the action complete?	—	Verify repair	—

Interior Illumination Light

General Description

The circuit consists of lighting switch, tail relay, and illumination lights.

All these lights come on when lighting switch is turned on with the switch to either parking or headlight position.

Interior Illumination Lights Inoperative

Step	Action	Value(s)	Yes	No
1	Turn the light switch to clearance light position. Do the exterior light come on?	—	Go to Step 3	Go to Step 2
2	Refer to the diagnosis procedure in Clearance Light, Taillight and License Plate Light section. Is the action complete?	—	Verify repair	—
3	Repair an open circuit between tail relay harness side connector I-34 terminal 1 and interior lights. Is the action complete?	—	Verify repair	—

Turn Signal Light, Hazard Warning Light

General Description

The circuit consists of turn signal/light switch (combination switch) turn signal light, hazard warning switch and flasher unit. When turn signal light switch is turned on with starter switch on, turn signal light will operate. When turn signal light is flashing, indicator light in meter also starts flashing. When hazard warning switch is turned on, current flows to flasher unit through hazard warning switch to cause hazard warning light to flash independent of position of starter switch. At the same time, indicator lights in meter also start flashing.

Diagnosis

Turn Signal Light Does Not Flash

Step	Action	Value(s)	Yes	No
1	Is fuse C-14 normal?	—	Go to Step 2	Replace the fuse
2	1. Turn the hazard warning switch off. 2. Disconnect the switch connector I-11. Is there continuity between switch side connector I-11 terminal 5 and 10?	—	Go to Step 3	Replace or replace the switch
3	Turn the starter switch on. Is the battery voltage applied between harness side connector I-11 terminal 5 and the ground?	Approx. 12V	Go to Step 5	Go to Step 4
4	Repair an open circuit between the fuse C-14 and the hazard warning switch. Is the action complete?	—	Go to Step 3	—
5	1. Reconnect the connector I-11 with the hazard warning switch. 2. Disconnect the flasher unit connector I-47. Is the battery voltage applied between harness side connector I-47 terminal 3 and the ground?	Approx. 12V	Go to Step 7	Go to Step 6
6	Repair an open circuit between connector I-11 terminal 10 and connector I-47 terminal 3. Is the action complete?	—	Go to Step 5	—
7	Is there continuity between harness side connector I-47 terminal 2 and the ground B-8?	—	Go to Step 9	Go to Step 8
8	Repair an open circuit between connector I-47 terminal 2 and the ground B-8. Is the action complete?	—	Go to Step 7	—
9	1. Reconnect the flasher unit connector I-47. 2. Disconnect the turn signal light switch connector I-32. Is there continuity between switch side connector terminal 6 and 7 with the switch turned to the left position, and terminal 6 and 8 with the switch turned to the right position?	—	Go to Step 10	Repair or replace the switch
10	Is there continuity between harness side connector I-47 terminal 1 and harness side connector I-32 terminal 6?	—	Go to Step 12	Go to Step 11
11	Repair an open circuit between connector I-47 terminal 1 and connector I-32 terminal 6. Is the action complete?	—	Verify repair	—
12	Replace the flasher unit. Is the action complete?	—	Verify repair	—

8D-104 WIRING SYSTEM**Turn Signal Light Flashes Too Quickly**

Step	Action	Value(s)	Yes	No
1	Do all of turn signal lights flash?	—	Go to Step 2	Go to Step 3
2	Replace the flasher unit. Is the action complete?	—	Verify repair	—
3	Is the bulb of turn signal light that does not work normal?	—	Go to Step 4	Replace the bulb
4	Repair an open circuit between the turn signal light switch and the turn signal light. Is the action complete?	—	Verify repair	—

Stoplight

General Description

The circuit consists of stoplight, high mounted stoplight and stoplight switch.

With brake pedal depressed, stoplight switch is turned on to illuminate stoplight.

Stoplight switch controls not only the operation of stoplight but also the input of cruise cancel signals to cruise control unit.

- (12) B-6

Diagnosis

Both Stoplights Inoperative

Step	Action	Value(s)	Yes	No
1	Is the fuse C-6 normal?	—	Go to Step 2	Replace the fuse
2	Dieconnect the stoplight switch connector I-18. Is there continuity between connector I-18 terminal 1 and 4 with the brake pedal depressed?	—	Go to Step 3	Replace or replace the switch
3	Is the battery voltage applied between harness side connector I-18 terminal 1 and the ground?	Approx. 12V	Go to Step 5	Go to Step 4
4	Repair an open circuit between the fuse C-6 and connector I-18 terminal 1. Is the action complete?	—	Verify repair	—
5	Repair an open circuit between stoplight switch and the stoplight. Is the action complete?	—	Verify repair	—

Stoplight On The Left (or Right) Side Inoperative

Step	Action	Value(s)	Yes	No
1	1. Disconnect the stoplight connector B-9 or B-13. 2. Depress the brake pedal. Is the battery voltage applied between stoplight harness side connector terminal 2 and the ground?	Approx. 12V	Go to Step 2	Go to Step 3
2	Repair an open circuit between the stoplight and the ground. Is the action complete?	—	Verify repair	—
3	Repair an open circuit between the stoplight switch and the stoplight. Is the action complete?	—	Verify repair	—

8D-110 WIRING SYSTEM**High Mounted Stoplight Inoperative**

Step	Action	Value(s)	Yes	No
1	Depress the brake pedal. Do the stoplight come on?	—	Go to Step 3	Go to Step 2
2	Refer to the diagnosis procedure for “Both Stoplights inoperative” in this section. Is the action complete?	—	Verify repair	—
3	Is B-6 grounded securely?	—	Go to Step 4	Ground it securely
4	1. Disconnect the high mounted stoplight connector. 2. Depress the brake pedal. Is the battery voltage applied between harness side connector G-11 terminal 1 or connector G-4 terminal 2 and the ground?	Approx. 12V	Go to Step 6	Go to Step 5
5	Repair an open circuit between connector H-19 terminal 10 and the high mounted stoplight. Is the action complete?	—	Go to Step 4	—
6	Is there continuity between high mounted stoplight side connector terminals?	—	Go to Step 7	Repair or replace the light
7	Repair an open circuit between the high mounted stoplight and the ground B-6. Is the action complete?	—	Verify repair	—

Backup Light

General Description

The circuit consists of backup light switch (M/T), mode switch (A/T) and backup light.

When shift lever is set to "R" position, backup light switch (M/T) or mode switch (A/T) is activated to illuminate backup light.

Circuit Diagram

Diagnosis

Both Backup Lights Inoperative

Step	Action	Value(s)	Yes	No
1	Is the fuse C-14 normal?	—	Go to Step 2	Replace the fuse
2	Are B-6 and B-8 ground securely?	—	Go to Step 3	Ground then securely
3	1. Disconnect the mode switch connector M-16 or backup light switch connector M-8 and M-9. 2. Turn the starter switch on. Is the battery voltage applied between harness side connector M-16 terminal 5 and the ground, or harness side connector M-8 terminal 1 and the ground?	Approx. 12V	Go to Step 5	Go to Step 4
4	Repair an open circuit between the fuse C-14 and connector M-16 terminal 5 or connector M-8 terminal 1. Is the action complete?	—	Go to Step 3	—
5	Set the transmission gear to the reverse position. Is there continuity between mode switch side connector terminal 2 and 5, or backup light switch side connector terminals?	—	Go to Step 6	Repair or replace the switch
6	1. Reconnect the mode switch connector M-16 or backup light switch connector M-8 and M-9. 2. Disconnect the backup light connector B-9 or B-13. Is the battery voltage applied between the backup light harness side connector terminal 5 and the ground?	Approx. 12V	Go to Step 8	Go to Step 7
7	Repair an open circuit between the mode switch or backup light switch and the backup lights. Is the action complete?	—	Verify repair	—
8	Repair an open circuit between backup lights and the ground. Is the action complete?	—	Verify repair	—

Backup Light On The Left (or Right) Side Inoperative

Step	Action	Value(s)	Yes	No
1	Remove the backup light bulb on the left or right side. Is the bulb normal?	—	Go to Step 2	Replace the bulb
2	1. Set the transmission gear to the reverse position. 2. Turn the starter switch on. Is the battery voltage applied between backup light harness side connector B-9 or B-13 terminal 5 and the ground?	Approx. 12V	Go to Step 4	Go to Step 3
3	Repair an open circuit between connector H-15 terminal 12 and the backup light on the left or right side. Is the action complete?	—	Verify repair	—
4	Repair an open circuit between the backup light on the left or right side and the ground. Is the action complete?	—	Verify repair	—

Backup Lights Remain On

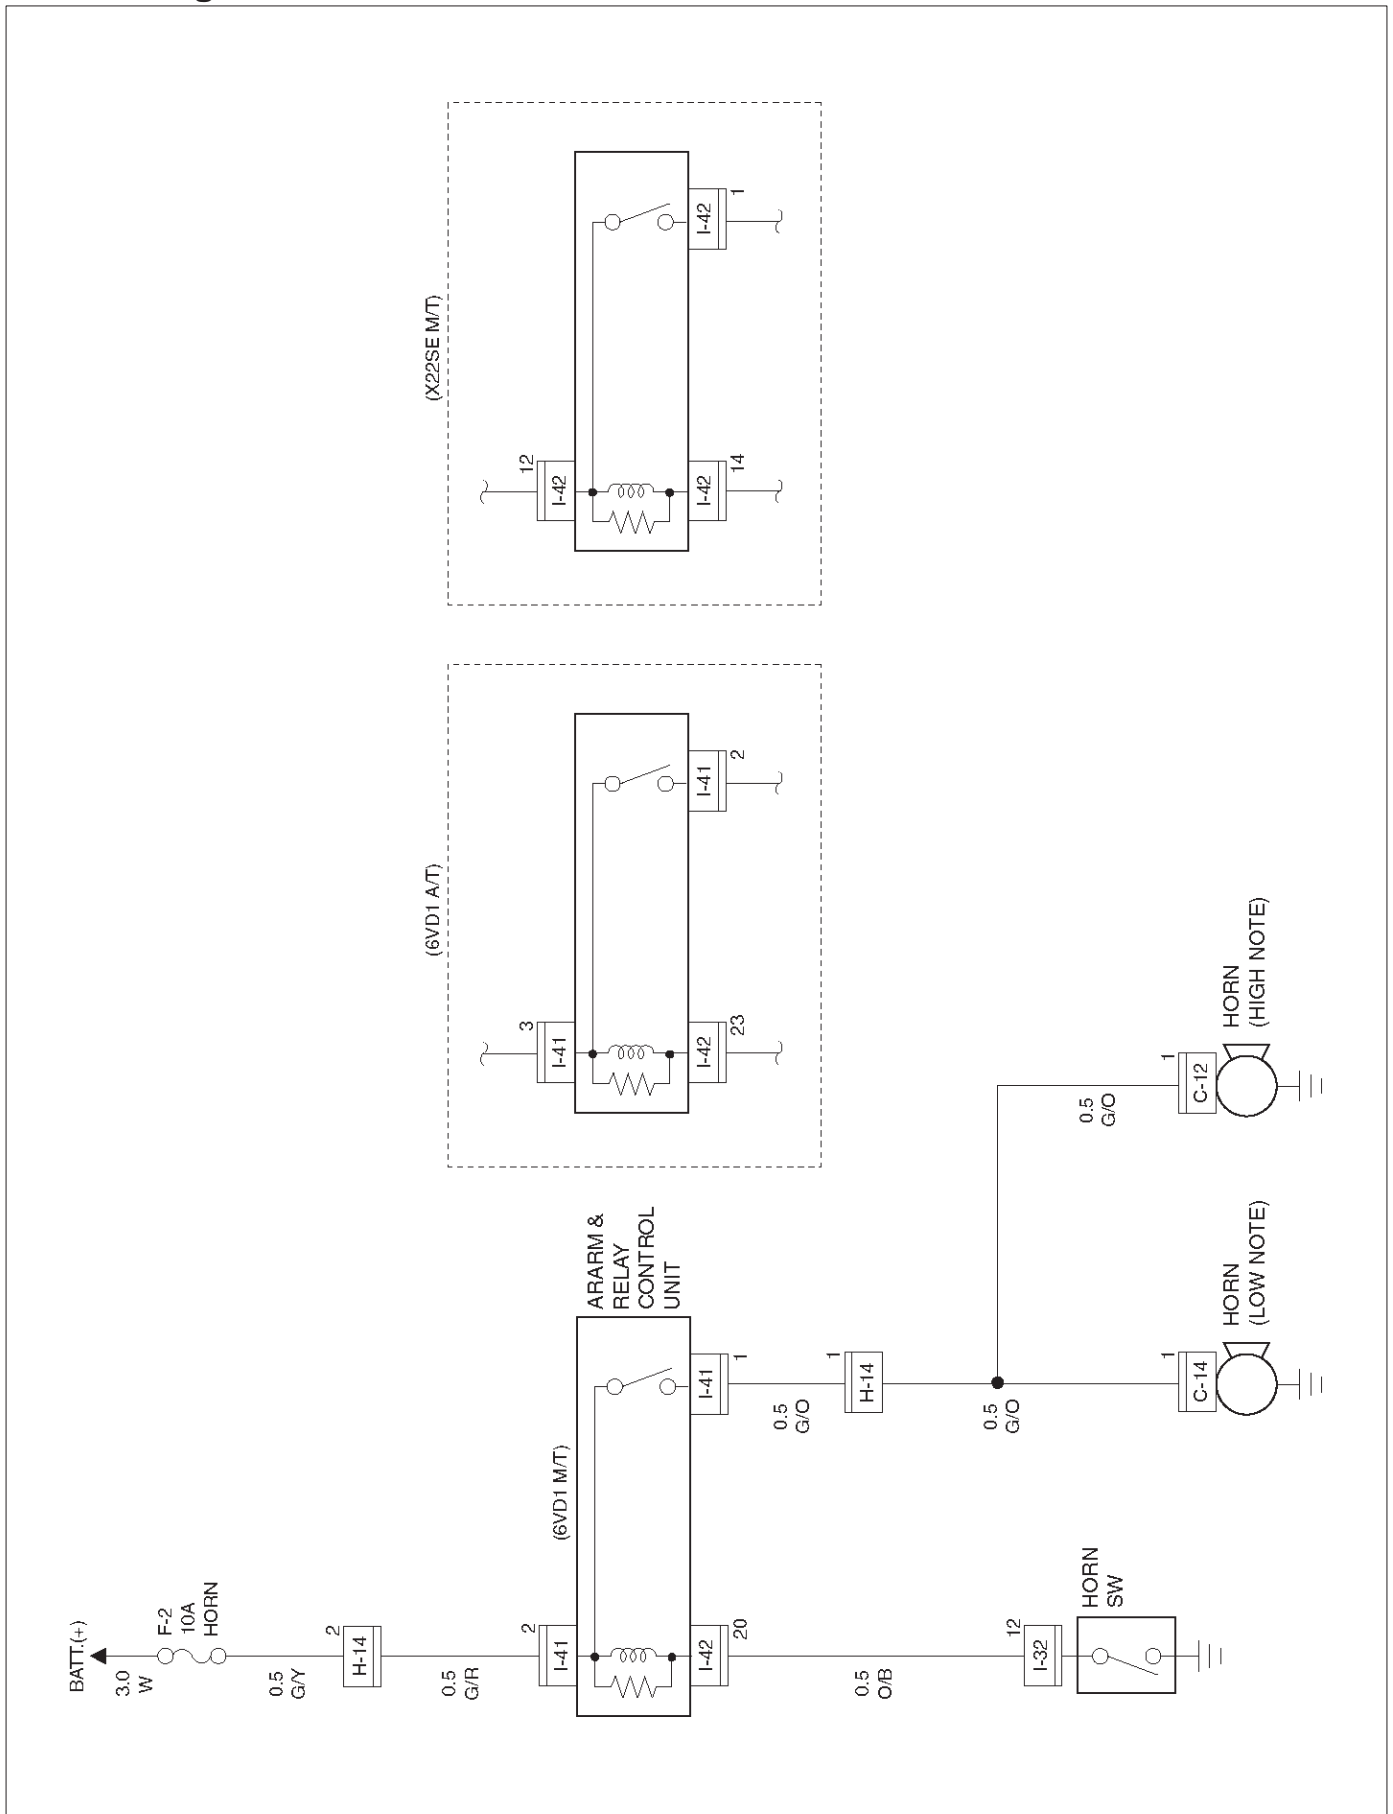

Step	Action	Value(s)	Yes	No
1	Repair or replace the mode switch or the backup light switch. Is the action complete?	—	Verify repair	—

Horn

General Description

The circuit consists of horn (high note), horn (low note), horn relay (alarm & relay control unit) and horn switch. When horn switch is pushed, (independent of position of starter switch) horn relay is activated to sound horns.

Circuit Diagram

Parts Location

D08RWD18

Legend

| (4) I-41, I-42 | (8) C-12 |
| | (9) Horn (High note) |

Diagnosis

Horn Do Not Sound

Step	Action	Value(s)	Yes	No
1	Is the fuse F-2 normal?	—	Go to Step 2	Replace the fuse
2	Disconnect the alarm & relay control unit connector I-41 and I-42. Is the battery voltage applied between harness side connector I-41 terminal 2 or 3 (6VD1), connector I-42 terminal 12 (X22SE) and the ground?	Approx. 12V	Go to Step 4	Go to Step 3
3	Repair an open circuit between the fuse F-2 and the alarm & relay control unit. Is the action complete?	—	Verify repair	—
4	Disconnect the horn switch connector. Is there continuity between harness side connector I-32 terminal 12 and connector I-42 terminal 20, 23 or 14?	—	Go to Step 6	Go to Step 5
5	Repair an open circuit between the alarm & relay control unit and the horn switch. Is the action complete?	—	Verify repair	—
6	Press the horn switch. Is there continuity between switch side connector I-32 terminal 12 and the ground?	—	Go to Step 7	Repair or replace the switch
7	1. Disconnect the horn connector. 2. Connect the battery positive terminal to the horn side connector terminal 1. Does the horn work?	—	Go to Step 8	Replace the horn
8	Is there continuity between harness side connector terminal between the horn and the alarm & relay control unit?	—	Go to Step 9	Go to Step 10
9	Replace the alarm & relay control unit. Is the action complete?	—	Verify repair	—
10	Repair an open circuit between the horn and the alarm & relay control unit. Is the action complete?	—	Verify repair	—

Horn Do Not Stop Sounding

Step	Action	Value(s)	Yes	No
1	Disconnect the horn switch connector I-32. Do the horn stop sounding?	—	Repair or replace the horn switch	Go to Step 2
2	Disconnect the alarm & relay control unit connector I-42. Is there continuity between harness side connector terminal 20 (23 or 14) and the ground?	—	Repair short circuit	Replace the alarm & relay control unit

Dome Light, Luggage Room Light, Courtesy Light, Map Light, Seat Belt Switch and Warning Buzzer

General Description

The circuit consists of door switch, dome light, luggage room light, courtesy light, map light tail relay, key cylinder switch and alarm & relay control unit.

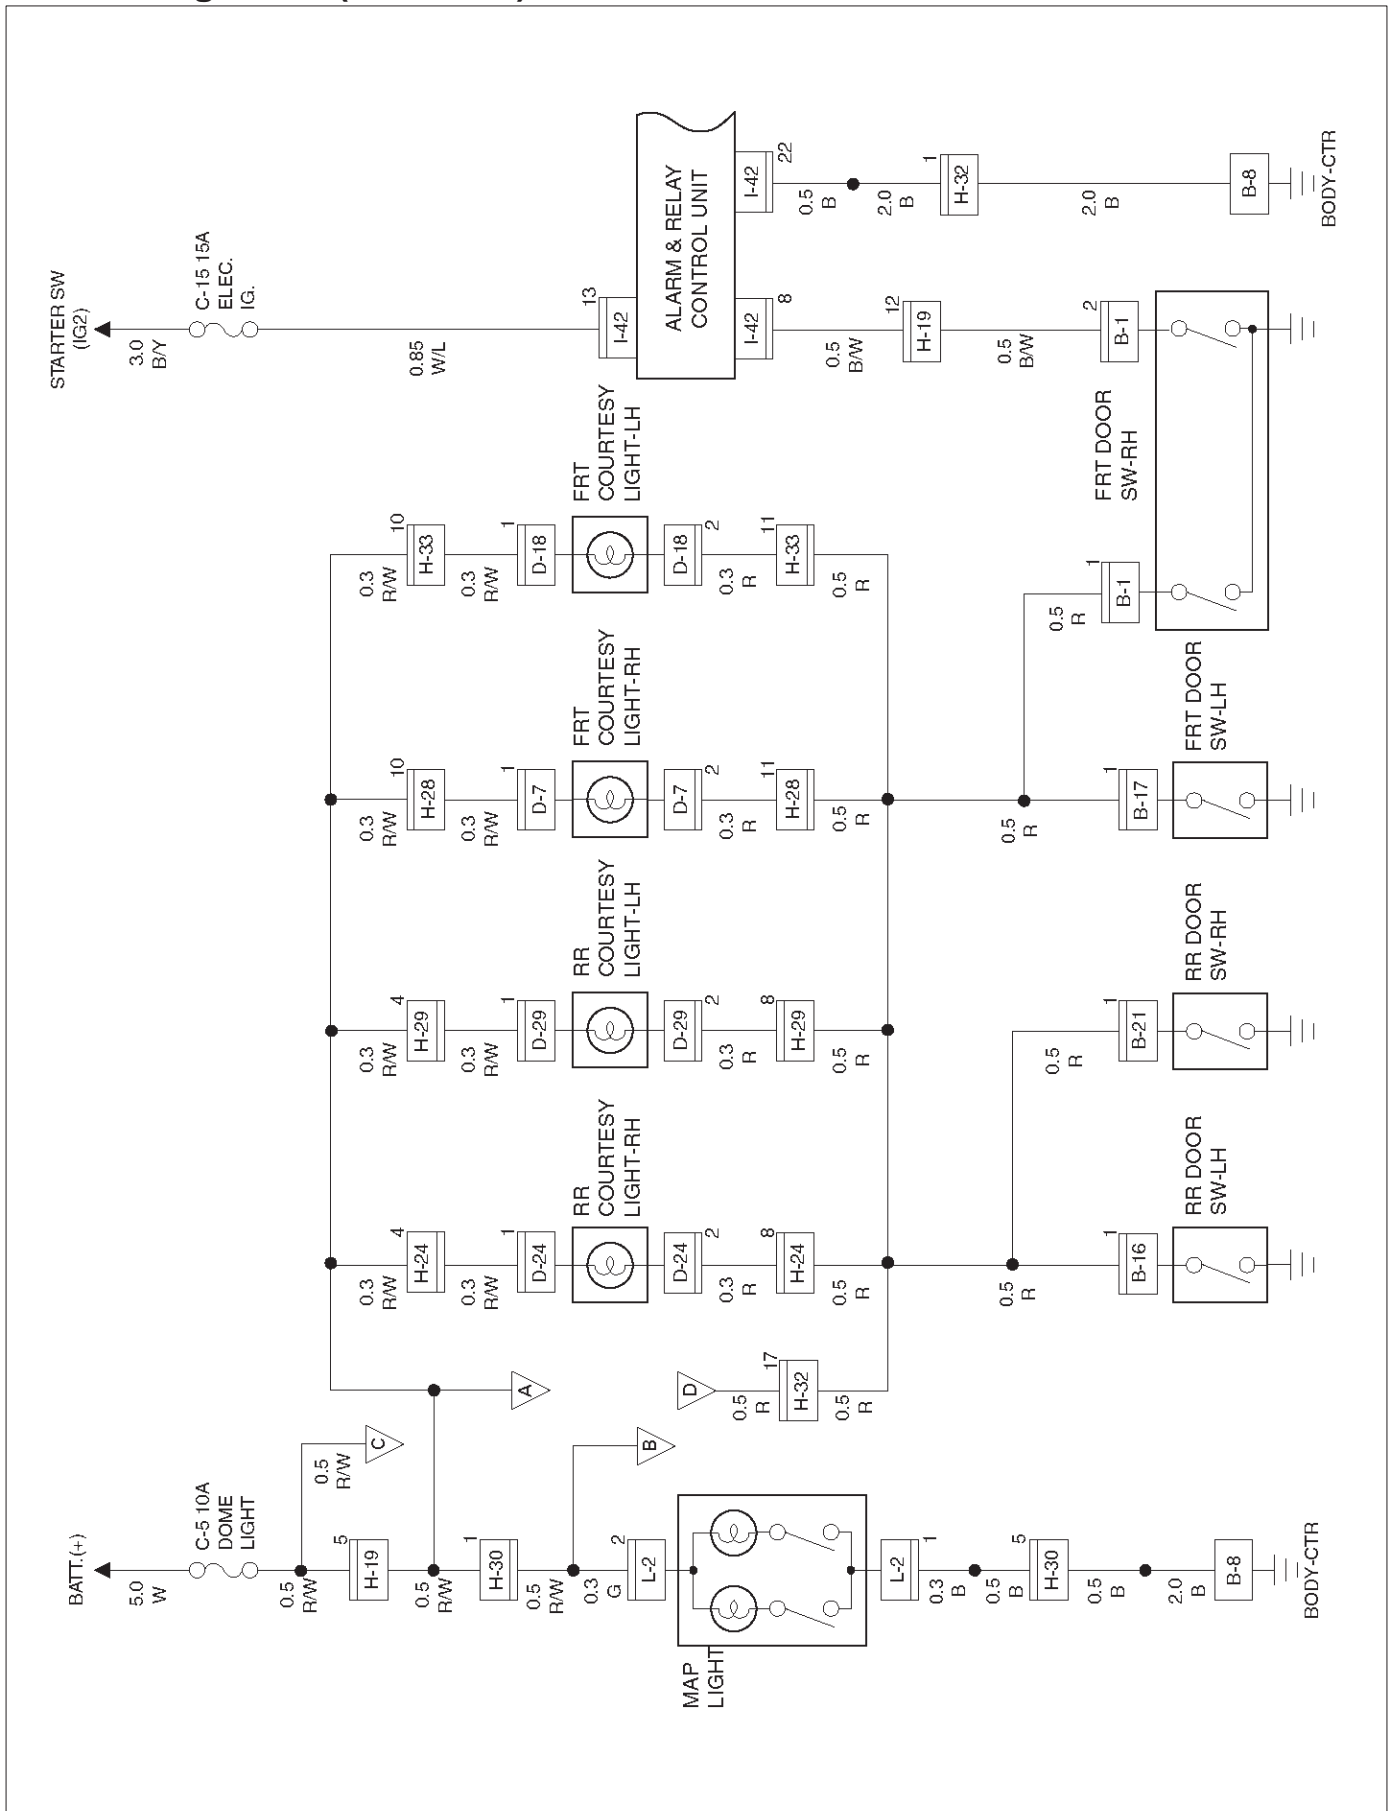

Dome light comes on with dome light switch turned to door position and any door open.

The buzzer sounds when starter switch is turned to either "ACC" or "OFF" position and FRT door-RH, is opened with lighting switch on.

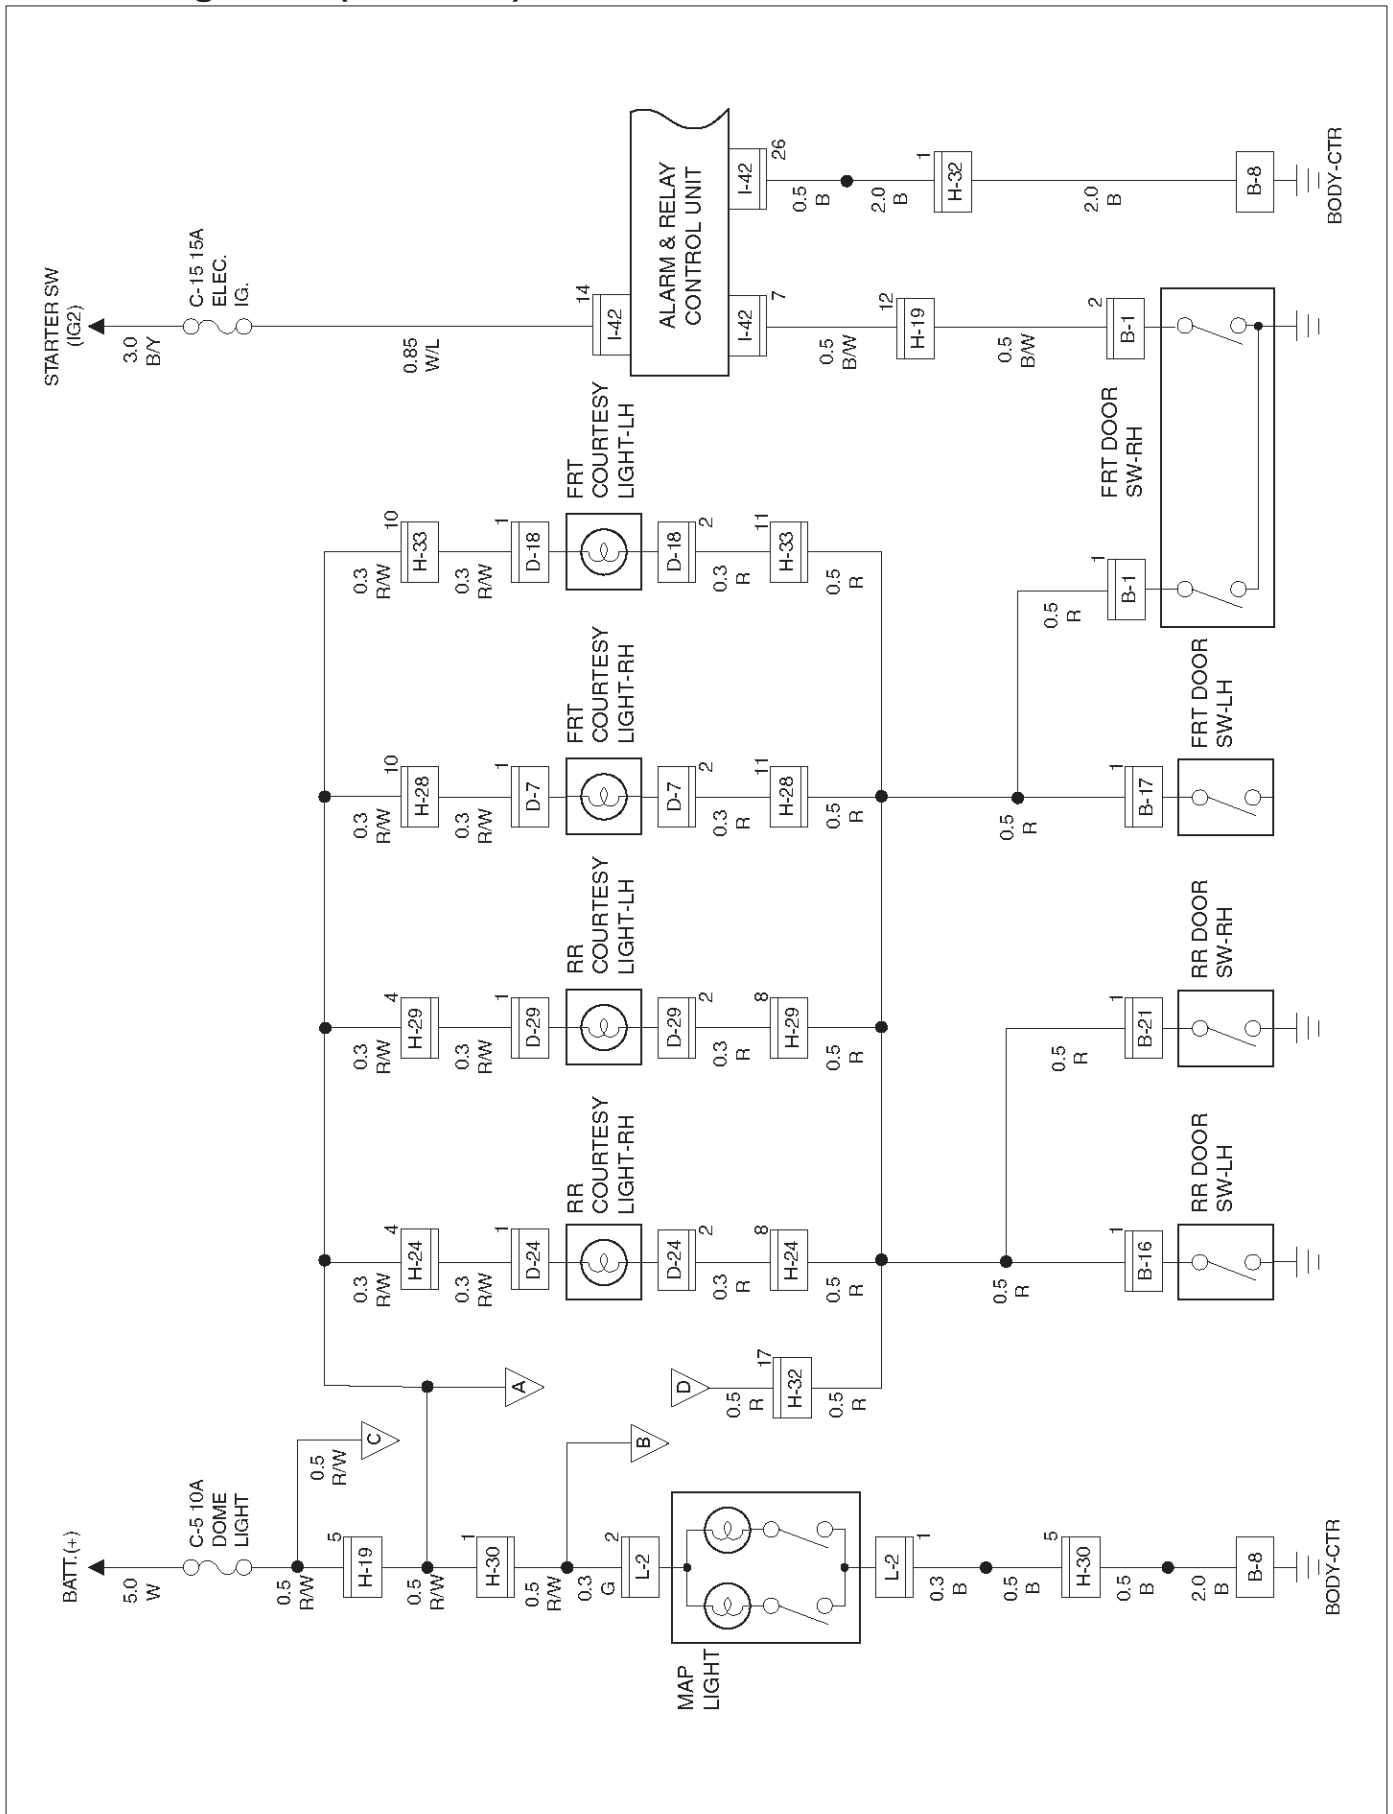

The buzzer also sounds when FRT door-RH is opened with starter key left in starter switch key cylinder.

These functions are controlled by alarm & relay control unit.

Diagnosis

Dome Light Inoperative

Step	Action	Value(s)	Yes	No
1	Remove the dome light bulb. Is the bulb normal?	—	Go to Step 2	Replace the bulb
2	1. Reinstall the bulb. 2. Disconnect the dome light connector L-3. 3. Set the dome light switch to door position. Is there continuity between the dome light side connector terminal 1 and 3?	—	Go to Step 3	Repair or replace the dome light
3	Is the battery voltage applied between harness side connector L-3 terminal 3 and the ground?	Approx. 12V	Go to Step 4	Go to Step 5
4	Repair an open circuit between the fuse C-5 and the dome light. Is the action complete?	—	Verify repair	—
5	Repair an open circuit between the dome light and the door switch or the tail gate switch. Is the action complete?	—	Verify repair	—

Power Door Lock

General Description

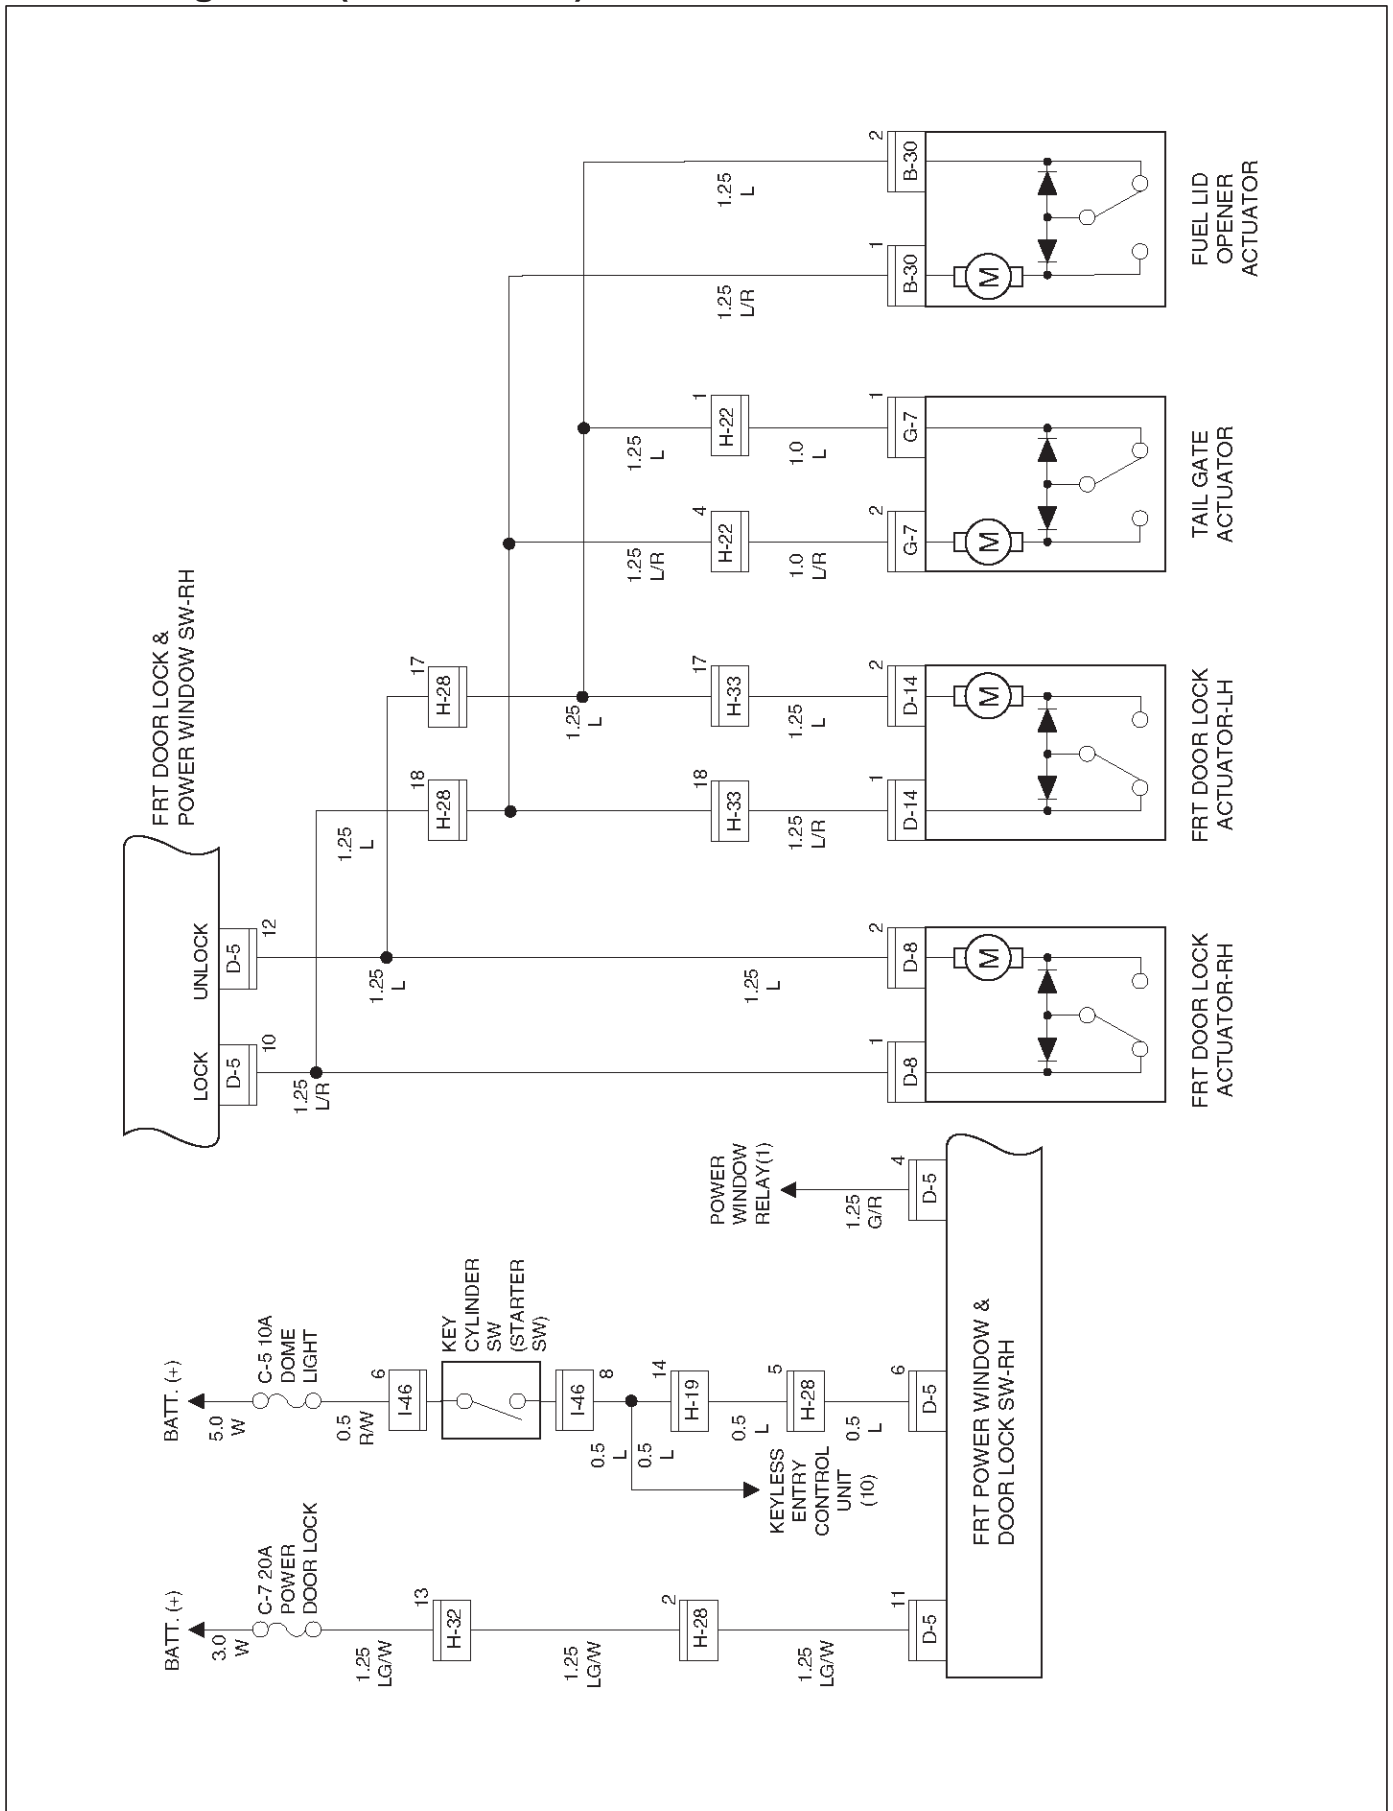

The door lock system consists of door lock switch keyless entry control unit and door lock actuator. Door lock switch on driver's side can actuate the door lock mechanism.

Locking or unlocking the lock switch on the driver side causes the door lock mechanism to be locked or unlocked.

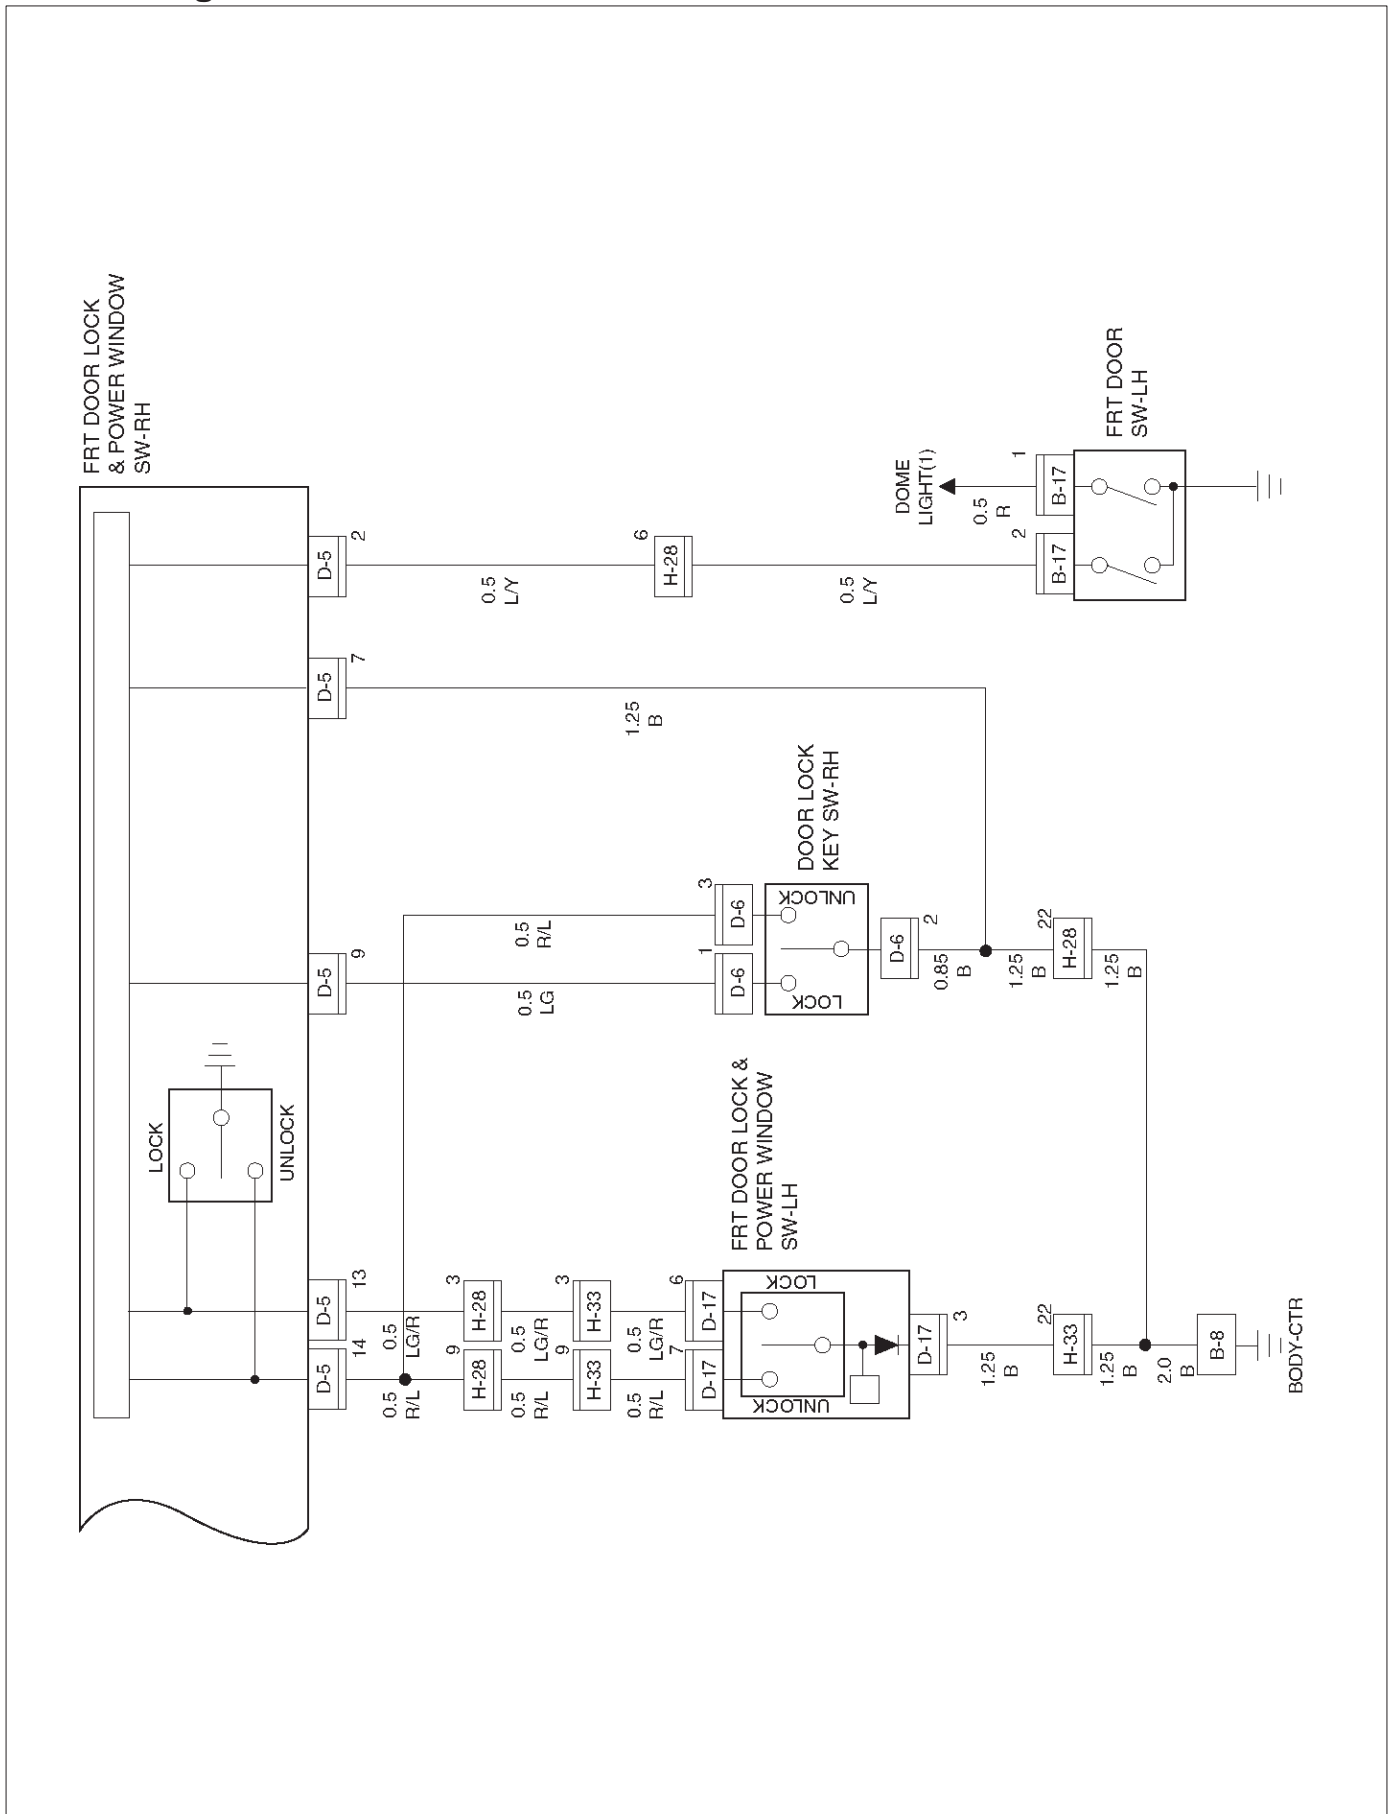

At this time, the current flows for approx. 1 second from door lock switch on driver's side to door lock actuator to run the motor.

When the key is in the key cylinder, Door Lock can not be done.

Diagnosis

All The Doors Do Not Lock And Unlock By Door Lock SW-RH

Step	Action	Value(s)	Yes	No
1	Is the fuse C-7 normal?	—	Go to Step 2	Replace the fuse
2	Disconnect the front power window & door lock SW-RH connector D-5. Is the battery voltage applied between harness side connector D-5 terminal 11 and the ground?	Approx. 12V	Go to Step 4	Go to Step 3
3	Repair an open circuit between the fuse C-7 and the switch. Is the action complete?	—	Verify repair	—
4	Disconnect the FRT door lock actuator-RH connector D-8. Is there continuity between harness side connector D-5 terminal 10 and connector D-8 terminal 1 (or connector D-5 terminal 12 and connector D-8 terminal 2)?	—	Go to Step 5	Go to Step 6
5	Replace the FRT power window & door lock SW-RH. Is the action complete?	—	Verify repair	—
6	Repair an open circuit between the FRT power window & door lock SW-RH and door lock actuator. Is the action complete?	—	Verify repair	—

All The Doors Do Not Lock and Unlock by FRT Door Lock SW-LH

Step	Action	Value(s)	Yes	No
1	Disconnect the FRT power window & door lock SW-RH and -LH connector D-5 and D-17. Is there continuity between harness side connector D-5 terminal 13 and connector D-17 terminal 6 (or connector D-5 terminal 14 and connector D-17 terminal 7)?	—	Go to Step 2	Go to Step 3
2	Replace the FRT power window & door lock SW-LH. Is the action complete?	—	Verify repair	—
3	Repair an open circuit between the FRT power window & door lock SW-RH and -LH. Is the action complete?	—	Verify repair	—

All the Doors Do Not Lock and Unlock by Door Lock Key SW

Step	Action	Value(s)	Yes	No
1	Is B-8 grounded securely?	—	Go to Step 2	Ground it securely
2	Disconnect the door lock key SW connector D-6. Is there continuity between harness side connector D-6 terminal 2 and the ground?	—	Go to Step 4	Go to Step 3
3	Repair an open circuit between connector D-6 terminal 2 and the ground B-8. Is the action complete?	—	Verify repair	—
4	Is there continuity between the switch side connector terminal 1 and 2 when the switch is turned to lock position, and terminal 2 and 3 when the switch is turned to unlock position?	—	Go to Step 5	Repair or replace the switch
5	Repair an open circuit between the door lock key SW and FRT power window & door lock SW-RH. Is the action complete?	—	Verify repair	—

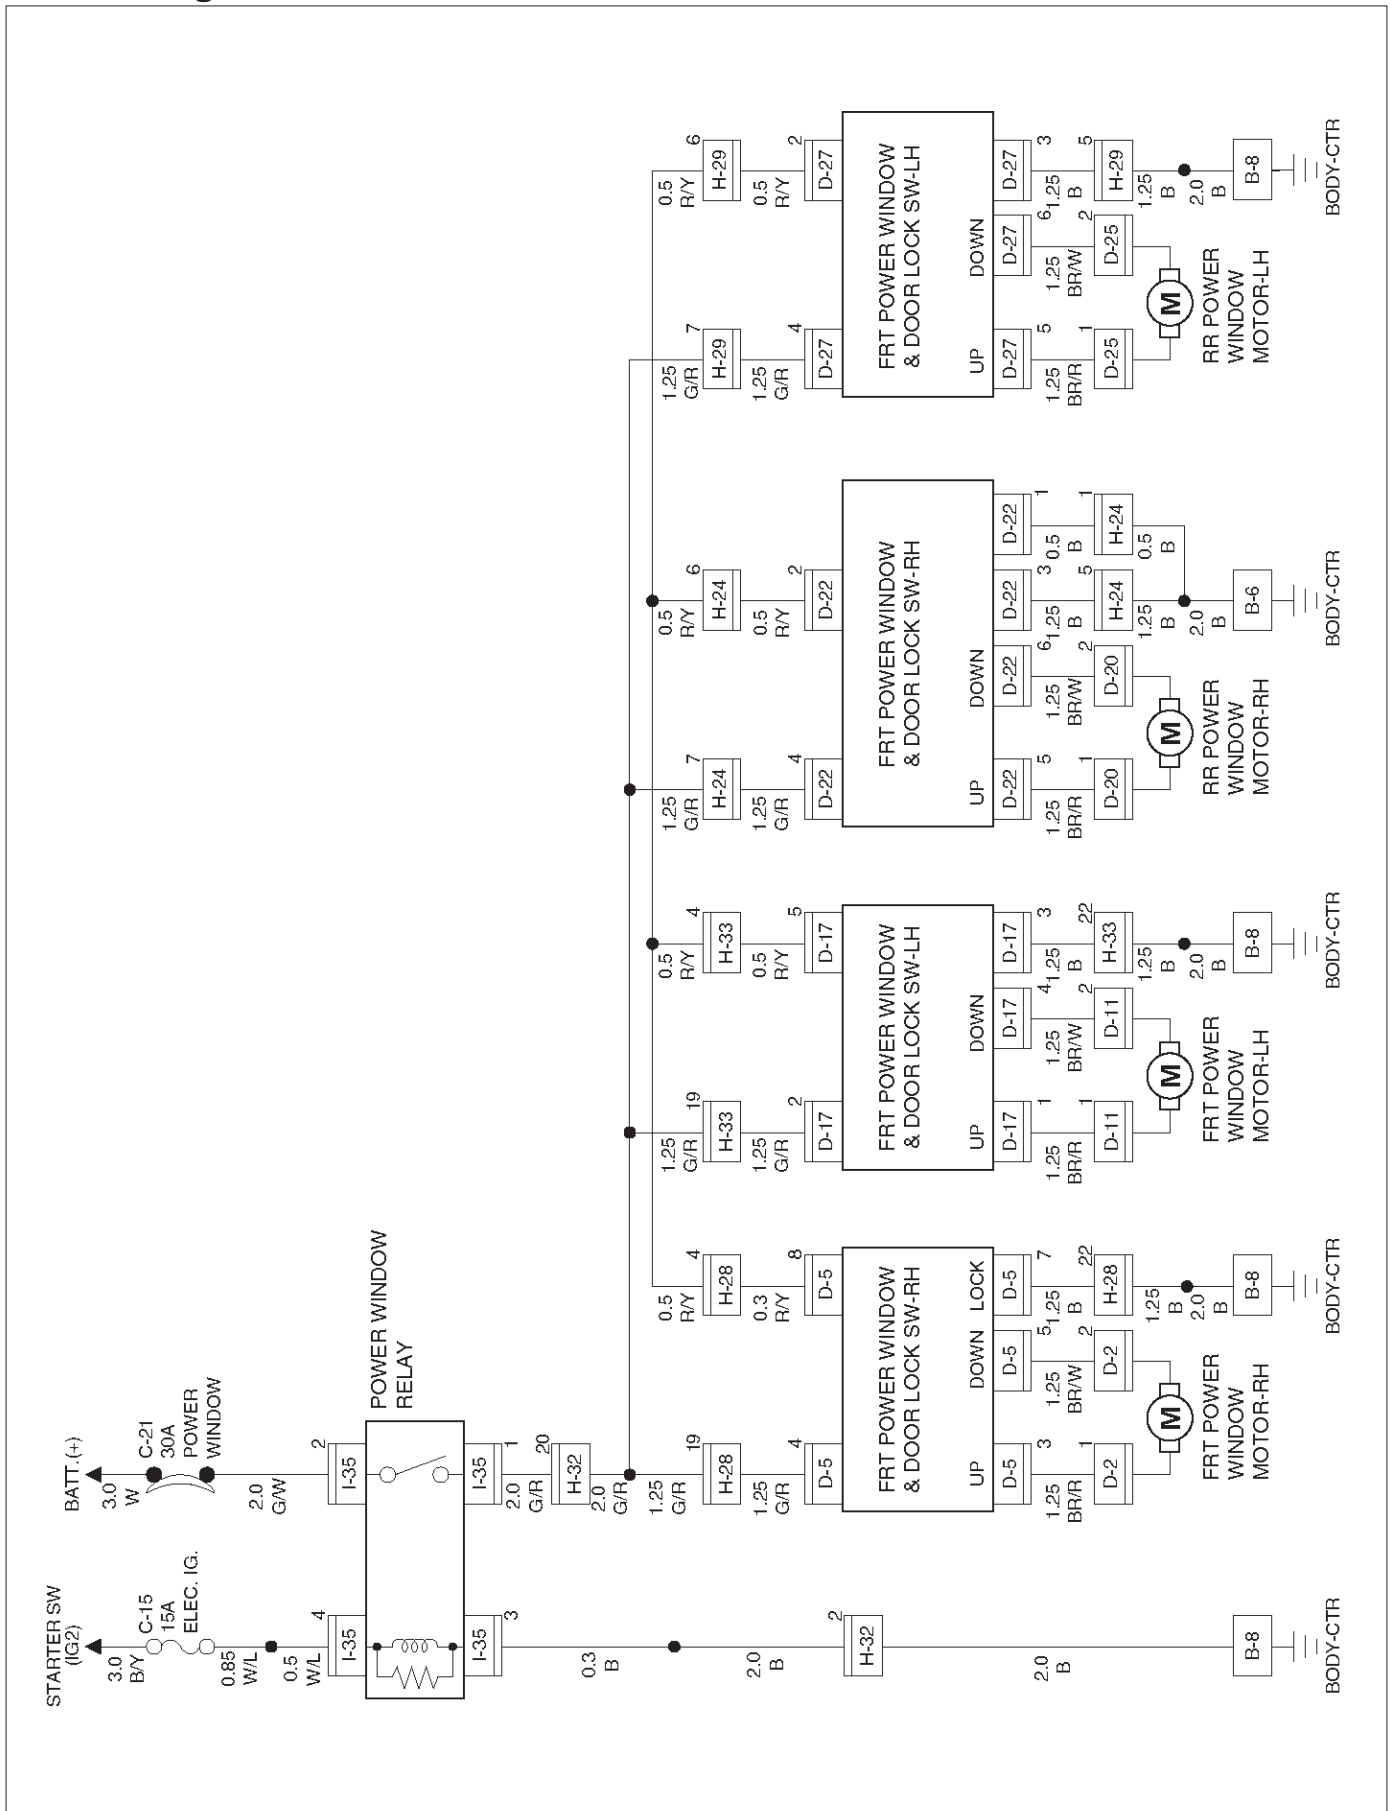

Power Window

General Description

The power window system consists of power window switches, power window motors and power window relay. With the starter switch in "ON" position, the battery voltage is supplied through power window relay to the power window switches. Selection of up or down switch changes over the motor rotating direction to open or close the window.

When the lock switch on the switch panel on the driver side is pressed, the power window switch is in open state. As a result, the power source to the other switches are cut off, and the power window motors do not run.

Diagnosis

All Window Do Not Operate

Step	Action	Value(s)	Yes	No
1	Is the fuse C-15 normal?	—	Go to Step 2	Replace the fuse
2	Is the circuit breaker C-21 normal?	—	Go to Step 3	Replace the circuit breaker
3	Is B-8 grounded securely?	—	Go to Step 4	Ground it securely
4	Disconnect the power window relay connector I-35. Is the battery voltage applied between harness side connector I-35 terminal 2 and the ground?	Approx. 12V	Go to Step 6	Go to Step 5
5	Repair an open circuit between the circuit breaker C-21 and connector I-35 terminal 2. Is the action complete?	—	Go to Step 4	—
6	Turn the starter switch on. Is the battery voltage applied between harness side connector I-35 terminal 4 and the ground?	Approx. 12V	Go to Step 8	Go to Step 7
7	Repair an open circuit between the fuse C-15 and connector I-35 terminal 4. Is the action complete?	—	Go to Step 6	—
8	Is there continuity between harness side connector I-35 terminal 3 and the ground B-8?	—	Replace the relay	Go to Step 9
9	Repair an open circuit between connector I-35 terminal 3 and the ground B-8. Is the action complete?	—	Verify repair	—

8D-140 WIRING SYSTEM

Window On The Driver's Side Does Not Operate

Step	Action	Value(s)	Yes	No
1	Turn the starter switch on. Is the battery voltage applied between harness side connector D-5 terminal 4 and the ground?	Approx. 12V	Go to Step 3	Go to Step 2
2	Repair an open circuit between connector I-35 terminal 1 and connector D-5 terminal 4. Is the action complete?	—	Go to Step 1	—
3	Connect the battery position terminal with harness side connector D-5 terminal 3 or 5, and the negative terminal with harness side connector D-5 terminal 5 or 3. Does the motor operate?	—	Replace the front power window & door lock switch-RH	Go to Step 4
4	1. Disconnect the front power window motor-RH connector D-2. 2. Connect the battery position terminal with the motor side connector D-2 terminal 1 or 2, and connect the battery negative terminal with the motor side connector D-2 terminal 2 or 1. Does the motor operate?	—	Go to Step 5	Replace the motor
5	Repair an open circuit between the front power window and door lock switch-Rh and the front power window motor-RH. Is the action complete?	—	Verify repair	—

Window On The Front Passenger's Side Does Not Operate

Step	Action	Value(s)	Yes	No
1	Is B-8 grounded securely?	—	Go to Step 2	Ground it securely
2	Disconnect the front power window and door lock switch-LH connector D-17. Is there continuity between harness side connector D-17 terminal 3 and the ground B-8?	—	Go to Step 4	Go to Step 3
3	Repair an open circuit between connector D-17 terminal 3 and the ground B-8. Is the action complete?	—	Go to Step 2	—
4	Turn the starter switch on. Is the battery voltage applied between harness side connector D-17 terminal 2 and the ground?	Approx. 12V	Go to Step 6	Go to Step 5
5	Repair an open circuit between connector I-35 terminal 1 and connector D-17 terminal 2. Is the action complete?	—	Go to Step 4	—
6	Connector the battery positive terminal with harness side connector D-17 terminal 1 or 4, and connect the battery negative terminal with harness side connector D-17 terminal 4 or 1. Does the motor operate?	—	Replace the front power window and door lock switch-LH	Go to Step 7
7	1. Disconnect the front power window motor-RH connector D-11. 2. Connector the battery positive terminal with the motor side connector D-11 terminal 1 or 2, and connect the battery negative terminal with the motor side connector D-11 terminal 2 or 1. Does the motor operate?	—	Go to Step 8	Replace the motor
8	Repair an open circuit between the front power window and door lock switch-LH and the front power window motor-LH. Is the action complete?	—	Verify repair	—

Rear Window On The Left (or Right) Side Does Not Operate

Step	Action	Value(s)	Yes	No
1	1. Disconnect the rear power window switch–RH connector D–22 or the rear power window and door lock switch–LH connector D–27. 2. Turn the starter switch on. Is the battery voltage applied between harness side connector D–22 terminal 4 and the ground, or harness side connector D–27 terminal 4 and the ground?	Approx. 12V	Go to Step 3	Go to Step 2
2	Repair an open circuit between connector I–35 terminal 1 and connector D–22 terminal 4 or connector D–27 terminal 4. Is the action complete?	—	Go to Step 1	—
3	Is there continuity between harness side connector D–22 terminal 3 and the ground B–6, or harness side connector D–27 terminal 3 and the ground B–6 or 8?	—	Go to Step 5	Go to Step 4
4	Repair an open circuit between connector D–22 terminal 3 or connector D–27 terminal 3 and the ground B–6 or 8. Is the action complete?	—	Go to Step 3	—
5	Connect the battery positive terminal with harness side connector D–22 terminals 5 or harness side connector D–27 terminal 5, and connect the battery negative terminal with harness side connector D–22 terminal 6 or harness side connector D–27 terminal 6. Does the motor operate?	—	Replace the rear power window switch–LH or –RH	Go to Step 6
6	1. Disconnect the rear power window motor connector D–20 or D–25. 2. Connect the battery positive terminal with motor side connector D–20 or D–25 terminal 1 or 2, and connect the battery negative terminal with the motor side connector D–20 or D–25 terminal 2 or 1. Does the motor operate?	—	Go to Step 7	Replace the motor
7	Repair an open circuit between the rear power window switch and the rear power window motor. Is the action complete?	—	Verify repair	—

Window On The Front Passenger's Side Does Not Operate by the Front Power Window and Door Lock Switch–RH

Step	Action	Value(s)	Yes	No
1	Disconnect the front power window and door lock switch–RH connector D–5 and the front power window and door lock switch–LH connector D–17. Is there continuity between harness side connector D–5 terminal 8 and harness side connector D–17 terminal 5?	—	Replace the front power window and door lock switch–LH	Go to Step 2
2	Repair an open circuit between connector D–5 terminal 8 and connector D–17 terminal 5. Is the action complete?	—	Verify repair	—

Lock SW Does Not Function

Step	Action	Value(s)	Yes	No
1	Repair or replace the front power window and door lock switch–RH. Is the action complete?	—	Verify repair	—

Cruise Control

General Description

The circuit consists of cruise control unit, cruise main switch, combination switch clutch switch (M/T), mode switch (A/T), stoplight switch, actuator and indicator lights. Cruise control system keeps the vehicle running at a fix speed until a signal canceling this fixed speed is received. When the cruise main switch is turned on with the vehicle in the running mode, the battery voltage is applied to the control unit.

When a signal from the combination switch is input to the control unit while vehicle is in this state, the actuator is activated to operate the system. Also, while the system is operating, the cruise indicator light in the meter panel lights up.

Set Function

When the cruise main switch turned on and the set switch is depressed with the vehicle speed within the set limit and cancel operation is refused the vehicle speed when the set switch is released is stored in the control unit as the set speed. But in case of the vehicle speed is over maximum limit speed of cruise control, maximum limit speed in the control unit is stored as the set speed.

Resume Function

Unless the vehicle speed falls below the minimum speed limit after canceling the set speed by the cancel switch, pushing the resume switch causes the vehicle to resume the speed before cancellation.

Acceleration Function

During cruise control driving, pushing the acceleration switch (on time is more than 0.6 sec.) causes an increase in cruise speed and vehicle accelerates at a controlled rate until acceleration switch released. Vehicle speed at the acceleration switch released plus 1.0 km/h is stored in the control unit as the set speed.

Top Up Function

During cruise control driving, the set speed can be increased 1.6 km/h each time by operating the accelerator switch quickly within 0.6 sec.

Coast Function

During cruise control driving, pushing the coast switch (on time is more than 0.6 sec.) causes a decrease in cruise speed and the vehicle decelerate at a controlled rate until coast switch released. Vehicle speed at the coast switch released ,minus 1.0 km/h is stored in the control unit as the set speed.

Top down Function

During cruise control driving, the set speed can be lowered 1.6 km/h each time by operating the coast switch quickly within 0.6 sec.

Cancel Function

During cruise control driving, the cruise control is released if the control unit receives a signal from the cancel switch, mode switch, clutch switch or brake switch. But the set speed is not erased.

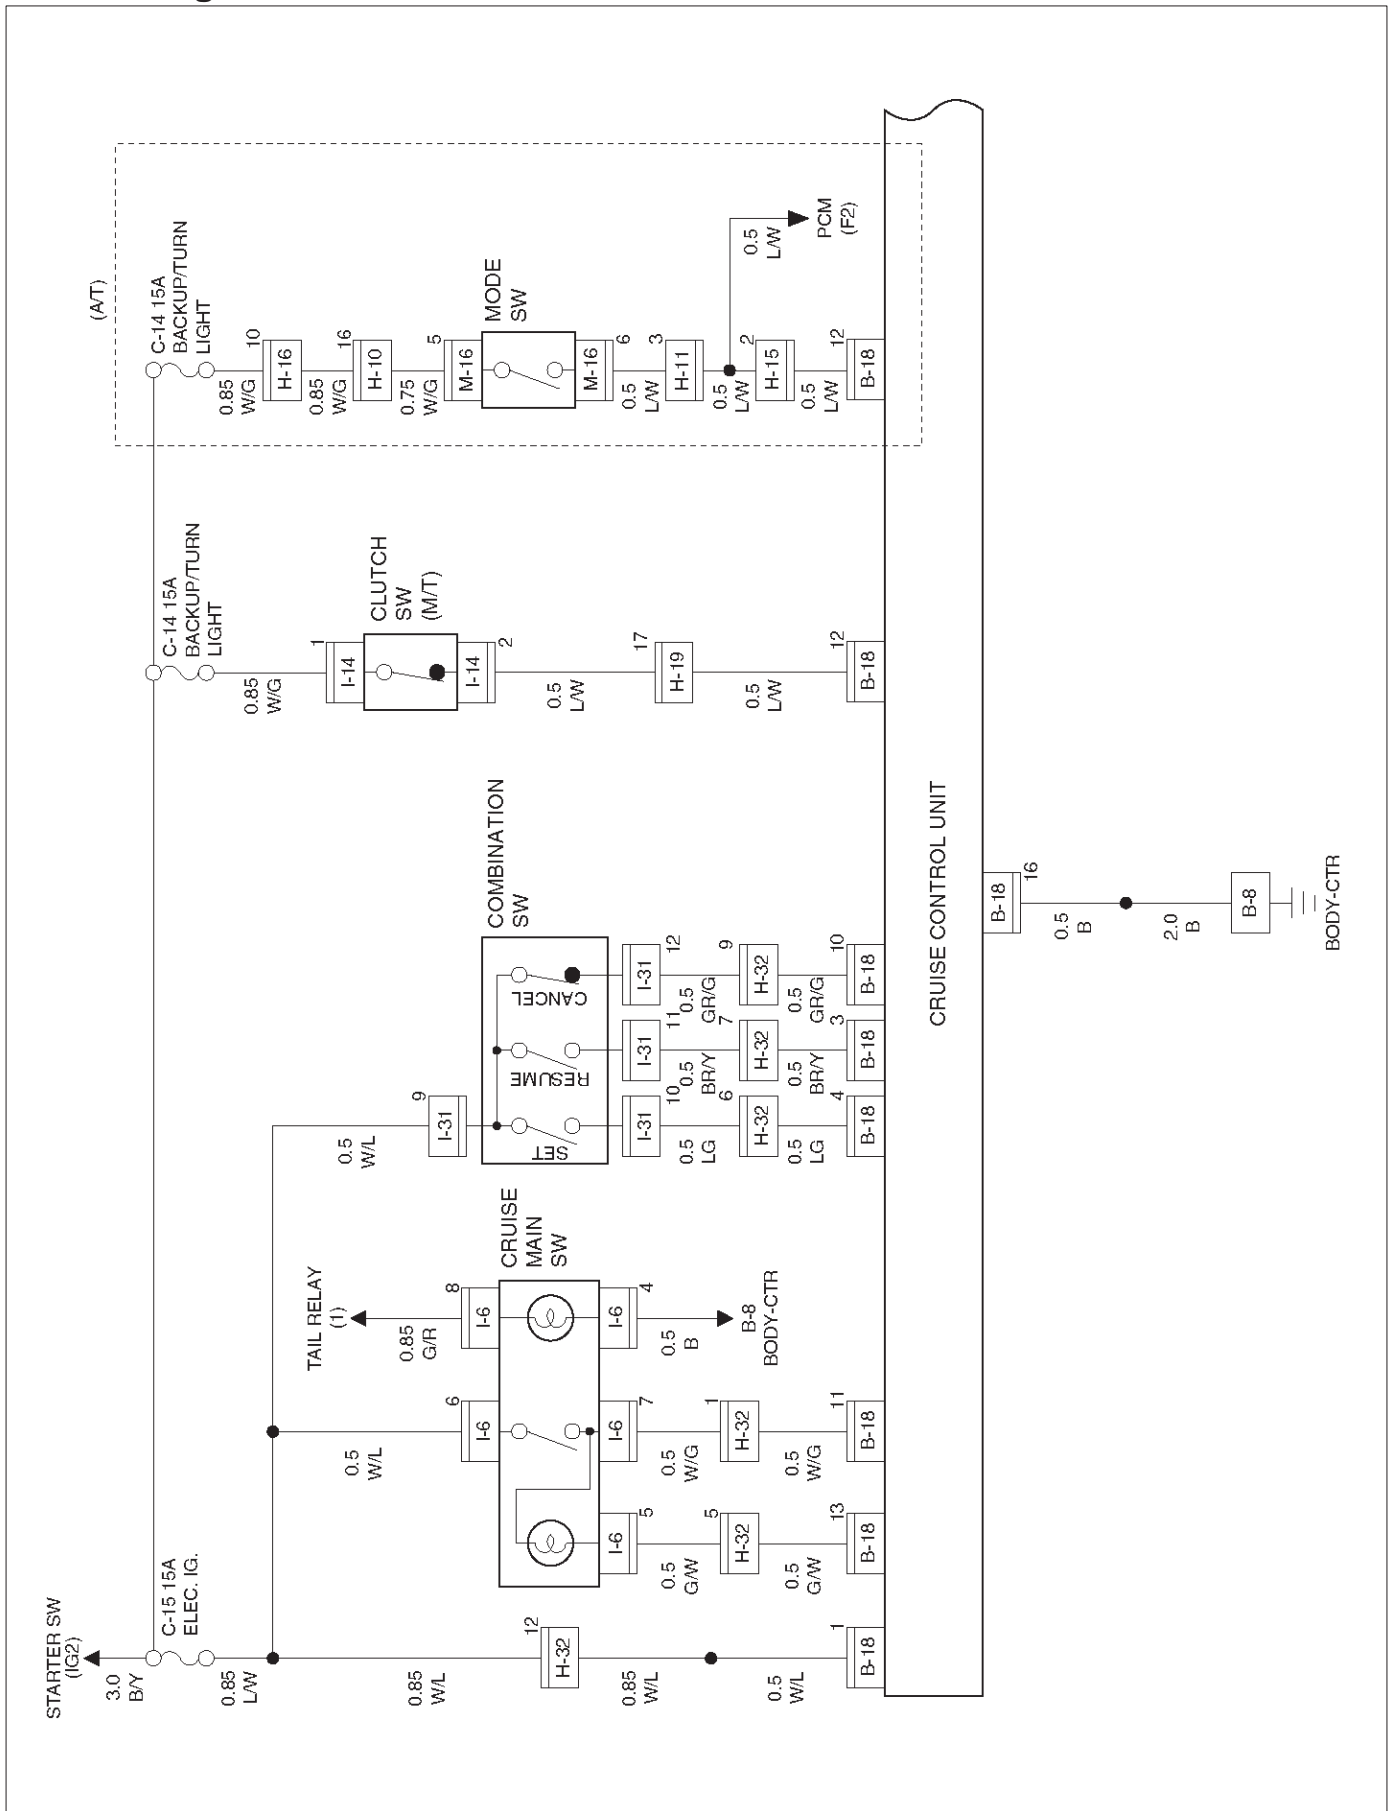

Down Cancel Function

The cruise control is canceled when the vehicle speed becomes the set speed minus 20 km/h during the cruise control working and the set speed is erased.

Over Drive (OD) Cancel Function

OD cancel function is required when the vehicle speed becomes the set speed minus 3 km/h during the cruise control working. OD cancel function is enabled when the acceleration function and/or resume function are working except the vehicle speed is in more than 120 km/h.

Diagnosis

The cruise control unit uses the cruise main indicator light and diagnosis the failure, when the control unit detects abnormality on the table below.

PART	POSSIBLE CAUSE	DETECTION PERIOD	DTC
Actuator	Motor system short circuit	Energizing motor	1-1
	Clutch system open circuit	Energizing clutch	1-2
	Clutch system open circuit	Energizing clutch	1-2
	Mechanical defect	Cruise controlling	1-3
	Close side of motor system open circuit	Cruise controlling	1-1
Cruise control unit	Open side of motor system continuously energizing	While starter SW on	1-4
	Clutch output abnormality	While starter SW on	1-4
Vehicle speed sensor	Signal of vehicle speed disconnection	Cruise controlling	2-1
	Signal of vehicle speed abnormality	Cruise controlling	2-1
Switch	Turning on switch at all times	While starter SW on	3-1
	Turning on switch at the same time	While starter SW on	3-1

DTC : Diagnostic Trouble Code

DTC Display Condition

1. While starter switch on and vehicle speed is 0 km/h, the DTC output begins in top priority by cancel switch turn on and off being repeated three times for 2 sec. while cruise main switch pushing on, and stops the DTC output whether vehicle speed is more than 10 km/h or the resume switch is turned on.
2. The cruise control unit outputs the DTC(s) in order from small figure of the code.
3. The header of display of DTC(s) is assumed 4 sec., and it is 2 sec. between different kind of codes.
4. The DTC(s) are erased with the starter switch turned off.

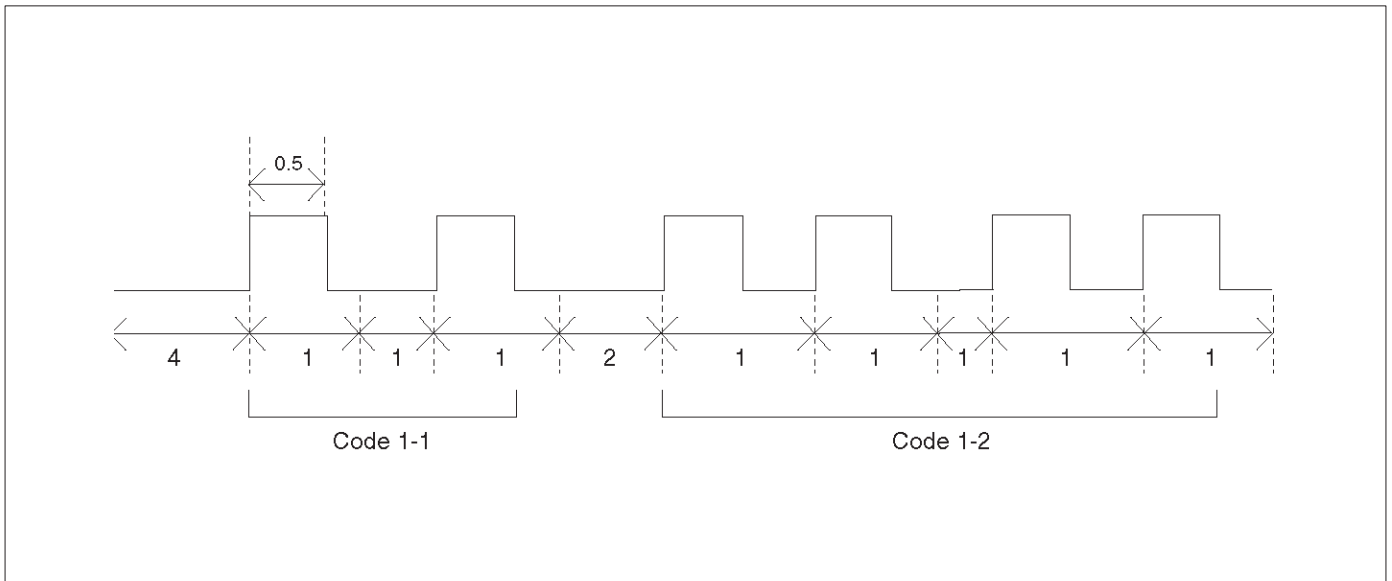

DTC Display Format

1. When no DTCs are detected. (The unit : sec.)

F08RW003

2. When two or more DTCs are detected. (The unit : sec.)

F08RW004

Diagnosis

DTC 1-1 Motor System Short Circuit

Step	Action	Value(s)	Yes	No
1	1. Turn the starter switch off. 2. Disconnect the actuator connector C-26. 3. Measure resistance between actuator side connector terminal 1 and 2. NOTE: If the control plate position is fully opened or fully closed, resistance can not be measured. Is the resistance within range specified in the value(s) column?	More than 4.2Ω	Go to Step 2	Replace the actuator
2	Measure continuity between harness side connector C-26 terminal 1 and the ground, terminal 2 and the ground, and terminals 1 and 2. Are the result same as specified in the value(s) column?	No continuity	Replace the control unit	Repair or replace the harness

DTC 1-2 Clutch System Open or Short Circuit

Step	Action	Value(s)	Yes	No
1	1. Turn the starter switch off. 2. Disconnect the actuator connector C-26. 3. Measure resistance between actuator side connector terminal 3 and 4. Is the resistance within range specified in the value(s) column?	34.7 – 42.4Ω	Go to Step 2	Replace the actuator
2	1. Disconnect the stoplight switch connector I-18. 2. Check continuity between switch side connector terminal 2 and 3. Is there continuity between terminals?	—	Go to Step 3	Adjust or replace the switch
3	1. Reconnect the stoplight switch connector I-18 2. Check continuity between harness side connector B-18 terminal 6 and I-18 terminal 3, C-26 terminal 4 and B-18 terminal 8. Is there continuity between terminals?	—	Go to Step 4	Repair open circuit
4	Check continuity between harness side connector C-26 terminal 3 and ground, C-26 terminal 4 and ground, B-18 terminals 6 and the ground. Are the results same as specified in the value(s) column?	No continuity	Replace the control unit	Repair short circuit

DTC 1-3 Mechanical Defect

Step	Action	Value(s)	Yes	No
1	1. Turn the starter switch off. 2. Disconnect the actuator connector C-26. 3. Connect the battery positive terminal to the actuator side connector terminal 3 and the battery negative terminal to terminal 4. Does the control plate move by hand?	—	Replace the actuator	Go to Step 2
2	Connect the battery positive terminal to the actuator side connector terminal 1 and 3, and the battery negative terminal to terminal 2 and 4. Do the control plate move to full open side?	—	Go to Step 3	Replace the actuator
3	Connect the battery positive terminal to the actuator side connector terminal 2 and 3, and the battery negative terminal to terminal 1 and 4. Does the control plate move to full close side?	—	Go to Step 4	Replace the actuator
4	Check continuity between harness side connector C-26 terminal 1 and B-18 terminal 7, C-26 terminal 2 and B-18 terminal 15. Is there continuity between terminals?	—	Replace the control unit	Repair or replace harness

DTC 1-4 Close Side of Motor System Continuously Energizing

Step	Action	Value(s)	Yes	No
1	1. Turn the starter switch off. 2. Disconnect the actuator connector C-26. 3. Measure resistance between actuator side connector terminal 1 and 2. NOTE: If the control plate position is fully opened or fully closed, resistance can not be measured. Is the resistance within range specified in the value(s) column?	More than 4.2Ω	Go to Step 2	Replace the actuator
2	Measure continuity between harness side connector C-26 terminal 2 and B-18 terminal 15, C-26 terminal 1 and B-18 terminal 7. Is there continuity between terminals?	—	Replace the control unit	Repair or replace the harness

Anti-Lock Brake System (ABS)

General Description

The circuit consists of the starter switch, stoplight switch, EHCU wheel speed sensor, ABS warning light, BRAKE warning light, and data link connector.

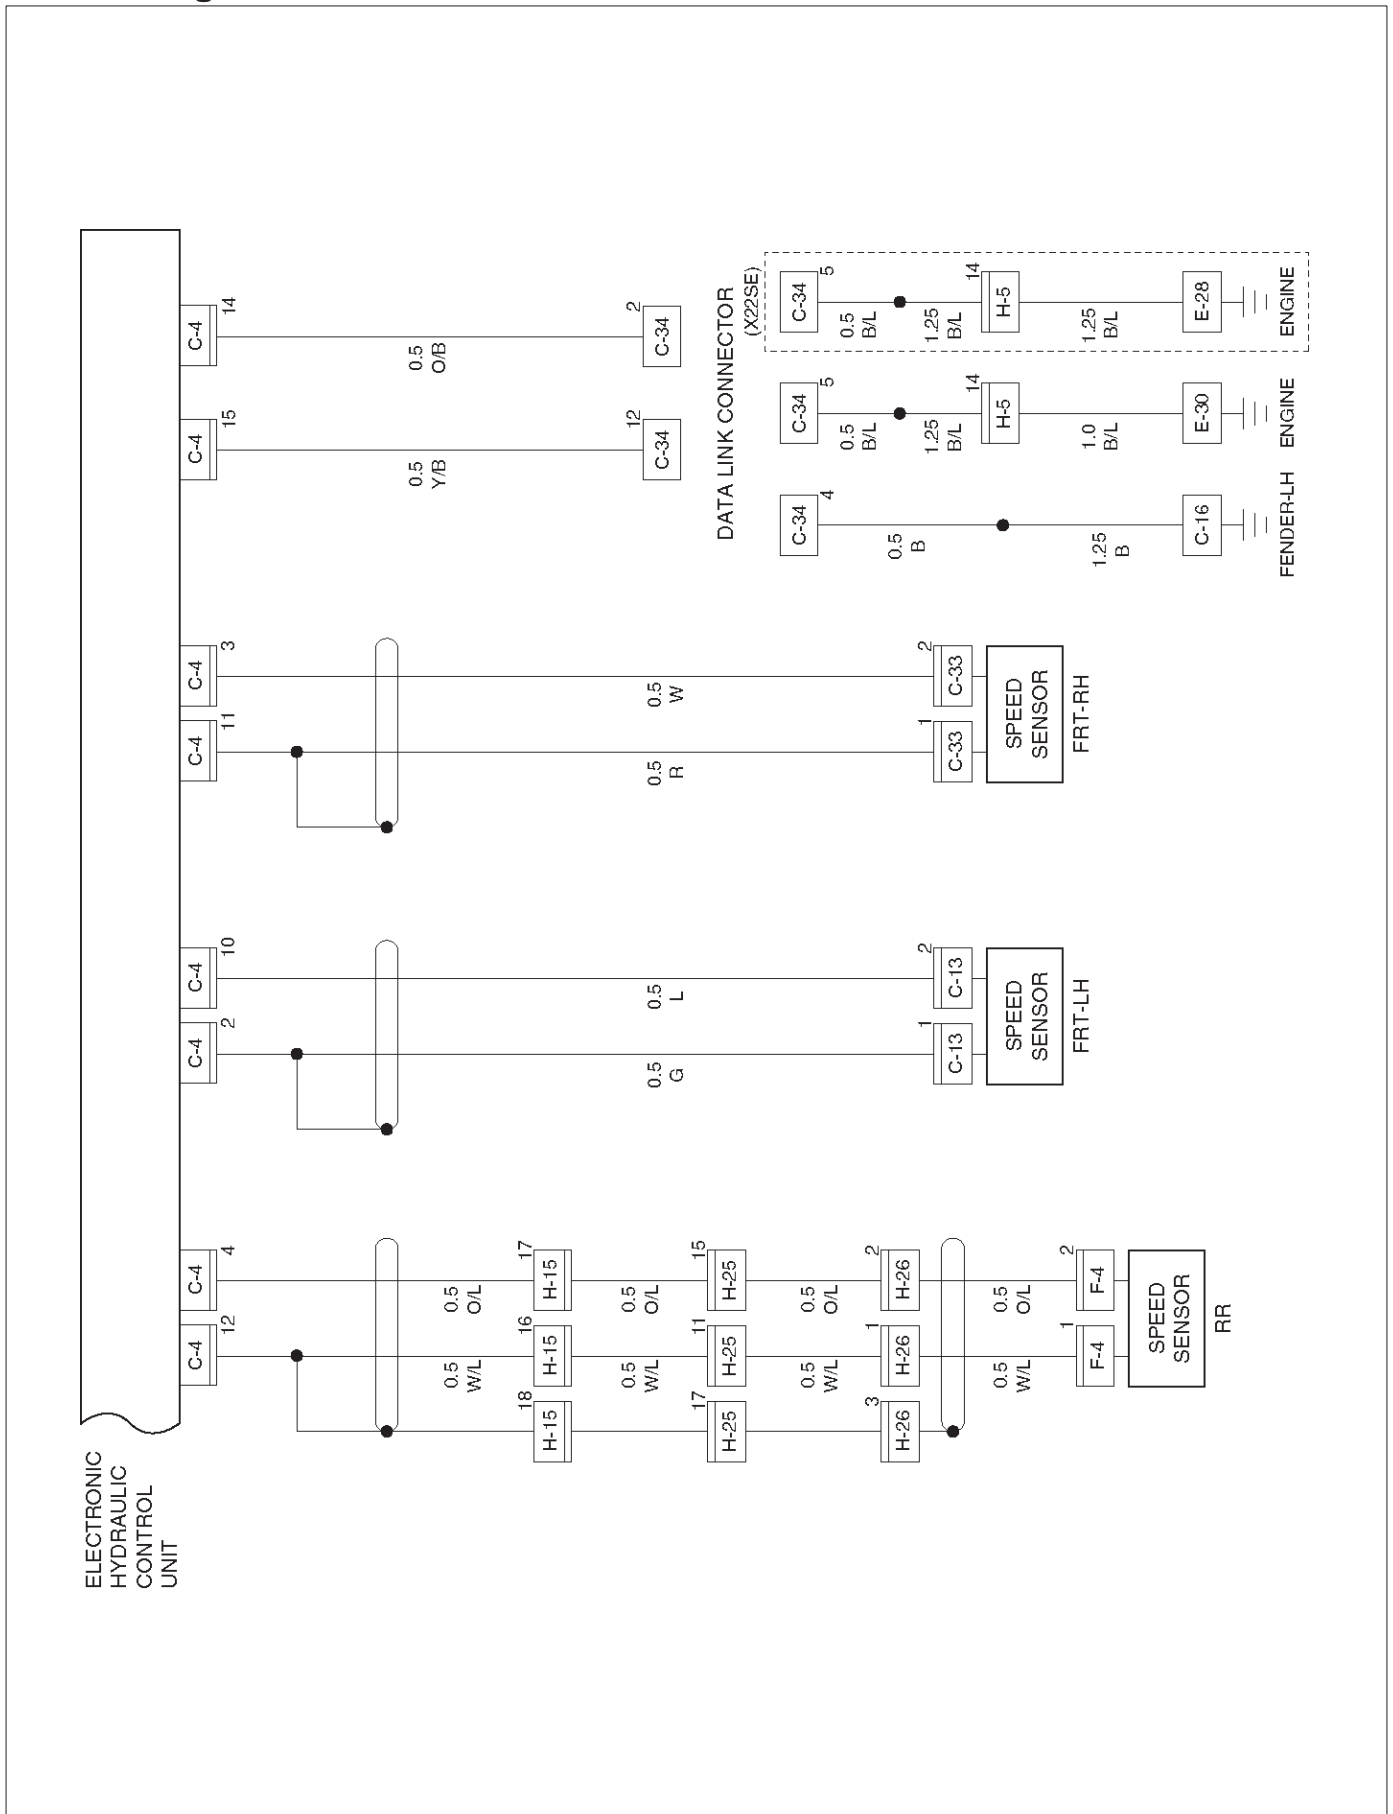

When the service brake is applied while in the running mode, the EHCU (Electronic Hydraulic Control Unit) judges which wheel is about to lock by using the wheel rotation speed signals sent from the three wheel speed sensors at the front wheels and rear differential. And the brake fluid pressure applied to the four wheels is controlled by the EHCU to prevent the wheels from locking.

Refer to Brake Control System in Brakes section in detail.

A/T Shift Lock

General Description

With the starter switch in the "ON" position and the shift lever in "P" position, the shift lever cannot be shifted from "P" to another position unless the brake pedal is depressed. This is because, unless the brake pedal is depressed, the solenoid pin underneath the shift lever retracts and the link lever then locks the shift lever cam.

Windshield Wiper and Washer

General Description

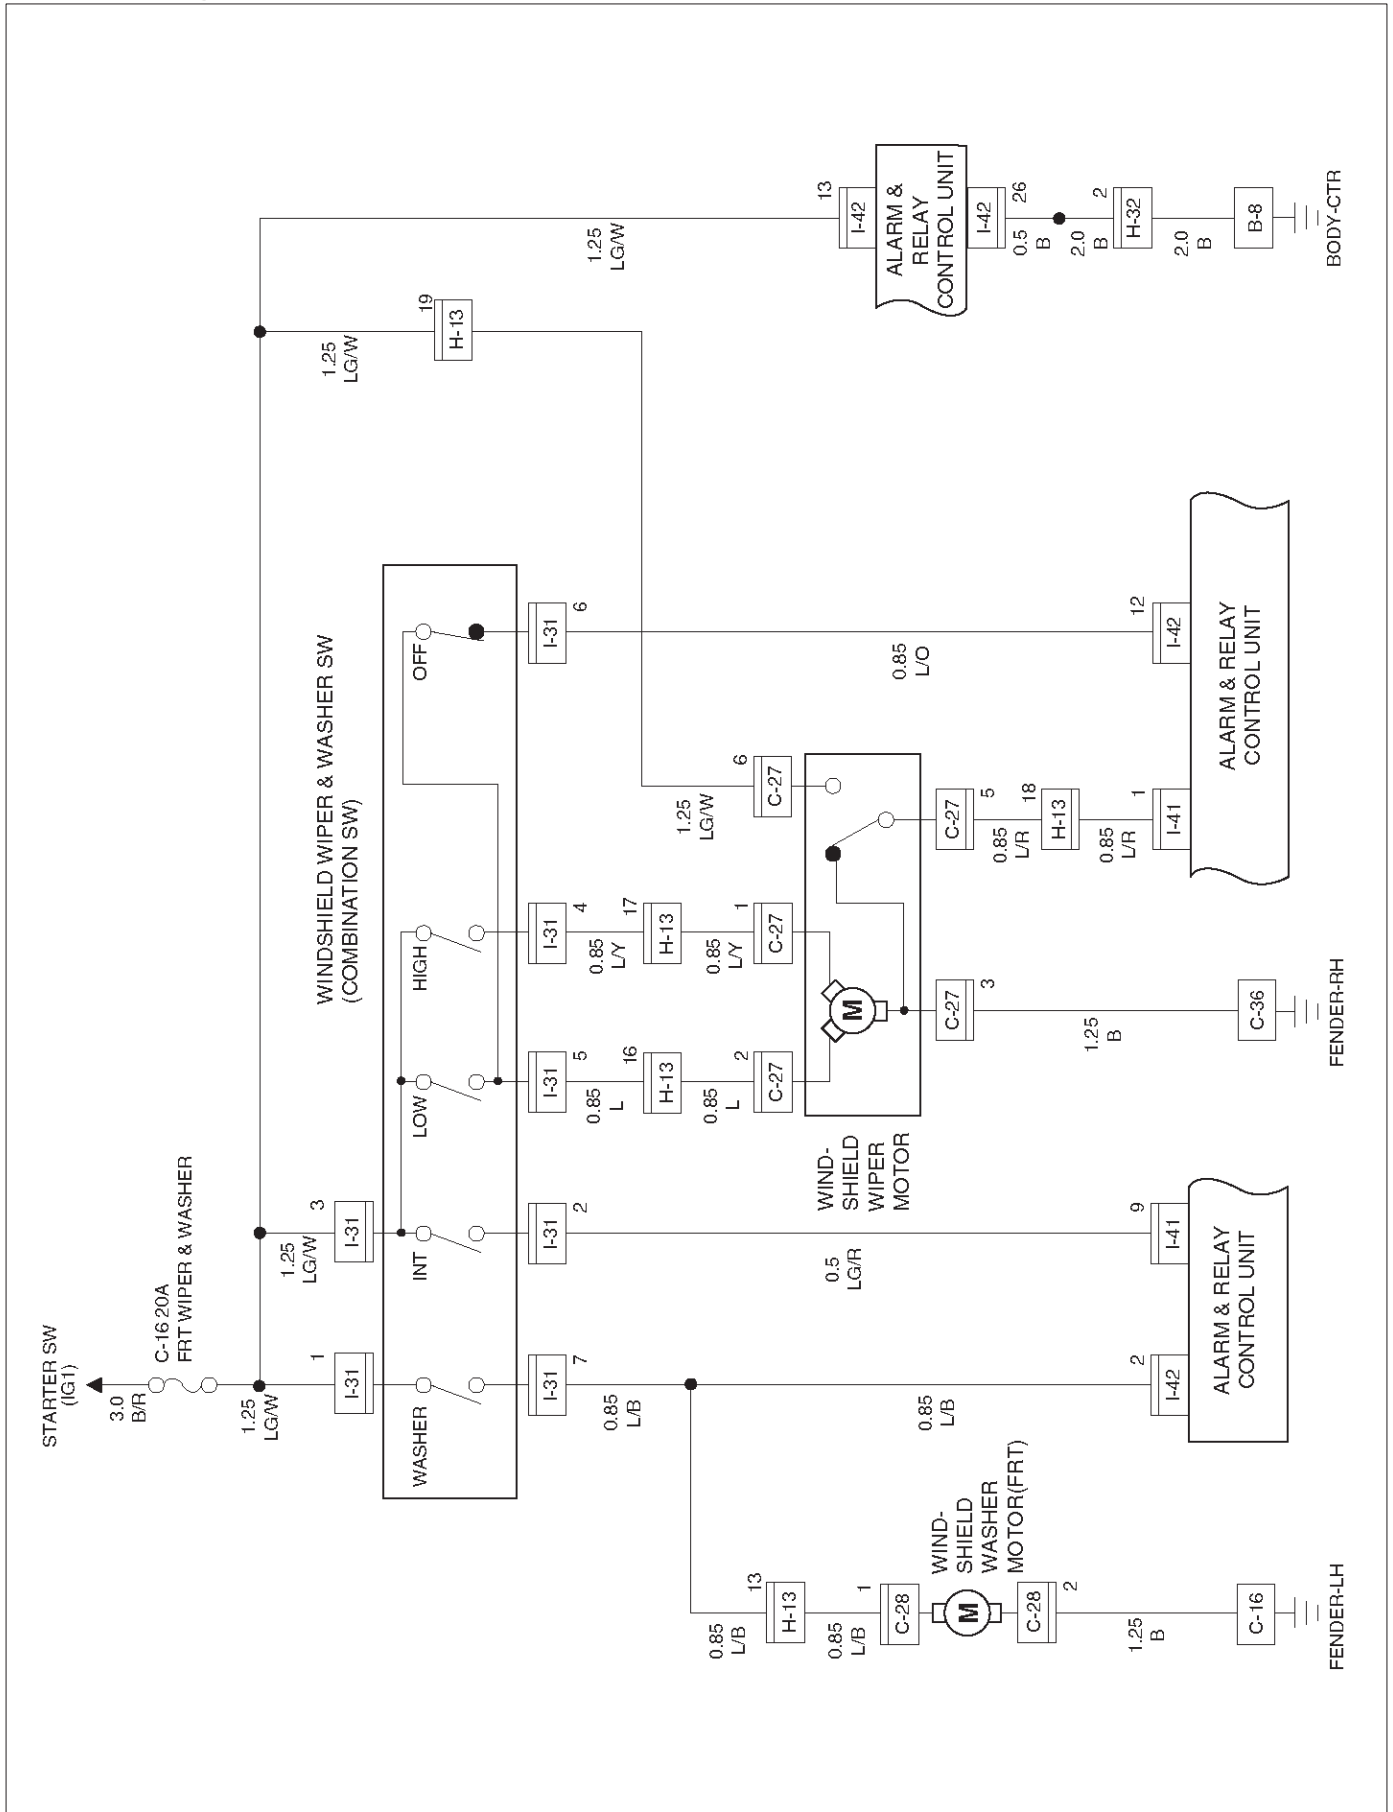

The system consists of a windshield wiper and washer switch, alarm & relay control unit, windshield wiper motor and windshield washer motor. With the starter switch in the "ON" position, when the windshield wiper switch is turned on ("ON" or "HI") the battery voltage is applied to the windshield wiper motor to operate the wipers.

