How To Create A Minecraft Server On A VPS

After you try this, you must obtain your server JAR file.

You can use this command to download the vanilla server JAR replacing the Version with the model you want

Instance: curl -o server.jar https://serverjars.com/api/fetchJar/vanilla/1.18.1

If you need to make use of Paper (advisable), you can run this command replacing the Version with the version you need

Instance: curl -o server.jar https://serverjars.com/api/fetchJar/paper/1.18.1

Step 3 - Starting your server

After you might have created your Minecraft server folder and have your server JAR file in it, you'll be able to run the following command

This now should create a brand new display screen, after that you should finally begin your server. You'll be able to run this command changing the to how a lot RAM you want to provide to your Minecraft server in MB.

You can even change the server.jar with your precise server JAR that you've in your Minecraft server folder.

Instance: java -Xms512M -Xmx4096M -jar server.jar

Starting your server for the first time will fail, this is since you want to just accept the Mojang EULA in the eula.txt file.

To do that, run:

And change the eula=false part to eula=true in case you settle for their EULA.

Step 3.1 - Becoming a member of your server

It is easy to hitch your Minecraft server! Minecraftservers You need to use your server's IP tackle to affix your server.
