

## **infinity: ignorance is bliss**

If something is infinite, how come it can become even more infinite? I am ignorant when it comes to science to say the least, yet infinities make me even more ignorant. My apologies but it appears I am curious about infinity like a cat is about the box. Initially, the universe had infinite density and temperature, and now this particular infinity is gone because this universe is neither that dense nor hot anymore. I take it since the universe is still expanding and accelerating its space is not infinite. But alleged infinities can cancel each other out as if though they never existed in the first place or at least nobody remembers them anymore, having in mind the canceled infinity of density and hotness of the initial phase of the universe. If this bomb called Big Bang created a seemingly infinite space, does that mean that the space is multiplying like rabbits and nobody can do anything about it? Big Bang is not an explosion in space, but rather an expansion of space. So space grows and reproduces like phantom DNA in that, it appears, we are talking about phantom space here which cannot stop growing because it likes ice cream. So what is space actually? It grows as an organism which, apparently, eats nothing but has enough energy to grow tremendously and fly at a highest velocity. If there wasn't much space in the initial phase of the universe, how come space is everywhere now? And what is beyond space? Nothing? Is this particular nothing the true nothing rather than birth of the universe? Perhaps there are degrees of nothingness likewise infinities, because some would make me believe that out of practically nowhere there are elephants in Africa and countless stars. If nowhere and nothing is the beginning of everything, just like I do not know is the beginning of wisdom and the most valuable statement in science, then perhaps my ignorance and nirvana sound great and so now I understand those who are not afraid to pass away and become possibly nothing which just might be the source of everything. No offense to naked scientists who think otherwise, but I myself prefer the presence of God and providence in that, I think there just might be an exceptional intelligence behind this extremely complex model of the universe. So instead of thinking about the origin of life likewise universe, perhaps the real question is the origin of God, who is, unfortunately, beyond the grasp of science and with residence in heaven. I guess I will read a bit the Bible now rather than Deniken or Sagan, even though science will undoubtedly assist me more in this life rather than God who awaits me in the next emanation.