When the "INT" switch is turned on, the operation of the wipers is controlled by the alarm & relay control unit. When the "WASHER" switch is turned on, the operation of the wipers is also controlled by the alarm & relay control unit and the windshield washer motor operates to squirt the washing solution when the washer switch is pressed.

Diagnosis

Windshield Wiper Does Not Operate At Any Switch Position

Step	Action	Value(s)	Yes	No
1	Is the fuse C-16 normal?	—	Go to Step 2	Replace the fuse
2	Is C-36 grounded securely?	—	Go to Step 3	Ground it securely
3	Disconnect the windshield wiper motor connector C-27. Is there continuity between harness side connector C-27 terminal 3 and the ground?	—	Go to Step 5	Go to Step 4
4	Repair an open circuit between connector C-27 terminal 3 and the ground C-36. Is the action complete?	—	Go to Step 3	—
5	1. Disconnect the windshield wiper & washer switch connector I-31. 2. Turn the starter switch on. Is the battery voltage applied between harness side connector I-31 terminal 3 and the ground?	Approx. 12V	Go to Step 7	Go to Step 6
6	Repair an open circuit between the fuse C-16 and connector I-31 terminal 3. Is the action complete?	—	Go to Step 5	—
7	Is the continuity between the windshield wiper and washer switch terminal normal?	—	Repair or replace the windshield wiper motor	Repair or replace the switch

Windshield Wiper Does Not Operate At “INT” Position

Step	Action	Value(s)	Yes	No
1	1. Disconnect the windshield wiper and washer switch connector I-31. 2. Turn the windshield wiper and washer switch to INT position. Is there continuity between switch side connector I-31 terminal 2 and 3, 5 and 6?	—	Go to Step 2	Repair or replace the switch
2	Is B-8 grounded securely?	—	Go to Step 3	Ground it securely
3	1. Reconnect the windshield wiper and washer switch connector I-31. 2. Disconnect the alarm and relay control unit connector I-41 and I-42. 3. Turn the starter switch on. Is the battery voltage applied between harness side connector I-42 terminal 12 (connector I-41 terminal 7 or 9) and the ground?	Approx. 12V	Go to Step 5	Go to Step 4
4	Repair an open circuit between connector I-31 terminal 2 and the alarm & relay control unit. Is the action complete?	—	Verify repair	—
5	Is the battery voltage applied between harness side connector I-41 terminal 3 or connector I-42 terminal 13 and the ground?	Approx. 12V	Replace the alarm and relay control unit	Go to Step 6
6	Repair an open circuit between the fuse C-16 and the alarm & relay control unit. Is the action complete?	—	Verify repair	—

Windshield Wiper Does Not Operate At “LO” Position

Step	Action	Value(s)	Yes	No
1	Repair or replace the windshield wiper and washer switch. NOTE: There should be continuity between switch side connector I-31 terminal 3 and 5 with the switch turned to the LOW position. Is the action complete?	—	Verify repair	—

Windshield Wiper Does Not Operate At "HI" Position

Step	Action	Value(s)	Yes	No
1	1. Disconnect the windshield wiper and washer switch connector I-31. 2. Turn the windshield wiper and washer switch to the HIGH position. Is there continuity between switch side connector I-31 terminal 3 and 4?	—	Go to Step 2	Repair or replace the switch
2	1. Reconnect the windshield wiper and washer switch connector I-31. 2. Disconnect the windshield wiper motor connector C-27. 3. Turn the starter switch on. Is the battery voltage applied between harness side connector C-27 terminal 1 and the ground?	Approx. 12V	Repair or replace the windshield wiper motor	Go to Step 3
3	Repair an open circuit between connector I-31 terminal 4 and connector C-27 terminal 1. Is the action complete?	—	Verify repair	—

Auto-Stop Function Of The Windshield Wiper Motor Does Not Operate

Step	Action	Value(s)	Yes	No
1	Disconnect the windshield wiper and washer switch connector I-31. Turn the windshield wiper and washer switch off. Is there continuity between switch side connector I-31 terminal 5 and 6?	—	Go to Step 2	Repair or replace the switch
2	Disconnect the windshield wiper motor connector C-27. Turn the starter switch on. Is the battery voltage applied between harness side connector C-27 terminal 6 and the ground?	Approx. 12V	Go to Step 4	Go to Step 3
3	Repair an open circuit between the fuse C-16 and connector C-27 terminal 6. Is the action complete?	—	Go to Step 2	—
4	1. Connect the battery positive terminal with motor side connector C-27 terminal 2 and the battery negative terminal with terminal 3. 2. While the motor is operating at low speed, disconnect the battery positive terminal from terminal 2 and then connect it with terminal 6 again. 3. Under this condition, connect motor side connector terminal 5 with terminal 2. Does the motor stop at the correct position?	—	Go to Step 5	Repair or replace the motor
5	Disconnect the alarm and relay control unit connector I-41 and I-42. Is the battery voltage applied between harness side connector I-41 terminal 3 or connector I-42 terminal 13 and the ground?	Approx. 12V	Go to Step 7	Go to Step 6
6	Repair an open circuit between the fuse C-16 and connector I-41 terminal 3 or connector I-42 terminal 13. Is the action complete?	—	Go to Step 5	—
7	1. Reconnect the windshield wiper and washer switch connector I-31 and windshield wiper motor connector C-27. 2. Turn the windshield wiper and washer switch to the low position. Is the battery voltage applied between harness side connector I-41 terminal 4 (1 or 2) and the ground?	Approx. 12V intermittently	Go to Step 9	Go to Step 8
8	Repair an open circuit between connector C-27 terminal 5 and connector I-41 terminal 4 (1 or 2). Is the action complete?	—	Go to Step 7	—

8D-168 WIRING SYSTEM

Step	Action	Value(s)	Yes	No
9	1. Connect the alarm and relay control unit harness side connector I-41 terminal 4 and connector I-42 terminal 11 (connector I-41 terminal 1 and connector I-42 terminal 12/connector I-41 terminal 1 and 2). 2. Turn the windshield wiper and washer switch to the off position. Does the motor stop at the correct position?	—	Replace the alarm and relay control unit	Go to Step 10
10	Repair an open circuit between connector I-31 terminal 6 and the alarm & relay control unit. Is the action complete?	—	Verify repair	—

Windshield Wiper Motor Does Not Stop

Step	Action	Value(s)	Yes	No
1	1. Disconnect the windshield wiper and washer switch connector I-31. 2. Turn the switch off. NOTE: When the switch is turned of OFF position, there is no continuity between the switch terminals except terminal 5 and 6. Is the continuity between the switch terminal normal?	—	Go to Step 2	Repair or replace the switch
2	Repair or replace the windshield motor. Is the action complete?	—	Verify repair	—

Windshield Washer Motor Does Not Operate

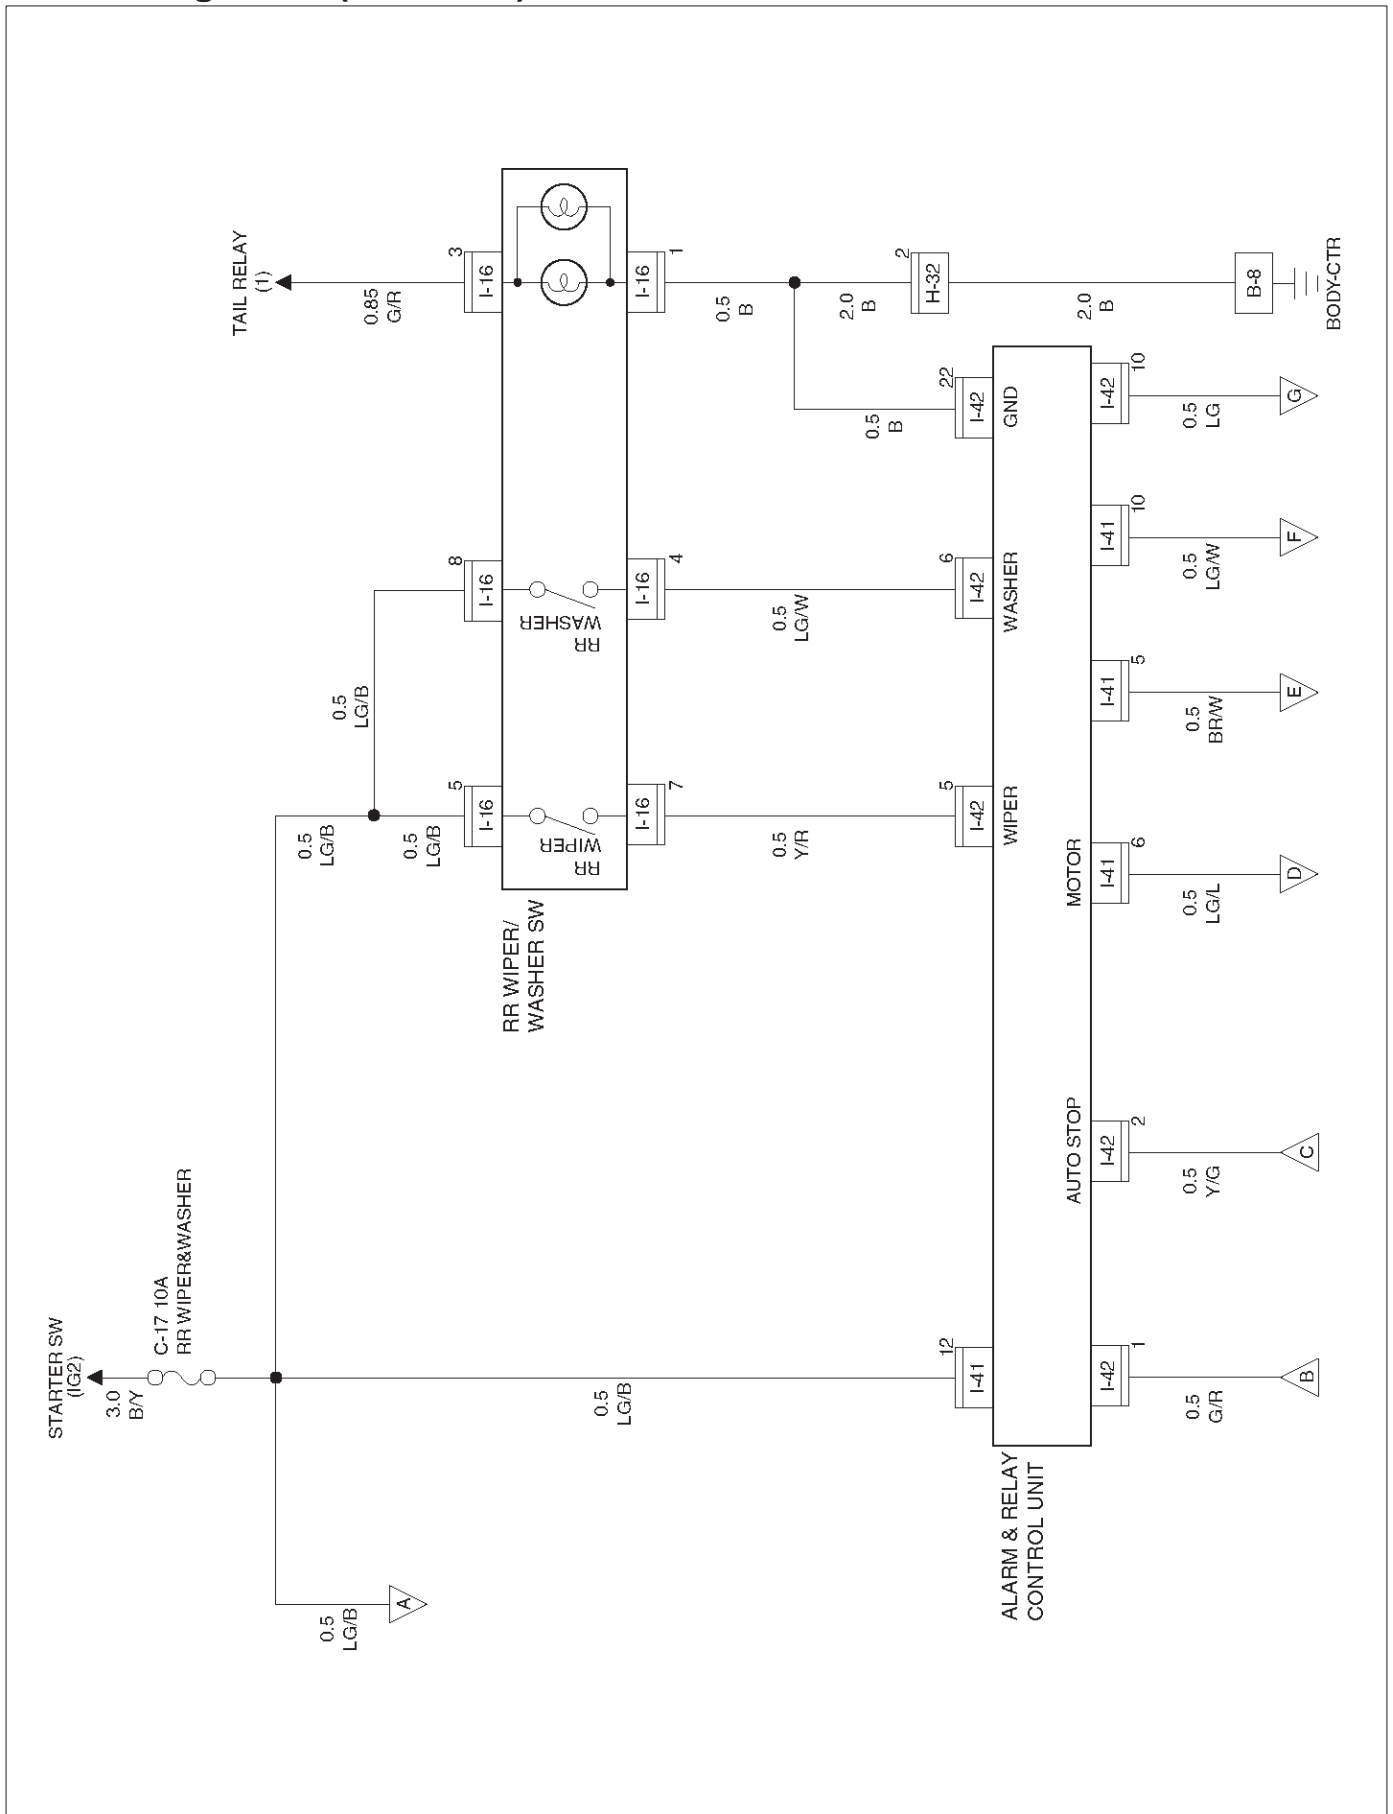

Step	Action	Value(s)	Yes	No
1	Does the windshield wiper motor operate?	—	Go to Step 6	Go to Step 2
2	Is the fuse C-16 normal?	—	Go to Step 3	Replace the fuse
3	1. Disconnect the windshield wiper and washer switch connector I-31. 2. Turn the starter switch on. Is the battery voltage applied between harness side connector I-31 terminal 1 and the ground?	Approx. 12V	Go to Step 5	Go to Step 4
4	Repair an open circuit between the fuse C-16 and connector I-31 terminal 1. Is the action complete?	—	Go to Step 3	—
5	Is C-16 grounded securely?	—	Go to Step 6	Ground it securely
6	Turn the windshield wiper and washer switch to the washer position. Is there continuity between switch side connector I-31 terminal 1 and 7?	—	Go to Step 7	Repair or replace the switch
7	1. Disconnect the windshield washer motor connector C-28. 2. Connect the battery positive terminal with the motor side connector C-28 terminal 1 and connect the battery negative terminal with terminal 2. Does the motor operate?	—	Go to Step 8	Repair or replace the motor
8	1. Reconnect the windshield wiper and washer switch connector I-31. 2. Turn the starter switch on. Is the battery voltage applied between harness side connector C-28 terminal 1 and the ground?	Approx. 12V	Go to Step 10	Go to Step 9
9	Repair an open circuit between connector I-31 terminal 7 and connector C-28 terminal 1. Is the action complete?	—	Verify repair	—
10	Repair an open circuit between connector C-28 terminal 2 and the ground C-16. Is the action complete?	—	Verify repair	—

Rear Wiper/Washer

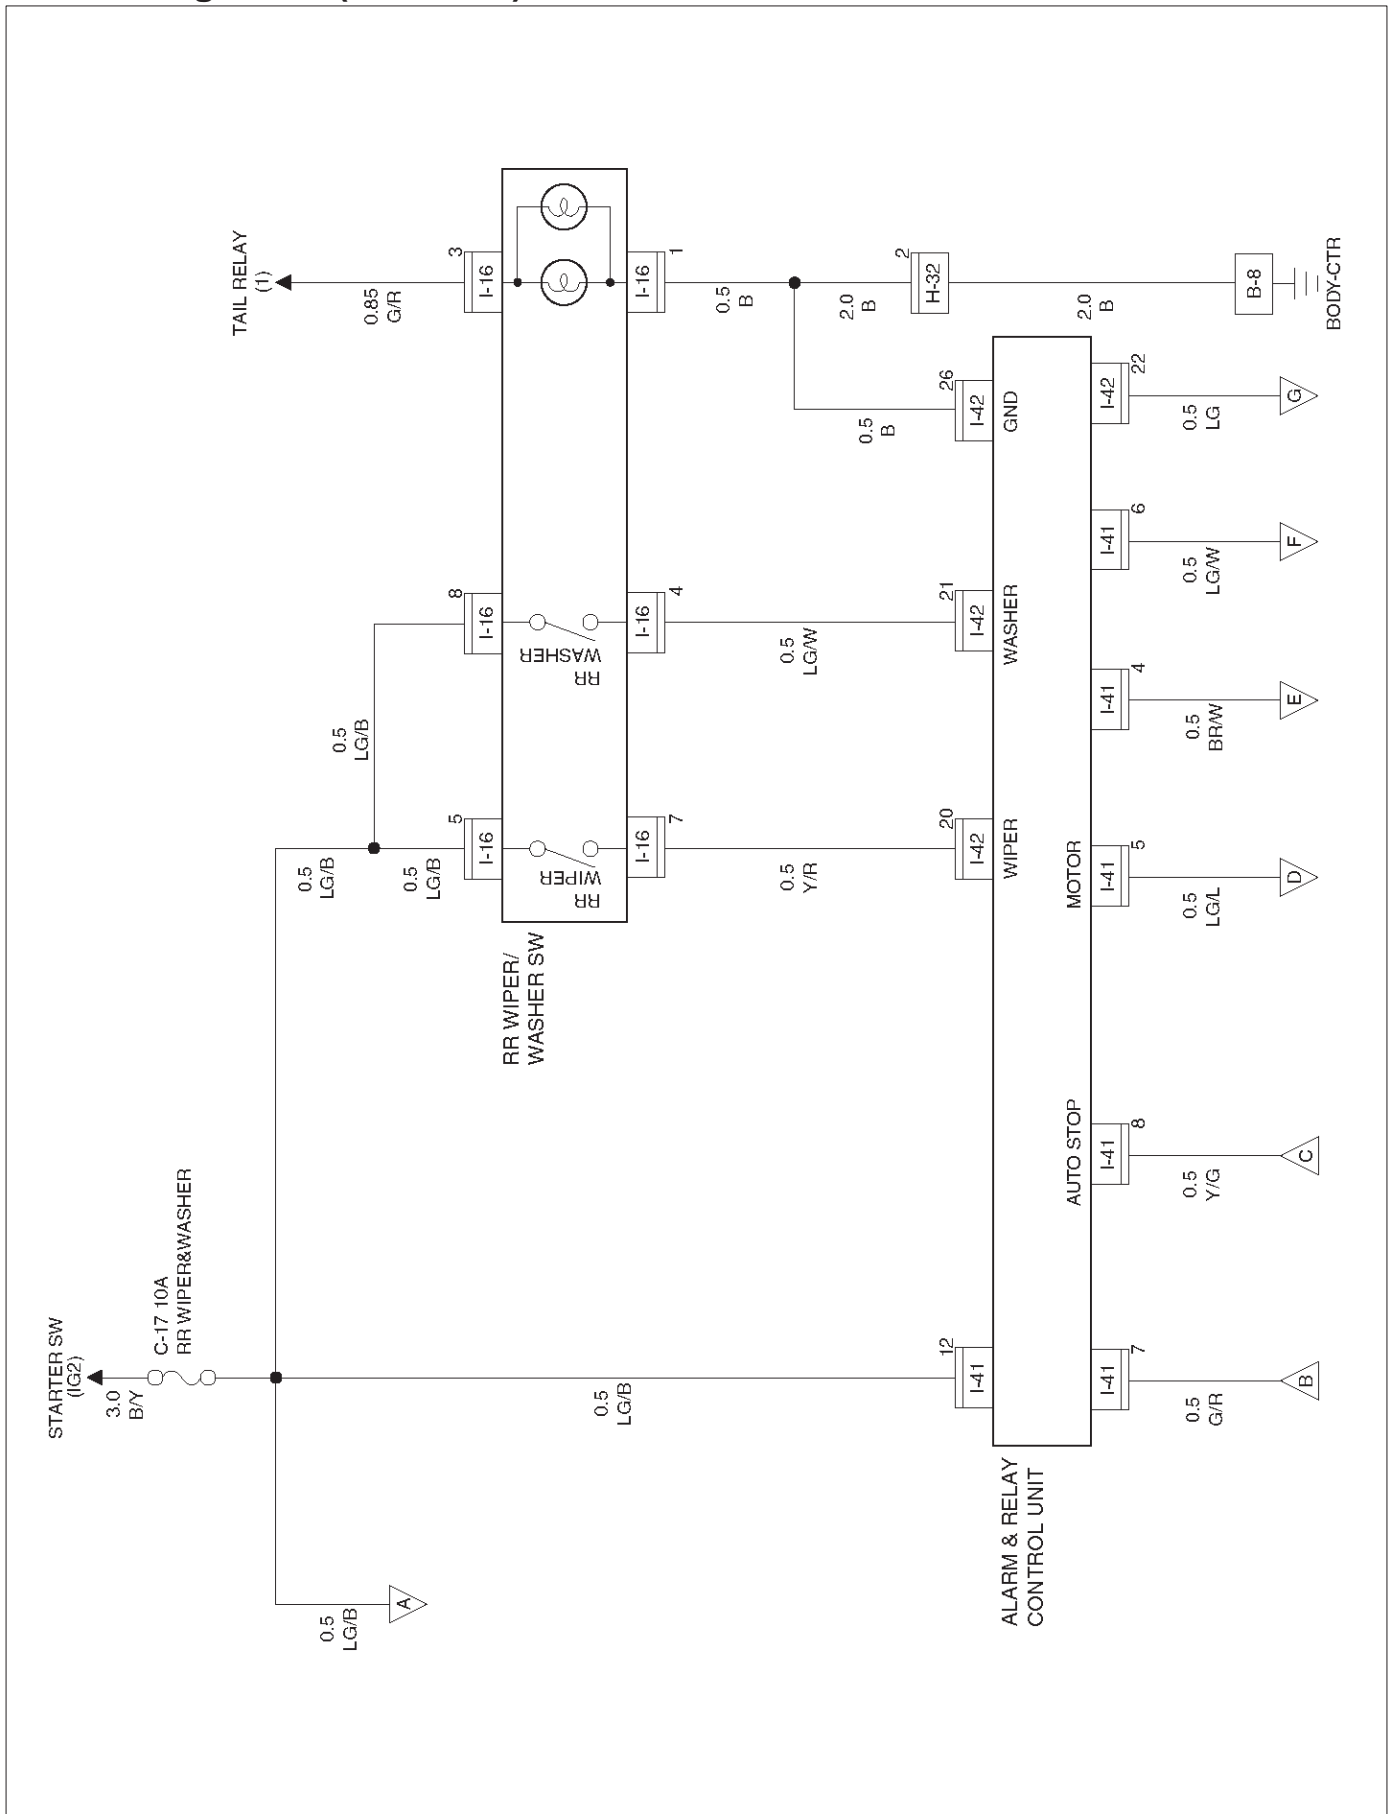

General Description

The system consists of the rear wiper and washer switch, the rear wiper motor, the rear washer motor and the alarm & relay control unit. The rear wiper provides intermittent and riseup functions and is controlled by the alarm & relay control unit. When the hatch gate is open, the rear wiper does not operate. The hatch gate actuator does not operate while the rear wiper is operating.

Diagnosis

Rear Wiper Motor Does Not Operate

Step	Action	Value(s)	Yes	No
1	Is the fuse C-17 normal?	—	Go to Step 2	Replace the fuse
2	1. Disconnect the rear wiper/washer switch connector I-16. 2. Turn the rear wiper switch on. Is there continuity between switch side connector I-16 terminal 5 and 7?	—	Go to Step 3	Repair or replace the switch
3	Turn the starter switch on Is the battery voltage applied between harness side connector I-16 terminal 5 and the ground?	Approx. 12V	Go to Step 5	Go to Step 4
4	Repair an open circuit between the fuse C-17 and connector I-16 terminal 5. Is the action complete?	—	Go to Step 3	—
5	Disconnect the alarm & relay control unit connector I-41 and I-42. Is the battery voltage applied between harness side connector I-41 terminal 12 or connector I-42 terminal 6 and the ground?	Approx. 12V	Go to Step 7	Go to Step 6
6	Repair an open circuit between the fuse C-17 and connector I-41 terminal 12 or connector I-42 terminal 6. Is the action complete?	—	Go to Step 5	—
7	Is there continuity between harness side connector I-16 terminal 7 and harness side connector I-42 terminal 5 or connector I-42 terminal 20?	—	Go to Step 9	Go to Step 8
8	Repair an open circuit between connector I-16 terminal 7 and connector I-42 terminal 5 or connector I-42 terminal 20. Is the action complete?	—	Go to Step 7	—
9	1. Disconnect the rear wiper motor connector G-6. 2. Connect the battery positive terminal with the motor side connector G-6 terminal 4 and the battery negative terminal with the motor side connector G-6 terminal 6. Does the motor operate?	—	Go to Step 10	Repair or replace the motor
10	Is there continuity between harness side connector I-41 terminal 6 or terminal 5 and harness side connector G-6 terminal 4?	—	Go to Step 12	Go to Step 11
11	Repair an open circuit between connector I-41 terminal 6 or terminal 5 and connector G-6 terminal 4. Is the action complete?	—	Go to Step 10	—
12	Is there continuity between harness side connector I-41 terminal 5 (or terminal 4) or the ground and harness side connector G-6 terminal 6?	—	Replace the alarm & relay control unit	Go to Step 13
13	Repair an open circuit between connector G-6 terminal 6 and connector I-41 terminal 5 (or terminal 4) or the ground B-6. Is the action complete?	—	Verify repair	—

Auto-Stop Function Of The Rear Wiper Motor Does Not Operate (X22SE Model)

Step	Action	Value(s)	Yes	No
1	1. Disconnect the rear wiper motor connector G-6 2. Connect the battery positive terminal with the motor side connector G-6 terminal 4 and the battery negative terminal with terminal 6. 3. While the motor is operating, disconnect the battery positive terminal from terminal 4 and then connect it with terminal 5 again. 4. Under this condition, connect the motor side connector terminal 3 with terminal 4. Does the motor stop at the correct position?	—	Go to Step 2	Repair or replace the motor
2	Turn the start switch on Is the battery voltage applied between harness side connector G-6 terminal 5 and the ground?	Approx. 12V	Go to Step 4	Go to Step 3
3	Repair an open circuit between the fuse C-17 and connector G-6 terminal 5. Is the action complete?	—	Go to Step 2	—
4	Disconnect the alarm & relay control unit connector I-41 and I-42. Is there continuity between harness side connector G-6 terminal 3 and harness side connector I-41 terminal 12?	—	Replace the alarm & relay control unit	Go to Step 5
5	Repair an open circuit between connector G-6 terminal 3 and connector I-41 terminal 12. Is the action complete?	—	Verify repair	—

Rear Wiper Motor Does Not Operate With Rear Wiper/Washer Switch At Wiper Position

Step	Action	Value(s)	Yes	No
1	1. Disconnect the rear wiper/washer switch connector I-16. 2. Turn the switch to rear wiper position. Is there continuity between the switch side connector I-16 terminal 5 and 7?	—	Go to Step 2	Repair or replace the switch
2	1. Reconnect the rear wiper/washer switch connector I-16. 2. Disconnect the alarm & relay control unit connector I-41 and I-42. 3. Turn the starter switch on. Is the battery voltage applied between harness side connector I-42 terminal 5 or terminal 20 and the ground?	Approx. 12V	Replace the alarm & relay control unit	Go to Step 3
3	Repair an open circuit between connector I-16 terminal 7 and connector I-42 terminal 5 or terminal 20. Is the action complete?	—	Verify repair	—

Rear Wiper Motor Does Not Operate With Rear Wiper/Washer Switch At Washer Position

Step	Action	Value(s)	Yes	No
1	1. Disconnect the rear wiper/washer switch connector I-16. 2. Turn the switch to the washer position. Is there continuity between the switch side connector I-16 terminal 8 and 4?	—	Go to Step 2	Repair or replace the switch
2	1. Reconnect the rear wiper/washer switch connector I-16. 2. Disconnect the alarm & relay control unit connector I-41 and I-42. 3. Turn the starter switch on. Is the battery voltage applied between harness side connector I-42 terminal 6 (21 or 19) and the ground?	Approx. 12V	Replace the alarm & relay control unit	Go to Step 3
3	Repair an open circuit between connector I-16 terminal 4 and connector I-42 terminal 6 (21 or 19). Is the action complete?	—	Verify repair	—

Rear Wiper Motor Does Not Stop Operating

Step	Action	Value(s)	Yes	No
1	1. Disconnect the rear wiper/washer switch connector I-16. 2. Turn the switch to the off position. NOTE: There should be no continuity. Is there continuity between the switch side connector I-16 terminal 5 and 7?	—	Repair or replace the switch	Replace the alarm & relay control unit

8D-180 WIRING SYSTEM

Rear Washer Motor Does Not Operate

Step	Action	Value(s)	Yes	No
1	Does the rear wiper motor operate?	—	Go to Step 6	Go to Step 2
2	Is the fuse C-17 normal?	—	Go to Step 3	Replace the fuse
3	1. Disconnect the rear wiper/washer switch connector I-16. 2. Turn the switch to the rear washer position. Is there continuity between the switch side connector I-16 terminal 8 and 4?	—	Go to Step 4	Replace the switch
4	Turn the starter switch on. Is the battery voltage applied between harness side connector I-16 terminal 8 and the ground?	Approx. 12V	Go to Step 6	Go to Step 5
5	Repair an open circuit between the fuse C-17 and connector I-16 terminal 8. Is the action complete?	—	Go to Step 4	—
6	1. Disconnect the rear wiper motor connector C-30. 2. Connect the battery positive terminal with the motor side connector C-30 terminal 1 and the battery negative terminal with terminal 2. Does the motor operate?	—	Go to Step 7	Repair or replace the motor
7	Reconnect the rear wiper/washer switch connector I-16. Is the battery voltage applied between harness side connector C-30 terminal 1 and the ground?	Approx. 12V	Go to Step 9	Go to Step 8
8	Repair an open circuit between the rear wiper/washer motor and the alarm & relay control unit. Is the action complete?	—	Verify repair	—
9	Repair an open circuit between connector C-30 terminal 2 and the ground C-36. Is the action complete?	—	Verify repair	—

Rear Defogger/Mirror Defogger

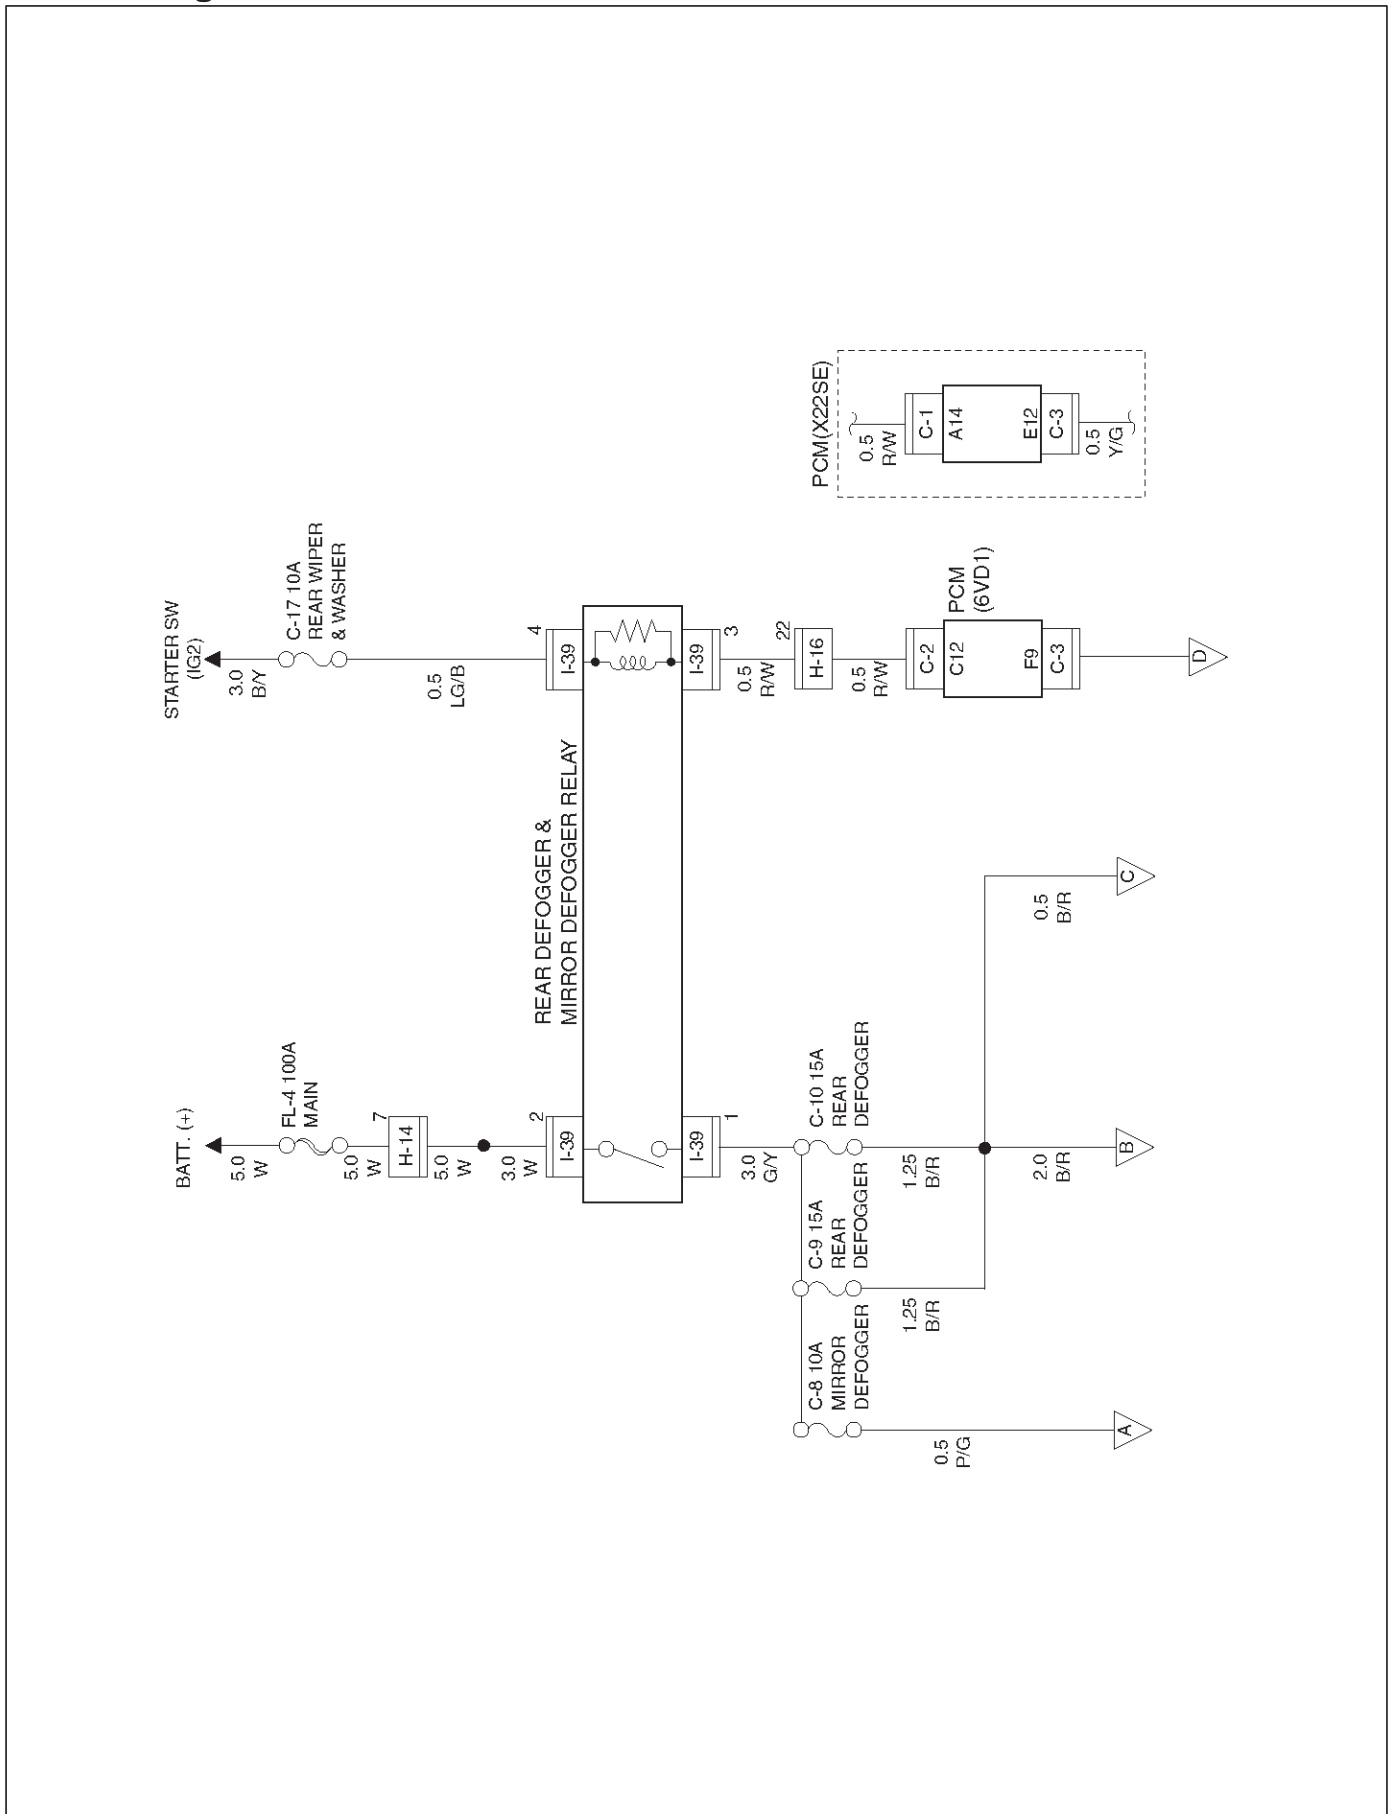

General Description

The system consists of the rear defogger and mirror defogger switch, the rear defogger & mirror defogger relay, the rear defogger & mirror defogger and the Powertrain Control Module (PCM).

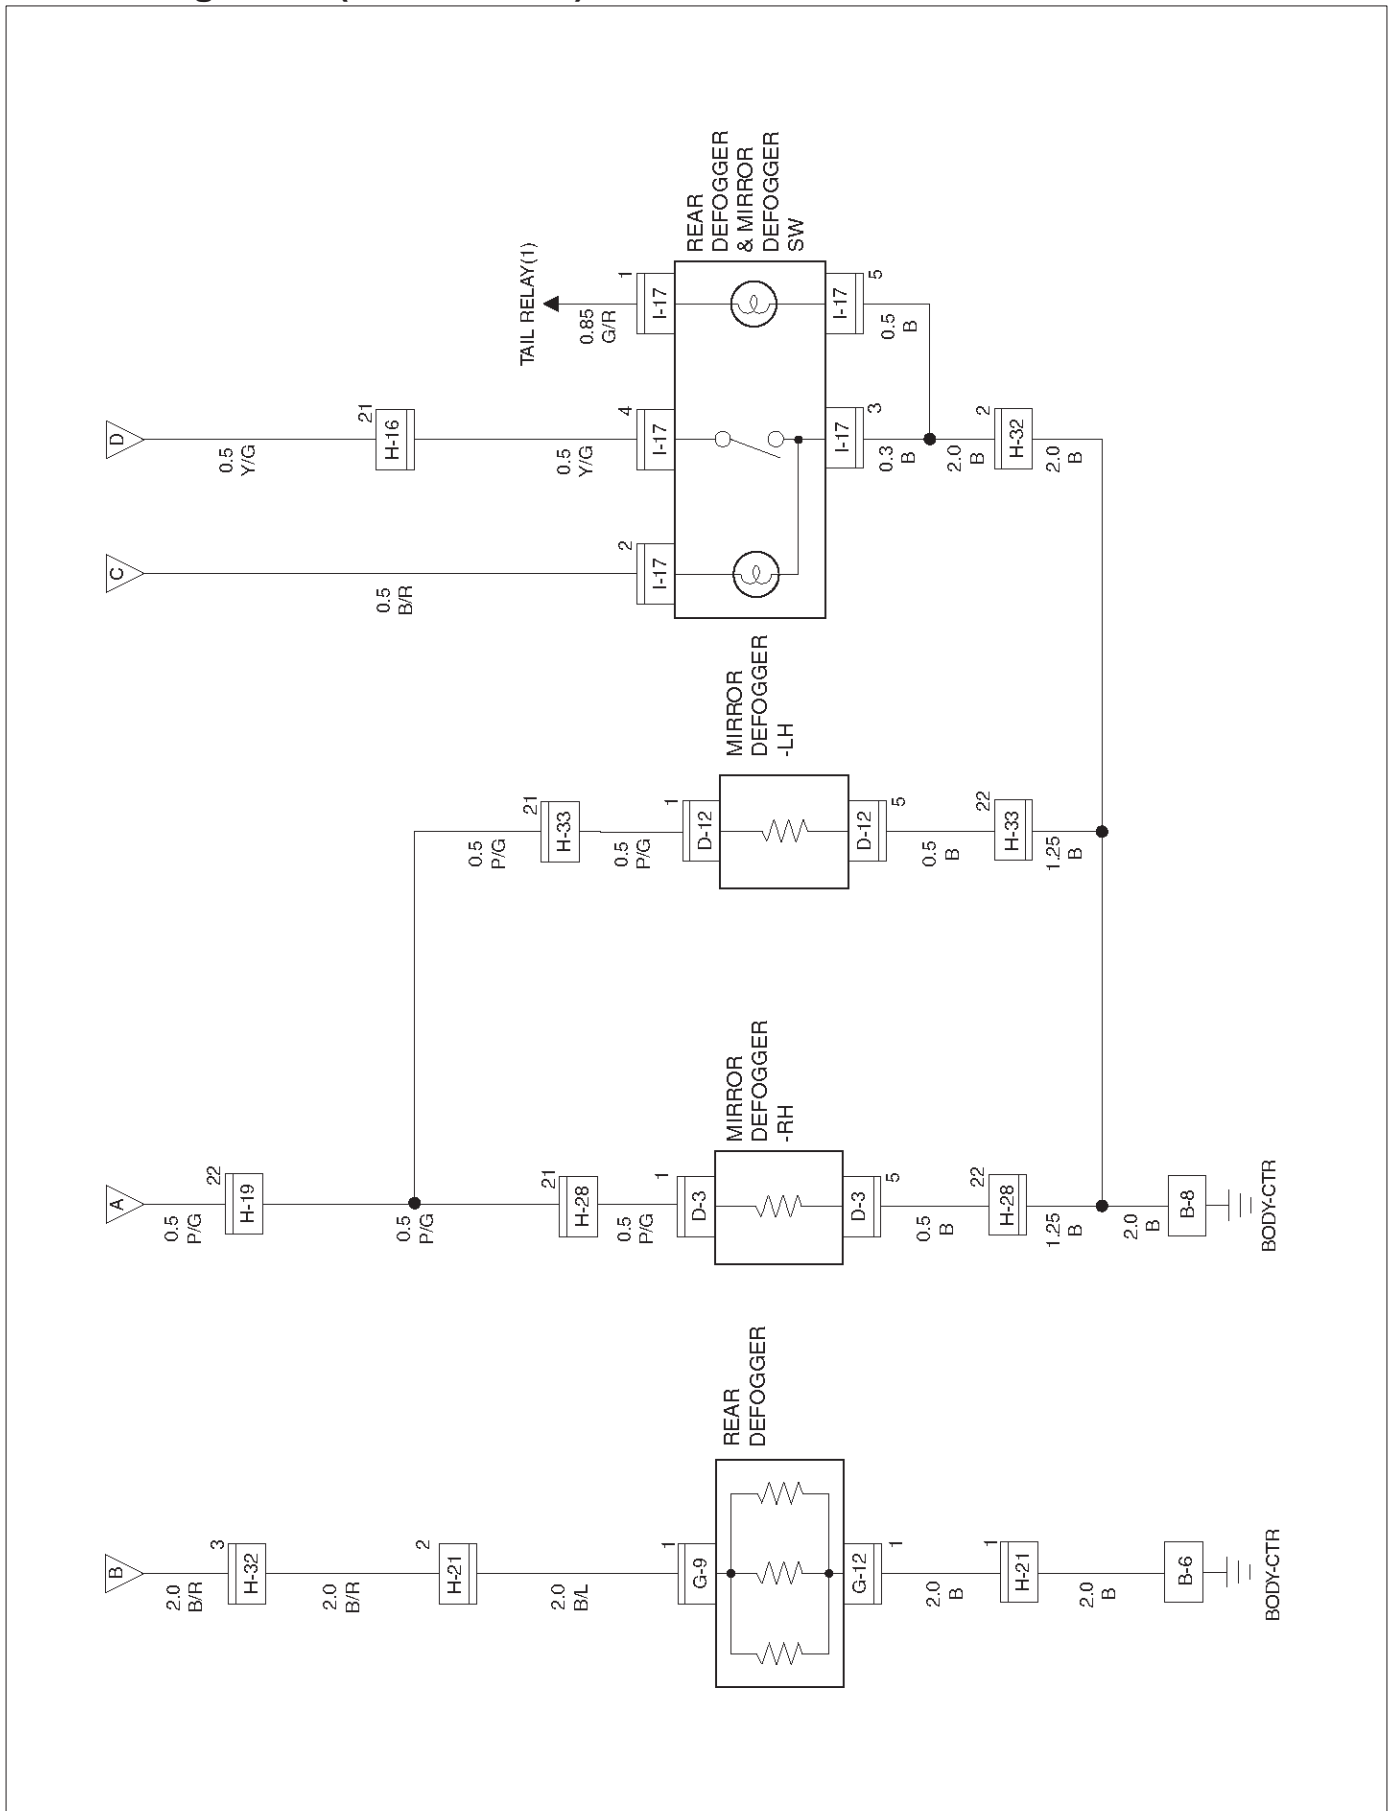

When the rear defogger and mirror defogger switch is turned on with the starter switch on, the rear defogger and mirror defogger relay is activated and the battery voltage is applied to the rear defogger and mirror defogger.

The PCM is provided with the timer. When the operation time of the timer elapses which has been set in advance, the rear defogger and mirror defogger relay is automatically deactivated and the rear defogger and mirror defogger is turned off.

Diagnosis

Rear Defogger Does Not Operate

Step	Action	Value(s)	Yes	No
1	Are the fuse C-9, C-10 and C-17 normal?	—	Go to Step 2	Replace the fuse(s)
2	Are B-6 and/or B-8 grounded securely?	—	Go to Step 3	Ground it (them) securely
3	Remove the rear defogger relay. Is the battery voltage applied between the rear defogger relay harness side connector I-39 terminal 2 and the ground?	Approx. 12V	Go to Step 5	Go to Step 4
4	Repair an open circuit between the battery and connector I-39 terminal 2. Is the action complete?	—	Go to Step 3	—
5	Turn the starter switch on. Is the battery voltage applied between harness side connector I-39 terminal 4 and the ground?	Approx. 12V	Go to Step 7	Go to Step 6
6	Repair an open circuit between the fuse C-17 and connector I-39 terminal 4. Is the action complete?	—	Go to Step 5	—
7	Disconnect the PCM connector C-1, C-2 and C-3. Is there continuity between harness side connector I-39 terminal 3 and harness side connector C-2 terminal C12 or connector C-1 terminal A14?	—	Go to Step 9	Go to Step 8
8	Repair an open circuit between connector I-39 terminal 3 and connector C-2 terminal C12 or connector C-1 terminal A14. Is the action complete?	—	Go to Step 7	—
9	Is there continuity between harness side connector I-17 terminal 4 and connector C-3 terminal F9 or connector C-3 terminal E12?	—	Go to Step 11	Go to Step 10
10	Repair an open circuit between connector I-17 terminal 4 and connector C-3 terminal F9 or connector C-3 terminal E12. Is the action complete?	—	Go to Step 9	—
11	Is there continuity between harness side connector I-17 terminal 3 and the ground?	—	Go to Step 13	Go to Step 12
12	Repair an open circuit between connector I-17 terminal 3 and the ground B-8. Is the action complete?	—	Go to Step 11	—
13	1. Reconnect the rear defogger relay. 2. Ground the PCM harness side connector C-2 terminal C12 or connector C-1 terminal A14. Is the battery voltage applied between the rear defogger harness side connector G-9 terminal 1 and the ground?	Approx. 12V	Go to Step 14	Repair an open circuit between the fuse C-9 or C-10 and the rear defogger
14	Is there continuity between the rear defogger harness side connector G-12 terminal 1 and the ground?	—	Go to Step 16	Go to Step 15

8D-188 WIRING SYSTEM

Step	Action	Value(s)	Yes	No
15	Repair an open circuit between connector G-12 terminal 1 and the ground B-6. Is the action complete?	—	Go to Step 14	—
16	1. Reconnect the PCM connector C-2 and C-3 or C-1. 2. Turn the rear defogger switch on. Is the battery voltage applied between the rear defogger harness side connector G-9 terminal 1 and the ground?	Approx. 12V	Go to Step 18	Go to Step 17
17	Replace the PCM. Is the action complete?	—	Verify repair	—
18	Repair broken heat wire or connector poor contact of the rear defogger. Is the action complete?	—	Verify repair	—

Rear Defogger Timer Does Not Function

Step	Action	Value(s)	Yes	No
1	Replace the PCM. Is the action complete?	—	Verify repair	—

Audio

General Description

The audio circuit is designed for the current to flow through the receiver circuit when the radio switch is turned on with the starter switch in "ACC" or "ON". Current runs through the memory circuit of the audio regardless of the position of the starter switch.

Cigarette Lighter, Digital Clock and Accessory Socket

General Description

When the cigarette lighter is pushed in with the starter switch at either "ACC" or "ON" position, a circuit is formed in the cigarette lighter case to heat the lighter coil.

The cigarette lighter is sprung back to its original position after the lighter coil is heated.

Diagnosis

Cigarette Lighter Does Not Work

Step	Action	Value(s)	Yes	No
1	Is the fuse C-3 normal?	—	Go to Step 2	Replace the fuse
2	Is B-8 grounded securely?	—	Go to Step 3	Ground it securely
3	1. Disconnect the cigarette lighter connector I-22. 2. Turn the starter switch to the ACC or ON position. Is the battery voltage applied between harness side connector I-22 terminal 1 and the ground?	Approx. 12V	Go to Step 5	Go to Step 4
4	Repair an open circuit between the fuse C-3 and connector I-22 terminal 1. Is the action complete?	—	Go to Step 3	—
5	Disconnect the cigarette lighter connector I-21. Is there continuity between harness side connector I-21 terminal 1 and the ground B-8?	—	Repair or replace the cigarette lighter assembly	Go to Step 6
6	Repair an open circuit between connector I-21 terminal 1 and the ground B-8. Is the action complete?	—	Verify repair	—

Cigarette Lighter Does Not Spring Out After Being Heated

Step	Action	Value(s)	Yes	No
1	Repair or replace the cigarette lighter. Is the action complete?	—	Verify repair	—

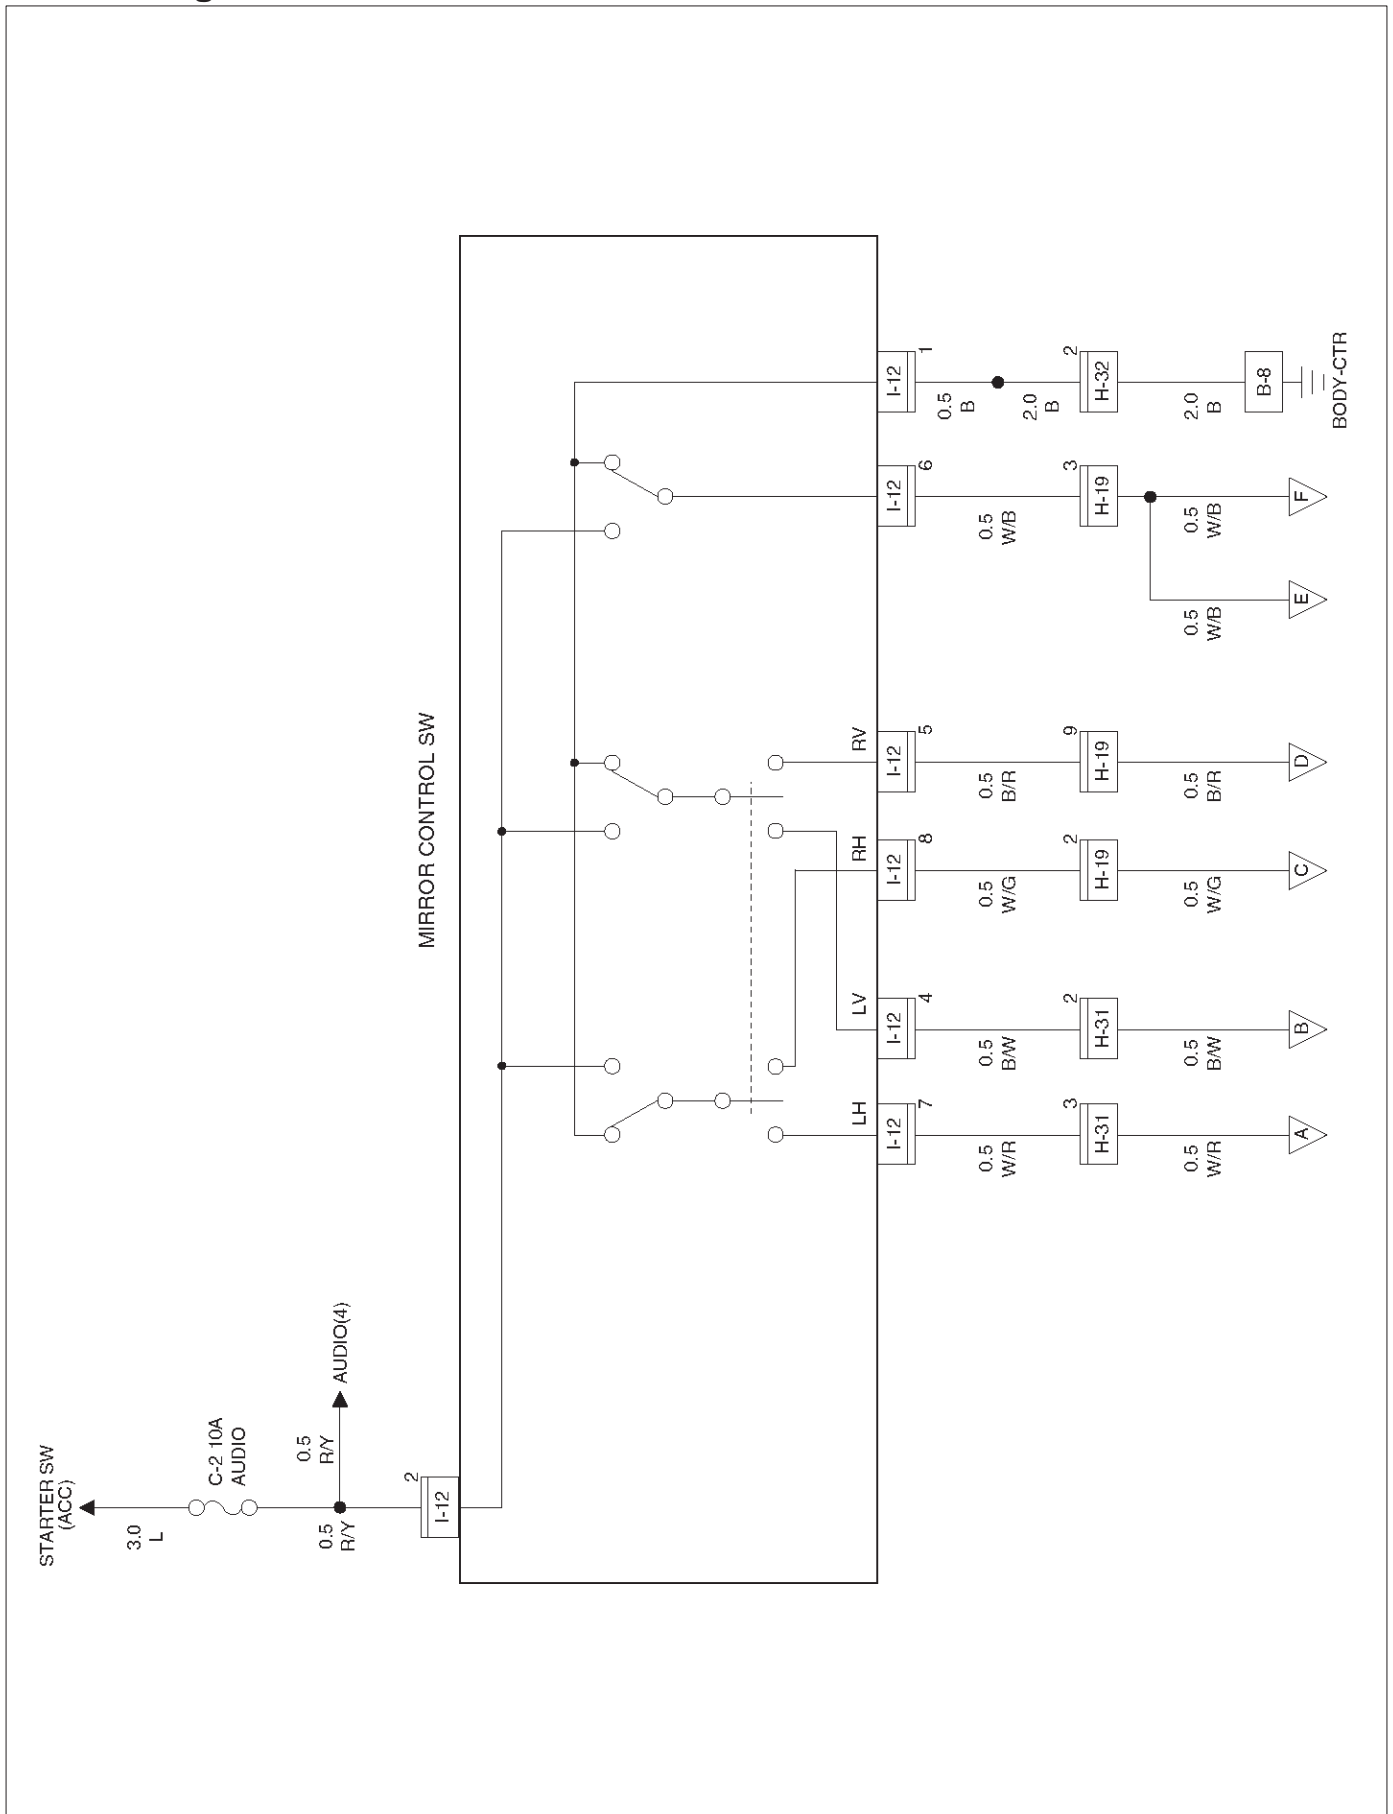

Power Door Mirror

General Description

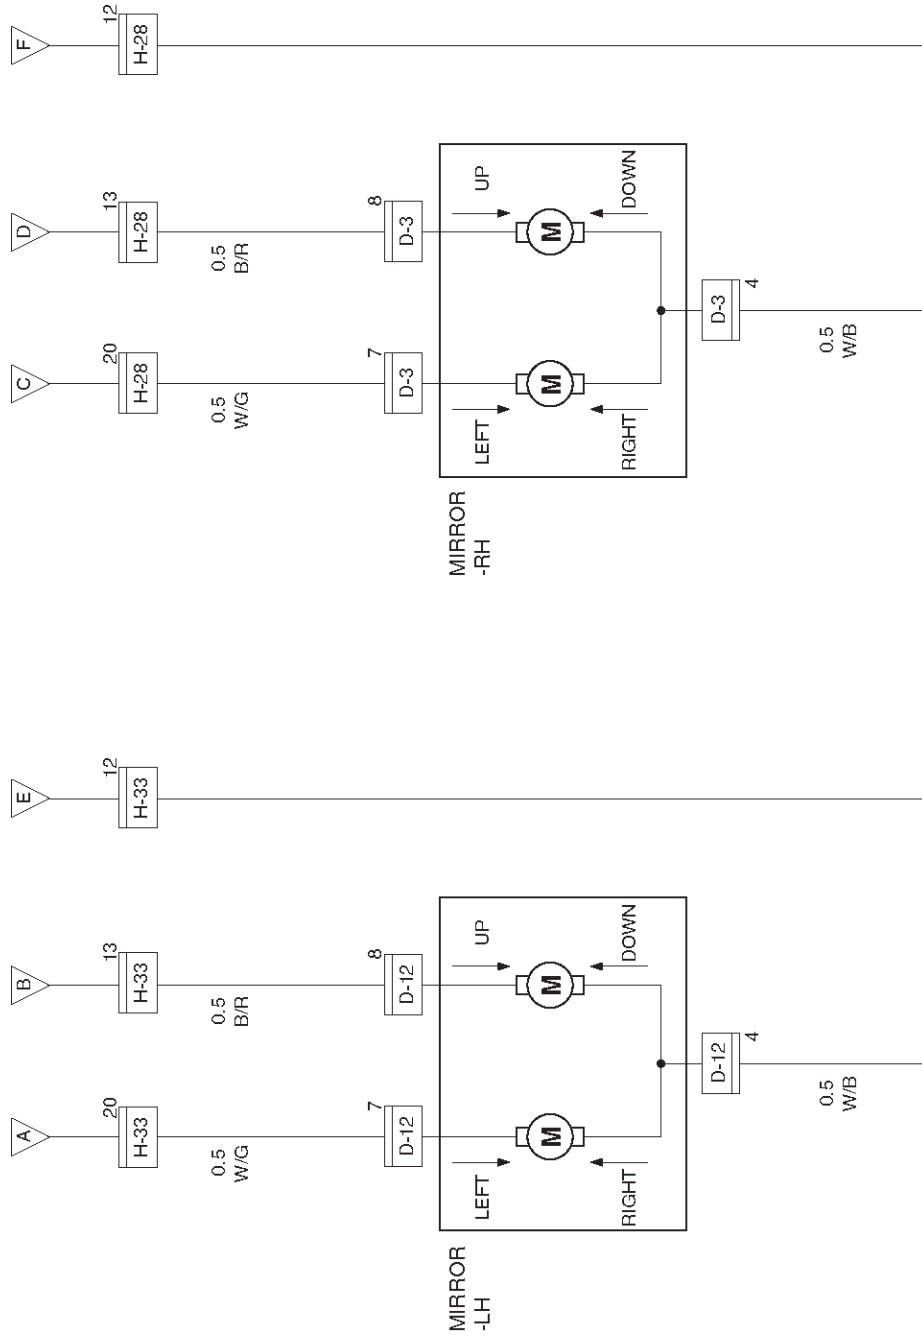

The system consists of the starter switch, the mirror control switch, and door mirrors on both sides.

When the mirror control switch is operated with the starter switch at either "ACC" or "ON" position, the motor in the door mirror (on either side) rotates to allow the horizontal and vertical adjustment of mirror angles.

Diagnosis

Mirrors On Both Sides Do Not Operate

Step	Action	Value(s)	Yes	No
1	Is the fuse C-2 normal?	—	Go to Step 2	Replace the fuse
2	Is the B-8 ground securely?	—	Go to Step 3	Ground it securely
3	Disconnect the mirror control switch connector I-12. Is the battery voltage applied between the harness side connector I-12 terminal 2 and the ground?	Approx. 12V	Go to Step 5	Go to Step 4
4	Repair an open circuit between the fuse C-2 and connector I-12 terminal 2. Is the action complete?	—	Go to Step 3	—
5	Is there continuity between the harness side connector I-12 terminal 6 and the ground?	—	Go to Step 7	Go to Step 6
6	Repair an open circuit between connector I-12 terminal 6 and mirror. Is the action complete?	—	Verify repair	—
7	Repair or replace the mirror control switch. Is the action complete?	—	Verify repair	—

Mirrors On the Left (or Right) Side Does Not Operate

Step	Action	Value(s)	Yes	No
1	Disconnect the mirror control switch connector I-12 and mirror connector D-12 or D-3. Is there continuity between the harness side connector I-12 terminal 6 and connector D-12 or D-3 terminal 4?	—	Go to Step 3	Go to Step 2
2	Repair an open circuit between connector I-12 terminal 6 and connector D-12 or D-3 terminal 4? Is the action complete?	—	Go to Step 1	—
3	Connect the battery positive terminal to the mirror side connector terminal 4, and the battery negative terminal to the mirror side connector terminal 7 or 8. Dose the mirror operate?	—	Repair or replace the mirror control switch	Replace the mirror

Mirrors On Both Sides Operate Only In The Vertical (Or Horizontal) Direction

Step	Action	Value(s)	Yes	No
1	Repair or replace the door mirror control switch. Is the action complete?	—	Verify repair	—

8D-202 WIRING SYSTEM**Mirror On Left (or Right) Sides Operate Only In The Vertical (Or Horizontal) Direction**

Step	Action	Value(s)	Yes	No
1	1. Disconnect the mirror connector D-12 or D-3. 2. Connector the battery positive terminal to the mirror connector terminal 4, and the battery negative terminal to the mirror connector terminal 7 or 8. Does the mirror operate?	—	Go to Step 2	Replace the mirror
2	Is there continuity between the harness side connector I-12 terminal 7 and connector D-12 terminal 7 (connector I-12 terminal 4 and connector D-12 terminal 8, connector I-12 terminal 8 and connector D-3 terminal 7, connector I-12 terminal 5 and connector D-3 terminal 8)?	—	Go to Step 4	Go to Step 3
3	Repair an open circuit between the mirror control switch and the mirror -LH or -RH Is the action complete?	—	Verify repair	
4	Repair or replace the mirror control switch. Is the action complete?	—	Verify repair	

Keyless Entry

General Description

This circuit consists of the keyless entry control unit, the front door lock, & power window switch (RH), the starter switch, the dome light, the door switch and the tail gate switch and possible to lock/unlock each door by operation of transmitter. Basic function of system is as follows.

1. Lock/unlock function

When the Keyless entry control unit receives the signal from the transmitter, the control unit sends the locker unlock signal to the front door lock and power window switch (RH).

Function code (lock or unlock) and proper ID code for each vehicle are added to the signal. But, when starter switch is on or any of the doors opens, lock/unlock function is not unable to work.

2. Answer back function

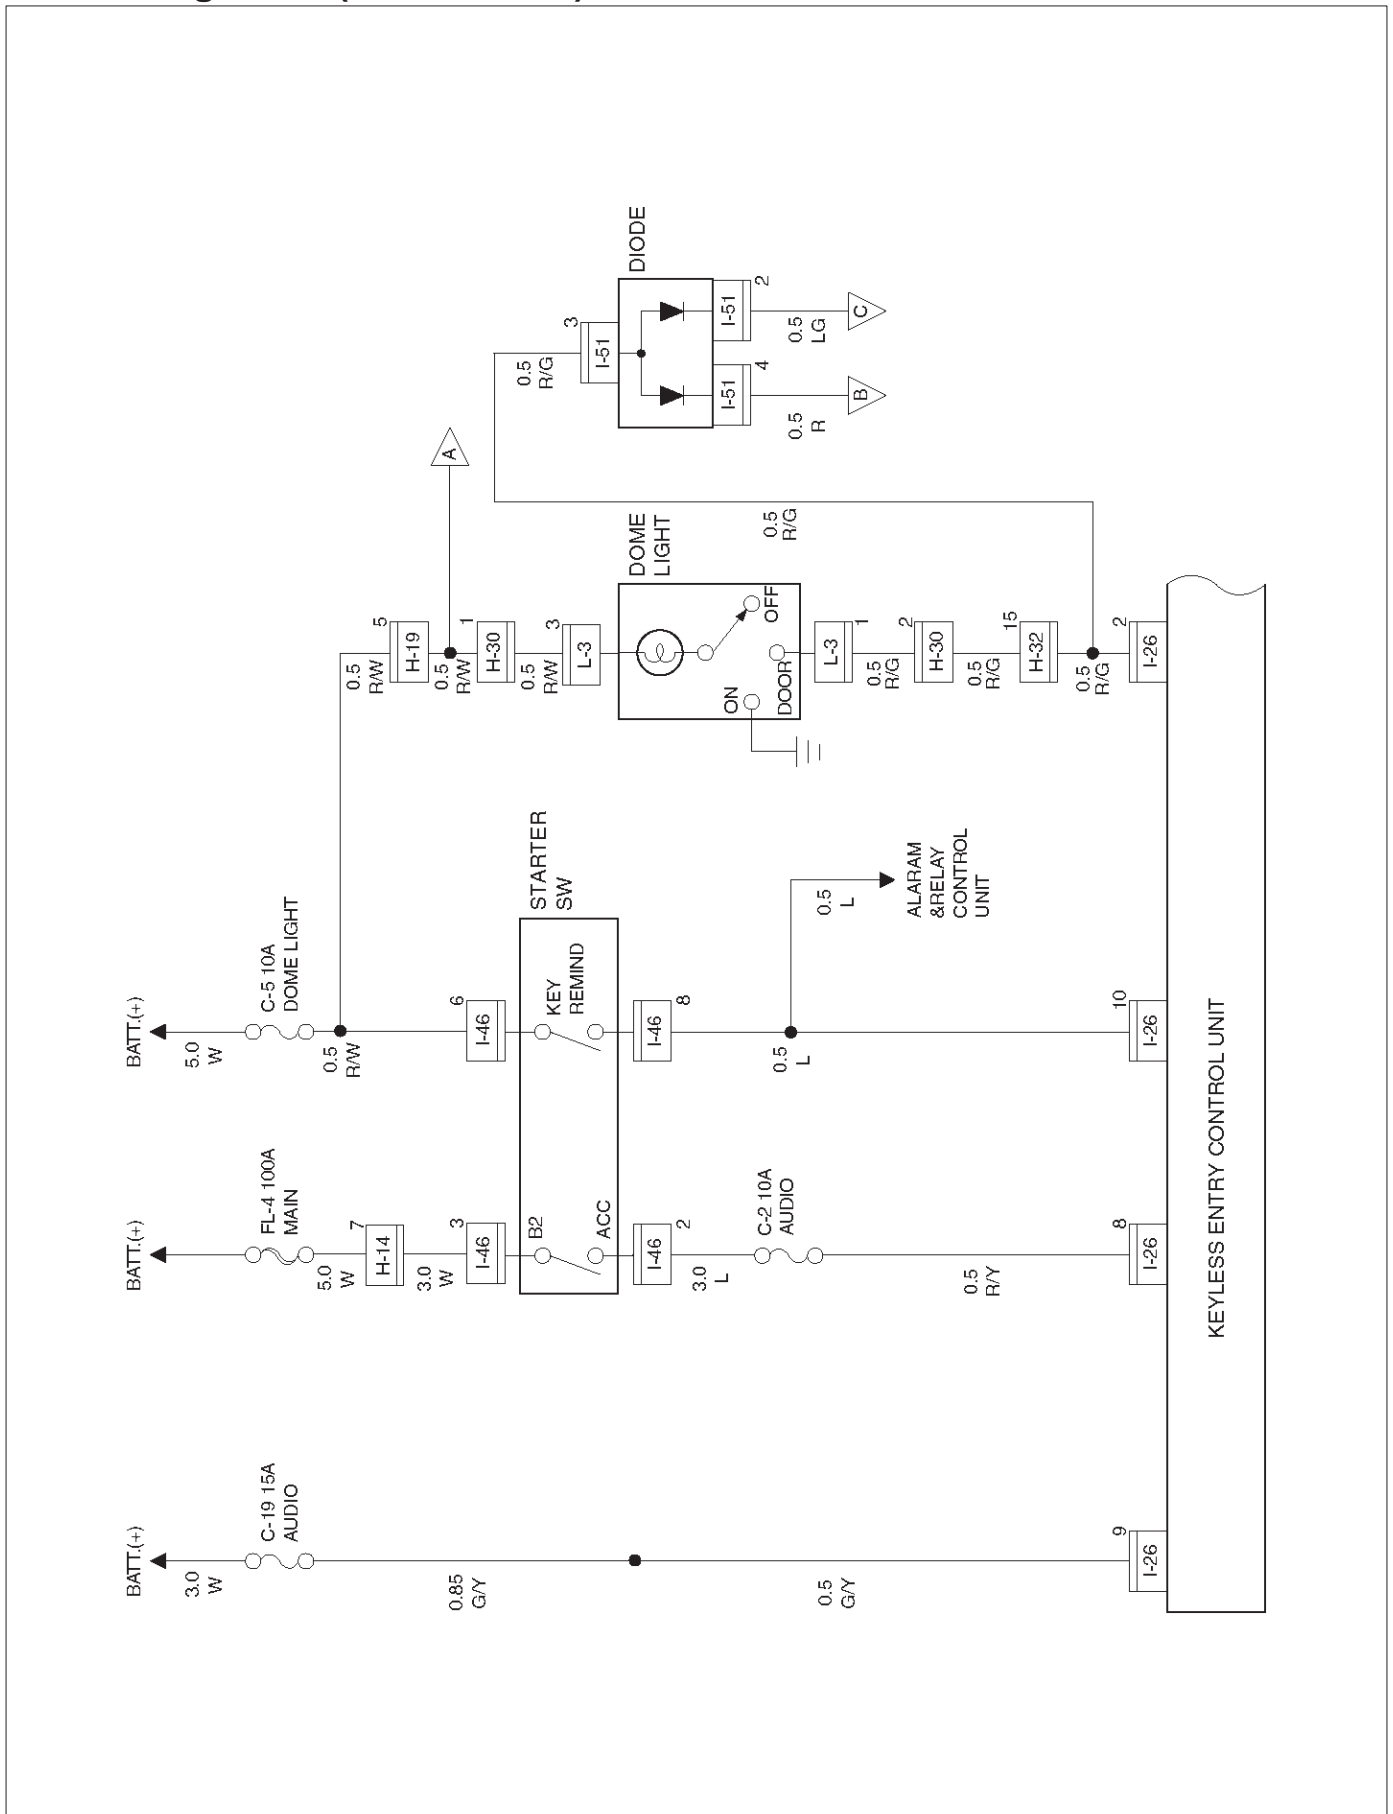

When receiving the signal from the transmitter, the keyless entry control unit responds by using the dome light. In case of being locked, the keyless entry control unit turns on the dome light at two times (about 0.5 second at each time). In case of being unlocked, it turns on the dome light at one time (about 3 seconds).

3. Autolock function

After unlock function is done, in case of effecting one of following conditions within about 30 seconds, the keyless entry control unit automatically sends the lock signal to lock each door.

1. The doors are closed.
2. Starter key is not inserted
3. The lock operation is not done by transmitter.

Keyless Entry System

ID Code Registration

This procedure registers a new ID code. When total number of registered ID codes and newly registered ID code exceed four, they are erased in order of older one.

Step	Action	Value(s)	Yes	No
1	1. Confirm that all the doors are closed and unlocked. 2. Open the driver's side door. 3. Insert the key into the starter switch. Is the action complete?	—	Go to Step 2	Go to Step 1
2	Turn the starter switch to ACC position and then to OFF position three times. NOTE: This step must be carried out within five seconds after step 1. Is the action complete?	—	Go to Step 3	Go to Step 1
3	Close the driver's side door and then open it two times. NOTE: This step must be carried out within ten seconds after step 2. Is the action complete?	—	Go to Step 4	Go to Step 1
4	1. Turn the starter switch to ACC position and then to OFF position three times. 2. Close the driver's side door and then open it. NOTE: This step must be carried out within ten seconds after step 3. Is the action complete?	—	Go to Step 5	Go to Step 1
5	The control unit lock and unlocks the doors one times. Does the control unit work normally?	—	Go to Step 6	Go to Step 1
6	Operate the lock or unlock button of the transmitter. NOTE: This step must be carried out within twenty seconds after step 5. Is the action complete?	—	Go to Step 7	Go to Step 1
7	The control unit locks and unlock the doors one times. Does the control unit work normally?	—	Go to Step 8	Go to Step 1
8	Operate the lock or unlock button of the transmitter. NOTE: This step must be carried out within twenty seconds after step 7. Is the action complete?	—	Go to Step 9	Go to Step 1
9	The control unit compares the two codes sent from the transmitter. If the code succeeds in registration, the control unit locks and unlocks the doors one time. If the two codes are different from each other or fails in registration, the control unit locks and unlocks the doors three times. NOTE: In any case, this procedure is finished.	—	Go to Step 1	Go to Step 1

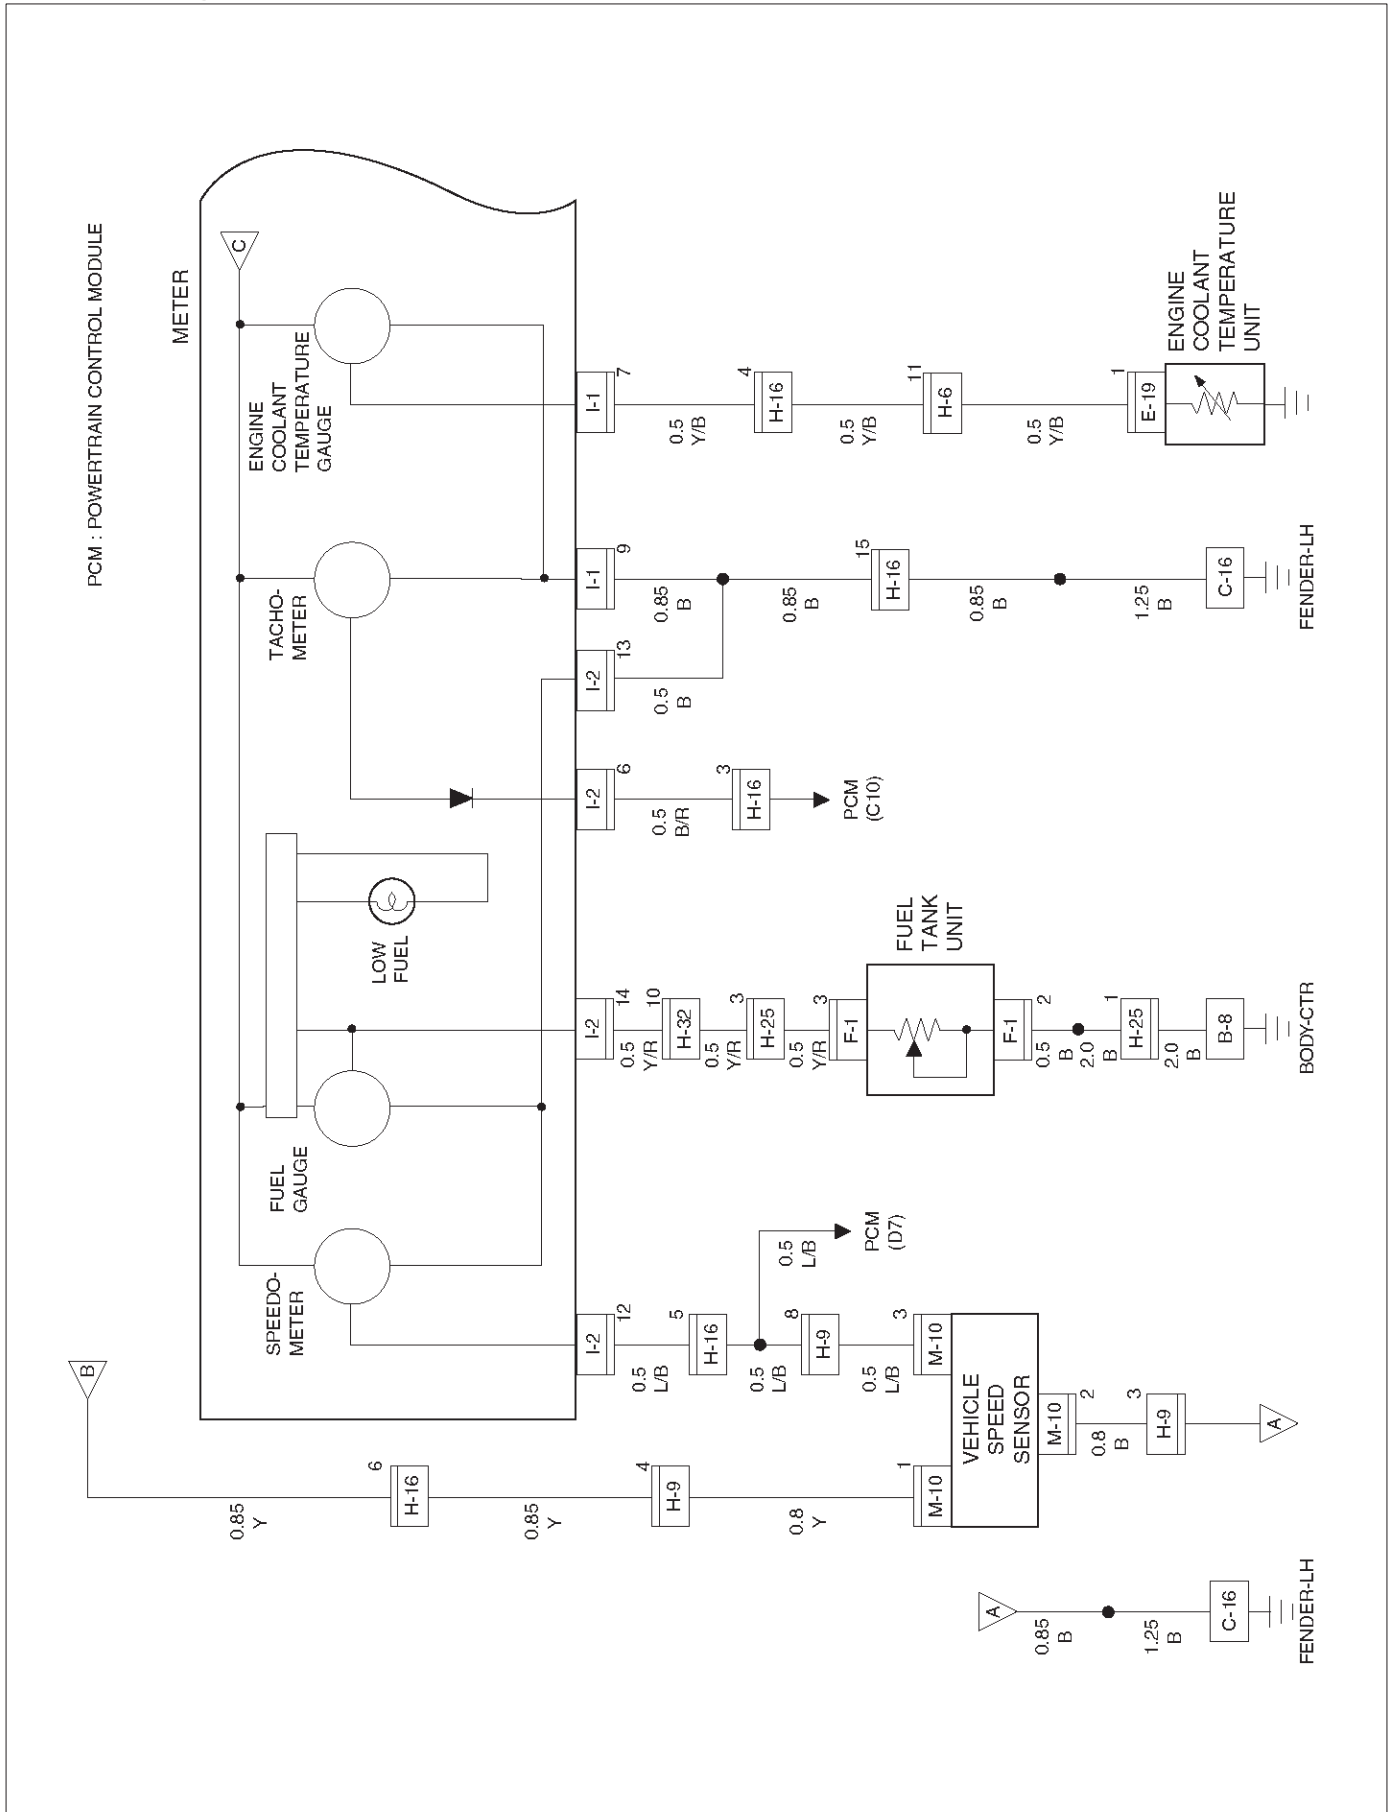

Meter and Warning/Indicator Light

General Description

The circuit consists of the starter switch, meter assembly, vehicle speed sensor, alarm & relay control unit, lighting switch, turn signal switch, engine coolant temperature unit, oil pressure unit, Powertrain Control Module, fuel tank unit, 4WD control unit, oil pressure switch, parking brake switch, brake fluid switch, seat belt switch, illumination controller.

The meter ASM contains the speedometer, tachometer, voltmeter, engine coolant temperature gauge, oil pressure gauge, fuel gauge and warning/indicator lights. The meter warning/indicator lights and their bulb sockets are a unit, they are installed from the back of the speedometer assembly.

Diagnosis

Speedometer and Odometer Do Not Function

Step	Action	Value(s)	Yes	No
1	Is C-16 grounded securely?	—	Go to Step 2	Ground it securely
2	Disconnect the vehicle speed sensor connector M-10. Is there continuity between harness side connector M-10 terminal 2 and the ground?	—	Go to Step 4	Go to Step 3
3	Repair an open circuit between connector M-10 terminal 2 and the ground C-16. Is the action complete?	—	Go to Step 2	—
4	Turn the starter switch on. Is the battery voltage applied between harness side connector M-10 terminal 1 and the ground?	Approx. 12V	Go to Step 6	Go to Step 5
5	Repair an open circuit between the fuse C-11 and connector M-10 terminal 1. Is the action complete?	—	Go to Step 4	—
6	Disconnect the meter connector I-2. Is there continuity between harness side connector I-2 terminal 12 and harness side connector M-10 terminal 3?	—	Go to Step 8	Go to Step 7
7	Repair an open circuit between connector I-2 terminal 12 and connector M-10 terminal 3. Is the action complete?	—	Verify repair	—
8	1. Disconnect the meter connector I-1. 2. Connector a resistance of 1.3 to 5K ohm (1.4W or more) between harness side connector I-1 terminal 12 and harness side connector I-2 terminal 12. 3. Install a speedometer tester. 4. Check the waveform at the time when the vehicle speed is 60 Km/h with a oscilloscope. NOTE: Normal waveform shows between approx. 12V and 2V and its cycle is 23.6msec Is the waveform normal?	—	Replace the meter assembly	Replace the vehicle speed sensor

Speedometer Does Not Function (Odometer is Normal)

Step	Action	Value(s)	Yes	No
1	Replace the meter assembly. Is the action complete?	—	Verify repair	—

Odometer Does Not Function (Speedometer is Normal)

Step	Action	Value(s)	Yes	No
1	Replace the meter assembly. Is the action complete?	—	Verify repair	—

8D-220 WIRING SYSTEM**Speedometer Pointer Fluctuates (May be Wide Fluctuation)**

Step	Action	Value(s)	Yes	No
1	NOTE: Refer to the step 8 of diagnosis procedure for Speedometer and Odometer Does Not Function in this section. Is the vehicle speed sensor signal normal?	—	Replace the meter assembly	Go to step 2
2	Repair a poor connections of the connectors or a failure in the circuit between connector 1-2 terminal 12 and connector M-10 terminal 3. Is the action complete?	—	Verify repair	—

Speedometer Pointer Jumps Erratically

Step	Action	Value(s)	Yes	No
1	NOTE: Refer to the step 8 of diagnosis procedure for Speedometer and Odometer Does Not Function in this section. Is the vehicle speed sensor signal normal?	—	Replace the meter assembly	Go to step 2
2	Repair a poor connections of the connectors or a failure in the circuit between connector 1-2 terminal 12 and connector M-10 terminal 3. Is the action complete?	—	Verify repair	—

Tachometer Does Not Function

Step	Action	Value(s)	Yes	No
1	1. Disconnect the meter connector I-2. 2. Check the waveform of terminal 6 when the engine revolution is 3000 rpm with a oscilloscope. NOTE: Normal waveform shows between 4.3V and 0.4V and its cycle is 6.7m sec. Is the waveform normal?	—	Replace the meter assembly	Go to step 2
2	Is the circuit between connector I-2 terminal 6 and the PCM connector C-2 terminal C10 normal?	—	Replace the PCM	Repair the circuit

Tachometer Pointer Fluctuates (May Be Wide Fluctuation)

Step	Action	Value(s)	Yes	No
1	NOTE: Refer to the step 1 of diagnosis procedure for Tachometer Does Not Function in this section. Is the waveform normal?	—	Replace the meter assembly	Go to step 2
2	Is the circuit between connector I-2 terminal 6 and the PCM connector C-2 terminal C-10 normal?	—	Replace the PCM	Repair the circuit

Tachometer Pointer Jumps Erratically

Step	Action	Value(s)	Yes	No
1	NOTE: Refer to the step 1 of diagnosis procedure for Tachometer Does Not Function in this section. Is the waveform normal?	—	Replace the meter assembly	Go to step 2
2	Is the circuit between connector I-2 terminal 6 and the PCM connector C-2 terminal C-10 normal?	—	Replace the PCM	Repair the circuit

Engine Coolant Temperature (ECT) Gauge Pointer Does Not Move

Step	Action	Value(s)	Yes	No
1	Is the engine coolant temperature (ECT) unit connector E-19 connected securely?	—	Go to step 2	Connect it securely
2	1. Disconnect the ECT unit connector E-19. 2. Connect a 3.4W bulb between harness side connector E-19 terminal 1 and the ECT unit ground. 3. Turn the starter switch on. Does the ECT gauge pointer move about 10 seconds after that?	—	Replace the ECT unit	Go to step 3
3	Is there continuity between harness side connector I-1 terminal 7 and connector E-19 terminal 1?	—	Replace the meter assembly	Repair the circuit

Engine Coolant Temperature (ECT) Gauge Reading is Too Low

Step	Action	Value(s)	Yes	No
1	1. Disconnect the ECT unit connector E-19. 2. Turn the starter switch on. 3. Connect harness side connector E-19 terminal 1 with the ground. Does the indication of the ECT gauge vary?	—	Replace the ECT unit	Go to step 2
2	1. Disconnect the meter connector I-1. 2. Connect meter side connector I-1 terminal 7 with the ground. Does the indication of the ECT gauge vary?	—	Go to step 3	Replace the meter assembly
3	Repair an open circuit between connector I-1 terminal 7 and connector E-19 terminal 1. Is the action complete?	—	Verify repair	—

8D-222 WIRING SYSTEM
Engine Coolant Temperature (ECT) Gauge Pointer Overshoots (or Goes Up To the “H” Range)

Step	Action	Value(s)	Yes	No
1	1. Disconnect the ECT unit connector E-19. 2. Turn the starter switch on. 3. Connect harness side connector E-19 terminal 1 with the ground. Does the indication of the ECT gauge vary?	—	Replace the ECT unit	Go to step 2
2	Disconnect the meter connector I-1. Does the indication of the ECT gauge vary?	—	Go to step 3	Replace the meter assembly
3	Repair an open circuit between connector I-1 terminal 7 and connector E-19 terminal 1. Is the action complete?	—	Verify repair	—

Fuel Gauge Needle Does Not Move

Step	Action	Value(s)	Yes	No
1	Is B-8 grounded securely?	—	Go to step 2	Ground it securely
2	Disconnect the fuel tank unit connector F-1. Is there continuity between the harness side connector F-1 terminal 2 and the ground?	—	Go to step 4	Go to step 3
3	Repair an open circuit between connector F-1 terminal 2 and the ground B-8. Is the action complete?	—	Verify repair	—
4	1. Connect a 3.4W bulb between the harness side connector F-1 terminal 3 and the ground. 2. Turn the starter switch on. Does the fuel gauge needle fluctuate after about 90 seconds?	—	Replace the fuel tank unit	Go to step 5
5	Disconnect the meter connector I-2. Is there continuity between the harness side connector I-2 terminal 14 and connector F-1 terminal 3?	—	Replace the meter assembly	Go to step 6
6	Repair an open circuit between the meter assembly and the fuel tank unit. Is the action complete?	—	Verify repair	—

Even the Tank is Filled Up With Fuel, The Needle Does Not Reach “F”

Step	Action	Value(s)	Yes	No
1	Disconnect and connect the fuel tank unit connector F-1 several times. Does the indication of the fuel gauge vary?	—	Go to step 2	Go to step 3
2	Repair a poor connection of the fuel tank unit connector F-1. Is the action complete?	—	Verify repair	—
3	1. Disconnect the fuel tank unit connector F-1. 2. Connect the harness side connector F-1 terminal 2 and 3 with a lead wire. 3. Turn the starter switch on. Does the fuel gauge needle overshoot to “F” after about 5 minutes?	—	Repair or replace the fuel tank unit	Replace the meter assembly

Even When The Tank Is Not Filled With Fuel, The Needle Overshoots To “F”

Step	Action	Value(s)	Yes	No
1	1. Disconnect the fuel tank unit connector F-1. 2. Turn the starter switch on. Does the needle point to “E”?	—	Replace the fuel tank unit	Go to step 2
2	Is there a short circuit between the meter connector I-2 terminal 14 and the fuel tank unit connector F-1 terminal 3?	—	Repair a short circuit	Replace the meter assembly

A/T Shift Indicator

General Description

The circuit consists of the starter switch, mode switch, alarm & relay control unit and A/T shift indicator (meter).

Heater and Air Conditioning

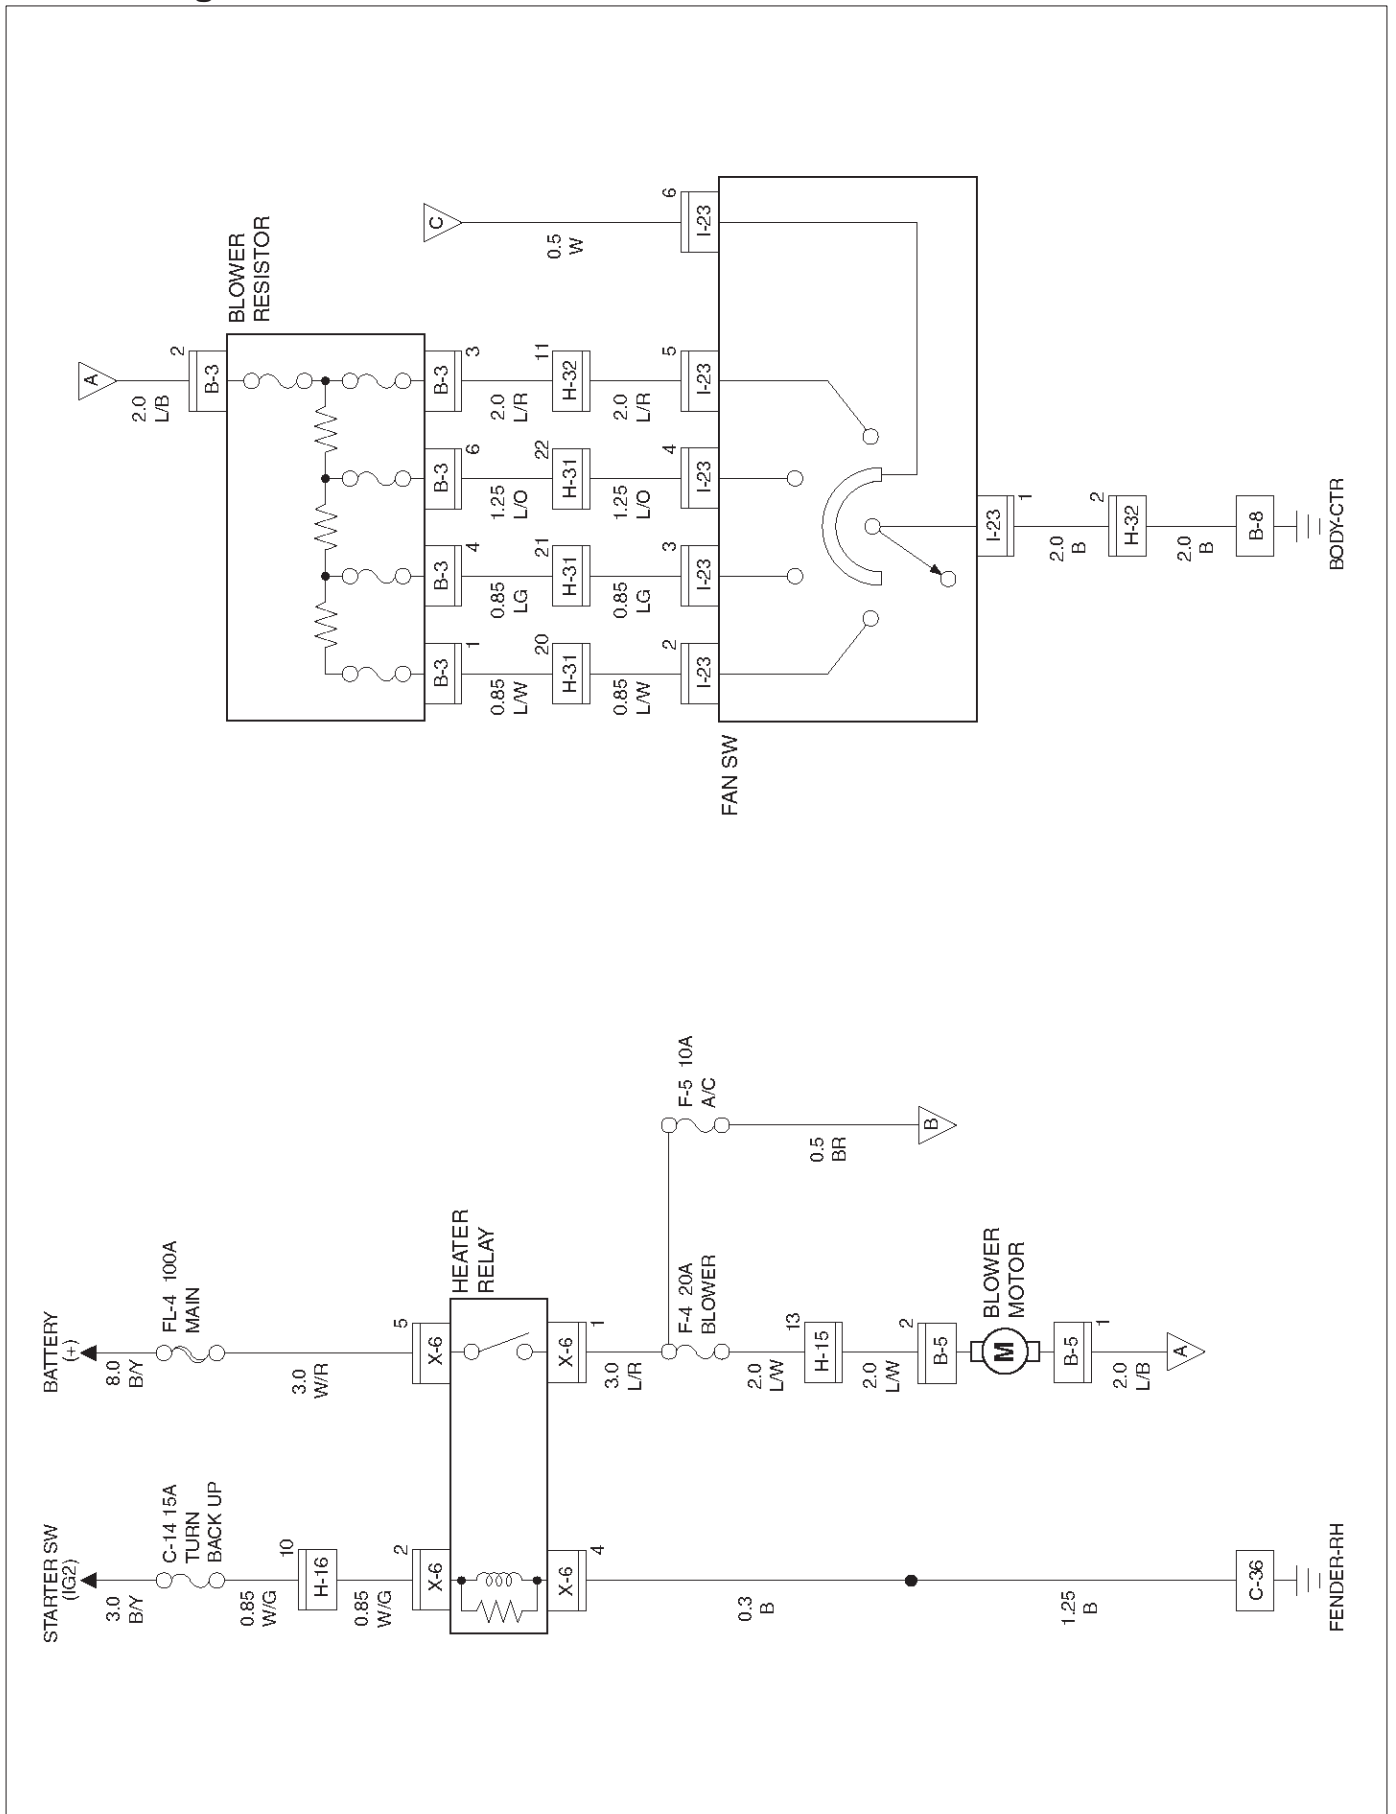

General Description

The heater and air conditioning system consists of pressure switch, A/C switch, electronic thermostat, blower motor, fan switch, magnetic clutch for A/C compressor, blower resistor, relays and PCM (or ECM). Basically the air conditioning system works while the A/C switch and the fan switch are turned on, and stops working when the pressure switch turns off or the electronic thermostat cuts off the circuit.

