

robotic manufacturing of advanced flying boats

Our discovery based innovated inventions grant a modern business development opportunity for manufacturing boats and ships with the yet most advanced hulls, ever made.

As a patent pending technology, we aim to protect our sought commercial-partner by keeping the trade-secrets and patenting the design as soon as we are ready to enter the global markets.

For this initiative, we are searching for the proper partner interested in taking leadership in the industry, as a new or as an existing manufacturer of metal based boats.

The Superior Hulls product line is planing the production to be started by costumed robotic manufacturing of the basic hull, with optional human finishing of the products for sports and recreation plus racing or just working boats. The special formation of the hulls is one of its key features, that we know all others will want to copy after we enter the markets, which is why most of our project is kept as a highly valued trade-secret at this time.

If you are interested, or know who is, just contact us by email
