Domain Registration And Web Hosting

In the age of technological advancement and fast connectivity websites are the most effective method of promoting ones business. A website is essential in the modern world. It can be used to pay for bills and book trips, purchase books, look for homes and even read news. Therefore, one has to have a website. However, creating a website and getting it up and running can be a tricky job, especially for the common public. This is certainly not helped by the general misconception that domain registration and web hosting are the same thing. Many online services offer both domain registration and web hosting. It is essential to be aware of the distinctions.

Before you can build websites domain registration and web hosting must be handled separately. TSA CLUB First, a domain needs to be registered by a domain registration company and then that domain must be hosted on the internet through a web hosting company. The first step of setting up a domain is domain registration. If you are planning to launch your own website, you need to name your website. You must register the domain name with a domain registration service to ensure that it is unique and that you are legally the owner of the domain.

You also need to pick an extension for your domain such as .com, .co, .uk, .org, .net etc. You should give careful consideration to the domain extension you choose to ensure that your full domain name is representative of your business or project. To ensure the credibility of the domain registration firm, always get it done through ICANN-accredited registrars, who collectively maintain the shared registration system (SRS).

After you've completed the domain registration process and you have registered your domain, you must create your website online. To achieve this, you'll must purchase a web hosting package from a hosting provider. Your website's requirements will determine which server you select. Normally, this choice would depend on the scripting language used for the website. If the scripting languages used on your website are PHP, mySQL or Perl. Then you need to go in for Linux Web Hosting. Linux web hosting includes features like a specific space storage, data transfer capacity, script installer and email feature real-time statistics, subdomains, anti-virus, dedicated IP addresses, private DNS servers web host manager panels control panel that comes with power features, DRII memory, transfer capacity and full administration of the system. Linux web hosting improves the operational structure of websites and provides the requisite support for running applications and websites successfully.

These are just a few of the differences between domain registration and web hosting. With this information, you can make your own site. To register and sign up for hosting plans, log on to www.Bigrock.com