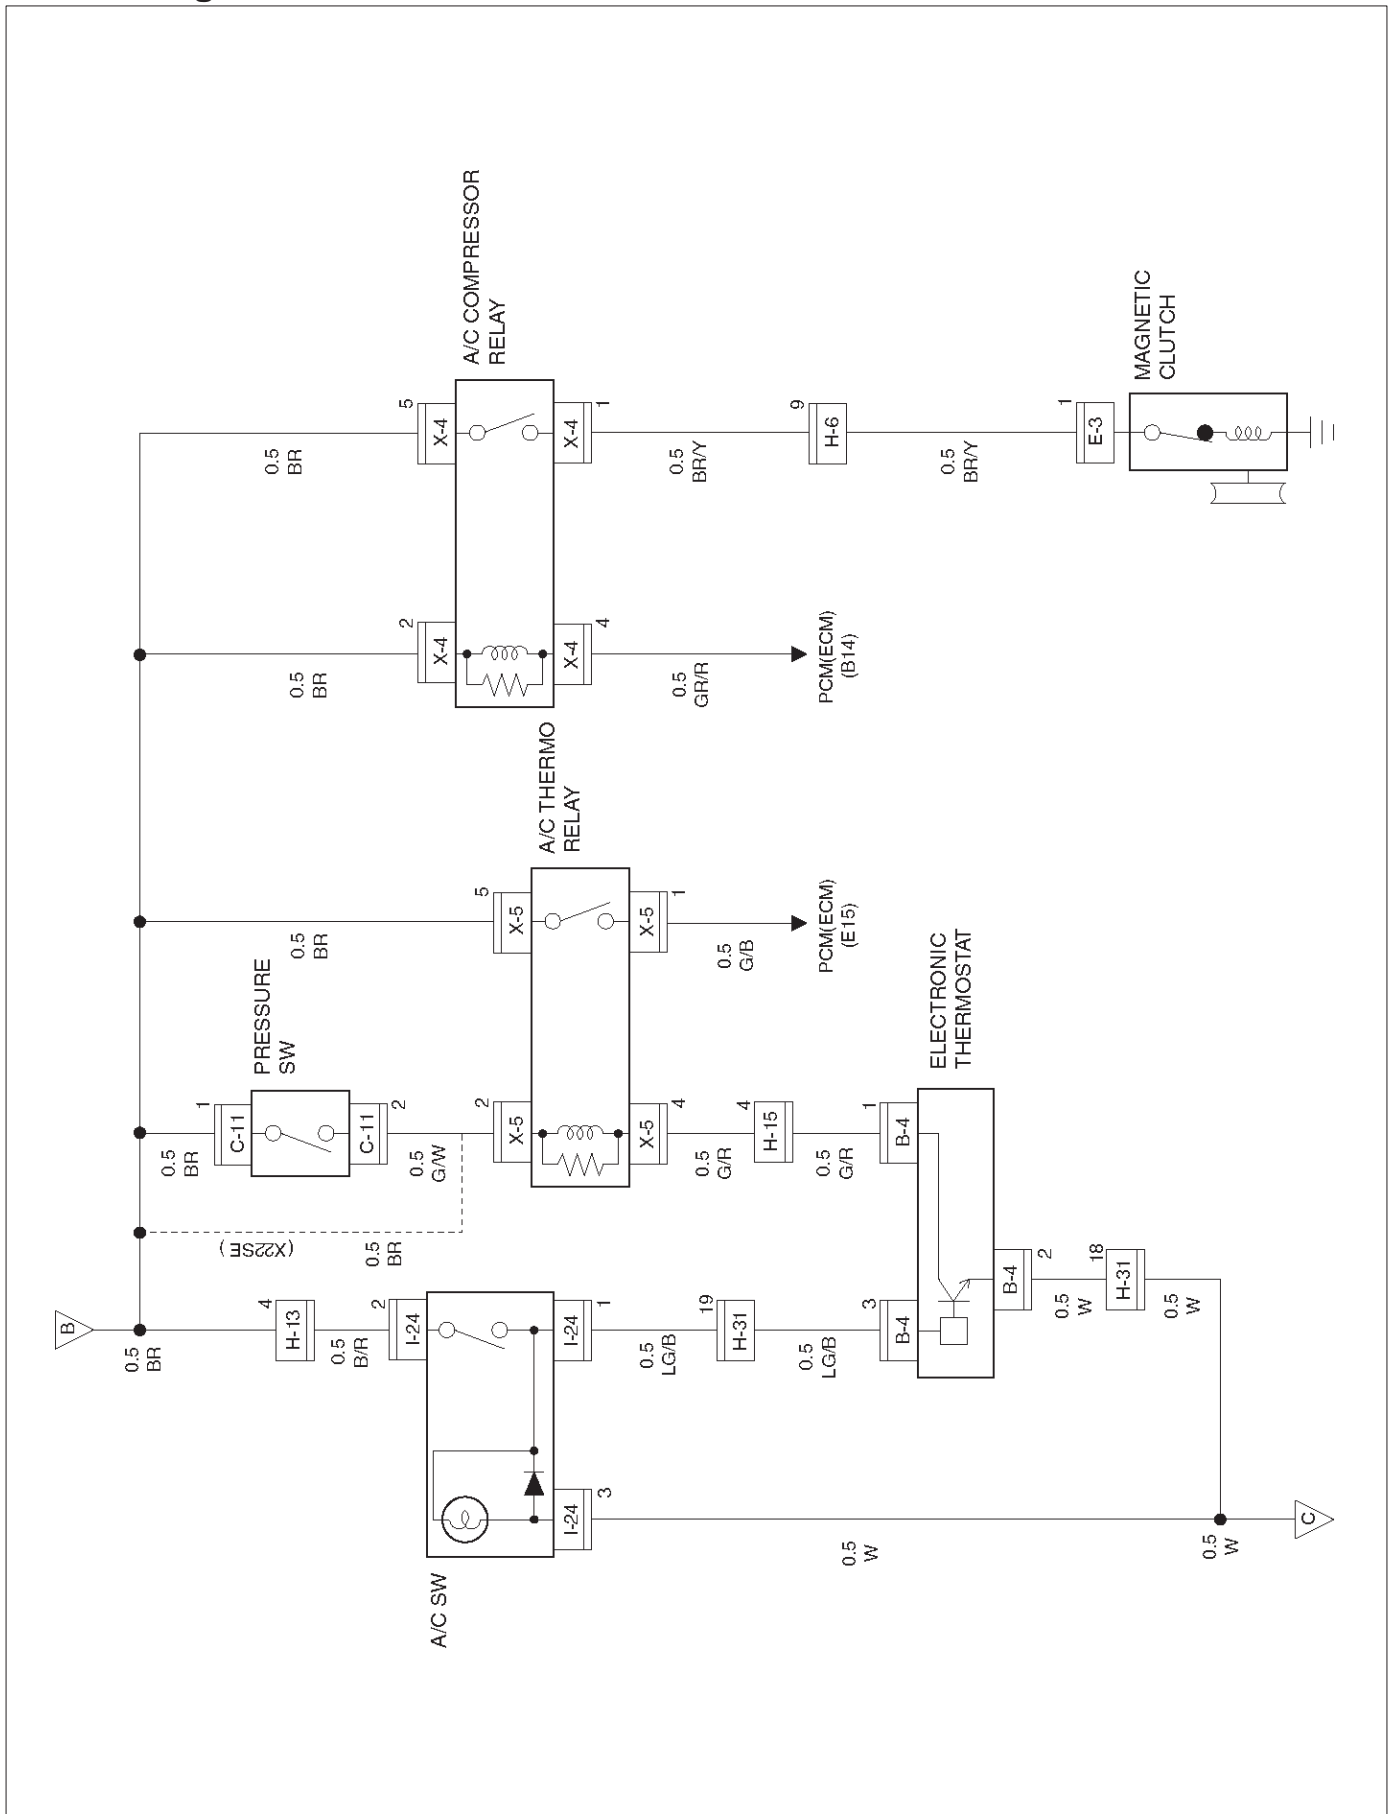

The PCM (or the ECM) also stops working of the air conditioning system to reduce the engine load.

Refer to Heating and Ventilation System, and Air Conditioning System in HVAC System.

Heater and Air Conditioning

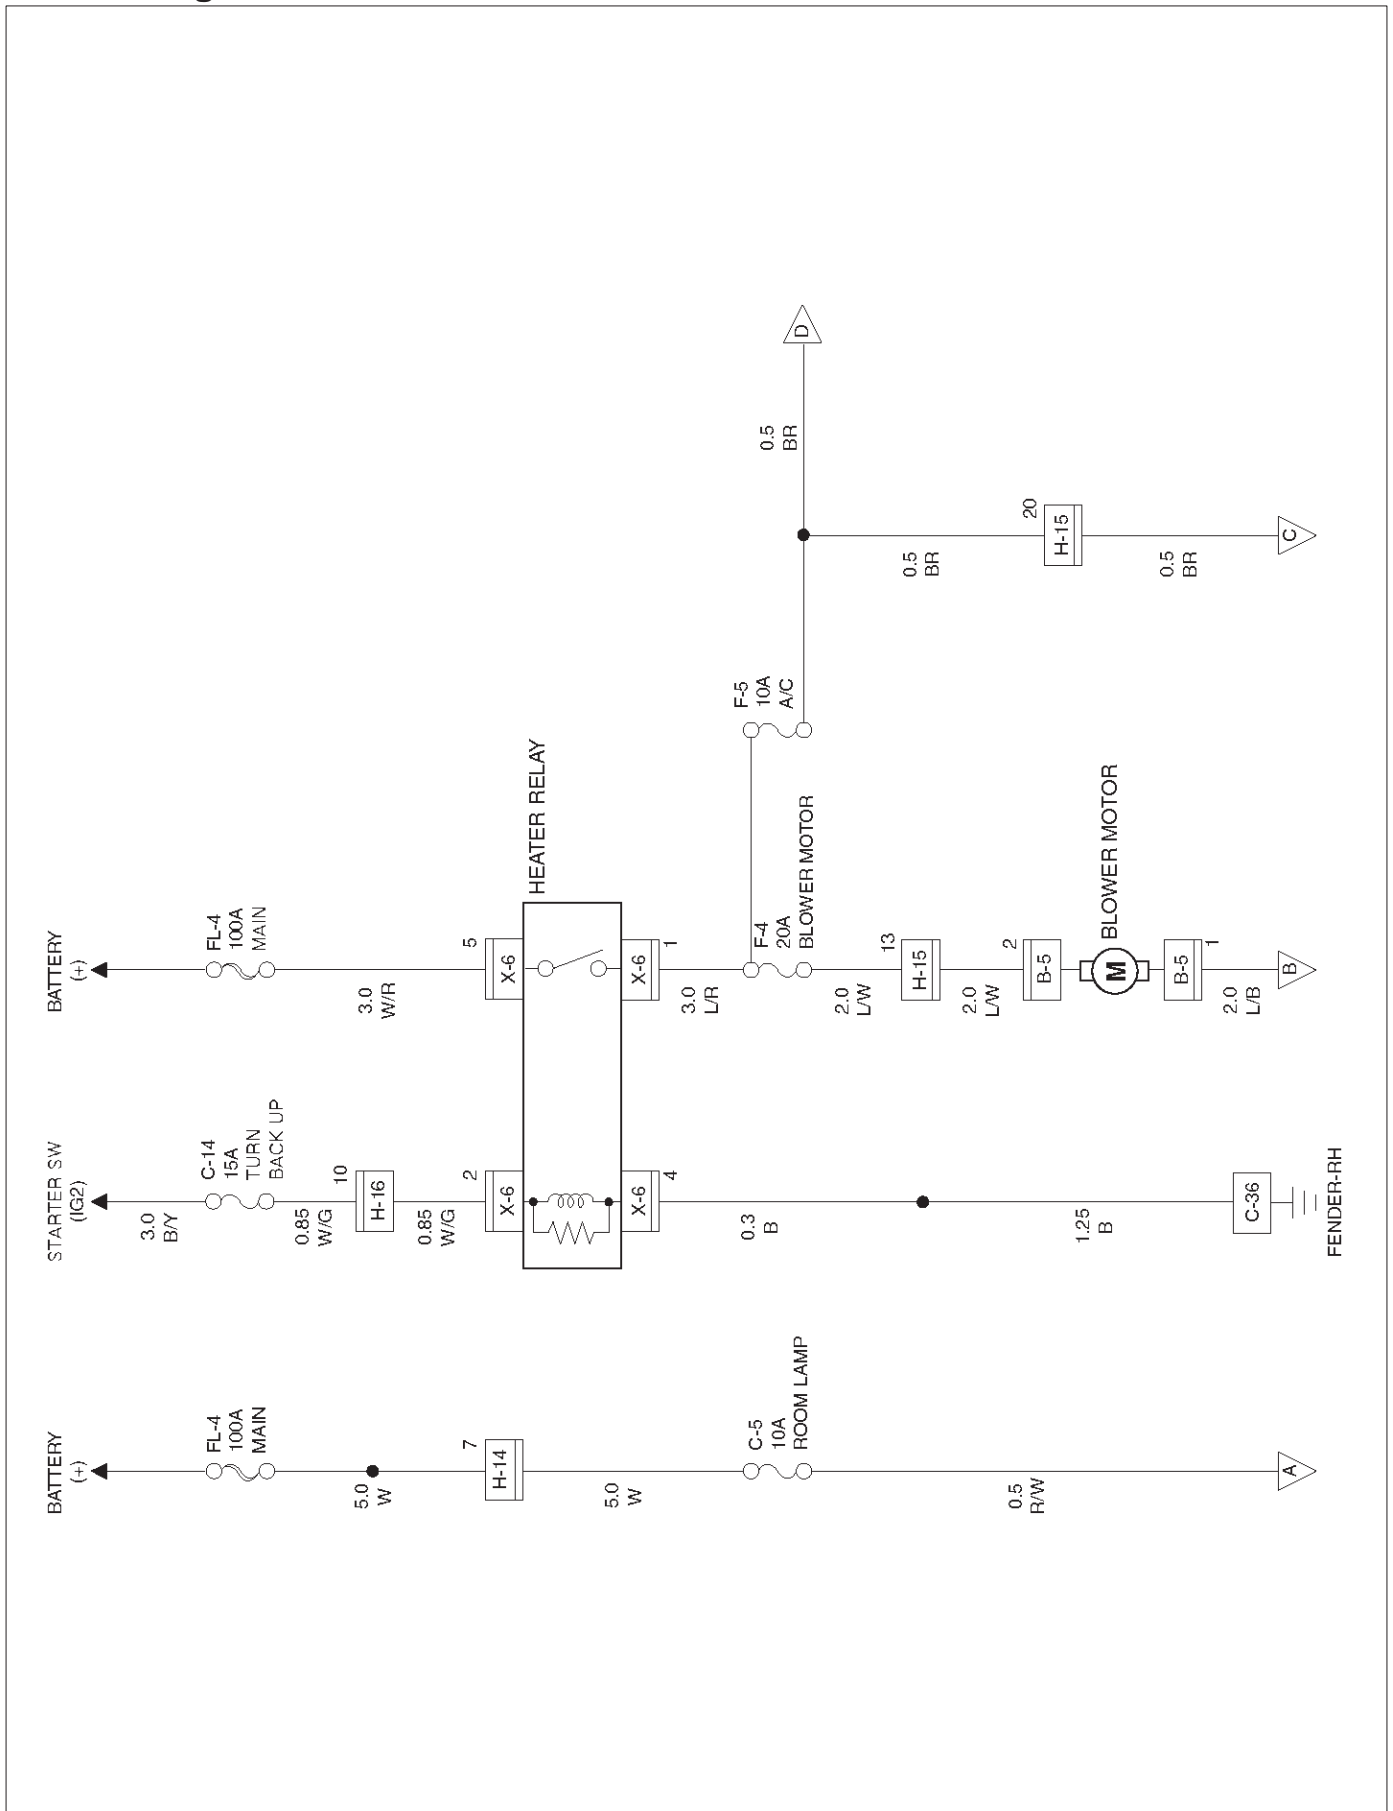

General Description

Using the signals from a variety of sensors, the full automatic heater and air conditioning system accurately senses outside air temperature, solar radiation quantity, evaporator's blowing temperature, heater core water temperature and interior temperature. These signals enable the control unit to automatically control blow temperature and air blow quantity, turn on or off the compressor and switch the blow port as well as switching between the fresh air intake and interior air circulation. Resetting the automatic function allows the system to switch to the manual control mode.

The self-diagnosis function of the control unit allows the unit to access and diagnose failed parts easier and quicker.

Refer to Air Conditioning System in HVAC System.

Sunroof

General Description

The circuit consists of the starter switch, sunroof switch, sunroof control unit, limit switch, and sunroof motor.

When the sunroof switch is turned on, the battery voltage is applied to the sunroof control unit through the circuit breaker and the power window relay on the circuit. Accordingly, when the sunroof switch is set to "Open" or "Close" position, the open or close relay incorporated into the control unit is activated to change the rotational direction of the sunroof motor to open or close the sunroof.

Also, the operational process (full close → limit stop → full open → safety stop → full close) of the sunroof is controlled by the control unit in accordance with signals received from the sunroof switch and limit switch.

Circuit Diagram-1

Diagnosis

Sunroof Inoperative

Step	Action	Value(s)	Yes	No
1	1. Disconnect the sunroof connector L-1. 2. Turn the starter switch on. Is the battery voltage applied between the harness side connector L-1 terminal 1 and the ground?	Approx. 12V	Go to Step 3	Go to Step 2
2	Repair an open circuit between the power window relay and the sunroof control unit. Is the action complete?	—	Verify repair	—
3	Replace the sunroof control unit. Is the action complete?	—	Verify repair	—

Safety Stop Mechanism Inoperative

Step	Action	Value(s)	Yes	No
1	Replace the sunroof control unit. Is the action complete?	—	Verify repair	—

Supplemental Restraint System (SRS) – Air Bag

General Description

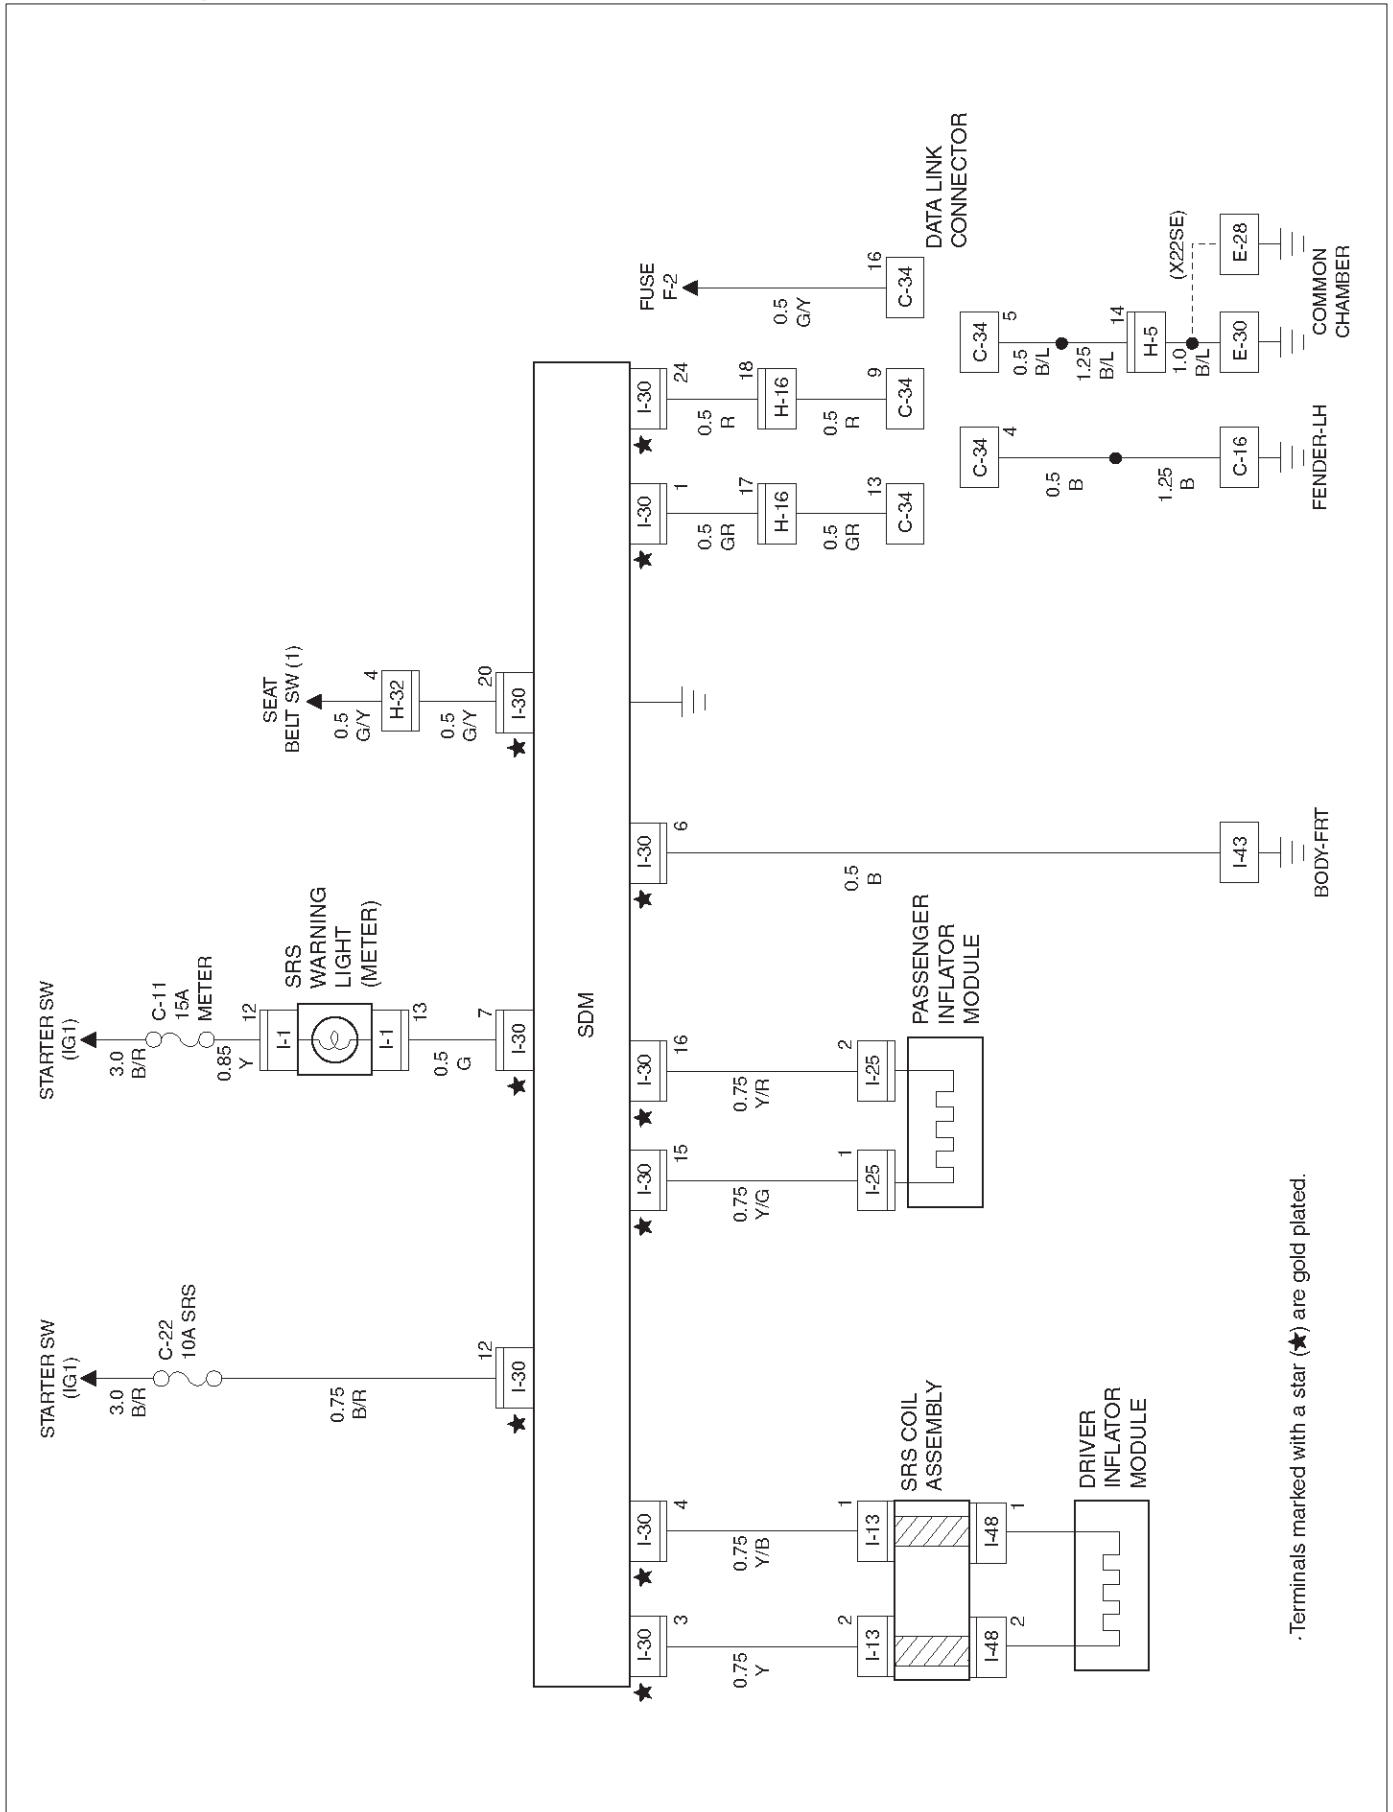

The circuit consists of Sensing and Diagnostic Module (SDM), driver's air bag assembly, SRS coil assembly, passenger's air bag assembly, and "AIR BAG" warning light. SDM, SRS coil assembly (driver side only), driver air bag assembly, passenger air bag assembly and connector wire make up the deployment loops. The function of the deployment loops is to supply current through air bag assembly, which will cause deployment of the air bags in the event of a frontal crash of sufficient force, up to 30 degrees off the center line of the vehicle. The air bag assemblies are only supplied enough current to deploy when the SDM detects vehicle velocity changes severe enough to warrant deployment.

The SDM contains a sensing device which converts vehicle velocity changes to an electrical signal.

The electrical signal generated is processed by the SDM and then compared to a value stored in memory. When the generated signal exceeds the stored value, the SDM will cause current to flow through the air bag assembly deploying the air bags.

Refer to Supplemental Restraint System (SRS) and Restraint Control System in Restraints.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Meter Assembly

General Description

The meter assembly has the speedometer, tachometer, engine coolant temperature gauge, fuel gauge and warning/indicator lights. These gauges and warning/indicator lights can be removed and installed from the back side of meter assembly.

Removal

1. Disconnect the battery ground cable.
2. Remove the Dash Side Trim Panel –RH (3).
3. Remove the lower cover Assembly(2).
 - Refer to the Instrument Panel Assembly in Body Structure section.
4. Remove the meter cluster Assembly(1).
 - Refer to the Instrument Panel Assembly in Body Structure section.

5. Remove four fixing screws and disconnect the meter connectors to remove the meter assembly(4).

CAUTION: The removed meter assembly should be placed upright or with its face side up.

Installation

To install, follow the removal steps in the reverse order.

Warning Light Bulb, Indicator Light Bulb, Illumination Light Bulb, A/T Shift Indicator Light Bulb

Removal

1. Disconnect the battery ground cable.
2. Remove the meter assembly(1).
 - Refer to the Meter Assembly removal steps in Meter and Gauge section.
3. Hold the bulb socket by hand and rotate it counterclockwise to remove the socket & bulb(2) from the meter body.

Installation

To install, follow the removal steps in the reverse order.

Vehicle Speed Sensor

Removal

1. Disconnect the battery ground cable.
2. Disconnect the connector, remove the vehicle speed sensor (1) by rotating it.

220RX003

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Tighten the vehicle speed sensor to the specified torque.

Torque: 27 N·m (2.8 kg·m/20 lbf·ft)

Fuel Tank Unit

Removal

1. Disconnect the battery ground cable.
2. Remove the fuel tank(1).
 - Refer to the Fuel Tank in Engine Fuel section
3. Disconnect the connectors, remove five screws and then remove the fuel tank unit(2).

825RW060

Installation

To install, follow the removal steps in the reverse order.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fasteners. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Frame

General Description

Proper frame alignment is important to assure normal vehicle life and performance of many other parts of the vehicle. If the vehicle has been involved in a fire, collision or has been overloaded, it is necessary to check the frame alignment.

Frame Dimensions (LWB)

8F-4 BODY STRUCTURE

Frame Dimensions (SWB)

General Description (Bumper)

Front and rear bumpers consist of bumper fascia, support, and reinforcement.

The absorbing capability for both front and rear bumper systems are achieved through reinforcements in each bumper.

Front Bumper

Parts Location

Legend

- (1) Backbar
- (2) Front Bumper Reinforcement Assembly
- (3) Support Assembly
- (4) Front Bumper Slider
- (5) Bumper Fascia
- (6) Front Bumper Assembly

Removal

1. Disconnect the battery ground cable.
2. Disconnect front fog light connector (With fog light).
3. Remove the front bumper fixing bolts.
 - Remove the two bolts from both sides of the front bumper.

601RW004

4. Remove the front bumper assembly.
5. Remove the support assembly.
 - Remove the three fixing bolts.
6. Remove the front bumper reinforcement assembly.
 - Remove the eleven fixing bolts.
7. Remove the three bolts at each backbar and remove backbars.
8. Remove the front fog light assembly (With fog light).
9. Remove the front bumper slider(1).
 - Remove the two screws(4) and the two nuts(3), and release the claw from the washer(2).

601RW018

Installation

To install, follow the removal steps in reverse order noting the following points:

1. Tighten the front bumper assembly fixing bolts to the specified torque.

Torque : 147 N·m (15 kg·m/108 lb ft)

2. Front bumper adjustment

- When the bolts fixing front bumper assembly are tightened, adjustment should be made between the back bar and front side bumper so that a clearance of 14.5 mm (0.57 in) is provided between the lower side of the fender and the upper side of the front bumper.

614RX002

Front Bumper Slider Bracket

Removal

1. Disconnect the battery ground cable.
2. Remove the front bumper.
 - Refer to Front Bumper in this section.
3. Remove the three nuts(1) and draw out the slider bracket(2).

601RW017

Installation

To install, follow the removal steps in reverse order.

Rear Bumper

Parts Location

Legend

- | | |
|--|-----------------------------------|
| (1) Protector | (10) License Plate Light Assembly |
| (2) Rear Mud Flap | (11) Rear License Plate Extension |
| (3) Bumper Bracket | (12) Reflector Assembly |
| (4) Rear Bumper Support | (13) Rear Bumper Assembly |
| (5) Rear Bumper Slider Bracket | (14) Rear Center Bumper |
| (6) Rear Corner Bumper | (15) Rear Bumper Fixing Bolt |
| (7) Backbar | (16) License Plate Light Harness |
| (8) Rear Bumper Reinforcement Assembly | |
| (9) Rear License Plate Bracket | |

Removal

1. Disconnect the battery ground cable.
2. Remove the rear mud flaps.
 - Remove the four bolts.
3. Remove the protectors.
 - Remove the three clips.
4. Remove the spare tire.
5. Remove the bumper brackets.
 - Remove the two nuts.
6. Remove the rear bumper supports.
 - Remove the nut and bolt.
7. Remove the rear bumper assembly(1).
 - Remove the two bolts(2) from each side.
 - Disconnect the license plate light harness connector.

690RW015

8. Remove the license plate light assembly and license plate harness.
9. Remove the rear license plate extension and bracket.
10. Remove the rear center bumper.
 - Remove the ten clips from the step part and three bolts from each upper and lower sides.
11. Remove the reflector assemblies.
12. Remove the rear corner bumpers.
 - Remove the three bolts from each rear corner bumper.
13. Remove the rear bumper slider brackets(1).
 - Remove the two screws(4) and two nuts(3), and then remove claw caught in the washer(2).

690RW017

14. Remove the backbars from the rear bumper reinforcement assembly.
 - Remove the three bolts at each backbar.

Installation

To install, follow the removal steps in reverse order, noting the following points:

1. Partially tighten the rear bumper bolts(2) (3) and adjust the clearance between the body (tailgate) and the rear bumper(1). Then fully tighten the rear bumper bolts(2) (3).

Torque : 147 N·m (15.0 kg·m/108 lb ft)

690RW008

8F-10 BODY STRUCTURE

2. Rear bumper adjustment.

- When the bolts fixing rear bumper assembly are tightened, adjustment should be made with shims so that clearances shown in the figure below are provided between the body (tailgate) (4) and the rear bumper(5).

3. Tighten the spare tire fixing bolts to the specified torque.

Torque : 118 N·m (12.0 kg·m/87 lb ft)

Rear Bumper Slider

Removal

- Remove the Rear bumper.
 - Refer to Rear bumper removal (in this section).
- Remove the rear bumper slider(1).
 - Remove the three bolts(2).

Installation

To install, follow the removal steps in reverse order, noting the following points:

- Apply chassis grease to the slider and the slider bracket moving surface.

General Description (Sheet Metal)

This section includes items of front end sheet metal that are attached by bolts, screws or clips and related accessory components.

Anticorrosion materials have been applied to the interior surfaces of some metal panels to provide rust

resistance.

When servicing these panels, areas on which this material has been disturbed, should be properly recoated with service-type anticorrosion material.

Engine Hood

Parts Location

Legend

(1) Engine Hood Assembly

(2) Windshield Washer Nozzle Tube

(3) Hood Hinge Bolt

Removal

1. Open the hood.
2. Support the hood.
3. Remove the windshield washer nozzle tube.

680R5001

4. Remove the hood hinge bolts.
 - Before removing the hinges from the engine hood, scribe a mark showing location of the hinges to facilitate installation in the original position.

610R5006

5. Remove the engine hood.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Tighten the engine hood hinge fixing bolts to the specified torque.

Torque : 10 N·m (1.0 kg·m/87 lb in)

2. Check the engine hood and fender(1).

Clearance: 4.5 mm (0.18 in)

Height (step): 0.5 mm (0.02 in)

- Adjust clearance with the hinges on the engine hood.
- Adjust height (step) with the hood rests(2).

610RW016

610RX001

610RX008

Engine Hood Lock

Parts Location

610RX010

Legend

- | | |
|-------------------------------|---------------------|
| (1) Hood Lock Control Lever | (4) Radiator Grille |
| (2) Control Cable | (5) Inner Liner |
| (3) Engine Hood Lock Assembly | |

Removal

1. Remove the hood lock control lever.
2. Remove the inner liner.
3. Remove the control cable.
 - Remove the cable fixing clips from the body panel.
4. Remove the radiator grille.
 - Refer to Radiator Grille in this section.
5. Remove the engine hood lock assembly.
 - Apply setting marks(1) to the hood lock assembly and the body prior to removal.

610RX009

Installation

To install, follow the removal steps in the reverse order noting the following points:

1. Reroute the control cable to its original position, and check and see if the lock assembly and control lever work normally.
2. Tighten the hood lock assembly fixing bolts to the specified torque.

Torque : 10 N·m (1.0 kg·m/87 lb in)

Radiator Grille

Parts Location

603RX003

Legend

- | | |
|----------------------------|------------------------------|
| (1) Radiator Grille Rubber | (3) Radiator Grille Assembly |
| (2) Screw | (4) Clip |

Removal

1. Open the hood.
2. Support the hood.
3. Remove radiator grille.
 - Raise the clips on the radiator grille and remove screw.

603RS006

4. Pull out the radiator grille rubber from fender panel front lower side.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Install the radiator grille clips remaining on the body side in the radiator grille, and then install the radiator grille on the body.

Front Fender Panel

Parts Location

Legend

- | | |
|--|--------------------------------------|
| (1) Antenna Assembly | (6) Inner Liner |
| (2) Side Turn Signal Light | (7) Front Combination Light Assembly |
| (3) Front Fender Panel | (8) Radiator Grille |
| (4) Front Wheel Arch Moulding (If so equipped) | |
| (5) Front Mud Flap | |

605RX001

Removal

1. Disconnect the battery ground cable.
2. Remove the radiator grille assembly.
 - Refer to Radiator Grille in this section.

3. Remove the front combination light assembly.
 - Remove the fixing screw and disconnect the connector.

801RW027

4. Remove the front mud flap.
5. Remove the inner liner.

647RS001

6. Remove the antenna assembly.
 - Refer to Rod Type Antenna in Entertainment section.
7. Remove the side turn signal light.
 - Refer to Side Turn Signal Light Bulb in Lighting System section.

8. Remove the front fender panel.
 - Remove the eight fixing bolts.

614RX006

9. Remove the front wheel arch moulding (If so equipped).
 - Refer to Wheel Arch Moulding in Exterior/Interior Trim section.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Tighten the front fender panel fixing bolts to the specified torque.

Torque : 7 N·m (0.7 kg·m/61 lb in)

2. Check the fender and front door(1).

Clearance: 5.0 mm (0.196 in)

Height (step): Flush

General Description (Body)

This publication contains essential removal, installation, adjustment and maintenance procedures.

Instrument Panel Assembly

Parts Location

740RX067

Legend

- | | |
|--|--------------------------------------|
| (1) Cross Beam | (11) Control Lever Assembly |
| (2) Instrument Harness Assembly | (12) Audio Sub Box |
| (3) Instrument Panel Assembly | (13) Radio Assembly |
| (4) Meter Assembly | (14) Glove Box |
| (5) Instrument Panel Center Reinforcement | (15) Passenger Lower Bracket |
| (6) Meter Cluster Assembly | (16) Glove Box Side Reinforcement |
| (7) Driver knee Bolster Assembly | (17) Instrument Upper Reinforcement |
| (8) Instrument Panel Driver Lower Cover Assembly | (18) Dash Side Trim Panel |
| (9) Lower Cluster Assembly | (19) Passenger Air Bag Cover |
| (10) Front Console Assembly | (20) Passenger Air Bag |
| | (21) Passenger Air Bag Reinforcement |

- (22) Instrument Panel Stay
- (23) Vent Duct Assembly

Removal

CAUTION: For precautions on installation or removal of SRS – air bag system, refer to Supplemental Restraint System (SRS) – AIR BAG in Restraint section.

1. Disconnect the battery ground cable.
2. Remove the lower cluster assembly.
 - Remove screw (3) and pull out the cluster at the clip positions (1).
 - Disconnect the cigarette lighter connectors (2).

470RW006

3. Remove the radio assembly and audio sub box.
 - Refer to Radio in Entertainment section.
4. Remove the front and rear consoles.
 - Refer to Consoles in Exterior/Interior Trim section.
5. Remove the dash side trim panels.
 - Remove the sill plates, then remove the trim panels.
6. Remove the glove box.
 - Remove the two fixing screws.

470RW007

7. Remove the instrument panel driver lower cover assembly.
 - Remove the engine hood opener two fixing screws and another one fixing screw. After four clips are pried, disconnect switch connector and duct.

610RW023

8. Remove the meter cluster assembly.
 - Remove the five fixing screws, two clips and switch connectors.
9. Remove the meter assembly.
 - Remove the four fixing screws and disconnect the connectors.
10. Remove the driver knee bolster assembly.
 - Remove the six fixing bolts and screw.

11. Remove the control lever assembly.
 - Refer to Control Lever Assembly and/or Control Cable in Heating, Ventilation and Air Conditioning (HVAC) section.

12. Remove the Instrument panel assembly.

CAUTION: For precautions on installation or removal of SRS – air bag system, refer to Supplemental Restraint System (SRS) – AIR BAG in Restraint section.

- Disconnect the instrument harness connectors (six connectors on the driver's side, three connectors on the passenger side and two connectors on the center side).
- Disconnect radio antenna cable plug and the ground cable fixing bolts from dash side panel.
- Remove the two fixing bolts of passenger air bag assembly and disconnect the connector.
- Remove the two fixing screws from fuse box.
- After pry the three hole cover from the surface of instrument panel, remove the three nuts.
- Remove the six bolts and one screw.

740RX070

13. Remove the passenger air bag.
 - Remove the four fixing nuts.

CAUTION: For precautions on installation or removal of SRS – air bag system, refer to Supplemental Restraint System in Restraint section.

827RW024

14. Remove the vent duct assembly.
 - Remove the five fixing screws.
15. Remove the passenger lower bracket.
 - Remove the three screws.
16. Remove the glove box side reinforcement.
17. Remove the instrument upper reinforcement.
 - Remove the nine screws.
18. Remove the instrument panel center reinforcement.
 - Remove the six screws.
19. Remove the instrument panel harness assembly (1).
 - Remove the clips.

740RX069

20. Remove the instrument panel stays.
 - Remove the two fixing nuts and two fixing bolts for each bracket.

8F-40 BODY STRUCTURE

21. Remove the cross beam.

- Remove the five fixing nuts, two fixing bolts (upper) and six fixing bolts (lower).

840RW025

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Adjust the control cable.
 - Refer to Control Lever Assembly in Heating, Ventilation and Air Conditioning (HVAC) section.

Front Door Assembly

Parts Location

630RW002

Legend

- | | |
|-----------------------------|------------------------|
| (1) Front Door Assembly | (4) Door Check Arm Pin |
| (2) Lower Hinge Bolt | (5) Upper Hinge Bolt |
| (3) Door Harness Connection | |

Removal

1. Disconnect the battery ground cable.
2. Apply a setting mark on the body side hinge.
3. Remove the door check arm pin.

630RW001

4. Remove the upper and lower hinge bolts.
- Position a wood block under the door for protection and support the door assembly with hands during removal or installation.

635RW003

5. Remove the door harness connection.
- Pull the door harness grommet out in order to disconnect the harness connection.

630RW004

6. Remove the front door assembly.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Align the door fitting to the body.
 - Check the fender and front door (1).

Clearance: 5.0 mm (0.196 in)

Height (step): Flush

- Check the front door and rear door (2).

Clearance: 6.0 mm (0.23 in)

Height (step): Flush

- Check the rear door and body (3) (4).

Clearance: 5.0 mm (0.196 in)

Height (step): Flush

Adjust clearance with door hinges.

Adjust height (step) by tapping on the fender lightly with a rubber hammer.

610RW024

2. Tighten the door hinge bolts to the specified torque.

Torque : 34 N·m (3.5 kg·m/25 lb ft)

3. Apply chassis grease to the door check arm pin and the door hinge moving surface.

Rear Door Assembly

Parts Location

Legend

- | | |
|-----------------------------|------------------------|
| (1) Rear Door Assembly | (4) Door Check Arm Pin |
| (2) Lower Hinge Bolt | (5) Upper Hinge Bolt |
| (3) Door Harness Connection | |

Removal

1. Disconnect the battery ground cable.
2. Apply a setting mark on the body side hinge.
3. Remove the door check arm pin.
4. Remove the upper and lower hinge bolts.
 - Position a wood block under the door for protection and support the door assembly with hands during removal or installation.

630RW003

650RW001

8F-44 BODY STRUCTURE

5. Remove the door harness connection.
 - Pull the door harness grommet out in order to disconnect the door harness connection.

630RW004

6. Remove the rear door assembly.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Align the door fitting to the body by referring to Front Door Assembly in this section.
2. Tighten the door hinge bolts to the specified torque.

Torque : 34 N·m (3.5 kg·m/25 lb ft)

3. Apply chassis grease to the check arm pin and the door hinge moving surface.

Front Window Regulator, Glass and Glass Run

Parts Location

635RW015

Legend

- | | |
|--------------------------|---------------------------|
| (1) Glass Run | (11) Speaker Grille |
| (2) Glass | (12) Grip Cover |
| (3) Window Regulator | (13) Inside Handle |
| (4) Waist Seal | (14) Power Window Switch |
| (5) Outside Handle | (15) Speaker Assembly |
| (6) Locking Link | (16) Tweeter |
| (7) Door Lock Assembly | (17) Door Mirror Cover |
| (8) Waterproof Sheet | (18) Door Mirror Assembly |
| (9) Door Trim Panel | |
| (10) Courtesy Light Lens | |

Removal

1. Disconnect the battery ground cable.
2. Remove the power window switch.
 - Pry out the power window switch and remove the connectors.

635RW016

3. Remove the screw while pulling the inside lever toward you and then remove the inside handle.

632RW003

4. Remove the speaker grille (1).
 - Pull out the front side of the grille.
5. Remove the speaker assembly (2).
 - Remove the four screws and disconnect the speaker harness connector (3).

890RX012

6. Remove the door mirror cover.
7. Remove the grip cover.
8. Remove the five screws (1), (3) and pull out the trim panel at the six clip positions (2).

635RW007

9. Remove the waterproof sheet.
10. Remove the two screws through the access hole and pull out the glass upward.

631RW006

11. Turn the glass inside out and pull it up from its rear side.

631RW007

12. Remove the window regulator.
 - Remove the seven fixing bolts.
 - Disconnect the window regulator motor harness connector.
13. Remove the glass run.
 - Pull the glass run (6) out from the door frame groove.

631RS007

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Check to see that the window regulator operates smoothly and the glass opens and closes properly.
2. Install the waterproof sheet with no clearance between the door panel and the waterproof sheet.

Rear Window Regulator, Glass and Glass Run

Parts Location

655RW011

Legend

- | | |
|-------------------------|--------------------------|
| (1) Glass Run | (9) Door Trim Panel |
| (2) Glass | (10) Courtesy Light Lens |
| (3) Fixed Glass | (11) Power Window Switch |
| (4) Window Regulator | (12) Inside Handle |
| (5) Outside Handle | (13) Waterproof Sheet |
| (6) Door Lock Assembly | (14) Waist Seal |
| (7) Bracket | |
| (8) Rear Corner Garnish | |

Removal

1. Disconnect the battery ground cable.
2. Remove the screw while pulling the inside lever toward you and then remove the inside handle.
3. Remove the one screw at the pull case.

655RW003

4. Remove the rear corner garnish.
5. Pull out the trim panel at the eight clip positions.
 - Disconnect the power window switch connector and courtesy light connector.

655RW002

6. Remove the power window switch.
7. Remove the bracket.
8. Remove the waterproof sheet (1).
 - Taking notice of the door harness, peel the waterproof sheet off the door panel carefully.

651RS002

9. Remove the fixed glass.
 - Remove one bolt and screw as shown in the figure, then pull it upward.

651RW002

8F-50 BODY STRUCTURE

10. Remove the glass.

- First, align the height of regulator to the access hole. Remove two screws attaching bottom channel and regulator, then remove the glass.

651RW006

- Remove the window glass by tilting it as necessary.

651RW007

11. Remove the window regulator.

- Remove the six fixing bolts and pull the regulator out from the lower hole of the door panel.
- Disconnect the connector.

651RW005

12. Remove the glass run.

- Pull the glass run out from the door frame.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Check to see that the window regulator operates smoothly and the glass opens and closes properly.
2. Install the waterproof sheet with no clearance between the door panel and the waterproof sheet.

Rear Tailgate (LWB)

Parts Location

681RW010

Legend

- (1) Hatchgate Lock Assembly
- (2) Tailgate Assembly
- (3) Tailgate Bell Crank
- (4) Hinges
- (5) Plug
- (6) Tailgate Stopper Link
- (7) Waterproof Sheet
- (8) Trim Cover Assembly
- (9) Rear Wiper Motor
- (10) Dove Tail
- (11) Key Cylinder
- (12) Tailgate Lock Assembly
- (13) Hatchgate Lock Actuator Assembly
- (14) Outside Handle
- (15) Tailgate Waist Seal

Removal

1. Disconnect the battery ground cable.
2. Remove the tailgate trim cover assembly (3).
 - Remove the two screws (2) holding the hatchgate lock assembly (1) first and the two screws fixing the trim cover assembly. Pull up the trim cover while detaching the clips from tailgate panel.

683RW001

3. Remove the tailgate trim brackets (2).
 - Remove the three fixing screws (3) and screw grommets (1).
4. Remove the waterproof sheet (4).
 - Remove the waterproof sheet, taking special care so as not to break it.

681RW014

5. Remove the hatchgate lock.
 - Disconnect the lock link and connector and remove the three fixing bolts.

6. Remove the key cylinder.
 - Disconnect the locking links.
 - Remove the key cylinder retaining clip with screwdriver to remove the key cylinder.

683RW025

7. Remove the hatchgate lock actuator assembly.
 - Disconnect the actuator harness connector.
 - Remove the two nuts holding hatchgate lock actuator assembly from inside.
8. Remove the outside handle.
 - Remove the two bolts holding the outside handle from inside.
9. Remove the tailgate lock assembly.
 - Remove the three screws holding the lock assembly.
10. Remove the dove tail.
11. Remove the tailgate locking links.
12. Remove the rear wiper arm.
 - Refer to Rear Wiper Arm/Blade in Wiper/Washer System section.
13. Remove the rear wiper motor.
14. Remove the tailgate harness cable.
15. Remove the spare tire carrier.
 - Refer to Spare Tire Carrier in this section.
16. Remove the tailgate stopper link.
17. Remove the tailgate assembly.
 - Remove the tailgate assembly, taking care so as not to damage the hinge. Tailgate assembly is heavy and removal operation require two people.
18. Remove the tailgate waist seal.

Installation

To install, follow the removal steps in the reverse order, noting the following point:

1. When setting up links, pay attention to the position and direction of the links.

683RW003

Legend

- (1) Tailgate Lock Link
- (2) Outside Handle
- (3) Key Cylinder Lock Link
- (4) Cancel Mechanism

2. Tighten the tailgate hinge fixing bolts to the specified torque.

Torque: 34 N·m (3.5 kg·m/25 lb ft)

3. Tighten the tailgate stopper link fixing bolts to the specified torque.

Torque: 34 N·m (3.5 kg·m/25 lb ft)

4. Tighten the dove tail fixing bolts to the specified torque.

Torque: 25 N·m (2.6 kg·m/19 lb ft)

Rear Tailgate (SWB)

Parts Location

681RX002

Legend

- | | |
|----------------------------------|---------------------------------------|
| (1) Tailgate Assembly | (7) Dove Tail |
| (2) Hinges | (8) Key Cylinder |
| (3) Tailgate Stopper Link | (9) Tailgate Lock Assembly |
| (4) Waterproof Sheet | (10) Outside Handle |
| (5) Tailgate Trim Cover Assembly | (11) Hatchgate Lock Actuator Assembly |
| (6) Rear Wiper Motor | |

Removal

1. Disconnect the battery ground cable.
2. Remove the spare tire carrier.
 - Refer to Spare Tire Carrier in this section.
3. Remove the rear wiper arm.
 - Refer to Rear Wiper Arm/Blade in Wiper/Washer System section.

4. Remove the tailgate glass stay and tailgate glass.
 - Refer to Tailgate Glass (SWB) in this section.
5. Remove the tailgate trim cover assembly.
 - Remove the two screws fixing the trim cover assembly and pull up the trim cover after detaching the clips from tailgate panel.
6. Remove the tailgate trim brackets (2).
 - Remove the three fixing screws (3) and screw grommets (1).
7. Remove the waterproof sheet (4).
 - Remove the waterproof sheet, taking special care so as not to break it.

681RW014

8. Remove the rear wiper motor.
 - Disconnect the motor connector and remove the two fixing bolts.
9. Remove the key cylinder.
 - Disconnect the locking links.
 - Remove the key cylinder retaining clip with screwdriver to remove the key cylinder.
10. Remove the hatchgate lock actuator assembly.
 - Disconnect the actuator harness connector.
 - Remove the two nuts holding hatchgate lock actuator assembly from inside.
11. Remove the outside handle.
 - Remove the two bolts holding the outside handle from inside.
 - Disconnect the locking link.
12. Remove the tailgate lock assembly.
 - Remove the three screws holding the lock assembly.
13. Remove the dove tail.
14. Remove the tailgate harness cable.
15. Remove the tailgate stopper link.
16. Remove the tailgate assembly.

- Remove the tailgate assembly, taking care so as not to damage the hinge. Tailgate assembly is heavy and removal operation requires two people.

Installation

To install, follow the removal steps in the reverse order, noting the following point:

1. Tighten the tailgate hinge fixing bolts to the specified torque.

Torque: 34 N·m (3.5 kg·m/25 lb ft)

2. Tighten the tailgate stopper link fixing bolts to the specified torque.

Torque: 34 N·m (3.5 kg·m/25 lb ft)

3. Tighten the dove tail fixing bolts to the specified torque.

Torque: 25 N·m (2.6 kg·m/19 lb ft)

Rear Hatchgate (LWB)

Parts Location

682RW002

Legend

- | | |
|--------------------------|------------------------------------|
| (1) High Mount Stoplight | (9) Hatchgate Glass |
| (2) Hatchgate Hinge | (10) Hatchgate Striker |
| (3) Hinge Collar | (11) Striker Fastener |
| (4) Hatchgate Glass Seal | (12) High Mount Stoplight Fastener |
| (5) Hatchgate Gas Stay | (13) Outside Handle Collar |
| (6) Hatchgate Ball Stud | (14) Outside Handle |
| (7) Ball Stud Spacer | (15) High Mount Stoplight Spacer |
| (8) Ball Stud Fastener | |

Removal

1. Disconnect the battery ground cable.
2. Disconnect the high mount stoplight and rear defogger harness connectors.
3. Remove the hatchgate ball stud (LH and RH).
 - Remove gas stay fixing screw and pull up the gas stay assembly (3) from the ball stud by spreading the retainer (2) holding the ball stud at the end of the gas stay with screwdriver (1), etc.

4. Remove the hatchgate hinge nuts from body side.
5. Remove the hatchgate glass.
 - When pulling down the hatchgate glass, exercise special care so as not to damage it. Hatchgate glass assembly is heavy and removal operation requires the two people.
6. Remove the two screws to remove hatchgate striker and fastener.
7. Remove the outside handle.
8. Remove the hinges.
9. Remove the high mount stoplight.
10. Remove the hatchgate finisher.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Attach the upper seal (1) to the hatchgate glass (2) indicated portion (3) so that the end of the glass contacts the bottom of the upper seal.

2. When installing the hatchgate glass, first attach the hinge to the hatchgate glass. Align the stud of the hinge to the hole at body while supporting the hatchgate glass with two people at indicated positions (1), and then partially tighten the hinge to body nut (2). After adjustment (refer to Adjustment in this section) is completed, fully tighten the nut, hinge to body nut.
 - Hatchgate hinge assembly for left and right sides from each other.

3. When installing gas stay assembly (1), first install the gas stay onto the rear quarter panel with fixing screw (2) and fastener (3) and then attach the gas stay upper end to the ball stud by spreading the retainer with screwdriver, etc. Gas stay assemblies for left and right sides differ from each other (The letter (4) L(LH) or R(RH) is embossed on the gas stay assembly.)

683RW005

4. When installing hatchgate striker assembly, first partially tighten the fixing screw and close the hatchgate and tailgate. Then fully tighten the fixing screw with the condition that the striker fits the hatchgate lock assembly at the tailgate. Make sure that clearance exists between hatchgate striker and lock assembly. After installation, again make sure that the striker fits the lock assembly properly.
5. Tighten the nuts; hinge to body (LH and RH)
Torque : 6 N·m (0.6 kg·m/52 lb in)
6. Tighten the screws; glass and hinge fix (LH and RH)
Torque : 6 N·m (0.6 kg·m/52 lb in)
- NOTE: When installing the hinge to the body, exercise special care not to damage the body paint surface.
7. Tighten the hatchgate striker fixing screws.
Torque : 6 N·m (0.6 kg·m/52 lb in)

Adjustment

- Hatchgate alignment is obtained by moving hatchgate hinges.

Legend

- | | |
|--------------------------|-----------------------------|
| (1) Hatchgate Striker | (6) Hatchgate Lock Assembly |
| (2) Hatchgate Glass | (7) Quarter Trim |
| (3) Tailgate Outer Panel | (8) Hatchgate Glass Seal |
| (4) Tailgate Inner Panel | (9) Quarter Outer Panel |
| (5) Trim Cover | |

Tailgate Glass (SWB)

Parts Location

682RW011

Legend

- | | |
|-----------------------------|--------------|
| (1) Tailgate Trim Cover | (8) Screw |
| (2) Tailgate Seal | (9) Collar |
| (3) Tailgate Glass Assembly | (10) Gasket |
| (4) Tailgate Moulding | (11) Clip |
| (5) Tailgate Glass Stay | (12) Grommet |
| (6) Bolt | (13) Nut |
| (7) Cap | |

Removal

1. Disconnect the battery ground cable.
 2. Remove the spare tire.
 3. Remove the rear wiper.
 4. Disconnect the rear defogger connectors (LH & RH).
- Refer to Rear Wiper Arm/Blade in Wiper/Washer System section.

5. Remove the tailgate glass stays.
 - Remove the two seats of two tailgate trim cover fixing bolts.
6. Remove the tailgate glass assembly.
 - Remove the two caps each on the left and right sides, then remove the screws.
 - Remove the two clips from the two ends of the tailgate moulding, then lift the glass assembly up and out.
 - Removing and installing the glass assembly require two persons.
7. Remove the tailgate seal.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Tighten the tailgate glass stay fixing bolts to the specified torque.

Torque : 19 N·m (2.0 kg·m/14 lb ft)

2. Make sure the lip is properly oriented when installing the tailgate seal.

Spare Tire Carrier

Parts Location

530RX005

Legend

- (1) Spare Tire
- (2) Spare Tire Carrier

Removal

1. Remove the spare tire (1).
2. Remove the spare tire carrier (2) by using spare tire carrier nut wrench 5-8840-2095-0 (J-34355).

Installation

1. Spare tire carrier.
 - Tighten the carrier fixing bolts to the specified torque.
Torque : 31 N·m (3.2 kg·m/23 lb ft)
2. Spare tire
 - Tighten the spare tire fixing bolts to the specified torque.
Torque : 118 N·m (12.0 kg·m/87 lb ft)

Windshield

Parts Location

Legend

- | | |
|-------------------------------|------------------------------|
| (1) Windshield Wiper Arm | (4) Windshield Side Moulding |
| (2) Windshield Upper Moulding | (5) Windshield Support |
| (3) Windshield | (6) Front Cowl Cover |

607RW002

Removal

1. Disconnect the battery ground cable.
2. Remove the front pillar trim cover.
 - Turn up the finisher and pry the trim cover clips free from the body panel.
3. Remove the sunvisors and sunvisor holders.
 - Refer to Headlining in Exterior/Interior Trim section.
4. Remove the rear view mirror.
 - Disconnect the connector (1).

8F-64 BODY STRUCTURE

- Turn the channel mount (2) 90 degrees clockwise and pull down.

5. Remove the windshield wiper arm.
 - Refer to Windshield Wiper Arm/Blade in Wiper/Washer System section.
6. Remove the windshield side moulding.
 - Pull the moulding out from drip rail.
7. Remove the front cowl cover.
8. Remove the windshield support.
9. Remove the upper moulding.
10. Remove the windshield.
 - Use a knife to cut through part of the adhesive caulking material.
 - Secure one end of a piece of steel piano wire (0.02 inches in diameter) to a piece of wood that can serve as a handle.
 - Use a pair of needle nose pliers to insert the other end of the piano wire through the adhesive caulking material at the edge of the windshield glass.
 - Secure the other end of the piano wire to another piece of wood.
 - With the aid of an assistant, carefully move the piano wire with a sawing motion to cut through the adhesive caulking material around the entire circumference of the windshield glass.

- Attach some cloth tape (1) on the body for protecting the painting surface.

- Clean the remaining adhesive caulking material from the area of the body which holds the windshield.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Clean the bonding surfaces of both the windshield and body panel with a soft rag and white gasoline.
2. Install the spacer.
 - Attach spacers in ten locations as shown in the figure.
 - Always use new spacer.

- 3. Install the windshield upper moulding.
 - Peel off the tear-away paper from the windshield upper moulding, and start applying it with one end of the glass and cut away the surplus at the other end of the glass for length adjustment.
 - Always use new upper moulding.
- 4. Temporary install the windshield support.
- 5. Apply the primer to the windshield and body panel.
 - Apply the primer (3) (Sun star # 435-40 or equivalent) to the windshield side bonding surface as shown in the figure.

- Apply the primer (Sun star # 435-95 or equivalent) to the body side bonding surface.

NOTE: Apply an adhesive 3 minutes or more but within 24 hours after the application of primer. If more than 24 hours have passed, reapply primer.

Primer should be handled as following:

1. Use the primer manufactured 3 months or less ago and having been kept in an refrigerator.
2. Wipe off primer-stains on positions other than requires application.
3. Stir the primer for a minute or more before use.

607RW003

Legend

- (1) Adhesive
- (2) Sealing Dam
- (3) Primer Coating Area
- (4) Windshield
- (5) Upper Moulding

6. Apply the adhesive (1) to the windshield.
- After drying primer completely, apply a sealing adhesive (Sun star # 555 or equivalent) along the edge of the glass so that the sealing adhesive has a 20 mm (0.79 in) junction at middle of the base of the glass.

NOTE: Apply an adhesive 3 minutes or more but within 24 hours after the application of primer. If more than 24 hours have passed, reapply primer.

Adhesive should be handled as follows:

1. Use the adhesive manufactured 3 months or less ago.
 2. Wipe off adhesive-stains on positions other than requires application.
7. Install the windshield.
- Set the windshield with sealing adhesive applied to entire circumference in the body panel. Specifically, adjust windshield support with the upper moulding making contact with the body panel, press the glass, and tighten the windshield support.

NOTE: Affix the glass within 5 minutes of application.

8. Install the front cowl cover.

9. Install side moulding.

- Use white gasoline and a soft cloth to wipe away any excess adhesive.
- Cure the bonding at a temperature of 20°C – 30°C (68°F – 86°F) for 24 hours.
- Check that the windshield does not leak water.

10. Install windshield wiper arm.

Rear Quarter Glass (LWB)

Parts Location

Legend

- | | |
|---------------------------------|--|
| (1) Quarter Trim Panel | (6) Clip |
| (2) Rear Quarter Glass Moulding | (7) Velcro Fastener |
| (3) Rear Quarter Glass | (8) Primer Coating Area (Glass side & Body side) |
| (4) Clip | (9) Sealant |
| (5) Body Panel | |

Removal

1. Disconnect the battery ground cable.
2. Remove the rear quarter trim panel.
 - Refer to Interior Trim Panels in Exterior/Interior Trim section.
3. Remove the rear quarter glass.
 - Refer to Windshield in this section.

Installation

1. Rear quarter glass.

- Clean the bonding surfaces of both the glass and the body panel.
- Be absolutely sure to apply glass primer to the side glass.
- Be absolutely sure to apply body primer fully to the body.

NOTE: Immediately wipe off the primer left on the body or extruded sealant.

- Attach the fastener to the indicated position of body with sealant as shown in the figure.
- Apply the sealant to the circumference of glass as shown in the figure.
- Insert the location pins on glass into the panel, push the glass against the panel, and bond them.
- Attach the moulding to the body with sealant.
- Cure the bonding at a temperature of 20°C – 30°C (68°F – 86°F) for 24 hours.
- Check that the rear quarter glass does not leak water.

2. Install the rear quarter trim panel.

Rear Quarter Glass (SWB)

Parts Location

641RW011

Legend

| (1) Resin Top | (5) Adhesive |
| (2) Velcro Fastener | (6) Body Panel |
| (3) Rear Quarter Glass Assembly | (7) Weather Strip |
| (4) Dam Seal | (8) Clip |

Removal

1. Disconnect the battery ground cable.
2. Remove the rear quarter glass assembly.
 - Refer to Windshield in this section.

Installation

1. Use alcohol or the like to wipe clean the areas of the resin top and glass assembly that are to be affixed to each other.
2. Apply the primer (2) to the area of the resin top to which the glass is to be affixed.
 - Top edge (1) and bottom edge (3) primer coat areas.

641RX002

8F-70 BODY STRUCTURE

3. Stick the velcro fasteners to the body in the specified locations.
4. Install the rear quarter glass assembly (1).
 - Apply the primer (4) to the rear quarter glass as shown in the figure.
 - Stick the dam seal (2) in place and then apply adhesive (3), as shown in the figure.
 - Allow a 20mm (0.79 in) overlap at the ends of the adhesive.
 - Insert the glass clips into the hole in the panel and then push the glass against the panel to affix it in place.

Side Window Glass (SWB)

Parts Location

Legend

- | | |
|---------------------------------------|---------------------------------------|
| (1) Spacer | (6) Side Window Glass |
| (2) Primer Coating Area on Glass Side | (7) Velcro Fastener |
| (3) Side Window Moulding | (8) Side Window Garnish Assembly |
| (4) Adhesive | (9) Body Panel |
| (5) Clip | (10) Primer Coating Area on Body Side |

Removal

- Remove the quarter trim cover.
 - Refer to Interior Trim Panels (SWB) in Exterior/Interior Trim section.
- Remove the side window garnish assembly.
 - Pull out the three clips to disengage them.
- Remove the side window moulding.
- Remove the side window glass.
 - Refer to Windshield in this section.

Installation

- Install the side window glass.
 - Clean the areas of the glass and body panel that

are to be affixed to each other.

- Apply the primer to the specified areas of the glass and body panel.
 - Stick the spacer and velcro fastener in place in the specified locations.
 - Apply the adhesive to the entire circumference of the glass, as shown in the figure.
 - Insert the glass clips into the panel and then push the glass against the panel to affix it in place.
 - Wipe away any adhesive that oozes out around the edges.
- Install the side window garnish assembly.
 - Install it securely so that it does not come loose in places.

8F-72 BODY STRUCTURE

3. Install the side window moulding.
 - Insert it securely so that it does not come loose in places.
 - Make sure that there is no water leakage from the side window glass.
4. Install the quarter trim cover.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Front Seat Assembly

Front Seat Assembly and Associated Parts

750RX011

Legend

- | | |
|------------------------|-------------------------------------|
| (1) Headrest | (7) Rear Cover |
| (2) Guide Holder | (8) Seat Adjuster |
| (3) Seat Back Assembly | (9) Front Seat Belt Buckle Assembly |
| (4) Reclining Device | (10) Hinge Cover |
| (5) Side Cover | (11) Front Seat Assembly |
| (6) Reclining Knob | |

Removal

1. Disconnect the battery ground cable.
2. Remove the rear covers.
 3. Remove the front seat assembly.
 - Remove the four fixing bolts.
 - Disconnect the seat belt warning connector (Driver's side only).

4. Pull out the reclining knob.
5. Remove the side cover.
 - Remove the two screws.
6. Remove the headrest.
7. Remove the reclining device.
 - Turn up the seat back trim cover in order to remove the reclining device fixing bolts (LWB).

750RS006

- Remove the push nut (2) of device (1) and disconnect the walk-in cable (3) (SWB).

750RW034

8. Remove the seat back assembly.
 - Remove the seat back assembly fixing nut on the opposite side of the reclining device.

750RS007

9. Remove the trim cover (Seat back side).
10. Remove the guide holder.
 - Pull the guide holder out by holding the bottom end of it from the seat back assembly.
11. Remove the seat adjuster.
 - Disconnect the release wire (4) and remove the fixing bolts.

750RW006

12. Remove the seat belt buckle assembly.
13. Remove the trim cover (Seat cushion side).

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Tighten the reclining device fixing bolts to the specified torque.

Torque: 46 N·m (4.7 kg-m/34 lbft)

2. Tighten the front seat assembly fixing bolts to the specified torque.

Torque: 39 N·m (4.0 kg-m/29 lbft)

Rear Seat Assembly (LWB)

Rear Seat Cushion Assembly and Associated Parts

| (2) Rear Seat Lock Assembly | (6) Seat Cushion Fixing Bolt |
| (3) Rear Seat Belt Buckle Assembly | (7) Rear Seat Cushion Assembly |
| (4) Seat Cushion Hinge | |

Removal

4. Remove the seat cushion hinges.

1. Remove the hinge covers.
2. Remove the seat cushion fixing bolts.
3. Remove the seat cushion assembly.
 - Pull on the strap of the rear seat lock assembly to release the seat lock.

8G-6 SEATS

5. Remove the rear cushion trim cover (1) and rear seat cushion pad (2).
 - Remove cushion trim cover from rear cushion frame (3) with prying the plastic retainers (4).

755RX028

6. Remove the rear seat lock assembly and rear seat belt buckle assembly.
7. Remove the rear seat lock strikers.
 - Remove the four bolts at each striker.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Tighten the rear seat lock assembly and rear seat belt buckle assembly fixing bolts to the specified torque.

Torque: 39 N·m (4.0 kg·m/29 lbft)

2. Tighten the rear seat lock striker fixing bolts to the specified torque.

Torque: 39 N·m (4.0 kg·m/29 lbft)

3. Tighten the seat cushion hinge fixing bolts to the specified torque.

Torque: 39 N·m (4.0 kg·m/29 lbft)

Rear Seat Back Assembly and Associated Parts

| (1) Headrest | (5) Seat Lock Cover |
| (2) Seat Back Assembly | (6) Side Hinge |
| (3) Guide Holder | (7) Body Floor Panel |
| (4) Release Knob | (8) Center Hinge |

Removal

1. Pull on the release knob and fold the seat back assembly forward.
2. Remove the luggage floor carpets.
 - Remove the carpet fixing nine clips at each from the backside of the seat back assembly.
3. Remove the seat back assembly.
 - Remove the four fixing bolts at each seat back.
4. Remove the seat lock covers.
5. Remove the headrests.
6. Remove the release knobs.
 - Turn the knob counterclockwise to remove it.
7. Remove the trim covers.
8. Remove the guide holders.
9. Remove the side hinges.
 - Remove the one fixing nut at each side hinge.

10. Remove the center hinge.
 - Remove the two fixing bolts.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Tighten the center hinge fixing bolts to the specified torque.

Torque: 39 N-m (4.0 kg-m/29 lb ft)

2. Tighten the side hinge fixing nuts to the specified torque.

Torque: 29 N-m (3.0 kg-m/22 lb ft)

Rear Seat Assembly (SWB)

Rear Seat Assembly and Associated Parts

755RW067-1

Legend

- | | |
|------------------------------------|---------------------------------|

| (6) Seat Lock Assembly | (14) Rear Floor Lock Striker |
| (7) Rear Seat Belt Buckle Assembly | (15) Free Hinge Cover |
| (8) Reclining Device | |

Removal

1. Fold the rear seat backs forward.
 - Pull up on the left and right release knobs.
2. Remove the rear seat leg covers.
 - Remove the one screw and clip from each.
3. Remove the rear seat assembly.
 - Remove the two sets of two fixing bolts from left and right sides, then pull on the seat lock strap to release the seat lock.
4. Remove the device covers (left and right).
 - Remove the three screws from each.
5. Remove the release knobs (left and right).
6. Remove the rear seat back assemblies (left and right).
 - Remove the two sets of two reclining device fixing bolts from the sides of the seat backs.
7. Remove the headrests.
8. Remove the trim covers.
9. Remove the guide holders.
10. Remove the reclining devices.
 - Remove the two sets of two fixing bolts from the sides of the seat cushions.
11. Remove the rear seat legs (left and right).
12. Remove the support covers (left and right).
 - Remove the three screws from each.
13. Remove the seat lock covers (left and right).
14. Remove the seat lock assemblies and the rear seat belt buckle assemblies (left and right).
 - Remove the two sets of two fixing bolts.
15. Remove the free hinge cover.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Tighten the seat lock assemblies and the rear seatbelt buckle assemblies to the specified torque.

Torque: 39 N·m (4.0 kg·m/29 lb ft)

2. Tighten the reclining devices to the specified torque.

Torque: 46 N·m (4.7 kg·m/34 lb ft)

3. Tighten the rear seat assembly fixing bolts to the specified torque.

Torque: 39 N·m (4.0 kg·m/29 lb ft)

| (5) Door Trim Panel | (11) Speaker Assembly |
| (6) Courtesy Light Lens | |

Removal

1. Disconnect the battery ground cable.
2. Remove the power window switch (1).
 - Pry out the power window switch and remove the connectors.

3. Remove the screw while pulling the inside lever toward you and then remove the inside handle.

4. Remove the speaker grille (1).
 - Pull out the front side of the grille.

5. Remove the speaker assembly (2).
 - Remove four screws and disconnect the speaker harness connector (3).

6. Remove the courtesy light lens.
7. Remove the five screws (1), (3) and pull out the door trim panel at the six clip positions (2).
 - Disconnect the tweeter connector and courtesy light connector.

8. Remove the waterproof sheet.
 - Taking notice of the door harness, peel the waterproof sheet off the door panel carefully.
9. Raise the glass up to the uppermost position, and then remove the rear guide rail.

8H-4 SECURITY AND LOCKS

10. Disconnect the locking links then remove the door lock assembly fixing screws and door lock assembly.

652RW002

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Apply chassis grease to the lock assembly and striker moving surface.
2. Tighten the door lock assembly fixing screws to the specified torque.

Torque 7 N·m (0.7kg·m/61 lbin)

3. Check that the door lock operates smoothly.

Front Outside Handle

Front Outside Handle and Associated Parts

635RW018

Legend

- | | |

| (3) Door Lock Assembly | (9) Inside Handle |
| (4) Waterproof Sheet | (10) Power Window Switch |
| (5) Door Trim Panel | (11) Speaker Assembly |
| (6) Courtesy Light Lens | |

Removal

1. Disconnect the battery ground cable.
2. Remove the door trim panel.
 - Refer to Front Door Lock Assembly in this section.
3. Remove the waterproof sheet.
 - Taking notice of the door harness, peel the waterproof sheet off the door panel carefully.
4. Disconnect the locking links and remove the outside handle.
5. Remove the fixing clip to remove the door lock cylinder.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Be sure to install the door lock cylinder at a right angle to the outside handle.
2. Check for smooth outside handle and lock cylinder operation.
3. Tighten the outside handle fixing bolts to the specified torque.

Torque 9N·m (0.9kg·m/78lbin)

Rear Door Lock Assembly

Rear Door Lock Assembly and Associated Parts

655RW012

| (4) Rear Corner Garnish | (9) Waterproof Sheet |
| (5) Door Trim Panel | |

Removal

1. Disconnect the battery ground cable.
2. Remove rear corner garnish.
3. Remove courtesies light lens.
4. Remove the screw while pulling the inside lever toward you and then remove the inside handle.
5. Remove the two screws at the pull case and courtesy light.

655RW003

6. Pull out the trim panel at the eight clip positions.
 - Disconnect the power window switch connector and courtesy light connector.

655RW002

7. Remove the bracket.
8. Remove the waterproof sheet.
 - Taking notice of the door harness, peel the waterproof sheet off the door panel carefully.
9. Disconnect the locking links and remove the door lock assembly fixing screws to remove the door lock assembly.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Apply chassis grease to the lock assembly and striker moving surface.
2. Tighten the door lock assembly fixing screws to the specified torque.

Torque 7N·m (0.7kg·m/61lbin)

3. Check that the door lock operates smoothly.

Rear Outside Handle

Rear Outside Handle and Associated Parts

| (2) Door Lock Assembly | (7) Power Window Switch |
| (3) Bracket | (8) Inside Handle |
| (4) Rear Corner Garnish | (9) Waterproof Sheet |
| (5) Door Trim Panel | |

Removal

1. Disconnect the battery ground cable.
2. Remove the door trim panel.
 - Refer to Rear Door Lock Assembly in this section.
3. Remove the waterproof sheet.
 - Taking notice of the door harness, peel the waterproof sheet off the door panel carefully.
4. Disconnect the locking link and remove fixing bolts to remove the outside handle.

Installation

To install, follow the removal steps in the reverse order, noting the following point:

1. Check that the outside handle operates smoothly.
2. Tighten the outside handle fixing bolts to the specified torque.

Torque 9N·m (0.9kg·m/78lb in)

Tailgate Lock and Hatchgate Lock (LWB)

Tailgate Lock, Hatchgate Lock and Associated Parts

681RW015

Legend

- | | |

| (3) Tailgate Lock Relay Lever | (8) Outside Handle |
| (4) Waterproof Sheet | (9) Hatchgate Lock Actuator Assembly |
| (5) Trim Cover Assembly | |

Removal

1. Disconnect the battery ground cable.
2. Remove the tailgate trim cover assembly (3).
 - Remove the two screws (2) holding the hatchgate lock assembly (1) first and the two screws fixing the trim cover assembly. Pull up the trim cover while detaching the clips from tailgate panel.

683RW001

3. Remove the tailgate trim brackets (2).
 - Remove the three screws (3) and screw grommets (1).
4. Remove the waterproof sheet (4).
 - Remove the waterproof sheet, taking special care so as not to break it.

681RW014

5. Remove the hatchgate lock.
 - Disconnect the lock link and connector and remove the three fixing bolts.
6. Remove the key cylinder.
 - Disconnect the lock links.
 - Remove the key cylinder retaining clip with screw driver to remove the key cylinder.

683RW025

7. Remove the hatchgate lock actuator assembly.
 - Disconnect the actuator harness connector.
 - Remove the two nuts holding hatchgate lock actuator assembly from inside.
8. Remove the outside handle.
 - Disconnect the lock links.
 - Remove the two bolts holding the outside handle from inside.
9. Remove tailgate lock assembly.
 - Remove the three screws holding the lock assembly.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. When setting up links, pay attention to the position and direction of the links.

683RW003

Legend

- (1) Tailgate Lock Link
- (2) Outside Handle
- (3) Key Cylinder Link
- (4) Cancel Mechanism

2. Apply chassis grease to the lock assembly and striker moving surface.
3. Check that the tailgate lock operates correctly after installing it.
4. Tighten the hatchgate lock assembly fixing bolts to the specified torque.

Torque 7N·m (0.7kg·m/61lbin)

Tailgate Lock (SWB)

Tailgate Lock and Associated Parts

681RW013

Legend

| (1) Tailgate Assembly | (5) Tailgate Lock Assembly |
| (2) Waterproof sheet | (6) Outside Handle |
| (3) Trim Cover Assembly | (7) Hatchgate Lock Actuator Assembly |
| (4) Key Cylinder | |

Removal

1. Disconnect the battery ground cable.
2. Remove the tailgate glass assembly and tailgate glass stay.
 - Refer to Tailgate Glass (SWB) in Body Structure section.
3. Remove the tailgate trim cover assembly.
 - Remove the two screws fixing the trim cover assembly and pull up the trim cover after detaching the clips from tailgate panel.
4. Remove the tailgate trim brackets (2).
 - Remove the three fixing screws (3) and screw grommets (1).

5. Remove the waterproof sheet (4).

- Remove the waterproof sheet, taking special care so as not to break it.

681RW014

6. Remove the key cylinder.

- Disconnect the lock links.
- Remove the key cylinder retaining clip with screw driver to remove the key cylinder.

7. Remove the hatchgate lock actuator assembly.

- Disconnect the actuator harness connector.
- Remove the two nuts holding hatchgate lock actuator assembly from inside.

8. Remove the outside handle.

- Disconnect the lock link.
- Remove the two bolts holding the outside handle from inside.

9. Remove tailgate lock assembly.

- Remove the three screws holding the lock assembly.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Apply chassis grease to the lock assembly and striker moving surface.
2. Tighten the hatchgate lock assembly fixing screws to the specified torque.

Torque 7N·m (0.7kg·m/61lb in)

3. Check that the tailgate lock operates correctly after installing it.

Fuel Filler Door Lock

Fuel Filler Door Lock and Associated Parts

This illustration is based on the SWB model.

686RW014

Legend

- | | |
|---|-------------------------------|
| (1) Link (SWB only) | (7) Rear End Floor Trim Cover |
| (2) Clip (SWB only) | (8) Canopy Cover |

| (4) Rod | (10) Luggage Side Upper Cover |
| (5) Accessory Socket | (11) Luggage Side Front Cover |
| (6) Luggage Trim Cover | |

Removal

1. Disconnect the battery ground cable.
2. Unlock the fuel filler door.
3. Remove the luggage trim cover on the left side.
 - Remove the two clips, then canopy cover.
 - Remove the luggage side lid assembly.
 - Remove the luggage side upper cover.
 - Remove the luggage side front cover.
4. Remove the quarter trim cover (LWB).
 - Refer to Interior Trim Panel in Exterior/Interior section.
5. Remove the fuel filler door lock actuator assembly.
 - Remove the two fixing bolts and one fixing screw. (For LWB, one bolt and two screws.)
6. Remove the fixing clip of the link.

7. Remove the fuel filler door lock cap (2).
- While pressing the two lock portions of the cap from inside of the vehicle, push the cap into the hole. Open the fuel filler door (3) and remove the cap out of the installation hole (1).

8. Remove the fuel filler door lock actuator assembly.
- Disconnect the body harness connector.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Install the cap by using the actuator assembly rod as a guide.
2. Take care not to pinch the drain hose and the harness while tightening the actuator fixing bolts and nut.

Key

Key Coding

Legend

- (1) Key (Actual size)
- (2) Key Code Tag
- (3) Position
- (4) Level

One key is used for the ignition, door, and tailgate lock cylinders. The keys are cut on both edges to make them reversible.

Key identification is obtained from the five character key code stamped on the key code tag. From this key code, the key code cutting combination can be determined from a code list (available to owners of key cutting equipment from suppliers).

If key codes are not available from records or tags, the key code can be obtained from the right hand door lock cylinder (if lock has not been replaced). Lock cylinders supplied by the factory as service parts are unmarked. If the original key is available, the key code cutting combination can be determined by laying the key on the diagram shown in the figure.

Key Styles

Legend

- (1) Blank Key Style "A"
- (2) Blank Key Style "B"

The keys come in styles A or B depending on the key code cutting combination. When the first position in the combination is a 1, 2 or 3, Style A is used. When the first position is a 4, Style B (factory pre-cut key) is used.

Power Door Lock System

General Description

The circuit consists of the door lock (& power window) switch, door lock actuator for the front and rear door, tailgate lock actuator, fuel filler door lock actuator and the door lock key switch.

The front door lock switch—LH is always provided with the battery voltage.

The key or the inside lock button on the both driver's and the front passenger's door can activate the lock mechanism of all the doors (including the tailgate).

When the driver's door lock switch or the front passenger's door lock switch is turned on, current flows for about one second to the door lock actuator of each door connected in parallel with the front door lock (& power window) switch—LH to activate the actuator to lock and unlock the doors.

Door Lock Key Switch

Removal and Installation

- Refer to Front Door Lock Assembly in this section.

Front Door Lock Actuator

Removal and Installation

- Refer to Front Door Lock Assembly in this section.

Rear Door Lock Actuator

Removal and Installation

- Refer to Rear Door Lock Assembly in this section.

Tailgate Lock Actuator

Removal and Installation

- Refer to Tailgate Lock Assembly in this section.

Fuel Filler Door Lock Actuator

Removal and Installation

- Refer to Fuel Filler Door Lock in this section.

Keyless Entry System

General Description

This circuit consists of the keyless entry control unit, the front door lock & power window switch (RH), the starter switch, the dome light, the door switch and the tail gate switch and possible to be locked/unlocked each door by operation of transmitter. Basic function of system is as follows.

Keyless Entry Control Unit

Removal

1. Disconnect the battery ground cable.
2. Remove the instrument panel assembly (1).
 - Refer to the Instrument Panel Assembly in Body Structure section.
3. Remove the keyless entry control unit (2).
 - Disconnect the connector.
 - Remove two fixing screws.

826RW007

Installation

To install, follow the removal steps in the reverse order.

Keyless Entry Control Unit/ Transmitter Replacement

Keyless Entry Control Unit Replacement

1. Remove and install the control unit.
 - Refer to Keyless Entry Control Unit in this section.
2. Register ID code.
 - Refer to ID Code Registration in Wiring System section.
3. Check that the keyless entry system works normally.

Transmitter Replacement

1. Prepare a new transmitter.
2. Register ID code.
 - Refer to ID Code Registration in Wiring System section.
3. Check that the keyless entry system works normally.

Transmitter Battery Replacement

1. Remove a screw to remove the cover.
2. Remove the batteries.
3. Set the new batteries into the transmitter.
4. Install the cover to the transmitter.
5. Check that the keyless entry system works normally.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Sunroof Glass (LWB)

Sunroof Glass and Associated Parts

665RW004

Legend

- (1) Sunroof Weatherstrip
- (2) Sunroof Glass

Removal

1. Tilt the sunroof and open the sunshade.
2. Disconnect the battery ground cable.
3. Pull out the front of sight shield (2).
4. Remove four sunroof glass fixing Torx screws (3) to remove the sunroof glass (1).

665RW011

Installation

1. Be sure to install the sunroof weatherstrip so that the joint of the weatherstrip is on the rear side of the vehicle.
2. Temporary install the glass to the sunroof frame.
3. Open and shut the sunroof four to five times to position correctly the sunroof weatherstrip and the glass in the longitudinal and latitudinal setting positions.

4. Adjust the setting position to flush the surface between the roof panel and weatherstrip of sunroof glass.
5. Tighten the sunroof glass fixing screws to the specified torque.

Torque: 4N·m (0.4 kg·m/35lbin)

6. After the sunroof glass is installed, recheck the roof panel and sunroof glass for vertical install position. If out of standard, adjust with fixing screws.

Sunroof Glass (SWB)

Sunroof Glass and Associated Parts

Legend

- | | |
|----------------------------|-----------------------|
| (1) Sunroof Weather Strip | (3) Sunshade Assembly |
| (2) Sunroof Glass Assembly | |

Removal

1. Disconnect the battery ground cable.
2. Remove the sunshade assembly.
 - Turn the knobs (1) 90 degrees and pull it out at angle. Then pull the sunroof handle (2) to disengage the lock.

665RW025

3. Remove the sunroof glass assembly.
 - Push the safety lever (2) behind the handle and push in on the hinge pins (1) from the left and right to disengage them. Raise the rear end of the sunroof glass assembly at an angle pull it free.

665RW026

4. Remove the sunroof handle cover and sunroof handle plate.
 - Remove the screw from the cover and the three fixing nuts from the plate.
5. Remove the weather strip.
6. Remove the headlining.

- Refer to Headlining in Exterior/Interior Trim section.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. When attaching the sunroof weather strip (1), make sure that the lip (2) securely overlaps the headlining (3).
- Assemble with the positioning marks centered toward the rear of the vehicle.

666RW007

2. Tighten the sunroof handle plate fixing nuts to the specified torque.

Torque: 8 N-m (0.8 kg-m/69 lb in)

Sunroof Deflector (LWB)

Removal

1. Open the sunroof.
 - Let a 5 mm drill go through two blind rivets (2) to disengage riveted portions.
2. Remove the sunroof deflector (1).

665RW006

Installation

To install, follow the removal steps in the reverse order.

Sunroof Deflector (SWB)

Parts Location

Legend

- | | |

| (2) Center Deflector Assembly | (5) Rear Sunroof Deflector Assembly |
| (3) Side Deflector Assembly (LH) | (6) Roof Panel (Resin Top side) |

665RX001

Removal

1. Disconnect the battery ground cable.
2. Remove the sunroof glass.
 - Refer to Sunroof Glass in this section.
3. Remove the headlining (Front roof side).
 - Refer to Headlining in Exterior/Interior Trim section.
4. Remove the sunroof deflector.
 - Remove the fixing screws.

Installation

To install, follow the removal steps in the reverse order.

Sunshade (LWB)

Disassembled View

665RW012

Legend

- | | |
|-------------------|----------------------|
| (1) Sunroof Glass | (3) Sunshade Stopper |
| (2) Sight Shield | (4) Sunshade |

Removal

1. Tilt the sunroof.
2. Disconnect the battery ground cable.
3. Remove the sunroof glass.
 - Refer to Sunroof Glass in this section.
4. Pull the sight shield upward using screwdriver.

665RW006

8I-8 SUNROOF/CONVERTIBLE TOP

5. Remove 2 sunshade stopper fixing screws and remove sunshade stopper (1).

665RW007

6. Pull out the sunshade (4) up to the guide rail edge. Lift the front of sunshade and clear the projection (3) of sunshade through the notch (2) of guide rail edge, then draw the sunshade out of the roof.

665RW009

Installation

To install, follow the removal steps in the reverse order.

Sunroof Frame Complete Assembly (LWB)

Sunroof Frame Complete Assembly and Associated Parts

665RW005

Legend

- | | |
|-------------------------------------|----------------|
| (1) Sunroof Drain Hose | (3) Headlining |
| (2) Sunroof Frame Complete Assembly | |

Removal

1. Disconnect the battery ground cable.
2. Remove the headlining.
 - Refer to Headlining in Exterior/Interior Trim section.

8I-10 SUNROOF/CONVERTIBLE TOP

3. Disconnect the sunroof drain hose at the sunroof frame side as shown in the figure.

4. Disconnect the sunroof harness connection.
5. Remove two sunroof frame complete assembly fixing nuts (front side) and six fixing bolts from the frame complete assembly, and then remove the sunroof frame complete assembly.

NOTE: Be sure to remove the frame complete assembly while supporting it.

Installation

1. Install the sunroof frame complete assembly.
2. After installing the frame complete assembly, loosen the sunroof glass fixing nuts and adjust the sunroof glass setting position.
 - Refer to Sunroof Glass in this section.
3. Install the sunroof drain hose.
4. Install the headlining.
 - Refer to Headlining in Exterior/Interior Trim section.

Sunroof Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the sunroof switch (1).
 - Remove the switch by pushing the spring with the tip of a screwdriver.
 - Disconnect the switch connector.

Installation

To install, follow the removal steps in the reverse order.

Sunroof Control Unit

Removal

1. Disconnect the battery ground cable.
2. Remove the headlining (2).
 - Refer to Headlining in Exterior/Interior Trim section.
3. Remove the sunroof control unit (1).
 - Disconnect two connectors.
 - Remove two screws.

665RW013

Installation

To install, follow the removal steps in the reverse order.

Safety Stop Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the sunroof drive unit assembly (1) to remove the safety stop switch (2).
 - Refer to Sunroof Frame Complete Assembly in this section.

665RS022

Installation

To install, follow the removal steps in the reverse order.

Limit Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the sunroof drive unit assembly (1) to remove the limit switch (2).
 - Refer to Sunroof Frame Complete Assembly in this section.

665R9025

Installation

To install, follow the removal steps in the reverse order.

Sunroof Motor

Removal

1. Disconnect the battery ground cable.
2. Remove the headlining (2).
 - Refer to Headlining in Exterior/Interior Trim section.
3. Remove the sunroof motor (1).
 - Disconnect the connector.
 - Remove three nuts and two screws.

665RW014

Installation

To install, follow the removal steps in the reverse order.

Resin Top Assembly

Resin Top Assembly and Associated Parts

668RW06

Legend

- | | |
|---------------------------|--------------------------------|
| (1) Rear Sunroof Assembly | (4) Air Outlet Grille Assembly |
| (2) Resin Top Assembly | (5) Rear Quarter Glass |
| (3) High Mount Stoplight | |

Removal

1. Disconnect the battery ground cable.
2. Remove the rear sunroof glass.
 - Refer to Sunroof Glass in this section.
3. Remove the sunroof deflector.
 - Remove the four fixing screws.
4. Remove the rear roof bracket covers (4) and remove the both sets of two bolts (3) on the resin top sides of the rear roof brackets (2).

666RW10

5. Remove the air outlet grille assembly (LH & RH).
 - Remove the two screws and pull the grille assemblies off toward the rear.
6. Remove the luggage light assembly and disconnect the connector.
7. Remove the high mount stoplight assembly and disconnect the connector.
8. Disconnect the rear washer hose (Right side, inside air outlet grille assembly).

688RW007

9. Disconnect the harness connector for the resin top (Left side, behind the luggage side trim).
 - Remove the canopy cover (1), the luggage side lid (2) and luggage side upper cover (3). Then pull out the harness and disconnect the connector.

686RX001

10. Remove the resin top assembly.
 - Remove the two fixing bolts each and nut each from the left and right sides, then lift the resin top up and off.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Removing and mounting the resin top should always be performed by two persons.
2. Tighten the resin top fixing bolts and nuts to the specified torque.

Torque: 15 N·m (1.5 kg·m/11 lb ft)

Seat Belt Cross Bar Assembly

Seat Belt Cross Bar Assembly and Associated Parts

Legend

- (1) Seat Belt Cross Bar Assembly
- (2) Rear Seat Belt Assembly

688RW08

Removal

1. Disconnect the battery ground cable.
2. Remove the resin top Assembly.
 - Refer to Resin Top Assembly in this section.
3. Remove the canopy cover (1).
 - Remove the two fixing clips.
4. Remove the luggage side lid (2).
5. Remove the luggage side upper cover (3).
6. Remove the luggage side front cover (4).

686RX001

7. Remove the weather strip.
8. Remove the rear end floor trim cover.
 - Remove the five fixing screws.
9. Remove the right luggage side trim cover.
 - Remove the jack & tool lid and take out the tools. Then remove the fixing screw and pull the clips out from the body panel.

687RW005

- To remove the left luggage side trim cover, disconnect the accessory socket connector.
10. Remove the rear seat belt assembly.
 - Refer to Rear Seat Belt in Restraints section.
 11. Remove the seat belt cross bar assembly.
 - Remove the two sets of seven fixing bolts on the left and right sides. One set of the fixing bolts are also used to secure the resin top in place.

688RW009

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Tighten the rear seat belt anchor bolts to the specified torque.

Torque: 39 N·m (4.0 kg·m/29 lb ft)

2. Tighten the seat belt cross bar assembly fixing bolts to the specified torque.

Torque: 19 N·m (1.9 kg·m/14 lb ft)

| (7) Door Lock Assembly/Door Lock Actuator | (16) Tweeter |
| (8) Waterproof Sheet | (17) Door Mirror Cover |
| (9) Door Trim Panel | (18) Door Mirror Assembly |

Removal

1. Disconnect the battery ground cable.
2. Remove the door mirror cover (2).
3. Remove the door mirror assembly (1).
 - Remove the three fixing bolts and disconnect the connectors.

635RW006

4. Remove the power window switch (1).
 - Pry the power window switch out and disconnect the switch connector.

635RW016

5. Remove the speaker cover.
6. Remove the front speaker.
 - Remove the front speaker fixing screws in order to disconnect the speaker connector.

7. Remove the inside handle fixing screw.

CAUTION: Take care not to apply excessive force on the inside handle link, lest this link is elongated, which could make it impossible to operate the door with the inside handle.

632RW003

8. Remove the door trim panel.
 - Remove the five fixing screws (1), (3) in order to pull out the six clip positions (2) from the door panel.

635RW007

- Disconnect the tweeter and courtesy light connectors to lift the door trim panel and unlock the engagement of the waist seal section. Then, pass the inside handle through the mounting hole of the trim panel, and detach the trim panel.

9. Remove the inside handle.
10. Remove the tweeter.

Installation

To install, follow the removal steps in the reverse order.

Rear Door Trim Panel

Rear Door Trim Panel and Associated Parts

655RW011

Legend

- | | |
|----------------------------|------------------------------|
| (1) Glass Run | (8) Rear Door Corner Garnish |

| (5) Outside Handle | (12) Inside Handle |
| (6) Door Lock Assembly | (13) Waterproof Sheet |
| (7) Bracket | (14) Outer Waste Seal |

Removal

1. Disconnect the battery ground cable.
2. Remove the one screw from the pullcase.

3. Remove the inside handle fixing screw.

CAUTION: Take care not to apply excessive force on the inside handle link, lest this link be elongated, which could make it impossible to operate the door with the inside handle.

4. Remove the rear door corner garnish.

5. Remove the door trim panel.

- Pull out the eight clip positions from the door panel.

- Disconnect the power window switch and courtesy light connectors to lift the trim panel and unlock the engagement of the waist seal section, then pass the inside lever through the mounting hole of the trim panel, and detach the trim panel.

6. Remove the inside handle.

7. Remove the power window switch.

- Remove the fixing screws of switch from backside of rear door trim.

Installation

To install, follow the removal steps in the reverse order.

Interior Trim Panels (LWB)

| (4) Rear Roof Trim Cover | (9) Center Pillar Upper Trim Cover |
| (5) Tailgate Weather Strip | (10) Front Pillar Trim Cover |

Removal

1. Disconnect the battery ground cable.
2. Remove the sill plates (Front & Rear).
3. Remove the dash side trim cover.
4. Remove the center pillar lower trim cover.
 - Remove the lower anchor bolt cover and lower anchor bolt from the front seat belt.
 - Pry the trim cover clips free from the body panel.
5. Remove the door finishers (Front & Rear).
6. Remove the center pillar upper trim cover.
 - Pry the trim cover clips free from the body panel.
7. Remove the front pillar trim cover.
 - Pry the trim cover clips free from the body panel.
8. Remove the tailgate weather strip.
9. Remove the rear end floor trim cover.
 - Remove the five fixing screws.

8J-8 EXTERIOR/INTERIOR TRIM

10. Remove the luggage room light.

- Remove the luggage room light lens (1) and the fixing screw.
- Disconnect the luggage room light connector.

825RW100

11. Remove the rear roof trim cover.

- Pry the trim cover clips free from the body panel.

12. Remove the lower anchor bolt cover and the lower anchor bolt (5) from the rear seat belt.

13. Remove the quarter trim cover (1).

- Remove the tool box lid (3) and three fixing screws (4).
Pry the quarter trim cover retainers (2) free from the body panel.
- Disconnect the accessory socket connector (LH side).

643RW001

14. Remove the front pillar assist grip (1) (Front & Rear).

- Open the both sides of the assist grip cover (2) and remove the fixing screws and the front pillar assist grip.

743RW003

Installation

To install, follow the removal steps in the reverse order, noting the following point:

1. Tighten the seat belt anchor bolt to the specified torque.

Torque: 39N·m (4.0kg·m/29lbft)

Interior Trim Panels (SWB)

Interior Trim Panels and Associated Parts

643RW010

| (3) Weather Strip | (8) Sill Plate |
| (4) Rear Roof Trim Cover | (9) Door Seal Finisher |
| (5) Rear End Floor Trim Cover | (10) Front Pillar Trim Cover |

Removal

1. Disconnect the battery ground cable.
2. Remove the resin top assembly.
 - Refer to Resin Top Assembly in Sunroof/Convertible Top section.
3. Remove the rear seat assembly.
 - Refer to Rear Seat Assembly in Seats section.
4. Remove the weather strip.
5. Remove the luggage side trim cover.
 - Refer to Seat Belt Cross Bar Assembly in Sunroof/Convertible Top section.
6. Remove the sill plate.
7. Remove the dash side trim cover.

8J-10 EXTERIOR/INTERIOR TRIM

8. Remove the rear speaker assembly.
 - Disengage the front portion of the speaker grille (1) and pull it forward and off.
 - Remove the three fixing screws securing the speaker (2) in place and disconnect the connector (3).

890RW048-1

9. Remove the front and rear seat belt lower anchor bolts.
10. Remove the quarter lower trim cover.
 - Disengage the clips from the body panel by twisting them free.
11. Remove the assist grips (1) (Front & Rear).
 - Open the both sides of the assist grip cover (2) and remove the fixing screws.

743RW003

12. Remove the door seal finisher.
13. Remove the dome light.
 - Remove the dome light lens (2) and the fixing screws.
 - Disconnect the dome light connector.

805RX001

14. Remove the rear roof bracket.
15. Remove the rear roof trim cover.
16. Remove the quarter upper trim cover.
17. Remove the front pillar trim cover.

Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Tighten the front and rear seat belt anchor bolts to the specified torque.

Torque: 39N·m (4.0kg·m/29lbft)

Headlining (LWB)

| (3) Headlining (Without Sunroof) | (8) Sunroof Switch (With Sunroof) |
| (4) Assist Grip | (9) Sunvisors |
| (5) Dome Light | (10) Sunvisor Holder |

Removal

1. Disconnect the battery ground cable.
2. Remove the interior trim panels.
 - Refer to Interior Trim Panels (LWB) in this section.
3. Remove the dome light.
 - Remove the dome light lens and the fixing screws.
 - Disconnect the dome light connectors.

8J-12 EXTERIOR/INTERIOR TRIM

4. Remove the sunroof switch (With sunroof).

- Pry the clip positions free from the sunroof switch bracket and disconnect the connector.

5. Remove the sunvisors.

- Remove the fixing screws and pull out the sunvisor holder (1) to remove it.

6. Remove the sunroof finisher (With sunroof).

7. Remove the headlining.

- Remove the headlining fixing clips.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Install the headlining so that the fixing clips will not come off.
2. To install the sunroof finisher (1), first fit it in at one place with the headlining (3) close to the sunroof frame complete (2), then install the entire finisher tightly by hitting it with a plastic hammer, not allowing it to move up.

| (2) Rear Roof Cover & Roof Bracket | (6) Sunroof Finisher |
| (3) Rear Roof Trim Cover | (7) Sunvisors |
| (4) Assist Grip | (8) Headlining |

Removal

1. Disconnect the battery ground cable.
2. Remove the rear roof bracket cover (4), rear roof bracket (2) connecting with resin top (1) and rear roof trim cover (3) by removing four fixing bolts.

666RW006

3. Remove the dome light lens.
4. Remove the dome light.
 - Remove the fixing screws.
 - Disconnect the dome light connector.
5. Remove the rear roof trim cover.

666RW004

6. Remove the interior trim panels.
 - Refer to Interior Trim Panels (SWB) in this section.
7. Remove the sunroof glass assembly.
 - Refer to Sunroof Glass (SWB) in Sunroof/Convertible Top section.
8. Remove the sunroof handle cover and sunroof handle plate.
 - Remove the screw from the cover and the three fixing nuts from the plate.
9. Remove the sunvisor.
 - Remove the sunvisor fixing screws and the sunvisor holder.
10. Remove the sunroof finisher.
11. Remove the headlining.

Installation

To install, follow the removal steps in the reverse order.

1. In case of installing sunroof finisher (1), fit the lip (2) to the headlining surely.

666RW007

Wheel Arch Protector (LWB)

Wheel Arch Protector and Associated Parts

620RW019

Legend

- | | |
|-------------------------------|--------------------------------|
| (1) Wheel Arch Protector | (6) Double Sided Adhesive Tape |
| (2) Rear Door Panel | (7) Clip |
| (3) Rear Door Wheel Arch Seal | (8) Screw Grommet |
| (4) Wheel Arch Cover | (9) Clip |
| (5) Body Panel | |

Removal

1. Remove the wheel arch cover.
 - Remove the four fixing screws.
2. Remove the wheel arch protector.
 - Remove the two fixing screws from the back side of the rear door panel and pull out the clips at three positions.
3. Remove the rear door wheel arch seal.
 - After disengaging five clips, peel off the double sided adhesive tape.

Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Use a new double sided adhesive tape whenever installing the rear door wheel arch seal. Using a white gasoline, clean the places in advance where a double sided adhesive tape is affixed.

Wheel Arch Protector (SWB)

Wheel Arch Protector and Associated Parts

620RW018

Legend

- | | |
|--------------------------|-------------------|
| (1) Wheel Arch Protector | (4) Screw Grommet |
| (2) Spire Nut | (5) Screw |
| (3) Quarter Outer Panel | (6) Clip |

Removal

1. Remove the wheel arch protector.
 - Remove the four fixing screws and pull out the clips at two positions.

Installation

To install, follow the removal steps in the reverse order.

Wheel Arch Moulding (SWB)

Wheel Arch Moulding and Associated Parts

620RW017

Legend

- (1) Front Wheel Arch Moulding
- (2) Front Mud Flap

- (3) Rear Wheel Arch Moulding

Removal

1. Remove the front mud flap (2).
 - Remove the four fixing screws (1).
(Three of four screws are fixed together with moulding.)

647RW002

8J-18 EXTERIOR/INTERIOR TRIM

2. Remove the front wheel arch moulding.
 - Remove the three fixing screws and pull out the clips at three positions from the fender panel.
3. Remove the rear wheel arch moulding.
 - Remove the seven fixing screws and pull out the clips at three positions from the quarter outer panel.

Installation

1. Install the rear wheel arch moulding (2).
 - Install the six spire nuts (1) and one screw grommet (4) to the body panel (5).
 - Put the three clips of the rear wheel arch moulding into the body panel in order of A, B and C.
 - Install the seven fixing screws (3).

2. Install the front wheel arch moulding (2).
 - Install the six spire nuts (1) to the body panel (4).
 - Put the four clips (3) of the front wheel arch moulding into the body in order of A, B, C and D.
3. Install the six fixing screws (6).
(Three of six screws are fixed together with the front mud flap.)

4. Install the front mud flap.

Fuel Filler Door

Parts Location

686RW010

Legend

- (1) Fuel Filler Door Fixing Screw
- (2) Basic Hole
- (3) Fuel Filler Door Buffer
- (4) Fuel Filler Door
- (5) Fuel Filler Door Hinge Buffer

Removal

1. Open the fuel filler door.
2. Remove the fuel filler door.
 - Remove the two fixing screws.
3. Pull out the fuel filler door buffer.
4. Pull out the fuel filler hinge buffer.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Install the fuel filler door to match the basic hole.
2. Adjust the clearance between quarter outer panel (1) and fuel filler door (2).

686RX003

Roof Rail

Parts Location

660RW022

Legend

- | | |
|---------------------------|----------------------------|
| (1) SWB | (5) Roof Rail Sub Assembly |
| (2) Roof Rail Assembly | (6) LWB |
| (3) Roof Rail Fixing Bolt | (7) Front Roof Rail Cover |
| (4) Rear Roof Rail Cover | |

Removal

1. Remove the front and rear of roof rail cover.
 - Pry the roof rail covers.
2. Remove the roof rail sub assembly.
 - Remove the four fixing bolts at each roof rail.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Tighten the roof rail sub assembly fixing bolts to the specified torque.

Torque 8N·m (0.8kg·m/69lbin)

Power Door Mirror System

General Description

The system consists of the starter switch, door mirror switch, rear defogger/mirror defogger switch and door mirrors on both sides.

When the door mirror switch is operated with the starter switch at either "ACC" or "ON" position, the motor in the door mirror (on either side) rotates to allow the horizontal and vertical adjustment of mirror angles.

When the rear defogger/mirror defogger switch is turned "ON" (with the starter switch at "ON" position), the heaters in both left and right mirrors and the rear hatchgate glass are activated to defog both mirrors and rear hatchgate glass at the same time.

Door Mirror Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the instrument panel lower cover (1). Refer to the instrument panel assembly in Body Structure section.
3. Remove the door mirror switch (2).

825RW266

Installation

To install, follow the removal steps in the reverse order.

Rear Defogger/Mirror Defogger Switch

Refer to Rear Defogger/Mirror Switch in Lighting System section.

Door Mirrors

Refer to Front Door Trim Panel in this section.

Power Window System

General Description

The power window system consists of power window switches and power window motors on driver and passenger sides and power window relay. With the starter switch in "ON" position, the battery voltage is supplied through power window relay to the power window switches on driver and passenger sides. Selection of up or down switch changes the motor rotating direction to open or close the window. When the lock switch on the switch panel on the driver side is pressed, the power window switch is in open state. As a result, the power source to the other switches are cut off, and the power window motors do not run.

Power Window Switch Driver Seat Side

Removal

1. Disconnect the battery ground cable.
2. Remove the switch (1).
 - Pull out the switch by pushing the spring with the tip of a screwdriver.
 - Disconnect the connector.

825RW265

Installation

To install, follow the removal steps in the reverse order.

Front Passenger Seat Side

Removal

1. Disconnect the battery ground cable.
2. Remove the switch (1).
 - Pull out the switch by pushing the spring with the tip of a screwdriver.
 - Disconnect the connector.

825RW264

Installation

To install, follow the removal steps in the reverse order.

Rear-Left and Right Sides

Removal

1. Disconnect the battery ground cable.
2. Remove the rear door trim panel (2).
 - Refer to Rear Door Trim Panel in this section.
 - Disconnect the rear power window switch (1) connector.

3. Remove the rear power window switch (1).
 - Remove the switch fixing screw from the back side of the rear door trim (2).

825RW081

825RW079

Installation

To install, follow the removal steps in the reverse order.

Power Window Motor

Driver Seat Side

Removal

1. Disconnect the battery ground cable.
2. Remove the window regulator assembly (2).
 - Refer to Window Regulator and Glass in Body Structure section.
3. Remove the power window motor (1).
 - Remove three screws.

825RW096

Installation

To install, follow the removal steps in the reverse order.

Front Passenger Seat Side

Removal and Installation

Refer to Front Window Motor — Driver Seat Side in this section.

Rear-Left Side

Removal

1. Disconnect the battery ground cable.
2. Remove the rear window regulator assembly (2).
 - Refer to Rear Window Regulator and Glass in Body Structure section.
3. Remove the power window motor (1).
 - Remove three screws.

825RW095

Installation

To install, follow the removal steps in the reverse order.

Rear-Right Side

Removal and Installation

Refer to Rear Power Window Motor — Left Side in this section.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Front Seat Belt (LWB)

Front Seat Belt and Associated Parts

| (3) Seat Belt Upper Anchor Bolt | (8) Retractor |
| (4) Center Pillar Upper Trim Cover | (9) Rear Sill Plate |
| (5) Front Seat Belt Assembly | (10) Front Sill Plate |

760RW040

Removal

1. Disconnect the battery ground cable.
2. Remove the sill plate (Front & Rear).
3. Remove the seat belt lower anchor bolt.
4. Remove the center pillar lower trim cover.
5. Remove the door seal finisher (Front & Rear).
6. Remove the center pillar upper trim cover.
7. Remove the seat belt upper anchor bolt.
8. Remove the retractor fixing bolt.
9. Remove the seat belt assembly.
 - Remove the two fixing bolts.
10. Remove the adjustable shoulder anchor assembly.

Inspection

If any of the following abnormalities is found, replace on an assembly basis.

- Deform and malfunction of adjustable shoulder anchor.
- No smooth move of upper/lower anchors in the circumferential direction.
- Damaged and/or deformed through ring.
- Damaged and/or deformed tongue.
- Damaged and/or frayed of webbing.
- Deformed retractor bracket.
- Seat belt not rewound up.
- Resistance or abnormal sound when seat belt is wound out and rewound.
- Retractor abnormality.

Inspection of retractor

1. ELR (Emergency Locking Retractor) lock inclining angle check.
 - When the retractor is moved gently from its installing position, make sure it is not locked within 15° in any directions, and it remains locked at 45° or larger.
2. ELR lock check.
 - When the seat belt is drawn slowly with the retractor installed, make sure it is not locked. And when it is drawn quickly, make sure it is locked.

CAUTION: Do not disassemble the retractor.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Tighten the adjustable shoulder anchor assembly fixing bolts to the specified torque.

Torque: 39N·m (4.0 kg·m/29lb ft)

2. Tighten the seat belt anchor bolts (Upper & Lower) and the retractor fixing bolts to the specified torque.

Torque: 39N·m (4.0 kg·m/29lb ft)

| (4) Assist Grip | (10) Sill Plate |
| (5) Rear Roof Trim Cover | (11) Door Seal Finisher |
| (6) Quarter Lower Trim Cover | |

Removal

1. Disconnect the battery ground cable.
2. Remove the rear seat assembly.
 - Refer to Rear Seat Assembly in Seats section.
3. Remove the resin top assembly.
 - Refer to Resin Top Assembly in Sunroof/Convertible Top section.
4. Remove the luggage side trim cover.
 - Refer to Rear Seat Belt (SWB) in this section.
5. Remove the sill plate.
6. Remove the seat belt lower anchor bolt (Front & Rear).

7. Remove the rear speaker (2).
- Remove the speaker grille (1) and remove the speaker fixing screws.
 - Disconnect the connector (3).

8. Remove the quarter lower trim cover.
- Pry the trim cover retainers free from the body panel.
9. Remove the dome light.
- Remove the dome light lens and the fixing screws.
 - Disconnect the dome light connector.
10. Remove the rear roof bracket (2).
- Remove the rear roof bracket cover (4) and remove rear roof bracket connecting with resin top (1) and rear roof trim cover (3) by removing four fixing bolts.

11. Remove the rear roof trim cover.
12. Remove the assist grip.
13. Remove the door seal finisher.
14. Remove the quarter upper trim cover.
15. Remove the seat belt upper anchor bolt.
16. Remove the retractor fixing bolt.
17. Remove the seat belt assembly.
18. Remove the adjustable shoulder anchor assembly.
- Remove two bolts.

Inspection

If any of the following abnormalities is found, replace on an assembly basis.

- Deform and malfunction of adjustable shoulder anchor.
- No smooth move of upper/lower anchors in the circumferential direction.
- Damaged and/or deformed through ring.
- Damaged and/or deformed tongue.
- Damaged and/or frayed of webbing.
- Deformed retractor bracket.
- Seat belt not rewound up.
- Resistance or abnormal sound when seat belt is wound out and rewound.
- Retractor abnormality.

Inspection of retractor

1. ELR (Emergency Locking Retractor) lock inclining angle check.
 - When the retractor is moved gently from its installing position, make sure it is not locked within 15° in any directions, and it remains locked at 45° or larger.
2. ELR lock check.
 - When the seat belt is drawn slowly with the retractor installed, make sure it is not locked. And when it is drawn quickly, make sure it is locked.

CAUTION: Do not disassemble the retractor.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Tighten the adjustable shoulder anchor assembly and retractor fixing bolts to the specified torque.

Torque: 39N·m (4.0kg-m/29lbf·ft)

2. Tighten the seat belt anchor bolts to the specified torque.

Torque: 39N·m (4.0kg-m/29lbf·ft)

| (6) Tailgate Weather Strip | (12) Rear Door Seal Finisher |

Removal

1. Disconnect the battery ground cable.
2. Remove the tailgate weather strip.
3. Remove the rear end floor trim cover.
4. Remove the luggage room light.
 - Remove the luggage room light lens (1) and the fixing screw.

- Disconnect the luggage room light connector.

825RW100

5. Remove the rear roof trim cover.
 - Pry the trim cover clips free from the body panel.
6. Remove the rear sill plate.
7. Remove the rear seat belt lower anchor bolt cover and the lower anchor bolt (5).
8. Remove the quarter trim cover (1).
 - Remove the tool box lid (3) and 3 fixing screws (4).
Pry the quarter trim cover retainers (2) free from the body panel.

643RW011

9. Remove the slider plate trim assembly (2).
 - Remove the two fixing screws from the adjustable shoulder anchor (1).

- Pull out the seat belt through the hole (3) on the slider plate trim.

755RW069

10. Remove the seat belt upper anchor bolt.
11. Remove the retractor.
12. Remove the rear seat belt assembly.
13. Remove the adjustable shoulder anchor assembly.
 - Remove the two fixing bolts.

Inspection

If any of the following abnormalities is found, replace on an assembly basis.

- Deform and malfunction of adjustable shoulder anchor.
- No smooth move of upper/lower anchors in the circumferential direction.
- Damaged and/or deformed through ring.
- Damaged and/or deformed tongue.
- Damaged and/or frayed of webbing.
- Deformed retractor bracket.
- Seat belt not rewound up.
- Resistance or abnormal sound when seat belt is wound out and rewound.
- Retractor abnormality.

Inspection of retractor

1. ELR (Emergency Locking Retractor) lock inclining angle check.
 - When the retractor is moved gently from its installing position, make sure it is not locked within 15° in any directions, and it remains locked at 45° or larger.
2. ELR lock check.
 - When the seat belt is drawn slowly with the retractor installed, make sure it is not locked. And when it is drawn quickly, make sure it is locked.

CAUTION: Do not disassemble the retractor.

Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Tighten the adjustable shoulder anchor assembly fixing bolts to the specified torque.
Torque: 39N·m (4.0kg·m/29lbft)
2. Tighten the seat belt anchor bolts (Upper & Lower) and the retractor fixing bolts to the specified torque.
Torque: 39N·m (4.0kg·m/29lbft)

Removal

1. Disconnect the battery ground cable.
2. Remove the canopy cover (1).
 - Remove two fixing clips.
3. Remove the luggage side lid (2).
4. Remove the luggage side front cover (4).
5. Remove the luggage side upper cover (3).

686RX001

9A-10 SEAT BELT SYSTEM

6. Remove the tailgate weather strip.
7. Remove the rear end floor trim cover.
8. Remove the luggage side trim cover (RH).
 - Remove the jack & tool lid and remove the tool.
 - Remove fixing screw and pry the trim cover retainers free from the body panel.

687RW005

9. Remove the luggage side trim cover (LH).
 - Remove fixing screw and pry the trim cover retainers free from the body panel.
 - Disconnect the accessory socket connectors.
10. Remove the seat belt lower anchor bolt.
11. Remove the shoulder anchor cover (2).
 - Release the hooked portion of cover from the shoulder anchor (1).

755RW070

12. Remove the seat belt upper anchor bolt.
13. Remove the retractor.
14. Remove the rear seat belt assembly.

Inspection

If any of the following abnormalities is found, replace on an assembly basis.

- No smooth move of upper/lower anchors in the circumferential direction.
- Damaged and/or deformed through ring.
- Damaged and/or deformed tongue.
- Damaged and/or frayed of webbing.
- Deformed retractor bracket.
- Seat belt not rewound up.
- Resistance or abnormal sound when seat belt is wound out and rewound.
- Retractor abnormality.

Inspection of retractor

1. ELR (Emergency Locking Retractor) lock inclining angle check.
 - When the retractor is moved gently from its installing position, make sure it is not locked within 15° in any directions, and it remains locked at 45° or larger.
2. ELR lock check.
 - When the seat belt is drawn slowly with the retractor installed, make sure it is not locked. And when it is drawn quickly, make sure it is locked.

CAUTION: Do not disassemble the retractor.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Align the projection of the retractor to the square hole of the seat belt cross bar assembly bracket.
2. Tighten the retractor fixing bolts to the specified torque.

Torque: 39N·m (4.0 kg·m/29 lbf·ft)

3. Tighten the seat belt anchor bolt to the specified torque.

Torque: 39N·m (4.0 kg·m/29 lbf·ft)

Front Seat Buckle Assembly

Removal

1. Disconnect the battery ground cable.
2. Disconnect the seat belt warning connector (driver's side) and remove a clip.
3. Remove the front seat buckle assembly (1).

760RW043

Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Tighten the buckle anchor bolt to the specified torque.

Torque: 39N·m (4.0kg·m/29lbft)

| (2) Rear Seat Lock Assembly | (5) LWB |
| (3) Rear Seat Belt Buckle Assembly | (6) Rear Cushion Frame Assembly |

Removal

1. Remove the seat lock cover (SWB).
2. Remove the rear cushion frame assembly (LWB).
 - Refer to Rear Seat Assembly in Seats section.
3. Remove the rear seat lock assembly and rear seat belt buckle assembly.

Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Tighten the rear seat lock assembly and rear seat belt buckle assembly fixing bolts to the specified torque.

Torque: 39N·m (4.0 kg·m/29lbft)

NOTE: Removal and installation procedure of rear center seat belt assembly same as rear seat belt buckle assembly procedures.

Child Seat Tether Anchor Bracket (Child Restraint)

General Description

Plastic plug is provided at two or three places on the luggage floor panel.

LWB

Remove the center plug from the floor panel.

SWB

Remove the right plug from the floor panel.

Install the bracket to the hole where the plug is removed.

Alternatively, the bracket may be installed in the right-hand or left-hand plug hole.

Child Seat Tether Anchor Bracket and Associated Parts

Legend

- | | |
|--------------------------|--------------------------------------|
| (1) Rear Seat (LWB) | (4) Child Seat Tether Anchor Bracket |
| (2) Rear seat (SWB) | (5) Tether Anchor Plug |
| (3) Luggage Floor carpet | |

Installation

1. Turn the plug counterclockwise to remove it.
2. Install the bracket such that its tether belt hook hole is facing toward the front of the vehicle.
3. Tighten the fixing bolt to the specified torque.

Torque: 20N·m (2.0kg·m/14lbft)

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

CAUTION: When fasteners are removed, always reinstall them at the same location from which they were removed. If a fastener needs to be replaced, use the correct part number fastener for that application. If the correct part number fastener is not available, a fastener of equal size and strength (or stronger) may be used. Fasteners that are not reused, and those requiring thread locking compound will be called out. The correct torque value must be used when installing fasteners that require it. If the above conditions are not followed, parts or system damage could result.

Restraint Devices

Legend

- (1) Deployed Air Bag
- (2) Knee Bolster
- (3) Seat Belt

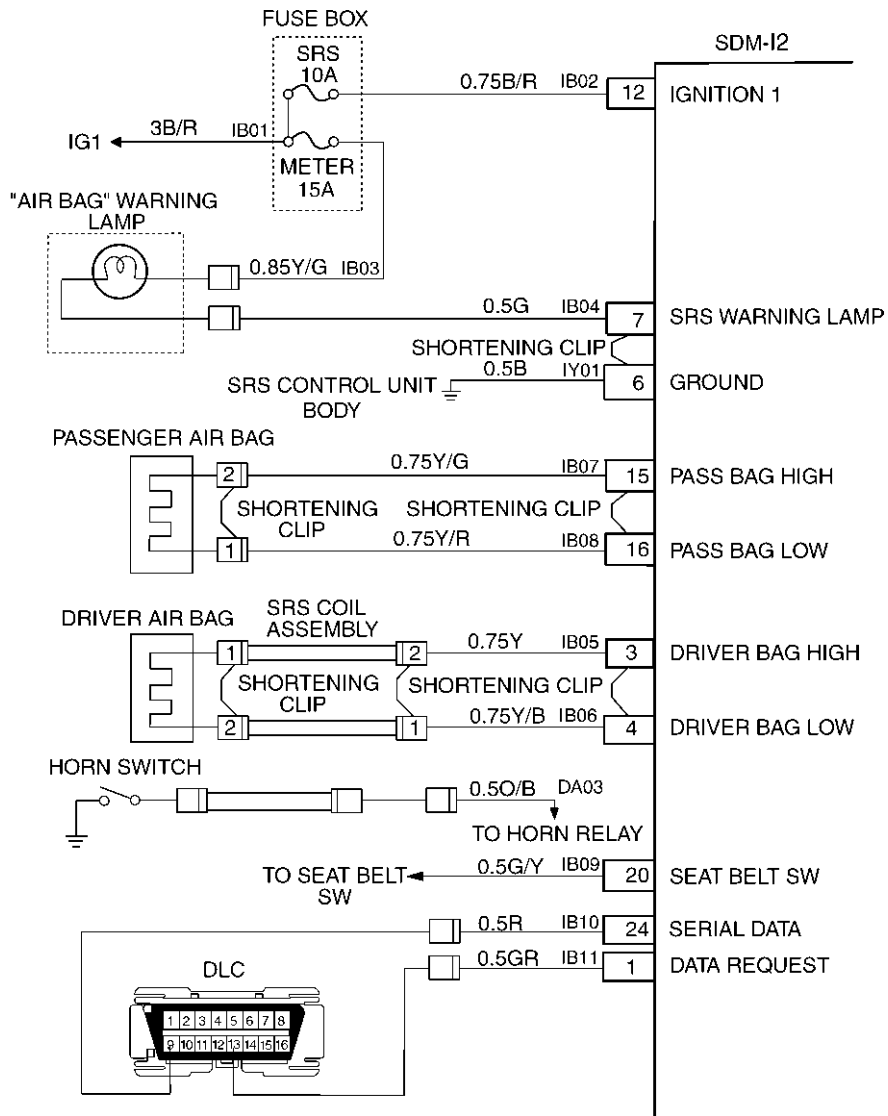

The Supplemental Restraint System (SRS) helps supplement the protection offered by the driver and front passenger seat belts by deploying an air bag from the center of the steering wheel and from the top of the right side of the instrument panel.

The air bag deploys when the vehicle is involved in a frontal crash of sufficient force up to 30 degrees off the centerline of the vehicle. To further absorb the crash energy there is a knee bolster located beneath the instrument panel for both the driver and passenger, and the steering column is collapsible.

System Description

The SRS consists of the Sensing and Diagnostic Module (SDM), the driver air bag assembly, the SRS coil assembly, the passenger air bag assembly, and the "AIR BAG" warning lamp in the instrument cluster. The SDM, SRS coil assembly (driver side only), driver air bag assembly, passenger air bag assembly and connector wire make up the deployment loops. The function of the deployment loops is to supply current through air bag assembly, which will cause deployment of the air bags in the event of a frontal crash of sufficient force, up to 30 degrees off the centerline of the vehicle. The air bag assemblies are only supplied enough current to deploy when the SDM detects vehicle velocity changes severe enough to warrant deployment. The SDM contains a sensing device which converts vehicle velocity change to an electrical signal. The electrical signal generated is processed by the SDM and then compared to a value stored in memory. When the generated signal exceeds the stored value, the SDM will cause current to flow through the air bag assembly deploying the air bags.

WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY.

The SDM is designed to perform the following functions in the Supplemental Restraint System (SRS):

1. Energy Reserve — The SDM maintains 24-Volt Loop Reserve (24VLR) energy supply to provide deployment energy when ignition voltage is lost in a frontal crash.
2. Frontal Crash Detection — The SDM monitors vehicle velocity changes to detect frontal crashes which are severe enough to warrant deployment.
3. Air Bag Deployment — When a frontal crash of sufficient force is detected, the SDM will cause enough current to flow through the air bag assembly to deploy the air bag.
4. Malfunction Detection — The SDM performs diagnostic monitoring of SRS electrical components and sets a diagnostic trouble code when a malfunction is detected.
5. Frontal Crash Recording — The SDM records information regarding SRS status during frontal crash.
6. Malfunction Diagnosis — The SDM displays SRS diagnostic trouble codes and system status information through the use of a scan tool.
7. Driver Notification — The SDM warns the vehicle driver of SRS malfunctions by controlling the "Air Bag" warning lamp.

The SDM is connected to the SRS wiring harness by a 24-pin connector. This harness connector uses a shorting clip across certain terminals in the contact area. This shorting clip connects the "AIR BAG" warning lamp to ground when the SDM harness connector is disconnected or Connector Position Assurance (CPA) is not inserted even if completely connected. This will cause the "AIR BAG" warning lamp to come "ON" steady whenever the ignition switch is at the ON or START positions with the SDM disconnected.

Component Description

SDM (Sensing and Diagnostic Module)

WARNING: DURING SERVICE PROCEDURES, BE VERY CAREFUL WHEN HANDLING A SDM. NEVER STRIKE OR JAR THE SDM. NEVER POWER UP THE SRS WHEN THE SDM IS NOT RIGIDLY ATTACHED TO THE VEHICLE. ALL SDM AND MOUNTING BRACKET FASTENERS MUST BE CAREFULLY TORQUED AND THE ARROW MUST BE POINTED TOWARD THE FRONT OF THE VEHICLE TO ENSURE PROPER OPERATION OF THE SRS. THE SDM COULD BE ACTIVATED WHEN POWERED

827RW067

Legend

- (1) Connector Position Assurance (CPA)
- (2) Supplemental Restraint System (SRS) Harness
- (3) Sensing and Diagnostic Module (SDM)

821RW116

SRS Coil Assembly

The SRS coil assembly consists of two current carrying coils. This is attached to the steering column and allow rotation of the steering wheel while maintaining continuous contact of the driver deployment loop to the driver air bag assembly.

There is a shorting clip on the yellow 2-pin connector near the base of steering column which connects the SRS coil to the SRS wiring harness.

The shorting clip shorts to the SRS coil and driver air bag assembly when the yellow 2-pin connector is disconnected. The circuit to the driver air bag assembly is shorted in this way to help prevent unwanted deployment of the air bag when servicing the steering column or other SRS components.

“Air Bag” Warning Lamp

Ignition voltage is applied to the “AIR BAG” warning lamp when the ignition switch is at the ON or START positions. The SDM controls the lamp by providing ground with a lamp driver. The “AIR BAG” warning lamp is used in the SRS to do the following:

1. Verify lamp and SDM operation by flashing SEVEN (7) times when the ignition switch is first turned “ON”.
2. Warn the vehicle driver of SRS electrical system malfunctions which could potentially affect the operation of the SRS. These malfunctions could result in nondeployment in case of a frontal crash or deployment for conditions less severe than intended.

The “AIR BAG” warning lamp is the key to driver notification of SRS malfunctions. For proper lamp operation, refer to the “SRS Diagnostic System Check” in this section.

825RS071

Air Bag Assemblies

The air bag assembly consist of an inflatable air bag

9J-6 SUPPLEMENTAL RESTRAINT SYSTEM

assembly and an inflator (a canister of gas-generating material and an initiating device). When the vehicle is in a frontal crash of sufficient force.

The SDM causes current flow through the deployment loops. Current passing through the inflator ignites the material in the air bag assembly. The gas produced from this reaction rapidly inflates the air bag assembly. There is a shorting clip on the driver air bag assembly connector which connects the SRS coil assembly. The shorting clip shorts across the driver air bag assembly circuits when driver air bag assembly connector is disconnected.

The circuit to the driver air bag assembly is shorted in this way to help prevent unwanted deployment of the air bag when servicing the driver air bag assembly, the steering column or other Supplemental Restraint System (SRS) components.

There is a shorting clip on the passenger air bag assembly connector which connects to the SRS harness. The shorting clip shorts across the passenger air bag assembly circuit when the passenger air bag assembly connector is disconnected. The circuit to the passenger air bag assembly is shorted in this way to help prevent unwanted deployment of the air bag when servicing the passenger air bag assembly, the instrument panel or other SRS components.

Steering Column

The steering column absorbs energy and is designed to compress in a frontal crash to decrease the chance of injury to the driver.

Knee Bolster

The knee bolsters are used to absorb energy to protect knees and control the forward movement of the vehicle's front seat occupants during a frontal crash, by limiting leg movement.

740RS021

Definition

Air Bag

An inflatable cloth cushion designed to deploy in certain frontal crashes. It supplements the protection offered by the seat belts by distributing the impact load more evenly over the vehicle occupant's head and torso.

(B+)

Battery voltage, (B+) The voltage available at the battery at the time of the indicated measurement. With the key "ON" and the engine not running, the system voltage will likely be between 12 and 12.5 volts. At idle the voltage may be 14 to 16 volts. The voltage could be as low as 10 volts during engine cranking.

Bulb Check

The Sensing and Diagnostic Module (SDM) will cause the "AIR BAG" warning lamp to flash seven times and then go "OFF" whenever the ignition switch transitions to the ON position from any other ignition switch position and no malfunctions are detected.

"CONTINUOUS MONITORING"

Tests performed by the SDM on the SRS every 100 milliseconds while "Ignition 1" voltage is in the normal operating voltage range at the SDM.

Data Link Connector (DLC)

Formerly "DLC" a connector which allows communication with an external computer, such as a scan tool.

Deploy

To inflate the air bag.

Deployment Loops

The circuits which supply current to the air bag assemblies to deploy the air bag.

Diagnostic Trouble Code (DTC)

Formerly "Code", a numerical designator used by the SDM to indicate specific SRS malfunctions.

Driver Current Source

An output of the SDM which applies current into the driver air bag assembly circuit during the "Initiator Assembly Resistance Test".

Driver Air Bag Assembly

An assembly located in the steering wheel hub consisting of an inflatable bag, an inflator and an initiator.

EEPROM

Electrically Erasable Programmable Read Only Memory. Memory which retains its contents when power is removed from the SDM.

Ignition Cycle

The voltage at the SDM "Ignition 1" inputs, with ignition switch "ON", is within the normal operating voltage range for at least ten seconds before turning ignition switch "OFF".

Ignition 1

A battery voltage (B+) circuit which is only powered with the ignition switch in the ON, or START positions.

Initiator

The electrical component inside the air bag assembly which, when sufficient current flows, sets off the chemical reaction that inflates the air bag.

"Initiator Assembly Resistance Test"

Tests performed once each ignition cycle when no malfunctions are detected during "Turn-ON" or "Continuous Monitoring." This test checks for the correct SDM configuration for the vehicle, shorts to "Ignition 1" in the deployment loops, high resistance or opens in the "Driver Side High", "Driver Side Low", "Passenger Side High" and "Passenger Side Low" circuits and measures the resistance of the inflator assembly consisting of: 1) Initiators, 2) SRS coil assembly (driver side only), 3) Connectors and associated wiring.

Normal Operating Voltage Range

The voltage measured between the SDM "Ignition 1" terminals and "Ground" terminals is between 9 and 16 volts.

Passenger Current Source

An output of the SDM which applies current into the passenger air bag assembly circuit during the "Initiator Assembly Resistance Test".

Passenger Air Bag Assembly

An assembly located in the left side of the instrument panel consisting of an inflatable bag, an inflator and an initiator.

Scan Tool

An external computer used to read diagnostic information from onboard computers via the data link connector.

SDM

Sensing and Diagnostic Module which provides reserve energy to the deployment loops, deploys the air bags when required and performs diagnostic monitoring of all SRS components.

Serial Data

Information representing the status of the SRS.

SRS

Supplemental Restraint System.

SRS Coil Assembly

An assembly of two current-carrying coils in the driver deployment loop that allows the rotation of the steering wheel while maintaining the continuous contact of the driver deployment loop to the driver air bag assembly.

SRS Wiring Harness

The wires and connectors that electrically connect the components in the Supplemental Restraint System (SRS).

"Turn-ON"

Test which the Sensing and Diagnostic Module (SDM) performs on the SRS once during each ignition cycle immediately after "Ignition 1" voltage is applied to the SDM and before "Continuous Monitoring".

Diagnosis

WARNING: TO AVOID DEPLOYMENT WHEN TROUBLESHOOTING THE SRS, DO NOT USE ELECTRICAL TEST EQUIPMENT SUCH AS A BATTERY-POWERED OR AC-POWERED VOLTMETER, OHMMETER, ETC., OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN THAT SPECIFIED IN THIS MANUAL. DO NOT USE A NON-POWERED PROBE-TYPE TESTER. INSTRUCTIONS IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT.

Diagnostic Trouble Codes

The "SRS Diagnostic System Check" must always be the starting point of any SRS diagnosis. The "SRS Diagnostic System Check" checks for proper "AIR BAG" warning lamp operation and checks for SRS diagnostic trouble codes using the scan tool.

1. Current diagnostic trouble codes – Malfunctions that are presently being detected. Current diagnostic trouble codes are stored in Random Access Memory (RAM).
2. History diagnostic trouble codes – All malfunctions detected since the last time the history memory was cleared. History diagnostic trouble codes are stored in Electronically Erasable Programmable

Read Only Memory (EEPROM).

Scan Tool Diagnostics

A scan tool is used to read current and history diagnostic trouble codes and to clear all diagnostic trouble codes after a repair is completed. The scan tool must be updated to communicate with the SRS through a replaceable cartridge before it can be used for SRS diagnostics. To use the scan tool, connect it to the data link connector and turn the ignition switch "ON". The scan tool reads serial data from the SDM "Serial Data" line terminal "24" to the data link connector terminal "9".

Use of Special Tools

WARNING: TO AVOID DEPLOYMENT WHEN TROUBLESHOOTING THE SRS, DO NOT USE ELECTRICAL TEST EQUIPMENT SUCH AS A BATTERY-POWERED OR AC-POWERED VOLTMETER, OHMMETER, ETC, OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN THAT SPECIFIED IN THIS MANUAL. DO NOT USE A NON POWERED PROBE-TYPE TESTER. INSTRUCTIONS IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT. YOU SHOULD BE FAMILIAR WITH THE TOOLS LISTED IN THIS SECTION UNDER THE HANDLING SRS SPECIAL TOOLS.

You should be able to measure voltage and resistance. You should be familiar with proper use of a scan tool such as the Tech 2 Diagnostic Computer, SRS Driver/ Passenger Load Tool 5-8840-2421-0, Connector Test Adapter Kit 5-8840-0385-0, and the DVM (Digital Multimeter) 5-8840-0285-0.

Repairs and Inspections Required After an Accident

NOTE: If any SRS components are damaged, they must be replaced. If SRS component mounting points are damaged, they must be replaced.

- Never use SRS parts from another vehicle. This does not include remanufactured parts purchased from an authorized dealer; they may be used for SRS repairs.
- Do not attempt to service the SDM, the SRS coil assembly, or the air bag assembly. Service of these items is by replacement only.
- Verify the part number of replacement air bag assembly.

CAUTION: Never use the air bag assembly from another vehicle.

Use only the air bag assembly for UE models.

CAUTION: Proper operation of the sensors and

Supplemental Restraint System (SRS) requires that any repairs to the vehicle structure return it to the original production configuration. Deployment requires, at a minimum, replacement of the SDM, air bag assembly and dimensional inspection of the steering column. Any visible damage to the SDM mounting bracket (s) requires replacement, and the steering column must be dimensionally inspected, whether deployment occurred or not.

Accident With Deployment – Component Replacement and Inspections

Certain SRS components must be replaced or inspected for damage after a frontal crash involving air bag deployment. Those components are:

- Air bag assembly
- SDM

CAUTION: Refer to "SDM Replacement Guidelines" below for important information on Sensing and

Diagnostic Module (SDM) replacement in both deployment and non deployment crashes.

- Supplemental Restraint System (SRS) coil assembly—Inspect wiring and connector for any signs of scorching, melting, or damage due to excessive heat. Replace if damaged. Refer to SRS coil assembly in this section.

Accident With or Without Deployment—Component Inspection

Certain SRS and restraint system components must be inspected after any crash, whether the air bag deployed or not. Those components are:

- Steering column—Dimensionally inspect per "Checking Steering Column for Accident Damage" in 3 of this workshop manual.
- Knee bolsters and mounting points— Inspect for any distortion, bending, cracking, or other damage.
- Instrument panel steering column reinforcement plate— Inspect for any distortion, bending, cracking, or other damage.
- Instrument panel braces—Inspect for any distortion, bending, cracking, or other damage.
- Seat belts and mounting points—Refer to "Seat Belts" in 10 of this workshop manual.

SDM Replacement Guidelines

SDM replacement policy requires replacement of SDM, after crash involving air bag deployment when "SRS Warning Lamp" turn "ON", "SRS Diagnosis" should be done according to "Section".

Wiring Damage

If any SRS wire harness is damaged, it should be replaced. Don't repair SRS. It is replace only.

SRS Connector (Plastic Body And Terminal Metal Pin) Damage

If any connector or terminal in the SRS wire harness (except pigtails) is damaged, it should be replaced.

SRS Wire Pigtail Damage

If the wiring pigtail (a wire or wires attached directly to the device, not by a connector) is damaged, the entire component (with pigtail) must be replaced. Examples of "pigtail" components are the driver air bag assembly, the passenger air bag assembly, and the SRS coil assembly.

On-Vehicle Service

Service Precautions

WARNING: WHEN PERFORMING SERVICE ON OR AROUND SRS COMPONENTS OR SRS WIRING, FOLLOW THE PROCEDURES LISTED BELOW TO TEMPORARILY DISABLE THE SRS. FAILURE TO FOLLOW PROCEDURES COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY OR OTHERWISE UNNEEDED SRS REPAIRS.

The SDM in Driver—Passenger SRS can maintain sufficient voltage to cause a deployment for up to 15 seconds after the ignition switch is turned "OFF", the battery is disconnected, or the fuse powering the SDM is removed.

Many of the service procedures require removal of the "SRS" fuse, and disconnection of the air bag assembly from the deployment loop to avoid an accidental deployment. If the air bag assembly is disconnected from the deployment loop as noted in the "Disabling the SRS" procedure that follows, service can begin immediately without waiting for the 15 second time period to expire.

Disabling The SRS

Removal

Turn the ignition switch to "lock" and remove key.

1. Remove SRS fuse "METER" and "SRS", from left dash side lower fuse block or disconnect battery.
2. Disconnect yellow 2-pin connector at the base of steering column.
3. Remove glove box assembly, Refer to "Passenger Air Bag Assembly Replacement" in section.
4. Disconnect yellow 2-pin connector behind the glove box assembly.

CAUTION: With the "SRS" fuse removed and ignition switch "ON", "AIR BAG" warning lamp will be "ON". This is normal operation and does not indicate an SRS malfunction.

Enabling The SRS

Installation

CAUTION: Never use the air bag assembly from another vehicle. Use only the air bag assembly for UE models.

Turn ignition switch to "LOCK" and remove key.

1. Connect yellow 2-pin connector passenger air bag assembly.
2. Install glove box assembly, refer to "Passenger Air Bag Assembly Replacement" in section.
3. Connect yellow 2-pin connector at the base of steering column.
4. Install "AIR BAG" fuse "METER" and "SRS" to left dash side lower fuse block or connect battery.

Turn ignition switch to "ON" and verify that the "AIR

BAG" warning lamp flashes seven times and then turns "OFF" If it does not operate as described, perform the "Supplemental Restraint System (SRS) Diagnostic System Check" in section.

Handling / Installation / Diagnosis

1. Air bag assembly should not be subjected to temperatures above 93°C (200°F).
2. Air bag assembly, and Sensing and Diagnostic Module (SDM) should not be used if they have been dropped from a height of 100 centimeters (3.28 feet).
3. When a SDM is replaced, it must be oriented with the arrow on the sensor pointing toward the front of the vehicle. It is very important for the SDM to be located flat on the mounting surface, parallel to the vehicle datum line. It is important that the SDM mounting surface is free of any dirt or other foreign material.
4. Do not apply power to the SRS unless all components are connected or a diagnostic chart requests it, as this will set a diagnostic trouble code.
5. The "SRS Diagnostic System Check" must be the starting point of any SRS diagnostics. The "SRS Diagnostic System Check" will verify proper "AIR BAG" warning lamp operation and will lead you to the correct chart to diagnose any SRS malfunctions. Bypassing these procedures may result in extended diagnostic time, incorrect diagnosis, and incorrect parts replacement.

Air Bag Assembly Handling / Shipping / Scrapping

Live (Undeployed) Air Bag Assembly

Special care is necessary when handling and storing a live (undeployed) air bag assembly. The rapid gas generation produced during deployment of the air bag could cause the air bag assembly, or an object in front of the air bag assembly, to be thrown through the air in the unlikely event of an accidental deployment.

827RX037

WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG OPENING IS POINTED AWAY FROM YOU. IN CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. NEVER CARRY THE AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF THE MODULE.

ALWAYS CARRY INFLATOR MODULE WITH TRIM COVER AWAY FROM BODY.

ALWAYS PLACE INFLATOR MODULE ON WORKBENCH WITH TRIM COVER UP, AWAY FROM LOOSE OBJECTS.

827RS044

Air Bag Assembly Shipping Procedure For Live (Undeployed) Air Bag Assemblies

Service personnel should refer to the latest Service Bulletins for proper Supplemental Restraint System (SRS) air bag assembly shipping procedures.

Deployed Air Bag Assembly

"You should wear gloves and glasses. After the air bag assembly has been deployed, the surface of the air bag may contain solid particulate. This solid particulate consists primarily of by products of the chemical reaction, Potassium Chloride and copper metal dust. Compounds of Potassium Borate, Strontium Chloride, Copper Chloride, and Ammonium Chloride may be found in amounts of about 1% (each) of the total particulate."

Air Bag Assembly Scrapping Procedure

During the course of a vehicle's useful life, certain situations may arise which will necessitate the disposal of a live (undeployed) air bag assembly. This information covers proper procedures for disposing of a live air bag assembly.

Before a live air bag assembly can be disposed of, it must be deployed. A live air bag assembly must not be disposed of through normal refuse channels.

WARNING: FAILURE TO FOLLOW PROPER SRS AIR BAG ASSEMBLY DISPOSAL PROCEDURES CAN RESULT IN AIR BAG DEPLOYMENT WHICH MAY CAUSE PERSONAL INJURY. AN UNDEPLOYED AIR BAG ASSEMBLY MUST NOT BE DISPOSED OF THROUGH NORMAL REFUSE CHANNELS. THE UNDEPLOYED AIR BAG ASSEMBLY CONTAINS SUBSTANCES THAT CAN CAUSE SEVERE ILLNESS OR PERSONAL INJURY IF THE SEALED CONTAINER IS DAMAGED DURING DISPOSAL. DISPOSAL IN ANY MANNER INCONSISTENT WITH PROPER PROCEDURES MAY BE A VIOLATION OF FEDERAL, STATE, AND / OR LOCAL LAW.

In situations which require deployment of a live air bag assembly module, deployment may be accomplished inside or outside the vehicle. The method employed depends upon the final disposition of the particular vehicle, as noted in "Deployment Outside Vehicle" and "Deployment Inside Vehicle" in this section.

Cautions About Air Bag Deployment And Disposal

Failure to follow proper procedures could result in erroneous air bag deployment which may cause personal injury be sure to follow proper procedures.

1. Turn off (Lock) the ignition switch and disconnect the minus terminal of the battery, then start the work 15 or more sec later. (Air bag is designed to work by the back-up power source even if the battery power source is cut off at vehicle collision).
2. Be sure not to disassemble the air bag.

3. Do not give an impact to the air bag and bring the air bag close to magnet. (The air bag could deploy unexpectedly).
4. Place the air bag with its trim cover up.
5. Do not let the air bag deploy directly on the floor. (The air bag may be blown off 20 ~ 30 cm (6.5 or 10 feet)).
6. Be sure to install the air bag firmly to a deployment tool (fixing tool).
7. Set a battery 10 m (33 feet) or more away from the air bag.
8. Before disconnecting air bag harness, ground the worker by touching the vehicle outer panel with bare hand.
9. When connecting or disconnecting the harness, do not work just in front of the air bag.
10. As deployment gives rise to big sound, warn the people around against it. Further, try to reduce the sound by covering the steering wheel or tires, and shut the vehicle windows in case of deployment inside the vehicle.
11. As deployment generates smoke, select a well ventilated place. (In case of deployment indoors, avoid deployment just under a fire alarm, smoke sensor, and fluorescent lamps).
12. Be careful not to inhale the smoke after deployment.
13. If part of the vehicle glass is damaged, cover the vehicle with a car cover to prevent the glass from braking at the time of deployment.
14. Do not touch the air bag immediately after deployment, since it remains hot for 30 minutes.
15. Do not water the air bag immediately after deployment.
16. Wear safety glasses and gloves throughout the work and wash the glasses and gloves after the work.
17. Do not reuse the removed air bag for another vehicle. (Deployment characteristic is different with vehicle types).

Deployment Outside Vehicle (Driver Air Bag Assembly)

Deployment outside the vehicle is proper when the vehicle is to be returned to service. This includes, for example, situations in which the vehicle will be returned to useful service after a functionally or cosmetically deficient air bag assembly is replaced. Deployment and disposal of a malfunctioning air bag assembly is, of course, subject to any required retention period. For deployment of a live (undeployed) air bag assembly outside the vehicle, the deployment procedure must be followed exactly. Always wear safety glasses during this deployment procedure until a deployed air bag assembly is scrapped or until an undeployed air bag assembly is shipped. Before performing the procedures you should be familiar with servicing the SRS and with proper handling of the air bag assembly. Procedures

should be read fully before they are performed. The following procedure requires use of 5-8840-2468-0 Supplemental Restraint System (SRS) Deployment Harness with the appropriate pigtail adapter. The procedure also requires the use of 5-8840-2420-0 Driver Side SRS Deployment Fixture. Do not attempt this procedure without 5-8840-2468-0 and fixture 5-8840-2420-0.

901RX046

901RX062

WARNING: FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED MAY RESULT IN PERSONAL INJURY. NEVER CONNECT DEPLOYMENT HARNESS TO ANY POWER SOURCE BEFORE CONNECTING DEPLOYMENT HARNESS TO THE DRIVER AIR BAG ASSEMBLY. DEPLOYMENT HARNESS SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. WEAR SAFETY GLASSES THROUGHOUT THIS

ENTIRE DEPLOYMENT AND DISPOSAL PROCEDURE.

NOTE: This information applies only to driver air bag assembly. Refer to "Deployment Outside Vehicle (Passenger Air Bag Assembly)" in this section for information on passenger air bag assembly scrapping.

18. Turn ignition switch to "LOCK", remove key and put on safety glasses.
19. Inspect 5-8840-2419-0 SRS Deployment Harness and appropriate pigtail adapter for damage. If harness or pigtail adapter is damaged, discard and obtain a replacement.
20. Short the two SRS deployment harness leads together by fully seating one banana plug into the other. SRS deployment harness shall remain shorted and not be connected to a power source until the air bag is to be deployed.

827RS003

21. Connect the appropriate pigtail adapter to the SRS deployment harness.

827RS004

9J-14 SUPPLEMENTAL RESTRAINT SYSTEM

1. Remove the driver air bag assembly from vehicle.
Refer to driver air bag assembly Removal in this Section.

WARNING: WHEN STORING A LIVE AIR BAG ASSEMBLY OR WHEN LEAVING A LIVE AIR BAG ASSEMBLY UNATTENDED ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE AIR BAG AND TRIM COVER UP AND AWAY FROM THE SURFACE. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. FAILURE TO FOLLOW PROCEDURES MAY RESULT IN PERSONAL INJURY.

22. Clear a space on the ground about 183 cm (6 feet) in clearance where the driver air bag assembly is to be deployed. A paved, outdoor location where there is no activity is preferred. If an outdoor location is not available, a space on the shop floor where there is no activity and sufficient ventilation is recommended. Ensure no loose or flammable objects are within the deployment area.

23. Place the J-41497 on the bench vice. This is necessary to provide sufficient stabilization of the fixture during deployment.
24. Attach the Driver air bag assembly in the J-41497. Air bag assembly must be mounted such that the bag will deploy upward. **SECURELY HAND-TIGHTEN ALL FASTENERS PRIOR TO DEPLOYMENT.**
25. Extend double pole extension cord to a position for away 10 m (33 feet) from the air bag assembly.
26. Place a power source near the shorted end of the SRS deployment harness. Recommended application: 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.

27. Connect the driver air bag assembly to the pigtail adapter on the Supplemental Restraint System (SRS) deployment harness. Deployment harness shall remain shorted and not be connected to a power source until the air bag is to be deployed. The driver air bag assembly will immediately deploy the air bag when a power source is connected to it.

NOTE: Ensure that the pigtail adapter is firmly seated into the driver air bag assembly connector. Failure to fully seat the connectors may leave the shorting bar located in the driver air bag assembly connector functioning (shorted) and may result in non deployment of the driver air bag assembly.

28. Verify that the area around the driver air bag assembly is clear of all people and loose or flammable objects.
29. Verify that the driver air bag assembly is firmly and properly in 5-8840-2420-0.
30. Notify all people in the immediate area that you intend to deploy the driver air bag. The deployment will be accompanied by a substantial noise which may startle the uninformed.
31. Separate the two banana plugs on the SRS deployment harness.

NOTE: When the air bag deploys, the rapid gas expansion will create a substantial noise. Notify all people in the immediate area that you intend to deploy the driver air bag.

WARNING: DEPLOYMENT HARNESS SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. CONNECTING THE DEPLOYMENT HARNESS TO THE POWER SOURCE SHOULD ALWAYS BE THE LAST STEP IN THE AIR BAG ASSEMBLY DEPLOYMENT PROCEDURE. FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED MAY RESULT IN PERSONAL INJURY.

32. Connect the Supplemental Restraint System (SRS) deployment harness wires to the power source to immediately deploy the driver air bag. Recommended application: 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.
33. Disconnect the SRS deployment harness from the power source.
34. Short the two SRS deployment harness leads together by fully seating one banana plug into the other.
35. In the unlikely event that the driver air bag assembly did not deploy after following these procedures, proceed immediately with Steps 24 through 26. If the driver air bag assembly did deploy, proceed with Steps 20 through 23.
36. Put on a pair of shop gloves and safety glasses to protect your hands and eyes from possible irritation and heat when handling the deployed driver air bag assembly. After the air bag assembly has been deployed, the surface of the air bag may contain solid particulate. This solid particulate consists primarily of by products of the chemical reaction, Potassium Chloride and copper metal dust. Compounds of Potassium Borate, Strontium Chloride, Copper Chloride, and Ammonium Chloride may be found in amounts of about 1% (each) of the total particulate.

WARNING: SAFETY PRECAUTIONS MUST BE OBSERVED WHEN HANDING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE METAL SURFACES OF THE AIR BAG ASSEMBLY WILL BE VERY HOT. ALLOW THE INFLATOR MODULE TO COOL BEFORE HANDLING ANY METAL PORTION OF IT. DO NOT PLACE THE DEPLOYED AIR BAG ASSEMBLY NEAR ANY FLAMMABLE OBJECTS. FAILURE TO FOLLOW PROCEDURES MAY RESULT IN FIRE OR PERSONAL INJURY.

AFTER A DRIVER AIR BAG ASSEMBLY HAS BEEN DEPLOYED, THE METAL CANISTER AND SURROUNDING AREAS OF THE DRIVER AIR BAG ASSEMBLY WILL BE VERY HOT. DO NOT TOUCH THE METAL AREAS OF THE DRIVER AIR BAG ASSEMBLY FOR ABOUT TEN MINUTES AFTER DEPLOYMENT. IF THE DEPLOYED DRIVER AIR BAG ASSEMBLY MUST BE MOVED BEFORE IT IS COOL,

WEAR GLOVES AND HANDLE BY THE AIR BAG OR TRIM COVER.

37. Disconnect the pigtail adapter from the driver air bag assembly as soon after deployment as possible. This will prevent damage to the pigtail adapter or SRS deployment harness due to possible contact with the hot driver air bag assembly canister. The pigtail adapter can be reused. They should, however, be inspected for damage after each deployment and replaced if necessary.
38. Dispose of the deployed driver air bag assembly through normal refuse channels after it has cooled for at least 30 minutes.
39. Wash your hands with mild soap and water afterward.

NOTE: The remaining steps are to be followed in the unlikely event that the driver air bag assembly did not deploy after following these procedures.

40. Ensure that the SRS deployment harness has been disconnected from the power source and that its two banana plugs have been shorted together by fully seating one banana plug into the other.

827RW055

41. Disconnect the pigtail adapter from the driver air bag assembly.

WARNING: WHEN STORING A LIVE AIR BAG ASSEMBLY OR WHEN LEAVING A LIVE INFLATOR MODULE UNATTENDED ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE BAG AND TRIM COVER UP AND AWAY FROM THE SURFACE. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. FAILURE TO FOLLOW PROCEDURES MAY RESULT IN PERSONAL INJURY.

42. Temporarily store the driver air bag assembly with its trim cover facing up, away from the surface upon which it rests.

Deployment Outside Vehicle (Passenger Air Bag Assembly)

WARNING: FAILURE TO FOLLOW PROPER SRS AIR BAG ASSEMBLY DISPOSAL PROCEDURES CAN RESULT IN AIR BAG DEPLOYMENT WHICH MAY CAUSE PERSONAL INJURY. UNDEPLOYED AIR BAG ASSEMBLIES MUST NOT BE DISPOSED OF THROUGH NORMAL REFUSE CHANNELS. THE UNDEPLOYED AIR BAG ASSEMBLY CONTAINS SUBSTANCES THAT CAN CAUSE SEVERE ILLNESS OR PERSONAL INJURY IF THE SEALED CONTAINER IS DAMAGED DURING DISPOSAL. DISPOSAL IN ANY MANNER INCONSISTENT WITH PROPER PROCEDURES MAY BE A VIOLATION OF FEDERAL, STATE AND/OR LOCAL LAWS.

Deployment out of the vehicle is proper when the vehicle is to be returned to service. This includes, for example, situations in which a functionally or cosmetically deficient air bag assembly is replaced. Deployment and disposal of an air bag assembly is, of course, subject to any required retention period. For deployment of a live air bag assembly out of the vehicle, the deployment procedure must be followed exactly. Always wear safety glasses during this deployment procedure until the deployed air bag assembly is scrapped. Before performing the procedures, you should be familiar with servicing the SRS system and with proper handling of the air bag assembly. Procedures should be read fully before they are performed.

The following procedure requires use of 5-8840-2468-0 SRS Deployment Harness with the appropriate pigtail adapter. The procedure also requires the use of 5-8840-2420-0 Passenger Side Supplemental Restraint System (SRS) Deployment Fixture. Do not attempt this procedure without 5-8840-2468-0 and fixture 5-8840-2420-0.

901RX046

901RW068

WARNING: FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED MAY RESULT IN PERSONAL INJURY. NEVER CONNECT DEPLOYMENT HARNESS TO ANY POWER SOURCE BEFORE CONNECTING DEPLOYMENT HARNESS TO THE AIR BAG ASSEMBLY. DEPLOYMENT HARNESS SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. WEAR SAFETY GLASSES THROUGHOUT THIS ENTIRE DEPLOYMENT AND DISPOSAL PROCEDURE.

NOTE: This information applies only to passenger air bag assembly. Information for disposing of a live driver air bag assembly can be found in "Deployment Outside Vehicle" (Driver Air Bag Assembly) in this section.

43. Turn ignition switch to "LOCK" remove key, and put on safety glasses.
44. Inspect 5-8840-2419-0 SRS Deployment Harness and appropriate pigtail adapter for damage. If harness or pigtail is damaged, discard and obtain a replacement.
45. Short the two SRS Deployment Harness leads together by fully seating one banana plug into the other. The SRS Deployment Harness shall remain shorted and not be connected to a power source until the air bag is to be deployed.

827RS003

46. Connect the appropriate pigtail adapter to the Supplemental Restraint System (SRS) Deployment Harness

827RS004

47. Remove passenger air bag assembly from vehicle. Refer to "Passenger Air Bag Assembly Removal" in this Section.
48. Clear a space on the ground approximately 183 cm (6 feet) in clearance where the fixture with attached air bag assembly is to be placed for deployment. A paved outdoor location where there is no activity is preferred. If an outdoor location is not available, a space on the shop floor where there is no activity and sufficient ventilation is recommended. Ensure that no loose or flammable objects are within the deployment area.
49. Place the 5-8840-2420-0 on the bench vice. This is necessary to provide sufficient stabilization of the fixture during deployment.
50. Attach the passenger air bag assembly in the 5-

8840-2420-0. Air bag assembly must be mounted such that the bag will deploy upward. SECURELY HAND-TIGHTEN ALL FASTENERS PRIOR TO DEPLOYMENT.

51. Extend double pole extension cord to a position for away 10 m (33 feet) from the air bag assembly.
52. Place a power source near the shorted end of the SRS deployment harness. (Recommended application: 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.)

827RX043

53. Connect the air bag assembly to the pigtail adapter on the SRS deployment harness. The SRS Deployment Harness shall remain shorted and not be connected to a power source until the air bag is to be deployed. The air bag assembly will immediately deploy the air bag when a power source is connected to it.

NOTE: Ensure that the pigtail adapter is firmly seated into the air bag assembly connector. Failure to fully seat the connectors may leave the shorting bar located in the air bag assembly connector functioning (shorting the deployment circuit) and may result in non deployment of the air bag assembly.

54. Verify that the area around the passenger air bag assembly is clear of all people and loose or flammable objects.
55. Verify that the passenger air bag assembly is firmly and properly in 5-8840-2420-0.

56. Notify all people in the immediate area of your intention to deploy the passenger air bag assembly. The deployment will be accompanied by a substantial noise which may startle the uninformed.
57. Separate the two banana plugs on the Supplemental Restraint System (SRS) deployment harness.

NOTE: When air bag deploys, the rapid gas expansion will create a substantial noise. Notify all people in the immediate area that you intend to deploy the air bag assembly.

WARNING: DEPLOYMENT HARNESS SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. CONNECTING THE DEPLOYMENT HARNESS TO THE POWER SOURCE SHOULD ALWAYS BE THE LAST STEP IN THE AIR BAG ASSEMBLY DEPLOYMENT PROCEDURE. FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED MAY RESULT IN PERSONAL INJURY.

58. Connect the SRS deployment harness wires to the power source to immediately deploy the air bag assembly. Recommended application : 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.
59. Disconnect the SRS deployment harness from the power source.
60. Short the two SRS deployment harness leads together by fully seating one banana plug into the other.
61. In the unlikely event that the passenger air bag assembly did not deploy after following these procedures, proceed immediately with Steps 24 through 26. If the passenger air bag assembly deployed as intended, proceed with Steps 20 through 23.
62. Put on a pair of shop gloves and safety glasses to protect your hands and eyes from possible irritation and heat when handling the deployed air bag assembly. After the air bag assembly has been deployed, the surface of the air bag may contain a powdery residue. This powder consists primarily of cornstarch (used to lubricate the bag as it inflates) and by products of the chemical reaction. Sodium hydroxide dust (similar to lye soap) is produced as a by product of the deployment reaction. The sodium hydroxide quickly reacts with the atmospheric moisture and is converted to sodium carbonate and sodium bicarbonate (baking soda). Therefore, it is unlikely that sodium hydroxide will be present for very long after deployment.

WARNING: SAFETY PRECAUTIONS MUST BE OBSERVED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE

METAL SURFACES OF THE AIR BAG ASSEMBLY WILL BE HOT. ALLOW THE AIR BAG ASSEMBLY TO COOL BEFORE HANDLING ANY METAL PORTION OF IT. DO NOT PLACE THE DEPLOYED INFLATOR MODULE NEAR ANY FLAMMABLE OBJECTS. FAILURE TO FOLLOW PROCEDURES MAY RESULT IN FIRE OR PERSONAL INJURY. AFTER AN AIR BAG ASSEMBLY HAS BEEN DEPLOYED, THE METAL CANISTER AND SURROUNDING AREAS OF THE AIR BAG ASSEMBLY WILL BE HOT. DO NOT TOUCH THE METAL AREAS OF THE AIR BAG ASSEMBLY FOR ABOUT THIRTY MINUTES AFTER DEPLOYMENT. IF THE DEPLOYED AIR BAG ASSEMBLY MUST BE MOVED BEFORE IT IS COOL, WEAR GLOVES AND HANDLE BY THE AIR BAG ITSELF.

63. Disconnect the pigtail adapter from the air bag assembly as soon after deployment as possible to avoid damage to the pigtail adapter or SRS deployment harness from contacting the hot air bag assembly canister. The pigtail adapter and SRS deployment harness are designed to be reused. They should, however, be inspected for damage after each deployment and replaced if necessary.
64. Dispose of the deployed air bag assembly through normal refuse channels after it has cooled for at least 30 minutes.
65. Wash your hands with mild soap and water afterward.

NOTE: The remaining steps are to be followed in the unlikely event that the air bag assembly did not deploy after following the above procedures.

66. Ensure that the SRS deployment harness has been disconnected from the the power source and that its two banana plugs have been shorted together by fully seating one banana plug into the other.

67. Disconnect the pigtail adapter from the air bag assembly.

WARNING: WHEN STORING A LIVE AIR BAG ASSEMBLY OR WHEN LEAVING A LIVE AIR BAG ASSEMBLY UNATTENDED ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE BAG UP AND AWAY FROM THE SURFACE. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. FAILURE TO FOLLOW PROCEDURES MAY RESULT IN PERSONAL INJURY.

68. Temporarily store the air bag assembly with the bag facing up, away from the surface upon which it rests.

Deployment Outside Vehicle (Fixing Air Bag on Tire)

Read and understand the items of “CAUTIONS ABOUT AIR BAG DEPLOYMENT AND DISPOSAL PROCEDURES” and “Usage of Deployment Tool” for safe deployment of air bag.

1. Remove air bag assembly from vehicle. Refer to air bag assembly Removal “in this section”.
2. Inspect 5-8840-2419-0 Supplemental Restraint System (SRS) Deployment Harness and appropriate pigtail adapter for damage. If harness or pigtail is damaged, discard and obtain a replacement.
3. Extend double pole extension cord to a position far away 10 m (33 feet) from the air bag assembly.
4. Place a power source near the extended end of SRS air bag deployment harness. (Use of 12V battery is recommended).

Legend

(A) 10 m (33 feet) or more

5. Insert one of the banana plugs into the other banana plug to short the two SRS air bag deployment harness. Do not the harness to a power source until deployment.

6. Prepare four 15 inch or larger tires without wheel and two same size tires with wheels.

7. How to fix Driver air bag.

1. Fix the air bag with its trim cover up on a tire with a wheel using an automobile use wire harness, (core size: 1.3 mm² (0.05 inch)) or a wire trebly at two or more points.
2. Connect SRS air bag assembly to the double pole extension cord of the air bag deployment harness.
Do not connect the deployment harness to a power source until air bag deployment.
(If connected the SRS air bag assembly deploys immediately)

NOTE: Ensure that the pigtail adapter is firmly seated into the air bag assembly connector. Failure to fully seat the connectors may leave the shorting bar located in the air bag assembly connector functioning (shorting the deployment circuit) and may result in non deployment of

9J-20 SUPPLEMENTAL RESTRAINT SYSTEM

the air bag assembly.

3. Place three tires without wheel on the tire on which air bag is fixed and a tire with a wheel on top. Bind the five tires with a rope so that the tires may not collapse.

Legend

(A) 10 m (33 feet) or more

8. How to fix Passenger air bag.

1. Fix the air bag with its trim cover side fixing the center of a tire without a wheel using an automobile use wire harness, (core size: 1.3 mm (0.05 inch)) or a wire trebly at two or more points.

2. Connect Supplemental Restraint System (SRS) air bag assembly to the deployment harness double pole extension cord end. Be sure not to connect the deployment harness to a power source. (If connected the SRS air bag assembly deploys immediately).

NOTE: Ensure that the pigtail adapter is firmly seated into the air bag assembly connector. Failure to fully seat the connectors may leave the shorting bar located in the air bag assembly connector functioning (shorting the deployment circuit) and may result in non deployment of the air bag assembly.

3. Put a tire without wheel on another, put the tire on which the air bag is fixing, put a tire without a wheel, and finally put a tire with a wheel on top. Bind the tires with a rope so that the tires pile may not collapse.

827RW050

Legend

(A) 10 m (33 feet) or more

9. Notify all people in the immediate area of your intention to deploy the passenger air bag assembly. The deployment will be accompanied by a substantial noise which may startle the uninformed.

WARNING: DEPLOYED HARNESS SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A CONNECTING THE DEPLOYMENT HARNESS TO THE POWER SOURCE SHOULD ALWAYS BE THE LAST STEP IN THE AIR BAG ASSEMBLY DEPLOYMENT PROCEDURE. FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED MAY RESULT IN PERSONAL INJURY.

10. Connect the Supplemental Restraint System (SRS) deployment harness wires to the power source to immediately deploy the air bag assembly. Recommended application : 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.

827LW011

WARNING: SAFETY PRECAUTIONS MUST BE OBSERVED WHEN HANDING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE METAL SURFACES OF THE AIR BAG ASSEMBLY WILL BE VERY HOT. ALLOW THE AIR BAG ASSEMBLY TO COOL BEFORE HANDLING ANY METAL PORTION OF IT. DO NOT PLACE THE DEPLOYED INFLATOR MODULE NEAR ANY FLAMMABLE OBJECTS. FAILURE TO FOLLOW PROCEDURES MAY RESULT IN FIRE OR PERSONAL INJURY. AFTER AN AIR BAG ASSEMBLY HAS BEEN DEPLOYED, THE METAL CANISTER AND SURROUNDING AREAS OF THE AIR BAG ASSEMBLY WILL BE HOT. DO NOT TOUCH THE METAL AREAS OF THE AIR BAG ASSEMBLY FOR ABOUT THIRTY MINUTES AFTER DEPLOYMENT. IF THE DEPLOYED AIR BAG ASSEMBLY MUST BE MOVED BEFORE IT IS COOL, WEAR GLOVES AND HANDLE BY THE AIR BAG IT SELF.

11. Disconnect the pigtail adapter from the air bag assembly as soon after deployment as possible to avoid damage to the pigtail adapter or SRS deployment harness from contacting the hot air bag assembly canister. The pigtail adapter and SRS deployment harness are designed to be reused. They should, however, be inspected for damage after each deployment and replaced if necessary.
12. Dispose of the deployed air bag assembly through normal refuse channels after it has cooled for at least 30 minutes.
13. Wash your hands with mild soap and water afterward.

NOTE: The remaining steps are to be followed in the unlikely event that the air bag assembly did not deploy after following the above procedures.

14. Ensure that the SRS deployment harness has been disconnected from the power source and that its two banana plugs have been shorted together by fully

seating one banana plug into the other.

827RW055

2. Disconnect the pigtail adapter from the air bag assembly.

WARNING: WHEN STORING A LIVE AIR BAG ASSEMBLY OR WHEN LEAVING A LIVE AIR BAG ASSEMBLY UNATTENDED ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE BAG UP AND AWAY FROM THE SURFACE. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. FAILURE TO FOLLOW PROCEDURES MAY RESULT IN PERSONAL INJURY.

3. Temporarily store the air bag assembly with the bag facing up, away from the surface upon which it rests.

066RW030

Deployment Inside Vehicle (Vehicle Scrapping Procedure)

Deployment inside vehicle is proper when the vehicle is to be destroyed or salvaged for component parts. This includes, but is not limited to, the following situations:

1. The vehicle has completed its useful life.
2. The vehicle has been damaged beyond repair in a non deployment type accident.
3. The vehicle has been stripped or damaged beyond repair in a theft.
4. The vehicle will be salvaged for component parts to be used on a vehicle with a different Vehicle Identification Number (VIN) as opposed to being rebuilt as same VIN. Never use SRS components from another vehicle.

WARNING: FAILURE TO FOLLOW PROPER SRS AIR BAG ASSEMBLY DISPOSAL PROCEDURES CAN RESULT IN AIR BAG DEPLOYMENT WHICH MAY CAUSE PERSONAL INJURY. UNDEPLOYED AIR BAG ASSEMBLIES MUST NOT BE DISPOSED OF THROUGH NORMAL REFUSE CHANNELS. THE UNDEPLOYED AIR BAG ASSEMBLY CONTAINS SUBSTANCES THAT CAN CAUSE SEVERE ILLNESS OR PERSONAL INJURY IF THE SEALED CONTAINER IS DAMAGED DURING DISPOSAL. DISPOSAL IN ANY MANNER INCONSISTENT WITH PROPER PROCEDURES MAY BE A VIOLATION OF FEDERAL, STATE AND/OR LOCAL LAWS.

15. Turn ignition switch to "LOCK", remove key and put on safety glasses.
16. Remove all loose objects from front seats.
17. Disconnect Supplemental Restraint System (SRS) coil assembly, yellow 2-pin connector located at the base of the steering column.
18. Cut the SRS coil assembly yellow 2-pin harness connector from the vehicle leaving at least 16 cm (six inches) of wire at the connector.
19. Strip 13 mm (1/2 inch) of insulation from yellow-green and yellow-black wire lead of the connector.
20. Cut two 900 cm (30 feet) deployment wires from 0.8 mm² (18 gauge) or thicker multi-strand wire. These wires will be used to fabricate the driver deployment harness.
21. Strip 13 mm (1/2 inch) of insulation from both ends of the wires cut in the previous step.

- Short the wires by twisting together one end from each. Deployment wires shall remain shorted and not be connected to a power source until the air bag is to be deployed.

WARNING: FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED COULD RESULT IN PERSONAL INJURY. NEVER CONNECT DEPLOYMENT WIRES TO ANY POWER SOURCE BEFORE CONNECTING DEPLOYMENT WIRES TO THE AIR BAG ASSEMBLY LEADS. DEPLOYMENT WIRES SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. WEAR SAFETY GLASSES THROUGHOUT THIS ENTIRE DEPLOYMENT AND DISPOSAL PROCEDURE.

- Twist together one connector wire lead to one deployment wire. The connection should be mechanically secure.

- Bend twisted connection made in the previous step flat and wrap tightly with electrical tape to insulate and secure.

- Twist together, bend and tape the remaining connector wire lead to the remaining deployment wire.
- Connect the deployment harness to the driver air bag assembly, yellow 2-pin connector at the base of the steering column. Route deployment harness out the driver side of the vehicle.

WARNING: DEPLOYMENT WIRES SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT.

Connecting the deployment wires to the power source should always be the final step in the air bag assembly deployment procedure.

Failure to follow procedures in the order listed could result in personal injury.

- Disconnect passenger air bag assembly, yellow 2-pin connector located behind glove box assembly.
- Cut the passenger air bag assembly harness connector from the vehicle leaving at least 16 cm (six inches) of wire at the connector.
- Strip 13 mm (1/2 inch) of insulation from yellow-green and yellow-red wire lead of the connector.
- Cut two 900 cm (30 feet) deployment wires from 0.8 mm² (18 gauge) or thicker multi-strand wire. These wires will be used to fabricate the passenger deployment harness.
- Strip 13 mm (1/2 inch) of insulation from both ends of the wires cut in the previous step.

6. Short the wires by twisting together one end from each. Deployment wires shall remain shorted and not be connected to a power source until the air bag is to be deployed.

WARNING: FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED COULD RESULT IN PERSONAL INJURY. NEVER CONNECT DEPLOYMENT WIRES TO ANY POWER SOURCE BEFORE CONNECTING DEPLOYMENT WIRES TO THE AIR BAG ASSEMBLY LEADS. DEPLOYMENT WIRES SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN SAFETY GLASSES THROUGHOUT THIS ENTIRE DEPLOYMENT AND DISPOSAL PROCEDURE.

30. Twist together one connector wire lead to one deployment wire. The connection should be mechanically secure.

7. Bend twisted connection made in the previous step flat and wrap tightly with electrical tape to insulate and secure.

31. Twist together, bend and tape the remaining connector wire lead to the remaining deployment wire.
32. Connect the deployment harness to the passenger air bag assembly, yellow 2-pin connector located behind the glove box assembly. Route deployment harness out the passenger side of the vehicle.

WARNING: DEPLOYMENT WIRES SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. CONNECTING THE DEPLOYMENT WIRES SHOULD ALWAYS BE THE FINAL STEP IN THE AIR BAG ASSEMBLY DEPLOYMENT PROCEDURE. FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED COULD RESULT IN PERSONAL INJURY.

33. Verify that the inside of the vehicle and the area surrounding the vehicle are clear of all people and loose or flammable objects.
34. Stretch the driver and passenger deployment harness to their full length.
35. Completely cover windshield area and front door window openings with a drop cloth, blanket or similar item. This reduces the possibility of injury due to possible fragmentation of the vehicle's glass or interior.
36. Notify all people in the immediate area that you intend to deploy the air bags. The deployment will be accompanied by a substantial noise which may startle the uninformed.
37. Separate the two ends of the driver deployment harness wires.

WARNING: DEPLOYMENT WIRES SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. CONNECTING THE DEPLOYMENT WIRES TO THE POWER SOURCE SHOULD ALWAYS BE THE FINAL STEP IN THE AIR BAG ASSEMBLY DEPLOYMENT PROCEDURE. FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED COULD RESULT IN PERSONAL INJURY.

NOTE: When the air bag deploys, the rapid gas expansion will create a substantial noise. Notify all people in the immediate area that you intend to deploy the air bags.

38. Connect the driver deployment harness wires to a power source to immediately deploy the driver air bag assembly. Recommended application: 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.
39. Separate the two ends of the passenger deployment harness wires.

WARNING: DEPLOYMENT WIRES SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. CONNECTING THE DEPLOYMENT WIRES TO THE POWER SOURCE SHOULD ALWAYS BE THE FINAL STEP IN THE AIR BAG ASSEMBLY DEPLOYMENT PROCEDURE. FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED COULD RESULT IN PERSONAL INJURY.

40. Connect the passenger deployment harness wires to a power source to immediately deploy the passenger air bag assembly. Recommended application: 12 volts minimum, 2 amps minimum. A vehicle battery is suggested. (Driver air bag assembly) Put on a pair of shop gloves and safety glasses to protect your hands and eyes from possible irritation and heat when handling the deployed air bag assembly. After the air bag assembly has been deployed, the surface of the air bag may contain solid particulate. This solid particulate consists primarily of by products of the chemical reaction, Potassium Chloride and copper metal dust. Compounds of Potassium Borate, Strontium Chloride, Copper Chloride, and Ammonium Chloride may be found in amounts of about 1% (each) of the total particulate. (Passenger air bag assembly)
Put on a pair of shop gloves and safety glasses to protect your hands and eyes from possible irritation and heat when handling the deployed air bag

assembly.

After the air bag assembly has been deployed, the surface of the air bag may contain a powdery residue. This powder consists primarily of cornstarch (used to lubricate the bag as it inflates) and by products of the chemical reaction. Sodium hydroxide dust (similar to lye soap) is produced as a by product of the deployment reaction. The sodium hydroxide then quickly reacts with atmospheric moisture and is converted to sodium carbonate and sodium bicarbonate (baking soda). Therefore, it is unlikely that sodium hydroxide will be present after deployment.

WARNING: SAFETY PRECAUTIONS MUST BE OBSERVED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE METAL SURFACES OF THE AIR BAG ASSEMBLY WILL BE VERY HOT. ALLOW THE AIR BAG ASSEMBLY TO COOL BEFORE HANDLING ANY METAL PORTION OF IT. DO NOT PLACE THE HOT DEPLOYED AIR BAG ASSEMBLY NEAR ANY FLAMMABLE OBJECTS. FAILURE TO FOLLOW PROCEDURES COULD RESULT IN FIRE OR PERSONAL INJURY.

After an air bag assembly has been deployed, the metal canister and surrounding areas of the air bag assembly will be very hot. Do not touch the metal areas of the air bag assembly for about 30 minutes after deployment. If the deployed air bag assembly must be moved before it is cool, wear gloves and handle by the air bag or trim cover.

41. Short the driver deployment harness wires by twisting together one end from each. Repeat this procedure for the passenger deployment harness.
42. Carefully remove drop cloth from vehicle and clean off any fragments or discard drop cloth entirely.
43. Disconnect driver deployment harness and passenger deployment harness from vehicle and discard.
44. In the unlikely event that either or both of the air bag assemblies did not deploy after following these procedures, proceed immediately with Steps 36 through 37. If the air bag assembly deployed, proceed to step 35.
45. With both air bags deployed, the vehicle may be scrapped in the same manner as a non-SRS equipped vehicle.

NOTE: The remaining steps are to be followed in the unlikely event that the air bag assembly did not deploy after following these procedures.

46. Remove the undeployed air bag assembly (s) from the vehicle. For driver air bag assembly refer to in the "Passenger Air Bag Assembly Removal" in this section.

WARNING: WHEN STORING A LIVE AIR BAG ASSEMBLY OR WHEN LEAVING A LIVE AIR BAG ASSEMBLY UNATTENDED ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. FAILURE TO FOLLOW PROCEDURES COULD RESULT IN PERSONAL INJURY.

47. Temporarily store the air bag assembly with the air bag opening facing up, away from the surface upon which it rests.

Deployed Air Bag Assembly Handling

Put on a pair of shop gloves and safety glasses to protect your hands and eyes from possible irritation and heat when handling the deployed air bag assembly.

After the air bag assembly has been deployed, the surface of the air bag may contain solid particulate. This solid particulate consists primarily of by products of the chemical reaction, Potassium Chloride and copper metal dust. Compounds of Potassium Borate, Strontium Chloride, Copper Chloride, and Ammonium Chloride may be found in amounts of about 1% (each) of the total particulate.

(Passenger air bag assembly)

Put on a pair of shop gloves and safety glasses to protect your hands and eyes from possible irritation and heat when handling the deployed air bag assembly.

After the air bag assembly has been deployed, the surface of the air bag may contain a powdery residue. This powder consists primarily of cornstarch (used to lubricate the bag as it inflates) and by products of the chemical reaction. Sodium hydroxide dust (similar to lye soap) is produced as a by product of the deployment reaction. The sodium hydroxide then quickly reacts with atmospheric moisture and is converted to sodium carbonate and sodium bicarbonate (baking soda). Therefore, it is unlikely that sodium hydroxide will be present after deployment.

Special Tools

WARNING: TO AVOID DEPLOYMENT WHEN TROUBLESHOOTING THE SRS, DO NOT USE ELECTRICAL TEST EQUIPMENT SUCH AS A BATTERY-POWERED OR AC-POWERED VOLTMETER, OHMMETER, ETC., OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN THAT SPECIFIED IN THIS MANUAL. DO NOT USE A NON POWERED PROBE-TYPE TESTER. INSTRUCTIONS IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT.

5-8840-2421-0 (J-41433) SRS Driver/ Passenger Load Tool

The Supplemental Restraint System (SRS) Driver/ Passenger Load Tool 5-8840-2421-0 is used only when called for in this section. It is used as a diagnostic aid and safety device to prevent inadvertent air bag assembly deployment.

The load tool has four yellow connectors attached to its case.

The three small connectors are electrically functional and serve as resistive load substitutions.

No more than two connectors are used at any time.

One of the small connectors is used to substitute for the load of the driver air bag assembly when it is connected at the top of the column to the SRS coil assembly.

Another small connector is used to substitute for the load of the driver air bag assembly and the SRS coil assembly when it is connected at the base of the column to the SRS wiring harness. The third small connector is used to substitute for the load of the passenger air bag assembly when connected to the passenger air bag assembly harness connector.

By substituting the resistance of the load tool when called for, a determination can be made as to whether an inflator circuit component is causing system malfunction and which component is causing the malfunction. The load tool should be used only when specifically called for in the diagnostic procedures.

5-8840-0285-0 (J-39200) DVM

The 5-8840-0285-0 Digital Multimeter (DVM) is the preferred DVM for use in SRS diagnosis and repair. However, 5-8840-0366-0 may be used if 5-8840-0285-0 is not available. No other DVMs are approved for SRS diagnosis and repair.

Scan Tool

The Tech 2 is used to read and clear SRS Diagnostic Trouble Codes (DTCs). Refer to the Tech 2 Operator's Manual for specific information on how to use the Tech 2.

901RW176

5-8840-2468-0 (J-42986) SRS Deployment Tool

The 5-8840-2468-0 Supplemental Restraint System (SRS) Deployment Tool must be used for deployment of the undeployed air bag.

901RX046

5-8840-0385-0 (J-35616-A) Connector Test Adapter Kit

The 5-8840-0385-0 Connector Test Adapter Kit must be used whenever a diagnostic procedure requests checking or probing a terminal. Using the appropriate adapter will ensure that no damage to the terminal will occur from the Digital Multimeter (DVM) probe, such as spreading or bending. The adapter will also give an idea of whether contact tension is sufficient, helping to find an open or intermittent open due to poor terminal contact.

901RS151

5-8840-2429-0 (J-42987) SRS Adapter For Load Tool

The J-42987 SRS Adapter be used for connect previous load tool to new SRS system when inspect SRS system harness.

901RW107

5-8840-2420-0 (J-41497) SRS Deployment Fixture

The 5-8840-2420-0 SRS Deployment Fixture must be used for deployment of the undeployed passenger side air bag.

901RW088

Tech 2 Scan Tool

From 1999 Vehi CROSS (VX), dealer service departments are recommended to use Tech 2. Please refer to Tech 2 scan tool user guide.

Legend

- | | |
|--------------------------------|-------------------------------------|
| (1) PCMCIA Card | (4) Data Link Connector (DLC) Cable |
| (2) RS 232 Loop Back Connector | (5) Tech-2 |
| (3) SAE 16/19 Adaptor | |

Getting Started

- Before operating the Isuzu PCMCIA card with the Tech 2, the following steps must be performed:
 1. The Isuzu 98 System PCMCIA card (1) inserts into the Tech 2 (5).
 2. Connect the SAE 16/19 adaptor (3) to the DLC cable (4).

1. Connect the DLC cable to the Tech 2 (5)
3. Mark sure the vehicle ignition is off.

2. Connect the Tech 2 SAE 16/19 adapter to the vehicle Data Link Connector (DLC).

740RX068

4. The vehicle ignition turns on.
5. Verify the Tech 2 power up display.

060RW009

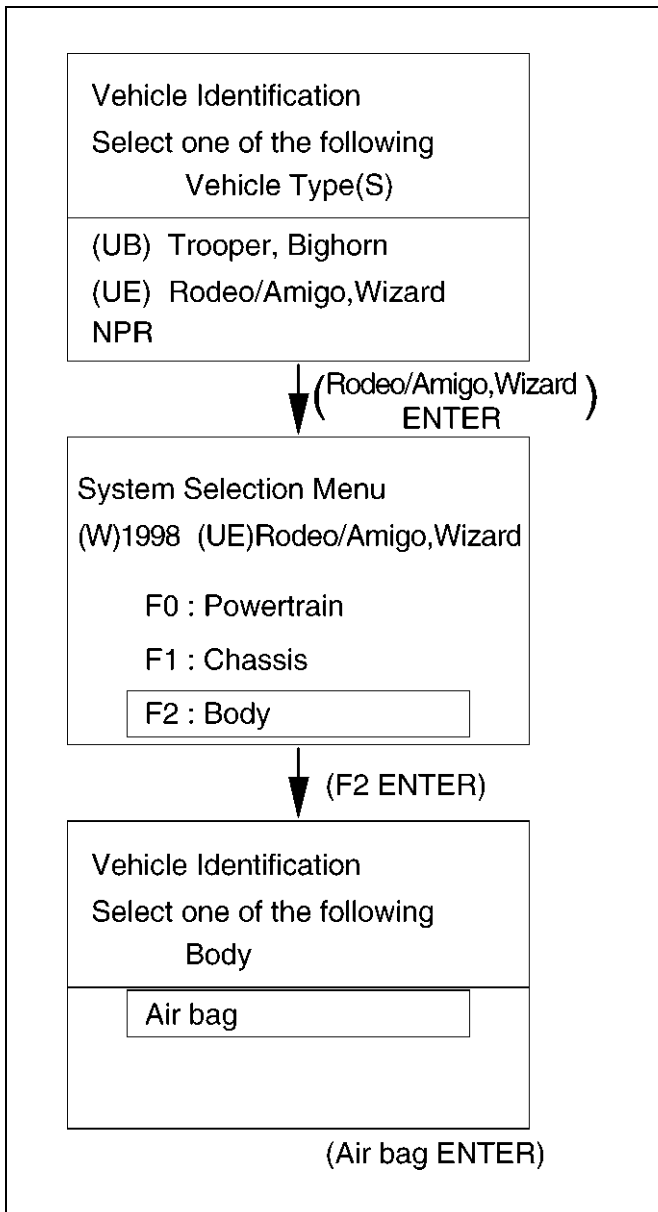

Operating Procedure

The power up screen is displayed when you power up the tester with the Isuzu systems PCMCIA card. Follow the operating procedure below.

060RX001

NOTE: The RS232 loop back connector is only to use for diagnosis of Tech 2 and refer to user guide of the Tech 2.

Service Precaution

CAUTION: When fasteners are removed, always reinstall them at the same location from which they were removed. If a fastener needs to be replaced, use the correct part number fastener for that application. If the correct part number fastener is not available, a fastener of equal size and strength (or stronger) may be used. Fasteners that are not reused, and those requiring thread locking compound will be called out. The correct torque value must be used when installing fasteners that require it. If the above conditions are not followed, parts or system damage could result.

WARNING: WHEN PERFORMING SERVICE ON OR AROUND SUPPLEMENTAL RESTRAINT SYSTEM (SRS) COMPONENTS OR SRS WIRING, FOLLOW THE PROCEDURES LISTED BELOW TO TEMPORARILY DISABLE THE SRS. FAILURE TO FOLLOW PROCEDURES COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY OR OTHERWISE UNNEEDED SRS REPAIRS.

The Sensing and Diagnostic Module (SDM) in Driver–Passenger SRS can maintain sufficient voltage to cause a deployment for up to 15 seconds after the ignition switch is turned “OFF,” the battery is disconnected, or the fuse powering the SDM is removed.

Many of the service procedures require removal of the “SRS–1” fuse, and disconnection of the air bag assembly from the deployment loop to avoid an accidental deployment. If the air bag assembly is disconnected from the deployment loop as noted in the “Disabling the SRS” procedure that follows, service can begin immediately without waiting for the 15 second time period to expire.

Disabling The SRS

Removal

Turn the ignition switch to “OFF” and turn the steering wheel so that the vehicle’s wheels are pointing straight ahead.

6. Remove SRS fuse METER and SRS, from left dash side lower fuse block or disconnect battery.
7. Disconnect yellow 2–pin connector at the base of steering column.
8. Remove glove box assembly; Refer to “Passenger Air Bag Assembly Replacement” in this section.
9. Disconnect passenger air bag assembly yellow 2–pin connector behind the glove box assembly.

CAUTION: With the “SRS” fuse removed and ignition switch “ON,” the “AIR BAG” warning lamp will be “ON.” This is normal operation and does not indicate an SRS malfunction.

Enabling The SRS

Installation

Turn ignition switch to “LOCK” and remove key.

1. Connect yellow 2–pin connector passenger air bag assembly.
 2. Install glove box assembly, Refer to “Passenger Air Bag Assembly Replacement” in this section.
 3. Connect yellow 2–pin connector at the base of the steering column.
 4. Install “AIR BAG” fuse METER and SRS to left dash side lower fuse block or connect battery.
- Turn ignition switch to “ON” and verify that the “AIR BAG” warning lamp flashes seven times and then turns “OFF” If it does not operate as described, perform the “SRS Diagnostic System Check” in section.

Handling / Installation / Diagnosis

5. Air bag assembly should not be subjected to temperatures above 93°C (200°F).
6. Air bag assembly, and SDM should not be used if they have been dropped from a height of 100 cm (3.3 feet) or more.
7. When a SDM is replaced, it must be oriented with the arrow on the SDM pointing toward the front of the vehicle. It is very important for the SDM to be located flat on the mounting surface, parallel to the vehicle datum line. It is important that the SDM mounting surface is free of any dirt or other foreign material.
8. Do not apply power to the SRS unless all components are connected or a diagnostic chart requests it, as this will set a diagnostic trouble code.
9. The “SRS Diagnostic System Check” must be the starting point of any SRS diagnostics. The “SRS Diagnostic System Check” will verify proper “AIR BAG” warning lamp operation and will lead you to the correct chart to diagnose any SRS malfunctions. Bypassing these procedures may result in extended diagnostic time, incorrect diagnosis, and incorrect parts replacements.

Inspections Required After An Accident

CAUTION: Certain SRS components must be replaced after a frontal crash involving air bag deployment.

In all types of accidents regardless of “Air Bag” deployment, visually inspect all of the following components and replace as required:

- Driver air bag assembly
- Passenger air bag assembly
- Steering wheel
- SRS coil assembly
- Steering column
- Knee bolster and instrument panel mounting attachments
- Driver seat and belt
- Passenger seat and belt
- SDM

Be sure to replace Sensing and Diagnostic Module (SDM) in accordance with “SDM Replacement Guidelines”. In cases of collision without causing air bag deployment, SDM could be used unless this manual instructs to replace.

CAUTION: Refer to SDM replacement Guidelines below for important information on SDM replacement in both deployment and non-deployment crashes.

SDM Replacement Guidelines

1. In case that the air bag has been deployed, replace the SDM.
2. When DTC 51, 53 and 71 are set.
3. When SDM fell down from a 100 cm (3.3 feet) height.

All above is SDM replacement Guideline.

Inspection is needed also on the following.

Inspect Supplemental Restraint System (SRS) coil assembly wiring and steering wheel for any signs of scorching melting or damage due to excessive heat. If coil assembly wire or steering wheel is damaged replace them. The steering column and wheel must be dimensionally checked to determine if they are damaged. Refer to in this Section of this manual.

Never use SRS parts from another vehicle. This does not include remanufactured parts purchased from an authorized Retailer they may be used for SRS repairs. Do not attempt to repair the SDM, the SRS harness, the SRS coil assembly, the air bag assembly, the steering wheel, or the steering column. Service of these items is replacement only.

Verify replacement part numbers.

CAUTION: Proper operation of the SDM and Supplemental Restraint System (SRS) requires that any repairs to the vehicle structure return it to its original production configuration.

Sensing and Diagnostic Module (SDM)

Service Precautions

WARNING: DURING SERVICE PROCEDURES, BE VERY CAREFUL WHEN HANDLING SDM. NEVER STRIKE OR JAR SDM. UNDER SOME CIRCUMSTANCES, IT COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY OR IMPROPER OPERATION OF THE SUPPLEMENTAL RESTRAINT SYSTEM (SRS). SDM MOUNTING BRACKET BOLTS MUST BE CAREFULLY TORQUED TO ASSURE PROPER OPERATION. NEVER POWER UP THE SRS WHEN SDM IS NOT RIGIDLY ATTACHED TO THE VEHICLE. THE SDM COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY.

WARNING: PROPER OPERATION OF THE SENSING AND DIAGNOSTIC MODULE (SDM) REQUIRES THE SDM TO BE RIGIDLY ATTACHED TO THE VEHICLE STRUCTURE AND THAT THE ARROW ON THE SENSOR BE POINTING TOWARD THE FRONT OF THE VEHICLE.

SDM is specifically calibrated and is keyed to the SDM location SRS wiring harness. Caution should be used to ensure proper location of the SDM. The keying of the SDM to its location and wiring harness connectors should never be modified in the field.

Removal

1. Disable the SRS. (Refer to "Disable the SRS" in this manual)
2. Remove dressing panel around the radio and disconnect cigar lighter harness.
3. Remove the transfer sift lever knob.
4. Remove the center console.
5. Remove three connector from Powertrain Control Module (PCM).
6. Remove PCM with bracket. (Fixed four bolts)
7. Remove right side stay between instrument panel and floor.
8. Remove driver and passenger seat.
9. Turn over carpet to rear side.

1. Remove air conditioning duct for rear seat. (Transform the duct during removing it)

827RW023

10. Pull CPA (3) (Connector Position Assurance—red color) out and push connector lock down to disconnect the SDM harness connector (2).
11. Remove the three SDM fixing bolts and remove SDM (1).

827RW044

Installation

1. Install the SDM (1) on bracket and fixing bolts and tighten the fixing bolts to the specified torque.
Torque: 10 ± 3 N·m (1.0 ± 0.3 kg·m/87 ± 26 lbin)
1. Connect the SDM harness connector (2) and after that, put CPA into connector (3).

2. Install air conditioning duct for rear seat to normal position.
2. Return carpet normal position.
3. Install right side stay between instrument panel and floor, tighten to the specified torque.

Torque: 10 ± 3 N·m (1.0 ± 0.3 kg·m/87 ± 26 lbin)

4. Install PCM with bracket and tighten to the specified torque.

Torque: 10 ± 3 N·m (1.0 ± 0.3 kg·m/87 ± 26 lbin)

5. Reconnect three connector to Powertrain Control Module (PCM).
6. Install the center console.
7. Install the transfer shift lever knob.
8. Install the dressing panel around the radio and reconnect cigar lighter harness.
9. Enable the SRS. (Refer to "Enabling the SRS" in this manual)

Driver Air Bag Assembly

Service Precautions

WARNING: SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY-PRODUCT OF THE DEPLOYMENT REACTION, THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWDER ON THE AIR BAG ASSEMBLY IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. WHEN PLACING A LIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE. NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

NOTE: In the event deployment has occurred, inspect coil assembly wire for any signs of scorching, melting or any other damage due to excessive heat. If the coil has been damaged, replace it.

Removal

1. Disable the Supplemental Restraint System (SRS). (Refer to "Disabling the SRS" in this section.)
2. Remove air bag assembly from steering wheel by removing two bolts. Lift air bag assembly out of steering wheel.

827RX036

3. Disconnect connector and remove air bag assembly.
4. Disconnect horn lead.

827RX035

Installation

1. Connect air bag to wiring harness connector.

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of air bag to prevent lead wire from being pinched.

2. Connect horn lead.
3. Install air bag into steering wheel and tighten bolts to specified sequence as shown in figure.

Torque: 8.8 N·m (0.9 kg·m/78 lbin)

CAUTION: Never use the air bag assembly from another vehicle.

Use only the air bag assembly for UE.

4. Enable the Supplemental Restraint System (SRS). (Refer to "Enabling the SRS" in this section.)

Steering Wheel

Service Precautions

WARNING: SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY-PRODUCT OF THE DEPLOYMENT REACTION, THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWDER ON THE AIR BAG ASSEMBLY IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. WHEN PLACING A LIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE. NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

NOTE: In the event deployment has occurred, inspect coil assembly wire for any signs of scorching, melting or any other damage due to excessive heat. If the coil has been damaged, replace it.

Removal

1. Disable the SRS. (Refer to "Disabling the SRS" in this section.)

827RX034

2. Remove the air bag assembly (5) from steering wheel (6) by removing two bolts (7). Lift air bag assembly out of steering wheel.

827RX036

3. Disconnect connector (2) and remove air bag assembly.

827RX035

3. Disconnect horn lead (1)
4. Remove steering wheel attachment nut (4).
5. Move the tires to the straight ahead position before removing the steering wheel. Install steering wheel puller onto steering wheel and remove steering wheel with 5-8521-0016-0.
6. Apply a setting mark (3) across the steering wheel and shaft so parts can be reassembled in their original position.

827RW063

7. Feed wiring through the wheel and remove wheel.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

Installation

1. Install the steering wheel and align the setting marks (3).
2. Tighten the steering wheel fixing nut (4) to the specified torque.

Torque: 34 N-m (3.5 kg-m/25 lbft)

3. Connect horn lead (1).
4. Connect air bag to wiring harness connector (2).

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of air bag to prevent lead wire from being pinched.

5. Install air bag into steering wheel and tighten bolts (7) to specified sequence as show in figure.

Torque: 8.8 N-m (0.9 kg-m/78 lb-in)

CAUTION: Never use the air bag assembly from another vehicle. Use only the air bag assembly for UE.

827RX034

6. Enable the Supplemental Restraint System (SRS). (Refer to "Enabling The SRS" in this section.)

SRS Coil Assembly

Service Precaution

WARNING: SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY-PRODUCT OF THE DEPLOYMENT REACTION, THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWDER ON THE AIR BAG ASSEMBLY IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. WHEN PLACING A LIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE. NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

NOTE: In the event deployment has occurred, inspect coil assembly wire for any signs of scorching, melting or any other damage due to excessive heat. If the coil has been damaged, replace it.

Removal

1. Disable the SRS. (Refer to "Disabling the SRS" in this section.)

825RX047

2. Remove the air bag assembly (6) from steering wheel (7) by removing two bolts (8). Lift air bag assembly out of steering wheel.

827RX036

4. Disconnect the 2-pin yellow connector (2) and remove air bag assembly.

827RX035

3. Disconnect horn lead connector (1).
4. Remove the steering wheel attachment nut (5).
5. Move the tires to the straight ahead position before removing the steering wheel and remove wheel with 5-8521-0016-0.
6. Apply a setting mark (4) across the steering wheel and shaft so parts can be reassembled in their original position.

827RW063

7. Feed wiring through the wheel and remove wheel.

CAUTION: Never apply force to the steering wheel in the direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

8. Remove the steering lower cover.
9. Remove the driver knee bolster assembly.

10. Remove the steering column cover (3).
11. Disconnect the wiring harness connectors (10) located at the base of steering column.
12. Disconnect the horn terminal NO.2 from connector and remove the tape binding harness. (Refer to How to Disconnect the horn terminal in this section.)

827RX029

13. Remove four bolts of combination switch assembly (9) attached to steering lock and remove the combination switch assembly (with SRS coil) from steering shaft.

825RX047

9J-42 SUPPLEMENTAL RESTRAINT SYSTEM

5. Remove four bolts of SRS coil assembly and remove the SRS coil assembly from the combination switch.

825RX033

6. Pull out the terminal of lead wire coming to black connector NO.12 while lifting the lock part with a minitenes screw driver (-).

827RX046

How to Disconnect the horn terminal

1. Lift the white part of black connector with a minitenes screw driver (-) and release connector terminal lock.

827RX045

Legend

- (1) Minitenes screw driver (-)
- (2) Connector lock knob

How to Connect Horn Terminal

1. Insert horn terminal from behind black connector NO.12 until connector lock works.

827RX047

Legend

- (1) Terminal
- (2) Connector lock knob

7. Push white connector into the black connector for a double lock.

827RX048

8. Install the combination switch assembly (with SRS coil) to steering lock of steering shaft and tighten the four bolts to a specified tightening torque.

825RX047

Installation

1. Set cancel cam and SRS coil in position and install the SRS coil to combination switch by tightening the four bolts to a specified tightening torque with four bolts.

Torque: 0.5 N·m (0.05 kg·m/0.4 lb ft)

825RX033

2. Insert the horn terminal into the connector NO.12 and bind the combination switch harness and SRS coil harness with a tape.(Refer to How to Connect the horn terminal in this section.)

3. Connect the wiring harness connectors (10) located at the base of steering column.
4. Turn the SRS coil clockwise to full, return about 3 turns and align the neutral mark.

NOTE: Whenever installing the new combination switch with SRS coil, be sure to tear off the lock pin for aligning the neutral position before it is installed to the base of steering column.

825RX032

CAUTION: When turning the SRS coil clockwise to full, stop turning if resistance is felt. Forced further turning may damage the cable in the SRS coil.

9J-44 SUPPLEMENTAL RESTRAINT SYSTEM

9. Install the steering column cover (3).

CAUTION: When installing the steering column cover, be sure to thread each harness as illustrated so that the harnesses starter switch, combination switch and SRS coil may not catch wiring.

5. Install the driver knee blower assembly.

6. Install the steering lower cover.

7. Install the steering wheel and align the setting marks (4).

8. Tighten the steering wheel fixing nut (5) to the specified torque.

Torque: 34 N-m (3.5 kg-m/25 lb ft)

9. Connect horn lead (1).

10. Connect air bag to wiring harness connector (2).

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of air bag to prevent lead wire from being pinched.

10. Install Air Bag (6) into steering wheel and tighten bolts (8) to specified sequence as figure.

Torque: 8.8 N-m (0.9 kg-m/78 lb in)

CAUTION: Never use the air bag assembly from another vehicle. Use only the air bag assembly for "UE".

11. Enable the SRS. (Refer to "Enabling The SRS" in this section.)

Steering Column

Service Precaution

WARNING: SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY-PRODUCT OF THE DEPLOYMENT REACTION, THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWDER ON THE AIR BAG ASSEMBLY IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. WHEN PLACING A LIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE. NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

NOTE: In the event deployment has occurred, inspect coil assembly wire for any signs of scorching, melting or any other damage due to excessive heat. If the coil has been damaged, replace it.

Removal

1. Disable the Supplemental Restraint System (SRS). (Refer to "Disabling The SRS" in this section.)

431RX012

2. Remove the air bag assembly (4) from steering wheel (2) by removing two bolts (5). Lift air bag assembly out of steering wheel.

827RX036

3. Disconnect the 2-pin yellow connector (7) and remove air bag assembly.

827RX035

4. Disconnect horn lead connector (8).
5. Remove the steering wheel attachment nut (3).
6. Move the tires to the straight ahead position before removing the steering wheel and removing wheel with 5-8521-0016-0.
7. Apply a setting mark (6) across the steering wheel and shaft so parts can be reassembled in their original position.

827RW063

8. Feed wiring through the wheel and remove wheel.
9. Remove the steering lower cover.
10. Remove the driver knee bolster assembly.
11. Remove the steering column cover (1).
12. Disconnect the wiring harness connectors (10) located at the base of steering column.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other

impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

13. Remove the combination switch assembly with Supplemental Restraint System (SRS) coil (9).

NOTE: SRS coil is a part of combination switch assembly, which cannot be replaced separately. Therefore, be sure not to remove the SRS coil from the combination switch assembly.

14. Remove the snap ring.
15. Remove the cushion rubber.
16. Disconnect shift lock cable.
17. Disconnect the starter switch harness connector (12) located base of steering column.
18. Remove steering lock cylinder assembly (11).
19. Remove the 2nd shaft (14) from the column shaft assembly (13) by removing bolt (15).
20. Remove steering column assembly (13).

431RX012

Installation

1. Install the 2nd shaft (14) to the column shaft assembly (13).
2. Install the steering column assembly (13).
3. Tighten the steering column fixing bolts (dash panel side) to the specified torque.

Torque: 20 N-m (2.0 kg-m/15 lbft)

4. Tighten the steering column fixing nuts (Cross beam) to the specified torque.

Torque: 17 N-m (1.7 kg-m/13 lbft)

5. Tighten the universal joint to the specified torque.

Torque: 31 N-m (3.2 kg-m/23 lbft)

6. Install steering lock cylinder assembly (11).
7. Connect shift lock cable.
8. Install cushion rubber.
9. Install snap ring.
10. Install the combination switch assembly with Supplemental Restraint System (SRS) coil (9).
11. Connect the wiring harness connector (10) located on the base of steering column.
12. Turn the SRS coil clockwise to full, return about 3 turns and align the neutral mark.

825RX032

CAUTION: When turning the SRS coil clockwise to full, stop turning if resistance is felt. Further forced turning may damage the cable in the SRS coil.

13. Install steering column cover (1).

825RS048

CAUTION: When installing the steering column cover, be sure to wire (through each harness) as illustrated so that the harnesses starter switch, combination switch and SRS coil may not catch wiring.

14. Install the steering wheel (2) and align the setting marks (6).
15. Tighten the steering wheel fixing nut (3) to the specified torque.

Torque: 34 N-m (3.5 kg-m/25 lbft)

16. Connect horn lead (8).
17. Connect air Bag wiring harness connector (7).

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of air bag to prevent lead wire from being pinched.

9J-48 SUPPLEMENTAL RESTRAINT SYSTEM

18. Install air bag into steering wheel and tighten bolts (5) to specified sequence as shown in figure.

Torque: 8.8 N-m (9.0 kg-m/78 lbin)

CAUTION: Never use the air bag assembly from another vehicle.

Use only the air bag assembly for UE.

431RX012

19. Enable the Supplemental Restraint System (SRS)
(Refer to "Enabling The SRS" in this section.)

Passenger Air Bag Assembly

Service Precaution

WARNING: SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY-PRODUCT OF THE DEPLOYMENT REACTION, THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWDER ON THE AIR BAG ASSEMBLY IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. WHEN PLACING A LIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE. NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

In the event deployment has occurred, inspect coil assembly wire for any signs of scorching, melting or any other damage due to excessive heat. If the coil has been damaged, replace it.

Removal

1. Disable the SRS. (Refer to "Disabling the SRS" in this section.)
2. Remove glove box assembly.
3. Disconnect passenger air bag assembly harness connector.
4. Remove air bag assembly fixing bolts and nuts.
5. Remove reinforcement.
6. Remove passenger air bag assembly from glove box opening of instrument panel.

827RX051

Installation

1. Install passenger air bag assembly from glove box opening of instrument panel.
2. Install reinforcement from glove box opening of instrument panel.
3. Install air bag assembly fixing nuts and bolts, and tighten to specified torque.
Torque: 7.8 N·m (69 lbin)
4. Connect air bag assembly harness connector.
5. Install glove box assembly.
6. Enable the SRS (Refer to "Enabling the SRS" in this section.)

SRS Air Bag System Inspection Standards For Repair

Parts Name	Inspection Standard		Part Replacement Standard
	Collision	Trouble	
Driver Air bag Assembly			<ol style="list-style-type: none"> 1. Air bag has deployed due to collision. 2. Pad surface has crack or scratch. 3. Connector has cracks. 4. Harness is disconnected or scratched. 5. Air bag is soaked in water, oil etc. 6. Air bag has fallen from a height of about 10 cm (3.3) feet. 7. Trouble diagnosis in Workshop Manual resulted in part replacement.
Passenger Air bag Assembly			
Sensing and Diagnostic Module (SDM)			<ol style="list-style-type: none"> 1. Air bag has deployed due to collision. 2. SDM is crack or deformed. 3. Connector has cracks. 4. SDM has fallen from a height of about 100 cm (3.3 feet). 5. Trouble diagnosis in Workshop Manual resulted in part replacement.
SRS Coil Assembly			<ol style="list-style-type: none"> 1. Burn or melt due to overheat. 2. Case is cracked or deformed. 3. Trouble diagnosis in Workshop Manual resulted in part replacement.
SRS Harness			<ol style="list-style-type: none"> 1. Air bag circuit wire harness is disconnected or damaged. 2. Connector has cracks. 3. Trouble diagnosis in Workshop Manual resulted in part replacement.
Steering Wheel			<ol style="list-style-type: none"> 1. Bracket is deformed. 2. A new air bag cannot be installed with ease. 3. When a new air bag is installed, pad interferes with the steering wheel, and clearance is uneven.
Steering Column			<ol style="list-style-type: none"> 1. Capsule is broken. 2. The fitting of column collapses. 3. Bellows pipe is deformed.
Instrument Panel & Knee bolster & Cover Glove box. Seat Seat Belt Wood shield Glass			<ol style="list-style-type: none"> 1. Dent, bend, cracks, and deform.
Mounts			<ol style="list-style-type: none"> 1. Repair or replace if dent, bend, cracks, and deform are found. 2. Retighten to specified torque if loose.

Inspection Standards

In cases of collision: When any type of collision has occurred regardless of air bag deployment.

In cases of trouble code: When trouble code has been detected by TECH 2 in case of the AIR BAG WARNING LIGHT failing to work or remaining lighted.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Diagnostic Information

Diagnostic Procedures

WARNING: WHEN FASTENERS ARE REMOVED, ALWAYS REINSTALL THEN AT THE SAME LOCATION FROM WHICH THEY WERE REMOVED. IF A FASTENER NEEDS TO BE Replaced, USE THE CORRECT PART NUMBER FASTENER FOR THAT APPLICATION. IF THE CORRECT PART NUMBER FASTENER IS NOT AVAILABLE, A FASTENER OF EQUAL SIZE AND STRENGTH (OR STRONGER) MAY BE USED. FASTENERS THAT ARE NOT REUSED, AND THOSE REQUIRING THREAD LOCKING COMPOUND WILL BE CALLED OUT. THE CORRECT TORQUE VALUE MUST BE USED WHEN INSTALLING FASTENERS THAT REQUIRE IT. IF THE ABOVE CONDITIONS ARE NOT FOLLOWED, PARTS OR SYSTEM DAMAGE COULD RESULT.

WARNING: TO AVOID DEPLOYMENT WHEN TROUBLESHOOTING THE SRS, DO NOT USE ELECTRICAL TEST EQUIPMENT SUCH AS A BATTERY-POWERED OR AC-POWERED VOLTMETER, OHMMETER, ETC., OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN THAT SPECIFIED IN THIS MANUAL. DO NOT USE A NONPOWERED, PROBE-TYPE TESTER. INSTRUCTIONS IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT.

The diagnostic procedures used in this section are designed to aid in finding and repairing SRS problems. Outlined below are the steps to find and repair SRS problems quickly and effectively. Failure to carefully follow these procedures may result in extended diagnostic time, incorrect diagnosis and incorrect parts Replacement.

1. Perform The "SRS Diagnostic System Check."

The "Supplemental Restraint System (SRS) Diagnostic System Check" should always be the starting point of any SRS diagnostics. The "SRS Diagnostic System Check" checks for proper "AIR BAG" warning lamp operation and checks for SRS trouble codes using both "Flash Code" and "Scan Tool" Methods.

2. Refer To The Proper Diagnostic Chart As Directed By The "SRS Diagnostic System Check."

The "SRS Diagnostic System Check" will lead you to the correct chart to diagnose any SRS problems. Bypassing these procedures may result in extended diagnostic time, incorrect diagnosis and incorrect parts Replacement.

3. Repeat the "SRS Diagnostic System Check" After Any Repair Or Diagnostic Procedures Have Been Performed.

Performing the "SRS Diagnostic System Check" after all repair or diagnostic procedures will assure that the repair has been made correctly and that no

other conditions exist.

Diagnostic Codes

The Sensing and Diagnostic Module (SDM) maintains a history record of all diagnostic codes that have been detected since the SRS codes were last cleared during service.

1. Active Codes—Faults that are presently detected this ignition cycle. Active codes are stored in Random Access Memory (RAM).
2. History Codes—All faults detected since the last time the history fault memory was cleared. History codes are stored in Electronically Erasable Programmable Read only Memory (EEPROM).

How To Read Trouble Codes

All codes (Active and history) can be read (or cleared) by using a scan tool or equivalent.

If a Diagnostic Trouble Code (DTC) is not available, have the vehicle serviced by dealer.

How To Clear Trouble Codes

Trouble codes can only be cleared by using a scan tool. If a scan tool is not available then inform the owner of the stored codes and suggest that the codes are cleared upon the next visit to a dealership.

Scan Tool Diagnostics

A scan tool can be used to read current and history codes and to clear all history codes after a repair is complete. The scan tool must be updated to communicate with the SRS through a replaceable cartridge for SRS diagnostics. To use the scan tool, connect it to the Data Link Connector (DLC) and turn the ignition switch "ON". Then follow the manufacturer's directions for communication with the SRS. The scan tool reads serial data from the Sensing and Diagnostic Module (SDM) "Serial Data" output (terminal 24) to the DLC.

Basic Knowledge Required

Before using this section of the Service Manual, there is some basic knowledge which will be required. Without this knowledge, you will have trouble using the diagnostic procedures in this section. Use care to prevent harm or unwanted deployment. Read all cautions in the service manual and on warning labels attached to SRS components.

Basic Electrical Circuits

You should understand the basic theory of electricity including series and parallel circuits, and understand the voltage drops across series resistors. You should know the meaning of voltage (volts), current (amps), and resistance (ohms). You should understand what happens in a circuit with an open or a shorted wire. You

should be able to read and understand a wiring diagram.

“Flash Code” Diagnostics

Flash code diagnostics can be used to read current codes and to determine if history codes are present but cannot be used to clear codes or read history codes. Flash code diagnostics is enabled by grounding by terminal 13 shorting to terminal 4 of the DLC with the ignition switch “ON”. Grounding terminal 13 of the DLC pulls the “Diagnostics Request” input (Terminal 1) of the SDM low and signals the SDM to enter the flash code diagnostic display mode.

The SDM displays the trouble codes by flashing the warning lamp. Each code that is displayed will consist of a number of flashes which represents the tens digit, a 1.2 second pause, following by a number of flashes which represents the ones digit of the code. Each code is displayed one time before moving on to the next code. After all of the codes have been displayed, the entire code sequence will continually be repeated until ground is removed from terminal 13 of the DLC.

Two special codes exist when reading in the flash code mode (Flash Code 12 and Flash Code 13). “Flash Code 12” will always be the first code displayed when the flash code mode is enabled. Code 12 is not an indication of a SRS problem but an indication that the flash code mode has been enabled. If there are no current or history codes present, the SDM will display code 12 until ground is removed from the DLC at terminal 13. “Flash Code 13” will be displayed if there are history codes. To read the history codes, a scan tool must be used.

Parts For Electrical Circuit

Wiring

Wire Color

D08RX174

Legend

- (1) Colored Stripe
- (2) Single Color

All wires have color-coded insulation. Wires belonging to a system's main harness will have a single color. Wires belonging to a system's sub-circuits will have a colored stripe. Striped wires use the following code to show wire size and colors.

D08RX175

Abbreviations are used to indicate wire color within a circuit diagram. Refer to the following table.

Wire Color Coding

Color-coding	Meaning	Color-coding	Meaning
B	Black	BR	Brown
W	White	LG	Light green
R	Red	GR	Grey
G	Green	P	Pink
Y	Yellow	LB	Light blue
L	Blue	V	Violet
O	Orange		

Distinction of Circuit by Wire Base Color

Base color	Circuits	Base color	Circuits
B	Starter circuit and grounding circuit	Y	Instrument circuit
W	Charging circuit	L, O, BR, LG, GR, P, SB, V	Other circuit
R	Lighting circuit		
G	Signal circuits		

System Schematic

SRS Diagnostic System Check

The diagnostic procedures used in this section are designed to find and repair Supplemental Restraint System (SRS) malfunctions. To get the best results, it is important to use the diagnostic charts and follow the sequence listed below:

- A Perform the "SRS Diagnostic System Check." The "SRS Diagnostic System Check" must be the starting point of any SRS diagnostics. The "SRS Diagnostic System Check" checks for proper "AIR BAG" warning lamp operation, the ability of the Sensing and Diagnostic Module (SDM) to communicate through the "Serial Data" line and whether SRS diagnostic trouble codes exist.
- B Refer to the proper diagnostic chart as directed by the "SRS Diagnostic System Check." The "SRS Diagnostic System Check" will lead you

to the correct chart to diagnose any SRS malfunctions. Bypassing these procedures may result in extended diagnostic time, incorrect diagnosis and incorrect parts replacement.

- C Repeat the "SRS Diagnostic System Check" after any repair or diagnostic procedures have been performed. Performing the "SRS Diagnostic System Check" after all repair or diagnostic procedures will ensure that the repair has been made correctly and that no other malfunctions exist

Circuit Description

When the ignition switch is first turned "ON", "ignition 1" voltage is applied from the "SRS" fuse to the SDM at the "ignition 1" input terminals "12". The SDM responds by flashing the "AIR BAG" warning lamp seven times while performing tests on the SRS.

Notes On System Check Chart:

Number(s) below refer to step number(s) on the "Supplemental Restraint System Diagnostic System Check" chart.

1. The "AIR BAG" warning lamp should flash seven times after ignition is first turned "ON."
2. After the "AIR BAG" warning lamp flashes seven times, it should turn "OFF."
3. Improper operation of the "AIR BAG" warning lamp is indicated. This test differentiates a warning lamp stays "ON" condition from a warning lamp does not come "ON" condition.
4. This test checks for the proper operation of the "Serial Data" line. This test will also determine whether history diagnostic trouble codes are stored and, if so, identify them.
5. This test checks for proper operation of the "Serial Data" line. This test will also identify the stored diagnostic trouble codes and whether they are current or history.

Diagnostic Aids:

The order in which diagnostic trouble codes are diagnosed is very important. Failure to diagnose the diagnostic trouble codes in the order specified may result in extended diagnostic time, incorrect diagnosis and incorrect parts Replacement.

SRS Diagnostic System Check

Step	Action	Yes	No
1	Note the "AIR BAG" warning lamp when ignition switch is turned "ON." Does the "AIR BAG" warning lamp flash seven (7) times?	Go to Step 2	Go to Step 3
2	Note the "AIR BAG" warning lamp after it flashed 7 times. Does the "AIR BAG" warning lamp go "OFF"?	Go to Step 4	Go to Step 5
3	Note the "AIR BAG" warning lamp when ignition switch is turned "ON." Does the "AIR BAG" warning lamp come "ON" steady?	Go to Chart B.	Go to Chart C.
4	1. Ignition switch "OFF." 2. Connect a scan tool to data link connector. 3. Follow direction given in the scan tool instruction manual. 4. Ignition switch "ON." 5. Request the SRS diagnostic trouble code display recode all history diagnostic trouble code(s) specify as such, on repair order. Is diagnostic trouble code(s) displayed?	Ignition switch "OFF." When DTC 71 is set, go to DTC 71 chart. For all other history codes refer to "Diagnostics Aids" for that specific DTC. A history DTC indicates the malfunction has been repaired or is intermittent.	SRS is functional and free of malfunctions, no further diagnosis is required. If scan tool indicates "No Data Received," refer to chassis electrical section.

Step	Action	Yes	No
5	1. Ignition switch "OFF." 2. Connect a scan tool to data link connector. 3. Follow directions as given in the scan tool instruction manual. 4. Ignition switch "ON." 5. Request the SRS diagnostic trouble code display, recode all diagnostic trouble code(s), specifying as current or history on repair order. Is diagnostic trouble code(s) displayed?	Ignition switch "OFF." When DTC 53 is set, go to DTC 53 chart. When DTC 51 is set, go to DTC 51 chart. When DTC 19 is set, go to DTC 19 chart. When DTC 25 is set, go to DTC 25 chart. Diagnose remaining current DTCs from lowest to highest. When only history DTCs exist, Refer to "Diagnostics Aids" for that specific DTC. A history DTC indicates the malfunction has been repaired or is intermittent.	If scan tool indicates "No Data Received," refer to chassis electrical section.

Chart A SDM Integrity Check

D09RX002

Circuit Description:

When the Sensing and Diagnostic Module (SDM) recognizes "ignition 1" voltage, applied to terminals "12", is greater than 9 volts, the "AIR BAG" warning lamp is flashed 7 times to verify operation. At this time the SDM performs "Turn-ON" tests followed by "Continuous Monitoring" tests. When a malfunction is detected, the SDM sets a current diagnostic trouble code and illuminates the "AIR BAG" warning lamp. The SDM will clear current diagnostic trouble codes and move them to a history file when the malfunction is no longer detected and/or the ignition switch is cycled, except for Diagnostic Trouble Codes (DTCs) 51, 53 and 71. DTC 71 can only be cleared using a scan tool "Clear Codes" command in case that the malfunction on DTC 71 has been solved and no DTCs 51 and 53 were remained. DTCs 51, 53 and 71 can not be cleared after a "Clear Codes" command is issued.

Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

1. This test confirms a current malfunction. If no current malfunction is occurring (history DTC set) the "Diagnostic Aids" for the appropriate diagnostic trouble code should be referenced. The SDM should not be replaced for a history diagnostic trouble code.
2. This test checks for a malfunction introduced into the SRS during the diagnostic process. It is extremely unlikely that a malfunctioning SDM would cause a new malfunction to occur during the diagnostic process.
3. When all circuitry outside the SDM has been found to operate properly, as indicated by the appropriate diagnostic chart, then and only then should the SDM be replaced.

Chart A SDM Integrity Check

WARNING: DURING SERVICE PROCEDURES. BE VERY CAREFUL WHEN HANDLING A SENSING AND DIAGNOSTIC MODULE (SDM). NEVER STRIKE OR JAR THE SDM. NEVER POWER UP THE SRS WHEN THE SDM IS NOT RIGIDLY ATTACHED TO THE VEHICLE. ALL SDM AND MOUNTING BRACKET FASTENERS MUST BE CAREFULLY TORQUED AND

THE ARROW MUST BE POINTING TOWARD THE FRONT OF THE VEHICLE TO ENSURE PROPER OPERATION OF THE SRS. THE SDM COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY.

Step	Action	Yes	No
1	<p>1. This chart assumes that the "SRS Diagnostic System Check" and either a symptom chart or a diagnostic trouble code chart diagnosis have been performed. When all circuitry outside the SDM has been found to operate properly, as indicated by the appropriate diagnostic chart, and the symptom or DTC remains current, the following diagnostic procedures must be performed to verify the need for SDM Replacement.</p> <p>2. Ignition switch "OFF."</p> <p>3. Reconnect all SRS components, ensure all components are properly mounted.</p> <p>4. Ensure the ignition switch has been "OFF" for at least 15 seconds.</p> <p>5. Note "AIR BAG" warning lamp as ignition switch is turned "ON."</p> <p>Does warning lamp flash 7 times then go "OFF"?</p>	<p>The symptom or DTC is no longer occurring. Clear SRS diagnostic trouble codes. Repeat the "SRS Diagnostic System Check."</p>	<p>Go to Step 2</p>
2	<p>Using a scan tool, request diagnostic trouble code display. Is the same symptom or DTC occurring as was when the "SRS Diagnostic System Check " was first performed?</p>	<p>Ignition switch "OFF." Go to the appropriate chart for the indicated malfunction.</p>	<p>Go to Step 3</p>
3	<p>1. Clear "SRS Diagnostic Trouble Codes." 2. Ignition switch "OFF" for at least two minutes. 3. Note "AIR BAG" warning lamp as ignition switch is turned "ON." Does warning lamp flash 7 times then go "OFF"?</p>	<p>SRS is functional and free of malfunctions. No further diagnosis is required. Go to Step 4</p>	<p>Ignition switch "OFF." Replace SDM. Go to Step 4</p>
4	<p>Reconnect all SRS components, ensure all components are properly mounted. Was this step finished?</p>	<p>Repeat the "SRS Diagnostic System Check."</p>	<p>Go to Step 4</p>

Chart B "AIR BAG" Warning Lamp Comes "ON" Steady

D09RX002

Circuit Description:

When the ignition switch is first turned "ON", "ignition 1" voltage is applied from the "METER" fuse to "AIR BAG", warning lamp which is connected to "Supplemental Restraint System (SRS) warning lamp", terminal "7". The "SRS" fuses apply system voltage to the "ignition 1" inputs, terminals "12". The Sensing and Diagnostic Module (SDM) responds by flashing the "AIR BAG" warning lamp 7 times. If "ignition 1" voltage is less than 9 volts, the "AIR BAG" warning lamp will come "ON" solid with no DTCs set.

4. This test determines whether the malfunction is a short to ground in Circuit IB04 – GREEN.

Chart Test Description:

Number (s) below refer to step number (s) on the diagnostic chart.

- 2. This test checks for an open in the "ignition 1" circuit to the SDM.
- 3. This test checks for the voltage of "ignition 1."

9J1-12 RESTRAINT CONTROL SYSTEM

Chart B "AIR BAG" Warning Lamp Comes "ON" Steady

Step	Action	Yes	No
1	1. When measurements are requested in this chart use 5-8840-0285-0 DVM with correct terminal adapter from 5-8840-0385-0. 2. Ignition switch "OFF." 3. Connect scan tool to data link connector, Follow directions as given in the scan tool instruction manual. 4. Ignition switch "ON." 5. Request SRS diagnostic trouble code display. Does scan tool indicate "No Data Received"?	Go to Step 2	Go to Step 3
2	1. Ignition switch "OFF." 2. Inspect SDM harness connector connection to SDM. Is it securely connected to the SDM?	Ignition switch "OFF." Replace SDM. Go to Step 5	Connect SDM securely to deactivate shorting clip in SDM harness connector. Go to Step 5
3	Using scan tool, request SRS data list. Is "ignition" more than 9 volts?	Go to Step 4	Ignition switch "OFF." Replace SDM. Go to Step 5
4	1. Ignition switch "OFF." 2. Disconnect SRS coil and passenger air bag assemblies. Yellow 2-pin connectors located at base of steering column and behind the glove box assembly. 3. Disconnect SDM. 4. Measure resistance from SDM harness connector terminal "6" to ground. Does DVM display "0L" (infinite)?	Go to Chart A.	Replace SRS harness. Go to Step 5
5	Reconnect all SRS components, ensure all components are properly mounted. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 5

Chart C "AIR BAG" Warning Lamp Does Not Comes "ON" Steady

D09RX002

Circuit Description:

When the ignition switch is first turned "ON", "ignition 1" voltage is applied from the "METER" fuse to the "AIR BAG" warning lamp which is connected to "Supplemental Restraint System (SRS) warning lamp", terminal "7". The "SRS" fuse apply system voltage to the "ignition 1" inputs, terminals "12". The Sensing and Diagnostic Module (SDM) responds by flashing the "AIR BAG" warning lamp seven times. If "ignition 1" voltage is more than 16 volts, the "AIR BAG" warning lamp will be still "OFF" solid with no DTCs set.

- the warning lamp circuit.
- 3. This test determines if the malfunction is in the instrument cluster.
- 4. This test checks for open in the warning lamp circuitry.
- 5. This test isolates the IB04-GREEN circuit and checks for a short in the IB04-GREEN circuit to B+.
- 8. This test checks for a short from the SDM warning lamp power feed circuit to ground.
- 9. This test determines whether the short to ground is due to a short in the wiring.

Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

- 1. This test decides whether power is available to SDM warning lamp power feed circuit.
- 2. This test determines whether the voltage is present in

Chart C "AIR BAG" Warning Lamp Does Not Comes "ON" Steady

Step	Action	Yes	No
1	1. When measurements are requested in this chart use 5-8840-0285-0 DVM with correct terminal adapter from 5-8840-0385-0. 2. Ignition switch "OFF." 3. Remove and inspect "METER" fuse to the "AIR BAG" warning lamp. Is fuse good?	Go to Step 2	Go to Step 7
2	1. Ignition switch "OFF." 2. Disconnect SRS coil and passenger air bag assemblies. Yellow 2-pin connectors located at base of steering column and behind the glove box assembly. 3. Disconnect SDM. 4. Ignition switch "ON." 5. Measure voltage on SDM harness connector from terminal "7" to terminal "6" (ground). Is system voltage present on terminal "7"?	Go to Step 4	Go to Step 3
3	1. Ignition switch "OFF." 2. Remove instrument meter cluster. 3. Check for proper connection to instrument cluster at IB04-GRN terminal. 4. If OK, then remove and inspect "AIR BAG" bulb. Is bulb good?	Go to Step 5	Replace bulb. Go to Step 6
4	1. Ignition switch "OFF." 2. Disconnect instrument meter cluster harness connector. 3. Ignition switch "ON." 4. Measure voltage on SDM harness connector from terminal "7" to terminal "6" (ground). Is voltage 1 volt or less?	Go to Chart A.	Replace SRS harness. Go to Step 6
5	1. Install bulb. 2. Measure resistance from instrument meter cluster harness connector IB04-GRN terminal to SDM harness connector terminal "7". Is resistance 5.0 ohms or less?	Service instrument meter cluster. Go to Step 6	Replace SRS harness. Go to Step 6
6	Reconnect all SRS components, ensure all components are properly mounted. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 6
7	Were you sent here from chart C?	Go to Step 8	Go to Step 1
8	1. Replace "METER" fuse. 2. Ignition switch "ON" wait 10 seconds then ignition switch "OFF." 3. Remove and inspect "METER" fuse. Is fuse good?	Install "METER" fuse. Go to Step 10	Go to Step 9

Step	Action	Yes	No
9	1. Disconnect SRS coil and passenger air bag assemblies. Yellow 2-pin connectors located at base of steering column and behind the glove box assembly. 2. Disconnect SDM. 3. Replace "METER" fuse. 4. Ignition switch "ON" wait to 10 seconds. 5. Ignition switch "OFF". 6. Remove and inspection "METER" fuse. Is fuse good?	Install "METER" fuse. Go to Chart A.	Replace SRS harness. Replace "METER" fuse. Go to Step 10
10	Reconnect all SRS components, ensure all components are properly mounted. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 10

DTC 15 Passenger Deployment Loop Resistance High

D09RX002

Circuit Description:

When the ignition switch is turned "ON", the Sensing and Diagnostic Module (SDM) will perform tests to diagnose critical malfunctions within itself. Upon passing these tests "ignition 1", and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. The SDM then proceeds with the "Resistance Measurement Test". "Passenger Bag Low" terminal "16" is grounded through a resistor and the passenger current source connected to "Passenger Bag High" terminal "15" allows a known amount of current to flow. By monitoring the voltage difference between "Passenger Bag High" and "Passenger Bag Low" the SDM calculates the combined resistance of the passenger air bag assembly, harness wiring Circuits (CKTs) IB07–YELLOW/GREEN and IB08–YELLOW/RED connector terminal contact.

DTC Will Set When:

The combined resistance of the passenger air bag assembly, harness wiring CKTs IB07–YELLOW/GREEN and IB08–YELLOW/RED, and connector terminal contact is above a specified value. This test is run once each ignition cycle during the "Resistance Measurement Test" when:

1. No "higher priority faults" are detected during "Turn-ON."
2. "Ignition 1" voltage is in the specified value.

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The ignition switch is turned "OFF."

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the Sensing and Diagnostic Module (SDM).
3. This test verifies proper connection of the yellow 2-pin connector.
4. This test checks for proper contact and/or corrosion of the yellow 2-pin connector terminals.
5. The test checks for a malfunctioning passenger air bag assembly.
6. This test determines whether the malfunction is due to high resistance in the wiring.

Diagnostic Aids:

An intermittent condition is likely to be caused by a poor connection at the passenger air bag assembly harness connector terminals "1" and "2", SDM terminal "15" and "16", or a poor wire to terminal connection in Circuits(CKTs) IB07-YELLOW/GREEN and IB08-YELLOW/RED. This test for this diagnostic trouble code is only run while the "AIR BAG" warning lamp is performing the bulb check, unless Diagnostic Trouble Code (DTC) 17 or DTC 26 is detected. When a scan tool "Clear Codes" command is issued and the malfunction is still present, the DTC will not reappear until the next ignition cycle.

DTC 15 Passenger Deployment Loop Resistance High

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	1. When measurements are requested in this chart use 5-8840-0285-0 DVM with correct terminal adapter from 5-8840-0385-0. 2. Use scan tool data list function, read and record the passenger deployment loop resistance. Is passenger resist more than 2.9 ohms?	Go to Step 3	Go to Chart A.
3	1. Ignition switch "OFF." 2. Make sure the passenger air bag assembly yellow 2-pin connector located behind the glove box assembly is seated properly. Is the yellow 2-pin connector connected properly?	Go to Step 4	Seat passenger air bag assembly yellow 2-pin connector properly. Go to Step 7
4	1. Disconnect and inspect the passenger air bag assembly yellow 2-pin connector located behind the glove box assembly. 2. If OK, reconnect the passenger air bag assembly 2-pin connector. 3. Ignition switch "ON." Is DTC 15 current?	Go to Step 5	Ignition switch "OFF." Go to Step 7
5	1. Ignition switch "OFF." 2. Disconnect SRS coil and passenger air bag 2-pin connectors located at the base of the steering column and behind the glove box assembly. 3. Connect 5-8840-2421-0 SRS driver / passenger load tool and appropriate adapters to SRS coil and passenger air bag assembly harness connectors. 4. Ignition switch "ON." Is DTC 15 current?	Go to Step 6	Ignition switch "OFF." Replace the passenger air bag assembly. Go to Step 7
6	1. Ignition switch "OFF." 2. There has been an increase in the total circuit resistance of the passenger inflator deployment loop. 3. Use the high resolution ohmmeter mode of the DVM while checking CKTs IB07-YEL/GRN and IB08-YEL/RED, and SDM connector terminal "15" and "16" to locate the root cause. Was a fault found?	Replace SRS harness. Go to Step 7	Go to Chart A.
7	1. Reconnect all components ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 7

DTC 16 Passenger Deployment Loop Resistance Low

D09RX002

Circuit Description:

When the ignition switch is turned "ON", the Sensing and Diagnostic Module (SDM) will perform tests to diagnose critical malfunctions within itself. Upon passing these tests "ignition 1", and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. The SDM then proceeds with the "Resistance Measurement Test". "Passenger Bag Low" terminal "16" is grounded through a resistor and the passenger current source connected to "Passenger Bag High" terminal "15" allows a known amount of current to flow. By monitoring the voltage difference between "Passenger Bag High" and "Passenger Bag Low", the SDM calculates the combined resistance of the passenger air bag assembly, harness wiring Circuits(CKTs) IB07-YELLOW/GREEN and IB08-YELLOW/RED connector terminal contact.

DTC Will Set When:

The combined resistance of the passenger air bag assembly, harness wiring CKTs IB07-YELLOW/GREEN and IB08-YELLOW/RED, and connector terminal contact is above a specified value. This test is run once each ignition cycle during the "Resistance Measurement Test" when:

1. No "higher priority faults" are detected during "Turn-ON",
2. "Ignition 1" voltage is in the specified value.

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The ignition switch is turned "OFF."

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the Sensing and Diagnostic Module (SDM).
3. This test verifies connection of the yellow 2-pin connector.
4. This test checks for proper operation of the shorting clip in the yellow 2-pin connector.
5. The test checks for a malfunction passenger air bag assembly.
6. This test determines whether the malfunctioning is due to shorting in the wiring.

Diagnostic Aids:

An intermittent condition is likely to be caused by a short between Circuits(CKTs) IB07-YELLOW/GREEN and IB08-YELLOW/RED, or a malfunctioning shorting clip on the passenger air bag assembly which would require replacement of the air bag assembly. The test for this diagnostic trouble code is only run while "AIR BAG" warning lamp is performing the bulb check, unless Diagnostic Trouble Code (DTC) 17 or DTC 26 is detected. When a scan tool "Clear Codes" command is issued and the malfunction is still present, the DTC will not reappear until the next ignition cycle.

DTC 16 Passenger Deployment Loop Resistance Low

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	1. When measurements are requested in this chart use 5-8840-0285-0 DVM with correct terminal adapter from 5-8840-0385-0. 2. Using scan tool data list function, read and record the passenger deployment loop resistance. Is passenger resist. less than 1.4 ohms?	Go to Step 3	Go to Chart A.
3	1. Ignition switch "OFF." 2. Make sure the passenger air bag assembly yellow 2-pin connector located behind the glove box assembly is seated properly. Is the yellow 2-pin connector connected properly?	Go to Step 4	Seat passenger air bag assembly yellow 2-pin connector properly. Go to Step 7
4	1. Disconnect and inspect the passenger air bag assembly yellow 2-pin connector located behind the glove box assembly. 2. If OK, reconnect the passenger air bag assembly 2-pin connector. 3. Ignition switch "ON." Is DTC 16 current?	Go to Step 5	Ignition switch "OFF." Go to Step 7
5	1. Ignition switch "OFF." 2. Disconnect SRS coil and passenger air bag 2-pin connectors located at the base of the steering column and behind the glove box assembly. 3. Connect 5-8840-2421-0 SRS driver / passenger load tool and appropriate adapters to SRS coil and passenger air bag assembly harness connectors. 4. Ignition switch "ON." Is DTC 16 current?	Go to Step 6.	Ignition switch "OFF." Replace the passenger air bag assembly. Go to Step 7
6	1. Ignition switch "OFF." 2. There has been a decrease in the total circuit resistance of the passenger inflator deployment loop. 3. Use the high resolution ohmmeter mode of the DVM while checking CKTs IB07-YEL/GRN and IB08-YEL/RED, and SDM connector terminal "15" and "16" to locate the root cause. Was a fault found?	Replace SRS harness. Go to Step 7	Go to Chart A.
7	1. Reconnect all components, ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 7

DTC 17 Passenger Deployment Loop Open

D09RX002

Circuit Description:

When the ignition switch is turned "ON", the Sensing and Diagnostic Module (SDM) will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, "ignition 1", and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. During "Continuous Monitoring" diagnostics, a fixed amount of current is flowing in the deployment loop. This produces proportional voltage drops in the loop. By monitoring the voltage difference between "Passenger Bag High" and "Passenger Bag Low", the SDM calculates the combined resistance of the passenger air bag assembly, harness wiring Circuits (CKTs) IB07–YELLOW/GREEN and IB08–YELLOW/RED, and connector terminal contact.

DTC Will Set When:

The voltage difference between "Passenger Bag High" terminal "15" and "Passenger Bag Low" terminal "16" is above or equal to a specified value for 500 milliseconds during "Continuous Monitoring".

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The voltage difference between "Passenger Bag High" terminal "15" and "Passenger Bag Low" terminal "16" is below a specified value for 500 milliseconds during "Continuous Monitoring".

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the Sensing and Diagnostic Module (SDM).
3. This test verifies proper connection of the yellow 2-pin connector.
4. This test checks for proper contact and/or corrosion of the shorting clip in the yellow 2-pin connector terminals.
5. The test checks for a malfunctioning passenger air bag assembly.
6. This test determines whether there is an open in the wiring.

Diagnostic Aids:

An intermittent condition is likely to be caused by a poor connection at the passenger air bag assembly harness connector terminals "1" and "2," SDM terminals "15" and "16," or an open in Circuits IB07-YELLOW/GREEN and IB08-YELLOW/RED.

DTC 17 Passenger Deployment Loop Open

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	1. When measurements are requested in this chart use 5-8840-0285-0 DVM with correct terminal adapter from 5-8840-0385-0. 2. Using scan tool data list function, read and record the passenger differential voltage. Is passenger differential voltage. more than 4.25 volts?	Go to Step 3	Go to Chart A.
3	1. Ignition switch "OFF." 2. Make sure the passenger air bag assembly yellow 2-pin connector located behind the glove box assembly is seated properly. Is the yellow 2-pin connector connected properly?	Go to Step 4	Seat passenger air bag assembly yellow 2-pin connector properly. Go to Step 7
4	1. Disconnect and inspect the passenger air bag assembly yellow 2-pin connector located behind the glove box assembly. 2. If OK, reconnected the passenger air bag assembly yellow 2-pin connector. 3. Ignition switch "ON." Is DTC 17 current?	Go to Step 5	Ignition switch "OFF." Go to Step 7
5	1. Ignition switch "OFF." 2. Disconnect SRS coil and passenger air bag assembly yellow 2-pin connectors located at the base of the steering column and behind the glove box assembly. 3. Connect 5-8840-2421-0 SRS driver / passenger load tool and appropriate adapters to SRS coil and passenger air bag assembly harness connectors. 4. Ignition switch "ON." Is DTC 17 current?	Go to Step 6	Ignition switch "OFF." Replace the passenger air bag assembly. Go to Step 7
6	1. Ignition switch "OFF." 2. There has been an open circuit in the passenger inflator deployment loop. 3. Use the high resolution ohmmeter mode of the DVM while checking CKTs IB07-YEL/GRN and IB08-YEL/RED, and SDM connector terminal "15" and "16" to locate the root cause. Was a fault found?	Replace SRS harness. Go to Step 7	Go to Chart A.
7	1. Reconnect all components ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 7

DTC 18 Passenger Deployment Loop Short To Ground

D09RX002

Circuit Description:

When the ignition switch is turned "ON", the Sensing and Diagnostic Module (SDM) will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, "ignition 1", and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges.

The SDM monitors the voltages at "Driver Bag Low" terminal "4" and "Passenger Bag Low" terminal "16" to detect short to ground in the air bag assembly circuits.

DTC Will Set When:

Neither of the two air bag assemblies is open. "Ignition 1" is within the normal operating voltage range. Once these conditions are met and the voltage at "Passenger Bag Low" is below a specified value, Diagnostic Trouble Code (DTC) 18 will set. This test is run once each ignition cycle and "Continuous

Monitoring".

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

This malfunction is no longer occurring and the ignition switch is turned "OFF".

DTC Chart Test Description:

- Number(s) below refer to circled number(s) on the diagnostic chart:
2. This test determines whether the SDM is malfunctioning.
 3. This test isolates the malfunction to one side of the passenger air bag assembly yellow 2-pin connector

9J1-26 RESTRAINT CONTROL SYSTEM

behind glove box compartment.

4. This test determines whether the malfunction is in Circuit(CKT) IB07-YELLOW/GREEN.
5. This test determines whether the malfunction is in CKT IB08-YELLOW/RED.

Diagnostic Aids:

An intermittent condition is likely to be caused by a short to ground in the passenger air bag assembly circuit. Inspect CKTs IB07-YELLOW/GREEN and IB08-YELLOW/RED carefully for cutting or chafing. If the wiring pigtail of the passenger air bag assembly is damaged, the component must be replaced.

DTC 18 Passenger Deployment Loop Short To Ground

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	1. When measurements are requested in this chart use 5-8840-0285-0 DVM with correct terminal adapter from 5-8840-0385-0. 2. Ignition switch "OFF." 3. Connect scan tool data link connector. Follow directions as given in the scan tool operator's manual. 4. Ignition switch "ON." 5. Read passenger sense LO. Is passenger sense LO less than 1.5 volts?	Go to Step 3	Go to Chart A.
3	1. Ignition switch "OFF." 2. Disconnect passenger air bag assembly yellow 2-pin connector behind the glove box assembly.. 3. Leave driver air bag assembly connected. Connect SRS driver / passenger load tool 5-8840-2421-0 and appropriate adapter to passenger air bag assembly harness connector. 4. Ignition switch "ON." Is DTC 18 current?	Go to Step 4	Ignition switch "OFF." Replace passenger air bag assembly. Go to Step 6
4	1. Ignition switch "OFF." 2. Disconnect SRS driver / passenger load tool. 3. Measure resistance on SDM harness connector from terminal "15" to terminal "6" (ground). Does DVM display "0L" (infinite)?	Go to Step 5	Replace SRS harness. Go to Step 6
5	Measure resistance on SDM harness connector from terminal "6" "16" to terminal (ground). Does DVM display "0L" (infinite)?	Go to Chart A.	Replace SRS harness. Go to Step 6
6	1. Reconnect all components, ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 6

DTC 19 Passenger Deployment Loop Short To Voltage

D09RX002

Circuit Description:

When the ignition switch is turned "ON", the Sensing and Diagnostic Module (SDM) will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, "ignition 1", and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges.

The SDM monitors the voltages at "Driver Bag Low" terminal "4" and "Passenger Bag Low" terminal "16" to detect short to B+ in the air bag assembly circuits.

DTC Will Set When:

"Ignition 1" is within the normal operating voltage range. Once these conditions are met and the voltage at "Passenger Bag Low" is above a specified value, Diagnostic Trouble Code (DTC) 19 will set. This test is run once each ignition cycle and "Continuous Monitoring".

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets DTC 19 and also DTC 71.

DTC Will Clear When:

The SDM is replaced.

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the SDM.
3. This test isolates the malfunction to one side of the passenger air bag assembly yellow 2-pin connector behind glove box compartment.
4. This test determines whether the malfunction is in Circuit(CKT) IB07-YELLOW/GREEN.

-
5. This test determines whether the malfunction is in CKT IB08-YELLOW/RED.

Diagnostic Aids:

An intermittent condition is likely to be caused by a short to B+ in the passenger air bag assembly circuit. Inspect CKTs IB07-YELLOW/GREEN and IB08-YELLOW/RED carefully for cutting or chafing. If the wiring pigtail of the passenger air bag assembly is damaged, the component must be replaced. A careful inspection of CKT IB07-YELLOW/GREEN and IB08-YELLOW/RED, including the passenger air bag assembly pigtail is essential to ensure that the replacement Sensing and Diagnostic Module (SDM) will not be damaged.

DTC 19 Passenger Deployment Loop Short To Voltage

CAUTION: When DTC 19 has been set, it is necessary to replace the Sensing and Diagnostic Module (SDM). Setting Diagnostic Trouble Code (DTC) 19 and 25 or 51 or 53 will also cause DTC 71 to set. When a scan tool "CLEAR CODES" command is issued and the malfunction is no

longer present, DTC 71 will remain current. Ensure that the short to voltage condition is repaired prior to installing a replacement SDM to avoid damaging the SDM.

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	1. When measurements are requested in this chart use 5-8840-0285-0 DVM with correct terminal adapter from 5-8840-0385-0. 2. Ignition switch "OFF." 3. Connect scan tool data link connector. Follow directions as given in the scan tool operator's manual. 4. Ignition switch "ON." 5. Read passenger sense LO. Is passenger sense LO more than 3.5 volts?	Go to Step 3	Go to Chart A.
3	1. Ignition switch "OFF." 2. Disconnect passenger air bag assembly yellow 2-pin connector behind the glove box assembly. 3. Leave driver air bag assembly connected. 4. Connect SRS driver / passenger load tool 5-8840-2421-0 and appropriate adapter to passenger air bag assembly harness connector. 5. Ignition switch "ON." Is passenger sense LO more than 3.5 volts?	Go to Step 4	Ignition switch "OFF." Replace passenger air bag assembly. Go to Step 6
4	1. Ignition switch "OFF." 2. Disconnect SDM. 3. Disconnect SRS driver / passenger load tool. 4. Measure resistance on SDM harness connector from terminal "15" to terminal "12" (IGNITION 1). Does DVM display "0L" (infinite)?	Go to Step 5	Replace SRS harness. Go to Step 6
5	Measure resistance on SDM harness connector from terminal "16" to terminal "12" (IGNITION 1). Does DVM display "0L" (infinite)?	Go to Chart A.	Replace SRS harness. Go to Step 6
6	1. Reconnect all components, ensure all component are properly mounted. 2. Ignition switch "ON." Is passenger sense LO less than 3.5 volts?	Ignition switch "OFF." Replace SDM. Go to Step 7	Go to Chart A.
7	1. Reconnect all components, ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 7

DTC 21 Driver Deployment Loop Resistance High

D09RX002

Circuit Description:

When the ignition switch is turned "ON", the Sensing and Diagnostic Module (SDM) will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, "ignition 1", and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges.

The SDM then proceeds with the "Resistance Measurement Test" "Driver Bag Low" terminal "4" is grounded through a current sink and the driver current source connected to "Driver Bag High" terminal "3" allows a known amount of current to flow. By monitoring the voltage difference between "Driver Bag High" and "Driver Bag Low", the SDM calculates the combined resistance of the driver air bag assembly, SRS coil assembly, harness wiring Circuits(CKTs) IB05-YELLOW and IB06-YELLOW/BLACK, and connector terminal contact.

DTC Will Set When:

The combined resistance of the driver air bag assembly, SRS Coil assembly, harness wiring CKTs IB05-YELLOW and IB06-YELLOW/BLACK, and connector terminal contact is above a specified value. This test run once each ignition cycle during the "Resistance Measurement Test" when:

No "higher priority faults" are detected during "Turn-ON" "Ignition 1" voltage is in the specified value.

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets DTC 21.

DTC Will Clear When:

The ignition switch is turned "OFF".

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the Sensing and Diagnostic Module (SDM).
3. This test verifies proper connection of the yellow 2-pin connector at the base of the steering column.
4. This test checks for proper contact and/or corrosion of the 2-pin connector terminals at the base of steering column.
5. This test isolate the malfunction to one side of the Supplemental Restraint System (SRS) coil assembly yellow 2-pin connector located at the base of the steering column.
6. This test determines whether the malfunction is due to high resistance in the wiring.
7. This test determines whether the malfunction is in the SRS coil assembly or the driver air bag assembly.

Diagnostic Aids:

An intermittent condition is likely to be caused by a poor connection at terminals "1" and "2" of the SRS coil 2-pin connector at the base of the steering column, terminal "1" and "2" of the driver air bag assembly 2-pin connector at the top of the steering column, SDM terminals "3" and "4" or a poor wire to terminal connection in Circuit IB05-YELLOW or IB06-YELLOW/BLACK. The test for this diagnostic trouble code is only run while the "AIR BAG" warning lamp is performing the bulb check, unless Diagnostic Trouble Code (DTC) 17 or DTC 26 is detected. When a scan tool "Clear Codes" command is issued and the malfunction is still present, the DTC will not reappear until the next ignition cycle.

DTC 21 Driver Deployment Loop Resistance High

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	1. When measurements are requested in this chart use 5-8840-0285-0 DVM with correct terminal adapter from 5-8840-0385-0. 2. Use scan tool data list function, read and record the driver deployment loop resistance. Is driver deployment loop resistance more than 4.4 ohms?	Go to Step 3	Go to Chart A.
3	1. Ignition switch "OFF." 2. Disconnect driver air bag assembly yellow 2-pin connector located at base of steering column is seated properly. Is the 2-pin connector connected properly?	Go to Step 4	Seat SRS coil assembly 2-pin connector properly. Go to Step 8
4	1. Disconnect and inspect the SRS coil assembly yellow 2-pin connector located base of steering column. 2. If OK, reconnect the SRS coil assembly yellow 2-pin connector. 3. Ignition switch "ON." Is DTC 21 current?	Go to Step 5	Ignition switch "OFF." Go to Step 8
5	1. Ignition switch "OFF." 2. Disconnect SRS coil and passenger air bag assembly yellow 2-pin connectors located at the base of steering column and behind the glove box assembly. 3. Connect SRS driver / passenger load tool 5-8840-2421-0 and appropriate adapter to SRS coil and passenger air bag assembly harness connectors. 4. Ignition switch "ON." Is DTC 21 current?	Go to Step 6	Go to Step 7
6	1. Ignition switch "OFF." 2. There has been a increase in the total circuit resistance of the driver deployment loop. 3. Use the high resolution ohmmeter mode of the DVM while checking CKTs IB05-YEL/IB06-YEL/BLK, and SDM connector terminal "3" and "4" to locate the root cause. Was a fault found?	Replace SRS harness. Go to Step 8	Go to Chart A.
7	1. Ignition switch "OFF." Disconnect SRS driver / passenger load tool from SRS coil assembly harness connector. Connect SRS driver / passenger load tool 5-8840-2421-0 on the top of steering column. Reconnect SRS coil assembly harness connector as the base of steering column. Ignition switch "ON." Is DTC 21 current?	Ignition switch "OFF." Replace SRS COIL ASSEMBLY. Refer to in this section. Go to Step 8	Ignition switch "OFF." Replace driver air bag assembly. Go to Step 8
8	Reconnect all components, ensure all component are properly mounted. Clear diagnostic trouble codes. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 8.

DTC 22 Driver Deployment Loop Resistance Low

D09RX002

Circuit Description:

When the ignition switch is turned "ON", the Sensing and Diagnostic Module (SDM) will perform tests to diagnose critical malfunctions within itself. Upon passing these tests "ignition 1", and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. The SDM then proceeds with the "Resistance Measurement Test" "Driver Bag Low" terminal "4" is grounded through a current sink and the driver current source connected to "Driver Bag High" terminal "3" allows a known amount of current to flow. By monitoring the voltage difference between "Driver Bag High" and "Driver Bag Low" the SDM calculates the combined resistance of the driver air bag assembly, Supplemental Restraint System (SRS) coil assembly, harness wiring Circuits (CKTs) IB05-YELLOW and IB06-YELLOW/BLACK and connector terminal contact.

DTC Will Set When:

The combined resistance of the driver air bag assembly, SRS coil assembly, harness wiring CKTs IB05-YELLOW and IB06-YELLOW/BLACK and connector terminal contact is above a specified value. This test is run once each ignition cycle during the "Resistance Measurement Test" when:

1. No "higher priority faults" are detected during "Turn-ON"
2. "Ignition 1" voltage is in the specified value.

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets DTC 22.

DTC Will Clear When:

The ignition switch is turned "OFF."

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the Sensing and Diagnostic Module (SDM).
3. This test verifies proper connection of the yellow 2-pin connector at the base of the steering column.
4. This test checks for proper operation of the shorting clip in the yellow 2-pin connector.
5. This test isolate the malfunction to one side of the Supplemental Restraint System (SRS) coil assembly yellow 2-pin connector located at the base of steering column.
6. This test determines whether the malfunction is due to shorting in the wiring.
7. This test determines whether the malfunction is in the SRS coil assembly or the driver air bag assembly.

Diagnostic Aids:

An intermittent condition is likely to be caused by a short between Circuits IB05-YELLOW or IB06-YELLOW/BLACK or a malfunctioning shorting clip on the driver air bag assembly or SRS coil assembly which would require replacement of the component. The test for this diagnostic trouble code is only run while the "AIR BAG" warning lamp is performing the bulb check, unless Diagnostic Trouble Code (DTC) 17 or DTC 26 is detected. When a scan tool "Clear Codes" command is issued and the malfunction is still present, the DTC will not reappear until the next ignition cycle.

DTC 22 Driver Deployment Loop Resistance Low

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	1. When measurements are requested in this chart use 5-8840-0285-0 DVM with correct terminal adapter from 5-8840-0385-0. 2. Use scan tool data list function, read and record the driver deployment loop resistance. Is driver resist. less than 1.9 ohms?	Go to Step 3	Go to Chart A.
3	1. Ignition switch "OFF." 2. Make sure the SRS coil assembly yellow 2-pin connector located at the base of steering column is seated properly. Is the 2-pin connector connected properly?	Go to Step 4	Seat driver air bag assembly 2-pin connector properly. Go to Step 8
4	1. Disconnect and inspect the SRS coil assembly yellow 2-pin connector located base of steering column. 2. If OK, reconnect the driver air bag assembly yellow 2-pin connector. 3. Ignition switch "ON." Is DTC 22 current?	Go to Step 5	Ignition switch "OFF." Go to Step 8
5	1. Ignition switch "OFF." 2. Disconnect SRS coil and passenger air bag 2-pin connectors located at the base of steering column and behind the glove box assembly. 3. Connect SRS driver / passenger load tool 5-8840-2421-0 and appropriate adapter to SRS coil and passenger air bag assembly harness connectors. 4. Ignition switch "ON." Is DTC 22 current?	Go to Step 6	Go to Step 7
6	1. Ignition switch "OFF." 2. There has been a decrease in the total circuit resistance of the driver deployment loop. 3. Use the high resolution ohmmeter mode of the DVM while checking CKTs IB05-YEL and IB06-YEL/BLK, and SDM connector terminal "3" and "4" to locate the root cause. Was a fault found?	Replace SRS harness. Go to Step 8	Go to Chart A.
7	1. Ignition switch "OFF." 2. Disconnect SRS driver / passenger load tool from SRS coil assembly harness connector. 3. Connect SRS driver / passenger load tool 5-8840-2421-0 to the top of steering column. 4. Reconnect SRS coil assembly harness connector as the base of steering column. 5. Ignition switch "ON." Is DTC 22 current?	Ignition switch "OFF." Replace SRS coil assembly. Refer to in this section. Go to Step 8	Ignition switch "OFF." Replace driver air bag assembly. Go to Step 8
8	1. Reconnect all components, ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 8

9J1-38 RESTRAINT CONTROL SYSTEM

4. This test determines whether the malfunction is in Circuit(CKT) IB05-YELLOW.
5. This test determines whether the malfunction is in CKT IB06-YELLOW/BLACK.
6. This test determines whether the malfunction is in the SRS coil assembly or the driver air bag assembly.

Diagnostic Aids:

An intermittent condition is likely to be caused by a short to ground in the driver air bag assembly circuit. Inspect CKTs IB05-YELLOW and IB06-YELLOW/BLACK carefully for cutting or chafing.

DTC 24 Driver Deployment Loop Short To Ground

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	<ol style="list-style-type: none"> When measurements are requested in this chart use 5-8840-0285-0 DVM with correct terminal adapter from 5-8840-0385-0. Ignition switch "OFF." Go to Step 3	Go to Chart A.
3	<ol style="list-style-type: none"> Ignition switch "OFF." Disconnect SRS coil assembly yellow 2-pin connector located at base of the steering column. Leave passenger air bag assembly connected. Connect SRS driver / passenger load tool 5-8840-2421-0 and appropriate adapter to SRS coil assembly harness connector. Ignition switch "ON." Is DTC 24 current?	Go to Step 4	Go to Step 6
4	<ol style="list-style-type: none"> Ignition switch "OFF." Disconnect SDM. Disconnect SRS driver / passenger load tool. Measure resistance on SDM harness connector "3" to terminal "6" (ground). Does DVM display "0L" (infinite)?	Go to Step 5	Replace SRS harness. Go to Step 7
5	Measure resistance on SDM harness connector from terminal "4" to terminal "6" (ground). Does DVM display "0L" (infinite)?	Go to Chart A.	Replace SRS harness. Go to Step 7
6	<ol style="list-style-type: none"> Ignition switch "OFF." Disconnect SRS driver / passenger load tool 5-8840-2421-0 from SRS coil assembly harness connector. Connect SRS driver / passenger load tool 5-8840-2421-0 and appropriate adapter 5-8840-0385-0 to driver air bag assembly harness connector. Located top of the steering column. Reconnect SRS coil assembly harness connector as the base of steering column. Ignition switch "ON." Is DTC 24 current?	Ignition switch "OFF." Replace SRS coil assembly. Refer to in this section. Go to Step 7	Ignition switch "OFF." Replace driver air bag assembly. Go to Step 7
7	<ol style="list-style-type: none"> Reconnect all components, ensure all component are properly mounted. Clear diagnostic trouble codes. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 7

DTC 25 Driver Deployment Loop Short To Voltage

D09RX002

Circuit Description:

When the ignition switch is turned "ON", the Sensing and Diagnostic Module (SDM) will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, "ignition 1", and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges.

The SDM monitors the voltage at "Driver Bag Low" terminal "4" and "Passenger Bag Low" terminal "16" to detect shorts to B+ in the air bag assembly circuits.

DTC Will Set When:

"Ignition 1" is in the normal operating voltage range. This test is run once each ignition cycle and "Continuous Monitoring". Once these conditions are met and the voltage at "Driver Bag Low" is above a specified value, Diagnostic Trouble Code (DTC) 25 will set.

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets DTC 25 and also DTC 71

DTC Will Clear When:

The SDM is replaced.

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the SDM is malfunctioning.
3. This test isolates the malfunction to one side of the Supplemental Restraint System coil assembly yellow 2-pin connector at the base of steering column.
4. This test determines whether the malfunction is in Circuit(CKT) IB05-YELLOW.

5. This test determines whether the malfunction is in CKT IB06-YELLOW/BLACK.
6. This test determines whether the malfunction is in the Supplemental Restraint System (SRS) coil assembly or the driver air bag assembly.

Diagnostic Aids:

An intermittent condition is likely to be caused by a short to B+ in the driver air bag assembly circuit. Inspect CKTs IB05-YELLOW and IB06-YELLOW/BLACK carefully for cutting or chafing. If the wiring pigtail of the driver air bag assembly and SRS coil assembly is damaged, the components must be replaced. A careful inspection of CKT IB05-YELLOW and IB06-YELLOW/BLACK, including the SRS coil assembly and driver air bag assembly is essential to ensure that the replacement Sensing and Diagnostic Module (SDM) will not be damaged.

DTC 25 Driver Deployment Loop Short To Ignition

CAUTION: When Diagnostic Trouble Code (DTC) 25 has been set, it is necessary to replace the Sensing and Diagnostic Module (SDM). Setting DTC 25 will also cause DTC 71 to set. When a scan tool "CLEAR CODES" command is issued and the malfunction is

no longer present, DTC 71 will remain current. Ensure that the short to voltage condition is repaired prior to installing a replacement SDM to avoid damaging the SDM.

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	1. When measurements are requested in this chart use 5-8840-0285-0 DVM with correct terminal adapter from 5-8840-0385-0. 2. Ignition switch "OFF." 3. Connect scan tool data link connector. Follow directions as given in the scan tool operator's manual. 4. Ignition switch "ON." 5. Read driver sense LO. Is driver sense LO more than 3.5 volts?	Go to Step 3	Go to Chart A.
3	1. Ignition switch "OFF." 2. Disconnect SRS coil assembly yellow 2-pin connector at the base of the steering column. Leave passenger air bag assembly connected. Connect SRS driver / passenger load tool 5-8840-2421-0 and appropriate adapter to SRS coil assembly harness connector. 3. Ignition switch "ON." Is driver sense LO more than 3.5 volts?	Go to Step 4	Go to Step 6
4	1. Ignition switch "OFF." 2. Disconnect SDM. 3. Disconnect SRS driver / passenger load tool. 4. Measure resistance on SDM harness connector from terminal "3" to terminal "12" (Ignition 1). Does DVM display "0L" (infinite)?	Go to Step 5	Replace SRS harness. Go to Step 7
5	Measure resistance on SDM harness connector from terminal "4" to terminal "12" (Ignition 1). Does DVM display "0L" (infinite)?	Go to Chart A.	Replace SRS harness. Go to Step 7
6	1. Ignition switch "OFF." 2. Connect SRS driver / passenger load tool 5-8840-2421-0 and appropriate adapter 5-8840-0385-0 to driver air bag assembly harness connector located of top of the steering column. 3. Reconnect SRS coil assembly harness connector as the base of steering column. 4. Ignition switch "ON." Is driver sense LO more than 3.5 volts?	Ignition switch "OFF." Replace SRS coil assembly. Go to Step 7	Ignition switch "OFF." Replace driver air bag assembly. Go to Step 7
7	1. Reconnect all components, ensure all components are properly mounted. 2. Ignition switch "ON." Is passenger sense LO less than 3.5 volts?	Replace SDM. Go to Step 8	Go to Chart A.

Step	Action	Yes	No
8	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 8

DTC 26 Driver Deployment Loop Open

D09RX002

Circuit Description:

When the ignition switch is turned "ON", the Sensing and Diagnostic Module (SDM) will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, "ignition 1", and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges.

During "Continuous Monitoring" diagnostics, a fixed amount of current is following in the deployment loop. This produces proportional voltage drops in the loop. By monitoring the voltage difference between "Driver Bag High" and "Driver Bag Low", the SDM calculates the combined resistance of the driver air bag assembly, SRS coil assembly, harness wiring Circuits (CKTs) IB05-YELLOW and IB06-YELLOW/BLACK, and connector terminal contact.

DTC Will Set When:

The voltage difference between "Driver Bag High" terminal "3" and "Driver Bag Low" terminal "4" is above or equal to a specified value for 500 milliseconds during "Continuous Monitoring."

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The voltage difference between "Driver Bag High" terminal "3" and "Driver Bag Low" terminal "4" is below a specified value for 500 milliseconds during "Continuous Monitoring."

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart:

1. This test determines whether the malfunction is in the Sensing and Diagnostic Module (SDM).
2. This test verifies proper connection of the yellow 2-pin connector at the base of the steering column.
3. This test checks for proper contact and/or corrosion of the yellow 2-pin connector at the base of the steering column.
4. This test isolates the malfunction to one side of the Supplemental Restraint System (SRS) coil assembly yellow 2-pin connector located at the base of steering column.
5. This test determines whether the open is in the wiring.
6. This test determines whether the malfunction is in the SRS coil assembly or the driver air bag assembly.

Diagnostic Aids:

An intermittent condition is likely to be caused by a poor connection at the driver air bag assembly harness 2-pin connector terminals "1" and "2" at the top of the steering column, SRS coil assembly harness 2-pin connection terminals "1" and "2", SDM terminals "3" and "4", or an open in Circuits(CKTs) IB05-YELLOW and IB06-YELLOW/BLACK.

DTC 26 Driver Deployment Loop Open

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	1. When measurements are requested in this chart use 5-8840-0285-0 DVM with correct terminal adapter from 5-8840-0385-0. 2. Use scan tool data list function, read and record the driver differential voltage. Is driver differential voltage more than 4.25 volts?	Go to Step 3	Go to Chart A.
3	1. Ignition switch "OFF." 2. Make sure the SRS coil assembly yellow 2-pin connector located at the base of steering column is seated properly. Is the yellow 2-pin connector connected properly?	Go to Step 4	Seat driver air bag assembly 2-pin connector. Go to Step 8
4	1. Disconnect and inspect the SRS coil assembly yellow 2-pin connector located base of steering column. 2. If OK, reconnect the SRS coil assembly yellow 2-pin connector. 3. Ignition switch "ON". Is DTC 26 current?	Go to Step 5	Ignition switch "OFF." Go to Step 8
5	1. Ignition switch "OFF." 2. Disconnect SRS coil and passenger air bag assembly, yellow 2-pin connectors located at the base of steering column and behind the glove box assembly. 3. Connect SRS driver / passenger load tool 5-8840-2421-0 and appropriate adapter to SRS coil and passenger air bag assembly harness connectors. 4. Ignition switch "ON." Is DTC 26 current?	Go to Step 6	Go to Step 7
6	1. Ignition switch "OFF." 2. There has been an open circuit in the driver deployment loop. Use the high resolution ohmmeter mode of the DVM while checking CKTs IB05 YEL and IB06 YEL/BLK, and SDM connector terminal "3" AND "4" to locate the root cause. Was a fault found?	Replace SRS harness. Go to Step 8	Go to Chart A.
7	1. Ignition switch "OFF." 2. Disconnect SRS driver / passenger load tool from SRS coil assembly harness connector. 3. Connect SRS driver / passenger load tool 5-8840-2421-0 on steering column. 4. Reconnect SRS coil assembly harness connector as the base of steering column. 5. Ignition switch "ON." Is DTC 26 current?	Ignition switch "OFF." Replace SRS coil assembly, refer to in this section. Go to Step 8	Ignition switch "OFF." Replace driver air bag assembly. Go to Step 8
8	1. Reconnect all components, ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the "SRS Diagnostic System Check."	Go to Step 8

DTC 51 Deployment Event Commanded

D09RX002

Circuit Description:

The Sensing and Diagnostic Module (SDM) contains a sensing device which converts vehicle velocity changes to an electrical signal. The electrical signal generated is processed by the SDM and then compared to a value stored in memory. When the generated signal exceeds the stored value, the SDM will cause current to flow through the air bag assembly deploying the air bags and causing Diagnostic Trouble Code (DTC) 51 to set.

DTC Will Set When:

The SDM detects a frontal crash, up to 30 degrees off the centerline of the vehicle, of sufficient force to warrant deployment of the air bags.

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp records

"Crash Data", and sets a diagnostic trouble code.

DTC Will Clear When:

The SDM is replaced.

DTC Chart Test Description:

- Number(s) below refer to step number(s) on the diagnostic chart:
2. If air bag assembly (s) has not deployed, DTC 51 may have falsely set.
 3. If DTC 51 has set with no signs of frontal impact, the diagnostic trouble code has falsely set.

DTC 51 Deployment Event Commanded

WARNING: DURING SERVICE PROCEDURES. BE VERY CAREFUL WHEN HANDLING A SENSING AND DIAGNOSTIC MODULE (SDM). NEVER STRIKE OR JAR THE SDM. NEVER POWER UP THE SRS WHEN THE SDM IS NOT RIGIDLY ATTACHED TO THE VEHICLE. ALL SDM AND MOUNTING BRACKET FASTENERS MUST BE CAREFULLY TORQUED AND THE ARROW MUST BE POINTING TOWARD

THE FRONT OF THE VEHICLE TO ENSURE PROPER OPERATION OF THE SUPPLEMENTAL RESTRAINT SYSTEM (SRS). THE SDM COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY.

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	Ignition switch "OFF." Have air bag assemblies deployed?	Replace components and perform inspections as directed in "repairs and inspections required after an accident" in this section. Clear diagnostic trouble codes. Repeat the "SRS Diagnostic System Check."	Go to Step 3
3	Inspect front of vehicle and undercarriage for signs of impact. Were signs of impact found?	Replace components and perform inspections as directed in "repairs and inspections required after an accident" in this section. Clear diagnostic trouble codes. Repeat the "SRS Diagnostic System Check."	Ignition switch "OFF." Replace SDM. Reconnect all SRS system components, ensure all components are properly mounted. Repeat the "SRS Diagnostic System Check."

DTC 53 Deployment Commanded With Deployment Loop Fault Or Energy Reserves Out Of Range

D09RX002

Circuit Description:

The Sensing and Diagnostic Module (SDM) contains a sensing drive which converts vehicle velocity changes to an electrical signal. The electrical signal generated is processed by the SDM and then compared to a value stored in memory. When the generated signal exceeds the stored value, the SDM will cause current to flow through the air bag assembly deploying the air bags. Diagnostic Trouble Code (DTC) 53 is set accompanying with DTC 51 when a deployment occurs while an air bag assembly circuit fault is present that could possible result in a no deployment situation in one or both air bag assemblies.

DTC Will Set When:

The SDM detects a frontal crash, up to 30 degrees off

the centerline of the vehicle, of sufficient force to warrant deployment of the air bags and an inflator circuit fault is present.

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp records "Crash Data", and sets a diagnostic trouble code.

DTC Will Clear When:

The SDM is replaced. If DTC 53 is set, one or more DTCs will be set in addition to DTC 53. Malfunction(s) setting DTC(s) (other than DTC 71) must be repaired so that DTC(s) will not be set when a new SDM is installed.

DTC Chart Test Description:

Number(s) below refer to step number(s) on the diagnostic chart:

2. If air bag assembly has not deployed, Diagnostic Trouble Code (DTC) 53 may have falsely set.
3. If DTC 53 has set with no signs of frontal impact, the diagnostic trouble code has falsely set.

DTC 53 Deployment Commanded With Deployment Loop Fault Or Energy Reserves Out Of Range

WARNING: DURING SERVICE PROCEDURES. BE VERY CAREFUL WHEN HANDLING A SENSING AND DIAGNOSTIC MODULE (SDM). NEVER STRIKE OR JAR THE SDM. NEVER POWER UP THE SRS WHEN THE SDM IS NOT RIGIDLY ATTACHED TO THE VEHICLE. ALL SDM AND MOUNTING BRACKET FASTENERS MUST BE CAREFULLY TORQUED AND THE ARROW MUST BE POINTING TOWARD THE

FRONT OF THE VEHICLE TO ENSURE PROPER OPERATION OF THE SRS. THE SDM COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY.

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	Ignition switch "OFF." Have air bag assemblies deployed?	Replace components and perform inspections as directed in "repairs and inspections required after an accident" in this section. Clear diagnostic trouble codes. Repeat the "SRS Diagnostic System Check."	Go to Step 3
3	Inspect front of vehicle and undercarriage for signs of impact. Were signs of impact found?	Replace components and perform inspections as directed in "repairs and inspections required after an accident" in this section. Clear diagnostic trouble codes. Repeat the "SRS Diagnostic System Check."	Ignition switch "OFF." Replace SDM. Reconnect all SRS system components, ensure all components are properly mounted. Repeat the "SRS Diagnostic System Check."

DTC 61 Warning Lamp Circuit Failure

D09RX002

Circuit Description:

When the ignition switch is turned "ON", battery voltage is applied to the "AIR BAG" warning lamp and to the "ignition 1" input terminal "12". The Sensing and Diagnostic Module (SDM) responds by flashing the "AIR BAG" warning lamp seven times. The SDM monitors the lamp driver output by comparing the output state at "Supplemental Restraint System (SRS) warning lamp" terminal "7" to the microprocessor commanded state. When "ignition 1" is in the specified value, and the output state Does not match the commanded state of the lamp driver for 500 milliseconds, DTC 61 is set.

DTC Will Set When:

"Ignition 1" voltage is in the specified value and the output state at the "SRS warning lamp" terminal does not match the commanded state of the lamp driver for 500 milliseconds. This test is run every 100

milliseconds during "Continuous Monitoring" tests and once per each ignition cycle at the beginning.

Action Taken:

SDM attempts to turn "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The ignition switch is turned "OFF."

Diagnostic Aids:

Refer to Charts B and C to diagnose warning lamp circuit malfunctions.

DTC 61 Warning Lamp Circuit Failure

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	<ol style="list-style-type: none">1. Malfunctions within the "AIR BAG" warning lamp circuitry will set this diagnostic trouble code.2. These malfunctions are addressed in the "SRS Diagnostic System Check" via Chart B and Chart C.3. Failure to properly perform the "SRS Diagnostic System Check" may result in misdiagnosis.4. Ignition switch "ON."5. Clear SRS diagnostic trouble codes. Is DTC 61 SET?	Ignition switch "OFF." Go to Chart A.	Repeat the "SRS Diagnostic System Check."

DTC 71 Internal SDM Fault

D09RX002

Circuit Description:

Diagnostic Trouble Code (DTC) 71 is an indication of a potential internal Sensing and Diagnostic Module (SDM) malfunction and will set if any of the following conditions are detected:

- 1) Deployment or microprocessor energy reserve failure.
- 2) Electronically Erasable Programmable Read Only Memory failure. (EEPROM).
- 3) Random Only Memory failure. (ROM).
- 4) Random Access Memory failure. (RAM).
- 5) Calibration check sum failure.
- 6) Deployment switch faults.
- 7) Accelerometer fault.
- 8) Arming sensor fault.
- 9) Diagnostic current faults.
- 10) DTC 19
- 11) DTC 25
- 12) DTC 51

13) DTC 53

DTC Will Set When:

Any of the above indicated malfunctions are detected by the SDM. The malfunctions described above are tested mainly during "Continuous Monitoring" and some ones run each ignition cycle.

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

A scan tool "Clear Codes" commanded is received by the SDM. Some of the indicated malfunctions will only allow the "AIR BAG" warning lamp to go out. But when DTC 19, 25, 51, 53 are also set, SDM is Replaced.

DTC 71 Internal SDM Fault

WARNING: DURING SERVICE PROCEDURES. BE VERY CAREFUL WHEN HANDLING A SENSING AND DIAGNOSTIC MODULE (SDM). NEVER STRIKE OR JAR THE SDM. NEVER POWER UP THE SRS WHEN THE SDM IS NOT RIGIDLY ATTACHED TO THE VEHICLE. ALL SDM AND MOUNTING BRACKET FASTENERS MUST BE CAREFULLY TORQUED AND THE ARROW MUST BE POINTING TOWARD THE FRONT OF THE VEHICLE TO ENSURE PROPER OPERATION OF THE SRS. THE SDM COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL

INJURY.

CAUTION: When Diagnostic Trouble Code (DTC) 19 or 25 or 51 or 53 has been set it is necessary to Replace the SDM. Setting DTC 19 and 25 or 51 or 53 will also cause DTC 71 to set. When a scan tool "CLEAR CODES" command is issued and the malfunction is no longer present, DTC 51 or 53 and DTC 71 will remain current. Ensure that the short to voltage condition DTC 19, 25 is repaired prior to installing a Replacement SDM to avoid damaging the SDM.

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check."
2	Note SRS "Diagnostic System Check." Is DTC 19 or 25 or 51 or 53 also set (current or history)? (Refer to notice above).	Go to DTC 19 if DTC 19 is set. Go to DTC 25 if DTC 25 is set. Go to DTC 51 if DTC 51 is set. Go to DTC 53 if DTC 53 is set.	Ignition switch "OFF." Replace SDM. Repeat the "SRS Diagnostic System Check."

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

The cruise control keeps the vehicle running at a fixed speed until a signal canceling this fixed speed is received.

When the main switch "AUTO CRUISE" is turned on with the vehicle in the running mode, the battery voltage is applied to the control unit. When a signal from the control switch is input to the control unit while the vehicle is in this state, the cruise control actuator is activated to operate the system. Also, while the system is operating, the "AUTO CRUISE" indicator light in the meter assembly lights up.

1 . SET/COAST Switch Function

1. **Set Function:** When the SET/COAST switch is pressed and released with the main switch on, the speed at which the vehicle is running at that moment is stored in the memory, and the vehicle automatically runs at the speed stored.
2. **Coast-Down Function:** When the SET/COAST switch is kept on while the vehicle is running, the vehicle decelerates during that time. The speed at which vehicle is running when the control switch is turned off is stored in the memory, and the vehicle automatically returns to the stored speed.
3. **Tap-Down Function:** When the SET/COAST switch is turned on and off instantaneously while the vehicle is running, the vehicle decelerates a mile for each on/off operation. The vehicle speed at which the vehicle was running when the SET/COAST was turned off last is stored in the memory, and the vehicle automatically returns to this stored speed.

2 . RESUME/ACCEL Switch Function

1. **Resume Function:** When the RESUME, ACCEL switch is turned on/off after the system is temporarily deactivated by pressing the brake or clutch pedal while the vehicle is running, the vehicle resumes, the speed stored before the system was released.
2. **Accelerate Function:** When the RESUME/ACCEL switch is kept on after the system is released completely, the vehicle accelerates its speed during that time. The vehicle speed at which the vehicle was running when the switch was turned off is stored in the memory, and the vehicle automatically returns to this speed.
3. **Tap-Up Function:** When the RESUME/ACCEL switch is turned on and off instantaneously while the vehicle is running, the vehicle accelerates a mile for each on/off operation. The vehicle speed at which the vehicle was running when the switch was turned off last is stored in the memory, and the vehicle automatically returns to this stored speed.

3 . CANCEL Function

1. Temporary Cancellation:

- When the brake pedal is pressed.
- When the clutch pedal is pressed. (M/T)
- When the select lever is shifted to any position other than "D", "3", "2" or "L". (A/T)
- When the vehicle speed has decreased about 20 km/h or more than the stored speed.

2. Complete Cancellation:

- When the starter switch or the main switch is turned off.
- When the failsafe function is activated.

Diagnosis

Refer to the Cruise Control System Diagnosis in Wiring System section.

Brake Switch

Removal and Installation

Refer to the Stoplight Switch Replacement in Brake section.

Adjustment

1. Check that the brake pedal (3) is fully returned by pedal return spring.
2. Disconnect the switch connector.
3. Loosen the lock nut (2).
4. Rotate the brake switch (1) by hand until push rod disappears from brake switch tip (4).
5. Return the brake switch by a half turn.
6. Tighten the lock nut.
7. Connect the switch connector.

310RS028

Clutch Switch

Removal and Installation

Refer to the Clutch Control in Clutch section.

Adjustment

1. Turn the clutch switch (1) until the switch plunger is fully retracted against the clutch pedal arm.
2. Adjust clutch switch by backing it out half a turn and measure the clearance (4) between the clutch pedal arm (3) and the clutch switch.
3. Lock the lock nut(2).
4. Connect clutch switch connector.

Clutch Switch (bolt) and Clutch Pedal Clearance

0.5 – 1.5 mm (0.020 – 0.059 in)

203RS016-1

Cruise Control Unit

Removal

1. Disconnect the battery ground cable.
2. Remove the rear console box assembly.
 - Remove four screws.
3. Remove the cover (3).
 - Remove four nuts.
4. Remove the cruise control unit (1).
 - Disconnect the connector (2).

825RX017

Installation

To install, follow the removal steps in the reverse order.

Cruise Actuator

Actuator Cable Diagram

825RW093

Legend

- | | |
|------------------------------|---|
| (1) Cruise Actuator Assembly | (4) Throttle Link (Cruise Control Side) |
| (2) Cruise Control Cable | |
| (3) Accelerator Cable | |

Removal

1. Disconnect the battery ground cable.
2. Remove the cruise actuator assembly (4).
 - Disconnect the connector (3).
 - Remove the cable end (1) from the throttle link (cruise control side).
 - Loosen two fixing nuts (2).
 - Remove three actuator assembly fixing screws.

825RW049

Installation

To install, follow the removal steps in the reverse order, noting the following point:

1. Take care not to bend the cable excessively.

10A-6 CRUISE CONTROL SYSTEM

Adjustment

After installing the cruise actuator, the following steps must be carried out for cruise control cable adjustment.

1. Install the cruise control cable end (3) to the throttle link (4).
2. Put the screw portion of the cable in the bracket (5).
3. Put the nut (1) to the bracket and then tighten the nut (2).
 - If the distance between the throttle link (4) and the throttle link lever (6) is out of the specified range, loosen the nut (2) to adjust it.

035RW140

Mode Switch

Removal and Installation

Refer to Mode Switch in Automatic Transmission section.

Cruise Control Main Switch

Removal

1. Disconnect the battery ground cable.
2. Remove the meter cluster assembly (1).
 - Refer to the Instrument Panel Assembly in Body Structure section.
3. Remove the cruise control main switch (2).
 - Disconnect the switch connector.
 - To remove the switch, push the lock from the back side of the instrument panel cluster assembly.

825RX035

Installation

To install, follow the removal steps in the reverse order.

Cruise Control Switch (Combination Switch)

Removal and Installation

Refer to Lighting Switch (Combination Switch) in Lighting System section.

WORKSHOP MANUAL

FRONTERA (UE)

FOREWORD

This manual includes special notes, important points, service data, precautions, etc. That are needed for the maintenance, adjustments, service, removal and installation of vehicle components.

All information, illustrations and specifications contained in this manual are based on the latest product information available at the time of publication.

All rights are reserved to make changes at any time without notice.

Arrangement of the material is shown in the table of contents on the right-hand side of this page. A black spot on the first page of each section can be seen on the edge of the book below each section title. These point to a more detailed table of contents preceding each section.

This manual applies to 2000 models.

General Repair Instruction

- If a floor jack is used, the following precautions are recommended.
Park vehicle on level ground, "block" front or rear wheels, set jack against the recommended lifting points (see "Lifting Instructions" in this section), raise vehicle and support with chassis stands and then perform the service operations.
- Before performing service operations, disconnect ground cable from the battery to reduce the chance of cable damage and burning due to short circuiting.
- Use a cover on body, seats and floor to protect them against damage and contamination.
- Brake fluid and anti-freeze solution must be handled with reasonable care, as they can cause paint damage.
- The use of proper tools and recommended essential and available tools, where specified, is important for efficient and reliable performance of service repairs.
- Use genuine Isuzu parts.
- Used cotter pins, plastic clips, gaskets, O-rings, oil seals, lock washers and self-locking nuts should be discarded and new ones should be installed, as normal function of the parts cannot be maintained if these parts are reused.
- To facilitate proper and smooth reassembly operation, keep disassembled parts neatly in groups. Keeping fixing bolts and nuts separate is very important, as they vary in hardness and design depending on position of installation.
- Clean the parts before inspection or reassembly. Also clean oil ports, etc. using compressed air, and make certain they are free from restrictions.
- Lubricate rotating and sliding faces of the parts with oil or grease before installation.
- When necessary, use a sealer on gaskets to prevent leakage.
- Carefully observe all specifications for bolt and nut torques.
- When removing or replacing parts that require refrigerant to be discharged from the air conditioning system, be sure to use the Vehicle Refrigerant Recovery and Recycling Equipment (VRRRE) to recover and recycle Refrigerant-134a.
- When a service operation is completed, make a final check to be sure the service has been done properly and the problem has been corrected.
- SUPPLEMENTAL RESTRAINT SYSTEM**
The vehicle is equipped with a Supplemental Restraint System (SRS) – Air Bags. This system is not to be serviced without consulting the appropriate service information. Consult Section 9J "SRS System" if work is to be done on the front of the vehicle such as bumper, sheet metal, seats, wiring, steering wheel or column. Also review SRS system information if any arc welding is to be done on the vehicle. The SRS system equipped vehicle can be identified by:
 - "AIR BAG" warning light on the instrument cluster.
 - A Code "J" for fifth digit of Vehicle Identification Number.

M24X2.0	359 – 539 N·m (265 – 398 lb ft)	431 – 711 N·m (318 – 524 lb ft)		554 – 831 N·m (409 – 613 lb ft)

The asterisk * indicates that the bolts are used for female-threaded parts that are made of soft materials such as casting, etc.

Abbreviations Charts

List of automotive abbreviations which may be used in this manual

A — Ampere(s)	EEPROM — Electronically Erasable Programmable Read Only Memory
ABS — Antilock Brake System	EGR — Exhaust Gas Recirculation
AC — Alternating Current	EI — Electronic Ignition
A/C — Air Conditioning	ETR — Electronically Tuned Receiver
ACCEL — Accelerator	EVAP — Evaporation Emission
ACC — Accessory	Exh — Exhaust
ACL — Air Cleaner	° F — Degrees Fahrenheit
Adj — Adjust	Fed — Federal (All States Except Calif.)
A/F — Air Fuel Ratio	FF — Front Drive Front Engine
AIR — Secondary Air Injection System	FL — Fusible Link
Alt — Altitude	FLW — Fusible Link Wire
AMP — Ampere(s)	FP — Fuel Pump
ANT — Antenna	FRT — Front
ASM — Assembly	ft — Foot
A/T — Automatic Transmission/Transaxle	FWD — Front Wheel Drive
ATDC — After Top Dead Center	4WD — Four Wheel Drive
ATF — Automatic Transmission Fluid	4 x 4 — Four Wheel Drive
Auth — Authority	4 A/T — Four Speed Automatic Transmission/Transaxle
Auto — Automatic	Gal — Gallon
BARO — Barometric Pressure	GEN — Generator
Bat — Battery	GND — Ground
B+ — Battery Positive Voltage	Gov — Governor
Bbl — Barrel	g — Gram
BHP — Brake Horsepower	Harn — Harness
BPT — Backpressure Transducer	HC — Hydrocarbons
BTDC — Before Top Dead Center	HD — Heavy Duty
° C — Degrees Celsius	Hg — Hydrargyrum (Mercury)
CAC — Charge Air Cooler	HiAlt — High Altitude
Calif — California	HO2S — Heated Oxygen Sensor
cc — Cubic Centimeter	HVAC — Heater-Vent-Air-Conditioning
CID — Cubic Inch Displacement	IAC — Idle Air Control
CKP — Crankshaft Position	IAT — Intake Air Temperature
CL — Closed Loop	IC — Integrated Circuit / Ignition Control
CLCC — Closed Loop Carburetor Control	ID — Identification / Inside Diameter
CMP — Camshaft Position	IGN — Ignition
CO — Carbon Monoxide	INJ — Injection
Coax — Coaxial	IP — Instrument Panel
Conn — Connector	IPC — Instrument Panel Cluster
Conv — Converter	Int — Intake
Crank — Crankshaft	ISC — Idle Speed Control
Cu. In. — Cubic Inch	J/B — Junction Block
CV — Constant Velocity	kg — Kilograms
Cyl — Cylinder(s)	km — Kilometers
DI — Distributor Ignition	km/h — Kilometer per Hour
Diff — Differential	kpa — Kilopascals
Dist — Distributor	kV — Kilovolts (thousands of volts)
DLC — Data Link Connector	kW — Kilowatts
DOHC — Double Overhead Camshaft	KS — Knock Sensor
DTC — Diagnostic Trouble Code	L — Liter
DTM — Diagnostic Test Mode	lb ft — Foot Pounds
DTT — Diagnostic Test Terminal	lb in — Inch Pounds
DVM — Digital Voltmeter (10 meg.)	LF — Left Front
DVOM — Digital Volt Ohmmeter	LH — Left Hand
EBCM — Electronic Brake Control Module	LR — Left Rear
ECM — Engine Control Module	LS — Left Side
ECT — Engine Coolant Temperature	LWB — Long Wheel Base
	L-4 — In-Line Four Cylinder Engine
	MAF — Mass Air Flow
	MAN — Manual

0A-10 GENERAL INFORMATION

MAP — Manifold Absolute Pressure	ST — Start / Scan Tool
Max — Maximum	Sw — Switch
MC — Mixture Control	SWB — Short Wheel Base
MFI — Multiport Fuel Injection	SYN — Synchronize
MIL — Malfunction Indicator Lamp	Tach — Tachometer
Min — Minimum	TB — Throttle Body
mm — Millimeter	TBI — Throttle Body Fuel Injection
MPG — Miles Per Gallon	TCC — Torque Converter Clutch
MPH — Miles Per Hour	TCM — Transmission Control Module
M/T — Manual Transmission/Transaxle	TDC — Top Dead Center
MV — Millivolt	Term — Terminal
N — Newtons	TEMP — Temperature
NA — Natural Aspirated	TOD — Torque On Demand
NC — Normally Closed	TP — Throttle Position
N-M — Newton Meters	TRANS — Transmission/Transaxle
NO — Normally Open	TURBO — Turbocharger
NOX — Nitrogen, Oxides of	TVRS — Television & Radio Suppression
OBD — On-Board Diagnostic	TVV — Thermal Vacuum Valve
OD — Outside Diameter	TWC — Three Way Catalytic Converter
O/D — Over Drive	3 A/T — Three Speed Automatic Transmission/ Transaxle
OHC — Overhead Camshaft	2WD — Two Wheel Drive
OL — Open Loop	4 x 2 — Two Wheel Drive
O ₂ — Oxygen	U-joint — Universal Joint
O ₂ S — Oxygen Sensor	V — Volt(s)
PAIR — Pulsed Secondary Air Injection System	VAC — Vacuum
P/B — Power Brakes	VIN — Vehicle Identification Number
PCM — Powertrain Control Module	VRRRE — Vehicle Refrigerant Recovery and Recycling Equipment
PCV — Positive Crankcase Ventilation	V-ref — ECM Reference Voltage
PRESS — Pressure	VSS — Vehicle Speed Sensor
PROM — Programmable Read Only Memory	VSV — Vacuum Switch Valve
PNP — Park/Neutral Position	V-6 — Six Cylinder "V" Engine
P/S — Power Steering	V-8 — Eight Cylinder "V" Engine
PSI — Pounds per Square Inch	W — Watt(s)
PSP — Power Steering Pressure	w/ — With
Pt. — Pint	w/b — Wheel Base
Pri — Primary	w/o — Without
PWM — Pulse Width Modulate	WOT — Wide Open Throttle
Qt. — Quart	
REF — Reference	
RF — Right Front	
RFI — Radio Frequency Interference	
RH — Right Hand	
RPM — Revolutions Per Minute	
RPM Sensor — Engine Speed Sensor	
RPO — Regular Production Option	
RR — Right Rear	
RS — Right Side	
RTV — Room Temperature Vulcanizing	
RWAL — Rear Wheel Antilock Brake	
RWD — Rear Wheel Drive	
SAE — Society of Automotive Engineers	
Sec — Secondary	
SFI — Sequential Multiport Fuel Injection	
SI — System International	
SIR — Supplemental Inflatable Restraint System	
SOHC — Single Overhead Camshaft	
Sol — Solenoid	
SPEC — Specification	
Speedo — Speedometer	
SRS — Supplemental Restraint System

Maintenance Schedule List

Normal Vehicle Use

The maintenance instructions in this Maintenance Schedule are based on the assumption that the vehicle will be used as designed:

- to carry passengers and cargo within the limitations specified on the tire placard located on the inside of the glove compartment door;
- to be driven on reasonable road surfaces within legal operating limits;
- to be driven on a daily basis, as a general rule, for at least several miles/kilometers;
- to be driven on unleaded fuel

Unusual or severe operating conditions will require more frequent vehicle maintenance, as specified in the following sections.

Service and Maintenance

SERVICE AND MAINTENANCE

Maintenance schedule

I: Inspect and correct or replace as necessary A: Adjust
 R: Replace or change T: Tighten to specified torque L: Lubricate

SERVICE AND MAINTENANCE

Maintenance schedule under severe driving conditions

Severe driving conditions

- A: Repeated short trips
- B: Driving on rough roads
- C: Driving on dusty roads
- D: Driving in extremely cold weather and/or on salted roads

- G4
- G6
- MT
- AT

- : L4 Gasoline engine
- : V6 Gasoline engine
- : Manual transmission
- : Automatic transmission

Item	Interval	Condition				
		A	B	C	D	A+D
Differential oil	Change every 20,000 km (12,000 miles) after changing at initial 10,000 km (6,000 miles)		●			
Front Brake pads and discs	Inspect every 5,000 km (3,000 miles)	●	●	●		

Recommended Fluids and Lubricants

USAGE	FLUID/LUBRICANT
Engine	API SE, SF, SG, SH or ILSAC GF-1 Engine oil (See oil chart on the following page for proper viscosity)
Engine coolant	Mixture of water and good quality ethylene glycol base type antifreeze.
Brake system	DOT-3 hydraulic brake fluid.
Power steering system	DEXRON® -III Automatic transmission fluid.
Automatic transmission	DEXRON® -III Automatic transmission fluid.
MUA Type Manual transmission & Transfer case	Engine oil (See oil chart on following page for proper viscosity)
Rear axle and front axle	GL-5 gear lubricant (Standard differential) GL-5 Limited slip differential gear lubricant together with limited slip differential lubricant additive (Part No. 8-01052-358-0) or equivalent (If equipped with optional limited slip differential) (See oil chart in this section for proper viscosity)
Clutch system a. Pivot points b. Clutch fork joint c. Master cylinder	Chassis grease Chassis grease DOT-3 hydraulic brake fluid
Hood latch assembly a. Pivots and spring anchor b. Release pawl	Engine oil Chassis grease
Hood and door hinges	Engine oil
Chassis lubrication	Chassis grease
Parking brake cables	Chassis grease
Front wheel bearings	Multipurpose grease
Shift on the fly system	GL-5 gear lubricant (SAE 75W-90)
Body door hinge pins and linkage, fuel door hinge, rear compartment lid hinges	Engine oil
Windshield washer solvent	Washer fluid
Key lock cylinder	Synthetic light weight engine oil (SAE 5W-30)
Accelerator linkage	Chassis grease

0B-10 MAINTENANCE AND LUBRICATION

Lubricant Viscosity Chart

Lubricants should be carefully selected according to the

lubrication chart. It is also important to select viscosity of lubricants according to the ambient temperature by referring to the following table.

Oil Viscosity Chart for Gasoline Engine

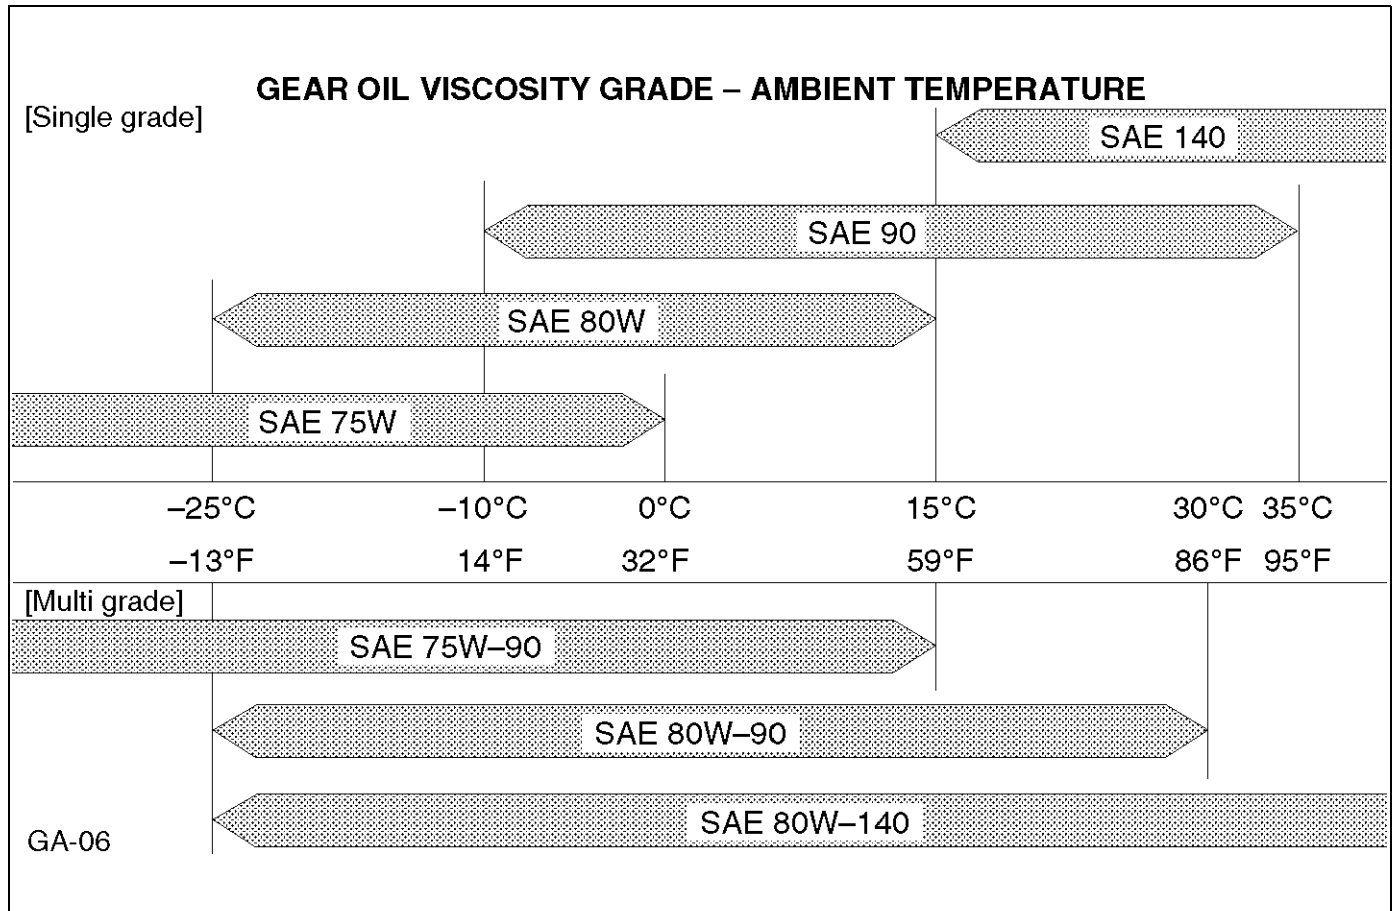

Oil Viscosity Chart for Manual Transmission and Transfer Case

Oil Viscosity Chart for Front Axle

Oil Viscosity Chart for Rear Axle

Recommended Liquid Gasket

Type	Brand Name	Manufacturer	Remarks
RTV* Silicon Base	Three Bond 1207B	Three Bond	For Engine Repairs
	Three Bond 1207C	Three Bond	
	Three Bond 1215	Three Bond	For Axle Case
	Three Bond 1280	Three Bond	Repairs T/M
	Three Bond 1281	Three Bond	Repairs T/M
Water Base	Three Bond 1141E	Three Bond	For Engine Repairs
Solvent	Three Bond 1104	Three Bond	For Engine Repairs
	Belco Bond 4	Isuzu	
	Belco Bond 401 Belco Bond 402	Isuzu Isuzu	
Anaerobic	LOCTITE 515 LOCTITE 518 LOCTITE 17430	Loctite Loctite Loctite	All

* RTV: Room Temperature Vulcanizer

NOTE:

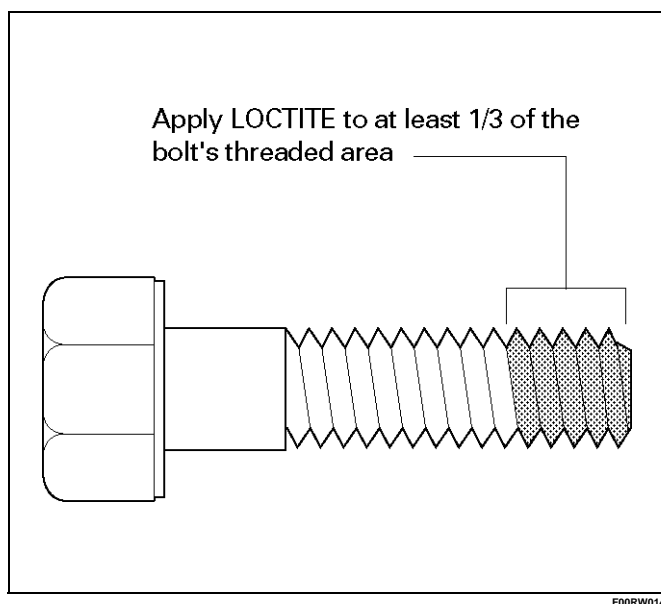

1. It is very important that the liquid gaskets listed above or their exact equivalent be used on the vehicle.
2. Be careful to use the specified amount of liquid gasket. Follow the manufacturer's instructions at all times.
3. Be absolutely sure to remove all lubricants and moisture from the connecting surfaces before applying the liquid gasket. The connecting surfaces must be perfectly dry.
4. Do not apply LOCTITE 17430, LOCTITE 515 and LOCTITE 518 between two metal surfaces having a clearance of greater than 0.25 mm (0.01 in). Poor adhesion will result.

Recommended Thread Locking Agents

LOCTITE Type	LOCTITE Color
LOCTITE 242	Blue
LOCTITE 262	Red
LOCTITE 271	Red

Application Steps

1. Completely remove all lubricant and moisture from the bolts and the female-threaded surfaces of the parts to be joined.
The surfaces must be perfectly dry.
2. Apply LOCTITE to the bolts.

3. Tighten the bolts to the specified torque.
After tightening, be sure to keep the bolts free from vibration and torque for at least an hour until LOCTITE hardens.

NOTE: When the application procedures are specified in this manual, follow them.

Maintenance Service Data
Service Data and Specifications

ENGINE	Valve clearance (cold): only V6-3.2L ENG	Intake 0.28±0.05 mm (0.011±0.002 in) Exhaust 0.3±0.05 mm (0.012±0.002 in)

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Heating and Ventilation System

General Description

Heater

When the engine is warming up, the warmed engine coolant is sent out into the heater core. The heater system supplies warm air into the passenger compartment to warm it up.

Outside air is circulated through the heater core of the heater unit and then back into the passenger compartment. By controlling the mixture of outside air and heater core air, the most comfortable passenger compartment temperature can be selected and maintained.

The temperature of warm air sent to the passenger compartment is controlled by the temperature control knob. This knob acts to open and close the air mix door, thus controlling the amount of air passed through the heater core.

The air selector knob, with its different modes, also allows you to select and maintain the most comfortable temperature.

The air source select lever is used to select either "FRESH" for the introduction of the outside air, or "CIRC" for the circulation of the inside air. When the lever is set to "FRESH", the outside air is always taken into the passenger compartment. When setting the lever to "CIRC" position, the circulation of air is restricted only to the inside air with no introduction of the outside air and the air in the passenger compartment gets warm quickly. However, the lever is normally set to "FRESH" to prevent the windshield from clouding.

Heater and Ventilation Associated Parts

840RY00049

Legend

- (1) Defroster Nozzle
- (2) Heater Hose
- (3) Rear Heater Duct
- (4) Ventiration Lower Duct

- (5) Heater Unit
- (6) Evaporator Assembly
- (7) Blower Assembly
- (8) Ventilation Duct

Ventilation

Setting the air source select lever to "FRESH" position allows the heating system to work with sending the fresh air from outside.

The blower fan also serves to deliver fresh outside air to the passenger compartment to assure adequate ventilation.

1A-6 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

Control Lever Assembly

The control lever assembly has some cables to control the mode and temperature of the heater unit and the mode door for the air source of the blower assembly.

The fan control is used to control the amount of air sent out by the resistor at four levels from "LOW" to "HIGH".

Legend

- (1) Air Source Select Lever
- (2) Air Select Knob
- (3) Fan Control Lever (Fan Switch)

- (4) Air Conditioning (A/C) Switch (W/ A/C)
- (5) Temperature Control Knob
- (6) Middle Position

Air Source Select Lever

The intake of outside air and the circulation of inside air are controlled by sliding this lever left or right.

Fan Control Lever

This lever controls the blower motor speed to regulate the amount of air delivered to the defrost, foot, and ventilation ducts:

1. Low
2. Medium Low
3. Medium High
4. High

Temperature Control Knob

When the temperature control knob is in the "COLD" position, the air mix door closes to block the flow air to the heater core.

When the temperature control knob is in the "HOT" position, the air mix door opens to allow air to pass through the heater core and heat the passenger compartment.

Placing the knob in a intermediate position will cause a lesser or greater amount air to reach the heater core. In this mode the passenger compartment temperature can be regulated.

Flow of Each Position of the Air Select Dials

C01RX001

Air Select Knob

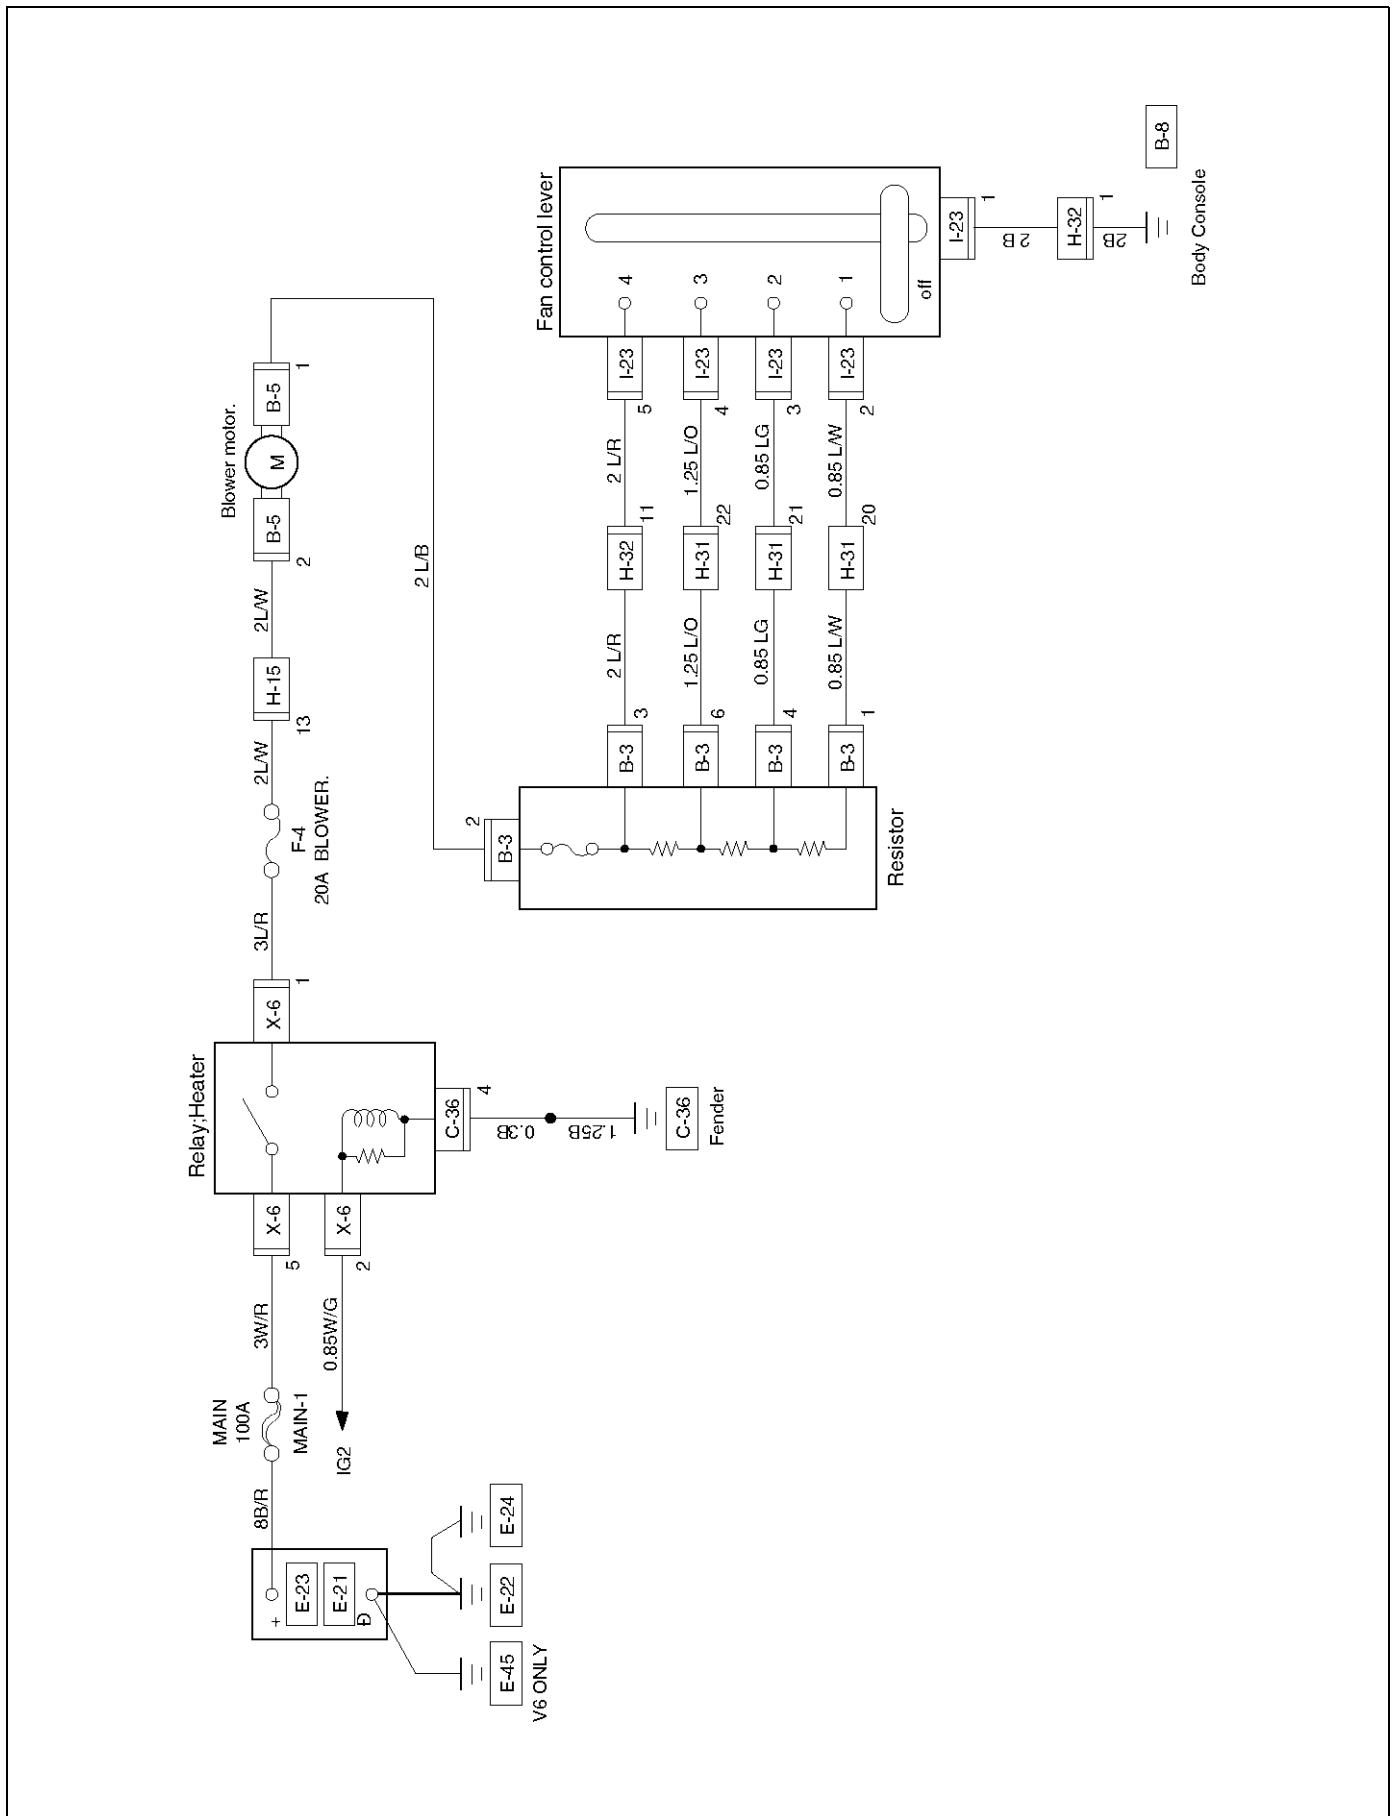

The air select knob allows you to direct heated air into the passenger compartment through different outlets.

- Vent** – In this position, air is discharged from the upper air outlet. Air quantity is controlled by the fan control lever.
- Bi-Level** – In this position, air flow is divided between the upper air outlets and the floor air outlets, with warmer air delivered to the floor outlets than the air delivered to the upper air outlets when the temp lever is in middle position.

- Foot** – In this position, air flow is delivered to the foot, while sending a small amount of air to the windshield.
- Def/Foot** – In this position, air flow is delivered to the foot, while sending approx. 40% of total amount of air to the windshield.
- Defrost** – In this position, most of the air is delivered to the windshield and a small amount is delivered to the side windows.

Moving the air source select lever to the "CIRC" position provides quickest heat delivery by closing the blower assembly mode door. In this position, outside air is not delivered to the passenger compartment.

Circuit Diagram

Diagnosis

Heating Cycle diagnosis

Condition	Possible cause	Correction
No heating or insufficient heating.	Blower motor does not run or runs improperly.	Refer to "FAN CONTROL LEVER (FAN SWITCH) DIAGNOSIS".
	Engine coolant temperature is low.	Check the engine coolant temperature after warming up the engine and check the thermostat. Replace as necessary.
	Insufficient engine coolant.	Add engine coolant as required.
	Circulation volume of engine coolant is insufficient.	Check if the water hose to the heater core is clogged, collapsed or twisted. Repair or replace as necessary.
	Heater core clogged or collapsed.	Clean or replace as necessary.
	The heater cores is not provided with air sent from the blower motor.	Repair the temperature control link unit or mode doors.
	Duct connections defective or unsealing.	Repair or replace as necessary.
Control lever moves but mode door does not operate.	Cable attaching clip is not correct.	Repair
	Link unit of heater or blower assembly defective.	Repair
The mode door cannot be set to the mode selected.	Link unit of heater unit or blower assembly defective.	Repair.
	Control cable is not adjusted.	Adjust.

1A-10 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

Fan Control Lever (Fan Switch) Diagnosis

Current flows to the blower motor through the heater relay (X-6) to activate the rotation of the blower motor by turning "ON" the fan control knob (fan switch). Blower motor speed is controlled in stages by the resistor, by operating the switch from "LOW" to "HIGH".

For the inspection of the relays, switches and units in each table, refer to "INDIVIDUAL INSPECTION" in this section.

D08RX250

Condition	Possible cause	Correction
Blower motor does not run.	—	Refer to Chart A
Blower motor does not run in certain position (s).	—	Refer to Chart B, C, D and E
Blower motor does not stop at "OFF" position.	—	Refer to Chart F

Chart "A" Blower Motor Does Not Run

Step	Action	Yes	No
1	Is relay (X-6) OK?	Go to Step 2	Replace
2	Is fuse F-4 (20A) OK?	Go to Step 3	Replace
3	Is resistor OK?	Go to Step 4	Replace
4	Is fan control lever OK?	Go to Step 5	Replace control lever assembly.
5	Is blower motor OK?	Go to Step 6	Replace
6	1. Turn the ignition switch "ON". 2. Turn fan control lever "ON". 3. Check to see if battery voltage is present at chassis side connector terminal No. B5-2 Is there a battery voltage?	Poor ground or open circuit either between chassis side connector terminal No. B5-1 and No. B3-2 or No. I23-1 and body ground (No. B-8).	Open circuit between No. F-4 (20A) fuse and No. B5-2.

Chart "B" Blower Motor Does Not Run At Low Position

Step	Action	Yes	No
1	Is resistor OK?	Go to Step 2	Replace
2	Is fan control lever (Fan Switch) OK?	Open circuit between chassis side connector terminal No. B3-1 and No. I23-2.	Replace control lever assembly.

Chart "C" Blower Motor Does Not Run At Medium Low Position

Step	Action	Yes	No
1	Is resistor OK?	Go to Step 2	Replace
2	Is fan control lever (Fan Switch) OK?	Open circuit between the chassis side connector terminal No. B3-4 and No. I23-3.	Replace control lever assembly.

Chart "D" Blower Motor Does Not Run At Medium High Position

Step	Action	Yes	No
1	Is resistor OK?	Go to Step 2	Replace
2	Is fan control lever (Fan Switch) OK?	Open circuit between chassis side connector terminal No. B3-6 and No. I23-4.	Replace control lever assembly.

1A-12 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)**Chart "E" Blower Motor Does Not Run At High Position**

Step	Action	Yes	No
1	Is resistor OK?	Go to Step 2	Replace
2	Is fan control lever (Fan Switch) OK?	Open circuit between chassis side connector terminal No. B3-3 and No. I23-5.	Replace control lever assembly.

Chart "F" Blower Motor Does Not Stop In The "OFF" Position

Step	Action	Yes	No
1	Is the fan control lever (Fan Switch) OK?	Short circuit between chassis side connector terminal No. B5-1 and No. B3-2, No. B3-3 and No. I23-5, No. B3-6 and No. I23-4, No. B3-4 and No. I23-3 or No. B3-1 and No. I23-2	Replace control lever assembly.

Individual Inspection

Blower Motor

1. Disconnect the blower motor (B-5) connector from the blower motor.
2. Connect the battery positive terminal to the No. 2 terminal of the blower motor and the negative to the No. 1.
3. Be sure to check to see if the blower motor operates correctly.

873RW008

Resistor

1. Disconnect the resistor (B-3) connector.
2. Check for continuity and resistance between the terminals of the resistor.

840RX013

Legend

- (1) Resistor Assembly
- (2) Connector Terminal (Resistor Side)

- (7) Ventilation Lower Duct
- (8) Instrument Panel Stay
- (9) Center Ventilation Duct and Side Defroster

Removal

1. Disconnect the battery ground cable.
2. Drain the engine coolant.
3. Discharge and recover refrigerant (with air conditioning).
 - Refer to Refrigerant Recovery in this section.
4. Remove the Instrument panel assembly.
 - Refer to Instrument Panel Assembly in Body and Accessories section.
5. Remove instrument panel stay.
6. Remove center ventilation duct and side defroster.
7. Disconnect resistor connector.
8. Remove evaporator assembly.
 - Refer to Evaporator Assembly in this section.
9. Remove ventilation lower duct.
10. Remove rear heater duct.
 - Remove foot rest, carpet and 3 clips.
11. Remove heater unit assembly.
 - Disconnect heater hoses at heater unit.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. When handling the PCM and the control unit, be careful not to make any improper connection of the connectors.
2. Adjust the control cables.
 - Refer to Control Lever Assembly in this section.
3. When installing the heater unit, defroster nozzle and center vent duct, be sure that the proper seal is made, without any gap between them.
4. After putting engine coolant in remove the air well and confirm the quantity of coolant.

 - Refer to Instrument Panel Assembly in Body Structure section.
4. Remove glove box.
5. Remove the control lever attaching screws.
6. Pull the control lever assembly out and disconnect the fan switch and air conditioning switch connectors.

865RX012

7. Remove control level assembly.
8. Disconnect control cables at each unit side.

865RX010

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Adjust the control cable.

865RX013

- Air source control cable.
 - 1 Slide the control lever to the left ("CIRC" position).
 - 2 Connect the control cable at the "CIRC" position of the link unit of the blower assembly and secure it with the clip.
 - Temperature control cable.
 - 1 Turn the control knob to the left ("MAX COLD" position).
 - 2 Connect the control cable at the "COLD" position of the temperature control link of the heater unit and secure it with the clip.
 - Air select control cable
 - 1 Turn the control knob to the right ("DEFROST" position).
 - 2 Connect the control cable at the "DEFROST" position of the mode control link of the heater unit and secure it with the clip.
2. Check the control cable operation.

Control Panel Illumination Bulb

Control Panel Illumination Bulb and Associated Parts

| (7) Pressure Switch or Pressure Sensor | (15) Mode (VENT) Control Door |
| (8) Receiver/Drier | (16) Heater Unit |
| | (17) Mode (DEF) Control Door |

The refrigeration cycle includes the following four processes as the refrigerant changes repeatedly from liquid to gas and back to liquid while circulating.

Evaporation

The refrigerant is changed from a liquid to a gas inside

the evaporator. The refrigerant mist that enters the evaporator vaporizes readily. The liquid refrigerant removes the required quantity of heat (latent heat of vaporization) from the air around the evaporator core cooling fins and rapidly vaporizes. Removing the heat cools the air, which is then radiated from the fins and lowers the temperature of the air inside the vehicle.

The refrigerant liquid sent from the expansion valve and the vaporized refrigerant gas are both present inside the evaporator as the liquid is converted to gas.

With this change from liquid to gas, the pressure inside the evaporator must be kept low enough for vaporization to occur at a lower temperature. Because of that, the vaporized refrigerant is sucked into the compressor.

Compression

The refrigerant is compressed by the compressor until it is easily liquefied at normal temperature.

The vaporized refrigerant in the evaporator is sucked into the compressor. This action maintains the refrigerant inside the evaporator at a low pressure so that it can easily vaporize, even at low temperatures close to 0°C (32°F).

Also, the refrigerant sucked into the compressor is compressed inside the cylinder to increase the pressure and temperature to values such that the refrigerant can easily liquefy at normal ambient temperatures.

Condensation

The refrigerant inside the condenser is cooled by the outside air and changes from gas to liquid.

The high temperature, high pressure gas coming from the compressor is cooled and liquefied by the condenser with outside air and accumulated in the receiver/drier. The heat radiated to the outside air by the high temperature, high pressure gas in the compressor is called heat of condensation. This is the total quantity of heat (heat of vaporization) the refrigerant removes from the vehicle interior via the evaporator and the work (calculated as the quantity of heat) performed for compression.

Expansion

The expansion valve lowers the pressure of the refrigerant liquid so that it can easily vaporize.

The process of lowering the pressure to encourage vaporization before the liquefied refrigerant is sent to the evaporator is called expansion. In addition, the expansion valve controls the flow rate of the refrigerant liquid while decreasing the pressure.

That is, the quantity of refrigerant liquid vaporized inside the evaporator is determined by the quantity of heat which must be removed at a prescribed vaporization temperature. It is important that the quantity of refrigerant be controlled to exactly the right value.

Compressor

The compressor performs two main functions:

It compresses low-pressure and low-temperature refrigerant vapor from the evaporator into high-pressure and high-temperature refrigerant vapor to the condenser.

It pumps refrigerant and refrigerant oil through the air conditioning system.

This vehicle is equipped with a five-vane rotary compressor.

The specified amount of the compressor oil is 150cc (5.0fl.oz.).

The oil used in the HFC-134a system compressor differs from that used in R-12 systems.

Also, compressor oil to be used varies according to the compressor model. Be sure to avoid mixing two or more different types of oil.

If the wrong oil is used, lubrication will be poor and the compressor will seize or malfunction.

The magnetic clutch connector is a waterproof type.

Magnetic Clutch

The compressor is driven by the drive belt from the crank pulley of the engine. If the compressor is activated each time the engine is started, this causes too much load to the engine. The magnetic clutch transmits the power from the engine to the compressor and activates it when the air conditioning is ON. Also, it cuts off the power from the engine to the compressor when the air conditioning is OFF. Refer to Compressor in this section for magnetic clutch repair procedure.

Legend

- (1) Magnetic Clutch
- (2) Magnetic Clutch Harness Connector
- (3) Compressor

Condenser

The condenser assembly is located in front of the radiator. It provides rapid heat transfer from the refrigerant to the cooling fins.

Also, it functions to cool and liquefy the high-pressure and high-temperature vapor sent from the compressor by the radiator fan or outside air.

A condenser may malfunction in two ways: it may leak, or it may be restricted. A condenser restriction will result in excessive compressor discharge pressure. If a partial restriction is present, the refrigerant expands after passing through the restriction.

Thus, ice or frost may form immediately after the restriction. If air flow through the condenser or radiator is blocked, high discharge pressures will result. During normal condenser operation, the refrigerant outlet line will be slightly cooler than the inlet line.

The vehicle is equipped with the parallel flow type condenser. A larger thermal transmission area on the inner surface of the tube allows the radiant heat to increase and the ventilation resistance to decrease.

The refrigerant line connection has a bolt at the block joint, for easy servicing.

875RX003

Legend

- (1) Pressure Switch
- (2) Receiver/Drier
- (3) Condenser & Receiver Tank Assembly
- (4) Condenser Fan (6VD1 A/T)

Receiver / Drier

The receiver/drier performs four functions:

- As the quantity of refrigerant circulated varies depending on the refrigeration cycle conditions, sufficient refrigerant is stored for the refrigeration cycle to operate smoothly in accordance with fluctuations in the quantity circulated.

- The liquefied refrigerant from the condenser is mixed with refrigerant gas containing air bubbles. If refrigerant containing air bubbles is sent to the expansion valve, the cooling capacity will decrease considerably. Therefore, the liquid and air bubbles are separated and only the liquid is sent to the expansion valve.
- The receiver/drier utilizes a filter and drier to remove the dirt and water mixed in the cycling refrigerant.
- The sight glass, installed atop the receiver/drier, show the state of the refrigerant.

A receiver/drier may fail due to a restriction inside the body of the unit. A restriction at the inlet to the receiver/drier will cause high pressure.

Outlet restrictions will be indicated by low pressure and little or no cooling. An excessively cold receiver/drier outlet may indicate a restriction.

The receiver/drier of this vehicle is made of aluminum with a smaller tank. It has a 300cc refrigerant capacity.

The refrigerant line connection has a bolt at the block joint, for easy servicing.

Dual Pressure Switch (V6,M/T)

The pressure switch (Dual pressure switch) is installed on the upper part of the receiver/drier, to detect excessively high pressure (high pressure switch) and prevent compressor seizure due to the refrigerant leaking (low pressure switch), so that the compressor is able to be turned "ON" or "OFF".

Compressor	ON (kPa/psi)	OFF (kPa/psi)
Low-pressure control	186.3±29.4 (27.0±4.3)	176.5±19.6 (25.6±2.8)
High-pressure control	2350.4±196.1 (340.7±28.4)	2942.0±196.1 (426.6±28.4)

Triple Pressure Switch (V6, A/T)

Triple pressure switch is installed on the upper part of the receiver/drier. This switch is constructed with a unitized type of two switches. One of them is a low and high pressure switch (Dual pressure switch) to switch "ON" or "OFF" the magnetic clutch as a result of irregularly high-pressure or low pressure of the refrigerant. The other one is a medium pressure switch (Cycling switch) to switch "ON" or "OFF" the condenser fan sensing the condenser high side pressure.

Compressor	ON (kPa/psi)	OFF (kPa/psi)
Low-pressure control	186.3±29.4 (27.0±4.3)	176.5±24.5 (25.6±3.6)
High-pressure control	2353.6±196.1 (341.3±28.4)	2942.0±196.1 (426.6±28.4)

Condenser fan	ON (kPa/psi)	OFF (kPa/psi)
Medium-pressure control	1471.0±98.1 (213.3±14.2)	1078.7±117.7 (156.4±17.1)

Pressure Sensor

The pressure sensor is installed on the upper part of the receiver/drier. This sensor converts high pressure detection of refrigerant to an electrical voltage signal and supplies it to the PCM. The PCM controls switching compressor idle speed and cooling fan operation by the electrical voltage signal.

Legend

- (1) Pressure Switch
- (2) Receiver Drier

Expansion Valve

This expansion valve is an external pressure type and it is installed at the evaporator intake port.

The expansion valve converts the high pressure liquid refrigerant sent from the receiver/drier to a low pressure liquid refrigerant by forcing it through a tiny port before sending it to the evaporator.

This type of expansion valve consists of a temperature sensor, diaphragm, ball valve, ball seat, spring adjustment screw, etc.

The temperature sensor contacts the evaporator outlet pipe, and converts changes in temperature to pressure. It then transmits these to the top chamber of the diaphragm.

The refrigerant pressure is transmitted to the diaphragm's bottom chamber through the external equalizing pressure tube.

The ball valve is connected to the diaphragm. The opening angle of the expansion valve is determined by

the force acting on the diaphragm and the spring pressure.

The expansion valve regulates the flow rate of the refrigerant. Accordingly, when a malfunction occurs to this expansion valve, both discharge and suction pressure get low, resulting in insufficient cooling capacity of the evaporator.

The calibration has been changed to match the characteristics of HFC-134a.

Legend

- (1) Expansion Valve
- (2) Insulator
- (3) Evaporator Assembly

Evaporator

The evaporator cools and dehumidifies the air before the air enters the passenger compartment. High-pressure liquid refrigerant flows through the expansion valve into the low-pressure area of the evaporator. The heat in the air passing through the evaporator core is lost to the cooler surface of the core, thereby cooling the air.

As heat is lost between the air and the evaporator core surface, moisture in the vehicle condenses on the outside surface of the evaporator core and is drained off as water.

When the evaporator malfunctions, the trouble will show up as an inadequate supply of cool air. The cause is typically a partially plugged core due to dirt, or a malfunctioning blower motor.

The evaporator core with a laminate louver fin is a single-sided tank type where only one tank is provided under the core.

- (2) Insulator
- (3) Expansion Valve

874RX008

Legend

- (1) Duct Sensor
- (2) Evaporator Core
- (3) Thermostat Unit

Electronic Thermostat (With Manual A/C)

The thermostat consists of the thermo sensor and thermostat unit which functions electrically to reduce the noises being generated while the system is in operation. The electronic thermo sensor is mounted at the evaporator core outlet and senses the surface temperature of the evaporator core. Temperature signals are input to the thermostat unit. This information is compared by the thermo unit and results in the output to operate the A/C thermostat relay and turn the magnetic clutch ON or OFF to prevent evaporator freeze-up.

A characteristic of the sensor is that the resistance decreases as the temperature increases and the resistance increases as the temperature decreases.

Refrigerant Line

Restriction in the refrigerant line will be indicated by:

1. Suction line — A restricted suction line will cause low suction pressure at the compressor, low discharge pressure and little or no cooling.
2. Discharge line — A restriction in the discharge line generally will cause the discharge line to leak.
3. Liquid line — A liquid line restriction will be evidenced by low discharge and suction pressure and insufficient cooling.

Refrigerant flexible hoses that have a low permeability to refrigerant and moisture are used. These low permeability hoses have a special nylon layer on the inside.

Circuit Diagram

Diagnosis

Air Conditioning Cycle Diagnosis

Condition	Possible cause	Correction
No cooling or insufficient cooling.	Magnetic clutch does not run.	Refer to "Magnetic Clutch Diagnosis" in this section.
	Compressor is not rotating properly. Drive belt is loosened or broken.	Adjust the drive belt to the specified tension or replace the drive belt.
	Compressor is not rotating properly. Magnetic clutch face is not clean and slips.	Clean the magnetic clutch face or replace.
	Compressor is not rotating properly. Incorrect clearance between magnetic drive plate and pulley.	Adjust the clearance. Refer to Compressor in this section.
	Compressor is not rotating properly. Compressor oil leaks from the shaft seal or shell.	Replace the compressor
	Compressor is not rotating properly. Compressor is seized.	Replace the compressor
	Insufficient or excessive charge of refrigerant.	Discharge and recover the refrigerant. Recharge to the specified amount.
	Leaks in the refrigerant system.	Check the refrigerant system for leaks and repair as necessary. Discharge and recover the refrigerant. Recharge to the specified amount.
	Condenser is clogged or insufficient radiation.	Clean the condenser or replace as necessary.
	Temperature control link unit of the heat unit is defective.	Repair the link unit.
	Unsteady operation due to a foreign substance in the expansion valve.	Replace the expansion valve.
	Poor operation of the electronic thermostat.	Check the electronic thermostat and replace as necessary.
Insufficient velocity of cooling air.	Evaporator clogged or frosted.	Check the evaporator core and replace or clean the core.
	Air leaking from the cooling unit or air duct.	Check the evaporator and duct connection, then repair as necessary.
	Blower motor does not rotate properly.	Refer to Fan Control Lever (Fan Switch) Diagnosis in this section.

*For the execution of the charging and discharging operation in the table above, refer to Recovery, Recycling, Evacuating and Charging in this section.

Checking The Refrigerant System With Manifold Gauge

Since Refrigerant-134a (HFC-134a) is used in the air conditioning system in this vehicle, be sure to use manifold gauges, charging hoses and other air conditioning service tools for HFC-134a when checking the refrigerant system.

Conditions:

- Run the engine at Idling
- Air conditioning switch is "ON"
- Run the blower motor at "HIGH" position
- Temperature control lever set to "MAX COLD"
- Air source selector lever at "CIRC"
- Open the engine hood
- Close all the doors
- At ambient temperature: approx. 25–30°C (77–86°F).

Normal Pressure:

- At low-pressure side: approx. 147.1–294.2 kPa (21.3–42.7 psi).
- At high-pressure side: approx. 1372.9–1863.3 kPa (199.1–270.2 psi).

Refer to the table on the refrigerant pressure-temperature relationship.

Pressure		Temperature	
(kPa)	(psi)	(°C)	(°F)
36	5.3	-20	-4.4
67	9.7	-15	5
104	15	-10	14
147	21	-5	23
196	28	0	32
255	37	5	41
314	45	10	50
392	57	15	59

1A-40 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

Connect The Manifold Gauge

Low-pressure hose (LOW) — Suction side

High pressure hose (HI) — Discharge side

901RX060

Legend

(1) High Side

(2) Low Side

Condition	Possible cause	Correction
Discharge (High Gauge) Pressure Abnormally High	Condenser clogged or dirty.	Clean the condenser fins
	Cooling fan does not operate properly.	Check the cooling fan operation.
Discharge (High Gauge) Pressure Abnormally High. Insufficient cooling.	Excessive refrigerant in system.	Discharge and recover refrigerant. Recharge to specified amount.
Discharge (High Gauge) Pressure Abnormally High. High pressure gauge drop. (After stopping A/C, the pressure drops approx. 196 kPa (28 psi) quickly)	Air in system.	Evacuate and charge refrigerant system.
Discharge (High Gauge) Pressure Abnormally Low. Insufficient cooling	Insufficient refrigerant in system.	Check for leaks. Discharge and recover the refrigerant. Recharge to the specified amount.
Discharge (High Gauge) Pressure Abnormally Low. Low pressure gauge indicates vacuum.	Clogged or defective expansion valve.	Replace the expansion valve.
Discharge (High Gauge) Pressure Abnormally Low. Frost or dew on refrigerant line before and after the receiver/drier or expansion valve, and low pressure gauge indicates vacuum.	Restriction caused by debris or moisture in the receiver/drier.	Check system for restriction and replace the receiver/drier.
Discharge (High Gauge) Pressure Abnormally Low. High and low pressure gauge balanced quickly. (After turned off A/C)	Compressor seal defective	Repair or replace the compressor.
	Poor compression due to a defective compressor gasket.	Repair or replace the compressor.
Suction (Low Gauge) Pressure Abnormally High. Low pressure gauge (Low pressure gauge is lowered after condenser is cooled by water.)	Excessive refrigerant in system.	Discharge and recover refrigerant Recharge to specified amount.
Suction (Low Gauge) Pressure Abnormally High. Low pressure hose temperature. (Low pressure hose temperature around the compressor refrigerant line connector is lower than around evaporator.)	Unsatisfactory valve operation due to defective temperature sensor of expansion valve.	Replace the expansion valve.
	Expansion valve opens too long.	Replace the expansion valve.
Suction (Low Gauge) Pressure Abnormally High. High and low pressure gauge balanced quickly. (After turned off A/C)	Compressor gasket is defective.	Repair or replace the compressor.
Suction (Low Gauge) Pressure Abnormally Low. Insufficient cooling.	Insufficient refrigerant in system.	Check for leaks. Discharge and recover the refrigerant. Recharge to specified amount.
Suction (Low Gauge) Pressure Abnormally Low. Frost on the expansion valve inlet line	Expansion valve clogged.	Replace the expansion valve.

1A-42 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

Condition	Possible cause	Correction
Suction (Low Gauge) Pressure Abnormally Low Receiver/drier inlet and outlet refrigerant line temperature. (A distinct difference in temperature develops.)	Receiver/Drier clogged.	Replace the receiver/drier.
Suction (Low Gauge) Pressure Abnormally Low. Expansion valve outlet refrigerant line. (Not cold and low pressure gauge indicates vacuum.)	Expansion valve temperature sensor is defective.	Replace the expansion valve.
Suction (Low Gauge) Pressure Abnormally Low. When the refrigerant line is clogged or blocked, the low pressure gauge reading will decrease, or a vacuum reading may be shown.	Clogged or blocked refrigerant line.	Replace refrigerant line.
Suction (Low Gauge) Pressure Abnormally Low. Evaporator core is frozen.	Thermo switch defective.	Replace thermo switch.
Suction (Low Gauge) and Discharge (High Gauge) Pressure Abnormally High. Insufficient cooling.	Excessive refrigerant in system.	Discharge and recover the refrigerant, the Recharge to the specified amount.
	Condenser clogged or dirty.	Clean the condenser fin.
Suction (Low Gauge) and Discharge (High Gauge) Pressure Abnormally High. Suction (Low) pressure hose (Not cold).	Air in system.	Evacuate and charge refrigerant.
Suction (Low Gauge) and Discharge (High Gauge) Pressure Abnormally Low. Insufficient cooling	Insufficient refrigerant in system.	Check for leaks. Discharge and recover refrigerant. Recharge to specified amount.

A/C — Air Conditioning

Magnetic Clutch Diagnosis

PCM- Powertrain Control Module, A/C-S Air Conditioning

When the air conditioning switch and the fan control knob (fan switch) are turned on with the engine running,

current flows through the thermostat and the compressor relay to activate the magnetic clutch.

1A-44 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

The air conditioning can be stopped by turning of the air conditioning switch or the fan control knob (fan switch). However, even when the air conditioning is in operation, the electronic thermostat, the pressure switch or the Powertrain Control Module (PCM;V6-3.2L)/ Engine Control Module (ECM;L4-2.2L) is used to stop the air conditioning temporarily by turning off the magnetic

clutch in the prearranged conditions to reduce the engine load which is being caused by the rise in the engine coolant temperature, and the acceleration of the vehicle, etc.

For the inspection of the relays, switches and units in the table, refer to "Individual Inspection" in this section.

Magnetic Clutch Does Not Run

Step	Action	Value(s)	Yes	No
1	Is the fuse No. F-5 normal?	—	Go to Step 2	Replace the fuse
2	Are the relay No.X-6 (heater relay). No.X-5 (Thermostat relay) and No.X-4 (compressor relay) normal?	—	Go to Step 3	Replace the relay
3	Is pressure switch normal?	—	Go to Step 4	Place the pressure switch.
4	Are the air conditioner switch and the fan control switch normal?	—	Go to Step 5	Replace the A/C switch and fan control switch
5	1. Turn the ignition switch "ON" (the engine is run). 2. Turn the air conditioner switch and the fan control switch on. Is the battery voltage applied between harness side connector terminal No.E3-1 and ground?	Approx.12V	Go to Step 6	Go to Step 7
6	Repair an open circuit between compressor side terminal and ground or replace compressor. Is the action complete?	—	Varyify repair	—
7	Is there continuity between harness side connector terminal No.X4-1 and No.E3-1?	—	Go to Step 9	Go to Step 8
8	Repair an open circuit between terminal No.X4-1 and No.E3-1. Is the action complete?	—	Go to Step 7	—
9	Is the battery voltage applied between harness side connector terminal No.X4-2 and ground, No.X4-5 and ground?	Approx.12V	Go to Step 11	Go to Step 10
10	Repair and open circuit between terminal No.X4-2 and No.F-5 fuse, No.X4-5 and No.F-5 fuse. Is the action complete?	—	Go to Step 9	—
11	Is there continuity between harness side connector terminal No.X4-4 and No.C1-B14?	—	Go to Step 13	Go to Step 12
12	Repair an open circuit between terminal No.X4-4 and No.C1-B14. Is the action complete?	—	Go to Step 11	—
13	Is the battery voltage applied between harness side connector terminal No.I24-2 and ground?	Approx.12V	Go to Step 15	Go to Step 14
14	Repair an open circuit between terminal No.I24-2 and No.F-5 fuse. Is the action complete?	—	Go to Step 13	—
15	Is the battery voltage applied between harness side connector terminal No.B4-3 and ground?	Approx.12V	Go to Step 17	Go to Step 16

Magnetic Clutch Does Not Run (Cont's)

Step	Action	Value(s)	Yes	No
16	Repair an open circuit between terminal No.B4-3 and No.I24-1. Is the action complete?	—	Go to Step 15	—
17	Is there continuity between harness side connector terminal No.I23-6 and No.B-2?	—	Go to Step 19	Go to Step 18
18	Repair an open circuit between terminal No.I23-6 and No.B4-2. Is the action complete?	—	Go to Step 17	—

20	Repair an open circuit between terminal No.I23-1 and No.B-8. Is the action complete?	—	Go to Step 19	—
21	Is the battery voltage applied between harness side connector terminal No.C11-1 and ground?	—	Go to Step 23	Go to Step 22
22	Repair an open circuit between terminal No.C11-1 and No.F-5 fuse. Is the action complete?	—	Go to Step 21	—
23	Is the battery voltage applied between harness side connector terminal No.X5-2 and ground?	—	Go to Step 25	Go to Step 24
24	Repair an open circuit between terminal No.X5-2 and No.C11-2. Is the action complete?	—	Go to Step 23	—
25	Is the battery voltage applied between harness side connector terminal No.B4-1 and ground?	—	Go to Step 27	Go to Step 26
26	Repair an open circuit between terminal No.B4-1 and No.X5-4. Is the action complete?	—	Go to Step 25	—
27	Is there continuity between harness side connector terminal No.X5-1 and No.C3-E15?	—	Go to Step 29	Go to Step 28
28	Repair an open circuit between terminal No.X5-1 and No.C3-E15. Is the action complete?	—	Verify repair	—
29	Replace the PCM. Is the action complete?	—	Verify repair	—

CAUTION: There are condition which air conditioner system dose not operate except trouble as follows.

1. The throttle is greater than 90%.
2. The ignition voltage is below 10.5 volts.
3. The engine speed is greater than 4500 RPM for 5 seconds or 5400 RPM.
4. The engine coolant temperature (ECT) is greater than 125°C (257°F).
5. The intake air temperature (IAT) is less than 5°C (41°F).
6. The power steering pressure switch signals a high pressure condition.

Individual Inspection

Fan Control Knob (Fan Switch) And Air Conditioning (A/C) Switch

1. Check for continuity between the fan switch and the A/C switch side connector terminals.

Legend

- (1) A/C Switch Connector (switch side)
- (2) Fan Switch Connector (switch side)

Heater (X-6), Thermostat (X-5), Condenser Fan (X-9) And Compressor (X-4) Relay

1. Disconnect relays and check for continuity and resistance between relay terminals.
 - For handling of these relays, refer to Heater Relay in this section.

Pressure Switch

1. Disconnect pressure switch connector and check for continuity between pressure switch side connector terminals (1) and (2).

General Repair Procedure

Precautions For Replacement or Repair of Air Conditioning Parts

There are certain procedures, practices and precautions that should be followed when servicing air conditioning systems:

- Keep your work area clean.
- Always wear safety goggles and protective gloves when working on refrigerant systems.
- Beware of the danger of carbon monoxide fumes caused by running the engine.
- Beware of discharged refrigerant in enclosed or improperly ventilated garages.
- Always disconnect the negative battery cable and discharge and recover the refrigerant whenever repairing the air conditioning system.
- When discharging and recovering the refrigerant, do not allow refrigerant to discharge too fast; it will draw compressor oil out of the system.
- Keep moisture and contaminants out of the system. When disconnecting or removing any lines or parts, use plugs or caps to close the fittings immediately. Never remove the caps or plugs until the lines or parts are reconnected or installed.
- When disconnecting or reconnecting the lines, use two wrenches to support the line fitting, to prevent from twisting or other damage.
- Always install new O-rings whenever a connection is disassembled.
- Before connecting any hoses or lines, apply new specified compressor oil to the O-rings.
- When removing and replacing any parts which require discharging the refrigerant circuit, the operations described in this section must be performed in the following sequence:
 - 1 Use the J-39500 (ACR⁴: HFC-134a Refrigerant Recovery / Recycling / Recharging / System) or equivalent to thoroughly discharge and recover the refrigerant.
 - 2 Remove and replace the defective part.
 - 3 After evacuation, charge the air conditioning system and check for leaks.

Repair Of Refrigerant Leaks

Refrigerant Line Connections

Install new O-rings, if required. When disconnecting or connecting lines, use two wrenches to prevent the connecting portion from twisting or becoming damaged.

852RS003

When connecting the refrigerant line at a block joint, securely insert the projecting portion of the joint portion into the connecting hole on the unit side and secure with a bolt. Apply the specified compressor oil to the O-rings prior to connecting.

CAUTION: Compressor (PAG) oil to be used varies according to the compressor model. Be sure to apply oil specified for the model of compressor.

850RW002

1A-48 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

O-rings (2) must be fitted in the groove (1) of refrigerant line.

Insert the nut into the union.

First, tighten the nut by hand as much as possible, then tighten the nut to the specified torque.

Leak Check

Inspection of refrigerant leak

Refrigerant leak may cause an adverse effect not only on the performance and durability of each component of the air-conditioner, but also on the global atmosphere. Therefore, it is most important to repair refrigerant leak when there is any leak found.

Inspection flow of refrigerant leak

Step	Action	Yes	No
1	1. Evacuate the refrigerant system. 2. Charge the refrigerant. Is there any refrigerant leak?	Repair refrigerant system.	Go to Step 2.
2	1. Operate the compressor for more than 5 minutes to raise the pressure on the high pressure side. Is there any refrigerant leak at high pressure components?	Repair refrigerant system.	Compressor operation to be confirmed.

Inspection Steps

Check the components of air-conditioner to see if there occurs any refrigerant leak along the flow of refrigerant.

- To avoid an error in the detection of refrigerant leak, make sure of there being no refrigerant vapor or cigarette smoke around the vehicle before conducting the inspection. Also, select a location where the refrigerant vapor will not get blown off with wind.
- Inspection should be conducted chiefly on the pipe connections and sections where a marked oil contamination is found. When refrigerant is leaking, oil inside is also leaking at the same time.
- It is possible to visually check the leak from inside the cooling unit. Follow the method below when checking. Remove the drain hose or resistor of the

cooling unit, and insert a leak detector to see if there occurs any leak.

High Pressure Side

- Discharger section of compressor.
- Inlet/outlet section of condenser.
- Inlet/outlet section of receiver driver.
- Inlet section of cooling unit.

Low Pressure Side

- Outlet section of cooling unit.
- Intake section of compressor.

Major Checking Points of Refrigerant Leak

Compressor

- Pipe connection
- Sealing section of shaft
- Mating section or cylinder

Condenser

- Pipe connection
- Welds of condenser body

Receiver driver

- Pipe connection
- Attaching section of pressure switch
- Section around the sight glass

Evaporator unit (cooling unit)

- Pipe connections
- Connections of expansion valve
- Brazed sections of evaporator
- The evaporator and expansion valve are contained in the case. Remove the drain hose or the resistor of the cooling unit and insert a leak detector when checking for any leak.

Flexible hose

- Pipe connection
- Caulking section of the hose
- Hose (cracks, pinholes, flaws)

Pipe

- Pipe connection
- Pipe (cracks, flaws)

Charge valve

- The charge valve, which is used to connect the gauge manifold, is normally provided with a resin cap. When the valve inside gets deteriorated, refrigerant will leak out.

Leak at Refrigerant Line Connections

1. Check the torque on the refrigerant line fitting and, if too loose, tighten to the specified torque.
 - Use two wrenches to prevent twisting and damage to the line.
 - Do not over tighten.
2. Perform a leak test on the refrigerant line fitting.
3. If the leak is still present, discharge and recover the refrigerant from the system.
4. Replace the O-rings.
 - O-rings cannot be reused. Always replace with

new ones.

- Be sure to apply the specified compressor oil to the new O-rings.
5. Retighten the refrigerant line fitting to the specified torque.
 - Use two wrenches to prevent twisting and damage to the line.
 6. Evacuate, charge and retest the system.

Leaks In The Hose

If the compressor inlet or outlet hose is leaking, the entire hose must be replaced. The refrigerant hose must not be cut or spliced for repair.

1. Locate the leak.
2. Discharge and recover the refrigerant.
3. Remove the hose assembly.
 - Cap the open connections at once.
4. Connect the new hose assembly.
 - Use two wrenches to prevent twisting or damage to the hose fitting.
 - Tighten the hose fitting to the specified torque.
5. Evacuate, charge and test the system.

Compressor Leaks

If leaks are located around the compressor shaft seal or shell, replace or repair the compressor.

Recovery, Recycling, Evacuation and Charging of HFC-134a

Air conditioning systems contain HFC-134a. This is a chemical mixture which requires special handling procedures to avoid personal injury.

- Always wear safety goggles and protective gloves.
- Always work in a well-ventilated area. Do not weld or steam clean on or near any vehicle-installed air conditioning lines or components.
- If HFC-134a should come in contact with any part of the body, flush the exposed area with cold water and immediately seek medical help.
- If it is necessary to transport or carry any container of HFC-134a in a vehicle, do not carry it in the passenger compartment.
- If it is necessary to fill a small HFC-134a container from a large one, never fill the container completely. Space should always be allowed above the liquid for expansion.
- HFC-134a and R-12 should never be mixed as their compositions are not the same.
- HFC-134a PAG oil tends to absorb moisture more quickly than R-12 mineral oil and, therefore, should be handled more carefully.
- Keep HFC-134a containers stored below 40°C (100°F).

1A-50 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

WARNING:

- SHOULD HFC-134A CONTACT YOUR EYE(S), CONSULT A DOCTOR IMMEDIATELY.
- DO NOT RUB THE AFFECTED EYE(S). INSTEAD, SPLASH QUANTITIES OF FRESH COLD WATER OVER THE AFFECTED AREA TO GRADUALLY RAISE THE TEMPERATURE OF THE REFRIGERANT ABOVE THE FREEZING POINT.
- OBTAIN PROPER MEDICAL TREATMENT AS SOON AS POSSIBLE. SHOULD THE HFC-134A TOUCH THE SKIN, THE INJURY MUST BE TREATED THE SAME AS SKIN WHICH HAS BEEN FROSTBITTEN OR FROZEN.

Refrigerant Recovery

The refrigerant must be discharged and recovered by using the J-39500 (ACR⁴:HFC-134a Refrigerant Recovery/Recycling/Recharging/System) or equivalent before removing or mounting air conditioning parts.

1. Connect the high and low charging hoses of the ACR⁴(or equivalent) as shown below.

Legend

- (1) High Side
- (2) Low Side

2. Recover the refrigerant by following the Manufacturer's Instructions.

3. When a part is removed, put a cap or a plug on the connecting portion so that dust, dirt or moisture cannot get into it.

Refrigerant Recycling

Recycle the refrigerant recovered by J-39500 (ACR⁴:HFC-134a Refrigerant Recovery / Recycling / Recharging / System) or equivalent.

For the details of the actual operation, follow the steps in the ACR⁴(or equivalent) Manufacturer's Instructions.

Evacuation of The Refrigerant System

Legend

- (1) High Side
- (2) Low Side

Explained below is a method using a vacuum pump. Refer to the ACR⁴(or equivalent) manufacturer's instructions when evacuating the system with a ACR⁴(or equivalent).

Air and moisture in the refrigerant will cause problems in the air conditioning system. Therefore, before charging the refrigerant, be sure to evacuate air and moisture thoroughly from the system.

1. Connect the gauge manifold.
 - High-pressure valve (HI) — Discharge-side.
 - Low-pressure valve (LOW) — Suction-side.
2. Discharge and recover the refrigerant.
3. Connect the center hose of the gauge manifold set to the vacuum pump inlet.
4. Operate the vacuum pump, open shutoff valve and then open both hand valves.
5. When the low-pressure gauge indicates approximately 750mmHg (30inHg), continue the evacuation for 5 minutes or more.
6. Close both hand valves and stop the vacuum pump.

7. Check to ensure that the pressure does not change after 10 minutes or more.
 - If the pressure changes, check the system for leaks.
 - If leaks occur, retighten the refrigerant line connections and repeat the evacuation steps.
8. If no leaks are found, again operate the vacuum pump for 20 minutes or more. After confirming that the gauge manifold pressure is at 750mmHg (30inHg), close both hand valves.
9. Close positive shutoff valve. Stop the vacuum pump and disconnect the center hose from the vacuum pump.

Charging The Refrigerant System

There are various methods of charging refrigerant into the air conditioning system.

These include using J-39500 (ACR⁴:HFC-134a Refrigerant Recovery/Recycling/Recharging/System) or equivalent and direct charging with a weight scale charging station.

Charging Procedure

• ACR⁴(or equivalent) Method

For the charging of refrigerant recovered by ACR⁴(or equivalent), follow the manufacturer's instruction.

Legend

- (1) High Side
- (2) Low Side

• Direct charging with a weight scale charging station method

1. Make sure the evacuation process is correctly completed.
2. Connect the center hose of the manifold gauge to the weight scale.
3. Connect the low pressure charging hose of the manifold gauge to the low pressure side service valve of the vehicle.
4. Connect the high pressure charging hose of the manifold gauge to the high pressure side service valve of the vehicle.

Legend

- (1) Weight Scale
- (2) Refrigerant Container
- (3) High Side
- (4) Low Side

5. Place the refrigerant container up right on a weight scale.

Note the total weight before charging the refrigerant.

- a Open the refrigerant container valve.
- b Open the low side valve on the manifold gauge set. Refer to the manufacturer's instructions for a weight scale charging station.

1A-52 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

6. Perform a system leak test:
 - Charge the system with approximately 200g (0.44lbs) of HFC-134a.
 - Make sure the high pressure valve of the manifold gauge is closed.
 - Check to ensure that the degree of pressure does not change.
 - Check for refrigerant leaks by using a HFC-134a leak detector.
 - If a leak occurs, recover the refrigerant. Repair the leak and start all over again from the first step of evacuation.
7. If no leaks are found, continue charging refrigerant to the air conditioning system.
 - Charge the refrigerant until the scale reading decreases by the amount of the charge specified.

Specified amount: 650g (1.43lbs)

- If charging the system becomes difficult:
 - 1 Run the engine at idle and close all the vehicle doors.
 - 2 Turn A/C switch "ON".
 - 3 Set the fan switch to its highest position.
 - 4 Set the air source selector lever to "CIRC".
 - 5 Slowly open the low side valve on the manifold gauge set.

WARNING: Be absolutely sure not to open the high pressure valve of the manifold gauge. Should the high pressure valve be opened, the high pressure refrigerant would flow backward, and this may cause the refrigerant container to burst.

8. When finished with the refrigerant charging, close the low pressure valve of the manifold gauge and container valve.
9. Check for refrigerant leaks.

Checking The A/C System

1. Run the engine and close all the vehicle doors.
2. Turn A/C switch "ON", set the fan switch to its highest position.
3. Set the air source lever to "CIRC", set the temperature lever to the full cool position.
4. Check the high and low pressure of the manifold gauge.
 - Immediately after charging refrigerant, both high and low pressures might be slightly high, but they settle down to the pressure guidelines shown below:
 - The ambient temperature should be between 25–30°C (77–86°F).
 - The pressure guideline for the high-pressure side is approximately 1372.9–1863.3kPa (199.1–270.2 psi).
 - The pressure guideline for the low-pressure side

is approximately 147.1–294.2kPa (21.3–42.7 psi).

- If an abnormal pressure is found, refer to Checking The Refrigerant System With Manifold Gauge in this section.
5. Put your hand in front of the air outlet and move the temperature control lever of the control panel to different positions. Check if the outlet temperature changes as selected by the control knob.

Reading Sight Glass

The sight glass provides accurate diagnosis only under the following conditions.

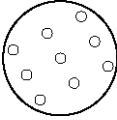

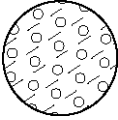

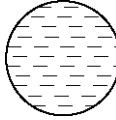

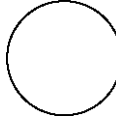

If the vehicle can be tested under these conditions, check the sight glass appearance and compare to the chart below.

- Engine speed idle
- A/C switch "ON"
- Blower fan operating at highest speed
- Air source selector lever at "RECIRC"
- Temperature control lever at coldest position
- Ambient temperature below 30°C (86°F) and humidity below 70% (See NOTE 1)
- High side pressure less than 1667.1 kPa (241.7 psi) (See NOTE 2)

NOTE: 1. If the vehicle cannot be moved to a testing location that meets these specifications, then the sight glass cannot be used for diagnosis. You must discharge and recover the refrigerant, then recharge the system with the specified amount of refrigerant.

Then continue checking the system performance.

NOTE: 2. If the high side pressure is greater than stated, the sight glass cannot be used for diagnosis. You must discharge and recover the refrigerant, then recharge the system with the specified amount of refrigerant. Then continue checking system performance.

<p>High and low pressure pipe temperature</p>	<p>The high pressure pipe is hot and the low pressure pipe is cold. | (3) Compressor | (8) To Condenser |
| (4) O-ring | (9) Serpentine Belt |
| (5) To Evaporator | |

Removal

1. Disconnect the battery ground cable.
2. Discharge and recover refrigerant
 - Refer to Refrigerant Recovery in this section.
3. Disconnect magnetic clutch harness connector.
4. Remove serpentine belt.
 - Move serpentine belt tensioner to loose side using wrench then remove serpentine belt.

Legend

- (1) Cooling Fan Pulley
- (2) Power Steering Oil Pump
- (3) Air Conditioner Compressor
- (4) Crankshaft Pulley
- (5) Generator
- (6) Tensioner
- (7) Idler Pulley

Installation

1. Install compressor.
 - Tighten the compressor fixing bolts to the specified torque.

Torque: 19N•m (1.9kg•m/14lb ft)

2. Connect refrigerant line connector.
 - Tighten the refrigerant line connector fixing bolts to the specified torque.

Torque: 15N•m (1.5kg•m/11lb ft)

- O-rings cannot be reused. Always replace with new ones.
 - Be sure to apply new compressor oil to the O-rings when connecting refrigerant lines.
3. Install serpentine belt.
 - Move serpentine belt tensioner to loose side using wrench, then install serpentine belt to normal position.
 4. Connect magnetic clutch harness connector.

5. Disconnect refrigerant line connector.
 - When removing the line connector, the connecting part should immediately be plugged or capped to prevent foreign matter from being mixed into the line.
6. Remove compressor.

- (2) Air Conditioner Compressor
- (3) Tensioner
- (4) Crankshaft Pulley

5. Disconnect refrigerant line connector.

- When removing the line connector, the connecting part should immediately be plugged or capped to prevent foreign matter from being mixed into the line.

6. Remove compressor.

New Compressor Installation

The new compressor is filled with 150cc (5.0fl.oz.) of compressor oil and nitrogen gas. When mounting the compressor on the vehicle, perform the following steps;

1. Gently release nitrogen gas from the new compressor.
 - Take care not to let the compressor oil flow out.
 - Inspect O-rings and replace if necessary.

871RX033

2. Turn the compressor several times by hand and release the compressor oil in the rotor.

3. When installing on a new system, the compressor should be installed as it is. When installing on a used system, the compressor should be installed after adjusting the amount of compressor oil. (Refer to Compressor in this section)

871RX035

Installation

1. Install compressor.

- Tighten the compressor fixing bolts to the specified torque.

Torque: 19N•m (1.9kg•m/14lb ft)

2. Connect refrigerant line connector.

- Tighten the refrigerant line connector fixing bolts to the specified torque.

Torque: 15N•m (1.5kg•m/11lb ft)

- O-rings cannot be reused. Always replace with new ones.
- Be sure to apply new compressor oil to the O-rings when connecting refrigerant lines.

3. Install serpentine belt.

- Move serpentine belt tensioner to loose side using wrench, then install serpentine belt to normal position.

4. Connect magnetic clutch harness connector.

Condenser Assembly

Condenser Assembly and Associated Parts

|-------------------------------|--------------------------------|
| (1) Engine Hood Lock | (4) Radiator Grille |
| (2) Pressure Switch Connector | (5) Engine Hood Front End Stay |
| (3) Refrigerant Line | (6) Condenser Assembly |

Removal

1. Disconnect the battery ground cable.
2. Discharge and recover refrigerant.
 - Refer to Refrigerant Recovery in this section.
3. Remove radiator grille.
4. Remove engine hood front end stay.
5. Remove engine hood lock.
 - Apply setting mark to the engine hood lock fixing position before removing it.
6. Disconnect pressure switch connector.
7. Disconnect refrigerant line.
 - When removing the line connector, the connecting part should immediately be plugged or capped to prevent foreign matter from being mixed into the line.
8. Remove condenser assembly.
 - Handle with care to prevent damaging the condenser or radiator fin.

Installation

1. Install condenser assembly.
 - If installing a new condenser, be sure to add 30cc (1.0fl.oz.) of new compressor oil to a new one.
 - Tighten the condenser fixing bolts to the specified torque.

Torque: 6 N•m (0.6kg•m/52 lb in)
2. Connect refrigerant line.
 - Tighten the inlet line connector fixing bolt to the specified torque.

Torque: 15 N•m (1.5kg•m/11 lb ft)

- Tighten the outlet line connector fixing bolt to the specified torque.

Torque: 6 N•m (0.6kg•m/52 lb in)

- O-rings cannot be reused. Always replace with new ones.
- Be sure to apply new compressor oil to the

O-rings when connecting the refrigerant line.

3. Connect pressure switch connector.
4. Install engine hood lock.
5. Install engine hood front end stay.
6. Install radiator grille.

Condenser Fan Motor

Condenser Fan Motor and Associated Parts

875RY0007

Legend

- (1) Condenser Fan Assembly
- (2) Condenser Fan Motor

- (3) Radiator Grille
- (4) Shroud
- (5) Fan

Removal

1. Disconnect the battery ground cable.
2. Discharge and recover refrigerant.
 - Refer to Refrigerant Recovery in this section.
3. Remove radiator grille.
4. Remove condenser fan assembly.
 - Disconnect the fan motor connector and remove the 4 fixing bolts.
5. Remove shroud.
 - Remove the 3 fixing nuts.
 - Loosen the condenser fixing nut and disconnect

the fan motor connector from bracket.

6. Remove fan.
 - Remove the fan fixing C-ring and plate.
7. Remove condenser fan motor.

Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Route the fan motor harness in its previous position, and fix it securely with clip and bracket.

Receiver / Drier

Receiver / Drier and Associated Parts

875RY00012

Legend

- (1) Pressure Switch Connector
- (2) Refrigerant Line
- (3) Radiator Grille
- (4) Receiver / Drier
- (5) Bracket Bolt

Removal

1. Disconnect the battery ground cable.
2. Discharge and recover refrigerant.
 - Refer to Refrigerant Recovery in this section.
3. Remove radiator grille.
4. Disconnect pressure switch connector.
5. Disconnect refrigerant line.
 - When removing the line connected part, the connecting part should immediately be plugged or capped to prevent foreign matter from being mixed into the line.
6. Remove bracket bolt.
7. Remove receiver/drier.
 - Loosen the bolt, then, using care not to touch or bend the refrigerant line, carefully pull out the receiver/drier.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. If installing a new receiver/drier, be sure to add 30cc (1.0fl.oz.) of new compressor oil to a new one.
2. Put the receiver/drier in the bracket and connect with the refrigerant line. Check that no excessive force is imposed on the line. Fasten the bracket bolt to the receiver/drier.
3. Tighten the refrigerant line to the specified torque.

Torque: 6 N•m (0.6kg•m/52 lb in)

4. O-rings cannot be reused. Always replace with new ones.
5. Be sure to apply new compressor oil to the O-rings when connecting the refrigerant line.

Pressure Switch

Pressure Switch and Associated Parts

875RY00012

Legend

- (1) Pressure Switch Connector
- (2) Refrigerant Line
- (3) Radiator Grille
- (4) Receiver / Drier
- (5) Bracket Bolt

Removal

1. Disconnect the battery ground cable.
2. Discharge and recover refrigerant.
 - Refer to "Refrigerant Recovery in this section."
3. Remove radiator grille.
4. Disconnect pressure switch connector.
5. Disconnect pressure switch.
 - When removing the switch connected part, the connecting part should immediately be plugged or capped to prevent foreign matter from being mixed into the line.

Installation

To install, follow the removal steps in the reverse order, noting the following point:

1. O-ring cannot be reused. Always replace with a new one.
2. Be sure to apply new compressor oil to the O-ring when connecting pressure switch.
3. Tighten the pressure switch to the specified torque.

Torque: 13 N•m (1.3kg•m/113 lb in)

Evaporator Assembly

Evaporator Assembly and Associated Parts

874RY00024

Legend

|--|------------------------------------|
| (1) Refrigerant Line | (5) Evaporator Assembly |
| (2) Drain Hose | (6) Glove Box |
| (3) Resistor and Electronic Thermostat Connector | (7) Sill Plate |
| (4) Electronic Thermostat | (8) Dash Side Trim Pad |
| | (9) Inst Panel Lower Reinforcement |

Removal

1. Disconnect the battery ground cable.
2. Discharge and recover refrigerant.
 - Refer to Refrigerant Recovery in this section.
3. Remove glove box.

4. Disconnect resistor (2) and electronic thermostat connector (1).

874RY00025

5. Disconnect drain hose.
6. Disconnect refrigerant line.
 - Use a back-up wrench when disconnecting and reconnecting the refrigerant lines.
 - When removing the refrigerant line connected part, the connecting part should immediately be plugged or capped to prevent foreign matter from being mixed into the line.
7. Remove evaporator assembly.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. To install a new evaporator assembly, add 50cc (1.7fl. oz.) of new compressor oil to the new core.
2. Tighten the refrigerant outlet line to the specified torque.

Torque: 25 N•m (2.5kg•m/18 lb ft)

3. Tighten the refrigerant inlet line to the specified torque.

Torque: 15 N•m (1.5kg•m/11 lb ft)

4. O-rings cannot be reused. Always replace with new ones.
5. Be sure to apply new compressor oil to the O-rings when connecting lines.

Electronic Thermostat, Evaporator Core and/or Expansion Valve Disassembled View

874RY0026

Legend

- | | |
|---------------------------|-------------------------|
| (1) Lining | (6) Attaching Screw |
| (2) Upper Case | (7) Lower Case |
| (3) Electronic Thermostat | (8) Evaporator Assembly |
| (4) Evaporator Core | (9) O-ring |
| (5) Lining: Case | (10) Expansion Valve |

Removal

1. Disconnect the battery ground cable.
2. Discharge and recover refrigerant.
 - Refer to Refrigerant Recovery in this section.
3. Remove evaporator assembly.
 - Refer to Evaporator Assembly in this section.
4. Remove the electronic thermostat sensor fixing clip. Pull the sensor from the evaporator assembly.
5. Remove attaching screw.
6. Remove upper case.
7. Remove lower case.
 - Slit the case parting face with a knife since the lining is separated when removing the evaporator.

874RW034

- Lift to remove the upper case.

874RY00027

8. Remove evaporator core.

874RY00028

9. Remove expansion valve.

- Tear off the insulator carefully.
- Remove the sensor fixing clip.
- Use a back-up wrench when disconnecting all refrigerant pipes.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. The sensor is installed on the core with the clip.
2. The sensor must not interfere with the evaporator core.
3. When installing the new evaporator core, install the thermo sensor to the evaporator core specified position with the clip in the illustration.

874RX014

Legend

- (1) Evaporator Core
- (2) Thermo Sensor
- (3) Lower Case
- (4) Upper Case

4. O-rings cannot be reused. Always replace with new ones.
5. Be sure to apply new compressor oil to the O-rings when connecting lines.
6. Be sure to install the sensor and the insulator on the place where they were before.
7. To install a new evaporator core, add 50cc (1.7 fl. oz.) of new compressor oil to the new core.
8. Tighten the refrigerant lines to the specified torque. Refer to Main Data and Specifications for Torque Specifications in this section.
9. Apply an adhesive to the parting face of the lining when assembling the evaporator assembly.

Refrigerant Line

Refrigerant Line and Associated Parts

852RY00032

Legend

Removal

1. Disconnect the battery ground cable.
2. Discharge and recover refrigerant.
 - Refer to Refrigerant Recovery in this section.
3. Remove radiator grille.
4. Remove clip and clamp.
5. Disconnect liquid line (High-pressure pipe).
6. Disconnect suction line (Low-pressure pipe) using a back-up wrench.
7. Disconnect suction line (Low-pressure hose) using a back-up wrench.
8. Disconnect discharge line (High-pressure hose) using a back-up wrench.
 - Use a backup wrench when disconnecting and reconnecting the refrigerant lines.
 - When removing the refrigerant line connecting part, the connecting part should immediately be

plugged or capped to prevent foreign matter from being mixed into the line.

Installation

To install, follow the removal steps in the reverse order, noting the following point:

1. O-rings cannot be reused. Always replace with new ones.
2. Be sure to apply new compressor oil to the O-rings when connecting lines.
3. Tighten the refrigerant line to the specified torque. Refer to Main Data and Specifications for Torque Specifications in this section.

Compressor

Service Precaution

WARNING: This vehicle has a Supplemental Restraint System (SRS). Refer to the SRS Component Location View in order to determine whether you are performing service on or near the SRS components or the SRS wiring. When you are performing service on or near the SRS components or the SRS wiring, refer to the SRS On-Vehicle Service Information. Failure to follow CAUTIONS could result in possible air bag deployment, personal injury, or otherwise unneeded SRS system repairs.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

When servicing the compressor, keep dirt or foreign material from getting on or into the compressor parts and system. Clean tools and a clean work area are important for proper service. The compressor connections and the outside of the compressor should be cleaned before any "On-Vehicle" repair, or before removal of the compressor. The parts must be kept clean at all times and any parts to be reassembled should be cleaned with Trichloroethane, naphtha, kerosene, or equivalent solvent, and dried with dry air. Use only lint free cloths to wipe parts.

The operations described below are based on bench overhaul with compressor removed from the vehicle, except as noted. They have been prepared in order of accessibility of the components. When the compressor is removed from the vehicle for servicing, the oil remaining in the compressor should be discarded and new compressor oil added to the compressor.

Compressor malfunction will appear in one of four ways: noise, seizure, leakage or low discharge pressure. Resonant compressor noises are not cause for alarm; however, irregular noise or rattles may indicate broken parts or excessive clearances due to wear. To check seizure, de-energize the magnetic clutch and check to

see if the drive plate can be rotated. If rotation is impossible, the compressor is seized. Low discharge pressure may be due to a faulty internal seal of the compressor, or a restriction in the compressor. Low discharge pressure may also be due to an insufficient refrigerant charge or a restriction elsewhere in the system. These possibilities should be checked prior to servicing the compressor. If the compressor is inoperative, but is not seized, check to see if current is being supplied to the magnetic clutch coil terminals.

The compressor oil used in the HFC-134a system compressor differs from that used in R-12 systems. Also, compressor oil to be used varies according to the compressor model. Be sure to avoid mixing two or more different types of oil.

If the wrong oil is used, lubrication will be poor and the compressor will seize or malfunction.

DKV-14G Type Compressor

DKV-14G is equipped with five-vane rotary compressor. These vanes are built into a rotor which is mounted on a shaft.

When the shaft rotates, the vanes built into the cylinder block assembly are operated by centrifugal force.

This changes the volume of the space formed by the rotor and cylinder, resulting in the intake and compression of the refrigerant gas. The discharge valve and the valve stopper, which protects the discharge valve, are built into the cylinder block assembly. There is no suction valve but a shaft seal is installed between the shaft and head; a trigger valve, which applies back pressure to the vanes, is installed in the cylinder block and a refrigerant gas temperature sensor is installed in the front head.

The specified quantity of compressor oil is contained in the compressor to lubricate the various parts using the refrigerant gas discharge pressure.

1A-72 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)**Diagnosis**

Condition	Possible cause	Correction
Noise from compression	Defective rotor/piston	Replace compressor/cylinder and shaft assembly
	Defective shaft	Replace compressor/cylinder and shaft assembly
Noise from magnetic clutch	Defective bearing	Replace magnetic clutch
	Defective clutch	Replace magnetic clutch
	Clearance between drive plate and pulley not standard	Adjust the clearance or replace magnetic clutch
Insufficient cooling	Defective gasket	Replace compressor/gasket
	Defective rotor/reed valve	Replace compressor/valve plate
	Defective trigger valve/suction valve	Replace compressor/suction valve
Not rotating	Defective rotor/piston	Replace compressor/cylinder and shaft assembly
	Defective shaft	Replace compressor/cylinder and shaft assembly
	Rotating parts seized due to insufficient oil	Replace compressor
Oil and/or gas leakage	Defective seal	Replace compressor/shaft seal
	Defective O-ring	Replace

Magnetic Clutch Assembly (DKV-14G Type)

Removal

1. Using drive plate holder J-33939 (1) to prevent the drive plate from rotating, then remove the drive plate bolt.

871RX029

2. Remove drive plate by using drive plate puller J-33944-A (2) and forcing screw J-33944-4 (1).

871RX023

1A-74 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

3. Remove shim (s).
4. Remove snap ring (1) by using snap ring pliers.

871RY00029

5. Remove pulley assembly by using pulley puller J-38424(2), pulley puller pilot J-8433(1) and pulley puller leg J-24092-2(3).

871RY00033

6. Loosen screw and disconnect the field coil wire connector.

871RY00030

7. Loosen three screws and remove the field coil.

871RY00034

Inspection and Repair

Drive Plate

If the frictional surface shows signs of damage due to excessive heat, the drive plate and pulley should be replaced.

Pulley Assembly

Check the appearance of the pulley assembly. If the frictional surface of the pulley shows signs of excessive grooving due to slippage, both the pulley and drive plate should be replaced. The frictional surfaces of the pulley assembly should be cleaned with a suitable solvent before reinstallation.

Coil

Check coil for loose connector or cracked insulation.

Installation

1. Install field coil.
 - Align the located portion (1) of the field coil and compressor.

871RY00035

- Tighten the mounting screw to the specified torque.

Torque: 5N-m (0.5kg-m/44 lb in)

2. Connect the lead wire connector with the rubber hold and tighten the screw.
3. Install pulley assembly by using pulley installer J-33940-A(2) and drive handle J-8092(1).

871RY00032

4. Install snap ring.
5. Install shim (s).
6. Install the drive plate to the compressor drive shaft together with the original shim(s)(1). Press the drive plate by hand.

871RY00031

1A-76 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

7. Install drive plate bolt by using drive plate holder J-33939 (1) to prevent the drive plate from rotating.

871RX029

- Tighten the drive plate bolt to the specified torque.

Torque: 13 N·m (1.3kg·m/113 lb in)

- After tightening the drive plate bolt, check to be sure the pulley rotates smoothly.

- Check to be sure that the clutch clearance is between 0.3-0.6 mm (0.01-0.02 in.)

871RY0028

Legend

- (1) Dial Gauge
- (2) Pulley Assembly
- (3) Field Coil Wire Connector

- If necessary, install adjusting shim(s).
- Adjusting shims are available in the following thickness.

Thickness

- 0.1 mm (0.0039 in.)
- 0.3 mm (0.0118 in.)
- 0.5 mm (0.0197 in.)

Compressor Oil

Oil Specification

- The HFC-134a system requires a synthetic (PAG) compressor oil whereas the R-12 system requires a mineral compressor oil. The two oils must never be mixed.
- Compressor (PAG) oil varies according to compressor model. Be sure to use oil specified for the model of compressor.
- **Always use HFC-134a Vane Rotary Type Compressor Oil (AIPDN Part No.2-90188-301-0)**

Handling of Oil

- The oil should be free from moisture, dust, metal powder, etc.
- Do not mix with other oil.
- The water content in the oil increases when exposed to the air. After use, seal oil from air immediately. (HFC-134a Vane Rotary Compressor Oil absorbs moisture very easily.)
- The compressor oil must be stored in steel containers, not in plastic containers.

Compressor Oil Check

The oil used to lubricate the compressor is circulating with the refrigerant.

Whenever replacing any component of the system or a large amount of gas leakage occurs, add oil to maintain the original amount of oil.

Oil Capacity

Capacity total in system: 150cc (5.0 fl.oz)

**Compressor (Service parts) charging amount:
150 cc (5.0 fl.oz)**

Checking and Adjusting Oil Quantity for Used Compressor

1. Perform oil return operation. Refer to Oil Return Operation in this section.
2. Discharge and recover refrigerant and remove the compressor.
3. Drain the compressor oil and measure the extracted oil with a measuring cylinder.

871RX020

4. If the amount of oil drained is much less than 90 cc (3.0 fl. oz.), some refrigerant may have leaked out. Conduct a leak tests on the connections of each system, and if necessary, repair or replace faulty parts.
5. Check the compressor oil contamination. (Refer to Contamination of Compressor Oil in this section.)
6. Adjust the oil level following the next procedure below.

(Charging Amount)	(Collected Amount)
more than 90cc (3.0 fl.oz)	same as collected amount
less than 90 cc (3.0 fl.oz)	90cc (3.0 fl.oz)

7. Install the compressor, then evacuate, charge and perform the oil return operation.

8. Check system operation.

When it is impossible to preform oil return operation, the compressor oil should be checked in the following order:

1. Discharge and recover refrigerant and remove the compressor.
2. Drain the compressor oil and measure the extracted oil with a measuring cylinder.
3. Check the oil for contamination.
4. If more than 90 cc (3.0 fl. oz.) of oil is extracted from the compressor, supply the same amount of oil to the compressor to be installed.
5. If the amount of oil extracted is less than 90 cc (3.0 fl. oz.), recheck the compressor oil in the following order.
6. Supply 90 cc (3.0 fl. oz.) of oil to the compressor and install it onto the vehicle.

1A-78 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

7. Evacuate and recharge with the proper amount of refrigerant.
8. Perform the oil return operation.
9. Remove the compressor and recheck the amount of oil.
10. Adjust the compressor oil, if necessary.

(Collected Amount)	(Charging Amount)
more than 90 cc (3.0 fl.oz)	same as collected amount
less than 90 cc (3.0 fl.oz)	90 cc (3.0 fl.oz)

Checking and Adjusting for Compressor Replacement

150 cc (5.0 fl.oz.) of oil is charged in compressor (service parts). So it is necessary to drain the proper amount of oil from the new compressor.

1. Perform oil return operation.
2. Discharge and recover the refrigerant and remove the compressor.
3. Drain the compressor oil and measure the extracted oil.
4. Check the compressor oil for contamination.
5. Adjust the oil level as required.

(Amount of oil drained from used compressor)	(Draining amount of oil from new compressor)
less than 90 cc (3.0 fl.oz)	Same as drained amount
more than 90 cc (3.0 fl.oz)	90 cc (3.0 fl.oz)

6. Evacuate, charge and perform the oil return operation.
7. Check the system operation.

Contamination of Compressor Oil

Unlike engine oil, no cleaning agent is added to the compressor oil. Even if the compressor runs for a long period of time (approximately one season), the oil never becomes contaminated as long as there is nothing wrong with the compressor or its method of use.

Inspect the extracted oil for any of the following conditions:

- The capacity of the oil has increased.
- The oil has changed to red.
- Foreign substances, metal powder, etc., are present in the oil.

If any of these conditions exists, the compressor oil is contaminated. Whenever contaminated compressor oil is discovered, the receiver/drier must be replaced.

Oil Return Operation

There is close affinity between the oil and the refrigerant. During normal operation, part of the oil recirculates with the refrigerant in the system. When checking the amount of oil in the system, or replacing any component of the system, the compressor must be run in advance for oil return operation. The procedure is as follows:

1. Open all the doors and the engine hood.
2. Start the engine and air conditioning switch to "ON" and set the fan control knob at its highest position.
3. Run the compressor for more than 20 minutes between 800 and 1,000 rpm in order to operate the system.
4. Stop the engine.

Replacement of Component Parts

When replacing the system component parts, supply the following amount of oil to the component parts to be installed.

(Component parts to be installed)	(Amount of Oil)
Evaporator	50 cc (1.7 fl. oz.)
Condenser	30 cc (1.0 fl. oz.)
Receiver/dryer	30 cc (1.0 fl. oz.)
Refrigerant line (one piece)	10 cc (0.3 fl. oz.)

Automatic Air Conditioning System

General Description

Using a variety of sensors, this automatic heater and air conditioner accurately senses outside air temperature, solar radiation quantity, evaporator's blowing temperature, and interior temperature, then enters these data to the automatic heater/air conditioner control unit (equipped with the built-in micro-computer). The data provided to the control unit enables to automatically control blow temperature and blow air

quantity, turn on or off the compressor and switch the blow port as well as switching between the fresh air intake and interior air circulation.

Resetting the automatic function allows you to switch to the manual control mode.

The self-diagnosis function of the automatic heater and air conditioner control unit (with the built-in micro-computer) allows the unit to access and diagnose a failed part easier and quicker.

Functions and Features

of this function, refer to the section titled "Self-Diagnosis").

Automatic interior temperature control

This function enables to maintain the interior temperature at the level specified from the temperature control switch despite of changes in factors such as vehicle speeds, outside air temperature and number of passengers.

Maximum cooling and heating function

You can select FC (Full cool, namely maximum cooling temperature) or FH (Full heat, maximum heating temperature) from the temperature control lever.

Automatic air flow control

Air flow is automatically and consecutively fine tuned according to the specified interior temperature and changes in aperture of the heater unit mix door.

Mode (blow port) control

This function automatically selects either one of the VENT, BI-LEVEL, FOOT or DEF mode for the blow port according to changes of temperature on the blow port. Using the mode switch allows you to select a desired blow port manually.

Intake (switching between the fresh air intake and circulation of interior air) control

The intake (switching between fresh air intake and circulation of interior air) mode automatically selects either FRESH (fresh air intake), MIX or RECIRC (interior air circulation) according to changes of the blow port temperature. Using the intake switch allows you to select a desired intake port manually (in the manual operation, FRESH and RECIRC modes alone are available). Pressing the DEF (defrost) mode switch selects the FRESH (fresh air intake).

Cooler start-up timing control

This function is used for maintaining the air flow at "LOW" level until the evaporator is sufficiently cooled down. It is intended to prevent a large volume of hot air being blowing into inside of a vehicle when the cooler is turned on in hot summer season.

Heater start-up timing control

This function is used for maintained the air flow at "LOW" level and also for maintaining the defrost mode until temperature of coolant in the heater core is sufficiently heated. It is intended to prevent a large volume of cool air being blown into inside of a vehicle when the heater is turned on in cold winter season.

Solar radiation quantity offset control

The photodiode on the solar radiation sensor determines solar radiation quantity accurately to offset interior temperature quickly.

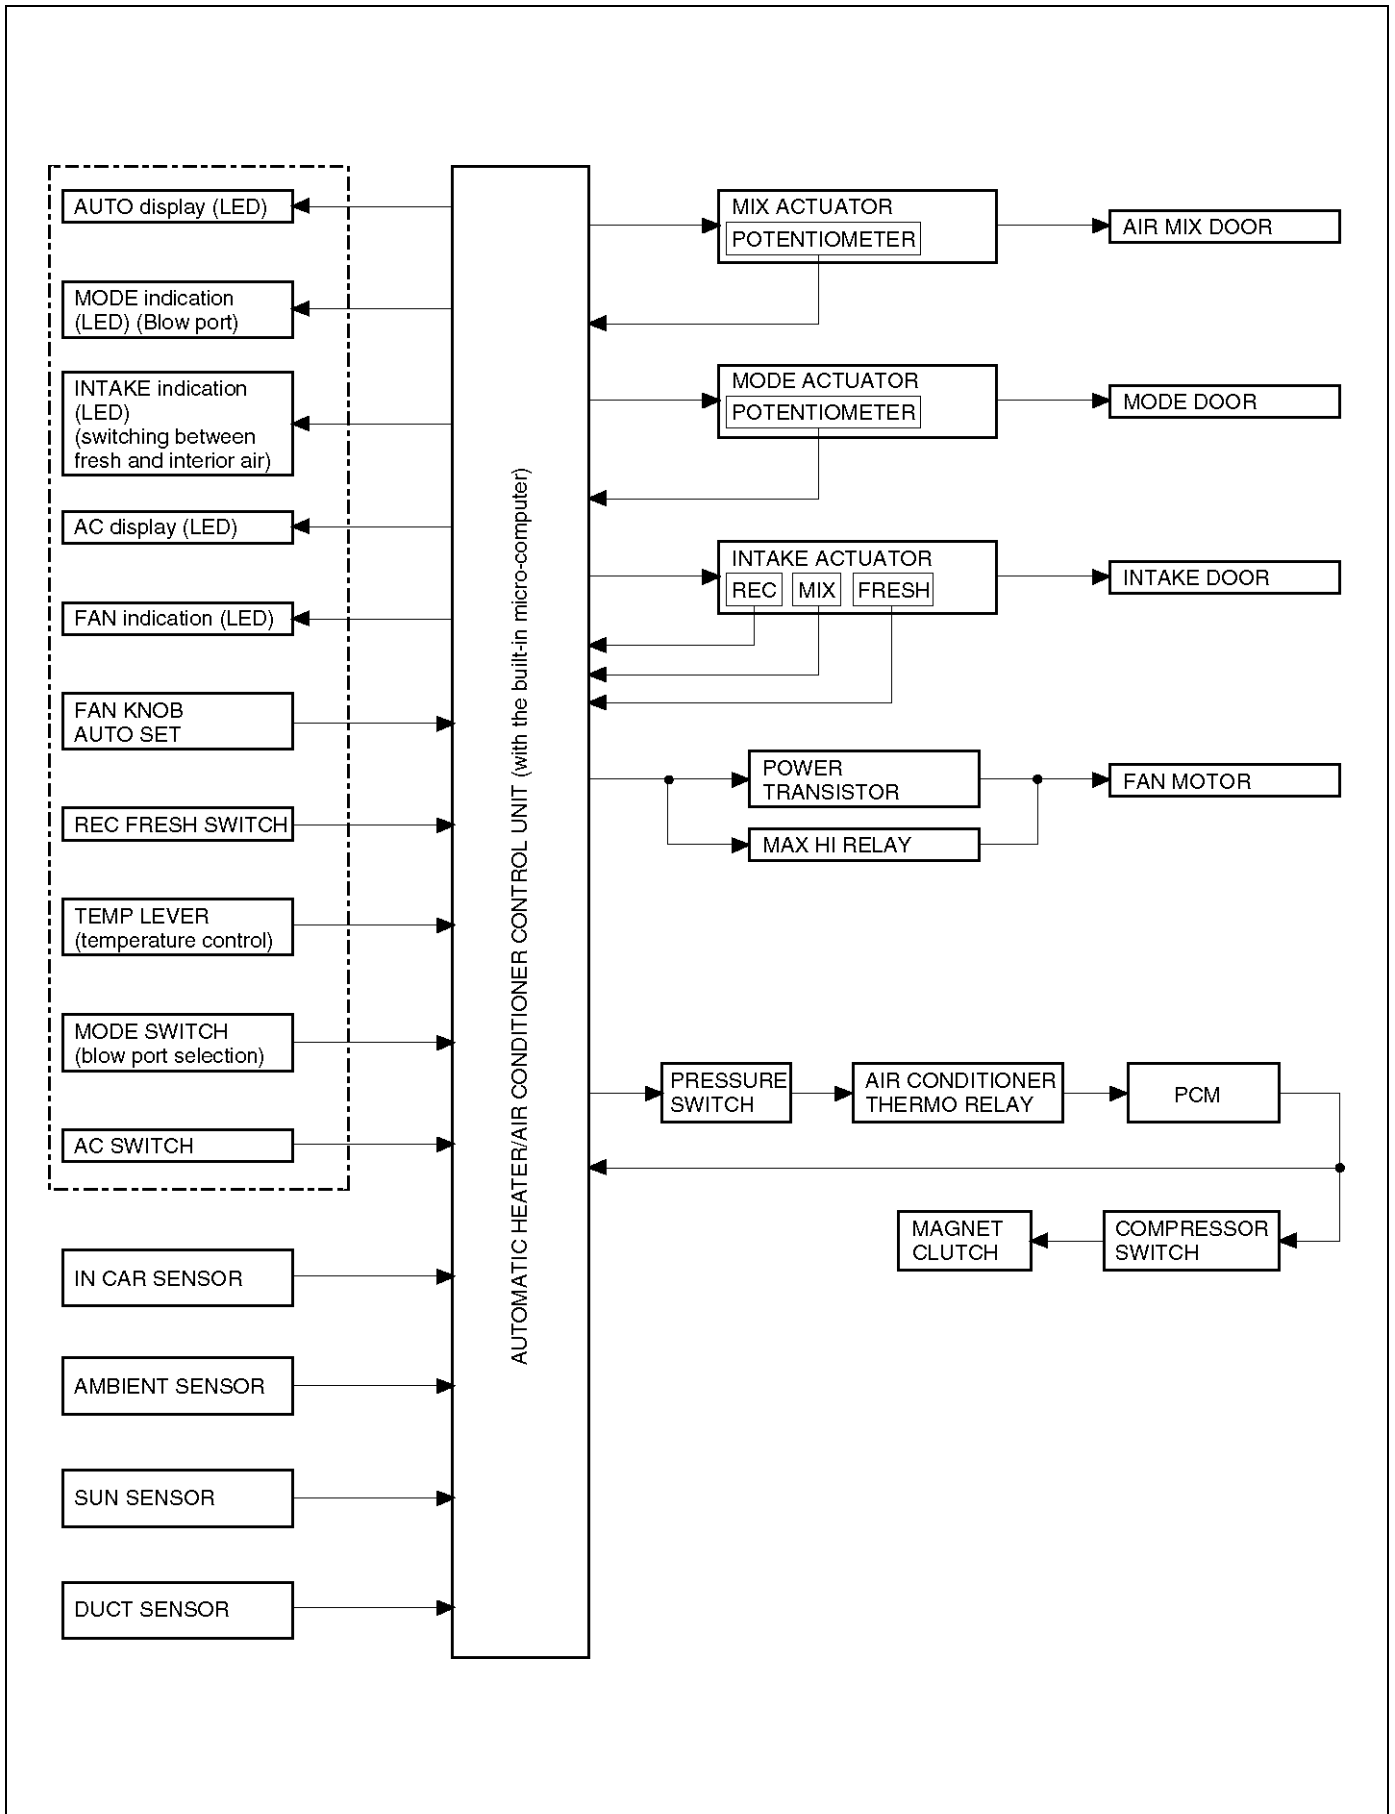

Switch position storing function

This function is used for storing switch positions being selected in the immediately preceding operation, namely the last time the ignition has been turned off. It simplifies the setup procedures when restarting the system.

Self-diagnosis function

The self-diagnosis function turned on from the panel switch makes your troubleshooting easier (for detail

Operation and Functions of Control Panel Switches

Auto Switch

1. Pressing this switch turns on the automatic control mode. It resets all manual switches except that for the fan control. However, when the Manual REC is selected for the intake or the Manual Open is selected, the modes are maintained.
2. It causes the A/C (air conditioner) to the ON mode (this function, however, available only when the fan is turned on and also the compressor is turned on because of the given outside air temperature level).

Indication

- The AUTO LED comes on.
- Currently selected mode for the Mode and Intake are respectively indicated.

- The A/C LED remains turned on even if the compressor has been turned off because of the given outside air temperature level. Pressing the air conditioning switch in this state turns off the A/C LED.

Mode Switch

1. Pressing the VENT, B/L or FOOT switch selects the corresponding mode.
2. When the Auto is selected for the Mode and Intake, pressing the mode switch fixes the Intake to the immediately preceding status.

Indication

- Turns off the Auto LED.
- Currently selected blow port is indicated.

DEF Switch

Press this switch to select the DEF mode.

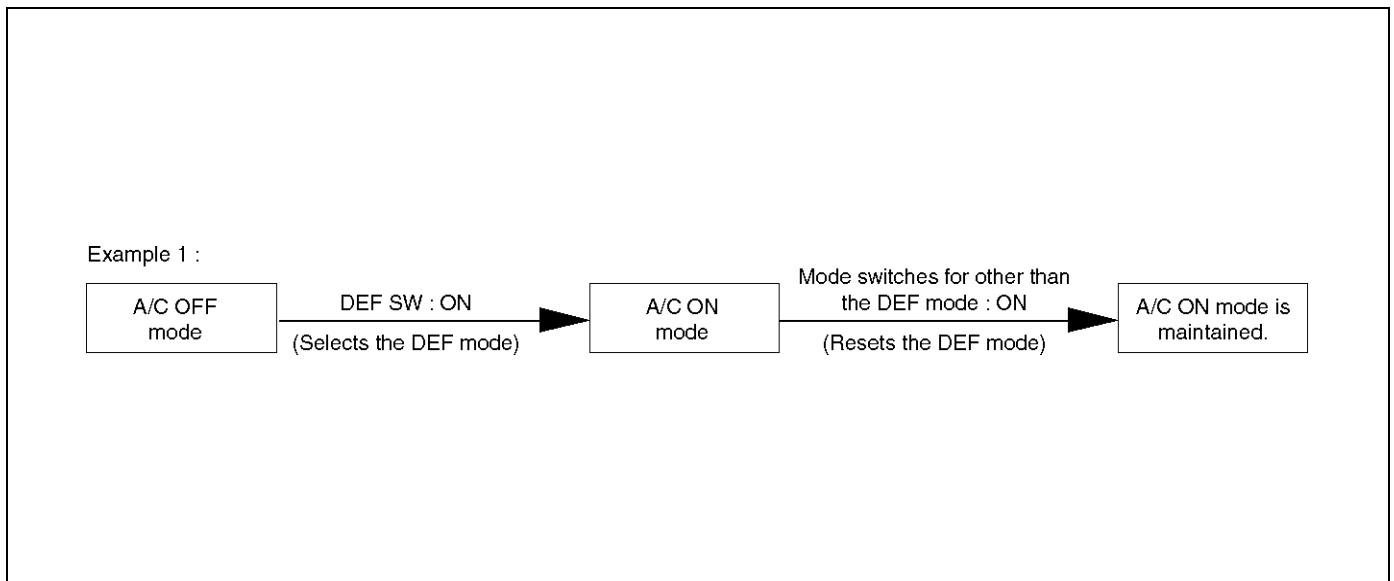

Blow port	Intake port	A/C	MIX
DEF	Auto FRESH *1	ON mode *2	Auto

*1: When the manual REC is selected for the Intake, the manual REC is maintained.

*2: The ON mode is enabled only when the fan is turned on, and also the compressor is turned on because of the given outside air temperature level.

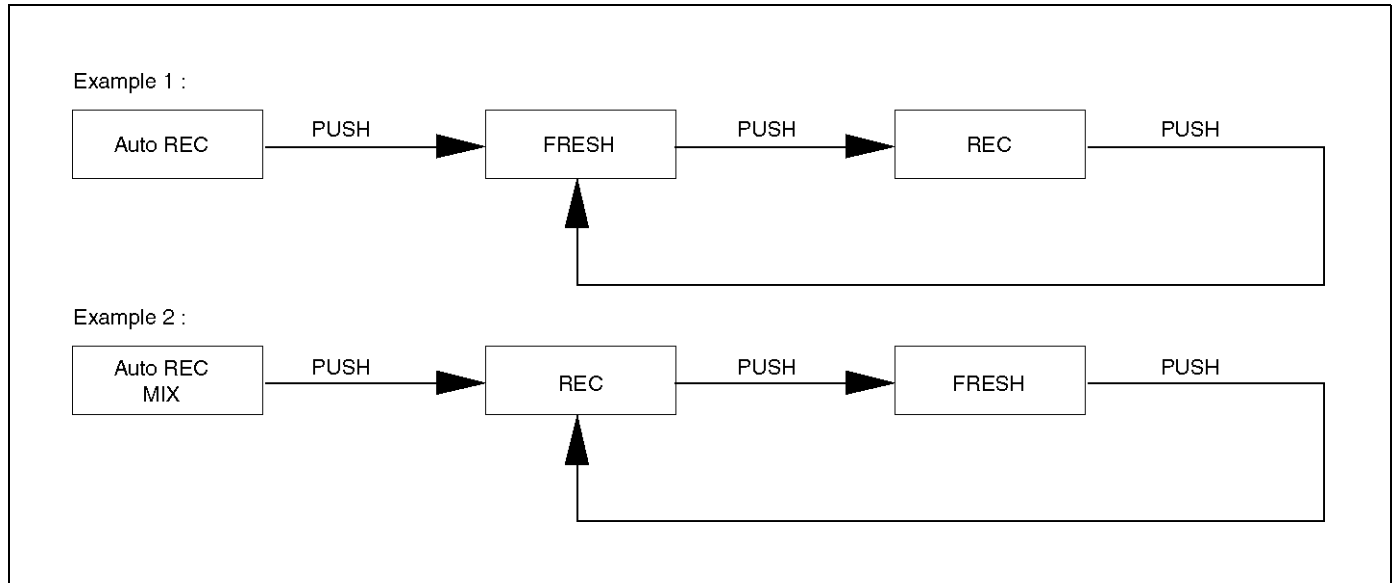

Indication

- The Auto LED is turned off.
- DEF is indicated for the blow port, A/C LED comes on (only when the fan is turned on), and status display is provided for the Intake and Cold Air Bypass.

Intake Switch

Pressing this switch sequentially selects a different intake port in the following order.

F01RX005

Indication

- The Auto LED maintains unaffected.
- Currently selected intake port is indicated.

F01RX007

Fan Switch

1. Sets the fan to the specified mode.
2. Even when the fan switch is turned off, status display for the Mode, Intake and Cold Air Bypass is maintained.

Temperature Control Knob

1. This knob is operable only when the fan is turned on. It may be used for the MAX control of each block except the fan.
2. When the manual mode is selected for the fan control, this manual mode is maintained.

MAX Control

	Mix	Fan	Mode	Intake	Cold air bypass	A/C
MAX/COOL	Full cool	MAX/HI	VENT	REC*1	OPEN*2	ON mode*3
MAX/HEAT	Full hot	AUTO/HI	FOOT*4	FRESH	CLOSE	Current status is maintained

1A-96 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

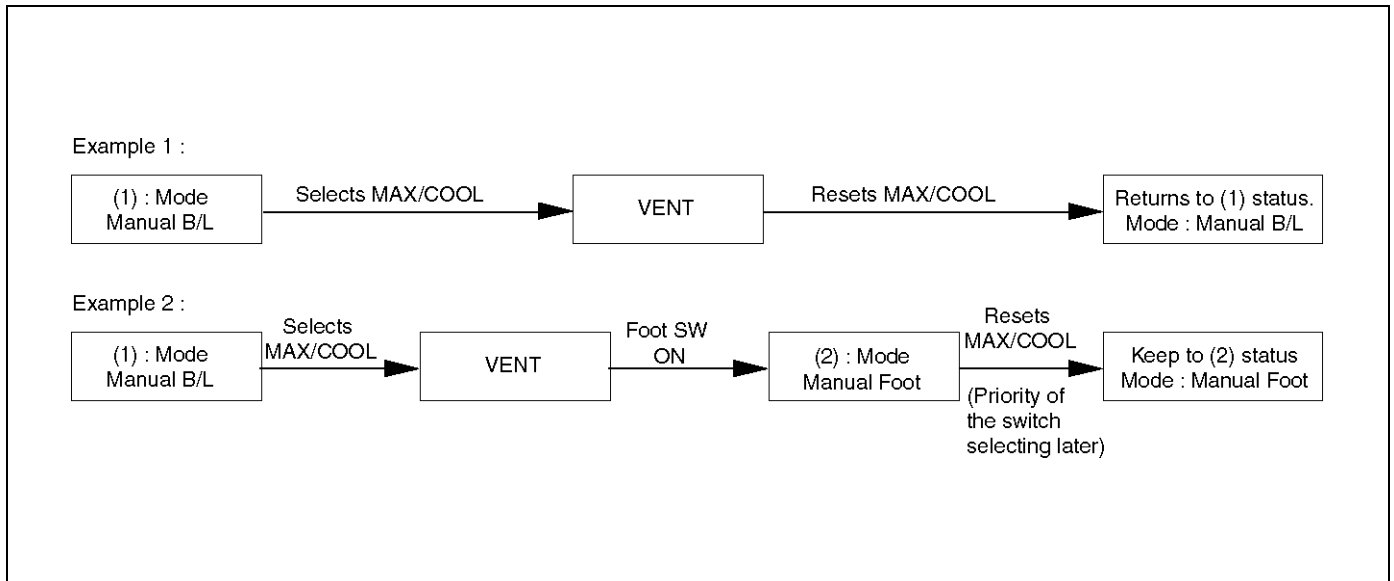

*1: In the A/C: OFF mode, FRESH shall be selected.

*2: When the fan is turned ON, CLOSE shall be selected.

*3: The ON mode is available only when ON is selected for the fan as well as for the cold outside air ON/OFF

selection.

*4: When the MAX control is selected from the DEF mode, this DEF mode shall be maintained.

F01RX008

Indication

- As long as the MAX control is selected, the immediately preceding indication shall be maintained for the AUTO.
- Status display is provided for others.

Air Conditioning Switch

Pressing this switch turns on or off the A/C (air conditioning) control. (The compressor remains turned off if the fan is turned off and also the compressor has been turned off because of the given outside air temperature level.)

Indication

1. The A/C LED remains turned on even if the compressor has been turned off because of the given outside air temperature level. In this case, however, the AUTO or DEF switch must be turned on and the A/C ON mode must also be turned on (by the MAX/C mode).
2. Pressing the A/C switch from the above state (1) turns off the A/C LED.

Overview of Construction, Movement and Control of Major Parts of Automatic Air Conditioner System

Automatic Heater/Air Conditioner Control Unit

Equipped with the built-in micro-computer, this control unit operates on signals from sensors and input signals from switches to offer total control of the blower fan, and actuators used for the mode door, intake door and air mix door.

Its self-diagnosis function enables quicker access to a failed part and its more accurate troubleshooting.

In Car Sensor

It is a sensor used for detecting room temperature of a vehicle. This sensor converts a given room temperature into a resistance value before entering the data to the automatic heater/air conditioner control unit.

This in car sensor unites the power driven aspirator and the motor fan so that a small amount of room air may be constantly fed to the sensor.

This sensor is provided on the control panel.

Legend

- (1) In Car Sensor
- (2) Automatic Air Conditioner Control Unit

Ambient Sensor

This sensor is used for detecting temperature outside the vehicle. It converts a given outside air temperature into a resistance value before entering the data to the automatic heater/air conditioner control unit.

Thermal effects from the condenser and radiator during idling after a run can be measured and offset the automatic amplifier.

This sensor is provided on the side plate situated at upper right side of the condenser.

Legend

- (1) Ambient Sensor

Duct Sensor

The duct sensor is the sensor to detect temperature change of the side of evaporator blower coming by fresh recirculation of intake door or "on" "off" of compressor.

The temperature is converted to resistant rate.

And it works as thermostat to control to prevent freezing of evaporator.

This sensor is installed in the upper case of evaporator.

Legend

- (1) Evaporator Core
- (2) Duct Sensor
- (3) Lower Case
- (4) Upper Case

Sun Sensor

It is a photodiode used for detecting quantity of solar radiation. This sensor converts the offset signal generated by changes in the interior temperature (which results from fluctuations in solar radiation) into photoelectric current to enter into the automatic heater/air conditioner control unit.

This sensor is provided at top of the defroster grill.

865RW009

Legend

- (1) Sun Sensor

Power Transistor

Receiving base current from the automatic heater/air conditioner control unit, the power transistor implements stage-less speed change of the blower fan motor. This transistor is provided on the evaporator.

874RX015

Legend

- (1) Evaporator Assembly
(2) Power Transistor

Max Hi Relay

This relay turned on or off by the signal from the automatic heater/air conditioner control unit. As the Max Hi relay is turned on, supply voltage is directly fed to the blower fan motor to select the Max Hi mode.

860RW028

Legend

- (1) Blower Unit
(2) Max High Relay

Actuator

The actuators are power driven type containing a small motor. Receiving output current from the automatic heater/air conditioner control unit, actuators drive the heater and blower unit mode doors.

Actuators consist of the mode actuator used for switching the mode (blow port selection), the mix actuator used for changing aperture of the air mix door, the intake actuator used for switching the intake mode (fresh air/interior air) and the cold air bypassing actuator.

860RW029

Legend

- (1) Mix Actuator
- (2) Heater Unit
- (3) Intake Actuator
- (4) Mode Actuator
- (5) Blower Unit

The actuator changes the motor speed using the gear and drives each door rotating the output axis united with the sliding contact.

860RW026

Legend

- (1) Output Axis
- (2) Motor
- (3) Printed Circuit Board
- (4) Sliding Contact

The mode and mix actuators are common actuators with the built-in potentiometer. For the intake actuator, the contact switch type is selected.

The potentiometer is a register assembled to the printed circuit board of the mix and mode actuators. It detects the air mix door position specified by rotation of the output axis as a ratio of the variable terminal (VM) voltage against the reference voltage (VDD: 5V), then signals the value to the automatic heater/air conditioner control unit.

C01RX016

Movement of Mix Actuator

Position of the air mix door is determined by the controller on the automatic heater/air conditioner control unit.

As the heat or cool side of the controller is grounded, the transistor on the driver is activated and, thus, the motor rotation is turned on. The sliding contact connected to the motor sends the position detection signal from the potentiometer to the automatic heater/air conditioner control unit. As the set temperature and interior temperature are balanced, the controller returns to the neutral and the motor rotation is stopped.

C-45		Rotation direction	Remarks
(+) side	(-) side		
8	6	Clockwise	Full heat side
6	8	Counter clockwise	Full cool side

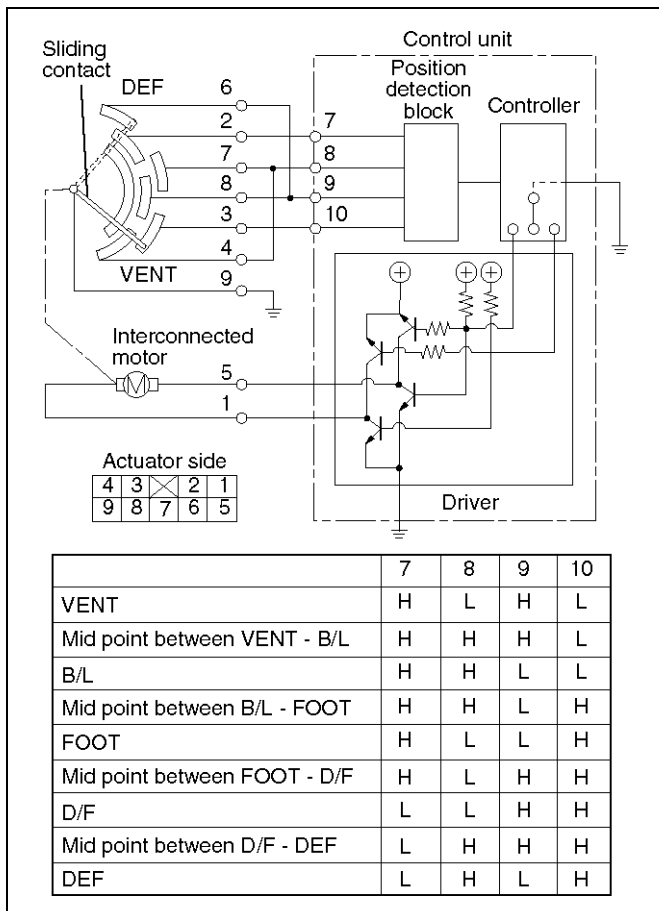

C01RX005

Movement of Mode Actuator

As target position of the mode door is decided on the controller of the control unit, the control unit reads the position detection signal from the actuator to select the clockwise or counter clockwise motor rotation direction. Grounding the controller VENT or DEF side after the direction selection activates the transistor on the driver, thus turning on the motor rotation. Accompanying the motor rotation, the sliding contact rotates, too. When the target position is reached, the controller on the control unit returns to the neutral and the motor stops.

Conduction pin		Rotation direction	Remarks
(+) side	(-) side		
5	1	Clockwise	VENT to DEF direction
1	5	Counter clockwise	DEF to VENT direction

Movement of Intake Actuator

The controller on the automatic heater/air conditioner control unit selects an intake mode to be used. As the Terminal No.5 B-26 is grounded via the sliding contact on the terminal plate, the transistor on the driver is activated, thus turning on the motor rotation. Then, accompanying move of the motor, the sliding contact rotates until grounding of the Terminal No.5 B-26 is

removed, thus stopping the motor.

Grounding terminal	Rotation direction	Remarks
No.5 B-26	Clockwise	RE-CIRCULATION→MIX→FREESH

Overview of Automatic Control of Automatic Air Conditioner

The automatic heater and air conditioner on this vehicle has the following features:

- Interior temperature control.
- Air flow control.
- Mode (blow port) control.
- Intake (switching between fresh air and interior air) control.
- Heater start timing control.
- Cooler start timing control.
- Compressor ON/OFF function according to outside air temperature level.
- Evaporator anti-freeze control.

Interior Temperature Control

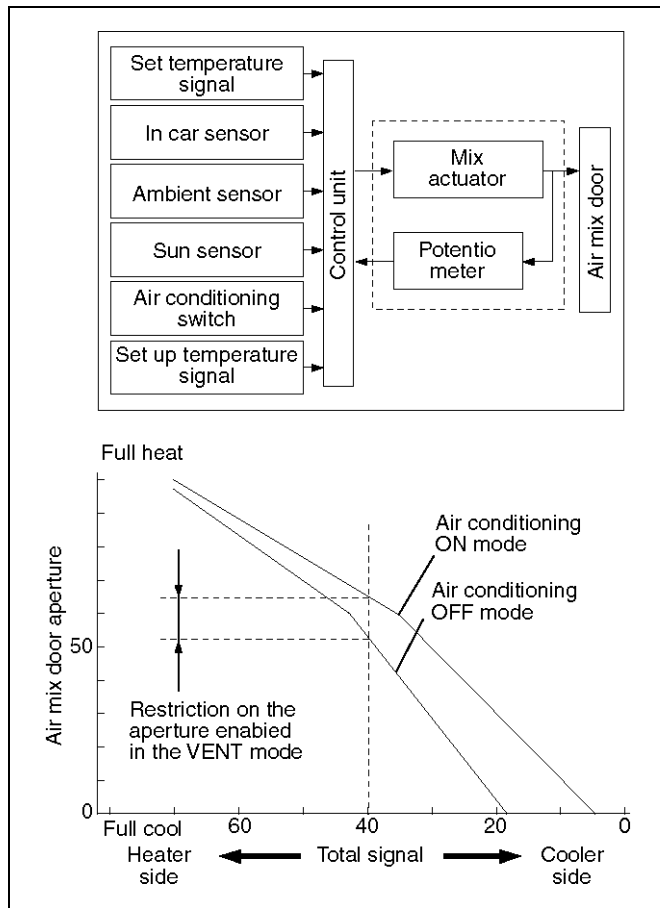

The automatic heater/air conditioner control unit operates on the setup temperature signal from the temperature control switch and other sensor signals to derive the total signal. Then, the control unit compares this signal against the signal from the potentiometer to determine rotation direction of the mix actuator. The mix actuator moves the air mix door to the aperture specified by the total signal so that the specified interior temperature is achieved.

If the compressor is turned off in the A/C (air conditioning) mode, aperture of the air mix door is offset

according to the outside air temperature or the specified interior temperature. This function removes the difference in the blowing temperature in this state and that of when the compressor is turned on.

When FH or FC is selected for the setup temperature, the air mix door is accordingly fixed to the Full Heat or Full Cool mode.

When the VENT mode is selected, aperture of the air mix door is controlled so that excessively heated air may not be blown from the VENT blow port.

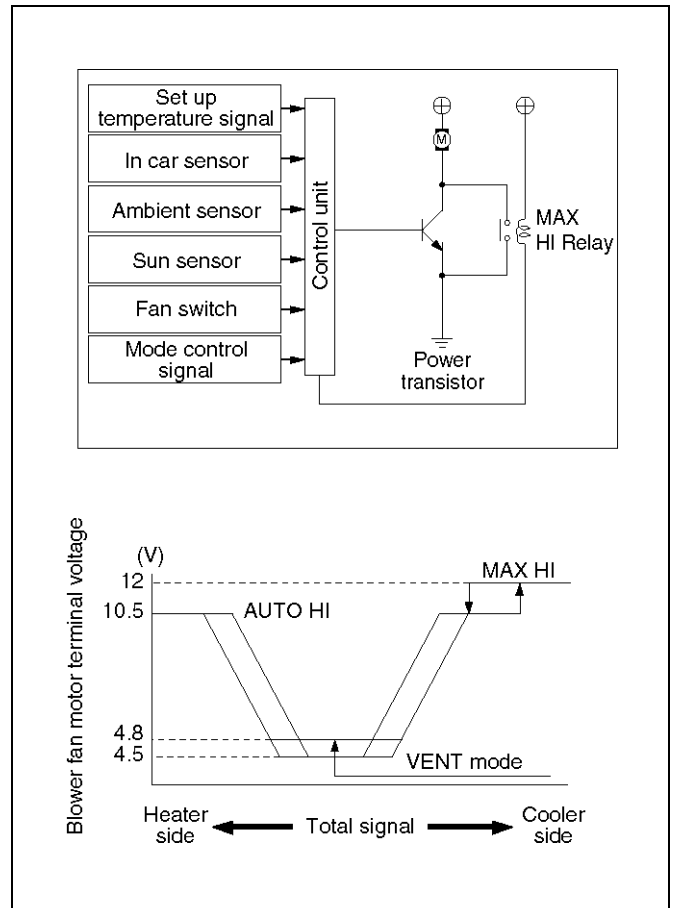

Air Flow Control

In the Auto Mode

- The automatic heater/air conditioner control unit operates on the setup temperature signal and other sensor signals to derive the total signal. Then, the control unit adjusts base potential of the power transistor to match it to the voltage pattern of the target fan so that stage-less fan speed control can be achieved.
- When solar radiation quantity is detected in the VENT or B/L mode, the control unit increases the minimum fan voltage to offset.
- When FH or FC is selected from the temperature control switch, air flow is accordingly fixed to MAX HI or AUTO HI.

In the Manual Mode

- Air flow specified from the fan switch is entered to the automatic heater/air conditioner control unit as the manual signal. The signal modifies the air flow to the level specified from the fan switch so that the required fan voltage is attained.

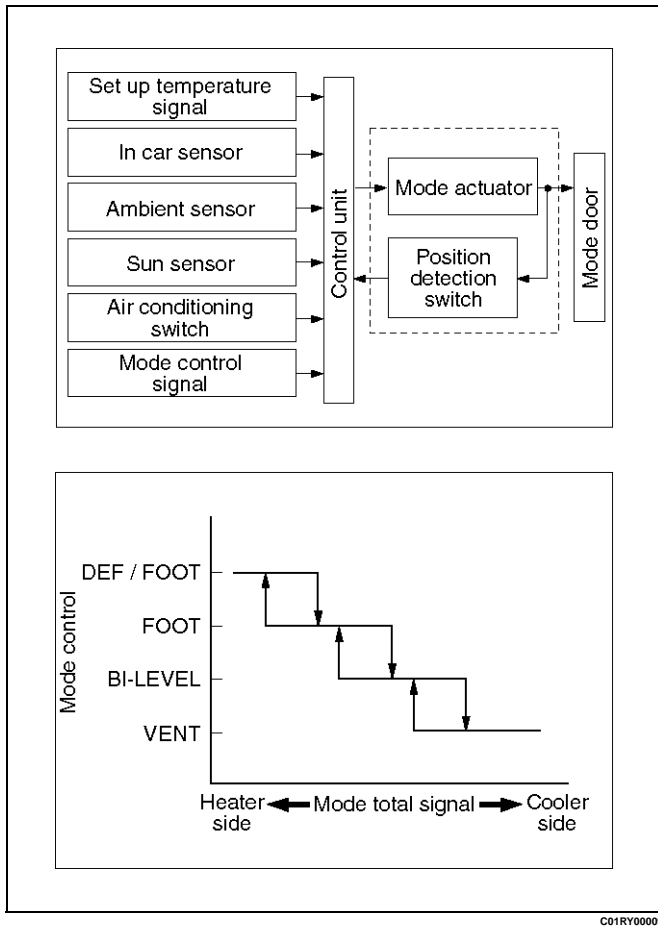

Mode (Blow Port) Control

- The automatic heater/air conditioner control unit operates on the setup temperature from the control switch, and temperature and solar radiation quantify from the sensors to determine the total mode control signal. According to the pattern specified by this signal, the control unit selects either one of the VENT, BI-LEVEL, FOOT or DEF/FOOT mode. The mode actuator determines the rotation direction comparing the target position against the current position being determined by the position detection signal.
- When FH or FC is selected for the temperature from the temperature control switch, mode is accordingly fixed to the VENT or FOOT.
- In the manual operation of the mode switch, you can select a desired blow port mode pressing the corresponding mode switch.

1A-102 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

- Operating the DEF mode switch selects the DEF for the blow port mode.

Intake (Fresh air/interior air switching) Control

In the Full Auto mode, the automatic heater/air conditioner control unit operates on the setup temperature signal and other sensor input signals to derive the total signal. According to the pattern specified by this signal, the control unit provides the intake control.

When the fan is turned off or the A/C (air conditioning) is turned off, the intake is fixed to the FRESH mode.

When FC or FH is selected from the control switch, the intake mode is accordingly fixed to the RECIRC or FRESH.

In the Manual Operation

- Pressing the FRESH (fresh air intake) or the RECIRC (room air circulation) accordingly selects the FRESH or RECIRC mode.

When the DEF Mode Switch is depressed

- The intake mode is fixed to the FRESH. When the MANU REC is selected, however, the mode is fixed the RECIRC.

When the Mode Switch is depressed

- If the automatic intake control is selected, the intake is fixed to the currently selected mode.

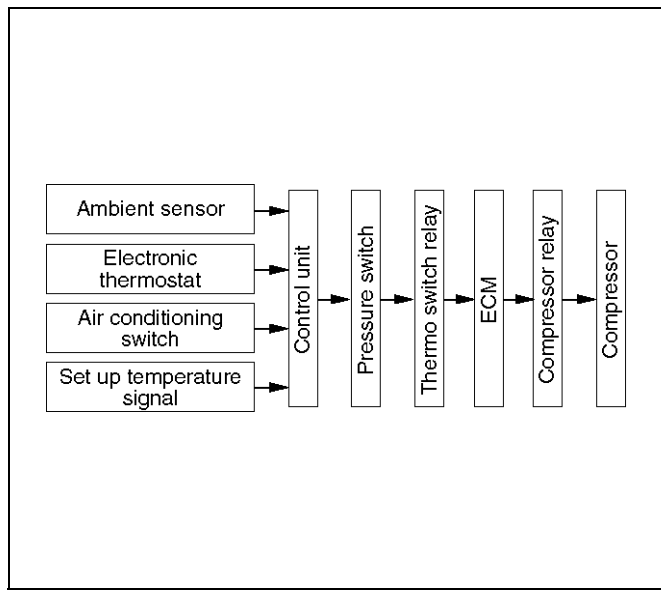

Compressor Control

In the automatic control mode, the automatic heater/air conditioner control unit turns on or off the compressor with the evaporator anti-freeze mechanism using the evaporation sensor. And, when outside air is detected to be low through the outside air temperature sensor signal, the control unit turns off the compressor using the compressor control function.

Manual Control

- In the automatic control mode, pressing the A/C (air conditioning) switch turns off the compressor.

- Pressing the DEF mode switch automatically turns on the compressor.

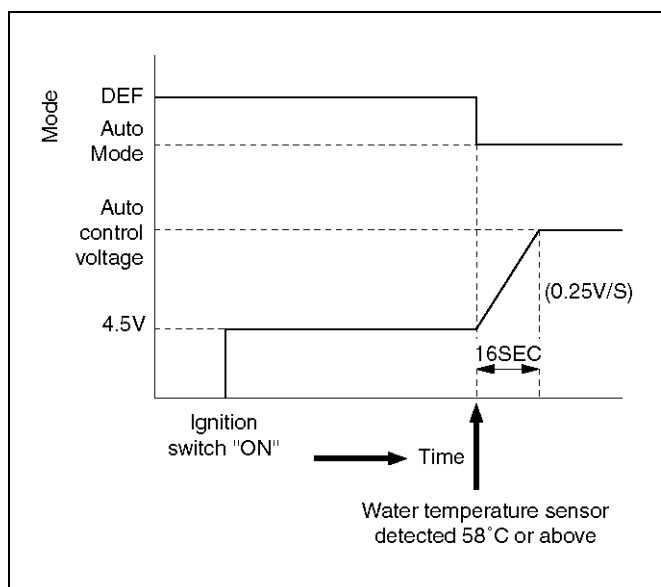

C01RY00010

Heating Start Timing Control

When the automatic heater/air conditioner is started, heating is turned on only when the coolant temperature detected by the coolant temperature sensor is 18°C or less and total signal derived from the sensor signals has detected that the heating condition is met.

If the coolant temperature detected by the sensor is 18°C or less, 4.5V is set for the blower fan motor terminal voltage and the DEF is selected for the blow port mode.

When the temperature detected by the sensor is above 18°C, the blow port mode is switched to the Auto Control and the voltage across the blower fan motor terminal is linearly increased from 4.5V to auto control voltage (auto airflow).

840RX015

Cooling Start Timing Control

When the automatic heater/air conditioner is started, cooling is turned on only when the temperature detected by the interior temperature sensor is 30°C or above and the total signal derived from the sensor signals has detected that the cooling condition is met.

When the cooling condition has been met, the fan voltage across the blower fan motor terminal is set to 4.5V for 7 seconds maximum, then it is linearly increased up to the auto airflow level at the rate of 0.6V/sec.

C06RX003

Troubleshooting

Troubleshooting, Its Overview and Procedures

The automatic heater and air conditioner equips with the "Self-Diagnosis Function" to check its major components.

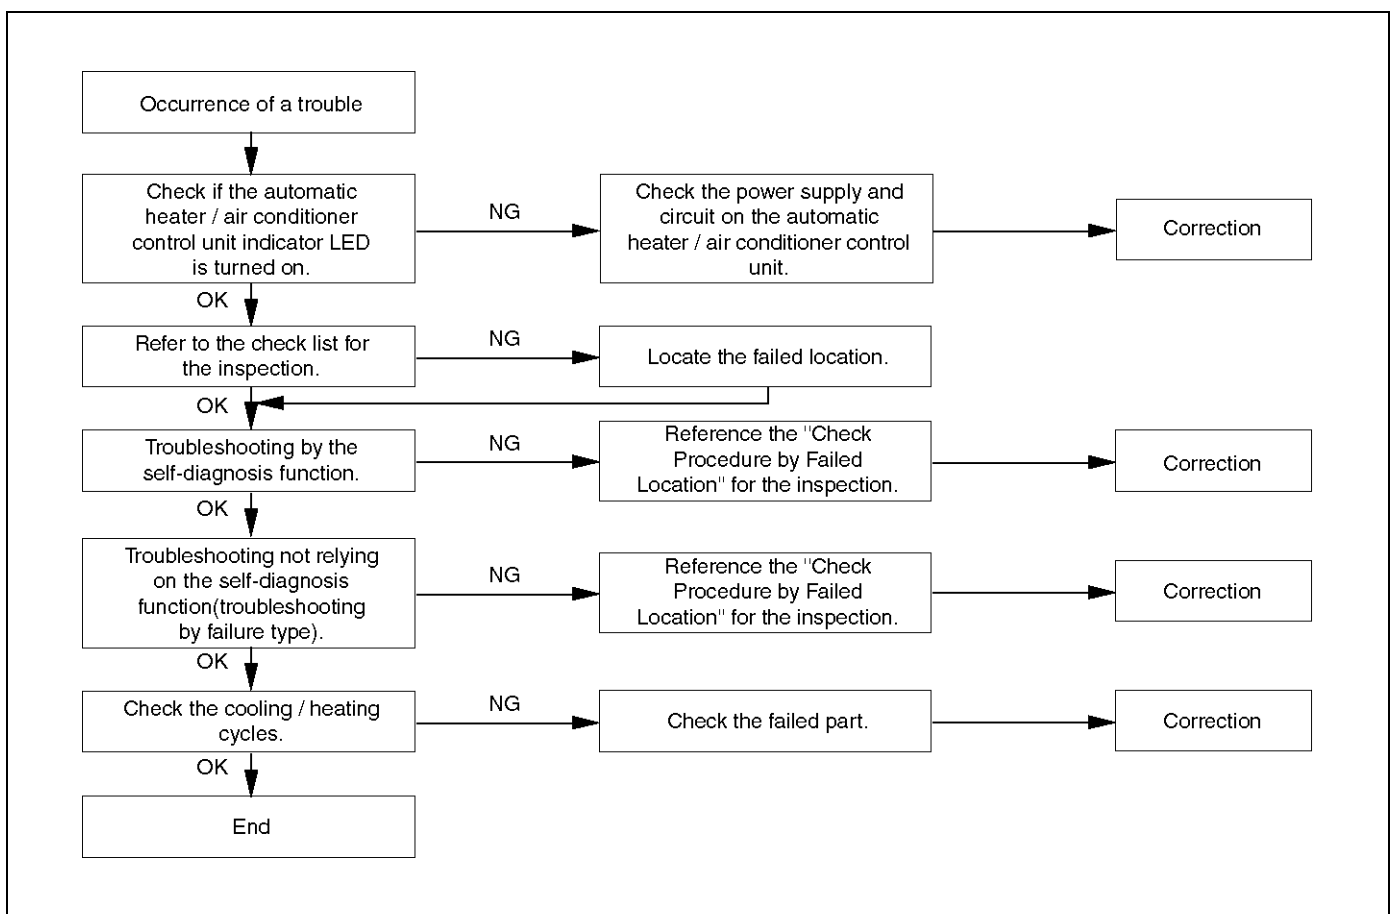

This function makes access to the sensors, actuators and blower fan motor system easier when checking them up and, when a failed part is located, this function restores its original performance.

When implementing the troubleshooting, this self-diagnosis function narrows the range to be

searched at the first step, then check relevant parts one by one according to the "Checking Procedures by Failed Location". As for a location this function is unappreciable, the system accurately determines characteristics of a given trouble and checks relevant parts according to the "Checking Procedures by Failed Location".

The following illustrates basic troubleshooting flow.

Basic Troubleshooting Flow

Auto Air Conditioner Control Unit Power Supply Diagnosis

This check is required because a trouble on the auto amplifier (control unit) power supply circuit or grounding circuit prevents accurate troubleshooting.

D08RX284

Condition	Possible cause	Correction
Power source does not supply to auto air conditioner control unit.	—	Refer to Chart A

1A-106 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

Chart "A": Check of Auto Amplifier Power Supply System

Step	Action	Value(s)	Yes	No
1	Is the fuse C-5 normal?	—	Go to Step 2	Replace the fuse
2	Is the fuse F-5 normal?	—	Go to Step 3	Replace the fuse
3	Disconnect the auto A/C control unit connector I-20. Is the battery voltage applied between the harness side connector terminal No.I20-8 and the ground?	Approx. 12V	Go to Step 5	Go to Step 4
4	Repair an open circuit between the fuse C-5 and terminal No.I20-8. Is the action complete?	—	Go to Step 4	—
5	Is there continuity between the harness side connector terminal No.I20-16 and the ground?	—	Go to Step 7	Go to Step 6
6	Repair an open circuit between terminal No.I20-16 and the ground No.B-8. Is the action complete?	—	Go to Step 5	—
7	Is there continuity between the harness side connector terminal No.I20-9 and the ground?	—	Go to Step 9	Go to Step 8
8	Repair an open circuit between terminal No.I20-9 and the ground No.B-8. Is the action complete?	—	Go to Step 7	—
9	Turn the lighting switch on. Is the battery voltage applied between the harness side connector terminal No.I20-10 and the ground?	Approx. 12V	Go to Step 11	Go to Step 10
10	Repair an open circuit between the lighting switch and terminal No.I20-10. Is the action complete?	—	Go to Step 9	—
11	Turn the starter switch on. Is the battery voltage applied between the harness side connector terminal No.I20-7 and the ground?	Approx. 12V	—	Go to Step 12
12	Repair an open circuit between the fuse F-5 and terminal No.I20-7. Is the action complete?	—	Verify repair	—

Performance and Movement checklist for Automatic Air Conditioner Related Parts

Start the engine, and when the engine coolant reached 50°C check performance and movement of the related parts according the following checklist.

Performance Check Using the Manual Switch

No.	Item	Checking Approach		Acceptance criteria
		Condition	Operation	
1	Blowing temperature (check movement of air mix door)	Auto switch must be turned on (FAN-AUTO MODE-AUTO)	1. Select FC for the setup temperature. 2. Select FH for the setup temperature. → Then, select the MAX Control.	1. Cold air shall be blown out. 2. Hot air shall be blown out.
2	Airflow volume (check movement of the mode door)	Set temperature to 25.0°C.	1. Turn the fan knob off. 2. Turn the fan knob from LOW to HI.	1. The fan shall be stopped, thus stopping air blow, too. 2. Airflow volume shall change from LOW to HI.
3	Blowing temperature (check movement of the mode door)	Set temperature to 25.0°C. Set the fan knob to HI.	Press the mode switch to change the blow port mode sequentially from the VENT through BI-LEVEL, FOOT up to DEF.	LED corresponding to each mode shall be turned on and the blow port mode shall be switched smoothly.
4	The interior/outside air switching mode (check movement of intake door)	Set temperature to 25.0°C.	Turn the LED off using the interior/outside air switch (this introduces the outside air intake mode). Then, the set fan knob to HI and press the interior/outside switch to turn on the LED.	The LED indication shall be switched from OFF to ON accompanying a change in air blowing sound.
5	Compressor	Set the temperature to 18.0°C (FC). (Outside air temperature is 0°C or above and interior temperature at ordinary temperature.)	Press the "OFF" switch. 1. Press the Auto switch. 2. Press the Air Conditioner switch.	1. As the fan knob is set to the Auto position, the A/C switch LED shall come on and the compressor shall be turned on. 2. As the A/C LED comes off, the compressor shall be turned off.

1A-108 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

Check of Auto Function

No.	Item	Checking Approach		Acceptance criteria
		Condition	Operation	
1	Auto function	FAN KNOB "AUTO" MODE SW "AUTO"	Select FC for the temperature.	The LED shall come on. Cold air shall be blown out. The following LEDs shall come on: <ul style="list-style-type: none"> • Blow port mode:  • Intake mode • Fan speed: MAX Hi • A/C
			Change the temperature gradually starting with 18°C up to 32°C.	The following phenomena shall be recognized. <ul style="list-style-type: none"> • Temperature of blown air: Cold air is changed to hot air. • Change in the air flow volume. • The blow port mode LED indication changes in the following sequence: <div style="text-align: center;">  (VENT) (BI-LEVEL) (FOOT) </div>
			Select FH for the temperature.	Cold air shall be blown out. The following LEDs shall come on. <ul style="list-style-type: none"> • Blow port mode: • Fan speed: Max. 

Troubleshooting With Self-Diagnosis Function

Overview of Self-Diagnosis Function

The self-diagnosis is implemented in 3 steps for each target. For detail of check procedure contained in each step, refer to the relevant section of "Check Procedure by Failed Location" listed in the Self-Diagnosis Operation Procedure.

For turning on the self-diagnosis function and switching of the check step, refer to the flow chart given below. You can reset the self-diagnosis function by turning the ignition switch off or turning the DEF switch on for 5 seconds.

Self-Diagnosis Operation Procedure

Step	Action	Value(s)	Yes	No
1	1. Set the IG to the OFF position. 2. Apply 60W bulb light to the solar radiation sensor. 3. Set the temperature setting lever on the automatic heater/air conditioner panel to the center position (25°C). 4. Set the fan switch on the same panel to the Auto position. Is the action complete?	—	Go to Step 2	—
2	While holding both the Auto switch and the DEF switch on the automatic heater/air conditioner panel, turn the IG off and then on. Is the current trouble diagnosing function turned on approximately in 10 seconds?	—	Go to Step 3	—
3	Does the A/C LED flash every 0.5 second interval?	—	Go to Step 4	Refer to *1.
4	Press the A/C switch once. Does the A/C LED flash every 0.5 second interval?	—	Go to Step 5	Refer to *2.
5	Refer to *3 chart "Check of Output Equipment". Does each output equipment function normally according to operation of the temperature setting level?	—	Go to Step 6	Repair or replace the output equipment or repair the harness
6	Press the DEF switch for 5 seconds consecutively or turn on and off the IG. Is the action complete?	—	Go to Step 1	—

***1 Displaying the Current Trouble Diagnosing Table**

Start the engine while holding down both the Auto switch and the DEF switch on the control panel, and the table will appear in approximately 10 seconds to the indicator lamp (LED) of the air conditioning switch. Result of the diagnosis along the following 9 items will be shown one by one in 0.5 second interval irrespective of presence or absence of a trouble for a given item.

When the display 9 items is completed, it is repeated with 3 seconds of interval in between. A failed item is indicated by flashing of the LED that is repeated 3 times within 0.5 seconds. If a trouble is indicated, you can locate the failed section by knowing when in the total sequence it has been displayed.

F01RX010

Item for Current Trouble Diagnosis

Display pattern	Failed part
	Normal pattern
	In car sensor
	Ambient sensor
	Sun sensor (Note 1)
	Duct sensor
	Temperature control lever (Note 2)
	Fan switch (Note 3)
	Mix actuator
	Mode (blow port) control
	Intake (fresh air/interior air switching) control

F01RY0008

As shown above, display of result along nine items is repeated with 3-second interval in between.

Note 1: When checking the solar radiation sensor, apply sufficient light using a 60W bulb. Otherwise, it can be diagnosed as failed.

Note 2: If the temperature setting lever is set on both

ends (one set to 18°C, blue scale = Full cool and the other to 31°C, red scale = Full hot), they can be diagnosed as failed.

Note 3: Likewise, the fan switch can be diagnosed as failed if set on both ends.

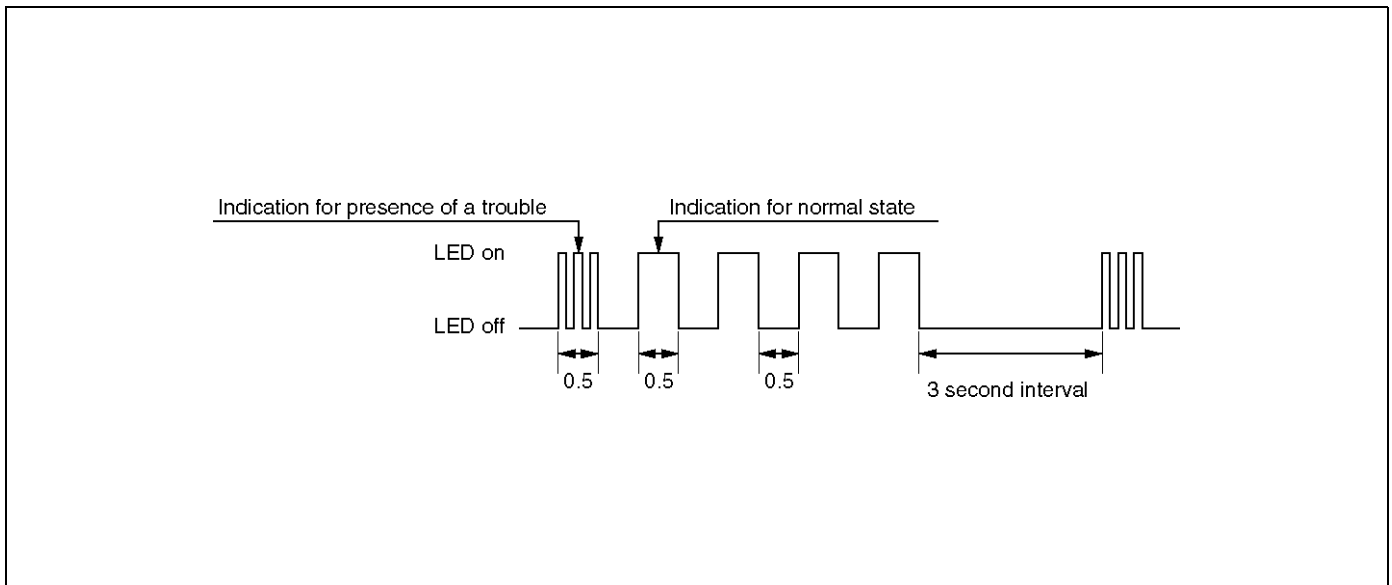

***2Displaying the Past Trouble Diagnosing Table**

The past trouble diagnosis displays only the items on which trouble has recurred 16 times in the past.

If you press the air conditioning switch once while the current trouble diagnosis is taking place, display of the past trouble diagnosis will appear on the indicator lamp (LED) of the air conditioning switch.

Results of the diagnosis along the following five items

are displayed one by one in 0.5 second interval irrespective of presence or absence of a trouble. A failed item is indicated by flashing of the LED that is repeated 3 times within 0.5 seconds. You can locate the failed section by counting in what sequence it has been displayed.

F01RX011

Display pattern	Failed part
<p>ON</p> <p>OFF</p>	Normal pattern
	In car sensor
	Ambient sensor
	Sun sensor
	Duct sensor
	Mix actuator

*3 Check of Output Equipment

Inspection By Failed Location

Inspection of the Sensors

When the self-diagnosis function has determined that trouble is present on the sensors, check them according to the following flow chart.

Sensors	Allowable range	Check method
In car sensor	Refer to the sensor resistance curve.	Chart 1
Ambient sensor	Refer to the sensor resistance curve.	Chart 2
Sun sensor	100 ohms maximum in forward and 0.02 mA minimum when exposed to 60W incandescent lamp.	Chart 3

1A-114 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

Chart 1: In Car Sensor

D08RY00888

Step	Action	Value(s)	Yes	No
1	Disconnect the in car sensor connector. (No.I-4) Is performance of the sensor normal? (Refer to the later section on "Individual Inspection")	—	Go to Step 2	Replace the in car sensor
2	Is there continuity between the harness side connector No.I44-1 and No.I4-3?	—	Go to Step 4	Go to Step 3
3	Repair an open circuit between terminal No.44-1 and No.I4-3. Is the action complete?	—	Go to Step 2	—
4	Is there continuity between the harness side connector No.I44-11 and No.I4-4?	—	Go to Step 6	Go to Step 5
5	Repair an open circuit between terminal No.I44-11 and No.I4-4. Is the action complete?	—	Verify repair	—
6	Replace the auto air conditioner control unit. Is the action complete?	—	Verify repair	—

Chart 2: Ambient Sensor

D08RY0086

Step	Action	Value(s)	Yes	No
1	Disconnect ambient sensor connector. (No.C-8) Is performance of the ambient sensor normal? (Refer to the later section on "Individual inspection")	—	Go to Step 2	Replace the ambient sensor
2	Connect the ambient sensor connector. Is resistance between the harness side connector No.I44-2 and No.I44-11 normal?	Refer to the later section on "Individual inspection"	Go to Step 4	Go to Step 3
3	Repair an open circuit between terminal No.I44-2 and No.C8-1 or No.I44-11 and No.C8-2. Is the action complete?	—	Verify repair	—
4	Replace the auto air conditioner control unit. Is the action complete?	—	Verify repair	—

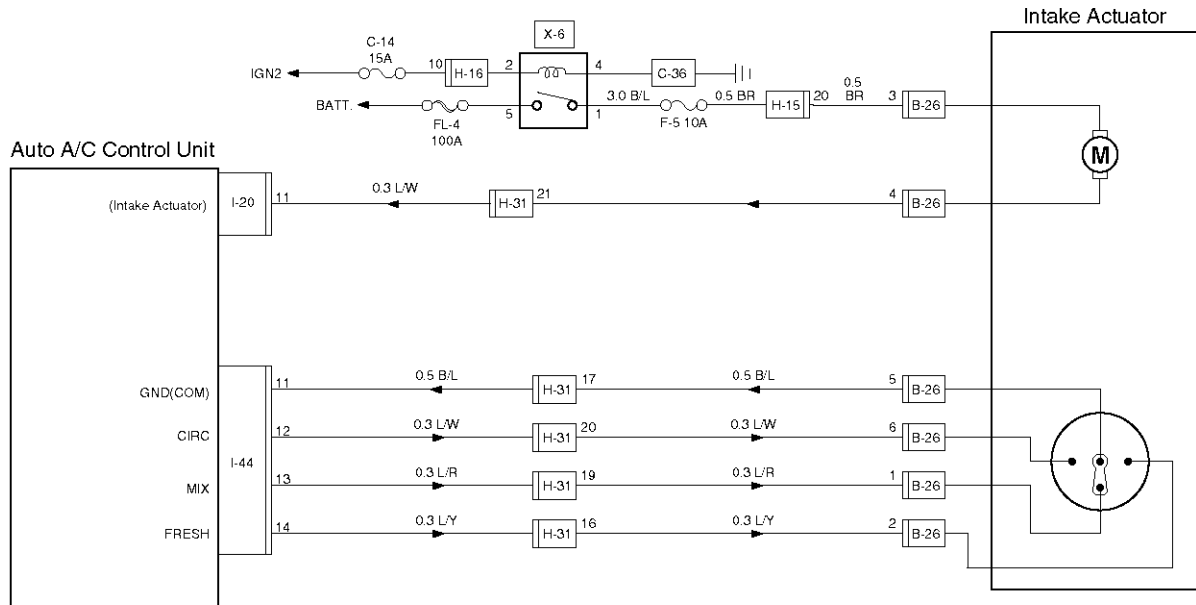

Chart 3: Sun Sensor

D08RY00887

Step	Action	Value(s)	Yes	No
1	Disconnect the sun sensor connector. (No.I-50) Is performance of the sun sensor normal? (Refer to the later section on individual inspection)	—	Go to Step 2	Replace the sun sensor.
2	Is there continuity between the harness side connector terminal No.I44-3 and No.I50-2?	—	Go to Step 4	Go to Step 4
3	Repair an open circuit between terminal No.I44-3 and No.50-2. Is the action complete?	—	Go to Step 2	—
4	Is there continuity between the harness side connector terminal No.I44-11 and No.I50-1?	—	Go to Step 6	Go to Step 5
5	Repair an open circuit between terminal No.I44-11 and I50-1. Is the action complete?	—	Go to Step 4	—
6	Replace the auto air conditioner control unit. Is the action complete?	—	Verify repair	—

13	Replace the auto air conditioner control unit. Is the action complete?	—	Verify repair	—

Inspection of the Fan Motor System

Condition	Possible cause	Correction
The fan dose not rotate at all	—	Refer to Chart A
The fan dose not rotate in the MAX-HI mode	—	Refer to Chart B
The fan dose not rotate in any mode other than MAX-HI	—	Refer to Chart C
The fan dose not stop	—	Refer to Chart D

Chart A: Fan Does Not Rotate At All

Step	Action	Value(s)	Yes	No
1	Are the fuse No.F-4 and No.F-5 normal?	—	Go to Step 2	Replace the fuse
2	Are the relay No.X-6 and No.B-25 normal?	—	Go to Step 3	Replace the relay
3	Turn on the ignition switch (the engine is run). Is the battery voltage applied between the harness side connector terminal No.B5-2 and ground?	—	Go to Step 5	Go to Step 4
4	Repair an open circuit between terminal No.B5-2 and No.F-4 fuse. Is the action complete?	—	Go to Step 3	—
5	Is there continuity between the harness side connector terminal No.B5-1 and ground (No.B-8)?	—	Go to Step 7	Go to Step 6
6	Repair an open circuit between terminal No.B5-1 and ground. Is the action complete?	—		
7	Is the battery voltage applied between the harness side connector terminal No.B5-1 and No.B5-2?	—	Go to Step 8	Go to Step 9
8	Replace the blower motor. Is the action complete?	—	Verify repair	—
9	Refer to chart B and C. Is the action complete?	—	Verify repair	—

1A-128 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

Chart B: Fan Does Not Rotate in MAX HI Mode

Step	Action	Value(s)	Yes	No
1	Is the MAX-HI relay (B-25) normal?	—	Go to Step 2	Replace the relay
2	1. Turn on the ignition switch (the engine is run). 2. Set the fan switch to the MAX-HI. Is there continuity between the harness side connector terminal No.B5-1 and No.B25-2?	—	Go to Step 4	Go to Step 3
3	Repair an open circuit between terminal No.B5-1 and No.B25-2. Is the action complete?	—	Go to Step 3	—
4	Is there continuity between the harness side connector terminal No.B25-4 and ground (No.B-8)?	—	Go to Step 6	Go to Step 5
5	Repair an open circuit between terminal No.B25-4 and ground (No.B-8). Is the action complete?	—	Go to Step 4	—
6	Is the battery voltage applied between the harness side connector terminal No.B25-1 and ground?	—	Go to Step 8	Go to Step 7
7	Repair an open circuit between terminal No.B25-1 and No.F-5 fuse. Is the action complete?	—	Go to Step 6	—
8	Is the battery voltage applied between the harness side connector terminal No.I20-12 and ground?	—	Go to Step 10	Go to Step 9
9	Repair an open circuit between terminal No.B25-3 and No.I20-12. Is the action complete?	—	Verify repair	—
10	Replace the auto air conditioner control unit. Is the action complete?	—	Verify repair	—

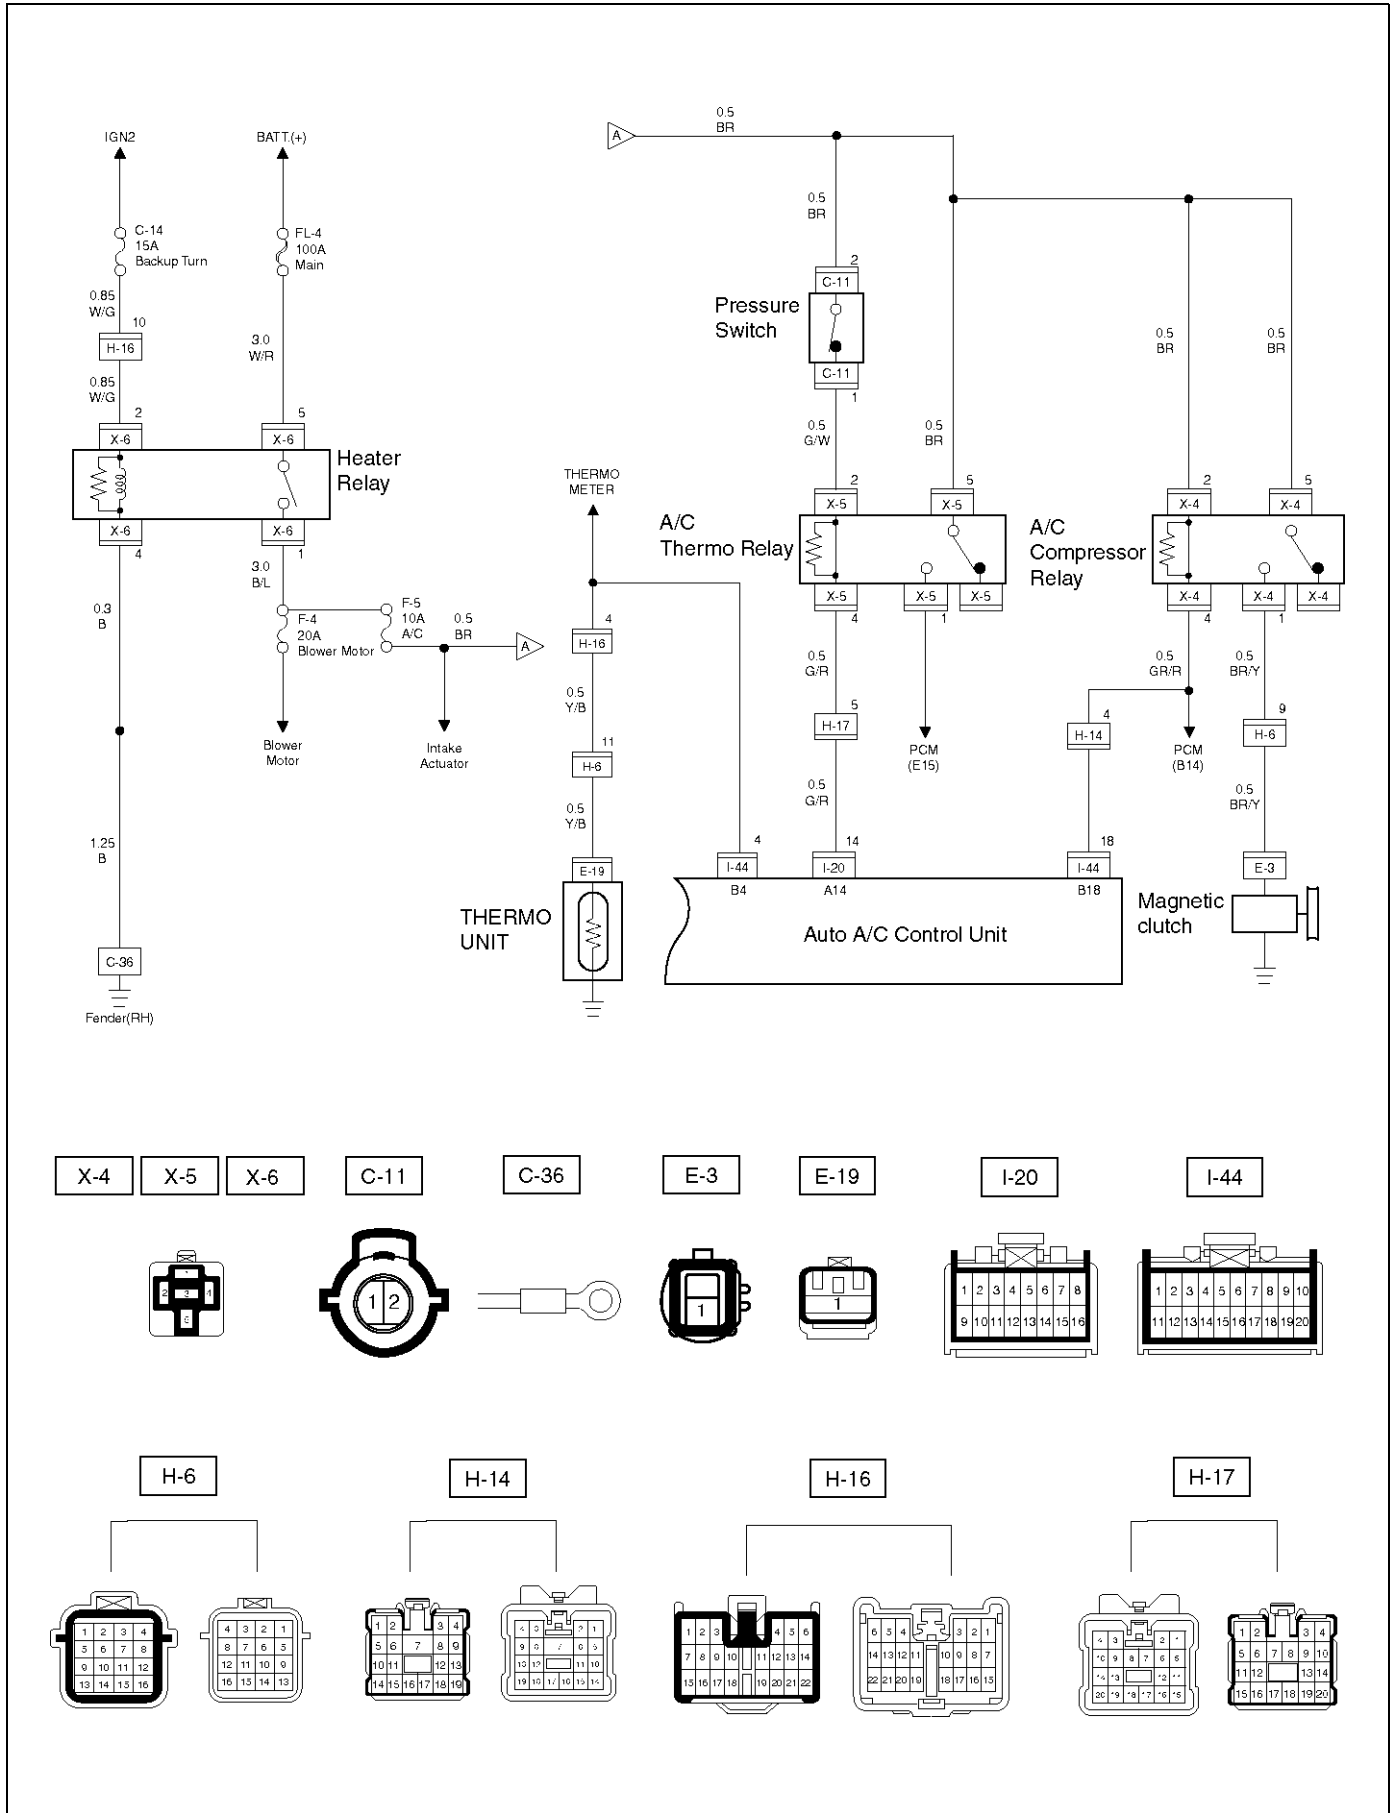

Chart C: Fan Does Not Rotate In Any Mode Other Than MAX HI

Step	Action	Value(s)	Yes	No
1	Is the power transistor performance normal? (Refer to the later section on "individual inspection")	—	Go to Step 2	Replace the power transistor
2	Is there continuity between the harness side connector terminal No.B5-1 and No.B35-1, No.B5-1 and No.I44-17?	—	Go to Step 4	Go to Step 3
3	Repair an open circuit between terminal. No.B5-1 and B35-1 No.B5-1 and I44-17	—	Go to Step 2	—
4	Is there continuity between the harness side connector terminal No.B35-3 and ground (No.B-8)?	—	Go to Step 6	Go to Step 5
5	Repair an open circuit between terminal No.B35-3 and ground. Is the action complete?	—	Go to Step 4	—
6	Is there continuity between the harness side connector terminal No.B35-2 and No.I44-19?	—	Go to Step 8	Go to Step 7
7	Repair an open circuit between terminal No.B35-2 and No.I44-19. Is the action complete?	—	Go to Step 6	—
8	Replace the auto air conditioner control unit. Is the action complete?	—	Verify repair	—

Chart D: Fan Does Not Stop

Step	Action	Value(s)	Yes	No
1	1. Disconnect the max high relay, the power transistor connector B-35 and the auto A/C control unit connector I-44. 2. Turn on the ignition switch. Does the blower motor stop?	—	Go to Step 3	Go to Step 2
2	Repair a short circuit between connector No.B5-1 and No.B25-2, No.B5-1 and No.B35-1, or No.B5-1 and I44-17. Is the action complete?	—	Verify repair	—
3	Is the max high relay normal? (Refer to the later section on "individual inspection".)	—	Go to Step 4	Replace the relay
4	Reinstall the max high relay. Does the blower motor start operating?	—	Go to Step 6	Go to Step 5
5	Repair a short circuit between connector No.B25-3 and No.I20-12. Is the action complete?	—	Go to Step 4	—
6	Is the power transistor normal? (Refer to the later section on "individual inspection".)	—	Go to Step 7	Replace the power transistor
7	Reinstall the power transistor. Does the blower motor start operating?	—	Replace the auto A/C control unit	—

Inspection of the Magnetic Clutch System
6VD1 Engine

Condition	Possible cause	Correction
Magnetic clutch does not work	—	Refer to Chart A

Chart A: Magnetic Clutch Does Not work

Step	Action	Value(s)	Yes	No
1	Is the fuse No.F-5 normal?	—	Go to Step 2	Replace the fuse
2	Is the relay No.X-4 (compressor relay) No.X-5 (A/C thermo relay) and No.X-6 (heater relay) normal?	—	Go to Step 3	Replace the fuse
3	Is the thermo unit normal?	—	Go to Step 4	Replace the thermo unit
4	Is the pressure switch normal?	—	Go to Step 5	Replace the pressure switch
5	1. Turn the ignition switch on. (the engine is run.) 2. Push the air conditioner switch on. Is the battery voltage applied between the harness side connector terminal No.E3-1 and the ground?	—	Go to Step 6	Go to Step 7
6	Repair or replace the magnetic clutch. Is the action complete?	—	Verify repair	—
7	Is there continuity between the harness side connector terminal No.X4-1 and No.E3-1?	—	Go to Step 9	Go to Step 8
8	Repair an open circuit between terminal No.X4-1 and No.E3-1. Is the action complete?	—	Go to Step 7	—
9	Is the battery voltage applied between the harness side connector terminal No.X4-5 and ground, No.X4-2 and ground?	—	Go to Step 11	Go to Step 10
10	Repair an open circuit between terminal No.X4-5 and fuse No.F-5, No.X4-2 and fuse No.F-5. Is the action complete?	—	Go to Step 9	—
11	Is the battery voltage applied between the harness side connector terminal No.I44-18 and ground?	—	Go to Step 13	Go to Step 12
12	Repair an open circuit between terminal No.I44-18 and No.X4-4. Is the action complete?	—	Go to Step 11	—
13	Is the battery voltage applied between the harness side connector terminal No.C11-2 and ground?	—	Go to Step 15	Go to Step 14
14	Repair an open circuit between terminal No.C11-2 and fuse No.F-5. Is the action complete?	—	Go to Step 13	—
15	Is the battery voltage applied between the harness side connector terminal No.X5-2 and ground, No.X5-5 and ground?	—	Go to Step 17	Go to Step 16
16	Repair an open circuit between terminal No.X5-2 and No.C11-1, No.X5-5 and fuse No.F-5. Is the action complete?	—	Go to Step 15	—
17	Is the battery voltage applied between the harness side connector terminal No.I20-14 and ground?	—	Go to Step 19	Go to Step 18
18	Repair an open circuit between terminal No.X5-4 and I20-14. Is the action complete?	—	Go to Step 17	—

1A-132 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

Chart A: Magnetic Clutch Does Not work (Cont'd)

Step	Action	Value(s)	Yes	No
19	Is there continuity between the harness side connector terminal No.I44-4 and ground?	—	Go to Step 21	Go to Step 20
20	Repair an open circuit between terminal No.I44-4 and No.E19-1. Is the action complete?	—	Go to Step 20	—
21	Dose the thermo relay "ON" when connecting ground to the harness connector terminal No.H17-5?	—	Go to Step 23	Go to Step 22
22	Failure on the auto air conditioner control unit. Is the action complete?	—	Verify repair	—

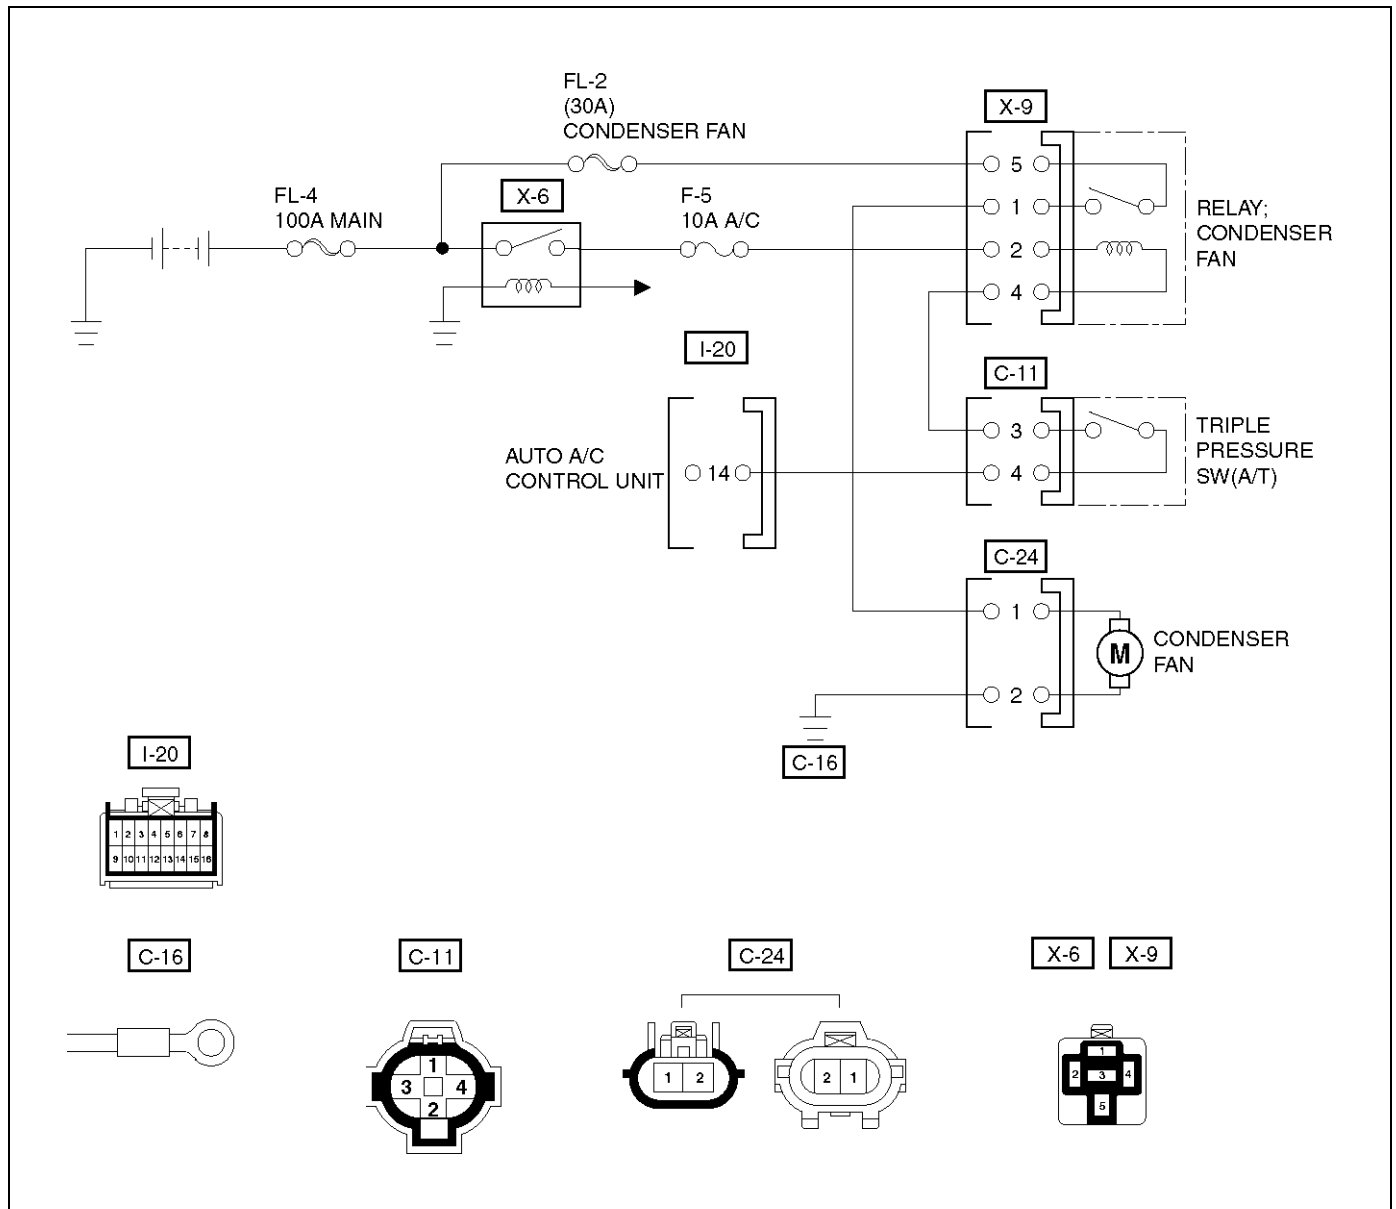

CAUTION: There are conditions which air conditioner system dose not operate except trouble as follows.

1. The throttle is griater than 90%.
2. The ignition voltage is below 10.5 volts.
3. The engine speed greater than 4500 RPM for 5 seconds or 5400 RPM.
4. The engine coolant temperature (ECT) is greater than 125°C (257°F).
5. The intake air temperature (IAT) is less than 5°C (41°F).
6. The power steering pressure switch signals a high pressure condition.

Condenser Fan Diagnosis

While the air conditioning is ON, the cycling switch in the triple pressure switch senses the refrigerant pressure, and activates the condenser fan to improve the cooling capacity of the condenser when the refrigerant pressure exceeds a set pressure value. The

condenser fan stops when the air conditioning is turned "OFF" or when the pressure goes down below the set pressure value.

D08RX255

Condition	Possible cause	Correction
Condenser fan does not run.	—	Refer to Chart A
Condenser fan does not stop.	—	Refer to Chart B

1A-134 HEATING, VENTILATION AND AIR CONDITIONING (HVAC)
Chart "A" Condenser Fan Does Not Run

Step	Action	Value(s)	Yes	No
1	Is the fusible link No.FL-2 normal?	—	Go to Step 2	Replace the fusible link wire
2	Is the fuse No.F-5 normal?	—	Go to Step 3	Replace the fuse
3	Is the heater relay (No.X-6) and condenser fan relay (No.X-9) normal?	—	Go to Step 4	Replace the relay
4	1. Disconnect the condenser fan motor connector No.C-24. 2. Connect the motor side connector terminal No.C24-1 to the battery positive terminal and No.C24-2 to the battery negative terminal. Dose the fan operate?	—	Go to Step 6	Go to Step 5
5	Repair or replace the condenser fan motor. Is the action complete?	—	Go to Step 4	—
6	Is there continuity between the harness side connector terminal No.C24-2 and ground (C-16)?	—	Go to Step 8	Go to Step 7
7	Repair an open circuit between terminal No.C24-2 and No.C-16. Is the action complete?	—	Go to Step 6	—

17	Replace the triple pressure switch. Is the action complete?	—	Verify repair	—
18	Replace the auto air conditioner control unit. Is the action complete?	—	Verify repair	—

Chart "B" Condenser Fan Does Not Stop

Step	Action	Value(s)	Yes	No
1	1. Turn on the ignition switch "ON" (the engine is run). 2. Air conditioning switch "OFF". 3. Disconnect the triple pressure switch. Does the condenser fan stop?	—	Go to Step 2	Go to Step 3
2	Replace the triple pressure switch. Is the action complete?	—	Verify repair	—
3	Disconnect the relay. Is there continuity between the harness side connector terminal No.X9-4 and ground?	—	Go to Step 4	Go to Step 5
4	Repair short circuit between terminal No.X9-4 and No.C11-3. Is the action complete?	—	Verify repair	—
5	Replace the relay condenser fan. Is the action complete?	—	Verify repair	—

Individual Inspection

In Car Sensor

1. Disconnect the in car sensor connector (I-4).
2. Measure resistance between the in car sensor side terminal No.14-3 and No.14-4.

865RX007

Sun Sensor

1. Disconnect the sun sensor connector (I-50).
2. Measure the current value on the sun sensor when placed it approximately 15 cm away from 60W incandescent lamp.

C01RX013

Ambient Sensor

1. Disconnect the connector (C-8) on the ambient sensor.
2. Measure resistance between the ambient sensor side terminals.

C01RX012

Power Transistor

1. Remove the power transistor connector (B-35) from the evaporator assembly.
2. Check the conduction between the power transistor side terminals.

Terminal No.	1	2	3	Conduction
Testing rod	-	+		Conducted (50Ω maximum)
	-		+	Conducted (100Ω maximum)
	+	-		Not conducted
	+		-	Conducted (220Ω maximum)
	-	+		Not conducted
		-	+	

C01RX015

MAX HI Relay

1. Remove the MAX – HI relay connector (B-25) from the blower assembly.
2. Check the conduction between the MAX – HI relay side terminals.

No conduction between terminals (2) and (4).

No.2 and No.4 are conducted when battery voltage is applied between (2) and (3).

C01RX014

In Car Sensor

1. Turn on the ignition switch (the engine is started). Start the air conditioner in "Full Auto".
2. Make sure that the interior sensor suctions cigarette smokes and such.

In Car Sensor

1. Dismount the in car sensor from the automatic heater/air conditioner control unit. Connect (+) end and (-) end of the battery to the aspirator motor side terminals No.14-1 and No.14-2, respectively, then check if the motor runs normally.

C01RW020

Heater (X-6), Thermostat (X-5), Condenser Fan (X-9) And Compressor (X-4) Relay

1. Disconnect relays and check for continuity and resistance between relay terminals.
 - For handling of these relays, refer to Heater Relay in this section.

901RX071

Condenser Fan

1. Disconnect the condenser fan connector.
2. Connect the battery positive terminal to the condenser fan side connector terminal No.C24-1 and negative to the No.C24-2.
3. Check that condenser fan is rotating correctly.

875RW010

Triple Pressure Switch (V6, A/T)

1. Disconnect the connector and check for continuity between pressure switch side connector terminals (1) and (2).
2. Reconnect the connector to activate the A/C switch, and check to see if there is continuity between the chassis side connector terminal (3) and (4) and the fan operates.

875RX009

On-Vehicle Service

Power Transistor

Legend

- (1) Power Transistor
- (2) Passenger knee bolster Reinforcement
- (3) Power Transistor Connector
- (4) Glove Box

Removal

1. Remove glove box.
2. Remove passenger knee bolster reinforcement.
3. Disconnect the power transistor connector.
4. Remove power transistor.

Installation

To install, follow the removal step in the reverse order.

Automatic Heater/Air Conditioner Control Unit

Legend

- (1) Connector
- (2) Automatic Air Control Unit
- (3) Meter Cluster Assembly
- (4) Instrument Center Cluster
- (5) Instrument Lower Cover

Removal

1. Disconnect the battery ground cable.
2. Remove instrument lower cover.
3. Remove meter cluster assembly.
 - Refer to Instrument Panel Assembly in Body Structure section.
4. Remove the automatic heater/air conditioner control unit attaching screws.
5. Pull the automatic heater/air conditioner unit out and disconnect the connectors.

Installation

To install, follow the removal step in the reverse order.

In Car Sensor

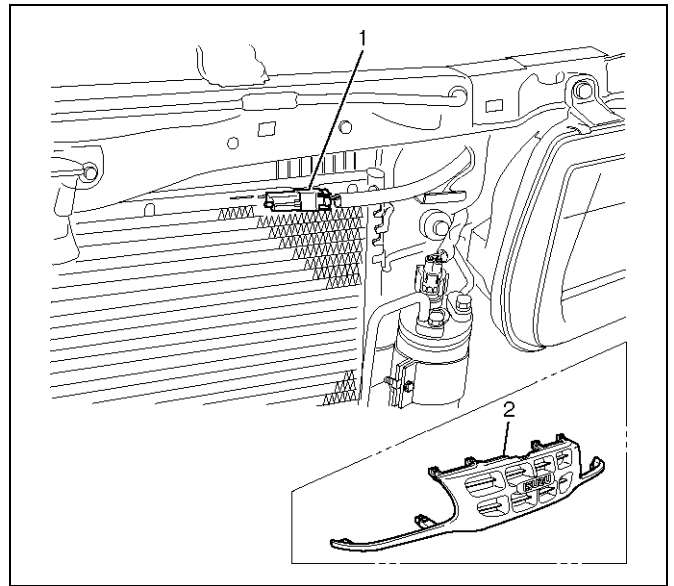

865RW014

Legend

- (1) In Car Sensor
- (2) Automatic Air Control Unit

Ambient Sensor

875RY00022

Legend

- (1) Ambient Sensor
- (2) Radiator Grille

Removal

1. Disconnect the battery ground cable.
2. Remove the automatic heater/air conditioner control unit.
 - Refer to the automatic heater/air conditioner control unit section.
3. Remove in car sensor.

Installation

To install, follow the removal step in the reverse order.

Removal

1. Disconnect the battery ground cable.
2. Remove radiator grille.
 - Refer to Radiator Grille in Body Structure section.
3. Disconnect the ambient sensor connector.
4. Remove the ambient sensor.

Installation

To install, follow the removal step in the reverse order.

Sun Sensor

865RW009

Legend

- (1) Sun Sensor

Removal

1. Disconnect the battery ground cable.
2. Remove the sun sensor.
3. Disconnect the sun sensor connector.

Installation

To install, follow the removal step in the reverse order.

Electronic Thermostat

874RW027

Legend

- (1) Duct Sensor
 (2) Evaporator Assembly
 (3) Thermostat Assembly

Removal

1. Disconnect the battery ground cable.
2. Remove evaporator assembly.
 - Refer to Evaporator Assembly section.
3. Remove electronic thermostat.

Installation

To install, follow the removal step in the reverse order.

Mode Actuator

860RW030

Legend

- (1) A/T Control Unit
- (2) Mode Actuator
- (3) Actuator Rod

Mix Actuator

860RW033

Legend

- (1) Instrument Panel Assembly
- (2) Instrument Panel Center Cluster
- (3) Actuator Rod
- (4) Mix Actuator

Removal

1. Disconnect the battery ground cable.
2. Remove the A/T control unit.
 - The connector shall remain connected.
3. Remove the actuator rod.
4. Remove the mode actuator.

Installation

To install, follow the remove step in the reverse order.

Removal

1. Disconnect the battery ground cable.
2. Remove the instrument panel assembly.
 - Refer to the Instrument Panel Assembly in Body Structure section.
3. Remove the instrument panel center cluster.
4. Remove the actuator rod.
5. Remove the mix actuator.

Installation

To install, follow the remove step in the reverse order.

Intake Actuator

860RX018

Legend

- (1) Evaporator Assembly
- (2) Intake Actuator
- (3) Intake Actuator Connector

Removal

1. Disconnect the battery ground cable.
2. Remove the blower assembly.
 - Refer to Blower Assembly section.
3. Disconnect the intake actuator connector.
4. Remove the intake actuator.

Installation

To install, follow the remove step in the reverse order.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or

fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Diagnosis

Since the problems in steering, suspension, wheels and tires involve several systems, they must all be considered when diagnosing a complaint. To identify the symptom, always road test the vehicle first. Proceed with the following preliminary inspections and correct any defects which are found.

1. Inspect tires for proper pressure and uneven wear.
2. Raise vehicle on a hoist, then inspect front and rear suspension and steering linkage for loose or damaged parts.
3. Spin the front wheels. Inspect for out-of-round tires, out-of-balance tires, loose and/or rough wheel bearings.

General Diagnosis

Condition	Possible cause	Correction
Vehicle Pulls	Mismatched or uneven tires.	Replace tire.
	Tires not adequately inflated.	Adjust tire pressure.
	Broken or sagging springs.	Replace spring.
	Radial tire lateral force.	Replace tire.
	Improper wheel alignment.	Adjust wheel alignment.
	Brake dragging in one wheel.	Repair brake.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension part(s).
	Faulty shock absorbers.	Replace shock absorber.
	Parts in power steering valve defective.	Replace power steering unit.
Abnormal or Excessive Tire Wear	Sagging or broken spring.	Replace spring.
	Tire out of balance.	Balance or replace tire.
	Improper wheel alignment.	Check front end alignment.
	Faulty shock absorber.	Replace shock absorber.
	Hard driving.	Replace tire.
	Overloaded vehicle.	Replace tire and reduce load.
	Tires not rotated periodically.	Replace or rotate tire.
	Worn or loose road wheel bearings.	Replace wheel bearing.
	Wobbly wheel or tires.	Replace wheel or tire.
	Tires not adequately inflated.	Adjust the pressure.
Wheel Hop	Blister or bump on tire.	Replace tire.
	Improper shock absorber operation.	Replace shock absorber.

Condition	Possible cause	Correction
Shimmy, Shake or Vibration	Tire or wheel out of balance.	Balance wheels or replace tire/or wheel.
	Loose wheel bearings.	Replace wheel bearing.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
	Excessive wheel run-out.	Repair or replace wheel and/or tire.
	Blister or bump on tire.	Replace tire.
	Excessive loaded radial run-out of tire/wheel assembly.	Replace tire or wheel.
	Improper wheel alignment.	Check wheel alignment.
	Loose or worn steering linkage.	Tighten or replace steering linkage.
	Loose steering unit.	Tighten steering unit.
	Tires not adequately inflated.	Adjust tire pressure.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension parts.
	Faulty shock absorber.	Replace shock absorber.
	Hub bearing preload misadjustment.	Adjust preload.
Parts in power steering valve defective.	Replace power steering unit.	
Hard Steering	Bind in steering linkage ball studs, upper or lower end ball joint.	Replace ball joint.
	Improper wheel alignment.	Check wheel alignment.
	Tire not adequately inflated.	Inflate tires to proper pressure.
	Bind in steering column or shaft.	Repair or replace.
	Improper power steering system operation.	Repair or replace. Refer to "Power steering system diagnosis"
Too Much Play In Steering	Wheel bearings worn.	Replace wheel bearings.
	Loose steering unit or linkage.	Retighten or repair.
	Worn or loose steering shaft universal joint.	Retighten or replace steering shaft.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
Poor Steering Wheel Returnability	Bind in steering linkage ball joints.	Replace ball joints.
	Bind in upper or lower end ball joints.	Replace ball joints.
	Bind in steering column and shaft.	Repair or replace.
	Bind in steering gear.	Check and repair steering gear.
	Improper wheel alignment.	Adjust wheel alignment.
	Tires not adequately inflated.	Adjust tire pressure.
	Loose steering wheel nut.	Retighten.
Worn wheel bearing.	Replace.	

2A-4 POWER-ASSISTED STEERING SYSTEM

Condition	Possible cause	Correction
Abnormal Noise	Worn, sticky or loose upper or lower ball joint, steering linkage ball joints or drive axle joints.	Replace.
	Faulty shock absorbers.	Replace.
	Worn upper or lower control arm bushing.	Replace.
	Loose stabilizer bar.	Retighten bolts or replace bushings.
	Loose wheel nuts.	Tighten nuts. Check for elongated wheel nut holes. Replace wheel if required.
	Loose suspension bolts or nuts.	Retighten suspension bolts or nuts.
	Broken or otherwise damaged wheel bearings.	Replace wheel bearing.
	Broken suspension springs.	Replace spring.
	Loose steering unit.	Retighten mounting bolt.
	Faulty steering unit.	Replace steering unit.
Wandering or Poor Steering Stability	Mismatched or unevenly worn tires.	Replace tire or inflate tires to proper pressure.
	Loose steering linkage ball joints.	Replace ball joints.
	Faulty shock absorbers.	Replace shock absorber.
	Loose stabilizer bar.	Tighten or replace stabilizer bar or bushings.
	Broken or sagging springs.	Replace spring (pairs).
	Improper wheel alignment.	Adjust wheel alignment.
Erratic Steering When Braking	Worn wheel bearings.	Replace wheel bearings.
	Broken or sagging springs.	Replace spring (pairs).
	Leaking caliper.	Repair or replace caliper.
	Warped discs.	Replace brake disc.
	Badly worn brake pads.	Replace brake pads.
	Tires are inflated unequally.	Inflate tires to proper pressure.

Power Steering System

There is some noise in all power steering systems. One of the most common is a hissing sound when the steering wheel is fully turned and the car is not moving. This noise will be most evident when the steering wheel is operated while the brakes are applied. There is no

relationship between this noise and steering performance. Do not replace the valve unless the "hissing" noise is extremely objectionable. A replacement valve will also have a slight noise, and is not always a cure for the condition.

Condition	Possible cause	Correction
Rattle or Chucking Noise	Pressure hose touching other parts of vehicle.	Adjust hose position. Do not bend tubing by hand.
	Tie rod ends loose.	Tighten or replace tie rod end.
	Loose steering unit mounting.	Tighten steering unit mounting.
Poor Return of Steering Wheel to Center	Improper front wheel alignment.	Adjust front wheel alignment.
	Wheel bearing worn.	Replace front wheel bearing.
	Tie rod end binding.	Replace tie rod end.
	Ball joint binding.	Replace ball joint.
	Tight or frozen steering shaft bearing.	Replace steering assembly.
	Sticky or plugged steering unit valve.	Flush or replace steering unit.
Momentary Increase In Effort When Turning Wheel Fast To Right or Left	High internal leakage.	Repair steering gear.
	Power steering fluid level low.	Replenish fluid.
Steering Wheel Surges or Jerks When Turning Especially During Parking	Insufficient pump pressure.	Repair pump assembly.
	Sticky steering unit valve.	Flush or replace steering unit.
	Power steering fluid level low.	Replenish fluid.
Excessive Wheel Kick Back or Loose Steering	Air in system.	Bleed hydraulic system.
	Tie rod end loose.	Tighten tie rod end.
	Wheel bearing worn.	Replace wheel bearing.
Hard Steering or Lack of Power Assist	Sticky steering unit valve.	Flush or replace steering unit.
	Insufficient pump pressure.	Repair pump assembly.
	Excessive internal pump leakage.	Repair pump assembly.
	Excessive internal steering gear leakage.	Repair steering gear.
	Power steering fluid level low.	Replenish fluid.
Unstable Engine Idling or Stalling When Turning	Pressure switch of the power steering pump or its harness is faulty.	Repair or replace.

2A-6 POWER-ASSISTED STEERING SYSTEM

Power Steering Pump

Foaming milky power steering fluid, low fluid level, and possible low pressure can be caused by air in the fluid, or loss of fluid due to internal pump leakage. Check for leak and correct. Bleed the system. Extremely cold

temperatures will cause air bubbles in the system if the fluid level is low. If the fluid level is correct and the pump still foams, remove the pump from the vehicle and check housing for cracks. If the housing is cracked, replace the pump housing.

Condition	Possible cause	Correction
Low Pressure Due to Steering Pump	Relief valve sticking or inoperative.	Replace relief valve.
	Side plate not flat against cam ring.	Replace side plate.
	Extreme wear of cam ring.	Replace cam ring.
	Scored side plate or rotor.	Replace side plate or rotor.
	Vanes sticking in rotor slots.	Repair or replace vanes and rotor.
	Cracked or broken side plate.	Replace side plate.
	High internal leakage.	Repair internal leakage.
Low Pressure Due to Steering Gear	Scored housing bore.	Replace housing.
Growling Noise In Steering Pump	Excessive back pressure in hoses or steering unit caused by restriction.	Repair steering unit or pump.
	Scored side plate or rotor.	Replace side plate or rotor.
	Worn cam ring.	Replace cam ring.
Groaning Noise In Steering Pump	Air in the fluid.	Bleed hydraulic system.
	Low fluid level.	Replenish fluid.
	Pump mounting loose.	Tighten mounting bolt.
Rattling Noise In Steering Pump	Vanes sticking in rotor slots.	Repair or replace vanes and rotor.
	Vane improperly installed.	Repair rotor and vane.
Swishing Noise In Steering Pump	Damaged relief valve.	Replace relief valve.
Whining Noise In Steering Pump	Scored side plate and vanes.	Replace side plate and vanes.

Steering Column Lock System

Condition	Possible cause	Correction
Will Not Unlock	Damaged lock cylinder.	Replace lock cylinder.
	Damaged park lock cable.	Replace park lock cable.
Will Not Lock	Lock spring broken or worn.	Replace lock cylinder.
	Damaged lock cylinder.	Replace lock cylinder.
	Ignition switch stuck.	Repair or replace ignition switch.
	Park lock cable damaged.	Replace park lock cable.
Key Cannot be Removed in "OFF-LOCK"	Ignition switch is not set correctly.	Correct ignition switch.
	Damaged lock cylinder.	Replace lock cylinder.
	Faulty shift lock mechanism.	Repair or replace the shift lock mechanism.

Column

Condition	Possible cause	Correction
Noise in Column	Universal joint loose.	Tighten joint.
	Shaft lock snap ring not seated.	Place snap ring in proper position.

Turn Signal Switch

to Turn Signal Switch in Electrical section for electrical diagnosis.

This diagnosis covers mechanical problems only. Refer

Condition	Possible cause	Correction
Turn Signal Will Not Stay In Turn Position	Foreign material or loose parts preventing movement of yoke.	Repair or replace signal switch.
	Broken or missing detent or canceling spring.	Replace signal switch.
Turn Signal Will Not Cancel	Loose switch mounting screws.	Tighten mounting screws.
	Switch or anchor bosses broken.	Replace turn signal switch.
	Broken, missing or out of position detent, return or canceling spring.	Replace turn signal switch.
	Worn canceling cam.	Replace turn signal switch.
Turn Signal Difficult To Operate	Turn signal switch arm loose.	Tighten arm screw.
	Broken or distorted yoke.	Replace turn signal switch.
	Loose or misplaced springs.	Replace turn signal switch.
	Foreign parts and/or material.	Repair turn signal switch.
	Loose turn signal switch mounting screws.	Tighten mounting screws.
Turn Signal Will Not Indicate Lane Change	Broken lane change pressure pad or spring hanger.	Replace turn signal switch.
	Broken, missing or misplaced lane change spring.	Replace turn signal switch.
	Base of wire damaged.	Replace turn signal switch.
Hazard Switch Cannot Be Turned Off	Foreign material between hazard switch to turn signal switch body.	Repair or replace hazard switch.
No Turn Signal Lights	Electrical failure in chassis harness.	Refer to Electrical section.
	Inoperative turn signal flasher unit.	Replace flasher unit.
	Loose chassis harness connector.	Repair loose connector.
Front or Rear Turn Signal Lights Not Flashing	Burned-out or damaged turn signal bulb.	Replace bulb.
	High resistance connection to ground at bulb socket.	Repair bulb socket.
	Loose chassis harness connector.	Repair loose connector.

2A-8 POWER-ASSISTED STEERING SYSTEM

General Description

The hydraulic power steering system consists of a pump, an oil reservoir, a steering unit, a pressure hose and a return hose.

Power Steering Unit

A02RW007

The power steering unit is rack and pinion type.
The toe-in angle can be adjusted by turning the rod on each side.
The steering housing cannot be disassembled.

Hydraulic Pump

A02RX002

The hydraulic pump is vane-type design. The submerged pump has housing and internal parts that are inside the reservoir and operate submerged in oil. There are two bore openings at the rear of the pump housing. The larger opening contains the cam ring, pressure plate, thrust plate, rotor and vane assembly, and end plate. The smaller opening contains the pressure line union, flow control valve and spring. The flow control orifice is part of the pressure line union. The pressure relief valve inside the flow control valve limits the pump pressure.

Steering Column

431RY0009

WARNING: TO AVOID DEPLOYMENT WHEN TROUBLE-SHOOTING THE SRS SYSTEM, DO NOT USE ELECTRICAL TEST EQUIPMENT, SUCH AS BATTERY-POWERED OR A/C-POWERED VOLT-METER, OHMMETER, ETC., OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN SPECIFIED IN THIS MANUAL. DO NOT USE A NON-POWERED PROBE-TYPE TESTER.

INSTRUCTION IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT.

When servicing a vehicle equipped with Supplemental Restraint System, pay close attention to all WARNINGS and CAUTIONS.

For detailed explanation about SRS, refer to Restraints section.

4. Bleed the system. Refer to Bleeding the Power Steering System in this section.
5. Start the engine and check the fluid level. Add power steering fluid if required. When the engine is at normal operating temperature, increase engine speed to 1500 rpm.

CAUTION: Do not leave shutoff valve fully closed for more than 5 seconds, as the pump could become damaged internally.

6. Fully close the shutoff valve. Record the highest pressures.
 - If the pressure recorded is within 9300–9800 kPa (95–100 kg/cm²/1350–1420 psi), the pump is functioning within its specifications.
 - If the pressure recorded is higher than 9800 kPa (100 kg/cm²/1420 psi), the valve in the pump is defective.
 - If the pressure recorded is lower than 9300 kPa (95 kg/cm²/1350 psi), the valve or the rotating group in the pump is defective.
7. If the pump pressures are within specifications, leave the valve open and turn (or have someone else turn) the steering wheel fully in both directions. Record the highest pressures and compare with the maximum pump pressure recorded in step 6. If this pressure cannot be built in either side of the power steering unit, the power steering unit is leaking internally and must be replaced.
8. Shut the engine off, remove the testing gauge.
9. Reconnect the pressure hose, check the fluid level and make the needed repairs.
10. If the problem still exists, the steering and front suspension must be thoroughly examined.

Maintenance

The hydraulic system should be kept clean and fluid level in the reservoir should be checked at regular intervals and fluid added when required. Refer to Recommended Fluids and Lubricants in General Information section for the type of fluid to be used and the intervals for filling.

If the system contains some dirt, flush it as described in this section. If it is exceptionally dirty, the pump must be completely disassembled before further usage. (The steering unit cannot be disassembled.)

All tubes, hoses, and fittings should be inspected for leakage at regular intervals. Fittings must be tight. Make sure the clips, clamps and supporting tubes and hoses are in place and properly secured.

Power steering hoses and lines must not be twisted, kinked or tightly bent. Air in the system will cause spongy action and noisy operation. When a hose is disconnected or when fluid is lost, for any reason, the system must be bled after refilling. Refer to Bleeding the Power Steering System in this section.

- Inspect belt for tightness.

- Inspect pulley for looseness or damage. The pulley should not wobble with the engine running.
- Inspect hoses so they are not touching any other parts of the vehicle.
- Inspect fluid level and fill to the proper level.

Fluid Level

1. Run the engine until the power steering fluid reaches normal operating temperature, about 55°C (130°F), then shut the engine off.
2. Check the level of fluid in the reservoir.
3. If the fluid level is low, add power steering fluid as specified in General Information to the proper level and install the receiver cap.
4. When checking the fluid level after the steering system has been serviced, air must be bled from the system. Refer to Bleeding the Power Steering System in this section.

Bleeding The Power Steering System

When a power steering pump or unit has been installed, or an oil line has been disconnected, the air that has entered the system must be bled out before the vehicle is operated. If air is allowed to remain in the power steering fluid system, noisy and unsatisfactory operation of the system may result.

Bleeding Procedure

When bleeding the system, and any time fluid is added to the power steering system, be sure to use only power steering fluid as specified in General Information.

1. Fill the pump fluid reservoir to the proper level and let the fluid settle for at least two minutes.
2. Start the engine and let it run for a few seconds. Do not turn the steering wheel. Then turn the engine off.
3. Add fluid if necessary.
4. Repeat the above procedure until the fluid level remains constant after running the engine.
5. Raise and support the front end of the vehicle so that the wheels are off the ground.
6. Start the engine. Slowly turn the steering wheel right and left, lightly contacting the wheel stops.
7. Add power steering fluid if necessary.
8. Lower the vehicle, set the steering wheel at the straight forward position after turning it to its full steer positions 2 or 3 times, and stop the engine.
9. Check the fluid level and refill as required.
10. If the fluid is extremely foamy, allow the vehicle to set a few minutes, then repeat the above procedure.

Flushing The Power Steering System

1. Raise and support the front end of the vehicle off the ground until the wheels are free to turn.
2. Remove the fluid return line at the pump inlet connector and plug the connector port on the pump. Position the line toward a large container to catch the draining fluid.
3. While running the engine at idle, fill the reservoir with new power steering fluid. Turn the steering wheel in both directions. Do not contact or hold the steering wheel to the wheel stops. This will cause the pump to go to pressure relief mode, which may cause a sudden fluid overflow at the reservoir.
4. Install all the lines and hoses. Fill the system with new power steering fluid and bleed the system as described in Bleeding The Power Steering System. Operate the engine for about 15 minutes. Remove the pump return line at the pump inlet and plug the connection on the pump. While refilling the reservoir, check the draining fluid for contamination. If foreign material is still evident, replace all lines, disassemble and clean or replace the power steering system components. Do not re-use any drained power steering fluid.

Steering Wheel Free Play Inspection

1. With the tires in the straight-ahead position, check the amount of steering wheel play by turning the wheel in both directions until the tires begin to move.

NOTE: The wheel free play should be checked with the engine running.

Free play: 0 – 30mm (0 – 1.18in)

2. Also check the steering wheel for play and looseness in the mount by moving it back and forth and sideways. When test driving, check for hard steering, steering shimmy and tendency to pull to one side.

Front End Alignment Inspection and Adjustment

General Description

“Front End Alignment” refers to the angular relationship between the front wheels, the front suspension attaching parts and the ground.

Proper front end alignment must be maintained in order to insure efficient steering, good directional stability and to prevent abnormal tire wear.

The most important factors of front end alignment are wheel toe-in, wheel camber and axle caster.

Camber:

This illustration shows view from the front of the vehicle.

Camber is the vertical tilting inward or outward of the front wheels. When the wheels tilt outward at the top, the camber is positive (+). When the wheels tilt inward at the top, the camber is negative (-). The amount of tilt measured in degrees from the vertical is called the camber angle (1). If camber is extreme or unequal between the wheels, improper steering and excessive tire wear will result. Negative camber causes wear on the inside of the tire, while positive camber causes wear to the outside.

Caster:

This illustration shows view from the side of the vehicle.

Caster (1) is the vertical tilting of the wheel axis either forward or backward (when viewed from the side of the vehicle). A backward tilt is positive (+) and a forward tilt is negative (-). On the short and long arm type suspension you cannot see a caster angle without a special instrument, but if you look straight down from the top of the upper control arm to the ground, the ball joints do not line up (fore and aft) when a caster angle other than 0 degree is present. With a positive angle, the lower ball joint would be slightly ahead (toward the front of the vehicle) of the upper ball joint center line.

Toe-in:

This illustration shows view from the top of the vehicle.

Toe-in is the measured amount the front wheels are turn in. The actual amount of toe-in is normally a fraction of a degree. Toe-in is measured from the center of the tire treads or from the inside of the tires. The purpose of toe-in is to insure parallel rolling of the front wheels and to offset any small deflections of the wheel support system which occurs when the vehicle is rolling forward. Incorrect toe-in results in excessive toe-in and unstable steering. Toe-in is the last alignment to be set in the front end alignment procedure.

Inspection

Before making any adjustments affecting caster, camber or toe-in, the following front end inspection should be made.

1. Inspect the tires for proper inflation pressure. Refer to Main Data and Specifications in Wheel and Tire System section.
2. Make sure that the vehicle is unladen condition (With no passenger or loading).
3. Make sure that the spare tire is installed at the normal position.
4. Inspect the front wheel bearings for proper adjustment. Refer to Front Hub and Disc in Driveline section.
5. Inspect the ball joints and tie rod ends. If excessive looseness is noted, correct before adjusting. Refer to Steering Linkage in this section.
6. Inspect the wheel and tires for run-out. Refer to Wheel Replacement in Wheel and Tire System section.
7. Inspect the trim height. If not within specifications, the correction must be made before adjusting caster.
8. Inspect the steering unit for looseness at the frame.
9. Inspect shock absorbers for leaks or any noticeable noise. Refer to Shock Absorber in Suspension section.
10. Inspect the control arms or stabilizer bar attachment for looseness. Refer to Suspension section .
11. Inspect the front end alignment using alignment equipment. Follow the manufacturer's instructions.
12. Park the vehicle must be on a level surface.

Trim Height Adjustment

Adjust the trim height (1) by means of the adjusting bolt on the height control arms.

CAUTION: When adjusting front end alignment, be sure to begin with trim height first, as it may change other adjusted alignments.

450RS003

410RS001

1. Check and adjust the tire inflation pressures.
2. Park the vehicle on a level ground and move the front of the vehicle up and down several times to settle the suspension.
3. Make necessary adjustment with the adjusting bolt on the height control arms.

Trim height: 119 ± 5mm (4.69 ± 0.2in)

Caster Adjustment

The caster angle can be adjusted by means of the caster shims (1) installed between the chassis frame (2) and fulcrum pins.

Caster angle: 2°30' ± 1°

CAUTION: Left and right side must be equal within 30'.

450RW006

450RS002

NOTE: Difference of the caster shim front/rear thickness should be 3.6mm (0.142in) or less. Overall thickness of caster shim and camber shim should be 10.8mm (0.425in) or less.

Tighten the fulcrum pin bolt to the specified torque.

Torque: 152N·m (15.5kg·m/112lbft)

Camber Adjustment

The camber angle can be adjusted by means of the camber shims (2) installed in position between the chassis frame (1) and fulcrum pins

Camber angle: $0^{\circ} \pm 30'$

King pin inclination: $12^{\circ}30' \pm 30'$

CAUTION: Left and right side must be equal within 30'.

450RW007

450RS005

NOTE: Overall thickness of caster shim and camber shim should be 10.8mm (0.425 in) or less. Tighten the fulcrum pin bolt to the specified torque.

Torque: 152N·m (15.5kg·m/112lbft)

	Position of shims		Camber angle	Caster angle
	Front side	Rear side		
Caster shim	When added	When removed	Decreases	Decreases
	When removed	When added	Increases	Increases
	—	When removed	Unchanged	Decreases
	—	When added	Unchanged	Increases
Camber shim	When added		Decreases	Unchanged
	When removed		Increases	Unchanged

2A-16 POWER-ASSISTED STEERING SYSTEM

Toe-in Adjustment

1. To adjust the toe-in angle, loosen the lock nuts (2) on the tie rod (1) and turn the tie rod. Turn both rods the same amount, to keep the steering wheel centered .

Toe-in: 0 to +2mm (0 to +0.08in)

2. Tighten the lock nut to the specified torque.

Torque: 98N·m (10.0kg·m/72lbft)

Main Data and Specifications

General Specification

Caster		$2^{\circ}30' \pm 1^{\circ}$
Camber		$0^{\circ} \pm 30'$
King pin inclination		$12^{\circ}30' \pm 30'$
Toe-in		0 to +2mm (0 to +0.08in)
Max. steering angle	inside	$32.6^{\circ} (+0^{\circ}30' \text{ to } -2^{\circ}30')$
	outside	31.8°

|----------------------------|----------------------------------|
| (1) Bracket | (3) Power Steering Unit Assembly |
| (2) Transfer Gear Assembly | (4) Crossmember |

Removal

1. Remove the stone guard.
2. Remove the transfer gear assembly.
Make a setting mark across the coupling flange and steering unit to ensure reassembly of the parts in the original position.
3. Drain power steering fluid.
4. Remove the tie rod end assembly from knuckle.
Use tie rod end remover 5-8840-2005-0.

901RW270

5. Disconnect the feed line and return line from steering unit.
Remove the clips on the crossmember and frame.
Wire the power steering line to frame.

NOTE: Take care to prevent foreign matter from entry when disconnect the power steering line.

6. Remove the torsion bar. Refer to Front Suspension in Suspension section.
7. Remove the lower control arm bolt (Frame side). Refer to Front Suspension in Suspension section.
8. Apply a setting mark across the crossmember and frame so parts can be reassembled in their original position.

6. Install tie-rod end assembly to knuckle.

Torque: 118N·m (12.0kg·m/87lbft)

7. Install transfer gear assembly.
Align the setting marks made at removal.

Torque: 31 N·m (3.2kg·m/23lbft)

8. Install the stone guard.

9. Bleed the system.
Refer to Bleeding the Power Steering System in this section.

9. Remove the crossmember fixing bolt.
10. Remove the power steering unit with the crossmember.
11. Remove the power steering unit.

Installation

1. Install power steering unit to crossmember.
Tighten fixing bolt to specified torque.
Torque: 116N·m (11.8kg·m/85lbft)
2. Install power steering unit with crossmember to frame by aligning the setting marks made when removing.
Tighten crossmember mounting bolt to specified torque.
Torque: 190N·m (19.4kg·m/140lbft)
3. Install lower control arm bolt.
Refer to Front Suspension in Suspension section.
4. Install torsion bar.
Refer to Front Suspension in Suspension section.
5. Connect the feed line and return line.
Torque: 25N·m (2.5kg·m/18lbft)

Power Steering Unit Disassembled View

| (3) Clip | (9) Valve Housing Assembly |
| (4) Bellows | (10) Mounting Rubber |
| (5) Band | (11) Dust Cover |
| (6) Tie-rod Assembly | |

Disassembly

NOTE: The valve housing is made of aluminum and care should be exercised when clamping in a vise, etc. to prevent distortion or damage.

1. Loosen lock nut and remove tie-rod end.
2. Remove clip and band, then remove bellows.
3. Remove tie-rod assembly.
To remove, move the boot toward the tie-rod end, then remove tab washer.
4. Remove oil line, mounting rubber and dust cover.

Inspection and Repair

Inspect the following parts for wear, damage or any abnormal conditions.

Tie-rod End

If looseness or play is found when checked by moving the end of ball joint at tie-rod end, replace tie-rod end.

Tie-rod Assembly

If the resistance is insufficient or play is felt when checked by moving the ball on the tie-rod, replace the tie-rod assembly.

Rubber Parts

If wear or damage is found through inspection, replace with new ones.

Reassembly

1. Install mounting rubber and dust cover (If removed).
2. Install oil line.

Torque: 13N·m (1.3kg·m/113lbin)

3. Install tie-rod assembly with tab washer.
Apply grease to ball joint, install tie-rod and tab washer, then tighten to specified torque.

Torque: 83N·m (8.5kg·m/61lbft)

After tightening, bend tab washer against width across flat of inner ball joint.

4. Apply a thin coat of grease to the shaft for smooth installation. Then install bellows.
5. Install band and clip.
6. Install tie-rod end and tighten lock nut.

Torque: 98N·m (10.0kg·m/72lbft)

Removal

1. Remove the drive belt.
2. Place a drain pan below the pump.
3. Disconnect the suction hose.
4. Disconnect the flexible hose.
5. Remove the power steering fixing bolt and remove the pump assembly.

Installation

1. Install the pump assembly to the pump bracket, tighten the fixing bolt to the specified torque.
Torque: 46N-m (4.7kg-m/34lbft)
2. Install the flexible hose.
Tighten the eye bolt to specified torque.
Torque: 54N-m (5.5kg-m/40lbft)
3. Install the drive belt.
4. Connect the suction hose, then fill and bleed system.
Refer to Bleeding the Power Steering System in this section.

Power Steering Pump Disassembled View

| (9) Side Plate | (20) O-ring |
| (10) Rotor and Vane | (21) Connector |
| (11) Pin | (22) Pressure Switch Assembly |

Disassembly

1. Clean the oil pump with solvent (plug the discharge and suction ports to prevent the entry of solvent). Be careful not to expose the oil seal of shaft assembly to solvent.
2. Remove the bolt, suction pipe and O-ring.
3. Remove the connector, O-ring, relief valve and spring.
4. Remove the pressure switch assembly.

5. Remove the bolt, rear housing and O-ring.
6. Remove the snap ring.
7. Remove the shaft assembly.
8. Remove the oil seal.

CAUTION: When removing the oil seal, be careful not to damage the housing.

9. Remove the pump cartridge assembly from the front housing.
10. Remove two O-rings.

Inspection and Repair

Make all necessary adjustments, repairs, and part replacements if wear, damage, or other problems are discovered during inspection.

Rotor

Check that the groove in the vane is free from excessive wear and that the vane slides smoothly. When part replacement becomes necessary, the pump cartridge should be replaced as a subassembly.

Vane

Sliding faces of the vane should be free from wear. (Particularly the curved face at the tip that contact with the cam should be free from wear and distortion). When part replacement becomes necessary, the pump cartridge should be replaced as a subassembly.

Cam

The inner face of the arm should have a uniform contact pattern without a sign of step wear. When part replacement becomes necessary, the pump cartridge should be replaced as a subassembly.

Side Plate

The sliding faces of parts must be free from step wear (more than 0.01 mm), which can be felt by the finger nail.

The parts with minor scores may be reused after lapping the face.

Relief Valve

The sliding face of the valve must be free from burrs and damage. The parts with minor scores may be reused after smoothing with emery cloth (#800 or finer).

Shaft

Oil seal sliding faces must be free from a step wear which can be felt by the finger nail. Bushing fitting face must be free from damage and wear.

O-ring, Oil Seal, Snap Ring

Be sure to discard used parts, and always use new parts for installation. Prior to installation, lubricate all seals and rings with power steering fluid.

Pressure Switch

Check the switch operation as follows:

With engine idling and A/C on, turn the steering wheel fully to the left; compressor should interrupt and engine idle speed will increase. Shut off A/C and again turn steering fully to the left; engine idle will increase. If system fails to function properly, disconnect connector at the pressure switch and repeat system check while testing continuity across disconnected SW connector.

Reassembly

1. Install oil seal to front housing. Be sure to discard used oil seal, and always use new parts for installation.

CAUTION: When installing the oil seal, be careful not to damage the oil seal contacting surface of the housing.

2. Install shaft assembly.

3. Install the vanes to roter with curved face in contact with the inner wall of cam.

4. Install roter and vanes to cam.
5. Install pin to front housing.
6. Install two new O-rings to front housing. Be sure to discard used O-ring.
7. Install side plate.

CAUTION: When installing side plate, be careful not to damage its inner surface. Damaged side plate may cause poor pump performance, pump seizure or oil leakage.

8. Install pump cartridge assembly to front housing.
9. Install snap ring to shaft end.
10. Install rear housing with a new O-ring. Be sure to discard used O-ring. Then install bolt and tighten it to specified torque.

Torque: 24N·m (2.4kg·m/17lbft)

11. Install suction pipe with a new O-ring. Be sure to discard used O-ring. Then install bolt and tighten it to specified torque.

Torque: 10N·m (1.0kg·m/87lb in)

12. Install relief valve and spring.
13. Install connector with a new O-ring. Be sure to discard used O-ring. Tighten the connector to specified torque.

Torque: 59N·m (6.0kg·m/43lbft)

14. Install pressure switch assembly and tighten it to specified torque.

Torque: 18N·m (1.8kg·m/13lbft)

Removal

1. Apply a setting mark across the universal joint and transfer gear so parts can be reassembled in their original position.
2. Remove universal joint bolt (steering shaft side).
3. Remove universal joint bolt (steering unit side).
4. Loosen fixing bolt and nut and remove transfer gear assembly with shim.

Inspection and Repair

The transfer gear assembly cannot be disassembled. If damage or abnormal condition are found, replace to new ones.

Installation

1. Install transfer gear assembly with shim by aligning the setting marks made when removing.
2. Tighten bolt and nut to the specified torque.
Torque: 54N·m (5.5kg·m/40lbft)
3. Connect universal joint (both side) and tighten the bolt to the specified torque.
Torque: 31 N·m (3.2kg·m/23lbft)

Supplemental Restraint System Steering Wheel & Column

Service Precaution

This steering wheel and column repair section covers the Supplemental Restraint System (SRS) steering column. The following repair procedures are specific to SRS components. When servicing a vehicle equipped with Supplemental Restraint System, pay close attention to all WARNINGS and CAUTIONS.

For detailed explanation about SRS, refer to Restraints section.

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS. SAFE HANDLING OF INFLATOR MODULES REQUIRES FOLLOWING THE PROCEDURES DESCRIBED BELOW FOR BOTH LIVE AND DEPLOYED MODULES.

SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY (AIR BAG). AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY (AIR BAG) SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY-PRODUCT OF THE DEPLOYMENT REACTION, THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWDER ON THE AIR BAG ASSEMBLY (AIR BAG) IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY AN AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. WHEN PLACING A LIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE.

NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

TO AVOID DEPLOYMENT WHEN TROUBLESHOOTING THE SRS SYSTEM, DO NOT USE ELECTRICAL TEST EQUIPMENT, SUCH AS BATTERY-POWERED OR A/C-POWERED VOLT-METER, OHMMETER, ETC., OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN SPECIFIED IN THIS MANUAL. DO NOT USE A NON-POWERED PROBE-TYPE TESTER.

INSTRUCTIONS IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT.

SRS Connectors

CAUTION: The special yellow color connectors are used for supplemental restraint system-air bag circuit.

When removing the cable harness, do not pull the cables. Otherwise, cable disconnection may occur. When connect the SRS connector, insert the connector completely. Imperfect locking may cause malfunction of SRS circuit.

Removal

To remove the connector, hold the cover insulator(1) and pull it. The cover insulator slides and lock will be released.

Do not hold the socket insulator(2).

827RW028

Installation

To install the connector, hold the socket insulator(1) and insert it. The cover insulator slides and connector will be locked.

Do not hold the cover insulator(2).

827RW027

Inflator Module

Inflator Module and Associated Parts

Legend

- | | |
|-------------------|---------------------|
| (1) Horn Lead | (3) Fixing Bolt |
| (2) SRS Connector | (4) Inflator Module |

Removal

1. Turn the steering wheel so that the vehicle's wheels are pointing straight ahead.
2. Turn the ignition switch to "LOCK".
3. Disconnect the battery "-" terminal cable, and wait at least 5 minutes.
4. Disconnect the yellow 2-way SRS connector located under the steering column.
5. Loosen the inflator module fixing bolt from behind the steering wheel assembly using a TORX® driver or equivalent until the inflator module can be released from steering assembly .

6. Disconnect the yellow 2-way SRS connector and horn lead located behind the inflator module.

827RW073

7. Remove inflator module.

Inspection and Repair

WARNING: THE INFLATOR MODULE SHOULD ALWAYS BE CARRIED WITH THE URETHANE COVER AWAY FROM YOUR BODY AND SHOULD ALWAYS BE LAID ON A FLAT SURFACE WITH THE URETHANE SIDE UP. THIS IS NECESSARY BECAUSE A FREE SPACE IS PROVIDED TO ALLOW THE AIR CUSHION TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY MAY RESULT .

827RW072

The inflator module consists of a cover, air bag, inflator, and retainer. Inspect the inflator module mainly for the following:

- Check for holes, cracks, severe blemishes and deformation on the cover.
- Check that the retainer is not deformed.
- Check for defects such as damage and breakage in the lead wire for the igniter.

If an abnormality is found as the result of the inspection, replace the inflator module with a new one.

Installation

1. Install inflator module.
2. Support the module and carefully connect the module connector and horn lead.

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of inflator to prevent lead wire from being pinched.

3. Tighten bolts to specified torque.

Torque: 9N·m (0.9kg·m/78lbin)

4. Connect the yellow 2-way SRS connector located under the steering column.
5. Connect the battery “-” terminal cable.
6. Set ignition to “ON” while watching warning light. Light should flash 7 times and then go off. If lamp does not operate correctly, refer to Restraints section.

Steering Wheel

Steering Wheel and Associated Parts

Legend

- | | |
|--------------------|-------------------------------|
| (1) Horn Lead | (4) Steering Wheel Fixing Nut |
| (2) SRS Connector | (5) Inflator Module |
| (3) Steering Wheel | |

CAUTION: Once the steering column is removed from the vehicle, the column is extremely susceptible to damage. Dropping the column assembly on its end could collapse the steering shaft or loosen the slide block which maintains column rigidity. Leaning on the column assembly could cause the jacket to bend or deform. Any of the above damage could impair the column's collapsible design. If it is necessary to remove the steering wheel, use only the specified steering wheel puller. Under no conditions should the end of the shaft be hammered upon, as hammering could loosen slide block which maintains column rigidity.

Removal

1. Turn the steering wheel so that the vehicle's wheels are pointing straight ahead.
2. Turn the ignition switch to "LOCK".
3. Disconnect the battery "-" terminal cable, and wait at least 5 minutes.
4. Disconnect the yellow 2-way SRS connector located under the steering column.

5. Loosen the inflator module fixing bolt from behind the steering wheel assembly using a TORX® driver or equivalent until the inflator module can be released from steering assembly.

827RW070

6. Disconnect the yellow 2-way SRS connector located behind the inflator module.

WARNING: THE INFLATOR MODULE SHOULD ALWAYS BE CARRIED WITH THE URETHANE COVER AWAY FROM YOUR BODY AND SHOULD ALWAYS BE LAID ON A FLAT SURFACE WITH THE URETHANE SIDE UP. THIS IS NECESSARY BECAUSE A FREE SPACE IS PROVIDED TO ALLOW THE AIR CUSHION TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY MAY RESULT.

827RW073

7. Disconnect horn lead.
8. Remove steering wheel fixing nut.

9. Apply a setting mark (1) across the steering wheel and shaft so parts can be reassembled in their original position, then remove steering wheel.

430RW021

10. Move the front wheels to the straight ahead position, then use steering wheel remover 5-8521-0016-0 to remove the steering wheel.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

430RX005

Installation

1. Install steering wheel by aligning the setting marks made when removing.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

2. Tighten the steering wheel fixing nut to the specified torque.

Torque: 34 N·m (3.5 kg·m/25 lb ft)

3. Connect horn lead.
4. Support the module and carefully connect the SRS connector.

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of inflator to prevent lead wire from being pinched.

5. Tighten bolts to specified torque.

Torque: 9 N·m (0.9 kg·m/78 lb in)

6. Connect the yellow 2-way SRS connector located under the steering column.
7. Connect the battery “-” terminal cable.
8. Turn the ignition switch to “ON” while watching warning light. Light should flash 7 times and then go off. If lamp does not operate correctly, refer to Restraints section.

Combination Switch

Combination Switch and Associated Parts

431RW028

Legend

- | | |
|---------------------------|--|
| (1) Steering Column Cover | (4) Combination Switch and SRS Coil Assembly |
| (2) Steering Wheel | (5) Instrument Panel Lower Cover |
| (3) Inflator Module | (6) Driver Knee Bolster (reinforcement) |

Removal

1. Turn the steering wheel so that the vehicle's wheels are pointing straight ahead.
2. Turn the ignition switch to "LOCK".
3. Disconnect the battery "-" terminal cable, and wait at least 5 minutes.
4. Disconnect the yellow 2-way SRS connector located under the steering column.

CAUTION: The wheels of the vehicle must be straight ahead and the steering column in the "LOCK" position before disconnecting the steering wheel. Failure to do so will cause the coil assembly to become uncentered which will cause damage to the coil assembly.

5. Remove the engine hood opening lever, then remove instrument panel lower cover.
6. Remove the driver knee bolster (reinforcement).

7. Loosen the inflator module fixing bolt from behind the steering wheel assembly using a TORX® driver or equivalent until the inflator module can be released from steering assembly. Disconnect the yellow 2-way SRS connector and horn lead located behind the inflator module, then remove inflator module.

827RW070

827RW073

WARNING: The INFLATOR MODULE SHOULD ALWAYS BE CARRIED WITH THE URETHANE COVER AWAY FROM YOUR BODY AND SHOULD ALWAYS BE LAID ON A FLAT SURFACE WITH THE URETHANE SIDE UP. THIS IS NECESSARY BECAUSE A FREE SPACE IS PROVIDED TO ALLOW THE AIR CUSHION TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY MAY RESULT.

827RW072

8. Apply a setting mark (1) across the steering wheel and shaft so parts can be reassembled in their original position. Move the front wheels to the straight ahead position, then use steering wheel remover 5-8521-0016-0 to remove the steering wheel.

430RW021

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

430RX005

9. Remove steering column cover.
10. Disconnect the wiring harness connectors located under the steering column then remove combination switch and SRS coil assembly.

NOTE: The SRS coil is a part of the combination switch assembly, which can not be replaced separately. Therefore, be sure not to remove the SRS coil from the combination switch assembly.

825RW288

Installation

1. Install combination switch and SRS coil assembly. After installation of combination switch assembly, connect the combination switch wiring harness connector and the SRS 2-way connector located under the steering column. Then turn the SRS coil counter clockwise to full, return about 3 turns and align the neutral mark.

CAUTION: When turning the SRS coil counter clockwise to full, stop turning if resistance is felt. Forced further turning may damage to the cable in the SRS coil.

825RW016

2A-38 POWER-ASSISTED STEERING SYSTEM

- When installing the steering column cover, be sure to route each wire harness as illustrated so that the harnesses do not catch on any moving parts.

Legend

- Steering Column Cover
- Starter Switch Harness
- Combination Switch Harness
- Inflator Module Harness

- Align the setting marks made when removing then install steering wheel.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

- Tighten the steering wheel fixing nut to the specified torque.

Torque: 34N-m (3.5kg-m/25lbft)

- Support the inflator module and carefully connect the SRS connector and horn lead.

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of inflator to prevent lead wire from being pinched.

- Tighten bolts to specified torque.

Torque: 9N-m (0.9kg-m/78lb in)

- Install driver knee bolster (reinforcement).
- Install instrument panel lower cover then Install the engine hood opening lever.
- Connect the SRS connector.
- Connect the battery "-" terminal cable.
- Turn the ignition switch to "ON" while watching warning light and check the light should flash 7 times and then go off. If lamp does not operate correctly, refer to Restraints section.

Lock Cylinder

Lock Cylinder and Associated Parts

431RW027

Legend

- | | |
|--|---|
| (1) Inflator Module | (6) Cushion Rubber |
| (2) Steering Wheel | (7) Lock Cylinder Assembly |
| (3) Steering Column Cover | (8) Instrument Panel Lower Cover |
| (4) Combination Switch and SRS Coil Assembly | (9) Driver Knee Bolster (reinforcement) |
| (5) Snap Ring | (10) Shift Lock Cable (for A/T) |

Removal

1. Turn the steering wheel so that the vehicle's wheels are pointing straight ahead.
2. Turn the ignition switch to "LOCK".
3. Disconnect the battery "-" terminal cable, and wait at least 5 minutes.
4. Disconnect the yellow 2-way SRS connector located under the steering column.

CAUTION: The wheels of the vehicle must be straight ahead and the steering column in the "LOCK" position before disconnecting the steering wheel. Failure to do so will cause the coil assembly to become uncentered which will cause damage to the coil assembly.

5. Remove the engine hood opening lever and steering lower cover.
6. Remove driver knee bolster (reinforcement).

7. Loosen the inflator module fixing bolt from behind the steering wheel assembly using a TORX® driver or equivalent until the inflator module can be released from steering assembly.

827RW070

8. Disconnect the yellow 2-way SRS connector and horn lead located behind the inflator module.

827RW073

9. Apply a setting mark (1) across the steering wheel and shaft so parts can be reassembled in their original position.

430RW021

10. Move the front wheels to the straight ahead position, then use steering wheel remover 5-8521-0016-0 to remove the steering wheel.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

430RX005

WARNING: THE INFLATOR MODULE SHOULD ALWAYS BE CARRIED WITH THE URETHANE COVER AWAY FROM YOUR BODY AND SHOULD ALWAYS BE LAID ON A FLAT SURFACE WITH THE URETHANE SIDE UP. THIS IS NECESSARY BECAUSE A FREE SPACE IS PROVIDED TO ALLOW THE AIR CUSHION TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY MAY RESULT.

827RW072

11. Remove steering column cover.
12. Disconnect the wiring harness connectors located under the steering column.
13. Remove the combination switch assembly with SRS coil.

NOTE: The SRS coil is a part of the combination switch assembly, which can not be replaced separately. Therefore, be sure not to remove the SRS coil from the combination switch assembly.

825RW288

14. Remove snap ring.
15. Remove cushion rubber.
16. Remove shift lock cable (for A/T).
17. Disconnect the starter switch harness connector located under the steering column then remove lock cylinder assembly.

Installation

1. Install lock cylinder assembly.
2. Install shift lock cable (for A/T).
3. Install cushion rubber.
4. Install snap ring.
5. Install Combination switch and SRS coil assembly. After installation of combination switch assembly, connect the combination switch wiring harness connector and the SRS 2-way connector located under the steering column.
6. Turn the SRS coil counter clockwise to full, return about 3 turns and align the neutral mark.

CAUTION: When turning the SRS coil counter clockwise to full, stop turning if resistance is felt. Forced further turning may damage the cable in the SRS coil.

825RW016

2A-42 POWER-ASSISTED STEERING SYSTEM

7. When installing the steering column cover, be sure to wire (through each harness) as illustrated so that the harnesses starter switch, combination switch and SRS coil may not catch wiring.

825RW017

Legend

- (1) Steering Column Cover
- (2) Starter Switch Harness
- (3) Combination Switch Harness
- (4) Inflator Module Harness

8. Install steering wheel by aligning the setting marks made during removal.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

9. Tighten the steering wheel fixing nut to the specified torque.

Torque: 34N·m (2.5kg·m/25lbft)

10. Support inflator module and carefully connect the SRS connector and horn lead, then install inflator module.

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of inflator to prevent lead wire from being pinched.

11. Tighten fixing bolts to specified torque.

Torque: 9N·m (0.9kg·m/78lb·in)

12. Install driver knee bolster (reinforcement).

13. Install instrument panel lower cover, then install the engine hood opening lever.

14. Connect the yellow 2-way SRS connector located under the steering column.

15. Connect the battery “-” terminal cable.

System Inspection

Turn the ignition switch to “ON” while watching warning light.

The light should flash 7 times and then go off. If lamp does not operate correctly, refer to Restraints section.

Steering Column

Steering Column and Associated Parts

431RW029

Legend

- | | |
|--|--|
| (1) Inflator Module | (7) Lock Cylinder Assembly |
| (2) Steering Wheel | (8) Shift Lock Cable (For A/T) |
| (3) Steering Column Cover | (9) Steering Column Assembly |
| (4) Combination Switch and SRS Coil Assembly | (10) Second Steering Shaft |
| (5) Snap Ring | (11) Instrument Panel Lower Cover |
| (6) Cushion Rubber | (12) Driver Knee Bolster (reinforcement) |

Removal

1. Turn the steering wheel so that the vehicle's wheels are pointing straight ahead.
2. Turn the ignition switch to "LOCK".
3. Disconnect the battery "-" terminal cable, and wait at least 5 minutes.

4. Disconnect the yellow 2-way SRS connector located under the steering column.

CAUTION: The wheel of the vehicle must be straight ahead and the steering column in the "LOCK" position before disconnecting the steering column from the steering gear. Failure to do so will cause the SRS coil assembly to become uncentered which will cause damage to the SRS coil assembly.

2A-44 POWER-ASSISTED STEERING SYSTEM

5. Remove the engine hood opening lever, then remove instrument panel lower cover.
6. Remove driver knee bolster (reinforcement).
7. Loosen the inflator module fixing bolt from behind the steering wheel assembly using a TORX® driver or equivalent until the inflator module can be released from steering assembly.

8. Disconnect the yellow 2-way SRS connector and horn lead located behind the inflator module.
9. Remove inflator module.

WARNING: THE INFLATOR MODULE SHOULD ALWAYS BE CARRIED WITH THE URETHANE COVER AWAY FROM YOUR BODY AND SHOULD ALWAYS BE LAID ON A FLAT SURFACE WITH THE URETHANE SIDE UP. THIS IS NECESSARY BECAUSE A FREE SPACE IS PROVIDED TO ALLOW THE AIR CUSHION TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY MAY RESULT.

10. Apply a setting mark (1) across the steering wheel and shaft so parts can be reassembled in their original position. Move the front wheels to the straight ahead position, then use steering wheel remover 5-8521-0016-0 to remove the steering wheel.

11. Remove steering column cover.
12. Disconnect the wiring harness connectors located under the steering column.

13. Remove the combination switch assembly with SRS coil.

NOTE: SRS coil is a part of combination switch assembly, which can not be replaced singly. Therefore, be sure not to remove the SRS coil from the combination switch assembly.

825RW288

14. Remove snap ring.
15. Remove cushion rubber.
16. Remove shift lock cable (For A/T).
17. Disconnect the starter switch harness connector located under the steering column, then remove lock cylinder assembly.

18. Apply a setting mark (1) across the universal joint and transfer gear to reassemble the parts in their original position, then remove steering column assembly and second shaft.

NOTE: A setting mark can be easily made if the shaft is withdrawn a little by loosening the steering shaft universal joint.

431RW009

Inspection

If the abnormal conditions are found through inspection, replace the steering column assembly.

Column Capsule

Check capsules on steering column bracket assembly; all must be securely seated in bracket slots and checked for any loose conditions when pushed or pulled by hand.

431RW030

Check clearance between capsule and bracket. It must be within 1mm (0.039 in).

431RW031

Column Tube

Check for collapses by measuring the distance as shown in the figure.

Standard distance: 162.2-165.8 mm (6.386-6.528 in)

431RY00010

Column Universal Joint for Tilt Mechanism

If the resistance is felt when checked by rotate the joint, replace the steering column assembly.

Sheared Injected Plastic Pin

Check the sheared injected plastic pins for any loose conditions or damage.

431RY00011

Shaft Length

Check the shaft length from the center of the universal joint to the end of the shaft. If column length is not in specifications, steering column should be replaced.

Standard length: 662.2-664.2 mm (26.149-26.228 in)

431RY00012

Shaft Universal Joint (Lower End)

If the resistance is felt when checked by rotate the joint, replace the steering column assembly.

Shaft Bellows Pipe

Check the shaft bellows pipe for bend by using straight edge. Measure the clearance between the bellows pipe and the straight edge (at center of the bellows pipe).

Standard: Less than 1mm (0.039 in)

431RW035

Tilt Mechanism

Tilt mechanism should move smoothly. While locked the tilt mechanism, be sure the steering column latch securely by pushing the steering wheel upward and downward.

Installation

1. Install steering column assembly and second steering shaft.
2. Align the setting marks on the universal joint and transfer gear made during removal.
3. Tighten the steering column fixing bolt (dash panel) to the specified torque.

Torque: 20N·m (2.0kg·m/14lbft)

4. Tighten the steering column fixing nuts (cross beam) to the specified torque.

Torque: 17N·m (1.7kg·m/12lbft)

5. Tighten the universal joint to the specified torque.

Torque: 31N·m (3.2kg·m/23lbft)

6. Install lock cylinder assembly.
7. Install shift lock cable (For A/T).
8. Install cushion rubber.
9. Install snap ring.
10. Install combination switch and SRS coil assembly. After installation of combination switch assembly, connect the combination switch wiring harness connector and the SRS 2-way connector located under the steering column.

2A-48 POWER-ASSISTED STEERING SYSTEM

11. Turn the SRS coil counter clockwise to full, return about 3 turns and align the neutral mark.

CAUTION: When turning the SRS coil counter clockwise to full, stop turning if resistance is felt. Forced further turning may damage to the cable in the SRS coil.

12. When installing the steering column cover, be sure to route each wire harness as illustrated so that the harnesses do not catch any moving parts.

Legend

- (1) Steering Column Cover
- (2) Starter Switch Harness
- (3) Combination Switch Harness
- (4) Inflator Module Harness

13. Install steering wheel and align the setting marks made when removing.

CAUTION: Never apply force to the steering wheel in direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

14. Tighten the steering wheel fixing nut to the specified torque.

Torque: 34N-m (3.5kg-m/25lbf)

15. Support the module and carefully connect the module connector and horn lead, then install inflator module.

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of inflator to prevent lead wire from being pinched.

16. Tighten bolts to specified torque.

Torque: 9N-m (0.9kg-m/78lbin)

17. Install driver knee bolster (reinforcement).
18. Install instrument panel lower cover.
19. Install the engine hood opening lever.
20. Connect the yellow 2-way SRS connector and horn lead located under the steering column.
21. Connect the battery "-" terminal cable.

System Inspection

Turn the ignition switch to "ON" while watching warning light.

The light should flash 7 times and then go off. If lamp does not operate correctly, refer to Restraints section.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

3C-2 FRONT SUSPENSION

General Description

The front suspension is designed to allow each wheel to compensate for changes in the road surface level without greatly affecting the opposite wheel. Each wheel is independently connected to the frame by a steering knuckle, ball joint assemblies, and upper and lower control arms. The front wheels are held in proper relationship to each other by two tie-rods which are connected to steering arms on the knuckles, and to a steering unit.

All models have a front suspension system consisting of control arms, stabilizer bar, shock absorber and a torsion bar. The front end of the torsion bar is attached to the lower control arm. The rear of the torsion bar is mounted into a height control arm at the crossmember. Vehicle trim height is controlled by adjusting this arm. Shock absorbers are mounted between the brackets on

the frame and the lower control arms. The lower portion of each shock absorber is attached to the lower control arm. The upper portion of each shock absorber extends through a frame bracket and is secured with two rubber bushings, two retainers and a nut.

Ball joint assemblies are bolted to the outer end of the upper and lower control arm and are attached to the steering knuckle.

The inner ends of the upper control arm have pressed in bushings. Bolts, passing through the bushing, attach the control arm to the frame. The inner ends of the lower control arm are attached to the frame by bolts passing through the bushings.

Side roll of the front suspension is controlled by a spring steel stabilizer bar. It is mounted in rubber bushings, which are held to the frame by brackets. The ends of the stabilizer bar are connected to the lower control arms by links.

Diagnosis

Condition	Possible cause	Correction
Vehicle Pulls	Mismatched or uneven tires.	Replace tire.
	Tires not adequately inflated.	Adjust tire pressure.
	Broken or sagging springs.	Replace spring.
	Radial tire lateral force.	Replace tire.
	Improper wheel alignment.	Adjust wheel alignment.
	Brake dragging in one wheel.	Repair brake.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension part(s).
	Faulty shock absorbers.	Replace shock absorber.
Abnormal or Excessive Tire Wear	Parts in power steering valve defective.	Replace power steering unit.
	Sagging or broken spring.	Replace spring.
	Tire out of balance.	Balance or replace tire.
	Improper wheel alignment.	Check front end alignment.
	Faulty shock absorber.	Replace shock absorber.
	Hard driving.	Replace tire.
	Overloaded vehicle.	Replace tire and reduce load.
	Tires not rotated periodically.	Replace or rotate tire.
	Worn or loose road wheel bearings.	Replace wheel bearing.
Wobbly wheel or tires.	Replace wheel or tire.	
Wheel Hop	Tires not adequately inflated.	Adjust the pressure.
	Blister or bump on tire.	Replace tire.
	Improper shock absorber operation.	Replace shock absorber.

Condition	Possible cause	Correction
Shimmy, Shake or Vibration	Tire or wheel out of balance.	Balance wheels or replace tire/or wheel.
	Loose wheel bearings.	Replace wheel bearing.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
	Excessive wheel runout.	Repair or replace wheel and/or tire.
	Blister or bump on tire.	Replace tire.
	Excessive loaded radial runout of tire/wheel assembly.	Replace tire or wheel.
	Improper wheel alignment.	Check wheel alignment.
	Loose or worn steering linkage.	Tighten or replace steering linkage.
	Loose steering unit.	Tighten steering unit.
	Tires not adequately inflated.	Adjust tire pressure.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension parts.
	Faulty shock absorber.	Replace shock absorber.
	Hub bearing preload misadjustment.	Adjust preload.
Parts in power steering valve defective.	Replace power steering unit.	
Hard Steering	Bind in steering linkage ball studs, upper or lower ball joint.	Replace ball joint.
	Improper wheel alignment.	Check wheel alignment.
	Tire not adequately inflated.	Inflate tires to proper pressure.
	Bind in steering column or shaft.	Repair or replace.
	Improper power steering system operation.	Repair or replace. Refer to Steering section.
Too Much Play In Steering	Wheel bearings worn.	Replace wheel bearings.
	Loose steering unit or linkage.	Retighten or repair.
	Worn or loose steering shaft universal joint.	Retighten or replace steering shaft.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
Poor Steering Wheel Returnability	Bind in steering linkage ball joints.	Replace ball joints.
	Bind in upper or lower ball joints.	Replace ball joints.
	Bind in steering column and shaft.	Repair or replace.
	Bind in steering gear.	Check and repair steering gear.
	Improper wheel alignment.	Adjust wheel alignment.
	Tires not adequately inflated.	Adjust pressure.
	Loose steering wheel nut.	Retighten.
Worn wheel bearing.	Replace.	

3C-4 FRONT SUSPENSION

Condition	Possible cause	Correction
Abnormal Noise	Worn, sticky or loose upper or lower ball joint, steering linkage ball joints or drive axle joints.	Replace.
	Faulty shock absorbers.	Replace.
	Worn upper or lower control arm bushing.	Replace.
	Loose stabilizer bar.	Retighten bolts or replace bushings.
	Loose wheel nuts.	Tighten nuts. Check for elongated wheel nut holes. Replace wheel if required.
	Loose suspension bolts or nuts.	Retighten suspension bolts or nuts.
	Broken or otherwise damaged wheel bearings.	Replace wheel bearing.
	Broken suspension springs.	Replace spring.
	Loose steering unit.	Retighten mounting bolt.
Faulty steering unit.	Replace steering unit.	
Wandering or Poor Steering Stability	Mismatched or unevenly worn tires.	Replace tire or inflate tires to proper pressure.
	Loose steering linkage ball joints.	Replace ball joints.
	Faulty shock absorbers.	Replace shock absorber.
	Loose stabilizer bar.	Tighten or replace stabilizer bar or bushings.
	Broken or sagging springs.	Replace spring (pairs).
	Improper wheel alignment.	Adjust wheel alignment.
Erratic Steering When Braking	Worn wheel bearings.	Replace wheel bearings.
	Broken or sagging springs.	Replace spring (pairs).
	Leaking caliper.	Repair or replace caliper.
	Warped discs.	Replace brake disc.
	Badly worn brake pads.	Replace brake pads.
	Tires are inflated unequally.	Inflate tires to proper pressure.
Low or Uneven Trim Height	Broken or sagging springs.	Replace springs (In pairs).
	Vehicle overloaded.	Reduce load.
	Incorrect springs.	Adjust or replace torsion bar.
Suspension Bottoms	Vehicle overloaded.	Reduce load.
	Faulty shock absorber.	Replace shock absorber.
	Incorrect, broken or sagging springs.	Replace springs.
Body Leans	Loose stabilizer bar.	Tighten stabilizer bar bolts or replace bushings.
	Faulty shock absorber, struts or mounting.	Replace shock absorber.
	Broken or sagging springs.	Replace springs (In pairs).
	Vehicle overloaded.	Reduce load.
Cupped Tires	Worn wheel bearings.	Replace wheel bearing.
	Excessive tire or wheel run out.	Replace tire or wheel.
	Worn ball joints.	Replace ball joints.
	Tire out of balance.	Adjust tire balance.

Shock Absorber

Shock Absorber and Associated Parts

450RW009

Legend

- | | |
|-------------------------------|-------------------------------|
| (1) Nut | (4) Shock Absorber |
| (2) Rubber Bushing and Washer | (5) Rubber Bushing and Washer |
| (3) Bolt and Nut | |

Removal

1. Raise the vehicle and support it with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel Replacement in this section.
3. Remove bolt and nut.
4. Remove nut.
5. Remove rubber bushing and washer.
6. Remove shock absorber.
7. Remove rubber bushing and washer.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

Check the following parts :

- Shock absorber
- Rubber bushing

Installation

1. Install rubber bushing and washer.
2. Install shock absorber.
3. Install rubber bushing and washer.
4. Install nut, then tighten it to the specified torque.

Torque: 20N·m (2.0kg·m/14lbft)

5. Install bolt and nut, then tighten to the specified torque.

Torque: 93N·m (9.5kg·m/69lbft)

Stabilizer Bar

Stabilizer Bar and Associated Parts

410RW007

Legend

- | | |
|--------------------|--------------------|
| (1) Rubber Bushing | (4) Nut |
| (2) Bracket | (5) Stabilizer Bar |
| (3) Link | |

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove the stone guard.
3. Remove wheel and tire assembly. Refer to Wheel Replacement in this section.
4. Remove nut.

CAUTION: Be careful not to break the ball joint boot.

5. Remove link.
6. Remove bracket.
7. Remove stabilizer bar.
8. Remove rubber bushing.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

Check the following parts :

- Stabilizer bar
- Rubber bushing
- Link ball joint

Installation

1. Install rubber bushing.
2. Install stabilizer bar.
3. Install bracket, then tighten it to the specified torque.

Torque: 25N-m (2.6kg-m/18lbft)

4. Install link.
5. Install nut, then tighten it to the specified torque.

Torque: 50N-m (5.1kg-m/37lbft)

Torsion Bar

Torsion Bar and Associated Parts

410RS003

Legend

- (1) Adjust Bolt, End Piece and Seat
- (2) Height Control Arm

- (3) Torsion Bar

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Apply the setting marks(1) to the adjust bolt and end piece, then remove adjust bolt, end piece and seat.

410RS004

3C-8 FRONT SUSPENSION

3. Apply the setting marks(2) to the height control arm and torsion bar, then remove height control arm.

410RS005

4. Apply the setting marks(3) to the torsion bar and lower control arm, then remove torsion bar.

410RS006

Installation

1. Apply grease to the serrated portions, then install torsion bar. Make sure the bars are on their correct respective sides and align the setting marks(3).

410RS007

410RS006

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

Check the following parts:

- Torsion bar
- Height control arm
- Adjust bolt
- Rubber seat

2. Apply grease to the portion that fits into the bracket then install height control arm and align the setting marks(2).

410RS005

3. Apply grease to the bolt portion of the end piece(4). Apply grease to the portion of the seat(5) that fits into the bracket.

410RS008

4. Apply grease to the serrated portions.
5. Install adjust bolt and seat, then turn the adjust bolt to the setting mark(1) applied during disassembly.

NOTE: Adjust the trim height. Refer to Front End Alignment Inspection and Adjustment in Steering section.

410RS004

Knuckle

Knuckle and Associated Parts

410RW006

Legend

- | | |
|----------------------|-------------------------|
| (1) Torsion Bar | (6) Needle Bearing |
| (2) Lower Ball Joint | (7) Thrust Washer |
| (3) Back Plate | (8) Oil Seal |
| (4) Knuckle Assembly | (9) Upper Ball Joint |
| (5) Knuckle | (10) Wheel Speed Sensor |

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel in this section.
3. Remove the brake caliper. Refer to Disc Brakes in Brake section.
4. Remove the hub assembly. Refer to Front Hub and Disk in this section.
5. Remove tie-rod end from the knuckle. Refer to Power Steering Unit in Steering section.
6. Remove the speed sensor from the knuckle.
7. Loosen torsion bar by height control arm adjust bolt, then remove torsion bar. Refer to Torsion Bar in this section.

8. Remove wheel speed sensor.
9. Remove back plate.
10. Remove lower ball joint by using remover 5-8840-2005-0.

CAUTION: Be careful not to damage the ball joint boot.

11. Remove upper ball joint by using remover 5-8840-2121-0.

CAUTION: Be careful not to damage the ball joint boot.

12. Remove knuckle assembly.
13. Remove oil seal.
14. Remove washer.

15. Remove needle bearing by using remover 5-8840-2000-0 and sliding hammer 5-8840-0019-0.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

Check the following parts:

- Knuckle
- Knuckle arm
- Needle bearing
- Thrust washer

Installation

1. Apply appropriate amount of multipurpose type grease to the new bearing (Approx. 5 g) and install needle bearing by using installer 5-8840-2128-0 and grip 5-8840-0007-0.

3C-12 FRONT SUSPENSION

2. Apply multipurpose type grease to the thrust washer, and install washer with chamfered side facing knuckle.
3. Use a new oil seal, and apply multipurpose type grease to the area surrounded by the lip (approx. 2 g). Then use installer 5-8840-2127-0 and grip 5-8840-0007-0 to install oil seal. After fitting the oil seal to the installer, drive it to the knuckle using a hammer or bench press until the tool front face contacts with the thrust washer.

4. Install knuckle assembly.
5. Install upper ball joint and tighten the nut to the specified torque, with just enough additional torque to align cotter pin holes. Install new cotter pin.

Torque: 98N·m (10.0kg·m/72lbft)

6. Install lower ball joint and tighten the nut to the specified torque, with just enough additional torque to align cotter pin holes. Install new cotter pin.

Torque: 147N·m (15.0kg·m/lbft)

7. Install back plate.
8. Install wheel speed sensor.
9. Install torsion bar, refer to Torsion Bar in this section.

NOTE: Adjust the trim height. Refer to Front End Alignment Inspection and Adjustment in Steering.

Upper Control Arm

Upper Control Arm and Associated Parts

450RW005

Legend

- | | |
|--------------------------------|-------------------------|
| (1) Bolt and Plate | (7) Bushing |
| (2) Camber Shims | (8) Plate |
| (3) Caster Shims | (9) Nut |
| (4) Nut Assembly | (10) Speed Sensor Cable |
| (5) Upper Control Arm Assembly | (11) Nut and Cotter Pin |
| (6) Fulcrum Pin | (12) Upper Ball Joint |

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel in this section.
3. Remove the brake caliper and disconnect brake pipe. Refer to Disc Brakes in Brake section.
4. Support lower control arm with a jack.
5. Remove speed sensor cable.
6. Remove nut and cotter pin then remove knuckle using remover 5-8840-2121-0.

3C-14 FRONT SUSPENSION

CAUTION: Be careful not to damage the ball joint boot.

7. Remove upper ball joint.
8. Remove bolt and plate.
9. Remove nut assembly.
10. Remove camber shims and note the positions and number of shims.
11. Remove caster shims and note the positions and number of shims.
12. Remove upper control arm assembly.
13. Remove nut.
14. Remove plate.
15. Remove bushing by using remover 5-8840-0256-0.

16. Remove fulcrum pin.

Inspection and Repair

Make necessary parts replacement if wear, damage, corrosion or any other abnormal conditions are found through inspection.

Check the following parts:

- Upper control arm
- Bushing
- Fulcrum pin

Installation

1. Install fulcrum pin.
2. Install bushing by using installer 5-8840-0256-0 and 5-8840-2307-0.

3. Install plate.

4. Install nut and tighten fulcrum pin nut finger-tight.

NOTE: Torque fulcrum pin nut after adjusting buffer clearance.

Buffer clearance: 22mm (0.87in)

Torque: 108N·m (11.0kg·m/80lbft)

5. Install upper control arm assembly with the fulcrum pin projections turned inward.

Legend

- (1) Projection
- (2) Outward

6. Install the caster shims(2) between the chassis frame and fulcrum pin.

7. Install the camber shims(1) between the chassis frame and fulcrum pin.

3C-16 FRONT SUSPENSION

8. Install nut assembly.
9. Install bolt and plate, then tighten the bolt to the specified torque.

Torque: 152N·m (15.5kg·m/112lbft)

10. Install upper ball joint and tighten it to the specified torque.

Torque: 57N·m (5.8kg·m/42lbft)

11. Install nut and cotter pin then tighten the nut to the specified torque, with just enough additional torque to align cotter pin holes. Install new cotter pin.

Torque: 98N·m (10.0kg·m/72lbft)

12. Install speed sensor cable.

Lower Control Arm

Lower Control Arm and Associated Parts

450RW010

Legend

- | | |
|----------------------------|-----------------------------|
| (1) Nut, Front | (8) Bolt, Torsion Bar Arm |
| (2) Bush, Front | (9) Torsion Bar Arm Bracket |
| (3) Bolt, Front | (10) Torsion Bar |
| (4) Nut, Rear | (11) Lower Control Arm |
| (5) Bush, Rear | (12) Lower Ball Joint |
| (6) Bolt, Rear | (13) Shock Absorber |
| (7) Bolt, Lower Ball Joint | (14) Stabilizer Link |

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel in this section.
3. Remove the tie-rod end from the knuckle. Refer to Power Steering Unit in Steering section.
4. Remove the retaining ring from the front axle driving shaft to release the shaft from hub. Refer to Front Hub and Disc in Driveline/Axle section.
5. Support lower control arm with a jack.

3C-18 FRONT SUSPENSION

6. Remove front nut.
7. Remove rear nut.
8. Remove torsion bar, refer to Torsion Bar in this section.
9. Remove torsion bar arm bracket.
10. Disconnect the stabilizer link at the lower control arm.
11. Remove the shock absorber lower end from the lower control arm.
12. Remove the lower ball joint from the lower control arm.
13. Remove front bolt.
14. Remove rear bolt.
15. Remove lower control arm.
16. Remove torsion bar arm bolt.
17. Remove lower ball joint bolt.
18. Remove front bushing by using remover 5-8840-2123-0.

19. Remove rear bushing by using remover 5-8840-2124-0.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

Check the following parts:

- Lower control arm
- Bushing

Installation

1. Install rear bushing by using installer 5-8840-2124-0.

901RW053

2. Install front bushing by using installer 5-8840-2123-0.

901RW156

3. Install lower ball joint bolt.
4. Install torsion bar arm bolt.
5. Install lower control arm.
6. Install rear bolt.
7. Install front bolt.
8. Install lower ball joint and tighten it to the specified torque.
Torque: 116N-m (11.8kg-m/85lbft)
9. Install shock absorber and tighten it to the specified torque.
Torque: 93N-m (9.5kg-m/69lbft)
10. Install stabilizer link and tighten it to the specified torque.
Torque: 50N-m (5.1kg-m/37lbft)
11. Install torsion bar arm bracket and tighten it to the specified torque.
Torque: 116N-m (11.8kg-m/85lbft)
12. Install Torsion bar, refer to Torsion Bar in this section.
13. Install rear nut and tighten lower link nut finger-tight.

NOTE: Torque lower control arm nut after adjusting buffer clearance.

Buffer clearance: 22mm (0.87in)

Torque: 235N-m (24.0kg-m/174lbft)

450RS012

3C-20 FRONT SUSPENSION

14. Install front nut then tighten lower link nut finger-tight.

NOTE: Torque lower control arm nut after adjusting buffer clearance .

Buffer clearance: 22mm (0.87in)

Torque: 190N·m (19.4kg·m/140lbft)

NOTE: Adjust the trim height. Refer to Front End Alignment Inspection and Adjustment in Steering section.

450RS012

Upper Ball Joint

Upper Ball Joint and Associated Parts

Legend

- (1) Bolt and Nut
- (2) Upper Ball Joint

- (3) Nut and Cotter Pin

450RW004

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove the speed sensor from the knuckle.

3C-22 FRONT SUSPENSION

3. Remove upper ball joint nut and cotter pin, then use remover 5-8840-2121-0 to remove the upper ball joint from the knuckle.

CAUTION: Be careful not to damage the ball joint boot.

4. Remove bolt and nut.
5. Remove upper ball joint.

Inspection and Repair

Make necessary parts replacement if wear, damage, corrosion or any other abnormal conditions are found through inspection.

- Inspect the lower end boot for damage or grease leak. Move the ball joint as shown in the figure to confirm its normal movement.
- Inspect screw/taper area of ball for damage.
- If any defects are found by the above inspections, replace the ball joint assembly with new one.

- After moving the ball joint 4 or 5 times, attach nut then measure the preload.

Starting torque: 0.5 –3.2N·m (0.05–0.33kg·m/0.4–2.4lbft)

If the above limits specified are exceeded, replace the ball joint assembly.

Installation

1. Install upper ball joint.
2. Install bolt and nut, then tighten them to the specified torque.

Torque: 57N·m (5.8kg·m/42lbft)

3. Install nut and cotter pin, then tighten the nut to the specified torque with just enough additional torque to align cotter pin holes. Install new cotter pin.

Torque: 98N·m (10.0kg·m/72lbft)

Lower Ball Joint

Lower Ball Joint and Associated Parts

450RW011

Legend

- | | |
|----------------------|------------------------|
| (1) Bolt | (3) Nut |
| (2) Lower Ball Joint | (4) Nut and Cotter Pin |

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel in this section.
3. Remove the tie-rod end from the knuckle. Refer to Power Steering Unit in Steering section.
4. Remove the retaining ring from the front axle driving shaft to release the shaft from hub. Refer to Front Hub and Disc in Driveline/Axle section.
5. Support lower control arm with a jack.
6. Remove lower ball joint nut and cotter pin, then use remover 5-8840-2005-0 to remove the lower ball joint from the knuckle.

CAUTION: Be careful not to damage the ball joint boot.

901RW271

3C-24 FRONT SUSPENSION

7. Remove nut.
8. Remove bolt.
9. Remove lower ball joint.

Inspection and Repair

Make necessary parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

- Inspect the lower end boot for damage or grease leak. Move the ball joint as shown in the figure to confirm its normal movement .
- Inspect screw/taper area of ball for damage.
- If any defects are found by the above inspections, replace the ball joint assembly with new one.

- After moving the ball joint 4 or 5 times, attach nut then measure the preload.

Starting torque: 0.5–6.4 N·m (0.05–0.65 kg·m/0.4–4.7 lbft)

- If the above limits specified are exceeded, replace the ball joint assembly.

Installation

1. Install lower ball joint.
2. Install bolt.
3. Install nut and tighten it to the specified torque.
Torque: 116 N·m (11.8 kg·m/85 lbft)
4. Install ball joint nut, then tighten it to the specified torque with just enough additional torque to align cotter pin holes. Install new cotter pin.

Torque: 147 N·m (15.0 kg·m/108 lbft)

Main Data and Specifications

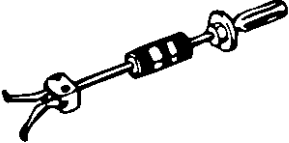

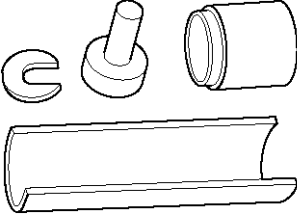

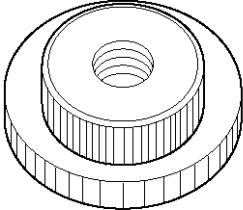

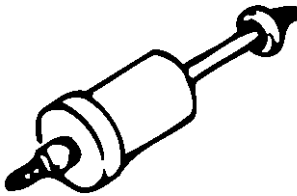

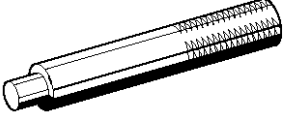

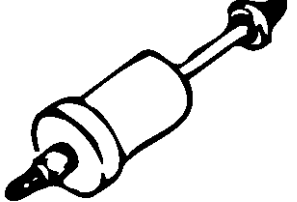

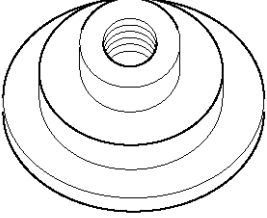

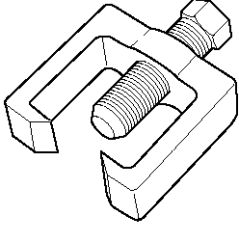

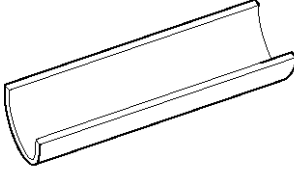

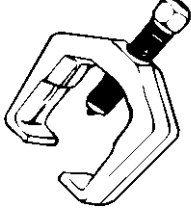

General Specifications

Front suspension	Type	Independent wishbone arms, torsion bar spring with stabilizer bar.
Torsion bar spring	Length	1142mm (45.0in)
	Diameter	Short wheel base: 27.0 mm (1.06 in) Long wheel base: 28.0 mm (1.10 in)
Front shock absorber	Type	Hydraulic, double acting, telescopic
	Piston diameter	30.0mm (1.18in)
	Stroke	125.0mm (4.92in)
	Compressed length	255.0mm (10.04in)
	Extended length	380.0mm (14.96in)
Stabilizer bar	Diameter	Short wheel base: 25.0 mm (0.98 in) Long wheel base: 24.0 mm (0.94 in)

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening

sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

The rear suspension is a 5-link, coil spring type suspension with a stabilizer bar, consisting of two trailing links, two upper links, lateral rod, shock absorber, and stabilizer. In this suspension, the links are specially arranged to enable the rear axle to move freely, thereby expanding suspension stroke, reducing friction, and improving lateral rigidity and roll control. All these result in improved stability, riding comfort, and rough road maneuverability.

Each link connects the axle housing with the frame through a runner bushing. The axle housing is supported by the trailing links and upper links longitudinally and by the lateral rod latitudinally.

3D-2 REAR SUSPENSION

Diagnosis

Condition	Possible cause	Correction
Vehicle Pulls	Mismatched or uneven tires.	Replace tire.
	Tires not adequately inflated.	Adjust tire pressure.
	Broken or sagging springs.	Replace spring.
	Radial tire lateral force.	Replace tire.
	Improper wheel alignment.	Adjust wheel alignment.
	Brake dragging in one wheel.	Repair brake.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension part(s).
	Faulty shock absorbers.	Replace shock absorber.
	Parts in power steering valve defective.	Replace power steering unit.
Abnormal or Excessive Tire Wear	Sagging or broken spring.	Replace spring.
	Tire out of balance.	Balance or replace tire.
	Improper wheel alignment.	Check front end alignment.
	Faulty shock absorber.	Replace shock absorber.
	Hard driving.	Replace tire.
	Overloaded vehicle.	Replace tire and reduce load.
	Tires not rotated periodically.	Replace or rotate tire.
	Worn or loose road wheel bearings.	Replace wheel bearing.
	Wobbly wheel or tires.	Replace wheel or tire.
Tires not adequately inflated.	Adjust the pressure.	
Wheel Hop	Blister or bump on tire.	Replace tire.
	Improper shock absorber operation.	Replace shock absorber.
Shimmy, Shake or Vibration	Tire or wheel out of balance.	Balance wheels or replace tire/or wheel.
	Loose wheel bearings.	Replace wheel bearing.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
	Excessive wheel runout.	Repair or replace wheel and/or tire.
	Blister or bump on tire.	Replace tire.
	Excessive loaded radial runout of tire/wheel assembly.	Replace tire or wheel.
	Improper wheel alignment.	Check wheel alignment.
	Loose or worn steering linkage.	Tighten or replace steering linkage.
	Loose steering unit.	Tighten steering unit.
	Tires not adequately inflated.	Adjust tire pressure.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension parts.
	Faulty shock absorber.	Replace shock absorber.
Hub bearing preload misadjustment.	Adjust preload.	
Parts in power steering valve defective.	Replace power steering unit.	

Condition	Possible cause	Correction
Hard Steering	Bind in steering linkage ball studs, upper or lower ball joint.	Replace ball joint.
	Improper wheel alignment.	Check wheel alignment.
	Tire not adequately inflated.	Inflate tires to proper pressure.
	Bind in steering column or shaft.	Repair or replace.
	Improper power steering system operation.	Repair or replace. Refer to Steering section.
Too Much Play In Steering	Wheel bearings worn.	Replace wheel bearings.
	Loose steering unit or linkage.	Retighten or repair.
	Worn or loose steering shaft universal joint.	Retighten or replace steering shaft.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
Poor Steering Wheel Returnability	Bind in steering linkage ball joints.	Replace ball joints.
	Bind in upper or lower ball joints.	Replace ball joints.
	Bind in steering column and shaft.	Repair or replace.
	Bind in steering gear.	Check and repair steering gear.
	Improper wheel alignment.	Adjust wheel alignment.
	Tires not adequately inflated.	Adjust pressure.
	Loose steering wheel nut.	Retighten.
	Worn wheel bearing.	Replace.
Abnormal Noise	Worn, sticky or loose upper or lower ball joint, steering linkage ball joints or drive axle joints.	Replace.
	Faulty shock absorbers.	Replace.
	Worn upper or lower control arm bushing.	Replace.
	Loose stabilizer bar.	Retighten bolts or replace bushings.
	Loose wheel nuts.	Tighten nuts. Check for elongated wheel nut holes. Replace wheel if required.
	Loose suspension bolts or nuts.	Retighten suspension bolts or nuts.
	Broken or otherwise damaged wheel bearings.	Replace wheel bearing.
	Broken suspension springs.	Replace spring.
	Loose steering unit.	Retighten mounting bolt.
	Faulty steering unit.	Replace steering unit.
Wandering or Poor Steering Stability	Mismatched or unevenly worn tires.	Replace tire or inflate tires to proper pressure.
	Loose steering linkage ball joints.	Replace ball joints.
	Faulty shock absorbers.	Replace shock absorber.
	Loose stabilizer bar.	Tighten or replace stabilizer bar or bushings.
	Broken or sagging springs.	Replace spring (pairs).
	Improper wheel alignment.	Adjust wheel alignment.

3D-4 REAR SUSPENSION

Condition	Possible cause	Correction
Erratic Steering When Braking	Worn wheel bearings.	Replace wheel bearings.
	Broken or sagging springs.	Replace spring (pairs).
	Leaking caliper.	Repair or replace caliper.
	Warped discs.	Replace brake disc.
	Badly worn brake pads.	Replace brake pads.
	Tires are inflated unequally.	Inflate tires to proper pressure.
Low or Uneven Trim Height	Broken or sagging springs.	Replace springs (In pairs).
	Vehicle overloaded.	Reduce load.
	Incorrect springs.	Adjust or replace torsion bar.
Suspension Bottoms	Vehicle overloaded.	Reduce load.
	Faulty shock absorber.	Replace shock absorber.
	Incorrect, broken or sagging springs.	Replace springs.
Body Leans	Loose stabilizer bar.	Tighten stabilizer bar bolts or replace bushings.
	Faulty shock absorber, struts or mounting.	Replace shock absorber.
	Broken or sagging springs.	Replace springs (In pairs).
	Vehicle overloaded.	Reduce load.
Cupped Tires	Worn wheel bearings.	Replace wheel bearing.
	Excessive tire or wheel run out.	Replace tire or wheel.
	Worn ball joints.	Replace ball joints.
	Tire out of balance.	Adjust tire balance.

Coil Spring

Coil Spring and Associated Parts

Legend

- | | |
|------------------------------------|--------------------|
| (1) Stabilizer Bar | (5) Insulator |
| (2) Upper Link Fixing Bolt and Nut | (6) Shock Absorbar |
| (3) Rubber Plate | (7) Breather Hose |
| (4) Coil Spring | |

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Support the rear axle case with a jack.
3. Disconnect brake hose at the crossmember.
4. Remove breather hose.
5. Remove upper link fixing bolt, nut and rubber plate on the rear axle case (left-side only).
6. Disconnect the stabilizer bar at the stabilizer link.
7. Remove the shock absorber from the axle case.
8. Remove spring insulator.
9. Remove the insulator and coil spring while lowering the rear axle case.

CAUTION: Be sure not to let the brake hose, parking brake cable, and breather hose extend to their full length.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

Check the following parts:

- Coil spring
- Insulator

Installation

1. Install coil spring and make sure that the coil spring is installed in the proper position. Paint mark(1) should be downward.

2. Fit the end of the coil spring to the coil spring seat and mount the coil spring on the rear axle case.

3. Install the insulator on the coil spring. Jack up the axle case gently with the top of the coil spring set to the spring seat on the frame side.

4. Install shock absorber and tighten the nut lightly, then retighten it to the specified torque after the vehicle is at curb height.

NOTE: When mounting shock absorber, be sure not to use grease on bushings or any other nearby part.

Torque: 78 N·m (8.0kg·m/58 lbft)

5. Install stabilizer bar.

Torque: 31 N·m (3.2kg·m/23 lbft)

6. Install upper link with rubber plate and tighten fixing bolt.

Torque: 137 N·m (14.0kg·m/101 lbft)

7. Install breather hose.

8. Connect brake hose and bleed the brake system. Refer to Bleeding the Brake Hydraulic System in Brake section.

Shock Absorber

Shock Absorber and Associated Parts

Legend

- (1) Nut, Bush and Washer
 (2) Shock Absorber

- (3) Nut and Washer

Removal

1. Remove shock absorber fixing nut, bush and washer (upper side).
2. Remove shock absorber fixing nut and washer (lower side).
3. Remove shock absorber.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

Check the following parts:

- Shock absorber
- Rubber bushing

NOTE: When mounting rubber bushings, be sure not to use grease on bushings or any other nearby part.

Installation

1. Install shock absorber. When mounting shock absorber, be sure not to use grease on bushings or any other nearby part.
2. Install nut and washer (lower side), then tighten the nut lightly. Retighten to the bolt and nut specified torque after the vehicle is at curb height.

Torque: 78N-m (8.0kg-m/58lbft)

3. Install nut, bush and washer (upper side), then tighten the nut lightly. Retighten to the nut specified torque after the vehicle is at curb height.

Torque: 20N-m (2.0kg-m/14lbft)

Trailing Link

Trailing Link and Associated Parts

Legend

- | | |
|--------------------------------|-----------------------|
| (1) Bolt and Nut (Axle side) | (3) Bolt (Frame side) |
| (2) Protector (Left side only) | |

Removal

1. Remove the parking brake cable from the trailing link.
2. Remove the trailing link fixing bolt, nut and protector.
3. Remove trailing link.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

1. Trailing link
2. Rubber bushing
 - Remove the rubber bushing by using remover 5-8840-2298-0.

- Install the rubber bushing by using installer 5-8840-2298-0.

NOTE: When mounting rubber bushings, be sure not to use grease on bushings or any other nearby part.

Installation

1. Install trailing link. Make sure that the trailing link is in its correct position.

NOTE: When mounting trailing link, be sure not to use grease on bushings or any other nearby part.

2. Install bolt, nut and protector. Tighten the bolts and nuts lightly, then retighten them to the specified torque after the vehicle is at curb height.

Torque: 137N·m (14.0kg·m/101lbft)

3. Install parking brake cable.

CAUTION: The parking brake cable should not be overstrained or slackened.

Upper Link

Upper Link and Associated Parts

460RW037-1

Legend

- | | |
|------------------------------|--------------------------------|
| (1) Bolt and Nut (Axle side) | (4) Protector (Left side only) |
| (2) Rubber Plate | (5) Bolt (Frame side) |
| (3) Upper Link | |

Removal

1. Remove fuel tank. Refer to Engine Fuel in Engine section.
2. Remove the speed sensor cable from the upper link.
3. Remove bolt, nut, rubber plate and protector.
4. Remove upper link.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

1. Upper link
2. Rubber bushing
 - Remove the rubber bushing by using remover 5-8840-2565-0.

901RW282

- Install the rubber bushing by using to installer 5-8840-2565-0.

NOTE: When mounting rubber bushings, be sure not to use grease on bushings or any other nearby part.

Installation

1. Install upper link. Make sure that the upper link is in its correct position.

NOTE: When mounting upper link, be sure not to use grease bushings or any other nearby part.

2. Install bolt, nut, rubber plate and protector. Tighten the bolts and nuts lightly, then retighten them to the specified torque after the vehicle is at curb height.

Torque: 137N·m (14.0kg·m/101lbft)

3. Install speed sensor cable.
4. Install fuel tank.

Lateral Rod

Lateral Rod and Associated Parts

460RW036

Legend

- (1) Bolt and Nut (Frame side)
 (2) Lateral Rod

- (3) Nut and Washer (Axle side)

Removal

1. Remove nut and washer.
2. Remove bolt and nut.
3. Remove lateral rod.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

1. Lateral rod
2. Rubber bushing (Frame side)
 - Remove the rubber bushing (Frame side) by using remover 5-8840-2299-0.

901RW284

- Install the rubber bushing (Frame side) by using Installer 5-8840-2299-0.

NOTE: When mounting rubber bushings, do not use grease on bushings or any other nearby parts.

901RW285

3. Rubber bushing (Axle side)

- Remove the rubber bushing (Axle side) by using remover 5-8840-2327-0.

901RW287

- Install the rubber bushing (Axle side) by using installer 5-8840-2327-0.

901RW286

Installation

1. Install lateral rod and make sure that the lateral rod is in its correct position.

NOTE: When mounting lateral rod, be sure not to use grease on bushings or any other nearby part.

460RW035

Legend

- (1) Frame Side
- (2) Axle Side

2. Install bolt and nut. Tighten the bolt and nut lightly, then retighten them to the specified torque after the vehicle is at curb height.

Torque: 137N-m (14.0kg-m/101lbft)

3. Install nut and washer. Tighten the nut lightly, then retighten the nut to the specified torque after the vehicle is at curb height.

Torque: 78N-m (8.0kg-m/58lbft)

Stabilizer Bar

Stabilizer Bar and Associated Parts

Legend

- | | |
|------------------|--------------------|
| (1) Bracket | (4) Stabilizer Bar |
| (2) Link | (5) Rubber Bushing |
| (3) Bolt and Nut | |

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel in this section.
3. Remove bolt and nut.
4. Remove link.

CAUTION: Be careful not to damage the ball joint boot.

5. Remove bracket.

6. Remove rubber bushing.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

Check the following parts:

- Stabilizer bar
- Rubber bushing
- Link

Installation

1. Install rubber bushing.
2. Install bracket to axle housing and tighten to the specified torque.

Torque: 25 N·m (2.5 kg·m/19 lbf)

3. Install link.
4. Install bolt and nut, then tighten the nut to the specified torque.

Torque: 31 N·m (3.2 kg·m/27 lbf)

460RW010

Main Data and Specifications

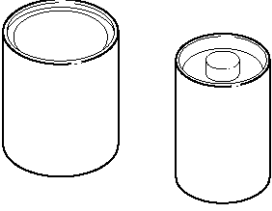

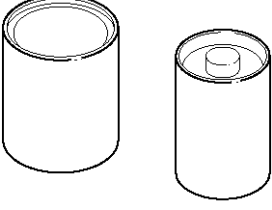

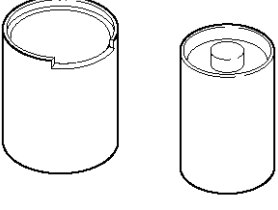

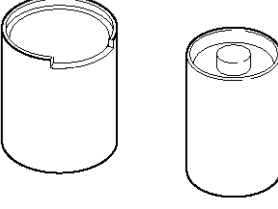

General Specifications

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

3E-2 WHEEL AND TIRE SYSTEM

General Description

Replacement wheels or tires must be equivalent to the originals in load capacity, specified dimension and mounting configuration. Improper size or type may affect bearing life, brake performance, speedometer/odometer calibration, vehicle ground clearance and tire clearance to the body and chassis. All model are equipped with metric sized tubeless steel belted radial tires. Correct tire pressures and driving habits have an important influence on tire life. Heavy cornering, excessively rapid acceleration and unnecessary sharp braking increase premature and uneven wear.

Diagnosis

Condition	Possible cause	Correction
Vehicle Pulls	Mismatched or uneven tires.	Replace tire.
	Tires not adequately inflated.	Adjust tire pressure.
	Broken or sagging springs.	Replace spring.
	Radial tire lateral force.	Replace tire.
	Improper wheel alignment.	Adjust wheel alignment.
	Brake dragging in one wheel.	Repair brake.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension part(s).
	Faulty shock absorbers.	Replace shock absorber.
	Parts in power steering valve defective.	Replace power steering unit.
Abnormal or Excessive Tire Wear	Sagging or broken spring.	Replace spring.
	Tire out of balance.	Balance or replace tire.
	Improper wheel alignment.	Check front end alignment.
	Faulty shock absorber.	Replace shock absorber.
	Hard driving.	Replace tire.
	Overloaded vehicle.	Replace tire and reduce load.
	Tires not rotated periodically.	Replace or rotate tire.
	Worn or loose road wheel bearings.	Replace wheel bearing.
	Wobbly wheel or tires.	Replace wheel or tire.
Tires not adequately inflated.	Adjust the pressure.	
Wheel Hop	Blister or bump on tire.	Replace tire.
	Improper shock absorber operation.	Replace shock absorber.
Shimmy, Shake or Vibration	Tire or wheel out of balance.	Balance wheels or replace tire/or wheel.
	Loose wheel bearings.	Replace wheel bearing.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
	Excessive wheel runout.	Repair or replace wheel and/or tire.
	Blister or bump on tire.	Replace tire.
	Excessive loaded radial runout of tire/wheel assembly.	Replace tire or wheel.
	Improper wheel alignment.	Check wheel alignment.
	Loose or worn steering linkage.	Tighten or replace steering linkage.
	Loose steering unit.	Tighten steering unit.
	Tires not adequately inflated.	Adjust tire pressure.
	Loose, bent or broken front or rear suspension parts.	Tighten or replace the appropriate suspension parts.
	Faulty shock absorber.	Replace shock absorber.
Hub bearing preload misadjustment.	Adjust preload.	
Parts in power steering valve defective.	Replace power steering unit.	

Condition	Possible cause	Correction
Hard Steering	Bind in steering linkage ball studs, upper or lower ball joint.	Replace ball joint.
	Improper wheel alignment.	Check wheel alignment.
	Tire not adequately inflated.	Inflate tires to proper pressure.
	Bind in steering column or shaft.	Repair or replace.
	Improper power steering system operation.	Repair or replace. Refer to Steering section.
Too Much Play In Steering	Wheel bearings worn.	Replace wheel bearings.
	Loose steering unit or linkage.	Retighten or repair.
	Worn or loose steering shaft universal joint.	Retighten or replace steering shaft.
	Worn steering linkage ball joints.	Replace ball joints.
	Worn upper or lower end ball joints.	Replace ball joints.
Poor Steering Wheel Returnability	Bind in steering linkage ball joints.	Replace ball joints.
	Bind in upper or lower ball joints.	Replace ball joints.
	Bind in steering column and shaft.	Repair or replace.
	Bind in steering gear.	Check and repair steering gear.
	Improper wheel alignment.	Adjust wheel alignment.
	Tires not adequately inflated.	Adjust pressure.
	Loose steering wheel nut.	Retighten.
	Worn wheel bearing.	Replace.
Abnormal Noise	Worn, sticky or loose upper or lower ball joint, steering linkage ball joints or drive axle joints.	Replace.
	Faulty shock absorbers.	Replace.
	Worn upper or lower control arm bushing.	Replace.
	Loose stabilizer bar.	Retighten bolts or replace bushings.
	Loose wheel nuts.	Tighten nuts. Check for elongated wheel nut holes. Replace wheel if required.
	Loose suspension bolts or nuts.	Retighten suspension bolts or nuts.
	Broken or otherwise damaged wheel bearings.	Replace wheel bearing.
	Broken suspension springs.	Replace spring.
	Loose steering unit.	Retighten mounting bolt.
	Faulty steering unit.	Replace steering unit.
Wandering or Poor Steering Stability	Mismatched or unevenly worn tires.	Replace tire or inflate tires to proper pressure.
	Loose steering linkage ball joints.	Replace ball joints.
	Faulty shock absorbers.	Replace shock absorber.
	Loose stabilizer bar.	Tighten or replace stabilizer bar or bushings.
	Broken or sagging springs.	Replace spring (pairs).
	Improper wheel alignment.	Adjust wheel alignment.

Condition	Possible cause	Correction
Erratic Steering When Braking	Worn wheel bearings.	Replace wheel bearings.
	Broken or sagging springs.	Replace spring (pairs).
	Leaking caliper.	Repair or replace caliper.
	Warped discs.	Replace brake disc.
	Badly worn brake pads.	Replace brake pads.
	Tires are inflated unequally.	Inflate tires to proper pressure.
Low or Uneven Trim Height	Broken or sagging springs.	Replace springs (In pairs).
	Vehicle overloaded.	Reduce load.
	Incorrect springs.	Adjust or replace torsion bar.
Suspension Bottoms	Vehicle overloaded.	Reduce load.
	Faulty shock absorber.	Replace shock absorber.
	Incorrect, broken or sagging springs.	Replace springs.
Body Leans	Loose stabilizer bar.	Tighten stabilizer bar bolts or replace bushings.
	Faulty shock absorber, struts or mounting.	Replace shock absorber.
	Broken or sagging springs.	Replace springs (In pairs).
	Vehicle overloaded.	Reduce load.
Cupped Tires	Worn wheel bearings.	Replace wheel bearing.
	Excessive tire or wheel run out.	Replace tire or wheel.
	Worn ball joints.	Replace ball joints.
	Tire out of balance.	Adjust tire balance.

Irregular and Premature Wear

Irregular and/or premature wear has many causes. Some of them are incorrect inflation pressures, lack of tire rotation, poor driving habits or improper wheel alignment. Incorrect inflation is common cause of tire premature wear.

NOTE: Due to their design, radial tires tend to wear faster in the shoulder area, particularly on the front tires. This makes regular rotation especially necessary. After rotation, be sure to check wheel nut torque, and set tire pressures.

Tire Rotation

Tire rotation is recommended to equalize wear for longer tire life.

Legend

(1) Spare Tire

If the following conditions are noted, rotate the tires:

- Front tire wear is different from rear.
- Uneven wear exists across the tread of any tire.
- Left and right front tire wear is unequal.
- Left and right rear tire wear is unequal.

Check wheel alignment if the following conditions are noted:

- Left and right front tire wear is unequal.
- Wear is uneven across the tread of any front tire.
- Front tire treads have a scuffed appearance with "feather" edges on one side of the tread ribs or blocks.

Tread Wear Indicators

The original equipment tires have built-in tread wear indicators(1) to show when tires need replacement. These indicators may appear as wide bands. When the indicators appear in two or more grooves at three locations, tire replacement is recommended.

Inflation of Tires

710RX004

Tire pressure, in cold condition (after vehicle has set for three hours or more, and driven less than one mile), should be checked monthly or before any extended trip. Tire pressure increases approximately 15% when the tires become hot during driving. Tire pressure specification is shown on the label located on the left door lock pillar.

NOTE: Check the tire pressure whenever irregular wear is found. Tire inflation greatly affects tire wear. If the alignment check does not reveal any alignment problems, check the condition of the shock absorbers and wheel/tire balance.

Diagnosis List

If the following conditions are noted, rotation is required.

1. Front tire wear is different from rear.
2. Uneven wear exists across the tread of any tire.
3. Left and right front tire wear is unequal.
4. Left and right rear tire wear is unequal.

If the following conditions are noted, check the wheel alignment.

1. Left and right front tire wear is unequal.
2. Uneven wear exists across the tread of any tire.
3. Front tire treads have scuffed appearance with "feather" edges on one side of tread ribs or blocks.
4. There is cupping, flat spotting etc.

Higher than recommended pressure can cause:

1. Hard ride.
2. Poor steering stability.
3. Rapid and uneven wear at center of the tread.

Lower than recommended pressure can cause:

1. Tire squeal on turns.
2. Hard steering.
3. Rapid and uneven wear on the edges of the tread.

4. Tire rim bruises and rupture.
5. Tire cord breakage.
6. High tire temperatures.
7. Reduced handling.
8. Reduced fuel economy.

Unequal pressure on same axle can cause:

1. Uneven braking.
2. Steering lead.
3. Reduced handling.
4. Swerve on acceleration.

Radial Tire Waddle

480RW011

Waddle is side-to-side movement at the front and/or rear of the car. It can be caused by the steel belt not being straight within the tire, or by excessive lateral runout of the tire or wheel. It is most noticeable at low speed, about 8 to 48 km/h (5 to 30 mph). It may also cause rough ride at 80 to 113 km/h (50 to 70 mph). The car can be road tested to see which end of the car has the faulty tire. If the tire causing the waddle is on the rear, the rear end of the car will "waddle". From the driver's seat, it feels as if someone is pushing on the side of the car.

If the faulty tire is on the front, the waddle is more easily seen. The front sheet metal appears to be moving back and forth. It feels as if the driver's seat is the pivot point in the car.

Another more time-consuming method of determining the faulty tire is substituting tire and wheel assemblies that are known to be good. Follow these steps:

1. Drive the car to determine if the waddle is coming from the front or rear.
2. Install tire and wheel assemblies known to be good (from a similar car) in place of those on the end of the car which is waddling. If the waddle cannot be isolated to front or rear, start with the rear tires.

3E-8 WHEEL AND TIRE SYSTEM

3. Road test again. If improvement is noted, install the original tire and wheel assemblies one at a time until the faulty tire is found. If no improvement is noted, install tires known to be good in place of all four. Then, install the originals one at a time until the faulty tire is found.

Radial Tire Lead/Pull

"Lead/Pull" is vehicle deviation from a straight path, on a level road with no pressure on the steering wheel.

Lead is usually caused by:

1. Poorly manufactured radial tires.

2. Uneven brake adjustment.

3. Wheel alignment.

The way in which a tire is built can produce lead in a car. An example of this is placement of the belt. Off-center belts on radial tires can cause the tire to develop a side force while rolling straight down the road and the tire will tend to roll like a cone.

The "Radial Tire Lead/Pull Correction" chart should be used to make sure that front wheel alignment is not mistaken for tire lead.

Rear tires will not cause lead/pull.

Radial Tire Lead/Pull Correction Chart

Step	Action	Yes	No
1	1. Inflate tires to recommended pressure. 2. Road test vehicle on level uncrowned road. Was a problem corrected?	End.	Go to Step 2
2	Switch front tires side to side and road test again. Was a problem corrected?	If roughness results, replace tires.	Go to Step 3
3	Did the vehicle lead in same direction?	Go to Step 4	Go to Step 5
4	Put tires back in original position and check alignment. Was a problem corrected?	End.	Go to Step 5
5	Install known good tire on one front side. Was a problem corrected?	Replace tire.	Install a known good tire in place of other front tire. If lead corrected, replace tire.

Typical examples of abnormal tire ahead wear and major causes:

CAUTION: Similar wear patterns can be caused by worn suspension parts, misalignment of wheels and tires, and other suspension related problems.

Spotty wear – wear localized on shoulder sections, and in an extreme cases, the tire becomes polygonal in shape.

1. Tire or wheel out of round or distorted.
 2. Hub or knuckle out of round or distorted.
 3. Play in hub bearings or ball joint.
 4. Rotating parts out of balance.
- Tread wear one-sided.

480RW003

1. Rotating parts out of balance.
 2. Tire or wheel out of round.
 3. Hub or knuckle out of round or distorted.
- Localized tread wear.

480RW004

1. Once spotty wear develops in tread due to hard braking or abrupt starting, localized wear tends to be promoted.
- Shoulder wear (generally wear develops in outer shoulder):

480RW005

1. Camber or toe-in incorrect.
2. Shoulder wear caused by repeated hard-cornering. Wear in shoulders at points opposed to each other.

480RW006

3E-10 WHEEL AND TIRE SYSTEM

1. Tire or wheel out of round or distorted.
 2. Play in bearings or ball joint.
- Premature wear in shoulders.

480RW007

1. Flexing of tire excessive due to under-inflation.
- One sided feather edging.

480RW008

1. Wear caused by repeated hard cornering.
2. Camber or toe-in incorrect.

Wheel

Wheel and Associated Parts

480RX008

Legend

(1) Wheel Lug Nut

(2) Wheel and Tire

Removal

1. Loosen wheel lug nut by approximately 180° (half a rotation), then raise the vehicle and remove the nuts.
2. Remove wheel and tire.

NOTE: Never use heat to loosen a tight wheel lug nut. The application of heat to the hub can shorten the life of the wheel and may cause damage to wheel bearings.

Installation

1. Install wheel and tire.
2. Install wheel lug nut, and lower the vehicle. Tighten the wheel lug nuts to the specified torque in numerical order.

Torque: 118N·m (12.0kg·m/87lbft)

CAUTION: Before installing wheels, remove any build-up of corrosion on the wheel mounting surface and brake disc mounting surface by scraping and wire brushing. Installing wheels without good metal-to-metal contact at mounting surfaces can cause wheel nuts to loosen, which can later allow a wheel to come off while the vehicle is moving.

NOTE: Valve caps should be on the valve stems to keep dust and water out.

490RS020

Tire

Tire Replacement

When replacement is necessary, the original metric the size should be used. Most metric tire sizes do not have exact corresponding alphanumeric tire sizes. It is recommended that new tires be installed in pairs on the same axle. If necessary to replace only one tire, it should be paired with tire having the most tread, to equalize braking traction.

CAUTION: Do not mix different types of tires such as radial, bias and bias-belted tires except in emergencies, because vehicle handling may be seriously affected and may result in loss of control.

Tire Dismounting

Remove valve cap on valve step and deflate the tire. Then use a tire changing machine to mount or dismount tires.

Follow the equipment manufacturer's instruction. Do not use hand tools or tire lever alone to change tires as they may damage the tire beads or wheel rim.

Tire Mounting

Rim bead seats should be cleaned with a wire brush or coarse steel wool to remove lubricants, and light rust. Before mounting a tire, the bead area should be well lubricated with an approved tire lubricant.

After mounting, inflate the tire to 200kPa (2.0kg/cm², 28 psi) so that beads are completely seated. Inflate the air to specified pressure and install valve cap to the stem.

WARNING: NEVER STAND OVER TIRE WHEN INFLATING. BEAD MAY BREAK WHEN BEAD SNAPS OVER RIM'S SAFETY HUMP AND CAUSE SERIOUS PERSONAL INJURY.

NEVER EXCEED 240 KPA (2.4kg/cm², 35 PSI) PRESSURE WHEN INFLATING. IF 240 KPA (2.4kg/cm², 35 PSI) PRESSURE WILL NOT SEAT BEADS, DEFLATE, RE-LUBRICATE AND RE-INFLATE. OVER INFLATION MAY CAUSE THE BEAD TO BREAK AND CAUSE SERIOUS PERSONAL INJURY.

Tire Repair

There are many different materials on the market used to repair tires.

Manufacturers have published detailed instructions on how and when to repair tires. These instructions can be obtained from the tire manufacturer if they are not included with the repair kit.

Wheel Inspection

Damaged wheels and wheels with excessive run-out must be replaced.

Wheel run out at rim (Base on hub Bore):

Steel	Aluminum
1– Vertical play: Less than 1.5 mm (0.059 in)	1– Vertical play: Less than 0.7 mm (0.028 in)
2– Horizontal play: Less than 1.5 mm (0.059 in)	2– Horizontal play: Less than 0.7 mm (0.028 in)

480RS012

General Balance Procedure

Deposits of mud, etc. must be cleaned from the inside of the rim.

The tire should be inspected for the following: match mount paint marks, bent rims, bulges, irregular tire wear, proper wheel size and inflation pressure. Then balance according to the equipment manufacturer's recommendations.

There are two types of wheel and tire balance. Static balance is the equal distribution of weight around the wheel.

Assemblies that are statically unbalanced cause a bouncing action called tramp. This condition will eventually cause uneven tire wear.

480RS013

Legend

- (1) Heavy Spot Wheel Shimmy
- (2) Add Balance Weights Here

Dynamic balance is the equal distribution of weight on each side of the wheel center-line so that when the tire spins there is no tendency for the assembly to move from side to side. Assemblies that are dynamically unbalanced may cause shimmy.

480RS014

Legend

Balancing Wheel and Tire

On-vehicle Balancing

On-Vehicle balancing methods vary with equipment and tool manufacturers. Be sure to follow each manufacturer's instructions during balancing operation.

Off-vehicle Balancing

Most electronic off-vehicle balancers are more accurate than the on-vehicle spin balancers. They are easy to use and give a dynamic balance. Although they do not correct for drum or disc unbalance (as on-vehicle spin balancing does), they are very accurate.

480RS015

WARNING: STONES SHOULD BE REMOVED FROM THE TREAD TO AVOID OPERATOR INJURY DURING SPIN BALANCING AND TO OBTAIN A GOOD BALANCE.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Front Drive Axle

Diagnosis

Condition	Possible cause	Correction
Oil Leak At Front Axle	Worn or defective oil seal.	Replace the oil seal.
	Front axle housing cracked.	Repair or replace.
Oil Leak At Pinion Shaft	Too much gear oil.	Correct the oil level.
	Oil seal worn or defective.	Replace the oil seal.
	Pinion flange loose or damaged.	Tighten or replace.
Noises In Front Axle Drive Shaft Joint	Broken or worn drive shaft joints and bellows (BJ and DOJ).	Replace the drive shaft joints and bellows.
"Clank" When Accelerating From "Coast"	Loose drive shaft joint to output shaft bolts.	Tighten.
	Damaged inner drive shaft joint.	Replace.
Shudder or Vibration During Acceleration	Excessive drive shaft joint angle.	Repair.
	Worn or damaged drive shaft joints.	Replace.
	Sticking spider assembly (inner drive shaft joint).	Lubricate or replace.
	Sticking joint assembly (outer drive shaft joint).	Lubricate or replace.
Vibration At Highway Speeds	Out of balance or out of round tires.	Balance or replace.
	Front end out of alignment.	Align.
Noises in Front Axle	Insufficient gear oil.	Replenish the gear oil.
	Wrong or poor grade gear oil.	Replace the gear oil.
	Drive pinion to ring gear backlash incorrect.	Adjust the backlash.
	Worn or chipped ring gear, pinion gear or side gear.	Replace the ring gear, pinion gear or side gear.
	Pinion shaft bearing worn.	Replace the pinion shaft bearing.
	Wheel bearing worn.	Replace the wheel bearing.
	Differential bearing loose or worn.	Tighten or replace.
Wanders and Pulls	Wheel bearing preload too tight.	Adjust the wheel bearing preload.
	Incorrect front alignment.	Adjust the front alignment.
	Steering unit loose or worn.	Tighten or replace.
	Tire worn or improperly inflated.	Adjust the inflation or replace.
	Front or rear suspension parts loose or broken.	Tighten or replace.
Front Wheel Shimmy	Wheel bearing worn or improperly adjusted.	Adjust or replace.
	Incorrect front alignment.	Adjust the front alignment.
	Worn ball joint or bush.	Replace the ball joint or bush.
	Steering unit loose or worn.	Tighten or replace.
	Tire worn or improperly inflated.	Replace or adjust the inflation.
	Shock absorber worn.	Replace the shock absorber.

Pinion Shaft Oil Seal

Pinion Shaft Oil Seal and Associated Parts

Legend

- | | |
|----------------|------------------------|
| (1) Flange Nut | (4) Outer Bearing |
| (2) Flange | (5) Collapsible Spacer |
| (3) Oil Seal | |

Removal

1. Raise the vehicle and support it at the frame.
The hoist must remain under the front axle housing.
2. Drain the front axle oil by loosening the drain plug(1).

412RS001

4A1-4 DIFFERENTIAL (FRONT)

3. Remove the front propeller shaft. Refer to Front Propeller Shaft in this section.
4. Remove flange nut by using pinion flange holder 5-8840-2157-0.

5. Remove flange.
6. Remove oil seal.
7. Remove outer bearing by using remover 5-8840-2323-0.

8. Remove collapsible spacer.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection. Check the following parts.

1. Seal surface of the pinion.
2. Cage bore for burns.

Installation

1. Install collapsible spacer. Discard the used collapsible spacer and install a new one.
2. Install outer bearing.

NOTE: Do not drive in, but just temporarily set in the outer bearing by hand, which should be indirectly pressed in finally by tightening the flange nut.

3. Install oil seal, use oil seal installer 9-8522-1275-0 to install a new oil seal that has grease on seal lip.

4. Install flange.
5. Install flange nut, refer to Differential Assembly Overhaul for flange nut reassembly in this section.

NOTE: Discard the used nut and install a new one.

Front Drive Axle Assembly

Front Drive Axle Assembly and Associated Parts

Legend

- | | |
|---|--------------------------------------|
| (1) Propeller Shaft | (5) Mounting Bolt |
| (2) Mounting Nut | (6) Tie-rod End; Power Steering Unit |
| (3) Front Axle Case Assembly and Front Drive Shaft Assembly | (7) Knuckle and Back Plate |
| (4) Washer | (8) Hub and Disc Assembly |
| | (9) Suspension Crossmember |

4A1-6 DIFFERENTIAL (FRONT)

Removal

1. Jack up the vehicle and support it using jack stand.
2. Remove the tire and wheel.
3. Remove the stone guard.
4. Remove the brake caliper fixing bolt and hang the caliper. Refer to Disc Brakes in Brake section.
5. Remove the antilock brake system speed sensor. Refer to Front Wheel Speed Sensor in Brake section.
6. Remove the hub and disc assembly. Refer to Front Hub and Disc in this section.
7. Remove the propeller shaft, refer to Front Propeller Shaft in this section.
8. Loosen the height control arm of the torsion bar, then remove the torsion bar from lower control arm. refer to Torsion Bar in Suspension section.
9. Remove the suspension crossmember.
10. Remove the lower nut (1) of the stabilizer link.
11. Remove the lower bolt and nut (2) of the shock absorber.

12. Remove the tie-rod end from the knuckle. Refer to Power Steering Unit in Steering Section.
13. Disconnect the hose of the shift on the fly, at the hose clip portion (1).
14. Disconnect the shift switch connector (2).

15. Remove the bolts and nuts of the lower control arm (Frame side), then disconnect the lower control arm from frame.
16. Disconnect between the right side upper control arm and the knuckle, then remove the knuckle with lower control arm.

CAUTION: When removing the knuckle, be careful not to damage the oil seal inside of the knuckle.

17. Support the differential case by the jack.
18. Remove the front axle mounting bolts and nuts, lower the jack slowly. Remove the left side drive shaft end from the knuckle, then lower the axle assembly from the vehicle.

CAUTION:

1. During the work, be sure that the axle assembly is supported securely.
2. Be careful not to damage the bellows of the power steering unit by interference.
3. Be careful not to damage the hose bracket of the shift on the fly by interference.

Installation

1. Support the differential case by the jack.
2. Jack up the front drive axle assembly, install the left side drive shaft to the knuckle, then install the mount bolts and nuts.

CAUTION:

1. Be careful not to damage the bellows of the power steering unit by interference.
2. Be careful not to damage the hose bracket of the shift on the fly by interference.
3. When installing the drive shaft to the knuckle, be careful not to damage the oil seal inside of the knuckle.
3. Tighten the mounting bolts and nuts to the specified torque.

Torque: 168N·m (17.2kg·m/124 lbft)

4. Install the right side knuckle with lower control arm to the upper control arm.
Refer to Knuckle in Suspension section.

CAUTION: When insert the drive shaft to the knuckle, be careful not to damage the oil seal inside of the knuckle.

5. Align the bolt hole of the lower control arm, install the bolts and nuts.

NOTE: Adjust the buffer clearance before tighten the bolts and nuts of the lower control arm.

6. Install the hose of the shift on the fly (1).
7. Install the shift switch connector (2) of the shift on the fly.

8. Install the tie-rod end of the power steering unit to the knuckle, tighten the nut to the specified torque.

Torque: 118N·m (12.0kg·m/87 lbft)

9. Install lower bolts and nuts of the shock absorber, tighten it to the specified torque.

Torque: 93N·m (9.5kg·m/69 lbft)

10. Install lower nuts of the stabilizer link, tighten it to the specified torque.
11. Install the suspension crossmember.
12. Install the torsion bar.
Refer to Torsion Bar in Suspension section.
13. Install the front propeller shaft.
Refer to Front Propeller Shaft in this section.
14. Install the hub and disc assembly and adjust the bearing preload.
Refer to Front Hub and Disc in this section.
15. Install the wheel speed sensor of the antilock brake system.
16. Install the brake caliper. Tighten the bolt of the caliper bracket to the specified torque.
Torque: 50N·m (5.1kg·m/37 lbft)
17. Install the stone guard.
18. Install the tire and wheel.
19. Lower the vehicle, adjust the trim height.
Refer to Trim Height Adjustment in Steering section.
20. Tighten the bolts and nuts of the lower control arm to the specified torque.
Refer to Lower Control Arm in Suspension section.

Differential Assembly

Disassembled View

415RX003

Legend

- | | |
|-------------------------------|------------------------------|
| (1) Differential Assembly | (12) Collapsible Spacer |
| (2) Flange Nut | (13) Pinion Gear |
| (3) Flange | (14) Inner Bearing |
| (4) Dust Cover | (15) Adjust Shim |
| (5) Oil Seal | (16) Diff Cage Assembly |

| (8) Differential Carrier | (19) Adjust Shim |
| (9) Bearing Cap | (20) Bolt |
| (10) Bolt | (21) Axle Case |
| (11) Inner Bearing Outer Race | |

Disassembly

1. Remove differential carrier fixing bolt.
2. Remove differential assembly.
3. Using holding fixture 5-8840-0275-0 and holding fixture base 5-8840-0003-0, fix the differential assembly to the bench.

4. Remove bearing cap bolt.
5. Apply a setting mark to the side bearing cap and the differential carrier then remove bearing cap.

6. Remove differential cage assembly.
7. Remove side bearing outer race, after removal, keep the right and left hand side bearing assemblies separate to maintain inner and outer race combinations.
8. Remove side bearing, using remover 5-8840-0013-0, 5-8840-0014-0 and adapter 9-8521-1743-0.

9. Remove adjust shim, note the thickness and position of the shims removed.
10. Remove the flange nut using holding wrench 5-8840-2157-0 after raising up its staked parts completely.

4A1-10 DIFFERENTIAL (FRONT)

11. Remove flange.
12. Remove dust cover.
13. Remove the drive pinion assembly using a soft metal rod and a hammer.

14. Remove collapsible spacer.
15. Remove the inner bearing using remover 5-8840-0015-0 and a press.

16. Remove adjust shim.
17. Remove oil seal.
18. Remove outer bearing.
19. Remove the inner bearing outer race (1) and the outer bearing outer race (2) by using a brass bar and a hammer.

Reassembly

- Using installer 9-8522-1141-0 and grip 5-8840-0007-0, install outer bearing outer race.

415RW018

- Using installer 9-8522-1274-0 and grip 5-8840-0007-0, install Inner bearing outer race.

415RW017

- Install adjust shim and adjust drive pinion mounting distance:

- Apply gear oil to the inner and outer drive pinion bearing.
Clean the pinion setting gauge set.
Then install the gauge set together with the inner and outer bearings.
- Tighten the nut to the specified torque.

Torque: 2.3N-m (0.2kg-m/20lbin)

415RS009

Legend

- Pilot : 5-8840-2085-0
- Nut and Bolt: 5-8840-2089-0
- Gauge Plate : 5-8840-2087-0

- Clean the side bearing bores. Install the dial indicator with the discs and arbor. Install and tighten the bearing caps to the specified torque.

Torque: 98N-m (10kg-m/72lbf)

415RS010

Legend

- Dial Indicator: 5-8840-0126-0
- Disc (2 pcs.): 5-8840-2088-0
- Arbor: 5-8840-0128-0
- Gauge Plate: 5-8840-2087-0

4A1-12 DIFFERENTIAL (FRONT)

- Set the dial indicator to "0". Place it on the mounting post of the gauging arbor with the contact button touching the indicator pad. Force the dial indicator downward until the needle has made a half turn clockwise. Tighten down the dial indicator in this position.

Legend

- Dial Indicator
- Gauging Arbor
- Plunger
- Gauge Plate

- Position the plunger on the gauge plate. Move the gauging arbor slowly back and forth and locate the position at which the dial indicator shows the greatest deflection. At this point, once again set the dial indicator to "0". Repeat the procedure to verify the "0" setting.

- After the ZERO setting is obtained, rotate the gauging arbor until the dial indicator rod does not touch the gauging plate. Record the number the dial indicator needle points to.

Legend

- Example=Dial indicator reading of 0.085

- Record the pinion depth code on the head of the drive pinion. The number indicates a necessary change in the pinion mounting distance. A plus number indicates the need for a greater mounting distance (which can be achieved by decreasing the shim thickness). A minus number indicates the need for a smaller mounting distance (which can be achieved by increasing the shim thickness). If examination reveals pinion depth code "0", the pinion is "nominal".

8. Select the shim using chart;

Pinion marking Dial indicator reading (Inches)	+10	+8	+6	+4	+2	0	-2	-4	-6	-8	-10

0.006	2.56 (0.1008)										

NOTE: When ordering shims, find the part number in the parts catalog by using the thickness of shims listed in the above table.

4A1-14 DIFFERENTIAL (FRONT)

- Place the shim on the drive pinion. Install the inner bearing onto the pinion using an installer 9-8522-1165-0 and a press.

NOTE: Do not apply pressure to the roller cage and apply pressure only to the inner race.

425RW067

- Discard the used collapsible spacer and install a new one.
- Install pinion gear.
- Install outer bearing.
- Use oil seal installer 9-8522-1275-0 to install a new oil seal that has been soaked in front axle lubricant.

NOTE: Take care to use a front differential oil seal, NOT the rear differential oil seal.

415RW024

- Install duct cover.
- Install flange.
- Install flange nut.
 - Apply lubricant to the pinion threads.
 - Tighten the nut to the specified torque using the pinion flange holder 5-8840-2157-0.

Torque: 177-275 N·m (18-28kg·m/130-203lbf)

NOTE: Discard used flange nut and install new one and do not over tighten the flange nut.

425RW057

- Adjust pinion bearing preload.
 - Measure the bearing preload by using a torque meter. Note the scale reading required to rotate the flange.
 - Continue tightening flange nut until the specified starting torque is obtained.

Starting torque:

New bearing: 0.7-1.1 N·m (6.5-11.5kg·cm/5.6-10lbin)

Used bearing: 0.4-0.5 N·m (3.3-5.7kg·cm/2.9-5.0lbin)

425RS027

4. Using punch 5-8840-2293-0, stake the flange nut at two points.

NOTE: When staking, be sure to turn the nut to insure that there is no change in bearing preload. Make sure of preload again as instructed in 3)

415RW019

Legend

- (1) 1.3mm or less

3. Using two sets of feeler gauges, insert a feeler stock of sufficient thickness between each bearing outer race and the carrier to remove all end play. Make certain the feeler stock is pushed to the bottom of the bearing bores. Mount the dial indicator 5-8840-0126-0 on the carrier so that the indicator stem is at right

12. Install adjust shim.

1. Attach the side bearing to the differential assembly without shims. Support the opposite side using a pilot to prevent bearing damage.

425RS029

Legend

- (1) Drive handle:5-8840-0007-0
- (2) Installer:9-8522-1164-0
- (3) Pilot:9-8521-1743-0

2. Insert the differential cage assembly with bearing outer races into the side bearing bores of the carrier.

425RS030

angles to a tooth on the ring gear.

425RS031

4. Adjust feeler gauge thickness from side to side until ring gear backlash is in the specified range.

Backlash: 0.13–0.18mm (0.005 –0.007 in)

425RS032

With zero end play and correct backlash established, remove the feeler gauge packs, determine the thickness of the shims required and add 0.05 mm (0.002 in) to each shim pack to provide side bearing preload. Always use new shims.

5. Use bearing remover 5-8840-0013-0, 5-8840-0014-0 and pilot 9-8521-1743-0 to remove side bearing.

415RW020

13. Install the side bearings together with the selected shims.

425RS029

Legend

- (1) Drive Handle: 5-8840-0007-0
 (2) Installer: 9-8522-1164-0
 (3) Pilot: 9-8521-1743-0

14. Install side bearing outer race.
15. Install differential cage assembly.
16. Install bearing cap then align the setting marks(1) applied at disassembly.

425RS035

17. Tighten the cap bolt to the specified torque.

Torque: 98N·m (10kg·m/72lbft)

425RS036

1. Measure the amount of run-out of the ring gear at its rear face.

Standard: 0.02 mm (0.001 in)

Limit: 0.05 mm (0.002 in)

425RS037

Gear Tooth Contact Pattern Check and Adjustment

1. Apply a thin coat of prussian blue or equivalent to the faces of the 7-8 teeth of the ring gear. Check the impression of contact on the ring gear teeth and make necessary adjustment as described in illustration if the contact is abnormal.

425RS038

Legend

- (1) Heel
- (2) Toe
- (3) Concave Side (Coast)
- (4) Convex Side (Drive)

18. Install differential assembly.

1. Clean the faces of the front axle case and differential carrier.
Apply Three Bond TB1215 or equivalent to the sealing side of the axle case and the carrier.
2. Attach the differential case and the carrier assembly to the front axle case and tighten the nuts and bolts.

Torque: 25 N·m(2.5 kg·m/19 lbft)

415R5014

3. Fill the axle case with hypoid gear lubricant, to just below the filler hole.

Lubricant capacity: 1.4 liter(1.2 Imp qt/1.5 USqt)

Differential Cage Assembly

Disassembled View

Legend

| (2) Thrust Washer | (6) Bolt |
| (3) Side Gear | (7) Differential Cage |
| (4) Cross Pin | (8) Lock Pin |

415RS015

Disassembly

1. Remove bolt.
2. Remove ring gear.
3. Remove lock pin, break staking on the lock pin, using a 5mm (0.20 in) diameter drill.

425RS042

4. Remove the cross pin, using a soft metal rod and a hammer.

425RS043

5. Remove pinion gear.
6. Remove side gear.
7. Remove thrust washer.

415RS016

Clearance between the differential pinion and the cross pin measurement:

Standard: 0.06 - 0.12 mm (0.002 - 0.005 in)

Limit: 0.2 mm (0.008 in)

425RS045

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

Check the following parts.

1. Ring gear, pinion gear
2. Bearing
3. Side gear, pinion gear, cross pin
4. Differential cage, carrier
5. Thrust washer
6. Oil seal

Ring gear replacement:

1. The ring gear should always be replaced with the drive pinion as a set.
2. Discard used bolts and install new ones.
3. When installing the ring gear, apply LOCTITE 271 or equivalent to all the threaded area and half of the unthreaded area of the bolt.
4. Discard used bolts and install new ones..

Torque: 108N·m(11.0Kg·m/80lbft)

4A1-22 DIFFERENTIAL (FRONT)

Clearance between the side gear and the differential box:

Standard: 0.03 - 0.10 mm (0.001 - 0.004 in)

Limit: 0.15 mm (0.006 in)

425RS046

Legend

- (1) Side Gear
- (2) Differential Box

Play in splines between the side gear and the axle shaft:

Standard: 0.08 - 0.36 mm (0.003 - 0.014 in)

Limit: 0.5 mm (0.02 in)

425RS047

Reassembly

1. Install thrust washer.
2. Install side gear.
3. Install the pinion gear with thrust washer by engaging it with the side gears while turning both pinion gears simultaneously in the same direction.

425RS048

4. Install cross pin.

1. Be sure to install the cross pin so that it is in alignment with the lock pin hole in the differential cage.

425RS049

2. Adjust the backlash between the side gear and the pinion gear.

Backlash: 0.03 - 0.08 mm (0.001 - 0.003 in)

Thickness of thrust washers available:

1.00mm, 1.05mm, 1.10mm(0.039in, 0.041in, 0.043in)

425RS050

5. Install lock pin. After lock pin installation, stake the cage to secure the lock pin.

425RS051

Legend

- (1) Staked Portion
(2) Lock Pin

6. Clean the ring gear threaded holes to remove the locking agent. When installing the ring gear, apply LOCTITE 271 or equivalent to all the threaded area and half of the unthreaded area of the bolt.
7. Tighten the bolts in diagonal sequence as illustrated.

Torque: 108N·m(11.0kg·m/80lbf·ft)

NOTE: Discard used bolts and install new ones.

415RS016

4A1-24 DIFFERENTIAL (FRONT)**Main Data and Specifications****General Specifications**

Axle tube Type		It consists of the duct, a cast iron housing and the axle tube.
Gear type		Hypoid
Gear ratio	(to 1)	4.100 (6VD1 with A/T) 4.300 (6VD1 with M/T) 4.777 (X22SE with M/T)
Differential type		Two pinion
Oil capacity	liter (US qt)	1.4 (1.5) (Differential) 0.12 (0.13) (Actuator Housing: Shift on the fly)
Type of lubricant		GL-5 (75W-90)
Axle shaft type		Constant velocity joint (Birfield joint type and double offset joint)
Hub locking Type		Rigid
